The diet of the Hottentots is the fleſh and entrails of their cattle, and certain wild beaſts, with roots and fruits of different kinds. But, excepting at their public feaſts, they rarely kill any cattle for their own eating, unleſs in caſes of great neceſſity. Yet if any of their cows or ſheep die naturally, they make no ſcruple to eat them, and eſteem them as wholeſome food. If the men are not contented with the roots, fruits, or milk, which the women take care to provide, they go out a-hunting, or, if near the ſea, a-fiſhing. They always hunt in large companies. The entrails of cattle, or of ſuch wild beaſts as they kill for food, are looked upon as moſt exquiſite eating, after they have been boiled in beaſts blood mingled with milk. Sometimes they broil them; but in general they eat them half raw. In either caſe, they devour their victuals in a very furious and ravenous manner, without any regard to decency. They have no ſet meals; but eat as their appetite or humour directs, either by night or day. In fair weather, they eat in the open air; in wind or rain, in their huts. They have traditionary laws as to abſtaining from certain meats. Swines fleſh, and fiſh without ſcales, are prohibited to both ſexes: hares and rabbits are forbidden to the men, but not to the women: the pure blood of beaſts, and the fleſh of the mole, are forbidden to the women, but not to the men.

The naſtineſs of the Hottentots makes them ſwarm with lice, ſome of which are exceedingly big. Theſe laſt they eat, throwing away the unſizeable ones; and if they are aſked how they can devour ſuch deteſtable vermin, they plead the law of retaliation, and urge that it is no ſhame to eat thoſe who would eat them. The Europeans at the Cape have a ſort of field-ſhoes, cut out of the raw hide of an ox or ſtag, with the hairy ſide outwards. Theſe, when thrown away, the Hottentots gather and lay up againſt a rainy day, when their proviſions fall ſhort, and eat them heartily; firſt ſingeing off the hair, then ſoaking them in water, and laſtly broiling them on the fire.

Theſe are the cuſtoms which chiefly diſtinguiſh the Hottentots from all other people on earth; but beſides theſe, they have others in common with the generality of barbarous nations. If a woman is delivered of female twins, they generally deſtroy the worſt-favoured; or if the children are male and female, the latter periſhes, by being expoſed on the bough of a tree, or buried alive with the conſent of the whole village. Some of theſe deſerted infants have been found by the Europeans, and educated by them; yet it is ſaid, that, when arrived at the years of maturity, they always renounced the European manners, apparel, and religion, to conform to thoſe of their own people. After a youth is diſcharged from the tuition of his mother in the manner already mentioned, he may inſult, and even beat her, whenever he pleaſes; for which he receives applauſe inſtead of reproof. Nay, it is uſual for them to go and abuſe their mothers immediate-

Hottentots. mediately after their being admitted into the order of men, to shew their contempt for the conversation of females. If the eldeſt ſon, or, in default of ſons, the next male relation, determines to get rid of his father, mother, or other relation, who are conſidered as ſuperannuated, and incapable of any uſeful domeſtic performance, the village is convoked, and informed of the condition and requeſt of the heir. Conſent is never refuſed; and a day is immediately appointed for the removal of the ſuperannuated man or woman. There is now no diſtinction of perſons; the wealthieſt man, or the captain of the village, muſt ſubmit as well as the meaneſt, and is compelled to ſurrender his whole eſtate to the claimant. The whole village accompany him to a lonely hut, where he is left with a ſmall quantity of proviſions ſet within his reach, where he ſoon periſhes, or is devoured by wild beaſts. Adultery among the Hottentots is always puniſhed with death: but they allow divorce, if the huſband can ſhew ſufficient cauſe for it; and of the ſufficiency of which the reſt of the village are the judges. In this caſe, the men may marry again, but the woman is not allowed to do ſo while her huſband lives. If a widow marries, ſhe cuts off a joint of her finger, beginning with the little one, for every huſband after the firſt.

In other reſpects, the Hottentots are the moſt lazy people in the world: they eſteem thinking a labour, and avoid both as capital plagues; paſſing three parts in four of their lives in the moſt ſhameful ſtupidity and idleneſs. Occaſionally, however, they are ſurpriſingly active. In ſwiftneſs, they are ſaid to ſurpaſs the fleeteſt horſe; and are famed for their dexterity in diſcharging their arrows, javelins, &c. Though unacquainted with agriculture and the qualities of tobacco before the arrival of the Europeans, they excel, and are conſulted by moſt of thoſe reſident in their country, concerning the management of lands and the choice of tobacco. Their mutual affection, liberality, and benevolence, extend to each other in the moſt friendly manner; and, naturally compaſſionating diſtreſs, they are extremely hoſpitable to ſtrangers of every nation. They are of good ſenſe and integrity in the execution of juſtice, and in chaſtity excel almoſt all other nations in the world.

Beſides the methods of fighting with bows and arrows, darts, &c. common to all barbarous nations, the Hottentots have a kind of oxen trained to war. Theſe they call *Bakkeleyers*, or fighting oxen; and the ſkill of the Hottentot generals is chiefly diſplayed by chooſing the moſt proper time and place for driving in the beaſts among the enemy. Theſe animals ſtamp, kick, and gore, with incredible fury; and, if well followed by the men, ſpeedily rout the enemy. A battle decides the war; for an Hottentot army once routed never rallies again. The conquerors triumph and purſue the enemy with aſtoniſhing ſhouts and exclamations. All priſoners are killed; and both armies bury their dead, which are never inſulted or plundered. Deſerters and ſpies are immediately put to death.

The Hottentots are very ſhy of entering upon any diſcourſe concerning their religion; whence it hath been doubted whether they have any at all. Kolben, however, aſſures us, that they believe in a God, the author of all things. This ſupreme power they call the *God of gods*; and ſay, "he is a good man, who does nobody any hurt, and from whom none need be apprehenſive of any, and that he lives far beyond the moon." But it does not appear, that they have any inſtitution of worſhip directly regarding this ſupreme deity. They excuſe themſelves when preſſed on this head, by a tradition, that their firſt parents ſo grievouſly offended this great God, that he curſed them and their poſterity with hardneſs of heart; ſo that they know little about him, and have leſs inclination to ſerve him. They adore the moon, by aſſembling at night in the fields, killing cattle, and offering milk and fleſh. This they do conſtantly at the full and change. They welcome her; and then invoke her for favourable weather, to grant them fodder for their cattle, &c. They alſo regard as a good deity an inſect of the beetle kind, peculiar to theſe countries. It is about the ſize of a child's little finger, the back green, the belly ſpeckled red and white, with two wings and two horns. Wherever they meet this animal, they pay it the higheſt honour and veneration. If it viſits a village, they aſſemble about it in troops as if a divinity had appeared among them; they kill a ſheep or two as a thank-offering, and eſteem it as an omen of the greateſt happineſs and proſperity. They believe its appearance expiates all their guilt. If the inſect lights upon a Hottentot, the perſon is looked upon as a ſaint, and ever after treated with uncommon reſpect. The village kills the fatteſt ox for a thank-offering; and the caul powdered with buchu, and twiſted like a rope, is put collar-wiſe about the ſaint's neck, and there muſt remain till it rots off. A fort of veneration is alſo paid to deceaſed ſaints or heroes. They believe in an evil deity, whom they repreſent as a little, malicious, ill-natured being, a great enemy to Hottentots, and the author of all the miſchiefs which befal them in this world, beyond which he hath no power. They therefore worſhip and offer ſacrifices to him, in order to ſoften and bring him into better temper. Some of them even pretend, that they have ſeen him in the ſhape of a deformed, hairy, frightful monſter, dreſſed in white, with a head and feet like thoſe of a horſe. All ſudden pain, croſs accidents, and ſickneſs, are by the Hottentots aſcribed to witchcraft; ſo that charms and amulets are in high eſteem among them. They ſeem to have no notion of a future ſtate, either good or bad, after death, much leſs of a reſurrection; yet that they believe the immortality of the ſoul, ſeems evident from the following particulars. 1. They offer prayers and praiſes to the good Hottentots deceaſed. 2. They are apprehenſive of the return of departed ſpirits to moleſt them; for which reaſon they remove their village on the death of any of its inhabitants. 3. They believe it is in the power of wizards and witches to lay theſe ſpirits. But they ſeem to think theſe departed ſouls remain in or about thoſe places where the body was inhabited by them; for of a heaven or hell, rewards or puniſhments, they have not the leaſt notion. Hottentots.

This appears to be the whole that can be collected concerning the Hottentot religion, and to which they are invincibly attached. If you attempt to reaſon with them, they hear you ſullenly, or quit you abruptly. They avoid, if poſſible, any religious ſubject. Some of them have pretended a belief of Chriſtianity;

Hottentots. nity: but when the motive was removed, they always returned to their former idolatry; and, in ſpite of all the endeavours of the Dutch miſſionaries at the Cape, they have never been able to make a ſingle convert.

Of the cape-town and country adjacent peopled by the Dutch, Mr Foſter gives the following account: "The town is neat and well built; looks white at a diſtance, and ſeems to riſe out of a deſart ſurrounded by broken maſſes of black and dreary mountains. The ſtorehouſes of the Dutch Eaſt-India company are all ſituated neareſt the water, and the private buildings lie beyond them in a gentle aſcent. The fort which commands the road, is on the eaſt ſide of the town, but ſeems not to be of great ſtrength; beſides which, there are ſeveral batteries on both ſides. The ſtreets in the town are broad, and regular; all the principal ones are planted with oaks; and ſome have in their middle a canal of running water, which, on account of its ſmall quantity, they are obliged to huſband by ſluices, ſo that parts of it are ſometimes entirely drained, and occaſion no very pleaſant ſmell. The national character of the Dutch ſtrongly manifeſts itſelf in this particular; their ſettlements being always ſupplied with canals, though reaſon and common ſenſe evidently prove their noxious influence on the health of the inhabitants, eſpecially at Batavia.

"The houſes are built of brick, and many of them are white-waſhed on the outſide. The rooms are in general lofty and ſpacious, and very airy, which the hot climate requires. There is but one church in the whole town; and that is extremely plain, and ſeems to be rather too ſmall for the congregation. That ſpirit of toleration, which has been ſo beneficial to the Dutch government at home, is not to be met with in their colonies. It is but very lately that they have ſuffered even the Lutherans to build churches at Batavia, and at this place; and at the preſent time, a clergyman of that perſuaſion is not tolerated at the Cape, but the inhabitants are obliged to content themſelves with the chaplains of Daniſh and Sweduſh Eaſt-India-men, who give them a ſermon, and adminiſter the ſacrament once or twice a-year, and are very handſomely rewarded. The government and the inhabitants do not give themſelves the trouble to attend to a circumſtance of ſo little conſequence in their eyes as the religion of their ſlaves, who in general ſeem to have none at all. A few of them follow the Mahommedan rite; and weekly meet in a private houſe belonging to a free Mahommedan, in order to read or rather chaunt ſeveral prayers and chapters of the Khoran. As they have no prieſt among them, they cannot partake of any other acts of worſhip (A).

"The ſlaves belonging to the company, who amount to ſeveral hundreds, are lodged and boarded in a ſpacious houſe erected for that purpoſe, where they are likewiſe kept at work. Another great building ſerves as an hoſpital for the ſailors belonging to the Dutch Eaſt-India ſhips, which touch here, and commonly have prodigious numbers of ſick on board, on their voyage from Europe towards India. The vaſt num- Hottentots.
ber of men, ſometimes ſix, ſeven, or eight hundred, which theſe ſhips carry out to ſupply the military in India, the ſmall room to which they are confined, and the ſhort allowance of water and ſalt proviſion they receive, on a long voyage through the torrid zone, generally make conſiderable havock among them: it is therefore no uncommon circumſtance at the Cape, that a ſhip on her paſſage thither from Europe, loſes eighty or a hundred men, and ſends between two and three hundred others dangerouſly ill to the hoſpital. A fact no leſs deplorable than certain, is, that the ſmall expence and facility with which the *ziel-verkoopers* actually carry on their infamous trade of ſupplying the India company with recruits, makes them leſs attentive to the preſervation of health among theſe poor people. Nothing is more common, in this and other Dutch colonies, than to meet with ſoldiers in the company's ſervice, who, upon inquiry, acknowledge they have been kidnapped in Holland. There is an apothecary's ſhop belonging to the hoſpital, where the moſt neceſſary remedies are prepared, but no expenſive drugs are to be found in it; and the method of adminiſtering to all the patients indiſcriminately out of two or three huge bottles, full of different preparations, ſuffices to convince us, that the freſh air of the land, and the freſh proviſions here, contribute much more to the recovery of the ſick, than the ſkill of their phyſicians. Patients who are able to walk, are ordered to go up and down the ſtreets every fair morning; and all kinds of greens, pot-herbs, ſallads, and antiſcorbutics, are raiſed for their uſe, in an adjacent garden belonging to the company. Travellers have ſometimes praiſed and ſometimes depreciated this garden, according to the different points of view in which it has been conſidered. It is true, a few regular walks of indifferent oaks, encompaſſed with elm and myrtle hedges, are not objects engaging enough to thoſe who are uſed to admire the perfection of gardening in England, or who contemplate in Holland and France cypreſs, box, and yew-trees cut out into vaſes, ſtatues, and pyramids, or *charmilles* turned into pieces of architecture! But conſidering that the trees were planted in the beginning of this century, more for uſe than ornament; that they ſhelter the kitchen-herbs for the hoſpital, againſt the deſtructive violence of ſtorms; and that they form the only ſhady and airy walks, comfortable to voyagers and ſick perſons in this hot climate: I cannot wonder that ſome ſhould extol as "a delightful ſpot *," what others contemptuouſly call "*a friar's garden*†." * Byron.
† Bougainville.

"The governor depends immediately upon the Eaſt-India company, and has the rank of an *edele heer*, the title given to the members of the ſupreme council of Batavia. He preſides here over a council, conſiſting of a ſecond or deputy-governor, the fiſcal, the major (who commands the fort), the ſecretary, the treaſurer, the comptroller of proviſions, the comptroller of liquors, and the book-keeper; each of which has a branch of the company's commerce aſſigned to his

(A) We would not be underſtood to throw an odium on the Dutch in particular, when it is well known that the negroes, who wear the chains of the Engliſh and French, are equally neglected: it was only intended to awaken a fellow-feeling towards an unhappy race of MEN, among the coloniſts of all nations; and to remind them, whilſt they enjoy, or *ſtrive* to enjoy, the ineſtimable bleſſing of LIBERTY, to exert themſelves in acts of humanity and kindneſs towards thoſe from whom they with-hold it, perhaps, without remorſe.

his care. This council has the whole management of the civil and military departments; but the deputy-governor preſides over another, named the *court of juſtice*, which tries all offences and crimes, and conſiſts of ſome of the members of the former; but no two relations can ſit and vote in the ſame council, to prevent the influence of parties.

"The income of the governor is very conſiderable; for, beſides a fixed appointment, and the uſe of houſes, gardens, proper furniture, and every thing that belongs to his table, he receives about 10 dollars for every leagre of wine which the company buy of the farmer, in order to be exported to Batavia. The company allows the ſum of 40 dollars for each leagre, of which the farmer receives but 24: what remains is ſhared between the governor, and ſecond or deputy; the former taking two-thirds, which ſometimes are ſaid to amount to 4000 dollars per annum. The deputy-governor has the direction of the company's whole commerce here, and ſigns all orders to the different departments under him, as well as the governor to others. He and the fiſcal have the rank of *upper koopman*. The fiſcal is at the head of the police, and ſees the penal laws put in execution: his income conſiſts of fines, and of the duties laid on certain articles of commerce; but if he be ſtrict in exacting them, he is univerſally deteſted. The ſound policy of the Dutch has likewiſe found it neceſſary to place the fiſcal as a check, to overawe the other officers of the company, that they may not counteract the intereſts of their maſters, or infringe the laws of the mother-country. He is, to that end, commonly well verſed in juridical affairs, and depends ſolely upon the mother-country. The major (at preſent Mr Von Prehn, who received us with great politeneſs) has the rank of *koopman* or merchant: this circumſtance ſurpriſes a ſtranger, who, in all other European ſtates, is uſed to ſee military honours confer diſtinction and precedence; and appears ſtill more ſingular to one who knows the contraſt in this particular between Holland and Ruſſia, where the idea of military rank is annexed to every place, even that of a profeſſor at the univerſity. The number of regular ſoldiers at this colony amounts to about 700; of which 400 form the garriſon of the fort, near the Cape-town. The inhabitants capable of bearing arms form a militia of 4000 men; of whom a conſiderable part may be aſſembled in a few hours, by means of ſignals made from alarm-places in different parts of the country. We may from hence make ſome eſtimate of the number of white people in this colony, which is at preſent ſo extenſive, that the diſtant ſettlements are above a month's journey from the Cape; but theſe remote parts lie ſometimes more than a day's journey from each other, are ſurrounded by various nations of Hottentots, and too frequently feel the want of protection from their own government at that diſtance. The ſlaves in this colony are at leaſt in the proportion of five or more to one white perſon. The principal inhabitants at the Cape have ſometimes from 20 to 30 ſlaves, which are in general treated with great lenity, and ſometimes become great favourites with their maſters, who give them very good cloathing, but oblige them to wear neither ſhoes nor ſtockings, reſerving theſe articles to themſelves. The ſlaves are chiefly brought from Madagaſcar, and a little veſſel annually goes from the Cape thither on that trade; there are, however, beſides them, a number of Malays and Bengaleſe, and ſome negroes. The coloniſts themſelves are for the greateſt part Germans, with ſome families of Dutch, and ſome of French Proteſtants. The character of the inhabitants of the town is mixed. The are induſtrious, but fond of good living, hoſpitable, and ſocial; though accuſtomed to hire their apartments to ſtrangers, for the time they touch at this ſettlement, and uſed to be complimented with rich preſents of ſtuffs, &c. by the officers of merchant ſhips. They have no great opportunities of acquiring knowledge, there being no public ſchools of note at the Cape; their young men are therefore commonly ſent to Holland for improvement, and their female education is too much neglected. A kind of diſlike to reading, and the want of public amuſements, make their converſation unintereſting, and too frequently turn it upon ſcandal, which is commonly carried to a degree of inveteracy peculiar to little towns. The French, Engliſh, Portugueſe, and Malay languages, are very commonly ſpoken, and many of the ladies have acquired them. This circumſtance, together with the accompliſhments of ſinging, dancing, and playing a tune on the lute, frequently united in an agreeable perſon, make amends for the want of refined manners and delicacy of ſentiment. There are, however, among the principal inhabitants, perſons of both ſexes, whoſe whole deportment, extenſive reading, and well-cultivated underſtanding would be admired and diſtinguiſhed even in Europe. Their circumſtances are in general eaſy, and often very affluent, on account of the cheap rate at which the neceſſaries of life are to be procured: but they ſeldom amaſs ſuch prodigious riches here as at Batavia; and I was told the greateſt private fortune at the Cape did not exceeed 100,000 dollars, or about 22,500 l. ſterling.

"The farmers in the country are very plain hoſpitable people; but thoſe who dwell in the remoteſt ſettlements ſeldom come to town, and are ſaid to be very ignorant; this may eaſily be conceived, becauſe they have no better company than Hottentots, their dwellings being often ſeveral days journey aſunder, which muſt in a great meaſure preclude all intercourſe. The vine is cultivated in plantations within the compaſs of a few days journey from the town; which were eſtabliſhed by the firſt coloniſts, and of which the ground was given in perpetual property to them and their heirs. The company at preſent never part with the property of the ground, but let the ſurface to the farmer for an annualrent, which, though extremely moderate, being only 25 dollars for 60 acres *, yet does not give ſufficient encouragement to plant vineyards. The diſtant ſettlements, therefore, chiefly raiſe corn and rear cattle; nay, many of the ſettlers entirely follow the latter branch of ruſtic employment, and ſome have very numerous flocks. We were told there were two farmers who had each 15,000 ſheep, and oxen in proportion; and ſeveral who poſſeſſed 6000 or 8000 ſheep, of which they drive great droves to town every year: but lions and buffaloes, and the fa-

* Each acre of 666 ſquare Rhynland roods, the rood of 12 feet. The proportion of the Rhynland foot to the Engliſh, is about 116 to 120.

Hottentots. tigue of the journey, deſtroy numbers of their cattle before they can bring them ſo far. They commonly take their families with them in large waggons covered with linen or leather, ſpread over hoops, and drawn by 8, 10, and ſometimes 12 pair of oxen. They bring butter, mutton-tallow, the fleſh and ſkins of ſea-cows (hippopotamus), together with lion and rhinoceros' ſkins, to ſell. They have ſeveral ſlaves, and commonly engage in their ſervice ſeveral Hottentots of the poorer ſort, and (as we were told) of the tribe called *Boſchemans*, or *Buſhmen*, who have no cattle of their own, but commonly ſubſiſt by hunting, or by committing depredations on their neighbours. The opulent farmers ſet up a young beginner by intruſting to his care a flock of 400 or 500 ſheep, which he leads to a diſtant ſpot, where he finds plenty of good graſs and water; the one-half of all the lambs which are yeaned fall to his ſhare, by which means he ſoon becomes as rich as his benefactor.

"Though the Dutch company ſeem evidently to diſcourage all new ſettlers, by granting no lands in private property; yet the products of the country have of late years ſufficed not only to ſupply the iſles of France and Bourbon with corn, but likewiſe to furniſh the mother-country with ſeveral ſhip-loads. Theſe exports would certainly be made at an eaſier rate than at preſent, if the ſettlements did not extend ſo far into the country, from whence the products muſt be brought to the Table-bay by land-carriage, on roads which are almoſt impaſſable. The intermediate ſpaces of uncultivated land between the different ſettlements are very extenſive, and contain many ſpots fit for agriculture; but one of the chief reaſons why the coloniſts are ſo much divided and ſcattered throughout the country, is to be met with in another regulation of the company, which forbids every new ſettler to eſtabliſh himſelf within a mile of another. It is evident, that if this ſettlement were in the hands of the commonwealth, it would have attained to a great population, and a degree of opulence and ſplendor, of which it has not the leaſt hopes at preſent: but a private company of Eaſt-India merchants find their account much better in keeping all the landed property to themſelves, and tying down the coloniſt, leſt he ſhould become too great and powerful.

"The wines made at the Cape are of the greateſt variety poſſible. The beſt, which is made at M. Vander Spy's plantation of Conſtantia, is ſpoken of in Europe, more by report than from real knowledge; 30 leagres (B) at the utmoſt are annually raiſed of this kind, and each leagre ſells for about 50l. on the ſpot. The vines from which it is made were originally brought from Shiraz in Perſia. Several other ſorts grow in the neighbourhood of that plantation, which produce a ſweet rich wine, that generally paſſes for genuine Conſtantia in Europe. French plants of burgundy, muſcade, and frontignan, have likewiſe been tried, and have ſucceeded extremely well, ſometimes producing wines ſuperior to thoſe of the original ſoil. An excellent dry wine, which has a ſlight agreeable tartneſs, is commonly drank in the principal families, and is made of Madeira vines tranſplanted to the Cape. Several low ſorts, not entirely diſagreeable, are raiſed in great plenty, and ſold at a very cheap rate; ſo that the ſailors of the Eaſt-India ſhips commonly indulge themſelves very plentifully in them whenever they come aſhore. Hotting Houlier

"The products of the country ſupply with proviſions the ſhips of all nations which touch at the Cape. Corn, flour, biſcuit, ſalted beef, brandy, and wine, are to be had in abundance, and at moderate prices; and their freſh greens, fine fruits (C), good mutton and beef, are excellent reſtoratives to ſeamen who have made a long voyage."

HOTTINGER (John Henry), born at Zurich in Switzerland in 1620, profeſſed the Oriental languages at Leyden, and was eſteemed by all his learned colleagues. He was drowned, with part of his family, in the river Lemit, in the year 1667. He wrote a prodigious number of works; the principal of which are, 1. *Exercitationes Anti-Morinianæ de Pentateucho Samaritano*, quarto, in which he defends the Hebrew text againſt father Morin. 2. *Hiſtoria Orientalis*, quarto. 3. *Bibliothecarius quadripartitus*. 4. *Theſaurus Philologicus Sacræ Scripturæ*, quarto. 5. *Hiſtoria Eccleſiaſtica*. 6. *Promptuarium, ſive Bibliotheca Orientalis*, 4to. 7. *Diſſertationes miſcellaneæ*, &c.

HOTTONIA, WATER-VIOLET; a genus of the monogynia order, belonging to the pentandria claſs of plants.—There is but one ſpecies, viz. the paluſtris, with a naked ſtalk. It grows naturally in the ſtanding waters in many parts of England. The leaves, which are for the moſt part immerſed in water, are finely winged and flat like moſt of the ſea-plants; and at the bottom have long fibrous roots, which ſtrike into the mud: the flower-ſtalks riſe on five ſix inches above the water, and toward the top have two or three whorls of purple flowers, terminated by a ſmall cluſter of the ſame. Theſe flowers have the appearance of thoſe of the ſtock-gilliflower, ſo make a pretty appearance on the ſurface of the water.—It may be propagated in deep ſtanding waters, by procuring its ſeeds when they are ripe, from the places of their natural growth; which ſhould be immediately dropped into the water in thoſe places where they are deſigned to grow, and the ſpring following they will appear; and if they are not diſturbed, they will ſoon propagate themſelves in great plenty.—Cows eat this plant; ſwine refuſe it.

HOVEDEN (Roger de), born of an illuſtrious family, became chaplain to king Henry II. and left behind him two books of *Engliſh Annals*, carried on from the year 732, where Bede ended, to the 4th of king John, 1201. Sir H. Saville and Mr Selden reckon him among the moſt conſiderable hiſtorians who flouriſhed in the 11th and 12th centuries.

HOULIERES (Antoniette de), a French lady, whoſe poetry is highly eſteemed in France. Her works and thoſe of her daughter have been collected and printed together in two volumes. Moſt of the Idyls, particularly thoſe on ſheep and birds, ſurpaſs every thing of the kind in the French language: the thoughts and expreſſions are noble; and the ſtyle pure, flowing, and chaſte. Mademoiſelle des Houlieres carried the poetic prize in the French academy againſt Fontenelle. Both of theſe ladies were members

(B) A leagre contains about 108 gallons, or a pipe.
(C) Their grapes and oranges are ſome of the beſt in the world.

Hound, Hours.

bers of the academy of Ricovatri; the mother was alſo a member of the academy of Arles.—Thoſe who deſire to be more particularly acquainted with the hiſtory of Madam des Houlieres may conſult her life prefixed to her works in the Paris edition of 1747, 2 vols 12mo.

HOULSWORTHY, a large town of Devonſhire, ſeated between two branches of the river Tamer, having a good market for corn and proviſions. W. Long. 4. 42. N. Lat. 50. 50.

HOUND. See CANIS, BLOOD-*Hound*, and GRE-*Hound*.

HOUR, in chronology, an aliquot part of a natural day, uſually a 24th, but ſometimes a 12th. The origin of the word *hora*, or ὥρα, comes, according to ſome authors, from a furname of the ſun, the father of hours, whom the Egyptians call *Horus*. Others derive it from the Greek ὁρίζειν, to *terminate*, *diſtinguiſh*, &c. Others from the word ὄρον, *urine*; holding, that Triſmegiſtus was the firſt that ſettled the diviſion of hours, which he did from obſervation of an animal conſecrated to Serapis, named *cynocephalus*, which makes water 12 times a-day, and as often in the night, at equal intervals.

An hour, with us, is a meaſure or quantity of time, equal to a 24th part of the natural day, or nycthemeron; or the duration of the 24th part of the earth's diurnal rotation. Fifteen degrees of the part of the equator anſwer to an hour; though not preciſely, but near enough for common uſe. It is divided into 60 minutes; the minute into 60 ſeconds, &c.

The diviſion of the day into hours is very ancient: as is ſhewn by Kircher, *Oedip. Ægypt.* Tom. II. P. II. claſſ. VII. c. 8.: though the paſſages he quotes from Scripture do not prove it.—The moſt ancient hour is that of the 12th part of the day. Herodotus, lib. ii. obſerves, that the Greeks learnt from the Egyptians, among other things, the method of dividing the day into twelve parts.—The aſtronomers of Cathaya, &c. biſhop Beveridge obſerves, ſtill retain this diviſion. They call the hour, *chag*; and to each chag give a peculiar name, taken from ſome animal: The firſt is called *zeth*, "mouſe;" the ſecond, *chiu*, "bullock;" the third, *zem*, "leopard;" the fourth, *mau*, "hare;" the fifth, *chiu*, "crocodile, &c."

The diviſion of the day into 24 hours, was not known to the Romans before the firſt Punic war.—Till that time they only regulated their days by the riſing and ſetting of the ſun. They divided the 12 hours of their day into four, viz. *prime*, which commenced at ſix o'clock; *third*, at nine; *ſixth*, at twelve, and *none*, at three. They alſo divided the night into four watches, each containing three hours.

HOURS, HORÆ, in the ancient mythology, were certain goddeſſes, the daughters of Jupiter and Themis; at firſt only three in number, Eunomina, Dice, and Irene; to which were afterwards added two more, Carpo and Thallote.—Homer makes them the door-keepers of heaven. Ovid allots them the employment of harneſſing the horſes of the ſun:

Jungere equos Titan velocibus imperat Horis.

HOURS, *Horæ*, in the Romiſh church, are certain prayers performed at ſtated times of the day; as matins, veſpers, lauds, &c.—The leſſer hours, are *prime*, *tierce*, *ſixth*, and *none*. They are called *hours*, or *canonical hours*, as being to be rehearſed at certain hours preſcribed by the canons of that church, in commemoration of the myſteries accompliſhed at thoſe hours. Theſe hours were anciently alſo called *courſe*, *curſus*; F. Mabillon has a diſſertation on them, entitled, *De Curſu Gallicano*. House.

The firſt conſtitution enjoining the obſervation of the canonical *hours*, is of the ninth century, being found in a capitular of Heito biſhop of Baſil directed to his curates, importing that the prieſts ſhall never be abſent at the canonical hours either by day or night.

HOUSE, a habitation, or place built with conveniencies for dwelling in. See ARCHITECTURE.

HOUSE is alſo uſed for one of the eſtates of the kingdom aſſembled in parliament. Thus we ſay, the houſe of lords, the houſe of commons, &c. See PEERS, COMMONS, &c.

HOUSE is alſo uſed for a noble family; or a race of illuſtrious perſons iſſued from the ſame ſtock. In this ſenſe we ſay, the houſe or family of the Stuarts, the Bourbons, the houſe of Hanover, of Auſtria, of Lorrain, of Savoy, &c.

Cheap, eaſy, and expeditious Method of conſtructing HOUSES, *which have been found to be very uſeful hoſpitals for the recovery of the ſick, and therefore may probably make very wholeſome places of reſidence for the healthy.*—The firſt thing to be done is to chooſe a dry and airy ſituation, on a gravelly or chalky ſoil if poſſible; upon this lay down the plan of your building, making one end of it face that quarter from whence the pureſt and healthieſt winds may be expected to blow, of a breadth that can be conveniently roofed. Then, if boarding does not come ſo cheap, drive ſtakes, at about ſix feet diſtance from each other, into the ground, ſo as to ſtand about ſix feet above it; and, interlacing them with wattles, coat the wattles on the ſide next the weather, with freſh ſtraw; and make the roof in the ſame manner, but thicker, or of thatch in the uſual way, with a hole at the very top of it, to open occaſionally. Let the end of the building facing the wholeſomeſt quarter lie open ſome feet back, ſo as to form a porch, where the convaleſcents may take the air without danger of any injury from the weather. A large chimney and kitchen grate may be erected at the other end. If the ſoil happens to be chalky or gravelly, you may hollow it four or five feet deep, within a foot or eighteen inches of the walls; but let the ſteps into this hollow lie far enough within the porch, that no water may get into it, and, if of chalk, the ſteps may not grow ſlippery in wet weather. From time to time open the vent-hole at the roof; by means of which all the unwholeſome infectious air, as being warmer, and conſequently lighter, than that which is pure and wholeſome, will be driven out by the ruſhing in of the freſh air: a purpoſe, which the little openings, that may be left in the ſides and roofs of ſuch rude and haſty buildings, will, even of themſelves, anſwer ſo well, as ſufficiently to compenſate any cold they may let in, even in the coldeſt months. Let the floor likewiſe be ſcraped three or four inches deep every five or ſix days, and what comes off removed to ſome diſtance. Halls of this kind, 50 feet long and 20 broad, coſt but a trifle to build; yet, with

House. with these precautions (even without the addition of clean straw for every new patient to lie on, inclosed in clean washed sacks fit for the purpose, which come infinitely cheaper than the bare cleaning of flock or even feather beds, supposing it possible to clean such beds), proved of infinitely more advantage in the recovery of sick soldiers, than the low-roofed rooms of the farm-houses of the Isle of Wight, or even the better accommodations of Carisbrooke castle in the same island, in which there perished four times the number of sick that there did in these temporary receptacles; which were first thought of by doctor Procklesby, on occasion of some terrible infections from confined animal-effluvia.

Is it not surprising, that we have not availed ourselves more of the above discovery in natural history, being, perhaps, the most important the moderns can boast of, in the most useful science, viz. the superior lightness of unwholesome and infectious air! The upper sashes in most houses, even of those who pretend to some knowledge in these matters, are generally immoveable, by means of which no part of the foul air above the level of the lowest rail of the other sash's greatest rise, can escape by the window; and, if it escapes by the doors, it is generally for want of a vent in the highest part of the roof, merely to accumulate in the upper story of the house, and add to the infection, which the great quantities of old furniture usually stored up there are of themselves but too apt to create, when care is not frequently taken to open the windows of it. Thus, the chief benefit to be expected from lofty rooms is in a great measure lost. Whereas, were the upper sashes contrived to come down, all the air might be easily changed, and that almost insensibly, by letting them down an inch or two. Nay, the upper sash might be often let entirely down with less danger or inconvenience from cold, than the lower thrown up the tenth part of an inch, though the doing of the former would be attended with infinitely more advantage to the health of the inhabitants than the latter. It is, perhaps, on this principle, that we are to account for the good health enjoyed by the poor who live crowded in damp cellars, and often with great numbers of rabbits, poultry, and even swine about them. These cellars are open to the street, with doors reaching from the floor to the very ceiling, but never so close at bottom or at top as to prevent a free circulation of air; in consequence of which, that all-vivifying fluid, as fast as it is spoiled by passing through the lungs of the inhabitants and their stock, or is infected by their insensible perspiration, excrements, &c. is driven out and replaced by the fresh air.

House, in astrology, denotes the twelfth part of the heavens.

The division of the heavens into houses, is founded upon the pretended influence of the stars, when meeting in them, on all sublunary bodies. These influences are supposed to be good or bad; and to each of these houses particular virtues are assigned, on which astrologers prepare and form a judgment of their horoscopes. The horizon and meridian are two circles of the celestial houses, which divide the heavens into four equal parts, each containing three houses; six of which are above the horizon, and six below it; and six of these are called *eastern*, and six *western houses*.

House, Household. A scheme or figure of the heavens is composed of 12 triangles, also called *houses*, in which is marked the stars, signs, and planets, so included in each of these circles. Every planet has likewise two particular houses, in which it is pretended that they exert their influence in the strongest manner; but the sun and moon have only one, the house of the former being Leo, and that of the latter Cancer.

The houses in astrology have also names given them according to their qualities. The first is the house of life: this is the ascendant, which extends five degrees above the horizon, and the rest below it. The second is the house of riches: the third, the house of brothers: the fourth, in the lowest part of the heavens, is the house of relations, and the angle of the earth: the fifth, the house of children: the sixth, the house of health: the seventh, the house of marriage, and the angle of the west: the eighth, the house of death: the ninth, the house of piety: the tenth, the house of offices: the eleventh, the house of friends: and the twelfth, the house of enemies.

Country-House, is the *villa* of the ancient Romans, the *quinta* of the Spaniards and Portuguese, the *closerie* and *cassine* of the French, and the *vigna* of the Italians.

It ought always to have wood and water near it; these being the principal beauties of a rural seat. The trees make a far better defence than hills, as they yield a cooling and healthy air, shade during the heat of summer, and very much break the severities of the winter season.

It should not be situated too low, on account of the moisture of the air; and, on the other hand, those built on places exposed to the winds are expensive to keep in repair. In houses not above two stories high, and upon a good foundation, the length of two bricks, or 18 inches, for the heading course, will be sufficient for the ground-work of any common structure; and six or seven courses above the earth, to a water-table, where the thickness of the walls are abated, or taken in, on either side the thickness of a brick, *viz.* two inches and a quarter. But for large and high houses of three, four, or five stories, with garrets, their walls ought to be three heading courses of bricks, or 28 inches at least, from the foundation to the first water-table; and at every a story a water-table, or taking in, on the inside, for the summers, girders, and joists to rest upon, laid into the middle, or one quarter of the wall at least, for the better bond. But as for the partition-wall, a brick and half will be sufficiently thick; and for the upper stories, a brick length or nine inch brick will suffice.

House-*Breaking*, or *Robbing*, is the breaking into and robbing a house in the day-time; the same crime being termed BURGLARY, when done by night: both are felony, without benefit of clergy.

HOUSEHOLD, the whole of a family considered collectively, including the mistress, children, and servants. But the household of a sovereign prince includes only the officers and domestics belonging to his palace.

The principal officers of his majesty's household are, the lord steward, lord chamberlain of the household, the groom of the stole, the master of the great wardrobe,

Household. robe, and the master of the horse.

The civil government of the king's house is under the care of the lord steward of the king's household; who, as he is the chief officer, all his commands are observed and obeyed. His authority extends over all the other officers and servants, except those of his majesty's chapel, chamber, and stable, and he is the judge of all crimes committed either within the court or the verge.

Under him are the treasurer of the household, the comptroller, cofferer, the master of the household, the clerks of the green-cloth, and the officers and servants belonging to the accounting-house, the marshalsea, the verge, the king's kitchen, the household kitchen, the acatery, bake-house, pantry, buttery, cellar, pastry, &c. Next to the lord steward is the lord chamberlain of the household, who has under him the vice-chamberlain, the treasurer, and comptroller of the chamber; 48 gentlemen of the privy chamber, 12 of whom wait quarterly, and two of them lie every night in the privy-chamber; the gentleman usher, the grooms of the great chamber, the pages of the presence-chamber; the mace-bearers, cup-bearers, carvers, musicians, &c. See *Lord* CHAMBERLAIN *of the Household*.

The groom of the stole has under him the 11 other lords of the bed-chamber, who wait weekly in the bed-chamber, and by turns lie there a-nights on a pallet-bed; and also the grooms of the bed-chamber, the pages of the bed-chamber and back-stairs, &c. See *Groom of the* STOLE.

The master or keeper of the great wardrobe has under him, a deputy, comptroller, clerk of the robes, brusher, &c. and a number of tradesmen and artificers, who are all sworn servants to the king.

The master of the horse has under his command the equerries, pages, footmen, grooms, coachmen, farriers, sadlers, and all the other officers and tradesmen employed in his majesty's stables.

Next to the civil list of the king's court, is the military, consisting of the band of gentlemen pensioners, the yeomen of the guard, and the troops of the household; of which the two first guard the king above stairs.

When the king dines in public, he is waited upon at table by his majesty's cup-bearers, carvers, and gentlemen sewers; the musicians playing all the time. The dinner is brought up by the yeomen of the guard, and the gentlemen sewers set the dishes in order. The carvers cut for the king, and the cup-bearers serve him the drink with one knee on the ground, after he has first tasted it in the cover.

HOUSE *and Window Duty*, a branch of the king's extraordinary revenue *.—As early as the conquest mention is made in domesday book of fumage or fugage, vulgarly called *smoke-farthinges*; which were paid by custom to the king for every chimney in the house. And we read that Edward the Black prince (soon after his successes in France) in imitation of the English custom, imposed a tax of a florin upon every hearth in his French dominions. But the first parliamentary establishment of it in England was by statute 13 & 14 Car. II. c. 10. whereby an hereditary revenue of 2*s*. for every hearth, in all houses paying to church and poor, was granted to the king for ever. And, by subsequent statutes, for the more regular assessment of this tax, the constable and two other substantial inhabitants of the parish, to be appointed yearly, (or the surveyor appointed by the crown, together with such constable or other public officer) were, once in every year, empowered to view the inside of every house in the parish. But, upon the revolution, by stat 1. W. & M. c. 10. hearth-money was declared to be "not only a great oppression to the poorer sort, but a badge of slavery upon the whole people, exposing every man's house to be entered into and searched at pleasure, by persons unknown to him; and therefore, to erect a lasting monument of their majesties goodness, in every house in the kingdom the duty of hearth-money was taken away and abolished." This monument of goodness remains among us to this day: but the prospect of it was somewhat darkened, when in six years afterwards, by statute 7 W. III. c. 18. a tax was laid upon all houses (except cottages) of 2*s*. now advanced to 3*s*. *per* house, and a tax also upon all windows, if they exceeded nine, in such house. Which rates have been from time to time varied, being now extended to all windows exceeding six; and power is given to surveyors, appointed by the crown, to inspect the outside of houses, and also to pass through any house, two days in the year, into any court or yard to inspect the windows there. Housing, Howard.

See *Revenue*.

HOUSING, or HOUSE-*Line*, in the sea-language, a small line, formed of three fine strands, or twists of hemp, smaller than rope-yarn. It is chiefly used to seize blocks into their stropps, to bind the corners of the sails, or to fasten the bottom of a sail to its bolt-rope, &c. See BOLT-*Rope*.

HOWARD (HENRY), earl of Surry, a soldier and a poet, the son and grandson of two lord treasurers, dukes of Norfolk, was born probably about the year 1520, and educated in Windsor castle, with young Fitzroy, earl of Richmond, natural son to king H. VIII. Wood says, from tradition, that he was some time a student at cardinal college, Oxford. In his youth he became enamoured of the Fair Geraldine, whom his sonnets have immortalized. In 1532, Howard with his companion Richmond was at Paris, where they continued some time. The latter died in 1536; after which our young hero made a tour to Italy, and at Florence, like a true *enamorato*, published a challenge against all comers, whether Christians, Jews, Saracens, Turks, or cannibals, in defence of the beauty of his fair Geraldine; and was victorious in the tournament instituted by the grand duke on the occasion. The duke, we are told, was so charmed with his gallant exploits, that he would gladly have retained him at his court; but he rejected the invitation, being determined to maintain the superlative beauty of his Geraldine, in all the principal cities in Italy. This romantic resolution was however frustrated by the command of his sovereign, Henry VIII. to return to England.

In 1540, he signalized himself in a tournament at Westminster, against Sir John Dudley, Sir Thomas Seymour, and others. In 1542, he marched, under the command of his father, against the Scots; and in the same year was confined in Windsor castle for eating flesh in Lent, contrary to the king's proclamation. In 1544, on the expedition to Boulogne in France, he was appointed field-marshal of the English army; and after the taking of that town, in 1546, made captain-general

Howard. general of the king's forces in France. He was at this time knight of the garter. In the same year, attempting to intercept a convoy, he was defeated by the French, and soon after superseded in his command by the earl of Hertford.

Surry, after his return to England, conscious of his former services, and peevish under his disgrace, could not help reflecting on the king and council. This was his first step towards destruction. He had married Frances, the daughter of John earl of Oxford; and, after her death, is said to have made love to the princess Mary. For this the Seymours, rivals of the Norfolk family, and now in favour with the king, accused him of aspiring to the crown; adding, that he already presumed to quarter part of the royal arms with his own: but, whatever might be the pretence, the cause of his ruin was the jealousy and power of his enemies. In short, the destruction of the Howards being determined, Surry, and his father the duke of Norfolk, were committed to the tower, in December 1546; and on the 13th of January following, Surry was tried at Guild-hall by a common jury, and beheaded on Tower-hill on the 19th day of the same month, nine days before the death of the king, who thus, that the measure of his crimes might be full, finished his life with the murder of his best subject. The accusations brought against this amiable and innocent young nobleman on his trial, were so extremely ridiculous, that one is astonished how it was possible, even in the most despotic reign, to find a judge and jury so pusillanimously villanous as to carry on the farce of justice on the occasion. We boast of our excellent constitution, and our trial by juries; but this example may teach us, that our constitution and our juries are not incompatible with despotic monarchy. He was first interred in the church of All-hallows, Barkin, near Tower-hill; and afterwards, in the reign of king James I. removed to Farmingham in Suffolk, by his son Henry earl of Northampton.

As to the character of this unfortunate earl, all our poets have sung his praise. Mr Walpole begins his anecdotes of Surry with these words:—"We now emerge from the twilight of learning to an almost classic author, that ornament of a boisterous, yet not unpolished court, the earl of Surrey, celebrated by Drayton, Dryden, Fenton, Pope, illustrated by his own muse, and lamented for his unhappy death: a man (as Sir Walter Raleigh says), no less valiant than learned, and of excellent hopes." Leland calls him the conscript enrolled heir of Sir Thomas Wyatt, the elder, in his learning and other excellent qualities; and the author of *The Art of English Poetry* says, that the earl of Surrey, and Sir Thomas Wyatt, may be justly called the *reformers of our poetry and style*. His poems were published in 1557, 12mo; and in 1565, 1574, 1585, 1587, 8vo. Several of the sonnets are by Sir Thomas Wyatt and others.

Howard (Charles), an able statesman and experienced seaman, was the son of lord William Howard, baron of Effingham, and born in 1536. He served under his father, who was lord high admiral of England, till the accession of queen Elizabeth. In January 1573, he succeeded his father in his title and estate: after which he successively became chamberlain of the household, and knight of the garter; and, in 1585, was made lord high admiral, at that critical juncture when the Spaniards were sending their armada, in their opinion, to the assured conquest of this kingdom. When he received intelligence of the approach of the Spanish fleet, and saw the prodigious consequence it was to get out the few ships that were ready at Plymouth, he not only gave orders in every thing himself, but wrought also with his own hands, and the first night left the port with six ships. The next morning, though he had only 30 sail, and those the smallest of the fleet, he attacked the Spanish navy; but first dispatched his brother-in-law, Sir Edward Hobby, to the queen, to desire her to make the proper disposition of her landforces for the security of the coast, and to hasten as many ships as possible to his assistance. His valour was conspicuously displayed in his repeated attacks of a superior enemy. The coolness of his temper was no less conspicuous; and it was owing to his magnanimity and prudence that the victory was so great. The queen expressed her sense of his merit in the most honourable terms; and granted him a pension for life. In 1596, he commanded in chief at sea, as Essex did by land, the forces sent against Spain, when his prudence and moderation were among the principal causes of the successes the English met with in that great and glorious enterprize; so that, upon his return the next year, he was advanced to the dignity of earl of Nottingham. The next eminent service in which his Lordship was engaged was in 1599, when the Spaniards seemed to meditate a new invasion. Her majesty, who always placed her safety in being too quick for her enemies, drew together, in a fortnight's time, such a fleet, and such an army, as took away all appearance of successs from her foreign and domestic enemies; and she gave the earl the sole and supreme command of both the fleet and army, with the title of *lord lieutenant general of all England*, an office unknown in succeeding times. When age and infirmity had unfitted him for action, he resigned his office, and spent the remaining part of his life in ease and retirement, till the time of his decease, which happened in 1624, in the 87th year of his age.

HOWE (John), a learned English nonconformist divine born in 1630. He became minister of Great Torrington in Devonshire, and was appointed household chaplain to Cromwell; but seems to have been free from the fanaticism then in fashion, as he offended Cromwell greatly by preaching against the notion of particular faith which the ministers of his court were great advocates for. When Oliver died, he continued chaplain to Richard; and when Richard was deposed, he returned to Torrington, where he continued till the act of uniformity took place and set him aside. He afterwards settled at Utrecht, until the declaration for liberty of conscience was published by king James II. under shelter of which he returned to London, where he died in 1705. He published a great number of sermons and religious works, which have been reprinted together in one volume folio.

Howe-*Island*, a small island of the South Sea, discovered by Captain Wallis, called by the inhabitants of the Society-Island *Mopeha*; lies in S. Lat. 16. 46. and W. Long. 154. 8.

HOWEL (James), a voluminous writer of the 17th century, supported himself many years by writing and translating

Howitz || Huahine.

translating of books. Though he had been a zealous loyaliſt, he afterwards flattered Cromwell; yet on the reſtoration he was made hiſtoriographer to the king, being the firſt in England who enjoyed that title. He died in 1666.

HOWITZ, a kind of mortar, mounted upon a field-carriage like a gun. The difference betweena mortar and a howitz is, that the trunnions of the firſt are at the end, and at the middle in the laſt. The invention of howitzes is of much later date than mortars, for they really had their origin from them. The conſtructions of howitzes are as various and uncertain as thoſe of mortars, excepting the chambers, which are all cylindric. They are diſtinguiſhed by the diameter of the bore; for inſtance, a ten inch howitz is that the diameter of which is 10 inches; and ſo of the ſmaller ones.

HOY, a ſmall veſſel, chiefly uſed in coaſting, or carrying goods to or from a ſhip, in a road or bay, where the ordinary lighters cannot be managed with ſafety or convenience.

It would be very difficult to deſcribe, preciſely, the marks of diſtinction between this veſſel and ſome others of the ſame ſize, which are alſo rigged in the ſame manner; becauſe what is called a *hoy* in one place, would aſſume the name of a *ſloop* or *ſmack* in another; and even the people who navigate theſe veſſels, have, upon examination, very vague ideas of the marks by which they are diſtinguiſhed from thoſe abovementioned. In Holland, the hoy has two maſts; in England, it has but one, where the main-ſail is ſometimes extended by a boom, and ſometimes without it. Upon the whole, it may be defined a ſmall veſſel, uſually rigged as a ſloop, and employed for carrying paſſengers and luggage from one place to another, particularly on the ſea-coaſt.

Hoy, an iſland of Scotland, and one of the Orcades. It is about 10 miles long; and that part called *Waes* is fruitful and pretty populous, and is a good place for fiſhing.

HOYE, a town of Germany, in Weſtphalia, and capital of a county of the ſame name. It is ſeated on the river Weſer, and is ſubject to the elector of Hanover. E. Long. 9. 0. N. Lat. 53. 5.

HUAHINE, one of the Society-*Iſlands*, in the South Sea, ſituated in S. Lat. 16. 43. W. Lon. 150. 52. and is about ſeven or eight leagues in compaſs. Its ſurface is hilly and uneven, and it has a ſafe and convenient harbour. It was firſt diſcovered by Captain Cook in 1769. It is divided by a deep inlet into two peninſulas connected by an iſthmus, which is entirely overflowed at high water. From the appearance of its hills it may be concluded, that the country has at ſome period or other been the ſeat of a volcano. The ſummit of one of them had much the appearance of a crater, and a blackiſh ſpongy earth was ſeen upon one of its ſides, which ſeemed to be lava; and the rocks and clay every where had a burnt appearance. The iſland is plentifully ſupplied with water by many rivulets which deſcend from the mountains and broken rocks. The inhabitants are nearly as fair as Europeans; and their conduct is bolder than that of the inhabitants of the other Society Iſlands. They are a ſtout large-made people, ſome of the talleſt being ſix feet three inches in height; they are extremely indolent, and ſeem to have as little curioſity as fear. The dogs, however, in ſpite of their ſtupidity, are in great favour with all their women, "who could not have careſſed them (ſays Mr Forſter) with a more ridiculous affection if they had been European ladies of faſhion." Here was ſeen a middle-aged woman, whoſe breaſts were full of milk, offering them to a little puppy who had been trained up to ſuck them. The ſight diſguſted thoſe who ſaw it ſo much, that they could not forbear expreſſing their diſlike to it; but the woman ſmiled, and told them that ſhe allowed young pigs to do the ſame. It appeared afterwards that this woman had loſt her child. Some of the gentlemen were preſent at a dramatic entertainment on this iſland: the piece repreſented a girl running away from her parents; and ſeemed to be levelled at a female paſſenger who had come in Captain Cook's ſhip from O'Taheitee, and who happened to be preſent at the repreſentation. It made ſuch an impreſſion on the girl, that the gentlemen could ſcarce prevail upon her to ſee the piece out, or to refrain from tears while it was acting. It concluded with the reception ſhe was ſuppoſed to meet with from her friends, which was made out not to be a very agreeable one.—Theſe people introduce extempore pieces upon occaſion; and it is moſt probable that this was meant as a ſatire upon the girl abovementioned, and to diſcourage others from acting in the ſame manner.

Huber || Hudſon.

HUBER (Ulric), one of the greateſt civilians in the 17th century, was born at Dockum in 1636. He became profeſſor of law at Franeker; and wrote, 1. A treatiſe *De jure civitatis*. 2. *Jurisprudentia Friſica*. 3. *Specimen philoſophiæ civilis*. 4. *Inſtitutiones hiſtoriæ civilis*; and ſeveral other works which are eſteemed. He died in 1694.

HUBERT (St), a town of the Netherlands, on the confines of Liege, with a very fine abbey, where they bring thoſe that are bit by mad animals to be cured. E. Long. 5. 25. N. Lat. 34. 32.

HUBNER (John), a learned geographer of Germany, taught geography at Leipſic and Hamburgh with extraordinary reputation; and died at Hamburgh in 1732, aged 63. His principal work is A Geographical treatiſe, printed at Baſil in 1746, in 6 vols 12mo.

HUDSON (Jeffery). See Dwarf.

Hudson (Henry), an eminent Engliſh navigator, who, about the beginning of the laſt century, undertook to find out a paſſage by the north-eaſt or north-weſt to Japan and China. For this purpoſe he was four times fitted out: he returned three times unſucceſsful; but in the laſt voyage, in 1610, being perſuaded that the great bay to which his name has been ſince given, muſt lead to the paſſage he ſought, he wintered there, to proſecute his diſcovery in the ſpring. But their diſtreſſes during the winter producing a mutiny among his men, when the ſpring arrived, they turned him, with his ſon and ſeven ſick men, adrift in his own ſhallop, and proceeded home with the ſhip. As Hudſon and his unhappy companions were never heard of afterward, it is to be ſuppoſed they all periſhed.

Hudson (John), a very learned Engliſh critic, born in 1662. He diſtinguiſhed himſelf by ſeveral valuable editions of Greek and Latin authors; and, in 1701, was elected head keeper of the Bodleian library at Oxford. In 1712, he was appointed principal of St Mary's Hall, through the intereſt of the famous Dr Ratcliffe: and it is ſaid that the univerſity

Hudson's Bay.

of Oxford is indebted for the moſt ample benefactions of that phyſician to Dr Hudſon's ſolicitations. He died in 1719, while he was preparing for publication a catalogue of the Bodleian library, which he had cauſed to be fairly tranſcribed in ſix folio volumes.

HUDSON'S *Bay*, a large bay of North America, lying between 51 and 69 degrees of latitude, diſcovered in 1610 by Henry Hudſon. This intrepid mariner, in ſearching after a north-weſt paſſage to the South-ſeas, diſcovered three ſtreights, through which he hoped to find out a new way to Aſia by America. He ſailed boldly into the middle of the new gulph, and was preparing to explore all its parts, when his treacherous crew put him into the long-boat, with ſeven others, and left him, without either arms or proviſions, expoſed to all the dangers both of ſea and land. The barbarians, who refuſed him the neceſſaries of life, could not, however, rob him of the honour of the diſcovery; and the bay, which he firſt found out, will ever be called by his name.

Raynal. The miſeries of the civil war which followed ſoon after, had, however, made the Engliſh forget this diſtant country, which had nothing to attract them. A ſucceſſion of more quiet times had not yet induced them to attend to it; when Groſeillers and Radiſſon, two French Canadians, having met with ſome diſcontent at home, informed the Engliſh, who were engaged in repairing the miſchiefs of diſcord by trade, of the profits ariſing from furs, and of their claim to the country that furniſhed them. Thoſe who propoſed this undertaking ſhewed ſo much ability, that they were intruſted with the execution of it; and the firſt eſtabliſhment they formed ſucceeded ſo well, that it ſurpaſſed their own hopes as well as their promiſes.

This ſucceſs alarmed the French; who were afraid, and with reaſon, that moſt of the fine furs which they got from the northern parts of Canada would be carried to Hudſon's bay. Their alarms were confirmed by the unanimous teſtimony of their *Coureurs de Bois*, who, ſince 1656, had been four times as far as the borders of the ſtreight. It would have been an eligible thing to have gone by the ſame road to attack the new colony; but the diſtance being thought too conſiderable, notwithſtanding the convenience of the rivers, it was at length determined that the expedition ſhould be made by ſea. The fate of it was truſted to Groſeillers and Radiſſon, who had been eaſily prevailed upon to renew their attachment to their country.

Theſe two bold and turbulent men ſailed from Quebec in 1682, in two veſſels ill equipped; and on their arrival, finding themſelves not ſtrong enough to attack the enemy, they were contented with erecting a fort in the neighbourhood of that they deſigned to have taken. From this time there began a rivalſhip between the two companies, one ſettled at Canada, the other in England, for the excluſive trade of the bay, which was conſtantly kept up by the diſputes it occaſioned; till at laſt, after each of their ſettlements had been frequently taken and recovered, all hoſtilities were terminated by the treaty of Utrecht, by which the whole was ceded to Great-Britain.

Hudſon's Bay, properly ſpeaking, is only a mart for trade. The ſeverity of the climate having deſtroyed all the corn ſown there at different times, has fruſtrated every hope of agriculture, and conſequently of population. Throughout the whole of this extenſive coaſt, there are not more than ninety or a hundred ſoldiers, or factors, who live in four bad forts, of which York-fort is the principal. Their buſineſs is to receive the furs brought by the neighbouring ſavages in exchange for merchandiſe, of which they have been taught the value and uſe. Hudſon's Bay.

Though theſe ſkins are much more valuable than thoſe which are found in countries not ſo far north, yet they are cheaper. The ſavages give 10 beaver-ſkins for a gun, two for a pound of powder, one for four pounds of lead, one for a hatchet, one for ſix knives, two for a pound of glaſs-beads, ſix for a cloth-coat, five for a petticoat, and one for a pound of ſnuff. Combs, looking-glaſſes, kettles, and brandy, fell in proportion. As the beaver is the common meaſure of exchange, by another regulation as fraudulent as the firſt, two otters ſkins and three martins are required inſtead of one beaver. Beſides this oppreſſion, which is authoriſed, there is another which is at leaſt tolerated, by which the ſavages are conſtantly defrauded in the quality, quantity, and meaſure of what is given them, and by which they loſe about one third of the value.

From this regulated ſyſtem of impoſition, it is eaſy to gueſs that the commerce of Hudſon's bay is a monopoly. The capital of the company that is in poſſeſſion of it was originally no more than 10,565 *l.* and has been ſucceſſively increaſed to 104,146 *l.* This capital brings them in an annual return of forty or fifty thouſand ſkins of beavers or other animals, upon which they make ſo exorbitant a profit, that it excites the jealouſy and clamours of the nation. Two thirds of theſe beautiful furs are either conſumed in kind in the three kingdoms, or made uſe of in the national manufactures. The reſt are carried into Germany, where the nature of the climate makes them a valuable commodity.

This bay is about ten degrees in breadth: the entrance is ſix leagues broad; but is only to be attempted from the beginning of July to the end of September, and is even then rather dangerous. This danger ariſes from mountains of ice, ſome of which are ſaid to be from 15 to 18 hundred feet thick, and which, having been produced by winters of five or ſix years duration in little gulphs conſtantly filled with ſnow, are forced out of them by north-weſt winds, or by ſome other extraordinary cauſe. The beſt way of avoiding them is to keep as near as poſſible to the northern coaſt, which muſt neceſſarily be leſs obſtructed and moſt free, by the natural directions of both winds and currents.

The north-weſt wind, which blows almoſt conſtantly in winter, and very often in ſummer, frequently raiſes violent ſtorms within the bay itſelf, which is rendered ſtill more dangerous by the number of ſhoals that are found there. Happily, however, ſmall groups of iſlands are met with at different diſtances, which are of a ſufficient height to afford a ſhelter from the ſtorm. Beſide theſe ſmall archipelagoes, there are in many places large piles of bare rock. Except the alga marina, the bay produces as few vegetables as the other northern ſeas.

Throughout all the countries ſurrounding this bay, the ſun never riſes nor ſets without forming a great cone of light: this phenomenon is ſucceeded by the Aurora Borealis, which tinges the hemiſphere with coloured

Hudſon's River ‖ Hue.

coloured rays of ſuch a brilliancy, that the ſplendour of them is not effaced even by that of the full moon. Notwithſtanding this, there is ſeldom a bright ſky. In ſpring and autumn, the air is always filled with thick fogs, and in winter with an infinite number of ſmall icicles. Though the heats in ſummer are pretty conſiderable for ſix weeks or two months, there is ſeldom any thunder or lightning.

One of the effects of the extreme cold or ſnow that prevails in this climate, is that of turning thoſe animals white in winter which are naturally brown or grey. Nature has beſtowed upon them all, ſoft, long, and thick furs, the hair of which falls off as the weather grows milder. In moſt of theſe quadrupeds, the feet, the tail, the ears, and, generally ſpeaking, all thoſe parts in which the circulation is ſlower becauſe they are the moſt remote from the heart, are extremely ſhort. Wherever they happen to be ſomething longer, they are proportionably well covered. Under this gloomy ſky, all liquors become ſolid by freezing, and break the veſſels they are in. Even ſpirit of wine loſes its fluidity. It is not uncommon to ſee fragments of large rocks looſened and detached from the great maſs by the force of the froſt. All theſe phenomena, common enough during the whole winter, are much more terrible at the new and full moon, which in theſe regions has an influence upon the weather, the cauſes of which are not known.

In this frozen zone, iron, lead, copper, marble, and a ſubſtance reſembling ſea-coal, have been diſcovered. In other reſpects, the ſoil is extremely barren. Except the coaſts, which are for the moſt part marſhy, and produce a little graſs and ſome ſoft wood, the reſt of the country affords nothing but very high moſs, and a few weak ſhrubs very thinly ſcattered.

For an account of the inhabitants, ſee GREENLAND.

HUDSON's-*River*, a large river of North America, which riſes on the eaſt of Lake Ontario, and running by Albany, and on the back of the ſouth part of New-England through part of New-York, falls into the bay of the ſea beyond the weſt end of Long-Iſland, and below the town of New-York.

HUE *and* CRY, in law, the purſuit of a perſon who has committed felony on the high way.—Of this cuſtom, which is of Britiſh origin, the following deduction is given by Mr Whitaker. "When it was requiſite for the Britons to call out their warriors into the field, they uſed a method that was particularly marked by its expeditiouſneſs and deciſiveneſs, and remains partially among us to this moment. They raiſed a cry, which was immediately caught up by others, and in an inſtant tranſmitted from mouth to mouth thro' all the region. And, as the notice paſſed along, the warriors ſnatched their arms, and hurried away to the rendezvous. We have a remarkable deſcription of the fact in Cæſar, and there ſee the alarm propagated in 16 or 17 hours through 160 miles in a line. And the ſame practice has been retained by the Highlanders to our own time. When the lord of a clan received intelligence of an enemy's approach, he immediately killed a goat with his own ſword, dipped the end of a half-burnt ſtick in the blood, and then gave it and the notice of the rendezvous to be carried to the next hamlet. The former ſymbolically threatened fire and ſword to all his followers that did not inſtantly repair to the latter. The notice was diſpatched from hamlet to hamlet with the utmoſt expedition. And in three or four hours the whole clan was in arms, and aſſembled at the place appointed. This was within theſe few years the ordinary mode by which the chieftains aſſembled their followers for war. The firſt perſon that received the notice, ſet out with it at full ſpeed, delivered it to the next that he met, who inſtantly ſet out on the ſame ſpeed, and handed it to a third. And, in the late rebellion of 1745, it was ſent by an unknown hand through the region of Braidalbin; and, flying as expeditiouſly as the Gallick ſignal in Cæſar, traverſed a tract of 32 miles in three hours. This quick method of giving a diffuſive alarm is even preſerved among ourſelves to the preſent day; but is applied, as it ſeems from Cæſar's account above to have been equally applied among the Celtæ, to the better purpoſes of civil polity. The *buteſium and clamour* of our laws, and the *hue and cry* of our own times, is a well-known and powerful proceſs for ſpreading the notice and continuing the purſuit of any fugitive felons. The cry, like the clamour of the Gauls or the ſummons of the Highlanders, is taken from town to town and from county to county; and a chain of communication is ſpeedily carried from one end of the kingdom to the other.

Hueſca ‖ Huet.

HUESCA, an ancient and conſiderable town of Spain, in the kingdom of Arragon, with a biſhop's ſee and an univerſity. It is ſeated on the Iſſuela in a ſoil producing excellent wine, in W. Long. 0. 13. N. Lat. 40. 2.

HUESCAR, or GUESCAR, a town of Spain in the kingdom of Granada, ſeated on a plain in W. Long. 1. 45. N. Lat. 37. 32.

HUESNE, or HUENA, a ſmall iſland in the Baltic Sea, in the Sound, where was the famous obſervatory of Tycho Brahe. E. Long. 13. 5. N. Lat. 55. 54.

HUET (Peter Daniel), a very learned French writer, born at Caen in Normandy, on the 8th of February 1630. He diſcovered, from his infancy, a great inclination to the ſtudy of polite literature and the ſciences, and at firſt applied himſelf to the law; but Des Cartes's principles, and Bochart's ſacred geography, made him change his ſtudies for thoſe of philoſophy, mathematics, the languages, and antiquities. His admiration for Bochart made him deſirous of knowing him. He contracted a very ſtrict friendſhip with him, and accompanied that learned man to Sweden. Here Chriſtina would have engaged him in her ſervice; but he, ſenſible of her inconſtant temper, returned to France. All he brought with him was a copy of a MS. of Origen, which he tranſcribed at Stockholm. He refuſed ſeveral offers from Chriſtina after ſhe abdicated and went to Rome, and from Guſtavus her ſucceſſor. In 1670, Mr Boſſuet being appointed by the king preceptor to the dauphin, his majeſty choſe Mr Huet for his colleague, with the title of *ſub-preceptor to the prince*. It was he that formed the plan of the commentaries *in uſum Delphini*, and directed the execution. His ſentiments of piety determined him to enter into holy orders, which he did at the age of 46. Soon after this, he was preſented by the king to the abbey of Aunay; and in 1685 was nominated to the biſhopric of Soiſſons, which

Hughes ‖ Huguenots.

he exchanged for the see of Avranches. After governing that diocese ten years, he resigned, and was made abbot of Fontenay near Caen. His love to his native place determined him to fix there. But lawsuits coming upon him, he retired to Paris, and lodged among the Jesuits in the *Maison Professe*, whom he had made heirs to his library. A severe distemper weakened his body extremely, but not the vivacity of his genius: he wrote his own life in a very elegant style; and died in 1721, aged 91. He was a man of very agreeable conversation; and of great probity, as well as immense erudition.—The following are the titles of his principal works. 1. *De Claris interpretibus, et de optimo genere interpretandi.* 2. An edition of Origen's commentaries on the holy Scriptures, in Greek and Latin. 3. A treatise on the origin of the Romans. 4. *Demonstratio evangelica*, folio. 5. *Quæstiones Alnetanæ de concordia rationis et fidei.* 6. Of the situation of the terrestrial paradise, in French. 7. A history of the commerce and navigation of the ancients, which has been translated into English. 8. *Commentarius de rebus ed eâm pertinentibus.* 9. *Huetiana.* 10. Latin and Greek verses, &c.

HUGHES (John), an ingenious and polite writer, was born in 1677. In the earliest parts of his youth he cultivated the sister-arts, poetry, drawing, and music, in each of which he by turns made a considerable progress; but followed those and his other studies only as agreeable amusements, under frequent confinement on account of his ill state of health. The lord Chancellor Cowper made him secretary for the commissions of the peace without his knowledge, and distinguished him with singular marks of his esteem. He continued in the same employment under the earl of Macclesfield, and held it to the day of his death; which happened in 1719, the very night in which his tragedy, intitled *The siege of Damascus*, was first acted. He was then 42. He translated Fontenelle's dialogues of the dead, Vertot's revolutions of Portugal, and the letters of Abelard and Eloisa. He gave a very accurate edition of Spencer's works, with his life, a glossary, and remarks; and wrote several papers in the Tatler, Spectator, and Guardian. Mr Duncombe, who married his sister, collected his poems and essays in 2 vols 12mo, in 1735.

HUGHLY, a town of Asia, in the kingdom of Bengal, seated on the most westerly branch of the river Ganges. It is of large extent, reaching about two miles along the river-side, and drives a great trade in all the commodities of that country; affording rich cargoes for 50 or 60 ships annually, besides what is brought on carriages to the neighbouring towns. Saltpetre is brought hither from Patnia in vessels above 50 yards long and five broad. The inhabitants are chiefly Indians; but there are also Portuguese, English, and other Europeans. E. Long. 87. 55. N. Lat. 22. 0.

HUGO Capet, chief of the third race of the kings of France, being count of Paris and Orleans: he was raised to the throne for his military valour and public virtues in 987. See France, n° 27.

HUGUENOTS, a name given by way of contempt to the Calvinists of France.

The name had its rise in the year 1560; but authors are not agreed as to its origin. The most plausible opinion, however, is that of Pasquier, who observes, that at Tours, the place where they were first thus denominated, the people had a notion, that an apparition or hobgoblin, called king *Hugon*, strolled about the streets in the night-time; from whence, as those of the reformed religion met chiefly in the night to pray, &c. they called them *Huguenots*, that is, the disciples of king Hugon.

Hulk ‖ Hume.

HULK, on old ship of war, fitted with an apparatus, to fix or take out the masts of his majesty's ships, as occasion requires. See Plate CLXI. fig. 7.

The mast of this vessel is extremely high, and withal properly strengthened by *shrouds and stays*, in order to secure what are called the *sheers*, which serve, as the arm of a crane, to hoist out or in the masts of any ship lying alongside. The sheers are composed of several long masts, whose heels rest upon the side of the hulk, and having their heads declining outward from the perpendicular, so as to hang over the vessel whose masts are to be fixed or displaced. The tackles, which extend from the head of the mast to the sheer-heads, are intended to pull in the latter towards the mast-head, particularly when they are charged with the weight of a mast after it is raised out of any ship, which is performed by strong tackles depending from the sheer-heads. The effort of these tackles is produced by two capsterns, fixed on the deck for this purpose.

Hulk, is also a name bestowed on any old vessel laid by as unfit for further service. It is probably derived from the ὁλκάδες, or vessels of burden, of the ancient Grecians.

HULL, in the sea-language, is the main body of a ship, without either masts, yards, sails, or rigging. Thus, *to strike a hull* in a storm, is to take in her sails, and to lash the helm on the lee-side of the ship; and *to hull*, or *lie a-hull*, is said of a ship whose sails are thus taken in, and helm lashed a-lee.

Hull, in geography. See Kingston *upon Hull*.

HUMAN, in general, is an appellation given to whatever relates to mankind: thus we say, the human soul, human body, human laws, &c.

HUMANITY, the peculiar nature of man, whereby he is distinguished from all other beings.

Humanities, in the plural, signify grammar, rhetoric, and poetry, known by the name of *literæ humaniores*; for teaching of which, there are professors in the universities of Scotland, called *humanists*.

HUMBER, a river formed by the Trent, the Ouse, and several other streams united. It divides Yorkshire from Lincolnshire, and falls into the German Sea at Holderness.

HUME (David, esq;), a late celebrated philosopher and historian, was born in the south part of Scotland on the 26th of April O. S. in the year 1711. Being the younger son of a country gentleman of good family, but no great fortune, his patrimony was of consequence insufficient to support him. For this reason he was destined for the bar, and passed thro' his academical courses in the university of Edinburgh; but being more inclined to studies of a different nature, he never put on the gown, nor even took the introductory steps necessary for that purpose. The writings of Locke and Berkeley had directed the attention of

Hume. of the generality of learned men towards metaphyſics; and Mr Hume having early applied himſelf to ſtudies of this kind, publiſhed in 1739 the two firſt volumes of his *Treatiſe of human nature*, and the third the following year. He had the mortification, however, to find his book generally decried; and to perceive, that the taſte for ſyſtematic writing was now on the decline. He therefore divided this treatiſe into ſeparate Eſſays and Diſſertations, which he afterwards publiſhed at different times with alterations and improvements.

In 1742, Mr Hume publiſhed two ſmall volumes, conſiſting of Eſſays moral, political, and literary. Theſe were better received than his former publication; but contributed little to his reputation as an author, and ſtill leſs to his profit; and his ſmall patrimony being now almoſt ſpent, he accepted an invitation from the marquis of Anandale to come and live with him in England. With this nobleman he ſtaid a twelvemonth, during which time his ſmall fortune was conſiderably increaſed. He then received an invitation from General St Clair, to attend him as a ſecretary to his expedition, which was at firſt meant againſt Canada, but afterwards ended in an excurſion againſt the coaſt of France. In 1747, he received an invitation from the general to attend him in the ſame ſtation in his military embaſſy to the courts of Vienna and Turin. He then wore the uniform of an officer; and was introduced at theſe courts as aid-de-camp to the general, along with Sir Harry Erſkine and captain Grant, afterwards general Grant. In 1749, he returned to Scotland, and lived two years with his brother at his country-houſe; where he compoſed the ſecond part of his eſſays, called *Political Diſcourſes*. And now the general approbation of his performances was indicated by a more extenſive ſale than formerly, and likewiſe by the numerous anſwers publiſhed by different perſons in order to counteract their ſuppoſed pernicious tendency. In 1752, were publiſhed at Edinburgh his Political Diſcourſes, the only work of his which was well received on its firſt appearance; and the ſame year, at London, his Inquiry concerning the Principles of Morals, which in his own opinion was incomparably the beſt of all his performances. This year alſo he was appointed librarian to the faculty of Advocates at Edinburgh; the principal advantage reſulting from which employment was, that he had by that means the command of a large library. He then formed the plan of writing the Hiſtory of England: but deeming the whole to be too extenſive, he confined his hiſtory to that of Britain under the houſe of Stuart. The book was almoſt univerſally decried on its firſt appearance, and ſoon after ſeemed to ſink in oblivion. Dr Herring, primate of England, and Dr Stone, primate of Ireland, were the only literati of the author's acquaintance who approved of the work, and ſent him meſſages not to be diſcouraged.

Notwithſtanding the approbation of theſe eminent men, however, Mr Hume's ſpirits were ſo much ſunk by his bad ſucceſs, that he had ſome thoughts of retiring to France, changing his name, and bidding adieu to his own country for ever; but his deſign was rendered impracticable by the breaking out of the war of 1755 between France and Britain. He then publiſhed his Natural Hiſtory of Religion: to which an anſwer was publiſhed, ſoon after its appearance, in the name of Dr Hurd, biſhop of Litchfield and Coventry; of which, however, he hath ſince diſclaimed being the ſole author. In 1756, the ſecond volume of the Hiſtory of the Stuarts was publiſhed, two years after the appearance of the firſt. This was better received, and helped to retrieve the character of the former volume. Three years after, his Hiſtory of the Houſe of Tudor made its appearance; which was almoſt as ill received as the Hiſtory of the Stuarts had been, the reign of Elizabeth being particularly obnoxious. The author, however, had now learned to deſpiſe popular clamours; and continued to finiſh at his leiſure the more early part of the Engliſh hiſtory, which was publiſhed in 1761, and was received with tolerable ſucceſs. Hume.

Mr Hume being now turned of fifty, and having obtained by the ſale of his books a competent and independent fortune, retired into his native country of Scotland, determined never more to ſet his foot out of it. From this reſolution, however, he was diverted by the earl of Hertford; whom he attended as ſecretary on his embaſſy to Paris in 1763. In 1765, the earl being appointed lord lieutenant of Ireland, Mr Hume was intruſted with the ſole management of the buſineſs of the ſtate till the arrival of the duke of Richmond towards the latter end of the year. In 1767, he returned to Edinburgh with a much larger income, procured to him by the earl of Hertford, than he formerly had; and now formed the ſame deſign he had formerly entertained, namely, of burying himſelf in his philoſophical retreat. In this, however, he was again diſappointed, by receiving an invitation from general Conway to be under ſecretary; and this invitation he was prevented from declining, both by the character of the perſon, and his connections with lord Hertford. In 1769, he returned to Edinburgh, poſſeſſed of L. 1000 a-year, healthy, and though ſomewhat ſtricken in years, yet having a proſpect of long enjoying his eaſe, and of ſeeing the increaſe of his reputation. Of his laſt illneſs and character, he himſelf gives the following account. "In ſpring 1775, I was ſtruck with a diſorder in my bowels; which at firſt gave me no alarm, but has ſince, as I apprehend it, become mortal and incurable. I now reckon upon a ſpeedy diſſolution. I have ſuffered very little pain from my diſorder; and what is more ſtrange, have, notwithſtanding the great decline of my perſon, never ſuffered a moment's abatement of my ſpirits; inſomuch, that were I to name the period of my life which I ſhould moſt chooſe to paſs over again, I might be tempted to point to this latter period. I poſſeſs the ſame ardour as ever in ſtudy, and the ſame gaiety in company. I conſider, beſides, that a man of ſixty-five, by dying, cuts off only a few years of infirmities; and though I ſee many ſymptoms of my literary reputation's breaking out at laſt with additional luſtre, I knew that I could have but few years to enjoy it. It is difficult to be more detached from life than I am at preſent.

"To conclude, hiſtorically, with my own character. I am, or rather was, (for that is the ſtyle I muſt now uſe in ſpeaking of myſelf, which emboldens me the more to ſpeak my ſentiments); I was, I ſay, a man of mild diſpoſitions, of command of temper, of an open,

Humerus || Humurus.

open, social, and cheerful humour, capable of attachment, but little susceptible of enmity, and of great moderation in all my passions. Even my love of literary fame, my ruling passion, never soured my temper, notwithstanding my frequent disappointments. My company was not unacceptable to the young and careless, as well as to the studious and literary; and as I took a particular pleasure in the company of modest women, I had no reason to be displeased with the reception I met with from them. In a word, though most men any wife eminent have found reason to complain of calumny, I never was touched, or even attacked, by her baleful tooth: and though I wantonly exposed myself to the rage of both civil and religious factions, they seemed to be disarmed in my behalf of their wonted fury. My friends never had occasion to vindicate any one circumstance of my character and conduct: not but that the zealots, we may well suppose, would have been glad to invent and propagate any story to my disadvantage, but they could never find any which they thought would wear the face of probability. I cannot say there is no vanity in making this funeral oration of myself, but I hope it is not a misplaced one; and this is a matter of fact which is easily cleared and ascertained."

His fears concerning the incurableness of his disorder proved too true. He died on the 25th of August 1776; and was buried in the Calton church-yard, Edinburgh, where a monument is erected to his memory.

HUMERUS, in anatomy. See ANATOMY, n° 48.

Luxation of the HUMERUS. See SURGERY.

HUMIDITY, that quality in bodies whereby they are capable of wetting other bodies. This differs very much from fluidity; and seems to be merely a relative thing, depending on the congruity of the component particles of the liquor to the pores of such particular bodies as it is capable of adhering to, penetrating a little into, or wetting. Thus, for instance, quicksilver is not a moist thing with regard to our hands or clothes; but may be called so in reference to gold, tin, or lead, to whose surfaces it will perfectly adhere, and render them soft and moist.

HUMILITY. See MORALS, n° 118.

HUMMING-BIRD. See TROCHILUS.

HUMOUR, in a general sense, denotes much the same with liquid or fluid. See FLUID.

HUMOUR. See WIT.

HUMPHREY (Dr Laurence), a very learned English divine in the 16th century, who, during the persecution under queen Mary, retired with other Protestant refugees to Zurich. He returned on the accession of queen Elizabeth; and was made president of Magdalene college, Oxford, dean of Gloucester, and then dean of Winchester. He was a great and general scholar, an able linguist, and a deep divine; and published, 1. *De religionis conservatione et reformatione, deque primatu regum.* 2. *De ratione interpretandi auctores.* 3. *Optimates; sive de nobilitate, ejusque origine.* 4. Sermons, and other works. He died in 1590.

HUMULUS, the HOP; a genus of the pentandria order, belonging to the diœcia class of plants. There is only one species, viz. the lupulus, which is sometimes found wild in hedges near houses and gardens, but probably is not indigenous. The stalk is weak and climbing; it creeps up the support in a spiral, ascending always from the right hand to the left. The stalk and the leaves are rough to the touch: the upper leaves are heart-shaped, the lower ones divided into three lobes serrated on the edges, and grow in pairs on long footstalks. The male flowers grow on a distinct plant on branched pedunculs; the females on pedunculs in pairs of the form of a *strobilus* or cone, composed of large imbricated calyces containing each one or two seeds. For the culture and uses of hops, see the article HOP. Hundr

HUNDRED, HUNDREDUM, or *Centuria*, a part or division of a county; which was anciently so called from its containing an hundred families, or from its furnishing an hundred able men for the king's wars. After king Alfred's dividing this kingdom into counties, and giving the government of each county to a sheriff, these counties were divided into hundreds, of which the constable was the chief officer. The grants of hundreds were at first made by the king to particular persons: but they are not now held by grant or prescription, their jurisdiction being devolved to the county-court; a few of them only excepted, that have been by privilege annexed to the crown, or granted to some great subjects, and still remain in the nature of a franchise.

HUNDRED-*Court*. This is only a larger COURT-*Baron*, being held for all the inhabitants of a particular hundred instead of a manor. The free suitors are here also the judges, and the steward the registrar, as in the case of a court-baron. It is likewise no court of record; resembling the former in all points, except that in point of territory it is of a greater jurisdiction. This is said by Sir Edward Coke to have been derived out of the county-court for the ease of the people, that they might have justice done them at their own doors, without any charge or loss of time: but its institution was probably co-eval with that of hundreds themselves, which were formerly observed to have been introduced tho' not invented by ALFRED, being derived from the polity of the ancient Germans. The *centeni*, we may remember, were the principal inhabitants of a district composed of different villages, originally in number an *hundred*, but afterwards only called by that name; and who probably gave the same denomination to the district out of which they were chosen. Cæsar speaks positively of the judicial power exercised in *their* hundred-courts and courts-baron. "*Principes regionum, atque pagorum,*" (which we may fairly construe, the lords of hundreds and manors) "*inter suos jus dicunt, controversiasque minuunt.*" And Tacitus, who had examined their constitution still more attentively, informs us not only of the authority of the lords, but that of the *centeni*, the hundredors, or jury; who were taken out of the common freeholders, and had themselves a share in the determination. "*Eliguntur in conciliis et principes, qui jura per pagos vicosque reddunt: centeni singulis, ex plebe comites, consilium simul et auctoritas, adsunt.*" This hundred-court was denominated *hæreda* in the Gothic constitution. But this court, as causes are equally liable to removal from hence, as from the common court-baron, and by the same writs, and may also be reviewed by writ of false judgment, is therefore fallen into equal disuse

Hungary. diſuſe with regard to the trial of actions.

HUNGARY, a kingdom of Europe, the greateſt part of which was anciently called *Pannonia*. It had the name of *Hungary* from the Hunns, a Scythian or Tartar nation, who ſubdued it in the ninth century. It lies between the 18th and 22d degrees of eaſt long. and betwixt the 45th and 49th degrees of north lat. being bounded to the north by the Carpathian mountains, which ſeparate it from Poland; to the ſouth by Servia, and the river Drave, which ſeparates it from Sclavonia; to the weſt by Moravia, Auſtria, and Stiria; and to the eaſt by Walachia and Tranſylvania. It is about 240 miles in length, and 235 in breadth; and is divided into the Upper and Lower Hungary, the former being that part which lies towards the eaſt, and the latter that which lies towards the weſt.

The northern parts of the kingdom are mountainous and barren, but healthy; the ſouthern, on the contrary, are level, and exceeding fruitful, but not very healthy. The country along the Danube, from Preſburg to Belgrade, for upwards of 200 miles, is one continued plain, and no ſoil can be more fertile; but the air, by reaſon of the many ſwamps and moraſſes, is not ſo wholeſome as on the higher and drier grounds. Here are mines of gold, ſilver, copper, iron, lead, quickſilver, cinnabar, antimony, yellow orpiment, ſulphur, vitriol, marcaſite, ſalt native and factitious, ſaltpetre, magnets, aſbeſtos or ſtone-flax, marble of ſeveral colours, alabaſter, with diamonds, and all ſorts of precious ſtones. Corn is in ſuch plenty, that it is ſold for one ſixth of its price in England. Their grapes are large and luſcious; and their wines preferred to any in Europe. They have vaſt numbers of cattle and horſes, the latter moſtly mouſe-coloured, with buffaloes, deer, wild-fowl, game, and fiſh, and many ſpecies of wild beaſts, particulary chamois goats, bears, and lynxes. Of vegetables, beſides vines, and the common ſorts, here are tobacco, ſaffron, buck-wheat, millet, melons, and cheſnuts. Here alſo are excellent warm baths, and ſprings of various kinds and qualities. The chief mountains of Hungary are the Crapack or Carpathian, which is the general name for all thoſe that ſeparate this kingdom from Poland, Moravia, Sileſia, and ſome part of Auſtria. The ſides of moſt of them are covered with wood, and their tops with ſnow. The chief rivers are the Danube, the Drave, the Save, the Wag or Waag, the Gran, the Temes, the Raab, and Theiſs, all well ſtocked with fiſh. There are ſeveral lakes among the Carpathian mountains, and ſome alſo in the lowlands.

The inhabitants are a mixture of the deſcendants of the ancient Huns, Sclavonians, Camani, Germans, Walachians, Greeks, Jews, Turks, and a wandering people called *Zigduns*, ſaid to be of uncertain origin, but probably the ſame as thoſe we call *gypſies*. The Hungarians are ſaid to be of a ſanguine choleric temper, and ſomewhat fierce, cruel, proud, and revengeful. They have been always reputed good ſoldiers, being much more inclined to arms, martial exerciſes, and hunting, than to arts, learning, trade, or agriculture. The nobility affect great pomp and magnificence, and are much addicted to feaſting and carouſing. The men in general are ſtrong and well proportioned. They ſhave their beards, but leave whiſkers on the upper-lip; wearing fur caps on their heads, a cloſe-bodied coat girt with a ſaſh, with a ſhort cloak or mantle over all, ſo contrived as to be buckled under the arm, and leave the right hand at liberty. Their horſe are called *huſſars*, and their foot *heydukes*. The former wear a broad-ſword, or ſcymetar, and carry a hatchet or battle-ax. Their horſes are fleet, but not near ſo large as the German horſes, and therefore they ſtand up on their ſhort ſtirrups when they ſtrike. The heydukes uſually wear feathers in their caps, according to the number of the enemies they pretend to have killed. Both horſe and foot are an excellent militia, very good at a purſuit, or ravaging and plundering a country, but not equal to regular troops in a pitched battle. The women, when they go abroad, wear ſhort cloaks and a veil. Hungary.

There are four languages ſpoken in this country, viz. the Hungarian, which, like the people, is of Scythian origin, and has little or no affinity with any European tongue; the German, Sclavonian, Wallachian, and Latin. The laſt is ſpoken, not only by the better ſort, but alſo by the common people, though very corruptly. The people called *Zigduns* have alſo a particular jargon.—Chriſtianity was planted in Hungary in the ninth and tenth centuries. In the ſixteenth the reformation made a great progreſs in it; but at preſent, though the Roman-catholics hardly make a fourth part of the inhabitants, their religion is predominant, the Proteſtants enjoying only a bare toleration. Beſides ſeveral ſects of Proteſtants, here are alſo great numbers of the Greek church and Jews; the laſt pay double taxes of all kinds. Beſides Jeſuits colleges and other convents, there are ſeveral univerſities for the Roman-catholics. The Lutherans alſo and Calviniſts have their gymnaſiums and ſchools, but under divers reſtrictions.

As to the traffic of this country, it is almoſt wholly in the hands of the Greeks and Jews. The exports conſiſt chiefly of wine, horſes, cattle, metals, minerals, ſaffron, wool, and leather. Hungary, in particular, furniſhes Auſtria, and other countries weſt of it, with vaſt droves of cattle, as well as variety of excellent wines, of which thoſe of Tockay are reckoned the beſt. The principal manufactures are thoſe of copper, braſs, iron, and other hard wares. Great quantities of braſs and iron are exported, wrought and unwrought.

Hungary at firſt, like moſt other countries, was divided into many little principalities and ſtates, which at length were united under one head, who had the title of *duke*. The laſt of theſe dukes was Geyſa: who, becoming a proſelyte to Chriſtianity, was baptized; after which he reſigned the government to his ſon Stephen, who took the title of *king*, *anno* 1000. But as the throne was filled by election, though generally out of the ſame family, the diſpoſal of the crown was diſputed between the Turkiſh and German emperors for near 200 years: but after the year 1527, when Ferdinand archduke of Auſtria was advanced to the throne, the Auſtrians found means to influence the elections in ſuch a manner, as to keep the crown in their

Hungary, Hunger.

their family till 1687, when it was ſettled hereditarily on their heirs male; and now, in conſequence of an act made by the diet at Preſburg in 1723, in caſe of the failure of heirs-male, it is to deſcend to females. The ſtates of the kingdom conſiſt of the prelates, the barons, the gentry, and the royal towns. To the firſt claſs belong two archbiſhops, about a dozen biſhops, near as many abbots and provoſts, with the Pauline and Præmonſtratenſian Jeſuits. To the ſecond, the ſtadtholder or palatine, who repreſents the king; the court-judge; the ban or viceroy of Dalmatia, Croatia, and Sclavonia; the Stadtholder of Tranſilvania; the great treaſurer, the great cup-bearer, the ſteward of the houſhold, the maſter of the horſe, the lord chamberlain, the captain of the yeomen of the guards, and the grand-marſhal of the courts, who are ſtyled the great barons, together with the inferior bans or counts and barons. To the third claſs belong the gentry, ſome of whom have noble manors, and others only the privileges of nobles. To the fourth claſs belong the royal free cities, which are not ſubject to the counts, but hold immediately of the king. The gentry alſo, who hold of the archbiſhops and biſhops, have the ſame privileges as the Hungarian nobility. The common people are vaſſals to the lords, on whoſe lands they live, whether theſe lands belong to the crown, the clergy, nobility, or gentry.

The ordinary revenue of this kingdom is ſaid to exceed a million Sterling, ariſing from the mines, duties on cattle, royal demeſnes, ſalt-works, contributions, cuſtoms, &c. The fortifications and garriſons conſtantly maintained on the frontiers, againſt the Turks, are a great expence to the government. Hungary can eaſily bring into the field 100,000 men, regulars and militia; for there are 50,000 in actual pay, and the provinces furniſh the other 50,000 when they are wanted.

Hungary-*Water*, a diſtilled water prepared from the tops or flowers of roſemary; ſo denominated from a queen of Hungary, for whoſe uſe it was firſt made. See Pharmacy, n° 573.

HUNGER, an uneaſy ſenſation occaſioned by long abſtinence from food when the body is in a healthy ſtate.—Many ſpeculations and conjectures have been formed concerning the cauſe of this ſenſation, but none of them in any degree ſatisfactory. The moſt ingenious and plauſible is that of Dr Haller, viz. that as the liver is not then ſuſtained by the ſtomach and inteſtines, it deſcends by its own weight, and, principally by means of its middle ligament, pulls the diaphragm along with it. It is in that place, therefore, that we have this uneaſy ſenſation, and not at the ſuperior orifice of the ſtomach as is generally thought.—But if this was the caſe, an empty ſtomach ſhould always be accompanied with hunger, which does not hold in fact: becauſe, in certain diſeaſes, people will often faſt a long time without any ſenſation of hunger; and on the contrary, there are caſes where ſcarce any degree of repletion of the ſtomach and inteſtines can extinguiſh the deſire of food. See (the *Index* ſubjoined to) Medicine.

When animals die for want of food, their death is not directly the conſequence of hunger, *i. e.* it does not proceed from a deficiency of juices, but from a bad quality of them. The blood, being deprived of its uſual ſupplies of freſh chyle, contracts a putreſcent diſpoſition; from whence ariſes a fever of the putrid kind, and of a nature ſimilar to the jail or hoſpital fever. Hunt.

Preſervatives againſt Hunger *and Thirſt.* There were ſome compoſitions in vogue among the ancients, for averting the direful effects of hunger and thirſt; and were held by them to be extremely neceſſary in time of ſcarcity, long voyages, and warlike expeditions. Pliny ſays, that a ſmall portion of ſome things allays the hunger and thirſt, and preſerves ſtrength: ſuch as butter, cheeſe made of mare's milk, and liquorice. The American Indians uſe a compoſition of the juice of tobacco, with calcined ſhells of ſnails, cockles, oyſters, &c. which they make into pills, and dry in the ſhade. Whenever they go upon a long journey, and are likely to be deſtitute of proviſions by the way, they put one of theſe pills between the lower lip and the teeth, and by ſwallowing what they ſuck from it, feel neither hunger, thirſt, nor fatigue, for four or five days together.

The following compoſition is an extract from a manuſcript ſcholium on a book of Heron in the Vatican library; and one much to the ſame effect, with ſome others, may be ſeen in Philo's fifth book of Military Affairs. It was reputed an exceeding nutritive medicament, and alſo very effectual for baniſhing thirſt. Both the beſiegers of cities, and the beſieged, fed upon it, in time of extremity, and called it the *Epimenidian Compoſition*, from the ſea-onion, which was an ingredient in its compoſition. The proceſs is thus:

The ſea-onion being boiled, waſhed with water, and afterwards dried, it was cut into very thin ſlices, to which a fifth part of ſeſame was added, and a fifteenth of poppy; all which being mixed and worked up into a maſs with honey, the whole was divided into portions about the bigneſs of a walnut, whereof two in the day, taken morning and evening, were ſufficient to prevent hunger and thirſt.

There was another way of preparing it, by taking a pint of ſeſame, the ſame quantity of oil, and two quarts of unſhelled ſweet almonds; when the ſeſame was dried, and the almonds ground and ſifted, the ſea-onions were to be peeled and ſliced, the roots and leaves being cut off: then, pounding them in a mortar till reduced to a pap, an equal part of honey was to be added, and both worked up with the oil: afterwards all the ingredients were to be put into a pot on the fire, and ſtirred with a wooden ladle till thoroughly mixed. When the maſs acquired a ſolid conſiſtence, it was taken off the fire, and formed into lozenges; of which two only, as above, were very ſufficient for a day's ſubſiſtence.

Avicenna relates, that a perſon, ſetting out upon a journey, drank one pound of oil of violets, mixed with melted beef-ſuet; and afterwards continued faſting for ten days together, without the leaſt hunger. He ſays, that the oil of almonds and beef-ſuet will effect the ſame by their viſcidity. Hence it was that this celebrated phyſician, who knew things more by unqueſtionable experiments than by idle ſpeculations and conjectures, preſcribed the following compoſition, which in time of famine, by ſea or land, might be extremely ſerviceable:

"Take of ſweet almonds, unſhelled, one pound; the

like

Huns. like quantity of melted beef-fuet; of oil of violets, two ounces; a ſufficient quantity of mucilage; and of the roots of marſh-mallows, one ounce: let all together be brayed in a mortar, and made into boluſſes about the bigneſs of a common nut. They muſt be kept ſo as to prevent their melting by the heat of the ſun."—See alſo the article GUM-*Arabic*.

HUNNS, a fierce and ſavage nation, who formerly inhabited that part of Sarmatia bordering on the Paulus Mœotis and the Tanais, the ancient boundary between Europe and Aſia. Their country, as deſcribed by Procopius, lay north of mount Caucaſus, which, extending from the Euxine to the Caſpian Seas, parts Aſiatic Sarmatia from Colchis, Iberia, and Albania; lying on the iſthmus between the two ſeas abovementioned. Here they reſided, unknown to other nations, and themſelves ignorant of other countries, till the year 376. At this time, an hind purſued by the hunters, or, according to ſome authors, an ox ſtung by a gad-fly, having paſſed the marſh, was followed by ſome Huns to the other ſide, where they diſcovered a country much more agreeable than their own. On their return, having acquainted their countrymen with what they had ſeen, the whole nation paſſed the marſh, and, falling upon the Alans who dwelt on the banks of the Tanais, almoſt exterminated them. They next fell upon the Oſtrogoths, whom they drove out of their country, and forced to retire to the plains between the Boryſthenes and the Tanais, now known by the name of *Podolia*. Then attacking the Viſigoths, they obliged them to ſhelter themſelves in the moſt mountainous parts of their country; till at laſt, the Gothic nations finding it impoſſible to withſtand ſuch an inundation of barbarians, obtained leave from the emperor Valens to ſettle in Thrace.

The Huns thus became maſters of all the country between the Tanais and Danube in 376, where they continued quietly till the year 388, when great numbers of them were taken into the pay of Theodoſius I. but, in the mean time, a party of them, called the *Nephthalite* or *White Huns*, who had continued in Aſia, over-ran all Meſopotamia, and even laid ſiege to Edeſſa, where they were repulſed with great ſlaughter by the Romans. The European Huns frequently paſſed the Danube, committing the greateſt ravages in the weſtern empire; ſometimes they fell upon the eaſtern provinces, where they put all to fire and ſword. They were often defeated and repulſed by the Romans, but the empire was now too weak to ſubdue or confine them from making excurſions; ſo that they continued to make daily encroachments, and became every day more formidable than before. In 441, the Huns, under Attila, threatened the weſtern empire with total deſtruction. This monarch, having made himſelf maſter of all the northern countries from the confines of Perſia to the banks of the Rhine, invaded Mœſia, Thrace, and Illyricum; where he made ſuch progreſs, that the emperor, not thinking himſelf ſafe in Conſtantinople, withdrew into Aſia. Attila then broke into Gaul; where he took and deſtroyed ſeveral cities, maſſacring the inhabitants with the greateſt cruelty. At laſt he was driven out with great ſlaughter by Aetius the Roman general and Theodoric king of the Goths, and could never afterwards make any great progreſs. About the year 452 or 453 Attila died, and his kingdom was immediately ſplit into a number of ſmall ones by his numerous children, who waged perpetual war with each other. The Huns then ceaſed to be formidable, and became daily leſs able to cope with the other barbarous nations whom Attila had kept in ſubjection. Still, however, their dominion was conſiderable; and in the time of Charles the Great they were maſters of Tranſylvania, Walachia, Servia, Carniola, Carinthia, and the greater part of Auſtria, together with Boſnia, Sclavonia, and that part of Hungary which lies beyond the Danube. In the year 776, while Charles was in Saxony, two princes of the Huns, Caganus and Jugunus, ſent ambaſſadors to him, deſiring his friendſhip and alliance. Charles received them with extraordinary marks of friendſhip, and readily complied with their requeſt. However, they entered, not long after, into an alliance with Taſſilo duke of Bavaria, who had revolted from Charles, and raiſed great diſturbances in Germany. Charles diſſembled his reſentment till he had entirely reduced Bavaria, when he reſolved to revenge himſelf on the Huns for thoſe ſuccours they had underhand given to his enemy. Accordingly, he ordered levies to be made throughout his dominions; and having by that means aſſembled a very numerous army, he divided it into two bodies, one of which he commanded himſelf, and the other he committed to the care of his generals. The two armies entered the country of the Huns at different places, ravaged their country far and near, burnt their villages, and took all their ſtrong holds. This he continued for eight years, till the people were almoſt totally extirpated; nor did the Huns ever afterwards recover themſelves, or appear as a diſtinct nation. Huns.

There were two different nations that went by the name of *Huns*; the Nephthalite or White Huns, and the Sarmatian or Scythian Huns. The former inhabited a rich country, bordering to the north on Perſia, and at a great diſtance from the Sarmatian or Scythian Huns, with whom they had no intercourſe, nor the leaſt reſemblance either in their perſons or manners. They were a powerful nation, and often ſerved againſt the Romans in the Perſian armies; but, in the reign of the emperor Zeno, being provoked by Perozes king of Perſia laying claim to part of their country, they defeated the Perſians in two pitched battles, ſlew their king, over-ran all Perſia, and held it in ſubjection for the ſpace of two years, obliging Cabades, the ſon and ſucceſſor of Perozes, to pay them a yearly tribute. Theſe Huns, called by the writers of thoſe times the *white Huns*, did not wander, like the others, from place to place; but, contented with their own country, which ſupplied them with all neceſſaries, they lived under a regular goverument, ſubject to one prince, and ſeldom made inroads, unleſs provoked, either into the Perſian or Roman territories. They lived according to their own laws, and dealt uprightly with one another, as well as with the neighbouring people. Each of their great men uſed to chooſe 20 or more companions to enjoy with him his wealth, and partake of all his diverſions; but, upon his deceaſe, they were all buried with him in the ſame grave. This cuſtom favours of barbarity; but, in every other reſpect, the Nephthalite were a far more civilized nation than the Scythian Huns, who, break-

Huns ing into the empire, filled moſt of the provinces of Eu-
II rope with blood and ſlaughter.
Hunting. The latter were, according to Ammianus Marcel-
linus, a ſavage people, exceeding in cruelty the moſt barbarous nations. They began to practiſe their cruelty, ſays Jornandes, upon their own children the very firſt day they come into the world, cutting and mangling the cheeks of their males, to prevent the growth of hair, which they muſt have looked upon, contrary to the ſentiments of other nations, as unbecoming and unmanly. They had, perhaps, in this practice another view, which Jornandes ſeems to inſinuate elſewhere, viz. to ſtrike terror into the enemy with their countenances, thus deformed and covered with ſcars. They had no other food but roots and raw meat, being quite unacquainted with the uſe of fire, and no houſes at all, not even huts; but lived conſtantly expoſed to the air in the woods, and on the mountains, where, from their infancy, they were inured to hunger, thirſt, and all manner of hardſhips: nay, they had ſuch an averſion to houſes, which they called the *ſepulchres of the living*, that, when they went into other countries, they could hardly be prevailed upon to come within the walls of any houſe, not thinking themſelves ſafe when ſhut up and covered. They uſed even to eat and ſleep on horſeback, ſcarce ever diſmounting; which, in all likelihood, induced Zoſimus to write, that the Huns could not walk. They covered their nakedneſs with goats ſkins, or the ſkins of a ſort of mice ſewed together. Day and night were indifferent to them, as to buying, ſelling, eating, and drinking. They had no law, nor any kind of religion; but complied with their inclinations, whatever they prompted them to, without the leaſt reſtraint, or diſtinction between good and evil. In war, they began the battle with great fury, and an hideous noiſe: but, if they met with a vigorous oppoſition, their fury began to abate after the firſt onſet; and, when once put in diſorder, they never rallied, but fled in the utmoſt confuſion. They were quite unacquainted with the art of beſieging towns; and authors obſerve, that they never attacked the enemy's camp. They were a faithleſs nation, and thought themſelves no longer bound by the moſt ſolemn treaties, than they found their advantage in obſerving them. Hence we often find them, upon the leaſt proſpect of obtaining more advantageous conditions, breaking into the Roman empire, in defiance of the moſt ſolemn oaths and engagements. Several corps of Huns, after their coming into Europe, ſerved in the Roman armies againſt the Goths and other barbarous nations; nay, they were ready, for hire, to fight againſt each other, being blind to every other regard and conſideration.

HUNGERFORD, a town of Berkſhire, in England, ſeated on the river Kennet, in a low and watery ſoil, and noted for the beſt trouts and craw-fiſh in all England. W. Long. 1. 35. N. Lat. 26.

HUNNINGUEN, a town of Germany, in Alſace, and in Suntgaw, ſubject to the French; ſeated on the Rhine, and fortified by Vauban. E. Long. 11. 40. N. Lat. 47. 42.

HUNTING, the exerciſe or diverſion of purſuing four-footed beaſts of game. See the article GAME.

Four-footed beaſts are hunted in the fields, woods, and thickets, and that both with guns and gre- Hunting
hounds.

Birds, on the contrary, are either ſhot in the air, or taken with nets and other devices, which exerciſe is called *fowling*; or they are purſued and taken by birds of prey, which is called *hawking*. See the articles FOWLING, HAWKING, FALCONRY, SHOOTING, BIRD-*Catching*,, and DECOY.

The purſuing of four-footed beaſts, as badgers, deer, does, roebucks, foxes, hares, &c. properly termed *hunting*, is a noble exerciſe, ſerving not only to recreate the mind, but to ſtrengthen the limbs, whet the ſtomach, and cheer the ſpirits. However, all ſorts of weather are not proper for hunting; high winds and rain being great obſtacles to it. In the ſpring ſeaſon, this diverſion ſhould be taken in the night-time with nets; in the ſummer, the morning is the moſt proper time for it; and in the winter, it ſhould only be followed from nine in the morning till two in the afternoon. The general rule is, that you place yourſelf under the wind, where you deſign to wait for game.

F. de Launay, profeſſor of the French laws, has an expreſs treatiſe of hunting.—From thoſe words of God to Adam, Gen. i. 26, and 28. and to Noah, Gen. ix. 2, 3. hunting was conſidered as a right devolved or made over to man; and the following ages appear to have been of the ſame ſentiment. Accordingly we find, that among the more civilized nations, as the Perſians, Greeks, and Romans, it made one of their genteeler diverſions; and as to the wilder and more barbarous, it ſerved them with food and neceſſaries.—The Roman juriſprudence, which was formed on the manners of the firſt ages, made a law of it, and eſtabliſhed it as a maxim, that as the natural right of things which have no maſter belongs to the firſt poſſeſſor, wild beaſts, birds, and fiſhes, are the property of whomſoever can take them firſt.

But the northern nations of barbarians who over-ran the Roman empire, bringing with them a ſtronger taſte for the diverſion, and the people being now poſſeſſed of other and more eaſy means of ſubſiſtence from the lands and poſſeſſions of thoſe they had vanquiſhed, their chiefs and leaders began to appropriate the right of hunting, and, inſtead of a natural right, to make it a royal one.—Thus it continues to this day; the right of hunting, among us, belonging only to the king, and thoſe who derive it from him.

The hunting uſed by the ancients, was much like that now practiſed for the rein-deer; which is ſeldom hunted at force, or with hounds; but only drawn with a blood-hound, and foreſtalled with nets and engines. Thus did they with all beaſts; whence a dog is never commended by them for opening, before he has diſcovered where the beaſt lies. Hence, they were not in any manner curious as to the muſic of their hounds, or the compoſition of their kennel or pack, either for deepneſs, loudneſs, or ſweetneſs of cry, which is a principal point in the hunting of our days.—Their huntſmen, indeed, were accuſtomed to ſhout and make a great noiſe, as Virgil obſerves in the third of his Georgics: *Ingentem clamore premes ad retia cervum.* But that confuſion was only to bring the deer to the nets laid for him.

The Sicilian way of hunting had ſomething in it very

Hunting very extraordinary.—The nobles or gentry being informed which way a herd of deer paſſed, gave notice to one another, and appointed a meeting; every one bringing with him a croſs-bow or long bow, and a bundle of ſtaves ſhod with iron, the heads bored, with a cord paſſing through them all: thus provided, they came to the herd, and, caſting themſelves about in a large ring, ſurrounded the deer.—Then, each taking his ſtand, unbound his faggot, ſet up his ſtake, and tied the end of the cord to that of his next neighbour, at the diſtance of ten foot from one another.—Then taking feathers, died in crimſon, and faſtened on a thread, they tied them to the cord; ſo that with the leaſt breath of wind, they would whirl round.—Which done, the perſons who kept the ſtands withdrew, and hid themſelves in the next covert. Then the chief ranger entering within the line with hounds to draw after the herd, rouſed the game with their cry; which flying towards the line, were turned off, and, ſtill gazing on the ſhaking and ſhining feathers, wandered about as if kept in with a real wall or pale. The ranger ſtill purſued, and calling every perſon by name, as he paſſed by their ſtand, commanded him to ſhoot the firſt, third, or ſixth, as he pleaſed; and if any of them miſſed, or ſingled out another than that aſſigned him, it was counted a grievous diſgrace. By ſuch means, as they paſſed by the ſeveral ſtations, the whole herd was killed by the ſeveral hands. *Pier. Hieroglyphic.* lib. vii. cap. 6.

The gentlemen and maſters of the ſport have invented a new ſet of terms which may be called the *hunting language*. The principal are thoſe which follow:

1. For beaſts as they are in company.—They ſay, a *herd* of harts, and all manner of deer. A *bey* of roes. A *founder* of ſwine. A *rout* of wolves. A *richeſs* of martens. A *brace* or *leaſh* of bucks, foxes, or hares. A *couple* of rabbits or coneys.

2. For their lodging.—A hart is ſaid to *harbour*. A buck *lodges*. A roe *beds*. A hare *ſeats* or *forms*. A coney *ſits*. A fox *kennels*. A marten *trees*. An otter *watches*. A badger *earths*. A boar *couches*.—Hence, to expreſs their diſlodging, they ſay, *Unharbour* the hart. *Rouſe* the buck. *Start* the hare. *Bolt* the coney. *Unkennel* the fox. *Tree* the marten. *Vent* the otter. *Dig* the badger. *Rear* the boar.

3. For their noiſe at rutting time.—A hart *belleth*. A buck *growns* or *troats*. A roe *bellows*. A hare *beats* or *taps*. An otter *whines*. A boar *freams*. A fox *barks*. A badger *ſhrieks*. A wolf *howls*. A goat *rattles*.

4. For their copulation.—A hart or buck goes to *rut*. A roe goes to *tourn*. A boar goes to *brim*. A hare or coney goes to *buck*. A fox goes to *clickitting*. A wolf goes to *match* or *make*. An otter *hunteth* for his kind.

5. For the footing and treading.—Of a hart, we ſay the *flot*. Of a buck, and all fallow-deer, the *view*. Of all deer, if on the graſs and ſcarce viſible, the *foiling*. Of a fox, the *print*; and of other the like vermin, the *footing*. Of an otter, the *marks*. Of a boar, the *track*. The hare, when in open field, is ſaid to *fore*; when ſhe winds about to deceive the hounds, ſhe *doubles*; when ſhe beats on the hard highway, and her footing comes to be perceived, ſhe *pricketh*: in ſnow, it is called the *trace* of the hare.

6. The tail of a hart, buck, or other deer, is called the *ſingle*. That of a boar, the *wreath*. Of a fox, the *bruſh* or *drag*; and the tip at the end, the *chape*. Of a wolf, the *ſtern*. Of a hare and coney, the *ſcut*. Hunting.

7. The ordure or excrement of a hart and all deer, is called *fewmets* or *fewmiſhing*. Of a hare, *crotiles* or *crotiſing*. Of a boar, *leſſes*. Of a fox, the *billiting*; and of other the like vermin, the *fuants*. Of an otter, the *ſpraints*.

8. As to the attire of deer, or parts thereof, thoſe of a ſtag, if perfect, are the *bur*, the *pearls*, the little *knobs* on it, the *beam*, the *gutters*, the *antler*, the *ſur-antler*, *royal*, *ſur-royal*, and all at top the *croches*. Of the buck, the *bur*, *beam*, *brow-antler*, *black-antler*, *advancer*, *palm*, and *ſpellers*. If the croches grow in the form of a man's hand, it is called a *palmed head*. Heads bearing not above three or four, and the croches placed aloft, all of one height, are called *crowned heads*. Heads having double croches, are called *forked heads*, becauſe the croches are planted on the top of the beam like forks.

9. They ſay, a *litter* of cubs, a *neſt* of rabbits, a ſquirrel's *dray*.

10. The terms uſed in reſpect of the dogs, &c. are as follow.—Of gre-hounds, two make a *brace*; of hounds, a *couple*. Of gre-hounds, three make a *leaſh*; of hounds, a *couple* and *half*.—They ſay, *let ſlip* a gre-hound; and, *caſt off* a hound. The ſtring wherein a gre-hound is led, is called a *leaſh*; and that of a hound, a *lyome*. The gre-hound has his *collar*, and the hound his *couples*. We ſay a *kennel* of hounds, and a *pack* of beagles.

HUNTING, as practiſed among us, is chiefly performed with dogs; of which we have various kinds, accommodated to the various kinds of game, as *hounds*, *gre-hounds*, *blood-hounds*, *terriers*, &c. See CANIS, HOUND, &c.

In the kennels or packs they generally rank them under the heads of *enterers*, *drivers*, *flyers*, *tyers*, &c.

On ſome occaſions, nets, ſpears, and inſtruments for digging the ground, are alſo required: nor is the hunting-horn to be omitted.

The uſual chaſes among us, are the *hart*, *buck*, *roe*, *hare*, *fox*, *badger*, and *otter*.—We ſhall here give ſomething of what relates to each thereof: firſt premiſing an explanation of ſome general terms and phraſes, more immediately uſed in the progreſs of the ſport itſelf; what belongs to the ſeveral ſorts of game in particular, being referred for the reſpective articles.

When the hounds then, being caſt off, and finding the ſcent of ſome game, begin to open and cry; they are ſaid to *challenge*. When they are too buſy ere the ſcent be good, they are ſaid to *babble*. When too buſy where the ſcent is good, to *bawl*. When they run it endwiſe orderly, holding in together merrily, and making it good, they are ſaid to be in *full cry*. When they run along without opening at all, it is called *running mute*.

When ſpaniels open in the ſtring, or a gre-hound in the courſe, they are ſaid to *lapſe*.

When beagles bark and cry at their prey, they are ſaid to *yearn*.

When the dogs hit the ſcent the contrary way, they are ſaid to *draw amiſs*.

Hunting. When they take freſh ſcent, and quit the former chaſe for a new one, it is called *hunting change*.

When they *hunt* the game by the heel or track, they are ſaid to *hunt counter*.

When the chaſe goes off, and returns again, traverſing the ſame ground, it is called *hunting the foil*.

When the dogs run at a whole herd of deer, inſtead of a ſingle one, it is called *running riot*.

Dogs ſet in readineſs where the game is expected to come by, and caſt off after the other hounds are paſſed, are called a *relay*. If they be caſt off ere the other dogs be come up, it is called a *vauntlay*.

When, finding where the chaſe has been, they make a proffer to enter, but return, it is called a *blemiſh*.

A leſſon on the horn to encourage the hounds, is named a *call*, or a *recheat*. That blown at the death of a deer, is called the *mort*. The part belonging to the dogs of any chaſe they have killed, is the *reward*. They ſay, *take off* a deer's ſkin; *ſtrip* or *caſe* a hare, fox, and all ſorts of vermin; which is done by beginning at the ſnout, and turning the ſkin over the ears down to the tail.

Hunting is practiſed in a different manner, and with different apparatus, according to the nature of the beaſts which are hunted, a deſcription of whom may be found under their reſpective articles, *infra*.

With regard to the ſeaſons, that for hart and buck-hunting begins a fortnight after midſummer, and laſts till Holy-rood day; that for the hind and doe, begins on Holy-rood day, and laſts till Candlemas; that for fox-hunting begins at Chriſtmas, and holds till Lady-day; that for roe-hunting begins at Michaelmas, and ends at Chriſtmas; hare-hunting commences at Michaelmas, and laſts till the end of February; and where the wolf and boar are hunted, the ſeaſon for each begins at Chriſtmas, the firſt ending at Lady-day, and the latter at the Purification.

When the ſportſmen have provided themſelves with nets, ſpears, and a hunting-horn to call the dogs together, and likewiſe with inſtruments for digging the ground, the following directions will be of uſe to them in the purſuit of each ſort of game.

Badger-Hunting. In doing this, you muſt ſeek the earths and burrows where he lies, and in a clear moonſhine night go and ſtop all the burrows, except one or two, and therein place ſome ſacks, faſtened with drawing ſtrings, which may ſhut him in as ſoon as he ſtraineth the bag. Some uſe no more than to ſet a hoop in the mouth of the ſack, and ſo put it into the hole; and as ſoon as the badger is in the ſack and ſtraineth it, the ſack ſlippeth off the hoop and follows him into the earth, ſo he lies tumbling therein till he is taken. Theſe ſacks or bags being thus ſet, caſt off the hounds, beating about all the woods, coppices, hedges, and tufts, round about, for the compaſs of a mile or two; and what badgers are abroad, being alarmed by the hounds, will ſoon betake themſelves to their burrows: and, obſerve that he who is placed to watch the ſacks, muſt ſtand cloſe and upon a clear wind; otherwiſe the badger will diſcover him, and will immediately fly ſome other way into his burrow. But if the hounds can encounter him before he can take his ſanctuary, he will then ſtand at a bay like a boar, and make good ſport, grievouſly biting and clawing the dogs, for the manner of their fighting is lying on their backs, uſing both teeth and nails; and by blowing up their ſhins defend themſelves againſt all bites of the dogs, and blows of the men upon their noſes as aforeſaid. And for the better preſervation of your dogs, it is good to put broad collars about their necks made of greys ſkins. Hunting.

When the badger perceives the terriers to begin to yearn him in his burrow, he will ſtop the hole betwixt him and the terriers, and if they ſtill continue baying, he will remove his couch into another chamber or part of the burrow, and ſo from one to another, barricading the way before them, as they retreat, until they can go no further. If you intend to dig the badger out of his burrow, you muſt be provided with the ſame tools as for digging out a fox; and beſides, you ſhould have a pail of water to refreſh the terriers, when they come out of the earth to take breath and cool themſelves. It will alſo be neceſſary to put collars of bells about the necks of your terriers, which making a noiſe may cauſe the badger to bolt out. The tools uſed for digging out of the badger, being troubleſome to be carried on mens backs, may be brought in a cart. In digging, you muſt conſider the ſituation of the ground, by which you may judge where the chief angles are; for elſe, inſtead of advancing the work, you will hinder it. In this order you may beſiege them in their holds, or caſtles; and may break their platforms, parapets, caſemates, and work to them with mines and countermines until you have overcome them.

Having taken a live and luſty badger, if you would make ſport, carry him home in a ſack and turn him out in your court-yard, or ſome other incloſed place, and there let him be hunted and worried to death by your hounds.

Thereare the following profits and advantages which accrue by killing this animal. Their fleſh, blood, and greaſe, though they are not good food, yet are very uſeful for phyſicians and apothecaries for oils, ointments, ſalves, and powders for ſhortneſs of breath, the cough of the lungs, for the ſtone, ſprained ſinews, colt-aches, &c. and the ſkin being well dreſſed, is very warm and good for old people who are troubled with paralytic diſtempers.

Buck-Hunting. Here the ſame hounds and methods are uſed as in running the ſtag; and, indeed, he that can hunt a hart or ſtag well, will not hunt a buck ill.

In order to facilitate the chace, the game-keeper commonly ſelects a fat buck out of the herd, which he ſhoots in order to maim him, and then he is run down by the hounds.

As to the method of hunting the buck. The company generally go out very early for the benefit of the morning. Sometimes they have a deer ready lodged; if not, the coverts are drawn till one is roufed: or ſometimes in a park a deer is pitched upon, and forced from the herd, then more hounds are laid on to run the chace. If you come to be at a fault, the old ſtaunch hounds are only to be relied upon till you recover him again: if he be ſunk, and the bounds thruſt him up, it is called an *imprime*, and the company all ſound a recheat; when he is run down, every one ſtrives to get in to prevent his being torn by the hounds, fallow-deer ſeldom or never ſtanding at bay.

He

Hunting. He that firſt gets in, cries hoo-up, to give notice that he is down and blows a death. When the company are all come in, they paunch him, and reward the hounds; and generally the chief perſon of quality amongſt them *takes fay*, that is, cuts his belly open, to ſee how fat he is. When this is done, every one has a chop at his neck; and the head being cut off, is ſhewed to the hounds, to encourage them to run only at male deer, which they ſee by the horns, and to teach them to bite only at the head: then the company all ſtanding in a ring, one blows a ſingle death; which being done, all blow a double recheat, and ſo conclude the chace with a general halloo of hoo-up, and depart the field to their ſeveral homes, or to the place of meeting; and the huntſman, or ſome other, hath the deer caſt croſs the buttocks of his horſe, and ſo carries him home.

Fox-HUNTING makes a very pleaſant exerciſe, and is either above or below ground.

1. Above ground. To hunt a fox with hounds, you muſt draw about groves, thickets, and buſhes near villages. When you find one, it will be neceſſary to ſtop up his earth the night before you deſign to hunt, and that about midnight; at which time he is gone out to prey: this may be done by laying two white ſticks acroſs in his way, which he will imagine to be ſome gin or trap laid for him; or elſe they may be ſtopped up with black thorns and earth mixed together.

At firſt, only caſt off your ſure finders; and as the drag mends, add more as you dare truſt them. The hound firſt caſt off ſhould be old and ſtaunch; and when you hear ſuch a hound call on merrily, you may caſt off ſome others to him; and when they run it on the full cry, caſt off the reſt: thus you ſhall complete your paſtime. The words of comfort are the ſame which are uſed in other chaces. The hounds ſhould be left to kill the fox themſelves, and to worry and tear him as much as they pleaſe: ſome hounds will eat him with eagerneſs.

When he is dead, hang him at the end of a pike-ſtaff, and halloo in all your hounds to bay him: but reward them with nothing belonging to the fox; for it is not good, neither will the hounds in common eat it.

2. Under ground. In caſe a fox does ſo far eſcape as to earth, countrymen muſt be got together with ſhovels, ſpades, mattocks, pickaxes, &c. to dig him out, if they think the earth not too great. They make their earths as near as they can in ground that is hard to dig, as in clay, ſtony ground, or amongſt the roots of trees; and their earths have commonly but one hole, and that is ſtraight a long way in before you come at their couch. Sometimes craftily they take poſſeſſion of a badger's old burrow, which hath a variety of chambers, holes, and angles.

Now to facilitate this way of hunting the fox, the huntſman muſt be provided with one or two terriers to put into the earth after him, that is, to fix him into an angle; for the earth often conſiſts of many angles: the uſe of the terrier is to know where he lies; for as ſoon as he finds him, he continues baying or barking, ſo that which way the noiſe is heard that way dig to him. Your terriers muſt be garniſhed with bells hung in collars, to make the fox bolt the ſooner; beſides, the collars will be ſome ſmall defence to the terriers.

The inſtruments to dig withal are theſe: a ſharp-pointed ſpade, which ſerves to begin the trench where the ground is hardeſt and broader tools will not ſo well enter; the round hollowed ſpade, which is uſeful to dig among roots, having very ſharp edges; the broad flat ſpade to dig withal, when the trench has been pretty well opened, and the ground ſofter; mattocks and pickaxes to dig in hard ground, where a ſpade will do but little ſervice; the coal-rake to cleanſe the hole, and to keep it from ſtopping up; clamps, wherewith you may take either fox or badger out alive to make ſport with afterwards. And it would be very convenient to have a pail of water to refreſh your terriers with, after they are come out of the earth to take breath. Hunting.

Hare-HUNTING. As, of all chaces, the hare makes the greateſt paſtime, ſo it gives no little pleaſure to ſee the craft of this ſmall animal for her ſelf-preſervation. If it be rainy, the hare uſually takes to the high-ways; and if ſhe come to the ſide of a young grove, or ſpring, ſhe ſeldom enters, but ſquats down till the hounds have over-ſhot her; and then ſhe will return the very way ſhe came, for fear of the wet and dew that hangs on the boughs. In this caſe, the huntſman ought to ſtay an hundred paces before he comes to the wood-ſide, by which means he will perceive whether ſhe return as aforeſaid; which if ſhe do, he muſt halloo in his hounds, and call them back; and that preſently, that the hounds may not think it the counter ſhe came firſt.

The next thing that is to be obſerved, is the place where the hare lits, and upon what wind ſhe makes her form, either upon the north or ſouth wind; ſhe will not willingly run into the wind, but run upon aſide, or down the wind; but if ſhe form in the water, it is a ſign ſhe is foul and meaſled: if you hunt ſuch a one, have a ſpecial regard all the day to the brook-ſides; for there, and near plaſhes, ſhe will make all her croſſings, doublings, &c.

Some hares have been ſo crafty, that as ſoon as they have heard the ſound of a horn, they would inſtantly ſtart out of their form, though it was at the diſtance of a quarter of a mile, and go and ſwim in ſome pool, and reſt upon ſome ruſh-bed in the midſt of it; and would not ſtir from thence till they have heard the ſound of the horn again, and then have ſtarted out again, ſwimming to land, and have ſtood up before the hounds four hours before they could kill them, ſwimming and uſing all ſubtilties and croſſings in the water. Nay, ſuch is the natural craft and ſubtilty of a hare, that ſometimes, after ſhe has been hunted three hours, ſhe will ſtart a freſh hare, and ſquat in the ſame form. Others having been hunted a conſiderable time, will creep under the door of a ſheep-cot, and hide themſelves among the ſheep; or, when they have been hard hunted, will run in among a flock of ſheep, and will by no means be gotten out from among them, till the hounds are coupled up, and the ſheep driven into their pens. Some of them (and that ſeems ſomewhat ſtrange,) will take the ground like a coney, and that is called *going to the vault*. Some hares will go up one ſide of the hedge, and come down the other, the thickneſs of the hedge being the only diſtance between the courſes. A hare that

Hunting. that has been ſorely hunted, has got upon a quickſet hedge, and ran a good way upon the top thereof, and then leapt off upon the ground. And they will frequently betake themſelves to furz-buſhes, and will leap from one to the other, whereby the hounds are frequently in default.

Having found where a hare hath relieved in ſome paſture or corn-field, you muſt then conſider the ſeaſon of the year, and what weather it is: for if it be in the ſpring-time or ſummer, a hare will not then ſet in buſhes, becauſe they are frequently infeſted with piſmires, ſnakes, and adders; but will ſet in corn-fields, and open places. In the winter-time, they ſet near towns and villages, in tufts of thorns and brambles, eſpecially when the wind is northerly or ſoutherly. According to the ſeaſon and nature of the place where the hare is accuſtomed to ſit, there beat with your hounds, and ſtart her; which is much better ſport than trayling of her from her relief to her form.

After the hare has been ſtarted and is on foot, then ſtep in where you ſaw her paſs, and halloo in your hounds, until they have all undertaken it and go on with it in full cry: then recheat to them with your horn, following fair and ſoftly at firſt, making not too much noiſe either with horn or voice; for at the firſt, hounds are apt to overſhoot the chace through too much heat. But when they have run the ſpace of an hour, and you ſee the hounds are well in with it, and ſtick well upon it, then you may come in nearer with the hounds, becauſe by that time their heat will be cooled, and they will hunt more ſoberly. But above all things, mark the firſt doubling, which muſt be your direction for the whole day; for all the doublings that ſhe ſhall make afterwards will be like the former; and according to the policies that you ſhall ſee her uſe, and the place where you hunt, you muſt make your compaſſes great or little, long or ſhort, to help the defaults, always ſeeking the moiſteſt and moſt commodious places for the hounds to ſcent in.

To conclude: Thoſe who delight in hunting the hare, muſt riſe early, leſt they be deprived of the ſcent of her foot-ſteps.

Hart or Stag HUNTING. Geſner, ſpeaking of hart-hunting, obſerves, that this wild, deceitful, and ſubtile beaſt frequently deceives its hunter, by windings and turnings. Wherefore, the prudent hunter muſt train his dogs with words of art, that he may be able to ſet them on and take them off again at pleaſure.

Firſt of all, he ſhould encompaſs the beaſt in her own layer, and ſo unharbour her in the view of the dogs, that ſo they may never loſe her ſlot or footing. Neither muſt he ſet upon every one, either of the herd or thoſe that wander ſolitary alone, or a little one; but partly by ſight, and partly by their footing and fumets, make a judgment of the game, and alſo obſerve the largeneſs of his layer.

The huntſman, having made theſe diſcoveries in order to the chace, takes off the couplings of the dogs; and ſome on horſeback, others on foot, follow the cry, with the greateſt art, obſervation, and ſpeed; remembering and intercepting him in his ſubtile turnings and headings; with all agility leaping hedges, gates, pales, ditches; neither fearing thorns, down hills, nor woods, but mounting freſh horſe, if the firſt tire. Follow the largeſt head of the whole herd, which muſt be fingled out of the chace; which the dogs perceiving, muſt follow; not following any other. The dogs are animated to the ſport by the winding of horns, and the voices of the huntſmen. But ſometimes the crafty beaſt ſends forth his little ſquire to be ſacrificed to the dogs and hunters, inſtead of himſelf, lying cloſe the mean time. In this caſe, the huntſman muſt ſound a retreat, break off the dogs, and take them in, that is, leam them again, until they be brought to the fairer game; which riſeth with fear, yet ſtill ſtriveth by flight, until he be wearied and breathleſs. The nobles call the beaſt a *wiſe hart*, who, to avoid all his enemies, runneth into the greateſt herds, and ſo brings a cloud of error on the dogs, to obſtruct their farther purſuit; ſometimes alſo bearing ſome of the herd into his footings, that ſo he may the more eaſily eſcape, by amuſing the dogs. Afterwards he betakes himſelf to his heels again, ſtill running with the wind, not only for the ſake of refreſhment, but alſo becauſe by that means he can the more eaſily hear the voice of his purſuers whether they be far from him or near to him. But at laſt being again diſcovered by the hunters and ſagacious ſcent of the dogs, he flies into the herds of cattle, as cows, ſheep, &c. leaping on a cow or ox, laying the fore-parts of his body thereon, that ſo touching the earth only with his hinder feet, he may leave a very ſmall or no ſcent at all behind for the hounds to diſcern. But their uſual manner is, when they ſee themſelves hard beſet and every way intercepted, to make force at their enemy with their horns, who firſt comes upon him, unleſs they be prevented by ſpear or ſword. When the beaſt is ſlain, the huntſman with his horn windeth the fall of the beaſt; and then the whole company comes up, blowing their horns in triumph for ſuch a conqueſt; among whom, the ſkilfulleſt opens the beaſt, and rewards the hounds with what properly belongs to them, for their future encouragement; for which purpoſe the huntſmen dip bread in the ſkin and blood of the beaſt, to give to the hounds. Hunting

It is very dangerous to go in to a hart at bay; of which there are two ſorts, one on land and the other in water. Now if the hart be in a deep water, where you cannot well come at him, then couple up your dogs; for ſhould they continue long in the water, it would endanger their ſurbating or foundering. In this caſe, get a boat, and ſwim to him, with dagger drawn, or elſe with rope that has a nooſe, and throw it over his horns: for if the water be ſo deep that the hart ſwims, there is no danger in approaching him; otherwiſe you muſt be very cautious.

As to the land-bay, if a hart be burniſhed, then you muſt conſider the place; for if it be in a plain and open place, where there is no wood nor covert, it is dangerous and difficult to come in to him; but if he be on a hedge-ſide, or in a thicket, then, while the hart is ſtaring on the hounds, you may come ſoftly and covertly behind him, and cut his throat. If you miſs your aim, and the hart turn head upon you, then take refuge at ſome tree; and when the hart is at bay, couple up your hounds; and when you ſee the hart turn head to fly, gallop in roundly to him, and kill him with your ſword.

Directions at the Death of a Hart or Buck. The firſt

unting. firſt ceremony, when the huntſman comes in to the death of a deer, is to cry "ware haunch," that the hounds may not break in to the deer; which being done, the next is the cutting his throat, and there blooding the youngeſt hounds, that they may the better love a deer, and learn to leap at his throat: then the mort having been blown, and all the company come in, the beſt perſon who hath not taken ſay before, is to take up the knife that the keeper or huntſman is to lay acroſs the belly of the deer, ſome holding by the fore-legs, and the keeper or huntſman drawing down the pizzle, the perſon who takes ſay, is to draw the edge of the knife leiſurely along the middle of the belly, beginning near the briſket, and drawing a little upon it, enough in the length and depth to diſcover how fat the deer is; then he that is to break up the deer, firſt ſlits the ſkin from the cutting of the throat downwards, making the arber, that ſo the ordure may not break forth, and then he paunches him, rewarding the hounds with it.

In the next place, he is to preſent the ſame perſon who took ſay, with a drawn hanger, to cut off the head of the deer. Which being done, and the hounds rewarded, the concluding ceremony is, if it be a ſtag, to blow a triple mort; and if a buck, a double one; and then all who have horns, blow a recheat in concert, and immediately a general whoop, whoop.

Otter-HUNTING is performed with dogs, and alſo with a ſort of inſtruments called *otter-ſpears*; with which when they find themſelves wounded, they make toland, and fight with the dogs, and that moſt furiouſly, as if they were ſenſible that cold water would annoy their green wounds.

There is indeed craft to be uſed in hunting them; but they may be catched in ſnares under water, and by river-ſides: but great care muſt be taken, for they bite ſorely and venomouſly; and if they happen to remain long in the ſnare, they will not fail to get themſelves free by their teeth.

In hunting them, one man muſt be on one ſide of the river, and another on the other, both beating the banks with dogs; and the beaſt not being able to endure the water long, you will ſoon diſcover if there be an otter or not in that quarter; for he muſt come out to make his ſpraints, and in the night ſometimes to feed on graſs and herbs.

If any of the hounds finds out an otter, then view the ſoft grounds and moiſt places, to find out which way he bent his head: if you cannot diſcover this by the marks, you may partly perceive it by the ſpraints; and then follow the hounds, and lodge him as a hart or deer. But if you do not find him quickly, you may imagine he is gone to couch ſomewhere farther off from the river; for ſometimes they will go to feed a conſiderable way from the place of their reſt, chooſing rather to go up the river than down it. The perſons that go a-hunting otters, muſt carry their ſpears, to watch his vents, that being the chief advantage; and if they perceive him ſwimming under water, they muſt endeavour to ſtrike him with their ſpears, and if they miſs, muſt purſue him with the hounds, which, if they be good and perfectly entered, will go chanting and trailing along by the river ſide, and will beat every root of a tree, and oſier-bed, and tuft of buſhes; nay, they will ſometimes take water, and bait the beaſt, like a ſpaniel, by which means he will hardly eſcape. Hunting.

Roe-buck HUNTING is performed divers ways, and very eaſily in the woods.

When chaſed, they uſually run againſt the wind, becauſe the coolneſs of the air refreſhes them in their courſe; therefore the huntſmen place their dogs with the wind: they uſually, when hunted, firſt take a large ring, and afterwards hunt the hounds. They are alſo often taken by counterfeiting their voice, which a ſkilful huntſman knows how to do by means of a leaf in his mouth. When they are hunted, they turn much and often, and come back upon the dogs directly; and when they can no longer endure, they take ſoil, as the hart does, and will hang by a bough in ſuch a manner, that nothing of them ſhall appear above the water but their ſnout, and they will ſuffer the dogs to come juſt upon them before they will ſtir.

The veniſon of a roe-buck is never out of ſeaſon, being never fat, and therefore they are hunted at any time; only that ſome favour ought to be ſhown the doe while ſhe is big with fawn, and afterwards till her fawn is able to ſhift for himſelf; but ſome roe-does have been killed with five fawns in their bellies.

He is not called, by the ſkilful in the art of hunting, a *great* roe-buck, but a *fair roe-buck*; the herd of them is called a *bevy*: and if he hath not bevy-greaſe upon his tail, when he is broken up, he is more fit to be dog's meat than man's meat. The hounds muſt be rewarded with the bowels, the blood, and feet ſlit aſunder, and boiled all together; this is more properly called a *doſe* than a *reward*.

HUNTING-*Match*. The firſt thing that is to be conſidered by one who deſigns to match his horſe for his own advantage, and his horſe's credit, is not to flatter himſelf with the opinion of his horſe, by fancying that he is a ſwift, when he is but a ſlow galloper; and that he is a whole-running-horſe (that is, that he will run four miles without a ſob at the height of his ſpeed) when he is not able to run two or three. Very probably ſome gentlemen are led into this error, by their being miſtaken in the ſpeed of their hounds, who, for want of trying them againſt other dogs that have been really fleet, have ſuppoſed their own to be ſo, when, in reality, they are but of a middling ſpeed: and becauſe their horſe, when trained, was able to follow them all day, and upon any hour, to command them upon deep as well as light earths, have therefore made a falſe concluſion, that their horſe is as ſwift as the beſt; but, upon trial againſt a horſe that has been rightly trained after hounds that were truly fleet, have bought their experience perhaps full dear. Therefore it is adviſable for all lovers of hunting to procure two or three couple of tried hounds, and once or twice a-week to follow after them at rain-ſcent; and when he is able to top them on all ſorts of earth, and to endure heats and colds ſtoutly, then he may better rely on his ſpeed and toughneſs.

That horſe which is able to perform a hare-chaſe of five or ſix miles briſkly and courageouſly, till his body be as it were bathed in ſweat; and then, after the hare has been killed, in a nipping froſty morning, can endure to ſtand till the ſweat be frozen on his back, ſo that he can endure to be pierced with the cold

Hunting. cold as well as the heat; and then, even in that extremity of cold, to ride another chafe as briſkly and with as much courage as he did the former; that horſe which can thus endure heats and colds, is moſt valued by ſportſmen. Therefore, in order to make a judgment of the goodneſs of a horſe, obſerve him after the death of the firſt hare, if the chace has been any thing briſk: if, when he is cold, he ſhrinks up his body, and draws his legs up together, it is an infallible ſign of want of vigour and courage: the like may be done by the ſlackening of his girths after the firſt chace, and from the dulneſs of his teeth, and the dulneſs of his countenance, all which are true tokens of faintneſs and being tired; and ſuch a horſe is not to be relied on, in caſe of a wager.

Here it will not be improper to take notice of the way of making matches in former times, and the modern way of deciding wagers. The old way of trial was, by running ſo many train-ſcents after hounds, as was agreed upon between the parties concerned, and a bell-courſe, this being found not ſo uncertain, but more durable than hare-hunting; and the advantage conſiſted in having the trains led on earth moſt ſuitable to the qualifications of the horſes. But now others cauſe to hunt the hare till ſuch an hour, and then to run this wild-gooſe chace; a method of racing that takes its name from the manner of the flight of wild-geeſe, which is generally one after another; ſo the two horſes, after running of twelveſcore yards, had liberty, which horſe ſoever could get the leading, to ride what ground he pleaſed, the hindmoſt horſe being bound to follow him, within a certain diſtance agreed on by articles, or elſe to be whipped up by the triers or judges which rode by; and whichever horſe could diſtance the other, won the match.

But this chace, in itſelf very inhuman, was ſoon found to be a very deſtructive to good horſes, eſpecially when two good horſes were matched; for neither being able to diſtance the other, till both were ready to ſink under their riders through weakneſs, oftentimes the match was fain to be drawn and left undecided, though both the horſes were quite ſpoiled.

This brought up the cuſtom of train-ſcents, which afterwards was changed to three heats and a ſtraight courſe; and that the lovers of horſes might be encouraged to keep good ones, plates have been erected in many places in England. The fewer of theſe before you come to the courſe, if your horſe be fiery and mettled, the better; and the ſhorter the diſtance, the better. Alſo, above all things, be ſure to make your bargain to have the leading of the firſt train; and then make choice of ſuch grounds where your horſe may beſt ſhow his ſpeed, and the fleeteſt dogs you can procure: give your hounds as much law before you as your triers will allow, and then, making a looſe, try to win the match with a wind; but if you fail in this attempt, then bear your horſe, and ſave him for the courſe; but if your horſe be ſlow, but well-winded, and a true ſpurred nag, then the more train-ſcents you run before you come to the ſtraight courſe, the better. But here you ought to obſerve to gain the leading of the firſt train; which in this caſe you muſt lead upon ſuch deep earths, that it may not end near any light ground: for this is the rule received among horſemen, that the next train is to begin where the laſt ends, and the laſt train is to be ended at the ſtarting place of the courſe; therefore remember to end your laſt on deep earths, as well as the firſt.

HUNTINGDON, the county-town of Huntingdonſhire in England, ſeated upon an eaſy aſcent, on the north ſide of the river Ouſe. It was made a free borough by king John, conſiſting of a mayor, 12 aldermen, burgeſſes, &c. by whom the two members of parliament are choſen. It had anciently 15 pariſhes, and has now but two; in one of which, called *St John's*, Oliver Cromwell was born, in 1599. Here was formerly a caſtle, built by William the Conqueror, which afterwards belonged to David, a prince of Scotland, with the title of *earl;* but Henry VIII. gave it to George Haſtings, with the earldom annexed, in whoſe family it ſtill continues. It ſtands in the great north road; and has a bridge built of free-ſtone over the Ouſe, which is made navigable for ſmall veſſels as high as Bedford. It is the place where the aſſizes are kept, and where the county-jail ſtands. It has a good market-place, and ſeveral convenient inns, beſides a grammar-ſchool; and is very populous. W. Long. 0. 15. N. Lat. 52. 23.

HUNTINGDONSHIRE, a county of England, bounded on the ſouth by Bedfordſhire; on the weſt by Northamptonſhire, as alſo on the north; and by Cambridgeſhire on the eaſt. It is a good corn country; and abounds in paſtures, eſpecially on the eaſtern ſide, which is fenny. The reſt is diverſified by riſing hills and ſhady groves, and the river Ouſe waters the ſouthern part.

The air of this county is in moſt parts pleaſant and wholeſome, except among the fens and meres, though they are not ſo bad as the hundreds of Kent and Eſſex. The ſoil is fruitful, and produces great crops of corn, and the hilly parts afford a fit paſture for ſheep. They have great numbers of cattle; and plenty of water-fowl, fiſh, and turf for firing; which laſt is of great ſervice to the inhabitants, there being but little wood, though the whole county was a foreſt in the time of Henry II. The only river beſides the Ouſe is the Nen, which runs through Whittleſey Mere.

HU-QUANG, a province of the kingdom of China, in Aſia, which has a great river called *Yang*, and *Tſe-chiang*, which runs croſs it from eaſt to weſt. It is divided into the north and ſouth parts, the former of which contains eight cities of the firſt rank, and 60 of the ſecond and third; and the latter, ſeven of the firſt rank, and five of the ſecond and third. It is a flat, open country, watered every-where with brooks, lakes, and rivers, in which there are great numbers of fiſh. Here are plenty of wild-fowls; the fields nouriſh cattle without number, and the ſoil produces corn, and various kinds of fruits. There is gold found in the ſands of the rivers; and in the mines they have iron, tin, &c. In ſhort, there is ſuch a variety of all ſorts of commodities, that it is called *the magazine of the empire*.

HURA, the SAND-BOX-TREE; a genus of the monadelphia order, belonging to the monœcia claſs of plants. There is but one ſpecies, viz. the crepitans, a native of the Weſt-Indies. It riſes with a ſoft ligneous ſtem to the height of 24 feet, dividing into many branches, which abound with a milky juice, and have ſcars on their bark where the leaves have fallen

Hurdles ‖ Hurricane.

fallen off. The male-flowers come out from between the leaves upon foot-ſtalks three inches long; and are formed into a cloſe ſpike or column, lying over each other like the ſcales of fiſh. The female-flowers are ſituated at a diſtance from them; and have a long funnel-ſhaped tube ſpreading at the top, where it is cut into 12 reflexed parts. After the flower, the germen ſwells, and becomes a round compreſſed ligneous capſule, having 12 deep furrows, each being a diſtinct cell, containing one large round compreſſed ſeed. When the pods are ripe, they burſt with violence, and throw out their ſeeds to a conſiderable diſtance. It is propagated by ſeeds, raiſed on a hot-bed; and the plants muſt be conſtantly kept in a ſtove. The kernels are ſaid to be purgative, and ſometimes emetic.

HURDLES, in fortification, are made of twigs of willows or oſiers interwoven cloſe together, ſuſtained by long ſtakes. They are made in the figure of a long ſquare, the length being five or ſix feet, and the breadth three and an half. The cloſer they are wattled together, the better. They ſerve to render the batteries firm, or to conſolidate the paſſage over muddy ditches; or to cover traverſes and lodgements for the defence of the workmen againſt fire-works or ſtones thrown againſt them.

The Romans had a kind of military execution for mutineers, called *putting to death under the hurdle*. The manner of it was this: The criminal was laid at his length in a ſhallow water, under an hurdle, upon which was heaped ſtones, and ſo preſſed down till he was drowned.

HURDLES, in huſbandry, certain frames made either of ſplit timber, or of hazle-rods wattled together, to ſerve for gates in incloſures, or to make ſheep-folds, &c.

HURDS, or HORDS, of flax or hemp; the coarſer parts ſeparated in the dreſſings from the tear, or fine ſtuff. See FLAX.

HURL-BONE, in a horſe, a bone near the middle of the buttock, very apt to go out of its ſockets with a hurt or ſtrain.

HURON, a vaſt lake of North-America, ſituated between 84° and 89° W. Long. and between 43° and 46° of N. Lat. from whence the country contiguous to it is called *the country of the Hurons*, whoſe language is ſpoken over a great extent in the ſouthern parts of America.

HURRICANE, a general name for any violent ſtorm of wind; but which is commonly applied to thoſe ſtorms which happen in the warmer climates, and which greatly exceed the moſt violent ſtorms known in this country. The following deſcription of them is given in the *Account of the European ſettlements in America*: "It is in the rainy ſeaſon, principally in the month of Auguſt, more rarely in July and September, that they are aſſaulted by *hurricanes*, the moſt terrible calamity to which they are ſubject from the climate. This deſtroys, at one ſtroke, the labour of many years, and fruſtrates the moſt exalted hopes of the planter; and often juſt at the moment when he thinks himſelf out of the reach of fortune. It is a ſudden and violent ſtorm of wind, rain, thunder, and lightning; attended with a furious ſwelling of the ſea, and ſometimes with an earthquake; in ſhort, with every circumſtance which the elements can aſſemble that is terrible and deſtructive. Hurricane ‖ Huſband.

"Firſt, they ſee, as a prelude to the enſuing havock, whole fields of ſugar-canes whirled into the air, and ſcattered over the face of the country. The ſtrongeſt trees of the foreſt are torn up by the roots, and driven about like ſtubble. Their wind-mills are ſwept away in a moment. Their works, their fixtures, the ponderous copper-boilers and ſtills, of ſeveral hundred weight, are wrenched from the ground, and battered to pieces. Their houſes are no protection: the roofs are torn off at one blaſt, whilſt the rain, which in an hour riſes five feet, ruſhes in upon them with an irreſiſtible violence.

"There are ſigns, which the Indians of theſe iſlands taught our planters, by which they can prognoſticate the approach of a hurricane. It comes on either in the quarters, or at the full or change of the moon. If it will come on at the full moon, you being at the change, obſerve theſe ſigns. That day you will ſee the ſky very turbulent. You will obſerve the ſun more red than at other times. You will perceive a dead calm, and the hills clear of all thoſe clouds and miſts which uſually hover about them. In the clefts of the earth, and in the wells, you will hear a hollow rumbling ſound, like the ruſhing of a great wind. At night the ſtars ſeem much larger than uſual, and ſurrounded with a ſort of burs. The north-weſt ſky has a black and menacing look; and the ſea emits a ſtrong ſmell, and riſes into vaſt waves, often without any wind. The wind itſelf now forſakes its uſual ſteady eaſterly ſtream, and ſhifts about to the weſt; from whence it ſometimes blows, with intermiſſions, violently and irregularly, for about two hours at a time. You have the ſame ſigns at the full of the moon. The moon itſelf is ſurrounded with a great bur, and ſometimes the ſun has the ſame appearance."

Hurricanes produce a moſt dangerous agitation in the ſea, where the waves break and daſh againſt each other with aſtoniſhing fury. During their continuance, the veſſels which were anchored in the roads frequently cut their cables and put to ſea, where they drive at the mercy of the winds and waves, after having ſtruck their yards and top-maſts. Theſe deſtructive phænomena are now thought to ariſe from electricity, though the manner in which it acts in this caſe is by no means known. It ſeems probable, indeed, that not only hurricanes, but even the moſt gentle gales of wind, are produced by the action of the electric fluid; for which ſee the articles WIND, WHIRLWIND, &c.

HURST, HYRST, or HERST, are derived from the Saxon *hyrſt*, i. e. *a wood*, or *grove of trees*. There are many places in Kent, Suſſex, and Hampſhire, which begin and end with this ſyllable; and the reaſon may be, becauſe the great wood called *Andrefwald* extended through thoſe countries.

HURST-*Caſtle*, a fortreſs of Hampſhire in England, not far from Limington. It is ſeated on the extreme point of a neck of land which ſhoots into the ſea, towards the iſle of Wight, from which it is diſtant two miles.

HUSBAND, a man joined or contracted with a woman in marriage. See MARRIAGE.

Husbandry || Huſſites.

HUSBANDRY, the buſineſs or employment of a farmer, or perſon who cultivates land. See AGRICULTURE.

HUSK, the ſame with what botaniſts call the *calix* or *cup* of a flower. See CALIX.

HUSO, in ichthyology. See ACCIPENSER.

HUSS (John), a celebrated divine and martyr, born at Huſſenitz in Bohemia, in 1376. He was liberally educated in the univerſity of Prague, and in 1400 was made miniſter of the church of Bethlehem in that city. He adopted the opinions of Wickliffe, and preached with great zeal againſt the errors of the church of Rome; for which he was ſentenced to the ſtake by the council of Conſtance, in 1415. He was burned with much formality, after having been degraded; and his aſhes were thrown into the Rhine. His writings, which are numerous and learned, were collected into a body, on the invention of PRINTING.

HUSSARS, are the national cavalry of Hungary and Croatia. Their regimentals conſiſt in a rough furred cap, adorned with a cock's feather, (the officers either an eagle's, or a heron's;) a doublet, with a pair of breeches to which the ſtockings are faſtened, and yellow or red boots: beſides, they occaſionally wear a ſhort upper waiſtcoat edged with furs, and five rows of round metal-buttons; and in bad weather, a cloak. Their arms are a ſabre, carbine, and piſtols. They are irregular troops: hence, before beginning an attack, they lay themſelves ſo flat on the necks of their horſes, that it is hardly poſſible to diſcern their force; but, being come within piſtol-ſhot of the enemy, they raiſe themſelves with ſuch ſurpriſing quickneſs, and begin the fight with ſuch vivacity on every ſide, that, unleſs the enemy is accuſtomed to their method of engaging, it is very difficult for troops to preſerve their order. When a retreat is neceſſary, their horſes have ſo much fire, and are ſo indefatigable, their equipage ſo light, and themſelves ſuch excellent horſemen, that no other cavalry can pretend to follow them. They leap over ditches, and ſwim over rivers, with ſurpriſing facility. They never encamp, and conſequently are not burthened with any camp-equipage, ſaving a kettle and a hatchet to every ſix men. They always lie in the woods, out-houſes, or villages, in the front of the army. The emperor, queen of Hungary, and king of Pruſſia, have the greateſt number of troops under this name in their ſervice.

HUSSITES, the followers of John Huſs, who was burnt for hereſy. See HUSS.

It is evident in what the pretended hereſy of John Huſs and Jerome of Prague conſiſted, from the anſwer they made to the council, when they were admoniſhed to conform to the ſentiments of the church. "They were lovers (they ſaid) of the holy goſpel, and ſincere diſciples of Jeſus Chriſt: that the church of Rome, and all other churches in the world, were widely departed from the apoſtolical tradition; that the clergy ran after riches and pleaſures, lorded it over the people, affected the higheſt ſeats at entertainments, bred horſes and dogs; and the revenues of the church, which belonged to the poor members of Chriſt, were conſumed in vanity and wantonneſs: and that the prieſts were ignorant of the commands of God, or, if they did know them, paid but little regard to them."

Undiſmayed by the fate of their leader, the Huſſites not only ſtuck to his doctrines, but, chooſing John Ziſca for their chief in Bohemia, they maintained a war for a long time againſt the emperor Sigiſmund with great ſucceſs; and Procopius Holy, another of their leaders, conducted them with equal courage. The Huſſites ſpread over all Bohemia and Hungary, and even Sileſia and Poland; and there are ſome remains of them ſtill ſubſiſting in all theſe parts. The followers of Huſs were alſo called *Calixtins*, *Taborites*, and *Bohemian Brethren*. Huſſites || Hutchinſ

HUSTINGS (from the Saxon word *Huſtinge*, i. e. *conciliam*, or *curia*), a court held in Guild-hall before the lord-mayor and aldermen of London, and reckoned the ſupreme court of the city. Here deeds may be inrolled, outlawries ſued out, and replevins and writs of error determined. In this court alſo is the election of aldermen, of the four members of parliament for the city, &c. This court is very ancient, as appears by the laws of Edward the Confeſſor. Some other cities have likewiſe had a court bearing the ſame name, as Wincheſter, York, &c.

HUSUM, a town of Denmark, in the duchy of Sleſwick, and capital of a bailiwick of the ſame name, with a ſtrong citadel, and a very handſome church. It is ſeated near the river Ow, on the German Sea; and is ſubject to the dukes of Holſtein-Gottorp. E. Long. 9. 5. N. Lat. 54. 55.

HUTCHESON (Dr Francis), a very elegant writer and excellent philoſopher, was the ſon of a diſſenting miniſter in the north of Ireland, and was born on the 8th of Auguſt 1694. He early diſcovered a ſuperior capacity; and having gone through a ſchool-education, began his courſe of philoſophy at an academy, whence he removed to the univerſity of Glaſgow, where he applied himſelf to all the parts of literature, in which his progreſs was ſuitable to his uncommon abilities.

He then returned to Ireland; and entering into the miniſtry, was juſt about to be ſettled in a ſmall congregation of diſſenters in the north of Ireland, when ſome gentlemen about Dublin, who knew his great abilities and virtues, invited him to take up a private academy there. He complied with the invitation, and met with much ſucceſs. He had been fixed but a ſhort time in Dublin, when his ſingular merits and accompliſhments made him generally known; and his acquaintance was ſought by men of all ranks, who had any taſte for literature, or any regard for learned men. The late lord viſcount Moleſworth is ſaid to have taken great pleaſure in his converſation, and to have aſſiſted him with his criticiſms and obſervations upon his "Inquiry into the ideas of beauty and virtue," before it came abroad. He received the ſame favour from Dr Synge, lord biſhop of Elphin, with whom he alſo lived in great friendſhip. The firſt edition of this performance came abroad without the author's name, but the merit of it would not ſuffer him to be long concealed. Such was the reputation of the work, and the ideas it had raiſed of the author, that lord Granville, who was then lord lieutenant of Ireland, ſent his private ſecretary to inquire at the bookſeller's for the author; and when he could not learn his name, he left a letter to be conveyed to him: in conſequence of which he ſoon became acquainted with his

Hutcheson, Hutchinson

his excellency, and was treated by him, all the time he continued in his government, with diſtinguiſhing marks of familiarity and eſteem.

From this time his acquaintance began to be ſtill more courted by men of diſtinction either for ſtation or literature in Ireland. Archbiſhop King, the author of the celebrated book *De origine mali*, held him in great eſteem; and the friendſhip of that prelate was of great uſe to him in ſcreening him from two ſeveral attempts made to proſecute him, for daring to take upon him the education of youth, without having qualified himſelf by ſubſcribing the eccleſiaſtical canons, and obtaining a licence from the biſhop. He had alſo a large ſhare in the eſteem of the primate Bolter, who through his influence made a donation to the univerſity of Glaſgow of a yearly fund for an exhibitioner to be bred to any of the learned profeſſions. A few years after his "Inquiry into the ideas of Beauty and Virtue," his "Treatiſe on the Paſſions" was publiſhed: both theſe works have been often reprinted; and always admired, both for the ſentiment and language, even by thoſe who have not aſſented to the philoſophy of them, nor allowed it to have any foundation in nature. About this time he wrote ſome philoſophical papers, accounting for laughter, in a different way from Hobbes, and more honourable to human nature: which papers were publiſhed in the collection called *Hibernicus's Letters*.

After he had taught in a private academy at Dublin for ſeven or eight years with great reputation and ſucceſs, he was called, in the year 1729, to Scotland, to be a profeſſor of philoſophy in the univerſity of Glaſgow. Several young gentlemen came along with him from the academy, and his high reputation drew many more thither both from England and Ireland. Here he ſpent the remainder of his life in a manner highly honourable to himſelf, and ornamental to the univerſity of which he was a member. His whole time was divided between his ſtudies and the duties of his office; except what he allotted to friendſhip and ſociety. A firm conſtitution and a pretty uniform ſtate of good health, except ſome few ſlight attacks of the gout, ſeemed to promiſe a longer life; yet he did not exceed the 53d year of his age. He was married, ſoon after his ſettlement in Dublin, to Mrs Mary Wilſon a gentleman's daughter in the county of Langford; by whom he left behind him one ſon, Francis Hutcheſon, doctor of medicine. By this gentleman was publiſhed, from the original manuſcript of his father, "A Syſtem of Moral Philoſophy, in three books, by Francis Hutcheſon, LL. D. at Glaſgow, 1755," in two volumes, 4to.

HUTCHINSON (John), a philoſophical writer, whoſe notions have made no inconſiderable noiſe in the world, was born in 1674. He ſerved the duke of Somerſet in the capacity of ſteward; and in the courſe of his travels from place to place employed himſelf in collecting foſſils: we are told, that the large and noble collection bequeathed by Dr Woodward to the univerſity of Cambridge, was actually made by him, and even unfairly obtained from him. When he left the duke's ſervice to indulge his ſtudies with more freedom, the duke, then maſter of the horſe to George I. made him his riding ſurveyor, a kind of ſinecure place of 200 l. a-year with a good houſe in the Meuſe. In 1724 he publiſhed the firſt part of *Moſes's Principia*, in which he ridiculed Dr Woodward's Natural Hiſtory of the Earth, and exploded the doctrine of gravitation eſtabliſhed in Newton's Principia: in 1727, he publiſhed the ſecond part of *Moſes's Principia*, containing the principles of the Scripture philoſophy. From this time to his death, he publiſhed a volume every year or two, which, with the MSS. he left behind, were publiſhed in 1748, in 12 vols. 8vo. On the Monday before his death, Dr Mead urged him to be bled; ſaying pleaſantly, "I will ſoon fend you to *Moſes*," meaning to his ſtudies: but Mr Hutchinſon taking it in the literal ſenſe, anſwered in a muttering tone, "I believe, doctor, you will;" and was ſo diſpleaſed, that he diſmiſſed him for another phyſician; but died a few days after, Auguſt 28th 1737. Singular as his notions are, they are not without ſome defenders, who have obtained the appellation of *Hutchinſonians*.

Huy ‖ Hyacinth.

HUY, a town of the Netherlands in the biſhopric of Liege, and capital of Condroſs. It is advantageouſly ſeated on the river Maeſe, over which there is a bridge. E. Long. 10. 22. N. Lat. 52. 31.

HUYGENS (Chriſtian), one of the greateſt mathematicians and aſtronomers of the 17th century, was the ſon of Conſtantine Huygens, lord of Zuylichem, who had ſerved three ſucceſſive princes of Orange in the quality of ſecretary; and was born at the Hague, in 1629. He diſcovered from his infancy an extraordinary fondneſs for the mathematics; in a little time made a great progreſs in them; and perfected himſelf in thoſe ſtudies under the famous profeſſor Schooten, at Leyden. In 1649, he went to Holſtein and Denmark, in the retinue of Henry count of Naſſau; and was extremely deſirous of going to Sweden, in order to ſee Des Cartes, but the count's ſhort ſtay in Denmark would not permit him. He travelled into France and England; was, in 1663, made a member of the Royal Society; and, upon his return into France, M. Colbert, being informed of his merit, ſettled a conſiderable penſion upon him to engage him to fix at Paris; to which Mr Huygens conſented, and ſtaid there from the year 1666 to 1681, where he was admitted a member of the Academy of Sciences. He loved a quiet and ſtudious manner of life, and frequently retired into the country to avoid interruption, but did not contract that moroſeneſs which is ſo frequently the effect of ſolitude and retirement. He was the firſt who diſcovered Saturn's ring, and a third ſatellite belonging to that planet, which had hitherto eſcaped the eyes of aſtronomers. He diſcovered the means of rendering clocks exact, by applying the pendulum, and rendering all its vibrations equal by the cycloid. He brought teleſcopes to perfection, made many other uſeful diſcoveries, and died at the Hague in 1695. He was the author of ſeveral excellent works. The principal of theſe are contained in two collections; the firſt of which was printed at Leyden in 1682, in quarto, under the title of *Opera varia*; and the ſecond at Amſterdam in 1728, in two volumes quarto, intitled *Opera reliqua*.

HYACINTH, in natural hiſtory, a genus of pellucid gems, whoſe colour is red with an admixture of yellow.

The hyacinth, though leſs ſtriking to the eye than

Hyacinth. Hyacinthus

any other red gems, is not without its beauty in the fineſt ſpecimens. It is found of various ſizes, from that of a pin's head to the third of an inch in diameter. Like common cryſtal, it is ſometimes found columnar, and ſometimes in a peeble-form; and is always hardeſt and brighteſt in the larger maſſes.

Its colour is a dull or deadiſh red, with an admixture of yellow in it; and this mixed colour is found in all the variety of tints that a prevalence of the red or of the yellow in different degrees is capable of giving it.

Our jewellers allow all thoſe gems to be hyacinths or jacinths, that are of a due hardneſs with this mixed colour; and as they are of very different beauty and value in their ſeveral degrees and mixture of colours, they divide them into four kinds; three of which they call *hyacinths*, but the fourth, very improperly, a *ruby*. 1. When the ſtone is in its moſt perfect ſtate, and of a pure and bright flame-colour, neither the red nor the yellow prevailing, in this ſtate they call it *hyacintha la belle*. 2. When it has an over-proportion of the red, and that of a duſkier colour than the fine high red in the former; and the yellow that appears in a faint degree in it is not a fine, bright, and clear, but a duſky browniſh yellow; then they call it the *ſaffron hyacinth*. 3. Such ſtones as are of a dead whitiſh yellow, with a very ſmall proportion of red in them, they call *amber-hyacinths*. And, 4. When the ſtone is of a fine deep red, blended with a duſky and very deep yellow, they call it a *rubacelle*. But though the over-proportion of a ſtrong red in this gem has made people refer it to the claſs of rubies, its evident mixture of yellow ſhews that it truly belongs to the hyacintha.

The hyacinth la belle is found both in the Eaſt and Weſt Indies. The oriental are the harder, but the American are often equal to them in colour. The rubacelle is found only in the Eaſt Indies, and is generally brought over among the rubies; but it is of little value: the other varieties are found in Sileſia and Bohemia.

HYACINTHUS, HYACINTH; a genus of the monogynia order, belonging to the hexandria claſs of plants. There are ſix ſpecies; of which the moſt remarkable is the orientalis, or eaſtern hyacinth. Of this there are a great number of varieties, amounting to ſome hundreds, each of which differs from the reſt in ſome reſpect or other. This plant hath a large, purpliſh, bulbous root, ſending up ſeveral narrow erect leaves eight or ten inches long; the flower-ſtalk is upright, robuſt, and ſucculent, from 10 to 15 inches in height; adorned upward with many large funnel or bell-ſhaped flowers, ſwelling at the baſe, and cut half way into ſix parts; collected into a large pyramidal ſpike of different colours in the varieties; flowering in April or May.

Theſe plants are cultivated with the greateſt ſucceſs in Holland, from whence great numbers are annually imported into Britain. Each variety is by the floriſts diſtinguiſhed either by the name of the place where firſt raiſed, or the perſon who raiſed them, or the names of illuſtrious perſonages, as of kings, generals, poets, and celebrated ancient hiſtorians, gods, goddeſſes, &c. They are ſold by all the ſeed-dealers. The prices are from three pence per root to five or ten pounds or more; and ſome varieties are in ſuch high eſteem among the floriſts, that 20 or 30 *l.* will be given for a ſingle bulb. They are hardy, and will proſper any where, though the fine kinds require a little ſhelter during the winter. They may be propagated either by ſeeds or off-ſets from the roots.

The properties of a good oriental hyacinth are, a ſtem perfectly upright, of moderate length, and ſo ſtrong and well-proportioned that it will ſuſtain the weight of the florets without bending: the florets ſhould be large, ſwelling below, expanded above, and numerous, 10 or 15 at leaſt, but are often 20 or 30 in number; and ſhould be placed equally round the ſtem, the pedicles on which they grow longer below than above, diminiſhing gradually in length upward in ſuch a manner as to repreſent a pyramid, and each pedicle ſufficiently ſtrong to ſupport the florets without drooping. The curious in theſe plants are careful never to plant the fine ſorts two years together in the ſame bed of earth; for by planting them every year in a freſh bed, the beauty of the flowers is greatly improved.

HYADES, in aſtronomy, are ſeven ſtars in the bull's head, famous among the poets for the bringing of rain. Whence their name Ὑάδες, from the Greek, ὕειν, "to rain." The principal of them is in the left eye, by the Arabs called *aldebaran*.

The poets feign them the daughters of Atlas and Pleone. Their brother Hyas being torn to pieces by a lioneſs, they wept his death with ſuch vehemence that the gods, in compaſſion to them, tranſlated them into heaven, and placed them in the bull's forehead, where they continue to weep; this conſtellation being ſuppoſed to preſage rain. Others repreſent the Hyades as Bachus's nurſes; and the ſame with the Dodonides, who fearing the reſentment of Juno, and flying from the cruelty of king Lycurgus, were tranſlated by Jupiter into heaven.

HYBERNACULUM, in botany, WINTER-QUARTERS; defined by Linnæus to be part of the plant which defends the embryo herb from injuries during the ſeverities of the winter. See BULBUS and GEMMA.

HYBLA (anc. geog.) or MEGARA, which laſt name it took from the Megareans, who led thither a colony; called alſo *Hybla Parva*, and *Galeotis*. In Strabo's time Megara was extinct, but the name *Hybla* remained on account of its excellent honey named from it. It was ſituated on the eaſt coaſt of Sicily between Syracuſe and the Leontines. *Galeotæ*, and *Megarenſes*: the names of the people, who were of a prophetic ſpirit, being the deſcendants of Galeus the ſon of Apollo. *Hyblæus* the epithet.—The *Hyblæi colles*, ſmall eminences at the ſprings of the Alabus near this place, were famous for their variety of flowers, eſpecially thyme; the honey gathered from which was by the ancients reckoned the beſt in the world, excepting that of Hymettus in Attica. By the moderns it was called *Mel Paſſi*, for the ſame reaſon, namely, on account of its excellent honey, and extraordinary fertility, till it was overwhelmed by the lava of Ætna; and having then become totally barren, its name was changed to *Mal Paſſi*. In a ſecond eruption, by a ſhower of aſhes from the mountain, it ſoon reaſſumed its ancient beauty and fertility; and for many years was called *Bel Paſſi*.

Hybla
Hyde.

Paſſi: and laſt of all, in the year 1669, it was again laid under an ocean of fire, and reduced to the moſt wretched ſterility; ſince which time it is again known by the appellation of *Mal Paſſi*. However, the lava in its courſe over this beautiful country has left ſeveral little iſlands or hillocks, juſt ſufficient to ſhew what it formerly was. Theſe make a ſingular appearance in all the bloom of the moſt luxuriant vegetation, ſurrounded and rendered almoſt inacceſſible by large fields of black and rugged lava.

HYBLA-*Major*, (anc. geog.) was ſituated in the tract lying between mount Ætna and the river Symethus. In Pauſanias's time deſolate.

HYBLA-*Minor*, or *Heræa*, (anc. geog.) an inland town of Sicily, ſituated between the rivers Oanus and Herminius; now RAGUSA.

HYBRIDA PLANTA, a monſtrous production of two different ſpecies of plants, analogous to a mule among animals. The ſeeds of hybrid plants will not propagate.

HYÆNA, in zoology. See CANIS.

HYÆNIUS LAPIS, in natural hiſtory, the name of a ſtone ſaid to be found in the eyes of the Hyæna. Pliny tells us, that thoſe creatures were in old times hunted and deſtroyed for the ſake of theſe ſtones, and that it was ſuppoſed they gave a man the gift of prophecy by being put under his tongue.

HYDATIDES, in medicine, little tranſparent veſicles or bladders full of water, ſometimes found ſolitary, and ſometimes in cluſters upon the liver, and various other parts, eſpecially in hydropical caſes.

HYDATOSCOPIA, called alſo HYDROMANCY, a kind of divination or method of foretelling future events by water.

HYDE (Edward), earl of Clarendon, and lord high chancellor of England, was deſcended from an ancient family in Cheſhire, and born at Dinton near Hindon, in Wiltſhire, in 1608. He was entered of Magdalenhall Oxford, where, in 1625, he took the degree of A. B. and afterward ſtudied the law in the Middle-Temple. In the parliament which begun at Weſtminſter April 10. 1640, he ſerved for Wotton-Baſſet in Wiltſhire. But that parliament being ſoon after diſſolved, he was choſen for Saltaſh in Cornwall in the long parliament. His abilities were much taken notice of, and he was employed in ſeveral committees to examine into divers grievances; but at laſt being diſſatisfied with the proceedings in the parliament, he retired to the king, and was made chancellor of the exchequer, a privy-counſellor, and knight. Upon the declining of the king's cauſe, he went to France, where, after the death of king Charles I. he was ſworn of the privy-council to Charles II. In 1649, he and the lord Cottington were ſent ambaſſadors extraordinary into Spain, and in 1657 he was conſtituted lord high chancellor of England. The year before the reſtoration, the duke of York falling in love with Mrs Anne Hyde, the lord chancellor's eldeſt daughter, reſolved to marry her, which he performed; but carefully concealed it, both from the king and chancellor. Upon the reſtoration, he was choſen chancellor of the univerſity of Oxford; and ſoon after created baron of Hindon, in Wiltſhire, viſcount Cornbury in Oxfordſhire, and earl of Clarendon in Wiltſhire; and, on the death of Henry lord Falkland, was made lord lieutenant of Oxfordſhire. He took care neither to load the king's prerogative, nor encroach upon the liberties of the people; and therefore would not ſet aſide the petition of right, nor endeavour to raiſe the ſtar-chamber or high-commiſſion courts again: nor did he attempt to repeal the bill for triennial parliaments; and when he might have obtained two millions for a ſtanding revenue, he aſked but one million two hundred thouſand pounds *per annum*, which he thought would ſtill put the king upon the neceſſity of having recourſe to his parliament. In this juſt conduct he is ſaid to have been influenced by the following incident, which happened ſome years before. When he firſt began to grow eminent in the law, he went down to viſit his father in Wiltſhire; who, one day as they were walking in the fields together, obſerved to him, that men of his profeſſion were apt to ſtretch the prerogative too far, and to injure liberty; but charged him, if ever he came to any eminence in his profeſſion, never to ſacrifice the laws and liberty of his country to his own intereſt or the will of his prince: he repeated his advice twice; and immediately falling into a fit of an apoplexy, died in a few hours: and this circumſtance had a laſting influence upon him. In 1662, he oppoſed a propoſal for the king's marriage with the infanta of Portugal, and the ſale of Dunkirk: however, the following year, articles of high treaſon were exhibited againſt him by the earl of Briſtol; but they were rejected by the houſe of lords. In 1664, he oppoſed the war with Holland. In Auguſt 1667, he was removed from his poſt of lord chancellor; and in November following impeached of high treaſon and other crimes and miſdemeanors by the houſe of commons: upon which he retired into France, when a bill was paſſed for baniſhing him from the king's dominions. See BRITAIN, n° 211, 217. He reſided at Rouen in Normandy; and dying there in 1674, his body was brought to England and interred in Weſtminſter-abbey. He wrote, 1. A hiſtory of the rebellion, 3 vols folio, and 6 vols octavo; a ſecond part of which was lately bequeathed to the public by his lordſhip's deſcendant the late lord Hyde and Cornbury. 2. A letter to the duke of York, and another to the ducheſs of York, upon occaſion of their embracing the Romiſh religion. 3. An anſwer to Hobbes's Leviathan. 4. A hiſtory of the rebellion and civil wars in Ireland, octavo; and ſome other works.

Hyde.

The reverend Mr Granger, in his Biographical Hiſtory of England, obſerves, that "the virtue of the earl of Clarendon was of too ſtubborn a nature for the age of Charles II. Could he have been content, (ſays he,) to have enſlaved millions, he might have been more a monarch than an unprincely king. But he did not only look upon himſelf as the guardian of the laws and liberties of his country, but had alſo a pride in his nature that was above vice; and choſe rather to be a victim himſelf, than to ſacrifice his integrity. He had only one part to act, which was that of an honeſt man. His enemies allowed themſelves a much greater latitude; they loaded him with calumnies, blamed him even for their own errors and miſconduct, and helped to ruin him by ſuch buffooneries as he deſpiſed. He was a much greater, perhaps a much happier, man, alone and in exile, than Charles the Second upon his throne."

And

Hyde. And the following character of this nobleman is given by Mr Walpole. "Sir Edward Hyde, (fays he), who oppofed an arbitrary court, and embraced the party of an afflicted one, muft be allowed to have acted confcientioufly. A better proof was his behaviour on the reftoration, when the torrent of an infatuated nation intreated the king and his miniſter to be abſolute. Had Clarendon fought nothing but power, his power had never ceafed. A corrupted court and a blinded populace were leſs the cauſes of the chancellor's fall, than an ungrateful king, who could not pardon his lordſhip's having refufed to accept for him the ſlavery of his country. Like Juſtice herſelf, he held the balance between the neceſſary power of the ſupreme magiſtrate, and the intereſts of the people. This never-dying obligation his cotemporaries were taught to overlook and clamour againſt, till they removed the only man who, if he could, would have corrected his maſter's evil government. Almoſt every virtue of a miniſter made his character venerable. As an hiſtorian, he ſeems more exceptionable. His majeſty and eloquence, his power of painting characters, his knowledge of his ſubject, rank him in the firſt claſs of writers; yet he has both great and little faults. Of the latter, his ſtories of ghoſts and omens are not to be defended. His capital fault is his whole work being a laboured juſtification of king Charles. If he relates faults, ſome palliating epithet always ſlides in, and he has the art of breaking his darkeſt ſhades with gleams of light that take off all impreſſion of horror. One may pronounce on my lord Clarendon, in his double capacity of ſtateſman and hiſtorian, that he acted for liberty, but wrote for prerogative."

Hyde (Dr Thomas), profeſſor of Arabic at Oxford, and one of the moſt learned writers of the 17th century, was born in 1636; and ſtudied firſt at Cambridge, and afterwards at Oxford. Before he was 18 years of age, he was ſent from Cambridge to London to aſſiſt Mr Brian Walton in the great work of the Polyglot Bible; and about that period undertook to tranſcribe the Perſian Pentateuch out of the Hebrew characters, which archbiſhop Uſher, who well knew the difficulty of the undertaking, pronounced to be an impoſſible taſk to a native Perſian. After he had happily ſucceeded in this, he aſſiſted in correcting ſeveral parts of Mr Walton's work, for which he was perfectly qualified. He was made archdeacon of Glouceſter, canon of Chriſt-church, head keeper of the Bodleian library, and profeſſor both of Hebrew and Arabic, in the univerſity of Oxford. He was interpreter and ſecretary of the Oriental languages, during the reigns of Charles II. James II. and William III.; and was perfectly qualified to fill this poſt, as he could converſe in the languages which he underſtood. There never was an Engliſhman in his ſituation of life who made ſo great a progreſs; but his mind was ſo engroſſed by his beloved ſtudies, that he is ſaid to have been but ill qualified to appear to any advantage in common converſation. Of all his learned works, (the very catalogue of which, as obſerved by Anth. Wood, is a curioſity), his *Religio Veterum Perſarum* is the moſt celebrated. Dr Gregory Sharpe, the late learned and ingenious maſter of the temple, has collected ſeveral of his pieces formerly printed, and republiſhed them, with ſome additional diſſertations, and his life prefixed, in two elegant volumes quarto. This great man died on the 18th of February, 1702. Among his other works are, 1. A Latin tranſlation of Ulug Beig's obſervations on the longitude and latitude of the fixed ſtars; and, 2. A catalogue of the printed books in the Bodleian library.

Hydnum
Hydrocephalus

HYDNUM, in botany; a genus of fungi, belonging to the cryptogamia claſs of plants. It is of the horizontal kind, echinated or beſet with ſharp-pointed fibres on its under part. One of the ſpecies, named the *imbricatum*, is a native of Britain, and is found in woods. It hath a convex hat, tiled, ſtanding on a ſmooth pillar, of a pale fleſh-colour, with white prickles. It is eaten in Italy, and is faid to be of a very delicate taſte.

HYDRA, in fabulous hiſtory, a ſerpent in the Marſh of Lerna, in Peloponneſus, repreſented by the poets with many heads, one of which being cut off, another immediately ſucceeded in its place, unleſs the wound was inſtantly cauterized. Hercules attacked this monſter; and having cauſed Iolaus to hew down wood for flaming brands, as he cut off the heads he applied the brands to the wounds, by which means he deſtroyed the Hydra.

Hydra, in aſtronomy. See there, n° 206.

HYDRAGOGUES, among phyſicians, remedies which evacuate a large quantity of water in dropſies. The word is formed of ὑδωρ *water*, and ἀγειν to *draw* or *lead*; but the application of the term proceeds upon a miſtaken ſuppoſition, that every purgative had ſome particular humour which it would evacuate, and which could not be evacuated by any other. It is now, however, diſcovered, that all ſtrong purgatives will prove *hydragogues*, if given in large quantity, or in weak conſtitutions. The principal medicines recommended as hydragogues, are the juice of elder, the root of iris, ſoldanella, mechoacan, jalap, &c.

HYDRANGEA, in botany; a genus of the digynia order, belonging to the decandria claſs of plants. There is but one ſpecies, viz. the arborefcens, a native of North America, from whence it hath lately been brought to Europe, and is preferved in gardens, more for the ſake of variety than beauty. It riſes about three feet high; and hath many ſoft pithy ſtalks, garniſhed with two oblong heart-ſhaped leaves placed oppoſite. The flowers are produced at the top of the ſtalks in a corymbus. They are white, compoſed of five petals with ten ſtamina ſurrounding the ſtyle. It is eaſily propagated by parting the roots; the beſt time for which is the end of October. The plants thrive beſt in a moiſt ſoil, and require to be ſheltered from ſevere froſts.

HYDRAULICS, the ſcience of the motion of fluids, and the conſtruction of all kinds of inſtruments and machines relating thereto. See Hydrostatics, chap. iv.

HYDRENTEROCELE, in ſurgery, a ſpecies of hernia, wherein the inteſtines deſcend into the ſcrotum, together with a quantity of water.

HYDROCELE, in ſurgery, denotes any hernia ariſing from water; but is particularly uſed for ſuch a one of the ſcrotum, which ſometimes grows to the ſize of one's head, without pain, but exceeding troubleſome to the patient. See Surgery.

HYDROCEPHALUS, a preternatural diſtenſion of

Hydrocharis — Hydromel.

of the head to an uncommon size by a stagnation and extravasation of the lymph; which, when collected in the inside of the cranium, is then termed *internal*; as that collected on the outside is termed *external*. See (the *Index* subjoined to) MEDICINE.

HYDROCHARIS, the LITTLE WATER-LILY; a genus of the decandria order, belonging to the dicœcia class of plants. There is only one species, a native of Britain, growing in slow streams and wet ditches. It hath kidney-shaped leaves, thick, smooth, and of a brownish green colour, with white blossoms. There is a variety with double flowers of a very sweet smell.

HYDROCOTYLE, WATER-NAVELWORT; a genus of the digynia order, belonging to the pentandria class of plants. There are several species, none of which are ever cultivated in gardens. One of them, a native of Britain, growing in marshy grounds, is supposed by the farmers to occasion the rot in sheep. The leaves have central leaf-stalks, with about five flowers in a rundle; the petals are of a reddish white.

HYDROGRAPHY, the art of measuring and describing the sea, rivers, canals, lakes, &c.—With regard to the sea, it gives an account of its tides, counter-tides, soundings, bays, gulphs, creeks, &c.; as also of the rocks, shelves, sands, shallows, promontories, harbours; the distance and bearing of one port from another; with every thing that is remarkable, whether out at sea or on the coast.

HYDROMANCY, a method of divination by water, practised by the ancients. See DIVINATION, n° 7.

HYDROMEL, honey diluted in nearly an equal weight of water. When this liquor has not fermented, it is called *simple hydromel*; and when it has undergone the spirituous fermentation, it is called the *vinous hydromel*, or *mead*.

Honey, like all saccharine substances, vegetable or animal, is susceptible of fermentation in general, and particularly of the spirituous fermentation. To induce this fermentation, nothing is necessary but to dilute it sufficiently in water, and to leave this liquor exposed to a convenient degree of heat. To make good vinous hydromel or mead, the whitest, purest, and best-tasted honey must be chosen; and this must be put into a kettle with more than its weight of water: a part of this liquor must be evaporated by boiling, and the liquor scummed, till its consistence is such that a fresh egg shall be supported upon its surface without sinking more than half its thickness into the liquor; then the liquor is to be strained and poured through a sinnel into a barrel: this barrel, which ought to be nearly full, must be exposed to a heat as equable as is possible, from 20 to 27 or 28 degrees of Mr Reaumur's thermometer, taking care that the bung-hole be slightly covered, but not closed. The phenomena of the spirituous fermentation will appear in this liquor, and will subsist during two or three months, according to the degree of heat; after which they will diminish and cease. During this fermentation, the barrel must be filled up occasionally with more of the same kind of liquor of honey, some of which ought to be kept apart on purpose to replace the liquor which flows out of the barrel in froth. When the fermentation ceases, and the liquor has become very vinous, the barrel is then to be put in a cellar and well closed. A year afterwards the mead will be fit to be put into bottles.

Hydrometer
Hydroscope

The vinous hydromel or mead is an agreeable kind of wine: nevertheless it retains long a taste of honey, which is unpleasing to some persons; but this taste it is said to lose entirely by being kept a very long time.

The spirituous fermentation of honey, as also that of sugar, and of the most of vinous liquors, when it is very saccharine, is generally more difficultly effected, requires more heat, and continues longer than that of ordinary wines made from the juice of grapes; and these vinous liquors always preserve a saccharine taste, which shews that a part only of them is become spirituous.

HYDROMETER, an instrument to measure the gravity, density, velocity, force, &c. of water and other fluids. See HYDROSTATICS, n° 13.

HYDROMPHALUS, in medicine and surgery, a tumour in the navel, arising from a collection of water.

HYDROPHANÆ, in natural history: A genus of semi-pellucid gems, composed of crystal and earth; the latter ingredient being in large proportion, and mixed imperfectly, as in the chalcedony; and giving a general cloudiness or mistiness to the stone; but of such an imperfect and irregular admixture, as not to be capable of a polish like the chalcedony; and appearing of a dusky and foul surface till thrown into water, in which they become lucid and in some degree transparent, either in part or totally; also changing their colour, which returns to them on their being taken out of the water. To this genus belongs the oculus beli of authors, or whitish grey hydrophanes variegated with yellow, and with a black central nucleus; and the oculus mundi, or lapis mutabilis, which is likewise a whitish grey kind without veins.

HYDROPHOBIA, an aversion or dread of water: a terrible symptom of the *rabies canina*; and which has likewise been found to take in violent inflammations of the stomach and in hysteric fits. See (the *Index* subjoined to) MEDICINE.

HYDROPHYLACIA, a word used by Kircher and some others who have written in the same system, to express those great reservoirs of water which lie places in the Alps and other mountains for the supply of rivers which run through the several lower countries. This he makes to be one of the great uses of mountains in the œconomy of the universe.

HYDROPHYLLUM, WATER-LEAF; a genus of the monogynia order, belonging to the pentandria class of plants. There is only one species, viz. the Virginianum, or water-leaf of Morinus. It grows naturally in Canada and many other parts of America on moist spongy ground. The root is composed of many strong fleshy fibres, from which arise many leaves with footstalks five or six inches long, jagged into three, five, or seven lobes, almost to the midrib, indented on their edges. The flowers are produced in loose clusters hanging downward, are bell-shaped, and of a dirty white colour. It may be propagated by parting the roots; which ought to be done in autumn, that the plants may be well rooted before spring, otherwise they will require a great deal of water.

HYDROPS, in medicine, the same with DROPSY.

HYDROSCOPE, an instrument anciently used for the measuring of time.

The hydroscope was a kind of water-clock, consisting

Hydrostatics. ing of a cylindrical tube, conical at bottom: the cylinder was graduated, or marked out with divisions, to which the top of the water becoming successively contiguous, as it trickled out at the vertex of the cone, pointed out the hour. See HYDROSTATICS, n° 41, 42. Hydrostatics.

HYDROSTATICS;

A SCIENCE which treats of the weight, motion, and equilibria of liquid bodies. Under this head, not only accounts of the nature and properties of fluids in general are introduced, and the laws by which they act; but also the art of weighing solid bodies in fluids, in order to discover their specific gravities.

SECT. I. *Of* FLUIDS *in general.*

1 Fluid defined, &c. SIR Isaac Newton's definition of a fluid is, That it is a body yielding to any force impressed, and which hath its parts very easily moved one among another. See FLUIDITY.

This definition supposes the motion spoken of produced by a partial pressure; for in the case of an incompressible fluid, it is demonstrated by Dr Keil, that under a total or an equal pressure, it would be impossible that the yielding body should move.

The original and constituent parts of fluids are by the moderns conceived to be particles small, smooth, hard, and spherical: according to which opinion, every particle is of itself a solid, or a fixed body; and, when considered singly, is no fluid, but becomes so only by being joined with other particles of the same kind. From this definition, it hath been concluded by some philosophers, that some substances, such as mercury, are essentially fluid, on account of the particular configuration of their particles; but later discoveries have evinced the fallacy of this opinion, and that fluidity is truly to be reckoned an effect of heat. See FLUIDITY.

That fluids have vacuities, will appear upon mixing salt with water, a certain quantity whereof will be dissolved, and thereby imbibed, without enlarging the dimensions. A fluid's becoming more buoyant, is a certain proof that its specific gravity is increased, and of consequence that many of its vacuities are thereby filled: after which it may still receive a certain quantity of other dissoluble bodies, the particles whereof are adapted to the vacancies remaining, without adding any thing to its bulk, though the absolute weight of the whole fluid be thereby increased.

This might be demonstrated, by weighing a phial of rain-water critically, with a nice balance: pour this water into a cup, and add salt to it; refund of the clear liquor what will again fill the phial; an increase of weight will be found under the same dimensions, from a repletion, as has been said, of the vacuities of the fresh water with saline particles.

And as fluids have vacuities, or are not perfectly dense; it is also probable, that they are compounded of small spheres of different diameters, whose interstices may be successively filled with apt materials for that purpose: and the smaller these interstices are, the greater will the gravity of the fluid always be.

For instance, suppose a barrel be filled with bullets in the most compact manner, a great many small-shot may afterwards be placed in the interstices of those balls; the vacuities of the shot may then be replenished with a certain quantity of sea-sand; the interstices of the grains of the sand may again be filled with water; and thus may the weight of the barrel be greatly augmented, without increasing the general bulk.— Now this being true with regard to solids, is applicable also to fluids. For instance, river-water will dissolve a certain quantity of salt; after which it will receive a certain quantity of sugar; and after that, a certain quantity of alum, and perhaps other dissoluble bodies, and not increase its first dimensions. 2 Its natural and properties.

The more perfect a fluid is, the more easily will it yield to all impressions, and the more easily will the parts unite and coalesce when separated. A perfect fluid is that whose parts are put into motion by the *least* force imaginable: an imperfect one is that whose parts yield to a *small* force, not the *least*. It is probable, that in nature there is no perfect fluid, the element of fire perhaps excepted; since we see that the mutual attraction of the parts of all the fluids, subject to our experiments, renders them cohesive in some degree; and the more they cling together, the less perfect their fluidity is. If, for instance, a glass be filled with water above the brim, it will visibly rise to a convex surface, which, was it a perfect fluid, free from either tenacity or cohesion, would be impossible.

Mercury, the most perfect fluid we know, is not exempt from this attraction; for, should the bottom of a flat glass, having a gentle rising toward the middle, be covered thin with quicksilver, a little motion of the machine will cause the fluid soon to separate from the middle, and lie round it like a ring, having edges of a considerable thickness.

But if a like quantity thereof be poured into a golden cup, it will, on the contrary, appear higher considerably on the sides than in the middle. Which may proceed in part, perhaps, from the gold's being of great density, and therefore capable of exerting thereon a greater degree of attraction than other metals. Probably too it may happen from its having pores of an apter disposition and magnitude to receive the minute mercurial particles, than those of iron and some other metals; and therefore the attraction of cohesion in this experiment may obtain also: and every one knows how easily these two bodies incorporate, and make a perfect *amalgama*. But the reason commonly given for the two phænomena is, that mercury, in the first case, attracts itself more than it does glass; and, in the last case, mercury attracts gold more than it does itself.

Sir Isaac Newton held all matter to be originally homogeneous; and that from the different modifications and texture of it alone, all bodies receive their various structure, composition, and form. In his definition of a fluid, he seems to imply, that he thought fluids to be composed of primary solids; and, in the beginning of his *Principia*, he speaks of sand and powders as of imperfect fluids.

Borelli

2 Preſſure of fluids.

Borrelli has demonſtrated, that the conſtituent parts of fluids are not fluid, but conſiſtent bodies; and that the elements of all bodies are perfectly firm and hard.

3 Florentine experiment.

The incompreſſibility of water, proved by the Florentine experiment, is a ſufficient evidence alſo, that each primary particle or ſpherule thereof is a perfect and impenetrable ſolid. Mr Locke too, in his *Eſſay on Human Underſtanding*, admits this to be ſo.

This famous experiment was firſt attempted by the great lord Verulam, who incloſed a quantity of water in lead, and found that it inclined rather to make its way through the pores of the metal, than be reduced into leſs compaſs by any force that could be applied. The academics of Florence made this experiment afterwards more accurately with a globe of ſilver, as being a metal leſs yielding and ductile than gold. This being filled with water, and well cloſed, they found, by hammering gently thereon, that the ſphericity of the globe was altered to a leſs capacious figure (as might geometrically be proved); but a part of the water always like dew came through its ſides before this could be obtained. This has been attempted by Sir Iſaac Newton, and ſo many competent judges, on gold and ſeveral other metals ſince, with equal ſucceſs, that we do not hold any fluid in its natural ſtate, except the air, to be either compreſſible or elaſtic.—In ſome experiments by Mr Canton, it hath been obſerved, that water is more or leſs compreſſed according to the different conſtitution of the atmoſphere; whence it hath been concluded that the Florentine experiment was erroneous: but it will not follow, that water can be compreſſed by any artificial force, becauſe nature hath a method of compreſſing it; any more than that ſolid metal can be compreſſed artificially, though we know that very ſlight degrees of heat and cold will expand or contract its dimenſions. See WATER.

SECT. II. *Of the Gravity and Preſſure of Fluids.*

4 Fluids preſs as much upward as downward.

ALL bodies, both fluid and ſolid, preſs downwards by the force of gravity: but fluids have this wonderful property, that their preſſure upwards and ſidewiſe is equal to their preſſure downwards; and this is always in proportion to their perpendicular height, without any regard to their quantity: for, as each particle is quite free to move, it will move towards that part or ſide on which the preſſure is leaſt. And hence, no particle or quantity of a fluid can be at reſt, till it is every way equally preſſed.

Plate CLII. fig. 2.

To ſhew by experiment that fluids preſs upward as well as downward, let A B be a long upright tube filled with water near to its top; and CD a ſmall tube open at both ends, and immerſed into the water in the large one: if the immerſion be quick, you will ſee the water riſe in the ſmall tube to the ſame height that it ſtands in the great one, or until the ſurfaces of the water in both are on the ſame level: which ſhews that the water is preſſed upward into the ſmall tube by the weight of what is in the great one; otherwiſe it could never riſe therein, contrary to its natural gravity; unleſs the diameter of the bore were ſo ſmall, that the the attraction of the tube would raiſe the water; which will never happen, if the tube be as wide as that in a common barometer. And, as the water riſes no higher in the ſmall tube than till its ſurface be on a level with the ſurface of the water in the great one, this ſhews that the preſſure is not in proportion to the quantity of water in the great tube, but in proportion to its perpendicular height therein: for there is much more water in the great tube all around the ſmall one, than what is raiſed to the ſame height in the ſmall one as it ſtands in the great.

Take out the ſmall tube, and let the water run out of it; then it will be filled with air. Stop its upper end with the cork C, and it will be full of air all below the cork: this done, plunge it again to the bottom of the water in the great tube, and you will ſee the water riſe up in it to the height E. Which ſhews that the air is a body, otherwiſe it could not hinder the water from riſing up to the ſame height as it did before, namely, to A; and in ſo doing, it drove the air out at the top; but now the air is confined by the cork *C*: And it alſo ſhews that the air is a compreſſible body; for if it were not ſo, a drop of water could not enter into the tube.

The preſſure of fluids being equal in all directions, it follows, that the ſides of a veſſel are as much preſſed by a fluid in it, all around in any given ring of points, as the fluid below that ring is preſſed by the weight of all that ſtands above it. Hence the preſſure upon every point in the ſides, immediately above the bottom, is equal to the preſſure upon every point of the bottom. —To ſhew this by experiment, let a hole be made at *e* Fig. 3. in the ſide of the tube AB cloſe by the bottom; and another hole of the ſame ſize in the bottom at *C*; then pour your water into the tube, keeping it full as long as you chooſe the holes ſhould run, and have two baſons ready to receive the water that runs through the two holes, until you think there is an enough in each baſon; and you will find by meaſuring the quantities, that they are equal. Which ſhews that the water run with equal ſpeed through both holes; which it could not have done, if it had not been equally preſſed through them both. For, if a hole of the ſame ſize be made in the ſide of the tube, as about *f*, and if all three are permitted to run together, you will find that the quantity run through the hole at *f* is much leſs than what has run in the ſame time thro' either of the holes C or *e*.

In the ſame figure, let the tube be re-curved from the bottom at C into the ſhape DE, and the hole at C be ſtopt with a cork. Then, pour water into the tube to any height, as *A g*, and it will ſpout up in a jet EFG, nearly as high as it is kept in the tube AB, by continuing to pour in as much there as runs thro' the hole E; which will be the caſe whilſt the ſurface *A g* keeps at the ſame height. And if a little ball of cork G be laid upon the top of the jet, it will be ſupported thereby, and dance upon it. The reaſon why the jet riſes not quite ſo high as the ſurface of the water *A g*, is owing to the reſiſtance it meets with in the open air: for, if a tube either great or ſmall, was ſcrewed upon the pipe at E, the water would riſe in it until the ſurfaces of the water in both tubes were on the ſame level; as will be ſhewn by the next experiment.

5 The hydroſtatic paradox.

Any quantity of a fluid, how ſmall ſoever, may be made to balance and ſupport any quantity, how great ſoever. This is deſervedly termed *the hydroſtatical paradox*; which we ſhall firſt ſhew by an experiment,

Preſſure of fluids.

and then account for it upon the principle above mentioned, namely, that *the preſſure of fluids is directly as their perpendicular height, without any regard to their quantity.*

Plate CLII. fig. 4.

Let a ſmall glaſs tube DCG, open at both ends, and bended at B, be joined to the end of a great one AI at *cd*, where the great one is alſo open; ſo that theſe tubes in their openings may freely communicate with each other. Then pour water through a ſmall necked funnel into the ſmall tube at H; this water will run through the joining of the tubes at *cd*, and riſe up into the great tube; and if you continue pouring until the ſurface of the water comes to any part, as A, in the great tube, and then leave off, you will ſee that the ſurface of the water in the ſmall tube will be juſt as high at D; ſo that the perpendicular altitude of the water will be the ſame in both tubes, however ſmall the one be in proportion to the other. This ſhews, that the ſmall column DCG balances and ſupports the great column A*cd*; which it could not do if their preſſures were not equal againſt one another in the recurved bottom at B.—If the ſmall tube be made longer, and inclined in the ſituation GEF, the ſurface of the water in it will ſtand at F, on the ſame level with the ſurface A in the great tube: that is, the water will have the ſame perpendicular height in both tubes, although the column in the ſmall tube is longer than that in the great one; the former being oblique, and the latter perpendicular.

Since then the preſſure of fluids is directly as their perpendicular heights, without any regard to their quantities, it appears, that whatever the figure or ſize of veſſels be, if they are of equal heights, and if the areas of their bottoms are equal, the preſſures of equal heights of water are equal upon the bottoms of theſe veſſels; even though the one ſhould hold a thouſand or ten thouſand times as much water as would fill the other. To confirm this part of the hydroſtatical paradox by an experiment, let two veſſels be prepared of equal heights, but very unequal contents, ſuch as AB fig. 5. and AB in fig. 6. Let each veſſel be open at both ends, and their bottoms D *d*, D *d* be of equal widths. Let a braſs bottom CC be exactly fitted to each veſſel, not to go into it, but for it to ſtand upon; and let a piece of wet leather be put between each veſſel and its braſs bottom, for the ſake of cloſeneſs. Join each bottom to its veſſel by a hinge D, ſo that it may open like the lid of a box; and let each bottom be kept up to its veſſel by equal weights E and E hung to lines which go over the pulleys F and F (whoſe blocks are fixed to the ſides of the veſſels at *f*) and the lines tied to hooks at *d* and *d*, fixed in braſs bottoms oppoſite to the hinges D and D. Things being thus prepared and fitted, hold the veſſel AB (fig. 6.) upright in your hands over a baſon on a table, and cauſe water to be poured into the veſſel ſlowly, till the preſſure of the water bears down its bottom at the ſide *d*, and raiſes the weight E; and then part of the water will run out at *d*. Mark the height at which the ſurface H of the water ſtood in the veſſel, when the bottom began to give way at *d*; and then, holding up the other veſſel AB (fig. 5.) in the ſame manner, cauſe water to be poured into it at H; and you will ſee, that when the water riſes to A in this veſſel, juſt as high as it did in the former, its bottom will alſo give way at *d*, and it will loſe part of the water.

Fig. 5, 6.

Preſſure of fluids.

The natural reaſon of this ſurpriſing phenomenon is, that ſince all parts of a fluid at equal depths below the ſurface are equally preſſed in all manner of directions, the water immediately below the fixed part B *f* (fig. 5.) will be preſſed as much upward againſt its lower ſurface within the veſſel, by the action of the column A *g*, as it would be by a column of the ſame height, and of any diameter whatever; (as was evident by the experiment with the tube, fig. 4.) and therefore, ſince action and reaction are equal and contrary to each other, the water immediately below the ſurface B *f* will be preſſed as much downward by it, as if it was immediately touched and preſſed by a column of the height *g* A, and of the diameter B *f*: and therefore, the water in the cavity BD *df* will be preſſed as much downward upon its bottom CC, as the bottom of the other veſſel (fig. 6.) is preſſed by all the water above it.

To illuſtrate this a little farther, let a hole be made at *f* in the fixed top B *f*, and let a tube G be put into it; then, if water be poured into the tube A, it will (after filling the cavity B *d*) riſe up into the tube G, until it comes to a level with that in the tube A; which is manifeſtly owing to the preſſure of the water in the tube A, upon that in the cavity of the veſſel below it. Conſequently, that part of the top B *f*, in which the hole is now made, would, if corked up, be preſſed upward with a force equal to the whole weight of all the water which is ſupported in the tube G: and the ſame thing would hold at *g*, if a hole were made there. And ſo, if the whole cover or top B *f* were full of holes, and had tubes as high as the middle one A *g* put into them, the water in each tube would riſe to the ſame height as it is kept in the tube A, by pouring more into it, to make up the deficiency that it ſuſtains by ſupplying the others, until they are all full; and then the water in the tube A would ſupport equal heights of water in all the reſt of the tubes. Or, if all the tubes except A, or any other one, were taken away, and a large tube equal in diameter to the whole top B *f* were placed upon it and cemented to it, and then if water were poured into the tube that was left in either of the holes, it would aſcend through all the reſt of the holes, until it filled the large tube to the ſame height that it ſtands in the ſmall one, after a ſufficient quantity had been poured into it: which ſhews, that the top B *f* was preſſed upward by the water under it, and before any hole was made in it, with a force equal that wherewith it is now preſſed downward by the weight of all the water above it in the great tube. And therefore, the reaction of the fixed top B *f* muſt be as great, in preſſing the water downward upon the bottom CC, as the whole preſſure of the water in the great tube would have been, if the top had been taken away, and the water in that tube left to preſs directly upon the water in the cavity BD *df*.

Fig. 5.

6

The hydroſtatic bellows, fig. 7.

Perhaps the beſt machine in the world for demonſtrating the upward preſſure of fluids, is the hydroſtatic bellows, which conſiſts of two thick oval boards AB, EF, each about 16 inches broad, and 18 inches long: the ſides are of leather, joined very cloſe to the top and bottom by ſtrong nails. CD is a pipe ſcrewed into a piece of braſs on the top-board

Preſſure of fluids.

board at C. Let ſome water be poured into the pipe at D, which will run into the bellows, and ſeparate the boards a little. Then lay three weights, each weighing 100 pounds, upon the upper board; and pour more water into the pipe, which will run into the bellows, and raiſe up the board with all the weights upon it; and if the pipe be kept full, until the weights are raiſed as high as the leather which covers the bellows will allow them, the water will remain in the pipe, and ſupport all the weights, even though it ſhould weigh no more than a quarter of a pound, and they 300 pounds: nor will all their force be able to cauſe them to deſcend and force the water out at the top of the pipe.

The reaſon of this will be made evident, by conſidering what has been already ſaid of the reſult of the preſſure of fluids of equal heights without any regard to their quantity. For, if a hole be made in the upper board, and a tube be put into it, the water will riſe in the tube to the ſame height that it does in the pipe; and would riſe as high (by ſupplying the pipe) in as many tubes as the board could contain holes. Now, ſuppoſe only one hole to be made in any part of the board, of an equal diameter with the bore of the pipe, and that the pipe holds juſt a quarter of a pound of water; if a perſons claps his finger upon the hole, and the pipe be filled with water, he will find his finger to be preſſed upward with a force equal to a quarter of a pound. And as the ſame preſſure is equal upon all equal parts of the board, each part, whoſe area is equal to the area of the hole, will be preſſed upward with a force equal to that of a quarter of a pound: the ſum of all which preſſures againſt the under ſide of an oval board 16 inches broad, and 18 inches long, will amount to 300 pounds; and therefore ſo much weight will be raiſed up and ſupported by a quarter of a pound of water in the pipe.

7 How a man may raiſe himſelf upward by his breath.

Hence, if a man ſtands upon the upper board, and blows into the bellows through the pipe, he will raiſe himſelf upward upon the board: and the ſmaller the bore of the pipe is, the eaſier he will be able to raiſe himſelf. And then, by clapping his finger upon the top of the pipe, he can ſupport himſelf as long as he pleaſes; provided the bellows be air-tight, ſo as not to loſe what is blown into it.

8 How lead may be made to ſwim in water. Fig. 8.

Upon this principle of the upward preſſure of fluids, a piece of lead may be made to ſwim in water, by immerſing it to a proper depth, and keeping the water from getting above it. Let CD be a glaſs tube, open at both ends; and EFG a flat piece of lead, exactly fitted to the lower end of the tube, not to go within it, but for it to ſtand upon; with a wet leather between the lead and the tube, to make cloſe work. Let this leaden bottom be half an inch thick, and held cloſe to the tube by pulling the packthread IHL upward at L with one hand, whilſt the tube is held in the other by the upper end C. In this ſituation, let the tube be immerſed in water in the glaſs veſſel AB, to the depth of ſix inches below the ſurface of the water at K; and then, the leaden bottom EFG will be plunged to the depth of ſomewhat more than eleven times its own thickneſs: holding the tube at that depth, you may let go the thread at L; and the lead will not fall from the tube, but will be kept to it by the upward preſſure of the water below it occaſioned by the height of the water at K above the level of the lead. For as lead is 11.33 times as heavy as its bulk of water, and is in this experiment immerſed to a depth ſomewhat more than 11.33 times its thickneſs, and no water getting into the tube between it and the lead, the column of water E*abc*G below the lead is preſſed upward againſt it by the water KDEGL all around the tube; which water being a little more than 11.33 times as high as the lead is thick, is ſufficient to balance and ſupport the lead at the depth KE. If a little water be poured into the tube upon the lead, it will increaſe the weight upon the column of water under the lead, and cauſe the lead to fall from the tube to the bottom of the glaſs veſſel, where it will lie in the ſituation *b d*. Or, if the tube be raiſed a little in the water, the lead will fall by its own weight, which will then be too great for the preſſure of the water around the tube upon the column of water below it. But the following method of making an extremely heavy body float upon water is more elegant. Take a long glaſs tube, open at both ends; ſtopping the lower end with a finger, pour in ſome quickſilver at the other end, ſo as to take up about half an inch in the tube below. Immerſe this tube, with the finger ſtill at the bottom, in a deep glaſs veſſel filled with water; and when the lower end of the tube is about ſeven inches below the ſurface, take away the finger from it, and then you will ſee the quickſilver not ſink into the veſſel, but remain ſuſpended upon the tube, and floating, if we may ſo expreſs it, upon the water in the glaſs-veſſel.

Specific gravity.

9 How light wood may be made to lie at the bottom of water.

In the ſame manner as an heavy body was made to ſwim on water, by taking away the upward preſſure; ſo may a light body, like wood, be made to remain ſunk at the bottom, by depriving it of all preſſure from below: for if two equal pieces of wood be planed, ſurface to ſurface, ſo that no water can get between them, and then one of them (*c d*) be cemented to the inſide of the veſſel's bottom; then the other being placed upon this, and, while the veſſel is filling, being kept down by a ſtick; when the ſtick is removed and the veſſel full, the upper piece of wood will not riſe from the lower one, but continue ſunk under water, though it is actually much lighter than water; for as there is no reſiſtance to its under ſurface to drive it upward, while its upper ſurface is ſtrongly preſſed down, it muſt neceſſarily remain at the bottom.

SECT. III. *Of the Specific Gravity of Bodies.*

10 Of ſpecific gravity.

When an unſpongy or ſolid body ſinks in a veſſel of water, it removes a body of water equal to its own bulk, out of the place to which it deſcends. If, for inſtance, a copper ball is let drop into a glaſs of water, we well know, that if it ſinks, it will take up as much room as a globe of water equal to itſelf in ſize took up before.

Let us ſuppoſe, that this watery globe removed by the ball were frozen into a ſolid ſubſtance, and weighed in a ſcale againſt the copper ball: now the copper ball being more in weight than the globe, it is evident that it will ſink its own ſcale, and drive up the oppoſite, as all heavier bodies do when weighed againſt lighter; if, on the contrary, the copper ball be lighter than the water globe, the ball will riſe. Again, then, let us ſuppoſe the copper ball going to be immerſed in water; and that, in order to deſcend, it muſt diſplace a globe of water equal to itſelf in bulk. If the copper ball be heavier than the globe, its preſſure will overcome the other's reſiſtance, and it will ſink to the bot-

Specific gravities.

tom; but if the watery globe be heavier, its preſſure upwards will be greater than that of the ball downward, and the ball will riſe or ſwim. In a word, in proportion as the ball is heavier than the ſimilar bulk of water, it will deſcend with greater force; in proportion as it is lighter, it will be raiſed more to the ſurface.

From all this we may deduce one general rule, which will meaſure the force with which any ſolid body tends to ſwim or ſink in water; namely, *Every body immerſed in water, loſes juſt as much of its weight as equals the weight of an equal bulk of water.* Thus, for inſtance, if the body be two ounces, and an equal bulk of water be one ounce, the body when plunged will ſink towards the bottom of the water with a weight of one ounce. If, on the contrary, the ſolid body be but one ounce, and the weight of an equal bulk of water be two ounces; the ſolid, when plunged, will remove but one ounce, that is, half as much water as is equal to its own bulk: ſo that, conſequently, it cannot deſcend; for to do that, it muſt remove a quantity of water equal to its own bulk. Again, if the ſolid be too ounces, and the equal bulk of water two ounces, the ſolid, wherever it is plunged, will neither riſe nor ſink, but remain ſuſpended at any depth.

Thus we ſee the reaſon why ſome bodies ſwim in water, and others ſink. Bodies of large bulk and little weight, like cork or feathers, muſt neceſſarily ſwim, becauſe an equal bulk of water is heavier than they; bodies of little bulk but great weight, like lead or gold, muſt ſink, becauſe they are heavier than an equal bulk of water. The bulk and the weight of any body conſidered together, is called its *ſpecific gravity*; and the proportion of both in any body is eaſily found by water. A body of little bulk and great weight, readily ſinks in water, and it is ſaid to have ſpecific gravity; a body of great bulk and little weight, loſes almoſt all its weight in water, and therefore is ſaid to have but little ſpecific gravity. A woolpack has actually greater real gravity, or weighs more in air, than a cannon ball; but for all that, a cannon ball may have more ſpecific gravity, and weigh more than the woolpack, in water. *Denſity* is a general term that means the ſame thing; *ſpecific gravity* is only a relative term, uſed when ſolids are weighed in fluids, or fluids in fluids.

As every ſolid ſinks more readily in water, in proportion as its ſpecific gravity is great, or as it contains greater weight under a ſmaller bulk, it will follow, that the ſame body may very often have different ſpecific gravities, and that it will ſink at one time and ſwim at another. Thus a man, when he happens to fall alive into the water, ſinks to the bottom; for the ſpecific gravity of his body is then greater than that of water: but if, by being drowned, he lies at the bottom for ſome days, his body ſwells by putrefaction, which diſunites its parts; thus its ſpecific gravity becomes leſs than that of water, and he floats upon the ſurface.

11 How to diſcover adulterations in metals.

Several more important uſes are the reſult of our being able exactly to determine the ſpecific gravities of bodies. We can, by weighing metals in water, diſcover their adulterations or mixtures with greater exactneſs than by any other means whatſoever. By this means, the counterfeit coin, which may be offered us as gold, will be very eaſily diſtinguiſhed, and known to be a baſer metal. For inſtance, if we are offered a braſs counter for a guinea, and we ſuſpect it; ſuppoſe, to clear our ſuſpicions, we weigh it in the uſual manner againſt a real guinea in the oppoſite ſcale, and it is of the exact weight, yet ſtill we ſuſpect it; What is to be done? To melt or deſtroy the figure of the coin would be inconvenient and improper: a much better and more accurate method remains. We have only to weigh a real guinea in water, and we ſhall thus find that it loſes but a nineteenth part of its weight in the balance: We then weigh the braſs counter in water, and we actually find it loſes an eighth part of its weight by being weighed in this manner. This at once demonſtrates, that the coin is made of a baſe metal, and not gold; for as gold is the heavieſt of all metals, it will loſe leſs of its weight by being weighed in water than any other.

This method Archimedes firſt made uſe of to detect a fraud with regard to the crown of Hiero king of Syracuſe. Hiero had employed a goldſmith to make him a crown, and furniſhed him with a certain weight of gold for that purpoſe; the crown was made, the weight was the ſame as before, but ſtill the king ſuſpected that there was an adulteration in the metal. Archimedes was applied to; who, as the ſtory goes, was for ſome time unable to detect the impoſition. It happened, however, one day as the philoſopher was ſtepping into a bath, that he took notice the water roſe in the bath in proportion to the part of his body immerſed. From this accident he received a hint; wherewith he was ſo tranſported, that he jumped out of the bath, and ran naked about the ſtreets of Syracuſe, crying in a wild manner, *I have found it! I have found it!*—In conſequence of this ſpeculation, he made two maſſes of the juſt weight of the crown; one of gold, the other of ſilver. Theſe he ſeverally let down carefully into a veſſel of water, wherein the riſe of the fluid might eaſily be determined by meaſure. Being of different ſpecific gravities, they were conſequently of different magnitudes, and on immerſion took up the room of different quantities of water; by comparing whereof with their abſolute gravities in the air, he became fully maſter of the relation, in point of weight, each of theſe metals had to water, and conſequently to each other. He then ſerved the crown in like manner; and by comparing his obſervations, he at length detected the cheat, and fairly aſſigned the quantities of gold and ſilver contained in the crown reſpectively.

12 The hydroſtatic balance.

Upon this difference in the weight of bodies in open air and water, the hydroſtatic balance has been formed; which differs very little from a common balance, but that it hath an hook at the bottom of one ſcale, on which the weight we want to try may be hung by an horſe-hair, and thus ſuſpended in water, without wetting the ſcale from whence it hangs. Firſt, the weight of the body we want to try is balanced againſt the parcel or weight in open air; then the body is ſuſpended by the hook and horſe-hair at the bottom of the ſcale in water, which we well know will make it lighter, and deſtroy the balance. We then can know how much lighter it will be, by the quantity of the weights we take from the ſcale to make it equipoiſe; and of conſequence we thus preciſely can find out its ſpecific gravity compared to water (A). This is the moſt exact

(A) This is the common hydroſtatic balance. The reader will ſee an improved apparatus at *Hydroſtatic* BALANCE, in the order of the alphabet.

pecific vities.

exact and infallible method of knowing the genuineness of metals, and the different mixtures with which they may be adulterated, and it will anſwer for all ſuch bodies as can be weighed in water. As for thoſe things that cannot be thus weighed, ſuch as quickſilver, ſmall ſparks of diamond, and ſuch like, as they cannot be ſuſpended by an horſe-hair, they muſt be put into a glaſs-bucket, the weight of which is already known: this, with the quickſilver, muſt be balanced by weights in the oppoſite ſcale, as before, then immerſed, and the quantity of weights to be taken from the oppoſite ſcale will ſhew the ſpecific gravity of the bucket and the quickſilver together: the ſpecific gravity of the bucket is already known; and of conſequence the ſpecific gravity of the quickſilver, or any other ſimilar ſubſtance, will be what remains.

As we can thus diſcover the ſpecific gravity of different ſolids by plunging them in the ſame fluid, ſo we can diſcover the ſpecific gravity of different fluids, by plunging the ſame ſolid body into them; for in proportion as the fluid is light, ſo much will it diminiſh the weight of the body weighed in it. Thus we may know that ſpirit of wine has leſs ſpecific gravity than water, becauſe a ſolid that will ſwim in water will ſink in ſpirit; on the contrary, we may know that ſpirit of nitre has greater ſpecific gravity than water, becauſe a ſolid that will ſink in water will ſwim upon the ſpirit of nitre. Upon this principle is made that ſimple inſtrument called an *hydrometer*, which ſerves to meaſure the lightneſs or weight of different fluids. For that liquors weigh very differently from each other is found by experience. Suppoſe we take a glaſs-veſſel which is divided into two parts, communicating with each other by a ſmall opening of a line and an half diameter. Let the lower part be filled up to the diviſion with red wine, then let the upper part be filled with water. As the red-wine is lighter than water, we ſhall ſee it in a ſhort time riſing like a ſmall thread up through the water, and diffuſing itſelf upon the ſurface, till at length we ſhall find the wine and water have changed their places; the water will be ſeen in the lower half, and the wine in the upper half, of the veſſel. Or take a ſmall bottle AB, the neck of which muſt be very narrow, the mouth not more than $\frac{1}{6}$ of an inch wide; and have a glaſs-veſſel CD, whoſe height exceeds that of the bottle about two inches. With a ſmall funnel fill the bottle quite full of red-wine, and place it in the veſſel CD, which is to be full of water. The wine will preſently come out of the bottle, and riſe in form of a ſmall column to the ſurface of the water; and at the ſame time the water, entering the bottle, will ſupply the place of the wine; for water being ſpecifically heavier than wine, muſt hold the loweſt place, while the other naturally riſes to the top. A ſimilar effect will be produced if the bottle be filled with water, and the veſſel with wine: for the bottle being placed in the veſſel in an inverted poſition, the water will deſcend to the bottom of the veſſel, and the wine will mount into the bottle.

In the ſame manner we may pour four different liquors, of different weights, into any glaſs-veſſel, and they ſhall all ſtand ſeparate and unmixed with each other. Thus, if we take mercury, oil of tartar, ſpirit of wine, and ſpirit of turpentine, ſhake them together in a glaſs, and then let them ſettle a few minutes, each ſhall ſtand in its proper place, mercury at the bottom, oil of tartar next, ſpirit of wine, and then ſpirit of turpentine above all. Thus we ſee liquors are of very different denſities; and this difference it is that the hydrometer is adapted to compare. In general, all vinous ſpirits are lighter than water; and the leſs they contain of water, the lighter they are. The hydrometer, therefore, will inform us how far they are genuine, by ſhewing us their lightneſs; for in pure ſpirit of wine it ſinks leſs than in that which is mixed with a ſmall quantity of water.

Specific gravities.

The hydrometer ſhould be made of copper: for ivory imbibes ſpirituous liquors, and thereby alters their gravity; and glaſs requires an attention that is incompatible with expedition. The moſt ſimple hydrometer conſiſts of a copper ball B *b*, to which is ſoldered a braſs wire AB, one quarter of an inch thick. The upper part of this wire being filed flat, is marked *proof*, at *m*, fig. 2. becauſe it ſinks exactly to that mark in proof-ſpirits. There are two other marks at A and B, fig. 1. to ſhew whether the liquor be one-tenth above or below proof, according as the hydrometer ſinks to A, or emerges to B, when a braſs weight, as C or K, is ſcrewed to its bottom *c*. There are other weights to ſcrew on, which ſhew the ſpecific gravity of different fluids, quite down to common water.

Plate CLIV. fig. 1.

The round part of the wire above the ball may be marked ſo as to repreſent river-water when it ſinks to RW, fig. 2. the weight which anſwers to that water being then ſcrewed on; and when put into ſpring-water, mineral-water, ſea-water, and water of ſalt ſprings, it will gradually riſe to the marks SP, MI, SE, SA. On the contrary, when it is put into Briſtol water, rain-water, port-wine, and mountain-wine, it will ſucceſſively ſink to the marks *br*, *ra*, *po*, *mo*. Inſtruments of this kind are ſometimes called *areometers*.

There is another ſort of hydrometer that is calculated to aſcertain the ſpecific gravity of fluids to the greateſt preciſion poſſible, and which conſiſts of a large hollow ball B, fig. 3. with a ſmaller ball *b* ſcrewed on to its bottom, partly filled with mercury or ſmall ſhot, in order to render it but little ſpecifically lighter than water. The larger ball has alſo a ſhort neck at C, into which is ſcrewed the graduated braſs-wire AC, which, by a ſmall weight at A, cauſes the body of the inſtrument to deſcend in the fluid, with part of the ſtem.

When this inſtrument is ſwimming in the liquor contained in the jar ILMK, the part of the fluid diſplaced by it will be equal in bulk to the part of the inſtrument under water, and equal in weight to the whole inſtrument. Now, ſuppoſe the weight of the whole to be four thouſand grains, it is then evident we can by this mean compare the different dimenſions of four thouſand grains of ſeveral ſorts of fluids. For if the weight at A be ſuch as will cauſe the ball to ſink in rain-water till its ſurface come to the middle point of the ſtem 20; and after that, if it be immerſed in common ſpring-water, and the ſurface be obſerved to ſtand at one-tenth of an inch below the middle point 20; it is apparent, that the ſame weight of each water differs only in bulk by the magnitude of one-tenth of an inch in the ſtem.

Now, ſuppoſe the ſtem to be ten inches long, and to weigh a hundred grains, then every tenth of an inch will

Specific gravities.

will weigh one grain: and as the ſtem is of braſs, which is about eight times heavier than water, the ſame bulk of water will be equal to one-eighth of a grain, and conſequently to the one-eighth of one four-thouſandth part, that is, one thirty-two thouſandth part of the whole bulk. This inſtrument is capable of ſtill greater preciſion, by making the ſtem or neck conſiſt of a flat thin ſlip of braſs, inſtead of one that is cylindrical: for by this means we increaſe the ſurface, which is the moſt requiſite circumſtance, and diminiſh the ſolidity, which neceſſarily renders the inſtrument ſtill more accurate.

To adapt this inſtrument to all purpoſes, there ſhould be two ſtems, to ſcrew on and off, in a ſmall hole at *a*. One ſtem ſhould be a ſmooth thin ſlip of braſs, or rather ſteel, like a watch-ſpring ſet ſtraight, ſimilar to that we have juſt now mentioned; on one ſide of which is to be the ſeveral marks or diviſions to which it will ſink in different ſorts of water, as rain, river, ſpring, ſea, and ſalt-ſpring waters, &c.; and on the other ſide you may mark the diviſions to which it ſinks in various lighter fluids, as hot Bath water, Briſtol water, Lincomb water, Cheltenham water, port-wine, mountain, madeira, and other ſorts of wines. But here the weight at A on the top muſt be a little leſs than before when it was uſed for heavier waters.

But in trying the ſtrength of the ſpirituous liquors, a common cylindric ſtem will do beſt, becauſe of its ſtrength and ſteadineſs: and this ought to be ſo contrived, that, when immerſed in what is called proof-ſpirit, the ſurface of the ſpirit may be upon the middle point 20; which is eaſily done by duly adjuſting the ſmall weight A on the top, and making the ſtem of ſuch a length, that, when immerſed in water, it may juſt cover the ball and riſe to *a*; but, when immerſed in pure ſpirit, it may riſe to the top A. Then, by dividing the upper and lower parts *a* 20 and A 20, into ten equal parts each, when the inſtrument is immerſed into any ſort of ſpirituous liquor, it will immediately ſhow how much it is above or below proof.

Proof-ſpirit conſiſts of half water and half pure ſpirit, that is, ſuch as, when poured on gun-powder, and ſet on fire, will burn all away; and permits the powder to take fire and flaſh, as in open air. But if the ſpirit be not ſo highly rectified, there will remain ſome water, which will make the powder wet, and unfit to take fire. Proof-ſpirit of any kind weighs ſeven pounds twelve ounces per gallon.

The common method of ſhaking the ſpirits in a phial, and raiſing a head of bubbles, to judge by their manner of riſing or breaking whether the ſpirit be proof, or near it, is very fallacious. There is no way ſo certain, and at the ſame time ſo eaſy and expeditious, as this by the hydrometer.

Yet, after all, we are not entirely to depend, and with geometrical certainty rely, upon either the hydrometer or the hydroſtatic balance; for there are ſome natural inconveniencies that diſturb the exactneſs with which they diſcover the ſpecific gravities of different bodies. Thus, if the weather be hotter at one time than another, all fluids will ſwell, and conſequently they will be lighter than when the weather is cold: the air itſelf is at one time heavier than at another, and will buoy up bodies weighed in it; they will therefore appear lighter, and will of conſequence ſeem heavier in water. In ſhort, there are many cauſes that would prevent us from making tables of the ſpecific gravities of bodies, if rigorous exactneſs were only expected; for the individuals of every kind of ſubſtance differ from each other, gold from gold, and water from water. In ſuch tables, therefore, all that is expected is to come as near the exact weight as we can; and from an inſpection into ſeveral, we may make an average near the truth. Thus, Muſchenbroek's table makes the ſpecific gravity of rain-water to be nearly eighteen times and an half leſs than that of a guinea; whereas our Engliſh tables make it to be but ſeventeen times and an half, nearly, leſs than the ſame. But though there may be ſome minute variation in all our tables, yet they in general may ſerve to conduct us with ſufficient accuracy.

Specific gravity

In conſtructing tables of ſpecific gravities with accuracy, the gravity of water muſt be repreſented by unity or 1.000, where three ciphers are added, to give room for expreſſing the ratios of other gravities in decimal parts, as in the following table.

A TABLE of the SPECIFIC GRAVITIES of ſeveral ſolid and fluid bodies.

Take away the decimal point from the numbers in the right-hand column, or (which is the ſame) multiply them by 1000, and they will ſhew how many ounces avoirdupoiſe are contained in a cubic foot of each body.

The uſe of the table of ſpecific gravities will beſt appear by an example. Suppoſe a body to be compounded of gold and ſilver, and it is required to find the quantity of each metal in the compound.

Firſt find the ſpecific gravity of the compound, by weighing it in air and in water; and dividing its aërial weight by what it loſes thereof in water, the quotient will ſhew its ſpecific gravity, or how many times it is heavier than its bulk of water. Then, ſubtract the ſpecific gravity of ſilver (found in the table) from that of the compound, and the ſpecific gravity of the compound from that of gold; the firſt remainder ſhews the bulk of gold, and the latter the bulk of ſilver, in the whole compound: and if theſe remainders be multiplied by the reſpective ſpecific gravities, the products will ſhew the proportion of weights of each metal in the body. Example:

Suppoſe the ſpecific gravity of the compounded body be 13; that of ſtandard ſilver (by the table) is 10.5, and that of gold 19.63: therefore 10.5 from 13, remains 2.5, the proportional bulk of the gold; and 13 from 19.63, remains 6.63, the proportional bulk of ſilver in the compound. Then, the firſt remainder 2.5, multiplied by 19.63, the ſpecific gravity of gold, produces 49.075 for the proportional weight of gold; and the laſt remainder 6.63 multiplied by 10.5, the ſpecific gravity of ſilver, produces 69.615 for the proportional weight of ſilver in the whole body. So that for every 49.07 ounces or pounds of gold, there are 69.6 pounds or ounces of ſilver in the body.

Hence it is eaſy to know whether any ſuſpected metal be genuine, or allayed, or counterfeit; by finding how much it is heavier than its bulk of water, and comparing the ſame with the table: if they agree, the metal is good; if they differ, it is allayed or counterfeited.

A cubical inch of good brandy, rum, or other proof ſpirits, weighs 235.7 grains; therefore, if a true inch cube of any metal weighs 235.7 grains leſs in ſpirits than in air, it ſhews the ſpirits are proof. If it loſes leſs of its aërial weight in ſpirits, they are above proof; if it loſes more, they are under: For, the better the ſpirits are, they are the lighter; and the worſe, the heavier. Hydraulics. 16 How to try ſpirituous liquors.

SECT. IV. *Hydraulics.*

HYDRAULICS is that part of hydroſtatics, which teaches to eſtimate the ſwiftneſs or the force of fluids in motion.

It has been always thought an inquiry of great curioſity, and ſtill greader advantage, to know the cauſes by which water ſpouts from veſſels to different heights and diſtances. We have obſerved, for inſtance, an open veſſel of liquor upon its ſtand, pierced at the bottom: the liquor, when the opening is firſt made, ſpouts out with great force; but as it continues to run, becomes leſs violent, and the liquor flows more feebly. A knowledge of hydraulics will inſtruct us in the cauſe of this diminution of its ſtrength; it will ſhew preciſely how far the liquor will ſpout from any veſſel, and how faſt or in what quantities it will flow. Upon the principles of this ſcience, many machines worked by water are entirely conſtructed; ſeveral different engines uſed in the mechanic arts, various kinds of mills, pumps, and fountains, are the reſult of this theory, judiciouſly applied.

And what is thus demonſtrated of the bottom of the veſſel, is equally true at every other depth whatſoever. Let us then reduce this into a theorem: *The velocity with which water ſpouts out at a hole in the ſide or bottom of a veſſel, is as the ſquare root of the depth or diſtance of the hole below the ſurface of the water.* For, in order to make double the quantity of a fluid run through one hole as through another of the ſame ſize, it will require four times the preſſure of the other, and therefore muſt be four times the depth of the other below the ſurface of the water: and for the ſame reaſon, three times the quantity running in an equal time through the ſame ſort of hole, muſt run with three times the velocity; which will require nine times the preſſure, and conſequently muſt be nine times as deep below the ſurface of the fluid: and ſo on.—To prove this by an experiment: Let two pipes, as C and *g*, of equal ſized bores, be fixed into the ſide of the veſſel AB; the pipe *g* being four times as deep below the ſurface of the water at *b* in the veſſel as the pipe C is: and whilſt theſe pipes run, let water be conſtantly poured into the veſſel, to keep the ſurface ſtill at the ſame height. Then, if a cup that holds a pint be ſo placed as to receive the water that ſpouts from the pipe C, and at the ſame moment a cup that holds a quart be ſo placed as to receive the water that ſpouts from the pipe *g*, both cups will be filled at the ſame time by their reſpective pipes. 17 The velocity of ſpouting water. Plate CLII. fig. 9.

The horizontal diſtance to which a fluid will ſpout from a horizontal pipe in any part of the ſide of an upright veſſel below the ſurface of the fluid, is equal to twice the length of a perpendicular to the ſide of the veſſel, drawn from the mouth of the pipe to a ſemi-circle deſcribed upon the altitude of the fluid: and therefore, the fluid will ſpout to the greateſt diſtance poſſible 18 The horizontal diſtance to which water will ſpout from pipes.

Hydraulics.

poſſible from a pipe whoſe mouth is at the centre of the ſemicircle; becauſe a perpendicular to its diameter (ſuppoſed parallel to the ſide of the veſſel) drawn from that point, is the longeſt that can poſſibly be drawn from any part of the diameter to the circumference of the ſemicircle. Thus, if the veſſel AB be full of water, the horizontal pipe D be in the middle of its ſide, and the ſemicircle N *d c b* be deſcribed upon D as a centre, with the radius or ſemidiameter D *g* N, or D *f b*, the perpendicular D *d* to the diameter N D *b* is the longeſt that can be drawn from any part of the diameter to the circumference N *d c b*. And if the veſſel be kept full, the jet G will ſpout from the pipe D, to the horizontal diſtance N M, which is double the length of the perpendicular D *d*. If two other pipes, as C and E, be fixed into the ſide of the veſſel at equal diſtances above and below the pipe D, the perpendiculars C *c* and E *e*, from theſe pipes to the ſemicircle, will be equal; and the jets F and H ſpouting from them will each go to the horizontal diſtance N K; which is double the length of either of the equal perpendiculars C *c* or D *d*.

Plate CLII. fig. 9.

19 How water may be conveyed over hills and valleys.

Fluids by their preſſure may be conveyed over hills and valleys in bended pipes, to any height not greater than the level of the ſprings from whence they flow. This is what the ancients were ignorant of; and therefore they uſually built AQUEDUCTS (vaſt rows of arches one above another, between two hills, at a vaſt expence of money, time, and labour,) in order to convey water over them, croſs the valley, in a common channel. This is now done to equal advantage, and at much leſs expence, by a range of pipes laid down one hill and up the other. An inſtance whereof may be given by a bent tube or crane; into one of the equal legs whereof if water be poured, it will riſe to the ſame level exactly in the other. The reaſon is obvious: In the leg A, (fig. 14.) there are, ſuppoſe, two ounces of water endeavouring by the power of gravity to deſcend with the force of 2; theſe will thruſt forward, buoy up, and ſupport an equal quantity of a like fluid in B; and the bottom of the machine C, againſt which both ſides equally bear, will of conſequence ſuſtain a double preſſure, or that of four ounces; and in the preſent caſe will pretty well repreſent the prop or fixed point of a balance-beam; as the equal fluid-columns AC, and BC, may be admitted to denote equal weights, ſuſpended on the balance-arms, counterpoiſing each other. So that the riſe of fluids to their firſt level, thus conſidered, is a caſe truly ſtatical; and all their other motions proceed only from weight added.

20 The ſyphon.

A *ſyphon*, generally uſed for decanting liquors, is a bended pipe, whoſe legs are of unequal lengths; and the ſhorteſt leg muſt always be put into the liquor intended to be decanted, that the perpendicular altitude of the column of liquor in the other leg may be longer than the column in the immerſed leg, eſpecially above the ſurface of the water. For, if both columns were equally high in that reſpect, the atmoſphere, which preſſes as much upward as downward, and therefore acts as much upward againſt the column in the leg that hangs without the veſſel, as it act downward upon the ſurface of the liquor in the veſſel, would hinder the running of the liquor through the ſyphon, even though it were brought over the bended part by ſuction. So that there is nothing left to cauſe Hydraulics. the motion of the liquor, but the ſuperior weight of the column, in the longer leg, on account of its having the greater perpendicular height.

Let D be a cup filled with water to C; and A B C a ſyphon, whoſe ſhorter leg BCF is immerſed in the water from C to F. If the end of the other leg were no lower than the line AC, which is level with the ſurface of the water, the ſyphon would not run, even though the air ſhould be drawn out of it at the mouth A. For although the ſuction would draw ſome water at firſt, yet the water would ſtop at the moment the ſuction ceaſed; becauſe the air would act as much upward againſt the water at A, as it acted downward for it by preſſing on the ſurface at C. But if the leg AB comes down to G, and the air be drawn out at G by ſuction, the water will immediately follow, and continue to run until the ſurface of the water in the cup comes down to F; becauſe, till then, the perpendicular height of the column BAG will be greater than that of the column CB; and, conſequently, its weight will be greater, until the ſurface comes down to F; and then the ſyphon will ſtop, though the leg CF ſhould reach to the bottom of the cup. For which reaſon, the leg that hangs without the cup is always made long enough to reach below the level of its bottom; as from *d* to E: and then, when the ſyphon is emptied of air by ſuction at E, the water immediately follows, and by its continuity brings away the whole from the cup; juſt as pulling one end of a thread will make the whole clue follow. Fig. 2

If the perpendicular height of a ſyphon, from the ſurface of the water to its bended top at B, be more than 33 feet, it will draw no water, even though the other leg were much longer, and the ſyphon quite emptied of air, becauſe the weight of a column of water 33 feet high, is equal to the weight of as thick a column of air, reaching from the ſurface of the earth to the top of the atmoſphere: ſo that there will then be an equilibrium; and conſequently, though there would be weight enough of air upon the ſurface C to make the water aſcend in the leg CB almoſt to the height B, if the ſyphon were emptied of air, yet the weight would not be ſufficient to force the water over the bend; and therefore, it could never be brought into the leg BAG.

Mercury may be drawn through a ſyphon in the ſame manner as water; but then the utmoſt height of the ſyphon muſt always be leſs than 30 inches, as mercury is near 14 times heavier than water. That fluids are forced through the ſyphon by the preſſure of the atmoſphere, is proved experimentally by the air-pump; for, if a ſyphon immerſed in a veſſel of water be placed when running in the receiver, and the air extracted, the running will immediately ceaſe. If the ſyphon is very ſmall, however, this is not always the caſe; and the running of capillary ſyphons *in vacuo* is a circumſtance very difficult to be explained. See BAROMETER, n° 10—13. and SYPHON.

There is a ſort of ſyphon that will draw off water without having the air previouſly extracted from it: this conſiſts of a capillary tube, about 1-10th of an inch bore, and acts by the attraction of cohesion: for the water being attracted by the leg immerſed, is

Hydraulics. slowly drawn up to the top of the ſyphon, and from thence gradually deſcends by its own gravity. From the ſame cauſe it is, that if one end of a piece of the liſt of cloth be put into the water of a veſſel, and the other end hang over its ſide, the water will be ſucked up by the end of the liſt in the veſſel, which in this caſe acts as a bundle of very fine capillary tubes, and drop from the other end. This experiment with a capillary tube will ſucceed *in vacuo*.

Upon the principle of the ſyphon depend the experiments of *Tantalus's cup*, n° 38; *the Fountain at command*, n° 39; and *the inverted drinking-glaſs*, n° 52. As to the laſt of theſe, it may be here obſerved, that if the paper was put dry on ſuch a veſſel empty, it would ſink in the air, and fall away even by its own gravity; and if put on wet, it were to be doubted whether a very ſmall weight added thereto would not ſeparate it from the glaſs, ſo inconſiderable would the tenacity of the water be in this caſe. The paper therefore cannot be ſuppoſed to ſupport the incumbent weight of water; and the true cauſe thereof muſt be this: The bottom and ſides of the inverted glaſs-veſſel being rigid, keep off the preſſure of the air from the fluid above, whereas it hath liberty of acceſs and freely acts thereon below: and that it does ſo, will in part appear to an obſerver by the concavity of the paper underneath. Could the air's preſſure in this caſe be any-how admitted through the foot of the veſſel inverted, without doubt the whole column would deſcend together. And the like would happen ſhould the paper be removed; but for a different reaſon, viz. the large column of water in the mug, being compoſed of many collateral ones, which, being diſpoſed as in a bundle, reſt on the paper wherewith the veſſel is covered, as on a common baſe; and theſe being all equally denſe, and equally fluid, are all retained, and continued of the ſame length, by the general and uniform preſſure of the air againſt the paper below; and ſo long as this continues, none of them getting the leaſt advantage over the reſt, they are all ſuſtained in a body compact together. But when the paper is removed, it being ſcarce poſſible to hold the veſſel ſo exactly level, but that ſome one or other of theſe ſmaller fluid columns will become longer, conſequently heavier, than thoſe adjacent, and, over-balancing the reſt, will deſcend, and give the lighter fluid, the air, leave to riſe into its place, even to the top of the glaſs; the general preſſure whereof being there admitted, will ſoon cauſe the reſt of them to move, and the whole quantity will then deſcend, ſeemingly together.

Again, ſhould a veſſel be but part filled with water, the ſame effect will follow to a certain degree. For inſtance, ſuppoſe we fill a long glaſs half with water, cover it with paper, and turn it down as before. Six inches ſuppoſe of water, endeavouring to deſcend, will by its weight rarefy the air in the glaſs above it, perhaps a 60th part or more. The denſer air without will then overpoiſe the air rarefied within; and therefore a certain quantity of water, equal to the difference of the two preſſures, will in this caſe be thereby buoyed up and ſupported. But the air within the glaſs being dilated as aforeſaid, the water ſuſpended muſt be expected to hang ſomething below the mouth of it; though not enough, perhaps, to overcome the tenacity of the water, and make it all deſcend. Hydraulics.

21

Upon the principle of the ſyphon alſo we may eaſily account for *intermitting* or *reciprocating ſprings*. Let AA be part of a hill, within which there is a cavity BB; and from this cavity a vein or channel running in the direction of BCDE. The rain that falls upon the ſide of the hill will ſink and ſtrain through the ſmall pores and crannies G, G, G, G; and fill the cavity K with water. When the water riſes to the level HHC, the vein BCDE will be filled to C, and the water will run through CDF as through a ſyphon; which running will continue until the cavity be emptied, and then it will ſtop until the cavity be filled again. Intermitting ſprings Plate CLIII. fig. 2.

We have ſeen that fluids led in pipes, will always riſe to the level of the reſervoir whence they are ſupplied; the riſing column being puſhed forward, and raiſed by another equally heavy, at the ſame time endeavouring to deſcend. A like effect might be expected from jets of water thus impelled, did not friction againſt the ſides of the machines, and the reſiſtance of the air, both lateral and perpendicular, generally prove an abatement, and prevent its riſing ſo high as the head. 22 Jets-d'eau.

Where jets are executed in the beſt manner, and the friction ſpoken of is as much as poſſible removed, the impediment of the air only, through which they needs muſt beat in their riſe, will cauſe them, according to experiment, to fall ſhort of the height of the reſervoirs, in the following proportions, viz.

Jet. Feet.	Reservoir. Feet. Inches.
5	5 : 1
10	10 : 4
15	15 : 9
20	21 : 4
25	27 : 1
30	33 : 0
35	39 : 1
40	45 : 4
45	51 : 9
50	58 : 4
55	65 : 1
60	72 : 0
65	79 : 1
70	86 : 4
75	93 : 9
80	101 : 4
85	109 : 1
90	117 : 0
95	125 : 1
100	133 : 4

Whence in general it may be obſerved:

That as often as a five-foot jet (to be taken in theſe matters as a ſtandard,)

Shall be contained in the height of any jet propoſed;

By ſo many inches multiplied into themſelves, or ſquared,

The ſurface of the water in the reſervatory which ſupplies it, ought to exceed that jet in height.

Thus, to obtain a jet of 30 feet, which contains five

Hydraulics. feet six times, the reservoir ought to be 36 inches, or a yard higher; and a jet of 60 feet may be had from a head higher by four times that difference, 144 inches, or four yards. So that *jets done in the best manner fall short of the heights of their reservatories, in a kind of subduplicate ratio of the heights to which they rise.*

This great disproportion in the rise of jets must in general be owing to the resistance of the air they are made to move through; which has been shewn to be in proportion to the squares of their celerities respectively: nor can the acceleration of the falling water in the pipe, or the retardment of the rising stream by the action of gravity, be concerned at all in it; since these are probably adequate, and counterbalance each other every where in the same level.

The air's resistance being thus considerable, it will always be found necessary to increase the bore of the adjutage or spouting-pipe with the height of the reservatory: for if it be too small, the rising stream will want sufficient weight and power to divide the air; which being denseſt near the earth, a small stream of water, endeavouring to mount to a great height, will be dashed against it with so great violence, as to fall away in a mist and be wholly lost. And it may be observed, that the weightier any body is, the greater force it will have when in motion: since an ounce-ball fired from a musquet, will go much farther, and do greater execution, than will an equal weight of shot; and these again may be projected farther than so much lead rasped into powder and fired off. A charge of water fired from a pistol would scarce wet a paper at the distance of six feet. Accordingly, should a cask of water be any where pierced with holes of two, four, six, eight, and twelve lines over, all in the same level, the larger bore will always be found to throw the water farthest.

It may be of use here to add Mr Marriote's proportions of the bores of the adjutages and pipes of conduct, who was very conversant in these things, and hath written very well on this subject.

N. B. The French divide their inch into 12 equal parts, which they call *lines*.

Heights of Reservoirs.	*Diameters of fit Adjutages.*	*Diameter of the Pipes of Conduct.*
FEET.		LINES.
5	3, 4, 5, or 6	22
10	4, 5, or 6 ——	25 INCHES.
15	5, or 6 ——	27, or $2\frac{1}{4}$
20	6, or half an inch	30, or $2\frac{1}{2}$
25	Ditto ——	33, or $2\frac{3}{4}$
30	Ditto ——	36, or 3
40	7, or 8 ——	51, or $4\frac{1}{4}$
50	8, or 10 ——	65, or $5\frac{1}{4}$
60	10 or 12 ——	72, or 6
80	12, or 14 ——	84, or 7
100	12, 14, or 15	96, or 8

Hence it may be remarked, that there is a certain and fit proportion to be observed between the adjutage whereby the jet is delivered, and the pipe conducting it from the head. In general, *About five times the diameter of the adjutage for jets under half an inch, and six or seven times for all above, will size the pipes of conduct pretty well:* not but it will always be an error on the right side, to have them rather larger than in strictness they ought to be, that the jet may always be freely supplied with water, and in due time. Hydraulic Engines.

For a like reason, if there be occasion for a cock to be placed in any part of the pipe of conduct, particular care must be taken that it should be there bigger in proportion, that the water-way may not be pinched; but that the cavity be left at least equal to the bore of the rest of the pipe.

The bore of an adjutage cannot be too smooth or true. Those that are cylindrical are best; those that are bored conical worst, because of the reflections of the water from the inclined sides of the machine, which in the hurry of the issuing stream will in them unavoidably be made.

When fluids are designed to be raised higher than the springs from whence they flow, forcing engines must be used; of which, and other hydraulic machines, we come now to give a particular account.

SECT. V. *Hydraulic Engines.*

23 Of pumps.

THE pump is at once the most common and most useful of all the hydraulic instruments. It was first invented by Ctesebes, a mathematician of Alexandria, 120 B. C. When the air's pressure came afterwards to be known, it was much improved, and it is now brought to a great degree of perfection.

Of this machine there are simply three kinds, viz. the sucking, the forcing, and the lifting-pump. By the two last, water may be raised to any height, with an adequate apparatus and sufficient power: by the former it may, by the general pressure of the atmosphere on the surface of the well-water, be raised no more than 33 feet, as was before hinted, though in practice it is seldom applied to the raising it much above 28; because from the variations observed on the barometer, it is apprehended that the air may, on certain occasions, be something lighter than 33 feet of water; and whenever that shall happen, for want of the due counterpoise, this pump may fail in its performance.

24 The common sucking-pump.

The *common sucking-pump*, with which we draw water out of wells, is an engine both pneumatic and hydraulic. It consists of a pipe open at both ends, in which is a moveable piston, bucket, or sucker, as big as the bore of the pipe in that part wherein it works; and is leathered round, so as to fit the bore exactly; and may be moved up and down, without suffering any air to come between it and the pipe or pump-barrel.

We shall explain the construction of this and the forcing-pump by pictures of glass models, in which both the action of the pistons and motion of the valves are seen.

Plate CLIII. fig. 3. Hold the model DCBL upright in the vessel of water K, the water being deep enough to rise at least as high as from A to I. The valve *a* on the moveable bucket G, and the valve *b* on the fixed box H, (which box quite fills the bore of the pipe or barrel at H) will each lie close, by its own weight, upon the hole in the bucket and box, until the engine begins to work. The valves are made of brass, and covered underneath with leather for closing the holes the more exactly: and the bucket G is raised and depressed alternately by the handle E and rod D *d*, the bucket being supposed at B before the working begins.

Take hold of the handle E, and thereby draw up the

Hydraulic Engines.

the bucket from B to C, which will make room for the air in the pump all the way below the bucket to dilate itſelf, by which its ſpring is weakened, and then its force is not equivalent to the weight or preſſure of the outward air upon the water in the veſſel K: and therefore, at the firſt ſtroke, the outward air will preſs up the water through the notched foot A, into the lower pipe, about as far as *e*: this will condenſe the rarefied air in the pipe between *e* and C to the ſame ſtate it was in before; and then, as its ſpring within the pipe is equal to the force or preſſure of the outward air, the water will riſe no higher by the firſt ſtroke; and the valve *b*, which was raiſed a little by the dilation of the air in the pipe, will fall, and ſtop the hole in the box H; and the ſurface of the water will ſtand at *e*. Then depreſs the piſton or bucket from C to B; and as the air in the part B cannot get back again through the valve *b*, it will (as the bucket deſcends) raiſe the valve *a*, and ſo make its way through the upper part of the barrel *d* into the open air. But upon raiſing the bucket G a ſecond time, the air between it and the water in the lower pipe at *a* will be again left at liberty to fill a larger ſpace; and ſo its ſpring being again weakened, the preſſure of the outward air on the water in the veſſel K will force more water up into the lower pipe from *e* to *f*; and when the bucket is at its greateſt height C, the lower valve *b* will fall, and ſtop the hole in the box H as before. At the next ſtroke of the bucket or piſton, the water will riſe through the box H towards B; and then the valve *b*, which was raiſed by it, will fall when the bucket G is at its greateſt height. Upon depreſſing the bucket again, the water cannot be puſhed back through the valve *b*, which keeps cloſe upon the hole whilſt the piſton deſcends. And upon raiſing the piſton again, the outward preſſure of the air will force the water up through H, where it will raiſe the valve, and follow the bucket to C. Upon the next depreſſion of the bucket G, it will go down into the water in the barrel B; and as the water cannot be driven back through the now cloſe valve *b*, it will raiſe the valve *a* as the bucket deſcends, and will be lifted up by the bucket when it is next raiſed. And now, the whole ſpace below the bucket being full, the water above it cannot ſink when it is next depreſſed; but upon its depreſſion, the valve *a* will riſe to let the bucket go down; and when it is quite down, the valve *a* will fall by its weight, and ſtop the hole in the bucket. When the bucket is next raiſed, all the water above it will be lifted up, and begin to run off by the pipe F. And thus, by raiſing and depreſſing the bucket alternately, there is ſtill more water raiſed by it; which getting above the pipe F, into the wide top I, will ſupply the pipe, and make it run with a continued ſtream.

So, at every time the bucket is raiſed, the valve *b* riſes, and the valve *a* falls; and at every time the bucket is depreſſed, the valve *b* falls, and *a* riſes.

As it is the preſſure of the air or atmoſphere which cauſes the water to riſe and follow the piſton or bucket G as it is drawn up; and ſince a column of water 33 feet high is of equal weight with as thick a column of the atmoſphere from the earth to the very top of the air; therefore, the perpendicular height of the piſton or bucket from the ſurface of the water in the well muſt always be leſs than 33 feet; otherwiſe the water will never get above the bucket. But, when the height is leſs, the preſſure of the atmoſphere will be greater than the weight of the water in the pump, and will therefore raiſe it above the bucket: and when the water has once got above the bucket, it may be lifted thereby to any height, if the rod D be made long enough, and a ſufficient degree of ſtrength be employed to raiſe it with the weight of the water above the bucket.

Hydraulic Engines.

The force required to work a pump, will be as the height to which the water is raiſed, and as the ſquare of the diameter of the pump-bore in that part where the piſton works. So that, if two pumps be of equal heights, and one of them be twice as wide in the bore as the other, the wideſt will raiſe four times as much water as the narroweſt; and will therefore require four times as much ſtrength to work it.

The wideneſs or narrowneſs of the pump, in any other part beſides that in which the piſton works, does not make the pump either more or leſs difficult to work, except what difference may ariſe from the friction of the water in the bore; which is always greater in a narrow bore than in a wide one, becauſe of the greater velocity of the water.

The pump-rod is never raiſed directly by ſuch a handle as E at the top, but by means of a lever, whoſe longer arm (at the end of which the power is applied) generally exceeds the length of the ſhorter arm five or ſix times; and, by that means, it gives five or ſix times as much advantage to the power. Upon theſe principles, it will be eaſy to find the dimenſions of a pump that ſhall work with a given force, and draw water from any given depth. But, as theſe calculations have been generally neglected by pump-makers (either for want of ſkill or induſtry) the following table was calculated by the late ingenious Mr Booth for their benefit. In this calculation, he ſuppoſed the handle of the pump to be a lever increaſing the power five times; and had often found that a man can work a pump four inches diameter and 30 feet high, and diſcharge 27½ gallons of water (Engliſh wine-meaſure) in a minute. Now, if it be required to find the diameter of a pump that ſhall raiſe water with the ſame eaſe from any other height above the ſurface of the *well*; look for that height in the firſt column, and over-againſt it in the ſecond you have the diameter or width of the pump, and in the third you find the quantity of water which a man of ordinary ſtrength can diſcharge in a minute.

25 The forcing pump, Plate CLII. fig. 4.

The *forcing-pump* raiſes water through the box H in the ſame manner as the ſucking-pump does, when the plunger or piſton *g* is lifted up by the rod *D d*. But this plunger has no hole thro' it, to let the water in the barrel B C get above it, when it is depreſſed to B, and the valve *b* (which roſe by the aſcent of the water through the box H when the plunger *g* was drawn up) falls down and ſtops the hole in H, the moment that the plunger is raiſed to its greateſt height. Therefore, as the water between the plunger *g* and box H can neither get through the plunger upon its deſcent, nor back again into the lower part of the pump L *e*, but has a free paſſage by the cavity around H into the pipe MM, which opens into the air-veſſel KK at P; the water is forced through the pipe MM by the deſcent of the plunger, and driven into the air-veſſel; and in running up through the pipe at P, it opens the valve *a*; which ſhuts at the moment the plunger begins to be raiſed, becauſe the action of the water againſt the under ſide of the valve then ceaſes.

The water, being thus forced into the air-veſſel KK by repeated ſtrokes of the plunger, gets above the lower end of the pipe GHI, and then begins to condenſe the air in the veſſel KK. For, as the pipe GH is fixed air-tight into the veſſel below F, and the air has no way to get out of the veſſel but through the mouth of the pipe at I, and cannot get out when the mouth I is covered with water, and is more and more condenſed as the water riſes upon the pipe, the air then begins to act forcibly by its ſpring againſt the ſurface of the water at H: and this action drives the water up through the pipe IHGF, from whence it ſpouts in a jet S to a great height; and is ſupplied by alternately raiſing and depreſſing of the plunger *g*, which conſtantly forces the water that it raiſes thro' the valve H, along the pipe MM, into the air-veſſel KK.

Hydraulic Engines.

The higher that the ſurface of the water H is raiſed in the air-veſſel, the leſs ſpace will the air be condenſed into which before filled that veſſel; and therefore the force of its ſpring will be ſo much the ſtronger upon the water, and will drive it with the greater force through the pipe at F: and as the ſpring of the air continues whilſt the plunger *g* is riſing, the ſtream or jet S will be uniform, as long as the action of the plunger continues; and when the valve *b* opens, to let the water follow the plunger upward, the valve *a* ſhuts, to hinder the water, which is forced into the air-veſſel, from running back by the pipe MM into the barrel of the pump.

If there was no air-veſſel to this engine, the pipe GHI would be joined to the pipe MMN at P; and then, the jet S would ſtop every time the plunger is raiſed, and run only when the plunger is depreſſed.

26 The liſting pump. Plate CLII. fig. 13.

Of *liſting-pumps* there are ſeveral ſorts; the moſt common is thus conſtructed. AB is the barrel, fixed in the frame KILM; which is alſo fixed immoveable, with the lower part in the water that is to be pumped up. GEQHO is a frame with two ſtrong iron rods, moveable through holes in the upper and lower parts of the pump, IK and LM. In the bottom of this frame is fixed an inverted piſton BD, with its bucket and valve uppermoſt at D. From the top of the barrel there goes off a part KH, either fixed to the barrel, or moveable by a ball and ſocket (as here repreſented at F); but in either caſe ſo very exact and tight, that no water or air can poſſibly get into the barrel, as that would prevent the effect of the pump. In this part, at C, is fixed a valve opening upward.

When the piſton frame is thruſt down into the water, the piſton D will deſcend, and the water beneath it ruſh up through the valve at D, and get above the piſton; where, upon the frame's being lifted up, the piſton will force the water through the valve C, into the ciſtern P, there to run off by the ſpout. It is to be remembered, that this ſort of pump muſt be ſet ſo far in the water, that the piſton may play below its ſurface. It appears by the above deſcription, that this is only a different manner of conſtructing a forcing-pump.

By means of forcing-pumps, — water may be raiſed to any height above the level of a river or ſpring; and machines may be contrived to work theſe pumps, either by a running ſtream, a fall of water, or by horſes. An inſtance in each ſort will be ſufficient to ſhew the method.

Plate CLII. fig. 5.

1. By a running ſtream, or a fall of water. Let AA be a wheel, turned by the fall of water BB; and have any number of cranks (ſuppoſe ſix) as C, D, E, F, G, H, on its axis, according to the ſtrength of the fall of water, and the height to which the water is intended to be raiſed by the engine. As the wheel turns round, theſe cranks move the levers *c*, *d*, *e*, *f*, *g*, *h*, up and down, by the iron rods *i*, *k*, *l*, *m*, *n*, *o*; which alternately raiſe and depreſs the piſtons by the other iron rods *p*, *q*, *r*, *s*, *t*, *u*, *w*, *x*, *y*, in 12 pumps; nine whereof, as L, M, N, O, P, Q, R, S, T, appear in the plate; the other three being hid behind the work at V. And as pipes may go from all theſe pumps, to convey

Hydraulic Engines.

vey the water (drawn up by them to a ſmall height) into a cloſe ciſtern, from which the main pipe proceeds, the water will be forced into this ciſtern by the deſcent of the piſtons. And as each pipe, going from its reſpective pump into the ciſtern, has a valve at its end in the ciſtern, theſe valves will hinder the return of the water by the pipes; and therefore, when the ciſtern is once full, each piſton upon its deſcent will force the water (conveyed into the ciſtern by a former ſtroke) up the main pipe, to the height the engine was intended to raiſe it: which height depends upon the quantity raiſed, and the power that turns the wheel. When the power upon the wheel is leſſened by any deſect of the quantity of water turning it, a proportionable number of the pumps may be laid aſide, by diſengaging their rods from the vibrating levers.

This figure is a repreſentation of the engine erected at Blenheim for the duke of Marlborough, by the late ingenious Mr Alderſea. The water-wheel is $7\frac{1}{2}$ feet in diameter, according to Mr Switzer's account in his Hydraulics.

When ſuch a machine is placed in a ſtream that runs upon a ſmall declivity, the motion of the levers and action of the pumps will be but ſlow; ſince the wheel muſt go once round for each ſtroke of the pumps. But, when there is a large body of flow running water, a cog or ſpur wheel may be placed upon each ſide of the water-wheel AA, upon its axis, to turn a trundle upon each ſide; the cranks being upon the axis of the trundle. And by proportioning the cog-wheels to the trundles, the motion of the pumps may be made quicker, according to the quantity and ſtrength of the water upon the firſt wheel; which may be as great as the workman pleaſes, according to the length and breadth of the float-boards or wings of the wheel. In this manner, the engine for raiſing water at London-Bridge is conſtructed in which the water-wheel is 20 feet diameter, and the floats 14 feet long.

ABCD is a wheel turned by water according to the order of the letters. On the horizontal axis are four ſmall wheels, toothed almoſt half round; and the parts of their edges on which there are no teeth are cut down ſo as to be even with the bottoms of the teeth where they ſtand.

The teeth of theſe four wheels take alternately into the teeth of four racks, which hang by two chains over the pullies Q and L; and to the lower ends of theſe racks there are four iron rods fixed, which go down into the four forcing-pumps, S, R, M, and N. And, as the wheels turn, the racks and pump-rods are alternately moved up and down.

Thus ſuppoſe the wheel G has pulled down the rack I, and drawn up the rack K by the chain: as the laſt tooth of G juſt leaves the uppermoſt tooth of I, the firſt tooth of H is ready to take into the lowermoſt tooth of the rack K, and pull it down as far as the teeth go; and then the rack I is pulled upward thro' the whole ſpace of its teeth, and the wheel G is ready to take hold of it, and pull it down again, and ſo draw up the other.——In the ſame manner, the wheels E and F work the racks O and P.

Theſe four wheels are fixed on the axle of the great wheel in ſuch a manner, with reſpect to the poſitions of their teeth, that, whilſt they continue turning round, there is never one inſtant of time in which one or other of the pump-rods is not going down and forcing the water. So that, in this engine, there is no occaſion for having a general air-veſſel to all the pumps, to procure a conſtant ſtream of water flowing from the upper end of the main pipe.

From each of theſe pumps, near the loweſt end, in the water, there goes off a pipe, with a valve on its fartheſt end from the pump; and theſe ends of the pipes all enter one cloſe box, into which they deliver the water: and into this box, the lower end of the main conduct-pipe is fixed. So that, as the water is forced or puſhed into the box, it is alſo puſhed up the main pipe to the height that it is intended to be raiſed.

(2d) 28 A pump-and gentlemen want to have water raiſed, and brought to their houſes from a rivulet or ſpring; this may be effected by a horſe-engine, working three forcing-pumps which ſtand in a reſervoir filled by the ſpring or rivulet: the piſtons being moved up and down in the pumps by means of a triple crank ABC, which, as it is turned round by the trundle G, raiſes and depreſſes the rods D, E, F. If the wheel has three times as many cogs as the trundle has ſtaves or rounds, the trundle and cranks will make three revolutions for every one of the wheel: and as each crank will fetch a ſtroke in the time it goes round, the three cranks will make nine ſtrokes for every turn of the great wheel. engine to go by horſes. Plate CLIII. fig. 6.

The cranks ſhould be made of caſt iron, becauſe *that* will not bend; and they ſhould each make an angle of 120 with both of the others, as at *a*, *b*, *c*; which is (as it were) a view of their *radii* in looking endwiſe at the axis: and then there will be always one or other of them going downward, which will puſh the water forward with a continued ſtream into the main pipe. For, when *b* is almoſt at its loweſt ſituation, and is therefore juſt beginning to loſe its action upon the piſton which it moves, *c* is beginning to move downward, which will by its piſton continue the propelling force upon the water: and when *c* is come down to the poſition of *b*, *a* will be in the poſition of *c*.

The more perpendicularly the piſton-rods move up and down in the pumps, the freer and better will their ſtrokes be: but a little deviation from the perpendicular will not be material. Therefore, when the pump-rods D, E, and F, go down into a deep well, they may be moved directly by the cranks, as is done in a very good horſe-engine of this ſort at the late Sir James Creed's at Greenwich, which forces up water about 64 feet from a well under ground, to a refervoir on the top of his houſe. But when the cranks are only at a ſmall height above the pumps, the piſtons muſt be moved by vibrating levers, as in the above engine at Blenheim: and the longer the levers are, the nearer will the ſtrokes be to a perpendicular.

29 A calculation of the quantity of water that may be raiſed by a horſe-engine.

Let us ſuppoſe, that in ſuch an engine as Sir James Creed's, the great wheel is 12 feet diameter, the trundle 4 feet, and the radius or length of each crank 9 inches, working a piſton in its pump. Let there be three pumps in all, and the bore of each pump be four inches diameter. Then, if the great wheel has three times as many cogs as the trundle has ſtaves, the trundle

Hydraulic Engines.

dle and cranks will go three times round for each revolution of the horſes and wheel, and the three cranks will make nine ſtrokes of the pumps in that time, each ſtroke being 18 inches (or double the length of the crank) in a four-inch bore. Let the diameter of the horſe-walk be 18 feet, and the perpendicular height to which the water is raiſed above the ſurface of the well be 64 feet.

If the horſes go at the rate of two miles an hour (which is very moderate walking) they will turn the great wheel 187 times round in an hour.

In each turn of the wheel the piſtons make nine ſtrokes in the pumps, which amount to 1683 in an hour.

Each ſtroke raiſes a column of water 18 inches long and four inches thick, in the pump barrels; which column, upon the deſcent of the piſton, is forced into the main pipe, whoſe perpendicular altitude above the ſurface of the well is 64 feet.

Now, ſince a column of water 18 inches long, and 4 inches thick, contains 226.18 cubic inches, this number multiplied by 1683 (the ſtrokes in an hour) gives 380661 for the number of cubic inches of water raiſed in an hour.

A gallon, in wine-meaſure, contains 231 cubic inches, by which divide 380661, and it quotes 1468 in round numbers, for the number of gallons raiſed in an hour; which, divided by 63, gives $26\frac{1}{2}$ hogſheads. If the horſes go faſter, the quantity raiſed will be ſo much the greater.

In this calculation it is ſuppoſed that no water is waſted by the engine. But as no forcing engine can be ſuppoſed to loſe leſs than a fifth part of the calculated quantity of water, between the piſtons and barrels, and by the opening and ſhutting of the valves, the horſes ought to walk almoſt $2\frac{1}{2}$ miles *per* hour to fetch up this loſs.

A column of water 4 inches thick and 64 feet high, weighs $349\frac{9}{16}$ pounds averdupois, or $424\frac{5}{16}$ pounds troy; and this weight, together with the friction of the engine, is the reſiſtance that muſt be overcome by the ſtrength of the horſes.

The horſe-tackle ſhould be ſo contrived, that the horſes may rather puſh on than drag the levers after them. For, if they draw, in going round the walk, the outſide leather-ſtraps will rub againſt their ſides and hams; which will hinder them from drawing at right angles to the levers, and ſo make them pull at a diſadvantage. But if they puſh the levers before their breaſts, inſtead of dragging them, they can always walk at right angles to theſe levers.

It is noways material what the diameter of the main or conduct pipe be: for the whole reſiſtance of the water therein againſt the horſes will be according to the height to which it is raiſed, and the diameter of that part of the pump in which the piſton works, as we have already obſerved. So that by the ſame pump, an equal quantity of water may be raiſed in (and conſequently made to run from) a pipe of a foot diameter, with the ſame eaſe as in a pipe of five or ſix inches: or rather with more eaſe, becauſe its velocity in a large pipe will be leſs than in a ſmall one, and therefore its friction againſt the ſides of the pipe will be leſs alſo.

And the force required to raiſe water depends not upon the length of the pipe, but upon the perpendicular height to which it is raiſed therein above the level of the ſpring. So that the ſame force, which would raiſe water to the height AB in the upright pipe A *i k l m n o p q* B, will raiſe it to the ſame height or level B1H in the oblique pipe AEFGH. For the preſſure of the water at the end A of the latter, is no more than its preſſure againſt the end A of the former.

Hydraulic Engines.

Plate CLIII. fig. 7.

The weight or preſſure of water at the lower end of the pipe, is always as the ſine of the angle to which the pipe is elevated above the level parallel to the horizon. For, although the water in the upright pipe AB would require a force applied immediately to the lower end A equal to the weight of all the water in it, to ſupport the water, and a little more to drive it up and out of the pipe; yet, if that pipe be inclined from its upright poſition to an angle of 80 degrees (as in A 80) the force required to ſupport or to raiſe the ſame cylinder of water will then be as much leſs, as the ſine 80 *b* is leſs than the radius AB; or as the ſine of 80 degrees is leſs than the ſine of 90. And ſo, decreaſing as the ſine of the angle of elevation leſſens, until it arrives at its level AC or place of reſt, where the force of the water is nothing at either end of the pipe. For, altho' the abſolute weight of the water is the ſame in all poſitions, yet its preſſure at the lower end decreaſes, as the ſine of the angle of elevation decreaſes; as will appear plainly by a farther conſideration of the figure.

Let two pipes, AB and AC, of equal lengths and bores, join each other at A; and let the pipe AB be divided into 100 equal parts, as the ſcale S is; whoſe length is equal to the length of the pipe.—Upon this length, as a radius, deſcribe the quadrant BDC, and divide it into 90 equal parts or degrees.

Let the pipe AC be elevated to 10 degrees upon the quadrant, and filled with water: then, part of the water that is in it will riſe in the pipe AB; and if it be kept full of water, it will raiſe the water in the pipe AB from A to *i*; that is, to a level *i* 10 with the mouth of the pipe at 10: and the upright line *a* 10, equal to A *c*, will be the ſine of 10 degrees elevation; which being meaſured upon the ſcale S, will be about 17.4 of ſuch parts as the pipe contains 100 in length: and therefore, the force or preſſure of the water at A, in the pipe A 10, will be to the force or preſſure at A in the pipe AB, as 17.3 to 100.

Let the ſame pipe be elevated to 20 degrees in the quadrant; and if it be kept full of water, part of that water will run into the pipe AB, and riſe therein to the height A *k*, which is equal to the length of the upright line *b* 20, or to the ſine of 20 degrees elevation; which, being meaſured upon the ſcale S, will be 34.2 of ſuch parts as the pipe contains 100 in length. And therefore, the preſſure of the water at A, in the full pipe A 20, will be to its preſſure, if that pipe were raiſed to the perpendicular ſituation AB, as 34.2 to 100.

Elevate the pipe to the poſition A 30 on the quadrant, and if it be ſupplied with water, the water will riſe from it, into the pipe AB, to the height A *l*, or to the ſame level with the mouth of the pipe at 30. The ſine of this elevation, or of the angle of 30 degrees, is *c* 30; which is juſt equal to half the length

of

Hydraulic Engines.

of the pipe, or to 50 of ſuch parts of the ſcale as the length of the pipe contains 100. Therefore, the preſſure of the water at A, in a pipe elevated 30 degrees above the horizontal level, will be equal to one half of what it would be if the ſame pipe ſtood upright in the ſituation AB.

And thus, by elevating the pipe to 40, 50, 60, 70, and 80 degrees on the quadrant, the ſines of theſe elevations will be *d* 40, *e* 50, *f* 60, *g* 70, and *h* 80; which will be equal to the heights Am, An, Ao, Ap, and Aq: and theſe heights meaſured upon the ſcale *S* will be 64.3, 76.6, 86.6, 94.0, and 98.5; which expreſs the preſſures at A in all theſe elevations, conſidering the preſſure in the upright pipe AB as 100.

28	469	58	848	88	999
29	485	59	857	89	1000
30	500	60	866	90	1000

Becauſe it may be of uſe to have the lengths of all the ſines of a quadrant from 0 degrees to 90, we have given the foregoing Table, ſhewing the length of the ſine of every degree in ſuch parts as the whole pipe (equal to the radius of the quadrant) contains 1000. Then the ſines will be integral or whole parts in length. But if you ſuppoſe the length of the pipe to be divided only into 100 equal parts, the laſt figure of each part or ſine muſt be cut off as a decimal; and then thoſe which remain at the left hand of this ſeparation will be integral or whole parts.

Thus, if the radius of the quadrant (ſuppoſed to be equal to the length of the pipe AC) be divided into 1000 equal parts, and the elevation be 45 degrees, the ſine of that elevation will be equal to 707 of theſe parts: but if the radius be divided only into 100 equal parts, the ſame ſine will be only 70.7 or $70\frac{7}{10}$ of theſe parts. For, as 1000 is to 707, ſo is 100 to 70.7.

As it is of great importance to all engine-makers, to know what quantity and weight of water will be contained in an upright round pipe of a given diameter and height; ſo as, by knowing what weight is to be raiſed, they may proportion their engines to the force which they can afford to work them; we ſhall ſubjoin Tables ſhewing the number of cubic inches of water contained in an upright pipe of a round bore, of any diameter from one inch to ſix and a half, and of any height from one foot to two hundred: together with the weight of the ſaid number of cubic inches, both in troy and avoirdupois ounces. The number of cubic inches divided by 231, will reduce the water to gallons in wine-meaſure; and, divided by 282, will reduce it to the meaſure of ale-gallons. Alſo, the troy ounces divided by 12, will reduce the weight to troy pounds; and the avoirdupois ounces divided by 16, will reduce the weight to avoirdupois pounds.

And here we muſt repeat it again, that the weight or preſſure of the water acting againſt the power that works the engine, muſt always be eſtimated according to the perpendicular height to which it is to be raiſed, without any regard to the length of the conduct-pipe, when it has an oblique poſition, and as if the diameter of that pipe were juſt equal to the diameter of that part of the pump in which the piſton works. Thus, by the following Tables, the preſſure of the water, againſt an engine whoſe pump is of a $4\frac{1}{2}$ inch bore, and the perpendicular height of the water in the conduct pipe is 80 feet, will be equal to 8057.5 troy ounces, and to 8848.2 avoirdupois ounces; which makes 671.4 troy pounds, and 553 avoirdupois.

EXAMPLE. *Required the number of cubic inches, and the weight of the water, in an upright pipe 278 feet high, and $1\frac{1}{4}$ inch diameter.*

	Feet.	*Cubic inches.*	*Troy oz.*	*Avoir. oz.*
	200	4241.1	2238.2	2457.8
	70	1484.4	783.3	860.2
	8	169.6	89.5	98.3
Anſw.	278	5895.1	3111.0	3416.3

Here the neareſt ſingle decimal figure is only taken into the account; and the whole being reduced by diviſion, amounts to $25\frac{1}{2}$ wine-gallons in meaſure; to $259\frac{1}{4}$ pounds troy, and to $213\frac{1}{4}$ pounds avoirdupois.

Theſe tables were at firſt calculated to ſix decimal places for the ſake of exactneſs: but in tranſcribing them there are no more than two decimal figures taken into the account, and ſometimes but one; becauſe there is no neceſſity for computing to hundredth-parts of an inch or of an ounce in practice.

Hydraulic Engines.

Under the article STEAM-*Engine*, the reader will find a particular account of that useful invention, with a correct deſcription and plate of it in its improved ſtate.

30 Steam-engine.

THE *multiplying machine* has no dependence on the action of the atmoſphere; but, by the weight of water only, and without pump-work of any kind, raiſes water ſufficient to ſerve a gentleman's ſeat, with an overplus for fountains, fiſh-ponds, &c.

31 Engine for raiſing water by a multiplying wheel. Plate CLVI fig. 6.

AB are two copper pans or buckets of unequal weight and ſize, ſuſpended to chains, which alternately wind off and on the multiplying-wheel YZ; whereof the wheel Y is ſmaller in diameter, and Z larger, in proportion to the different lifts each is deſigned to perform.

When the buckets are empty, they are ſtopped level with the ſpring at X, whence they are both filled with water in the ſame time.

The greater of the two A, being the heavier when full, preponderates and deſcends ten feet, perhaps from C to D; and the leſſer, B, depending on the ſame axis, is thereby weighed up or raiſed from E to F, ſuppoſe thirty feet.

Here, by particular little contrivances, opening the valves placed at bottom of each of theſe buckets, they both diſcharge their water in the ſame time, through apertures proportionable to their capacities; the ſmaller into the ciſtern W, whence it is conveyed for ſervice by the pipe T, and the larger at D, to run waſte by the drain below at H. The bucket B being empty, is ſo adjuſted as then to overweigh; and deſcending ſteadily as it roſe betwixt the guiding rods VV, brings or weighs up A to its former level at X, where both being again repleniſhed from the ſpring, they thence proceed as before. And thus will they continue conſtantly moving (merely by their circumſtantial difference of water-weight, and without any aſſiſtance than that of ſometimes giving the iron-work a little oil) ſo long as the materials ſhall laſt, or the ſpring ſupply water.

The ſteadineſs of the motion is in part regulated by a worm turning a jack-fly, and a little ſimple wheel-work at LM; which communicating with the multiplying wheel axle at M, is thereby moved forward or backward as the buckets either riſe or deſcend. But what principally keeps the whole movement ſteady, is the equilibrium preſerved in the whole operation by a certain weight of lead, at the end of a lever of fit length, and fixed on one of the ſpindles of the wheel-work, the numbers whereof are ſo calculated as, during the whole performance up and down, to let it move no more than one-fourth of a circle, from G to K; by which contrivance, as more or leſs of the chains ſuſpending the buckets come to be wound off their reſpective wheels Y and Z, this weight gradually falls in as a counter-balance, and ſo continues the motion equable and eaſy in all its parts.

The water waſted by this machine is not above the hundredth part of what a water-wheel will expend, to raiſe an equal quantity. But where a fall, proportionable to the intended riſe of water, cannot be had, with a convenient ſewer to carry off the waſte water over and above, this device cannot be well put in practice.

32 Perſian wheel. Plate III. fig. 8.

WATER may alſo be raiſed by means of a ſtream AB turning a wheel CDE, according to the order of the letters, with buckets *a*, *a*, *a*, *a*, &c. hung upon the wheel by ſtrong pins *b*, *b*, *b*, *b*, &c. fixed in the ſide of the rim: but the wheel muſt be made as high as the water is intended to be raiſed above the level of that part of the ſtream in which the wheel is placed. As the wheel turns, the buckets on the right hand go down into the water, and are thereby filled, and go up full on the left hand, until they come to the top at K, where they ſtrike againſt the end *n* of the fixed trough M, and are thereby overſet, and empty the water into the trough; from which it may be conveyed in pipes to the place which it is deſigned for: and as each bucket gets over the trough, it falls into a perpendicular poſition again, and goes down empty, until it comes to the water at A, where it is filled as before. On each bucket is a ſpring *r*, which, going over the top or crown of the bar *m*, (fixed to the trough M), raiſes the bottom of the bucket above the level of its mouth, and ſo cauſes it to empty all its water into the trough.

Hydraulic Engines.

Sometimes this wheel is made to raiſe water no higher than its axis; and then, inſtead of buckets hung upon it, its ſpokes, C, *d*, *e*, *f*, *g*, *b*, are made of a bent form, and hollow within; theſe hollows opening into the holes C, D, E, F, in the outſide of the wheel, and alſo into thoſe at O in the box N upon the axis. So that as the holes CD, &c. dip into the water, it runs into them; and as the wheel turns, the water riſes in the hollow ſpokes *c d*, &c. and runs out in a ſtream P from the holes at O, and falls into the trough Q, from whence it is conveyed by pipes. And this is a very eaſy way of raiſing water, becauſe the engine requires neither men nor horſes to turn it.

33 Fire-engines.

ENGINES for extinguiſhing fire are either forcing or lifting-pumps; and being made to raiſe water with great velocity, their execution in great meaſure depends upon the length of their levers, and the force wherewith they are wrought.

Plate CLV. fig. 15.

For example, AB is the common ſquirting fire-engine. D C is the frame of a lifting-pump, wrought by the levers E and F acting always together. During the ſtroke, the quantity of water raiſed by the piſton N ſpouts with force through the pipe G, made capable of any degree of elevation by means of the yielding leather-pipe H, or by a ball and ſocket, capable of turning every way, ſcrewed on the top of the pump. Between the ſtrokes on this machine the ſtream is diſcontinued. The engine is ſupplied by water poured in with buckets above; the dirt and filth whereof are kept from choaking the pump work by help of the ſtrainer IK.

A conſiderable improvement has ſince been made to theſe machines in order to keep them diſcharging a continual ſtream. In doing whereof it is not to be underſtood that they really throw out more water than do the ſquirting ones of the ſame ſize and dimenſions with themſelves; but that the velocity of the water, and of courſe the friction of all the parts, being leſs violent, the ſtream is more even and manageable, and may be directed hither or thither with greater eaſe and certainty than if it came forth only by fits and ſtarts: The machine, thus improved, is therefore generally better adapted to the purpoſe intended than the former, eſpecially in the beginning of theſe calamitous accidents.

Hydraulic Engines. Plate CLV. fig. 16.

The ſtream is made continual from the ſpring of air confined in a ſtrong metal veſſel CC, in the fire-engine AB, fixed between the two forcing-pumps D and E, wrought with a common double lever FG moving on the centre H. The piſtons in D and E both ſuck and force alternately, and are here repreſented in their different actions; as are alſo the reſpective valves at IK and LM.

The water to ſupply this engine, if there be no opportunity of putting the end of a ſucking-pipe, occaſionally to be ſcrewed on, into a moat or canal, which would ſpare much hurry and labour in caſe of fire, is alſo poured into the veſſel AB; and being ſtrained through the wire-grate N, is, by the preſſure of the atmoſphere, raiſed through the valves K and M into the barrels of D or E, when either of their forcers aſcend; whence again it will be powerfully puſhed when they deſcend into the air-veſſel CC, thro' the valves I and L by turns: by the force whereof the common air between the water and the top of the air-veſſel O will from time to time be forcibly crowded into leſs room, and much compreſſed; and the air being a body naturally endowed with a ſtrong and lively ſpring, and always endeavouring to dilate itſelf every way alike in ſuch a circumſtance, bears ſtrongly both againſt the ſides of the veſſel wherein it is confined, and the ſurface of the water thus injected; and ſo makes a conſtant regular ſtream to riſe through the metal pipe P into the leather one Q, ſcrewed thereon; which being flexible, may be led about into rooms and entries, as the caſe may require.

Should the air contained in this veſſel be compreſſed into half the ſpace it took up in its natural ſtate, the ſpring thereof will be much about doubled; and as before it equalled and was able to ſuſtain the preſſure of a ſingle atmoſphere, it having now a double force, by the power of that ſpring alone will throw water into air, of the common degree of denſity, about thirty feet high. And ſhould this compreſſure be ſtill augmented, and the quantity of air which at firſt filled the whole veſſel be reduced into one-third of that ſpace, its ſpring will be then able to reſiſt, and conſequently to raiſe the weight of a treble atmoſphere; in which caſe, it will throw up a jet of water ſixty feet high. And ſhould ſo much water again be forced into the veſſel as to fill three parts of the capacity, it will be able to throw it up about ninety feet high: and wherever the ſervice ſhall require a ſtill greater riſe of water, more water muſt be thruſt into this veſſel; and the air therein being thus driven by main force into a ſtill narrower compaſs, at each exploſion, the gradual reſtitution thereof to its firſt dimenſions is what regularly carries on the ſtream between the ſtrokes, and renders it continual during the operation of the machine.

This experiment, in little, may be either made on the lifting or forcing pump, the noſels of which may be left large, on purpoſe for the reception of the ſmall pipe F, reaching nearly to the valve at E, and occaſionally to be ſcrewed in. Between this pipe and the ſides and top of the noſel H, a quantity of air will neceſſarily be lodged, which, when the forcer acts, will be compreſſed at every ſtroke by the riſe of the water; more whereof will be puſhed through E than can immediately get away through the pipe F, which is to be always leſs in diameter than the opening of the valve at E. The degree of which condenſation, and that of the reſtitution to its natural ſtate of denſity, may be obſerved through the glaſs-machines to ſatisfaction. Hydraulic Engines.

34 The ſcrew of Archimedes. Plate CLIV. fig. 4.

ARCHIMEDES's SCREW is a ſort of ſpiral pump, and receives its name from its inventor. It conſiſts of a long cylinder AB with a hollow pipe CD round it; and is placed in an oblique poſition, with the lower end in the water, the other end being joined to the lower end of the winch IK, ſupported by the upright piece IR.

When this ſcrew is immerſed in the water, it immediately riſes in the pipe by the orifice C to a level with the ſurface of the water EF; and if the point in the ſpiral, which in the beginning of the motion is coincident with the ſurface of the water, happen not to be on the lower ſide of the cylinder, the water, upon the motion of the ſcrew, will move on in the ſpiral till it come to the point on the other ſide that is coincident with the water. When it arrives at that point, which we will ſuppoſe to be O, it cannot afterwards poſſeſs any other part of the ſpiral than that on the loweſt part of the cylinder: for it cannot move from O toward H or G, becauſe they are higher above the horizon; and as this will be conſtantly the caſe after the water in the ſpiral has attained the point O, it is plain it muſt always be on the under ſide of the cylinder.

But becauſe the cylinder is in conſtant motion, every part of the ſpiral ſcrew, from O to D, will by degrees ſucceed to the under part of the cylinder. The water therefore muſt ſucceed to every part of it, from O to D, as it comes on the lower ſide; that is, it muſt aſcend on the lower part of the cylinder through all the length of the pipe, till it come to the orifice at D, where it muſt run out, having nothing further to ſupport it.

35 The pumps balance-pumps, fig. 5, 6.

THERE is a ſimple and eaſy method of working two pumps at once, by means of the balance AB, having a large iron ball at each end, and placed in equilibrium on the two ſpindles C, as repreſented in the 6th figure. On the right and left are two boards I, nailed to two croſs pieces, faſtened to the axis of the machine. On theſe boards the perſon who is to work the pump ſtands, and ſupports himſelf by a croſs piece nailed to the two poſts ED, fig. 5. At the diſtance of ten inches on each ſide the axis, are faſtened the piſtons MN.

The man, by leaning alternately on his right and left foot, puts the balance in motion, by which the pumps OP are worked, and the water thrown into the pipe H, and carried to a height proportional to the diameter of the valves, and the force of the balance. There muſt be placed on each ſide an iron ſpring, as F and G, to return the balance, and prevent its acquiring too great velocity.

36 The chain-pump. Plate CLV. fig. 3.

THE *Chain-pump*, AB, is ordinarily made from twelve to twenty-four feet long; and conſiſts of two collateral ſquare barrels, and a chain of piſtons of the ſame form, fixed at proper diſtances thereon. The chain is moved in theſe round a coarſe kind of wheel-work at either end of the machine, the teeth whereof are ſo made as to receive one half of the flat piſtons, and let them fold in; and they take hold of the links as they riſe in one of the barrels, and return by the other. The machine is wrought either by the turning

Entertaining experiments.

of one handle or two, according to the labour required, depending on the height to which the water is to be raifed. A whole row of the piftons (which go free of the fides of the barrel by perhaps a quarter of an inch) are always lifting when the pump is at work; yet do they, by the general puth in the ordinary way of working, as it is pretty brifk, commonly bring up a full bore of water in the pump. This machine is fo contrived, that, by the continual folding in of the piftons, ftones, dirt, and whatever happens to come in the way, may alfo be cleared; and therefore it is generally made ufe of to drain ponds, to empty fewers, and remove foul waters, in which no other pump could work.

37 The hydraulic fcoop. Plate CLIV fig. 9.

THE laft machine to be defcribed confifts of five pieces of board, forming a fort of fcoop, as B. The handle C is fufpended by a rope faftened to three poles, placed in a triangle, and tied together at A.

The working of this machine confifts entirely in balancing the fcoop that contains the water, and directing it in fuch manner that the water may be thrown in any given direction. It is evident that the operation of this machine is fo very eafy, that it may rather be confidered as an agreeable and falutary recreation than hard labour.

With this machine a man of moderate ftrength, by two ftrokes in four feconds, can draw half a cubic foot of water, that is, more than four hundred cubic feet in an hour.

This machine is frequently ufed by the Dutch in emptying the water from their dikes.

38 The fyphon diffufed, Tantalus's cup, &c. Plate CLIV.

SECT. VI. *Entertaining Experiments.*

1. SEVERAL amufing appearances may be produced by difguifing or diverfifying a fyphon. It may, for example, be difguifed in a cup, from which no liquor will flow till the fluid is raifed therein to a certain height; but when the efflux is once begun, it will continue till the veffel is emptied. Thus, fig. 11. is a cup, in the centre whereof is fixed a glafs pipe A, continued through the bottom at B, over which is put another glafs tube, made air-tight at top by means of the cork at C; but left fo open at foot, by holes made at D, that the water may freely rife between the tubes as the cup is filled. Till the fluid in the cup fhall have gained the top of the inmoft pipe at A, no motion will appear: The air however from between the two pipes being in the mean time extruded, by the rife of the denfer fluid, and paffing down the inner tube, will get away at bottom; and the water, as foon as the top of the inclofed tube fhall be covered thereby, will very foon follow, and continue to rife in this machine, as in the fyphon, till the whole is run off.

This is called by fome, a *Tantalus's cup;* and, to humour the thought, a hollow figure is fometimes put over the inner tube, of fuch a length, that when the fluid is got nearly up to the lips of the man, the fyphon may begin to act and empty the cup.

This is in effect no other than if the two legs of the fyphon were both within the veffel, as in fig. 12. into which the water poured will rife in the fhorter leg of the machine, by its natural preffure upwards, to its own level; and when it fhall have gained the bend of the fyphon, it will come away by the longer leg, as already defcribed. An apple, an orange, or any other folid, may be put into the veffel, to raife the water, when it is near the bend, to fet it a-running, by way of amufement.

Entertaining experiments.

Again, let the handle of the cup, fig. 8. be hollow; let the tube CD, fcrewed therein, communicate freely with the water poured into the cup, that it may rife equally in both. Being once above the level ED, it will overflow, and, defcending through the cavity DB, will empty the cup of its liquor. Plate CLIV

39 The fountain at command. Plate CLIII fig. 1.

2. The device called *the fountain at command*, acts upon the fame principle with the fyphon in the cup. Let two veffels A and B be joined together by the pipe C, which opens into them both. Let A be opened at top, B clofe both at top and bottom, (fave only a fmall hole at *b* to let the air get out of the veffel B,) and A be of fuch a fize as to hold about fix times as much water as B. Let a fyphon DEF be foldered to the veffel D, fo that the part DE may be within the veffel, and F without it; the end D almoft touching the bottom of the veffel, and the end F below the level of D: the veffel B hanging to A by the pipe C (foldered into both), and the whole fupported by the pillars G and H upon the ftand I. The bore of the pipe muft be conliderably lefs than the bore of the fyphon.

The whole being thus conftructed, let the veffel A be filled with water, which will run through the pipe C, and fill the veffel B. When B is filled above the top of the fyphon at E, the water will run through the fyphon, and be difcharged at F. But as the bore of the fyphon is larger than the bore of the pipe, the fyphon will run fafter than the pipe, and will foon empty the veffel B; upon which the water will ceafe from running through the fyphon at F, until the pipe C refills the veffel B, and then it will begin to run as before. And thus the fyphon will continue to run and ftop alternately, until all the water in the veffel A has run through the pipe C.—So that, after a few trials, one may eafily guefs about what time the fyphon will ftop, and when it will begin to run; and then, to amufe others, he may call out "*ftop*," or "*run*," accordingly.

40 Portable fountain and clepfydra. Plate CLV. fig. 18.

3. This fig. reprefents a very pretty portable fountain, which, being charged with water, and inverted, will play a jet nearly as high as the refervoir, till the fluid is exhaufted; and then turned up on the other end, the fame thing will happen, and a real clepfydra, or water-clock, be thereby formed.

This device confifts of two hollow veffels, A and B, communicating with each other only by the recurved tubes C and D; at the ends of which, E and F, are placed fmall adjutages to direct the jet. G and H are two open tubes, foldered into the bottom of the bafons belonging to A and B, through which the water flows in, and fills thofe veffels to a certain height, that is, according to their length. They by their difpofition alfo prevent the return of the water the fame way, when the machine is turned upfide down.

41 Hydroscope, or water-clock. Plate CLVI. fig. 4.

4. Provide a cylindric veffel of glafs or china, ABCD, about a foot high, and four inches diameter. Make a hole in its bottom, in which glue a fmall glafs-tube E, of about one-third of an inch diameter, and whofe end has been partly clofed in the flame of a lamp, fo that it will not fuffer the water to pafs out but by drops, and that very flowly. Cover the top of the veffel

Entertaining experiments.

fel with a circle of wood F, in the centre of which make a round hole about half an inch diameter.

Have a glafs-tube GH, a foot high, and a quarter of an inch diameter; and at one end let it have a fmall glafs globe I, to which you may hang a weight L, by which it is kept *in equilibrio*, on or near the furface of the water; or you may pour a fmall quantity of mercury into the tube, for the fame purpofe. Fill the veffel with water; put the tube in it, and over it place the cover F, through the hole of which the tube muft pafs freely up and down. Now, as the water drops gradually out of the veffel, the tube will continue to defcend till it come to the bottom.

Therefore, paſte on the tube a graduated paper, and put it in the veffel when nearly full of water. Hang a watch by it, fet to a certain hour; and as the tube defcends, mark the hours, with the half and quarter hours. If the veffel be fufficiently large, with regard to the hole at the bottom, it will go for 12 hours, a day, or as much longer as you pleafe, and requires no other trouble than that of pouring in water to a certain height. Care muft be had, however, that the water be clean; for if there be any fediment, it will in time ſtop the fmall hole at bottom, or at leaſt render the motion of the water irregular.

The veffel may be of tin, but the pipe at bottom fhould be glafs, that its fmall aperture may not alter by uſe. It is to be obſerved, that the tube of one of theſe clocks is not to be graduated by another: for though the veffel be of the fame diameter at top, it may not be perfectly cylindrical throughout; nor is it eaſy to make the hole at the bottom of one veffel exactly of the fame dimenſion with that of another.

42 Clepſydra. Plate CLVI fig. 7.

5. The hon. Mr Charles Hamilton has deſcribed a curious clepſydra or water-clock of new conſtruction. An open canal *e e*, fupplied with a conſtant and equal ſtream by the ſyphon *d*, has at each end *f f*, open pipes of exactly equal bores, which deliver the water that runs along the canal *e*, alternately into the veſſels *g* 1, *g* 2, in ſuch a quantity as to raiſe the water from the mouth of the tantalus *t*, exactly in an hour. The canal *e e* is equally poiſed by the two pipes *f* 1, *f* 2, upon a centre *r*, the ends of the canal *e* are raiſed alternately, as the cups *z z* are depreſſed, to which they are connected by lines running over the pullies *l l*. The cups *z z* are fixed at each end of the balance *m m*, which moves up and down upon its center *v*. *n* 1, *n* 2, Are the edges of two wheels or pullies, moving different ways alternately, and fitted to the cylinder *o* by oblique teeth both in the cavity of the wheel and upon the cylinder, which, when the wheel *n* moves one way, that is, in the direction of the minute-hand, meet the teeth of the cylinder and carry the cylinder with it, and, when *n* moves the contrary way, ſlip over thoſe of the cylinder, the teeth not meeting, but receding from each other. One or other of theſe wheels *n n* continually moves *o* in the ſame direction, with an equable and uninterrupted motion. A fine chain goes twice round each wheel, having at one end a weight *x*, always out of water, which equiponderates with *y* at the other end, when kept floating on the ſurface of the water in the veſſel *g*, which *y* muſt always be; the two cups *z*, *z*, one at each end of the balance, keep it *in æquilibrio*, till one of them is forced down by the weight and impulſe of the water, which it receives from the tantalus *t t i*: each of theſe cups *z*, *z*, has likewiſe a tantalus of its own *h*, *h*, which empties it after the water has done running from *g*, and leaves the two cups again *in æquilibrio*: *q* is a drain to carry off the water. The dial-plate, &c. needs no deſcription. The motion of the clepſydra is effected thus: As the end of the canal *e e*, fixed to the pipe *f* 1, is, in the figure, the loweſt, all the water ſupplied by the ſyphon runs through the pipe *f* 1, into the veſſel *g* 1, till it runs over the top of the tantalus *t*; when it immediately runs out at *i* into the cup *z*, at the end of the balance *m*, and forces it down; the balance moving on its centre *v*. When one ſide of *m* is brought down, the ſtring which connects it to *f* 1, running over the pulley *l*, raiſes the end *f* 1, of the canal *e*, which turns upon its centre *r*, higher than *f* 2; conſequently, all the water which runs through the ſyphon *d* paſſes through *f* 2 into *g* 2, till the ſame operation is performed in that veſſel, and ſo on alternately. As the height the water riſes in *g* in an hour, viz. from *s* to *t*, is equal to the circumference of *n*, the float *y* riſing thro' that height along with the water, lets the weight *x* act upon the pulley *n*, which carries with it the cylinder *o*; and this, making a revolution, cauſes the index *k* to deſcribe an hour on the dial-plate. This revolution is performed by the pulley *n* 1; the next is performed by *n* 2, whilſt *n* 1 goes back, as the water in *g* 1 runs out through the tantalus; for *y* muſt follow the water, as its weight increaſes, out of it. The axis *o* always keeps moving the ſame way; the index *p* deſcribes the minutes; each tantalus muſt be wider than the ſyphon, that the veſſels *g g* may be emptied as low as *s*, before the water returns to them.

43 A fountain which ſpouts water in form of a ſhower. fig. 2.

6. To the tube wherein the water is to riſe, fit a ſpherical or lenticular head, AB, made of a plate of metal, and perforated at top with a great number of little holes. The water riſing with vehemence towards AB, will be there divided into innumerable little threads, and afterwards broke, and diſperſed into the fineſt drops.

44 A fountain which ſpreads the water in form of a table-cloth. fig. 3.

7. To the tube AB, folder two ſpherical ſegments C and D, almoſt touching each other; with a ſcrew E, to contract or amplify the interſtice or chink at pleaſure. Others chooſe to make a ſmooth, even cleft, in a ſpherical or lenticular head, fitted upon the tube. The water ſpouting through the chink, or cleft, will expand itſelf in manner of a cloth.

45 The globular fountain. Plate CLVI. fig. 11.

8. Make a hollow globe A, of copper or lead, and of a ſize adapted to the quantity of water that comes from the pipe to which it is to be placed. Pierce a number of ſmall holes thro' this globe, that all tend towards its centre; obſerving, however, that the diameters of all theſe holes, taken together, muſt not exceed that of the pipe at the part from whence the water flows. Annex to it a pipe B, of ſuch height as you think convenient; and let it be ſcrewed at C, to the pipe from whence the jet flows. The water that comes from the jet ruſhing with violence into the globe, will be forced out at the holes, with the direction in which they are made, and will produce a very pleaſing ſphere of water.

45 The hydraulic dancer. fig. 17.

9. Procure a little figure made of cork, as AB, which you may paint, or dreſs in a light ſtuff, after your own fancy. In this figure you are to place the ſmall hollow cone C, made of thin leaf braſs. When the figure is placed on the jet-d'eau that plays in

ntertain- g experi- ents.

in a perpendicular direction, it will remain fuſpended on the top of the water, and perform a great variety of motions.

If a hollow ball of copper, of an inch diameter, and very light, be placed on a ſimilar jet, it will, in like manner, remain ſuſpended, revolving on its centre, and ſpreading the water all round it, in the manner repreſented by fig. 14. or Plate CLVI. fig. 1.—But note, that as it is neceſſary the ball, &c. when on the deſcent, ſhould keep the ſame preciſe perpendicular wherein it roſe (ſince otherwiſe it would miſs the ſtream and fall downright,) ſuch a *fountain* ſhould only be played in a place free from wind.

47 e hemi- ier cal caſe. te CLV. 2.

10. Make a hollow leaden cone A, whoſe axis is one-third of the diameter of its baſe. The circle C, that forms its baſe, muſt be in proportion to the ſurface of water that flows from the jet on which it is to be placed, that it may flow from it equally on all ſides. To the cone join the pipe B, which ſerves not only as a ſupport, but is to be pierced with a number of holes, that it may ſupply the cone with a ſufficient quantity of water. Screw the tube juſt mentioned to the top of that from whence the jet proceeds.—The water that ruſhes into the cone from the pipe, will run over its circumference, and form a hemiſpherical caſcade. If this piece be ſo conſtructed that it may be placed in a reverſed poſition, it will produce a fountain in the form of a vaſe, (ſee fig. 8.); and if there be a ſufficient quantity of water, both theſe pieces may be placed on the ſame pipe, the fountain at top and the caſcade underneath, which by their variety will produce a very pleaſing appearance.

48 e water- te CLVI 5.

11. Let there be two portions of a hollow ſphere, that are very ſhallow: and let them be ſo joined together, that the circular ſpace between them may be very narrow. Fix them vertically to a pipe from whence a jet proceeds. In that part by which the portions of the ſphere are joined, there muſt be made a number of holes; then the water ruſhing into the narrow cavity will be forced out the holes, and produce a regular figure of the ſun, as in the plate. This piece requires a large quantity and force of water to make it appear to advantage.

Several pieces of this ſort may be placed over each other, in a horizontal direction, and ſo that the ſame pipe may ſupply them all with water (ſee fig. 7.) It is proper to obſerve, that the diameter of theſe pieces muſt continually diminiſh, in proportion to their diſtance from the bottom.

e CLV.

49 revol- water- e CLV. 2.

12. Make a hollow circle A, the ſides of which are to be pierced with 12 or 15 holes, made in an inclined direction: or you may place the like number of ſmall tubes round the circle. Fix this circle on the top of a jet, in ſuch manner that it may turn freely round. The water ruſhing violently into the hollow circle will keep it in continual motion; and at the ſame time forcing out of the holes or ſmall tubes, will form a revolving figure with rays in different directions, as in the plate.

50 com- ou jet

13. Provide a ſtrong copper veſſel A, of ſuch figure as you think convenient; in which ſolder a pipe BE, of the ſame metal. Let there be a cock at H, which muſt be made ſo tight that no air can paſs by it. The pipe BE muſt go very near the bottom of the veſſel, but not touch it. There muſt be another pipe F, at whoſe extremity G there is a very ſmall hole: this pipe muſt be ſcrewed into the former.

Entertaining experiments.

The veſſel being thus diſpoſed, take a good ſyringe; and placing the end of it in the hole at G, open the cock, and force the air into the veſſel; then turn the cock and take out the ſyringe. Repeat this operation ſeveral times, till the air in the veſſel be ſtrongly condenſed. Then fill the ſyringe with water, and force it into the veſſel, in the ſame manner as you did the air; and repeat this operation till you can force no more water into the veſſel; then ſhut the cock. This veſſel will be always ready to perform an extempore jet d'eau: for, on turning the cock, the ſpring of the compreſſed air will force out the water with great violence, and the jet will continue, tho' conſtantly decreaſing in force, till the water is all exhauſted, or the air within the veſſel is come to the ſame denſity with that without.

51 The marvellous veſſel, fig. 5.

14. Let there be made a tin veſſel, about ſix inches high, and three inches in diameter. The mouth of this veſſel muſt be only one quarter of an inch wide; and in its bottom make a great number of ſmall holes, about the ſize of a common ſewing needle. Plunge this veſſel in water, with its mouth open; and when it is full, cork it up and take it out of the water. So long as the veſſel remains corked, no water whatever will come out, but as ſoon as it is uncorked, the water will iſſue from the ſmall holes at its bottom. You muſt obſerve, that if the holes at the bottom of the veſſel be more than one-ſixth of an inch diameter, or if they be in too great number, the water will run out tho' the veſſel be corked; for then the preſſure of the air againſt the bottom of the veſſel will not be ſufficient to confine the water.

52 A glaſs full of water inverted, and the water not ſpilt. Fig. 13.

An experiment ſimilar to this is made with a glaſs filled with water, over which a piece of paper is placed. The glaſs is then inverted; and the water, by the preſſure of the air under it, will remain in the glaſs. That the paper, tho' the ſeeming, is not the real, ſupport of the water, will appear from n° 20.

53 The circulating fountain, fig. 10.

15. In this fountain the boxes CE and DYX being cloſe, you ſee only the baſon ABW, with a hole at W, through which the water that ſpouts out at B falls and runs down through the pipe WX into the box DYX, from whence it drives out the air, through the aſcending pipe YZ, into the cavity of the box CE, where preſſing upon the water contained in that box, it forces it out, through the ſpouting pipe OB, as long as there is any water in CE; ſo that the continuance of the play is while the water in CE ſpouts out and falls down through the pipe WX, into the cavity DYX. The force of the jet is in proportion to the height of the pipe WX, or of the diſtance between the boxes CE and DY. The height of the water, meaſured from the baſon ABW to the ſurface of the water in the lower box DYX, is always equal to the height, meaſured from the top of the jet to the ſurface of the water in the middle cavity CE. Now, ſince the ſurface CE is always falling, and the water DY is always riſing, the height of the jet muſt continually decreaſe, till it is ſhorter by the depth of the cavity CE, which is emptying, added to the depth of the cavity DY, which is always filling; and when the jet is fallen ſo low, it immediately ceaſes.

The method of preparing this fountain is as follows. Firſt, pour water in at W, till you have filled the cavity

Entertaining experiments.

vity DXY: then turn the fountain over, and the water will run from the cavity DXY, into the cavity CE, which you will know to be full by the water's running out at B when it is held down. Set the fountain up again, and pour about a pint of water into the bason ABW; and as soon as it has filled the pipe WX, the fountain will play, and continue as long as there is any water in CE. You may then empty the water left in the bason into any other veſſel, and invert the fountain; which, upon being placed again erect, will begin to play, when the water poured out of the bason is put into it again. There are fountains of this ſort that have four pipes, inſtead of two, and by that means the water is forced up to twice the height it is in this. See alſo n° 40.

54 The magical caſcade, fig. 9.

16. Procure a tin veſſel ABC, five inches high and four in diameter; and let it be cloſed at top. To the bottom of this veſſel let there be ſoldered the pipe DE, of ten inches length and half an inch in diameter: this pipe muſt be open at each end, and the upper end muſt be above the water in the veſſel. To the bottom alſo fix five or ſix ſmall tubes F, about one-eighth of an inch diameter. By theſe pipes the water contained in the veſſel is to run ſlowly out.

Place this machine on a ſort of tin bason GH, in the middle of which is a hole of one quarter of an inch diameter. To the tube DE, fix ſome pieces that may ſupport the veſſel over the bason; and obſerve that the end D, of the tube DE, muſt be little more than one quarter of an inch from the bason. There muſt be alſo another veſſel placed under the bason, to receive the water that runs from it.

Now, the ſmall pipes diſcharging more water into the bason than can run out at the hole in its centre, the water will riſe in the bason, above the lower end of the pipe DE, and prevent the air from getting into the veſſel AB; and conſequently the water will ceaſe to flow from the ſmall pipes. But the water continuing to flow from the bason, the air will have liberty again to enter the veſſel AB, by the tube DE, and the water will again flow from the ſmall pipes. Thus they will alternately ſtop and flow, as long as any water remains in the veſſel AB.

As you will eaſily know, by obſerving the riſe of the water, when the pipes will ceaſe to flow, and by the fall of it, when they will begin to run again, you may ſafely predict the change; or you may command them to run or ſtop, and they will ſeem to obey your orders.

55 The illuminated fountain, fig. 4.

17. This fountain begins to play when certain candles placed round it are lighted, and ſtops when thoſe candles are extinguiſhed. It is conſtructed as follows. Provide two cylindrical veſſels, AB and CD. Connect them by tubes open at both ends, as HL, FB, &c. ſo that the air may deſcend out of the higher into the lower veſſel. To theſe tubes fix candleſticks H, &c. and to the hollow cover CF, of the lower veſſel, fit a ſmall tube EF, furniſhed with a cock G, and reaching almoſt to the bottom of the veſſel. In G let there be an aperture with a ſcrew, whereby water may be poured into CD.

Now, the candles at H, &c. being lighted, the air in the contiguous pipes will be thereby rarified, and the jet from the ſmall tube EF will begin to play: as the air becomes more rarified, the force of the jet will increaſe, and it will continue to play till the water in the lower veſſel is exhauſted. It is evident, that as the motion of the jet is cauſed by the heat of the candles, if they be extinguiſhed, the fountain muſt preſently ſtop.

Entertaining experiments.

56 The ſolar fountain, fig. 12.

18. The motion of the water in this fountain is produced by the heat of the ſun, in the following manner. GNS is a thin hollow globe of copper, of 18 inches diameter, ſupported by a ſmall inverted bason, placed on a frame with four legs ABCD, which have between them, at the bottom, a bason of two feet diameter. Through the leg C paſſes a concealed pipe, which comes from G, the bottom of the inſide of the globe: this pipe goes by HV, and joins the upright pipe uI, to make a jet at I. The ſhort pipe uI, which goes to the bottom of the bason, has a valve at V, under the horizontal pipe Hu, and another valve at V, above that horizontal pipe, under the cock at K. The uſe of this cock is to keep the fountain from playing in the day, till you think proper. The north pole N of the globe has a ſcrew that opens a hole, whereby water is poured into the globe.

The machine being thus prepared, and the globe half filled with water, let it be ſet in an open place, when the heat of the ſun, rariſying the air as it heats the copper, the air will preſs ſtrongly againſt the water, which coming down the pipe GCHVI, will lift up the valve V, and ſhut the valve u. The cock being opened, the water will ſpout out at I, and continue to play a long time, if the ſun ſhine.

At night, when the air is condenſed, that which is on the outſide of the veſſel will preſs on the adjutage I, and ſhut the valve V; and at the ſame time preſſing on the water in the bason DuH, which has been played in the day, will puſh it up, through the valve u, and pipe uHG, into the globe, ſo as to fill it again, to the ſame height as at firſt. When the ſun ſhines again on the globe, the fountain will play again, &c. A ſmall jet will play ſix or eight hours.

If the globe be ſet to the latitude of the place, and rectified before it be fixed, with the hour-lines or meridians drawn upon it, the hours marked, and the countries painted, as on the common globe, it will form a good dial; the ſun then ſhining upon the ſame places in this globe, as it does on the earth itſelf. This fountain was invented by Dr Deſaguliers.

57 The hydraulic diſinks.

19. There is a pretty contrivance, by which the ſpecific gravity of the body is ſo altered, that it riſes and ſinks in water at our pleaſure. Let little images of men, about an inch high, of coloured glaſs, be beſpoke at a glaſs-houſe; and let them be made ſo as to be hollow within, but ſo as to have a ſmall opening into this hollow, either at the ſole of the foot or elſewhere. Let them be ſet aſloat in a clear glaſs-phial of water, filled within about an inch of the mouth of the bottle; then let the bottle have its mouth cloſed with a bladder, cloſely tied round its neck, ſo as to let no air eſcape one way or the other. The images themſelves are nearly of the ſame ſpecific gravity with water, or rather a little more light, and conſequently float near the ſurface. Now when we preſs down the bladder, tied on at the top, into the mouth of the bottle, and thus preſs the air upon the ſurface of the water in the bottle; the water being preſſed will force into the hollow of the image through the little opening: thus the air within

Hydrothorax || Hygrometer.

within the images will be preſſed more cloſely together, and being alſo more filled with water now than before, the images will become more heavy, and will conſequently deſcend to the bottom; but, upon taking off the preſſure from above, the air within them will again drive out the water, and they will riſe to the ſame heights as before. If the cavities in ſome of the images be greater than thoſe in others, they will riſe and fall differently, which makes the experiment more amuſing. Hygrometer.

HYG

HYDROTHORAX, a collection of water in the breaſt. See (the Index ſubjoined to) MEDICINE.

HYGINUS (Caius Julius), a grammarian, the freedman of Auguſtus, and the friend of Ovid, was born in Spain, or, according to others, in Alexandria. He wrote many books which are mentioned by ancient authors; all of which are loſt, except ſome fables, and a work entitled *Aſtronomicon Poeticon*; and even theſe are come down to us very imperfect. The beſt edition of theſe remains is that of Munker, publiſhed with ſome other pieces of antiquity in 2 vols 8vo, 1681, under the title of *Mythographi Latini*.

HYGROMETER, an inſtrument for meaſuring the degrees of dryneſs or moiſture of the atmoſphere, in like manner as the barometer and thermometer meaſure its different degrees of gravity or warmth.

Though every ſubſtance which ſwells in moiſt, and ſhrinks in dry weather, is capable of becoming an hygrometer; yet this kind of inſtrument is far from being as yet arrived at ſuch a degree of perfection as the barometers and thermometers. There are three general principles on which hygrometers have been conſtructed. 1. The lengthening and ſhortening of ſtrings by dryneſs and moiſture, or their twiſting and untwiſting by the ſame. 2. The ſwelling and ſhrinking of ſolid ſubſtances by moiſture or dryneſs; and, 3. By the increaſe or decreaſe of the weight of particular bodies whoſe nature is to abſorb the humidity of the atmoſphere.

1. On the firſt of theſe principles Mr Smeaton hath conſtructed an hygrometer greatly ſuperior to any that had appeared before, and of which the following account is given in the 62d volume of the Philoſophical Tranſactions.

"Having ſome years ago attempted to make an accurate and ſenſible hygrometer by means of a hempen cord of a conſiderable length, I quickly found, that, though it was more than ſufficiently ſuſceptible of every change in the humidity of the atmoſphere, yet the cord was upon the whole in a continual ſtate of lengthening. Though this change was the greateſt at firſt, yet it did not appear probable that any given time would bring it to a certainty; and, furthermore, it ſeemed, that as the cord grew more determinate in mean length, the alteration by certain differences of moiſture grew leſs. Now, as on conſidering wood, catgut, paper, &c. there did not appear to be a likelihood of finding any ſubſtance ſufficiently ſenſible of differences of moiſture that would be unalterable under the ſame degrees thereof; this led me to conſider of a conſtruction which would readily admit of an adjuſtment; ſo that, though the cord whereby the inſtrument is actuated may be variable in itſelf, both as to abſolute length and difference of length under given degrees of moiſture, yet that, on ſuppoſition of a material departure from its original ſcale, it might be readily reſtored thereto; and, in conſequence, that any number of hygrometers ſimilarly conſtructed, might, like thermometers, be capable of ſpeaking the ſame language.

"The two points of heat the more readily determinable in a thermometer, are the points of freezing and boiling water. In like manner, to conſtruct hygrometers which ſhall be capable of agreement, it is neceſſary to eſtabliſh two different degrees of a moiſture which ſhall be as fixed in themſelves, and to which we can have recourſe as readily and as often as poſſible.

"One point is given by making the ſubſtance perfectly wet, which ſeems ſufficiently determinable; the other is that of perfect dry, which I do not apprehend to be attainable with the ſame preciſion. A readineſs to imbibe wet, ſo that the ſubſtance may be ſoon and fully ſaturated, and alſo a facility of parting with its moiſture on being expoſed to the fire to dry; at the ſame time, that neither immerſion, nor a moderate expoſition to the warmth of the fire, ſhall injure its texture; are properties requiſite to the firſt mover of ſuch an hygrometer, that in a manner exclude all ſubſtances that I am acquainted with, beſides hempen and flaxen threads and cords, or ſubſtances compounded of them.

"Upon theſe ideas, in the year 1758, I conſtructed two hygrometers as nearly alike as poſſible, in order that I might have the means of examining their agreement or diſagreement on ſimilar or diſſimilar treatment. The interval or ſcale between dry and wet I divided into 100 equal parts, which I call the degrees of this hygrometer. The point of 0 denotes perfect dry; and the numbers increaſe with the degrees of moiſture to 100, which denotes perfect wet.

"On comparing them for ſome time, when hung up together in a paſſage or ſtaircaſe, where they would be very little affected by fire, and where they would be expoſed to as free an air as poſſible in the inſide of the houſe, I found that they were generally within one degree, and very rarely differed two degrees; but as theſe compariſons neceſſarily took up ſome time, and were frequently interrupted by long avocations from home, it was ſome years before I could form a tolerable judgment of them. One thing I ſoon obſerved, not altogether to my liking, which was, that the flaxen cords made uſe of ſeemed to make ſo much reſiſtance to the entry of ſmall degrees of moiſture, (ſuch as is commonly experienced within doors in the ſituation above-mentioned), that all the changes were compriſed within the firſt 30° of the ſcale; but yet, on expoſing them to the warm ſteam of a waſh-houſe, the index quickly mounted to 100. I was therefore deſirous of impregnating the cords with ſomething of a ſaline nature, which ſhould diſpoſe them more forcibly to attract moiſture; in order that the index might, with the ordinary changes of the moiſture in the atmoſphere, travel over a greater part of the ſcale of 100. How to do this in a regular and fixed quantity, was the ſubject of many experiments, and ſeveral years interrupted inquiry. At laſt I tried the one hereafter deſcribed, which ſeemed to anſwer my intention in a great meaſure; and tho'

Hygrometer.

upon the whole it does not appear probable that ever this inſtrument will be made capable of ſuch an accurate agreement as the mercurial thermometers are, yet if we can reduce all the diſagreements of an hygrometer within $\frac{1}{100}$th part of the whole ſcale, it will probably be of uſe in ſome philoſophical inquiries, in lieu of inſtruments which have not yet been reduced to any common ſcale at all.

" Fig. 1. and 2. ABC is an orthographic delineation of the whole inſtrument ſeen in front in its true proportion. DE is that of the profile, or inſtrument ſeen edgewiſe. FG in both repreſents a flaxen cord about 35 inches long, ſuſpended by a turning peg F, and attached to a loop of braſs-wire at A, which goes down into the box cover H, and defends the index, &c. from injury; and by a glaſs expoſes the ſcale to view.

" Fig. 3. ſhews the inſtrument to a larger ſcale, the upright part being ſhortened, and the box-cover removed; in which the ſame letters repreſent the ſame parts as in the preceding figures; GI are two loops or long links of braſs-wire, which lay hold of the index KL, moveable upon a ſmall ſtud or centre K. The cord FG is kept moderately ſtrained by a weight M of about half a pound avoirdupois.—It is obvious, that, as the cord lengthens and ſhortens, the extreme end of the index riſes and falls, and ſucceſſively paſſes over N 2 the ſcale diſpoſed in the arch of a circle, and containing 100 equal diviſions. This ſcale is attached to the braſs ſliding ruler QP, which moves upon the directing piece RR, fixed by ſcrews to the board, which makes the frame or baſe of the whole; and the ſcale and ruler NQP is retained in any place nearer to, or further from, the centre K, as may be required by the ſcrew S.

" Fig. 4. repreſents in profile the ſliding piece and ſtud I (fig. 3.), which traverſes upon that part of the index next the centre K; and which can, by the two ſcrews of the ſtud, be retained upon any part of the index that is made parallel; and which is done for three or four inches from the centre, for that purpoſe. The ſtud is filed to the edges, like the fulcrum of a ſcale-beam; one being formed on the under-ſide, the other on the upper, and as near as may be to one another. An hook formed at the lower end of the wire-loops CI, retains the index, by the lowermoſt edge of the ſtud; while the weight M hangs by a ſmall hook upon the upper edge: by theſe means the index is kept ſteady, and the cords ſtrained by the weight, with very little friction or burthen upon the central ſtud K.

" Fig. 5. is a parallellogram of plate braſs, to keep out duſt, which is attached to the upper edge of the box-cover H; and ſerves to ſhut the part of the box-cover neceſſarily cut away, to give leave for the wire GI to traverſe with the ſliding ſtud nearer to or further from the centre of the index K; and where, in fig. 5. *a* is an hole of about an inch diameter, for the wire GI to paſs through in the riſing and falling of the index freely without touching; *b* is a ſlit of a leſſer ſize, ſufficient to paſs the wire, and admit the cover to come off without deranging the cord or index; *cc* are two ſmall ſcrews applied to two ſlits, by which the plate ſlides lengthways, in order to adapt the hole *a* to the wire GI, at any place of the ſtud I upon the index KL.

" 1. In this conſtruction, the index KL being 12 inches long, 4 inches from the extreme end are filed ſo narrow in the direction in which it is ſeen by the eye, that any part of theſe four inches lying over the diviſions of the ſcale, becomes an index thereto. The ſcale itſelf ſlides four inches, ſo as to be brought under any part of the four inches of the index attenuated as abovementioned. Hygrometer.

" 2. The poſition of the directing piece RR is ſo determined as to be parallel to a right line drawn thro' o upon the ſcale, and the centre K of the index; conſequently, as the attenuated part of the index forms a part of a radius or right line from the ſame centre, it follows, that whenever the index points to o upon the ſcale, though the ſcale is moved nearer to or further from the centre of the index, yet it produces no change in the place to which the index points.

" 3. When the divided arch of the ſcale is at 10 inches from the centre, (that is, at its mean diſtance); then the centre of the arch and the centre of the index are coincident. At other diſtances, the extremes of which are eight or twelve inches, the centre of the diviſions, and the centre of the index pointing thereto, not being coincident, the index cannot move over the ſpaces *geometrically* proportionable to one another in all ſituations of the ſcale, yet, the whole ſcale not exceeding 30° of a circle, it will be found on computation, that the error can never be ſo great as $\frac{1}{1000}$ part of the ſcale, or 1° of the hygrometer; which in this inſtrument being conſidered as indiviſible, the mechanical error will not be ſenſible.

" The cord here made uſe of is flax, and between $\frac{1}{75}$th and $\frac{1}{70}$th of an inch in diameter; which can be readily aſcertained by meaſuring a number of turns made round a pencil or ſmall ſtick. It is a ſort of cord uſed in London for making nets, and is of that particular kind called by net-makers *flaxen three-threads laid*. A competent quantity of this cord was boiled in one pound avoirdupois of water, in which was put two pennyweights troy of common ſalt; the whole was reduced by boiling to ſix ounces avoirdupois, which was done in about half an hour. As this aſcertains a given ſtrength of the brine, on taking out the cord; it may be ſuppoſed that every fibre of the cord is equally impregnated with ſalt. The cord being dried, it will be proper to ſtretch it: which may be done ſo as to prevent it from nutwiſting, by tying three or four yards to two nails againſt a wall, in an horizontal poſition, and hanging a weight of a pound or two to the middle, ſo as to make it form an obtuſe angle. This done for a week or more in a room, will lay the fibres of the cord cloſe together, and prevent its ſtretching ſo faſt after being applied to the inſtrument, as it would otherwiſe be apt to do.

" The hygrometer is to be adjuſted in the following manner. The box-cover being taken off to prevent its being ſpoiled by the fire, and chooſing a day naturally dry, ſet the inſtrument nearly upright, about a yard from a moderate fire; ſo that the cord may become dry, and the inſtrument warm, but not ſo near as would ſpoil the fineſt linen by too much heat, and yet fully evaporate the moiſture; there let the inſtrument ſtay till the index is got as low as it will go; now and then ſtroaking the cord betwixt the thumb and

Hygrometer.

and finger downwards, in order to lay the fibres thereof close together; and thereby causing it to lengthen as much as possible. When the index is thus become stationary, which will generally happen in about an hour, more or less, as the air is naturally more or less dry, by means of the peg at top raise or depress the index, till it lies over the point *o*. This done, remove the instrument from the fire; and having ready some warm water in a tea-cup, take a middling camel's-hair pencil, and, dipping it in the water, gently anoint the cord till it will drink up no more, and till the index becomes stationary and water will have no more effect upon it, which will also generally happen in about an hour. If in this state the index lies over the degree marked 100, all is right: if not, slack the screw S, and slide the scale nearer to or further from the centre, till the point 100 comes under the index, and then the instrument is adjusted for use: but if the compass of the slide is not sufficient to effect this, as may probably happen on the first adjustment, slack the proper screws, and move the sliding stud *I* nearer to or further from the centre of the index, according as the angle formed by the index between the two points of dry or wet happens to be too small or too large for the scale."

1. On the second general principle, namely, that of the swelling of solid bodies by moisture, and their contraction by dryness, Mr De Luc's is the best. He makes choice of ivory for the construction of his hygrometer, because he finds, that, being once wetted, ivory regularly swells by moisture, and returns exactly to the same dimensions when the moisture is evaporated, which other bodies do not. This hygrometer is represented in fig. 6. *a a b* is an ivory tube open at the end *a a*, and close at *b*. It is made of a piece of ivory taken at the distance of some inches from the top of a pretty large elephant's tooth, and likewise at the same distance from its surface, and from the canal which reaches to that point. (This particular direction is given, that the texture of the ivory in all different hygrometers may be the same, which is of great importance.) This piece is to be bored exactly in the direction of its fibres; the hole must be very straight, its dimensions $2\frac{1}{2}$ lines in diameter, and 2 inches 8 lines in depth from *a a* to *c*. Its bore is then to be exactly filled with a brass cylinder, which, however, must project somewhat beyond the ivory tube, and thus it is to be turned on a proper machine, till the thickness of the ivory is exactly $\frac{1}{50}$ of a line, except at the two extremities. At the bottom *b*, the tube ends in a point; and at the top *a a* it must for about two lines be left a little thicker, to enable it to bear the pressure of another piece put into it. Thus the thin or hygrometrical part of the tube will be reduced to $2\frac{1}{2}$ French inches, including the concavity of the bottom. Before this piece is used, it must be put into water, so that the external part alone may be wetted by it; and here it is to remain till the water penetrates to the inside, and appears in the form of dew, which will happen in a few hours. The reason of this is, that the ivory tube remains somewhat larger ever after it is wetted the first time.

For this hygrometer, a glass tube must be provided about 14 inches long, the lower end of which is shewn in *d d e e*. Its internal diameter is about $\frac{1}{4}$ of a line. If now the ivory tube is exactly filled with mercury, and the glass one affixed to it, as the capacity of the former decreases by being dried, the mercury will be forced up into the glass one. Hygrometer.

The piece *f f g g* is intended to join the ivory with the glass tube. It is of brass, shaped as in the figure. A cylindrical hole is bored through it, which holds the glass tube as tight as possible without danger of breaking it; and its lower part is to enter with some degree of difficulty into the ivory pipe. To hinder that part of the tube which includes the brass piece from being affected by the variations of the moisture, it is covered with a brass verrel represented in *h h i i*. The pieces must be united together with gum-lac or mastic.

The introduction of the mercury is the next operation. For this purpose, a slip of paper three inches wide is first to be rolled over the glass tube, and tied fast to the extremity nearest the ivory pipe. A horse-hair is then to be introduced to the tube, long enough to enter the ivory pipe by an inch, and to reach three or four inches beyond the extremity of the glass one. The paper which has been shaped round the tube must now be raised, and used as a funnel to pour the mercury into the instrument, which is held upright. The purest quicksilver is to be used for this purpose, and it will therefore be proper to use that revived from cinnabar. It easily runs into the tube; and the air escapes by means of the horse hair, assisted with some gentle shakes. Fresh mercury must from time to time be supplied, to prevent the mercurial tube from being totally emptied; in which case, the mercurial pellicle which always forms by the contact of the air would run in along with it.

Some air-bubbles generally remain in the tube; they may be seen through the ivory pipe, which is thin enough to have some transparency. These being collected together by shaking, must be brought to the top of the tube, and expelled by means of the horse-hair. To facilitate this operation, some part of the mercury must be taken out of the tube, in order that the air may be less obstructed in getting out, and the horse-hair have a freer motion to assist it. Air, however, cannot be entirely driven out in this manner. It is the weight of the mercury with which the tube is for that reason to be filled, which in time completes its expulsion, by making it pass through the pores of the ivory. To hasten this, the hygrometers are put into a proper box. This is fixed nearly in a vertical direction to the saddle of a horse, which is set a-trotting for a few hours. The shakes sometimes divide the column of mercury in the glass tube, but it is easily re-united with the horse-hair. When, upon shaking the hygrometer vertically, no small tremulous motion is any longer perceived in the upper part of the column, one may be sure that all the air is gone out.

The scale of this hygrometer may be adjusted, as soon as the air is gone out, in the following manner. The instrument is to be suspended in a vessel of water cooled with ice, fresh quantities of which are to be added as the former melts. Here it is to remain till it has sunk as low as it will sink by the enlargement of the capacity of the ivory tube, owing to the moisture it has imbibed. This usually happens in seven or eight hours, and is to be carefully noted. In two or

Hygrometer.

three hours the mercury begins to aſcend, becauſe the moiſture paſſes into the cavity, and forces it up. The the loweſt ſtation of the mercury is then to be marked 0; and for the more accurate marking the degrees on the ſcale, M. De Luc always choſe to have his hygrometrical tube made of one which had formerly belonged to a thermometer. The reaſon of this is, that in the thermometer the expanſion of the mercury by heat had been already determined. The diſtance between the thermometrical points of melting ice and boiling water at 27 French inches of the barometer was found to be 1937 parts. The bulb of this preparatory thermometer was broke in a baſon, in order to receive carefully all the mercury that it contained. This being weighed in nice ſcales amounted to 1428 grains. The hygrometer contained 460 grains of the ſame mercury. Now it is plain, that the extent of the degrees on the hygrometer, ought to be to that of the degrees on the preparatory thermometer as the diffe-rent weights of the mercury contained in each; conſequently 1428 : 460 : : 1937 : 624 nearly; and therefore the correſponding intervals ought to follow the ſame proportion: and thus the length of a ſcale was obtained, which might be divided into as many parts as he pleaſed.

Fig. 7. is a repreſentation of De Luc's hygrometer when fully conſtructed. In elegance it far exceeds Smeaton's or any other, and probably alſo in accuracy; for by means of a ſmall thermometer fixed on the board along with it, the expanſion of the mercury by heat may be known with great accuracy, and of conſequence how much of the height of the mercury in the hygrometer is owing to that cauſe, and how much to the mere moiſture of the atmoſphere.

3. On the third principle, namely, the alteration of the weight of certain ſubſtances by their attracting the moiſture of the air, few attempts have been made, nor do they ſeem to have been attended with much ſucceſs. Sponges dipped in a ſolution of alkaline ſalts, and ſome kinds of paper, have been tried. Theſe are ſuſpended to one end of a very accurate balance, and counterpoiſed by weights at the other, and ſhew the degrees of moiſture or dryneſs by the aſcent or deſcent of one of the ends. But, beſides that ſuch kinds of hygrometers are deſtitute of any fixed point from whence to begin their ſcale, they have another inconvenience (from which indeed Smeaton's is not free, and which has been found to render it erroneous), namely, that all ſaline ſubſtances are deſtroyed by long continued expoſure to the air in very ſmall quantities, and therefore can only imbibe the moiſture for a certain time. Oil of vitriol hath therefore been recommended in preference to the alkaline or neutral ſalts. See CHEMISTRY, n° 105; and, indeed, for ſuch as do not chuſe to be at the trouble of conſtructing a hygrometer on the principles of Mr Smeaton or De Luc, this will probably be found the moſt eaſy and accurate. Fig. 8. repreſents an hygrometer of this kind. A is a ſmall glaſs cup containing a ſmall quantity of oil of vitriol, B an index counterpoiſing it, and C the ſcale; where it is plain, that as the oil of vitriol attracts the moiſture of the air the ſcale will deſcend, which will raiſe the index, and *vice verſa*. This liquid is exceedingly ſenſible of the increaſe or decreaſe of moiſture. A ſingle grain, after its full increaſe, has varied its equilibrium ſo ſenſibly, that the tongue of a balance, only an inch and a half long, has deſcribed an arch one third of an inch in compaſs, (which arch would have been almoſt three inches if the tongue had been one foot), even with ſo ſmall a quantity of liquor; conſequently, if more liquor, expanded under a large ſurface, were uſed, a pair of ſcales might afford as nice an hygrometer as any kind yet invented.—A great inconvenience, however, is, that as the air muſt have full acceſs to the liquid, it is impoſſible to keep out the duſt, which, by continually adding its weight, muſt render the hygrometer falſe: add to this, that even oil of vitriol itſelf is by time deſtroyed, and changes its nature, if a ſmall quantity of it is continually expoſed to the air. So that of all the inventions that have hitherto appeared, De Luc's alone ſeems capable of being brought to the requiſite perfection.

Hygroſcope.

HYGROSCOPE. The ſame with HYGROMETER.

HYLA (anc. geog.), a river of Myſia Minor, famous for Hylas the favourite boy of Hercules, who was carried down the ſtream and drowned. It is ſaid to run by Pruſa; whence it ſeems to be the ſame with the *Rhyndacus*, which runs north-weſt into the Propontis.

HYLAS, in fabulous hiſtory, ſon of Theodamus, was raviſhed by the nymphs of a fountain as he was taking out ſome water for Hercules by whom he was beloved.

HYMEN, or HYMENÆUS, a fabulous divinity, the ſon of Bacchus and Venus Urania, was ſuppoſed by the ancients to preſide over marriages; and accordingly was invoked in epithalamiums, and other matrimonial ceremonies, under the formula, *Hymen, o Hymenæe!*

The poets generally crown this deity with a chaplet of roſes; and repreſent him, as it were, diſſolved and enervated with pleaſures; dreſſed in a yellow robe, and ſhoes of the ſame colour; with a torch in his hand.—Catullus, in one of his epigrams, addreſſes him thus:

Cinge tempora floribus,
Suaveolentis amaraci.

It was for this reaſon, that the new-married couple bore garlands of flowers on the wedding-day: which cuſtom alſo obtained among the Hebrews; and even among Chriſtians, during the firſt ages of the church, as appears from Tertullian, *De corona militari*, where he ſays, *Coronant & nuptæ ſponſos.*—S. Chryſoſtom likewiſe mentions theſe crowns of flowers; and to this day the Greeks call marriage στεφανωμα, in reſpect of this crown or garland.

Hymen.

HYMEN, in anatomy, a membrane in general; but by it is uſually underſtood the membrane which appears in the form of a creſcent, and is ſituated at the entrance of the vagina. When this membrane is ruptured, it is ſhrivelled up, and forms the caruncuiæ myrtiformes. It naturally ſhrinks with years, and often diſappears before the age of 20, ſo can be no proof of virginity.

In ſome infants this membrane ſo cloſes up the urethra, that the urine cannot be voided: in others, the urine paſſes, but when the menſes flow, they cannot be diſcharged, becauſe of the imperforated hymen.

When the mark of perforation cannot be ſeen, the cure is thought to be impracticable; but when the puncture

menæal || hyofcya-mus.

puncture of a lancet could not produce the defired effect, a trochar and canula hath fucceeded, though a paſſage of four inches was perforated before the end was obtained.—In the memoirs of the Royal Academy of Sciences for 1756, we have an account of a conception without any perforation of the hymen.

HYMENÆAL, ſomething belonging to marriage; ſo called from HYMEN. See POETRY, n° 157.

HYMN, a ſong or ode in honour of God; or a poem, proper to be ſung, compoſed in honour of ſome deity. See SONG, and ODE.—The word is Greek, ὕμνος, *hymn*, formed of the verb ὑμέω, *celebro*, "I celebrate."—Iſodore, on this word, remarks, that *hymn* is properly a ſong of joy, full of the praiſes of God: by which, according to him, it is diſtinguiſhed from *threna*, which is a mourning ſong, full of lamentation.

St Hilary, biſhop of Poictiers, is ſaid to have been the firſt that compoſed hymns to be ſung in churches, and was followed by St Ambroſe. Moſt of thoſe in the Roman Breviary were compoſed by Prudentius. They have been tranſlated into French verſe by Meſſieurs de Port Royal.—In the Greek Liturgy there are four kinds of hymns; but the word is not taken in the ſenſe of a praiſe offered in verſe, but ſimply of a laud or praiſe. The angelic hymn, or *Gloria in excelſis*, makes the firſt kind; the *triſagion* the ſecond; the *Cherubic hymn*, the third; and the hymn of *victory* and *triumph* called ἐπινίκιος, the laſt.

The hymns or odes of the ancients, generally conſiſted of three ſtanzas or couplets; the firſt called *ſtrophe*, the ſecond *antiſtrophe*, and the laſt *epode*.

HYMMETTUS (anc. geog.), a mountain of Attica near Athens, famous for its marble quarries, and for its excellent honey. *Hymettius* the epithet. Pliny ſays that the orator Craſſus was the firſt who had marble columns from this place.

HYOIDES, in anatomy, a bone placed at the root of the tongue. See ANATOMY, n° 27.

HYOSCYAMUS, HENBANE; a genus of the monogynia order, belonging to the pentandria claſs of plants. There are ſeveral ſpecies, one of which, viz. the niger, or common henbane, is a native of Britain. It grows on road-ſides, and among rubbiſh. It is a biennial plant, with long fleſhy roots which ſtrike deep into the ground, ſending out ſeveral large ſoft leaves, deeply ſlaſhed on their edges; the following ſpring the ſtalks come up, which are about two feet high, garniſhed with flowers ſtanding on one ſide in a double row, ſitting cloſe to the ſtalks alternately. They are of a dark purpliſh colour, with a black bottom; and are ſucceeded by roundiſh capſules which open with a lid at the top, and have two cells filled with ſmall irregular ſeeds.—The ſeeds, leaves, and roots of this plant, as well as of all other ſpecies of this genus, are poiſonous: and many well atteſted inſtances of their bad effects are recorded; madneſs, convulſions, and death, being the common conſequence. In a ſmaller doſe, they occaſion giddineſs and ſtupor. It is ſaid that the leaves ſcattered about a houſe will drive away mice.—The juice of the plant evaporated to an extract, is ordered by the Edinburgh college in ſome caſes as a narcotic, in which reſpect undoubtedly it may be a powerful medicine if properly managed. The doſe is from half a ſcruple to half a dram.—Goats are not fond of the plant; horſes, cows, ſheep, and ſwine, refuſe it.

Hyo thyroides || Hypatia.

HYO-THYROIDES, in anatomy, one of the muſcles belonging to the os hyoides. See ANATOMY, *Table of the Muſcles*.

HYPALLAGE, among grammarians, a ſpecies of hyperbaton, conſiſting in a mutual permutation of one caſe for another. Thus Virgil ſays, *Dare claſſibus auſtros*, for *dare claſſes auſtris*; and again, *Necdum illis labra admovi*, for *necdum illa labris admovi*.

HYPANTE, or HYPERPANTE, a name given by the Greeks to the feaſt of the preſentation of Jeſus in the temple.—This word, which ſignifies *lowly* or *humble meeting*, was given to this feaſt from the meeting of old Simeon and Anna the propheteſs in the temple when Jeſus was brought thither.

HYPATIA, a learned and beautiful lady of antiquity, the daughter of Theon a celebrated philoſopher and mathematician, and preſident of the famous Alexandrian ſchool, was born at Alexandria about the end of the fourth century. Her father, encouraged by her extraordinary genius, had her educated not only in all the ordinary qualifications of her ſex, but cauſed her likewiſe to be inſtructed in the moſt abſtruſe ſciences. She made ſuch great progreſs in philoſophy, geometry, aſtronomy, and the mathematics, that ſhe paſſed for the moſt learned perſon of her time. At length ſhe was thought worthy to ſucceed her father in that diſtinguiſhed and important employment, the government of the ſchool of Alexandria; and to teach out of that chair where Ammonius, Hierocles, and many other great men, had taught before; and this at a time too when men of great learning abounded both at Alexandria and in many other parts of the Roman empire. Her fame was ſo extenſive, and her worth ſo univerſally acknowledged, that we cannot wonder if ſhe had a crowded auditory. "She explained to her hearers, (ſays Socrates), the ſeveral ſciences that go under the general name of philoſophy; for which reaſon there was a confluence to her, from all parts, of thoſe who made philoſophy their delight and ſtudy." One cannot repreſent to himſelf without pleaſure, the flower of all the youth of Europe, Aſia, and Africa, ſitting at the feet of a very beautiful lady, (for ſuch we are aſſured Hypatia was), all greedily ſwallowing inſtruction from her mouth, and many of them, doubtleſs, love from her eyes; though we are not ſure that ſhe ever liſtened to any ſolicitations, ſince Suidas, who talks of her marriage with Iſodorus, yet relates at the ſame time that ſhe died a maid.

Her ſcholars were as eminent as they were numerous; one of whom was the celebrated Syneſius, who was afterwards biſhop of Ptolemais. This ancient Chriſtian Platoniſt every where bears the ſtrongeſt, as well as the moſt grateful teſtimony of the virtue of his tutoreſs; and never mentions her without the moſt profound reſpect, and ſometimes in terms of affection coming little ſhort of adoration. But it was not Syneſius only, and the diſciples of the Alexandrian ſchool, who admired Hypatia for her virtue and learning: never was woman more careſſed by the public, and yet never woman had a more unſpotted character. She was held as an oracle for her wiſdom, which made her conſulted by the magiſtrates in all important caſes; and this frequently drew her among the greateſt concourſe of men, without the leaſt cenſure of her manners.

In

Hypatia || Hyperbaton.

In a word, when Nicephorus intended to paſs the higheſt compliment on the princeſs Eudocia, he thought he could not do it better than by calling her another *Hypatia*.

While Hypatia thus reigned the brighteſt ornament of Alexandria, Oreſtes was governor of the ſame place for the emperor Theodoſius, and Cyril was biſhop or patriarch. Oreſtes having had a liberal education, could not but admire Hypatia; and as a wiſe governor frequently conſulted her. This, together with an averſion which Cyril had againſt Oreſtes, proved fatal to the lady. Above 500 monks aſſembling, attacked the governor one day, and would have killed him, had he not been reſcued by the townſmen; and the reſpect which Oreſtes had for Hypatia cauſing her to be traduced among the Chriſtian multitude, they dragged her from her chair, tore her to pieces, and burned her limbs. Cyril is not clear from a ſuſpicion of fomenting this tragedy. Cave indeed endeavours to remove the imputation of ſuch an horrid action from the patriarch; and lays it upon the Alexandrian mob in general, whom he calls *leviſſimum hominum genus*, "a very trifling inconſtant people." But though Cyril ſhould be allowed neither to have been the perpetrator, nor even the contriver of it, yet it is much to be ſuſpected that he did not diſcountenance it in the manner he ought to have done: which ſuſpicion muſt needs be greatly confirmed by reflecting, that he was ſo far from blaming the outrage committed by the monks upon Oreſtes, that he afterwards received the dead body of Ammonius, one of the moſt forward in that outrage, who had grievouſly wounded the governor, and who was juſtly puniſhed with death. Upon this riotous ruffian Cyril made a panegyric in the church where he was laid, in which he extolled his courage and conſtancy, as one that had contended for the truth; and changing his name to *Thaumaſius*, or the "Admirable," ordered him to be conſidered as a martyr. "However, (continues Socrates), the wiſeſt part of Chriſtians did not approve the zeal which Cyril ſhewed on this man's behalf, being convinced that Ammonius had juſtly ſuffered for his deſperate attempt."

HYPECOUM, WILD CUMIN; a genus of the digynia order, belonging to the tetrandria claſs of plants. There are four ſpecies, all of them low herbaceous plants with yellow flowers. The juice of theſe plants is of a yellow colour, reſembling that of celandine, and is affirmed by ſome eminent phyſicians to be as narcotic as opium. From the nectarium of the bloſſom the bees collect great quantities of honey. All the ſpecies are eaſily propagated by ſeeds.

HYPER, a Greek prepoſition frequently uſed in compoſition, where it denotes exceſs; its literal ſignification being *above*, or *beyond*.

HYPERBATON, in grammar, a figurative conſtruction inverting the natural and proper order of words and ſentences. The ſeveral ſpecies of the hyperbaton are, the anaſtrophe, the hyſteron-proteron, the hypallage, ſynchyſis, tmeſis, parentheſis, and the hyperbaton ſtrictly ſo called. See ANASTROPHE, &c.

HYPERBATON, ſtrictly ſo called, is a long retention of the verb which completes the ſentence, as in the following example from Virgil.

Interea Reges: ingenti mole Latinus
Quadrijugo vehitur curru, cui tempora circum Hyperbole. Hyperbo
Aurati bis ſex radii fulgentia cingunt,
Solis avi ſpecimen: bigis it Turnus in albis
Bino manu lato criſpans haſtilia ferro:
Hinc Pater Æneas, Romanæ ſtirpis origo,
Sidereo flagrans clypeo et celeſtibus armis;
Et juxta Aſcanius, magnæ ſpes altera Romæ:
Procedunt Caſtris.

HYPERBOLA, a curve formed by cutting a cone in a direction parallel to its axis. See CONIC-*Sections*.

HYPERBOLE, in rhetoric, a figure, whereby the truth and reality of things are exceſſively either enlarged or diminiſhed. See ORATORY, n° 58.

An object uncommon with reſpect to ſize, either very great of its kind or very little, ſtrikes us with ſurpriſe; and this emotion forces upon the mind a momentary conviction that the object is greater or leſs than it is in reality: the ſame effect, preciſely, attends figurative grandeur or littleneſs; and hence the hyperbole, which expreſſes this momentary conviction. A writer, taking advantage of this natural deluſion, enriches his deſcription greatly by the hyperbole: and the reader, even in his cooleſt moments, reliſhes this figure, being ſenſible that it is the operation of nature upon a warm fancy. *Elements of Criticiſm.*

It cannot have eſcaped obſervation, that a writer is generally more ſucceſsful in magnifying by a hyperbole than in diminiſhing. The reaſon is, that a minute object contracts the mind, and fetters its powers of imagination; but that the mind, dilated and inflamed with a grand object, moulds objects for its gratification with great facility. Longinus, with reſpect to a diminiſhing hyperbole, cites the following ludicrous thought from a comic poet: "He was owner of a bit of ground not larger than a Lacedemonian letter." But, for the reaſon now given, the hyperbole has by far the greater force in magnifying objects; of which take the following examples:

> For all the land which thou ſeeſt, to thee will I give it, and to thy ſeed for ever. And I will make thy ſeed as the duſt of the earth: ſo that if a man can number the duſt of the earth, then ſhall thy ſeed alſo be numbered. *Gen.* xiii. 15. 16.
>
> Illa vel intactæ ſegetis per ſumma volaret
> Gramina: nec teneras curſu læſſiſſet ariſtas.
> *Æneid.* vii. 808.
>
> ——— ——Atque imo barathri ter gurgite vaſtos
> Sorbet in abruptum fluctus, rurſuſque ſub auras
> Erigit alternos, et ſidera verberat unda.
> *Æneid.* iii. 421.
>
> ———Horrificis juxta tonat Ætna ruinis,
> Interdumque atram prorumpit ad æthera nubem,
> Turbine fumantem piceo et candente favilla:
> Attollitque globos flammarum, et ſidera lambit.
> *Æneid.* iii. 571.

Speaking of Polyphemus,

> ——————Ipſe arduus, altaque pulſat
> Sidera. *Æneid.* iii. 619.

> ——————When he ſpeaks,
> The air, a charter'd libertine, is ſtill.
> *Henry* V. *act* 1. *ſc.* 1.

Now

Hyperbole.

Now ſhield with ſhield, with helmet helmet clos'd,
To armour armour, lance to lance oppos'd,
Hoſt againſt hoſt with ſhadowy ſquadrons drew,
The ſounding darts in iron tempeſts flew,
Victors and vanquiſh'd join promiſcuous cries,
And ſhrilling ſhouts and dying groans ariſe;
With ſtreaming blood the ſlipp'ry fields are dy'd,
And ſlaughter'd heroes ſwell the dreadful tide.
Iliad iv. 508.

Quintilian is ſenſible that this figure is natural: "For, (ſays he), not contented with truth, we naturally incline to augment or diminiſh beyond it; and for that reaſon the hyperbole is familiar even among the vulgar and illiterate:" and he adds, very juſtly, "That the hyperbole is then proper, when the object of itſelf exceeds the common meaſure." From theſe premiſſes, one would not expect the following inference, the only reaſon he can find for juſtifying this figure of ſpeech, "Conceditur enim amplius dicere, quia dici quantum eſt, non poteſt: meliuſque ultra quam citra ſtat oratio." (We are indulged to ſay more than enough, becauſe we cannot ſay enough; and it is better to be above than under.) In the name of wonder, why this ſlight and childiſh reaſoning, when immediately before he had obſerved, that the hyperbole is founded on human nature? We could not reſiſt this perſonal ſtroke of criticiſm; intended not againſt our author, for no human creature is exempt from error; but againſt the blind veneration that is paid to the ancient claſſic writers, without diſtinguiſhing their blemiſhes from their beauties.

Having examined the nature of this figure, and the principle on which it is erected; let us proceed to the rules by which it ought to be governed. And, in the firſt place, it is a capital fault, to introduce an hyperbole in the deſcription of an ordinary object or event; for in ſuch a caſe, it is altogether unnatural, being deſtitute of ſurpriſe, its only foundation. Take the following inſtance, where the ſubject is extremely familiar, viz. ſwimming to gain the ſhore after a ſhipwreck,

I ſaw him beat the ſurges under him,
And ride upon their backs: he trod the water;
Whoſe enmity he flung aſide, and breaſted
The ſurge moſt ſwoln that met him: his bold head
'Bove the contentious waves he kept, and oar'd
Himſelf with his good arms, in luſty ſtrokes
To th' *ſhore*, that o'er his wave-born baſis bow'd,
As ſtooping to relieve him. *Tempeſt, act* 2. *ſc.* 1.

In the next place it may be gathered from what is ſaid, that an hyperbole can never ſuit the tone of any diſpiriting paſſion: ſorrow in particular will never prompt ſuch a figure, and for that reaſon the following hyperboles muſt be condemned as unnatural:

K. Rich. Aumerle, thou weep'ſt, my tender-hearted couſin!
We'll make foul weather with deſpiſed tears;
Our ſighs, and they, ſhall lodge the ſummer-corn,
And make a dearth in this revolving land.
Richard II. *act* 3. *ſc.* 6.

Draw them to Tyber's bank, and weep your tears
Into the channel, till the loweſt ſtream
Do kiſs the moſt exalted ſhores of all. Hyperbole.
Julius Cæſar, act 1. *ſc.* 1.

Thirdly, A writer, if he wiſh to ſucceed, ought always to have the reader in his eye: he ought, in particular, never to venture a bold thought or expreſſion, till the reader be warmed and prepared. For this reaſon, an hyperbole in the beginning of a work can never be in its place. Example:

Jam pauca aratro jugera regiæ
Moles relinquent. *Horat. Carm. lib.* 2. *ode* 15.

In the fourth place, The niceſt point of all, is to aſcertain the natural limits of an hyperbole, beyond which being overſtrained it has a bad effect. Longinus, (chap. iii.) with great propriety of thought, enters a caveat againſt an hyperbole of this kind: he compares it to a bow-ſtring, which relaxes by overſtraining, and produceth an effect directly oppoſite to what is intended. To aſcertain any preciſe boundary, would be difficult, if not impracticable. We ſhall therefore only give a ſpecimen of what may be reckoned overſtrained hyperboles. No fault is more common among writers of inferior rank; and inſtances are found even among thoſe of the fineſt taſte; witneſs the following hyperbole, too bold even for an Hotſpur.

Hotſpur, talking of Mortimer:

In ſingle oppoſition hand to hand,
He did confound the beſt part of an hour
In changing hardiment with great Glendower.
Three times they breath'd, and three times did they drink,
Upon agreement, of ſwift Severn's flood;
Who then affrighted with their bloody looks,
Ran fearfully among the trembling reeds,
And hid his criſp'd head in the hollow bank,
Blood-ſtained with theſe valiant combatants.
Firſt Part Henry IV. *act* 1. *ſc* 4.

Speaking of Henry V.

England ne'er had a King until his time.
Virtue he had, deſerving to command:
His brandiſh'd ſword did blind men with its beams:
His arms ſpread wider than a dragon's wings:
His ſparkling eyes, replete with awful fire,
More dazzled, and drove back his enemies,
Than mid-day ſun fierce bent againſt their faces.
What ſhould I ſay? his deeds exceed all ſpeech:
He never lifted up his hand, but conquer'd.
Firſt Part Henry VI. *act* 1. *ſc.* 1.

Laſtly, An hyperbole, after it is introduced with all advantages, ought to be comprehended within the feweſt words poſſible: as it cannot be reliſhed but in the hurry and ſwelling of the mind, a leiſurely view diſſolves the charm, and diſcovers the deſcription to be extravagant at leaſt, and perhaps alſo ridiculous. This fault is palpable in a ſonnet which paſſeth for one of the moſt complete in the French language: Phillis, in a long and florid deſcription, is made as far to outſhine the ſun as he outſhines the ſtars:

Le ſilence regnoit ſur la terre et ſur l'onde,
L'air devenoit ſerain et l'Olimp vermeil,

En

Hyperboreans
Hyperia.

Et l'amourex Zephir affranchi du someil,
Reſſuſcitoit les fleurs d'une haleine feconde.
L'Aurore deployoit l'or de ſa treſſe blonde,
Eet ſemoit de rubis le chemin du ſoleil;
Enfin ce Dieu venoit au plus grand appareil
Qu'il ſoit jamais venu pour eclairer le monde:

Quand la jeune Philis au viſage riant,
Sortant de ſon palais plus clair que l'orient,
Fit voir une lumiere et plus vive et plus belle.

Sacre flambeau du jour, n'en ſoiez point jaloux,
Vous parutes alors auſſi peu devant elle,
Que les feux de la nuit avoient fait devant vous.
Malleville.

There is in Chaucer a thought expreſſed in a ſingle line, which ſets a young beauty in a more advantageous light than the whole of this much laboured poem:

Up roſe the ſun, and up roſe Emelie.

HYPERBOREAN, in the ancient geography. The ancients denominated thoſe people and places *Hyperborean*, which were to the northward of the Scythians. They had but very little acquaintance with theſe Hyperborean regions; and all they tell us of them is very precarious, much of it falſe. Diodorus Siculus ſays, the Hyperboreans were thus called by reaſon they dwelt beyond the wind Boreas; ὑπερ ſignifying "above, or beyond," and Βορεας, *Boreas*, the "north wind." This etymology is very natural and plauſible; notwithſtanding all that Rudbeck has ſaid againſt it, who would have the word to be Gothic, and to ſignify *nobility*. Herodotus doubts, whether or no there were any ſuch nations as the Hyperborean. Strabo, who profeſſes that he believes there are, does not take *hyperborean* to ſignify *beyond Boreas* or the north, as Herodotus underſtood it: the prepoſition υπερ, in this caſe, he ſuppoſes only to help to form a ſuperlative; ſo that *hyperborean*, on his principle, means no more than *moſt northern*: by which it appears the ancients ſcarce knew themſelves what the name meant.

HYPERCATALECTIC, in the Greek and Latin poetry is applied to a verſe that has one or two ſyllables too much, or beyond the regular and juſt meaſure; as,

Muſæ ſorores ſunt Minervæ:

Alſo,

Muſæ ſorores Palladis lugent.

HYPERCRITIC, an over-rigid cenſor, or critic: one who will let nothing paſs, but animadverts ſeverely on the ſlighteſt fault. See CRITICISM. The word is compounded of υπερ, *ſuper*, "over, above, beyond;" and κριτικος, of κριτης, *judex*, of κρινω *judico*, "I judge."

HYPERDULIA, in the Romiſh theology, is the worſhip rendered to the holy virgin. The word is Greek, υπερδουλια, compoſed of υπερ, *above*, and δουλια, *worſhip*, *ſervice*. The worſhip offered to ſaints is called *dulia*; and that to the mother of God, *hyperdulia*, as being ſuperior to the former.

HYPERIA (anc. geog.), the ſeat of the Phæacians near the Cyclops, (Homer): ſome commentators take it to be Camarina in Sicily; but, according to others, ſuppoſed to be an adjoining iſland, which they take to be Melita, lying in ſight of Sicily. And this ſeems to be confirmed by Apollonius Rhodius. Whence the Phæacians afterwards removed to Corcyra, called *Scheria*, *Phæacia*, and *Macris*; having been expelled by the Phœnicians, who ſettled in Melita for commerce, and for commodious harbours, before the war of Troy. (Diodorus Siculus.) Hyperia

HYPERICUM, St JOHN'S WORT; a genus of the polyandria order, belonging to the polyadelphia claſs of plants.

Species. Of this genus there are 29 ſpecies, moſt of them hardy deciduous ſhrubs, and under-ſhrubby plants, adorned with oblong and oval ſimple foliage, and pentapetalous yellow flowers in cluſters. The moſt remarkable are, 1. The *hircinum*, or ſtinking St John's-wort. This riſes three or four feet high, with ſeveral ſhrubby two-edged ſtalks from the root, branching by pairs oppoſite at every joint; oblong, oval, cloſe-fitting oppoſite leaves; and, at the ends of all the young ſhoots, cluſters of yellow flowers. Of this there are three varieties; one with ſtrong ſtalks, ſix or eight feet high, broad leaves, and large flowers; the other with ſtrong ſtalks, broad leaves, and without any diſagreeable odour; the third hath variegated leaves. All theſe varieties are ſhrubby; and flower in June and July in ſuch numerous cluſters, that the ſhrubs appear covered with them; and produce abundance of ſeed in autumn. 2. The *canarienſe* hath ſhrubby ſtalks, dividing and branching ſix or ſeven feet high; oblong, cloſe-fitting leaves by pairs; and, at the ends of the branches, cluſters of yellow flowers appearing in June and July. 3. The *aſcyron*, or dwarf American St John's-wort, hath ſpreading roots, ſending up numerous, ſlender, ſquare ſtalks, a foot long; oval, ſpear-ſhaped, cloſe-fitting, ſmooth leaves by pairs oppoſite; and, at the ends of the ſtalks, large yellow flowers. 4. The *androſæmum*, commonly called *tutſan*, or *park-leaves*, hath an upright under-ſhrubby ſtalk, two feet high, branching by pairs oppoſite; and at the ends of the ſtalks, cluſters of ſmall yellow flowers appearing in July and Auguſt, and ſucceeded by roundiſh berry-like black capſules. This grows naturally in many parts of Britain. 5. The *balearicum*, or wart-leaved St John's-wort, is a native of Majorca; and hath a ſhrubby ſtalk, branching two feet high, with reddiſh ſcarified branches, ſmall oval leaves warted underneath, and large yellow flowers appearing great part of the year. 6. The *monogynum*, or one-ſtyled *China hypericum*, hath a ſhrubby purpliſh ſtalk, about two feet high; oblong, ſmooth, ſtiff, cloſe-fitting leaves, of a ſhining green above, and white underneath; cluſters of ſmall yellow flowers, with coloured cups, and only one ſtyle, flowering the greateſt part of the year. 7. The *laſianthus*, or Surinam St John's-wort, hath ſhrubby ſtalks, branching a yard high; ſpear-ſhaped ſerrated leaves; hoary underneath, and yellow flowers from the axillas of the ſtalks. It is a native of Surinam and Carolina.

Culture. The four firſt ſpecies are hardy, and will grow in any ſoil or ſituation; the three laſt muſt be potted, in order to have ſhelter in the green-houſe in winter. The two firſt ſpecies propagate very faſt by ſuckers, which are every year ſent up plentifully from the

Hyperides & Hypnum.

the root; and in autumn or ſpring may be readily ſlipped off from the old plants with roots to each, or the whole plant may be taken up and divided into as many parts as there are ſuckers and ſlips with roots, planting the ſtrongeſt where they are to remain, and the weakeſt in nurſery-rows, where they are to remain a year in order to acquire ſtrength. They may alſo be propagated by ſeeds ſown in autumn, in a bed of common earth, in drills an inch deep. The other two hardy ſorts are alſo propagated by ſlipping the roots in autumn, or early in the ſpring; and may likewiſe be raiſed in great plenty from ſeeds. The three other ſpecies are propagated by layers and cuttings, planted in pots, and plunged in a hot-bed.

Properties. The tutſan hath long held a place in the medicinal catalogues; but its uſes are very much undetermined. The leaves given in ſubſtance are ſaid to deſtroy worms. By diſtillation they yield an eſſential oil. The flowers tinge ſpirits and oils of a fine purple colour. Cows, goats, and ſheep, eat the plant; horſes and ſwine refuſe it. The dried plant boiled in water with alum, dyes yarn of a yellow colour; and the Swedes give a fine purple tinge to their ſpirits with the flowers.

HYPERIDES, an orator of Greece, was the diſciple of Plato and Iſocrates, and governed the republic of Athens. He defended with great zeal and courage the liberties of Greece; but was put to death by Antipater's order, 322 B. C. He compoſed many orations, of which only one now remains. He was one of the ten celebrated Greek orators.

HYPERMNESTRA, in fabulous hiſtory, one of the 50 daughters of Danaus king of Argos. She alone refuſed to obey the cruel order Danaus had given to all his daughters, to murder their huſbands the firſt night of their marriage; and therefore ſaved the life of Lynceus, after ſhe had made him promiſe not to violate her virginity. Danaus, enraged at her diſobedience, confined her cloſely in priſon, whence Lynceus delivered her ſome time after.

HYPERSARCOSIS, in medicine and ſurgery, an exceſs of fleſh, or rather a fleſhy excreſcence, ſuch as thoſe generally ariſing upon the lips of wounds, &c.

HYPHEN, an accent or character in grammar, implying that two words are to be joined, or connected into one compound word, and marked thus -; as *pre-eſtabliſhed*, *five-leaved*, *&c.* Hyphens alſo ſerve to connect the ſyllables of ſuch words as are divided by the end of the line.

HYPNOTIC, in the materia medica, ſuch medicines as any way produce ſleep, whether called *narcotics*, *hypnotics*, *opiates*, or *ſoporifics*.

HYPNOTICUS SERPENS, the *Sleep-ſnake*, in zoology, the name of an Eaſt-Indian ſpecies of ſerpent, called by the Ceyloneſe *nintipolong*, a word importing the ſame ſenſe. It is of a deep blackiſh brown, variegated with ſpots of white, and is a very fatal kind in its poiſon; its bite always bringing on a ſleep which ends in death.

HYPNUM, FEATHER-MOSS; a genus of the order of muſci, belonging to the cryptogamia claſs of plants. There are 46 ſpecies, all of them natives of Great Britain; none of them, however, have any remarkable property, except the proliferum and parietinum. The firſt is of a very ſingular ſtructure, one ſhoot growing out from the centre of another; the veil is yellow and ſhining; the lid with a kind of long bill; the leaves not ſhining; ſometimes of a yellowiſh, and ſometimes of a deep green. This moſs covers the ſurface of the earth in the thickeſt ſhades, through which the ſun never ſhines, and where no other plant can grow. The ſecond hath ſhoots nearly flat and winged, undivided for a conſiderable length, and the leaves ſhining; but the old ſhoots do not branch into new ones as in the preceding ſpecies. It grows in woods and ſhady places; and, as well as the former, is uſed for filling up the chinks in wooden houſes.

Hypobole & Hypopyon.

HYPOBOLE. See ORATORY, n° 81.

HYPOCAUSTUM, among the Greeks and Romans, a ſubterraneous place, where was a furnace to heat the baths. The word is Greek, formed of the prepoſition ὑπὸ, *under*; and the verb καίω, *to burn*.—Another ſort of hypocauſtum was a kind of kiln to heat their winter-parlours. The remains of a Roman hypocauſtum, or ſweating-room, were diſcovered under ground at Lincoln in 1739. We have an account of theſe remains in the Philoſophical Tranſactions, n° 461. § 29.—Among the moderns, the hypocauſtum is that place where the fire is kept, which warms a ſtove or hot-houſe.

HYPOCHÆRIS, HAWK'S-EYE; a genus of the polygamia æqualis order, belonging to the ſyngeneſia claſs of plants. There are four ſpecies; none of which have any remarkable property, except the maculata, or ſpotted hawk's-eye. It is a native of Britain, and grows on high grounds. The leaves are oblong, egg-ſhaped, and toothed; the ſtem almoſt naked, generally with a ſingle branch; the bloſſoms yellow, opening at ſix in the morning, and cloſing at four in the afternoon. The leaves are boiled and eaten like cabbage. Horſes are fond of this plant when green, but not when dry. Cows, goats, and ſwine eat it; ſheep are not fond of it.

HYPOCHONDRIA, in anatomy, a ſpace on each ſide the epigaſtric region, or upper part of the abdomen. See ANATOMY, n° 349, *d*.

HYPOCHONDRIAC PASSION, a diſeaſe in men, ſimilar to the hyſteric affection in women. See (the *Index* ſubjoined to) MEDICINE.

HYPOCISTIS, in the materia medica, an inſpiſſated juice obtained from the ſeſſile aſarum, much reſembling the true Egyptian acacia. They gather the fruit while unripe, and expreſs the juice, which they revaporate ove a very gentle fire, to the conſiſtence of an extract, and then form into cakes, and expoſe them to the ſun to dry. It is an aſtringent of conſiderable power; is good againſt diarrhœas and hæmorrhages of all kinds; and may be uſed in redellent gargariſms in the manner of the true acacia; but it is very rarely met with genuine in our ſhops, the German acacia being uſually ſold under its name.

HYPOGASTRIC, an appellation given to the internal branch of the iliac artery.

HYPOGASTRIUM, in anatomy, the middle part of the lower region of the belly. See ANATOMY, n° 349, *d*.

HYPOPYON, in medicine, a collection of purulent matter under the corner of the eye.

Hypothec ‖ Hyssopus.

HYPOTHEC, in law, a right of security established by law to creditors upon the goods and effects of their debtors, for the payment of certain debts.

HYPOTHENUSE, in geometry, the longest side of a right-angled triangle, or that which subtends the right-angle.

HYPOSTASIS, a Greek term, literally signifying *substance*, or *subsistence*; used in theology for *person*.—The word is Greek, ὑποστασις compounded of ὑπο, *sub*, "under;" and ιστημι, *sto, existo*, "I stand, I exist;" q.d. *sub-sistentia*. Thus we hold, that there is but one nature or essence in God, but three *hypostases* or persons.

The term *hypostasis* is of a very ancient standing in the church. St Cyril repeats it several times, as also the phrase *union according to hypostasis*. The first time it occurs is in a letter from that father to Nestorius, where he uses it instead of προσωπον, the word we commonly render *person*, which did not seem expressive enough. "The philosophers (says St Cyril) have allowed three *hypostases*: They have extended the Divinity to three *hypostases*: They have even sometimes used the word *trinity*: And nothing was wanting but to have admitted the consubstantiality of the three *hypostases*, to shew the unity of the divine nature, exclusive of all triplicity in respect of distinction of nature, and not to hold it necessary to conceive any respective inferiority of *hypostases*."

This term occasioned great dissentions in the ancient church; first among the Greeks, and afterwards also among the Latins. In the council of Nice, *hypostasis* was defined to denote the same with *essence* or *substance*; so that it was hereby to say that Jesus Christ was of a different *hypostasis* from the Father; but custom altered its meaning. In the necessity they were under of expressing themselves strongly against the Sabellians, the Greeks made choice of the word *hypostasis*, and the Latins of *persona*; which change proved the occasion of endless disagreement. The phrase τρεις υποστασεις, used by the Greeks, scandalized the Latins, whose usual way of rendering υποστασις in their language was by *substantia*. The barrenness of the Latin tongue in theological phrases, allowed them but one word for the two Greek ones, ουσια and υποστασις; and thus disabled them from distinguishing *essence* from *hypostasis*. For which reason they chose rather to use the term *tres personæ*, and *tres hypostases*.—An end was put to logomachias, in a synod held at Alexandria about the year 362, at which St Athanasius assisted; from which time the Latins made no great scruple of saying *tres hypostases*, nor the Greeks of *three persons*.

HYPOTHESIS, in general, denotes something supposed to be true, or taken for granted, in order to prove or illustrate a point in question. Hypotheses, however elegant or artful, ought to be first proved by repeated observations and constant experience, before they are received as truths.

HYPOTIPOSIS. See ORATORY, n° 91.

HYRCANIA (anc. geog.), a country of the farther Asia, lying to the south-east of the *Mare Hyrcanum* or *Caspium*; with Media on the west, Parthia on the south, and Margiana on the west. Famous for its tygers, (Virgil); for its vines, figs, and olives, (Strabo).

HYSSOPUS, HYSSOP; a genus of the gymnospermia order, belonging to the didynamia class of plants. There are three species; but only one of them, viz. the *officinalis*, or common hyssop, is cultivated for use. This hath under-shrubby, low, bushy stalks, growing a foot and a half high; small, spear-shaped, close-sitting, opposite leaves, with several smaller ones rising from the same joint; and all the stalks and branches terminated by erect whorled spikes of flowers, of different colours in the varieties. They are very hardy plants; and may be propagated either by slips or cuttings, or by seeds. The leaves have an aromatic smell, and a warm pungent taste. Besides the general virtues of aromatics, they are particularly recommended in humoural asthmas, coughs, and other disorders of the breast and lungs; and are said notably to promote expectoration.

Hysteri ‖ Hystrix

HYSTERICS, or HYSTERIC PASSION. See (*Index* subjoined to) MEDICINE.

HYSTERON PROTERON, in grammar and rhetoric, a species of the hyperbaton, wherein the proper order of construction is so inverted, that the part of any sentence which should naturally come first is placed last: as in this of Terence, *Valet et vivit*, for *vivit et valet*; and in the following of Virgil, *Moriamur, & in media arma ruamus*, for *In media arma ruamus, & moriamur*.

HYSTRIX, in zoology, a genus of quadrupeds belonging to the order of glires, the characters of which are these: They have two fore-teeth, obliquely divided both in the upper and under jaw, besides eight grinders; and the body is covered with quills or prickles. There are four species, viz.

1. The *cristata*, or crested porcupine, has four toes on the fore-feet, five toes on the hind-feet, a crested head, a short tail, and the upper lip is divided like that of a hare. The length of the body is about two feet, and the height about two feet and a half. The porcupine is covered with prickles, some of them nine or ten inches long, and about $\frac{1}{4}$ of an inch thick. Like the hedge-hog, he rolls himself up in a globular form, in which position he is proof against the attacks of the most rapacious animals. The prickles are exceedingly sharp, and each of them has five large black and as many white rings, which succeed one another alternately from the root to the point. These quills the animal can erect or let down at pleasure; when irritated, he beats the ground with his hind-feet, erects his quills, shakes his tail, and makes a considerable rattling noise with his quills.

Most authors have asserted that the porcupine, when irritated, darts his quills to a considerable distance against the enemy, and that he will kill very large animals by this means. But M. Buffon, and some other late historians, assure that the animal possesses no such power. M. Buffon frequently irritated the porcupine, but never saw any thing like this darting of his quills. He says indeed, that when the creature was much agitated with passion, some of the quills which adhered but slightly to the skin, would fall off, particularly from the tail; and this circumstance, he imagines, has given rise to the mistake.

The porcupine, though originally a native of Africa and the Indies, can live and multiply in the more temperate climates of Spain and Italy. Pliny, and every other natural historian since the days of Aristotle, tells

Hyſtrix tells us, that the porcupine, like the bear, conceals itſelf during the winter, and that they bring forth their young in 80 days. But theſe circumſtances remain to this day uncertain. It is remarkable, that although this animal be very common in Italy, no perſon has ever given us a tolerable hiſtory of it. We only know in general, that the porcupine, in a domeſtic ſtate, is not a fierce or ill-natured animal; that with his fore-teeth, which are ſtrong and ſharp, he can cut through a ſtrong board; that he eats bread, fruits, roots, &c.; that he does conſiderable damage when he gets into a garden; that he grows fat, like moſt animals, about the end of ſummer; and that his fleſh is not bad food.

2. The *prehenſilis*, or *cuandu*, has four toes on the fore-feet, five on the hind-feet, and a long tail. It is conſiderably leſs than the former ſpecies; being only 17 inches long from the point of the muzzle to the origin of the tail, which is nine inches long; the legs and feet are covered with long browniſh hair; the reſt of the body is covered with quills interſperſed with long hairs; the quills are about five inches long, and about $\frac{1}{12}$ of an inch in diameter. He feeds upon birds and ſmall animals. He ſleeps in the day like the hedge-hog, and ſearches for his food in the night. He climbs trees, and ſupports himſelf by twiſting his tail round the branches. He is generally found in the high grounds of America from Braſil to Louiſiana, and the ſouthern parts of Canada. His fleſh is eſteemed very good eating. Hyſtrix Jablonſki.

3. The *dorſata* has four toes on the fore-feet, five on the hind-feet; and has quills only on the back, which are ſhort, and almoſt hid among the long hair. He is about two feet long. He is a native of Hudſon's-bay. The ſavages eat his fleſh, and make uſe of his ſkin as a fur, after taking off the prickles.

4. The *macroura*, has five toes both on the hind and fore-feet; his tail is very long, and the prickles are elevated. He is a native of Africa and the Eaſt-Indies.

I.

I, or *i*, the ninth letter and third vowel of the alphabet, is pronounced by throwing the breath ſuddenly againſt the palate, as it comes out of the larynx, with a ſmall hollowing of the tongue, and nearly the ſame opening of the lips and talk as in pronouncing *a* or *e*. Its ſound varies: in ſome words it is long, as *high*, *mind*, &c.; in others ſhort, as *bid*, *hid*, *fin*, &c.; in others, again, it is pronounced like *y*, as in *collier*, *onion*, &c.; and in a few, it ſounds like *ee*, as in *machine*, *magazine*, &c. No Engliſh word ends in *i*, *e* being either added to it, or elſe the *i* turned into *y*.

But beſides the vowel, there is the *jod* conſonant; which, becauſe of its different pronunciation, has likewiſe a different form, thus J, j. In Engliſh, it has the ſoft ſound of *g*; nor is uſed, but when *g* ſoft is required before vowels, where *g* is uſually hard: thus we ſay, *jack*, *jet*, *join*, &c. inſtead of *gack*, *get*, *goin*, &c. which would be contrary to the genius of the Engliſh language.

I, uſed as a numeral, ſignifies no more than *one*, and ſtands for ſo many units as it is repeated times: thus I, one; II, two; III, three, &c.; and when put before a higher numeral, it ſubſtracts itſelf, as IV, four; IX, nine, &c. But when ſet after it, ſo many are added to the higher numeral, as there are I's added: thus VI is 5+1, or ſix; VII, 5+2, or ſeven; VIII, 5+3, or eight. The ancient Romans likewiſe uſed IↃ for 500, CIↃ for 1000, IↃↃ for 5000, CCIↃↃ for 10,000, IↃↃↃ for 50,000, and CCCIↃↃↃ for 100,000. Farther than this, as Pliny obſerves, they did not go in their notation; but, when neceſſary, repeated the laſt number, as CCCIↃↃↃ, CCCIↃↃↃ, for 200,000; CCCIↃↃↃ, CCCIↃↃↃ, CCCIↃↃↃ, for 300,000; and ſo on.

The ancients ſometimes changed *i* into *u*; as *ducumus* for *decimus*; *maxumus* for *maximus*, &c. — According to Plato, the vowel *i* is proper to expreſs delicate but humble things, as in this verſe in Virgil, which abounds in *i*'s, and is generally admired:

Accipiunt inimicum imbrem, rimiſque fatiſcunt.

I, uſed as an abbreviature, is often ſubſtituted for the whole word JESUS, of which it is the firſt letter.

JABES-GALAAD, or JABESH-GILEAD, (anc. geogr.) a city of Judæa, lying beyond the river Jordan, called *Jabiſus* and *Jabiſſa* by Joſephus; the metropolis of Gilead. In Jerome's time, a village on an eminence, ſix miles from Pella.

JABLONSKI (Daniel Erneſt), a learned Poliſh Proteſtant divine, born at Dantzick in 1660. He became ſucceſſively miniſter of Magdeburg, Liſſa, Koningſberg, and Berlin; and was at length eccleſiaſtical counſellor, and preſident of the academy of ſciences at the latter. He took great pains to effect an union between the Lutherans and Calviniſts; and wrote ſome works which are in good eſteem, particularly Meditations on the origin of the Scriptures, &c. He died in 1741.

JABLONSKI (Theodore), counſellor of the court of Pruſſia, and ſecretary of the royal academy of ſciences at Berlin, was alſo a man of diſtinguiſhed merit. He loved the ſciences, and did them honour, without that ambition which is generally ſeen in men of learning: it was owing to this modeſty that the greateſt part of his works were publiſhed without his name. He publiſhed in 1711, a French and German dictionary; a Courſe of Morality, in 1713; a Dictionary of Arts and Sciences, in 1721; and tranſlated *Tacitus de moribus Germanorum* into High Dutch, in 1724.

Jabne || Jackſon

JABNE (anc. geogr.), a town of Paleſtine, near Joppa; called *Jamnia* or *Jamnial*, by the Greeks and Romans. In Joſhua xv. it ſeems to be called *Jabneel*; but in 2 Chron. xxvi. *Jabne*. It was taken from the Philiſtines by Uzziah, who demoliſhed its fortifications. Its port, called *Jamnitarum portus*, lay between Joppa and Azotus.

JABOK (anc. geogr.), a river of the Peræa, the north boundary of the Amorites, running with an oblique courſe from the eaſt into the river Jordan.

JACCA, an ancient town of Spain, in the kingdom of Arragon, with a biſhop's ſee, and a fort; ſeated on a river of the ſame name, among the mountains of Jacca, which are part of the Pyrenees. W. Long. 0. 19. N. Lat. 44. 22.

JACK, in mechanics, a well-known inſtrument of common uſe for raiſing great weights of any kind.

The common kitchen-jack is a compound engine, where the weight is the power applied to overcome the friction of the parts and the weight with which the ſpit is charged; and a ſteady and uniform motion is obtained by means of the fly.

JACK, in the ſea-language, a ſort of flag or colours, diſplayed from a maſt erected on the outer end of a ſhip's bowſprit. In the Britiſh navy the jack is nothing more than a ſmall union flag, compoſed of the interſection of the red and white croſſes; but in merchant-ſhips this union is bordered with a red field. See the article UNION.

JACK-*Flag*, in a ſhip, that hoiſted up at the ſprit-ſail top-maſt head.

JACK-*Daw*, the Engliſh name of a ſpecies of corvus. See CORVUS.

This bird is very miſchievous to the farmer and gardener; and is of ſuch a thieviſh diſpoſition, that he will carry away much more than he can make uſe of. There is a method of deſtroying them by a kind of ſprings much uſed in England; and is ſo uſeful, that it ought to be made univerſal.—A ſtake of about five feet long is to be driven firmly into the ground, and made ſo faſt that it cannot move, and ſo ſharp in the point that the bird cannot ſettle upon it. Within a foot of the top there muſt be a hole bored thro' it, of three quarters of an inch diameter; through this hole is to be put a ſtick of about eight inches long; then a horſe-hair ſpringe or nooſe is to be made faſt to a thin hazel-wand, and this brought up to the place where the ſhort ſtick is placed, and carried with it through the hole, the remainder being left open under that ſtick. The other end of the hazel rod is to be put through a hole in the ſtake near the ground, and faſtened there. The ſtake is to be planted among the jack-daw's food, and he will naturally be led to ſettle on it; but finding the point too ſharp, he will deſcend to the little croſs ſtick. This will ſink with his weight, and the ſpringe will receive his leg, and hold him faſt.

JACKALL, in zoology. See CANIS.

JACKSON (Thomas), an eminent Engliſh divine, was born at Witton in the biſhopric of Durham in 1579, of a good family. He commenced doctor of divinity at Oxford in 1622; and at laſt was made chaplain in ordinary, prebendary of Winchester, and dean of Peterborough. He was a very great ſcholar; and died in 1640. His performance upon the Creed, is a learned and valuable piece; which, with his other works, was publiſhed in 1673.

Jacob || Jaquelot

JACOB (Ben Hajim), a rabbi famous for the collection of the Maſorah in 1525; together with the text of the bible, the Chaldaic paraphraſe, and Rabbinical commentaries.

JACOB (Ben Naphthali), a famous rabbi of the 5th century; he was one of the principal maſſorets, and bred at the ſchool of Tiberias in Paleſtine with Ben Aſer, another principal maſſoret. The invention of points in Hebrew to ſerve for vowels, and of accents to facilitate the reading of that language, are aſcribed to theſe two rabbis; and ſaid to be done in an aſſembly of the Jews held at Tiberias, A. D. 476.

JACOB (Giles), an eminent law-writer, born at Romſey in the county of Southampton, in 1686. He was bred under a conſiderable attorney; and is principally known for his *Law Dictionary* in one vol. folio, which has been often printed; a new and improved edition having been lately given by counſellors Ruſſhead and Morgan. Mr Jacob alſo wrote two dramatic pieces; and a *Poetical Regiſter*, containing the lives and characters of Engliſh dramatic poets. The time of his death is not known.

JACOBÆUS (Oliger), a celebrated profeſſor of phyſic and philoſophy at Copenhagen, was born in 1651 at Arhuſen in the peninſula of Jutland, where his father was biſhop. Chriſtian V. intruſted him with the management of his grand cabinet of curioſities; and Frederic IV. in 1698, made him counſeller of his court of juſtice. He wrote many medical works, and ſome excellent poems.

JACOBINE MONKS, the ſame with DOMINICANS.

JACOBITES, a term of reproach beſtowed on the perſons who, vindicating the doctrines of paſſive obedience and non-reſiſtance with reſpect to the arbitrary proceedings of princes, diſavow the revolution in 1688, and aſſert the ſuppoſed rights and adhere to the intereſts of the late abdicated king James and his family.

JACOBITES, in church-hiſtory, a ſect of Chriſtians in Syria and Meſopotamia; ſo called, either from Jacob a Syrian who lived in the reign of the emperor Mauritius, or from one Jacob a monk who flouriſhed in the year 550.

The Jacobites are of two ſects, ſome following the rites of the Latin church, and others continuing ſeparated from the church of Rome. There is alſo a diviſion among the latter, who have two rival patriarchs. As to their belief, they hold but one nature in Jeſus Chriſt; with reſpect to purgatory and prayers for the dead, they are of the ſame opinion with the Greeks and other eaſtern Chriſtians: they conſecrate unleavened bread at the euchariſt, and are againſt confeſſion, believing that it is not of divine inſtitution.

JACOBUS, a gold coin, worth 25 ſhillings; ſo called from king James the firſt of England, in whoſe reign it was ſtruck. See COIN.

We uſually diſtinguiſh two kinds of *Jacobus*, the *old* and the *new*; the former valued at 25 ſhillings, weighing ſix pennyweight ten grains: the latter, called alſo *Carolus*, valued at 23 ſhillings; in weight five pennyweight twenty grains.

JAQUELOT. See JAQUELOT.

JACU-

Jaculator || Jago.

JACULATOR, or SHOOTING-FISH. See CHÆTODON.

JAFFA, the modern name of the city of JOPPA in Judæa.

JAFNAPATAN, a sea-port town, seated at the north-east end of the island of Ceylon in the East Indies. The Dutch took it from the Portuguese in 1658, and have continued in the possession of it since that time. They export from thence great quantities of tobacco, and some elephants, which are accounted the most docile of any in the whole world. E. Long. 80. 25. N. Lat. 9. 30.

JAGENDORF, a town and castle of Silesia, capital of a province of the same name, seated on the river Oppa. E. Long. 17. 47. N. Lat. 50. 4.

ST JAGO, a large river of South America, which rises in the audience of Quito and Peru. It is navigable; and falls into the South Sea, after having watered a fertile country abounding in cotton-trees, and inhabited by wild Americans.

St JAGO, the largest, most populous and fertile of the Cape Verd islands on the coast of Africa, and the residence of the Portuguese viceroy. It lies about 13 miles eastward from the island of Mayo, and abounds with high barren mountains; but the air, in the rainy season, is very unwholesome to strangers. Its produce is sugar, cotton, wine, and some excellent fruits. The animals are black cattle, horses, asses, deer, goats, hogs, civet-cats, and some very pretty green monkeys with black faces.

St JAGO, a handsome and considerable town of South America, the capital of Chili, with a good harbour, a bishop's see, and a royal audience. It is seated in a large and beautiful plain, abounding with all the necessaries of life, at the foot of the Cordilleras, on the river Mapocho, which runs across it from east to west. Here are several canals and a dyke, by means of which they water the gardens and cool the streets.—It is very much subject to earthquakes. W. Long. 69. 35. S. Lat. 33. 40.

St JAGO *de Cuba*, a town of North America, situated on the southern coast of the island of Cuba in the bottom of a bay with a good harbour, and on a river of the same name. W. Long. 76. 44. N. Lat. 20. 0.

JAGO *de los Cavalleros*, a town of America, and one of the principal of the island of Hispaniola. It is seated on the river Yague, in a fertile soil, but bad air. W. Long. 70. 5. N. Lat. 19. 40.

St JAGO *del Entero*, a town of South America, one of the most considerable of Tucuman, and the usual residence of the inquisitor of the province. It is seated on a large river, in a flat country, where there is game, tygers, guanacos, commonly called *camel-sheep*, &c.

JAGO *de la Vega*, otherwise called *Spanish-town*, is the capital of the island of Jamaica, in America, where the assembly and the grand courts of justice are held. It is seated in a fine pleasant valley, on the banks of the Rio Cobre. It was once a large, populous place, containing 2000 houses, two churches, a monastery, and several private chapels; but it is now reduced to a small compass, and has only one fine church, and a chapel, with about 500 inhabitants. Being an inland place, its trade is small; but several wealthy merchants and gentlemen reside there, living in a gay manner. There are a great number of coaches; and they have lately got a playhouse, with good actors. It is seated near the south-east part of the island, in W. Long. 76. 45. N. Lat. 18. 20.

Jaquar || Jalap.

JAQUAR, a name given to the Brasilian once, a species of FELIS.—It grows to the size of a wolf: its hair of a bright tawny colour; the breast and belly whitish; the tail shorter than the body, the upper part deep tawny, marked irregularly with black spots. It inhabits the hottest parts of South America from the Isthmus of Darien to Buenos Ayres; is fierce, and destructive to man and beast. Like the tiger, it plunges its head into the body of its prey, and sucks out the blood before it devours it; makes a great noise like the howling of a hungry dog; and is a very cowardly animal, easily put to flight either by the shepherds dogs or by a lighted torch, being very fearful of fire. It lies in ambush near the sides of rivers.—There is sometimes seen a singular combat between this animal and the crocodile: when the jaquar comes to drink, the crocodile, ready to surprise any animal that approaches, raises its head out of the water; the former strikes its claws into the eyes, the only penetrable part of this dreadful reptile, who immediately dives under water, pulling his enemy along with him, where they commonly both perish.

JAIL-FEVER, a very dangerous distemper of the contagious kind, arising from the putrescent disposition of the blood and juices. See (the *Index* subjoined to) MEDICINE.

JALAP, in botany and the materia medica, the root of a species of convolvulus or bind-weed. See CONVOLVULUS.

This root is brought to us in thin transverse slices from Xalapa, a province of New Spain. Such pieces should be chosen as are most compact, hard, weighty, dark-coloured, and abound most with circular striæ. Slices of bryony root are said to be sometimes mixed with jalap; but these may be easily distinguished by their whiter colour and less compact texture. Jalap has no smell, and very little taste upon the tongue; but when swallowed it affects the throat with a sense of heat, and occasions a plentiful discharge of saliva.—Taken in substance in a dose of about half a dram, (less or more according to the circumstances of the patient), in plethoric or cold phlegmatic habits, it proves an effectual and in general a safe purgative, performing its office mildly, seldom occasioning nausea or gripes which too frequently accompany the other strong cathartics. In hypochondriacal disorders, and hot bilious habits, it gripes violently if the jalap is good; but rarely takes due effect as a purge. An extract made by water purges almost universally, but weakly; and at the same time has a considerable effect by urine. The root remaining after this process, gripes violently. The pure resin prepared with spirit of wine occasions most violent gripings and other terrible symptoms, but scarce proves at all cathartic; triturated with sugar, or with almonds into the form of an emulsion, or dissolved in spirit and mixed with syrups, it purges plentifully in a small dose, without occasioning much disorder. The part of the jalap remaining after the separation of the resin yields to water an extract which has no effect as a cathartic, but operates powerfully by urine.—Hoffman particularly cautions against giving jalap to children; and assures us, that it will

Jamaica. will deſtroy appetite, weaken the body, and perhaps occaſion even death: but herein he is contradicted by Groſſry; who obſerves, that children whoſe veſſels are lax, and the food ſoft and lubricating, bear theſe kinds of medicines better than adults.—Certain it is, however, that jalap, when given to children, moſt frequently proves emetic as well as cathartic.

JAMAICA, an iſland of the Weſt Indies, the largeſt of the Antilles, lying between 17° and 19° N. Lat. and between 76° and 79° W. Long.; in length near 170 miles, and about 60 in breadth. It approaches in its figure to an oval. The windward paſſage right before it hath the iſland of Cuba on the weſt, and Hiſpaniola on the eaſt, and is about 20 leagues in breadth.

This iſland was diſcovered by admiral Chriſtopher Columbus in his ſecond voyage, who landed upon it May 5. 1494; and was ſo much charmed with it, as always to prefer it to the reſt of the iſlands: in conſequence of which, his ſon choſe it for his dukedom. It was ſettled by Juan de Eſquivel A. D. 1509, who built the town, which, from the place of his birth, he called *Seville*, and 11 leagues farther to the eaſt ſtood Melilla. Oriſtan was on the ſouth ſide of the iſland, ſeated on what is now called *Blue Fields River*. All theſe are gone to decay; but St Jago, now Spaniſh Town, is ſtill the capital. The Spaniards held this country 160 years, and in their time the principal commodity was cacao; they had an immenſe ſtock of horſes, aſſes, and mules, and prodigious quantities of cattle. The Engliſh landed here under Penn and Venables, May 11. 1654, and quickly reduced the iſland. Cacao was alſo their principal commodity till the old trees decayed, and the new ones did not thrive; and then the planters from Barbadoes introduced ſugar-canes, which hath been the great ſtaple ever ſince.

The proſpect of this iſland from the ſea, by reaſon of its conſtant verdure, and many fair and ſafe bays, is wonderfully pleaſant. The coaſt, and for ſome miles within, the land is low; but removing farther, it riſes and becomes hilly. The whole iſle is divided by a ridge of mountains running eaſt and weſt, ſome riſing to a great height: and theſe are compoſed of rock, and a very hard clay; through which, however, the rains that fall inceſſantly upon them, have worn long and deep cavities, which they call *gullies*. Theſe mountains, however, are far from being unpleaſant, as they are crowned even to their ſummits by a variety of fine trees. There are alſo about a hundred rivers that iſſue from them on both ſides; and, though none of them are navigable for any thing but canoes, are both pleaſing and profitable in many other reſpects. The climate, like that of all countries between the tropics, is very warm towards the ſea, and in marſhy places unhealthy; but in more elevated ſituations, cooler; and, where people live temperately, to the full as wholeſome as in any part of the Weſt Indies. The rains fall heavy for about a fortnight in the months of May and October; and as they are the cauſe of fertility, are ſtyled ſeaſons. Thunder is pretty frequent, and ſometimes ſhowers of hail: but ice or ſnow, except on the tops of the mountains, are never ſeen; but on them, and at no very great height, the air is exceedingly cold.

The moſt eaſtern parts of this ridge are famous under the name of the *Blue Mountains*. This great chain of rugged rocks defends the ſouth ſide of the iſland from thoſe boiſterous north-weſt winds, which might be fatal to their produce. Their ſtreams, tho' ſmall, ſupply the inhabitants with good water, which is a great bleſſing, as their wells are generally brackiſh. The Spaniards were perſuaded that theſe hills abounded with metals: but we do not find that they wrought any mines; or if they did, it was only copper, of which they ſaid the bells in the church of St Jago were made. They have ſeveral hot ſprings, which have done great cures. The climate was certainly more temperate before the great earthquake; and the iſland was ſuppoſed to be out of the reach of hurricanes, which ſince then it hath ſeverely felt. The heat, however, is very much tempered by land and ſea breezes; and it is aſſerted, that the hotteſt time of the day is about eight in the morning. In the night, the wind blows from the land on all ſides, ſo that no ſhips can then enter their ports. Jamaica.

In an iſland ſo large as this, which contains above five millions of acres, it may be very reaſonably conceived that there are great variety of ſoils. Some of theſe are deep, black, and rich, and mixed with a kind of potter's earth; others ſhallow and ſandy; and ſome of a middle nature. There are many ſavannahs, or wide plains, without ſtones, in which the native Indians had luxuriant crops of maize, which the Spaniards turned into meadows, and kept in them prodigious herds of cattle. Some of theſe ſavannahs are to be met with even amongſt the mountains. All theſe different ſoils may be juſtly pronounced fertile, as they would certainly be found, if tolerably cultivated, and applied to proper purpoſes. A ſufficient proof of this will ariſe from a very curſory review of the natural and artificial produce of this ſpacious country.

It abounds in maize, pulſe, vegetables of all kinds, meadows of fine graſs, a variety of beautiful flowers, and as great a variety of oranges, lemons, citrons, and other rich fruits. Uſeful animals there are of all ſorts, horſes, aſſes, mules, black cattle of a large ſize, and ſheep, the fleſh of which is well taſted, though their wool is hairy and bad. Here are alſo goats and hogs in great plenty; ſea and river fiſh; wild, tame, and water fowl. Amongſt other commodities of great value, they have the ſugar-cane, cacao, indigo, pimento, cotton, ginger, and coffee; trees for timber and other uſes, ſuch as mahogany, manchineel, white wood, which no worm will touch, cedar, olives, and many more. Beſides theſe, they have ſuſtick, red wood, and various other materials for dyeing. To theſe we may add a multitude of valuable drugs, ſuch as guaiacum, china, ſarſaparilla, caſſia, tamarinds, vanellas, and the prickle-pear or opuntia, which produces the cochineal; with no inconſiderable number of odoriferous gums. Near the coaſt they have ſalt-ponds, with which they ſupply their own conſumption, and might make any quantity they pleaſed.

As this iſland abounds with rich commodities, it is happy likewiſe in having a number of fine and ſafe ports. Point Morant, the eaſtern extremity of the iſland, hath a fair and commodious bay. Paſſing on to the ſouth, there is Port Royal: on a neck of land which forms one ſide of it, there ſtood once the faireſt town in the iſland; and the harbour is as fine a one as can be wiſhed, capable of holding a thouſand large veſſels, and ſtill the ſtation of our ſquadron. Old Harbour is alſo a convenient port, ſo is Maccary Bay; and

Jamaica. and there are at leaſt twelve more between this and the weſtern extremity, which is Point Negrillo, where our ſhips of war lie when there is a war with Spain. On the north ſide there is Orange Bay, Cold Harbour, Rio Novo, Montego Bay, Port Antonio one of the fineſt in the iſland, and ſeveral others. The north-weſt winds, which ſometimes blow furiouſly on this coaſt, render the country on that ſide leſs fit for canes, but pimento thrives wonderfully; and certainly many other ſtaples might be raiſed in ſmall plantations, which are frequent in Barbadoes, and might be very advantageous here in many reſpects.

The town of Port Royal ſtood on a point of land running far out into the ſea, narrow, ſandy, and incapable of producing any thing. Yet the excellence of the port, the convenience of having ſhips of ſeven hundred tons coming cloſe up to their wharfs, and other advantages, gradually attracted inhabitants in ſuch a manner, that though many of their habitations were built on piles, there were near two thouſand houſes in the town in its moſt flouriſhing ſtate, and which let at high rents. The earthquake by which it was overthrown happened on the 7th of June 1692, and numbers of people periſhed in it. This earthquake was followed by an epidemic diſeaſe, of which upwards of three thouſand died: yet the place was rebuilt; but the greateſt part was reduced to aſhes by a fire that happened on the 9th of January 1703, and then the inhabitants removed moſtly to Kingſton. It was, however, rebuilt for the third time; and was riſing towards its former grandeur, when it was overwhelmed by the ſea, Auguſt 20. 1722. There is, notwithſtanding, a ſmall town there at this day. Hurricanes ſince that time have often happened, and occaſioned terrible deva-ſtations; yet they have been leſs frequent and leſs violent of late years, and the climate is alſo ſaid to be altered for the better.

In ſo large an iſland as this, it might be expected there ſhould be a conſiderable number of great towns; which, however, there is not. The reaſon of this is very obvious; for the wealth of the inhabitants ariſing from their plantations, of which there are at preſent about five hundred, and each of theſe containing ſome hundreds of inhabitants, it appears from hence that every plantation forms a village, and accounts ſufficiently for the diſpoſal of the greateſt part of the inhabitants. There are however ſome few towns; the largeſt of which is Kingſton, which ſtands on the harbour of Port Royal, contains about 1600 houſes, and is very populous. St Jago de la Vega, or, as it is uſually called, *Spaniſh Town*, is properly the capital of the iſland, being the reſidence of the governor, the place where the aſſembly meets, and is alſo the ſeat of the principal courts of juſtice.

The adminiſtration of public affairs is by a governor and council of royal appointment, and the repreſentatives of the people in the lower houſe of aſſembly. They meet at Spaniſh Town, and things are conducted with great order and dignity. The colony hath a conſiderable public revenue; of which the quit-rents, by a grant of the crown, make a part. Another branch ariſes from a tax or fine laid upon ſuch as keep fewer than three white to 100 black ſervants. This is preferring the eaſe to the ſecurity of the community, in reſpect to which it would have operated much more beneficially as a regulation. The iſland is divided into three counties, Middleſex, Surry, and Cornwall, containing 19 pariſhes, over each of which preſides a magiſtrate ſtyled a *cuſtos*, but theſe pariſhes in point of ſize are a kind kind of hundreds. Yet is this fine country, upon the whole, but thinly peopled, and indifferently cultivated; for though near a fourth part of the lands are patented, yet not above a ninth part is actually under cultivation. The commerce of Jamaica is very conſiderable, not only with all parts of Great Britain and Ireland, but with Africa, North and South America, the Weſt India iſlands, and the Spaniſh main, for the encouragement of which a late act was paſſed. The ſhips annually employed are upwards of 500 ſail. The number of inhabitants is very uncertain; ſome ſay about 30,000 or perhaps more whites, and about 170,000 negroes.

Jamaica || Jambic.

The following account of the exports of this iſland, in 1770, will contribute more than all that hath been ſaid, to ſhew the importance of Jamaica. They conſiſted in 2249 bales of cotton, which at 10 pounds per bale, the price in the iſland, amounts to 22,490 l.; 1873 hundred weight of coffee, at three pounds five ſhillings per hundred, 6088 l.; 2753 bags of ginger, at two pounds five ſhillings per bag, 6194 l.; 2211 hides, at ſeven ſhillings per hide, 773 l.; 15,796 hogſheads of rum, at ten pounds per hogſhead, 157,960 l. To Ireland, 679 hogſheads, at ten pounds per hogſhead, 6790 l. Mahogany, 15,282 pieces, and 8500 feet, 50,000 l. Of pimento, 2,089,734 pounds weight, 52,243 l. Sugar, 57,675 hogſheads, 6425 tierces, 52 barrels, at ſeventeen pounds ten ſhillings per hogſhead, twelve pounds per tierce, and four pounds per barrel, amounting in the whole to 1,086,620 l. Sarſaparilla, 205 bags, at ten pounds per bag, 2250 l. Exports to Great Britain and Ireland 1,391,210 l. To North America, 146,324 l. To the other iſlands, 595 l. Total of the exports, 1,538,730 l.

JAMBI, or Jambis, a ſea-port town and ſmall kingdom of Aſia, on the eaſtern coaſt of the iſland of Sumatra. It is a trading place. The Dutch have a fort here; and export pepper from thence, with the beſt ſort of canes. E. Long. 103. 55. S. Lat. 0. 30.

IAMBIC, in ancient poetry, a ſort of verſe, ſo called from its conſiſting either wholly, or in great part, of iambus's. See Iambus.

Ruddiman makes two kinds of iambic, viz. dimeter and trimeter; the former containing four feet, and the latter ſix. And as to the variety of their feet, they conſiſt wholly of iambus's, as in the two following verſes of Horace:

1 2 3 4 5 6
Dim. *Inar|ſit æ|ſtuo|ſus|*
Trim. *Suis| & ipſa Ro|ma vi|ribus|ruit.*

Or, a dactylus, ſpondeus, anapeſtus, and ſometimes tribrachys, obtain in the odd places; and the tribrachys alſo in the even places, excepting the laſt. Examples of all which may be ſeen in Horace; as,

Dimeter.

1 2 3 4 5 6
Canidi|a tra|ctavit|dapes|
Vide|re prope|rantes domum|

Trimeter.

Quò quò|ſcele|ſti ruî|tis aut|cur dex|teris.

Alitibus atque canibus homicidæ Hectorem.
Pavidumque lepos aut advenam laqueo gruem.

JAMBLICUS, the name of two celebrated Platonic philosophers, one of whom was of Colchis, and the other of Apamea in Syria. The first, whom Julian equals to Plato, was the disciple of Anatolius and Porphyry, and died under the reign of the emperor Constantine.—The second also enjoyed great reputation. Julian wrote several letters to him, and it is said he was poisoned under the reign of Valens.—It is not known to which of the two we ought to attribute the works we have in Greek under the name of *Jamblicus*, viz. 1. The history of the life of Pythagoras, and the sect of the Pythagoreans. 2. An exhortation to the study of philosophy. 3. A piece against Porphyry's letter on the mysteries of the Egyptians.

IAMBUS, in the Greek and Latin prosody, a poetical foot, consisting of a short syllable followed by a long one; as in

⏑ – ⏑ – ⏑ –
Θεὸς, κύριε, *Dei, meas.*

Syllaba longa brevi subjecta vocatur iambus, as Horace expresses it; who also calls the iambus a swift, rapid foot, *pes citus*.

The word, according to some, took its rise from Iambus, the son of Pan and Echo, who invented this foot; or, perhaps, who only used sharp-biting expressions to Ceres, when afflicted for the death of Proserpine. Others rather derive it from the Greek ἰάπτω, *venenum*, "poison;" or from ἰαμβίζω, *maledico*, "I rail, or revile;" because the verses composed of iambus's were at first only used in satire.

JAMES (St.), called *the Great*, the son of Zebedee, and the brother of John the evangelist, was born at Bethsaida, in Galilee. He was called to be an apostle, together with St John, as they were mending their nets with their father Zebedee, who was a fisherman; when Christ gave them the name of *Boanerges*, or *Sons of Thunder*. They then followed Christ, were witnesses with St Peter of the transfiguration on mount Tabor, and accompanied our Lord in the garden of olives. It is believed that St James first preached the gospel to the dispersed Jews; and afterwards returned to Judea, where he preached at Jerusalem, when the Jews raised up Herod Agrippa against him, who put him to a cruel death about the year 44. Thus St James was the first of the apostles who suffered martyrdom. St Clement of Alexandria relates, that his accuser was so struck with his constancy, that he became converted and suffered with him. There is a magnificent church at Jerusalem which bears the name of *St James*, and belongs to the Armenians. The Spaniards pretend, that they had St James for their apostle, and boast of possessing his body; but Baronius, in his Annals, refutes their pretensions.

JAMES (St.), called *the Less*, an apostle, the brother of Jude, and the son of Cleophas and Mary the sister of the mother of our Lord, is called in Scripture the *Just*, and the *brother* of Jesus, who appeared to him in particular after his resurrection. He was the first bishop of Jerusalem, when Ananias II. high priest of the Jews, caused him to be condemned, and delivered him into the hands of the people and the Pharisees, who threw him down from the steps of the temple, when a fuller dashed out his brains with a club, about the year 62. His life was so holy, that Josephus considers the ruin of Jerusalem as a punishment inflicted on that city for his death. He was the author of the epistle which bears his name. James.

JAMES, the name of several kings of Scotland and of Great Britain. See (*History of*) SCOTLAND and BRITAIN.

JAMES I. king of Scotland in 1423, the first of the house of Stuart, was taken prisoner by the English in 1406, who were at war with Robert III. his father; and remained so till 1424, when he was set at liberty by John duke of Bedford regent of England during the minority of Henry VI. In 1437, this unfortunate prince was assassinated in his bed by the relations of those whom he had punished for mal-administration during his imprisonment.

JAMES II. king of Scotland, 1437, succeeded his father, being then but seven years of age; and was killed at the siege of Roxburgh in 1460, aged 29. This prince wrote, 1. A panegyric on his queen, before she was married to him. 2. Scotch sonnets: one of them, a lamentation while in England, is in manuscript in the Bodleian library, and bestows great praises on Gower and Chaucer. 3. *Rythmi Latini*. 4. On music.

JAMES III. king of Scotland, succeeded his father in 1460. He was a tyrannical prince; and having irritated his subjects, they rebelled against him, and he was slain by them in battle in 1488, aged 35.

JAMES IV. king of Scotland, succeeded his father in 1488. He was a pious and valiant prince; subdued his rebellious subjects; and afterwards, taking part with Louis XII. against Henry VIII. of England, he was slain in the battle of Flouden-Field in 1513, aged 41.

JAMES V. king of Scotland, in 1513, was but 18 months old when his father lost his life. When of age, he assisted Francis I. king of France, against the emperor Charles le Quint; for which service Francis gave him his eldest daughter in marriage, in 1535. This princess died in two years; and James married Mary of Lorraine, daughter of Claud duke of Guise, and widow of Louis d'Orleans, by whom he had only one child, the unfortunate Mary queen of Scots, born only eight days before his death, which happened December 13. 1542. This was the first prince of his family who died a natural death, since its elevation to the throne. He wrote the celebrated ballad called *Christ's Kirk on the Green*, and other little poems, which, at least, tradition reports to have been of his composition. They have a character of ease and libertinism, says Mr Walpole, which makes the tradition the more probable, and are to be found in a collection of Scottish poems called *The Evergreen*; the Gaber-luinzie Man is reckoned the best. There is something very ludicrous in the young woman's distress when she thought that her first favour had been thrown away on a beggar.

JAMES I. king of England in 1603, and VI. of Scotland in 1567, son of Mary queen of Scots; whom he succeeded in Scotland, as he did Elizabeth in England. Strongly attached to the Protestant religion, he signalized himself in its support; which gave rise to the horrid conspiracy of the Papists to destroy him and all the English nobility by the Gunpowder Plot, discovered

vered November 5. 1605. The following year, a political teſt of loyalty was required, which ſecured the king's perſon, by clearing the kingdom of thoſe diſaffected Roman-Catholic ſubjects who would not ſubmit to it. The chief glory of this king's reign conſiſted in the eſtabliſhment of new colonies, and the introduction of ſome manufactures. The nation enjoyed peace, and commerce flouriſhed during his reign. Yet his adminiſtration was deſpiſed both at home and abroad: for, being the head of the Proteſtant cauſe in Europe, he did not ſupport it in that great criſis, the war of Bohemia; abandoning his ſon-in-law the elector Palatine; negotiating when he ſhould have fought, deceived at the ſame time by the courts of Vienna and Madrid; continually ſending illuſtrious ambaſſadors to foreign powers, but never making a ſingle ally. He valued himſelf much upon his polemical writings; and ſo fond was he of theological diſputations, that to keep them alive, he founded, for this expreſs purpoſe, Chelſea-college; which was converted to a much better uſe by Charles II. His *Baſilicon Doron*, Commentary on the Revelation, writings againſt Bellarmine, and his *Dæmonologia*, or doctrine of witchcraft, are ſufficiently known. There is a collection of his writings and ſpeeches in one folio volume. Several other pieces of his are extant; ſome of them in the Caballa, others in manuſcript in the Britiſh Muſeum, and others in Howard's collection. He died in 1625, in the 59th year of his age, and 23d of his reign.

JAMES II. king of England, Scotland, &c. 1685, grandſon of James I. ſucceeded his brother Char. II. It is remarkable, that this prince wanted neither courage nor political abilities whilſt he was duke of York; on the contrary, he was eminent for both: but when he aſcended the throne, he was no longer the ſame man. A bigot from his infancy to the Romiſh religion and to its hierarchy, he ſacrificed every thing to eſtabliſh them, in direct contradiction to the experience he had acquired, during the long reign of his brother, of the genius and character of the people he was to govern. Guided by the jeſuit Peters his confeſſor, and the infamous chancellor Jeffries, he violated every law enacted for the ſecurity of the Proteſtant religion; and then, unable to face the reſentment of his injured ſubjects, he fled like a coward, inſtead of diſarming their rage by a diſmiſſion of his Popiſh miniſters and prieſts. He rather choſe to live and die a bigot, or, as he believed, a ſaint, than to ſupport the dignity of his anceſtors, or periſh beneath the ruins of his throne. The conſequence was the revolution in 1689. James II. died in France in 1710, aged 68. He wrote Memoirs of his own life and campaigns to the reſtoration; the original of which is preſerved in the Scotch college, at Paris. This piece is printed at the end of Ramſay's life of Marſhal Turenne. 2. Memoirs of the Engliſh affairs, chiefly naval, from the year 1660 to 1673. 3. The royal ſufferer, king James II. conſiſting of meditations, ſoliloquies, vows, &c. ſaid to be compoſed by his majeſty at St Germains. 4. Three letters; which were publiſhed by William Fuller, gent. in 1702, with other papers relating to the court of St Germains, and are ſaid in the title-page to be printed by command.

JAMES (Thomas), a learned Engliſh critic and divine, born about the year 1571. He recommended himſelf to the office of keeper of the public library at Oxford, by the arduous undertaking of publiſhing a catalogue of the MSS in each college-library at both univerſities. He was elected to this office in 1602, and held it 18 years, when he reſigned it to proſecute his ſtudies with more freedom. In the convocation held with the parliament at Oxford in 1625, of which he was a member, he moved to have proper commiſſioners appointed to collate the MSS. of the fathers in all the libraries in England, with the Popiſh editions, in order to detect the forgeries in the latter; but this propoſal not meeting with the deſired encouragement, he engaged in the laborious taſk himſelf, which he continued until his death in 1629. He left behind him a great number of learned works.

JAMES (Richard), nephew of the former, entered into orders in 1615: but, being a man of humour, of three ſermons preached before the univerſity, one concerning the obſervation of Lent was without a text, according to the moſt ancient manner; another againſt the text; and the third beſide it. About the year 1619, he travelled through Wales, Scotland, Shetland, into Greenland, and Ruſſia, of which he wrote obſervations. He aſſiſted Selden in compoſing his *Marmora Arundeliana*; and was very ſerviceable to Sir Robert Cotton, and his ſon Sir Thomas, in diſpoſing and ſettling their noble library. He died in 1638; and has an extraordinary character given him by Wood for learning and abilities.

Knights of St JAMES, a military order in Spain, firſt inſtituted about the year 1170 by Ferdinand II. king of Leon and Galicia. The greateſt dignity belonging to this order is that of Grand Maſter, which has been united to the crown of Spain. The knights are obliged to make proof of their deſcent from families that have been noble, for four generations, on both ſides; they muſt likewiſe make it appear, that their ſaid anceſtors have neither been Jews, heretics, nor Saracens; nor have ever been called into queſtion by the inquiſition. The novices are obliged to ſerve ſix months in the galleys, and to live a month in a monaſtery; they obſerve the rules of St Auſtin, making no vows but of poverty, obedience, and conjugal fidelity.

JAMES's *Powder*, an antimonial medicine, ſomewhat of the nature of tartar emetic, prepared by the late Dr Robert James, phyſician in London, who died on the 23d of March 1776. His powder was found to be of conſiderable efficacy in ſome kinds of fevers; ſo that it is much to be regretted, that the inventor thought proper to conceal his method of preparing it even till his death.

JAMES-*Town*, in North America, was once the capital of Virginia, but now Williamſburg claims that honour. It is ſeated on a peninſula on the north ſide of James river; and conſiſts of about 80 houſes, chiefly for the entertainment of ſeafaring men; for the ſeat of the government, and the courts of juſtice, have been removed to Williamſburg, which is ſeven miles north of it. W. Long. 77. 30. N. Lat. 37. 0.

St JAMES's *Day*, a feſtival of the Chriſtian church, obſerved on the 25th of July, in honour of St James the greater, ſon of Zebedee.

Epiſtle of St JAMES, a canonical book of the New Teſtament, being the firſt of the *catholic* or *general* epiſtles;

Jamesone epistles; which are so called, as not being written to one but to several Christian churches.
Janiculum.

This general epistle is addressed partly to the believing and partly to the infidel Jews; and is designed to correct the errors, soften the ungoverned zeal, and reform the indecent behaviour of the latter; and to comfort the former under the great hardships they then did, or shortly were to suffer, for the sake of Christianity.

JAMESONE (George), an excellent painter, justly termed the *Vandyke of Scotland*, was the son of Andrew Jamesone, an architect; and was born at Aberdeen, in 1586. He studied under Rubens, at Antwerp; and, after his return, applied with indefatigable industry to portraits in oil, though he sometimes practised in miniature, and also in history and landscapes. His largest portraits were somewhat less than life. His earliest works are chiefly on board, afterwards on a fine linen cloth smoothly primed with a proper tone to help the harmony of his shadows. His excellence is said to consist in delicacy and softness, with a clear and beautiful colouring; his shades not charged, but helped by varnish, with little appearance of the pencil. When king Charles I. visited Scotland in 1633, the magistrates of Edinburgh, knowing his majesty's taste, employed this artist to make drawings of the Scottish monarchs; with which the king was so pleased, that, inquiring for the painter, he sat to him, and rewarded him with a diamond-ring from his own finger. It is observable, that Jamesone always drew himself with his hat on, either in imitation of his master Rubens, or on having been indulged in that liberty by the king when he sat to him. Many of Jamesone's works are in both the colleges of Aberdeen; and the Sybils there he is said to have drawn from living beauties in that city. His best works are from the year 1630 to his death, which happened at Edinburgh in 1644.

JAMYN (Amadis), a celebrated French poet in the 16th century. He is esteemed the rival of Ronsard, who was his cotemporary and friend. He was secretary and chamber-reader in ordinary to Char. IX. and died about 1585. He wrote, 1. Poetical works, 2 vols. 2. Philosophical discourses to Pasicharis and Rodanthe, with seven academical discourses. 3. A translation of the Iliad of Homer, begun by Hugh Sabel, and finished by Jamyn; with a translation into French verse of the three first books of the Odyssey.

JANEIRO, a province of Brasil in South America, seated between the tropic of Capricorn, and 22° of S. Lat. It is bounded on the north by the province of Spirito Sancto, on the east and south by the Atlantic Ocean, and on the west by the mountains which separate it from Guiara, in Spanish America. This is the most valuable province which the Portuguese are masters of; for they import from thence yearly great quantities of gold and precious stones, which they find in the mountains to a prodigious value.

JANICULUM, or Janicularis, a hill of Rome, added by Ancus Martius; the burial-place of Numa, and of Statius Cæcilius the poet: to the east and south, having the Tiber; to the west, the fields; to the north, a part of the Vatican. So called, either from an ancient city, (Virgil); or because it was a *janua*, or gate, from which to issue out and make incursions on the Tuscans, (Verrius Flaccus.) Now called *Mons Aureus*, corruptly *Montorius*, from its sparkling sands. From this hill, on account of its height, is the most extensive prospect of Rome: but it is less inhabited, because of its gross air; neither is it reckoned among the seven hills. Hither the people retired, and were hence afterwards recalled by Q. Hortensius the dictator, (Pliny.) Janizaries.

JANIZARIES, an order of infantry in the Turkish armies; reputed the grand seignior's foot-guards. Vossius derives the word from *genizers*, which in the Turkish language signifies *novi homines* or *milites*. D'Herbelot tells us, that *jenitcheri* signifies a *new band*, or *troop*; and that the name was first given by Amurath I. called the *Conqueror*, who choosing out one fifth part of the Christian prisoners whom he had taken from the Greeks, and instructing them in the discipline of war and the doctrines of their religion, sent them to Hagi Bektasche (a person whose pretended piety rendered him extremely revered among the Turks), to the end that he might confer his blessing on them, and at the same time give them some mark to distinguish them from the rest of the troops.—Bektasche, after blessing them in his manner, cut off one of the sleeves of the fur-gown which he had on, and put it on the head of the leader of this new militia; from which time, viz. the year of Christ 1361, they have still retained the name *jenitcheri*, and the fur-cap.

As, in the Turkish army, the European troops are distinguished from those of Asia; the janizaries are also distinguished into *janizaries of Constantinople*, and *of Damascus*. Their pay is from two aspers to twelve *per diem*; for when they have a child, or do any signal piece of service, their pay is augmented.—Their dress consists of a dolyman, or long gown, with short sleeves, which is given them annually by the grand seignior on the first day of Ramazan. They wear no turban; but, in lieu of that, a kind of cap, which they call *zarcola*, and a long hood of the same stuff hanging on their shoulders. On solemn days they are adorned with feathers, which are stuck in a little case in the fore-part of the bonnet.—Their arms, in Europe, in time of war, are a sabre, a carabine or musquet, and a cartouch-box hanging on the left side. At Constantinople, in time of peace, they wear only a long staff in their hand. In Asia, where powder and fire-arms are more uncommon, they wear a bow and arrows, with a poinard, which they call *haniare*.—Though the janizaries are not prohibited marriage, yet they rarely marry, nor then but with the consent of their officers; as imagining a married man to make a worse soldier than a bachelor.—It was Osman, or Ottoman, or, as others will have it, Amurath, who first instituted the order of janizaries. They were at first called *jaja*, that is, footmen, to distinguish them from the other Turks, the troops whereof consisted mostly of cavalry. The number of janizaries is generally above 40,000; divided into 162 companies or chambers called *odas*, in which they live together at Constantinople as in a convent. They are of a superior rank to all other soldiers, and are also more arrogant and factious, and it is by them that the public tranquillity is mostly disturbed. The government may therefore be said to be in the hands of the janizaries. They have, however, some good qualities: they are em-

Jansen, Janseniſts.

employed to eſcort travellers, and eſpecially ambaſſadors and perſons of high rank, on the road; in which caſe, they behave with the utmoſt zeal and fidelity.

JANSEN (Cornelius), biſhop of Ypres, one of the moſt learned divines of the 17th century, and principal of the ſect called from his name *Janſeniſts*. He was born in Holland of Catholic parents, and ſtudied at Louvain. Being ſent to tranſact ſome buſineſs of conſequence relating to the univerſity, into Spain, the Catholic king, viewing with a jealous eye the intriguing policy of France, engaged him to write a book to expoſe the French to the pope as no good Catholics, ſince they made no ſcruple of forming alliances with Proteſtant ſtates. Janſen performed this taſk in his *Mars Gallicus;* and was rewarded with a mitre, being promoted to the ſee of Ypres in 1635. He had, among other writings, before this, maintained a controverſy againſt the Proteſtants upon the points of grace and predeſtination; but his *Auguſtinus* was the principal labour of his life, on which he ſpent above 20 years. See the next article.

JANSENISTS, in church-hiſtory, a ſect of the Roman Catholics in France, who followed the opinions of Janſenius, biſhop of Ypres, and doctor of divinity of the univerſities of Louvain and Douay, in relation to grace and predeſtination.

In the year 1640, the two univerſities juſt mentioned, and particularly father Molina and father Leonard Celſus, thought fit to condemn the opinions of the Jeſuits on grace and free-will. This having ſet the controverſy on foot, Janſenius oppoſed to the doctrine of the Jeſuits the ſentiments of St Auguſtine; and wrote a treatiſe on grace, which he entitled *Auguſtinus*. This treatiſe was attacked by the Jeſuits, who accuſed Janſenius of maintaining dangerous and heretical opinions; and afterwards, in 1642, obtained of pope Urban VIII. a formal condemnation of the treatiſe wrote by Janſenius: when the partiſans of Janſenius gave out that this bull was ſpurious, and compoſed by a perſon entirely devoted to the jeſuits. After the death of Urban VIII. the affair of Janſeniſm began to be more warmly controverted, and gave birth to an infinite number of polemical writings concerning grace. And what occaſioned ſome mirth, was the titles which each party gave to their writings: one writer publiſhed *The torch of St Auguſtine*, another found *Snuffers for St Auguſtine's torch*, and father Veron formed *A gag for the Janſeniſts*, &c. In the year 1650, 68 biſhops of France ſubſcribed a letter to pope Innocent X. to obtain an inquiry into and condemnation of the five following propoſitions, extracted from Janſenius's Auguſtinus: 1. Some of God's commandments are impoſſible to be obſerved by the righteous, even though they endeavour with all their power to accompliſh them. 2. In the ſtate of corrupted nature, we are incapable of reſiſting inward grace. 3. Merit and demerit in a ſtate of corrupted nature, does not depend on a liberty which excludes neceſſity, but on a liberty which excludes conſtraint. 4. The Semipelagians admitted the neceſſity of an inward preventing grace for the performance of each particular act, even for the beginning of faith; but they were heretics in maintaining that this grace was of ſuch a nature, that the will of man was able either to reſiſt or obey it. It is Semipelagianiſm to ſay, that Jeſus Chriſt died, or ſhed his blood, for all mankind in general.

January, Janus.

In the year 1652, the pope appointed a congregation for examining into the diſpute in relation to grace. In this congregation Janſenius was condemned; and the bull of condemnation, publiſhed in May 1653, filled all the pulpits in Paris with violent outcries and alarms againſt the hereſy of the Janſeniſts. In the year 1656, pope Alexander VII. iſſued out another bull, in which he condemned the five propoſitions of Janſenius. However, the Janſeniſts affirm, that theſe propoſitions are not to be found in this book; but that ſome of his enemies having cauſed them to be printed on a ſheet, inſerted them in the book, and thereby deceived the pope. At laſt Clement XI. put an end to the diſpute by his conſtitution of July 17. 1705; in which, after having recited the conſtitutions of his predeceſſors in relation to this affair, he declares, "That in order to pay a proper obedience to the papal conſtitutions concerning the preſent queſtion, it is neceſſary to receive them with a reſpectful ſilence." The clergy of Paris, the ſame year, approved and accepted this bull, and none dared to oppoſe it.

This is the famous bull *Unigenitus*, ſo called from its beginning with the words *Unigenitus Dei Filius*, &c. which has occaſioned ſo much confuſion in France.

JANUARY, in chronology, the firſt month of the year, ſo called from JANUS, one of the ancient Roman deities, painted with two faces; one whereof was ſuppoſed to look towards the new year, and the other towards the old.—January was introduced into the year by Numa Pompilius; Romulus's year beginning in the month of March. The Chriſtians heretofore faſted on the firſt of January, by way of oppoſition to the ſuperſtitution of the heathens; who, in honour of Janus, obſerved this day with feaſtings, dancings, maſquerades, &c.

JANUS, in heathen worſhip, the firſt king of Italy, who, it is ſaid, received Saturn into his dominions, after his being driven from Arcadia by Jupiter. He tempered the manners of his ſubjects, and taught them civility; and from him they learned to improve the vine, to ſow corn, and to make bread. After his death, he was adored as a god. Romulus cauſed a temple to be erected to him, the gates of which were open in time of war, and ſhut in time of peace. This temple was ſhut up, for the firſt time, in the reign of Numa; the ſecond, after the firſt Punic war; and thrice under Auguſtus. Nero, Veſpaſian, and ſeveral others, obſerved the ſame ceremony; but we do not find that it was obſerved by the Chriſtian emperors.

This deity was thought to preſide over all new undertakings. Hence, in all ſacrifices, the firſt libations of wine and wheat were offered to Janus, and all prayers prefaced with a ſhort addreſs to him. January, the firſt month of the year was dedicated to and named from him. At this feſtival, the Romans offered cakes of new meal and ſalt, with new wine and frankincenſe. Then the conſuls for the new year ſolemnly entered on their office, all artificers and tradeſmen began their works, quarrels were laid aſide, mutual preſents were made, and the day concluded with mirth and joy.

Janus was repreſented with two faces, either to denote his prudence, or that he views at once the paſt

Japan. and approaching years; he had a ſceptre in his right hand, and a key in his left, to ſignify his extenſive authority, and his invention of locks.

Tho' this is properly a Roman deity, the abbé la Pluche repreſents it as derived from the Egyptians, who made known the riſing of the dog-ſtar, which opened their ſolar year, with an image with a key in its hand, and two faces, one old and the other young, to tipify the old and new year.

JAPAN, a general name for a great number of iſlands lying between the eaſtern coaſt of Aſia and the weſtern one of America, and which all together form a large and potent empire. They extend from the 30th to the 41ſt degree of latitude, and from the 130th to the 147th of eaſt longitude.

Were South and North Britain divided by an arm of the ſea, Japan might be moſt aptly compared to England, Scotland, and Ireland, with their reſpective ſmaller iſlands, peninſulas, bays, channels, &c. all under the ſame monarch.

The Europeans call the empire *Japan*; but the inhabitants *Niphon*, from the greateſt iſland belonging to it; and the Chineſe *Ciphon*, probably on account of its eaſtern ſituation; theſe names ſignifying, in both languages, the *Baſis* or *Foundation of the Sun*. It was firſt diſcovered by the Portugueſe, ſome time between the years 1535 and 1548.

Smollet's Preſent State of all Nations.

Moſt of the iſlands which compoſe it are ſurrounded with ſuch high craggy mountains, and ſuch ſhallow and boiſterous ſeas, that ſailing about them is extremely dangerous; and the creeks and bays are choaked up with ſuch rocks, ſhelves, and ſands, that it looks as if Providence had deſigned it to be a kind of little world by itſelf. Theſe ſeas have likewiſe many dangerous whirlpools, which are very difficult to paſs at low water, and will ſuck in and ſwallow up the largeſt veſſels, and all that comes within the reach of their vortex, daſhing them againſt the rocks at the bottom; inſomuch that ſome of them are never ſeen again, and others thrown upon the ſurface at ſome miles diſtance. Some of theſe whirlpools alſo make a noiſe terrible to hear.

The Chineſe pretend that the Japan iſlands were firſt peopled by themſelves: but it is more probable that the original inhabitants were a mixture of different nations, driven thither by thoſe tempeſtuous ſeas, and at different times; and this conjecture is confirmed by the great difference obſervable between the preſent inhabitants, in regard to feature, complexion, ſhapes, habits, cuſtoms, and language, notwithſtanding their having been ſo long united under one monarch.

As theſe iſlands lie in the fifth and ſixth climates, they would be much hotter in ſummer than England, were not the heats refreſhed by the winds which continually blow from the ſea around them, and to which they are much expoſed by the height of their ſituation: this circumſtance, however, not only renders their winters exceſſive cold, but the ſeaſons more inconſtant. They have great falls of ſnow in winter, which are commonly followed by hard froſts. The rains in ſummer are very violent, eſpecially in the months of June and July, which on that account are called *ſat-ſuki*, or *water-months*. The country is alſo much ſubject to dreadful thunders and lightnings, as well as ſtorms and hurricanes, which frequently do a great deal of damage. Japan.

The ſoil, though naturally barren and mountainous, by the induſtry of the inhabitants, not only ſupplies them with every neceſſary of life, but alſo furniſhes other countries with them; producing, beſides corn, the fineſt and whiteſt rice, and other grains, with a great variety of fruits, and vaſt numbers of cattle of all ſorts. Beſides rice, and a ſort of wheat and barley, with two ſorts of beans, they have Indian wheat, millet, and ſeveral other kinds, in great abundance. Their ſeas, lakes, and rivers, abound with fiſh; and their mountains, woods, and foreſts, are well ſtocked with horſes, elephants, deer, oxen, buffaloes, ſheep, hogs, and other uſeful animals. Some of their mountains alſo are enriched with mines of gold, ſilver, and copper, exquiſitely fine, beſides tin, lead, iron, and various other minerals and foſſils; whilſt others abound with ſeveral ſorts of marble and precious ſtones. Of theſe mountains, ſome may be juſtly ranked among the natural rarities of this country; one, in particular, in the great iſland of Niphon, is of ſuch prodigious height as to be eaſily ſeen forty leagues off at ſea, though its diſtance from the ſhore is about eighteen. Some authors think it exceeds the famous Peak of Teneriffe; but it may rather be called a cluſter or group of mountains, among which are no leſs than eight dreadful volcanoes, burning with incredible fury, and often laying waſte the country round about them: but, to make ſome amends, they afford great variety of medicinal waters, of different degrees of heat; one of theſe, mentioned by Varenius, is ſaid to be as hot as burning oil, and to ſcorch and conſume every thing thrown into it.

The many brooks and rivers that have their ſources among the mountains, form a great number of delightful cascades, as well as ſome dreadful cataracts. Among the great variety of trees in the foreſts here, the cedars exceed all of that kind through India, for ſtraightneſs, height, and beauty. They abound in moſt of the iſlands, eſpecially the largeſt.

Their ſeas, beſides fiſh, furniſh them with great quantities of red and white coral, and ſome pearls of great value, beſides a variety of ſea-plants and ſhells; which laſt are not inferior to thoſe that are brought from Amboyna, the Molucca and other eaſtern iſlands.

The vaſt quantity of ſulphur, with which moſt of the Japan iſlands abound, makes them ſubject to frequent and dreadful earthquakes. The inhabitants are ſo accuſtomed to them, that they are ſcarcely alarmed at any, unleſs they chance to be very terrible indeed, and lay whole towns in ruins, which very often proves the caſe. On theſe occaſions, they have recourſe to extraordinary ſacrifices, and acts of worſhip to their deities or demons, according to the different notions of each ſect, and ſometimes even proceed to offer human victims; but in this caſe they only take ſome of the vileſt and moſt abandoned fellows they can meet with, becauſe they are only ſacrificed to the malevolent deities.

With reſpect to religion, that of the Japaneſe is allowed by all writers to have been downright heathenism and idolatry from time immemorial. They do not ſeem ſo much as to have any ſort of notion of a Supreme Creator; but believe the world to have exiſted from

Japan. from eternity, and that the gods they worſhip were men or beings that lived on earth ſeveral thouſands of years, and were afterwards, for their piety, mortification, and even by their voluntary death, raiſed to that height of power and dignity they have ever ſince enjoyed. They are divided, however, into various ſects; probably according to the various nations that firſt ſettled there. One of them is called the *ſect of Stutto*, which is that of their philoſophers and moraliſts, whoſe profeſſors, like the Chineſe literati, deſpiſe all notions of public worſhip and popular ſuperſtition. Every perſon here is at liberty to chooſe what ſect pleaſes him beſt, no compulſion being uſed by the government or by the parents. Moſt of the ſects believe a future ſtate of bliſs or miſery, though they are not agreed about the nature and duration of it: the generality, however, think that it will conſiſt in a tranſmigration of the ſoul from one body to another, more or leſs excellent and happy, according to their behaviour in their late ſtate; and that this revolution will continue, as well as the world, to eternal ages. All the different ſects, or at leaſt the prieſts and prieſteſſes of them, however divided in other reſpects, agree in regarding the five following negative precepts as abſolutely binding; 1. Not to kill, nor to eat any thing that is killed; 2. Not to ſteal; 3. Not to defile another man's bed; 4. Not to lie; 5. Not to drink wine. From the example of their two chief deities, Amida and Xaca, the Japaneſe have a notion of its being ſuch a meritorious thing to diſpatch one's ſelf, that great numbers of them embrace, in the moſt public manner, a voluntary death, either by drowning, hanging, or flinging themſelves down from a precipice, or by poiſon, dagger, or any other quick riddance. The followers of Xaca commonly drown themſelves; but thoſe of Amida ſhut themſelves up in ſome cloſe confined place, where they have juſt room to ſit, and, being immured on every ſide, have only a little hole to breathe through by means of a ſmall cane, and never ceaſe calling on that deity till they expire.

There is not a country in all the eaſt that abounds more with temples and monaſteries than this: not only cities and towns, but plains and mountains, and even deſarts, ſwarm with them; for the prieſts here, like thoſe of the church of Rome, are either ſecular or regular. The former live in private houſes of their own, allow themſelves one or two wives, and live on the income and offerings made to their reſpective temples and deities, and are at their own liberty as to the practice of abſtinence and other ſeverities: the regulars live in communities, under their reſpective ſuperiors, and lead more or leſs recluſe and auſtere lives, according to their ſects. Some of the monaſteries contain a thouſand, or even more of them, who, beſides a perpetual celibacy and other mortifications, are all bound to obſerve the five rules before mentioned. Both ſecular and regular are under the government of the dairo or high-prieſt, who is the head of all the religions and ſects in the empire. Beſides the multitude of idols in their temples, there is a great number of others ſet up in their other public buildings, in their piazzas and markets, ſtreets, and even public roads.

The Japaneſe have as great variety of feſtivals as of ſects and deities, which it would therefore be endleſs to deſcribe: they conſiſt in general in the anniverſary of their gods and of their dead relations. Japan.

Chriſtianity, if Popery deſerves that name, had once made a conſiderable progreſs in this country; but, about the year 1622, a dreadful perſecution was raiſed againſt the miſſionaries, and all that adhered to them, occaſioned partly by the indiſcreet zeal of the former, partly by the jealouſy of the unconverted nobles, but eſpecially of the Japaneſe prieſts, who could not, without the greateſt envy and regret, behold their old religion, with all its powerful attractives of profit, popular eſteem, and reſpect, daily loſing ground; but more particularly by the policy and treachery of the Dutch, who found effectual means to undermine them. All the Chriſtian converts were put to death; and the Europeans, except the Dutch, forbid to come within the Japaneſe dominions under the ſevereſt penalties.

With reſpect to the government of theſe iſlands, it is and has been for a long time monarchical; though formerly it ſeems to have been ſplit into a great number of petty kingdoms, which were at length all ſwallowed by one. The imperial dignity had been enjoyed, for a conſiderable time before the year 1500, by a regular ſucceſſion of princes, under the title of *dairos*, a name ſuppoſed to have been derived from Dairo the head of that family. Soon after that epoch, ſuch a dreadful civil war broke out, and laſted ſo many years, that the empire was quite ruined. During theſe diſtractions and confuſions, a common ſoldier, by name Tayckoy, a perſon of obſcure birth, but of an enterpriſing genius, found means to raiſe himſelf to the imperial dignity; having, in little more than three years time, by an uncommon ſhare of good fortune ſubdued all his competitors and opponents, and reduced all their cities and caſtles. The dairo, not being in a condition to obſtruct or put a ſtop to his progreſs, was forced to ſubmit to his terms; and might perhaps have been condemned to much harder, had not Tayckoy been apprehenſive leſt his ſoldiers, who ſtill revered their ancient natural monarch, ſhould have revolted in his favour. To prevent this, he granted him the ſupreme power in all religious matters, with great privileges, honours, and revenues annexed to it; whilſt himſelf remained inveſted with the whole civil and military power, and was acknowledged and proclaimed king of Japan. This great revolution happened in 1517, and Tayckoy reigned ſeveral years with great wiſdom and tranquillity; during which he made many wholeſome laws and regulations, which ſtill ſubſiſt, and are much admired to this day. At his death, he left the crown to his ſon Tayckoſama, then a minor; but the treacherous prince under whoſe guardianſhip he was left, deprived him of his life before he came of age. By this murder, the crown paſſed to the family of Jejaſſama, in which it ſtill continues. Tayckoy and his ſucceſſors have contented themſelves with the title of *cubo*, which, under the dairos, was that of prime miniſter, whoſe office is now ſuppreſſed; ſo that the cubo, in all ſecular concerns, is quite as abſolute and deſpotic, and has as extenſive a power over the lives and fortunes of all his ſubjects, from the petty kings down to the loweſt perſons, as ever the dairos had. The dairo reſides conſtantly at Meaco, and the cubo at Jedo.

The

Japan. The Japaneſe traffic with the Chineſe, Koreans, and people of Jetzo: but, of the European nations, the Dutch alone are ſuffered to trade with them; having declared, as ſome ſay, after the expulſion of the Portugueſe, that they were no Chriſtians; but more probably on the merit of ſupplanting and aſſiſting in expelling the Portugueſe: for it is impoſſible that the Japaneſe can be ignorant that the Dutch profeſs Chriſtianity, as they trade to China; and we find the Japaneſe uſe as much caution in their commerce with the Dutch as if they were really Chriſtians.

At the ſeaſon that the Dutch fleet is expected, the governor of Nangaſaque places centinels on the hills to give notice of the approach of any ſhips. When they appear, a boat is ſent off to every ſhip, with a waiter or officer; and as ſoon as the ſhips come to an anchor, an expreſs is immediately diſpatched to court, before whoſe return the Dutch may not diſpoſe of any thing. In the mean time, the particulars of every ſhip's cargo are taken, with the name, age, ſtature, and office, of every man on board, which is tranſlated and printed in the Japaneſe language. When the expreſs is returned, the ſhips crew are permitted to come on ſhore, and are all muſtered before a Japaneſe commiſſary; and every perſon is called over aloud, and made to give an account of his age, quality, and office, to ſee if it agrees with the particulars given in by the Dutch: after this examination they are ſent on board again, and the ſails of the ſhip, with the guns, arms, ammunition, and helm, are brought on ſhore, and the hatches ſealed down by a Japaneſe officer; nor can they be opened, whatever the ſhip's crew may want, without a permiſſion from the governor, who always ſends a perſon to ſee what is taken out, and ſeal them down again; nor dare the Dutch ſailors light a candle or make any fire on board their ſhips, any more than on ſhore. The ſhips are allowed no communication with one another; nor is any officer or ſailor ſuffered to go on ſhore, except the perſons who are appointed to carry the company's preſent to the king at Jedo or Yeddo. His majeſty having accepted the preſent, and prepared another for the company, the Dutch officer is conveyed to Nangaſaque under a ſtrong guard as he came. This journey, and the tranſacting their mercantile affairs, uſually take up about three months and a half.

The Dutch, who attend the king on this occaſion, approach him on their knees, with their hands joined together, and carried to their foreheads, as the Japaneſe governors and miniſters alſo do.

While the Dutch ſhips lie in the road, none of the Japaneſe are allowed to go on board them to trade with the ſailors; and thoſe that carry proviſions on board are not ſuffered to take any money for them till the permiſſion to trade comes from court, and then they deliver in their accounts and are paid. After this, the Japaneſe permit ſix perſons from every veſſel to come on ſhore, and buy and ſell for themſelves, and ſtay four days, either in Diſnia or in the city, as they ſee fit; when theſe ſix men return on board, ſix others are allowed to go on ſhore and traffic in the like manner, and ſo on.

The goods are generally paid in bullion or pieces of ſilver, of ten or five crowns value, or ſmaller pieces by weight; for they have no coin, except ſome little pieces of copper.

After ſix weeks free trade, there is no further communication allowed of between the city of Nangaſaque and the Dutch in the iſland of Diſnia, or with the ſhipping; whereupon the fleet prepares to return, and the factory in Diſnia are confined to their little iſland again, until the ſeaſon of the year for traffic returns. Japan.

With reſpect to the character of the Japaneſe, they are generally very active, and of a quick apprehenſion and good underſtanding, modeſt, patient, and courteous, and excelling all the Orientals in docility. They are ſo juſt in their dealings, that one may abſolutely depend on their word; and, contrary to the Chineſe, diſdain to take the leaſt advantage of thoſe they deal with. They are all very induſtrious and laborious, and much given to ſtudy and reading. They affect a ſurpriſing neatneſs and decency in their eating, drinking, furniture, dreſs, and converſation; and have an abhorrence to intemperance, luxury, and defamation. Drunkenneſs and gluttony are as much detected by the rich and poor, as cheating and diſhoneſty. This is the bright ſide of their character. On the other hand, they are repreſented as proud, ambitious, cruel, and uncharitable; and ſo inſenſible of the miſeries of their fellow-creatures, that they will ſuffer them to periſh, rather than relieve them. They are likewiſe ſaid to be ſo paſſionate and revengeful, that they will make away with themſelves if they cannot find an opportunity of revenging an affront. They allow not only of polygamy, but alſo of fornication: but there is ſtill a more heinous and unnatural vice laid to their charge, viz. that of ſodomy, which is not only committed with impunity, both by prieſts and laiety, but without either brand or diſgrace. In their wars they are very fierce and cruel, ſeldom giving or aſking for quarter; and when a town is taken, they commonly deſtroy it by fire and ſword. Like the Chineſe, they are ſo given to aſtrology, that they ſcarce undertake any thing of moment, without conſulting ſome pretender to that art. There is a vaſt number of univerſities diſperſed all over the empire, in which the bonzas preſide, richly endowed, finely ſituated, and accommodated with all the conveniences of life, as well as with large libraries.

The Japaneſe laws and puniſhments are ſevere beyond all juſtice; and may be juſtly ſaid, like thoſe of the Spartan Draco, to be written in blood. They have few, if any, written laws, the emperor's will being the ſupreme one, and next to it that of the kings and princes in their reſpective dominions. The very lords of every diſtrict, and even the heads of every family, have power of life and death over all that are under them, and try and condemn them according to their will. There is ſcarcely any crime ſo ſmall, that is not puniſhed with death, except the offender be a petty king or prince, and even theſe are not always exempted. Every petty larceny, inſult, detraction, cheating of any kind, even at play, a lie or prevarication before a magiſtrate, are all capital, as well as the more heinous crimes of treaſon, murder, parricide, inceſt, rape, adultery. Their moſt common way of putting criminals to death, is by crucifixion with their heads downwards, boiling in oil, tearing them to pieces by horſes, or cutting them in pieces by the hangman. For the higheſt crimes, not only the criminal, but his parents alſo, brothers, and even children, are all put to

Japan. to death. The Japaneſe have but very little ſkill in phyſic and ſurgery. In the cure of diſeaſes they depend much on their medicinal waters, and on certain roots and plants, particularly the root ginſeng, brought from China. The operation of blood-letting is performed by pricking the belly with a fine needle, made either of gold or ſilver. By this acupuncture they not only aſſwage, but effectually cure, an endemic colicky diſorder common among them, and called *ſpenki*. The other diſeaſes to which they are moſt liable, are the dropſy, diarrhœa, ſmall-pox, bloody-flux; but the gout, ſtone, and gravel, are hardly known among them.

The Japaneſe are much addicted to poetry, muſic, and painting; the firſt is ſaid to be grand as to the ſtyle and imagery, loftineſs, and cadence; but, like that of the Chineſe, is not eaſily underſtood or reliſhed by the Europeans. The ſame may be ſaid of their muſic, both vocal and inſtrumental; the beſt of which, of either kind, would hardly be tolerable to a nice European ear. They are better painters than the Chineſe, but much inferior to the Europeans; moſt of their performances in that kind, are either in water-colours on paper, fine leather, &c. or in their japanning and fine porcelain-ware. What is moſt to be admired in their paintings, is the ſingular beauty of the colours, in many of which they greatly excel us.

They pretend, like the Chineſe, to have been the inventors of printing from time immemorial, and their method is the ſame with theirs on wooden blocks; but they excel them in the neatneſs of cutting them, as well as in the goodneſs of their ink and paper. They likewiſe lay claim to the invention of gunpowder; and are vaſtly ſuperior to the Chineſe in the uſe of all ſorts of fire, eſpecially of artillery, as well as the curiouſneſs of their fire-works.

Their manner of writing is much the ſame as that of the Chineſe, viz. in columns from top to bottom, and the columns beginning at the right and ending at the left hand. Their characters were alſo originally the ſame, but now differ conſiderably.

Their language hath ſome affinity with the Chineſe, though it appears from its various dialects to have been a kind of compound of that and other languages, derived from the various nations that firſt peopled thoſe iſlands. It is not only very regular, polite, elegant, and copious, but abounds with a great variety of ſynonima, adapted to the nature of the ſubject they are upon, whether ſublime, familiar, or low; and to the quality, age, and ſex, both of the ſpeaker and perſon ſpoken to.

The Japaneſe are commonly very ingenious in moſt handicraft trades; and excel even the Chineſe in ſeveral manufactures, particularly in the beauty, goodneſs, and variety of their ſilks, cottons, and other ſtuffs, and in their japan and porcelain wares. No eaſtern nation comes up to them in the tempering and fabricating of ſcymitars, ſwords, muſkets, and other ſuch weapons.

The Japaneſe architecture is much in the ſame taſte and ſtyle as that of the Chineſe, eſpecially as to their temples, palaces, and other public buildings; but in private ones they affect more plainneſs and neatneſs than ſhow: theſe laſt, being moſtly built of wood, make their cities exceedingly liable to conflagrations, which, wherever they happen, generally reduce the greateſt part of them to aſhes, they having neither engines nor any other method of ſtopping the progreſs of the flames. The gardens about their houſes are adorned with a variety of flowers, trees, verdure, baths, terraces, and other embelliſhments. The furniture and decorations of the houſes of perſons of diſtinction, conſiſt in japan-work of various colours, curious paintings, beds, couches, ſkreens, cabinets, tables, a variety of porcelain jars, vaſes, tea-equipage, and other veſſels and figures, together with ſwords, guns, ſcymitars, and other arms. Their retinues are more or leſs numerous and ſplendid, according to their rank; but there are few of the lords who have leſs than 50 or 60 men richly clad and armed, ſome on foot, but moſt on horſeback. As for their petty kings and princes, they are ſeldom ſeen without 300 or 200 at leaſt, when they either wait on the emperor, which is one half of the year, or attend him abroad. The Japaneſe dreſs is much like that of the Chineſe, only ſomewhat more elegant and neat, and moſt commonly of ſilk or cotton. They wear nothing on their heads either winter or ſummer, though they ſhave themſelves cloſe all over, except one lock, which is left hanging on the top by way of ornament: but to guard themſelves from ſun or rain, they always carry an umbrella in one hand; and, if rich enough, have them held over their heads by a ſervant. The poorer fort have, inſtead of that, either a fan or ſhort ſkreen. The women of faſhion, eſpecially the young ones, adorn themſelves with flowers, feathers, pearls, &c. but are ſeldom ſeen abroad, or even at home, to any but thoſe of the family, without a veil.

The proper colour here for feſtivals is black, for mourning white. Inſtead of riſing at the approach of a ſuperior, they fet themſelves down; and inſtead of bowing or proſtrating when they ſalute, they ſtand upright. They chooſe to have their teeth and nails of a ſhining black, and to let the latter grow to an exceſſive length. The chief food of the Japaneſe is rice, pulſe, fruits, roots, herbs, eating very little fleſh, and that only of ſuch beaſts as they take in hunting. Inſtead of knives, forks, and ſpoons, they make uſe of the ſame ſorts of ſmall ſticks as the Chineſe. Their common drink is either water or tea; but they have other liquors, ſome diſtilled from rice or wheat, others made of their grains boiled with ſugar or honey, or of fruits, or tapped from the palm, birch, and other trees.

After marriage, the wife is confined to her own apartment, from whence ſhe hardly ever ſtirs, except once a-year to the funeral-rites of her family; nor is ſhe permitted to ſee any man, except perhaps ſome very near relation, and that as ſeldom as can be. The wives, as well as in China and other parts of the eaſt, bring no portion with them, but are rather bought by the huſband of their parents and relations. The bridegroom moſt commonly ſees his bride for the firſt time upon her being brought to his houſe from the place of the nuptial ceremony: for in the temple where it is performed ſhe is covered over with a veil, which reaches from the head to the feet. A huſband can put his wives to a more or leſs ſevere death, if they give him the leaſt cauſe of jealouſy, by being ſeen barely to converſe with ano-

Japanning. another man, or suffering one to come into their apartment.

The Japanese, both poor and rich, make an annual procession to the sepulchres of their dead relations, with songs and music; carrying money, victuals, cloathing, &c. as presents to relieve their various wants in the other world.

When a prince or great man dies, there are commonly about 10, 20, or more youths of his household, and such as were his greatest favourites, who put themselves to a voluntary death, at the place where the body is buried or burned: as soon as the funeral pile, consisting of odoriferous woods, gums, spices, oils, and other ingredients, is set on fire, the relations and friends of the deceased throw their presents into it, such as cloaths, arms, victuals, money, sweet herbs, flowers, and other things which they imagine will be of use to him in the other world. Those of the middle or lower rank commonly bury their dead, without any other burning than that of some odoriferous woods, gums, &c. The sepulchres into which the bones and ashes of persons of rank are deposited, are generally very magnificent, and situated at some distance from the towns.

JAPAN *Earth*. See TERRA *Japonica*.

JAPANNING, the art of varnishing and drawing figures on wood, in the same manner as is done by the natives of Japan in the East Indies.

The substances which admit of being japanned are almost every kind that are dry and rigid, or not too flexible; as wood, metals, leather, and paper prepared.

Wood and metals do not require any other preparation, but to have their surface perfectly even and clean: but leather should be securely strained either on frames, or on boards; as its bending or forming folds would otherwise crack and force off the coats of varnish: and paper should be treated in the same manner, and have a previous strong coat of some kind of size; but it is rarely made the subject of japanning till it is converted into *papier machè*, or wrought by other means into such form, that its original state, particularly with respect to flexibility, is lost.

One principal variation from the method formerly used in japanning is, the using or omitting any priming or undercoat on the work to be japanned. In the older practice, such priming was always used; and is at present retained in the French manner of japanning coaches and snuff-boxes of the *papier machè*: but in the Birmingham manufacture here, it has been always rejected. The advantage of using such priming or undercoat is, that it makes a saving in the quantity of varnish used; because the matter of which the priming is composed fills up the inequalities of the body to be varnished; and makes it easy, by means of rubbing and water-polishing, to gain an even surface for the varnish: and this was therefore such a convenience in the case of wood, as the giving a hardness and firmness to the ground was also in the case of leather, that it became an established method; and is therefore retained even in the instance of the *papier machè*, by the French, who applied the received method of japanning to that kind of work on its introduction. There is nevertheless this inconvenience always attending the use of an undercoat of size, that the japan coats of varnish and colour will be constantly liable to be cracked and peeled off by any violence, and will not endure near so long as the bodies japanned in the same manner, but without any such priming; as may be easily observed in comparing the wear of the Paris and Birmingham snuff-boxes; which latter, when good of their kind, never peel or crack, or suffer any damage, unless by great violence, and such a continued rubbing as wastes away the substance of the varnish; while the japan coats of the Parisian crack and fly off in flakes, whenever any knock or fall, particularly near the edges, exposes them to be injured. But the Birmingham manufacturers, who originally practised the japanning only on metals, to which the reason above given for the use of priming did not extend, and who took up this art of themselves as an invention, of course omitted at first the use of any such undercoat; and not finding it more necessary in the instance of *papier machè*, than on metals, continue still to reject it. On which account, the boxes of their manufacture are, with regard to the wear, greatly better than the French. Japanni

The laying on the colours in gum-water, instead of varnish, is also another variation from the method of japanning formerly practised: but the much greater strength of the work, where they are laid on in varnish or oil, has occasioned this way to be exploded with the greatest reason in all regular manufactures: however, they who may practise japanning on cabinets, or other such pieces as are not exposed to much wear and violence, for their amusement only, and consequently may not find it worth their while to encumber themselves with the preparations necessary for the other methods, may paint with water-colours on an undercoat laid on the wood, or other substance of which the piece to be japanned is formed; and then finish with the proper coats of varnish, according to the methods below taught: and if the colours are tempered with the strongest isinglass size and honey, instead of gum-water, and laid on very flat and even, the work will not be much inferior in appearance to that done by the other method, and will last as long as the old japan.

Of JAPAN *Grounds*.—The proper grounds are either such as are formed by the varnish and colour, where the whole is to remain of one simple colour; or by the varnish either coloured, or without colour, on which some painting or other decoration is afterwards to be laid. It is necessary, however, before we proceed to speak of the particular grounds, to shew the manner of laying on the priming or undercoat, where any such is used.

This priming is of the same nature with that called *clear-coating*, or vulgarly *clear-coaling*, practised erroneously by the house-painters; and consists only in laying on and drying in the most even manner, a composition of size and whiting, or sometimes lime instead of the latter. The common size has been generally used for this purpose: but where the work is of a nicer kind, it is better to employ the glover's or the parchment size; and if a third of isinglass be added, it will be still better, and, if not laid on too thick, much less liable to peel and crack. The work should be prepared for this priming, by being well smoothed with the fish-skin or glass-shaver; and, being made thoroughly clean, should be brushed over once or twice with

Japanning. with hot ſize, diluted with two thirds of water, if it be of the common ſtrength. The priming ſhould then be laid on with a bruſh as even as poſſible; and ſhould be formed of a ſize, whoſe conſiſtence is betwixt the common kind and glue, mixed with as much whiting as will give it a ſufficient body of colour to hide the ſurface of whatever it is laid upon, but not more.

If the ſurface be very clean, on which the priming is uſed, two coats of it, laid on in this manner, will be ſufficient; but if, on trial with a fine rag wet, it will not receive a proper water poliſh, on account of any inequalities not ſufficiently filled up and covered, two or more coats muſt be given it; and whether a greater or leſs number be uſed, the work ſhould be ſmoothed, after the laſt coat but one is dry, by rubbing it with the Dutch ruſhes. When the laſt coat is dry, the water poliſh ſhould be given, by paſſing over every part of it with a fine rag gently moiſtened, till the whole appear perfectly plain and even. The priming will then be completed, and the work ready to receive the painting or coloured varniſh; the reſt of the proceedings being the ſame in this caſe as where no priming is uſed.

When wood or leather is to be japanned, and no priming is uſed, the beſt preparation is to lay two or three coats of coarſe varniſh compoſed in the following manner:

"Take of rectified ſpirit of wine one pint, and of coarſe ſeed-lac and reſin each two ounces. Diſſolve the ſeed-lac and reſin in the ſpirit; and then ſtrain off the varniſh."

This varniſh, as well as all others formed of ſpirit of wine, muſt be laid on in a warm place; and, if it can be conveniently managed, the piece of work to be varniſhed ſhould be made warm likewiſe: and for the ſame reaſon all dampneſs ſhould be avoided; for either cold or moiſture chills this kind of varniſh, and prevents its taking proper hold of the ſubſtance on which it is laid.

When the work is ſo prepared, or by the priming with the compoſition of ſize and whiting above deſcribed, the proper japan ground muſt be laid on, which is much the beſt formed of ſhell-lac varniſh, and the colour deſired, if white be not in queſtion, which demands a peculiar treatment; or great brightneſs be not required, when alſo other means muſt be purſued.

The colours uſed with the ſhell-lac varniſh may be any pigments whatever which give the teint of the ground deſired; and they may be mixed together to form browns or any compound colours.

As metals never require to be undercoated with whiting, they may be treated in the ſame manner as wood or leather, when the under-coat is omitted, except in the inſtances particularly ſpoken of below.

White JAPAN *Grounds.*—The forming a ground perfectly white, and of the firſt degree of hardneſs, remains hitherto a deſideratum, or matter ſought for, in the art of japanning, as there are no ſubſtances which form a very hard varniſh, but what have too much colour not to deprave the whiteneſs, when laid on of a due thickneſs over the work.

The neareſt approach, however, to a perfect white varniſh, already known, is made by the following compoſition.

"Take ſlake white, or white lead, waſhed over and ground up with a ſixth of its weight of ſtarch, and then dried; and temper it properly for ſpreading with the maſtich varniſh prepared as under the article VARNISH. Japanning.

"Lay theſe on the body to be japanned, prepared either with or without the under-coat of whiting, in the manner as above ordered; and then varniſh it over with five or ſix coats of the following varniſh:

"Provide any quantity of the beſt ſeed-lac; and pick out of it all the cleareſt and whiteſt grains, reſerving the more coloured and fouler parts for the coarſe varniſhes, ſuch as that uſed for priming or preparing wood or leather. Take of this picked ſeed-lac two ounces, and of gum-animi three ounces; and diſſolve them, being previouſly reduced to a groſs powder, in about a quart of ſpirit of wine; and ſtrain off the clear varniſh."

The ſeed-lac will yet give a ſlight tinge to this compoſition; but cannot be omitted where the varniſh is wanted to be hard; though, when a ſofter will anſwer the end, the proportion may be diminiſhed, and a little crude turpentine added to the gum-animi to take off the bitterneſs.

A very good varniſh, free entirely from all bitterneſs, may be formed by diſſolving as much gum-animi as the oil will take, in old nut or poppy oil; which muſt be made to boil gently when the gum is put into it. The ground of white colour itſelf may be laid on in this varniſh, and then a coat or two of it may be put over the ground; but it muſt be well diluted with oil of turpentine when it is uſed. This, though free from brittleneſs, is nevertheleſs liable to ſuffer by being indented or bruiſed by any ſlight ſtrokes; and it will not well bear any poliſh, but may be brought to a very ſmooth ſurface without, if it be judiciouſly managed in the laying it on. It is likewiſe ſomewhat tedious in drying, and will require ſome time where ſeveral coats are laid on; as the laſt ought not to contain much oil of turpentine.

Blue JAPAN *Grounds.*—Blue japan grounds may be formed of bright Pruſſian blue, or of verditer glazed over by Pruſſian blue, or of ſmalt. The colour may be beſt mixed with ſhell-lac varniſh, and brought to a poliſhing ſtate by five or ſix coats of varniſh of ſeed-lac: but the varniſh, nevertheleſs, will ſomewhat injure the colour by giving to a true blue a caſt of green, and fouling in ſome degree a warm blue by the yellow it contains: where, therefore, a bright blue is required, and a leſs degree of hardneſs can be diſpenſed with, the method before directed in the caſe of white grounds muſt be purſued.

Red JAPAN *Grounds.*—For a ſcarlet japan ground, vermilion may be uſed: but the vermilion has a glaring effect, that renders it much leſs beautiful than the crimſon produced by glazing it over with carmine or fine lake; or even with roſe-pink, which has a very good effect uſed for this purpoſe. For a very bright crimſon, nevertheleſs, inſtead of glazing with carmine, the Indian lake ſhould be uſed, diſſolved in the ſpirit of which the varniſh is compounded, which it readily admits of when good: and, in this caſe, inſtead of glazing with the ſhell-lac varniſh, the upper or poliſhing coats need only be uſed; as they will equally receive and convey the tinge of the Indian lake, which may be actually diſſolved by ſpirit of wine: and this will be found a much cheaper method than the uſing carmine. If, nevertheleſs, the higheſt degree of brightneſs be required,

Japanning. quired, the white varniſhes muſt be uſed.

Yellow JAPAN *Grounds.*—For bright yellow grounds, the king's yellow, or the turpeth mineral, ſhould be employed, either alone or mixed with fine Dutch pink: and the effect may be ſtill more heightened by diſſolving powdered turmeric-root in the ſpirit of wine of which the upper or poliſhing coat is made; which ſpirit of wine muſt be ſtrained from off the dregs, before the ſeed-lac be added to it to form the varniſh.

The ſeed-lac varniſh is not equally injurious here, and with greens, as in the caſe of other colours; becauſe, being only tinged with a reddiſh yellow, it is little more than an addition to the force of the colours.

Yellow grounds may be likewiſe formed of the Dutch pink only; which, when good, will not be wanting in brightneſs, though extremely cheap.

Green JAPAN *Grounds.*—Green grounds may be produced by mixing the king's yellow and bright Pruſſian blue, or rather the turpeth mineral and Pruſſian blue; and a cheap, but fouler kind, by verdigriſe with a little of the abovementioned yellows, or Dutch pink. But where a very bright green is wanted, the cryſtals of verdigriſe, called *diſtilled verdigriſe*, ſhould be employed; and to heighten the effect, they ſhould be laid on a ground of leaf-gold, which renders the colour extremely brilliant and pleaſing.

They may any of them be uſed ſucceſsfully with good ſeed-lac varniſh, for the reaſon before given; but will be ſtill brighter with white varniſh.

Orange-coloured JAPAN *Grounds.*—Orange-coloured japan grounds may be formed by mixing vermilion or red-lead with king's yellow, or Dutch pink; or the orange-lake, which will make a brighter orange ground than can be produced by any mixture.

Purple JAPAN *Grounds.*——Purple japan grounds may be produced by the mixture of lake and Pruſſian blue; or a fouler kind, by vermilion and Pruſſian blue. They may be treated as the reſt, with reſpect to the varniſh.

Black JAPAN *Grounds to be produced without Heat.*—Black grounds may be formed by either ivory-black, or lamp-black: but the former is preferable, where it is perfectly good.

Theſe may be always laid on with ſhell-lac varniſh; and have their upper or poliſhing coats of common ſeed-lac varniſh, as the tinge or foulneſs of the varniſh can be here no injury.

Common black JAPAN *Grounds on Iron or Copper, produced by means of Heat.*——For forming the common black japan grounds by means of heat, the piece of work to be japanned muſt be painted over with drying oil; and, when it is of a moderate dryneſs, muſt be put into a ſtove of ſuch degree of heat as will change the oil black, without burning it ſo as to deſtroy or weaken its tenacity. The ſtove ſhould not be too hot when the work is put into it, nor the heat increaſed too faſt; either of which errors would make it bliſter: but the ſlower the heat is augmented, and the longer it is continued, provided it be reſtrained within the due degree, the harder will be the coat of japan. This kind of varniſh requires no poliſh, having received, when properly managed, a ſufficient one from the heat.

The fine Tortoiſe-ſhell JAPAN *Ground, produced by means of Heat.*—The beſt kind of tortoiſe-ſhell ground produced by heat is not leſs valuable for its great hard- Japanning.
neſs, and enduring to be made hotter than boiling water without damage, than for its beautiful appearance. It is to be made by means of a varniſh prepared in the following manner:

"Take of good linſeed-oil one gallon, and of umbre half-a-pound: boil them together till the oil become very brown and thick: ſtrain it then through a coarſe cloth, and ſet it again to boil; in which ſtate it muſt be continued till it acquire a pitchy conſiſtence; when it will be fit for uſe."

Having prepared thus the varniſh, clean well the iron or copper plate, or other piece which is to be japanned; and then lay vermilion tempered with ſhell-lac varniſh, or with drying oil diluted with oil of turpentine, very thinly, on the places intended to imitate the more tranſparent parts of the tortoiſe-ſhell. When the vermilion is dry, bruſh over the whole with the black varniſh, tempered to a due conſiſtence with oil of turpentine; and when it is ſet and firm, put the work into a ſtove, where it may undergo a very ſtrong heat, and muſt be continued a conſiderable time; if even three weeks or a month, it will be the better.

This was given amongſt other receipts by Kunkel; but appears to have been neglected till it was revived with great ſucceſs in the Birmingham manufactures, where it was not only the ground of ſnuff-boxes, dreſſing-boxes, and other ſuch leſſer pieces, but of thoſe beautiful tea-waiters which have been ſo juſtly eſteemed and admired in ſeveral parts of Europe where they have been ſent. This ground may be decorated with painting and gilding, in the ſame manner as any other varniſhed ſurface, which had beſt be done after the ground has been duly hardened by the hot ſtove; but it is well to give a ſecond annealing with a more gentle heat after it is finiſhed.

Method of painting JAPAN *Work.*—Japan work ought properly to be painted with colours in varniſh; though, in order for the greater diſpatch, and, in ſome very nice works in ſmall, for the freer uſe of the pencil, the colours are ſometimes tempered in oil; which ſhould previouſly have a fourth part of its weight of gum-animi diſſolved in it; or, in default of that, of the gums ſandarac or maſtic. When the oil is thus uſed, it ſhould be well diluted with ſpirit of turpentine, that the colours may be laid more evenly and thin; by which means, fewer of the poliſhing or upper-coats of varniſh become neceſſary.

In ſome inſtances, water-colours are laid on grounds of gold, in the manner of other paintings; and are beſt, when ſo uſed, in their proper appearance, without any varniſh over them; and they are alſo ſometimes ſo managed as to have the effect of embоſſed work. The colours employed in this way, for painting, are beſt prepared by means of iſinglaſs ſize corrected with honey or ſugar-candy. The body of which the embоſſed work is raiſed, need not, however, be tinged with the exterior colour; but may be beſt formed of very ſtrong gum-water, thickened to a proper conſiſtence by bole-armenian and whiting in equal parts; which being laid on in the proper figure, and repaired when dry, may be then painted with the proper colours tempered in the iſinglaſs ſize, or in the general manner with ſhell-lac varniſh.

Manner

Japanning. *Manner of Varnifhing* JAPAN *Work.*—The laft and finifhing part of japanning lies in the laying on and polifhing the outer coats of varnifh; which are neceffary, as well in the pieces that have only one fimple ground of colour, as with thofe that are painted. This is in general beft done with common feed-lac varnifh, except in the inftances and on thofe occafions where we have already fhewn other methods to be more expedient: and the fame reafons which decide as to the fitnefs or impropriety of the varnifhes, with refpect to the colours of the ground, hold equally with regard to thofe of the painting: for where brightnefs is the moft material point, and a tinge of yellow will injure it, feed-lac muft give way to the whiter gums; but where hardnefs, and a greater tenacity, are moft eflential, it muft be adhered to; and where both are fo neceffary, that it is proper one fhould give way to the other in a certain degree reciprocally, a mixed varnifh muft be adopted.

This mixed varnifh, as we have already obferved, fhould be made of the picked feed-lac. The common feed-lac varnifh, which is the moft ufeful preparation of the kind hitherto invented, may be thus made:

"Take of feed-lac three ounces, and put it into water to free it from the ficks and filth that are frequently intermixed with it; and which muft be done by ftirring it about, and then pouring off the water, and adding freth quantities in order to repeat the operation, till it be freed from all impurities, as it very effectually may be by this means. Dry it then, and powder it grofsly, and put it, with a pint of rectified fpirit of wine, into a bottle, of which it will not fill above two-thirds. Shake the mixture well together; and place the bottle in a gentle heat, till the feed appear to be diffolved; the fhaking being in the mean time repeated as often as may be convenient: and then pour off all that can be obtained clear by this method, and ftrain the remainder through a coarfe cloth. The varnifh thus prepared muft be kept for ufe in a bottle well ftopt."

When the fpirit of wine is very ftrong, it will diffolve a greater proportion of the feed-lac: but this will faturate the common, which is feldom of a ftrength fufficient for making varnifhes in perfection. As the chilling, which is the moft inconvenient accident attending thofe of this kind, is prevented, or produced more frequently, according to the ftrength of the fpirit; we fhall therefore take this opportunity of fhewing a method by which weaker rectified fpirits may with great eafe, at any time, be freed from the phlegm, and rendered of the firft degree of ftrength.

"Take a pint of the common rectified fpirit of wine, and put it into a bottle, of which it will not fill above three parts. Add to it half an ounce of pearl-aftes, falt of tartar, or any other alkaline falt, heated red-hot, and powdered, as well as it can be without much lofs of its heat. Shake the mixture frequently for the fpace of half an hour; before which time, a great part of the phlegm will be feparated from the fpirit, and will appear, together with the undiffolved part of the falts, in the bottom of the bottle. Let the fpirit then be poured off, or freed from the phlegm and falts, by means of a tritorium or feparating funnel; and let half an ounce of the pearl-aftes, heated and powdered as before, be added to it, and the fame treatment repeated. This may be done a third time, if the quantity of phlegm feparated by the addition of the pearl-aftes appear conftderable. An ounce of alum reduced to powder and made hot, but not burnt, muft then be put into the fpirit, and fuffered to remain fome hours; the bottle being frequently fhaken: after which, the fpirit, being poured off from it, will be fit for ufe." Japanning.

The addition of the alum is neceffary, to neutralize the remains of the alkaline falt or pearl-aftes; which would otherwife greatly deprave the fpirit with refpect to varnifhes and lacquer, where vegetable colours are concerned; and muft confequently render another diftillation neceffary.

The manner of ufing the feed-lac or white varnifhes is the fame, except with regard to the fubftance ufed in polifhing; which, where a pure white or great clearnefs of other colours is in queftion, fhould be itfelf white: whereas the browner forts of polifhing duft, as being cheaper, and doing their bufinefs with greater difpatch, may be ufed in other cafes. The pieces of work to be varnifhed fhould be placed near a fire, or in a room where there is a ftove, and made perfectly dry; and then the varnifh may be rubbed over them by the proper bruthes made for that purpofe, beginning in the middle, and paffing the brufh to one end; and then with another ftroke from the middle, paffing it to the other. But no part fhould be croffed or twice paffed over, in forming one coat, where it can poffibly be avoided. When one coat is dry, another muft be laid over it; and this muft be continued at leaft five or fix times, or more, if on trial there be not a fufficient thicknefs of varnifh to bear the polifh, without laying bare the painting or the ground colour underneath.

When a fufficient number of coats is thus laid on, the work is fit to be polifhed: which muft be done, in common cafes, by rubbing it with a rag dipped in Tripoli or pumice-ftone, commonly called *rotten ftone*, finely powdered: but towards the end of the rubbing, a little oil of any kind fhould be ufed along with the powder; and when the work appears fufficiently bright and gloffy, it fhould be well rubbed with the oil alone, to clean it from the powder, and give it a ftill brighter luftre.

In the cafe of white grounds, inftead of the Tripoli or pumice-ftone, fine putty or whiting muft be ufed; both which fhould be waffied over to prevent the danger of damaging the work from any fand or other gritty matter that may happen to be commixed with them.

It is a great improvement of all kinds of japan work, to harden the varnifh by means of heat; which, in every degree that it can be applied fhort of what would burn or calcine the matter, tends to give it a more firm and ftrong texture. Where metals form the body, therefore, a very hot ftove may be ufed, and the pieces of work may be continued in it a conftderable time; efpecially if the heat be gradually increafed: but where wood is in queftion, heat muft be fparingly ufed, as it would otherwife warp or fhrink the body, fo as to injure the general figure.

Jaquelot || Jasher.

JAQUELOT (Isaac), a celebrated French Protestant divine, born in 1647 at Vassy in Champagne, where his father was minister. The revocation of the edict of Nantz obliging him to quit France, he took refuge first at Heidelberg, and then at the Hague, where he procured an appointment in the Walloon church. Here he continued till that capital was taken by the king of Prussia, who, hearing him preach, made him his French minister in ordinary at Berlin; to which city he removed in 1702. While he lived at Berlin, he entered into a warm controversy with M. Bayle on the doctrine advanced in his dictionary favouring manichæism, which continued until death imposed silence on both parties: and it was in this dispute that M. Jaquelot openly declared in favour of the Remonstrants. He wrote, among other works, 1. *Dissertations sur l'existence de Dieu.* 2. *Dissertations sur le Messie.* 3. *Lettres a Messieures les Prelats de l'Eglise Gallicane.* He was employed in finishing an important work upon the divine authority of the holy scriptures, when he died suddenly, in 1708, aged 61.

JAR, or Jarr, an earthen pot or pitcher, with a big belly and two handles.—The word comes from Spanish *jarra*, or *jarro*, which signify the same.

Jar is used for a sort of measure or fixed quantity of divers things.—The *jar* of oil is from 18 to 26 gallons; the *jar* of green ginger, is about 100 pound weight.

JARCHI (Solomon), otherwise *Rafchi* and *Isaaki Solomon*, a famous rabbi, born at Troyes in Champagne, who flourished in the 12th century. He was a perfect master of the talmud and gemara; and he filled the postils of the bible with so many talmudical reveries, as totally extinguished both the literal and moral sense of it. A great part of his commentaries are printed in Hebrew, and some have been translated into Latin by the Christians. They are all greatly esteemed by the Jews, who have bestowed on the author the title of *prince of commentators*.

JARIMUTH, Jarmuth, or *Jerimoth*, Josh. xv. a town reckoned to the tribe of Judah, four miles from Eleutheropolis, westward, (Jerome). Thought to be the same with Ramoth and Remeth, Josh. xix. and Nehem. x. 2. (Reland).

JARNAC, a town of France, in Orleanois and in Angumois, remarkable for a victory gained by Henry III. over the Huguenots in 1569. It is seated on the river Charente, in W. Long. 0. 13. N. Lat. 45. 40.

JAROSLOW, a handsome town of Poland, in the palatinate of Russia, with a strong citadel. It is remarkable for its great fair, its handsome buildings, and a battle gained by the Swedes in 1656, after which they took the town. It is seated on the river Saine, in E. Long. 22. 23. N. Lat. 49. 58.

JASHER (The book of). This is a book which Joshua mentions, and refers to, in the following passage: "And the sun stood still, and the moon stayed, until the people had avenged themselves upon their enemies: is not this written in the book of Jasher?"

It is difficult to determine what this *book of Jasher*, or "the upright," is. St Jerom and the Jews believed it to be Genesis, or some other book of the Pentateuch, wherein God foretold he would do wonderful things in favour of his people. Huetius supposes it was a book of morality, in which it was said that God would subvert the course of nature in favour of those who put their trust in him. Others pretend, it was public annals, or records, which were styled *justice* or *upright*, because they contained a faithful account of the history of the Israelites. Grotius believes, that this book was nothing else but a song, made to celebrate this miracle and this victory. This seems the more probable opinion, because the words cited by Joshua as taken from this work, "Sun, stand thou still upon Gibeon, and thou moon in the valley of Ajalon," are such poetical expressions as do not suit with historical memoirs; besides that in the 2d book of Samuel (i. 18.) mention is made of a book under the same title, on account of a song made on the death of Saul and Jonathan.

Jasmine, || Jasminum.

JASMINE. See Jasminum.

Arabian Jasmine. See Nyctanthes.

JASMINUM, Jasmine, or *Jessamine-tree*; a genus of the monogynia order, belonging to the diandria class of plants.

Species. 1. The officinalis, or common white jasmine, hath shrubby long slender stalks and branches, rising upon support 15 or 20 feet high, with numerous white flowers from the joints and ends, of a very fragrant odour. There is a variety with white-striped, and another with yellow-striped leaves. 2. The fruticans, or shrubby yellow jasmine, hath shrubby, angular, trailing stalks and branches, rising upon support eight or ten feet high; trifoliate and simple alternate leaves; with yellow flowers from the sides and ends of the branches, appearing in June; frequently producing berries of a black colour. This species is remarkable for sending up many suckers from its roots; often so plentifully as to overspread the ground, if not taken up annually. 3. The humilis, or dwarf yellow jasmine, hath shrubby firm stalks, and angular branches, of low, somewhat robust and bushy growth; broad, trifoliate, and pinnated leaves; and large yellow flowers in July, sometimes succeeded by berries. 4. The grandiflorum, or great-flowered Catalonian jasmine, hath a shrubby firm upright stem, branching out into a spreading head from about three to six or eight feet high, with large flowers of a blush-red colour without, and white within, appearing from July to November. Of this there is a variety with semi-double flowers, having two series of petals. 5. The azoricum, or azorian white jasmine, hath shrubby, long slender stalks and branches, rising upon support 15 or 20 feet high, with pretty large flowers of a pure white colour; coming out in loose bunches from the ends of the branches, and appearing most part of the summer and autumn. 6. The odoratissimum, or most sweet-scented yellow Indian jasmine, hath a shrubby upright stalk branching erect, without support, six or eight feet high, with bright yellow flowers in bunches from the ends of the branches; flowering from July till October, and emitting a most fragrant odour.

Culture. The three first species are sufficiently hardy to thrive in this climate without any shelter. They may be easily propagated by layers and cuttings; and the striped varieties by grafting or budding on stocks of the common kind.—The other three species, which are tender, may also be increased by layers, or seeds,

Jafon ‖ Jatropha.

ſeeds, or by grafting and budding them upon the common white and ſhrubby yellow jaſmine. They require ſhelter in a green-houſe in winter, and therefore muſt always be kept in pots to move them out and in occaſionally. The pots muſt be filled with light, rich earth, frequently watered in ſummer, and about once a week in winter, but always moderately during that ſeaſon. Prune off all the decayed wood at any time when it appears, and ſhorten or retrench the rambling ſhoots as you ſee occaſion, to preſerve the heads ſomewhat regular; managing them in other reſpects as the common green-houſe plants.

JASON, the Greek hero who undertook the Argonautic expedition, the hiſtory of which is obſcured by fabulous traditions, flouriſhed about 937 B. C.

JASPER, in natural hiſtory, a genus of ſcrupi, of a complex irregular ſtructure, of a great variety of colours, and emulating the appearance of the finer marbles, or ſemipellucid gems.

The great characteriſtic of jaſpers is, that they all readily ſtrike fire with ſteel, and make not the leaſt effervеſcence with aquafortis.

Jaſpers, though commonly reckoned among the precious ſtones, ought undoubtedly to be ranged among the ſcrupi; being only opake cryſtalline maſſes, variouſly debaſed with an earthy admixture: and to this laſt ingredient it is that they owe all their variety of colours, as white, green, red, brown, and bluiſh.

The ſeveral kinds of nephritic ſtone, and the lapis divinus or jade, are all genuine jaſpers; but the hard, bright, green jaſper of the Eaſt Indies, ſeems to be the true kind. It is found in maſſes of various ſizes and ſhapes: but the more uſual ſtandard as to ſize is between four and ſix inches in diameter; tho' there are maſſes of it found of a foot or more in diameter, and others no larger than a horſe-bean. It is generally ſimple and unmixed: but if it be variegated at all, it is always with white; and this is diſpoſed not in ſtreaks or veins, but in clouds. It is capable of a very fine poliſh; and, when the white clouds are well diſpoſed, is very beautiful; and, in pieces not too thick, is tolerably pellucid when held up againſt the light.

JASPONYX, in natural hiſtory, the pureſt horn coloured onyx, with beautiful green zones, which are compoſed of the genuine matter of the fineſt jaſpers. See JASPER and ONYX.

JATROPHA, the CASSADA-PLANT; a genus of the monodelphia order, belonging to the monœcia claſs of plants. There are ſeven ſpecies; the moſt remarkable of which is the manihot or manioc, the root of which is naturally poiſonous, but may be deprived of that quality, and made into bread; and as ſuch is uſed both in Africa and America, though it hath been diſputed whether the plant is really a native of the latter country, or imported to it from Africa. The ſhrub riſes ſeven or eight feet high, with a thin bark, that is grey, red, or violet, according to the different colours of the wood which it covers. The trunk and branches are filled with ſmall prominences or knots, exhibiting the veſtigia of the fallen leaves; for as the tree increaſes in height, the leaves relinquiſh the bottom of the branches, and are only to be found near the top. The wood is ſoft and brittle. The plant is better propagated by layers than from ſeed; at leaſt, little of the root proper for eating is to be obtained by the latter method. The principal root produces ſuckers, in number from four to ſeven, and of different length and thickneſs, according to the age of the tree and goodneſs of the ſoil. The bark of the roots is like that of the trunk, grey, when the wood is grey; red, when red; white, when white: but the inſide or heart is always white, and of the conſiſtence of turnip. Jatropha.

The roots of white manioc are ripe in eight months; thoſe of the other kind require 14 or 18 months to attain their full ſize and maturity. When ripe, they are plucked out of the earth by tearing up the whole tree, which never fails to be accompanied by the root; and if in that operation any of the offsets ſhould be ſeparated from the main root, which is eaſily obſerved, they take them up with a hoe. It requires no great force to pluck up theſe ſhrubs; for, beſides that the ſoil is of a ſoft nature, the roots do not penetrate very deep into it.

When plucked up, the negroes deſtined for this work grate or raſp the bark with a blunt knife, as is done to turnips, and then throw them into a tub full of water. They are then reduced to a powder or meal, reſembling the coarſe ſawings of wood: this is effected by rubbing the root very forcibly againſt a copper file or grater, about 15 or 18 inches long, and 10 or 12 broad, that is faſtened by ſmall nails upon a plank of timber, three feet and a half long and one broad. The negro, who files, puts one end of the plank into a wooden trough or tub, and holds the other againſt his ſtomach; at his ſide is a baſket, containing roots that are raſped, waſhed, and fit for being filed; one of theſe he takes in each hand, and paſſes it violently upon the file or grater, till it is reduced to a rough powder.

All the roots being grated in this manner, they take the powder and put it into a preſs, with a view to ſqueeze out the juice, which is regarded as a very ſtrong poiſon, not only for men, but for beaſts alſo, who drink of it, or chance to eat of theſe roots before the juice is expreſſed. It is remarkable, that animals which die in conſequence of having ſwallowed any quantity of this ſubſtance, have their breaſts prodigiouſly ſwelled, without any viſible alteration on the noble parts. Some have hence argued, that the juice in queſtion is not eſſentially a poiſon; but that poſſeſſing a ſuperfluity of nouriſhment, it proves an overmatch to the digeſtive faculties, and thus proves mortal.

Beſides this ſuper-abundance of nouriſhment, ſays father Labat, a part of its malignity conſiſts in its coldneſs, which ſtops the circulation, benumbs the animal-ſpirits, and at length cauſes death: hence the beſt antidote againſt this poiſon is heat and violent motion. The patient, after ſwallowing large quantities of oil, to excite a nauſea and vomiting, is made to run as quick as he can, and drink plentifully of the ſtrongeſt ſpirits; in fine, every method is uſed to excite violent heat, to rouſe the ſpirits, and put the blood in motion.

Animals which have accuſtomed themſelves inſenſibly to the juice of manioc, feel no inconvenience from the root of it, but rather the contrary. It is in this manner that the Turks, by a gradual and conſtant

uſe,

Jatropha. use, have rendered opium a harmleſs and even exhilarating medicine.

The juice of manioc loſes its malignity when heated. The natives of the Weſt-Indies, who uſe it in all their ſauces, feel no ſort of inconvenience from it, becauſe they never uſe it till after being boiled. Of the ſame juice they make ſtarch, by drying it in the ſun, where it becomes as white as ſnow, and is frequently made into cakes, which are as delicate as if made with the fineſt wheat-flour.

When the manioc is ſufficiently preſſed, they either make it into bread, called *caſſada*, or into flour for preſerving. For the firſt-mentioned purpoſe, they have a plate of iron, two feet broad and half an inch thick; this they place upon a tripod, or on ſtones, and kindle a fire below it. When ſufficiently heated, ſo as not to admit of the touch, they lay on the whole ſurface about the thickneſs of three fingers of manioc, which has been previouſly preſſed and ſifted. The heap falls down in proportion as it roaſts, and the parts join and incorporate. This compreſſion and incorporation is aided by the perſon who roaſts, ſlightly paſſing a piece of wood over the plate. When the ſide of the cake next the plate is ſufficiently done, that is, adheres, and the colour, formerly very white, becomes red, it is turned; and the other ſide allowed to roaſt till the ſame ſymptoms appear. When roaſted, it is laid in the ſun for two or three hours, with a view to diſſipate any poiſonous humidity, which may ſtill lurk in the root under this new form.

The inſide of caſſada is as white as ſnow, the ſides of a pale gold colour; the ſubſtance, which is very nouriſhing, and of eaſy digeſtion, may be preſerved ſeven or eight months, or more, provided it is kept dry and ſometimes expoſed to the ſun. When dipped in water, or put in ſoup, caſſada ſwells up to a great height, which ſeems to prove its great abundance in ſubſtance.

The other mode of preparation, however, is moſt common, as being more convenient for preſerving, diſtributing to the negroes, and tranſporting from place to place. The manioc, in this caſe, is put into a pan or ſtove that is but ſlightly heated, where it is continually turned, like coffee-beans, with a ſmall wooden inſtrument contrived for that purpoſe. This motion prevents it from ſticking to the pan; ſo that, when dried and roaſted, it has the appearance of thick red grains of ſalt. This mode of preparation is much more expeditious than the former. When dried, it is put in granaries, where it may be preſerved whole years, if kept dry, or put into a ſtove every ſix months.

This ſubſtance may be eat quite dry, as crumbled bread, or as the Turks eat roaſted rice. When moiſtened, it ſwells prodigiouſly.

This latter method of preparing manioc is never practiſed by the natives, who uſe only caſſada, which they prepare once every day, or oftener, as occaſion requires; for they eat it quite hot, as being then more delicate and agreeable to the taſte. Before their intercourſe with the Europeans had procured them iron plates, they made their caſſada upon large flat ſtones, whoſe thickneſs they adjuſted to that purpoſe. In default of copper ſiles or grates, they made uſe of a plank of wood, in which were fixed very ſmall ſharp bits of pebbles.

One ſort of manioc is ſaid to be exempt from the poiſonous quality poſſeſſed by the juice of the others. It is called *camoniac*, that is, chief of maniocs: in fact, its wood, leaves, and roots, are larger and thicker than the others, and it is eaten without danger, or any precaution; but as it is longer of growing and ripening, and the roots yield much leſs meal, becauſe lighter and more ſpungy, it is generally neglected. Java.

The ſmall bits of manioc which have eſcaped the grater, and the clods which have not paſſed the ſieve, are not uſeleſs. They are dried in the ſtove after the flour is roaſted, and then pounded in a mortar to a fine white powder, with which they make ſoup. It is likewiſe uſed for making a kind of thick coarſe caſſada, which is roaſted till almoſt burnt; of this, fermented with molaſſes and Weſt-India potatoes, they prepare a much eſteemed drink or beverage called *ouycou*. This liquor, the favourite drink of the natives, is ſometimes made extremely ſtrong, eſpecially on any great occaſion, as a feaſt; with this they get intoxicated, and, remembering their old quarrels, maſſacre and murder each other. Such of the inhabitants and workmen as have not wine, drink ouycou. It is of a red colour, ſtrong, nouriſhing, refreſhing, and eaſily inebriates the inhabitants, who ſoon acquiſtom themſelves to it as eaſily as beer.—The leaves of manioc are uſed in both Indies, as thoſe of ſpinnage are with us.

JAVA, a large iſland of the Eaſt Indies, lying between 105° and 116° E. Long. and from 6° to 8° S. Lat. extending in length 700 miles, and in breadth about 100. It is ſituated to the ſouth of Borneo, and ſouth-eaſt from the peninſula of Malacca, having Sumatra lying before it, from which it is ſeparated by a narrow paſſage, now ſo famous in the world by the name of the *Straits of Sunda*. The country is mountainous and woody in the middle; but a flat coaſt, full of bogs and marſhes, renders the air unhealthful. It produces pepper, indigo, ſugar, tobacco, rice, coffee, cocoa-nuts, plaintains, cardamoms, and other tropical fruits. Gold alſo, but in no great quantities, hath been found in it. It is diverſified by many mountains, woods, and rivers; in all which nature has very bountifully beſtowed her treaſures. The mountains are many of them ſo high as to be ſeen at the diſtance of three or four leagues. That which is called the *Blue Mountain* is by far the higheſt of them all, and ſeen the fartheſt off at ſea. They have frequent and very terrible earthquakes in this iſland, which ſhake the city of Batavia and places adjacent, to ſuch a degree, that the fall of the houſes is expected every moment. The waters in the road are exceſſively agitated, inſomuch that their motion reſembles that of a boiling pot; and in ſome places the earth opens, which affords a ſtrange and terrible ſpectacle. The inhabitants are of opinion, that theſe earthquakes proceed from the mountain Parang, which is full of ſulphur, ſaltpetre, and bitumen. The fruits and plants of this iſland are all in their ſeveral kinds excellent, and almoſt out of number. There are abundance of foreſts ſcattered over it, in which are all kinds of wild beaſts, ſuch as buffaloes, tygers, rhinoceroſes, and wild horſes, with an infinite variety of ſerpents, ſome of them of an enormous ſize. Crocodiles are prodigiouſly large in Java, and are found chiefly

Java. chiefly about the mouths of rivers; for, being amphibious animals, they delight moſtly in marſhes and ſavannahs. This creature, like the tortoiſe, lays its eggs in the hot ſands, without taking any further care of them; and the ſun hatches them at the proper ſeaſon, when they run inſtantly into the water. There is, in ſhort, no kind of animal wanting here: fowls they have of all ſorts, and exquiſitely good, eſpecially peacocks, partridges, pheaſants, wood-pigeons: and, for curioſity, they have the Indian bat, which differs little in form from ours; but its wings, when extended, meaſure a full yard, and the body of it is of the ſize of a rat. They have fiſh in great plenty, and very good; ſo that for the value of three-pence there may be enough bought to dine ſix or ſeven men. They have likewiſe a multitude of tortoiſes, the fleſh of which is very little inferior to veal, and there are many who think it better.

It is ſaid, that there are in the iſland upwards of 40 great towns, which, from the number of their inhabitants, would, in any other part of the world, merit the title of *cities*; and more than 4,500 villages, beſides hamlets, and ſtraggling houſes, lying very near each other, upon the ſea-coaſt, and in the neighbourhood of great towns: ſo that, upon a fair and moderate computation, there are within the bounds of the whole iſland, taking in perſons of both ſexes, and of all ranks and ages, more than thirty millions of ſouls; ſo that it is thrice as populous as France, which, though twice as big, is not computed to have more than twenty millions of inhabitants.

There are a great many princes in the iſland, of which the moſt conſiderable are, the emperor of Materan, who reſides at Katafura, and the kings of Bantam and Japara. Upon the firſt of theſe many of the petty princes are dependant; but the Dutch are abſolute maſters of the greateſt part of the iſland, particularly of the north coaſt, though there are ſome of the princes beyond the mountains, on the ſouth coaſt, who ſtill maintain their independency. The natives of the country, who are eſtabliſhed in the neighbourhood of Batavia, and for a tract of about 40 leagues along the mountains of the country of Bantam, are immediately ſubject to the governor-general. The company ſend droſſards, or commiſſaries, among them, who adminiſter juſtice and take care of the public revenues.

The city of Batavia is the capital not only of this iſland, but of all the Dutch dominions in India. It is an exceeding fine city, ſituated in the latitude of 6° ſouth, at the mouth of the river Jucatra, and in the boſom of a large commodious bay, which may be conſidered not only as one of the ſafeſt harbours in India, but in the world. The city is ſurrounded by a rampart, 21 feet thick, covered on the outſide with ſtone, and fortified with 22 baſtions. This rampart is environed by a ditch 45 yards over, and full of water, eſpecially when the tides are high, in the ſpring. The avenues to the town are defended by ſeveral forts, each of which is well furniſhed with excellent braſs cannon: no perſon is ſuffered to go beyond theſe forts without a paſſport. The river Jucatra paſſes through the midſt of the town, and forms 15 canals of running water, all faced with free-ſtone, and adorned with trees that are ever green: over theſe canals are 56 bridges, beſides thoſe which lie without the town. The ſtreets are all perfectly ſtraight, and each, generally ſpeaking, 30 feet broad. The houſes are built of ſtone, after the manner of thoſe in Holland. The city is about a league and a half in circumference, and has five gates; but there are ten times the number of houſes without that there are within it. There is a very fine town-houſe, four Calviniſt churches, beſides other places of worſhip for all ſorts of religions, a ſpin-huys or houſe of correction, an orphan-houſe, a magazine of ſea-ſtores, ſeveral for ſpices, with wharfs and cord-manufactures, and many other public buildings. The garriſon conſiſts commonly of between 2000 and 3000 men. Beſides the forts mentioned above, there is the citadel of Batavia, a very fine regular fortification, ſituated at the mouth of the river, and flanked with four baſtions; two of which command the ſea, and the other two the town. It is in this citadel that the governor-general of the Indies has his palace; over-againſt which is that of the director-general, who is the next perſon to the governor. The counſellors, and other principal officers of the company, have alſo their apartments there; as have likewiſe the phyſician, the ſurgeon, and the apothecary. There are in it, beſides, arſenals and magazines, furniſhed with ammunition for many years. The city of Batavia is not only inhabited by Dutch, French, Portugueſe, and other Europeans, eſtabliſhed here on account of trade; but alſo by a vaſt number of Indians of different nations, Javaneſe, Chineſe, Malayans, Negroes, Amboyneſe, Armenians, natives of the iſle of Bali, Mardykers or Topaſſes, Macaſſers, Timors, Bougis, &c. Of the Chineſe, there are, it is ſaid, about 100,000 in the iſland; of which, near 30,000 reſided in the city till the year 1740, when the Dutch, pretending that they were in a plot againſt them, ſent a body of troops into their quarter, and demanded their arms, which the Chineſe readily delivered up; and the next day the governor ſent another body, with orders to murder and maſſacre every one of the Chineſe, men, women, and children. Some relate there were 20,000, others 30,000, that were put to death, without any manner of trial: and yet the barbarous governor, who was the inſtrument of this cruel proceeding, had the aſſurance to embark for Europe, imagining he had amaſſed wealth enough to ſecure him againſt any proſecution in Holland; but the Dutch, finding themſelves deteſted and abhorred by all mankind for this piece of tyranny, endeavoured to throw the odium of it upon the governor, though he had the hands of all the council of Batavia, except one, to the order for the maſſacre. The ſtates, therefore, diſpatched a packet to the Cape of Good Hope, containing orders to apprehend the governor, and ſend him back to Batavia to be tried. He was accordingly apprehended at the Cape; but has never been heard of ſince. It is ſuppoſed, he was thrown over-board in his paſſage to Batavia, that there might be no farther inquiries into the matter; and, it is ſaid, all the wealth this merciful gentleman had amaſſed, and ſent over before him in four ſhips, was caſt away in the paſſage. Java.

Beſides the garriſon here, the Dutch, it is ſaid, have about 15,000 men in the iſland, either Dutch, or formed out of the ſeveral nations they have enſlaved;

Javelin || Iberis.

flaved; and they have a fleet of between 20 and 30 men of war, with which they give law to every power on the coaſt of Aſia and Africa, and to all the European powers that viſit the Indian Ocean, unleſs we ſhould now except the Britiſh: it was, however, but a little before the revolution, that they expelled us from our ſettlement at Bantam.

JAVELIN, in antiquity, a ſort of ſpear five feet and an half long; the ſhaft of which was of wood, with a ſteel point.—Every ſoldier in the Roman armies had ſeven of theſe, which were very light and ſlender.

JAVELLO (Chryſoſtome), a learned Italian Dominican of the 16th century, taught philoſophy and theology at Bologna, and died about the year 1540. He wrote a work on philoſophy, another on politics, and another on Chriſtian œconomy, which are eſteemed; with notes on Pomponatius, and other works, printed in 3 vols folio.

JAWER, a city of Sileſia, capital of a province of the ſame name, with a citadel, and a large ſquare ſurrounded with piazzas. It is 12 miles ſouth-eaſt of Lignitz, 30 ſouth-weſt of Breſlau, and 87 eaſt of Prague. E. Long. 16. 29. N. Lat. 50. 56.

JAY (Guy Michael le), a French gentleman, who diſtinguiſhed himſelf by cauſing a polyglot bible to be printed at his own expence in 10 vols folio: but he ruined himſelf by that impreſſion, firſt becauſe he would not ſuffer it to appear under the name of cardinal Richelieu, who, after the example of cardinal Ximenes, was ambitious of eternizing his name by this means; and next, becauſe he made it too dear for the Engliſh market; on which Dr Walton undertook his polyglot bible, which, being more commodious, reduced the price of Mr le Jay's. After the death of his wife, M. le Jay took orders, was made dean of Vezelay in the Nivernois, and Lewis XIV. gave him the poſt of counſellor of ſtate.

JAZER, or Jaser, (anc. geog.), a Levitical city in the territory of the Amorrhites beyond Jordan, 10 miles to the weſt, or rather ſouth-weſt, of Philadelphia, and 15 miles from Eſebon; and therefore ſituated between Philadelphia and Heſhbon, on the eaſt border of the tribe of Gad, ſuppoſed to be the *Jazorem* of Joſephus. In Jeremiah xlviii. mention is made of the ſea of Jazer, that is a lake; taken either for an effuſion or overflowing of the Arnon, or a lake thro' which it paſſes, or from which it takes its riſe.

IBERIS, sciatica cress, or *Candy-tuft*; a genus of the ſiliculoſa order, belonging to the tetradynamia claſs of plants.

Species. 1. The umbellata, or common candy-tuft, hath herbaceous, ſhort, round, and very branchy ſtalks of tufty growth, from about ſix to eight or ten inches high; ſmall ſpear-ſhaped leaves, the lower ones ſerrated, the upper entire; and all the ſtalks and branches terminated by umbellate cluſters of flowers of different colours in the varieties. 2. The amara, or bitter candy-tuft, hath ſtalks branching like the former, which riſe from eight to ten or twelve inches high; ſmall, ſpear-ſhaped, and ſlightly indented leaves; and all the branches terminated by raceməſe bunches of white flowers in June and July. 3. The ſempervirens, commonly called *tree candy-tuft*, hath low underſhrubby ſtalks very branchy and buſhy, riſing to the height of 10 or 12 inches, with white flowers in umbels at the ends of the branches, appearing great part of the ſummer. 4. The ſemperflorens, or ever-flowering ſhrubby iberis, hath low underſhrubby ſtalks very branchy, growing to the height of 18 inches, with white flowers in umbels at the ends of the branches, appearing at all times of the year.

Culture. The two firſt kinds, being hardy annuals, may be ſowed in any common ſoil in the month of March, or from that time till midſummer, and will thus afford a ſucceſſion of flowers from June to September, which are ſucceeded by great plenty of ſeeds. The other two are ſomewhat tender; and therefore muſt be planted in pots, in order to be ſheltered from the winter froſts. They are eaſily propagated by ſlips or cuttings.

IBEX, in zoology. See Capra.

IBIS, in ornithology. See Tantalus.

IBYCUS, a Greek lyric poet, of whoſe works there are only a few fragments remaining, flouriſhed 550 B. C. It is ſaid, that he was aſſaſſinated by robbers; and that, when dying, he called upon ſome cranes he ſaw flying to bear witneſs. Some time after, one of the murderers ſeeing ſome cranes, ſaid to his companions, "There are the witneſſes of Ibycus's death:" which being reported to the magiſtrates, the aſſaſſins were put to the torture, and having confeſſed the fact, were hanged. Thence aroſe the proverb *Ibyci Grues*.

ICE, in phyſiology, a ſolid, tranſparent, and brittle body, formed of ſome fluid, particularly water, by means of cold. See Frost.

The younger Lemery obſerves, that ice is only a reeſtabliſhment of the parts of water in their natural ſtate; that the mere abſence of fire is ſufficient to account for this re-eſtabliſhment; and that the fluidity of water is a real fuſion, like that of metals expoſed to the fire; differing only in this, that a greater quantity of fire is neceſſary to the one than the other. Gallileo was the firſt that obſerved ice to be lighter than the water which compoſed it: and hence it happens, that ice floats upon water, its ſpecific gravity being to that of water as eight to nine. This rarefaction of ice ſeems to be owing to the air-bubbles produced in water by freezing; and which, being conſiderably large in proportion to the water frozen, render the body ſo much ſpecifically lighter: theſe air-bubbles, during their production, acquire a great expanſive power, ſo as to burſt the containing veſſels, tho' ever ſo ſtrong. See Congelation, Cold, &c.

M. Mairan, in a diſſertation on ice, attributes the increaſe of its bulk chiefly to a different arrangement of the parts of the water from which it is formed; the icy ſkin on the water being compoſed of filaments which are found to be conſtantly and regularly joined at an angle of 60°; and which, by this angular diſpoſition, occupy a greater volume than if they were parallel. He found the augmentation of the volume of water by freezing, in different trials, a 14th, an 18th, a 19th, and, when the water was previouſly purged

Ibex || Ice.

Ice.

ged of air, only a 22d part: that ice, even after its formation, continues to expand by cold; for, after water had been frozen to ſome thickneſs, the fluid part being let out by a hole in the bottom of the veſſel, a continuance of the cold made the ice convex; and a piece of ice which was at firſt only a 14th part ſpecifically lighter than water, on being expoſed ſome days to the froſt, became a 12th part lighter. To this cauſe he attributes the burſting of ice on ponds.

Wax, reſins, and animal-fats, made fluid by fire, inſtead of expanding like watery liquors, ſhrink in their return to ſolidity: for ſolid pieces of the ſame bodies ſink to the bottom of the reſpective fluids; a proof that theſe bodies are more denſe in their ſolid than in their fluid ſtate. The oils which congeal by cold, as oil-olive, and the eſſential oil of aniſeeds, appear alſo to ſhrink in their congelation. Hence, the different diſpoſitions of different kinds of trees to be burſt by, or to reſiſt, ſtrong froſts, are by ſome attributed to the juices with which the tree abounds; being in the one caſe watery, and in the other reſinous or oily.

Ice-*Houſe*, a building contrived to preſerve ice for the uſe of a family in the ſummer-ſeaſon.

Ice-houſes are more generally uſed in warm countries than with us; particularly in Italy, where the meaneſt perſon who rents a houſe, has his vault or cellar for ice.

As to the ſituation, it ought to be placed upon a dry ſpot of ground; becauſe wherever there is moiſture, the ice will melt: therefore in all ſtrong lands which retain the wet, too much pains cannot be taken to make drains all round them. The place ſhould alſo be elevated, and as much expoſed to the ſun and air as poſſible.

As to the figure of the building, that may be according to the fancy of the owner; but a circular form is moſt proper for the well in which the ice is to be preſerved, which ſhould be of a ſize and depth proportionable to the quantity to be kept: for it is proper to have it large enough to contain ice for two years conſumption; ſo that if a mild winter ſhould happen, in which little or no ice is to be had, there may be a ſtock to ſupply the want. At the bottom of the well, there ſhould be a ſpace of about two feet deep, left to receive any moiſture that may drain from the ice; over this ſpace ſhould be placed a ſtrong wooden grate, and from thence a ſmall drain ſhould be laid under ground to carry off the wet. The ſides of the well ſhould be built with brick or ſtone, at leaſt two bricks thick; for the thicker it is, the leſs danger there will be of the well being affected by any external cauſe. When the wall is brought up within three feet of the ſurface, there ſhould be another outer arch or wall begun, which ſhould be carried up to the height of the top of the intended arch of the well; and if there be a ſecond arch turned over this wall, it will add to the goodneſs of the houſe: the roof muſt be high enough above the inner arch to admit of a door-way to get out the ice. If the building is to be covered with ſlates or tiles, reeds ſhould be laid conſiderably thick under them, to keep out the ſun and external air; and if theſe reeds are laid the thickneſs of ſix or eight inches, and plaſtered over with lime and hair, there will be no danger of the heat getting through them. The external wall may be built in what form the proprietor pleaſes; and as theſe ice-houſes are placed in gardens, they are ſometimes ſo contrived as to have an handſome alcove-ſeat in front, with a ſmall door behind it, through which a perſon might enter to take out the ice; and a large door on the other ſide, fronting the north, with a porch wide enough for a ſmall cart to back, in order to ſhoot down the ice near the mouth of the well, which need not be more than two feet diameter, and a ſtone ſo contrived as to ſhut it up in the exacteſt manner: all the vacant ſpace above and between this and the large door ſhould be filled up with barley-ſtraw. The building thus finiſhed, ſhould have time to dry before the ice is put into it.

Ice, Iceland.

It is to be obſerved, that upon the wooden grate, at the bottom of the well, there ſhould be laid ſome ſmall faggots; and if upon theſe a layer of reeds is placed ſmooth for the ice to lie upon, it will be better than ſtraw, which is commonly uſed. As to the choice of the ice, the thinner it is, the eaſier it may be broken to powder; for the ſmaller it is broken, the better it will unite when put into the well. In putting it in, care muſt be taken to ram it as cloſe as poſſible; and alſo to allow a vacancy of two inches, all round, next the ſide of the well, to give paſſage to any moiſture occaſioned by the melting of ſome of the ice. When the ice is put into the well, if a little ſalt-petre be mixed with it at every ten inches or a foot in thickneſs, it will cauſe it to unite more cloſely into a ſolid maſs.

Ice-*Iſland*, a name given by ſailors to a great quantity of ice collected into one huge ſolid maſs, and floating about upon the ſeas near or within the Polar Circles.—Many of theſe fluctuating iſlands are met with on the coaſts of Spitzbergen, to the great danger of the ſhipping employed in the Greenland fiſhery. Towards the South Pole, they are ſtill more numerous and formidable; but for a particular account of theſe iſlands and their formation, ſee the articles North-*Sea* and South-*Sea*.

ICELAND, a large iſland lying in the northern part of the Atlantic Ocean, between 63 and 68 degrees of north latitude, and between 10 and 26 degrees of weſt longitude, its greateſt length being about 700 miles, and its breadth 300.

I
General account of the country.

This country lying partly within the frigid zone, and being liable to be ſurrounded with vaſt quantities of ice which come from the Polar Seas, is on account of the coldneſs of its climate very inhoſpitable; but much more ſo for other reaſons. It is exceedingly ſubject to earthquakes; and ſo full of volcanoes, that the little part of it which appears fit for the habitation of man ſeems almoſt totally laid waſte by them. The beſt account that hath yet appeared of the iſland of Iceland is in a late publication intitled, "Letters on Iceland, &c. written by Uno Von Troil, D.D. firſt chaplain to his Swediſh majeſty." This gentleman failed from London on the 12th of July 1772, in company with Mr Banks, Dr Solander, and Dr James Lind of Edinburgh, in a ſhip for which L. 100 Sterling was paid every month. After viſiting the weſtern iſles of Scotland, they arrived on the 28th of Auguſt at Iceland, where they caſt anchor at Beſſeſtedr or Beſſaſtadr, lying in about 64° 6′ N. Lat. in the weſtern part of the iſland. The country had to them the moſt diſmal appearance that can be conceived. "Imagine

Iceland. magine to yourſelf (ſays Dr Troil,) a country, which from one end to the other preſents to your view only barren mountains, whoſe ſummits are covered with eternal ſnow, and between them fields divided by vitrified cliffs, whoſe high and ſharp points ſeem to vie with each other to deprive you of the ſight of a little graſs which ſcantily ſprings up among them. Theſe ſame dreary rocks likewiſe conceal the few ſcattered habitations of the natives, and no where a ſingle tree appears which might afford ſhelter to friendſhip and innocence. The proſpect before us, though not pleaſing, was uncommon and ſurpriſing. Whatever preſented itſelf to our view bore the marks of deva ſtation; and our eyes, accuſtomed to behold the pleaſing coaſts of England, now ſaw nothing but the veſtiges of the operation of a fire, Heaven knows how ancient!

"On our landing, we found two tracts of lava, called *gorde* and *hualeyre-braun*, (for what we and the Italians call *lava*, is called in Iceland *braun*, from *brinna*, "to flow"), of which the laſt was particularly remarkable, ſince we find there a whole field covered with lava, which muſt have been liquefied in the higheſt degree; and whole mountains of turf. Chance had directed us exactly to a ſpot on which we could better than on any other part of Iceland conſider the operations of a fire which had laid waſte a ſtretch of 10 or 12 miles (A).

2 Mount Hecla deſcribed. "We had now ſeen almoſt all the effects of a volcano except the crater from whence the fire proceeded; and in order to examine this likewiſe, we undertook a journey of 12 days to mount Hecla itſelf. We travelled 50 or 60 miles, (300 or 360 Engliſh ones,) over an uninterrupted track of lava, and had at laſt the pleaſure of being the firſt who ever reached the ſummit of this celebrated volcano. The reaſon that no one has been there before is partly founded in ſuperſtition, and partly in the extreme difficulty of the aſcent before the laſt diſcharge of fire, which happened in 1766. This mountain has been more taken notice of than many others in the country of as great extent, partly from its having vomited fire more frequently, and partly from its ſituation, which expoſes it to the ſight of ſhips ſailing to Greenland and North America. It is ſituated in the ſourhern part of the iſland, about four miles from the ſea-coaſt, and is divided into three points at the top; the higheſt of which is that in the middle; and is, according to an exact obſervation with Ramſden's barometer, 5000 feet higher than the ſea. We made uſe of our horſes, but were obliged to quit them at the firſt opening from which the fire had burſt. This was a place ſurrounded with lofty glazed walls, and filled with high glazed cliffs, which I cannot compare with any thing I ever ſaw before.

"A little higher up, we found a large quantity of grit and ſtones; and ſtill farther on, another opening, which, though not deep, deſcended lower down than that of the higheſt point. We thought we plainly obſerved marks of hot boiling water in this place. Not far from thence the mountains began to be covered with ſnow, ſome ſmall ſpots excepted, which were bare. We could not at firſt diſcern the cauſe of this difference, but ſoon found that it proceeded from the vapour which aroſe from the mountain. As we aſcended higher, theſe ſpots became larger; and about 200 yards from the ſummit, we found a hole of about one yard and a half in diameter, from which ſo hot a ſteam exhaled, that it prevented us from aſcertaining the degree of heat with the thermometer. Iceland.

"The cold now began to be very intenſe, as Fahrenheit's thermometer, which was at 54 at the foot of the mountain fell to 24. The wind was alſo become ſo violent, that we were ſometimes obliged to lie down, to avoid being thrown into the moſt dreadful precipices by its fury.

"We were now arrived at one of the higheſt ſummits, when our conductor who did not take great pleaſure in the walk, endeavoured to perſuade us that this was the higheſt part of the mountains. We had juſt finiſhed our obſervations, and found by them that Ramſden's barometer ſtood at 24.238, and the thermometer fixed to it at 27, when happily the clouds divided, and we diſcovered a ſtill higher ſummit. Here we experienced at one and the ſame time a high degree of heat and cold; for in the air Fahrenheit's thermometer was conſtantly at 24, and when we ſet it down on the ground it roſe to 153. The barometer was here at 22.247.—We could not ſafely remain here for any long time, though we were very much inclined to it; and therefore deſcended, after having conſidered the laſt opening there, one of the ſides of which was entirely overturned, and the other quite covered with aſhes and grit. In our return we obſerved three conſiderable openings, in one of which every thing looked as red as brick. From another the lava had flowed in a ſtream of about 50 yards in breadth, and at ſome diſtance from thence the ſtream divided into three broad arms. Further on we found a large circular opening, at the bottom of which we obſerved a mountain in the form of a ſugar-loaf, in throwing up of which the fire ſeemed to have exhauſted itſelf.

"The mountain does not conſiſt of lava, but chiefly of ſand, grit, and aſhes; which are thrown up with the ſtones partly melted and partly diſcoloured by the fire. We likewiſe found ſeveral ſorts of pumice, and among them one piece with ſome ſulphur in it. The pumice was ſometimes ſo much burnt, that it was as light as tow; their form and colour was ſometimes very fine, but at the ſame time ſo ſoft, that it was difficult to remove them from one place to another. Of the common lava we found both large pieces and ſmall bits; as likewiſe a quantity of black jaſper burned at the extremities, and reſembling trees and branches. Among the ſtones thrown out of the mountain we ſaw ſome ſlate of a ſtrong red colour. In one place the lava had taken the form of chimney-ſtalks half-broken down.

3 Symptom preceding the eruptions. "It ſcarcely ever happens that any of the Iceland volcanoes begin to throw out fire unexpectedly. For beſides a loud rumbling noiſe which is heard at a conſiderable diſtance, for ſeveral days preceding any eruption, and a roaring and cracking in the part from whence the fire is going to burſt forth, many fiery meteors are obſerved, but unattended in general with any violent conculſion of the earth, though ſometimes earth-

(A) The miles mentioned by Dr Troil are always Swediſh, ten and an half of which are equal to a degree on one of the great circles on the globe; and therefore one Swediſh mile is nearly equal to ſix Engliſh miles. Ten or twelve ſuch miles are, conſequently, equal to 60 or 70 Engliſh ones.

Iceland.

earthquakes, of which the hiſtory of the country affords ſeveral inſtances, have accompanied theſe dreadful conflagrations.—It is likewiſe conſidered as a ſign of an impending eruption, when ſmall lakes, rivulets, and ſtreams, dry up. Some perſons believe, that it does not a little contribute to haſten the eruption, when the mountain is ſo covered with ice that the holes are ſtopped up through which the exhalations formerly found a free paſſage; and though it is by no means probable that this contributes much to it, it cannot be denied that the fire is generally contained in theſe mountains covered with ice, or, as the Icelanders call them, *jokuls*.

"The ſign of an eruption going to take place immediately, is the burſting of the maſs of ice with a dreadful noiſe. Flames then burſt forth, and lightning and balls of fire iſſue from the ſmoke. With the flames proceed a number of larger and ſmaller ſtones, which are ſometimes thrown to an incredible diſtance. A round ſtone about a Swediſh ell (two feet) in diameter was thrown from Hecla, in the laſt eruption, to the diſtance of near ſix Engliſh miles. Egbert Olafſen alſo relates, that at the laſt eruption of Kattlegiaa, another volcano, a ſtone which weighed 290 pounds was thrown to the diſtance of 24 Engliſh miles. A quantity of white pumice-ſtone is alſo thrown up, with the boiling waters; and it is conjectured with great probability that the latter proceed from the ſea, as a quantity of ſalt ſufficient to load ſeveral horſes has frequently been found after the mountain has ceaſed to burn.—Then follow generally brown or black pumice ſtone, ſand, aſhes, and lava.

4 ures and its form- by the ruptions.

"The lava is ſeldom found near the opening; but rather tufa, or looſe aſhes and grit; and indeed the greater part of the Icelandic mountains conſiſt of this matter, which, when it is grown cold, generally takes an arched form. The upper cruſt frequently grows hard and ſolid, whilſt the melted matter beneath it continues liquid; this forms great cavities, whoſe walls, bed, and roof, are of lava, and where great quantities of ſtalactite of lava are found. There are a great number of theſe caves in Iceland, ſome of which are very large, and are made uſe of by the inhabitants for ſheltering their cattle. The largeſt in the iſland is 5034 feet long, from 50 to 54 in breadth, and between 34 and 36 in height.

"Among the traces left by the eruptions of the Iceland volcanoes, are ſome prodigious clefts, the largeſt of which is called *Almenneggiaa*, near the water of Tingalla in the ſouth-weſtern part of the iſland. It is 105 feet in breadth, and of great length. The direction of the chaſm itſelf is from north to ſouth. Its weſtern wall, from which the other has been perpendicularly divided is 107 feet ſix inches in height, and conſiſts of many ſtrata (each of which is about 10 inches in height) of lava grown cold at different times, as may eaſily be diſcovered by the apparent cruſt which is full of bliſters, of a darker brown, and not ſo much compreſſed as the remaining part of the maſs of lava. The eaſtern wall is only 45 feet 4 inches in height; and that part of it which is directly oppoſite to the higheſt part of the other ſide is no more than 36 feet five inches high.

5 tory of erup- ns.

"The eruptions of the Iceland volcanoes are no leſs terrible and deſtructive than thoſe of Veſuvius and Ætna. The firſt mentioned in the ancient records happened in the ninth century, immediately after the arrival of the Norwegians on the iſland; and produced a lava three miles in length, and two and a half in breadth. After this there is no mention made of eruptions till the year 1000, when Chriſtianity was introduced. At a time when the chiefs of the country were aſſembled to conſult about the reception of the Chriſtian religion, information was brought that an eruption of fire had happened. The heathens conſidered this as a proof of the wrath of the gods, on which account they were reſolved to refuſe the new religion; but this reſolution was over-ruled by one of the aſſembly aſking, "On whom did the gods diſplay their wrath, when thoſe rocks on which we now ſtand were on fire?"—In 1311, 22 farms were deſtroyed by eruptions, and 70 more in 1366. Hecla deſtroyed two in 1374; ſeven in 1390; and 18 in one day in 1436. In the ſame manner five farms were deſtroyed in 1660, and many more in 1693. In 1727, 600 ſheep and 150 horſes were deſtroyed by the flood and pieces of ice which ruſhed down the ſide of a volcano during an eruption. In 1728, many farms were deſtroyed, and a large lake entirely dried up. Into this lake the ſtreams of fire that rolled from the mountains flowed during ſome years, and formed a tract of lava four miles in length, and one and a half in breadth. In 1755 ſix pariſhes were deſtroyed; and, in the laſt eruption of Hecla, a tract of many miles was laid waſte.

Iceland.

6 Lightning proceeds from the flame of the mountain.

"In the eruption of 1755, a flaſh of lightning was ſeen to burſt from the flame, and pierced through the cliffs which intercepted its way. The ſame lightning in one place killed eleven horſes, three of which were in a ſtable. A farmer was alſo killed by it near the door of his room: his upper cloaths, which were woollen, remained entirely unhurt; but his ſhirt and waiſtcoat, which were both of linen, were burnt; and when his clothes were pulled off, it was found that the fleſh and ſkin on his right ſide were conſumed to the very bones. The maid-ſervant who wanted to aſſiſt him in ſaving the cattle was likewiſe ſtruck by the lightning; but did not die till ſome days after, during which time ſhe ſuffered inexpreſſible torture. It is likewiſe ſaid that her cloaths were ſinged by the glutinous fires which cleaved to her body.

7 Account of the hot ſprings of Iceland.

"Iceland abounds with hot and boiling ſprings, ſome of which ſpout up into the air to a ſurpriſing height. All the jets d'eau which have been contrived with ſo much art, and at ſuch an enormous expence, cannot by any means be compared with theſe wonders of nature in Iceland. The water-works at Herenhauſen throw up a ſingle column of water of half a quarter of a yard in circumference to a height of about 70 feet; thoſe at the Winterkaſten at Caſſel, throw it up, but in a much thinner column, 130 feet; and the jet d'eau at St Cloud, which is thought the greateſt of all the French water-works, caſts up a thin column 80 feet into the air: but ſome ſprings in Iceland pour forth columns of water ſeveral feet in thickneſs to the height of many fathoms; and many affirm, of ſeveral hundred feet.

"Theſe ſprings are unequal in their degrees of heat; but we have obſerved none under 188 degrees of Fahrenheit's thermometer, in ſome it is 192, 193,

Iceland. 212, and in one small vein of water 213 degrees. From some the water flows gently, and the spring is then called *laug*, a "bath;" from others it spouts with a great noise, and is then called *hver*, or *kittel*. It is very common for some of these spouting springs to close up, and others to appear in their stead. All these hot waters have an incrusting quality, so that we very commonly find the exterior surface from whence it bursts forth covered with a kind of rind, which almost resembles chased work, and which we at first took for lime, but which was afterwards found by Mr Bergman to be of a siliceous or flinty nature. In some places the water tastes of sulphur, in others not; but when drank as soon as it is cold, tastes like common boiled water. The inhabitants use it at particular times for dyeing; and were they to adopt proper regulations, it might be of still greater use. Victuals may also be boiled in it, and milk held over its steam becomes sweet: owing, most probably, to the excessive heat of the water, as the same effect is produced by boiling it a long time over the fire. They have begun to make salt by boiling sea-water over it, which when it is refined, is very pure and good. The cows which drink this hot water yield a great deal of milk. Egbert Olafsen relates, that the water does not become turbid when alkali is thrown into it, nor does it change the colour of syrup of violets. Horrebow asserts, that if you fill a bottle at one of the spouting springs, the water will boil over two or three times while the spring throws forth its water; and if corked too soon, the bottle will burst.

8 A particular description of one named *Geyser*.

"Among the many hot springs to be met with in Iceland, several bear the name of *geyser*; the following is a description of the most remarkable of that name, and in the whole island. It is about two days journey from Hecla, near a farm called *Haukadal*. Here a poet would have an opportunity of painting whatever nature has of beautiful and terrible, united in one picture, by delineating this surprising phenomenon. Represent to yourself a large field, where you see on one side, at a great distance, high mountains covered with ice, whose summits are generally wrapped in clouds, so that their sharp and unequal points become invisible. This loss, however, is compensated by a certain wind, which causes the clouds to sink, and cover the mountain itself when its summit appears as it were to rest on the clouds. On the other side Hecla is seen, with its three points covered with ice, rising above the clouds, and, with the smoke which ascends from it, forming other clouds at some distance from the real ones: and on another side is a ridge of high rocks, at the foot of which boiling water from time to time issues forth; and further on extends a marsh of about three English miles in circumference, where are 40 or 50 boiling springs, from which a vapour ascends to a prodigious height.—In the midst of these is the greatest spring *geyser*, which deserves a more exact and particular account. In travelling to the place about an English mile and an half from the *hver*, from which the ridge of rocks still divided us, we heard a loud roaring noise, like the rushing of a torrent precipitating itself from stupendous rocks. We asked our guide what it meant; he answered, it was *geyser* roaring; and we soon saw with our naked eyes what before seemed almost incredible.

"The depth of the opening or pipe from which the water gushes cannot well be determined; for sometimes the water sunk down several fathoms, and some seconds passed before a stone which was thrown into the aperture reached the surface of the water. The opening itself was perfectly round, and 19 feet in diameter, and terminated in a bason 59 feet in diameter. Both the pipe and the bason were covered with a rough stalactic rind, which had been formed by the force of the water: the outermost border of the bason is nine feet and an inch higher than the pipe itself. The water here spouted several times a-day, but always by starts; and after certain intervals. The people who lived in the neighbourhood told us, that they rose higher in cold and bad weather than at other times; and Egbert Olafsen and several others affirm, that it has spouted to the height of 60 fathoms. Most probably they guessed only by the eye, and on that account their calculation may be a little extravagant; and indeed it is to be doubted whether the water was ever thrown up so high, though probably it sometimes mounts higher than when we observed it. The method we took to observe the height was as follows. Every one in company wrote down, at each time that the water spouted, how high it appeared to him to be thrown, and we afterwards chose the medium. The first column marks the spoutings of the water, in the order in which they followed one another; the second, the time when these effusions happened; the third, the height to which the water rose; and the last, how long each spouting of water continued.

N°	Time	Height	Duration
1	At VI 42 m.	30 feet	0 20 seconds
2	——51	6	0 20
3	—VII 16	6	0 10
4	——31	12	0 15
5	——51	60	0 6
6	—VIII. 17	24	0 30
7	——29	18	0 40
8	——36	12	0 40

The pipe was now for the first time full of water, which ran slowly into the bason.

9	——IX. 25	48	1 10
10	——X. 16	24	1 00

"At 35 minutes after twelve we heard as it were three discharges of a gun under ground, which made it shake: the water flowed over immediately, but instantly sunk again. At eight minutes after two, the water flowed over the border of the bason. At 15 minutes after three, we again heard several subterranean noises, though not so strong as before. At 43 minutes after four, the water flowed over very strongly during the space of a minute. In six minutes after, we heard many loud subterraneous discharges, not only near the spring, but also from the neighbouring ridge of rocks where the water spouted. At 51 minutes after six, the fountain spouted up to the height of 92 feet, and continued to do so for four minutes. After this great effort, it sunk down very low into the pipe, and was entirely quiet during several minutes; but soon began to bubble again: it was not, however, thrown up into the air, but only to the top of the pipe.

"The force of the vapours which throw up these waters is excessive; it not only prevents the stones which

Iceland. which are thrown into the opening from ſinking, but even throws them up to a very great height, together with the water. When the balon was full, we placed ourſelves before the ſun in ſuch a manner that we could ſee our ſhadows in the water; when every one obſerved round the ſhadow of his own head (though not round that of the heads of others,) a circle of almoſt the ſame colours which compoſe the rainbow, and round this another bright circle. This moſt probably proceeded from the vapours exhaling from the water.

"Not far from this place, another ſpring at the foot of the neighbouring ridge of rocks ſpouted water to the height of one or two yards each time. The opening through which this water iſſued, was not ſo wide as the other: we imagined it poſſible to ſtop up the hole entirely by throwing large ſtones into it, and even flattered ourſelves that our attempt had ſucceeded: but, to our aſtoniſhment, the water guſhed forth in a very violent manner. We haſtened to the pipe, and found all the ſtones thrown aſide, and the water playing freely through its former channel. In theſe large ſprings the waters were hot in the higheſt degree, and taſted a little of ſulphur; but in other reſpects it was pure and clear. In the ſmaller ſprings of the neighboorhood the water was tainted: in ſome, it was as muddy as that of a clay-pit; in others, as white as milk; and, in ſome few, as red as blood.

9 Account of the baſaltic pillars. "Iceland abounds with pillars of baſaltes, which the lower ſort of people imagine have been piled upon each other by the giants, who made uſe of ſupernatural force to effect it. They have generally from three to ſeven ſides; and are from four to ſix feet in thickneſs, and from 12 to 16 yards in length, without any horizontal diviſions. But ſometimes they are only from ſix inches to one foot in height, and they are then very regular, inſomuch that they are ſometimes made uſe of for windows and door-poſts. In ſome places they only peep out here and there among the lava, or more frequently among the tufa; in other places they are quite overthrown, and pieces of broken pillars only make their appearance. Sometimes they extend without interruption for two or three miles in length. In one mountain they have a ſingular appearance: on the top the pillars lie horizontally, in the middle they are ſloping; the loweſt are perfectly perpendicular; and in ſome parts they are bent into a ſemicircular figure. The matter of the Iceland baſaltes ſeems to be the ſame with that of Staffa; though in ſome it is more porous, and inclines to a grey. Some we obſerved which were of a blackiſh grey, and compoſed of ſeveral joints. Another time we obſerved a kind of porous glaſſy ſtone, conſequently a lava, which was ſo indiſtinctly divided, that we were for ſome time at a loſs to determine whether it was baſaltes or not, though at laſt we all agreed that it was."

10 Account of the climate. The climate of Iceland is not unwholeſome or naturally ſubject to exceſſive colds, notwithſtanding its northerly ſituation. There have been inſtances indeed of Fahrenheit's thermometer ſinking to 24° below the freezing point in winter, and riſing to 104° in ſummer. Since the year 1749, obſervations have been made on the weather; and the reſult of theſe obſervations hath been unfavourable, as the coldneſs of the climate is thought to be on the increaſe, and of conſequence the country is in danger of becoming unfit for the habitation of the human race. Wood, which formerly grew in great quantities all over the iſland, cannot now be raiſed. Even the hardy firs of Norway cannot be reared in this iſland. They ſeemed indeed to thrive till they were about two feet high; but then their tops withered, and they ceaſed to grow. This is owing chiefly to the ſtorms and hurricanes which frequently happen in the months of May and June, and which are very unfavourable to vegetation of every kind. In 1772, governor Thodal ſowed a little barley, which grew very briſkly; but, a ſhort time before it was to be reaped, a violent ſtorm ſo effectually deſtroyed it, that only a few grains were found ſcattered about. Beſides theſe violent winds, this iſland lies under another diſadvantage, owing to the floating ice already mentioned, which the coaſts are often beſet. This ice comes on by degrees, always with an eaſterly wind, and frequently in ſuch quantities as to fill up all the gulphs on the north-weſt ſide of the iſland, and even covers the ſea as far as the eye can reach; it alſo ſometimes drives to other ſhores. It generally comes in January, and goes away in March. Sometimes it only reaches the land in April; and, remaining there for a long time, does an incredible deal of miſchief. It conſiſts partly of mountains of ice, ſaid to be ſometimes 60 fathoms in height; and partly of field-ice, which is neither ſo thick nor ſo much dreaded. Sometimes theſe enormous maſſes are grounded in ſhoal water; and in theſe caſes they remain for many months, nay years, undiſſolved, chilling the atmoſphere for a great way round. When many ſuch bulky and lofty ice-maſſes are floating together, the wood which is often found drifting between them, is ſo much chafed, and preſſed with ſuch violence together, that it ſometimes takes fire; which circumſtance has occaſioned fabulous accounts of the ice being in flames. Iceland.

11 Deſtructive effects of the ice.

In 1753 and 1754, this ice occaſioned ſuch a violent cold, that horſes and ſheep dropped down dead by reaſon of it, as well as for want of food; horſes were obſerved to feed upon dead cattle, and the ſheep eat of each other's wool. In 1755, towards the end of the month of May, the waters were frozen over in one night to the thickneſs of an inch and five lines. In 1756, on the 26th of June, ſnow fell to the depth of a yard, and continued falling through the months of July and Auguſt. In the year following it froze very hard towards the end of May and beginning of June, in the ſouth part of the iſland, which occaſioned a great ſcarcity of graſs. Theſe froſts are generally followed by a famine, many examples of which are to be found in the Icelandic chronicles. Beſides theſe calamities, a number of bears annually arrive with the ice, which commit great ravages among the ſheep. The Icelanders attempt to deſtroy theſe intruders as ſoon as they get ſight of them. Sometimes they aſſemble together, and drive them back to the ice, with which they often float off again. For want of fire-arms, they are obliged to uſe ſpears on theſe occaſions. The government alſo encourages the deſtruction of theſe animals, by paying a premium of 10 dollars

Iceland. dollars for every bear that is killed, and purchasing the skin of him who killed it.

Thunder and lightning are seldom heard in Iceland, except in the neighbourhood of volcanoes. Aurora Borealis is very frequent and strong. It most commonly appears in dry weather; though there are not wanting instances of its being seen before or after rain, or even during the time of it. The lunar halo, which prognosticates bad weather, is likewise very frequent here; as are also parhelions, which appear from one to nine in number at a time. These parhelions are observed chiefly at the approach of the Greenland ice, when an intense degree of frost is produced, and the frozen vapours fill the air. Fire-balls, sometimes round, and sometimes oval, are observed, and a kind of *ignis fatuus* which attaches itself to men and beasts; and comets are also frequently mentioned in their chronicles. This last circumstance deserves the attention of astronomers.

Iceland, besides all the inconveniencies already mentioned, has two very terrible ones, called by the natives *skrida* and *sniofloedi*: the name of the first imports large pieces of a mountain tumbling down and destroying the lands and houses which lie at the foot of it: this happened in 1554, when a whole farm was ruined, and 13 people buried alive. The other word signifies the effects of a prodigious quantity of snow, which covers the tops of the mountains, rolling down in immense masses, and doing a great deal of damage: of this there was an instance in 1699, during the night, when two farms were buried, with all their inhabitants and cattle. This last accident Iceland has in common with all very mountainous countries, particularly Switzerland.

12. History of the island.

At what time the island of Iceland was first peopled is uncertain. An English colony indeed is said to have been settled there in the beginning of the fifth century; but of this there are not sufficient proofs. There is, however, reason to suppose, that the English and Irish were acquainted with this country under another name, long before the arrival of the Norwegians; for the celebrated Bede gives a pretty accurate description of the island. But of these original inhabitants we cannot pretend to say any thing, as the Iceland chronicles go no farther back than the arrival of the Norwegians. What they relate is to the following purpose.

Naddodr, a famous pirate, was driven on the coast of Iceland in 861, and named the country *Snio-land*, "Snow-land," on account of the great quantities of snow with which he perceived the mountains covered. He did not remain there long; but, on his return, extolled the country to such a degree, that one Garder Suafarson, an enterprising Swede, was encouraged by his account to go in search of it in 864. He sailed quite round the island, and gave it the name of *Gardalsholmur*, or Garder's-island. Having remained in Iceland during the winter, he returned in the spring to Norway, where he described the new-discovered island as a pleasant well-wooded country. This excited a desire in Floke, another Swede, reputed the greatest navigator of his time, to undertake a voyage thither. As the compass was then unknown, he took three ravens on board to employ them on the discovery. By the way he visited his friends at Ferro; and having failed farther to the northward, he let fly one of his ravens, which returned to Ferro. Some time after, he dismissed the second, which returned to the ship again, as he could find no land. The last trial proved more successful; the third raven took his flight to Iceland, where the ship arrived a few days after. Floke staid here the whole winter with his company; and, because he found a great deal of floating ice on the north side, he gave the country the name of *Iceland*, which it has ever since retained. Iceland.

When they returned to Norway in the following spring, Floke, and those that had been with him, made a very different description of the country. Floke described it as a wretched place; while one of his companions, named *Thorulfr*, praised it so highly, that he affirmed butter dropped from every plant; which extravagant commendation procured him the name of *Thorulfr-smior*, or Butter-Thorulfr.

From this time there are no accounts of any voyages to Iceland, till Ingolfr and his friend Leifr undertook one in 874. They spent the winter on the island, and determined to settle there for the future. Ingolfr returned to Norway, to provide whatever might be necessary for the comfortable establishment of a colony, and Leifr in the mean time went to assist in the war in England. After an interval of four years, they again met in Iceland, the one bringing with him a considerable number of people, with the necessary tools and instruments for making the country habitable; and the other imported his acquired treasures. After this period, many people went there to settle; and, in the space of 60 years, the whole island was inhabited. The tyranny of Harold king of Norway contributed not a little to the population of Iceland; and so great was the emigration of his subjects, that he was at last obliged to issue an order that no one should sail from Norway to Iceland, without paying four ounces of fine silver to the king.

Besides the Norwegians, new colonies arrived from different nations, between whom wars soon commenced; and the Icelandic histories are full of the accounts of their battles. To prevent these conflicts for the future, a kind of chief was chosen in 928, upon whom great powers were conferred. This man was the speaker in all their public deliberations; pronounced sentence in difficult and intricate cases; decided all disputes; and published new laws, after they had been received and approved of by the people at large: but he had no power to make laws, without the approbation and consent of the rest. He therefore assembled the chiefs, whenever the circumstances seemed to require it; and, after they had deliberated among themselves, he represented the opinion of the majority to the people, whose assent was necessary before it could be considered as a law. His authority among the chiefs and leaders, however, was inconsiderable, as he was chosen by them, and retained his place no longer than while he preserved their confidence.

This institution did not prove sufficient to restrain the turbulent spirits of the Icelanders. They openly waged war with each other; and, by their intestine conflicts, so weakened all parties, that the whole became at last a prey to a few arbitrary and enterprising men; who, as is too generally the case, wantonly

Iceland.

wantonly abused their power to the oppression of their countrymen, and the disgrace of humanity. Notwithstanding these troubles, however, the Icelanders remained free from a foreign yoke till 1261; when the greatest part of them put themselves under the protection of Hakans king of Norway, promising to pay him tribute upon certain conditions agreed on between them; and the rest followed their example in 1264. Afterwards, Iceland, together with Norway, became subject to Denmark. For a long time the care of the island was committed to a governor, who commonly went there once a-year; though, according to his instructions, he ought to have resided in Iceland. As the country suffered incredibly through the absence of its governors, it was resolved a few years ago that they should reside there, and have their seat at Bessestedr, one of the old royal domains. He has under him a bailiff, two laymen, a sheriff, and 21 *sysselmen*, or magistrates who superintend small districts; and almost every thing is decided according to the laws of Denmark.

13 Manners & of the Islanders.

At the first settlement of the Norwegians in Iceland, they lived in the same manner as they had done in their own country, namely, by war and piracy. Their situation with regard to the kings of Norway, however, soon obliged them to apply to other states, in order to learn as much of the knowledge of government and politics as was necessary to preserve their colony from subjugation to a foreign yoke. For this purpose they often sailed to Norway, Denmark, Sweden, England, and Scotland. The travellers, at their return, were obliged to give an account to their chiefs of the state of those kingdoms through which they passed. For this reason, history, and what related to science, was held in high repute as long as the republican form of government lasted; and the great number of histories to be met with in the country, shew at least the desire of the Icelanders to be instructed. To secure themselves, therefore, against their powerful neighbours, they were obliged to enlarge their historical knowledge. They likewise took great pains in studying perfectly their own laws, for the maintenance and protection of their internal security. Thus Iceland, at a time when ignorance and obscurity overwhelmed the rest of Europe, was enabled to produce a considerable number of poets and historians. When the Christian religion was introduced about the end of the 10th century, more were found conversant in the law than could have been expected, considering the extent of the country, and the number of its inhabitants. Fishing was followed among them; but they devoted their attention considerably more to agriculcultnre, which has since entirely ceased.

Two things have principally contributed towards producing a great change both in their character and way of life, viz. the progress of the Christian religion, and their subjection first to Norway, and afterwards to Denmark. For if religion, on one side, commanded them to desist from their ravages and warlike expeditions; the secular power, on the other, deprived them of the necessary forces for the execution of them: and, since this time, we find no farther traces of their heroic deeds, except those which are preserved in their histories.

The modern Icelanders apply themselves to fishing and breeding of cattle. They are middle-sized and well-made, though not very strong; and the women are in general ill-featured. Vices are much less common among them, than in other parts where luxury and riches have corrupted the morals of the people. Though their poverty disables them from imitating the hospitality of their ancestors in all respects, yet they continue to shew their inclination it: they cheerfully give away the little they have to spare, and express the utmost joy and satisfaction if you are pleased with their gift. They are uncommonly obliging and faithful, and extremely attached to government. They are very zealous in their religion. An Icelander never passes a river or any other dangerous place, without previously taking off his hat, and imploring the divine protection; and he is always thankful for the protection of the Deity, when he has passed the danger in safety. They have an inexpressible attachment to their native country, and are nowhere so happy. An Icelander therefore rarely settles in Copenhagen, tho' ever such advantageous terms should be offered him. On the other hand, we cannot ascribe any great industry or ingenuity to these people. They work on in the way to which they have all along been accustomed, without thinking of improvements. They are not cheerful in conversation, but simple and credulous; and have no aversion against a bottle, if they can find an opportunity. When they meet together, their chief pastime consists in reading their history. The master of the house makes the beginning, and the rest continue in their turns when he is tired. Some of them know these stories by heart; others have them in print, and others in writing. Besides this, they are great players at chess and cards, but only for their amusement, since they never play for money: which, however, seems to have been formerly in use among them; since, by one of their old laws, a fine is imposed upon those who play for money.

Iceland.

14 Their dress.

The modern Icelanders have made very little alteration in their dress from what was formerly in use. The men all wear a linen shirt next to the skin, with a short jacket, and a pair of wide breeches over it. When they travel, another short coat is put over all. The whole is made of coarse black cloth, called *wadmal;* but some wear clothes of a white colour. On their head they wear large three-cornered hats, and on their feet Iceland shoes and worsted stockings. Some of them indeed have shoes from Copenhagen; but, as they are rather too dear for them, they generally make their own shoes, sometimes of the hide of oxen, but more frequently of sheep's leather. They make them by cutting a square piece of leather, rather wider than the length of the foot; this they sew up at the toes, and behind at the heel, and tie it on with leather-thongs. These shoes are convenient enough where the country is level; but it would be very difficult for us who are not accustomed to walk with them amongst the rocks and stones, though the Icelanders do it with great ease.

The women are likewise dressed in black wadmal. They wear a bodice over their shifts, which are sewed up at the bosom; and above this a jacket laced before, with long narrow sleeves reaching down to the wrists.

Iceland. wriſts. In the opening on the ſide of the ſleeve, they have buttons of chaſed ſilver, with a plate fixed to each button; on which the lover, when he buys them in order to preſent them to his miſtreſs, takes care to have his name engraved along with hers. At the top of the jacket a little black collar is fixed, of about three inches broad, of velvet or ſilk, and frequently trimmed with gold cord. The petticoat is likewiſe of wadmal, and reaches down to the ankles. Round the top of it is a girdle of ſilver or ſome other metal, to which they faſten the apron, which is alſo of wadmal, and ornamented at top with buttons of chaſed ſilver. Over all this they wear an upper-dreſs nearly reſembling that of the Swediſh peaſants; with this difference, that it is wider at bottom: this is cloſe at the neck and wriſts, and a hand's-breadth ſhorter than the petticoat. It is adorned with a facing down to the bottom, which looks like cut velvet, and is generally wove by the Icelandic women. On their fingers they wear gold, ſilver, or braſs rings. Their head-dreſs conſiſts of ſeveral cloths wrapped round the head almoſt as high again as the face. It is tied faſt with a handkerchief, and ſerves more for warmth than ornament. Girls are not allowed to wear this head-dreſs till they are marriageable. At their weddings they are adorned in a very particular manner: the bride wears, cloſe to the face, round her head-dreſs, a crown of ſilver gilt. She has two chains round her neck, one of which hangs down very low before, and the other reſts on her ſhoulders. Beſides theſe, ſhe wears a leſſer chain, from whence generally hangs a little heart, which may be opened to put ſome kind of perfume in it. This dreſs is worn by all the Icelandic women without exception: only with this difference, that the poorer ſort have it of coarſe wadmal, with ornaments of braſs; and thoſe that are in eaſier circumſtances have it of broad cloth, with ſilver ornaments gilt.

15 Houſes. The houſes of the Icelanders are very indifferent, but the worſt are ſaid to be on the ſouth ſide of the iſland. In ſome parts they are built of drift-wood, in others of lava, almoſt in the ſame manner as the ſtone-walls we make for incloſures, with moſs ſtuffed between the pieces of lava. In ſome houſes the walls are wainſcotted on the inſide. The roof is covered with ſods, laid over rafting, or ſometimes over the ribs of whales; the walls are about three yards high, and the entrance ſomewhat lower. Inſtead of glaſs, the windows are made of the chorion and amnios of ſheep, or the membranes which ſurround the womb of the ewe. Theſe are ſtretched on a hoop, and laid over a hole in the roof. In the poorer ſort of houſes they employ for the windows the inner membrane of the ſtomach of animals, which is leſs tranſparent than the others.

16 Diet. As the iſland of Iceland produces no kind of grain, the inhabitants of conſequence have no bread but what is imported; and which being too dear for common uſe, is reſerved for weddings and other entertainments. The following liſt of their viands is taken from Troil's Letters.

" 1. Flour of *fialgras*, (lichen iſlandicus, or rock-graſs). The plant is firſt waſhed, and then cut into ſmall pieces by ſome; though the greater number dry it by fire or in the ſun, then put it into a bag in which it is well beaten, and laſtly work it into a flour by ſtamping.

" 2. Flour of *komſyrg*, (polygonum biſtorta), is prepared in the ſame manner, as well as the two other ſorts of wild corn *melur (Arundo arenaria*, and *Arundo foliorum lateribus convolutis)*, by ſeparating it from the chaff, pounding, and laſtly grinding it.

" 3. *Surt ſmoer*, (ſour butter). The Icelanders ſeldom make uſe of freſh or ſalt butter, but let it grow ſour before they eat it. In this manner it may be kept for 20 years, or even longer; and the Icelanders look upon it as more wholeſome and palatable than the butter uſed among other nations. It is reckoned better the older it grows, and one pound of it then is valued as much as two of freſh butter.

" 3. *Striug*, or whey boiled to the conſiſtence of four milk, and preſerved for the winter.

" 4. Fiſh of all kinds, both dried in the ſun and in the air, and either ſalted or frozen. Thoſe prepared in the laſt manner are preferred by many.

" 5. The fleſh of bears, ſheep, and birds, which is partly ſalted, partly hung or ſmoked, and ſome preſerved in caſks with ſour or fermented whey poured over it.

" 6. *Miſoſt*, or whey boiled to cheeſe, which is very good. But the art of making other kinds of good cheeſe is loſt, tho' ſome tolerably palatable is ſold in the eaſt quarter of Iceland.

" 7. *Beina-ſtriug*, bones and cartilages of beef and mutton, and likewiſe bones of cod, boiled in whey till they are quite diſſolved: they are then left to ferment, and are eat with milk.

" 8. *Skyr*. The curds from which the whey is ſqueezed are preſerved in caſks or other veſſels; they are ſometimes mixed with black crow-berries or juniper-berries, and are likewiſe eat with new milk.

" 9. *Syra*, is four whey kept in caſks, and left to ferment; which, however, is not reckoned fit for uſe till a year old.

" 10. *Blanda*, is a liquor made of water, to which a twelfth part of ſyra is added. In winter, it is mixed with the juice of thyme, and of the black crow-berries.

" 11. They likewiſe eat many vegetables, ſome of which grow wild, and ſome are cultivated; alſo ſhell-fiſh and muſhrooms."

The Icelanders in general eat three meals a-day, at ſeven in the morning, two in the afternoon, and nine at night. In the morning and evening they commonly eat curds mixed with new milk, and ſometimes with juniper or crow berries. In ſome parts, they alſo have pottage made of rock-graſs, which is very palatable, or curdled milk boiled till it becomes of a red colour, or new milk boiled a long time. At dinner, their food conſiſts of dried fiſh, with plenty of ſour butter; they alſo ſometimes eat freſh fiſh, and, when poſſible, a little bread and cheeſe with them. It is reported by ſome, that they do not eat any fiſh till it is quite rotten; this report perhaps proceeds from their being fond of it when a little tainted: they however frequently eat fiſh which is quite freſh, though, in the ſame manner as the reſt of their food, often without ſalt.

Their common beverage is milk, either warm from the cow, or cold, and ſometimes boiled: they likewiſe uſe butter-milk with or without water. On the coaſts

coasts they generally drink blanda and sour milk; which is sold after it is skimmed, at two fifths of a rixdollar per cask: some likewise send for beer from Copenhagen, and some brew their own. A few of the principal inhabitants also have claret and coffee. The common people sometimes drink a kind of tea, which they make from the leaves of the *dryas octopetala*, and the *veronica officinalis*.

On the coasts, the men employ themselves in fishing, both summer and winter. On their return home, when they have drawn and cleaned their fish, they give them to their wives, whose care it is to dry them. In the winter, when the inclemency of the weather prevents them from fishing, they are obliged to take care of their cattle and spin wool. In summer, they mow the grass, dig turf, provide fuel, go in search of sheep and goats that were gone astray, and kill cattle. They prepare leather with the *spiraea ulmaria* instead of bark. Some few work in gold and silver; and others are instructed in mechanics, in which they are tolerable proficients. The women prepare the fish, take care of the cattle, manage the milk and wool, sew, spin, and gather eggs and down. When they work in the evening, they use, instead of an hour-glass, a lamp with a wick made of epilobium dipt in train oil, which is contrived to burn four, six, or eight hours.

Among the common people of Iceland, time is not reckoned by the course of the sun, but by the work they have done, and which is prescribed by law. According to this prescription, a man is to mow as much hay in one day as grows on 30 fathoms of manured soil, or 40 fathoms of land which has not been manured; or he is to dig 700 pieces of turf eight feet long and three broad. If as much snow falls as reaches to the horses bellies, a man is required daily to clear a piece of ground sufficient for 100 sheep. A woman is to rake together as much hay as three men can mow, or to weave three yards of wadmal a-day.

The wages of a man are fixed at four dollars, and 12 yards of wadmal; and those of a woman at two dollars, and five yards of wadmal. When men are sent a-fishing out of the country, there is allowed to each man by law, from the 25th of September to the 14th of May, six pounds of butter, and 18 pounds of dried fish every week. This may seem to be too great an allowance; but it must be remembered that they have nothing else to live upon. When they are at home, and can get milk, &c. every man receives only five pounds of dried fish and three quarters of a pound of butter a-week.

The food and manner of life of the Icelanders by no means contribute to their longevity. It is very rare indeed to see an inhabitant of Iceland exceed the age of 50 or 60; and the greater part are attacked by grievous diseases before middle age. Of these the scurvy and elephantiasis or leprosy are the worst. They are also subject to the gout in their hands, owing to their frequent employment in fishing, and handling the wet fishing-tackle in cold weather. St Anthony's fire, the jaundice, pleurisy, and lowness of spirits, are frequent complaints in this country. The small-pox is also exceedingly fatal, and not long ago destroyed 16,000 persons. By these diseases, and the frequent famines with which the country has been afflicted, the inhabitants are reduced to a much fewer number than they formerly were, insomuch that it is computed they do not in all exceed 60,000.

Iceni
Ichneumon.

The exports of Iceland consist of dried fish, salted mutton and lamb, beef, butter, tallow, train-oil, coarse woollen cloth, stockings, gloves, raw wool, sheep-skins, lamb-skins, fox-furs of various colours, eider down, feathers, and formerly sulphur; but there is no longer a demand for this mineral. On the other hand, the Icelanders import timber, fishing-lines and hooks, tobacco, bread, horse-shoes, brandy, wine, salt, linen, a little silk, and a few other necessaries, as well as superfluities for the better sort. The whole trade of Iceland is engrossed by a monopoly of Danes, indulged with an exclusive charter. This company maintains factories at all the harbours of Iceland, where they exchange their foreign goods for the merchandize of the country; and, as the balance is in favour of the Icelanders, pay the overplus in Danish money, which is the only current coin in this island. All their accounts and payments are adjusted according to the number of fish: two pounds of fish are worth two skillings in specie, and 48 fish amount to one rixdollar. A Danish crown is computed at 30 fish: what falls under the value of 12 fish, cannot be paid in money; but must be bartered either for fish or roll-tobacco, an ell of which is equal to one fish. The weights and measures of the Icelanders are nearly the same with those used in Denmark.

19
Commerce and revenue.

The Icelanders being neither numerous nor warlike, and altogether unprovided with arms, ammunition, garrisons, or fleets, are in no condition to defend themselves from invasion; but depend entirely on the protection of his Danish majesty, to whom they are subject.

The revenues which he draws from this island consist of the income of divers estates, as royal demesne, amounting to about 8000 dollars per annum; of the money paid by the company for an exclusive trade, to the value of 20,000 dollars; and of a fixed proportion in the tythes of fish, paid in some particular districts.

ICENI, the ancient name of the people of Suffolk, Norfolk, Cambridgeshire, and Huntingdonshire, in England.

ICH-DIEN. See HERALDRY, chap. iv. sect. 2.

ICHNEUMON, in zoology. See VIVERRA.

ICHNEUMON, is also the name of a genus of flies of the hymenoptera order. It has no tongue; the antennæ have above 30 joints; the abdomen, in most of the species, is petiolated; and it has a sting in the tail inclosed in a double-valved cylindrical sheath. There are 77 species, principally distinguished by their colour.—These flies are sometimes at great pains to destroy and carry the caterpillars in whose bodies they intend to lay their eggs, to places where it is proper those eggs should be hatched. There is one species, whose worm produced from the egg can never succeed, unless it is both bred in the body of a caterpillar, and also have that habitation buried under ground. For this purpose, the parent-fly, when the time of laying her eggs is come, forms a hole in the ground, which she covers with a little clod of earth, that no dust may fall in to fill it up; when this is done, she goes out in quest of a caterpillar proper for her

Ichnography. Ichoglans.

purpose. Dr Lister assures us, that he has often seen one of these flies seize a caterpillar much larger than herself; and though this has been at a considerable distance from her hole, she has with great labour dragged the creature to it. As soon as she has arrived there with her load, she takes off the little pellet of earth from the mouth of the hole, and going down to see that all is ready for the reception of the new guest, she returns out of it and draws in the caterpillar, which she leaves there after giving it such wounds as, though they do not cause immediate death, yet disable the creature so as to make its escape impracticable. When the creature is thus lodged, she deposits her eggs in the flesh; after which she stops up the orifice of the hole very firmly with several pellets of dirt, and with dust carefully rammed in between, and will even fly up into gummy and resinous trees in order to get a cement to hold all firmly together. When the hole is thus filled up even with the surface of the rest of the ground, she draws a leaf or two to the place, and laying them over the mouth flies away. There is after this no more care taken; but the young worms are hatched from the eggs, and feed on the flesh of the caterpillar till they are fully grown. They then change into the nymph-state, and come out of that in form of their parent-flies, in which state they usually make their way out of the ground. Some of these ichneumons make the bodies of other smaller flies the places of hatching their eggs. They may be often met with flying with one of these small flies in their legs, the head of it being held close to their bellies. If they are watched on this occasion, they will usually be found to carry those flies to certain holes in the ground resembling worm-holes. The first that they carry serves as a nidus for their eggs: the rest are for food to the young ones while in the state of worms; these being too voracious to be subsisted long on the body of one fly, and therefore their parents carry them more every day. The old ones on this occasion crawl backwards into the holes, dragging the flies in after them. When their young worms have fed sufficiently, they are converted into nymphæ; the cases of which are made up of the wings, legs, and other hard parts of the flies they had been feeding upon.

ICHNOGRAPHY, in perspective, the view of any thing cut off by a plane, parallel to the horizon, just at the base of it.—The word is derived from the Greek ἴχνος, *footstep*, and γράφω, *I write*, as being a description of the footsteps or traces of a work.

Among painters it signifies a description of images or of ancient statues of marble and copper, of busts and semi-busts, of paintings in fresco, mosaic works, and ancient pieces of miniature.

ICHOGLANS, the grand signior's pages serving in the seraglio.—These are the children of Christian parents, either taken in war, purchased, or sent in presents from the viceroys and governors of distant provinces; they are the most sprightly, beautiful, and well-made that can be met with; and are always reviewed and approved of by the grand signior himself, before they are admitted into the seraglios of Pera, Constantinople, or Adrianople, being the three colleges where they are educated, or fitted for employments, according to the opinion the court entertains of them.

Ichor, Ichthyocolla.

ICHOR, properly signifies a thin watery humour like serum; but is sometimes used for a thicker kind flowing from ulcers, called also *sanies*.

ICHTHYOCOLLA, Isinglass, a preparation from the fish known by the name of *huso*. See Accipenser. The word is Greek, formed of ἰχθυς, *fish*, and κολλα, *glue*.—The method of making isinglass was long a secret in the hands of the Russians; but hath lately been discovered, and the following account of it published by Humphrey Jackson, Esq. in the 63d volume of the Philosophical Transactions.

"All authors who have hitherto delivered processes for making ichthyocolla, fish-glue, or isinglass, have greatly mistaken both its constituent matter and preparation.

"To prove this assertion, it may not be improper to recite what Pomet says upon the subject, as he appears to be the principal author whom the rest have copied. After describing the fish, and referring to a cut engraved from an original in his custody, he says: 'As to the manner of making the isinglass, the 'finewy parts of the fish are boiled in water, till all 'of them be dissolved that will dissolve; then the 'gluey liquor is strained, and set to cool. Being 'cold, the fat is carefully taken off, and the liquor 'itself boiled to a just consistency, then cut to pieces, 'and made into a twist, bent in form of a crescent, 'as commonly sold, then hung upon a string, and 'carefully dried.'

"From this account, it might be rationally concluded, that every species of fish which contained gelatinous principles would yield isinglass: and this parity of reasoning seems to have given rise to the hasty conclusions of those, who strenuously vouch for the extraction of isinglass from sturgeon; but as that fish is easily procurable, the negligence of ascertaining the fact by experiment seems inexcusable.

"In my first attempt to discover the constituent parts and manufacture of isinglass, relying too much upon the authority of some chemical authors whose veracity I had experienced in many other instances, I found myself constantly disappointed. Glue, not isinglass, was the result of every process; and although, in the same view, a journey to Russia proved fruitless, yet a steady perseverance in the research proved not only successful as to this object, but, in the pursuit, to discover a resinous matter plentifully procurable in the British fisheries, which has been found by ample experience to answer similar purposes. It is now no longer a secret, that our (A) lakes and rivers in North America are stocked with immense quantities of fish, said to be the same species with those in Muscovy, and yielding the finest isinglass, the fisheries

(A) As the lakes of North America lie nearly in the same latitude with the Caspian Sea, particularly lake Superior, which is said to be of greater extent, it was conjectured they might abound with the same sorts of fish; and, in consequence of public advertisements distributed in various parts of North America, offering premiums for the sounds of sturgeon and other fish, for the purpose of making isinglass, several specimens of fine isinglass, the produce of fish taken in these parts, have been lately sent to England, with proper attestations as to the unlimited quantity which may be procured.

Ichthyocolla.

fiſheries whereof, under due encouragement, would doubtleſs ſupply all Europe with this valuable article.

" No artificial heat is neceſſary to the production of iſinglaſs, neither is the matter diſſolved for this purpoſe; for, as the continuity of its fibres would be deſtroyed by ſolution, the maſs would become brittle in drying, and ſnap ſhort aſunder, which is always the caſe with glue, but never with iſinglaſs. The latter, indeed, may be reſolved into glue with boiling water; but its fibrous recompoſition would be found impracticable afterwards, and a fibrous texture is one of the moſt diſtinguiſhing characteriſtics of genuine iſinglaſs.

" A due conſideration that an imperfect ſolution of iſinglaſs, called *fining* by the brewers, poſſeſſed a peculiar property of clarifying malt-liquors, induced me to attempt its analyſis in cold ſubacid menſtruums. One ounce and an half of good iſinglaſs, ſteeped a few days in a gallon of ſtale beer, was converted into good fining, of a remarkable thick conſiſtence: the ſame quantity of glue, under ſimilar treatment, yielded only a mucilaginous liquor, reſembling diluted gum-water, which, inſtead of clarifying beer, increaſed both its tenacity and turbidneſs, and communicated other properties in no reſpect correſponding with thoſe of genuine fining. On commixing three ſpoonfuls of the ſolution of iſinglaſs with a gallon of malt liquor, in a tall cylindrical glaſs, a vaſt number of curdly maſſes became preſently formed, by the reciprocal attraction of the particles of iſinglaſs, and the feculencies of the beer, which, increaſing in magnitude and ſpecific gravity, arranged themſelves accordingly, and fell in a combined ſtate to the bottom, through the well-known laws of gravitation; for, in this caſe, there is no elective attraction, as ſome have imagined, which bears the leaſt affinity with what frequently occurs in chemical decompoſitions.

" If what is commercially termed *long* or *ſhort ſtapled iſinglaſs* be ſteeped a few hours in fair cold water, the entwiſted membranes will expand, and reaſſume their original beautiful (B) hue, and, by a dexterous addreſs, may be perfectly unfolded. By this ſimple operation, we find that iſinglaſs is nothing more than certain membranous parts of fiſhes, diveſted of their native mucoſity, rolled and twiſted into the forms abovementioned, and dried in the open air.

" The ſounds, or air-bladders, of freſh-water fiſh in general, are preferred for this purpoſe, as being the moſt tranſparent, flexible, delicate ſubſtances. Theſe conſtitute the fineſt ſorts of iſinglaſs; thoſe called *book* and *ordinary ſtaple*, are made of the inteſtines, and probably of the peritonæum of the fiſh. The belluga yields the greateſt quantity, as being the largeſt and moſt plentiful fiſh in the Muſcovy rivers; but the ſounds of all freſh-water fiſh yield, more or leſs, fine iſinglaſs, particularly the ſmaller ſorts, found in prodigious quantities in the Caſpian Sea, and ſeveral hundred miles beyond Aſtracan, in the Wolga, Yaik, Don, and even as far as Siberia, where it is called *ile* or *ila* by the natives, which implies a glutinous matter; it is the baſis of the Ruſſian glue, which is preferred to all other kinds for its ſtrength.

" The ſounds, which yields the finer iſinglaſs, conſiſt of parallel fibres, and are eaſily rent longitudinally; but the ordinary ſorts are found compoſed of double membranes, whoſe fibres croſs each other obliquely, reſembling the coats of a bladder: hence the former are more readily pervaded and divided with ſubacid liquors; but the latter, through a peculiar kind of interwoven texture, are with great difficulty torn aſunder, and long reſiſt the power of the ſame menſtruum; yet, when duly reſolved, are found to act with equal energy in clarifying liquors.

" Iſinglaſs receives its different ſhapes in the following manner:

" The parts of which it is compoſed, particularly the ſounds, are taken from the fiſh while ſweet and freſh, ſlit open, waſhed from their ſlimy *ſordes*, diveſted of every thin membrane which involopes the ſound, and then expoſed to ſtiffen a little in the air. In this ſtate, they are formed into rolls about the thickneſs of a finger, and in length according to the intended ſize of the ſtaple: a thin membrane is generally ſelected for the centre of the roll, round which the reſt are folded alternately, and about half an inch of each extremity of the roll is turned inwards. The due dimenſions being thus obtained, the two ends of what is called *ſhort-ſtaple* are pinned together with a ſmall wooden peg; the middle of the roll is then preſſed a little downwards, which gives it the reſemblance of a heart-ſhape; and thus it is laid on boards, or hung up in the air to dry. The ſounds, which compoſe the long-ſtaple, are larger than the former; but the operator lengthens this ſort at pleaſure, by interfolding the ends of one or more pieces of the ſound with each other. The extremities are faſtened with a peg, like the former; but the middle part of the roll is bent more conſiderably downwards; and, in order to preſerve the ſhape of the three obtuſe angles thus formed, a piece of round ſtick, about a quarter of an inch diameter, is faſtened in each angle with ſmall wooden pegs, in the ſame manner as the ends. In this ſtate, it is permitted to dry long enough to retain its form, when the pegs and ſticks are taken out, and the drying completed; laſtly, the pieces of iſinglaſs are colligated in rows, by running packthread through the peg-holes, for convenience of package and exportation.

" The membranes of the book ſort, being thick and refractory, will not admit a ſimilar formation with the preceding: the pieces therefore, after their ſides are folded inwardly, are bent in the centre, in ſuch manner that the oppoſite ſides reſemble the cover of a book, from whence its name; a peg being run acroſs the middle, faſtens the ſides together, and thus it is dried like the former. This ſort is interleaved, and the pegs run acroſs the ends, the better to prevent its unfolding.

" That called *cake-iſinglaſs*, is formed of the bits and fragments of the ſtaple ſorts, put into a flat metalline pan, with a very little water, and heated juſt enough to make the parts cohere like a pancake, when it is dried; but frequently it is overheated, and ſuch pieces, as before obſerved, are uſeleſs in the buſineſs of fining. Experience has taught the conſumers to reject them.

(B) If the tranſparent iſinglaſs be held in certain poſitions to the light, it frequently exhibits beautiful priſmatic colours.

Ichthyocolla.

" Iſinglaſs is beſt made in the ſummer, as froſt gives it a diſagreeable colour, deprives it of weight, and impairs its gelatinous principles; its faſhionable forms are unneceſſary, and frequently injurious to its native qualities. It is common to find oily putrid matter, and *exuviæ* of inſects, between the implicated membranes, which, through the inattention of the cellarman, often contaminate wines and malt-liquors in the act of clarification. Theſe peculiar ſhapes might, probably, be introduced originally with a view to conceal and diſguiſe the real ſubſtance of iſinglaſs, and preſerve the monopoly; but, as the maſk is now taken off, it cannot be doubted to anſwer every purpoſe more effectually in its native ſtate, without any ſubſequent manufacture whatever, eſpecially to the principal conſumers, who hence will be enabled to procure ſufficient ſupply from the Britiſh colonies. Until this laudable end can be fully accompliſhed, and as a ſpecies of iſinglaſs, more eaſily produceable from the marine fiſheries, may probably be more immediately encouraged, it may be manufactured as follows:

" The ſounds of cod and ling bear great analogy with thoſe of the *accipenſer* genus of Linnæus and Artedi; and are in general ſo well known, as to require no particular deſcription. The Newfoundland and Iceland fiſhermen ſplit open the fiſh, as ſoon as taken, and throw the back bones, with the ſounds annexed, in a heap; but previous to incipient putrefaction, the ſounds are cut out, waſhed from their ſlimes, and ſalted for uſe. In cutting out the ſounds, the inteſtinal parts are left behind, which are much the beſt; the Iceland fiſhermen are ſo ſenſible of this, that they beat the bone upon a block with a thick ſtick, till the pockets, as they term them, come out eaſily, and thus preſerve the ſound entire. If the ſounds have been cured with ſalt, that muſt be diſſolved by ſteeping them in water, before they are prepared for iſinglaſs; the freſh ſound muſt then be laid upon a block of wood, whoſe ſurface is a little elliptical, to the end of which a ſmall hair-bruſh is nailed, and with a ſaw-knife the membranes on each ſide of the ſound muſt be ſcraped off. The knife is rubbed upon the bruſh occaſionally, to clear its teeth; the pockets are cut open with ſciſſars, and perfectly cleanſed of the mucous matter with a coarſe cloth; the ſounds are afterwards waſhed a few minutes in lime-water in order to abſorb their oily principle, and laſtly in clear water. They are then laid upon nets, to dry in the air; but if intended to reſemble the foreign iſinglaſs, the ſounds of cod will only admit of that called *book*, but thoſe of ling both ſhapes. The thicker the ſounds are, the better the iſinglaſs, colour excepted; but that is immaterial to the brewer, who is its chief conſumer.

" This iſinglaſs reſolves into fining, like the other ſorts, in ſubacid liquors, as ſtale beer, cyder, old hock, &c. and in equal quantities produces ſimilar effects upon turbid liquors, except that it falls ſpeedier and cloſer to the bottom of the veſſel, as may be demonſtrated in tall cylindrical glaſſes; but foreign iſinglaſs retains the conſiſtency of fining preferably in warm weather, owing to the greater tenacity of its native mucilage.

" Vegetable acids are, in every reſpect, beſt adapted to fining: the mineral acids are too corroſive, and even infalubrious, in common beverage.

" It is remarkable, that, during the converſion of iſinglaſs into fining, the acidity of the menſtruum ſeems greatly diminiſhed, at leaſt to taſte, not on account of any alkaline property in the iſinglaſs, probably, but by its inveloping the acid particles. It is likewiſe reducible into jelly with alkaline liquors, which indeed are ſolvents of all animal-matters; even cold lime-water diſſolves it into a pulpous *magma*. Notwithſtanding this is inadmiſſible as fining, on account of the menſtruum, it produces admirable effects in other reſpects: for, on commixture with compoſitions of plaſter, lime, &c. for ornamenting walls expoſed to viciſſitudes of weather, it adds firmneſs and permanency to the cement; and if common brick-mortar be worked up with this jelly, it ſoon becomes almoſt as hard as the brick itſelf: but, for this purpoſe, it is more commodiouſly prepared, by diſſolving it in cold water, acidulated with vitriolic acid; in which caſe, the acid quits the jelly, and forms with the lime a *ſelenitic* maſs, while, at the ſame time, the jelly being deprived in ſome meaſure of its moiſture, through the formation of an indiſſoluble concrete amongſt its parts, ſoon dries, and hardens into a firm body; whence its ſuperior ſtrength and durability are eaſily comprehended.

" It has long been a prevalent opinion, that ſturgeon, on account of its cartilaginous nature, would yield great quantities of iſinglaſs; but, on examination, no part of this fiſh, except the inner coat of the ſound, promiſed the leaſt ſucceſs. This being full of *rugæ*, adheres ſo firmly to the external membrane, which is uſeleſs, that the labour of ſeparating them ſuperſedes the advantage. The inteſtines, however, which in the larger fiſh extend ſeveral yards in length, being cleanſed from their mucus, and dried, were found ſurpriſingly ſtrong and elaſtic, reſembling cords made with the inteſtines of other animals, commonly called *cat-gut*, and, from ſome trials, promiſed ſuperior advantages when applied to mechanic operations."

Iſinglaſs is ſometimes uſed in medicine; and may be given in a thin acrimonious ſtate of the juices, after the ſame manner as the vegetable gums and mucilages, regard being had to their different diſpoſition to putreſcence.

Ichthyology, Ichthyophagi.

ICHTHYOLOGY, the ſcience of fiſhes, or that part of zoology which treats of fiſhes. See FISH, and ZOOLOGY, n° 10.

ICHTHYOPHAGI, FISH-EATERS, a name given to a people, or rather to ſeveral different people, who lived wholly on fiſhes. The word is Greek, compounded of ἰχθὺς, *piſcis*, " fiſh," and φαγεῖν, *edere*, " to eat."

The Ichthyophagi ſpoken of by Ptolemy are placed by Sanſon in the provinces of Nanquin and Xantong. Agatharcides calls all the inhabitants between Carmania and Gedroſia by the name *Ichthyophagi*.

From the accounts given us of the Ichthyophagi by Herodotus, Strabo, Solinus, Plutarch, &c. it appears indeed that they had cattle, but that they made no uſe of them excepting to feed their fiſh withal. They made their houſes of large fiſh-bones, the ribs of whales ſerving them for their beams. The jaws of theſe animals ſerved them for doors; and the mortars wherein they pounded their fiſh, and baked it at the ſun, were nothing elſe but their vertebræ.

ICH-

ICHTHYPERIA, in natural hiſtory, a name given by Dr Hill to the bony palates and mouths of fiſhes, uſually met with either foſſile, in ſingle pieces, or in fragments. They are of the ſame ſubſtance with the bufonitæ; and are of very various figures, ſome broad and ſhort, others longer and ſlender; ſome very gibboſe, and others plainly arched. They are likewiſe of various ſizes, from the tenth of an inch to two inches in length, and an inch in breadth.

ICONOCLASTES, or ICONOCLASTÆ, breakers of images; a name which the church of Rome gives to all who reject the uſe of images in religious matters.—The word is Greek, formed from εικων, *imago*, and κλαειν, *rumpere*, "to break."

In this ſenſe, not only the reformed, but ſome of the eaſtern churches are called *Iconoclaſtes*, and eſteemed by them heretics, as oppoſing the worſhip of the images of God and the ſaints, and breaking their figures and repreſentations in churches.

ICOSAHEDRON, in geometry, a regular ſolid, conſiſting of 20 triangular pyramids, whoſe vertexes meet in the centre of a ſphere ſuppoſed to circumſcribe it; and therefore have their height and baſes equal: wherefore the ſolidity of one of theſe pyramids multiplied by 20, the number of baſes, gives the ſolid contents of the icoſahedron.

ICOSANDRIA, (from εικοσι, "twenty," and ανηρ, "a man, or huſband;" the name of the 12th claſs in Linnæus's ſexual method, conſiſting of plants with hermaphrodite flowers, which are furniſhed with 20 or more ſtamina, that are inſerted into the inner ſide of the calix or petals. See BOTANY, p. 1292.

ICTINUS, a celebrated Greek architect who lived about 430 B. C. built ſeveral magnificent temples, and among others that of Minerva at Athens.

IDA, (anc. geog.) a mountain ſituated in the heart of Crete where broadeſt; the higheſt of all in the iſland; round, and in compaſs 60 ſtadia, (Strabo); the nurſing-place of Jupiter, and where his tomb was viſited in Varro's time. Another *Ida*, a mountain of Myſia, or rather a chain of mountains (Homer, Virgil), extending from Zeleia on the ſouth of the territory of Cyzicus to Lectum the utmoſt promontory of Troas. The top was called *Gargara*, (Homer, Strabo); and celebrated by the poets for the judgment of Paris on the beauty of the three goddeſſes, Minerva, Juno, and Venus, to the laſt of whom he gave the preference.

IDALIUM, (anc. geog.) a promontory on the eaſt ſide of Cyprus. Now *Capo di Griego*; with a high rugged eminence riſing over it, in the form of a table. It was ſacred to Venus; and hence the epithet *Idalia* given her by the poets. The eminence was covered with a grove; and in the grove was a little town, in Pliny's time extinct. *Idalia*, according to Bochart, denotes the place or ſpot ſacred to the goddeſs.

IDEA, the reflex perception of objects, after the original perception or impreſſion has been felt by the mind. See METAPHYSICS, *paſſim*; and LOGIC, Part I.

IDENTITY, denotes that by which a thing is itſelf, and not any thing elſe; in which ſenſe *identity* differs from *ſimilitude*, as well as *diverſity*. See METAPHYSICS, n° 105,—120.

IDES, in the ancient Roman calendar, were eight days in each month; the firſt of which fell on the 15th of March, May, July, and October; and on the 13th day of the other months.—The origin of the word is conteſted. Some will have it formed from ιδειν, "to ſee;" by reaſon the full moon was commonly ſeen on the day of the ides: others from ειδος, "ſpecies, figure," on account of the image of the full moon then viſible: others from *idulium*, or *ovis idulis*, a name given by the Hetrurians to a victim offered on that day to Jupiter: others from the Hetrurian word *iduo*, i. e. *divido*; by reaſon the ides divided the moon into two nearly equal parts. Ides, Idiocy.

The ides came between the KALENDS and the NONES; and were reckoned backwards. Thus they called the 14th day of March, May, July, and October, and the 12th of the other months, the *pridie idus*, or the day before the ides; the next preceding day they called the *tertia idus*; and ſo on, reckoning always backwards, till they came to the NONES. This method of reckoning time is ſtill retained in the chancery of Rome, and in the calendar of the Breviary.—The ides of May were conſecrated to Mercury: the ides of March were ever eſteemed unhappy, after Cæſar's murder on that day: the time after the ides of June was reckoned fortunate for thoſe who entered into matrimony: the ides of Auguſt were conſecrated to Diana, and were obſerved as a feaſt-day by the ſlaves. On the ides of September, auguries were taken for appointing the magiſtrates, who formerly entered into their offices on the ides of May, afterwards on thoſe of March.

IDIOCY, a defect of underſtanding. Both idiocy and LUNACY excuſe from the guilt of crimes; (ſee CRIME, *par. ult.*) For the rule of law as to lunatics, which alſo may be eaſily adapted to idiots, is, that *furioſus furore ſolum punitur*. In criminal caſes, therefore, idiots and lunatics are not chargeable for their own acts, if committed when under theſe incapacities: no, not even for treaſon itſelf. Alſo, if a man in his ſound memory commits a capital offence, and before arraignment for it he becomes mad, he ought not to be arraigned for it; becauſe he is not able to plead to it with that advice and caution that he ought. And if, after he has pleaded, the priſoner becomes mad, he ſhall not be tried: for how can he make his defence? If, after he be tried and found guilty, he loſes his ſenſes before judgment, judgment ſhall not be pronounced; and if, after judgment, he becomes of non-ſane memory, execution ſhall be ſtayed: for, peradventure, ſays the humanity of the Engliſh law, had the priſoner been of ſound memory, he might have alleged ſomething in ſtay of judgment or execution. Indeed, in the bloody reign of Henry VIII. a ſtatute was made, which enacted, that if a perſon, being *compos mentis*, ſhould commit high treaſon, and after fall into madneſs, he might be tried in his abſence, and ſhould ſuffer death, as if he were of perfect memory. But this ſavage and inhuman law was repealed by the ſtatute 1 & 2 Ph. & M. c. 10. For, as is obſerved by Sir Edward Coke, "the execution of an offender is for example, *ut pœna ad paucos, metus ad omnes perveniat*: but ſo it is not when a madman is executed; but ſhould be a miſerable ſpectacle, both againſt law, and of extreme inhumanity and cruelty, and can be no Blackſt. Comment.

Idiocy. no example to others." But if there be any doubt whether the party be *compos* or not, this ſhall be tried by a jury. And if he be ſo found, a total idiocy, or abſolute infanity, excuſes from the guilt, and of courſe from the puniſhment, of any criminal action committed under ſuch deprivation of the ſenſes: but if a lunatic hath lucid intervals of underſtanding, he ſhall anſwer for what he does in thoſe intervals, as if he had no deficiency. Yet, in the caſe of abſolute madmen, as they are not anſwerable for their actions, they ſhould not be permitted the liberty of acting unleſs under proper control; and, in particular, they ought not to be ſuffered to go looſe, to the terror of the king's ſubjects. It was the doctrine of our ancient law, that perſons deprived of their reaſon might be confined till they recovered their ſenſes, without waiting for the forms of a commiſſion or other ſpecial authority from the crown: and now, by the vagrant acts, a method is chalked out for impriſoning, chaining, and ſending them to their proper homes.

The matrimonial contract likewiſe cannot take place in a ſtate of idiocy. It was formerly adjudged, that the iſſue of an idiot was legitimate, and his marriage valid. A ſtrange determination! ſince conſent is abſolutely requiſite to matrimony, and neither idiots nor lunatics are capable of conſenting to any thing. And therefore the civil law judged much more ſenſibly, when it made ſuch deprivations of reaſon a previous impediment, though not a cauſe of divorce if they happened after marriage. And modern reſolutions have adhered to the ſenſe of the civil law, by determining that the marriage of a lunatic, not being in a lucid interval, was abſolutely void. But as it might be difficult to prove the exact ſtate of the party's mind at the actual celebration of the nuptials, upon this account, (concurring with ſome private family-reaſons *) the ſtatute 15 Geo. II. c. 30. has provided, that the marriage of lunatics and perſons under phrenzies (if found lunatics under a commiſſion, or committed to the care of truſtees under any act of parliament) before they are declared of found mind by the lord chancellor, or the majority of ſuch truſtees, ſhall be totally void.

* See *Private Acts* 23 *Geo. II.* c. 6.

Idiots, and perſons of nonſane memory, as well as infants, and perſons under dureſs, are not totally diſabled either to convey or purchaſe, but *ſub modo* only. For their conveyances and purchaſes are voidable, but not actually void. The king, indeed, on behalf of an idiot, may avoid his grants or other acts. But it hath been ſaid, that a *non compos* himſelf, though he be afterwards brought to a right mind, ſhall not be permitted to allege his own infanity in order to avoid ſuch grant: for that no man ſhall be allowed to ſtupify himſelf, or plead his own diſability. The progreſs of this notion is ſomewhat curious. In the time of Edward I. *non compos* was a ſufficient plea to avoid a man's own bond: and there is a writ in the regiſter for the alienor himſelf to recover lands aliened by him during his infanity; *dum fuit non compos mentis ſuæ, ut dicit*, &c. But under Edward III. a ſcruple began to ariſe, whether a man ſhould be permitted to *bleminſh* himſelf, by pleading his own infanity: and, afterwards, a defendant in aſſiſe having pleaded a releaſe by the plaintiff ſince the laſt continuance, to which the plaintiff replied (*ore tenus*, as the manner then was) that he was out of his mind when he gave it, the court adjourned the aſſiſe; doubting, whether as the plaintiff was ſane both then and at the commencement of the ſuit, he ſhould be permitted to plead an intermediate deprivation of reaſon; and the queſtion was aſked, how he came to remember to releaſe, if out of his ſenſes when he gave it? Under Henry VI. this way of reaſoning (that a man ſhall not be allowed to diſable himſelf, by pleading his own incapacity, becauſe he cannot know what he did under ſuch a ſituation) was ſeriouſly adopted by the judges in argument; upon a queſtion, whether the heir was barred of his right of entry by the feoffment of his infane anceſtor. And from theſe looſe authorities, which Fitzherbert does not ſcruple to reject as being contrary to reaſon, the maxim that a man ſhall not ſtultify himſelf hath been handed down as ſettled law: though later opinions, feeling the inconvenience of the rule, have in many points endeavoured to reſtrain it. And, clearly, the next heir, or other perſon intereſted, may, after the death of the idiot or *non compos*, take advantage of his incapacity and avoid the grant. And ſo too, if he purchaſes under this diſability, and does not afterwards upon recovering his ſenſes agree to the purchaſe, his heir may either waive or accept the eſtate at his option. In like manner, an infant may waive ſuch purchaſe or conveyance, when he comes to full age; or, if he does not then actually agree to it, his heirs may waive it after him. Perſons alſo, who purchaſe or convey under dureſs, may affirm or avoid ſuch tranſaction, whenever the dureſs is ceaſed. For all theſe are under the protection of the law; which will not ſuffer them to be impoſed upon thro' the imbecillity of their preſent condition; ſo that their acts are only binding, in caſe they be afterwards agreed to when ſuch imbecillity ceaſes. Yet the guardians or committees of a lunatic, by the ſtatute 11 Geo. III. c. 20. are empowered to renew in his right, under the directions of the court of chancery, any leaſe for lives or years, and apply the profits of ſuch renewal for the benefit of ſuch lunatic, his heirs, or executors *.

* See Lunacy.

IDIOM, among grammarians, properly ſignifies the peculiar genius of each language, but is often uſed in a ſynonimous ſenſe with dialect.

IDIOPATHY, in phyſic, a diſorder peculiar to a certain part of the body, and not ariſing from any preceding diſeaſe, in which ſenſe it is oppoſed to ſympathy. Thus, an epilepſy is idiopathic when it happens merely through ſome fault in the brain; and ſympathetic when it is the conſequence of ſome other diſorder.

IDIOSYNCRASY, among phyſicians, denotes a peculiar temperament of body, whereby it is rendered more liable to certain diſorders than perſons of a different conſtitution uſually are.

IDLENESS, a reluctancy in people to be employed in any kind of work.

Idleneſs in any perſon whatſoever is a high offence againſt the public œconomy. In China it is a maxim, that if there be a man who does not work, or a woman that is idle, in the empire, ſomebody muſt ſuffer cold or hunger: the produce of the lands not being more than ſufficient, with culture, to maintain the inhabitants; and therefore, though the idle perſon may ſhift off the want from himſelf, yet it muſt in the end fall ſomewhere. The court alſo of Areopagus at

Idolatry
Jears.

Athens punished idlers, and exerted a right of examining every citizen in what manner he spent his time; the intention of which was, that the Athenians, knowing they were to give an account of their occupations, should follow only such as were laudable, and that there might be no room left for such as lived by unlawful arts. The civil law expelled all sturdy vagrants from the city: and, in our own law, all idle persons or vagabonds, whom our ancient statutes describe to be "such as wake on the night, and sleep on the day, and haunt customable taverns, and ale-houses, and routs about; and no man wot from whence they come, ne whether they go;" or such as are more particularly described by statute 17 Geo. II. c. 5. and divided into three classes, *idle* and *disorderly* persons, *rogues* and *vagabonds*, and *incorrigible rogues*;—all these are offenders against the good order, and blemishes in the government, of any kingdom. They are therefore all punished, by the statute last mentioned; that is to say, idle and disorderly persons with one month's imprisonment in the house of correction; rogues and vagabonds with whipping, and imprisonment not exceeding six months; and incorrigible rogues with the like discipline, and confinement not exceeding two years: the breach and escape from which confinement in one of an inferior class, ranks him among incorrigible rogues; and in a rogue (before incorrigible) makes him a felon, and liable to be transported for seven years. Persons harbouring vagrants are liable to a fine of forty shillings, and to pay all expences brought upon the parish thereby: in the same manner as, by our ancient laws, whoever harboured any stranger for more than two nights, was answerable to the public for any offence that such his inmate might commit.

IDOL, in pagan theology, an image, or fancied representation of any of the heathen gods.—This image, of whatever materials it consisted, was, by certain ceremonies called *consecration*, converted into a god. While under the artificer's hands, it was only a mere statue. Three things were necessary to turn it into a god; proper ornaments, consecration, and oration. The ornaments were various, and wholly designed to blind the eyes of the ignorant and stupid multitude, who are chiefly taken with shew and pageantry. Then followed the consecration and oration, which were performed with great solemnity among the Romans.

IDOLATRY, or the worship of idols, may be distinguished into two sorts. By the first, men adore the works of God, the sun, the moon, the stars, angels, dæmons, men and animals: by the second, men worship the work of their own hands, as statues, pictures, and the like: and to these may be added a third, that by which men have worshipped the true God under sensible figures and representations. This indeed may have been the case with respect to each of the above kinds of idolatry; and thus the Israelites adored God under the figure of a calf.

The stars were the first objects of idolatrous worship, on account of their beauty, their influence on the productions of the earth, and the regularity of their motions, particularly the sun and moon, which are considered as the most glorious and resplendent images of the Deity: afterwards, as their sentiments became more corrupted, they began to form images, and to entertain the opinion, that by virtue of consecration, the gods were called down to inhabit or dwell in their statues. Hence Arnobius takes occasion to rally the pagans for guarding so carefully the statues of their gods, who, if they were really present in their images, might save their worshippers the trouble of securing them from thieves and robbers.

As to the adoration which the ancient pagans paid to the statues of their gods, it is certain, that the wiser and more sensible heathens considered them only as simple representations or figures designed to recal to their minds the memory of their gods. This was the opinion of Varro and Seneca: and the same sentiment is clearly laid down in Plato, who maintains, that images are inanimate, and that all the honour paid to them has respect to the gods whom they represent. But as to the vulgar, they were stupid enough to believe the statues themselves to be gods, and to pay divine worship to stocks and stones.

Soon after the flood, idolatry seems to have been the prevailing religion of all the world; for wherever we cast our eyes at the time of Abraham, we scarcely see any thing but false worship and idolatry. And it appears from Scripture, that Abraham's forefathers, and even Abraham himself, were for a time idolaters.

The Hebrews were indeed expressly forbidden to make any representation of God; they were not so much as to look upon an idol: and from the time of the Maccabees to the destruction of Jerusalem, the Jews extended this precept to the making the figure of any man: by the law of Moses, they were obliged to destroy all the images they found, and were forbidden to apply any of the gold or silver to their own use, that no one might receive the least profit from any thing belonging to an idol. Of this the Jews, after they had smarted for their idolatry, were so sensible, that they thought it unlawful to use any vessel that had been employed in sacrificing to a false god, to warm themselves with the wood of a grove after it was cut down, or to shelter themselves under its shade.

But the preaching of the Christian religion, wherever it prevailed, entirely rooted out idolatry; as did also that of Mahomet, which is built on the worship of one God. It must not, however, be forgotten, that the Protestant Christians charge those of the church of Rome with paying an idolatrous kind of worship to the pictures or images of saints and martyrs: before these, they burn lamps and wax-candles; before these, they burn incense, and, kneeling, offer up their vows and petitions: they, like the Pagans, believe that the saint to whom the image is dedicated, presides in a particular manner about its shrine, and works miracles by the intervention of its image; and that if the image was destroyed or taken away, the saint would no longer perform any miracle in that place.

IDYLLION, in ancient poetry, is only a diminutive of the word EIDOS, and properly signifies any poem of moderate extent, without considering the subject. But as the collection of Theocritus's poems were called *idyllia*, and the pastoral pieces being by far the best in that collection, the term *idyllion* seems to be now appropriated to pastoral pieces.

JEARS, or GEERS, in the sea-language, an assemblage

Jebuſæi || Jeffreys.

blage of tackles, by which the lower yards of a ſhip are hoiſted along the maſt to their uſual ſtation, or lowered from thence as occaſion requires; the former of which operations is called *ſwaying*, and the latter *ſtriking*.

JEBUSÆI, one of the ſeven ancient people of Canaan, deſcendants of Jebuſi, Canaan's ſon; ſo warlike and brave, as to have ſtood their ground, eſpecially in Jebus, afterwards called *Jeruſalem*, down to the time of David. Judges i. 21. 1 Sam. v. 6.

JEDBURGH, a town of Scotland, capital of Tiviotdale or Roxburghſhire. It is well-built and populous, with a handſome church and town-hall, and a good market for corn and cattle. It gives the title of *lord* to the marquis of Lothian's eldeſt ſon, and is the ſeat of the ſheriff's court and preſbytery.

JEDDO, the capital town or city of the iſlands of Japan, where the emperor reſides. It is open on all ſides, having neither walls nor ramparts; and the houſes are built with earth, and boarded on the outſide to prevent the rain from deſtroying the walls. In every ſtreet there is an iron gate, which is ſhut up in the night; and a kind of cuſtom-houſe or magazine, to put merchandizes in. It is a large place, being nine miles in length and ſix in breadth, and contains 1,000,000 of inhabitants. A fire happened in 1658, which, in the ſpace of 48 hours, burnt down 100,000 houſes, and in which a vaſt number of the inhabitants periſhed. The emperor's palace and all the reſt were reduced to aſhes; but they are all rebuilt again. The royal palace is in the middle of the town; and is defended with walls, ditches, towers, and baſtions. Where the emperor reſides, there are three towers nine ſtories high, each covered with plates of gold; and the hall of audience is ſaid to be ſupported by pillars of maſſy gold. Near the palace are ſeveral others, where the relations of the emperor live. The empreſs has a palace of her own, and there are 20 ſmall ones for the concubines. Beſides, all the vaſſal kings have each a palace in the city, with a handſome garden, and ſtables for 2000 horſes. The houſes of the common ſort are nothing but a ground-floor, and the rooms are parted by folding-ſcreens; ſo that they can make the rooms larger or ſmaller at pleaſure. It is ſeated in an agreeable plain, at the bottom of a fine bay; and the river which croſſes it, is divided into ſeveral canals. E. Long. 140. 0. N. Lat. 35. 32.

JEFFERY. See GEOFFREY.

JEFFREYS (lord George), baron Wem, commonly called *Judge Jeffreys*, was the ſixth ſon of John Jeffreys, Eſq; of Acton in Denbighſhire; and was educated at Weſtminſter-ſchool, whence he removed to the Inner Temple, where he applied himſelf to the ſtudy of the law. Alderman Jeffreys, who was probably related to him, introduced him among the citizens of London; and he being a merry bottle-companion, ſoon came into great buſineſs, and was choſen their recorder. He was afterwards choſen ſolicitor to the duke of York; and in 1680 was knighted, and made chief-juſtice of Cheſter. At length, reſigning the recorderſhip, he obtained the poſt of chief-juſtice of the king's-bench, and, ſoon after the acceſſion of James II. the great ſeal. During the reign of king Charles II. he ſhewed himſelf a bitter enemy to thoſe diſſenting miniſters who, in that time of perſecution, were tried by him: he was one of the greateſt adviſers and promoters of all the oppreſſions and arbitrary meaſures carried on in the reign of James II.; and his ſanguinary and inhuman proceedings againſt Monmouth's unhappy adherents in the weſt will ever render his name infamous. Whenever the priſoner was of a different party, or he could pleaſe the court by condemning him, inſtead of appearing according to the duty of his office, as his counſel, he would ſcarce allow him to ſpeak for himſelf; but would load him with the groſſeſt and moſt vulgar abuſe, browbeat, inſult, and turn to ridicule the witneſſes that ſpoke in his behalf; and even threaten the jury with fines and impriſonment, if they made the leaſt heſitation about bringing in the priſoner guilty. Yet it is ſaid, that when he was in temper, and matters perfectly indifferent came before him, no one became a ſeat of juſtice better. Nay, it even appears, that, when he was under no ſtate-influence, he was ſometimes inclined to protect the natural and civil rights of mankind, of which the following inſtance has been given:—The mayor and aldermen of Briſtol had been uſed to tranſport convicted criminals to the American plantations, and ſell them by way of trade. This turning to good account, when any pilferers or petty rogues were brought before them, they threatened them with hanging; and then ſome officers who attended, earneſtly perſuaded the ignorant intimidated creatures to beg for tranſportation, as the only way to ſave them; and in general their advice was followed. Then, without more form, each alderman in courſe took one, and ſold him for his own benefit; and ſometimes warm diſputes aroſe between them about the next turn. This infamous trade, which had been carried on many years, coming to the knowledge of the lord chief juſtice, he made the mayor deſcend from the bench, and ſtand at the bar in his ſcarlet and furr, with his guilty brethren the aldermen, and plead as common criminals. He then obliged them to give ſecurities to anſwer informations; but the proceedings were ſtopped by the Revolution. Jeffreys.

However, the brutality Jeffreys commonly ſhewed on the bench, where his voice and viſage were equally terrible, at length expoſed him to a ſevere mortification. A ſcrivener of Wapping having a cauſe before him, one of the opponent's counſel ſaid he was a ſtrange fellow, and ſometimes went to church, and ſometimes to conventicles; and it was thought he was a trimmer. At this the chancellor fired: "A trimmer? (ſaid he); I have heard much of that monſter, but never ſaw one. Come forth, Mr Trimmer, and let me ſee your ſhape." He then treated the poor fellow ſo roughly, that, on his leaving the hall, he declared he would not undergo the terrors of that man's face again to ſave his life, and he ſhould certainly retain the frightful impreſſions of it as long as he lived. Soon after, the prince of Orange coming, the lord-chancellor, dreading the public reſentment, diſguiſed himſelf in a ſeaman's dreſs, in order to leave the kingdom; and was drinking in a cellar, when this ſcrivener coming into the cellar, and ſeeing again the face which had filled him with ſuch horror, ſtarted; on which, Jeffreys, fearing he was known, feigned a cough, and turned to the wall with his pot of beer in his hand.

But

Jehovah ‖ Jenkins.

But Mr Trimmer going out, gave notice that he was there; and the mob rushing in, seized him, and carried him before the lord-mayor, who sent him with a strong guard to the lords of the council, by whom he was committed to the Tower, where he died in 1689. — It is remarkable, that the late countess of Pomfret met with very rude insults from the populace on the western road, only because she was grand-daughter of the inhuman Jeffries.

JEHOVAH, one of the scripture-names of God, signifying the Being who is self-existent and gives existence to others.

So great a veneration had the Jews for this name, that they left off the custom of pronouncing it, whereby its true pronunciation was forgotten. They call it *tetragrammaton*, or "the name with four letters;" and believe, that whoever knows the true pronunciation of it cannot fail to be heard by God.

JEJUNUM, in anatomy, the name of one of the small intestines. See ANATOMY, n° 354, g.

JELLY. See GELLY; and CHEMISTRY, n° 521.

JEMTERLAND, a province of Sweden, bounded on the north by Angermania, on the east by Medalpadia, on the south by Helsingia, and on the west by Norway. It is full of mountains; and the principal towns are Reffundt, Lich, and Docra.

JENA, a strong town of Germany, in the circle of Upper Saxony, and in Thuringia, with an university. It is seated on the the river Sala, in E. Long. 2. 59. N. Lat. 51. 0.

JENCAPORE, a town of Asia, in Indostan, and in the dominions of the Great Mogul, capital of a territory of the same name. It is seated on the river Chaul, in E. Long. 76. 25. N. Lat. 30. 30.

JENISA, a river of the Russian empire, that runs from north to south through Siberia, and falls into the Frozen Ocean.

JENISKOI, a town of the Russian empire, in Siberia, seated on the river Jenisa. It is large, populous, and pretty strong; and there are villages for several miles round it. It is subject to the Tunguslians, who are pagans, and chiefly live on the above river. They pay a tribute to the emperor for every bow, reckoning a man and a woman for one. The climate is extremely cold; and no other fruits grow there but black and red currants, strawberries, and gooseberries. Corn, butchers meat, and wild fowls, are very cheap. E. Lon. 86. 25. N. Lat. 58. 40.

JENCOPING, a town of Sweden, in the province of Smaland, seated on the south side of the lake Werter, with a strong citadel. The houses are all built with wood. E. Long. 14. 20. N. Lat. 57. 22.

JENKIN (Robert), a learned English divine in the 18th century, was bred at Cambridge, became master of St John's college, and wrote several books much esteemed, *viz.* 1. An historical examination of the authority of General Councils, 4to. 2. The reasonableness and certainty of the Christian religion, 2 vols 8vo. 3. *Defensio S. Augustini.* This book is written against M. Le Clerc. 4. Remarks on some books lately published, *viz.* Mr Whiston's eight sermons, Locke's paraphrase, &c. 5. A translation from the French of the life of Apollonius Tyaneus.

JENKINS (Henry). See LONGEVITY.

JENKINS (Sir Leoline), a learned civilian and able statesman of the last century, born in Glamorganshire about the year 1623. Being rendered obnoxious to the parliament during the civil war by adhering to the king's cause, he consulted his safety by flight; but returning on the restoration, he was admitted an advocate in the court of arches, and succeeded Dr Exton as judge. When the queen-mother Henrietta died in 1669 at Paris, her whole estate, real and personal, was claimed by her nephew Lewis XIV.: upon which Dr Jenkins's opinion being called for and approved, he went to Paris, with three others joined with him in a commission, and recovered her effects; for which he received the honour of knighthood. He officiated as one of the mediators at the treaty of Nimeguen, in which tedious negociation he was engaged about four years and a half; and was afterwards made a privy-counsellor and secretary of state. He died in 1685; and as he never married, bequeathed his whole estate to charitable uses: he was so great a benefactor to Jesus-college Oxford, that he is generally looked on as the second founder. All his letters and papers were collected and printed in 1724, in 2 vols folio.

Jenkins ‖ Jeremiah.

JENNY-WREN, a name given by writers on song-birds to the wren. See WREN.

JEOFAILE, (compounded of three French words, *J'ay faille*, "I have failed"), a term in law, used for an oversight in pleading or other proceedings at law.

The shewing of these defects or oversights was formerly often practised by the counsel; and when the jury came into court in order to try the issue, they said, This inquest you ought not to take; and after verdict they would say to the court, To judgment you ought not to go. But several statutes have been made to avoid the delays occasioned by such suggestions; and a judgment is not to be stayed after verdict for mistaking the Christian or surname of either of the parties, or in a sum of money, or in the day, month, year, &c. where the same are rightly named in any preceding record.

JEREMIAH (*the Prophecy of*), a canonical book of the Old Testament. This divine writer was of the race of the priests, the son of Hilkia of Anathoth, of the tribe of Benjamin. He was called to the prophetic office when very young, about the 13th year of Josiah, and continued in the discharge of it about 40 years. He was not carried captive to Babylon with the other Jews, but remained in Judea to lament the desolation of his country. He was afterwards a prisoner in Egypt with his disciple Baruch, where it is supposed he died in a very advanced age. Some of the Christian fathers tell us he was stoned to death by the Jews, for preaching against their idolatry; and some say he was put to death by Pharaoh Hophrah, because of his prophecy against him. Part of the prophecy of Jeremiah relates to the time after the captivity of Israel, and before that of Judah, from the first chapter to the 44th; and part of it was in the time of the latter captivity, from the 44th chapter to the end. The prophet lays open the sins of Judah with great freedom and boldness, and reminds them of the severe judgments which had befallen the ten tribes for the same offences. He passionately laments their misfortune, and recommends a speedy reformation to them. Afterwards he predicts the grievous calamities that were approaching, particularly the 70 years captivity in Chaldea. He like-

Jericho || Jerome.

wise foretells their deliverance and happy return, and the recompence which Babylon, Moab, and other enemies of the Jews, ſhould meet with in due time. There are likewiſe ſeveral intimations in this prophecy concerning the kingdom of the Meſſiah; alſo ſeveral remarkable viſions, and types, and hiſtorical paſſages relating to thoſe times. The 52d chapter does not belong to the prophecy of Jeremiah, which probably was added by Ezra, and contains a narrative of the taking of Jeruſalem, and of what happened during the captivity of the Jews, to the death of Jechonias. St Jerom has obſerved upon this prophet, that his ſtyle is more eaſy than that of Iſaiah and Hoſea; that he retains ſomething of the ruſticity of the village where he was born; but that he is very learned and majeſtic, and equal to thoſe two prophets in the ſenſe of his prophecy.

JERICHO, or HIERICHUS, (anc. geog.) a city of Judea; ſituated between Jordan and Jeruſalem, at the diſtance of 150 ſtadia from the latter, and 60 from the former. Joſephus ſays the whole ſpace from Jeruſalem is deſart and rocky, and equally barren and uncultivated from Jericho to the lake Aſphaltites; yet the places near the town and above it are extremely fertile and delicious, ſo that it may be juſtly called a *divine plain*, ſurpaſſing the reſt of the land of Canaan, no unfruitful country, and ſurrounded by hills in the manner of an amphitheatre. It produces opobalſamum, myrobalans, and dates; from the laſt of which it is called the *city of palm-trees*, by Moſes.

JERIMOTH. See JARIMUTH.

JEROME (St), in Latin *Hieronymus*, a famous doctor of the church, and the moſt learned of all the Latin fathers, was the ſon of Euſebius; and was born at Stridon, a city of the ancient Pannonia, about the year 340. He ſtudied at Rome under Donatus, the learned grammarian. After having received baptiſm, he went into Gaul, and there tranſcribed St Hilary's book *de Synodis*. He then went into Aquileia, where he contracted a friendſhip with Heliodorus, who prevailed on him to travel with him into Thrace, Pontus, Bithynia, Galatia, and Cappadocia. In 372 St Jerome retired into a deſart in Syria, where he was perſecuted by the orthodox of Melitius's party, for being a Sabellian, becauſe he made uſe of the word *Hypoſtaſis*, which had been uſed by the council of Rome in 369. This obliged him to go to Jeruſalem; where he applied himſelf to the ſtudy of the Hebrew language, in order to receive a more perfect knowledge of the Holy Scriptures; and about this time he conſented to be ordained, on condition that he ſhould not be confined to any particular church. In 381, he went to Conſtantinople to hear St Gregory of Nazianzen; and the following year returned to Rome, where he was made ſecretary to pope Damaſus. He then inſtructed many Roman ladies in piety and the knowledge of the ſciences, which expoſed him to the calumnies of thoſe whom he zealouſly reproved for their irregularities; and pope Siricius not having all the eſteem for him which his learning and virtue juſtly entitled him to, this learned doctor left Rome, and returned to the monaſtery of Bethlehem, where he employed himſelf in writing againſt thoſe whom he called *heretics*, eſpecially againſt Vigilantius and Jovinian. He had a quarrel with John of Jeruſalem, and Ruſinus, about the Origeniſts. He was the firſt who wrote againſt Pelagius; and died on the 30th of September, 420, at about 80 years of age. There have been ſeveral editions of his works; the laſt, which is that of Verona, is in 11 vols folio. His principal works are, 1. A Latin verſion of the Holy Scriptures, diſtinguiſhed by the name of the *Vulgate*. 2. Commentaries on the Prophets, Eccleſiaſtes, St Matthew's Goſpel, and the Epiſtle to the Galatians, Epheſians, Titus, and Philemon. 3. Polemical treatiſes againſt Montanus, Helvidius, Jovinian, Vigilantius, and Pelagius. 4. Several letters. 5. A treatiſe on the lives and writings of the eccleſiaſtical authors who had flouriſhed before his time.—St Jerome's ſtyle is lively and animated, and ſometimes ſublime. Jerome, Jerſey.

JEROME *of Prague*, ſo called from the place of his birth, in Bohemia. He was neither a monk nor clergyman, but had a learned education. Having embraced the opinions of John Huſs, he began to propagate them in the year 1480. In the mean time the council of Nice kept a watchful eye over him, and conſidering him as a dangerous perſon, cited him to appear before them and give an account of his faith. In obedience to this citation, he went to Conſtance; but on his arrival, in 1415, finding Huſs in priſon, he ſet out for his own country. Being ſeized however on the way, impriſoned, and examined, he was ſo intimidated, that he retracted, and pretended to approve of the condemnation of Wickliff's and Huſs's opinions; but on the 26th of May, 1416, he condemned that recantation in theſe terms: "I am not aſhamed to confeſs here publicly my weakneſs. Yes, with horror I confeſs my baſe cowardice. It was only the dread of the puniſhment by fire which drew me to conſent, againſt my conſcience, to the condemnation of the doctrine of Wickliff and Huſs." Accordingly ſentence was paſſed on him; in purſuance of which he was delivered to the ſecular arm, and burnt in 1416. He was a perſon of great parts, learning, and elocution.

JERSEY, an iſland in the Engliſh channel, believed to be the iſland called in the Itinerary *Cæſarea*, in ſucceeding times *Augia*, by us *Gerſey*, more frequently *Jerſey*. It is ſituated 25 leagues ſouth from the continent of Britain; five leagues weſt from Cape Carteret in Normandy; three leagues ſouth from Sarke; ſeven leagues, according to the common computation, ſouth-eaſt from Guernſey, but in reality not ſo much; and nine leagues ſouth from Alderney. It is of an oblong figure, meaſuring 12 miles from weſt to eaſt, and ſix from north to ſouth; in circumference between 35 and 36; and, in point of extent, nearly equal to, or rather ſomewhat larger than, Guernſey: elevated like that; but on the oppoſite ſide declining from ſouth to north, the cliffs on that ſide which looks towards Guernſey being 40 or 50 fathom in height, whereas on the ſouth it is in a manner level with the ſea. Hence the diſtance between St Peter's and St Hellier's is really ſeven leagues, though the iſlands have not above four leagues of ſea between them. The people of Jerſey think, that from this elevation, they have a great advantage in point of climate: that their ſummers are warmer, and that their corn and fruits ripen better. The country is beautifully diverſified with little hills, warm valleys, and, towards the ſea, with pleaſant plains. The ſoil alſo varies very much; in ſome places gravelly, in others ſandy: but the greateſt part is a deep, rich, fertile mould; and there is hardly any part of the iſland that

Jerſey. that can be ſtyled barren. It is alſo thought to be better watered than Guernſey, abounding every where with rills, rivulets, and living ſprings; ſo that there are between 30 and 40 corn-mills driven by water, excluſive of ſeven fulling, and ſeveral windmills. The produce of this iſland is much the ſame with that of Guernſey; their paſture is ſo ſweet, that no country in Europe can boaſt of richer milk or finer butter; and they have grain of all kinds, and particularly a ſort of wheat called *froment-tremais*, from its being ſown in the latter end of May, and reaped in the beginning of Auguſt. But what chiefly diſtinguiſhes this iſland at preſent, is its orchards; which are very well fenced, regularly planted, and yield commonly immenſe quantities of fruit. Jerſey.

On the ſouth of the iſland the ſea ſeems to have encroached upon the land, (which, as we have before obſerved, declines on that ſide), and to have ſwallowed upwards of ſix ſquare miles, making a very beautiful bay of between two and three miles broad, and near the ſame in depth. In the eaſt corner of this bay ſtands the town of St Hellier, very happily ſituated, having a proſpect open to the ſea and Mount Eliſabeth Caſtle (which, ſince it was repaired and the works augmented in the reign of Charles II. entirely occupies a rocky iſle, which the ſea, when it devoured the ſoil, could not digeſt), covered with hills to the north, with meadows between them and the town, through which runs a copious and delightful ſtream that waters the place as well as can be wiſhed. The ſtreets are open and well-built, with a handſome ſquare in the centre, and well accommodated in point of markets, and every thing that can contribute to the convenience of the inhabitants, of whom there may be about 2000. There has been of late years a pier raiſed; which is a great advantage to the port, and of courſe not a little to the benefit of the town. But the principal haven is on the other ſide, in the weſtern corner of the bay, which receives its name from it, being called *St Aubin's*. It is about half the ſize of St Hellier, chiefly occupied by merchants and maſters of ſhips; and moſt of the buildings being new, make a very neat and elegant figure. A little to the eaſtward of the town a rock riſes up in the ſea, upon which the fort of St Aubin is erected; to which the inhabitants having joined a ſtrong, well-built pier, their haven is now equally ſecured againſt the fury of the winds, and the inſults of an enemy. Within the pier, a ſixth-rate juſt floats at a dead neap, and a veſſel of 200 tons at all times; but ſhips of ſuperior ſize muſt lie without, in the road, where there is good anchoring; and the whole bay being a fine, clean, hard ſand, renders the intercourſe between the two towns, which are about three miles diſtant, perfectly eaſy. There are, beſides theſe, ſeveral other havens of leſs note; as, St Brelade's Bay, at the back of St Aubin's; the great bay of St Ouen, which takes in the greateſt part of the weſt ſide of the iſland, where the largeſt ſhips may ride in 12 and 15 fathom, ſafe from all but eaſt winds. La Crevaſſe is a port only for boats; Greve de Lecq and port St John are alſo ſmall havens on the north ſide, where is likewiſe Bonnenuit. On the eaſt there is the bay of St Catherine, and the harbour of Roſel; to the ſouth of which lies the famous Mount Orgueil Caſtle, formerly Caſtle Gourray, upon a ſolid rock, which was entirely covered with its out-works; once the glory of this iſle, and ſtill majeſtic though in decay. To the ſouth-weſt lies the haven de la Chauſſée. The laſt we ſhall mention is the port de Pas, a very little to the eaſtward of St Aubin's bay. All theſe are covered with breaſt-works, well defended by cannon.

The ſtate of things and the occupations of the people are very much changed from what they were a century paſt, or a very little more. The country then was in a manner altogether arable or paſture, and the people in general applied themſelves to agriculture: whereas now every houſe has its orchards; and theſe orchards are ſo fenced with ſtrong and thick mounds of earth and ſtone, frequently ſurmounted by hedges, and ſometimes by trees, that it has been thought, not by tranſient ſpectators, but even on reflection affirmed by the moſt competent judges, theſe incloſures, together with larger or leſſer roads, take up not leſs than a third part of the ſurface of the iſland; and they have ſuch an abundance of fruit, that it is believed in a good year they make between 20,000 and 30,000 hogſheads of cyder; and if we conſider that this is the common drink of the inhabitants, we may eaſily acquieſce in the account. Their great manufacture is the ſame with that of Guernſey, the working up of their own wool, and that which by two acts of parliament they are allowed to import from England, which is 4000 tods; and ſome ſay that 10,000 pair of ſtockings, of all ſorts and ſizes, are brought weekly to the market of St Hellier. In ancient times they depended greatly upon their fiſhery, in which they are much inferior at preſent to Guernſey: but whereas they had formerly larger ſhips, and a greater ſhare of commerce, that is now in the hands of the people of Jerſey, who ſend annually 30 ſtout ſhips to the Newfoundland fiſhery; and in time of peace, great quantities of tobacco are ſmuggled from thence into France. For the defence of the iſland they have two troops of horſe, five regiments of infantry, and a fine train of artillery, excluſive of what is in their ſeveral caſtles, and on the redoubts and breaſt-works upon their coaſts, amounting in the whole to 115 18-pounders, given by King William to the iſland in 1692. There are always regular troops in Elizabeth Caſtle and in Fort St Aubin; and in time of war, they have commonly a body of forces from England. The whole number of inhabitants is computed at about 25,000, all of whom are (except a very few) natives of the place.

The iſland of Jerſey, with thoſe of Guernſey, Sark, Alderney, and their appendages, were parcel of the duchy of Normandy, and were united to the crown of England by the firſt princes of the Norman line. They are governed by their own laws, which are for the moſt part the ducal cuſtoms of Normandy, being collected in an ancient book of cuſtoms intitled *Le grand couſtumier*. The king's writ, or proceſs from the courts of Weſtminſter, is here of no force; but his commiſſion is. They are not bound by any common acts of our parliaments, unleſs particularly named. All cauſes are originally determined by their own officers, the bailiffs and jurats of the iſlands. But an appeal lies from them to the king and counſel in the laſt reſort.

New JERSEY, or, as it is commonly called, *the Jerſeys* (being two provinces united into one govern-

Jerſey, Jeruſalem.

ment), one of the Britiſh colonies in North America. They lie from 39 to 41 degrees of north latitude, and from 74 to 75 degrees 30 minutes longitude weſt from London. In length 150 miles, in breadth in ſome places about 100. Bounded on the north by New York, on the eaſt by the Atlantic, on the ſouth by Delawar Bay, on the weſt by Penſylvania. This ſituation, and their having on all ſides either the ſea or cultivated countries, accounts for the mildneſs of the climate, which is equally ſerene and pleaſant. The ſoil is almoſt every-where deep and fertile, producing vaſt quantities of excellent wheat and all other kinds of grain in abundance, a variety of rich fruits, fine timber-trees fit for building, and prodigious quantities of cattle of all ſorts. Abounding alſo in copper and iron ores, which are very rich. The inhabitants live here much at their eaſe, and with little labour, enjoying not only all the neceſſaries but moſt of the conveniencies of life, from whence this country hath not been improperly ſtyled the *Garden of America*. It is a royal government, the governor being aſſiſted by a council of 12 which compoſe the upper houſe, as the repreſentatives of the people do the lower houſe of aſſembly, and are in number 24. In Eaſt Jerſey, the capital is Perth Amboy, which hath a fine port, notwithſtanding which Elizabeth-Town is much larger. In Weſt Jerſey they have two ports, Burlington and Salem. The commodities of the Jerſeys are the ſame with thoſe of New York, and the number of inhabitants is ſaid to be 60,000.

The duke of York, as proprietor of the province laſt mentioned, by a deed, dated the 24th of June 1664, granted the ſouthern part of it to Sir George Carteret and Lord Berkeley of Stratton, which part was called *New Jerſey*. Ten years after this the two lords proprietors, with the conſent of the duke, divided this country into Eaſt Jerſey under Sir George Carteret, and Weſt Jerſey under Lord Berkeley. The duke of York, notwithſtanding this, reſumed for a ſhort ſpace the government of Weſt Jerſey; but by a new deed, in the year 1680, revived and confirmed the former diviſion, by which Weſt Jerſey was reſtored to lord Berkeley. Theſe proprietors afterwards aſſigned their rights to others; and the inhabitants frequently falling out with the governors they ſent over, and the aſſignees of the original proprietors diſagreeing amongſt themſelves, the latter, by a ſolemn act, April 17th, 1702, reſigned both provinces to the queen, reſerving however the property in the ſoil, &c. Since this period it hath been a royal government, though ſometimes the ſame perſon hath been governor of New York and the Jerſeys. The exports, 1769, amounted to no more than 2531 l. all for the Britiſh or foreign Weſt Indies. In 1770, there were entered inwards two ſhips and 41 ſloops; cleared outwards two ſhips and 47 ſloops.

JERUSALEM, a very famous and ancient city, capital of Judea or Paleſtine, now a province of Turky in Aſia. According to Manetho, an Egyptian hiſtorian, it was founded by the ſhepherds who invaded Egypt in an unknown period of antiquity †. According to Joſephus, it was the capital of Melchiſedek's kingdom, called *Salem* in the book of Geneſis: and the Arabians aſſert, that it was built in honour of Melchiſedek by 12 neighbouring kings; which when they had done, he called it *Jeruſalem*. We know nothing of it with certainty, however, till the time of king David, who took it from the Jebuſites, and made it the capital of his kingdom, which it ever after continued to be. It was firſt taken in the days of Jehoaſh, by Hazael the king of Syria, who ſlew all the nobility, but did not deſtroy their city. It was afterwards taken by Nebuchadnezzar king of Babylon, who deſtroyed it, and carried away the inhabitants. Seventy years after, permiſſion was granted by Cyrus king of Perſia to the Jews to rebuild their city, which was done; and it continued the capital of Judæa, (though frequently ſuffering much from the Grecian monarchs of Syria and Egypt,) till the time of Veſpaſian emperor of Rome, by whoſe ſon Titus it was totally deſtroyed *. It was, however, rebuilt by Adrian; and ſeemed likely to have recovered its former grandeur, being ſurrounded with walls, and adorned with ſeveral noble buildings; the Chriſtians alſo being permitted to ſettle in it. But this was a ſhort-lived change; ſo that when the empreſs Helena, mother of Conſtantine the Great, came to viſit this city, ſhe found it in the moſt forlorn and ruinous ſituation. Having formed a deſign of reſtoring it to its ancient luſtre, ſhe cauſed, with a great deal of coſt and labour, all the rubbiſh that had been thrown upon thoſe places where our Saviour had ſuffered, been buried, &c. to be removed. In doing this, they found the croſs on which he died, as well as thoſe of the two malefactors who ſuffered with him; and, as the writers of thoſe times relate, diſcovered by a miracle that which had borne the Saviour of mankind. She then cauſed a magnificent church to be built, which incloſed as many of the ſcenes of our Saviour's ſufferings as could conveniently be done, and adorned the city with ſeveral other buildings. The emperor Julian is ſaid to have formed a deſign of rebuilding the temple of Jeruſalem, and of reſtoring the Jewiſh worſhip. This ſcheme was contrived on purpoſe to give the lie to our Saviour's prophecy concerning the temple and city of Jeruſalem, namely, that the firſt ſhould be totally deſtroyed, without one ſtone being left upon another; and that Jeruſalem ſhould be trodden down of the Gentiles till the times of the Gentiles were fulfilled. In this attempt, however, according to the accounts of the Chriſtian writers of that age, the emperor was fruſtrated by an earthquake and fiery eruption from the earth, which totally deſtroyed the work, conſumed the materials which had been collected, and killed a great number of the workmen.

This event hath been the ſubject of much diſpute. Mr Warburton, who hath publiſhed a treatiſe expreſsly on the truth of this fact, hath collected the following teſtimonies in favour of it. The firſt is that of Ammianus Marcellinus, who tells us, "Julian (having been already thrice conſul) taking Salluſt, prefect of the ſeveral Gauls, for his colleague, entered a fourth time on this high magiſtracy; and although his ſenſibility of the many and great events which this year was likely to produce made him very anxious for the future, yet he both puſhed on the various and complicated preparatives for this expedition with the utmoſt application, and, having an eye in every quarter, and being deſirous to eternize his reign by the greatneſs of his atchievements, he projected to rebuild

Jernſalem.

† See *Egypt*, n° 2.

* See *Jews*.

Jeruſalem. rebuild at an immenſe expence the proud and magnificent temple of Jeruſalem; which, (after many combats, attended with much bloodſhed on both ſides, during the ſiege by Veſpaſian) was with great difficulty taken and deſtroyed by Titus. He committed the conduct of this affair to Alypius of Antioch, who had formerly been lieutenant in Britain. When therefore this Alypius had ſet himſelf to the vigorous execution of his charge, in which he had all the aſſiſtance that the governor of the province could afford him, horrible balls of fire breaking out near the foundations, with frequent and reiterated attacks, rendered the place from time to time inacceſſible to the ſcorched and blaſted workmen; and the victorious element continuing, in this manner, obſtinately and reſolutely bent, as it were, to drive them to a diſtance, Alypius thought beſt to give over the enterprize."

The next teſtimony is that of Gregory Nazianzen. Speaking of the emperor Julian, he ſays, "After having run through a courſe of every other tyrannical experiment againſt the faith, and upon trial deſpiſing all of them as trifling and contemptible, he at laſt brought down the whole body of the Jews upon us; whom, for their ancient turn to ſeditious novelties, and an inveterate hatred of the Chriſtian name, he choſe as the fitteſt inſtrument for his machinations. Theſe, under a ſhow of great good-will, which hid his ſecret purpoſe, he endeavoured to convince from their ſacred books and traditions, which he took upon him to interpret, that now was come the time foretold, when they ſhould return to their own land, rebuild their temple, and reſtore the law to its ancient force and ſplendor. When theſe things had been thoroughly inſinuated, and heartily entertained, (for deceit finds eaſy admittance when it flatters our paſſions), the Jews ſet upon the work of rebuilding with great attention, and puſhed on the project with the utmoſt labour and application. But when, now driven from their work by a violent whirlwind and a ſudden earthquake, they fled together for refuge to a certain neighbouring church, (ſome to deprecate the impending miſchief; others, as is natural in ſuch caſes, to catch at any help that preſents itſelf; and others again, inveloped in the crowd, were carried along with the body of thoſe who fled), there are who ſay, the church refuſed them entrance; and that when they came to the doors which were wide open but a moment before, they found them on a ſudden cloſed by a ſecret and inviſible hand; a hand accuſtomed to work theſe wonders by the terror and confuſion of the impious, and for the ſecurity and comfort of godly men. This, however, is now invariably affirmed and believed by all, that as they ſtrove to force their way in by violence, the fire which burſt from the foundations of the temple, met and ſtopped them. One part it burnt and deſtroyed, and another it deſperately maimed, leaving them a living monument of God's commination and wrath againſt ſinners. Thus the affair paſſed; and, let no man continue incredulous concerning this or the other miraculous works of God. But ſtill the thing moſt wonderful and illuſtrious was, a light which appeared in the heavens, of a croſs within a circle. That name and figure which impious men before eſteemed ſo diſhonourable upon earth, was now raiſed on high, and equally objected to the common view of all men; advanced by God himſelf as the trophy of his victory over unbelievers; of all trophies the moſt exalted and ſublime. Nay further, they who were preſent, and partakers of the miracle we are now about to ſpeak of, ſhew to this very day the ſign or figure of the croſs which was then marked or impreſſed upon their garments. For at that time, as theſe men, (whether ſuch as were of us, or ſtrangers) were ſhewing theſe marks, or attending to others who ſhewed them, each preſently obſerved the wonder, either on himſelf or his neighbour; having a radiant mark on his body or on his garment, in which there is ſomething that, in art and elegance, exceeded all painting or embroidery." Jeruſalem.

Notwithſtanding theſe teſtimonies, however, this fact hath been ſtrenuouſly conteſted by others; and indeed it muſt be owned that the teſtimonies above mentioned are by no means unexceptionable. In the laſt particularly, the propenſity to the marvellous is ſo exceedingly great, that every one muſt at firſt ſight be ſtruck with it. It is true indeed, the moſt miraculous part of it, as it ſeemed to be to Gregory, namely, the appearance of croſſes upon the garments and bodies of ſome of the people who were ſtruck, may be explained upon a natural principle; ſince we are aſſured that lightning will ſometimes produce effects of this kind *: but even this is no deciſive proof of the authenticity of the relation; though it cannot by any means diſcredit it, as ſome think. On the whole, however, it is not a matter of any conſequence whether this event happened with the circumſtances abovementioned or not. If Julian did make any attempt to rebuild the temple, it is certain that *ſomething* obſtructed the attempt, becauſe the temple was never actually rebuilt. If he made no ſuch attempt, the prophecy of our Saviour ſtill holds good; and it ſurely cannot be thought to detract from the merit of a prophecy, that no body ever attempted to elude it, or prove it to be a falſehood.

* See *Lightning*.

Jeruſalem continued in the hands of the eaſtern emperors till the reign of the Caliph Omar, who reduced it under his ſubjection. The Saracens continued in poſſeſſion of it till the year 1099, when it was taken by the cruſaders. They founded a new kingdom, of which Jeruſalem was the capital, which laſted 88 years under nine kings. At laſt this kingdom was utterly ruined by Saladin; and though the Chriſtians once more got poſſeſſion of the city, they were again obliged to reliquiſh it. In 1217, the Saracens were expelled by the Turks, who have ever ſince continued in poſſeſſion of it.

The city of Jeruſalem, in its moſt flouriſhing ſtate, was divided into four parts, each incloſed with its own walls; viz. 1. The old city of Jebus, which ſtood on mount Zion, where the prophets dwelt, and where David built a magnificent caſtle and palace, which became the reſidence both of himſelf and ſucceſſors; on which account it was emphatically called, *the city of David*. 2. The lower city, called alſo *the daughter of Zion*, being built after it; on which ſtood the two magnificent palaces which Solomon built for himſelf and his queen; that of the Maccabean princes; and the ſtately amphitheatre built by Herod, capable of containing 80,000 ſpectators; the ſtrong citadel, built

Jerusalem. built by Antiochus, to command and overtop the temple, but afterwards razed by Simon the Maccabee, who recovered the city from the Syrians; and laſtly, a ſecond citadel, built by Herod, upon a high and craggy rock, and called by him *Antonia*. 3. The new city, moſtly inhabited by tradeſmen, artificers, and merchants; and, 4. Mount Moriah, on which was built the ſo famed temple of Solomon, deſcribed in the ſixth and ſeventh chapters of the ſecond book of Kings; and, ſince then, that rebuilt by the Jews on their return from Babylon, and afterwards built almoſt anew and greatly adorned and enriched by Herod.

Some idea of the magnificence of this temple may be had from the following conſiderations. 1. That there were no leſs than 163,300 men employed in the work. 2. That notwithſtanding that prodigious number of hands, it took up ſeven whole years in building. 3. That the height of this building was 120 cubits, or 82 yards, rather more than leſs; and the courts round it about half as high. 4. That the front, on the eaſt ſide, was ſuſtained by ramparts of ſquare ſtone, of vaſt bulk, and built up from the valley below, which laſt was 300 cubits high, and being added to that of the edifice amounted to 420 cubits; to which, if we add, 5. The height of the principal tower above all the reſt, viz. 60, will bring it to 480 cubits, which, reckoning at two feet to a cubit will amount to 960 feet; but, according to the length of that meaſure, as others reckon it, viz. at two feet and an half, it will amount to 1200 feet; a prodigious height this from the ground, and ſuch as might well make Joſephus ſay, that the very deſign of it was ſufficient to have turned the brain of any but Solomon. 6. Theſe ramparts, which were raiſed in this manner, to fill up the prodigious chaſm made by the deep valley below, and to make the area of a ſufficient breadth and length for the edifice, were 1000 cubits in length at the bottom, and 800 at the top, and the breadth of them 100 more. 7. The huge buttreſſes which ſupported the ramparts were of the ſame height, ſquare at the top, and 50 cubits broad, and jutted out 150 cubits at the bottom. 8. The ſtones, of which they were built, were, according to Joſephus, 40 cubits long, 12 thick, and 8 high, all of marble, and ſo exquiſitely joined, that they ſeemed one continued piece, or rather poliſhed rock. 9. According to the ſame Jewiſh hiſtorian, there were 1453 columns of Parian marble, and twice that number of pilaſters; and of ſuch thickneſs, that three men could hardly embrace them, and their height and capitals proportionable, and of the Corinthian order. But it is likely Joſephus hath given us theſe two laſt articles from the temple of Herod, there being nothing like them mentioned by the ſacred hiſtorians, but a great deal about the prodigious cedars of Lebanon uſed in that noble edifice, the excellent workmanſhip of them adapted to their ſeveral ends and deſigns, together with their gildings and other curious ornaments. The only thing more we ſhall venture to add is, what is affirmed in Scripture, that all the materials of this ſtupendous fabric were finiſhed and adapted to their ſeveral ends before they were brought to Jeruſalem, that is, the ſtones in their quarries, and the cedars in Lebanon; ſo that their was no noiſe of ax, hammer, or any tool, heard in the rearing of it.

At preſent Jeruſalem is called by the Turks *Cudſembaric*, and *Coudſheriff*; and is reduced to a poor thinly-inhabited town, about three miles in circumference, ſituated on a rocky mountain, ſurrounded on all ſides, except the north, with ſteep aſcents and deep valleys; and theſe again environed with other hills, at ſome diſtance from them. In the neighbourhood of the city there grow ſome corn, vines, olives, &c. The ſtately church erected by the empreſs Helena, on mount Cavalry, is ſtill ſtanding. It is called the *church of the ſepulchre*; and is kept in good repair by the generous offerings of a conſtant concourſe of pilgrims, who annually reſort to it, as well as by the contributions of ſeveral Chriſtian princes. The walls of this church are of ſtone, and the roof of cedar; the eaſt end incloſes Mount Calvary, and the weſt the holy ſepulchre: the former is covered with a noble cupola, open at top, and ſupported by 16 maſſive columns. Over the high altar, at the eaſt end, is another ſtately dome. The nave of the church conſtitutes the choir; and in the inſide-iſles are ſhewn the places where the moſt remarkable circumſtances of our Saviour's paſſion was tranſacted, together with the tombs of Godfrey and Baldwin, the two firſt Chriſtian kings of Jeruſalem. In the chapel of the crucifixion, is ſhewn the very hole in the rock in which the croſs is ſaid to have been fixed. The altar in this chapel hath three croſſes on it; and is richly adorned, particularly with four lamps of immenſe value that hang before it, and are kept conſtantly burning. At the weſt end is that of the ſepulchre, which is hewn in that form out of the ſolid rock, and hath a ſmall dome ſupported by pillars of porphyry. The cloiſter round the ſepulchre is divided into ſundry chapels, appropriated to the ſeveral ſorts of Chriſtians who reſide there; as Greeks, Armenians, Maronites, Jacobites, Copts, Abyſſines, Georgians, &c. and on the north-weſt ſide of it are the apartments of the Latins, who have the care of the church, and are forced to reſide conſtantly in it; the Turks keeping the keys of it, and not ſuffering any of them to go out, but obliging them to receive their proviſions in at a wicket. At Eaſter there are ſome grand ceremonies performed in the church, repreſenting our Lord's paſſion, crucifixion, death, and reſurrection, at which a vaſt concourſe of pilgrims commonly aſſiſt. For a particular account of them, we refer the reader to doctors Shaw and Pococke. Jeruſalem.

On Mount Moriah, on the ſouth-eaſt part of the city, is an edifice called *Solomon's Temple*, ſtanding on or near the ſame ſpot as the ancient; but when or by whom erected is uncertain. In the midſt of it is a Turkiſh moſque, where the Jewiſh ſanctum ſanctorum is ſuppoſed to have ſtood. The building, which Dr Pococke thinks muſt have been formerly a Chriſtian church, is held in the utmoſt veneration by the Turks.

The city is now under the government of a ſangiac, who reſides in a houſe ſaid to have been that of Pontius Pilate, over-againſt the caſtle of Antonia built by Herod the Great. Many of the churches erected in memory of ſome remarkable goſpel-tranſaction, have been ſince converted into moſques; into ſome of which money will procure admittance, but not into others. Both the friars and other Chriſtians are kept ſo poor by the tyranny of the government, that the chief ſupport

erusalem. port and trade of the place conſiſts in providing ſtrangers with food and other accommodations, and ſelling them beads, relics, and other trinkets, for which they are obliged to pay conſiderable ſums to the ſangiac, as well as to his officers; and thoſe are ſeldom ſo well contented with their uſual duties, but they frequently extort ſome freſh ones, eſpecially from the Franciſcans, whoſe convent is the common receptacle for all pilgrims, and for which they have conſiderable allowances from the pope, and other crowned heads, beſides the preſents which ſtrangers generally make them at their departure. The moſt remarkable antiquities in the neighbourhood of Jeruſalem are, 1. The pools of Betheſda and Gihon; the former 120 paces long, 40 broad, and at leaſt eight deep, but now without water; and the old arches, which it ſtill diſcovers at the weſt end, are quite dammed up: the other, which is about a quarter of a mile without Bethlehem-gate, is a very ſtately relic, 106 paces long, and 60 broad. lined with a wall and plaſter, and ſtill well ſtored with water. 2. The tomb of the Virgin Mary, in the valley of Jehoſhaphat, into which one deſcends by a magnificent flight of 47 ſteps. On the right hand as one goes down, is alſo the ſepulchre of St Ann the mother, and on the left that of Joſeph the huſband, of that virgin-mother: ſome add likewiſe that of Jehoiakim her father. In all theſe are erected altars for prieſts of all ſorts to ſay maſs, and the whole is cut into the ſolid rock. 3. The tomb of king Jehoſhaphat, cut likewiſe into the rock, and divided into ſeveral apartments; in one of which is his tomb, which is adorned with a ſtately portico and entablature over it. 4. That commonly called *Abſalom's pillar* or *place*, as being generally ſuppoſed to be that which he is ſaid to have erected in his life-time to perpetuate his memory, as he had no male-iſſue. The place, however, both within and without, hath more the reſemblance of a ſepulchre than any thing elſe: though we do not read that he was buried there, neither do the people here affirm that he was. There is a great heap of ſtones about it, which is continually increaſing; the ſuperſtitious Jews and Turks always throwing ſome as they paſs, in token of their abhorrence of Abſalom's unnatural rebellion againſt ſo good and holy a parent. The ſtructure itſelf is about 20 cubits ſquare, and 60 high, riſing in a lofty ſquare, adorned below with four columns of the Ionic order, with their capitals, entablatures, &c. to each front. From the height of 20 to 40 cubits, it is ſomewhat leſs, and quite plain, excepting a ſmall fillet at the upper end; and from 40 to the top it changes into a round, which grows gradually into a point, the whole cut out of the ſolid rock. There is a room within, conſiderably higher than the level of the ground without, on the ſides of which are niches, probably to receive coffins. 5. A little eaſtward of this is that called the *tomb of Zechariah*, the ſon of Barachiah, whom the Jews ſlew between the temple and the altar, as is commonly ſuppoſed. This fabric is all cut out of the natural rock, 18 feet high, and as many ſquare; and adorned with Ionic columns on each front, cut out likewiſe of the ſame rock, and ſupporting a cornice. The whole ends in a pointed top, like a diamond. But the moſt curious, grand, and elaborate pieces, in this kind, are the grotts without the walls of Jeruſalem, ſtyled the *royal ſepulchres*; but of what kings is not agreed on. They conſiſt of a great number of apartments, ſome of them ſpacious, all cut out of the ſolid marble rock; and may juſtly be pronounced a royal work, and one of the moſt noble, ſurpriſing, and magnificent. For a particular account of them we muſt refer the reader, for want of room, to Pococke's Travels. In the neighbourhood of Jeruſalem is a ſpot of ground, about 30 yards long and 15 broad, now the burying-place of the Armenians, which is ſhewn as the Aceldama, or Field of Blood, formerly the Potter's Field, and ſince ſtyled *Campo Santto*, or the *Holy Field*, purchaſed with the price of Judas's treaſon, for the burial of ſtrangers. It is walled round, to prevent the Turks abuſing the bones of Chriſtians; and one half of it is taken up by a building in the nature of a charnel-houſe. Beſides the above, a great many other antiquities in the city and its environs are ſhewn to ſtrangers; there being ſcarce any place or tranſaction mentioned either in the Old or New Teſtament, but they ſhew the very ſpot of ground where the one ſtood, and the other was done; not only here, but all over Judæa.

JESI, an ancient town of Italy, in the territory of the church, and in the marca or march of Ancona, with a biſhop's ſee. It is ſeated on a mountain, near a river of the ſame name, in E. Long. 12. 20. N. Lat. 43. 50.

JESSO, Jedso, or *Yadſo*, a large iſland of Aſia to the north of Niphon, and ſaid to be governed by a prince tributary to the empire of Japan; but is very little known to the Europeans, ſo that nothing can be ſaid with certainty concerning it.

JESSES, ribbons that hang down from garlands or crowns in falconry; alſo ſhort ſtraps of leather faſtened to the hawk's legs, and ſo to the vervels.

JESUITS, or *the Society of* Jesus; a famous religious order of the Romiſh church, founded by Ignatius Loyola. See Ignatius.—The plan which this fanatic formed of its conſtitution and laws was ſuggeſted, as he gave out, and as his followers ſtill teach, by the immediate inſpiration of heaven. But notwithſtanding this high pretenſion, his deſign met at firſt with violent oppoſition. The pope, to whom Loyola had applied for the ſanction of his authority to confirm the inſtitution, referred his petition to a committee of cardinals. They repreſented the eſtabliſhment to be unneceſſary as well as dangerous, and Paul refuſed to grant his approbation of it. At laſt, Loyola removed all his ſcruples by an offer which it was impoſſible for any pope to reſiſt. He propoſed, that beſides the three vows of poverty, of chaſtity, and of monaſtic obedience, which are common to all the orders of regulars, the members of his ſociety ſhould take a fourth vow of obedience to the pope, binding themſelves to go whitherſoever he ſhould command for the ſervice of religion, and without requiring any thing from the holy ſee for their ſupport. At a time when the papal authority had received ſuch a ſhock by the revolt of ſo many nations from the Romiſh church; at a time when every part of the popiſh ſyſtem was attacked with ſo much violence and ſucceſs, the acquiſition of a body of men, thus peculiarly devoted to the ſee of Rome, and whom it might ſet in oppoſition to all its enemies, was an object of the higheſt conſequence. Paul inſtantly perceiving this, confirmed the inſtitution of the Jeſuits.

Jeſi || Jeſuits.

I Foundation of the order.

2 Confirmed by the pope, and from what motives.

Jeſuits. ſuits by his bull, granted the moſt ample privileges to the members of the ſociety, and appointed Loyola to be the firſt general of the order. The event hath fully juſtified Paul's diſcernment, in expecting ſuch beneficial conſequences to the ſee of Rome from this inſtitution. In leſs than half a century, the ſociety obtained eſtabliſhments in every country that adhered to the Roman-catholic church: its power and wealth increaſed amazingly; the number of its members became great; their character as well as accompliſhments were ſtill greater; and the Jeſuits were celebrated by the friends and dreaded by the enemies of the Romiſh faith as the moſt able and enterpriſing order in the church.

The conſtitution and laws of the ſociety were perfected by Laynez and Aquaviva, the two generals who ſucceeded Loyola, men far ſuperior to their maſter in abilities and in the ſcience of government. They framed that ſyſtem of profound and artful policy which diſtinguiſhes the order. The large infuſion of fanaticiſm mingled with its regulation ſhould be imputed to Loyola its founder. Many circumſtances concurred in giving a peculiarity of character to the order of Jeſuits, and in forming the members of it not only to take greater part in the affairs of the world than any other body of monks, but to acquire ſuperior influence in the conduct of them.

3 The object of the order ſingular.

The primary object of almoſt all the monaſtic orders is to ſeparate men from the world, and from any concern in its affairs. In the ſolitude and ſilence of the cloiſter, the monk is called to work out his own ſalvation by extraordinary acts of mortification and piety. He is dead to the world, and ought not to mingle in its tranſactions. He can be of no benefit to mankind but by his example and by his prayers. On the contrary, the Jeſuits are taught to conſider themſelves as formed for action. They are choſen ſoldiers, bound to exert themſelves continually in the ſervice of God, and of the pope his vicar on earth. Whatever tends to inſtruct the ignorant, whatever can be of uſe to reclaim or to oppoſe the enemies of the holy ſee, is their proper object. That they may have full leiſure for this active ſervice, they are totally exempted from thoſe functions the performance of which is the chief buſineſs of other monks. They appear in no proceſſions; they practiſe no rigorous auſterities; they do not conſume one half of their time in the repetition of tedious offices: but they are required to attend to all the tranſactions of the world, on account of the influence which theſe may have upon religion; they are directed to ſtudy the diſpoſitions of perſons in high rank, and to cultivate their friendſhip; and by the very conſtitution as well as genius of the order, a ſpirit of action and intrigue is infuſed into all its members.

4 Peculiarities in its policy.

As the object of the ſociety of Jeſuits differed from that of the other monaſtic orders, the diverſity was no leſs in the form of its government. The other orders are to be conſidered as voluntary aſſociations, in which whatever affects the whole body is regulated by the common ſuffrage of all its members. The executive power is veſted in the perſons placed at the head of each convent or of the whole ſociety; the legiſlative authority reſides in the community. Affairs of moment, relating to particular convents, are determined in conventual chapters; ſuch as reſpect the whole order are conſidered in general congregations. But Loyola, full of the ideas of implicit obedience, which he had derived from his military profeſſion, appointed that the government of his order ſhould be purely monarchical. A general, choſen for life by deputies from the ſeveral provinces, poſſeſſed power that was ſupreme and independent, extending to every perſon and to every caſe. He, by his ſole authority, nominated provincials, rectors, and every other officer employed in the government of the ſociety, and could remove them at pleaſure. In him was veſted the ſovereign adminiſtration of the revenues and funds of the order. Every member belonging to it was at his diſpoſal; and by his uncontrolable mandate he could impoſe on them any taſk, or employ them in what ſervice ſoever he pleaſed. To his commands they were required to yield not only outward obedience, but to reſign up to him the inclinations of their own wills and the ſentiments of their own underſtandings. They were to liſten to his injunctions as if they had been uttered by Chriſt himſelf. Under his direction they were to be mere paſſive inſtruments, like clay in the hands of the potter, or like dead carcaſes incapable of reſiſtance. Such a ſingular form of policy could not fail to imprefs its character on all the members of the order, and to give a peculiar force to all its operations. There is not, in the annals of mankind, any example of ſuch a perfect deſpotiſm, exerciſed not over monks ſhut up in the cells of a convent, but over men diſperſed among all the nations of the earth. Jeſuits.

5 Power of the general.

As the conſtitutions of the order veſt in the general ſuch abſolute dominion over all its members, they carefully provide for his being perfectly informed with reſpect to the character and abilities of his ſubjects. Every novice who offers himſelf as a candidate for entering into the order, is obliged to manifeſt his conſcience to the ſuperior, or a perſon appointed by him; and is required to confeſs not only his ſins and defects, but to diſcover the inclinations, the paſſions, and the bent of his ſoul. This manifeſtation muſt be renewed every ſix months. The ſociety, not ſatisfied with penetrating in this manner into the innermoſt receſſes of the heart, directs each member to obſerve the words and actions of the novices: they are conſtituted ſpies upon their conduct, and are bound to diſcloſe every thing of importance concerning them to the ſuperior. In order that this ſcrutiny into their character may be as complete as poſſible, a long noviciate muſt expire, during which they paſs through the ſeveral gradations of ranks in the ſociety; and they muſt have attained the full age of thirty-three years, before they can be admitted to take the final vows, by which they become profeſſed members. By theſe various methods, the ſuperiors, under whoſe immediate inſpection the novices are placed, acquire a thorough knowledge of their diſpoſitions and talents. In order that the general, who is the ſoul that animates and moves the whole ſociety, may have under his eye every thing neceſſary to inform or direct him, the provincials and heads of the ſeveral houſes are obliged to tranſmit to him regular and frequent reports concerning the members under their inſpection. In theſe they deſcend into minute details with reſpect to the character of each perſon, his abilities natural or acquired, his temper, his experience

Jesuits.

rience in affairs, and the particular department for which he is best fitted. These reports, when digested and arranged, are entered into registers kept of purpose, that the general may, at one comprehensive view, survey the state of the society in every corner of the earth: observe the qualifications and talents of its members; and thus choose, with perfect information, the instruments which his absolute power can employ in any service for which he thinks meet to destine them.

6 rogress of e power d influence of e order.

As it was the professed intention of the order of Jesuits to labour with unwearied zeal in promoting the salvation of men, this engaged them of course in many active functions. From their first institution, they considered the education of youth as their peculiar province; they aimed at being spiritual guides and confessors; they preached frequently in order to instruct the people; they set out as missionaries to convert unbelieving nations. The novelty of the institution, as well as the singularity of its objects, procured the order many admirers and patrons. The governors of the society had the address to avail themselves of every circumstance in its favour, and in a short time the number as well as influence of its members increased wonderfully. Before the expiration of the sixteenth century, the Jesuits had obtained the chief direction of the education of youth in every catholic country in Europe. They had become the confessors of almost all its monarchs; a function of no small importance in any reign, but, under a weak prince, superior even to that of minister. They were the spiritual guides of almost every person eminent for rank or power. They possessed the highest degree of confidence and interest with the papal court, as the most zealous and able champions for its authority. The advantages which an active and enterprising body of men might derive from all these circumstances are obvious. They formed the minds of men in their youth. They retained an ascendant over them in their advanced years. They possessed, at different periods, the direction of the most considerable courts in Europe. They mingled in all affairs. They took part in every intrigue and revolution. The general, by means of the extensive intelligence which he received, could regulate the operations of the order with the most perfect discernment; and, by means of his absolute power, could carry them on with the utmost vigour and effect.

7 its faith.

Together with the power of the order, its wealth continued to increase. Various expedients were devised for eluding the obligation of the vow of poverty. The order acquired ample possessions in every catholic country; and by the number as well as magnificence of its public buildings, together with the value of its property, moveable or real, it vied with the most opulent of the monastic fraternities. Besides the sources of wealth common to all the regular clergy, the Jesuits possessed one which was peculiar to themselves. Under pretext of promoting the success of their missions, and of facilitating the support of their missionaries, they obtained a special licence from the court of Rome to trade with the nations which they laboured to convert. In consequence of this, they engaged in an extensive and lucrative commerce both in the East and West Indies. They opened warehouses in different parts of Europe, in which they vended their commodities. Not satisfied with trade alone, they imitated the example of other commercial societies, and aimed at obtaining settlements. They acquired possession accordingly of a large and fertile province in the southern continent of America, and reigned as sovereigns over some hundred thousand subjects.

Jesuits.

8 Pernicious effects of these on civil society.

Unhappily for mankind, the vast influence which the order of Jesuits acquired by all these different means, has been often exerted with the most pernicious effect. Such was the tendency of that discipline observed by the society in forming its members, and such the fundamental maxims in its constitution, that every Jesuit was taught to regard the interest of the order as the capital object to which every consideration was to be sacrificed. This spirit of attachment to their order, the most ardent perhaps that ever influenced any body of men, is the characteristic principle of the Jesuits, and serves as a key to the genius of their policy as well as the peculiarities in their sentiments and conduct.

As it was for the honour and advantage of the society that its members should possess an ascendant over persons in high rank or of great power; the desire of acquiring and preserving such a direction of their conduct with greater facility, has led the Jesuits to propagate a system of relaxed and pliant morality, which accommodates itself to the passions of men, which justifies their vices, which tolerates their imperfections, which authorises almost every action that the most audacious or crafty politician would wish to perpetrate.

As the prosperity of the order was intimately connected with the preservation of the papal authority, the Jesuits, influenced by the same principle of attachment to the interests of their society, have been the most zealous patrons of those doctrines which tend to exalt ecclesiastical power on the ruins of civil government. They have attributed to the court of Rome a jurisdiction as extensive and absolute as was claimed by the most presumptuous pontiffs in the dark ages. They have contended for the entire independence of ecclesiastics on the civil magistrates. They have published such tenets concerning the duty of opposing princes who were enemies of the catholic faith as countenanced the most atrocious crimes, and tended to dissolve all the ties which connect subjects with their rulers.

As the order derived both reputation and authority from the zeal with which it stood forth in defence of the Romish church against the attacks of the reformers, its members, proud of this distinction, have considered it as their peculiar function to combat the opinions and to check the progress of the Protestants. They have made use of every art, and have employed every weapon against them. They have set themselves in opposition to every gentle or tolerating measure in their favour. They have incessantly stirred up against them all the rage of ecclesiastical and civil persecution.

Monks of other denominations have indeed ventured to teach the same pernicious doctrines, and have held opinions equally inconsistent with the order and happiness of civil society. But they, from reasons which are obvious, have either delivered such opinions with greater reserve, or have propagated them with less success. Whoever recollects the events which have

Jesuits.

happened in Europe during two centuries, will find that the Jesuits may justly be considered as responsible for most of the pernicious effects arising from that corrupt and dangerous casuistry, from those extravagant tenets concerning ecclesiastical power, and from that intolerant spirit, which have been the disgrace of the church of Rome throughout that period, and which have brought so many calamities upon civil society.

9 Some advantages resulting from the institution of this order.

But, amidst many bad consequences flowing from the institution of this order, mankind, it must be acknowledged, have derived from it some considerable advantages. As the Jesuits made the education of youth one of their capital objects, and as their first attempts to establish colleges for the reception of students were violently opposed by the universities in different countries, it became necessary for them, as the most effectual method of acquiring the public favour, to surpass their rivals in science and industry. This prompted them to cultivate the study of ancient literature with extraordinary ardour. This put them upon various methods for facilitating the instruction of youth; and, by the improvements which they made in it, they have contributed so much towards the progress of polite learning, that on this account they have merited well of society. Nor has the order of Jesuits been successful only in teaching the elements of literature; it has produced likewise eminent masters in many branches of science, and can alone boast of a greater number of ingenious authors than all the other religious fraternities taken together.

10 Settlement in Paraguay

But it is in the new world that the Jesuits have exhibited the most wonderful display of their abilities, and have contributed most effectually to the benefit of the human species. The conquerors of that unfortunate quarter of the globe had nothing in view but to plunder, to enslave, and to exterminate its inhabitants. The Jesuits alone have made humanity the object of their settling there. About the beginning of the last century, they obtained admission into the fertile province of Paraguay, which stretches across the southern continent of America, from the bottom of the mountains of Potosi to the confines of the Spanish and Portuguese settlements on the banks of the river de la Plata. They found the inhabitants in a state little different from that which takes place among men when they first begin to unite together; strangers to the arts, subsisting precariously by hunting or fishing, and hardly acquainted with the first principles of subordination and government. The Jesuits set themselves to instruct and to civilize these savages. They taught them to cultivate the ground, to rear tame animals, and to build houses. They brought them to live together in villages. They trained them to arts and manufactures. They made them taste the sweets of society, and accustomed them to the blessings of security and order. These people became the subjects of their benefactors, who have governed them with a tender attention, resembling that with which a father directs his children. Respected and beloved almost to adoration, a few Jesuits presided over some hundred thousand Indians. They maintained a perfect equality among all the members of the community. Each of them was obliged to labour, not for himself alone, but for the public. The produce of their fields, together with the fruits of their industry of every species, were deposited in common storehouses, from which each individual received every thing necessary for the supply of his wants. By this institution, almost all the passions which disturb the peace of society, and render the members of it unhappy, were extinguished. A few magistrates, chosen by the Indians themselves, watched over the public tranquillity, and secured obedience to the laws. The sanguinary punishments frequent under other governments were unknown. An admonition from a Jesuit, a slight mark of infamy, or, on some singular occasion, a few lashes with a whip, were sufficient to maintain good order among these innocent and happy people. Jesuits.

But, even in this meritorious effort of the Jesuits for the good of mankind, the genius and spirit of their order have mingled and are discernible. They plainly aimed at establishing in Paraguay an independent empire, subject to the society alone, and which, by the superior excellence of its constitution and police, could scarcely have failed to extend its dominion over all the southern continent of America. With this view, in order to prevent the Spaniards or Portuguese in the adjacent settlements from acquiring any dangerous influence over the people within the limits of the province subject to the society, the Jesuits endeavoured to inspire the Indians with hatred and contempt of these nations. They cut off all intercourse between their subjects and the Spanish or Portuguese settlements. They prohibited any private trader of either nation from entering their territories. When they were obliged to admit any person in a public character from the neighbouring governments, they did not permit him to have any conversation with their subjects; and no Indian was allowed even to enter the house where these strangers resided, unless in the presence of a Jesuit. In order to render any communication between them as difficult as possible, they industriously avoided giving the Indians any knowledge of the Spanish or of any other European language; but encouraged the different tribes which they had civilized to acquire a certain dialect of the Indian tongue, and laboured to make that the universal language throughout their dominions. As all these precautions, without military force, would have been insufficient to have rendered their empire secure and permanent, they instructed their subjects in the European arts of war. They formed them into bodies of cavalry and infantry, completely armed and regularly disciplined. They provided a great train of artillery, as well as magazines stored with all the implements of war. Thus they established an army so numerous and well-appointed, as to be formidable in a country where a few sickly and ill-disciplined battalions composed all the military force kept on foot by the Spaniards or Portuguese.

11 Downfall of the order in Europe.

Such were the laws, the policy, and the genius of this formidable order; of which, however, a perfect knowledge has only been attainable of late. Europe had observed, for two centuries, the ambition and power of the order. But while it felt many fatal effects of these, it could not fully discern the causes to which they were to be imputed. It was unacquainted with many of the singular regulations in the political constitution or government of the Jesuits, which formed the enterprising spirit of intrigue that distinguished its members, and elevated the body itself to such a height of power. It was a fundamental maxim with the

the Jesuits, from their first institution, not to publish the rules of their order. These they kept concealed as an impenetrable mystery. They never communicated them to strangers, nor even to the greater part of their own members. They refused to produce them when required by courts of justice; and, by a strange solecism in policy, the civil power in different countries authorised or connived at the establishment of an order of men, whose constitution and laws were concealed with a solicitude which alone was a good reason for having excluded them. During the prosecutions lately carried on against them in Portugal and France, the Jesuits have been so inconsiderate as to produce the mysterious volumes of their institute. By the aid of these authentic records, the principles of their government may be delineated, and the sources of their power investigated with a degree of certainty and precision which, previous to that event, it was impossible to attain.

The pernicious effects, however, of the spirit and constitution of this order, rendered it early obnoxious to some of the principal powers in Europe, and gradually brought on its downfal. The emperor Charles V. saw it expedient to check its progress in his dominions; it was expelled England, by proclamation 2 James I. in 1604; Venice, in 1606; Portugal, in 1759; France, in 1764; Spain and Sicily, in 1767; and totally suppressed and abolished by the late Pope Clement XIV. in 1773.

JESUS *the Son of Sirach*, a native of Jerusalem, composed, about 200 B. C. the book of Ecclesiasticus, called by the Greeks Πανάρετος, "replenished with virtue;" who also quote it under the title of *the Wisdom of Solomon the Son of Sirach.* His grandson, who was also of the same name, and a native of Jerusalem, translated it from the Hebrew into Greek about 121 B. C. We have this Greek version, but the Hebrew text is lost.

Jesus Christ, the Son of God, and Saviour of mankind, descended from heaven, and took upon him the human nature in Judæa, towards the conclusion of the reign of Herod the Great, king of that country. The place of his birth was Bethlehem, a flourishing city of Judah; but the year in which he was born is not precisely ascertained. The most general opinion is, that it happened about the year of Rome 748 or 749, and about 18 months before the death of Herod. Four inspired writers have transmitted to us an account of the life of Jesus Christ. They mention particularly his birth, lineage, family, and parents; but say very little concerning his infancy and earlier youth. Herod being informed that the Messiah, or king of the Jews, so much spoken of by the prophets, was now born, being afraid that his kingdom should now be taken away, contrived how to destroy his supposed rival: but Christ, being carried, while very young, into Egypt, escaped the cruelty of the tyrant; who, being determined to make sure work, made a general massacre of the infants about Bethlehem, from the age of two years and under.

After the death of Herod, our Saviour was brought back to Judæa; but we are totally ignorant of what his employment was during the interval between his return thither, and the time of his entering upon the ministry. We know only, that when he was but 12 years of age, he disputed in the temple with the most learned of the Jewish doctors; whom he surprised with his knowledge, and the answers he gave to their questions. After this, as the scripture tells us, he continued with his parents, and was subject to them, till he entered upon his ministry. It is said, indeed, though upon no sure foundation, that during this period he followed the trade of his father, who was a carpenter. In the 30th year of his age, he began his public ministry; to which the attention of the people was drawn by the preaching of John, a prophet miraculously inspired of God to proclaim the existence of the Saviour, as now descended upon earth, and visible to the eyes of all; and by this prophet Christ himself was baptized in the waters of Jordan, that he might not, in any point, neglect to answer the demands of the Jewish law.

It is not necessary here to enter into a particular detail of the life and actions of Jesus Christ. Every one knows, that his life was one continued scene of the most perfect sanctity, and the purest and most active virtue; not only without spot, but also beyond the reach of suspicion. And it is also well known, that by miracles of the most stupendous kind, and not more stupendous than salutary and beneficent, he displayed to the universe the truth of that religion which he brought with him from above, and demonstrated the reality of his divine commission in the most illustrious manner. For the propagation of his religion through the country of Judæa, our Saviour chose 12 apostles; whom, however, he sent out only once, and after their return kept them constantly about his person. But, besides these, he chose other 70, whom he dispersed throughout the country.

There have been many conjectures concerning the reason why the number of apostles was fixed at 12, and that of the other teachers at 70. The first, however, was, according to our Saviour's own words (Matt. xix. 28.), an allusion to the 12 tribes of Israel, thereby intimating that he was the king of these 12 tribes; and as the number of his other messengers answers evidently to that of the senators who composed the Sanhedrim, there is a high degree of probability in the conjecture of those who think that Christ by this number designed to admonish the Jews, that the authority of their Sanhedrim was now at an end, and that all power with respect to religious matters was vested in him alone. His ministry, however, was confined to the Jews; nor, while he remained upon earth, did he permit his apostles or disciples to extend their labours beyond this favoured nation. At the same time, if we consider the illustrious acts of mercy and benevolence that were performed by Christ, it will be natural to conclude, that his fame must soon have spread abroad in other countries. Indeed this seems probable from a passage in scripture, where we are told that some Greeks applied to the apostle Philip in order to see Jesus. We learn also from authors of no small note, that Abgarus† king of Edessa, being seized with a severe and dangerous illness, wrote to our Lord, imploring his assistance; and that Jesus not only sent him a gracious answer, but also accompanied it with his picture, as a mark of his esteem for that pious prince. These letters are still extant; but by the judicious part of mankind are universally looked upon as

† See *Abgarus.*

Jesus, Jet.

as ſpurious; and indeed the late Mr Jones, in his treatiſe entitled *A new and full method of ſettling the canonical authority of the New Teſtament*, hath offered reaſons which ſeem almoſt unanſwerable againſt the authenticity of the whole tranſaction.

The preaching of our Saviour, and the numberleſs miracles he performed, made ſuch an impreſſion on the body of the Jewiſh nation, that the chief-prieſts and leading men, jealous of his authority, and provoked at his reproaching them with their wicked lives, formed a conſpiracy againſt him. For a conſiderable time their deſigns proved abortive; but at laſt, Jeſus, knowing that he had fulfilled every purpoſe for which he came into the world, ſuffered himſelf to be taken through the treachery of one of his diſciples, named *Judas Iſcariot*, and was brought before the Sanhedrim. In this aſſembly he was accuſed of blaſphemy; and being afterwards brought before Pilate the Roman governor, where he was accuſed of ſedition, Pilate was no ſooner ſat down to judge in this cauſe, than he received a meſſage from his wife, deſiring him to have nothing to do with the affair, having that very day had a frightful dream on account of our Saviour, whom ſhe called *that juſt man*. The governor, intimidated by this meſſage, and ſtill more by the majeſty of our Saviour himſelf, and the evident falſehood of the accuſations brought againſt him, was determined if poſſible to ſave him. But the clamours of an enraged populace, who at laſt threatened to accuſe Pilate himſelf as a traitor to the Roman emperor, got the better of his love of juſtice, which indeed on other occaſions was not very fervent.

Our Saviour was now condemned by his judge, though contrary to the plaineſt dictates of reaſon and juſtice; was executed on a croſs between two thieves, and very ſoon expired. Having continued three days in a ſtate of death, he roſe from the dead, and made himſelf viſible to his diſciples as formerly. He converſed with them 40 days after his reſurrection, and employed himſelf during that time in inſtructing them more fully concerning the nature of his kingdom; and having manifeſted the certainty of his reſurrection to as many witneſſes as he thought proper, he was, in the preſence of many of his diſciples, taken up into heaven, there to remain till the end of the world. See CHRISTIANITY.

JET, in natural hiſtory, a kind of foſſile ſubſtance, the characters of which are theſe.—It is a ſolid, dry, opaque, inflammable body, found in large detached maſſes of a fine and regular ſtructure, having a grain like that of wood, ſplitting more eaſily in an horizontal than in any other direction; very light, and moderately hard; not fuſible, but readily inflammable, and burning a long time with a fine greeniſh white flame.

Jet is a ſubſtance concerning which many erroneous opinions have been entertained, and which hath been very little underſtood, even in Britain, where the fineſt in the world is produced; having been uſually confounded with a thing greatly inferior to it in value, the common cannel-coal; ſo that many believe there is no other jet than that ſubſtance: they are, however, eaſily diſtinguiſhed from each other by the following characters. Jet is always found in detached maſſes lodged in other ſtrata; but cannel-coal conſtitutes whole ſtrata of itſelf. Jet has the grain of wood, and ſplits horizontally with much greater eaſe than in any other direction; cannel-coal has no particular direction, and ſplits any way with equal eaſe. Jet is but moderately hard; cannel-coal not leſs ſo than many ſtones: jet, when ſet on fire, flames a long time; cannel-coal but a little while.——Jet is found in Italy, Germany, and the Eaſt Indies; but nowhere in ſuch plenty as in England. It is very common in Yorkſhire and the other northern counties, and is found in many of the clay-pits about London. By the ancients it was uſed in medicine, and celebrated as an emollient and diſcutient; but the modern practice takes no notice of it.

JET-*d'Eau*, a French term, frequently alſo uſed with us, for a fountain that caſts up water to a conſiderable height in the air. See HYDROSTATICS, n° 22.; and ICELAND, n° 7, 8.

JETTY-HEAD, a name uſually given, in the royal dock-yards, to that part of a wharf which projects beyond the reſt; but more particularly the front of a wharf, whoſe ſide forms one of the cheeks of a dry or wet dock.

JEWEL, any precious ſtone, or ornament beſet with them. See DIAMOND, RUBY, &c.

JEWEL (John), a learned Engliſh writer and biſhop, was born in 1522, and educated at Oxford. In 1540 he proceeded A. B. became a noted tutor, and was ſoon after choſen rhetoric leſturer in his college. In February 1544, he commenced A. M. He had early imbibed Proteſtant principles, and inculcated the ſame to his pupils; but this was carried on privately till the acceſſion of king Edward VI. in 1546, when he made a public declaration of his faith, and entered into a cloſe friendſhip with Peter Martyr, who was made profeſſor of divinity at Oxford. In 1550, he took the degree of B. D. and frequently preached before the univerſity with great applauſe. At the ſame time he preached and catechiſed every other Sunday at Sunningwell in Berkſhire, of which church he was rector. Upon the acceſſion of queen Mary to the crown in 1553, he was one of the firſt who felt the rage of the ſtorm then raiſed againſt the reformation; for before any law was made, or order given by the queen, he was expelled Corpus Chriſti college by the fellows, by their own private authority; but he continued in Oxford, till he was called upon to ſubſcribe to ſome of the Popiſh doctrines under the ſevereſt penalties, which he ſubmitted to. However, this did not procure his ſafety; for he was obliged to fly, and, after encountering many difficulties, arrived at Franckfort, in the 2d year of queen Mary's reign, where he made a public recantation of his ſubſcription to the Popiſh doctrines. Thence he went to Straſburg, and afterwards to Zurich, where he attended Peter Martyr, in whoſe houſe he reſided. He returned to England in 1558, after queen Mary's death; and, in 1559, was conſecrated biſhop of Saliſbury. This promotion was given him as a reward for his great merit and learning; and another atteſtation of theſe was given him by the univerſity of Oxford, who, in 1565, conferred on him in his abſence the degree of D. D. In this character he attended the queen to Oxford the following year, and preſided at the divinity-diſputations held before her majeſty on that occaſion. He had

Jet || Jewel.

Jewel.

had before greatly diſtinguiſhed himſelf by a ſermon preached at St Paul's-croſs, preſently after he was made a biſhop, wherein he gave a public challenge to all the Roman-catholics in the world, to produce but one clear and evident teſtimony out of any father or famous writer, who flouriſhed within 600 years after Chriſt, for any one of the articles which the Romaniſts maintain againſt the church of England; and, two years afterwards, he publiſhed his famous apology for this church. In the mean time, he gave a particular attention to his dioceſe; where he began in his firſt viſitation, and perfected in his laſt, ſuch a reformation, not only in his cathedral and parochial churches, but in all the churches of his juriſdiction, as procured him and the whole order of biſhops due reverence and eſteem. For he was a careful overlooker and ſtrict obſerver, not only of all the flocks, but alſo of the paſtors, in his dioceſe: and he watched ſo narrowly upon the proceedings of his chancellor and archdeacons, and of his ſtewards and receivers, that they had no opportunities of being guilty of oppreſſion, injuſtice, or extortion, nor of being a burthen to the people, or a ſcandal to himſelf. To prevent theſe and the like abuſes, for which the eccleſiaſtical courts are often too juſtly cenſured, he ſat often in his conſiſtory-court, and ſaw that all things were carried rightly there: he alſo ſat often as aſſiſtant on the bench of civil juſtice, being himſelf a juſtice of the peace. Amidſt theſe employments, however, the care of his health was too much neglected; to which, indeed, his general courſe of life was totally unfavourable. He roſe at four o'clock in the morning; and, after prayers with his family at five, and in the cathedral about ſix, he was ſo fixed to his ſtudies all the morning, that he could not without great violence be drawn from them. After dinner, his doors and ears were open to all ſuitors; and it was obſerved of him as of Titus, that he never ſent any ſad from him. Suitors being thus diſmiſſed, he heard, with great impartiality and patience, ſuch cauſes debated before him, as either devolved to him as a judge, or were referred to him as an arbitrator; and if he could ſpare any time from theſe, he reckoned it as clear gain to his ſtudy. About nine at night he called all his ſervants to an account how they had ſpent the day, and then went to prayers with them. From the chapel he withdrew again to his ſtudy till near midnight, and from thence to his bed; in which when he was laid, the gentleman of his bed-chamber read to him till he fell aſleep. This watchful and laborious life, without any recreation at all, except what his neceſſary refreſhment at meals and a very few hours of reſt afforded him, waſted his life too faſt. He died at Monkton-Farley, in 1571, in the 50th year of his age. He wrote, 1. A view of a ſeditious bull ſent into England by pope Pius V. in 1569. 2. A treatiſe on the Holy Scriptures. 3. An expoſition of St Paul's two epiſtles to the Theſſalonians. 4. A treatiſe on the ſacrament. 5. An apology for the national church. 6. Several ſermons, controverſial treatiſes, and other works.

"This excellent prelate (ſays the rev. Mr Granger) was one of the greateſt champions of the reformed religion, as he was to the church of England what Bellarmine was to that of Rome. His admirable Apology was tranſlated from the Latin by Anne, the ſecond of the four learned daughters of Sir Anthony Coke, and mother of Sir Francis Bacon. It was publiſhed, as it came from her pen, in 1564, with the approbation of the queen and the prelates. The ſame Apology was printed in Greek at Conſtantinople, under the direction of St Cyril the patriarch. His Defence of his Apology, againſt Harding and other Popiſh divines, was in ſuch eſteem, that queen Elizabeth, king James I. king Charles I. and four ſucceſſive archbiſhops, ordered it to be kept chained in all pariſh churches for public uſe.

Jewel; Jews.

JEWEL-*Blocks*, in the ſea-language, a name given to two ſmall blocks which are ſuſpended at the extremity of the main and fore-top-ſail yards, by means of an eye-bolt driven from without into the middle of the yard-arm, parallel to its axis. The uſe of theſe blocks is, to retain the upper-part of the top-maſt ſtudding-ſails beyond the ſkirts of the top-ſails, ſo that each of thoſe ſails may have its full force of action, which would be diminiſhed by the encroachment of the other over its ſurface. The *haliards*, by which thoſe ſtudding-ſails are hoiſted, are accordingly paſſed through the jewel-blocks; whence, communicating with a block on the top-maſt head, they lead downwards to the top or decks, where they may be conveniently hoiſted. See SAIL.

JEWS, a name derived from the patriarch Judah, and given to the deſcendants of Abraham by his eldeſt ſon Iſaac, who for a long time poſſeſſed the land of Paleſtine in Aſia, and are now diſperſed through all nations in the world.

The hiſtory of this people, as it is the moſt ſingular, ſo is it alſo the moſt ancient in the world; and the greateſt part being before the beginning of profane hiſtory, depends entirely on the authenticity of the Old Teſtament, where it is only to be found.—To repeat here what is ſaid in the ſacred writings would both be ſuperfluous and tedious, as thoſe writings are in every perſons hands, and may be conſulted at pleaſure. It ſeems moſt proper therefore to commence the hiſtory of the Jews from their return to Jeruſalem from Babylon, and the rebuilding of their city and temple under Ezra and Nehemiah, when the ſcripture leaves off any farther accounts, and profane hiſtorians begin to take notice of them.

I. Cyrus publiſhes a decree for rebuilding Jeruſalem.

Cyrus the Great, king of Perſia, having conquered Babylon and almoſt all the weſtern parts of Aſia, perceiving the deſolate and ruinous condition in which the province of Paleſtine lay, formed a deſign of reſtoring the Jews to their native country, and permitting them to rebuild Jeruſalem and re-eſtabliſh their worſhip. For this purpoſe he iſſued out a decree in the firſt year of his reign, about 536 B. C. by which they were allowed not only to return and rebuild their city, but to carry along with them all the ſacred veſſels which Nebuchadnezzar had carried off, and engaged to defray the expence of building the temple himſelf. This offer was gladly embraced by the more zealous Jews of the tribes of Judah, Benjamin, and Levi; but many more, being no doubt leſs ſanguine about their religion, choſe to ſtay where they were.

In 534 B. C. the foundations of the temple were laid, and matters ſeemed to go on proſperouſly, when the undertaking was ſuddenly obſtructed by the Samaritans. Theſe came at firſt expreſſing an earneſt deſire

Jews. desire to assist in the work, as they worshipped the same God with the Jews; but the latter refused their assistance, as they knew they were not true Israelites, but the descendants of those heathens who had been transplanted into the country of the ten tribes after their captivity by Shalmanezer. This refusal proved the source of all that bitter enmity which afterwards took place between the Jews and Samaritans; and the immediate consequence was, that the latter made all the opposition in their power to the going on of the work. At last, however, all obstacles were surmounted, and the temple finished as related in the books of Ezra and Nehemiah. The last of these chiefs died about 409 B. C. after having restored the Jewish worship to its original purity, and reformed a number of abuses which took place immediately on its commencement.

2 The temple &c. finished

But though the Jews were now restored to the free exercise of religion, they were neither a free nor a powerful people as they had formerly been. They were few in number, and their country only a province of Syria, subject to the kings of Persia. The Syrian governors conferred the administration of affairs upon the high-priests; and their accepting this office, and thus deviating from the law of Moses, must be considered as one of the chief causes of the misfortunes which immediately befel the people, because it made room for a set of men who aspired at this high office merely through ambition or avarice, without either zeal for religion, or love for their country. It besides made the high-priesthood capable of being disposed of at the pleasure of the governors, whereas the Mosaic institution had fixed it unalienably in the family of Aaron.—Of the bad effects of this practice a fatal instance happened in 373 B. C. Bagoses, governor of Syria, having contracted an intimate friendship with Jeshua the brother of Johanan the high-priest, promised to raise him to the pontifical office a few years after his brother had been invested with it. Jeshua came immediately to Jerusalem, and acquainted his brother with it. Their interview happened in the inner court of the temple; and a scuffle ensuing, Jeshua was killed by his brother, and the temple thus polluted in the most scandalous manner. The consequence to the Jews was, that a heavy fine was laid on the temple, which was not taken off till seven years after.

3 Administration of affairs conferred on the high-priests.

The first public calamity which befel the Jews nation after their restoration from Babylon, happened in the year 351 B. C.; for having some how or other disobliged Darius Ochus king of Persia, he besieged and took Jericho, and carried off all the inhabitants captives. From this time they continued faithful to the Persians, insomuch that they had almost drawn upon themselves the displeasure of Alexander the Great. That monarch having resolved upon the siege of Tyre, and being informed that the city was wholly supplied with provisions from Judea, Samaria, and Galilee, sent to Jaddua, then high-priest, to demand of him that supply which he had been accustomed to pay to the Persians. The Jewish pontiff excused himself on account of his oath of fidelity to Darius; which so provoked Alexander, that he had no sooner completed the reduction of Tyre than he marched against Jerusalem. The inhabitants then, being with good reason thrown into the utmost consternation, had recourse to prayers; and Jaddua is said, by a divine revelation to have been commanded to go and meet Alexander. He obeyed accordingly, and set out on his journey, dressed in his pontifical robes, at the head of all his priests in their proper habits, and attended by the rest of the people dressed in white garments. Alexander is said to have been seized with such awful respect on seeing this venerable procession, that he embraced the high-priest, and paid a kind of religious adoration to the name of God engraven on the front of his mitre. His followers being surprised at this unexpected behaviour, the Macedonian monarch informed them, that he paid that respect not to the priest, but to his God, as an acknowledgment for a vision which he had been favoured with at Dia; where he had been promised the conquest of Persia, and encouraged in his expedition by a person of much the same aspect and dressed in the same habit with the pontiff before him. He afterwards accompanied Jaddua into Jerusalem, where he offered sacrifices in the temple. The high-priest shewed him also the prophecies of Daniel, wherein the destruction of the Persian empire by himself is plainly set forth; in consequence of which the king went away highly satisfied, and at his departure asked the high-priest if there was nothing in which he could gratify himself or his people. Jaddua then told him, that, according to the Mosaic law, they neither sowed nor ploughed on the seventh year; therefore would esteem it an high favour if the king would be pleased to remit their tribute in that year. To this request the king readily yielded; and having confirmed them in the enjoyment of all their privileges, particularly that of living under their own laws, he departed.

Jews. 4 Interview of the high-priest with Alexander the Great.

Whether this story deserves credit or not (for the whole transaction is not without reason called in question by some), it is certain that the Jews were much favoured by Alexander; but with him their good fortune seemed also to expire. The country of Judea being situated between Syria and Egypt, became subject to all the revolutions and wars which the ambitious successors of Alexander waged against each other. At first it was given, together with Syria and Phenicia, to Leomedon the Mitylenian one of Alexander's generals; but he being soon after stripped of the other two by Ptolemy, Judea was next summoned to yield to the conqueror. The Jews scrupled to break their oath of fidelity to Leomedon; and were of consequence invaded by Ptolemy at the head of a powerful army. The open country was easily reduced; but the city being strongly fortified both by art and nature, threatened a strong resistance. A superstitious fear of breaking the sabbath, however, prevented the besieged from making any defence on that day; of which Ptolemy being informed, he caused an assault to be made on the sabbath, and easily carried the place. At first he treated them with great severity, and carried 100,000 men of them into captivity; but reflecting soon after on their known fidelity to their conquerors, he restored them to all the privileges they had enjoyed under the Macedonians. Of the captives he put some into garrisons, and others he settled in the countries of Libya and Cyrene. From those who settled in the latter of these countries descended

5 Miserable state of the Jews after Alexander's death.

Jews. fcended the Cyrenean Jews mentioned by the writers of the New Teſtament.

Five years after Ptolemy had ſubdued Judea, he was forced to yield it to Antigonus, reſerving to himſelf only the cities of Ace, Samaria, Joppa, and Gaza; and carrying off an immenſe booty, together with a great number of captives, whom he ſettled at Alexandria and endowed with conſiderable privileges and immunities.—Antigonus behaved in ſuch a tyrannical manner, that great numbers of his Jewiſh ſubjects fled into Egypt, and others put themſelves under the protection of Seleucus, who alſo granted them conſiderable privileges. Hence this nation came gradually to be ſpread over Syria, and Aſia Minor; while Judea ſeemed to be in danger of being depopulated, till it was recovered by Ptolemy in 292. The affairs of the Jews then took a more proſperous turn, and continued in a thriving way till the reign of Ptolemy Philopator, when they were grievouſly oppreſſed by the incurſions of the Samaritans, at the ſame time that Antiochus Theos, king of Syria, invaded Galilee. Ptolemy, however, marched againſt Antiochus, and defeated him; after which, having gone to Jeruſalem to offer ſacrifices, he ventured to profane the temple itſelf by going into it. He penetrated thro' the two outer courts; but as he was about to enter the ſanctuary, he was ſtruck with ſuch dread and terror that he fell down half-dead. A dreadful perſecution was then raiſed againſt the Jews, who had attempted to hinder him in his impious attempt; but this perſecution was ſtopped by a ſtill more extraordinary accident related under the article EGYPT, n° 30. and the Jews again received into favour.

6 Subdued by Antiochus the Great. About the year 204 B. C. the country of Judea was ſubdued by Antiochus the Great; and on this occaſion the loyalty of the Jews to the Egyptians failed them, the whole nation readily ſubmitting to the king of Syria. This attachment ſo pleaſed the Syrian monarch, that he ſent a letter to his general, wherein he acquainted him that he deſigned to reſtore Jeruſalem to its ancient ſplendor, and to recal all the Jews that had been driven out of it: that out of his ſingular reſpect to the temple of God, he granted them 20,000 pieces of ſilver, towards the charges of the victims, frankincenſe, wine, and oil; 1400 meaſures of fine wheat, and 375 meaſures of ſalt, towards their uſual oblations: that the temple ſhould be thoroughly repaired at his coſt; that they ſhould enjoy the free exerciſe of their religion; and reſtore the public ſervice of the temple, and the prieſts, Levites, ſingers, &c. to their uſual functions: that no ſtranger, or Jew that was unpuriſied, ſhould enter farther into the temple than was allowed by their law; and that no fleſh of unclean beaſts ſhould be brought into Jeruſalem, not even their ſkins: and all theſe under the penalty of paying 3000 pieces of ſilver into the treaſury of the temple. He further granted an exemption of taxes for three years to all the diſperſed Jews that ſhould come within a limited time to ſettle in the metropolis; and that all who had been ſold for ſlaves within his dominions ſhould be immediately ſet free.

7 Dreadful commotions. This ſudden proſperity proved of no long duration. About the year 176, a quarrel happened between Onias at that time high prieſt, and one Simon, governor of the temple, which was attended with the moſt fatal conſequences. The cauſes of this quarrel are unknown. The event, however, was, that Simon finding he could not get the better of Onias, informed Apollonius governor of Cœlofyria and Paleſtine, that there was at that time in the temple an immenſe treaſure, which at his pleaſure might be ſeized upon for the uſe of the king of Syria. Of this the governor inſtantly ſent intelligence to the king, who diſpatched one Heliodorus to take poſſeſſion of the ſuppoſed treaſure. This perſon, through a miraculous interpoſition, as the Jews pretend, failed in his attempt of entering the temple; upon which Simon accuſed the high-prieſt to the people, as the perſon who had invited Heliodorus to Jeruſalem. This produced a kind of civil war, in which many fell on both ſides. At laſt Onias having complained to the king, Simon was baniſhed; but ſoon after, Antiochus Epiphanes having aſcended the throne of Syria, Jaſon, the high-prieſt's brother, taking advantage of the neceſſities of Antiochus, purchaſed from him the high-prieſthood at the price of 350 talents, and obtained an order that his brother ſhould be ſent to Antioch, there to be confined for life.

Jaſon's next ſtep was to purchaſe liberty, at the price of 150 talents more, to build a gymnaſium at Jeruſalem ſimilar to thoſe which were uſed in the Grecian cities; and to make as many Jews as he pleaſed free citizens of Antioch. By means of theſe powers he became very ſoon able to form a ſtrong party in Judea; for his countrymen were exceedingly fond of the Grecian cuſtoms, and the freedom of the city of Antioch was a very valuable privilege. From this time there- 8 A general apoſtacy takes place. fore a general apoſtacy took place; the ſervice of the temple was neglected, and Jaſon abandoned himſelf without remorſe to all the impieties and abſurdities of paganiſm.

He did not, however, long enjoy his ill-acquired dignity. Having ſent his brother Menelaus with the uſual tribute to Antiochus, the former took the opportunity of ſupplanting Jaſon in the ſame manner that he had ſupplanted Onias. Having offered for the high-prieſthood 300 talents more than his brother had given, he eaſily obtained it, and returned with his new commiſſion to Jeruſalem. He ſoon got himſelf a ſtrong party; but Jaſon proving too powerful, forced Menelaus and his adherents to retire to Antioch. Here, the better to gain their point, they acquainted Antiochus that they were determined to renounce their old religion, and wholly conform themſelves to that of the Greeks: which ſo pleaſed the tyrant, that he immediately gave them a force ſufficient to drive Jaſon out of Jeruſalem; who thereupon took refuge among the Ammonites.

Menelaus being thus freed from his rival, took care to fulfil his promiſe to the king with regard to the apoſtacy, but forgot to pay the money he had promiſed. At laſt he was ſummoned to Antioch; and finding nothing but the payment of the promiſed ſum would do, ſent orders to his brother Lyſimachus to convey to him as many of the ſacred utenſils belonging to the temple as could be ſpared. As theſe were all of gold, the apoſtate ſoon raiſed a ſufficient ſum from them, not only to ſatisfy the king, but alſo to bribe the courtiers in his favour. But his brother Onias, who had been all this time confined at Antioch, getting intelligence of the ſacrilege, made ſuch bitter complaints, that an inſurrection

Jews. surrection was ready to take place among the Jews at Antioch. Menelaus, in order to avoid the impending danger, bribed Andronicus, governor of the city, to murder Onias. This produced the moſt vehement complaints as ſoon as Antiochus returned to the capital, (he having been abſent for ſome time in order to quell an inſurrection in Cilicia); which at laſt ended in the death of Andronicus, who was executed by the king's order. By dint of money, however, Menelaus ſtill found means to keep up his credit; but was obliged to draw ſuch large ſums from Jeruſalem, that the inhabitants at laſt maſſacred his brother Lyſimachus, whom he had left governor of the city in his abſence. Antiochus ſoon after took a journey to Tyre; upon which the Jews ſent deputies to him, both to juſtify the death of Lyſimachus, and to accuſe Menelaus of being the author of all the troubles which had happened. The apoſtate, however, was never at a loſs while he could procure money. By means of this powerful argument he pleaded his cauſe ſo effectually, that the deputies were not only caſt, but put to death; and this unjuſt ſentence gave the traitor ſuch a complete victory over all his enemies, that from thenceforth he commenced a downright tyrant. Jeruſalem was deſtitute of protectors; and the ſanhedrim, if there were any zealous men left among them, were ſo much terrified, that they durſt not oppoſe him, though they evidently ſaw that his deſign was finally to eradicate the religion and liberties of his country.

In the mean time, Antiochus was taken up with the conqueſt of Egypt, and a report was ſome how or other ſpread that he had been killed at the ſiege of Alexandria. At this news the Jews imprudently ſhewed ſome ſigns of joy; and Jaſon thinking this a proper opportunity to regain his loſt dignity, appeared before Jeruſalem at the head of about 1000 reſolute men. The gates were quickly opened to him by ſome of his friends in the city; upon which Menelaus retired into the citadel, and Jaſon, minding nothing but his reſentment, committed the moſt horrid butcheries. At laſt he was obliged to leave both the city and country, on the news that Antiochus was coming with a powerful army againſt him; for that prince, highly provoked at this rebellion, and eſpecially at the rejoicings the Jews had made on the report of his death, had actually reſolved to puniſh the city in the ſevereſt manner. Accordingly, about 170 B. C. having made himſelf maſter of the city, he behaved with ſuch cruelty, that within three days they reckoned no fewer than 40,000 killed, and as many ſold for ſlaves. In the midſt of this dreadful calamity, the apoſtate Menelaus found means not only to preſerve himſelf from the general ſlaughter, but even to regain the good graces of the king, who, having by his means plundered the temple of every thing valuable, returned to Antioch in a kind of triumph. Before he departed, however, he put Judea under the government of one Philip, a barbarous Phrygian; Samaria under that of Andronicus, a perſon of a ſimilar diſpoſition; and left Menelaus, the moſt hateful of all the three, in poſſeſſion of the high-prieſthood.

9 Jeruſalem taken by Antiochus Epiphanes.

10 His monſtrous cruelty.

Though the Jews ſuffered exceedingly under theſe tyrannical governors, they were ſtill reſerved for greater calamities. About 168 B. C. Antiochus having been moſt ſeverely mortified by the Romans, took it into his head to wreck his vengeance on the unhappy Jews. For this purpoſe he diſpatched Apollonius at the head of 22,000 men, with orders to plunder all the cities of Judea, to murder all the men, and ſell the women and children for ſlaves. Apollonius accordingly came with his army, and to outward appearance with a peaceable intention; neither was he ſuſpected by the Jews, as he was ſuperintendant of the tribute in Paleſtine. He kept himſelf inactive till the next ſabbath, when they were all in a profound quiet; and then, on a ſudden, commanded his men to arms. Some of them he ſent to the temple and ſynagogues, with orders to cut in pieces all whom they found there; whilſt the reſt going through the ſtreets of the city maſſacred all that came in their way; the ſuperſtitious Jews not attempting to make the leaſt reſiſtance for fear of breaking the Sabbath. He next ordered the city to be plundered and ſet on fire, pulled down all their ſtately buildings, cauſed the walls to be demoliſhed, and carried away captive about 10,000 of thoſe who had eſcaped the ſlaughter. From that time the ſervice of the temple was totally abandoned; that place having been quite polluted, both with the blood of multitudes who had been killed, and in various other ways. The Syrian troops built a large fortreſs on an eminence in the city of David; fortified it with a ſtrong wall and ſtately towers, and put a garriſon in it to command the temple over-againſt which it was built, ſo that the ſoldiers could eaſily ſee and ſally out upon all thoſe who attempted to come into the temple; ſo many of whom were continually plundered and murdered by them, that the reſt, not daring to ſtay any longer in Jeruſalem, fled for refuge to the neighbouring nations.

11 The temple profaned, and the Jewiſh religion aboliſhed.

Antiochus, not yet ſatiated with the blood of the Jews, reſolved either totally to aboliſh their religion, or deſtroy their whole race. He therefore iſſued out a decree that all nations within his dominions ſhould forſake their old religion and gods, and worſhip thoſe of the king under the moſt ſevere penalties. To make his orders more effectual, he ſent overſeers into every province to ſee them ſtrictly put in execution; and as he knew the Jews were the only people who would diſobey them, ſpecial directions were given to have them treated with the utmoſt ſeverity. Athenæus, an old and cruel miniſter, well verſed in all the pagan rites, was ſent into Judea. He began by dedicating the temple to Jupiter Olympius, and ſetting up his ſtatue on the altar of burnt-offerings. Another leſſer altar was raiſed before it, on which they offered ſacrifices to that falſe deity. All who refuſed to come and worſhip this idol were either maſſacred, or put to ſome cruel tortures till they either complied or expired under the hands of the executioners. At the ſame time, altars, groves, and ſtatues, were raiſed every where through the country, and the inhabitants compelled to worſhip them under the ſame ſevere penalties; while it was inſtant death to obſerve the ſabbath, circumciſion, or any other inſtitution of Moſes.

12 Reſtored by Mattathias.

At laſt, when vaſt numbers had been put to cruel deaths, and many more had ſaved their lives by their apoſtacy, an eminent prieſt, named *Mattathias*, began to ſignalize himſelf by his bravery and zeal for religion. He had for ſome time been obliged to retire to Modin his native place, in order to avoid the perſecution which raged at Jeruſalem. During his receſs there,

Jews. there, Apelles, one of the king's officers, came to oblige the inhabitants to comply with the abovementioned orders. By him Mattathias and his ſons were addreſſed in the moſt earneſt manner, and had the moſt ample promiſes made them of the king's favour and protection if they would renounce their religion. But Mattathias anſwered, that though the whole Jewiſh nation, and the whole world, were to conform to the king's edict, yet both he and his ſons would continue faithful to their God to the laſt minute of their lives. At the ſame time perceiving one of his countrymen juſt going to offer ſacrifices to an idol, he fell upon him and inſtantly killed him, agreeable to the law of Moſes in ſuch caſes. Upon this his ſons, fired with the ſame zeal, killed the officer and his men; overthrew the altar and idol; and, running about the city, cried out, that thoſe who were zealous for the law of God ſhould follow them; by which means they quickly ſaw themſelves at the head of a numerous troop, with whom they ſoon after withdrew into ſome of the deſarts of Judea. They were followed by many others, ſo that in a ſhort time they found themſelves in a condition to reſiſt their enemies; and having conſidered the danger to which they were expoſed by their ſcrupulous obſervance of the Sabbath, they reſolved to defend themſelves, in caſe of an attack, upon that day as well as upon any other.

In the year 167 B. C. Mattathias finding that his followers daily increaſed in number, began to try his ſtrength by attacking the Syrians and apoſtate Jews. As many of theſe as he took he put to death, but forced a much greater number to fly for refuge into foreign countries; and having ſoon ſtruck his enemies with terror, he marched from city to city, overturned the idolatrous altars, opened the Jewiſh ſynagogues, made a diligent ſearch after all the ſacred books, and cauſed freſh copies of them to be written; he alſo cauſed the reading of the Scriptures to be reſumed, and all the males born ſince the perſecution to be circumciſed. In all this he was attended with ſuch ſucceſs, that he had extended his reformation through a conſiderable part of Judea within the ſpace of one year; and would probably have completed it, had he not been prevented by death.

13 Exploits of Judas Maccabæus. Mattathias was ſucceeded by his ſon Judas, ſurnamed *Maccabeus*, the greateſt uninſpired hero of whom the Jews can boaſt. His troops amounted to no more than 6000 men; yet with theſe he quickly made himſelf maſter of ſome of the ſtrongeſt fortreſſes of Judea, and became terrible to the Syrians, Samaritans, and apoſtate Jews. In one year he defeated the Syrians in five pitched battles, and drove them quite out of the country; after which he purified the temple, and reſtored the true worſhip, which had been interrupted for three years and a half. Only one obſtacle now remained, viz. the Syrian garriſon abovementioned, which had been placed over-againſt the temple, and which Judas could not at preſent reduce. In order to prevent them from interrupting the worſhip, however, he fortified the mountain on which the temple ſtood, with an high wall and ſtrong towers round about, leaving a garriſon to defend it; making ſome additional fortifications at the ſame time to Bethzura, a fortreſs at about 20 miles diſtance.

In the mean time Antiochus being on his return from an unſucceſsful expedition into Perſia, received the diſagreeable news that the Jews had all to a man revolted, defeated his generals, driven their armies out of Judea, and reſtored their ancient worſhip. This threw him into ſuch a fury, that he commanded his charioteer to drive with the utmoſt ſpeed, threatening utterly to extirpate the Jewiſh race, without leaving a ſingle perſon alive. Theſe words were ſcarce uttered, when he was ſeized with a violent pain in his bowels, which no remedy could cure or abate. But notwithſtanding this violent ſhock, ſuffering himſelf to be hurried away by the tranſports of his fury, he gave orders for proceeding with the ſame precipitation in his journey. But while he was thus haſtening forward, he fell from his chariot, and was ſo bruiſed by the fall, that his attendants were forced to put him into a litter. Not being able to bear even the motion of the litter, he was forced to halt at a town called *Tabæ* on the confines of Perſia and Babylonia. Here he kept his bed, ſuffering inexpreſſible torments, occaſioned chiefly by the vermin which bred in his body, and the ſtench, which made him inſupportable even to himſelf. But the torments of his mind, cauſed by his reflecting on the former actions of his life, ſurpaſſed by many degrees thoſe of his body. Polybius, who in his account of this prince's death agrees with the Jewiſh hiſtorians, tells us, that the uneaſineſs of his mind grew at laſt to a conſtant delirium or ſtate of madneſs, by reaſon of ſeveral ſpectres and apparitions of evil genii or ſpirits, which he imagined were continually reproaching him with the many wicked actions of which he had been guilty. At laſt, having languiſhed for ſome time in this miſerable condition, he expired, and by his death freed the Jews from the moſt inveterate enemy they had ever known. Jews.

14 Dreadful death of Antiochus Epiphanes.

Notwithſtanding the death of Antiochus, however, the war was ſtill carried on againſt the Jews; but through the valour and good conduct of Judas, the Syrians were conſtantly defeated, and in 163 B. C. a peace was concluded upon terms very advantageous to the Jewiſh nation. This tranquillity, however, was of no long continuance; the Syrian generals renewed their hoſtilities, and were attended with the ſame ill ſucceſs as before. Judas defeated them in five engagements; but in the ſixth was abandoned by all his men except 800, who, together with their chief, were ſlain in the year 161 B. C.

15 Exploits of Jonathan, Simon, and Hyrcan. The news of the death of Judas threw his countrymen into the utmoſt conſternation, and ſeemed to give new life to all their enemies. He was ſucceeded, however, by his brother Jonathan; who conducted matters with no leſs prudence and ſucceſs than Judas had done, till he was treacherouſly ſeized and put to death by Tryphon, a Syrian uſurper, who ſhortly after murdered his own ſovereign. The traitor immediately prepared to invade Judea; but found all his projects fruſtrated by Simon, Jonathan's brother. This pontiff repaired all the fortreſſes of Judea, and furniſhed them with freſh garriſons, took Joppa and Gaza, and drove out the Syrian garriſon from the fortreſs of Jeruſalem; but was at laſt treacherouſly murdered by a ſon-in-law named Ptolemy, about 135 B. C.

Simon was ſucceeded by ſon Hyrcan; who not only ſhook off the yoke of Syria, but conquered the Samaritans, demoliſhed their capital city, and became maſter of all Paleſtine, to which he added the provinces

Jews. of Samaria and Galilee; all which he enjoyed till within a year of his death, without the leaſt diſturbance from without, or any internal diſcord. His reign was no leſs remarkable on the account of his great wiſdom and piety at home, than his conqueſts abroad. He was the firſt ſince the captivity who had aſſumed the royal title; and he raiſed the Jewiſh nation to a greater degree of ſplendor than it had ever enjoyed ſince that time. The author of the fourth book of the Maccabees alſo informs us, that in him three dignities were centered which never met in any other perſon, namely, the royal dignity, the high-prieſthood, and the gift of prophecy. But the inſtances given of this laſt are very equivocal and ſuſpicious. The laſt year of his reign, however, was imbittered by a quarrel with the phariſees; and which proceeded ſuch a length as was thought to have ſhortened his days. Hyrcan had always been a great friend to that ſect, and they had hitherto enjoyed the moſt honourable employments in the ſtate; but at length one of them, named *Eleazar*, took it into his head to queſtion Hyrcan's legitimacy, alleging, that his mother had formerly been a ſlave, and conſequently that he was incapable of enjoying the high-prieſthood. This report was credited, or pretended to be ſo, by the whole ſect; which irritated the high-prieſt to ſuch a degree, that he joined the ſadducees, and could never afterwards be reconciled to the phariſees, who therefore raiſed all the troubles and ſeditions they could during the ſhort time he lived.

Hyrcan died in 107 B. C. and was ſucceeded by his eldeſt ſon Ariſtobulus, who conquered Iturea, but proved a moſt cruel and barbarous tyrant, polluting his hands with the blood even of his mother and one of his brothers, keeping the reſt cloſely confined during his reign, which, however, was but ſhort. He
16 Alexander Jannæus, a great conqueror. was ſucceeded in 105 by Alexander Jannæus, the greateſt conqueror, next to king David, that ever ſat on the Jewiſh throne. He was hated, however, by the phariſees, and once in danger of being killed in a tumult excited by them; but having cauſed his guards to fall upon the mutinous mob, they killed 6000 of them, and diſperſed the reſt. After this, finding it impoſſible to remain in quiet in his own kingdom, he left Jeruſalem, with a deſign to apply himſelf wholly to the extending of his conqueſts; but while he was buſied in ſubduing his foreign enemies, the phariſees raiſed a rebellion at home. This was quaſhed in the year 86 B. C. and the rebels were treated in the moſt inhuman manner. The faction, however, was by this means ſo thoroughly quelled, that they never dared to lift up their heads as long as he lived; and Alexander having made ſeveral conqueſts in Syria, died about 79 B. C.

17 Conteſts between his ſons Hyrcanus and Ariſtobulus. The king left two ſons, Hyrcanus and Ariſtobulus; but bequeathed the government to his wife Alexandra as long as ſhe lived: but as he ſaw her greatly afraid, and not without reaſon, of the reſentment of the phariſees, he deſired his queen, juſt before his death, to ſend for the principal leaders of that party, and pretend to be entirely devoted to them; in which caſe, he aſſured her, that they would ſupport her and her ſons after her in the peaceable poſſeſſion of the government. With this advice the queen complied; but found herſelf much embarraſſed by the turbulent phariſees, who, after ſeveral exorbitant demands, would at laſt be contented with nothing leſs than the total extermination of their adverſaries the ſadducees. As the queen was unable to reſiſt the ſtrength of the phariſaic faction, a moſt cruel perſecution immediately took place againſt the ſadducees, which continued for four years; until at laſt, upon their earneſt petition, they were diſperſed among the ſeveral garriſons of the kingdom, in order to ſecure them from the violence of their enemies. A few years after this, being ſeized with a dangerous ſickneſs, her youngeſt ſon Ariſtobulus collected a ſtrong party in order to ſecure the crown to himſelf; but the queen, being diſpleaſed with his conduct, appointed her other ſon Hyrcanus, whom ſhe had before made high-prieſt, to ſucceed her alſo in the royal dignity. Soon after this ſhe expired, and left her two ſons competitors for the crown. The phariſees raiſed an army againſt Ariſtobulus, which almoſt inſtantly deſerted to him, ſo that Hyrcanus found himſelf obliged to accept of peace upon any terms; which, however, was not granted, till the latter had abandoned all title both to the royal and pontifical dignity, and contented himſelf with the enjoyment of his peculiar patrimony as a private perſon. Jews.

But this depoſition did not extinguiſh the party of Hyrcanus. A new cabal was raiſed by Antipater an Idumæan proſelyte, and father of Herod the Great; who carried off Hyrcanus into Arabia, under pretence that his life was in danger if he remained in Judea. Here he applied to Aretas king of that country, who undertook to reſtore the depoſed monarch; and for that purpoſe invaded Judea, defeated Ariſtobulus, and kept him cloſely beſieged in Jeruſalem. The latter had recourſe to the Romans; and 18 The Romans called in by Ariſtobulus. having bribed Scaurus, one of their generals, he defeated Aretas with the loſs of 7000 of his men, and drove him quite out of the country. The two brothers next ſent preſents to Pompey, at that time commander in chief of all the Roman forces in the eaſt, and whom they made the arbitrator of their differences. But he, fearing that Ariſtobulus, againſt whom he intended to declare, might obſtruct his intended expedition againſt the Nabatheans, diſmiſſed them with a promiſe, that as ſoon as he had ſubdued Aretas, he would come into Judea and decide their controverſy.

This delay gave ſuch offence to Ariſtobulus, that he ſuddenly departed for Judea without even taking leave of the Roman general, who on his part was no leſs offended at this want of reſpect. The conſequence was, that Pompey entered Judea with thoſe troops with which he had deſigned to act againſt the Nabathæans, and ſummoned Ariſtobulus to appear before him. The Jewiſh prince would gladly have been excuſed; but was forced by his own people to comply with Pompey's ſummons, to avoid a war with that general. He came accordingly more than once or twice to him, and was diſmiſſed with great promiſes and marks of friendſhip. But at laſt Pompey inſiſted, that he ſhould deliver into his hands all the fortified places he poſſeſſed; which let Ariſtobulus plainly ſee that he was in the intereſt of his brother, and upon this he fled to Jeruſalem with a deſign to oppoſe the Romans to the utmoſt of his power. He was quickly followed by Pompey; and to prevent hoſtilities was at laſt forced to go and throw himſelf at the feet of the haughty Roman, and to promiſe him a conſiderable ſum of money as the reward of his forbearance. This ſubmiſſion

Jews. mission was accepted; but Gabinius, being sent with some troops to receive the stipulated sum, was repulsed by the garrison of Jerusalem, who shut the gates against him, and refused to fulfil the agreement. This disappointment so exasperated Pompey, that he immediately marched with his whole army against the city.

19 Jerusalem taken by Pompey.

The Roman general first sent proposals of peace; but finding the Jews resolved to stand out to the last, he began the siege in form. As the place was strongly fortified both by nature and art, he might have found it very difficult to accomplish his design, had not the Jews been suddenly seized with a qualm of conscience respecting the observance of the sabbath-day. From the time of the Maccabees they had made no scruple of taking up arms against an offending enemy on the sabbath; but now they discovered, that tho' it was lawful on that day to stand on their defence in case they were actually attacked, yet it was unlawful to do any thing towards the preventing of those preparatives which the enemy made towards such future assaults. As therefore they never moved an hand to hinder the erection of mounds and batteries, or the making of breaches in their walls on the sabbath, the besiegers at last made such a considerable breach on that day, that the garrison could no longer resist them. The city was therefore taken in the year 63 B. C. 12,000 of the inhabitants were slaughtered, and many more died by their own hands; while the priests, who were offering up the usual prayers and sacrifices in the temple, chose rather to be butchered along with their brethren, than suffer divine service to be one moment interrupted. At last, after the Romans had satiated their cruelty with the death of a vast number of the inhabitants, Hyrcanus was restored to the pontifical dignity with the title of *prince;* but forbid to assume the title of *king*, to wear a diadem, or to extend his territories beyond the limits of Judea. To prevent future revolts, the walls were pulled down; and Scaurus was left governor with a sufficient force. But before he departed, the Roman general gave the Jews a still greater offence than almost any thing he had hitherto done; and that was by entering into the most sacred recesses of the temple, where he took a view of the golden table, candlestick, censers, lamps, and all the other sacred vessels; but out of respect to the Deity, forbore to touch any of them, and when he came out commanded the priests immediately to purify the temple according to custom.

Pompey having thus subdued the Jewish nation, set out for Rome, carrying along with him Aristobulus and his two sons Alexander and Antigonus, as captives to adorn his future triumph. Aristobulus himself and his son Antigonus were led in triumph; but Alexander found means to escape into Judea, where he raised an army of 10,000 foot and 1500 horse, and began to fortify several strong holds, from whence he made incursions into the neighbouring country. As for Hyrcanus, he had no sooner found himself freed from his rival brother, than he relapsed into his former indolence, leaving the care of all his affairs to Antipater, who, like a true politician, failed not to turn the weakness of the prince to his own advantage and the aggrandizing of his family. He foresaw, however, that he could not easily compass his ends, unless he ingratiated himself with the Romans; and therefore spared neither pains nor cost to gain their favour. Scaurus soon after received from him a supply of corn and other provisions, without which his army, which he had led against the metropolis of Arabia, would have been in danger of perishing; and after this, he prevailed on the king to pay 300 talents to the Romans, to prevent them from ravaging his country. Hyrcanus was now in no condition to face his enemy Alexander; and therefore had again recourse to the Romans, Antipater at the same time sending as many troops as he could spare to join them. Alexander ventured a battle; but was defeated with considerable loss, and besieged in a strong fortress named *Alexandrion*. Here he would have been forced to surrender; but his mother, partly by her address, and partly by the services she found means to do the Roman general, prevailed upon him to grant her son a pardon for what was past. The fortresses were then demolished, that they might not give occasion to fresh revolts; Hyrcanus was again restored to the pontifical dignity; and the province was divided into five several districts, in each of which a separate court of judicature was erected. The first of these was at Jerusalem, the second at Gadara, the third at Amath, the fourth at Jericho, and the fifth at Sephoris in Galilee. Thus was the government changed from a monarchy to an aristocracy, and the Jews now fell under a set of domineering lords. Jews. 20 Jewish government changed into an aristocracy.

Soon after this, Aristobulus found means to escape from his confinement at Rome, and raised new troubles in Judea, but was again defeated and taken prisoner: his son also renewed his attempts; but was in like manner defeated, with the loss of near 10,000 of his followers; after which Gabinius, having settled the affairs of Judea to Antipater's mind, resigned the government of his province to Crassus. The only transaction during his government was his plundering the temple of all its money and sacred utensils, amounting in the whole to 10,000 Attic talents, *i. e.* above two millions of our money. After this facrilege, Crassus set out on his expedition against Parthia, where he perished; and his death was by the Jews interpreted as a divine judgment for his impiety.

The war between Cæsar and Pompey afforded the Jews some respite, and likewise an opportunity of ingratiating themselves with the former, which the politic Antipater readily embraced. His services were rewarded by the emperor. He confirmed Hyrcanus in his priesthood, added to it the principality of Judea to be entailed on his posterity for ever, and restored the Jewish nation to their ancient rights and privileges; ordering at the same time a pillar to be erected, whereon all these grants, and his own decree, should be engraved, which was accordingly done; and soon after, when Cæsar himself came into Judea, he granted liberty also to fortify the city, and rebuild the wall which had been demolished by Pompey. 21 Jews favoured by Cæsar.

During the lifetime of Cæsar, the Jews were so highly favoured, that they could scarcely be said to feel the Roman yoke. After his death, however, the nation fell into great disorders; which were not finally quelled, till Herod, who was created king of Judea by Marc Anthony in 40 B. C. was fully established on the throne by the taking of Jerusalem by his allies the Romans in 37 B. C. The immediate consequence of this was another cruel pillage and massacre: then fol- 22 Herod raised to the Jewish throne.

Jews. lowed the death of Antigonus the ſon of Ariſtobulus, who had for three years maintained his ground againſt Herod, put to death his brother Phaſael, and cut off Hyrcanus's ears, in order the more effectually to incapacitate him for the high-prieſthood.

23 His tyranny and cruelty. The Jews gained but little by this change of maſters. The new king proved one of the greateſt tyrants mentioned in hiſtory. He began his reign with a cruel perſecution of thoſe who had ſided with his rival Antigonus; great numbers of whom he put to death, ſeizing and confiſcating their effects for his own uſe. Nay, ſuch was his jealouſy in this laſt reſpect, that he cauſed guards to be placed at the city-gates, in order to watch the bodies of thoſe of the Antigonian faction who were carried out to be buried, leſt ſome of their riches ſhould be carried along with them. His jealouſy next prompted him to decoy Hyrcanus, the baniſhed pontiff, from Parthia, where he had taken refuge, that he might put him to death, tho' contrary to his moſt ſolemn promiſes. His cruelty then fell upon his own family. He had married Mariamne, the daughter of Hyrcanus; whoſe brother, Ariſtobulus, a young prince of great hopes, was made high-prieſt at the interceſſion of his mother Alexandra. But the tyrant, conſcious that Ariſtobulus had a better right to the kingdom than himſelf, cauſed him ſoon after to be drowned in a bath. The next victim was his beloved queen Mariamne herſelf. Herod had been ſummoned to appear firſt before Marc Anthony, and then before Auguſtus, in order to clear himſelf from ſome crimes laid to his charge. As he was, however, doubtful of the event, he left orders, that in caſe he was condemned, Mariamne ſhould be put to death. This, together with the death of her father and brother, gave her ſuch an averſion for him, that ſhe ſhewed it on all occaſions. By this conduct the tyrant's reſentment was at laſt ſo much inflamed, that having got her falſely accuſed of infidelity, ſhe was condemned to die, and executed accordingly. She ſuffered with great reſolution; but with her ended all the happineſs of her huſband. His love for Mariamne increaſed ſo much after her death, that for ſome time he appeared like one quite diſtracted. His remorſe, however, did not get the better of his cruelty. The death of Mariamne was ſoon followed by that of her mother Alexandra, and this by the execution of ſeveral other perſons who had joined with her in an attempt to ſecure the kingdom to the ſons of the deceaſed queen.

Herod, having now freed himſelf from the greateſt part of his ſuppoſed enemies, began to ſhew a greater contempt for the Jewiſh ceremonies than formerly; and introduced a number of heatheniſh games, which made him odious to his ſubjects. Ten bold fellows at laſt took it into their heads to enter the theatre where the tyrant was celebrating ſome games, with daggers concealed under their clothes, in order to ſtab him or ſome of his retinue. In caſe they ſhould miſcarry in the attempt, they had the deſperate ſatisfaction to think, that, if they periſhed, the tyrant would be rendered ſtill more odious by the puniſhment inflicted on them. They were not miſtaken: for Herod being informed of their deſign by one of his ſpies, and cauſing the aſſaſſins to be put to a moſt excruciating death, the people were ſo much exaſperated againſt the informer, that they cut and tore him to pieces, and caſt his fleſh to the dogs. Herod tried in vain to diſcover the authors of this affront; but at laſt having cauſed ſome women to be put to the rack, he extorted from them the names of the principal perſons concerned, whom he cauſed immediately to be put to death with their families. This produced ſuch diſturbances, that, apprehending nothing leſs than a general revolt, he ſet about fortifying Jeruſalem with ſeveral additional works, rebuilding Samaria, and putting garriſons into ſeveral fortreſſes in Judea. Notwithſtanding this, however, Herod had ſhortly after an opportunity of regaining the affections of his ſubjects in ſome meaſure, by his generoſity to them during a famine; but as he ſoon relapſed into his former cruelty, their love was again turned into hatred, which continued till his death. Jews.

24 Rebuilds the temple. Herod now, about 23 B. C. began to adorn his cities with many ſtately buildings. The moſt remarkable and magnificent of them all, however, was the temple at Jeruſalem, which he is ſaid to have raiſed to a higher pitch of grandeur than even Solomon himſelf had done. Ten thouſand artificers were immediately ſet to work, under the direction of 1000 prieſts, the beſt ſkilled in carving, maſonry, &c. all of whom were kept in conſtant pay. A thouſand carts were employed in fetching materials; and ſuch a number of other hands were employed, that every thing was got ready within the ſpace of two years. After this they ſet about pulling down the old building, and rearing up the new one with the ſame expedition: ſo that the *holy place*, or temple properly ſo called, was finiſhed in a year and an half; during which we are told that it never rained in the day-time, but only in the night. The remainder was finiſhed in ſomewhat more than eight years. The *temple*, properly ſo called, or holy place, was but 60 cubits high, and as many in breadth; but in the front he added two wings or ſhoulders which projected 20 cubits more on each ſide, and which in all made a front of 120 cubits in length, and as many in height; with a gate 70 cubits high and 20 in breadth, but open and without any doors. The ſtones were white marble, 25 cubits in length, 12 in height, and nine in breadth, all wrought and poliſhed with exquiſite beauty; the whole reſembling a ſtately palace, whoſe middle being conſiderably raiſed above the extremities of each face, made it afford a beautiful viſta at a great diſtance, to thoſe who came to the metropolis. Inſtead of doors, the gates cloſed with very coſtly veils, enriched with a variety of flowering of gold, ſilver, purple, and every thing that was rich and curious; and on each ſide of the gates were planted two ſtately columns, from whoſe cornices hung golden feſtoons and vines, with their cluſters of grapes, leaves, &c. curiouſly wrought. The ſuperſtructure, however, which was probably reared on the old foundation without ſufficient additions, proved too heavy, and ſunk down about 20 cubits; ſo that its height was reduced to 100. This foundation was of an aſtoniſhing ſtrength and height, of which an account is given under the article JERUSALEM. The platform was a regular ſquare of a ſtade or furlong on each ſide. Each front of the ſquare had a ſpacious gate or entrance, enriched with ſuitable ornaments; but that on the weſt had four gates, one of which led to the palace, another

Jews. another to the city, and the two others to the ſuburbs and fields. This incloſure was ſurrounded on the outſide with a ſtrong and high wall of large ſtones, well cemented; and on the inſide, had on each front a ſtately piazza or gallery, ſupported by columns of ſuch a bigneſs, that three men could but juſt embrace them, their circumference being about 27 feet. There were in all 162 of them, which ſupported a cedar cieling of excellent workmanſhip, and formed three galleries, the middlemoſt of which was the largeſt and higheſt, it being 45 feet in breadth and 100 in height, whereas thoſe on each ſide were but 30 feet wide and 50 in height.

The piazzas and court were paved with marble of various colours; and, at a ſmall diſtance from the galleries, was a ſecond incloſure, ſurrounded with a flight of beautiful marble rails, with ſtately columns at proper diſtances, on which were engraven certain admonitions in Greek and Latin, to forbid ſtrangers, and thoſe Jews that were not purified, to proceed farther under pain of death. This incloſure had but one gate on the eaſt ſide; none on the weſt; but on the north and ſouth it had three, placed at equal diſtances from each other.

A third incloſure ſurrounded the *temple* properly ſo called, and the altar of burnt-offerings; and made what they called *the court of the Hebrews*, or *Iſraelites*. It was ſquare like the reſt: but the wall on the outſide was ſurrounded by a flight of 14 ſteps, which hid a conſiderable part of it; and on the top was a terrace, of about 12 cubits in breadth, which went quite round the whole cincture. The eaſt ſide had but one gate; the weſt none; and the north and ſouth four, at equal diſtances. Each gate was aſcended by five ſteps more, before one could reach the level of the inward court; ſo that the wall which incloſed it appeared within to be but 25 cubits high, though conſiderably higher on the outſide. On the inſide of each of thoſe gates were raiſed a couple of ſpacious ſquare chambers, in form of a pavilion, 30 cubits wide and 40 in height, each ſupported by columns of 12 cubits in circumference.

This incloſure had likewiſe a double flight of galleries on the inſide, ſupported by a double row of columns; but the weſtern ſide was only one continued wall, without gates or galleries. The women had likewiſe their particular courts ſeparate from that of the men, and one of the gates on the north and ſouth leading to it.

The altar of burnt-offerings was likewiſe high and ſpacious, being 40 cubits in breadth, and 15 in height. The aſcent to it was, according to the Moſaic law, ſmooth, and without ſteps; and the altar of unhewn ſtones. It was ſurrounded, at a convenient diſtance, with a low wall or rail, which divided the court of the prieſts from that of the lay Iſraelites; ſo that theſe laſt were allowed to come thus far to bring their offerings and ſacrifices; though none but the prieſts were allowed to come within that incloſure.

Herod cauſed a new dedication of this temple to be performed with the utmoſt magnificence; and preſented to it many rich trophies of his former victories, after the cuſtom of the Jewiſh monarchs.

This, and many other magnificent works, however, Jews.
did not divert the king's attention from his uſual jealouſies and cruelty. His ſiſter Salome, and one of his ſons named *Antipater*, taking advantage of this diſpoſition, prompted him to murder his two ſons by Mariamne, named *Alexander* and *Ariſtobulus*, who had been educated at the court of Auguſtus in Italy, and were juſtly admired by all who ſaw them. His cruelty ſoon after broke out in an impotent attempt to deſtroy the Saviour of the world, but which was attended with no other conſequence than the deſtruction of 2000 innocent children of his own ſubjects. His miſery was almoſt brought to its ſummit by the diſcovery of Antipater's deſigns againſt himſelf; who was accordingly tried and condemned for treaſon. Something ſtill more dreadful, however, yet awaited him; he was ſeized with a moſt loathſome and incurable diſeaſe, in in which he was tormented with intolerable pains, ſo
25
that his life became a burden. At laſt he died, to the His death.
great joy of the Jews, five days after he had put Antipater to death, and after having divided his kingdom among his ſons in the following manner.—Archelaus had Judea; Antipas, or Herod, was tetrarch of Galilee and Perea; and Philip had the regions of Trachonitis, Gaulon, Batanea, and Panias, which he erected likewiſe into a tetrarchy. To his ſiſter Salome he gave 50,000 pieces of money, together with the cities of Jamnia, Azotus, and Phaſaelis; beſides ſome conſiderable legacies to his other relations.

The cruelty of this monſter accompanied him to his grave; nay, he in a manner carried it beyond the grave. Being well appriſed that the Jews would rejoice at being freed from ſuch a tyrant, he bethought himſelf of the following infernal ſtratagem to damp their mirth. A few days before his death, he ſummoned all the heads of the Jews to repair to Jericho under pain of death; and, on their arrival, ordered them all to be ſhut up in the circus, giving at the ſame time ſtrict orders to his ſiſter Salome and her huſband to have all the priſoners butchered as ſoon as his breath was gone out. "By this means, (ſaid he,) I ſhall not only damp the people's joy, but ſecure a real mourning at my death." Theſe cruel orders, however, were not put in execution. Immediately after the king's death, Salome went to the Hippodrome, where the heads of the Jews were detained, cauſed the gates to be flung open, and declared to them, that now the king had no farther occaſion for their attendance, and that they might depart to their reſpective homes; after which, and not till then, the news of the king's death was publiſhed. Tumults, ſeditions, and
26
inſurrections, quickly followed. Archelaus was op- New diviſion of the kingdom by Auguſtus.
poſed by his brethren, and obliged to appear at Rome before Auguſtus, to whom many complaints were brought againſt him. After hearing both parties, the emperor made the following diviſion of the kingdom: Archelaus had one-half, under the title of *ethnarch*, or governor of a nation; together with a promiſe that he ſhould have the title of *king*, as ſoon as he ſhewed himſelf worthy of it. This ethnarchy contained Judæa Propria, Idumea, and Samaria: but this laſt was exempted from one-fourth of the taxes paid by the reſt, on account of the peaceable behaviour of the inhabitants during the late tumults. The remainder

Jews.

remainder was divided between Philip and Herod; the former of whom had Trachonitis, Batanea, and Auranitis, together with a small part of Galilee; the latter had the reft of Galilee, and the countries beyond the Jordan. Salome had half a million of filver, together with the cities of Jamnia, Azotus, Phafaelis, and Afcalon.

For fome years Archelaus enjoyed his government in peace; but at laft, both Jews and Samaritans, tired out with his tyrannical behaviour, joined in a petition to Auguftus againft him. The emperor immediately fummoned him to Rome, where, having heard his accufation and defence, he banifhed him to the city of Vienne in Dauphiny, and confifcated all his effects. Judea being by this fentence reduced to a Roman province, was ordered to be taxed; and Cyrenius the governor of Syria, a man of confular dignity, was fent thither to fee it put in execution: which having done, and fold the palaces of Archelaus, and feized upon all his treafure, he returned to Antioch, leaving the Jews in no fmall ferment on account of this new tax.

27 Archelaus banifhed, and a Roman governor appointed over Judæa.

Thus were the feeds of diffenfion fown between the Jews and Romans, which ended in the moft lamentable catafrophe of the former. The Jews, always impatient of a foreign yoke, knew from their prophecies, that the time was now come when the Meffiah fhould appear. Of confequence, as they expected him to be a great and powerful warrior, their rebellious and feditious fpirit was heightened to the greateft degree; and they imagined they had nothing to do but take up arms, and victory would immediately declare on their fide. From this time, therefore, the country was never quiet; and the infatuated people, while they rejected the true Meffiah, gave themfelves up to the direction of every impoftor who chofe to lead them to their own deftruction. The governors appointed by the Romans were alfo frequently changed, but feldom for the better. About the 16th year of Chrift, Pontius Pilate was appointed governor; the whole of whofe adminiftration, according to Jofephus, was one continued fcene of venality, rapine, tyranny, and every wicked action; of racking and putting innocent men to death, untried and uncondemned; and of every kind of favage cruelty. Such a governor was but ill calculated to appeafe the ferments occafioned by the late tax. Indeed Pilate was fo far from attempting this, that he greatly inflamed them by taking every occafion of introducing his ftandards with images and pictures, confecrated fhields, &c. into their city; and at laft attempting to drain the treafury of the temple, under pretence of bringing an aqueduct into Jerufalem. The moft remarkable tranfaction of his government, however, was his condemnation of Jesus Christ: feven years after which he was removed from Judæa; and in a fhort time Agrippa the grandfon of Herod the Great, was promoted by Caius to the regal dignity. He did not, however, long enjoy this honour; for, on his coming into Judæa, having raifed a perfecution againft the Chriftians, and blafphemoufly fuffering himfelf to be ftyled a *God* by fome deputies from Tyre and Sidon, he was miraculoufly ftruck with a difeafe, which foon put an end to his life. The facred hiftorian tells us, that he was eaten of worms; and Jofephus, that he was feized with moft violent pains in his heart and bowels; fo that he could not but reflect on the bafenefs of thofe flatterers, who had but lately complimented him with a kind of divine immortality, that was now about to expire in all the torments and agonies of a miferable mortal.

28 Agrippa made king.

On the death of Agrippa, Judæa was once more reduced to a province of the Roman empire, and had new governors appointed over it. Thefe were Ventidius, Felix, Feftus, Albinus, and Geffius Florus. Under their government the Jewifh affairs went on from bad to worfe; the country fwarmed with robbers and affaffins; the latter committing every-where the moft unheard-of cruelties under the pretence of religion; and about 64 A. C. were joined by 18,000 workmen, who had been employed in further repairing and beautifying the temple. About this time alfo, Geffius Florus, the laft and worft governor the Jews ever had, was fent into the country. Jofephus feems at a lofs for words to defcribe him by, or a monfter to compare him to. His rapines, cruelties, conniving for large fums with the banditti, and, in a word, his whole behaviour, were fo open and barefaced, that he was looked upon by the Jews more like a bloody executioner fent to butcher, than a magiftrate to govern them. In this diftracted ftate of the country, many of the inhabitants forfook it to feek for an afylum fomewhere elfe; while thofe who remained, applied themfelves to Ceftius Gallus, governor of Syria, who was at Jerufalem at the paffover; befeeching him to pity their unhappy ftate, and free them from the tyranny of a man who had totally ruined their country. Florus, who was prefent when thefe complaints were brought againft him, made a mere jeft of them; and Ceftius, inftead of making a ftrict inquiry into his conduct, difmiffed the Jews with a general promife that the governor fhould behave better for the future; and fet himfelf about computing the number of Jews at that time in Jerufalem, by the number of lambs offered at that feftival, that he might fend an account of the whole to Nero. By his computation, there were at that time in Jerufalem 2,556,000; tho' Jofephus thinks they rather amounted to 3,000,000.

29 The kingdom again reduced to a Roman province.

30 Caufe of the laft war with the Romans.

In the year 67 began the fatal war with the Romans, which was ended only by the deftruction of Jerufalem. The immediate caufe was the decifion of a conteft with the Syrians concerning the city of Cæfarea. The Jews maintained that this city belonged to them, becaufe it had been built by Herod; and the Syrians pretended that it had always been reckoned a Greek city, fince even that monarch had reared temples and ftatues in it. The conteft at laft came to fuch an height, that both parties took up arms againft each other. Felix put an end to it for a time, by fending fome of the chiefs of each nation to Rome, to plead their caufe before the emperor, where it hung in fufpenfe till this time, when Nero decided it againft the Jews. No fooner was this decifion made public, than the Jews in all parts of the country flew to arms; and, tho' they were every-where the fufferers, yet, from this fatal period, their rage never abated. Nothing was now to be heard of but robberies, murders, and

Jews.

and every kind of cruelty. Cities and villages were filled with dead bodies of all ages, even ſucking babes. The Jews, on their part, ſpared neither Syrians nor Romans, where they got the better of them; and this proved the deſtruction of great numbers of their peaceful brethren: 20,000 were maſſacred at Cæſarea, 50,000 at Alexandria, 2000 at Ptolemais, and 3,500 at Jeruſalem.

A great number of aſſaſſins, in the mean time, having joined the factions Jews in Jeruſalem, they beat the Romans out of Antonia, a fortreſs adjoining to the temple, and another called *Maſſada;* and likewiſe out of the towers called *Phaſael* and *Mariamne*, killing all who oppoſed them. The Romans were at laſt reduced to ſuch ſtraits, that they capitulated on the ſingle condition that their lives ſhould be ſpared; notwithſtanding which, they were all maſſacred by the furious zealots: and this treachery was ſoon revenged on the faithful Jews of Scythopolis. Theſe had offered to aſſiſt in reducing their factious brethren; but, their ſincerity being ſuſpected by the townſmen, they obliged them to retire into a neighbouring wood, where, on the third night, they were maſſacred to the number of 13,000, and all their wealth carried off. The rebels, in the mean time, croſſed the Jordan, and took the fortreſſes of Machæron and Cyprus; which laſt they razed to the ground, after having put all the Romans to the ſword.—This brought Ceſtius Gallus, the Syrian governor, into Judæa with all his forces; but the Jews, partly by treachery and partly by force, got the better of him, and drove him out of the country with the loſs of 5000 men.

All this time ſuch dreadful diſſenſions reigned among the Jews, that great numbers of the better ſort, foreſeeing the ſad effects of the reſentment of the Romans, left the city as men do a ſinking veſſel; and the Chriſtians, mindful of their Saviour's prediction, retired to Pella, a city on the other ſide of Jordan, whither the war did not reach. Miſerable was the fate of ſuch as either could not, or would not, leave that devoted city. Veſpaſian was now ordered to leave Greece where he was at that time, and to march with all ſpeed into Judea. He did ſo accordingly at the head of a powerful army, ordering his ſon Titus in the mean time to bring two more legions from Alexandria; but before he could reach that country, the Jews had twice attempted to take the city of Aſcalon, and were each time repulſed with the loſs of 10,000 of their number. In the beginning of the year 68, Veſpaſian entered Galilee at the head of an army of 60,000 men all completely armed and excellently diſciplined. He firſt took and burnt Gadara: then he laid ſiege to Jotapa, and took it after a ſtout reſiſtance; at which he was ſo provoked, that he cauſed every one of the Jews to be maſſacred or carried into captivity, not one being left to carry the dreadful news to their brethren. Forty thouſand periſhed on this occaſion; only 1200 were made priſoners, among whom was Joſephus the Jewiſh hiſtorian. Japha next ſhared the ſame fate, after an obſtinate ſiege; all the men being maſſacred, and the women and children carried into captivity. A week after this the Samaritans, who had aſſembled on Mount Gerizzim, were almoſt all put to the ſword, or periſhed. Joppa fell the next victim to the Roman vengeance. It had been formerly laid waſte by Ceſtius; but was now repeopled and fortified by the ſeditious Jews who infeſted the country. It was taken by ſtorm, and ſhared the ſame fate with the reſt. Four thouſand Jews attempted to eſcape, by taking to their ſhips; but were driven back by a ſudden tempeſt, and all of them were drowned or put to the ſword. Tarichea and Tiberias were next taken, but part of their inhabitants were ſpared on account of their peaceable diſpoſitions. Then followed the ſieges of Gamala, Giſchala, and Itabyr. The firſt was taken by ſtorm, with a dreadful ſlaughter of the Jews; the laſt by ſtratagem. The inhabitants of Giſchala were inclineable to ſurrender: but a ſeditious Jew of that town, named *John*, the ſon of Levi, head of the faction, and a vile fellow, oppoſed it; and, having the mob at his beck, ovcrawed the whole city. On the ſabbath he begged of Titus to forbear hoſtilities till to-morrow, and then he would accept his offer; but inſtead of that, he fled to Jeruſalem with as many as would follow him. The Romans, as ſoon as they were informed of his flight, purſued, and killed 6000 of his followers on the road, and brought back near 3000 women and children priſoners. The inhabitants then ſurrendered to Titus, and only the factious were puniſhed; and this completed the reduction of Galilee.

The Jewiſh nation by this time was divided into two very oppoſite parties: the one foreſeeing that this war, if continued, muſt end in the total ruin of their country, were for putting an end to it by ſubmitting to the Romans; the other, which was the remains of the faction of Judas Gaulonites, breathed nothing but war and confuſion, and oppoſed all peaceable meaſures with invincible obſtinacy. This laſt, which was by far the moſt numerous and powerful, conſiſted of men of the vileſt and moſt profligate characters that can be paralleled in hiſtory. They were proud, ambitious, cruel, rapacious, and committed the moſt horrid and unnatural crimes under the maſk of religion. They affirmed every where, that it was offering the greateſt diſhonour to God to ſubmit to any earthly potentate; much leſs to Romans and to heathens. This, they ſaid, was the only motive that induced them to take up arms, and to bind themſelves under the ſtricteſt obligations not to lay them down till they had either totally extirpated all foreign authority, or periſhed in the attempt.—This dreadful diſſenſion was not confined to Jeruſalem, but had infected all the cities, towns, and villages, of Paleſtine. Even houſes and families were ſo divided againſt each other, that, as our Saviour had expreſly foretold, a man's greateſt enemies were often thoſe of his own family and houſehold. In ſhort, if we may believe Joſephus, the zealots acted more like incarnate devils than like men who had any ſenſe of humanity left them.—This obliged the contrary party likewiſe to riſe up in arms in their own defence againſt thoſe miſcreants; from whom, however, they ſuffered much more than they did even from the exaſperated Romans.—The zealots began their outrages by murdering all that oppoſed them in the countries round about. Then they entered Jeruſalem; but met with a ſtout oppoſition from the other party headed by Ananus, who had lately been high-prieſt. A fierce engage-

35 Cruelty of the zealots.

ment

Jews. ment enſued betwcen them; and the zealots were driven into the inner cinčture of the temple, where they were cloſely beſieged. John of Giſchala above mentioned, who had pretended to ſide with the peaceable party, was then ſent with terms of accommodation; but, inſtead of adviſing the beſieged to accept of them, he perſuaded them ſtill to hold out, and call the Idumeans to their aſſiſtance. They did ſo, and procured 20,000 of them to come to their relief; but theſe new allies were refuſed admittance into the city. On that night, however, there happened ſuch a violent ſtorm, accompanied with thunder, lightning, and an earthquake, that the zealots from within the inner court ſawed the bolts and hinges of the temple-gates without being heard, forced the guards of the beſiegers, ſallied into the city, and let in the Idumeans. The city was inſtantly filled with butcheries of the moſt horrid kind. Barely to put any of the oppoſite party to death, was thought too mild a puniſhment; they muſt have the pleaſure of murdering them by inches: ſo that they made it now their diverſion to put them to the moſt exquiſite tortures that could be invented; nor could they be prevailed upon to diſpatch them till the violence of their torments had rendered them quite incapable of feeling them. In this manner periſhed 12,000 perſons of noble extraction, and in the flower of their age; till at laſt the Idumeans complained ſo much againſt the putting ſuch numbers to death, that the zealots thought proper to erect a kind of tribunal, which, however, was intended not for judgment, but condemnation; for the judges having once acquitted a perſon who was manifeſtly innocent, the zealots not only murdered him in the temple, but depoſed the new-created judges as perſons unfit for their office.

The zealots, after having exterminated all thoſe of any character or diſtinction, began next to wreak their vengeance on the common people. This obliged many of the Jews to forſake Jeruſalem, and take refuge with the Romans, though the attempt was very hazardous; for the zealots had all the avenues well guarded, and failed not to put to death ſuch as fell into their hands. Veſpaſian in the mean time ſtaid at Cæſarea an idle ſpectator of their outrages; well knowing that the zealots were fighting for him, and that the ſtrength of the Jewiſh nation was gradually waſting away. Every thing ſucceeded to his wiſh. The zealots, after having maſſacred or driven away the oppoſite party, turned their arms againſt each other. A party was formed againſt John, under one Simon who had his head-quarters at the fortreſs of Maſſada. This new miſcreant plundered, burned, and maſſacred, wherever he came, carrying the ſpoil into the fortreſs above-mentioned. To increaſe his party, he cauſed a proclamation to be publiſhed, by which he promiſed liberty to the ſlaves, and proportionable encouragement to the freemen who joined him. This ſtratagem had the deſired effect, and he ſoon ſaw himſelf at the head of a conſiderable army. Not thinking himſelf, however, as yet maſter of force ſufficient to beſiege Jeruſalem, he invaded Idumea with 20,000 men. The Idumeans oppoſed him with 25,000; and a ſharp engagement enſued, in which neither party was victorious. But Simon, ſoon after, having corrupted the Idumean general, got their army delivered up to him. By this means he eaſily became maſter of the country; where he committed ſuch cruelties, that the miſerable inhabitants abandoned it to ſeek for ſhelter in Jeruſalem.

35 They turn their arms againſt each other.

In the city, matters went in the ſame way. John tyrannized in ſuch a manner, that the Idumeans revolted, killed a great number of his men, plundered his palace, and forced him to retire into the temple. In the mean time the people, having taken a notion that he would ſally out in the night and ſet fire to the city, called a council, in which it was reſolved to admit Simon with his troops, in order to oppoſe John and his zealots. Simon's firſt attempt againſt his rival, however, was ineffectual, and he was obliged to content himſelf with beſieging the zealots in the temple. In the mean time the miſeries of the city were increaſed by the ſtarting up of a third party headed by one Eleazar, who ſeized on the court of the prieſts, and kept John confined within that of the Iſraelites. Eleazar kept the avenues ſo well guarded, that none were admitted to come into that part of the temple but thoſe who came thither to offer ſacrifices; and it was by theſe offerings chiefly that he maintained himſelf and his men. John by this means found himſelf hemmed in between two powerful enemies, Simon below, and Eleazar above. He defended himſelf, however, againſt them both with great reſolution; and when the city was inveſted by the Romans, having pretended to come to an agreement with his rivals, he found means totally to cut off or force Eleazar's men to ſubmit to him, ſo that the factions were again reduced to two.

36 The Romans advance to Jeruſalem.

The Romans, in the year 72, began to advance towards the capital. In their way they deſtroyed many thouſands, waſting the country as they went along; and in the year 73 arrived before the walls of Jeruſalem, under Titus afterwards emperor. As he was a man of an exceedingly merciful diſpoſition, and greatly deſired to ſpare the city, he immediately ſent offers of peace; but theſe were rejected with contempt, and he himſelf put in great danger of his life, ſo that he reſolved to begin the ſiege in form. In the mean time, Simon and John renewed their hoſtilities with greater fury than ever. John now held the whole temple, ſome of the out-parts of it, and the valley of Cedron. Simon had the whole city to range in; in ſome parts of which John had made ſuch devaſtations, that they ſerved them for a field of battle, from which they ſallied unanimouſly againſt the common enemy whenever occaſion ſerved; after which they returned to their uſual hoſtilities, turning their arms againſt each other, as if they had ſworn to make their ruin more eaſy to the Romans. Theſe drew ſtill nearer to the walls, having with great labour and pains levelled all the ground between Scopas and them, by pulling down all the houſes and hedges, cutting down the trees, and even cleaving the rocks that ſtood in their way, from Scopas to the tomb of Herod, and Bethara or the pool of ſerpents; in which work ſo many hands were employed, that they finiſhed it in four days.

37 Offers of peace rejected.

Whilſt this was doing, Titus ſent the beſieged ſome offers of peace; and Joſephus was pitched upon to be the meſſenger of them: but they were rejected with indignation. He ſent a ſecond time Nicanor and Joſephus with freſh offers, and the former received a wound

Jews. wound in his ſhoulder; upon which Titus reſolved to begin the aſſault in good earneſt, and ordered his men to raſe the ſuburbs, cut down all the trees, and uſe the materials to raiſe platforms againſt the wall. Every thing was now carried on with invincible ardour; the Romans began to play their engines againſt the city with all their might. The Jews had likewiſe their machines upon the walls, which they plied with uncommon fury: they had taken them lately from Ceſtius; but were ſo ignorant in their uſe, that they did little execution with them, till they were better inſtructed by ſome Roman deſerters: till then, their chief ſucceſs was rather owing to their frequent ſallies; but the Roman legions, who had all their towers and machines before them, made terrible havock. The leaſt ſtones they threw were near 100 weight; and theſe they could throw the length of a quarter of a mile againſt the city, and with ſuch a force, that they could do miſchief ou thoſe that ſtood at ſome diſtance behind them. Titus had reared three towers 50 cubits high; one of which happening to fall in the middle of the night, greatly alarmed the Roman camp, who immediately ran to arms at the noiſe of it; but Titus, upon knowing the cauſe, diſmiſſed them, and cauſed it to be ſet up again. Theſe towers, being plaited with iron, the Jews tried in vain to ſet fire to them, but were at length forced to retire out of the reach of their ſhot; by which the battering-rams were now at full liberty to play againſt the wall. A breach was ſoon made in it, at which the Romans entered; and the Jews, abandoning this laſt incloſure, retired behind the next. This happened about the 28th of April, a fortnight after the beginning of the ſiege.

39 e ſiege ried on th vigour.

John defended the temple and the caſtle of Antonia, and Simon the reſt of the city. Titus marched cloſe to the ſecond wall, and plied his battering-rams ſo furiouſly, that one of the towers, which looked towards the north, gave a prodigious ſhake. The men who were in it, made a ſignal to the Romans, as if they would ſurrender; and, at the ſame time, ſent Simon word to be ready to give them a warm reception. Titus, having diſcovered their ſtratagem, plied his work more furiouſly, whilſt the Jews that were in the tower ſet it on fire, and flung themſelves into the flames. The tower being fallen, gave them an entrance into the ſecond incloſure, five days after gaining the firſt; and Titus, who was bent on ſaving the city, would not ſuffer any part of the wall or ſtreets to be demoliſhed; which left the breach and lanes ſo narrow, that when his men were furiouſly repulſed by Simon, they had not room enough to make a quick retreat, ſo that there was a number of them killed in it. This overſight was quickly rectified; and the attack renewed with ſuch vigour, that the place was carried four days after their firſt repulſe.

39 amine and ſtilence in e city.

The famine, raging in a terrible manner in the city, was ſoon followed by a peſtilence; and as theſe two dreadful judgments increaſed, ſo did the rage of the factious, who, by their inteſtine feuds, had deſtroyed ſuch quantities of proviſion, that they were forced to prey upon the people with the moſt unheard-of cruelty. They forced their houſes; and, if they found any victuals in them, they butchered them for not appriſing them of it; and, if they found nothing but bare walls, which was almoſt every where the caſe, they put them to the moſt ſevere tortures, under pretence that they had ſome proviſion concealed. "I ſhould (ſays Joſephus) undertake an impoſſible talk, were I to enter into a detail of all the cruelties of thoſe impious wretches; it will be ſufficient to ſay, that I do not think, that ſince the creation any city ever ſuffered ſuch dreadful calamities, or abounded with men ſo fertile in all kind of wickedneſs."

Jews.

Titus, who knew their miſerable condition, and was ſtill willing to ſpare them, gave them four days to cool; during which he cauſed his army to be muſtered, and proviſions to be diſtributed to them in ſight of the Jews, who flocked upon the walls to ſee it. Joſephus was ſent to ſpeak to them afreſh, and to exhort them not to run themſelves into an inevitable ruin by obſtinately perſiſting in the defence of a place which could hold out but a very little while, and which the Romans looked upon already as their own. But this ſtubborn people, after many bitter invectives, began to dart their arrows at him; at which, not at all diſcouraged, he went on with greater vehemence: but all the effect it wrought on them was, that it prevailed on great numbers to ſteal away privately to the Romans, whilſt the reſt became only the more deſperate and reſolute to hold out to the laſt, in ſpite of Titus's merciful offers.

40 Offers of peace rejected.

To haſten therefore their deſtined ruin, he cauſed the city to be ſurrounded with a ſtrong wall, to prevent either their receiving any ſuccours or proviſion from abroad, or their eſcaping his reſentment by flight. This wall, which was near 40 ſtades or five miles in circuit, was yet carried on with ſuch ſpeed, and by ſo many hands, that it was finiſhed in three days; by which one may gueſs at the ardour of the beſiegers to make themſelves maſters of the city.

There was now nothing to be ſeen thro' the ſtreets of Jeruſalem, but heaps of dead bodies rotting above ground, walking ſkeletons, and dying wretches. As many as were caught by the Romans in their ſallies, Titus cauſed to be crucified in ſight of the town, to inject a terror among the reſt: but the zealots gave it out, that they were thoſe who fled to him for protection; which when Titus underſtood, he ſent a priſoner with his hands cut off to undeceive, and aſſure them, that he ſpared all that voluntarily came over to him; which encouraged great numbers to accept his offers, tho' the avenues were cloſely guarded by the factious, who put all to death who were caught going on that errand. A greater miſchief than that was, that even thoſe who eſcaped ſafe to the Roman camp were miſerably butchered by the ſoldiers, from a notion which theſe had taken that they had ſwallowed great quantities of gold; inſomuch that two thouſand of them were ripped up in one night, to come at their ſuppoſed treaſure. When Titus was appriſed of this barbarity, he would have condemned all thoſe butchering wretches to death; but they proved ſo numerous, that he was forced to ſpare them, and contented himſelf with ſending a proclamation thro' his camp, that as many as ſhould be ſuſpected thenceforward of that horrid villany, ſhould be put to immediate death: yet did not this deter many of them from it, only they did it more privately than before; ſo greedy were they of that bewitching metal. All this while the defection increaſed ſtill more tho' the inhumanity of the faction

Jews. within, who made the miſeries and dying groans of their ſtarving brethren the ſubject of their cruel mirth, and carried their barbarity even to the ſheathing of their ſwords in ſport in thoſe poor wretches, under pretence of trying their ſharpneſs.

When they found therefore, that neither their guards nor ſeverities could prevent the people's flight, they had recourſe to another ſtratagem equally impious and cruel; which was, to hire a pack of vile pretenders to prophecy, to go about and encourage the deſpairing remains of the people to expect a ſpeedy and miraculous delivrance; and this impoſture proved a greater expedient with that infatuated nation, than their other precautions.

42 Miſerable condition of the Jews. Nothing could be more dreadful than the famiſhed condition to which they were now reduced. The poor, having nothing to truſt to but the Romans mercy or a ſpeedy death, ran all hazards to get out of the city; and if in their flight, and wandering out for herbs or any other ſuſtenance, they fell into the hands of any of Titus's parties ſent about to guard the avenues, they were unmercifully ſcourged and crucified if they made the leaſt reſiſtance. The rich within the walls were now forced, tho' in the moſt private manner, to give half, or all they were worth, for a meaſure of wheat, and the middling ſort for one of barley. This they were forced to convey into ſome private place in their houſes, and to feed upon it as it was, without daring to pound or grind it, much leſs to boil or bake it, leſt the noiſe or ſmell ſhould draw the rapacious zealots to come and tear it from them. Not that theſe were reduced to any real want of proviſions, but they had a double end in this barbarous plunder; to wit, the ſtarving what they cruelly ſtyled all uſeleſs perſons, and the keeping their own ſtores in reſerve. It was upon this ſad and pinching juncture, that an unhappy mother was reduced to the extremity of butchering and eating her own child.

42 A mother eats her own child.

When this news was ſpread thro' the city, the horror and conſternation were as univerſal as they were inexpreſſible. It was then that they began to think themſelves forſaken by the Divine Providence, and to expect the moſt terrible effects of his anger againſt the poor remains of their nation; inſomuch that they began to envy thoſe that had periſhed before them, and to wiſh their turn might come before the ſad expected cataſtrophe. Their fears were but too juſt; ſince Titus, at the very firſt hearing of this inhuman deed, ſwore the total extirpation of city and people. "Since, (ſaid he,) they have ſo often refuſed my proffers of pardon, and have preferred war to peace, rebellion to obedience, and famine, ſuch a dreadful one eſpecially, to plenty, I am determined to bury that curſed metropolis under its ruins, that the ſun may never ſhoot his beams on a city where the mothers feed on the fleſh of their children, and the fathers, no leſs guilty than they, chooſe to drive them to ſuch extremities, rather than lay down their arms."

43 Titus ſwears the total ruin of the city.

This dreadful action happened about the end of July, by which time the Romans, having purſued their attacks with freſh vigour, made themſelves maſters of the fortreſs Antonia; which obliged the Jews to ſet fire to thoſe ſtately galleries which joined it to the temple, leſt they ſhould afford an eaſy paſſage to the beſiegers into this laſt. About the ſame time Titus, with much difficulty, got materials for raiſing new mounds and terraces, in order to haſten the ſiege, and ſave, if poſſible, the ſad remains of that once glorious ſtructure; but his pity proved ſtill worſe and worſe beſtowed on thoſe obſtinate wretches, who only became the more furious and deſperate by it. Titus at length cauſed fire to be ſet to the gates, after having had a very bloody encounter, in which his men were repulſed with loſs. The Jews were ſo terrified at it, that they ſuffered themſelves to be devoured by the flames, without attempting either to extinguiſh them, or ſave themſelves. All this while Joſephus did not ceaſe exhorting the infatuated people to ſurrender, to repreſent to them the dreadful conſequences of an obſtinate reſiſtance, and to aſſure them that it was out of mere compaſſion to them that he thus hazarded his own life to ſave theirs: he received one day ſuch a wound in his head by a ſtone from the battlements, as laid him for dead on the ground. The Jews ſallied out immediately, to have ſeized on his body; but the Romans proved too quick and ſtrong for them, and carried him off. Jews.

44 John plunders the temple. By this time the two factions within, but eſpecially that of John, having plundered rich and poor of all they had, fell alſo on the treaſury of the temple, whence John took a great quantity of golden utenſils, together with thoſe magnificent gifts which had been preſented to that ſacred place by the Jewiſh kings, by Auguſtus, Livia, and many other foreign princes, and melted them all to his own uſe. The repoſitories of the ſacred oil which was to maintain the lamps, and of the wine which was referved to accompany the uſual ſacrifices, were likewiſe ſeized upon, and turned into common uſe; and the laſt of this to ſuch exceſs, as to make himſelf and his party drunk with it. All this while, not only the zealots, but many of the people, were ſtill under ſuch an infatuation, that tho' the fortreſs Antonia was loſt, and nothing left but the temple, which the Romans were preparing to batter down, yet they could not perſuade themſelves, that God would ſuffer that holy place to be taken by heathens, and were ſtill expecting ſome ſudden and miraculous deliverance. Even that vile monſter John, who commanded there, either ſeemed confident of it, or elſe endeavoured to make them think him ſo. For when Joſephus was ſent for the laſt time to upbraid his obſtinately expoſing that ſacred building, and the miſerable remains of God's people, to ſudden and ſure deſtruction, he only anſwered him with the bittereſt invectives; adding, that he was defending the Lord's vineyard, which he was ſure could not be taken by any human force. Joſephus in vain reminded him of the many ways by which he had polluted both city and temple; and in particular of the ſeas of blood which he cauſed to be ſhed in both thoſe ſacred places, and which, he aſſured him from the old prophecies, were a certain ſign and forerunner of their ſpeedy ſurrender and deſtruction. John remained as inflexible as if all the prophets had aſſured him of a deliverance; till at length Titus, foreſeeing the inevitable ruin of that ſtately edifice, which he was ſtill extremely deſirous to ſave, vouchſafed even himſelf to ſpeak to them, and to perſuade them to ſurrender. But the factious, looking upon this condeſcenſion as the effects of his fear rather than generoſity, only grew the

more

Jews. more furious upon it, and forced him at last to come to those extremities, which he had hitherto endeavoured to avoid. That his army, which was to attack the temple, might have the freer passage towards it thro' the castle Antonia, he caused a considerable part of the wall to be pulled down, and levelled; which proved so very strong, that it took him up seven whole days, by which time they were far advanced in the month of July.

45 The daily sacrifice interrupted.

It was on the 17th day of that month, as all Josephus's copies have it, that the daily sacrifice ceased for the first time since its restoration by the brave Judas Maccabeus, there being no proper person left in the temple to offer it up. Titus caused the factious to be severely upbraided for it; exhorted John to set up whom he would to perform that office, rather than suffer the service of God to be set aside; and then challenged him and his party to come out of the temple, and fight on a more proper ground, and thereby save that sacred edifice from the fury of the Roman troops. When nothing could prevail on them, they began to set fire again to the gallery which yielded a communication between the temple and the castle Antonia. The Jews had already burnt about 20 cubits of it in length; but this second blaze, which was likewise encouraged by the besieged, consumed about 14 more; after which, they beat down what remained standing. On the 27th of July, the Jews, having filled part of the western portico with combustible matter, made a kind of flight; upon which, some of the forwardest of the Romans having scaled up to the top, the Jews set fire to it, which flamed with such sudden fury, that many of the former were consumed in it, and the rest, venturing to jump down from the battlements, were, all but one, crushed to death.

On the very next day, Titus having set fire to the north gallery, which inclosed the outer court of the temple, from fort Antonia to the valley of Cedron, got an easy admittance into it, and forced the besieged into that of the priests. He tried in vain six days to batter down one of the galleries of that precinct with an helepolis: he was forced to mount his battering-rams on the terrace, which was raised by this time; and yet the strength of this wall was such, that it eluded the force of these also, tho' others of his troops were busy in sapping it. When they found that neither rams nor sapping could gain ground, they bethought themselves of scaling; but were vigorously repulsed in the attempt, with the loss of some standards, and a number of men. When Titus therefore found, that his desire of saving that building was like to cost so many lives, he set fire to the gates, which, being plated with silver, burnt all that night, whilst the metal dropt down in the melting. The flame soon communicated itself to the porticoes and galleries; which the besieged beheld without offering to stop it, but contented themselves with sending whole vollies of impotent curses against the Romans. This was done on the eighth of August; and, on the next day, Titus, having given orders to extinguish the fire, called a council, to determine whether the remainder of the temple should be saved or demolished. That general was still for the former, and most of the rest declared for the latter; alleging, that it was no longer a temple, but a scene of war and slaughter, and that the Jews would never be at rest as long as any part of it was left standing: but when they found Titus stiffly bent on preserving so noble an edifice, against which, he told them, he could have no quarrel, they all came over to his mind. The next day, August the 10th, was therefore determined for a general assault: and the night before the Jews made two desperate sallies on the Romans; in the last of which, these, being timely succoured by Titus, beat them back into their inclosure.

46 The gates of the temple set on fire.

But whether this last Jewish effort exasperated the besiegers, or, which is more likely, as Josephus thinks, pushed by the hand of Providence, one of the Roman soldiers, of his own accord, took up a blazing firebrand, and, getting on his comrade's shoulders, threw it into one of the apartments that surrounded the sanctuary, thro' a window. This immediately set the whole north-side in a flame up to the third story, on the same fatal day and month in which it had been formerly burnt by Nebuchadnezzar. Titus, who was gone to rest himself a while in his pavilion, was awaked at the noise, and ran immediately to give orders to have the fire extinguished. He called, prayed, threatened, and even caned his men, but in vain; the confusion was so great, and the soldiers so obstinately bent upon destroying all that was left, that he was neither heard nor minded. Those that flocked thither from the camp, instead of obeying his orders, were busy, either in killing the Jews, or in increasing the flames. When Titus observed that all his endeavours were vain, he entered into the sanctuary and the most holy place, in which he found still such sumptuous utensils and other riches as even exceeded all that had been told him of it. Out of the former he saved the golden candlestick, the table of shew-bread, the altar of perfumes, all of pure gold, and the book or volume of the law, wrapped up in a rich gold tissue: but in the latter he found no utensils, because, in all probability, they had not made a fresh ark, since that of Solomon had been lost. Upon his coming out of that sacred place, some other soldiers set fire to it, and obliged those that had staid behind to come out; they all fell foul on the plunder of it, tearing even the gold plating off the gates and timber-work, and carried off all the costly utensils, robes, &c. they found, infomuch that there was not one of them who did not enrich himself by it.

47 A dreadful massacre.

An horrid massacre followed soon after, in which a great many thousands perished; some by the flames, others by the fall from the battlements, and a greater number by the enemy's sword, which destroyed all it met with, without distinction of age, sex, or quality. Among them were upwards of 6000 persons who had been seduced thither by a false prophet, who promised them, that they should find a speedy and miraculous relief there on that very day. Some of them remained five whole days on the top of the walls, and afterwards threw themselves on the general's mercy; but were answered that they had outstaid the time, and were led to execution. The Romans carried their fury to the burning of all the treasure-houses of the place, tho' they were full of the richest furniture, plate, vestments, and other things of value, which had been laid up in those places for security. In a word, they did not cease burning and butchering,

Jews. till they had deſtroyed all, except two of the temple-gates, and that part of the court which was deſtined for the women.

In the mean time the ſeditious made ſuch a vigorous puſh, that they eſcaped the fury of the Romans, at leaſt for the preſent, and retired into the city. But here they found all the avenues ſo well guarded, that there was no poſſibility left for them to get out; which obliged them to ſecure themſelves as well as they could on the ſouth-ſide of it, from whence Simon, and John of Giſchala, ſent to deſire a parley with Titus. They were anſwered, that though they had been the cauſe of all this bloodſhed and ruin, yet they ſhould have their lives ſpared, if they laid down their arms, and ſurrendered themſelves priſoners. To this they replied, that they had engaged themſelves, by the moſt ſolemn oaths, never to ſurrender; and therefore, only begged leave to retire into the mountains with their wives and children: which inſolence ſo exaſperated the Roman general, that he cauſed an herald to bid them ſtand to their defence; for that not one of them ſhould be ſpared, ſince they had rejected his laſt offers of pardon. Immediately after this, he abandoned the city to the fury of the ſoldiers, who fell forthwith on plundering, ſetting fire every where, and murdering all that fell into their hands; whilſt the factious, who were left, went and fortified themſelves in the royal palace, where they killed 8000 Jews, who had taken refuge there.

In the mean time, great preparations were making for a vigorous attack on the upper city, eſpecially on the royal palace; and this took them up from the 20th of Auguſt to the 7th of September, during which time great numbers came and made their ſubmiſſion to Titus. The warlike engines then played ſo furiouſly on the factious, that they were taken with a ſudden panic; and, inſtead of fleeing into the towers of Hippicos, Phaſael, or Mariamne, which were yet untaken and ſo ſtrong, that nothing but famine could have reduced them, they ran like madmen towards Siloah, with a deſign to have attacked the wall of circumvallation, and to have eſcaped out of the city; but, being there repulſed, they were forced to go and hide themſelves in the public ſinks and common ſewers, ſome one way and ſome another. All whom the Romans could find were put to the ſword, and the city was ſet on fire. This was on the eighth of September, when the city was taken and entered by Titus. He would have put an end to the maſſacre; but his men killed all, except the moſt vigorous, whom they ſhut up in the porch of the women, juſt mentioned. Fronto, who had the care of them, reſerved the youngeſt and moſt beautiful for Titus's triumph; and ſent all that were above ſeventeen years of age into Egypt, to be employed in ſome public works there; and a great number of others were ſent into ſeveral cities of Syria, and other provinces, to be expoſed on the public theatres, to exhibit fights, or be devoured by wild beaſts. The number of thoſe priſoners amounted to 97,000, beſides about 11,000 more, who were either ſtarved thro' neglect, or ſtarved themſelves through ſullenneſs and deſpair.—The whole number of Jews who periſhed in this war is computed at upwards of 1,400,000.

Beſides theſe, however, a vaſt number periſhed in caves, woods, wildernеſſes, common-ſewers, &c. of whom no computation could be made. Whilſt the ſoldiers were ſtill buſy in burning the remains of the city, and viſiting all the hiding-places, where they killed numbers of poor creatures who had endeavoured to evade their cruelty, the two grand rebels Simon and John were found, and reſerved for the triumph of the conqueror. John, being pinched with hunger, ſoon came out; and having begged his life, obtained it; but was condemned to perpetual impriſonment. Simon, whoſe retreat had been better ſtored, held out till the end of October. The two chiefs, with 700 of the handſomeſt Jewiſh captives, were made to attend the triumphal chariot; after which Simon was dragged through the ſtreets with a rope about his neck, ſeverely ſcourged, and then put to death; and John was ſent into perpetual impriſonment.—Three caſtles ſtill remained untaken, namely, Herodion, Machæron, and Maſſada. The two former capitulated; but Maſſada held out. The place was exceedingly ſtrong both by nature and art, well ſtored with all kinds of proviſions, and defended by a numerous garriſon of zealots, at the head of whom was one Eleazar, the grandſon of Judas Gaulonites, formerly mentioned. The Roman general having in vain tried his engines and battering-rams againſt it, bethought himſelf of ſurrounding it with a high and ſtrong wall, and then ordered the gates to be ſet on fire. The wind puſhed the flames ſo fiercely againſt the Jews, that Eleazar in deſpair perſuaded them firſt to kill their wives and children, and then to chooſe ten men by lot, who ſhould kill all the reſt; and laſtly one of the ſurviving ten to diſpatch them and himſelf; only this laſt man was ordered to ſet fire to the place before he put an end to his own life. All this was accordingly done; and on the morrow, when the Romans were preparing to ſcale the walls, they were greatly ſurpriſed neither to ſee nor hear any thing move. On this they made ſuch an hideous outcry, that two women, who had concealed themſelves in an aqueduct, came forth and acquainted them with the deſperate cataſtrophe of the beſieged.

Jews. 48 Simon and John taken. 49 Deſperate end of the garriſon of Maſſada. 50 State of the Jews ſince the deſtruction of their city.

Thus ended the Jewiſh nation and worſhip; nor have they ever ſince been able to regain the ſmalleſt footing in the country of Judea, nor indeed in any other country on earth, though there is ſcarce any part of the globe where they are not to be found. They continue their vain expectations of a Meſſiah to deliver them from the low eſtate into which they are fallen; and, notwithſtanding their repeated diſappointments, there are few who can ever be perſuaded to embrace Chriſtianity. Their ceremonies and religious worſhip ought to be taken from the law of Moſes; but they have added a multitude of abſurdities not worth the inquiring after. In many countries, and in different ages, they have been terribly maſſacred, and in general have been better treated by the Mahometans and Pagans than by Chriſtians. Since the revival of arts and learning, however, they have felt the benefit of that increaſe of humanity which hath taken place almoſt all over the globe. It is ſaid, that in this country the life of a Jew was formerly at the diſpoſal of the chief lord where they lived, and likewiſe all his goods. Now, however, the caſe is altered, and they enjoy the protection of government. A Jew

may

Jew's Igis.

may be a witneſs by our law, being ſworn on the Old Teſtament, and taking the oaths of allegiance.

Jew's *Ears*, in botany. See TREMELLA.

JEZIDES, among the Mahometans; a term of ſimilar import with heretics among Chriſtians.

The Jezides are a numerous ſect inhabiting Turky and Perſia, ſo called from their head Jezid, an Arabian prince, who ſlew the ſons of Ali, Mahomet's father-in-law; for which reaſon he is reckoned a parricide, and his followers heretics. There are about 20,000 Jezides in Turky and Perſia; who are of two ſorts, black and white. The white are clad like Turks; and diſtinguiſhed only by their ſhirts, which are not ſlit at the neck like thoſe of others, but have only a round hole to thruſt their heads through. This is in memory of a golden ring, or circle of light, which deſcended from heaven upon the neck of their cheq, the head of their religion, after his undergoing a faſt of forty days. The black Jezides, though married, are the monks or religious of the order; and theſe are called *Fakirs*.

The Turks exact exceſſive taxes from the Jezides, who hate the Turks as their mortal enemies; and when, in their wrath, they curſe any creature, they call it *muſſulman*: but they are great lovers of the Chriſtians, being more fond of Jeſus Chriſt than of Mahomet, and are never circumciſed but when they are forced to it. They are extremely ignorant, and believe both the bible and the koran without reading either of them: they make vows and pilgrimages, but have no places of religious worſhip.

All the adoration they pay to God conſiſts of ſome ſongs in honour of Jeſus Chriſt, the virgin, Moſes, and ſometimes Mahomet; and it is a principal point of their religion never to ſpeak ill of the devil, leſt he ſhould reſent the injury, if ever he ſhould come to be in favour with God again, which they think poſſible; whenever they ſpeak of him, they call him the *angel Peacock*. They bury their dead in the firſt place they come at, rejoicing as at a feſtival, and celebrating the entry of the deceaſed into heaven. They go in companies like the Arabians, and change their habitations every fifteen days. When they get wine, they drink it to exceſs; and it is ſaid, that they ſometimes do this with a religious purpoſe, calling it the blood of Chriſt. They buy their wives; and the market-price is two hundred crowns for all women, handſome or not, without diſtinction.

JEZREEL, or JEZREEL, a town in the north of Samaria, towards mount Carmel, where ſtood a palace of the kings of Iſrael, 1 Kings xxi. 18. On the borders of Galilee (Joſhua xix.) ſaid to be one of the towns of Iſſachar.—The valley of Jezreel (Judges vi. 17.) was ſituated to the north of the town, running from weſt to eaſt for ten miles, between two mountains; the one to the north, commonly called *Hermon*, near mount Tabor; the other *Gilboa*: in breadth two miles.

IF, an iſland of France, in Provence, and the moſt eaſtern of the three before the harbour of Marſeilles. It is very well fortified, and its port one of the beſt in the Mediterranean.

IGIS, a town of the country of the Griſons, in Caddea, with a magnificent caſtle, in which is a cabinet of curioſities, and a handſome library; 23 miles ſouth-weſt of Choira, and 23 ſouth of Glaris. E. lon. 9. 0. N. lat. 49. 10.

Iglaw, Ignatius.

IGLAW, a conſiderable and populous town of Germany, in Moravia, where they have a manufactory of good cloth, and excellent beer. It is ſeated on the river Igla, 40 miles weſt of Brin, and 80 ſouth-eaſt of Prague. E. long. 15. 5. N. lat. 49. 10.

IGNATIUS Loyola, (canonized), the founder of the well-known order of the Jesuits, was born at the caſtle of Loyola, in Biſcay, 1491; and became firſt page to Ferdinand V. king of Spain, and then an officer in his army. In this laſt capacity, he ſignalized himſelf by his valour; and was wounded in both legs at the ſiege of Pompeluna, in 1521. To this circumſtance the Jeſuits owe their origin; for, while he was under cure of his wound, a *Life of the ſaints* was put into his hands, which determined him to forſake the military for the eccleſiaſtical profeſſion. His firſt devout exerciſe was to dedicate himſelf to the bleſſed virgin as her knight: he then went a pilgrimage to the Holy Land; and on his return to Europe, he continued his theological ſtudies in the univerſities of Spain, though he was then 33 years of age. After this he went to Paris; and in France laid the foundation of this new order, the inſtitutes of which he preſented to Pope Paul III. who made many objections to them, but at laſt confirmed the inſtitution in 1540. The founder died in 1555, and left his diſciples two famous books; 1. Spiritual exerciſes; 2. Conſtitutions or rules of the order. But it muſt be remembered, that though theſe avowed inſtitutes contain many privileges obnoxious to the welfare of ſociety, the moſt diabolical are contained in the private rules intitled *Monita ſecreta*, which were not diſcovered till towards the cloſe of the laſt century; and moſt writers attribute theſe, and even the conſtitutions, to Laynez, the ſecond general of the order.

Ignatius (St), ſurnamed *Theophraſtus*, one of the apoſtolical fathers of the church, was born in Syria, and educated under the apoſtle and evangeliſt St John, and intimately acquainted with ſome other of the apoſtles, eſpecially St Peter and St Paul. Being fully inſtructed in the doctrines of Chriſtianity, he was, for his eminent parts and piety, ordained by St John, and confirmed, about the year 67, biſhop of Antioch, by thoſe two apoſtles, who firſt planted Chriſtianity in that city, where the diſciples alſo were firſt called *Chriſtians*. Antioch was then not only the metropolis of Syria, but a city the moſt famous and renowned of any in the eaſt, and the ancient ſeat of the Roman emperors, as well as of their viceroys and governors. In this important ſeat he continued to ſit ſomewhat above 40 years, both an honour and ſafeguard of the Chriſtian religion, till the year 107, when Trajan the emperor, fluſhed with a victory which he had lately obtained over the Scythians and Daci, about the ninth year of his reign, came to Antioch to make preparations for a war againſt the Parthians and Armenians. He entered the city with the pomp and ſolemnities of a triumph; and, as his firſt care uſually was about the concernments of religion, he began preſently to inquire into that affair. Chriſtianity had by this time made ſuch a progreſs, that the Romans grew jealous and uneaſy at it. This prince, therefore, had already commenced a perſecution againſt the Chriſtians

Ignatius. ans in other parts of the empire, which he now resolved to carry on here. However, as he was naturally of a mild disposition, tho' he ordered the laws to be put in force against them if convicted, yet he forbad them to be sought after.

In this state of affairs, Ignatius, thinking it more prudent to go himself than stay to be sent for, of his own accord presented himself to the emperor, and, it is said, there passed a long and particular discourse between them, wherein the emperor expressing a surprise how he dared to transgress the laws, the bishop took the opportunity to assert his own innocency, and to explain and vindicate his faith with freedom. The issue of this was, that he was cast into prison, and this sentence passed upon him, That, being incurably over-run with superstition, he should be carried bound by soldiers to Rome, and there thrown as a prey to wild beasts.

He was first conducted to Selecia, a port of Syria, at about 16 miles distance, the place where Paul and Barnabas set sail for Cyprus. Arriving at Smyrna in Ionia, he went to visit Polycarp bishop of that place, and was himself visited by the clergy of the Asian churches round the country. In return for that kindness, he wrote letters to several churches, as the Ephesians, Magnesians, and Trallians, besides the Romans, for their instruction and establishment in the faith; one of these was addressed to the Christians at Rome, to acquaint them with his present state, and passionate desire not to be hindered in that course of martyrdom which he was now hastening to accomplish.

His guard, a little impatient of their stay, set sail with him for Troas, a noted city of the lesser Phrygia, not far from the ruins of old Troy; where, at his arrival, he was much refreshed with the news he received of the persecution ceasing in the church of Antioch: hither also several churches sent their messengers to pay their respects to him; and hence too he dispatched two epistles, one to the church of Philadelphia, and the other to that of Smyrna; and, together with this last, as Eusebius relates, he wrote privately to Polycarp, recommending to him the care and inspection of the church of Antioch.

From Troas they sailed to Neapolis, a maritime town in Macedonia; thence to Philippi, a Roman colony, where they were entertained with all imaginable kindness and courtesy, and conducted forwards on their journey, passing on foot through Macedonia and Epirus, till they came to Epidanium, a city of Dalmatia; where again taking shipping, they sailed through the Adriatic, and arrived at Rhegium, a port-town in Italy; directing their course thence through the Tyrrhenian sea to Puteoli, whence Ignatius desired to proceed by land, ambitious to trace the same way by which St Paul went to Rome: but this wish was not complied with; and, after a stay of 24 hours, a prosperous wind quickly carried them to the Roman port, the great harbour and station for their navy, built near Ostia, at the mouth of the Tyber, about 16 miles from Rome; whither the martyr longed to come, as much desirous to be at the end of his race, as his keepers, weary of their voyage, were to be at the end of their journey.

The Christians at Rome, daily expecting his arrival, were come out to meet and entertain him, and accordingly received him with a mixture of joy and sorrow; but when some of them intimated, that possibly the populace might be taken off from desiring his death, he expressed a pious indignation, intreating them to cast no rubs in his way, nor do any thing that might hinder him, now he was hastening to his crown. There are many such expressions as this in his epistle to the Romans, which plainly shew that he was highly ambitious of the crown of martyrdom. Yet it does not appear that he rashly sought or provoked danger. Among other expressions of his ardor for suffering, he said, that the wild beasts had feared and refused to touch some that had been thrown to them, which he hoped would not happen to him. Being conducted to Rome, he was presented to the præfect, and the emperor's letters probably delivered concerning him. The interval before his martyrdom was spent in prayers for the peace and prosperity of the church. That his punishment might be the more pompous and public, one of their solemn festivals, the time of their Saturnalia, and that part of it when they celebrated their Sigillaria, was pitched on for his execution; at which time it was their custom to entertain the people with the bloody conflicts of gladiators, and the hunting and fighting with wild beasts. Accordingly, on the 13th kal. January, *i. e.* December 20. he was brought out into the amphitheatre, and the lions being let loose upon him, quickly dispatched their meal, leaving nothing but a few of the hardest of his bones. These remains were gathered up by two deacons who had been the companions of his journey; and being transported to Antioch, were interred in the cemetery, without the gate that leads to Daphne; whence, by the command of the emperor Theodosius, they were removed with great pomp and solemnity to the Tycheon, a temple within the city, dedicated to the public genius of it, but now consecrated to the memory of the martyr. Ignatius.

St Ignatius stands at the head of those Antenicene fathers, who have occasionally delivered their opinions in defence of the true divinity of Christ, whom he calls the *Son of God, and his eternal Word.* He is also reckoned the great champion of the doctrine of the episcopal order, as distinct and superior to that of priest and deacon. And one, the most important, use of his writings respects the authenticity of the holy Scriptures, which he frequently alludes to, in the very expressions as they stand at this day.—Archbishop Usher's edition of his works printed in 1647, is thought the best; yet there is a fresher edition extant at Amsterdam, where, beside the best notes, there are the dissertations of Usher and Pearson.

St Ignatius's *Bean*, the seed of a fruit of the gourd kind. The best account of the plant that has yet appeared, is that sent by father Camelli to Ray and Petiver, and published in the philosophical transactions for the year 1699: he observes, that it grows in the Philippine islands, and winds itself about the tallest trees to the top; that it has large, ribbed, bitter leaves, a flower like that of the pomegranate, and a fruit larger than a melon. Some resemble the fruit to a pomegranate, probably from misapplying Camelli's words. The fruit is covered with a thin, glossy, blackish, green, and as it were marbled-shell, under which is lodged

gnatius
l
gnition.

lodged another of a ſtony hardneſs: within this is contained a ſoft, yellow, bitteriſh pulp, in which lie the ſeeds or beans, to the number commonly of 24, each covered with a ſilvery down.

The ſame gentleman gives an account of the virtues attributed to theſe ſeeds by the Indians; but experience has ſhewn that they are dangerous. Konig relates, that a perſon, by drinking ſome of a ſpirituous tincture of them inſtead of aqua vitæ, was thrown into ſtrong convulſions; and Dr Grim, that a dram of the ſeed in ſubſtance occaſioned, for a time, a total deprivation of the ſenſes. Others mention violent vomitings and purgings from its uſe. Neumann hath obſerved intermitting fevers removed by drinking, on the approach of a paroxyſm, an infuſion of ſome grains of the bean made in carduus water: We are not, however from hence to look upon this medicine as an univerſal febrifuge, or to uſe it indiſcriminately.

Theſe beans (for ſo cuſtom requires that we ſhould call them) are about the ſize of a moderately large nutmeg; in figure ſomewhat roundiſh, but extremely irregular, ſcarcely any two being entirely alike, full of unequal depreſſions and prominences; in colour, externally yellowiſh brown, but when the outer ſkin is taken off, of a blackiſh brown, and in part quite blackiſh; in conſiſtence hard and compact as horn, ſo as not to be reducible into a powdery form but by cutting or raſping: for all their hardneſs, however, they are not proof againſt worms. When freſh, they have ſomewhat of a muſky ſmell, which by age is loſt: their taſte is very bitter, reſembled by ſome to that of centaury.

Four drams of theſe beans, boiled in water, gave juſt two drams of gummy extract; after which, rectified ſpirit of wine ſcarcely took up half a grain. Half an ounce, treated firſt with ſpirit, gave two ſcruples and a half of a gummy one. The ſpirituous extract made at firſt is of a yellowiſh colour, and the watery greeniſh. They are both bitter: the ſpirituous impreſſes at firſt a very agreeable bitterneſs, ſomewhat like that of peach-kernels; which going off, leaves in the month a ſtrong bitter. The diſtilled liquors have no taſte or ſmell.

IGNAVUS, the Sloth, in zoology. See Bradypus.

IGNIS-FATUUS, a kind of light, ſuppoſed to be of an electric nature, appearing frequently in mines, marſhy places, and near ſtagnating waters. It was formerly thought, and is ſtill by the ſuperſtitious believed, to have ſomething ominous in its nature, and to preſage death and other misfortunes. There have been inſtances of people being decoyed by theſe lights into marſhy places, where they have periſhed; whence the names of *Ignis-fatuus*, *Will-with-a-wiſp*, and *Jack-with-a-lanthorn*, as if this appearance was an evil ſpirit which took delight in doing miſchief of that kind. For a further account of the nature and properties of the ignis-fatuus, ſee the articles Light and Meteor.

IGNITION, properly ſignifies the ſetting fire to any ſubſtance; but the ſenſe is commonly reſtrained to that kind of burning which is not accompanied with flame, ſuch as that of charcoal, cinders, metals, ſtones, and other ſolid ſubſtances.

The effects of ignition are firſt to diſſipate what is called the *phlogiſton* of the ignited ſubſtance, after which it is reduced to aſhes. Vitrification next follows; and laſtly, the ſubſtance is totally diſſipated in vapour. All theſe effects, however, depend on the preſence of the air; for *in vacuo* the phlogiſton of any ſubſtance cannot be diſſipated. Neither can a body which is totally deſtitute of phlogiſton be ignited in ſuch a manner as thoſe which are not deprived of it: for as long as the phlogiſton remains, the heat is kept up in the body by the action of the external air upon it; but when the phlogiſton is totally gone, the air always deſtroys, inſtead of augmenting the heat. Philoſophers have therefore been greatly embarraſſed in explaining the phenomena of ignition. It hath been found a matter of no ſmall difficulty to determine how far the air, and how far the phlogiſton, is concerned in this operation; but as theſe inquiries cannot be entered into without firſt determining the nature of the Phlogiston, we muſt refer to that article for an account of the different theories of ignition.

IGNORAMUS, in Engliſh law, a phraſe which ſignifies "We are ignorant." This is uſed, when the grand jury impanelled on the inquiſition of criminal cauſes reject the evidence as too weak to make good the preſentment or indictment brought againſt a perſon, ſo as to bring him upon his trial by a petty jury; in which caſe they indorſe this word on the back of the bill of indictment. In conſequence of this, all further proceedings againſt the party accuſed are ſtopped, and the ſuppoſed offender is delivered without further anſwer.

IGNORANCE, the privation or abſence of knowledge. The cauſes of ignorance, according to Locke, are chiefly theſe three. 1. Want of ideas. 2. Want of a diſcoverable connection between the ideas we have. 3. Want of tracing and examining our ideas. See Metaphysics, n° 195—205.

Ignorance, or miſtake, in law, a defect of will, whereby a perſon is excuſed from the guilt of a crime, when, intending to do a lawful act, he does that which is unlawful. For here the deed and the will acting ſeparately, there is not that conjunction between them which is neceſſary to form a criminal act. But this muſt be an ignorance or miſtake of fact, and not an error in point of law. As if a man intending to kill a thief or houſe-breaker in his own houſe, by miſtake kills one of his own family, this is no criminal action: but if a man thinks he has a right to kill a perſon excommunicated or outlawed wherever he meets him, and does ſo; this is wilful murder. For a miſtake in point of law, which every perſon of diſcretion not only may, but is bound and preſumed to know, is, in criminal caſes, no ſort of defence. *Ignorantia juris quod quiſque tenetur ſcire, neminem excuſat*, is as well the maxim of our own law as it was of the Roman.

Ignoramus
l
Jib.

IGUANA, in zoology, a ſpecies of Lacerta.

IHOR, Johor, or *Jor*, a town of Aſia, in Malacca, and capital of a province of the ſame name in the peninſula beyond the Ganges. It was taken by the Portugueſe in 1603, who deſtroyed it, and carried off the cannon; but it has ſince been rebuilt, and is now in poſſeſſion of the Dutch. E. Long. 93. 55. N. Lat. 1. 15.

JIB, the foremoſt ſail of a ſhip, being a large ſtay-ſail extended from the outer end of the bowſprit prolonged by the jib-boom, towards the fore-top-maſt-head

Jib. head. See SAIL.

The jib is a fail of great command with any fide-wind, but efpecially when the fhip is *clofe-hauled*, or has the wind upon her beam; and its effort in *caſting* the fhip, or turning her head to leeward, is very powerful, and of great utility, particularly when the fhip is working through a narrow channel.

JIB-*Boom*, a boom run out from the extremity of the bowfprit, parallel to its length, and ſerving to extend the bottom of the jib, and the ſtay of the fore-top-gallant maſt. This boom, which is nothing more than a continuation of the bowſprit forward, to which it may be conſidered as a top-maſt, is uſually attached to the bowſprit by means of two large boom-irons, or by one boom-iron, and a cap on the outer end of the bowſprit; or, finally, by the cap without, and a ſtrong laſhing within, inſtead of a boom-iron, which is generally the method of ſecuring it in ſmall merchant-ſhips. It may therefore be drawn in upon the bowſprit as occaſion requires; which is uſually practiſed when the ſhip enters a harbour, where it might very ſoon be broke or carried away, by the veſſels which are moored therein, or paſſing by under ſail.

JIG. See MUSIC, n° 252.

JIN. See GENII.

IKENILD STREET, one of the four famous ways which the Romans made in England, called *Stratum Icenorum*, becauſe it began in the country of the *Iceni*, who inhabited Norfolk, Suffolk, and Cambridgeſhire.

ILA, or ISLA, one of the weſtern iſles of Scotland, lying to the weſt of Jura, from which it is ſeparated by a narrow channel. It extends 24 miles in length from north to ſouth, and is 18 in breadth from eaſt to weſt. On the eaſt ſide, it is full of mountains covered with heath; to the ſouthward, the land is tolerably well cultivated. In ſome parts the inhabitants have found great plenty of limeſtone, and lead-mines are worked in three different places. The only harbour in Iſla is at Lochdale, near the north end of the iſland. Here are ſeveral rivers and lakes well ſtored with trout, eels, and ſalmon. In the centre is Loch Finlagan, about three miles in circuit, with the little iſle of that name in the middle. Here the great Macdonald, lord of the iſles, once reſided in all the pomp of royalty; but his palaces and offices are now in ruins. Here he held his ſupreme court of judicature, conſiſting of fourteen judges, to which there was an appeal from all the leſſer tribunals. Inſtead of a throne, Macdonald ſtood on a ſtone ſeven feet ſquare, in which there was an impreſſion made to receive his feet; here he was crowned and anointed by the biſhop of Argyle and ſeven inferior prieſts, in preſence of the chieftains, to whom he took a ſolemn oath, importing, that he would maintain their rights and poſſeſſions, and do juſtice to all his vaſſals. There are ſeveral forts built on the iſles in freſh-water lakes, and divers caverns in different parts of the iſland, which have been uſed occaſionally as places of ſtrength. The air of Iſla is not ſo ſalubrious as that of Jura, becauſe it is more low and marſhy; nevertheleſs, the people enjoy a good ſhare of health: they are all Proteſtants, and have a variety of churches and chapels. The property of the iſland is at preſent veſted in Campbell of Shawfield. On the coaſt of Ila are ſeveral ſmall iſles, ſuch as Texa, Ouerſa, and Nave; nay, the natives pretend that there is an iſland four miles in length about 30 leagues to the ſouth-weſt of Iſla. They ſay, it was diſcovered by the maſter of an Engliſh ſhip, who found it a low flat, covered with long graſs, and watered by a river, on the eaſt ſide of which he ſaw great heaps of fiſh bones. A great number of ſeals lay baſking on the rocks, and the cliffs were covered with ſea-fowl. Finding many planks and boards which the ſea had caſt on the ſhore, he ordered his men to raiſe a pile about two ſtories, as a land-mark for mariners. After his departure, the inhabitants of Collonſay, in fair weather, diſcerned from the top of an eminence an object which they ſuppoſed to be land; which, however, vaniſhed, by next winter, when in all probability the pile was blown down by a ſtorm.

Ilchester. ILCHESTER, a town of Somerſetſhire in England, ſeated on the river Yeovil. It is a place of great antiquity, as appears by the Roman coins which are ſometimes dug up. It once had 16 churches, but now has only two. It is a corporation, and ſends two members to parliament; here the county-gaol is kept. W. Long. 2. 45. N. Lat. 51. 5.

ILERDA, (anc. geog.) the capital of the Ilergetes; ſituated on an eminence between the rivers Sicoris and Cinga; an unhappy city, often beſieged, and often taken, becauſe lying expoſed to the incurſions from Gaul; and under Gallienus it was deſtroyed by the Germans. Now LERIDA, in Catalonia, on the river Segra.

Ilex. ILEX, the HOLM, or *Holly-tree*, a genus of the tetragynia order, belonging to the tetrandria claſs of plants.

There are ſeveral ſpecies of this genus; but the moſt remarkable is the aquifolium, or common holly. Of this there are a great number of varieties with variegated leaves, which are propagated by the nurſery-gardeners for ſale, and ſome years paſt were in very great eſteem, but at preſent are but little regarded, the old taſte of filling gardens with thorn evergreens being pretty well aboliſhed; however, in the diſpoſition of clumps, or rather plantations, of evergreen trees and ſhrubs, a few of the moſt lively colours may be admitted, which will have a good effect in the winter-ſeaſon, if they are properly diſpoſed.

The beſt of theſe varieties are the painted lady holly, Britiſh holly, Bradley's beſt holly, phyllis or cream-holly, milkmaid holly, Pritchet's beſt holly, gold-edged hedgehog holly, Cheyney's holly, glory-of-the-weſt holly, Broaderick's holly, Partridge's holly, Herefordſhire white holly, Blind's cream holly, Longſtaff's holly, Eales's holly, ſilver-edged hedgehog holly. All theſe variegatics are propagated by budding or grafting them upon ſtocks of the common green holly: there is alſo a variety of the common holly with ſmooth leaves; but this is frequently found intermixed with the prickly-leaved on the ſame tree, and often on the ſame branch there are both ſorts of leaves.

The common holly grows naturally in woods and foreſts in many parts of England, where it riſes from 20 to 30 feet high, and ſometimes more, but their ordinary height is not above 25 feet: the ſtem by age becomes large, and is covered with a greyiſh ſmooth bark; and thoſe trees which are not lopped or browſed by cattle, are commonly furniſhed with branches the greateſt part of their length, ſo form a ſort of cone; the branches

the branches are garniſhed with oblong oval leaves, of a lucid green on their upper ſurface, but are pale on their under, having a ſtrong midrib: the edges are indented and waved, with ſharp thorns terminating each of the points, ſo that ſome of the thorns are railed upward, and others are bent downward, and being very ſtiff they are troubleſome to handle. The leaves are placed alternate on every ſide of the branches; and from the baſe of their footſtalks come out the flowers in cluſters, ſtanding on very ſhort footſtalks; each of theſe ſuſtain five, fix, or more flowers. They are of a dirty white, and appear in May; but are ſucceeded by roundiſh berries, which turn to a beautiful red about Michaelmas, and continue on the trees, if they are not deſtroyed, till after Chriſtmas.

The common holly is a very beautiful tree in winter; therefore deſerves a place in all plantations of evergreen trees and ſhrubs, where its ſhining leaves and red berries make a fine variety; and if a few of the beſt variegated kinds are properly intermixed, they will enliven the ſcene. It is propagated by ſeeds, which never come up the firſt year, but lie in the ground as the haws do; therefore the berries ſhould be buried in the ground one year, and then taken up and ſown at Michaelmas, upon a bed expoſed only to the morning ſun; the following ſpring the plants will appear, which muſt be kept clean from weeds; and if the ſpring ſhould prove dry, it will be of great ſervice to the plants if they are watered once a-week; but they muſt not have it oftener, nor in too great quantity, for too much moiſture is very injurious to theſe plants when young. In this ſeed-bed the plants may remain two years; and then ſhould be tranſplanted in the autumn, into beds at about ſix inches aſunder, where they may ſtand two years longer; during which time they muſt be conſtantly kept clean from weeds, and if the plants have thriven well, they will be ſtrong enough to tranſplant where they are deſigned to remain: for when they are tranſplanted at that age, there will be leſs danger of their failing, and they will grow to a larger ſize than thoſe which are removed when they are much larger; but if the ground is not ready to receive them at that time, they ſhould be tranſplanted into a nurſery in rows at two feet diſtance, and one foot aſunder in the rows, in which place the plants may remain two years longer; and if they are deſigned to be grafted or budded with any of the variegated kinds, that ſhould be performed after the plants have grown one year in the nurſery: but the plants ſo budded or grafted ſhould continue two years after in the nurſery, that they may make good ſhoots before they are removed; though the plain ones ſhould not ſtand longer than two years in the nurſery, becauſe when they are older they do not tranſplant ſo well. The beſt time for removing hollies is in the autumn, eſpecially in dry land; but where the ſoil is cold and moiſt, they may be tranſplanted with great ſafety in the ſpring, if the plants are not too old, or have not ſtood long unremoved, for if they have, there is great doubt of their growing when removed.

Uſes. Sheep in the winter are fed with croppings of holly. Birds eat the berries. The bark fermented and afterwards waſhed from the woody fibres, makes the common bird-lime. The plant makes an impenetrable fence, and bears cropping; however, it is not found in all reſpects to anſwer for this purpoſe equally well with the hawthorn. The wood is uſed in fineering, and is ſometimes ſtained black to imitate ebony. Handles for knives and cogs for mill-wheels are made of it. It is alſo made into hones for whetting of razors. Mr Miller ſays, he has ſeen the floor of a room laid with compartments of holly and mahogany, which had a very pretty effect.

ILFRACOMB, a town of Devonſhire, ſeated on the Severn ſea, almoſt oppoſite to Swanſea in Glamorganſhire, with a good harbour. W. Long. 4. 15. N. Lat. 51. 15.

ILIAD, the name of an ancient epic poem, the firſt and fineſt of thoſe compoſed by Homer.

The poet's deſign in the Iliad was to ſhew the Greeks, who were divided into ſeveral little ſtates, how much it was their intereſt to preſerve a harmony and good underſtanding among themſelves: for which end he ſets before them the calamities that befel their anceſtors from the wrath of Achilles, and his miſunderſtanding with Agamemnon; and the advantages that afterwards accrued to them from their union. The iliad is divided into 24 books or rhapſodies, which are marked with the letters of the alphabet.

ILIUM, Ilion, or *Ilios*, (anc. geog.) a name for the city of Troy, but moſt commonly uſed by the poets, and diſtinguiſhed by the epithet *Vetus*; at a greater diſtance from the ſea than what was afterwards called *Ilium Novum*, and thought to be the *Ilienſium Pagus* of Strabo. New or modern Ilium was a village nearer the ſea, with a temple of Minerva; where Alexander, after the battle of Granicus, offered gifts, and called it a city, which he ordered to be enlarged. His orders were executed by Lyſimachus, who encompaſſed it with a wall of 40 ſtadia. It was afterwards adorned by the Romans, who granted it immunities as to their mother-city. From this city the *Ilias* of Homer takes its name, containing an account of the war carried on between the Greeks and Trojans on account of the rape of Helen; a variety of diſaſters being the conſequence, gave riſe to the proverb *Ilias Malorum*.

ILKUCH, a royal town of Poland, in the palatinate of Cracow, remarkable for its ſilver-mines mixed with lead. It is ſeated in a barren and mountainous country, in E. Long. 20. 0. N. Lat. 50. 26.

ILLECEBRUM, in botany, a genus of the monogynia order, belonging to the pentandria claſs of plants. There are ſeveral ſpecies, of which the moſt remarkable are the paronychia and the capitatum. Both theſe have trailing ſtalks near two feet long, which ſpread on the ground, garniſhed with ſmall leaves like thoſe of knot-graſs. The heads of the flowers come out from the joints of the ſtalks, having neat ſilvery bractea ſurrounding them, which make a pretty appearance. Their flowers appear in June, and there is generally a ſucceſſion of them for at leaſt two months; and when the autumn proves warm, they will ripen their ſeeds in October. They are propagated by ſeeds which ſhould be ſown in a bed of light earth in the beginning of April: the plants will come up in May, when they ſhould be kept clean from weeds till they are fit to remove. Some ſhould be planted in ſmall pots, and the reſt in a warm border, obſerving to water and ſhade them till they have taken new root.

Illenois ‖ Illuminating.

Illyricum ‖ Image.

Thefe plants are fometimes killed in fevere winters; for which reafon it is directed to plant fome of them in pots, that they may be fheltered during that feafon.

ILLENOIS, a people of North America, inhabiting a country lying near a large lake of the fame name, (called alfo *Michigan*), formed by the river St Laurence. The country is fertile; and the people plant Indian corn, on which they chiefly fubfift. They are civil, active, lively, and robuft; and are much lefs cruel in their difpofitions than the other Indian nations. They are, however, faid to be great libertines, and to marry a number of wives; but fome of their villages have embraced Chriftianity.

ILLICIUM, a genus of the octagynia order, belonging to the dodecandria clafs of plants. There is only one fpecies, viz. the anifatum, a native of the woods of China and Japan. It rifes with an erect branched ftem to the height of a cherry-tree; and is covered with an afh-coloured bark, under which is another bark that is green, fleffy, fomewhat mucous, and of an aromatic tafte, combined with a fmall degree of aftringency. The wood is hard and brittle; the pith fmall in quantity, fungous, and of a green herbaceous colour. The leaves refemble thofe of laurel; the flowers, in fome fort, thofe of narciffus. Thefe laft generally ftand fingle, are of a pale white, and conlift of 16 petals, which differ in their form. The extremity of the flower-ftalk being continued into the *germen*, or feed-bud of the flower, forms eight conjoined capfules, or one deeply divided into eight parts. Of thefe capfules, fome frequently decay; the reft inclofe each a fingle feed, fomewhat refembling that of palma chrifti, and which, when the hardifh corticle that clofely covers and involves it is broken, exhibits a kernel that is white, fleffy, foft, and of a vapid tafte. The bonzes, or priefts of China and Japan, infufe into the inhabitants a fuperftitious belief, that the gods are delighted with the prefence of this tree. Hence, they generally place before their idols garlands and bundles made of the branches. A fimilar opinion the Bramins inculcate into the Indians, of the Malabar-fig, or *ficus religiofa*. The bark of the anife-tree, reduced to powder, and equally burnt, the public watchmen in Japan, by a very curious contrivance defcribed by Kempfer, render ufeful in the meafuring of time during the darknefs of the night. The fame powder is frequently burnt in brazen veffels on the Japanefe altars, as incenfe is in other countries, from a belief that the idols in whofe honour the ceremony is performed are greatly refrefhed with the agreeable fragrancy of its odour. It is remarkable, that a branch of this tree being added to a decoction of the poifonous fifh, termed by the Dutch *de opblafer*, (a fifh the moft delicate, if the poifonous matter be firft properly expelled), increafes its noxious quality, and exafperates the poifon to an aftonifhing degree of activity and power.

ILLUMINATING, a kind of miniature-painting much practifed in Britain about the 12th and 13th centuries, and of which many curious fpecimens are ftill remaining, particularly in the Harleian collection. From this word is derived the modern one of *limning*. It was chiefly ufed as we ufe copperplates, in illuftrating and adorning the bible and other books. This art was much practifed by the clergy, and even by fome in the higheft ftations in the church. "The famous Ofmund (fays Bromton), who was confecrated bifhop of Salifbury A. D. 1076, did not difdain to fpend fome part of his time in writing, binding, and *illuminating* books." Mr Strutt hath given the public an opportunity of forming fome judgment of the degree of delicacy and art with which thefe illuminations were executed, by publifhing prints of a prodigious number of them, in his *Regal and eccleſiaſtical antiquities of England*, and *View of the cuſtoms, &c. of England*. In the firft of thefe works we are prefented with the genuine portraits, in miniature, of all the kings, and feveral of the queens, of England, from Edward the Confeffor to Henry VII. moftly in their crowns and royal robes, together with the portraits of many other eminent perfons of both fexes.

The illuminators and painters of this period feem to have been in poffeffion of a conliderable number of colouring materials, and to have known the arts of preparing and mixing them, fo as to form a great variety of colours. In the fpecimens of their miniature-paintings that are ftill extant, we perceive not only the five primary colours, but alfo various combinations of them. There is even fome appearance, that they were not ignorant of the art of painting in oil, from the following precept of Henry III. "Pay out of our treafury, to Odo the goldfmith, and Edward his fon, one hundred and feventeen fhillings and ten pence, for oil, varnifh, and colours bought, and pictures made, in the chamber of our queen at Weftminfter, between the octaves of the Holy Trinity, in the twenty-third year of our reign, and the feaft of St Barnabas the apoftle, in the fame year, which is fifteen days." This was a conliderable fum (equal in quantity of filver to 17 pounds 14 fhillings of our money, and in efficacy to 88 pounds) to be expended in painting one chamber in fo fhort a time.

ILLYRICA, (anc. geog.) a country extending from the Adriatic to Pannonia. Its boundaries are variouſly aſſigned. Pliny makes it extend in length from the river Arfia to the Drinius, thus including Liburnia to the weft, and Dalmatia to the eaft; which is alfo the opinion of Ptolemy, who fettles its limits from mount Scardus and the Upper Mœfia on the eaft to Iftria in the weft. The country is now called *Sclavonia*.

ILLYRIUS, (Matthias, Flaccus, or Francowitz), one of the moft learned divines of the Augfburgh confeffion, born in Iftria, anciently called *Illyrica*, in 1520. He is faid to have been a man of vaft genius, extenfive learning, of great zeal againft Popery; but of fuch a reftlefs and paffionate temper, as overbalanced all his good qualities, and occafioned much difturbance in the Proteftant church. He publifhed a great number of books, and died in 1575.

IMAGE, in a religious fenfe, is an artificial repreſentation or fimilitude of fome perfon or thing, ufed either by way of decoration and ornament, or as an object of religious worfhip and adoration; in which laft fenfe, it is ufed indifferently with the word IDOL.

IMAGE, in optics, a figure in the form of any object, made by the rays of light iffuing from the feveral points of it, and meeting in fo many other points, either at the bottom of the eye, or on any other ground, or in any tranfparent medium, where there is no furface to reflect them. Thus we are faid to fee all objects

maginaion
&
mitation.

jects by means of their images formed in the eye.

IMAGINATION, a power or faculty of the mind, whereby it conceives and forms ideas of things communicated to it by the outward organs of ſenſe. See METAPHYSICS; and MORALS, n° 184.

Force of IMAGINATION. See MONSTER.

IMAN, a name applied by the Mahometans to him who is head of the congregations in their moſques; and, by way of eminence, to him who has the ſupreme authority both in reſpect to ſpirituals and temporals.

IMAUS, (anc. geog.), the largeſt mountain of Aſia, (Strabo); and a part of Taurus, (Pliny); from which the whole of India runs off into a vaſt plain, reſembling Egypt. It extends far and wide through Scythia, as far as to the Mare Glaciale, dividing it into the Hither or *Scythia intra Imaum*, and into the Farther or *Scythia extra Imaum*, (Ptolemy); and alſo ſtretching out along the north of India to the eaſtern ocean, ſeparates it from Scythia. It had various names according to the different countries it ran through: Poſtellus thinks it is the *Sephar* of Scripture.

IMBECILLITY, a languid, infirm ſtate of body, which, being greatly impaired, is not able to perform its uſual exerciſes and functions.

IMBIBING, the action of a dry porous body, that abſorbs or takes up a moiſt or fluid one: thus, ſugar imbibes water; a ſponge, the moiſture of the air, &c.

IMBRICATED, among botaniſts. See BOTANY, p. 1298, n° 142.

IMITATION, derived from the Latin *imitare*, to *repreſent*, or *repeat*, a ſound or action, either exactly, or nearly in the ſame manner, as they were originally exhibited.

IMITATION, in muſic, admits of two different ſenſes. Sound and motion are either capable of imitating themſelves by a repetition of their own particular modes; or of imitating other objects of a nobler and more abſtracted nature. Nothing perhaps is ſo purely mental, nothing ſo remote from external ſenſe, as not to be imitable by muſic. But as the deſcription of this in M. Rouſſeau, article *Imitation*, is nobly animated, and comprehends all that is neceſſary to be ſaid on the ſubject, we tranſlate it as follows.

" Dramatic or theatrical muſic (ſays he), contributes to imitation no leſs than painting or poetry: it is in this common principle that we muſt inveſtigate both the origin and the final cauſe of all the fine arts; as M. le Batteaux has ſhown †. But this imitation is not equally extenſive in all the imitative arts. Whatever the imagination can repreſent to itſelf is in the department of poetry. Painting, which does not preſent its pictures to the imagination immediately, but to external ſenſe and to one ſenſe alone, paints only ſuch objects as are diſcoverable by ſight. Muſic might appear ſubjected to the ſame limits with reſpect to the ear; yet it is capable of painting every thing, even ſuch images as are objects of ocular perception alone: by a magic almoſt inconceivable, it ſeems to tranſform the ears into eyes, and endow them with the double function of perceiving viſible objects, by the mediums of their own; and it is the greateſt miracle of an art, which can only act by motion, that it can make that very motion repreſent abſolute quieſcence. Night, ſleep, ſilence, ſolitude, are the noble efforts, the grand images, repreſented by a pictureſque muſic. We know that noiſe can produce the ſame effect with ſilence, and ſilence the ſame effect with noiſe; as when one ſleeps at a lecture inſipidly and monotonically delivered, but wakes the inſtant when it ends. But muſic acts more intimately upon our ſpirits, in exciting by one ſenſe diſpoſitions ſimilar to thoſe which we find excited by another; and, as the relation between theſe images cannot be ſenſible unleſs the impreſſion be ſtrong, painting, when diveſted of this energy, cannot reſtore to muſic that aſſiſtance in imitations which ſhe borrows from it. Though all nature ſhould be aſleep, he who contemplates her does not ſleep; and the art of the muſician conſiſts in ſubſtituting, for this image of inſenſibility in the object, thoſe emotions which its preſence excites in the heart of the contemplator. He not only ferments and agitates the ocean, animates the flame to conflagration, makes the fountain murmur in his harmony, calls the rattling ſhower from heaven, and ſwells the torrent to reſiſtleſs rage; but he paints the horrors of a boundleſs and frightful deſart, involves the ſubterraneous dungeon in tenfold gloom, ſoothes the tempeſt, tranquillizes the diſturbed elements, and from the orcheſtra diffuſes a recent fragrance through imaginary groves; nay, he excites in the ſoul the ſame emotions which we feel from the immediate perception and full influence of theſe objects."

Imitation.

Under the word *Harmony*, Rouſſeau has ſaid, that no aſſiſtance can be drawn from thence, no original principle which leads to muſical imitation; ſince there cannot be any relation between chords and the objects which the compoſer would paint, or the paſſions which he would expreſs. In the article *Melody*, he imagines he has diſcovered that principle of imitation which harmony cannot yield, and what reſources of nature are employed by muſic in repreſenting theſe objects and theſe paſſions.

It is hoped, however, that, in our article of MELODY, we have ſhown upon what principle muſical imitation may be compatible with harmony; though we admit, that from melody it derives its moſt powerful energy, and its moſt attractive graces. Yet we muſt either be deceived beyond all poſſibility of cure, or we have felt the power of imitative harmony in a high degree. We are certain that the fury, the impetuoſity, the rapid viciſſitudes, of a battle, may be ſucceſsfully and vividly repreſented in harmony. We have participated the exultation and triumph of a conqueſt, inſpired by the ſound of a full chorus. We have felt all the ſolemnity and grandeur of devotion from the ſlow movement, the deep chords, the ſwelling harmony, of a ſentimental compoſition played upon the organ. Nor do we imagine harmony leſs capable of repreſenting the tender depreſſion, the fluctuating and tremulous agitation, of grief. As this kind of imitation is the nobleſt effort of muſic, it is aſtoniſhing that it ſhould have been overlooked by M. D'Alembert. He has indeed apologized, by informing us, that his treatiſe is merely elementary: but we are uncertain how far this apology ought to be regarded as ſufficient, when it is at the ſame time conſidered, that he has given an account of imitation in its mechanical, or what Rouſſeau calls its

† *Les Beaux Arts reduits à un meme principe.*

Immaculate ‖ Immunity.

technical, ſenſe; which, however, to prevent ambiguity, we ſhould rather chooſe to call *nymeſis*, or *anacephalioſis*. To Rouſſeau's account of the word in this acceptation, we return.

"Imitation (ſays he), in its technical ſenſe, is a reiteration of the ſame air, or of one which is ſimilar, in ſeveral parts where it is repeated by one after the other, either in uniſon, or at the diſtance of a fourth, a fifth, a third, or any other interval whatever. The imitation may be happily enough purſued even though ſeveral notes ſhould be changed; provided the ſame air may always be recognized, and that the compoſer does not deviate from the laws of proper modulation. Frequently, in order to render the imitation more ſenſible, it is preceded by a general reſt, or by long notes which ſeem to obliterate the impreſſion formerly made by the air till it is renewed with greater force and vivacity by the commencement of the imitation. The imitation may be treated as the compoſer chooſes; it may be abandoned, reſumed, or another begun at pleaſure; in a word, its rules are as much relaxed as thoſe of the fugue are ſevere: for this reaſon, it is deſpiſed by the moſt eminent maſters; and every imitation of this kind too much affected, almoſt always betrays a novice in compoſition."

IMMACULATE, ſomething without ſtain, chiefly applied to the conception of the holy virgin. See Conception *Immaculate*.

IMMATERIAL, ſomething devoid of matter, or that is pure ſpirit: thus God, angels, and the human ſoul, are immaterial beings.

IMMEDIATE, whatever is capable of producing an effect without the intervention of external means; thus we ſay, an immediate cauſe, in oppoſition to a mediate or remote one.

IMMENSITY, an unlimited extenſion, or which no finite and determinate ſpace, repeated ever ſo often, can equal.

IMMER, the moſt eaſterly iſland of all the New Hebrides in the South Sea. It lies about four leagues from Tanna, and ſeems to be about five leagues in circumference; it is of a conſiderable height, with a flat-top.

IMMERSION, that act by which any thing is plunged into water or other fluid.

It is uſed in chemiſtry for a ſpecies of calcination, when any body is immerſed in a fluid to be corroded: or it is a ſpecies of lotion; as when a ſubſtance is plunged into any fluid, in order to deprive it of a bad quality, or communicate to it a good one.

Immersion, in aſtronomy, is when a ſtar or planet is ſo near the ſun with regard to our obſervations, that we cannot ſee it; being, as it were, inveloped and hid in the rays of that luminary. It alſo denotes the beginning of an eclipſe of the moon, or that moment when the moon begins to be darkened, and to enter into the ſhadow of the earth.

IMMORTAL, that which will laſt to all eternity, as having in it no principle of alteration or corruption: thus God and the human ſoul are immortal. See Soul.

IMMUNITY, a privilege or exemption from ſome office, duty, or impoſition, as an exemption from tolls, &c.

Immunity is more particularly underſtood of the liberties granted to cities and communities.

IMOLA, a town of Italy, in the territory of the church, and in Romagna, with a biſhop's ſee. It is a very handſome populous place; and is ſeated on the river Santerno, in E. Long. 11. 43. N. Lat. 44. 28. Imola ‖ Impatiens.

IMPALE, in heraldry, is to conjoin two coats of arms pale-wiſe. Women impale their coats of arms with thoſe of their huſbands. See Heraldry, p. 3589, 3610.

To impale cities, camps, fortifications, &c. is to incloſe them with palliſadoes.

To Impale, or *Empale*, ſignifies alſo to put to death by ſpitting on a ſtake fixed upright.

IMPALPABLE, that whoſe parts are ſo extremely minute, that they cannot be diſtinguiſhed by the ſenſes, particularly by that of feeling.

IMPANATION, a term uſed by divines to ſignify the opinion of the Lutherans with regard to the euchariſt, who believe that the ſpecies of bread and wine remain together with the body of our Saviour after conſecration.

IMPANNELLING, in law, ſignifies the writing down or entering into a parchment, liſt, or ſchedule, the names of a jury ſummoned by the ſheriff to appear for ſuch public ſervices as juries are employed in.

IMPARLANCE, in law, a petition in court for a day to conſider or adviſe what anſwer the defendant ſhall make to the plaintiff's action; and is the continuance of the cauſe till another day, or a longer time given by the court.

IMPASTATION, the mixtion of various materials of different colours and conſiſtencies, baked or bound together with ſome cement, and hardened either by the air or by fire.

IMPATIENS, touch-me-not, and *Balſamine*; a genus of the monogamia order, belonging to the ſyngeneſia claſs of plants.

Species. 1. The noli-me-tangere, or common yellow balſamine, is a native of Britain, but is cultivated in many gardens for curioſity. It hath a fibrous root, an upright, jointed, ſucculent, ſtalk, about 18 inches high, with alternate oval leaves; and, from the axillas of the ſtalks, long, ſlender, branching footſtalks, each ſuſtaining many yellow flowers; ſucceeded by taper capſules, that burſt open and dart forth their ſeeds with great velocity, whence its name. 2. The balſamina, or balſam, is a native of India. It hath a fibrous root, an upright, thick, ſucculent ſtalk, branching all around a foot and an half or two feet high; with long, ſpear-ſhaped, ſawed leaves, the upper ones alternate; and from the joints of the ſtalk and branches cluſters of ſhort foot-ſtalks, each ſuſtaining one large irregular flower, of different colours in the varieties; flowering from June or July till September.

Culture. The firſt ſpecies is very hardy, and will grow freely from the ſeeds in any common border; but the ſecond requires artificial warmth. The ſeeds will indeed grow in the full ground, but rarely before the month of May; and more freely then, if covered with a hand-glaſs, &c. But the plants raiſed by artificial heat will flower five or ſix weeks ſooner than thoſe raiſed in the natural ground. The ſeeds ought therefore always to be ſowed on a hotbed in March or April, and the plants continued therein till June, and if the frames be deep they will then be drawn up to the length of two or three feet; after which they may be

mpeach-ment ‖ mperfect.

be planted in pots, which muſt likewiſe be continued in the hot-bed till the plants have taken freſh root.

IMPEACHMENT, an accuſation and proſecution for treaſon and other crimes and miſdemeanours. Any member of the lower houſe of parliament may impeach any one belonging either to that body, or to the houſe of lords. The method of proceeding is to exhibit articles on the behalf of the commons, by whom managers are appointed to make good their charge. Theſe articles are carried to the lords, by whom every perſon impeached by the commons is always tried; and if they find him guilty, no pardon under the great ſeal can be pleaded to ſuch an impeachment. 12 Will. III. cap. ii.

IMPENETRABILITY, in philoſophy, that property of body, whereby it cannot be pierced by another: thus, a body which ſo fills a ſpace as to exclude all others, is ſaid to be impenetrable.

IMPERATIVE, one of the moods of a verb, uſed when we would command, intreat, or adviſe: thus, *go read, take pity, be adviſed*, are imperatives in our language. But in the learned languages, this mood has a peculiar termination to diſtinguiſh it from others, as *i*, or *ito*, "go;" *lege*, or *legito*, "read," &c. and not only ſo, but the termination varies, according as you addreſs one or more perſons, as *audi* and *audite*; ακουε, ακουετω, ακουετωσαν, &c.

IMPERATOR, in Roman antiquity, a title of honour conferred on victorious generals by their armies, and afterwards confirmed by the ſenate.

IMPERATORIA, MASTERWORT; a genus of the digynia order, belonging to the pentandria claſs of plants.—There is but one ſpecies, viz. the oſtruthium, a native of the Auſtrian and Styrian Alps, and other mountainous places of Italy. Mr Lightfoot alſo informs us, that he has found it in ſeveral places on the banks of the Clyde in Scotland; but whether indigenous or not, is uncertain. The root is as thick as a man's thumb, running obliquely in the ground; it is fleſhy, aromatic, and has a ſtrong acrid taſte, biting the tongue like pellitory of Spain: the leaves ariſe immediately from the root; they have long foot-ſtalks, dividing into three very ſhort ones at the top, each ſuſtaining a trilobate leaf, indented on the border. The footſtalks are deeply channelled, and, when broken, emit a rank odour. The flower-ſtalks riſe about two feet high, dividing into two or three branches, each being terminated by a pretty large umbel of white flowers whoſe petals are ſplit; theſe are ſucceeded by oval compreſſed ſeeds, ſomewhat like thoſe of dill, but larger.—The plant is cultivated in gardens for the ſake of its roots, which are uſed in medicine. It may be propagated either by ſeeds, or by parting the roots in autumn. They thrive beſt in a ſhady ſituation.—The root has a flavour ſimilar to that of angelica, and is eſteemed a good ſudorific. There are inſtances of its having cured the ague when the bark had failed. It ſhould be dug up in winter, and a ſtrong infuſion made in wine.

IMPERFECT, ſomething that is defective, or that wants ſome of the properties found in other beings of the ſame kind.

IMPERFECT *Tenſe*, in grammar, a tenſe that denotes ſome preterite caſe, or denotes the thing to be at that time preſent and not quite finiſhed; as *ſcribebam*, "I was writing."

IMPERIAL, ſomething belonging to an emperor, or empire. See EMPEROR, and EMPIRE.—Thus we ſay, his *imperial* majeſty, the *imperial* crown, *imperial* arms, &c.

IMPERIAL *Crown*. See HERALDRY, p. 3606.

IMPERIAL *Chamber*, is a ſovereign court, eſtabliſhed for the affairs of the immediate ſtates of the empire. See CHAMBER.

IMPERIAL *Cities*, in Germany, are thoſe which own no other head but the emperor.

Theſe are a kind of little commonwealths; the chief magiſtrate whereof does homage to the emperor, but in other reſpects, and in the adminiſtration of juſtice, is ſovereign.

Imperial cities have a right of coining money, and of keeping forces and fortified places. Their deputies aſſiſt at the imperial diets, where they are divided into two branches, that of the Rhine, and that of Suabia. There were formerly 22 in the former, and 37 in the latter; but there are now only 48 in all.

IMPERIAL *Diet*, is an aſſembly or convention of all the ſtates of the empire. See DIET.

IMPERIALI (John Baptiſt), a celebrated phyſician of Vicenza, where he was born in 1568. He compoſed ſeveral eſteemed works both in proſe and verſe, written in good Latin; and died in 1623.

IMPERSONAL VERB, in grammar, a verb to which the nominative of any certain perſon cannot be prefixed; or, as others define it, a verb deſtitute of the two firſt and primary perſons, as *decet*, *opportet*, &c. The impersonal verbs of the active voice end in *t*, and thoſe of the paſſive in *tur*; they are conjugated thro' the third perſon ſingular of almoſt all the tenſes and moods: they want the imperative, inſtead of which we uſe the preſent of the ſubjunctive; as *pœniteat*, *pugnetur*, &c. nor, but a few excepted, are they to be met with in the ſupines, participles, or gerunds.

IMPERVIOUS, a thing not to be pervaded or paſſed through, either by reaſon of the cloſeneſs of its pores, or the particular configuration of its parts.

IMPETUS, in mechanics, the force with which one body ſtrikes or impells another.

IMPLICATION, in law, is where ſomething is implied that is not expreſſed by the parties themſelves in their deeds, contracts, or agreements.

To IMPLY, or CARRY, in *Muſic*. Theſe we have uſed as ſynonimous terms in that article. They are intended to ſignify thoſe ſounds, which ought to be the proper concomitants of any note, whether by its own nature, or by its poſition in artificial harmony. Thus every note, conſidered as an independent ſound, may be ſaid to *carry* or *imply* its natural harmonics, that is to ſay, its octave, its twelfth, and its ſeventeenth; or, when reduced, its eight, its fifth, and its third. But the ſame ſound when conſidered as conſtituting any part of harmony, is ſubjected to other laws and different limitations. It can then only be ſaid to *carry* or *imply* ſuch ſimple ſounds, or complications of ſound, as the preceding and ſubſequent chords admit or require. For theſe the laws of melody and harmony muſt be conſulted. See MELODY, and HARMONY.

IMPORTATION in commerce, the bringing merchandize into a kingdom from foreign countries; in

Imperial ‖ Importation.

Importation. in contradiſtinction to exportation. See EXPORTATION.

We ſhall here give ſome of the principal laws relating to the importation of goods into this kingdom. Goods imported without entry or paying cuſtoms, are forfeited; and the lord-treaſurer, the barons of the exchequer, or chief magiſtrates of the place where the offence was committed, or next adjoining to it, may grant a warrant to any perſon, who, with the aſſiſtance of a conſtable, may break open doors, cheſts, &c. and take thence any prohibited or unaccuſtomed goods; but this is to be done within one month after the offence was committed. But if falſe information is given, the perſon wrongfully accuſed may recover coſts and damages.

No ſhip or veſſel arriving from beyond ſea is to be above three days in failing from Graveſend to the place of diſcharge on the river Thames, unleſs hindered by contrary winds or other impediment. And no ſhip bound for the port of London is to touch or ſtay at any place adjoining to any ſhore, between Graveſend and Cheſter-quay. True entries are to be made of all ſuch ſhips lading, upon oath of the maſter or purſer for that voyage; alſo where ſhe took in her lading, where ſhe was built, how manned, who were the owners, and who the maſter during the voyage. In all out-ports, ſhips are to come directly to the place of unlading, and make true entries as aforeſaid, upon penalty of the forfeiture of 100 l.

After any ſhip is cleared, and the watchmen and tideſmen diſcharged from their attendance, if there be found on board any concealed goods that have not paid the duty inwards, the maſter, or other perſon taking charge of the ſhip, ſhall forfeit 100 l.

Porters, carmen, watermen, &c. aſſiſting in landing unaccuſtomed goods, ſhall on conviction, for the firſt offence, be committed to the next jail till they find ſecurity for their good behaviour; and for their ſecond offence they are to be committed to priſon for two months, without bail or mainprize, or till they are diſcharged by the court of exchequer, or each of them pay 5 l. to the ſheriff of the county.

No merchant-denizen ſhall cover a ſtranger's goods, but ſhall, by himſelf or agent, ſign one of his bills of every entry, with the mark, number, and contents of every parcel of goods, without which no entry ſhall paſs. And no children of aliens under the age of 21 years, ſhall have entry made in their names, nor be permitted to trade.

Merchants, trading into the port of London, ſhall have free liberty to lade and unlade their goods at any of the lawful quays between the tower and London-bridge, from ſun-riſing to ſun-ſetting, from September 10. to March 10.; and between ſix o'clock in the morning and ſix in the evening, from March 10. to September 10.; giving notice thereof to the reſpective officers appointed to attend the lading and unlading of goods. And ſuch officers as ſhall refuſe to be preſent ſhall forfeit 5 l. for every default.

To prevent combination between importers, and ſeizers of goods unlawfully imported or exported, none ſhall ſeize them but the officers of the cuſtoms, or ſuch as ſhall be authoriſed ſo to do by the lord-treaſurer, under-treaſurer, or a ſpecial commiſſion from his majeſty under the great privy-ſeal.

If any ſeizer of prohibited or unaccuſtomed goods does not make due proſecution thereof, it is lawful for the cuſtom-houſe officers, or others deputed thereto, to make ſeizure of ſuch goods; and they ſhall be, in law, adjudged the firſt true informers and ſeizers, and have the benefit thereof, notwithſtanding any law and ſtatute to the contrary. Importation ‖ Impotence.

All foreign goods permitted to be landed by bills at ſight, bills at view or ſufferance, ſhall be landed at the moſt convenient quays and wharfs, as the officers of the cuſtoms ſhall direct; and there, or at the king's ſtore-houſe of the reſpective ports, ſhall be meaſured, weighed, numbered, &c. by the officers appointed, who ſhall perfect the entry, and ſubſcribe their names to it, and the next day make their report to the cuſtomer, collector, or comptroller; or, in default thereof, ſhall forfeit 100 l.

Any merchant who ſhall import goods, ſhall have liberty to break bulk in any lawful port or quay, the maſter or purſer firſt making oath of the true contents of the ſhip's lading. No Engliſh merchant ſhall put on ſhore in Scotland or Ireland, any merchandize of the growth or produce of any of his majeſty's plantations, unleſs the ſame have been firſt landed in England, Wales, or Berwick, and paid the duties with which they are chargeable, under the penalty of forfeiting the ſhip and goods, three-fourths to the king, and one-fourth to the informer or him that ſhall ſue for the ſame: but if a ſhip be diſabled, or driven into any port of Ireland, and unable to proceed on her voyage, her goods may be put on ſhore, under the hands of the principal officers of the cuſtoms there reſiding, till the goods can be put on board ſome other veſſel, to be tranſported to ſome part of England or Wales.

Natives of England or Ireland may import into England, directly from Ireland, any hemp, flax, thread, yarn and linen, of the growth and manufacture of Ireland, cuſtom-free; the chief officer ſo importing bringing a certificate from the chief office in Ireland, expreſſing the particulars of the goods, with the names and places of abode of the exporters thence, and of ſuch as have ſworn that the ſaid goods are *bona fide* of the growth and manufacture of that kingdom, and who they are conſigned to in England; and the chief officer ſhall make oath, that the ſaid goods are the ſame that are on board by virtue of that certificate.

IMPOST, in law, ſignifies in general a tribute or cuſtom, but is more particularly applied to ſignify that tax which the crown receives for merchandizes imported into any port or haven.

IMPOSTHUME, in ſurgery, &c. See ABSCESS.

IMPOTENCE, or IMPOTENCY, in general, denotes want of ſtrength, power, or means, to perform any thing.

Divines and philoſophers diſtinguiſh two ſorts of impotency; natural, and moral. The firſt is a want of ſome phyſical principle, neceſſary to an action; or where a being is abſolutely defective, or not free and at liberty to act: The ſecond only imports a great difficulty; as a ſtrong habit to the contrary, a violent paſſion, or the like.

Impotency is more particularly uſed for a natural inability to coition. Impotence with reſpect to men

is

Impregnation || Impressing.

is the same as sterility in women; that is, an inability of propagating the species. There are many causes of impotence; as, a natural defect in the organs of generation, which seldom admits of a cure: accidents, or diseases; and in such cases the impotence may, or may not, be remedied, according as these are curable or otherwise.—The most common causes are, early and immoderate venery, or the venereal disease. We have instances, however, of unfitness for generation in men by an impediment to the ejection of the semen in coition, from a wrong direction which the orifice at the *verumontanum* got, whereby the seed was thrown up into the bladder. M. Petit cured one patient under such a difficulty of emission, by making an incision like to that commonly made in the great operation for the stone.

IMPREGNATION, the getting a female with child. See PREGNANCY.

The term *impregnation* is also used, in pharmacy, for communicating the virtues of one medicine to another, whether by mixture, coction, digestion, &c.

IMPRESSING SEAMEN. The power of impressing sea-faring men for the sea-service by the king's commission, has been a matter of some dispute, and submitted to with great reluctance; though it hath very clearly and learnedly been shewn by Sir Michael Foster, that the practice of impressing, and granting powers to the admiralty for that purpose, is of very ancient date, and hath been uniformly continued by a regular series of precedents to the present time: whence he concludes it to be part of the common law. The difficulty arises from hence, that no statute has expressly declared this power to be in the crown, though many of them very strongly imply it. The statute 2 Ric. II. c. 4. speaks of mariners being arrested and retained for the king's service, as of a thing well known, and practised without dispute; and provides a remedy against their running away. By a later statute, if any waterman, who uses the river Thames, shall hide himself during the execution of any commission of pressing for the king's service, he is liable to heavy penalties. By another, (5 *Eliz.* c. 5.) no fisherman shall be taken by the queen's commission to serve as a mariner; but the commission shall be first brought to two justices of the peace, inhabiting near the sea-coast where the mariners are to be taken, to the intent that the justices may choose out and return such a number of able-bodied men, as in the commission are contained, to serve her majesty. And, by others, especial protections are allowed to seamen in particular circumstances, to prevent them from being impressed. Ferrymen are also said to be privileged from being impressed, at common law. All which do most evidently imply a power of impressing to reside somewhere; and, if any where, it must, from the spirit of our constitution, as well as from the frequent mention of the king's commission, reside in the crown alone.—After all, however, this method of manning the navy is to be considered as only defensible from public necessity, to which all private considerations must give way.

The following persons are exempted from being impressed: Apprentices for three years; the master, mate, and carpenter, and one man for every 100 tons, of vessels employed in the coal-trade; all under 18 years of age, and above 55; foreigners in merchant-ships and privateers; landmen betaking themselves to sea for two years; seamen in the Greenland fishery, and harpooners, employed, during the interval of the fishing season, in the coal-trade, and giving security to go to the fishing next season.

Impression || Imprisonment.

IMPRESSION is applied to the species of objects which are supposed to make some mark or impression on the senses, the mind, and the memory. The Peripatetics assert, that bodies emit species resembling them, which are conveyed to the common *sensorium*, and they are rendered intelligible by the active intellect; and, when thus spiritualized, are called *expressions*, or *express species*, as being expressed from the others.

IMPRESSION also denotes the *edition* of a book, regarding the mechanical part only; whereas *edition*, besides this, takes in the care of the editor, who corrected or augmented the copy, adding notes, &c. to render the work more useful.

IMPRISONMENT, the state of a person restrained of his liberty, and detained under the custody of another.

No person is to be imprisoned but as the law directs, either by the command or order of a court of record, or by lawful warrant; or the king's process, on which one may be lawfully detained. And at common law, a person could not be imprisoned unless he were guilty of some force and violence, for which his body was subject to imprisonment, as one of the highest executions. Where the law gives power to imprison, in such case it is justifiable, provided he that does it in pursuance of a statute, exactly pursues the statute in the manner of doing it; for otherwise it will be deemed false imprisonment, and of consequence it is unjustifiable. Every warrant of commitment for imprisoning a person, ought to run, "Till delivered by due course of law," and not "Until farther order;" which has been held ill: and thus it also is, where one is imprisoned on a warrant not mentioning any cause for which he is committed. See ARREST and COMMITMENT.

False IMPRISONMENT. Every confinement of the person is an imprisonment, whether it be in a common prison, or in a private house, or in the stocks, or even by forcibly detaining one in the public streets. Unlawful or *false imprisonment*, consists in such confinement or detention without sufficient authority: which authority may arise either from some process from the courts of justice; or from some warrant from a legal power to commit, under his hand and seal, and expressing the cause of such commitment; or from some other special cause warranted, for the necessity of the thing, either by common law, or act of parliament; such as the arresting of a felon by a private person without warrant, the impressing of mariners for the public service, or the apprehending of waggoners for misbehaviour in the public highways. False imprisonment also may arise by executing a lawful warrant or process at an unlawful time, as on a Sunday; or in a place privileged from arrests, as in the verge of the king's court. This is the injury. The remedy is of two sorts; the one *removing* the injury, the other *making satisfaction* for it.

The means of *removing* the actual injury of false imprisonment, are four-fold, 1. By writ of MAINPRIZE. 2. By writ *De* ODIO *et Atia*. 3. By writ *De* HOMINE *Replegiando*.

Impromptu || Impurity.

Replegiando. 4. By writ of HABEAS *Corpus*. See those articles.

The *fatisfactory* remedy for this injury of falſe impriſonment, is by an action of treſpaſs *vi et armis*, uſually called *an action of falſe impriſonment*; which is generally, and almoſt unavoidably, accompanied with a charge of aſſault and battery alſo: and therein the party ſhall recover damages for the injuries he has received; and alſo the defendant is, as for all other injuries committed with force, or *vi et armis*, liable to pay a fine to the king for the violation of the public peace.

IMPROMPTU, or INPROMPTU, a Latin word frequently uſed among the French, and ſometimes in Engliſh, to ſignify a piece made off-hand, or *extempore*, without any previous meditation, by mere force and vivacity of imagination.——Many authors pique themſelves on their *impromptu's*, which yet were done at leiſure and in cold blood.

IMPROBATION, in Scots law, the name of an action brought for ſetting any deed or writing aſide upon the head of forgery.

IMPROPRIATION, in eccleſiaſtical law. See APPROPRIATION.

IMPURITY, in the law of Moſes, is any legal defilement. Of theſe there were ſeveral ſorts. Some were voluntary, as the touching a dead body, or any animal that died of itſelf, or any creature that was eſteemed unclean; or the touching things holy, by one who was not clean, or was not a prieſt; the touching one who had a leproſy, one who had a gonorrhœa, or who was polluted by a dead carcaſe, &c. Sometimes theſe impurities were involuntary; as when any one inadvertently touched bones, or a ſepulchre, or any thing polluted; or fell into ſuch diſeaſes as pollute, as the leproſy, &c.

The beds, clothes, and moveables, which had touched any thing unclean, contracted alſo a kind of impurity, and in ſome caſes communicated it to others.

Theſe legal pollutions were generally removed by bathing, and laſted no longer than the evening. The perſon polluted plunged over head in the water, and either had his clothes on when he did ſo, or waſhed himſelf and his clothes ſeparately. Other pollutions continued ſeven days, as that which was contracted by touching a dead body. That of women in their monthly courſes laſted till this was over with them. Other impurities laſted 40 or 50 days; as that of women who were lately delivered, who were unclean 40 days after the birth of a boy, and 50 after the birth of a girl. Others again laſted till the perſon was cured.

Many of theſe pollutions were expiated by ſacrifices; and others by a certain water or lye, made with the aſhes of a red heifer, ſacrificed on the great day of expiation. When the leper was cured, he went to the temple, and offered a ſacrifice of two birds, one of which was killed and the other ſet at liberty. He who had touched a dead body, or had been preſent at a funeral, was to be purified with the water of expiation, and this upon pain of death. The woman who had been delivered, offered a turtle and a lamb for her expiation; or if ſhe was poor, two turtles or two young pigeons.

Theſe impurities, which the law of Moſes has expreſſed with the greateſt accuracy and care, were only figures of other more important impurities, ſuch as the ſins and iniquities committed againſt God, or faults committed againſt our neighbour. The ſaints and prophets of the Old Teſtament were ſenſible of this; and our Saviour, in the goſpel, has ſtrongly inculcated, that they are not outward and corporeal pollutions which render us unacceptable to God, but ſuch inward pollutions as infect the ſoul, and are violations of juſtice, truth, and charity. Imputation || Inarching.

IMPUTATION, in general, the charging ſomething to the account of one, which belonged to another: thus, the aſſertors of original ſin maintain, that Adam's ſin is imputed to all his poſterity.

In the ſame ſenſe, the righteouſneſs and merits of Chriſt are imputed to true believers.

INACCESSIBLE, ſomething that cannot be come at, or approached, by reaſon of intervening obſtacles, as a river, rock, &c. It is chiefly uſed in ſpeaking of heights and diſtances. See GEOMETRY.

INACHUS, founder of the kingdom of Argos, 1856 B. C. See ARGOS.

INALIENABLE, that which cannot be legally alienated or made over to another: thus the dominions of the king, the revenues of the church, the eſtates of a minor, &c. are inalienable, otherwiſe than with a reſerve of the right of redemption.

INANIMATE, a body that has either loſt its ſoul, or that is not of a nature capable of having any.

INANITION, among phyſicians, denotes the ſtate of the ſtomach when empty, in oppoſition to repletion.

INARCHING, in gardening, is a method of grafting, commonly called *grafting by approach*; and is uſed when the ſtock intended to graft on, and the tree from which the graft is to be taken, ſtand ſo near, or can be brought ſo near, that they may be joined together. The branch to be inarched is to be fitted to that part of the ſtock where it is to be joined; the rind and wood are to be paired away on one ſide for the length of three inches, and the ſtock or branch where the graft is to be united muſt be ſerved in the ſame manner, ſo that the two may join equally, and the ſap meet. A little tongue is then to be cut upwards in the graft, and a notch made in the ſtock to admit it; ſo that, when they are joined, the tongue will prevent their ſlipping, and the graft will more cloſely unite to the ſtock. Having thus brought them exactly together, they muſt be tied with ſome baſs, or worſted, or other ſoft tying; and then the place muſt be covered with ſome grafting clay, to prevent the air from drying the wound, and the wet from rotting the ſtock. A ſtake muſt be fixed in the ground, to which both the ſtock and the graft muſt be tied to prevent the winds from diſplacing them. When they have remained in this ſtate for four months, they will be ſufficiently united, and the graft may then be cut off from the mother-tree, obſerving to ſlope it cloſe to the ſtock; and at this time there ſhould be freſh clay laid all round the part. This operation ſhould be performed in April or May, that the graft may be perfectly united to the ſtock before the enſuing winter.

Inarching is chiefly practiſed upon oranges, myrtles, jeſſamines, walnuts, firs, and ſome other trees which do not ſucceed well in the common way of grafting. But it is a wrong practice when orange-trees are de-

Inauguration — Incenſe.

Inceſt — Inclination.

deſigned to grow large, for theſe are ſeldom long-lived after the operation.

INAUGURATION, the coronation of an emperor or king, or the conſecration of a prelate: ſo called from the ceremonies uſed by the Romans, when they were received into the college of augurs.

INCA, or YNCA, a name given by the natives of Peru to their kings and the princes of the blood. Pedro de Cieca, in his Chronicle of Peru, gives the origin of the incas; and ſays, that that country was, for a long time, the theatre of all manner of crimes, of war, diſſention, and the moſt dreadful diſorders, till at laſt two brothers appeared, one of whom was called *Mangocapa*; of this perſon, the Peruvians relate many wonderful ſtories. He built the city of Cuſco, made laws, eſtabliſhed order and harmony by his wiſe regulations; and he and his deſcendants took the name of *inca*, which ſignifies king or great lord. Theſe incas became ſo powerful, that they rendered themſelves maſters of all the country from Paſto to Chili, and from the river Maule on the ſouth to the river Augaſmago on the north; theſe two rivers forming the bounds of their empire, which extended above thirteen hundred leagues in length. This they enjoyed till the diviſions between inca Guaſcar and Atabalipa; which the Spaniards laying hold of, made themſelves maſters of the country, and deſtroyed the empire of the incas. See PERU.

INCAMERATION, a term uſed in the chancery of Rome, for the uniting of lands, revenues, or other rights, to the pope's domain.

INCANTATION, denotes certain ceremonies, accompanied with a formula of words, and ſuppoſed to be capable of raiſing devils, ſpirits, &c. See CHARM, &c.

INCAPACITY, in the canon-law, is of two kinds: 1. The want of a diſpenſation for age in a minor, for legitimation in a baſtard, and the like: this renders the proviſion of a benefice void in its original. 2. Crimes and heinous offences, which annul proviſions at firſt valid.

INCARNATION, in theology, the act whereby the ſecond Perſon of the Holy Trinity aſſumed the human nature, viz. a true body and reaſonable ſoul, in order to accompliſh the redemption of fallen mankind.

INCARNATIVES, in ſurgery, medicines which aſſiſt nature in filling up wounds or ulcers with fleſh; or rather remove the obſtructions thereto.

INCENSE, or FRANKINCENSE, in the materia medica, &c. a dry reſinous ſubſtance, known among authors by the names THUS and OLIBANUM.

Incenſe is a rich perfume, with which the Pagans, and the Roman-Catholics ſtill, perfume their temples, altars, &c.——The word comes from the Latin *incenſum*, q. d. *burnt*; as taking the effect for the thing itſelf.

The burning of incenſe made part of the daily ſervice of the ancient Jewiſh church. The prieſts drew lots to know who ſhould offer it: the deſtined perſon took a large ſilver diſh, in which was a cenſer full of incenſe; and being accompanied by another prieſt carrying ſome live coals from the altar, went into the temple. There, in order to give notice to the people, they ſtruck upon an inſtrument of braſs placed between the temple and the altar; and being returned to the altar, he who brought the fire left it there, and went away. Then the offerer of incenſe having ſaid a prayer or two, waited the ſignal, which was the burning of the holocauſt; immediately upon which he ſet fire to the incenſe, the whole multitude continuing all the time in prayer. The quantity of incenſe offered each day, was half a pound in the morning, and as much at night.

One reaſon of this continual burning of incenſe might be, that the multitude of victims that were continually offered up, would have made the temple ſmell like a ſlaughter-houſe, and conſequently have inſpired the comers rather with diſguſt and averſion, than awe and reverence, had it not been overpowered by the agreeable fragrance of thoſe perfumes.

INCEST, the crime of venereal commerce between perſons who are related in a degree wherein marriage is prohibited by the law of the country.

Some are of opinion, that marriage ought to be permitted between kinsfolks, to the end that the affection ſo neceſſary in marriage might be heightened by this double tie: yet the rules of the church have formerly extended this prohibition even to the ſeventh degree; but time has now brought it down to the third or fourth degree.

Moſt nations look on inceſt with horror, Perſia and Egypt alone excepted. In the hiſtory of the ancient kings of thoſe countries we meet with inſtances of the brother's marrying the ſiſter; the reaſon was, becauſe they thought it too mean to join in alliance with their own ſubjects, and ſtill more ſo to have married into any foreign family.

INCEST *Spiritual*, a crime committed in like manner between perſons who have a ſpiritual alliance by means of baptiſm or confirmation.

Spiritual inceſt is alſo underſtood of a vicar, or other beneficiary, who enjoys both the mother and daughter; that is, holds two benefices, the one whereof depends upon the collation of the other.

Such a ſpiritual inceſt renders both the one and the other of theſe benefices vacant.

INCH, a well-known meaſure of length; being the twelfth part of a foot, and equal to three barley-corns in length.

INCH *of Candle*, (ſale by). See CANDLE.

INCHANTMENT. See WITCHCRAFT.

INCIDENCE, denotes the direction in which one body ſtrikes on another. See OPTICS and MECHANICS.

Angle of INCIDENCE. See ANGLE.

INCIDENT DILIGENCE, in Scots law, a warrant granted by a lord ordinary in the court of ſeſſion, for citing witneſſes for proving any point, or for production of any writing neceſſary for preparing the cauſe for a final determination, or before it goes to a general proof.

INCISIVE, an appellation given to whatever cuts or divides: thus, the foreteeth are called *dentes inciſivi*, or cutters; and medicines of an attenuating nature, *incidents*, or inciſive medicines.

INCLE, a kind of tape made of linen yarn.

INCLINATION, is a word frequently uſed by mathematicians, and ſignifies the mutual approach, tendency, or leaning of two lines or two planes to-

Inclined ‖ Incus.

wards each other, so as to make an angle.

INCLINED PLANE, in mechanics, one that makes an oblique angle with the horizon. See MECHANICS.

INCOGNITO, or INCOG, is applied to a person who is in any place where he would not be known: but it is more particularly applied to princes, or great men, who enter towns, or walk the streets, without their ordinary train or the usual marks of their distinction and quality.

INCOMBUSTIBLE, something that cannot be burnt, or consumed by fire. See ASBESTUS.

INCOMMENSURABLE, a term in geometry, used where two lines, when compared to each other, have no common measure, how small soever, that will exactly measure them both. And in general, two quantities are said to be incommensurable, when no third quantity can be found that is an aliquot part of both.

INCOMMENSURABLE *Numbers*, are such as have no common divisor that will divide them both equally.

INCOMPATIBLE, that which cannot subsist with another without destroying it: thus cold and heat are incompatible in the same subject, the strongest overcoming and expelling the weakest.

INCORPORATION, in pharmacy, is much the same as impastation, being a reduction of dry substances to the consistence of a paste, by the admixture of some fluid: thus pills, boles, troches, and plasters, are made by incorporation. Another incorporation is when things of different consistencies are by digestion reduced to one common consistence.

INCORPORATION, or *Body-Corporate*. See CORPORATION.

INCRASSATING, in pharmacy, &c. the rendering of fluids thicker by the mixture of other substances less fluid, or by the evaporation of the thinner parts.

INCUBATION, the action of a hen, or other fowl, brooding on her eggs. See HATCHING.

INCUBUS, NIGHT-MARE, a disease consisting in an oppression of the breast, so very violent, that the patient cannot speak or even breathe. The word is derived from the Latin *incubare*, to "lie down" on any thing and press it: the Greeks call it ἐφιάλτης, q. d. *saltator*, "leaper," or one that rusheth on a person.

In this disease the senses are not quite lost, but drowned and astonished, as is the understanding and imagination; so that the patient seems to think some huge weight thrown on him, ready to strangle him. Children are very liable to this distemper; so are fat people, and men of much study and application of mind; by reason the stomach in all these finds some difficulty in digestion. See (*Index* subjoined to) MEDICINE.

INCUMBENT, a clerk or minister who is resident on his benifice; he is called *incumbent*, because he does, or at least ought to bend his whole study to discharge the cure of his church.

INCURVATION *of the* RAYS *of* LIGHT, their bending out of a rectilinear straight course, occasioned by refraction. See OPTICS.

INCUS, in anatomy, a bone of the internal ear, somewhat resembling one of the anterior dentes molares. See ANATOMY, n° 405. *e*.

indefeasible ‖ Index.

INDEFEASIBLE, a term in law for what cannot be defeated or made void; as an indefeasible estate of inheritance, &c.

INDEFEASIBLE *Right to the Throne*. See HEREDITARY *Right*.

INDEFINITE, that which has no certain bounds, or to which the human mind cannot affix any.

INDEFINITE, in grammar, is understood of nouns, pronouns, verbs, participles, articles, &c. which are left in an uncertain indeterminate sense, and not fixed to any particular time, thing, or other circumstance.

INDELIBLE, something that cannot be cancelled or effaced.

INDEMNITY, in law, the saving harmless; or a writing to secure one from all damage and danger that may ensue from any act.

INDENTED, in heraldry, is when the outline of an ordinary is notched like the teeth of a saw.

INDEPENDENTS, a sect of Protestants in Britain and Holland, so called from their independency on other churches, and their maintaining, that each church or congregation has sufficient power to act and perform every thing relating to religious government within itself, and is no way subject or accountable to other churches or their deputies.

They therefore disallow parochial and provincial subordination, and form all their congregations upon a scheme of co-ordinancy. But though they do not think it necessary to assemble synods, yet if any be held, they look upon their resolutions as prudential counsels, but not as decisions to which they are obliged to conform.

The present Independents differ from the Presbyterians only in their church-government; in being generally more attached to the doctrines distinguished by the term *orthodoxy*, such as original sin, election, reprobation, &c.; and in administring the Lord's Supper at the close of the afternoon's service. See PRESBYTERIANS.

The several sects of Baptists are all Independents with respect to church-government; and, like them, administer the Lord's Supper in the evening; whereas the Presbyterians administer it after the forenoon's service. See ANABAPTISTS.

INDETERMINATE, in general, an appellation given to whatever is not certain, fixed, and limited; in which sense it is the same with *indefinite*.

INDEX, in arithmetic and algebra, shews to what power any quantity is involved, and is otherwise called its *exponent*. See ALGEBRA, n° 9.

Expurgatory INDEX, a catalogue of prohibited books in the church of Rome.

The first catalogues of this kind were made by the inquisitors; and these were afterwards approved of by the council of Trent, after some alteration was made in them by way of retrenchment or addition. Thus an index of heretical books being formed, it was confirmed by a bull of Clement VIII. in 1595, and printed with several introductory rules; by the fourth of which, the use of the scriptures in the vulgar tongue if forbidden to all persons without a particular licence; and by the tenth rule it is ordained, that no book shall be printed at Rome, without the approbation of the Pope's vicar, or some person delegated by the Pope;

nor

India || Indictment.

nor in any other places, unless allowed by the bishop of the diocese, or some person deputed by him, or by the inquisitor of heretical pravity.

The Trent index being thus published, Philip II. of Spain ordered another to be printed at Antwerp, in 1571, with considerable enlargements. Another index was published in Spain in 1584; a copy of which was snatched out of the fire when the English plundered Cadiz. Afterwards there were several expurgatory indexes printed at Rome and Naples, and particularly in Spain.

INDIA PROPER, or HITHER INDIA, a large peninsula in Asia, bounded on the north by Usbec Tartary and Thibet; on the east, by another part of Thibet, the kingdom of Asem, Ava, and Pegu; on the south, by the bay of Bengal and the Indian ocean; and by the same ocean and Persia, on the west; situated between 66° and 92° of east longitude, and between 7° and 40° of north latitude: being about 2000 miles in length from north to south, and 1500 miles in breadth from east to west where broadest; though the southern part of the peninsula is not 300 miles broad. All the country within these limits is either subject or tributary to the great Mogul. It is frequently called *Indostan*; a name supposed to be derived from the river Indus, on its western frontiers: it is also called the *Mogulstan*, from the imperial family now upon the throne, who trace their pedigree from Tamerlane, a Mogul Tartar. See MOGULS.

INDIA *beyond the Ganges*, is a country bounded by Thibet and Boutan on the north; by China, Tonquin, and Cochin-China, on the east; by the Indian Ocean, on the south; and by the hither India, the bay of Bengal, and the straits of Malacca, on the west: it is situated between 92° and 104° of east longitude, and between the equator and 30° degrees of north latitude: being near 2000 miles in length from north to south, but of a very unequal breadth; in which limits are comprehended the kingdoms of Asem, Ava, Pegu, Laos, Siam, Cambodia, and Malacca, governed by as many Indian princes; only the Dutch have usurped the dominion of Malacca.

INDIAN *Berry*. See COCCULUS.

INDIAN *Ink*. See INK.

INDICATION, in physic, whatever serves to direct the physician how to act.

INDICATIVE, in grammar, the first mood or manner of conjugating a verb, by which we simply affirm, deny, or ask something: as, *amant*, they love; *non amant*, they do not love; *amantne?* do they love?

INDICTION, in chronology, a cycle of 15 years. See CYCLE.

INDICTMENT, in law, one of the modes of prosecuting an offender. See PROSECUTION.

Blackst. Comment.

In English law, it is a written accusation of one or more persons of a crime or misdemeanor, preferred to, and presented upon oath by, a grand jury. To this end, the sheriff of every county is bound to return to every session of the peace, and every commission of *oyer* and *terminer*, and of general gaol-delivery, twenty-four good and lawful men of the county, some out of every hundred, to inquire, present, do, and execute all those things, which on the part of our lord the king shall then and there be commanded them. They ought to be freeholders; but to what amount is uncertain: which seems to be *casus omissus*, and as proper to be supplied by the legislature as the qualifications of the petit jury; which were formerly equally vague and uncertain, but are now settled by several acts of parliament. However, they are usually gentlemen of the best figure in the county. As many as appear upon this pannel, are sworn upon the grand jury, to the amount of twelve at the least, and not more than twenty-three; that twelve may be a majority. Which number, as well as the constitution itself, we find exactly described so early as the laws of King Ethelred: *Exeant seniores duodecim thani, et praefectus cum eis, et jurent super sanctuarium quod eis in manus datur, quod nolint ullum innocentem accusare, nec aliquem noxium celare.* In the time of King Richard I. (according to Hoveden), the process of electing the grand jury, ordained by that prince, was as follows: Four knights were to be taken from the county at large, who chose two more out of every hundred; which two associated to themselves ten other principal freemen, and those twelve were to answer concerning all particulars relating to their own district. This number was probably found too large and inconvenient; but the traces of this institution still remain, in that some of the jury must be summoned out of every hundred. This grand jury are previously instructed in the articles of their inquiry, by a charge from the judge who presides upon the bench. They then withdraw to sit and receive indictments, which are preferred to them in the name of the king, but at the suit of any private prosecutor; and they are only to hear evidence on behalf of the prosecution: for the finding of an indictment is only in the nature of an inquiry or accusation, which is afterwards to be tried and determined; and the grand jury are only to inquire upon their oaths, whether there be sufficient cause to call upon the party to answer it. A grand jury, however, ought to be thoroughly persuaded of the truth of an indictment, so far as their evidence goes; and not to rest satisfied merely with remote probabilities: a doctrine that might be applied to very oppressive purposes. Indictment.

Wilk. LL. Ang. Lax. 117.

The grand jury are sworn to inquire only for the body of the county, *pro corpore comitatus*; and therefore they cannot regularly inquire of a fact done out that county for which they are sworn, unless particularly enabled by act of parliament. And to so high a nicety was this matter anciently carried, that where a man was wounded in one county, and died in another, the offender was at common law indictable in neither, because no complete act of felony was done in any one of them: but by statute 2 and 3 Ed. VI. c. 24. he is now indictable in the county where the party died. And, by statute 2 Geo. II. c. 21. if the stroke or poisoning be in England, and the death upon the sea or out of England, or *vice versa*, the offenders, and their accessories, may be indicted in the county where either the death, poisoning, or stroke, shall happen. And so in some other cases; as, particularly, where treason is committed out of the realm, it may be inquired of in any county within the realm, as the king shall direct, in pursuance of statutes 26 Hen. VIII. c. 13. 33.; Hen. VIII. c. 23. 35.; Hen. VIII. c. 2. 5. 6.; Edw. VI. c. 11. And

Indictment. counterfeiters, washers, or miniſhers, of the current coin, together with all manner of felons and their acceſſories, may, by ſtatute 26 Hen. VIII. c. 6. (confirmed and explained by 34 and 35 Hen. VIII. c. 26. § 75. 76.) be indicted and tried for thoſe offences, if committed in any part of Wales, before the juſtices of gaol-delivery and of the peace, in the next adjoining county of England, where the king's writ runneth: that is, at preſent in the county of Hereford or Salop; and not, as it ſhould ſeem, in the county of Cheſter or Monmouth: the one being a county palatine where the king's writ did not run; and the other a part of Wales, in 26 Hen. VIII. Murders alſo, whether committed in England or in foreign parts, may, by virtue of the ſtatue 33 Hen. VIII. c. 23. be inquired of and tried by the king's ſpecial commiſſion in any ſhire or place in the kingdom. By ſtatute 10 and 11 W. III. c. 25. all robberies, and other capital crimes, committed in Newfoundland, may be inquired of and tried in any county in England. Offences againſt the black act, 9 Geo. I. c. 22. may be inquired of and tried in any county of England, at the option of the proſecutor. So felonies in deſtroying turnpikes, or works upon navigable rivers, erected by authority of parliament, may, by ſtatutes 8 Geo. II. c. 20. and 13 Geo. III. c. 84. be inquired of and tried in any adjacent county. By ſtatute 26 Geo. II. c. 19. plundering or ſtealing from any veſſel in diſtreſs or wrecked, or breaking any ſhip contrary to 12 Ann. ſt. 2. c. 18. may be proſecuted either in the county where the fact is committed, or in any county next adjoining; and if committed in Wales, then in the next adjoining Engliſh county: by which is underſtood to be meant, ſuch Engliſh county as, by the ſtatute 26 Hen. VIII. above mentioned, had before a concurrent juriſdiction of felonies committed in Wales. Felonies committed out of the realm, in burning or deſtroying the king's ſhips, magazines, or ſtores, may, by ſtatute 12 Geo. III. c. 24. be inquired of and tried in any county of England, or in the place where the offence is committed. By ſtatute 13 Geo. III. c. 63. miſdemeanors committed in India may be tried upon information or indictment in the court of king's bench in England; and a mode is marked out for examining witneſſes by commiſſion, and tranſmitting their depoſitions to the court. But, in general, all offences muſt be inquired into, as well as tried, in the county where the fact is committed. Yet if larciny be committed in one county, and the goods carried into another, the offender may be indicted in either; for the offence is complete in both. Or he may be indicted in England for larciny in Scotland, and carrying the goods with him into England, or *vice verſa*; or for receiving in one part of the united kingdom goods that have been ſtolen in another. But for robbery, burglary, and the like, he can only be indicted where the fact was actually committed: for though the carrying away and keeping of the goods is a continuation of the original taking, and is therefore larciny in the ſecond county, yet it is not a robbery or burglary in that juriſdiction. And if a perſon be indicted in one *county* for larciny of goods originally taken in another, and be thereof convicted, or ſtands mute, he ſhall not be admitted to his clergy; provided the original taking be attended with ſuch circumſtances as would have ouſted him of his clergy by virtue of any ſtatute made previous to the year 1691. Indictment.

When the grand jury have heard the evidence, if they think it a groundleſs accuſation, they uſed formerly to endorſe on the back of the bill, *Ignoramus*; or, We know nothing of it: intimating, that though the facts might poſſibly be true, that truth did not appear to them. But now they aſſert in Engliſh more abſolutely, *Not a true bill;* or (which is the better way) *Not found:* and then the party is diſcharged without farther anſwer. But a freſh bill may afterwards be preferred to a ſubſequent grand jury. If they are ſatisfied of the truth of the accuſation, they then endorſe upon it, "A true bill;" anciently, *Billa vera.* The indictment is then ſaid to be found, and the party ſtands indicted. But to find a bill, there muſt at leaſt twelve of the jury agree: for ſo tender is the law of England of the lives of the ſubjects, that no man can be convicted at the ſuit of the king of any capital offence, unleſs by the unanimous voice of twenty-four of his equals and neighbours; that is, by twelve at leaſt of the grand jury, in the firſt place, aſſenting to the accuſation; and afterwards by the whole petit jury, of twelve more, finding him guilty upon his trial. But if twelve of the grand jury aſſent, it is a good preſentment, though ſome of the reſt diſagree. And the indictment, when ſo found, is publicly delivered into court.

Indictments muſt have a preciſe and ſufficient certainty. By ſtatute 1 Hen. V. c. 5. all indictments muſt ſet forth the Chriſtian name, ſirname, and addition of the ſtate and degree, myſtery, town, or place, and the county of the offender; and all this to identify his *perſon*. The *time* and *place* are alſo to be aſcertained, by naming the day and townſhip in which the fact was committed: though a miſtake in theſe points is in general not held to be material, provided the *time* be laid previous to the finding of the indictment, and the *place* to be within the juriſdiction of the court; unleſs where the place is laid, not merely as a *venue*, but as part of the deſcription of the fact. But ſometimes the *time* may be very material, where there is any limitation in point of time aſſigned for the proſecution of offenders; as by the ſtatute 7 Will. III. c. 3. which enacts, that no proſecution ſhall be had for any of the treaſons or miſpriſions therein mentioned, (except an aſſaſſination deſigned or attempted on the perſon of the king), unleſs the bill of indictment be found within three years after the offence committed: and, in caſe of murder, the time of the death muſt be laid within a year and a day after the mortal ſtroke was given. The offence itſelf muſt alſo be ſet forth with clearneſs and certainty; and in ſome crimes particular words of art muſt be uſed, which are ſo appropriated by the law to expreſs the preciſe idea which it entertains of the offence, that no other words, however ſynonimous they may ſeem, are capable of doing it. Thus, in treaſon, the facts muſt be laid to be done "treaſonably, and againſt his allegiance;" anciently, *proditorie et contra ligeantiæ ſuæ debitum*;" elſe the indictment is void. In indictments for murder, it is neceſſary to ſay that the party indicted "murdered," not "killed" or "ſlew," the other; which, till the late ſtatute, was expreſſed in Latin by the word *murdravit*.

dictment *dravit.* In all indictments for felonies, the adverb "feloniously," *felonicè*, muſt be uſed; and for burglaries alſo, *burglariter*, or, in Engliſh, "burglariouſly:" and all theſe to aſcertain the intent. In rapes, the word *rapuit*, or "raviſhed," is neceſſary, and muſt not be expreſſed by any periphraſis, in order to render the crime certain. So in larcinies alſo, the words *felonicè cepit et aſportavit*, "feloniouſly took or carried away," are neceſſary to every indictment; for theſe only can expreſs the very offence. Alſo, in indictments for murder, the length and depth of the wound ſhould in general be expreſſed, in order that it may appear to the court to have been of a mortal nature: but if it goes through the body, then its dimenſions are immaterial; for that is apparently ſufficient to have been the cauſe of the death. Alſo, where a limb, or the like, is abſolutely cut off, there ſuch deſcription is impoſſible. Laſtly, in indictments, the *value* of the thing which is the ſubject or inſtrument of the offence, muſt ſometimes be expreſſed. In indictments for larcinies this is neceſſary, that it may appear whether it be grand or petit larciny; and whether intitled or not to the benefit of clergy. In homicides of all ſorts it is neceſſary; as the weapon with which it is committed is forfeited to the king as a deodand. For the manner of proceſs upon an indictment, ſee PROCESS.

INDICTMENT, in Scots law, the name of the ſummons, or libel, upon which criminals are cited before the court of juſticiary to ſtand trial. See LAW, Part III. n° clxxxvi. 44.

Plea to INDICTMENT. See PLEA.

INDIES, Eaſt and Weſt. See INDIA, and AMERICA.

INDIGESTION, in medicine, a crudity, or want of due coction, either in the food, an humour of the body, or an excrement. See ANOREXIA, APEPSIA, and *(Index* ſubjoined to) MEDICINE.

INDIGETES, a name which the ancients gave to ſome of their gods.—There are various opinions about the ſignification of this word; ſome maintaining it was given to all the gods in general; others only to the ſemi-gods, or great men deified. Others ſay, it was given to ſuch gods as were originally of the country, or rather ſuch as were the gods of the country that bore this name. Others, again, hold that it was aſcribed to ſuch gods as were patrons and protectors of particular cities.

INDIGO, a dye prepared from the leaves and ſmall branches of the *Indigofera Tinctoria*. See INDIGOFERA.

INDIGOFERA, the INDIGO PLANT; a genus of the decandria order, belonging to the diadelphia claſs of plants.—There are five ſpecies; the moſt remarkable of which is the *tinctoria*, a native of the warm parts of Aſia, Africa, and America, and from which the Indigo dye is made. The root of this plant is three or four lines thick, and more than a foot long, of a faint ſmell ſomething like parſley. From this root iſſues a ſingle ſtem nearly of the ſame thickneſs, about two feet high, ſtraight, hard, almoſt woody, covered with a bark ſlightly ſplit, of a grey aſh-colour towards the bottom, green in the middle, reddiſh at the extremity, and without appearance of pith in the inſide. The leaves, ranged in pairs around the ſtalk, are of an oval form, ſmooth, ſoft to the touch, furrowed above, of a deep green on the under-ſide, and connected by a very ſhort peduncle. From about one-third of the ſtem to the extremity there are ears that are loaded with very ſmall flowers from a dozen to 15, but deſtitute of ſmell. The piſtil, which is in the midſt of each flower, changes into a pod, in which the ſeeds are incloſed. Indigofera.

This plant requires a ſmooth rich ſoil, well tilled, and not too-dry. The ſeed of it, which, as to figure and colour, reſembles gun-powder, is ſowed in little furrows that are about the breadth of the hoe, two or three inches deep, at a foot's diſtance from each other, and in as ſtraight a line as poſſible. Continual attention is required to pluck up the weeds, which would ſoon choak the plant. Though it may be ſown in all ſeaſons, the ſpring is commonly preferred. Moiſture cauſes this plant to ſhoot above the ſurface in three or four days. It is ripe at the end of two months. When it begins to flower, it is cut with pruning-knives; and cut again at the end of every ſix weeks, if the weather is a little rainy. It laſts about two years, after which term it degenerates; it is then plucked up, and planted afreſh. As this plant ſoon exhauſts the ſoil, becauſe it does not abſorb a ſufficient quantity of air and dew to moiſten the earth, it is of advantage to the planter to have a vaſt ſpace which may remain covered with trees, till it becomes neceſſary to fell them in order to make room for the indigo.

Indigo is diſtinguiſhed into two kinds, the *true* and the *baſtard*. Though the firſt is ſold at a higher price on account of its ſuperiority, it is uſually advantageous to cultivate the other, becauſe it is heavier. The firſt will grow in many different ſoils; the ſecond ſucceeds beſt in thoſe which are moſt expoſed to the rain. Both are liable to great accidents. Sometimes the plant becomes dry, and is deſtroyed by an inſect frequently found on it; at other times, the leaves, which are the valuable part of the plant, are devoured in the ſpace of 24 hours by caterpillars. This laſt misfortune, which is but too common, has given occaſion to the ſaying, "that the planters of indigo go to bed rich, and riſe in the morning totally ruined."

This production ought to be gathered in with great precaution, for fear of making the farina that lies on the leaves, and is very valuable, fall off by ſhaking it. When gathered, it is thrown into the ſteeping-vat, which is a large tub filled with water. Here it undergoes a fermentation, which in 24 hours at furtheſt is completed. A cock is then turned, to let the water run into the ſecond tub, called the *mortar* or *pounding tub*. The ſteeping-vat is then cleaned out, that freſh plants may be thrown in; and thus the work is continued without interruption.

The water which has run into the pounding-tub is found impregnated with a very ſubtile earth, which alone conſtitutes the dregs or blue ſubſtance that is the object of this proceſs, and which muſt be ſeparated from the uſeleſs ſalt of the plant, becauſe this makes the dregs ſwim on the ſurface. To effect this, the water is forcibly agitated with wooden buckets, that are full of holes and fixed to a long handle. This part of the proceſs requires the greateſt precautions. If the agitation be diſcontinued too ſoon, the part that

Indigofera || Indoſtan.

that is uſed in dying, not being ſufficiently ſeparated from the ſalt, would be loſt. If, on the other hand, the dye were to be agitated too long after the complete ſeparation, the parts would be brought together again, and form a new combination; and the ſalt reacting on the dregs, would excite a ſecond fermentation, that would alter the dye, ſpoil its colour, and make what is called *burnt indigo*. Theſe accidents are prevented by a cloſe attention to the leaſt alterations that the dye undergoes, and by the precaution which the workmen take to draw out a little of it from time to time in a clean veſſel. When they perceive that the coloured particles collect by ſeparating from the reſt of the liquor, they leave off ſhaking the buckets, in order to allow time to the blue dregs to precipitate to the bottom of the tub, where they are left to ſettle till the water is quite clear.—Holes made in the tub, at different heights, are then opened one after another, and this uſeleſs water is let out.

The blue dregs remaining at the bottom having acquired the conſiſtence of a thick muddy liquid, cocks are then opened, which draw it off into the ſettler. After it is ſtill more cleared of much ſuperfluous water in this third and laſt tub, it is drained into ſacks; from whence, when water no longer filters through the cloth, this matter, now become of a thicker conſiſtence, is put into cheſts, where it entirely loſes its moiſture. At the end of three months the indigo is fit for ſale.

It is uſed, in waſhing, to give a blueiſh colour to linen: painters alſo employ it in their water-colours; and dyers cannot make fine blue without indigo. The ancients procured it from the Eaſt-Indies; in modern times, it has been tranſplanted into America. The cultivation of it, ſucceſſively attempted at different places, appears to be fixed at Carolina, St. Domingo, and Mexico. That which is known under the name of *Guatimala* indigo, from whence it comes, is the moſt perfect of all.

INDIVIDUAL, a particular being of any ſpecies, or that which cannot be divided into two or more beings equal or alike.

The uſual diviſion in logic is made into *genera*, or into *genus's*; thoſe *genera* into *ſpecies*; and thoſe *ſpecies* into *individuals*.

INDIVISIBLE, among metaphyſicians.—A thing is ſaid to be abſolutely *indiviſible*, that is a ſimple being, and conſiſts of no parts into which it may be divided. Thus, God is *indiviſible* in all reſpects; as is alſo the human mind; not having extenſion, or other properties of body.

Indivisibles, in geometry, the elements or principles into which any body or figure may be ultimately reſolved; which elements are ſuppoſed to be infinitely ſmall: thus, a line may be ſaid to conſiſt of points, a ſurface of parallel lines, and a ſolid of parallel and ſimilar ſurfaces.

INDORSEMENT, in law, any thing written on the back of a deed; as a receipt for money received.

There is likewiſe an *indorſement*, by way of aſſignment, on bills of exchange and notes of hand; which is done by writing a perſon's name on the back thereof.

INDOSTAN, proper India, or *the Empire of the Great Mogul*; a country of Aſia, bounded on the weſt by Perſia, on the ſouth by the weſtern peninſula of India, on the eaſt by the eaſtern peninſula, and on the north by ſeveral kingdoms of Independent Tartary, and comprehending a conſiderable part of the ancient India; more, indeed, than the ancient Greeks and Romans ever had any diſtinct knowledge of. Indoſtan || Induction

The period in which the country of Indoſtan was originally peopled is now totally unknown. The averſion which the Indians themſelves have to diſcover their hiſtory to foreigners, has involved it in deep obſcurity; and what can be collected from the hiſtorians of Greece and Rome, does little more than let us know that ſuch a people as the Indians exiſted in their days. The only light we have to direct us on this obſcure ſubject, is derived from an hiſtorical poem founded upon fact, and tranſlated into the Perſian language in the reign of Mohammed Akbar, who died in the 1605th year of the Chriſtian æra; and even this account is exceedingly barren of intereſting particulars: ſo that, till the time of the invaſion of the Moguls, the hiſtory of Indoſtan affords nothing either inſtructing or amuſing; for which reaſon, it more properly comes under the articles Mogul, and Mogul's *Empire*.

In almoſt all ages, the inhabitants of this country have been remarkable for their riches, their ſloth, and their effeminacy; which have rendered them a prey to many barbarous invaders, who in their turn have degenerated and been ſubdued by others. Their ſloth and effeminacy ſeems in a great meaſure to be owing to their ſyſtem of religion; though no doubt ſome natural cauſes, ſuch as the climate, &c. alſo concur. The Indians are directed by their religion to eſteem abſolute inactivity or idleneſs the ſummit of all earthly, and indeed heavenly happineſs; ſince, according to them, their great god Brama himſelf hath been eternally doing nothing, and will continue to eternity in the ſame ſtate of inactivity. In conſequence of this principle, they carry their inactivity to a ſurprizing and almoſt incredible height; they yield to every oppreſſor, and ſuffer themſelves to be tyrannized over by foreign as well as domeſtic deſpots.—A great part of the country is now ſubject to the Engliſh Eaſt-India Company: but for a full account of the extent of their juriſdiction, as well as the diſpoſitions, manners, cuſtoms, &c. of the inhabitants, ſee the articles abovementioned; alſo Brama, Brachman, and Bramin.

INDUCTION. See Logic, n° 98, 99; and Oratory, n° 32.

Induction, in law, is putting a clerk or clergyman in poſſeſſion of a benefice or living to which he is collated or preſented. See the article Parson.—Induction is performed by a mandate from the biſhop to the arch-deacon, who uſually iſſues out a precept to other clergymen to perform it for him. It is done by giving the clerk corporal poſſeſſion of the church, as by holding the ring of the door, tolling a bell, or the like; and is a form required by law, with intent to give all the pariſhioners due notice, and ſufficient certainty of their new miniſter, to whom their tythes are to be paid. This therefore is the inveſtiture of the temporal part of the benefice, as inſtitution

Indult || Indus.

dulgences tion is of the ſpiritual. And when a clerk is thus preſented, inſtituted, and inducted into a rectory, he is then, and not before, in full and complete poſſeſſion; and is called in law *perſona imperſonata*, or *parſon imparſonee*.

INDULGENCES, in the Romiſh church, are a remiſſion of the puniſhment due to ſins, granted by the church, and ſuppoſed to ſave the ſinner from Purgatory.

According to the doctrine of the Romiſh church, all the good works of the ſaints over and above thoſe which were neceſſary towards their own juſtification, are depoſited, together with the infinite merits of Jeſus Chriſt, in one inexhauſtable treaſury. The keys of this were committed to St Peter, and to his ſucceſſors the popes, who may open it at pleaſure, and by tranſferring a portion of this ſuperabundant merit to any particular perſon, for a ſum of money, may convey to him either the pardon of his own ſins, or a releaſe for any one in whom he is intereſted, from the pains of Purgatory. Such indulgences were firſt invented in the 11th century, by Urban II. as a recompenſe for thoſe who went in perſon upon the glorious enterprize of conquering the Holy Land. They were afterwards granted to thoſe who hired a ſoldier for that purpoſe; and in proceſs of time were beſtowed on ſuch as gave money for accompliſhing any pious work enjoined by the Pope.

The power of granting indulgences has been greatly abuſed in the church of Rome. Pope Leo X. in order to carry on the magnificent ſtructure of St Peter's at Rome, publiſhed indulgences, and a plenary remiſſion to all ſuch as ſhould contribute money towards it. Finding the project take, he granted to Albert elector of Mentz, and archbiſhop of Magdeburg, the benefit of the indulgences of Saxony and the neighbouring parts, and farmed out thoſe of other countries to the higheſt bidders; who, to make the beſt of their bargain, procured the ableſt preachers to cry up the value of the ware. The form of theſe indulgences was as follows. "May our Lord Jeſus Chriſt have mercy upon thee, and abſolve thee by the merits of his moſt holy paſſion. And I, by his authority, that of his bleſſed apoſtles Peter and Paul, and of the moſt holy Pope, granted and committed to me in theſe parts, do abſolve thee, firſt, from all eccleſiaſtical cenſures, in whatever manner they have been incurred; then from all thy ſins, tranſgreſſions, and exceſſes, how enormous ſoever they may be, even from ſuch as are reſerved for the cognizance of the holy ſee, and as far as the keys of the holy church extend: I remit to you all puniſhment which you deſerve in Purgatory on their account; and I reſtore you to the holy ſacraments of the church, to the unity of the faithful, and to that innocence and purity which you poſſeſſed at baptiſm; ſo that when you die, the gates of puniſhment ſhall be ſhut, and the gates of the paradiſe of delight ſhall be opened: and if you ſhall not die at preſent, this grace ſhall remain in full force when you are at the point of death. In the name of the Father, and of the Son, and of the Holy Ghoſt."

Berſon's harles V. l. ii. 89.

The terms in which the retailers of indulgences, deſcribed their benefits and the neceſſity of purchaſing them, are ſo extravagant, that they appear almoſt incredible. If any man (ſaid they) purchaſes letters of indulgence, his ſoul may reſt ſecure with reſpect to its ſalvation. The ſouls confined in purgatory, for whoſe redemption indulgences are purchaſed, as ſoon as the money tinkles in the cheſt, inſtantly eſcape from that place of torment, and aſcend into heaven. That the efficacy of indulgences was ſo great, that the moſt heinous ſins, even if one ſhould violate (which was impoſſible) the mother of God, would be remitted and expiated by them, and the perſon be freed both from puniſhment and guilt. That this was the unſpeakable gift of God, in order to reconcile men to himſelf. That the croſs erected by the preachers of indulgences was equally efficacious with the croſs of Chriſt itſelf. "Lo! the heavens are open; if you enter not now, when will you enter? For twelve pence you may redeem the ſoul of your father out of purgatory; and are you ſo ungrateful, that you will not reſcue your parent from torment? If you had but one coat, you ought to ſtrip yourſelf inſtantly, and ſell it, in order to purchaſe ſuch benefits," &c.

It was this great abuſe of indulgences that contributed not a little to the firſt reformation of religion in Germany, where Martin Luther began firſt to declaim againſt the preachers of indulgences, and afterwards againſt indulgences themſelves: but ſince that time the popes have been more ſparing in the exerciſe of this power: however, they ſtill carry on a great trade with them to the Indies, where they are purchaſed at two rials a-piece, and ſometimes more.

The pope likewiſe grants indulgences to perſons at the point of death; that is, he grants them, by a brief, power to chooſe what confeſſor they pleaſe, who is authorized thereby to abſolve them from all their ſins in general.

INDULT, in the church of Rome, the power of preſenting to benefices granted to certain perſons by the pope. Of this kind is the indult of kings and ſovereign princes in the Romiſh communion, and that of the parliament of Paris granted by ſeveral popes. By the concordat for the abolition of the pragmatic ſanction, made between Francis I. and Leo X. in 1516, the French king has the power of nominating to biſhoprics, and other conſiſtorial benefices, within his realm. At the ſame time, by a particular bull, the pope granted him the privilege of nominating to the churches of Britany and Provence. In 1648 pope Alexander VIII. and in 1668 Clement IX. granted the king an indult for the biſhoprics of Metz, Toul, and Verdun, which had been yielded to him by the treaty of Munſter; and in 1668 the ſame pope Clement IX. granted him an indult for the benefices in the counties of Rouſſillon, Artois, and the Netherlands. The cardinals likewiſe have an indult granted them by agreement between pope Paul IV. and the ſacred college in 1555, which is always confirmed by the popes at the time of their election. By this treaty the cardinals have the free diſpoſal of all the benefices depending on them, and are empowered likewiſe to beſtow a benefice *in commendam*.

INDULTO, a duty, tax, or cuſtom, paid to the king of Spain for all ſuch commodities as are imported from the Weſt Indies in the galleons.

INDUS, a large river of Aſia, which riſes in the mountains which ſeparate Tartary from India, and diſcharges itſelf into the Indian ocean.

Inertia || Infant.

INERTIA *of* MATTER, in philosophy, is defined by Sir Isaac Newton to be a passive principle by which bodies persist in their motion or rest, receive motion in proportion to the force impressing it, and resist as much as they are resisted. It is also defined by the same author to be a power implanted in all matter, whereby it resists any change endeavoured to be made in its state. See MECHANICS.

IN ESSE is applied to things which are actually existing.

Authors make a difference between a thing *in esse*, and a thing *in posse*: a thing that is not, but may be, they say is *in posse*, or *potentia*; but a thing apparent and visible, they say is *in esse*, that is, has a real being *eo instanti*, whereas the other is casual, and at best but a possibility.

INFALLIBLE, something that cannot err, or be deceived.

One of the great controversies between the Protestants and Papists, is the infallibility which the latter attribute to the pope; though, in fact, they themselves are not agreed on that head, some placing this pretended infallibility in the pope and a general council.

INFAMY, in law, is a term which extends to forgery, perjury, gross cheats, &c. by which a person is rendered incapable of being a witness or juror, even though he is pardoned for his crimes.

INFANCY, the first part of life.—Fred. Hoffman says, that the human species are *infants* until they begin to talk, and *children* to the age of puberty.—Anatomy discovers to us, that during infancy there is much imperfection in the human frame; *e. g.* its parts are disproportioned, and its organs incapable of those functions which in future life they are designed to perform. The head is larger in proportion to the bulk of the body than that of an adult. The liver and pancreas are much larger in proportion than in advanced life; their secretions are more in quantity also. The bile is very inert; the heart is stronger and larger than in future life; the quantity of blood sent through the heart of an infant, in a given time, is also more in proportion than in adults. Though these circumstances have their important usefulness, yet the imperfection attending them subjects this age to many injuries and dangers from which a more perfect state is exempted. Dr Percival observes, in his *Essays Med. and Exp.* that of all the children who are born alive, two thirds do not live to be two years old.

Infants have a larger proportion of brain than adults, hence are more subject to nervous disorders; and hence the diagnostics of diseases are in many respects obscure or uncertain, as particularly those taken from the pulse, which, from the irritability of the tender bodies of infants, is suddenly affected by a variety of accidents too numerous, and seemingly too trivial to gain our attention. However, no very great embarrassment arises to the practitioner from hence; for the disorders in this state are generally acute, less complicated than those in adults, and are more easily discovered than is generally apprehended.—See (the *Index* subjoined to) MEDICINE.

INFANT, denotes a young child. See INFANCY.

INFANT, in law, is a person under 21 years of age; whose capacities, incapacities, and privileges, are various.

1. In *criminal* matters. The law of England does in some cases privilege an infant under the age of 21, as to common misdemeanours; so as to escape fine, imprisonment, and the like: and particularly in the cases of omission, as not repairing a bridge, or a high way, and other similar offences; for not having the command of his fortune till the age of 21, he wants the capacity to do those things which the law requires. But where there is any notorious breach of the peace, a riot, battery, or the like, (which infants when full-grown are at least as liable as others to commit); for those, an infant above the age of 14 is equally liable to suffer, as a person of the full age of 21. Infant. Blackst. Comment.

With regard to capital crimes, the law is still more minute and circumspect; distinguishing with greater nicety the several degrees of age and discretion. By the ancient Saxon law, the age of twelve years was established for the age of possible discretion, when first the understanding might open: and from thence till the offender was 14, it was *ætas pubertati proxima*, in which he might, or might not, be guilty of a crime, according to his natural capacity or incapacity. This was the dubious stage of discretion: but, under twelve, it was held, that he could not be guilty in will, neither after fourteen could be supposed innocent, of any capital crime which he in fact committed. But by the law, as it now stands, and has stood at least ever since the time of Edward III. the capacity of doing ill, or contracting guilt, is not so much measured by years and days, as by the strength of the delinquent's understanding and judgment. For one lad of 11 years old may have as much cunning as another of 14; and in these cases our maxim is, that *malitia supplet ætatem*. Under seven years of age, indeed, an infant cannot be guilty of felony; for then a felonious discretion is almost an impossibility in nature: but at eight years old, he may be guilty of felony. Also, under 14, though an infant shall be *prima facie* adjudged to be *doli incapax*; yet if it appear to the court and jury, that he was *doli capax*, and could discern between good and evil, he may be convicted and suffer death. Thus a girl of 13 has been burnt for killing her mistress: and one boy of ten, and another of nine years old, who had killed their companions, have been sentenced to death, and he of ten years actually hanged; because it appeared upon their trials, that the one hid himself, and the other hid the body he had killed; which hiding manifested a consciousness of guilt, and a discretion to discern between good and evil. And there was an instance in the last century, where a boy of eight years old was tried at Abingdon for firing two barns; and, it appearing that he had malice, revenge, and cunning, he was found guilty, condemned, and hanged accordingly. Thus also, in very modern times, a boy of ten years old was convicted on his own confession of murdering his bedfellow; there appearing in his whole behaviour plain tokens of a mischievous discretion; and, as the sparing this boy merely on account of his tender years might be of dangerous consequence to the public, by propagating a notion that children might commit such atrocious crimes with impunity, it was unanimously agreed by all the judges, that he was a proper subject of capital punishment. But, in all such cases, the evidence of that

Infant. that malice, which is to supply age, ought to be ſtrong and clear beyond all doubt and contradiction.

2. In *civil* matters. The ages of male and female are different for different purpoſes. A male at 12 years old may take the oath of allegiance; at 14 is at the years of diſcretion, and therefore may conſent or diſagree to marriage, may chooſe his guardian, and, if his diſcretion be actually proved, may make his teſtament of his perſonal eſtate; at 17 may be an executor; and at 21 is at his own diſpoſal, and may aliene his lands, goods, and chattels. A female alſo at ſeven years of age may be betrothed or given in marriage; at nine is entitled to dower; at 12 is at years of maturity, and therefore may conſent or diſagree to marriage, and, if proved to have ſufficient diſcretion, may bequeath her perſonal eſtate; at 14 is at years of legal diſcretion, and may chooſe a guardian; at 17 may be executrix; and at 21 may diſpoſe of herſelf and her lands. So that full age in male or female is 21 years, which age is completed on the day preceding the anniverſary of a perſon's birth; who till that time is an infant, and ſo ſtyled in law. Among the ancient Greeks and Romans, women were never of age, but ſubject to perpetual guardianſhip, unleſs when married, *niſi conveniſſent in manum viri:* and, when that perpetual tutelage wore away in proceſs of time, we find that, in females as well as males, full age was not till 25 years. Thus by the conſtitution of different kingdoms, this period, which is merely arbitrary, and *juris poſitivi*, is fixed at different times. Scotland agrees with England in this point; (both probably copying from the old Saxon conſtitutions on the continent, which extended the age of minority *ad annum vigeſimum primum, et eo uſque juvenes ſub tutelam reponunt)*: but in Naples perſons are of full age at 18; in France, with regard to marriage, not till 30; and in Holland at 25.

The very diſabilities of infants are privileges; in order to ſecure them from hurting themſelves by their own improvident acts. An infant cannot be ſued but under the protection, and joining the name, of his guardian; for he is to defend him againſt all attacks as well by law as otherwiſe: but he may ſue either by his guardian, or *prochein amy*, his next friend who is not his guardian. This *prochein amy* may be any perſon who will undertake the infant's cauſe; and it frequently happens, that an infant, by his *prochein amy*, inſtitutes a ſuit in equity againſt a fraudulent guardian.

With regard to eſtates and civil property, an infant hath many privileges. In general, an infant ſhall loſe nothing by nonclaim, or neglect of demanding his right; nor ſhall any other *laches* or negligence be imputed to an infant, except in ſome very particular caſes.

It is generally true, that an infant can neither aliene his lands, nor do any legal act, nor make a deed, nor indeed any manner of contract, that will bind him. But ſtill to all theſe rules there are ſome exceptions: part of which were juſt now mentioned in reckoning up the different capacities which they aſſume at different ages: and there are others, a few of which it may not be improper to recite, as a general ſpecimen of the whole. And, firſt, it is true, that infants cannot aliene their eſtates: but infant-truſtees, or mortgagees, are enabled to convey, under the direction of the court of chancery or exchequer, or other courts of equity, the eſtates they hold in truſt or mortgage, to ſuch perſon as the court ſhall appoint. Alſo it is generally true, that an infant can do no legal act: yet an infant, who has an advowſon, may preſent to the benefice when it becomes void. For the law in this caſe diſpenſes with one rule, in order to maintain others of far greater conſequence: it permits an infant to preſent a clerk (who, if unfit, may be rejected by the biſhop), rather than either ſuffer the church to be unſerved till he comes of age, or permit the infant to be debarred of his right by lapſe to the biſhop. An infant may alſo purchaſe lands, but his purchaſe is incomplete: for, when he comes to age, he may either agree or diſagree to it, as he thinks prudent or proper, without alleging any reaſon; and ſo may his heirs after him, if he dies without having completed his agreement. It is, farther, generally true, that an infant, under 21, can make no deed but what is afterwards voidable: yet in ſome caſes he may bind himſelf apprentice by deed indented or indentures, for ſeven years; and he may by deed or will appoint a guardian to his children, if he has any. Laſtly, it is generally true, that an infant can make no other contract that will bind him: yet he may bind himſelf to pay for his neceſſary meat, drink, apparel, phyſic, and ſuch other neceſſaries; and likewiſe for his good teaching and inſtruction, whereby he may profit himſelf afterwards. Infante, or Infatuate.

INFANTE, and INFANTA, all the ſons and daughters of the kings of Spain and Portugal, except the eldeſt; the princes being called *infantes*, and the princeſſes *infantas*.

INFANTRY, in military affairs, the whole body of foot-ſoldiers, whether independent companies or regiments.—The word takes its origin from one of the infantas of Spain, who, finding that the army commanded by the king her father had been defeated by the Moors, aſſembled a body of foot-ſoldiers, and with them engaged and totally routed the enemy. In memory of this event, and to diſtinguiſh the foot-ſoldiers, who were not before held in much conſideration, they received the name of *infantry*.

Heavy-armed INFANTRY, among the ancients, were ſuch as wore a complete ſuit of armour, and engaged with broad ſhields and long ſpears. They were the flower and ſtrength of the Grecian armies, and had the higheſt rank of military honour.

Light-Armed INFANTRY, among the ancients, were deſigned for ſkirmiſhes, and for fighting at a diſtance. Their weapons were arrows, darts, or ſlings.

Light INFANTRY, among the moderns, have only been in uſe ſince the year 1756. They have no camp-equipage to carry, and their arms and accoutrements are much lighter than thoſe of the infantry. Light infantry are the eyes of a general, and the givers of ſleep and ſafety to an army. Wherever there is found light cavalry, there ſhould be light infantry. They ſhould be accuſtomed to the pace of four miles an hour, as their uſual marching pace, and to be able to march at five miles an hour upon all particular occaſions. Moſt of the powers on the continent have light infantry.

INFATUATE, to prepoſſeſs any one in favour of ſome perſon or thing that does not deſerve it, ſo far as that he cannot eaſily be diſabuſed.—The word *infatuate* comes from the Latin *fatuus*, "fool;" of *fari*, "to ſpeak out," which is borrowed from the Greek φαω,

Infection ‖ Infinitesimals.

φαω, whence φατης, which signifies the same with *vates* in Latin, or *prophet* in English; and the reason is, because their prophets or priests used to be seized with a kind of madness or folly, when they began to make their predictions, or deliver oracles.

The Romans called those persons *infatuati*, who fancied they had seen visions, or imagined the god Faunus, whom they called *Fatuus*, had appeared to them.

INFECTION, among physicians. See Contagion.

INFEFTMENT, in Scots law, the solemnity of the delivery of an heritable subject to the purchaser.

INFIBULATION, in surgery, an operation which is the reverse of circumcision; for it confines the prepuce so over the glans penis, that it cannot be drawn back. The operation is thus performed. Extend the skin which is above the glans, and with ink mark the part on each side through which the perforation is to be made; then let it retract itself. If the marks recur upon the glans, too much of the skin hath been taken up, and the marks must be made nearer to the end of the prepuce, but only so as that they may not return upon the glans, and thus the seat of the fibula is determined. Then a needle, armed with a waxed thread, is passed through, and moved backward and forward every day, until a cicatrix is formed. After this the fibula is fixed.

Thus the ancient Romans were used to preserve their singing boys from all premature and preposterous ideal venery, and so preserve their voices longer. The fibula seems to have been a kind of ring.

INFINITE, that which has neither beginning nor end: in which sense God alone is infinite.

Infinite is also used to signify that which has had a beginning, but will have no end, as angels and human souls. This makes what the schoolmen call *infinitum a parte post*; as, on the contrary, by *infinitum a parte ante*, they mean that which has an end but had no beginning.

Infinite *Quantities*. The very idea of magnitudes infinitely great, or such as exceed any assignable quantities, does include a negation of limits; yet if we nearly examine this notion, we shall find that such magnitudes are not equal among themselves, but that there are really, besides infinite length and infinite area, three several sorts of infinite solidity; all of which are *quantitates sui generis*, and that those of each species are in given proportions.

Infinite length, or a line infinitely long, is to be considered either as beginning at a point, and so infinitely extended one way, or else both ways from the same point; in which case the one, which is a beginning infinity, is the one half of the whole, which is the sum of the beginning and ceasing infinity; or, as may be said, of infinity *a parte ante* and *a parte post*, which is analogous to eternity in time and duration, in which there is always as much to follow as is past, from any point or moment of time; nor doth the addition or subduction of finite length, or space of time, alter the case either in infinity or eternity, since both the one or the other cannot be any part of the whole.

INFINITESIMALS, among mathematicians, are defined to be infinitely small quantities.

In the method of infinitesimals, the element, by which any quantity increases or decreases, is supposed to be infinitely small; and is generally expressed by two or more terms, some of which are infinitely less than the rest, which being neglected as of no importance, the remaining terms form what is called the *difference of the proposed quantity*. The terms that are neglected in this manner, as infinitely less than the other terms of the element, are the very same which arise in consequence of the acceleration, or retardation, of the generating motion, during the infinitely small time in which the element is generated; so that the remaining terms express the elements that would have been produced in that time, if the generating motion had continued uniform: therefore those differences are accurately in the same ratio to each other as the generating motions or fluxions. And hence, though in this method infinitesimal parts of the elements are neglected, the conclusions are accurately true without even an infinitely small error, and agree precisely with those that are deduced by the method by fluxions *.

Infinity ‖ Information.

* See *Fluxions*.

INFINITY. See Metaphysics, n° 66—69.

INFIRMARY, a kind of hospital, where the weak and sickly are properly taken care of.

INFLAMMABILITY, that property of bodies which disposes them to kindle or catch fire. See Fire, Flame, Phlogiston, &c.

INFLAMMATION, in medicine and surgery, a redness and swelling of any part of the body, attended with heat, pain, and symptoms of fever. See (the *Index* subjoined to) Medicine.

Inflammation *of Oils by concentrated Acids*. See Chemistry, n° 219.

INFLECTED rays. See *Inflected* Rays.

INFLECTION, or *Point of* Inflection, in the higher geometry, is a point where a curve begins to bend a contrary way.

Inflection, in grammar, the variation of nouns and verbs, by declension and conjugation.

INFLUENCE, a quality supposed to flow from the heavenly bodies, either with their light or heat; to which astrologers idly ascribe all sublunary events.

INFORMATION, in law, is nearly the same in the crown-office, as what in other courts is called a *declaration*. See Prosecution.

Informations are of two sorts; first, those which are partly at the suit of the king, and partly at that of a subject; and secondly, such as are only in the name of the king. The former are usually brought upon penal statutes, which inflict a penalty upon conviction of the offender, one part to the use of the king, and another to the use of the informer. By the statute 31 Eliz. c. 5. no prosecution upon any penal statute, the suit and benefit whereof are limited in part to the king and in part to the prosecutor, can be brought by any common informer after one year is expired since the commission of the offence; nor on behalf of the crown, after the lapse of two years longer; nor, where the forfeiture is originally given only to the king, can such prosecution be had after the expiration of two years from the commission of the offence.

The informations that are exhibited in the name of the king alone, are also of two kinds: first, those which are truly and properly his own suits, and filed *ex officio* by his own immediate officer, the attorney-ge-

general: fecondly, thofe in which, though the king is the nominal profecutor, yet it is at the relation of fome private perfon or common informer; and they are filed by the king's coroner and attorney in the court of king's bench, ufually called the *mafter of the crown-office*, who is for this purpofe the ftanding officer of the public. The objects of the king's own profecutions, filed *ex officio*, by his own attorney-general, are properly fuch enormous mifdemeanors, as peculiarly tend to difturb or endanger his government, or to moleft or affront him in the regular difcharge of his royal functions. For offences fo high and dangerous, in the punifhing or preventing of which a moment's delay would be fatal, the law has given to the crown the power of an immediate profecution, without waiting for any previous application to any other tribunal: which power, thus neceffary, not only to the eafe and fafety, but even to the very exiftence, of the executive magiftrate, was originally referred in the great plan of the Englifh conftitution; wherein provifion is wifely made for the due preforvation of all its parts. The objects of the other fpecies of informations, filed by the mafter of the crown-office upon the complaint or relation of a private fubject, are any grofs and notorious mifdemeanors, riots, batteries, libels, and other immoralities of an atrocious kind, not peculiarly tending to difturb the government (for thofe are left to the care of the attorney-general), but which, on account of their magnitude or pernicious example, deferve the moft public animadverfion. And when an information is filed, either thus, or by the attorney-general *ex officio*, it muft be tried by a petit jury of the county where the offence arifes: after which, if the defendant be found guilty, he muft refort to the court for his punifhment. See a hiftory and vindication of this mode of profecution in the work quoted on the margin, vol. iv. p. 309,—312.

INFRACTION, a term chiefly ufed to fignify the violation of a treaty.

INFRA-SCAPULARIS, in anatomy. See ANATOMY, *Table of the Mufcles*.

INFRA-*Spinatus*, in anatomy. See ANATOMY, *ibid.*

INFULA, in antiquity, a broad kind of fillet, made of white wool, which the prieffs ufed to tie round their heads.

INFUNDIBULIFORM, in botany, an appellation given to fuch monopetalous or one-leaved flowers as refemble a funnel in fhape, or which have a narrow tube at one end, and gradually widen towards the limb or mouth.

INFUSION, in chemiftry, taken in its moft general fenfe, conffits in placing compound bodies in a liquor intended to be impregnated with fome of their principles, either without heat, or with a heat lefs than that of the boiling liquor.

From this definition we may fee that *infufion* is one of the principal operations of the analyfis by menftruums, in the fame manner in which decoction is, of which *infufion* may be confidered as the firft degree.

Infufion may may be made in watery, fpirituous, oily, acid, or alkaline liquors, according to the nature of the matters to be infufed, and of the principles intended to be extracted. It is nevertheleffs practifed upon vegetable matters only; and almoft always for the preparation of remedies, which are alfo called *infufions*. Infufion ‖ Ingria.

Aromatic plants, and other odoriferous vegetable matters, are generally infufed, when their odoriferous principle is to be preferved, in which their virtue conffits, and which is at the fame time fo volatile as to be diffipated and loft by the heat of ebullition. To preferve ftill better thefe volatile principles, the fmalleft heat requifite for the extraction ought to be employed; and thefe *infufions* ought to be made in matraffes, or other veffels, which may be exactly clofed.

The principles extracted by *infufion* are different according to the menftruum employed. Pure water may be impregnated with the odoriferous principle, or *fpiritus rector*, with faline, faponaceous, mucilaginous, extractive principles. Spirit of wine diffolves the *fpiritus rector*, the eflential oils, thofe refinous matters the bafe of which is an oil of the nature of eflential oils, and the greateft part of the faponaceous extractive matter. Thofe *infufions* made by fpirit of wine are particularly called *tinctures*, efpecially in pharmacy. Oils diffolve the *fpiritus rector*, and any oily matter. Acids and alkalis diffolve the earthy fubftances of vegetables, and almoft all their other principles: but they difguife them, alter them, and change confiderably their virtues by the combination. They are therefore not much ufed for thefe kinds of extractions.

INGELSHEIM, a town of Germany, in the palatinate of the Rhine, remarkable for having been the refidence of the emperors; feated on the river Salva, on an eminence, from whence there is a charming profpect. E. Long. 8. 5. N. Lat. 49. 58.

INGENUOUS, in a general fenfe, fignifies *open, fair*, and *candid*.

INGENUOUS, *(ingenuus,)* in Roman antiquity, an appellation given to perfons born of free parents, who had never been flaves: for the children of the *liberti*, or perfons who had obtained their liberty, were called *libertini*, not *ingenui*; this appellation of *ingenuus* being referved for their children, or the third generation.

INGLUVIES, the crop or craw of granivorous birds, ferving for the immediate reception of the food, where it is macerated for fome time, before it is tranfmitted to the true ftomach.

INGOLSTADT, a handfome town of Germany, and the ftrongeft in Bavaria, with a famous univerfity, and a handfome church. The houfes are built with ftone, and the ftreets large. It is feated on the Danube, in E. Long. 11. 10. N. Lat. 48. 42.

INGOT, a mafs of gold, or filver, melted down, and caft in a mould, but not coined or wrought.

INGRAFTING, in gardening. See GRAFTING.

INGRESS, in aftronomy, fignifies the fun's entering the firft fcruple of one of the four cardinal figns, efpecially Aries.

INGRIA, a province of the Ruffian empire, lying on the gulph of Finland, being about 130 miles in length, and 50 in breadth. It abounds in game and fifh; and here are a great number of elks, which come

Ingroſſer || Ingulphus.

in troops from Finland in the ſpring and autumn. It was conquered by the czar Peter the Great, and Peterſburgh is the capital town. It is bounded by the river Nieva, and the gulph of Finland, on the north; by Great Novogorod, on the eaſt and ſouth; and by Livonia, on the weſt.

INGROSSER, one who buys up great quantities of any commodity, before it comes to market, in order to raiſe the price.

INGUEN, in anatomy, the ſame with what is otherwiſe called *groin*, or *pubes*.

INGULPHUS, abbot of Croyland, and author of the hiſtory of that abbey, was born in London about A. D. 1030. He received the firſt part of his education at Weſtminſter; and when he viſited his father, who belonged to the court of Edward the Confeſſor, he was ſo fortunate as to engage the attention of queen Edgitha. That amiable and learned princeſs took a pleaſure in examining our young ſcholar on his progreſs in grammar, and in diſputing with him in logic; nor did ſhe ever diſmiſs him without ſome preſent as a mark of her approbation. From Weſtminſter he went to Oxford, where he applied to the ſtudy of rhetoric, and of the Ariſtotelian philoſophy, in which he made greater proficiency than many of his contemporaries. When he was about 21 years of age, he was introduced to William duke of Normandy, (who viſited the court of England, A. D. 1051,) and made himſelf ſo agreeable to that prince, that he appointed him his ſecretary, and carried him with him into his own dominions. In a little time he became the prime favourite of his prince, and the diſpenſer of all preferments, humbling ſome, and exalting others, at his pleaſure; in which difficult ſtation, he confeſſeth, he did not behave with a proper degree of modeſty and prudence. This excited the envy and hatred of many of the courtiers; to avoid the effects of which, he obtained leave from the duke to go in pilgrimage to the Holy Land, which was then become faſhionable. With a company of 30 horſemen, he joined Sigfrid duke of Mentz, who, with many German nobles, biſhops, clergy, and others, was preparing for a pilgrimage to Jeruſalem. When they were all united, they formed a company of no fewer than 7000 pilgrims. In their way they ſpent ſome time at Conſtantinople, performing their devotions in the ſeveral churches. In their paſſage through Lycia, they were attacked by a tribe of Arabs, who killed and wounded many of them, and plundered them of a prodigious maſs of money. Thoſe who eſcaped from this diſaſter, at length reached Jeruſalem, viſited all the holy places, and bedewed the ruins of many churches with their tears, giving money for their reparation. They intended to have bathed in Jordan; but being prevented by the roving Arabs, they embarked on board a Genoeſe fleet at Joppa, and landed at Brunduſium, from whence they travelled through Apulia to Rome. Having gone through a long courſe of devotions in this city, at the ſeveral places diſtinguiſhed for their ſanctity, they ſeparated, and every one made the beſt of his way into his own country. When Ingulph and his company reached Normandy, they were reduced to 20 half-ſtarved wretches, without money, cloaths, or horſes: A faithful picture of the fooliſh diſaſtrous journeys into the Holy Land, ſo common in thoſe times. Ingulph was now ſo much diſguſted with the world, that he reſolved to forſake it, and became a monk in the abbey of Fontenelle in Normandy; in which, after ſome years, he was advanced to the office of prior. When his old maſter was preparing for his expedition into England, A. D. 1066, he was ſent by his abbot, with 100 merks in money, and 12 young men, nobly mounted and completely armed, as a preſent from their abbey. Ingulph having found a favourable opportunity, preſented his men and money to his prince, who received him very graciouſly; ſome part of the former affection for him reviving in his boſom. In conſequence of this he raiſed him to the government of the rich abbey of Croyland in Lincolnſhire, A. D. 1076, in which he ſpent the laſt 34 years of his life, governing that ſociety with great prudence, and protecting their poſſeſſions from the rapacity of the neighbouring barons by the favour of his royal maſter. The lovers of Engliſh hiſtory and antiquities are much indebted to this learned abbot, for his excellent hiſtory of the abbey of Croyland, from its foundation, A. D. 664, to A. D. 1091, into which he hath introduced much of the general hiſtory of the kingdom, with a variety of curious anecdotes that are nowhere elſe to be found. Ingulph died of the gout, at his abbey, A. D. 1109, in the 79th year of his age.

Inhaler || Inhumation.

INHALER, in medicine, a machine for breathing in warm ſteams into the lungs, recommended by Mr Mudge in the cure of the catarrhous cough. The body of the inſtrument holds about a pint; and the handle, which is fixed to the ſide of it, is hollow. In the lower part of the veſſel, where it is ſoldered to the handle, is a hole, by means of which, and three others on the upper-part of the handle, the water, when it is poured into the *inhaler*, will riſe to the ſame level in both. To the middle of the cover a flexible tube about five or ſix inches long is fixed, with a mouth-piece of wood or ivory. Underneath the cover there is a valve fixed, which opens and ſhuts the communication between the upper and internal part of the *inhaler* and the external air. When the mouth is applied to the end of the tube in the act of inſpiration, the air ruſhes into the handle, and up through the body of warm water, and the lungs become, conſequently, filled with hot vapours. In exſpiration, the mouth being ſtill fixed to the tube, the breath, together with the ſteam on the ſurface of the water in the *inhaler*, is forced up through the valve in the cover. In this manner, therefore, the whole act of reſpiration is performed through the *inhaler*, without the neceſſity, in the act of exſpiration, of either breathing through the noſe, or removing the pipe from the mouth. See (the *Index* ſubjoined to) MEDICINE.

INHERITANCE, a perpetual right or intereſt in lands, inveſted in a perſon and his heirs. See DESCENT.

INHIBITION, in Scots law, a diligence obtained at the ſuit of a creditor againſt his debtor, prohibiting him from ſelling or contracting debts upon his eſtate to the creditor's prejudice.

INHUMATION, in chemiſtry, a method of digeſting ſubſtances, by burying the veſſel in which they are contained in horſe-dung or earth.

IN-

Injection. INJECTION, the forcibly throwing certain liquid medicines into the body by means of a ſyringe, tube, clyſter-pipe, or the like.

Anatomical INJECTION, the filling the veſſels of a human, or other animal body, with ſome coloured ſubſtance, in order to make their figures and ramifications viſible. The beſt account of the method of injecting the veſſels of animals, is that by the late Dr Monro, publiſhed in the Medial Eſſays, vol. i. p. 79.

"The inſtrument with which the liquor is commonly thrown into the veſſels is a tight eaſy going ſyringe of braſs, to which ſeveral ſhort pipes are fitted, and can be fixed by ſcrews, the other extremities of theſe pipes being of different diameters without any ſcrew, that they may ſlide into other pipes, which are ſo exactly adapted to them at one end, that when they are preſſed a little together, nothing can paſs between them: and becauſe their coheſion is not ſo great as to reſiſt the puſhing force of the injection, which would drive off this ſecond pipe, and ſpoil the whole operation; therefore the extremity of this ſecond ſort of pipes, which receives the firſt kind, is formed on the outſide into a ſquare, bounded behind and before by a riſing circle, which hinders the key that cloſely graſps the ſquare part from ſliding backwards or forwards; or a bar of braſs muſt ſtand out from each ſide of it to be held with the fingers. The other extremity of each of theſe ſecond ſort of pipes is of different diameter; and near it a circular notch, capable of allowing a thread to be ſunk into it, is formed; by this, the thread tying the veſſel at which the injection is to be made, will not be allowed to ſlide off.

"Beſides this form deſcribed, common to all this ſecond ſort of pipes, we ought to have ſome of the larger ones, with an additional mechaniſm, for particular purpoſes; as, for inſtance, when the larger veſſels are injected, the pipe faſtened into the veſſel ought either to have a valve or a ſtop-cock, that may be turned at pleaſure, to hinder any thing to get out from the veſſel by the pipe; otherwiſe, as the injection, in ſuch a caſe, takes time to coagulate, the people employed in making the injection muſt either continue all that while in the ſame poſture; or, if the ſyringe is too ſoon taken off, the injected liquor runs out, and the larger veſſels are emptied. When the ſyringe is not large enough to hold at once all the liquor neceſſary to fill the veſſels, there is a neceſſity of filling it again. If, in order to do this, the ſyringe was to be taken off from the pipe fixed in the veſſel, ſome of the injection would be loſt, and what was expoſed to the air would cool and harden; therefore ſome of the pipes ought to have a reflected curve tube coming out of their ſide, with a valve ſo diſpoſed, that no liquor can come from the ſtraight pipe into the crooked one, but, on the contrary, may be allowed to paſs from the crooked to the ſtraight one: the injector then, taking care to keep the extremity of the reflected pipe immerſed in the liquor to be injected, may, as ſoon as he has puſhed out the firſt ſyringeful, fill it again by only drawing back the ſucker; and, repeating this quickly, will be able to throw ſeveral ſyringefuls into the veſſels.

"All theſe different ſorts of pipes are commonly made of braſs. Injection.

"The liquors thrown into the veſſels with a deſign to fill the ſmall capillary tubes, are either ſuch as will incorporate with water, or ſuch as are oily; both kinds have their advantages and inconveniencies, which I ſhall mention in treating of each, and ſhall conclude with that which I have found by experience to ſucceed beſt.

"All the different kinds of glue, or ichthyocolla, ſyths, common glue, &c. diſſolved and pretty much diluted, mix eaſily with the animal-fluids, which is of great advantage, and will paſs into very ſmall veſſels of a well-choſen and prepared ſubject, and often anſwer the intention ſufficiently, where the deſign is only to prepare ſome very fine membrane, on which no veſſels can be expected to be ſeen ſo large as the eye can diſcover whether the tranſverſe ſections of the veſſels would be circular, or if their ſides are collapſed. But when the larger veſſels are alſo to be prepared, there is a manifeſt diſadvantage to the uſefulneſs and beauty of the preparation; for if nothing but the glutinous liquor is injected, one cannot keep a ſubject ſo long as the glue takes of becoming firm; and therefore, in diſſecting the injected part, ſeveral veſſels will probably be cut and emptied. To prevent this, one may indeed either ſoak the part well in alcohol, which coagulates the glue; but then it becomes ſo brittle, that the leaſt handling makes it crack; and if the preparation is to be kept, the larger veſſels appear quite ſhrivelled, when the watery part of the injection is evaporated: or the efflux of the injection may be prevented, by carefully tying every veſſel before we are obliged to cut it; ſtill, however, that does not hinder the veſſels to contract when the glue is drying. If, to obviate theſe difficultics, the glutinous liquor ſhould firſt be injected in ſuch quantity as the capillary veſſels will contain, and the common oily or waxy injection is puſhed in afterwards to keep the larger veſſels diſtended, the wax is very apt to harden before it has run far enough; the two ſorts of liquors never miſs to mix irregularly, and the whole appears interrupted and broken by their ſoon ſeparating from each other; which is ſtill more remarkable afterwards, when the watery particles are evaporated.

"Spirits of wine coloured mixes with water and oils, and ſo far is proper to fill the very ſmaller veſſels with: but, on the other hand, it coagulates any of our liquors it meets, which ſometimes block up the veſſels ſo much, that no more injection will paſs; then it ſcarce will ſuſpend ſome of the powders that prove the moſt durable colours; and as it entirely evaporates, the veſſels muſt become very ſmall; and the ſmall quantity of powder left, having nothing to ſerve for connecting its particles together, generally is ſeen ſo interrupted, that the ſmall ramifications of veſſels rather have the appearances of random ſcratches of a pencil, than of regular continued canals.

"Melted tallow, with a little mixture of oil of turpentine, may ſometimes be made to fill very ſmall veſſels, and keeps the larger ones at a full ſtretch; but where any quantity of the animal liquors are ſtill in the veſſels, it is liable to ſtop too ſoon, and never can be introduced into numbers of veſſels which other liquors enter; and it is ſo brittle, that very little handling

Injection. ling makes it crack, and thereby renders the preparation very ugly (A).

"The method I have always fucceeded beft with, in making what may be called *fubtile* or *fine injections*, is, firft to throw in coloured oil of turpentine, in fuch a quantity as might fill the very fmall veffels; and, immediately after, to puth the common coarfe injection into the larger ones. The oil is fubtile enough to enter rather fmaller capillary tubes than any colouring can; its refinous parts, which remain after the fpiritous are evaporated, give a fufficient adhefion to the particles of the fubftance with which it is coloured, to keep them from feparating, and it intimately incorporates with the coarfer injection; by which, if the injection is rightly managed, it is impoffible for the fharpeft eye to difcover that two forts have been made ufe of (B.)

"All the liquors with which the veffels of animals are artificially filled, having very faint, and near the fame colours, would not at all appear in the very fmall veffels, becaufe of their becoming entirely diaphanous, without a mixture of fome fubftance to impart its colour to them; and where feveral forts of even the larger veffels of any part were filled, one fort could not be diftinguifhed from another, unlefs the colour of each was different; which has likewife a good effect in making preparations more beautiful. Wherefore anatomifts have made ufe of a variety of fuch fubftances, according to their different fancies or intentions; fuch as gamboge, faffron, ink, burnt ivory, &c. which can be eafily procured from painters. My defign being only to confider thofe that are fit to be mixed with the injecting liquors propofed to fill capillary veffels, which is fcarce ever to be done in any other, except the branches of the arteries and of fome veins, I fhall confine myfelf to the common colours employed to thefe laft named two forts of veffels, which colours are red, green, and fometimes blue, without mentioning the others which require very little choice.

"Anatomifts have, I imagine, propofed to imitate the natural colours of the arteries and veins in a living creature, by filling the arteries with a red fubftance, and the veins with a blue or green: from which, however, there are other advantages, fuch as the ftrong reflection which fuch bodies make of the rays of light, and the unaptnefs moft fuch bodies have to tranfmit thefe fame rays, without at leaft a conliderable reflection of the rays peculiar to themfelves; or, in other words, their unfitnefs to become completely pellucid; without which, the very fine veffels, after being injected, would ftill be imperceptible. The animal or vegetable fubftances made ufe of for colouring injections, fuch as chochineal, laque, *rad. anchufæ*, brazil-wood, indigo, &c. have all one general fault of being liable to run into little knots which ftop fome of the veffels; their colour fades fooner when kept dry; they more eafily yield their tincture when the parts are preferved in a liquor; and rats, mice, and infects, will take them for food: for which reafons, though I have frequently fucceeded in injecting them, I rather prefer the mineral kind, fuch as minium or vermilion for red; of which this laft is, in my opinion, the beft, becaufe it gives the brighteft colour, and is commonly to be bought finely levigated. The green-coloured powder generally ufed is verdigreafe; but I rather chufe that preparation of it called *diftilled verdigreafe*; becaufe its colour is brighter, and it does not fo often run into fmall knots as the common verdigreafe, but diffolves in the oily liquors. Injection.

"The method of preparing the injection compofed of thefe materials, is to take, for the fine one, a pound of clear oil of turpentine, which is gradually poured on three ounces of vermilion, or diftilled verdigreafe finely powdered, or rather well levigated by grinding on marble; ftir them well with a fmall wooden fpatula till they are exactly mixed, then ftrain all through a fine linen rag. The feparation of the groffer particles is, however, rather better made, by pouring fome ounces of the oil upon the powder, and, after ftirring them together ftrongly, ftop rubbing with the fpatula for a fecond or fo, and pour off into a clean veffel the oil with the vermilion or verdigreafe fufpended in it; and continue this fort of operation till you obferve no more of the powder come off; and all that remains is granulated. The coarfer injection is thus prepared: Take tallow, 1 pound; wax, bleached white, 5 ounces; fallad oil, 3 ounces; melt them in a fkillet put over a lamp; then add Venice turpentine, 2 ounces; and as foon as this is diffolved, gradually fprinkle in of vermilion or verdigreafe prepared, 3 ounces; then pafs all through a clean, dry, warmed linen-cloth, to feparate all the groffer particles; and, when you defign to make it run far into the veffels, fome oil of turpentine may be added immediately before it is ufed.

"The next thing to be confidered, and indeed what chiefly contributes to the fuccefs of injections, is the choice and preparation of the fubject whofe veffels are to be filled.

"In chufing a fit fubject, take thefe few general rules: 1. The younger the creature to be injected is, the injection will, *cæteris paribus*, go fartheft, and *vice verfa*. 2. The more the creature's fluids have been diffolved and exhaufted in life, the fuccefs of the operation will be greater. 3. The lefs folid the part defigned to be injected is, the more veffels will be filled. 4. The more membranous and tranfparent parts are, the injection fhows better; whereas, in the folid very hard parts of a rigid old creature, that has died with its veffels full of thick ftrong blood, it is fcarce poffible to inject great numbers of fmall veffels.

"Therefore, in preparing a fubject for injecting, the principal things to be aimed at are, To diffolve the fluids, empty the veffels of them, relax the folids, and prevent the injection's coagulating too foon. To an-

(A) Rigieus (*introduct. in notitiam rerum natur.* &c. 4*to*, *Hagæ*, 1743, *titul. Balfamum*) gives Ruyfch's method of injecting and preferving animals, which, he fays, Mr Blumentroft, prefident of the Peterfburgh academy, aflured him was copied from the receipt given in Ruyfch's own hand-writing to the Czar. According to this receipt, melted tallow, coloured with vermilion, to which, in the fummer, a little white wax was added, was Ruyfch's injecting *ceracea materies*.

(B) Mr Ranby's injecting matter, as publifhed by Dr Hales, (*Hæmaft.* Ex. 21.), is white rofin and tallow, of each two ounces, melted and ftrained through linen; to which was added three ounces of vermilion, or finely ground indigo, which was firft well rubbed with eight ounces of turpentine varnifh.

Injection. anſwer all theſe intentions, authors have propoſed to inject tepid or warm water by the arteries, till it returns clear and untinged by the veins, and the veſſels are thereby ſo emptied of blood, that all the parts appear white; after which, they puſh out the water by forcing in air; and, laſtly, by preſſing with their hands, they ſqueeze the air alſo out. After this preparation, one can indeed inject very ſubtilely; but generally there are inconveniencies attend it. For in all the parts where there is a remarkable *tunica celluloſa*, it never miſſes to be full of the water, which is apt to ſpoil any parts deſigned to be preſerved either wet or dry; and ſome particles of the water ſeldom miſs to be mixed in the larger as well as ſmaller veſſels with the oily injection, and make it appear diſcontinued and broken: wherefore it is much better to let this injection of water alone, if it can be poſſibly avoided, and rather to macerate the body or part to be injected a conſiderable time in water, made ſo warm (c) as one can hold his hand eaſily in it; taking care to keep it of an equal warmth all the time, by taking out ſome of the water as it cools, and pouring in hot water in its place; by which the veſſels will be ſufficiently ſoftened and relaxed, the blood will be melted down, and the injection can be in no danger of hardening too ſoon; whereas, if the water is too hot, the veſſels ſhrink, and the blood coagulates. From time to time we ſqueeze out the liquids as much as poſſible at the cut veſſel by which the injection is to be thrown in (d). The time this maceration is to be continued, is always in proportion to the age of the ſubject, the bulk and thickneſs of what we deſign to inject, and the quantity of blood we obſerve in the veſſels, which can only be learned by experience; at leaſt, however, care ought to be taken, that the whole ſubject, or part macerated, is perfectly well warmed all through; and that we continue the preſſure with our hands, till no more blood can be brought away, whatever poſition we put the ſubject in.

When the ſyringe, injections, and ſubject, are all in readineſs, one of the ſecond ſort of pipes is choſen, as near to the diameter of the veſſel by which the injection is to be thrown as poſſible; for if the pipe is too large, it is almoſt needleſs to tell it cannot be introduced. If the pipe is much ſmaller than the veſſel, it is ſcarce poſſible to tie them ſo firmly together, but, by the wrinkling of the coats of the veſſel, ſome ſmall paſſage will be left, by which part of the injection will ſpring back on the injector, in the time of the operation, and the neareſt veſſels remain afterwards undiſtended, by the loſs of the quantity that oozes out. Having choſen a fit pipe, it is introduced at the cut orifice of the veſſel, or at an inciſion made in the ſide of it; and then a waxed thread being brought round the veſſel, as near to its coats as poſſible, by the help of a needle, or a flexible eyed probe, the ſurgeon's knot is made with the thread, and it is drawn as firmly as the thread can allow; taking care that it ſhall be ſunk into the circular notch of the pipe all round, otherwiſe it will very eaſily ſlide off, and the pipe will be brought out probably in the time of the operation, which ruins it. Injection.

"If there have been large veſſels cut, which communicate with the veſſels you deſign to inject, or if there are any others proceeding from the ſame trunk, which you do not reſolve to fill, let them be all carefully now tied up, to ſave the injected liquor, and make the operation ſucceed better in the view you then have."

"When all this is done, both ſorts of injections are to be warmed over a lamp, taking care to ſtir them conſtantly, leſt the colouring powder fall to the bottom and burn (e). The oil of turpentine needs be made no warmer than will allow the finger to remain in it, if the ſubject has been previouſly well warmed in water; when the maceration has not been made, the oil ought to be ſcalding hot, that it may warm all the parts which are deſigned to be injected. The coarſe injection ought to be brought near to a boiling. In the mean time, having wrapt ſeveral folds of linen round the parts of the ſyringe which the operator is to grip, and ſecured the linen with thread, the ſyringe is to be made very hot by ſucking boiling water ſeveral times up (f), and the pipe within the veſſel is to be warmed by applying a ſponge dipped in boiling water to it (g).

"After all is ready, the ſyringe being cleared of the water, the injector fills it with the finer injection; and then introducing the pipe of the ſyringe into that in the veſſel, he preſſes them together, and either with one hand holds this laſt pipe firm, with the other grips the ſyringe, and with his breaſt puſhes the ſucker; or, giving the pipe in the veſſel to be held by an aſſiſtant, in any of the ways mentioned in the deſcription of theſe ſorts of pipes, he grips the ſyringe with one hand, and puſhes the ſucker with the other, and conſequently throws in the injection, which ought to be done ſlowly, and with no great force, but proportioned to the length and bulk of the part to be injected and ſtrength of the veſſels. The quantity of this fine injection to be thrown in is much to be learned by uſe. The only rule I could ever fix to myſelf in this matter, was to continue puſhing till I was ſenſible of a ſtop which would require a conſiderable force to overcome. But this will not hold where all the branches of any veſſel are not injected; as for inſtance, when the veſſels of the thorax only are to be injected: for the aorta bears too great a proportion to the branches ſent from it, and therefore leſs fine injection is requiſite here. As ſoon as that ſtop is felt, the ſucker of the ſyringe is to be drawn back, that the neareſt large veſſels may be emptied. Then the ſyringe is taken off, emptied of the fine injection, and filled with the coarſer, which is to be puſhed into the veſſels quickly and forcibly, having always regard to the ſtrength and firmneſs of the veſſels, bulk, &c. of the part. Continue to thruſt the ſucker, till a full ſtop, or a ſort of puſh backwards,

(c) Ruyſch orders a previous maceration for a day or two in cold water; which muſt have a better effect in melting the blood than warm water has.

(d) When Ruyſch intended to inject the whole body, he put one pipe upwards, and another downwards, in the deſcending aorta.

(e) Ruyſch melts his tallow by the heat of warm water, into which he puts the veſſel containing the injection.

(f) He warms his ſyringe by laying it on hot coals.

(g) He warms his pipe, by putting the body, after the pipe is fixed in the veſſel, into hot water. When this is to be done, a cork ought to be put into the pipe, to prevent the water getting into the veſſel that is to be injected.

Injury, Ink.

wards is felt, when you muſt beware of thruſting any more, otherwiſe ſome of the veſſels will be burſted, and the whole, or a conſiderable ſhare of the preparation you deſigned, will be ſpoiled by the extravaſation; but rather immediately ſtop the pipe by the turn-cock, and take out the ſyringe to clean it, and allow ſufficient time for the coarſe injection to coagulate fully, before any part is diſſected. Ruyſch, immediately after throwing in the injection, put the body into cold water, and ſtirred it continually for ſome time, to prevent the vermilion to ſeparate from the tallow.

INJURY, any wrong done to a man's perſon, reputation, or goods. See Assault.

INK, a black liquor uſed in writing, generally made of an infuſion of galls, copperas, and gum-arabic.

The properties which this liquid ought to have, are, 1. To flow freely from the pen, and ſink a little into the paper, that the writing be not eaſily diſcharged. 2. A very deep black colour, which ſhould be as deep at firſt as at any time afterwards. 3. Durability, ſo that the writing may not be ſubject to decay by age. 4. Ink ſhould be deſtitute of any corroſive quality, that it may not deſtroy the paper, or go through it in ſuch a manner as to render the writing illegible. No kind of ink, however, hath yet appeared which is poſſeſſed of all theſe qualities. The ink uſed by the ancients was poſſeſſed of the ſecond, third, and fourth qualities above-mentioned, but wanted the firſt. Dr Lewis hath diſcovered its compoſition from ſome paſſages in ancient authors. "Pliny and Vitruvius, (ſays he), expreſsly mention the preparation of ſoot, or what we now call *lamp-black*, and the compoſition of writing-ink from lamp-black and gum. Dioſcorides is more particular, ſetting down the proportions of the two ingredients, viz. three ounces of the ſoot to one of the gum. It ſeems the mixture was formed into cakes or rolls; which being dried in the ſun, were occaſionally tempered with water, as the cakes of Indian ink are among us for painting."

In Mr Delaval's Treatiſe on Colours, p. 37. he acquaints us, that with an infuſion of galls and iron filings, he had not only made an exceedingly black and durable ink, but by its means, without the addition of any acid, dyed ſilk and woollen cloth of a good and laſting black. This kind of ink, however, tho' the colour is far ſuperior to that of any other, hath the inconvenience of being very eaſily diſcharged, either by the ſmalleſt quantity of any acid, or even by ſimple water; becauſe it doth not penetrate the paper in ſuch a manner as is neceſſary to preſerve it from the inſtantaneous action of the acid or of the water. During the action of the infuſion of galls upon the iron in making this kind of ink, a very conſiderable effervescence takes place, and a quantity of air is diſcharged, the nature of which hath not yet been examined.

The materials uſually employed for the making of ink are, common green vitriol, or copperas, and galls; but almoſt all of them are deficient in durability, which is a property of ſuch importance, that Dr Lewis hath thought the ſubject of ink-making not unworthy of his attention. From experiments made by that author, he infers, that the decay of inks is chiefly owing to a deficiency of galls; that the galls are the moſt periſhable ingredient, the quantity of theſe, which gives the greateſt blackneſs at firſt, (which is about equal parts with the vitriol), being inſufficient to maintain the colour: that for a durable ink, the quantity of galls cannot be much leſs than three times that of the vitriol; that it cannot be much greater, without leſſening the blackneſs of the ink: that by diminiſhing the quantity of water, the ink was rendered blacker and more durable; that diſtilled water, rain water, and hard ſpring-water, had the ſame effects: that white-wine produced a deeper black colour than water; that the colour produced by vinegar was deeper than that by wine; that proof-ſpirit extracted only a reddiſh brown tinge: that the laſt-mentioned tincture ſunk into, and ſpread upon, the paper; and hence the impropriety of adding ſpirit of wine to ink, as is frequently directed, to prevent mouldineſs or freezing: that other aſtringents, as oak-bark, biſtort, ſloe-bark, &c. were not ſo effectual as galls, nor gave ſo good a black, the colour produced by moſt of theſe, excepting oak-bark, being greeniſh: that the juice of ſloes did not produce a black colour with martial vitriol; but that, nevertheleſs, the writing made with it became black, and was found to be more durable than common ink: that inks made with ſaturated ſolutions of iron in nitrous, marine, or acetous acids, in tartar, or in lemon-juice, were much inferior to the ink made with martial vitriol: that the colour of ink was depraved by adding quicklime, which was done with an intention of deſtroying any ſuperabundant acid which might be ſuppoſed to be the cauſe of the loſs of the colour of ink: that the beſt method of preventing the effects of this ſuperabundant acid is probably by adding pieces of iron to engage it; and that this conjecture was confirmed by an inſtance the author had heard of, the great durability of the colour of an ink in which pieces of iron had been long immerſed: and laſtly, that a decoction of logwood uſed inſtead of water, ſenſibly improved both the beauty and deepneſs of the black, without diſpoſing it to fade. The ſame author obſerves, that the addition of gum-arabic is not only uſeful, by keeping the colouring matter ſuſpended in the fluid, but alſo by preventing the ink from ſpreading, by which means a greater quantity of it is collected on each ſtroke of the pen. Sugar, which is ſometimes added to ink, was found to be much leſs effectual than gums, and to have the inconvenience of preventing the drying of the ink. The colour of ink is found to be greatly injured by keeping the ink in veſſels made of copper or of lead, and probably of any other metal, excepting iron, which the vitriolic acid can diſſolve.

The foregoing experiments point out for the beſt proportions of the ingredients for ink, One part of green vitriol, one part of powdered logwood, and three parts of powdered galls. The beſt menſtruum appears to be vinegar or white-wine, though for common uſe water is ſufficient. If the ink be required to be of a full colour, a quart, or at moſt three pints, of liquor, may be allowed to three ounces of galls, and to one ounce of each of the other two ingredients. Half an ounce of gum may be added to each pint of the liquor. The ingredients may be all put together at once in a convenient veſſel, and well ſhaken four or five times each day. In 10 or 12 days the ink will be fit for uſe, though it will improve by re-

Ink.

remaining longer on the ingredients. Or it may be made more expeditiously, by adding the gum and vitriol to a decoction of galls and logwood in the menstruum. To the ink, after it has been separated from the feculencies, some coarse powder of galls, from which the fine dust has been sifted, together with one or two pieces of iron, may be added, by which its durability will be secured.

In some attempts made by the Doctor to endow writing ink with the great durability of that of the ancients, as well as the properties which it hath at present, he first thought of using animal-glues, and then of oily matters. "I mixed both lamp-black (says he) and ivory-black with solution of gum arabic, made of such consistence as just to flow sufficiently from the pen. The liquors wrote of a fine black colour; but when dry, part of the colour could be rubbed off, especially in moist weather, and a pencil dipped in water washed it away entirely.

"I tried solutions of the animal-glues, with the same event. Isinglass or fish-glue being the most difficultly dissoluble of these kinds of bodies, I made a decoction of it in water, of such strength, that the liquor concreted into a jelly before it was quite cold: with this jelly, kept fluid by sufficient heat, I mixed some ivory-black: characters drawn with this mixture on paper bore rubbing much better than the others, but were discharged without much difficulty by a wet pencil.

"It was now suspected, that the colour could not be sufficiently fixed on paper without an oily cement. As oils themselves are made miscible with watery fluids by the intervention of gum, I mixed some of the softer printers varnish, after-mentioned, with about half its weight of a thick mucilage of gum arabic, working them well together in a mortar, till they united into a smooth uniform mass: this was beaten with lamp-black, and some water added by little and little, the rubbing being continued till the mixture was diluted to a due consistence for writing. It wrote freely, and of a full brownish-black colour: the characters could not be discharged by rubbing, but water washed them out, though not near so readily as any of the foregoing. Instead of the printers varnish or boiled oil, I mixed raw linseed oil in the same manner with mucilage and lamp-black; and on diluting the mixture with water, obtained an ink not greatly different from the other.

"Though these oily mixtures answered better than those with simple gums or glues, it was apprehended that their being dischargeable by water would render them unfit for the purposes intended. The only way of obviating this imperfection appeared to be, by using a paper which should admit the black liquid to sink a little into its substance. Accordingly I took some of the more sinking kinds of paper, and common paper made damp as for printing; and had the satisfaction to find, that neither the oily nor the simple gummy mixtures spread upon them so much as might have been expected, and that the characters were as fixed as could be desired, for they could not be washed out without rubbing off part of the substance of the paper itself.

"All these inks must be now and then stirred or shaken during the time of use, to mix up the black powder, which settles by degrees to the bottom: those with oil must be well shaken also, though not used, once a-day, or at least once in three or four days, to keep the oil united with the water and gum; for if once the oil separates, which it is apt to do by standing at rest for some days, it can no longer be mixed with the thin fluid by any agitation. But though this imperfect union of the ingredients renders these inks less fit for general use than those commonly employed, I apprehend there are many occasions in which these kinds of inconveniences will not be thought to counterbalance the advantage of having writings which we may be assured will be as lasting as the paper they are written upon. And indeed the inconvenience may be in a great measure obviated by using cotton in the ink-stand, which, imbibing the fluid, prevents the separation of the black powder diffused through it.

"All the inks, however, made on the principle we are now speaking of, can no be discharged by washing, unless the paper admits them to sink into its substance. The ancients were not insensible of this imperfection; and sometimes endeavoured to obviate it, according to Pliny, by using vinegar, instead of water, for tempering the mixture of lamp-black and gum. I tried vinegar, and found it to be of some advantage, not as giving any improvement to the cement, but by promoting the sinking of the matter into the paper. As this washing out of the ink may be prevented, by using a kind of paper easy enough to be procured, it is scarcely to be considered as an imperfection; and indeed, on other kinds of paper, it is an imperfection only so far as it may give occasion to fraud, for none of these inks are in danger of being otherwise discharged than by design. The vitriolic inks themselves, and those of printed books and copperplates, are all dischargeable; nor can it be expected of the ink-maker to render writings secure from frauds.

"But a further improvement may yet be made, namely, that of uniting the ancient and modern inks together; or using the common vitriolic ink instead of water, for tempering the ancient mixture of gum and lamp-black. By this method it should seem that the writings would have all the durability of those of former times, with all the advantage that results from the vitriolic ink fixing itself in the paper. Even where the common vitriolic mixture is depended on for the ink, it may in many cases be improved by a small addition of the ancient composition, or of the common Indian ink which answers the same purpose: when the vitriolic ink is dilute, and flows so pale from the pen, that the fine strokes, on first writing, are scarcely visible, the addition of a little Indian ink is the readiest means of giving it the due blackness. By this admixture it may be presumed also that the vitriolic ink will be made more durable, the Indian ink in some measure covering it, and defending it from the action of the air. In all cases, where Indian ink or other similar compositions are employed, cotton should be used in the ink-stand, as already mentioned, to prevent the settling of the black powder."

Indian INK, a valuable black for water-colours, brought from China and other parts of the East Indies, sometimes in large rolls, but more commonly in small quadrangular cakes, and generally marked with Chinese characters. Dr Lewis, from experiments made on this substance, hath shewn that it is composed

Ink. of fine lamp-black and animal-glue: and accordingly, for the preparation of it, he defires us to mix the lamp-black with as much melted glue as is fufficient to give it a tenacity proper for being made into cakes; and thefe when dry, he tells us, anfwered as well as thofe imported from the Eaft Indies, both with regard to the colour, and the freedom of working. Ivory-black, and other charcoal-blacks, levigated to a great degree of finenefs, anfwered as well as the lamp-black; but in the ftate in which ivory-black is commonly fold, it proved much too gritty, and feparated too haftily from the water.

Printing INK, is totally different from Indian ink, or that made ufe of in writing. It is an oily compofition, of the conſiſtence of an ointment: the method of preparing it was long kept a fecret by thofe whofe employment it was to make it, and who were intereſted in concealing it; and even yet is but imperfectly known. The properties of good printing-ink are, to work clean and eafily, without daubing the types, or tearing the paper; to have a fine black colour; to wafh eafily off the types; to dry ſoon; and to preſerve its colour, without turning brown. This laſt, which is a moſt neceſſary property, is effectually obtained by ſetting fire to the oil with which the printing ink is made for a few moments, and then extinguiſhing it by covering the veſſel (A). It is made to wafh eafily off the types, by uſing ſoap as an ingredient; and its working clean depends on its having a proper degree of ſtrength, which is given by a certain addition of roſin. A good deal, however, depends on the proportion of the ingredients to each other; for if too much ſoap is added, the ink will work very foul, and daub the types to a great degree. The ſame thing will happen from uſing too much black, at the ſame time that both the ſoap and black hinder the ink from drying; while too much oil and roſin tear the paper, and hinder it from waſhing off.—The following receipt has been found to make printing ink of a tolerable good quality. "Take a Scots pint of linſeed oil, and ſet it over a pretty briſk fire in an iron or copper veſſel capable of holding three or four times as much. When it boils ſtrongly, and emits a thick ſmoke, kindle it with a piece of paper, and immediately take the veſſel off the fire. Let the oil burn for about a minute; then extinguiſh it by covering the veſſel; after it has grown pretty cool, add two pounds of black roſin, and one pound of hard ſoap cut into thin ſlices. If the oil is very hot when the ſoap is added, almoſt the whole mixture will run over the veſſel. The mixture is then to be ſet again over the fire; and when the ingredients are thoroughly melted, a pound of lamp-black, previouſly put through a lawn ſieve, is to be ſtirred into it. The whole ought then to be ground on a marble ſtone, or in a mill like the levigating mill deſcribed under the article CHEMISTRY, n° 97."

Though the above receipt is greatly ſuperior to any that hath been hitherto publiſhed, all of which are capitally deficient in not mentioning the neceſſary ingredients of roſin and ſoap; yet it muſt be acknowledged, that ink made in this manner is inferior in point of colour, and is likewiſe more apt to daub the types and make an indiſtinct impreſſion, than ſuch as is prepared by ſome of thoſe who make the manufacture of this commodity their employment; ſo that either a variation in the proportion of the ingredients, a nicety in the mixture, or ſome additional ingredient, ſeems neceſſary to bring it to the requiſite perfection. Ink.

INK *for the Rolling Preſs*, is made of linſeed oil burnt in the ſame manner as that for common printing-ink, and then mixed with Francfort-black, and finely ground. There are no certain proportions which can be determined in this kind of ink; every workman adding oil or black to his ink, as he thinks proper, in order to make it ſuit his own taſte.—Some, however, mix a portion of common boiled oil which has never been burnt: but this muſt neceſſarily be a bad practice, as ſuch oil is apt to go through the paper; a fault very common in prints, eſpecially if the paper is not very thick. No ſoap is added; becauſe the ink is not cleared off from the copperplates with alkaline ley as in common printing, but with a bruſh dipped in oil.

INK is alſo an appellation given to any coloured liquor uſed in writing, whether red, yellow, green, &c. Many different kinds of theſe inks may be prepared by the directions given under the article COLOUR-MAKING, which it would be ſuperfluous here to repeat.

Sympathetic INK, a liquor with which a perſon may write, and yet nothing appear on the paper after it is dry, till ſome other means are uſed, ſuch as holding the paper to the fire, rubbing it over with ſome other liquor, &c.

Theſe kinds of ink may be divided into ſeven claſſes, and that with reſpect to the means uſed to make them viſible; viz. 1. Such as become inviſible by paſſing another liquor over them, or by expoſing them to the vapour of that liquor. 2. Thoſe that do not appear ſo long as they are kept cloſe, but ſoon become viſible on being expoſed to the air. 3. Such as appear by ſtrewing or ſifting ſome very fine powder of any colour over them. 4. Thoſe which become viſible by being expoſed to the fire. 5. Such as become viſible by heat, but diſappear again by cold or the moiſture of the air. 6. Thoſe which become viſible by being wetted with water. 7. Such as appear of various colours, red, yellow, blue, &c.

I. The firſt claſs contains four kinds of ink, viz. ſolutions of lead, biſmuth, gold, and green vitriol. The firſt two become viſible in the ſame manner, viz. by the contact of ſulphureous liquids or fumes. For the firſt, a ſolution of common ſugar-of-lead in water will anſwer as well as more troubleſome preparations. If you write with this ſolution with a clean pen, the writing when dry will be totally inviſible: but if it be wetted with a ſolution of *hepar ſulphuris*, or of orpiment, diſſolved by means of quick-lime; or if it be expoſed to the ſtrong vapours of theſe ſolutions, but eſpecially to the vapour of volatile tincture of ſulphur; the writing will appear of a brown colour, more or leſs deep according to the ſtrength of the ſulphureous fume. By the ſame means, what is wrote with the ſolution of biſmuth in ſpirit of nitre will appear of a deep black.

The ſympathetic ink prepared from gold, depends on

(A) This is mentioned by Dr Lewis in his Philoſophical Commerce of Arts; but he ſeems not to have been acquainted with the method of giving it the other neceſſary properties.

Ink. on the property by which that metal precipitates from its folvent on the addition of a folution of tin. If you write with a folution of gold in *aqua regia*, and let the paper dry gently in the fhade, nothing will appear for the firft feven or eight hours. Dip a pencil or a fmall fine fponge in the folution of tin, and drawing it lightly over the inviſible characters, they will immediately appear, of a purple colour.

Characters wrote with a folution of green vitriol carefully depurated, will likewiſe be inviſible when the paper is dry; but if wetted with an infuſion of galls, they will immediately appear as if wrote with common ink. If, inſtead of this infuſion, a folution of the phlogiſticated alkali, impregnated with the colouring matter Pruſſian blue is made up of, the writing will appear of a very deep blue.

II. To the fecond claſs belong the folutions of all thoſe metals which are apt to attract phlogiſton from the air, ſuch as lead, biſmuth, ſilver, &c. The ſympathetic ink of gold already mentioned belongs alſo to this claſs; for if the characters wrote with it are long expoſed to the air, they become by degrees of a deep violet colour, nearly approaching to black. In like manner, characters wrote with a folution of ſilver in *aqua fortis* are inviſible when newly dried, but being expoſed to the ſun, appear of a grey colour like ſlate. To this claſs alſo belong ſolutions of lead in vinegar; copper in *aqua fortis*; tin in *aqua regia*; emery, and ſome kinds of pyrites, in ſpirit of ſalt; mercury, in *aqua fortis*; or iron, in vinegar. Each of theſe has a particular colour when expoſed to the air; but they have the diſagreeable property of corroding the paper, ſo that after ſome time the characters appear like holes cut out of the paper.

III. The third claſs of ſympathetic inks contains ſuch liquids as have ſome kind of glutinous viſcoſity, and at the ſame time are long a drying; by which means, though the eye cannot diſcern the characters wrote with them upon paper, the powders ſtrewed upon them immediately adhere, and thus make the writing become viſible. Of this kind are urine, milk, the juices of ſome vegetables, weak ſolutions of the deliqueſcent ſalts, &c.

IV. This claſs, comprehending all thoſe that become viſible by being expoſed to the fire, is very extenſive, as it contains all thoſe colourleſs liquids in which the matter diſſolved is capable of being reduced, or of reducing the paper, into a ſort of charcoal by a ſmall heat. A very eaſily procured ink of this kind is oil of vitriol diluted with as much water as will prevent it from corroding the paper. Letters wrote with this fluid are perfectly inviſible when dry, but inſtantly appear as black as if wrote with the fineſt ink on being held near the fire. Juice of lemons or onions, a ſolution of ſal-ammoniac, green vitriol, &c. will anſwer the ſame purpoſe, though not ſo eaſily, or with ſo little heat.

V. The fifth claſs comprehends only ſolutions of Regulus of Cobalt in ſpirit of ſalt; for the properties of which, ſee CHEMISTRY, n° 259.

VI. This claſs comprehends ſuch inks as become viſible when characters wrote with them are wetted with water. They are made of all ſuch ſubſtances as depoſit a copious ſediment when mixed with water, diſſolving only imperfectly in that fluid. Of this kind are dried alum, ſugar-of-lead, vitriol, &c. We have therefore only to write with a ſtrong ſolution of theſe ſalts upon paper, and the characters will be inviſible when dry; but when we apply water, the ſmall portion of dried ſalt cannot again be diſſolved in the water. Hence the inſoluble part becomes viſible on the paper, and ſhews the characters wrote in white, grey, brown, or any other colour which the precipitate aſſumes.

VII. Characters may be made to appear of a fine crimſon, purple, or yellow, by writing on paper with ſolution of tin in *aqua regia*, and then paſſing over it a pencil dipt in a decoction of cochineal, Brazil-wood, logwood, yellow-wood, &c.—For an account of the nature of all theſe ſympathetic inks, however, and the principles on which they are made, ſee the articles CHEMISTRY and COLOUR-MAKING, *paſſim*.

INLAND, a name for any part of a country at a diſtance from the ſea. Inland, Inn.

INLAND *Navigation*. See CANAL.

INLAND *Trade*, that kind of trade carried on between the different parts of the ſame kingdom, whether over land, or by means of inland navigation.

INN, a place appointed for the entertainment and relief of travellers.

Inns are licenſed and regulated by juſtices of the peace, who oblige the landlord to enter into recognizances for keeping good order. If a perſon who keeps a common inn, refuſes to receive a traveller into his houſe as a gueſt, or to find him victuals and lodging on his tendering a reaſonable price for them, he is liable to an action of damages, and may be indicted and fined at the king's ſuit. The rates of all commodities ſold by inn-keepers, according to our ancient laws, may be aſſeſſed: and inn-keepers not ſelling their hay, oats, beans, &c. and all manner of victuals at reaſonable prices, without taking any thing for litter, may be fined and impriſoned, &c. by 21 Jac. I. c. 21. Where an inn-keeper harbours thieves, perſons of infamous character, or ſuffers any diſorders in his houſe, or ſets up a new inn where there is no need of one, to the hindrance of ancient and well-governed inns, he is indictable and fineable; and by ſtatute, ſuch inn may be ſuppreſſed. Action upon the caſe lies againſt any inn-keeper, if a theft be committed on his gueſt by a ſervant of the inn, or any other perſon not belonging to the gueſt; though it is otherwiſe where the gueſt is not a traveller, but one of the ſame town or village, for there the inn-keeper is not chargeable; nor is the maſter of a private tavern anſwerable for a robbery committed on his gueſt: it is ſaid, that even tho' the travelling gueſt does not deliver his goods, &c. into the inn-keeper's poſſeſſion, yet if they are ſtolen, he is chargeable. An inn-keeper is not anſwerable for any thing out of his inn, but only for ſuch as are within it; yet, where he of his own accord puts the gueſt's horſe to graſs, and the horſe is ſtolen, he is anſwerable, he not having the gueſt's orders for putting ſuch horſe to graſs. The inn-keeper may juſtify the ſtopping of the horſe, or other thing of his gueſt, for his reckoning, and may detain the ſame till it be paid. Where a perſon brings his horſe to an inn, and leaves him in the ſtable, the inn-keeper may detain him till ſuch time as the owner pays for his keeping; and *Black. Comment.*

Innate ‖ Innocent's.

and if the horſe eats out as much as he is worth, after a reaſonable appraiſement made, he may ſell the horſe and pay himſelf: but when a gueſt brings ſeveral horſes to an inn, and afterwards takes them all away except one, this horſe ſo left may not be ſold for payment of the debt for the others; for every horſe is to be ſold, only to make ſatisfaction for what is due for his own meat.

INNS *of Court*, are colleges in London, for the ſtudy of the laws of England, with all conveniencies for the lodging and entertainment of the profeſſors and ſtudents.

In theſe colleges, there are not only ſuch ſtudents as ſtudy the laws of this kingdom, in order to render themſelves capable of practiſing in the courts of law at Weſtminſter; but alſo ſuch other gentlemen of fortune as apply themſelves to this ſtudy, in order to know and vindicate their rights, and to render themſelves more ſerviceable to their country.

Our inns of court, which are numerous, and juſtly famed for the production of men of learning, are governed by maſters, principals, benchers, ſtewards, and other officers; and have public halls for exerciſes, readings, &c. which the ſtudents are obliged to attend and perform for a certain number of years, before they can be admitted to plead at the bar. Theſe ſocieties have not, however, any judicial authority over their members; but inſtead of this, they have certain orders among themſelves, which have, by conſent, the force of laws: for lighter offences, perſons are only *excommoned*, or put out of commons; for greater, they loſe their chambers, and are expelled the college: and when once expelled out of one ſociety, they are never received by any of the others. The gentlemen in theſe ſocieties may be divided into benchers, outer-barriſters, inner-barriſters, and ſtudents.

The four principal inns of court are the Inner-temple, Middle-temple, Lincoln's-inn, and Gray's-inn; the other inns are the two Serjeant's-inns; and the others, which are leſs conſiderable, are Clifford's-inn, Symond's-inn, Clement's-inn, Lion's-inn, Furnival's-inn, Staple's-inn, Thavie's-inn, Barnard's-inn, and New-inn. Theſe are moſtly taken up by attorneys, follicitors, &c.; but they belong to the inns of court, who ſend yearly ſome of their barriſters to read to them.

INNATE IDEAS, thoſe ſuppoſed to be ſtamped on the mind, from the firſt moment of its exiſtence, and which it conſtantly brings into the world with it: a doctrine which Mr Locke has taken great pains to refute.

INNERKEITHING. See INVERKEITHING.

INNERLOCHY, or FORT-WILLIAM, a fortreſs lately erected in the Highlands of Scotland, at the mouth of a large lake in the county of Lochaber, 28 miles S. W. of Lochneſs, and 100 N. W. of Edinburgh. W. Long. 5. 15. N. Lat. 56. 55.

INNISKILLING, a ſtrong town of Ireland, in the county of Fermanagh, and province of Ulſter. The inhabitants diſtinguiſhed themſelves in favour of king William ſoon after the revolution, againſt king James's party. It is ſeated between two lakes, in W. Long. 5. 50. N. Lat. 54. 20.

INNOCENT'S DAY, a feſtival of the Chriſtian church, obſerved on December 28th, in memory of the maſſacre of the innocent children by the command of Herod king of Judæa. See JESUS *Chriſt*; and JEWS, n° 24. pai. *ult.* The Greek church in their kalendar, and the Abyſſinians of Ethiopia in their offices, commemorate 14,000 infants on this occaſion.

Innominata, Inoculation.

INNOMINATA OSSA, in anatomy. See there, n° 38. *a*, *b*.

INOCULATION, or BUDDING, in gardening, is commonly practiſed upon all ſorts of ſtone-fruit; as nectarines, peaches, apricots, plumbs, cherries, as alſo upon oranges and jaſmines: and indeed this is preferable to any ſort of grafting for moſt ſorts of fruit. The method of performing it is as follows: You muſt be provided with a ſharp pen-knife with a flat haft, which is to raiſe the bark of the ſtock to admit the bud; and ſome found baſs-mat, which ſhould be ſoaked in water, to increaſe its ſtrength, and render it more pliable: then having taken off the cuttings from the trees you would propagate, you muſt chooſe a ſmooth part of the ſtock, about five or ſix inches above the ſurface of the ground, if deſigned for dwarfs; but if for ſtandards, they ſhould be budded ſix feet above-ground. Then with your knife make an horizontal cut acroſs the rind of the ſtock, and from the middle of that cut make a ſlit downwards, two inches in length, that it may be in the form of a T; but you muſt be careful not to cut too deep, leſt you wound the ſtock: then having cut off the leaf from the bud, leaving the foot-ſtalk remaining, you ſhould make a croſs cut, about half an inch below the eye, and with your knife ſlit off the bud, with part of the wood to it: this done, you muſt with your knife pull off that part of the wood which was taken with the bud, obſerving whether the eye of the bud be left to it or not; for all thoſe buds which loſe their eyes in ſtripping, are good for nothing: then having gently raiſed the bark of the ſtock with the flat haft of your pen-knife clear to the wood, thruſt the bud therein, obſerving to place it ſmooth between the rind and wood of the ſtock, cutting off any part of the rind belonging to the bud, that may be too long for the ſlit made in the ſtock; and ſo having exactly fitted the bud to the ſtock, tie them cloſely round with baſs-mat, beginning at the under-part of the ſlit, and ſo proceeding to the top, taking care not to bind round the eye of the bud, which ſhould be left open.

When your buds have been innoculated three weeks or a month, thoſe which are freſh and plump you may be ſure are joined; and at this time you ſhould looſen the bandage, which if it be not done in time, will injure if not deſtroy the bud. The March following cut off the ſtock ſloping, about three inches above the bud, and to what is left faſten the ſhoot which proceeds from the bud: but this muſt continue no longer than one year; after which the ſtock muſt be cut off cloſe above the bud. The time for innoculating is from the middle of June to the middle of Auguſt: but the moſt general rule is, when you obſerve the buds formed at the extremity of the ſame year's ſhoot, which is a ſign of their having finiſhed their ſpring growth. The firſt ſort commonly inoculated is the apricot; and the laſt the orange-tree, which ſhould never be done till the latter end of Auguſt. And in doing this work, you ſhould always make choice of cloudy weather; for if it be done in the middle of the day,

day, when the weather is hot, the ſhoots will perſpire ſo faſt, as to leave the buds deſtitute of moiſture.

INOCULATION, in medicine, the art of tranſplanting the ſmall-pox from one perſon to another, by impregnating the blood of the ſound perſon with the variolous matter from a puſtule taken from the other. See (the *Index* ſubjoined to) MEDICINE.

INOSCULATION, in anatomy. See ANASTOMOSIS.

INPROMPTU, or IMPROMPTU. See IMPROMPTU.

INQUEST, in Scots law, the ſame with JURY.

INQUISITION, in the church of Rome, a tribunal in ſeveral Roman Catholic countries, erected by the popes for the examination and puniſhment of heretics.

This court was founded in the twelfth century by father Dominic and his followers, who were ſent by pope Innocent III. with orders to excite the Catholic princes and people to extirpate heretics, to ſearch into their number and quality, and to tranſmit a faithful account thereof to Rome. Hence they were called *inquiſitors*; and this gave birth to the formidable tribunal of the inquiſition, which was received in all Italy, and the dominions of Spain, except the kingdom of Naples and the Low Countries.

This diabolical tribunal takes cognizance of hereſy, Judaiſm, Mahometaniſm, Sodomy, and polygamy; and the people ſtand in ſo much fear of it, that parents deliver up their children, huſbands their wives, and maſters their ſervants, to its officers, without daring in the leaſt to murmur. The priſoners are kept for a long time, till they themſelves turn their own accuſers, and declare the cauſe of their impriſonment; for they are neither told their crime, nor confronted with witneſſes. As ſoon as they are impriſoned, their friends go into mourning, and ſpeak of them as dead, not daring to ſolicit their pardon, leſt they ſhould be brought in as accomplices. When there is no ſhadow of proof againſt the pretended criminal, he is diſcharged, after ſuffering the moſt cruel tortures, a tedious and dreadful impriſonment, and the loſs of the greateſt part of his effects. The ſentence againſt the priſoners is pronounced publicly, and with extraordinary ſolemnity. In Portugal, they erect a theatre capable of holding 3000 perſons; in which they place a rich altar, and raiſe ſeats on each ſide in the form of an amphitheatre. There the priſoners are placed; and over-againſt them is a high chair, whither they are called, one by one, to hear their doom, from one of the inquiſitors.

Theſe unhappy people know what they are to ſuffer, by the cloaths they wear that day. Thoſe who appear in their own cloaths, are diſcharged upon payment of a fine: thoſe who have a ſanto benito, or ſtrait yellow coat without ſleeves, charged with St Andrew's croſs, have their lives, but forfeit all their effects: thoſe who have the reſemblance of flames, made of red ſerge, ſewed upon their ſanto benito, without any croſs, are pardoned, but threatened to be burnt if ever they relapſe: but thoſe who, beſides theſe flames, have on their ſanto benito their own picture, ſurrounded with figures of devils, are condemned to expire in the flames. The inquiſitors, who are eccleſiaſtics, do not pronounce the ſentence of death; but form and read an act, in which they ſay, that the criminal being convicted of ſuch a crime, by his own confeſſion, is with much reluctance delivered to the ſecular power to be puniſhed according to his demerits: and this writing they give to the ſeven judges who attend at the right ſide of the altar, who immediately paſs ſentence. For the concluſion of this horrid ſcene, ſee ACT *of Faith*.

INSCRIBED, in geometry. A figure is ſaid to be inſcribed in another, when all its angles touch the ſide or planes of the other figure.

INSCRIPTION, a title or writing carved, engraved, or affixed to any thing, to give a more diſtinct knowledge of it, or to tranſmit ſome important truth to poſterity.

The inſcriptions mentioned by Herodotus and Diodorus Siculus, ſufficiently ſhew that this was the firſt method of conveying inſtruction to mankind, and tranſmitting the knowledge of hiſtory and ſciences to poſterity: thus the ancients engraved upon pillars both the principles of ſciences, and the hiſtory of the world. Piſiſtratus carved precepts of huſbandry on pillars of ſtone; and the treaties of confederacy between the Romans and Jews, were engraved on plates of braſs. Hence, antiquarians have been very curious in examining the inſcriptions on ancient ruins, coins, medals, &c.

Academy of INSCRIPTIONS. See ACADEMY.

INSECTS, INSECTA, in natural hiſtory, a ſmaller ſort of animals, commonly ſuppoſed to be exſanguious; and diſtinguiſhed by certain inciſures, cuttings, or indentings in their bodies. The word is originally Latin, formed of *in*, and *ſeco*, "I cut;" the reaſon of which is, that in ſome of this tribe, as ants, the body ſeems to be cut or divided into two; or becauſe the bodies of many, as worms, caterpillars, &c. are compoſed of divers circles, or rings, which are a ſort of inciſuræ.

By ſome natural hiſtorians, this claſs of animals is conſidered as the moſt imperfect of any, while others prefer them to the larger animals. One mark of their imperfection is ſaid to be, that many of them can live a long time, though deprived of thoſe organs which are neceſſary to life in the higher ranks of nature. Many of them are furniſhed with lungs and an heart, like the nobler animals; yet the caterpillar continues to live, though its heart and lungs, which is often the caſe, are entirely eaten away.—It is not, however, from their conformation alone that inſects are inferior to other animals, but from their inſtincts alſo. It is true, that the ant and the bee preſent us with ſtriking inſtances of aſſiduity; yet even theſe are inferior to the marks of ſagacity diſplayed by the larger animals. A bee taken from the ſwarm is totally helpleſs and inactive, incapable of giving the ſmalleſt variation to its inſtincts. It has but one ſingle method of operating; and if put from that, it can turn to no other. In the purſuits of the hound, there is ſomething like choice; but in the labours of the bee, the whole appears like neceſſity and compulſion.—All other animals are capable of ſome degree of education; their inſtincts may be ſuppreſſed or altered; the dog may be taught to fetch and carry, the bird to whiſtle a tune, and the ſerpent to dance: but the inſect has only one invariable method of operating; no arts can turn it from its inſtincts; and indeed its life

Inoſculation. Inſcribed. Inſects.

Infects. life is too ſhort for inſtruction, as a ſingle ſeaſon often terminates its exiſtence.—Their amazing number is alſo an imperfection. It is a rule that obtains through all nature, that the nobler animals are ſlowly produced, and that nature acts with a kind of dignified œconomy; but the meaner births are laviſhed in profuſion, and thouſands are brought forth merely to ſupply the neceſſities of the more favourite part of the creation. Of all productions in nature, inſects are by far the moſt numerous. The vegetables which cover the ſurface of the earth bear no proportion to the multitudes of inſects; and though, at firſt ſight, herbs of the field ſeem to be the parts of organized nature produced in the greateſt abundance, yet, upon more minute inſpection, we find every plant ſupporting a mixture of ſcarce perceptible creatures, that fill up the compaſs of youth, vigour, and age, in the ſpace of a few days exiſtence.—In Lapland, and ſome parts of America, the inſects are ſo numerous, that if a candle is lighted they ſwarm about it in ſuch multitudes, that it is inſtantly extinguiſhed by them; and in theſe parts of the world, the miſerable inhabitants are forced to ſmear their bodies and faces with tar, or ſome other unctuous compoſition, to protect them from the ſtings of their minute enemies.

On the other hand, Swammerdam argues for the perfection of inſects in the following manner. "After an attentive examination (ſays he) of the nature and anatomy of the ſmalleſt as well as the largeſt animals, I cannot help allowing the leaſt an equal, or perhaps a ſuperior, degree of dignity. If, while we diſſect with care the larger animals, we are filled with wonder at the elegant diſpoſition of their parts, to what an height is our aſtoniſhment raiſed, when we diſcover all theſe parts arranged, in the leaſt, in the ſame regular manner! Notwithſtanding the ſmallneſs of ants, nothing hinders our preferring them to the largeſt animals, if we conſider either their unwearied diligence, their wonderful ſtrength, or their inimitable propenſity to labour. Their amazing love to their young is ſtill more unparalleled among the larger claſſes. They not only daily carry them to ſuch places as may afford them food; but if by accident they are killed, and even cut into pieces, they will with the utmoſt tenderneſs carry them away piecemeal in their arms. Who can ſhew ſuch an example among the larger animals which are dignified with the title of *perfect?* Who can find an inſtance in any other creature that can come in competition with this?"

On this diſpute it is only neceſſary to obſerve, that the wiſdom of the Creator is ſo conſpicuous in all his works, and ſuch ſurpriſing art is diſcovered in the mechaniſm of the body of every creature, that it is very difficult, if not impoſſible, to ſay where it is moſt, and where it is leaſt, to be obſerved.—The nature and properties of inſects are certainly very wonderful. Many particulars relating to them may be found under different articles of this work; but thoſe who deſire to ſee this ſubject treated in a full and ample manner, muſt have recourſe to the works of Reaumur and Swammerdam.

Of the Kinds of INSECTS, *and where the Collector for the Cabinet may find them.* Inſects in general are known to moſt people, the ſyſtematic diſtinctions but to few; nor have we any Engliſh names for the greateſt part of them. The general denominations of beetles, butterflies, moths, flies, bees, wafps, and a few other common names, are all that our language ſupplies. It would, therefore, be in vain to enumerate the immenſe variety of genera and ſpecies to any perſon unſkilled in the ſcience of entomology: we may, however, give directions under general names where to find each kind. Inſects.

The claſs of inſects is divided by Linnæus into ſeven orders. See ZOOLOGY.

I. The COLEOPTERA, (from κολεος, a *ſheath*, and πτερον, a *wing*,) are ſuch inſects as have cruſtaceous *elytra* or ſhells, which ſhut together, and form a longitudinal future down the back of the inſect; as the beetle, (*buprestris ignita*,) fig. 11. Many of them (as *ſcarabæus* or chaffer, *dermeſtes* or leather-eater, *hiſter* or mimick-beetle, *ſtaphylinus* or rove-beetle, &c.) are found in and under the dung of animals, eſpecially of cows, horſes, and ſheep. Some (as *lucanus* or ſtag-beetle, *cerambyx* or capricorn beetle, *dermeſtes*, &c.) are found in rotten and half-decayed wood, and under the decayed bark of trees. Others (as *hiſter*, *ſilpha* or carrion-beetle, *ſtaphylinus*, &c.) on the carcaſes of animals that have been dead four or five days; on moiſt bones that have been gnawed by dogs or other animals; on flowers having a fetid ſmell; and on ſeveral kinds of fungous ſubſtances, particularly the rotten and moſt ſtinking. Others (as *byrrhus*, *curculio* or weevil, *bruchus* or ſeed-beetle, &c.) may be found in a morning about the bottoms of perpendicular rocks and ſand-banks, and alſo upon the flowers of trees and herbaceous plants. Many kinds (as *gyrinus* or whirl-beetle, *dytiſcus* or water-beetle, &c.) may be caught in rivers, lakes, and ſtanding pools, by means of a thread-net, with ſmall meſhes, on a round wire-hoop, fixed at the end of a long pole. In the middle of the day, when the ſun ſhines hot, ſome (as the *coccinella* or lady-fly, *buprestis* or burn-cow, *chryſomela* or golden honey-beetle, *cantharis* or ſoft-winged-beetle, *elater* or ſpring-beetle, *necydalis* or clipt-winged beetle, &c.) are to be ſeen on plants and flowers, blighted trees and ſhrubs. Others (as *lampyris* or glow-worm, &c.) frequent moiſt meadows, and are beſt diſcovered at night, by the ſhining light which they emit. A great variety ſit cloſe on the leaves of plants, particularly of the burdock, elecampane, coltsfoot, dock, thiſtle, and the like, (as the *caſſida* or tortoiſe-beetle, &c.); or feed on different kinds of tender herbs (as the *meloë* or bliſter-beetle.) Numbers (as the *tenebrio* or ſtinking-beetle,) may be found in houſes, dark cellars, damp pits, caves, and ſubterraneous paſſages; or on umbelliferous flowers, (as the *cerambyx*, *ptinus*, &c.); or on the trunks as well as on the leaves of trees, in timber-yards, and in the holes of decayed wood. Some (as the *leptura* or wood-beetle, *cicindela* or gloſſy-beetle, &c.) inhabit wild commons, the margins of pools, marſhes, and rivulets; and are likewiſe ſeen creeping on flags, reeds, and all kinds of water-plants. Multitudes (as the *carabus* or ground-beetle) live under ſtones, moſs, rubbiſh, and wrecks near the ſhores of lakes and rivers. Theſe are found alſo in bogs, marſhes, moiſt places, pits, holes of the earth, and on ſtems of trees; and in an evening they crawl plentifully along path-ways after a ſhower of rain. Some (as the *forficula* or earwig) may be diſcovered in

Plate CLIV.

Lettſome's Naturaliſt's and Trav.'s Companion, p. 2, &c.

Insects. in the hollow ſtems of decayed umbelliferous plants, and on many ſorts of flowers and fruits.

II. HEMIPTERA, (from ἡμισυ, *half*, and πτερον, a *wing*,) have their upper wings uſually half cruſtaceous and half membranaceous, not divided by a longitudinal ſuture, but incumbent on each other; as the *cimex*, fig. 12. Some of theſe (as the *blatta* or cock-roach) are found about bake-houſes, &c.; others (as the *mantis* or camel-cricket, *gryllus* or locuſt, *fulgora*, *cicada*, or flea-locuſt, *cimex* or bug, &c.) on graſs, and all kinds of field-herbage. Some (as *notonecta* or boat-fly, *nepa* or water-ſcorpion, &c.) frequent rivers, lakes, and ſtanding pools.

III. LEPIDOPTERA, (from λεπις, a *ſcale*, and πτερον, a *wing*,) are inſects having four wings, covered with fine ſcales in the form of powder or meal; as in the butterfly, (*papilio antiopa*,) fig. 13. In the day, when the ſun is warm, butterflies are ſeen on many ſorts of trees, ſhrubs, plants, and flowers. Moths may be ſeen in the day-time, ſitting on pales, walls, trunks of trees, in ſhades, out-houſes, dry holes, and crevices; on fine evenings, they fly about the places they inhabit in the day-time: ſome (as the *ſphinx* or hawk-moth,) are ſeen flying in the day-time over the flowers of honey-ſuckles and other plants with tubular flowers. Inſects of this ſpecies feldom ſit to feed, but continue vibrating on the wing, while they thruſt the tongue or probolcis into the flowers.

IV. NEUROPTERA, (from νευρον, a *nerve*, and πτερον, a *wing*,) have four membranous tranſparent naked wings, generally like network; as in the *panorpa coa*, fig. 14. Of theſe, ſome (as the *myrmeleon*, *hemerobius* or pearl-fly, *raphidia* or camel-fly, &c.) are found in woods, hedges, meadows, ſand-banks, walls, pales, fruits, and umbelliferous flowers. Others (as *libellula* or dragon-fly, *ephemera* or may-fly, *phryganea* or ſpring-fly, &c.) fly about lakes and rivers in the day.

V. HYMENOPTERA, (from υμην, a *membrane*, and πτερον, a *wing*), are inſects with four membranous wings, tail furniſhed with a ſting; as in the *tenthredo*, fig. 15. Theſe, including waſps, bees, &c. frequent hedges, ſhrubs, flowers, and fruits.

VI. DIPTERA, (from δυο, two, and πτερον, a *wing*,) are ſuch as have only two wings, and poiſers; as in the fly, fig. 16. Flies of various kinds conſtitute this claſs; of which ſome (as *æſtras* or gad-fly, *muſca* or fly, *tabanus* or whame,) fly about the tops of trees, little hills, horſes, cows, ſheep, ditches, dunghills, and every offenſive object. Others (as *tipula*, *conops*, *aſilus* or waſp-fly, &c.) are found on all ſorts of flowers, particularly thoſe of a fetid ſmell.

VII. APTERA (from α, *without*, and πτερον, a *wing*, inſects having no wings. This laſt diviſion contains ſcorpions, ſpiders, crabs, lobſters, &c.

Of Catching and Preſerving INSECTS *for Collections*. In the following directions, we ſhall relate the methods of killing them the moſt readily, and with the leaſt pain, as the purſuit of this part of natural hiſtory hath been often branded with cruelty; and however reaſonably the naturaliſt may exculpate himſelf by pleading the propriety of ſubmitting to an evil which leads to uſeful diſcoveries, yet for wanton cruelty there never can be a juſt pretext:

—The poor beetle that we tread upon,
In corp'ral ſufferance feels a pang as great
As when a giant dies. Insects.

1. The firſt claſs, conſiſting of beetles (*coleoptera*), are hard-winged. Many kinds fly about in the day, others in the evening, ſome at night only. They may be caught with a gauze-net, or a pair of forceps covered with gauze. When they are taken, ſtick a pin thro' the middle of one of the hard wings, and paſs it thro' the body. They may be killed inſtantly, by immerſion in hot water, as well as in ſpirit of wine; then ſtick them on a piece of cork, and afterwards carefully place their legs in a creeping poſition, and let them continue expoſed to the air until all the moiſture is evaporated from their bodies. Beetles may alſo be preſerved in ſpirit of wine, brandy, or rum, cloſely corked up.

2. Inſects of the ſecond claſs (*hemiptera*) may be killed in the ſame manner as beetles, and likewiſe by means of a drop of the etherial oil of turpentine applied to the head; or in the manner to be deſcribed under the next claſs for killing moths.

3. The diviſion of butterflies and moths, (*lepidoptera*), as well as all flies within membranaceous wings, ſhould be catched with a gauze net, or a pair of gauze forceps: when taken in the forceps, run a pin through the thorax or ſhoulders, between the fore-wings. After this is done, take the pin by the head, and remove the forceps, and with the other hand pinch the breaſt of the inſect, and it will immediately die: the wings of butterflies ſhould be expanded, and kept ſo by the preſſure of ſmall ſlips of paper for a day or two. Moths expand their wings when at reſt, and they will naturally take that poſition.

The larger kinds of theſe inſects will not ſo readily expire by this method, as by ſticking them upon the bottom of a cork exactly fitted to the mouth of a bottle, into which a little ſulphur had been put, and by gradually heating the bottle, till an exhalation of the ſulphur take place, when the inſect inſtantly dies, without injuring its colours or plumage.

The beſt method of having the moſt perfect butterflies, is to find out, if poſſible, the larva or caterpillar of each, by examining the plants, ſhrubs, or trees, they uſually feed upon, or by beating the ſhrubs and trees with long poles, and thereby ſhaking the caterpillars into a ſheet ſpread underneath to receive them; to put them into boxes covered with thin canvas, gauze, or cat-gut, and to feed them with the freſh leaves of the tree or herb on which they are found; when they are full grown, they will go into the pupa or chryſalis ſtate, and require then no other care till they come out perfect butterflies, at which time they may be killed, as before directed. Sometimes theſe inſects may be found hanging to walls, pales, and branches of trees, in the chryſalis ſtate.

Moths might likewiſe be procured more perfect, by collecting the caterpillars, and breeding them in the ſame manner as butterflies. As the larvæ or caterpillars cannot be preſerved dry, nor very well kept in ſpirit, it would be ſatisfactory if exact drawings could be made of them while they are alive and perfect. It may be neceſſary to obſerve, that in breeding theſe kinds of inſects, ſome earth ſhould be put into the boxes, as likewiſe ſome rotten wood in the corners; becauſe, when the caterpillars change into the pupa

or

Insects. or chryſalis ſtate, ſome go into the earth, and continue under ground for many months before they come out into the moth ſtate; and ſome cover themſelves with a hard ſhell, made up of ſmall pieces of rotten wood.

4. The fourth claſs of inſects (*neuroptera*) may be killed with ſpirit of wine, oil of turpentine, or by the fumes of ſulphur.

5. Thoſe of the next claſs (*hymenoptera*) may be killed in the ſame manner. A pin may be run thro' one of their wing-ſhells and body.

6. Inſects of the ſixth claſs (*diptera*) may likewiſe be killed by ſpirit, or by fumes of ſulphur.

7. Thoſe of the laſt diviſion (*aptera*) are in general ſubjects which ſhould be kept in ſpirit.

When in ſearch of inſects, we ſhould have a box ſuitable to carry in the pocket, lined with cork at the bottom and top to ſtick them upon, until they are brought home. If this box be ſtrongly impregnated with camphor, the inſects ſoon become ſtupified, and are thereby prevented from fluttering and injuring their plumage. Beſides a gauze forceps, the collector ſhould have a large muſqueto gauze-net, and alſo a pin-cuſhion with three or four different ſizes of pins, to ſuit the different ſizes of inſects.

In hot climates, inſects of every kind, but particularly the larger, are liable to be eaten by ants and other ſmall inſects; eſpecially before they are perfectly dry: to avoid this, the piece of cork on which our inſects are ſtuck in order to be dried, ſhould be ſuſpended from the cieling of a room, by means of a ſlender ſtring or thread; beſmear this thread with bird-lime, or ſome adhefive ſubſtance, to intercept the rapacious vermin of theſe climes in their paſſage along the thread.

After our inſects are properly dried, they may be placed in the cabinet or boxes where they are to remain: theſe boxes ſhould be kept dry; and alſo made to ſhut very cloſe, to prevent ſmall inſects from deſtroying them; the bottoms of the boxes ſhould be covered with pitch, or green wax, over which paper may be laid; or, which is better, lined with cork, well impregnated with a ſolution of corroſive ſublimate mercury in a ſaturated ſolution of crude ſal-ammoniac in water, an ounce of which will diſſolve 20 ſcruples of the ſublimate.

The fineſt collections have been ruined by ſmall inſects, and it is impoſſible to have our cabinets too ſecure. Such inſects as are thus attacked may be fumigated with ſulphur, in the manner deſcribed for killing moths; if this prove ineffectual, they may be immerſed in ſpirit of wine, without much injuring their fine plumage or colours, and afterwards let them be ſprinkled about their bodies and inſertions of the wings with the ſolution above-mentioned. But baking the inſects in an oven, in the manner deſcribed for Birds (under that article), is the moſt effectual method of extirpating theſe enemies; however, the utmoſt caution is requiſite in this proceſs, in regulating the heat of the oven.

N. B. All kinds of inſects having no wings, may be preſerved in ſpirits, brandy, or rum; except crabs, lobſters, and the like, which may conveniently be preſerved dry.

Insects *giving root to Plants*. Of this we have an account, by Mr Fourgeroux, in the Memoirs of the Academy of Sciences for 1769. The plants, of which Mr Fougeroux gives an account, are perfectly the reverſe of the worm-plant of China, deſcribed by Mr Reaumur in the year 1726. For, in that caſe, a worm fixes its ſnout into the extremity of the plant, and derives nouriſhment from it. But the plants, of which an account is here given, derive their nouriſhment from the animals. Inſects.

The greateſt part of the animal-plants which he has ſeen, grow, he tells us, on the chryſalis of a ſpecies of cicada. The plant growing on theſe inſects has got the generic name of *clavaria*, becauſe its ſtalks and branches, when it has any, are terminated by tubercles, which give the appearance of little clubs. The root of this plant, in general, covers the body of the inſect, and ſometimes is even extended over its head. When theſe productions have for ſome time been preſerved in ſpirits, the plant and animal may be ſeparated from each other without hurting either. Small grooves, formed by the rings of the animal, may be obſerved running croſs the roots of the plant: but no veſtige can be found of the root's having any where penetrated the body of the inſect. Theſe plants produce fibres differing in length and number. The fibres are terminated by tubercles, which, before the plant arrives at maturity, are ſolid; but, after that period, they are found puncture, probably by worms which have ſuffered a metamorphoſis upon eſcaping from them.

According to Mr Fourgeroux, plants grow, not only on the chryſalis of the cicada, but upon the cicada itſelf. He ſaw one of this kind upon a cicada brought from Cayenne. The plant, in this caſe, differed from the clavaria already mentioned. It was a ſpecies of fucus, compoſed of long, white, ſilky fibres, covering the body of the inſect, and extending from ſeven to eight lines above and below its belly.

The author has found the clavaria growing upon worms. He has found it chiefly upon worms, which ſuffering a metamorphoſis, become afterwards a ſmall ſpecies of May-bug. This chryſalis, he obſerves, is very different from that of the cicada; and, even in its worm-ſtate, may eaſily be diſtinguiſhed from it.

After deſcribing theſe different ſpecies of animal-plants, the author next proceeds to offer his opinion upon this ſubject. He firſt conſiders what had been ſaid by Dr Watſon, in the Philoſophical Tranſactions, concerning the vegetating-fly of the Caribbee iſlands *. Dr Watſon's account of theſe flies is, that they bury themſelves about the month of May, and begin to be metamorphoſed in June; and that the little plant which grows upon them reſembles a branch of coral, is about three inches in height, and carries ſmall protuberances, where worms are generated, which are again converted into flies. The author imagines, that, in this account, Dr Watſon has been deceived by the worms, which he has already obſerved will eat into the clavaria, and undergo a change in the holes which they have there made. Mr Fourgeroux is rather inclined to adopt the opinion of Dr Hill, founded upon obſervations made at Martinico. There the cicadæ are very frequent; and, during their chryſalis ſtate, bury themſelves among dead leaves, to wait their metamorphoſis. Dr Hill imagines, that the ſeeds of the clavaria are then attached to them, and are afterwards developed, much in the ſame manner as the fungus ex pede equino

* See Vegetable Fly.

Insects || spiration.

equino grows upon the hoofs of dead horſes.

It may appear aſtoniſhing, that the clavaria ſhould attach itſelf ſo conſtantly to the nymphæ of the cicadæ in America, as it is not obſerved to do ſo in other countries. For this Mr Fourgeroux attempts to account, from viewing the clavaria as a paraſite peculiar to this ſpecies of inſect; from the great number of the nymphæ of cicadæ which abound in America; and from the circumſtances of the climate and ſoil, which may render this phenomenon very common there, although it be not obſerved in Europe.

Insects *blown from the Noſe.* Of this we are furniſhed with many accounts in the works of medical authors. The fact is confirmed by Dr Monro *, who has received at different times ſome of theſe inſects from different perſons. They were all of the ſcolopendra kind, though not exactly anſwering to any deſcription of Linnæus. One of theſe he received from Mr Hill ſurgeon in Dumfries. It was an inch and a half long; and lived ſome hours after it was diſcharged, creeping about ſlowly on a table. It was then put into ardent ſpirits, ſoon after which it died.

A. Med. m. ii. 312.

INSERTION, in anatomy, the cloſe conjunction of the veſſels, tendons, fibres, and membranes of the body with ſome other parts.

INSIPID, an appellation given to things without taſte.

INSOLATION, in chemiſtry, the ſuffering matters to ſtand and digeſt in the heat of the ſun, inſtead of that of a furnace.

INSOLVENT, a term applied to perſons unable to pay their debts.

Trial by INSPECTION, or Examination, is when, for the greater expedition of a cauſe, in ſome point or iſſue, being either the principal queſtion, or ariſing collaterally out of it, but being evidently the object of ſenſe, the judges of the court, upon the teſtimony of their own ſenſes, ſhall decide the point in diſpute. For, where the affirmative or negative of a queſtion is matter of ſuch obvious determination, it is not thought neceſſary to ſummon a jury to decide it; who are properly called in to inform the conſcience of the court of dubious facts: and therefore, when the fact, from its nature, muſt be evident to the court either from ocular demonſtration or other irrefragable proof, there the law departs from its uſual reſort, the verdict of 12 men, and relies on the judgment of the court alone. As in caſe of a ſuit to reverſe a fine for non-age of the cognizor, or to ſet aſide a ſtatute or recognizance entered into by an infant; here, and in other caſes of the like ſort, a writ ſhall iſſue to the ſheriff, commanding him that he conſtrain the ſaid party to appear, that it may be aſcertained by the view of his body by the king's juſtices, whether he be of full age or not: *Ut per aſpectum corporis ſui conſtare poterit juſticiariis noſtris, ſi prædictus an ſit plenæ ætatis necne.* If, however, the court has, upon inſpection, any doubt of the age of the party, (as may frequently be the caſe), it may proceed to take proofs of the fact; and particularly may examine the infant himſelf upon an oath of *voir dire, veritatem dicere;* that is, to make true anſwers to ſuch queſtions as the court ſhall demand of him: or the court may examine his mother, his godfather, or the like.

INSPIRATION, among divines, implies the conveying of certain extraordinary and ſupernatural notices or motions into the ſoul. Inſpiration || Inſtauration.

Some authors reduce the inſpiration of the ſacred writers to a particular care of providence, which prevented any thing they had ſaid from failing or coming to nought; maintaining, that they never were really inſpired, either with knowledge or expreſſion.

According to M. Simon, inſpiration is no more than a direction of the Holy Spirit, which never permitted the ſacred writers to be miſtaken.

It is a common opinion, that the inſpiration of the Holy Spirit regards only the matter, not the ſtyle or words; which ſeems to fall in with M. Simſon's doctrine of direction.

Among the heathens, the prieſts and prieſteſſes were ſaid to be divinely inſpired when they gave oracles.

The poets, too, laid claim to it; and to this end always invoked Apollo and the muſes at the beginning of any great work.

Inspiration, in phyſic, is underſtood of that action of the breaſt, by which the air is admitted within the lungs; in which ſenſe, inſpiration is a branch of reſpiration, and ſtands oppoſed to Expiration.

This admiſſion of the air depends immediately on its ſpring or elaſticity, at the time when the cavity of the breaſt is enlarged by the elevation of the thorax and abdomen, and particularly by the motion of the diaphragm downwards: ſo that the air does not enter the lungs, becauſe they are dilated; but thoſe dilate, becauſe the air enters within them. Nor is it the dilatation of the breaſt which draws in the air, as is commonly thought, tho' this is a condition abſolutely neceſſary to inſpiration; but an actual intruſion of the air into the lungs. See Respiration.

INSPISSATING, in pharmacy, an operation whereby a liquor is brought to a thicker conſiſtence, by evaporating the thicker parts.

INSPRUCK, a city of Germany, in the circle of Auſtria, and capital of the county of Tyrol, and formerly the reſidence of the archdukes of Auſtria. It is ſeated in a pleaſant valley, in E. long. 11. 27. N. Lat. 47. 3.

INSTALLATION, the act of giving viſible poſſeſſion of an order, rank, or office, by placing in the proper ſeat. See Installment.

INSTALLMENT, a ſettling or inſtating any perſon in a dignity. The word is derived from the Latin *in*, and *ſtallum*, a term uſed for a ſeat in church, in the choir, or a ſeat or bench in a court of juſtice, &c. Though Voſſius is of opinion the word is of German origin.

Installment is chiefly uſed for the induction of a dean, prebendary, or other eccleſiaſtical dignitary, into the poſſeſſion of his ſtall, or proper ſeat, in the cathedral church to which he belongs. This is ſometimes alſo called *inſtallation.*

Installment is likewiſe uſed for the ceremony, whereby the knights of the garter are placed in their rank, in the chapel of St George at Windſor.

INSTANT, a part of duration in which we perceive no ſucceſſion; or it is that which takes up the time only of one idea in our minds.

INSTAURATION, the re-eſtabliſhment or reſtauration of a religion, a church, or the like, to its

Inſtep ‖ Inſurance.

former ſtate. The word is by ſome derived from the old Latin *inſtaurum*, which ſignified the "ſtock" of things neceſſary for the tilling and managing of grounds; as cattle, tools, harneſs, &c. But the word *inſtaurum* is only of the middle age: *inſtauratio* is of much greater antiquity, and by ſome derived from *inſtar*, "like;" as importing a thing's being brought to its former likeneſs or appearance. See RESTAURATION.

INSTEP, in the manege, is that part of a horſe's hind leg which reaches from the ham to the paſtern-joint.

INSTINCT, a natural diſpoſition or ſagacity wherewith animals are endued; by virtue whereof they are enabled to provide for themſelves, know what is good for them, and determined to preſerve and propagate their ſpecies.

INSTINCT bears ſome analogy to reaſon, and ſupplies the defect of it in brutes. See BRUTE.

INSTITUTES, in literary hiſtory, a book containing the elements of the Roman law.

The inſtitutes are divided into four books; and contain an abridgement of the whole body of the civil law, being deſigned for the uſe of ſtudents. See LAW, n° 6,—11. and 43, 44.

INSTITUTE, in Scots law. When by diſpoſition or deed of entail a number of perſons are called to the ſucceſſion of an eſtate one after another, the perſon firſt named is called the *inſtitute*, the others *ſubſtitutes*.

INSTITUTION, in general, ſignifies the eſtabliſhing or founding ſomething.—In the canon and common law, it ſignifies the inveſting a clerk with the ſpiritualities of a rectory, &c. which is done by the biſhop, who uſes the following formula: "I inſtitute you rector of ſuch a church with the cure of ſouls, and receive your care and mine."

INSTITUTIONS, in literary matters, denote a ſyſtem of the elements or rules of any art or ſcience.

Thus phyſical, or medicinal inſtitutions, are ſuch as teach the neceſſary præcognita to the practice of medicine, or the cure of diſeaſes.

INSTRUMENT, in general, whatever is ſubſervient to a cauſe in producing any effect.

Notorial INSTRUMENT, in Scots law, any fact certified in writing, under the hand of a notary-public.

INSULAR, any thing belonging to an iſland.—Inſular ſituations are productive of many happy conſequences to the inhabitants, both with reſpect to the climate, ſecurity, and convenience for commerce; for a particular account of which, ſee ISLAND and COAST.

INSULATED, in architecture, an appellation given to ſuch columns as ſtand alone, or free from any contiguous wall, like an iſland in the ſea; whence the name.

INSULATED, in electrical experiments. When any body is prevented from communicating with the earth by the interpoſition of an electric body, it is ſaid to be *inſulated*. See ELECTRICITY, n° 20.

INSURANCE, in law and commerce, a contract, whereby one party engages to pay the loſſes which the other may ſuſtain, for a ſtipulated premium or conſideration. The moſt common ſorts are, Inſurance againſt the dangers of the ſeas, inſurance againſt fire, inſurance of debts, and inſurance of lives.

I. INSURANCE *againſt Loſs at Sea*, is a moſt beneficial inſtitution, for promoting the ſecurity of trade, and preventing the ruin of individuals; and is now conducted by a regular ſyſtem of rules, eſtabliſhed by the interpoſition of the legiſlature, the deciſion of the courts of juſtice, and the practice of merchants. Inſurance

It is carried on to the beſt advantage by public companies, or by a conſiderable number of private perſons, each of whom only engages for a ſmall ſum, on the ſame veſſel. There are two public companies eſtabliſhed by authority of parliament, viz. the London and Royal Exchange Inſurance-Companies. For procuring ſubſcription by private perſons, brokers are generally employed, who extend the policy or contract of inſurance, procure ſubſcriptions, and aſſiſt at ſettling loſſes. They are entitled to an allowance for their trouble, generally 5 per cent. on premiums, and 2 per cent. on loſſes.

The parties who engage to pay the damage are called the *inſurers* or *under-writers*; the parties for whoſe ſecurity they engage are called the *inſured*. The premium is underſtood to be paid when the inſurance is made; but, if it be not paid, the inſurers have a preferable right on the ſubject inſured.

On this ſubject, we ſhall conſider, What is neceſſary to render an inſurance valid:——When the riſk commences, and when it terminates:—What conſtitutes a total or a partial loſs:—What proof of loſs is neceſſary:—and, How the loſs is adjuſted.

Firſt, In order to render an inſurance valid, the inſured muſt have property really at ſtake; the voyage muſt take place under the circumſtances agreed on; the dangers inſured againſt muſt not be contrary to law; and a candid account muſt be given of circumſtances which enhance the danger.

1. The condition of poſſeſſing property was required by 19 Geo. II. c. 37. to prevent ſhips from being fraudulently deſtroyed when inſured above their value; and to diſcourage a practice which had become common, of converting policies to the purpoſe of mere wagers. In tranſactions of this kind, as the inſured had no property, and could claim no indemnification for partial damage; ſo the inſurers, having loſt their wager by the ſhip's being loſt, could claim no abatement, though part was ſaved: accordingly, the policies contained clauſes of intereſt or no intereſt, free from average, and without benefit of ſalvage. All ſuch policies are declared invalid.

This reſtriction does not extend to privateers, nor to ſhips trading to the Spaniſh or Portugueſe plantations.

Inſurances are commonly made as intereſt ſhall appear; and it is incumbent on the inſured to prove the value of his property. The value of the goods may be proved by the invoices; and the cocquet muſt be produced, if required, to inſtruct that the goods were actually ſhipped. It is admitted to value the ſhip at prime coſt and charges, deducting the freights that have been drawn ſince purchaſed, if the proprietors chooſe to ſtand to that rule; but they are not reſtricted to it. Sometimes the value of the ſhip or goods is expreſſed in the policy; and this value muſt be admitted, although it be higher than the true one: but it is incumbent on the inſured to prove that he had property

Insurance. property at ſtake; and, if the property be trifling in compariſon of the ſum inſured, the inſurance will be ſet aſide, as an evaſion of the ſtatute.

Expected profits, and bounty on the whale-fiſhery, if ſpecified in the policy, may be inſured.

When the value is leſs than the ſum inſured, the owners may claim a return of premium for the exceſs.

If there be ſeveral policies on the ſame ſubject, of different dates, the earlier one is valid, and the others muſt be vacated. If they be of the ſame date, they muſt be vacated in equal proportions.

When a policy is vacated, in whole, or in part, the under-writers have a right to retain ½ per cent. for their trouble.

In the caſe of a cargo intended for A, but afterwards ſent to B, both expected it, and inſured, and B claimed for the value on its being loſt. The underwriters anſwered, that it was a double inſurance, and they ought only to pay their proportion. Judgment was given, finding them liable for the whole, and reſerving to them any demand competent againſt the underwriters who inſured for A.

Fraudulently to caſt away or deſtroy a ſhip inſured above its value, is felony.

2. If the ſhip does not proceed on the voyage, or if, being warranted to depart with convoy, it departs without convoy, the inſurance muſt be vacated.

If the extent of a trading voyage be uncertain, the longeſt one in contemplation is deſcribed in the policy, and it is agreed that part of the premium ſhall be returned if the voyage be ſhortened. In like manner, in time of war, when inſurance is made without condition of convoy, it is agreed that part of the premium be returned in caſe it fail with convoy.

When a ſhip is warranted to depart with convoy, it is underſtood from the uſual place of convoy, (*e. g.* the Downs,) and it is inſured till it arrive there.

The common proof of failing with convoy is the production of failing orders; but, if a ſhip be prevented by the weather from receiving the failing orders, other proof may be admitted.

A ſhip was inſured from the Thames to Halifax, warranted to fail from Portſmouth with convoy. The convoy had failed before the ſhip arrived there, and the underwriters declined to inſure it, without convoy, for the reſt of the voyage. They were found liable to return part of the premium, retaining only in proportion to the accuſtomed rate from London to Portſmouth. This deciſion ſeems to eſtabliſh the following principle, that, when the voyage performed is only part of that deſcribed in the policy, and when the riſk can be proportioned, the underwriters are bound to return part of the premium, though there be no agreement for that purpoſe.

But, if a ſhip, inſured only againſt the hazards of the ſea, be taken by the enemy, the inſured have no right to claim a return of premium, though the capture happen ſoon, under pretence that little ſea-hazard was incurred.

If a ſhip deviates from the voyage deſcribed in the policy without neceſſity, it ſets aſide the inſurance. An intention to deviate is not ſufficient to ſet it aſide; there muſt be an actual deviation; and, even in that caſe, the inſurers are liable for damages ſuſtained before deviation.

It is no deviation to go out of the way to the accuſtomed place of convoy, nor to the neareſt place where neceſſary repairs may be had. Deviation, for the purpoſe of ſmuggling, if without the knowledge of the owners, does not ſet aſide the inſurance, nor when the maſter is forced by the crew to return. Insurance.

In inſurances to the Eaſt-Indies, and home, the inſurers are underſtood to take the riſk of detention in the country, and of country voyages.

3. Inſurance of prohibited goods, againſt the riſk of ſeizure by the government, is unlawful, and invalid. The inſurers, inſured, brokers, and all acceſſories, are liable to the fine of 500l.

4. If the inſured have any information of more than common danger, they muſt reveal every ſuch circumſtance to the inſurers, otherwiſe the policy is ſet aſide.

This rule is eſtabliſhed for the preſervation of good faith; and there are ſeveral ſtrong deciſions in ſupport of it. If a ſhip be ſpoke to leaky at ſea, or if there be a report of its being loſt, theſe circumſtances muſt be communicated to the inſurers. Even the concealment of a falſe report of loſs vitiates the inſurance; and, if the ſhip be afterwards loſt, though in a different manner, the inſured will recover nothing. In a voyage from Carolina to London, another ſhip had failed 10 days after that which was inſured, and arrived ſeven days before the inſurance was made; and the concealment of this circumſtance, though the fact was not proved to the ſatisfaction of the jury, was conſidered as ſufficient to ſet it aſide. Alſo, ſince the commencement of the American war, a ſhip being inſured from Portugal, by the month, without condefcending on the voyage, failed for North-America, and was taken by a provincial privateer. The inſurers refuſed to pay, becauſe the hazardous deſtination was concealed; and it was only upon proof of the inſured being equally ignorant of it, that they were found liable.

But the inſured are not obliged to take notice of general perils, which the inſurers are underſtood to have in contemplation; dangerous navigation, Weſt-Indian hurricanes, enterprizes of the enemy, and the like.

Inſurance is not ſet aſide by a miſtake in the name of the ſhip or maſter, or the like.

Inſurance may be made on an uncertain ſhip; on any ſhip that the goods may be loaded on; on any ſhip that A ſhall fail in from Virginia. In this laſt caſe, the policy is not transferred to a ſhip which A goes on board during the voyage.

Secondly, If a ſhip be inſured at and from a port, the inſurance commences immediately if the ſhip be there, or at its arrival there. If it be damaged when preparing for a voyage, the inſurers are liable; but not if the voyage be laid aſide for ſeveral years, with conſent of the owners. Inſurance from a port commences when the ſhip breaks ground; and, if it ſet fail, and be driven back and loſt in the port, the inſurers are liable.

Inſurance on goods generally continues till they be landed; but, if they be ſold after the ſhip's arrival, and freight contracted to another port, the inſurance is concluded. Goods ſent on board another ſhip or

Insurance. lighter are not at the risk of the insurer; but goods sent ashore in the long-boat are.

Insurance on freight commences when the goods are put on board.

Goods from the East-Indies, insured to Gibraltar, and to be re-shipped from thence to Britain, were put on board a store-ship at Gibraltar, to wait an opportunity of re-shipping, and were lost: The custom of putting goods aboard a store-ship being proved, the insurers were found liable.

Loss of sails ashore, when the ship is repairing, is comprehended within the insurance. What is necessarily understood, is insured, as well as what is expressed; the essential means, and intermediate steps, as well as the end. Ships performing quarantine are at the risk of the insurer.

Thirdly, The insurers are liable for a total loss when the subject perishes through any of the perils insured against. Baratry, though it properly signifies running away with the ship, extends to any kind of fraud in the master or mariners. Insurance against detention of princes does not extend to ships that are seized for transgressing the laws of foreign countries.

The insurers are also liable for a total loss, when damage is sustained, and the remaining property abandoned or vested in the insurers.

If a ship be stranded, or taken, and kept by the enemy, or detained by any foreign power, or seized for the service of the government, the proprietors have a right to abandon.

But, if a ship be taken by the enemy, and be retaken, or makes its escape, before action against the insurers; have the insured a right to abandon, or must they only claim for the damages sustained as an average loss? There are opposite decisions, according as the circumstances of the case were strong. When the ship was long detained, the goods perishable, the voyage intirely lost, or so disturbed, that the pursuit of it was not worth the freight, or when the damage exceeds half the value of the thing, they have been found intitled to abandon; (Goss against Withers, 2 Burrow, 683.). But, if the voyage be completed with little trouble or delay, they are not intitled; (Hamilton against Mendez, 2 Burrow, 1198.).

The insured cannot claim, as for a total loss, on an offer to abandon, when the loss is, in its nature, only partial; for, if this were permitted, they might devolve the loss occasioned by bad markets on the insurers.

And, in all cases, the insured have their option to abandon, or not. They may retain their property if they please, and claim for an average loss; and they must make their option before they claim.

If the goods be so much damaged, that their value is less than the freight, the insurers are accountable as for a total loss.

The insurers are liable for general average, when the property is charged with contribution; and for particular average, when the property is damaged, or part of it destroyed.

If the damage be sustained through the fault of the ship, the owners of the goods may have recourse, either against the master or insurers; and, if the insurers be charged, they stand in the place of the owners, and have recourse against the master.

In order to prevent the insurers from being troubled with frivolous demands for average, it is generally stipulated, that none shall be charged under 5 *per cent.* or some other determined rate; and corn, flax, fruit, fish, and like perishable goods, are warranted free from average, unless general, or the ship be stranded. Insurance.

In order to encourage every effort to save the ship, the insurers are liable for charges laid out with that design, although the subject perish. Thus, they may be charged with more than the sum insured.

In case of goods being damaged, the proportion of the sum insured, for which the underwriters are liable, is regulated by the proportion of the prices which the sound and damaged goods fetch at the port of destination. The prime cost of the goods is not considered, nor the necessity of immediate sale, in consequence of damage. Although the damaged goods sell above prime cost, the insurers are liable.

Fourthly, If a ship be lost, and the crew saved, the loss is proved by the evidence of the crew.

If damage be sustained, the extent is proved by an examination of the subject damaged, at the ship's arrival; and the cause by the evidence of the crew.

If the ship be stranded, evidence must be taken at the place where stranded.

Documents of loss must be laid before the underwriters, with all convenient speed; and, if these be sufficiently clear, the loss should be immediately settled. The underwriters generally grant their notes at a month or six weeks date for their proportions.

If a ship be not heard of for a certain time, it is presumed lost; and the underwriters are liable to pay the sums insured, the property being abandoned to them in the event of the ship's return. Six months are allowed for a voyage to any part of Europe, a year to America, and two years to the East Indies.

By the ordinance of Hamburgh, if a ship be three months beyond the usual time of performing a voyage, the underwriters may be desired to pay 92 *per cent.* on an abandon. If they decline it, they are allowed 14 months more, and then they must pay the full value.

A ship insured against the hazards of the sea, but not against the enemy, if never heard of, is presumed lost at sea.

Fifthly, In order that the manner of settling losses may be understood, we must explain what is meant by covering property. We mentioned already, that insurances for greater sums than the insured had really at stake, were contrary to law: but some latitude is allowed in that respect; for if the owner were to insure no more than the exact value of his property, he would lose the premium of insurance, and the abatement, if any was agreed on.

For example, if he has goods on board to the value of 100 l. and insures the same at 5 *per cent.* to abate 2 *per cent.* in case of loss; then, if a total loss happen, he recovers 98 l. from the insurers, of which 5 l. being applied to re-place the premium, the nett sum saved is only 93 l.: but, if the value on board be only 93 l. and the sum insured 100 l. he would be fully indemnified for the loss; and his property, in that case, is said to be covered.

To find how much should be insured to cover any sum, subtract the amount of the premium and abatement

ment (if any), from 100 l. As the remainder is to 100 l. fo is the value, to the fum which covers it.

In cafe of a total lofs, if the fum infured be not greater than that which covers the property, the infurers muft pay it all. If greater, they pay what covers the property, and return the premium on the overplus.

Partial loffes are regulated by this principle, that whereas the owner is not fully indemnified, in cafe of a total lofs, unlefs he covers his property, therefore he fhould only be indemnified for a partial lofs in the fame proportion; and, if it be not fully infured, he is conſidered as infurer himſelf, for the part not covered, and muft bear a ſuitable proportion of the lofs. Therefore the value of the property is proved, and the fum required to cover it computed. If that fum be all infured, the underwriters pay the whole damage; if only part be infured, they pay their fhare, which is computed by the following rule: As the fum which covers the property is to the fum infured, fo is the whole damage to the part for which the infurers are liable.—For example, if the value of the property be 360 l. the fum infured 300 l. the premium 8 *per cent.* and abatement 2 *per cent.*; then the fum which fhould be infured to cover the property is 400 l.; and, if damage be ſuſtained to the extent of 200 l. the owners will recover 150 l.

If a voyage is infured out and home, the premium outward muſt be conſidered as part of the value on the homeward property, and the fum neceſſary to cover it computed accordingly. For example, to infure 100 l. out and home, at 5 *per cent.* each voyage, abatement 2 *per cent.* we compute thus:

93 : 100 :: L. 100 : L. 107 : 10 : 6, to be infured outward, premium on L. 107 : 10 : 6 outwards, at 5 *per cent.* L. 5 : 7 : 6; 93 : 100 :: L. 105 : 7 : 6 : L. 113 : 6 s. to be infured home; the premium on which is L. 5 : 13 : 6; and, if the ſhip be loſt on the homeward voyage,

From the fum infured home	L. 113 6 0	
Subtract the diſcount, 2 *per cent.*	- 2 5 3	
Sum for which the infurers are liable		L. 111 — —
Infurance out	L. 5 7 6	
Infurance home -	5 13 3	
	11 — 9	
Covered property		L. 100 — —

II. Insurance *againſt Fire.* There are ſeveral offices in Britain for this purpoſe, of which the fun fire-office is the moſt conſiderable. Infurances are divided into common, hazardous, and doubly hazardous, according to the nature of the ſubject infured. When the fum infured is high, there is a higher premium *per cent.* demanded; and money, papers, jewels, pictures, and gun-powder, are not comprehended. If a ſubject be wrong deſcribed, in order that it may be infured at a lower premium, the policy is void. The benefit of a policy is transferred, by indorſement, to the repreſentatives of the perſon in whoſe favour it was made; and it may be transferred to other houſes when the infured changes his habitation. If infurance be made on the ſame ſubject in different offices, it muſt be ſpecified, by indorſement, on the policy; and, in caſe of loſs, the offices pay proportionally. The infurers pay all expences in attempting to extinguiſh fire, or ſave goods, though not ſucceſsful. If the value of a ſubject be infured in part, and damage be ſuſtained, the infurers pay the whole, if it does not exceed the ſum infured.

III. Insurance *of Debts.* See Bottomry.

IV. In virtue of Insurances *for Lives*, when the perſon dies, a ſum of money becomes payable to the perſon on whoſe behalf the policy of infurance was granted. The principal infurance office of this kind, is that of the amicable ſociety for a perpetual aſſurance, kept in Serjeant's inn, Fleet-ſtreet, London.

In this office, after paying the charges of the policy, and 10 s. entrance-money, each perſon pays 5 l. *per annum*, by quarterly payments; and from theſe payments, the dividends, which uſually amount 100 l. and upwards, are to ariſe. All perſons admitted are to be between the ages of 12 and 45, and in a good ſtate of health. Any perſon is allowed to have two or three infurances or numbers on the ſame life, whereby ſuch perſon will be intitled to a claim on each number ſo infured; and every claimant is empowered to put in a new life in the room of one deceaſed, within 12 kalendar months next after the end of the current year. By becoming members of this ſociety, clergymen, phyſicians, lawyers, tradeſmen, and all whoſe income ceaſes at the time of their death, may, in all probability, leave to their families a claim of not leſs than 100 l. for every 5 l. annually paid in.—The value of infurances upon lives, depends upon the probability of the continuance of any propoſed life or lives, during any propoſed term. Any queſtions of this kind may be determined from Dr Halley's table, and from the principles of the doctrine of chances. But, as far as we can learn of the practice on ſuch occaſions, the premiums paid to infurers are generally higher than any computation founded on obſervations concerning the probabilities of human life will warrant, Thus it is not unuſual to make a perſon pay 5 *per cent.* for the infurance of his life for a twelvemonth; that is, in caſe the perſon dies within the year, the infurer is to pay 100 l. for every 5 l. received. Now it appears from Dr Halley's table, which eſtimates the probability of life low enough, that 5 *per cent.* is an adequate value only for a life of an advanced age, ſuch as 64.

*Re-*Insurance is a ſecond contract, made by an infurer, to transfer the riſk he has engaged for to another. It is in general forbidden by 19 Geo. II. c. 37. but is permitted to the repreſentatives of an infurer, in caſe of his death, or to his aſſignees, in caſe of his bankruptcy; and it muſt be mentioned in the policy that it is a re-infurance.

INTAGLIOS, precious ſtones on which are engraved the heads of great men, inſcriptions, and the like; ſuch as we frequently ſee ſet in rings, ſeals, &c.

INTEGER, in arithmetic, a whole number, in contradiſtinction to a fraction.

INTEGRAL, or integrant, in philoſophy, appellations given to parts of bodies which are of a ſimilar nature with the whole: thus filings of iron have the ſame nature and properties as bars of iron.

Bodies may be reduced into their integrant parts by triture or grinding, limation or filing, ſolution, amalgation, &c. See Grinding, &c.

Integuments || Interdict.

INTEGUMENTS, in anatomy, denote the common coverings which inveſt the body; as the cuticula, cutis, &c. See ANATOMY.

INTEGUMENT, is alſo extended to the particular membranes which inveſt certain parts of the body; as the coats or tunics of the eye.

INTENDANT, one who has the conduct, inſpection, and management of any thing. See SUPERINTENDANT.

This is a title frequent among the French: they have *intendants of the marine*, who are officers in the ſea-ports, whoſe buſineſs it is to take care the ordinances and regulations relating to ſea-affairs be obſerved: *intendants of the finances*, who have the direction of the revenues: *intendants of provinces*, who are appointed by the king to take care of the adminiſtration of juſtice, policy, and finances in the provinces: alſo *intendants of buildings*, *of houſes*, &c.

INTENDMENT, in law, is the intention, deſign, or true meaning, of a perſon or thing, which frequently ſupplies what is not fully expreſſed: but tho' the intent of parties in deeds and contracts is much regarded by the law, yet it cannot take place againſt the rules of law.

INTENDMENT *of Crimes*; this, in caſe of treaſon, where the intention is proved by circumſtances, is puniſhable in the ſame manner as if it was put in execution. So, if a perſon enter a houſe in the night-time, with an intent to commit burglary, it is felony; alſo, an aſſault, with an intent to commit a robbery on the highway, is made felony, and puniſhed with tranſportation, 7 Geo. II. c. 21.

INTENT, in the civil law, ſignifies to begin, or commence, an action or proceſs.

INTENTION, in medicine, that judgment, or method of cure, which a phyſician forms to himſelf from a due examination of ſymptoms.

INTENTION, in phyſics, the increaſe of the power, or energy of any quality, as heat, cold, &c. By which it ſtands oppoſed to *remiſſion*, which ſignifies its decreaſe or diminution.

INTENTION, in metaphyſics, denotes an exertion of the intellectual faculties with more than ordinary vigour; when the mind with earneſtneſs fixes its view on any idea, conſiders it on all ſides, and will not be called off by any ſolicitation.

INTERCALARY, an appellation given to the odd day inſerted in leap-year; which was ſo called from *calo*, *calare*, "to proclaim," it being proclaimed by the prieſts with a loud voice.

INTERCOLUMNIATION, in architecture, denotes the ſpace between two columns, which is always to be proportioned to the height and bulk of the columns.

INTERCOSTAL, in anatomy, an appellation given to ſuch muſcles, nerves, arteries, and veins, as lie between the ribs.

INTERDICT, an eccleſiaſtical cenſure, by which the church of Rome forbids the performance of divine ſervice in a kingdom, province, town, &c. This cenſure has been frequently executed in France, Italy, and Germany; and in the year 1170, pope Alexander III. put all England under an interdict, forbidding the clergy to perform any part of divine ſervice, except baptizing of infants, taking confeſſions, and giving abſolution to dying penitents. But this cenſure being liable to the ill conſequences of promoting libertiniſm and a neglect of religion, the ſucceeding popes have very ſeldom made uſe of it. Intereſt.

There was alſo an interdict of perſons, who were deprived of the benefit of attending on divine ſervice. Particular perſons were alſo anciently interdicted of fire and water, which ſignified a baniſhment for ſome particular offence: by their cenſure no perſon was allowed to receive them, or allow them fire or water; and being thus wholly deprived of the two neceſſary elements of life, they were doubtleſs under a kind of civil death.

INTEREST, is the premium or money paid for the loan or uſe of other money. See ARITHMETIC, n° 20.

Many good and learned men have in former times very much perplexed themſelves and other people by raiſing doubts about the legality of intereſt in *foro conſcientiæ*. It may not be amiſs here to inquire upon what grounds this matter does really ſtand.

The enemies to intereſt in general make no diſtinction between that and uſury, holding any increaſe of money to be indefenſibly uſurious. And this they ground as well on the prohibition of it by the law of Moſes among the Jews, as alſo upon what is laid down by Ariſtotle, That money is naturally barren; and to make it breed money is prepoſterous, and a perverſion of the end of its inſtitution, which was only to ſerve the purpoſes of exchange, and not of increaſe. Hence the ſchool-divines have branded the practice of taking intereſt, as being contrary to the divine law both natural and revealed; and the canon law has preſcribed the taking any the leaſt increaſe for the loan of money as a mortal ſin.

But, in anſwer to this, it may be obſerved, that the Moſaical precept was clearly a political, and not a moral, precept. It only prohibited the Jews from taking uſury from their brethren the Jews; but in expreſs words permitted them to take it of a ſtranger: which proves that the taking of moderate uſury, or a reward for the uſe, for ſo the word ſignifies, is not *malum in ſe*, ſince it was allowed where any but an Iſraelite was concerned. And as to Ariſtotle's reaſon, deduced from the natural barrenneſs of money, the ſame may with equal force be alleged of houſes, which never breed houſes; and twenty other things, which nobody doubts it is lawful to make profit of, by letting them to hire. And though money was originally uſed only for the purpoſes of exchange, yet the laws of any ſtate may be well juſtified in permitting it to be turned to the purpoſes of profit, if the convenience of ſociety (the great end for which money was invented) ſhall require it. And that the allowance of moderate intereſt tends greatly to the benefit of the public, eſpecially in a trading country, will appear from that generally acknowledged principle, that commerce cannot ſubſiſt without mutual and extenſive credit. Unleſs money therefore can be borrowed, trade cannot be carried on: and if no premium were allowed for the hire of money, few perſons would care to lend it; or at leaſt the eaſe of borrowing at a ſhort warning (which is the life of commerce) would be entirely at an end. Thus, in the dark ages of monkiſh ſuperſtition and civil tyranny, when intereſt was laid under a total interdict,

Intereſt. terdict, commerce was alſo at its loweſt ebb, and fell entirely into the hands of the Jews and Lombards: but when mens minds began to be more enlarged, when true religion and real liberty revived, commerce grew again into credit; and again introduced with itſelf its inſeparable companion, the doctrine of loans upon intereſt.

And, really, conſidered abſtractedly from this its uſe, ſince all other conveniences of life may be either bought or hired, but money can only be hired, there ſeems no greater impropriety in taking a recompenſe or price for the hire of this, than of any other convenience. If one borrow 100l. to employ in a beneficial trade, it is but equitable that the lender ſhould have a proportion of the gains. To demand an exorbitant price is equally contrary to conſcience, for the loan of a horſe, or the loan of a ſum of money: but a reaſonable equivalent for the temporary inconvenience which the owner may feel by the want of it, and for the hazard of his loſing it entirely, is not more immoral in one caſe than it is in the other. And indeed the abſolute prohibition of lending upon any, even moderate intereſt, introduces the very inconvenience which it ſeems meant to remedy. The neceſſity of individuals will make borrowing unavoidable. Without ſome profit by law, there will be but few lenders: and thoſe principally bad men, who will break thro' the law, and take a profit; and then will endeavour to indemnify themſelves from the danger of the penalty, by making that profit exorbitant. Thus, while all degrees of profit were diſcountenanced, we find more complaints of uſury, and more flagrant inſtances of oppreſſion than in modern times when money may be eaſily had at a low intereſt. A capital diſtinction muſt therefore be made between a moderate and exorbitant profit; to the former of which we uſually give the name of *intereſt*, to the latter the truly odious appellation of *uſury*: the former is neceſſary in every civil ſtate; if it were but to exclude the latter, which ought never to be tolerated in any well-regulated ſociety. For, as the whole of this matter is well ſummed up by Grotius, "if the compenſation allowed by law does not exceed the proportion of the hazard run, or the want felt, by the loan, its allowance is neither repugnant to the revealed nor to the natural law: but if it exceeds thoſe bounds, it is then oppreſſive uſury; and tho' the municipal laws may give it impunity, they never can make it juſt."

We ſee, that the exorbitance or moderation of intereſt, for the money lent, depends upon two circumſtances; the inconvenience of parting with it for the preſent, and the hazard of loſing it entirely. The inconvenience to individual lenders can never be eſtimated by laws; the rate therefore of general intereſt muſt depend upon the uſual or general inconvenience. This reſults entirely from the quantity of ſpecie or current money in the kingdom: for, the more ſpecie there is circulating in any nation, the greater ſuperfluity there will be, beyond what is neceſſary to carry on the buſineſs of exchange and the common concerns of life. In every nation, or public community, there is a certain quantity of money thus neceſſary; which a perſon well ſkilled in political arithmetic might perhaps calculate as exactly, as a private banker can the demand for running caſh in his own ſhop: all above this neceſſary quantity may be ſpared, or lent, without much inconvenience to the reſpective lenders; and the greater this national ſuperfluity is, the more numerous will be the lenders, and the lower ought the rate of the national intereſt to be: but where there is not enough, or barely enough, circulating caſh, to anſwer the ordinary uſes of the public, intereſt will be proportionably high; for lenders will be but few, as few can ſubmit to the inconvenience of lending. Intereſt.

So alſo the hazard of an entire loſs has its weight in the regulation of intereſt: hence, the better the ſecurity, the lower will the intereſt be; the rate of intereſt being generally in a compound *ratio*, formed out of the inconvenience, and the hazard. And as, if there were no inconvenience, there ſhould be no intereſt but what is equivalent to the hazard; ſo, if there were no hazard, there ought to be no intereſt, ſave only what ariſes from the mere inconvenience of lending. Thus, if the quantity of ſpecie in a nation be ſuch, that the general inconvenience of lending for a year is computed to amount to three *per cent.* a man that has money by him will perhaps lend it upon good perſonal ſecurity at five *per cent.* allowing two for the hazard run; he will lend it upon landed ſecurity, or mortgage, at four *per cent.* the hazard being proportionably leſs; but he will lend it to the ſtate, on the maintenance of which all his property depends, at three *per cent.* the hazard being none at all.

But ſometimes the hazard may be greater, than the rate of intereſt allowed by law will compenſate. And this gives riſe to the practice, 1. Of bottomry, or *reſpondentia*. 2. Of policies of inſurance. See Bottomry, and Insurance.

Upon the two principles of inconvenience and hazard, compared together, different nations have at different times eſtabliſhed different rates of intereſt. The Romans at one time allowed *centeſimæ, one per cent.* monthly, or *twelve per cent. per annum*, to be taken for common loans; but Juſtinian reduced it to *trientes*, or one third of the *as* or *centeſimæ*, that is, *four per cent.*; but allowed higher intereſt to be taken of merchants, becauſe there the hazard was greater. So too Grotius informs us, that in Holland the rate of intereſt was then eight *per cent.* in common loans, but twelve to merchants. Our law eſtabliſhes one ſtandard for all alike, where the pledge or ſecurity itſelf is not put in jeopardy; leſt, under the general pretence of vague and indeterminate hazards, a door ſhould be opened to fraud and uſury: leaving ſpecific hazards to be provided againſt by ſpecific inſurances, or by loans upon *reſpondentia*, or bottomry. But as to the rate of legal intereſt, it has varied and decreaſed for 200 years paſt, according as the quantity of ſpecie in the kingdom has increaſed by acceſſions of trade, the introduction of paper-credit, and other circumſtances. The ſtatute 37 Hen. VIII. c. 9. confined intereſt to ten *per cent.* and ſo did the ſtatute 13 Eliz. c. 8. But as, through the encouragements given in her reign to commerce, the nation grew more wealthy; ſo, under her ſucceſſor, the ſtatute 21 Jac. 1. c. 17. reduced it to eight *per cent.*; as did the ſtatute 12 Car. II. c. 13. to ſix: and laſtly, by the ſtatute 12 Ann. ſt. 2. c. 16. it was brought down to five *per cent.* yearly, which is now the extremity of legal intereſt that can be taken. But yet, if a contract which carries intereſt be made in a foreign

Interjection || Interpreter.

foreign country, our courts will direct the payment of intereſt according to the law of that country in which the contract was made. Thus Iriſh, American, Turkiſh, and Indian intereſt, have been allowed in our courts to the amount of even 12 *per cent.* For the moderation or exorbitance of intereſt depends upon local circumſtances; and the refuſal to enforce ſuch contracts would put a ſtop to all foreign trade. And, by ſtat. 14 Geo. III. c. 79. all mortgages and other ſecurities upon eſtates or other property in Ireland or the plantations, bearing intereſt not exceeding ſix *per cent.* ſhall be legal; though executed in the kingdom of Great Britain: unleſs the money lent ſhall be known at the time to exceed the value of the thing in pledge; in which caſe alſo, to prevent uſurious contracts at home under colour of ſuch foreign ſecurities, the borrower ſhall forfeit treble the ſum ſo borrowed.

INTERJECTION, in grammar, an indeclinable part of ſpeech, ſignifying ſome paſſion or emotion of the mind. See GRAMMAR.

INTERIM, a name given to a formulary, or kind of confeſſion of the articles of faith, obtruded upon the Proteſtants after Luther's death by the emperor Charles V. when he had defeated their forces; ſo called becauſe it was only to take place in the *interim* (mean time) till a general council ſhould have decided all points in diſpute between the Proteſtants and Romaniſts. It retained moſt of the doctrines and ceremonies of the Romaniſts, excepting that of marriage, which was allowed to the clergy, and communion to the laity under both kinds. Moſt of the Proteſtants rejected it. There were two other interims; one of Leipſic, the other of Franconia.

INTERLOCUTOR, in Scots law. The ſentence or judgment of a court of law, is commonly called an *interlocutor* before decree is extracted.

INTERLOPERS, are properly thoſe who, without due authority, hinder the trade of a company or corporation lawfully eſtabliſhed, by dealing in the ſame way.

INTERLUDE, an entertainment exhibited on the theatre between the acts of a play, to amuſe the ſpectators while the actors take breath and ſhift their dreſs, or to give time for changing the ſcenes and decorations.

INTERMITTENT, or INTERMITTING, *Fevers*, ſuch fevers as go off and ſoon return again, in oppoſition to thoſe which are continual. See (the *Index* ſubjoined to) MEDICINE.

INTERPOLATION, among critics, denotes a ſpurious paſſage inſerted into the writings of ſome ancient author.

INTERPOSITION, the ſituation of a body between two others, ſo as to hide them, or prevent their action.

The eclipſe of the ſun is occaſioned by an interpoſition of the moon between the ſun and us; and that of the moon by the interpoſition of the earth between the ſun and moon. See ECLIPSE.

INTERPRETER, a perſon who explains the thoughts, words, or writings, of ſome other, which before were unintelligible.—The word *interpres*, according to Iſidore, is compoſed of the prepoſition *inter*, and *partes*, as ſignifying a perſon in the middle betwixt two parties, to make them mutually underſtand each others thoughts: others derive it from *inter*, and *præs*, i. e. *fidejuſſor*; q. d. a perſon who ſerves as ſecurity between two others who do not underſtand one another.

Interregnum || Interval.

There have been great debates about interpreting Scripture. The Romaniſts contend, that it belongs abſolutely to the church: adding, that where ſhe is ſilent, reaſon may be conſulted; but where ſhe ſpeaks, reaſon is to be diſregarded. The Proteſtants generally allow reaſon the ſovereign judge, or interpreter; though ſome among them have a ſtrong regard to ſynods, and others to the authority of the primitive fathers. Laſtly, others have recourſe to the Spirit within every perſon to interpret for them; which is what Bochart calls αυτοδιδακτα του πνευματος.

INTERREGNUM, the time during which the throne is vacant in elective kingdoms; for in ſuch as are hereditary, like ours, there is no ſuch thing as an interregnum.

INTERREX, the magiſtrate who governs during an interregnum.

This magiſtrate was eſtabliſhed in old Rome, and was almoſt as ancient as the city itſelf: after the death of Romulus there was an interregnum of a year, during which the ſenators were each interrex in their turn, five days a-piece.

After the eſtabliſhment of conſuls and a commonwealth, though there were no kings, yet the name and function of *interrex* was ſtill preſerved: for, when the magiſtrates were abſent, or there was any irregularity in their election, or they had abdicated, ſo that the comitia could not be held; provided they were unwilling to create a dictator, they made an interrex, whoſe office and authority was to laſt five days; after which they made another. To the interrex was delegated all the regal and conſular authority, and he performed all their functions. He aſſembled the ſenate, held comitia or courts, and took care that the election of magiſtrates was according to rules. Indeed at firſt it was not the cuſtom of the interrex to hold comitia, at leaſt we have no inſtance of it in the Roman hiſtory. The patricians alone had the right of electing an interrex; but this office fell with the republic, when the emperors made themſelves maſters of every thing.

INTERROGATION, or *Point of* INTERROGATION, in grammar, a character of this form (?) ſerving to denote a queſtion.

INTERVAL, the diſtance or ſpace between two extremes, either in time, or place. The word comes from the Latin *intervallum*, which, according to Iſidore, ſignifies the ſpace *inter foſſam & murum*, "between the ditch and the wall:" others note, that the ſtakes or piles, driven into the ground in the ancient Roman bulwarks, were called *valla*; and the interſtices or vacancy between them, *intervalla*.

INTERVAL, in muſic. The diſtance between any given ſound and another, ſtrictly ſpeaking, is neither meaſured by any common ſtandard of extenſion nor duration; but either by immediate ſenſation, or by computing the difference between the numbers of vibrations produced by two or more ſonorous bodies, in the act of ſounding, during the ſame given time. As the vibrations are ſlower and fewer during the ſame inſtant, for example, the ſound is proportionally lower or graver; on the contrary, as during the ſame period the vibrations

tions increaſe in number and velocity, the ſounds are proportionably higher or more acute. An interval in muſic, therefore, is properly the difference between the number of vibrations produced by one ſonorous body of a certain magnitude and texture and of thoſe produced by another of a different magnitude and texture in the ſame time.

Intervals are divided into conſonant and diſſonant. A conſonant interval is that whoſe extremes, or whoſe higheſt and loweſt ſounds, when ſimultaneouſly heard, coaleſce in the ear, and produce an agreeable ſenſation called by Lord Kaims a *tertium quid*. A diſſonant interval, on the contrary, is that whoſe extremes, ſimultaneouſly heard, far from coaleſcing in the ear, and producing one agreeable ſenſation, are each of them plainly diſtinguiſhed from the other, produce a grating effect upon the ſenſe, and repel each other with an irreconcileable hoſtility. In proportion as the vibrations of different ſonorous bodies, or of the ſame ſonorous body in different modes, more or leſs frequently coincide during the ſame given time, the chords are more or leſs perfect, and conſequently the intervals more or leſs conſonant. When theſe vibrations never coincide at all in the ſame given time, the diſcord is conſummate, and conſequently the interval abſolutely diſſonant.

Intervals are not only divided according to their natures, but alſo with reſpect to their degrees. In this view, they are either enharmonic, chromatic, or diatonic. Of theſe therefore in their order, from the leaſt to the greateſt.

An enharmonic interval is what they call the *eighth part of a tone*, or the difference between a major and minor ſemitone generally diſtinguiſhed by the name of a *comma*. Commas, however, are of three different kinds, as their quantities are more or leſs; but ſince theſe differences cannot be aſcertained without long and intricate computations, it is not neceſſary for us to attempt an inveſtigation, whoſe purſuit is ſo unpleaſant, and whoſe reſult attended with ſo little utility. It has by muſicians been generally called the *eighth part of a tone;* but they ought to have conſidered, that a comma is by no means the object of auricular perception, and that its eſtimate can only be formed by calculation. For a more minute diſquiſition of this matter, our readers may conſult the article Comma in the Muſical Dictionary, or the article Music in this Work, Notes *n* and *s*. A chromatic interval conſiſts properly of a minor ſemitone, but may alſo admit the major. A diatonic interval conſiſts of a ſemitone-major at leaſt, but may conſiſt of any number of tones within the octave. When an octave higher or lower is aſſumed, it is obvious that we enter into another ſcale which is either higher or lower, but ſtill a repetition of the former degrees of ſound.

Intervals again are either ſimple or compound. All the intervals within any one octave are ſimple; ſuch as the ſecond major or minor, the third, the fourth, the fifth, the ſixth, the ſeventh, &c. of theſe afterwards. All intervals whoſe extremes are contained in different octaves, ſuch as the ninth, the tenth, the eleventh, the twelfth, the thirteenth, the fourteenth, the fifteenth, &c. may be termed *compound intervals*.

The ſemitone either exactly or nearly divides the tone into two equal parts. In the theory of harmonical computation three kinds of ſemitones are recogniſed, *viz.* the greateſt, the intermediate, and the ſmalleſt ſemitone. But in practice, to which theſe explications are chiefly adapted, the ſemitone is only diſtinguiſhed into major and minor. The ſemitone major is the difference between the third major and the fourth, as E F. Its ratio is as 15 to 16, and it forms the leaſt of all diatonic intervals. Interval.

The ſemitone minor conſiſts of the difference between the third major and minor: it may be marked in the ſame degree by a ſharp or a flat, and it only forms a chromatic interval; its ratio is as 24 to 25.

Though ſome diſtinction is made between theſe ſemitones by the manner of marking them, yet on the organ and harpſichord no diſtinction can be made; nor is there any thing more common for us than to ſay, that D ſharp in riſing is E flat in deſcending, and ſo through the whole diapaſon above or below; beſides, the ſemitone is ſometimes major and ſometimes minor, ſometimes diatonick and ſometimes chromatic, according to the different modes in which we compoſe or practiſe; yet in practice theſe are called *ſemitones* minor, which are marked by ſharps or flats, without changing the degree; and ſemitones major are thoſe which form the interval of a ſecond.

With reſpect to the three ſemitones recogniſed in theory, the greateſt ſemitone is the difference between a tone major and a ſemitone minor; and its ratio is as 25 to 27. The intermediate ſemitone is the difference between a ſemitone major and a tone major; and its ratio is as 128 to 135. In a word, the ſmall ſemitone conſiſts of the difference between the greateſt and the intermediate ſemitone; and its ratio is as 125 to 128.

Of all theſe intervals, there is only the ſemitone major, which is ſometimes admitted as a ſecond in harmony.

The interval of a tone which characteriſes the diatonic ſpecies of compoſition, is either major or minor. The former conſiſts of the difference between the fourth and fifth; and its ratio is as 8 to 9: and the latter, whoſe ratio is as 9 to 10, reſults from the difference between the third minor and the fourth.

Seconds are diſtinguiſhed into four kinds; two of which are not in practice ſufficiently momentous to be mentioned. The ſecond major is ſynonimous with the interval of a tone; but as that tone may be either major or minor, its ratio may be either as 8 to 9, or as 9 to 10.

The ſecond minor conſiſts of the diſtance from B to C, or from E F; and its ratio is as 15 to 16.

The third is ſo called, becauſe it conſiſts of two gradations, or three diatonic ſounds, as from G to B aſcending, or from A to C, incluſive of the extremes; of which the firſt is a third major, compoſed of two full tones, and its ratio as 4 to 5; the ſecond, a third minor conſiſting of a tone and a ſemitone major, and its ratio as 5 to 6.

The fourth has by ſome been reckoned an imperfect, but more juſtly by others a perfect, chord. It conſiſts of three diatonic degrees, but takes its name from the four different ſounds of which it is formed; or, in other words, the number by which it is denominated includes the extremes. It is compoſed of a tone major, a tone minor, and a ſemitone major, as from C to F aſcending; its ratio as 3 to 4.

Interval. The fifth next to the octave, is perhaps the moſt perfect interval, as leaſt ſuſceptible of alteration. The number from whence it aſſumes its name likewiſe includes its extremes. It conſiſts of two tones major, one minor, and a ſemitone major, as from A to E aſcending; its ratio is as 2 to 3.

The ſixth is not found among the natural order of conſonances, but only admitted by combination. It is not here neceſſary to mention its various diſtinctions and uſes, as we only give an account of intervals in general.

The ſixth major conſiſts of four tones and a ſemitone major, as from G to E aſcending; its ratio is as 3 to 5. The ſixth minor contains three tones and two ſemitones major, as from E to C aſcending; its ratio is as 5 to 8.

The ſeventh, as a reduplication of the ſecond, is a diſſonance. When major, it conſiſts diatonically of five tones, three major, and two minor, and a major ſemitone, as from C to B aſcending; its ratio is as 8 to 15.

When minor, it conſiſts of four tones, three major and one minor, and two major ſemitones, as from E to D aſcending; its ratio is as 5 to 9.

The octave is the moſt perfect of all chords, and in many caſes hardly to be diſtinguiſhed by the ear from an uniſon; that is to ſay, from that coincidence of ſound produced by two muſical ſtrings, whoſe matter, lengths, diameters, and tenſions, are the ſame. As the vibrations of two ſtrings in uniſon during any given time, are preciſely coincident; ſo whilſt the loweſt extreme of the octave vibrates once, the higheſt vibrates twice; and conſequently its ratio is as 1 to 2, as from c to C aſcending. It conſiſts of ſix full tones and two ſemitones major. Its name is derived from the Latin *octo*, "eight;" becauſe that number likewiſe includes its extremes. It may likewiſe be divided into twelve ſemitones. It contains the whole diatonic ſcale; and every ſeries above or below conſiſts only of the ſame returning ſounds. From whence the natures, diſtances, and powers, of every interval greater than the octave, as the ninth, the tenth, the eleventh, the twelfth, the thirteenth, the fourteenth, the fifteenth, the triple octave, &c. may eaſily be computed.

During our paſt obſervations upon the term *interval*, we have either wholly neglected our faithful aſſociate M. Rouſſeau, or only maintained a diſtant and momentary intercourſe with him. We now propoſe to pay him a more permanent and familiar viſit; but as he is engaged in the diſpute between the Pythagoreans and Ariſtoxenians, we think it more advantageous to decline the controverſy, and to follow him, after having eſcaped the fray, like a gentleman and a ſcholar. Having put the partizans of Ariſtoxenus to ſilence, let us, with him, forſake the liſts of combat, nor ſtain his triumph by inſulting the falling champions.

"We divide, (ſays he), as did the ancients, intervals into conſonant and diſſonant. The conſonances are perfect or imperfect *; diſſonances are either ſuch by nature, or become ſuch by accident. There are only two intervals naturally diſſonant, viz. the ſecond and ſeventh, including their octaves or replications; nay, ſtill theſe two may be reduced to one alone, as the ſeventh is properly no more than a replication of the ſecond; for B, the ſeventh above the loweſt C, where we have generally begun the ſcale, is really an octave above B, the note immediately below that C; and conſequently the interval between theſe lower ſounds is no more than that of a ſecond major, to which all diſſonances may therefore be ultimately reduced, whether conſidered as major or minor; but even all the conſonances may become diſſonant by accident. See Discord. Interval.

* See *Conſonance*

"Beſides, every interval is either ſimple or reduplicated. Simple intervals are ſuch as the limits of a ſingle octave comprehend. Every interval which ſurpaſſes this extent is reduplicated; that is to ſay, compounded of one or more octaves, and of the ſimple interval whoſe replication it is.

"Simple intervals are likewiſe divided into direct and inverted. Take any ſimple interval whatever for a direct one; the quantity which, added to itſelf, is required to complete the octave, will be found an inverted interval; and the ſame obſervation holds reciprocally true of ſuch as are inverted

"There are only ſix kinds of ſimple intervals; of which three contain ſuch quantities, as, added to the other three, are required to complete the octave; and of conſequence likewiſe the one muſt be inverſions of the other. If you take at firſt the ſmalleſt intervals, you will have, in the order of direct intervals, the ſecond, the third, and fourth; for inverted, the ſeventh, the ſixth, and fifth. Suppoſe theſe to be direct, the others will be inverted; every thing here is reciprocal.

"To find the name of any interval whatever, it is only neceſſary to add the denomination of unity to the degree which it contains. Thus the interval of one degree ſhall give a ſecond; of two, a third; of three, a fourth; of ſeven, an octave; of nine, a tenth, &c. But this is not ſufficient to determine an interval with accuracy; for under the ſame name it may be either major or minor, true or falſe, diminiſhed or redundant.

"The conſonances which are imperfect, and the two natural diſſonances, may be major or minor; which, without changing their degree, occaſions in the interval the difference of a ſemitone: ſo that if, from a minor interval, we ſtill deduce a ſemitone, it becomes an interval diminiſhed; if, by a ſemitone, we increaſe a major interval, it becomes an interval redundant.

"The perfect conſonances are by their nature invariable. When their intervals are ſuch as they ought to be, we call them *juſt*, or *true*: and if we dilate or contract this interval by a ſemitone, the conſonance is termed *falſe*, and becomes a diſſonance; *redundant*, if the ſemitone be added; *diminiſhed*, if it be abſtracted. We improperly give the name of a *falſe fifth* to the fifth diminiſhed; this is taking the genus for the ſpecies: the fifth redundant is every jot as falſe as the diminiſhed, it is even more ſo in every reſpect."

In the Muſical Dictionary, plate C, fig. 2. may be ſeen a table of all the ſimple intervals practicable in Muſic, with their names, their degrees, their values and their ratios.

Having aſcertained the diſtinction between major and minor intervals, it is only neceſſary to add, that theſe

Intestate ‖ Intrigue.

these may be natural or artificial. Of the natural we have already given some account, by ascertaining the distances and ratios of such as have been mentioned. Of the artificial, we may observe, that they are such as change their position from what it naturally is in the diatonick scale, to what the conveniency of composition or transposition requires it to be. A note thus artificially heightened by a semitone, together with the character which expresses that elevation, is called a *sharp;* on the contrary, a note artificially depressed by a semitone, together with the character by which that depression is signified, is called a *flat*. The character which restores a note thus depressed or raised to its primary state, is called a *natural*. Major or minor intervals, as they prevail, characterise the major or minor mode. See Mode.

This subject is sufficiently explained in the article Music, Chap. IV.

INTESTATE, in law, a person that dies without making a will.

INTESTINES, in anatomy. See there, n° 354.

INTESTINAL, something belonging to or seated in the intestines.

INTONATION, in music, the action of sounding the notes in the scale with the voice, or any other given order of musical tones. Intonation may be either true or false, either too high or too low, either too sharp or too flat; and then this word *intonation*, attended with an epithet, must be understood concerning the manner of performing the notes.

In executing an air, to form the sounds, and preserve the intervals as they are marked with justness and accuracy, is no inconsiderable difficulty, and scarcely practicable, but by the assistance of one common idea, to which, as to their ultimate test, these sounds and intervals must be referred. these common ideas are those of the key, and the mode in which the performer is engaged; and from the word *tone*, which is sometimes used in a sense almost identical with that of the key, the word *intonation* may perhaps be derived. It may also be deduced from the word *diatonic*, as in that scale it is most frequently conversant; a scale which appears most convenient and most natural to the voice. We feel more difficulty in our intonation of such intervals as are greater or lesser than those of the diatonick order; because, in the first case, the glottis and vocal organs are modified by gradations too large; or too complex, in the second.

INTRENCHMENT, in the military art, any work that fortifies a post against an enemy who attacks. It is generally taken for a ditch or trench with a parapet. Intrenchments are sometimes made of faſcines with earth thrown over them, of gabions, hogsheads, or bags filled with earth, to cover the men from the enemy's fire.

INTRIGUE, an assemblage of events or circumstances, occurring in an affair, and perplexing the persons concerned in it. In this sense, it is used to signify the nodus or plot of a play or romance; or that point wherein the principal characters are most embarrassed through the artifice and opposition of certain persons, or the unfortunate falling out of certain accidents and circumstances.

In tragedy, comedy, or an epic poem, there are always two designs. The first and principal is that of the hero of the piece: the second contains the designs of all those who oppose him. These opposite causes produce opposite effects, to wit, the efforts of the hero for the execution of his design, and the efforts of those who thwart it. As those causes and designs are the beginning of the action, so these efforts are the middle, and there form a knot or difficulty which we call the *intrigue*, that makes the greatest part of the poem. It lasts as long as the mind of the reader or hearer is suspended about the event of those opposite efforts: the solution or catastrophe commences when the knot begins to unravel and the difficulties and doubts begin to clear up.

Intrigue ‖ Inveges.

The intrigue of the Iliad is twofold. The first comprehends three days fighting in Achilles's absence, and consists on the one side in the resistance of Agamemnon and the Greeks, and on the other in the inexorable temper of Achilles. The death of Patroclus unravels this intrigue, and makes the beginning of a second. Achilles resolves to be revenged, but Hector opposes his design; and this forms the second intrigue, which is the last day's battle.

In the Æneid there are also two intrigues. The first is taken up in the voyage and landing of Æneas in Italy; the second is his establishment there: the opposition he met with from Juno in both these undertakings, forms the intrigue.

As to the choice of the intrigue, and the manner of unravelling it, it is certain they ought both to spring naturally from the ground and subject of the poem. Bossu gives us three manners of forming the intrigue of a poem: the first is that already mentioned; the second is taken from the fable and design of the poet; in the third the intrigue is so laid, as that the solution follows from it of course.

INTRINSIC, a term applied to the real and genuine values and properties, &c. of any thing, in opposition to their *extrinsic* or *apparent* values.

INTRODUCTION, in general, signifies any thing which tends to make another in some measure known before we have leisure to examine it thoroughly; and hence it is used on a great variety of occasions. Thus we speak of the introduction of one person to another; the introduction to a book, &c.—It is also used to signify the actual motion of any body out of one place into another, when that motion has been occasioned by some other body.

Introduction, in oratory. See Oratory, n° 26.

INTUITION, among logicians, the act whereby the mind perceives the agreement or disagreement of two ideas, immediately by themselves, without the intervention of any other; in which case the mind perceives the truth as the eye does the light, only by being directed towards it. See Logic, n° 25. 27.

INVECTED, in heraldry, denotes a thing fluted or furrowed. See Heraldry, Plate CXLIV. fig. I. (A.)

INVECTIVE, in rhetoric, differs from reproof, as the latter proceeds from a friend, and is intended for the good of the person reproved; whereas the invective is the work of an enemy, and entirely designed to vex and give uneasiness to the person against whom it is directed.

INVEGES (Augustin), a learned Sicilian Jesuit, wrote in Italian an History of the city of Palermo,

Inverary and other works, which are esteemed. He died in 1677, aged 82.

Inverlochy. INVERARY, a parliament town of Scotland, in Argyleshire, seated on Loch-fin in W. Long. 5. 0. N. Lat. 47. 3.—Here is a castle, the principal feat of the dukes of Argyle, chief of the Campbells. It was built by duke Archibald; is quadrangular, with a round tower at each corner; and in the middle rises a square one glazed on every side to give light to the staircase and galleries, which has from without a most disagreeable effect. This castle is built of a coarse *lapis ollaris* brought from the other side of Loch-fin; and is of the same kind with that found in Norway, of which the king of Denmark's palace is built. The founder of the castle designed to have built a new town on the west side of the little bay on which the house stands: he finished a few houses, a custom-house, and an excellent inn; but his death put a stop to the conclusion of the plan; which, when brought to perfection, will give the place a very different appearance from what it now bears; the old town being composed of the most wretched hovels that can be imagined.

INVERKEITHING, a parliament-town of Scotland, in the county of Fife, situated on the northern shore of the Frith of Forth, in W. Long. 3. 15. N. Lat. 56. 5. It was much favoured by William, who granted its first charter. He extended its liberties considerably, and in the time of David I. it became a royal residence. The Moubrays had large possessions here, which were forfeited in the reign of Robert II. The Franciscans had a convent in this town; and, according to Sir Robert Sibbald, the Dominicans had another.

INVERLOCHY, or Fort William, a fortress erected in the Highlands of Scotland in king William's time. Even prior to that, however, there had been a small fortress erected by general Monk. The present fort is a triangle, has two bastions, and is capable of admitting a garrison of 800 men. It was well defended in 1746 against the rebels, who raised the siege with much disgrace. It was also attempted by those of 1715, but without success. The fort lies on a narrow arm of the sea called *Lochiel*, which extends some miles higher up the country, making a bend to the north; and extends likewise westward towards the isle of Mull, or near 24 Scotch miles.

This fort on the west, Fort Augustus in the centre, and Fort George on the east, form what is called the *chain* from sea to sea. This space is called *glen-more*, or the *great glen*, which, including water and land, is almost a level of 70 miles. There is in fact little land, but what is divided by a frith, loch, or river; except two miles which lie between Loch-oich and Loch-lochy, called *Lagan-achadrom*. By means of Fort-George all entrance up the Frith towards Inverness is prevented. Fort-Augustus curbs the inhabitants midway, and Fort-William is a check to any attempts in the west. Detachments are made from all these garrisons to Inverness, Bernera barracks opposite to the Isle of Skie, and castle Duart in the Isle of Mull. Other small parties are also scattered in huts throughout the country, to prevent the stealing of cattle.—Fort William is surrounded by vast mountains, which occasions almost perpetual rain. Benevish soars above the rest, and ends in a point said to be 1450 yards above the level of the sea. The fort stands in W. Long. 5. 15. N. Lat. 56. 55.

Inverness Inverted.

INVERNESS, a town of Scotland, and capital of a county of the same name, finely seated on the river Ness, over which there is a stone bridge of seven arches, in W. Long. 4°. N. Lat. 57. 36. It is large, well built, and very populous, being the last town of any note in Britain. As there are always regular troops in its neighbourhood, there is a great air of politeness, a plentiful market, and more money and business stirring than could have been expected in such a remote part of the island. The country in the neighbourhood is remarkably well cultivated; and its produce clearly shews, that the soil and climate are not despicable. There is a profitable salmon-fishery; which, however, might be improved in many respects. They have also some branches both of the woollen and linen manufacture; and, in consequence of their excellent military roads, a great proportion of inland trade. But, besides all this, Inverness is a port with 20 creeks dependent upon it, part on the Murray Frith to the east, and part on the north of the town, reaching even the south border of the county of Caithness; yet the foreign commerce here is far from being extensive. There are indeed some few merchants in the town, and some few ships belonging to it; but they are small in size, as well as few in number. The harbour too is none of the best, which induced the inhabitants to apply to the legislature upwards of 40 years ago, when they obtained a grant for 19 years; which, by another law, was continued for the space of 21 years farther; and, in consequence of this, they have made, and are still making, very considerable improvements.

Inverness-*Shire*, a county of Scotland, adjoining to Ross and Cromartie on the north; to Murray-land on the east, of which it includes a part; to Lorn, Braidalbin, and Athol, on the south; and on the west is washed by the Atlantic ocean. It extends 60 miles in length from east to west, and 55 where broadest, from south to north. It produces plenty of iron ore, has large woods of fir and oak, plenty of pasturage, and some corn. Here also is plenty of deer, hares, partridges, grouse, and all sorts of game, whether fowls or quadrupeds. The hills and mountains feed numerous flocks of black cattle: the rivers and lakes, of which there is a great number, afford abundance of salmon, eels, and trout; and for sea-fish, there is hardly a district in Scotland so well provided.

INVERSE, is applied to a manner of working the rule of three. See Arithmetic, n° 13.

Inverse, in music. See Inverted.

INVERTED, in music, is derived from the Latin preposition *in*, and *vertere*, "to turn any thing a contrary way." The analogy of this term, and its use in music, will appear more obvious from the sequel.

It signifies a change in the order of the notes which form a chord, or in the parts which compose harmony: which happens by substituting in the bass, those sounds which ought to have been in the upper part: an operation not only rendered practicable, but greatly facilitated, by the resemblance which one note has to another in different octaves; whence we derive the power of exchanging one octave for another with so much pro-

verted. propriety and ſucceſs, or by ſubſtituting in the extremes thoſe which ought to have occupied the middle ſtation; and *vice verſa*.

It is certain, that in every chord there muſt be a fundamental and natural order, which is the ſame with that of its generation: but the circumſtances of ſucceſſion, taſte, expreſſion, the beauty of melody, and variety, the approximation of harmony, frequently oblige the compoſer to change that order by inverting the chords, and of conſequence the diſpoſition of the parts.

As three things may be arranged in ſix different orders, and four things in twenty-four; it would ſeem at firſt, that a perfect chord ſhould be ſuſceptible of ſix inverſions, and a diſſonant chord of twenty-four; ſince one is compoſed of four and the other of three ſounds, and ſince inverſion conſiſts only in a tranſpoſition of octaves. But it muſt be obſerved, that in harmony all the different diſpoſitions of acuter ſounds are not reckoned as inverſions, whilſt the ſame ſounds remain in the lower parts. Thus, theſe two orders of the perfect chord *ut mi ſol*, or C E G, and *ut ſol mi*, or C G E, are only taken for the ſame inverſion, and only bear the ſame name; this reduces the whole of inverſions of which a perfect chord is ſuſceptible to three; that is to ſay, to as many inverſions as the chord contains different ſounds: for the replications of the ſame ſound are here reckoned as nothing.

Every time, therefore, when the fundamental baſs is heard in the loweſt parts, or if the fundamental baſs be retrenched, every time when the natural order is preſerved in the chords, the harmony is direct. As ſoon as that order is changed, or as ſoon as the fundamental ſounds, without being in the lower parts, are heard in ſome of the others, the harmony is *inverted*. It is an inverſion of the chord, when the fundamental ſound is tranſpoſed; it is likewiſe an inverſion of the harmony, when the treble or any other part moves as the baſs ought to have done.

Every where, where a direct chord can be well placed, its inverſions will likewiſe be ſo with reſpect to the harmony; for it is ſtill the ſame fundamental ſucceſſion. Thus, at every note of the fundamental baſs, it is in the power of the compoſer to arrange the chord at his pleaſure, and of conſequence every moment to produce different inverſions; provided that he does not change the regular and foundamental ſucceſſion; provided alſo, that the diſſonances may always be prepared and reſolved in the ſame parts where they are firſt heard, that the ſenſible note may always aſcend, and that ſuch falſe relations may be avoided as would be too harſh upon the ear in the ſame part. This is the key of theſe myſterious diſtinctions which compoſers have made between thoſe chords where the treble is ſyncopated, and thoſe in which the baſs ought to be ſyncopated; as, for inſtance, between the ninth and the ſecond: it is thus that in the firſt the chord is direct, and the diſſonance in the treble; in the others, the chord is reverſed, and the diſſonance in the baſs.

With reſpect to chords by ſuppoſition, greater precaution is neceſſary in inverting them. As the ſound which they add to the baſs is abſolutely foreign to the harmony; it is often only tolerable there, on account of its vaſt diſtance from the other ſounds, which renders the diſſonance leſs harſh. But if theſe added ſounds ſhould happen to be tranſpoſed in the higher parts, as it ſometimes does; if this tranſpoſition be not performed with much art, it may produce a very bad effect; and never can this be happily practiſed without taking away ſome other ſound from the chord. See, at the article ACCORD in the Muſical Dictionary, the caſes when *inverſion* may be practiſed, and the choice of ſuch as are proper. Inveſtigation ‖ Inula.

The perfect knowledge of *inverſion* depends on art and ſtudy alone: the choice is a different matter; to this an ear and a taſte are neceſſary; experience of the different effects are likewiſe indiſpenſable; and though the choice of inverſions be indifferent with reſpect to the foundation of the harmony, it is by no means ſuch in regard of the effect and expreſſion. It is certain, that the fundamental baſs is formed to ſupport the harmony, and to prevail beneath. Every time therefore when the order is changed and the harmony inverted, there ought to be good reaſons for it: without which, the compoſer will fall into the vice of our more recent muſic, where the melody of the treble is often like what the baſs ſhould be, and the baſs always like that of the treble, where every thing is confounded, reverſed, diſordered, without any other reaſon than to ſubvert the eſtabliſhed order, and to ſpoil the harmony.

INVESTIGATION, properly denotes the ſearching or finding out any thing by the tracts or prints of the feet; whence mathematicians, ſchoolmen, and grammarians, come to uſe the term in their reſpective reſearches.

INVESTING *a* PLACE, is when a general, having an intention to beſiege it, detaches a body of horſe to poſſeſs all the avenues; blocking up the garriſon, and preventing relief from getting into the place, till the army and artillery are got up to form the ſiege.

INVESTITURE, in law, a giving livery of ſeiſin or poſſeſſion. There was anciently a great variety of ceremonies uſed upon inveſtitures; as at firſt they were made by a certain form of words, and afterwards by ſuch things as had the greateſt reſemblance to the thing to be transferred: thus, where lands were intended to paſs, a turf, &c. was delivered by the granter to the grantee. In the church, it was cuſtomary for princes to make inveſtiture of eccleſiaſtical benefices, by delivering to the perſons they had choſen, a paſtoral ſtaff and a ring.

INULA, ELECAMPANE; a genus of the polygamia ſuperflua order, belonging to the ſyngeneſia claſs of plants. There are 22 ſpecies, of which the helenium, or common elecampane, is the moſt remarkable. It is a native of Britain; but is cultivated in gardens for the ſake of the root, which is uſed in medicine. The root is perennial, thick, branching, and of a ſtrong odour. The lower leaves are eight or nine inches long, and four broad in the middle, rough on their upper ſide, but downy on the under ſide. The ſtalks riſe about four feet high, and divide toward the top into ſeveral ſmaller branches, garniſhed with oblong oval leaves indented on their edges, ending in acute points. Each branch is crowned with one large yellow radiated flower, ſucceeded by narrow four-cornered ſeeds, covered with down. It may be propagated in autumn by ſeeds or offſets.

Medicinal Uſes, &c. The root of elecampane, e-

ſpe-

Inundatæ || Involucrum

specially when dry, has an agreeable aromatic smell; its taste, on chewing, is glutinous, and as it were somewhat rancid; in a little time it discovers an aromatic bitterness, which by degrees becomes considerably acrid and pungent. It possesses the general virtues of alexipharmacs; and is principally recommended for promoting expectoration in humoral asthmas and coughs. Liberally taken, it is said to excite urine, and to loosen the belly. In some parts of Germany, large quantities of this root are candied, and used as a stomachic for strengthening the tone of the viscera in general, and for attenuating tenacious juices. Spirituous liquors extract its virtues in greater perfection than watery ones. The former scarce elevate any thing in distillation: with the latter an essential oil arises, which concretes into white flakes; this possesses at first the flavour of the elecampane, but is very apt to lose it in keeping. Outwardly applied, a decoction of it is said to cure the itch. The root bruised and macerated in urine with balls of ashes and whortleberries, dyes a blue colour.

INUNDATÆ, the name of the 15th order in Linnæus's fragments of a natural method; consisting of plants which grow in the water. See BOTANY, p. 1307.

INVOCATION, in theology, the act of adoring God, and especially of addressing him in prayer for his assistance and protection. See the articles ADORATION and PRAYER.

The difference between the invocation of God and of the saints, as practised by the Papists, is thus explained in the catechism of the council of Trent. "We beg of God, (says the catechism,) to give us good things, and to deliver us from evil; but we pray to the saints, to intercede with God and obtain those things which we stand in need of. Hence we use different forms in praying to God, and to the saints: to the former we say, *hear us, have mercy on us;* to the latter we only say, *pray for us.*" The council of Trent expressly teaches, that the saints who reign with Jesus Christ offer up their prayers to God for men; and condemn those who maintain the contrary doctrine. The Protestants reject and censure this practice as contrary to scripture, deny the truth of the fact, and think it highly unreasonable to suppose that a limited finite being should be in a manner omnipresent, and at one and the same time hear and attend to the prayers that are offered to him in England, China, and Peru; and from thence infer, that if the saints cannot hear their requests, it is inconsistent with common sense to address any kind of prayer to them.

INVOCATION, in poetry, an address at the beginning of a poem, wherein the poet calls for the assistance of some divinity, particularly of his muse, or the deity of poetry.

INUNDATION, a sudden overflowing of the dry land by the waters of the *ocean, rivers, lakes, springs,* or *rains.* See all these articles.

INVOICE, an account in writing of the particulars of merchandise, with their value, custom, charges, &c. transmitted by one merchant to another in a distant country.

INVOLUCRUM, among botanists. See BOTANY, p. 1293.

INVOLUTION, in algebra. See ALGEBRA, n° 9. Involution || Joan.

JOAB, general of the army of king David, defeated the Syrians and the other enemies of David, and took the fort of Zion from the Jebusites, who, thinking it impregnable, committed it to the care of the lame and blind, whom they placed on the walls. He signalized himself in all David's wars, but was guilty of basely murdering Abner and Amasa. He procured a reconciliation between Absalom and David; and afterwards slew Absalom, contrary to the express orders of the king. He at length joined Adonijah's party; and was put to death by the order of Solomon, 1014 B. C.

JOACHIMITES, in church-history, the disciples of Joachim a Cistertian monk, who was an abbot of Flora in Calabria, and a great pretender to inspiration.

The Joachimites were particularly fond of certain ternaries: The Father, they said, operated from the beginning till the coming of the Son; the Son, from that time to theirs, which was the year 1260; and from that time the Holy Spirit was to operate in his turn. They also divided every thing relating to men, to doctrine, and the manner of living, into three classes, according to the three persons in the Trinity: The first tenary was that of men; of whom the first class was that of married men, which had lasted during the whole period of the Father; the second was that of clerks, which had lasted during the time of the Son; and the last was that of the monks, in which there was to be an uncommon effusion of grace by the Holy Spirit: The second ternary was that of doctrine, viz. the Old Testament, the New, and the everlasting Gospel; the first they ascribed to the Father, the second to the Son, and the third to the Holy Spirit: A third ternary consisted in the manner of living, viz. under the Father, men lived according to the flesh; under the Son, they lived according to the flesh and the spirit; and under the Holy Ghost, they were to live according to the spirit only.

JOAN (Pope), called by Platina *John VIII.* is said to have held the holy see between Leo IV. who died in 855, and Benedict III. who died in 858. Marianus Scotus says, she fat two years five months and four days. Numberless have been the controversies, fables, and conjectures, relating to this pope. It is said that a German girl, pretending to be a man, went to Athens, where she made great progress in the sciences; and afterward came to Rome in the same habit. As she had a quick genius, and spoke with a good grace in the public disputations and lectures, her great learning was admired, and every one loved her extremely; so that after the death of Leo, she was chosen pope, and performed all offices as such. Whilst she was in possession of this high dignity, she was got with child; and as she was going in a solemn procession to the Lateran church, she was delivered of that child, between the Coliseum and St Clement's church, in a most public street, before a crowd of people, and died on the spot, in 857. By way of embellishing this story, may be added the precaution reported to have been afterward taken to avoid such another accident. After the election of a pope, he was placed on a chair with an open seat, called the *groping chair,* when

Joan ‖ Job.

when a deacon came moſt devoutly behind and ſatisfied himſelf of the pontiff's ſex by feeling. This precaution, however, has been long deemed unneceſſary, becauſe the cardinals now always get baſtards enough to eſtabliſh their virility before they arrive at the pontificate.

JOAN *d'Arc*, or the Maid of Orleans, whoſe heroic behaviour in reanimating the expiring valour of the French nation, though by the moſt ſuperſtitious means, (pretending to be inſpired), deſerved a better fate. She was burnt by the Engliſh as a ſorcereſs, in 1421, aged 24. See FRANCE, n° 60.

JOANNA (St), one of the Comora iſlands in the Indian ocean, E. Long. 44. 25. S. Lat. 12. 0. The north ſide ſhoots out into two points, 26 miles aſunder, between which there is a great bay. This iſland is a proper place of refreſhment for the Eaſt India ſhips, whoſe crews, when ill of the ſcurvy, ſoon recover by the uſe of limes, lemons, and oranges, and from the air of the land. The iſland abounds with horned cattle, goats, fowls, rice, pepper, cocoa-nuts, plantains, bananas, oranges, lemons, limes, pine-apples, guavas, plums, yams, and potatoes. They have likewiſe honey and ſugar-canes; and the ſoil is ſo rich, that it ſeems proper for any other vegetables: all theſe, except the cocoa-nuts, may be gathered at pleaſure. The proſpect of the country is exceeding beautiful, and may be called without exaggeration a *terreſtrial paradiſe*; every valley being a delightful grove, and the hills covered with variety of evergreen trees, combined with water-falls and caſcades, render it impoſſible that they ſhould receive any addition from art. The town where the king reſides is at the eaſt ſide of the iſland; and though it is three quarters of a mile in length, it does not contain above 200 houſes. However, the villages are thick, and there are cottages almoſt every where. Their principal houſes are built with ſtone, with a quadrangle in the middle, and are only one ſtory high. All the other houſes, or rather huts, are ſlightly compoſed of plaſtered reeds; and yet the moſques are tolerable ſtructures, very neat and clean in the inſide. The horned cattle are a kind of buffaloes, having a large hump on their ſhoulders, which is very delicious eating. They have neither horſes nor aſſes, nor beaſts of prey; but they have monkies of ſeveral ſorts, and bats as large as a weaſel; they have alſo various ſorts of birds not yet diſtinguiſhed by any particular name.

JOB, or *Book of* JOB, a canonical book of the Old Teſtament, containing a narrative of a ſeries of misfortunes which happened to a man whoſe name was *Job*, as a trial of his virtue and patience; together with the conferences he had with his cruel friends on the ſubject of his miſfortunes, and the manner in which he was reſtored to eaſe and happineſs. This book is filled with thoſe noble, bold, and figurative expreſſions, which conſtitute the very ſoul of poetry.

Many of the Jewiſh rabbins pretend that this relation is altogether a fiction: others think it a ſimple narrative of a matter of fact, juſt as it happened: while a third ſort of critics acknowledge, that the groundwork of the ſtory is true, but that it is wrote in a poetical ſtrain, and decorated with peculiar circumſtances, to render the narration more profitable and entertaining.

The time is not ſet down in which Job lived. Some have thought that he was much ancienter than Moſes, becauſe the law is never cited by Job or his friends, and becauſe it is related that Job himſelf offered ſacrifices. Some imagine that this book was wrote by himſelf; others ſay, that Job wrote it originally in Syriac or Arabic, and that Moſes tranſlated it into Hebrew: but the rabbins generally pronounce Moſes to be the author of it, and many Chriſtian writers are of the ſame opinion.

JOBBER, in law, a perſon that buys and ſells cattle for others. Hence ſtock-jobbers are perſons who buy and ſell ſtocks for other perſons.

JOBERT (Lewis), a pious and learned jeſuit, born at Paris in 1647. He diſtinguiſhed himſelf as a preacher; and beſides ſeveral other tracts wrote a treatiſe entitled *La Science des Medailles*, which is in good eſteem. He died in 1719; and the beſt edition of this work is that of Paris in 1739, 2 vols 12mo.

JODELLE (Stephen), lord of Limodin, was born at Paris in 1532; and diſtinguiſhed himſelf ſo greatly by his poetical talents, that he was reckoned one of the Pleiades celebrated by Ronſard. He is ſaid to be the firſt Frenchman who wrote plays in his own language according to the ancient form. He was remarkably ready at compoſition, writing without ſtudy or labour; and was well ſkilled in polite arts and genteel exerciſes. In his younger years he embraced the reformed religion, and wrote a ſatire on the maſs in 100 Latin verſes; yet all of a ſudden returned to that maſs again. He died in 1579, very poor.

JOEL, the ſon of Phatuel, and the ſecond of the leſſer prophets, 800 B. C. foretold the captivity of Babylon, the deſcent of the Holy Ghoſt on the apoſtles, and the laſt judgment. His prophecy is in Hebrew, and contains only three chapters. The ſtyle is ſtrong, expreſſive, and figurative.

JOHN (St), the BAPTIST, the fore-runner of Jeſus Chriſt, was the ſon of Zacharias and Elizabeth. He retired into a deſart, where he lived on locuſts and wild honey; and about the year 29 began to preach repentance, and to declare the coming of the Meſſiah. He baptized his diſciples, and the following year Chriſt himſelf was baptized by him, in the river Jordan. Some time after, having reproved Herod Antipas, who had a criminal correſpondence with Herodias his brother Philip's wife, he was caſt into priſon, where he was beheaded. His head was brought to Herodias, who, according to St Jerome, pierced his tongue with the bodkin ſhe uſed to faſten up her hair, to revenge herſelf after his death for the freedom of his reproofs.

JOHN (St), the apoſtle, or the evangeliſt, was the brother of St James the Great, and the ſon of Zebedee. He quitted the buſineſs of fiſhing to follow Jeſus, and was his beloved diſciple. He was witneſs to the actions and miracles of his Maſter; was preſent at his tranſfiguration on mount Tabor; and was with him in the garden of Olives. He was the only apoſtle who followed him to the croſs; and to him Jeſus left the care of his mother. He was alſo the firſt apoſtle who knew him again after his reſurrection. He preached

Jobber ‖ John.

John. preached the faith in Asia; and principally resided at Ephesus, where he maintained the mother of our Lord. He is said to have founded the churches of Smyrna, Pergamus, Thyatira, Sardis, Philadelphia, and Laodicea. He is also said to have preached the gospel amongst the Parthians, and to have addressed his first epistle to that people. It is related, that, when at Rome, the emperor Domitian caused him to be thrown into a caldron of boiling oil, when he came out unhurt; on which he was banished to the isle of Patmos, where he wrote his Apocalypse. After the death of Domitian, he returned to Ephesus, where he composed his Gospel, about the year 96; and died there, in the reign of Trajan, about the year 100, aged 94.

Gospel of St JOHN, a canonical book of the New Testament, containing a recital of the life, actions, doctrine, and death, of our Saviour Jesus Christ, written by St John the apostle and evangelist.

St John wrote his Gospel at Ephesus, after his return from the isle of Patmos, at the desire of the Christians of Asia. St Jerome says, he would not undertake it, but on condition that they should appoint a public fast to implore the assistance of God; and that, the fast being ended, St John, filled with the Holy Ghost, broke out into these words, "In the beginning was the Word," &c. The ancients assign two reasons for this undertaking: the first is, because, in the other three Gospels, there was wanting the history of the beginning of Jesus Christ's preaching, till the imprisonment of John the Baptist, which therefore he applied himself particularly to relate. The second reason was, in order to remove the errors of the Corinthians, Ebionites, and other sects.

Revelation of St JOHN. See APOCALYPSE.

JOHN *of Salisbury*, bishop of Chartres in France, was born at Salisbury in Wiltshire, in the beginning of the 12th century. Where he imbibed the rudiments of his education, is unknown; but we learn, that in the year 1136, being then a youth, he was sent to Paris, where he studied under several eminent professors, and acquired considerable fame for his application and proficiency in rhetoric, poetry, divinity, and particularly in the learned languages. Thence he travelled to Italy: and, during his residence at Rome, was in high favour with pope Eugenio III. and his successor Adrian IV. After his return to England, he became the intimate friend and companion of the famous Thomas BECKET, archbishop of Canterbury, whom he attended in his exile, and is said to have been present when that haughty prelate was murdered in his cathedral. What preferment he had in the church during this time, does not appear; but in 1176 he was promoted by king Henry II. to the bishopric of Chartres in France, where he died in 1182.

This John of Salisbury was really a phænomenon. He was one of the first restorers of the Greek and Latin languages in Europe; a classical scholar, a philosopher, a learned divine, and an elegant Latin poet. He wrote several books; the principal of which are, his Life of St Thomas of Canterbury, a collection of letters, and Polycraticon.

Pope JOHN XXII. a native of Cahors, before called *James d'Euse*, was well skilled in the civil and canon law; and was elected pope after the death of Clement V. on the 7th of August 1316. He published the constitutions called *Clementines*, which were made by his predecessor; and drew up the other constitutions called *Extravagantes*. Lewis of Bavaria being elected emperor, John XXII. opposed him in favour of his competitor; which made much noise, and was attended with fatal consequences. That prince, in 1329, caused the antipope Peter de Corbiera, a cordelier, to be elected, who took the name of Nicholas V. and was supported by Michael de Cesenne, general of his order; but that antipope was the following year taken and carried to Avignon, where he begged pardon of the pope with a rope about his neck, and died in prison two or three years after. Under this pope arose the famous question among the cordeliers, called *the bread of the cordeliers*; which was, Whether those monks had the property of the things given them, at the time they were making use of them? for example, Whether the bread belonged to them when they were eating it, or to the pope, or to the Roman church? This frivolous question gave great employment to the pope; as well as those which turned upon the colour, form, and stuff of their habits, whether they ought to be white, grey, or black; whether the cowl ought to be pointed or round, large or small; whether their robes ought to be full, short, or long; of cloth, or of serge, &c. The disputes on all these minute trifles were carried so far between the minor brothers, that some of them were burned upon the occasion. He died at Avignon in 1334, aged 90.

JOHN, king of England. See ENGLAND, n° 133, 144.

JOHN *of Gaunt*, duke of Lancaster, a renowned general, father of Henry IV. king of England, died in 1438.

JOHN *of Leyden*, otherwise called *Buccold*. See ANABAPTISTS.

JOHN *Sobieski* of Poland, one of the greatest warriors in the 17th century, was, in 1665, made grand-marshal of the crown; and, in 1667, grand-general of the kingdom. His victories obtained over the Tartars and the Turks procured him the crown, to which he was elected in 1674. He was an encourager of arts and sciences, and the protector of learned men. He died in 1696, aged 72.

St JOHN's *Day*, the name of two Christian festivals; one observed on June 24th, kept in commemoration of the wonderful circumstances attending the birth of John the Baptist; and the other on December 27th, in honour of St John the evangelist.

St JOHN's *Wort*. See HYPERICUM.

JOHN's *(St)*, an island of the East-Indies, in Asia, and one of the Philippines, east of Mindanayo, from which it is separated by a narrow strait. E. Long. 125. 25. N. Lat. 7. 0.

JOHN's *(St)*, an island of North-America, in the bay of St Lawrence, having New-Scotland on the south and west, and Cape Breton on the east. The English got possession of it when Louisbourg was surrendered to them, on July 26, 1758.

JOHNSON (BEN), one of the most considerable dramatic poets of the last age, whether we consider the number or the merit of his productions. He was born

John ‖ Johnson.

Johnson. born at Weſtminſter in 1574, and was educated at the public ſchool there under the great Camden. He was deſcended from a Scots family; and his father, who loſt his eſtate under Queen Mary, dying before our poet was born, and his mother marrying a bricklayer for her ſecond huſband, Ben was taken from ſchool to work at his father-in-law's trade. Not being captivated with this employment, he went into the Low Countries, and diſtinguiſhed himſelf in a military capacity.

On his return to England, he entered himſelf at St John's college, Cambridge; and having killed a perſon in a duel, was condemned, and narrowly eſcaped execution. After this he turned actor; and Shakeſpeare is ſaid to have firſt introduced him to the world, by recommending a play of his to the ſtage, after it had been rejected. His Alchymiſt gained him ſuch reputation, that in 1619 he was, at the death of Mr Daniel, made poet-laureat to King James I. and maſter of arts at Oxford.

As we do not find Johnſon's œconomical virtues any where recorded, it is the leſs to be wondered at, that after this we find him petitioning king Charles, on his acceſſion, to enlarge his father's allowance of 100 merks into pounds; and quickly after we learn, that he was very poor and ſick, lodging in an obſcure alley: on which occaſion it was, that Charles, being prevailed on in his favour, ſent him ten guineas; which Ben receiving, ſaid, "His majeſty has ſent me ten guineas, becauſe I am poor, and live in an alley; go and tell him, that his ſoul lives in an alley."

He died in Auguſt 1637, aged 63 years, and was buried in Weſtminſter-Abbey.—The moſt complete edition of his works was printed in 1756, in 7 vols. 8vo.

Johnson (Samuel), an Engliſh divine, remarkable for his learning, and ſteadineſs in ſuffering for the principles of the revolution in 1688. He was born in 1649; and, entering into orders, obtained in 1670 the rectory of Corringham in the hundreds of Eſſex, worth no more than L. 80 a-year; which was the only church-preferment he ever had. The air of this place not agreeing with him, he was obliged to place a curate on the ſpot, at the expence of half his income, while he ſettled at London; a ſituation much more to his liking, as he had a ſtrong propenſity to politics. The times were turbulent: the duke of York declaring himſelf a Papiſt, his ſucceſſion to the crown began to be warmly oppoſed; and Mr Johnſon, who was naturally of no ſubmiſſive temper, being made chaplain to lord William Ruſſel, engaged the eccleſiaſtical champion for paſſive obedience Dr Hicks, in a treatiſe intitled *Julian the apoſtate, &c.* publiſhed in 1682. He was anſwered by Dr Hicks in a piece intitled *Jovian, &c.* To which he drew up, and printed, a reply, under the title of *Julian's arts to undermine and extirpate Chriſtianity, &c.*; but by the advice of his friends ſuppreſſed the publication. For this unpubliſhed work he was committed to priſon; but not being able to procure a copy, the court proſecuted him for writing the firſt tract, condemned him to a fine of 500 merks, and to lie in priſon until it was paid. By the aſſiſtance of Mr Hambden, who was his fellow-priſoner, he was enabled to run into farther troubles; for on the encampment of the army on Hounſlow-heath, in 1686, he printed and diſperſed, *An humble and hearty addreſs to all the Proteſtants in the preſent army*; for this he was ſentenced to a ſecond fine of 500 merks, to be degraded from the prieſthood, to ſtand twice in the pillory, and to be whipped from Newgate to Tyburn. It happened luckily, that, in the degradation, they omitted to ſtrip him of his caſſock; which circumſtance, ſlight as it may appear, rendered his degradation imperfect, and afterwards preſerved his living to him. Interceſſion was made to get the whipping omitted; but James replied, "That ſince Mr Johnſon had the ſpirit of martyrdom, it was fit he ſhould ſuffer:" and he bore it with firmeſs, and even with alacrity. On the Revolution, the parliament reſolved the proceedings againſt him to be null and illegal; and recommended him to the king, who offered him the rich deanery of Durham: but this he refuſed, as inadequate to his ſervices and ſufferings, which he thought to merit a biſhopric. The truth was, he was paſſionate, ſelf-opiniated, and turbulent; and though, through Dr Tillotſon's means, he obtained a penſion of 300 l. a-year, with other gratifications, he remained diſcontented; pouring forth all his uneaſineſs againſt a ſtanding army, and the great favours ſhewn to the Dutch. He died in 1703, and his works were afterwards collected in one volume folio.

Johnson (John), a learned divine, born in 1662. He was zealous for the Revolution, and preached a noted ſermon at Feverſham on the occaſion, from the words, "Remember Lot's wife;" wherein he ſet forth the great danger of looking back, and vindicated the liturgy againſt Mr Baxter and others. He publiſhed *The Clergyman's Vade Mecum*, and *A Collection of Eccleſiaſtical Laws* as a continuation of it; but catching the infection ſpread by Dr Sachaverel, he, on the acceſſion of Geo. I. to the amazement of all his old friends, entertained unfavourable thoughts of the Proteſtant ſucceſſion, and refuſed to read the uſual prayers for the king. Being proſecuted, however, he thought proper to ſubmit; and died vicar of Cranbrook in Kent, in 1725.

JOIGNY, a town of France, in Champagne, and in the dioceſe of Sens, with a very handſome caſtle. It conſiſts of three pariſhes, and is pleaſantly ſituated on the river Yonne, in E. Long. 3. 25. N. Lat. 47. 56.

JOINERY, the art of working in wood, or of fitting various pieces of timber together. It is called by the French *menuiſerie*, "ſmall work," to diſtinguiſh it from carpentery, which is employed about large and leſs curious works.

JOINT, in general, denotes the juncture of two or more things. The joints of the human body are called by anatomiſts *articulations*. See Anatomy, n° 2. *b*, *c*, *d*, *e*, *f*.

The ſuppleneſs to which the joints may be brought by long practice from the time of infancy, is very ſurpriſing. Every common poſture-maſter ſhews us a great deal of this; but one of the moſt wonderful inſtances we ever had of it, was in a perſon of the name of *Clark*, and famous for it in London, where he was commonly known by the name of *Clark the poſture-maſter*. This man had found the way, by long practice, to diſtort many of the bones, of which nobody

Johnſon Joint.

Jointure || Joli.

before had ever thought it poſſible to alter the poſition. He had ſuch an abſolute command of his muſcles and joints, that he could almoſt diſjoint his whole body; ſo that he once impoſed on the famous Mullens by his diſtortions, in ſuch a manner, that he refuſed to undertake his cure: but, to the amazement of the phyſician, no ſooner had he given over his patient, than he ſaw him reſtore himſelf to the figure and condition of a proper man, with no diſtortion about him.

JOINTURE, in law, generally ſignifies a ſettlement of lands and tenements, made on a woman in conſideration of marriage.

JOINVILLE (John Sire de), an eminent French ſtateſman of the 13th century, who was ſeneſchel or high-ſteward of Champagne, and one of the principal lords in the court of Lewis IX. He attended that monarch in all his expeditions; and had ſo much confidence placed in him, that all matters of juſtice in the palace were referred to his deciſion, and the king undertook nothing of conſequence without conſulting him. He wrote the hiſtory of St Lewis in French, which is a very curious and intereſting piece; and died about the year 1318. The beſt edition of this work is that of Du Cange, in folio, with learned remarks.

JOINVILLE, an ancient and conſiderable town of France, in Champagne, with the title of a principality, and a large magnificent caſtle. It is ſituated on the river Marne, in E. Long. 5. 10. N. Lat. 48. 20.

JOISTS, or JOYSTS, in architecture, thoſe pieces of timber framed into the girders and ſummers, on which the boards of the floor are laid.

IOLAUS, in fabulous hiſtory, the ſon of Iphicles, aſſiſted Hercules in overcoming the hydra, by procuring and lighting firebrands, as faſt as Hercules cut off its heads. As a reward for this piece of ſervice, Hercules prevailed on Hebe to reſtore him to youth, when decrepid with age.

JOLI, or JOLY, (Claudius), a worthy pariſh-prieſt, and an excellent ſcholar, deſcended from a family eminent for learning and piety; was born at Paris in 1607. He applied himſelf firſt to the law, and pleaded for ſome time at the bar: but inclining afterwards to the church, he entered into orders, and in 1631 obtained a canonry in the cathedral church of Notre Dame at Paris; the duties of which office he diſcharged with an exactneſs beyond all example as long as he lived. Diſcovering at the ſame time occaſionally a capacity for ſtate-affairs, the duke de Longueville, the French plenipotentiary for negociating a general peace, took Joly with him to Munſter, where he proved a good aſſiſtant. On his return, he reſumed his former employments with his uſual zeal. In 1671 he was made precentor in his church; and ſeveral times official of Paris, without his ſeeking; always behaving, as an eccleſiaſtical magiſtrate, with perfect integrity, and teſtifying a ſincere love for juſtice. He died in 1700, and left many works; in which, as in as many mirrors, his true character fully appears.

JOLI (Guy), king's counſellor to the Chatelet, and ſyndic of the revenues of the Hotel de Ville at Paris, attached himſelf for a long time to cardinal de Retz in the capacity of ſecretary. Beſide other tracts, he wrote *Memoirs* from 1648 to 1665, including thoſe of Cardinal de Retz; a tranſlation of which into Engliſh was publiſhed in 1755. Jona.

JONA, or IONA, the moſt celebrated of all the Hebrides, called alſo *St Columb-kill*, from St Columba *, who came hither from Ireland, and here lies buried. The iſland ſtretches two miles in length from ſouth to north in the neighbourhood of Mull, and is about a mile broad from eaſt to weſt. One end of it is rocky and barren; the other, plain, arable, and fruitful. Columba having converted the northern Picts by his preaching, their king is ſaid to have beſtowed upon him this iſland, where he erected two churches and two monaſteries, and inſtituted a ſeminary that ſoon became famous for learning and ſanctity. Theſe foundations were richly endowed by the kings of Scotland and lords of the iſles: Jona became the cathedral of the biſhop of the iſles; and, on account of its ſuppoſed ſanctity, was choſen as a burying-place for kings, heroes, and churchmen. St Mary's church in this iſland is built in form of a croſs, in the Gothic manner; on each ſide of the choir are two chapels, having, at the entrance, large pillars carved in baſſo-relievo: the ſteeple, doors, and windows, are adorned with curious fret-work; the altar is large, magnificent, and compoſed of fine poliſhed marble. Within the church ſeveral abbots are interred, and among theſe M'Ilkenich, whoſe ſtatue of black marble appears as big as the life, in an epiſcopal habit, with the mitre and croſier; the reſt are repreſented in the ſame manner, and ſome diſtinguiſhed by Latin inſcriptions. Behind the church are the ruins of a cloiſter, library, and hall; in which laſt there uſed to be public diſputations. At the weſt end of the church, in a little cell, we find the tomb of Columba, but undiſtinguiſhed by any inſcription. Hard by ſtands the croſs of St Martin, an entire porphyry ſtone, eight feet high above the ground, ſtanding on a pedeſtal, and exhibiting on the eaſt ſide the figure of a tree, and on the weſt a large crucifix. At a little diſtance from hence we ſee the ruins of Dun-ni Manich, or Monks Fort, built of ſtone and lime; which ſeems to have been a kind of raiſed baſtion, on which the monks enjoyed the cool air, and a proſpect of the whole country. A little farther weſtward lie the black ſtones, ſo called, not for their colour, which is grey, but on account of the dreadful vengeance which was ſaid to overtake all thoſe who ſwore an oath on theſe ſtones and were afterwards guilty of perjury. Kneeling on theſe ſtones with uplifted hands, Macdonald, lord of the iſles, confirmed the grants of lands to his adherents and vaſſals, ſolemnly ſwearing before witneſſes, that he would never revoke the rights and privileges he then beſtowed.

The other church in Jona is called *St Ouran's*, from the patron to which it is dedicated. The ſtatelieſt tomb in this church belongs to the laird of M'Kinnon. On the wall above appears a crucifix, engraved with the family-arms underneath. On the tomb-ſtone lies a ſtatue as big as the life in armour, a ſhip under ſail, a lion at the head, and another at the feet, with this inſcription, *Hic eſt abbas Lachlan Much-finnone, et ejus filius, Abbates de I. Ætatis in Dno. Mo. CCCC. ann.* But the moſt remarkable ſpot is the cœmetery on the ſouth ſide, in which the king and chieftains lie buried under ſhrines. Each particular vault was diſtinguiſhed

* See *Hebrides*, and *Columba*.

Jona ‖ Jonas.

ed by an inſcription; but theſe are now not legible. In that on the right hand, four kings of Ireland were interred; on the left, eight kings of Norway lie buried; and in the middleſt, eight and forty kings of Scotland. Here are likewiſe the tombs of Macdonald of Ila, Gilbred, and Paul Sporran, ancient tribes of the ſame name; the Macleans of Duart, Lochbuy, and Coll, Macaliſter, likewiſe a branch of the Macdonalds, Mac-ouvrey of Ulvay, and ſeveral dignified clergymen; one of which exhibits this inſcription, *Hic jacet Johannes Turnbull, quondam epiſcopus Canterburienſis.* All theſe monuments are of laymen;[4] adorned with ſtatues in armour, and armorial enſigns engraven in ſtone.

About a quarter of a mile farther ſouth, is the church of Ronad, the burying-place of ſeveral abbeſſes; one of whom is thus inſcribed: *Hic jacet Dna. Anna Terleti, filia quondam prioreſſa de Jona, quæ obiit anno Mo. Chriſti, animam Abrahamo commendamus.* If this inſcription be true, the prioreſſes in thoſe days did not live a life of celibacy; though indeed a little alteration in the punctuation and orthography will deſtroy this ſuppoſition; for example, *Hic jacet Dna. Anna, Tarleti filia, quondam prioreſſe de Jona, &c.* In the middle of a long pavement belonging to the adjoining nunnery, ſtands another ſtone croſs, called *Maclean's croſs*, like that which we have already deſcribed. On the ſhore is a ſmall dock dug to preſerve the curich or boat, made of timber covered with hides, in which Columba is ſaid to have tranſported himſelf and eighteen eccleſiaſtics from Ireland. One copy of this apoſtle's life, written in the Iriſh character, which by the by is no other than the old Saxon, was in the poſſeſſion of John Macneil in the iſle of Barray; and another in the hands of Macdonald of Benbecula. The monaſtery of Jona furniſhed divers biſhops to the dioceſes of Scotland and England; among others, the famous Aidanus, biſhop of Lindisfairn, now Holy Iſland.

JONAH, or *Prophecy of* JONAH, a canonical book of the Old Teſtament; in which it is related, that Jonah (about 771 B. C.) was ordered to go and prophecy the deſtruction of the Ninevites, on account of their wickedneſs. But the prophet, inſtead of obeying the divine command, embarked for Tarſhiſh; when, a tempeſt ariſing, the mariners threw him into the ſea: he was ſwallowed by a great fiſh; and after being three days and nights in its belly, was caſt upon the land. Hereupon being ſenſible of his paſt danger and ſurpriſing deliverance, he betook himſelf to the journey and embaſſy to which he was appointed; and arriving at Nineveh the metropolis of Aſſyria, he, according to his commiſſion, boldly laid open their ſins and miſcarriages, and proclaimed their ſudden overthrow: upon which the whole city, by prayer and faſting, and a ſpeedy repentance, happily averted the divine vengeance, and eſcaped the threatened ruin. Jonah upon this, fearing to paſs for a falſe prophet, retired to a hill at ſome diſtance from the city; where God, by a miracle, condeſcended to ſhew him the unreaſonableneſs of his diſcontent.

JONAS (Juſtus), a Proteſtant divine, born at North Hauſen, in Thuringia, in 1493. He was one of Luther's moſt zealous diſciples. He contracted a ſtrict friendſhip with Melancthon; became principal of the college of Wittemburg, and afterwards dean of the univerſity of that city. He wrote a treatiſe in favour of the marriage of prieſts, and other works; and died in 1555.

Jonas ‖ Jones.

JONAS (Arnagrimus), a learned Icelander, acquired great reputation by his ſkill in the ſciences, and particularly in aſtronomy. He was coadjutor to Gudebran de Thorlac, biſhop of Hola, in Iceland. He refuſed that biſhopric, after the death of Gundebran; and died in 1649. He wrote ſeveral works; the principal of which are, *Idea veræ Magiſtratûs*, and his hiſtory and deſcription of Iceland.

JONATHAN, the ſon of Saul, celebrated in Sacred hiſtory for his valour, and his friendſhip for David againſt the intereſt of his own houſe. Slain in battle, 1055 B. C.

JONATHAN *Maccabæus*, brother of Judas, a renowned general of the Jews. He forced Bacchides the Syrian general, who made war with the Jews, to accept a peace; conquered Demetrius Soter, and afterwards Apollonius, that prince's general; but, being enſnared by Tryphon, was put to death, 144 B. C.

JONES (Inigo), a celebrated Engliſh architect, was the ſon of a cloth-worker of London, and was born in 1572. He was at firſt put apprentice to a joiner; but early diſtinguiſhed himſelf by his inclination to drawing or deſigning, and was particularly taken notice of for his ſkill in landſcape-painting. This afterwards recommended him to the favour of William earl of Pembroke, who ſent him abroad with a handſome allowance in order to perfect himſelf in that branch. He was no ſooner at Rome, than he found himſelf in his proper ſphere: he felt that nature had not formed him to decorate cabinets, but to deſign palaces. He dropt the pencil, and conceived Whitehall. In the ſtate of Venice he ſaw the works of Palladio, and learned how beautiful taſte may be exerted on a leſs theatre than the capital of an empire. How his abilities diſtinguiſhed themſelves in a ſpot where they certainly had no opportunity to act, we are not told, though it would not be the leaſt curious part of his hiſtory; certain it is, that, on the ſtrength of his reputation at Venice, Chriſtian IV. invited him to Denmark, and appointed him his architect; but on what buildings he was employed in that country, we are yet to learn. James I. found him at Copenhagen, and queen Anne took him in the quality of her architect to Scotland. He ſerved prince Henry in the ſame capacity, and the place of ſurveyor-general of the works was granted to him in reverſion. On the death of that prince, with whom at leaſt all his lamented qualities did not die, Jones travelled once more into Italy, and, aſſiſted by ripeneſs of judgment, perfected his taſte. To the interval between theſe voyages Mr Walpole is inclined to aſſign thoſe buildings of Inigo, which are leſs pure, and border too much upon the baſtard ſtyle, which one may call *king James's gothic*. Inigo's deſigns of that period are not gothic; but have a littleneſs of parts, and a weight of ornaments, with which the revival of the Grecian taſte was encumbered, and which he ſhook off in his grander deſigns. The ſurveyor's place fell, and he returned to England; and, as if architecture was not all he had learned at Rome, with an air of Roman diſintereſtedneſs he gave up the profits of his office,

Jones. which he found extremely in debt; and prevailed upon the comptroller and paymaſter to imitate his example, till the whole arrears were cleared.

In 1620, he was employed in a manner very unworthy of his genius: king James ſet him upon diſcovering, that is, gueſſing, who were the founders of Stonehenge. His ideas were all Romanized; conſequently, his partiality to his favourite people, which ought rather to have prevented him from charging them with that maſs of barbarous clumſineſs, made him conclude it a Roman temple.

In the ſame year Jones was appointed one of the commiſſioners for the repair of St Paul's; but which was not commenced till the year 1633, when Laud, then biſhop of London, laid the firſt ſtone, and Inigo the fourth. In the reſtoration of that cathedral, he made two capital faults. He firſt renewed the ſides with very bad Gothic; and then added a Roman portico, magnificent and beautiful indeed, but which had no affinity with the ancient parts that remained, and made his own Gothic appear ten times heavier. He committed the ſame error at Wincheſter, thruſting a ſcreen in the Roman or Grecian taſte into the middle of that cathedral. Jones indeed was by no means ſucceſsful when he attempted Gothic. The chapel of Lincoln's-Inn has none of the characteriſtics of that architecture. The cloyſter beneath ſeems oppreſſed by the weight of the building above.

The authors of the life of Jones place the erecting of the Banqueting-houſe in the reign of king Charles; but it appears, from the accounts of Nicholas Stone, that it was begun in 1619, and finiſhed in two years—a ſmall part of the pile deſigned for the place of our kings; but ſo complete in itſelf, that it ſtands a model of the moſt pure and beautiful taſte. Several plates of the intended palace at Whitehall have been given; but Mr Walpole thinks, from no finiſhed deſign. The four great ſheets are evidently made up from general hints; nor could ſuch a ſource of invention and taſte as the mind of Inigo, ever produce ſo much ſameneſs. The whole fabric, however, was ſo glorious an idea, that one forgets for a moment (ſays Mr Walpole), in the regret for its not being executed, the confirmation of our liberties, obtained by a melancholy ſcene that paſſed before the windows of that very Banqueting-houſe.

In 1623 he was employed at Somerſet-houſe, where a chapel was to be fitted up for the Infanta, the intended bride of the prince. The chapel is ſtill in being. The front to the river, part only of what was deſigned, and the water-gate, were erected afterwards on the deſigns of Inigo, as was the gate at York-ſtairs.

On the acceſſion of Charles, Jones was continued in his poſts under both king and queen. His fee as ſurveyor, was eight ſhillings and four-pence a-day, with an allowance of 46l. a-year for houſe-rent, beſides a clerk, and incidental expences. What greater rewards he had, are not upon record.

During the proſperous ſtate of the king's affairs, the pleaſures of the court were carried on with much taſte and magnificence. Poetry, painting, muſic, and architecture, were all called in to make them rational amuſements. Mr Walpole is of opinion, that the celebrated feſtivals of Louis XIV. were copied from the ſhews exhibited at Whitehall, in his time the moſt polite court in Europe. Ben Johnſon was the laureat; Inigo Jones the inventor of the decorations; Laniere and Feraboſco compoſed the ſymphonies; the king, the queen, and the young nobility, danced in the interludes. We have accounts of many of thoſe entertainments, called *maſques*; they had been introduced by Anne of Denmark. Jones.

Lord Burlington had a folio of the deſigns for theſe ſolemnities, by Inigo's own hand, conſiſting of habits, maſks, ſcenes, &c. The harmony of theſe maſks was a little interrupted by a war that broke out between the compoſers, Inigo and Ben; in which, whoever was the aggreſſor, the turbulent temper of Johnſon took care to be moſt in the wrong. Nothing exceeds the groſſneſs of the language that he poured out, except the badneſs of the verſes that were the vehicle. There he fully exerted all the brutal abuſe which his contemporaries were willing to think wit, becauſe they were afraid of it; and which only ſeems to ſhew the arrogance of the man, who preſumed to ſatirize Jones and rival Shakeſpear.

The works of Inigo Jones are not ſcarce; Surgeon's-hall is one of his beſt works. One of the moſt admired is the Arcade of Covent-garden, and the Church: "Two ſtructures, (ſays Mr Walpole), of which I want taſte to ſee the beauties. In the arcade there is nothing remarkable; the pilaſters are as arrant and homely ſtripes as any plaſterer would make. The barn-roof over the portico of the church ſtrikes my eyes with as little idea of dignity or beauty, as it could do if it covered nothing but a barn. It muſt be owned, that the defect is not in the architect, but in the order. —Who ever ſaw a beautiful Tuſcan building? Would the Romans have choſen that order for a temple?" The expence of building that church was 4500l.

Ambreſbury in Wiltſhire was deſigned by Jones, but executed by his ſcholar Webb. Jones was one of the firſt that obſerved the ſame diminution of pilaſters as in pillars. Lindſay-houſe in Lincoln's-Inn Fields, which he built, owes its chief grace to this ſingularity. In 1618 a ſpecial commiſſion was iſſued to the lord chancellor, the earls of Worceſter, Pembroke, Arundel, and others, to plant, and reduce to uniformity, Lincolns-Inn Fields, as it ſhall be drawn by way of map, or ground-plot, by Inigo Jones, ſurveyor-general of the works. That ſquare is laid out with a regard to ſo trifling a ſingularity, as to be of the exact dimenſions of one of the pyramids: this would have been admired in thoſe ages when the Keep at Kenelworth Caſtle was erected in the form of an horſe-ſetter, and the Eſcurial in the ſhape of St Laurence's gridiron.

Coleſhill in Berkſhire, the ſeat of Sir Matthew Pleydell, built in 1650, and Cobham-hall in Kent, were Jones's. He was employed to rebuild Caſtle Aſhby, and finiſhed one front: but the civil war interrupted his progreſs there and at Stoke-park in Northamptonſhire. Shaftſbury-houſe, now the London Lying-in hoſpital, on the eaſt ſide of Alderſgate-ſtreet, is a beautiful front. The Grange, the ſeat of the lord chancellor Henley in Hampſhire, is entirely of this maſter. It is not a large houſe, but by far one of the beſt proofs of his taſte. The hall, which opens to a ſmall veſtibule with a cupola, and the ſtair-caſe

Ionia. || Jouk.

caſe adjoining, are beautiful models of the pureſt and moſt claſſic antiquity. The gate of Beaufort-garden at Cheſſea, deſigned by Jones, was purchaſed by lord Burlington, and tranſported to Chiſwick. He drew a plan for a palace at Newmarket; but not that wretched hovel that ſtands there at preſent. One of the moſt beautiful of his works is the Queen's houſe at Greenwich. The firſt idea of the hoſpital is ſaid to have been taken by his ſcholar Webb, from his papers.

Inigo taſted early the misfortunes of his maſter. He was not only a favourite, but a Roman catholic: in 1646, he paid 545 l. for his delinquency and ſequeſtration. Whether it was before or after this fine, it is uncertain, that he and Stone the maſon buried their joint ſtock in Scotland-yard; but an order being publiſhed to encourage the informers of ſuch concealments, and four perſons being privy to the ſpot where the money was hid, it was taken up, and reburied in Lambeth-marſh.

Grief, misfortunes, and age, put an end to his life at Somerſet-houſe, July 21. 1651.

Several of his deſigns have been publiſhed by Mr Kent, Mr Colin Campbell, and Mr Iſaac Ware. He left in MS. ſome curious notes on Palladio's architecture, which are inſerted in an edition of Palladio publiſhed in 1714.

IONIA (anc. geog.), a diſtrict of the Hither Aſia, a great colony of Greeks, led thither after that of Æolia. It conſiſted of twelve cities, ten of which were on the continent, and two on the iſlands of Samos and Chios; extending from Phocœa to Miletus, incluſive from north to ſouth, according to Herodotus, Strabo, and Mela: Though Ptolemy confines it between the Hermus to the north, and the Meander to the ſouth. *Jones* or *Jaones* the people, (Homer) taking name from *Javan* their progenitor: A ſoft and luxurious nation. Plato baniſhes from his republic the Ionian muſic, as too effeminate. The *Attagen Ionicus*, (Horace, Martial), was a bird in eſteem for its flavour with perſons who loved good eating.—The *Ionian* ſea was that part of the Mediterranean extending between Epirus and Peloponneſus to the eaſt, and Magna Græcia and part of Sicily to the weſt.

IONIC ORDER. See ARCHITECTURE, p. 352.

IONIC *Dialect*, in grammar, a manner of ſpeaking peculiar to the people of Ionia.

IONIC *Sect* was the firſt of the ancient ſects of philoſophers; the others were the Italic and Ekatic. The founder of this ſect was Thales, who, being a native of Miletus in Ionia, occaſioned his followers to aſſume the appellation of *Ionic*: Thales was ſucceeded by Anaximander, and he by Anaximenes, both of Miletus; Anaxagoras Clazomenius ſucceeded them, and removed his ſchool from Aſia to Athens, where Socrates was his ſcholar. It was the diſtinguiſhing tenet of this ſect, that water was the principle of all natural things.

JONK, or JONQUE, in naval affairs, is a kind of ſmall ſhip, very common in the Eaſt Indies. Theſe veſſels are about the bigneſs of our fly-boats; and differ in the form of their building, according to the different methods of naval architecture uſed by the nations to which they belong. Their ſails are frequently made of mats, and their anchors are made of wood.

JONSTON (John), a learned Poliſh naturaliſt and phyſician, born in 1603. He travelled all over Europe, and procured eſteem every-where by his knowledge; afterward he bought the eſtate of Ziebendorf in the duchy of Lignitz in Silеſia, where he ſpent the remainder of his days. He wrote a natural hiſtory of birds, fiſh, quadrupeds, inſects, ſerpents, and dragons, in folio; a piece upon the Hebrew and Greek feſtivals, a thaumatography, and ſome poems. He died in 1675. Johnſton || Jordin.

JOPPE (anc. geogr.), a town of Samaria, on the Mediterranean, ſituate in a plain (1 Macc. x.), in the tribe of Ephraim (Joſh. xvi.). Here Andromeda is fabled to have been bound and expoſed to the ſea-monſter, and delivered by Perſeus. Now *Jaffa*, a port-town of Paleſtine. E. Long. 36. 0. N. Lat. 32. 20.

JORDANO (Luca), an eminent Italian painter, was born at Naples in 1632. He became very early a diſciple of Joſeph Ribera; but going afterwards to Rome, he attached himſelf to the manner of Pietro da Cortona, whom he aſſiſted in his great works. Some of his pictures being ſeen by Charles II. king of Spain, he engaged him in painting the Eſcurial; in which taſk he acquitted himſelf as a great painter. The king ſhewed him a picture of Baſſani, expreſſing his concern that he had not a companion: Luca painted one ſo exactly in Baſſani's manner, that it was taken for a performance of that maſter; and for this ſervice he was knighted, and gratified with ſeveral honourable and valuable employments. The great works he executed in Spain, gave him ſtill greater reputation when he returned to Naples; ſo that though he was a very quick workman, he could not ſupply the eager demands of the citizens. No one, not even Tintoret, ever painted ſo much as Jordano; and his generoſity carried him ſo far as to preſent altar-pieces to churches that were not able to purchaſe them. His labours were rewarded with great riches; which he left to his family, when he died, in 1705.

JORDANS (James), one of the moſt eminent painters of the Flemiſh ſchool, was born at Antwerp in 1593. He learned the principles of his art from Adam Van Ort, whoſe daughter he married; which connexion hindered him from gratifying his inclination of viſiting Italy. He improved moſt under Rubens; for whom he worked, and from whom he drew his beſt principles: his taſte directed him to large pieces; and his manner was ſtrong, true, and ſweet. A great number of altar-pieces painted by him are preſerved in the churches in the Netherlands, which maintain the reputation of this artiſt. He died in 1678.

JORTIN (John), a very learned and ingenious Engliſh clergyman, was born in Huntingdonſhire, about the year 1701. Having ſome private fortune of his own, and being of a peculiar diſpoſition that could not ſolicit promotion, he remained long without preferment. In 1738, lord Winchelſea gave him the living of Eaſtwell in Kent; but the place not agreeing with his health, he ſoon reſigned it. Archbiſhop Herring, who had a great value for him, about the year 1751 preſented him to the living of St Dunſtan's in the Eaſt; and biſhop Oſbaldiſton in 1762 gave him that of Kenſington, with a prebend in St Paul's cathedral, and made him archdeacon of London. His temper,

Joseph || Jotapata.

temper, as well as his aſpect, was rather moroſe and ſaturnine; but in company that he liked, he was at all times facetious, yet ſtill with a mixture of *ſal cenſura ſuperiorum*. His ſermons were ſenſible and argumentative; and would have made more impreſſion on his hearers, had he been more attentive to the advantages flowing from a good delivery: but he appeared to greater advantage as a writer. His remarks on eccleſiaſtical hiſtory, his ſix diſſertations, his life of Eraſmus, and his ſermons, were extremely well received by the public. He died in the year 1770.

JOSEPH, the ſon of Jacob; memorable for his chaſtity, and the honours conferred on him at the court of Egypt, &c. He died in 1635 B. C. aged 110.

JOSEPHUS, the celebrated hiſtorian of the Jews, was of noble birth, by his father Mattathias deſcended from the high-prieſts, and by his mother of the blood-royal of the Maccabees; he was born A. D. 37, under Caligula, and lived under Domitian. At 16 years of age he betook himſelf to the ſect of the Eſſenes, and then to the Phariſees; and having been ſucceſsful in a journey to Rome, upon his return to Judæa he was made captain-general of the Galilæans. Being taken priſoner by Veſpaſian, he foretold his coming to the empire, and his own deliverance by his means. He accompanied Titus at the ſiege of Jeruſalem, and writ his "Wars of the Jews," which Titus ordered to be put in the public library. He afterwards lived at Rome, where he enjoyed the privileges of a Roman citizen, and where the emperors loaded him with favours, and granted him large penſions. Beſides the above work, he wrote, 1. Twenty books of Jewiſh antiquities, which he finiſhed under Domitian. 2. Two books againſt Appian. 3. An elegant diſcourſe on the martyrdom of the Maccabees. 4. His own life. Theſe works are excellently written in Greek.

JOSHUA, the renowned general of the Jews, who conducted them through the wilderneſs, &c. died in 1424 B. C. aged 110.

Joshua, a canonical book of the Old Teſtament, containing a hiſtory of the wars and tranſactions of the perſon whoſe name it bears. This book may be divided into three parts: the firſt of which is a hiſtory of the conqueſt of the land of Canaan; the ſecond, which begins at the 12th chapter, is a deſcription of that country, and the diviſion of it among the tribes; and the third, compriſed in the two laſt chapters, contains the renewal of the covenant he cauſed the Iſraelites to make, and the death of their victorious leader and governor. The whole comprehends a term of 17, or, according to others, of 27 years.

JOSIAH, king of Judah; the deſtroyer of idolatry, and the reſtorer of the true worſhip, an excellent magiſtrate, and a valiant general, was ſlain in battle, 609 B. C.

JOTAPATA (anc. geogr.), a town of the Lower Galilee, diſtant 40 ſtadia from Gabara: a very ſtrong place, ſituate on a rock, walled round, and encompaſſed on all hands with mountains, ſo as not to be ſeen but by thoſe who came very near. It was with great difficulty taken by Veſpaſian, being defended by Joſephus, who commanded in it; when taken, it was ordered to be razed.

JOUBERT (Lawrence), counſellor and phyſician to the king of France, chancellor and judge of the univerſity of Montpelier, was born at Valence in Dauphiny in 1530. He became the diſciple of Rondelet at Montpelier; and at his death ſucceeded to the regius profeſſorſhip of that univerſity, where he had given abundant proofs of his merit, and ſtrengthened his reputation by the lectures he read in that capacity, as well as by the works he publiſhed. Henry III. who paſſionately wiſhed to have children, ſent for him to Paris, in hopes by his aſſiſtance to render his marriage fruitful; but he was diſappointed, without any loſs of repute to Joubert. Much offence was indeed taken at a piece he publiſhed under the title of *Vulgar errors*, in which he treated of virginity and generation more plainly than had ever before been done in the French language. But, though he had promiſed ſomething more on the ſame ſubject, he was ſo piqued at the clamour raiſed againſt it, that the public ſaw no more, of ſix parts promiſed, than the firſt, and part of the ſecond, though they were greatly called for. He died in 1582; and his ſon Iſaac tranſlated ſome of his Latin paradoxes into French. Joubert || Journal.

JOVIAN, the Roman emperor, elected by the army, after the death of Julian the apoſtate, in 363. He at firſt refuſed, ſaying he would not command idolatrous ſoldiers; but, upon an aſſurance that they would embrace Chriſtianity, he accepted the throne, and immediately ſhut all the Pagan temples, and forbid their ſacrifices. But he did not long enjoy the dignity to which his merit had raiſed him; being ſuffocated in his bed by the fumes of a fire that had been made to dry the chamber, in 364, the 33d of his age, and the eighth month of his reign. See Constantinople, n° 71—73.

JOVIUS (Paul), in Italian *Giovio*, a celebrated hiſtorian, was born at Como in Italy, in the year 1483. As his father died in his infancy, he was educated by his eldeſt brother Benedict Jovius, under whom he became well ſkilled in claſſical learning; and then went to Rome, for the ſake of enjoying the benefit of the Vatican library. He there wrote his firſt piece, *De piſcibus Romanis*, which he dedicated to cardinal Lewis of Bourbon. He received a penſion of 500 crowns for many years from Francis I. king of France, whoſe favour he ſecured by his flatteries. But, in the following reign, having diſguſted the conſtable Montmorency, his name was ſtruck out of the liſt of penſioners. Jovius did not ſuffer his ſpirits to ſink under this misfortune: he had obtained a high reputation in the learned world by his writings; and having always ſhewed great reſpect to the houſe of Medicis, on whoſe praiſes he had expatiated in his works, he applied to Clement VII. and obtained the biſhoprick of Nocera. His principal piece is his hiſtory, which is that of his own time throughout the world, beginning with 1494, and extending to the year 1544. This was the chief buſineſs of his life. For he formed the plan of it in the year 1515; and continued upon it till his death, which happened at Florence in 1552. It is printed in three volumes folio. He is allowed to have been a man of wit as well as learning; he was maſter of a bright and poliſhed ſtyle, and has many curious obſervations: but being a venal writer, his hiſtories are not much credited.

JOURNAL, or Day-book. See Book-keeping.

Jour-

Journal ‖ pecacuanha.

JOURNAL, in navigation, a ſort of diary, or daily regiſter of the ſhip's courſe, winds, and weather; together with a general account of whatever is material to be remarked in the period of a ſea-voyage.

In all ſea-journals, the day, or what is called the 24 *hours*, terminates at noon, becauſe the errors of the dead-reckoning are at that period generally corrected by a ſolar obſervation. The daily compact uſually contains the ſtate of the weather; the variation, increaſe, or diminution of the wind; and the ſuitable ſhifting, reducing, or enlarging the quantity of ſail extended; as alſo the moſt material incidents of the voyage, and the condition of the ſhip and her crew; together with the diſcovery of other ſhips or fleets, land, ſhoals, breakers, ſoundings, &c *.

See Navigation.

JOURNAL, is alſo a name common for weekly eſſays, news-papers, &c. as the Grays-Inn journal, the Weſtminſter journal, &c.

JOURNAL, is alſo uſed for the titles of ſeveral books which come out at ſtated times, and give abſtracts, accounts, &c. of the new books that are publiſhed, and the new improvements daily made in arts and ſciences; as the *Journal de Sçavans*, &c.

JOURNEY, a tract of ground paſſed over in travelling by land; properly as much as may be paſſed over in one day.

Management of a Horſe on a JOURNEY. See HORSE.

JOURNEYMAN, properly one who works by the day only; but the word is now uſed for any one who works under a maſter, either by the day, the year, or the piece.

JOUVENET (John), a celebrated French painter, was born at Rouen in 1644; where his father, who was a painter, bred him up to the ſame profeſſion: but his greateſt improvement was confeſſedly derived from the inſtructions of Nicholas Pouſſin, and ſtudying the works of that maſter. He acquired ſo good a knowledge of deſign, as qualified him for employment in ſeveral grand works in the palaces at Paris and Trianon; in many of the churches and convents; and in the hoſpital of invalids, where he painted the twelve apoſtles, each figure being 14 feet high. He was eſteemed to have a ready invention, to be correct in his deſigns, and to have a taſte for grandeur in his compoſitions: it is obſerved of this artiſt, that being deprived of the uſe of his right hand by a paralytic diſorder, he nevertheleſs continued to paint with his left. He died in the year 1717.

JOY, that affection of the mind conſequent on being put in poſſeſſion of what we have deſired. For the effects of joy in the animal œconomy, ſee (the *Index* ſubjoined to) MEDICINE.

IPECACUANHA, in the materia medica, a Weſt-Indian root, of which there are two kinds, diſtinguiſhed by their colour, and brought from different places; but both poſſeſſing the ſame virtues, tho' in a different degree. The one is grey, and brought from Peru; the other is brown, and is brought from the Braſils: and theſe are indifferently ſent into Europe under the general name of *ipecacuanha*.

Theſe two ſorts have been by ſome ſuppoſed to be the roots of two different plants: but this is a miſtake; the only difference is, that one grows in a different place, and in a richer and moiſter ſoil, and is better ſupplied with juices than the other.

Ipecacuanha is an excellent, mild, and ſafe emetic; it is alſo a noble reſtringent; and, given in doſes too ſmall to vomit, is the greateſt of all remedies for a dyſentery. Small doſes are alſo an excellent remedy in diarrhœas of a more ſimple kind; and in the fluor albus we hardly know a better medicine.

Ipecacuanha ‖ Ipſwich.

IPICRATES, general of the Athenians, had that command conferred upon him at 20 years of age, and became famous for the exactneſs of his military diſcipline. He made war on the Thracians; reſtored Seuthes, who was an ally of the Athenians; attacked the Lacedæmonians; and, on many other occaſions, gave ſignal proofs of his conduct and courage. Many ingenious repartees have been mentioned of this general: a man of good family with no other merit than his nobility, reproaching him one day for the meanneſs of his birth, he replied, "I ſhall be the firſt of my race, and thou the laſt of thine." He died 380 B. C.

IPOMEA, QUAMOCLIT, or *Scarlet Convolvulus*; a genus of the monogynia order, belonging to the pentandria claſs of plants. There are ſeveral ſpecies; but not more than one, (the coccinea), cultivated in our gardens. This hath long, ſlender, twining ſtalks, riſing upon ſupport ſix or ſeven feet high. The leaves are heart-ſhaped, pointed, and angulated at the baſe, and from the ſides of the ſtalks and branches ariſe many ſlender footſtalks; each ſupporting ſeveral large and beautiful funnel-ſhaped and ſcarlet flowers. There is a variety with orange-coloured flowers. Both of them are annual, riſing from ſeed in ſpring, flowering in July and Auguſt, ripening their ſeeds in September and October, and totally periſhing in a ſhort time after. They are tender, and muſt be brought up in a hot-bed till the latter end of May or beginning of June, when they may be planted out to adorn the borders, or ſome may be planted in pots to move occaſionally to adorn any particular place; but in either caſe, there muſt be ſticks for them to twine upon.

IPSWICH, the capital of the county of Suffolk in England, ſeated in E. Long. 1. 6. N. Lat. 52. 12. The name comes from the Saxon *Gypeſwick*, that is, a town ſituated upon the Gyppen, now called *Orwell*. It had once 21 churches, but now has only 12. It was plundered by the Danes in 991, and afterwards beſieged by king Stephen. It had charters and a mint in the reign of king John, but its laſt charter was from Charles II. The remains of a wall and ſix or ſeven religious houſes are ſtill to be ſeen. Though it is not in ſo flouriſhing a ſtate as formerly when the harbour was more commodious, yet it is ſtill a large well-built town. Beſides the churches already mentioned, it has ſeveral meeting-houſes, two chapels, a town-hall, council-chamber, a large market-place with a croſs in the middle of it, a ſhire-hall for the county-ſeſſions, a library, ſeveral hoſpitals, a free-ſchool, a handſome ſtone bridge over the river, ſtately ſhambles in the market-place built by cardinal Wolſey, who was a native of the town and a butcher's ſon, and who alſo began to build a college here on the ruins of a ſmall college of black canons, which ſtill bears his name, though it was never finiſhed. Here are alſo ſeveral alms-houſes, three charity-ſchools, and a convenient key and cuſtom-houſe. By virtue of Charles II.'s charter,

Ipſwich, Ireland.

charter, the town is governed by two bailiffs, a recorder, 12 portmen, of whom the bailiffs are two, a town-clerk, two coroners, and 24 common-council. The bailiffs and 24 of the portmen are juſtices of the peace. The town enjoys a great many privileges, as paſſing fines and recoveries, trying criminal, and even crown and capital cauſes among themſelves, ſettling the aſſize of bread, wine, and beer. No freeman is obliged to ſerve on juries out of the town, or bear any office for the king, except that of the ſheriff, or to pay tolls or duties in any other part of the kingdom. They have an admiralty juriſdiction beyond Harwich on the Eſſex coaſt, and on both ſides the Suffolk coaſt, by which they are intitled to all goods caſt on ſhore. The bailiffs even hold an admiralty-court beyond Landguard fort. By a trial in king Edward III.'s time, is appears that the town had a right to the cuſtom-duties for all goods coming into Harwich-haven. They claim a right alſo to all waiſes and ſtrays, &c. The manufactures of the town are chiefly woollen and linen cloth. It has ſtill a conſiderable foreign trade. The tide riſes pretty high, and brings great ſhips within a ſmall diſtance of the town. They export a great deal of corn to London, and ſometimes to Holland. Formerly, they had a great trade in ſhip-building; but that having declined, they now ſend great quantities of timber to the king's yard at Chatham. It has ſeveral great fairs for cattle, cheeſe, and butter; and is admirably ſituated for the trade to Greenland, becauſe the ſame wind that carries them out of the river will carry them to Greenland. It is worth remarking, that it is one of the beſt places in England for perſons in narrow circumſtances, houſe-rent being eaſy, proviſions cheap and plentiful, the paſſage by land or water to London, &c. convenient, and the company of the place good. It gives title of viſcount, as well as Thetford, to the duke of Graſton.

IRELAND, one of the Britannic iſlands, ſituated between the 5th and 10th degrees of weſt longitude, and between the 51ſt and 56th of north latitude, extending in length about 300 miles, and about 150 in breadth.

The ancient hiſtory of this iſland is involved in ſo much obſcurity, that it has been the object of contention among the antiquarians for upwards of a century and an half. The Iriſh hiſtorians pretend to very great antiquity. According to them, the iſland was firſt inhabited about 322 years after the flood. At that time Partholanus the ſon of Scara landed in Munſter on the 14th of May with 1000 ſoldiers, and ſome women, from Greece. This voyage he had undertaken on account of his having killed his father and mother in his native country. The ſame hiſtorians inform us, that a great number of lakes broke out in Ireland during the reign of Partholanus, which had no exiſtence when he came into the iſland, with many other particulars not worth mentioning; but the moſt ſurpriſing circumſtance is, that about 300 years after the arrival of this Grecian colony, all of them periſhed by a plague, not a ſingle perſon remaining to tell the fate of the reſt; in which caſe, it is wonderful how the cataſtrophe ſhould have been known.

1 Origin of the Iriſh, according to their own hiſtorians.

After the extinction of this firſt colony, Ireland remained a perfect wilderneſs for 30 years; when another colony arrived from the eaſt, under the direction of one Nemedius. He ſet ſail from the Euxine ſea with 30 tranſports, each manned with 40 heroes; and at laſt arrived on the coaſts of Ireland, after a very tedious and ſtrange navigation. During his reign alſo many lakes were formed in the country, which had no exiſtence before; the moſt material circumſtance, however, was an unſucceſsful war in which he was engaged with ſome African pirates, who in the end enſlaved his people. The victors proved ſuch inſupportable tyrants, that the Iriſh found themſelves under a neceſſity of quitting the iſland altogether. They embarked on board a fleet of 1130 ſhips, under the command of three grandſons of Nemedius, viz. Simon Breac, To Chath, and Briatan Maol. The firſt returned to Greece, the ſecond failed to the northern parts of Europe, and the third landed in the north of Scotland, and from him the iſland of Britain is ſaid to have taken its name, and the Welſh their origin. Ireland.

About 216 years after the death of Nemedius, the deſcendants of Simon Breac returned from Greece into Ireland. They were conducted by five princes of great reputation, who divided the iſland into five kingdoms, nearly equal in ſize. Theſe kingdoms were called *Munſter*, *Leinſter*, *Connaught*, *Meath*, and *Ulſter*; and the ſubjects of theſe kings are called by the Iriſh hiſtorians, *Firbolgs*.

The Firbolgs were in proceſs of time expelled or totally ſubdued, after the loſs of 100,000 men in one battle, by the *Tuath de Dannans*, a nation of necromancers who came from Attica, Bœotia, and Achaia, into Denmark; from Denmark to Scotland; and from Scotland to Ireland. Theſe necromancers were ſo completely ſkilled in their art, that they could even reſtore the dead to life, and bring again into the field thoſe warriors who had been ſlain the day before. They had alſo ſome curioſities which poſſeſſed a wonderful virtue. Theſe were a ſword, a ſpear, a cauldron, and a marble chair; on which laſt were crowned firſt the kings of Ireland, and afterwards thoſe of Scotland. But neither the powerful virtues of theſe Daniſh curioſities, nor the more powerful ſpells of the magic art, were able to preſerve the *Tuath de Dannans* from being ſubdued by the Gadelians when they invaded Ireland.

The Gadelians were deſcended from one Gathelus, from whom they derived their name. He was a man of great conſequence in Egypt, and intimately acquainted with Moſes the Jewiſh legiſlator. His mother was Scota, the daughter of Pharaoh, by Niul the ſon of a Scythian monarch cotemporary with Nimrod. The Gadelians, called alſo *Scots*, from Scota abovementioned, conquered Ireland about 1300 B. C. under Heber and Heremon, two ſons of Mileſius king of Spain, from whom were deſcended all the kings of Ireland down to the Engliſh conqueſt, and who are therefore ſtyled by the Iriſh hiſtorians, princes of the *Mileſian race*.

From this period the Iriſh hiſtorians trace a gradual refinement of their countrymen from a ſtate of the groſſeſt barbarity, until a monarch, named *Ollam Fodla*, eſtabliſhed a regular form of government, erected a grand ſeminary of learning, and inſtituted the *Fes*, or triennial convention of provincial kings, prieſts, and poets, at Feamor or Tarah in Meath, for the eſtabliſhment

Ireland. ment of laws and regulation of government. But whatever were the inſtitutions of this monarch, it is acknowledged that they proved inſufficient to withſtand the wildneſs and diſorder of the times. To Kimbath, one of his ſucceſſors, the annaliſts give the honour of reviving them, beſides that of regulating Ulſter, his family-province, and adorning it with a ſtately palace at Eamannia near Armagh. His immediate ſucceſſor, called *Hugony*, is ſtill more celebrated for advancing the work of reformation. It ſeems, that, from the earlieſt origin of the Iriſh nation, the iſland had been divided into the five provincial kingdoms abovementioned, and four of theſe had been ſubject to the fifth, who was nominal monarch of the whole iſland. Theſe four, however, proved ſuch obſtinate diſturbers of the peace, that Hugony, to break their power, parcelled out the country into 25 dynaſties, binding them by oath to accept no other monarch but one of his own family. This precaution proved ineffectual. Hugony himſelf died a violent death, and all his ſucceſſors for a ſeries of ages were aſſaſſinated, ſcarcely with one exception.

About 100 B. C. the pentarchal government was reſtored, and is faid to have been ſucceeded by a conſiderable revolution in politics. The Iriſh bards had for many ages diſpenſed the laws, and the whole nation ſubmitted to their deciſions; but as their laws were exceedingly obſcure, and could be interpreted only by themſelves, they took occaſion from thence to oppreſs the people, until at laſt they were in danger of being totally exterminated by a general inſurrection. In this emergency they fled to Convocar-Mac-Neſſa, the reigning monarch, who promiſed them his protection in caſe they reformed; but at the ſame time, in order to quiet the juſt complaints of his people, he employed the moſt eminent among them to compile an intelligible, equitable, and diſtinct, body of laws, which were received with the greateſt joy, and dignified with the name of *celeſtial deciſions*. Theſe deciſions ſeem to have produced but very little reformation among the people in general. We are now preſented with a new ſeries of barbarities, murders, factions, and anarchy; and in this diſordered ſituation of affairs it was, according to the Iriſh hiſtorians, that the chieftain mentioned by Tacitus addreſſed himſelf to Agricola, and encouraged him to make a deſcent on Ireland. This ſcheme happened not to ſuit the views of the Roman general at that time, and therefore was not adopted; and ſo confident are theſe hiſtorians of the ſtrength of their country even in its then diſtracted ſtate, that they treat the notion of its being ſubdued by a Roman legion and ſome auxiliaries (the force propoſed to Agricola), as utterly extravagant; acquainting us at the ſame time, that the Iriſh were ſo far from dreading a Roman invaſion, that they failed to the aſſiſtance of the Picts, and having made a ſucceſsful incurſion into South Britain, returned home with a conſiderable booty.

In the ſame ſtate of barbarity and confuſion the kingdom of Ireland continued till the introduction of Chriſtianity by St Patrick, about the middle of the fifth century. This miſſionary, according to the adverſaries of the Iriſh antiquity, firſt introduced letters into Ireland, and thus laid the foundations of a future civilization. On the other hand, the advocates for that antiquity maintain, that the Iriſh had the knowledge of letters, and had made conſiderable progreſs in the arts, before the time of St Patrick; tho' they allow, that he introduced the Roman character, in which his copies of the Scripture and liturgies were written. To enter into this diſpute would be contrary to our plan. It is ſufficient to obſerve, that, excepting by ſome of the Iriſh themſelves, the hiſtory already given is generally reckoned entirely fabulous, and thought to have been invented after the introduction of Chriſtianity. An origin of the Iriſh nation hath been found out much nearer than Aſia, Greece, or Egypt; namely, the iſland of Britain, from whence it is now thought that Ireland was firſt peopled. A diſpute hath ariſen concerning the place from whence the firſt emigrants from Britain ſet ſail for Ireland. The honour of being the mother-country of the Iriſh hath been diſputed between the North and South Britons. Mr Macpherſon has argued ſtrenuouſly for the former, and Mr Whitaker for the latter. For an account of their diſpute, however, we muſt refer to the works of theſe gentlemen. Mr Whitaker claims the victory, and challenges to himſelf the honour of being the firſt who clearly and truly demonſtrated the origin of the Iriſh. Ireland.

3 Early hiſtory of Ireland by Mr Whitaker.

The name of Ireland, according to Mr Whitaker, is obviouſly derived from the word *Jar*, or *Eir*, which in the Celtic language ſignifies "weſt." This word was ſometimes pronounced *Iver*, and *Hiver*; whence the names of *Iris*, *Ierna*, *Juverna*, *Iverna*, *Hibernia*, and *Ireland*; by all of which it hath at ſome time or other been known.

About 350 B. C. according to the ſame author, the Belgæ croſſed the channel, invaded Britain, and ſeized the whole extended line of the ſouthern coaſt, from Kent to Devonſhire. Numbers of the former inhabitants, who had gradually retired before the enemy, were obliged at laſt to take ſhipping on the weſtern coaſt of England, and paſſed over into the uninhabited iſle of Ireland. Theſe were afterwards joined by another body of Britons driven out by the Belgæ under Divitiacus, about 100 B. C. For two centuries and a half afterwards, theſe colonies were continually reinforced with freſh ſwarms from Britain; as the populouſneſs of this iſland, and the vicinity of that invited them to ſettle in the one, or the bloody and ſucceſſive wars in Britain during this period naturally induced them to relinquiſh the other: and the whole circuit of Ireland appears to have been completely peopled about 150 years after Chriſt; and as the inhabitants had all fled equally from the dominion of the Belgæ, or for ſome other cauſe left their native country, they were diſtinguiſhed among the Britons by one general and very appoſite name, *viz.* that of *Scuites*, or *Scoti*, "the wanderers, or refugees."

3 Names and ſituation of the tribes by which it was inhabited.

Mr Whitaker alſo informs us, "that in the times of the Romans Ireland was inhabited by 18 tribes; by one upon the northern and three on the ſouthern ſhore, ſeven upon the weſtern, ſix on the eaſtern, and one in the centre.

"Along the eaſtern coaſt, and the Vergivian or internal ocean, were ranged the Damnii, the Voluntii, and the Eblani, the Caucii, the Menapii, and the Coriondii. The firſt inhabited a part of the two counties of Antrim and Down, extending from Fair-head, the moſt north-eaſterly extremity of the iſland, to Iſamnum

Ireland. Promontorium, or the point of Ardglaſs haven in the county of Down; and having the Logia or Lagan, which falls into Carrickfergus Bay, within their poſſeſſions, and Dunum or Down-patrick for their capital. The Voluntii poſſeſſed the coaſt from the point of that haven to the river Buvinda or Boyne, the remainder of Down, the breadth of Ardmagh, and all Louth; having the Vinderus or Carlingford river in their dominions, and the town of Laberus near the river Deva (Atherdee in the county of Louth) for their metropolis. And the Eblani reached from the Boyne to the Læbius, Læv-ui, or Liffy; reſiding in Eaſt-Meath, and in the large portion of Dublin county which is to the north of this river; and acknowledging Mediolanum, Eblana, or Dublin, for their principal town. The Caucii ſpread from the Liffy to the Letrim, the Oboca of the ancients; had the reſt of Dublin county, and ſuch parts of Wicklow as lie to the north of the latter; and owned Dunum or Rath-Downe for their chief city. The Menapii occupied the coaſt betwixt the Letrim and Cancarne-point, all the reſt of Wicklow, and all Wexford to the point; their chief town, Menapia, being placed upon and to the eaſt of Modona, Slanus, or Slane. And the Coriondii inhabited at the back of the Caucii and Menapii, to the weſt of the Slane and Lify, and in all Kildare and all Catherlogh; being limited by the Boyne and Barrow on the weſt, the Eblani on the north, and the Brigantes on the ſouth.

"Upon the ſouthern ſhore and along the verge of the Cantabrian ocean, lay the Brigantes, the Vodiæ, and the Ibernii. The firſt owned the reſt of Wexford and all Waterford: extending to the Blackwater, Aven-More, or Dabrona, on the ſouth-weſt; having the great mouth of the Barrow with their territories, and Brigantia, Waterford, or ſome town near it, for their firſt city; and giving name of *Brigas* to the Suir or Swire, their limitary ſtream on the north, and the appellation of *Bergie* to their own part of the county of Wexford. The Vodiæ poſſeſſed the ſhire of Corke from the Blackwater to the Ban, the river of Kinſale, and the Dobona or Dubana of the ancients; and affixed the name of *Vodium Promontorium* to the point of Balycotton iſland. And the Ibernii inhabited the remainder of Corke, and all that part of Kerry which lies to the ſouth-eaſt of Dingle-ſound; having Ruſina or Ibaune for their capital, the Promontorium Auſtrinum or Miſſen-Head about the middle of their dominions, and the river Ibernus or Dingle-ſound for their northern barrier; and leaving their names to the three diviſions of Ibaune, Beare, and Iveragh.

"Upon the weſtern ſhore of the iſland and along the Great Britannic or Atlantic ocean, were the Lucanii or Lucenii, the Velaborii, and the Cangani, the Auterii, the Nagnatæ, the Hardinii, and Venicnii. The Lucenii inhabited the peninſula of land that lies along the river Ibernus or Dingle-ſound, and perhaps ſome adjoining parts of Kerry. The Velaborii ranged along the ſmall remainder of the latter, and over the whole of Limerick to the Senus or Shannon; having the Durius or Caſheen flowing through their dominions, and Regia, Limeric, or ſome town near it, for their metropolis. And the latter was probably that city near Limerick, the ſite of which is ſtill famous, and retains the appellation of *Cathair*, or the fortreſs; and where the remains of ſtreets, and other marks of a town, may yet be traced. The Cangani lived in the county of Clare: Macolicum near the Shannon, perhaps Feakle or Melic, being their principal town; a headland in the Bay of Galway, near Glaniny, being denominated *Beniſamnum Promontorium*; and the adjoining iſles of Arran, called *Inſulæ Canganæ*. The Auterii were ſettled in the county of Galway; winding along the deep receſs of the Sinus Auſoba or Bay of Galway; ſtretching towards the north as far the Libnius, or the river that bounds the ſhire in that part; and poſſeſſing the ſmall portion of Mayo, which lies to the ſouth of it. And theſe were ſubject to Auterium, anciently Aterith, and now Athenree; and have left their name to the diviſion of Athenree. The Nagnatæ occupied the reſt of the large county of Mayo, all Sligo and all Roſcommon, all Letrim as far as Logh Allin on the ſouth-eaſt, and all Fermanagh to Balyſhannon and Logh Erne; being bounded by the Rhebius or river of Balyſhannon, and the Lake Rhebius or Logh Erne; having a deep bay, called *Magnus Sinus*, that curves along Mayo, Sligo, and Letrim counties; and acknowledging Nagnat, Necmaht, or Alnecmaht, the town of the Nagnatæ, for their capital. And the Hardinii and Venicnii were confederated together under the title of the *Venicnian Nations*, extended from Balyſhannon to the North-Cape, and poſſeſſed all Donnegalle, except the two whole diviſions of Raphoe and Enis-Owen, and the eaſtern part of Killmacrenen. The Venicnii lay along the immediate margin of the ſhore, giving name to the Promontorium Venicnium or Cape Horn, and to the Inſula Venicnia or North-Arran Iſland. And their metropolis Rheba was ſeated upon the lake Rhebius, and in the country of the Hardinii on the ſouth-eaſt.

"Upon the northern ſhore and along the margin of the Deucaledonian ocean, were only the Roboguii; inhabiting the reſt of Donnegalle, all Derry, and all Antrim to the Fair-Head, and the Damnii; and giving their own name to the former and the diviſion of Raphoe. And they had the rivers Vidua or Shipharbour, Argita or Logh Swilly, Darabouna or Logh Foile, and Banna or Ban, in their territories; and acknowledged Robogdium, Robogh, or Raphoe, for their chief city.

"The central regions of the iſland, all Tyrone, the remainder of Fermanagh and Letrim, all Monaghan, and the reſt of Ardmagh; all Cavan, all Longford, and all Weſt-Meath; all the King's and Queen's county, all Kilkenny, and all Tipperary; were planted by the Scoti. The Shannon, Logh Allin, and Logh Erne, were their great boundaries on the weſt; the Barrow, Boyne, and Logh Neagh, on the eaſt; the Swire and Blackwater on the ſouth; and a chain of mountains on the north. And the two greateſt of their towns were Rheba, a city ſeated, liked the Rheba of the Venicnians, upon the lake and river Rhebius, but on a different part of them, and ſomewhere in the north of Cavan; and Ibernia, a town placed a little to the eaſt of the Shannon, and ſomewhere in the county of Tipperary."

But whether we are to receive as truth the accounts given by Mr Whitaker, thoſe of the Iriſh annaliſts, or any other, it is certain, that, till little more than a century ago, Ireland was a ſcene of confuſion and ſlaughter Ireland.

Ireland. slaughter. The Iriſh hiſtorians acknowledge this, as we have already ſeen. Very few of their monarchs eſcaped a violent death. The hiſtories of their kings indeed amount to no more than this, viz. that they began to reign in ſuch a year, reigned a certain number of years, and were ſlain in battle by the valiant prince who ſucceeded to the throne. The introduction of Chriſtianity ſeems to have mended the matter very little, or rather not at all. The ſame wars between the chiefs continued; and the ſame murders and treacheries took place among the inhabitants, till they were invaded by the Danes or Normans, about the end of the eighth century. At this time, we are told, that the monarchical power was weak, by reaſon of the factious and aſſuming diſpoſition of the inferior dynaſtics; but that the evils of the political conſtitution had conſiderably ſubſided by the reſpect paid to religion and learning. The firſt invaſions of the Danes were made in ſmall parties for the ſake of plunder, and were repelled by the chieftain whoſe dominions were invaded. Other parties appeared in different parts of the iſland, and terrified the inhabitants by the havoc they committed. Theſe were in like manner put to flight, but never failed to return in a ſhort time; and in this manner was Ireland harraſſed for the ſpace of 20 years, before the inhabitants thought of putting an end to their inteſtine conteſts, and uniting againſt the common enemy. The northern pirates, either by force or treaty, gradually obtained ſome ſmall ſettlements on the iſland; till at length Turges, or Turgeſius, a warlike Norwegian, landed with a powerful armament in the year 815. He divided his fleet and army, in order to ſtrike terror in different quarters. His followers plundered, burned, and maſſacred, without mercy, and perſecuted the clergy in a dreadful manner on account of their religion. The Danes already ſettled in Ireland, flocked to the ſtandard of Turgeſius, who thus was enabled to ſeat himſelf in Armagh, from which he expelled the clergy, and ſeized their lands. The Iriſh, in the mean time, were infatuated by their private quarrels; till at laſt, after ſome ill-conducted and unſucceſsful efforts, they ſunk into a ſtate of abject ſubmiſſion, and Turgeſius was proclaimed monarch of the whole iſland, in 845.

4 Invaſion of the Danes.

The new king proved ſuch a tyrant, that he ſoon became intolerable. A conſpiracy was formed againſt him; and he was ſeized by Melachline prince of Meath, in a time of apparent peace. An univerſal inſurrection enſued; the Danes were maſſacred or diſperſed; their leader condemned to death for his cruelties, and drowned in a lake. The foreigners, however, were not exterminated, but the remains of them were allowed to continue on the iſland as ſubjects or tributaries to ſome particular chieftains. A new colony ſoon arrived, but under pretence of peaceable intentions, and a deſign of enriching the country by commerce. The Iriſh, through an infatuated policy, ſuffered them to become maſters of Dublin, Limeric, Waterford, and other maritime places, which they enlarged and fortified with ſuch works as had till then been unknown in Ireland. The Danes did not fail to make uſe of every opportunity of enlarging their territories, and new wars quickly enſued. The Iriſh were ſometimes victorious, and ſometimes not; but were never able to drive out their enemies, ſo that they continued to be a very diſtinguiſhed and powerful *ſept*, or tribe, in Ireland. The wars with the Danes were no ſooner at an end, than the natives, as uſual, turned their arms againſt each other. The country was harraſſed by the competitions of the chiefs; laws and religion loſt their influence, and the moſt horrid licentiouſneſs and immorality prevailed. Thus the whole iſland ſeemed ready to become a prey to the firſt invader, when an attempt was made upon it by Magnus king of Norway. This attempt miſcarried, through his own raſhneſs; for, having landed without oppoſition, he advanced into the country without the leaſt apprehenſion. The conſequence of this was, that he was ſurrounded and cut in pieces with all his followers. His death, however, proved of little benefit to Ireland; the ſame diſorders which had gradually reduced the kingdom to a ſtate of extreme weakneſs, ſtill continued to operate, and to facilitate the ſucceſs of the Engliſh invaſion, which happened in the reign of Henry II. Ireland.

5 Henry II. of England meditates an invaſion of Ireland.

The firſt motives which induced this monarch to think of an expedition againſt Ireland are not well known. It was ſuppoſed that he had been provoked by ſome aſſiſtance which the Iriſh princes had given to the French; but, whatever might be in this, it is certain that the deſign was conceived ſoon after he aſcended the throne; and his flatterers ſoon furniſhed him with ſufficient reaſons for conſidering the Iriſh as his ſubjects. It was affirmed, that they had originally poſſeſſed themſelves of their country by permiſſion of Gurguntius a Britiſh king; and that, as deſcendents of the Britons, they were the natural and rightful ſubjects of the Engliſh monarch. It was alſo ſuggeſted, that the renowned king Arthur, Egfred the Northumbrian prince, and Edgar one of the Saxon kings of England, had all led their armies into Ireland, and there made valuable acquiſitions, which their ſucceſſor was in honour bound to recover and maintain. All theſe ſuggeſtions, however, or whatever elſe had occurred to himſelf, ſeemed yet inſufficient to Henry; and therefore he took the moſt effectual method to enſure his reputation, namely, by an application to the pope. To him he repreſented, that the inhabitants of Ireland were ſunk into the moſt wretched ſtate of corruption, both with regard to morals and religion; that Henry, zealous for the honour and enlargement of God's kingdom, had conceived the pious deſign of erecting it in this unhappy country; was ready to devote himſelf and all his powers to this meritorious ſervice; implored the benediction of the pontiff; and requeſted his permiſſion and authority to enter Ireland, to reduce the diſobedient and corrupt, to eradicate all ſin and wickedneſs, to inſtruct the ignorant, and ſpread the bleſſed influence of the goſpel in all its purity and perfection; promiſing at the ſame time to pay a yearly tribute to St Peter from the land thus to be reduced to his obedience, and to the holy ſee. Adrian, the reigning pope, rejoiced at this application which tended ſo much to the advancement of his own power.

6 Is inveſted with the ſovereignty by the Pope.

A bull was therefore immediately formed, conformable to the moſt ſanguine wiſhes of Henry, which was ſent to England without delay, together with a ring, the token of his inveſtiture as rightful ſovereign of Ireland. But whatever inclination the king of England or the pope might at this time (A. D. 1156) have

Ireland.

for the fubjection of Ireland, the fituation of the Engliſh affairs obliged him to defer it for ſome time.

7 State of Ireland at that time.

The ſtate of Ireland, as we have already obſerved, was at this time extremely favourable for an invaſion. The monarch enjoyed little more than a titular dignity, being haraſſed by a faction, and oppoſed by powerful rivals. A number of chieftains who aſſumed the title and rights of royalty, paid a precarious tribute to their ſuperior, and united, if they were diſpoſed to unite, with him, rather as his allies than his ſubjects. In Ulſter, the family of the northern *Hi Nial*, as it was called, exerciſed an hereditary juriſdiction over the counties now called *Tirone*, *Derry*, and *Donnegal*. They alſo claimed a right of ſupremacy over the lords of Fermanagh, Antrim, and Argial, which included the counties of Armagh, Monaghan, Lowth, and ſome adjacent diſtricts: while Dunleve, prince of Uladh (now Down), diſputed the ſuperiority of this family, and affected an independent ſtate. In Munſter, reigned the deſcendants of Brien, a famous ſovereign of former times, impatient to recover the honours of their family; but at laſt, being confined by powerful rivals to the territory of North Munſter, they were obliged to leave the family of Mac Arthy ſovereigns of Deſmond, the ſouthern diviſion. In Connaught, the princes known by the name of *O'Connor*, were acknowledged ſovereigns of the eaſtern territory. Tiernan O'Ruarc, an active and reſtleſs military chief, had the ſupremacy in Breffney, containing the modern county of Leitrim, and ſome adjacent diſtricts. Meath, or the ſouthern Hi-Nial, was ſubject to the family of Clan-Colman, Murchard O'Malachlyn, and his ſucceſſors. Leinſter, divided into ſeveral principalities, was ſubject to Dermod, a fierce, haughty, and oppreſſive tyrant. His father had governed with great cruelty. Seventeen of his vaſſal lords had been either put to death, or had their eyes put out, by his order in one year; and Dermod ſeemed to inherit too great a portion of the ſame temper. His ſtature and bodily ſtrength made him admired by the inferior orders of his ſubjects, and theſe he was careful to protect and favour. His donations and endowments of religious houſes recommended him to the clergy; but his tributary chieftains felt the weight of his pride and tyranny, and to them his government was extremely odious.

The chief competitors for the rank of monarch of Ireland, in the mean time, were, the heirs of the two houſes of O'Connor, and the northern Hi-Nial. Torlogh O'Connor was in poſſeſſion; but he was not generally recogniſed, and was oppoſed by his rival O'Lochlan: notwithſtanding which, he maintained his dignity with magnificence and vigour, till a deciſive victory gained by him over O'Brien raiſed O'Lochlan's jealouſy ſo much, that he obliged him, in a convention of the ſtates, to allow him the ſovereignty of the northern diviſion. In conſequence of this partition, it was reſolved to transfer the territory of O'Ruarc to a perſon more inclined to the intereſts of the two ſovereigns. An expedition was accordingly undertaken; O'Ruarc was ſurpriſed, defeated, and driven from his dominions. Dermod, who had conceived an unlawful paſſion for Dervorghal, the wife of O'Ruarc, took the opportunity of her huſband's diſtreſſes, to carry her off in triumph. O'Ruarc conceived the moſt implacable reſentment againſt Dermod; and therefore applying himſelf to Torlogh, promiſed an inviolable attachment to his intereſt; and prevailed on him not only to reinſtate him in his poſſeſſions, but to revenge the inſult offered by Dermod, and to reſtore his wife. By means of ſuch a powerful ally, O'Ruarc found frequent opportunities of haraſſing his antagoniſt till the death of Torlogh, which happened in 1156, upon which O'Lochlan ſucceeded to the ſovereignty. Dermod was the firſt to acknowledge the authority of this new ſovereign, by whoſe means he hoped to be able to revenge himſelf on O'Ruarc. He ſoon found, however, that he had acted too precipitately. His patron, having treacherouſly ſeized and put out the eyes of Dunleve prince of Down, the neighbouring chieftains took arms, in order to ſecure themſelves from his barbarity. O'Lochlan was defeated and killed; upon which the monarchy devolved on Roderic the ſon of the late Torlogh O'Connor.

Ireland.

The new prince had acquired the reputation of valour, and was determined to eſtabliſh this reputation by ſome remarkable exploit in the beginning of his reign. Having therefore engaged in his ſervice the Oſtmen, or deſcendants of the Danes, he marched againſt Dermod as the chief partizan of his fallen rival. The king of Leinſter was ſeized with the utmoſt conſternation; and in deſpair ſet fire to his own town of Ferns, leſt the enemy ſhould have the ſatisfaction of ſpoiling it. Roderic ſtill advanced, attended by O'Ruarc, Dermod's implacable enemy, and ſoon over-ran the whole province. All the inferior lords at once acknowledged Roderic's authority. Dermod was depoſed, as a man utterly unworthy of his ſtation; another of his family was raiſed to the throne; and the unfortunate prince, finding it impoſſible to ſtay with ſafety in Ireland, embarked with 60 of his followers for England, and ſoon arrived at the port of Briſtol, with a deſign to ſolicit aſſiſtance from king Henry.

8 Dermod, an exiled prince, ſolicits aſſiſtance from Henry II.

In England, Dermod's character was unknown, and he was regarded as an injured prince driven from his throne by an iniquitous confederacy. The clergy received him as the benefactor of their order, and entertained him in the monaſtery of Auguſtines with great hoſpitality. Having learned that Henry was then in Aquitain, he immediately went thither, and in a very abject manner implored his aſſiſtance, promiſing to acknowledge him as his liege lord, and to hold his dominions, which he was thus confident of regaining, in vaſſalage to Henry and his heirs.

Though nothing could be more flattering to the ambition of the king of England than this ſervile addreſs, yet the ſituation of his own affairs rendered it impoſſible for him at that time to reap from it any of the advantages with which it flattered him. He therefore diſmiſſed the Iriſh prince with large preſents, and a letter of credence addreſſed to all his ſubjects; notifying his grace and protection granted to the king of Leinſter; and declaring, that whoſoever within his dominions ſhould be diſpoſed to aid the unfortunate prince in the recovery of his kingdom, might be aſſured of his free licence and royal favour.

Dermod returned to England highly pleaſed with the reception he had met with; but notwithſtanding the king's letter, none of the Engliſh ſeemed to be diſpoſed to try their fortunes in Ireland. A month

c-

Ireland.

elapsed without any prospect of succours, so that Dermod began to despair. At last, however, he persuaded, with great promises, Richard Earl of Chepstow, or, as it was formerly called, *Strigul*; a nobleman of considerable influence in Wales, but of broken fortune, to assist him with a considerable force to be transported next spring into Ireland. Overjoyed at this first instance of success, he advanced into South Wales, where, by the influence of the bishop of St David's, he procured many other friends. Robert Fitz-Stephen, a brave and experienced officer, covenanted with him to engage in his service with all his followers, and Maurice Fitz-Gerald his maternal brother; while Dermod, on his part, promised to cede to the two principal leaders, Fitz-Stephen and Fitz-Gerald, the entire dominion of the town of Wexford, with a large adjoining territory, as soon as, by their assistance, he should be reinstated in his rights.

9 Persuades some adventurers to follow him to Ireland.

The Irish prince having now accomplished his purpose, set sail for Ireland in the winter of 1169, and recovered a small part of his dominions even before the arrival of his new allies; but being attacked with a superior force by his old enemies Roderic and O'Ruarc, he found himself obliged to feign submission till the English allies came to his assistance. The expected succours arrived in the month of May 1170, in a creek called the *Bann*, near the city of Wexford. Robert Fitz-Stephen commanded 30 knights, 60 men in armour, and 300 archers. With these came Harvey of Mountmorres, nephew to earl Richard. He had no military force along with him; but came solely with a view of discovering the nature of the country, and reporting it to his uncle. Maurice of Pendergast commanded 10 knights and 200 archers: and thus the English force which was to contend with the whole strength of Ireland, amounted to no more than 600 men.

10 Their successes.

Trifling as this assistance may seem, it nevertheless changed the face of affairs almost instantaneously. Numbers of Dermod's subjects, who had abandoned him in his distress, now flocked to his standard. Wexford was immediately attacked, and surrendered in a few days; Fitz-Stephen and Fitz-Gerald were jointly invested with the lordship of this city and its domain; and Harvey of Mountmorres was declared lord of two considerable districts on the coast. After three or four weeks spent in feasting and rejoicing, a new expedition was undertaken against the prince of Ossory, (a district of Leinster), who had not only revolted from Dermod, but put out the eyes of one of his sons, and that with such cruelty, that the unhappy youth expired under the operation. The allied army was now increased to 3000 men, who were opposed by the prince of Ossory at the head of 5000, strongly entrenched among woods and morasses. By the superior conduct of the English troops, however, the Irish were decoyed from their advantageous situation, and thus were entirely defeated. The English were for keeping the field till they had totally reduced their enemies: but Dermod, accustomed only to ravage and plunder, contented himself with destroying the country; and a sudden reverse of fortune seemed ready to take place. The prince of Ossory, though defeated, still appeared in arms, and only waited for an opportunity of again opposing the enemy in the field. Maurice Pendergast also joined him with his whole troop, being provoked by Dermod, who had refused him leave to return to Wales. This defection, however, was in part supplied by the arrival of Fitz-Gerald with 10 knights, 30 horsemen, and 100 archers. Pendergast in a short time repented of his new alliance, and retired into Wales; so that the prince was obliged to make his submission to Dermod, which the latter with some reluctance accepted. Ireland.

In the mean time, Roderick having settled all his other affairs, advanced against the allies with a powerful army. Dermod was thrown into despair; but, encouraged by Fitz-Stephen, he encamped in a very strong situation, where he was soon besieged by Roderic. The latter, however, dreading the valour of the English, condescended to treat, first with them, and then with Dermod, in order to detach them from the interests of each other: but as this proceeded evidently from fear, his offers were rejected by both parties; upon which he began to prepare for battle: but at the very time when the engagement should have commenced, either through the suggestions of his clergy, or of his own fears, Roderic entered into a new negociation; which at last terminated in a peace. The terms were, that Dermod should acknowledge the supremacy of Roderic, and pay him such service as the monarchs of Ireland had usually received from inferior princes; and as a security for his faithful performance of this article, he delivered up his favourite son as an hostage to Roderic: but in order to establish this accommodation on the firmest basis, the latter obliged himself to give his daughter in marriage to the young prince as soon as Leinster should be reduced, and the peace of the island effectually restored. By a secret article, Dermod engaged to dismiss the British forces immediately after the settlement of his own province, and in the mean time not to bring over any further reinforcements from England. 11 Peace concluded.

Thus ended the first British expedition into Ireland; the consequences of which were so little dreaded at that time by the natives, that their historians, though they dwell upon the provincial wars and contests in other parts of the island, speak of the settlement of the Welshmen in Leinster with a careless indifference. But though the settlement of this colony seemed very little alarming to the generality, it could not escape the observation of discerning persons, that a man of Dermod's character would not long keep his treaties; and that on the first emergency he would have recourse to his former allies, who thus would establish themselves more and more, till at last they would reduce the country entirely under their subjection. These reflections, if any such were then made, were in a short time verified. Dermod was scarce settled in his own dominions, when he began to aspire at the sovereignty, and form schemes for dethroning Roderic. He applied to Fitz-Stephen and Fitz-Gerald; by whom he was again directed to apply to Richard earl of Chepstow, more commonly known by the name of *Strongbow*, on account of his feats of archery. Richard was very much inclined to accept of his invitation; but thought it incumbent upon him first to obtain the consent of king Henry. The king, however, did not incline that his subjects should make conquests for themselves in any other country, and therefore 12 New machinations of Dermod.

Ireland.

therefore diſmiſſed Richard with an equivocal anſwer; but the latter being willing to underſtand his ſovereign's words in the moſt favourable ſenſe, immediately ſet about the neceſſary preparations for his expedition. In May 1711, Raymond le Groſs, Richard's domeſtic friend, and the near relation of Fitz-Stephen and Fitz-Gerald, landed at a place called *Dondonalf*, near Waterford, with 10 knights and 70 archers; and along with them came Hervey of Mountmorres, attended by a ſmall train. The Engliſh immediately intrenched themſelves, and erected a temporary fort for themſelves: which proved a very neceſſary precaution; for the natives, juſtly attributing this new debarkation to the practices of Dermod, inſtantly formed a tumultuous army, and marched to expel the invaders. The Engliſh prepared to meet them; but when they perceived the great ſuperiority of the enemy, they thought proper to retire to their fort. Here, however, they muſt have been totally cut off, had they not luckily collected a numerous herd of cattle from the neighbouring country for their ſubſiſtence. Theſe they drove with fury among the Iriſh, who were thus put into the utmoſt confuſion. The invaders ſeized the favourable moment; and, falling upon their diſordered enemies, put them to flight, and drove great numbers of them into the ſea, where they periſhed. Seventy priſoners were taken, all of them principal citizens of Waterford; who, though they offered large ſums for their ranſom, and even that the city ſhould be delivered up to the Engliſh, were all barbaroufly put to death. This ſucceſs and cruelty ſo intimidated the Iriſh, that they ſuffered theſe mercileſs invaders to maintain their ſtation unmoleſted, and wait for the arrival of their aſſociates.

13 A new body of Engliſh arrive in Ireland.

14 Their ſucceſs and cruelty.

Richard in the mean time having aſſembled his vaſſals, led them through Wales, where he was joined by great numbers of other adventurers; but, when juſt on the point of embarking, was ſurpriſed by a poſitive command from the king, to deſiſt from his intended enterprize, on pain of forfeiture of his lands and honours. He was now, however, too much intereſted in his ſcheme to retract; and therefore pretended to diſbelieve the authenticity of the royal mandate. On the eve of the feaſt of St. Bartholomew, he landed at Waterford with 200 knights and 1200 infantry, all choſen and well appointed ſoldiers. They were immediately joined by Raymond and his troop; and the very next day it was reſolved to make an attempt upon Waterford. The city was taken by ſtorm, and a dreadful maſſacre enſued; to which the cruel Dermod had the merit of putting an end. The marriage of Richard with Eva, the daughter of Dermod, was ſolemnized without delay, and a ſcene of joy and feſtivity ſucceeded the calamities of war.

15 Earl Richard arrives with a powerful reinforcement.

A new expedition was now undertaken againſt Dublin; the inhabitants of which had either manifeſted ſome recent diſaffection to Dermod, or had never been thoroughly forgiven for their old defection. Roderic advanced againſt the allied army with a formidable body, conſiſting, as is ſaid, of 30,000 men: but, fearing to come to a general engagement, he contented himſelf with ſome ſlight ſkirmiſhes; after which, great part of his vaſſals forced him to diſmiſs them, and Dublin was left to its fate. The inhabitants were treated very ſeverely; however, a conſiderable body of them, with Heſculph their governor, had the good fortune to gain ſome veſſels lying in the harbour, and made their eſcape to the northern iſlands. Earl Richard was now inveſted with the lordſhip of Dublin; and appointed Milo de Cogan, a brave Engliſh knight, his governor; while he himſelf, in conjunction with the forces of Dermod, over-ran the country of Meath, committing every where the moſt horrid cruelties. Roderic, in the mean time, unable to oppoſe them in the field, ſent deputies to Dermod, commanding him to retire, and putting him in mind that his ſon was in his hands, and muſt anſwer with his life for the breach of thoſe treaties which his father made ſo little ſcruple to violate. Natural affection, however, had very little place in the breaſt of Dermod. He expreſſed the utmoſt indifference about his ſon; and, with the greateſt arrogance, claimed the ſovereignty of all Ireland: Roderic, provoked at this anſwer, cut off the young prince's head.

Ireland.

This piece of impotent cruelty ſerved only to make the king odious to his own ſubjects, while Dermod and his Engliſh allies committed every where the greateſt deva ſtations, and threatened to ſubdue the whole iſland. This indeed they would probably have accompliſhed, had not the extraordinary ſucceſs of Strongbow alarmed king Henry; who, fearing that he might render himſelf totally independent on the crown of Britain, iſſued his royal edict, ſtrictly forbidding any Engliſh veſſel from paſſing into Ireland with men, arms, or proviſions; and commanding all his ſubjects at that time reſident in Ireland, of whatever rank or degree, to return to their country before the enſuing feaſt of Eaſter, on pain of forfeiting their lands, and being declared traitors.

16 All the adventurers recalled by the king.

Our adventurers were plunged into the greateſt diſtreſs by this peremptory edict. They now found themſelves cut off from all ſupplies in the midſt of their enraged enemies, and in danger of being forſaken by thoſe who had attached themſelves to them during their ſucceſs. Raymond was diſpatched with a moſt ſubmiſſive meſſage to the offended monarch; but before he received any favourable anſwer, every thing was thrown into confuſion by the death of Becket *, ſo that the king had neither leiſure nor inclination to attend to the affairs of Ireland. About the ſame time the death of Dermod their great ally ſeemed almoſt to give a finiſhing ſtroke to the Engliſh affairs. An univerſal defection took place among their aſſociates; and before they had time to concert any proper meaſures, Heſculph, who had formerly eſcaped from Dublin, appeared before that city with a formidable body of troops armed after the Daniſh manner. A furious attack enſued; which at laſt ended in the defeat and captivity of Heſculph, who was immediately put to death. This danger, however, was ſoon followed by one ſtill greater. Roderic had formed a powerful confederacy with many of the Iriſh chieftains, and the kings of the northern iſles, in order to extirpate the Engliſh totally from the iſland. The harbour of Dublin was blocked up by a fleet of 30 ſhips from the northern iſles; while the confederated Iriſh took their ſtations in ſuch a manner as to ſurround the city, and totally cut off all ſupplies of proviſions. In two month's time the Engliſh were reduced to great ſtraits.

* See *England*, n° 117, 118.

17 Diſtreſs of the Engliſh.

Ireland. straits. On the first alarm, Richard had sent for assistance to Fitzstephen; who having weakened his own force, in order to serve the earl, the people of Wexford had risen and besieged Fitzstephen in his fort called *Carrig* near that city. A messenger now arrived, informing Strongbow that his friend was in the utmost danger, and must fall into the hands of his enemies if not assisted within three days; upon which a council of war was called, in order to deliberate on the measures necessary to be pursued in this desperate emergency. It was soon resolved to enter into a treaty with Roderic upon any terms that were not totally servile or oppressive. Laurence prelate of Dublin was appointed to carry the terms; which were, that Richard proposed to acknowledge Roderic as his sovereign, and to hold the province of Leinster as his vassal, provided he would raise the siege. Laurence soon returned with an answer, probably of his own framing; namely, that Dublin, Waterford, Wexford, and all the forts possessed by the British, should be immediately given up; and that the earl and his associates, should depart with all their forces by a certain day, leaving every part of the island free from their usurpations, and absolutely renouncing all their pretended claims. On these conditions they were to be spared; but the least reluctance or delay would determine the besiegers to storm the city.

These terms, though they contained nothing insolent or unreasonable, considering the present situation of the English, were yet intolerable to our indigent adventurers. After some time spent in silence, Milo de Cogan, suddenly starting up, declared his resolution to die bravely rather than submit to the mercy of barbarians. The spirit of desperate valour was instantly caught by the whole assembly; and it was resolved to risk their whole fortune on one desperate effort, by sallying out against the enemy, and to make their attack upon that quarter where Roderic himself commanded. Accordingly, having persuaded a body of the townsmen to take part in this desperate enterprize, they marched out against their enemies, who expected nothing less than such a sudden attack. The besiegers were secure and careless, without discipline or order; in consequence of which, they were unable to sustain the furious assault of the English. A terrible slaughter ensued, and the Irish instantly fled in the greatest confusion; their monarch himself escaping only by mixing half naked with the crowd. The other chieftains who were not attacked caught the panic, and broke up their camps with precipitation; while the victors returned from the pursuit to plunder, and among other advantages gained as much provision as was sufficient to support them for a whole year.

18 They totally defeat their enemies.

Strongbow being thus relieved from his distress, committed the government of Dublin to Milo de Cogan, while he proceeded immediately to Wexford in order to relieve Fitzstephen: but in this he was disappointed; for that brave officer, having often repulsed his enemies, was at last treacherously deceived into submission and laid in irons. Strongbow, however, continued to advance; and was again attacked by the Irish, whom he once more defeated. On his arrival at Wexford, he found it burnt to the ground; the enemy having retired with Fitzstephen and the rest of the prisoners to Holy Island, a small island in the middle of the harbour, from whence they sent a deputation, threatening to put all the prisoners to death if the least attempt was made to molest them in their present situation. The earl then proceeded to Waterford, and from thence to Ferns; where he for some time exercised a regal authority, rewarding his friends and punishing his enemies. A more important object, however, soon engaged his attention. The king of England having settled his affairs as well as he could, now determined to conquer Ireland for himself. A summons was instantly dispatched to earl Richard, expressing the greatest resentment at his presumption and disobedience, and requiring his immediate presence in England. The earl found himself under a necessity of obeying; and having made the best dispositions the time would permit for the security of his Irish possessions, embarked for England, and met the king at Newnham near Gloucester. Henry at first affected great displeasure; but soon allowed himself to be pacified by a surrender of the city of Dublin, and a large territory adjacent, together with all the maritime towns and forts acquired by Strongbow; while on his part he consented that the earl should have all his other possessions granted in perpetuity, to be held of the king and his heirs. The other adventurers made their peace in a similar manner; while the Irish chieftains, instead of uniting in the defence of their country, only thought how to make the most of the approaching invasion, or at least how to avert the threatened evils from their own particular districts. They saw the power of their own sovereign on the point of total dissolution; and they saw it with indifference, if not with an envious and malignant satisfaction. Some were even ready to prevent their invader, and to submit before he appeared on the coast. The men of Wexford, who had possessed themselves of Fitzstephen, resolved to avert the consequences of their late perfidy and cruelty, by the forwardness of their zeal for the service of the king of England, and the readiness of their submissions. Their deputies cast themselves at Henry's feet; and, with the most passionate expressions of obedience, humbly intreated that he would accept them as his faithful vassals, ready to resign themselves, their lands, and possessions, to his absolute disposal. "They had already, (they said), endeavoured to approve their zeal by seizing Robert Fitzstephen, a traitor to his sovereign, who had lately entered their territory by force of arms without any due warrant or fair pretence, had slaughtered their people, seized their lands, and attempted to establish himself independent of his liege lord. They kept him in chains, and were ready to deliver him to the disposal of his sovereign."—The king received them with expressions of the utmost grace and favour; commended their zeal in repressing the unwarrantable attempts of Fitzstephen; declared that he should soon inquire into his crimes, and the wrongs they had sustained, and inflict condign punishment for every offence committed by his undutiful subjects. —Thus were the Irishmen dismissed in the utmost joy and exultation; and the artifice of Henry, while it inspired these men with dispositions favourable to his interests, proved also the most effectual means of saving Fitzstephen from their cruelty.

19 Earl Richard summoned to England.

Henry, having completed the preparations necessary for

Ireland.

Ireland. for his expedition, embarked at Milford with ſeveral of his barons, 400 knights, and about 4000 ſoldiers, on board a fleet of 240 ſail. He landed at Waterford on the feaſt of St Luke in October 1172; with a profeſſed deſign not to conquer, but to take poſſeſſion of a kingdom already his own, as being granted him by the pope. Moſt of the Iriſh indeed ſeemed to be of the ſame opinion, and therefore ſubmitted without the leaſt reſiſtance. Strongbow ſet them an example, by making a formal ſurrender of Waterford, and doing homage to the king for the territory of Leinſter. Fitz-Stephen was delivered up, with many accuſations of tyranny and injuſtice. He was at firſt ſent to priſon; but ſoon purchaſed his liberty, by ſurrendering Wexford, and doing homage for the reſt of his poſſeſſions to the king. The prince of Deſmond was the firſt Iriſh chieftain who ſubmitted. On the very day after the king's arrival, he attended his court, reſigned the city of Corke, did him homage, and ſtipulated to pay a tribute for the reſt of his territory. An Engliſh governor and garriſon were immediately appointed to take poſſeſſion of his capital; and the king diſplayed his power and magnificence by marching to Liſmore, where he choſe a ſituation and gave the neceſſary orders for building a fort. The prince of Thomond next ſubmitted and did homage. He was followed by the princes of Offory, Decies, and all the inferior chiefs of Munſter.

20 King Henry lands in Ireland.

21 Many Iriſh chieftains ſubmit to him.

The king, after having provided for the ſecurity of all his newly acquired territories, and put garriſons in the cities of Limerick, Corke, Waterford, and Wexford, proceeded to take poſſeſſion of Dublin, which had been ſurrendered by Strongbow. The neighbouring lords took the opportunity of ſubmitting as he advanced. O'Carrol of Argial, a chieftain of great conſequence, repaired to his camp, and engaged to become his tributary; and even O'Ruarc, whom Roderic had made lord of a conſiderable part of Meath, voluntarily ſubmitted to the new ſovereign.

22 Roderic ſtill holds out.

Roderic, though ſurpriſed at the defection of ſo many of his allies, ſtill determined to maintain his own dignity, and at leaſt preſerve his province of Connaught, ſeeing he could no longer call himſelf monarch of the whole iſland. With this deſign he entrenched himſelf on the banks of the Shannon; and now, when diſencumbered from a crowd of faithleſs and diſcontented followers, he appears to have acted with a ſpirit and dignity becoming his ſtation. Hugh de Lacy and William Fitz-Andelm were commiſſioned by the king to reduce him: but Roderic was too ſtrong to be attacked with any probability of ſucceſs by a detachment from the Engliſh army; and he at leaſt affected to believe, that his ſituation was not yet ſo totally deſperate as to reduce him to the neceſſity of reſigning his dignity and authority, while his own territory remained inviolate, and the brave and powerful chiefs of Ulſter ſtill kept retired in their own diſtricts without any thoughts of ſubmiſſion. Henry in the mean time attempted to attach the Iriſh lords to his intereſts by elegant and magnificent entertainments, ſuch as to them appeared quite aſtoniſhing. Some hiſtorians pretend that he eſtabliſhed the Engliſh laws in all thoſe parts which had ſubmitted to his juriſdiction; but this muſt appear extremely improbable, when we conſider how tenacious a rude and barbarous people are of their ancient laws and cuſtoms. The Iriſh lords had been accuſtomed to do homage to a ſuperior; and they had made no ſubmiſſion to Henry which they had not formerly done to Roderic, and probably thought their ſubmiſſion to the king of England more honourable than that to their Iriſh monarchs; and it cannot be ſuppoſed, that a wiſe and politic monarch, ſuch as Henry undoubtedly was, ſhould form at once ſuch an extravagant ſcheme as altering the laws of a great number of communities, none of which he had ſubdued by force of arms. By his tranſactions both with the natives and adventurers, however, Henry had attained the abſolute dominion of ſeveral maritime cities and their dependencies; ſo that he had both a conſiderable number of real ſubjects, and a large extent of territory, in the iſland. To theſe ſubjects indeed Henry granted the Engliſh laws; and gave the city of Dublin by charter to the inhabitants of Briſtol, to be held of him and his heirs, with the ſame liberties and free cuſtoms which they enjoyed at Briſtol, and throughout all his land. And, by another charter, executed ſoon after, he confirmed to his burgeſſes of Dublin all manner of rights and immunities throughout his whole land of England, Normandy, Wales, and Ireland, wherever they and their effects ſhall be, to be fully and honourably enjoyed by them as his free and faithful ſubjects. And as it was not eaſy to induce his Engliſh ſubjects immediately to ſettle in theſe maritime towns, he permitted the Oſtmen to take poſſeſſion of Waterford; and to them he granted a particular right of denization, whereby they were inveſted with the rights and privileges of free ſubjects, and for the future to be governed by the laws of his realm. For the better execution of theſe new laws, the king alſo made a diviſion of the diſtricts now ſubject to him into ſhires or counties; which was afterwards improved and enlarged, as the extenſion of the Engliſh ſettlements and the circumſtances of the country required. Sheriffs were appointed both for the counties and cities, with itinerant judges, and other miniſters of juſtice, and officers of ſtate, and every appendage of Engliſh government and law. To complete the whole ſyſtem, a chief governor, or repreſentative of the king, was appointed. His buſineſs was to exerciſe the royal authority, or ſuch parts of it as might be committed to him in the king's abſence; and, as the preſent ſtate of Ireland, and the apprehenſions of war or inſurrections, made it neceſſary to guard againſt ſudden accidents, it was provided, That in caſe of the death of any chief governor, the chancellor, treaſurer, chief-juſtices, and chief baron, keeper of the rolls, and king's ſerjeant at law, ſhould be empowered, with conſent of the nobles of the land, to elect a ſucceſſor, who was to exerciſe the full power and authority of this office, until the royal pleaſure ſhould be further known.

23 Henry obliged to leave Ireland.

But while Henry was thus regulating the government of his new dominions, he received the unwelcome news, that two cardinals, Albert and Theodine, delegated by the pope, had arrived in Normandy the year before, to make inquiſition into the death of Becket; that having waited the king's arrival until their patience was exhauſted, they now ſummoned him to appear without delay, as he would avert the dreadful ſentence of excommunication, and preſerve his dominions

Ireland. nions from a general interdict. Such denunciations were of too great conſequence to admit of his longer ſtay in Ireland; he therefore ordered his forces and the officers of his houſehold to embark without delay, reſerving three ſhips for the conveyance of himſelf and his immediate attendants. Having therefore but a ſhort time to ſecure his Iriſh intereſts, he addreſſed himſelf to the original Engliſh adventurers, and by grants and promiſes laboured to detach them from Strongbow, and to bind them firmly to himſelf. To make amends for what he had taken from Fitz-Stephen, he granted him a conſiderable diſtrict in the neighbourhood of Dublin, to be held by knight's ſervice; at the ſame time entruſting the maritime towns to his own immediate dependants. Waterford was committed to Humphrey de Bohun, Robert Fitz-Bernard, and Hugh de Guadville, with a train of 20 knights. In Wexford were ſtationed William Fitz-Andelm, Philip of Haſtings, and Philip de Braoſa, with a like number of attendants. Hugh de Lacy had a grant of all the territory of Meath, where there was no fortified place, and where of conſequence no particular reſervation was neceſſary, to be held of the king and his heirs, by the ſervice of 50 knights, in as full a manner as it had been enjoyed by any of the Iriſh princes. He alſo conſtituted him lord governor of Dublin, with a guard of 20 knights. Robert Fitz-Stephen and Maurice Fitz-Gerald were appointed his coadjutors, with an equal train; and theſe, with others of the firſt adventurers, were thus obliged, under the the pretence of an honourable employment, to reſide at Dublin, ſubject to the immediate inſpection of de Lacy, in whom Henry ſeems to have placed his chief confidence. Lands were aſſigned in the neighbourhood of each city for the maintenance of the knights and ſoldiers. Orders were given to build a caſtle in Dublin, and fortreſſes in other convenient places; and to John de Courcey, a baron diſtinguiſhed by his enterpriſing genius and abilities for war, was granted the whole province of Ulſter, provided he could reduce it by force of arms.

Diſorders enſue on the king's departure.

Henry was no ſooner gone, than his barons began to contrive how they might beſt ſtrengthen their own intereſts, and the Iriſh how they might beſt ſhake off the yoke to which they had ſo readily ſubmitted. De Lacy parcelled out the lands of Meath to his friends and adherents, and began to erect forts to keep the old inhabitants in awe. This gave offence to O'Ruarc, who ſtill enjoyed the eaſtern part of this territory as a tributary prince. He repaired to Dublin, in order to obtain redreſs from Lacy for ſome injuries real or pretended; but, as the parties could not come to an agreement, another conference was appointed on a hill called *Taragh*. Both parties came with a conſiderable train of armed followers; and the event was a ſcuffle, in which O'Ruarc and ſeveral of his followers were killed, and which ſerved to render the Engliſh not a little odious to the natives.

This ſpirit of diſaffection had ſoon after an opportunity of ſhewing itſelf on the rebellion of king Henry's ſons, of which an account is given under the article ENGLAND, n° 119, *& ſeq.* The king had been obliged to weaken his forces in Ireland, by withdrawing ſeveral of his garriſons. The ſoldiers who remained were alſo diſcontented with their general Hervey of Mountmorres, on account of his ſeverity in diſcipline, and reſtraining them from plunder, to which they imagined themſelves intitled on account of the deficiencies of their pay. Raymond le Gros, the ſecond in command, was much more beloved by the ſoldiery: and to ſuch a height had the jealouſies between the commanders ariſen, that all effectual oppoſition to the Iriſh chieftains was prevented; and the event might have been fatal to the Engliſh intereſt, had not Henry found out a remedy. He ſummoned earl Richard to attend him at Rouen in Normandy, and communicated his intentions of committing the affairs of Ireland to his ſole direction. The earl expreſſed the utmoſt readineſs to ſerve his maſter; but obſerved, that he had already experienced the envy and malignity of his ſecret enemies; that if he ſhould appear in ſuch a diſtinguiſhed character as that of the king's deputy in Ireland, their inſidious practices would be renewed, and his conduct miſrepreſented. He therefore requeſted that a colleague might be appointed in the commiſſion; and recommended Raymond as a perſon of approved loyalty and abilities, as well as highly acceptable to the ſoldiery. The king replied, with an affected air of regard and confidence, that he had his free conſent to employ Raymond in any ſervice he ſhould deem neceſſary; not as a colleague, but as an aſſiſtant; but that he relied entirely on the earl himſelf, and implicitly truſted every thing to his direction. To reward his ſervices, he granted him the town of Wexford, together with a fort erected at Wicklow; and then diſmiſſed him with the moſt gracious expreſſions of favour. Ireland.

25 Strongbow the firſt governor of Ireland.

The earl landed at Dublin, where he was received with all the reſpect due to the royal commiſſion. He ſignified the king's pleaſure, that Robert Fitz-Bernard, with the garriſon of Waterford, ſhould inſtantly embark and repair to Normandy; that Robert Fitz-Stephen, and Maurice Pendergaſt, ſhould attend the ſervice of their ſovereign in England; and, agreeably to the king's inſtructions, took on him the cuſtody of the cities of Dublin, Waterford, and Wexford. Hugh de Lacy, and Milo de Cogan, were, with the other lords, commanded to repair to England for the ſervice of the king; by which the earl's forces were conſiderably weakened, and he ſoon found himſelf under a neceſſity of appointing Raymond to the chief command. The new general proved ſucceſsful in ſome enterprizes againſt the rebellious Iriſh; but having preſumed upon his merits to demand in marriage Baſilia the earl's ſiſter, Richard refuſed his conſent, and Raymond retired into Wales.

Thus the ſupreme command again devolved upon Hervey of Mountmorres; who, being ſenſible that his character had ſuffered much from a compariſon with that of Raymond, determined to emulate his ſucceſſes by ſome bold attempt againſt the rebels. A detachment of 400 of his men, however, had the misfortune to be ſurprized and cut off by the enemy; and this ſucceſs ſerved as a ſignal for a general revolt. Several of the Leinſter chieftains, who had lately made their ſubmiſſions, and bound themſelves to the ſervice of king Henry, now openly diſclaimed all engagements. Even Donald Kevanagh, ſon to the late king Dermod, who had hitherto adhered to the Engliſh in their greateſt difficulties, now declared againſt them, and

26 A general revolt of the Iriſh.

Ireland.

claimed a right to the kingdom of Leinſter; while Roderic, on his part, was active in uniting the princes of Ulſter, the native lords of Meath, and other chiefs, againſt their common enemy. This produced the immediate recall of Raymond; and Richard no longer refuſed his conſent to the marriage with his ſiſter, which was ſolemnized immediately on Raymond's arrival. The very next morning, the bridegroom was obliged to take the field againſt Roderic, who had committed great devaſtations in Meath. By the vigorous conduct of the Engliſh commander, however, he was not only prevented from doing farther miſchief, but at laſt convinced of the folly of reſiſtance; and therefore determined to make a final ſubmiſſion. Yet, conſcious of his dignity, he diſdained to ſubmit to a ſubject; and therefore, inſtead of treating with earl Richard, he ſent deputies directly to the king. The deputies were, Catholicus archbiſhop of Tuam, the abbot of St Brandan, and *Maſter Lawrence*, as he is ſtyled, chancellor to the king of Connaught.

27 Roderic ſubmits to king Henry.

28 Terms of his ſubmiſſion.

The terms of this ſubmiſſion, by which Henry became ſole monarch of Ireland, were as follow: Roderic conſented to do homage and pay tribute, as liege-man to the king of England; on which condition he was allowed to hold the kingdom of Connaught, as well as his other lands and ſovereignties, in as ample a manner as he had enjoyed them before the arrival of Henry in Ireland. His vaſſals were to hold under him in peace, as long as they paid their tribute and continued faithful to the king of England; in which Roderic was to enforce their due obedience, and for this purpoſe to call to his aſſiſtance the Engliſh government, if neceſſary. The annual tribute to be paid was every 10th merchantable hide, as well from Connaught, as from the reſt of the iſland; excepting thoſe parts under the immediate dominion of the king of England and his barons, viz. Dublin and Meath with their appurtenances, Wexford and all Leinſter, and Waterford with its lands as far as Dungarvan incluſive; in all which diſtricts Roderic was not to interfere, nor claim any power or authority. The Iriſh who had fled from theſe diſtricts were to return, and either pay their tribute, or perform the ſervices required by their tenures, at the option of their immediate lords; and, if refractory, Roderic, at the requiſition of their lords, was to compel them to return. He was to take hoſtages from his vaſſals, ſuch as he and his liege-lord ſhould think proper; and on his part to deliver either theſe or others to the king, according to the royal pleaſure. His vaſſals were to furniſh hawks and hounds annually to the Engliſh monarch; and were not to detain any tenant of his immediate demeſnes in Ireland, contrary to his royal pleaſure and command. This treaty was ſolemnly ratified in a grand council of prelates and temporal barons, among whom we find the archbiſhop of Dublin one of the ſubſcribing witneſſes. As metropolitan of Leinſter, he was now become an Engliſh ſubject, and was probably ſummoned on this occaſion as one obliged to attend, and who had a right to aſſiſt in the king's great council. It is alſo obſervable, that Henry now treated with Roderic not merely as a provincial prince, but as monarch of Ireland. This is evidently implied and ſuppoſed in the articles; although his monarchical powers and privileges were little more than nominal, frequently diſregarded and oppoſed by the Iriſh toparchs. Even by their ſubmiſſions to Henry, many of them in effect diſavowed and renounced the ſovereignty of Roderic; but now his ſupremacy ſeems to be induſtriouſly acknowledged, that the preſent ſubmiſſion might appear virtually the ſubmiſſion of all the ſubordinate princes, and thus the king of England be inveſted with the ſovereignty of the whole iſland. The marks of ſovereignty, however, were no more than homage and tribute: in every other particular, the regal rights of Roderic were left inviolate. The Engliſh laws were only to be enforced in the Engliſh pale: and, even there, the Iriſh tenant might live in peace, as the ſubject of the Iriſh monarch; bound only to pay his quota of tribute, and not to take arms againſt the king of England.

Ireland.

But though the whole iſland of Ireland thus became ſubject to the king of England, it was far from being ſettled in tranquillity, or indeed from having the ſituation of its inhabitants mended almoſt in any degree. One great occaſion of diſturbance was, that the Engliſh laws were confined only to thoſe parts which had been ſubdued by force of arms; while the chieftains that had only ſubmitted to pay tribute, were allowed to retain the ancient Iriſh laws within the limits of their own juriſdictions. By theſe old Iriſh laws, many crimes accounted capital with us, ſuch as robbery, murder, &c. might be compenſated by a ſum of money. Hence it happened, that very unequal puniſhments were inflicted for the ſame offence. If one Engliſhman killed another, he was puniſhed with death; but if he killed an Iriſhman, he was puniſhed only by a fine. If an Iriſhman, on the other hand, killed an Engliſhman, he was certainly puniſhed with death: and as in times of violence and outrage, the crime of murder was very frequent, the circumſtance juſt mentioned tended to produce an implacable hatred between the original inhabitants and the Engliſh. As the Iriſh laws were thus more favourable to the barbarity natural to the tempers of ſome individuals, many of the Engliſh were alſo tempted to lay aſide the manners and cuſtoms of their countrymen altogether, and to aſſociate themſelves with the Iriſh, that, by becoming ſubject to their laws, they might thus have an opportunity of gratifying their brutal inclinations with leſs controul than formerly; and in proceſs of time, theſe *degenerate Engliſh*, as they were called, proved more bitter enemies to their countrymen than even the Iriſh themſelves.

29 Cauſes of the ſubſequent diſtreſſes of Ireland.

Another cauſe of the diſtreſſes of Ireland was, the great power of the Engliſh barons, among whom Henry had divided the greateſt part of his Iriſh dominions. The extent of their authority only inflamed them with a deſire for more; and, inſtead of contributing their endeavours to increaſe the power of their ſovereign, or to civilize the barbarous people over whom they were placed, they did every thing in their power to counteract and deſtroy each other. Henry himſelf, indeed, ſeems to have been infected with a very fatal jealouſy in this reſpect; for, though the abilities and fidelity of Raymond had abundantly manifeſted themſelves, the king never could allow himſelf to continue him in the government of the iſland: and the conſequence of degrading him never failed to be a ſcene of uproar and confuſion. To theſe two reaſons

we

Ireland.

we must likewise add another; namely, that in those parts of the kingdom where the Irish chieftains enjoyed the sovereignty, they were at full liberty to make war upon each other as formerly, without the least restraint. This likewise induced many of the English to degenerate, that they might have an opportunity of sharing the plunder got by these petty wars; so that on the whole, the island was a perpetual scene of horror, almost unequalled in the history of any country.

30 Fitz-Andelm's bad government.

After the death of earl Richard, Raymond was immediately elected to succeed him; but was superseded by the king, who appointed William Fitz-Andelm, a nobleman allied to Raymond, to succeed in his place. The new governor had neither inclination nor abilities to perform the task assigned to him. He was of a rapacious temper, sensual and corrupt in his manners; and therefore only studied to enrich himself. The native Irish, provoked by some depredations of the English, commenced hostilities; but Fitz-Andelm, instead of repressing these with vigour in the beginning, treated the chieftains with affected courtesy and flattery. This they had sufficient discernment to see, and to despise; while the original adventurers had the burden of the whole defence of the *English pale*, as the English territories were called, thrown upon them, at the same time that the bad conduct of the governor was the cause of perpetual disorders. The consequence of this was, that the lords avowed their hatred of Fitz-Andelm: the soldiers were mutinous, ill-appointed, and unpaid: and the Irish came in crowds to the governor with perpetual complaints against the old adventurers, which were always decided against the latter; and this decision increased their confidence, without lessening their disaffection.

In this unfavourable state of affairs, John de Courcey, a bold adventurer, who had as yet reaped none of the benefits he expected, resolved to undertake an expedition against the natives, in order to enrich himself with their spoils. The Irish at that time were giving no offence; and therefore pleaded the treaty lately concluded with King Henry: but treaties were of little avail, when put in competition with the necessities of an indigent and rapacious adventurer. The consequence was, that the flame of war was kindled through the whole island. The chieftains took advantage of the war with the English, to commence hostilities against each other. Desmond and Thomond, in the southern province, were distracted by the jealousies of contending chiefs, and the whole land was wasted by unnatural and bloody quarrels. Treachery and murder were revenged by practices of the same kind, in such a manner as to perpetuate a succession of outrages the most horrid, and the most disgraceful to humanity. The northern province was a scene of the like enormities; though the new English settlers, who were considered as a common enemy, ought to have united the natives among themselves. All were equally strangers to the virtues of humanity; nor was religion, in the form it then assumed, capable of restraining these violences in the least.

31 He is superseded by Hugh de Lacey.

Ireland was thus in a short time reduced to such a state, that Henry perceived the necessity of recalling Fitz-Andelm, and appointing another governor. He was recalled accordingly; and Hugh de Lacey appointed to succeed him. He left his government without being regretted, and is said by the historians of those times to have done only one good action during the whole course of his administration. This action was nothing more important, than the removing of a relic, called the *staff of Jesus*, from the cathedral of Armagh to that of Dublin; probably that it might be in greater safety, as the war raged violently in Ulster. De Lacey, however, was a man of a quite different disposition, and every way qualified for the difficult government with which he was invested: but at the same time, the king, by investing his son John with the lordship of Ireland, gave occasion to greater disturbances than even those which had already happened. The nature of this lordship hath been much disputed; but the most probable opinion is, that the king's son was now to be invested with all the rights and powers which had formerly belonged to Roderic, who was allowed the title of *king of Ireland*. It doth not appear, indeed, that Henry had any right to deprive Roderic of these powers, and still less had he to dispose of any of the territories of those chieftains who had agreed to become his tributaries; which nevertheless he certainly did, and which failed not to be productive of an immediate war with these chiefs.

31 Prince John made lord of Ireland.

The new governor entered on his office with all that spirit and vigour which was necessary; but being misrepresented to the king by some factious barons, he was in a short time recalled, and two others, totally unfit for the goverment, appointed in his room. This error was soon corrected, and Lacey was replaced in three months. The same jealousy which produced his first degradation, soon produced a second; and Philip de Braosa, or *Philip of Worcester*, as he is called, a man of a most avaricious disposition, was appointed to succeed him. This governor behaved in such a manner, that his superstitious subjects expected every moment that the vengeance of heaven would fall upon him, and deliver them from his tyranny. His power, however, was of short duration; for now prince John prepared to exercise the authority with which his father had invested him in Ireland. He was attended by a considerable military force: his train was formed of a company of gallant Normans in the pride of youth; but luxurious, insolent, and followed by a number of Englishmen, strangers to the country they were to visit, desperate in their fortunes, accustomed to a life of prodigacy, and filled with great expectations of advantage from their present service. The whole assembly embarked in a fleet of 60 ships; and arrived at Waterford after a prosperous voyage, filling the whole country with the greatest surprise and expectation.

32 His indiscretion.

The young prince had not yet arrived at the years of discretion; nor indeed, from his subsequent conduct, doth it appear that his disposition was such as qualified him in the least for the high dignity to which he was raised. The hardy Welshmen who first migrated into Ireland, immediately waited upon him to do him homage; but they were disagreeable to the gay courtiers, and to the prince himself, who minded nothing but his pleasures. The Irish Lords were at first terrified by the magnificent representation of the force of the English army; and being reconciled to submission by the dignity of the prince's station, hastened in crowds to Waterford to do him homage.

Ireland. They exhibited a ſpectacle to the Norman courtiers, which the latter did not fail to treat with contempt and ridicule. The Iriſh Lords, with uncouth attire, thick buſhy beards, and hair ſtanding on end, advanced with very little ceremony; and, according to their own notions of reſpect, offered to kiſs the young prince. His attendants ſtepped in, and prevented this horrid violation of decorum by thruſting away the Iriſhmen. The whole aſſembly burſt into peals of laughter, pulled the beards, and committed ſeveral other indignities on the perſons of their gueſts; which were immediately and ſeverely reſented. The chieftains left the court, boiling with indignation; and meeting others of their countrymen haſtening to do homage to the prince, they informed them of the reception they themſelves had met with. A league was inſtantly formed to extirpate the Engliſh, and the whole nation flew to arms; while John and his courtiers, inſtead of oppoſing the enemy, employed themſelves in harraſſing and oppreſſing thoſe who were under their immediate juriſdiction. The country was therefore over-run by the barbarians, agriculture entirely neglected, and a dreadful famine threatened to follow the calamities of war.

34 A general revolt.

This terrible devaſtation had continued for eight months before the king was fully acquainted with it. He then determined to recal his ſon; but was at a loſs whom he ſhould name for his ſucceſſor. Lacey had been murdered by an Iriſh peaſant, and the king was at laſt obliged to have recourſe to John de Courcey, whoſe boiſterous valour ſeemed now to be abſolutely neceſſary to prevent the Engliſh from being totally exterminated. The new governor was obliged at firſt to act on the defenſive; but as his enemies ſoon forgot their league, and began their uſual hoſtilities againſt each other, he was at laſt enabled to maintain his authority of the Engliſh government, and to ſupport their acquiſitions in Ireland, though not to extend them.

35 Suppreſſed by John de Courcey.

In this ſituation were the affairs of Ireland when Henry II. died, and was ſucceeded by his ſon Richard I. The new king was determined on an expedition to the holy land, which left him no leiſure to attend to the affairs of Ireland. John, by virtue of the powers granted him by his father, took upon him the management of Iriſh affairs; and immediately degraded de Courcey from his government, appointing in his place Hugh de Lacey the younger. De Courcey, provoked at this indignity, retired into Ulſter, where he was immediately engaged in a furious war with the natives, and at laſt almoſt entirely detached himſelf from the Engliſh government. The greateſt confuſion enſued; Hugh de Lacy was recalled from his government, and William Petit, earl marſhal of England, appointed in his place. Petit's adminiſtration proved more unfortunate than that of any of his predeceſſors. Confederacies every where took place againſt the Engliſh; the latter were every where defeated, their towns taken; and their power would certainly have been annihilated, had not the Iriſh, as uſual, turned their arms againſt each other.

36 Miſerable ſtate of Ireland under Richard I.

37 Somewhat better under John.

In this deſperate ſituation matters continued during the whole reign of king Richard, and part of the reign of John, while the diſtreſſes of the country were increaſed by the diſſentions and diſaffection of the Engliſh lords, who aſpired at independency, and made war upon each other like Iriſh chieftains. The prudent conduct of a governor named *Meiler Fitz-Henry*, however, at laſt put an end to theſe terrible commotions; and about the year 1208, the kingdom was more quiet than it had been for a long time before. In 1210, John came over to Ireland in perſon with an army, with a deſign, as he ſaid, to reduce his refractory nobles to a ſenſe of their duty. More than 20 Iriſh chiefs waited upon him immediately to do him homage; while three of the Engliſh barons, Hugh and Walter de Lacy, and William de Braoſa, fled to France. The king, at the deſire of his Iriſh ſubjects, granted them, for their information, a regular code and charter of laws, to be depoſited in the exchequer of Dublin, under the king's ſeal. For the regular and effectual execution of theſe laws, beſides the eſtabliſhment of the king's courts of judicature in Dublin, there was now made a new and more ample diviſion of the king's lands of Ireland into counties, where ſheriffs, and many other officers, were appointed. Theſe counties were, Dublin, Meath, Kildare, Argial, now called *Lowth*, Katherlagh, Kilkenny, Wexford, Waterford, Cork, Kerry, Limerick, Tipperary; which marks the extent of the Engliſh dominions at this time as confined to a part of Leinſter and Munſter, and to thoſe parts of Meath and Argial which lie in the province of Ulſter, as now defined. Before his departure, the king gave liberty to John de Grey, biſhop of Norwich, whom he appointed governor, to coin money of the ſame weight with that of England; and which, by royal proclamation, was made current in England as well as Ireland.

This eccleſiaſtical governor is ſaid to have managed affairs ſo happily, that, during the violent conteſts between John and his barons, Ireland enjoyed an unuſual degree of tranquillity. We are not to imagine, however, that this unhappy country was at this or indeed any other period, till the end of Queen Eliſabeth's reign, perfectly free from diſorders, only they were confined to thoſe diſtricts moſt remote from the Engliſh government. In 1219, the commotions were renewed, through the immeaſurable ambition and contentions of the Engliſh barons, who deſpiſed all controul, and oppreſſed the inhabitants in a terrible manner. The diſorders in England during the reign of Henry III. encouraged them to deſpoile the royal authority; they were ever the ſecret enemies, and ſometimes the avowed adverſaries, of each other; and in many places where they had obtained ſettlements, the natives were firſt driven into inſurrections by their cruelty, and then puniſhed with double cruelty for their reſiſtance. The Engliſh laws, which tended to puniſh the authors of theſe outrages, were ſcorned by an imperious ariſtocratic faction, who, in the phrenzy of rapine and ambition, trampled on the moſt ſalutary inſtitutions. In 1228, a remonſtrance was preſented to the king againſt this dangerous neglect and ſuſpenſion of the laws; which he anſwered by a mandate to the chief governor, directing that the whole body of nobility, knights, free tenants, and bailiffs of the ſeveral counties, ſhould be convened; that the charter of Engliſh laws and cuſtoms received from king John, and to which they were bound by oath, ſhould be read over in their preſence; that they ſhould be directed for

38 Relapſes into its former ſtate under Henry III.

Ireland.

for the future ſtrictly to obſerve and adhere to theſe; and that proclamation ſhould be made in every county of Ireland, ſtrictly enjoining obedience, on pain of forfeiture of lands and tenements. How little effect was produced by this order, we may learn from another, dated in 1246; where the barons are commanded, for the peace and tranquillity of the land, to *permit* it to be governed by the laws of England.

39 Exceſſive depravation of manners.

Nothing indeed can be conceived more terrible than the ſtate of Ireland during the reign of Henry III. People of all ranks appear to have been ſunk in the loweſt degree of depravity. The powerful Engliſh lords not only ſubverted the peace and ſecurity of the people, by refuſing to admit the ſalutary laws of their own country, but behaved with the utmoſt injuſtice and violence to the natives who did not enjoy the benefits of the Engliſh conſtitution. The clergy appear to have been equally abandoned with the reſt: nor indeed could it be otherwiſe; for, through the partialities of Henry himſelf, the neglected, the worthleſs, and the depreſſed among the Engliſh clergy, found refuge in the church of Ireland. What were the manners of theſe clergy, will appear from the following petition of a widow to king Edward I.

"Margaret le Blunde, of Caſhel, petitions our lord the king's grace, that ſhe may have her inheritance which ſhe recovered at Chonmell before the king's judges, &c. againſt David Macmackerwayt biſhop of Caſhel.

"*Item*, the ſaid Margaret petitions redreſs on account that her father was killed by the ſaid biſhop.

"*Item*, for the impriſonment of her grandfather and mother, whom he ſhut up and detained in priſon until they periſhed by famine, becauſe they attempted to ſeek redreſs for the death of their ſon, father of your petitioner, who had been killed by the ſaid biſhop.

"*Item*, for the death of her ſix brothers and ſiſters, who were ſtarved to death by the ſaid biſhop, becauſe he had their inheritance in his hands at the time he killed their father.

"And it is to be noted, that the ſaid biſhop had built an abbey in the city of Caſhel, on the king's lands granted for this purpoſe, which he hath filled with robbers, who murder the Engliſh, and depopulate the country; and that when the council of our lord the king attempts to take cognizance of the offence, he fulminates the ſentence of excommunication againſt them.

"It is to be noted alſo, that the ſaid Margaret has five times croſſed the Iriſh ſea. Wherefore, ſhe petitions for God's ſake, that the king's grace will have compaſſion, and that ſhe may be admitted to take poſſeſſion of her inheritance.

"It is further to be noted, that the aforeſaid biſhop hath been guilty of the death of many other Engliſhmen beſides that of her father; and that the aforeſaid Margaret hath many times obtained writs of our lord the king, but to no effect, by reaſon of the influence and bribery of the ſaid biſhop.

"She further petitions, for God's ſake, that ſhe may have coſts and damages, &c."

40 Little alteration under Edward I.

Matters continued in the ſame deplorable ſtate during the reign of Edward I. with this additional grievance, that the kingdom was infeſted by invaſions of the Scots. The Engliſh monarch indeed poſſeſſed all that prudence and valour which were neceſſary to have reduced the iſland to a ſtate of tranquillity; but his project of conquering Scotland left him but little leiſure to attend to the diſtracted ſtate of Ireland. Certain it is, however, that the grievous diſtreſs of that country gave him great uneaſineſs; ſo that he tranſmitted his mandate to the prelates of Ireland, requiring them to interpoſe their ſpiritual authority for compoſing the public diſorders. About the ſame time, the Iriſh who lay contiguous to the Engliſh, and who dwelt among them, preſented a petition to the king, offering to pay him 8000 merks, upon condition that they were admitted to the privileges of Engliſh ſubjects. To this petition he returned a favourable anſwer; but his good intentions were defeated by the licentious nobility, who knew that theſe laws would have circumſcribed their rapacious views, and controuled their violence and oppreſſion. Petitions of the ſame kind were ſeveral times repeated during this reign, but as often defeated; though ſome means were uſed for the peace of the kingdom, ſuch as the frequent calling of parliaments, appointing ſheriffs in ſome new counties, &c.

Theſe means were not altogether without effect. They ſerved to give ſome check to the diſorders of the realm, though by no means to terminate or ſubdue them. The incurſions of the natives were repreſſed, and the Engliſh lords began to live on better terms with each other; and, in 1311, under Edward II. the moſt powerful of them were reconciled by the marriage of Maurice and Thomas Fitz-John, afterwards the heads of the illuſtrious houſes of Deſmond and Kildare, to two daughters of the earl of Ulſter. But juſt at this happy period, when the nation ſeemed to have ſome proſpect of tranquillity, more dreadful calamities than any hitherto related were about to take place. The Scots had juſt recovered their liberty under Robert Bruce, and were now in no danger of being again enſlaved by a foreign power. Edward, the king's brother, as a recompence for his ſervices, demanded a ſhare of the royal authority. This was refuſed by Robert, and Edward was for the preſent ſatisfied by being declared heir apparent to the crown. But the king, wiſely conſidering the neceſſity of finding out ſome employment for a youth of ſuch an aſpiring and ambitious diſpoſition, pointed out to his brother the iſland of Ireland, the conqueſt of which would be eaſy, on account of the diſtracted ſtate in which it almoſt always was, and which would make him an independent ſovereign. This propoſal was eagerly embraced by Edward, and every thing neceſſary for the expedition immediately got ready. On the 25th of May 1315, he landed on the north-eaſtern coaſt of Ireland with 6000 men, to aſſert his claim to the ſovereignty of this kingdom. The Iriſh lords of Ulſter, who had invited and encouraged him to this enterprize, were now prepared to receive their new monarch, flocked with eagerneſs to his ſtandard, and prepared to wreak their vengeance on the common enemy. Their progreſs was marked by deſolation and carnage. The Engliſh ſettlers were ſlaughtered, or driven from their poſſeſſions, their caſtles levelled with the ground, and their towns ſet on fire. The Engliſh lords were neither prepared to reſiſt the invaſion, nor ſufficiently united among themſelves. The conſequence was, that the

Ireland.

the enemy for some time met with no interruption. An intolerable scarcity of provisions, however, prevented Bruce from pursuing his advantages; and tho' his brother landed in Ireland with a powerful army, the famine prevented him from being of any essential service. The forces which he left behind him, however, proved of considerable advantage; and by means of this reinforcement, he was enabled to take the city of Carrickfergus.

The terrible devastations committed by Bruce and his associates, now induced some English lords to enter into an association to defend their possessions, and repel these invaders. For this purpose, they raised a considerable body of forces; which coming to an engagement with Fedlim prince of Connaught, one of Bruce's principal allies, entirely defeated and killed him with 8000 of his men. This defeat, however, had very little effect on the operations of Bruce himself. He ravaged the country to the walls of Dublin, traversed the district of Offory, and penetrated into Munster, destroying every thing with fire and sword. The English continued to augment their army, till at last it amounted to 30,000 men; and then Bruce, no longer able to oppose such a force, found it necessary to retire into the province of Ulster. His retreat was effected with great difficulty; and during the time of his inactivity, the distresses of his army increased to such a degree, that they are said to have fed upon the bodies of their dead companions. At last an end was put to the sufferings and the life of this adventurer in
41 They are totally defeated.
the battle of Dundalk, in 1318, where he was defeated and killed by the English under Sir Robert Birmingham. A brave English knight, named *Maupas*, had rushed forward to encounter Bruce himself, and both antagonists had killed each other; the body of Maupas being found, after the battle, stretched upon that of Bruce. The king of Scotland had been advancing with powerful succours to his brother: but Edward, confident of victory, refused to wait his arrival; and Robert, on hearing of his brother's death, instantly retired.

The defeat of the Scottish invaders did not put an end to the disturbances of this unhappy country. The contentions of the English with one another, of the Irish with the English, and among themselves, still kept the island in a state of the utmost barbarity and confusion. An attempt was made indeed, in the reign of Edward II. to establish an university in Dublin; but for want of proper encouragement the institution for some time languished, and then expired amidst
43 Miseries of the Irish under Edward III.
the confusion and anarchy of the country. The reign of Edward III. proved not much more favourable than preceding times had been. He was too much taken up with the idea of conquering France, to pay much regard to the interests of Ireland. The unhappy people, indeed, sensible of their own miseries, petitioned the king to admit all his subjects in Ireland to a participation of the English laws; but the petition being delivered as usual to the chief governor, and laid before the parliament, it was either clandestinely defeated or openly rejected. A new scene of tumult and bloodshed immediately ensued; which at last produced an order from the king, prohibiting all Irishmen, or Englishmen married and having estates in Ireland, from bearing any public office whatever.—This, instead of having a tendency to promote peace, made the disorders much greater than before; and at last produced a remonstrance from the states met at Kilkenny, in which they grievously complain not only of the disorders of the kingdom, but also of the conduct of the king himself in the edict abovementioned: and to this remonstrance the king thought proper to give a gracious and condescending answer, in order to procure from Ireland the succours he wanted in his expedition against France. Ireland.

It is not be supposed, that mere promises, unassisted by any vigorous exertion, could make the least alteration in the state of a kingdom involved in so much misery. The disorders, however, at last became insupportable to the inhabitants themselves; and a parliament was summoned in 1367, the result of which was the famous statute of Kilkenny. The preamble
44 Statute of Kilkenny.
to this act recites, that the English had become mere Irish in their language, names, apparel, and manner of living; had rejected the English laws, and submitted to those of the Irish, with whom they had united by marriage-alliance, to the ruin of the common-wealth.—It was therefore enacted, that marriage, nurture of infants, &c. with the Irish, should be considered and punished as high treason.—Again, if any man of English race shall use an Irish name, the Irish language, or the Irish apparel, or any mode or custom of the Irish, the act provides, that he shall forfeit lands and tenements, until he hath given security in the court of chancery to conform in every particular to the English manners; or if he have no lands, that he shall be imprisoned till the like security be given. The Brehon law was pronounced to be a pernicious custom and innovation lately introduced among the English subjects; and it was therefore ordained, that in all their controversies they should be governed by the common law of England; and that whoever should submit to the Irish jurisdiction, should be adjudged guilty of high treason. As the English had been accustomed to make war or peace with the bordering Irish at pleasure, they were now expressly prohibited from levying war without special warrant from the state.—It was also made highly penal for the English to permit their Irish neighbours to graze their lands, to present them to ecclesiastical benefices, or to receive them into monasteries or religious houses; to entertain their bards, who perverted their imaginations by romantic tales; or their news-tellers, who seduced them by false reports.—It was made felony to impose or cess any forces upon the English subject against his will. And as the royal liberties and franchises were become sanctuaries for malefactors, express power was given to the king's sheriffs to enter into all franchises, and there to apprehend felons and traitors.—Lastly, because the great lords, when they levied forces for the public service, acted with partiality, and laid unequal burthens upon the subjects, it was ordained that four wardens of the peace in every county should adjudge what men and armour every lord or tenant should provide.—The statute was promulged with particular solemnity; and the spiritual lords, the better to enforce obedience, denounced an excommunication on those who should presume to violate it in any instance.

This statute, it is evident, could not tend to promote the peace of the kingdom. This could only have

Ireland.

have been done by removing the animoſity between the native Iriſh and Engliſh; but ſo far was the ſtatute of Kilkenny from having any tendency of this kind, that it manifeſtly tended to increaſe the hatred between them. During the whole of this reign, therefore, the ſtate of the Iriſh government continued to be greatly diſordered and embroiled. The Engliſh intereſt gradually declined; and the connections of the king's ſubjects with the original inhabitants, occaſioned by their vicinity and neceſſary intercourſe, in deſpite of all legal injunctions, obliged the king to relax the ſeverity of the ſtatutes of Kilkenny, in caſes where they proved impracticable, or oppreſſive in the execution. The perpetual hoſtility, however, in which the different parties lived, proved an effectual bar to the introduction of thoſe arts which contribute to the comfort and refinement of mankind. Even foreign merchants could not venture into ſuch a dangerous country without particular letters of protection from the throne. The perpetual ſucceſſion of new adventurers from England, led by intereſt or neceſſity, ſerved only to inflame diſſenſion, inſtead of introducing any eſſential improvement. Lawyers ſent from England were notoriouſly inſufficient, if not corrupt; and, as ſuch, had frequently been the objects of complaint. The clergy were a mean grovelling race, totally influenced by the crown. Even prelates were commonly made the inferior agents of government in collecting forces, and raiſing war againſt the Iriſh enemy; but were not to be enticed into this ſervice, except by remittances from the exchequer. Attendance in parliament they dreaded as the greateſt hardſhip; and either recurred to mean excuſes to avert the penalty of abſence, or ſued to the king to be exempted by patent from contributing or aſſenting to thoſe laws by which they were to be governed.

45 Power of the Engliſh receives under Henry VII.

In this deplorable ſituation the kingdom continued till the time of Henry VII. who laid the foundation of the future civilization of the Iriſh, as he alſo did of the Engliſh nation. This he effected by enacting ſome ſalutary laws, and appointing faithful and active governors to ſee them put in execution. Of theſe governors Sir Edward Poynings contributed more than any other to the tranquillity of the ſtate. During his adminiſtration was enacted the law known by the name of *Poyning's Law*, and which hath ſince been the ſubject of much political debate. The purport of it was, That no parliament ſhould be held in that iſland without firſt giving notice to the king of England, and acquainting him with the acts to be paſſed in that parliament; neither ſhould any act paſſed, or any parliament held, without the approbation of the king and council, be deemed valid. Thus was the power of the turbulent barons greatly broken; and the governor, not having it in his power to aſſemble parliaments when he pleaſed, became a perſon of much leſs conſequence. The whole Iriſh legiſlation alſo became dependent on that of England, and hath ever ſince continued to be ſo.

46 Poyning's law.

From this time we may date the revival of the Engliſh power in Ireland; which from the Scottiſh war in the time of Edward II. had gradually declined into a miſerable and precarious ſtate of weakneſs. The authority of the crown, which had at laſt been defied, inſulted, and rejected, even in the Engliſh territory, was reſtored and confirmed, and the rebellions vigorouſly oppoſed and ſuppreſſed. The ſeignory of the Britiſh crown over the whole body of the Iriſh, which in former reigns ſeemed to have been totally forgotten, was now formally claimed and aſſerted, and ſome of the moſt ferocious chieftains by their marriage-connections became the avowed friends of the Engliſh power. An ignominious tribute, called the *Black Rent*, was indeed ſtill paid to ſome chieftains; but their hoſtilities were oppoſed and chaſtiſed, and even in their own diſtricts they were made to feel the ſuperiority of Engliſh government.

Ireland.

During the reign of Henry VIII. the Iriſh affairs were neglected; and the diſorders, which had only been checked, and never thoroughly eradicated, returned as uſual. They were further promoted by the innovations in religion which the king introduced, and which were exceedingly diſagreeable both to Engliſh and Iriſh. The Reformation, however, continued to make ſome progreſs, though ſlowly, during the reign of Edw. VI. and even in the reign of queen Mary; for as the perſecution did not reach thither, many Proteſtants fled to Ireland in order to avoid the queen's cruelty. The machinations of the Spaniards againſt queen Elizabeth excited the Iriſh to freſh inſurrections. The king of Spain, indeed, not only encouraged the natives in thoſe inſurrections, but actually ſent over troops to aſſiſt them in driving out the Engliſh altogether. This they had well nigh effected; but the Spaniards, upon ſeeing an army of Iriſh defeated by an handful of their enemies, were ſo much provoked, that they ſurrendered all the places they had made themſelves maſters of, and even offered to aſſiſt the Engliſh in reducing the rebels; though it was not thought proper to accept of their aſſiſtance. The conſequence of this was, that the Iriſh, abandoned by theſe allies, were unable to carry on the war; and the grand rebel O'Neal of Tirowen, or Tirone, after much treachery, evaſion, and many pretended ſubmiſſions, was at laſt obliged to ſubmit in good earneſt. He fell upon his knees before the deputy, and petitioned for mercy with an air and aſpect of diſtreſs. He ſubſcribed his ſubmiſſion in the moſt ample manner and form. He implored the queen's gracious commiſeration; and humbly ſued to be reſtored to his dignity, and the ſtate of a ſubject, which he had juſtly forfeited. He utterly renounced the name of *O'Neal*, which he had aſſumed on account of the great veneration in which it was held among the Iriſh. He abjured all foreign power, and all dependency except on the crown of England; reſigned all claim to any lands excepting ſuch as ſhould be conferred upon him by letters patent; promiſing at the ſame time to aſſiſt the ſtate in aboliſhing all barbarous cuſtoms, and eſtabliſhing law and civility among his people. The lord deputy, on the part of the queen, promiſed a full pardon to him and all his followers; to himſelf the reſtoration of his blood and honours, with a new patent for his lands, except ſome portions reſerved for certain chieftains received into favour, and ſome for the uſe of Engliſh garriſons.

47 All the diſorders ended in the reign of queen Elizabeth.

No inſurgent now remained in this kingdom who had not obtained or ſued for mercy. Many, indeed, were driven by neceſſity to the continent, and earned a ſubſiſtence by ſerving in the armies of Spain; and thus a race of Iriſh exiles was trained to arms, filled with a ma-

Ireland.

malignant reſentment againſt the Engliſh. Thus the honour of reducing all the enemies of the crown of England in this iſland, after a continued conteſt for 440 years, was reſerved for the arms of Elizabeth. The ghaſtlineſs of famine and deſolation was now ſomewhat enlivened by the reſtoration of tranquillity. Indeed, from the moſt authentic accounts, the prices of proviſions were ſo high, that, conſidering the value of money at that time, it is ſurpriſing how the inhabitants could ſubſiſt. From an account of the rates of proviſions taken by the mayor of Dublin in 1602, it appears, That wheat had riſen from 36s. to 9 l. the quarter; barley-malt from 10s. to 43s. the barrel; oat-malt from 5s. to 22s. the barrel; peaſe from 5s. to 40s. the peck; oats from 3s. 4d. to 20s. the barrel; beef from 26s. 8d. to 8 l. the carcaſe; mutton from 3s. to 26s. the carcaſe; veal from 10s. to 29s. the carcaſe; a lamb from 12 d. to 6s.; a pork from 8s. to 20s.

47 Exorbitant prices of proviſions at that time.

48 The Iriſh civilized by James I.

Under James I. Ireland began to aſſume a quite different appearance. That monarch valued himſelf upon promoting the arts of peace, and made it his ſtudy to civilize his barbarous Iriſh ſubjects. By repeated conſpiracies and rebellions, a vaſt tract of land had eſcheated to the crown in ſix northern counties, Tyrconnel, now called *Donnegal*, Tirone, Derry, Farmanagh, Cavan, and Armagh, amounting to about 500,000 acres; a tract of country covered with woods, where rebels and banditti found a ſecure refuge, and which was deſtined to lie waſte without the timely interpoſition of government. James reſolved to diſpoſe of theſe lands in ſuch a manner as might introduce all the happy conſequences of peace and cultivation. He cauſed ſurveys to be taken of the ſeveral counties where the new ſettlements were to be eſtabliſhed; deſcribed particularly the ſtate of each; pointed out the ſituations proper for the erections of towns and caſtles; delineated the characters of the Iriſh chieftains, the manner in which they ſhould be treated, the temper and circumſtances of the old inhabitants, the rights of the new purchaſers, and the claims of both; together with the impediments to former plantations, and the methods of removing them.

At his inſtances it was reſolved, that the perſons to whom lands were aſſigned ſhould be either new undertakers from Great Britain, eſpecially from Scotland, or *ſervitors*, as they were called; that is, men who had for ſome time ſerved in Ireland, either in civil or military offices; or old Iriſh chieftains or captains. Among the laſt were included even thoſe Iriſh who had engaged in the rebellion of Tirone, and ſtill harboured their ſecret diſcontents. To gain them, if poſſible, by favour and lenity, they were treated with particular indulgence. Their under-tenants and ſervants were allowed to be of their own country and religion; and, while all the other planters were obliged to take the oath of allegiance, they were tacitly excepted. The ſervitors were allowed to take their tenants either from Ireland or Britain, provided no Popiſh recuſants were admitted. The Britiſh undertakers were confined to their own countrymen.

In the plantations which had been formerly attempted, the Iriſh and Engliſh had been mixed together, from a fond imagination that the one would have learned civility and induſtry from the other. But experience had now diſcovered, that this intercourſe ſerved only to make the Iriſh envy the ſuperior comforts of their Engliſh neighbours, and to take the advantage of a free acceſs to their houſes to ſteal their goods and plot againſt their lives. It was therefore deemed neceſſary to plant them in ſeparate quarters; and in the choice of theſe ſituations, the errors of former times were carefully corrected. The original Engliſh adventurers, on their firſt ſettlement in Ireland, were captivated by the fair appearance of the plain and open diſtricts. Here they erected their caſtles and habitations; and forced the old natives into the woods and mountains, their natural forteſſes. There they kept themſelves unknown, living by the milk of their kine, without huſbandry or tillage; there they increaſed to incredible numbers by promiſcuous generation; and there they held their aſſemblies, and formed their conſpiracies without diſcovery. But now the northern Iriſh were placed in the moſt open and acceſſible parts of the country, where they might lie under the cloſe inſpection of their neighbours, and be gradually habituated to agriculture and the mechanic arts. To the Britiſh adventurers were aſſigned places of the greateſt ſtrength and command; to the ſervitors, ſtations of the greateſt danger, and greateſt advantage to the crown: but as this appeared a peculiar hardſhip, they were allowed guards and entertainment, until the country ſhould be quietly and completely planted.

The experience of ages had ſhewn the inconvenience of enormous grants to particular lords, attended with ſuch privileges as obſtructed the adminiſtration of civil government: and, even in the late reign, favourite undertakers had been gratified with ſuch portions of land as they were by no means able to plant. But, by the preſent ſcheme, the lands to be planted were divided in three different proportions; the greateſt to conſiſt of 2000 Engliſh acres, the leaſt of 1000, and the middle of 1500. One half of the eſcheated lands in each county was aſſigned to the ſmalleſt, the other moiety divided between the other proportions: and the general diſtributions being thus aſcertained, to prevent all diſputes between the undertakers, their ſettlements in the reſpective diſtricts were to be determined by lot. Eſtates were aſſigned to all, to be held of them and their heirs. The undertakers of 2000 acres were to hold of the king *in capite;* thoſe of 1500 by knights ſervice; thoſe of 1000 in common ſoccage. The firſt were to build a caſtle, and incloſe a ſtrong court-yard, or *bawn*, as it was called, within four years; the ſecond, to finiſh an houſe and bawn within two years; and the third, to incloſe a bawn; for even this rude ſpecies of fortification was accounted no inconſiderable defence againſt an Iriſh enemy. The firſt were to plant upon their lands, within three years, 48 able men of Engliſh or Scottiſh birth, to be reduced to 20 families; to keep a demeſne of 600 acres in their own hands; to have four fee-farmers on 120 acres each; ſix leaſe-holders, each on 100 acres; and on the reſt, eight families of huſbandmen, artificers, and cottagers. The others were under the like obligations proportionably. All were, for five years after the date of their patents, to reſide upon their lands either in perſon, or by ſuch agents as ſhould be approved by the ſtate, and to keep a ſufficient quantity of arms for their defence. The Britiſh and ſervitors were not to alienate

Ireland.

alienate their lands to mere Iriſh, or to demiſe any portions of them to ſuch perſons as ſhould refuſe to take the oaths to government; they were to let them at determined rents, and for no ſhorter term than 21 years or three lives. The houſes of their tenants were to be built after the Engliſh faſhion, and united together in towns or villages. They had power to erect manours, to hold courts-baron, and to create tenures. The old natives, whoſe tenures were granted in fee-ſimple, to be held in ſoccage, were allowed the like privileges. They were enjoined to ſet their lands at certain rents, and for the like terms as the other undertakers; to take no Iriſh exactions from their inferior tenants, and to oblige them to forſake their old Scythian cuſtom of wandering with their cattle from place to place for paſture, or *creaghting*, as they called it; to dwell in towns, and conform to the Engliſh manner of tillage and huſbandry. An annual rent from all the lands was reſerved to the crown for every 60 Engliſh acres, ſix ſhillings and eight pence from the undertakers, ten ſhillings from ſervitors, and 13 ſhillings and four pence from Iriſh natives. But for two years they were exempt from ſuch payments, except the natives, who were not ſubject to the charge of tranſportation. What gave particular credit to this undertaking, was the capital part which the city of London was perſuaded to take in it. The corporation accepted of large grants in the county of Derry; they engaged to expend L. 20,000 on the plantation, to build the cities of Derry and Colerain, and ſtipulated for ſuch privileges as might make their ſettlements convenient and reſpectable. As a competent force was neceſſary to protect this infant plantation, the king, to ſupport the charge, inſtituted the order of baronets, an hereditary dignity, to be conferred on a number not exceeding 200; each of whom, on paſſing his patent, was to pay into the exchequer ſuch a ſum as would maintain 30 men in Ulſter, for three years, at 8*d.* daily pay.

But ſcarcely had the lands been allotted to the different patentees, when conſiderable portions were reclaimed by the clergy as their rightful property. And ſo far had the eſtates of the northern biſhoprics been embarraſſed, both by the uſurpations of the Iriſh lords, and the claims of patentees, that they ſcarcely afforded a competent, much leſs an honourable proviſion for men of worth and learning, while the ſtate of the parochial clergy was ſtill more deplorable. Moſt of the northern churches had been either deſtroyed in the late wars, or fallen to ruin: the benefices were ſmall, and either ſhamefully kept by the biſhops in the way of commendam or ſequeſtration; or filled with miniſters as ſcandalous as their income. The wretched flock was totally abandoned; and for many years Divine Service had not been uſed in any pariſh-church of Ulſter, except in cities and great towns. To remedy theſe abuſes, and to make ſome proper proviſion for the inſtruction of a people immerſed in lamentable ignorance, the king ordained, that all eccleſiaſtical lands ſhould be reſtored to their reſpective fees and churches, and that all lands ſhould be deemed eccleſiaſtical from which biſhops had in former times received rents or penſions: that compoſitions ſhould be made with the patentees for the ſite of cathedral churches, the reſidences of biſhops and dignitaries, and other church-lands which were not intended to be conveyed to them; who were to receive equivalents if they compounded freely; or elſe to be deprived of their patents as the king was deceived in his grant, and the poſſeſſions reſtored to the church. To provide for the inferior clergy, the biſhops were obliged to reſign all their impropriations, and relinquiſh the tythes paid them out of pariſhes, to the reſpective incumbents; for which ample recompence was made out of the king's lands. Every proportion allotted to undertakers was made a pariſh, with a parochial church to each. The incumbents, beſides their tythes and duties, had glebe-lands aſſigned to them of 60, 90, or 120 acres, according to the extent of their pariſhes. To provide for a ſucceſſion of worthy paſtors, free-ſchools were endowed in the principal towns, and conſiderable grants of lands conferred on the univerſity of Dublin, which had been re-eſtabliſhed by queen Elizabeth, together with the advowſon of ſix parochial churches, three of the largeſt, and three of the middle proportion in each county.

Such was the general ſcheme of this famous northern plantation, ſo honourable to the king, and of ſuch conſequence to the realm of Ireland. Its happy effects were immediately perceived, although the execution by no means correſponded with the original idea. Buildings were ſlowly erected; Britiſh tenants were difficult to be procured in ſufficient numbers; the old natives were at hand, offered higher rents, and were received into thoſe diſtricts from which it was intended to exclude them. In this particular, the Londoners were accuſed of being notoriouſly delinquent. They acted entirely by agents; their agents were intereſted and indolent, and therefore readily countenanced this dangerous intruſion of the natives; an error of which ſufficient cauſe was afterwards found to repent. For the preſent, however, a number of loyal and induſtrious inhabitants was poured into the northern counties, conſiderable improvements made by the planters, and many towns erected. To encourage their induſtry, and advance his own project, the king was pleaſed to incorporate ſeveral of theſe towns, ſo that they had a right of repreſentation in the Iriſh parliament.

49
State of Ireland ſince that time.

The only diſturbance that now enſued was from the Popiſh party, who never could bear to ſee the Proteſtant religion eſtabliſhed in preference to their own, while they had power to reſiſt. After numberleſs ineffectual machinations and complaints, their fury broke out in a terrible maſſacre of the new Engliſh ſettlers in the year 1641 *. The affairs of Britain were at that time in ſuch confuſion, that the rebellion could not be quelled in leſs than ten years; during which time the country was reduced to a moſt deplorable ſituation. It recovered again under Cromwell, Charles II. and the ſhort reign of James II. On the acceſſion of William III. matters were once more thrown into confuſion by an attempt made in favour of the exiled monarch, who came over thither in perſon, and whoſe bad ſucceſs is related under the article BRITAIN, n° 309.—325. Since that time, Ireland hath recovered from the miſerable ſituation to which it was ſo long reduced. As yet, however, it is far from being in ſuch a flouriſhing ſtate as either South or North Britain. The great obſtacle to the improvement of

* See *Britain*, n° 103, —106.

Ireland. the kingdom is the extreme poverty and oppreſſion of the common people. The produce of the kingdom, either in corn or cattle, is not above two thirds at moſt of what by good cultivation it might yield. The high roads throughout the ſouthern and weſtern parts are lined with beggars, who live in huts or cabbins without chimnies, or any covering capable of defending the wretched inhabitants from the cold, wind, and rain. "It is a ſcandal (ſays a judicious traveller, who lately viſited Ireland,) to the proprietors of this fertile country, that there is not the greateſt plenty of good corn and hay in it; but ſome of the beſt land in the king's dominions is ſuffered to be torn in pieces, and cultivated in the vileſt manner, by a ſet of abject miſerable occupiers; who are abſolutely no better than ſlaves to the deſpicable, lazy, and oppreſſive ſubordinate landlords."

50 Climate, &c. of Ireland. Ireland enjoys a peculiar bleſſing in not producing or nouriſhing any venomous creature. Mr O'Halloran ſays, that even frogs were never known to live there before the reign of William III. Indeed, it is not improbable but the breed of them might have come from France in the ſuite of James II.

The climate of Ireland would almoſt perfectly agree with that of England, were the ſoil equally improved, being abundantly fruitful both in corn and graſs, eſpecially the latter; in conſequence of which, an infinite number of black cattle and ſheep are bred, particularly in the province of Connaught. Few countries produce finer grain than that which grows in the improved parts of this kingdom. The northern and eaſtern counties are beſt cultivated and incloſed, and the moſt populous.

Ireland is known to have many rich mines; and there is no inconſiderable proſpect of gold and ſilver in ſome parts of the kingdom. No country in the world abounds more in beautiful lakes, both freſh and ſalt-water ones; and it is alſo plentifully watered with many beautiful rivers. The commodities which Ireland exports, as far as her preſent trade will permit, are hides, tallow, beef, butter, cheeſe, honey, wax, hemp, metals, and fiſh: wool and glaſs were, till December 23, 1779, prohibited; but her linen trade is of late grown of very great conſequence. England, in the whole, is thought to gain yearly by Ireland upwards of 1,400,000l. and in many other reſpects ſhe muſt be of very great advantage to that kingdom. Formerly, indeed, ſhe was rather a burden to her elder ſiſter, than any benefit; but the times are changed now, and improve every day.

51 Linen manufacture early introduced. Mr O'Halloran ſays, the linen manufacture was carried on in Ireland in very early days, to a great extent; and Gratianus Lucius quotes a deſcription of the kingdom, printed at Leyden in 1627, in which the author tells us, "That this country abounds with flax, which is ſent ready ſpun in large quantities to foreign nations. Formerly, (ſays he), they wove great quantities of linen, which was moſtly conſumed at home, the natives requiring above 30 yards of linen in a ſhirt or ſhift." So truly expenſive was the Iriſh faſhion of making up ſhirts, on account of the number of plaits and folds, that, in the reign of Henry VIII. a ſtatute paſſed, by which they were forbidden, under a ſevere penalty, to put more than ſeven yards of linen in a ſhirt or ſhift.

Ireland. We may form ſome idea of what the trade of Ireland muſt have been in former times, when, ſo late as the reign of Brien Boru, who died in 1014, notwithſtanding the ravages and diſtreſſes which a Daniſh war, of above 200 years continuance, muſt have produced throughout the kingdom, the annual duties ariſing from goods imported into the ſingle port of Limerick, and paid in red wine, amounted to 365 pipes! Even ſo lately as the laſt century, it is ſcarcely credible what riches this city derived from the bare manufacture of ſhoes, which were exported in amazing quantities; whereas now, inſtead of ſhoes and boots, we ſee the raw hides ſhipped off for foreign markets.

No country in the world ſeems better ſituated for a maritime power than Ireland, where the ports are convenient to every nation in Europe, and the havens ſafe and commodious. The great plenty of timber, the ſuperior excellence of the oak, and the acknowledged ſkill of her ancient artizans, in wood-works, are circumſtances clearly in her favour. That the Iriſh formerly exported large quantities of timber, is manifeſt from the churches of Glouceſter, Weſtminſter-monaſtery and palace, &c. being covered with Iriſh oak.

52 Government, population, &c. The government of the kingdom is in the hands of a viceroy, or lord-lieutenant, who lives in very great ſpendor. In his abſence there are lords-juſtices, (ſtyled their *excellencies*) generally three in number, viz. lord-primate, lord high chancellor, and the ſpeaker of the houſe of commons. The parliament of Ireland meet every other Winter, or oftener, according to exigencies. Their only power conſiſts in propoſing bills, which are ſubject to the privy-council of England, and in a negative voice to any amendments. As to civil magiſtrates and the diſtribution of juſtice, they are here on the ſame footing as in England.

Ireland is divided into four large provinces, and thoſe again into 32 counties, as follows:

I. ULSTER.

Counties.	*Houſes.*	*Extent*, &c.
1. Antrim	20738	Length 68 miles, 460 circumfer.
2. Armagh	13125	Breadth 98 miles, 460 circumfer.
3. Cavan	9268	Iriſh plantations.
4. Down	26090	Acres 2836837 4496205
5. Donnegal	12357	Pariſhes, 365 [Engliſh
6. Fermanagh	5674	Boroughs, 29
7. Londonderry	14528	Baronies, 55
8. Monaghan	26637	Archbiſhopric, 1
9. Tyrone	16545	Biſhoprics, 6
		Market-towns, 58

II. LEINSTER.

1. Caterlogh, or Carlow	5444	Leng. 104 miles, Bread. 55 miles, 360 circumf.
2. Dublin	24145	I. acr. 2642958, or 4281155
3. Kildare	8887	Pariſhes, 858 [Engliſh
4. Kilkenny	3231	Boroughs, 53
5. King's-county	9294	Baronies, 99
6. Longford	6057	Market-towns, 63
7. Lowth	8150	Archbiſhopric, 1
8. Meath (Eaſt)	14000	Biſhoprics, 3
9. Queen's-county	11226	The rivers are, the Boyne, Barrow, Liffy, Noir, and the May.
10. Weſtmeath	9621	
11. Wexford	13015	
12. Wicklow	7781	

III. MUN-

III. MUNSTER.

Counties.	*Houses.*	*Extent*, &c.
1. Clare	11381 Leng. 100 } miles	600cir-
2. Cork	47334 Bread. 107 }	cumfer.
3. Kerry	11653 Acres 3289932,	5329146,
4. Limerick	19380 Parifhes, 740	[Engliſh
5. Tipperary	18325 Boroughs, 26	
6. Waterford	9485 Baronies, 63	
	Houſes, 117197	
	Archbiſhopric, 1	
	Biſhops, 6	

IV. CONNAUGHT.

1. Galway	15576 Length 90 } miles	500cir-
	Breadth 80 }	cumfer.
2. Leitrim	5156 Acres 2272915,	3681746,
	Pariſhes, 330	[Engliſh
3. Mayo	15089 Boroughs, 10	
	Baronies, 43	
4. Roſcommon	8780 Archbiſhopric, 1	
	Biſhop, 1	
5. Sligo	5970 Houſes, 49966	
	Rivers are the Shannon,	
	May, Suck, and Gyll.	

In 1731, while the duke of Dorſet was lord-lieutenant, the inhabitants were numbered, and it was found that the four provinces contained as follows:

Connaught	21604		221780	
Leinſter	203087		447916	
Munſter	115130	Proteſtants	482044	Papiſts
Ulſter	360632		158020	
	700453		1309768	

There are 44 charter working-ſchools at preſent in Ireland, wherein 2025 boys and girls are maintained and educated. Theſe ſchools are maintained by an annual bounty of 1000l. by a tax upon hawkers and pedlars, and by ſubſcriptions and legacies. The children admitted, are thoſe born of Popiſh parents, or ſuch as would be bred Papiſts if neglected, and are of ſound limbs. Their age muſt be from ſix to ten; the boys at 16, and the girls at 14, are apprenticed into Proteſtant families. The firſt ſchool was opened in 1734. Five pounds are given to every perſon educated in theſe ſchools, upon his or her marrying a Proteſtant. An Engliſh act of parliament, lately tolerated the Catholic religion in Ireland, and by that means has relieved thouſands of uſeful ſubjects.

The return of houſes in Ireland for the year 1754, was 395,439; and for the year 1766, it was 424,046. Suppoſing therefore the numbers to have increaſed at the ſame rate, the number of houſes now cannot be leſs than 454,130; which, allowing five perſons to a family, will make the number of inhabitants 2,260,650: but as the return of houſes by hearth-collectors is rather under than above the truth, and as there are many families in every pariſh, who are by law excuſed from that tax, and therefore not returned, the number on a moderate eſtimate will be 2,500,000. Sir W. Petty reckoned 160,000 cabins without a chimney; and if there be an equal number of ſuch houſes now, the number of people will be above 3,000,000. Mr Molyneux ſays, "Ireland has certainly been better inhabited formerly; for on the wild mountains between Ardmach and Dundalk, are obſervable the marks of the plough, as they are alſo on the mountains of Altmore. The fame has been obſerved in the counties of Londonderry and Donnegal. Mountains that are now covered with bogs have been formerly ploughed; for when you dig five or ſix feet deep, you diſcover a proper ſoil for vegetation, and find it ploughed into ridges and furrows: a plough was found in a very dead bog near Donnegal; and an hedge, with ſome wattles, ſtanding under a bog that was five or ſix feet in depth. The ſtump of a large tree was found in a bog ten feet deep at Caſtle-Forbes; the trunk had been burnt, and ſome of the cinders and aſhes ſtill were lying on the ſtump. Mr Molyneaux further ſays, that on the top of an high mountain, in the north, there were then remaining the ſtreets and other marks of a large town. Ireland.

53 Appearance and character of the inhabitants.

Beauty ſeems to be more diffuſed in England, among the lower ranks of life, than in Ireland; which may, however, be attributed to the mere modes of living. In England, the meaneſt cottager is better fed, better lodged, and better dreſſed, than the moſt opulent farmers here, who, unaccuſtomed to what our peaſants reckon the comforts of life, know no luxury but in deep potations of aquavitæ.

From this circumſtance, we may account for a fact reported by the officers of the army here. They ſay, that the young fellows of Ireland, who offer to enliſt, are more generally below the given height, than in England. There can be no appeal from their teſtimony; for they were Iriſh, and the ſtandard is an infallible teſt. No reaſon, indeed, can be given why the cauſes which promote or prevent the growth of other animals, ſhould not have ſimilar effects upon the human ſpecies. In England, where there is no ſtint of proviſions, the growth is not checked; but, on the contrary, it is extended to the utmoſt bound of nature's original intention: whereas, in Ireland, where food is neither in the ſame quantity nor of the ſame quality, the body cannot expand itſelf, but is dwarfed and ſtunted in its dimenſions. The gentlemen of Ireland are full as tall as thoſe of England; the difference then, between them and the commonalty, can only proceed from the difference of food.

The inhabitants, in general, of this kingdom, are very far from what they have too often and unjuſtly been repreſented by thoſe of our country who never ſaw them, a nation of wild Iriſh. Miſerable and oppreſſed, as by far too many of them are, an Engliſhman will find as much civility in general, as amongſt the ſame claſs in his own country; and, for a ſmall pecuniary conſideration, they will exert themſelves to pleaſe you as much as any people, perhaps, in the king's dominions. Poverty and oppreſſion will naturally make mankind four, rude, and unſociable, and eradicate, or at leaſt ſuppreſs, all the more amiable principles and paſſions of humanity. But it ſhould ſeem unfair and ungenerous to judge of, or decide againſt, the natural diſpoſition of a man reduced by indigence and oppreſſion almoſt to deſperation. Let commerce, agriculture, and arts, but call forth the dormant activity of their genius, and rouze the native ſpirit of enterprize, which now lies torpid within them; let liberal laws unfetter their minds, and plenty cheer their tables, they will ſoon ſhew themſelves deſerving to rank

Ireland. with the moſt reſpectable ſocieties in Europe.

54 Account of the bogs in Ireland.

The bogs wherewith Ireland is in ſome places over-grown, are not injurious to health, as is commonly imagined; the watery exhalations from theſe are neither ſo abundant, nor ſo noxious, as thoſe from marſhes, which become prejudicial from the various animal and vegetable ſubſtances which are left to putrify as ſoon as the waters are exhaled by the ſun. Bogs are not, as one might ſuppoſe from their blackneſs, maſſes of putrefaction; but on the contrary, they are of ſuch a texture, as to reſiſt putrefaction above any other ſubſtance we know of. A ſhoe, all of one piece of leather, very neatly ſtitched, was taken out of a bog ſome years ago, yet entirely freſh;—from the very faſhion of which, there is ſcarce room to doubt, that it had lain there ſome centuries. Butter, called *rouſkin*, hath been found in hollowed trunks of trees, where it had been hid ſo long, that it was become hard and almoſt friable, yet not devoid of unctuoſity; that the length of time it had been buried was very great, we learn from the depth of the bog, which was ten feet, that had grown over it. But the common phenomenon of timber-trees dug out of theſe bogs, not only found, but alſo ſo embalmed as afterwards to defy the injuries of time, demonſtrate the antiſeptic quality of them.

The horns of the mooſe-deer muſt have lain many centuries in a bog; for the Iriſh hiſtories do not recognize the exiſtence of the animal whereon they grew. Indeed, human bodies have, in many places, been dug up entire, which muſt have lain there for ages.

The growth of bogs, however, is variable in different places, from the variety of conditions in the ſituation, ſoil, humidity, and quantity of vegetable food; in ſome places it is very rapid, in others very ſlow; and therefore their altitudes cannot afford any certain meaſure of time.

In the manufacturing counties of the north, peat-fuel has become ſo ſcarce, that turburies lett from five to eight guineas an acre. In ſome places they are ſo eradicated, there does not remain a trace of them, the ground being now converted into rich meadows and ſweet paſtures.

55 Trade of Ireland on the increaſe.

If we truſt to authorities, we muſt conclude that Ireland was not originally inferior to England, either in the fertility of the ſoil, or ſalubrity of the climate. When this country ſhall have felt the happy effects of the late indulgences of the Britiſh parliament, by repealing ſeveral acts which reſtrained the trade of this kingdom with foreign ports, and allowing the exportation of woollen manufactures and glaſs, and ſhall have received further indulgences from the ſame authority; and when the ſpirit of induſtry ſhall be infuſed, in conſequence of it, into the common people; their country will not be inferior to any other on the globe, under the ſame parallel. It is very difficult to ſay, whether foreign or domeſtic cauſes have operated moſt powerfully in laying waſte this fruitful country; which, by being relieved from their late unnatural prohibitions, will be enabled to furniſh a grand proportion of ſupplies to Great Britain, and will unavoidably become of vaſt importance by its reciprocal trade, in reſtraining the increaſe of that of France, who cannot carry on this important branch of traffic without the aſſiſtance of Iriſh wool. The wool of France is ſhort and coarſe, being, in the language of the manufacturers, neither fine in the thread nor long in the ſtaple. This obliges them to have recourſe to the wool of Ireland, which poſſeſſes both theſe qualities. Aſſiſted by a pack of Iriſh wool, the French are enabled to manufacture two of their own; which they will no longer be able to procure, as the Iriſh will now work up their own wool, which they uſed to export; great part of which found its way to France, and enabled them to ſupply other markets to the great prejudice of Britain. The happy effects of it have been already felt; for, notwithſtanding it was ſo late as December 23. 1779, that the royal aſſent was given to the taking off their reſtraints on woollen exports, it appears, that on January 10, following, an export-entry was made at the cuſtom-houſe of Dublin, of 1300 yards of ſerge for a foreign market, by William Worthington, Eſq.

Irenæus ‖ Iris.

IRENÆUS (St), biſhop of Lyons, was born in Greece about the year 120. He was the diſciple of Pappias and St Polycarp, by whom, it is ſaid, he was ſent into Gaul in 157. He ſtopped at Lyons, where he performed the office of a prieſt; and in 178 was ſent to Rome, where he diſputed with Valentinus, and his two diſciples Florinus and Blaſtus. At his return to Lyons, he ſucceeded Photinus, biſhop of that city; and ſuffered martyrdom in 202, under the reign of Severus. He wrote many works in Greek, of which there only remains a barbarous Latin verſion of his five books againſt heretics, ſome Greek fragments in different authors, and pope Victor's letter mentioned by Euſebius. The beſt editions of his works are thoſe of Eraſmus, in 1526; of Grabe, in 1702; and of Father Maſſuet, in 1710. St Irenæus's ſtyle is cloſe, clear, and ſtrong, but plain and ſimple. Dodwell has compoſed ſix curious diſſertations on the works of St Irenæus.

He ought not to be confounded with St Irenæus the deacon, who in 275 ſuffered martyrdom in Tuſcany, under the reign of Aurelian; nor with St Irænæus, biſhop of Sirmich, who ſuffered martyrdom on the 25th of March 304, during the perſecution of Dioclefian and Maximianus.

IRENE, empreſs of the eaſt, celebrated for her valour, wit, and beauty; but deteſtable for her cruelty, having ſacrificed her own ſon to the ambition of reigning alone. She died in 803.

IRIS, the RAINBOW. See RAINBOW.

IRIS, in anatomy. See there, n° 406, m.

IRIS, the *Flower de Luce*, or Flag-flower, &c. in botany, a genus of the monogynia order, belonging to the hexandria claſs of plants.

There are 21 ſpecies, all herbaceous flowering perennials, both of the fibrous, tuberous, and bulbous rooted kind, producing thick annual ſtalks from 3 or 4 inches to a yard high, terminated by large hexapetalous flowers, having three of the petals reflexed quite back and three erect; moſt of which are very ornamental, appearing in May, June, and July.

Culture. All the ſpecies are eaſily propagated by offſets from the roots, which ſhould be planted in September, October, or November, though almoſt any time from September to March will do. They may alſo be raiſed from ſeed, which is the beſt method for procuring varieties. It is to be ſown in autumn, ſoon after it ripens, in a bed or border of common earth,

Iron
||
Iroquois.

earth, and raked in. The plants will rise in the spring, and are to be transplanted next autumn.

Properties. The roots of the Florentine white iris, when dry, are supposed to have a pectoral virtue. They have an agreeable smell, resembling that of violets; and hence are used in perfumes, and in flavouring of liquors. When recent, they have a bitter, acrid, nauseous taste; and when taken into the body, prove strongly cathartic; on which account they have been recommended in dropsies, in the dose of three or four scruples.—The juice of the species called *bastard acorus*, or *yellow flag-flower*, is also very acrid, and hath been found to produce plentiful evacuations from the bowels when other means had failed. For this purpose, it may be given in doses of 80 drops every hour or two; but the degree of its acrimony is so uncertain, that it can hardly ever come into general use. The fresh roots have been mixed with the food of swine bitten by a mad dog, and they escaped the disease, when others, bitten by the same dog, died raving mad. Goats eat the leaves when fresh; but cows, horses, and swine, refuse them. Cows will eat them when dry. The roots are used in the island of Jura for dying black.

IRON, a metal of a white, livid, greyish colour; extremely hard; and, next to platina, the most difficult to be fused. See METAL; METALLURGY; and CHEMISTRY, n° 145, 202, 242, 279, 382. See also COLOUR-*Making*, n° 13, 32; and DYEING, n° 17.

From some observations made by Mr King on a petrifaction found on the coast of East Lothian in Scotland, he hath concluded, that iron greatly promotes petrifaction *. He hath likewise observed, that solutions of iron may be of considerable efficacy in preventing the destruction of stones by the sun and air. See the articles STONE, PETRIFACTION; also ROCK, MARBLE, MOUNTAIN, &c.

* Phil. Trans. N° XIX. 35. et seq.

IRON-*Sick*, in the sea-language, is said of a ship or boat, when her bolts or nails are so eaten with rust, and so worn away, that they occasion hollows in the planks, whereby the vessel is rendered leaky.

IRON-*Wood*, in botany. See the article SIDEROXYLUM.

IRON-*Wort*, in botany. See the article SIDERITIS.

IRONY, in rhetoric, is when a person speaks contrary to his thoughts, in order to add force to his discourse; whence Quintilian calls it *diversiloquium*.

Thus, when a notorious villain is scornfully complimented with the titles of a very honest and excellent person; the character of the person commended, the air of contempt that appears in the speaker, and the exorbitancy of the commendations, sufficiently discover the dissimulation of irony.

Ironical exhortation is a very agreeable kind of trope; which, after having set the inconveniences of a thing in the clearest light, concludes with a feigned encouragement to pursue it. Such is that of Horace, when, having beautifully described the noise and tumults of Rome, he adds ironically,

"Go now, and study tuneful verse at Rome!"

IROQUOIS, the name of five nations in North America, in alliance with the British colonies. They are bounded by Canada on the north, by the British plantations of New York and Pensilvania on the east and south, and by the lake Ontario on the west.

IRRADIATION, the act of emitting subtile effluvia, like the rays of the sun, every way. See EFFLUVIA.

Irradiation
||
Isæus.

IRREGULAR, something that deviates from the common forms or rules: thus, we say an irregular fortification, an irregular building, an irregular figure, &c. See the articles FORTIFICATION, &c.

IRREGULAR, in grammar, such inflections of words as vary from the general rules; thus we say, irregular nouns, irregular verbs, &c.

The distinction of irregular nouns, according to Mr Ruddiman, is into three kinds, viz. variable, defective, and abundant; and that of irregular verbs into anomalous, defective, and abundant.

IRROMANGO, or ERRAMONGO, one of the new Hebrides islands, is about 24 or 25 leagues in circuit; the middle of it lies in E. Long. 169. 19. S. Lat. 18. 54. The inhabitants are of the middle size, and have a good shape and tolerable features. Their colour is very dark; and they paint their faces, some with black, and others with red pigment: their hair is curly and crisp, and somewhat woolly. Few women were seen; and those very ugly: they wore a petticoat made of the leaves of some plant. The men were quite naked, excepting a belt tied about the waist, and a piece of cloth, or a leaf, used for a wrapper. No canoes were seen in any part of the island. They live in houses covered with thatch; and their plantations are laid out by line, and fenced round. An unlucky scuffle between the British sailors and these people, in which four of the latter were desperately wounded, prevented captain Cook from being able to give any particular information concerning the produce, &c. of this island.

IRTIS, a large river of Asia, in Siberia, which rises among the hills of the country of the Kalmucks, and, running north-east, falls into the Oby near Tobolsk. It abounds with fish, particularly sturgeon, and delicate salmon.

IRVIN, a sea-port town of Scotland, in the bailiewick of Cunningham; seated at the mouth of a river of the same name on the Frith of Clyde; in W. Long. 2. 55. N. Lat. 55. 36.

ISAAC, the Jewish patriarch, and example of filial obedience, died 1716, B. C. aged 180.

ISAIAH, the first of the four greater prophets, was the son of Amos; and was of royal blood, his father being brother to Azariah king of Juda. He prophesied under the reigns of Uzziah, Jotham, Ahaz, and Hezekiah, from the 785th to the 681st year before the Christian æra; when king Manasseh caused him to be put to death in a very advanced age. His prophecies are in Hebrew; his style is noble, sublime, and florid: he speaks so clearly of Christ, and of the great circumstances of his life and death, that he appears to be rather an evangelist and an historian who relates what has already happened, than a man who foretels what was not to be accomplished till several ages were passed.

ISÆUS, a Greek orator, born at Colchis, in Syria, was the disciple of Lysias, and the master of Demosthenes; and taught eloquence at Athens, about 344 years B. C. Sixty-four orations are attributed to him; but he composed no more than 50, of which only 10 are now remaining. He took Lysias for his model, and so well imitated his style and elegance, that

Isatis. that we might eaſily confound the one with the other, were it not for the figures which Iſæus firſt introduced into frequent uſe. He was alſo the firſt who applied eloquence to politics, in which he was followed by his diſciple Demoſthenes.

He ought not to be confounded with Iſæus, another celebrated orator, who lived at Rome in the time of Pliny the Younger, about the year 97.

ISATIS, WOAD; a genus of the ſiliquoſa order, belonging to the tetradynamia claſs of plants. There are four ſpecies; but the only one worthy of notice is the tinctoria, or common woad, which is cultivated in ſeveral parts of Britain for the purpoſes of dyeing; being uſed as a foundation for many of the dark colours. See COLOUR-*Making*, n° 37; and WOAD.

The plant is biennial; the lower leaves are of an oblong oval figure, and pretty thick conſiſtence, ending in obtuſe roundiſh points; they are entire on their edges, and of a lucid green. The ſtalks riſe four feet high, dividing into ſeveral branches, garniſhed with arrow-ſhaped leaves ſitting cloſe to the ſtalks; the branches are terminated by ſmall yellow flowers, in very cloſe cluſters, which are compoſed of four ſmall petals, placed in form of a croſs, which are ſucceeded by pods ſhaped like a bird's tongue, which, when ripe, turn black, and open with two valves, having one cell, in which is ſituated a ſingle ſeed.

This ſort is ſown upon freſh land which is in good heart, for which the cultivators of woad pay a large rent. They generally chooſe to have their lands ſituated near great towns, where there is plenty of dreſſing; but they never ſtay long on the ſame ſpot: for the beſt ground will not admit of being ſown with woad more than twice; and if it is oftener repeated, the crop ſeldom pays the charges of culture, &c. Thoſe who cultivate this commodity have gangs of people who have been bred to the employment; ſo that whole families travel about from place to place, wherever their principal fixes on land for the purpoſe. As the goodneſs of woad conſiſts in the ſize and fatneſs or thickneſs of the leaves, the only method to obtain this, is by ſowing the ſeed upon ground at a proper ſeaſon, and allowing the plants proper room to grow; as alſo to keep them clean from weeds, which, if permitted to grow, will rob the plants of their nouriſhment. After having made choice of a proper ſpot of land, which ſhould not be too light and ſandy, nor over ſtiff and moiſt, but rather a gentle hazel loam, whoſe parts will eaſily ſeparate, the next is to plough this up juſt before winter, laying it in narrow high ridges, that the froſt may penetrate through the ridges to mellow and ſoften the clods; then in the ſpring plough it again croſſwiſe, laying it again in narrow ridges. After it has lain for ſome time in this manner, and the weeds begin to grow, it ſhould be well harrowed to deſtroy them: this ſhould be repeated twice while the weeds are young; and, if there are any roots of large perennial weeds, they muſt be harrowed out, and carried off the ground. In June the ground ſhould be a third time ploughed, when the furrows ſhould be narrow, and the ground ſtirred as deep as the plough will go, that the parts may be as well ſeparated as poſſible; and when the weeds appear again, the ground ſhould be well harrowed to deſtroy them. Toward the end of July, or the beginning of Auguſt, it ſhould be ploughed the laſt time, when the land ſhould be laid ſmooth; and when there is a proſpect of ſhowers, the ground muſt be harrowed to receive the ſeeds, which ſhould be ſown in rows with the drill-plough, or in broad-caſt after the common method; but it will be proper to ſteep the ſeeds one night in water before they are ſown, which will prepare them for vegetation: if the ſeeds are ſown in drills, they will be covered with an inſtrument fixed to the plough for that purpoſe, but thoſe which are ſown broad-caſt in the common way muſt be well harrowed in. If the ſeeds are good, and the ſeaſon favourable, the plants will appear in a fortnight, and in a month or five weeks will be fit to hoe; for the ſooner this is performed when the plants are diſtinguiſhable, the better they will thrive, and the weeds being then young will be ſoon deſtroyed. The method of hoeing theſe plants is the ſame as for turneps: with this difference only, that theſe plants need not be thinned ſo much; for at the firſt hoeing, if they are ſeparated to the diſtance of four inches, and at the laſt to ſix inches, it will be ſpace enough for the growth of the plants; and if this is carefully performed, and in dry weather, moſt of the weeds will be deſtroyed: but as ſome of them may eſcape in this operation, and young weeds will riſe, ſo the ground ſhould be a ſecond time hoed in the beginning of October, always chooſing a dry time for this work; at this ſecond operation, the plants ſhould be ſingled out to the diſtance they are to remain. After this, if carefully performed, the ground will be clean from weeds till the ſpring, when young weeds will come up: therefore about the middle of March will be a good time to hoe the ground again; for while the weeds are young, it may be performed in leſs than half the time it would require if the weeds were permitted to grow large, and the ſun and wind will much ſooner kill them: this hoeing will alſo ſtir the ſurface of the ground, and greatly promote the growth of the plants; if this is performed in dry weather, the ground will be clean till the firſt crop of woad is gathered, after which it muſt be again well cleaned; if this is carefully repeated after the gathering each crop, the land will always lie clean, and the plants will thrive the better. The expence of the firſt hoeing will be about ſix ſhillings *per* acre, and for the after hoeings half that price will be ſufficient, provided they are performed when the weeds are young, for if they are ſuffered to grow large, it will require more labour, nor can it be ſo well performed. Isatis.

If the land, in which this ſeed is ſown, ſhould have been in culture before for other crops, ſo not in good heart, it will require dreſſing before it is ſown, in which caſe rotten ſtable-dung is preferable to any other; but this ſhould not be laid on till the laſt ploughing, juſt before the ſeeds are ſown, and not ſpread till the land is ploughed, that the ſun may not exhale the goodneſs of it, which in ſummer is ſoon loſt when ſpread on the ground. The quantity ſhould not be leſs than 20 loads to each acre, which will keep the ground in heart till the crop of woad is ſpent.

The time for gathering of the crop is according to the ſeaſon: but it ſhould be performed as ſoon as the leaves are fully grown, while they are perfectly green; for when they begin to change pale, great part of their goodneſs is over, for the quantity will be leſs, and

Isatis || Ischia.

and the quality greatly diminished.

If the land is good, and the crop well husbanded, it will produce three or four gatherings; but the two first are the best. These are commonly mixed together in the manufacturing of it: but the after crops are always kept separate; for if these are mixed with the other, the whole will be of little value. The two first crops will fell from 25 to 30l. a ton; but the latter will not bring more than 7 or 8l. and sometimes not so much. An acre of land will produce a ton of woad, and in good seasons near a ton and an half.

When the planters intend to save the seeds, they cut three crops of the leaves, and then let the plants stand till the next year for seed; but if only one crop is cut, and that only of the outer leaves, letting all the middle leaves stand to nourish the stalks, the plants will grow stronger, and produce a much greater quantity of seeds.

These seeds are often kept two years, but it is always best to sow new seeds when they can be obtained. The seeds ripen in August; and when the pods turn to a dark colour, the seeds should be gathered. It is best done by reaping the stalks in the same manner as wheat, spreading the stalks in rows upon the ground: and in four or five days the seeds will be fit to thresh out, provided the weather is dry; for if it lies long, the pods will open and let out the seeds.

There are some of the woad planters, who feed down the leaves in winter with sheep; which is a very bad method: for all plants which are to remain for a future crop, should never be eaten by cattle, for that greatly weakens the plants; therefore those who eat down their wheat in winter with sheep are equally blameable.

ISATIS, in zoology, a synonime of the *Lagopus*. See CANIS.

ISAURA, (anc. geog.), a strong city at mount Taurus, in Isauria: twice demolished: first by Perdiccas, or rather by the inhabitants, who, through despair, destroyed themselves by fire, rather than fall into the hands of the enemy; again, by Servilius, who thence took the surname *Isauricus*. Strabo says, there were two *Isauri*, the old and the new, but so near, that other writers took them but for one.

ISAURIA, (anc. geog.) a country touching Pamphylia and Cilicia on the north, rugged and mountainous, situate almost in mount Taurus, and taking its name from *Isaura*.

ISCHIUM, in anatomy, one of the bones of the pelvis. See ANATOMY, n° 40.

ISCHURY, a disease consisting of an entire suppression of urine. See (the *Index* subjoined to) MEDICINE.

ISCLASTICS, a kind of games, or combats, celebrated in Greece and Asia, in the time of the Roman emperors.

The victor at these games had very considerable privileges conferred on him, after the example of Augustus and the Athenians, who did the like to conquerors at the olympic, pythian, and isthmian games. They were crowned on the spot immediately after their victory, had pensions allowed them, were furnished with provisions at the public cost, and were carried in triumph to their country.

ISCHIA, an Island of Italy, in the kingdom of Naples, about 15 miles in circumference, lying on the coast of the Terra di Lavoro, from which it is three miles distant. It is full of agreeable valleys, which produce excellent fruits. It hath also mountains on which grow vines of an excellent kind: likewise fountains, rivulets, and fine gardens.

Ischia || Isis.

ISCHIA, a town of Italy, and capital of an island of the same name, with a bishop's see, and a strong fort. Both the city and fortress stand upon a rock, which is joined to the island by a strong bridge; the rock is about seven furlongs in circumference. The city is like a pyramid of houses piled upon one another, which makes a very singular and striking appearance. At the end of the bridge next the city are iron gates, which open into a subterraneous passage, through which they enter the city. They are always guarded by soldiers who are natives of the island. E. Long. 13. 55. N. Lat. 40. 50.

ISENACH, a town of Germany, in the circle of Upper Saxony, from whence one of the Saxon princes takes the title of *duke*. There are iron mines in the neighbourhood. E. Long. 9. 17. N. Lat. 51. 0.

ISENBURG, a large town of Germany, capital of a county of the same name, with a handsome castle, seated on the river Seine, in E. Long. 7. 14. N. Lat. 50. 28. The county belongs to the elector of Treves.

ISENGHEIN, a town of the Austrian Netherlands, with the title of a *principality*, seated on the river Mandera, in E. Long. 3. 18. N. Lat. 50. 44.

ISH, in Scots law, signifies *expiry*. Thus we say "the *ish* of a lease." It signifies also *to go out*; thus we say "free *ish* and entry" from and to any place.

ISIA, feasts and sacrifices anciently solemnized in honour of the goddess Isis.

The *isia* were full of abominable impurities; and for that reason, those who were initiated were obliged to take an oath of secrecy: they were held for nine days successively; but were so abominable, that the senate abolished them at Rome, under the consulship of Piso and Gabinius.

ISENARTS, or EISENARTS, a considerable town of Germany in Austria, and in Styria; famous for its iron mines. E. Long. 15. 25. N. Lat. 46. 56.

ISERNIA, a town of Italy, in the kingdom of Naples, and in the county of Molise, with a bishop's see. It is seated at the foot of the Appenines, in E. Long. 14. 20.

ISIDORUS, called DAMIATENSIS, or PELUSIOTA, from his living in a solitude near that city, was one of the most famous of all St Chrysostom's disciples, and flourished in the time of the general council held in 421. We have 2012 of his epistles in five books. They are short, but well written in Greek. The best edition is that of Paris, in Greek and Latin, printed in 1638, in folio.

ISIGNI, a town of France, in Lower Normandy, with a small harbour, and well known on account of its salt-works, its cyder, and its butter. W. Long. 0. 50. N. Lat. 49. 20.

ISIS, an Egyptian goddess, whose worship was so infamous, that the priests were forbid to speak any thing of it; and the senate did often prohibit its practice.

Isinglass. Island.

practice in Rome. She is pictured with a *ſiſtrum* in her hand, a muſical inſtrument not much unlike a cymbal; and was often called *Terra*, from whence ſhe is repreſented as having many breaſts. Some hiſtorians ſay ſhe was queen of Egypt, and reigned there with her huſband Oſiris, A. M. 2500.

ISINGLASS. See Ichthyocolla.

ISLAND, a tract of dry land encompaſſed with water; in which ſenſe it ſtands contradiſtinguiſhed from Continent, or Terra Firma.

Several naturaliſts are of opinion, that the iſlands were formed at the deluge; others think, that there have been new iſlands formed by the caſting up of vaſt heaps of clay, mud, ſand, &c.; others think they have been ſeparated from the continent by violent ſtorms, inundations, and earthquakes. Theſe laſt have obſerved, that the Eaſt-Indies, which abound in iſlands more than any other part of the world, are likewiſe more annoyed with earthquakes, tempeſts, lightnings, volcanos, &c. than any other part. Others again conclude, that iſlands are as ancient as the world, and that there were ſome at the beginning; and, among other arguments, ſupport their opinion from Gen. x. 5. and other paſſages of Scripture.

Varenius thinks that there have been iſlands produced each of theſe ways. St Helena, Aſcenſion, and other ſteep rocky iſlands, he ſuppoſes to have become ſo by the ſea's overflowing their neighbouring champaigns: but by the heaping up huge quantities of ſand, and other terreſtrial matter, he thinks the iſlands of Zealand, Japan, &c. were formed. Sumatra and Ceylon, and moſt of the Eaſt-India iſlands, he thinks, were rent off from the main land; and concludes, that the iſlands of the Archipelago were formed in the ſame way, imagining it probable that Deucalion's flood might contribute towards it. The ancients had a notion that Delos, and a few other iſlands, roſe from the bottom of the ſea; which, how fabulous ſoever it may appear, agrees with later obſervations. Seneca takes notice, that the iſland Theraſia roſe thus out of the Ægean ſea in his time, of which the mariners were eye-witneſſes.

It is indeed very probable, that many iſlands have exiſted not only from the deluge, but from the creation of the world; and we have undoubted proofs of the formation of iſlands in all the different ways abovementioned. Another way, however, in which iſlands are frequently formed in the South Sea, is by the coralline inſects: (See Corallina.) On this ſubject the following curious diſſertation by Alexander Dalrymple, Eſq; hath appeared in the Philoſophical Tranſactions for the year 1767.

"Theſe iſlands are generally long and narrow: they are formed by a narrow bar of land, incloſing the ſea within it; generally, perhaps always, with ſome ingreſs at leaſt to the tide; commonly with an opening capable of receiving a canoe, and frequently ſufficient to admit even larger veſſels.

"The origin of theſe iſlands will explain their nature. What led me firſt to this deduction was an obſervation of Abdul Roobin, a Sooloo pilot, that all the iſlands lying off the north-eaſt coaſt of Borneo had ſhoals to the eaſtward of them.

"Theſe iſlands being covered to the weſtward by Borneo, the winds from that quarter do not attack them with violence. But the north-eaſt winds, tumbling in the billows from a wide ocean, heap up the coral with which thoſe ſeas are filled. This, obvious after ſtorms, is perhaps at all other times imperceptibly effected. Island.

"The coral banks, raiſed in the ſame manner, become dry. Theſe banks are found of all depths, at all diſtances from ſhore, entirely unconnected with the land, and detached from each other: although it often happens that they are divided by a narrow gut without bottom.

"Coral banks alſo grow, by a quick progreſſion, towards the ſurface; but the winds, heaping up the coral from deeper water, chiefly accelerate the formation of theſe into ſhoals and iſlands. They become gradually ſhallower; and, when once the ſea meets with reſiſtance, the coral is quickly thrown up by the force of the waves breaking againſt the bank; and hence it is, that, in the open ſea, there is ſcarce an inſtance of a coral bank having ſo little water that a large ſhip cannot paſs over, but it is alſo ſo ſhallow that a boat would ground on it.

"I have ſeen theſe coral banks in all the ſtages; ſome in deep water, others with few rocks appearing above the ſurface; ſome juſt formed into iſlands, without the leaſt appearance of vegetation; and others from ſuch as have a few weeds on the higheſt part, to thoſe which are covered with large timber, with a bottomleſs ſea at a piſtol-ſhot diſtance.

"The looſe coral, rolled inward by the billows in large pieces, will ground; and the reflux being unable to carry them away, they become a bar to coagulate the ſand, always found intermixed with coral; which ſand, being eaſieſt raiſed, will be lodged at top. When the ſand-bank is raiſed by violent ſtorms beyond the reach of common waves, it becomes a reſting-place to vagrant birds, whom the ſearch of prey draws thither. The dung, feathers, &c. increaſe the ſoil, and prepare it for the reception of accidental roots, branches, and ſeed, caſt up by the waves, or brought thither by birds. Thus iſlands are formed: the leaves and rotten branches intermixing with the ſand, form in time a light black mould, of which in general theſe iſlands conſiſt; more ſandy as leſs woody; and, when full of large trees, with a greater proportion of mould.

"Cocoa nuts, continuing long in the ſea without loſing their vegetative powers, are commonly to be found in ſuch iſlands; particularly as they are adapted to all ſoils, whether ſandy, rich, or rocky.

"The violence of the waves within the tropics, muſt generally be directed to two points, according to the monſoons.

"Hence the iſlands formed from coral banks muſt be long and narrow, and lie nearly in a meridional direction. For even ſuppoſing the banks to be round, as they feldom are when large, the ſea, meeting moſt reſiſtance in the middle, muſt heave up the matter in greater quantities there than towards the extremities: and, by the ſame rule, the ends will generally be open, or at leaſt loweſt. They will alſo commonly have ſoundings there, as the remains of the bank, not accumulated, will be under water.

"Where the coral banks are not expoſed to the common monſoon, they will alter their direction; and

Island. and be either round, extend in the parallel, or be of irregular forms, according to accidental circumſtances.

"The interior parts of theſe iſlands being ſea, ſometimes form harbours capable of receiving veſſels of ſome burthen, and, I believe, always abound greatly with fiſh; and, ſuch as I have ſeen, with turtle-graſs and other ſea-plants, particularly one ſpecies, called by the Sooloos *gammye*, which grows in little globules, and is ſomewhat pungent, as well as acid, to the taſte.

"It need not be repeated, that the ends of thoſe iſlands only are the places to expect ſoundings; and they commonly have a ſhallow ſpit running out from each point.

"Abdul Roobin's obſervation points out another circumſtance, which may be uſeful to navigators; by conſideration of the winds to which any iſlands are moſt expoſed, to form a probable conjecture which ſide has deepeſt water; and from a view which ſide has the ſhoals, an idea may be formed which winds rage with moſt violence."

Iſlands from their ſituation enjoy many great advantages, the principal of which are theſe. In the firſt place, many benefits are derived to the inhabitants of an iſland from its unity. The very largeſt country on a continent is ſtill but a part, which implies dependance, and is neceſſarily attended with a train of imperfections; from all of which, by the unerring and unalterable laws of nature, the people who live in an iſland are or may be entirely free. All countries on the continent are expoſed to continual dangers, againſt which their inhabitants muſt be perpetually upon their guard. This renders a large military force requiſite. It involves them in continual negotiations, leagues, and alliances; all of which, however, cannot exempt them from frequent wars, or the miſeries that attend them, and which have commonly bad effects on their internal policy. In the next place, the climate is generally mild and ſalubrious from the vapours of the ſurrounding ſea, which according to the latitude abates the violence of heat, and moderates the rigour of cold, both which are ſenſibly and conſtantly leſs than on continents under the ſame elevation of the pole. We have a remarkable inſtance of this, in the iſlands called anciently *Stœchades*, in the modern Latin *Inſulæ Arearum*, by us the iſlands of *Hieres*. They are three in number, lying in 43° north latitude, before the port of Toulon. In them, the fruits of France and Italy arrive at the higheſt perfection, and all the medical herbs of Italy, Greece, and Egypt, grow wild. Yet the climate is wonderfully temperate and pleaſant in all ſeaſons*.—There is alſo commonly a greater variety, and always a greater fertility, in the ſoil, occaſioned chiefly by the warmth of the circumambient air, frequent ſhowers, and, in conſequence of both, being continually impregnated with vegetable ſalts. Another conſiderable advantage ariſes from its acceſſibility on every ſide, by which it is open to receive ſupplies from other countries, and has the conveniency of exporting its commodities and manufactures to all markets, and, in compariſon of the continent, at all ſeaſons. The oppoſite ſides of an iſland may in regard to commerce be conſidered as two countries; each has its ports, its proper commodities, its proper correſpondencies; in conſequence of which, it promotes the cultivation, and procures vent for the manufactures, of a large diſtrict behind it; while the intermediate midland ſpace finds a profit in that inland trade, which theſe two diſtricts ſupply. The winds contrary on one ſide are favourable on the other; and the ſea, the common road to both coaſts, is continually ploughed by veſſels outward and homeward bound, which keeps up that active and enterprizing ſpirit which characterizes iſlanders. An iſland has at once the moſt extenſive and the moſt effectual frontier, and this on all ſides, ſubſiſting for ever, without repairs, and without expence: and, which is ſtill more, derives from this very frontier a great part of the ſubſiſtence of its inhabitants, and a valuable article in its commerce, from its fiſheries. It is commonly ſaid the ſea is a mine, but in truth it is better; its treaſures are more laſting and more certain, procured by labour ſolely, and fit for uſe or for ſale as ſoon as procured, quickly conſumed, and thereby the ſource of continual employment to a ſtout, hardy, laborious race of men, who likewiſe find employment for numbers, and are in various reſpects otherwiſe beneficial members of the community. The defence of this natural barrier, which, as we have ſaid, coſts nothing; but on the contrary yields much, is not only permanent, but in every reſpect more to be relied on than any that could be raiſed by the ſkill and induſtry of men at the greateſt expence. All theſe bleſſings and benefits are inſured by the leſſon that Nature dictates, ſome would ſay the law which ſhe preſcribes, to the inhabitants of every iſland, to place all their hopes in the aſſiduous cultivation of their own country, to bend all their endeavours to raiſing and extending their commerce, and to put their truſt in Providence, and in the ſafeguard which ſhe directs; men accuſtomed to robuſt and hardy exerciſes, and in what neceſſarily ariſes from their way of life, a naval force. The firſt inhabitants come in veſſels, are for a time dependent on the country from whence they came, arrive at independence by enlarging their correſpondence: and thus commerce is natural and eſſential to the people of an iſland; which is the reaſon that they thrive ſo long as they poſſeſs it, and gradually decline in the ſame proportion in which that decays.

Island. *of Ice.* See Ice-*Iſland.*

Floating-Islands. Hiſtories are full of accounts of floating iſlands; but the greateſt part of them are either falſe or exaggerated. What we generally ſee of this kind is no more than the concretion of the lighter and more viſcous matter floating on the ſurface of the water in cakes; and, with the roots of the plants, forming congeries of different ſizes, which, not being fixed to the ſhore in any part, are blown about by the winds, and float on the ſurface. Theſe are generally found in lakes, where they are confined from being carried too far; and, in proceſs of time, ſome of them acquire a very conſiderable ſize. Seneca tells us of many of theſe floating iſlands in Italy; and ſome later writers have deſcribed not a few of them in other places. But, however true theſe accounts might have been at the time when they were written, very few proofs of their authenticity are now to be found; the floating iſlands having either diſappeared again, or been fixed to the ſides in ſuch a manner as to make a part of the ſhore. Pliny tells us of a great iſland

* See *America*, n° 6.—23.

Iſland
‖
Iſnic.

which at one time ſwam about in the lake Cutilia in the country of Reatinum, which was diſcovered to the old Romans by a miracle; and Pomponius tells us, that in Lydia there were ſeveral iſlands ſo looſe in their foundations, that every little accident ſhook and removed them.

ISLAND (or *Iceland*) *Cryſtal*, a body famous among the writers on optics, for its property of a double refraction; but named very improperly, as it has none of the diſtinguiſhing properties of cryſtal, and is plainly a body of another claſs. Dr Hill has determined it to be a genus of ſpars, which he has called, from their figure, *parallellopipedia*, and of which he has deſcribed ſeveral ſpecies; all of which, as well as ſome other bodies of a different genus, have the ſame properties. It is always found in form of an oblique parallellopiped with ſix ſides; and is found of various ſizes, from a quarter of an inch to three inches or more in diameter. It is pellucid, and not much leſs bright than the pureſt cryſtal; and its planes are all tolerably ſmooth, tho', when nicely viewed, they are found to be waved with crooked lines made by the edges of imperfect plates. What appears very ſingular in the ſtructure of this body is, that all the ſurfaces are placed in the ſame manner, and conſequently it will ſplit off into thin plates either horizontally or perpendicularly; but this is found, on a microſcope examination, to be owing to the regularity of figure, ſmoothneſs of ſurface, and niceneſs of joining, in the ſmall parallellopiped concretions of which the whole is compoſed. It is very ſoft, and eaſily ſcratched with the point of a pin. It will not give fire on being ſtruck againſt ſteel; and ferments and is totally diſſolved in aquafortis. It was firſt diſcovered in Iceland, from whence it has its name; but has been found in France, Germany, and many other places. In England, fragments of other ſpars are often miſtaken for it; many of them having in ſome degree the ſame properties. For an account of the ſingular refractive property of this ſubſtance, ſee (the *Index* ſubjoined to) OPTICS.

ISLE-ADAM, a town of France, with a handſome caſtle, and the title of a baron; ſeated on the river Oiſe, three miles from Beaumont, and 20 from Paris. E. Long. 2. 13. N. Lat. 49. 7.

ISLE-*de-Dieu*, a ſmall iſland of France in the ſea of Gaſcony, and on the coaſt of Poitou, from which it is 14 miles. W. Long. 2. 5. N. Lat. 46. 45.

ISLE-*de-France*, is one of the 12 general governments of France; bounded on the north by Picardy; on the weſt by Normandy, on the ſouth by the government of Orleannois, and on the eaſt by that of Champagne. It is about 90 miles in length, and as much in breadth; and is watered by the rivers Seine, Marne, Oiſe, and Aiſne. The air is temperate, and the ſoil fertile; and it abounds in wine, corn, and fruits. In contains 10 ſmall diſtricts, and Paris is the capital city.

ISNY, an imperial town of Germany, in Suabia, and in Algow; ſeated on the river Iſny, in E. Long. 9. 10. N. Lat. 47. 33.

ISNIC, a town of Turky in Aſia, and in Natolia, with a Greek archbiſhop's ſee. It is the ancient Nice, famous for the firſt general council held here in 325. There is now nothing remaining of its ancient ſplendor but an aqueduct. The Jews inhabit the greateſt part of it; and it is ſeated in a country fertile in corn and excellent wine. E. Long. 30. 9. N. Lat. 47. 15.

Iſochronal
‖
Iſpahan.

ISOCHRONAL, is applied to ſuch vibrations of a pendulum, as are performed in the ſame ſpace of time; as all the vibrations or ſwings of the ſame pendulum are, whether the arches it deſcribes are ſhorter or longer.

ISOCHRONAL-*Line*, that in which a heavy body is ſuppoſed to deſcend without any acceleration.

ISOCRATES, one of the greateſt orators of Greece, was born at Athens, 436 B. C. He was the ſon of Theodorus, who had enriched himſelf by making muſical inſtruments, and gave his ſon a liberal education. Iſocrates was the diſciple of Prodicus, Gorgias, and other great orators. He endeavoured at firſt to declaim in public, but without ſucceſs; he therefore contented himſelf with inſtructing his ſcholars and making private orations. He always ſhewed great love for his country; and being informed of the loſs of the battle of Cheronea, he abſtained four days from eating, and died, aged 98. There are ſtill extant 21 of his diſcourſes or orations, which are excellent performances, and have been tranſlated from the Greek into Latin by Wolfius. Iſocrates particularly excelled in the juſtneſs of his thoughts, and the elegance of his expreſſions. There are alſo nine letters attributed to him.

ISOLA, a town of Italy, in the kingdom of Naples, and in the Farther Calabria, with a biſhop's ſee. It is a ſea-port town, and is ſeated 15 miles ſouth-eaſt of St Severina. E. Long. 7. 33. N. Lat. 39. 1.

ISOPERIMETRICAL FIGURES, in geometry, are ſuch as have equal perimeters or circumferences.

ISOSCELES TRIANGLE, in geometry, one that has two equal ſides,

ISPAHAN, or, as the Perſians pronounce it, *Spauhawn*, the capital of Perſia, is ſituated in the province of Irac, Agemi, or Perſia Proper, upon the ruins, as generally ſuppoſed, of the ancient Hecatompylos, or, as others think, of the Aſpa of Ptolemy. Moſt of the Eaſtern aſtronomers and geographers place it in N. Lat. 32. 25. E. Long. 86. 40. It ſtands in a very extenſive plain, ſurrounded by mountains; and has eight diſtricts belonging to it, that contain about 400 towns and villages. The fertility of the ſoil, the mildneſs of the ſeaſons, and the fine temperature of the air, all conſpire to render Iſpahan one of the moſt charming and delightful cities in the world. It is unanimouſly agreed, that the preſent city is of no great antiquity; and the two parts into which it is divided, preſerve the names of two contiguous towns, from the junction of which it was formed. The inhabitants of theſe, notwithſtanding their neighbourhood, bear an inveterate antipathy to each other; which they diſcover on all public occaſions. Spauhawn owes the glory it now poſſeſſes to the great Shah Abas; who, after the conqueſt of the kingdoms of Lar and Ormus, charmed with the ſituation of this place, made it the capital of his empire, between the years 1620 and 1628. The mountains, with which this city is ſurrounded, defend it alike from the ſultry heats of ſummer, and the piercing winds of the winter-ſeaſon; and the plain on which it ſtands, is watered by ſeveral rivers, which contribute alike to its ornament and uſe. Of theſe rivers,

the

Ifpahan. the Zenderoud, after being joined by the Mahmood, paſſes by Spauhawn; where it has three fine bridges over it, and is as broad as the Seine at Paris. The waters of theſe united ſtreams are ſweet, pleaſant, and wholeſome, almoſt beyond compariſon; as, indeed, are all the ſprings found in the gardens belonging to the houſes of Spauhawn. The extent of Spauhawn is very great; not leſs, perhaps, than 20 miles within the walls, which are of earth, poorly built, and ſo covered with houſes and ſhaded with gardens, that in many places it is difficult to diſcover them. The Perſians are wont to ſay, *Spauhawn niſpigehon*, i. e. Spauhawn is half the world. Sir John Chardin ſays, that tho' ſome reckoned 11,000,000 of inhabitants in it, he did not himſelf look upon it as more populous than London. At a diſtance, the city is not eaſily diſtinguiſhed; for many of the ſtreets being adorned with plantains, and every houſe having its garden, the whole looks like a wood. The ſtreets in general are neither broad nor convenient; there being three great evils which attend them: the firſt is, that being built on common ſewers, theſe are frequently broke up, which is very dangerous, conſidering that moſt people are on horſeback; the ſecond is, that there are many wells or pits in them, which are not leſs dangerous; the third ariſes from the people's emptying all their ordure from the tops of their houſes: this laſt, indeed, is in ſome meaſure qualified by the dryneſs of the air, and by its being quickly removed by the peaſants, who carry it away to dung their grounds. Some reckon eight, and others ten gates, beſides poſterns; but all agree that there is no difficulty of entering at any hour of the day or night. The three principal ſuburbs annexed to it are, Abbas-abad, built by Shah Abas, and belonging to the people of Tauris; Julfa, inhabited by a colony of Armenians, called by ſome *New Julfa*, to diſtinguiſh it from the ancient city of that name, ſituated in Armenia, upon the Araxes, whence the original inhabitants of New Julfa were brought; and Ghebr-Abad, or, as the Arabs pronounce it, Kebr-Abad, the ſtreet of the magians, occupied entirely by the profeſſors of magiſm, or the religion of the ancient Perſians. The river Zenderoud ſeparates the city of Iſpahan and Abas-Abad, from Julfa and Ghebr-Abad. This city has ſuffered greatly ſince the commencement of the dreadful rebellion in 1721; the whole kingdom from that period, till a few years ago, having been almoſt a continued ſcene of blood, ravages, and confuſion. A celebrated modern traveller, who was on the ſpot, tells us, that the inhabitants of Julfa, not many years before the above revolution happened, amounted to 30,000 ſouls; had 13 churches; and above 100 prieſts; and paid the Perſian court 200 tomans yearly for the free exerciſe of their religion: that ſome of the ſtreets were broad and handſome, and planted with trees, with canals and fountains in the middle; others narrow and crooked, and arched a top; others again, though extremely narrow, as well as turning and winding many ways, were of an incredible length, and reſembled ſo many labyrinths: that, at a ſmall diſtance from the town, there were public walks, adorned with rows of plane-trees on each ſide, ways paved with ſtones, fountains, and ciſterns: that there were above 100 caravanſeras for the uſe of merchants and travellers, many of which were built by the kings and prime nobility of Perſia: that, as little rain fell there, the ſtreets were frequently full of duſt, which rendered the city diſagreeable during a conſiderable part of the ſummer; that the citizens, however, to make this inconvience more tolerable, uſed to water them when the weather was warmer than uſual: that there was a caſtle in the eaſtern part of the town, which the citizens looked upon as impregnable, in which the public money, and moſt of the military ſtores, were ſaid to be kept: that, notwithſtanding the baths and caravanſeras were almoſt innumerable, there was not one public hoſpital: that moſt of the public buildings were rather neat than magnificent, though the great meydan or market-place, the royal palace (which is three quarters of a league in circumference), and the alley denominated *Tober-bag*, adjoining to it, made a very grand appearance: that the former contained the royal moſque; the building denominated *kayſerich*, where all ſorts of foreign commodities were expoſed to ſale; and the mint, ſtyled by the Perſians *ferraa-khoneh*, where the current-money of the kingdom was coined: that, beſides the native Perſians, there were then in Iſpahan above 10,000 Indians, all ſupported by trade; 20,000 Georgians, Circaſſians, and Tartars of Dagheſtan or Leſgees, with a conſiderable number of Engliſh, Dutch, Portugueſe, and a few French: that the Capuchins, diſcalceated or bare-footed Carmelites, Jeſuits, Dominicans, and Auſtin friars, had likewiſe their convents here, though they were unable to make any converts; and that there were above 100 moſques and public colleges. But ſince the fatal period abovementioned, the ſuburb of Julfa was almoſt totally abandoned by the Armenians. The government of Iſpahan, 23 leagues long and as many broad, comprehending ſeveral diſtricts, moſt of them formerly well peopled, appeared not many years ago little better than a deſart; moſt of the inhabitants of that fertile and delightful tract being fled and diſperſed. Multitudes of them had taken a precarious refuge in the mountains of Loriſtan, lying between Iſpahan and Suſter, whoſe lands were left untilled, and their houſes mouldered into ruins. In ſhort, all the diſtreſſes of an unſucceſsful war, or the invaſion of a barbarous enemy, could not have plunged the people of Iſpahan into greater miſery than the victories of their tyrannical king, Nadir Shah, who ſeemed more ſolicitous to humble his own ſubjects than his enemies. As this was the caſe before the death of that uſurper, in what condition muſt we ſuppoſe Iſpahan and the reſt of Perſia to be in now, as the kingdom hath been ever ſince, till very lately, deſolated by a civil war occaſioned by ſeveral competitors for the crown? Whoever deſires to be more fully informed in relation to the ſtate of the city before the troubles, may conſult Sir John Chardin, Mr Tavernier, M. le Brun, and Dr Kæmpfer, who is much later than the others.

Iſpahan ſi Iſrael.

ISPIDA, in ornithology. See ALCEDO.

ISRAEL, a name given by the Deity to the patriarch Iſaac, and often uſed for the whole nation of the Jews.

Kingdom of ISRAEL, that of the ten tribes after their revolt from the houſe of David; called alſo the kingdom of *Ephraim* and of *Samaria*; extending both on this and on the other ſide of Jordan; and from Syria, thro' Galilee, to the borders of Benjamin; compriſing

Iſſachar
||
Iſſus.

priſing the tribes of Dan and Simeon, and the weſt of Judah, quite to the borders of Egypt.

ISSACHAR, one of the diviſions of Paleſtine by tribes; lying to the ſouth of Zabulon, ſo as by a narrow ſlip to reach the Jordan, between Zabulon and Manaſſeh, Joſh. xix. But whether it reached to the ſea, is a queſtion; ſome holding that it did: an aſſertion not eaſy to be proved, as Joſhua makes no mention of the ſea in this tribe, nor does Joſephus extend it farther than to mount Carmel; and in Joſh. xvii. 10. Aſher is ſaid to touch Manaſſeh on the north, which could not be if Iſſachar extended to the ſea.

ISSOUDUN, a conſiderable town of France, in Berry. It carries on a great trade in wood, cattle, cloth, hats, and ſtockings; is ſeated partly on a plain, and partly on an eminence. E. Long. 2. 5. N. Lat. 46. 57.

ISSUE, in law. See PLEA *and Iſſue*.

ISSUES, in ſurgery, are little ulcers made deſignedly by the ſurgeon in various parts of the body, and kept open by the patient, for the preſervation and recovery of his health.

ISSUS, now AJAZO, a town of Cilicia in Natolia, with a harbour on the Levant Sea, a little to the north of Scanderoon. E. Long. 36. 25. N. Lat. 36. 56.

Near this place, in a difficult paſs between the mountains and the ſea, Alexander the Great fought his ſecond battle with Darius. One great cauſe of the defeat which the Perſians received here was the bad conduct of their monarch, who led his numerous forces into a narrow place, where they had not room to act. Alexander was ſo much ſurpriſed when he firſt received the news that Darius was behind him, that he could ſcarce believe it to be true: but when he was thoroughly ſatisfied of the fact, and that Darius had again paſſed the river Pinarus, he called a council of war, wherein, without aſking any body's advice, he only told them, that he hoped they would remember their former actions; and that they, who were always conquerors, were about to fight people who were always beat. He further obſerved, that Darius ſeemed to be infatuated, ſince he had with ſuch expedition quitted an open and champaign country, where his numbers might have acted with advantage, to fight in a place incloſed, where the Macedonian phalanx might be well drawn up, and where his numbers could only incommode him. He then made the neceſſary diſpoſitions for repaſſing the mountains, poſted guards where he found them neceſſary, and then commanded his troops to refreſh themſelves, and to take their reſt till morning.

At break of day he began to repaſs the mountains, obliging his forces to move in cloſe order where the road was narrow, and to extend themſelves as they had more room; the right wing keeping always cloſe to the mountain, and the left to the ſea-ſhore. On the right there was a battalion of heavy-armed troops, beſides the targeteers under the command of Nicanor the ſon of Parmenio. Next theſe, extending to the phalanx, were the corps of Cœnus and Perdiccas; and on the left, the reſpective bodies commanded by Amyntas, Ptolemy, and Meleager. The foot appointed to ſupport them were commanded by Craterus; but the whole left wing was committed to Parmenio, with ſtrict orders not to decline from the ſea-ſhore, leſt the Perſians ſhould ſurround them. Darius ordered 20,000 foot and 30,000 horſe to retire, finding that he already wanted room to draw up the reſt. His firſt line conſiſted of 30,000 Greek mercenaries, having on their right and left 60,000 heavy-armed troops, being the utmoſt the ground would allow. On the left, towards the mountain, he poſted 20,000 men, which, from the hollow ſituation of the place, were brought quite behind Alexander's right wing. The reſt of his troops were formed into cloſe and uſeleſs lines behind the Greek mercenaries, to the number in all of 600,000 men. When this was done, he ſuddenly recalled the horſe who had retired, ſending part of them to take poſt on his right againſt the Macedonians commanded by Parmenio; and the reſt he ordered to the left towards the mountain: but, finding them unſerviceable there, he ſent the greateſt part of them to the right; and then took upon himſelf, according to the cuſtom of the Perſian kings, the command of the main body. As ſoon as Alexander perceived that the weight of the Perſian horſe was diſpoſed againſt his left wing, he diſpatched, with as much ſecrecy as he could, the Theſſalian cavalry thither, and ſupplied their places on the right by ſome brigades of horſe from the van, and light-armed troops. He alſo made ſuch diſpoſitions, that, notwithſtanding the mighty advantage of the hollow mountain, the Perſians could not ſurround him. But, as theſe precautions had conſiderably weakened the centre of his army, he ordered thoſe advanced poſts on the enemy's left, of which he was moſt apprehenſive, to be attacked at the very beginning of the fight; and, when they were eaſily driven from them, he recalled as many troops as were neceſſary to ſtrengthen his centre. Iſſus.

When all things were in order, Alexander gave ſtrict command, that his army ſhould march very ſlowly. As for Darius, he kept his troops fixed in their poſts, and in ſome places threw up ramparts; whence the Macedonians rightly obſerved, that he thought himſelf already a priſoner. Alexander at the head of the right wing engaged firſt, and without any difficulty broke and defeated the left wing of Darius. But, endeavouring to paſs the river Pinarus after them, his troops in ſome meaſure loſing their order, the Greek mercenaries fell upon them in flank, and made them fight, not only for victory, but for their lives. Ptolemy the ſon of Seleucus, and 120 Macedonians of ſome rank, were killed upon the ſpot. But the foot next to Alexander's right wing coming in ſeaſonably to its relief, fell upon the mercenaries in flank, amongſt whom a dreadful carnage was made; they being in a manner ſurrounded by the horſe and light-armed troops, which at firſt purſued the left wing, and the foot that had now paſſed the river. The Perſian horſe on the right ſtill fought gallantly; but, when they were thoroughly informed of the rout of their left wing, of the deſtruction of the Greek mercenaries, and that Darius himſelf was fled, they began to break, and betake themſelves to flight alſo. The Theſſalian cavalry purſued them cloſe at the heels; the narrow craggy roads incommoded them exceedingly, ſo that vaſt numbers of them periſhed. As for Darius, he fled, ſoon after the left wing was broken, in a chariot with a few of his favourites: as far as the country was plain

and

Iſſus, Iſthmia.

and open, he eſcaped well enough; but, when the roads became rocky and narrow, he quitted it, and, mounting an horſe, rode all the night: his chariot, in which were his cloak and his bow, fell into the hands of Alexander, who carried them back to his camp.

In reſpect to the battle of Iſſus, Diodorus informs us, that Alexander looked every-where about for Darius; and, as ſoon as he diſcovered him, with his handful of guards attacked him and the flower of the Perſian army which was about him; being as deſirous of obtaining this victory by his perſonal valour, as of ſubduing the Perſian empire by the courage of his ſoldiers. But when Oxathres, the brother of Darius, ſaw Alexander's deſign, and how fiercely he fought to accompliſh it, he threw himſelf, with the horſe who were about him, between his brother's chariot and the enemy, where an obſtinate fight was maintained, till the dead bodies roſe like an entrenchment about the chariot of Darius. Many of the Perſian nobility were ſlain, and Alexander himſelf was wounded in the thigh. At laſt, the horſes in the chariot of Darius ſtarted, and became ſo unruly, that the king himſelf was forced to take the reins; the enemy, however, preſſed ſo hard upon him, that he was conſtrained to call for another chariot, and mounted it in great danger. This was the beginning of the rout, which ſoon after became general. According to this author, the Perſians loſt 200,000 foot, and 10,000 horſe; the Macedonians 300 foot, and 150 horſe.

Juſtin informs us, that the Perſian army conſiſted of 400,000 foot, and 100,000 horſe. He ſays, that the battle was hard fought, that both the kings were wounded, and that the Perſians ſtill fought gallantly when their king fled, but that they were afterwards ſpeedily and totally routed: he is very particular as to their loſs, which he ſays amounted to 61,000 foot, 10,000 horſe, and 40,000 taken priſoners; of the Macedonians he ſays there fell no more than 130 foot, and 150 horſe. Curtius ſays, that of the Perſians there fell 100,000 foot, and 10,000 horſe: of Alexander's army 504, he ſays, were wounded; 32 foot and 150 horſe killed. That we may not ſuſpect any error in tranſcribers, his own obſervation confirms the fact: *Tantulo impendio ingens victoria ſtetit*, "So ſmall was the coſt of ſo great a victory."

ISTHMIA, or ISTHMIAN *Games*; one of the four ſolemn games which were celebrated every fifth year in Greece. They had their name from the Iſthmus of Corinth, where they were celebrated. In their firſt inſtitution, according to Pauſanias, they conſiſted only of funeral rites and ceremonies in honour of Melicertes: but Theſeus afterwards, as Plutarch informs us, in emulation of Hercules, who had appointed games at Olympia in honour of Jupiter, dedicated thoſe to Neptune, his reputed father; who was regarded as the particular protector of the Iſthmus and commerce of Corinth. The ſame trials of ſkill were exhibited here as at the other three ſacred games; and particularly thoſe of muſic and poetry. Theſe games, in which the victors were only rewarded with garlands of pine-leaves, were celebrated with great magnificence and ſplendour as long as paganiſm continued to be the eſtabliſhed religion of Greece; nor were they omitted even when Corinth was ſacked and burned by Mummius the Roman general; at which time the care of them was tranſferred to the Sicyonians, but was reſtored again to the Corinthians when their city was rebuilt. Iſthmus, & Italy.

ISTHMUS, a narrow neck, or ſlip of ground, which joins two continents: or joins a peninſula to the terra firma, and ſeparates two ſeas. See PENINSULA.

The moſt celebrated iſthmuſes are thoſe of Panama, or Darien, which joins North and South America; that of Suez, which connects Aſia and Africa; that of Corinth, or Peloponneſus, in the Morea; that of Crim-Tartary, otherwiſe called *Taurica Cherſoneſus*; that of the peninſula Romania, and Eriſſo, or the iſthmus of the Thracian Cherſoneſus, 12 furlongs broad, being that which Xerxes undertook to cut through. The ancients had ſeveral deſigns of cutting the iſthmus of Corinth, which is a rocky hillock, about ten miles over; but they were all in vain, the invention of ſluices being not then known. There have been attempts too for cutting the iſthmus of Suez, to make a communication between the Red ſea and the Mediterranean: but theſe alſo failed; and in one of them, a king of Egypt is ſaid to have loſt 120,000 men.

ISTRIA, a peninſula of Italy, in the territory of Venice, lying in the north part of the Adriatic ſea. It is bounded by Carniola on the north; and on the ſouth, eaſt, and weſt, by the ſea. The air is unwholeſome, eſpecially near the coaſt; but the ſoil produces plenty of wine, oil, and paſtures; there are alſo quarries of fine marble. One part of it belongs to the Venetians, and the other to the houſe of Auſtria. Cabo d'Iſtria is the capital town.

ITALIAN, the language ſpoken in Italy. See the article LANGUAGE.

This tongue is derived principally from the Latin; and of all the languages formed from the Latin, there is none which carries with it more viſible marks of its original than the Italian. It is accounted one of the moſt perfect among the modern tongues, containing words and phraſes to repreſent all ideas, to expreſs all ſentiments, to deliver one's ſelf on all ſubjects, to name all the inſtruments and parts of arts, &c. It is, however, complained, that it has too many diminutives and ſuperlatives, or rather augmentatives; but without any great reaſon: for if theſe words convey nothing farther to the mind than the juſt ideas of things, they are no more faulty than our pleonaſms and hyperboles. The language correſponds to the genius of the people: they are ſlow and thoughtful; and accordingly their language runs heavily, though ſmoothly, and many of their words are lengthened out to a great degree. They have a great taſte for muſic; and, to gratify their paſſion this way, have altered abundance of their primitive words, leaving out conſonants, taking in vowels, ſoftening and lengthening out their terminations for the ſake of the cadence. Hence the language is extremely muſical, and ſucceeds better than any other in operas, and ſome parts of poetry; but it fails in ſtrength and nerves: hence alſo a great part of its words borrowed from the Latin became ſo far diſguiſed, that they are not eaſily known again.

ITALY, one of the fineſt countries of Europe, lying between 7 and 10 degrees of E. Long. and between 37 and 46 degrees of N. Lat. On the north, north-

Italy. north-west, and north-east, it is bounded by France, Switzerland, the country of the Grisons, and Germany; on the east, by the Adriatic sea, or gulf of Venice; and on the south and west, by the Mediterranean; its figure bearing some resemblance to that of a boot. Its length from Aosta, at the foot of the Alps in Savoy, to the utmost verge of Calabria, is about 600 miles; but its breadth is very unequal, being in some places near 400 miles, in others not above 25 or 30.

1 Its different names. Italy was anciently known by the names of *Saturnia*, *Oenotria*, *Hesperia*, and *Ausonia*. It was called *Saturnia* from Saturn; who, being driven out of Crete by his son Jupiter, is supposed to have taken refuge here. The names of *Oenotria* and *Ausonia*, it borrowed from its ancient inhabitants the Oenotrians and Ausones; and that of *Hesperia*, or *Western*, was given it by the Greeks, from its situation with respect to Greece. The name of *Italia*, or *Italy*, which, in process of time, prevailed over all the rest, is by some derived from Italus, a king of the Siculi: by others, from the Greek word *Italos*, signifying an ox; this country abounding, by reason of its rich pastures, with oxen of an extraordinary size and beauty. All these names were originally peculiar to particular provinces of Italy, but afterwards applied to the whole country.

2 Division in ancient times. This country was in ancient times, like most others, divided into a great number of petty states and kingdoms. In after-times, when the Gauls settled in the western parts, and many Greek colonies in the eastern parts, it was divided, with respect to its inhabitants, into three great parts, viz. Gallia Cisalpina, *Italy* properly so called, and Magna Grecia. The most western and northern parts of Italy were in great part possessed by the Gauls: and hence took the name of *Gallia*, with the epithets of *Cisalpina* and *Citerior*, because they lay on the side of the Alps next to Rome; and *Togata*, with relation to the Roman gown or dress which the inhabitants used; but this last epithet is of a much later date than the former. This appellation was antiquated in the reign of Augustus, when the division of Italy into eleven provinces, introduced by that prince, took place. Hence it is that the name of *Cisalpine Gaul* frequently occurs in the authors who flourished before, and scarce ever in those who wrote after the reign of Augustus. This country extended from the Alps and the river Varus, parting it from Transalpine Gaul, to the river Aesus; or, as Pliny will have it, to the city of Ancona, in the ancient Picenum. On the north, it was divided from Rhaetia by the Alps, called *Alpes Rhaticae*; and from Illyricum by the river Formio: but on this side, the borders of Italy were, in Pliny's time, extended to the river Arsia in Istria. On the south, it reached to the Ligustic sea, and the Apennines parting it from Etruria; so that under the common name of *Cisalpine Gaul* were comprehended the countries lying at the foot of the Alps, called by Pliny and Strabo the *Subalpine countries*, Liguria, Gallia Cispadana, and Transpadana. *Italy*, properly so called, extended on the coast of the Adriatic, from the city of Ancona to the river Trento, now the Tortore; and, on the Mediterranean, from the Macra to the Silarus, now the Sele. Magna Graecia comprised Apulia, Lucania, and the country of the Brutii. It was called *Greece*, because most of the cities on the coast were Greek colonies. The inhabitants gave it the name of *Great*, not as if it was larger than Greece, but merely out of ostentation, as Pliny informs us. Italy.

All these countries were inhabited by a great number of different nations settled at different times, and from many different parts. The names of the most remarkable of them were the *Aborigines*, or those whose origin was utterly unknown, and consequently were thought to have none; the *Sabines*, *Hetrurians* or *Tuscans*, the *Umbri*, *Samnites*, *Campani*, *Apulii*, *Calabrii*, *Lucanii*, the *Brutii*, and the *Latins*. From a colony of the latter proceeded the Romans, who gradually subdued all these nations one after another, and held them in subjection for upwards of 700 years. All these nations were originally brave, hardy, temperate, and well skilled in the art of war; and the Romans much more so than the rest. Their subjection to Rome, however, inured them to slavery; their oppression by the emperors broke their spirit; and the vast wealth which was poured into the country from all parts of the world, during the time of the Roman prosperity, corrupted their manners, and made them degenerate from their former valour. Of this degeneracy the barbarous nations of the north took the advantage to invade the empire in innumerable multitudes. Though often repelled, they never failed to return; and it was found necessary to take great numbers of them into the Roman service, in order to defend the empire against the rest of their countrymen. In the year 476, the Heruli, presuming on the services they had done the empire, demanded a third part of the lands of Italy; and being refused, chose one Odoacer, a man of low birth, but of great valour and experience, for their king; and having totally destroyed the remains of the Roman empire, proclaimed Odoacer king of Italy. The new monarch, however, did not think proper to alter the Roman form of government, but suffered the people to be governed by the senate, consuls, &c. as before. He enjoyed his dignity in peace till the year 488, when Zeno, emperor of Constantinople, being hard pressed by Theodoric king of the Ostrogoths, advised him to turn his arms against Odoacer, whom he could easily overcome, and thus make himself sovereign of one of the finest countries in the world.

3 Subdued by the Romans.

4 By the Heruli.

5 Invaded by Theoderic the Ostrogoth. Theodoric accepted the proposal with great joy, and set out for Italy, attended by an infinite number of people, carrying with them their wives, children, and effects, on waggons. Several Romans of great distinction attended him in this war; while, on the other hand, many of his countrymen chose to remain in Thrace, where they became a separate nation, and lived for a long time in amity with the Romans. The Goths, being destitute of shipping, were obliged to go round the Adriatic. Their march was performed in the depth of winter; and, during the whole time, a violent famine and plague raged in their army. They were also opposed by the Gepidæ and Sarmatians; but at last, having defeated these enemies, and overcome every other obstacle, they arrived in Italy in the year 489. Theodoric advanced to the river Sontius, now Zonzo, near Aquileia, where he halted for some time to refresh his troops. Here he was met by Odoacer at

Italy.

at the head of a very numerous army, but compofed of many different nations commanded by their refpective chiefs, and conſequently without ſufficient union or zeal for the common cauſe. Theodoric therefore gained an eaſy victory, cut many of his enemies in pieces, and took their camp. Odoacer retired to the plains of Verona, and encamped there at a ſmall diſtance from the city; but Theodoric purſued him cloſe, and ſoon forced him to a ſecond engagement. The Goths obtained another victory; but it coſt them dear. Odoacer's men made a much better reſiſtance than before, and great numbers fell on both ſides. The victory, however, was ſo far deciſive, that Odoacer was obliged to ſhut himſelf up in Ravenna; ſo that Theodoric having now no enemy to oppoſe him in the field, beſieged and took ſeveral important places, and among the reſt Milan and Pavia. At the ſame time, Tufa, commander in chief of Odoacer's forces, deſerted to the enemy with the greateſt part of the troops he had with him, and was immediately employed in conjunction with a Gothic officer in purſuit of his ſovereign. Odoacer had left that city, and was advanced as far as Faenza, where he was cloſely beſieged by Tufa; but the traitor, declaring again for his old maſter, joined him with all his troops, and delivered up ſeveral officers that had been appointed by Theodoric to ſerve under him. Theſe were ſent in irons to Ravenna; and Odoacer being joined by Frideric, one of Theodoric's allies, with a conſiderable body of troops, once more advanced againſt his enemies. He recovered all Liguria, took the city of Milan, and at laſt beſieged Theodoric himſelf in Pavia. The Goths, having brought all their families and effects along with them, were greatly diſtreſſed for want of room; and muſt have undoubtedly ſubmitted, if their enemies had continued to agree among themſelves. The quarrels of his followers proved the ruin of Odoacer. Theodoric, finding that the enemy remitted the vigour of their operations, applied for ſuccours to Alaric king of the Viſigoths, who had ſettled in Gaul. As the Viſigoths and Oſtrogoths were originally one and the ſame nation, and the Viſigoths had received among them, ſome years before, a great number of Oſtrogotha, under the conduct of Videmir, couſin-german to Theodoric, the ſupplies were readily granted. The inaction of the enemy gave theſe ſuccours time to arrive; upon which Theodoric inſtantly joined them, and, marching againſt his enemies, gave them a total overthrow. Odoacer again took refuge in Ravenna, but was cloſely beſieged by Theodoric in 490. The ſiege laſted three years; during which Odoacer defended himſelf with great bravery, and greatly annoyed the beſiegers with his ſallies. Theodoric, however, impatient of delay, leaving part of his army to blockade the city, marched with the reſt againſt the ſtrong holds which Odoacer had garriſoned. All theſe he reduced with little difficulty; and in 492 returned to the ſiege of Ravenna. The beſieged were now reduced to great ſtraights both by the enemy without and a famine within, the price of wheat being riſen to ſix pieces of gold per buſhel. On the other hand, the Goths were quite worn out with the fatigues of ſuch a long ſiege; ſo that both parties being willing to put an end to the war, Odoacer ſent John biſhop of Ravenna to Theodoric with terms of accommodation.

6 Odoacer defeated.

Jornandes informs us, that Odoacer only begged his life; which Theodoric bound himſelf, by a ſolemn oath, to grant him: but Procopius ſays, that they agreed to live together on equal terms. This laſt ſeems very improbable: but whatever were the terms of the agreement, it is certain that Theodoric did not keep them; for having a few days after invited Odoacer to a banquet, he diſpatched him with his own hand. All his ſervants and relations were maſſacred at the ſame time; except his brother Aonulphus, and a few more, who had the good luck to make their eſcape, and retired beyond the Danube.

Italy.

7 Submits, and is put to death.

Thus Theodoric became maſter of all Italy, and took upon himſelf the title of *king* of that country, as Odoacer had done before; though, with a pretended deference to the emperor of Conſtantinople, he ſent meſſengers aſking liberty to aſſume that title after he had actually taken it. Having ſecured his new kingdom as well as he could by foreign alliances, Theodoric next applied himſelf to legiſlation, and enacted many ſalutary laws beſides thoſe of the Romans which he retained. He choſe Ravenna for the place of his reſidence, in order to be near at hand to put a ſtop to the incurſions of the barbarians. The provinces were governed by the ſame magiſtrates that had preſided over them in the times of the emperors, viz. the *conſulares*, *correctores*, and *præſides*. But beſides theſe, he ſent, according to the cuſtom of the Goths, inferior judges, diſtinguiſhed by the name of *counts*, to each city. Theſe were to adminiſter juſtice, and to decide all controverſies and diſputes. And herein the polity of the Goths far excelled that of the Romans. For in the Roman times a whole province was governed by a conſularis, a corrector, or a præſes, who reſided in the chief city, and to whom recourſe was to be had, at a great charge, from the moſt remote parts: but Theodoric, beſides theſe officers, appointed, not only in the principal cities, but in every ſmall town and village, inferior magiſtrates of known integrity, who were to adminiſter juſtice, and by that means ſave thoſe who had law-ſuits the trouble and expence of recurring to the governor of the whole province; no appeals to diſtant tribunals being allowed, but in matters of the greateſt importance, or in caſes of manifeſt injuſtice.

8 Theodoric proclaimed king of Italy, and uſes his power with moderation.

Under the adminiſtration of Theodoric Italy enjoyed as great happineſs as had been experienced under the very beſt emperors. As he had made no alteration in the laws except that abovementioned, ſo he contented himſelf with the ſame tributes and taxes that had been levied by the emperors; butwas, on all occaſions of public calamity, much more ready to remit them than moſt of the emperors had been. He did not treat the natives as thoſe of the other Roman provinces were treated by the barbarians who conquered them. Theſe ſtripped the ancient proprietors of their lands, eſtates, and poſſeſſions, dividing them among their chiefs; and giving to one a province with the title of *duke*, to another a frontier country with the title of *marquis*; to ſome a city with the title of *count*, to others a caſtle or village with the title of *baron*. But Theodoric, who piqued himſelf upon governing after the Roman manner, and obſerving the Roman laws and inſtitutions, left every one in the full enjoyment of his ancient property. As to religion, though he himſelf, like moſt of his countrymen, profeſſed the tenets of Arius, he al-

Italy. allowed his subjects to profess the orthodox doctrine without moleſtation, giving liberty even to the Goths to renounce the doctrines in which they had been educated, and embrace the contrary opinions. In ſhort, his many virtues, and the happineſs of his ſubjects, are celebrated by all the hiſtorians of thoſe times. The end of his reign, however, was ſullied by the death of the celebrated philoſopher Boethius, and his father-in-law Symmachus. They were both beheaded in Pavia, on an unjuſt ſuſpicion of treaſon; and ſcarce was the ſentence put in execution when the king repented, and abandoned himſelf to the moſt pungent ſorrow. The exceſs of his grief affected his underſtanding; for, not long after, the head of a large fiſh being ſerved up to ſupper, he fancied the head of the fiſh to be that of Symmachus threatening him in a ghaſtly manner. Hereupon, ſeized with horror and amazement, he was carried to his bed-chamber, where he died in a few days, on the 2d of September 526.

9 Beheads Boethius and Symmachus, and dies of grief.

After the death of Theodoric, the kingdom devolved to Athalric his grandſon; who being at that time only eight years of age, his mother Amalaſuntha took upon her the regency. Her adminiſtration was equally upright with that of Theodoric himſelf: but the barbarians of whom her court was compoſed, finding fault with the encouragement ſhe gave to learning, forced her to abandon the education of her ſon, who thereupon plunged into all manner of wickedneſs, and behaved to his mother with the greateſt arrogance; and the faction finding themſelves thus ſtrengthened, at laſt commanded the queen to retire from court.

10 Amalaſuntha Regent; governs equitably.

Amalaſuntha, exerting her authority, ſeized three of the ringleaders of the ſedition, whom ſhe confined in the moſt remote parts of Italy. But theſe maintaining a ſecret correſpondence with their friends and relations, never ceaſed to ſtir up the people againſt her; inſomuch, that the queen, apprehending that the faction might in the end prevail, wrote to the emperor Juſtinian, begging leave to take refuge in his dominions. The emperor readily complied with her requeſt, offering a noble palace at Durazzo for her habitation; but the queen having in the mean time cauſed the three ringleaders to be put to death, and no new diſturbances ariſing thereupon, ſhe did not accept of the emperor's offer. In 533, Athalric having contracted a lingering diſtemper by his riotous living and debaucheries, Amalaſuntha, to avoid the calamities with which Italy was threatened in caſe of his death, formed a deſign of delivering it up to Juſtinian: but before her ſcheme was ripe for execution, Athalric died. Upon which the queen took for her collegue one Theodotus her couſin; obliging him, however, to ſwear that he would ſuffer her to enjoy and exerciſe her former power. This he very readily did, but ſoon forgot his promiſe; and, when ſhe took the liberty to remind him of it, cauſed her to be ſeized and confined in an iſland of the lake Bolſena in Tuſcany. But as Theodotus had great reaſon to believe that this conduct would be reſented by Juſtinian, he obliged her to write to him that no injury or injuſtice had been done her. Along with this letter he ſent one written by himſelf, and filled with heavy complaints againſt Amalaſuntha. The emperor, however, was ſo far from giving credit to what Theodotus urged againſt her, that he openly eſpouſed her cauſe, wrote her a moſt affectionate letter, and aſ-

11 Is treacherouſly impriſoned, and put to death

ſured her of his protection. But before this letter could reach her, the unhappy princeſs was ſtrangled in the bath by the friends of thoſe whom in the reign of her ſon ſhe had deſervedly put to death for raiſing diſturbances in the ſtate. Italy.

12 For which reaſon Juſtinian makes war on the Goths.

On the news of Amalaſuntha's death, Juſtinian reſolved upon an immediate war with the Goths; and, to facilitate the enterprize, uſed his utmoſt endeavours to induce the Franks to aſſiſt him. To his ſolicitations he added a large ſum of money; which laſt was very acceptable to his new allies. They promiſed to aſſiſt the emperor to the utmoſt of their power; but, inſtead of performing their promiſe, while Juſtinian's arms were employed againſt the Goths, Thierri, the eldeſt ſon of Clovis, ſeized on ſeveral cities of Liguria, the Alpes Cottiæ, and great part of the preſent territory of Venice, for himſelf. Juſtinian, however, found ſufficient reſources in the valour of Beliſarius, notwithſtanding the defection of his treacherous allies. This celebrated general was veſted with the ſupreme command, and abſolute authority. His inſtructions were to pretend a voyage to Carthage, but to make an attempt upon Sicily; and, if he thought he could ſucceed in the attempt, to land there; otherwiſe to ſail for Africa, without diſcovering his intentions. Another general, named *Mundus*, commander of the troops in Illyricum, was ordered to march into Dalmatia, which was ſubject to the Goths, and attempt the reduction of Salonæ, the better to open a paſſage into Italy. This he accompliſhed without difficulty, and Beliſarius made himſelf maſter of Sicily ſooner than he himſelf had expected. The iſland was reduced on the laſt of December 535; upon which Beliſarius, without loſs of time, paſſed over to Reggio, which opened its gates to him. From Reggio he purſued his march to Rome, the provinces of Abrutium, Lucania, Puglia, Calabria, and Samnium, readily ſubmitting to him. The city of Naples endured a ſiege; but Beliſarius entered in thro' an aqueduct, and gave it up to be plundered by his ſoldiers.

Theodotus, alarmed at theſe ſucceſſes, and having neither capacity nor inclination to carry on the war, ſent ambaſſadors to Juſtinian with propoſals of peace. He agreed to renounce all pretenſions to the iſland of Sicily; to ſend the emperor yearly a crown of gold weighing 300 pounds; to ſupply him with 3000 men whenever he ſhould think proper to demand them. Several other articles were contained in the propoſal, which amounted to the owning of Juſtinian for his lord, and that he held the crown of Italy only through his favour. As he apprehended, however, that theſe offers might not yet be ſatisfactory, he recalled his ambaſſadors for further orders. They were now defired to inform Juſtinian, that Theodotus was willing to reſign the kingdom to him, and content himſelf with a penſion ſuitable to his quality. But he obliged them by an oath not to mention this propoſal, till they found that the emperor would not accept of the other. The firſt propoſals were accordingly rejected as they had ſuppoſed; upon which the ambaſſadors produced the ſecond, ſigned by Theodotus himſelf, who, in his letter to the emperor, told him among other things, that being unacquainted with war, and addicted to the ſtudy of philoſophy, he preferred his quiet to a kingdom. Juſtinian, tranſported with joy, and

13 Theodotus offers to reſign the kingdom.

Italy.

and imagining the war already finiſhed, anſwered the king in a moſt obliging manner, extolling his wiſdom, and giving him, beſides what he demanded, the greateſt honours of the empire. The agreement being confirmed by mutual oaths, lands were aſſigned to Theodotus out of the king's domain, and orders were diſpatched to Beliſarius to take poſſeſſion of Italy in his name.

In the mean time a body of Goths having entered Dalmatia, with a deſign to recover the city of Salonæ, were encountered by an inferior army of Romans, commanded by the ſon of Mundus abovementioned. The Goths proved victorious; and the young general of the Romans was killed, and moſt of his army cut in pieces. Mundus marched againſt the enemy to revenge the death of his ſon; but met with no better ſucceſs, his troops being defeated, and he himſelf killed in the engagement. Upon this the Romans abandoned Salonæ and all Dalmatia; and Theodotus, elated with his ſucceſs, refuſed to fulfil the articles of the treaty. Juſtinian diſpatched Conſtantianus, an officer of great valour and experience, into Illyricum, with orders to raiſe forces there, and to enter Dalmatia; at the ſame time he wrote to Beliſarius to purſue the war with the utmoſt vigour.

14 Theodotus refuſes to fulfil the articles of the treaty.

The Goths were now reduced to the greateſt ſtraits. Conſtantianus drove them out of Dalmatia; and Beliſarius having reduced all the provinces which compoſe the preſent kingdom of Naples, advanced towards Rome. The chief men of the nation, finding their king incapable of preventing the impending ruin, aſſembled without his conſent, and diſpatched ambaſſadors to Beliſarius with propoſals of peace. Theſe propoſals were rejected; and Beliſarius returned for anſwer that he would hearken to no terms, nor ſheath his ſword, till Italy was reannexed to the empire to which it belonged. The Goths finding Theodotus ſtill inactive, unanimouſly depoſed him; and choſe in his ſtead one Vitiges, a man of great valour, but of a mean deſcent. Theodotus fled to Ravenna; but the new king diſpatched after him a meſſenger, who ſoon overtook him and cut off his head.

15 He is depoſed, and Vitiges choſen in his ſtead.

Vitiges began his government by writing a circular letter, in which he exhorted his countrymen to exert their ancient courage, and fight bravely for their lives and liberties. He then marched with what forces he could collect towards Rome; but not thinking himſelf able to defend that city againſt the Roman forces, he abandoned it to Beliſarius, and arriving at Ravenna was joined by the Goths from all parts, ſo that he ſoon found himſelf at the head of a conſiderable army. Beliſarius in the mean time entered Rome without oppoſition, on the 9th or 10th of December 537. The Gothic garriſon retired by the Porta Flaminia, while Beliſarius entered by the Porta Aſinaria. Leudaris, governor of the city, who ſtaid behind, was ſent, together with the keys, to the emperor. Beliſarius immediately applied himſelf to the repairing of the walls and other fortifications; filled the granaries with corn, which he cauſed to be brought from Sicily; and ſtored the place with proviſions, as if he had been preparing for a ſiege; which gave no ſmall uneaſineſs to the inhabitants, who choſe rather that their city ſhould lie open to every invader, than that they ſhould be liable to the calamities of a ſiege. While Beliſarius was thus employed at Rome, the city of Benevento, with great part of the territory of Samnium, was delivered up to him: at the ſame time the cities of Narnia, Spoleto, and Peruſia, revolting from the Goths, received Roman garriſons; as did moſt of the cities of Tuſcany.

Italy.

16 He collects a great army.

In the mean time, Vitiges having collected an army of 150,000 men, reſolved to march directly to Rome, and engage Beliſarius; or if he declined an engagement, to lay ſiege to the city. But apprehending that the Franks, who were in confederacy with the emperor, might fall upon him at the ſame time, he ſent ambaſſadors to them, with offers of all the Gothic poſſeſſions in Gaul, beſides a conſiderable ſum of money, provided they joined him againſt the emperor. The Franks with their uſual treachery conſented to the propoſal, received the money and the territories agreed on, and then refuſed to fulfill the terms of the treaty. Vitiges, however, began his march to Rome, leaving behind him all the fortified towns on the road, the reduction of which he knew would coſt him too much trouble. Beliſarius, whoſe army, reduced by the many towns he had garriſoned, did not now amount to above 5000 men, diſpatched meſſengers to Conſtantianus in Tuſcany; and to Beſſas, by nation a Goth, but of the emperor's party, in Umbria, with orders to join him with all poſſible expedition; writing at the ſame time to the emperor himſelf for ſupplies, in the moſt preſſing manner. Conſtantianus joined him purſuant to his orders; and ſoon after, Beſſas, who, falling in with part of the enemy's vanguard, killed a conſiderable number of them, and put the reſt to flight. Beliſarius had built a fort upon a bridge about a mile from Rome, and placed a ſtrong garriſon in it to diſpute the paſſage with the enemy; but the garriſon, ſeized with a panic at the approach of the Goths, abandoned their poſt in the night, and fled into Campania. Early in the morning, Vitiges paſſed over great part of his army, and marched on till he was met by Beliſarius, who, knowing nothing of what had happened, came with 1000 horſe to view the ground about the bridge. He was greatly ſurpriſed when he beheld the enemy marching up againſt him: however, left he ſhould heighten their courage by his flight or retreat, he ſtood his ground, and received the enemy at the head of his ſmall body, expoſing himſelf, without his uſual prudence and diſcretion, to the greateſt dangers. Being known by ſome fugitives, and diſcovered to the enemy, they all aimed at him alone, which made his own men the more ſolicitous to defend him; ſo that the whole conteſt was for ſome time about his perſon. At laſt the Goths were driven back to their camp, which the Romans with great temerity attempted to force. In this attempt, however, they met with ſuch a vigorous reſiſtance, that they ſoon abandoned the enterpriſe, and retired with precipitation to a neighbouring eminence; whence they were forced down by the enemy, put to flight, and purſued to the very gates of the city. Here they were in greater danger than ever; for thoſe within, fearing that the enemy might in that confuſion enter with them, refuſed to admit them. The general himſelf cried out earneſtly to them, telling who he was, and commanding them to open the gates; but as they had been informed by thoſe who firſt fled, that he was

17 Obſtinate engagement between the Goths and Romans.

 ſlain,

Italy. slain, and they could not diſtinguiſh him on account of the blood and duſt with which his face was covered, they gave no ear to what he ſaid. In this extremity, having encouraged his men, who were now driven into a narrow compaſs, to make a laſt effort, he put himſelf at their head, and attacked the enemy with ſuch fury, that the Goths, imagining freſh troops were ſallying out upon them, began to give ground, and at laſt retired to their camp. The Roman general did not purſue them; but entered the city, where he was received with loud acclamations.

18 Rome beſieged by the Goths. A few days after, the city was cloſely inveſted by Vitiges; who, to diſtreſs the inhabitants, pulled down the aqueducts by which water was conveyed into the city, and which had been built at an immenſe charge by the Roman emperors. Beliſarius on his part omitted nothing for his defence; inſomuch that the cowardly citizens aſſembled in a tumultuous manner, and railed at the general on account of his ſuppoſed temerity. Vitiges, to encourage this mutinous diſpoſition, diſpatched ambaſſadors to the ſenate with propoſals of peace. Theſe ambaſſadors, however, were diſmiſſed without any anſwer, and the ſiege was begun with great vigour. Beliſarius made a gallant defence; and in ſeven months is ſaid to have deſtroyed 40,000 of the Goths. About this time he received a ſupply of 1600 archers from the emperor; and theſe, in ſeveral ſucceſsful ſallies, are ſaid to have killed 4000 more of the enemy.

The Romans, elated with their ſucceſſes, now became impatient for an engagement; and at laſt, notwithſtanding all the remonſtrances of their general, forced him to lead them out againſt the enemy. The ſucceſs was anſwerable to the raſh attempt. The Romans were defeated, with the loſs of ſome of their braveſt officers, and a great many of their common ſoldiers; after which they contented themſelves with ſallying out in ſmall parties, which they commonly did with the greateſt ſucceſs.

But though the Romans had the ſatisfaction thus cutting off their enemies, they were moſt grievouſly afflicted with a famine and plague; inſomuch that the inhabitants, no longer able to bear their calamities, were on the point of forcing Beliſarius to venture a ſecond battle, when a ſeaſonable ſupply of troops, viz. 3000 Iſaurians, 800 Thracian horſe, and 1300 horſe of other nations, together with 500 Italians who joined them by the way, arrived at Rome. Beliſarius immediately ſallied out by the Flaminian gate, and fell upon the Goths in order to give his allies time to enter by the oppoſite ſide of the city, which they did without the loſs of a man.—The Goths, hearing of the arrival of theſe troops, and their numbers being magnified as is uſual in ſuch caſes, began to deſpair of becoming maſters of the city; eſpecially as the famine and plague raged with great violence in their camp, and their army was much reduced. Ambaſſadors were therefore diſpatched to Beliſarius with propoſals of peace; but the only thing they could obtain was a ceſſation of arms for three months, during which time they might ſend ambaſſadors to the emperor. The negociations with the emperor, however, proved unſucceſsful; and the ſiege was purſued with great vigour till Vitiges received the news of the taking of Rimini by the Romans. As this city was but a day's journey from Ravenna, the Goths were ſo much alarmed, that they immediately raiſed the ſiege of Rome, after it had continued a year and nine days. Beliſarius fell upon their rear as they paſſed the bridge of the Tiber, and cut great numbers of them in pieces, while others, ſtruck with a panic, threw themſelves into the river and were drowned. Italy.

19 The ſiege raiſed.

The firſt enterprize of Vitiges, after raiſing the ſiege of Rome, was an attempt upon Rimini: but while he was employed in this ſiege, the Romans made themſelves maſters of Milan; upon which a Gothic general named *Uraia*, was immediately diſpatched with a powerful army to retake it. In the mean time, however, a ſupply of 7000 Romans arrived from the emperor, under the command of Narſes, a celebrated general. The immediate conſequence of this was the raiſing of the ſiege of Rimini; for Vitiges, perceiving the two Roman armies coming againſt him, and concluding, from the many fires they made, that they were much more numerous than they really were, fled in ſuch haſte, that the greateſt part of the baggage was left behind. The confuſion of the Goths was ſo great, that had not the garriſon been extremely feeble, they might have eaſily cut them off in their retreat, and thus put an end to the war at once. The ſucceſs of the Romans, however, was now retarded by ſome miſunderſtandings between the two generals; ſo that, though Beliſarius made himſelf maſter of Urbinum and Urbiventum, while Narſes reduced ſome other places; yet the important city of Milan was ſuffered to fall into the hands of the Goths, who maſſacred all the inhabitants that were able to bear arms, to the number of 300,000, and ſold the women for ſlaves. The city was alſo totally demoliſhed; and this diſaſter made ſuch an impreſſion on the mind of Juſtinian, that he immediately recalled Narſes, and gave the command of his troops to Beliſarius.

20 Milan taken by the Goths.

Vitiges, who had promiſed himſelf great advantages from the diſagreement of the two generals, was much diſappointed by the recall of Narſes; and therefore, dreading the power of Beliſarius when at the head of a formidable army, thought of engaging in alliance with ſome foreign prince. In his choice, however, he was ſomewhat at a loſs. He knew the treachery of the Franks, and therefore did not apply to them. He applied to the Lombards; but, though tempted by the offer of a large ſum of money, they continued inviolably attached to the Roman intereſt. At laſt he found means to perſuade Choſroes king of Perſia to make war upon Juſtinian, which he thought would infallibly procure the recall of Beliſarius. But the Roman general, underſtanding his deſign, puſhed on the war in the moſt vigorous manner; while in the mean time, the treacherous Franks, thinking both nations ſufficiently weakened by their mutual hoſtilities, reſolved to attack both, and ſeize upon the country for which they contended. Accordingly, Theodebert, unmindful of the oaths he had taken both to the Goths and Romans, paſſed the Alps at the head of 150,000, or, as ſome will have it, 200,000 men, and entered Liguria. As no hoſtilities were committed by them on their march, the Goths concluded that they were come to their aſſiſtance; and therefore took care to ſupply them with proviſions. Thus they croſſed the Po without oppoſition; and having ſecured the

21 Italy invaded by the Franks.

Italy.

the bridge, marched towards the place where a body of Goths were encamped; who, looking upon them as friends, admitted them without hesitation. But they were soon convinced of their mistake; for the Franks falling unexpectedly upon them, drove them out of the camp with great slaughter, and seized on their baggage and provisions. A body of Romans that lay at a small distance from the Goths, concluding that they had been defeated by Belisarius, advanced with great joy to meet *him* as they imagined; but the Franks falling unawares upon them, treated them as they had done the Goths, and made themselves masters of their camp. Thus they acquired a very considerable booty and store of provisions: but the latter being soon consumed, and the country round about quite exhausted, vast numbers of the Franks perished; so that Theodebert at last found himself obliged to return. In his way he destroyed Genoa, and several other places, and arrived in his own dominions loaded with booty.

22 Success of Belisarius.

In the mean time, Belisarius was making great progress. He took the cities of Auximum and Fæsulæ, after an obstinate siege; the inhabitants of the former having for some time fed on grass before they would surrender. After this he invested Ravenna, the capital of all the Gothic dominions in Italy. The place was defended by a very numerous garrison, commanded by the king in person, who exerted all his bravery in the defence of his metropolis. As the siege, however, was pushed on with great vigour, it was evident that the city must at last submit; and the great successes of the Romans began to give jealousy to the neighbouring potentates. Theodebert king of the Franks offered to assist Vitiges with an army of 500,000 men; but Belisarius, being informed of this negociation, sent ambassadors to Vitiges, putting him in mind of the treachery of the Franks, and assured him that the emperor was ready to grant him very honourable terms. The king, by the advice of his counsellors, rejected the alliance of the Franks, and sent ambassadors to Constantinople; but in the mean time, Belisarius, in order to bring the citizens to his own terms, bribed one of them to set fire to a magazine of corn, by which means the city was soon straitened for want of provisions. But, notwithstanding this disaster, they still continued to hold out, till the arrival of the ambassadors from Constantinople, who brought very favourable terms. These were, That the country beyond the Po, with respect to Rome, should remain to the Goths; but that the rest of Italy should be yielded to the emperor, and the royal treasure of the Goths should be equally divided between him and the king. To these conditions, however, Belisarius positively refused to assent; being desirous of leading captive the king of the Vandals, to Constantinople. He therefore pursued the siege with more vigour than ever, without hearkening to the complaints of his soldiers and officers, who were quite tired out with the length of the siege: he only obliged such of the officers as were of opinion that the town could not be taken, to express their opinion in writing, that they might not deny it afterwards.

The Goths were as weary of the siege as the Romans; but, fearing lest Justinian should transplant them to Thrace, formed a resolution, without the consent of their king, of surrendering to Belisarius himself, and declaring him emperor of the west. To this they were the more encouraged by the refusal of Belisarius to agree to the terms proposed by the emperor, from whence they concluded that he designed to revolt, and make himself emperor of Italy. Of this, however, Belisarius had no design; but thought proper to accept of the title, in order to accelerate the surrender of the city, after acquainting his principal officers with what had passed. Vitiges at last discovered the plot; but finding himself in no condition to oppose it, he commended the resolution of his people, and even wrote to Belisarius, encouraging him to take upon him the title of *king*, and assuring him of his assistance. Hereupon Belisarius pressed the Goths to surrender; which, however, they still refused, till he had taken an oath that he would treat them with humanity, and maintain them in the possession of all their rights and privileges. Upon this he was admitted into the city, where he behaved with great moderation towards the Goths; but seized on the royal treasure, and secured the person of the king. The Roman army, when it entered Ravenna, appeared so very inconsiderable, that the Gothic women, on beholding it, could not forbear spitting in the faces of their husbands, and reviling them as cowards.

Italy.

23 Ravenna reduced, and Vitiges taken prisoner.

The captivity of Vitiges, and the taking of Ravenna, did not put an end to the war. Belisarius was soon after recalled to take the command of the army in the east. The Goths were greatly surprised that he should leave his new kingdom out of regard to the orders of the emperor; but, after his departure, chose one Ildebald, a man of great experience in affairs both civil and military, for their king. He revived the drooping spirits of his countrymen, defeated the Romans, and reduced all the province of Venetia; but was in a short time murdered, and Eraric, a Rugian, succeeded to the throne. He was scarce invested with the sovereignty, when his subjects began to think of deposing him, and raising Totila to the throne; which the latter accepted, upon condition that they previously dispatched Eraric. This was accordingly done; after which Totila was proclaimed king of Italy, in the year 542.

24 Success of Totila against the Romans.

The new king proved a very formidable enemy to the Romans, who now lost ground every-where. They made an attempt on the city of Verona; in which they miscarried through their own avarice, having disputed about the division of the plunder till the opportunity of taking the town was past. They were next defeated in two bloody engagements; the consequence of which was, that the Goths made themselves masters of all the strong places in Tuscany. From thence marching into Campania and Samnium, they reduced the strong town of Beneventum, and laid siege to Naples. During the siege of this last place, several detachments were sent from the king's army, which took Cumæ, and recovered all Brutia, Lucania, Apulia, and Calabria, where they found considerable sums which had been gathered for the emperor's use. The Romans, in the mean time, disheartened by their losses, and deprived of those sums which should have paid their wages, refused to take the field. A considerable fleet was therefore sent by Justinian to the re-

Italy. lief of Naples: but Totila, having timely notice of this defign, manned, with incredible expedition, a great number of light veffels; which, falling unexpectedly on the Roman fleet, took or funk every fhip, and made prifoners of all on board, excepting a few who efcaped in their boats. A fimilar fate attended another fleet difpatched from Sicily for the fame purpofe. They put to fea in the depth of winter; and, meeting with a violent ftorm, were driven afhore near the enemy's camp; who funk the fhips, and made what flaughter they pleafed of the feamen and foldiers. Upon this fecond diſaſter, the Neapolitans, defpairing of further relief, fubmitted to Totila; who granted them honourable terms, and treated them with great humanity. As they had been long pinched with famine, Totila, apprehending they might endanger their lives by indulging their appetites too much at firſt, placed guards at the gates to prevent their going out, taking care at the fame time to fupply them fparingly with provifions, but increafing their allowance every day. Being thus by degrees reſtored to their former ſtrength, he ordered the gates to be ſet open, and gave every one full liberty to ſtay in the city, or remove, as he thought fit. The garriſon he treated with extraordinary kindneſs. They were firſt ſupplied with ſhips to carry them to Conſtantinople; but the king having diſcovered that their real deſign was to ſail to Rome, in order to reinforce the garriſon of that city, (which they knew he was ſoon to beſiege,) he was ſo far from puniſhing them as they expected, that he furniſhed them with horſes, waggons, and proviſions, and ordered a body of Goths to eſcort them to Rome by land, as the winds had proved unfavourable for their paſſage by ſea.

Totila having thus become maſter of Naples and moſt of the other fortreſſes in theſe parts, began to think of reducing Rome alſo. He firſt attempted to perſuade the citizens to a ſurrender: but finding his perſuaſions ineffectual, he ſent a detachment of his army into Calabria to reduce Otranto, which had not yet ſubmitted; after which, he marched with the reſt of his forces againſt the towns in the neighbourhood of Rome. The city of Tibur, now Tivoli, about 18 miles from Rome, was betrayed to him, and all the inhabitants, together with their biſhop, put to the ſword. Several other ſtrong holds in the neighbourhood of that city he took by ſtorm; ſo that Rome was in a manner blocked up by land, all communication with the neighbouring country being cut off.

Juſtinian, in the mean time, being greatly perplexed by the bad news he every day received from Italy, recalled Beliſarius from Perſia, notwithſtanding the ſucceſs which attended him there. To ſave Rome, however, was now impoſſible even for Beliſarius himſelf. As ſoon as he arrived in Italy, finding himſelf unable either to relieve the towns which were beſieged, or to ſtop the progreſs of the Goths, he diſpatched letters to Juſtinian, informing him, that being deſtitute of men, arms, and money, it was impoſſible for him to proſecute the war; upon which the emperor ordered new levies to be made, all the veterans being engaged in the Perſian war. In the mean time, however, Totila purſued his good fortune; took the cities of Firmum, Aſculum, Auximum, Spoletum, &c. and at length advanced to Rome, which he inveſted on all ſides. As he drew near the city, two officers, whom Beliſarius had ſent into the city, ventured to make a ſally, though contrary to the expreſs orders of their general, thinking they ſhould ſurpriſe the Goths; but they were themſelves taken in an ambuſcade, and, moſt of their men being cut in pieces, narrowly eſcaped falling into the hands of the enemy. Beliſarius made ſeveral attempts to relieve the city: but all of them, however well concerted, by ſome accident or other proved unſucceſsful; which gave him ſo much uneaſineſs, that he fell into a feveriſh diſorder, and was for ſome time thought to be in danger of his life. The city was ſoon reduced to great ſtraits: a dreadful famine enſued; and the unhappy citizens having conſumed every thing that could be ſuppoſed to give them nouriſhment, even the graſs that grew near the walls, were obliged to feed on their own excrements. Many put an end to their lives, in order to free themſelves from the intolerable calamities they ſuffered. The reſt addreſſed their governor Beſſas in the moſt pathetic manner, intreating him to ſupply them with food; or if that was not in his power, either to give them leave to go out of the town, or to put an end to their miſeries by putting them to death. Beſſas replied, that to ſupply them with food was impoſſible, to let them go unſafe, and to kill them impious. In the end, however, he ſuffered thoſe who were willing to retire, to leave the city, upon paying him a ſum of money; but moſt of them either died on the road, or were cut in pieces by the enemy. At laſt, the beſieged, unable to bear their miſeries any longer, began to mutiny, and to preſs their governor to come to an agreement with Totila. This, however, he ſtill refuſed; upon which, four of the Iſaurians who guarded one of the gates, went privately to the camp of Totila, and offered to admit him into the city. The king received this propoſal with great joy; and ſending four Goths of great ſtrength and intrepidity into the town along with them, he ſilently approached the gates in the night-time with his whole army. The gates were opened by the Iſaurians, as they had promiſed; and upon the firſt alarm, Beſſas with moſt of the ſoldiers and officers, fled out of the town. The inhabitants took ſanctuary in the churches; and only 60 of them and 26 ſoldiers were killed after the town was taken. Totila, however, gave his ſoldiers full liberty to plunder the city: which they did for ſeveral days together, ſtripping the inhabitants of all their wealth, and leaving nothing in their houſes but naked walls; by which means many perſons of diſtinction were reduced to beg their bread from door to door. In the houſe of Beſſas was found an immenſe treaſure, which he had ſcandalouſly amaſſed during the ſiege, by ſelling to the people, at an exorbitant price, the corn which had been ſtored up for the uſe of the garriſon.

Totila, thus become maſter of Italy, ſent ambaſſadors to Juſtinian with very reſpectful letters, deſiring to live on the ſame terms with him that Theodoric had done with his predeceſſor Anaſtaſius, promiſing in that caſe to reſpect him as his father, and to aſſiſt him, when he pleaſed, with all his force, againſt any other nation whatever. On the contrary, if the emperor rejected his offers, he threatened to level Rome with the ground, to put the whole ſenate to the ſword, and carry the war into Illyricum. The emperor returned no other

Italy.

25 Rome beſieged.

26 And taken.

Italy.

ther anſwer, than that he referred the whole to Beliſarius, who had full power to manage all things of that nature. Upon this Totila reſolved to deſtroy the city; and had actually thrown down a third part of the wall, when he received a letter from Beliſarius, diſſuading him from his intention. After having ſeriouſly conſidered this letter, Totila thought proper to alter his reſolution with regard to the deſtruction of the city; but ſent every one of the inhabitants into Lucania, without leaving a ſingle perſon in the metropolis. Beliſarius hearing of this, immediately returned to the capital, and undertook to repeople and repair it. He cleared the ditch which had been filled by Totila, but was for the preſent obliged to fill up the breaches in the walls with ſtones looſely heaped upon one another; and in this ſituation the city was again attacked by the Goths. Beliſarius, however, had taken care to ſupply the inhabitants with plenty of proviſions, ſo that they were now in no danger of ſuffering by famine; and the aſſaults of the enemy were vigorouſly repelled notwithſtanding the bad ſituation of the fortifications, ſo that Totila at laſt abandoned the enterprize.

27 Beliſarius recalled.

In the mean time the Perſians gained great advantages over the Romans in the Eaſt, ſo that there was a neceſſity for recalling Beliſarius a ſecond time. He was no ſooner gone, than Totila renewed his efforts with greater vigour than ever; and at the ſame time the Franks, concluding that both Romans and Goths would be much weakened by ſuch a deſtructive war, ſeized upon Venetia which belonged to both nations, and made it a province of the French empire. Totila did not oppoſe them; but having obtained a reinforcement of 6000 Lombards, returned immediately before Rome, fully intent on making himſelf maſter of that metropolis. Having cloſely inveſted it by ſea and land, he hoped in a ſhort time to reduce it by famine: but againſt this the governor wiſely provided, by cauſing corn to be ſown within the walls; ſo that he could probably have defied the power of Totila, had not the city been again betrayed by the Iſaurians, who opened one of the gates, and admitted the enemy.

Thus the empire of the Goths was a third time eſtabliſhed in Italy; and Totila, immediately on his becoming maſter of Rome, diſpatched ambaſſadors to Juſtinian, offering to aſſiſt him as a faithful ally againſt any nation whatever, provided he would allow him the quiet poſſeſſion of Italy. But Juſtinian was ſo far from hearkening to this propoſal, that he would not even admit the ambaſſadors into his preſence; upon which Totila reſolved to purſue the war with the utmoſt vigour, and to make himſelf maſter, not only of thoſe places which the Romans poſſeſſed in Italy, but in Sicily alſo. This he fully accompliſhed, when Narſes, who had formerly been joined in the command with Beliſarius, was appointed general, with abſolute and uncontrouled authority. But while this general was making the neceſſary preparations for his expedition, Totila, having equipped a fleet of 300 galleys, ſent them to pillage the coaſts of Greece, where they got an immenſe booty. They made a deſcent on the iſland of Corfu; and having laid it waſte, they ſailed to Epirus, where they ſurpriſed and plundered the cities of Nicopolis and Anchialus, taking many ſhips on the coaſt, among which were ſome laden with proviſions for the army of Narſes. After theſe

28 Narſes ſent into Italy.

ſucceſſes they laid ſiege to Ancona in Dalmatia: but, being defeated both by ſea and land, Totila once more ſent ambaſſadors to Conſtantinople, offering to yield Sicily and all Dalmatia, to pay an annual tribute for Italy, and to aſſiſt the Romans as a faithful ally in all their wars; but Juſtinian, bent upon driving the Goths out of Italy, would not even ſuffer the ambaſſadors to appear in his preſence. Italy.

Totila, finding that no terms could be obtained, began to levy new forces, and make great preparations by ſea and land. He ſoon reduced the iſlands of Corſica and Sardinia; but this was the laſt of his ſucceſſes. Narſes arrived in Italy with a very formidable army; and an immenſe treaſure to pay the troops their arrears, the want of which had been one great cauſe of the bad ſucceſs of Beliſarius in his laſt expedition. He immediately took the road to Rome; while Totila aſſembled all his forces, in order to decide the fate of Italy by a general engagement. The battle proved very obſtinate; but at laſt the Gothic cavalry being put to the rout, and retiring in great confuſion among the infantry, the latter were thereby thrown into ſuch diſorder, that they could never afterwards rally. Narſes, obſerving their confuſion, encouraged his men to make a laſt effort; which the Goths not being able to withſtand, betook themſelves to flight, with the loſs of 6000 men killed on the ſpot. Totila finding the day irrecoverably loſt, fled with only five horſemen for his attendants; but was purſued and mortally wounded by a commander of one of the bodies of barbarians who followed Narſes. He continued his flight, however, for ſome time longer; but was at laſt obliged to halt in order to get his wound dreſſed, ſoon after which he expired. 29 Who defeats and kills Totila.

This diſaſter did not yet entirely break the ſpirit of the Goths. They choſe for their king one Teia, deſervedly eſteemed one of the moſt valiant men of their nation, and who had on ſeveral occaſions diſtinguiſhed himſelf in a moſt eminent manner. All the valour and experience of Teia, however, were now inſufficient to ſtop the progreſs of the Romans. Narſes made himſelf maſter of a great number of cities, and of Rome itſelf, before the Goths could aſſemble their forces. The Roman general next proceeded to inveſt Cumæ, which Teia determined at all events to relieve, as the royal treaſure was lodged in that city. This brought on an engagement, which, if Procopius is to be credited, proved one of the moſt bloody that ever was fought. The Roman army conſiſted of vaſt multitudes brought from different nations: the Goths were few in compariſon; but, animated by deſpair, and knowing that all was at ſtake, they fought with the utmoſt fury. Their king placed himſelf in the firſt rank, to encourage his men by his example; and is ſaid to have given ſuch proofs of his valour and conduct as equalled him to the moſt renowned heroes of antiquity. The Romans diſcovering him, and knowing that his death would probably put an end to the battle, if not to the war itſelf, directed their whole force againſt him, ſome attacking him with ſpears, and others diſcharging againſt him ſhowers of darts and arrows. Teia maintained his ground with great intrepidity, received the miſſive weapons on his ſhield, and killed a great number of the enemy with his own hand. When his ſhield was ſo loaded with darts that he 30 And Teia.

Italy.

he could not eaſily wield it, he called for another. Thus he ſhifted his ſhield three times; but as he attempted to change it another time, his breaſt being neceſſarily expoſed for a moment, a dart ſtruck him in that moment with ſuch force, that he immediately fell down dead in the place where he had ſtood from the beginning of the battle, and upon heaps of the enemy, whom he had killed. The Romans, ſeeing him fall, cut off his head and expoſed it to the ſight of the Goths, not doubting but they would be immediately diſheartened and retire. In this, however, they were diſappointed. The Goths maintained the fight with great vigour, till night put an end to the engagement. The next day the engagement was renewed early in the morning, and continued till night; but on the third day, the Goths deſpairing of being able to overcome an enemy ſo much ſuperior to them in numbers, ſent deputies to Narſes, offering to lay down their arms, provided ſuch of them as choſe to remain in Italy were allowed to enjoy their eſtates and poſſeſſions, without moleſtation, as ſubjects of the empire, and thoſe who were willing to retire elſewhere, were ſuffered to carry with them all their goods and effects.

31 The end of the empire of the Goths in Italy.

To theſe terms Narſes readily aſſented; and thus the empire of the Goths in Italy was finally deſtroyed, the country now becoming a province of the eaſtern Roman empire.

In this conqueſt, Narſes had been aſſiſted, as already obſerved, by many barbarous nations, among whom were the Lombards, at that time ſettled in Pannonia. On the concluſion of the war, they were diſmiſſed with rich preſents, and the nation for ſome time continued faithful allies to the Romans. In the mean time Juſtinian dying, Narſes, who governed Italy with an abſolute ſway, was accuſed to the emperor Juſtin II. and to the empreſs Sophia, of aſpiring at the ſovereignty of the country. Hereupon he was recalled, and Longinus ſent to ſucceed him. As Narſes was an eunuch, the empreſs is reported to have ſaid, that his employment at Conſtantinople ſhould be to diſtribute in the apartment of her women the portion of wool which each was to ſpin. Narſes, enraged at this ſarcaſm, replied, that he ſhould begin ſuch a web as ſhe ſhould never be able to finiſh; and immediately diſpatched meſſengers to Alboinus king of the Lombards, inviting them into Italy. Along with the meſſengers he ſent ſome of the beſt fruits the country afforded, in order to tempt him the more to become maſter of ſuch a rich kingdom.

32 Narſes invites the Lombards.

Alboinus, highly pleaſed with the opportunity of invading a country with which his ſubjects were already well acquainted, began, without loſs of time, to make the neceſſary preparations for his journey. In the month of April 568, he ſet out with his whole nation, men, women, and children; carrying with them all their moveables. This promiſcuous multitude arrived by the way of Iſtria; and advancing through the province of Venetia, found the whole country abandoned, the inhabitants having fled to the neighbouring iſlands in the Adriatic. The gates of Aquileia were opened by the few inhabitants who had courage to ſtay: moſt of them, however, had fled with all their valuable effects; and among the reſt the Patriarch Paulinus, who had carried with him all the valuable ſacred utenſils of the churches. From Aquileia, Alboinus proceeded to Forum Julii, of which he likewiſe became maſter without oppoſition. Here he ſpent the winter; during which time he erected Friuli into a dukedom, which has continued ever ſince. In 569, he made himſelf maſter of Trivigi, Oderzo, Monte Selce, Vicenza, Verona, and Trent; in each of which cities he left a ſtrong garriſon of Lombards under the command of an officer, whom he diſtinguiſhed by the title of *duke*: but theſe dukes were only officers and governors of cities, who bore the title no longer than the prince thought proper to continue them in their command or government. Padua and ſome other cities Alboinus left behind him without attempting to reduce them, either becauſe they were too well garriſoned, or becauſe they lay too much out of his way. In 570, he entered Liguria. The inhabitants were ſo terrified at his approach, that they left their habitations with ſuch of their effects as they could carry off, and fled into the moſt mountainous and inacceſſible parts of the country. The cities of Breſcia, Bargamo, Lodi, Como, and others quite to the Alps, being left almoſt without inhabitants, ſubmitted of courſe; after which he reduced Milan, and was thereupon proclaimed king of Italy.

Italy.

33 Who reduce the greateſt part of Italy.

But though the Lombards had thus conferred the title of king of Italy on their ſovereign, he was by no means poſſeſſed of the whole country, nor indeed was it ever in the power of the Lombards to get poſſeſſion of the whole. Alboinus having made himſelf maſter of Venetia, Liguria, Æmilia, Hetruria, and Umbria, applied himſelf to legiſlation and the civiliſation of his ſubjects. But before he could make any progreſs in this work, he was taken off by the treachery of his wife; and Clephis, one of the nobles, choſen king in his ſtead. Clephis rebuilt ſome cities which had been ruined during the wars between the Goths and Romans, and extended his conqueſts to the very gates of Rome; but as he behaved both to the Romans and Lombards with the greateſt cruelty, he was murdered, after a ſhort reign of 18 months. His cruelty gave the Lombards ſuch an averſion againſt regal power, that they changed their form of government, being governed only by their dukes for the ſpace of ten years. During this interregnum, they proved ſucceſsful in their wars with the Romans, and made themſelves maſters of ſeveral cities: but perceiving that their kingdom, thus divided, could not ſubſiſt, they reſolved once more to ſubmit to the authority of one man; and accordingly, in 585, Autharis was choſen king of the Lombards.

The great object of ambition to the new race of Lombard monarchs was the conqueſt of all Italy; and this proved at laſt the ruin of their empire by Charles the Great, as related under the article FRANCE, nº 21. As the Lombards, however, had not been poſſeſſed of the whole territory of Italy, ſo the whole of it never came into the poſſeſſion of Charlemagne: neither, ſince the time of the Goths, hath the whole of this country been under the dominion of any ſingle ſtate. Some of the ſouthern provinces were ſtill poſſeſſed by the emperors of Conſtantinople; and the liberal grants of Pepin and Charlemagne himſelf to the pope, had inveſted him with a conſiderable ſhare of temporal power. The territories of the pope indeed were ſuppoſed to be held in vaſſalage from France; but this the popes themſelves

33 Subdued by Charlemagne.

Italy. 34 Extent of his Italian dominions

selves always ſtiffly denied. The indiſputed territory of Charlemagne in Italy, therefore, was reſtricted to Piedmont, the Milaneſe, the Mantuan, the territory of Genoa, Parma, Modena, Tuſcany, Bologna, the dukedoms of Friuli, Spoleto, and Benevento; the laſt of which contained the greateſt part of the preſent kingdom of Naples.

The feudal government which the Lombards had introduced into Italy, naturally produced revolts and commotions, as the different dukes inclined either to change their maſters, or to ſet up for themſelves. Several revolts indeed happened during the life of Charlemagne himſelf; which, however, he always found means to cruſh; but after his death, the ſovereignty of Italy became an object of contention between the kings of France and the emperors of Germany. That great monarch had divided his extenſive dominions among his children; but they all died during his lifetime, except Lewis, whom he aſſociated with himſelf in the empire, and who ſucceeded to all his dominions after his death. From this time we may date the troubles with which Italy was ſo long overwhelmed; and of which, as they proceeded from the ambition of thoſe called kings of Italy and their nobles, of the kings of France, and of the emperors of Germany, it is difficult to have any clear idea. The following ſhort ſketch, however, may perhaps give ſome ſatisfaction on this perplexed ſubject.

35 History of the diſturbances in Italy after the time of Charlemagne.

At the time Lewis the ſon of Charlemagne was declared emperor of the Weſt, Italy was held by Bernard the ſon of Pepin, brother to Lewis. Though this Bernard bore the title of *king*, yet he was only accounted a vaſſal of the emperor. His ambition, however, ſoon prompted him to rebel againſt his uncle; but being abandoned by his troops, he was taken priſoner, had his eyes pulled out, and died three days after. As the diſturbances ſtill continued, and the nobles of Lombardy were yet very refractory, Lothaire, eldeſt ſon to the emperor, was, in the year 823, ſent into Italy; of which country he was firſt crowned king at Rome, and afterwards emperor of the Weſt, during his father's life-time. But though his abilities were ſufficient to have ſettled every thing in a ſtate of tranquillity, his unbounded ambition prompted him to engage in rebellion againſt his father; whom he more than once took priſoner; though in the end he was obliged to ſubmit, and aſk pardon for his offences, which was obtained only on condition of his not paſſing the Alps without leave obtained from his father.

In the mean time, the Saracens, taking advantage of theſe inteſtine wars, landed on the coaſts of Italy, and committed ſuch ravages, that even the biſhops were obliged to arm themſelves for the defence of the country. Lothaire, however, after returning from his unnatural war with his father, was ſo far from attempting to put an end to theſe ravages, or to reſtore tranquillity, that he ſeized on ſome places belonging to the ſee of Rome, under pretence that they were part of his kingdom of Lombardy; nor would he forbear theſe encroachments, till expreſsly commanded to do ſo by his father. After having embroiled himſelf, and almoſt loſt all his dominions, in a war with his brothers after the death of Lewis, and declared his ſon, alſo called *Lewis*, king of Italy, this ambitious prince died, leaving to Lewis the title of *emperor*, as well as *king of Italy*, with which he had before inveſted him. Italy.

The new emperor applied himſelf to the reſtoration of tranquillity in his dominions, and driving out the Saracens from thoſe places which they had ſeized in Italy. This he fully accompliſhed, and obliged the infidels to retire into Africa; but in 875, he died, without naming any ſucceſſor. After his death, ſome of the Italian nobles, headed by the duke of Tuſcany, repreſented to the pope, that as Lewis had left no ſucceſſor, the regal dignity, which had ſo long been uſurped by foreigners, ought now to return to the Italians. The pope, however, finding that Charles the Bald, king of France, had ſuch an ambition for the imperial crown, that he would ſtick at nothing to obtain it, reſolved to gratify him, though at as high a price as poſſible. He accordingly crowned him emperor and king of Lombardy, on condition of his owning the independency of Rome, and that he himſelf only held the empire by the gift of the pope. This produced a conſpiracy among the diſcontented nobles; and at the ſame time the Saracens, renewing their incurſions, threatened the eccleſiaſtical territories with the utmoſt danger. The pope ſolicited the emperor's aſſiſtance, with the greateſt earneſtneſs; but he died before any thing effectual could be done: after which, being diſtreſſed by the Saracens on one hand, and the Lombard nobles on the other, the unhappy pontiff was forced to fly into France. Italy now fell into the utmoſt confuſion and anarchy; during which time many of the nobles and ſtates of Lombardy aſſumed an independence, which they have ever ſince retained.

In 879, the pope was reconciled to Italy with an army by Boſon ſon-in-law to Lewis II. of France: but though he inclined very much to have raiſed this prince to the dignity of king of Italy, he found his intereſt inſufficient for that purpoſe, and matters remained in their former ſituation. The nobles, who had driven out the pope, were now indeed reconciled to him: but notwithſtanding this reconciliation, the ſtate of the country was worſe than ever; the great men renouncing the authority of any ſuperior, and every one claiming to be ſovereign in his own territories. To add to the calamities, which enſued through the ambition of theſe deſpots, the Saracens committed every where the moſt terrible ravages; till at laſt the Italian nobles, deſpiſing the kings of the Carlovingian race, who had weakened themſelves by their mutual diſſentions, began to think of throwing off even all nominal ſubmiſſion to a foreign yoke, and retaining the imperial dignity among themſelves. Thus they hoped, that, by being more united among themſelves, they might be more able to reſiſt the common enemy. Accordingly, in 885, they went to pope Adrian; and requeſting him to join them in aſſerting the independency of Italy, they obtained of him the two following decrees, viz. That the popes, after their election, might be conſecrated without waiting for the preſence of the king or his ambaſſadors; and that, if Charles the Groſs died without ſons, the kingdom of Italy, with the title of *emperor*, ſhould be conferred on ſome of the Italian nobles.

Theſe decrees were productive of the worſt conſequences imaginable. The emperor complained of being

Italy.

ing deprived of his right; and the diſſentions between the Italian nobles themſelves became more fatal than ever. The two moſt powerful of theſe noblemen, Berengarius duke of Friuli, and Guido or Vido duke of Spoleto, entered into an agreement, that, on the death of the emperor, the former ſhould ſeize on the kingdom of Italy, and the latter on the kingdom of France. Berengarius ſucceeded without oppoſition, but Vido was diſappointed, the French having already choſen Eudes or Otho for their king. Upon this he returned to Italy, and turned his arms againſt Berengarius. Vido proved victorious in an engagement, and drove his rival into Germany; where he ſought the aſſiſtance of Arnolphus, who had ſucceeded to the crown after the death of Charles. Having thus obtained the kingdom of Italy, Vido employed his time in reforming the abuſes of the ſtate, and confirming the grants formerly given to the pope out of gratitude for his having ſanctified his uſurpation and declared him lawful king of Italy. This tranquillity, however, was of ſhort duration. Arnolphus ſent an army into Italy; the Saracens from Spain ravaged the northern parts of the country, and, getting poſſeſſion of a caſtle near the Alps, held it for many years after, to the great diſtreſs of the neighbouring parts, which were expoſed to their continual incurſions; and at the ſame time Benevento was beſieged and taken by the forces of the eaſtern emperor, ſo that Vido found his empire very conſiderably circumſcribed in its dimenſions.

The new king, diſtreſſed by ſo many enemies, aſſociated his ſon Lambert with him in the government, and bribed the Germans to return to their own country. In 893, however, they again invaded Italy; but were ſuddenly obliged to leave the country, after having put Berengarius in poſſeſſion of Pavia. In the mean time, Vido died, and his ſon Lambert drove out Berengarius: but having joined a faction, headed by one Sergius, againſt pope Formoſus, the latter offered the kingdom of Italy to Arnolphus; who thereupon entered the country with an army, beſieged and took Rome, maſſacring the faction of Sergius with the moſt unrelenting cruelty.

Arnolphus thus maſter of Italy, and crowned emperor by the pope, began to form ſchemes of ſtrengthening himſelf in his new acquiſitions by putting out eyes of Berengarius: but the latter, having timely notice of this treachery, fled to Verona; and the Italians, were ſo provoked at this and the other cruelties of Arnolphus, that they drove him out of the country. His departure occaſioned the greateſt confuſion at Rome. Formoſus died ſoon after; and the ſucceſſors to the papal dignity, having now no army to fear, excited the greateſt diſturbances. The body of Formoſus was dug up and thrown into the Tiber by one pope, while that pope was ſtrangled, and Formoſus's body buried again in the Vatican, by order of another. At laſt the coronation of Arnolphus was declared void, the Sergian faction entirely demoliſhed, and the abovementioned decrees of Adrian annulled; it being now determined that the elected popes ſhould not be conſecrated but in preſence of the emperor or his ambaſſadors.

During theſe confuſions Lambert enjoyed the kingdom in quiet; but the nobles, hating him on account of his arbitrary and tyrannical government, began again to think of Berengarius. In the mean time, however, another faction offered the crown to Lewis king of Arles. This new competitor entered Italy with an army in 899; but was forced by Berengarius to renounce his claim upon oath, and to ſwear, that he would never again enter Italy, even though he ſhould be invited to be crowned emperor.—This oath, however, was ſoon forgot. Lewis readily accepted of another invitation, and was crowned king of Italy at Pavia in 901. The following year he forced Berengarius to fly into Bavaria; but having unadviſedly diſbanded his army, as thinking himſelf now ſecurely ſeated on the throne, Berengarius, who watched every opportunity, ſurpriſed him at Verona, and put out his eyes. Italy.

Thus Berengarius at laſt became king of Italy without a rival; and held his kingdom for 20 years afterwards, without any oppoſition from his ſubjects, who at laſt became ſenſible of the miſchiefs ariſing from civil diſcords. He was not yet, however, without troubles. The Hungarians invaded Italy with a formidable army, and advanced within a ſmall diſtance of Pavia. Berengarius armed the whole force of his dominions; and came againſt them with ſuch a multitude, that the Hungarians retired without venturing an engagement. A great many of their men were loſt in paſſing a river; upon which they ſent deputies to Berengarius, offering to reſtore all their booty, and never to come again into Italy, provided they were allowed a ſafe retreat. Theſe conditions were imprudently denied; upon which the Hungarians attacked the army of Berengarius in deſpair, and defeated them with great ſlaughter. After this they over-ran the whole country, and plundered the towns of Treviſo, Vicenza, and Padua, without reſiſtance, the inhabitants flying every where into fortified places. This devaſtation they continued for two years; nor could their departure be procured without paying them a large ſum of money: which, however, proved of little avail; for the following year they returned, and ravaged the territory of Friuli without controul. Scarcely were theſe invaders departed, when the Saracens, who had ſettled at the foot of the Alps, invaded Apulia and Calabria, and made an irruption as far as Acqui in the neighbourhood of Pavia; while the inhabitants, inſtead of oppoſing them, fled to ſome ſorts which had been erected in the time of the firſt irruption of the Hungarians. In 912, however, John, preſbyter of Ravenna, having attained the papal dignity by means of Theodora, wife of Adelbert count of Tuſcany, applied himſelf to regulate the affairs of the church, and to repreſs the inſults of the Saracens. While he was conſidering on the moſt proper methods of effecting this, one of the Saracens, who had received an injury from his countrymen, fled to Rome, and offered to deliver the Italians from their invaſions, if the Pope would but allow him a ſmall body of men. His propoſals being accepted, 60 young men were choſen, all well armed; who being conducted by the Saracen into by-paths, attacked the infidels as they were returning from their inroads, and ſeveral times defeated great parties of them. Theſe loſſes affecting the Saracens, a general alliance was concluded amongſt all their cities; and having fortified a town on the Garigliano, they abandoned the reſt,

Italy.

reſt, and retired thither. Thus they became much more formidable than before; which alarming the pope, he conſulted with Atenulphus prince of Benevento and Capua, ſending at the ſame time ambaſſadors to Conſtantine the Greek emperor, inviting him to an alliance againſt the infidels. The Saracens, unable to withſtand ſuch a powerful combination, were beſieged in their city: where being reduced to great ſtraits, they at laſt ſet fire to it, and ſallied out into the woods; but being purſued by the Italians, they were all cut off to a man.

In this expedition it is probable that Berengarius gave great aſſiſtance; for this very year, 915, he was crowned emperor by the pope. This gave diſpleaſure to many of the ambitious nobles; conſpiracies were repeatedly formed againſt him; in 922, Rodolphus king of Burgundy was crowned alſo king of Italy; and in 924, Berengarius was treacherouſly aſſaſſinated at Verona; of which diſturbances, the Hungarians taking the advantage, plundered the cities of Mantua,
36 Pavia plundered and burnt by the Hungarians. Breſcia, and Bergamo. Marching afterwards to Pavia, they inveſted it cloſely on all ſides; and about the middle of March 925, taking advantage of the wind, they ſet fire to the houſes next the walls, and during the confuſion broke open the gates, and, getting poſſeſſion of the city, treated the inhabitants with the greateſt barbarity. Having burnt the capital of the kingdom, they next proceeded to Placenza, where they plundered the ſuburbs; and then returned to Pannonia, laden with booty.

The affairs of Italy now fell into the utmoſt confuſion. A faction was formed againſt Rodolphus in favour of Hugh count of Arles. The latter prevailed, and was crowned king at Pavia in 927. The Italians, however, ſoon repented of their choice. The Romans firſt invited him to be their governor, and then drove him out with diſgrace; at the ſame time chooſing a conſul, tribunes, &c. as if they had deſigned to aſſert their ancient liberty. One faction, in the mean time, offered the crown to Rodolphus, and the other to Arnold duke of Bavaria, while the Saracens took this opportunity to plunder the city of Genoa.

Hugh, in the mean time, was not inactive. Having collected an army, he marched directly againſt Arnold, and entirely defeated him. Rodolphus delivered him from all apprehenſions on his part, by entering into an alliance with him, and giving his daughter Adelaide in marriage to Lotharius, Hugh's ſon. Being thus free from all danger from foreign enemies, he marched againſt the Romans; but with them he alſo came to an agreement, and even gave his daughter in marriage to Alberic, whom they had choſen conſul. In the mean time the country was infeſted by the Hungarians and Saracens, and at the ſame time depopulated by a plague. Endleſs conſpiracies were formed againſt Hugh himſelf; and at laſt, in 947, he was totally deprived of the regal power by Berengarius, grandſon to the firſt king of that name; ſoon after which he retired into Burgundy, and became a monk.

Though Berengarius was thus poſſeſſed of the ſupreme power, he did not aſſume the title of *king* till after the death of Lotharius, which happened in 950; but, in the mean time, Italy was invaded by Henry duke of Bavaria, and the Hungarians. The former took and plundered the city of Aquileia, and ravaged the neighbouring country; after which he returned without moleſtation into Germany: the latter made a furious irruption, and Berengarius being unable to oppoſe them, was at laſt obliged to purchaſe their departure by money. In raiſing the ſum agreed upon, however, Berengarius is ſaid to have been more oppreſſive than even the Hungarians themſelves. Every individual, without diſtinction of age or ſex, was obliged to pay ſo much for their head; not excepting even the poor. The churches were likewiſe robbed; by which means the king raiſed an immenſe ſum of money, 10 buſhels of which he gave to the Hungarians, but kept the much greater part to himſelf.

37 Italy oppreſſed by the Hungarians and Berengarius.

Berengarius, not yet ſatisfied, wanted to be put in poſſeſſion of Pavia, which was held by Adelaide, the widow of Lotharius. In order to obtain his purpoſe, he propoſed a marriage between her and his ſon Adelbert. This propoſal was rejected; upon which Berengarius beſieged and took the city. The queen was confined in a neighbouring caſtle, from whence ſhe made her eſcape by a contrivance of her confeſſor. With him, and one female attendant, ſhe concealed herſelf for ſome days in a wood; but, being obliged to remove from thence for want of food, ſhe applied for protection to Adelard biſhop of Reggio. By him ſhe was recommended to his uncle Atho, who had a ſtrong caſtle in the neighbourhood of Canoza. Here ſhe was quickly beſieged by Berengarius; upon which meſſengers were diſpatched to Otho king of Germany, acquainting him, that, by expelling Berengarius, and marrying Adelaide, he might eaſily obtain the kingdom of Italy. This propoſal he readily accepted, and married Adelaide; but allowed Berengarius to retain the greateſt part of his dominions, upon condition of his doing homage for them to the kings of Germany. He deprived him, however, of the dukedom of Friuli, and marquiſate of Verona, which he gave to Henry duke of Bavaria.

38 Otho crowned king of Italy and emperor of the weſt.

Berengarius thus freed from all apprehenſion, not only oppreſſed his ſubjects in a moſt tyrannical manner, but revolted againſt Otho himſelf. This at laſt procured his ruin: for, in 961, Otho returned with an army into Italy, where he was crowned king by the archbiſhop of Milan; and the year following was crowned emperor by the pope. On this occaſion he received the imperial crown from his holineſs, and kiſſed his feet with great humility: after which they both went to the altar of St Peter, and bound themſelves by a ſolemn oath, the pope to be always faithful to the emperor, and to give no aſſiſtance to Berengarius or Adelbert his enemies; and Otho, to conſult the welfare of the church, and to reſtore to it all its patrimony granted by former emperors. Otho, beſides this, beſtowed very rich preſents on the church of St Peter. He ordained that the election of popes ſhould be according to the canons; that the elected pope ſhould not be conſecrated till he had publicly promiſed, in preſence of the emperor's commiſſaries, to obſerve every thing formerly ſpecified with regard to the rights of the emperors; that theſe commiſſaries ſhould conſtantly reſide at Rome, and make a report every year how juſtice was adminiſtered by the judges; and, in caſe of any complaints, the commiſſaries ſhould lay them before the pope; but if he neglected to intimate them, the

Italy. imperial commiſſaries might then do what they pleaſed.

Thus we ſee that Otho, however much he might allow the pope's ſupremacy in ſpiritual matters, plainly aſſumed the ſovereignty in temporals to himſelf; and thus Italy was for upwards of 300 years accounted a part of the German empire. The popes, however, by no means reliſhed this ſuperiority of the emperor. The latter was hardly departed, when the pope (John XII.) broke the oath which he had juſt before ſworn with ſo much ſolemnity; and entered firſt into an alliance with Adelbert count of Tuſcany to expel the Germans, and then ſolicited the Hungarians to invade Italy. This treachery was ſoon puniſhed by Otho. He returned with part of his army, and aſſembled a council of biſhops. As the pope did not appear, Otho pretended great concern for his abſence. The biſhops replied, that the conſciouſneſs of his guilt made him afraid to ſhew himſelf. The emperor then inquired particularly into his crimes; upon which the biſhops accuſed him of filling the palace with lewd women, of ordaining a biſhop in a ſtable, caſtrating a cardinal, drinking the devil's health, &c.

39 He depoſes the pope. As the pope ſtill refuſed to appear in order to juſtify himſelf from theſe charges, he was formally depoſed; and Leo the chief ſecretary, though a layman, elected in his ſtead.

The new pope, in compliment to the emperor, granted a bull, by which it was ordained that Otho and his ſucceſſors ſhould have a right of appointing the popes and inveſting archbiſhops and biſhops; and that none ſhould dare to conſecrate a biſhop without leave obtained from the emperor. Thus were the affairs of the Italians ſtill kept in the utmoſt confuſion even during the reign of Otho I. who appears to have been a wiſe and active prince. He was no ſooner gone, than the new pope was depoſed, all his decrees annulled, and John replaced. The party of Leo was now treated with great cruelty: but John was ſoon ſtopped in his career; for about the middle of May the ſame year (964) in which he had been reſtored, being ſurpriſed in bed with a Roman lady, he received a blow on the head from the devil (according to the authors of thoſe times) of which he died eight days after. After his death a cardinal-deacon, named *Benedict*, was elected by the Romans, but depoſed by Otho, and baniſhed to Hamburgh.

40 The Italians revolt, but are reduced. The emperor was ſcarce returned to Germany, when his fickle Italians revolted, and ſent for Adlebert who had fled to Corſica. But being ſoon reduced, they continued quiet for about a year; after which they revolted again, and impriſoned the pope. Otho, however, provoked at their rebellious diſpoſition, ſoon returned, and puniſhed the rebels with great ſeverity; after which he made ſeveral laws for the better regulation of the city of Rome, granted ſeveral privileges to the Venetians, and cauſed his ſon Otho, then only 13 years of age, to be crowned emperor.

This ceremony being over, Otho diſpatched an ambaſſador to Nicephorus, emperor of Conſtantinople, demanding his ſtep-daughter Theophania in marriage for the young emperor; but upon this alliance being rejected, and that not without circumſtances of the moſt atrocious perfidy, Otho inſtantly invaded the countries of Apulia and Calabria, and entirely defeated the Greek army in thoſe parts. In the mean time, however, Nicephorus being killed, and his throne uſurped by John Zimiſces, Otho immediately entered into an alliance with the latter, and eaſily obtained Theophania for his ſon. She was crowned with great ſolemnity on the 8th of April 969: at the ſame time it is pretended by ſome authors, that the Greeks renounced their rights to Calabria and Apulia; though this is denied by others. After the celebration of this marriage, the emperor undertook an expedition againſt the Saracens, who ſtill reſided at the foot of the Alps; but being informed of the death of ſeveral nobles in Germany, he thought proper to return thither, where he died of an apoplexy in the year 973. Italy.

41 State of Italy at the death of Otho. At the time of Otho's death Italy was divided into the provinces of Apulia, Calabria, the dukedom of Benevento, Campania, Terra Romana, the dukedom of Spoleto, Tuſcany, Romagna, Lombardy, and the marquiſates of Aſcona, Verona, Friuli, Treviſo, and Genoa. Apulia and Calabria were ſtill claimed by the Greeks; but all the reſt were either immediately ſubject to, or held of, the kings of Italy. Otho conferred Benevento (including the ancient Samnium) on the duke of that name. Campania and Lucania he gave to the dukes of Capua, Naples, and Salerno. Rome with its territory, Ravenna with the exarchate, the dukedom of Spoleto, with Tuſcany, and the marquiſate of Ancona, he granted to the pope; and retained the reſt of Italy under the form of a kingdom. Some of the cities were left free, but all tributary. He appointed ſeveral hereditary marquiſates and counties, but reſerved to himſelf the ſovereign juriſdiction in their territories. The liberty of the cities conſiſted in a freedom to chooſe their own magiſtrates, to be judged by their own laws, and to diſpoſe of their own revenues, on condition that they took the oath of allegiance to the king, and paid the cuſtomary tribute. The cities that were not free were governed by the commiſſaries, or lieutenants of the emperor; but the free cities were governed by two or more conſuls, afterwards called *poteſtates*, choſen annually, who took the oath of allegiance to the emperor, before the biſhop of the city, or the emperor's commiſſary. The tribute exacted was called *foderum, parata, et manſionaticum*. By the *foderum* was meant a certain quantity of corn which the cities were obliged to furniſh to the king, when marching with an army, or making a progreſs through the country; though the value of this was frequently paid in money. By the *parata* was underſtood the expence laid out in keeping the public roads and bridges in repair; and the *manſionaticum* included thoſe expences which were required for lodging the troops, or accommodating them in their camp. Under pretence of this laſt article the inhabitants were ſometimes ſtripped of all they poſſeſſed, except their oxen, and feed for the land. Beſides regulating what regarded the cities, Otho diſtributed honours and poſſeſſions to thoſe who had ſerved him faithfully. The honours conſiſted in the titles of *duke*, *marquis*, *count*, *captain*, *valvaſor*, and *valvaſin*; the poſſeſſions were, beſides land, the duties ariſing from harbours, ferries, roads, fiſh-ponds, mills, ſalt-pits, the uſes of rivers, and all pertaining to them, and ſuch like. The dukes, marquiſes, and counts, were thoſe who received dukedoms, marquiſates, and counties,

Italy.

ties, from the king in fiefs; the captains had the command of a certain number of men by a grant from the king, duke, marquis, or count; the valvafors were fubordinate to the captains, and the valvafins to them.

42 Great diturbances happen on the death of Otho I.

No fooner was the death of Otho I. known in Italy, than, as if they had been now freed from all reftraint, the nobles declared war againft each other: fome cities revolted, and chofe to themfelves confuls; while the dominions of others were feized by the nobles, who confirmed their power by erecting citadels. Rome efpecially was harraffed by tumults, occafioned chiefly by the feditious practices of one Cincius, who preffed his fellow-citizens to reftore the ancient republic. As the pope continued firm in the intereft of the emperor, Cincius caufed him to be ftrangled by one Franco a cardinal deacon; who was foon after rewarded with the pontificate, and took upon him the name of *Boniface VII.* Another Pope was chofen by the faction of the count of Tufcany; who being approved by the emperor, drove Cincius and Boniface out of the city. Diftarbances of a fimilar kind took place in other cities, though Milan continued quiet and loyal in the midft of all this uproar and confufion.

In the mean time Boniface fled for refuge to Conftantinople, where he excited the emperor to make war againft Otho II. In 979 an army was accordingly fent into Italy, which conquered Apulia and Calabria; but the next year Otho entered Italy with a formidable army, and, having taken a fevere revenge on the authors of the diftarbances, drove the Greeks entirely out of the provinces they had feized. Having then caufed his fon Otho III. at that time a boy of ten years of age, to be proclaimed emperor, he died at Rome in the year 983. Among the regulations made by this emperor, one is very remarkable, and muft give us a ftrange idea of the inhabitants of Italy at that time. He made a law, That no Italian fhould be believed upon his oath; and that in any difpute which could not be decided otherwife than by witneffes, the parties fhould have recourfe to a duel.

Otho III. fucceeded to the empire at twelve years of age; and, during his minority, the diftarbances in Italy revived. Cincius, called alfo *Crefcentius*, renewed his fcheme of reftoring the republic. The pope (John XV.) oppofing his fchemes, was driven out of the city; but was foon after recalled, on hearing that he had applied to the emperor for affiftance. A few years after Crefcentius again revolted, and expelled Gregory V. the fucceffor of John XV.; raifing to the papal dignity a creature of his own, under the name of *John* XVI. Otho, enraged at this infult, returned to Rome with a powerful army in 998, befieged and took it by aflault; after which he caufed Crefcentius to be beheaded, and the pope he had fet up to be thrown headlong from the caftle of St Angelo, after having his eyes pulled out, and his nofe cut off. Four years after, he himfelf died of the fmall-pox; or, according to fome, was poifoned by the widow of Crefcentius, whom he had debauched under a promife of marriage, juft as he was about to punifh the Romans for another revolt.

43 Rome taken by Otho III.

Otho was fucceeded in the imperial throne by Henry duke of Bavaria, and grandfon to Otho II. Henry had no fooner fettled the affairs of Germany, than he found it neceffary to march into Italy againft Ardouin marquis of Ivrea, who had aflumed the title of *King of Italy*. Him he defeated in an engagement, and was himfelf crowned king of Italy at Pavia in 1005; but, a few years after, a new conteft arofe about the papal chair, which again required the prefence of the emperor. Before he arrived, however, one of the competitors (Benedict VIII.) had got the better of his rival, and both Henry and his queen received the imperial crown from his hands. Before the emperor entered the church, the pope propofed to him the following queftion: "Will you obferve your fidelity to me and my fucceffors in every thing?" To which, tho' a kind of homage, he fubmitted, and anfwered in the affirmative. After his coronation, he confirmed the privileges beftowed on the Roman fee by his predeceffors, and added fome others of his own; ftill, however, referving for himfelf the fovereignty and the power of fending commiffaries to hear the grievances of the people. Having repelled the incurfions of the Saracens, reduced fome more rebellious of his fubjects, and reduced the greateft part of Apulia and Calabria, he died in the year 1024.

Italy.

The death of this emperor was, as ufual, followed by a competition for the crown. Conrad being chofen emperor of Germany, was declared king of Italy by the archbifhop of Milan; while a party of the nobles made offer of the crown to Robert king of France, or his fon Hugh. But this offer being declined, and likewife another to William duke of Guienne, Conrad enjoyed the dignity conferred on him by the archbifhop without moleftation. He was crowned king of Italy at Monza, in 1026; and the next year he received the imperial crown from pope John XX. in prefence of Canute the Great, king of England, Denmark, and Norway, and Rodolph III. king of Burgundy. His reign was fimilar to that of his predeceffors. The Italians revolted, the pope was expelled, the malcontents were fubdued, and the pope reftored; after which the emperor returned to Germany, and died in 1039.

44 The diforders increafe under Henry III.

Under Henry III. who fucceeded Conrad, the diftarbances were prodigioufly augmented. Pope Sylveller II. was driven out by Benedict; who in his turn was expelled by John bifhop of Sabinum, who aflumed the title of *Sylveller III.* Three months after, Benedict was reftored, and excommunicated his rivals; but foon after refigned the pontificate for a fum of money. In a fhort time he reclaimed it; and thus there were at once three popes, each of whom was fupported on a branch of the papal revenue, while all of them made themfelves odious by the fcandalous lives they led. At laft a prieft called *Gratian* put an end to this fingular triumvirate. Partly by artifice, and partly by prefents, he perfuaded all the three to renounce their pretenfions to the papacy; and the people of Rome, out of gratitude for fo fignal a fervice to the church, chofe him pope, under the name of *Gregory VI.* Henry III. took umbrage at this election, in which he had not been confulted, and marched with an army into Italy. He depofed Gregory, as having been guilty of fimony; and filled the papal chair with his own chancellor, Heidiger, bifhop of Bamberg, who aflumed the name of *Clement II.* and afterwards confecrated Henry and the empref

Italy.

Agnes. This ceremony being over, and the Romans having ſworn never to elect a pope without the approbation of the reigning emperor, Henry proceeded to Capua, where he was viſited by Drago, Rainulphus, and other Norman adventurers; who, leaving their country at different times, had made themſelves maſters of great part of Apulia and Calabria, at the expence of the Greeks and Saracens. Henry entered into treaty with them; and not only ſolemnly inveſted them with thoſe territories which they had acquired by conqueſt, but prevailed on the pope to excommunicate the Beneventines, who had refuſed to open their gates to him, and beſtowed that city and its dependencies, as fiefs of the empire, upon the Normans, provided they took poſſeſſion by force of arms. The emperor was ſcarce returned to Germany, when he received intelligence of the death of Clement II. He was ſucceeded in the apoſtolic ſee by Damaſus II.; who alſo dying ſoon after his elevation, Henry nominated Bruno biſhop of Toul, to the vacant chair. This Bruno, who was the emperor's relation, immediately aſſumed the pontificals; but being a modeſt and pious prelate, he threw them off on his journey, by the perſuaſion of a monk of Cluny, named *Hildebrand*, afterwards the famous Gregory VII. and went to Rome as a private man. "The emperor alone," ſaid Hildebrand, "has no right to create a pope." He accompanied Bruno to Rome, and ſecretly retarded his election, that he might arrogate to himſelf the merit of obtaining it. The ſcheme ſucceeded to his wiſh: Bruno, who took the name of *Leo IX.* believing himſelf indebted to Hildebrand for the pontificate, favoured him with his particular friendſhip and confidence; and hence originated the power of this enterpriſing monk, of obſcure birth, but boundleſs ambition, who governed Rome ſo long, and whoſe zeal for the exaltation of the church occaſioned ſo many troubles to Europe.

45 He inveſts the Normans with ſome territories in Apulia and Calabria.

Leo, ſoon after his elevation, waited on the emperor at Worms, to crave aſſiſtance againſt the Norman princes, who were become the terror of Italy, and treated their ſubjects with great ſeverity. Henry furniſhed the Pope with an army; at the head of which he marched againſt the Normans, after having excommunicated them, accompanied by a great number of biſhops and other eccleſiaſtics, who were all either killed or taken priſoners, the Germans and Italians being totally routed. Leo himſelf was led captive to Benevento, which the Normans were now maſters of, and which Henry had granted to the pope in exchange for the fief of Bamberg in Germany; and the apoſtolic ſee is to this day in poſſeſſion of Benevento, by virtue of that donation. The Normans, however, who had a right to the city by a prior grant, reſtored it, in the mean time, to the princes of Lombardy; and Leo was treated with ſo much reſpect by the conquerors, that he revoked the ſentence of excommunication, and joined his ſanction to the imperial inveſtiture for the lands which they held in Apulia and Calabria.

Leo died ſoon after his releaſe; and the emperor, about the ſame time, cauſed his infant ſon, afterwards the famous Henry IV. to be declared king of the Romans, a title ſtill in uſe for the acknowledged heir of the empire. Gebehard, a German biſhop, was elected pope, under the name of *Victor II.* and confirmed by the addreſs of Hildebrand, who waited on the emperor in perſon for that purpoſe, though he diſdained to conſult him beforehand. Perhaps Hildebrand would not have found this taſk ſo eaſy, had not Henry been involved in a war with the Hungarians; who preſſed him hard, but whom he obliged at laſt to pay a large tribute, and furniſh him annually with a certain number of fighting men.

46 Henry IV. declared king of the Romans.

As ſoon as the emperor had finiſhed this war, and others to which it gave riſe, he marched into Italy to inſpect the conduct of his ſiſter Beatrice, widow of Boniface marquis of Mantua, and made her priſoner. She had married Gozelo, duke of Lorrain, without the emperor's conſent; and contracted her daughter Matilda, by the marquis of Mantua, to Godfrey duke of Spoleto and Tuſcany, Gozelo's ſon by a former marriage. This formidable alliance juſtly alarmed Henry: he therefore attempted to diſſolve it, by carrying his ſiſter into Germany, where he died ſoon after his return, in the 39th year of his age, and the 16th of his reign.

This emperor, in his laſt journey to Italy, concluded an alliance with Contarini, doge of Venice. That republic was already rich and powerful, though it had only been enfranchiſed in the year 998, from the tribute of a mantle of cloth of gold, which it formerly paid, as a mark of ſubjection, to the emperors of Conſtantinople. Genoa was the rival of Venice in power and in commerce, and was already in poſſeſſion of the iſland of Corſica, which the Genoeſe had taken from the Saracens. Theſe two cities ingroſſed at this time almoſt all the trade of Europe. There was no city in any reſpect equal to them either in France or Germany.

47 Increaſe of the pope's power.

Henry IV. was only five years old at his father's death. The popes made uſe of the reſpite given them by his minority, to ſhake off in a great meaſure their dependence upon the emperors. After a variety of conteſts about the pontificate, Nicholas II. a creature of Hildebrand's, was elected; who, among others, paſſed the following celebrated decree, viz. That, for the future, the cardinals only ſhould elect the pope; and that the election ſhould afterwards be confirmed by the reſt of the clergy and the people, "ſaving the honour (adds he) due to our dear ſon Henry, now king; and who, if it pleaſe God, ſhall be one day emperor, according to the right which we have already conferred upon him." After this he entered into a treaty with the Norman princes above-mentioned; who, though they had lately ſworn to hold their poſſeſſions from the emperor, now ſwore to hold them from the pope; and hence aroſe the pope's claim of ſovereignty over the kingdom of Naples and Sicily.

Thus was the power of the German emperors in Italy greatly diminiſhed, and that of the popes proportionally exalted; of which Henry ſoon had ſufficient evidence. For, having aſſumed the government into his own hands in the year 1072, being then 22 years of age, he was ſummoned by Alexander II. to appear before the tribunal of the holy ſee, on account of his looſe life, and to anſwer the charge of having expoſed the inveſtiture of biſhops to ſale; at the ſame time that the pope excited his German ſubjects to rebel againſt him. The rebels, however, were defeated, and peace was reſtored to Germany: but ſoon after, Hildebrand above-mentioned, being elected

48 His conteſt with the emperor.

to

Italy. to the pontificate under the name of *Gregory VII.* openly assumed the superiority over every earthly monarch whatever. He began with excommunicating every eccleſiaſtic who ſhould receive a benefice from the hands of a layman, and every layman who ſhould take upon him to confer ſuch a benefice. Henry, inſtead of reſenting this inſolence, ſubmitted, and wrote a penitential letter to the pope: who, upon this, condeſcended to take him into favour, after having ſeverely reprimanded him for his looſe life; of which the emperor now confeſſed himſelf guilty.

The quarrel between the church and the emperor was, however, ſoon brought to a criſis by the following accident. Solomon, king of Hungary, being depoſed by his brother Geyſa, had fled to Henry for protection, and renewed the homage of Hungary to the empire. Gregory, who favoured Geyſa, exclaimed againſt this act of ſubmiſſion, and ſaid in a letter to Solomon, "You ought to know that the kingdom of Hungary belongs to the Roman church; and learn that you will incur the indignation of the holy ſee, if you do not acknowledge that you hold your dominions of the pope and not of the emperor." Henry, though highly provoked at this declaration, thought proper to treat it with neglect; upon which Gregory reſumed the diſpute about inveſtitures. The predeceſſors of Henry had always enjoyed the right of nominating biſhops and abbots, and of giving them inveſtiture by the croſs and the ring. This right they had in common with almoſt all princes. The predeceſſors of Gregory VII. had been accuſtomed, on their part, to ſend legates to the emperors, in order to intreat their aſſiſtance, to obtain their confirmation, or deſire them to come and receive the papal ſanction; but for no other purpoſe. Gregory, however, ſent two legates to ſummon Henry to appear before him as a delinquent, becauſe he ſtill continued to beſtow inveſtitures, notwithſtanding the apoſtolic decree to the contrary; adding, that if he ſhould fail to yield obedience to the church, he muſt expect to be excommunicated and dethroned. Incenſed at this arrogant meſſage from one whom he conſidered as his vaſſal, Henry diſmiſſed the legates with very little ceremony, and in 1706 convoked an aſſembly of all the princes
49 The empe- ror depoſes the pope. and dignified eccleſiaſtics at Worms; where, after mature deliberation, they concluded, that Gregory having uſurped the chair of St Peter by indirect means, infected the church of God with a great many novelties and abuſes, and deviated from his duty to his ſovereign in ſeveral ſcandalous attempts, the emperor, by that ſupreme authority derived from his predeceſſors, ought to diveſt him of his dignity, and appoint another in his place. In conſequence of this determination, Henry ſent an ambaſſador to Rome, with a formal deprivation of Gregory; who, in his turn, convoked a council, at which were preſent 110 biſhops, who unanimouſly agreed that the pope had juſt cauſe to depoſe Henry, to diſſolve the oath of allegiance which the princes and ſtates had taken in his favour, and to prohibit them from holding any correſpondence with
50 him on pain of excommunication, which was immedi- And he the ately fulminated againſt the emperor and his adhe- emperor. rents. "In the name of Almighty God, and by our authority, (ſaid Gregory), I prohibit Henry, the ſon of our emperor Henry, from governing the Teutonic kingdom, and Italy: I releaſe all Chriſtians from their oath of allegiance to him; and ſtrictly forbid all perſons from ſerving or attending him as king!" The circular letters written by this pontiff breathe the ſame ſpirit with his ſentence of depoſition. He there repeats, ſeveral times, that "biſhops are ſuperior to kings, and made to judge them?" expreſſions alike artful and preſumptuous, and calculated for bringing in all the churchmen of the world to his ſtandard. Italy.

Gregory knew well what conſequences would follow the thunder of the church. The German biſhops came immediately over to his party, and drew along with them many of the nobles: the flame of civil war ſtill lay ſmothering, and a bull properly directed was ſufficient to ſet it in a blaze. The Saxons, Henry's old enemies, made uſe of the papal diſpleaſure as a pretence for rebelling againſt him. Even Guelfe, to whom the emperor had given the duchy of Bavaria, ſupported the malcontents with that power which he owed to his ſovereign's bounty: nay, thoſe very princes and prelates who had aſſiſted in depoſing Gregory, gave up their monarch to be tried by the pope; and his holineſs was ſolicited to come to Augſburg for that purpoſe.

Willing to prevent this odious trial at Augſburg, Henry took the unaccountable reſolution of ſuddenly paſſing the Alps at Tirol, accompanied only by a few domeſtics, to aſk abſolution of pope Gregory his oppreſſor; who was then in Canoza, on the Appennine mountains; a fortreſs belonging to the counteſs or ducheſs Matilda, abovementioned. At the gates of this place the emperor preſented himſelf as an humble penitent. He alone was admitted without the outer court; where, being ſtripped of his robes, and wrapped in ſack-cloth, he was obliged to remain three days, in the month of January, bare-footed and faſting, before he was permitted to kiſs the feet of his holineſs; who all that time was ſhut up with the devout Matilda, whoſe ſpiritual director he had long been, and, as ſome ſay, her gallant. But be that as it may, her attachment to Gregory, and her hatred to the Germans, was ſo great, that ſhe made over all her eſtates to the apoſtolic ſee; and this donation is the true cauſe of all the wars which ſince that period have raged between the emperors and the popes. She poſſeſſed in her own right, great part of Tuſcany, Mantua, Parma, Reggio, Placentia, Ferrara, Modena, Verona, and almoſt the whole of what is now called the *patrimony of St Peter*, from Viterbo to Orvieto; together with part of Umbria, Spoleto, and the Marche of Ancona.
51 Who is at laſt obliged to ſubmit.

The emperor was at length permitted to throw himſelf at the pontiff's feet; who condeſcended to grant him abſolution, after he had ſworn obedience to him in all things, and promiſed to ſubmit to his ſolemn deciſion at Augſburg: ſo that Henry got nothing but diſgrace by his journey; while Gregory, elated by his triumph, and now looking upon himſelf (not altogether without reaſon) as the lord and maſter of all the crowned heads in Chriſtendom, ſaid in ſeveral of his letters, that it was his duty "to pull down the pride of kings."

This extraordinary accommodation gave much diſguſt to the princes of Italy. They never could forgive the inſolence of the pope, nor the abject humility of the emperor. Happily however for Henry, their indignation

Italy.

dignation at Gregory's arrogance overbalanced their deteſtation of his meanneſs. He took advantage of this temper; and by a change of fortune, hitherto unknown to the German emperors, he found a ſtrong party in Italy, when abandoned in Germany. All Lombardy took up arms againſt the pope, while he was raiſing all Germany againſt the emperor. Gregory, on the other hand, made uſe of every art to get another emperor elected in Germany; and Henry, on his part, left nothing undone to perſuade the Italians to elect another pope. The Germans choſe Rhodolph, duke of Suabia, who was ſolemnly crowned at Mentz; and Gregory, heſitating on this occaſion, behaved truly like the ſupreme judge of kings. He had depoſed Henry, but ſtill it was in his power to pardon that prince: he therefore affected to be diſpleaſed that Rodolph was conſecrated without his order; and declared, that he would acknowledge as emperor and king of Germany, him of the two competitors who ſhould be moſt ſubmiſſive to the holy ſee.

52 Rodolph choſen emperor of Germany.

Henry, however, truſting more to the valour of his troops, than to the generoſity of the pope, ſet out immediately for Germany, where he defeated his enemies in ſeveral engagements: and Gregory, ſeeing no hopes of ſubmiſſion, thundered out a ſecond ſentence of excommunication againſt him, confirming at the ſame time the election of Rodolph, to whom he ſent a golden crown, on which the following well-known verſe, equally haughty and puerile, was engraved:

Petra dedit Petro, Petrus diadema Rodolpho.

This donation was alſo accompanied with a moſt enthuſiaſtic anathema againſt Henry. After depriving him of *ſtrength in combat*, and condemning him *never to be victorious*, it concludes with the following remarkable apoſtrophe to St Peter and St Paul: "Make all men ſenſible, that as you can bind and looſe every thing in heaven, you can alſo upon earth take from or give to every one, according to his deſerts, empires, kingdoms, principalities—let the kings and the princes of the age, then inſtantly feel your power, that they may not dare to deſpiſe the orders of your church; let your juſtice be ſo ſpeedily executed upon Henry, that nobody may doubt but he falls by your means, and not by chance."

In order to avoid the effects of this ſecond excommunication, Henry aſſembled at Brixen, in the county of Tirol, about 20 German biſhops: who acting alſo for the biſhops of Lombardy, unanimouſly reſolved, that the pope, inſtead of having power over the emperor, owed him obedience and allegiance; and that Gregory VII. having rendered himſelf unworthy of the papal chair by his conduct and rebellion, ought to be depoſed from a dignity he ſo little deſerved. They accordingly degraded Hildebrand; and elected in his room Guibert, archbiſhop of Ravenna, a perſon of undoubted merit, who took the name of *Clement* III. Henry promiſed to put the new pope in poſſeſſion of Rome; but he was obliged, in the mean time, to employ all his forces againſt his rival Rodolph, who had re-aſſembled a large body of troops in Saxony. The two armies met near Merſburg, and both fought with great fury; but the fortune of the day ſeemed inclined to Rodolph, when his hand was cut off by the famous Godfrey of Bouillon, then in the ſervice of Henry, and afterwards renowned for his conqueſt of Jeruſalem.

53 Defeated and killed.

Diſcouraged by the misfortune of their chief, the rebels immediately gave way; and Rodolph perceiving his end approaching, ordered the hand that was cut off to be brought him, and made a ſpeech to his officers on the occaſion, which could not fail to have an influence on the emperor's affairs. "Behold, (ſaid he), the hand with which I took the oath of allegiance to Henry; and which oath, at the inſtigation of Rome, I have violated, in perfidiouſly aſpiring at an honour that was not my due."

Thus delivered from this formidable antagoniſt, Henry ſoon diſperſed the reſt of his enemies in Germany, and ſet out for Italy in order to ſettle Clement in the papal chair. But the gates of Rome being ſhut againſt him, he was obliged to attack it in form. The ſiege continued upwards of two years; Henry, during that time, being obliged to quell ſome inſurrections in Germany. The city was at length carried by aſſault, and with difficulty ſaved from being pillaged; but Gregory was not taken: he retired into the caſtle of St Angelo, and thence defied and excommunicated the conqueror. The new pope was, however, conſecrated with the uſual ceremonies; and expreſſed his gratitude by crowning Henry, with the concurrence of the Roman ſenate and people. Mean while the ſiege of St Angelo was going on; but the emperor being called about ſome affairs into Lombardy, Robert Guiſcard took advantage of his abſence to releaſe Gregory, who died ſoon after at Salerno. His laſt words, borrowed from the Scripture, were worthy of the greateſt ſaint: "I have loved juſtice, and hated iniquity; therefore I die in exile!"

54 Rome taken by Henry IV.

Henry, however, did not enjoy all the advantages which might have been expected from the death of Gregory. The ſubſequent popes trod in the paths of their predeceſſor. In 1101, Paſcal II. excited young Henry to rebel againſt his father. The emperor did all in his power to diſſuade him from proceeding to extremities, but in vain. The young prince perſiſted in his rebellious intentions; and having by feigned ſubmiſſions prevailed on the emperor to diſband his army, he treacherouſly ſeized and confined him. Henry, however, found means to eſcape from his confinement, and attempted to engage all the ſovereigns of Europe in his quarrel; but before any thing effectual could be done, he died at Liege in the year 1106.

55 Diſpute between the pope and Henry V.

The diſpute about inveſtitures was not terminated by the depoſition and death of Henry IV. His ſon Henry V. purſued the very ſame conduct for which he had depoſed his father. Paſcal oppoſed him with violence: upon which Henry gave him an invitation into Germany, to end the diſpute in an amicable manner. Paſcal did not think proper to accept of this invitation; but put himſelf under the protection of Philip I. king of France, who undertook to mediate between the contending parties. His mediation, however, proved ineffectual, and Henry was prevented by the wars in Hungary and Poland from paying any further attention to the affair of inveſtitures. At laſt, having ſettled his affairs in Germany, he took a reſolution of going to Rome, in order to ſettle the diſpute perſonally with the pope. To give his arguments the greater weight, however, he marched at the head of an army of 80,000 men. Paſcal received him with great appearance of friendſhip, but would not renounce the

Italy. the claim of inveſtitures; and Henry finding himſelf deceived in his expectations, ordered the pope to be ſeized. The conſul put the citizens in arms to defend the pope, and a battle was fought within the walls of Rome. The ſlaughter was ſo great, that the waters of the Tiber were tinged with blood. The Romans were defeated, and Paſcal was taken priſoner. The latter renounced his right of inveſtiture; ſolemnly ſwore never to reſume it, and broke his oath as ſoon as Henry was gone, by fulminating the ſentence of excommunication againſt him. In 1114 died the counteſs Matilda, who had bequeathed all her dominions to the pope, as we have already obſerved; but Henry thinking himſelf the only lawful heir, alleged, that it was not in Matilda's power to alienate her eſtates, which depended immediately on the empire. He therefore ſet out for Lombardy, and ſent ambaſſadors to the pope, beſeeching him to revoke the ſentence of excommunication abovementioned. Paſcal, however, would not even favour the ambaſſadors with an audience; but, dreading the approach of Henry himſelf, he took refuge among the Norman princes in Apulia. Henry arrived at Rome in 1117; but being ſoon after obliged to leave it in order to ſettle ſome affairs in Tuſcany, the pope returned to Rome, but died in a few days. On the third day after his deceaſe, cardinal Cajetan was elected his ſucceſſor, without the privity of the emperor, under the name of *Gelaſius II.* The new pope was inſtantly depoſed by Henry; who ſet up the archbiſhop of Prague, under the name of *Gregory VIII.* Gelaſius, though ſupported by the Norman princes, was obliged to take refuge in France, where he died; and the archbiſhop of Vienna was elected by the cardinals then preſent, under the name of *Calixtus II.*

The new pope attempted an accommodation with Henry; which not ſucceeding, he excommunicated the emperor, the antipope, and his adherents. He next ſet out for Rome, where he was honourably received; and Gregory VIII. was forced to retire to Sutri, a ſtrong town garriſoned by the emperor's troops. Here he was beſieged by Calixtus and the Norman princes. The city was ſoon taken, and Gregory thrown into priſon by his competitor; but at laſt, the ſtates of the empire, being quite wearied out with ſuch a long quarrel, unanimouſly ſupplicated Henry for peace. He referred himſelf entirely to their deciſion; and a diet being aſſembled at Wurtzburg, it was decreed, that an embaſſy ſhould be immediately ſent to the pope, deſiring that he would convoke a general council at Rome, by which all diſputes might be determined. This was accordingly done, and the affair of inveſtitures at length regulated in the following manner, viz. That the emperor ſhould leave the communities and chapters at liberty to fill up their own vacancies, without beſtowing inveſtitures with the croſs and ring; that he ſhould reſtore all that he had unjuſtly taken from the church; that all elections ſhould be made in a canonical manner, in preſence of the emperor or his commiſſaries; and whatever diſputes might happen, ſhould be referred to the deciſion of the emperor, aſſiſted by the metropolitan and his ſuffragans; that the perſon elected ſhould receive from the emperor the inveſtiture of the fiefs and ſecular rights, not with the croſs, but with the ſceptre; and ſhould pay allegiance to him for theſe rights only.

56 Determination of the affair of inveſtitures.

After the death of Henry, the uſual diſorders took place in Italy; during which, Roger duke of Apulia conquered the iſland of Sicily, and aſſumed the right of creating popes, of whom there were two at that time, viz. Innocent II. and Anacletus. Roger drove out the former, and Lothario emperor of Germany the latter, forcing Roger himſelf at the ſame time to retire into Sicily. The emperor then conducted Innocent back to Rome in triumph, and having ſubdued all Apulia, Calabria, and the reſt of Roger's Italian dominions, erected them into a principality, and beſtowed it, with the title of *duke*, upon Renaud a German prince, and one of his own relations.

In the reign of Conrad III. who ſucceeded Lothario, the celebrated factions called the *Guelphs* and *Gibelins* *, aroſe, which for many years deluged the cities of Italy with blood. They took their origin during a civil war in Germany, in which the enemies of the emperor were ſtyled *Guelphs*, and his friends *Gibelines*; and theſe names were quickly received in Italy as well as other parts of the emperor's dominions. Of this civil war many of the cities in Italy took the advantage to ſet up for themſelves; neither was it in the power of Conrad, who during his whole reign was employed in unſucceſsful cruſades, to reduce them; but, in 1158, Frederic Barbaroſſa, ſucceſſor to Conrad, entered Italy at the head of a very numerous and well diſciplined army. His army was divided into ſeveral columns for the conveniency of entering the country by as many different routes. Having paſſed the Alps, he reduced the town of Breſcia; where he made ſeveral ſalutary regulations for the preſervation of good order and military diſcipline. Continuing to advance, he beſieged Milan, which ſurrendered at diſcretion. He was crowned king of Lombardy at Monza; and having made himſelf maſter of all the other cities of that country, he ordered a minute inquiry to be ſet on foot concerning the rights of the empire, and exacted homage of all thoſe who held of it, without excepting even the biſhops. Grievances were redreſſed; magiſtracies reformed; the rights of regality diſcuſſed and aſcertained; new laws enacted for the maintenance of public tranquillity and the encouragement of learning, which now began to revive in the ſchool of Bologna; and, above all, ſubvaſſals were not only prohibited from alienating their lands, but alſo compelled, in their oath to their lords paramount, to except the emperor nominally, when they ſwore to ſerve and aſſiſt them againſt all their enemies. The pope took umbrage at this behaviour towards the eccleſiaſtics: but Frederic juſtified what he had done, telling his deputies it was but reaſonable they ſhould do homage for the fiefs they poſſeſſed; as Jeſus Chriſt himſelf, though the lord of all the ſovereigns upon earth, had deigned to pay for himſelf and St Peter the tribute which was due to Cæſar.

* See *Guelphs* and *Gibelines*.

57 Italy invaded by Frederic Barbaroſſa.

Frederic having ſent commiſſaries to ſuperintend the election of new magiſtrates at Milan, the inhabitants were ſo much provoked at this infringement of their old privileges, that they inſulted the imperialiſts, revolted, and refuſed to appear before the emperor's tribunal. This he highly reſented, and reſolved to chaſtiſe them ſeverely: for which purpoſe he ſent for

Italy.

Italy.

for a reinforcement from Germany, which ſoon after arrived with the empreſs, while he himſelf ravaged Liguria, declared the Milaneſe rebels to the empire, and plundered and burnt the city of Crema which was in alliance with that of Milan.

In the mean time, pope Adrian IV. dying, two oppoſite factions elected two perſons known by the names of *Victor II.* and *Alexander III.* The emperor's allies neceſſarily acknowledged the pope choſen by him; and thoſe princes who were jealous of the emperor, acknowledged the other. Victor II. Frederic's pope, had Germany, Bohemia, and one half of Italy, on his ſide; while the reſt ſubmitted to Alexander III. The emperor took a ſevere revenge on his enemies; Milan was razed from the foundation, and ſalt ſtrewed on its ruins; Breſcia and Placentia were diſmantled; and the other cities which had taken part with them, were deprived of their privileges. Alexander III. however, who had excited the revolt, returned to Rome after the death of his rival; and at his return the civil war was renewed. The emperor cauſed another pope, and after his death a third, to be elected. Alexander then fled to France, the common aſylum of every pope who was oppreſſed by the emperors; but the flames of civil diſcord which he had raiſed, continued daily to ſpread. In 1168, the cities of Italy, ſupported by the Greek emperor and the king of Sicily, entered into an aſſociation for the defence of their liberties; and the pope's party at length prevailed. In 1176, the imperial army, worn out by fatigues and diſeaſes, was defeated by the confederates, and Frederic himſelf narrowly eſcaped. About the ſame time, he was defeated at ſea by the Venetians; and his eldeſt ſon Henry, who commanded his fleet, fell into the hands of the enemy. The pope, in honour of this victory, failed out into the open ſea, accompanied by the whole ſenate; and after having pronounced a thouſand benedictions on that element, threw into it a ring as a mark of his gratitude and affection. Hence the origin of that ceremony which is annually performed by the Venetians, under the notion of eſpouſing the Adriatic. Theſe misfortunes diſpoſed the emperor towards a reconciliation with the pope: but, reckoning it below his dignity to make an advance, he rallied his troops, and exerted himſelf with ſo much vigour in repairing his loſs, that the confederates were defeated in a battle; after which he made propoſals of peace, which were now joyfully accepted, and Venice was the place appointed for a reconciliation. The emperor, the pope, and a great many princes and cardinals, attended; and there the emperor, in 1177, put an end to the diſpute, by acknowledging the pope, kiſſing his feet, and holding his ſtirrup while he mounted his mule. This reconciliation was attended with the ſubmiſſion of all the towns of Italy which had entered into an aſſociation for their mutual defence. They obtained a general pardon, and were left at liberty to uſe their own laws and forms of government, but were obliged to take the oath of allegiance to the emperor as their ſuperior lord. Calixtus, the antipope, finding himſelf abandoned by the emperor in conſequence of this treaty, made alſo his ſubmiſſion to Alexander, who received him with great humanity; and in order to prevent, for the future, thoſe diſturbances which had ſo often attended the elections of the popes, he called a general council, in which it was decreed, that no pope ſhould be deemed duely elected, without having two thirds of the votes in his favour.

58 He takes and deſtroys Milan, &c.

59 Submits to the pope.

Italy.

The affairs of Italy being thus ſettled, Barbaroſſa returned to Germany; and having quieted ſome diſturbances which had ariſen during his abſence in Italy, at laſt undertook an expedition into the Holy Land; where having performed great exploits, he was drowned as he was ſwimming in the river Cydnus, in the year 1190. He was ſucceeded by his ſon Henry VI. who at the ſame time became heir to the dominions of Sicily by the right of his wife, daughter of William king of that country. After ſettling the affairs of Germany, the new emperor marched with an army into Italy, in order to be crowned by the pope, and to recover the ſucceſſion of Sicily, which was uſurped by Tancred his wife's natural brother. For this purpoſe, he endeavoured to conciliate the affections of the Lombards, by enlarging the privileges of Genoa, Piſa, and other cities, in his way to Rome; where the ceremony of the coronation was performed by Celeſtin III. on the day after Eaſter in the year 1191. The pope, then in the 86th year of his age, had no ſooner placed the crown upon Henry's head than he kicked it off again, as a teſtimony of the power reſiding in the ſovereign pontiff to make and unmake emperors at his pleaſure.

60 Frederic' ſucceeded by Henry VI.

The coronation being over, Henry prepared for the conqueſt of Naples and Sicily; but in this he was oppoſed by the pope: for though Celeſtin conſidered Tancred as an uſurper, and deſired to ſee him deprived of the crown of Sicily, which he claimed as a fief of the ſee, yet he was much more averſe to the emperor's being put in poſſeſſion of it, as that would render him too powerful in Italy for the intereſt of the church. Henry, however, without paying any regard to the threats and remonſtrances of his holineſs, took almoſt all the towns of Campania, Calabria, and Apulia; inveſted the city of Naples; and ſent for the Genoeſe fleet, which he had before engaged, to come and form the blockade by ſea: but before its arrival, he was obliged to raiſe the ſiege, in conſequence of a dreadful mortality among his troops: and all future attempts upon Sicily were ineffectual during the life of Tancred.

61 His perfidy and cruelty.

The whole reign of Henry from this time ſeems to have been a continued train of the moſt abominable perfidies and cruelties. Having treacherouſly ſeized and impriſoned Richard I. of ENGLAND, in the manner related under that article, n° 128,—130. he had no ſooner received the ranſom paid for his royal captive, than he made new preparations for the conqueſt of Sicily. As Tancred died about this time, the emperor, with the aſſiſtance of the Genoeſe, accompliſhed his purpoſe. The queen dowager ſurrendered Salerno, and her right to the crown, on condition that her ſon William ſhould poſſeſs the principality of Tarentum; but Henry no ſooner found himſelf maſter of the place, than he ordered the infant-king to be caſtrated, to have his eyes put out, and to be confined in a dungeon. The royal treaſure was tranſported to Germany, and the queen and her daughter confined in a convent.

In the mean time, the empreſs, though near the age of

Italy. of 50, was delivered of a ſon, named *Frederic*; and Henry ſoon after aſſembled a diet of the princes of Germany, to whom he explained his intentions of rendering the imperial crown hereditary, in order to prevent thoſe diſturbances which uſually attended the election of emperors. A decree paſſed for this purpoſe; and Frederic, yet in his cradle, was declared king of the Romans. Soon after, the emperor being ſolicited to undertake a cruſade, obeyed the injunctions of the pope, but in ſuch a manner as to make it turn out to his own advantage. He convoked a general diet at Worms, where he ſolemnly declared his reſolution of employing his whole power, and even of hazarding his life, for the accompliſhment of ſo holy an enterpriſe; and he expatiated upon the ſubject with ſo much eloquence, that almoſt the whole aſſembly took the croſs. Nay, ſuch multitudes from all the provinces of the empire enliſted themſelves, that Henry divided them into three large armies; one of which, under the command of the biſhop of Mentz, took the route of Hungary, where it was joined by Margaret, queen of that country, who entered herſelf in this pious expedition, and actually ended her days in Paleſtine: the ſecond was aſſembled in Lower Saxony, and embarked in a fleet furniſhed by the inhabitants of Lubec, Hamburg, Holſtein, and Friezland: and the emperor in perſon conducted the third into Italy, in order to take vengeance on the Normans in Naples and Sicily, who had riſen againſt his government.

The rebels were humbled; and their chiefs were condemned to periſh by the moſt excruciating tortures. One Jornandi, of the houſe of the Norman princes, was tied naked on a chair of red-hot iron, and crowned with a circle of the ſame burning metal, which was nailed to his head. The empreſs ſhocked at ſuch cruelty, renounced her faith to her huſband, and encouraged her countrymen to recover their liberties. Reſolution ſprung from deſpair. The inhabitants betook themſelves to arms; the empreſs Conſtantia headed them; and Henry, having diſmiſſed his troops, no longer thought neceſſary to his bloody purpoſes, and ſent them to purſue their expedition to the Holy Land, was obliged to ſubmit to his wife, and to the conditions which ſhe was pleaſed to impoſe on him in favour of the Sicilians. He died at Meſſina in 1197, ſoon after this treaty; and, as was ſuppoſed, of poiſon adminiſtered by the empreſs.

62 Diſturbances in the beginning of the reign of Frederic II.

The emperor's ſon Frederic had already been declared king of the Romans, and conſequently became emperor on the death of his father; but as Frederic II. was yet a minor, the adminiſtration was committed to his uncle the duke of Suabia, both by the will of Henry and by an aſſembly of the German princes. Other princes, however, incenſed to ſee an elective empire become hereditary, held a new diet at Cologne, and choſe Otho duke of Bruniwick, ſon of Henry the Lion. Frederic's title was confirmed in a third aſſembly, at Arnſburg; and his uncle, Philip duke of Suabia, was elected king of the Romans, in order to give greater weight to his adminiſtration. Theſe two elections divided the empire into two powerful factions, and involved all Germany in ruin and deſolation. Innocent III. who had ſucceeded Celeſtin in the papal chair, threw himſelf into the ſcale of Otho, and excommunicated Philip and all his adherents. This able and ambitious pontiff was a ſworn enemy of the houſe of Suabia; not from any perſonal animoſity, but out of a principle of policy. That houſe had long been terrible to the popes, by its continual poſſeſſion of the imperial crown; and the acceſſion of the kingdom of Naples and Sicily, made it ſtill more to be dreaded: Innocent, therefore, gladly ſeized the preſent favourable opportunity for diveſting it of the empire, by ſupporting the election of Otho, and ſowing diviſions among the Suabian party. Otho was alſo patroniſed by his uncle, the king of England; which naturally inclined the king of France to the ſide of his rival. Faction claſhed with faction; friendſhip, with intereſt: caprice, ambition, or reſentment, gave the ſway; and nothing was beheld on all hands, but the horrors and the miſeries of civil wars.

Italy.

Meanwhile, the empreſs Conſtantia remained in Sicily, where all was peace, as regent and guardian for her infant ſon, Frederic II. who had been crowned king of that iſland, with the conſent of pope Celeſtin III. But ſhe alſo had her troubles. A new inveſtiture from the holy ſee being neceſſary, on the death Celeſtin, Innocent III. his ſucceſſor, took advantage of the critical ſituation of affairs for aggrandizing the papacy, at the expence of the kings of Sicily. They poſſeſſed, as has been already obſerved, the privilege of filling up vacant benefices, and of judging all eccleſiaſtical cauſes in the laſt appeal: they were really popes in their own iſland, though vaſſals of his holineſs. Innocent pretended that theſe powers had been ſurrepitiouſly obtained; and demanded, that Conſtantia ſhould renounce them in the name of her ſon, and do liege, pure and ſimple homage for Sicily. But before any thing was ſettled relative to this affair, the empreſs died, leaving the regency of the kingdom to the pope; ſo that he was enabled to preſcribe what conditions he thought proper to young Frederic. The troubles of Germany ſtill continued; and the pope redoubled his efforts, to detach the princes and prelates from the cauſe of Philip, notwithſtanding the remonſtrances of the king of France, to whom he proudly replied, "Either Philip muſt loſe the empire, or I the papacy." But all theſe diſſentions and troubles in Europe, did not prevent the formation of another cruſade, or expedition into Aſia, for the recovery of the Holy Land. Thoſe who took the croſs were principally French and Germans: Baldwin, count of Flanders, was their commander; and the Venetians, as greedy of wealth and power as the ancient Carthaginians, furniſhed them with ſhips, for which they took care to be amply paid both in money and territory. The Chriſtian city of Zara, in Dalmatia, had withdrawn itſelf from the government of the republic: the army of the croſs undertook to reduce it to obedience; and it was beſieged and taken, notwithſtanding the threats and excommunications of the pope.

While the cruſaders were ſpreading deſolation thro' the eaſt, Philip and Otho were in like manner deſolating the weſt. At length Philip prevailed; and Otho, obliged to abandon Germany, took refuge in England. Philip, elated with ſucceſs, confirmed his election by a ſecond coronation, and propoſed an accommodation with the pope, as the means of finally eſtabliſhing his throne; but before it could be brought about, he fell a ſacrifice to private revenge,

Italy. being assassinated by the count Palatine of Bavaria, whose daughter he had promised to marry, and afterwards rejected. Otho returned to Germany on the death of Philip; married that prince's daughter; and was crowned at Rome by pope Innocent III. after yielding to the holy see the long disputed inheritance of the countess Matilda, and confirming the rights and privileges of the Italian cities. But these concessions, as far at least as regarded the pope, were only a sacrifice to present policy: Otho, therefore, no sooner found himself in a condition to act offensively, than he resumed his grant; and, in 1210, not only recovered the possessions of the empire, but made hostile incursions into Apulia, ravaging the dominions of young Frederic, king of Naples and Sicily, who was under the protection of the holy see. For this reason he was excommunicated by Innocent, and Frederic, now 17 years of age, was elected emperor by a diet of the German princes. Otho, however, on his return to Germany, finding his party still considerable, and not doubting but he should be able to humble his rival by means of his superior force, entered into an alliance with his uncle, John king of England, against Philip Augustus king of France, A. D. 1213. The unfortunate battle of Bouvines, where the confederates were defeated, compleated the fate of Otho. He attempted to retreat into Germany, but was prevented by young Frederic; who had marched into the empire at the head of a powerful army, and was every where received with open arms. Thus abandoned by all the princes of Germany, and altogether without resource, Otho retired to Brunswick, where he lived four years as a private man, dedicating his time to the duties of religion.

Frederic II. being now universally acknowledged emperor, was crowned at Aix-la-Chapelle in 1215, with great magnificence; when, in order to preserve the favour of the pope, he added to the other solemnities of his coronation, a vow to go in person to the Holy Land.

The bad success of this expedition hath been already taken notice of, under the article Croisade. The emperor had, on various pretences, refused to go into the east; and in 1225, the pope, incensed at the loss of Damietta, wrote a severe letter to him, taxing him with having sacrificed the interests of Christianity by delaying so long the performance of his vow, and threatening him with immediate excommunication if he did not instantly depart with an army into Asia. Frederic, exasperated at these reproaches, renounced all correspondence with the court of Rome; renewed his ecclesiastical jurisdiction in Sicily; filled up vacant fees and benefices; and expelled some bishops, who were creatures of the pope, on pretence of their being concerned in practices against the state.

63 His quarrel with the pope.

The pope at first threatened the emperor with the thunder of the church, for presuming to lift up his hand against the sanctuary; but finding Frederic not to be intimidated, he became sensible of his own imprudence in wantonly incurring the resentment of so powerful a prince, and thought proper to soothe him by submissive apologies and gentle exhortations. They were accordingly reconciled, and conferred together at Veroli in 1226; where the emperor, as a proof of his sincere attachment to the church, published some very severe edicts against heresy, which seem to have authorised the tribunal of the inquisition. A solemn assembly was afterwards held at Ferentino, where both the pope and the emperor were present, together with John de Brienne, titular king of Jerusalem, who was come to Europe to demand succours against the soldan of Egypt. John had an only daughter, named *Yolanda*, whom he proposed as a wife to the emperor, with the kingdom of Jerusalem as her dower, on condition that Frederic should, within two years, perform the vow he had made to lead an army into the holy land. Frederic married her on these terms, because he chose to please the pope; and since that time the kings of Sicily have taken the title of *king of Jerusalem*. But the emperor was in no hurry to go and conquer his wife's portion, having business of more importance on his hands at home. The chief cities of Lombardy had entered into a secret league, with a view to renounce his authority. He convoked a diet at Cremona, where all the German and Italian noblemen were summoned to attend. A variety of subjects were there discussed; but nothing of consequence was settled. An accommodation, however, was soon after brought about by the mediation of the pope; who, as umpire of the dispute, decreed, that the emperor should lay aside his resentment against the confederate towns, and that the towns should furnish and maintain 400 knights for the relief of the holy land.

Peace being thus concluded, Honorius reminded the emperor of his vow: Frederic promised compliance: but his holiness died before he could see the execution of a project which he seemed to have so much at heart. He was succeeded in the papal chair by Gregory IX. brother of Innocent III.; who, pursuing the same line of policy, urged the departure of Frederic for the holy land; and finding the emperor still backward, declared him incapable of the imperial dignity, as having incurred the sentence of excommunication. Frederic, incensed at such insolence, ravaged the patrimony of St Peter; and was actually excommunicated. The animosity between the Guelphs and Ghibellines revived; the pope was obliged to quit Rome; and Italy became a scene of war and desolation, or rather of an hundred civil wars; which, by inflaming the minds and exciting the resentment of the Italian princes, accustomed them but too much to the horrid practices of poisoning and assassination.

During these transactions, Frederic, in order to remove the cause of all these troubles, and gratify the prejudices of a superstitious age, by the advice of his friends, resolved to perform his vow; and he accordingly embarked for the Holy Land, leaving the affairs of Italy to the management of Renaldo duke of Spoleto. The pope prohibited his departure before he should be absolved from the censures of the church; but Frederic went in contempt of the church, and succeeded better than any person who had gone before him. He did not indeed desolate Asia, and gratify the barbarous zeal of the times by spilling the blood of infidels; but he concluded a treaty with Miliden, soldan of Egypt and master of Syria; by which the end of his expedition seemed fully answered. The soldan ceded to him Jerusalem and its territory, as far as Joppa; Bethlem, Nazareth, and all the country between Jerusalem and Ptolemais; Tyre, Sidon, and the

64 His expedition to the Holy Land.

Italy.

Italy. the neighbouring territories: in return for which, the emperor granted the Saracens a truce of ten years; and, in 1230, prudently returned to Italy, where his preſence was much wanted.

Frederic's reign, after his return from the eaſt, was one continued quarrel with the popes. The cities of Lombardy had revolted during his abſence, at the inſtigation of Gregory IX.; and before they could be reduced, the ſame pontiff excited the emperor's ſon Henry, who had been elected king of the Romans, to rebel againſt his father. The rebellion was ſuppreſſed, the prince was confined, and the emperor obtained a complete victory over the aſſociated towns. But his troubles were not yet ended. The pope excommunicated him anew, and ſent a bull, filled with the moſt abſurd and ridiculous language, into Germany, in order to ſow diviſion between Frederic and the princes of the empire.

Frederic retorted in the ſame ſtrain, in his apology to the princes of Germany, calling Gregory the *Great Dragon*, the *Antichriſt*, &c. The emperor's apology was ſuſtained in Germany; and finding he had nothing to fear from that quarter, he reſolved to take ample vengeance on the pope and his aſſociates. For that purpoſe he marched to Rome, where he thought his party was ſtrong enough to procure him admiſſion: but this favourite ſcheme was defeated by the activity of Gregory, who ordered a crufade to be preached againſt the emperor, as an enemy of the Chriſtian faith; a ſtep which incenſed Frederic ſo much, that he ordered all his priſoners, who wore the croſs, to be expoſed to the moſt cruel tortures. The two factions of the Guelphs and Ghibellines continued to rage with greater violence than ever, involving cities, diſtricts, and even private families, in troubles, diviſions, and civil butchery; no quarter being given on either ſide. Meanwhile Gregory IX. died, and was ſucceeded in the ſee of Rome by Celeſtin IV. and afterwards by Innocent IV. formerly cardinal Fieſque, who had always expreſſed the greateſt regard for the emperor and his intereſt. Frederic was accordingly congratulated upon this occaſion: but having more penetration than thoſe about him, he ſagely replied, "I ſee little reaſon to rejoice; the cardinal was my friend, but the pope will be my enemy." Innocent ſoon proved the juſtice of this conjecture. He attempted to negociate a peace for Italy; but not being able to obtain from
65 Is depoſed by the pope. Frederic his exorbitant demands, and in fear for the ſafety of his own perſon, he fled into France, aſſembled a general council at Lyons, and, in 1245, depoſed the emperor.

Conrad, the emperor's ſecond ſon, had already been declared king of the Romans, on the death of his brother Henry, which ſoon followed his confinement: but the empire being now declared vacant by the pope, the German biſhops, (for none of the princes were preſent), at the inſtigation of his holineſs, proceeded to the election of a new emperor; and they choſe Henry landgrave of Thuringia, who was ſtyled in deriſion, *The king of prieſts*. Innocent now renewed the crufade againſt Frederic. It was proclaimed by the preaching friars, ſince called *Dominicans*, and the minor friars, known by the name of *Cordeliers* or *Franciſcans*. The pope, however, did not confine himſelf to theſe meaſures only, but engaged in conſpiracies againſt the life of an emperor, who had dared to reſiſt the decree of a council, and oppoſe the whole body of monks and zealots. Frederick's life was ſeveral times in danger from plots, poiſonings, and aſſaſſinations; which induced him, it is ſaid, to make choice of Mahometan guards, who, he was certain, would not be under the influence of the prevailing ſuperſtition. Italy.

About this time the landgrave of Thuringia dying, the ſame prelates who had taken the liberty of creating one emperor made another; namely, William count of Holland, a young nobleman of twenty years of age, who bore the ſame contemptuous title with his predeceſſor. Fortune, which had hitherto favoured Frederic, ſeemed now to deſert him. He was defeated before Parma, which he had long beſieged; and to complete his misfortune, he ſoon after learned, that his natural ſon Entius, whom he had made king of Sardinia, was worſted and taken priſoner by the Bologneſe.

In this extremity, Frederic retired to his kingdom of Naples, in order to recruit his army; and there died of a fever, in the year 1250. After his death, the affairs of Germany fell into the utmoſt confuſion, and Italy continued long in the ſame diſtracted ſtate in which he had left it. The clergy took arms againſt the laity; the weak were oppreſſed by the ſtrong; and all laws divine and human were diſregarded. After the death of Frederic's ſon Conrad who had aſſumed the imperial dignity as ſucceſſor to his father, and the death of his competitor William of Holland, a variety of candidates appeared for the empire, and ſeveral were elected by different factions; among whom was Richard earl of Cornwall, brother to Henry II. king of England: but no emperor was properly acknowledged till the year 1273, when Rodolph, count of Hapſburg, was unanimouſly raiſed to the vacant throne. During the interregnum which preceded the
66 Decline of the power of the German empe-rors. election of Rodolph, Denmark, Holland, and Hungary, entirely freed themſelves from the homage they were wont to pay to the empire; and much about the ſame time ſeveral German cities erected a municipal form of government, which ſtill continues. Lubec, Cologne, Brunſwic, and Dantzic, united for their mutual defence againſt the encroachments of the great lords, by a famous aſſociation, called the *Hanſeatic league*; and theſe towns were afterwards joined by eighty others, belonging to different ſtates, which formed a kind of commercial republic. Italy alſo, during this period, aſſumed a new plan of government. That freedom for which the cities of Lombardy had ſo long ſtruggled, was confirmed to them for a ſum of money: they were emancipated by the fruits of their induſtry. Sicily likewiſe changed its government and its prince; of which revolution a particular account is given under the article SICILY.

From the time of Frederic II. we may date the ruin of the German power in Italy. The Florentines, the Piſans, the Genoeſe, the Luccans, &c. became independent, and could not again be reduced. The power of the emperor, in ſhort, was in a manner annihilated, when Henry VII. undertook to reſtore it in the be-
67 Expedition of Henry VII. into Italy. ginning of the 14th century. For this purpoſe a diet was held at Francfort, where proper ſupplies being granted for the emperor's journey, well known by the name of the *Roman expedition*, he ſet out for

Italy. Italy, accompanied by the dukes of Auſtria and Bavaria, the archbiſhop of Triers, the biſhop of Liege, the counts of Savoy and Flanders, and other noblemen, together with the militia of all the imperial towns. Italy was ſtill divided by the factions of the Guelphs and Gibelines, who butchered one another without humanity or remorſe. But their conteſt was no longer the ſame: it was not now a ſtruggle between the empire and the prieſthood, but between faction and faction, inflamed by mutual jealouſies and animoſities. Pope Clement V. had been obliged to leave Rome, which was in the anarchy of popular government. The Colonnas, the Urſini, and the Roman barons, divided the city; and this diviſion was the cauſe of a long abode of the popes in France, ſo that Rome ſeemed equally loſt to the popes and the emperors. Sicily was in the poſſeſſion of the houſe of Arragon, in conſequence of the famous maſſacre called the *Sicilian veſpers*, which delivered that iſland from the tyranny of the French *. Carobert, king of Hungary, diſputed the kingdom of Naples with his uncle Robert, ſon of Charles II. of the houſe of Anjou. The houſe of Eſte had eſtabliſhed itſelf at Ferrara; and the Venetians wanted to make themſelves maſters of that country. The old league of the Italian cities no longer ſubſiſted. It had been formed with no other view than to oppoſe the emperors; and ſince they had neglected Italy, the cities were wholly employed in aggrandizing themſelves, at the expence of each other. The Florentines and the Genoeſe made war upon the republic of Piſa. Every city was alſo divided into factions within itſelf. In the midſt of theſe troubles Henry VII. appeared in Italy in the year 1311, and cauſed himſelf to be crowned king of Lombardy at Milan. But the Guelphs had concealed the old iron crown of the Lombard kings, as if the right of reigning were attached to a ſmall circlet of metal. Henry ordered a new crown to be made, with which the ceremony of inauguration was performed.

* See *Sicily*.

Cremona was the firſt place that ventured to oppoſe the emperor. He reduced it by force, and laid it under heavy contributions. Parma, Vicenza, and Placentia, made peace with him on reaſonable conditions. Padua paid 100,000 crowns, and received an imperial officer as governor. The Venetians preſented Henry with a large ſum of money, an imperial crown of gold enriched with diamonds, and a chain of very curious workmanſhip. Breſcia made a deſperate reſiſtance, and ſuſtained a very ſevere ſiege; in the courſe of which the emperor's brother was ſlain, and his army diminiſhed to ſuch a degree, that the inhabitants marched out under the command of their preſect, Thibault de Druſſati, and gave him battle: but they were repulſed with great loſs, after an obſtinate engagement; and at laſt obliged to ſubmit, and their city was diſmantled. From Breſcia Henry marched to Genoa, where he was received with expreſſions of joy, and ſplendidly entertained. He next proceeded to Rome; where, after much bloodſhed, he received the imperial crown from the hands of the cardinals. Clement V. who had originally invited Henry into Italy, growing jealous of his ſucceſs, had leagued with Robert king of Naples, and the Urſini faction, to oppoſe his entrance into Rome. He entered it in ſpite of them, by the aſſiſtance of the Colonnas. Now maſter of that ancient city, Henry appointed it a governor; and ordered, that all the cities and ſtates of Italy ſhould pay him an annual tribute. In this order he comprehended the kingdom of Naples, to which he was going to make good his claim of ſuperiority by arms, when he died at Benevento in 1313, as is commonly ſuppoſed, of poiſon given him by a Dominican friar, in the conſecrated wine of the ſacrament. Italy.

68 State of Italy ſince that time.

The efforts of Henry VII. were unable to reſtore the imperial power in Italy. From this time the authority of the emperor in that country conſiſted in a great meaſure in the convenience which the Gibelines found in oppoſing their enemies under the ſanction of his name. The power of the pope was much of the ſame nature. He was leſs regarded in Italy than in any other country in Chriſtendom. There was indeed a great party who called themſelves *Guelphs*; but they affected this diſtinction only to keep themſelves independent of the imperialiſts; and the ſtates and princes who called themſelves *Guelphs* paid little more acknowledgement to his holineſs, than ſheltering themſelves under his name and authority. The moſt deſperate wars were carried on by the different cities againſt each other; and in theſe wars Caſtruccio Caſtracani, and Sir John Hawkwood an Engliſhman, are celebrated as heroes. A detail of theſe tranſactions would furniſh materials for many volumes; and after all ſeems to be but of little importance, ſince nothing material was effected by the utmoſt efforts of valour, and the belligerant ſtates were commonly obliged to make peace without any advantage on either ſide. By degrees, however, this martial ſpirit ſubſided; and in the year 1492, the Italians were ſo little capable of reſiſting an enemy, that Charles VIII. of France conquered the whole kingdom of Naples in ſix weeks, and might eaſily have ſubdued the whole country had it not been for his own imprudence. Another attempt on Italy was made by Lewis XII and a third by Francis I. But for an account of the bad ſucceſs of theſe expeditions, ſee the article FRANCE n° 68—75. In the reigns of Lewis XIII. and XIV. an obſtinate war was carried on between the French and Spaniards, in which the Italian ſtates bore a very conſiderable ſhare. The war concluded in 1660, with very little advantage to the French, who have been always unſucceſsful in their Italian wars. The like bad ſucceſs attended them in that part of the world, in the war which commenced between Britain and Spain in the year 1740. But the particulars of theſe wars with regard to the different ſtates of Italy, naturally fall to be conſidered under the hiſtory of thoſe ſtates into which the country is now divided; viz. Sardinia, Milan or the Milaneſe, Genoa, Venice, Tuſcany or Florence, Lucca, St Marino, Parma, Mantua, Modena, Rome, and Naples.

69 Air, &c. of Italy.

The air of Italy is very different, according to the different ſituations of the ſeveral countries contained in it. In thoſe on the north of the Apennines it is more temperate, but on the ſouth it is generally very warm. The air of the Campania of Rome, and of the Ferrareſe, is ſaid to be unhealthful; which is owing to the lands not being duly cultivated, nor the marſhes drained. That of the other parts is generally pure, dry, and

Italy.

and healthy. In ſummer, the heat is very great in the kingdom of Naples; and would be almoſt intolerable, if it was not ſomewhat alleviated by the ſea-breezes. The ſoil of Italy in general is very fertile, being watered by a great number of rivers. It produces a great variety of wines, and the beſt oil in Europe; excellent ſilk in abundance; corn of all ſorts, but not in ſuch plenty as in ſome other countries; oranges, lemons, citrons, pomegranates, almonds, raiſins, ſugar, mulberry-trees without number, figs, peaches, nectarines, apricots, pears, apples, filberts, cheſnuts, &c. Moſt of theſe fruits were at firſt imported by the Romans from Aſia Minor, Greece, Africa, and Syria, and were not the natural products of the ſoil. The tender plants are covered in winter on the north ſide of the Apennines, but on the ſouth ſide they have no need of it. This country alſo yields good paſture; and abounds with cattle, ſheep, goats, buffaloes, wild boars, mules, and horſes. The foreſts are well ſtored with game; and the mountains yield not only mines of iron, lead, alum, ſulphur, marble of all ſorts, alabaſter, jaſper, porphyry, &c. but alſo gold and ſilver; with a great variety of aromatic herbs, trees, ſhrubs, and ever-greens, as thyme, lavender, laurel, and bays, wild olive-trees, tamarinds, juniper, oaks, and pines.

A very extenſive trade is carried on in many places in Italy, particularly at Leghorn, Genoa, Bologna, Venice, and Naples; the country having a great variety of commodities and manufactures for exportation, eſpecially wine, oil, perfumes, fruits, and ſilks. Travellers alſo bring large ſums of money into Italy, beſides what they lay out in pictures, curioſities, relics, antiquities, &c.

70 Dreſs, diſpoſition, &c. of the inhabitants.

The Italians are generally well proportioned, tho' their complexions are none of the beſt. As to dreſs, they follow the faſhions of the countries on which they border, or to which they are ſubject, namely, thoſe of France, Spain, and Germany. With reſpect to their genius and taſte in architecture, painting, carving, and muſic, they are thought to excel greatly, and to leave the other nations of Europe far behind them: but their muſic ſeems too ſoft and effeminate to deſerve all the praiſe beſtowed on it; and their houſes are far inferior to thoſe of England in reſpect of convenience. No country hath produced better politicians, hiſtorians, poets, painters, and ſculptors, we mean ſince the revival of the arts and ſciences, excluſive of thoſe of ancient times. The Italians are very affable, courteous, ingenious, ſober, and ready-witted; but extremely jealous, vindictive, laſcivious, ceremonious, and ſuperſtitious. In reſpect to jealouſy, indeed, we are told, that a very extraordinary change hath lately taken place; and that the Italians are now no leſs indulgent and complaiſant to their wives, than the moſt polite huſbands in France itſelf. In their tempers, the Italians ſeem to be a good medium between the French and Spaniards; neither ſo gay and volatile as the one, nor ſo grave and ſolemn as the other. Boiled ſnails, ſerved up with oil and pepper, or fried in oil, and the hinder parts of frogs, are reckoned dainty diſhes. Kites, jackdaws, hawks, and magpies, are alſo eaten, not only by the common people, but the better ſort. Wine is drank here both in ſummer and winter cooled by ice or ſnow. The women affect yellow hair, as the Roman ladies and courtezans formerly did. They alſo uſe paint and waſhes, both for their hands and faces. The day here is reckoned from ſun-ſet to ſun-ſet, as the Athenians did of old.

Itch ‖ Ittigius.

ITCH, a cutaneous diſeaſe, appearing in ſmall watery puſtules on the ſkin; commonly of a mild nature, though ſometimes attended with obſtinate and dangerous ſymptoms. See (the *Index* ſubjoined to) MEDICINE.

ITCH-*Inſect*. See ACARUS.

ITEA, in botany, a genus of the monogynia order, belonging to the pentandria claſs of plants. There is but one ſpecies, a native of North-America. It grows by the ſides of rivers, and in other parts where the ground is moiſt. It riſes to the height of eight or 10 feet, ſending out many branches garniſhed with ſpear-ſhaped leaves placed alternately, and ſlightly ſawed on their edges, of a light green colour. At the extremity of the branches are produced fine ſpikes of white flowers three or four inches long, ſtanding erect. When theſe ſhrubs are in vigour, they will be entirely covered with flowers, ſo that they make a beautiful appearance during the flowering ſeaſon, which is in July. They are propagated by layers, and are not injured by the cold of this climate; but are apt to die in ſummer, if they are planted on a dry gravelly ſoil. The ſhoots ſhould be laid down in autumn, and will be rooted in one year.

ITHACA (anc. geogr.), an iſland in the Ionian Sea on the coaſt of Epirus; the country of Ulyſſes near Dulichium, with a town and port ſituated at the foot of mount Neius. According to Pliny, it is about 25 miles in compaſs; according to Artemidorus, only 10; and is now found to be only eight miles round. It is now uninhabited, and called *Jathaco*.

ITINERARY, ITINERARIUM; a journal, or an account of the diſtances of places. The moſt remarkable is that which goes under the names of *Antoninus* and *Æthicus*; or, as Barthius found in his copy, *Antoninus Æthicus*; a Chriſtian writer, poſterior to the times of Conſtantine. Another, called *Hieroſolymitanum*, from Bourdeaux to Jeruſalem, and from Heraclea through Aulona and Rome to Milan, under Conſtantine.——*Itinerarium* denotes a day's march.

ITIUS PORTUS (anc. geogr.), the *crux geographorum*, ſuch being the difficulty of aſcertaining its poſition. It would be endleſs to recite the ſeveral opinions concerning it, with the ſeveral reaſons advanced in ſupport of them. Three ports are mentioned by Cæſar; two without any particular name, viz. the Higher and the Lower, with reſpect to the *Portus Itius*. Calais, Boulogne, St Omer, and Whitſand, have each in their turn had their ſeveral advocates. Cæſar gives two diſtinctive characters or marks which ſeem to agree equally to Boulogne and Whitſand, namely, the ſhortneſs of the paſſage, and the ſituation between two other ports; therefore nothing can with certainty be determined about the ſituation of the *Portus Itius*.

ITTIGIUS (Thomas), a learned profeſſor of divinity at Leipſic, and ſon of John Ittigius, profeſſor of phyſic in the ſame univerſity. He firſt publiſhed *A treatiſe upon burning mountains*; after which he became a miniſter, and exerciſed that function in various churches

churches there. He furniſhed ſeveral papers in the Leipſic acts, beſides publiſhing ſome hiſtorical works and diſſertations. He died in 1710.

ITZEHOA, an ancient and handſome town of Germany, in the circle of Lower Saxony, and duchy of Holſtein. It belongs to the king of Denmark, and is ſeated on the river Stoer, in E. Long. 9. 25. N. Lat. 54. 8.

JUAN (St) DE LA FRONTERA, a town of South-America, in Chili, in the province of Chiquito, near the lake Guanacho. The territory of this town is inhabited by 20,000 native Americans, who are tributary to Spain. It contains mines of gold, and produces a kind of almonds that are very delicate. It is ſeated at the foot of the Andes, in W. Long. 66. 35. S. Lat. 23. 25.

JUAN *de Porto Ricco*, an iſland of America, and one of the Caribbees, being 100 miles in length, and 50 in breadth. It belongs to the Spaniards; and is full of very high mountains, and extremely fertile valleys, interſperſed with woods, and well watered with ſprings and rivulets. It produces ſugar, rum, ginger, corn, and fruits; partly proper to the climate, and partly introduced from Spain. Beſides, there are ſo many cattle, that they often kill them for the ſake of the ſkins alone. Here are a great number of uncommon trees, and there is a little gold in the north part of the iſland. It is commonly ſaid that the air is healthy; and yet the earl of Cumberland, when he had taken this iſland, loſt moſt of his men by ſickneſs, and for that reaſon was forced to abandon it. This happened in the reign of queen Elizabeth. It is ſubject to ſtorms and hurricanes, like the reſt of theſe iſlands. It lies to the eaſt of Hiſpaniola, at the diſtance of 50 miles.

JUAN *de Porto Ricco*, the capital town of the iſland of Porto Ricco, with a good harbour defended by ſeveral forts, and a biſhop's ſee. It is ſeated on the north coaſt of the iſland, in W. Long. 65. 35. N. Lat. 18. 30.

JUAN *Fernandez*, an iſland in the great South Sea, in S. Lat. 33. 40. and W. Long. 78. 30. from London. It was formerly a place of reſort for the buccaniers who annoyed the weſtern coaſt of the Spaniſh continent. They were led to reſort hither from the multitude of goats which it nouriſhed; to deprive their enemies of which advantage, the Spaniards tranſported a conſiderable number of dogs, which increaſing greatly, have almoſt extirpated the goats, who now only find ſecurity among the ſteep mountains in the northern parts, which are inacceſſible to their purſuers. There are inſtances of two men living, at different times, alone on this iſland for many years; the one a Muſquito Indian; the other Alexander Selkirk, a Scotchman, who was, after five years, taken on board an Engliſh ſhip, which touched here in about 1710, and brought back to Europe. From the hiſtory of this recluſe, Daniel de Foe is ſaid to have conceived the idea of writing the adventures of Robinſon Cruſoe. This iſland was very propitious to the remains of commodore Anſon's ſquadron in 1741, after having been buffeted with tempeſts, and debilitated by an inveterate ſcurvy, during a three months paſſage round Cape Horn: they continued here three months; during which time the dying crews, who on their arrival could

ſcarcely with one united effort heave the anchor, were reſtored to perfect health. Captain Carteret, in the Swallow, in 1767, having met with many difficulties and impediments in his paſſage into the South Sea, by the Straits of Magelhaens, attempted to make this iſland in order to recruit the health of his men; but he found it fortified by the Spaniards, and therefore choſe rather to proceed to the iſland of Maſafuero. But M. de Bougainville, that fame year, is ſaid to have touched here for refreſhments, although in the narrative of the voyage the fact is cautiouſly ſuppreſſed. This iſland is not quite 15 miles long, and about ſix broad; its only ſafe harbour is on the north ſide. It is ſaid to have plenty of excellent water, and to abound with a great variety of eſculent vegetables highly antiſcorbutic; beſides which, commodore Anſon ſowed a variety of garden-ſeeds, and planted the ſtones of plums, apricots, and peaches, which he was many years afterwards informed had thriven greatly; and now doubtleſs furniſh a very valuable addition to the natural productions of this ſpot. Vaſt ſhoals of fiſh of various kinds frequent this coaſt, particularly cod of a prodigious ſize; and, it is ſaid, in not leſs abundance than on the banks of Newfoundland. There are but few birds here, and thoſe few are of ſpecies well known and common.

JUAN *Blanco*. See PLATINA.

JUBILEE, a time of public and ſolemn feſtivity among the ancient Hebrews. This was kept every 50th year: it began about the autumnal equinox, and was proclaimed by ſound of trumpet throughout all the country. At this time all ſlaves were releaſed, all debts annihilated, and all lands, houſes, wives and children, however alienated, were reſtored to their firſt owners. During this whole year all kind of agriculture was forbidden; and the poor had the benefit of the harveſt, vintage, and the other productions of the earth, in the ſame manner as in the ſabbatic or ſeventh year. As this was deſigned to put the Iſraelites in mind of their Egyptian ſervitude, and to prevent their impoſing the like upon their brethren, it was not obſerved by the Gentile proſelytes.

The Chriſtians, in imitation of the Jews, have likewiſe eſtabliſhed *jubilees*, which began in the time of pope Boniface VIII. in the year 1300, and are now practiſed every 25 years: but theſe relate only to the pretended forgiveneſs of ſins, and the indulgences granted by the church of Rome; together with the privilege of performing a thouſand frolics in maſquerade. The ceremony of the *jubilee* obſerved at Rome, begins in the following manner: The pope goes to St Peter's church, to open the holy gate, which is walled up, and opened only on this occaſion; and, holding a golden hammer in his hand, he knocks at the gate three times, repeating theſe words, *Aperite mihi portas juſtitiæ, &c.* "Open to me the gates of "righteouſneſs; I will go into them, and I will praiſe "the Lord, (Pſal. cxviii. 19.)" Upon which the maſons fall to work, and break down the wall that ſtops up the gate: which done, the pope kneels down before it, and the penitentiaries ſprinkle him with holy water. Then, taking up the croſs, he begins to ſing *Te Deum;* and enters the church, followed by the clergy. In the mean time, three cardinal-legates are ſent to open the three other holy gates which are in the

Jucatan
||
Judæa.

the churches of St John of Lateran, St Paul, and St Mary the Greater. When the holy year is expired, the holy gates are ſhut in this manner: The pope, after he has bleſſed the ſtones and mortar, lays the firſt ſtone, and leaves there 12 boxes of gold and ſilver medals; after which the holy gates are walled up as before, and continue ſo till the next *jubilee*.

JUCATAN, or YUCATAN, a large province of North-America, in New Spain, which is a peninſula. It is over-againſt the iſland of Cuba, and contains a large quantity of timber, proper for building ſhips; as alſo ſugar, caſſia, and Indian corn. The original inhabitants are few, they having been very ill uſed by the Spaniards. Merida is the capital town. It is a flat, level country; and is very unhealthy, which may be owing to the frequent inundations.

JUDAH, the fourth ſon of Jacob, and father of the chief of the tribes of the Jews, diſtinguiſhed by his name, and honoured by giving birth to the Meſſiah, died 1636 B. C.

JUDAH *Hakkadoſh*, or the Saint, a rabbi celebrated for his learning and riches, lived in the time of the emperor Antoninus, and was the friend and preceptor of that prince. Leo of Modena, a rabbi of Venice, tells us, that rabbi Judah, who was very rich, collected about 26 years after the deſtruction of the temple, in a book which he called the *Miſna*, the conſtitutions and traditions of the Jewiſh magiſtrates who preceded him. But as this book was ſhort and obſcure, two Babyloniſh rabbis, Rabbena and Aſe, collected all the interpretations, diſputes, and additions, that had been made until their time upon the Miſna, and formed the book called the *Babyloniſh Talmud* or *Gemara;* which is preferable to the Jeruſalem Talmud, compoſed ſome years before by rabbi Jochanan of Jeruſalem. The Miſna is the text of the Talmud; of which we have a good edition in Hebrew and Latin by Surenhuſius, with notes, in 3 vols folio. It were to be wiſhed the fame had been done to the Gemara.

The kingdom of JUDAH was of ſmall extent, compared with that of the kingdom of Iſrael; conſiſting only of two tribes, Benjamin and Judah: its eaſt boundary, the Jordan; the Mediterranean its weſt, in common with the Danites, if we except ſome places recovered by the Philiſtines, and others taken by the kings of Iſrael: on the ſouth, its limits ſeem to have been contracted under Hadad of the royal progeny of Edom, (1 Kings xi. 14.)

Tribe of JUDAH, one of the 12 diviſions of Paleſtine by tribes, (Joſh. xv.) having Idumea on the ſouth, from the extremity of the Lacus Aſphaltites, alſo the Wilderneſs of Zin, Cadeſbarnea, and the brook or river of Egypt; on the eaſt, the ſaid lake; on the weſt, the Mediterranean; and on the north, the mouth of the ſaid lake; where it receives the Jordan, Bethſemes, Thimna, quite to Ekron on the ſea.

JUDEA, (anc. geog.) taken largely, either denotes all Paleſtine, or the greater part of it; and thus it is generally taken in the Roman hiſtory: Ptolemy, Rutilius, Jerome, Origen, and Euſebius, take it for the whole of Paleſtine. Here we conſider it as the third part of it on this ſide the Jordan, and that the ſouthern part, diſtinct from Samaria and Galilee; under which notion it is often taken, not only in Joſephus, but alſo in the New Teſtament. It contained four tribes; Judah, Benjamin, Dan, and Simeon, together with Philiſtia and Idumea; ſo as to be comprifed between Samaria on the north, Arabia Petræa on the ſouth, and to be bounded by the Mediterranean on the weſt, and by the Lacus Aſphaltites, with part of Jordan, on the eaſt. Joſephus divides it into 11 toparchies; Pliny into 10; by which it has a greater extent than that juſt mentioned. See PALESTINE.

Judaiſm
||
Judgment.

JUDAISM, the religious doctrines and rites of the Jews.

JUDAS MACCABEUS, a celebrated general of the Jews, renowned for his many victories over his enemies, at laſt ſlain in battle, 261 B. C. See (*Hiſtory* of the) JEWS, n° 13.

JUDE (St), brother of St James the younger, and ſon of Joſeph, (Mat. xiii. 55.) He preached in Meſopotamia, Arabia, Syria, Idumea; and died in Berytus for the confeſſion of Chriſt. He writ that epiſtle which goes under his name, and after the death of moſt of the apoſtles. He was cruelly put to death for reproving the ſuperſtition of the Magi.

JUDE, *or the General Epiſtle of Jude*, a canonical book of the New Teſtament, written againſt the heretics, who, by their diſorderly lives and impious doctrines, corrupted the faith and good morals of the Chriſtians. St Jude draws them in lively colours, as men given up to their paſſions, full of vanity, conducting themſelves by worldly wiſdom, and not by the ſpirit of God.

JUDENBURG, a handſome and conſiderable town of Germany, in the circle of Auſtria, and capital of Upper Styria, with a handſome caſtle; the public buildings with the ſquare are very magnificent. It is ſeated on the river Meur. E. Long. 15. 20. N. Lat. 47. 20.

JUDEX (Matthew), one of the principal writers of the centuries of Magdeburg, was born at Tipplefwolde in Miſnia, in 1528. He taught theology with great reputation; but met with many diſquiets in the exerciſe of his miniſtry from party-feuds. He wrote ſeveral works, and died in 1564.

JUDGE, a chief magiſtrate of the law, appointed to hear cauſes, to explain the laws, and to paſs ſentence.

Book of JUDGES, a canonical book of the Old Teſtament, ſo called from its relating the ſtate of the Iſraelites under the adminiſtration of many illuſtrious perſons who were called *judges*, from being both the civil and military governors of the people, and who were raiſed up by God upon ſpecial occaſions, after the death of Joſhua, till the time of their making a king. In the time of this peculiar polity, there were ſeveral remarkable occurrences, which are recorded in this book. It acquaints us with the groſs impiety of a new generation which ſprung up after the death of Joſhua; and gives us a ſhort view of the diſpenſations of heaven towards this people, ſometimes relieving and delivering them, and at others ſeverely chaſtiſing them by the hands of their enemies.

JUDGMENT, among logicians, a faculty or rather act of the human ſoul, whereby it compares its ideas, and perceives their agreement or diſagreement. See METAPHYSICS, n° 242—245; and LOGIC, Part II.

JUDGMENT, in law, is the ſentence pronounced by the

Judgment. the court upon the matter contained in the record. Judgments are of four sorts. Firſt, where the facts are confeſſed by the parties, and the law determined by the court; as in caſe of judgment upon *demurrer:* ſecondly, where the law is admitted by the parties, and the facts diſputed; as in a caſe of judgment on *verdict:* thirdly, where both the fact and the law ariſing thereon are admitted by the defendant; which is the caſe of judgments by *confeſſion* or *default*: or, laſtly, where the plaintiff is convinced that either fact, or law, or both, are inſufficient to ſupport his action, and therefore abandons or withdraws his proſecution; which is the caſe in judgments upon a *nonſuit* or *retraxit*.

The judgment, though pronounced or awarded by the judges, is not their determination or ſentence, but the determination and ſentence of the *law*. It is the concluſion that naturally and regularly follows from the premiſes of law and fact, which ſtand thus: Againſt him who hath rode over my corn, I may recover damages by law; but A hath rode over my corn; therefore I ſhall recover damages againſt A. If the major propoſition be denied, this is a demurer in law: if the minor, it is then an iſſue of fact: but if both be confeſſed (or determined) to be right, the concluſion or judgment of the court cannot but follow. Which judgment or concluſion depends not therefore on the arbitrary caprice of the judge, but on the ſettled and invariable principles of juſtice. The judgment, in ſhort, is the remedy preſcribed by law for the redreſs of injuries; and the ſuit or action is the vehicle or means of adminiſtering it. What that remedy may be, is indeed the reſult of deliberation and ſtudy to point out; and therefore the ſtyle of the judgment is, not that it is decreed or reſolved by the court, for then the judgment might appear to be their own; but, "it is conſidered," *conſideratum eſt per curiam*, that the plaintiff do recover his damages, his debt, his poſſeſſion, and the like: which implies that the judgment is none of their own; but the act of law, pronounced and declared by the court, after due deliberation and inquiry. See *Blackſt. Comment.* iii. 396.

JUDGMENT, in criminal caſes, is the next ſtage of proſecution, after TRIAL and CONVICTION are paſt, in ſuch crimes and miſdemeanors as are either too high or too low to be included within the benefit of clergy. For when, upon a capital charge, the JURY have brought in their VERDICT guilty in the preſence of the priſoner; he is either immediately, or at a convenient time ſoon after, aſked by the court, if he has any thing to offer why judgment ſhould not be awarded againſt him. And in caſe the defendant be found guilty of a miſdemeanor, (the trial of which may, and does uſually, happen in his abſence, after he has once appeared), a *capias* is awarded and iſſued, to bring him in to receive his judgment; and, if he abſconds, he may be proſecuted even to outlawry. But whenever he appears in perſon, upon either a capital or inferior conviction, he may at this period, as well as at his arraignment, offer any exceptions to the indictment, in *arreſt* or ſtay of judgment: as for want of ſufficient certainty in ſetting forth either the perſon, the time, the place, or the offence. And, if the objections be valid, the whole proceedings ſhall be ſet aſide; but the party may be indicted again. And we may take notice, 1. That none of the ſtatutes of *jeofails*, for Judgment. amendment of errors, extend to indictments or proceedings in criminal caſes; and therefore a defective indictment is not aided by a verdict, as defective pleadings in civil caſes are. 2. That, in favour of life, *Blackſt.* great ſtrictneſs has at all times been obſerved, in every *Comment.* point of an indictment. Sir Matthew Hale indeed complains, "that this ſtrictneſs is grown to be a blemiſh and inconvenience in the law, and the adminiſtration thereof: for that more offenders eſcape by the over eaſy ear given to exceptions in indictments, than by their own innocence; and many times groſs murders, burglaries, robberies, and other heinous and crying offences, remain unpuniſhed by theſe unſeemly niceties: to the reproach of the law, to the ſhame of the government, to the encouragement of villany, and to the diſhonour of God." And yet, notwithſtanding this laudable zeal, no man was more tender of life than this truly excellent judge.

A pardon alſo may be pleaded in arreſt of judgment: and it has the ſame advantage when pleaded here, as when pleaded upon ARRAIGNMENT; viz. the ſaving the ATTAINDER, and, of courſe, the CORRUPTION of blood: which nothing can reſtore but parliament, when a pardon is not pleaded till after ſentence. And certainly, upon all accounts, when a man hath obtained a pardon, he is in the right to plead it as ſoon as poſſible. See PARDON.

Praying the benefit of clergy may alſo be ranked among the motions in arreſt of judgment. See *Benefit of* CLERGY.

If all theſe reſources fail, the court muſt pronounce that judgment which the law hath annexed to the crime. Of theſe ſome are capital, which extend to the life of the offender, and conſiſt generally in being hanged by the neck till dead; though in very atrocious crimes other circumſtances of terror, pain, or diſgrace, are ſuperadded: as, in treaſons of all kinds, being drawn or dragged to the place of execution; in high treaſon affecting the king's perſon or government, embowelling alive, beheading, and quartering; and in murder, a public diſſection. And, in caſe of any treaſon committed by a female, the judgment is to be burned alive. But the humanity of the Engliſh nation has authoriſed, by a tacit conſent, an almoſt general mitigation of ſuch parts of theſe judgments as favour of torture or cruelty: a ſledge or hurdle being uſually allowed to ſuch traitors as are condemned to be drawn; and there being very few inſtances (and thoſe accidental or by negligence) of any perſon's being embowelled or burned, till previouſly deprived of ſenſation by ſtrangling. Some puniſhments conſiſt in exile or banihment, by abjuration of the realm, or tranſportation to the American colonies: others in loſs of liberty, by perpetual or temporary impriſonment. Some extend to confiſcation, by forfeiture of lands, or moveables, or both, or of the profits of lands for life: others induce a diſability, of holding offices or employments, being heirs, executors, and the like. Some, though rarely, occaſion a mutilation or diſmembering, by cutting off the hand or ears: others fix a laſting ſtigma on the offender, by ſlitting the noſtrils, or branding in the hand or face. Some are merely pecuniary, by ſtated or diſcretionary fines: and laſtly, there are others, that conſiſt principally in their

Judgment || Ives.

their ignominy, though moſt of them are mixed with ſome degree of corporal pain; and theſe are inflicted chiefly for ſuch crimes, as either ariſe from indigence, or render even opulence diſgraceful. Such as whipping, hard labour in the houſe of correction, the pillory, the ſtocks, and the ducking-ſtool.

Diſguſting as this catalogue may ſeem, it will afford pleaſure to a Britiſh reader, and do honour to the Britiſh laws, to compare it with that ſhocking apparatus of death and torment to be met with in the criminal codes of almoſt every other nation in Europe. And it is moreover one of the glories of our law, that the nature, tho' not always the quantity or degree, of puniſhment is aſcertained for every offence; and that it is not left in the breaſt of any judge, nor even of a jury, to alter that judgment, which the law has beforehand ordained, for every ſubject alike, without reſpect of perſons. For, if judgments were to be the private opinions of the judge, men would then be ſlaves to their magiſtrates; and would live in ſociety, without knowing exactly the conditions and obligations which it lays them under. And beſides, as this prevents oppreſſion on the one hand; ſo, on the other, it ſtifles all hopes of impunity or mitigation, with which an offender might flatter himſelf if his puniſhment depended on the humour or diſcretion of the court. Whereas, where an eſtabliſhed penalty is annexed to crimes, the criminal may read their certain conſequence in that law, which ought to be the unvaried rule, as it is the inflexible judge, of his actions.

JUDGMENT *of God, (Judicium Dei)*, in law, a term applied to the trial by combat, by ordeal, &c. See the articles DUEL, COMBAT, ORDEAL, &c.

JUDICIAL COMBAT. See BATTEL.

JUDOIGNE, a town of the Auſtrian Netherlands, in Brabant. Near this town the duke of Marlborough gained that ſignal victory over the French in 1706, called the *battle of Ramilies*. It is ſeated on the river Gete, 13 miles ſouth-eaſt of Louvain, and 16 north of Namur.

IVES, or YVES, (St.), a celebrated biſhop of Chartres, born in the territory of Beauvais in the 11th century. His merit procured his election to the ſee of Chartres in 1092, or 1093, under the pontificate of Urban II. who had depoſed Geoffroy his predeceſſor for ſundry accuſations againſt him. Ives particularly ſignalized himſelf by his zeal againſt Philip I. who had put away his wife Bertha of Holland, and had taken Bertrade of Montford, wife of Fouques count of Anjou. Afterward he devoted himſelf wholly to the functions of his miniſtry; made ſeveral religious foundations; and died in 1115. Pope Pius V. permitted the monks of the congregation of Lateran, to celebrate the feſtival of St Ives on the 20th of May. We have a collection of decrees of his compiling, *Exceptiones eccleſiaſticarum regularum*, a *Chronicon*, and 22 ſermons; all very valuable pieces, which were collected and publiſhed in one volume folio, in 1647, by John Baptiſt Souciet, canon of Chartres.

IVES (St.), a ſea-port town of Cornwall, in England, ſeated on a bay of the ſame name; which being unſafe, it is only frequented by fiſhermen, for the taking of pilchards. However, it is a corporation, and ſends two members to parliament. W. Long. 6. 15. N. Lat. 50. 15.

IVES (St.), a town of Huntingdonſhire, in England. It is an ancient, large, and handſome place, ſeated on the river Ouſe, over which is a fine ſtone bridge. Here was a priory, which is now in ruins. It has one large church, two diſſenting, and a Popiſh meeting, with about 500 houſes; the ſtreets are pretty wide, and tolerably well paved. W. Long. 0. 7. N. Lat. 52. 20.

Ives || Juglans.

JUGERUM, in Roman antiquity, a ſquare of 120 Roman feet; its proportion to the Engliſh acre being as 10,000 to 16,997.

JUGLANS, a genus of the polyandria order, belonging to the monœcia claſs of plants. There are five ſpecies, the moſt remarkable of which is the regia or common walnut. This riſes 50 feet high or more, with a large upright trunk, branching into a very large ſpreading head, with large pinnated leaves, of two or three pair of oval, ſmooth, ſomewhat ſerrated lobes, terminated by an odd one; and monœcious flowers, ſucceeded by cluſters of large green fruit, incloſing furrowed nuts of different ſhapes and ſizes in the varieties, ripening in September and October. Other two ſpecies, called the *nigra* and *alba*, or black and white Virginian walnut, are alſo cultivated in this country, though they are leſs proper for fruit, having very ſmall kernels.

Culture. All the ſorts are propagated by planting their nuts, which will grow in any common ſoil. The nuts, being procured in the proper ſeaſon, in their outer covers or huſks if poſſible, they ſhould be preſerved in dry ſand until February, and then planted. After two years growth in the ſeed-bed, they are to be taken out, and planted in the nurſery, where they muſt remain till grown five or ſix feet high, when they muſt be tranſplanted where they are finally to remain; but if intended for timber as well as fruit-trees, they ought to be finally tranſplanted when they have attained the height of three or four feet.

Uſes. The fruit is uſed at two different ſtages of growth; when green to pickle; and, when ripe, to eat raw. As a pickle, the nuts may be uſed when about half or three-fourths grown, before the outer coat or ſhell becomes hard; ſuch nuts ſhould be choſen as are moſt free from ſpecks, and for this purpoſe they muſt be gathered by hand. Walnuts are ready for pickling in July and Auguſt. They are fully ripe in September and October; and are then commonly beat down with long poles, eſpecially on large trees; for, as the walnuts grow moſtly at the extremities of the branches, it would be troubleſome and tedious to gather them by hand. As ſoon as gathered, lay them in heaps a few days to heat and ſweat, to cauſe their outer huſks, which adhere cloſely, to ſeparate from the ſhell of the nuts; then clean them from the rubbiſh, and depoſit them in ſome dry room for uſe, covering them over cloſe with dry ſtraw half a foot thick, and they will keep three or four months. They are always readily ſold at market, eſpecially in London; where, at their firſt coming in, they are ſold with the huſks on, by the ſack or buſhel; but afterwards are bought clean, and ſold both by meaſure and by the thouſand. The wood of the walnut-tree is alſo very valuable; not indeed where ſtrength is neceſſary, it being of a very brittle nature; but the cabinet-makers and joiners eſteem it highly for ſeveral ſorts of houſehold

Jugora
Juice.

furniture and other light works; for, being beautifully veined, it takes a fine polifh, and the more knotty it is, the more it is valued for particular purpofes. Walnut-trees are alfo well adapted for planting round the borders of orchards, where, by their large fpreading heads, they will alfo guard the leffer fruit-trees from boifterous winds. The kernels of the nuts are fimilar in quality to almonds; but are not, like them, ufed in medicine.

JUGORA, a confiderable province of Mufcovy, depending on the government of Archangel. It has the title of a duchy; and is inhabited by a kind of Tartars, who are very favage, and much of the fame difpofition with the Samoiedes.

IVICA, or YVICA, the name of an ifland in the Mediterranean. See YVICA.

JUICE, denotes the fap of vegetables, or the liquors of animals. See ANATOMY, BLOOD, PLANTS, SAP, &c.

The juices of feveral plants are expreffed to obtain their eflential falts, and for feveral medicinal purpofes, with intention either to be ufed without further preparation, or to be made into fyrups and extracts. The general method of extracting thefe juices is, by pounding the plant in a marble mortar, and then by putting it into a prefs. Thus is obtained a muddy and green liquor, which generally requires to be clarified, as we fhall foon obferve. The juices of all plants are not extracted with equal eafe. Some plants, even when frefh, contain fo little juice, that water muft be added while they are pounded, otherwife fcarcely any juice would be obtained by expreffion. Other plants, which contain a confiderable quantity of juice, furnifh by expreffion but a fmall quantity of it, becaufe they contain alfo much mucilage, which renders the juice fo vifcid that it cannot flow. Water muft alfo be added to thefe plants to obtain their juice. The juices thus obtained from vegetables by a mechanical method, are not, properly fpeaking, one of their principles, but rather a collection of all the proximate principles of plants which are foluble in water; fuch as the faponaceous extractive matter, the mucilage, the odoriferous principle, all the faline and faccharine fubftances; all which are diffolved in the water of the vegetation of the plants. Befides all thefe matters, the juice contains fome part of the refinous fubftance, and the green colouring matter, which in almoft all vegetables is of a refinous nature. Thefe two latter fubftances, not being foluble in water, are only interpofed between the parts of the other principles which are diffolved in the juice, and confequently difturbs its tranfparency. They nevertheleis adhere together in a certain degree, and fo ftrongly in moft juices, that they cannot be feparated by filtration alone. When therefore thefe juices are to be clarified, fome previous preparations muft be ufed by which the filtration may be facilitated. Juices which are acid, and not very mucilaginous, are fpontaneoufly clarified by reft and gentle heat. The juices of moft antifcorbutic plants abounding in faline volatile principles, may be difpofed to filtration merely by immerfion in boiling water; and as they may be contained in clofed bottles while they are thus heated in a water-bath, their faline volatile part, in which their medicinal qualities chiefly conift, may thus be preferved. Fermentation is alfo an effectual method of clarifying juices which are fufceptible of it; for all liquors which have fermented, clarify fpontaneoufly after fermentation. But this method is not ufed to clarify juices, becaufe many of them are fufceptible of only an imperfect fermentation, and becaufe the qualities of moft of them are injured by that procefs. The method of clarification moft generally ufed, and indifpenfably neceffary for thofe juices which contain much mucilage, is boiling with the white of an egg. This matter, which has the property of coagulating in boiling water, and of uniting with mucilage, does accordingly, when added to the juice of plants, unite with, and coagulate, their mucilage, and feparates it from the juice in form of fcum, together with the greateft part of the refinous and earthy matters which difturb its tranfparency. And as any of thefe refinous matters which may remain in the liquor, after this boiling with the whites of eggs, are no longer retained by the mucilage, they may eafily be feparated by filtration. See FILTRATION. Juice.

The juices, efpecially before they are clarified, contain almoft all the fame principles as the plant itfelf; becaufe in the operation by which they are extracted, no decompofition happens, but every thing remains, as to its nature, in the fame ftate as in the plant. The principles contained in the juice are only feparated from the groffer oily, earthy, and refinous parts, which compofe the folid matter that remains under the prefs. Thefe juices, when well prepared, have therefore the fame medicinal qualities as the plants from which they are obtained. They muft evidently differ from each other as to the nature and proportions of the principles with which they are impregnated, as much as the plants from which they are extracted differ from each other in thofe refpects.

Moft vegetable juices coagulate when they are expofed to the air, whether they are drawn out of the plant by wounds, or naturally run out; tho' what is called *naturally running out*, is generally the effect of a wound in the plant, from a fort of canker, or fome other internal caufe. Different parts of the fame plant yield different juices. The fame veins in their courfe through the different parts of the plant yield juices of a different appearance. Thus the juice in the root of the cow parfnep is of a brimftone colour; but in the ftalk it is white.

Among thofe juices of vegetables which are clammy and readily coagulate, there are fome which readily break with a whey. The great wild lettuce, with the fmell of opium yields the greateft plenty of milky juice of any known Britifh plant. When the ftalk is wounded with a knife, the juice flows readily out like a thick cream, and is white and ropy; but if thefe wounds are made at the top of the ftalks, the juice that flows out of them is daffhed with a purple tinge, as if cream had been fprinkled over it with a few drops of red wine. Some little time after letting this out, it becomes much more purple, and thickens; and finally, the thicker part of it feparates, and the thin whey fwims at top. The whey or thin part of this feparated matter is eafily preffed out from the curd by fqueezing between the fingers, and the curd will then remain white; and on waffhing with water, it becomes like rags. The purple whey, for in this is contained all the colour, foon dries into a purple cake, and

Juice. and may be crumbled between the fingers into a powder of the same colour. The white curd being dried and kept for some time, becomes hard and brittle. It breaks with a shining surface like resin, and is inflammable; taking fire at a candle, and burning all away with a strong flame. The same thick part being held over a gentle heat, will draw out into tough long threads, melting like wax. The purple cake made from the whey is quite different from this; and when held to a candle scarce flames at all, but burns to a black coal. The whole virtue of the plant seems also to consist in this thin part of its juice: for the coagulum or curd, though looking like wax or resin, has no taste at all; whereas the purple cake made from the serum is extremely bitter, and of a taste somewhat resembling that of opium.

Of the same kind with the wild lettuce are the throatwort, spurge, and many other plants. These are all replete with a milky juice which separates into curds and whey like that already described. But this, though a common law of nature, is not universal; for there are many plants which yield the like milky juices, without any separation ensuing upon their extravasation. The white juice of the sonchus never separates, but dries into an uniform cake: the common red wild poppy bleeds freely with a milky juice; and the heads or capsules of seed bleed not less freely than the rest of the plant, even after the flower is fallen. This juice, on being received into a shell or other small vessel, soon changes its white to a deep yellow colour, and dries it into a cake which seems resinous and oily, but no whey separates from it. The tragopogon, or goat's-beard, when wounded, bleeds freely a milky juice; it is at first white, but becomes immediately yellow, and then more and more red; till at length it is wholly of a dusky red. It never separates, but dries together into one cake; and is oily and resinous, but of an insipid taste. The great bindweed also bleeds freely a white juice; the flowers, as well as the stalks and leaves, affording this liquor. It is of a sharp taste; and as many of the purging plants are of this class, it would be worth trying whether this milk is not purgative.

These juices, as well as the generality of others which bleed from plants, are white like milk; but there are some of other colours. The juice of the great celandine is of a fine yellow colour; it flows from the plant of the thickness of cream, and soon dries into a hard cake, without any whey separating from it. Another yellow juice is yielded by the seed-vessels of the yellow centaury in the month of July, when the seeds are full grown. This is very clammy; it soon hardens altogether into a cake without any whey separating from it. It sticks to the fingers like birdlime, is of the colour of pale amber, and will never become harder than soft wax, if dried in the shade; but if laid in the sun, it immediately becomes hard like resin. These cakes burn like wax, and emit a very pleasant smell. The great angelica also yields a yellowish juice on being wounded; and this will not harden at all, but if kept several years will still be soft and clammy, drawing out into threads, or half melted resin.

Another kind of juices very different from all these, are those of a gummy nature. Some of these remain liquid a long time, and are not to be dried without the assistance of heat; the others very quickly harden of themselves, and are not inflammable. The gum of the juice of rhubarb-leaves soon hardens; and is afterwards soluble in common water, and sparkles when put into the flame of a candle. The clusters of the common honeysuckle are full of a liquid gum. This they frequently throw out, and it falls upon the leaves, where it retains its own form. The red hairs of the ros solis are all terminated by large bladders of a thin watery fluid. This is also a liquid gum; it sticks to the fingers, draws out into long threads, and stands the force of the sun all day. In the centre of each of these dew-drops there is a small red bladder, which stands immediately on the summit of the red hair, and contains a purple juice which may be squeezed out of it. The pinguicula, or butter-wort, has also a gummy matter on its leaves in much greater quantity than the ros solis.

Some plants yield juices which are manifestly of an oily nature. These, when rubbed, are not at all of a clammy nature, but make the fingers glib and slippery, and do not all harden on being exposed to the air. If the stalk of elecampane be wounded, there flows out an oily juice swimming upon a watery one. The stalks of the hemlock also afford a similar oily liquor swiming upon the other; and in like manner the white mullein, the berries of ivy, the bay, juniper, dog-berry tree, and the fruit of the olive, when wounded, shew their oil floating on the watery juice. Some of these oily juices, however, harden into a kind of resin. Our ivy yields such a juice very abundantly; and the juice of the small purple-berried juniper is of the same kind, being hard and fat, and not very gummy. If the bark of the common ivy is wounded in March, there will ooze out a tough and greasy matter of a yellowish colour, which, taken up between the fingers, feels not at all gummy or sticking, but melts in handling into a sort of oil, which, in process of time, hardens and crusts upon the wounds, and looks like brown sugar. It burns with a lasting flame, and smells very strong. The tops of the wild lettuce, and the leaves growing near the tops, if examined with a magnifying glass, shew a great number of small bladders, or drops of an oily juice of a brownish colour, hardening into a kind of resin; they are easily wiped off when of any size, and are truly an oily juice a little hardened. It is probable also, that the fine blue flour or powder, called the *bloom*, upon the surface of our common plums, is no other than such an oily juice exsudating from their pores in small particles, and hardening into a sort of resin.

Juice ‖ Julian.

JUJUBES, in the materia medica, the name of a fruit of the pulpy kind, produced on a tree which Linnæus makes a species of rhamnus. See RHAMNUS.

The jujubes have been made a general ingredient in pectoral decoctions; but they are now seldom used on these occasions, and are scarce at all heard of in prescription, or to be met with in our shops.

JULEP, in pharmacy, a medicine composed of some proper liquor and a syrup or sugar, of extemporaneous preparation, without decoction. See PHARMACY, n° 917, &c.

JULIAN, the famous Roman emperor, styled *the Apostate*, because he professed the Christian religion

Julian. before he aſcended the throne, but afterwards openly embraced Paganiſm, and endeavoured to aboliſh Chriſtianity. He made no uſe of violence, however, for this purpoſe; for he knew that violent meaſures had always rendered it more flouriſhing: he therefore behaved with a politic mildneſs to the Chriſtians; recalled all who had been baniſhed on account of religion under the reign of Conſtantius; and undertook to pervert them by his careſſes, and by temporal advantages and mortifications covered over by artful pretences: but he forbad Chriſtians to plead before courts of juſtice, or to enjoy any public employments. He even prohibited their teaching polite literature; well knowing the great advantages they drew from profane authors in their attacks upon Paganiſm and irreligion. Though he on all occaſions ſhewed a ſovereign contempt for the Chriſtians, whom he always called *Galileans*, yet he was ſenſible of the advantage they obtained by their virtue and the purity of their manners; and therefore inceſſantly propoſed their example to the Pagan prieſts. At laſt, however, when he found that all other methods failed, he gave public employments to the moſt cruel enemies of the Chriſtians, when the cities in moſt of the provinces were filled with tumults and ſeditions, and many of them were put to death: Though it has been pleaded by Julian's apologiſts, that the behaviour of the Chriſtians furniſhed ſufficient pretence for moſt of his proceedings againſt them, and the animoſities among themſelves furniſhed him with the means; that they were continually prone to ſedition, and made a merit of inſulting the public worſhip; and, finally, that they made no ſcruple of declaring, that want of numbers alone prevented them from engaging in an open rebellion. Hiſtorians mention, that Julian attempted to prove the falſehood of our Lord's prediction with reſpect to the temple of Jeruſalem; and reſolved to have that edifice rebuilt by the Jews, about 300 years after its deſtruction by Titus: but all their endeavours ſerved only the more perfectly to verify what had been foretold by Jeſus Chriſt; for the Jews, who had aſſembled from all parts to Jeruſalem, digging the foundations, flames of fire burſt forth, and conſumed the workmen *. However, the Jews, who were obſtinately bent on accompliſhing that work, made ſeveral attempts; but it is ſaid, that all who endeavoured to lay the foundations periſhed by theſe flames, which at laſt obliged them entirely to abandon the work. Julian being mortally wounded in a battle with the Perſians, it is ſaid, that he then catched in his hand ſome of the blood which flowed from his wound, and throwing it towards heaven, cried, "Thou Galilean haſt conquered." But notwithſtanding this popular report, Theodoret relates, that Julian diſcovered a different diſpoſition, and employed his laſt moments in converſing with Maximus the philoſopher, on the dignity of the ſoul. He died the following night, aged 32. For a particular account of his reign and exploits, ſee (*Hiſtory of*) Constantinople, n° 7. 33.—70.

* See *Jeruſalem.*

Julian, Juliers.

No prince was ever more differently repreſented by different authors; on which account it is difficult to form a true judgement of his real character. It muſt, however, be acknowledged, that he was learned, liberal, temperate, brave, vigilant, and a lover of juſtice: but, on the other hand, he had apoſtatized to Paganiſm; was an enemy to the Chriſtian religion; and was, in fact, a perſecutor, though not of the moſt ſanguinary claſs. We have ſeveral of his diſcourſes or orations; ſome of his letters; a treatiſe, intitled *Miſopogon*, which is a ſatire on the inhabitants of Antioch; and ſome other pieces, all written in an elegant ſtyle. They were publiſhed in Greek and Latin by father Petau, in 1630, in quarto; and of which Spanheimius gave a fine edition in folio, in 1696. His moſt famous work was that compoſed againſt the Chriſtians, of which there are ſome fragments in Cyril's refutation of it.

Julian *Period*, in chronology, a period ſo called, as being adapted to the Julian year.

It is made to commence before the creation of the world. Its principal advantage lies here, that the ſame years of the cycles of the ſun, moon, and indiction, of which three cycles it was made to conſiſt by Joſeph Scaliger in 1580, belonging to any year of this period, will never fall together again till after the expiration of 7980 years. There is taken for the firſt year of this period that which hath the firſt of the cycle of the ſun, the firſt of the cycle of the moon, and the firſt of the indiction cycle, and ſo reckoning on.

The firſt year of the Chriſtian æra is always, in our ſyſtems of Chronology, the 4714th of the Julian period.

To find what year of the Julian period any given year of Chriſt anſwers to; To the given year of Chriſt add 4713, becauſe ſo many years of the Julian period were expired A. D. 1; and the ſum gives the year of the Julian period ſought.

On the contrary, having the year of the Julian period given, to find what year of Chriſt anſwers thereto; From the year of the Julian period given ſubſtract 4713, and the remainder will be the year ſought.

Julian (St.), a harbour on the ſouth of Patagonia, in South America, where ſhips uſually touch that are bound to the ſouth ſeas. S. Lat. 48. 15.

JULIERS, a duchy in the circle of Weſtphalia, in Germany, ſeated between the rivers Maeſe and Rhine, and bounded by Pruſſian Guelderland on the north, by the electorate of Triers on the ſouth, by the electorate of Cologne on the eaſt, and by the Netherlands on the weſt. It is about 60 miles long, and 30 broad; and is a very plentiful country, abounding in cattle, corn, and fine meadows, and is well ſupplied with wood; but it is moſt remarkable for a fine breed of horſes, and woad for dying, which is gathered here in abundance. The chief towns are Juliers, Aix-la-Chapelle, Duren, Munſter-Eifel, Bedbur, Weſinburgh, and Lafteren. It is ſubject to the elector Palatine, with the conſent of the kings of Pruſſia and Poland.

Juliers, a city, capital of the duchy of Juliers in Weſtphalia; ſome think this city was founded by Julius Cæſar, or Julia Agrippina; but this is much queſtioned by others, becauſe it is not mentioned before Antoninus's Itinerary and Theodoſius's Tables. The town is ſmall, but well fortified, and neatly built; the houſes are of brick, and the ſtreets broad and regular. The citadel is large and very ſtrong, containing a palace of the ancient dukes, and a ſpacious piazza. In the ſuburbs there is a monaſtery of Carthuſians, nobly

Julio & Juncus.

nobly endowed by several dukes of Juliers. The town is but poorly inhabited, though they have a fine woollen manufactory in this country, and likewise another of linen. It was taken by Prince Maurice of Nassau in 1610, and by the Spaniards in 1622. It is seated on the river Roer, in E. Lon. 6. 35. N. Lat. 50. 55.

JULIO ROMANO. See ROMANO.

JULIUS CÆSAR. See CÆSAR.

JULIUS II. (Julian de la Rovere) pope, remarkable for his warlike disposition, and his political negociations: by the latter, he engaged the principal powers of Europe to league with him against the republic of Venice, called *the league of Cambray*, signed in 1508. The Venetians having purchased peace by the cession of part of Romania, Julius turned his arms against Louis XII. king of France, and appeared in person, armed cap-a-pee, at the siege of Mirandola; which place he took by assault in 1511. But proceeding to excommunicate Louis, the king wisely turned his own weapons against him, by calling a general council at Pisa: at which the pope refusing to appear, was declared to be suspended from the holy see; and Louis, in his turn, excommunicated the pope, who died soon after in 1512. He built the famous church of St Peter at Rome, and was a patron of the polite arts.

JULIUS *Pollux*. See POLLUX.

JULY, the seventh month of the year; during which the sun enters the sign Leo. The word is derived from the Latin *Julius*, the surname of C. Cæsar the dictator, who was born in it. Mark Antony first gave this month the name *July*, which before was called *Quintilis*, as being the fifth month of the year in the old Roman kalendar established by Romulus, which begun in the month of March. For the same reason, August was called *Sextilis*; and September, October, November, and December, still retain the name of their first rank:

Quæ sequitur, numero turba notata suo. OVID. Fast.

On the 19th day of this month the dog-days are commonly supposed to begin; when, according to Hippocrates and Pliny, the sea boils, wine turns sour, dogs go mad, the bile is increased and irritated, and all animals decline and languish.

JUMIEGE, a town of Normandy, in France, and in the territory of Caux, with a celebrated Benedictine abbey. It is seated on the river Seine, in E. Long. 0. 55. N. Lat. 49. 25.

JUNCTURE, in composition, See ORATORY, n° 46.

JUNCUS, the RUSH; a genus of the monogynia order, belonging to the hexandria class of plants. There are many species, which are universally known, being very troublesome weeds, and difficult to be eradicated. The pith of two kinds, called the *conglomeratus* and *effusus*, or round-headed and soft rushes, are used for wicks to lamps and rush-lights. The *conglomeratus*, and *aculus* or marine rush, are planted with great care on the banks of the sea in Holland, in order to prevent the water from washing away the earth; which would otherwise be removed every tide, if it were not for the roots of those rushes, which fasten very deep in the ground, and mat themselves near the surface in such a manner as to hold the earth closely together. Therefore, whenever the inhabitants perceive that the roots of these rushes are destroyed, they are very assiduous in repairing them. In the summer-time, when the rushes are fully grown, they are cut and tied up in bundles, which are dried, and afterwards carried into the larger towns and cities, where they are wrought into baskets, and several other useful things, which are frequently sent into England. These sorts do not grow so strong in this country as on the Maese, where they sometimes arrive at the height of four feet and upwards.

June & Juniperus.

A species of rush termed *juncus odoratus*, "sweet rush, or camel's hay," is sometimes brought to us from Turky and Arabia, tied up in bundles about a foot long. The stalk, in shape and colour, somewhat resembles a barley-straw; it is full of fungous pith like that of our common rushes: the leaves are like those of wheat, and surround the stalk with several coats, as in the reed. The flowers are of a carnation colour, striped with a lighter purple. The whole plant, when in perfection, has a hot, bitterish, not unpleasant, aromatic taste, and a very fragrant smell: by long keeping it loses greatly its aromatic flavour. Distilled with water, it yields a considerable quantity of an essential oil. It was formerly often used in medicine as an aromatic, and in obstructions of the viscera, &c. but is very little employed at present.

JUNE, the sixth month of the year, during which the sun enters the sign of Cancer. The word comes from the Latin *Junius*, which some derive *à Junone*. Ovid, in the 6th of his *Fasti*, makes the goddess say,

Junius à nostro nomine nomen habet.

Others rather derive it *à junioribus*, this being for young people, as the month of May was for old ones. *Junius est juvenum, qui fuit ante senum.*

In this month is the summer solstice.

JUNGERMANNIA, a genus of the order of algæ, belonging to the cryptogamia class of plants. There are 29 species, all natives of Britain, growing in woods, shady places, by the sides of ditches, &c. Many of them are beautiful objects for the microscope.

JUNIPERUS, the JUNIPER TREE; a genus of the monadelphia order, belonging to the dioecia class of plants.

Species. 1. The *communis*, or common juniper, grows naturally in many parts of Britain, upon dry barren commons, where it seldom rises above the height of a low shrub. Mr Evelyn assures us, that "the juniper, though naturally of the growth of England, is very little known in many parts of the country: for it grows naturally only in dry, chalky, or sandy land; and, where the soil is opposite to this, the plant is rarely found. Those who have been used to see it in its wild state, on sandy barren commons, &c. will have little inducement to plant it; as there they will see it procumbent, seldom shewing a tendency to aspire: but when planted in a good soil, it will rise to the height of 15 or 16 feet, and produce numerous branches from the bottom to the top, forming a well-looking bushy plant. These branches are exceeding tough, and covered with a smooth bark of a reddish colour, having a tinge of purple. The leaves are narrow and sharp-pointed, growing by threes on the branches: their upper surface has a greyish streak down the middle; but

Juniperus. but their under ſurface is of a fine green colour, and they garniſh the ſhrub in great plenty. The flowers are ſmall, and of a yelloviſh colour. They are ſucceeded by the berries, which are of a blueiſh colour when ripe." Of this ſpecies there is a variety called *Swediſh juniper*, which grows 10 or 12 feet high, very branchy the whole length, with the branches growing more erect, and leaves, flowers, and fruit, like the former. But Mr Miller affirms the Swediſh juniper to be a diſtinct ſpecies. A proſtrate and very dwarfiſh variety is mentioned by Mr Lightfoot, under the name of *dwarf Alpine juniper*. It is frequently found in the mountains in the Highlands of Scotland, and has broader and thicker leaves than the former; the berries are alſo larger, or more oval than ſpherical. 2. The *oxycedrus*, or Spaniſh juniper, riſes from 10 to 15 feet high, cloſely branched from bottom to top; having ſhort, awl-ſhaped, ſpreading leaves by threes, and ſmall dioecious flowers, ſucceeded by large reddiſh-brown berries. 3. The *thuriſera*, or blue-berried Spaniſh juniper, grows 20 feet high or more, branching in a conic form, with acute imbricated leaves growing by fours, and ſmall dioecious flowers, ſucceeded by large blue flowers. 4. The *Virginiana*, or Virginia cedar, grows 30 or 40 feet high, branching from bottom to top in a conic manner, ſmall leaves by threes adhering at their baſe; the younger ones imbricated, and the old ones ſpreading; with dioecious flowers, ſucceeded by ſmall blue berries. 5. The *Lycia*, or Lycian cedar, grows 20 feet high, branching erect; garniſhed with ſmall obtuſe oval leaves, every-where imbricated; having dioecious flowers, ſucceeded by large oval brown berries, It is a native of Spain and Italy. 6. The *Phœnicia*, or Phenician cedar, grows about 20 feet high, branching pyramidally; adorned with ternate and imbricated obtuſe leaves; and dioecious flowers, ſucceeded by ſmall yelloviſh berries. It is a native of Portugal. 7. The *Bermudiana*, or Bermudian cedar, grows 20 or 30 feet high, has ſmall acute leaves by threes below, the upper ones awl-ſhaped, acute, and decurrent, by pairs or fours, ſpreading outward, and dioecious flowers, ſucceeded by purpliſh berries. It is a native of Bermudas. 8. The *Sabina*, or ſavin tree; of which there are the following varieties, viz. ſpreading, upright, and variegated ſavin. The firſt grows three or four feet high, with horizontal and very ſpreading branches; with ſhort, pointed, decurrent, erect, oppoſite leaves; and dioecious flowers, ſucceeded by blueiſh berries, but very rarely producing either flowers or fruit. The ſecond grows eight or ten feet high, with upright branches, dark-green leaves like the former, and dioecious flowers, ſucceeded by plenty of berries. The third has the ends of many of the ſhoots and young branches variegated with white, and the leaves finely ſtriped; ſo that it makes a beautiful appearance.

Culture. The propagation of all the junipers is by ſeed, and of the ſavins by layers and cuttings; but theſe laſt may alſo be raiſed from the berries, if they can be procured. They may all be ſowed in beds of common light earth; except the cedar of Bermudas, which muſt be ſowed in pots, to have ſhelter in winter. When the hardy kinds have had two or three years growth in the ſeed-bed, they may be planted out in autumn or in ſpring, in nurſery-rows two feet aſunder, there to remain till of due ſize for final tranſplantation into the ſhrubbery. The Bermudas cedar muſt be ſheltered under a frame for the firſt year or two; when they muſt be ſeparated into ſmall pots, to be ſheltered alſo in winter for three or four years, till they have acquired ſome ſize and ſtrength; then turned out into pots in the full ground, where they are to remain in a warm ſituation; though a ſhelter of mats for the firſt winter or two during hard froſts will be of great ſervice. The ſeaſon for tranſplanting all the ſorts is either in autumn, October or November, or in March, and early in April. Juniperus.

Uſes, &c. Juniper-berries have a ſtrong, not diſagreeable ſmell; and a warm, pungent, ſweet taſte; which, if they are long chewed, or previouſly well bruiſed, is followed by a bitteriſh one. The pungency ſeems to reſide in the bark; the ſweet in the juice; the aromatic flavour in oily veſicles ſpread through the ſubſtance of the pulp, and diſtinguiſhable even by the eye; and the bitter in the ſeeds. The freſh berries yield, on expreſſion, a rich, ſweet, honey-like aromatic juice; if previouſly pounded ſo as to break the ſeeds, the juice proves tart and bitter.—Theſe berries are uſeful carminatives and ſtomachics: for theſe purpoſes a ſpirituous water and eſſential oil are prepared from them, and they are alſo ingredients in various medicines. The liquor remaining after the diſtillation of the oil paſſed through a ſtrainer, and gently exhaled to the conſiſtence a rob, proves likewiſe a medicine of great utility, and in many caſes is perhaps preferable to the oil or the berry itſelf. Hoffman is expreſsly of this opinion, and recommends the rob of juniper in debility of the ſtomach and inteſtines, and ſays it is particularly ſerviceable to old people who are ſubject to theſe diſorders, or labour under a difficulty with regard to the urinary ſecretion. This rob is of a dark browniſh-yellow colour, a balſamic ſweet taſte, with a little of the bitter, more or leſs, according as the ſeeds in the berry have been more or leſs bruiſed. The Swedes prepare an extract from the berries, probably of the nature of the rob above mentioned, which ſome people eat for breakfaſt. In Germany the berries are bruiſed and put into the ſauce made uſe of for a wild boar; and are frequently alſo eaten with other pork, to give it a wild-boar flavour. In Carniola and ſome other diſtricts, the inhabitants make a kind of wine of them ſteeped in water; but it is difficult to prevent this liquor from growing ſour. Thruſhes and groſs feed on the berries, and diſſeminate the ſeed in their dung.—It is remarkable that the berries of the juniper are two years in ripening. They ſometimes appear in an uncommon form; the leaves of the cup grow double the uſual ſize, approaching, but not cloſing; and the three petals ſit exactly cloſe, ſo as to keep the air from the *tipulæ juniperi* which inhabit them.—The whole plant has a ſtrong aromatic ſmell. The wood when burnt emits a fragrant odour like incenſe. It is of a reddiſh colour, very hard and durable; and, when large enough, is uſed in marquetry and vaneering, and in making cups, cabinets, &c. From the clefts of the bark, in warm climates, there ſometimes exſudes a reſinous gum called by the Arabs *Sandaracha* *. This reſin, or as it is improperly called *gum*, is brought to us from Africa, where

* See *Sandaracha*.

Junius. where the trees grow very large, and in great numbers.—Graſs will not grow beneath juniper, but this tree itſelf is ſaid to be deſtroyed by the meadow-oat. The oil of juniper mixed with that of nuts makes an excellent varniſh for pictures, wood-work, and preſerving iron from ruſting. The reſin powdered and rubbed into paper prevents the ink from ſinking through it, for which it is frequently uſed under the name of POUNCE.—The charcoal made from this wood endures longer than any other, inſomuch that live embers are ſaid to have been found in the aſhes, after being a year covered.

JUNIUS (Adrian), one of the moſt learned men of the age in which he lived, was born at Horn in Holland in 1511. He travelled into all parts of Europe, and practiſed phyſic with reputation in England; where, among other works, he compoſed a Greek and Latin Lexicon, to which he added above 6500 words; an Epithalamium on the marriage of queen Mary with king Philip of Spain; and *Animadverſa & de Coma Commentarius*, which is the moſt applauded of all his works. He died in 1575.

JUNIUS (Francis), profeſſor of divinity at Leyden, was born at Bourges in 1545, of a noble family, and ſtudied ſome time at Lyons. Bartholomew Aneau, who was principal of the college in that city, gave him excellent inſtructions with regard to the right method of ſtudying. He was remarkable for being proof againſt all temptations to lewdneſs; but a libertine ſo far overpowered him by his ſophiſtry, that he made him an atheiſt: however, he ſoon returned to his firſt faith; and, averſe as he was to unlawful love, he had no averſion to matrimony, but was married no leſs than four times. He was employed in public affairs by Henry IV.; and at laſt was invited to Leyden to be profeſſor of divinity, which employment he diſcharged with honour, till he was ſnatched away by the plague in 1602. Du Pin ſays, he was a learned and judicious critic. He wrote, in conjunction with Emmanuel Tremellius, a Latin verſion of the Hebrew text of the Bible. He alſo publiſhed Commentaries on a great part of the Holy Scriptures; and many other works, all in Latin.

JUNIUS (Francis), or *Francis du Jon*, the ſon of the preceding, was born at Heidelberg, in 1589. He at firſt deſigned to devote himſelf to a military life; but after the truce concluded in 1609, he applied himſelf entirely to ſtudy. He came to England in 1620, and lived 30 years in the earl of Arundel's family. He was greatly eſteemed, not only for his profound erudition, but alſo for the purity of his manners; and was ſo paſſionately fond of the ſtudy of the Northern languages, that, being informed there were ſome villages in Frieſland where the ancient language of the Saxons was preſerved, he went and lived two years in that country. He returned to England in 1675; and after ſpending a year at Oxford, retired to Windſor, in order to viſit Voſſius, at whoſe houſe he died in 1677. The univerſity of Oxford, to which he bequeathed his manuſcripts, erected a very handſome monument to his memory. He wrote, 1. *De Pictura Veterum*, which is admired by all the learned; the beſt edition of it is that of Rotterdam in 1694. He publiſhed the ſame work at London, in Engliſh. 2. An explication of the old Gothic manuſcript, called the *Silver one*, becauſe the four Goſpels are there written in ſilver Gothic letters; this was publiſhed with notes by Thomas Mareſchal, or Marſhal. 3. A large Commentary on the Harmony of the four Goſpels by Tatian, which is ſtill in manuſcript. 4. A Gloſſary in five languages, in which he explains the origin of the Northern languages; publiſhed at Oxford in 1745, in folio, by Mr Edward Lee.

Junk || Ivory.

JUNK, in the ſea-language, old cables cut into ſhort pieces, and given to boatſwains for making ſwabs, plats, and nippers; as alſo to the ſhip-carpenters, and to poor people, to be pricked into oakum, for caulking ſhips, &c.

JUNO, in pagan worſhip, was the ſiſter and wife of Jupiter, and the goddeſs of kingdoms and riches; and alſo ſtyled the *queen of heaven*: ſhe preſided over marriage and child-birth, and was reprefented as the daughter of Saturn and Rhea. She married Jupiter; but was not the moſt complaiſant wife; for, according to Homer, that god was ſometimes obliged to make uſe of all his authority to keep her in due ſubjection; and the ſame author obſerves, that on her entering into a conſpiracy againſt him, he puniſhed her by ſuſpending her in the air with two anvils faſtened to her feet, and golden manacles on her hands, which all the other deities looked on without a poſſibility of helping her. However, her jealouſy made her frequently find opportunities of interrupting her huſband in the courſe of his amours, and prompted her to puniſh with unrelenting fury Europa, Semele, Io, Latona, and the reſt of his miſtreſſes. Jupiter himſelf having conceived without any commerce with a female, Juno, in revenge, conceived Vulcan by the wind, Mars by touching a flower pointed out to her by the goddeſs Flora, and Hebe by eating greedily of lettuces.

Juno, as the queen of heaven, preſerved great ſtate: her uſual attendants were Terror and Boldneſs, Caſtor, Pollux, and 14 nymphs; but her moſt faithful attendant was the beautiful Iris, or the rainbow. Homer deſcribes her in a chariot adorned with precious ſtones, the wheels of which were of ebony, and which was drawn by horſes with reins of gold. But ſhe is more commonly painted drawn by peacocks. She was repreſented in her temple at Corinth, ſeated on a throne, with a crown on her head, a pomegranate in one hand, and in the other a ſceptre with a cuckoo on its top. This ſtatue was of gold and ivory.

Some mythologiſts ſuppoſe, that Juno ſignifies the air; others, that ſhe was the Egyptian Iſis; who being repreſented under various figures, was by the Greeks and Romans repreſented as ſo many diſtinct deities.

JUNTO, in matters of government, denotes a ſelect council for taking cognizance of affairs of great conſequence, which require ſecrecy.

In Spain and Portugal, it ſignifies much the ſame with convention, aſſembly, or board among us: thus we meet with the junto of the three eſtates, of commerce, of tobacco, &c. See BOARD, &c.

IVORY, in natural hiſtory, &c. a hard, ſolid, and firm ſubſtance, of a white colour, and capable of a very good poliſh. It is the tuſk of the elephant *; and is hollow from the baſe to a certain height, the cavity being filled up with a compact medullary ſubſtance, ſeeming

* See Elephas.

Ivory
Jura.

seeming to have a great number of glands it it. It is observed, that the Ceylon ivory, and that of the island of Achem, do not become yellow in the wearing, as all other ivory does; for this reason the teeth of these places bear a larger price than those of the coast of Guinea.

Hardening, Softening, and Staining, of IVORY. See BONES and HORNS.

JUPITER, in pagan worship, the greatest of their deities, was the son of Saturn and Rhea. That goddess perceiving that her husband devoured her children as fast as she brought them forth; and being in pain for Jupiter, she substituted a stone in his room, which Saturn immediately swallowed. He was educated on mount Ida by the Corybantes. Virgil tells us, that he was fed by the bees; out of gratitude for which, he changed them from an iron to a golden colour. Some say, that his nurses were Amalthæa and Melissa, who gave him goats milk and honey; and others, that Amalthæa was the name of the goat which nourished him, and which, as a reward for her great services, was changed into a constellation. According to others, he was fed by wild pigeons, who brought him ambrosia from Oceanus; and by an eagle, who carried nectar in his beak from a steep rock: for which he rewarded the former, by making them the foretellers of winter and summer; and the last, by giving him immortality, and making him his thunderbearer. When grown up, he defeated the Titans, dethroned his father Saturn, and divided his kingdom with his two brothers; Jupiter had the earth, Neptune the sea, and Pluto hell. Jupiter had several wives: the first of whom, named *Metis*, he is said to have devoured when big with child, by which he himself became pregnant; and Minerva issued out of his head, completely armed and fully grown. His second was Themis; the name of his third is not known; his fourth was the celebrated Juno, whom he deceived under the form of a cuckoo, which to shun the violence of a storm fled for shelter to her lap. He was the father of the Muses and Graces; and had a prodigious number of children by his mistresses. He metamorphosed himself into a satyr to enjoy Antiope; into a bull, to carry off Europa; into a swan, to abuse Leda; into a shower of gold, to corrupt Danäe; and into several other forms to gratify his passions. He had Bacchus by Semele, Pallas by Thetis, Diana and Apollo by Latona; and was the father of Mercury and the other gods.

He had a multiplicity of names, either from the places where he was worshipped, or the attributes ascribed to him; and is usually reprefented feated on a throne of ivory or gold, furrounded with clouds, veſted in a purple robe, graſping his thunder in the right hand and holding a ſceptre in his left, with the eagle at his feet.

The ridiculous ſtories which the poets had publiſhed concerning this god, ſerved as a foundation to the religion of the heathens; but ſome perſons of a graver character endeavour to explain them, either by allegories, or the principles of natural philoſophy.

JURA, one of the Hebrides, or Weſtern Iſlands of Scotland, lying oppoſite to Knapdale in Argyleſhire, is ſuppoſed to be about 34 miles long, and 10 broad. It is the moſt rugged of all the Hebrides; and is compoſed chiefly of vaſt mountains, naked, and without a poſſibility of cultivation. Some of the ſouth and weſtern ſides only are improveable, and in good ſeaſons as much bear and oats are raiſed as will maintain the inhabitants; though by the diſtillation, as Mr Pennant ſuppoſes, of their grain, they ſometimes want. Bear produces four or five fold, and oats three fold. Sloes are the only fruits of the iſland. An acid for punch is here made from the berries of the mountain-aſh; and a kind of ſpirit is alſo diſtilled from them. Neceſſity hath inſtructed the inhabitants in the uſe of native dyes. Thus, the juice of the tops of heath boiled, ſupplies them with a yellow; the roots of the white water-lily, with a dark-brown; thoſe of the yellow water-iris, with a black; and the galium verum, *ru* of the iſlanders, with a very fine red, not inferior to madder. On the hills is ſome paſture for cattle; and the produce, when Mr Pennant viſited the iſland, amounted to about 300 or 400 head of black cattle, ſold annually, at 3l. each, to graziers who come for them; about 100 horſes, alſo ſold annually; a few ſheep with fleeces of a moſt excellent quality, and great numbers of goats. The other animals of Jura are about 100 ſtags; though theſe muſt formerly have been much more numerous, as the original name of the iſland was *Deir-ay*, or the *iſle of deer*, ſo called by the Norwegians on account of the abundance of deer found in it. Here alſo Mr Pennant had ſome obſcure account of a worm that, in a leſs pernicious degree, reſembles the *furia infernalis* * of Linnæus. The *jillan*, a little worm of Jura, ſmall as a thread, and not an inch in length, inſinuates itſelf under the ſkin, cauſes a redneſs and great pain, flies ſwiftly from place to place; but is cured by a poultice of cheeſe and honey. Of the mountains of Jura, thoſe from their ſhape called the *paps*, are the moſt remarkable. There are only three very large ones; the biggeſt, called *Beinn-an-oir*, or *the mountain of gold*, lies fartheſt to the north; the ſecond is called *Beinn-ſheunta*, or *the hallowed mountain*; and the third, *Beinn-a-chaolois*, or *the mountain of the ſound*, is the leaſt of the three. Mr Pennant aſcended the firſt with great labour and difficulty. It is compoſed of vaſt ſtones, covered with moſſes near the baſe; but all above, bare and unconnected with each other. The whole, he ſays, ſeems a *cairn*, the work of the ſons of Saturn. The grandeur of the proſpect from the top abundantly made amends for the fatigue of aſcending the mountain. Jura itſelf afforded a ſtupendous ſcene of rock, varied with innumerable little lakes. From the weſt ſide of the hill ran a narrow ſtripe of rock terminating in the ſea, and called *the ſlide of the old hag*. To the ſouth appeared Ilay extended like a map beneath his feet; and beyond that the north of Ireland; to the eaſt two other iſlands, Cantyre, Arran, and the frith of Clyde bounded by Ayrſhire; an amazing tract of mountains to the north-eaſt as far as *Ben-lomond; Skarba* finiſhed the northern view; and over the weſtern ocean were ſcattered Colonſay and Oranſay, Mull, Iona, and its neighbouring iſles; and ſtill further, the long extents of Tirey and Col, juſt apparent. The other paps are ſeen very diſtinctly, but all of them inferior in height. Mr Banks and his friends mounted that to the ſouth, and found the height to be 2359 feet; but this is far overtopped by *Beinn-an-oir*. The ſtones of this mountain are white,

Jura.

* See *Furia*, in the APPENDIX.

Jura ‖ Jurieu.

white, a few red, quartzy, and compoſed of ſmall grains; but ſome are *breciated*, or filled with cryſtalline kernels of an amethyſtine colour. The other ſtones of the iſland are, a cinereous ſlate, veined with red, and uſed here as a whet-ſtone; a micaceous ſand-ſtone; and between the ſmall iſles and Ardfin, a micaceous quartzy rock-ſtone. On the weſt ſide of the iſland there is an anchoring-place called *Whitfarlan*; towards the north end is a bay called *Da'l yaul*; and on the ſame coaſt is formed another riding-place for veſſels among ſeveral ſmall iſlands. Between the north end of Jura and the ſmall iſle of Skarba, there is a famous whirlpool, called *Cory-Vrekan*, from Brecan, ſon to a king of Denmark, who periſhed in this gulph. His body being caſt aſhore on the north ſide of Jura, was buried in a cave, and his grave is ſtill diſtinguiſhed by a tombſtone and altar. In this vortex, which extends about a mile in breadth, the ſea begins to boil and ferment with the tide of flood, increaſing gradually to a number of whirlpools, which, in the form of pyramids, ſpout up the water with a great noiſe, as high as the maſt of a ſmall veſſel, agitated into ſuch a foam as makes the ſea appear white even at the diſtance of two leagues. About half flood the violence begins to decreaſe, and continues to do ſo till about half an hour after high-water: then it boils as before, till within an hour of low-water, when the ſmalleſt fiſhing-boat may croſs it without danger.

Jura is furniſhed with many rivulets and ſprings of excellent water, and the air is remarkably healthy; its ſalubrity being increaſed by the high ſituation, perpetually fanned by breezes. It is, however, but ill-peopled; and did not contain above 700 or 800 inhabitants at the time it was viſited by Mr Pennant. The women are prolific, and very often bear twins. The inhabitants live to a great age, and are liable to few diſtempers. Men of 90 can work; and there was then living a woman of 80, who could run down a ſheep. Then inhabitants are all Proteſtants, but addicted to ſome ſuperſtitions. The pariſh is ſuppoſed to be the largeſt in Great Britain, and the duty the moſt dangerous and troubleſome: it conſiſts of Jura, Oranſay, Colonſay, Skarba, and ſeveral little iſles divided by narrow and dangerous ſounds; forming a length of not leſs than 60 miles; ſupplied by only one miniſter and an aſſiſtant.

The very old clans of Jura are the *Mac-ilvuys*, and the *Mac-raines*: but it ſeems to have changed maſters more than once. In 1549, Donald of Cantyre, Mac-guillayne of Doward, Mac-guillayne of Kinloch-buy, and Mac-duffie of Colonſay, were the proprietors: Mac-lean of Mull had alſo a ſhare in 1586. At preſent it belongs to the duke of Argyle, Mr Macneil of Colonſay, and Mr Campbell of Shawfield.

IVREA, an ancient and ſtrong town of Italy, in Piedmont, and capital of Canavez, with a ſtrong fort, a biſhop's ſee, the title of a marquiſate, and an ancient caſtle. It is ſubject to the king of Sardinia, and ſeated on the river Doria between two hills, in E. Long. 7. 48. N. Lat. 45. 12.

JURIEU (Peter), an eminent French Proteſtant divine, called ironically by the papiſts the *Goliath* of the Proteſtants, was born in 1637. He was educated in England under his maternal uncle Peter du Moulin, and took orders in the Engliſh church: but, returning to ſucceed his father as paſtor of a reformed congregation at Mer in the diocеſe of Blois, he was made profeſſor of divinity and Hebrew at Sedan, where he acquired great reputation. This univerſity being taken from the Proteſtants, a profeſſorſhip of divinity was founded for him at Rotterdam; and he was alſo appointed miniſter of the Walloon church in the ſame town: being now in a place of liberty, he gave full ſcope to an imagination naturally warm, and applied himſelf to ſtudy the book of Revelation, of which he fancied he had by a kind of inſpiration diſcovered the true meaning; a notion that led him to many enthuſiaſtical conjectures. He was moreover ſo unfortunate as to quarrel with his beſt friends for oppoſing his viſionary opinions, which produced violent diſputes between him and Meſſrs Bayle and de Beauval. He died in 1713; and left a great number of eſteemed works behind him.

Juriſconſultus ‖ Jury.

JURISCONSULTUS, (*ICtus*,) among the Romans, was a perſon learned in the law; a maſter of the Roman juriſprudence; who was conſulted on the interpretation of the laws and cuſtoms, and on the difficult points in law-ſuits. The fifteen books of the digeſts were compiled wholly from the anſwers or reports of the ancient juriſconſulti. Tribonianus, in deſtroying the 2000 volumes from whence the code and digeſt were taken, has deprived the public of a world of things, which would have given them light into the ancient office of the juriſconſulti. We ſhould ſcarce have known any thing beyond their bare names, had not Pomponius, who lived in the ſecond century, taken care to preſerve ſome circumſtances of their office.

The Roman juriſconſulti ſeem to have been the ſame with our chamber-counſellors, who arrived at the honour of being conſulted, through age and experience, but never pleaded at the bar. Their pleading advocates, or lawyers, never became juriſconſulti. See ADVOCATE.

In the times of the commonwealth, the advocati had by much the more honourable employment, as being in the ready way to attain the higheſt preferments. They then deſpiſed the juriſconſulti, calling them in deriſion *formularii* and *legulei*, as having invented certain forms and monoſyllables, in order to give their anſwers the greater appearance of gravity and myſtery. But in proceſs of time they became ſo much eſteemed, that they were called *prudentes* and *ſapientes*, and the emperors appointed the judges to follow their advice. Auguſtus advanced them to be public officers of the empire; ſo that they were no longer confined to the petty councils of private perſons.—Bern. Rutilius has written the lives of the moſt famous juriſconſulti who have lived within theſe 2000 years.

JURISPRUDENCE, the ſcience of what is juſt or unjuſt; or the knowledge of laws, rights, cuſtoms, ſtatutes, &c. neceſſary for the adminiſtration of juſtice. See LAW.

JURY, a certain number of men ſworn to inquire into and try a matter of fact, and to declare the truth upon ſuch evidence as ſhall appear before them.

Juries are, in theſe kingdoms, the ſupreme judges in all courts and in all cauſes in which either the life, property, or reputation, of any man is concerned: this is the diſtinguiſhing privilege of every Briton, and one

Jury || Juſtel.

of the moſt glorious advantages of our conſtitution; for as every one is tried by his peers, the meaneſt ſubject is as ſafe and as free as the greateſt. See the article TRIAL.

JURY-*Maſt*, whatever is ſet up in room of a maſt that has been loſt in a ſtorm or in an engagement, and to which a leſſer yard, ropes, and ſails, are affixed.

JUS CORONÆ. See HEREDITARY *Right*, and SUCCESSION.

JUS *Deliberandi*, in Scots law, that right which an heir has, by law, of deliberating for a certain time whether he will repreſent his predeceſſor. See LAW, N° clxxx. 23.

JUS *Devolutum*, in Scots law, the right of the church, of preſenting a miniſter to a vacant pariſh, in caſe the patron ſhall neglect to uſe that right within the time limited by law. See LAW, N° clix. 9.

JUS *Mariti*, in Scots law, the right the huſband acquires to his wife's moveable eſtate, in virtue of the marriage. See LAW, N° clx. 7.—11.

JUS *Relictæ*, in Scots law, the right the wife has in the goods in communion, in caſe of the previous deceaſe of the huſband. See LAW, *ibid.*

JUS *Præventionis*, in Scots law, the preferable right of juriſdiction acquired by a court, in any cauſe to which other courts are equally competent, by having exerciſed the firſt act of juriſdiction. See LAW, N° clvi. 5.

JUST, a ſportive kind of combat on horſeback, man againſt man, armed with lances. The word is by ſome derived from the French *jouſte*, of the Latin *juxta*, becauſe the combatants fought near one another. Salmaſius derives it from the modern Greek *zouſtra*, or rather τζουρα, which is uſed in this ſenſe by Nicephorus Gregorius. Others derive it from *juſta*, which in the corrupt age of the Latin tongue was uſed for this exerciſe, by reaſon it was ſuppoſed a more juſt and equal combat than the tournament.

The difference between juſts and tournaments conſiſts in this, that the latter is the genus, of which the former is only a ſpecies. Tournaments included all kinds of military ſports and engagements made out of gallantry and diverſion: Juſts were thoſe particular combats where the parties were near each other, and engaged with lance and ſword. Add, that the tournament was frequently performed by a number of cavaliers, who fought in a body: The juſt was a ſingle combat of one man againſt another.—Though the juſts were uſually made in tournaments, after a general rencounter of all the cavaliers, yet they were ſometimes ſingly, and independent of any tournament. See TOURNAMENT.

He who appeared for the firſt time at a juſt, forfeited his helm or caſque, unleſs he had forfeited before at a tournament.

JUSTEL (Chriſtopher), a learned counſellor, and ſecretary to the French king, was born at Paris, in 1580, and applied himſelf to the ſtudy of eccleſiaſtical hiſtory. He maintained a correſpondence with the moſt learned men of his time, as archbiſhop Uſher, Sir Henry Spelman, Blondel, &c. till his death, which happened in 1649. He wrote, 1. The code of the canons of the church univerſal, and the councils of Africa, with notes. 2. A genealogical hiſtory of the houſe of Auvergne. And, 3. Collections of Greek and Latin canons, from ſeveral manuſcripts, which formed the *Bibliotheca juris canonici veteris*, publiſhed in 2 vols folio, by William Voet and our author's ſon. Juſtice.

JUSTEL (Henry), ſon of the foregoing, was born at Paris in 1620. He became ſecretary and counſellor to the king; and was as diſtinguiſhed for his own learning, as remarkable for encouraging it in others. He came to London in 1681, on the perſecution of the Proteſtants; and was made keeper of the royal library at St James's: which office he held till his death in 1693, when he was ſucceeded by the famous Dr Bentley. He wrote ſeveral books, the titles of which may be ſeen in the Catalogue of the Bodleian library.

JUSTICE, in a moral ſenſe, is one of the four cardinal virtues, which gives every perſon his due.

JUSTICE, in a legal ſenſe, a perſon deputed by the king to adminiſter juſtice to his ſubjects, whoſe authority ariſes from his deputation, and not by right of magiſtracy.

Fountain of JUSTICE, one of the characters or attributes of the king. See PREROGATIVE.

By the fountain of juſtice the law does not mean the *author* or *original*, but only the *diſtributor*. Juſtice is not derived from the king, as from his *free gift*; but he is the ſteward of the public, to diſpenſe it to whom it is *due*. He is not the ſpring, but the reſervoir; from whence right and equity are conducted, by a thouſand channels, to every individual. The original power of judicature, by the fundamental principles of ſociety, is lodged in the ſociety at large: but as it would be impracticable to render complete juſtice to every individual, by the people in their collective capacity, therefore every nation has committed that power to certain ſelect magiſtrates, who with more eaſe and expedition can hear and determine complaints; and in England this authority has immemorially been exerciſed by the king or his ſubſtitutes. He therefore has alone the right of erecting courts of judicature: for, though the conſtitution of the kingdom hath entruſted him with the whole executive power of the laws, it is impoſſible, as well as improper, that he ſhould perſonally carry into execution this great and extenſive truſt: it is conſequently neceſſary, that courts ſhould be erected, to aſſiſt him in executing this power; and equally neceſſary, that, if erected, they ſhould be erected by his authority. And hence it is, that all juriſdictions of courts are either mediately or immediately derived from the crown, their proceedings run generally in the king's name, they paſs under his ſeal, and are executed by his officers.

It is probable, and almoſt certain, that in very early times, before our conſtitution arrived at its full perfection, our kings in perſon often heard and determined cauſes between party and party. But at preſent, by the long and uniform uſage of many ages, our kings have delegated their whole judicial power to the judges of their ſeveral courts; which are the grand depoſitary of the fundamental laws of the kingdom, and have gained a known and ſtated juriſdiction, regulated by certain and eſtabliſhed rules, which the crown itſelf cannot now alter but by act of parliament. And, in order to maintain both the dignity and independence of the judges in the ſuperior courts, it is enacted by the ſtatute 13 W. III. c. 2. that their commiſſions

Juſtice. miſſions ſhall be made (not, as formerly, *durante bene placito*, but) *quamdiu bene ſe geſſerint*, and their ſalaries aſcertained and eſtabliſhed; but that it may be lawful to remove them on the addreſs of both houſes of parliament. And now, by the noble improvements of that law in the ſtatute of 1 Geo. III. c. 23. enacted at the earneſt recommendation of the king himſelf from the throne, the judges are continued in their offices during their good behaviour, notwithſtanding any demiſe of the crown (which was formerly held immediately to vacate their ſeats), and their full ſalaries are abſolutely ſecured to them during the continuance of their commiſſions; his majeſty having been pleaſed to declare, that "he looked upon the independence and uprightneſs of the judges, as eſſential to the impartial adminiſtration of juſtice; as one of the beſt ſecurities of the rights and liberties of his ſubjects; and as moſt conducive to the honour of the crown."

In criminal proceedings, or proſecutions for offences, it would ſtill be a higher abſurdity, if the king perſonally ſat in judgment; becauſe in regard to theſe he appears in another capacity, that of *proſecuter*. All offences are either againſt the king's peace, or his crown and dignity; and are ſo laid in every indictment. For though in their conſequences they generally ſeem (except in the caſe of treaſon and a very few others) to be rather offences againſt the kingdom than the king; yet, as the public, which is an inviſible body, has delegated all its power and rights, with regard to the execution of the laws, to one viſible magiſtrate, all affronts to that power, and breaches of thoſe rights, are immediately offences againſt him, to whom they are ſo delegated by the public. He is therefore the proper perſon to proſecute for all public offences and breaches of the peace, being the perſon injured in the eye of the law. And this notion was carried ſo far in the old Gothic conſtitution, (wherein the king was bound by his coronation oath to conſerve the peace), that in caſe of any forcible injury offered to the perſon of a fellow-ſubject, the offender was accuſed of a kind of perjury, in having violated the king's coronation oath; *dicebatur fregiſſe juramentum regis juratum*. And hence alſo ariſes another branch of the prerogative, that of *pardoning* offences; for it is reaſonable, that he only who is injured ſhould have the power of forgiving. See PARDON.

In this diſtinct and ſeparate exiſtence of the judicial power, in a peculiar body of men, nominated indeed, but not removeable at pleaſure, by the crown, conſiſts one main preſervative of the public liberty; which cannot ſubſiſt long in any ſtate, unleſs the adminiſtration of common juſtice be in ſome degree ſeparated both from the legiſlative and alſo from the executive power. Were it joined with the legiſlative, the life, liberty, and property, of the ſubject would be in the hands of arbitrary judges, whoſe deciſions would be then regulated only by their own opinions, and not by any fundamental principles of law; which, though legiſlators may depart from, yet judges are bound to obſerve. Were it joined with the executive, this union might ſoon be an over-balance for the legiſlative. For which reaſon, by the ſtatute of 16 Car. I. c. 10. which aboliſhed the court of ſtar-chamber, effectual care is taken to remove all judicial power out of the hands of the king's privy-council; who, as then was evident from recent inſtances, might ſoon be inclined to pronounce that for law, which was moſt agreeable to the prince or his officers. Nothing therefore is more to be avoided in a free conſtitution, than uniting the provinces of a judge and a miniſter of ſtate. And indeed, that the abſolute power, claimed and exerciſed in a neighbouring nation, is more tolerable than that of the eaſtern empires, is in a great meaſure owing to their having veſted the judicial power in their parliaments, a body ſeparate and diſtinct from both the legiſlative and executive: and, if ever that nation recovers its former liberty, it will owe it to the efforts of thoſe aſſemblies. In Turky, where every thing is centered in the ſultan or his miniſters, deſpotic power is in its meridian, and wears a more dreadful aſpect. Juſtice.

A conſequence of this prerogative is the legal ubiquity of the king. His majeſty, in the eye of the law, is always preſent in all his courts, though he cannot perſonally diſtribute juſtice. His judges are the mirror by which the king's image is reflected. It is the regal office, and not the royal perſon, that is always preſent in court, always ready to undertake proſecutions, or pronounce judgment, for the benefit and protection of the ſubject. And from this ubiquity it follows, that the king can never be nonſuit; for a nonſuit is the deſertion of the ſuit or action by the non-appearance of the plaintive in court. For the ſame reaſon alſo, in the forms of legal proceedings, the king is not ſaid to appear by his attorney, as other men do; for he always appears, in contemplation of law, in his own proper perſon.

From the ſame original, of the king's being the fountain of juſtice, we may alſo deduce the prerogative of iſſuing proclamations, which is veſted in the king alone. See PROCLAMATION.

JUSTICIA, MALABAR-NUT; a genus of the monogynia order, belonging to the diandra claſs of plants. There are 19 ſpecies, all of them natives of the Eaſt Indies, growing many feet high; ſome adorned with fine large leaves, others with ſmall narrow ones, and all of them with monopetalous ringent flowers. Only two ſpecies are cultivated in our gardens, viz. the adhatoda or common Malabar-nut, and the hyſſopifolia or ſnap-tree. The firſt grows ten or twelve feet high, with a ſtrong woody ſtem, branching out widely all around; having large, lanceolate, oval leaves, placed oppoſite; and from the ends of the branches ſhort ſpikes of white flowers, with dark ſpots, having the helmet of the corolla concave. The ſecond hath a ſhrubby ſtem branching from the bottom pyramidally three or four feet high; ſpear-ſhaped, narrow, entire leaves, growing oppoſite; and white flowers, commonly by threes, from the ſides of the branches; ſucceeded by capſules, which burſt open with elaſtic force for the diſcharge of the ſeeds; whence the name of *ſnap-tree*. Both ſpecies flower here in ſummer, but never produce any fruit. They are propagated by layers and cuttings, and require the ſame treatment with other tender exotics.

JUSTICIAR, in the old Engliſh laws, an officer inſtituted by William the Conqueror, as the chief officer of ſtate, who principally determined in all caſes civil and criminal. He was called in Latin *Capitalis Juſticiarius totius Angliæ*. For JUSTICIAR in Scotland, ſee LAW, N° clvi. 10.—12.

Justiciary ‖ Justinian.

JUSTICIARY, or *Court of* JUSTICIARY, in Scotland. See LAW, N° clvi. 10—12.

JUSTIN, a celebrated hiſtorian, lived, according to the moſt probable opinion, in the ſecond century, under the reign of Antoninus Pius. He wrote, in elegant Latin, an abridgement of the hiſtory of Trogus Pompeius; comprehendiag the actions of almoſt all nations, from Ninus the founder of the Aſſyrian empire, to the emperor Auguſtus. The original work, to the regret of the learned, is loſt: this abridgement, being written in a polite and elegant ſtyle, was probably the reaſon why that age neglected the original. The beſt editions of Juſtin are, *ad uſum Delphini*, in 4to, and *cum notis variorum et Gronovii*, in 8vo.

JUSTIN (St.) commonly called *Juſtin Martyr*, one of the earlieſt and moſt learned writers of the eaſtern church, was born at Neapolis, the ancient Sechem of Paleſtine. His father Priſcus, a Gentile Greek, brought him up in his own religion, and had him educated in all the Grecian learning. To complete his ſtudies he travelled to Egypt; and followed the ſect of Plato, with whoſe intellectual notions he was much pleaſed. But one day, walking by the ſea-ſide, wrapt in contemplation, he was met by a grave ancient perſon, of a venerable aſpect; who, falling into diſcourſe with him, turned the converſation by degrees from the excellence of Platoniſm to the ſuperior perfection of Chriſtianity; and reaſoned ſo well, as to raiſe in him an ardent curioſity to inquire into the merits of that religion; in conſequence of which inquiry, he was converted about the year 132. On his embracing that religion, he quitted neither the profeſſion nor the habit of a philoſopher: but a perſecution breaking out under Antoninus, he compoſed *An apology for the Chriſtians*; and afterwards preſented another to the emperor Marcus Aurelius, in which he vindicated the innocence and holineſs of the Chriſtian religion, againſt Creſcens, a Cynic philoſopher, and other calumniators. He did honour to Chriſtianity by his learning and the purity of his manners; and ſuffered martyrdom in 167. Beſides his two Apologies, there are ſtill extant his *Dialogue with Trypho*, a Jew; two treatiſes addreſſed to the Gentiles, and another on the unity of God. Other works are alſo aſcribed to him. The beſt editions of St Juſtin are thoſe of Robert Stephens, in 1551 and 1571, in Greek and Latin: that of Morel, in Greek and Latin, in 1656; and that of Don Prudentius Marandus, a learned Benedictine, in 1742, in folio. His ſtyle is plain, and void of all ornament.

JUSTINIAN I. ſon of Juſtin the elder, was made Cæſar and Auguſtus in 527, and ſoon after emperor. He conquered the Perſians by Belifarius his general, and exterminated the Vandals; regained Africa; ſubdued the Goths in Italy; defeated the Moors; and reſtored the Roman empire to its primitive glory. See (Hiſtory of) CONSTANTINOPLE, n° 98,—102. and ITALY, n° 12. &c.

The empire being now in the full enjoyment of a profound peace and tranquillity, Juſtinian made the beſt uſe of it, by collecting the immenſe variety and number of the Roman laws into one body. To this end, he ſelected ten of the moſt able lawyers in the empire; who, reviſing the Gregorian, Theodoſian, and Hermogenian codes, compiled one body, called *Codex Juſtinianus*. This may be called the *ſtatute law*, as conſiſting of the reſcripts of the emperors. But the reduction of the other part was a much more difficult taſk: it was made up of the deciſions of the judges and other magiſtrates, together with the authoritative opinions of the moſt eminent lawyers; all which lay ſcattered, without any order, in no leſs than 2000 volumes and upwards. Theſe were reduced to the number of 50; but ten years were ſpent in the reduction. However, the deſign was completed in the year 553, and the name of *Digeſts* or *Pandects* given to it. Beſides theſe, for the uſe chiefly of young ſtudents in the law to facilitate that ſtudy, Juſtinian ordered four books of inſtitutes to be drawn up, containing an abſtract or abridgement of the text of all the laws: and, laſtly, the laws of modern date, poſterior to that of the former, were thrown into one volume in the year 541, called the *Novellæ*, or New Code.

Juſtinia ni ‖ Jutland.

This emperor died in the year 565, aged 83, in the 39th of his reign, after having built a great number of churches; particularly the famous Sancta Sophia at Conſtantinople, which is eſteemed a maſterpiece of architecture.

JUSTINIANI (St Laurence), the firſt patriarch of Venice, was born there, of a noble family, in 1381. He was a very pious prelate, and died in 1485; he left ſeveral pieces of piety, which were printed together at Lyons in 1568, in one volume folio, with his life prefixed by his nephew. Clement VII. beatified him in 1524, and he was canonized by Alexander VIII. in 1690.

JUSTINIANI (Bernard), was born at Venice in 1408. He obtained the ſenator's robe at the age of 19, ſerved the republic in ſeveral embaſſies, and was elected procurator of St Mark in 1474. He was a learned man, and wrote *the hiſtory of Venice*, with ſome other works of conſiderable merit; and died in 1498.

JUSTINIANI (Auguſtin), biſhop of Nebo, one of the moſt learned men of his time, was deſcended from a branch of the ſame noble family with the two foregoing; and was born at Genoa in 1480. He aſſiſted at the fifth council of Latcran, where he oppoſed ſome articles of the concordat between France and the court of Rome. Francis I. of France made him his almoner; and he was for five years regius profeſſor of Hebrew at Paris. He returned to Genoa in 1522, where he diſcharged all the duties of a good prelate; and learning and piety flouriſhed in his dioceſe. He periſhed at ſea in his paſſage from Genoa to Nebbio, in 1536. He compoſed ſeveral pieces; the moſt conſiderable of which is, *Pſalterium Hebræum, Græcum, Arabicum, et Chaldæum, cum tribus Latinis interpretationibus et gloſſis*. This was the firſt pſalter of the kind printed; and there is alſo aſcribed to the ſame prelate a tranſlation of Maimonides's *More Nevochim*.

JUTES, the ancient inhabitants of Jutland in Denmark.

JUTLAND, a large peninſula, which makes the principal part of the kingdom of Denmark. It is bounded on the ſouth-eaſt by the duchy of Holſtein, and is ſurrounded on the other ſides by the German ocean

Juvenal, Juvencus.

ocean and the Baltic sea. It is about 180 miles in length from north to south, and 50 in breadth from east to west. The air is very cold, but wholesome; and the soil is fertile in corn and pastures, which feed a great number of beeves, that are sent to Germany, Holland, and elsewhere. This was anciently called the *Cimbrian Chersonesus*, and is supposed to be the country from whence the Saxons came into England. It is divided into two parts, called *North* and *South Jutland*: the latter is the duchy of Slesvick, and lies between North Jutland and the duchy of Holstein; and the duke of that name is in possession of part of it, whose capital town is Gottorp, for which reason the sovereign is called the *duke of Holstein Gottorp*.

JUVENAL (Decius Junius), the celebrated Roman satyrist, was born about the beginning of the emperor Claudian's reign, at Aquinum in Campania. His father was probably a freed-man, who, being rich, gave him a liberal education, and, agreeably to the taste of the times, bred him up to eloquence; in which he made a great progress, first under Fronto the grammarian, and afterwards, as is generally conjectured, under Quintilian; after which he attended the bar, and made a distinguished figure there for many years by his eloquence. In the practice of this profession he had improved his fortune and interest at Rome before he turned his thoughts to poetry, the very style of which, in his satires, speaks a long habit of declamation; *subactum redolent declamatorem*, say the critics. It is said, he was above 40 years of age when he recited his first essay to a small audience of his friends; but, being encouraged by their applause, he ventured a greater publication: which reaching the ears of Paris, Domitian's favourite at that time, though but a pantomime player, whom our satyrist had severely insulted, that minion made his complaint to the emperor; who sent him thereupon into banishment, under pretence of giving him the command of a cohort in the army, which was quartered at Pentapolis, a city upon the frontiers of Egypt and Libya.

After Domitian's death, our satirist returned to Rome, sufficiently cautioned, not only against attacking the characters of those in power, under arbritrary princes, but against all personal reflections upon the great men then living; and therefore he thus wisely concludes the debate he is supposed to have maintained for a while, with a friend, on this head, in the first satire, which seems to be the first that he wrote after his banishment:

Experiar quid concedatur in illos
Quorum Flaminia tegitur cinis atque Latina.

"I will try what liberties I may be allowed with those whose ashes lie under the Flaminian and Latin ways," along each side of which the Romans of the first quality used to be buried.—It is believed that he lived till the reign of Adrian, in 128. There are still extant 16 of his satires, in which he discovers great wit, strength, and keenness in his language: but his style is not perfectly natural, and the obscenities with which these satires were filled render the reading of them dangerous to youth.

JUVENCUS (Caius Vectius Aquilinus), one of the first of the Christian poets, was born of an illustrious family in Spain. About the year 320 he put the life of Jesus Christ into Latin verse, of which he composed four books. In this work he followed almost word for word the text of the four evangelists: but his verses are written in a bad taste; and his Latin is not pure.

Juxon, Ixia.

JUXON (Dr William), born at Chicester in 1682, was bred at Merchant-Taylor's school, and from thence elected into St John's college, Oxford, of which he became president. King Charles I. made him bishop of London; and, in 1635, promoted him to the post of lord high treasurer of England. The whole nation, and especially the nobility, were greatly offended at this high office being given to a clergyman; but he behaved so well in the administration, as soon put a stop to all the clamour raised against him. This place he held no longer than the 17th of May 1641, when he prudently resigned the staff, to avoid the storm which then threatened the court and the clergy. In the following February, an act passed depriving the bishops of their votes in parliament, and incapacitating them from any temporal jurisdiction. In these leading steps, as well as the total abolition of the episcopal order which followed, he was involved with his brethren; but neither as bishop nor as treasurer was a single accusation brought against him in the long parliament. During the civil wars, he resided at his palace at Fulham, where his meek, inoffensive, and genteel behaviour, notwithstanding his remaining steady in his loyalty to the king, procured him the visits of the principal persons of the opposite party, and respect from all. In 1648, he attended on his majesty at the treaty in the isle of Wight; and, by his particular desire, waited upon him at Cotton-house, Westminster, the day after the commencement of his trial; during which he frequently visited him in the office of a spiritual father, and his majesty declared he was the greatest comfort to him in that afflictive situation. He likewise attended his majesty on the scaffold, where the king taking off his cloak and George, gave him the latter: after the execution, our pious bishop took care of the body, which he accompanied to the royal chapel at Windsor, and stood ready with the common-prayer book in his hands, to perform the last ceremony for the king; but was prevented by colonel Whichcot, governor of the castle.—He continued in the quiet possession of Fulham-palace till the ensuing year 1649, when he was deprived, having been spared longer than any of his brethren. He then retired to his own estate in Gloucestershire, where he lived in privacy, till the restoration, when he was presented to the see of Canterbury; and in the little time he enjoyed it, expended, in buildings and reparations at Lambeth-palace and Croydon-house, near 15,000 l. He died in 1663; having bequeathed 7000 l. to St John's college, and to other charitable uses near 5000 l. He published a *Sermon on Luke* xviii. 31. and *Some considerations upon the act of uniformity*.

IVY, in botany. See HEDERA.

IXIA, in botany, a genus of the monogynia order, belonging to the triandria class of plants. There are several species, consisting of herbaceous, tuberous, and bulbous-rooted flowery perennials, from one to two feet high, terminated by hexpetalous flowers of different colours. They are propagated by off-sets, which should be taken off in summer at the decay of the leaves:

Ixion, Jynx.

leaves: but as all the plants of this genus are natives of warm climates, few of them can bear the open air of this country in winter.

IXION, in fabulous hiſtory, king of the Lapithæ, married Dia the daughter of Deionius, to whom he refuſed to give the cuſtomary nuptial preſents. Deionius in revenge took from him his horſes: when Ixion, diſſembling his reſentment, invited his father-in-law to a feaſt, and made him fall through a trap-door into a burning furnace, in which he was immediately conſumed. Ixion being afterwards ſtung with remorſe for his cruelty, ran mad; on which Jupiter, in compaſſion, not only forgave him, but took him up into heaven, where he had the impiety to endeavour to corrupt Juno. Jupiter, to be the better aſſured of his guilt, formed a cloud in the reſemblance of the goddeſs, upon which Ixion begat the centaurs: but boaſting of his happineſs, Jove hurled him down to Tartarus, where he lies fixed on a wheel encompaſſed with ſerpents, which turns without ceaſing.

JYNX, in ornithology, a genus of birds belonging to the order of accipitres. Of this genus there is only one known ſpecies, called, from its ſingular manner of twiſting its head about, *wry-neck*. "Nature, (ſays Mr Pennant), by the elegance of its penciling the colours of this bird, hath made ample amends for their want of ſplendor. Its plumage is marked with the plaineſt kinds. A liſt of black and ferruginous ſtrokes divides the top of the head and back. The ſides of the head and neck are aſh-coloured, beautifully traverſed with fine lines of black and reddiſh brown. The quill-feathers are duſky; but each web is marked with ruſt-coloured ſpots. The chin and breaſt are of a light yellowiſh brown, adorned with ſharp pointed bars of black. The tail conſiſts of ten feathers, broad at their ends and weak; of a pale aſh colour, powdered with black and red, and marked with four equidiſtant bars of black. The tongue is long and cylindric; for the ſame uſe as that of the woodpecker. The toes are alſo diſpoſed the ſame way. The bill is ſhort, weak, and a little arcuate. The irides are of a yellowiſh hazel. Jynx.

"The wry-neck we believe to be a bird of paſſage, appearing here in the ſpring before the cuckoo. The Welſh conſider it as the forerunner or ſervant of that bird, and call it *Gwas y gog*, or the cuckoo's attendant: the Swedes regard it in the ſame light. The food of this ſpecies is inſects; but chiefly ants, for on examination we found the ſtomach of one filled with their remains. As the tongue of this bird, like that of the ant-bear or tamandria, is of an enormous length; it poſſibly not only makes uſe of it to pick thoſe inſects out of their retreat, but like that quadruped may lay it across their path, and when covered with ants draw it into its mouth. Its weight is one ounce and a quarter: the length ſeven inches; the breadth 11. It takes its name from a manner it has of turning its head back to the ſhoulders; eſpecially when terrified: it has alſo the faculty of erecting the feathers of the head like thoſe of the jay. Its note is like that of the keſtril, a quick-repeated ſqueak. Its eggs are white, and have ſo thin a ſhell that the yolk may be ſeen through it. This bird builds in the hollows of trees, making its neſt of dry graſs, in which we have counted nine young.
