DICTIONARY

OF

ARTS, SCIENCES,

AND

MISCELLANEOUS LITERATURE;

Conſtructed on a PLAN,

BY WHICH

THE DIFFERENT SCIENCES AND ARTS

Are digeſted into the FORM of Diſtinct

TREATISES OR SYSTEMS,

COMPREHENDING

The HISTORY, THEORY, and PRACTICE, of each,
according to the Lateſt Diſcoveries and Improvements;

AND FULL EXPLANATIONS GIVEN OF THE

VARIOUS DETACHED PARTS OF KNOWLEDGE,

WHETHER RELATING TO

NATURAL and ARTIFICIAL Objects, or to Matters ECCLESIASTICAL,
CIVIL, MILITARY, COMMERCIAL, *&c.*

Including ELUCIDATIONS of the moſt important Topics relative to RELIGION, MORALS,
MANNERS, and the OECONOMY of LIFE:

TOGETHER WITH

A DESCRIPTION of all the Countries, Cities, principal Mountains, Seas, Rivers, *&c.*
throughout the WORLD;

A General HISTORY, *Ancient* and *Modern*, of the different Empires, Kingdoms, and States;

AND

An Account of the LIVES of the moſt Eminent Perſons in every Nation,
from the earlieſt ages down to the preſent times.

Compiled from the writings of the beſt Authors, in ſeveral languages; the moſt approved Dictionaries, as well of general ſcience as of its particular branches; the Tranſactions, Journals, and Memoirs, of Learned Societies, both at home and abroad; the MS. Lectures of Eminent Profeſſors on different ſciences; and a variety of Original Materials, furniſhed by an Extenſive Correſpondence.

THE THIRD EDITION, IN EIGHTEEN VOLUMES, GREATLY IMPROVED.

ILLUSTRATED WITH FIVE HUNDRED AND FORTY-TWO COPPERPLATES.

VOL. XI.

INDOCTI DISCANT, ET AMENT MEMINISSE PERITI.

EDINBURGH:
PRINTED FOR A. BELL AND C. MACFARQUHAR.
MDCCXCVII.

ENCYCLOPÆDIA BRITANNICA.

M E D A L S.

Utility of them in History, &c.

MEDAL, denotes a piece of metal in the form of coin, such as was either current money among the ancients, or struck on any particular occasion, in order to preserve to posterity the portrait of some great person, or the memory of some illustrious action. Scaliger derives the word *medal* from the Arabic *methalia*; a sort of coin with a human head upon it. But the opinion of Vossius is generally received; viz. that it comes from *metallum*, "metal;" of which substance medals are commonly made.

Sect. I. *Utility of Medals in History, and various other Sciences.*

There are few studies of more importance to history than that of medals; the sole evidence we can have of the veracity of an historian being only such collateral documents as are evident to every body, and cannot be falsified. In modern times, these are found in public memoirs, instructions to ambassadors, and state papers of various kinds. Such memorials, however, are subject to various accidents, and besides commonly remain in the countries where they are first published, and cannot therefore give to the world at large that perfect and entire satisfaction which ought to be derived from genuine history; so that more durable and widely diffused monuments are still to be wished for. Such are public buildings, inscriptions, and statues; but these, excepting a few instances of the two last, are always confined to particular countries; so that medals alone remain as infallible documents of truth, capable of being diffused over all countries in the world, and of remaining through the latest ages.

1 Various writers on medals.

The first who showed the importance of medals in ascertaining the dates, and arranging the order of events, in ancient history, by means of medals, was Vaillant, in his History of the Kings of Syria, printed at Paris in 1681. By medals alone, he has been enabled to fix the chronology and important events of history, in the three most ancient kingdoms of the world, viz. Egypt, Syria, and Parthia. Many coins have been discovered since his time, which confirm the accounts he has given. He was followed in this method by Father Hardouin, though with less success. Hardouin's best work is his *Herodiades*, or Series of Successors to Herod king of Judæa. The same plan was pursued by Noris, in his learned Treatise on the Syro-Macedonian princes, and by Bayer in his History of Osrhoene, as well as by Froelich, in the work intitled *Annales Regum et Rerum Syriæ*, Vien. 1754, and another named Kevenhullers *Regum veterum Numismata Anecdota aut Perrara*, Vien. 1752, 4to, of which Froelich was properly the author. Corsini and Cary likewise published works of a similar nature; the former in 1744, *De Minnisari, aliorumque Armeniæ Regum, Nummis*, &c.; the latter in 1752, *Histoire des Rois de Thrace, et du Bosphore Cimmerien, eclaircie par les Medailles.*

2 Of the Greek coins.

The study of the Greek coins does not show the dates of events, though it illustrates the chronology of reigns. This defect, however, is abundantly supplied by those of Rome, which commonly mark the date of the prince's consulship, the year of his tribunician power; giving also, upon the reverse, the representation or poetical symbol of some grand event. The year of the tribunician power is sometimes imagined by antiquaries to be synonymous with that of the emperor's reign: but this is not the case; and Mr Pinkerton is at some pains to set them right in this respect. He finds fault with Julius Cæsar, when he assumed the sovereign authority, for taking upon him the title of Perpetual Dictator, as being synonymous with that of king or absolute governor, which the Romans abhorred. "He ought (says our author), under the disguise of some supreme magistrate of annual election, to have lulled the people with a dream, that they might terminate his power when they pleased; or that he himself would resign it, when the necessities of state which had required his temporary elevation had subsided." To this error Mr Pinkerton ascribes the assassination of the Dictator, and commends the policy of Augustus, who, with far inferior abilities, continued in possession of the most absolute authority as long as he lived. The tribuneship was an office of annual election; and if put into the hands of any others than plebeians, must have been the supreme power of the state, as it belonged to that office to put a negative upon every public measure whatever. Augustus, being of senatorial rank, could not assume this office; but he invested himself with the tribunician power, which had the advantages of appearing to be only a temporary supremacy, though in truth it was continued during his whole lifetime. Towards the end of his reign, he frequently assumed his destined successor, Tiberius, for his colleague, though in the beginning he had enjoyed it alone. This, with his artifice of resigning his power every ten years, and

3 Method used by Augustus to secure his power.

Utility of them in Hiſtory, &c.

re-aſſuming it at the deſire, as was pretended, of the ſenate, ſecured his ſovereignty as long as he lived.— His example was followed by his ſucceſſors; ſo that moſt of them have the inſcription *Tribunicia Poteſtate* upon their medals, with the date affixed to it thus, *Tr. Pot.* VII. Yet though this date generally implies the year of the emperor's reign, it ſometimes happens that the emperor, by ſpecial favour from a former prince, had been endowed with this title before he came to the throne, as being the ſucceſſor to that prince, of which we have already given an inſtance in Tiberius. Beſides the tribunician power, the emperors very frequently enjoyed that of the conſuls; and the date of their conſulſhip is frequently expreſſed in their coins.

The office of Pontifex Maximus was likewiſe aſſumed by the Roman emperors in order to ſecure themſelves in their authority; which, Mr Pinkerton obſerves, was one of the moſt efficacious artifices they could have fallen upon. "In the Greek heroic times (ſays he), king and prieſt were carefully united in one perſon; and when ſovereigns aroſe in Denmark and Sweden, the ſame plan was followed, as appears from Snorro, and other writers. Nothing could lend more ſecurity to the perſon of the monarch than an office of ſupreme ſanctity, which alſo confirmed his power by all the terrors of ſuperſtition. Even the Chriſtian ſyſtem was afterwards debaſed by a mock alliance with government; though it be clear from the whole New Teſtament, that ſuch an alliance is ſubverſive of its genuine inſtitution, and the greateſt of all its corruptions. But the Roman Catholic clergy, in the dark ages, were the authors of 'no church no king,' for their own intereſt; while the Roman emperors only ſought to ſtrengthen their power by the dark awe of ſuperſtition. The title of Pontifex Maximus was ſo important, that it was retained even by the Chriſtian emperors till the time of Gratian. Its influence in the ſtate was, indeed, prodigious. Cicero obſerves, that to this office were ſubject temples, altars, penates, gods, houſes, wealth, and fortune of the people.— That of augur is alſo borne by many emperors; and its authority was ſuch, that by the law of the twelve tables no public buſineſs could be tranſacted without a declaration from the augur concerning its event.— The pro-conſular power was alſo given to Auguſtus and the other emperors. It conferred a direct authority over all the provinces, and implied the emperor to be chief pro-conſul, or governor of each, and of all. Another ſpecial power aſſigned to the emperors, but not occurring on coins, was the *Jus Relationis Tertiæ, Quartæ*, &c. or the right of making three or four motions in the ſenate on the ſame day, while the ſenators could only propoſe one.

Hence our author infers, that medals afford the moſt authentic documents of the Roman hiſtory, in particular, that could have been invented by man.— The hiſtories of Nerva and Trajan are much better elucidated by medals than by authors; for the hiſtory of Suetonius ends with Domitian, and the *Hiſtoriæ Auguſtæ Scriptores* begins with Adrian: ſo that the reigns of the two emperors juſt mentioned are almoſt unknown; and Mr Pinkerton is ſurpriſed that none of the learned have attempted to ſupply the defect.— "Capitolinus (ſays he), in his life of Maximinus Junior, is quite puzzled to know if Maximus and Pupienus were two emperors, or two names for the ſame. Had he happened on any of thoſe coins which bear M. CL. PUPIENUS MAXIMUS AUG. he would have ſeen at once that Maximus was only another name for Pupienus."

4 Uſe of medals in geography.

Medals are uſeful in other ſciences beſides hiſtory. In geography, we find the ſituation of towns determined by their vicinity to ſome noted river, mountain, &c. Thus, ΜΑΓΝΗΤΩΝ ΣΙΠΥΛΟΥ ſhows that Magneſia was ſituated under Mount Sipylus. In like manner, it is ſhown from a medal, that Epheſus ſtood on the river Cayſter; and there is extant a medal, bearing an inſcription, which ſignifies Alexandria on the Scamander; a name given to Troy by Alexander the Great. The reverſe has upon it the famous Apollo Smintheus of Homer. In natural hiſtory, alſo, medals are uſeful chiefly from the coins ſtruck on the celebration of the ſecular games, in which the figures of various animals are preſerved; and thus it may very often be determined whether any animal be known to the ancients or not. On many of the Greek medals are ſeveral uncommon plants and animals. Thus, on moſt of the medals of Cyrene is the figure of the celebrated *Sylphium*; and on thoſe of Tyre, the ſhell-fiſh from which the famous Tyrian purple was procured. By means of medals, alſo, the exact delineations of many noble edifices are preſerved, though not even a veſtige of their ruins be now exiſting; ſo that the uſes of them to the architect are very conſiderable. To the connoiſſeur they are abſolutely neceſſary; becauſe by them alone he is enabled to aſcribe ancient buſts and ſtatues to their proper perſons, with multitudes of other points of knowledge which cannot be otherwiſe determined. The elucidations of obſcure paſſages in ancient authors by means of medals are ſo numerous and well known, that it is needleſs to inſiſt upon them.

5 In natural hiſtory.

6 In architecture.

7 In the fine arts.

Mr Addiſon has treated the connection betwixt medals and poetry at conſiderable length; but Mr Pinkerton finds fault with him for preferring the Latin to the Greek poets. He obſerves alſo, that the knowledge of Greek medals is moſt neceſſary for a ſculptor, and perhaps an architect; but an acquaintance with Latin ones is preferable for a poet, or perhaps a painter. The reaſon of this difference is, that the former generally have on the obverſe the head of ſome king, god, or goddeſs, of exquiſite relief and workmanſhip; but the reverſe ſeldom affords much fancy of ſymbol in the early Greek coins; and in the imperial Greek coins, is chiefly impreſſed with the temples of their deities. To a perſon of poetical imagination, however, the Roman coins afford the greateſt entertainment, from the fine perſonifications and ſymbols to be found on their reverſes; of which our author gives the following inſtances:

8 Latin medals of uſe to a poet.

9 Perſonifications on Roman medals.

"HAPPINESS has ſometimes the caduceus, or wand of Mercury, which Cicero, 1. *Offic.* tells us was thought to procure every wiſh. She has in a gold coin of Severus heads of poppy, to expreſs that our prime bleſs lies in oblivion of misfortune.

"HOPE is repreſented as a ſprightly girl, walking quickly, and looking ſtraight forward. With her left hand

Utility of them in History, &c.

hand ſhe holds up her garments, that they may not impede the rapidity of her pace; while in her right hand ſhe holds forth the bud of a flower; an emblem infinitely more fine than the trite one of an anchor, which is the ſymbol of Patience and not of Hope. This perſonification, with ſome others, muſt have been very familiar to the ancients; for often in this, and in a few more inſtances, no name, as SPES AUG. or the like, is inſerted in the legend.

"ABUNDANCE is imagined as a ſedate matron, with a cornucopia in her hands, of which ſhe ſcatters the fruits, and does not hold up her cornucopia and keep the contents to herſelf, as many modern poets and painters make her do.

"The Emperor Titus, having cauſe to import a great ſupply of corn during a ſcarcity at Rome, that ſupply, or the ANNONA, is finely repreſented as a ſedate lady, with filled cornucopia in her left hand, which ſhe holds upright, to indicate that ſhe does not, however, mean to ſcatter it, as Abundance has a title to do, but to give it to Equity to deal out. This laſt particular is ſhown by her holding a little image of Equity, known by her ſcales and *haſta pura*, or pointleſs ſpear, in her right hand, over a baſket filled with wheat. Behind the ANNONA is the prow of a ſhip decked with flowers, to imply that the corn was brought by ſea (from Africa), and that the ſhips had had a proſperous voyage. The beſt poet in the world would not have given us a finer train of imagery; the beſt painter would have been puzzled to expreſs ſo much matter in ſo ſmall a compaſs.

"SECURITY ſtands leaning upon a pillar, indicative of her being free from all deſigns and purſuits; and the poſture itſelf correſponds to her name. Horace, in deſcribing the wiſe man, mentions his being *teres atque rotundus*; round and poliſhed, againſt all the rules of chance: an idea ſeemingly derived from the column upon which this ideal lady reclines.

"The emblems of PIETY, MODESTY, and the like, are equally appoſite and poetical.

"The happineſs of the ſtate is pictured by a ſhip ſailing before a proſperous breeze: an image than which the ſuperlative genius of Gray could find none more exquiſite; and he has accordingly uſed it in his moſt capital production "The Bard," with due ſucceſs.

"The different countries of the then known world are alſo delineated with great poetical imagery. It affords patriotic ſatisfaction in particular to a Briton, to ſee his native iſland often repreſented upon the earlieſt imperial coins ſitting on a globe, with a ſymbol of military power, the *labarum* in her hand, and the ocean rolling under her feet. An emblem almoſt prophetic of the vaſt power which her dominion over the ſea will always give her, provided ſhe exerts her element of empire with due vigour and perſeverance.

"Coins alſo preſent us with Achaia, Africa, Alamannia, Alexandria, Arabia, Armenia, Aſia, Bithynia, Cappadocia, Dacia, Dardania, Egypt, Gallia, Hiſpania, Italia, Judæa, Macedon, Mauritania, Pannonia, Parthia, Phrygia, Sarmatia, Sicily, Scythia, Syria, and the rivers Danube, Nile, Rhine, Tyber. This perſonification of provinces ſeems to have ariſen from the figures of provinces carried in triumphs; as the perſonification of our old poets ſprung from the ideal perſons actually repreſented in the myſterial plays.

Utility of them in History, &c.

"There is one colonial medal of rude execution of Auguſtus and Agrippa, which has an high claim to merit in diſplaying the ancient poetical imagery. It is inſcribed IMP. and DIVI. F. and on the reverſe, the conqueſt of Egypt is repreſented by the metaphor of a crocodile, an animal almoſt peculiar to that country, and at that period eſteemed altogether ſo; which is chained to a palm-tree, at once a native of the country, and ſymbolic of victory.

To Medals uſeful to a painter.

"As the reverſes are ſo uſeful for knowledge of perſonification, ſymbols of countries and actions, and the like; ſo the portraits to be ſeen on old coins are no leſs important to a painter; the high merit of a great number of them, in every character, juſtly intitling them to be regarded as the beſt ſtudies in the world. Not to mention, that, to an hiſtoric painter, the ſcience of ancient medals is abſolutely neceſſary, that he may delineate his perſonages with the features they really bore while in exiſtence. This can only be attained in this way, or from ſtatues and buſts; any one of which will coſt as much as hundreds of medals; and indeed a collection of ſuch is only attainable by princes."

To a ſculptor.

The ſame things which render the ſtudy of medals important to a painter, do ſtill more ſo to a ſculptor; and in this particular, the ſtudy of the Greek coins is remarkably uſeful. The ſkill of the Greeks in the art of ſculpture has always been admired throughout the world; and on their coins the heads of ſeveral deities are repreſented in the moſt exquiſite *alto-relievo*. Our author therefore thinks it ſtrange, that the Grecian coins ſhould have hitherto been ſo little attended to by men of learning and taſte. They may have been looked upon, he ſuppoſes, as belonging only to the province of the antiquary; but he aſſures us, that the Greek medals will afford ſatisfaction to the perſons who value them only as pieces of workmanſhip. In moſt reſpects, they greatly excel thoſe of Rome even in its beſt times; which our author ſuppoſes to have been from the days of Auguſtus to Adrian. "In the days of Adrian, in particular (ſays he), the Roman mint ſeems to have been the very ſeat of art and genius; witneſs the vaſt number of exquiſite perſonifications, engraven with equal workmanſhip, which ſwarm on the medals of that prince. Yet from his time down to Poſthumus, coins of admirable workmanſhip are to be found. Thoſe of the Fauſtinas and Lucilla deſerve particular mention. There is one, and not an uncommon one, of the latter in great braſs, which yields to nothing of the kind. The reverſe is a Venus with the name around her. The portrait of the obverſe ſeems to ſpring from the field of the coin; it looks and breathes, nay talks, if you truſt your eyes. The coins of Tarſus are extremely remarkable for a kind of perſpective in the figures, as Froelich obſerves. On others are found triumphal arches, temples, fountains, aqueducts, amphitheatres, circi, hippodromes, palaces, baſilicas, columns and obeliſks, baths, ſea-ports, pharoſes, and the like. Theſe furniſh much pleaſure and inſtruction to the architect, and ſerve to form his taſte to the ancient manner; that manner which unites perfect ſimplicity with ſublimity and grace; that manner which every

Entertainment from studying them.

age admires, in proportion as it has genius to imitate."

Sect. II. *Entertainment arising from the Study of Medals.*

Besides the purposes which the study of medals answers in the useful arts, a great variety of sources of entertainment are to be found in it. Mr Pinkerton observes, that the most barbarous nations are more pleased with the rudest efforts of art, than with the most admirable works of nature; and that in proportion as the powers of the mind are large and various, such are also the pleasures which it receives from those superlative productions of art, which can only be the offspring of vast genius. Hence works of art are agreeable both to the enlightened and to the ignorant. The chief amusement, therefore, which attends the study of medals, originates from the strength and spirit, the finish and beauty, which the engraver has displayed in the execution of them. It besides gives a kind of personal acquaintance with the persons of whom they are the representations. Portraits have always been highly entertaining to mankind; and our author is of opinion, that the love of them gave rise both to painting and sculpture. They are no where to be found so ancient, numerous, and so well preserved as in medals. Amusement is also derived even from the representations of ideal heads and persons; nay, even from the minutest symbols. Thus the Greek coins of cities present us with heads of deities of exquisite workmanship, apparently copied from statues or paintings; so that we may even guess at the works of Apelles and Praxiteles from some of the Greek medals. Their reverses afford still greater variety; there being scarce an object either in art or nature which is not represented upon some of them: and to the satisfaction arising from a view of these, we may likewise add that of beholding, in a lively manner, the dresses, manners and customs, religious and civil ceremonies, of the ancients: so that from medals we may obtain an interesting history of manners; which, though very lately cultivated, may perhaps afford the most useful and entertaining of all the provinces of history.

11 Difference betwixt a medallist and antiquary.

There is a very considerable difference betwixt the study of medals and that of a mere antiquary. The latter frequently seems to take delight in coins merely in proportion to their rust and deformity; so that it is often a recommendation of some of their pieces, that neither portrait, reverse, nor legend, can be discovered; at least in such manner as can be intelligibly explained. "The delight of the antiquarist (says Mr Pinkerton) may be called a depraved appetite of the mind, which feeds on trash, and fills itself with emptiness. It is perhaps a mere childish curiosity mingled with caprice and hypochondricism. Against this character the ridicule of Severus is particularly shot, but with little effect; for our antiquists exceed in visions and nonsense. I say *antiquists*; for the name of antiquary is sacred. By *antiquary*, in foreign countries, is implied a man who illustrates their ancient laws, manners, poetry, but especially their ancient history. There, men of the most elevated minds are antiquaries; as Muratori, Leibnitz, Montesquieu, Du Bos. Here men of talents will not stoop, forsooth, to studies the most important to their country, but leave its antiquities to chance. Every thing is important but our history; and we are profound in every ancient matter that is superficial; and superficial in what is profound. Even England cannot boast of one general historian, but trusts to the inaccuracy of Rapin, and the ignorant neatness of Hume. It is therefore no wonder that the study of antiquity is here ridiculous, though most important in other countries; none requiring greater talents, learning, or industry. But the historic antiquary has the pleasure of benefiting society, and enlightening whole nations, while the medallic has only an innocent amusement. This amusement, considered merely as rising from antiquarian objects, has not been explained, though felt by most people, and more by the learned. It seems analogical with that which we derive from an extensive prospect: for as the mind delights to expand itself into distant places, so also into distant times. We connect ourselves with these times, and feel as it were a double existence. The passions are singularly affected by minute circumstances, though mute to generalities; and the relicts of antiquity impress us more than its general history."

History.

Sect III. *History of Medals.*

The study of medals is not of very ancient date: None of the classic writers give any account of collections of them; though indeed many little particulars are passed without notice by them. In the times of the Greeks, a collection of such coins as then existed must have been but little regarded, as consisting only of those struck by the numerous little states which at that time used the Greek characters and language. Hence they would have had an air of domestic coinage, and no attention would have been paid to them, however exquisite their workmanship might have been. The little intercourse at that time carried on betwixt the different provinces also, greatly impeded any communication of knowledge to those who wrote histories; so that it is no wonder to find any small collections that might then have existed altogether unnoticed by them.

13 Greek coins imitated by the Romans.

Almost as soon as any communication was opened between the Greeks and Romans, the latter treated the arts of the Greeks with all due respect and applause. Their coins were imitated by the Romans, and preserved in cabinets by the senators among their choicest treasures. Suetonius informs us, that on solemn occasions Augustus was accustomed to present his friends with medals of foreign states and princes, along with other valuable testimonies of his friendship. In a more advanced period of the Roman empire, however, individuals would undoubtedly form collections of coins peculiar to their own state; for Dr Stukeley, in his Medallic History of Carausius, informs us, that a complete series of silver coins was lately found in Britain, containing all the emperors down to Carausius inclusively. From Banduri we also know, that certain Greek coins were specially preserved by the Romans; and it appears from their code, that ancient gold and silver coins were made use of instead of gems; to which distinction those of Sicily were particularly intitled. From the decline of the Roman empire till towards the end of the 5th century, History. ry, almost all branches of literature were involved in darkness, and the medallic science among the rest. While the Christian dominion of Constantinople lasted, indeed, almost all the arts and sciences may be said to have been kept within its own boundaries; though the Arabs and eastern nations had some arts and sciences of their own: but after the destruction of the imperial city by the Turks, the Greeks were once more compelled to become fathers to the European Science. Even before this time, indeed, some vestiges of a revival of literature had appeared in Italy; "and so intimate and necessary a connection (says Mr Pinkerton) has now the study of medals with that of ancient erudition, that on the earliest appearance of a revival of the latter, the former was also disclosed."

14 Collectors of medals. The first among the moderns who began to study the medallic science was Petrarch. Being desired by the Emperor Charles IV. to compose a book containing the lives of eminent men, and to place him in the list, he replied, that he would do so whenever the emperor's life and conduct deserved it. In consequence of this conversation he afterwards sent the emperor a collection of gold and silver coins bearing the representations of eminent men, with an address suitable to his former declaration. A collection of coins was made in the next age by Alphonso king of Arragon; but though this monarch collected all that could be found throughout Italy, we know that there could not have been very many, as the whole were contained in an ivory cabinet, and carried always about with him. A very considerable collection was made by Anthony Cardinal St Mark, nephew to Eugene IV. who ascended the pontifical chair in 1431; and soon after the grand museum at Florence was begun by Cosmo de Medici, where a collection of ancient coins and medals had a place among other curiosities. Corvinus king of Hungary about the same time formed a noble collection of coins along with ancient manuscripts and other valuable relicts of antiquity.

Mr Pinkerton considers Agnolo Poliziano, more commonly known by the name of *Angelus Politianus*, as the first writer who adduced medals as vouchers of ancient orthography and customs. He cites different coins of the Medicean collection in his Miscellanea written about the year 1490. By means of a cabinet of medals collected by Maximilian I. emperor of Germany, Joannes Huttichius was enabled to publish a book of the lives of the emperors, enriched with their portraits, delineated from ancient coins. It is generally supposed that this book, which appeared in 1525, was the first work of the kind; but Labbe, in his *Bibliotheca Nummaria*, mentions another named *Illustrium Imagines*, by one Andreas Fulvius, printed in 1517, in which most of the portraits seem to be from medals. About the year 1512 also, Guillaume Bude, a French author, had written his treatise *De Asse*, though it was not printed till many years afterwards. M. Grollier, treasurer of the French armies in Italy, during part of the 16th century, had a great collection of coins of different kinds of metals. After his death, his brass medals were sent to Provence, and were about to be sent into Italy; when the king of France, having got information of the transaction, gave orders to stop them, and purchase the whole at a very high price for his own cabinet of antiquities. M. Grollier had an assortment of gold and silver as well as of brass medals: the cabinet in which they were contained fell two centuries afterwards into the hands of M. L'Abbe de Bothelin; and was known to have been that of Grollier from some slips of paper, on which was his usual inscription for his books, *Joannis Grollierii, et amicorum.*

15 Number of cabinets. Cotemporary with Grollier was Guillaume de Choul, who was likewise a man of rank and fortune. He had a good collection of medals, and published many in his Treatise on the Religion of the ancient Romans in 1557. In the low countries we know, from the letters of Erasmus, that the study of medals was begun about the beginning of the 16th century. About the middle of that century, Hubertzus Goltzius, a printer and engraver, travelled over most countries in Europe searching for coins and medals, in order to publish books concerning them. From one of these works it appears, that there were then in the low countries 200 cabinets of medals; 175 in Germany, upwards of 380 in Italy, and 200 in France. It is probable, however, that there are now four times as many in these countries, besides 500 in Britain; but we are not to imagine that all these were grand collections, for of such there are not above a dozen even in Italy: most of those just mentioned were of the class named *caskets* of medals, containing from 100 to 1000 or 2000.

16 Number of coins found in Britain. There are few countries, Italy excepted, in which a greater number of coins have been found than in Britain; though we are by no means well acquainted with the time when the study of them commenced. Mr Pinkerton suspects that Cambden was one of the first, if not the very first, British author who produced medals in his works, and who must have had a small collection. Speed's Chronicle, published in the 17th century, was illustrated with coins from Sir Robert Cotton's cabinet. Gorlæus's collection was purchased by Henry prince of Wales, brother to Charles I. to whom he left it at his death According to Joseph Scaliger, it consisted of 30,000 coins and medals. A collection of 5500 coins was purchased by Archbishop Laud for L.600, and given to the Bodleian library. Thomas earl of Arundel, earl-marshal of England, well known from the Arundelian tables and other antiquities which he imported from Greece and Italy into Britain, had a rich cabinet of medals collected by Daniel Nisum. The dukes of Buckingham and Hamilton, Sir William Paston, Sir Thomas Fanshaw of Ware-Park, Sir Thomas Hanmer, Ralph Sheldon, Esq; Mr Selden, &c. are enumerated by Evelyn as collectors of medals. Charles I. as well as his historian the earl of Clarendon, were also collectors. The king had a very fine cabinet; which, however, were dissipated and lost during the civil commotions. Oliver Cromwell had a small collection; and the cabinet of Charles II. is mentioned by Vaillant in the preface to his treatise intitled *Nummi in Coloniis*," &c. This branch of magnificence has not been much attended to by succeeding British monarchs; though his present majesty has a very good collection of ancient gold coins.

17 British cabinets. A great number of fine cabinets have been formed in Britain since the time of Evelyn. About the year 1720 Haym makes mention of those of the duke of Devonshire, the earls of Pembroke and Winchelsea, Sir

Of what constructed

Sir Hans Sloane, Sir Andrew Fontaine, Mr Sadler, Mr Abdy, Mr Wren, Mr Chichelcy, and Mr Kemp. At present there are many remarkable collections; but that of the late Dr Hunter is deservedly esteemed the most remarkable in Europe, excepting that of the French king. It was not only formed at a great expence, but with much care and ability; many foreign medals offered to it having been rejected. The other remarkable collections are those of the duke of Devonshire, the earl of Pembroke, earl Fitzwilliam, formerly the marquis of Rockingham's, the honourable Horace Walpole, the reverend Mr Crachrode, the reverend Mr Southgate, Mr Townley, Mr R. P. Knight, Mr Edward Knight, Mr Tyson, Mr Barker, Mr Brown, and several others. The museum and universities have also collections; as well as the lawyers library, and the colleges in Scotland.

Sect. IV. *Materials of which Medals are constructed.*

18 Ancient gold coin.

Medals are formed of gold, silver, and the various modifications of copper. The gold usually made use of in coinage is about the fineness of 22 carats; and as the art of purifying this metal was very much unknown in former times, the most ancient medals are for this reason much more impure than the modern coins. Gold is never found in its native state above 22 carats fine; and the very ancient medals are much under that standard. Many of them are composed of a mixture of gold and silver, called by the ancients *electrum*. The gold medals were made of much finer metal after Philip of Macedon became possessed of the gold mines of Philippi in Thrace, and the medals of his son Alexander the Great are equally fine; as well as those of some other princes of that age. Those of the Egyptian Ptolemies are of the fineness of 23 carats three grains, with only one grain of alloy. The Roman coins are very pure even from the earliest times; the art of refining gold being well known before any was coined at Rome. Some authors are of opinion, that the Roman coins begin to fall short of their purity after the time of Titus; but Mr Pinkerton denies that any thing of this kind takes place till the time of the Emperor Severus; and even then only in a very few instances. Most of the Roman gold was brought from Dalmatia and Dacia, where that metal is still to be met with. A very remarkable circumstance is observed in the eastern part of Hungary, which belonged to the ancient Dacia: It germinates in the vines of Tokay, and is found in their stems; as it is elsewhere in the straw of corn.

19 Metal called *electrum*.

Pliny informs us, and indeed it is generally known, that gold and silver are found mixed together in the earth. When the silver amounted to one-fifth part of the gold, the metal was called *electrum*; but sometimes the quantity of silver was added artificially. The gold was in those days as well as at present refined by means of mercury: and the ancient artists had certainly attained to great perfection in this branch of metallurgy; as Bodin tells us, that the goldsmiths of Paris upon melting one of Vespasian's gold coins found only $\frac{1}{788}$ part of alloy.

20 Ancient silver.

Most of the ancient silver, particularly that of Greece, is less pure than that of succeeding times; even the Roman silver is rather inferior to the present standard, and that from the very beginning; but in the time of Severus, the silver appears very bad, and continues so until the time of Dioclesian. Many writers upon this subject have mistaken the *denarii aerei*, "coins of brass washed with silver," for silver currency. Silver coins are extremely scarce from the time of Claudius Gothicus to that of Dioclesian, or from the year 270 to 284; in which short space no fewer than eight emperors reigned. Silver at that time was found mostly in Spain; and the commerce with that country was disturbed by the usurpers who arose in Gaul: and such were the troubles of the times, that not only the silver, but also the gold coins of those eight emperors, are extremely scarce. There is still, however, some silver extant of these eight emperors; and it is certain, that copper washed was never used as silver currency, but was entirely a distinct coinage. Occasional depravations of silver had taken place long before; as Pliny tells us, that Mark Anthony mixed iron with his silver denarii; and Mr Pinkerton informs us, that he had seen a denarius of Anthony, which was attracted by a magnet.

21 Ancient brass.

The ancient brass coins consist of two kinds: the red or Cyprian, which indeed is no other than copper; and the common yellow brass. Our author observes, that in the Roman coinage brass was of double the value of copper, and he is of opinion, that it was the same among the Greeks; and the latter is the metal most commonly made use of in the Greek coinage. The Roman sestertii are always of brass: the middling-sized kind are partly copper and partly brass; the former being double the value of the latter, which are the *ases*.

22 Mixed metals.

Mr Pinkerton next proceeds to give an account of the mixed metals used among the Romans. In Britain all kinds of coins made of mixed metal are without hesitation alleged to be forgeries; although it is certain that the variety of mixed metals used in coinage was very considerable. The most valuable mixture was that of gold or silver already mentioned, named *electrum*; the silver commonly amounting to one-fifth part of the gold made use of, or perhaps more. Of this mixture are many of the early coins of Lydia, and some other Asiatic states; also those of the kings of the Bosporus Cimmerius, during the imperial ages of Rome. Next to the electrum were the coins of Corinthian brass: but Mr Pinkerton informs us, that not a single coin was ever struck of this metal by the ancients; it having been constantly employed only in the fabrication of vases or toys. It was in use at any rate only for a very short time; being altogether unknown in the days of Pliny the Elder. Our author therefore ridicules those who pretend not only to find out imperial coins of this metal, but to discover three kinds of it; *viz*. one in which the gold predominates, another in which the silver prevails, and a third where the brass is most conspicuous. He gives Æneas Vico, one of the most ancient writers on medals, as the author of this idea; but whose opinions were confuted by one Savot, a writer in the 17th century. Vico mentions a coin of this kind struck under Augustus, another of Livia, and a third of Claudius. The mistake, he is of opinion, arose from the circumstance of the first propagator not being able to account for the various

23 Corinthian brass.

Of what conſtructed

various mixtures and modifications of braſs obſervable in ancient coins of the large ſize; and which in ſo common a metal appear very odd to the moderns. Beſides the authority of Pliny and other antiquaries of more modern date, who all declare that they never ſaw a ſingle medal of Corinthian braſs, or of that metal mixed with ſilver and gold, our author adduces another evidence which he looks upon to be ſuperior to either; *viz.* that thoſe who have given into this ſuppoſition, imagine, that the large pieces called *ſeſtertii*, and others called *dupondiarii*, worth about twopence or a penny, are ſaid to have been compoſed of this precious metal. It is unreaſonable to think, that any proportion of gold or ſilver could have been made uſe of in theſe. The coins ſaid to have been ſtruck upon Corinthian braſs are only done upon a modification of common braſs; of which we know, that in proportion to the quantity of zinc made uſe of in conjunction with the copper, the metal aſſumes a variety of hues. On the authority of Pliny he informs us, that the coins miſtaken for Corinthian braſs were no other than prince's metal.

24 Egyptian ſilver coins.

The Egyptian ſilver coins ſtruck under the Roman emperors are at firſt of tolerably pure ſilver; but afterwards degenerate into a mixture of copper and tin with a little ſilver. They are very thick, but many of them are elegantly ſtruck, with uncommon reverſes. There are likewiſe three ſets of braſs coins belonging to this country from the earlieſt times of the Roman emperors there. Some of theſe are of bell-metal or pot-metal; and after the time of Gallienus and Valerian, the coinage of braſs with a ſmall addition of ſilver becomes authoriſed by the ſtate; the coins ſtruck upon it being called *denarii æreι.* Thoſe of lead or copper plated with ſilver have been fabricated by Roman forgers. Some coins of lead, however, have been met with of undoubted antiquity: and an ancient writer informs us, that tin-money was coined by Dionyſius; but none has been found. The lead coins of Tigranes king of Armenia, mentioned as genuine by Jobert, are accounted forgeries by Mr Pinkerton and other modern medalliſts. Plautus, however, makes mention of leaden coins, and ſeveral of them have been found; but our author looks upon them to have been chiefly eſſay pieces, ſtruck in order to let the artiſt judge of the progreſs of the dye. Others are the plated kind already mentioned, fabricated by ancient forgers, but having the plating worn off. A great number of leaden coins are mentioned by Ficorini in a work intitled *Piombi Antichi*, in which he ſuppoſes them to have ſerved as tickets for gueſts; and coins of the ſame kind are alſo mentioned by Paſſeri. In the work intitled *Notitia Imperii Romani*, there is mention of coins made of leather, but none of them have ever been found.

Sect. V. *Of Ancient Money.*

Ancient Money

In conſidering the different ſizes, values, &c. of the Greek and Roman coins, our author treats of the medals as money; a knowledge of which, he ſays, is eſſentially neceſſary to every reader of the claſſics; inſomuch that it may almoſt diſpute the preference with the ſtudies of ancient geography and chronology. Notwithſtanding all that has been written upon the ſubject, however, our author is of opinion, that the ſcience is ſtill in its infancy, in as far as it relates to the real money of the ancients. "The ideal (ſays he), which is indeed the moſt important province of diſcuſſion, has been pretty clearly aſcertained; and we are almoſt as well acquainted with the Attic *mna* or *mina*, and the perplexing progreſs of the Roman *ſeſtertia*, as with our own *pounds*. But with the actual coin of the ancients the caſe is different; and the ignorance even of the learned in this point is wonderful."

25 Knowledge of ancient money imperfect.

Our author now goes on, with great aſperity of language, to particulariſe the ignorant manner in which modern authors have treated the ſubject of medals. "Arbuthnot and Clarke (ſays he) are if poſſible more ignorant of medals than Budæus the very firſt. The latter profeſſes his love of medals, but quotes a conſular coin with the head of Cicero; and looks upon one of the 30 pieces of ſilver, the reward of the treachery of Judas, and which was ſaid to be preſerved among ſome relicts at Paris, to be worthy of reference and commemoration. Arbuthnot, if we may judge from his book, had never ſeen any ancient coins; and Clarke, it is well known, was quite ignorant of them. The latter, with all his labour, ſeems even to have known nothing of the theoretic part of the real ancient money. Indeed Dr Mead's catalogue ſeems to have been almoſt the only *book* on medals which had undergone his peruſal. On the other hand, the ignorance of medalliſts on this ſcore is no leſs profound. To this day they look upon the *didrachms* of Ægina, ſo celebrated in antiquity, as *tridrachms* of Ægium; and upon the early obolus as a braſs coin. In the Roman claſs the large braſs is eſteemed the *as*, while it ſhall be proved that it is the *ſeſtertius*, and worth four *aſes*. The *denarius* is reckoned at ten aſes even in the imperial times; whereas it only went at that rate for the firſt 90 years after the coinage of ſilver at Rome. The denarius æreus is taken for ſilver currency; with other miſtakes which evince that medalliſts are as ignorant of the theory as the others are of the practice."

26 Money firſt coined in the eaſt.

In his account of the ancient Greek money, Mr Pinkerton obſerves, that the light of ſcience, like that of the ſun, has proceeded from eaſt to weſt. "It is moſt probable (ſays he), that the firſt invention of money aroſe like the other arts and ſciences; and ſpread from thence into the weſtern parts of the world. In its firſt ſhape it appeared as mere pieces of metal without any ſtated form or impreſſion; in lieu of which, it was regulated by weight. Even down to the Saxon government in England, large ſums were regulated by weight; and in our own times every ſingle piece is weighed in gold; though with regard to ſilver this nicety is not minded, nor indeed does it ſeem practicable. Among the ancients, whoſe commercial tranſactions were leſs important and extenſive than thoſe of the moderns, ſilver was weighed as well as gold; nay even braſs, in ſome caſes.

27 Its firſt rude ſtate.

28 Greek money.

In Greece, large ſums were determined by *mnæ* or *minæ*; and the moſt capital ſums by *talents*. In every country the mina is ſuppoſed to have contained 100 drachmæ, or ſmall ſilver coins, of that country, and the talent 60 minæ. The mina is ſuppoſed to be a pound weight of the country to which it belonged. The Attic pound, according to Dr Arbuthnot, contained

Ancient Money.

tained 16 ounces, equal to our avoirdupois pound: but Mr Pinkerton looks upon this as a very absurd opinion, and accuses the Doctor of having adopted it merely that he may explain a passage in Livy. He is of opinion, that the Attic pound is very nearly the same with the pound Troy. The mina of Athens had at first 73 drachms; but by Solon it was fixed at 100. The ancient drachm weighed the same which it does at present in medical weight, *viz.* the eighth part of an ounce. The mina or pound of 12 ounces had consequently 96 of these drachms; but four of them were given to the round sum to supply defects in the alloy; "and indeed (says our author), in consequence of a common practice in all ages and in all countries, of giving some addition to a large weight. Thus the pound in weight had but 96 drachmæ in fact, while the pound in tale had 100; as the Roman libra in weight had but 84 denarii; in tale 100; and as our pound in tale, by an inverse progress, is not a third of our pound in common weight."

29 Of the ancient talents.

Notwithstanding the very severe criticism on Dr Arbuthnot just mentioned, however, we find our author adopting his account of the *talents* used in coinage in several countries. Thus, according to the Doctor,

The Syrian talent had	15 Attic minæ.
Ptolemaic -	20
Antiochian -	60
Eubœan - -	60
Babylonian -	70
Larger Attic -	80
Tyrian -	80
Egyptian -	80
Eginean -	100
Rhodian -	100

Notwithstanding the concession made here by Mr Pinkerton to the Doctor, he tells us, that he very much questions this list of talents, and that many ancient writers are little to be relied upon. "Writers on this subject confess, that the numbers in all ancient manuscripts are the parts most subject to error, as being almost always contracted. They ought to allow that the authors themselves must often be liable to wrong information.

"Herodotus mentions, that King Darius ordered gold to be paid into his treasury by the Euboic talent, and silver by the Babylonian. The Euboic is esteemed the same with that called afterwards the Attic; and as we estimate gold by carats, so it is natural to suppose, that the most precious metal would be regulated by the most minute weight. But I confess, I take the Babylonic talent to be the same with that of Ægina. Mr Raper has proved the first coins of Macedon to be upon the standard of Ægina. Now the early Persian coins are upon that very scale, the largest tetradrachms weighing from 430 to 440 grains. Hence it follows, that the Persian silver coins were of the Æginian standard; and the payment was certainly to be made according to the standard of the money. The larger Attic talent was of 80 lesser minæ; because the larger Attic mina was of 16 ounces. The Alexandrian talent, according to Festus, consisted of 12,000 denarii, being the same with that used by the Egyptian kings in their coins; and is shown by Mr Raper to have been the same with the talent of Ægina. Perhaps the whole of the ancient coins of Asia, Africa, Greece, Magna Grecia, and Sicily, are reducible to three talents or standards. 1. That of Ægina, used in most of the more ancient silver coinages; as would seem in even the later of Egypt, Carthage, Cyrene, &c. 2. The Attic (being the Asiatic gold standard, afterwards used by Phidon king of Argos in estimating gold, and called Euboic from Eubœa, one of the quarters of the city of Argos), used in Athens and the greater part of the world as the standard both of gold and silver. 3. The Doric or Sicilian talent of 24 nummi, each worth an obolus and an half; whence the talent is estimated at six Attic drachms or three darics. These weights continued to be the standard of money after it began to be distinguished by impression; nay, to the fall of Greece and prevalence of the Roman empire."

30 Coinage originates in Lydia.

Coinage, according to Herodotus, was first invented by the Lydians, from whom the Greeks quickly received it. The former could not have received it from the Persians, whose empire did not begin till 570 B.C. though our author supposes that it might have proceeded from the Syrians, who carried on commerce in very ancient times. The most ancient Greek coins of silver have an indented mark upon one side, and a tortoise upon the other; and those of greatest antiquity have no letters upon them. Those of later date have ΑΙΓΙ marked upon them, which medallists interpret of Ægium in Achaia; being led into that supposition by the tortoise, which they look upon as the sure mark of the Peloponnesus. But though our author agrees that the tortoise was so, he thinks that they are otherwise very far wrong in their conclusions. Ægium in Achaia was a place of no consequence till the times of Aratus and the Achaian league; but there are 11 of these coins in Dr Hunter's cabinet, which show that they must have been struck in times of the most remote antiquity, and that the place where they were struck was rich and flourishing at the time. The coins we speak of are not uncommon; but those which have the name ΑΙΓΕΙΩΝ at full length, and which may perhaps belong to Ægium in Achaia, are extremely scarce; insomuch that in all Dr Hunter's vast collection there are not above one or two. They are likewise constructed upon a scale quite different from all other Grecian money; being of 8, 13, 15½, 90, and about 186 grains. The Grecian drachma at an average is 66 grains; and Mr Pinkerton thinks it would have been strange if pieces had been struck of eight-tenths of an obolus, of an obolus and an half, or of a drachma and an half. Ægium being originally an obscure village, could not be the first which coined money; so that Mr Pinkerton supposes the name ΑΙΓΙ to have stood for Ægialus, the ancient name of Sicyon, a wealthy and powerful city; or rather Ægina, the mint of which was much celebrated, and perhaps the most ancient in Greece.

31 Most ancient Greek coins described.

Other arguments in favour of these coins being derived from Ægina, are drawn from their weight as well as their workmanship, which are quite different from those bearing the name of Ægium at full length. The coinage of Ægina is known to have been different from that of the rest of Greece; insomuch that its drachma was worth 10 Attic oboli, while the Attic drachma was valued only at six. Hence the drach-

mas

Ancient Money.

mas of Ægina were named by the Greeks παχειας, or *thick*; a name very applicable to the coins in queſtion. From theſe obſervations, our author is of opinion, that we may even diſtinguiſh the preciſe weight of the ancient coins of Ægina. According to the exact proportion, the drachma of this place ſhould weigh exactly 110 grains; and one of them very much rubbed weighed above 90. The others of larger ſize, which ſeem to be didrachms of Ægina, weigh from 181 to 194 grains; but the latter being the only one he could meet with in good preſervation, it was impoſſible to form any juſt medium. Even in thoſe beſt preſerved, he thinks that ten grains may be allowed for a waſte of the metal in ſo long a time as 2400 years, which would bring the drachma of Ægina near its proper ſtandard. The obolus of Ægina was in proportion to its drachma of ſix oboli. It is the piece of 15½ grains, and 13 when very much rubbed. The hemiobolon is that of eight, and when rubbed ought to weigh nine.

32 The drachma the moſt general denomination.

The general denomination of the Greek money is the drachma, or eighth part of an ounce; which to this day is retained in the medical weights, the Grecian coins receiving their names from the weights they bore; though in ſome inſtances the weights received their appellations from the coins. The ſilver drachma, according to Mr Pinkerton, was about nine pence ſterling; and he finds fault with thoſe who make the drachma and denarius both equal to one another, the latter being no more than eight pence. The didrachm of ſilver, according to the ſame calculation, was worth 18d.; but the *tridrachm* occurs very rarely: and Mr Pinkerton is even of opinion, that medalliſts give this name to the didrachm of Ægina. The largeſt of all the Grecian coins is the tetradrachm, which on the Æginean ſtandard is worth five ſhillings; but in thoſe of the other ſtates only four. There are, however, many ſubdiviſions in the ſilver drachma; the higheſt being the tetraobolion or coin of four oboli; being in proportion to the drachma as our groat to a ſixpence, weighing about 44 grains, and being in value about ſixpence. The hemidrachm or triobolion comes next in value, weighing about 33 grains, and worth fourpence halfpenny. The ſilver diobolion, or third of the drachma, weighs about 22 grains, and is worth three pence. The obolus of ſilver weighs about 11 grains, and is worth only three halfpence. There is likewiſe a hemiobolion in ſilver, or half the obolus, of five grains and an half, value three farthings: and another called *tetartobolion dichalcos* or quarter obolus, which is the moſt minute coin yet met with; and by reaſon of its extreme ſmallneſs, weighing only two grains and a quarter, is now very ſcarce: but there is one in the cabinet of Dr Hunter, and ſome more have been lately brought from Athens by Mr Stuart. Some of them are likewiſe met with at Tarentum. It would appear, however, that there were ſome ſtill ſmaller, and of value only three-fourths of a farthing. None of theſe have been met with; and the ſmallneſs of the ſize renders it improbable that any will ever be met with; as the peaſants, who commonly diſcover coins, would probably either not obſerve them at all, or if they did would neglect them as things of no value.

33 Different names of Greek coins

Many different names have been impoſed on the coins belonging to the different ſtates of Greece: thus Κορη, *the maiden*, was a name often applied to the tetradrachm, and which would ſeem to apply to thoſe of Athens; though there are coins of other cities with the head of Proſerpine, and the word Κορη, to which it would appear more applicable in our author's opinion. Χελωνη, *the ſhell*, was the name of another coin from its type. A Sicilian coin was named Δημαρετιον, from Gelon's wife. A tetradrachm was named Κραπαταγους, and had eight ευβοεας or hemidrachms. The τροιζηνιον, ſo called from its country Troizene, had Pallas on one ſide and a trident on the reverſe. The hemiobolion was the πελανορ of Lacedemon; and the Κολλυβος is ſuppoſed to have been equal to the Roman ſeſtertius or quarter drachma. The *cyſtophori* were coins with the myſtic cheſt or hamper of Bacchus upon them, out of which a ſerpent riſes; and are much celebrated in antiquity. We are told by Livy, that Marcus Acilius, in his triumph over Antiochus and the Etolians, carried 248,000 of them; Cneius Manlius Vulſo in that over Gallo-Græcia had 250,000; and Lucius Emilius Regillus, in his naval triumph over the fleets of Antiochus, had 131,300. Cicero likewiſe mentions his being poſſeſſed of a vaſt ſum in them. The moſt probable opinion concerning them ſeems to be, that they are all ſilver tetradrachms; ſuch as belong to the cities of Apamea and Laodicea in Phrygia; Pergamus in Myſia; Sardes and Tralles in Lydia; and Epheſus; but it is a miſtake to aſcribe any to Crete. Mr Pinkerton thinks it abſurd to imagine that Crete, a ſmall iſland, ſhould ſtrike ſuch vaſt numbers of coins; though Cicero mentions his being in poſſeſſion of an immenſe treaſure in them at the time he was governor of Aſia Minor. "It is moſt likely (ſays Mr Pinkerton), that his wealth ſhould be in the coin of the country to which he belonged. But what had theſe triumphs or Cicero's government to do with Cretan money? But indeed the coins themſelves, as above noticed, eſtabliſh the fact."

34 Coins of Cyzicus.

Another ſet of coins famous in antiquity were thoſe of Cyzicus in Myſia, which were of gold; but they are now almoſt entirely vaniſhed by being recoined in other forms. The Αρυανδικον νομισμα, or *money of Aryandes*, who was made governor of Egypt by Cambyſes, is made mention of by Heſychius; but none of them, as far as is known, have reached our times. They muſt have been marked with Perſian characters, if with any. The coin of Queen *Philiſtis* is mentioned by the ſame writer, and many of theſe pieces are ſtill extant; but we know not where this queen reigned, nor does there ſeem to be any method of finding it out. Mr Pinkerton inclines to believe, that ſhe preſided over Sicily; and as a confirmation of that ſuppoſition, mentions ſome inſcriptions of ΒΑΣΙΛΙΣΣΑΣ ΦΙΛΙΣΤΙΔΟΣ on the *Gradini* of the theatre at Syracuſe; but which appear not older than the Roman times. Some authors are of opinion, that ſhe reigned in Coſſara or Malta; which our author thinks much more improbable.

35 Athenian coins.

The moſt particular attention with regard to the names and ſtandard of coins is due to thoſe of Athens; and it is remarkable, that moſt of them which have reached us are of a very late period, with the names of magiſtrates

Ancient Money.

magiſtrates inſcribed upon them. Some of theſe bear the name of Mithridates; and few are older than the era of that prince; who, it is well known, took the city of Athens in his war with the Romans. I ſuſpect (ſays Mr Pinkerton) that no Athenian coins of ſilver are poſterior to Sylla's infamous deſtruction of that city: an event the more remarkable, as Salluſt tells us, that Sylla was learned in Greek. Indeed Caligula, Nero, and moſt of the peſts of ſociety, have been learned men, in ſpite of a noted axiom of Ovid,

Sed ingenuas didiciſſe feliciter artes
Emollit mores, nec ſinit eſſe feros.

It is ſtill more remarkable, that the fabric of Athenian coins is almoſt univerſally very rude: a ſingular circumſtance, if we reflect how much the arts flouriſhed there. It can only be accounted for from the excellence of their artiſts being ſuch as to occaſion all the good ones to be called into other countries, and none but the bad left at home. In like manner, the coins ſtruck at Rome in the imperial times are excellent, as being done by the beſt Greek artiſts; while thoſe of Greece, though famous at that time for producing miraculous artiſts, are during that period commonly of very mean execution. The opulence of Athens in her days of glory was very great; owing in an eminent degree to her rich commerce with the kingdoms on the Euxine ſea; carried on chiefly from Delos, which belonged to Athens, and was the grand centre of that trade." Hence it has become matter of ſurpriſe to Neumann, that when there are ſo many coins of Mycene, an iſland even proverbially poor, there ſhould be none of Delos. But Mr Pinkerton accounts for this from Mycene's being a free ſtate, and Delos ſubject to Athens. "It may be well ſuppoſed (ſays he, that Athens had a mint at Delos; and ſuch Athenian coins as have ſymbols of Apollo, Diana, or Latona, were ſtruck in this iſland."

36 Greek copper money.

The copper-money of the Greeks is next in antiquity to the ſilver. Mr Pinkerton is of opinion, that it was not uſed at Athens till the 26th year of the Peloponneſian war; about 404 years before Chriſt, and 300 after ſilver was firſt coined there. The firſt copper coins were thoſe of Gelo of Syracuſe, about 490 B. C.

37 Of the chalcos.

The chalcos of braſs, of which eight went to the ſilver obolus, ſeems to have been the firſt kind of Greek coin. At firſt it was looked upon as of ſo little conſequence, that it became proverbial; and to ſay that a thing was not worth a *chalcos*, was equivalent to ſaying that it was worth nothing. As the Greeks became poor, however, even this diminutive coin was ſubdivided into two, four, nay eight λεπτα or ſmall coins; but our author cenſures very ſeverely thoſe who have given an account of thoſe diviſions. "Pollux and Suidas, copying from him (ſays he), tell us, that there were ſeven lepta to one chalcos; a number the moſt unlikely that can be, from its indiviſibility and incapacity of proportion.

"Pollux lived in the time of Commodus, ſo was too late to be of the ſmalleſt authority: Suidas is four or five centuries later, and out of the queſtion. Pliny tells us, that there were ten chalci to the obolus; Diodorus and Cleopatra that there were ſix; Iſidorus ſays there were four: and if ſuch writers differ about the larger denomination, we may well imagine that the ſmaller equally varied in different ſtates; an idea ſupported by theſe undeniable witneſſes the coins which remain. Moſt of the Greek copper-coin which has reached our times conſiſts of chalci; the lepta being ſo ſmall as to be much more liable to be loſt." In Dr Hunter's cabinet, however, there are ſeveral of the dilepta of Athens: and from being ſtamped with the repreſentation of two owls, ſeem to be the ſame with the ſilver diobolus: "a circumſtance (ſays Mr Pinkerton) of itſelf ſufficient to confute Pollux; for a dilepton can form no part of ſeven; a number indeed which never appeared in any coinage of the ſame metals, and is contradictory to common ſenſe. It may be obſerved, that the whole braſs coins of Athens publiſhed by Dr Combe are reducible to four ſizes, which may be the *lepton*, *dilepton*, *tetralepton* or *hemichalcos*, and *chalcos*. The firſt is not above the ſize of one of king James I.'s farthing tokens; the laſt about that of our common farthing." The *lepta* was alſo called Κερμα, as being change for the poor. The Κιδαβος, perhaps ſo called from the figure of a wolf upon it, was the coin of a particular ſtate, and if of braſs muſt have weighed three chalci. The other names of the copper-coins of Greece are but little known. Lycurgus ordered iron money to be coined at Sparta; but ſo periſhable is this metal, that none of that kind of money has reached our times.

38 Lepton, dilepton, &c.

After the conqueſt of Greece by the Romans, moſt of the coins of that country diminiſhed very much in their value, the gold coinage being totally diſcontinued: though ſome of the barbarous kings who uſed the Greek character were permitted to coin gold, but they uſed the Roman model; and the ſtandard uſed by the few cities in Aſia who ſpoke the Greek language in the times of the emperors is entirely unknown. Copper ſeems to have been the only metal coined at that time by the Greeks themſelves; and that upon the Roman ſtandard, then univerſal through the empire, that there might be no impediment to the circulation of currency. They retained, however, ſome of their own terms, uſing them along with thoſe of the Romans. The *aſſarion* or *aſſarium* of Rome, the name of the diminiſhed *as*, being 16 to the drachma or denarius, the obolus was ſo much diminiſhed in value as to be ſtruck in braſs not much larger than the old chalcus, and valued at between two and three aſſaria; which was indeed its ancient rate as to the drachma. This appears from the copper coins of Chios, which have their names marked upon them. The braſs obolus, at firſt equal in ſize to the Roman ſeſtertius or large braſs, leſſens by degrees to about the ſize of a ſilver drachma. From the badneſs of the imperial coinage in Greece alſo, it appears that braſs was very ſcarce in that country, as well as in all the cities uſing the Greek characters; being found moſtly in the weſtern countries of the Roman empire. The time of this declenſion in ſize of the Greek coins is by Mr Pinkerton ſuppoſed to have been from Auguſtus down to Gallienus. He is of opinion, however, that the copper obolus, at firſt above the ſize of large braſs, was uſed in Greece about the time of its firſt ſubjection to Rome; and that the lepta ceaſing, the chalci came in their room, with the dichalcus and the hemiobolion of braſs.

39 Era of the declenſion of the Greek coinage.

With

Ancient Money.

40 Gold coins of Greece.

With reſpect to the gold coins of the Greeks, Mr Pinkerton is of opinion that none of that metal was coined before the time of Philip of Macedon, as none have reached our times prior to the reign of that monarch. From a paſſage in Thucydides our author concludes, that in the beginning of the Peloponneſian war the Athenians had no gold coin. Mentioning the treaſure in the Acripolis or citadel of Athens, at the commencement of that war, the hiſtorian mentions ſilver coin, and gold and ſilver in bullion; and had any of the gold been in coin, he would certainly have mentioned it. Philip began his reign about 68 years after the beginning of the Peloponneſian war; and we can ſcarce ſuppoſe that any city would have preceded the elegant and wealthy Athens in the coining of gold.

41 Gold coined early in Sicily.

Notwithſtanding, however, this deficiency of gold coin among the Greeks, it is certain that the coinage of gold had taken place in Sicily long before; as we have gold coins of Gelo about 491 B. C. of Hiero I. 478, and of Dionyſius I. in 404, all uſing the Greek characters; though not to be ranked among the gold coins of Greece, as Philip cauſed his to be. Gold coins of Syracuſe even appear of the third claſs of antiquity, or with an indented ſquare, and a ſmall figure in one of its ſegments. Gold coins were uſed in the cities of Brettium, Tarentum, and throughout Magna Grecia; alſo in Panticapæa in Thrace, and likewiſe Coſa in that country; but not in Tuſcany, as is commonly believed, though Neumann proves that they are ſtruck by Brutus, and are unqueſtionably as ancient as the Greek coins. The Thebans and Athenians probably coined the firſt gold after Philip had ſet them the example, and when they were attempting to reſiſt the projects of that enterpriſing monarch. The Ætolians probably coined their gold during the time of their greateſt power, about a century after Philip, and when they were combating the power of Aratus and the Achæan league. "There is (ſays Mr Pinkerton) but one ἡμιχρυσος of Thebes, much worn, in Dr Hunter's cabinet, and weighing but 59 grains; and perhaps not above two or three χρυσοι or gold didrachms of Athens in the world; one of which is alſo in the collection of Dr Hunter, and weighs 132½ grains. It appears to be more modern than the reign of Philip. That monarch having got poſſeſſion of the mines of Philippi in Thrace, improved them ſo much, that they produced him annually above a thouſand talents of gold, or 2,880,000 l. of our money. From this gold the firſt coins named from the monarch *Philippi* were ſtruck. They were marked with his portrait; and for many ages after were ſo numerous, that they were common in the Roman empire; whence the name *Philippi* became at length common to gold, ſilver, and at laſt even braſs coins of their ſize. Even in the time of Philip gold was very ſcarce in Greece; but after the Phocians had plundered the temple of Delphos, this precious metal, which had been valued as gems, and conſecrated only to the decoration of the temples of the gods, began to be known among the Greeks. The comparative value of gold and ſilver, however, ſeem to have been at that time very different from what they are now. Herodotus values gold at 13 times its weight in ſilver; Plato in his Hipparchus at 12; and even the low value of 10 to 1 ſeems to have been the ſtated value in Greece, tho' in Rome the plenty of ſilver from the Spaniſh mines made the value of gold to be much higher; and there is no reaſon to think that it was ever valued in that city at leſs than 12 times its weight in ſilver. The *Philippus*, χρυσος, gold piece, or *ſtater*, is a didrachm, and is the moſt common of all the ancient coins. Mr Pinkerton is of opinion that it went for 20 ſilver drachms on its firſt appearance; but in latter times for 25 Greek drachmæ or Roman denarii. There are proofs of the Philippi being didrachms, both from the writings of ancient authors and from numbers of the coins themſelves, which remain to this day; and that the χρυσος, or principal gold coin of Greece, was of the ſame weight, is alſo evident from ancient writings. It was anciently worth about 15s. but valuing gold now at the medium price of 4 l. per ounce, it is worth about 20 s. The ἡμιχρυσος, or half the former coin, ſcarcely occurs of the coinage of Philip and Alexander, though it does of Hiero I. of Syracuſe and of king Pyrrhus. It paſſed for ten ſilver drachmas, and was valued only at 7s. 6d. though now worth 10s. There was another diviſion of this kind worth about 5s. There were beſides ſome leſſer diviſions of gold coins, which could not be worth above two drachmas. Theſe were coined in Cyrene; and there were beſides ſeveral old gold coins of Aſia Minor, the value of which is now unknown. Our author ſuppoſes that they were coined not with relation to their weight as parts of the drachma, but merely to make them correſpond with ſo many ſilver pieces as was neceſſary. There are alſo larger coins than the χρυσος, the διχρυσος of Alexander and Lyſimachus being double its value. Some others are met with by Lyſimachus, Antiochus III. and ſome of the Egyptian monarchs, weighing four times the χρυσος, and now worth about 4l. ſterling. Some weigh even more; but this our author ſuppoſes owing to the gold being leſs pure.

42 Roman money.

In Rome, as well as in Greece, the money was at firſt eſtimated by weight; and the firſt metal coined by that people was copper, ſilver being long unknown in Rome; nor is it certainly known that any ſilver has ever been found in the Italian mines. In Rome the firſt valuation of money was by the *libra gravis æris*, or pound of heavy braſs: and in the progreſs of their conqueſts, the little ſilver and gold that came in their way was regulated by the ſame ſtandard, as appears from the ſtory of Brennus.

43 Of the Roman pound.

The weights made uſe of were the ſame with thoſe which continue to this day. The pound conſiſted of 12 ounces of 458 grains each; but the pound by which the money was weighed appears to have conſiſted only of 420 grains to the ounce, or to have contained in all 5040 grains. This became the ſtandard of copper; and when ſilver came to be coined, ſeven denarii went to the ounce as eight drachms did in Greece. Gold was regulated by the *ſcriptulum* or *ſcrupulum*, the third part of a denarius, and by the larger weights juſt mentioned. The number 10 was at firſt uſed by the Romans in counting their money; but finding afterwards that a ſmaller number was more convenient, they divided it into quarters; and as the quarter of 10 is 2½, they for this

44 Seſtertius, as, &c.

reaſon beſtowed upon it the name of *ſeſtertius* or "half the third;" to expreſs that it was two of any weights, meaſures, &c. and half a third; whence the ſeſtertius came

Ancient Money.

came at laſt to be the grand eſtimate of Roman money. The *as* being at firſt the largeſt, and indeed the only Roman coin, the word *ſeſtertius* means *ſeſtertius as*, or "two aſes and an half." On the firſt coining of ſilver, the denarius of ten aſes was ſtruck in the moſt common and convenient denary diviſion of money, or that by tens; the ſeſtertius being of courſe two aſes and an half. But the denarius being afterwards eſtimated at 16 aſes, the name ſeſtertius wâs ſtill applied to a quarter of the denarius, though it now contained four aſes. The term *ſeſtertius* was applied to all ſums not exceeding 1000 ſeſtertii, or L. 8 : 6 : 8; but for greater ſums the mode of the ſeſtertius was likewiſe altered, though not to exclude the former. Very large ſums of money were eſtimated by the hundred weight of braſs; for the Romans were at firſt unacquainted with the talent. The hundred weight, by way of eminence, was diſtinguiſhed by the name of *pondus*, and *ſeſtertium pondus* became a phraſe for two hundred weight and an half. Mr Pinkerton is of opinion, that we may value the *as libralis* of ancient Rome at about eight-pence Engliſh. Eſtimating the *as* therefore at a pound weight, the *ſeſtertium pondus* was equal to 1000 *ſeſtertii*, or L. 8 : 6 : 8; and by a coincidence which our author ſuppoſes to have been the effect of deſign, as ſoon as the ſilver coinage appeared, the *ſeſtertium centum denariorum* was always equal to L. 8, 6s. 8d. alſo. The word *ſeſtertium* itſelf, however, ſeems to have been unknown prior to the coinage of ſilver money at Rome: the *pondera gravis æris* being ſufficient before that time for all the purpoſes of a ſtate in which money was ſo ſcarce. But however this may be, the *pondus* or hundred weight of braſs was preciſely worth 100 denarii, or a pound of ſilver. As the great ſeſtertium was always valued at 1000 of the ſmaller, or L. 8 : 6 : 8, we never find one ſeſtertium mentioned in authors, but two, three, or more; ten thouſand of them being equal to L. 8,333,333 : 6 : 8.

45 Whence the Romans derived their coinage.

The ſtates from which the Romans may be ſuppoſed firſt to have derived their coinage, were the Etruſcans and the Greek colonies in Magna Grecia and Sicily. Joſeph Scaliger, Gronovius, &c. contend that it was from the Sicilians that the Romans firſt derived their knowledge of money; but Mr Pinkerton argues that it was from the Etruſcans. In confirmation of his opinion he appeals to the ſtate of the Roman territories in the time of Servius Tullius, who is looked upon to have been the firſt who coined money at Rome. At that time the whole Roman dominion did not extend beyond ten miles round the city; and was entirely ſurrounded by the Etruſcan and Latin ſtates; Cuma being the next Greek colony to it that was of any conſequence, and which was in the neighbourhood of Naples, at about the diſtance of 150 miles. Our author aſks, Is it reaſonable to think that the Romans received the uſe of money from the Etruſcans and Latians who were their neighbours, or from the Greeks, who were at a diſtance, and at that time, as far as appears from their hiſtory, abſolutely unknown to them? "If this argument (adds he) is ſtrong with regard to the neareſt Grecian colonies, what muſt it be with reſpect to Sicily, an iſland 300 miles diſtant from Rome, where it was not known, at that time, if a boat went by land or water?" Arguments, however, for this opinion, have been derived from the ſimilarity betwixt the Sicilian and Roman coins; which Mr Pinkerton now proceeds to examine. The Greek pound in Sicily was called λιτρα, and conſiſted, like the Roman, of 12 ουγκιαι, or ounces; and Mr Pinkerton grants that the Roman *libra* was derived from the Greek λιτρα, but denies that the *as*, or libra, a coin, was from Sicilian model. The Sicilians had indeed a coin named λιτρα; but it was of ſilver, and of equal value to the Eginean ſtandard, ten of which went to the Sicilian δεκαλιτρον. He differs from Gronovius, that the ſtandard of Ægina was uſed at Corinth, and of courſe at Syracuſe; as it appears from Ariſtotle, that the Sicilians had a talent or ſtandard of their own. The Sicilian obolus or λιτρα contained alſo 12 ounces or *chalci*, ſo named at firſt becauſe they weighed an ounce weight; but the ουγκιαι of Hiero weigh more than a troy ounce; and the braſs coins of Agrigentum are marked with cyphers as far as ſix: the largeſt weighing only 186 grains, or about one third of the primitive ounce. Our author denies that even the Roman denarius took its riſe from the Sicilian δεκαλιτρον, as many authors aſſert. Were this the caſe, it would have weighed 180 grains; whereas the Roman denarii are not above the third part of the quantity.

46 Origin of the Sicilian coins.

From all theſe conſiderations, our author is of opinion that the Sicilians borrowed the diviſion of their λιτρα from the Etruſcans, or poſſibly from the Romans themſelves; which our author thinks is more probable than that the Romans had it from Sicily. The ſtrongeſt argument, however, againſt the Roman coinage being borrowed from the Sicilian is, that though great numbers of Sicilian coins are to be found in the cabinets of medalliſts, yet none of them reſemble the *as libralis* of the Romans in any degree. In moſt cabinets alſo there are Etruſcan coins upon the exact ſcale of the *as libralis*, and ſeveral of its diviſions; from whence Mr Pinkerton concludes, that "theſe, and theſe alone, muſt have afforded a pattern to the primitive Roman coinage." The Etruſcans were a colony from Lydia, to which country Herodotus aſcribes the firſt invention of coinage. "Thoſe coloniſts (ſays Mr Pinkerton), upon looking round their ſettlements, and finding that *no* ſilver was to be had, and *much leſs* gold," ſupplied the mercantile medium with copper; to which the caſe of Sweden is very ſimilar, which, as late as the laſt century, had copper coins of ſuch magnitude, that wheel-barrows were uſed to carry off a ſum not very conſiderable.

47 Of the moſt ancient Roman coins.

Some coins are found which exceed the *as libralis* in weight; and theſe are ſuppoſed to be prior to the time of Servius Tullius. Some of them are met with of 34 and of 53 Roman ounces; having upon one ſide the figure of a bull rudely impreſſed, and upon the other the bones of a fiſh. They are moſt commonly found at Tudder, or Tudertum in Umbria; but they appear always broken at one end: ſo that Mr Pinkerton is of opinion that perhaps ſome might be ſtruck of the decuſſis form, or weighing ten pounds. Theſe pieces, in our author's opinion, make it evident, that the Romans derived their large braſs coins from the Etruſcans and the neighbouring ſtates: they are all caſt in moulds; and the greater part of them appear much more ancient than the Roman aſes, even ſuch as are of the greateſt antiquity.

Mr

Mr Pinkerton agrees with Sir Iſaac Newton as to the time that Servius Tullius reigned in Rome, which he ſuppoſes to be about 460 B. C. His coinage ſeems to have been confined to the as, or piece of braſs having the impreſſion of Janus on the one ſide and the prow of a ſhip on the other, becauſe Janus arrived in Italy by ſea. Varro, however, informs us, that the very firſt coins of Tullius had the figure of a bull, or other cattle upon them, like the Etruſcan coins, of which they were imitations. Thoſe with the figure of Janus and the prow of a ſhip upon them may be ſuppoſed firſt to have appeared about 400 B. C. but, in a ſhort time, various ſubdiviſions of the as were coined. The

48 Subdiviſions of the as.

ſemis or half is commonly ſtamped with the head of Jupiter laureated; the *triens* or third, having four cyphers, as being originally of four ounces weight, has the head of Minerva; the *quadrans* or quarter, marked with three cyphers, has the head of Hercules wrapt in the lion's ſkin; the *ſextans* or ſixth, having only two cyphers, is marked with the head of Mercury with a cap and wings; while the *uncia* having only one cypher, is marked with the head of Rome. All theſe coins appear to have been caſt in moulds, by a conſiderable number at a time; and in the Britiſh muſeum there are four of them all united together as taken out of the mould in which perhaps dozens were caſt together. In proceſs of time, however, the ſmaller diviſions were ſtruck inſtead of being caſt; but the larger ſtill continued to be caſt until the as fell to two ounces. Even after this time it was ſtill called *libra*, and accounted a pound of copper;

49 Larger denominations of it ſtruck.

though there were now larger denominations of it coined, ſuch as the *biſſas* or double as: *treſſis* and *quadruſſis* of three and four aſes; nay as far as *decuſſis* or ten aſes, marked X. Olivieri mentions one in his own cabinet weighing upwards of 25 ounces, and caſt when the as was about three ounces weight. There is likewiſe in the Muſæum Etruſcum a decuſſis of 40 Roman ounces, caſt when the as was at four ounces. There was likewiſe a curious decuſſis in the Jeſuit's library at Rome, for which an Engliſh medalliſt offered 20l.; but it was ſeized by the Pope along with every other thing belonging to the ſociety.

50 Decreaſe of the as in weight.

Mr Pinkerton conteſts the opinion of Pliny that the as continued of a pound weight till the end of the firſt Punic war. His opinion (he ſays) is confuted by the coins which ſtill remain; and it appears probable to him that the as decreaſed gradually in weight; and, from one or two of the pieces which ſtill exiſt, he ſeems to think that the decreaſe was ſlow, as from a pound to eleven ounces, then to ten, nine, &c.; but neither the as nor its parts were ever correctly fixed. During the time of the ſecond Punic war, when the Romans were ſore preſſed by Hannibal, the as was reduced to a ſingle ounce. It is ſaid to have taken place in the 215th year before our era, being about 36 years after the former change. This as libralis, with the face of Janus upon it, is the form moſt commonly met with previous to its being reduced to two ounces. Our author ſuppoſes that the as libralis continued for at leaſt a century and an half after the coinage of Tullus, down to 300 B. C. about the year of Rome 452, between which and the 502d year of Rome a gradual diminution of the as to two ounces muſt have taken place. The following table of the dates of the Roman coinage is given by Mr Pinkerton.

The libralis, coined by Tullus with the figures of oxen, &c. about 167 years after the building of Rome, according to Sir Iſaac Newton, or about the year before Chriſt 460

About 175 B. C. alſo, we are informed by Pliny, that the as was reduced to half an ounce by the Papyrian law, at which it continued till the time of Pliny himſelf, and long after.

After the Romans began to have an intercourſe with Greece, a variety of elegant figures appear upon the parts of the as, though not on the as itſelf till after the time of Sylla. Towards the latter end of the republic alſo, *dupondii*, or double aſes, were coined, together with the ſeſtertii æris, which came in place of the *quadruſſes*, when the denarius began to be reckoned at 16 aſes; probably at the time the latter was reduced to half an ounce. In ſome inſtances it is to be obſerved, that the Romans accommodated their coins to the country where 51.

Coins on the Greek ſcale marked as Roman.

their army was ſtationed; whence we have many coins marked as Roman, which have been coined in Magna Grecia and Sicily, and are evidently upon the Greek and not the Roman ſcale. In the latter part of the republican times, alſo, the types begin to vary; ſo that we have a braſs coin ſuppoſed to be ſtruck by Sextus Pompeius in Sicily, having upon it a double head of that warrior, repreſenting a Janus. Mr Pinkerton ſuppoſes it to have been a dupondius; which indeed appears to be the caſe from the double head. This coin is of copper, and ſtill weighs an ounce, notwithſtanding its antiquity.

The largeſt imperial copper coin was the ſeſtertius, 52

Of the ſeſtertius.

a piece worth about two-pence of our money. Mr Pinkerton cenſures ſeverely the opinion of other medalliſts, all of whom ſay that the ſeſtertius was of ſilver. "In fact (ſays he), it would be as rational in any antiquary, a thouſand years hence, to contend that the halfpenny and farthing are of ſilver, becauſe they were ſo in the reign of Henry VIII." In confirmation of his own opinion, he quotes the following paſſage from Pliny: "The greateſt glory of braſs is now due to the Marian, called alſo that of Cordova. This, after the Livian, moſt abſorbs the lapis calaminaris, and imitates the goodneſs of native orichalcum in our ſeſtertii and dupondiarii, the aſes being contented with their own copper." Gronovius confeſſes that he does not know what to make of this paſſage, and that it cauſes him heſitate in his opinion. The *Livian* mine mentioned here by Pliny, is ſuppoſed to have got its name from *Livia* the wife of Auguſtus; and it is probable that the pieces marked with her portrait, intitled JUSTITIA, SALUS, VIRTUS, &c. were dupondii from this very mine, the metal being exceedingly fine, and of the kind named *Corinthian braſs* by the ancient medalliſts. "Perhaps (ſays Mr. Pinkerton) the mine received its name from this very

6 cir-

Ancient Money.

circumstance of her coins being struck in the metal taken from it."

53 Coinage of yellow brass.

No change took place in the Roman coinage from the time that the as fell to half an ounce to the days of Pliny: but Mr Pinkerton observes, that before the time of Julius Cefar yellow brass began to be used, and was always looked upon to be double the value of Cyprian or red copper. There are but few coins in large brass immediately before Julius Cæsar, or even belonging to that emperor; but from the time of Augustus downward, the large coins are all found of brass, and not one of them copper. The largest of what are called the middle size are all of yellow brass; and the next size, which is the as, and weighs half an ounce, is universally copper. What the ancients named *orichalcum*, or what we call *brass*, was always looked upon to be greatly superior in value to the æs cyprium. Procopius, speaking of a statue of Justinian, tells us, that brass inferior in colour to gold is almost equal in value to silver. The mines of native brass were very few in number, and were owing entirely to the singular combination of copper and lapis calaminaris in the bowels of the earth, which very seldom occurs; and the ancients were far from being well acquainted with the method of combining these two bodies artificially; so that yellow brass was always esteemed at double the value of copper: and hence, in the ancient coinages, the brass and copper pieces were kept as distinct as those of gold and silver.

Mr Pinkerton challenges to himself the discovery that the imperial sestertius was of brass; and is at considerable pains to bring proofs of it. Besides the testimony of Pliny, which of itself would be decisive, this is supported by the strongest collateral evidence of other authors. From a passage in Julius Africanus, who wrote the [illegible], or *Treatise on Medicine*, it appears that the nummus, or sestertius, weighed an ounce, and of consequence that it could not be silver but brass; and all the large imperial Roman coins weigh an ounce. We know not the age in which Julius Africanu lived; but as he makes the denarius to contain 16 ases, he must have been before the age of Gallienus, when it had 60. Gronovius supposes him to have been the same mentioned by Eusebius. This author speaks of a Julius Africanus who lived in the time of Heliogabulus, and whom Mr Pinkerton supposes to have been the same with him above mentioned.

54 Diminution of the sestertius.

The sestertius underwent no change till the time of Alexander Severus, when it was diminished by one third of its weight. Trajanus Decius was the first who coined double sestertii, or quinarii, of brass; but from the time of Trebonianus Gallus to that of Gallienu, when the first brass ceases, the sestertius does not weigh above the third part of an ounce: the larger coins are accounted double sestertii; and after the time of Gallienus it totally vanishes. In the time of Valerian and Gallienus we find a new kind of coinage, mentioned by the name of *denarii æris*, or *Philippi ærei*. Two sizes of denarii began to be used in the time of Caracalla; the larger of six sestertii, or 24 assaria; the smaller of four sestertii, or 16 assaria as usual. In the time of Pupienus, the latter was reduced to such a small size as not to weigh more than 35 grains; though in Caracalla's time it weighed 56. After the time of Gordian III. the smaller coin fell into disuse, as breeding confusion. The larger denarius of six sestertii, though diminished at last to the size of the early denarius, still retained its value of six sestertii, or 24 assaria. The *Philippus æreus* came at length in place of the sestertius. It was also called *denarius*; from which we may learn not only their size, but that they were in value ten assaria as the first denarius. In the reign of Dioclesian, the place of the sestertius was supplied by the *follis*, that emperor having restored the silver coin to its purity, and likewise given this form to the copper; but it would seem that this restoration of the coinage only took place towards the end of his reign; whence we have but few of his silver coins, and still fewer of the *folles*, though the *denarii ærei* continue quite common down to the time of Constantine. The follis of Dioclesian seems to have weighed above half an ounce; and Mr Pinkerton is of opinion, that Dioclesian designed this coin to supply the place of the denarius æreus; which of course was worth ten assariæ, and six of them went to the silver denarius. From this time the assarium diminishes to the size of 30 grains; and soon after the follis appeared, the denarius æreus was entirely dropped, the former having gradually supplied its place. Some mints appear to have retained the use of the denarius longer than others; and in some the change was preceded, and gradually brought in by washing the follis with silver, or tin, as the denarius had formerly been. Pieces of this kind occur in the times of Dioclesian, Maximian I. and II. and Constantius I.; that is, for about ten years after the follis made its appearance. Some countries, however, retained the denarius æreus; others the follis; and some had a medium betwixt the two, or the follis washed in imitation of the denarius.

55 New coinage introduced by Constantine I.

Towards the end of the reign of Constantine I. a new coinage was introduced throughout the whole empire. The follis coined by this prince was of half an ounce weight; 24 of them going to the milliarensis, or larger silver coin. The word *follis* signifies also a purse, in which sense we sometimes find it mentioned in the Byzantine history. The common follis of silver, when it occurs by itself, means a purse of 250 milliarenses, as the sestertium was 250 denarii; and by a law of Constantine I. every man paid to the state a follis or purse according to his income. The method of counting by purses continues in Turkey to this day.

56 Of the dupondius.

The *dupondius* was only half the value of the sestertius, or about one penny Sterling; and before the yellow brass appeared it seems to have been struck upon copper, and double the size of the as. There are some of this coin, struck in the time of Julius Cæsar, in yellow brass, weighing half an ounce, with a head of Venus Victrix upon one side; on the reverse, a female figure, with serpents at her feet: while others have a Victory on the reverse, with Q. Oppius Pr. After the time of Augustus, the dupondius was struck in yellow brass; which Pliny tells us was also the case in his time. The word dupondiarius seems to have been used by Pliny, and adopted, not to express that the coin was *dupondius*, but that it was of dupondiary value. Neither was the former word confined to signify double weight, but was used also for double length or measure, as in the instance of *dupondius pes*, or two feet, &c. In the imperial

perial times, therefore, *dupondius* was uſed, not to ſignify a coin of double the weight of the as, but of double the value. It was one of the moſt common of the Roman coins; and ſeems to have been very common even in Conſtantinople. In the time of Juſtinian, it ſeems there was a cuſtom of nicknaming young ſtudents of the law *dupondii*, againſt which the emperor made a law; but it is not known what gave riſe to the name. The dupondius, though of the ſame ſize with the as, is commonly of finer workmanſhip, the metal being greatly ſuperior in value. It continues to be of yellow braſs, as well as the ſeſtertius, to the time of Gallienus; but the as is always of copper.

57
Of the aſſarium.

The imperial as, or *aſſarium*, was worth only an halfpenny. At firſt it weighed half an ounce, and was always of copper till the time of Gallienus, when it was made of braſs, and weighed only the eight part of an ounce. From the time of Gallienus to that of Diocleſian, it continued to diminiſh ſtill more, the ſize being then twenty to an ounce. This was the ſame with the lepta, or ſmalleſt coins but the νουμμια, which weighed only ten grains.

58
Parts of the as.

The parts of the as occur but ſeldom; which may, indeed, be well expected, conſidering the low value of it; though there ſtill occur ſome of thoſe called ſemis, triens, quadrans, ſextans, and uncia, coined in the times of Nero and Domitian. There is no ſmall braſs from the time of Pertinax to that of Gallienus, excepting that of Trajanus Decius; but in the time of Gallienus it becomes extremely common; and the coins of ſmall braſs, as well as the larger, are always marked S. C. ſuch as want it being univerſally accounted forgeries, and were plated with ſilver, though the plating be now worn off. The ſmall pieces ſtruck for ſlaves during the time of the ſaturnalia muſt alſo be diſtinguiſhed from the parts of the as. The S. C. upon theſe moſt probably ſignifies *Saturni Conſulto*, and were ſtruck in ridicule of the true coins, as the ſlaves on that occaſion had every privilege of irony.

59
Of the ſmalleſt Roman coins.

The ſeſtertius diminiſhes from Pertinax to Gallienus ſo faſt that no parts of the as are ſtruck, itſelf being ſo ſmall. Trajanus Decius, indeed, coined ſome ſmall pieces, which went for the ſemis of the time. The ſmall braſs coins under Gallienus were called aſſaria, ſixty of which went to the ſilver denarius. They are about the ſize of the denarius, and ſome of them occur of the coinage of Gallus and his family, of half that ſize, which appear to have been ſtruck during the latter part of his reign, when the aſſarium was diminiſhed to a ſtill ſmaller ſize. It is probable, however, that ſome of theſe very ſmall coins had been ſtruck in all ages of the empire, in order to ſcatter among the people on ſolemn occaſions. Mr Pinkerton is of opinion

60
Of the miſſilia.

that they are the *miſſilia*, though moſt other medalliſts think that they were medallions. "But if ſo (ſays our author), they were certainly called *miſſilia a non mittendo*; for it would be odd if fine medallions were ſcattered among the mob. It is a common cuſtom juſt now to ſtrike counters to ſcatter among the populace on ſuch occaſions, while medals are given to peers of the kingdom; and we may very juſtly reaſon from analogy on this occaſion."

The *aſſarion* or *lepton* of the Conſtantinopolitan empire was, as we have already obſerved, one of the ſmalleſt coins known in antiquity, weighing no more than 20 grains; and the *nummi* were the very ſmalleſt which have reached our times, being only one-half of the former. By reaſon of their extreme ſmallneſs, they are very ſcarce; but Mr Pinkerton informs us, that he has in his poſſeſſion a fine one of Theodoſius II. which has on it the emperor's head in profile. Theodoſius P. F. AV.; on the reverſe a wreath, having in the centre VOT. XX.: MULT. XXX.

61
Coins of the lower empire.

The principal coin of the lower empire was the follis, which was divided into an half and quarter, named [illegible] and [illegible]; the latter of which is ſhown by Du Cange to have been a ſmall braſs coin, as the other is ſuppoſed to have been by Mr Pinkerton.—Beſides theſe, the follis was divided into 8 oboli, 16 aſſaria or lepta, and 3[illegible] noumia, though in common computation it contained 40 of theſe laſt. This coin, notwithſtanding ſo many diviſions, was of no more value than an halfpenny.

Mr Pinkerton controverts an opinion, common among medalliſts, that the largeſt braſs coin or follis of the lower empire had 40 ſmall coins, expreſſed by the letter M upon it; the next had 30, expreſſed by the letter Λ; the half by the letter K; and the quarter marked I, which contained only 10. Mr. Pinkerton informs us, that he has three coins of Anaſtaſius, all marked M in large: one of them weighs more than half an ounce; the ſecond 40 grains leſs; and the third of 160 grains, or one-third of an ounce; but the ſize is ſo very unequal, that the laſt, which is very thick, does not appear above half the ſize of the firſt. There are pieces of Juſtinian which weigh a whole ounce; but the ſize of copper was increaſed as the ſilver became ſcarcer; and the value of the coinage cannot be deduced from the weight of the coins, as it is plain that our own coinage is not of half the value with regard to the metal. A great number of medallions were ſtruck by Conſtantius II. but there is no other copper larger than the half ounce, excepting that of Anaſtaſius, when the follis began to be ſtruck larger. All medalliſts allow the others to be medallions.

The metal employed in theſe very ſmall coins, though at firſt of braſs, was always a baſe and refuſe kind; but copper is generally made uſe of in the parts of the as from the earlieſt times to the lateſt; and if braſs be ſometimes employed, it is never ſuch as appears in the ſeſtertii and dupondiarii, which is very fine and beautiful, but only the refuſe. "Yellow braſs of the right ſort (ſays Mr Pinkerton) ſeems totally to have ceaſed in the Roman coinage with the ſeſtertius, under Gallienus, though a few ſmall coins of very bad metal appear under that hue as late as Julian II."

62
Roman ſilver.

Silver was coined in Rome only as late as the 485th year of the city, or 266 B. C. Varro indeed ſpeaks of ſilver having been coined by Servius Tullius, and the libella having been once in ſilver; but Pliny's authority muſt be accounted of more weight than that of this author, as he miſtakes the λιτρα of Sicily for Roman coins, having been current at Rome during the time of the firſt Punic war. Even Pliny, according to our author, very frequently miſtakes with regard to matters much antecedent to his own time; and among

Ancient Money.

among the moderns he criticises severely Erasmus and Hume. "Erasmus (says he), who had been in England for some time, talks of leaden money being used here. Not even a leaden token was struck in the reign of Henry VIII.; yet his authority has been followed with due deference to so great a name; for how could Erasmus, who must have seen the matter with his own eyes, assert a direct falsehood? To give a later instance in a writer of reputation, Mr Hume, in vol. vi. of his history, has these words, in treating of the reign of James I. "It appears that copper halfpence and farthings began to be coined in this reign. Tradesmen had commonly carried on their retail business by leaden tokens. The small silver penny was soon lost; and at this time was nowhere to be found." Copper halfpence and farthings were not struck till Charles II. 1672: there were small tokens for farthings struck in copper by James I. but not one for the halfpenny. The silver farthings had ceased with Edward VI. but the silver halfpence continued the sole coins till Charles II. It was by copper tokens that small business was carried on. The silver penny was much used till the end of the reign of George I.; and, so far from being nowhere to be found, is superabundant of every reign since that period, not excepting even the present reign of George III. From these instances the reader may judge how strangely writers of all ages blunder, when treating a subject of which they are entirely ignorant."

63 Denarii when first coined.

The first silver denarii coined at Rome, are supposed by our author to have been those which are impressed with the ROMA; and he inclines to account those the most ancient which have a double female head on the one side, and on the reverse Jupiter in a car, with Victory holding the reins, and the word ROMA indented in a rude and singular manner. The double female head seems to denote Rome, in imitation of the Janus then upon the as. There are 15 of these in the cabinet of Dr Hunter; one of the largest weighs $98\frac{1}{4}$ grains: and the rest, which seem to be of greatest antiquity, are of various weights betwixt that and 84; the smaller and more modern weigh 58 or 59 grains; but Mr Pinkerton is of opinion, that the large ones are of the very first Roman coinage, and struck during that interval of time betwixt the coinage of the first silver denarius and the as of two ounces. He takes the indentation of the word ROMA to be a mark of great antiquity; such a mode being scarcely known any where else, except in Caulonia, Crotona, and other towns of Italy; all of them allowed to be struck at least 400 B. C. As these large coins are not double denarii, they must have been struck prior to the small ones; and Newmann has given an account of one of them recoined by Trajan, in which the indentation of ROMA is carefully preserved. The first denarius was in value 10 asses, when the as weighed three ounces; and allowing 90 grains at a medium for one of these large denarii, the proportion of copper to silver must have been as 1 to 160; but when the as fell to one ounce, the proportion was as 1 to 80: when it fell to half an ounce, so that 16 asses went to the denarius, the proportion was as 1 to 64, at which it remained. Copper with us, in coinage, is to silver as 1 to 40; but in actual value as 1 to 72.

At Rome the denarius was worth 8d.; the quinarius 4d.; and the sestertius, whether silver or brass, 2d. The denarius is the coin from which our penny is derived, and was the chief silver coin in Rome for 600 years. According to Celsus, seven denarii went to the Roman ounce, which in metals did not exceed 430 grains; but as all the denarii hitherto met with weigh at a medium only 60 grains, this would seem to make the Roman ounce only 420 grains; though perhaps this deficiency may be accounted for from the unavoidable waste of metal even in the best preserved of these coins. According to this proportion the Roman pound contained 84 denarii; but in tale there was a very considerable excess; for no fewer than 100 denarii went to the Roman pound. The Greek ounce appears to have been considerably larger than that of Rome, containing about 528 grains; yet notwithstanding this apparently great odds, the difference in the coins was so small, that the Greek money went current in Rome, and the Roman in Greece. The denarius at first went for 10 asses, and was marked X; it was afterwards raised to 16; which Mr Pinkerton supposes to have been about 175 B. C. Some are met with bearing the number XVI. nay, with every number up to CCCCLXXVI. These large numbers are supposed to have been mint-marks of some kind or other. After being raised to 16 ases, it continued at the same value till the time of Gallienus; so that till that time we are to look upon its constituent parts to be 16 ases or assaria, eight dupondii, four brass sestertii, and two silver quinarii. Under the emperor Severus, however, or his successor Caracalla, denarii were struck of two sizes, one of them a third heavier than the common; which we must of consequence suppose to have borne a third more value. This large piece obtained the name of *argenteus*, and *argenteus Philippus*, or the "silver Philip;" the name of Philip having become common to almost every coin. The common denarii now began to be termed *minuti* and *argentei Philippi minutuli*, &c. to express their being smaller than the rest. Some have imagined that the large denarii were of the same value with the small, only of worse metal; but Mr Pinkerton observes, that among the few which have any difference of metal, the smallest are always the worst. The first mention of the *minuti* is in the time of Alexander Severus, who reduced the price of pork from eight minuti at Rome to two and to one. The *minutus argenteus* of that age was about 40 grains; and from the badness of the metal was not worth above 4d. of our money. Thus the price of meat was by this prince reduced first to 8d. and then to 4d.

[63] Value of the denarius and its parts.

64 Restoration of the purity of the Roman coins.

According to Zozimus and other writers, the purity of the Roman coin was restored by Aurelian: but Mr Pinkerton controverts this opinion; thinking it more probable, that he only made the attempt without success; or that his reformation might be entirely confined to gold, on which there is an evident change after the time of this emperor. His successor Tacitus is said to have allowed no brass to be mixed with silver upon any account; yet the few coins of this emperor are very much alloyed. We are certain, however, that the emperor Dioclesian restored the silver to its ancient purity; the denarii struck in his reign being very small indeed, but of as fine silver as the most ancient coins of the empire. After Gordian

Ancient Money

dian III. the ſmall denarius entirely vaniſhed, while the large one was ſo much diminiſhed, that it reſembled the *minutus*, or ſmall one of Caracalla in ſize. Gallienus introduced the *denarii æri* inſtead of the *ſeſtertii*. The *argenteus*, though reduced more than one third in ſize, contained ſix denarii aerei, the old ſtandard of ſeſtertii. According to the writers of this period, and ſome time afterwards, the denarius or argenteus contained 60 aſſaria; whence it follows, that each denarius æreus had 10; and from this it probably had its name. The aſſaria are of the ſize of the argentei already mentioned; and ſhow the copper to have retained nearly its old proportion of value to the ſilver, viz. 1 to 60.

65 Reformation of the ſilver coin by Conſtantine.

A larger ſilver coin was introduced by Conſtantine I. who accommodated the new money to the pound of gold in ſuch a manner, that 1000 of the former in tale were equal to the latter in value; ſo that this new piece from thence obtained the name of the *milliarenſis* or "thouſander." Its weight at a medium is 70 grains, or 70 to the pound of ſilver: but Mr Pinkerton is of opinion, that it might have contained 72 grains, of which two have now periſhed by the ſoftneſs of the ſilver; that the pound contained 72; or that two of the number might be allowed for coinage; while the alloy alone would pay for coining gold. The code ſays, that 60 went to the pound; but the numbers of this are quite corrupt. The *milliarenſis* was worth about a ſhilling ſterling. The argentei or denarii, however, were ſtill the moſt common currency; and having been originally rated at the 100 to the pound of ſilver in tale, they from thence began to be called *centenionales*, or "hundreders." Thoſe of Conſtantine I. and II. Conſtans, and Conſtantius, weigh from 50 grains down to 40; thoſe of Julian and Jovian, from 40 to 30; and of the ſucceeding emperors from that time to Juſtinian, from 30 to 20. Under Heraclius they ceaſed entirely; and from Juſtinian to their total abolition, had been brought down from 15 to 10 grains. A like decreaſe of weight took place in the milliarenſis; thoſe of Conſtantine and Conſtans being above 70 grains in weight; thoſe of Arcadius not above 60; and the milliarenſis of Juſtinian not more than 30 grains; but, from the weight of thoſe in Dr Hunter's cabinet, Mr Pinkerton deduces the medium to have been exactly $70\frac{8}{17}$ grains. These coins were alſo called *majorinæ*.

66 Account of the ſmall Roman coins.

The ſmaller ſilver coins of Rome were, 1. The *quinarius*, at firſt called *victoriatus*, from the image of Victory on its reverſe; and which it continued to bear from firſt to laſt. Its original value was five aſes, but it was afterwards raiſed to eight, when the value of the denarius increaſed to 16. According to Pliny, it was firſt coined in conſequence of the *lex Clodia*, about the 525th year of Rome. Some are of opinion, that it was called κερατιον under the Conſtantinopolitan empire, becauſe it was worth a κερατιον of gold, 144 of which went to the ounce: but this is denied by Mr Pinkerton, becauſe at the time that the word κερατιον firſt appears in hiſtory, the denarius did not weigh above 30 grains; and of conſequence, as 25 muſt have gone to the gold ſolidus, of which there were ſix in the ounce, 130 denarii muſt have gone to the ounce of gold. He is therefore of opinion, that the word κερατιον was only another name for the denarius when much reduced in ſize; probably owing to the great ſcarcity of ſilver in Conſtantinople, though in the ſame city there was plenty of gold; and of conſequence, the gold ſolidus was never diminiſhed. "For Monteſquieu (ſays our author) has well obſerved, that gold muſt be common where ſilver is rare. Hence gold was the common regulation of accounts in the Eaſtern empire." The δινεϱτιον met with in ancient authors, according to Mr Pinkerton, was merely an improper name for the *milliarenſis*; when, on account of the ſcarcity of ſilver, the denarius was reduced, and no milliarenſis coined: ſo that the current milliarenſis of former reigns happened to be double to the denarius or centenonialis. The quinarius diminiſhes in ſize along with the other coins: thoſe of Auguſtus weighing 30 grains, of Severus 25, of Conſtantine I. 20, of Juſtinian 12, and of Heraclius only 5. A new ſilver coinage ſeems to have taken place after the days of this emperor; as the little we then meet with, which in the beſt cabinets ſcarce exceeds a dozen of coins, conſiſts entirely of large unſhapely pieces of coarſe metal.

67 Diviſions of the denarius.

2. The conſular denarius had alſo four ſilver ſeſtertii, till the as fell to half an ounce, when it was thought proper to coin the ſeſtertius in braſs, as it continued to be ever afterwards. "The very laſt ſilver ſeſtertius (ſays Mr Pinkerton) which appears, is one with a head of Mercury, and H. S.; on the reverſe a Caduceus P. SEPVLLIVS; who appears to be the P. SEPVLLIVS MACER of the denarii of Julius Cæſar. If ſo, as is moſt probable, the ſeſtertius was coined in ſilver down to Auguſtus; and it is of courſe not to be expected that any of braſs can appear till Auguſtus, under whom they are actually quite common. I have indeed ſeen no coin which could be a conſular braſs ſeſtertius; and tho' we have certainly braſs dupondii of Cæſar, yet it is reaſonable to infer, that the braſs ſeſtertius was firſt coined by Auguſtus. Not one ſilver ſeſtertius appears during the whole imperial period, yet we know that the ſeſtertius was the moſt common of all ſilver coins. The conſular ſeſtertii of ſilver, marked H. S. are not uncommon, nor the quinarii; but the latter are very ſcarce of all the emperors, if we except one inſtance, the ASIA RECEPTA of Auguſtus.

68 Roman gold.

"The Roman gold coinage was ſtill later than that of ſilver. Pliny tells us, that "gold was coined 62 years after ſilver; and the ſcruple went for 60 ſeſterces. It was afterwards thought proper to coin 40 pieces out of the pound of gold. And our princes have by degrees diminiſhed their weight to 45 in the pound." This account is confirmed by the pieces which ſtill remain; for we have that very coin weighing a ſcruple, which went for 20 ſeſterces. On one ſide is the head of Mars, and on the other an eagle; and it is marked XX. We have another coin of the ſame kind, but double, marked XXXX; and its triple, marked ↓X or 60; the ↓ being the old numeral character for 50." Mr Pinkerton, the diſcoverer of this, treats other medalliſts with great aſperity. Savot and Hardouin are mentioned by name; the latter (he ſays) is "ignorant of common ſenſe;" and neither he nor Savot could explain it but by reading back-

Ancient Money.

backward; put the ⅃ for the Roman V, and thus making it xv. Other readings have been given by various medallifts, but none have hit upon the true one excepting our author, though the coin itfelf led to it; being juft three times the weight of that marked XX. We have likewife half the largeft coin, which is marked xxx, and which weighs 26 grains; the fmalleft is only $17\frac{1}{2}$; the xxxx weighs 34; and the LX or drachma 53. There is alfo the didrachm of this coinage, of 106 grains.

69 Account of the aurei.

The *aurei* or Roman gold coins, were at firft 48 in the pound; but they were afterwards diminifhed in number to 40, owing to an augmentation in the weight of each coin. In the time of Sylla, the aureus weighed no lefs than from 164 to 168 grains, and there were only 30 in the pound; but fuch confufion in the coinage was introduced by that conqueror, that no perfon could know exactly what he was worth. Till this time the aureus feems to have continued of the value of 30 filver denarii, about one pound fterling; for about that time it was enlarged a whole third, that it might ftill be equivalent to the full number of denarii. But after Sylla had taken Athens, and the arts and manners of Greece became objects of imitation to the Romans, the aureus fell to 40 in the pound, probably when Sylla had abdicated his dictatorfhip. Thus, being reduced near to the fcale of the Greek *χρυσος*, it paffed for 20 denarii, as the latter did for as many drachmas, being in currency 13s. 4d. fterling. "This (fays Mr Pinkerton) is the more probable, becaufe we know from Suetonius, that the great Cæfar brought from Gaul fo much gold, that it fold for nine times its weight of filver: but the Gallic gold was of a very bafe fort."

In the time of Claudius, the aureus was valued at 100 feftertii, or 25 filver denarii, at which it continued till the time of Heliogabalus, when it fell to about 92 grains at a medium, or rofe in number to 55 in the pound. In the reign of Philip, during which the city completed its thoufandth year, the aureus was coined of two or three fizes. Thefe are impreffed with a head of Rome on one fide, and various figures on the other; but the workmanfhip is fo rude, that they are fuppofed to have been ftruck in fome of the more uncivilized provinces of the empire. The practice of having different gold coins, however, continued under Valerian, Gallienus, and his fucceffors. In the time of Gallienus, they were of 30, 65, and from 86 to 93 grains; the double aurei being from 172 to $183\frac{1}{2}$ grains; but the aureus properly fo called was from 86 to 93; thofe of 30 and 32 being the *trientes aurei* of the *Hiftoriæ Auguftæ Scriptores;* while the larger, from 62 to 65, are to be accounted double trientes, and were perhaps called *minuti aurei*. The value of thefe different fizes of aurei is not known.

70 Alteration in the gold coin made by Aurelian.

That Aurelian made fome alteration in the coin is certain; but Mr Pinkerton fuppofes it to have been only in the gold; becaufe under him and his fucceffor Probus, the common aureus was of 100 grains, a fize confined to thofe emperors: there are likewife halves of about 50 grains; and double aurei, commonly of very fine workmanfhip, of upwards of 200 grains. In the time of Gallienus, the precious metal was fo common, that this emperor vied in magnificence with Nero and Heliogabalus. Aurelian, who plundered the rich city of Palmyra, and thus became mafter of the treafures of the eaft, obtained fuch a profufion of gold, that he looked upon it to be produced by nature in greater plenty than filver. It is remarkable, that during this emperor's reign there was a rebellion among the money-coiners, which could not be quelled but by the deftruction of feveral thoufands; which Mr Pinkerton afcribes to his having ordered the gold to be reftored to its former fize, but to go for no more filver than it formerly did. "So very little filver (fays he) occurs of this period, that it is plain no alteration in the filver produced the war with the moneyers: and in the brafs he made no change; or if he had, it were ftrange that fuch commotions fhould arife about fo trifling a metal. But if, as appears from the coins, he ordered the aureus, which had fallen to 80 grains, to be raifed to about 100, it is no wonder that the contractors fhould be in an uproar; for a whole quarter of their coinage, amounting as would feem to all their profits, was loft. Aurelian judged, that when he found gold fo common in the eaft, it was equally fo in the weft; and that the moneyers muft have made a moft exorbitant profit; but his ideas on this fubject were partial and unjuft: and after his fhort reign, which did not exceed five months after the alteration, the gold returned to its former courfe; though a few pieces occur of Aurelian's ftandard, ftruck, as would feem, in the commencement of the reign of Probus his fucceffor.

From this time to that of Conftantine I. the aureus weighed between 70 and 80 grains; but in his reign it was changed for the folidus, of which fix went to the ounce of gold, which went for 14 milliarenfes, and 25 denarii as before; the value of filver being now to gold as 14 to 1. This new coin continued of the fame value to the final downfal of the Conftantinopolitan empire; gold being always very plentiful in that city, though filver became more and more fcarce. The folidus was worth 12s. fterling. Here again our author moft feverely criticifes Mr Clarke and Mr Raper: the former (he fays) with refpect to the value of gold in the time of Conftantine I. "has left all his fenfes behind him. In page 267. he abfurdly afferts, that 20 denarii went to the folidus in the time of Theodofius I. and proceeds with this deplorable error to the end of his work. He then tells us, that only 14 denarii went to the folidus under Conftantine I. &c." To Mr Raper, however, he is a little more merciful, as he owns, that "though he (Mr Raper) has ftrangely confounded the milliarenfis with the denarius, he has yet kept common fenfe for his guide." Mr Pinkerton argues, indeed with great probability, "that had any change in the coinage taken place between the time of Conftantine and Theodofius I. that is, in lefs than 50 years, the laws of that period, which are all in the Theodofian code, muft have noticed it." To this and other arguments upon the fubject, Mr Pinkerton adds the following obfervation upon the value of gold and filver: "As a ftate advances to its height, gold increafes in value; and as a ftate declines, it decreafes, providing the metals are kept on a par as to purity. Hence we may argue, that gold decreafed in its relation to filver perhaps four or five centuries, furnifhed moft European kingdoms with gold in coin, which otherwife would, from their want of arts, and of

Ancient Money.

of intercourse with the east, then the grand seminary of that metal, have almost been ignorant of what gold was. These gold coins were called *Bezants* in Europe, because sent from Byzantium or Constantinople; and were *solidi* of the old scale, six to the ounce. In Byzantine writers, the solidus is also called *nomisma*, or "the coin;" *crysinos*, because of gold; *hyperperos*, from its being refined with fire, or from its being of bright gold flaming like fire. The *solidi* also, as the *aurei* formerly, received names from the princes whose portraits they bore; as *Michelati*, *Manuelati*. *Solidus* is a term used also for the aureus by Apuleius, who lived in the time of Antoninus the Philosopher; nay, as early as in the Prætorian edicts of the time of Trajan. It was then a distinction from the semissis or half. In the time of Valerian, when aurei of different sizes had been introduced, it became necessary to distinguish the particular aurei meant. Hence in the Imperial Rescripts, published by the *Historiæ Augustæ Scriptores*, Valerian uses the term *Philippeos nostri vultus*, for the common aurei. Aurelian uses the same term *aurei Philippei*, for the aurei which he had restored to their size in some degree. Gallienus uses *aurei Valeriani* for his father's coins. *Aurei Antoniniani* are likewise put by Valerian for coins of the early Antonini, of superior standard to any then used.

71 Divisions of the aureus.

In the first gold coinage at Rome, the aureus was divided into four parts; the semissis of 60 sestertii; the tremissis, or third, of 40; the fourth, the name of which is not mentioned, of 30; and the scrupulum of 20. But in a short time all of these fell into disuse, except the semissis or half, which is extremely scarce; so that it is probable that few have been struck. It is an erroneous opinion (according to Mr Pinkerton) that the semissis was called a *denarius aureus*. The aureus itself indeed had this name; but the name of *quinarius* is applied to the semissis with greater propriety than the former. Trientes, or tremisses of gold, are found of Valerian and his son Gallienus, and weigh about 30 grains. Those of Salonina the wife of Gallienus weigh 33 grains. Under the Constantinopolitan empire, tremisses again make their appearance; and from the time of Valentinian downwards, the thirds are the most common coins of gold, being worth about 4s. sterling. The semissis is likewise mentioned, but none occur earlier than the time of Basiliscus. The gold tremissis was the pattern of the French and Spanish gold coins; as the silver denarius, in its diminished state, was of the Gothic and Saxon penny.

72 Account of the Roman method of coining

We shall close this account of the Roman money with some remarks concerning the mint, and method of coinage. This at first seems to have been under the direction of the quæstor. About the time that silver was first coined in Rome, *viz.* about 266 B. C. the *triumviri monetales* were created. They were at first of senatorial rank, but were by Augustus chosen from among the equestrian; and the title of *triumviri* was continued till after the time of Caracalla; but under Aurelian there was probably but one master of the mint called *Rationalis*; and Mr Pinkerton is of opinion that the change took place under Gallienus. He seems also to have permitted the provincial cities to coin gold and silver, as well as to have altered the form of the mints in the capital, and to have ordered them all to strike money with Latin legends, and of the same forms; as in his time we first meet with coins with mint-marks of cities and offices. The violent insurrection which took place in his reign has already been mentioned, as well as its probable cause; and Mr Gibbon has shown, that the concealed enemies of Aurelian took such advantage of this insurrection, that it cost 7000 of his best troops before it could be quelled. About this time the *procurator monetæ* seems to have succeeded the *rationalis* as director of the mint. In the colonies, the direction of the mint seems to have been given to the decemviri, whose names frequently occur on colonial coins; "which (says Mr Pinkerton), though generally of rude invention, and ruder execution, are yet often interesting and important."

Ancient Money.

The engraving of the ancient dyes used in coinage was a work of much genius and labour; and at Rome Greek artists were generally employed in it; but it has been thought a matter of great surprise, that scarce any two ancient coins are to be found exactly the same. Hence some antiquaries have imagined, that only a single coin was thrown off from each dye. M. Beauvais informs us, that the only two Roman imperial coins of the first times which he had seen perfectly alike were those of the Emperor Galba. It is, however, the opinion of the best judges, that a perfect similarity betwixt two medals is a very great reason for supposing one of them to be forged. "It must also be observed (says Mr Pinkerton), that the differences in coins, apparently from the same dye, are often so minute as to escape an eye not used to microscopic observations of this sort. But it would be surprising if any two ancient coins were now found struck with the same dye; for out of each million issued, not above one has reached us. Dyes soon give way by the violence of the work; and the ancients had no puncheons nor matrices, but were forced to engrave many dyes for the same coin. Even in our mint, upon sending for a shilling's worth of new halfpence, it will appear that three or four dyes have been used. Sometimes the obverse of the dye gives way, sometimes the reverse; but among us it is renewed by puncheons, though with variations in the lettering or other minute strokes; while the ancients were forced to recur to another dye differently engraven. The engravers of the dye were called *cælatores*; other officers employed in the mint were the *spectatores*, *expectatores*, or *nummularii*. The melters were styled *fusarii*, *flatuarii*, and *flaturarii*; those who adjusted the weight were called *æquatores monetarum*; those who put the pieces into the dye *suppositores*, and those who struck them *malleatores*. At the head of each office was an officer named *primicerius*, and the foreman was named *optio et exactor*."

In order to assist the high relief on the coins, the metal, after being melted and refined, was cast into bullets, as appears from the ancient coins not being cut or filed on the edges, but often cracked, and always rough and unequal. These bullets were then put into the dye, and received the impression by repeated strokes of the hammer, though sometimes a machine appears to have been used for this purpose: for Boiterue informs us, that there was a picture of the Roman mintage in a grotto near Baiæ, where a machine was represented holding up a large stone as if to let it fall suddenly, and strike the coin at once. None of the ancient money was cast in moulds, excepting

Preſervation. ing the moſt ancient and very large Roman braſs, commonly called *weights*, and other Italian pieces of that ſort; all the reſt being mere forgeries of ancient and modern times. Some Roman moulds which have been found are a proof of this; and from theſe ſome medalliſts have erroneouſly imagined that the ancients firſt caſt their money in moulds, and then ſtamped it, in order to make the impreſſion more clear and ſharp.

The ancients had ſome knowledge of the method of crenating the edges of their coins, which they did by cutting out regular notches upon them; and of this kind we find ſome of the Syrian and ancient conſular coins, with a few others. The former were caſt in this ſhape, and then ſtruck; but the latter were crenated by inciſion, to prevent forgery, by ſhowing the inſide of the metal: however, the ancient forgers alſo found out a method of imitating this; for Mr Pinkerton informs us, that he had a Roman conſular coin, of which the inciſions, like the reſt, were plated with ſilver over the copper.

Sect. VI. *Of the Preſervation of Medals.*

We now come to conſider what it is that diſtinguiſhes one medal from another, and why ſome are ſo highly prized more than others. This, in general, beſides its genuineneſs, conſiſts in the high degree of preſervation in which it is. This, by Mr Pinkerton, is called the *conſervation* of medals, and is by him regarded as *good* and as *perfect*. In this, he ſays that a true judge is ſo nice, that he will reject even the rareſt coins if in the leaſt defaced either in the figures or legend. Some, however, are obliged to content themſelves with thoſe which are a little rubbed, while thoſe of ſuperior taſte and abilities have in their cabinets only ſuch as are in the very ſtate in which they came from the mint; and ſuch, he ſays, are the cabinets of Sir Robert Auſtin, and Mr Walpole of Roman ſilver at Strawberryhill. It is abſolutely neceſſary, however, that a coin be in what is called *good* preſervation; which in the Greek or Roman emperors, and the colonial coins, is ſuppoſed to be when the legends can be read with ſome difficulty; but when the conſervation is perfect, and the coin juſt as it came from the mint, even the moſt common coins are valuable.

73 Braſs and copper beſt preſerved by the ruſt that covers them.

The fine ruſt, like varniſh, which covers the ſurface of braſs and copper coins, is found to be the beſt preſerver of them; and is brought on by lying in a certain kind of ſoil. Gold cannot be contaminated but by iron mold, which happens when the coin lies in a ſoil impregnated with iron; but ſilver is ſuſceptible of various kinds of ruſt, principally green and red; both of which yield to vinegar. In gold and ſilver coins the ruſt muſt be removed, as being prejudicial; but in braſs and copper it is preſervative and ornamental; a circumſtance taken notice of by the

74 Different kinds of this ruſt.

ancients. "This fine ruſt (ſays Mr Pinkerton), which is indeed a natural varniſh not imitable by the art of man, is ſometimes a delicate blue, like that of a turquoiſe; ſometimes of a bronze brown, equal to that obſervable in ancient ſtatues of bronze, and ſo highly prized; and ſometimes of an exquiſite green, a little on the azure hue, which laſt is the moſt beautiful of all. It is alſo found of a fine purple, of olive, and of a cream colour or pale yellow: which laſt is exquiſite, and ſhows the impreſſion to as much advantage as paper of cream colour, uſed in all great foreign preſſes, does copperplates and printing. The Neapolitan patina (the ruſt in queſtion) is of a light green; and when free from excreſcence or blemiſh is very beautiful. Sometimes the purple patina gleams thro' an upper coat of another colour, with as fine effect as a variegated ſilk or gem. In a few inſtances a ruſt of a deeper green is found; and it is ſometimes ſpotted with the red or bronze ſhade, which gives it quite the appearance of the Eaſt Indian ſtone called the *blood-ſtone*. Theſe ruſts are all, when the real product of time, as hard as the metal itſelf, and preſerve it much better than any artificial varniſh could have done; concealing at the ſame time not the moſt minute particle of the impreſſion of the coin."

75 Medals how diminiſhed in value.

The value of medals is lowered when any of the letters of the legend are miſplaced; as a ſuſpicion of forgery is thus induced. Such is the caſe with many of thoſe of Claudius Gothicus. The ſame, or even greater, diminution in value takes place in ſuch coins as have not been well fixed in the dye, which has occaſioned their ſlipping under the ſtrokes of the hammer, and thus made a double or triple image. Many coins of this kind are found in which the one ſide is perfectly well-formed, but the other blundered in the manner juſt mentioned. Another blemiſh, but of ſmaller moment, and which to ſome may be rather a recommendation, is when the workmen through inattention have put another coin into the dye without taking out the former. Thus the coin is convex on one ſide, and concave on the other, having the ſame figure upon both its ſides.

75 Countermarked medals.

The medals ſaid by the judges in this ſcience to be *countermarked* are very rare, and highly valued. They have a ſmall ſtamp impreſſed upon them, in ſome an head, in others a few letters, ſuch as Aug: N. PROBUS, &c. which marks are ſuppoſed to imply an alteration in the value of the coin; as was the caſe with the countermarked coins of Henry VIII. and Queen Mary of Scotland. Some have a ſmall hole through them; ſometimes with a little ring faſtened in it, having been uſed as ornaments; but this makes no alteration in their value. Neither is it any diminution in the value of a coin that it is ſplit at the edges; for coins of undoubted antiquity have often been found in this ſtate, the cauſe of which has already been explained. On the contrary, this cracking is generally conſidered as a great merit; but Mr Pinkerton ſuſpects that one of theſe cracked coins has given riſe to an error with reſpect to the wife of Carauſius who reigned for ſome time in Britain. The inſcription is read ORIUNA Aug: and there is a crack in the medal juſt before the O of oriuna. Without this crack Mr Pinkerton ſuppoſes that it would have been read FORTUNA Aug.

76 Silver and gold how tarniſhed.

Some particular ſoils have the property of giving ſilver a yellow colour as if it had been gilt. It naturally acquires a black colour through time, which any ſulphureous vapour will bring on in a few minutes From its being ſo ſuſceptible of injuries, it was always mixed by the ancients with much alloy, in order to harden it. Hence the impreſſions of the ancient ſilver coins remain perfect to this day, while thoſe of modern coins are obliterated in a few years. On this ac-

Preſervation. account Mr Pinkerton expreſſes a wiſh, that modern ſtates would allow a much greater proportion of alloy in their ſilver coin than they uſually do. As gold admits of no ruſt except that from iron above mentioned, the coins of this metal are generally in perfect conſervation, and freſh as from the mint.

77 How to cleanſe them. To cleanſe gold coins from this ruſt, it is beſt to ſteep them in aquafortis, which, though a very powerful ſolvent of other metals, has no effect upon gold. Silver may be cleanſed by ſteeping for a day or two in vinegar, but more effectually by boiling in water with three parts of tartar and one of ſea-ſalt; on both theſe metals, however, the ruſt is always in ſpots, and never forms an entire incruſtation as on braſs or copper. The coins of theſe two metals muſt never be cleanſed, as they would thus be rendered full of ſmall holes eaten by the ruſt. Sometimes, however, they are found ſo totally obſcured with ruſt, that nothing can be diſcovered upon them; in which caſe it is beſt to clear them with a graver; but it may alſo be done by boiling them for 24 hours in water with three parts of tartar and one of alum; not ſea-ſalt as in ſilver coins.

78 Why ancient coins are in ſuch an high ſtate of preſervation. The high ſtate of preſervation in which ancient coins are uſually found, is thus accounted for by Mr Hancarville. He obſerves, that the chief reaſon is the cuſtom of the ancients always to bury one or more coins with their dead, in order to pay for their paſſage over the river Styx. "From Phidon of Argos (ſays he) to Conſtantine I. are 36 generations: and from Magna Græcia to the Euphrates, from Cyrene to the Euxine Sea, Grecian arts prevailed, and the inhabitants amounted to about 30,000,000. There died therefore, in that time and region, not leſs than ten thouſand millions of people, all of whom had coins of one ſort or other buried with them. The tombs were ſacred and untouched; and afterwards neglected, till modern curioſity or chance began to diſcloſe them. The urn of Flavia Valentina, in Mr Towley's capital collection, contained ſeven braſs coins of Antoninus Pius and Eleagabalus. Such are generally black, from being burnt with the dead. The beſt and freſheſt coins were uſed on theſe occaſions from reſpect to the dead; and hence their fine conſervation. At Syracuſe a ſkeleton was found in a tomb, with a beautiful gold coin in its mouth; and innumerable other inſtances might be given, for hardly is a funeral urn found without coins. Other incidents alſo conſpire to furniſh us with numbers of ancient coins, though the above recited circumſtance be the chief cauſe of perfect conſervation. In Sicily, the ſilver coins with the head of Proſerpine were found in ſuch numbers as to weigh 600 French livres or pounds. In the 16th century, 60,000 Roman coins were found at Modena, thought to be a military cheſt hid after the battle of Bedriacum, when Otho was defeated by Vitellius. Near Breſt, in the year 1760, between 20 and 30,000 Roman coins were found. A treaſure of gold coins of Lyſimachus was found at Deva on the Marus; and Strabo, lib. vii. and Pauſan *in Attic.* tell that he was defeated by the Getæ; at which time this treaſure ſeems to have fallen into their hands."

79 Number of ancient coins. Thus Mr Pinkerton, from the authority of Mr Hancarville and others: but conſidering theſe vaſt numbers of coins found in various places, it ſeems ſurpriſing how ſo few ſhould now remain in the cabinets of the curious, as the ſame author informs us that the whole of the different ancient coins known to us amount only to about 80,000, though he owns that the calculation cannot be eſteemed accurate.

Sect. VII. *How to diſtinguiſh true Medals from counterfeits.*

How to diſtinguiſh true from counterfeits. The moſt difficult and the moſt important thing in the whole ſcience of medals is the method of diſtinguiſhing the true from the counterfeit. The value put upon ancient coins made the forgery of them almoſt coeval with the ſcience itſelf; and as no laws inflict a puniſhment upon ſuch forgers, men of great genius and abilities have undertaken the trade: but whether to the real detriment of the ſcience or not, is a matter of ſome doubt; for if only exact copies of genuine medals are ſold for the originals, the impoſition may be deemed trifling: but the caſe muſt be accounted very different, if people take it upon them to forge medals which never exiſted. At firſt the forgeries were extremely groſs; and medals were forged of Priam, of Ariſtotle, Artemiſia, Hannibal, and moſt of the other illuſtrious perſonages of antiquity. Moſt of theſe were done in ſuch a manner, that the fraud could eaſily be diſcovered; but others have impoſed even upon very learned men. Mr Pinkerton mentions a remarkable medal of the emperor Heraclius, repreſenting him in a chariot on the reverſe, with Greek and Latin inſcriptions, which Joſeph Scaliger and Lipſius imagined to have been ſtruck in his own time, but which was certainly iſſued in Italy in the 15th century. "Other learned men (ſays our author) have been ſtrangely miſled, when ſpeaking of coins; for to be learned in one ſubject excludes not groſs ignorance in others. Budæus, de Aſſe, quotes a denarius of Cicero, M. TULL.. Eraſmus, in one of his Epiſtles, tells us with great gravity, that the gold coin of Brutus, ſtruck in Thrace, ΚΟΣΩΝ, bears the patriarch Noah coming out of the ark with his two ſons, and takes the Roman eagle for the dove with the olive branch. Winkelman, in his letters, informs us, that the ſmall braſs piece with Virgil's head, reverſe EPO, is undoubtedly ancient Roman; and adds, that no knowledge of coins can be had out of Rome: but Winkelman, ſo converſant in ſtatues, knew nothing of coins. It is from other artiſts and other productions that any danger of deceit ariſes. And there is no wonder that even the ſkilful are miſled by ſuch artiſts as have uſed this trade; for among them appear 80 Coins forged by excellent artiſts. the names of Victor Gambello, Giovani del Cavino, called the PADUAN, and his ſon Aleſſandro Baſſiano, likewiſe of Padua, Benvenuto Cellini, Aleſſandro Greco, Leo Aretino, Jacobo da Frezzo, Federigo Bonzagna, and Giovani Jacopo, his brother; Sebaſtiano Plumbo, Valerio de Vicenza, Gorlæus a German, Carteron of Holland, and others, all or moſt of them of the 16th century; and Cavino the Paduan, who is the moſt famous, lived in the middle of that century. The forgeries of Cavino are held in no little eſteem, being of wonderful execution. His and thoſe of Carteron are the moſt numerous, many of the other artiſts here mentioned not having forged above two or three coins. Later forgers were

How to distinguish true from counterfeits.

were Dervieu of Florence who confined himself to medallions, and Cogornier who gave coins of the 30 tyrants in small brass. The chief part of the forgeries of Greek medals which have come to my knowledge are of the first mentioned, and a very gross kind, representing persons who could never appear upon coin, such as Priam, Æneas, Plato, Alcibiades, Artemisia, and others. The real Greek coins were very little known or valued till the works of Goltzius appeared, which were happily posterior to the æra of the grand forgers. Why later forgers have seldom thought of counterfeiting them cannot easily be accounted for, if it is not owing to the masterly workmanship of the originals, which sets all imitation at defiance. Forgeries, however, of most ancient coins may be met with, and of the Greek among the rest.

81
Roman forgeries more conspicuous than Greek ones.

"The forgeries are more conspicuous among the Roman medals than any other kind of coins; but we are not to look upon all these as the work of modern artists. On the contrary, we are assured that many of them were fabricated in the times of the Romans themselves, some of them being even held in more estimation than the genuine coins themselves, on account of their being plated, and otherwise executed in a manner to which modern forgers could never attain. Even the ancients held some of these counterfeits in such estimation, that Pliny informs us there were frequently many true denarii given for one false one."—Caracalla is said to have coined money of copper and lead plated with silver; and plated coins, the work of ancient forgers, occur of many Greek cities and princes; nay, there are even forgeries of barbaric coins. "Some Roman coins (says Mr Pinkerton) are found of iron or lead plated with brass, perhaps trials of the skill of the forger. Iron is the most common; but one decursio of Nero is known of lead plated with copper. Neumann justly observes, that no historic faith can be put in plated coins, and that most faulty reverses, &c arise from plated coins not being noticed as such. Even of the Roman consular coins

82
Denarius of Brutus.

not very many have ever been forged. The celebrated silver denarius of Brutus, with the cap of liberty and two daggers, is the chief instance of a consular coin of which a counterfeit is known. But it is easily rejected by this mark: in the true coin the cap of liberty is below the guard or hilt of the daggers; in the false, the top of it rises above that hilt."

83
Imperial medals.

The imperial series of medals is the grand object of modern medallic forgeries; and the deception was at first extended to the most eminent writers upon the subject. The counterfeits are by Mr Pinkerton divided into six classes:

I. Such as are known to be imitations, but valued on account of the artists by which they are executed. In this class the medals of the Paduan rank highest; the others being so numerous, that a complete series of imperial medals of almost every kind, nay almost of every medallion, may be formed from among them. In France, particularly, by far the greater part of the cabinets are filled with counterfeits of this kind. They are distinguished from such as are genuine by the following marks: 1. The counterfeits are almost universally thinner. 2. They are never worn nor damaged. 3. The letters are modern. 4. They are either destitute of varnish entirely, or have a false one, which is easily known by its being black, shining, and greasy, and very easily hurt with the touch of a needle, while the varnish of ancient medals is as hard as the metal itself. Instead of the greasy black varnish above mentioned, indeed, they have sometimes a light green one, spotted with a kind of iron marks, and is composed of sulphur, verdigrease, and vinegar. It may frequently be distinguished by the hairstrokes of the pencil with which it was laid on being visible upon it. 5. The sides are either filed or too much smoothed by art, or bear the marks of a small hammer 6. The counterfeits are always exactly circular, which is not the case with ancient medals, especially after the time of Trajan.

84
Paduan forgeries how known.

The Paduan forgeries may be distinguished from those of inferior artists by the following marks: 1. The former are seldom thinner than the ancient. 2. They very seldom appear as worn or damaged, but the others very frequently, especially in the reverse, and legend of the reverse, which sometimes, as in forged Othos, appear as half consumed by time. 3. The letters in moulds taken from the antique coins have the rudeness of antiquity. 4. False varnish is commonly light green or black, and shines too much or too little. 5. The sides of forged coins are frequently quite smooth, and undistinguishable from the ancient, though to accomplish this requires but little art. 6. Counterfeit medals are frequently as irregular in their form as the genuine; but the Paduan are generally circular, though false coins have often little pieces cut off, in perfect imitation of the genuine. 7. In cast coins the letters do not go sharp down into the metal, and have no fixed outline; their minute angles, as well as those of the drapery, are commonly filled up, and have not the sharpness of the genuine kind. Where the letters or figures are faint, the coin is greatly to be suspected.

85
Letters the principal criterion of medals.

The letters form the great criterion of medals, the ancient being very rude, but the modern otherwise; the reason of which, according to Cellini, is, that the ancients engraved all their matrices with the graver or burin, while the modern forgers strike theirs with a punch.

86
Vico's account of false patina.

According to Vico, the false patina is green, black, russet, brown, grey, and iron-colour. The green is made from verdigrease, the black is the smoke of sulphur, the grey is made of chalk steeped in urine, the coin being left for some days in the mixture. The russet is next to the natural, by reason of its being a kind of froth which the fire forces from ancient coins; but when false, it shines too much. To make it they frequently took the large brass coins of the Ptolemies, which were often corroded, and made them red hot in the fire; put the coins upon them, and a fine patina adhered. Our author does not say in what manner the iron-covered patina was made. "Sometimes (adds he) they take an old defaced coin, covered with real patina, and stamp it anew; but the patina is then too bright in the cavities, and too dull in the protuberances. The trial of brass coins with the tongue is not to be despised; for if modern the patina tastes bitter or pungent, while if ancient it is quite tasteless."

Mr Pinkerton informs us, that all medallions from Julius Cæsar to Adrian are much to be suspected of forgery; the true medals of the first 14 emperors being

How to distinguish true from counterfeits.

ing exceedingly valuable, and to be found only in the cabinets of princes.

87 Medals cast from the Paduan forgeries.

II. The second class of counterfeit medals contains those cast from moulds taken from the Paduan forgeries, and others done by eminent masters. These are sometimes more difficult to be discovered than the former, because in casting them they can give any degree of thickness they please; and, filling the small sand-holes with mastic, they retouch the letters with a graver, and cover the whole with varnish. The instructions already given for the former class, however, are also useful for those of the second, with this addition, that medals of this class are generally lighter than the genuine, because fire rarefies the metal in some degree, while that which is struck is rather condensed by the strokes. In gold and silver medals there cannot be any deception of this kind; because these metals admit not of patina, and consequently the varnish betrays the imposition. The marks of the file on the margin of those of the second class are a certain sign of forgery; though these do not always indicate the forgery to be of modern date, because the Romans often filed the edges of coins to accommodate them to the purposes of ornament, as quarter guineas are sometimes put into the bottom of punch laddles. It is common to imitate the holes of medals made by time by means of aqua-fortis; but this destroys the sides of a coin more effectually than if it had been eat into naturally. The fraud, however, is not easily distinguished.

88 Medals cast from an antique.

III. *Medals cast in moulds from an antique.*—In this mode some forgers, as Beauvais informs us, have been so very careful, that they would melt a common medal of the emperor whom they meant to counterfeit, lest the quality of the metal should betray them. "This (says Mr Pinkerton) has been done in the silver Septimius Severus, with the reverse of a triumphal arch, for which a common coin of the same prince has been melted; and in other instances. Putting metals in the fire or upon hot iron to cleanse them, gives them an appearance of being cast; for some spots of the metal being softer than the rest will run, which makes this one of the worst methods of cleaning medals.— The directions given for discovering the two former deceptions hold good also in this.

89 Ancient medals retouched.

IV. *Ancient medals retouched and altered.*—This is a class of counterfeits more difficult to be discovered than any other. "The art (says Mr Pinkerton) exerted in this class is astonishing; and a connoisseur is the less apt to suspect it, because the coins themselves are in fact ancient. The acute minds of the Italian artists exerted themselves in this way, when the other forgeries became common and known. With graving tools they alter the portraits, the reverses, and the inscriptions themselves, in a surprising manner. Of a Claudius struck at Antioch they make an Otho; of a Faustina, a Titiana; of a Julia Severa, a Didia Clara; of a Macrinus, a Pescennius, &c. Give them a Marcus Aurelius, he starts up a Pertinax, by thickening the beard a little, and enlarging the nose. In short, wherever there is the least resemblance in persons, reverses, or legends, an artist may from a trivial medal generate a most scarce and valuable one. This fraud is distinguishable by the false varnish which sometimes masks it; but, above all, by the letters of the legend, which are always altered. Though this be sometimes done with an artifice almost miraculous, yet most commonly the characters straggle, are disunited, and not in a line."

In counterfeits of this kind sometimes the obverse is not touched, but the reverse made hollow, and filled with mastic coloured like the coin, and engraven with such device and legend as was most likely to bring a great price; others are only retouched in some minute parts, by which, however, the value of the coin is much diminished. "Against all these arts (says Mr Pinkerton), severe scrutiny must be made by the purchaser upon the medal itself; and the investigation and opinion of eminent antiquaries had upon its being altered, or genuine as it is issued from the mint.

90 Medals with new devices, or soldered.

V. *Medals impressed with new devices, or soldered.*—In the first article of this class the reverses have been totally filed off, and new ones impressed with a dye and hammer. This is done by putting the face or obverse, whichever is not touched, upon different folds of pasteboard, afterwards applying the dye and striking it with a hammer. The forgery in this class is very easily discovered, as the devices and inscriptions on the counterfeits are known not to exist on true medals: as the Pons Ælius on the reverse of Adrian; the Expeditio Judaica of the same emperor, &c. The difference of fabrication in the face or reverse will be discovered at the first glance by any person of skill.

The soldered medals consist of two halves belonging to different medals, sawed through the middle and then joined with solder. This mode of counterfeiting is common in silver and brass coins. "They will take an Antoninus, for example, and saw off the reverse, then solder to the obverse which they have treated in the same manner. This makes a medal, which, from an unknowing purchaser, will bring an hundred times the price of the two coins which compose it. When the deceit is used in brass coins, they take care that the metals be of one hue; though indeed some pretenders in this way sometimes solder copper and brass together, which at once reveals the deceit. Medals which have a portrait on each side, and which are generally valuable, are the most liable to a suspicion of this fraud. To a very nice eye the minute ring of solder is always visible; and upon inserting a graver, the fabrication falls into halves."

In the same manner reverses are sometimes soldered to faces not originally belonging to them; as one mentioned by Pere Jobert of Domitian with an amphitheatre, a reverse of Titus joined to it. Another art is sometimes made use of in this kind of counterfeits, of which there is an instance of the temple of Janus upon Nero's medals; where the middle brass is taken off, and inserted in a cavity made in the middle of a large coin of that prince. In the coins of the lower empire, however, the reverses of medals are sometimes so connected with their obverses, that a suspicion of forgery sometimes occurs without any foundation. They are met with most commonly after the time of Gallienus, when such a number of usurpers arose, that it was difficult to obtain an exact portrait of their features; the coiners had not time, therefore, to strike a medal for these as they could have done for other emperors who reigned longer. Hence, on the reverse

How to diſtinguiſh true from counterfeits. of a medal of Marius, who reigned only three days, there is PACATOR ORBIS, which ſhows that at that time they had reverſes ready fabricated, to be applied as occaſion might require.

91 Plated medals, &c. VI. *Plated medals, or thoſe which have clefts.*—It has been already remarked, that many true medals are cracked in the edges; owing to the repeated ſtrokes of the hammer, and the little degree of ductility which the metal poſſeſſes. This the forgers attempt to imitate by a file; but it is eaſy to diſtinguiſh betwixt the natural and artificial cleft by means of a ſmall needle. The natural cleft is wide at the extremity, and appears to have a kind of almoſt imperceptible filaments; the edges of the crack correſponding with each other in a manner which no art can imitate.

The plated medals which have been forged in ancient times were long ſuppoſed to be capable of reſiſting every effort of modern imitation; but of late years, "ſome ingenious rogues (ſays Mr Pinkerton) thought of piercing falſe medals of ſilver with a red hot needle, which gave a blackneſs to the inſide of the coin, and made it appear plated to an injudicious eye. This fraud is eaſily diſtinguiſhed by ſcraping the inſide of the metal." It is, however, very difficult to diſtinguiſh the forgeries of rude money when not caſt; and our author gives no other direction than to conſult a ſkilful medalliſt. Indeed, notwithſtanding all the directions already given, this ſeems to be a reſource which cannot by any means with ſafety be neglected.

92 Mr Pinkerton's directions for knowing medals. A real and practical knowledge of coins "is only to be acquired (ſays he) by ſeeing a great number, and comparing the forged with the genuine. It cannot therefore be too much recommended to the young connoiſſeur, who wiſhes to acquire ſome knowledge in this way, to viſit all the ſales and cabinets he can, and to look upon all ancient medals with a very microſcopic eye. By theſe means only is to be acquired that ready knowledge which enables at firſt glance to pronounce upon a forgery, however ingenious. Nor let the ſcience of medals be from this concluded to be uncertain; for no knowledge is more certain and immediate, when it is properly ſtudied by examination of the real objects. A man who buys coins, truſting merely to his theoretic peruſal of medallic books, will find himſelf woefully miſtaken. He ought to ſtudy coins firſt, where only they can be ſtudied, in themſelves. Nor can it be matter of wonder or implication of caprice, that a medalliſt of ſkill ſhould at one perception pronounce upon the veracity or falſehood of a medal; for the powers of the human eye, employed in certain lines of ſcience, are amazing. Hence a ſtudent can diſtinguiſh a book among a thouſand ſimilar, and quite alike to every other eye: hence a ſhepherd can diſcern, &c.: hence the medalliſt can

93 Forgeries of modern coins. ſay in an inſtant, 'this is a true coin, and this is a falſe,' though to other people no diſtinction be perceptible."

Forgeries of modern coins and medals, Mr Pinkerton obſerves, are almoſt as numerous as of the ancient. The ſatyric coin of Louis XII. PERDAM BABYLONIS NOMEN, is a remarkable inſtance: the falſe coin is larger than the true, and bears date 1512. The rude coins of the middle ages are very eaſily forged, and forgeries have accordingly become common. Forged coins of Alfred and other early princes of England have appeared, ſome of which have been done with great art. "The two noted Engliſh pennies of Rich. I. ſays our author, are of this ſtamp; and yet have impoſed upon Meſſrs Folkes and Snelling, who have publiſhed them as genuine in the two beſt books upon Engliſh coins. But they were fabricated by the late Mr White of Newgate-ſtreet, a noted collector, who contaminated an otherwiſe fair character by ſuch practices. Such forgeries, though eaſy, require a ſkill in the hiſtory and coinage of the times which luckily can hardly fall to the lot of a common Jew or mechanic forger. But the practice is deteſtable, were no gain propoſed: and they who ſtoop to it muſt ſuppoſe, that to embarraſs the path of any ſcience with forgery and futility, implies no infamy. In forgeries of ancient coin, the fiction is perhaps ſufficiently atoned for by the vaſt ſkill required; and the artiſt may plauſibly allege, that his attention was not to deceive, but to excite his utmoſt powers, by an attempt to rival the ancient maſters. But no poſſible apology can be made for forging the rude money of more modern times. The crime is certainly greater than that which leads the common coiner to the gallows; inaſmuch as it is committed with more eaſe, and the profit is incomparably larger."

Value.

SECT. VIII. *Of the Value of Medals.*

ALL ancient coins and medals, though equally genuine, are not equally valuable. In medals, as well as in every thing elſe, the ſcarcity of a coin ſtamps a value upon it which cannot otherwiſe be derived from its intrinſic worth. There are four or five degrees of rarity reckoned up; the higheſt of which is called *unique*. The cauſe is generally aſcribed to the fewneſs of number thrown off originally, or to their having been called in, and recoined in another form. To the former cauſe Mr Pinkerton aſcribes the ſcarcity of the copper of Otho and the gold of Peſcennius Niger; to the latter that of the coinage of Caligula: "though this laſt (ſays he) is not of ſingular rarity; which ſhows that even the power of the Roman ſenate could not annihilate an eſtabliſhed money; and that the firſt cauſe of rarity, ariſing from the ſmall quantity originally ſtruck, ought to be regarded as the principal."

In the ancient cities Mr Pinkerton aſcribes the ſcarcity of coin to the poverty or ſmallneſs of the ſtate; but the ſcarcity of ancient regal and imperial coins ariſes principally from the ſhortneſs of the reign; and ſometimes from the ſuperabundance of money before, which rendered it almoſt unneceſſary to coin any money during the reign of the prince. An example of this we have in the ſcarcity of the ſhillings of George III. which ſhows that ſhortneſs of reign does not always occaſion a ſcarcity of coin; and thus the coins of Harold II. who did not reign a year, are very numerous, while thoſe of Richard I. who reigned ten, are almoſt unique. 94 Cauſes of the ſcarcity of medals in ancient cities.

Sometimes the rareſt coins loſe their value, and become common. This our author aſcribes to the high price given for them, which tempts the poſſeſſors to bring them to market; but chiefly to the diſcovering of hoards of them. The former cauſe took place with Queen Anne's farthings, ſome of which formerly ſold at five guineas; nay, if we could believe the newſpapers, Value. pers, one of them was some years ago sold for 960l. the latter with the coins of Canute, the Danish king of England; which were very rare till a hoard of them was discovered in the Orkneys.

[94] Rare coins sometimes become common, and vice versa. As discoveries of this kind, however, produce a temporary plenty, so when they are dispersed the former scarcity returns; while on the other hand some of the common coins become rare through the mere circumstance of neglect.

95 Silver coins in what cases most esteemed. As double the number of copper-coins of Greek cities are to be met with that there are of silver, the latter are of consequence much more esteemed: but the reverse is the case with those of the Greek princes. All the Greek civic coins of silver are very rare excepting those of Athens, Corinth, Messana, Dyrrhachium, Massilia, Syracuse, and some others. Of the Greek monarchic coins, the most rare are the tetradrachms of the kings of Syria, the Ptolemies, the sovereigns of Macedon and Bithynia, excepting those of Alexander the Great and Lysimachus. Those of the kings of Cappadocia are of a small size, and scarce to be met with. Of those of Numidia and Mauritania, the coins of Juba the father are common; but those of the son and nephew Ptolemy scarce. Coins of the kings of Sicily, Parthia, and Judæa, are rare; the last very much so. We meet with no coins of the kings of Arabia and Comagene except in brass: those of the kings of Bosphorus are in electrum, and a few in brass, but all of them rare; as are likewise those of Philetenis king of Pergamus and of the kings of Pontus. In the year 1777, a coin of Mithridates sold for L. 26, 5s. Didrachms of all kings and cities are scarce excepting those of Corinth and her colonies; but the gold coins of Philip of Macedon, Alexander the Great, and Lysimachus, as has already been observed, are common. The silver tetradrachms of all kings bear a very high price. The didrachm of Alexander the Great is one of the scarcest of the smaller Greek silver coins; some of the other princes are not uncommon.

96 Greek copper coins. In most cases the copper money of the Greek monarchs is scarce; but that of Hiero I. of Syracuse is uncommonly plenty, as well as that of several of the Ptolemies.

97 Roman consular coins. The most rare of the consular Roman coins are those restored by Trajan: of the others the gold consular coins are the most rare, and the silver the most common; excepting the coin of Brutus with the cap of Liberty already mentioned, with some others. Some of the Roman imperial coins are very scarce, particularly those of Otho in brass; nor indeed does he occur at all on any coin struck at Rome: but the reason of this may with great probability be supposed to have been the shortness of his reign. His portrait upon the brass coins of Egypt and Antioch is very bad; as well as almost all the other imperial coins of Greek cities. The best likeness is on his gold and silver coins; the latter of which are very common. The Greek and Egyptian coins are all of small or middling sizes, and have reverses of various kinds: those of Antioch have Latin legends, as well as most of the other imperial coins of Antioch. They have no other reverse but the SC in a wreath; excepting in one instance or two of the large and middle brass, where the inscriptions are in Greek. Latin coins of Otho in brass, with figures on the reverse, are certainly false; though in the cabinet of D'Ennery at Paris there was an Otho in middle brass restored by Titus, which was esteemed genuine by connoisseurs. Value.

98 Leaden Roman coins. The leaden coins of Rome are very scarce: Most of them are pieces struck or cast on occasion of the saturnalia; others are tickets for festivals and exhibitions, both private and public. The common tickets for theatres were made of lead, as were the *contorniati*; perpetual tickets, like the English silver tickets for the opera. Leaden medallions are also found below the foundations of pillars and other public buildings, in order to perpetuate the memory of the founders. From the time of Augustus also we find that leaden seals were used. The work of Ticorini upon this subject, intitled *Piomli Antiochi*, is much recommended by Mr Pinkerton.

99 Of coins blundered in the mintage. The Roman coins, which have been blundered in the manner formerly mentioned, are very rare, and undeservedly valued by the connoisseurs. The blunders in the legends of these coins, which in all probability are the mere effects of accident, have been so far mistaken by some medallists, that they have given rise to imaginary emperors who never existed. A coin of Faustina, which has on the reverse SOUSTI. S. C. puzzled all the German antiquaries, till at last Klotz gave it the following facetious interpretation: *Sine omni utilitate sectamini tantas ineptias.*

100 Heptarchic coins of England. The heptarchic coins of England are generally rare except those called *stycas*, which are very common, as well as those of Burgred king of Mercia. The coins of Alfred which bear his bust are scarce, and his other money much more so. Those of Hardyknute are so rare, that it was even denied that they had an existence; but Mr Pinkerton informs us, that there are three in the British museum, upon all of which the name HARTHCANUT is quite legible. No English coins of King John are to be met with, tho' there are some Irish ones; and only French coins of Richard I. "Leake (says Mr Pinkerton) made a strange blunder in ascribing coins of different kings with two faces, and otherwise spoiled in the stamping, to this prince; in which, as usual, he has been followed by a misled number."

101 Scottish coins. Coins of Alexander II. of Scotland are rather scarce; but those of Alexander III. are more plentiful. Those of John Baliol are rare, and none of Edward Baliol to be found.

Sect. IX. *Of the Purchase of Medals.*

Medals are to be had at the shops of goldsmiths and silversmiths, with those who deal in curiosities, &c. but in great cities there are professed dealers in them. The best method of purchasing medals, however, is that of buying whole cabinets, which are every year exposed to auction at London. In these the rare medals are sold by themselves; but the common ones are put up in large lots, so that the dealers commonly purchase them. Mr Pinkerton thinks it would be better that medals were sold one by one; because a lot is often valued and purchased for the sake of a single coin; while the others separately would sell for perhaps four times the price of the whole lot. "If any man of common sense and honesty (says Mr Pinkerton)

Purchase.

kerton) were to take up the trade of selling coins in London, he would make a fortune in a short time. This profitable business is now in the hands of one or two dealers, who ruin their own interest by making an elegant study a trade of knavery and imposition. If they buy 300 coins for 10s. they will ask 3s. for one of the worst of them! nay, sell forged coins as true to the ignorant. The simpletons complain of want of business. A knave is always a fool."

102 Price of gold coins of Carthage, &c.

The gold coins of Carthage, Cyrene, and Syracuse, are worth about twice their intrinsic value as metal; but the other gold civic coins from 5l. to 30l. each. The only gold coins of Athens certainly known to exist are two lately procured by the king. One of these remains in possession of his majesty, but the other was given by the queen to Dr Hunter. There was another in the British museum, but suspected not to be genuine. Dr Hunter's coin, then, if sold, would bear the highest price that could be expected for a coin.

103 Of silver coins.

The silver coins of Syracuse, Dyrrhachium, Massilia, Athens, and a few other states, are common; the drachmas and coins of lesser size are worth about five shillings; the didrachms, tetradrachms, &c. from five to ten, according to their size and beauty; the largest, as might naturally be expected, being more valuable than the small ones. The tetradrachms, when of cities whose coins are common, are worth from 7s. 6d. to 1l. 1s. but it is impossible to put a value upon the rare civic coins; ten guineas have been given for a single one.

104 Greek copper coins.

The Greek copper coins are common, and are almost all of that kind called *small brass;* the middle size being scarce, and the largest in the ages prior to the Roman emperors extremely so. The common Greek coins of brass bring from 3d. to 18d. according to their preservation; but when of cities, whose coins are rare, much higher prices are given. "The want of a few cities, however (says Mr Pinkerton), is not thought to injure a collection; as indeed new names are discovered every dozen of years, so that no assortment can be perfect. To this it is owing that the rarity of the Grecian civic coins is not much attended to."

105 Gold coins of Philip and Alexander.

The gold coins of Philip and Alexander the Great being very common, bear but from five to ten shillings above their intrinsic value; but those of the other princes, being rare, sell from 3l. to 30l. each, or even more.

The tetradrachms are the dearest of the silver monarchic money, selling from five to ten shillings; and if very rare, from 3l. to 30l. Half these prices may be obtained for the drachmas, and the other denominations in proportion.

106 Greek copper coins more rare than the silver.

The Greek copper coins are for the most part scarcer than the silver, except the Syro-Grecian, which are common, and almost all of the size called small brass. "They ought (says Mr Pinkerton) to bear a a high price; but the metal and similarity to the copper civic coins, which are common, keep their actual purchase moderate, if the seller is not well instructed, and the buyer able and willing to pay the price of rarity."

The name of weights given to the ancient Roman ases is, according to our author, exceedingly improper; as that people had weights of lead and brass sides, without the least appearance of a portrait upon them. These denote the weight by a certain number of knobs; and have likewise small *fleurettes* engraved upon them. According to Mr Pinkerton, whenever we meet with a piece of metal stamped on both sides with busts and figures, we may lay it down as a certain rule that it is a coin; but when slightly ornamented and marked upon one side only, we may with equal certainty conclude it to be a weight.

107 Price of the ancient Roman ases.

The ancient Roman ases are worth from 2s. to 2l. according to the singularity of their devices. Consular gold coins are worth from 1l to 5l. Pompey with his sons 21l. and the two Bruti 2?l. The silver coins are universally worth from a shilling to half a crown, excepting that of the cap of Liberty and a few others, which if genuine will bring from 10s to 5l. The consular copper bears an equal price with the silver, but is more rare; the consular silver coins restored by Trajan are worth 20s. each.

With regard to the Roman imperial coins, it is to be observed, that some of those which belong to princes whose coins are numerous, may yet be rendered extremely valuable by uncommon reverses. Mr Pinkerton particularly points out that of Augustus, with the legend C. MARIUS TROGVS, which is worth three guineas, though the silver coins of that prince in general are not worth above a shilling. In like manner, the common gold coins of Trajan are not worth above twenty shillings, while those with *Basilica Ulpia, Forum Trajani, Divi Nerva et Trajanus, Pater, Divi Nerva et Platina Aug. Profectio Aug. Regna Assignata, Rex Parthus*, and some others, bear from three to six pounds. The ticket medals belong to the Roman Senate, and are worth from three to ten shillings. The forged coins and medallions of the Paduan sell from one to three shillings each.

108 Barbaric coins.

Of the coins of other nations, those of Hilderic king of the Vandals are in silver, and worth 10s.; the small brass of Athanaric, 5s.; the gold of Theodoric 2l.; the second brass of Theodahat 5s.; the second brass of Baducta rare, and worth 10s.; the third brass, 3s. The British coins are very rare, and worth from ten shillings to two guineas each, sometimes much more. Medals with unknown characters are always scarce and dear. Saxon pennies of the heptarchy are rare, and worth from ten shillings to *ten pounds*, according to their scarcity and preservation. The coins of the English kings are common; those of Edward the Confessor, in particular; others are rare, and worth from ten shillings to two guineas, while two of Hardyknute are worth no less than ten guineas. The gold medals of Henry, in 1545, and the coronation of Edward, are worth 20l. each: the Mary of Trezzo, 3l.; Simon's head of Thurloe in gold is worth 12l.; his oval medal in gold upon Blake's naval victory at sea is worth 30l.; and his trial piece, if brought to a sale, would, in Mr Pinkerton's opinion, bring a still higher price. The medals of Queen Anne, which are intrinsically worth about two guineas and a half, sell for about 3l. each; the silver, of the size of a crown piece, sell for 10s. and the copper from five to ten shillings. Dassier's copper pieces sell from two to five shillings, and a few bear a higher price.

The Scottish gold coins sell higher than the English,

Arrangement, &c.

liſh, but the others are on a par. The ſhilling of Mary with the buſt is rare, and ſells for no leſs than 30 l.; the half 3 l.; and the royal 5 l. 5 s. The

109 Gold coins of Scotland

French teſtoon of Francis and Mary brings 10 l. 10 s. and the Scottiſh one of Mary and Henry would bring 50 l. as would alſo the medal of James IV. The coronation medal of Francis and Mary is worth 20 l. Briot's coronation medal ſold in 1755 only for two guineas at Dr Mead's ſale; but would now bring 20 l. if ſold according to rarity.

110 Engliſh coins ſtruck in Ireland.

The Engliſh coins ſtruck in Ireland are of much the ſame price with thoſe of the native country; but the St Patrick's halfpence and farthings are rather ſcarce, and the rare crown of white metal is worth 4 l. The gun-money of James II. and all other Iriſh coins are very common.

Sect. X. *Arrangement of Medals, with the Inſtruction to be derived from them.*

Having thus given a full account of every thing in general relative to medals, we muſt now come to ſome particulars reſpecting their arrangement, and the entertainment which a medalliſt may expect from the trouble and expence he is at in making a collection.

It has already been obſerved, that one of the principal uſes of medals is the elucidation of ancient hiſtory. Hence the arrangement of his medals is the firſt thing that muſt occur in the formation of a cabinet. The moſt ancient medals with which we are acquainted are thoſe of Alexander I. of Macedon, who began to reign about 501 years before Chriſt. The ſeries ought of conſequence to begin with him, and to be ſucceeded by the medals of Sicily, Caria, Cyprus, Heraclia, and Pontus. Then follow Egypt, Syria, the Cimmerian Boſphorus, Thrace, Bithynia, Parthia, Armenia, Damaſcus, Cappadocia, Paphlagonia, Pergamus, Galatia, Cilicia, Sparta, Pæonia, Epirus, Illyricum, Gaul, and the Alps, including the ſpace of time from Alexander the Great to the birth of Chriſt, and which is to be accounted the third medallic ſeries of ancient monarchs. The laſt ſeries goes down to the fourth century, including ſome of the monarchs of Thrace, Boſphorus, and Parthia, with thoſe of Comagene, Edeſſa or Oſrhoene, Mauritania, and Judæa. A moſt diſtinct ſeries is formed by the Roman emperors, from Julius Cæſar to the deſtruction of Rome by the Goths; nay for a much longer period, were it not that towards the latter part of it the coins become ſo barbarous as to deſtroy the beauty of the collection. Many ſeries may be formed of modern potentates.

By means of medals we can with great certainty determine the various ornaments worn by ancient

111 Diadem an ancient emblem of ſovereign authority.

princes as badges of diſtinction. The Grecian kings have generally the diadem, without any other ornament; and though in general the ſide of the face is preſented to view, yet in ſome very ancient Greek and Roman conſular coins, full faces of excellent workmanſhip are met with. On ſeveral coins alſo two or three faces are to be ſeen, and theſe are always accounted very valuable.

The diadem, which was no more than a ribbon tied round the head with a floating knot behind, adorns all the Grecian princes from firſt to laſt, and is almoſt an infallible mark of ſovereign power. In the Roman conſular coins it is ſeen in conjunction with Numa and Ancus, but never afterwards till the time of Licinius, the colleague of Conſtantine. Diocleſian, indeed, according to Mr Gibbon, firſt wore the diadem, but his portrait upon coins is never adorned with it. So great an averſion had the Romans to kingly power, that they rather allowed their emperors to aſſume the radiated crown, the ſymbol of divinity, than to wear a diadem; but after the time of Conſtantine it becomes common. The radiated crown appears firſt on the poſthumous coins of Auguſtus as a mark of deification, but in ſomewhat more than a century became common.

The laurel crown, at firſt a badge of conqueſt, was afterwards permitted by the ſenate to be worn by Julius Cæſar, in order to hide the baldneſs of his head. From him all the emperors appear with it on their medals, even to our own times. In the lower empire the crown is ſometimes held by a hand above the head, as a mark of piety. Beſides theſe, the naval, mural, and civic crowns, appear on the medals both of emperors and other eminent men, to denote their great actions. The laurel crown is alſo ſometimes worn by the Greek princes. The Arſacidæ of Parthia wear a kind of ſaſh round the head, with their hair in rows of curls like a wig. The Armenian kings have the *tiara*, a kind of cap which was eſteemed the badge of imperial power in the eaſt. Conical caps are ſeen on the medals of Xerxes, a petty prince of Armenia, and Juba the father, the former having a diadem around it.

112 Symbols of deity on the coins of Alexander and his ſucceſſors.

The impious vanity of Alexander and his ſucceſſors in aſſuming divine honours is manifeſt on their medals, where various ſymbols of divinity are met with. Some of them have an horn behind their ear, either to denote their ſtrength, or that they were the ſucceſſors of Alexander, to whom this badge might be applied as the ſon of Jupiter Ammon. This, however, Mr Pinkerton obſerves, is the only one of theſe ſymbols which certainly denotes an earthly ſovereign, it being doubted whether the reſt are not all figures of gods.—According to Eckhet, even the horn and diadem belong to Bacchus, who invented the latter to cure his headachs; and, according to the ſame author, the only monarch who appears on coins with the horn is Lyſimachus. We are informed, however, by Plutarch, that Pyrrhus had a creſt of goats horns to his helmet; and the goat we know was a ſymbol of Macedon. Perhaps the ſucceſſors of Alexander wore this badge of the horn in conſequence. The helmet likewiſe frequently appears on the heads of ſovereigns, and Conſtantine I. has helmets of various forms curiouſly ornamented.

The diadem is worn by moſt of the Greek queens, by Orodaltis, daughter of Lycomedes, king of Bithynia; and though the Roman empreſſes never appear with it, yet this is more than compenſated by the variety of their head-dreſſes. Sometimes the buſt of an empreſs is ſupported by a creſcent, to imply that ſhe was the moon as her huſband was the ſun of the ſtate. The toga, or veil drawn over the face, at firſt implied that the perſon was inveſted with the pontifical office; and accordingly we find it on the buſts of Julius Cæſar, while Pontifex Maximus. It likewiſe implies the au-

guſtſhip,

Arrangement, &c. gurship, the augurs having a particular kind of gown called *lana*, with which they covered their heads when observing an omen. In latter times this implies only consecration, and is common in coins of empresses. It is first met with on the coins of Claudius Gothicus as the mark of consecration of an emperor. The *nimbus*, or glory, now appropriated to saints, has been already mentioned. It is as ancient as Augustus, but is not to be met with on many of the imperial medals, even after it began to be appropriated to them. There is a curious coin, which has upon the reverse of the common piece with the head of Rome Urbs Roma, in large brass, Constantine I. sitting amid victories and genii, with a triple crown upon his head for Europe, Asia, and Africa, with the legend Securitas Romæ.

113 Portraits upon medals.

In general only the bust is given upon medals, though sometimes half the body or more; in which latter case the hands often appear with ensigns of majesty in them; such as the globe said to have been introduced by Augustus as a symbol of universal dominion; the sceptre sometimes confounded with the consular staff, a roll of parchment, the symbol of legislative power, and an handkerchief expressive of the power over the public games, where the emperor gave the signal. Some princes hold a thunderbolt, showing that their power on earth was equal to that of Jupiter in Heaven; while others hold an image of Victory.

Medals likewise afford a good number of portraits of illustrious men; but they cannot easily be arranged in chronological order, so that a series of them is not to be expected. It is likewise vain to attempt the formation of a series of gods and goddesses to be found on ancient coins. Mr Pinkerton thinks it much better to arrange them under the several cities or kings whose names they bear. A collection of the portraits of illustrious men may likewise be formed from medals of modern date.

114 Reverses of Greek and Roman coins.

The reverses of ancient Greek and Roman coins afford an infinite variety of instruction and amusement. They contain figures of deities at full length, with their attributes and symbols, public symbols and diversions, plants, animals, &c. &c. and in short almost every object of nature or art. Some have the portrait of the queen, son, or daughter of the prince whose image appears on the face or obverse; and these are esteemed highly by antiquaries, not only because every coin stamped with portraits on both sides is accounted valuable, but because they render it certain that the person represented on the reverse was the wife, son, or daughter of him who appears on the obverse; by which means they assist greatly in the adjusting of a series. Some, however, with two portraits are common, as Augustus, the reverse of Caligula; and Marcus Aurelius, reverse of Antoninus Pius.

We find more art and design in the reverses of the Roman medals than of the Greek: but, on the other hand, the latter have more exquisite relief and workmanship. The very ancient coins have no reverses, excepting a rude mark struck into the metal resembling that of an instrument with four blunt points on which the coin was struck; and was owing to its having been fixed by such an instrument on that side to receive the impression upon the other. To this succeeds the image of a dolphin, or some small animal, in one of the departments of the rude mark, or in an hollow square: and this again is succeeded by a more perfect image, without any mark of the hollow square. Some of the Greek coins are hollow in the reverse, as those of Caulonia, Crotona, Metapontum, and some other ancient cities of Magna Grecia. About 500 B. C. perfect reverses appear on the Greek coins, of exquisite relief and workmanship. "The very muscles of men and animals (says Mr Pinkerton) are seen, and will bear inspection with the largest magnifier as ancient gems. The ancients certainly had not eyes different from ours; and it is clear that they must have magnified objects. A drop of water forms a microscope; and it is probable this was the only one of the ancients. To Greek artists we are indebted for the beauty of the Roman imperial coins; and these are so highly finished, that on some reverses, as that of Nero's decursion, the *adventus* and *progressio* of various emperors, the *fundator pacis* of Severus, the features of the emperor, riding or walking, are as exact as on the obverse. But though the best Greek artists were called to Rome, yet the Greek coins under the Roman emperors are sometimes well executed, and always full of variety and curiosity. No Roman or Etruscan coins have been found of the globular form, or indented on the reverse like the early Greek. The first Greek are small pieces of silver, while the Roman are large masses of copper. The former are struck; the latter cast in moulds. The reverses of the Roman coins are very uniform, the prow of a ship, a car, or the like, till about the year 100 B. C. when various reverses appear on their consular coins in all metals. The variety and beauty of the Roman imperial reverses are well known. The medallist much values those which have a number of figures; as the *Puellæ Faustinianæ*, of Faustina, a gold coin no larger than a sixpence, which has 12 figures; that of Trajan, *regna assignata*, has four; the *congiarium* of Nerva five; the allocution of Trajan seven; of Hadrian 10; of Probus 12. Some Roman medals have small figures on both sides, as the *Apolloni sancto* of Julian II. Such have not received any peculiar name among the medallists. Others have only a reverse, as the noted *spintriati*, which have numerals I. II. &c. on the obverse."

115 Of the deities represented upon ancient coins.

The *names* of the deities represented on the reverses of Greek coins are never expressed; perhaps, as Mr Pinkerton supposes, out of piety, a symbolical representation of their attributes being all that they thought proper to delineate; but the Roman coins always express the name, frequently with an adjunct, as Veneri Victrici, &c. In others, the name of the emperor or empress is added; as Pudicitiæ Augustæ, round an image of Modesty; Virtus Augusti, a legend for an image of Virtue.

The principal symbols of the divine attributes to be met with on the Greek medals are as follow:

1. Jupiter is known on the coins of Alexander the Great by his eagle and thunderbolts; but when the figure occurs only on the obverses of coins, he is distinguished by a laurel crown, and placid bearded countenance. Jupiter Ammon is known by the ram's-horn twisting round his ear; a symbol of power and strength, assumed by some of the successors of Alexander the Great, particularly by Lysimachus.

2 Nep-

Arrangement, &c.

2. Neptune is known by his trident, dolphin, or being drawn by sea-horses; but he is seldom met with on the Grecian coins.

3. Apollo is distinguished by an harp, branch of laurel, or tripod; and sometimes by a bow and arrows. In the character of the Sun, his head is surrounded with rays; but when the bust only occurs, he has a fair young face, and is crowned with laurel. He is frequent on the coins of the Syrian princes.

4. Mars is distinguished by his armour, and sometimes by a trophy on his shoulders. His head is armed with a helmet, and has a ferocious countenance.

5. Mercury is represented as a youth, with a small cap on his head, wings behind his ears and on his feet. He is known by the cap, which resembles a small hat, and the wings. He appears also with the caduceus, or wand twined with serpents, and the *marsupium*, or purse, which he holds in his hand.

6. Æsculapius is known by his bushy beard, and his leaning on a club with a serpent twisted round it. He sometimes occurs with his wife Hygeia or Health, with their son *Telesphorus* or Convalescence between them.

7. Bacchus is known by his crown of ivy or vine, his diadem and horn, with a tiger and satyrs around him.

8. The figure of Hercules is common on the coins of Alexander the Great, and has frequently been mistaken for that of the prince himself. He appears sometimes as a youth and sometimes with a beard. He is known by the club, lion's skin, and remarkable apparent strength; sometimes he has a cup in his hand, and a poplar tree, as a symbol of vigour, is sometimes added to the portrait.

9. The Egyptian Serapis is known by his bushy beard, and a measure upon his head.

10. Apis is delineated in the form of a bull, with a flower of the lotos, the water-lily of the Nile, supposed by Macrobius to be a symbol of creation; and Jamblichus tells us, that Osiris was thought to have his throne in it.

11. Harpocrates, the god of Silence, appears with his finger on his mouth; sometimes with the sistrum in his left hand; a symbol common to most of the Egyptian deities.

12. Canopus, another Egyptian deity, appears in the shape of an human head placed on a kind of pitcher. "This deified pitcher (says Mr Pinkerton) seems to refer to an anecdote of ancient superstition, which, I believe, is recorded by Plutarch. It seems some Persian and Egyptian priests had a contest which of their deities had the superiority. The Egyptian said, that a single vase, sacred to Serapis, would extinguish the whole power of the Persian deity of fire. The experiment was tried; and the wily Egyptian, boring holes in the vase and stopping them with wax, afterwards filled the vase with water; which, gushing through the holes as the wax melted, extinguished the Persian deity. Hence the vase was deified."

13. The *Holy Senate* and *Holy People*, appear frequently on Greek imperial coins, sometimes represented as old men with beards, at others as youths.

The goddesses represented on medals are,

1. Juno, represented by a beautiful young woman, sometimes with a diadem, sometimes without any badge, which is reckoned a sufficient distinction, as the other goddesses all wear badges. Sometimes she appears as the goddess of marriage; and is then veiled to the middle and sometimes to the toes. She is known by the peacock, a bird sacred to her from the fable of Argus.

2. Minerva is very common on the coins of Alexander the Great; and her bust has been mistaken by the celebrated painter Le Brun for the hero himself. She is very easily distinguished by the helmet. Her symbols are, her armour; the spear in her right hand, and the ægis, with a Medusa's head, in her left; an owl commonly standing by her.

3. Diana of Ephesus is commonly represented on the Greek imperial coins; and appears with a great number of breasts, supposed to denote universal Nature. She is supported by two deer, and carries a pannier of fruit upon her head. The bust of this goddess is known by the crescent on her brow, and sometimes by the bow and quiver at her side.

4. Venus is known by an apple, the prize of beauty, in her hand. Sometimes she is distinguished only by her total want of dress; but is always to be known by her extraordinary beauty, and is sometimes adorned with pearls about the neck.

5. Cupid is sometimes met with on the Syrian coins, and is known by his infancy and wings.

6. Cybele is known by a turreted crown and lion; or is seen in a chariot drawn by lions.

7. Ceres is known by her garland of wheat, and is common on the Sicilian coins; that island being remarkable for its fertility. Sometimes she has two serpents by her, and is sometimes drawn in a chariot by them. She carries in her hands the torches with which she is fabled to have gone in search of her daughter Proserpine.

8. Proserpine herself is sometimes met with on coins with the name of κορη or the *girl*.

9. The Egyptian Isis has a bud or flower on her head; a symbol of the perpetual bloom of the inhabitants of heaven. She carries also a sistrum in her hand.

10. The Sidonian Astarte appears on a globe supported on a chariot with two wheels, and drawn by two horses.

These are the deities most commonly represented on the Greek coins. The more uncommon are, Saturn with his scythe, or with a hook on the Heraclian coins; Vulcan with his tongs, on the reverse of a coin of Thyatira, represented at work in the presence of Minerva. Adranus, a Sicilian god, is sometimes represented on coins with a dog. Anubis, an Egyptian deity, has a dog's head. Atis is known by his Phrygian bonnet; Castor and Pollux by a star on the head of each; Dis, by his old face, dishevelled hair and beard, and a hook; Flora by her crown of flowers; Nemesis by her wheel; and Pan by his horns and ears belonging to some kind of beast.

116 Table of Symbols.

There are likewise to be found on medals many different symbols by themselves; of the most remarkable of which we shall give the following table, with their significations:

Symbols.	Signification.
1. Vases with sprigs,	Solemn games.

2. Small

Arrangement, &c.

Symbols.	Signification.
2. Small cheſt or hamper, with a ſerpent leaping out,	Myſtic rites of Bacchus.
3. Anchor on Seleucian medals,	Coin ſtruck at Antioch, where an anchor was dug up.
4. Apollo on Syrian coins, on an inverted hamper.	Covered tripod.
5. Bee, - -	Ariſteus the ſon of Apollo.
6. Laurel, - -	Apollo.
7. Reed, - -	A river.
8. Ivy and grapes, - -	Bacchus.
9. Poppy, - -	Ceres and Proſerpine.
10. Corn, - - -	Ceres.
11. Owl and olive, - -	Minerva.
12. Dove, - - -	Venus.
13. Torch, - -	Diana, Ceres, or Proſerpine.
14. Mudnis, or conic ſtone,	The ſun, Belus, or Venus.

Symbols of Countries, &c.

15. Pomegranate flowers, -	Rhodes.
16. Owl, - - -	Athens.
17. Pegaſus, - -	Corinth.
18. Wolf's head, -	Argos.
19. Bull's head, - -	Bœotia.
20. Minotaur's head and labyrinth,	Crete.
21. Horſe's head, -	Pharſalia.
22. Lion, - -	Marſeilles.
23. Tortoiſe, - -	Peloponneſus.
24. Sphinx, - -	Scio.
25. Three legs joined, as in the Iſle of Man-money,	Sicily.
26. Horſe, - -	Theſſaly.
27. The creſcent, -	Byzantium (A).
28. Bull, - -	Suppoſed to be a river.
29. Enſign, with the letters COL.	A colony drawn from one legion.
30. Bull, - -	Apis, ſtrength or ſecurity.
31. Caduceus, - -	Peace and concord.
32. Cornucopia, -	Abundance.
33. Pontifical hat, -	Prieſthood.
34. Parazonium, - -	Baton of command.

Symbols.	Signification.
35. Globe on an altar with three ſtars. - - -	The world preſerved by the gods for the three ſons of Conſtantine I.
36. Fort and gate, - -	Security.
37. Tribuli, a kind of Chevaux de Frize, - -	Unknown.
38. Altar or tripod, -	Piety.
39. Dolphin, - -	Apollo.
40. Lectiſternia, - -	Feſtivals.
41. Lituus, or twiſted wand, -	Augurſhip.
42. Apex, or cap with ſtrings,	Pontificate.
43. Thenſa, or chariot employed to carry images, - -	Conſecration of an empreſs.
44. Peacock, - -	Ditto.
45. Eagle, - -	Conſecration of an emperor.

117 Legends of Medals. The legends put upon medals are deſigned as explanations of them; but as the compaſs of even the largeſt coins does not admit of any great length of inſcription, it has always been found neceſſary to uſe abbreviations; and in readily decyphering theſe lies a conſiderable part of the difficulty of the ſcience. This, however, is greater in the Roman than in the Greek medals; for the Greeks commonly inſert as much of the word as is ſufficient to enable us eaſily to underſtand its meaning; but it is common for thoſe who attempt to explain letters that do not often occur, to fall into very ridiculous errors. Of this Mr Pinkerton gives a moſt remarkable inſtance in Fortunius Licetus, a learned man, who finding upon a coin of Adrian the letters L. ΙΔ. ſignifying the 14th year of that emperor's reign, imagined that they ſignified *Lucernas invenit Delta*; "Delta invented lanthorns;" and thence aſcribed the origin of lanthorns to the Egyptians. Tables explaining the meaning of the abbreviations found upon medals have been publiſhed by Patin, Urſatus, and others.

118 Extraordinary miſtake of Fortunius Licetus.

Sect. XI. *Of Medallions, Medalets, &c.*

Besides the ordinary coins of the ancients, which paſſed in common circulation through the country, there were others of a larger ſize, which are now termed *medallions*. Theſe were ſtruck on the commencement of the reign of a new emperor and other ſolemn occaſions: frequently alſo, by the Greeks in particular, as monuments of gratitude or of flattery. Sometimes they were mere trial or pattern pieces; and thoſe abound after the time of Maximian with the words *Tres Monetæ* on the reverſe. The common opinion is,

(A) This appears on the early coins of Byzantium, with the legend ΒΥΖΑΝΤΙΝ ΣΩΤ. "the preſerver of Byzantium." The reaſon of this was, that when Philip of Macedon beſieged the city, and was about to ſtorm it in a cloudy night, the moon ſhone out on a ſudden and diſcovered him; by which means the inhabitants had time to collect their forces and repulſe him. The Turks, on entering Conſtantinople, found this badge in many places; and ſuſpecting ſome magical power in it, aſſumed the ſymbol and its power to themſelves; ſo that the creſcent is now the chief Turkiſh enſign.

Medallions, &c. is, that all the Roman pieces of gold exceeding the denarius aureus, all in silver exceeding the denarius, and all in brass exceeding the sestertius, went under the denomination of *medallions:* but Mr Pinkerton thinks that many of these large pieces went in circulation, tho' not very commonly, as our five and two guinea pieces, silver crowns, &c. do in this country. The finest medallions were presented by the mint-masters to the emperor, and by the emperor to his friends, as specimens of fine workmanship. The best we have at present are of brass, and many of them composed of two sorts of metal; the centre being copper, with a ring of brass around it, or the contrary; and the inscription is sometimes confined to one of the metals, sometimes not. There is a remarkable difference between the Greek and Roman medallions in point of thickness; the latter being frequently three or four lines thick, while the other seldom exceed one. Very few medallions, however, were struck by the Greeks before the time of the Roman emperors; but the Greek medallions of the emperors are more numerous than those of the Romans themselves. All these pieces, however, are of such high price that few private persons are able to purchase them. In the last century Christina queen of Sweden procured about 300. In the king of France's collection there are 1200; a number formerly supposed not to exist; and Dr Hunter's collection contains about 400, exclusive of the Egyptian.

Besides these large pieces, there are smaller ones of a size somewhat larger than our half-crowns; and by Italian medallists are called *medaglion cini*, or small medallions. They are still scarcer than the large kind.

119 Of medalets. There is still a third kind, which have almost escaped the notice of medallists, viz. the small coins or *missilia* scattered among the people on solemn occasions; such as those struck for the slaves on account of the saturnalia; counters for gaming; tickets for baths and feasts; tokens in copper and in lead; &c. These are distinguished by Mr Pinkerton by the name of *medalets*. Many, or perhaps almost all, of those struck for the saturnalia were satyrical; as the slaves had then a licence to ridicule not only their masters but any person whatever. Mr Pinkerton mentions one of the most common pieces of this kind, which has on the obverse the head of an old woman veiled, with a laurel crown; the reverse only S. C. within a wreath. Baudelot is of opinion that it is the head of Acca Laurentia, the nurse of Romulus, to whom a festival was ordained. "Perhaps (says Mr Pinkerton), it was struck in ridicule of Julius Cæsar; for the manner of the laurel crown, and its high appearance over the head, perfectly resemble that of Julius on his coins." Some have a ship upon one side; on the reverse Ŧ, or a cross, which was the image of Priapus; and occasioned many false invectives against the first Christians, who paid such respect to the cross. Some pieces have the heads of the emperors upon one side; on the reverse only numerals III. IV. V. &c. and the noted *spintriati* of Tacitus. Both these kinds appear tickets for the baths, as the number seems to denote the particular bath. Some have the head of a girl, with a vessel used at the baths in her hand. The spintriati are so immodest, that few will bear mention. But some are merely ludicrous; as one which has an ass with a bell about his neck, and a soldier riding him; another with two figures hoisting a woman in a basket into the air. Of those that will just bear mention, is a man with titles around him, as chief of the games; and a woman in ridicule of the modest bath-girl above-mentioned. There is also one marked XIX, on which appears an imperator triumphing in a car: this car is placed on the back of a camel; and behind the imperator is a monkey mimicking him.

120 Of the contorniati. A fourth class of medals are called *contorniati* from the Italian *contorniato*, "encircled;" because of the hollow circle which commonly runs around them. They are distinguished from medallions by their thinness, faint relief, reverses sometimes in relief, sometimes hollow; and in general by the inferiority in their workmanship. The opinions of medallists concerning these pieces are very various; some suppose them to have been struck by Gallienus to the memory of illustrious men and celebrated *athletæ*, at the time that he caused all the consecration coins of his predecessors to be restored; others ascribe their invention to Greece, &c. but Mr Pinkerton is of opinion that they were only tickets for places at public games. Many of them, notwithstanding their inferior workmanship, are very valuable on account of their preserving the portraits of some illustrious authors of antiquity no where else to be found. Much dependance, however, cannot be put on the portraits of Greek authors and eminent men found upon some of them; for though we know that the busts of Sallust, Horace, &c. must have been struck when their persons were fresh in the memory of the artists, yet it was otherwise with Homer, Solon, Pythagoras, &c. which are to be found on some of them. Even these, however, are valuable, as being ancient and perhaps traditional portraits of these great men. The last whose portraits are supposed to have been delineated in this way, are Apollonius Tyaneus who flourished in the time of Domitian, and Apuleius in that of Marcus Antoninus. Mr Pinkerton thinks it a confirmation of his opinion concerning these medals, that the reverses always contain some device alluding to public games, as that of a charioteer driving a chariot, &c.

Sect. XII. *Directions for making Cabinets.*

We must now proceed to the last part of our subject, viz. that of giving directions for the formation of cabinets. As we have already seen that the formation of any one must be attended with very considerable expence, it is necessary for every one who attempts this to proportion the cabinet to his own circumstances. There are, properly speaking, three kinds of cabinets. I. Those meant to contain a coin of every sort that has been issued from the mint in every age and country; but this, which may be called the large and complete cabinet, is not to be purchased by private persons. That of Dr Hunter already mentioned is perhaps one of the best private cabinets ever known; and cost 23,000l. but as many duplicates were sold as cost 2000l. by which means the expence was reduced to 21,000. The vast collection made by the king of France cost upwards of 100,000l. The smaller

Directions for making cabinets.

smaller cabinet may be supposed to consist only of middle and small Roman brass, English pennies, groats, &c. with a few medals of the more valuable kind, and may be supposed to incur an expence of from 200 to 1000l. The smallest kind is called a *casket* of medals, and does not consist of above a thousand at most of various kinds; and consequently the expence must depend on the pleasure of the proprietor.

In the formation of the grand cabinet, it must be observed that the Greek medals of every denomination do not admit of any arrangement by the metals like the Roman; not any regular series of this kind being met with even in the most opulent cabinets. Hence in all collections the civic coins are ranged according to an alphabetical order; and the monarchic in a chronological one. The same rule is to be observed in the Roman consular medals; they are ranged, like the coins of the Greek cities, in an alphabetical series of the families. The Roman imperial coins are only those capable of being arranged according to sizes and metals. Even from this must be excepted the minimi, or very smallest coins; which are so scarce, that the only regular series of them in the world is that belonging to the king of Spain, which was formed by a most skilful French medallist, and consists of all the metals. The arrangement of a grand cabinet, according to Mr Pinkerton, is as follows.

" I. The coins of cities and of free states in alphabetical order: whether using Greek, Roman, Punic, Etruscan, or Spanish characters.

" II. Kings in chronological series, both as to foundation of empire and seniority of reign.

" III. Heroes, heroines, founders of empires, and cities.

" IV. Other illustrious persons.

" V. Roman ases.

" VI. Coins of families, commonly called consular.

" VII. Imperial medallions.

" VIII. Imperial gold.

" IX. Imperial *minimi* of all metals.

" X. Imperial silver.

" XI. Imperial first brass.

" XII. Second brass.

" XIII. Third brass.

" XIV. Colonial coins, which are all of brass.

" XV. Greek cities under the emperors, of all metals and sizes. In a smaller cabinet they may be put with the Roman, according to their metal and size. Those without the emperor's head go to class I. tho' struck in Roman times.

" XVI. Egyptian coins struck under the Roman emperors, of all metals and sizes. They are mostly of a base metal called by the French *patin*; it is a kind of pot metal or brittle brass.

" XVII. Contorniati, or ticket medals.

" XVIII. Coins of Gothic princes, &c. inscribed with Roman characters.

" XIX. Coins of southern nations using uncommon alphabets; as the Persian, Punic, Etruscan, and Spanish.

" XX. Coins of northern nations using uncommon characters, as the Punic and German.

" In the modern part no series can be formed of copper that will go back above two centuries; but sequences (chronological series) of gold and silver may be arranged of all the different empires, kingdoms, and states, as far as their several coinages will allow. Those of England and France will be the most perfect. Modern silver is commonly arranged in three sequences; the dollar, the groat, and the penny sizes. The medals of each modern country ought of course to be separated; though it is best to arrange each set in chronological order, let their size of metal be what they will. It may be remarked here, that our modern medals, of the size of a tea-saucer, are only so many monuments of barbarism. The ancient medallions are almost universally but little larger than our crown-piece, though three or four of them may extend to about two inches diameter, but very many modern medals to four inches and more. A large medal always declares an ignorant prince or an ignorant artist. Into the size of a crown-piece the ancients threw more miracles in this way than will ever appear in these monstrous productions."

These directions will likewise apply to the formation of a cabinet of the second kind: but if the collector means to form a series of large Roman brass, he will find the coins of four or five emperors so scarce as not to be attainable in that series, even at any price. He must therefore supply their places with middle brass, as is allowed with regard to Otho; even in the best cabinets, there not being above three coins of that emperor in large brass known in the world; whereas of the middle brass, two or three hundred may exist. For this reason Mr Pinkerton concludes, that in cabinets of the second class, the collector may mingle the large and second brass together as he thinks proper, in order to save expence; though it would not do so well to unite such disproportionate sizes as the large and small. " In the small sequence, however (says he), there can be no harm in his mixing gold, silver, and brass, as chance or curiosity may lead him to purchase any of these metals. And tho' your starched bigotted medallist may sneer because such a sequence would controvert his formal and narrow way of thinking, common sense will authorise us to laugh at the pedant in our turn, and to pronounce such a series more various, rich, and interesting, than if the collector had arranged only one metal, and rejected a curious article because he did not collect gold or silver. In like manner, if, in the modern part of the smaller cabinet, any coin of a series is of high price, or of bad impression, there can be no impropriety in putting another of the same reign, which is cheaper, or better executed, though of a different denomination or of a little larger size. In short, the collector has no rules but in the Greek cities and Roman families, to observe alphabetical order and chronology in every thing else.

Tables of Ancient Coins.

The most ancient coins, according to Froelich, are distinguished by the following marks, which he accounts infallible. 1. Their oval circumference, and globulous swelling shape. 2. Antiquity of alphabet. 3. The characters being retrograde, or the first division of the legend in the common style, while the next is retrograde. 4. The indented square already described. 5. The simple structure of the mintage. 6. Some of

Ancient Coins.

of the very old coins are hollowed on the reverſe, with the image impreſſed on the front. 7. The dreſs, ſymbols, &c. frequently of the rudeſt deſign and execution.

Table I. *Ancient Greek Coins.*

1. Thoſe without impreſſion.

2. With one or more hollow indented marks on one ſide, and an impreſſion in relief on the other.—Of Chalcedon on the Helleſpont, Leſbos, Abdera in Thrace, Acanthus in Macedon, thoſe ſaid to belong to Egium in Achaia. This claſs continues from about 900 to 700 B. C.

3. With an indented ſquare divided into ſegments, having a ſmall figure in one of them; the reſt blank, with a figure in relief on the obverſe.—Of Syracuſe and other places adjacent.—Continue from 700 to 600 B. C.

4. Coins hollow on the reverſe, with figures in relief on the obverſe.—Of Caulonia, Crotona, Metapontum, &c. Suppoſed by ſome to be a local coinage of Magna Græcia; but probably of equal antiquity with the former.

5. Coins in which a ſquare dye is uſed on one or both ſides.—Of Athens, Cyrene, Argos, &c.—Of Alexander I. and Archelaus I. of Macedon. Diſuſed in the reign of the latter about 420 B. C.

6. Complete coins, both in obverſe and reverſe, occur firſt in Sicily in the time of Gelo, about 491 B. C.

7. Coins of Alexander the Great and his ſucceſſors. About the time of this hero the Greek coins began to attain to perfection, and were ſtruck of uncommon beauty. It is remarkable, that on the coins of this monarch his own image ſeldom occurs. The only one yet found of Alexander with his portrait upon it, and ſtruck during his reign, is a ſilver hemidrachm in Dr Hunter's cabinet, which is repreſented Plate CCXCII. n° 3. After his death many coins bear his portrait. Trebellius Pollio informs us, that ſome coins, particularly thoſe of Alexander, uſed to be worn as amulets; and many medals are met with in cabinets bored ſeemingly with that intention.

8. Coins of the ſucceſſors of Alexander.—Thoſe of the Syrian monarchs almoſt equal the coins of Alexander himſelf in beauty. Thoſe of Antiochus VI. are ſuppoſed to be the moſt perfect patterns of male beauty to be met with any where. The Egyptian Ptolemies are ſomewhat inferior.

9. The coins of the Arſacidæ of Parthia done by Greek workmen.

10. The Greek imperial coins, being ſuch as have the head of an emperor or empreſs; ſuch as have not theſe impreſſions being claſſed with the civic coins, though ſtruck under the Roman power. None of the imperial coins occur in gold. Of ſilver there are thoſe of Antioch, Tyre, Sidon, Tarſus, Berytus, Cæſarea. Egyptian ſilver coins of baſe metal. Syrian ſilver coins, which ſometimes bear on the reverſe the club of Hercules, or the Tyrian ſhell-fiſh. Thoſe of Sidon bear the image of the goddeſs Aſtarte, or her chariot. Thoſe of Cæſarea in Cappadocia of better work than the Syrian. Lycian coins of good workmanſhip: on the reverſe two harps and an owl ſitting upon them. Silver coins of Gelon in Sarmatia reſembling the Syrian. The ſituation of this town is very much unknown. It ſeems to have been ſituated on the north of the Euxine ſea, where ſome Sarmatic or Sclavonic tribes were mingled with the Scythians or Goths. The Greek imperial braſs coins are very numerous. A ſeries of almoſt all the emperors may be had from thoſe of Antioch, with a Latin legend on the obverſe and Greek on the reverſe. Thoſe of Bithynia and Phrygia remarkable for good workmanſhip. The coins of Tarſus remarkable for their curious views of objects, almoſt in perſpective. The Egyptian coins, from the time of Auguſtus to Nero, are worſe executed than afterwards. From Nero to Commodus they are frequently of admirable workmanſhip, and in a peculiar ſtyle, diſtinct both from the Greek and Roman. From the time of Commodus they decline, and are loſt after the reign of Conſtantius I. The Egyptian braſs coins of the Roman period are likewiſe of excellent workmanſhip, eſpecially in the time of Antoninus Pius.

Table II. *Roman Coins.*

I. The conſular coins, called alſo the coins of families, and arranged alphabetically in cabinets, according to the names of the families which appear on them. They are,

1. *Braſs Coins.*—Theſe conſiſt chiefly of large pieces of rude workmanſhip without any intereſting imagery. In cabinets they are generally kept in boxes apart by themſelves. The as bears the head of Janus; the ſemis of Jupiter with S; the triens of Minerva with four ciphers; the quadrans of Hercules with three ciphers; the ſextans of Mercury with two cyphers; and the uncia bears the head of Rome with one cipher. In all theſe pieces the prow of a ſhip is conſtantly the figure on the reverſe, with very few exceptions. Sometimes, indeed, they have a ſhell, two heads of barley, a frog, an anchor, or a dog, on the reverſe. About the time of Julius Cæſar both the obverſes and the reverſes of the coins began to be altered.

2. *Silver.* Of this the denarius was the firſt and principal coin. It was ſtamped originally with X, denoting that the value was ten aſes. On the reverſe was Caſtor and Pollux, or a chariot of Victory. Afterwards the buſts of various deities make their appearance; and in the ſeventh century of Rome the portraits of illuſtrious perſons deceaſed are met with: but till the time of Julius Cæſar no figure of any living perſon is to be met with; Julius himſelf being the firſt who aſſumed that honour. The workmanſhip on the beſt and worſt ſilver is much the ſame. The reverſes are very curious, and point out many remarkable events in Roman hiſtory; but none of theſe occur till about a century before the Chriſtian era. The large denarii, with Roma, are the moſt ancient; and ſome of theſe bear the Pelaſgic A, not the Roman. The ſilver ſeſtertii have a head of Mercury, with a caduceus on the reverſe. The quinarii have always a head of Jupiter, with a Victory on the reverſe.

3. *Gold.*—Moſt of theſe are of great value. The number of theſe exceeds not 100; thoſe of braſs 200; and of ſilver 2000. The aureus is the general gold coin; but two or three gold ſemiſſes of families likewiſe occur.

Ancient Coins.

II. Roman imperial coins.

1. *Brafs.*—This is of three fizes; large, middle, and fmall. The firft forms a moft beautiful feries, but very expenfive. The various colours of the patina have the fineft effect. It is the moft important of all the Roman coins, and exceeds even the gold in value.

The middle brafs is next in value to the former; and in it are many rare and curious coins, particularly interefting to Britons, as elucidating the hiftory of the ifland. Of thefe are the triumphal arch of Claudius; the EXERC. BRITANNICUS of Adrian; the coins of Antoninus Pius, Commodus, Severus, with a Victory, VICTORIA BRITAN.: but efpecially thofe perfonifying the country BRITANNIA. "The number of Roman coins relating to Britain (fays Mr Pinkerton) is remarkable, more than 20 having been ftruck at various times; while thofe perfonifying Italy, Gaul, Spain, and other regions of the empire, exceed not four or fix at moft for each country. Only one country vies with Britain, and that is Dacia on the extreme north-eaft of the empire, as Britain on the extreme north-weft. No doubt this circumftance of remotenefs in thefe two countries recommended them to this particular attention, as more expreffive of the Roman power.

The fmall brafs feries abounds alfo with curious coins. They are fcarce till the time of Valerian and Gallienus, but very common afterwards. Mr Pinkerton recommends, therefore, to form a feries in filver as well as brafs; both being the cheapeft of all the Roman coins. "In this feries (fays he), it is a common fault to arrange many coins which have been plated with gold or filver, the forgeries of ancient times, but which time has worn off either wholly or in part. All real brafs coins have the S. C. till the time of Gallienus; as the fenate alone had the power of ftriking brafs, while the emperor himfelf had that of gold and filver. When the S. C. therefore, is wanting, the coin was certainly once plated; as, in general, the different type and fabric, being thofe of gold and filver, fufficiently fhow themfelves. With Pertinax, A. D. 192, there is a temporary ceffation of fmall brafs; nor after him do any princes occur in that feries till Valerian, A. D. 254, excepting Trajanus Decius, A. D. 250 only. After Valerian the feries is continuous and common. The brafs coinage gradually declined in fize from the time of Severus; fo that parts of the as could not be ftruck, or at leaft it was held unneceffary to ftrike them. Trajanus Decius attempted in vain to reftore the coinage; and Valerian and Gallienus were forced to iffue denarii ærei and fmall affaria. The feries of large and of middle brafs are of two fixed and known fizes; the former about that of our crown, the latter of the half crown: though after Severus they gradually leffen. But the fmall brafs takes in all parts of the as; and every brafs coin not larger than our fhilling belongs to this feries. The *minimi*, indeed, or very fmalleft, it is proper to keep apart. The coins of Julius Cefar in this fize are of peculiarly fine workmanfhip. They bear his portrait reverfe of Auguftus, or the reverfe has a crocodile EGYPTO CAPTA. There are feveral with Mark Anthony, and fome with Cleopatra; but the more common pieces are thofe with only numerals on the obverfe, which go the length of XIII; probably tickets for the baths. A great many occur in the time of Nero; of which Mr Pinkerton particularifes one which has "on the reverfe a table ornamented with griffins and other devices. Upon it is placed a wreath of laurel, and a beautiful vafe, of which the emboffed human figures are fo minute, and finifhed fo furprifingly, as to ftamp thefe coins the moft exquifite productions of the ancient mint." From the time of Nero to that of Vefpafian no fmall brafs occurs: but there are many of this emperor and of his fon Titus; while Domitian has as many as Nero, and Domitia his wife has almoft as many.. Succeeding emperors to the time of Pertinax have alfo many brafs coins; but from his time to that of Valerian there are no real fmall brafs, excepting thofe of Trajanus Decius. After Gallienus there are a great many coins of this kind; and Mr Pinkerton mentions one in Dr Hunter's cabinet, of an unknown perfon named Nigrianus. The coin feems to have been ftruck at Carthage; and our author concludes that he was an African Ufurper, father to Nigrinianus.

2. *Silver.*—This feries is very complete, and the cheapeft of any; efpecially as the fmall brafs becomes a fine fupplement to it: the latter being had in plenty when the filver becomes fcarce, and the filver being plentiful when the brafs is fcarce.

3. *Gold.*—The Roman imperial gold coins form a feries of great beauty and perfection; but on account of their great price are beyond the purchafe of private perfons.

4. *The colonial coins* occur only in brafs, none, excepting that of Nemaufus, having a right to coin filver. They begin in Spain with Julius Cæfar and Anthony, and ceafe with Caligula, who took away the privilege of coinage from the Spanifh colonies. The moft beautiful are thofe of Corinth. The other remarkable colonial coins are thofe of Emerita, Ilice, Terraco, Caffandria, Babba, Berytus, Cæfarea, Patræ, Emifa, Heliopolis or Balbec, Ptolemais, Sidon, Tyre, Deulton, Dium, Troas, Rhefaina, Neapolis of Samaria, which bears a reprefentation of Mount Gerizzim with the temple on it, Hippo in Africa, &c. On many of thefe coins we meet with fine reprefentations of temples, triumphal arches, gods, goddeffes, and illuftrious perfons. But coins with thofe reprefentations are by no means common; the colonial coins till the time of Trajan bearing only a plough, or fome other fimple badge of a colony. Camelodunum is the only colony in Britain of which we have any coins.

5. The *minimi.*—This includes the fmalleft coins of all denominations, moft of which do not exceed the fize of a filver penny. They are the moft curious of all; but no feries of them was ever formed by any perfon except the Abbe Rothelin, whofe collection formed of all metals paffed to the queen of Spain. The reafon of the fcarcity of thefe fmall coins is probably their diminutive fize; by reafon of which they are moftly loft.

It is furprifing that numbers of Roman coins are found through all countries once fubject to that powerful people. Some have been met with in the Orkneys,

6

Ancient Coins.

neys, and many in the moſt remote parts of Europe, Aſia, and Africa, known to the ancients.

Table III. *Coins of other ancient Nations.*

1. The Lydians appear to have invented coinage; though, perhaps, this honour may be diſputed with them by the Greeks.

2. The Aſſyrians, Medes, Babylonians, Phenicians, and Egyptians, had no coins. In the mouths of the mummies are only thin, unſtamped, and round pieces of gold to pay Charon's fare.

3. No Indian or Chineſe coins are to be met with till a very late period; and even then ſo rude as ſcarce to be worth notice. Voltaire mentions a collection of ancient Chineſe and Indian coins made by the emperor of China in 1700; but Mr Pinkerton ſuppoſes it to have conſiſted only of the Greek and Roman money which had been introduced into theſe countries.

4. The Lydian coins have no legends; ſo that mere conjecture only determines the ancient coins of electrum and ſilver found in Aſia, and different from the Perſian, to belong to Lydia. Crœſus coined gold into a form which he called *ſtaters*; and Mr Pinkerton mentions a very ancient gold coin in Dr Hunter's cabinet, which he ſuppoſes to have been one of theſe. It has a globous figure, with indented marks on one ſide, and on the other a man kneeling, with a fiſh held out in the left hand, and a ſword depending in the right. It weighs four drams; which Joſephus tells us was the weight of the Lydian gold coins. In the ſame collection are other gold coins little inferior in antiquity; the moſt ancient of which, our author ſuppoſes, may have been coined by the cities of Aſia Minor, as coinage paſſed through them to Greece. They are of admirable workmanſhip, and as much ſuperior to the beſt Sicilian coins, as the latter are to all the reſt in the world. Theſe gold coins are all extremely pale; owing to the want of knowledge in refining gold.

5. Perſian coins.—Theſe were firſt ſtruck by Darius Hyſtaſpes, whence they had the name of *Darics*. They are of gold, and generally have the figure of an archer: they weigh about four drachms; and ſome occur with the indented mark on one ſide, while others have figures upon both. The ſilver coins have generally a king in a chariot of two horſes, with a charioteer, and ſometimes another figure on foot behind on the obverſe; while the reverſe preſents a ſhip, ſometimes a ram, bull, or other animal. The gold coins, which only had the title of *Darics*, are extremely ſcarce, having been melted down, as is ſuppoſed, and recoined by Alexander the Great on his conqueſt of Aſia.

There is a ſecond ſeries of Perſian coins beginning with Artaxares, or Artaxerxes, who overthrew the Parthian monarchy about the year 210. Theſe are large and thin, with the king's buſt on one ſide and the altar of Mathras on the other; generally with a human figure on each ſide. Theſe coins continue till the year 636, when Perſia was conquered by the Saracens. Theſe have only Perſian letters upon them, which have never been explained by any antiquaries. Mr Pinkerton ſays that they ſeem to partake of the ancient Greek, Gothic, and Alanic.

6. The Hebrew ſhekels, originally didrachms, but after the time of the Maccabees tetradrachms, are almoſt all forgeries of modern Jews, as well as the braſs coins with Samaritan characters upon them. They have all a ſprig upon one ſide and a vaſe on the other. Mr Pinkerton ſays, that the admiſſion of one of them into a cabinet would almoſt be a diſgrace to it.

7. Phœnician and Punic coins are very intereſting on account of the great power and wealth of theſe nations. The alphabets have been cleared by their relation to the Hebrew and Syriac languages.

8. The coins of Palmyra come under the ſame denomination with the former, Palmyra being a Syrian city.

9. The Etruſcan coins have the characters of that nation, which have been explained by their affinity to the Pelaſgic, or oldeſt Greek and Latin.

10. The Spaniſh coins are inſcribed with two or three alphabets allied to the old Greek or Punic; but the inſcriptions have not been ſufficiently explained.

11. Gauliſh coins.—Theſe are numerous; but the moſt ancient have no legends; and even after the Greek letters were introduced into Gaul by a colony at Marſeilles, the legends are very difficult to be explained.

12. Britiſh coins. From a paſſage in Cæſar's commentaries, it has been inferred that the Britons uſed ſome kind of coins even in his time. Mr Pinkerton informs us, that ſome rude coins of copper very much mingled with tin are frequently found in England; which, he ſuppoſes, may be ſome of the ancient Britiſh money. They are of the ſize of a didrachm, the common form of the nummus aureus among the ancients. After the time of Cæſar, coinage increaſed among the Britons; and there are many found of Cunobelinus mentioned in the Roman hiſtory. Moſt of theſe have on one ſide CUNO, with an ear of wheat, a horſe, a kind of head of Janus, or other ſymbol; and have frequently alſo the letters CAMU; ſuppoſed to mean Camelodunum. Sometimes the word TASCIA occurs; the meaning of which has not yet been explained.

13. Gothic coins of France, Italy, and Spain, to the time of Charles the Great. Theſe have the Roman characters upon them. The Italian coins are moſtly of the ſize of ſmall braſs; and in this way we meet with coins of Athalaric, Theodahat, Witigez, and other Gothic princes. Many others occur, the inſcriptions of which, though meant for Roman, are ſo perverted as to be illegible.

Table IV. *Modern Coins.*

1. Of Japan.—Theſe are thin plates of gold and ſilver, of an oval figure, with ſmall marks or figures ſtamped on them.

2. China.—Theſe are only copper, about the ſize of a farthing, with a ſquare hole in the middle to put them on ſtrings. The inſcriptions on them do not expreſs the name of the ſovereign, but the year of his reign; as the *happy year*, the *illuſtrious year*, &c.

3. The Tartarian coins are rude, having only inſcriptions upon them; and they are all poſterior to the time of Jenghiz khan.

4. Coins of Thibet, Pegu, and Siam, are much the

ſame,

Modern Coins.

fame, prefenting only infcriptions without any figures. They are alfo of late date.

5. India.—Some old coins have been found in the neighbourhood of Calcutta, of gold, filver, copper, and tin, all mixed together. Thefe have commonly a warrior with a fword on one fide and an Indian female idol on the other, of the fame form with the celebrated fculptures in the ifland of Elephanta; but it is impoffible to tell what antiquity they are of. The modern coins are the pagoda of gold, worth little more than fix fhillings; the roupee of filver upwards of two fhillings; and the cafh, of copper. There is a remarkable fet of roupees, which fhow the twelve figns; a lion on one, a bull on another, &c. but the occafion on which they were ftruck is unknown. The other coins of India have generally Perfian infcriptions upon them.

6. Perfia.—The Perfic coins fince its conqueft by the Arabs continue on the Arabian model.

7. Arabia.—Some coins of the petty princes of Arabia are met with as old as the imperial ages of Rome; but till the time of Haroun Alrafhid, no regular coinage appears in the vaft empire of the Saracens. Even then the reverfe has only an infcription, and the obverfe is copied from any Greek or Syrian coin which happened to fall in the moneyer's way. The later Arabian coins are moftly filver, with the name and titles of the prince on one fide, and fome infcription from the Koran on the other. The more modern coins of this country are in the fhape of a fifh-hook, with Arabic infcriptions.

8. Turkey.—No regular coinage was formed by the Turks till they became mafters of Conftantinople. They refemble thofe of Perfia and Arabia, having merely infciptions on both fides.

9. The coins of the African ftates, at leaft fuch as profefs the Mohammedan religion, have merely infcriptions without any figures: thofe of the internal parts are unknown; and no coinage was ufed among the Mexicans and Peruvians, the only civilized nations in America; but La Hontan mentions an American favage who had a fquare medal of copper depending from his neck. Mr Pinkerton fuppofes it to have come from Japan.

10. Modern Italic coins. Befides the Gothic princes mentioned in the former table, the exarchs of Ravenna coined money with the infcription FELIX RAVENNA, &c. The Lombards iffued no coins, but there are fome ftill extant of Charlemagne. The following lift fhows the origin of the coinage in various Italian ftates.

Rome. Papal coinage originates with Hadrian I. Size of filver pennies, with the Pope's name on one fide, and SCOS PETRUS on the other. No coins appear from 975 to 1099, excepting of Leo IX. In 1303 appear pennies of the fenate and people of Rome, with Peter on the one fide and Paul on the other. There are groats of Clement V. with his portrait three quarters length; but the fide-head begins with Sixtus V. in 1470. Gold was firft coined by John XXII. in 1316. The coins of Alexander VI. Julius II. and Leo X. are remarkable for beauty and elegance.

Milan. Coinage began with Charlemagne. The firft coin of the family of Vifconti occurs in 1330 under Azo. The fet finifhes with Louis XII.

Naples. Coinage begins in 840 and 880, with Duke Sergius and Bifhop Athanafius. The next coins are of Roger of Sicily, and Roger II. in 1130, William I. II. and Tancred. Naples and Sicily were fubdued in 1194 by the emperor of Germany; in 1255 Manfred appears; in 1266 Charles of Provence; and others till Joan in 1414: after which follow the houfe of Arragon, and later kings.

Venice begins in the 10th century. The firft coins are filver pennies marked VENECI. Then follow the coins of Henrico Dandulo in 1192, of Ziani in 1205, &c. Gold was firft coined at Venice in 1280, and copper in 1471; but the filver groats are as old as 1192.

Florence. Silver was coined here in the 12th century, or before; but in 1252 the firft gold coins ftruck in Europe after the 8th century made their appearance, and were named *florins* from the flower of the lily upon them. They were imitated by the popes, by France, and England. They have on one fide St John the Baptift ftanding, on the other a large *fleur de lis*, and it is not doubted that the French *fleurs de lis* took their origin from thefe coins. They weigh a drachm, and are no lefs than 24 carats fine according to Italian writers, and are worth about 12 fhillings.

Geneva firft began to coin money in 1129, under the government of Conrad. Thofe of the dukes of Savoy began in the fame century.

Aquileia. Coins were iffued from this city by the patriarchs from 1204 to 1440.

Ferrara. Coins of the marquifes from 1340.

11. French coins During the race of Clovis, from 490 till 751, the coins are chiefly gold *trientes*, with fome *folidi* and *femiffes*. The former are of good workmanfhip, with the heads of kings. The reverfe has a crofs, with the name of the town where they were ftruck.

The coins of the fecond race begin with Pepin in 751, and continue till Hugh Capet in 987. The coins of the firft race are elegant, but thofe of the fecond entirely the reverfe, being almoft all filver pennies, and feldom bearing the portrait of the king. Thofe of Charlemagne have only CAROLUS in the field; while the reverfe bears R. F. or fome fuch infcription; though one piece ftruck at Rome has a rude buft of him. The coins of Louis le Debonnaire are better done.

The third race begins with Hugh Capet in 987, and extends to this time. The coinage did not begin to improve till 1226 under St Louis, when the groat appears. Its name in Italian is *groffo*, in French *groffe*, in Englifh *groat*, or great coin; fo called from its fize in comparifon with the penny; and it paffed from Italy to France, to Germany, and to England. After the conqueft of France by the Englifh, bafe coins of many kinds were introduced; and in the year 1574, in the time of Henry III. copper was firft introduced into the French coinage. Befides thefe, the other remarkable coins of France are, the blancs or billon groats, firft iffued in 1348; the *ecus a la couronne*, or crowns of gold, fo called from the crown on one fide, and

Modern Coins.

and begun by Charles VI. in 1384; those of Ann of Bretagne in 1498: the *teston*, or piece with the king's head, of Louis XII.; the *Henri* of Henry II. with Gaul sitting in armour, and a Victory in her hand. There are many coins of cardinal Bourbon, elected king in 1589; and in 1642, Louis XIV. takes the title of CATALONIÆ PRINCEPS. The first *Louis d'Or* made its appearance in 1640; but such was the poverty of France, if we believe certain authors, that in 1719 the duke of Orleans regent struck copper for silver.

12. Spanish coins. The most early series of these consists almost entirely of trientes, finely done. On one side they have the head of the king with his name, and on the other a cross, with the name of the town, commonly in Bœtica, or the south part of Spain, where there were a great many Roman colonies, and which was fertile to a proverb. The Moresque coins of Spain, like those of the rest of the Mohammedan states, present us only with insipid inscriptions on both sides. Indeed the Mohammedan religion, by its absolute refusal to allow the representation of any living creature, has prevented the progress of coinage in any degree throughout those regions which it has overspread. The inscriptions on the ancient Spanish coins are in the Cufic or old Arabic characters.

13. Portugal. No description of the coins of this kingdom has yet appeared.

14. Germany. No account of the German coins has been published; though it is well known that not only the emperors, but many of the cities, particularly those called *Hanse-towns*, issued money; and many of the coins issued by the cities were superior in elegance even to those issued by the emperors

15. Denmark. Here the coinage begins with Canute the Great in 1014. The pieces are at first extremely rude, ornamented only with rings and runic characters. These are succeeded by copper pieces, some of which have a cross, others a pastoral staff on one side, with the letter A on the other. Later coins have strokes IIII, &c. all round them; but those of Harold, Hardicanute, and Magnus Bonus, in 1041, are of neat workmanship, and have the portraits of the princes at half length. The coins of Nicolas or Niel, as he is called by the Danes, are rude, as well as those of Waldemar I. and the celebrated Margaret. In 1376 Olaf caused money to be struck with a grinning full face, with a crowned O upon the other side. "The Swedes (says Mr Pinkerton) took these coins extremely ill, as they thought they grinned at them." Silver was first coined in Denmark by Philippa queen of Eric, and daughter to Henry IV. of England.

16. Sweden. The coinage of this kingdom began in 818 under Biorno, on the plan of Charlemagne. The coins are marked with a cross. Next follow those of Olaf in 1019; which Mr Pinkerton supposes to have been the first true Swedish coins; and that the art of coinage first passed from England into Denmark in the time of Canute the Great, and from Denmark into Sweden. These coins were struck on the English model. During the time that Sweden was subject to Denmark, or miserably harassed by the Danes, the coins of both kingdoms were the same; but after the time of Gustavus Vasa many elegant pieces appear. In 1634, dollars were coined with the portrait of Gustavus Adolphus, who was killed two years before: On the reverse they have the arms of Sweden, with the chemical marks of mercury and sulphur. In 1716, 1717, and 1718, Charles XII. being in extreme want of money, issued small copper coins with Saturn, Jupiter, Mars, &c. upon them, to go for dollars; and on account of this scheme, Baron Goertz, the suggestor of it, was brought to the block.

17. Norway. The coins of this country begins with Olaf in 1006; after which time there are various coins of other princes; but copper was not coined till the year 1343.

Besides the coins already mentioned, there are ecclesiastic coins of France, Germany, Denmark, Sweden, Norway, &c. Those of Denmark and Sweden are numerous, but the Norwegian coins of this denomination are rare. Mr Pinkerton describes a silver one in his possession as having arms and a mitre, with the inscription on one side SANCTUS OLAWS REX NORVEY; on the reverse OLAWS DEI GRA. ARCEP. NID'SEN, meaning NIDROSIENSIS, or archbishop of *Nidros*, now Drontheim.

18. Bohemia. The coinage of this kingdom appears at a very early date, viz. in the year 909, under duke Boleslaus I. These coins are followed by others of Boleslaus II. and Emma his wife in 970; of Boleslaus III. in 1002; Jaromir in 1020; Udalrich in 1030, and other princes. The *bracteate* money of Ottocar I. was coined in 1197.

19. Poland. The coinage of this country is nearly as ancient as that of Bohemia. The coins are on the German model, but no particular account of them has been published.

20. Russia. None of the Russian money appears to be more ancient than the 13th century. The first are the *kopecks* or silver pennies, which have upon them rude figures of animals on one side, and a man standing with a bow or spear on the other. There are likewise coins of Moscow struck by Aristoteles the architect in 1482. The *roubles* or dollars and their halfs. There are some of the impostor Demetrius in 1605, which are very scarce.

21. Prussia. The first Prussian coins were struck at Culm by the Teutonic knights in 1230. They were silver pennies, and upon the German plan. In the next century were struck shillings, groats, and *schots*; the last were the largest, and are extremely rare. They have the Prussian shield, an eagle surmounting a cross, with a rose-shaped border, MONETA DOMINORUM PRUSSIÆ: on the reverse is a cross fleurie, within a border of a similar kind, having the inscription HONOR MAGISTRI, JUSTITIAM DILIGIT.—Gold coins were struck in the same century. In the time of Copernicus the money was so debased, that 12 or 13 marks were worth but one of pure silver.

22. England. The English coins are of various kinds.

1st. *Heptarchic*. These are only of two sorts, viz. the *skeatta* or penny of silver, and the *styca* of copper. Few of the pennies appear till after the year 700; though some are met with which bear the name of Ethelbert I. king of Kent, as old as 560. At first they had only rude figures of serpents, but in latter

 times.

Modern Coins.

times legends were likewiſe added. Moſt of theſe pennies have pagan ſymbols upon them. The ſtyca was only coined in Northumberland, and was a very ſmall piece about the value of half a farthing.

2d. Coins of the *chief monarchs* of England. Mr Pinkerton denies that an end was put to the heptarchy by Egbert in 832, as is commonly ſuppoſed; though he owns that he was *chief monarch* of the country, as ſeveral others had been before him. Edgar, who reigned in 959, according to him was the firſt king of England; and the coins of the chief monarchs form almoſt a complete ſeries from the time of Egbert to Edgar. The only chief monarch of whom there are no coins is Ethelbald, who reigned in 857. Moſt of theſe coins bear rude portraits; but the reverſes are ſometimes curious and intereſting. Some have views of cathedrals and other buildings; particularly one of Edward the Elder in 900; which has the cathedral of York with three rows of windows, round arched as the other Saxon and Norman buildings; the Gothic arch being quite unknown till after the 12th century. Some coins of Anlaf king of Northumberland have the famous raven, the Daniſh enſign; and thoſe of other princes have frequently very curious reverſes.

3d. *Eccleſiaſtic* coins appear of the archbiſhops of Canterbury, Wulfred, in 804, Ceolnoth in 830, and Plegmund in 889.

4th. Coins of the *kings* of England. The ſilver penny, which had begun during the heptarchy, continued to be the general coin after the kingdom had been united under one head; and extends in a continued ſeries from Egbert almoſt to the preſent reign. The only kings wanting are Edmund Ironſide, Richard I. and John. At firſt the penny weighed $22\frac{1}{2}$ grains; but towards the cloſe of the reign of Edward III. it fell to 18 grains; and in that of Edward IV. to 12. In the time of Edward VI. it was diminiſhed to eight grains; and in Queen Elizabeth's reign to $7\frac{23}{31}$; at which it ſtill continues.

Halfpennies and farthings were firſt ſtruck in ſilver by Edward I. in 1280; the former continued to the time of the commonwealth, but the latter ceaſed with Edward VI. The groat was introduced by Edward III. in 1354, and continues to this day, though not in common circulation. The half-groat or twopence is of the ſame date, and alſo continues to the preſent time.

Shillings were firſt coined by Henry VII. in 1503. At firſt it was called *teſtoon*, from the *teſte*, *tete*, or head of the king upon it; the name *ſhilling* being derived from the German *ſchelling;* under which appellation coins had been ſtruck at Hamburgh in 1407. The crown was firſt coined in its preſent form by Henry VIII. Formerly it had appeared only in gold, whence the phraſe of crowns of gold; though theſe indeed were the largeſt gold coins known for a long time in France and other countries on the continent, being worth about 10s. ſterling. They had their name from the crown ſtamped on one ſide, and were firſt coined by Charles VI. in 1384, and continued till the time of Louis XIV. The half-crown, ſixpence, and threepence, were coined by Edward VI. In 1558 Queen Elizabeth coined three halfpenny, and in 1561 three farthing pieces; but they were diſcontinued in 1582.

Modern Coins.

From the year 1601 to the preſent time the coins of England remain the ſame.

Gold was coined in England by Henry III. in 1257; the piece was called a *gold penny*, and was larger than the ſilver one; and the execution is by no means bad for the time. The ſeries of gold coinage, however, commences properly from Edward III. In 1344 this monarch firſt ſtruck florins, in imitation of thoſe in Italy; and it is remarkable, that though theſe coins at the time they were firſt iſſued bore only ſix ſhillings value, they are now intrinſically worth 19s.; ſo much has the value of gold increaſed ſince that time. The half and quarter florin were ſtruck at the ſame time, but only the laſt has been found. The florin, however, being found inconvenient, gave place to the noble of 6s. 8d. value, and exactly half a mark. The latter had its name from being a limited ſum in accounts; and was eight ounces in weight, two-thirds of the money pound. It is ſometimes alſo called *ſelibra*, as being one half of the commercial pound of 16 ounces. The noble had its name from the nobility of the metal; the gold of which it was coined being of the fineſt ſort. Sometimes it is called *Roſe Noble*, from both ſides being impaled in an undulating circle. It continued with the half and quarter noble to be the only gold coin till the angels of Edward IV. appeared in 1465. Theſe had their name from being ſtamped with the image of Michael and the dragon. The angelites of 3s. 4d. value were ſubſtituted in their place. In 1527 Henry VIII. added to the gold coins the crown and half-crown at their preſent value; and the ſame year he gave *ſovereigns* of 22s. 6d. and *ryals* of 11s. 3d. angels at 7s. 6d. and nobles at their old value of 6s. 8d. In 1546 he cauſed ſovereigns to be coined of the value of 20s. and half ſovereigns in proportion. His gold crown is about the ſize of our ſhilling, and the half-crown of ſixpence, but thin. All his coins, however, gold as well as ſilver, are much debaſed; and it was not without much labour and trouble that Edward VI. brought it back to its former ſtandard. On the union of the two crowns, James gave the ſovereign the name of *unite;* the value continuing of 20s. as before. He coined alſo roſe-ryals of 30s. value, ſpur-ryals of 15s. angels of 10s. and angelets of 5s. Under the commonwealth, the ſovereign got the name of the *twenty-ſhilling* piece, and continued current till the coinage of guineas. Theſe were ſo called from their being coined of Guinea gold, and were at firſt only to go for 20s. though by an univerſal but tacit conſent they always paſſed for 21s. Half-guineas, double guineas, and five guinea pieces, were alſo coined during the ſame reign; which ſtill continue, though the two latter are not in common circulation. Quarter guineas were coined by George I. and likewiſe by his preſent majeſty; but they were found ſo troubleſome on account of their ſmall ſize, that they were ſtopped within a year or two when received at the bank of England; and thus are not to be met with at preſent. A few pieces of 7s. value have likewiſe been coined, and are known by the lion above the helmet; but none have been iſſued. In 1688 the guinea roſe to 21s. 6d. and continued to increaſe in value till 1696, when it was as high as 30s.; but after the recoinage in 1697 and 1698 it fell by degrees, and in 1717 was at its old ſtandard of 21s. and at that time ſilver

was

Modern Coins.

was fixed at its prefent ftandard value, viz. as 1 to 15½ in weight.

Though the firft money coined in Britain, as we have already obferved, was copper, yet, excepting the Northumbrian ftycas, no copper coin was found in England from the time of the Saxon conqueft till the year 1672. An averfion to a copper coinage it feems was prevalent throughout the nation; and Queen Elizabeth, who without hefitation ufed bafe money for Ireland, yet fcrupled at coining copper for England. This want of fmall coin occafioned fuch an increafe of private tokens for halfpennies and farthings, that it became a ferious object to government; and in 1594 a copper coinage was ferioufly thought of This year a fmall copper coin was ftruck about the fize of a filver twopence, with the queen's monogram on one fide, and a rofe on the other; the running legend on both fides being THE PLEDGE OF A HALFPENNY. Of this there are patterns both in copper and filver, but both of them foon fell into difufe. On the 19th of May 1613, King James by royal proclamation iffued farthing tokens. They are generally of the fame fize with the two pence, with two fceptres in faltier furmounted with a crown, and the harp upon the other; with an intention, as it would feem, that if they were refufed in England they might pafs in Ireland. In 1635 Charles I. coined thofe with the rofe inftead of the harp; but the circulation of thefe was entirely ftopped by the vaft number of counterfeits which appeared, and by the king's death in 1648. After this the private tokens began again to circulate, till put a ftop to by the coinage of farthings in 1672. The workmanfhip of the tokens is quite contemptible. In 1672 the halfpence as well as the farthings which had been ftruck two years before began to circulate. They were of pure Swedifh copper, the dyes engraved by Roettier; and they continued till the year 1684, when fome difputes arofe about the copper lately obtained from the Englifh mines. Tin farthings were coined with a ftud of copper in the centre, and infcribed round the edge as the crown pieces, with NUMMORUM FAMULUS, 1685 or 1686. In 1685 halfpence of the fame kind were coined; and the tin coinage continued till the year 1692, to the value of more than L.65,000; but next year the tin was all called in by government, and the copper coinage recommenced. The farthings of Queen Anne are all trial pieces excepting thofe of 1714, the laft year of her reign. "They are (fays Mr Pinkerton) of exquifite workmanfhip, exceeding moft copper coins either ancient or modern, and will do honour to the engraver Mr Croker to the end of time. The one, whofe reverfe is Peace in a car, PAX MISSA PER ORBEM, is the moft efteemed; and next to it the BRITANNIA under a portal. The other halfpence and farthings are lefs valuable.

23 Scotland. Silver pennies of Alexander I. who reigned in 1107, are believed to exift; and there certainly are fome of Alexander II. in 1214. There are likewife coins of David in 1124; but perhaps none of Malcolm IV. his fucceffor, whofe reign was very fhort. There are many coins of William I. in 1165; and a large hoard of his pennies was found at Invernefs in 1780.

The money of Scotland continued to be of the fame value with that of England till the country was drained by the vaft ranfom of David II. after which it became neceffary to reduce its fize; and fo much did this diminution affect England, that Edward III. found himfelf obliged to leffen the Englifh coin alfo. The diminution of the Scottifh coin, however, continued ftill to go on until it became impracticable to keep par with that of England. In the firft year of Robert III. it paffed only for one half its nominal value in England: in 1393, Richard II. ordered it only to go for the weight of the genuine metal it contained. In 1600 it had funk to fuch a degree as to pafs only for a twelfth part of the Englifh money, and continued at that low ebb till the coinage of Scotland was entirely cancelled by the Union of the two kingdoms.

Of filver coins we have only pennies till the year 1293, when Edward I. having coined halfpence and farthings, Alexander III. of Scotland coined alfo halfpence, of which we have a few, but no farthings are to be met with; but there are filver farthings of Robert I. and David II. The latter introduced the groat and half-groat, which completed the fet of Scottifh filver. It continued unaltered till the time of Queen Mary, when they all ceafed to be coined in filver, on account of the high price of that metal. In 1553 fhillings were firft coined, with the buft of the queen on one fide and the arms of France and Scotland on the other. The filver crown was firft coined in 1565, which went for 30 s. Scots; leffer pieces of 20 s. and 10 s. having likewife been ftruck, and marks of filver, worth 3 s. 4 d. Englifh, were alfo coined about the fame time. Thefe coins have upon them the marks XXX. XX. X. to denote their value. They are commonly called Cruickftone dollars, from the palm-tree upon them, miftaken for a remarkable yew at Cruickfton near Glafgow, where Henry Darnley refided. It is defcribed, however, in the act as a palm, with a "fhell-padoc" (a tortoife) crawling up. This alludes to Darnley's marriage with the queen, as the motto from Propertius DAT GLORIA VIRES alfo implies. The motto NEMO ME IMPUNE LACESSET firft appears on the Scottifh coins in 1578, and the invention is given to the celebrated Buchanan. In 1582, the crown of an ounce weight went for 40 s. Scots, and was accordingly marked XL.; in 1597 the mark was L. the Scottifh money being then only one-tenth of the Englifh: the mark was LX in 1601, the value being then reduced to one twelfth, at which it has ever fince continued. In the time of Charles I. half marks, 40 and 20 penny-pieces, were coined. In 1675 the Scottifh dollars firft appeared, in value 56 s. Scots, with halves and quarters of proportional value. In 1686, James VII. coined 60, 40, 20, 10, and 5 s. pieces; but only thofe of 40 and 10 s. are known, with thefe numbers under the buft. At the Union of the kingdoms, all the Scottifh coins were called in, and recoined at Edinburgh, with the mark E under the buft to diftinguifh it; fince which there has been no coinage in Scotland. The Scottifh filver coins are in general equal, if not fuperior, in the workmanfhip to the Englifh.

Gold was firft iffued by Robert II. about 30 years after Edward III. of England had coined the fame metal in that country. The pieces were at firft called St Andrew's, from the figure of that tutelar Saint

Modern Coins.

upon the crofs, and who appears on the obverfe with the arms of Scotland, and on the reverfe a lion in a fhield. The lion was another name for the largeft gold coin in Scotland, from the arms of the kingdom upon it. The next was the unicorn, under James III.; which were followed by the bonnet-pieces of James V. Thefe laft are of admirable workmanfhip, being almoft equal to the ancient coins in this refpect. In imitation of the French, the monarch we fpeak of diminifhed the fize of the coin without leffening its weight; an improvement not adopted by the Englifh for a whole century. The laft gold coined in Scotland was the piftole and half piftole, of twelve and fix pounds Scots. Thefe coins have the fun under the head. The gold coins of Scotland fell in the fame proportion with the filver.

The copper coinage of Scotland is of more early date than that of England. It was preceded by money of *billon*, or copper wafhed with filver, called black money. James III. firft coined black farthings in 1466; and this is recorded by hiftorians as one of his greateft faults. This kind of coinage, however, continued as late as the reign of James VI. In his time the true copper coinage began; but as the value of Scottifh money was now declined almoft to the utmoft, the pieces fuddenly affumed a form almoft refembling that of the French coins. The *bodle*, fo called from Bothwell the mintmafter, being equal in fize to the *liard*, and worth two pennies Scottifh, was ftruck. The billon coin, formerly called *bas-piece*, and worth fix pennies Scots, was now coined in copper, and termed the *baw-bee*. Thus it correfponded with the French half fol and Englifh halfpenny, the Scots penny being now equivalent to the French *denier*. Some pieces named *Atkinfons* were coined by James VI. in 1582, when the Scottifh money was to the Englifh as 1 to 8; but on its being ftill farther reduced, they went for 8 pennies, a third more than the value of the baw-bee. Befides thefe there were the hardie and plack, the former being worth three and the latter four pennies Scots. This coinage continued through the reigns of Charles I. and II. but Scottifh coins of the former are, perhaps, the fcarceft of any.

24. Ireland. The firft coins introduced into this kingdom feem to have been thofe of the Danes, and which have only a number of ftrokes around them inftead of letters. In the tenth century, however, this coinage had been confiderably improved; and in 930 and 994 there are pennies ftruck in Dublin, with the infcription ON DVFLI or DYFLI, *Duflin* or *Dyflin* being the Danifh name of that city. There are likewife coins of the Irifh princes themfelves, and of the Englifh monarchs, ftruck in Ireland as early as the ninth century; and it is afferted by fome, that Ireland even in thefe days had been conquered by England; of which, indeed, thefe coins feem to be a proof. None of the Irifh coins of Henry II. are to be met with, but we have fome of the coins of John; and from his time to that of Henry V. the Irifh coins are known by a triangle inclofing the king's head, which appears alfo upon the coins of other nations at this period. The harp does not appear upon the Irifh coins till the time of Henry VIII. Till the time of this monarch, the Englifh and Irifh coins are the fame; but the fame debafement of the coin which at that time took place in England extended alfo to Ireland; but in 1601 copper halfpence and farthings were coined alfo for this kingdom. Thefe circulated in Ireland when James VI. iffued his farthing-tokens of copper, the latter being of two fizes, that if they failed in England they might be fent to Ireland as pennies and halfpence. In 1635 a mint was eftablifhed in Dublin by Charles I. but it was ftopped by the Irifh maffacre, and the many difturbances which followed; fince which time the fcheme has not been refumed. After the maffacre, St Patrick's halfpence and farthings were coined by the Papifts, bearing the legends FLOREAT REX, and on the reverfe ECCE GREX; on the farthing QUIESCAT PLEBS. Copper-tokens were ftruck by towns and tradefmen, as in England and Scotland. In 1680, halfpence and farthings were iffued by authority, with the harp and date. In 1689, James II. having invaded Ireland, inftituted a mint, and coined fhillings and half-crowns of all the refufe metal he could find, particularly fome brafs guns were employed, whence the coinage is commonly called *gun-money*. Even this metal, however, foon became fo fcarce, that a diminution in its fize is quite apparent from June 1689 to July 1690; and as the month of their mintage is marked upon them, this decreafe is eafily perceived. In March 1690, pennies of lead mixed with tin were iffued; and on the 15th of June the fame year, crowns of white metal were coined; but thefe are now very fcarce. In 1722, the patent for coining halfpence and farthings was given to William Wood, which excited fuch difcontent in Ireland. From the fmall fize allowed by the patent to thefe pieces, it was fuppofed that the patentee would have gained 60,000 l. but as he caufed them to be ftruck of a fize ftill fmaller, his gains were eftimated at 100,000 l. The coins, however, are of admirable workmanfhip, and very fine copper, bearing the beft portrait of king George I. to be found any where. Sir Ifaac Newton, at that time at the head of the mint, declared that they were fuperior to the Englifh coins in every thing except the fize. In 1737 the Irifh halfpence and farthings, with the harp on the reverfe, were coined, and continue to the prefent time. In 1760, there was fuch a fcarcity of copper coin, that fome private perfons applied for leave to coin halfpence, which appeared with a very bad portrait of George II. and the words VOCE POPULI around it. No gold or filver has been coined in Ireland fince the maffacre of 1641.

TABLE V. *Modern Medals, properly fo called.*

1 Scottifh medals. Thefe take the lead in the prefent article, the firft modern medals of gold being thofe of David II. ftruck between the years 1330 and 1370. Only two of them now exift; one in the collection of Mr Barker of Birmingham, and the other in that of Dr Hunter. In 1478, there is a medal of James III. fent to the fhrine of St Amboife in France. It is defcribed as of two inches and a third in diameter; the weight near two ounces; having on the obverfe a beardlefs king, with long hair, fitting on a throne, holding in one hand a naked fword; in the other a fhield, with the Scottifh arms. On the borders of the canopy above the throne is an infcription in Gothic letters, IN MI DEFFEN, being corrupt

French

Modern Medals.

French for *In my defence*; a common motto in the Scottish arms. Above the canopy is VILLA BERWICI: the reverse bears St Andrew and his cross, SALVUM FAC POPULUM TUUM DOMINE. There is also a medal of James IV. in the collar of St Michael, having on the reverse a Doric pillar surmounted by a young Janus, standing on a hill, beyond which is the sea, and land on either side. This, however, is by some suspected to be a forgery.

The most remarkable Scottish medals are those of the unfortunate Mary. The first is properly French, having been issued at her coronation as queen of France, along with her husband king Francis II. On the obverse of this piece there are portraits of Francis and Mary, face to face, with three legends around them, the outermost containing their titles; the middle one the following sentence: HORA NONA DOMINUS J. H. S. EXPIRAVIT HELLI CLAMANS; the innermost the name of the city (Paris). On the reverse are the arms of France and Scotland. Fine testoons were also coined upon the same plan, and are now so rare that Dr Hunter gave ten guineas for one he has in his collection. The same portraits appear on the fine crown of Mary and Henry, in 1565, which is so rare as to be esteemed a medal of the highest value; and Mr Pinkerton imagines, that if brought to a sale it would bring 40 or 50 guineas.

Another remarkable medal of Mary represents her full faced, and weeping, with the inscription, O GOD GRANT PATIENCE IN THAT I SUFFER VRANG. The reverse has in the centre, QUHO CAN COMPARE WITH ME IN GRIEF, I DIE AND DAR NOCHT SEEK RELIEF; with this legend around, HOURT NOT THE (figure of a heart) QUHAIS JOY THOU ART. There are also many counters of this unfortunate princess, being thin silver-pieces of the size of a shilling. "They all appear (says Mr Pinkerton) to have been done in France by Mary's direction, who was fond of devices. Her cruel captivity could not debar her from intercourse with her friends in France, who must with pleasure have executed her orders, as affording her a little consolation."

The coronation medal of Charles I. struck at Edinburgh for his inauguration, June 18. 1663, is remarkable as being the only one ever coined of Scottish gold, and the first in Britain struck with a legend on the edge. With respect to the workmanship, it is inferior to Simon's. Of these medals only three are known to exist, of which one is in the Museum. It is not uncommon in silver; in which case it sometimes wants the legend on the edge.

2. Italian medals. These appear in the 15th century, and from that time successively in most European countries. Vittore Pisano, a painter of Verona, is celebrated as the restorer of the art, but it remains to be accounted for how the medals of king David already mentioned came to exist so long before. Mr Pinkerton considers this artist rather as an inventor than a restorer, his medals having no resemblance to the ancient coins, as being large, and all cast. They were first modelled in wax, then a mould taken from the model in fine sand, and other ingredients. After a good cast was procured, it was touched up, and made a model for the rest. These medals of Pisano are almost always inscribed *Opus Pisani Pictoris*. The portraits of a great number of illustrious men were done by him in this manner; and in the British Museum is a large brass medal of Pisano by himself.—Other artists were Boldu, Marescotto, Matth eus de Pallus, Sperandes, Misaldone &c. Towards the end of the century, however, the medals began to assume a more elegant appearance; and the Papal ones are not only the most elegant but the most ancient series of all the modern medals. The improvement began in the reign of Alexander VI. so famous for his own crimes, and those of his nephew Cæsar Borgia. His successors, Julius II. Leo X. Hadrian VI. and Clement VII. had many of their medals designed by Raphael, Julio Romano, and other eminent painters, and the engraving executed by artists of equal merit. Among these were the celebrated Cellini, and the noted Paduan forgers of Roman coins, Cavino and Bassiano. In 1644 Cormanni, a medallic artist, was imprisoned on account of a piece which represented the Pope upon one side, and Olympia Maidalchina, the *relation* of his holiness, on the other. The unfortunate Cormanni poisoned himself. About this time the family of the Hamerani, originally from Germany, began to engrave the papal medals; which they did with surprising merit for several generations. Each of the daughters did a fine medal, as we are informed by Venuti.

Besides the papal medals, there are many issued by the various states of Italy. There are medals of Frederic II. of Sicily in 1501, of several Venetian generals in 1509, of Alfonso duke of Ferrara in 1511, and of the celebrated Andrew Daria in 1528.

3 French medals. Till the reign of Louis XIV. the medals of this country are neither fine nor numerous; but this monarch exceeds all modern princes in this way. Many of his pieces are well designed and executed, though objectionable on account of their falsehood.

4. Danish medals. These appear of Christian II. in 1516, of Frederic and Sophia in 1532, of Frederic I. and Christian III. in bonnets worn in the 16th century. The elephant of the house of Oldenburg is frequent upon Danish medals.

5. Swedish medals. These begin with Gustavus Vasa; and several of Christina are likewise to be met with. There are also some curious ones of Charles XII.

6. Dutch medals. These begin in 1566; and many of them are remarkable for maps and plans, which must be very interesting to posterity. "Had the Greeks and Romans (says Mr Pinkerton) given us maps and plans, what a fine system of ancient geography and topography a cabinet of medals must have been!"

7. Medals of Spain, Portugal, and Germany. The Spanish medals began with Gonsalo in 503, many of which are curious and interesting. Under Cha V. there are many curious Spanish medals; but those of Germany begin with Frederic in 1453. They are extremely numerous; as we may easily suppose from the greatness of the empire, and the various states which compose it. There is a famous medal of Sebastian king of Portugal, famous for his unfortunate expedition into Africa in 1578; with his bust, full face, and three quarters in length. On the reverse is a shell-fish in the sea, with the moon and seven stars, bearing the inscription SERENA CALSA PAVENT. There is also a curious

Modern Medals.

curious lozenge-ſhaped coin of the ſame with the arms of Portugal, and the king's name and title: On the reverſe is a croſs with the inſcription IN HOC SIGNO VINCES, 1578.

8. Satyric medals. Theſe began almoſt as ſoon as the knowledge of the art of coining medals was revived. They ſeem to have been almoſt unknown to the ancients. One indeed of the Emperor Gallienus is ſuppoſed to have been ſatyric. It has on the front the emperor's buſt, with the inſcription GALLIENÆ AUG. the reverſe is Peace in a car, PAX UBIQUE; but this has been proved to be only a blundered coin. Some other ancient medal , however, are not liable to this objection. The firſt modern ſatyric medal publiſhed wa that of Frederic king of Sicily in 1501 againſt hi antagoniſt Ferdinand king of Spain. It has on one ſide the head of Ferdinand, with the inſcription FERDINANDUS R. AR. VETUS VULPES ORBIS; on the reverſe a wolf carrying off a ſheep, JUGUM MÆUM SUAVE EST ET ONUS MEUM LEVE. Many others have been ſtruck, of which the wit would now perhaps be difficult to be found out: but of all nations the Dutch have moſt diſtinguiſhed themſelves in this way; and paid very dear for their conduct, as they brought upon themſelves by one or two ſatyric medals the whole power of France under Louis XIV.

9. Engliſh medal . The firſt of theſe is in the duke of Devonſhire's collection. It is of a large ſize, and done on the plan of the early Italian medals. It has on the reverſe the arms of Kendal, with the inſcription TEMPORE OBSIDIONIS TURCORUM, MCCCCLXXX. On the other ſide is a portrait with IO. KENDAL RHODI TURCUPELLERIUS It wa found laſt century in Knareſborough foreſt; but Mr Pinkerton has no doubt of its having been done in Italy The next is that of Henry VIII in [illegible]45, and is of gold, larger than the crown-piece, with the king's head upon the obverſe, and three legends within each other, including his titles, &c. The reverſe contains two inſcriptions, declaring him to be the head of the church; the one in Hebrew, the other in Greek. It was imitated exactly by Edward VI. whoſe coronation medal is the firſt we have. There are two medals of Philip and Mary, whoſe execution is tolerably good; but thoſe of Elizabeth are very poor. There are good medals of Jame I. and his queen; with a fine one of Charles I. and Henrietta, though the workmanſhip is much inferior to the antique. There are many good medals of Charles, with various devices upon their reverſes. Under the commonwealth the celebrated Simon produced medals which are deſervedly reckoned the moſt admirable pieces of modern workmanſhip. There are many good medals of Charles II. James II. and William III. Some are alſo found of James after his abdication. Some fine gold, ſilver, and copper medals, were iſſued in the time of Queen Anne; the two laſt affording a ſeries of all the great actions of the duke of Marlborough. About the year 1740, a ſeries of medal was engraved in London by Daſſier, a native of Geneva, containing all the kings of England; being 36 in number. They are done upon fine copper, and executed with great taſte. There are beſides many medals of private perſons in England; ſo that it may juſtly be ſaid, that this country for medals exceeds almoſt every other in Europe.

To this account of modern coins and medals we ſhall add that of another ſet called *ſiege pieces*, and which were iſſued during the time of a ſiege in caſes of urgent neceſſity. Theſe were formed of any kind of metal; ſometimes of no metal; and Patin mentions a remarkable one ſtruck at Leyden in 1574, when the place was beſieged by the Spaniards. It was of thick paper or paſteboard, having a lion rampant, with this inſcription, PUGNO PRO PATRIA, 1574; and on the reverſe, LUGDUNUM BATAVORUM. There are various ſiege-pieces of Charles I. both in gold and ſilver, ſome of the latter being of the value of 20 ſhillings.

The *nummi bracteati* are a ſpecies of modern coins ſomewhat between counters and money; and have their name from the word BRACTEA, a ſpangle or thin bit of metal. They are commonly little thin plates of ſilver, ſtamped as would ſeem with wooden dies upon one ſide only, with the rude impreſſion of variou figures and inſcriptions. Moſt of them are eccleſiaſtic, and were ſtruck in Germany, Switzerland, Denmark, Sweden, Norway, and a few in Poland. They continued to be in uſe in Germany till the end of the 15th century; and ſome are ſtill uſed in Switzerland at this day.

ς. or ϛ	6.	Ξ.	60.	Χ.	600.		
Ζ.	7.	Ο.	70.	Ψ.	700.		
Η.	8.	Π.	80.	Ω.	800.		
Θ.	9.	ϙ or ϥ	90.	ϡ.	900.		

Examples. I is 10: add A or B, and IA makes 11: fo IB, 12; IΓ, 13, &c. K is 20, KA, 21, &c. PIA makes 111. The Englifh word AIR marks the grand initial numerals. On coins the numerals are often placed in retrograde order; which makes no difference in the value, as every letter is appropriated to its number. Thus ΓΛΤ or ΓΑΤ imply the fame, 333. But this advantage being unknown to the Roman numerals and Arabic ciphers, is apt to puzzle the beginner.

Roman Coins.

A

A. AULUS: in the exergue it implies the firft mint, as ANT. A. coined at Antioch in the firft mint.
A. A. A. F. F. Auro, Argento, Ære, Flando, Feriundo.
A. or AN. Annus.
A. A. Apollo Augufti.
A. F. A. N. Auli filius, Auli nepos.
ABN. Abnepos.
ACT. Actiacus, or Actium.
AD FRV. EMV. Ad fruges emundas.
ADIAB Adiabenicus.
ADOP. Adoptatus.
ADQ. Adquifita.
ADV Adventus.
AED. Ædes.
AED. P. Ædilitia poteftate.
AED. S. Ædes facræ.
AED. CVR. Ædilis Curulis.
AED PL. Ædilis Plebis.
AEL. Ælius.

Abbreviations.

AEM. or AIMIL. Æmilius.
AET. Æternitas.
AFR. Africa, or Africanus.
ALBIN. Albinus.
ALIM. ITAL. Alimenta Italiæ.
ANN. AVG. Annona Auguſti.
A. N. F. F. Annum Novum Fauſtum Felicem.
ANIC. Anicius.
ANN. DCCCLXIIII. NAT. VRB. P. CIR. CON. Anno 864 Natali Urbis Populo Circenſes conſtituti.
ANT. AVG. Antonius Augur.
ANT. Antonius, or Antoninus.
AP. Appius.
A. P. F. Argento Publico Feriundo.
A POP. FRVG. AC. A Populo Fruges Acceptæ.
AQ. or AQL. Aquilius.
AQVA MAR. Aqua Martia.
ARAB. ADQ. Arabia Adquiſita.
ARR. Arrius.
AVG. Augur, Auguſtus, Auguſta.
AVG. D. F. Auguſtus Divi Filius.
AVGG. Two Auguſti.
AVGGG. Three Auguſti.
AVR. or AVREL. Aurelius.

B

B. The mark of the ſecond mint in any city.
BON. EVENT. Bonus Eventus.
B. R. P. NAT. Bono Reipublicæ Nato.
BRIT. Britannicus.
BRVT. Brutus.

C

C. Caius, Colonia.
C. A. Cæſarea Auguſta.
C. CAE. or CAES. Cæſar.
CAESS. Cæſares.
CARTH. Carthage.
CEN. Cenſor.
CENS. P. Cenſor Perpetuus.
CEST. Ceſtius, or Ceſtianus.
CIR. CON. Circum Condidit, or Circenſes Conceſſit.
CIVIB. ET SIGN. MILIT. A. PARTH. RECVP. Civibus et Signis Militaribus a Parthis Recuperatis.
CN. Cneius.
COEL. Cœlius.
CON. OB. Conſtantinopoli Obſignata, or Conſtantinopoli Officina ſecunda, or Conflata Obryzo.
COL. Colonia.
CON. SVO. Conſervatori ſuo.
CONCORD. Concordia.
CL. V. Clypeus Votivus.
COMM. Commodus.
CLOD. Clodius.
CL. or CLAVD. Claudius.
COS. Conſul.
COSS. Conſules.
CORN. Cornelius.
CVR. X. F. Curavit Denarium Faciendum.

D

D. Decimus, Divus, Deſignatus.
DAC. Dacicus.
D. F. Dacia felix.
D. M. Diis Manibus.
DES. or DESIG. Deſignatus.
DICT. Dictator.
DOMIT. Domitianus.
D. N. Dominus noſter.
DID. Didius.
D. P. Dii Penates.
DV. Divus.

E

EID. MAR. Idus Martiæ.
EX. CONS. D. Ex Conſenſu Decuriorum.
EX. S. C. Ex Senatus Conſulto.
EQ. ORDIN. Equeſtris Ordinis.
EX. A. PV. Ex Argento, or Auctoritate Publica.
EXER. Exercitus.
ETR. Etruſcus.

F

F. Filius, or Filia, or Felix, or Faciundum, or Fecit.
FEL. Felix.
FELIC. Felicitas.
FL. Flavius.
FLAM. Flamen.
FORT. RED. Fortunæ Reduci.
FOVRI. Fourius for Furius.
FONT. Fonteius.
FRVGIF. Frugiferæ (Cereri).
FVL. Fulvius.
FVLG. Fulgerator.

G

G. Gneius, Genius, Gaudium.
GA. Gaditanus.
G. D. Germanicus Dacicus.
GEN. Genius.
GERM. Germanicus.
GL. E. R. Gloria Exercitus Romani.
GL. P. R. Gloria Populi Romani.
GOTH. Gothicus.
G. P. R. Genio Populi Romani.
G. T. A. Genius Tutelaris Ægypti, or Africæ.

H

HEL. Helvius.
HEL. Heliopolis.
HER. Herennius, or Herennia.
HO. Honos.
HS. Seſtertius.

I

I. Imperator, Jovi, Julius.
IAN. CLV. Janum cluſit for clauſit.
IMP. Imperator.
IMPP. Imperatores.
I. S. M. R. Juno Soſpita, Mater or Magna Regina.
IT. Italia, Iterum.
ITE. Iterum.
IVL. Julius or Julia.
IVST. Juſtus.
I-I. S. Seſtertius.
I. O. M. SACR. Jovi Optimo, Maximo, Sacrum.
II. VIR. Duumvir.
III. VIR. R. P. C. Triumvir Reipublicæ Conſtituendæ.
IIII. VIR. A. P. F. Quatuorvir, or Quatuorviri, Auro, or Argento, or Ære, Publico Feriundo.
IVN. Junior.

26. The ryal of Queen Mary of Scotland.
27. Letters on Anglo-Saxon coins.
28. Abbreviations on ditto.
29. Monetarius.

Impressions of MEDALS. See CASTING.

Medallion.

MEDALLION, or MEDALION, a medal of an extraordinary size, supposed to be anciently struck by the emperors for their friends, and for foreign princes and ambassadors. But, that the smallness of their number might not endanger the loss of the devices they bore, the Romans generally took care to stamp the subject of them upon their ordinary coins.

Medallions, in respect of the other coins, were the same as modern medals in respect of modern money: they were exempted from all commerce, and had no other value than what was set upon them by the fancy of the owner. Medallions are so scarce, that there cannot be any set made of them, even though the metals and sizes should be mixed promiscuously.

Mede.

MEDE (Joseph), a very learned English divine of the 17th century, was educated at Cambridge, and soon distinguished himself to great advantage; for by the time he had taken the degree of master of arts in 1610, he had made an uncommon progress in all academical studies. His first appearance as a writer was by an address to Dr Andrews, then bishop of Ely, in

Mede. a Latin tract *De Sanctitate Relativa*, which was highly approved of by that prelate, who desired him to be his domestic chaplain. This Mr Mede very civilly refused; valuing the liberty of his studies above any hopes of preferment, and esteeming that freedom which he enjoyed in his cell, so he used to call it, as the haven of all his wishes And indeed these thoughts had possessed him betimes; for when he was a school-boy, he was sent to by his uncle, Mr Richard Mede, a merchant, who, being then without children, offered to adopt him for his son if he would live with him: but he refused the offer, preferring, as it should seem, a life of study to a life of gain.

He was not chosen fellow of his college 'till after he was master of arts, and then not without the assistance of his friend bishop Andrews: for he had been passed over at several elections, on account of a causeless suspicion which Dr Cary, then master of the college, afterwards bishop of Exeter, had conceived of him, that "he looked too much towards Geneva." Being made fellow, he became an eminent and faithful tutor. After he had well grounded his pupils in humanity, logic, and philosophy, so that they were able to walk as it were alone, he used to set every one his daily task; which he rather chose, than to confine himself and them to precise hours for lectures. In the evening they all came to his chamber; and the first question he put to each was, *Quid dubitas?* "What doubts have you met with in your studies to-day?" For he supposed, that to doubt nothing and to understand nothing was just the same thing. This was right, and the best method to make young men exercise their rational powers, and not acquiesce in what they learn mechanically, and by rote, with an indolence of spirit which prepares them to receive and swallow implicitly whatever is offered to them. As to himself, he was so entirely devoted to the study of all excellent knowledge, that he made even the time he spent in his amusements serviceable to his purpose. He allowed himself little no exercise but walking; and often, in the fields or college garden, would take occasion to speak of the beauty, signatures, virtues, or properties of the plants then in view. for he was a curious florist, an accurate herbalist, and thoroughly versed in the book of nature. The chief delight he took in company was to discourse with learned friends.

Mr Mede was a curious inquirer into the most abstruse parts of learning, and endeavoured after the knowledge of those things which were most remote from the vulgar track. Among other things, he spent no small pains and time in sounding the depths of astrology, and blotted much paper in calculating the nativities of his near relations and fellow-students: but this was in his younger years, and he afterwards discovered the vanity and weakness of this fanciful art. He applied himself to the more useful study of history and antiquities; particularly to those mysterious sciences which made the ancient Chaldeans, Egyptians, and other nations, so famous; tracing them as far as he could have any light to guide him in their oriental schemes and figurative expressions, as likewise in their hieroglyphics, not forgetting to inquire also into the oneirocritics of the ancients: which he did the rather, because of that affinity he conceived they might have with the language of the prophets. He was a curious and laborious searcher of antiquities relating to religion, ethnic, Jewish, Christian, and Mahometan: to which he added other attendants, necessary for understanding the more difficult parts of Scripture.

In 1620, he refused the provostship of Trinity-college, Dublin, into which he had been elected at the recommendation of archbishop Usher, who was his particular friend; as he did also when it was offered to him a second time, in 1630. The height of his ambition was, only to have had some small donative sinecure added to his fellowship, or to have been thrown into some place of quiet; where, retired from the noise and tumults of the world, and possessed of a competency of fortune, he might have been entirely at leisure for study and acts of piety. In the mean time, although his circumstances were scanty, for he had nothing but his fellowship and a college lecture, his charity was diffusive and uncommon; and, strange as it may now seem, he devoted the tenth of his income to pious and charitable uses. But his frugality and temperance always afforded him plenty. His prudence or moderation, either in declaring or defending his private opinions, was very remarkable; as was also his freedom from partiality, prejudice or prepossession, pride, anger, selfishness, flattery, and ambition. He was meek, patient, equally remote from superstition and licentiousness of thinking; and, in short, possessed every virtue. This great and good man died in 163[illegible], in his [illegible]2d year, having spent above two-thirds of his time in college.

Medea. MEDEA, in fabulous history, a celebrated sorceress, daughter of Æetes king of Colchis. Her mother's name, according to the more received opinion of Hesiod and Hyginus, was Idyia, or, according to others, Ephyre, Hecate, Asterodia, Antiope, and Neæra. She was the niece of Circe. When Jason came to Colchis in quest of the golden fleece, Medea became enamoured of him, and it was to her well-directed labours that the Argonauts owed their preservation. Medea had an interview with her lover in the temple of Hecate; where they bound themselves by the most solemn oaths to eternal fidelity. No sooner had Jason overcome all the difficulties which Æetes had placed in his way, than Medea embarked with the conquerors for Greece. To stop the pursuit of her father, she tore to pieces her brother Absyrtus, and left his mangled limbs in the way through which Æetes was to pass. This act of barbarity, some have attributed to Jason, and not to her. When Jason reached Iolchos his native country, the return and victories of the Argonauts were celebrated with universal rejoicings; but Æson the father of Jason was unable to assist at the solemnity on account of the infirmities of his age. Medea, at her husband's request, removed the weakness of Æson; and by drawing away the blood from his veins, and filling them again with the juice of certain herbs, she restored him to the vigour and sprightliness of youth. This sudden change in Æson astonished the inhabitants of Iolchos; and the daughters of Pelias were also desirous to see their father restored by the same power to the vigour of youth. Medea, willing to revenge the injuries which her husband's family had suffered from Pelias, increased their curiosity; and betrayed them into the murder of their father

ther as preparatory to his rejuvenefcence, which fhe afterwards refufed to accomplifh. This action greatly irritated the people of Iolchos; and Medea with her hufband fled to Corinth to avoid their refentment. Here they lived for 10 years with mutual attachment, when the love of Jafon for Glauce the king's daughter interrupted their harmony, and Medea was divorced. Medea revenged the infidelity of Jafon, by caufing the death of Glauce, and the deftruction of her family. She alfo killed two of her children in their father's prefence; and when Jafon attempted to punifh the barbarity of the mother, fhe fled through the air upon a chariot drawn by winged dragons. From Corinth Medea came to Athens, where, after fhe had undergone the neceffary purification of her murder, fhe married king Ægeus, or (according to others) lived in an adulterous manner with him. From her conduct with Ægeus, Medea had a fon who was called *Medus*. Soon after, when Thefeus wifhed to make himfelf known to his father, Medea, jealous of his fame and fearful of his power, attempted to poifon him at a feaft which had been prepared for his entertainment. Her attempts, however, failed of fuccefs, and the fight of the fword which Thefeus wore by his fide convinced Ægeus that the ftranger againft whofe life he had fo bafely confpired was his own fon. The father and the fon were reconciled; and Medea, to avoid the punifhment which her wickednefs deferved, mounted her fiery chariot and difappeared through the air. She came to Colchis; where, according to fome, fhe was reconciled to Jafon, who had fought her in her native country after her fudden departure from Corinth. She died at Colchis, as Juftin mentions, when fhe had been reftored to the confidence of her family. After death fhe married Achilles in the Elyfian fields, according to the traditions mentioned by Simonides. The murder of Mermerus and Pheres, the youngeft of Jafon's children by Medea, is not to be attributed to the mother, according to Elian; but to the Corinthians, who affaffinated them in the temple of Juno Acræa. To avoid the refentment of the gods, and to deliver themfelves from the peftilence which vifited their country after fo horrid a maffacre, they engaged the poet Euripides for five talents to write a tragedy, which cleared them of the murder, and reprefented Medea as the cruel affaffin of her own children. And befides, that this opinion might be the better credited, feftivals were appointed, in which the mother was reprefented with all the barbarity of a fury murdering her own fons.

MEDEOLA, CLIMBING AFRICAN ASPARAGUS, in botany: A genus of the hexandria order, belonging to the trigynia clafs of plants; and in the natural method ranking under the 11th order, *Sarmentaceæ*. There is no calyx; the corolla is fexpartite and revoluted; the berry trifpermous. Its characters are thefe: The flower has no empalement; it has fix oblong oval petals, and fix awl-fhaped ftamina terminated by incumbent fummits; and three horned germina terminating the ftyle; the germina afterward turn to a roundifh trifid berry with three cells, each containing one heart-fhaped feed. There are two fpecies.

MEDIA, now the province of GHILAN in Perfia, once the feat of a potent empire, was bounded, according to Ptolemy, on the north by part of the Cafpian Sea; on the fouth by Perfis, Sufiana, and Affyria; on the eaft by Parthia and Hyrcania; and on the weft by Armenia Major. It was anciently divided into feveral provinces, *viz*. Tropatene, Charomithrene, Darites, Marciane, Amariace, and Syro-Media. By a later divifion, however, all thefe were reduced to two; the one called *Media Magna*, the other *Media Atropatia*, or fimply *Atropatene*. Media Magna was bounded by Perfis, Parthia, Hyrcania, the Hyrcanian Sea, and Atropatene, and contained the cities of Ecbatan, Laodicea, Apamea, Raga, Rageia or Ragea, &c. Atropatene lay between the Cafpian mountains and the Cafpian Sea.

This country originally took its name from Madai, the third fon of Japhet; as is plain from Scripture, where the Medes are conftantly called *Madai*. Among profane authors, fome derive the name *Media*, from one Medus the fon of Jafon and Medea; others from a city called *Media*. Sextus Rufus tells us that in his time it was called *Medena*, and from others we learn that it was alfo called *Aria*. The moft probable hiftory of the Medes is as follows.

This people lived in fubjection to the Affyrians till the reign of Sennacherib, when they threw off the yoke, and lived for fome time in a ftate of anarchy. But at laft, rapine and violence, the natural confequences of fuch a fituation, prevailed fo much that they were conftrained to have recourfe to fome kind of government, that they might be enabled to live in fafety. Accordingly, about 699 B. C. one Dejoces having procured himfelf to be chofen king, united the fcattered tribes into which the Medes were at that time divided; and having applied himfelf as much as poffible to the civilization of his barbarous fubjects, left the throne to his fon Phraortes, after a reign of 53 years.

The new king, who was of a warlike and enterprifing difpofition, fubdued almoft all the Upper Afia lying between Mount Taurus and the river Halys which runs through Cappadocia into the Euxine Sea. Elated with this good fuccefs, he invaded Affyria, the empire of which was now much declined, and greatly weakened by the revolt of many nations which had followed the example of the Medes. Nebuchodonofor or Chyniladan, however, the reigning prince, having affembled what forces he could, engaged Phraortes, defeated, took him prifoner, and put him to death; after which, entering Media, he laid wafte the country, took the metropolis of Ecbatan itfelf, and levelled it with the ground.

On the death of Phraortes, his fon Cyaxares was placed on the throne. He was no lefs valiant and enterprifing than his father, and had better fuccefs againft the Affyrians. With the remains of that army which had been defeated under his father, he not only drove the conquerors out of Media, but obliged Chyniladan to fhut himfelf up in Nineveh. To this place he immediately laid clofe fiege; but was obliged to give over the enterprize on account of an irruption of the Scythians into his own country. Cyaxares engaged thefe new enemies with great refolution; but was utterly defeated; and the conquerors over-ran not only all Media, but the greateft part of Upper Afia, extending their conquefts into Syria, and as far as the confines of Egypt. They continued mafters of all this vaft tract of country for 28 years, till at last Media was delivered from their yoke by a general massacre at the instigation of Cyaxares.

After this deliverance, the Medes soon repossessed themselves of the territories they had lost; and once more extended their frontiers to the river Halys, their ancient boundary to the westward. After this we find the Medes engaged in a war with the Lydians; which, however, ended without any remarkable transaction: but on the conclusion of it, Cyaxares having entered into a strict alliance with Nebuchadnezzar king of Babylon, returned in conjunction with the Babylonians before Nineveh; which they took and levelled with the ground, putting most of the inhabitants to the sword.

After this victory the Babylonian and Median empires seem to have been united: however, after, the death of Nebuchadnezzar, or rather in his lifetime, a war ensued, which was not extinguished but by the dissolution of the Babylonian empire. The Medes, under Astyages the son of Cyaxares I. withstood the power of the Babylonian monarchs; and under Cyrus and Cyaxares II. utterly destroyed their empire by the taking of BABYLON, as is related under that article. After the death of Cyaxares, the kingdom fell to Cyrus, by whom the seat of the empire was transferred to PERSIA, under which article the history of Media now falls to be considered, as also the manners, &c. of the inhabitants.

MEDIANA, the name of a vein or little vessel, made by the union of the cephalic and basilic, in the bend of the elbow.

MEDIASTINUM, in anatomy, a double membrane, formed by a duplicature of the pleura; serving to divide the thorax and the lungs into two parts, and to sustain the viscera, and prevent their falling from one side of the thorax to the other. See ANATOMY, n° 117.

MEDIATE, or INTERMEDIATE, something that stands betwixt and connects two or more terms considered as extremes; in which sense it stands opposed to *immediate*.

MEDIATOR, a person that manages or transacts between two parties at variance in order to reconcile them. The word, in Scripture, is applied, 1. To Jesus Christ, who is the only intercessor and peace-maker between God and man, (1 Tim. ii. 5.) 2. To Moses, who interposed between the Lord and his people, to declare unto them his word; (Deut. v. 5. iii. 19.)

MEDICAGO, SNAIL-TREFOIL, in botany: A genus of the decandria order, belonging to the diadelphia class of plants; and in the natural method ranking under the 32d order, *Papilionaceæ*. The legumen is compressed and screwed; the carina of the corolla luring down from the vexillum. There are nine species, though only five are commonly cultivated in this country. They are low trailing plants, adorned with small yellow flowers, succeeded by small, round, snail-shaped fruit, which are downy, and armed with a few short spines. They are all easily propagated by seeds. For the properties and culture of LUCERN, a species of this genus, see AGRICULTURE, n° 183.

MEDICINAL, any thing belonging to medicine.

MEDICINAL Springs, a general name for any fountain, the waters of which are of use for removing certain disorders. They are commonly either chalybeate or sulphureous. See SPRINGS and WATER.

MEDICINE.

MEDICINE is the art of preventing, curing, or alleviating, those diseases to which the human species are subjected.

History of Medicine.

1 Origin of medicine among the Jews;

THE fabulous history of the ancients derives this art immediately from their gods; and, even among the moderns, some are of opinion that it may justly be considered as of divine revelation. But without adopting any supposition of which no probable evidence can be given, we may conclude that mankind were naturally led to it from casual observations on the diseases to which they found themselves subjected; and that therefore, in one sense at least, it is as ancient as the human race. But at what period it began to be practised as an art, by particular individuals following it as a profession, is not known. The most ancient physicians we read of were those who embalmed the patriarch Jacob by order of his son Joseph. The sacred writer styles these physicians *servants* to Joseph: whence we may be assured that they were not *priests*, as the first physicians are generally supposed to have been; for in that age we know the Egyptian priests were in such high favour, that they retained their liberty, when, through a public calamity, all the rest of the people were made slaves to the prince.

It is not probable, therefore, that among the Egyptians religion and medicine were originally conjoined; and if we suppose the Jews not to have invented the art, but received it from some other nation, it is as little probable that the priests of that nation were their physicians as those of Egypt.

That the Jewish physicians were absolutely distinct from their priests, is very certain. Yet as the Jews resided for such a long time in Egypt, it is probable they would retain many of the Egyptian customs, from which it would be very difficult to free them. We read, however, that when king Asa was diseased in his feet, "he sought not to the Lord, but to the physicians." Hence we may conclude, that among the Jews the medicinal art was looked upon as a mere human invention; and it was thought that the Deity never cured diseases by making people acquainted with the virtues of this or that herb, but only by his miraculous power. That the same opinion prevailed among the heathens who were neighbours to the Jews, is also probable from what we read of Ahaziah king of Judah, who having sent messengers to inquire of

Origin of Medicine.

of Baal-zebub god of Ekron concerning his disease, he did not desire any remedy from him or his priests, but simply to know whether he should recover or not.

What seems most probable on this subject therefore is, that religion and medicine came to be mixed together only in consequence of that degeneracy into ignorance and superstition which took place among all nations. The Egyptians, we know, came at last to be sunk in the most ridiculous and absurd superstition; and then, indeed, it is not wonderful to find their priests commencing physicians, and mingling charms, incantations, &c. with their remedies. That this was the case, though long after the days of Joseph, we are very certain; and indeed it seems as natural for ignorance and barbarism to combine religion with physic, as it is for a civilized and enlightened people to keep them separate. Hence we see, that among all modern barbarians their priests or conjurors are their only physicians.

2 Among the Egyptians;

We are so little acquainted with the state of physic among the Egyptians, that it is needless to say much concerning them. They attributed the invention of medicine, as they did also that of many other arts, to Thoth, the Hermes or Mercury of the Greeks. He is said to have written many things in hieroglyphic characters upon certain pillars, in order to perpetuate his knowledge, and render it useful to others. These were transcribed by Agathodemon, or the second Mercury, the father of Tat, who is said to have composed books of them, that were kept in the most sacred places of the Egyptian temples. The existence of such a person, however, is very dubious, and many of the books ascribed to him were accounted forgeries as long ago as the days of Galen; there is also great reason to suspect that those books were written many ages after Hermes, and when physic had made considerable advances. Many of the books attributed to him are trifling and ridiculous; and though sometimes he is allowed to have all the honour of inventing the art, he is on other occasions obliged to share it with Osiris, Isis, and Apis or Serapis.

After all, the Egyptian physic appears to have been little else than a collection of absurd superstitions. Origen informs us, that they believed there were 36 demons, or gods of the air, who divided the human body among them; that they had names for all of them; and that by invoking them according to the part affected, the patient was cured. Of natural medicines we hear of none recommended by the father of Egyptian physic; except the herb *moly*, which he gave to Ulysses in order to secure him from the enchantments of Circe; and the herb *mercury*, of which he first discovered the use. His successors made use of venesection, cathartics, emetics, and clysters. There is no proof, however, that this practice was established by Hermes; on the contrary, the Egyptians themselves pretended that the first hint of those remedies was taken from some observations on brute animals. Venesection was taught them by the hippopotamus, which is said to perform thi operation upon itself. On these occasions, he comes out of the river, and strikes his leg against a sharp-pointed reed. As he takes care to direct the stroke against a vein, the consequence must be a considerable effusion of blood; and this being suffered to run as long as the creature thinks proper, he at last stops up the orifice with mud. The hint of clysters was taken from the ibis, a bird which is said to give itself clysters with its bill, &c. They used venesection, however, but very little, probably on account of the warmth of the climate; and the exhibition of the remedies above mentioned, joined with abstinence, formed the most of their practice.

3 Among the Greeks.

The Greeks too had several persons to whom they attributed the invention of physic, particularly Prometheus, Apollo or Pæan, and Æsculapius; which last was the most celebrated of any. But here we must observe, that as the Greeks were a very warlike people, their physic seems to have been little else than what is now called *surgery*, or the cure of wounds, fractures, &c. Hence Æsculapius, and his pupils Chiron, Machaon, and Podalirius, are celebrated by Homer only for their skill in curing these, without any mention of their attempting the cures of internal diseases. We are not, however, to suppose that they confined themselves entirely to surgery. They no doubt would occasionally prescribe for internal disorders; but as they were most frequently conversant with wounds, we may naturally suppose the greatest part of their skill to have consisted in knowing how to cure these. If we may believe the poets, indeed, the knowledge of medicine seems to have been very generally diffused. Almost all the heroes of antiquity are reported to have been physicians as well as warriors. Most of them were taught physic by the centaur Chiron. From him Hercules received instructions in the medicinal art, in which he is said to have been no less expert than in feats of arms. Several plants were called by his name; whence some think it probable that he found out their virtues, though others are of opinion that they bore the name of this renowned hero on account of their great efficacy in removing diseases. Aristæus king of Arcadia was also one of Chiron's scholars; and is supposed to have discovered the use of the drug called *silphium*, by some thought to be asafætida. Theseus, Telamon, Jason, Peleus, and his son Achilles, were all renowned for their knowledge in the art of physic. The last is said to have discovered the use of verdegrise in cleansing foul ulcers. All of them, however, seem to have been inferior in knowledge to Palamedes, who hindered the plague from coming into the Grecian camp after it had ravaged most of the cities of Hellespont, and even Troy itself. His method was to confine his soldiers to a spare diet, and to oblige them to use much exercise.

The practice of these ancient Greek physicians, notwithstanding the praises bestowed on them by their poets, seems to have been very limited, and in some cases even pernicious. All the external remedies applied to Homer's wounded heroes were fomentations; while inwardly their physicians gave them wine, sometimes mingled with cheese scraped down. A great deal of their physic also consisted in charms, incantations, amulets, &c. of which, as they are common to all superstitious and ignorant nations, it is superfluous to take any farther notice.

In this way the art of medicine continued among the Greeks for many ages. As its first professors knew nothing of the animal œconomy, and as little of the theory of diseases, it is plain, that whatever they did

4 Æſculapius. muſt have been in conſequence of mere random trials, or empiriciſm, in the moſt ſtrict and proper ſenſe of the word. Indeed, it is evidently impoſſible that this or almoſt any other art could originate from another ſource than trials of this kind. Accordingly, we find, that ſome ancient nations were accuſtomed to expoſe their ſick in temples, and by the ſides of highways, that they might receive the advice of every one who paſſed. Among the Greeks, however, Æſculapius was reckoned the moſt eminent practitioner of his time, and his name continued to be revered after his death. He was ranked amongſt the gods; and the principal knowledge of the medicinal art remained with his family to the time of Hippocrates, who reckoned himſelf the ſeventeenth in a lineal deſcent from Æſculapius, and who was truly the firſt who treated of medicine in a regular and rational manner.

5 Hippocrates. Hippocrates, who is ſuppoſed to have lived 400 years before the birth of Chriſt, is the moſt ancient author whoſe writings expreſsly on the ſubject of the medical art are preſerved; and he is therefore juſtly conſidered as the father of phyſic. All the accounts which we have prior to this time, if not evidently fabulous, are at the utmoſt highly conjectural. Even the medical knowledge of Pythagoras, ſo much celebrated as a philoſopher, can hardly be conſidered as reſting on any other foundation. But from the time of Hippocrates, medicine, ſeparated from philoſophy and religion, ſeems to have aſſumed the form of a ſcience, and to have been practiſed as a profeſſion. It may not, therefore, be improper to give a particular account of the ſtate of medical knowledge as tranſmitted to us in his writings. The writings of Hippocrates, however, it may be remarked, are even more than preſerved. Nor is it wonderful that attempts

6 His writings. ſhould have been made to increaſe the value of manuſcripts, by attributing them to a name of ſuch eminence. But although what are tranſmitted to us under the title of his works may have been written by different hands, yet the preſumption is, that moſt, if not all of them, are of nearly as early a date, and contain the prevailing opinions of thoſe times.

According to the moſt authentic accounts, Hippocrates was a native of the iſland of Cos, and born in the beginning of the 88th Olympiad. In the writings tranſmitted to us as his, we find a general principle adopted, to which he gives the name of *Nature*. To this principle he aſcribes a mighty power. "Nature (ſays he) is of itſelf ſufficient to every animal. She performs every thing that is neceſſary to them, without needing the leaſt inſtruction from any one how to do it." Upon this footing, as if Nature had been a principle endowed with knowledge, he gives her the title of *juſt;* and aſcribes virtues or powers to her, which are her ſervants, and by means of which ſhe performs all her operations in the bodies of animals: and diſtributes the blood, ſpirits, and heat, through all parts of the body, which by theſe means receive life and ſenſation. And in other places he tells us, that it is this faculty which gives nouriſhment, preſervation, and growth, to all things.

7 His idea of nature. The manner in which nature acts, or commands her ſubſervient power to act, is by attracting what is good and agreeable to each ſpecies, and by retaining, preparing, and changing it; and on the other ſide in rejecting whatever is ſuperfluous or hurtful, after ſhe has ſeparated it from the good. This is the foundation of the doctrine of depuration, concoction, and criſis in fevers, ſo much inſiſted upon by Hippocrates and moſt other phyſicians. He ſuppoſes alſo, that every thing has an inclination to be joined to what agrees with it, and to remove from every thing contrary to it; and likewiſe that there is an affinity between the ſeveral parts of the body, by which they mutually ſympathize with each other. When he comes to explain what this principle called *nature* is, he is obliged to reſolve it into *heat*, which, he ſays, appears to have ſomething immortal in it.

8 Of the cauſes of diſeaſe. As far as he attempts to explain the cauſes of diſeaſe, he refers much to the humours of the body, particularly to the blood and the bile. He treats alſo of the effects of ſleep, watchings, exerciſe, and reſt, and all the benefit or miſchief we may receive from them. Of all the cauſes of diſeaſes, however, mentioned by Hippocrates, the moſt general are diet and air. On the ſubject of diet he has compoſed ſeveral books, and in the choice of this he was exactly careful; and the more ſo, as his practice turned almoſt wholly upon it. He alſo conſidered the air very much; he examined what winds blew ordinarily or extraordinarily; he conſidered the irregularity of the ſeaſons, the riſing and ſetting of ſtars, or the time of certain conſtellations; alſo the time of the ſolſtices, and of the equinoxes; thoſe days, in his opinion, producing great alterations in certain diſtempers.

9 His diviſions of diſeaſes. He does not, however, pretend to explain how, from theſe cauſes, that variety of diſtempers ariſes which is daily to be obſerved. All that can be gathered from him with regard to this is, that the different cauſes above-mentioned, when applied to the different parts of the body, produce a great variety of diſtempers. Some of theſe diſtempers he accounted *mortal*, others *dangerous*, and the reſt eaſily *curable*, according to the cauſe from whence they ſpring, and the parts on which they fall. In ſeveral places alſo he diſtinguiſhes diſeaſes, from the time of their duration, into *acute* or *ſhort*, and *chronical* or *long*. He likewiſe diſtinguiſhes diſeaſes by the particular places where they prevail, whether ordinary or extraordinary. The firſt, that is, thoſe that are frequent and familiar to certain places, he called *endemic* diſeaſes; and the latter, which ravaged extraordinarily ſometimes in one place, ſometimes in another, which ſeized great numbers at certain times, he called *epidemic*, that is, *popular* diſeaſes; and of this kind the moſt terrible is the plague. He likewiſe mentions a third kind, the oppoſite of the former; and theſe he calls *ſporadic*, or ſtraggling diſeaſes: theſe laſt include all the different ſorts of diſtempers which invade at any one ſeaſon, which are ſometimes of one ſort, and ſometimes of another. He diſtinguiſhed between thoſe diſeaſes which are hereditary, or born with us, and thoſe which are contracted afterwards; and likewiſe between thoſe of a *kindly* and ſuch as are of a *malignant* nature, the former of which are eaſily and frequently cured, but the latter give the phyſicians a great deal of trouble, and are ſeldom overcome by all their care.

Hippocrates remarked four ſtages in diſtempers; viz.

Hippocrates.

viz. the beginning of the diſeaſe, its augmentation, its ſtate or height, and its declination. In ſuch diſeaſes as terminate fatally, death comes in place of the declination. In the third ſtage, therefore, the change is moſt conſiderable, as it determines the fate of the ſick perſon; and this is moſt commonly done by means of a *criſis*. By this word he underſtood any ſudden change in ſickneſs, whether for the better or for the worſe, whether health or death ſucceed immediately. Such a change, he ſays, is made at that time by *nature*, either abſolving or condemning the patient. Hence we may conclude, that Hippocrates imagined diſeaſes to be only a diſturbance of the animal economy, with which Nature was perpetually at variance, and uſing her utmoſt endeavours to expel the offending cauſe. Her manner of acting on theſe occaſions is to reduce to their natural ſtate thoſe humours whoſe diſcord occaſions the diſturbance of the whole body, whether in relation to their quantity, quality, mixture, motion, or any other way in which they become offenſive. The principal means employed by nature for this end is what Hippocrates calls *concoction*.

10
His opinion of a criſis.

By this he underſtood the bringing the morbific matter lodged in the humours to ſuch a ſtate, as to be eaſily fitted for expulſion by whatever means nature might think moſt proper. When matters are brought to this paſs, whatever is ſuperfluous or hurtful immediately empties itſelf, or nature points out to phyſicians the way by which ſuch an evacuation is to be accompliſhed. The criſis takes place either by bleeding, ſtool, vomit, ſweat, urine, tumors or abſceſſes, ſcabs, pimples, ſpots, &c. But theſe evacutions are not to be looked upon as the effects of a true criſis, unleſs they are in conſiderable quantity; ſmall diſcharges not being ſufficient to make a criſis. On the contrary, ſmall diſcharges are a ſign that nature is depreſſed by the load of humours, and that ſhe lets them go thro' weakneſs and continual irritation. What comes forth in this manner is crude, becauſe the diſtemper is yet too ſtrong; and while matters remain in this ſtate, nothing but a bad or imperfect criſis is to be expected. This ſhows that the diſtemper triumphs, or at leaſt is equal in ſtrength to nature, which prognoſticates death, or a prolongation of the diſeaſe. In this laſt caſe, however, nature often has an opportunity of attempting a new criſis more happy than the former, after having made freſh efforts to advance the concoction of the humours.—It muſt here be obſerved, however, that, according to Hippocrates, concoction cannot be made but in a certain time, as every fruit has a limited time to ripen; for he compares the humours which nature has digeſted to fruits come to maturity.

The time required for concoction depends on the differences among diſtempers mentioned above. In thoſe which Hippocrates call *very acute*, the digeſtion or criſis happens by the fourth day; in thoſe which are only *acute*, it happens on the ſeventh, 11th, or 14th day; which laſt is the longeſt period generally allowed by Hippocrates in diſtempers that are truly acute: though in ſome places he ſtretches it to the 20th, or 21ſt, nay, ſometimes to the 40th or 60th days. All diſeaſes that exceed this laſt term are called *chronical*. And while in thoſe diſeaſes that exceed 14 days, he conſiders every fourth day as critical, or at leaſt remarkable, by which we may judge whether the criſis on the following fourth day will be favourable or not; ſo in thoſe which run from 20 to 40 he reckons only the ſevenths, and in thoſe that exceed 40 he begins to reckon by 20. Beyond the 120th he thinks that the number of days has no power over the criſis. They are then referred to the general changes of the ſeaſons; ſome terminating about the equinoxes; others about the ſolſtices; others about the riſing or ſetting of the ſtars of certain conſtellations; or if numbers have yet any place, he reckons by months, or even whole years. Thus (he ſays), certain diſeaſes in children have their criſis in the ſeventh month after their birth, and others in their ſeventh or even their 14th year.

Though Hippocrates mentions the 21ſt as one of the critical days in acute diſtempers, as already noticed; yet, in other places of his works, he mentions alſo the 20th. The reaſon he gives for this in one of thoſe places of his works is, that the days of ſickneſs were not quite entire. In general, however, he is much attached to the odd days: inſomuch that in one of his aphoriſms he tells us, "The ſweats that come out upon the 3d, 5th, 7th, 9th, 11th, 14th, 17th, 21ſt, 27th, 31ſt, or 34th days, are beneficial; but thoſe that come out upon other days ſignify that the ſick ſhall be brought low, that his diſeaſe ſhall be very tedious, and that he ſhall be ſubject to relapſes." He further ſays, "That the fever which leaves the ſick upon any but an odd day is uſually apt to relapſe." Sometimes, however, he confeſſes that it is otherwiſe; and he gives an inſtance of a ſalutary criſis happening on the ſixth day. But theſe are very rare inſtances, and therefore cannot, in his opinion, overthrow the general rule.

Beſides the criſis, however, or the change which determines the fate of the patient, Hippocrates often ſpeaks of another, which only changes the ſpecies of the diſtemper, without reſtoring the patient to health; as when a vertigo is turned to an epilepſy, a tertian fever to a quartan, or to a continual, &c.

11
His accuracy in prognoſtics.

But what has chiefly contributed to procure the vaſt reſpect generally paid to Hippocrates, is his induſtry in obſerving the moſt minute circumſtances of diſeaſes, and his exactneſs in nicely deſcribing every thing that happened before, and every accident that appeared at the ſame time with them; and likewiſe what appeared to give eaſe, and what to increaſe the malady: which is what we call *writing the hiſtory of a diſeaſe*.—Thus he not only diſtinguiſhed one diſeaſe from another by the ſigns which properly belonged to each; but by comparing the ſame ſort of diſtemper which happened to ſeveral perſons, and the accidents which uſually appeared before and after, he could often foretel a diſeaſe before it came, and afterwards give a right judgment of the event of it. By this way of prognoſticating, he came to be exceedingly admired: and this he carried to ſuch a height, that it may juſtly be ſaid to be his maſter-piece; and Celſus, who lived after him, remarks, that ſucceeding phyſicians, though they found out ſeveral new things relating to the management of diſeaſes, yet were obli-

Hippocrates. ged to the writings of Hippocrates for all that they knew of signs.

From the look; The first thing Hippocrates considered, when called to a patient, was his looks. It was a good sign with him to have a visage resembling that of a person in health, and the same with what the sick man had before he was attacked by the disease. As it varied from this, so much the greater danger was apprehended. The following is the description which he gives of the looks of a dying man.—"When a patient (says he) has his nose sharp, his eyes sunk, his temples hollow, his ears cold and contracted, the skin of his forehead tense and dry, and the colour of his face tending to a pale-green, or lead colour, one may give out for certain that death is very near at hand; unless the strength of the patient has been exhausted all at once by long watchings, or by a looseness, or being a long time without eating." This observation has been confirmed by those of succeeding physicians, who have, from him, denominated it the *Hippocratic face*. The lips hanging relaxed and cold, are likewise looked upon by this author as a confirmation of the foregoing prognostic. He took also his signs from the disposition of the eyes in particular. When a patient cannot bear the light; when he sheds tears involuntarily; when, in sleeping, some part of the white of the eye is seen, unless he usually sleeps after that manner, or has a looseness upon him: these signs, as well as the foregoing ones, prognosticate danger. The eyes deadened, as it were with a mist spread over them, or their brightness lost, likewise presages death, or great weakness. The eyes sparkling, fierce, and fixed, denote the patient to be delirious, or that he soon will be seized with a frenzy. When the patient sees any thing red, and like sparks of fire and lightning pass before his eyes, you may expect an hæmorrhagy; and this often happens before those crises which are to be attended by a loss of blood.

From the posture in bed; The condition of the patient is also shown by his posture in bed. If you find him lying on one side, his body, neck, legs, and arms, a little contracted, which is the posture of a man in health, it is a good sign: on the contrary, if he lies on his back, his arms stretched out, and his legs hanging down, it is a sign of great weakness; and particularly when the patient slides or lets himself fall down towards the feet, it denotes the approach of death. When a patient in a burning fever is continually feeling about with his hands and fingers, and moves them up before his face and eyes as if he was going to take away something that passed before them; or on his bed-covering, as if he was picking or searching for little straws, or taking away some filth, or drawing out little flocks of wool; all this is a sign that he is delirious, and that he will die. Amongst the other signs of a present or approaching delirium, he also adds this: When a patient who naturally speaks little begins to talk more than he used to do, or when one that talks much becomes silent, this change is to be reckoned a sort of delirium, or is a sign that the patient will soon fall into one. The frequent trembling or starting of the tendons of the wrist, presage likewise a delirium. As to the different sorts of delirium, Hippocrates is much more afraid of those that run upon mournful subjects, than such as are accompanied with mirth.

From respiration; When a patient breathes fast, and is oppressed, it is a sign that he is in pain, and that the parts above the diaphragm are inflamed. Breathing long, or when the patient is a great while in taking his breath, shows him to be delirious; but easy and natural respiration is always a good sign in acute diseases. Hippocrates depended much on respiration in making his prognostics; and therefore has taken care in several places to describe the different manner of a patient's breathing. Continual watchings in acute diseases, are signs of present pain, or a delirium near at hand.

From excrementitious discharges. Hippocrates also drew signs from all excrements, whatever they are, that are separated from the body of man. His most remarkable prognostics, however, were from the urine. The patient's urine, in his opinion, is best when the sediment is white, soft to the touch, and of an equal consistence. If it continue so during the course of the distemper, and till the time of the crisis, the patient is in no danger, and will soon be well. This is what Hippocrates called *concocted urine*, or what denotes the concoction of the humours; and he observed, that this concoction of the urine seldom appeared thoroughly, but on the days of the crisis which happily put an end to the distemper. Urine. "We ought (said Hippocrates) to compare the urine with the purulent matter which runs from ulcers. As the pus, which is white, and of the same quality with the sediment of the urine we are now speaking of, is a sign that the ulcer is on the point of closing; so that which is clear, and of another colour than white, and of an ill smell, is a sign that the ulcer is virulent, and in the same manner difficult to be cured: the urines that are like this we have described are only those which may be named good; all the rest are ill, and differ from one another only in the degrees of more and less. The first never appear but when nature has overcome the disease; and are a sign of the concoction of humours, without which you cannot hope for a certain cure. On the contrary, the last are made as long as the crudity remains, and the humours continue unconcocted. Among the urines of this last sort, the best are reddish, with a sediment that is soft, and of an equal consistence; which denotes, that the disease will be somewhat tedious, but without danger. The worst are those which are very red, and at the same time clear and without sediment; or that are muddy and troubled in the making. In urine there is often a sort of cloud hanging in the vessel in which it is received; the higher this rises, or the farther distant it is from the bottom, or the more different from the colour of the laudable sediment abovementioned, the more there is of crudity. That which is yellow, or of a sandy colour, denotes abundance of bile; that which is black is the worst, especially if it has an ill smell, and is either altogether muddy or altogether clear. That whose sediment is like large ground wheat, or little flakes or scales spread one upon another, or bran, presages ill, especially the last. The fat or oil that sometimes swims upon the top of the urine, and appears in a form something like a spider's web, is a sign of a consumption of the flesh and solid parts. The making

Hippocrates.

king of a great quantity of urine is the sign of a crisis, and sometimes the quality of it shows how the bladder is affected. We must also observe, that Hippocrates compared the state of the tongue with the urine; that is to say, when the tongue was yellow, and charged with bile, the urine he knew must of course be of the same colour; and when the tongue was red and moist, the urine was of its natural colour.

Fæces.

His prognostics from the excretions by stool are as follow. Those that are soft, yellowish, of some consistence, and not of an extraordinary ill smell, that answer to the quantity of what is taken inwardly, and that are voided at the usual hours, are the best of all. They ought also to be of a thicker consistence when the distemper is near the crisis; and it ought to be taken for a good prognostic, when some worms, round and long, are evacuated at the same time with them. The prognosis, however, may still be favourable, though the matter excreted be thin and liquid, provided it make not too much noise in coming out, and the evacuation be not in a small quantity nor too often; nor in so great abundance, nor so often, as to make the patient faint. All matter that is watery, white, of a pale green, or red, or frothy and viscous, is bad. That which is blackish, or of a livid hue, is the most pernicious. That which is pure black, and nothing else but a discharge of black bile, always prognosticates very ill; this humour, from what part soever it comes, showing the ill disposition of the intestines. The matter that is of several different colours, denotes the length of the distemper; and, at the same time, that it may be of dangerous consequence. Hippocrates places in the same class the matter that is bilious or yellow, and mixed with blood, or green and black, or like the dregs or scrapings of the guts. The stools that consist of pure bile, or entirely of phlegm, he also looks upon to be very bad.

Matter cast up by vomiting ought to be mixed with bile and phlegm; where one of these humours only is observed, it is worse. That which is black, livid, green, or of the colour of a leek, indicates alarming consequences. The same is to be said of that which smells very ill; and if at the same time it be livid, death is not far off. The vomiting of blood is very often mortal.

Expectoration.

The spittings which give ease in diseases of the lungs and in pleurisies, are those that come up readily and without difficulty; and it is good if they be mixed at the beginning with much yellow: but if they appear of the same colour, or are red, a great while after the beginning of the distemper, are salt and acrimonious, and cause violent coughings, they are not good. Spittings purely yellow are bad; and those that are white, viscous, and frothy, give no ease. Whiteness is a good sign of concoction in regard to spittings; but they ought not at all to be viscous, nor too thick, nor too clear. We may make the same judgment of the excrements of the nose according to their concoction and crudity. Spittings that are black, green, and red, are of very bad consequence. In inflammations of the lungs, those that are mixed with bile and blood presage well if they appear at the beginning, but are bad if they arise not about the seventh day. But the worst sign in these distempers is, when there is no expectoration at all, and the too great quantity of matter that is ready to be discharged this way makes a rattling in the breast. After spitting of blood, the discharge of purulent matter often follows, which brings on a consumption, and at last death.

Sweat.

A kind good sweat is that which arises on the day of the crisis, and is discharged in abundance all over the body, and at the same time from all parts of the body, and thus carries off the fever: A cold sweat is alarming, especially in acute fevers, for in others it is only a sign of long continuance. When the patient sweats no where but on the head and neck, it is a sign that the disease will be long and dangerous. A gentle sweat in some particular part, of the head and breast, for instance, gives no relief, but denotes the seat of the distemper, or the weakness of the part. This kind of sweat was called by Hippocrates *ephidrosis*.

From the pulse.

The hypochondria, or the abdomen in general, ought always to be soft and even, as well on the right side as on the left. When there is any hardness or unevenness in those parts, or heat and swellings, or when the patient cannot endure to have it touched, it is a sign the intestines are indisposed.

Hippocrates also inquired into the state of the pulse, or the beating of the arteries. The most ancient physicians, however, and even Hippocrates himself, for a long time, by this word understood the violent pulsation that is felt in an inflamed part, without putting the fingers to it. It is observed by Galen, and other physicians, that Hippocrates touches on the subject of the pulse more slightly than any other on which he treats. But that our celebrated physician understood something even on this subject, is easily gathered from several passages in his writings; as when he observes, that in acute fevers the pulse is very quick and very great; and when he makes mention, in the same place, of trembling pulses, and those that beat slowly; when he observes, that in some diseases incident to women, when the pulse strikes the finger faintly, and in a languishing manner, it is a sign of approaching death. He remarks also, in the *Coacæ Prænotiones*, that he whose vein, that is to say, whose artery of the elbow, beats, is just going to run mad, or else that the person is at that time very much under the influence of anger.

From this account of Hippocrates, it will appear, that he was not near so much taken up with reasoning on the phænomena of diseases, as with reporting them. He was content to observe these phenomena accurately, to distinguish diseases by them, and judged of the event by comparing them exactly together. For his skill in prognostics he was indeed very remarkable, as we have already mentioned, insomuch that he and his pupils were looked upon by the vulgar as prophets. What adds very much to his reputation is, that he lived in an age when physic was altogether buried in superstition, and yet he did not suffer himself to be carried away by it; on the contrary, on many occasions, he expresses his abhorrence of it.

Having thus seen in what Hippocrates makes the difference between health and sickness to consist, and likewise the most remarkable signs from whence he drew his prognostics, we must now consider the means he prescribed for the preservation of health, and the

cure

Hippocrates.

12 His maxims for the preſervation of health.

cure of diſeaſes. One of his principal maxims was this, That, to preſerve health, we ought not to overcharge ourſelves with too much eating, nor neglect the uſe of exerciſe and labour. In the next place, That we ought by no means to accuſtom ourſelves to too nice and exact a method of living; becauſe thoſe who have once begun to act by this rule, if they vary in the leaſt from it, find themſelves very ill; which does not happen to thoſe who take a little more liberty, and live ſomewhat more irregularly. Notwithſtanding this, he does not neglect to inquire diligently into what thoſe who were in health uſed for food in his time.

Diet.

Here we cannot help taking notice of the prodigious diſparity between the delicacy of the people in our days and in thoſe of Hippocrates: for he takes great pains to tell the difference between the fleſh of a dog, a fox, a horſe, and an aſs; which he would not have done if at that time they had not been uſed for victuals, at leaſt by the common people. Beſides theſe, however, Hippocrates ſpeaks of all other kinds of proviſion that are now in uſe; for example, ſalads, milk, whey, cheeſe, fleſh as well of birds as of four-footed beaſts, freſh and ſalt fiſh, eggs, all kinds of pulſe, and the different kinds of grain we feed on, as well as the different ſorts of bread that are made of it. He alſo ſpeaks very often of a ſort of liquid food, or broth, made of barley-meal, or ſome other grain, which they ſteeped for ſome time, and then boiled in water. With regard to drink, he takes a great deal of pains to diſtinguiſh the good waters from the bad. The beſt, in his opinion, ought to be clear, light, without ſmell or taſte, and taken out of the fountains that turn towards the eaſt. The ſalt-waters, thoſe that he calls hard, and thoſe that riſe out of fenny ground, are the worſt of all; he condemns alſo thoſe that come from melted ſnow. But though Hippocrates makes all thoſe diſtinctions, he adviſes thoſe who are in health to drink of the firſt water that comes in their way. He ſpeaks alſo of alum waters, and thoſe that are hot; but does not enlarge upon their qualities. He adviſes to mix wine with an equal quantity of water: and this (he ſays) is the juſt proportion; by uſing which the wine will expel what is hurtful to the body, and the water will ſerve to temper the acrimony of the humours.

Exerciſe.

For thoſe that are in health, and likewiſe for ſuch as are ſick, Hippocrates adviſes exerciſe. The books, however, which treat on this ſubject, M. Le Clerc conjectures to have been written by Herodicus, who firſt introduced gymnaſtic exerciſe into medicine, and who is ſaid by Hippocrates himſelf to have killed ſeveral people by forcing them to walk while they were afflicted with fevers and other inflammatory diſorders. The advices given in them conſiſt moſtly in directions for the times in which we ought to walk, and the condition we ought to be in before it; when we ought to walk ſlowly, and when to run, &c.; and all this with reſpect to different ages and temperaments, and with deſign to bring the body down, or diſſipate the humours. Wreſtling, although a violent exerciſe, is numbered with the reſt. In the ſame place alſo mention is made of a play of the hands and fingers, which was thought good for health, and called *chironomie;* and of another diverſion which was performed round a ſort of ball hung up, which they called *corycus*, and which they ſtruck forward with both their hands.

Hippocrates.

Excretions.

With regard to thoſe things which ought to be ſeparated from, or retained in the human body, Hippocrates obſerves, that people ought to take great care not to load themſelves with excrements, or keep them in too long; and beſides the exerciſe above-mentioned, which carries off one part of them, and which he preſcribed chiefly on this account, he adviſes people to excite and rouſe up nature when ſhe flagged, and did not endeavour to expel the reſt, or take care of the impediments by which ſhe was reſiſted. For this reaſon he preſcribed meats proper for looſening the belly; and when theſe were not ſufficient, he directed the uſe of clyſters and ſuppoſitories. For thin and emaciated perſons he directed clyſters compoſed only of milk and oily unctuous ſubſtances, which they mixed with a decoction of chick-peaſe; but for ſuch as were plethoric, they only made uſe of ſalt or ſea-water.

As a preſervative againſt diſtempers, Hippocrates alſo adviſed the uſe of vomits, which he directed to be taken once or twice a month during the time of winter and ſpring. The moſt ſimple of theſe were made of a decoction of hyſſop, with an addition of a little vinegar and ſalt. He made thoſe that were of a ſtrong and vigorous conſtitution take this liquor in a morning faſting; but ſuch as were thin and weakly took it after ſupper.—Venery, in his opinion, is wholeſome, provided people conſult their ſtrength, and do not purſue it to exceſs; which he finds fault with on all occaſions, and would have exceſs avoided alſo in relation to ſleep and watching. In his writings are likewiſe to be found ſeveral remarks concerning good and bad air; and he makes it appear that the good or bad diſpoſition of this element does not depend ſolely on the difference of the climate, but on the ſituation of every place in particular. He ſpeaks alſo of the good and bad effects of the paſſions, and recommends moderation in regard to them.

From what we have already related concerning the opinions of Hippocrates, it may naturally be concluded, that for the moſt part he would be contented with obſerving what the ſtrength of nature is able to accompliſh without being aſſiſted by the phyſician. That this was really the caſe, may be eaſily perceived from a peruſal of his books entitled, "Of epidemical diſtempers;" which are, as it were, journals of the practice of Hippocrates: for there we find him often doing nothing more than deſcribing the ſymptoms of a diſtemper, and informing us what has happened to the patient day after day, even to his death or recovery, without ſpeaking a word of any kind of remedy. Sometimes, however, he did indeed make uſe of remedies; but theſe were exceedingly ſimple and few, in compariſon of what have been given by ſucceeding practitioners. Theſe remedies we ſhall preſently conſider, after we have given an abridgement of the principal maxims on which his practice is founded.

13 His maxims for the cure of diſeaſe.

Hippocrates aſſerted in the firſt place, That contraries, or oppoſites, are the remedies for each other; and this maxim he explains by an aphoriſm; in which he ſays, that evacuations cure thoſe diſtempers which come from repletion, and repletion thoſe that are cauſed

Hippocrates.

fed by evacuation. So heat is destroyed by cold, and cold by heat, &c. In the second place, he asserted, that physic is an addition of what is wanting, and a subtraction or retrenchment of what is superfluous: an axiom which is explained by this, viz. that there are some juices or humours, which in particular cases ought to be evacuated, or driven out of the body, or dried up; and some others which ought to be restored to the body, or caused to be produced there again. As to the method to be taken for this addition or retrenchment, he gives this general caution, That you ought to be careful how you fill up, or evacuate, all at once, or too quickly, or too much; and that it is equally dangerous to heat or cool again on a sudden; or rather, you ought not to do it: every thing that runs to an excess being an enemy to nature. In the fourth place, Hippocrates allowed that we ought sometimes to dilate, and sometimes to lock up: to dilate, or open the passages by which the humours are voided naturally, when they are not sufficiently opened, or when they are closed; and, on the contrary, to lock up or straiten the passages that are relaxed, when the juices that pass there ought not to pass, or when they pass in too great quantity. He adds, that we ought sometimes to smooth, and sometimes to make rough; sometimes to harden, and sometimes to soften again; sometimes to make more fine or supple; sometimes to thicken; sometimes to rouse up, and at other times to stupify or take away the sense; all in relation to the solid parts of the body, or to the humours. He gives also this farther lesson, That we ought to have regard to the course the humours take, from whence they come, and whither they go; and in consequence of that, when they go where they ought not, that we make them take a turn about, or carry them another way, almost like the turning the course of a river: or, upon other occasions, that we endeavour if possible to recal, or make the same humours return back again; drawing upward such as have a tendency downward, and drawing downward such as tend upward. We ought also to carry off, by convenient ways, that which is necessary to be carried off; and not let the humours once evacuated enter into the vessels again. Hippocrates gives also the following instruction, That when we do any thing according to reason, though the success be not answerable, we ought not too easily, or too hastily, to alter the manner of acting, as long as the reasons for it are yet good. But as this maxim might sometimes prove deceitful, he gives the following as a corrector to it: "We ought (says he) to mind with a great deal of attention what gives ease, and what creates pain; what is easily supported, and what cannot be endured." We ought not to do any thing rashly; but ought often to pause, or wait, without doing any thing: by this way, if you do the patient no good, you will at least do him no hurt.

These are the principal and most general maxims of the practice of Hippocrates, and which proceed upon the supposition laid down at the beginning, viz. that nature cures diseases. We next proceed to consider particularly the remedies employed by him, which will serve to give us further instructions concerning his practice.

14 His maxims respecting diet.

Diet was the first, the principal, and often the only remedy made use of by this great physician to answer the greatest part of the intentions above mentioned: by means of it he opposed moist to dry, hot to cold, &c.; and what he looked upon to be the most considerable point was, that thus he supported nature, and assisted her to overcome the malady. The dietetic part of medicine was so much the invention of Hippocrates himself, that he was very desirous to be accounted the author of it; and the better to make it appear that it was a new remedy in his days, he says expressly, that the ancients had wrote almost nothing concerning the diet of the sick, having omitted this point, though it was one of the most essential parts of the art.

15 Diet in acute diseases.

The diet prescribed by Hippocrates for patients labouring under acute distempers, differed from that which he ordered for those afflicted with chronical ones. In the former, which require a more particular exactness in relation to diet, he preferred liquid food to that which was solid, especially in fevers. For these he used a sort of broth made of cleansed barley; and to this he gave the name of *ptisan*. The manner in which the ancients prepared a ptisan was as follows: They first steeped the barley in water till it was plumped up; and afterwards they dried it in the sun, and beat it to take off the husk. They next ground it; and having let the flour boil a long time in the water, they put it out into the sun, and when it was dry they pressed it close. It is properly this flour so prepared that is called *ptisan*. They did almost the same thing with wheat, rice, lentils, and other grain: but they gave these ptisans the name of the grain from whence they were extracted, as *ptisan of lentils*, *rice*, &c. whereas the ptisan of barley was called simply *ptisan*, on account of the excellency of it. When they wanted to use it, they boiled one part of it in 10 or 15 of water; and when it began to grow plump in boiling, they added a little vinegar, and a very small quantity of anise or leek, to keep it from clogging or filling the stomach with wind. Hippocrates prescribes this broth for women that have pains in their belly after delivery. "Boil some of this ptisan (says he), with some leek, and the fat of a goat, and give it to the woman in bed." This will not be thought very singular, if we reflect on what has been hinted above concerning the indelicate manner of living in those times. He preferred the ptisan to all other food in fevers, because it softened and moistened much, and was besides of easy digestion. If he was concerned in a continual fever, he would have the patient begin with a ptisan of a pretty thick consistence, and go on by little and little, lessening the quantity of barley-flour as the height of the distemper approached; so that he did not feed the patient but with what he called the *juice of the ptisan*; that is, the ptisan strained, where there was but very little of the flour remaining, in order that nature being discharged in part from the care of digesting the aliments, she might the more easily hold out to the end, and overcome the distemper, or the cause of it. With regard to the quantity, he caused the ptisan to be taken twice a-day by such patients as in health used to take two meals a-day, not thinking it convenient that those who were sick should eat oftener than when they were well. He also would not allow eating twice a-day to those who eat but once in that time when in health. In the paroxysm of a fever

Hippocrates.

fever he gave nothing at all; and in all diſtempers where there are exacerbations, he forbid nouriſhment while the exacerbations continued. He let children eat more; but thoſe who were grown up to man's eſtate, or were of an advanced age, leſs; making allowance, however, for the cuſtom of each particular perſon, or for that of the country.

But though he was of opinion that too much food ought not to be allowed to the ſick, he was not of the mind of ſome phyſicians who preſcribed long abſtinence, eſpecially in the beginning of fevers. The reaſon he gave for this was, that the contrary practice weakened the patients too much during the firſt days of the diſtemper, by which means their phyſicians were obliged to allow them more food when the illneſs was at its height, which in his opinion was improper. Beſides, in acute diſtempers, and particularly in fevers, Hippocrates made choice of refreſhing and moiſtening nouriſhment; and amongſt other things preſcribed orange, melon, ſpinach, gourd, and dock. This ſort of food he gave to thoſe that were in a condition to eat, or could take ſomething more than a ptiſan.

Drink.

The drink he commonly gave to his patients was made of eight parts of water and one of honey. In ſome diſtempers they added a little vinegar; but beſides theſe, they had another ſort named κυκεων, or *mixture*. One preſcription of this ſort we find intended for a conſumptive perſon; it conſiſted of rue, aniſe, celery, coriander, juice of pomegranate, the rougheſt red wine, water, flour of wheat and barley, with old cheeſe made of goats milk. Hippocrates did not approve of giving plain water to the ſick; but though he generally preſcribed the drinks above mentioned, he did not abſolutely forbid the uſe of wine, even in acute diſtempers and fevers, provided the patients were not delirious nor had pains in their head. Beſides, he took care to diſtinguiſh the wines proper in theſe caſes: preferring to all other ſorts white-wine that is clear and has a great deal of water, with neither ſweetneſs nor flavour.

16 Diet in chronic diſeaſes.

Theſe are the moſt remarkable particulars concerning the diet preſcribed by Hippocrates in acute diſtempers; in chronical ones he made very much uſe of milk and whey; though we are not certain whether this was done on account of the nouriſhment expected from them, or that he accounted them medicines.

17 His maxims reſpecting bathing.

There were many diſeaſes for which he judged the bath was a proper remedy; and he takes notice of all the circumſtances that are neceſſary in order to cauſe the patient receive benefit from it, among which the following are the principal. The patient that bathes himſelf muſt remain ſtill and quiet in his place without ſpeaking while the aſſiſtants throw water over his head or are wiping him dry; for which laſt purpoſe he deſired them to keep ſponges, inſtead of that inſtrument called by the ancients *ſtrigil*, which ſerved to rub off from the ſkin the dirt and naſtineſs left upon it by the unguents and oils with which they anointed themſelves. He muſt alſo take care not to catch cold; and muſt not bathe immediately after eating and drinking, nor eat or drink immediately after coming out of the bath. Regard muſt alſo be had whether the patient has been accuſtomed to bathe while in health, and whether he has been benefited or hurt by it. Laſtly, he muſt abſtain from the bath when the body is too open, or too coſtive, or when he is too weak; or if he has an inclination to vomit, a great loſs of appetite, or bleeds at the noſe. The advantage of the bath, according to Hippocrates, conſiſts in moiſtening and refreſhing, taking away wearineſs, making the ſkin ſoft and the joints pliant; in provoking urine, making the noſtrils open, and opening the other excretories. He allows two baths in a day to thoſe who have been accuſtomed to it in health.

18 His maxims reſpecting exerciſe.

In chronical diſtempers Hippocrates approved very much of exerciſe, though he did not allow it in acute ones: but even in theſe he did not think that a patient ought always to lie a-bed; but tells us, that "we muſt ſometimes puſh the timorous out of bed, and rouſe up the lazy."

19 His maxims reſpecting purgation.

When he found that diet and exerciſe were not ſufficient to eaſe nature of a burden of corrupted humours, he was obliged to make uſe of other means, of which *purgation* was one. By this word he underſtood all the contrivances that are made uſe of to diſcharge the ſtomach and bowels; though it commonly ſignifies only the evacuation by the belly by ſtool. This evacuation he imagined to be occaſioned by the purgative medicines attracting the humours to themſelves. When firſt taken into the body, he thought they attracted that humour which was moſt ſimilar to them, and then the others, one after another.—Moſt of the purgatives uſed in his time were emetics alſo, or at leaſt were very violent in their operation downwards. Theſe were the white and black hellebore; the firſt of which is now reckoned among the poiſons. He uſed alſo the Cnidian berries, which are nothing elſe but the ſeeds of thymelea or chamælea; cneorum peplium, which is a ſort of milk-thiſtle; thapſia; the juice of hippophaë, a ſort of rhamnus; elaterium, or juice of the wild cucumber; flowers of braſs, coloquintida, ſcammony the magneſian ſtone, &c.

As theſe purgatives were all very ſtrong, Hippocrates was extremely cautious in their exhibition. He did not preſcribe them in the dog-days; nor did he ever purge women with child, and very ſeldom children or old people. He principally uſed purgatives in chronical diſtempers; but was much more wary in acute ones. In his books intitled "Of Epidemical Diſtempers," there are very few patients mentioned to whom he gave purgative medicines. He alſo takes notice expreſsly, that theſe medicines having been given in caſes of the diſtempers of which he was treating, had produced very bad effects. We are not, however, from this to conclude, that Hippocrates abſolutely condemned purging in acute diſtempers; for in ſome places he expreſsly mentions his having given them with ſucceſs. He was of opinion, for inſtance, that purging was good in a pleuriſy when the pain was ſeated below the diaphragm; and in this caſe he gave black hellebore, or ſome peplium mixed with the juice of *laſerpitium*, which is ſuppoſed to have been our aſafætida.

The principal rule Hippocrates gives with relation to purging is, that we ought only to purge off the humours that are concocted, and not thoſe that are yet crude, taking particular care not to do it at the beginning of the diſtemper, leſt the humours ſhould be

Hippocrates.

be difturbed or ftirred up, which happens pretty often. He was not, however, the firft who remarked that it would be of ill confequence to ftir the humours in the beginning of an acute diftemper. The Egyptian phyficians had before obferved the fame thing. By the *beginning* of a diftemper, Hippocrates underftood all the time from the firft day to the fourth complete.

Hippocrates imagined that each purgative medicine was adapted to the carrying off fome particular humour; and hence the diftinction of purgatives into hydragogue, cholagogue, &c. which is now juftly exploded. In confequence of this notion, which prevailed long after his time, he pretended that we knew if a purgative had drawn from the body what was fit to be evacuated according as we found ourfelves well or ill upon it. If we found ourfelves well, it was a fign that the medicine had effectually expelled the offending humour. On the contrary, if we were ill, he imagined, whatever quantity of humour came away, that the humour which caufed the illnefs ftill remained; not judging of the goodnefs or badnefs of a purge by the quantity of matters that were voided by it, but by their quality and the effect that followed after it.

Vomits were alfo pretty much ufed as medicines by Hippocrates. We have already feen what thofe were which he prefcribed to people in health by way of preventives. With regard to the fick, he fometimes advifed them to the fame, when his intentions were only to cleanfe the ftomach. But when he had a mind to recal the humours, as he termed it, from the inmoft receffes of the body, he made ufe of brifker remedies. Among thefe was white hellebore; and this indeed he moft frequently ufed to excite vomiting. He gave this root particularly to melancholy and mad people; and from the great ufe made of it in thefe cafes by Hippocrates and other ancient phyficians, the phrafe *to have need of hellebore*, became a proverbial expreffion for being out of one's fenfes. He gave it alfo in defluxions, which come, according to him, from the brain, and throw themfelves on the noftrils or ears, or fill the mouth with faliva, or that caufe ftubborn pains in the head, and a wearinefs or an extraordinary heavinefs, or a weaknefs of the knees, or a fwelling all over the body. He gave it to confumptive perfons in broth of lentils, to fuch as were afflicted with the dropfy called *leucophlegmatia*, and in other chronical diforders. But we do not find that he made ufe of it in acute diftempers, except in the cholera morbus, where he fays he prefcribed it with benefit. Some took this medicine fafting; but moft took it after fupper, as was commonly practifed with regard to vomits taken by way of prevention. The reafon why he gave this medicine moft commonly after eating was, that by mixing with the aliments, its acrimony might be fomewhat abated, and it might operate with lefs violence on the membranes of the ftomach. With the fame intention alfo he fometimes gave a plant called *fefamoides*, and fometimes mixed it with hellebore. Laftly, in certain cafes he gave what he called *foft* or *fweet* hellebore. This term had fome relation to the quality of the hellebore, or perhaps to the quantity he gave of it.

When Hippocrates intended only to keep the body open, or evacuate the contents of the inteftines, he made ufe of fimples; as for example, the herb mercury, or cabbage; the juice or decoction of which he ordered to be drank. For the fame purpofe he ufed whey, and alfo cows and affes milk; adding a little falt to it, and fometimes letting it boil a little. If he gave affes milk alone, he caufed a great quantity of it to be taken, fo that it muft of neceffity loofen the body. In one place he prefcribes no lefs than nine pounds of it to be taken as a laxative, but does not fpecify the time in which it was to be taken. With the fame intention he made ufe of fuppofitories and clyfters. The former were compounded of honey, the juice of the herb mercury, of nitre, powder of colocynth, and other fharp ingredients, to irritate the anus. Thefe they formed into a ball, or into a long cylindrical mafs like a finger. The clyfters he made ufe of for fick people were fometimes the fame with thofe already mentioned as preventives for people in health. At other times he mixed the decoction of herbs with nitre, honey, and oil, or other ingredients, according as he imagined he could by that means attract, wafh, irritate, or foften. The quantity of liquor he ordered was about 36 ounces; from which it is probable he did not intend that it fhould all be ufed at one time.

On fome occafions Hippocrates propofed to purge the head alone. This practice he employed, after purging the reft of the body, in an apoplexy, inveterate pains of the head, a certain fort of jaundice, a confumption, and the greateft part of chronical diftempers. For that purpofe he made ufe of the juices of feveral plants, as celery; to which he fometimes added aromatic drugs, making the patients fnuff up this mixture into their noftrils. He ufed alfo powders compounded of myrrh, the flowers of brafs, and white hellebore, which he caufed them put up into the nofe, to make them fneeze, and to draw the phlegm from the brain. For the fame purpofe alfo he ufed what he calls *tetragonon*, that is, "fomething having four angles;" but what this was, is now altogether unknown, and was fo even in the days of Galen. The latter phyfician, however, conjectures it to be antimony, or certain flakes found in it.

In the diftemper called *empyema* (or a collection of matter in the breaft), he made ufe of a very rough medicine. He commanded the patient to draw in his tongue as much as he was able; and when that was done, he endeavoured to put into the hollow of the lungs a liquor that irritated the part, which, raifing a violent cough, forced the lungs to difcharge the purulent matter contained in them. The materials that he ufed for this purpofe were of different forts; fometimes he took the root of arum, which he ordered to be boiled with a little falt, in a fufficient quantity of water and oil; diffolving a little honey in it. At other times, when he intended to purge more ftrongly, he took the flowers of copper and hellebore; after that he fhook the patient violently by the fhoulders, the better to loofen the pus. This remedy, according to Galen, he received from the Cnidian phyficians; and it has never been ufed by the fucceeding ones, probably becaufe the patients could not fuffer it.

10
His maxims refpecting blood-letting.

Blood-letting was another method of evacuation pretty much ufed by Hippocrates. Another aim he had in this, befides the mere evacuation, was to divert or recal the courfe of the blood when he imagined it was going where it ought not. A third end of bleeding was to procure a free motion of the blood and fpirits,

Hippocrates.

rits, as we may gather from the following paſſage: "When any one becomes ſpeechleſs of a ſudden (ſays he), it is cauſed by the ſhutting of the veins, eſpecially when it happens to perſons otherwiſe in good health, without any outward violence. In this caſe the inward vein of the right-arm muſt be opened, and more or leſs blood taken away, according to the age or conſtitution of the patient. Thoſe that loſe their ſpeech thus have great fluſhings in their face, their eyes are ſtiff, their arms are diſtended, their teeth gnaſh, they have palpitations of the arteries, cannot open their jaws, the extremities are cold, and the ſpirits are intercepted in the veins. If pain enſues, it is by the acceſſion of the black bile and ſharp humours. For the internal parts being vellicated or irritated by theſe humours, ſuffer very much; and the veins, being alſo irritated and dried, diſtend themſelves extraordinarily, and are inflamed, and draw all that can flow to them; ſo that the blood corrupting, and the ſpirits not being able to paſs through the blood by their ordinary paſſages, the parts grow cold by reaſon of this ſtagnation of the ſpirits. Hence come giddineſs, loſs of ſpeech, and convulſions, if this diſorder reaches to the heart, the liver, or to the great veins. From hence ariſe alſo epilepſies and palſies, if the defluxions fall upon the parts laſt mentioned; and that they dry up, becauſe the ſpirits are denied a paſſage through them. In this caſe, after fomentation, a vein muſt be opened, while the ſpirits and humours are yet ſuſpended and unſettled."

Hippocrates had alſo a fourth intention for bleeding, and this was refreſhment. So in the iliac paſſion, he orders bleeding in the arm and in the head; to the end, ſays he, that the ſuperior venter, or the breaſt, may ceaſe to be overheated. With regard to this evacuation, his conduct was much the ſame as to purging, in reſpect of time and perſons. We ought, ſays he, to let blood in acute diſeaſes, when they are violent, if the party be luſty and in the flower of his age. We ought alſo to have regard to the time, both in reſpect to the diſeaſe and to the ſeaſon in which we let blood. He alſo informs us, that blood ought to be let in great pains, and particularly in inflammations. Among theſe he reckons ſuch as fall upon the principal viſcera, as the liver, lungs, and ſpleen, as alſo the quinſy and pleuriſy, if the pain of the latter be above the diaphragm. In theſe caſes he would have the patients blooded till they faint, eſpecially if the pain be very acute; or rather he adviſes that the orifice ſhould not be cloſed till the colour of the blood alters, ſo that from livid it turn red, or from red livid. In a quinſey he blooded in both arms at once. Difficulty of breathing he alſo reckons among the diſtempers that require bleeding; and he mentions another ſort of inflammation of the lungs, which he calls a ſwelling or tumor of the lungs ariſing from heat; in which caſe he adviſes to bleed in all parts of the body; and directs particularly to the arms, tongue, and noſtrils. To make bleeding the more uſeful in all pains, he directed to open the vein neareſt the part affected; in a pleuriſy he directs to take blood from the arm of the ſide affected; and for the ſame reaſon, in pains of the head, he directs the veins of the noſe and forehead to be opened. When the pain was not urgent, and bleeding was adviſed by way of prevention, he directed the blood to be taken from the parts fartheſt off, with a deſign to divert the blood inſenſibly from the ſeat of pain. The higheſt burning fevers, which ſhow neither ſigns of inflammation nor pain, he does not rank among thoſe diſtempers that require bleeding. On the contrary, he maintains that a fever itſelf is in ſome caſes a reaſon againſt bleeding. If any one, ſays he, has an ulcer in the head, he muſt bleed, *unleſs he has a fever*. He ſays further, thoſe that loſe their ſpeech of a ſudden muſt be blooded, unleſs they have a fever. Perhaps he was afraid of bleeding in fevers, becauſe he ſuppoſed that they were produced by the bile and pituita, which grew hot, and afterwards heated the whole body, which is, ſays he, what we call *fever*, and which, in his opinion, cannot well be evacuated by bleeding. In other places alſo he looks upon the preſence or abundance of bile to be an objection to bleeding; and he orders to forbear veneſection even in a pleuriſy, if there be bile. To this we muſt add, that Hippocrates diſtinguiſhed very particularly between a fever which followed no other diſtemper, but was itſelf the original malady, and a fever which came upon inflammation. In the early ages of phyſic, the firſt were only properly called *fevers:* the others took their names from the parts affected; as *pleuriſy*, *peripneumony*, *hepatitis*, *nephritis*, &c. which names ſignify that the pleura, the lungs, the liver, or the kidneys, are diſeaſed, but do not intimate the fever which accompanies the diſeaſe. In this latter ſort of fever Hippocrates conſtantly ordered bleeding, but not in the former. Hence, in his books Of Epidemic Diſtempers, we find but few directions for bleeding in the acute diſtempers, and particularly in the great number of continual and burning fevers there treated of. In the firſt and third book we find but one ſingle inſtance of bleeding, and that in a pleuriſy; in which, too, he ſtaid till the eighth day of the diſtemper. Galen, however, and moſt other commentators on Hippocrates, are of opinion that he generally blooded his patients plentifully in the beginning of acute diſorders, though he takes no notice of it in his writings. But had this been the caſe, he would not perhaps have had the opportunity of ſeeing ſo many fevers terminate by criſes, or natural evacuations, which happen of themſelves on certain days. Hippocrates, in fact, laid ſo much weight upon the aſſiſtance of nature and the method of diet, which was his favourite medicine, that he thought if they took care to diet the patients before mentioned, according to rule, they might leave the reſt to nature. Theſe are his principles, from which he never deviates; ſo that his pieces Of Epidemical Diſeaſes ſeem to have been compoſed only with an intention to leave to poſterity an exact model of management in purſuance of theſe principles.

With regard to the rules laid down by Hippocrates for bleeding, we muſt further take notice, that in all diſeaſes which had their ſeat above the liver, he blooded in the arm, or in ſome of the upper parts of the body; but for thoſe that were ſituated below it he opened the veins of the foot, ankle, or ham. If the belly was too laxative, and bleeding was at the ſame time thought neceſſary, he ordered the looſeneſs to be ſtopped before bleeding.

Almoſt all theſe inſtances, however, regard ſcarce any thing but acute diſtempers; but we find ſeveral con-

Hippocrates.

concerning chronical diseases. "A young man complained of great pain in his belly, with a rumbling while he was fasting, which ceased after eating: this pain and rumbling continuing, his meat did him no good; but, on the contrary, he daily wasted and grew lean. Several medicines, as well purges as vomits, were given him in vain. At length it was resolved to bleed him by intervals, first in one arm and then in the other, till he had scarce any blood left, and by this method he was perfectly cured."

Hippocrates let blood also in a dropsy, even in a tympany; and in both cases he prescribes bleeding in the arm. In a disease occasioned by an overgrown spleen, he proposes bleeding several times repeated at a vein of the arm which he calls the *splenetic;* and in a kind of jaundice, he proposes bleeding under the tongue. On some occasions he took away great quantities of blood, as appears from what we have already observed. Sometimes he continued the blooding till the patient fainted: at other times he would blood in both arms at once; at others, he did it in several places of the body, and at several times. The veins he opened were those of the arm, the hands, the ankles on both sides, the hams, the forehead, behind the head, the tongue, the nose, behind the ears, under the breasts, and those of the arms; besides which, he burnt others, and opened several arteries. He likewise used cupping-vessels, with intent to recal or withdraw the humours which fell upon any part. Sometimes he contented himself with the bare attraction made by the cupping-vessels, but sometimes also he made scarifications.

21 His maxims respecting diuretics and sudorifics.

When bleeding and purging, which were the principal and most general means used by Hippocrates for taking off a plethora, proved insufficient for that purpose, he had recourse to diuretics and sudorifics. The former were of different sorts, according to the constitution of the persons: sometimes baths, and sometimes sweet wine, were employed to provoke urine; sometimes the nourishment which we take contributes to it: and amongst those herbs which are commonly eaten, Hippocrates recommends garlic, leeks, onions, cucumbers, melons, gourds, fennel, and all other things which have a biting taste and a strong smell. With these he numbers honey, mixed with water or vinegar, and all salt meats. But, on some occasions, he took four cantharides, and, pulling off their wings and feet, gave them in wine and honey. These remedies were given in a great number of chronical distempers after purging, when he thought the blood was overcharged with a sort of moisture which he calls *ichor;* or in suppressions of urine, and when it was made in less quantity than it ought. There were also some cases in which he would force sweat as well as urine; but he neither mentions the diseases in which sudorifics are proper, nor lets us know what medicines are to be used for this purpose, except in one single passage, where he mentions sweating, by pouring upon the head a great quantity of water till the feet sweat; that is, till the sweat diffuses itself over the whole body, running from head to foot. After this he would have them eat boiled meat, and drink pure wine, and being well covered with clothes, lay themselves down to rest. The disease for which he proposes the above mentioned remedy is a fever; which is not, according to him, produced by bile or pituita, but by mere lassitude, or some other similar cause; from whence we may conclude that he did not approve of sweating in any other kind of fever.

Other remedies which Hippocrates tells us he made use of were those that purged neither bile nor phlegm, but act by cooling, drying, heating, moistening, or by closing and thickening, resolving and dissipating. These medicines, however, he does not particularly mention; and it is probable they were only some particular kinds of food. To these he joined *hypnotics*, or such things as procure sleep; but these last were used very seldom, and, it is most probable, were only different preparations of poppies.

22 The use he made of specifics.

Lastly, besides the medicines already mentioned, which acted in a sensible manner, Hippocrates made use of others called *specifics;* whose action he did not understand, and for the use of which he could give no reason besides his own experience, or that of other physicians. These he had learned from his predecessors the descendants of Æsculapius, who, being *empirics*, did not trouble themselves about inquiring into the operation of their remedies, provided their patients were cured.

23 His external applications.

Of the external remedies prescribed by Hippocrates, fomentations were the chief. These were of two kinds. The one was a sort of bath, in which the patient sat in a vessel full of a decoction of simples appropriated to his malady; so that the part affected was soaked in the decoction. This was chiefly used in distempers of the womb, of the arms, the bladder, the reins, and generally all the parts below the diaphragm. The second way of fomenting was, to take warm water and put it into a skin or bladder, or even into a copper or earthen vessel, and to apply it to the part affected; as, for example, in a pleurisy. They used likewise a large sponge, which they dipped in the water, or other hot liquor, and squeezed out part of the liquor before they applied it. The same use they made of barley, vetches, or bran, which were boiled in some proper liquor, and applied in a linen bag. These are called *moist* fomentations. The dry ones were made of salt or millet, heated considerably, and applied to the part. Another kind of fomentation was the vapour of some hot liquor; an instance of which we find in his first book of Womens Distempers. He cast, at several times, bits of red-hot iron into urine, and, covering up the patient close, caused her to receive the steam below. His design in these kinds of fomentations was to warm the part, to resolve or dissipate, and draw out the peccant matter, to mollify and assuage pain, to open the passages, or even to shut them, according as the fomentations were emollient or astringent.

24 Fomentations.

25 Fumigations.

Fumigations were likewise very often used by Hippocrates. In the quinsey, he burned hyssop with sulphur and pitch, and caused the smoke to be drawn into the throat by a funnel; and by this means he brought away abundance of phlegm through the mouth and through the nose. For this purpose he took nitre, marjoram, and cress-seeds, which he boiled in water, vinegar, and oil, and, while it was on the fire, caused the patient to draw in the steam by a pipe. In his works we find a great number of fumigants for the distempers of women, to promote the menstrual flux, Hippocrates

flux, to check it, to help conception, and to eafe pains in the matrix, or the fuffocation of it. On thefe occafions he ufed fuch aromatics as were then known, viz. cinnamon, caffia, myrrh, and feveral odoriferous plants; likewife fome minerals, fuch as nitre, fulphur, and pitch, and caufed them to receive the vapours through a funnel into the uterus.

26 Gargles.

Gargles, a kind of fomentations for the mouth, were alfo known to Hippocrates. In the quinfey he ufed a gargle made of marjoram, favory, celery, mint, and nitre, boiled with water and a little vinegar. When this was ftrained, they added honey to it, and wafhed their mouths frequently with it.

27 Oils and ointments.

Oils and ointments were likewife much ufed by Hippocrates, with a view to mollify and abate pain, to ripen boils, refolve tumors, refresh after wearinefs, make the body fupple, &c. For this purpofe, fometimes pure oil of olives was ufed; fometimes certain fimples were infufed in it, as the leaves of myrtle and rofes; and the latter kind of oil was in much requeft among the ancients. There were other forts of oils fometimes in ufe, however, which were much more compounded. Hippocrates fpeaks of one called *fufinum*, which was made of the flowers of the iris, of fome aromatics, and of an ointment of narciffus made with the flowers of narciffus and aromatics infufed in oil. But the moft compounded of all his ointments was that called *netopum*, which he made particularly for women; and confifted, according to Hefychius, of a great number of ingredients. Another ointment, to which he gave the name of *ceratum*, was compofed of oil and wax. An ointment which he recommends for the foftening of a tumor, and the cleanfing of a wound, was made by the following receipt: "Take the quantity of a nut of the marrow or fat of a fheep, of maftic or turpentine the quantity of a bean, and as much wax; melt thefe over a fire, with oil of rofes, for a ceratum." Sometimes he added pitch and wax, and, with a fufficient quantity of oil, made a compofition fomewhat more confiftent than the former, which he called *cerapiffus*.

28 Cataplafms.

Cataplafms were a fort of remedies lefs confiftent than the two former. They were made of powders or herbs fteeped or boiled in water or fome other liquor, to which fometimes they added oil. They were ufed with a view to foften or refolve tumors, ripen abfceffes, &c. though they had alfo cooling cataplafms made of the leaves of beets or oak, fig or olive-trees, boiled in water.

29 Collyria.

Laftly, to complete the catalogue of the external remedies ufed by Hippocrates, we fhall mention a fort of medicine called *collyrium*. It was compounded of powders, to which was added a fmall quantity of fome ointment, or juice of a plant, to make a folid or dry mafs; the form of which was long and round, which was kept for ufe. Another compofition of much the fame nature was a fort of lozenge of the bignefs of a fmall piece of money, which was burnt upon coals for a perfume, and powdered for particular ufes. In his works we find likewife defcriptions of powders for feveral ufes, to take off fungous flefh, and to blow into the eyes in opthalmies, &c.

Thefe were almoft all the medicines ufed by Hippocrates for external purpofes. The compound medicines given inwardly were either liquid, folid, or lambative. The liquid ones were prepared either by decoction or infufion in a proper liquor, which, when ftrained, was kept for ufe; or by macerating certain powders in fuch liquors, and fo taking them together, or by mixing different kinds of liquors together. The folid medicines confifted of juices infpiffated; of gums, refins, or powders, made up with them or with honey, or fomething proper to give the neceffary confiftence to the medicine. Thefe were made up in a form and quantity fit to be fwallowed with eafe. The lambative was of a confiftence between folid and fluid; and the patients were obliged to keep it for fome time to diffolve in the mouth, that they might fwallow it leifurely. This remedy was ufed to take off the acrimony of thofe humours which fometimes fall upon this part, and provoke coughing and other inconveniences. The bafis of this laft compofition was honey. It is worth our obfervation, that the compound medicines of Hippocrates were but very few, and compofed only of four or five ingredients at moft; and that he not only underftood pharmacy, or the art of compounding medicines, but prepared fuch as he ufed himfelf, or caufed his fervants prepare them in his houfe by his directions.

We have thus given fome account of the ftate of medicine as practifed and taught by Hippocrates, who, as we have already obferved, has for many ages been juftly confidered as the father of phyfic. For when we attend to the ftate in which he found medicine, and the condition in which he left it, we can hardly beftow fufficient admiration on the judgment and accuracy of his obfervations. After a life fpent in unwearied induftry, he is faid to have died at Lariffa, a city in Theffaly, in the 101ft year of his age, 361 years before the birth of Chrift.

After the days of Hippocrates, medicine in ancient Greece gradually derived improvement from the labour of other phyficians of eminence. And we may particularly mention three to whom its future progrefs feems to have been not a little indebted, viz. Praxagoras, Erafiftratus, and Herophilus.

The firft phyfician of eminence who differed confiderably in his practice from Hippocrates was Praxagoras. Cœlius Aurelianus acquaints us, that he made great ufe of vomits in his practice, infomuch as to exhibit them in the iliac paffion till the excrements were difcharged by the mouth. In this diftemper he alfo advifed, when all other means failed, to open the belly, cut the inteftine, take out the indurated fæces, and then to few up all again; but this practice has not probably been followed by any fubfequent phyfician. 30 Praxagoras.

Erafiftratus was a phyfician of great eminence, and flourifhed in the time of Seleucus, one of the fucceffors of Alexander the Great. According to Galen, he entirely banifhed venefection from medicine; though fome affirm that he did not totally difcard it, but only ufed it lefs frequently than other phyficians. His reafons for difapproving of venefection are as follow: It is difficult to fucceed in venefection, becaufe we cannot always fee the vein we intend to open, and becaufe we are not fure but we may open an artery inftead of a vein. We cannot afcertain the true quantity to be taken. If we take too little, the intention is by no means anfwered: if we take too much, we run a rifk of deftroying the patient. The evacuation of the venous blood alfo is 31 Erafiftratus.

Erasistratus. succeeded by that of the spirits, which on that occasion pass from the arteries into the veins. It must likewise be observed, that as the inflammation is formed in the arteries by the blood coagulated in their orifices, venesection must of course be useless and of no effect.

As Erasistratus did not approve of venesection, so neither did he of purgatives, excepting very rarely, but exhibited clysters and vomits; as did also his master Chrysippus. He was of opinion, however, that the clysters should be mild; and condemned the large quantity and acrid quality of those used by the ancients. The reason why purgatives were not much used by him was, that he imagined purging and venesection could answer no other purpose than diminishing the fulness of the vessels; and for this purpose he asserted that there were more effectual means than either phlebotomy or purging. He asserted that the humours discharged by cathartics were not the same in the body that they appeared after the discharge; but that the medicines changed their nature, and produced a kind of corruption in them. This opinion has since been embraced by a great number of physicians. He did not believe that purgatives acted by attraction; but substituted in the place of this principle what Mr Le Clerc imagines to be the same with Aristotle's *fuga vacui*. The principal remedy substituted by him in place of purging and venesection was abstinence. When this, in conjunction with clysters and vomits, was not sufficient to eradicate the disease, he then had recourse to exercise. All this was done with a view to diminish the plenitude, which, according to him, was the most frequent cause of all diseases. Galen also informs us, that Erasistratus had so great an opinion of the virtues of succory in diseases of the viscera and lower belly, and especially in those of the liver, that he took particular pains to describe the method of boiling it, which was, to boil it in water till it was tender; then to put it into boiling water a second time, in order to destroy its bitterness; afterwards to take it out of the water, and preserve it in a vessel with oil; and lastly, when it is to be used, add a little weak vinegar to it. Nay, so minute and circumstantial was Erasistratus with regard to the preparation of his favourite succory, that he gave orders to tie several of the plants together, because that was the more commodious method of boiling them. The rest of Erasistratus's medicines consisted almost entirely of regimen; to which he added some topical remedies, such as cataplasms, fomentations, and unctions. In short, as he could neither endure compounded medicines, nor superstitious and fine-spun reasonings, he reduced medicine to a very simple and compendious art.

With regard to surgery, Erasistratus appears to have been very bold; and as an anatomist he is said to have been exceedingly cruel, insomuch that he is represented by some as having dissected criminals while yet alive*. In a scirrhous liver, or in tumors of that organ, Cœlius Aurelianus observes, that Erasistratus made an incision through the skin and integuments, and having opened the abdomen he applied medicines immediately to the part affected. But tho' he was thus bold in performing operations on the liver, yet he did not approve of the paracentesis or tapping in the dropsy; because (said he) the waters being evacuated, the liver, which is inflamed and become hard like a stone, is more pressed by the adjacent parts which the waters kept at a distance from it, so that by this means the patient dies. He declared also against drawing teeth which were not loose; and used to tell those who talked with him on this operation, That in the temple of Apollo there was to be seen an instrument of lead for drawing teeth; in order to insinuate that we must not attempt the extirpation of any but such as are loose, and call for no greater force for their extirpation than what may be supposed in an instrument of lead.

* See Anatomy, *Hist.*

Herophilus, the disciple of Praxagoras, and cotemporary of Erasistratus, followed a less simple practice: 32 Herophilus.
he made so great use of medicines both simple and compound, that neither he nor his disciples would undertake the cure of any disorder without them. He seems also to have been the first who treated accurately of the doctrine of pulses, of which Hippocrates had but a superficial knowledge. Galen, however, affirms, that on this subject he involved himself in difficulties and advanced absurdities; which indeed we are not greatly to wonder at, considering the time in which he lived. He took notice of a disease at that time pretty rare, and to which he ascribes certain sudden deaths. He calls it a *palsy of the heart*; and perhaps it may be the same disease with what is now termed the *angina pectoris*.

According to Celsus, it was about this time that medicine was first divided into three branches, viz. the dietetic, the pharmaceutical, and the chirurgical medicine. The first of these employed a proper regimen in the cure of diseases; the second, medicines; and the third, the operation of the hands: and the same author informs us, that these three branches became now the business of as many distinct classes of men; so that from this time we may date the origin of the three professions of physicians, apothecaries, and surgeons.—Before this division, those called *physicians* discharged all the several offices belonging to the three professions; and there were only two kinds of them, viz. one called ἀρχιτεκτονικοι, who only gave their advice to the patients, and directions to those of an inferior class, who were called δημιουργοι, and worked with their hands either in the performing operations, or in the composition and application of remedies.

The first grand revolution which happened in the 33 The Empirics.
medicinal art after the days of Herophilus and Erasistratus was occasioned by the founding of the empiric sect by Serapion of Alexandria about 287 years before Christ. The division into dogmatists and empirics had indeed subsisted before; but about this time the 34 Serapion.
latter party began to grow strong, and to have champions publicly asserting its cause. Galen informs us, that Serapion used Hippocrates very ill in his writings, in which he discovered an excess of pride, self-sufficiency, and contempt for all the physicians that went before him. We have some sketches of his practice in Cœlius Aurelianus, from which we may infer that he retained the medicines of Hippocrates and the other physicians who went before him, tho' he rejected their reasoning. We know not what arguments he advanced for the support of his sentiments, since his works are lost, as well as those of the other empirics; and we should know nothing at all of any

Serapion. of them, if their adverſaries had not quoted them in order to confute them.

The empirics admitted only one general method of obtaining ſkill in the medical art, which was by experience, called by the Greeks ἐμπειρία. From this word they took their name, and refuſed to be called after the founder or any champion of their ſect. They defined experience a knowledge derived from the evidence of ſenſe. It was either fortuitous, or acquired by deſign. For acquiring practical ſkill they recommended what they called τήρησις, or one's own obſervation, and the reading of hiſtories or caſes faithfully related by others. Hence they thought that we are enabled to know a diſeaſe by its reſemblance to others; and, when new diſeaſes occurred, to conclude what was proper to be done from the ſymptoms they had in common with others that were before known. They aſſerted, that obſervation ought principally to be employed in two different ways; firſt in diſcovering what things are ſalutary, and what are of an indifferent nature; and, ſecondly, what particular diſeaſe is produced by a certain concurrence of ſymptoms; for they did not call every ſymptom a diſeaſe, but only ſuch a combination of them as from long experience they found to accompany each other, and produced ſuch diſorders as began and terminated in the ſame manner.

On the other hand, the dogmatiſt affirmed, that there was a neceſſity for knowing the latent as well as the evident cauſes of diſeaſes, and that the phyſician ought to underſtand the natural actions and functions of the human body, which neceſſarily preſuppoſes a knowledge of the internal parts. By ſecret or latent cauſes they meant ſuch as related to the elements or principles of which our bodies are compoſed, and which are the origin of a good or bad ſtate of health. They aſſerted that it was impoſſible to know how to cure a diſeaſe without knowing the cauſe whence it proceeded; becauſe undoubtedly it behoved them to vary prodigiouſly in themſelves according to the different cauſes by which they were produced.

35. Aſclepiades. The next remarkable perſon in the hiſtory of phyſic is Aſclepiades, who flouriſhed in the century immediately preceding the birth of Chriſt. He introduced the philoſophy of Democritus and Epicurus into medicine, and ridiculed the doctrines of Hippocrates. He aſſerted, that matter conſidered in itſelf was of an unchangeable nature; and that all perceptible bodies were compoſed of a number of ſmaller ones, between which there were interſperſed an infinity of ſmall ſpaces totally void of all matter. He thought that the ſoul itſelf was compoſed of theſe ſmall bodies. He laughed at the principle called *Nature* by Hippocrates, and alſo at the imaginary faculties ſaid by him to be ſubſervient to her; and ſtill more at what he called *Attraction*. This laſt principle Aſclepiades denied in every inſtance, even in that of the loadſtone and ſteel, imagining that this phenomenon proceeded from a concourſe of corpuſcles, and a particular diſpoſition or modification of their pores. He alſo maintained, that nothing happened or was produced without ſome cauſe; and that what was called *nature* was in reality no more than *matter* and *motion*. From this laſt principle he inferred that Hippocrates knew not what he ſaid when he ſpoke of Nature as an intelligent being, and aſcribed qualities of different kinds to her. For the ſame reaſon he ridiculed the doctrine of Hippocrates with regard to criſes; and aſſerted that the termination of diſeaſes might be as well accounted for from mere matter and motion. He maintained, that we were deceived if we imagined that nature always did good; ſince it was evident that ſhe often did a great deal of harm. As for the days particularly fixed upon by Hippocrates for criſes, or thoſe on which we uſually obſerve a change either for the better or the worſe, Aſclepiades denied that ſuch alterations happened on thoſe days rather than on others. Nay, he aſſerted that the criſis did not happen at any time of its own accord, or by the particular determination of nature for the cure of the diſorder, but that it depended rather on the addreſs and dexterity of the phyſician; that we ought never to wait till a diſtemper terminates of its own accord, but that the phyſician by his care and medicines muſt haſten on and advance the cure.—According to him, Hippocrates and other ancient phyſicians attended their patients rather with a view to obſerve in what manner they died than in order to cure them; and this under pretence that Nature ought to do all herſelf, without any aſſiſtance. Aſclepiades.

According to Aſclepiades, the particular aſſemblage of the various corpuſcles abovementioned, and repreſented as of different figures, is the reaſon why there are ſeveral pores or interſtices within the common maſs, formed by theſe corpuſcles; and why theſe pores are of a different ſize. This being taken for granted, as theſe pores are in all the bodies we obſerve, it muſt of courſe follow that the human body has ſome peculiar to itſelf, which, as well as thoſe of all other bodies, contain other minute bodies, which paſs and repaſs by thoſe pores that communicate with each other; and as theſe pores or interſtices are larger or ſmaller, ſo the corpuſcles which paſs through them differ proportionably as to largeneſs and minuteneſs. The blood conſiſts of the largeſt of theſe corpuſcles, and the ſpirits, or the heat, of the ſmalleſt.

From theſe principles he infers, that as long as the corpuſcles are freely received by the pores, the body remains in its natural ſtate; and on the contrary, it begins to recede from that ſtate, when the corpuſcles find any obſtacle to their paſſage. Health therefore depends on the juſt proportion between the pores and the corpuſcles they are deſtined to receive and tranſmit; as diſeaſes, on the contrary, proceed from a diſproportion between theſe pores and the corpuſcles. The moſt uſual obſtacle on this occaſion proceeds from the corpuſcles embracing each other, and being retained in ſome of their ordinary paſſages, whether theſe corpuſcles arrive in too large a number, are of irregular figures, move too faſt or too ſlow, &c.

Among the diſorders produced by the corpuſcles ſtopping of their own accord, Aſclepiades reckoned phrenſies, lethargies, pleuriſies and burning fevers. Pains, in particular, are claſſed among the accidents which derive their origin from a ſtagnation of the largeſt of all the corpuſcles of which the blood conſiſts. Among the diſorders produced by the bad ſtate and diſpoſition of the pores, he placed deliquiums, languors, extenuations, leanneſs, and dropſies. Theſe laſt diſorders he thought proceeded from the pores being too much relaxed and opened: the dropſy in par-

Asclepiades particular, he thinks, proceeds from the flesh being perforated with various small holes, which convert the nourishment received into them into water. Hunger, and especially that species of it called *fames canina*, proceeds from an opening the of large pores of the stomach and belly; and thirst from an opening of their small ones. Upon the same principles he accounted for intermittent fevers. Quotidian fevers are caused by a retention of the largest corpuscles, those of the tertian kind by a retention of corpuscules somewhat smaller, and quartan fevers are produced by a retention of the smallest corpuscles of all.

The practice of Asclepiades was suited to remove these imaginary causes of disorders. He composed a book concerning common remedies, which he principally reduced to three, *viz.* gestation, friction, and the use of wine. By various exercises he proposed to render the pores more open, and to make the juices and small bodies, which cause diseases by their retention, pass more freely; and while the former physicians had not recourse to gestation till towards the end of long continued disorders, and when the patients, tho' entirely free from fever, were yet too weak to take sufficient exercise by walking, Asclepiades used gestation from the very beginning of the most burning fevers. He laid it down as a maxim, that one fever was to be cured by another; that the strength of the patient was to be exhausted by making him watch and endure thirst to such a degree, that, for the two first days of the disorder, he would not allow them to cool their mouths with a drop of water. Celsus also observes, that though Asclepiades treated his patients like a butcher during the first days of the disorder, he indulged them so far afterwards as even to give directions for making their beds in the softest manner. On several occasions Asclepiades used frictions to open the pores. The dropsy was one of the distempers in which this remedy was used; but the most singular attempt was, by this means, to lull phrenetic patients asleep. But though he enjoined exercise so much to the sick, he denied it to those in health; a piece of conduct not a little surprising and extraordinary. He allowed wine freely to patients in fevers, provided the violence of the distemper was somewhat abated. Nor did he forbid it to those who were afflicted with a phrenzy: nay, he ordered them to drink it till they were intoxicated, pretending by that means to make them sleep; because, he said, wine had a narcotic quality and procured sleep, which he thought absolutely necessary for those who laboured under that disorder. To lethargic patients he used it on purpose to excite them, and rouse their senses: he also made them smell strong-scented substances, such as vinegar, castor, and rue, in order to make them sneeze; and applied to their heads cataplasms of mustard made up with vinegar.

Besides these remedies, Asclepiades enjoined his patients abstinence to an extreme degree. For the first three days, according to Celsus, he allowed them no aliment whatever; but on the fourth began to give them victuals. According to Cælius Aurelianus, however, he began to nourish his patients as soon as the accession of the disease was diminished, not waiting till an entire remission; giving to some aliments on the first, to others on the second, to others on the third, and so on to the seventh day. It seems almost incredible to us, that people should be able to fast till this last mentioned term; but Celsus assures us, that abstinence till the seventh day was enjoined by the predecessors of Asclepiades, and by Heraclides Tarentinus. Asclepiades

The next great revolution which happened in the medicinal art, was brought about by Themison, the disciple of Asclepiades, who lived not long before the time of Celsus, during the end of the reign of Augustus, or beginning of that of Tiberius. The sect founded by him was called *methodic*, because he endeavoured to find a method of rendering medicine more easy than formerly. 36 Methodic sect.

He maintained, that a knowledge of the causes of diseases was not necessary, provided we have a due regard to what diseases have in common and analogous to one another. In consequence of this principle, he divided all diseases into two, or at most three, kinds. The first included diseases arising from stricture; the second, those arising from relaxation; and the third, those of a mixed nature, or such as partook both of stricture and relaxation. 37 Themison.

Themison also asserted, that diseases are sometimes acute, and sometimes chronical; that for a certain time they increase; that at a certain time they are at their height; and that at last they were observed to diminish. Acute diseases, therefore, according to him, must be treated in one way, and chronical ones in another; one method must be followed with such as are in their augmentation, another with such as are at their height, and a third with such as are in their declension. He asserted, that the whole of medicine consisted in the observation of that small number of rules which are founded upon things altogether evident. He said, that all disorders, whatever their nature was, if included under any of the kinds above mentioned, ought to be treated precisely in the same way, in whatever country and with whatever symptoms they happen to arise. Upon these principles, he defined medicine to be a method of conducting to the knowledge of what diseases have in common with each other, and which at the same time is evident.

Themison was old when he laid the foundation of the Methodic sect; and it was only brought to perfection by Thessalus, who lived under the emperor Nero. 38 Thessalus. Galen and Pliny accuse this physician of intolerable insolence and vanity, and report that he gave himself the air of despising all other physicians; and so intolerable was his vanity, that he assumed the title of *the conqueror of physicians*, which he caused to be put upon his tomb in the Appian way. Never was mountebank (says Pliny) attended by a greater number of spectators than Thessalus had generally about him; and this circumstance is the less to be wondered at, if we consider that he promised to teach the whole art of medicine in less than six months. In reality, the art might be learned much sooner if it comprehended no more than what the methodists thought necessary: for they cut off the examination of the causes of diseases followed by the dogmatics; and substituted in the room of the laborious observations of the empirics, indications drawn from the analogy of diseases, and the mutual resemblance they bear to each other. The most skilful of all the methodic sect, and he who put the last hand to it, was Soranus. He lived under the emperors Trajan and Adrian, and was a native of Ephesus. 39 Soranus.

40 Celsus. One of the most celebrated medical writers of antiquity

Celsus. tiquity was Celsus, whom we have already had occasion to mention. Most writers agree that he lived in the time of Tiberius, but his country is uncertain. It is even disputed whether or not he was a professed physician. Certain it is, however, that his books on medicine are the most valuable of all the ancients next to those of Hippocrates. From the latter, indeed, he has taken so much, as to acquire the name of the *Latin Hippocrates;* but he has not attached himself to him so closely as to reject the assistance of other authors. In many particulars he has preferred Asclepiades. With him he laughs at the critical days of Hippocrates, and ascribes the invention of them to a foolish and superstitious attachment to the Pythagorean doctrine of numbers. He also rejected the doctrine of Hippocrates with regard to venesection, of which he made a much more general use; but did not take away so much at a time, thinking it much better to repeat the operation than weaken the patient by too great an evacuation at one time. He used cupping also much more frequently, and differed from him with regard to purgatives. In the beginning of disorders, he said, the patients ought to endure hunger and thirst: but afterwards they were to be nourished with good aliments; of which, however, they were not to take too much, nor fill themselves all of a sudden, after having fasted. He does not specify how long the patient ought to practise abstinence; but affirms, that in this particular it is necessary to have a regard to the disease, the patient, the season, the climate, and other circumstances of a like nature. The signs drawn from the pulse he looked upon to be very precarious and uncertain. "Some (says he) lay great stress upon the beating of the veins or the arteries; which is a deceitful circumstance, since that beating is slow or quick, and varies very much, according to the age, sex, and constitution of the patient. It even sometimes happens that the pulse is weak and languid when the stomach is disordered, or in the beginning of a fever, though in other respects the body be in a good state; so that we might, in this latter case, be induced to believe, that a man is very weak, when he is just entering into a violent paroxysm, has strength enough left, and may be easily recovered from it. On the contrary, the pulse is often high, and in a violent commotion, when one has been exposed to the sun, or comes out of a bath, or from using exercise; or when one is under the influence of anger, fear, or any other passion. Besides, the pulse is easily changed by the arrival of the physician, in consequence of the patient's anxiety to know what judgement he will pass upon his case. To prevent this, the physician must not feel the patient's pulse on his first arrival: he must first sit down by him, assume a chearful air, inform himself of his condition; and if he is under any dread, endeavour to remove it by encouraging discourse; after which he may examine the beating of the artery. This nevertheless does not hinder us from concluding, that if the sight of the physician alone can produce so remarkable a change in the pulse, a thousand other causes may produce the same effect." But although Celsus thought for himself, and in not a few particulars differed from his predecessors, yet in his writings, which are not only still preserved, but have gone through almost innumerable editions, we have a compendious view of the practice of almost all his predecessors: and he treats of the healing art in all its branches, whether performed *manu, victu, vel medicamentis.* His writings, therefore, will naturally be had recourse to by every one who wishes either to become acquainted with the practice of the ancients prior to the fall of the Roman empire, or to read medical Latin in its greatest purity.

41 Galen.

About the 131st year after Christ, in the reign of the emperor Adrian, lived the celebrated Galen, a native of Pergamus, whose name makes such a conspicuous figure in the history of physic. At this time the dogmatic, empiric, methodic, and other sects, had each their abettors. The methodics were held in great esteem, and looked upon to be superior to the dogmatics, who were strangely divided among themselves, some of them following Hippocrates, others Erasistratus, and others Asclepiades. The empirics made the least considerable figure of any. Galen undertook the reformation of medicine, and restored dogmatism. He seems to have been of that sect which was called *eclectic,* from their choosing out of different authors what they esteemed good in them, without being particularly attached to any one more than the rest. This declaration he indeed sets out with; but, notwithstanding this, he follows Hippocrates much more than any of the rest, or rather follows nobody else but him. Though before his time several physicians had commented on the works of Hippocrates, yet Galen pretends that none of them had understood his meaning. His first attempt therefore was to explain the works of Hippocrates; with which view he wrote a great deal, and after this set about composing a system of his own. In one of his books entitled, "Of the establishment of medicine," he defines the art to be one which teaches to preserve health and cure diseases. In another book, however, he proposes the following definition: "Medicine (says he) is a science which teaches what is sound, and what is not so; and what is of an indifferent nature, or holds a medium between what is sound and what is the reverse." He affirmed, that there are three things which constitute the object of medicine, and which the physician ought to consider as sound, as not sound, or of a neutral and indifferent nature. These are the body itself, the signs, and the causes. He esteems the human body sound, when it is in a good state or habit with regard to the simple parts of which it is composed, and when besides there is a just proportion between the organs formed of these simple parts. On the contrary, the body is reckoned to be unsound, when it recedes from this state, and the just proportion above mentioned. It is in a state of neutrality or indifference, when it is in a medium between soundness and its opposite state. The salutary signs are such as indicate present health, and prognosticate that the man may remain in that state for some time to come. The insalubrious signs, on the contrary, indicate a present disorder, or lay a foundation for suspecting the approach of one. The neutral signs, or such as are of an indifferent nature, denote neither health nor indisposition, either for the present, or for the time to come. In like manner he speaks of causes salutary, unsalutary, and indifferent.

These three dispositions of the human body, that is, soundness, its reverse, and a neutral state, comprehend all the differences between health and disorder or indispo-

Galen. diſpoſition: and each of theſe three ſtates or diſpoſitions has a certain extent peculiar to itſelf. A ſound habit of body, according to the definition of it already given, is very rare, and perhaps never to be met with; but this does not hinder us to ſuppoſe ſuch a model for regulating our judgment with reſpect to different conſtitutions. On this principle Galen eſtabliſhes eight other principal conſtitutions, all of which differ more or leſs from the perfect model abovementioned. The four firſt are ſuch as have one of the four qualities of hot, cold, moiſt, or dry, prevailing in too great a degree; and accordingly receive their denomination from that quality which prevails over the reſt. The four other ſpecies of conſtitutions receive their denominations from a combination of the abovementioned; ſo that, according to his definition, there may be a hot and dry, a hot and moiſt, a cold and moiſt, and a cold and dry, conſtitution. Beſides theſe differences, there are certain others which reſult from ocult and latent cauſes, and which, by Galen, are ſaid to ariſe from an *idioſyncraſy* of conſtitution. It is owing to this idioſyncraſy that ſome have an averſion to one kind of aliment and ſome to another; that ſome cannot endure particular ſmells, &c. But though theſe eight laſt-mentioned conſtitutions fall ſhort of the perfection of the firſt, it does not thence follow, that thoſe to whom they belong are to be claſſed among the valetudinary and diſeaſed. A diſeaſe only begins when the deviation becomes ſo great as to hinder the action of the parts.

Galen deſcribes at great length the ſigns of a good or bad conſtitution, as well as thoſe of what he calls a *neutral habit*. Theſe ſigns are drawn from the original qualities of cold, hot, moiſt, and dry, and from their juſt proportion or diſproportion with reſpect to the bulk, figure, and ſituation, of the organical parts. With Hippocrates he eſtabliſhes three principles of an animal body; the parts, the humours, and the ſpirits. By the parts he properly meant no more than the ſolid parts; and theſe he divided into ſimilar and organical. Like Hippocrates, he alſo acknowledged four humours; the blood, the phlegm, the yellow bile and black bile. He eſtabliſhed three different kinds of ſpirits; the vital, the animal, and the natural. The firſt of theſe are, according to him, nothing elſe but a ſubtle vapour ariſing from the blood, which draws its origin from the liver, the organ or inſtrument of ſanguification. After theſe ſpirits are conveyed to the heart, they, in conjunction with the air we draw into the lungs, become the matter of the ſecond ſpecies, that is, of the vital ſpirits, which are again changed into thoſe of the animal kind in the brain. He ſuppoſed that theſe three ſpecies of ſpirits ſerved as inſtruments to three kinds of faculties, which reſide in the reſpective parts where theſe faculties are formed. The natural faculty is the firſt of theſe, which he placed in the liver, and imagined to preſide over the nutrition, growth, and generation, of the animal. The vital faculty he lodged in the heart, and ſuppoſed that by means of the arteries it communicated warmth and life to all the body. The animal faculty, the nobleſt of all the three, and with which the reaſoning or governing faculty was joined, according to him, has its ſeat in the brain; and, by means of the nerves, diſtributes a power of motion and ſenſation to all the parts, and preſides over all the other faculties. The original ſource or principle of motion in all theſe faculties, Galen, as well as Hippocrates, defines to be *Nature*. Galen.

Upon theſe principles Galen defined a diſeaſe to be "ſuch a preternatural diſpoſition or affection of the parts of the body, as primarily, and of itſelf, hinders their natural and proper action." He eſtabliſhed three principal kinds of diſeaſes: the firſt relates to the ſimilar parts; the ſecond, to the organical; and the third is common to both theſe parts. The firſt kind of diſeaſes conſiſts in the intemperature of the ſimilar parts; and this is divided into an intemperature *without matter*, and an intemperature *with matter*. The firſt diſcovers itſelf when a part has more or leſs heat or cold than it ought to have without that change of quality in the part being ſupported and maintained by any matter. Thus, for inſtance, a perſon's head may be overheated and indiſpoſed by being expoſed to the heat of the ſun, without that heat being maintained by the continuance or congeſtion of any hot humour in the part. The ſecond ſort of intemperature is when any part is not only rendered hot or cold, but alſo filled with a hot or cold humour, which are the cauſes of the heat or cold felt in the part. Galen alſo acknowledged a ſimple intemperature: that is, when one of the original qualities, ſuch as heat or cold, exceeds alone and ſeparately; and a compound intemperature, when two qualities are joined together, ſuch as heat and dryneſs, or coldneſs and humidity. He alſo eſtabliſhed an equal and unequal temperature. The former is that which is equally in all the body, or in any particular part of it, and which creates no pain, becauſe it is become habitual, ſuch as dryneſs in the hectic conſtitution. The latter is diſtinguiſhed from the former, in that it does not equally ſubſiſt in the whole of the body, or in the whole of a part. Of this kind of intemperature we have examples in certain fevers, where heat and cold, equally, and almoſt at the ſame time, attack the ſame part; or in other fevers, which render the ſurface of the body cold as ice, while the internal parts burn with heat; or laſtly, in caſes where the ſtomach is cold and the liver hot.

The ſecond kind of diſorders, relating to the organical parts, reſults from irregularities of theſe parts, with reſpect to the number, bulk, figure, ſituation, &c.; as when one has ſix fingers, or only four; when one has any part larger or ſmaller than it ought to be, &c. The third kind, which is common both to the ſimilar and the organical parts, is a ſolution of continuity, which happens when any ſimilar or compound part is cut, bruiſed, or corroded.

Like Hippocrates, Galen diſtinguiſhed diſeaſes into acute and chronical; and, with reſpect to their nature and genius, into benign and malignant; alſo into epidemic, endemic, and ſporadic.

After having diſtinguiſhed the kinds of diſeaſes, Galen comes to explain the cauſes; which he divides into external and internal. The external cauſes of diſeaſes, according to him, are ſix things, which contribute to the preſervation of health when they are well diſpoſed and properly uſed, but produce a contrary effect when they are imprudently uſed or ill diſpoſed. Theſe ſix things are, the air, aliments and drink, motion and reſt, ſleeping and watching, retention and excretion, and laſtly the paſſions. All theſe are called the *procatarctic* or *beginning* cauſes, becauſe they put in

Galen.

in motion the internal cauſes; which are of two kinds, the *antecedent* and the *conjunct*. The former is diſcovered only by reaſoning; and conſiſts for the moſt part in a peccancy of the humours, either by plenitude or cacochymy, *i. e.* a bad ſtate of them. When the humours are in too large a quantity, the caſe is called a *plethora;* but we muſt obſerve, that this word equally denotes too large a quantity of all the humours together, or a redundance of one particular humour which prevails over the reſt. According to theſe principles, there may be a ſanguine, a bilious, a pituitous, or a melancholy plenitude: but there is this difference between the ſanguine and the three other plenitudes, that the blood, which is the matter of the former, may far ſurpaſs the reſt: whereas, if any of the three laſt mentioned ones do ſo, the caſe is no longer called *plenitude*, but *cacockymy;* becauſe theſe humours, abounding more than they ought, corrupt the blood. The cauſes he alſo divides into ſuch as are manifeſt and evident, and ſuch as are latent and obſcure. The firſt are ſuch as ſpontaneouſly come under the cognizance of our ſenſes when they act or produce their effects: the ſecond are not of themſelves perceptible, but may be diſcovered by reaſoning: the third ſort, *i. e.* ſuch as he calls *occult* or *concealed*, cannot be diſcovered at all. Among this laſt he places the cauſe of the hydrophobia.

He next proceeds to conſider the ſymptoms of diſeaſes. A ſymptom he defines to be "a preternatural affection depending upon a diſeaſe, or which follows it as a ſhadow does a body." He acknowledged three kinds of ſymptoms: the firſt and moſt conſiderable of theſe conſiſted in the action of the parts being injured or hindered; the ſecond in a change of the quality of the parts, their actions in the mean time remaining entire; the third related to defects in point of excretion and retention.

After having treated of ſymptoms, Galen treats of the *ſigns* of diſeaſes. Theſe are divided into *diagnoſtic* and *prognoſtic*. The firſt are ſo called becauſe they enable us to know diſeaſes, and diſtinguiſh them from each other. They are of two ſorts, *pathognomonic* and *adjunct*. The firſt are peculiar to every diſeaſe, make known its preciſe ſpecies, and always accompany it, ſo that they begin and end with it. The ſecond are common to ſeveral diſeaſes, and only ſerve to point out the difference between diſeaſes of the ſame ſpecies. In a pleuriſy, for inſtance, the pathognomonic ſigns are a cough, a difficulty of breathing, a pain of the ſide, and a continued fever; the adjunct ſigns are the various ſorts of matter expectorated, which are ſometimes bloody, ſometimes bilious, &c. —The diagnoſtic ſigns were drawn from the defective or diſordered diſpoſition of the parts, or from the diſeaſes themſelves; ſecondly, from the cauſes of diſeaſes; thirdly, from their ſymptoms; and laſtly, from the particular diſpoſitions of each body, from things which prove prejudicial and thoſe that do ſervice, and from epidemical diſeaſes.—The prognoſtic ſigns he gathered from the ſpecies, virulence, and peculiar genius of the diſeaſe: but as we have already ſoken ſo largely concerning the prognoſtics of Hippocrates, it is ſuperfluous to be particular on thoſe of Galen.—His method of cure differed little from that of Hippocrates: but from the ſpecimen already given of Galen's method of teaching the medical art, it is evident that his ſyſtem was little elſe than a collection of ſpeculations, diſtinctions, and reaſonings; whereas that of Hippocrates was founded immediately upon facts, which he had either obſerved himſelf, or had learned from the obſervation of others.

The ſyſtem of Galen, however, notwithſtanding its defects and abſurdities, remained almoſt uncontradicted for a very long period. Indeed it may be conſidered as having been the prevailing ſyſtem till the inundation of the Goths aud Vandals put an almoſt entire ſtop to the cultivation of letters in Europe. But during the general prevalence of the ſyſtem of Galen, there appeared ſome writers to whom medicine was indebted for improvements, at leaſt in certain particulars. Among the moſt diſtinguiſhed of theſe we may mention Oribaſius, Ætius, Alexander, and Paulus.

42 Oribaſius.

Oribaſius flouriſhed about the year 360, and was phyſician to the emperor Julian. He ſpeaks very fully of the effects of bleeding by way of ſcarification, a thing little taken notice of by former writers; from his own experience he aſſures us that he had found it ſucceſsful in a ſuppreſſion of the menſes, defluxions of the eyes, headach, and ſtraitneſs of breathing even when the perſon was extremely old. He tells his own caſe particularly, when the plague raged in Aſia, and he himſelf was taken ill, that the ſecond day he ſcarified his leg, and took away two pounds of blood; by which means he entirely recovered, as did ſeveral others who uſed it. In this author alſo we find the firſt deſcription of a ſurpriſing and terrible diſtemper, which he termed λυκανθρωπια, a ſpecies of melancholy and madneſs, which he deſcribes thus. "The perſons affected get out of their houſes in the night-time, and in every thing imitate wolves, and wander among the ſepulchres of the dead till day-break. You may know them by theſe ſymptoms: Their looks are pale; their eyes heavy, hollow, dry, without the leaſt moiſture of a tear; their tongue exceedingly parched and dry, no ſpittle in their mouth, extreme thirſt; their legs, from the falls and the bruiſes they receive, full of incurable ſores and ulcers."

43 Ætius.

Ætius lived very near the end of the fifth, or in the beginning of the ſixth century. Many paſſages in his writings ſerve to ſhow us how much the actual and potential cautery were uſed by the phyſicians of that age. In a palſy, he ſays, that he ſhould not at all heſitate to make an eſchar either way, and this in ſeveral places; one in the nape, where the ſpinal marrow takes its riſe, two on each ſide of it; three or four on the top of the head, one juſt in the middle, and three others round it. He adds, that in this caſe, if the ulcers continue running a good while, he ſhould not doubt of a perfect recovery. He is ſtill more particular when he comes to order this application for an inveterate aſthma, after all other remedies have been tried in vain. One, he ſays, ſhould be made on each ſide near the middle of the joining of the clavicle, taking care not to touch the wind-pipe: two other little ones are then to be made near the carotids under the chin, one on each ſide, ſo that the cauſtic may penetrate no further than the ſkin; two others under the breaſts, between the third and fourth ribs; and again, two more backwards towards the fifth and ſixth ribs. Beſides theſe there ought to be one in the

Ætius. middle of the thorax near the beginning of the xiphoid cartilage over the orifice of the ftomach; one on each fide between the eighth and ninth ribs; and three others in the back, one in the middle, and the two others juft below it, on each fide of the vertebræ. Thofe below the neck ought to be pretty large, not very fuperficial, not very deep: and all thefe ulcers fhould be kept open for a very long time.

Ætius takes notice of the worms bred in different parts of the body called *dracunculi*, which were unknown to Galen. He feems alfo to be the firft Greek writer among the Chriftians, who gives us any fpecimen of medicinal fpells and charms; fuch as that of a finger of St Blafius for removing a bone which fticks in the throat, and another in relation to a fiftula. He gives a remedy for the gout, which he calls the *grand drier;* the patient is to ufe it for a whole year, and obferve the following diet each month. "In September, he muft eat and drink milk: In October, he muft eat garlic; in November, abftain from bathing; in December, he muft eat no cabbage; in January, he is to take a glafs of pure wine in the morning; in February, to eat no beet; in March, to mix fweet things both in eatables and drinkables; in April, not to eat horfe-radifh, nor in May the fifh called *polypus;* in June, he is to drink cold water in a morning; in July, to avoid venery; and laftly, in Auguft, to eat no mallows." This may fufficiently fhow the quackery of thofe times, and how fuperftition was beginning to mix itfelf with the art.

44 Alexander. Alexander, who flourifhed in the reign of Juftinian, is a more original author than either of the two former. He confines himfelf directly to the defcribing the figns of difeafes, and the methods of cure, without meddling with anatomy, the materia medica, or furgery, as all the reft did. He employs a whole book in treating of the gout. One method he takes of relieving this difeafe is by purging; and in moft of the purges he recommends hermodactyls, of which he has a great opinion. In a caufus, or burning fever, where the bile is predominant, the matter fit for evacuation, and the fever not violent, he prefers purging to bleeding, and fays that he has often ordered purging in acute fevers with furprifing fuccefs. In the caufus alfo, if a fyncope happens from crude and redundant humours, he recommends bleeding. In a fyncope fucceeding the fuppreffion of any ufual evacuation, he recommends bleeding, with frictions. The diagnoftics upon which he founds this practice are the following: viz. a face paler and more fwelled than ufual, a bloated habit of body, with a little fluggifh pulfe, having long intervals between the ftrokes. In tertian, and much more in quartan fevers, he recommends vomits above all other remedies, and affirms that by this remedy alone he has cured the moft inveterate quartans. On the bulimus, or canine appetite, he makes a new obfervation, viz. that it is fometimes caufed by worms. He mentions the cafe of a woman who laboured under this ravenous appetite, and had a perpetual gnawing at her ftomach and pain in her head: after taking *hiera*, fhe voided a worm above a dozen of cubits long, and was entirely cured of her complaints.—He is alfo the firft author who takes notice of *rhubarb;* which he recommends in a weaknefs of the liver and dyfentery.—Alexander is recommended by Dr Freind as one of the beft practical writers among the ancients, and well worthy the perufal of any modern. Alexander.

45 Paulus. Paulus was born in the ifland Ægina, and lived in the 7th century. He tranfcribes a great deal from Alexander and other phyficians. His defcriptions are fhort and accurate. He treats particularly of womens diforders; and feems to be the firft inftance upon record of a profeffed *man-midwife*, for fo he was called by the Arabians: and accordingly he begins his book with the diforders incident to pregnant women. He treats alfo very fully of furgery; and gives fome directions, according to Dr Freind, not to be found in the more ancient writers.

46 Arabian Phyficians. After the downfal of the Roman empire, and when the inundation of Goths and Vandals had almoft completely exterminated literature of every kind in Europe, medicine, though a practical art, fhared the fame fate with more abftract fciences. Learning in general, banifhed from the feat of arms, took refuge among the eaftern nations, where the arts of peace ftill continued to be cultivated. To the Arabian phyficians, as they have been called, we are indebted both for the prefervation of medical fcience, as it fubfifted among the Greeks and Romans, and likewife for the defcription of fome new difeafes, particularly the fmall-pox. Among the moft eminent of the Arabians, we may mention Rhafes, Avicenna, Albucafis, and Avenzoar. But of their writings it would be tedious, and is unneceffary to give any particular account.—They were for the moft part, indeed, only copiers of the Greeks; we are, however, indebted to them for fome improvements. They were the firft who introduced chemical remedies, though of thefe they ufed but few, nor did they make any confiderable progrefs in the chemical art. Anatomy was not in the leaft improved by them, nor did furgery receive any advancement till the time of Albucafis, who lived probably in the 12th century. They added a great deal to botany and the materia medica, by the introduction of new drugs, of the aromatic kind efpecially, from the eaft, many of which are of confiderable ufe. They alfo found out the way of making fugar; and by help of that, fyrups; which two new materials are of great ufe in mixing up compound medicines. 47 Rhafes.

With regard to their practice, in fome few particulars they deviated from the Greeks. Their purging medicines were much milder than thofe formerly in ufe; and even when they did prefcribe the old ones, they gave them in a much lefs dofe than formerly. The fame reflection may be made concerning their manner of bleeding, which was never to that exceffive degree practifed by the Greeks. They deviated from Hippocrates, however, in one very trivial circumftance, which produced a violent controverfy. The queftion was, Whether blood in a pleurify ought to be drawn from the arm of the affected fide or the oppofite? Hippocrates had directed it to be drawn from the arm of the affected fide; but the Arabians, following fome other ancient phyficians, ordered it to be drawn from the oppofite one. Such was the ignorance of thofe ages, that the univerfity of Salamanca in Spain made a decree, that no one fhould dare to let blood but in the contrary arm; and endeavoured to procure an edict from the emperor Charles V. to fecond it;

Arabian Physicians.

it; alleging that the other method was of no less pernicious consequence to medicine, than Luther's heresy had been to religion.

In consequence of the general decay of learning in the western parts of the world, the Greek writers became totally forgot, because nobody could read the language; and the Arabians, though mostly copiers from them, enjoyed all the reputation that was due to the others. The Arabian physic was introduced into Europe very early, with the most extravagant applause: and not only this, but other branches of their learning, came into repute in the west; insomuch that in the 11th century, the studies of natural philosophy and the liberal arts were called *the studies of the Saracens*. This was owing partly to the crusades undertaken against them by the European princes; and partly to the settlement of the Moors in Spain, and the intercourse they and other Arabians had with the Italians. For, long before the time of the crusades, probably in the middle of the 7th century, there were Hebrew, Arabic, and Latin professors of physic settled at Salernum: which place soon grew into such credit, that Charles the Great thought proper to found a college there in the year 802; the only one at that time in Europe.

48 College of Salernum.

49 Constantine.

Constantine the African flourished here towards the latter end of the 11th century. He was a native of Carthage; but travelled into the east, and spent 30 years in Babylon and Bagdad, by which means he became master of the oriental languages and learning. He returned to Carthage; but being informed of an attempt against his life, made his escape into Apulia, where he was recommended to Robert Guiscard, created in 1060 duke of that country, who made him his secretary. He was reputed to be very well versed in the Greek, as well as the eastern tongues; and seems to have been the first who introduced either the Greek or Arabian physic into Italy. His works, however, contain nothing that is new, or material; though he was then counted a very learned man, and for that age no doubt was so.

50 State of medicine in the 15th and 16th centuries.

From this time to the end of the 15th and beginning of the 16th century, the history of physic furnishes us with no interesting particulars. This period, however, is famous for the introduction of chemistry into medicine, and the description of three new distempers, the sweating sickness, the venereal disease, and the scurvy.

51 Sweating sickness in England.

The sweating sickness began in 1483, in the army of Henry VII. upon his landing at Milford-haven, and spread itself at London from the 21st of September to the end of October. It returned here five times, and always in summer; first in 1485, then in 1506, afterwards in 1517, when it was so violent that it killed many in the space of three hours, so that numbers of the nobility died, and of the commonalty in several towns often the one half perished. It appeared the fourth time in 1528, and then proved mortal in six hours; many of the courtiers died of it, and Henry VIII. himself was in danger. In 1529, and only then, it infested the Netherlands and Germany, in which last country it did much mischief. The last return of it was in 1551, and in Westminster it carried off 120 in a day. Dr Caius describes it as a pestilent contagious fever, of the duration of one natural day; the sweat he reckoned to be only a natural symptom, or crisis of the distemper. It first affected some particular part, attended with inward heat and burning, unquenchable thirst, restlessness, sickness at stomach, but seldom vomiting, headach, delirium, then faintness, and excessive drowsiness. The pulse was quick and vehement, and the breath short and laborious.—Children, poor and old people, were less subject to it. Of others, scarce any escaped the attack, and most of them died. Even by travelling into France or Flanders they did not escape; and what is still more strange, the Scots were said not to be affected: abroad the English only were seized, and foreigners in England were free. At first the physicians were much puzzled how to treat this disease. The only cure they ever found, however, was to carry on the sweat for a long time; for, if stopped, it was dangerous or fatal. The way, therefore, was for the patient to lie still, and not expose himself to cold. If nature was not strong enough to force out the sweat, it was necessary to assist her by art, with cloaths, wine, &c. The violence of the distemper was over in 15 hours; but there was no security for the patient till 24 were passed. In some strong constitutions there was a necessity to repeat the sweating, even to 12 times. The removing out of bed was attended with great danger; some who had not sweated enough fell into very ill fevers.—No flesh-meat was to be allowed in all the time of the distemper; nor drink for the first five hours. In the seventh, the distemper increased; in the ninth the delirium came on, and sleep was by all means to be avoided. However terrible this distemper appeared at first, it seldom proved obstinate, if treated in the above-mentioned manner.

Moderns.

In the beginning of the 16th century, the famous chemist Paracelsus introduced a new system into medicine, founded on the principles of his art. 52 Paracelsus.

The Galenical system had prevailed till his time; but the practice had greatly degenerated, and was become quite trifling and frivolous. The physicians rejected the use of opium, mercury, and other efficacious remedies. Paracelsus, who made use of these, had therefore greatly the advantage over them; and now all things relating to medicine were explained on imaginary chemical principles. It will easily be conceived that a practice founded in this manner could be no other than the most dangerous quackery. At this time, however, it was necessary; for now a new disease over-ran the world, and threatened greater destruction than almost all the old ones put together, both by the violence of its symptoms, and its baffling the most powerful remedies at that time known.—This was the venereal disease, which is said to have been imported from the West-Indies by the companions of Christopher Columbus. Its first remarkable appearance was at the siege of Naples in 1494, from whence it was soon after propagated through Europe, Asia, and Africa. 53 Appearance of the venereal disease.

The symptoms with which it made the attack at that time were exceedingly violent, much more so than they are at present; and consequently were utterly unconquerable by the Galenists. The quacks and chemists, who boldly ventured on mercury, though they no doubt destroyed numbers by their excessive use of it, yet showed that a remedy for this terrible distemper was at last found out, and that a proper method of treating it might soon be fallen upon. Shortly after, the West-Indian specific, guaiacum,

cum. was discovered: the materia medica was enriched with that and many other valuable medicines, both from the East and West-Indies: which contributed considerably to the improvement of the practice of physic. At this period, as sea voyages of considerable duration became more frequent, the scurvy became a more frequent distemper, and was of course more accurately described. But probably, from supposed analogy to the contagious which at that time were new in Europe, very erroneous ideas were entertained with regard to its being of an infectious nature: And it is not impossible, that from its being attended also with ulcers, it was on some occasions confounded with syphilitic complaints.

54 Progress of medicine in the 17th and 18th centuries.

The revival of learning, which now took place throughout Europe, the appearance of these new distempers, and the natural fondness of mankind for novelty, contributed greatly to promote the advancement of medicine as well as other sciences. While at the same time, the introduction of the art of printing rendered the communication of new opinions as well as new practices so easy a matter, that to enumerate even the names of those who have been justly rendered eminent for medical knowledge would be a very tedious task. It was not, however, till 1628 that Dr William Harvey of London demonstrated and communicated to the public one of the most important discoveries respecting the animal economy, the circulation of the blood. This discovery, more effectually than any reasoning, overturned all the systems which had subsisted prior to that time.

55 Discovery of the circulation.

It may justly be reckoned the most important discovery that has hitherto been made in the healing art: for there can be no doubt that it puts the explanation of the phenomena of the animal body, both in a state of health and disease, on a more solid and rational footing than formerly. It has not, however, prevented the rise of numerous fanciful and absurd systems. These, though fashionable for a short time, and strenuously supported by blind adherents, have yet in no long period fallen into deserved contempt. And notwithstanding the abilities and industry of Stahl, Hoffman, Boerhaave, and Cullen, we may easily venture to assert that no general system has yet been proposed which is not liable to innumerable and unsurmountable objections. Very great progress has indeed been made in explaining the philosophy of the human body, from ascertaining by decisive experiment the influence of the circulating, the nervous, and the lymphatic systems in the animal economy. But every attempt hitherto made to establish any general theory in medicine, that is to conduct the cure of every disease on a few general principles, has equally deviated from truth with those of Hippocrates and Galen; and has equally tended to mislead those who have adopted it. Indeed we may with confidence venture to assert, that from the very nature of the subject itself, medicine does not admit of such simplicity. No one can deny that the human body consists of a very great number of different parts, both solids and fluids. It is, however, equally certain, that each of these is from many different causes liable to deviations from the sound state. And although some slight changes may take place without what can be called a morbid affection, yet we well know, that every change taking place to a certain degree in any one part will necessarily and unavoidably produce an affection of the whole. Hence we may without hesitation venture to affirm, that every general theory which can be proposed, attempting to explain the phenomena, and conduct the cure of all diseases on a few general principles, though for some time it may have strenuous advocates, will yet in the end be found to be both ill-grounded and pernicious.

The art of medicine has been much more usefully improved by careful attention to the history, theory, and practice of particular diseases, and by endeavouring to ascertain from cautious observation the symptoms by which they are to be distinguished, the causes by which they are induced, and the means by which they are to be prevented, alleviated, or cured. On this footing, therefore, we shall endeavour to give a brief account of at least the most important affections to which the human body is subjected, delivering what appear to us to be the best established facts and observations respecting each.

But before entering on the consideration of particular diseases, or what has commonly been styled the practice of medicine, it is necessary to give a general view of the most important functions of the animal body, and of the chief morbid affections to which they are subjected; a branch which has usually been named the *Theory* or *Institutions of Medicine*.

THEORY of MEDICINE, or an Account of the principal Functions of the Animal Body.

WHILE the functions of living animals, but particularly of the human species, are very numerous, the accounts given of these both in a state of health and disease are very various. Without, therefore, pretending to enumerate the contradictory opinions of different authors, we shall here present the reader with a view of this subject, extracted from one of the latest and best publications respecting it, the *Conspectus Medicinæ Theoreticæ* of Dr James Gregory, formerly professor of the institutions of medicine in the university of Edinburgh, and now professor of practice.

In this work, which was first published in 1780, and afterwards reprinted under an enlarged form in 1782, Dr Gregory introduces his subject by observing, that some functions of the human body relate to itself only, and others to external things.

56 Division of the functions into animal, vital, and natural.

To the latter class belong those which by physicians are called the *animal functions*; to which are to be referred all our senses, as well as the power of voluntary motion, by which we become acquainted with the universe, and enjoy this earth. Among the functions which relate to the body, only some have been named *vital*, such as the circulation of the blood and respiration; because, without the constant continuance of these life cannot subsist. Others, intended for repairing the waste of the system, have been termed the *natural functions*

Diviſion of functions. *tions:* for by the conſtant attrition of the ſolids, and the evaporation of the fluid parts of the body, we ſtand in need of nouriſhment to ſupply this waſte; after which the putrid and excrementitious parts muſt be thrown out by the proper paſſages. The digeſtion of the food, ſecretion of the humours, and excretion of the putrid parts of the food, are referred to this claſs; which, though neceſſary to life, may yet be interrupted for a conſiderable time without danger.

57 Diſtinction of diſeaſes into ſimple and compound. A *diſeaſe* takes place, when the body has ſo far declined from a ſound ſtate, that its functions are either quite impeded, or performed with difficulty. A diſeaſe therefore may happen to any part of the body either ſolid or fluid, or to any one of the functions: and thoſe may occur either ſingle, or ſeveral of them joined together; whence the diſtinction of diſeaſes into *ſimple* and *compound*.

We have examples of the moſt ſimple kinds of diſeaſes, in the rupture or other injury of any of the corporeal organs, by which means they become leſs fit for performing their offices; or, though the organs themſelves ſhould remain ſound, if the ſolids or fluids have degenerated from a healthy ſtate; or if, having loſt their proper qualities, they have acquired others of a different, perhaps of a noxious nature; or laſtly, if the moving powers ſhall become too weak or too ſtrong, or direct their force in a way contrary to what nature requires.

58 Symptoms. The moſt ſimple diſeaſes are either productive of others, or of *ſymptoms*, by which alone they become known to us.—Every thing in which a ſick perſon is obſerved to differ from one in health is called a *ſymptom;* and the moſt remarkable of theſe ſymptoms, and which moſt conſtantly appear, define and conſtitute the diſeaſe.

The cauſes of diſeaſes are various; often obſcure, and ſometimes totally unknown. The moſt full and perfect proximate cauſe is that which, when preſent, produces a diſeaſe, when taken away removes it, and when changed alſo changes it.—There are alſo remote cauſes, which phyſicians have been accuſtomed to divide into the *prediſponent* and *exciting* ones.

59 Prediſponent cauſe. The former are thoſe which only render the body fit for a diſeaſe, or which put it into ſuch a ſtate that it will readily receive one.

60 Exciting cauſe. The exciting cauſe is that which immediately produces the diſeaſe in a body already diſpoſed to receive it.

The prediſponent cauſe is always inherent in the body itſelf, though perhaps it originally came from without; but the exciting cauſe may either come from within or from without.

From the combined action of the prediſponent and exciting cauſes comes the *proximate* cauſe, which neither of the two taken ſingly is able to produce;

61 Proximate cauſe. ſeeing neither every exciting cauſe will produce a diſeaſe in every perſon, nor will every one prediſpoſed to a diſeaſe fall into it without an exciting cauſe.—A body prediſpoſed to diſeaſe therefore has already declined ſomewhat from a ſtate of perfect health, although none of its functions are impeded in ſuch a manner that we can truly ſay the perſon is diſeaſed. Yet ſometimes the prediſponent cauſe, by continuing long, may arrive at ſuch an height, that it alone, without the addition of any exciting cauſe, may produce a real diſeaſe.—Of this we have examples in the debility of the ſimple ſolids, the mobility of the living ſolids, and in plethora.—The exciting cauſe alſo, though it ſhould not be able immediately to bring on a diſeaſe; yet if it continues long, will by degrees deſtroy the ſtrongeſt conſtitution, and render it liable to various diſeaſes; becauſe it either produces a prediſponent cauſe, or is converted into it, ſo that the ſame thing may ſometimes be an exciting cauſe, ſometimes a prediſponent one; of which the inclemencies of the weather, ſloth, luxury, &c. are examples. Origin of Diſeaſes.

62 Hereditary diſeaſes. Diſeaſes, however, ſeem undoubtedly to have their origin from the very conſtitution of the animal machine; and hence many diſeaſes are common to every body when a proper exciting cauſe occurs, though ſome people are much more liable to certain diſeaſes than others. Some are hereditary; for as healthy parents naturally produce healthy children, ſo diſeaſed parents as naturally produce a diſeaſed offspring. Some of theſe diſeaſes appear in the earlieſt infancy; others occur equally at all ages; nor are there wanting ſome which lurk unſuſpected even to the lateſt old age, at laſt breaking out with the utmoſt violence on a proper occaſion. Some diſeaſes are born with us, even though they have no proper foundation in our conſtitution, as when a fœtus receives ſome hurt by an injury done to the mother; while others, neither born with us nor having any foundation in the conſtitution, are ſucked in with the nurſe's milk.

63 Diſeaſes from age and ſex. Many diſeaſes accompany the different ſtages of life; and hence ſome are proper to infancy, youth, and old age. Some alſo are proper to each of the ſexes: eſpecially the weaker ſex, proceeding, no doubt, from the general conſtitution of the body, but particularly from the ſtate of the parts ſubſervient to generation. Hence the diſeaſes peculiar to virgins, to menſtruating women, to women with child, to lying-in women, to nurſes, and to old women.

64 Diſeaſes from climate. The climate itſelf, under which people live, produces ſome diſeaſes; and every climate hath a tendency to produce a particular diſeaſe, either from its exceſs of heat or cold, or from the mutability of the weather. An immenſe number of diſeaſes alſo may be produced by impure air, or ſuch as is loaded with putrid, marſhy, and other noxious vapours. The ſame thing may happen likewiſe from corrupted aliment, whether meat or drink; though even the beſt and moſt nutritious aliment will hurt if taken in too great quantity; not to mention poiſons, which are endowed with ſuch pernicious qualities, that even when taken in a very ſmall quantity they produce the moſt grievous diſeaſes, or perhaps even death itſelf.

65 Diſeaſes from accidents. Laſtly, from innumerable accidents and dangers to which mankind are expoſed, they frequently come off with broken limbs, wounds, and contuſions, ſometimes quite incurable; and theſe misfortunes, though proceeding from an external cauſe at firſt, often terminate in internal diſeaſes.

Hitherto we have mentioned only the dangers which come from without; but thoſe are not leſs, nor fewer in number, which come from within. At every breath, man pours forth a deadly poiſon both to himſelf and others. Neither are the effluvia of the lungs alone hurtful: there flows out from every pore of the body a moſt ſubtile and poiſonous matter, perhaps of a putreſcent

Origin of Difeafes. fcent nature, which being long accumulated, and not allowed to diffufe itfelf through the air, infects the body with moft grievous difeafes; nor does it ftop here, but produces a contagion which fpreads devaftation far and wide among mankind. From too much or too little exercife of our animal-powers alfo no fmall danger enfues. By inactivity either of body or mind, the vigour of both is impaired; nor is the danger much lefs from too great employment. By moderate ufe, all the faculties of the mind, as well as all the parts of the body, are improved and ftrengthened; and here nature has appointed certain limits, fo that exercife can neither be too much neglected, nor too much increafed, with impunity. Hence thofe who ufe violent exercife, as well as thofe who fpend their time in floth and idlenefs, are equally liable to difeafes; but each to difeafes of a different kind: and hence alfo the bad effects of too great or too little employment of the mental powers.

66
Difeafes from paffions of the mind.

Befides the dangers arifing from thofe actions of the body and mind which are in our own power, there are others arifing from thofe which are quite involuntary. Thus, paffions of the mind, either when carried to too great excefs, or when long continued, equally deftroy the health; nay, will even fometimes bring on fudden death. Sleep alfo, which is of the greateft fervice in reftoring the exhaufted ftrength of the body, proves noxious either by its too great or too little quantity. In the moft healthy body, alfo, many things always require to be evacuated. The retention of thefe is hurtful, as well as too profufe an evacution, or the excretion of thofe things either fpontaneoufly or artificially which nature directs to be retained. As the folid parts fometimes become flabby, foft, almoft diffolved, and unfit for their proper offices; fo the fluids are fometimes infpiffated, and formed even into the hardeft folid maffes. Hence impeded actions of the organs, vehement pain, various and grievous difeafes. Laftly, fome animals are to be reckoned among the caufes of difeafes: namely, fuch as fupport their life at the expence of others: and thefe either invade us from without, or take up their refidence within the body, gnawing the bowels while the perfon is yet alive, not only with great danger and diftrefs to the patient, but fometimes even producing death itfelf.

67
Vis medicatrix naturæ.

Man, however, is not left without defence againft fo many and fo great dangers. The human body is poffeffed of a moft wonderful power, by which it preferves itfelf from difeafes, keeps off many, and in a very fhort time cures fome already begun, while others are by the fame means more flowly brought to a happy conclufion. This power, called the *autocrateia*, or *vis medicatrix naturæ*, is well known both to phyficians and philofophers, by whom it is moft juftly celebrated; this alone is fufficient for curing many difeafes, and is of fervice in all. Nay, even the beft medicines operate only by exciting and properly directing this force; for no medicine will act on a dead carcafe. But though phyficians juftly put confidence in this power, and though it generally cures difeafes of a flighter nature, it is not to be thought that thofe of the more grievous kind are to be left to the unaffifted efforts of the *vis medicatrix*. Phyficians therefore have a twofold error to avoid, namely, either defpifing the powers of nature too much, or putting too great confidence in them; becaufe in many difeafes thefe efforts are either too feeble or too violent, infomuch that fometimes they are more to be dreaded than even the difeafe itfelf. So far therefore is it from being the duty of a phyfician always to follow the footfteps of Nature, that it is often neceffary for him to take a directly contrary courfe, and oppofe her efforts with all his might.

68
Chemical analyfis of the animal folids.

After this general view of the functions of the animal body, of the nature and caufes of difeafe, and of the powers by which thefe are to be combated, Dr Gregory proceeds to treat of the folid materials of which the body is formed. He tells us, that the animal folid, when chemically examined, yields earth, oil, falt, water, phlogifton or inflammable air, and a great quantity of mephitic air. Thefe elements are found in various proportions in the different parts of the body; and hence thefe parts are endowed with very different mechanical powers, from the hardeft and moft folid bone to the foft and almoft fluid retina. Nay, it is principally in this difference of proportion between the quantities of the different elements, that the difference between the folid and fluid parts of the animal confift, the former having much more earth and lefs water in their compofition than the latter. The cohefion, he thinks, is owing to fomething like a chemical attraction of the elements for one another; and its caufe is neither to be fought for in the gluten, fixed air, nor earth. This attraction, however, is not fo ftrong but that even during life the body tends to diffolution; and immediately after death putrefaction commences, provided only there be as much moifture in it as will allow an inteftine motion to go on. The greater the heat, the fooner does putrefaction take place, and with the greater rapidity does it proceed; the mephitic air flies off, and together with it certain faline particles; after which, the cohefion of the body being totally deftroyed, the whole falls into a putrid colluvies, of which at length all the volatile parts being diffipated, nothing but the earth is left behind.

This analyfis, he owns, is far from being perfect; becaufe nobody has ever been able, by combining the chemical principles of flefh, to reproduce a compound any thing like what the flefh originally was: but, however imperfect the analyfis may be, it ftill has the advantage of fhowing in fome meafure the nature and caufes of certain difeafes, and thus leads phyficians to the knowledge of proper remedies.

69
Qualities of the animal folids.

The folid parts are fitted for the purpofes of life in three feveral ways; namely, by their cohefion, their flexibility, and their elafticity, all of which are various in the various parts of the body. Moft of the functions of life confift in various motions. In fome the moft violent and powerful motions are required; and therefore fuch a degree of cohefion is neceffary in thefe parts as will be fufficient for allowing them to perform their offices without any danger of laceration. It is therefore neceffary that fome of the folid parts fhould be more flexible than others; and it is likewife neceffary that thefe parts, along with their flexibility, fhould have a power of recovering their former fhape and fituation, after the removal of the force by which they were altered.

Thefe variations in flexibility, within certain limits

Qualities of the Animal Solids. mits, ſeldom produce any material conſequence with regard to the health: though ſometimes, by exceeding the proper bounds, they may bring on real and very dangerous diſeaſes; and this either by an exceſs or diminution of their coheſion, flexibility, or elaſticity. By augmenting the coheſion, the elaſticity is alſo for the moſt part augmented, but the flexibility diminiſhed; by diminiſhing the coheſion, the flexibility becomes greater, but the elaſticity is diminiſhed.

The cauſes of theſe affections, though various, may be reduced to the following heads. Either the chemical compoſition of the matter itſelf is changed; or, the compoſition remaining the ſame, the particles of the ſolid may be ſo diſpoſed, that they ſhall more or leſs ſtrongly attract one another. As to the compoſition, almoſt all the elements may exiſt in the body in an undue proportion, and thus each contribute its ſhare to the general diſorder. But of many of theſe things we know very little; only it is apparent, that the fluid parts, which conſiſt chiefly of water, and the ſolid, which are made up of various elements, are often in very different proportions: the more water, the leſs is the coheſion or elaſticity, but the greater the flexibility; and the reverſe happens, if the ſolid or earthy part predominates.

70
Cauſes affecting the ſolids.

The remote cauſes of theſe different ſtates, whether prediſponent or exciting, are very various. In the firſt place, idioſyncraſy itſelf, or the innate conſtitution of the body, contributes very much to produce the abovementioned effects. Some have naturally a much harder and drier temperament of the body than others; men, for inſtance, more than women; which can with the utmoſt difficulty, indeed ſcarce by any means whatever, admit of an alteration. The ſame thing takes place at different periods of life; for, from firſt to laſt, the human body becomes always drier and more rigid. Much alſo depends on the diet made uſe of, which always produces a correſponding ſtate of the ſolids in proportion to its being more or leſs watery. Neither are there wanting ſtrong reaſons for believing, that not only the habit of the body, but even the diſpoſition of the mind, depends very much on the diet we make uſe of. The good or bad concoction of the aliment alſo, the application of the nouriſhment prepared from it, and likewiſe the ſtate of the air with regard to moiſture or dryneſs, affect the temperament of the body not a little; and hence thoſe who inhabit mountains or dry countries, are very different from the inhabitants of low marſhy places. Laſtly, the manner of living contributes ſomewhat to this effect: Exerciſe preſſes out and exhales the moiſture of the body, if in too great quantity; on the contrary, ſloth and lazineſs produce an effect directly oppoſite, and cauſe a redundancy of humour.

But, putting the chemical compoſition of the ſolid parts out of the queſtion altogether, they may be affected by many other cauſes. The condenſation, for inſtance, or compreſſion of the particles, whether by mechanical cauſes or by means of cold or heat, makes a conſiderable alteration in the ſtrength and elaſticity of every ſolid body. How much mechanical preſſure contributes to this may be underſtood from the experiments of Sir Cliſton Wintringham: and hence alſo are we to deduce the reaſon of many facts of the higheſt importance in the animal economy; namely, the growth, ſtate, decreaſe of the body; its rigidity daily increaſing; and at laſt the unavoidable death incident to old age from a continuance of the ſame cauſes.

Perhaps the different denſity of the ſolids is in ſome meaſure owing to Nature herſelf; but it ſeems rather to depend more on the powers of exerciſe or inactivity in changing the ſtate of the ſolids, the effects of which on the body, whether good or bad, may hence be eaſily underſtood.

Heat relaxes and expands all bodies, but cold renders them more denſe and hard; the effects of which on the human body are well known to moſt people. Though the body is found to preſerve a certain degree of heat almoſt in every ſituation, it is impoſſible but that its ſurface muſt be affected by the temperature of the ambient atmoſphere; and we have not the leaſt reaſon to doubt that every part of the body may thus feel the effects of that temperature. What a difference is there between one who, expoſed to the ſouth-wind, becomes lazy and languid, ſcarce able to drag along his limbs; and one who feels the force of the cold north-wind, which renders the whole body alert, ſtrong, and fit for action?

That theſe various cauſes, each of which is capable of affecting the conſtitution of the body when taken ſingly, will produce much greater effects when combined, is ſufficiently evident. The experiments of Bryan Robinſon, the effects of the warm bath, and indeed daily experience, ſhow it fully.

It is not yet certainly known what is the ultimate ſtructure of the minuteſt parts of the animal-ſolid; whether it conſiſts of ſtraight fibres or threads, whoſe length is very conſiderable in proportion to their breadth, variouſly interwoven with one another, as Boerhaave ſuppoſes; or of ſpiral ones, admirably convoluted and interwoven with one another, as ſome microſcopical experiments ſeem to ſhow; or whether the cellular texture be formed of fibres and *laminæ*, and from thence the greateſt part of the body, as the celebrated Haller hath endeavoured to prove.

71
Cellular texture.

The cellular texture is obſerved throughout the whole body: it ſurrounds and connects the fibres themſelves, which are ſufficiently apparent in many of the organs; and ſlightly joins the different parts which ought to have any kind of motion upon the neighbouring ones. By a condenſation of the ſame ſubſtance alſo, the ſtrongeſt, and what ſeem the thinneſt, membranes are formed; the moſt ſimple of which, being accurately examined, diſcover the cellular ſtructure. This cellular ſubſtance ſometimes increaſes to a ſurpriſing degree, and all parts formed of it, membranes, veſſels, &c. eſpecially by a gentle diſtenſion; for a ſudden and violent diſtenſion either breaks it altogether, or renders it thinner. Sometimes alſo it grows between neighbouring parts, and joins thoſe which nature has left free. Preternatural concretions of this kind are often obſerved after an inflammation of the lungs or of the abdominal viſcera; and theſe new membranes are found to be truly cellular. This ſubſtance, when cut, or by any other means divided, grows together of its own accord; but if, by reaſon of very great inflammation and ſuppuration, a large portion of the cellular texture has been deſtroyed, it is never again renewed, and an ugly ſcar is left. It is even ſaid, Cellular Texture. faid, that this fubftance, in certain cafes, is capable of joining the parts either of the fame body with one another, or of a foreign body with them; and upon this, if on any foundation, refts the art of Taliacotius and that of tranfplanting teeth, lately fo much talked of.

The cellular texture is in fome places merely a kind of net-work, in others filled with fat. Wherever too great bulk or compreffion would have been inconvenient or dangerous, as in the head, lungs, eyes, eyebrows, penis, fcrotum, &c. there it collects no fat, but is lax, and purely reticulated; but between the mufcles of the body and limbs below the fkin, in the abdomen, efpecially in the omentum and about the kidneys, very much fat is fecreted and collected.

72 Animal fat. The fat is a pure animal oil, not very different from the expreffed and mild vegetable ones; during life it is fluid, but of different degrees of thicknefs in different parts of the body. It is fecreted from the blood, and is often fuddenly reabforbed into it, though pure oil is very rarely obferved in the blood. It is indeed very probable, that oil, by digeftion, partly in the primæ viæ, and partly in the lungs, is converted into gluten, and this again into oil by means of fecretion; though no organs fecreting the fat can be fhown by anatomifts. It is, however, probable, that there are fuch organs; and that the cellular texture has fome peculiar ftructure in thofe parts which are deftined to contain the fat already fecreted, without fuffering it to pafs into other places; for it never paffes into thofe parts which are purely reticulated, although the cellular texture is eafily permeable by air or water over the whole body from head to foot.

The fat is augmented by the ufe of much animal-food, or of any other that is oily and nourifhing, provided the digeftion be good; by the ufe of ftrong drink, efpecially malt-liquor; by much reft of body and mind, much fleep and inactivity, caftration, cold, repeated bloodletting, and in general by whatever diminifhes the vital and animal powers. Much, however, depends on the conftitution of the body itfelf; nor is it poffible to fatten a human creature at pleafure like an ox. A certain degree of fatnefs, according to the age of the perfon, is a fign and effect of good health; but when too great, it becomes a difeafe of itfelf, and the caufe of other difeafes. It may always be very certainly removed by ftrong exercife, little fleep, and a fpare and folid diet. The fat always makes up a confiderable part of the bulk of the body, and very often by far the greateft part. Its ufe feems to be to make the motion of the body more eafy and free by leffening the friction of the moving parts, and thus preventing the abrafion of the folids, which would otherwife happen. It is alfo of ufe to hinder the parts from growing together, which fometimes happens, when by an ulcer or any other accident a part of the cellular texture containing the fat is deftroyed. Befides all this, the fat contributes not a little to the beauty of the body, by filling up the large interftices between the mufcles, which would otherwife give the perfon a deformed and fhocking appearance. It is thought to be nutritious, when abforbed from its cells by the blood; but of this we have no great certainty. It feems to have fome power of defending from the cold, feeing nature has beftowed it in very great quantity on thofe animals which inhabit the colder regions. Animal Fat.

73 Vital folids. Thofe parts of the body which enjoy fenfe and mobility, are called *living* or *vital* folids. They are the brain, cerebellum, medulla oblongata, fpinal marrow, the nerves arising from thefe and diffufed throughout the whole body, and which are diftributed through the various organs of fenfe and through the mufcles, and laftly the mufcles themfelves. Senfation is much more general than mobility, as being common to all the parts already mentioned. Mobility is proper to the mufcular fibres alone: wherever there is fenfation, therefore, we may believe that there are nerves; and wherever there is mobility, we may believe that mufcular fibres exift. Nay, even mobility itfelf feems to originate from the connection which the mufcles have with the nerves; for foon after the nerves are compreffed, or tied, or cut, the mufcles to which they are diftributed lofe their faculties; which happens, too, when the brain itfelf, or the origin of the nerves, is affected. Some reckon that the mufcles are produced from the nerves, and confift of the fame kind of matter. Both indeed have a fimilar ftructure, as being fibrous and of a white colour: for the mufcles when well freed from the blood, of which they contain a great abundance, are of this colour as well as the nerves; neither can the nervous fibres by any means be diftinguifhed from the mufcular fibres themfelves. Both have alfo fenfation; and both ftimulants and fedatives act in the fame manner, whether they be applied to the mufcles themfelves or to the nerves.

It is difficult for us to difcover the origin of many parts of the body, or to afcertain whether they are produced all at the fame time or one after another: yet it muft be owned, that many of the mufcular parts are obferved to have attained a remarkable degree of ftrength, while the brain is ftill foft and almoft fluid; and that the action of thefe mufcular parts is required for the action and growth of the brain. The mufcles are alfo of a much firmer contexture than the nerves; and enjoy a power of their own, namely, that of irritability, of which the nerves never participate. Of neceffity, therefore, either the mufcles muft be conftructed of fome kind of matter different from that of the nerves; or if both are made of the fame materials, their organization muft be exceedingly different. But if the fubftance of the mufcles and nerves be totally different, we may eafily be convinced that much of the one is always mixed with the other; for it is impoffible to prick a mufcle even with the fmalleft needle, without wounding or lacerating many nervous fibres at the fame time. Since, therefore, there is fuch a clofe connection between the mufcles and nerves both as to their functions and ftructure, they are defervedly reckoned by phyfiologifts to be parts of the fame genus, called the *genus nervofum*, or *nervous fyftem*.

After treating of fenfe in general, Dr Gregory proceeds to confider particularly each of the fenfes both external and internal. He begins with the fenfe of feeling, as being the moft fimple, and at the fame time in common to every part of the nervous fyftem. In fome places, however, it is much more acute than in others; in the fkin, for inftance, 74 Senfe of feeling.

External Senses. ſtance, and eſpecially in the points of the fingers. Theſe are reckoned to have *nervous papillæ*, which by the influx of the blood are ſomewhat erected in the action of contact, in order to give a more acute ſenſation; though indeed this opinion ſeems rather to be founded on a conjecture derived from the ſtructure of the tongue, which is not only the organ of taſte, but alſo a moſt delicate organ of touch, than upon any certain obſervations.

75 Pain. From the ſenſe of feeling, as well as all the other ſenſes, either pain or pleaſure may ariſe; nay, to this ſenſe we commonly refer both pain and almoſt all other troubleſome ſenſations, tho' in truth pain may ariſe from every vehement ſenſation. It is brought on by any great force applied to the ſentient part; whether this force comes from within or from without. Whatever, therefore, pricks, cuts, lacerates, diſtends, compreſſes, bruiſes, ſtrikes, gnaws, burns, or in any manner of way ſtimulates, may create pain. Hence it is ſo frequently conjoined with ſo many diſeaſes, and is often more intolerable even than the diſeaſe itſelf. A moderate degree of pain ſtimulates the affected part, and by degrees the whole body; produces a greater flux of blood and nervous power to the part affected; and often ſtimulates to ſuch motions as are both neceſſary and healthful. Hence, pain is ſometimes to be reckoned among thoſe things which guard our life. When very violent, however, it produces too great irritation, inflammation and its conſequences, fever, and all thoſe evils which flow from too great force of the circulation; it diſorders the whole nervous ſyſtem, and produces ſpaſms, watching, convulſions, delirium, debility, and fainting. Neither the mind nor body can long bear very vehement pain; and indeed Nature has appointed certain limits, beyond which ſhe will not permit pain to be carried, without bringing on delirium, convulſions, ſyncope, or even death, to reſcue the miſerable ſufferer from his torments.

Long continued pain, even though in a more gentle degree, often brings on debility, torpor, palſy, and rigidity of the affected part. But if not too violent, nor accompanied with fever, ſickneſs, or anxiety, it ſometimes ſeems to contribute to the clearneſs and acuteneſs of the judgment, as ſome people teſtify who have been afflicted with the gout.

76 Anxiety. Anxiety is another diſagreeable ſenſation, quite different from pain, as being more obtuſe and leſs capable of being referred to any particular part, though frequently more intolerable than any pain. But we muſt take care to diſtinguiſh between this anxiety of which we treat in a medical ſenſe, and that which is ſpoken of in common diſcourſe. The latter does not at all depend on the ſtate of the body, but belongs entirely to the mind; and ariſes from a ſenſe of danger, or a foreſight of any misfortune. The former is truly corporeal; and derives, no leſs than pain, its origin from a certain ſtate of the body. Notwithſtanding this difference, however, it is very poſſible for both theſe kinds of anxiety to be preſent at the ſame time, or for the one to be the cauſe of the other. A very great bodily anxiety will ſtrike fear and deſpondency into the moſt reſolute mind; and mental anxiety, on the contrary, if very violent and long-continued, may induce the former, by deſtroying the powers of the body, eſpecially thoſe which promote the circulation of the blood.

Anxiety, in the medical ſenſe of the word, ariſes in the firſt place from every cauſe diſturbing or impeding the motion of the blood through the heart and large veſſels near it. Anxiety, therefore, may ariſe from many diſeaſes of the heart and its veſſels, ſuch as its enlargement, too great conſtriction, oſſification, polypus, palpitation, ſyncope, inflammation, debility, and alſo ſome affections of the mind. It is likewiſe produced by every difficulty of breathing, from whatever cauſe it may ariſe; becauſe then the blood paſſes leſs freely through the lungs: anxiety of this kind is felt deep in the breaſt. It is ſaid alſo to ariſe from the difficult paſſage of the blood through the liver or other abdominal viſcera.

A certain kind of anxiety is very common and troubleſome to hypochondriacal people; and ariſes from the ſtomach and inteſtines being either loaded with indigeſted and corrupted food, or diſtended with air produced by fermentation and extricated from the aliments. By ſuch a load, or diſtenſion, the ſtomach, which is a very delicate organ, becomes greatly affected. Beſides, the free deſcent of the diaphragm is thus hindered, and reſpiration obſtructed. Anxiety of this kind is uſually very much and ſuddenly relieved by the expulſion of the air; by which, as well as by other ſigns of a bad digeſtion, it is eaſily known. In theſe caſes the anxiety is uſually, though with little accuracy, referred to the ſtomach.

Anxiety alſo frequently accompanies fevers of every kind, ſometimes in a greater and ſometimes in a leſſer degree. In this caſe it ariſes as well from the general debility as from the blood being driven from the ſurface of the body and accumulated in the large veſſels; as in the beginning of an intermittent fever. Or it may ariſe from an affection of the ſtomach, when overloaded with crude, corrupted aliment; or diſtended and nauſeated with too much drink, eſpecially medicated drink. As the fever increaſes, the anxiety of the patient becomes greater and greater; remarkably ſo, according to the teſtimony of phyſicians, either immediately before the criſis or on the night preceding it; as before the breaking out of exanthemata, hæmorrhagy, ſweat, or diarrhœa, which ſometimes remove fevers. The patient feels likewiſe an anxiety from the ſtriking in of any eruption or critical metaſtaſis. This ſenſation alſo accompanies fevers and moſt other diſeaſes, when the vital power is exhauſted, and death approaches, of which it is the forerunner and the ſign. It happens at that time, becauſe the vital powers, unable to perform their functions, cannot make the blood circulate. But what kind of anxiety this is, the other ſigns of approaching death ſhows very evidently. Moreover, even in the time of ſleep, anxiety may ariſe from the ſame cauſes: hence frightful dreams, which frequently diſturb our repoſe with ſurpriſe and terror.

Itching, an uneaſy ſenſation, with a deſire of ſcratching the place affected, is often very troubleſome, altho' it ſeems to be more a-kin to pleaſure than to pain. 77 Itching.
As pain proceeds from too great an irritation, either chemical or mechanical, ſo does itching proceed from a ſlight one. Titillation, or friction, of a woollen ſhirt, for

External Senses. for instance, upon the skin of a person unaccustomed to it, and of a delicate constitution, excites itching; as do also many acrid fossils, vegetables, and animals. Hence an itching is the first sensation after the application of cantharides, although the same, when augmented, becomes painful. The same effect is produced by any thing acrid thrown out upon the skin; as in exanthematic fevers, the disease called the *itch*, &c. Lice, worms, especially ascarides, irritating either the skin or the intestines, excite a troublesome itching. Certain species of internal itching excites people to many necessary actions both in a diseased and healthy state; such as the excretion of the fæces and urine, coughing, sneezing, and the like.

Too acute a sensation over the whole body is very rarely if ever observed. In a particular part the sense of feeling is often more acute than it ought to be, either from the cuticle itself being too thin and soft, or being removed; or from the part itself being inflamed, or exposed to too great heat. It becomes obtuse, or is even quite destroyed over the whole body, or in great part of it, from various affections of the brain and nerves; as when they are wounded, compressed, or defective in vital power. This is called *anæsthesia*, and sometimes accompanies palsy.

This sense may be deficient in a particular part, either from the nerve being diseased, or from its being compressed or wounded, or from the part itself being exposed to too great a degree of cold;—or from the scarf-skin which covers it being vitiated, either becoming too thick or hard, by the handling of too rough, or hard, or hot bodies, as is the case with glass-makers and smiths; or from the elevation of the cuticle from the subjacent cutis, or true skin itself, by the interposition of blood, serum, or pus; or from the cutis being macerated, relaxed, or become torpid, which sometimes happens to hydropic persons; or lastly, from the whole organ being corrupted by gangrene, burning, cold, or contusion. This sense is very rarely depraved, unless perhaps in the case of delirium, when all the functions of the brain are disturbed in a surprising manner.

78 Taste. The sense next to be considered is that of taste, the principal organ of which is the tongue; the nearer the tip of it, the more acute is the sense, and the nearer the glottis so much the more obtuse. It must be owned, however, that some kind of acrid substances, the taste of which is scarce perceived upon the tip of the tongue, excite a most vehement sensation about its roots, or even in the throat itself. The tongue is endowed with many large and beautiful nervous papillæ, which seem to be the chief seat of this sense, and in the act of tasting are elevated and erected, in order to give the more acute sensation.

Nothing can be tasted which is not soluble in the saliva, that, being applied in a fluid form, it may pervade the involucra of the tongue, and affect its nervous pulp; and hence insoluble earths are quite insipid. Neither is it sufficient for a body to be soluble that it may be tasted: it must also have something in it saline, or at least acrid, in order to stimulate the nervous substance; and hence, whatever has less salt than the saliva is totally insipid.

The taste is rarely found to be too acute, unless through a fault in the epidermis which covers the tongue. If this be removed or wounded, or covered with ulcers, aphthæ, &c. then the taste, becoming too acute, is painful: or sometimes no other sensation than that of pain is felt. It may be impaired, as well as the sense of feeling, from various diseases of the brain and nerves; of which, however, the instances are but rare. In some people it is much more dull than in others; and in such the sense of smelling is usually deficient also. The taste is most commonly deficient on account of the want of saliva; for a dry tongue cannot perceive any taste: hence this sense is very dull in many diseases, especially in fevers, catarrhs, &c. as well on account of the defect of saliva as of appetite, which is of so much service in a state of health; or by reason of the tongue being covered with a viscid mucus.

The taste is frequently depraved; when, for example, we have a perception of taste without the application of any thing to the tongue; or, if any thing be applied to it, when we perceive a taste different from what it ought to be. This happens for the most part from a vitiated condition of the saliva, which is itself tasted in the mouth. Hence we may perceive a sweet, saline, bitter, putrid, or rancid taste, according to the state of the saliva: which may be corrupted either from the general vitiated condition of the mass of humours, or the glands which secrete it; of the mouth itself; or even of the stomach, the vapours and eructations of which rise into the mouth, especially when the stomach is diseased.

Besides the faults of the saliva, however, the taste may be vitiated from other causes; as, for instance, the condition of the nervous papillæ. This, however, is as yet but little known to us; for the taste is sometimes plainly vitiated when at the same time the saliva appears quite insipid when tasted by other people.

Physicians, in almost every disease, but especially in fevers, inquire into the state of the tongue; not, indeed, without the greatest reason: for from this they can judge of the condition of the stomach; of the thirst, or rather the occasion the patient has for drink, when, on account of his delirium or stupor, he neither feels his thirst nor is able to call for drink. And, lastly, from an inspection of the tongue, physicians endeavour to form some judgment concerning the nature, increase, and remission of the fever.

After the sense of taste, Dr Gregory next treats of that of smell. Its seat is in that very soft and delicate membrane, filled with nerves and blood-vessels, which covers the internal parts of the nose, and the various sinuses and cavities proceeding from thence. This sense is more acute about the middle of the septum, and the *ossa spongiosa*, where the membrane is thicker and softer, than in the deeper cavities, where the membrane is thinner, less nervous, and less filled with blood-vessels; although even these do not seem to be altogether destitute of the sense of smelling. 79 Smell.

As by our taste we judge of the soluble parts of bodies, so by our smell we judge of those very volatile and subtile parts which fly off into the air; and like the organ of taste, that of smell is kept moist, that it may have the more exquisite sensation, partly by its proper mucus, and partly by the tears which descend from the eyes.

Some kinds of odours greatly affect the nervous system, External Senses.

ſtem, and produce the moſt ſurpriſing effects. Some gratefully excite it, and immediately recruit the ſpirits when almoſt ſinking; while ſome produce fainting, nay, as it is alleged, even ſudden death. To this head alſo are we to refer thoſe antipathies, which, though truly ridiculous, are often not to be ſubdued by any force of mind.

This ſenſe is ſometimes too acute, as well from ſome diſeaſe in the organ itſelf, which happens more rarely, as from the too great ſenſibility of the nervous ſyſtem in general, as is ſometimes obſerved in nervous fevers, phrenitis, and hyſteria. It is more frequently, however, too dull, either from diſeaſes of the brain and nerves, as from ſome violence done to the head, or from ſome internal cauſe; or it may proceed from a dryneſs of the organ itſelf, either on account of the cuſtomary humours being ſuppreſſed or turned another way, or from the membranes being oppreſſed with too great a quantity of mucus or of tears. Of both theſe caſes we have inſtances in the catarrh, where at firſt the noſtrils are dry, but afterwards are deluged with a thin humour, or ſtopped up with a thick one. But in theſe, and many other examples, the membrane of the noſe itſelf is affected with inflammation, relaxation, or too great tenſion, by which it is impoſſible but the nerves, which conſtitute a great part of it, muſt be vitiated. It is evident alſo, that whatever obſtructs the free entrance of the air into the noſtrils, or impedes its paſſage through them, muſt prove detrimental to the ſenſe of ſmelling.

80 Hearing.

The ſenſe of hearing is more frequently vitiated than almoſt any of the reſt, as having a moſt delicate organ, and one compoſed of many and very ſmall parts, of which an account is given under the article Anatomy.—It frequently becomes too acute; either from the general habit of the body being too irritable, ſuch as often happens to hyſterical and lying-in-women: or from too great a ſenſibility of the brain itſelf, which is not unfrequently obſerved in fevers, as well as in phrenitis, and ſometimes in the true mania; or it may be from a diſeaſe of the ear itſelf, as when it is affected with inflammation, pain, or too great tenſion.—It may be rendered dull, or even be altogether deſtroyed, ſo that the perſon ſhall become totally deaf from the ſame cauſes acting with different degrees of force. This happens eſpecially from the want of the external ear; or from the meatus auditorius being ſtopped up with mucus, wax, or other matters; or from the ſides of the canal growing together, as ſometimes happens after ſuppuration or the ſmall-pox; or by the membrane of the tympanum becoming rigid or relaxed, or being eroded or ruptured; or the tympanum itſelf, or the Euſtachian tube, may from certain cauſes be obſtructed; or ſome of the little bones or membranes, or ſome of the muſcles of the labyrinth itſelf, may be affected with concretion, ſpaſm, palſy, or torpor; or laſtly, it may happen from diſeaſes of the brain and nerves, all the organs of hearing remaining ſound. Hence deafneſs is often a nervous diſeaſe, coming ſuddenly on, and going off of its own accord. Hence alſo it is common in old people, all of whoſe ſolid parts are too rigid, while their nervous parts have too little ſenſibility.

Perſons labouring under fevers, eſpecially of the typhous kind, often become deaf. When this comes on along with other ſigns of an oppreſſed brain, and a great proſtration of ſtrength, it may be a very bad ſign; but for the moſt part it is a very good one, even though accompanied with ſome degree of torpor or ſleepineſs.

A very common diſeaſe in the ſenſe of hearing is when certain ſounds, like thoſe of a drum, a bell, the falling of water, &c. are heard without any tremor in the air, or without a ſound perſon's hearing any thing. This diſeaſe is called *tinnitus aurium*, of which various kinds have been obſerved. For the moſt part it is a very ſlight tranſient diſorder; but ſometimes it is moſt obſtinate, long-continued, and troubleſome. It ſometimes ariſes from the ſlighteſt cauſe, ſuch as any thing partially ſtopping up the meatus auditorius or Euſtachian tube itſelf, ſo that acceſs is in part denied to the air; whence it happens that the latter ſtrikes the membrane of the tympanum, or perhaps the interior parts, unequally, and with too much force. Hence *bombi*, a kind of tinnitus, are heard even by the moſt healthy when they yawn.

A much more frequent and troubleſome ſpecies of tinnitus accompanies many diſeaſes both of the febrile and nervous kind. This is occaſioned partly by the increaſed impetus of the blood towards the head, with an increaſe of ſenſibility in the nervous ſyſtem itſelf, ſo that the very beatings of the arteries are heard; and partly from the increaſed ſenſation and mobility of the nerves and muſcles of the labyrinth: whence it happens, that the parts which ought to be at reſt until excited by the tremor of the air, begin to move of their own accord, and impart their motion to other parts which are already in a morbid ſtate of too great ſenſibility.

A tinnitus ſometimes ariſes from any vehement affection of the mind; ſometimes from a diſorder in the ſtomach; ſometimes from a rheumatic diſorder affecting the ears and head; or from a catarrh, which commonly affects the tube. Sometimes, however, the tinnitus alone affects the patient; and even this is a diſeaſe of no ſmall conſequence. Theſe various cauſes, however, both of this and other diſorders of the hearing, are often very difficult to be diſtinguiſhed, as well on account of the inacceſſible ſituation of the organ, as on account of the little knowledge we have of its action. But from whatever cauſe it ariſes, both this and the other various affections of the hearing can neither be cured certainly nor eaſily.

81 Sight.

Concerning the nature of the ſenſe of ſight, the reader may conſult the articles Anatomy and Optics. Of this ſenſe ſome ſlight diſorders, or rather varieties, are often obſerved. Thoſe perſons are called *ſhort-ſighted* who cannot ſee diſtinctly unleſs the object be very near them. This diſorder ariſes from too great a refraction of the rays by reaſon of their being too ſoon collected into a focus by the cryſtalline lens, and diverging again before they fall upon the retina, by which means they make an indiſtinct picture upon it. The moſt uſual cauſe is too great a convexity of the eye or ſome of its humours, as too prominent a cornea. It is a diſorder common to young people, which is ſometimes removed when they grow older. As ſoon as the firſt approaches of ſhort-ſightedneſs are obſerved, it is ſuppoſed it may be obviated by the perſon's

External Senses.

accustoming himself to view remote objects, and keeping his eyes off very small and near ones; as, on the contrary, it may be brought on by the opposite custom; because the eye accommodates itself somewhat to the distances of those objects which it is accustomed to view. But a concave glass, which causes the rays of light to diverge more than naturally they would before falling upon the cornea, is the most simple and certain remedy.

Long-sighted people are those who cannot see an object distinctly unless it be at a considerable distance from them. This arises from causes contrary to the former; namely, the eye being too flat, so that there is no room for refracting the rays and bringing them into a focus. Hence this defect is common in old people, and remedied by the use of convex glasses.

Those are called *nyctalopes* who see better with a very weak than with a strong light. It is a defect very seldom to be met with in the human race, though every person is sensible of it who hath been long kept in the dark and is then suddenly brought into the light. The disease arises from too great a sensibility of the retina, and the pupil being too open.

The sight is liable to many and grievous disorders. It is sharpened beyond measure, so that the person either perceives nothing distinctly, or with great pain, from the same causes that induce a similar disorder in the other senses; namely, excessive sensibility in the general habit of body; or a particular state of the brain common in phrenitis, or even in those afflicted with fevers arising from inflammation or too great excitement; though more frequently from the condition of the eye itself, one becomes unable to bear the light. The inflammation of the tunica adnata, and the forepart of the sclerotica, is communicated to the back parts of it, and from thence to the choroides and retina itself. Hence the light becomes intolerable, and vision is attended with pain and great irritation, sometimes inducing or augmenting a delirium.

The sense of seeing is made dull, or even totally abolished, by age; the aqueous humour not being supplied in sufficient quantity, and the cornea and lens, or the vitreous humour, becoming shrivelled or decayed. It may likewise happen from the cornea becoming dry and opaque; which is to be imputed to the languid motion of the blood, and to great numbers of the small vessels being obstructed or having their sides concreted;—or from the crystalline lens becoming yellow like amber, and the retina itself less sensible, for old age diminishes every sensation. It is totally abolished by injuries of the brain, the optic nerve, or the retina, even though the structure of the organ should remain sound. This disease is called an *amaurosis*; and is easily known by the dilatation and immobility of the pupil, the humours of the eye remaining clear. It is commonly owing to congestion of blood; and sometimes, where no congestion of blood can be shown, to mere torpor of the nerves. If it be only a torpor of part of the retina, we see black spots in those things at which we look; or flies seem to pass before our eyes, a very bad sign in fevers, and almost always mortal. The sight is abolished also by the obscurity or opacity of any of the parts through which the rays ought to pass and be refracted; as if the cornea lose its transparency by being covered with spots; or the aqueous humours become corrupted with blood, serum, or pus; or the lens (which often happens and which is called a *cataract*) becomes of a grey or brown colour, or the vitreous humour be in like manner corrupted; or lastly, when all the humours being dissolved, confused, and mixed together, by inflammation and suppuration, either do not suffer the light to pass at all, or to pass imperfectly and unequally; whence either no image is formed on the retina, or it appears obscure, distorted, imperfect, and ill-coloured.

The sight is also depraved, when things appear to it of a colour different from their own, or even in another situation and of another shape than they ought to have. This happens from the humours being tinctured with any unusual colour, as is said to happen in some instances of jaundice; or from an extravasation and mixture of the blood with the aqueous humour. A surprising depravation also, or constant and perpetual defect of vision, is not unfrequently observed in men otherwise very healthy, and who see quite clearly; namely, that they cannot distinguish certain colours, green, for example, from red*. Another depravation is, when, without any light being admitted to the eyes, sparks, small drops of a flame or gold colour, and various other colours, are observed to float before us. This is generally a very slight and transient disorder, common to those whose constitutions are very irritable; and arises from the slight impulse, as it would seem, on the retina, by the vessels beating more vehemently than usual. A fiery circle is observed by pressing the eye with the finger after the eye-lids are shut. The same reason, perhaps, may be given for those sparks which are seen by persons labouring under the falling-sickness, and increasing to the size of an immense and luminous beam before they fall down in convulsions. A similar beam those who have recovered from hanging or drowning testify that they have observed: for by reason of the respiration being suppressed, the vessels of the head swell and compress the whole brain and nervous parts of the head. Sparks of the same kind, and these too of no good omen, are observed in patients labouring under a fever, where a phrenitis or fierce delirum is at hand: and likewise in those who are threatened with palsy, apoplexy, or epilepsy.—A distinct but false perception, namely of visible things which do not exist, is to be imputed to some injury of the brain, to madness or a delirium, not to any disease of the eye.

* See the article COLOURS (*incapacity of distinguishing*).

A very frequent defect of vision remains to be mentioned; namely, squinting. A person is said to squint who has the axes of the eyes more oblique than usual, and directed to different points. Hence a great deformity, and often an imperfect and confused vision by which the objects are sometimes seen double. It is an evil for the most part born with the person, and often corrected by those attempts which an infant makes to see more pleasantly and distinctly; and this even without being conscious of its own defects. It is also easily learned, especially in infants, even without their own knowledge, by that kind of imitation which has a great influence over the human race, especially in their tender years.—It is by no means, however, so easily unlearned.

Squinting is frequently occasioned by a spasm, palsy, rigi-

External Senses. rigidity, &c. of the muscles which manage the eye; by epilepsy; by certain diseases of the head, the hydrocephalus especially; or by any great injury done to the head. Sometimes, though very rarely, it comes on suddenly without any known cause. It is very probable, however, that squinting often arises from a fault of the retinæ, when their central points, for instance, and those similarly placed with respect to the centre, do not agree. In this case there must be a contortion of the eye, that the object may not be seen double. This seems also to be the reason why squinting is horribly increased when the person brings the object near his eye in order to view it more perfectly. Or if the central point of either, or both, of the retinæ be insensible, or nearly so, it is necessary for the person to distort his eyes that he may have any distinct vision of objects. If the optic nerve had not entered the retina obliquely, but passed directly through its centre, we would all either have squinted or seen double.

82 Vertigo. Physicians have referred to the sense of vision that most troublesome sensation which we call a *vertigo:* though it seems rather to belong to that of feeling, or of consciousness; for in many instances the disorder is not removed either in the dark or by shutting the eyelids. The vertigo takes place when external objects really at rest seem to reel, to whirl round, to tremble, or to move in any manner of way. If the disorder be very violent, the person is neither able to see, on account of a dimness of sight; nor can he stand, as the powers fail which ought to govern the limbs. A nausea also usually accompanies the vertigo, and the one generally produces the other.

This disorder is observed to be both the symptom and forerunner of some dangerous diseases; such as apoplexy, epilepsy, hysteria; hæmorrhages from the nose and other parts; suppressions of the menses; plethora; fevers, as well such as are accompanied with debility as those in which there is an increased impetus of the blood towards the head. An injury done to the head also, but rarely one done to the eyes unless in so far as it affects the whole head, brings on a vertigo. A vertigo may be likewise produced by a very great and sudden loss of blood or other fluid; by debility; syncope; various diseases of the alimentary canal, of the stomach especially; poisons admitted into the body, particularly of the narcotic kind, as opium, wine, &c. and hence vertigo is a sympton of every kind of drunkenness. Various motions also, either of the head or the whole body, being tossed in a ship, especially if the vessel be small and the sea runs high, produce a vertigo. In these and similar examples, the unusual and inordinate motions of the blood are communicated to the nervous parts which are in the head; or these being affected by sympathy from the neighbouring parts, produce a confused sensation as if of a rotatory motion. Nay, it is often produced from an affection of the mind itself, as from beholding any thing turned swiftly round, or a great cataract, or looking down a precipice, or even by intense thought without looking at any thing.

Though a vertigo be for the most part a symptom and concomitant of other diseases, yet it is sometimes a primary disease, returning at intervals, increasing gradually, and equally impeding and destroying the functions of the body and mind.

Internal Senses. 83 Memory. After having treated of the external senses, doctor Gregory next proceeds to consider those properly called *internal;* which are, the *memory*, the *imagination*, and the *judgment*. The first is lessened, disturbed, or even totally destroyed, in many diseases, especially those which affect the brain; as the apoplexy, palsy, internal tumors of the head, external violence applied, fevers, especially those in which there is an increased motion of the blood towards the head, or where the brain is any other way very much affected. It is very rarely, however, depraved in such a manner that ideas are not represented to the mind in their proper order; or if at any time such a disorder occurs, it is considered rather as a disorder of the imagination, or as a delirium, than a failure of the memory. The mind is said to be disordered when the perceptions of memory or imagination are confounded with those of sense, and of consequence those things believed to be now present which are really past or which never existed; or when the sense of the person concerning ordinary things is different from that of other people. The general name for such disorders is *vesania:* if from fever, it is called *delirium*. A general fury without a fever, is called *mania*, or *madness:* but a partial madness, on one or two points, the judgment remaining sound in all other respects, is called *melancholia*. There is, however, no exact and accurate limits between a sound mind and madness. All immoderate vivacity borders upon madness; and, on the other hand, a sorrowful and gloomy disposition approaches to melancholy.

84 Delirium. Delirium accompanies fevers of many different kinds. Sometimes it is slight, easily removed, and scarce to be accounted a bad sign. Often, however, it is very violent, and one of the very worst of signs, requiring the utmost care and attention.

A delirium is either fierce or mild. The fierce delirium is preceded and accompanied by a redness of the countenance, a pain of the head, a great beating of the arteries, and noise in the ears; the eyes in the mean time looking red, inflamed, fierce, shining, and unable to bear the light; there is either no sleep at all, or sleep troubled with horrid dreams; the wonted manners are changed; an unusual peevishness and ill-nature prevail. The depravation of judgment is first observed between sleep and waking, and by the person's crediting his imagination, while the perceptions of sense are neglected, and the ideas of memory occur in an irregular manner. Fury at last takes place, and sometimes an unusual and incredible degree of bodily strength, so that several people can scarce keep a single patient in his bed.

The mild delirium, on the contrary, is often accompanied with a weak pulse, a pale collapsed countenance, and a vertigo when the patient sits in an erect posture; he is seldom angry, but often stupid, and sometimes remarkably grieved and fearful. The loss of judgment, as in the former kind, is first perceived when the patient is half awake; but a temporary recovery ensues upon the admission of the light and the conversation of his friends. The patient mutters much to himself, and attends little to the things around him; at last, becoming quite stupid, he neither feels the sen-

Delirium. ſenſations of hunger or thirſt, nor any of the other propenſities of nature, by which means the urine and excrements are voided involuntarily. As the diſorder increaſes, it terminates in ſubſultus tendinum, tremors, convulſions, fainting, and death. The other ſpecies of delirium alſo frequently terminates in this, when the ſpirits and ſtrength of the patient begin to fail.

The ſymptoms accompanying either of theſe kinds of delirium ſhow an unuſual, inordinate, and unequal motion of the blood through the brain, and a great change in that ſtate of it which is neceſſary to the exerciſe of the mental powers. It is ſufficiently probable, that an inflammation of the brain, more or leſs violent and general, ſometimes takes place, although the ſigns of univerſal inflammation are frequently ſlight. This we learn from the diſſection of dead bodies, which often ſhow an unuſual redneſs of the brain or of ſome of its parts, or ſometimes an effuſion or ſuppuration.

The ſtate of the brain, however, may be much affected, and a delirium induced, by many other cauſes beſides the motion of the blood. In many fevers, typhus, for inſtance, the nervous ſyſtem itſelf is much ſooner and more affected than the blood; and though the morbid affections of the nervous ſyſtem are as inviſible to the ſenſes as the healthy ſtate of it, the ſymptoms of its injuries plainly ſhow that its action, or *excitement* as ſome call it, is unequal and inordinate. In this way, too, a delirium is produced by ſeveral poiſons.

85 Melancholy and mania. The pathology of melancholy and mania is much more obſcure; as coming on without any fever, or diſturbance in the blood's motion. Often alſo they are hereditary, depending on the original ſtructure of the body, eſpecially of the brain; the fault of which, however, cannot be detected by the niceſt anatomiſt. But it is well known, that various diſeaſes of the brain, obſtructions, tumors, either of the brain itſelf, or of the cranium preſſing upon it, any injury done to the head, and, as ſome phyſicians relate, the hardneſs and dryneſs of the brain, and ſome peculiar irritations affecting the nervous ſyſtem, are capable of bringing on this malady. And indeed ſo great are the irritations affecting the nervous ſyſtem in mad people, that they often ſleep little or none for a long time.—Yet even this ſo defective and imperfect knowledge of the diſeaſes of the brain and nerves, is by no means free from difficulties. For though we know that the brain, or a certain part of it, is hurt, or that it is irritated by a ſwelling, or a pointed bone growing into it, nobody can foretel how great, or what may be the nature of the malady from ſuch a hurt: for examples are not wanting of people who, after loſing a large part of the brain, have recovered and lived a long time; or of thoſe who have perceived no inconvenience from a large portion of that viſcus being corrupted, until at length they have fallen ſuddenly down and died in convulſions.

86 Idiotiſm. Another diſeaſe of the internal ſenſes, quite different from theſe, is *fatuity* or *idiotiſm*. Thoſe are called *idiots* who are deſtitute either of judgment or memory, or elſe have theſe faculties unequal to the common offices of life. A kind of idiotiſm is natural and common to all infants; neither is it to be accounted a diſeaſe: but if it laſts beyond the ſtate of infancy, it is a real diſeaſe, and for the moſt part incurable. It has the ſame cauſes with the other diſeaſes of the internal ſenſes: although theſe can ſcarcely be detected by the eye or by the knife of the anatomiſt. It frequently accompanies, or is the effect of, epilepſy. Hence, if the epilepſy derives its origin from cauſes not ſeated in the head, as from worms lodging in the inteſtines, the fatuity may be cured by diſlodging theſe, and removing the epilepſy. It is not unlikely that the fatuity of children, and the dotage of old men, may ariſe from the brain being in the former too ſoft and in the latter too hard.

87 Diſorders in the muſcular power. The muſcular power may be diſeaſed in a great number of ways. The mobility itſelf may be too great; but this muſt be carefully diſtinguiſhed from vigour. By mobility is meant the eaſe with which the muſcular fibres are excited into contraction. The vigour, on the other hand, is that power with which the contraction is performed. They are ſometimes joined, but more frequently ſeparate, and for the moſt part the exceſſes of each are owing to contrary cauſes.

88 Mobility. Too great mobility is when motions are excited by too ſlight a ſtimulus, or when too violent motions are produced by the cuſtomary ſtimulus. A certain habit of body, ſometimes hereditary, renders people liable to this diſeaſe. Women have a greater ſhare of mobility than men have. Infants have a great deal of mobility, often too great; youth has leſs than infancy, but more than man's eſtate; though old age has commonly too little. A lazy, ſedentary life, full diet, a ſuppreſſion of the uſual evacuations, fulneſs of the blood-veſſels, and ſometimes their being ſuddenly emptied, laxity, flaccidity of the ſolids in general, but ſometimes too great a tenſion of the moving fibres, the uſe of diluents, eſpecially when warm, or heat applied in any manner, produce too great mobility. And this may be either general or particular, according as the cauſes have been applied to the whole body or only to a part of it.

89 Vigour. Vigour in general is rarely morbid; although ſometimes certain muſcular parts appear to have too great ſtrength. In maniacs and phrenitics, an immenſe ſtrength is obſerved in all the muſcles, eſpecially in thoſe that ſerve for voluntary motion; which is not unjuſtly reckoned morbid. The reaſon of this exceſs is very obſcure; however, it is plainly to be referred to a diſeaſed ſtate of the brain.

A more frequent and more important exceſs of vigour is obſerved in thoſe muſcular fibres that do not obey the will, ſuch as thoſe which move the blood. Its circulation is thus often increaſed, not without great inconvenience and danger to the patient. But a ſlighter exceſs of this kind, pervading the whole body, renders people apt to receive inflammatory diſeaſes, and is uſually called a *phlogiſtic diatheſis*. But this is better obſerved when local, as in inflammation itſelf.

Too great vigour of the muſcular fibres may ariſe from the nervous power increaſed beyond meaſure, as in mania, phrenitis, or violent affections of the mind; from too great a tenſion of the fibres, by which they more eaſily and vehemently conceive motions, as of the arteries when filled with too much blood; from catching cold, by being expoſed either to cold or heat, as uſually happens in the ſpring; or laſtly, though the nervous power and tenſion of the fibres ſhould

ſhould not at all be changed, their action may become too great, from a ſtimulus more violent than uſual being applied, or from the uſual ſtimulus if the fibres themſelves have already acquired too great a ſhare of mobility.

90 Torpor. The oppoſite to too great mobility is torpor, and to too great vigour is debility. Torpor is ſuch a diminution of mobility as renders the parts unequal to their functions. It ariſes from cauſes directly oppoſite to mobility; ſuch as, in the firſt place, a harder and more rigid contexture of the parts themſelves, or even ſometimes from one too lax and flaccid; from old age; from ſome peculiar temperament of body, ſuch as one phlegmatic, frigid, or inſenſible; too great and inceſſant labour, cold, ſpare diet, and an exhauſted body. This evil is the more to be dreaded, becauſe, the powers of the body being deficient, nature is neither able to make any effort of herſelf, nor are the remedies, in other caſes the moſt efficacious, capable of affording her any aſſiſtance.

91 Debility. Debility takes place, when the motion of the muſcles, either voluntary or involuntary, is not performed with ſufficient ſtrength. A greater or leſſer ſhare of debility, either general or of ſome particular part, accompanies almoſt all diſeaſes, and is indeed no ſmall part of them: for it is hardly poſſible that a diſeaſe can ſubſiſt for any length of time without inducing ſome degree of debility. When a ſtate of debility is induced, it renders a man obnoxious to innumerable diſorders, and throws him as it were defenceleſs in their way. It often depends on the original ſtructure of the body, ſo that it can be corrected neither by regimen nor medicines of any kind. A different degree of ſtrength alſo accompanies the different ages of mankind; and thus, in ſome caſes, debility cannot be reckoned morbid. But a truly morbid and unwonted debility ariſes from the nervous force being diminiſhed; from diſeaſes of the brain and nerves, or of the muſcles through which they are diſtributed; from a decay of the nerves themſelves; from a want of the due tenſion of the fibres, or the fibres themſelves becoming torpid; from the body exhauſted by ſpare diet, want, evacuations; or laſtly, from diſeaſes affecting the whole body, or ſome particular parts of it.

92 Palſy. The higheſt degree of debility, namely, when the ſtrength of the muſcles is altogether or nearly deſtroyed, is called *paralyſis* or *palſy*; and is either univerſal, or belonging only to ſome particular muſcles. An univerſal palſy ariſes from diſeaſes of the brain and nerves, ſometimes very obſcure, and not to be diſcovered by the anatomiſt; for the nervous power itſelf is often deficient, even when the ſtructure of the nerves remains unhurt: yet often a compreſſion, obſtruction, or injury of the veſſels, extravaſation of blood, or ſerum, collections of pus, ſwellings, &c. are diſcovered. It frequently ariſes from certain poiſons acting on the nerves; from the fumes of metals; from the diſeaſes of parts, and affections of the muſcles, very remote from the brain, as in the colic of Poictou. A palſy of ſingle muſcles, but leſs perfect, often ariſes without any defect of the brain or nerves, from any violent and continued pain, inflammation, too great tenſion, relaxation, reſt, or deſtruction of the contexture of the parts, ſuch as commonly happens after the rheumatiſm, gout, luxations, fractures of the bones, and iſchuria.

An *univerſal* palſy, however, as it is called, ſeldom affects the whole body, even though it ſhould originate from a diſeaſe of the brain. We moſt commonly ſee thoſe who are paralytic affected only on one ſide, which is called an *hemiplegia*. It is ſaid that the ſide of the body oppoſite to the diſeaſed ſide of the brain is moſt commonly affected. If all the parts below the head become paralytic, it is called a *paraplegia*. In theſe diſeaſes the ſenſes for the moſt part remain; though ſometimes they are aboliſhed, and at others rendered dull. Sometimes, tho' rarely, and which is an exceeding bad ſymptom, the motion, ſenſation, pulſe, and heat of the paralytic limbs are loſt; in which caſe the arteries themſeves become paralytic. A palſy of the whole body, as far as regards the voluntary motions, with anæſtheſia and ſleep, is called an *apoplexy*. This proceeds from ſome injury of the brain: though a ſtate very ſimilar to it is induced by narcotics, opium, wine itſelf, or any generous liquor taken to exceſs; and laſtly, by breathing in air corrupted by noxious impregnations, ſuch as a large proportion of carbonic acid, hydrogenous gas, or any ſimilar active aeriform fluid

Another diſeaſe to which muſcular motion is liable, and that neither ſlight nor unfrequent, is called *ſpaſm*. 93 Spaſm. This is a violent and irregular motion of the muſcles. Of ſpaſms there are two kinds, the tonic and clonic. The latter is frequently called a *convulſion*; in order to diſtinguiſh it from the other, which is more peculiarly called *ſpaſm*.

Spaſm therefore is a violent, conſtant, and preternatural contraction of the muſcular fibres; but a convulſion is an unuſual and violent contraction alternated with relaxation. People are rendered liable to ſpaſm by too ſenſible an habit of body, or too great mobility; and hence it is a diſeaſe common in women, in infants, and in weak, luxurious, lazy, and plethoric people. It is brought on thoſe already prediſpoſed to it, by any kind of ſtimulus applied to the brain, or to any nerve, muſcle, or nervous part connected with it: of which we have examples in dentition; worms lodged in the inteſtines, and irritating them; any acrid matter infecting the blood, or much affecting the ſtomach and inteſtines; the irritation of any nerve, or of the brain itſelf, by an exoſtoſis, ſwelling, too great fulneſs of the veſſels, pain, vehement affections of the mind, ſudden evacuation, or poiſons admitted into the body. Frequently, however, the malady originates from ſlight cauſes, little known, and not eaſily obſerved.

Spaſm is both the cauſe and effect, and frequently conſtitutes the greateſt part, of moſt diſeaſes. It is often very difficult either to be known or cured; becauſe it is ſo multiform, and produces as many different ſymptoms as there are organs affected; of which it ſurpriſingly diſturbs, impedes, or increaſes the functions. It is a diſeaſe ſeated in the original ſtamina of the conſtitution; and neither to be removed by ſlight remedies, nor in a ſhort time.

With regard to ſleep, Dr Gregory obſerves, that its 94 Sleep. uſe is ſufficiently apparent from the effects which it produces in the body. It reſtores the powers both of mind and body when exhauſted by exerciſe, giving vigour to the one, and reſtoring its wonted alacrity to the

Disorders of Sleep.

the other. It renders the muscles again active and moveable, after they have become wearied, rigid, painful, and trembling by hard labour. It moderates the quickness of the pulse, which usually increases at night, and brings it back to its morning standard. It seems also to assist the digestion of the aliment; lessens both the secretions and excretions; and renders the fluids thicker than otherwise they would be, especially in a body endowed with little sensibility or mobility. Hence sleep is not only useful, but absolutely necessary for preserving life and health; and is a most excellent remedy both for alleviating, and totally removing, a great many diseases.

Want of sleep is hurtful in a great many different ways, especially to the nervous system. It renders the organs of sense both external and internal, as well as those of every kind of motion, unfit for performing their offices. Hence the sensations are either abolished, or become imperfect or depraved; and hence imbecility of mind, defect of memory, a kind of delirium, mania itself, pain of the head, weakness of the joints, an imperfect or inordinate action of the vital organs, quickness of pulse, heat, fever, depraved digestion, atrophy, leanness, and an increase or perturbation of the secretions and excretions.

Sleep may be prevented both in healthy and sick people from various causes; such as strong light, noise, pain, anger, joy, grief, fear, anxiety, hunger, thirst, vehement desire, motion of the body, memory, imagination, intense thought, &c. On the other hand, sleep is brought on by a slight impression on the organs of sense, or none at all; by the humming of bees, the noise of falling water, cold and insipid discourse; or lastly, by such an exercise of the memory as is neither too laborious nor disturbing to the mind.—Too great an impulse of the blood towards the head, such as often happens in fevers, prevents sleep; but a free and equal distribution of the blood through the whole body, especially the extreme parts, frequently brings it on. Whatever weakens the body also favours sleep; and hence various kinds of evacuations, the warm bath, fomentations, sometimes heat itself, are useful for promoting it. It also comes on easily after taking food, or indulging venery; the violent sensation being then quieted, and the body itself somewhat weakened. Cold produces a deep sleep of long continuance, not easily disturbed, and often terminating in death. Lastly, there are certain substances which, when applied to the body, not only do not excite the nervous system, but plainly lay us asleep, and render us unfit for sensation: of this kind are those called *narcotics*, as opium and the like; among which also we may reckon wine taken in too great quantity. Lastly, watching itself is often the cause of sleep; because while a man is awake he always more or less exercises the organs of his body, by which the nervous influence is diminished, and thus the more violently the body is exercised, in the same proportion is the person under a necessity of sleeping.

Sleep is deficient in many diseases; for there are few which do not excite pain, anxiety, or uneasiness, sufficient to prevent the approach of sleep, or to disturb it. Fevers generally cause those who labour under them to sleep ill; as well on account of the uneasiness which accompanies this kind of diseases, as by reason of the impetus of the blood towards the head being frequently increased; and likewise from the stomach being disordered, loaded with meat, or distended with drink. Hence also we may see the reason why many hypochondriac and hysteric patients sleep so ill; because they have a bad digestion, and their stomach is disposed to receive many though frequently slight disorders; the slightest of which, however, is sufficient to deprive the patient of rest, provided the body be already irritable, and endowed with too great a share of mobility.

Want of sleep will hurt in diseases as well as in health; and for the same reason; but in a greater degree, and more quickly, in the former than in the latter; and is therefore not only a very troublesome symptom of itself, but often produces other very dangerous ones.

Too much sleep, on the other hand, produces many mischiefs, rendering the whole body weak, torpid, and lazy; and it even almost takes away the judgment. It also disturbs the circulation, and diminishes most of the secretions and excretions. Hence plethora, fatness, flaccidity, and an inability for the common offices of life.—The causes of this excess are, either the usual causes of sleep above-mentioned increased beyond measure, or some fault in the brain, or a compression of it by an extravasation of the humours; or sometimes, as it would seem, from great debility produced by an unusual cause, as in those who are recovering from typhous fevers and other diseases. In these examples, however, this excess of sleep is by no means hurtful; nor even, perhaps, in these cases where an excess of grief continued for a long time, or a great fright, have produced a surprising and unexpected somnolency. Lastly, many people have accustomed themselves, and that not without a great deal of hurt to their constitutions, to sleep too much. Nor are there examples wanting of some who have passed whole days, and even months, in sleep almost uninterrupted.

With regard to the manner in which the circulation of the blood is performed, and the various principles of which it is composed, see the articles Blood, and Anatomy. As for the disorders to which the blood and its circulation are subject, Dr Gregory observes, that in our younger years the veins are much more dense, firm, and strong, than the arteries; but the latter, by reason of the continual pressure upon them, and the strength which they exert, become daily more firm, hard, and strong, until at last they equal or exceed the veins themselves in strength; and it is not uncommon in old men to find some part of the arteries converted into an horny substance, or even into a solid bone. Hence in the state of infancy the greatest part of the blood is contained in the arteries, and in old age in the veins; an affair indeed of no small moment, as it shows the reason in some measure of the state of increase and decrease of the body. Besides, if any disease happens from too great a quantity of blood, it thence appears that it must show itself in young subjects in the arteries, and in old ones in the veins; and this is the reason of many diseases which accompany certain periods of life. 95 Circulation.

In most, if not in all species of animals, the arteries of the females are much more lax and capacious when compared with the veins, and the veins much less, than in

Disorders of Circulation.

in the males of the fame genus. The defign of nature in this conformation, is probably that they may be the better able to nourifh the fœtus in their womb. The fame likewife feems to be the reafon why women are more inclined to plethora than men; and to this greater capacity of the arteries and fmallnefs of the veins are we to afcribe that beauty and elegant fhape of the arms in women, not disfigured or livid with veins as in men.

The blood is alfo diftributed in various proportions to the different parts of the body, and that proportion too differs at different periods of our lives. At firft an immenfe quantity is fent to the head, becaufe that part of the body is firft to be evolved and fitted for its offices: but as foon as the parts begin to make a confiderable refiftance to the efforts of the blood, and the veffels cannot eafily be further dilated, it is neceffarily fent off to other parts; by which means the reft of the body increafes in bulk, and becomes fitted for performing its proper functions. The effect of this change is alfo very foon obferved, namely, when none of the blood paffes through the navel, and of confequence a greater quantity is fent by the iliac arteries to the inferior extremities. Thefe, though fo fmall and flender in the fœtus, increafe very fuddenly; fo that often in not many months the child can not only ftand on its feet, but even walk tolerably well.

96 Pulfation of the arteries.

Phyficians are wont to judge of the ftate of the circulation by the pulfe; which indeed is very various, as well with regard to its frequency, as to the ftrength and equality of its ftrokes and intervals.—Its common quicknefs in a healthy grown-up perfon is about 70 ftrokes in a minute. In a fœtus, perhaps, it is more than double; and in an infant a few months old, hardly lefs than 120. As we grow up, this quicknefs gradually diminifhes; fo that in extreme old age it fometimes does not exceed 50, or is even flower. This rule however, is not without exceptions: for many, efpecially thofe of an irritable habit, have the pulfe much quicker; while others, even in the vigour of their age, have the pulfe remarkably flow. It is for the moft part fomewhat quicker in women than in men.

The pulfe is alfo rendered quicker, both in a healthy and difeafed body, by the application of ftimuli of many different kinds. Exercife efpecially, by accelerating the return of the blood through the veins, increafes the quicknefs of the pulfe to a furprifing degree. Various kinds of irritations affecting the nervous fyftem, as intenfe thinking, paffions of the mind, pain, heat, ftimulating medicines, wine, fpices, &c. likewife produce the fame effect. The acrimony of the blood itfelf alfo is thought to quicken the pulfe.

When a perfon firft awakes in the morning, the pulfe is flow, but becomes quicker by degrees on account of the many irritating matters applied to the body. Its quicknefs is increafed after taking food, efpecially of the animal kind, or fuch as is hot or feafoned with fpices. In the evening a flight fever comes on, for which reft and fleep are the remedy. Thefe things, however, are fcarce to be obferved in a healthy perfon, but are very evident in one that is feverifh, efpecially when the difeafe is a hectic.—Again, even debility itfelf often renders the pulfe quicker than ufual; becaufe the ventricle of the heart not being quite emptied, it is the fooner dilated again, and of confequence contracts the fooner. For this reafon a phyfician can never judge of the ftrength of the circulation from the frequency of the pulfe.

Laftly, in all fevers, however different from one another, the pulfe is found to be too quick, partly perhaps from debility, partly from the acrimony of the fluids, and partly from the repulfion of the blood from the furface of the body, and the accumulation of it in the large veffels where it acts as a ftimulus; though it muft be owned, that a great deal of this is obfcure, if not totally unknown; nor in truth are we able to underftand in what manner the *autocrateia* acts with regard to the frequency of the pulfe.

The pulfe is feldom obferved too flow, unlefs when the mobility of the body is much diminifhed, as in decrepid old age, or from a compreffion or difeafe of the brain; but a greater compreffion of the brain ufually produces a ftill more remarkable flownefs of the pulfe, as in the hydrocephalus, apoplexy, &c.—Sometimes alfo the pulfe is too flow in thofe who are recovering from tedious fevers. But this is a matter of little moment, and feems to be owing to fome kind of torpor. Indeed it has generally been confidered as a mark of a thorough and complete folution of the fever; for it is commonly obferved, that when this ftate of the pulfe takes place, the patient feldom fuffers a relapfe.

While the frequency of the pulfe continues the fame, its ftrokes may be either full, great, ftrong, and hard; or foft, fmall, and weak. A full, great, and ftrong pulfe takes place when the ventricle ftrongly and completely empties itfelf; throwing out a great quantity of blood into the arteries, which fully diftends them and ftimulates them to a ftrong contraction. A pulfe of this kind is common in ftrong healthy men, and is feldom to be accounted a fymptom of difeafe. But if it be too ftrong, and ftrike the finger of the perfon who feels it violently and fharply, it is called a *hard pulfe*. This hardnefs is produced by a fudden and violent contraction of the heart and arteries, which diftends even the remote branches, as thofe of the wrift, too fuddenly and fmartly, and excites them alfo to fudden and violent contractions.

A hard pulfe therefore denotes too great an action of the heart and arteries. It may arife from various caufes: in the firft place, from too great a tenfion of the veffels; for inftance, from their being too full, and by that means more prone to motion, and the more fit for receiving violent motions. It may arife alfo from too great a denfity and firmnefs of the folids; and hence it is moft frequent in cold countries, among ftrong robuft people, and fuch as are accuftomed to hard labour. It may likewife arife from various caufes irritating the whole nervous fyftem, or only the heart and arteries. Laftly it accompanies many fevers as well as moft inflammatory diforders, whether the inflammation arifes from a general ftimulus applied to the whole body, or from the irritation of particular parts, by degrees extended over the whole body. In fuch a ftate of the circulation, the patient frequently ftands in need of blood-letting, and almoft always bears it well.

A

Diforders of Circulation.

A fmall, weak, and foft pulfe is generally owing to caufes oppofite to the foregoing and indicates a contrary ftate of the circulation and nervous fyftem. It frequently requires ftimulants; nor does it generally require blood-letting, or eafily bear it. Sometimes, however, a pulfe of this kind is obferved even in the cafe of a dangerous inflammation, of the ftomach for inftance, or inteftines. But in thefe and the like examples, we ought to attend to the nature of the malady, much more than to the ftate of the pulfe.

The pulfe is faid to intermit, when the ftroke does not return after the ufual interval, and perhaps not till after twice, thrice, or four times the ufual fpace. A pulfe of this kind feems to be almoft natural and conftant in fome animals, and is common to fome men even in the moft perfect health; and if thefe happen to be feized with a fever, the pulfe fometimes becomes equal nor can the difeafe be removed before the intermiffion has returned.

Moreover, in fome people, though their pulfe beats equally while in health, yet the flighteft illnefs makes it intermit; and in others, efpecially thofe who have a great deal of mobility in their conftitution, fuch as hypochrondriac and hyfteric people, the intermiffion of the pulfe is felt, without applying the finger to the artery, merely by the uneafinefs which they perceive in their breafts during thofe intervals in which the pulfe is deficient. An intermittent pulfe likewife occurs in many difeafes of the breaft, efpecially when water is collected in it; and the like happens in the end of all difeafes, efpecially fevers, when the ftrength is nearly exhaufted, and death approaches, of which it is frequently the forerunner.

An intermitting pulfe therefore feems to arife from an unequal influx of the nervous power into the heart, or from the decay and exhauftion of the nervous power, by which means the heart is not able to contract till it has been diftended beyond its due pitch. Or laftly, it may arife from difeafes of the organ itfelf, or the neighbouring parts; from fwellings, water, &c. prefsing upon them, and impeding the action of the heart: which indeed is a very dangerous diforder, and almoft always mortal.

Many other variations of the pulfe are enumerated by phyficians, but moft of them uncertain, and not confirmed by experience. We fhall therefore now confider the motion of the blood, which may be either too great, too fmall, or irregular.

A quick pulfe, *cæteris paribus*, produces a more rapid circulation, becaufe the fooner that the ventricle of the heart is emptied, the more quickly is the blood thrown into the arteries; and their actions muft anfwer to this ftronger ftimulus. Hence exercife, heat, ftimulants, plethora, every kind of irritation, paffions of the mind, and fever, increafe the circulation. The effect of this increafe is a diftenfion of the veffels, a ftimulus applied to the whole body, an increafe of heat, and often a debility. The fecretion of fweat is increafed while the other fecretions are diminifhed, and the various functions of the body impeded; thirft comes on, the appetite is loft, the fat confumed, and a difpofition to putrefcency introduced. Sometimes the fmaller veffels are burft; whence effufions of blood and hæmorrhages But we are by no means to forget, that this violent motion of the blood, however hurtful it may feem, is among the beft remedies made ufe of by nature in curing many difeafes.

The motion of the blood is diminifhed, efpecially by debility torpor the want of irritation or of exercife: the fame thing happens to all the humours, if there be any obftruction in the veffels, or any caufe by which their return is hindered or rendered more difficult. Thus, from the very weight of the blood itfelf, if a perfon has ftood long on his feet, the humours return more flowly from the inferior extremities. Any difeafe of the heart and arteries alfo as an aneurifm, contraction, offification, muft neceffarily obftruct the circulation. The fame thing happens from obftructions of the veins, or interrupted refpiration, by which the paffage of the blood through the lungs to the left fide of the heart is impeded.

But, from whatever caufes this diminution of the circulation takes place, the bad confequences are perceived chiefly in the veins, becaufe in them the blood always moves more flowly than in the arteries. Hence varices, and congeftions of blood, efpecially in thofe parts of the body where the veins are deftitute of valves, and of confequence where the motion of the mufcles cannot affift the circulation. Hence alfo arife dropfies from an impeded or languid motion of the blood; becaufe the refiftance of the veins being increafed, the blood is received into them with the greater difficulty, and more of the thin humour is driven into the exhaling veffels, and by them depofited in fuch quantities as cannot be reabforbed by the lymphatics. Thefe difeafes, as well as all others proceeding from defects of the circulation, are alfo more difficult of cure than others, becaufe all the vital powers are weakened at the fame time.

Another diforder of the circulation is where the blood is carried to one part of the body in too great quantity, by which means the other parts are deprived of their due proportion. This irregular diftribution of the vital fluid frequently arifes from a ftimulus applied to the part itfelf, or to the brain, or at length acting on the mind, which, according to the laws of fympathy, produces a certain and definite diftribution of the blood. It arifes alfo not unfrequently from a fpafm taking place in fome other parts, which drives the blood out of its ordinary courfe.

In proportion to this irregularity of the circulation are the confequences; heat, fwelling, rednefs, inflammation, rupture of veffels, hæmorrhages, effufions, deftruction, corruption, and fuppuration of the cellular texture and adjoining parts, &c. Even this evil, however, nature often converts into an excellent remedy; and phyficians, following her fteps, frequently attempt to direct the diftribution of the blood in particular difeafes, well knowing that a change in the diftribution of the blood is frequently efficacious either for radically curing fome difeafes or relieving their moft urgent fymptoms

97 Palpitation.

Laftly, fome diforders in the motion of the heart itfelf, and thofe of no fmall confequence, remain yet to be taken notice of, namely, palpitation and fyncope. A palpitation is a violent and irregular action of the heart, fuch as for the moft part is perceived by the patient himfelf, and that not without a great deal of uneafinefs and oppreffion at his breaft; and is alfo manifeft to the by-ftanders if they apply their hands, or look

Diforders of Circulation.

look at his naked breaft; the pulfe of the arteries in the mean time being weak, unequal, and intermitting. This is a fpafmodic diforder; and is induced by various caufes affecting either the nervous fyftem in general, or the heart in particular. Every difeafe of the organ itfelf, fuch as a conftriction of its valves and blood-veffels, an offification, enlargement, or polypus, hindering the free action of the heart, and evacuation of blood from it, are capable of exciting it to violent and unufual contractions. The fame effect will alfo follow plethora, or too violent an impulfe of the blood, &c. The heart will likewife frequently palpitate from a violent excitement of the nervous fyftem, efpecially where the conftitution is endowed with a great deal of mobility. Hence palpitations from any affection of the mind, and in hyfteric women. Palpitation may likewife arife from an affection of the ftomach, occafioned by worms, a furfeit, flatus, or ftimulation by various acrid fubftances. It frequently alfo accompanies the gout when driven back, or even when a fit is coming on. Sometimes it arifes from debility, whatever may be the caufe; frequently from any difficulty in breathing; and many of thefe caufes may be joined at the fame time, or fome of them produce others.

Hence we may fee why the evil is fometimes flight and of fhort continuance; at other times altogether incurable, and certainly mortal in a longer or fhorter time; why it fometimes returns at intervals, often coming on and being increafed by every kind of irritation and exercife, and fometimes relieved or totally removed by ftimulants or exercife.

98 Syncope.

A fyncope is when the action of the heart, and, along with it that of the arteries, is fuddenly and very much leffened; whence the animal-powers, the fenfes, and voluntary motions, immediately ceafe. This may be produced by almoft all the caufes of palpitation; becaufe whatever can difturb and diforder the motion of the heart, may alfo weaken or fufpend it. The vitiated ftructure of the heart itfelf therefore, violent paffions of the mind, whether of the depreffing kind, or thofe which fuddenly and vehemently excite, various kinds of nervous difeafes, thofe of the ftomach, every kind of debility and evacuation, efpecially a great lofs of blood, exceffive and unremitting labour, long watching, heat, pain, many kinds of poifons, &c. produce fainting.

Hence we fee, that whatever weakens the motion of the blood through the brain tends to produce fainting; and, on the contrary, whatever tends to augment that motion, alfo tends to refrefh, and prevent the perfon from fainting. Hence alfo we fee how the mere pofture of the body may either bring on or keep off fainting, or remove it after it has already come on. We likewife fee how this diforder may fometimes be of little confequence and eafily removed; at others very dangerous, not only as a fymptom, but in even itfelf, as fometimes terminating in death; and laftly, how it may be ufed as a remedy by a fkilful phyfician, and artificially induced, either to free the patient from violent pain, or to ftop an immoderate effufion of blood fcarce to be reftrained by any other method.

99 Buff-coloured cruft on the blood.

With regard to the diforders of the blood itfelf, Dr Gregory obferves, that the glutinous part of it produces that buff-coloured appearance often feen upon blood drawn from people afflicted with inflammatory diforders, and even fometimes when no fuch difeafes are prefent. This cruft indeed is nothing elfe than the pure gluten of the blood taking longer time than ufual to coagulate, by which means the red particles have an opportunity of falling to the bottom. This indicates no lentor, denfity, thicknefs, or tenacity of the blood, as was formerly thought; but rather its thinnefs, or at leaft a lefs tendency in it to coagulate. It arifes for the moft part from a violent agitation and conquaffation of the blood within the body; and hence it accompanies many fevers, all inflammations, fometimes hæmorrhages, exanthemata, plethora, pain, and many irritations. It muft however be allowed, that in feveral of thefe difeafes it is rendered highly probable, at leaft from experiments apparently accurate, that the quantity of the gluten of the blood is really encreafed in the proportion which it bears to the other parts. This cruft, however, is not always to be accounted morbid, as it often happens to the moft healthy; and may even be produced or deftroyed by the flighteft caufes while the blood is running from the vein, fo that frequently we fhall fee a very thick and tenacious cruft on the blood flowing into one cup, while that which runs into another has little or none at all. In general, however, the appearance of this cruft fhows, that the patient will bear bloodletting well, though thofe have been in a great miftake who directed this operation to be repeated till no more cruft appeared on the blood.

Diforders of the Blood.

The glutinous part of the blood alfo frequently produces thofe maffes called *polypi*, which fometimes take place during life, but more frequently after death, in the large veffels near the heart, or even in the cavities of that organ. Similar maffes alfo are frequently formed in the uterus, and are called *moles*.

The quantity of blood contained in a healthy body is very various, and difficult to be afcertained. Many difeafes, however, may arife from its being either too fcanty or too abundant. Too great a quantity of blood is produced by the ufe of rich, nourifhing diet, ftrong drink, accompanied with a good digeftion; from a lazy, fedentary life, or much fleep, efpecially in thofe who have been formerly accuftomed to much exercife; with many other caufes of the fame kind. It renders the perfon dull, weak, and languid, and fometimes almoft totally oppreffes him; nor are thofe organs deftined for moving the blood fufficient for driving forward fuch a load. The pulfe finks; and fometimes a fyncope, vertigo, or palpitation takes place. More frequently, however, the veffels are too much diftended, and ready to be thrown into violent and irregular motions. Hence a difpofition to fevers, inflammations, an unequal diftribution of the blood, unufual congeftions, rupture of the veffels, and hæmorrhages. Moreover, by reafon of the clofe connection between the fanguiferous and the nervous fyftem, a fulnefs of blood produces a difpofition to fpafm and other difeafes of that kind. 100 Plethora.

Hence we may underftand why a plethora is fometimes accompanied with a weak and fometimes with a ftrong and hard pulfe, why it is the caufe as well as a part of fo many diftempers, why it is the effect of a high ftate of health, &c.

Disorders of the Blood.

The want of a due quantity of blood is no lefs pernicious than too great an abundance of it. It debilitates the perfon, and renders him unable to perform the proper offices of life; produces a languid circulation, fyncope, fpafms, and at laft death itfelf. In a flighter degree of the difeafe the body is emaciated through want of nourifhment, and its functions are vitiated in various ways. It may arife from want, bad food, or fuch as affords little nourifhment: from bad digeftion, or the chyle being hindered from paffing into the blood: from fevers, or other difeafes which exhauft the body and hinder nutrition: or laftly, from various evacuations, particularly of blood; and that the more efpecially if they are fudden, for in flow evacuations the veffels accommodate themfelves furprifingly to the quantity left in them. Befides, if the body be flowly exhaufted, the excretions are leffened by reafon of the deficiency of the vital power; fo that the unufual expence is eafily compenfated by the unufual retention. But if the evacuation happens to be very fudden and great, it may either prove mortal in a fhort time, or break the conftitution to a degree beyond recovery.

101 Inanition.

102 Morbid thinnefs of the blood.

By a great and long-continued deficiency of blood the quality of it alfo is impaired; becaufe the thin part of it is eafily and foon made up; but the glutinous, thick, and red part, not fo eafily. Hence the blood becomes thin, pale, fcarcely capable of coagulation, or of affording a proper fupport to the body. Too great thinnefs of the blood alfo proceeds from ufing much drink, efpecially of the aqueous kind, flender and little nourifhing diet, a bad digeftion in the ftomach; from difeafes of the lungs and thofe organs which elaborate the red part; or from fuppreffions of the ufual evacuations of thin humours, as fweat or urine, induced by cold, a fault of the fecreting organs, or by putrefcency. But along with this other diforders of the blood concur.

A too thin and watery blood makes the face pale, the body weak, languid, and torpid; the folid parts become flaccid from want of nourifhment, and having too great a quantity of water in their compofition. It brings on hydropic effufions of water in all parts of the body, by reafon of the increafed exhalation of that thin fluid which moiftens all the inward parts; partly by reafon of the blood itfelf being in fome meafure diffolved, fo that it paffes out of the veffels more eafily and plentifully than it ought to do; and partly by reafon of the veffels being relaxed beyond their ufual pitch, and not making a proper refiftance. Befides, in this cafe, the lymphatics are fo far from abforbing more than ufual, that, partaking likewife of the general debility, they are fcarce fufficient for performing their proper offices.

Nature, however, has taken care, by the moft fimple means, to provide againft fo many and fo great evils; for neither does the blood fo eafily become thin as fome have imagined, nor when this quality takes place does it want a proper remedy. For almoft inftantly, if the perfon be otherwife in health, the excretions of the thinner matters are greatly augmented, and the whole mafs of blood in a fhort time becomes as thick as formerly.

[102] Morbid thicknefs of the blood.

The oppofite to this, namely, too great a thicknefs of the blood, though often fpoken of by phyficians, is very rarely if ever obferved; and thofe fevers and inflammations which have been thought to arife from thence, are now found to originate from other caufes. The following would feem to be the law of the human conftitution. As foon as the blood has attained the due degree of thicknefs, or gone in the leaft beyond it, the excretions are either fuppreffed or diminifhed, the body attracts more moifture from the air, the perfon is thirfty, and drinks as much as is neceffary for diluting the blood. But if water be wanting, and the perfon cannot fatisfy his thirft, then the blood is fo far from being thickened that by reafon of a putrefcency begun or augmented, it is much diffolved, becomes acrid, and is with difficulty contained in the veffels.

103 Acrimony of the blood.

The acrimony of the fluids has afforded a large field for declamation to the fpeculative phyficians, and upon this flender foundation many perplexed and intricate theories have been built. It is certain indeed, that the blood in a ftate of health has fome fmall fhare of acrimony; and this acrimony, from certain caufes, may be a little increafed fo as to produce various difeafes of a dangerous nature. This we are affured of from the increafe of motion in the heart and arteries, and the fimilar augmentation of the action of the fecretory organs, from acrid fubftances taken inwardly. The fame thing alfo appears from the unufual acrimony of the fecreted fluids in fuch cafes, by which the veffels are fometimes greatly ftimulated, and fometimes even quite eroded. Very many acrid fubftances, however, are daily taken into the ftomach; fo that thefe muft either be corrected in the *primæ viæ*, or changed by digeftion before they pafs into the blood; or at leaft by dilution with much water, or being blunted by an admixture with gluten, oil, or inflammable air, they muft depofit much of their acrimony, and at laft be thrown out of the body as noxious fubftances. Thus a vaft quantity of falts, acid, alkaline, and neutral, may pafs through the body, without in the leaft affecting the health; though thefe falts, if taken in very large quantity, undiluted, or not thrown out of the body, will do much hurt.

Moreover, even while life continues putrefaction is going on, and produces much of that fubftance called *animal* falt; for into this a great part of our food is converted, and paffes off by the urine. But if this putrefcent difpofition be too great, it will produce too large a quantity of animal falt; efpecially if much of any faline fubftance is otherwife thrown into the body without proper dilution: and this kind of difeafe is well known to failors who have been long at fea without having an opportunity of getting frefh provifions.

For this fpontaneous putrefcency, nature has fuggefted a proper remedy, namely, frefh meat, efpecially of the vegetable and acefcent kind, and fuch as is well impregnated with aerial acid, which it may impart to the body. But where this kind of food is wanting, the putrefaction goes on apace, and a very great thinnefs and acrimony of the juices take place; efpecially if there be alfo a fcarcity of water, or the excretions which ought to carry the putrid matters out of the body languifh, either from cold, floth, torpor, depreffing paffions of the mind, or from the conftitution being broken by difeafes; or laftly, from too great heat, which always favours putrefaction.

Be-

Disorders of the Blood.

Besides, it would seem, that sometimes a disposition to putrefaction is much increased by the reception of a putrid ferment into the body; of which we have examples in some infectious fevers, where the contagion is very much assisted by heat, animal-diet, certain kinds of salts, dibility and nastiness.

Lastly, any single part of the body may putrefy from various causes, as from inflammation, gangrene, cold, &c. and thus may the whole body be infected; although for the most part the disease proves fatal before the corruption has spread over the whole body.

But when the mass of blood begins to putrefy greatly, it not only becomes very acrid, but thin also, so that it either will not coagulate at all, or shows only a slight and very loose crassamentum. Nay, even the red globules are broke down and destroyed; in which case it necessarily follows, that the blood must become very acrid, as well on account of the evolution of the salt, as by reason of the rancid and putrid gluten, which stimulates, and frequently even erodes, the vessels; producing spots, first red, then livid and black, tumors, and ulcers scarce possible to be cured, without first removing the putrescent disposition of the humours. From the same causes proceed hæmorrhages from every part of the body, hardly to be restrained; a most intolerable fetor of the breath and all the excrements; the highest debility and laxity of the solids; the putrefaction acting as a poison to the nervous system, and at length bringing on death.

An acrimony of the acid kind never takes place in the human blood, nor in any of the humours secreted from it; though one of them, namely the milk, turns acid spontaneously in a very short time after it is drawn from the breast. Neither, indeed, does an alkaline acrimony seem ever to take place in the blood. Putrescency indeed tends this way, and at last terminates in it; but scarcely while the person lives, though the nature of the urine, even while recent, seems to be but little distant from that of an alkali.

Many kinds of acrimony indeed may exist in the blood from too liberal an use of spices, wine, &c. but of these we know nothing certain. We well know, however, that the body is often infected with various kinds of morbid acrimony, which bring on many and dangerous diseases, as the small-pox, measles, cancers, lues venerea, &c. of which the origin and manner of acting are very little understood, though the effects are abundantly evident. In most cases, nature has taken no less care to provide against the *acrimony* than against the too great *thickness* of the blood. Sometimes an antidote is afforded, either by the excitement of thirst, that the acrid substance may be diluted with plenty of drink; or by increasing the evacuations, that it may be thrown out of the body; or lastly, by exciting various motions and actions of the vital powers, by which it may be either subdued, changed, rendered innocent, or expelled from the body by new and unwonted passages.

104 Respiration.

With regard to respiration, Dr Gregory observes, that it may be obstructed from various causes seated either in the lungs themselves or the surrounding parts. But from whatever cause this obstruction may arise, it undoubtedly produces all those diseases which proceed from an interrupted circulation. The lungs themselves also being at length compressed, and not suffered to dilate sufficiently, cannot throw off the vapour which arises from them; and hence they are frequently oppressed with moisture. At the same time they are irritated, so that a greater quantity of mucus, and that of a thicker kind than usual, is secreted; by which means the passages through which the air enters them are stopped up, and a violent cough at length throws off the load

Disorders of Respiration.

The respiration is also subject to some other disorders, as a cough and sneezing; which, though at first sight they may seem very dangerous, are not destitute of use, and may even be reckoned among the most salutary attempts of nature to relieve the patient. Often, however, they are attended with danger, or very great uneasiness; namely, when they are either too violent or exerted in vain. At any rate, it is necessary for a physician to know the nature, causes, and effects, of these, that he may be enabled to promote them when necessary, to moderate them when too violent, and to stop them when noxious or to no purpose.

A cough is a violent, frequently involuntary, and sonorous exspiration, suddenly expelling the air with great force through the glottis somewhat contracted. 105 Cough.
The convulsion of the muscles serving for exspiration, gives a great force to the air, while the contraction of the glottis produces the sound. It is often long continued, being repeated at certain intervals, during each of which the inspiration is imperfect and obstructed by reason of the contraction of the glottis. It is excited by any kind of acrid substance, either chemically or mechanically applied to those passages through which the air enters. These are lined with a membrane so exceedingly delicate and impatient of stimulus, that it cannot even bear the touch of the mildest substance, such as a small drop of water, without throwing the muscles serving for exspiration into a violent convulsion; the glottis at the same time contracting by means of the sympathy between it and the neighbouring parts. Thus the air is thrown out with such violence, that it drives the irritating substance along with it; and thus a cough becomes not only useful, but absolutely necessary for the preservation of life, as being able to free the lungs from every kind of irritating substance or foulness, which might soon bring on a suffocation. Hence a cough is almost an inseparable companion of every inflammation of the lungs, as well as every difficulty in respiration; and even frequently accompanies the entrance of the purest air when the trachea and bronchiæ are excoriated, or become too sensible. Examples also are not wanting, where a violent and troublesome cough has arisen from an irritation of the nervous system, or even of some particular part, of the ear, for instance, the stomach and intestines by worms, the liver by inflammation, &c.

Coughing may also be voluntarily excited, and may then be managed at pleasure. Even when involuntary, it may be moderated, or suppressed, by a contrary effort: though a violent fit of coughing cannot by any means be resisted. When it is once excited, the cough goes on till the irritating substance be expelled, or the sense of irritation abolished, or perhaps overcome by a more uneasy sensation than even the cough itself; after, Disorders of Respiration.

ter which, the irritation again returning at a certain interval, the cough alfo comes on. Hence we are taught a method of allaying and quieting this moft troublefome malady, though frequently it is not in our power to remove the caufe of it altogether.

A very violent cough is often dangerous. For by the retention of the breath, and the ftrong efforts made in coughing, a great quantity of blood is collected in the lungs, of which the veffels are diftended, and frequently broken; and hence there fometimes happens a violent and even fatal hemorrhage. More frequently, however, it is the caufe of a flower, though equally fatal, difeafe. Nay, a frequent and troublefome cough, without any great hemorrhage, or even without any hemorrhage at all, may damage the lungs to fuch a degree, efpecially if they be of a more tender ftructure than ufual, as to lay the foundation of a phthifis almoft always incurable.

Again, by a long-continued and violent cough, the paffage of the blood through the lungs being impeded, it muft neceffarily flow through the veins towards the head: hence rednefs and lividnefs in the countenance, hemorrhages, palfies, apoplexies, and fometimes mortal convulfions. Laftly, by a violent cough the abdominal vifcera are perpetually compreffed with remarkable violence; and if any part happens to be weaker than ufual, a hernia, prolapfus uteri, abortion, or fimilar accidents, may happen.

Even when the cough is more gentle, if it happens to be importunate and frequent, although we have nothing of this kind to fear, yet the patient is by no means free from danger; as he is thereby agitated, fatigued, has his conftitution broken, is deprived of reft, has a fever brought upon him, his lungs are fhaken and irritated, digeftion and all the other functions are impeded, till at laft he finks under a complication of maladies.

106 Sneezing.

Sneezing is fomewhat akin to cough, as confifting of a very full infpiration, to which fucceeds a moft violent exfpiration, by which the air is driven out through the noftrils with immenfe violence, and fweeps the paffage through them as it goes out. It is a convulfion much more violent than a cough, and is befides very difficult to be ftopped when once a propenfity to it has taken place. As a cough proceeds from an irritation of the glottis, trachea, bronchia, and lungs, fo fneezing arifes from an irritation of the membrane of the noftrils, but rarely from fympathy with any diftant part. It is fometimes of fervice, as well as a cough; though it is alfo fometimes prejudicial, for the reafons which have been already affigned.

107 Digeftion.

The laft part of Dr Gregory's treatife neceffary to be taken notice of here, is that which confiders difeafes arifing from a bad digeftion, difordered motion of the inteftines, and fome of the principal fecretions. The firft of thefe, he fays, are fometimes very troublefome, though feldom dangerous. The principal fymptoms are oppreffion, anxiety, pain at the ftomach; eructations, by reafon of air extricated from the fermenting aliments, and irritating the ftomach; naufea and vomiting, from the irritation and diftenfion of the fame organ; the belly fometimes too coftive, and fometimes too loofe; a defect of nourifhment; a general debility; relaxation of the folid parts; too great thinnefs of the fluids; all the functions impeded; pain of the head; vertigo, fyncope, afthma, palpitation; great finking of the fpirits, efpecially if the patient has been of a peculiar conftitution; fometimes the gout, fometimes a dropfy, or a flow fever which may prove mortal.

Diforders of Digeftion.

108 Coftivenefs.

The motion of the inteftines may be either too great or too little; and hence proceeds either coftivenefs or loofenefs. The former is frequently not to be accounted morbid; but, when it is, it may arife from the ftructure of the inteftines being injured, or from their being fhut up or obftructed by fpafm or otherwife, or from a deficiency of thofe humours which moiften the inteftines; or it may arife from mere debility, from a palfy of the fibres perhaps, or from a deficiency of the ufual ftimulus, of the bile, for inftance, or from too dry or flender a diet.

The confequences of long-continued coftivenefs, are firft an affection of the alimentary canal, and then of the whole body. The ftomach is difeafed, and does not digeft the aliments properly; the whole body is left deftitute of its ufual ftimulus; the blood is corrupted, perhaps from the reforption of the putrid matter into it. The circulation through the abdominal vifcera is impeded; hence frequent and irregular congeftions, varices of the veins, hemorrhoids, &c. Nay, the inteftines themfelves being overloaded, diftended and irritated by an heavy, acrid, and putrid load of aliment or other matters, are excited to new and unufual contractions, which, if they do not get the better of the obftruction, bring on tormina, colic, or an iliac paffion, inflammation and gangrene, fatal in a very fhort time.

109 Loofenefs.

Loofenefs, or diarrhœa, is a malady extremely common; being fometimes a primary difeafe, and fometimes only a fymptom or an effect of others. Sometimes it is a falutary effort of nature, fuch as the phyfician ought to imitate and bring on by art. It is alfo familiar to infants, and to people of a certain conftitution; and to them coftivenefs is very prejudicial. It may arife, in the firft place, from fomething taken into the body, or generated in the inteftines; from a fermentation and corruption of the mafs of aliments; from the bile being too abundant and acrid, or from blood or pus poured into the inteftines; from the inteftines themfelves being eroded, or deprived of their natural mucus; from the humours being driven from the furface of the body towards the inward parts, as by cold, efpecially when applied to the feet; or from a general corruption of the whole body, as in the phthifis, hectic, or putrid fever, efpecially towards the end of thefe diforders. In fevers it is fometimes falutary, or even puts an end to the difeafe altogether, or at leaft renders it milder: more frequently, however, deriving its origin from putrefcency, it is of no fervice, but rather exhaufts the ftrength of the patient. A diarrhœa likewife, almoft incurable, and often mortal in a fhort time, frequently arifes after the operation for the fiftula in ano. Some have their inteftines fo extremely weak and moveable, that from the flighteft caufe, fuch as catching cold, any violent commotion of the mind, &c. they are fubject to a violent diarrhœa. Laftly, whatever be its origin, if it hath continued for a long time, the vifcera are rendered fo weak and irritable, Diforders of the Alimentary Canal.

ritable, that the difeafe, though often removed, ftill returns from the flighteft caufes, and even fuch as are not eafily difcovered.

A diarrhœa proves very pernicious, by hindering digeftion and the nourifhment of the body; for the ftomach is commonly affected, and the aliments pafs through the inteftines fo quickly, that they can neither be properly digefted, nor are the lacteals able to abforb the chyle from them as they go along. Such a violent evacuation is alfo hurtful by exhaufting the body, and carrying off a great quantity of the nutritious matter from the blood. Neither, indeed, is it only the alimentary mafs which is thrown out fooner than it ought to be; but at the fame time, a great quantity of the fluids fecreted in the inteftines, fo that the whole body quickly partakes of the debility.

Sometimes a violent and long-continued diarrhœa rifes to fuch a height, that the aliment is difcharged with little or no alteration. Sometimes alfo, though rarely, from a fimilar caufe, or from the obftruction of the mefenteric glands, and its other paffages into the blood, the chyle itfelf is thrown out like milk along with the excrements; and this difeafe is called the 110 *fluxus cœliacus*.

Dyfentery.

A dyfentery is attended with very fevere gripes in the belly, a frequent defire of going to ftool, and vain efforts which excrete nothing befides the mucus of the inteftines mixed with a little blood; and is accompanied with exceffive debility, and frequently with putrefcency and fever. It is thought to arife from the conftriction of fome part of the inteftines, of the colon efpecially: by which means the bowels, though ever fo much irritated, can pafs nothing; neither can the difeafe be removed until the belly has been well purged by proper medicines.

111 Tenefmus.

A tenefmus is a frequent and infatiable propenfity to ftool, without being able to pafs any thing, notwithftanding the moft violent efforts. It may be occafioned by any kind of irritation, either of the rectum itfelf or of the neighbouring parts, by acrid fubftances taken into the body; by fome of the ftronger purges, efpecially aloes, which is very difficult of folution, and will pafs even to the rectum with very little alteration; by a violent and obftinate diarrhœa, dyfentery, hæmorrhoids, worms, fiftula, calculus, ulcer in the bladder, urethra, &c. It is often very pernicious, both from the exceffive uneafinefs it occafions to the patient, and from its exhaufting his ftrength, by the frequent and vain efforts bringing on a prolapfus ani, and communicating the violent irritation to the neighbouring parts, as the bladder, &c.

112 Naufea and vomiting.

A naufea and vomiting are diforders very common, and owing to almoft innumerable caufes; not only to affections of the ftomach itfelf, but alfo to affections and irritations of the remoteft parts of the body which may act upon the ftomach by fympathy. Every irritation and diftention of that vifcus therefore, a load of crude aliment, an obftruction about the pylorus, all acrid fubftances taken into it, difeafes of the liver, inteftines, kidneys, uterus, the head, the feet, the fkin, or indeed the whole body, inflammation, the ftone, king's evil, fcirrhus, apoplexy, compreffion of the brain, fracture of the fkull, vertigo, fyncope, violent pain, the gout, efpecially when repelled, fevers, paffions of the mind, difagreeable imaginations or difcourfes, frequently induce naufea and vomiting.

Thefe affections are often ferviceable by freeing the ftomach from fomething with which it was overloaded; promoting fpitting in fome cafes where the lungs are overcharged with mucus, blood, pus, or water; producing fweat, and a free and proper diftribution of blood to the furface of the body; partly, perhaps, by the great ftraining which accompanies vomiting, but rather by that wonderful fympathy which takes place between the ftomach and fkin: and hence, in many difeafes, vomiting is a moft excellent remedy. It is however in fome cafes hurtful, if too violent or too frequently repeated, partly by debilitating and making the ftomach more eafily moved; and partly by fatiguing the patient with violent ftrainings, which occafion hernias, abortions, &c. 113

Iliac paffion.

Sometimes we find the motion of the inteftines totally inverted, from the anus to the mouth; a moft dangerous diftemper, which hath obtained the name of the *iliac paffion*. It moft frequently arifes from fome obftruction in the alimentary canal hindering the defcent of the excrements, as fcirrhus, fpafm, inflammation, &c.: though the moft perfect iliac paffion takes place without any obftruction, fo that clyfters will be vomited; and even after this has continued for feveral days, the patients have at length recovered.

A flighter degree of the iliac paffion, namely the inverfion of the periftaltic motion of the duodenum, always takes place in long continued and violent vomiting, as in fea-ficknefs, or when a perfon has taken too large a dofe of an emetic; by which means a vaft quantity of bile frequently afcends into the ftomach, and is difcharged by vomiting. 114

Cholera.

An exceffive vomiting with loofenefs is called a *cholera*, when the matter difcharged has a bilious appearance. It arifes from a very great irritation of the alimentary canal without any obftruction; and is for the moft part occafioned by too great a quantity, or from an acrimony of the bile, from whence it takes its name. It may originate from feveral caufes, as too ftrong a dofe of an emetic and cathartic medicine, eating too great a quantity of fummer-fruits, &c. and is a very violent malady, often killing the patient in a few hours, unlefs proper remedies be applied in time. 115

Obftructed perfpiration.

From a fuppreffion of any of the fecretions, or a diforder of any of the fecretory organs, many mifchiefs may arife. A diminution of perfpiration produces plethora, laffitude, languor, depreffion of mind, bad digeftion, lofs of appetite, and even a general corruption of the humours from the retention of fuch a quantity of putrefcent matter.—The more fuddenly the diminution or fuppreffion of the perfpiration takes place, the fooner the mifchief is produced, and the greater it is; not only by retaining the matter which ought to be thrown out, but by repelling the humours from the furface of the body, and directing them to other parts; whence fevers, inflammations, congeftions of the blood, &c. frequently take place.

Thus fuppreffion of perfpiration may arife from many different caufes; as from cold fuddenly applied to the body when very hot; fometimes from very violent

Diſorders of Secretion.

paſſions of the mind; or from ſpaſmodic diſeaſes, as the hyſterics, &c. It may be ſuppreſſed alſo by that kind of conſtriction of the veſſels of the ſkin which is produced by various kinds of fevers, the nature of which has hitherto been but little known.

116 Exceſſive perſpiration.

Exceſſive perſpiration or ſweating is injurious by debilitating the body, relaxing the ſkin, and expoſing the patient to all the evils which ariſe from catching cold. It may even be carried to ſuch a height as to produce fainting and death; though it muſt be owned that we cannot eaſily bring examples of people having from this cauſe their blood inſpiſſated, corrupted, or being thence made liable to inflammations and fevers.

117 Suppreſſion of urine.

A ſuppreſſion of urine is ſtill more dangerous than that of perſpiration, and unleſs relieved in a ſhort time will certainly prove fatal. This diſorder, which is called *iſchuria*, may ariſe from various diſeaſes of the kidneys, ureters, bladder, urethra, &c. Thus any obſtruction or irritation of one or other of the kidneys or ureters, by a ſtone, gravel, mucus, blood, inflammations, ſpaſm, ſuppuration, ſcirrhus, ſwellings of the neighbouring parts, &c. may either prevent the urine from being ſecreted, or may give riſe to a ſcanty or depraved ſecretion, or finally may obſtruct its paſſage into the bladder after it is ſecreted.

The urine alſo, after it has entered the bladder, is there frequently ſuppreſſed, by reaſon of various diſorders to which that organ is liable, as an irritation or inflammation, ſpaſm, acrid ſubſtances injected, or ſympathy with the neighbouring parts; or by reaſon of the texture of the bladder itſelf being deſtroyed, or from a palſy, ſcirrhus, ulcer, &c. in the bladder. Or, laſtly, the urine may be retained in the bladder from a general ſtupor, as from a diſeaſe of the brain, which happens in ſome fevers, when the patient is neither ſenſible of the uſual ſtimulus, nor even of one much greater, ſo that the fibres can ſcarcely be excited to contraction by any means whatever. This, in fevers, is always a bad ſign, and ſometimes even proves fatal.

A ſuppreſſion of urine for any length of time produces an immenſe diſtenſion of the bladder, oppreſſion, uneaſineſs, and pain, not only of the part itſelf, but of the ſurrounding ones, and even of the whole body; a ſpaſm, or inſuperable conſtriction of the ſphincter; an inflammation, gangrene, or laceration of the bladder itſelf; a violent irritation of the whole habit; then a nauſea, vomiting, vertigo, general ſtupor, and an impregnation of the whole maſs of blood with a humour of an urinous nature, which at laſt being poured out into various cavities of the body, eſpecially of the head, ſoon brings on a deep ſleep, convulſions, and death.

118 Dyſuria.

From the ſame cauſes, but acting with leſs force, proceeds that diſeaſe called a *dyſuria*, when the urine paſſes with difficulty and pain, and is frequently red, black, bloody, purulent, mucous and ſandy; the reaſon of all which appearances is very much unknown.—The moſt frequent complaint, however, in

119 Strangury

making water, is where the patient has a continual and violent deſire of paſſing his urine, while at the ſame time only two or three drops can be paſſed at once, and that not without ſome pain. This is occaſioned, even in healthy people, by ſome acrid ſubſtance taken into the ſtomach; and is very common to old people, who are generally ſubject to diſorders of the kidneys and bladder. It ariſes alſo frequently from a ſtone irritating the bladder, or from an inflammation of it, or its being deprived of its mucus, or this laſt being ſomehow or other corrupted; or laſtly, from certain diſeaſes or ſome particular ſtate of the neighbouring parts, as of the uterus, vagina, urethra, proſtrate gland, &c.

120 Incontinence of urine.

Akin to the ſtrangury is an incontinence of urine, when the patient's water either comes away againſt his will, or altogether without his knowledge. This diſorder may ariſe from debility, palſy, an ulcer or wound, or any long-continued and violent irritation of the bladder, eſpecially of its ſphincter, as from a ſtone, a general palſy, or in females, difficult labour injuring the neighbouring parts.—This ſymptom occurs in a great number of diſeaſes, eſpecially in the hydrocephalus.—Sometimes the urine is expelled with violence, either by reaſon of univerſal ſpaſms, or by violent contractions of the muſcles of reſpiration, as in ſneezing, laughter, &c.

121 Urinary calculi.

Among the diſorders incident to the urine we may reckon the production of calculi, which frequently bring on the moſt excruciating and dangerous diſeaſes.—The urine, beſides the water and ſalts, contains no ſmall ſhare of the glutinous part of the blood already ſomewhat corrupted, and ſtill inclined to farther corruption. Hence the urine even of the moſt healthy people depoſits a ſediment after it has ſtood for ſome time; and though none of this ſediment be formed in an healthy body, yet if the ſmalleſt particle of foreign matter be introduced into the bladder, a cruſt ſoon gathers round it, and it is ſure to become the baſis of a ſtone, which by degrees grows to a very great ſize. It is not unlikely, alſo, that ſome unknown fault of the fluids may contribute to the production of thoſe calculi, as the ſtone is well known to be an hereditary diſeaſe, and to be born with the patient. Calculous perſons alſo are commonly ſubject to complaints of the ſtomach, eſpecially to an acidity of it; and many have received no little relief from alkaleſcent or alkaline medicines.—From the ſame cauſes may calculi be formed in the kidneys; from which proceed a horrid train of ſymptoms deſcribed in the ſubſequent part of this treatiſe.

It is now found by accurate experiments of the moſt able chemiſts, that urinary calculi do not, as was once ſuppoſed, conſiſt almoſt entirely of an earthy matter. Their principal conſtituent is a peculiar acid approaching more nearly to the phoſphoric found in the bones than to any other. But the acid of calculus being in ſome reſpects peculiar in its nature, has among modern chemiſts obtained a peculiar name, and been diſtinguiſhed by the appellation of the *lithic acid*. It is highly probable that this acid preſent in the circulating maſs, is precipitated and diſengaged by the introduction of other acids, and thus thrown off in greater quantities by the kidneys. Thus then we can underſtand the influence of acids as tending to the generation of calculus, and of alkalies as tending to prevent it.

122 Scirrhus.

The laſt diſorder here to be taken notice of is a diſorder of the glands themſelves, owing to ſome kind of obſtruction, and is one of the moſt dreadful diſeaſes incident to human nature. Hence happens a

Scirrhus. great swelling and surprising hardness, not only without pain, but sometimes even with a diminution of sensation in the part affected; and when the gland is thus affected, it is called a *scirrhus*. Sometimes it remains in this state for a long time; but sooner or later produces the most excruciating torment. By degrees it is infected with a slow and malignant suppuration, degenerating into an horrid ulcer, consuming not only the part itself, but eating away the neighbouring ones, and corrupting the whole body with the most acrid and incurable poison. This disease is called a *cancer*, of which the causes are very little known.

Versatility of the Human Constitution. Of the organs in both sexes concerned in the function of generation, and of that function as far as we yet know any thing respecting it, an account has already been given in ANATOMY; and after what has already been said of the different functions, and of the morbid affections, to which these are subjected, we may conclude our remarks on the theory of medicine, with mentioning the remarkable versatility of the human constitution; which, more than that of any other animal, is capable of accommodating itself to every climate and to all kind of diet. Hence we may conclude, that a large proportion of the diseases to which we are subjected are produced by ourselves.

PRACTICE of MEDICINE, or an Account of the principal Diseases to which the Human Body is subjected.

123 General Arrangement of Diseases. WE have already defined medicine to be the art of preventing, curing, and alleviating, these diseases to which mankind are subjected. While these affections, however, are in number almost infinite, each in its progress is subjected to almost endless varieties from differences in climate, constitution, treatment, and a variety of other particulars. Hence we may readily explain both the difficulty of distinguishing morbid affections from each other in actual practice, and the diversity of names which have been affixed to them in the writings of ancient physicians. It may readily be supposed, that in this as well as other subjects, there has been a gradual improvement from the progressive labours of industrious and ingenious men. And although much yet remains to be done in the proper arrangement and distinction of diseases, or what has been called *methodical nosology*, yet there cannot be a doubt, that during the course of the present century, this subject has received very great improvements For these, we are in the first place highly indebted to the labours of Franciscus Boissier de Sauvages, an emiment professor of medicine at Montpelier, who, following out an idea suggested by the sagacious Dr Sydenham of England, first successfully attempted to arrange diseases as botanists had done plants, into classes, orders, genera, and species. Since the publication of the *Nosologia Methodica* of Sauvages, this subject has been successfully cultivated by several ingenious men, particularly by Sir Charles Linnæus of Upsal, to whose genius for arrangement every branch of natural history, but botany in particular, has been so highly indebted; by Rudolphus Augustus Vogel, an eminent professor at Gottingen; and by John Baptist Sagar, a distinguished physician at Iglaw in Moravia: But of all the systems of arrangement yet presented to the medical world, that published by the late illustrious Dr William Cullen of Edinburgh, may justly be considered as the best. In treating, therefore, of the principal diseases to which the human body is subjected, we shall follow his plan, endeavouring to deliver the best established observations respecting the history, theory, and practice of each. And in treating of particular genera of disease, although we follow the arrangement of Dr Cullen, yet for the satisfaction of the reader, we shall point out the classes to which the same affection is referred by the other eminent writers whom we have mentioned. And on this account, it may not be improper briefly to enumerate the general classes to which each of them have referred the affections of the human body.

The classes of Sauvages are,

1. Vitia.	6. Debilitates.
2. Febres.	7. Dolores.
3. Phlegmasiæ.	8. Vesaniæ.
4. Spasmi.	9. Fluxus.
5. Anhelationes.	10. Cachexiæ.

The classes of Linnæus are,

1. Exanthematici.	7. Motorii.
2. Critici.	8. Suppressorii.
3. Phlogistici.	9. Evacuatorii.
4. Dolorosi.	10. Deformes.
5. Mentales.	11. Vitia.
6. Quietales.	

The classes of Vogel are,

1. Febres.	7. Hyperæstheses.
2. Profluvia.	8. Cachexiæ.
3. Epischeses.	9. Paranoiæ.
4. Dolores.	10. Vitia.
5. Spasmi.	11. Deformitates.
6. Adynamiæ.	

The classes of Sagar are,

1. Vitia.	8. Anhelationes.
2. Palgæ.	9. Debilitates.
3. Cachexiæ.	10. Exanthemata.
4. Dolores.	11. Phlegmasiæ.
5. Fluxus.	12. Febres.
6. Suppressiones.	13. Vesaniæ.
7. Spasmi.	

After this short view of different classifications, we shall next present to our readers a more particular account of the arrangement of Dr Cullen; which, although it can by no means be represented as free from errors or imperfections, is yet in many respects the best that has hitherto been published.

CULLEN's *Arrangement*.

CLASS I. PYREXIÆ. A frequent pulse coming on after an horror; considerable heat; many of the functions

General Arrangement of Diseases.

tions injured; the ftrength of the limbs efpecially diminifhed.

ORDER I. Febres. Pyrexia without any primary local affection, following langour, laffitude, and other fymptoms of debility.

Sect. I. *Intermittentes.* Fevers arifing from the miafma of marfhes; with an apyrexia, or at leaft a very evident remiffion; but the difeafe returns conftantly, and for the moft part with a horror or trembling There is only one paroxyfm in a day.

Genus I. Tertiana. Similar paroxyfms at an interval of about 48 hours, coming on moft commonly at mid-day. A tertian hath either;

I. An apyrexia interpofed;

1. Varying the duration of the paroxyfms.

A. The tertian whofe paroxyfms are not extended beyond 12 hours.

B. The tertian with paroxyfms extended beyond 12 hours.

2. Varying in the return of the paroxyfms.

C. The tertian returning every day with unequal paroxyfms alternately fimilar to one another.

D. The tertian returning every third day with two paroxyfms on the fame day.

E. The tertian returning every day, with two paroxyfms on every third day, and only one on the intermediate ones.

F. The tertian returning every day, with a notable remiffion interpofed between the odd and the even days, but a lefs remarkable one between the even and the odd one.

3. Varying in its fymptoms.

G. The tertian accompanied with a difpofition to fleep.

H. Accompanied with fpafms and convulfive motions.

I. Accompanied with an efflorefcence on the fkin.

K. With phlegmafia.

4. Varying in being complicated with other difeafes.

5. Varying as to its origin.

II. With the interpofition only of a remiffion between the paroxyfms.

Genus II. Quartana. Similar paroxyfms, with an interval of about 72 hours, coming on in the afternoon.

I. With the interpofition of an apyrexia.

1. Varying in the type.

A. The quartan with fingle paroxyfms, returning every fourth day, none on the other days.

B. With two paroxyfms every fourth day, and none on the other days.

C. With three paroxyfms every fourth day, and none on the intermediate days.

D. Of the four days having only the third free from fever, with fimilar paroxyfms every fourth day.

E. The quartan coming on every day, with fimilar paroxyfms every fourth day.

2. Varying in its fymptoms.

3. Varying in being complicated with other difeafes.

II. With a remiffion only between the paroxyfms.

Genus III. Quotidiana. Similar paroxyfms with an interval of about 24 hours, coming on in the morning.

I. With the interpofition of an apyrexia.

1. Varies in being folitary.

A. Univerfal.

B. Partial.

2. Complicated with other difeafes.

II. With a remiffion only between the paroxyfms.

Sect. II. *Continuæ.* Fevers without any intermiffion, and not occafioned by marfh miafmata; attended with exacerbations and remiffions, though not very remarkable.

Genus IV. Synocha. Great heat; a frequent, ftrong, and hard pulfe; high-coloured urine; the functions of the fenforium a little difturbed.

Genus V. Typhus. A contagious difeafe; the heat not greatly above the natural; the pulfe fmall, weak, and for the moft part frequent; the urine little changed; the functions of the fenforium very much difturbed, and the ftrength greatly diminifhed.

The fpecies are,

I. Typhus *petechialis.* Typhus for the moft part with petechiæ.

Varying in degree. 1. Mild typhus. 2. Malignant typhus.

II. Typhus *icterodes.* Typhus with a yellownefs of the fkin.

Genus VI. Synochus. A contagious difeafe. A fever compofed of a fynocha and typhus; in the beginning a fynocha, but towards the end a typhus.

ORDER II. Phlegmafiæ. A fynocha fever, with inflammation or topical pain, the internal function of the part being at the fame time injured; the blood covered with fize.

Genus VII. Phlogofis. Pyrexia; rednefs, heat, and painful tenfion, of fome external part.

The fpecies are,

I. Phlogofis (*phlegmone*) of a vivid red colour; a fwelling well defined, for the moft part elevated to a point, and frequently degenerating into an abfcefs, with a beating or throbbing pain.

The variations are, 1. In the form. 2. In the fituation.

II. Phlogofis (*erythema*) of a reddifh colour, vanifhing by preffure; of an unequal and creeping circumference, with fcarce any fwelling; ending in the fcaling off the cuticle, in phlyctenæ, or blifters.

The variations are, 1. In the degree of violence. 2. In the remote caufe. 3. In being complicated with other difeafes.

The confequences of a phlogofis are, an imposthume, gangrene, fphacelus.

Genus VIII. Ophthalmia. A rednefs and pain of the eye, with an inability to bear the light; for the moft part with an effufion of tears.

The fpecies and varieties of the ophthalmia are,

I Idiopathic.

1. Ophthalmia (*membranarum*), in the tunica adnata, and the membranes lying under it, or the coats of the eye.

A. Varying in the degree of the external inflammation

B. In the internal coats affected.

2. Ophthalmia (*tarfi*) of the eye-lids, with fwelling, erofion, and glutinous exfudation.

II Symptomatic.

1. From a difeafe of the eye itfelf.

2. From diseases of other parts, or of the whole body.

Genus IX. Phrenitis. Violent pyrexia; pain of the head; redness of the face and eyes; inability to endure the light or any noise; watchfulness; a fierce delirium, or typhomania.

I. Idiopathic.

II. Symptomatic.

Genus X. Cynanche. Pyrexia sometimes inclining to a typhus; difficulty of swallowing and breathing; with a sensation of narrowness in the fauces.

The species are,

I. Cynanche (*tonsillaris*) affecting the mucous membrane of the fauces, but especially the tonsils, with redness and swelling, accompanied with a synocha.

II. Cynanche (*maligna*) affecting the tonsils and mucous membrane of the fauces with swelling, redness, and mucous crusts of a whitish or ash-colour, creeping, and covering ulcers; with a typhous fever and exanthemata.

II. Cynanche (*trachealis*) attended with difficult respiration, noisy and hoarse inspiration, loud cough, without any apparent tumor in the fauces, somewhat difficult deglutition, and a synocha.

IV. Cynanche (*pharingæa*) attended with redness in the bottom of the fauces, very difficult and painful deglutition, respiration sufficiently free, and a synocha.

V. Cynanche (*parotidæa*) with great swelling of the parotids and maxillary glands appearing on the outside: the respiration and deglutition but little injured; a synocha, for the most part mild.

Diseases of this genus are symptomatic, either from external or internal causes.

Genus XI. Pneumonia. Pyrexia, with a pain in some part of the thorax, difficult respiration, and cough. The species are.

I. Peripneumony, with a pulse not always hard, but sometimes soft; an obtuse pain of the breast; the respiration always difficult; sometimes the patient cannot breathe unless in an upright posture; the face swelled, and of a livid colour; the cough for the most part moist, frequently bloody.

1. Simple idiopathic peripneumonies.

Varying in degree.

2. Idiopathic peripneumonies complicated with fever.

3. Symptomatic peripneumonies.

II. Pleurisy, with a hard pulse; for the most part attended with a pungent pain of one side, augmented chiefly during the time of inspiration; an uneasiness when lying on the side; a most painful cough, dry in the beginning of the disease, afterwards moist, and frequently bloody.

1. Simple idiopathic pleurisies.

2. Pleurisies, complicated (1.) With fever. (2.) With catarrh.

3. Symptomatic pleurisies.

4. False pleurisies.

The consequences of pleurisy are a vomica or empyema.

Genus XIII. Carditis. Pyrexia; pain about the heart; anxiety; difficulty of breathing; cough; unequal pulse; palpitation of the heart, and fainting.

I. Idiopathic.

II. Symptomatic.

Genus XIV. Peritonitis. Pyrexia; pain of the belly, exasperated by an upright posture, without the proper signs of other abdominal phlegmasiæ. If the diagnostics of the following diseases are given, they may be reckoned as so many species of this genus.

I. Peritonitis (*propria*) situated in the peritonæum, properly so called, surrounding the inside of the abdomen.

II. Peritonitis (*omentalis*) in the peritonæum extended through the omentum.

III. Peritonitis (*mesenterica*) in the peritonæum spread through the mesentery.

Genus XV. Gastritis. Pyrexia inclining to a typhus; anxiety; pain and heat of the epigastrium, augmented when any thing is taken into the stomach; an inclination to vomit, and an immediate rejection of every thing swallowed; an hickup.

I. Idiopathic.

1. From internal causes.

A. Gastritis (*phlegmonodea*) attended with acute pain and violent pyrexia.

2. From external causes.

B. Gastritis (*erysipelatosa*), with a less violent fever and pain; an erysipelatous redness appearing on the fauces.

II. Symptomatic.

Genus XVI. Enteritis. Pyrexia of a typhous nature; pungent pain of the belly, stretching and twisting round the navel; vomiting; the belly obstinately bound.

I. Idiopathic.

1. Enteritis (*phlegmonodæa*), with acute pain, violent fever, vomiting, and constipation of the belly.

2. Enteritis (*erysipelatosa*) with less acute fever and pain, without vomiting; but accompanied with a diarrhœa.

II. Symptomatic.

Genus XVII. Hepatitis. Pyrexia; tension and pain of the right hypochondrium; sometimes pungent like that of a pleurisy, but more frequently obtuse; a pain reaching to the clavicle and top of the right shoulder; a difficulty of lying on the left side; dyspnœa; dry cough, vomiting, and hickup.

Genus XVIII. Splenitis. Pyrexia; tension, heat, and swelling of the left hypochondrium, the pain increasing by pressure; without the signs of nephritis.

Genus XIX. Nephritis. Pyrexia; pain in the region of the kidney, often following the course of the ureter; frequent making of water, either thin and colourless, or very red; vomiting; stupor of the thigh; with a retraction or pain of the testicle of the same side. The species are,

I. Idiopathic. Spontaneous.

II. Symptomatic.

Genus XX. Cystitis. Pyrexia; pain and swelling of the hypogastrium; frequent and painful making of water, or ischuria; and tenesmus. The species are,

I. Those arising from internal causes.

II. Those from external causes.

Genus XXI. Hysteritis. Pyrexia; heat, tension, swelling,

General Arrangement of Diseases.

swelling, and pain of the hypogastrium; the os uteri painful when touched; vomiting.

Genus XXII. Rheumatismus. A disease arising from an external and frequently very evident cause; pyrexia; pain about the joints, frequently pursuing the course of the muscles; infesting the knees and other large joints rather than those of the feet or hands; increased by external heat.

The species are either idiopathic or symptomatic. The former varies in situation.

A. In the muscles of the loins.

B. In the muscles of the coxendix.

C. In the muscles of the breast.

Genus XXIII. Odontalgia; a rheumatism of the jaws from a caries of the teeth.

Genus XXIV. Podagra. An hereditary disease, arising without any evident external cause, but for the most part preceded by an unusual affection of the stomach; pyrexia; pain of a joint for the most part of the great toe of the foot, at least infesting chiefly the wrists and ankles; returning by intervals; and often alternated with affections of the stomach and other internal parts.

I. Podagra (*regularis*) with a pretty violent inflammation of the joints remaining for some days, and by degrees going off with swelling, itching, and desquamation of the affected part.

II. Podagra (*atonica*) with an atony of the stomach, or some other internal part; and either without the usual inflammation of the joints, or only with slight and wandering pains; and frequently alternated with dyspepsia, or other symptoms of atony.

III. Podagra (*retrograda*) with the inflammation of the joints suddenly receding, and an atony of the stomach and other parts immediately following.

IV. Podagra (*aberrans*) with the inflammation of an internal part either preceding or not, and suddenly receding; with an inflammation of the joints.

Genus XXV. Arthropuosis. Deep, obtuse, and long-continued pains of the joints or muscular parts, frequently following contusions; with either no swelling, or a moderate and diffused one; no phlogosis; pyrexia, at first gentle, afterwards hectic, and at length an imposthume.

Order III. Exanthemata. Contagious diseases; affecting a person only once in their life; beginning with fever; after a certain time appear phlogoses, for the most part small and in considerable number, and dispersed over the skin.

Genus XXVI. Erysipelas. A synocha of two or three days, for the most part attended with drowsiness, often with a delirium. In some part of the skin, most frequently the face, appears a phlogosis *erythema*. (G. VII. Sp. 2.) The species are,

I. Erysipelas (*vesiculosum*) with erythema, redness creeping, occupying a large space, and in some parts ending in large blisters.

II. Erysipelas (*phlyctænodes*), with an erythema formed of a number of papulæ, chiefly occupying the trunk of the body, ending in phlyctenæ or small blisters.

The disease is also symptomatic.

Genus XXVII. Pestis. An exceedingly contagious typhus, with the highest debility. On an uncertain day of the disease buboes and carbuncles break forth. It is various in degree, but the species are uncertain.

Genus XXVIII. Variola; a contagious synocha, with vomiting, and pain on pressing the epigastrium. On the third day begins, and on the fifth is finished, the eruption of inflammatory pustules, which suppurate in the space of eight days, and at last go off in crusts; frequently leaving depressed cicatrices or pockpits in the skin. The species are,

I. Variola (*discreta*) with few, distinct, turgid pustules, having circular bases; the fever ceasing immediately after the eruption.

II. Variola (*confluens*) with numerous, confluent, irregularly shaped pustules, flaccid, and little elevated; the fever remaining after the eruption.

Genus XXIX. Varicella. Synocha; papulæ breaking out after a short fever, similar to those of the small-pox, but hardly ever coming to suppuration; after a few days going off in small scales, but never leaving any mark.

Genus XXX. Rubeola. A contagious synocha, with sneezing, epiphora, and dry hoarse cough. On the fourth day, or a little later, break forth small, clustered, and scarce elevated papulæ; after three days going off in very small branny scales.

I. Rubeola (*vulgaris*) with very small confluent, corymbose papulæ, scarce rising above the skin.

Varying,

1. In the symptoms being more severe, and the course of the disease less regular.

2. In being accompanied with a quinsey.

3. With a putrid diathesis.

II. Rubeola (*variolodes*) with distinct papulæ, raised above the skin.

Genus XXXI. Miliaria. Synochus with anxiety, frequent sighing, fœtid sweat, and points on the skin. On an uncertain day of the disease, break out red, small, distinct papulæ, spread over the whole body as well as the face; the apices of which, after one or two days, become very small white pustules, remaining for a short time.

Genus XXXII. Scarlatina. A contagious synocha. On the fourth day of the disease the face swells a little; at the same time an universal redness occupies the skin in large spots, at length running together; after three days going off in branny scales; frequently succeeded by an anasarca. The species are,

I. Scarlatina (*simplex*), not accompanied with cynanche.

II. Scarlatina (*cynanchica*), with an ulcerous cynanche.

Genus XXXIII. Urticaria. An amphemerina fever. On the second day of the disease, red spots resembling the stinging of nettles, almost vanishing during the day, but returning in the evening with the fever, and after a few days going off altogether in very small scales.

Genus XXXIV. Pemphigus. A contagious typhus. On the first, second, or third day of the disease, blisters break out in several parts of the body, of the bigness of a bean, remaining for many days, and at last pouring out a thin ichor.

Genus XXXV. Aphtha. Synochus; the tongue somewhat swelled and of a livid colour, as well as the fauces; eschars first appearing in the fauces, but at length

length occupying the whole internal part of the mouth, of a white colour, fometimes diftinct, often running together; quickly growing again when taken off; and remaining for an uncertain time.

The fpecies are, 1. Idiophatic. 2. Symptomatic.

ORDER IV. Hæmorrhagiæ. Pyrexia, with a profufion of blood, without any external violence: the blood drawn from a vein hath the fame appearance as in phlegmafiæ.

Genus XXXVI. Epiftaxis. Pain or weight of the head, rednefs of the face; a profufion of blood from the nofe.

I Idiopathic.

Varying according to the time of life.

1. Epiftaxis of young people, with fymptoms of an arterious plethora.

2. Epiftaxis of old people, with fymptoms of a venous plethora.

II. Symptomatic.

1. From internal caufes.

2. From external caufes.

Genus XXXVII. Hæmoptyfis. Rednefs of the cheeks; a fenfation of uneafinefs, or pain, and fometimes of heat in the breaft; difficulty of breathing; tickling of the fauces; either a fevere or lefs violent cough, bringing up florid and frequently frothy blood.

The idiopathic fpecies are,

1. Hæmoptyfis (*plethorica*), without any external violence, and without being preceded by any cough or fuppreffion of any cuftomary evacuation.

2. Hæmoptyfis (*violenta*), from external violence applied.

3. Hæmoptyfis (*phthifica*), after a long-continued cough, with a leannefs and debility.

4. Hæmoptyfis (*calculofa*), in which fome calculous molecules, for the moft part of a calcareous nature, are thrown up.

5. Hæmoptyfis (*vicaria*), after the fuppreffion of a cuftomary evacuation.

Befides thefe, there are a number of fymptomatic fpecies mentioned by different authors. The confequence of an hæmoptyfis is, a

Phthifis. A wafting and debility of the body, with a cough, hectic fever, and for the moft part a purulent expectoration The fpecies are,

I. An incipient phthifis, without any expectoration of pus.

II. A confirmed phthifis, with an expectoration of pus.

Both fpecies vary, 1. As to their remote caufe. 2. As to the origin of the purulent matter.

Genus XXXVIII. Hæmorrhois. Weight and pain of the head; vertigo; pain of the loins; pain of the anus; livid painful tubercles, from which for the moft part blood flows out; which fometimes alfo drops out of the anus, without any apparent tumor. The fpecies are,

1. Hæmorrhois (*tumens*), external from marifcæ.

Varying.

A. Bloody.

B. Mucous.

2. Hæmorrhois (*procidens*), external from a *procidentia ani.*

3. Hæmorrhois (*fluens*), internal, without any fwelling, or *procidentia ani.*

4. Hæmorrhois (*cæca*), with pain and fwelling of the anus, without any profufion of blood.

Genus XXXIX. Menorrhagia. Pains of the back, belly, and loins, like thofe of child-birth; an unufually copious flux of the menfes or blood from the vagina. The fpecies are,

1. Menorrhagia (*rubra*), bloody in women neither with child nor in child-birth.

2. Menorrhagia (*abortus*), bloody in women with child.

3. Menorrhagia (*lochialis*), bloody in women after delivery.

4. Menorrhagia (*vitiorum*) bloody from fome local difeafe.

5. Menorrhagia (*alba*), ferous, without any local difeafe, in women not with child.

6. Menorrhagia (*Nabothi*), ferous in women with child.

ORDER V. Profluvia. Pyrexia, with an increafed fecretion, naturally not bloody.

Genus XL. Catarrhus. Pyrexia frequently contagious; an increafed excretion of mucus, at leaft efforts to excrete it.

The fpecies are for the moft part fymptomatic.

1. From cold.

2. From contagion

Genus XLI. Dyfenteria. Contagious pyrexia; frequent mucous or bloody ftools, while the alvine feces are for the moft part retained; gripes; tenefmus.

Varying:

1. Accompanied with worms.

2. With the excretion of fmall flefhy or febaceous bodies.

3. With an intermittent fever.

4. Without blood.

5. With a miliary fever.

CLASS II. NEUROSES. An injury of the fenfe and motion, without an idiopathic pyrexia or any local affection.

ORDER. I. Comata. A diminution of voluntary motion, with fleep, or a deprivation of the fenfes.

Genus XLII. Apoplexia. Almoft all voluntary motion diminifhed, with fleep more or lefs profound; the motion of the heart and arteries remaining.

The idiopathic fpecies are,

1. Apoplexia (*fanguinea*) with fymptoms of univerfal plethora, efpecially of the head.

2. Apoplexia (*ferofa*) with a leucophlegmatia over the whole body, efpecially in old people.

3. Apoplexia (*hydrocephalica*) coming on by degrees; affecting infants, or thofe below the age of puberty, firft with laffitude, a flight fever and pain of the head, then with flownefs of the pulfe, dilatation of the pupil of the eye, and drowfinefs.

4. Apoplexia (*atrabiliaria*) taking place in thofe of a melancholic conftitution.

5. Apoplexia (*traumatica*) from fome external injury mechanically applied to the head.

6. Apoplexia (*venenata*) from powerful fedatives taken internally or applied externally.

7. Apo-

7. Apoplexia (*mentalis*) from a passion of the mind.

8. Apoplexia (*cataleptica*) the muscles remaining contractile, by external motion of the limbs.

9. Apoplexia (*suffocata*) from some external suffocating power.

The apoplexia is frequently symptomatic.

1 Of an intermitting fever. 2 Continued fever. 3 Phlegmasia. 4 Exanthema. 5 Hysteria. 6 Epilepsy. 7 Podagra. 8 Worms. 9 Ischuria. 10 Scurvy.

Genus XLIII. Paralysis. Only some of the voluntary motions diminished, frequently with sleep.

The idiopathic species are,

1 Paralysis (*partialis*) of some particulur muscles only.

2 Paralysis (*hemiplegica*) of one side of the body.

Varying according to the constitution of the body.

a. Hemiplegia in a plethoric habit.

b In a leucophlegmatic habit

3 Parlysis *paraplegica*) of one half of the body taken transversely.

4 Paralysis (*venenata*) from sedative powers applied either internally or externally.

A symptom either of an Asthenia or Palsy is,

Tremor; an alternate motion of a limb by frequent strokes and intervals.

The species are, 1 Asthenic. 2 Paralytic. 3 Convulsive.

Order II. Adynamiæ. A diminution of the involuntary motions whether vital or natural.

Genus XLIV. Syncope; a diminution, or even a total stoppage, of the motion of the heart for a little.

I. Idiopathic.

1 Syncope (*cardiaca*), returning frequently without any manifest cause, with violent palpitations of the heart during the intervals.—From a fault of the heart or neighbouring vessels.

2. Syncope (*occasionalis*) arising from some evident cause.—From an affection of the whole system.

II. Symptomatic; or symptoms of diseases either of the whole system, or of other parts besides the heart.

Genus XLV. Dyspepsia. Anorexia, nausea, vomiting, inflation, belching, rumination, cardialgia, gastrodynia, more or fewer of those symptoms at least concurring; for the most part with a constipation of the belly, and without any other disease either of the stomach itself or of other parts.

I. Idiopathic.

II. Symptomatic.

1. From a disease of the stomach itself.

2. From a disease of other parts, or of the whole body.

Genus XLVI. Hypochondriasis. Dyspepsia, with languor, sadness and fear without any adequate causes, in a melancholy temperament.

Genus XLVII. Chlorosis. Dyspepsia, or a desire of something not used as food; a pale or discoloured complexion; the veins not well filled; a soft tumor of the whole body; asthenia; palpitation; suppression of the menses

Order III. Spasmi. Irregular motions of the muscles or muscular fibres.

Sect. I. *In the animal functions.*

Genus XLVIII. Tetanus;—a spastic rigidity of almost the whole body.

Varying according to the remote cause, as it arises either from something internal, from cold, or from a wound. It varies likewise from whatever cause it may arise, according to the part of the body affected.

Genus XLIX. Trismus. A spastic rigidity of the lower jaw.—The species are,

1. Trismus (*nascentium*), seizing infants under two months old.

2. Trismus (*traumaticus*), seizing people of all ages either from a wound or cold.

Genus L. Convulsio.—An irregular clonic contraction of the muscles without sleep.

I. Idiopathic.

II. Symptomatic.

Genus LI. Chorea, attacking those who have not yet arrived at puberty, most commonly within the 10th or 14th year, with convulsive motions for the most part of one side in attempting the voluntary motion of the hands and arms, resembling the gesticulations of mountebanks; in walking, rather dragging one of their feet after them than lifting it.

Genus LII. Raphania. A spastic contraction of the joints, with a convulsive agitation, and most violent periodical pain.

Genus LIII. Epilepsia. A convulsion of the muscles, with sleep.

The idiopathic species are,

1. Epilepsia (*cerebralis*), suddenly attacking without any manifest cause, without any sense of uneasiness preceding, excepting perhaps a slight vertigo or scotomia.

2. Epilepsia (*sympathica*), without any manifest cause, but preceded by the sensation of a kind of air rising from a certain part of the body towards the head.

3. Epilepsia (*occasionalis*), arising from a manifest irritation, and ceasing on the removal of that irritation.

Varying according to the difference of the irritating matter. And thus it may arise,

From injuries of the head; pain; worms; poison; from the repulsion of the itch, or an effusion of any other acrid humour; from crudities in the stomach; from passions of the mind; from an immoderate hemorrhagy; or from debility.

Sect. II. *In the vital functions.*

In the action of the heart.

Genus LIV. Palpitatio. A violent and irregular motion of the heart.

In the action of the lungs.

Genus LV. Asthma. A difficulty of breathing returning by intervals, with a sense of straitness in the breast, and a noisy respiration with hissing. In the beginning of the paroxysm there is either no cough at all, or coughing is difficult; but towards the end the cough becomes free, frequently with a copious spitting of mucus.—The idiopathic species are,

1. Asthma (*spontaneum*), without any manifest cause or other concomitant disease.

2. Asthma (*exanthematicum*), from the repulsion of the itch or other acrid effusion.

3. Asthma (*plethoricum*), from the suppression of some

General Arrangement of Diseases.

some customary sanguineous evacuation, or from a spontaneous plethora.

Genus LVI. Dyspnœa. A continual difficulty of breathing, without any sense of straitness, but rather of fullness and infarction in the breast; a frequent cough throughout the whole course of the disease.

The idiopathic species are,

1. Dyspnœa (*catarrhalis*), with a frequent cough, bringing up plenty of viscid mucus.

2. Dyspnœa (*sicca*), with a cough for the most part dry.

3. Dyspnœa (*aërea*), increased by the least change of weather.

4. Dyspnœa (*terrea*), bringing up with the cough an earthy or calculous matter.

5. Dyspnœa (*aquosa*), with scanty urine and œdematous feet; without any fluctuation in the breast, or other signs of an hydrothorax.

6. Dyspnœa (*pinquedinosa*), in very fat people

7. Dyspnœa (*thoracica*), from an injury done to the parts surrounding the thorax, or from some bad conformation of them.

8. Dyspnœa (*extrinseca*), from evident external causes.

The symptomatic species of dyspnœa are symptoms,

1. Of diseases of the heart or large vessels.

2. Of a swelling in the abdomen.

3. Of various diseases.

Genus LVII. Pertussis. A contagious disease; convulsive strangulating cough reiterated with noisy inspiration; frequent vomiting.

Sect. III. *In the natural functions.*

Genus LVIII. Pyrosis. A burning pain in the epigastrium, with plenty of aqueous humour, for the most part insipid, but sometimes acrid, belched up.

Genus LIX. Colica. Pain of the belly, especially twisting round the navel; vomiting; a constipation.

The idiopathic species are,

1. Colica (*spasmodica*), with retraction of the navel, and spasms of the abdominal muscles.

Varying, by reason of some symptoms superadded. Hence,

a, Colica, with vomiting of excrements, or of matters injected by the anus.

b, Colica, with inflammation supervening.

2. Colica (*pictonum*), preceded by a sense of weight or uneasiness in the belly, especially about the navel; then comes on the colic pain, at first slight and interrupted, chiefly augmented after meals: at length more severe and almost continual, with pains of the arms and back, at last ending in a palsy.

Varying according to the nature of the remote cause; and hence,

a, From metallic poison.

b, From acids taken inwardly.

c, From cold.

d, From a contusion of the back.

3. Colica (*stercorea*), in people subject to costiveness.

4. Colica (*accidentalis*), from acrid matter taken inwardly.

5. Colica (*meconialis*), in new-born children from a retention of the meconium.

6. Colic (*callosa*), with a sensation of stricture in some part of the intestines, and frequently of a collection of flatus with some pain before the constricted part; which flatus also passing through the part where the stricture is felt, gradually vanishes; the belly slow, and at last passing only a few liquid fæces.

7. Colica (*calculosa*), with a fixed hardness in some part of the abdomen, and calculi sometimes passing by the anus.

Genus LX. Cholera. A vomiting of bilious matter, and likewise a frequent excretion of the same by stool; anxiety; gripes; spasms in the calves of the legs.

I. Idiopathic.

1. Cholera (*spontanea*), arising in a warm season, without any manifest cause.

2. Cholera (*accidentalis*), from acrid matters taken inwardly.

II. Symptomatic.

Genus LXI. Diarrhœa. Frequent stools; the disease not infectious; no primary pyrexia.

I. Idiopathic.

1. Diarrhœa (*crapulosa*), in which the excrements are voided in greater quantity than naturally.

2. Diarrhœa (*biliosa*), in which yellow feces are voided in great quantity.

3. Diarrhœa (*mucosa*), in which either from acrid substances taken inwardly, or from cold, especially applied to the feet, a great quantity of mucus is voided.

4. Diarrhœa (*cæliaca*), in which a milky humour of the nature of chyle is passed.

5. Diarrhœa (*lienteria*), in which the aliments are discharged with little alteration soon after eating.

6. Diarrhœa (*hepatirrhœa*), in which a bloody serous matter is discharged without pain.

II. Symptomatic.

Genus LXII. Diabetes. A chronical profusion of urine, for the most part preternatural, and in immoderate quantity.

I. Idiopathic.

1. Diabetes (*mellitus*), with urine of the smell, colour, and taste of honey.

2. Diabetes (*insipidus*), with limpid, but not sweet, urine.

II. Symptomatic.

Genus LXIII. Hysteria. Rumbling of the bowels; a sensation as of a globe turning itself in the belly, ascending to the stomach and fauces, and there threatening suffocation; sleep; convulsions; a great quantity of limpid urine; the mind involuntarily fickle and mutable.

The following are by Sauvages reckoned distinct idiopathic species; but, by Dr Cullen, only varieties of the same species.

A, From a retention of the menses.

B, From a menorrhagia cruenta.

C, From a menorrhagia serosa, or fluor albus.

D, From an obstruction of the viscera.

E, From a fault of the stomach.

F, From too great salacity.

Genus LXIV. Hydrophobia. A dislike and horror at any kind of drink, as occasioning a convulsion of the pharynx; induced, for the most part, by the bite of a mad animal. The species are,

1. Hydro-

I. Hydrophobia (*rabiosa*), with a desire of biting the bystanders, occasioned by the bite of a mad animal.

II. Hydrophobia (*simplex*), without madness, or any desire of biting.

Order IV. Vesaniæ. Disorders of the judgment, without any pyrexia or coma.

Genus LXV. Amentia; an imbecility of judgement, by which people either do not perceive, or do not remember, the relations of things. The species are,

I. Amentia (*congenita*), continuing from a person's birth.

II. Amentia (*senilis*), from the diminution of the perceptions and memory through extreme old age.

III Amentia (*acquisita*), occurring in people formerly of a sound mind, from evident external causes.

Genus LXVI. Melancholia; a partial madness, without dyspepsia.

Varying according to the different subjects concerning which the person raves; and thus it is,

1. With an imagination in the patient concerning his body being in a dangerous condition, from slight causes; or that his affairs are in a desperate state.

2. With an imagination concerning a prosperous state of affairs.

3 With violent love, without satyriasis or nymphomania.

4. With a superstitious fear of a future state.

5. With an aversion from motion and all the offices of life.

6. With restlessness, and an impatience of any situation whatever.

7. With a weariness of life.

8. With a deception concerning the nature of the patient's species.

Dr Cullen thinks that there is no such disease as that called *dæmonomania*, and that the diseases mentioned by Sauvages under that title are either,

1. Species of melancholy or mania; or

2. Of some disease by the spectators falsely ascribed to the influence of an evil spirit; or

3. Of a disease entirely feigned; or

4. Of a disease partly true and partly feigned.

Genus LXVII. Mania; universal madness.

1. Mania (*mentalis*), arising entirely from passions of the mind.

2. Mania (*corporea*), from an evident disease of the body.

Varying according to the different disease of the body.

3. Mania (*obscura*), without any passion of mind or evident disease of the body preceding.

The symptomatic species of mania are,

1. Paraphrosyne from poisons.

2. Paraphrosyne from passion.

3 Paraphrosyne febrilis.

Genus LXVIII. Oneirodynia. A violent and troublesome imagination in time of sleep.

1. Oneirodynia (*activa*), exciting to walking and various motions.

2. Oneirodynia (*gravans*), from a sense of some weight incumbent, and pressing on the breast especially.

CLASS III. Cachexiæ; a depraved habit of the whole or greatest part of the body, without primary pyrexia or neurosis.

Order I. Marcores; a wasting of the whole body.

Genus LXIX. Tabes. Leanness, asthenia, hectic pyrexia. The species are,

1. Tabes (*purulenta*), from an external or internal ulcer, or from a vomica.

Varying in its situation: hence,

2. Tabes (*scrophulosa*), in scrophulous constitutions

3. Tabes (*venenata*), from poison taken inwardly.

Genus LXX. Atrophia. Leanness and asthenia, without hectic pyrexia. The species are,

1. Atrophia (*inanitorum*), from too great evacuation.

2. Atrophia (*famelicorum*), from a deficiency of nourishment.

3. Atrophia (*cacochymica*), from corrupted nourishment.

4. Atrophia (*debilium*), from the function of nutrition being depraved, without any extraordinary evacuation or cacochymia having preceded.

Order II. Intumescentiæ. An external tumor of the whole or greatest part of the body.

Sect. I. *Adiposæ.*

Genus LXXI. Polysarcia; a troublesome swelling of the body from fat.

Sect. II. *Flatuosæ.*

Genus LXXII. Pneumatosis; a tense elastic swelling of the body, crackling under the hand. The species are,

1. Pneumatosis (*spontanea*), without any manifest cause.

2. Pneumatosis (*traumatica*), from a wound in the breast.

3 Pneumatosis (*venenata*), from poison injected or applied.

4. Pneumatosis (*hysterica*), with hysteria.

Genus LXXIII. Tympanites; a tense, elastic, sonorous swelling of the abdomen; costiveness; a decay of the other parts The species are,

1. Tympanites (*intestinalis*), with a tumor of the abdomen frequently unequal, and with a frequent evacuation of air relieving the tension and pain.

2. Tympanites (*abdominalis*), with a more evident noise, a more equable tumor, and a less frequent emission of flatus, which also gives less relief.

Genus LXXIV. Physometra; a slight elastic swelling in the epigastrium, having the figure and situation of the uterus.

Sect. III. *Aquosæ or Hydropes.*

Genus LXXV. Anasarca. A soft, inelastic swelling of the whole body, or some part of it. The species are,

1. Anasarca (*serosa*), from a retention of serum on account of the suppression of the usual evacuations, or from an increase of the serum on account of too great a quantity of water taken inwardly.

2. Anasarca (*oppilata*), from a compression of the veins.

3 Anasarca (*exanthematica*), arising after exanthemata, especially after the erysipelas.

4. Anafarca (*anæmia*), from the thinnefs of the blood produced by hemorrhagy.

5. Anafarca (*debilium*), in weak people after long difeafes, or from other caufes.

Genus LXXVI. Hydrocephalus. A foft inelaftic fwelling of the head, with the futures of the cranium opened.

Genus LXXVII. Hydrorachitis. A foft, flender tumor above the vertebræ of the loins; the vertebræ gaping from each other.

Genus LXXVIII. Hydrothorax. Dyfpnœa; palenefs of the face; œdematous fwellings of the feet; fcanty urine; lying down difficult; a fudden and fpontaneous waking out of fleep, with palpitation; water fluctuating in the breaft

Genus LXXIX Afcites A tenfe, fcarce elaftic, but fluctuating fwelling of the abdomen. The fpecies are,

1. Afcites (*abdominalis*), with an equal fwelling of the whole abdomen, and with a fluctuation fufficiently evident.

Varying according to the caufe

A, From an obftruction of the vifcera.

B, From debility

C, From a thinnefs of the blood

2 Afcites (*faccatus*), with a fwelling of the abdomen, in the beginning at leaft, partial, and with a lefs evident fluctuation

Genus LXXX Hydrometra. A fwelling of the hypogaftrium in women, gradually increafing, keeping the fhape of the uterus, yielding to preffure, and fluctuating; without ifchuria or pregnancy

Genus LXXXI. Hydrocele A fwelling of the fcrotum, not painful; increafing by degrees, foft, fluctuating, and pellucid.

Sect. IV *Solidæ*.

Genus LXXXII. Phyfconia. A fwelling chiefly occupying a certain part of the abdomen, gradually increafing, and neither fonorous nor fluctuating. The fpecies are,

Phyfconia hepatica.
Phyfconia fplenica.
Phyfconia renalis.
Phyfconia uterina.
Phyfconia ab ovario.
Phyfconia mefenterica.
Phyfconia inteftinalis.
Phyfconia omentalis.
Phyfconia polyfplachna.
Phyfconia vifceralis.
Phyfconia externa lupialis.
Phyfconia externa fcirrhodea.
Phyfconia externa hydatidofa.
Phyfconia ab adipe fubcutaneo.
Phyfconia ab excrefcentia.

Genus LXXXIII. Rachitis. A large head, fwelling moft in the forepart, the ribs depreffed; abdomen fwelled, with a decay of the other parts.

Varying,

1. Simple, without any other difeafe.
2. Joined with other difeafes.

Order III. Impetigines. Cachexies chiefly deforming the fkin and external parts of the body.

Genus LXXXIV. Scrophula. Swellings of the conglobate glands, efpecially in the neck; fwelling of the upper lip and fupport of the nofe; the face florid, fkin thin, abdomen fwelled. The fpecies are,

1. Scrophula (*vulgaris*), fimple, external, and permanent.

2. Scrophula (*mefenterica*), fimple, internal, with palenefs of the face, want of appetite, fwelling of the abdomen, and unufual fetor of the excrements.

3. Scrophula (*fugax*), moft fimple, appearing only about the neck; for the moft part proceeding from the reforption of the matter of ulcers in the head.

4. Scrophula (*Americana*). joined with the yaws.

Genus LXXXV. Syphilis. A contagious difeafe, after impure venery, and a diforder of the genitals; ulcers of the tonfils; of the fkin, efpecially about the margin of the hair; corymbofe papulæ, ending in crufts and crufty ulcers; pains of the bones; exoftofes.

Genus LXXXVI. Scorbutus; in cold countries, attacking after putrefcent diet, efpecially fuch as is falt and of the animal-kind, where no fupply of frefh vegetables is to be had; afthenia; ftomacace; fpots of different colours on the fkin, for the moft part livid, and appearing chiefly among the roots of the hair.

Varying in degree.

a, Scorbutus incipiens.
b, Scorbutus crefcens.
c, Scorbutus inveteratus.

Varying alfo in fymptoms.

d, Scorbutus lividus.
e, Scorbutus petechialis.
f, Scorbutus pallidus.
g, Scorbutus ruber.
h, Scorbutus calidus.

Genus LXXXVII. Elephantiafis; a contagious difeafe; thick, wrinkled, rough, unctuous fkin, deftitute of hairs, anæfthefia in the extremities, the face deformed with pimples, the voice hoarfe and nafal.

Genus LXXXVIII. Lepra; the fkin rough, with white, branny, and chopped efchars, fometimes moift beneath, with itching.

Genus LXXXIX. Frambœfia; fwellings refembling fungi, or the fruit of the mulberry or rafpberry, growing on various parts of the fkin.

Genus XC. Trichoma; a contagious difeafe; the hairs thicker than ufual, and twifted into inextricable knots and cords.

Genus XCI. Icterus; yellownefs of the fkin and eyes; white fæces; urine of a dark red, tinging what is put into it of a clay colour.

The idiopathic fpecies are,

1. Icterus (*calculofus*), with acute pain in the epigaftric region, increafing after meals; biliary concretions voided by ftool.

2. Icterus (*fpafmodicus*), without pain, after fpafmodic difeafes and paffions of the mind.

3. Icterus (*hepaticus*), without pain, after difeafes of the liver.

4. Icterus (*gravidarum*), arifing during the time of pregnancy, and going off after delivery.

5. Icterus (*infantum*), coming on in infants a few days after birth.

CLASS

CLASS IV. Locales. An affection of some part, but not of the whole body.

Order I. Dysethesiæ. The senses depraved or destroyed, from a disease of the external organs.

Genus XCII. Caligo. The sight impaired or totally destroyed, on account of some opaque substance interposed between the objects and the retina, inherent in the eye itself or the eye-lids. The species are,

1. Caligo *(lentis)*, occasioned by an opaque spot behind the pupil.

2. Caligo *(corneæ)*, from an opacity of the cornea.

3. Caligo *(pupillæ)*, from an obstruction of the pupil.

Varying according to the different causes from which it proceeds.

4. Caligo *(humorum)*, from a disease or defect of the aqueous humour.

Varying according to the different state of the humour.

5. Caligo *(palpebrarum)*, from a disease inherent in the eye-lids.

Varying according to the nature of the disease in the eye-lids.

Genus XCIII. Amaurosis. The sight diminished, or totally abolished, without any evident disease of the eye; the pupil for the most part remaining dilated and immoveable. The species are,

1. Amaurosis (*compressionis*), after the causes and attended with the symptoms of congestion in the brain.

Varying according to the nature of the remote cause.

2. Amaurosis *(atonica)*, after the causes and accompanied with symptoms of debility.

3. Amaurosis (*spasmodica*), after the causes and with the signs of spasm.

4. Amaurosis (*venenata*), from poison taken into the body or applied outwardly to it.

Genus XCIV. Dysopia. A depravation of the sight, so that objects cannot be distinctly perceived, except at a certain distance, and in a certain situation. The species are,

1. Dysopia (*tenebrarum*), in which objects are not seen unless they be placed in a strong light.

2. Dysopia *(luminis)*, in which objects are not distinctly seen unless by a weak light.

3. Dysopia (*dissitorum*), in which distant objects are not perceived.

4 Dysopia (*proximorum*), in which the nearest objects are not perceived.

5. Dysopia (*lateralis*), in which objects are not perceived unless placed in an oblique posture.

Genus XCV. Pseudoblepsis; when the sight is diseased in such a manner that the person imagines he sees things which really do not exist, or sees things which do exist after some other manner than they really are. The species are,

1. Pseudoblepsis (*imaginaria*), in which the person imagines he sees things which really do not exist.

Varying according to the nature of the imagination.

2. Pseudoblepsis (*mutans*), in which objects really existing appear somehow changed.

Varying according to the change perceived in the objects, and according to the remote cause.

Genus XCVI. Dysecœa. A diminution or total abolition of the sense of hearing. The species are,

1. Dysecœa *(organica)*, from a disease in the organs transmitting sounds to the internal ear.

Varying according to the nature of the disease and of the part affected.

2. Dysecœa *(atonica)*, without any evident disease of the organs transmitting the sounds.

Varying according to the nature of the cause.

Genus XCVII. Paracusis; a depravation of the hearing. The species are,

1. Paracusis *(imperfecta)*, in which though sounds coming from external objects are heard, yet it is neither distinctly nor in the usual manner.

Varying,

a, With a dulness of hearing.

b, With an hearing too acute and sensible.

c, When a single external sound is doubled by some internal causes.

d, When the sounds which a person desires to hear are not perceived, unless some other violent sound is raised at the same time.

2. Paracusis *(imaginaria)*, in which sounds not existing externally are excited from internal causes.

Varying according to the nature of the sound perceived, and according to the nature of the remote cause.

Genus XCVIII. Anosmia; a diminution or abolition of the sense of smell. The species are,

1. Anosmia *(organica)*, from a disease in the membrane lining the internal parts of the nostrils.

Varying according to the nature of the disease.

2. Anosmia *(atonica)*, without any evident disease of the membrane of the nose.

Genus XCIX. Agheustia; a diminution or abolition of the sense of taste.

1. Agheustia *(organica)*, from a disease in the membrane of the tongue, keeping off from the nerves those substances which ought to produce taste.

2. Agheustia *(atonica)*, without any evident disease of the tongue.

Genus C. Anæsthesia; a diminution or abolition of the sense of feeling The species from Sauvages, adopted by Dr Cullen, are,

1. Anæsthesia a spina bifida.
2. Anæsthesia plethorica.
3. Anæsthesia nascentium.
4. Anæsthesia melancholica.

Order II. Dysorexia; error or defect of appetite.

Sect. I. Appetitus erronei.

Genus CI Bulimia; a desire for food in greater quantities than can be digested.

The idiopathic species are,

1. Bulimia *(helluonum)*, an unusual appetite for food, without any disease of the stomach.

2. Bulimia *(syncopalis)*, a frequent desire of meat, on account of a sensation of hunger threatening syncope.

3 Bulimia *(emetica)*, an appetite for a great quantity of meat, which is thrown up immediately after it is taken.

Genus CII. Polydipsia; an appetite for an unusual quantity of drink.

The polydipsia is almost always symptomatic, and varies

General Arrangement of Diseases.

varies only according to the nature of the disease which accompanies it.

Genus CIII. Pica; a desire of swallowing substances not used as food.

Genus CIV. Satyriasis; an unbounded desire of venery in men. The species are,

1. Satyriasis (*juvenilis*), an unbounded desire of venery, the body at the same time being little disordered.

2. Satyriasis (*furens*), a vehement desire of venery, with a great disorder of the body at the same time.

Genus CV. Nymphomania; an unbounded desire of venery in women.

Varying in degree.

Genus CVI. Nostalgia; a violent desire in those who are absent from their country of revisiting it.

1. Nostalgia (*simplex*), without any other disease.

2. Nostalgia (*complicata*), accompanied with other diseases.

Sect. II. Appetitus deficientes.

Genus CVII. Anorexia. Want of appetite for food. Always symptomatic.

1. Anorexia (*humoralis*), from some humour loading the stomach.

2. Anorexia (*atonica*), from the tone of the fibres of the stomach being lost.

Genus CVIII. Adipsia; a want of thirst. Always a symptom of some disease affecting the sensorium commune.

Genus CIX. Anaphrodisia; want of desire for, or impotence to, venery.

The true species are,

1. Anaphrodisia paralytica.

2. Anaphrodisia gonorrhoica.

The false ones are,

1. Anaphrodisia a mariscis.

2. Anaphrodisia ab urethræ vitio.

Order III. Dyscinesiæ. An impediment, or depravation of motion from a disorder of the organs.

Genus CX. Aphonia; a total suppression of voice without coma or syncope. The species are,

1. Aphonia (*gutturalis*), from the fauces or glottis being swelled.

2. Aphonia (*trachealis*), from a compression of the trachea.

3. Aphonia (*atonica*), from the nerves of the larynx being cut.

Genus CXI. Mutitas; a want of power to pronounce words. The species are,

1. Mutitas (*organica*), from the tongue being cut out or destroyed.

2. Mutitas (*atonica*), from the injuries done to the nerves of the tongue.

3. Mutitas (*surdorum*), from people being born deaf, or the hearing being destroyed during childhood.

Genus CXII. Paraphonia; a depraved sound of the voice. The species are,

1. Paraphonia (*puberum*), in which, about the time of puberty, the voice from being acute and sweet, becomes more grave and harsh.

2. Paraphonia (*rauca*), in which, by reason of the dryness or flaccid tumor of the fauces, the voice becomes rough and hoarse.

3. Paraphonia (*resonans*), in which, by reason of an obstruction in the nostrils, the voice becomes hoarse, with a sound hissing through the nostrils.

4. Paraphonia (*palatina*), in which, on account of a defect or division of the uvula, for the most part with an hare-lip, the voice becomes obscure, hoarse, and unpleasant.

5. Paraphonia (*clangens*), in which the voice is changed to one acute, shrill, and small.

6. Paraphonia (*comatosa*), in which, from a relaxation of the velum palati and glottis, a sound is produced during inspiration.

Genus CXIII. Psellismus; a defect in the articulation of words. The species are,

1. Psellismus (*hæsitans*), in which the words, especially the first ones of a discourse, are not easily pronounced, and not without a frequent repetition of the first syllable.

2. Psellismus (*ringens*), in which the sound of the letter R is always aspirated, and, as it were, doubled.

3. Psellismus (*lallans*), in which the sound of the letter L becomes more liquid, or is pronounced instead of R.

4. Psellismus (*emolliens*), in which the hard letters are changed into the softer ones, and thus the letter S is much used.

5. Psellismus (*balbutiens*), in which, by reason of the tongue being large, or swelled, the labial letters are better heard, and often pronounced instead of others.

6. Psellismus (*acheilos*), in which the labial letters cannot be pronounced at all, or with difficulty.

7. Psellismus (*logostomatum*), in which, on account of the division of the palate, the guttural letters are less perfectly pronounced.

Genus CXIV. Strabismus; the optic axes of the eyes not converging. The species are,

1. Strabismus (*habitualis*), from a bad custom of using only one eye.

2. Strabismus (*commodus*), from the greater debility or mobility of one eye above the other; so that both eyes cannot be conveniently used.

3. Strabismus (*necessarius*), from a change in the situation or shape of the parts of the eye.

Genus CXV. Contractura; a long-continued and rigid contraction of one or more limbs. The species are,

1. Contractura (*primaria*), from the muscles becoming contracted and rigid.

a, From the muscles becoming rigid by inflammation.

b, From muscles becoming rigid by spasm.

c, From muscles contracted by reason of their antagonists having become paralytic.

d, From muscles contracted by an irritating acrimony.

2. Contractura (*articularis*), from stiff joints.]

Order IV. Apocenoses. A flux either of blood or some other humour flowing more plentifully than usual, without pyrexia, or an increased impulse of fluids.

Genus CXVI. Profusio; a flux of blood.

Genus CXVII. Ephidrosis; a preternatural evacuation of sweat.

General Arrangement of Diseases.

Symptomatic ephidroses vary according to the nature of the diseases which they accompany, the different nature of the sweat itself, and sometimes the different parts of the body which sweats most.

Genus CXVIII. Epiphora; a flux of the lacrymal humour.

Genus CXIX. Ptyalismus; a flux of saliva.

Genus CXX. Enuresis; an involuntary flux of urine without pain. The species are,

1. Enuresis (*atonica*), after diseases injuring the sphincter of the bladder.

2. Enuresis (*irritata*), from a compression or irritation of the bladder.

Genus CXXI. Gonorrhœa; a preternatural flux of humour from the urethra in men, with or without a desire of venery. The species are,

1. Gonorrhœa (*pura*), in which, without any impure venery having preceded, a humour resembling pus, without disuria or propensity to venery, flows from the urethra.

2. Gonorrhœa (*impura*), in which, after impure venery, an humour like pus flows from the urethra with dysuria. The consequence of this is,

Gonorrhœa (*mucosa*), in which, after an impure gonorrhœa, a mucous humour flows from the urethra with little or no dysuria.

3. Gonorrhœa (*laxorum*), in which an humour for the most part pellucid, without any erection of the penis, but with a propensity to venery, flows from the urethra while the person is awake.

4. Gonorrhœa (*dormientium*), in which the seminal liquor is thrown out, with erection and desire of venery, in those who are asleep and have lascivious dreams.

Order V. Epischeses; suppressions of evacuations.

Genus CXXII. Obstipatio; the stools either suppressed, or slower than usual. The species are,

1. Obstipatio (*debilium*), in lax, weak, and for the most part dyspeptic persons.

2. Obstipatio (*rigidorum*), in people whose fibres are rigid, and frequently of an hypochondriac disposition.

3. Obstipatio (*obstructorum*), with symptoms of the colica 1st, 2d, 4th, and 7th, abovementioned.

Genus CXXIII. Ischuria; an absolute suppression of urine. The species are,

1. Ischuria (*renalis*), coming after a disease of the kidneys, with pain, or troublesome sense of weight in the region of the kidneys, and without any swelling of the hypogastrium, or desire of making water.

2. Ischuria (*ureterica*), coming after a disease of the kidneys, with a sense of pain or uneasiness in some part of the ureter, and without any tumor of the hypogastrium, or desire of making water.

3. Ischuria (*vesicalis*), with a swelling of the hypogastrium, pain at the neck of the bladder, and a frequent stimulus to make water.

4. Ischuria (*urethralis*), with a swelling of the hypogastrium, frequent stimulus to make water, and pain in some part of the urethra.

All these species are subdivided into many varieties, according to their different causes.

Genus CXXIV. Dysuria; a painful, and somehow impeded emission of urine. The species are,

1. Dysuria (*ardens*), with heat of water, without any manifest disorder of the bladder.

2. Dysuria (*spasmodica*), from a spasm communicated from the other parts to the bladder.

3. Dysuria (*compressionis*), from the neighbouring parts pressing upon the bladder.

4. Dysuria (*phlogistica*), from an inflammation of the neighbouring parts.

5. Dysuria (*irritata*), with signs of a stone in the bladder.

6. Dysuria (*mucosa*), with a copious excretion of mucus.

Genus CXXV. Dyspermatismus; a flow, impeded, and insufficient emission of semen in the venereal act. The species are,

1. Dyspermatismus (*urethralis*), from diseases of the urethra.

2. Dyspermatismus (*nodosus*), from knots on the cavernous bodies.

3. Dyspermatismus (*præputialis*), from too narrow an orifice of the prepuce.

4. Dyspermatismus (*mucosus*), from mucus infarcting the urethra.

5. Dyspermatismus (*hypertonicus*), from too strong an erection of the penis.

6. Dyspermatismus (*epilepticus*), from a spasmodic epilepsy happening during the time of coition.

7. Dyspermatismus (*apractodes*), from an imbecility of the parts of generation.

8. Dyspermatismus (*refluus*), in which there is no emission of semen, because it returns from the urethra into the bladder.

Genus CXXVI. Amenorrhœa. The menses either flowing more sparingly than usual, or not at all, at their usual time, without pregnancy. The species are,

1. Amenorrhœa (*emansionis*), in those arrived at puberty, in whom, after the usual time, the menses have not yet made their appearance, and many different morbid affections have taken place.

2. Amenorrhœa (*suppressionis*) in adults, in whom the menses which had already begun to flow are suppressed.

3. Amenorrhœa (*difficilis*), in which the menses flow sparingly, and with difficulty.

Order VI. Tumores; an increased magnitude of any part without phlogosis.

Genus CXXVII. Aneurisma; a soft tumor, with pulsation, above an artery.

Genus CXXVIII. Varix; a soft tumor, without pulsation, above a vein.

Genus CXXIX. Ecchymoma; a diffused, and scarce eminent, livid tumor.

Genus CXXX. Scirrhus; an hard tumor of some part, generally of a gland, without pain, and difficultly brought to suppuration.

Genus CXXXI. Cancer. A painful tumor of a scirrhous nature, and degenerating into an ill-conditioned ulcer.

Genus CXXXII. Bubo; a suppurating tumor of a conglobate gland.

Genus CXXXIII. Sarcoma; a soft swelling, without pain.

Genus CXXXIV. Verruca; a harder scabrous swelling.

Genus CXXXV. Clavus; a hard, lamellated thickness of the skin.

Genus

Febres

Genus CXXXVI. Lupia. A moveable, soft tumour below the skin, without pain.

Genus CXXXVII. Ganglion. An harder moveable swelling, adhering to a tendon.

Genus CXXXVIII. Hydatis; a cuticular vesicle filled with aqueous humour.

Genus CXXXIX. Hydarthrus; a most painful swelling of the joints, chiefly of the knee, at first scarce elevated, of the same colour with the skin, diminishing the mobility.

Genus CXL. Exostosis; a hard tumor adhering to a bone.

Order VII. Ectopiæ; tumors occasioned by the removal of some part out of its proper situation.

Genus CXLI. Hernia; an ectopia of a soft part as yet covered with the skin and other integuments.

Genus CXLII. Prolapsus; a bare ectopia of some soft part.

Genus CXLIII. Luxatio; the removal of a bone from its place in the joints.

Order VIII. Dialyses. A solution of continuity; manifest to the sight or touch.

Genus CXLIV. Vulnus; a recent and bloody solution of the unity of some soft part by the motion of some hard body.

Genus CXLV. Ulcus. A purulent or ichorous solution of a soft part.

Genus CXLVI. Herpes; a great number of phlyctenæ or small ulcers, gathering in clusters, creeping, and obstinate.

Genus CXLVII. Tinea; small ulcers among the roots of the hair of the head, pouring out a humour which changes to a white friable scurf.

Genus CXLVIII. Psora. Itchy pustules and little ulcers of an infectious nature, chiefly infesting the hands.

Genus CXLIX. Fractura; bones broken into large fragments.

Genus CL. Caries; an exulceration of a bone.

Having thus presented to our readers Dr Cullen's general systematic view of all the diseases to which the human body is subjected, we come next to give a more particular account of the more important affections, treating of them in the order which Dr Cullen has arranged them.

(Tertiana legitima, *Senert. Hoffm. Cleghorn*, Minorc. *Sauv.* Sp I.)

1 *Description.* This disease, in its most regular form, consists of repeated paroxisms, returning every second day, the patient during the intermediate period enjoying apparently a state of good health. This is the most common form of ague, as it is commonly called in Britain. Each paroxysm consists of three parts, the cold, the hot, and the sweating stages. The paroxysm commonly begins with a remarkable shivering, increasing frequently to a convulsive shaking of the limbs. The extremities are always cold, sometimes remarkably so. The cold for the most part is first perceived about the lumbar regions, from thence ascending along the spine turns towards the pit of the stomach. Sometimes it begins in the first joint of the fingers and tip of the nose. Sometimes it attacks only a particular part of the body, as one of the arms, the side of the head, &c. This cold is often preceded by a heavy and sleepy torpor, languor, and lassitude, which we are partly to ascribe to real weakness and partly to mere laziness. To these symptoms succeed yawning and stretching; after which the cold comes on as above described, not unfrequently with a pain of the back, and a troublesome sensation of tension in the precordia and hypochondria. To this succeed nausea and vomiting: and the more genuine the disease, the more certainly does the vomiting come on; by which a great deal of tough mucous matter, and sometimes bilious stuff or indigested food is evacuated during the first paroxysms. In some there is only a violent straining to vomit, without bringing up any thing: sometimes, instead of these symptoms, a diarrhœa occurs; and this chiefly in weak, phlegmatic, and aged people, or where an indigested mucous saburra has long remained in the primæ viæ.

When these symptoms have continued for an hour or two, the cold begins to go off, and is succeeded by a lassitude, languor, and flaccidity of the whole body, but chiefly in the limbs, with an uneasy soreness as if the parts had been bruised; excepting in those cases where the nausea continues for a longer time. After this languor, a heat comes on, the increase of which is generally slow, but sometimes otherwise, with pain of the head, thirst, and bitterness in the mouth. The pulse is quick and unequal; sometimes beating 130 strokes in a minute. As soon as this heat has abated, a little moisture or sweat is observed to break forth; not always indeed in the first, but always in the succeeding paroxysms, and the urine lets fall a quantity of lateritious sediment. The whole paroxysm is scarce ever over in less than six hours, more frequently eight, and in violent cases extends to 12 hours; but that which exceeds 12 hours is to be reckoned a spurious kind, and approaching to the nature of continued fevers. All these symptoms, however, are repeated every second day, in such a manner that the patient is quite free from fever for at least 24 hours. The paroxysms return much about the same time, though sometimes a little sooner or later.

3. *Causes*

Febres

3. *Causes of this disease, and persons subject to it.* The genuine tertian attacks men rather than women, young people rather than old; the latter being more subject to anomalous tertians. It likewise seizes the lusty and active, rather than the lazy and indolent. Those, however, who are apt to nauseate their meat, fall easily into a tertian fever. The cause, according to Dr Cullen, is the miasma of marshes, and that only. Other physicians have taken in many more causes, almost every thing indeed which debilitates the body: but the Doctor denies that any of these, though they may dispose the body for receiving the disease, or may augment it, can by any means produce it without the concurrence of the marsh miasma; and it cannot be denied, that it is a disease almost peculiar to marshy situations. Thus we find it very frequent in the fenny counties of Britain, although in other parts of this island it may be considered as a rare disease.

3. *Prognosis.* The genuine simple tertian, unless improper medicines be administered, is generally very easily cured; nay, the vulgar reckon it of such a salutary nature, that after it they imagine a person becomes more strong and healthy than before. Hippocrates has observed, that these fevers terminate of their own accord after seven or nine paroxysms. Juncker tells us, that it frequently terminates before the seventh paroxysm, but rarely before the fourth. He also denies that any thing critical is to be observed in its going off; but in this he differs from Vogel, who tells us, that the urine, for some days after the fever is quite gone off, appears slimy, and lets fall much sediment. The latter also informs us, that besides the common crisis by sweat and urine, the tertian hath one peculiar to itself, namely, dry scabby ulcers breaking out upon the lips. These sometimes appear about the third or fourth paroxysm; and then we may venture to foretel that the disease will go off spontaneously after the seventh. But though the disease be never dangerous, in cold climates at least, when properly treated; yet the improper use of hot and stimulating medicines may change it into a continued fever, more or less dangerous according to the quantity of medicines taken and the constitution of the patient; in which case the prognosis must be regulated by the particular symptoms which occur. In warm climates, however, the tertian fever may be considered as a much more dangerous disease; and unless the most powerful remedies be employed, the patient is in danger of falling a victim to every paroxysm.

A variety of theories have been proposed for explaining the phenomena of this affection; but we may easily assert, that every thing hitherto said upon the subject is highly unsatisfactory. For although it be now almost universally admitted, that this fever does arise from the effluvia of marshes, yet in what manner the action of those effluvia induces fever, and particularly why this fever returns in regular paroxysms, are questions with regard to which we are still totally in the dark. Dr Cullen, with much ingenuity, attempted to prove, that the remote causes of this, as well as of other fevers, operated by inducing a state of debility; that this debility gives rise to spasm, induces increased action, from which the phenomena are to be explained. But this theory is liable to no less numerous and unsurmountable objections than the exploded hypotheses which had before been proposed by others. For it is an undeniable truth, that debility often exists, even to the highest imaginable degree, without any fever; nay, that when fever has taken place, the debility is often much greater after it is entirely gone than at any period during its course. When spasm and increased action do take place, we have no reason to view them in any other light than merely as symptoms of the disease; and while they are often absent in this affection, they frequently occur in others where the sickness, anxiety, and other characterising symptoms of fever are entirely absent: and, upon the whole, a probable or rational theory of intermittents, as well as of other fevers, still remain to be discovered.

Tertiana.

Cure. The treatment of all genuine intermittents, whether *tertians*, quotidians, or quartans, being almost precisely the same, the general method of cure applicable to them all may be here given, to which it will be easy to refer when we come to describe the others.

In treating intermittent fevers, physicians have formed indications of cure according to their different theories. The followers of Boerhaave, Stahl, &c. who imagined that the disease proceeded from a lentor or other disorders in the blood, always thought it necessary to correct and evacuate these peccant humours by emetics and purgatives before they attempted to stop the disease by the Peruvian bark or any other medicine. The bark, indeed, among some, seems to be held in very little estimation by them; since Vogel affirms, that this medicine, instead of deserving to have the preference of all other febrifuge medicines, ought rather to be ranked among the lowest of the whole; and for this reason he ascribes the cures, said to be obtained by the use of the Peruvian bark, entirely to nature.

According to Dr Cullen, the indications of cure in intermitting fevers may be reduced to the following.

1. In the time of intermission, to prevent the return of the paroxysms.

2. In the time of paroxysms, to conduct these in such a manner as to obtain a final solution of the disease.

3. To take off certain circumstances which might prevent the fulfilling of the two first indications.

The first indication may be answered in two ways. 1. By increasing the action of the heart and arteries some time before the period of accession, and supporting that increased action till the period of accession be over, and thus to prevent the recurrence of that atony and spasm of the extreme vessels, which he thinks give occasion to the recurrence of paroxysms. 2. By supporting the tone of the vessels, and thereby preventing atony and the consequent spasm, without increasing the action of the heart and arteries, the recurrence of paroxysms may be prevented.

The action of the heart and arteries may be increased, 1. By various stimulant remedies internally given or externally applied, and that without exciting sweat. 2. By the same remedies, or others, managed in such a manner as to excite sweating, and to support that

Febres

ſweating till the period of acceſſion be for ſome time paſt. 3. By emetics, ſupporting for the ſame time the tone and action of the extreme veſſels.

The tone of the extreme veſſels may be ſupported without increaſing the action of the heart and arteries, by various tonic medicines; as, 1. Aſtringents alone. 2. Bitters alone. 3. Aſtringents and bitters conjoined. 4. Aſtringents and aromatics conjoined. 5. Certain metallic tonics; and, 6. Opiates. A good deal of exerciſe, and as full a diet as the condition of the patient's appetite and digeſtion allow of, will be proper during the time of intermiſſion, and may be conſidered as belonging to this head. Although many particulars in this plan of cure are deduced from Dr Cullen's theory, yet there can be no doubt that the object chiefly to be aimed at is to employ ſuch remedies during the intermiſſions as will prevent a recurrence of the paroxyſm. Of all the remedies hitherto employed with this intention, the moſt celebrated, perhaps the moſt certainly effectual, is the Peruvian bark; or, to ſpeak more properly, the bark of the *Cinchona officinalis* of Linnæus. But it muſt be obſerved, that good effects are only to be expected from this medicine when given in ſubſtance and in large quantity; and for its uſe the following rules or obſervations have been given.

1. The bark may with ſafety be employed at any period of intermitting fevers, providing that at the ſame time there be neither a phlogiſtic diatheſis prevailing in the ſyſtem, nor any conſiderable or fixed congeſtion preſent in the abdominal viſcera.

2. The proper time for exhibiting the bark in intermittent fevers is during the time of intermiſſion, and it is to be abſtained from in the time of paroxyſms.

3. In the caſe of genuine intermittents, while a due quantity of bark is employed, the exhibition of it ought to be brought as near to the time of acceſſion as the condition of the patient's ſtomach will allow.

4. In all caſes of intermittents, it is not ſufficient that the recurrence of paroxyſms be ſtopped for once by the uſe of the bark; a relapſe is commonly to be expected, and ſhould be prevented by the exhibition of the bark repeated at proper intervals.

The advantage of adminiſtering the bark as early as poſſible, was fully aſcertained by Dr Lind in the years 1765, 66, and 67, during an uncommon prevalence of intermittents. When the diſeaſe was ſtopped by the bark immediately after the firſt or ſecond fit, which was the caſe with 200 of the Doctor's patients as well as himſelf, neither a jaundice nor dropſy enſued; whereas, when the bark could not be adminiſtered, on account of the imperfect remiſſion of the fever, or when the patient had neglected to take it, either a dropſy, jaundice, or conſtant headach, were the certain conſequences; and the violence of the diſeaſe was in proportion to the number of the preceding fits, or to the continuance of the fever. By every paroxyſm the dropſical ſwellings were viſibly increaſed, and the colour of the ſkin rendered of a deeper yellow. When the fever continued a few days without remiſſion, the belly and legs generally ſwelled; a violent headach, likewiſe, and vertigo, for the moſt part diſtreſſed the patient; ſo that ſome, even after the fever had left them, were not able to walk acroſs their chamber for a fortnight or three weeks. When the returns of the fever were regular and even, but ſlight, four or five fits of a ſimple tertian were ſometimes followed by the moſt dangerous ſymptoms; eſpecially in the year 1765, when theſe fevers raged with the greateſt violence. If, as frequently happened, a dropſical patient relapſed into the ague, there was an abſolute neceſſity for putting an immediate ſtop to it by the bark; and in upwards of 70 ſuch patients, Dr Lind obſerved the moſt beneficial effects to accrue from this practice. He never preſcribed the bark until the patient was free from all ſymptoms of the fever; but in that caſe, without regard to a cough, or any other chronical indiſpoſition, he ordered it to be given in large doſes.

Tertiana

The bark has been often obſerved to fail in removing intermittents, from not continuing the uſe of it for a ſufficient length of time, from adminiſtering it in too ſmall a doſe, or from giving it in an improper form. It was a prevailing opinion, that an ounce, or an ounce and an half, of the bark, taken during one intermiſſion, is ſufficient to prevent the return of another paroxyſm. But this is not always the caſe; for a ſevere fit will often attack a patient who has taken ſuch a quantity. When this happens, the patient ought to perſevere during the following intermiſſions, with an increaſe of the doſe, till five or ſix ounces at leaſt have been taken. The medicine alſo ought not to be omitted as ſoon as one fit is ſtopped, but ſhould be continued in a ſmaller doſe, and after longer intervals, for at leaſt ten days or a fortnight. Even for ſeveral months after the diſeaſe is entirely removed, it would be adviſable to take a little bark occaſionally in damp weather, or during an eaſterly wind, to prevent a relapſe. Where the intervals between the fits are ſhort, as in quotidians and double tertians, from one to two drachms of it ought to be taken every two or three hours.

The form in which this medicine is adminiſtered is of ſome conſequence. Mucilages and ſyrups have been recommended to conceal the taſte of it; but, from various experiments, Dr Lind found nothing more effectual for this purpoſe than ſmall-beer or milk, eſpecially the latter. A drachm of bark mixed with two ounces of milk, and quickly drank, may eaſily be taken by a perſon of the moſt delicate taſte, and by waſhing the mouth afterwards with milk there will not remain the leaſt flavour of the bark; but if the mixture be not drank immediately, the bark will impart a bitter taſte to the milk. This medicine is commonly given in electuaries or boluſes; but Dr Lind obſerves, that in theſe forms it proves much leſs efficacious than when adminiſtered in juleps or draughts, with the plentiful addition of wine or ſpirits. He has remarked, that ſix drachms of powdered bark, given in a julep, conſiſting of one fourth or one third of brandy, is as effectual as an ounce of the powder in the form of an electuary, and proves leſs diſagreeable to the ſtomach. For patients unaccuſtomed to wine or ſpirits, each draught ſhould be warmed with ſpiritus ſalis ammoniaci, or tinct. myrrh. by both of which the efficacy of the bark is increaſed. Dr Lind is alſo fully convinced that wine or ſpirits improve the virtues of the bark much more than elixir vitrioli, tinct. roſar. or ſuch other medicines as have been recommended by different phyſicians.

For thoſe who nauſeate the bark from a weakneſs of

Febres of the stomach or other cause, he advises it to be given in clysters, in which form it is as efficacious as when taken by the mouth. For this purpose the extract is most proper with the addition of a sufficient quantity of the tinctura thebaica, in order to its being longer retained. For children labouring under intermitting fevers, Dr Lind orders the spine of the back to be anointed, at the approach of the fit, with a liniment composed of equal parts of tinctura thebaica and liniment sapon. which has often prevented it. If this should not produce the desired effect, he informs us, that two or three tea-spoonfuls of syrup. e. mecon. given in the hot fit, will generally mitigate the symptoms. But for the entire removal of the disease, after purging with magnesia alba, he prescribes a drachm of the extract. cort. Peruvian. with a few drops of tinct. thebaic. in a clyster, to be repeated every three hours for a child of about a year old. When the stomach is oppressed with phlegm, the magnesia frequently occasions vomiting, which should be promoted with warm water. The constant heaviness of the head occasioned by those fevers in such tender constitutions is best relieved by the application of a blister to the back.

The bark has also proved effectual for the cure of intermittents in children, even when externally applied, by putting the powder of it into a quilted waistcoat. Of its efficacy in this way several instances are related by Dr Samuel Pye in the second volume of Medical Observations and Inquiries. In short, so effectual was the bark found in removing these fevers when properly applied, that of between four and five hundred afflicted with them in the year 1765, Dr Lind lost only two, neither of whom had taken this medicine.

In all these fevers, a vomit was administered whenever the patient complained of a sickness and reaching to vomit, or was seized with a spontaneous vomiting; and the bark was never given till this sickness was removed, or a purgative taken to clear more perfectly the whole alimentary canal. In those patients who were troubled with a cough, attended with a pain in the side affecting the breathing, when the pain was not relieved by warm fomentations, the balsamum anodynum, or by a blister, the Doctor generally ordered a few ounces of blood to be taken away, and endeavoured to stop the fever as soon as possible by the administration of the bark; having found that every return of the fever increased all such pains.—When the headach was very violent, and harassed the patient during the intermissions, the success of the bark was rendered more complete by the application of a blister to the back.—A giddiness of the head, which is the symptom most commonly remaining after even a slight intermitting fever, was generally relieved by the sal C. C. and the bark in wine. The former of these was administered in the following manner.

℞ Aq. Alex. Simp. ℥vii.

Sal. C. C. ʒss.

Syr. e Cort. Aurant. ℥i. M. f. julep. Cap. cochlear. ij. subinde.

If from the continuance of the fever the patient was distressed with flatulence, a distension of the abdomen, and a swelling of the legs, a spoonful of tinctura sacra, with the addition of 30 drops of the spirit lavend. compos. was ordered to be taken every night.—A continuance of the bark, a change of air, and the cold bath, were often found requisite to prevent a relapse. Tertiana

Such is the method of cure recommended by this experienced author, who has also discovered the efficacy and success of opium in intermitting fevers. He informs us, that he has prescribed an opiate to upwards of 300 patients labouring under this disease; and he observed, that, if taken during the intermission, it had not the least effect either in preventing or mitigating the succeeding paroxysm: when given in the cold fit, it once or twice seemed to remove it; but when given half an hour after the commencement of the hot fit, it generally gave immediate relief.—When given in the hot fit, the effects of opium are as follow. 1. It shortens and abates the fit; and this with more certainty than an ounce of the bark is found to remove the disease. It generally gives a sensible relief to the head, takes off the burning heat of the fever, and occasions a profuse sweat. This sweat is attended with an agreeable softness of the skin, instead of the burning sensation which affects patients sweating in the hot fit, and is always much more copious than in those who have not taken opium. 3. It often produces a soft and refreshing sleep to a patient tortured in the agonies of the fever, from which he awakes bathed in sweat, and in a great measure free from all complaints.

The Doctor has always observed, that the effects of opium are more uniform and constant in intermitting fevers than in any other disease, and are then more quick and sensible than those of any other medicine. An opiate thus given soon after the commencement of the hot fit, by abating the violence and lessening the duration of the fever, preserves the constitution so entirely uninjured, that, since he used opium in agues, a dropsy or jaundice has seldom attacked any of his patients in those diseases. When opium did not immediately abate the symptoms of the fever, it never increased their violence. On the contrary, most patients reaped some benefit from an opiate given in the hot fit, and many of them bore a larger dose at that time than they could do at any other. The Doctor assures us, that even a delirium in the hot fit is not increased by opium, though opium will not remove it. Hence he thinks it probable, that many symptoms attending these fevers are spasmodic; but more especially the head-ach. However, if the patient be delirious in the fit, the administration of the opiate ought to be delayed until he recovers his senses, when it will be found greatly to relieve the weakness and faintness which commonly succeed the delirium Dr Lind is of opinion, that opium in this disease is the best preparative for the bark; as it not only produces a complete intermission, in which case alone that remedy can be safely administered; but occasions such a salutary and copious evacuation by sweat, as generally to render a much less quantity of bark requisite. He commonly prescribes the opiate in about two ounces of tinctura sacra, when the patient is costive, who is to take the bark immediately after the fit. By these means the paroxysm is shortened, and the intestines are cleansed,

Febres

previous to the administration of the bark; as the opiate doth not prevent, but only somewhat retards, the operation of the purgative. When a vomit is given immediately before the paroxysm, the administration of the opiate should be postponed till the hot fit is begun.

In the administration of the Peruvian bark, care should be taken that it be of a good quality. And different opinions have been entertained with respect to the choice, even where there is no reason to believe that it has been adulterated by the mixture of other articles. For a long time, the preference was given to small quilled pieces of a pale coloured bark; but of late the red bark, which is generally in larger masses, of an apparently coarser texture, and evidently of a more resinous nature, has been highly celebrated by Dr Saunders and others. And in cases where it does not disagree with the stomach or excite looseness, it is admitted by the most accurate observers to be more powerful in preventing the return of intermittents. Whether the red bark be the product of a different species of the cinchona, or be obtained as well as the pale quilled bark from the cinchona officinalis, is not yet ascertained with sufficient accuracy.

A species of cinchona, distinguished by the title of *cinchona Jamaicensis*, has been discovered in Jamaica and other islands in the West Indies. A very accurate description of it has been given by Dr Wright of Jamaica in the Philosophical Transactions of London. The bark of this species also has been recommended in the cure of intermittents; but the advantages of it have not hitherto been sufficiently confirmed by experience. See CINCHONA and JESUITS *Bark*.

The barks of various trees readily cultivated in Britain, particularly different species of the salix, the prunus, the fraxinus, and the quercus, have by some been represented as no less efficacious than the Peruvian bark. But we may safely venture to assert, that although several of them may possess some power in stopping intermittents, yet that none hitherto tried can be considered as in any degree approaching to the cinchona in point of efficacy.

But although the Peruvian bark be the best cure for intermittents hitherto discovered, yet while it can by no means be represented as the only cure, it is very certain that other remedies have in different cases succeeded after the cinchona has failed. Cures have often been obtained by the use of different aromatics, bitters, and astringents. Many articles from the mineral kingdom also have been employed with advantage. And intermittents have unquestionably been in certain cases stopped by different preparations of iron, zinc, copper, lead, and mercury. But of all the articles of this nature, arsenic has of late been the most celebrated. Arsenic is on good grounds conjectured to be the basis of an article much employed in the cure of intermittents in some of the countries where they are most prevalent, and sold under the title of the *tasteless ague drop*. The great success attending the use of this article, led Dr Fowler, an ingenious physician of Stafford, to examine it with particular attention. And in a treatise which he has lately published, entitled *Medical Reports* on the effects of arsenic in the cure of agues, he has given a formula for an arsenical solution, which he has found very successful in affections of this kind, and which is probably very nearly the same with the tasteless ague drop. Dr Fowler's mineral solution, as he styles it, is found by dissolving 64 grains of arsenic and as much fixed vegetable alkaline salt in a pound of distilled water. This solution is given in doses from three to 12 drops, varied according to the condition of the patient, and repeated two or three times a-day. And where the Peruvian bark has failed in stopping intermittents, it seems to be one of the most powerful remedies yet discovered. But after all remedies prove ineffectual, intermittents are often stopped by change of season and of situation.

Tertiana.

But besides the remedies employed in tertian fevers and other intermittents, with the view of preventing the return of paroxysms, it is often also necessary to employ powerful articles with other intentions, particularly to mitigate and shorten the paroxysm when present; to obviate urgent symptoms, especially those of an inflammatory or putrid nature; and to obtain a complete apyrexia or intermission from fever after the paroxysm has ceased. With these intentions, recourse is not unfrequently had to emetics, laxatives, bloodletting, blisters, opium, diluents, or sudorifics, as the circumstances of the case may require.

The *Irregular* or *Spurious* TERTIAN. 127

Sp. I. var. 1. B.

Tertiana notha sive spuria, *Sauv.* sp. 2. *Sennert. Cleghorn. Hoffman.*

The characteristic marks of this fever are, that its paroxysms last longer than 12 hours, and consequently it inclines more to the quotidian or continued fever than the former. Its paroxysms have no stated hour of attacking. The cure, however, is precisely the same with that above described, observing the proper cautions already mentioned with regard to the use of the bark.

The *Double* TERTIAN. Sp. I. var. 2. C. 128

Tertiana duplex, *Sauv.* sp. 13. *Vog.* G. 12. *Sennert. Cleghorn*

Duplicata, *Lin.* 18.

The double tertian comes on every day; but differs from the quotidian in so far, that its paroxysms do not answer to each other singly, but alternately. The first day, for instance, the fit will come on in the forenoon, the second in the afternoon, the third in the forenoon, and the fourth in the afternoon.

Of these fevers we shall give the following description from Cleghorn's treatise on the diseases of Minorca: "They are called *double tertians* when there are two fits and two intervals within the time of each period. But commonly there is some difference between the two fits, either in respect of the hour they come at, the time of their duration, or the nature and violence of their concomitant symptoms. Some double tertians begin in this manner.—On the evening of Monday, for example, a slight fit comes on, and goes off early next morning; but on Tuesday, towards the middle of the day, a more severe paroxysm begins, and continues till night. Then there is an interval to Wednesday evening, when a slight fit commences a new period of the fever, which proceeds in the same manner as the first; so that (according to the way physicians calculate the days of diseases, by beginning to

Febres

to reckon from the first hour of their invasion), both paroxysms happen on the odd days, while the greatest part of the even days is calm and undisturbed. But in most double tertians the patient has a fit every day of the disease; the severe one commonly appearing at noon upon the odd days, the slight one towards evening on the even days; though sometimes the worst of the two fits happen on the even days.

"There is a tertian fever sometimes to be met with, during each period of which there are three different fits, and as many intervals. For example, towards Monday noon the patient is seized with a paroxysm, which declines about five or six o'clock the same evening: a few hours after, another fit begins, and continues until morning: from which time there is an interval to Tuesday evening, when a third fit comes on, and lasts most part of the night. On Wednesday there are again two paroxysms, as on Monday and on Thursday, like that of Tuesday; and thus the fever goes on with a double fit on each of the odd days, and a single fit on the even days.

"In double tertians, that interval is the most considerable which follows the severe fit; for the slight fit oftener ends in a remission than intermission, and frequently lingers till the other approaches: Hence it is, that the night preceding the vehement fit is much more restless than that which comes after it, as has been observed by Hippocrates. In double tertians, the vehement fit often comes on a little earlier in each period, while the slight fit returns at the same hour, or perhaps later and later every other day: so that the motions of one have no influence on those of the other; from whence it appears, that each of these fits hath its own proper independent causes."

129 *Duplicated* TERTIAN. Sp. I. var. 2. D.

Tertiana duplicata, *Sauv.* sp. 14. *Jones. River.*

This hath two fits on the same day, with an intermediate day on which there are none. This also does not differ in any remarkable particular from those already described.

130 The *Triple* TERTIAN. Sp. I. var. 2. E.

Tertiana triplex, *Sauv.* sp. 15. *Cleghorn.*

Semitertiana, *Hoffman.*

Semitertiana primi ordinis, *Spig.*

This differs from the former in having a single and double fit alternately: thus, for instance, if there are two fits the first day, there is only one the second, two the third, one the fourth, &c. Its cure the same as before.

131 The *Semi*-TERTIAN. Sp. I. var. 2. F.

Hemitritæus, *Celf.*

Semitertiana, *Cleghorn.*

Semitertiana secundi ordinis, *Spig.*

Amphimerina hemitritæus, *Sauv.* sp. 8.

Amphimerina pseudo hemitritæus, *Sauv.* sp. 9.

The semitertian is described by Dr Cullen as having only an evident *remission* between its paroxysms; more remarkable between the odd and even day, but less so between the even and odd one. For this reason, he adds, that possibly some semitertians ought rather to be classed among the remittents; and owns that it is difficult to settle the boundaries between them. But Cleghorn, whom he quotes, describes it in the following manner. "A fit begins on Monday noon, for example, and goes off the same night. On Tuesday afternoon a second fit comes on, and gradually increases till Wednesday night, when it terminates. On Thursday morning there is such another interval as happened on Tuesday morning: But on Thursday afternoon another long fit like the preceding commences; and returning regularly every other day, leaves only a short interval of ten or twelve hours during the eight and forty.

Tertiana.

Concerning the cure of these fevers Dr Cullen observes, that though no entire apyrexia occurs, the bark may be given during the remissions; and it should be given even though the remissions be inconsiderable; if, from the known nature of the epidemic, intermissions or considerable remissions are not to be expected, and that great danger is apprehended from repeated exacerbations.

The *Sleepy* TERTIAN. Sp. I. var. 3. G. 132

Tertiana carotica, *Sauv.* sp. 10. *Werlhof.*

Tertiana hemiplegica, *Sauv* sp. 20. *Werlholf.*

Quotidiana soporosa, *Sauv.* sp. 8 *Car. Pis.*

Febris caput impetens, *Sydenham*, ep. ad R. Brady.

This, according to Vogel, is a most dangerous species, and very commonly fatal; for which reason he ranks it among those intermittents which he calls *malignant.* Sometimes he tells us the alarming symptom of a sleepiness comes on, not at the beginning of the disease, but will unexpectedly occur during the third, fourth, fifth, or sixth paroxysm. It commonly begins with the cold fit, and continues during the whole time of the paroxysm, and, becoming stronger at every succeeding one, at last terminates in a mortal apoplexy. Sometimes fevers of this kind rage epidemically. Vogel relates, that he saw a simple tertian changed into one of these dangerous fevers. The patient was a woman of a delicate constitution, and the symptom appeared in consequence of her being put in a violent passion: however, it occurred but once, and she recovered. Hoffman mentions a carus in a double tertian occurring seven times without proving mortal; tho' Vogel says, that the powers of nature are very seldom sufficient to conquer the disease.

In 1678, Dr Sydenham tells us that intermittents raged epidemically at London, where none had appeared before from 1664. Of them "it is to be noted (says he), that though quartans were most frequent formerly, yet now tertians or quotidians were most common, unless the latter be intitled double tertians; and likewise, that though these tertians sometimes began with chilness and shivering, which were succeeded first by heat, and soon after by sweat, and ended at length in a perfect intermission, returning again after a fixed time, yet they did not keep this order after the third or fourth fit, especially if the patient was confined to his bed and used hot cardiacs, which increase the disease. But afterwards this fever became so unusually violent, that only a remission happened in the place of an intermission; and approaching every day nearer the species of continued fevers, it seized the head, and proved fatal to abundance of person."

From this description of Sydenham's we may have an idea of the nature of the disease. As to its cure, Febres he strongly recommends the bark; telling us, that, even in the *most continued* kind of intermittents, "the nearer the intermittent approaches to a continued fever, either spontaneously, or from using too hot a regimen, so much the more necessary is it to exhibit a larger quantity of the bark; and that he took advantage of a remission, though ever so small.

Tertians of this kind occur with very different symptoms from those of the true ones, and sometimes even with those which are very extraordinary. In some they are attended with symptoms of asthma, in others with those of hysterics, in others with convulsions. Where the symptoms of asthma occur, the disease must be treated with diuretics and antispasmodics joined with the bark. In the hysteric asthma the fit comes on with cold, yawning, cardialgia, terror and dejection of mind. The disease is to be removed by mild aperients and antihysterics joined with the bark.

Of the convulsive tertian we have a most remarkable instance in the Edinburgh Medical Essays, Vol. V. The patient was a farmer's son about 26 years of age, of a strong plethoric habit of body. He had laboured under an ague half a-year, and had taken a great deal of bark. While he was telling his case to the surgeon (Mr Baine of Pembroke), he was suddenly taken with a violent stamping of his feet; and the convulsions gradually ascended from the soles of the feet to his legs, thighs, belly, back, and shoulders. His head was then most violently convulsed, with a total deprivation of speech; but he had a most dismal vociferation, that might have been heard at a considerable distance, his abdomen and thorax working and heaving violently and unusually in the mean time. This fit having lasted half an hour, a profuse sweat broke out over all his body, which relieved him; and he then became capable of answering such questions as were put. These extraordinary fits, he said, had been occasioned by a fright, and his neighbours had concluded that he was bewitched. They returned sometimes twice a day, and always at the times the ague used to return. During the paroxysm his pulse was very high and quick, his face much inflamed, and his eyes ready to start out of his head. After the fit was over, he complained of a most torturing pain of the bowels. His tongue was generally moist, and he had a suppression of urine.—This formidable disease, however, was totally subdued by the use of the bark, mercurials, antispasmodics, opiates, and saline draughts.

Tertiana petechialis, *Sauv.* sp. 3. *Donat. Lautter.*

Tertiana scorbutica, *Wedel.* A. N. C. Dec. I. A. II. obs. 193. 134

Tertiana urticata, *Sauv.* sp. 22. *Planchon.* Journ. de Med. 1765. *Cleghorn.*

Tertiana miliaris, *Sauv.* sp. 21. Walthier.

This species of tertian is accompanied with red or livid blotches on the skin, or an eruption like that occasioned by the stinging of nettles. In the latter case Dr Cleghorn says the disease is very dangerous; and as the former indicates an incipient dissolution and putrefaction of the blood, it must also be reckoned of very dangerous tendency.

The *Inflammatory* TERTIAN. Sp. I. var. 3. K. 135

Tertiana pleuritica, *Sauv.* sp. 4. *Valef. Lautt.*

Pleuritis periodica, *Sauv.* G. 103. sp. 14.

Tertiana arthritica, *Sauv.* sp 5. *Morton. Lautt.*

Sauvages inform us, that he has seen a true and genuine pleurisy having all the pathognomic signs of the disease, but assuming the form of an intermittent; that is, the patient is one day affected with the pleurisy, and the next seemingly in perfect health. He also tells us, that in the month of May 1760 a tertian raged epidemically, which after the third fit imitated a pleurisy, the pain of the side and difficulty of breathing coming regularly on, and the fever from an intermittent becoming remittent; the blood had also the same appearance with that of pleuritic persons, and the distemper yielded to bleeding and gentle cathartics.—Morton also informs us, that he has observed similar disorders an hundred times over, which were always certainly and safely cured by the Peruvian bark.

The TERTIAN *complicated* with other *Disorders.* Sp. I. var. 4. 136

Tertiana scorbutica, *Sauv.* sp. 9. *Etmuller. Timæus.*

Tertiana syphilitica, *Sauv.* sp. 17. *Deidier.*

Tertiana verminosa, *Sauv.* sp. 18. *Stisser.* in act. Helmstad. *Lanscis.* de noxis palud. *Pringle. Ramazzini. Van den Bosch.* de const. vermin.

The scorbutic tertian, according to Sauvages, is exceedingly anomalous, its periods being sometimes much anticipated, and sometimes much postponed. It is exceedingly obstinate, and will return if the body be not cleared of its scorbutic taint. The patient is affected with lancinating pains of a wandering nature. The urine lets fall a dusky red sediment, or a thick branny matter is copiously scattered up and down in it, seemingly tinged with blood. The usual symptoms of scurvy, viz. livid spots, and rotten fetid gums, also frequently occur. For this the Peruvian bark is very useful, both as a febrifuge and antiscorbutic.

A tertian accompanied with worms is taken notice of by Sir John Pringle in his treatise on the diseases of the army. The worms, he tells us, were of the round kind; and though we are by no means to reckon them the cause of the fever, they never failed to make it worse, occasioning obstinate gripings or sickness at stomach. In these cases stitches were frequent; but, being flatulent, were not often relieved by bleeding. The worms were discharged by vomiting

Febres

as well as by stool. For discharging these worms, he commonly gave half a drachm of rhubarb with 12 grains of calomel; without observing any inconvenience from such a large dose of mercury. Anthelmintics, which act slowly, had little chance of doing good; for though worms will sometimes lie long in the bowels without giving much uneasiness to a person otherwise well, yet in a fever, especially one of a putrid kind (to which his intermittents always seemed to incline), the worms being disturbed by the increase of heat, and the corruption of the humours in the *primæ viæ*, begin to move about, and struggle to get out. Lancisius, who makes this remark, adds, that upon opening the bodies of some who had died at Rome of fevers of this kind, wounds were found in the intestines made by the biting of the worms; nay, that some of them had even pierced through the coats of the guts, and lay in the cavity of the abdomen. Pringle never had any instance of this; but knew many cases in which the worms escaped by the patient's mouth, though there had been no previous retching to bring them up. One soldier was thrown into violent convulsions, but was cured by the abovementioned powder.

137 The TERTIAN *varied* from its *Origin*. Sp. I. var. 5.

Tertiana accidentalis, *Sauv.* Sp. 12. *Sydenham.*
Tertiana a scabie, *Sauv.* sp. 12. *Juncker*, tab. 80. *Hoffman*, II. p. 12.

The existence of fevers of this kind, as we have already observed, is denied by Dr Cullen; the accidental fever of Sauvages was said to arise from any slight error in the non-naturals, and consequently was very easily cured. That which arose from the repulsion of the itch, was cured as soon as the cruption returned.

The remittent fevers are much more dangerous than the true intermittents, as being generally attended with much greater debility of the nervous fyftem and tendency to putrefcency in the fluids than the latter. Sauvages divides his tritæophya, a remittent tertian, into the following fpecies.

139 1. *Tritæophya fyncopalis*, or that attended with fainting. It begins like a tertian, with cold fucceeded by heat and profufe fweating; but attended with much more dangerous fymptoms, fuch as cardialgia, enormous vomiting, great weaknefs, fmall contracted pulfe, coldnefs of the extremities, and, unlefs timely affiftance be given, kills during the fecond or third paroxyfm.

140 2. The *caufus*, or burning fever of Hippocrates, returns every third day without any new fenfation of cold; and is attended with great thirft, heat, but without diarrhœa or fweat, and continues only for one week or two at the utmoft. It attacks chiefly young people of a robuft and bilious habit of body, who have been accuftomed to much exercife, and expofed to the fun during the heats of fummer, and have alfo ufed a phlogiftic regimen The tongue is dry, fometimes black; the urine of a red or flame colour; together with pain of the head, anxiety, and fometimes other fymptoms ftill more dangerous.

141 3. *Tritæophya Vratiflavienfis*, was a peftilential difeafe occafioned by famine, during which the people fed on putrid aliments: the air was infected by the vaft numbers of bodies of thofe flain in battle, and the inhabitants were alfo dejected by reafon of being deprived of their harveft, and other calamities; to all which was added the continuance of a calm in the atmofphere for a long time. It began with an acute fever, leipyria or coldnefs of the external parts and fenfation of burning heat inwardly; general weaknefs; pain of the head and præcordia; ferous or bilious diarrhœa; a delirium, in fome furious, and accompanied with a dread of being expofed to the air; on the fecond day the thirft was violent, attended with a bilious vomiting as well as diarrhœa, tough vifcid fpitting, fainting, burning heat in the bowels, the tongue dry and feeming as if burnt with a hot iron, a fuppreffion of the voice, anxiety, ftupor; after which quickly followed convulfions and death. In fome fevers a leipyria came on with an exceeding great cold of the extremities, prefently followed by an intolerable heat of the vifcera, with fymptomatic fweats, violent diarrhœa, followed by a very itchy miliary eruption. On the fourth day came on copious fweats, fpafms of the lower jaw, naufea, involuntary paffing of urine, flight delirium, a flux of ichorous matter from the noftrils, an exceeding tough fpitting, an epilepfy, and death. Profeffor Hahn, who gives the hiftory of this difeafe, was himfelf attacked by it, and fuffered in the following manner. On the firft day was a violent feverifh paroxyfm without rigor, a fharp pain in the occiput, and immediately an inflammatory pain over the whole head; the feet were extremely cold, and the extremities rigid with fpafms. The pain continued to increafe daily to fuch a degree, that the contact of the air itfelf became at laft intolerable; a dejection of mind and incredible weaknefs followed; he paffed reftlefs nights with continual fweating, heavy and pained eyes, and an univerfal fenfation of rheumatifm over the whole body. On the third day the pains were affuaged, but he had a very bad night. On the fourth day all the fymptoms were worfe, the feet quite chilled, the hands very red and agitated with convulfive motions; he was terrified with apprehenfions of death, and had a vomiting every now and then: this day fponges dipped in cold water were applied over the whole body, and he ufed cold water for his drink. On the eighth day the pulfe was convulfive; and the pains were fo violent, that they made him cry out almoft continually. On the ninth day he was delirious, and threw up fome grumous blood. On the 11th his pulfe was more quiet, and he had a fweat; a decoction of the bark was given: his voice was broken, his fpeech interrupted, and his teeth chattered upon one another. On the 12th his jaw was convulfed, he had a rifus fardonicus, and deafnefs; after which, the paroxyfms returned lefs frequently, and only towards night. On the 14th he had a chilling cold over the whole body, a cold fweat; frequent lotions were applied, and all the fymptoms became milder. On the 18th he had a quick delirium, but fainted as foon as taken out of bed; a fenfation of hunger, followed by copious fweats; profound fleep; an averfion from noife; every thing appeared new and extraordinary. On the 36th a cholera; on the 48th a fcaling off of the fkin, and falling off of the nails. This epidemic carried off above 3000 people at Warfaw. Frequent lotion of the body either cold or tepid, watery glyfters, and the copious introduction of watery fluids under the form of drink, were of fervice. But the moft favourable crifis was under the form of fome cutaneous eruption.

4. *Tritæophya typhodes.* The principal fymptom of this fever was a continual fweat with which the patients were almoft always wet; with paroxyfms returning every third day. Sauvages tells us, that he had twice an opportunity of obferving this fever; one was in the teacher of an academy, about 40 years of age, and of a melancholic temperament. He fweated every other night fo plentifully, that he was obliged to change his linen nine times; and even on the intermediate days was never perfectly free of fever, and had his fkin moiftened with fweat. The other was of a woman who went about in man's clothes, and was difcovered only after her death. The difeafe began with a flight fenfation of cold, after which fhe fweated for eight hours. It was attended with the higheft debility, anxiety, and at the fame time an infatiable hunger. 142

5. *Tritæophya elodes*, was an inflammatory epidemic, but not contagious, terminating about the 14th or 21ft day. The difeafe came on in the night-time, with difturbed reft, univerfal weaknefs, watchings, great heat and fweat, rednefs of the face and almoft of the whole body, fparkling eyes, the tongue dry and white; a hard, tenfe, and turgid pulfe: about the third day a kind of frenzy frequently came on with the feverifh paroxyfm, the forerunner of an univerfal miliary eruption; or, what was worfe, with purple fpots fo clofe together, that they looked like an eryfipelas of 143

Febres

of the whole body. Sometimes blifters of the fize of fmall pearls, filled with acrid ferum, appeared on the neck, armpits, and trunk of the body, which were of all others the moft dangerous. There was a variety of the difeafe, which our author calls the *humoralis*, and in which the pulfe was foft and feeble, with greater weaknefs over the whole body, and the difpofition to fleep more frequent than in the other; the eyes languid; the tongue very white, but not dry; and worms were difcharged.

144 6 *Tritæophya affodes.* This fpecies arofe from a foulnefs of the primæ viæ, and the effluvia of waters in which hemp had been fteeped. It began with rigor, followed by great heats, reftleffnefs, toffing of the limbs, terrible faintings, immoderate thirft, drynefs of tongue, delirium, and at length exceffive watchings; thefe laft, however, were lefs dangerous than vertigoes or comatofe difpofitions, which brought on convulfions or apoplexies.

145 7. *Tritæophya carotica.* This had exacerbations every other evening; and its diftinguifhing fymptom was an exceffive inclination to fleep, preceded by a fevere headach, and followed by delirium, and fometimes convulfions; the tongue was black, and the patient infenfible of thirft after the delirium came on. In thofe cafes where the difeafe proved fatal, a fubfultus tendinum and other grievous fymptoms came on.

146 9. *Tritæophya leipyria* is only a variety of the tritæophya caufus, already defcribed.

147 10. *Tritæophya deceptiva.* This fpecies at firft affumes the appearance of a continued fever; but afterwards degenerates into a remittent, or even an intermittent. It is defcribed by Sydenham, but attended with no remarkable fymptoms.

148 11. The laft of Sauvages's fpecies of Tritæophya belonging to the remitting tertian is the *Americana*. This, according to Sauvages, is the ardent fever with which the Europeans are ufually feized on their firft coming to America, and generally carries off one half of them. Of this there are two varieties, the *very acute* and the *acute*. The very acute ends before the feventh day. It comes on a few days after the perfon's arrival, with lofs of appetite, with dyfpnœa and fighing from weaknefs, head-ach, laffitude, pain of the loins: a pyrexia fucceeds, with great thirft, fweat, and heat; the ficknefs increafes, naufea comes on, with vomiting of porraceous bile; the tongue rough, the extremities often cold; watching, furious delirium; and the patient frequently dies on the third day. Copious fweats, and a plentiful hemorrhagy from the nofe on the fifth day, but not fooner, are ferviceable; but a bilious diarrhœa is the beft crifis of all.

The acute kind terminates moft frequently on the ninth, but very rarely goes beyond the fifteenth day. Death frequently comes on between the fourth and feventh days. It begins with head-ach, pain in the loins, and fometimes fhivering; great laffitude, dyfpnœa, thirft; burning fever, increafing every third day; inflation of the abdomen, pain at the pit of the ftomach, naufea, and bilious vomiting. Such is the ftate of the difeafe within twenty-four hours. The eyes are red, and full of tears; the urine pellucid; there is a low delirium, and continual anxiety; the tongue is dry and red, and fometimes, though rarely, black, which is a ftill worfe fign; the pulfe, formerly ftrong and full, finks about the fourth day, and becomes tenfe and fpafmodic: if a carus then comes on, the patient dies the fifth or fixth day; but if the pulfe keeps up, and no carus comes on, a crifis is to be expected by fweat, by a copious hemorrhagy from the nofe, or, which is ftill more fafe, by a bilious diarrhœa, which is never falutary if it comes on before the fifth day.

Tertiana.

To the remitting tertian alfo belong the following fpecies mentioned by Sauvages, viz.

1. *Tertiana fubcontinua.* This begins like a genuine tertian, and at firft hath diftinct paroxyfms; but thefe grow gradually more and more obfcure, the difeafe acquiring daily more of the appearance of continued fever, by which it is to be diftinguifhed from the other varieties of this fpecies. It is not unfrequently joined with thofe fymptoms which attend the fatal fever already mentioned; as cardialgia, cholera, fyncope, &c. but in a much lefs degree. The difeafe commonly begins with little or no fenfe of cold, but rather a fenfation of heat; when the tertian is doubled, it has firft a flighter and then a more fevere fit; and thus goes on with an exacerbation on the even days: and though it fhould change from a double into a fingle tertian, we are ftill to fufpect it, if a weak fit is the forerunner of a very ftrong one. This change of the tertian into a continued fever is alfo to be prognofticated if a heat remarkable to the touch is perceived on the day of intermiffion, together with fome difturbance of the pulfe, thirft, and drynefs of the tongue; all of which fhow an univerfal tendency to inflammation: the fame is foretold by the urine being in fmall quantity, and very red, or of a faffron colour; alfo an ulcerous or aphthous inflammation of the throat, with difficulty of fwallowing, or any very fevere fymptom coming on in the beginning of the difeafe, excepting only a delirium, which is eafily removed. 149

2. *Quotidiana deceptiva.* This is a diforder of an inflammatory kind, with a ftrong tendency to putrefcency, and fometimes affumes the form of a quotidian. In it the patient frequently complains of cold when he really is hot, and the remiffion is very indiftinct; and the difeafe is known by the great languor of the patient and the foulnefs of his tongue. 150

3. *Amphimerina cardiaca* is an acute malignant fever, with daily exacerbations, attended with fainting and vomiting of green bile. Afterwards, the weaknefs increafing, the patient's extremities grow cold, and a profufe fweat comes on, which is frequently fucceeded by death on the fourth day. Another fpecies refembling this Sauvages calls the *fyncopalis*; but the cardiaca differs from it in being attended with cardialgia. 151

4. *Amphimerina paludofa.* This is the fever defcribed by the Britifh phyficians under many different names, and appearing under various forms, according to the different conftitutions of the patients. This fever in the Eaft Indies, according to Dr Lind of Windfor, generally comes on fuddenly, and begins with a fenfe of debility and a very great lownefs of fpirits. Thefe fymptoms are attended with a greater or lefs degree of chillinefs, a dizzinefs, a naufea, very acute pains in the head and loins, and a trembling of the hands; the countenance is pale, the fkin commonly very dry and corrugated, the eyes dull and heavy the pulfe quick and fmall, the breath generally difficult, and interrupted with hiccough. 152

Febres Tertiana.

As the paroxyfm increafes, the chillinefs now and then gives way to irregular heats, which foon become violent and permanent; the naufea likewife increafes; and in fome there comes on a vomiting, in which they throw up a great deal of bile. Sometimes bile is likewife voided by ftool. The fkin grows red; the eyes fmall, and fometimes not a little inflamed. The pulfe becomes fuller, and the breath more difficult, attended with great reftleffnefs and a troublefome thirft; notwithftanding which (fo great is the naufea) the patient cannot endure any kind of liquids. The tongue becomes foul, and the pain of the head and loins more violent; a delirium then follows; a flight moifture appears on the face, and from thence fpreads to the other parts; whilft the violence of the other fymptoms abates, and fhows the beginning of a remiffion, which is completed by plentiful fweats.

On the fever's remitting, the pulfe returns almoft to its natural ftate; the pains of the head and loins ftill continue, though fomewhat lefs violent, as likewife the naufea and want of appetite. When the difeafe gains ftrength, the remiffion is fcarcely obvious, and is immediately followed by another paroxyfm; which begins, not indeed with fo great a fhivering, but is attended with a greater pain of the head, the greateft anxiety, a heartburn, naufea, vomiting, and bilious ftools. The matter moft commonly evacuated by vomit and ftool is whitifh like chalk and water, or curdled milk which is vomited by fucking children, when the curd is much broke down. A heat, immoderate thirft, and delirium, now come on. The tongue becomes more foul; the teeth and infide of the lips are covered with a black cruft; the breath grows hot and fetid: another remiffion enfues, attended with a fweat; but this remiffion is both fhorter and lefs obvious than the firft.

This fecond remiffion is fucceeded by a paroxyfm, in which the fymptoms are far more violent than in the former; that which the patient difcharges by vomiting and purging is more fetid; the mouth, teeth, and infide of the lips, are not only covered with a black cruft, but the tongue becomes fo dry and ftiff, that the patient's voice can fcarce be heard. Violent delirium, with reftleffnefs and anxiety, come on chiefly during the paroxyfm; nor do thefe fymptoms abate till the fever remits, and the patient fweats.

When the fever becomes fo violent, during the third fit, as to end in death, which is generally the cafe, fome of the fick have a coma; in others the delirium becomes more violent The difcharges now become more fetid, and have a cadaverous fmell; the ftools are involuntary; the pulfe is fo quick, fmall, and irregular, that it is fcarce to be counted, or even felt; a cold fweat is diffufed over the whole body, efpecially the head and neck: the face becomes Hippocratic and convulfed; the patient picks the bed-clothes; a fubfultus tendinum comes on; the fick lie conftantly on their backs, and infenfibly flide down to the foot of the bed; their extremities grow cold; they are then feized with convulfions, with which the fcene clofes.

In this fever, the urine, which at the beginning is pale, becomes of a deeper colour by degrees, but without depofiting any fediment. There feldom or never appear any petechiæ, and the prickly heat which was before on the fkin vanifhes on the firft appearance of the fever. But though thefe were the general fymptoms of this diforder, they varied in the different fubjects, and at different feafons of the fame year. The pulfe, for example, in fome, was quick in the beginning of the diforder; in others, it varied with the other fymptoms. The fkin was generally dry in the beginning of the fit; but in fome it was moift, and covered with fweat from the very firft beginning of the difeafe. In the month of September, when the diforder raged moft, the remiffions were very imperfect and obfcure; but, on the return of winter and the healthy feafon, they became more regular, and the difeafe affumed the appearance of an intermitting fever, to fuch a degree as at length not to be diftinguifhed from it. In fome the remiffions could fcarce be perceived, and the fever continued for two weeks without any material change for the better or the worfe. At this time numbers were feized with it. When the diforder continued for any time without a change, it generally ended in death; while the weather grew better, it fometimes, in the fpace of a few days, from a common fever became an intermitting one, and the patient recovered, unlefs his liver, which was fometimes the cafe, happened to be affected. The cure of an inflammation of the liver proved uncertain and tedious; as it was commonly followed by a colliquative diarrhœa, which generally endangered the patient's life.—Every fucceeding paroxyfm was obferved to be more dangerous than the preceding; the third generally proved fatal; fome died during the firft. When this happened, the fever, in the language of the country, was called a *puca*, that is a ftrong fever.

This difeafe, according to Dr Lind of Haflar hofpital, is the autumnal fever of all hot countries, the epidemic difeafe between the tropics, and the difeafe moft fatal to Europeans in all hot and unhealthy climates. All authors agree that intermittents in general, but particularly this dangerous kind of them, are produced by heat and moifture. Dr Lind of Windfor remarks, that the European feamen are very fubject to the fever above mentioned when they happen to arrive at Bengal in autumn. They are predifpofed to it from the nature of their food, their confinement on board, the very great heats to which they are expofed during the voyage, and their lying for hours together expofed to the night colds.

Moft of the meat ufed by the crews of thofe fhips is falted, and often in a putrid ftate, without any frefh vegetables, they having only bifcuits, and fome other farinaceous matters. The quantity of the vinous or fpirituous liquors allowed them is by far too fmall to fubdue the putrefcent difpofition of their animal-food. Their fluids confequently become, from day to day, more and more putrefcent, and of courfe the more apt to breed and contract this diforder. This difpofition is likewife induced by their being ftowed very clofe together, and that for a confiderable length of time, and in a foul air, efpecially when the weather happens to be too ftormy to permit the hatches and port-holes to be kept open.

Though the heats they endure in the voyage to India are lefs confiderable than thofe of the country itfelf, yet they are too much for an European conftitution

Febres Tertiana.

to bear. The general heat at sea within the tropics is about 84° of Fahrenheit's thermometer, which is sufficient to relax them, and promote a corruption of their humours, especially when it coincides with the above causes. It likewise creates a languor and indolence, which alone are sufficient to increase that putrescence. These causes are apt to be considerably aggravated by the mens being often exposed, when on duty, for hours together, to rain, damp, and cold air; a circumstance which frequently happens to them when working their ships up the river Ganges in the night-time. Hence the perspiration is checked, and the excrementitious fluid which used to be discharged by the skin being retained in the body, contributes, he thinks, very much towards the predisposition to this disease.

But the most powerful of all the remote causes is justly thought to be the effluvia of marshes replete with putrid animal-substances. We have not, however, been able to determine from what kind of putrid animal-substances these effluvia derive their virus. For that every kind of putrefaction has not such an effect appears from this, that neither practical anatomists, nor those who by their trades are exposed to the putrid effluvia of animals, for instance such tanners and butchers as keep their shops and stalls very dirty, are more subject than others to putrid diseases. Nor are the ship-stewards and their servants, whose business it is to deliver out their provisions to the ships crews, and who spend the most of their time amongst the putrid and rancid effluvia of the places in which those provisions are kept, more subject to putrid fevers than their ship mates. But whatever be in this, we are well assured that some particular putrid fermentations produce noxious vapours, which, united with those of marshes, render them more pernicious. Hence evidently proceeds the extreme unhealthfulness of a place called *Culpi* on the eastern bank of the Ganges. The shores about it are full of mud, and the banks covered with trees. Opposite to the place where the ships lie there is a creek, and about a mile from its entrance stands the town of Culpi: the ships lie about a mile from the shore. None of the sailors on board the ships stationed at this place enjoyed their health. The burying ground also contributed not a little to spread the infection The ground being marshy, the putrid water flowed from the old graves into the new ones, which infected the grave-diggers and those that attended the funerals; and from this cause many were suddenly seized while they were performing the last duty to their companions. This place has ever been remarkable for the unhealthfulness of its air. It was once customary to send some of the Company's servants here to receive the cargoes of the ships, and send them to Calcutta; but so many of them died on this duty, that the Company was at length obliged to dispense with it.

Hence it plainly appears, how apt putrid animal and vegetable substances are to render the effluvia of fenny places more pernicious than they would otherwise be. The reason why great inundations of the Nile and Ganges are followed by a healthy season is, that by this means the putrid animal and vegetable substances dispersed over the contiguous countries are carried off into the sea.—The noxious vapours arising from fens spread but a little way. Dr Lind has often known ships crews at a very little distance from the shore quite free from this disorder. But although these marsh miasmata first bring on the disease, yet contagion particularly spreads it, and renders it more epidemic. Thus the Drake East Indiaman continued free from the disorder for two weeks together, when she had no communication with the other ships; whereas, as soon as the disorder was brought on board, many were seized with it within a few days in such a manner as to leave no room to entertain the least doubt concerning its pestilential nature.

Dr Lind of Haslar hospital has given a very curious and learned account of the appearance of this fever throughout the various parts of the globe. It was very common in England in the years 1765 and 1766, one obvious cause of which was the prevalence of the eastern wind. This wind in England is often said to bring with it a fog from the sea; but the truth of the matter is, that in many places of this island the east-wind frequently raises a copious vapour from water, mud, and all marshy or damp places. To this exhaling quality of the eastern wind Dr Lind has often been an eye-witness. When the wind changes to the east, the mud sometimes sends up a vapour as thick as smoke; and the doctor has observed two fish-ponds in his neighbourhood, one of fresh and the other of salt water, which on the approach of an easterly wind sometimes also emit a dense vapour, as from a pot of boiling water. In order to view this phenomenon distinctly, the person should stand at about 100 yards distance from the mud or ponds. If the sun shines when the wind changes to the east, he will observe a constant steam of vapours arising out of the ponds, from about five to ten yards in height, while the air about him remains serene. As the vapour or fog arising from other bodies glides along the surface of the earth, and is brought by the easterly wind to the ponds, he will still be able, for some time, to distinguish the vapours ascending perpendicularly out of the ponds from those which are carried in an horizontal direction by the wind; especially if the sun continues to shine, though faintly.

This evaporating quality of the east-wind seems to manifest itself also by its effects both on the thermometer and the human body; for a thermometer hung over a damp piece of ground during the fogs or exhalations arising from it, will often indicate a degree of cold below the freezing point. The chilliness of the body, so sensibly perceived when in this situation, seems to proceed from the same cause, and to produce nearly the same sensations, which the damp arising from the wet floor in a chamber communicates to those who happen to be in it.

Winds are not constant in their effects. As we have sometime warm weather with a north-wind, and sometimes very little heat with one blowing from the south; so the fogs attending an east-wind are not constant, neither is the evaporation above mentioned at all times to be perceived. It is possible, however, that in all this there may be a deception; and that instead of supposing the quantity of vapours exhaled to be increased by an easterly wind, the coldness of that wind may only condense and render visible the vapours in the air at that time. But even this supposition is liable to great objections, as our coldest north-winds seldom or never produce such an effect, but on the contrary are attended with dry and serene weather.

Febres

Be this as it will, however, an east-wind is usually accompanied with a cold, damp, and unwholesome vapour, which is observed to affect the health both of animals and vegetables, and in many places to produce obstinate intermitting fevers, and also to occasion frequent relapses. In particular spots of the low damp island of Portsea, the ague frequently prevails during the autumnal season, and in some years is much more frequent and violent than in others. It is also observable, that this disease always attacks strangers, or those who have formerly lived on a drier soil, and in a more elevated situation, with greater severity than those who are natives of the island.

The year 1765 was remarkable, not only for the long continuance of the easterly winds, but for an excessive degree of heat, which produced a more violent and general rage of those diseases than had been known for many years before. In the month of August the quicksilver in Fahrenheit's thermometer often rose to 82° in the middle of the day. This considerable addition of heat, together with the want of refreshing rains, greatly spread the fever, increased its violence, and even changed its form in many places. At Portsmouth, and throughout almost the whole island of Portsea, an alarming continual or remitting fever raged, which extended itself as far as Chichester. At the same time, the town of Gosport, though distant only one mile from Portsmouth, enjoyed an almost total exemption from sickness of every kind; whereas in the neighbouring villages and farm-houses, a mild regular tertian ague distressed whole families. The violence of the fever, with its appearances in a continued, remitting, or intermitting form, marked in some measure the nature of the soil. In Portsmouth the symptoms were bad, worse at Kingston, and still more dangerous and violent at a place called *Half-way Houses*; a street so named, about half a mile from Portsmouth, where scarcely one in a family escaped this fever, which generally made its first attack with a delirium. In the large suburb of Portsmouth called the *Common*, it seemed to rage with more violence than in the town, some parts excepted; but even whole streets of this suburb, together with the houses in the dock-yard, escaped its attack.

The marines, who were three times a-week exercised early in the morning on South Sea beach, suffered much from the effect of the stagnant water in an adjoining morass. Half a dozen of them were frequently taken ill in their ranks when under arms; some being seized with such a giddiness of their head, that they could scarcely stand; while others fell down speechless, and upon recovering their senses complained of a violent head-ach. When such patients were received into the hospital, it was observed that some few had a regular ague, but that far the greater number laboured under a remitting fever, in which sometimes indeed there was no perceptible remission for several days. A constant pain and giddiness of the head were the most inseparable and distressing symptoms of this disease. Some were delirious, and a few vomited up a quantity of bile; but in all the countenance was yellow. A long continuance of the fever produced a dropsy or jaundice, or both. Even a slight attack reduced the most robust constitution to a state of extreme debility; and this weakness, together with the giddiness, continued for a long time after the fever. A scabby eruption now and then made its appearance on the lips and the corners of the mouth: but dry itchy spots over the whole body, resembling much the common itch, and seeming to partake of the nature of that disease, were more frequently observed in the patients at Portsmouth, where there was not the least reason to suspect any infection.

Tertiana.

Such is the appearance of the remitting fever occasioned by marsh miasmata in England. In the Netherlands its symptoms are not much different. Dr Wind informs us, that at Middleburg, the capital of West Zealand, a sickness generally reigns towards the latter end of August, or the beginning of September, which is always most violent after hot summers. It commences after the rains which fall in the end of July; the sooner it begins the longer it continues, and it is only checked by the coldness of the weather. Towards the end of August and the beginning of September it is a continual burning fever, attended with a vomiting of bile, which is called the *gall sickness*. This fever, after continuing three or four days, intermits, and assumes the form of a double tertian; leaving the patient in a fortnight, or perhaps sooner. Strangers that have been accustomed to breathe a dry pure air do not recover so quickly. Foreigners in indigent circumstances, such as the Scots and German soldiers, who are garrisoned in the adjacent places, are apt after those fevers to have a swelling in their legs and a dropsy; of which many die.

These diseases, the Doctor observes, are the same with the double tertians common within the tropics. Such as are seized with the gall-sickness have at first some flushes of heat over the body, a loss of appetite, a white foul tongue, a yellow tinct in the eyes, and a pale colour in the lips. Such as live well, drink wine, and have warm clothes and good lodgings, do not suffer so much during the sickly season as the poor people; however, these diseases are not infectious, and seldom prove mortal to the natives.

Sir John Pringle observes, that the prevailing epidemic of autumn in all marshy countries, is a fever of an intermitting nature, commonly of a tertian form, but of a bad kind; which, in the dampest places and worst seasons, appears as a double tertian, a remitting, or even an ardent fever. But however these fevers may vary in their appearance according to the constitution of the patient and other circumstances, they are all of a similar nature. For though, in the beginning of the epidemic, when the heat or rather the putrefaction in the air is the greatest, they assume a continued or a remitting form, yet by the end of autumn they usually terminate in regular intermittents.

In Zealand, where the air is more corrupted than in other parts of the Netherlands, this distemper, as we have already observed, is called the *gall-sickness*; and indeed both the redundance and depravation of the gall is sometimes so great, that it has been generally ascribed to the corruption and overflowing of that humour. But though it cannot with justice be said to originate from corrupted gall or bile, it is certain that the disease may be continued, and the symptoms aggravated, by an increased secretion and putrefaction of the bile occasioned by the fever. In proportion to the coolness of the season, to the height and dryness of the ground,

Febres Tertiana.

ground, this diftemper is milder, remits or intermits more freely, and removes further from the nature of a continued fever. The higher ranks of people in general are leaft liable to the difeafes of the marfhes; for fuch countries require dry houfes, apartments raifed above the ground, moderate exercife, without labour in the fun or evening damps, a juft quantity of fermented liquors, plenty of vegetables, and frefh meats. Without fuch helps, not only ftrangers, but the natives themfelves are fickly, efpecially after hot and clofe fummers. The hardieft conftitutions are very little excepted more than others: and hence the Britifh in the Netherlands have always been fubject to fevers.

By this diftemper the Britifh troops were haraffed throughout the whole of the war from 1743 to 1747. It appeared in the month of Auguft 1743; the paroxyfms came on in the evening, with great heat, thirft, a violent headach, and often a delirium. Thefe fymptoms lafted moft of the night, but abated in the morning, with an imperfect fweat, fometimes with an hæmorrhagy of the nofe or a loofenefs. The ftomach from the beginning was difordered with a naufea and fenfe of oppreffion, frequently with a bilious and offenfive vomiting. If evacuations were either neglected, or too fparingly ufed, the patient fell into a continued fever, and fometimes grew yellow as in a jaundice. When the feafon was further advanced, this fever was attended with a cough, rheumatic pains, and fizy blood. The officers being better accommodated than the common men, and the cavalry who had cloaks to keep them warm, were not fo fubject to it: and others who belonged to the army, but lay in quarters, were leaft of all affected; and the lefs in proportion to their being little expofed to heats, night-damps, and the other fatigues of the fervice.

In this manner did the remitting fever infeft the army for the remaining years of the war; and that exactly in proportion to their diftance from the marfhy places, of which we have feveral notable inftances in Pringle's obfervations. In Hungary the fame difeafe appears with ftill more violence, and is readily complicated with fevers of a truly peftilential nature, by which means it becomes extremely dangerous. Hungary is acknowledged to be the moft fickly climate in Europe, and indeed as bad as any in the world. Here it was where the crufaders, in only marching through the country to invade Afia, often loft half their number by ficknefs; and where the Auftrians not long fince buried, in a few years, above 40,000 of their beft troops, who fell a facrifice to the malignant difpofition of the Hungarian air. The reafon of this uncommon malignity is, that Hungary abounds with rivers, which, by often overflowing, leave that low flat country overfpread with lakes and ponds of ftagnating water, and with large unwholefome marfhes. So great is the impurity of thefe ftagnated waters, that by them the rivers, even the Danube, whofe courfe is flow, become in fome places corrupted and offenfive. The air is moift, and in fummer quite fultry. In the nights of harveft, Kramer tells us, it was fo very damp, that the Auftrian foldiers could not fecure themfelves from the moifture even by a triple tent-covering. Here epidemical diftempers begin conftantly to rage during the hotteft months of the year; which are July, Auguft, and September: and thefe complaints, according to the obfervations of the phyfician above-mentioned, are the fame with thofe which are epidemic upon the coaft of Guinea, and in the fickly climates of the Eaft and Weft Indies, of which malignant fevers of the remitting and intermitting kind are the moft common and dangerous.

The heat of the fun in Hungary, according to the fame author, is more intenfe than in any other country of Europe; and in proportion to the heat is the peftilential quality of the marfhy exhalations. It is conftantly obferved, that the nearer any city or fort is to a morafs or a large river with foul and oozy banks, the more unhealthy are the inhabitants. At fuch feafons and places, the air fwarms with numberlefs infects and animalcules, a fure fign of its malignant difpofition; and the hotter the fummer, the more frequent and mortal are the difeafes. In fhort, this country, on account of its unhealthinefs, has been termed *the grave of the Germans*; and in Italy, the Campania of Rome is almoft equally unhealthy. Lancifius, phyfician to Pope Clement XI. furnifhes us with a very ftriking inftance of the malignant quality of the air of Campania. Thirty gentlemen and ladies of the firft rank in Rome having made an excurfion, upon a party of pleafure, towards the mouth of the Tyber, the wind fuddenly fhifting, blew from the fouth over the putrid marfhes, when 29 were immediately feized with a tertian fever, only one efcaping.

The ifland of Sardinia is annually vifited with an epidemical ficknefs, which rages from June to September, and is called by the natives the *intemperies*. In fome years there is a want of rain for four or five months; and then it is that this ficknefs exerts its utmoft violence, being always more fatal in fome places than in others, and in particular to ftrangers. Of this the Britifh had a fevere proof in 1758.—Admiral Broderick, in the Prince fhip of war, anchored in the bay of Oriftagni, where 27 of his men, fent afhore on duty, were feized with the epidemical diftemper of this ifland; twelve of them in particular, who had flept on fhore, were brought on board delirious. All of them in general laboured under a low fever, attended with great oppreffion at the breaft and at the pit of the ftomach, a conftant retching, and fometimes a vomiting of bile; upon which a delirium often enfued. Thefe fevers changed into double tertians, and terminated in obftinate quartan agues. It is worthy of remark, that in this fhip, which lay only two miles from the land, none were taken ill but fuch as had been on fhore, of whom feven died. The prior of a convent, making a vifit to the Englifh officers, informed them, that the intemperies of the ifland was a remitting or intermitting fever, and that he himfelf had fuffered feveral attacks of it. Sardinia was formerly fo remarkable for its unwholefome air, that the Romans ufed to banifh their criminals thither; and it is at prefent but thinly peopled, owing to the mortality occafioned by this annual ficknefs. For although it is about 140 miles long, and in feveral places 75 miles broad, yet it is computed that the whole number of its inhabitants does not exceed 250,000: an inconfiderable number, when compared with the inhabitants of the leffer, but comparatively more healthful, ifland of Corfica; though even there the French loft a number of their troops by intermitting and remitting fevers.

 vers. In the island of Minorca, too, Dr Cleghorn informs us, that fevers of this kind prevail exceedingly; that their types are various, their symptoms violent, the intermiſſions fallacious, and that they frequently and ſuddenly prove fatal. It is more than probable, he adds, from the accounts of ſeveral phyſicians and travellers, that epidemical tertians are not wholly confined to the coaſts and iſlands of the Mediterranean, but that they are equally frequent and deſtructive in many other parts of the globe; and perhaps may be deemed the anniverſary autumnal diſtempers of moſt hot countries in the world. And though in the mild climate of Britain, a tertian may always eaſily be cured when once it is diſcovered; yet in warm climates, ſuch is the rapid progreſs of the diſtemper, that it is neceſſary to know it in the very beginning, which is very difficult for thoſe who have never ſeen any but the tertians uſually met with in Britain.

From Dr Cleghorn's account of Minorca, however, it doth not appear why that iſland ſhould be ſo much infeſted with fevers of this kind, ſince it is far from being a marſhy country; nay, on the contrary, is very dry. The ſouth wind, he obſerves, is very unhealthy; and it is the prevalence of this wind which brings on the fever: but ſtill the difficulty is not removed. becauſe the ſea-air is ſo far from bringing on ſuch dangerous diſeaſes, that it is one of the greateſt preſervatives againſt them when it can be had. As to the moiſture which muſt neceſſarily accompany an inſular ſituation, that cannot reaſonably be admitted as a cauſe of this or any other diſeaſe. In the London Medical Obſervations we find a paper on a ſubject very ſimilar to the preſent, namely, the miſchiefs produced by lying in damp ſheets, or being expoſed to moiſt vapour. The author tells us, that he hardly knows a diſtemper the origin of which hath not by ſome been aſcribed to lying in a damp bed, or ſitting in a wet room; and yet he does not know any one which will certainly be produced by theſe cauſes, and people frequently expoſe themſelves to ſuch cauſes without ſuffering any ill effects. "It muſt be owned indeed, (ſays he), that the vapours ariſing from the bilge-water of ſhips tend to produce a ſcurvy. The ſwampy plains alſo near the mouths of great rivers which are often overflowed, and low grounds which cannot readily be drained, and thoſe tracts of land where the thickneſs and extent of the woods keep the ground moiſt and half putrid for want of ventilation, are deſtructive to the neighbouring inhabitants, by occaſioning obſtinate intermittents in the colder climates, and peſtilential fevers in the hotter regions. But all this miſchief ariſes not merely from moiſture, but from an unventilated and putrid moiſture; for the inoffenſiveneſs of mere wetneſs, untainted with putridity, may be reaſonably inferred from the following conſiderations. The air is often fully ſaturated with moiſture, and could not be more filled by the vapours ariſing from a chamber covered with water; and yet neither is any epidemical diſtemper produced by it, nor are thoſe remarkably aggravated with which the ſick happen at that time to be afflicted. The air from rivers and from the ſea is probably more repleniſhed with vapours than inland countries cleared of their woods: yet the moſt celebrated of the ancient phyſicians recommended the bank of a running river for the ſituation of a houſe, on account of its peculiar healthfulneſs; and many invalids are ſent by the modern phyſicians to the ſea ſide, only for the benefit of the ſea air.

"Where the ſailors are cleanly, and not too much crowded, they are often as healthy during long voyages at ſea, as they would have been upon any part of the land. Venice is not obſerved to be leſs healthy than London or Paris.

"Thoſe who are much diſpoſed to ſweat, lie many hours in bed-clothes impregnated probably with a leſs wholeſome moiſture than would have been left in the ſheets half-dried after waſhing; and I have not yet had reaſon to think that any remarkable injury was done to the health by the continuance of ſuch ſweats almoſt every night for weeks, and for months, except what aroſe from the too great copiouſneſs of this evacuation.

"Children, and ſuch as are troubled with the ſtone, and thoſe who, from other infirmities or age, conſtantly wet their beds with their urine, do not appear to ſuffer in their health on this account.

"It is a common practice, in ſome diſorders, to go to bed with the legs or arms wrapped in linen cloths thoroughly ſoaked in Malvern water, ſo that the ſheets will be in many places as wet as they can be; and I have known theſe patients and their bedfellows receive no harm from a continuance of this practice for many months. Nor can it be ſaid that the Malvern water is more innocent than any other water might be, on account of any ingredients with which it is impregnated; for the Malvern water is purer than that of any other ſpring in England which I ever examined or heard of.

"The greateſt valetudinarians do not ſcruple to ſprinkle lavender-water upon their ſheets; and yet, when the ſpirit is flown off, there is left what is as truly water as if it had been taken from the river.

"Is it obſerved, that laundreſſes are peculiarly unhealthy above other women, though they live half their time in the midſt of wet linen, in an air fully ſaturated with vapours? Many other employments might be mentioned, the perſons occupied in which are conſtantly expoſed to wet floors or pavements, or to be ſurrounded with watery vapours, or to have their clothes often wet for many hours together.

"Is it the coldneſs of wet linen which is to be feared? But ſhirts and ſheets, colder than any unfrozen water can be, are ſafely worn and lain in by many perſons, who, during a hard froſt, neither warm their ſhirts nor their ſheets.—Or does the danger lie in the dampneſs? But then how comes it to paſs, that a warm or cold bath, and long-continued fomentations, can be uſed, without the deſtruction of thoſe who uſe them? Or is it from both together? Yet we have long heard of the thickneſs and continuance of the cold fogs in the ſeas north-weſt of England, but have never yet been told of any certain ill effect which they have upon thoſe that live in theſe countries."

With regard to the cauſes of fevers, however, Dr Lind is of opinion, that noxious vapours ariſing from the earth are for the moſt part to be blamed. Even in countries ſeemingly dry, and where violent rains are not

Febres not frequent, he thinks that the air may load itself with putrid exhalations from the ground; and that, except in the burning defarts of Arabia or Africa, people are nowhere exempt from difeafes occafioned by putrid moifture. In moft of the hot countries, however, the pernicious effects of the putrid vapours are by no means equivocal. In Guinea, they feem to be more extraordinary than any where elfe in the world; neither indeed can it be fuppofed, that a hot and moift atmofphere can be without putrefcency. It may in general be remarked, that in fultry climates, or during hot weather, in all places fubject to great rains, where the country is not cleared and cultivated, but is over-run with thickets, fhrubs, or woods, efpecially if there are marfhes or ftagnating waters in the neighbourhood, ficknefs may be dreaded, and particularly the remitting fever of which we now treat. The fens, even in different counties of England, are known to be very prejudicial to the health of thofe who live near them, and ftill more fo to ftrangers; but the woody and marfhy lands in hot countries are much more pernicious to the health of Europeans. In all thofe unhealthy places, particularly during fogs or rains, a raw vapour, difagreeable to the fmell, arifes from the earth, and efpecially in the huts or houfes. But of all the vapours which infeft the torrid zone, the moft malignant and fatal are the *harmattans:* They are faid to arife from the conflux of feveral rivers in the king of *Dormeo's* dominions at Benin (the moft unwholefome part of Guinea), where travellers are obliged to be carried on mens backs for feveral days journey, through fwampy grounds, and over marfhes, amidft ftinking ooze, and thickets of mangrove trees which are annually overflown. Thefe vapours come up the coaft to a furprifing diftance, with the fouth-eaft and north-eaft winds: and it has been obferved, that in their progrefs they have often changed both the courfe of the winds and of the fea currents. The times of their appearance at Cape Coaft are the months of December, January, or February. The north-eaft and fouth-eaft winds are always unhealthy, but particularly fo during the harmattan feafon. Some years this vapour is fcarcely perceptible; but in others it is thick, noxious, and deftructive to the blacks as well as whites.—The mortality is in proportion to the denfity and duration of the fog. It has a raw putrid fmell; and is fometimes fo thick, that a perfon or houfe cannot be difcerned through it, at the diftance of 15 or 20 yards: and it continues fo for 10 or 14 days; during which it opens the feams of fhips, fplits or opens the crevices of wood as if fhrunk or dried with a great fire, and deftroys both man and beaft.—In the year 1754 or 1755, the mortality occafioned in Guinea by this ftinking fog was fo great, that in feveral negro towns the living were fcarce fufficient to bury the dead.—Twenty women brought over from Holland by a new governor to the Caftle *del Mina*, perifhed, together with moft of the men in the garrifon. The gates of Cape Coaft caftle were fhut up for want of centinels to do duty; the blacks dying at this time as well as the white people. It is lucky that it is only in fome years that *harmattans* are fo very thick and noxious, otherwife that part of the country would be depopulated. It is obferved that all fogs are extremely unhealthy in thofe parts, particularly before and after the rainy feafons; but the above account of the *harmattans* appeared fo very extraordinary and incredible to fome of Dr Lind's readers, that he thought proper to publifh a further corroboration of the facts abovementioned. "A gentleman (fays he), who had long refided at Cape Coaft caftle, informed me, that during the time of this fog, being in the upper chambers of the fort, the boards of the floor fhrunk fo much, that he could difcern the candles burning in the apartments below him (there are no plafter ceilings ufed in thofe hot countries), and that he could then even diftinguifh what people were doing in the apartments below; the feams of the floor having opened above half an inch, while the fog lafted, which afterwards, upon its being difpelled, became clofe and tight as before."

Tertiana.

In this country the rains and dews feem to be poffeffed of qualities almoft equally pernicious with the fogs. This much is certain, that in Guinea, many of the principal negroes, and efpecially of the mulattoe Portuguefe, take the utmoft precaution to avoid being wet with thofe rains, efpecially fuch as fall firft. At the fetting in of the rainy feafon, they generally fhut themfelves up in a clofe well-thatched hut, where they keep a conftant fire, fmoke tobacco, and drink brandy, as prefervatives againft the noxious quality of the air at that time. When wet by accident with the rain, they immediately plunge themfelves into falt-water, if near it. Thofe natives generally bathe once a-day, but never in the frefh water rivers when they are overflown with the rains: at fuch times they prefer for that purpofe the water of fprings. The firft rains which fall in Guinea are commonly fuppofed to be the moft unhealthy. They have been known, in 48 hours, to render the leather of the fhoes quite mouldy and rotten; they ftain clothes more than any other rain; and foon after their commencement, even places formerly dry and parched fwarm with frogs. At this time fkins, part of the traffic of Senegal, quickly generate large worms; and it is remarked, that the fowls, which greedily prey on other infects, refufe to feed on thefe. It has been farther obferved, that woollen cloths wet in thofe rains, and afterwards hung up to dry in the fun, have fometimes become full of maggots in a few hours.—It is alfo probable, that as in fome of thofe countries the earth, for fix or eight months of the year, receives no moifture from the heavens but what falls in dews, which every night renew the vegetation, the furface of the ground in many places becomes hard and incruftated with a dry fcurf, which pens up the vapours below: until by the continuance of the rains for fome time, this cruft is foftened, and the long pent up vapours fet free. That thefe dews do not penetrate deep into the earth is evident from the conftant drynefs and hardnefs of fuch fpots of ground in thofe countries as are not covered with grafs and other vegetables. Thus the large rivers in the dry feafon being confined within narrow bounds, leave a great part of their channel uncovered, which having its moifture totally exhaled, becomes a folid hard cruft; but no fooner the rains fall, than by degrees this long parched up cruft of earth and clay gradually foftens, and the ground, which before had not the leaft fmell, begins to emit a ftench, which in four or five weeks becomes exceedingly noifome, at which time the ficknefs is generally moft violent.

This ficknefs, however, is not different from the remitting

Febres remitting fever which has been defcribed under fo many various forms and names. An inflammatory fever is feldom obferved, during the feafon of ficknefs, in this part of the world; and we fhall conclude our defcription of the *amphimerina paludofa* with fome extracts from the furgeon's journal of a fhip that failed up the rivers of Guinea.

"On the 5th of April we failed up the river of Gambia, and found all the Englifh in the fort in perfect health. The furgeons of the factory informed me, that a relaxation of the ftomach, and confequently a weakened digeftion, feemed to bring on moft of the difeafes fo fatal to Europeans in the fickly feafon. They were generally of a bilious nature, attended with a low fever, fometimes of a malignant, at other times of a remitting kind.—On the 12th of April, after failing 30 miles up the river St Domingo, we came to Catchou, a town belonging to the Portuguefe, in Lat. 20° N. In this town were only four white people, the governor and three friars. The number of whites in the trading fhips were 51. One morning, towards the latter end of April, a little rain fell. On the 13th of May there was a fecond fhower, accompanied with a tornado. On the 18th of May it rained the whole day; and the rain continued, with but fhort intervals, until the beginning of October.

"In the month of June, almoft two-thirds of the white people were taken ill. Their ficknefs could not be well characterifed by any denomination commonly applied to fevers: it however approached neareft to what is called a *nervous fever*, as the pulfe was always low, and the brain and nerves feemed principally affected. It had alfo a tendency to frequent remiffions. It began fometimes with a vomiting, but oftener with a delirium. Its attack was commonly in the night; and the patients, being then delirious, were apt to run into the open air. I obferved them frequently recover their fenfes for a fhort time, by means of the heavy rain which fell upon their naked bodies. But the delirium foon returned: they afterwards became comatofe, their pulfe funk, and a train of nervous fymptoms followed; their fkin often became yellow; bilious vomitings and ftools were frequent fymptoms. The fever reduced the patient's ftrength fo much, that it was generally fix weeks or two months before he was able to walk abroad. A confuming flux, a jaundice, a dropfy, or obftructions in the bowels, were the confequences of it. Of 51 white men, being the companies of four fhips which were at Catchou, one-third died of the fever, and one-third more of the flux, and other difeafes confequent upon it; and of thefe not one was taken ill till the rains began.

"I believe, on the whole face of the earth, there is fcarce to be found a more unhealthy country than this during the rainy feafon: and the idea I then conceived of our white people was by making a comparifon of their breathing fuch a noxious air, with a number of river-fifh put into ftagnating water; where, as the water corrupts, the fifh grow lefs lively, they droop, pine away, and many die.

"Thus fome perfons became dull, inactive, or flightly delirious, at intervals; and, without being fo much as confined to their beds, they expired in that delirious and comatofe ftate in lefs than 48 hours, after being in apparent good health. The white people in general became yellow; their ftomach could not receive much food without loathing and retchings. Indeed it is no wonder that this ficknefs proved fo fatal, that recoveries from it were fo tedious, and that they were attended with fluxes, dropfies, the jaundice, ague-cakes, and other dangerous chronical diftempers. It feemed more wonderful to me that any white people ever recover, while they continue to breathe fo peftiferous an air as that at Catchou during the rainy feafon. We were, as I have already obferved, 30 miles from the fea, in a country altogether uncultivated, overflowed with water, furrounded with thick impenetrable woods, and over-run with flime. The air was vitiated, noifome, and thick; infomuch that the lighted torches or candles burnt dim, and feemed ready to be extinguifhed: even the human voice loft its natural tone. The fmell of the ground and of the houfes was raw and offenfive; but the vapour arifing from putrid water in the ditches was much worfe. All this, however, feemed tolerable, when compared with the infinite numbers of infects fwarming every where, both on the ground and in the air; which, as they feemed to be produced and cherifhed by the putrefaction of the atmofphere, fo they contributed greatly to increafe its impurity. The wild bees from the woods, together with millions of ants, over-ran and deftroyed the furniture of the houfes; at the fame time, fwarms of cockroaches often darkened the air, and extinguifhed even candles in their flight; but the greateft plague was the mufquettos and fand-flies, whofe inceffant buzz and painful ftings were more infupportable than any fymptom of the fever. Befides all thefe, an incredible number of frogs on the banks of the river made fuch a conftant and difagreeable croaking, that nothing but being accuftomed to fuch an hideous noife could permit the enjoyment of natural fleep. In the beginning of October, as the rains abated, the weather became very hot; the woods were covered with abundance of dead frogs, and other vermin, left by the recefs of the river; all the mangroves and fhrubs were likewife overfpread with ftinking flime."

After fo particular a defcription of the remitting fever in many different parts of the world, we prefume it will be needlefs to take notice of any little varieties which may occur in the warm parts of America, as both the nature and cure of the diftemper are radically the fame: neither fhall we lengthen out this article with further defcriptions of remitting fevers from the works of foreign authors, as, from what we have already faid, their nature cannot well be miftaken.

Cure. The great difficulty in the cure of remitting fevers arifes from their not being fimple difeafes, but a complication of feveral others. Fevers, properly fpeaking, have but three or four different appearances which they can affume without a complication. One is, when they are attended with a phlogiftic diathefis; another is, when they affume the form of genuine intermittents; a third is, when they produce a great debility of the nervous fyftem; and the fourth is, when along with this debility there is alfo a rapid tendency to putrefaction. If, therefore, all thefe fpecies happen to make an attack at once, the moft dangerous fever we can imagine will be produced; and however contrary it may be to our theories to admit the poffibility of fuch

Tertiana.

such an attack, the truth of the fact is too often confirmed by fatal experience. In the beginning of remittent fevers, for instance, the symptoms indicate a high degree of inflammation: but if the practitioner attempts to remove this inflammation by blood-letting or other evacuations, the pulse sinks irrecoverably, and the person dies with such symptoms as show that the nervous system has been from the beginning greatly affected; at the same time the high stimulants and cordials, or the bark, which would have conquered the nervous part of the disease, increase the inflammatory part of it to such a degree, that, by a too early exhibition of them the patient also dies, but after another manner.

In the remitting fever of the East Indies, Dr Lind of Windsor formed the following indications of cure. 1. To allay the violence of the fever. 2. To evacuate the putrid humours, and take great care to prevent the body from inclining to putrefaction. 3. To keep up the strength of the patient as much as possible during the disorder. 4. To lose no time in preventing the return of the paroxysms.

To allay the violence of the fever, every thing that can contribute to increase it ought to be carefully avoided or removed; such as great heat, too strong a light falling on the eyes, noise, and motion. If during the paroxysm the head and loins be affected with violent pains, the pulse be full and hard, and the heat intense, bleeding may be used, but with the greatest caution: for, however useful this operation may be in cold climates, the success of it in warm ones is so far from being certain, that the lives of the patients have been often very much endangered, nay even destroyed by it. Dr Badenoch, and the surgeon of the Ponsborne, endeavoured each of them to relieve two patients by blood-letting; and the consequence was, that each of them lost one patient. Dr Lind bled two patients; one of whom was Mr Richardson, the first mate of the ship, who complained of a most violent pain in his head, with a full hard pulse. About four or five ounces of blood were taken from him, by which he was greatly relieved: nor was the cure retarded by it; nay, the fever afterwards became less irregular. At the time the other patient was bled, the disease was exceedingly frequent and violent. He was so earnest for bleeding, that he fired all the rest with the same desire, swearing, that by refusing them this only remedy, every one of them would be sent to their graves. To quiet them, therefore, and get quit of their importunities, the Doctor complied with their request, and took about five or six ounces from him who had been the first to require it. The consequence was, that he immediately lost his strength; and in less than an hour, during which time he made his will, was carried off by the next fit. It is necessary, however, to observe, and indeed the Doctor himself makes the observation, with regard to this patient, that he was bled at an improper time, namely, between the fits; whereas, had he been bled in the hot fit, it is possible he might have been relieved.

In support of the advantages to be derived from bleeding under proper circumstances, we have the authority both of Cleghorn and Pringle. As Dr Cleghorn practised in a very hot country, his observations must in the present case have greater weight than those of Pringle, who practised in a colder one. The former acquaints us, that if he was called in early enough, unless there was a strong contra-indication, he always used to take away some blood from people of all ages; namely, from robust adults, 10 or 12 ounces; from others a smaller quantity, in proportion to their strength and years. And further, if a violent head-ach, obstinate delirium, and great heat or pains of the bowels, were urgent, the bleeding was repeated within a day or two. By this seasonable evacuation, he found the vehemence of all the paroxysms somewhat diminished; the apyrexies became more complete; the operation of emetics and cathartics rendered safer and more successful; and the terrible symptoms which happened about the height of the distemper, such as raving *sopor*, difficulty of breathing, inflammations of the abdominal viscera, &c. were either prevented or mitigated. But if the fever had continued for some time before he was called, and the mass of blood appeared to be too much melted down or inclined to a putrid dissolution, he either abstained from bleeding entirely, or took away a very small quantity, though some importunate symptoms might seem to require a larger evacuation. As to the time of performing the operation, he acquaints us, that it is safe enough, except when the cold fit lasts or is soon expected, or while the skin is covered with critical sweats; and that he usually opened a vein in the beginning of the hot fit; by which means the sick were relieved, the immoderate heat of the body, which is often productive of fatal effects, was diminished, and the critical sweats brought on sooner and in greater abundance.

But though Dr Lind found venesection to be of such pernicious tendency in his patients, cooling acidulated liquors were of the utmost service, as they corrected the putrid humours, lessened the heat and thirst, and of course prevented the fever from arriving at so great an height as it would otherwise have done. Those cooling liquors are the best which are made up with some farinaceous substance, as they most easily unite with our fluids. Fossile acids too, and crystals of tartar, especially the latter, are of considerable use, not only in this but in other fevers. The neutral salts, prepared with the juice of lemons, were likewise given with success during the heat of the fever. They lessen the nausea, the fits become more regular, and the remissions more full; and they are particularly grateful when given in a state of effervescence. The good effects of these draughts we are in a great measure to ascribe to the antiseptic quality of the fixed air extricated from them during the effervescence; of which we shall speak more fully when treating of the typhous fevers.

During the remission, it is proper to evacuate the putrid humours by small doses of ipecacuanha, or rather tartar emetic. The tartar emetic indeed appears to be endowed with some kind of febrifuge virtue, which Dr Cullen thinks is owing to its relaxing the febrile spasm taking place in the capillary vessels. But should there appear any symptoms of a topical inflammation in some of the abdominal viscera, a thing which never happens unless the disorder has been of some standing, vomiting is to be avoided, and we are to depend upon purgatives alone for the evacu-

Febres

evacuation of the putrid bile, which are always ufeful in the cure of this diforder. But all acrid and ftrong purgatives are to be carefully avoided, and only the mild antifeptic ones made ufe of, fuch as cryftals of tartar, or tamarinds made up with manna or with Glauber's falt.

Under the article GALL, we have obferved, from Dr Percival, the effect which vegetable acids have in fweetening putrid bile; whence it feems probable, that a liberal ufe of thefe acids would be much more ferviceable than a repetition of any kind of purgatives. Though in thefe difeafes there is a great quantity of putrefcent bile collected in the body, yet it feems much more probable that this is the *effect* rather than the *caufe* of the diforder; and therefore, though we carry off the quantity collected ever fo often, more of the fame kind will ftill be produced by the putrefcent difpofition of the other fluids, at the fame time that the ftrength of the patient muft neceffarily be diminifhed by repeated evacuations, when it ought rather to be kept up by all poffible means. We ought well to obferve, however, that the mineral acids have not that property of fweetening putrid bile which the vegetable ones have; and therefore the fame relief will not be given by them which might reafonably be expected from vinegar or lemon-juice.

In order to keep up the ftrength of the patient, good food is abfolutely neceffary. Dr Lind allowed the fick fmall meffes of panada made with boiled rice and barley mixed with currants or raifins and prunes, feafoned with fugar and a little wine, efpecially claret. During the paroxyfms, they had gruel made of flour and rice, with fugar and the juice of acid fruit; and when the fit went off, a little wine was added to this mixture.

The fhirts and bedding muft be very often changed and well aired; their ftools, and all filth and naftinefs, are to be immediately removed; the places where they are lodged fhould be well aired and frequently fprinkled with vinegar; and, in the laft place, the fick muft be exceedingly well nurfed. Blifters, according to Dr Lind, fhould never be ufed till the fever has been of long continuance, or the fpirits and pulfe of the patient have begun to flag. But here our author has implicitly followed Dr Huxham, whofe theory concerning the ufe of blifters is now found to be erroneous. According to that celebrated author, blifters are capable of doing confiderable hurt in all cafes where there is a tendency to inflammation, by increafing the motion of the fluids and the ofcillatory power of the veffels, both of which are already too great. They are alfo improper, according to him, where there is a confiderable tendency of the fluids to putrefaction; becaufe he fuppofes the falts of thefe flies to operate in the fame manner with volatile alkalies, that is, by diffolving and putrefying the blood ftill farther. But Sir John Pringle has fhown, that, in inflammatory fevers as well as thofe of the putrid kind, both blifters and volatile falts may be of fervice; the latter, particularly, he hath experimentally proved to be fo far from promoting putrefaction, that they are exceedingly ftrong antifeptics.

In the Eaft Indies, Dr Lind found it abfolutely neceffary to exhibit the bark in large quantities, and as early as poffible. By this method he not only fecured the patient from the imminent danger of death to which he was expofed at every fit, but likewife conquered thofe obftructions which were apt to enfue in the abdominal vifcera, and which are to be attributed to the continuance of the diforder, and not to the bark employed to cure it. He always gave the bark during the fecond remiffion, as all his care was during the firft to cleanfe the primæ viæ. He obferves, however, that it is to no purpofe to give the bark till the neceffary purgations are over; but affures us, that it never fails, unlefs from the coming on of a vomiting or diarrhœa it cannot be taken in fufficient quantities before the return of a paroxyfm. To prevent the medicine from vomiting or purging, he mixed a few drops of liquid laudanum with every dofe of it. Half a drachm was given every half hour in fome convenient vehicle, beginning as foon as the fever had confiderably abated, and the pulfe was returned nearly to its natural ftate; both which generally happened before the fweats were over. An ounce of the bark was fometimes found too little to check the fever, but an ounce and a half never failed. It muft be continued daily in fmall dofes till the patient has recovered his ftrength, and then a greater quantity muft be given, efpecially at the feafon when the rivers overflow the country.

Tertiana

Dr Pringle found the autumnal remittents in the Netherlands complicated with a great many inflammatory fymptoms; for which reafon it was generally found neceffary to open a vein in the beginning. The vernal and later autumnal remitting fevers are accompanied with pleuritic and rheumatic pains from the coldnefs of the weather, and on that account require more bleeding. A phyfician unacquainted with the nature of the difeafe, and attending chiefly to the paroxyfms and remiffions, would be apt to omit this evacuation entirely, and give the bark too foon, which would bring on a continued inflammatory fever. In thefe countries a vein may be fafely opened either during the remiffion or in the height of a paroxyfm; and our author alfo found good effects refulting from bleeding in the hot fits of the marfh-fever, even after it had almoft come to regular intermiffions. After bleeding, a purgative was ufually exhibited, of which he gives us the following formula.

R. Infufi fenæ commun. ℥iij.
Elect. Lenitiv. ℥fs.
Nitr. pur. ʒi.
Tinct. fen. ʒvi. M.

Of this only one half was taken at once; and if it did not operate twice in four hours, the remainder was then taken. This potion agreed with the ftomach, purged plentifully, and therefore was a very ufeful compofition. Next morning, when there was almoft always fome remiffion, he gave one grain of emetic tartar rubbed with 12 grains of crabs-eyes, and repeated the dofe in two hours, if the firft had little or no effect; or at any rate in four hours. This medicine was intended not only to vomit, but alfo to operate by ftool, and excite a fweat. If thefe evacuations were procured, the fever generally became eafier, and was even fometimes cured. This he prefers to the ipecacuanha, and therefore in the latter years of his practice difufed that root entirely. The fame medicine was repeated next day or the day following; or if not,

Febres Tertiana.

not, a laxative clyster was thrown in: and this method was continued till the fever either went off altogether, or intermitted in such a manner as to be cured by the bark.

A similar method was followed by Dr Huck in the remitting fevers of the West Indies and North America. In the beginning he let blood; and in the first remission gave four or five grains of ipecacuanha, with from half a grain to two grains of emetic tartar. This powder he repeated in two hours, taking care that the patient should not drink before the second dose; for then the medicine more readily passed into the bowels after it had operated by vomiting. If after two hours more the operation either way was small, he gave a third dose, which commonly had a good effect in opening the first passages; and then the fever either went quite off, or intermitted in such a manner as to yield to the bark. On the continent, he found little difficulty after the intermission; but in the West Indies, unless he gave the bark upon the very first intermission, though imperfect, the fever was apt to assume a continued and dangerous form.

In the remitting fevers of hot countries, however, it must be observed, that the lancet must in all cases be much more sparingly used than in similar diseases of the colder regions; and we must also be sparing of venesection in those countries where the marsh effluvia are very strong and prevail much. For this reason Dr Lind of Haslar greatly condemns the practice of indiscriminate bleeding when people first arrive in hot climates. The first diseases indeed which occur in a voyage to the southward are for the most part of an inflammatory nature, and owing to a sudden transition from cold to hot weather. This occasions a fullness and distension of the vessels; whence all Europeans, on their first arrival under the tropic, bear evacuations much better than afterwards. The practice of indiscriminately bleeding, however, a number of the ship's company when they first come into a warm latitude, is by no means found to answer the purpose of a preventive. In such cases, indeed, as plainly indicate a plethoric disposition brought on by the heat, blood-letting is certainly useful. The signs of this are a pain and giddiness in the head; a heaviness and dulness of the eyes, which sometimes appear slightly inflamed: there is also commonly a sense of weight and fulness in the breast, the pulse at the same time being quick and oppressed.

But the case is quite different after a longer continuance of sultry weather, and when the constitution is in some measure habituated to the hot climate. For it is then observed, that the symptoms of inflammations in the bowels, even the most dangerous, are not near so severe in such climates as in cold countries; nor can the patients bear such large evacuations. The physician, however, must take care not to be misled by the apparent mildness of the symptoms: for he will find, notwithstanding such deceitful appearances, that the inflammation makes a more rapid progress in hot countries than in cold, suppurations and mortifications being much more suddenly formed; and that in general all acute distempers come sooner to a crisis in the warm southern than in colder regions. Hence it is an important rule of practice in those climates, to seize the most early opportunity, in the commencement of all threatening inflammations, to make frequent though not copious evacuations by blood-letting. For by delay the inflammation quickly passes from it first to its last or fatal stage; at least an imperfect crisis in such inflammatory fevers ensues, which fixes an obstruction in the viscera extremely difficult to remove.

It is indeed a general maxim with some physicians in the West Indies, that in most acute distempers bleeding in that country is prejudicial. This is founded upon a supposition that the crassamentum of the blood is thinned, and the solids greatly weakened, by the heat of the climate. It is therefore objected, that bleeding in such an habit of body weakens the powers of nature, and withdraws the strength which is requisite to support the patient until the crisis of the fever.

This reasoning is partly just; but, like all general maxims, will admit of exceptions. First with regard to sailors, it is to be remembered, that they are more exposed to quick vicissitudes of heat, cold, damps, and to various changes of the air and weather, than most of the other inhabitants of the Torrid Zone. Add to this, that their intemperance, and the excesses they are apt to fall into whenever it is in their power to commit them, render them more liable to inflammations than any other set of people. Hence their diseases require more plentiful evacuations than the land-inhabitants of those parts of the world, and generally they bear them better. But with regard to the natives of the country, or those who have remained long there, it must be proper to bleed them very sparingly, making a small allowance for the different seasons of the year, the temperature of the air, and the situation of the places where they reside. Thus, in some parts, even on the island of Jamaica, at particular seasons, the weather is cool; wherefore, in these places, and at such seasons, the inhabitants having their fibres more rigid, and a firmer crasis of their blood, bear venesection much better.

In cold countries the state of the air greatly assists in restoring the impaired spring of the fibres; whereas every thing almost in warm weather, such as heat, moisture, &c. concur to relax and weaken the habit of body. Thus we may daily see persons in Britain, after having suffered a most severe fit of sickness, recover their strength and spirits in a few days, and in a very short time their natural constitution. But the case is very different in the sultry regions of the Torrid Zone, or indeed in any part of the world where the heat of the season causes the mercury to stand for any length of time at the 77th degree and upward of Fahrenheit's thermometer. During such an excess of heat, debility after fevers is apt to remain with European constitutions for several months. In Jamaica, the convalescents are sent to the cool summits of the mountains; but a retreat to a more northern climate is often absolutely necessary to recover their wonted tone and vigour of body. It is a well-established observation, that the negroes and aborigines of the Torrid Zone cannot bear plentiful evacuations by the lancet. They commonly mix the most stimulating poignant spices with their ordinary light food, and this is found by experience suitable to their constitutions.

As proper preventives for the dangerous fevers of which

Febres

which we are treating, Dr Lind on all occasions recommends the avoiding of stagnant water, or putrid marshes; the use of proper food, cleanliness, and sobriety. Of the propriety of removing from the neighbourhood of those places whose pestilential effluvia produce the disorders, we cannot possibly entertain a doubt; and of the efficacy of proper food in preventing putrid disorders he gives a remarkable instance in the Sheerness man of war, bound to the East Indies. As they went out, the men being apprehensive of sickness in so long a voyage, petitioned the captain not to oblige them to take up their salt provisions, but rather to permit them to live upon the other species of their allowance. It was therefore ordered, that they should be served with salt-meat only once a-week; and the consequence was, that, after a passage of five months and one day, the ship arrived at the Cape of Good Hope without having a single person sick on board. As the use of Sutton's pipes had been then newly introduced into the king's ships, the captain was willing to ascribe part of such an uncommon healthfulness to their beneficial effects; but it was soon discovered, that, by the neglect of the carpenter, the cock of the pipes had been all this while kept shut. This ship remained in India some months, where none of the men, except the boat's crew, had the benefit of going on shore; notwithstanding which, the crew continued to enjoy the most perfect state of health; they were, however, well supplied with fresh meat. On leaving India, knowing they were to stop at the Cape of Good Hope, and trusting to a quick passage, and the abundance of refreshments to be had there, they eat their full allowance of salt-meats, during a passage of only 10 weeks; and it is to be remarked the air-pipes were now open. The effect of this was, that when they were arrived at the Cape, 20 of them were afflicted in a most miserable manner with scorbutic and other disorders. These, however, were speedily recovered by the refreshments they met with on shore. Being now thoroughly sensible of the beneficial effects of eating, in these southern climates, as little salt meat as possible when at sea, they unanimously agreed, in their voyage home from the Cape, to refrain from their too plentiful allowance of salt flesh. And thus the Sheerness arrived at Spithead, with her full complement of 160 men in perfect health and with unbroken constitutions; having in this voyage of 14 months and 15 days buried but one man, who died in a mercurial salivation.

Thus we see, that a free and pure air is not a sufficient preservative against a putrescent state of the fluids, without proper food; and, on the other hand, we have a very remarkable instance of the inefficacy of the most salutary food to prevent putrid diseases, in a very noxious state of the atmosphere. In the year 1717, at the siege of Belgrade in Hungary, the fever of the country, and the flux, occasioned a most extraoadinary mortality among the troops. The dread of these diseases caused every one, as may naturally be supposed, to have recourse to different precautions for self-preservation. Prince Eugene, the commander in chief, had water and the provisions for his table sent him twice a-week from Vienna. The pure stream of the river Kahlenberg was regularly brought to him: he avoided all excesses, and lived regularly, or rather abstemiously; refreshed himself often by eating a cool melon; and mixed his usual wine, which was Burgundy, with water. Yet notwithstanding his utmost care, he was seized with a dysentery; which would have quickly put an end to his life, had not the speedy conclusion of that campaign permitted him to make a quick retreat.

Quartana.

At this unhealthy season, when hardly one imperial officer, much less their several domestics, escaped those malignant diseases, the renowned Count Bonneval and his numerous retinue continued in perfect health, to the surprise, or, to use the words of Dr Kramer, to the *envy*, of all who beheld him. The only precaution he used was to take, two or three times a-day, a small quantity of brandy in which the bark was infused; and he obliged all his attendants and domestics to follow his example. It is no less remarkable that the count, placing his certain preservation in the use of this single medicine, lived for many years afterwards in the most unhealthy spots of Hungary, without any attack or apprehension of disease; and continued to enjoy a perfect state of health during the hottest and most sickly seasons. And thus, with an unbroken and sound constitution, which is seldom the case of those who reside long in such climates, he lived to a great age. There is an instance produced by the same author of a whole regiment in Italy having been preserved by the use of the bark from the attack of these malignant diseases, viz. the flux, and *bilious* fever as it is frequently called, when the rest of the Austrian army, not pursuing that method, became greatly annoyed with them.

The intemperance and irregular living of those Europeans who visit the hot climates is frequently accused as the cause of their destruction; but, our author thinks, without sufficient reason: for though intemperance will make the body more liable to receive such diseases, it will not bring them on. It must by no means, however, be imagined, that in these climates Europeans may with impunity be guilty of excesses in eating or drinking; for the least error in that way will often prove fatal by debilitating the body, whose utmost strength in time of full health was perhaps scarce sufficient to resist the pestilential miasmata of the atmosphere.

It appears, therefore, from the concurrent testimony of the most eminent physicians, that the most proper medicine to be used, either as a preventive or cure for remitting and intermitting disorders is the Peruvian bark, administered with proper precautions, and after the *primæ viæ* have been evacuated of the putrid bilious matter collected in them. In those species of *tritæophya*, &c. belonging to this class, enumerated by Sauvages, the same remedies only were useful; but in that pestilential distemper which he calls *tritæophya Vratislaviensis*, he tells us, that washing the body with water sometimes hot sometimes cold, watery clysters, and plenty of aqueous drink, were likewise of use.

GENUS II. QUARTANA; the QUARTAN FEVER. 153

Quartana auctorum, *Sauv.* Gen. 89. *Lin.* 17. *Vog.* 3. *Sag.* 711. *Hoffm.* II. p. 23. *Junck.* tab. 81.

The *Genuine* QUARTAN. Sp. I. var. 1. A.

Quartana legitima, *Sauv.* sp. 1. *Sydenham* de morb. acut. cap. v.

Description.

Febres Quartana.

Description. The genuine quartan, according to Juncker, keeps its form more exactly than other intermittents; scarcely coming on at any other time than four or five in the afternoon. The cold is less violent than in the tertian; but is very perceptible, though it doth not proceed to such a height as to make the limbs shake; and continues for about two hours. It is preceded and accompanied by a langour both of body and mind. There is seldom any vomiting unless when the stomach is manifestly overloaded with aliment; neither is there any diarrhœa, but the belly in general is rather bound, not only on the days on which the paroxysm takes place, but also on the intermediate ones. The heat, which slowly succeeds the cold, is less troublesome to the patient by its violence than by the uneasy dryness of the skin, which is scarce ever moistened with sweat. This heat rarely continues longer than four or six hours, unless perhaps at the first or second paroxysm. It is accompanied also with a giddiness and dull pain of the head. On the termination of the paroxysm, the patient returns to a middling state of health, and continues in the same for the rest of the intermediate days; only there remains somewhat of a loathing, and a deep-seated pain as if the person was all over bruised or broken, which kind of sensation the physicians are wont to call *osteocopus*. The fit returns every fourth day, and that precisely at the same hours, being rarely postponed.

Causes of, and persons subject to, this disorder. The same general causes concur in producing this as in other intermittents, namely marsh miasmata, and whatever can dispose the body to be easily affected by them. Studious people, and those of a melancholic turn, are said to be particularly subject to quartans; but what are the immediate causes which produce a return of the fits every fourth day, instead of every day, or every third day, must probably lie for ever concealed, as depending upon the secret and inexplicable mechanism of the human body.

Prognosis. A simple quartan, where there is no reason to dread any induration of the viscera, may very certainly admit of a cure; and the prognosis can never be unfavourable, unless in cases of extreme weakness, or where the distemper hath been unskilfully treated.

Cure. This does not in the least differ from that which hath been fully laid down for the simple tertian, and which it is therefore needless to repeat here.

The *Duplicated* QUARTAN. Sp. I. var. 1. B.

154 Quartana duplicata, *Sauv.* sp. 4. *Bonet.*

This is entirely similar to the duplicated tertian already mentioned; proper allowance being made for the difference between the type of a tertian and quartan.

The *Triplicated* QUARTAN. Sp. I. var. 1. C.

155 Quartana triplicata, *Sauv.* sp. 16.

This hath three paroxysms every fourth day, while the intermediate days are entirely free from fever.

The *Double* QUARTAN. Sp. I. var. 1. D.

156 Quartana duplex, Sauv. sp. 3. *Vog.* sp. 13.

In the double quartan, the fits come on every day except the third; but so that the first paroxysm answers to the third, the second to the fourth, and so on.

The *Triple* QUARTAN. Sp. I. var. 1. E.

Quartana triplex, *Sauv.* sp. 5. *Vog.* sp. 14. *Bartholin.* H. anat. c. 1. 95. 157

This comes on every day, but the quartan type is still preserved by the times of accession; that is, the time of the fourth paroxysm's coming on answers to that of the first, the fifth to the second, the sixth to the third, &c.

The QUARTAN, accompanied with *Symptoms* of other diseases. Sp. I. var. 2.

8. Amphimerina spasmodica, *Sauv.* sp. 16.

To the tertian or quartan fevers also belong the *Erraticæ* of authors. As all those above mentioned differ only in the slight circumstance of the type from the intermitting and remitting tertians already described at length, it is unnecessary here to take up time in describing every minute circumstance related by physicians concerning them, especially as it could contribute nothing towards the laying down a better method of cure than what hath been already suggested.

GENUS

Febres

GENUS III. QUOTIDIANA; the QUOTIDIAN FEVER.

Quotidiana auctorum, *Sauv.* gen. 86. *Lin.* 15. *Vog.* I. *Hoffm.* II. 33. *Junck.* tab. 79.

161 The *Genuine* QUOTIDIAN. Sp. I. var. I. A.
Quotidiana simplex, *Sauv.* sp. 1.
Quotidiana legitima, *Sennert.* de febr. cap. 18.

Description. This kind of fever generally comes on about six or seven o'clock in the morning, beginning with a considerable degree of cold and shivering, which lasts for about an hour; and is often accompanied with vomiting, or spontaneous diarrhœa, or both. It is succeeded by a pretty strong heat, accompanied with thirst, restlessness, and pain of the head. When the heat abates a little, a spontaneous sweat commonly follows, and the whole paroxysm rarely exceeds six hours. It returns, however, every day almost always at the same hour, unless it be evidently disturbed.

Causes of, and persons subject to, the disease. The same general causes are to be assigned for the quotidian as for other intermittents. This kind occurs but rarely; and is said to attack people of a phlegmatic temperament rather than any other: also old people rather than young, and women rather than men.

The prognosis and method of cure are not different from those of tertians and quartans.

The *Partial* QUOTIDIAN. Sp. I. var. I. B.

162 Quotidiana partialis, *Sauv.* sp. 16. *Cnoffel*, E N. C. D. I. A. III. obs. 205. Edin. Med. Eff. vol. i. art. 31. vol. ii. art. 16.

Cephalalgia intermittens, *Sauv.* sp. 7.
Cephalæa febricosa, *Sauv.* sp. 4.
Quotidiana ophthalmica, *Morton*, ibid. hist. 17. *Van Swieten*, ibid.
Ophthalmia febricosa, *Sauv.* sp. 23.

These distempers attack only some particular part of the body, as the head, the eye, arm, &c. producing periodical affections of those parts returning once in 24 hours; and are to be cured by the bark, as other intermittents. They are known to belong to this class, by the evident intermission of the pain or other affection of the part. The *quotidiana hysterica*, *Sauv.* sp. 3. *quotidiana catarrhalis*, *Sauv.* sp. 9, and *quotidiana stranguriosa*, *Sauv.* sp. 11. seem to be symptomatic disorders.

The *Remitting* QUOTIDIAN. Sp. II.

163 Amphimerina, *Sauv.* gen. 84. *Lin.* 20.
Quotidiana continua, *Vog.* 15.

Diaria, *Lin.* 11.
Febris inflammatoria auctorum.

Description. The most simple kind of synocha is the ephemera or diary fever. It begins without any sensation of cold or shivering, unless there be some internal inflammation, or the small-pox or measles happen to be present. A continual heat without any intermission constitutes the essence of this disease. The heat, however, is more tolerable than in the synocha properly so called. In some the pains of the head are pungent and throbbing, answering to the pulsations of the arteries; but in others they are dull and heavy. The face is red and bloated; and there is a remarkable lassitude of the limbs, with a strong, full, and frequent pulse. The urine is red, and deposits a sediment almost of the colour of orange-peel; and in the very first day of the disease, signs of concoction (according to the Hippocratic phrase) appear. The fever commonly goes off with a gentle sweat, but sometimes, though more rarely, with an hemorrhagy of the nose. Its shortest period is 24 hours; but if it goes beyond the fourth day, it is then a *synocha* properly so called.

The simple synocha, according to Vogel, begins with cold and shivering, succeeded by vehement heat, redness, and dryness of the skin. The face, especially, is very red, and the thirst intense. The head is either pained or heavy. The patient either doth not sleep at all, or is disturbed with dreams. A moist sweat then breaks out all over the skin. The pulse is full, quick, and frequent; the judgment is sometimes a little disturbed: young people are apt to be terrified with imaginations; and they for the most part incline to sleep: the respiration is difficult, and the belly costive; at the same time that a tensive kind of lassitude is perceived over the whole body. A complete crisis takes place either on the fourth or at the farthest on the eleventh day. The characteristic marks of the simple synochus, therefore, are, A redness of the face, moisture of the skin, a strong and frequent pulse.

Causes of, and persons subject to, this disease. As we have already remarked of intermittents, so must we also now remark of continued fevers, that it is impossible to discover those minute causes which occasion the difference of type betwixt one inflammatory fever and another, though most authors pretend to enumerate these with great certainty. Thus Juncker tells us, that the cause of the simple ephemera is plethora, together with any immoderate agitation and commotion of the fluids while in that state. Vogel reckons among the causes of his *febris diaria*, passions of the mind, pain, want, exposure to the sun, &c.; a repulsion or absorption

Febres of certain humours; wounds, fractures, luxations, &c.; so that in general we may reckon every thing tending to increase the action of the arterial system to be in certain circumstances a cause of inflammatory fever.— Hence we find those are most subject to the synocha whose constitution is either naturally robust, or who are exposed to those causes which tend to produce an increased action of the arterial system; such as hard labour, high living, &c.

Prognosis. The most simple kind of synocha, that is, the ephemera or diary fever, is commonly cured without the assistance of medicine, and therefore the prognosis is for the most part favourable: yet, if it be improperly treated by heating medicines, it may easily be converted into the other kind; or, if there be a putrid disposition of the fluids, into a fever of a very dangerous nature. The same thing is to be understood even of the most violent kind; for simple inflammatory fevers are not dangerous unless complicated with an affection of some particular part, as the pleura, stomach, &c.

Cure. Dr Cullen objects to the plan of those who are for leaving the cure of continued fevers to the operations of nature; because these operations are neither certain in themselves, nor are they so well understood as to enable us to regulate them properly; and it is likewise possible to supersede them by art. The plan therefore on which he proceeds is, to form his indications of cure upon the means of obviating the tendency to death in fevers; and these he reduces to three. 1. To moderate the violence of re-action.— 2 To remove or obviate the causes of debility; and, 3. To obviate or correct the tendency of the fluids to putrefaction.

The *first* indication may be answered, 1. By all those means which diminish the action of the heart and arteries. 2. By those which take of the spasm of the extreme vessels, which, according to his theory, is the chief cause of violent re-action.

I. The action of the heart and arteries may be diminished, 1. By avoiding or moderating those irritations which, in one degree or other, are almost constantly applied to the body. 2. By the use of certain sedative powers. 3. By diminishing the tension or tone of the arterial system.

[1.] The irritations above-mentioned are the impressions made upon our senses, the exercise of the body and mind, and the taking in of aliments. The avoiding of these as much as possible, or the moderating their force, makes what is properly called the *antiphlogistic regimen*, proper to be employed in *almost* every continued fever. This regimen is to be directed in the following manner.

1. Impressions on the external senses, as stimulant to the system, and a chief support of its activity, should be avoided as much as possible; especially such as are of a stronger kind, and which give pain and uneasiness. No impression is to be more carefully guarded against than that of external heat; and at the same time every other means of increasing the heat of the body is to be shunned. Both these precautions are to be taken as soon as a hot stage is fully formed, and to be attended to during its continuance, except in certain cases, where a determination to sweating is necessary, or where the stimulant effects of heat may be compensated by circumstances which determine it Synocha. to produce a relaxation and revulsion.

2. All motion of the body is to be avoided as much as possible, and that posture only chosen which employs the fewest muscles, and keeps none of them long in a state of contraction. Speaking, as it accelerates respiration, is particularly to be avoided. It must also be observed, that every motion of the body is more stimulant in proportion as the patient is weaker.

3. The exercise of the mind is also to be avoided, as being a stimulus to the body; but here an exception is to be made in the case of a delirium coming on, when the presenting of accustomed objects may divert the irregular train of ideas then arising in the mind.

4. The presence of recent aliment in the stomach proves always a stimulus to the system, and ought therefore to be as moderate as possible. A total abstinence for some time may be of service; but as this cannot be long continued with safety, we must avoid the stimulus of aliment by choosing that kind which gives the least. Alimentary matters are also to be accounted more stimulant in proportion to their alkalescent qualities; and this leads us to avoid all animal, and use only vegetable food. For the same reason, aromatic and spirituous liquors are to be avoided; and in answering the present indication, we must abstain from all fermented liquors except those of the lowest quality. Other stimuli are, the sensation of thirst, crudities or corrupted humours in the stomach, a preternatural retention of the fæces in the intestines, and a general acrimony of all the humours, which is in most fevers to be suspected. These are to be removed by such methods as the urgency of the symptoms require, by diluting liquors, vomiting, the use of acids, laxative clysters, and large quantities of antiseptic drinks.

[2.] The second method of moderating the violence of reaction is by the employment of certain sedative powers, with a view to diminish the activity of the whole body, and particularly that of the sanguiferous system. The first of these to be mentioned is the application of cold. Heat is the chief support of the activity of the animal-system; and the system is therefore provided with a power of generating heat in itself: but at the same time we may observe, that this would go to excess, were it not constantly moderated by a cooler temperature in the surrounding atmosphere. When, therefore, the generating power of heat in the system is increased, as is commonly the case in fevers, it is necessary not only to avoid all further means of increasing it, but also to apply air of a cooler temperature; or at least to apply it more entirely and freely than in a state of health. This is shown, from some late observations, to be a very powerful means of moderating the violence of reaction; but what is the mode of its operation, to what circumstances of fever it particularly applies, or what limitations it requires, are not yet fully ascertained.

Another sedative power very frequently employed in fevers, is that of certain medicines known in the materia medica by the name of *refrigerants*. The chief of these are acids of all kinds when sufficiently diluted, and which are, in several respects, remedies adapted to continued fevers. Those especially in use are

Febres Synocha.

are the vitriolic and vegetable; and on many accounts the latter are to be preferred. Another set of refrigerants are the neutral salts formed of the vitriolic, nitrous, or vegetable acids, with alkalies either fixed or volatile. All these neutrals, while they are dissolved in water, generate cold; but as that cold ceases soon after the dissolution is finished, and as the salts are generally exhibited in a dissolved state, their refrigerant power in the animal body does not all depend upon their power of generating cold with water. Nitre is the refrigerant chiefly employed; but all the others, compounded as above mentioned, partake more or less of the same quality. Besides these neutrals, some metallic salts have also been employed in fevers, particularly the sugar of lead: but the refrigerant powers of this salt are by no means ascertained, and its deliterious qualities are too well known to admit of its being freely used.

[3.] The third general method of diminishing the reaction of the system, is by lessening the tension, tone, and activity of the sanguiferous system. As the activity of the system in a great measure depends upon the tone, and this again upon the tension, of the vessels, given to them by the quantity of fluids they contain, it is evident, that the diminution of the quantity of these must diminish the activity of the sanguiferous system. The most efficacious means of diminishing the quantity of fluids is by the evacuations of blood-letting and purging. The former is evidently one of the most powerful means of diminishing the activity of the whole body, and especially of the sanguiferous system; and it must therefore be the most effectual means of moderating the reaction in fevers. When the violence of reaction, and its constant attendant a phlogistic diathesis, are sufficiently evident; when these constitute the principal part of the disease, and may be expected to continue through the whole of it, as in the cases of synocha; then blood-letting is the principal remedy, and may be employed as far as the symptoms of the disease may seem to require, and the constitution of the patient will bear. It must, however, be remarked, that a greater evacuation than is necessary may occasion a slower recovery, and render the person more liable to a relapse, or bring on other diseases. It is also to be observed, that this evacuation is the more effectual, as the blood is more suddenly drawn off, and as the body is at the same time more free from all irritation, and therefore when it is in a posture in which the fewest muscles are in action.

With regard to purging, when we consider the quantity of fluids constantly present in the cavity of the intestines, and the quantity which may be drawn off from the innumerable excretories that open into this cavity, it will be obvious, that a very great evacuation may be made in this way; and if this be done by a stimulus that is not at the same time communicated to the rest of the body, it may, by emptying both the cavity of the intestines and the arteries which furnish the excretions poured into it, induce a considerable relaxation in the whole system; and is therefore suited to moderate the violence of reaction in fevers. But it is to be observed, that as the fluid drawn from the excretories opening into the intestines is not all drawn immediately from the arteries, and as what is even more immediately drawn from these is drawn off slowly; so the evacuation will not, in proportion to its quantity, occasion such a sudden depletion of the red vessels as blood-letting does; and therefore cannot act so powerfully in taking off the phlogistic diathesis of the system.

At the same time the evacuation may induce a considerable degree of debility; and therefore, in those cases in which a dangerous state of debility is likely to occur, purging is to be employed with a great deal of caution; and this caution is more difficult to be observed than in the case of blood-letting: and it is further to be noticed, that as purging takes off in some measure the determination of the blood to the vessels on the surface of the body, it seems to be an evacuation not well adapted to the cure of fevers.

II. The other method of moderating the violence of reaction in fevers is by the exhibition of those remedies suited to take off the spasm of the extreme vessels, supposed to be the irritation which chiefly supports the reaction. The means to be employed for this purpose are either internal or external.

First, The internal means are, 1. Those which determine the force of the circulation to the extreme vessels on the surface of the body, and, by restoring the tone and activity of these vessels, overcome the spasm on their extremities. 2. Those medicines which have the power of taking off spasm in any part of the system, and which are known under the title of ANTISPASMODICS.

(1.) Those remedies which are fit to determine to the surface of the body are, 1. Diluents. 2. Neutral salts. 3. Sudorifics. 4. Emetics.

1. Water enters, in a large proportion, into the composition of all the animal fluids, and a large quantity of it is always diffused through the whole of the common mass. In a sound state, the fluidity of the whole mass depends upon the quantity of water present in it. Water therefore is the proper diluent of our mass of blood, and other fluids are diluent only in proportion to the quantity of water they contain.

In a healthy state, also, the fulness of the extreme vessels and the quantity of excretion are in proportion to the quantity of water present in the body. But in fever, though the excretions be in some measure interrupted, they continue in such quantity as to exhale the more fluid parts of the blood; and, while a portion of them is at the same time necessarily retained in the larger vessels, the smaller, and the extreme vessels, both from the deficiency of fluid and their own contracted state, are less filled, and therefore allowed to remain in that condition. To remedy this contracted state, nothing is more necessary than a large supply of water or watery fluids taken in by drinking or otherwise; for as any superfluous quantity of water is forced off by the several excretories, such a force applied may be a means of dilating the extreme vessels, and of overcoming the spasm affecting their extremities. Accordingly, the throwing in of a large quantity of watery fluids has been, at all times, a remedy much employed in fevers; and in no instance more remarkably than by the Spanish and Italian physicians, in the use of what they call the *diæta aquea*. This practice consists in taking away every other kind of aliment and drink, and in giving, in divided portions, every day for several days together, six or eight pounds of plain water, generally cold, but sometimes warm. All this, however, is to be done only after the disease has continued for some time, and at least for a week.

2. A second means of determining to the surface of the body, is by the use of neutral salts. These neutrals, in a certain dose, taken into the stomach, produce soon after a sense of heat upon the surface of the body; and, if the body be covered close and kept warm, a sweat is readily brought out. The same medicines taken during the cold stage of a fever, very often put an end to it, and bring on the hot one; and they are also remarkable for stopping the vomiting which so frequently attends the cold stage of fevers. All this shows, that neutral salts have a power of determining the blood to the surface of the body, and may therefore be of use in taking off the spasm which subsists there in fevers. The neutral most commonly employed in fevers, is that formed of an alkali with the native acid of vegetables. But all the other neutrals have more or less of the same virtue; and perhaps some of them, particularly the ammoniacal salts, possess it in a stronger degree. As cold water taken into the stomach often shows the same diaphoretic effects with the neutral salts, it is probable that the effect of the latter depends upon their refrigerant powers.

3. A third method of determining to the surface of the body, and taking off the spasm subsisting there, is by the use of sudorifics and of sweating. The propriety of this remedy has been much disputed; and many specious arguments may be adduced both for and against the practice. In its favour may be urged, 1. That in healthy persons, in every case of increased action of the heart and arteries, a sweating takes place, and is, seemingly, the means of preventing the bad effects of such increased action. 2. That, in fevers, their most usual solution and termination is by spontaneous sweating. 3. That, even when excited by art, is has been found useful at certain periods, and in certain species of fever.—On the other hand, it may be urged against the practice of sweating, 1. That in fevers, as a spontaneous sweating does not immediately come on, there are some circumstances different from those in the state of health, and which may render it doubtful whether the sweating can be safely excited by art. 2. That in many cases the practice has been attended with bad consequences. The means commonly employed have a tendency to produce an inflammatory diathesis; which, if not taken off by the sweat succeeding, must be increased with much danger. Thus sweating employed to prevent the accessions of intermitting fevers has often changed them into a continued form, which is always dangerous. 3. The utility of the practice is doubtful, as sweating, when it happens, does not always give a final determination, as must be manifest in the case of intermittents, and in many continued fevers which are sometimes in the beginning attended with sweatings which do not prove final; and, on the contrary, whether they be spontaneous or excited by art, they seem often to aggravate the disease.

From these considerations, it is doubtful if the practice of sweating can be admitted very generally; but, at the same time, it is also very doubtful if the failure of the practice, or the mischiefs said to arise from it, have not been owing to the improper conduct of the practitioner. With respect to the last, it is almost agreed among physicians, 1. That sweating has been generally hurtful when excited by stimulant, heating, and inflammatory medicines. 2. That it has been hurtful when excited by much external heat, and continued with a great increase of the heat of the body. 3. That it is always hurtful when it does not relieve; and rather increases the frequency and hardness of the pulse, the anxiety and difficulty of breathing, the headach, and delirium. 4. That it is always hurtful if it be urged when the sweat is not fluid, and when it is partial and on the superior parts of the body only.

In these cases, it is probable, that either an inflammatory diathesis is produced, which increases the spasm on the extreme vessels; or that, from other causes, the spasm is too much fixed to yield easily to the increased action of the heart and arteries; and upon either supposition it must be obvious, that urging the sweat may produce determinations to some of the internal parts, with very great danger.

Notwithstanding these doubts, however, it still remains true, 1. That sweating has been often useful in preventing the accessions of fevers when they have been certainly foreseen, and a proper conduct employed. 2. That even after fevers have in some measure come on, sweating has interrupted their progress when properly employed, either at the very beginning of the disease, or during its approach and gradual formation. 3. That even after pyrexiæ have continued for some time, sweating has been successfully employed in curing them, as is particularly exemplified in the case of a rheumatism. 4. That certain fevers produced by a very powerful sedative contagion, have been generally treated most successfully by sweating.

These instances are in favour of sweating, but give no general rule; and it must be left to farther experience to determine how far any general rule can be established in this matter. In the mean time, if the practice of sweating is to be attempted, the following rules may be laid down for the conduct of it 1. That a sweat should be excited without the use of stimulant inflammatory medicines. 2. That it should be excited with as little external heat, and with as little increase of the heat of the body, as possible. 3. That, when excited, it should be continued for a due length of time; not less than 12 hours, and sometimes for 24 or 48 hours; always, however, supposing that it proceeds without the dangerous circumstances already mentioned. 4. That for some part of the time, and as long as the person can easily bear, it should be carried on without admitting of sleep. 5. That it should be rendered universal over the whole body; and therefore particularly that care should be taken to bring the sweating to the lower extremities. 6. That the practice should be rendered safer by moderate purging excited at the same time. 7. That it should not be suddenly checked by cold any how applied to the body.

When attention is to be given to these rules, the sweating may be excited, 1. By warm bathing, or a fomentation of the lower extremities. 2. By frequent draughts of tepid liquors, chiefly water, rendered more grateful

grateful by the addition of a light aromatic, or more powerful by that of a fmall quantity of wine. 3. By giving fome dofes of neutral falts. 4. Moft effectually, and perhaps moft fafely, by a large dofe of an opiate, joined with a portion of neutral-falts, and of an emetic.

The fourth mean of determining to the furface of the body, and thereby taking off the fpafm affecting the extreme veffels, is by the ufe of emetics. Thefe, particularly of the antimonial kind, have been employed in the cure of fevers ever fince the introduction of chemical medicines; and though of late their ufe has become very general, their efficacy is ftill difputed, and their manner of operating is differently explained.

Vomiting is in many refpects ufeful in fevers; as it evacuates the contents of the ftomach, as it emulges the biliary and pancreatic ducts, and evacuates the contents of the duodenum, and perhaps alfo of a larger portion of the inteftines; as it agitates the whole of the abdominal vifcera, it expedes the circulation in them, and promotes their feveral fecretions; and laftly, as it agitates alfo the vifcera of the thorax, it has like effects there.

It is not to this caufe, however, that we are to impute the effect vomiting has in determining to the furface of the body. This muft be attributed to the particular operation of emetics upon the mufcular fibres of the ftomach, whereby they excite the action of the extreme arteries on the furface of the body, and by this means effectually determine the blood to thefe veffels, remove the atony, and take off the fpafm affecting them. For this purpofe they are exhibited in two different ways; that is, either in fuch dofes as may excite full and repeated vomitings, or in fuch dofes as may excite ficknefs and naufea only, with little or no vomiting at all.

Full vomiting is well fuited to determine to the furface of the body, and thereby to obviate the atony and fpafm which lay the foundation of fever. Thus, vomiting excited a little before the expected acceffion of the paroxyfm of an intermittent, has been found to prevent the paroxyfm altogether. It has been obferved alfo, that when contagion has been applied to a perfon, and firft difcovers its operation, a vomit given has prevented the fever which might otherwife have been expected.

Thefe are the advantages to be obtained by exciting vomiting at the firft approach of fevers, or of the paroxyfm of fevers; and they may alfo be applied after fevers are formed, to take off, perhaps entirely, the atony and fpafm, or at leaft to moderate thefe, fo that the fever may proceed more gently and fafely. It is feldom, however, that vomiting is found to produce a final folution of fevers; and after they are once formed, it is commonly neceffary to repeat the vomiting feveral times; but this is attended with inconveniency, and fometimes with difadvantage. The operation of full vomiting is tranfitory, and the exercife of vomiting is a debilitating power; and therefore, when the vomiting does not remove the atony and fpafm very entirely, it may give occafion to their recurrence with greater force. For thefe reafons, after fevers are fully formed, fome phyficians have thought proper to employ emetics in naufeating dofes only. Thefe are capable of exciting the action of the extreme veffels, and their operation is more permanent. At the fame time they often fhow their power by exciting fome degree of fweat, and their operation is rendered more fafe by their commonly producing fome evacuation by ftool. But naufea continued for any great length of time, is to moft patients a fenfation highly diftreffing, and almoft infufferable.

The emetics chiefly in ufe at prefent are, ipecacuanha and antimony. The former may be employed for determining to the furface of the body: but, even in very fmall dofes, it fo readily excites vomiting, that it is with difficulty employed for the purpofe of naufeating only; and in whatever manner employed, there is reafon to fufpect that its effects are lefs permanent, and lefs powerfully communicated from the ftomach to the reft of the fyftem, than thofe of antimony. This laft is therefore generally preferred; and its preparations, feemingly various, may all be reduced to two heads; one comprehending thofe in which the reguline part is in a condition to be acted upon by acids, and therefore on meeting with acids in the ftomach it becomes active; and another, comprehending thofe preparations in which the reguline part is already joined with an acid, rendering it active. Of each kind there are great numbers, but not differing effentially from one another; the two moft worthy of notice are, the *calx nitrata antimonii* and *emetic tartar*, or *antimonium tartarifatum*, of the Edinburgh difpenfatory. Both thefe are very efficacious medicines; but the latter feems preferable, becaufe its dofe is capable of being better afcertained; though the former, on account of its flower operation, may have fome advantages, and in certain cafes be more efficacious as a purgative and fudorific.

The *calx nitrata antimonii*, when firft introduced into the pharmacopœia of the Edinburgh college, was fuppofed to be very nearly, if not precifely, the fame with a medicine which has of late been highly celebrated in the cure of fevers, Dr James's powder. But from later and more accurate obfervations, there is now reafon to believe that the pulvis antimonialis of the London pharmacopœia, formed by the calcination of antimony with hartfhorn, approaches more nearly to that celebrated arcanum. But at any rate, the calx antimonii nitrata, the pulvis antimonialis, and James's powder, are probably not effentially different from each other. The two latter, however, have the moft near refemblance; and accordingly the Edinburgh college in the laft edition of their pharmacopœia have introduced an article under the title of *antimonium calcareo-phofphoratum*, which they confider as fo much fimilar to James's powder, that they have ufed as a fynonyme for it, the title of *pulvis Jacobi*.

The time moft proper for exhibiting thefe medicines is a little before the acceffion, when that can be certainly known. In continued fevers the exacerbations are not always very obfervable; but there is reafon to believe, that one commonly happens about noon or foon after it; and that thefe, therefore, are the moft proper times for exhibiting emetics.

With refpect to the manner of adminiftration, that of the *calx nitrata* is fimple, as the whole of what is thought a proper dofe may be given at once; and no more can be properly given till the next acceffion. The adminiftration of the emetic tartar is different. It is to be given in fmall dofes, not fufficient to excite vomiting;

Fibres miting; and these doses are to be repeated after short intervals for several times, till sickness, nausea, and some, though not much, vomiting come on. The difference of administration must depend upon the dose, and the length of the interval at which it is given. If it be intended that the medicine should certainly operate by stool, the doses are made small, and the intervals long. On the contrary, when vomiting is proper, or when much purging ought to be avoided, and therefore some vomiting must be admitted, the doses are made larger, and the intervals shorter. With respect to both kinds of preparations, the repetition is to be made at the times of accession, but not very often: for if the first exhibitions, duly managed, have little effect, it is seldom that the after exhibitions have much; and it sometimes happens that the repeated vomiting, and especially repeated purging, does harm by weakening the patient.

(2.) The other set of internal medicines which are supposed useful in taking off the spasm of the extreme vessels, are those named *antispasmodic*. But whatever may be the virtues of some of them in this way, such is their power of stimulating at the same time, that very few of them can with safety be administered in fevers of an inflammatory nature. Almost the only one which can with safety be exhibited in these cases is camphor; and the operations of this are by no means well ascertained. Dr Huxham mentions it as a corrector of the acrimony of cantharides; and assures us, that it very effectually promotes a diaphoresis. But from the remarks of other practitioners, we have no just reason to suppose that it acts perceptibly in a dose of five or six grains, though in 15 or 20 it produces a particular kind of intoxication.

Secondly, The external means suited to take off the spasm of the extreme vessels, are blistering and warm bathing.

1. What are the effects of blistering so frequently employed in fevers, is not yet agreed upon among physicians. Dr Cullen is of opinion, that the small quantity of cantharides absorbed from a blistering plaster, is not sufficient to change the consistence of the mass of blood; and therefore, that such a quantity can neither do good by resolving phlogistic lentor if it exists, nor do harm by increasing the dissolution of the blood arising from a putrid tendency in it. The effects of cantharides upon the fluids, therefore, may be entirely neglected. The inflammation produced by the application of cantharides to the skin, affords a certain proof of their stimulant power: but in many persons the effect of that stimulus is not considerable; in many it is not communicated to the whole system; and even when it does take place in the whole system, it seems to be taken off very entirely by the effusion and evacuation of serum from the blistered part. It may be concluded, therefore, that neither much good is to be expected, nor much harm to be apprehended, from the stimulant power of blistering; and the certainty of this conclusion is established by the great benefit arising from the proper practice of blistering in inflammatory diseases. Much has been imputed to the evacuation made by blistering; but it is never so considerable as to affect the whole system; and therefore can neither by a sudden depletion relax the sanguiferous system, nor by any revulsion affect the general distribution of the fluids. The evacuation, however, is so considerable as to affect the neighbouring vessels; and the manifest utility of blistering near the part affected in inflammatory diseases leads us to think, that blistering, by deriving to the skin, and producing an effusion there, relaxes the spasm of the deeper seated vessels. It is in this manner, most probably, that the tumor of a joint, from an effusion into the cellular texture under the skin, takes off the rheumatic pain formerly affecting that joint. Analogous to this, probably, is the good effect of blistering in continued fevers; and arises from the relaxation of the spasm of the extreme vessels by a communication of the blistered part with the rest of the skin. A blister may be employed at any period in continued fevers; but it will be of most advantage in the advanced state of such fevers, when, the reaction being weaker, all ambiguity from the stimulating power of blistering is removed, and when it may best concur with other circumstances tending to a final solution of the spasm. Typhus.

From this view of the matter, it will appear, that the part of the body to which blisters ought to be applied is indifferent, except upon the suspicion of topical affection, when the blistering is to be made as near as possible to the part affected. Whether sinapisms and other *rubefacientia* act in a manner analogous to what has been supposed of blistering may be doubtful; but their effects in rheumatism and other inflammatory diseases render it probable.

2. The other external means of taking off the spasm of the extreme vessels is warm bathing. This was frequently, and in different circumstances, employed by the ancients; but has, till very lately, been neglected by modern physicians. As the heat of the bath stimulates the extreme vessels, and, with the concurrence of moisture, also relaxes them, it seems to be a safe stimulus, and well suited to take off the spasm affecting these vessels. It may be applied to the whole body by immersion; but this is in many respects inconvenient; and whether some of the inconveniences of immersion might not be avoided by a vapour-bath, is not yet determined by experience; but from extensive experience it appears, that most of the purposes of warm bathing can be obtained by a fomentation of the legs and feet, if properly administered, and continued for a due length of time, not less than an hour. The marks of the good effects of such a fomentation are, the patient's bearing it easily, its relieving delirium, and inducing sleep.

Defcription. Of all the defcriptions we have of the nervous fever, that of Dr Huxham is perhaps the beft. According to him, the patient at firft grows fomewhat liftlefs, and feels flight chills and fhudders, with uncertain flufhes of heat, and a kind of wearinefs all over, like what is felt after great fatigue. This is always attended with a fort of heavinefs and dejection of fpirit, and more or lefs of a load, pain, or giddinefs of the head; a naufea and difrelifh of every thing foon follows, without any confiderable thirft, but frequently with urging to vomit, though little but infipid phlegm is brought up. Though a kind of lucid interval of feveral hours fometimes intervenes, yet the fymptoms return with aggravation, efpecially towards night; the head grows more giddy or heavy; the heat greater; the pulfe quicker, but weak; with an oppreffive kind of breathing. A great torpor, or obtufe pain and coldnefs, affects the hinder-part of the head frequently, and oftentimes a heavy pain is felt on the top all along the *coronary future*; this, and that of the back-part of the head, generally attend nervous fevers, and are commonly fucceeded by fome degree of a delirium. In this condition the patient often continues for five or fix days, with a heavy, pale, funk countenance; feemingly not very fick, and yet far from being well; reftlefs, anxious, and commonly quite void of fleep, though fometimes very drowfy and heavy; but although he appears to thofe about him actually to fleep, he is utterly infenfible of it, and denies that he doth fo. The pulfe during all this time is quick, weak, and unequal: fometimes fluttering, and fometimes for a few moments flow; nay, even intermitting, and then, with a fudden flufh in the face, immediately very quick, and perhaps foon after furprifingly calm and equal; and thus alternately. The heats and chills are as uncertain and unequal; fometimes a fudden colour and glow arife in the cheeks, while the tip of the nofe and ears is cold, and the forehead at the fame time in a cold dewy fweat. Nay, it is very common, that a high colour and heat appear in the face, when the extremities are quite cold. The urine is commonly pale, and often limpid; frequently of a whey colour, or like vapid fmall-beer, in which there is either no manner of fediment, or a kind of loofe matter like bran irregularly fcattered up and down in it. The tongue at the beginning is feldom or never dry or difcoloured, but fometimes covered with a thin whitifh mucus: at length, indeed, it often appears very dry, red, and chapped, or of the colour of pomegranate-rind; but this moftly at the clofe of the difeafe: yet, however dry the tongue and lips feem, the patient fcarce ever complains of thirft, though fometimes of a heat in the tongue. About the feventh or eighth day, the giddinefs, pain, or heavinefs of the head become much greater, with a conftant noife in it, or *tinnitus aurium*; which is very difturbing to the fick, and frequently brings on a delirium. The load on the præcordia, anxiety and faintnefs, grow much more urgent; and they often fall into an actual deliquium, efpecially if they attempt to fit up; cold fweats fuddenly come out on the forehead, and on the backs of the hands (though at the fame time there is too much heat in the cheeks and palms), and as fuddenly go off. If the urine now grows more pale and limpid, a delirium is certainly to be expected, with univerfal tremors and *fubfultus tendinum*; the delirium is feldom violent, but as it were a confufion of thought and action, muttering continually to themfelves, and faltering in their fpeech Sometimes they awake only in a hurry and confufion, and prefently recollect themfelves, but forthwith fall into a muttering dozy ftate again. The tongue grows often very dry at the height, efpecially in its middle part, with a yellowifh lift on each fide, and trembles greatly when the fick attempts to put it out. Frequently profufe fweats pour forth all at once, about the ninth, tenth, or twelfth day, commonly coldifh and clammy on the extremities; oftentimes very thin ftools are difcharged, and then nature finks apace; the extremities grow cold, the nails pale or livid; the pulfe may be faid to tremble and flutter, rather than to beat, the vibrations being fo exceeding weak and quick that they can fcarce be diftinguifhed; though fometimes they creep on furprifingly flow, and very frequently intermit. The fick become quite infenfible and ftupid, fcarce affected with the loudeft noife or the ftrongeft light; though, at the beginning, ftrangely fufceptible of the impreffions of either. The delirium now ends in a profound coma, and that foon in eternal fleep. The ftools, urine, and tears, run off involuntarily, and denounce a fpeedy diffolution, as the vaft tremblings and twitchings of the nerves and tendons are preludes to a general convulfion, which at once fnaps off the thread of life. In one or other of thefe ways are the fick carried off, after having languifhed for 14, 18, or 20 days; nay, fometimes much longer. Moft patients grow deaf and ftupid towards the end of this difeafe, (fome extremely deaf), though too quick and apprehenfive at the beginning; infomuch that the leaft noife or light greatly offended them. Many from their immoderate fears feem to hurry themfelves out of life, where little danger is apparent at the beginning: nay, fome will not allow themfelves to fleep, from a vain fear of dozing quite away; and others from the vaft hurry, anxiety, and confufion they are fenfible of either during fleep or at their waking.

Typhus.

Caufes of, and perfons fubject to, the diforder. The nervous fever is moft frequently the confequence of contagion. It moft commonly attacks perfons of weak nerves, a lax habit of body, and a poor thin blood; thofe who have fuffered great evacuations, a long dejection of fpirits, immoderate watchings, ftudies, fatigue, &c.; alfo thofe who have ufed much crude unwholefome food, vapid impure drinks, or who have been confined long in damp foul air; who have broken the vigour of their conftitutions by falivations, too frequent purging, immoderate venery, &c. Hence we fee how the difeafe is connected with an extreme debility of the nervous fyftem; for, when people are prepared for this fever by having their nerves already weakened, the contagious particles immediately attack the nervous fyftem, without

out so much affecting the state of the blood or juices, though the latter are greatly affected in the putrid malignant fevers.

Prognosis. In nervous fevers, the prognosis is very much the same with that of the putrid malignant kind. And although death be not so frequent as in that modification of fever, yet it may justly be considered as a very fatal disease.

Cure. As this fever is produced by a contagion affecting the nervous system of a person already debilitated, and thus producing weakness in an extreme degree, we have now occasion to consider Dr Cullen's *two indications* of cure omitted under the *Synocha;* namely, to remove the cause and obviate the effects of debility, and to correct the putrescent tendency of the fluids; for though, in the beginning of nervous fevers, the tendency to putrefaction be not remarkable, it becomes exceedingly great towards their conclusion.

[1.] In answering the first indication, Dr Cullen observes, that most of the sedative powers inducing debility cease to act soon after they have been first applied; and therefore the removing them is not an object of the present indication. There is only one which may be supposed to continue to act for a long time, and that is the contagion applied; but we know nothing in the nature of contagion that can lead us to any measures for removing or correcting it. We know only its effects as a sedative power inducing debility, or as a ferment inducing a tendency to putrefaction in the fluids, the former of which at present falls under our consideration.—The debility induced in fevers by contagion, or other causes, appears especially in the weaker energy of the brain; but in what this consists, or how it may be restored, we do not well know; but as nature, seemingly for this purpose, excites the motion of the heart and arteries, we must ascribe the continuance of the debility to the weaker re-action of the sanguiferous system: the means, therefore, which we employ for obviating debility, are immediately directed to support and increase the action of the heart and arteries; and the remedies employed are tonics or stimulants.

In contagious diseases we know, both from the effects which appear, and from dissections, that the tone of the heart and arteries is considerably diminished; and that tonic remedies are therefore properly indicated. We are to consider these remedies as of two kinds; 1. The power of cold; 2. That of tonic medicines.

The power of cold as a tonic in fevers may be employed in two ways: either as thrown into the stomach, or as applied to the surface of the body. As we have already observed that the power of cold may be communicated from any one part to every other part of the system, so it will be readily allowed that the stomach is a part as fit as any other for this communication, and that cold drink taken into the stomach may prove an useful tonic in fevers.—This the experience of all ages has confirmed; but at the same time it has been frequently observed, that, in certain circumstances, cold drink taken into the stomach has proved very hurtful; and therefore that its use in fevers requires some limitations. What these limitations should be, and what are all the circumstances which may forbid the use of cold drink, it is difficult to determine; but it seems clearly forbidden in all cases where a phlogistic diathesis prevails in the system, and more especially when there are topical affections of an inflammatory nature.

The other method of employing cold as a tonic, is by applying it to the surface of the body, as a refrigerant power fit to moderate the violence of reaction; but probably it may here also be considered properly as a tonic, and useful in cases of debility.—Not only cool air, but cold water also may be applied to the surface of the body as a tonic. The ancients frequently applied it with advantage to particular parts as a tonic; but it is a discovery of modern times, that, in the case of putrid fevers attended with much debility, the body may be washed all over with cold water. This was first practised at Breslaw in Silesia, as appears from a dissertation under the title of *Epidemia Verna, quæ Wratislaviam anno* 1737 *afflixit*, to be found in the *Acta Nat. Curios.* vol. x. And from other writers it appears, that the practice has passed into some of the neighbouring countries; but in this island it does not appear that we have yet had any experience of it.

The medicines which have been employed in fevers as tonics are various. If the *saccharum saturni* hath been found useful, it is probably as a tonic rather than as a refrigerant; and the *ens veneris*, or other preparations of iron which have been employed, can act as tonics only. The preparations of copper, from their effects in epilepsy, are presumed to possess a tonic power; but whether their use in fevers be founded on their tonic or emetic powers, is uncertain. And upon the whole there may no doubt occur some instances of fevers being cured by tonics taken from the fossile kingdom; but the vegetable tonics are the most efficacious, and among these the Peruvian bark certainly holds the first place.

The bark has commonly been considered as a specific, or a remedy of which the operation was not understood. We must observe, however, that, as in many cases the effects of the bark are perceived soon after its being taken into the stomach, and before it can possibly be conveyed to the mass of blood, we may conclude, that its effects do not arise from its operating on the fluids; and must therefore depend upon its operating on the nerves of the stomach, and being thereby communicated to the rest of the nervous system. This operation seems to be a tonic power, the bark being a remedy in many cases of debility, particularly in gangrene: and if its operation may be explained from its possessing a tonic power, we may easily perceive why it is improper when a phlogistic diathesis prevails; and from the same view we can ascertain in what cases of continued fever it may be admitted. These cases are either where considerable remissions have appeared, when it may be employed to prevent the return of exacerbations, on the same footing as it is used in intermitting fevers; or in the advanced state of fevers, when all suspicion of an inflammatory state is removed, and a general debility prevails in the system; and its being then employed is sufficiently agreeable to the present practice.

Another set of medicines to be employed for obviating debility and its effects, are the direct stimulants.

Febres lants. These, in some measure, increase the tone of the moving fibres; but are different from the tonics, as they more directly excite and increase the action of the heart and arteries. This mode of their operation renders their use ambiguous; and when an inflammatory diathesis is present, the effects of the stimulants may be very hurtful; but it is still probable, that in the advanced state of these fevers, when debility prevails, they may be useful.

Of all the stimulants which may be properly employed, wine seems to be the most eligible. It has the advantage of being grateful to the palate and stomach, and of having its stimulant parts so much diluted, that it can be conveniently given in small doses; and therefore it may be employed with sufficient caution; but it is of little service unless taken pretty largely.—It may be suspected that wine has an operation analogous to that of opium; and on good grounds. But we can distinctly remark its stimulant power only; which renders its effects in the phrenitic delirium manifestly hurtful; and in the mild delirium depending on debility, as remarkably useful.

[2.] We must now proceed to the other indication of cure, namely, to correct or obviate the tendency in the fluids to putrefaction. This may be done, 1. By avoiding any new application of putrid or putrescent matter. 2. By evacuating the putrid or putrescent matter already present in the body. 3. By correcting the putrid or putrescent matter remaining in the body by diluents and antiseptics. 4. By supporting the tone of the vessels, and thereby resisting further putrefaction, or obviating its effects. 5. By moderating the violence of re-action, considered as a means of increasing putrefaction.

The further application of putrid or putrescent matter may be avoided, 1. By removing the patient from places filled with corrupted air. 2. By preventing the accumulation of the patient's own effluvia, by a constant ventilation, and by a frequent change of bed-clothes and body-linen. 3. By the careful and speedy removal of all excremental matters from the patient's chamber. 4. By avoiding animal-food.

The putrid or putrescent matter already present in the body, may be evacuated partly by frequent evacuations of the contents of the intestines; and more effectually still by supporting the excretions of perspiration and urine by the plentiful use of diluents. That which remains in the body may be rendered more mild and innocent by the use of diluents, or may be corrected by the use of antiseptics. These last are of many and various kinds; but which of them are conveniently applicable, or more particularly suited to the case of fevers, is not well ascertained. Those most certainly applicable and useful are acescent aliments, acids of all kinds, and neutral salts.

The progress of putrefaction may be considerably retarded, and its effects obviated, by supporting the tone of the vessels; and this may be done by tonic medicines, of which the chief are cold, and the Peruvian bark, as already mentioned. The violence of re-action increasing the tendency to putrefaction, may be moderated by the means already mentioned under *synocha*.

These are the proper indications to be observed in the cure of the slow nervous fever. Dr Huxham Typhus. observes, that evacuations (especially bleeding) are improper even at the beginning. Even a common purgative given at this time hath been followed by surprising languors, syncope, and a train of other ill symptoms. However, it may sometimes be necessary to cleanse the stomach and primæ viæ by a gentle emetic, or a mild laxative. Indeed, where nausea, sickness, and load at stomach are urgent, as is frequently the case in the beginning of this fever, a vomit is necessary. Clysters of milk, sugar, and salt, may be injected with safety and advantage every second or third day, if nature wants to be prompted to stool. The temperate, cordial, diaphoretic medicines, are certainly, according to our author, most proper in these fevers; and a well-regulated, supporting, diluting diet is necessary. The latter of itself, judiciously managed, will go a great way in the cure, especially assisted by well-timed and well-applied blisters, and a due care to keep the patient as quiet as possible both in body and mind. But it should be noted, that any strong opiates are commonly very pernicious, however much the want of sleep and restlessness may seem to demand them. Mild diaphoretics, such as neutral draughts or elixir paregoricum, have much better effects; which, by raising a gentle easy sweat, or at least a plentiful perspiration, calm the hurry of the spirits, and a refreshing sleep ensues. Where the confusion and dejection of spirits are very considerable, blisters have been advised to be applied to the neck, occiput, or behind the ears; and during all this a free use of thin wine-whey, some pleasant ptisan or gruel, with a little soft wine, must be indulged. Indeed the patients, in this case, should drink frequently: though such quantities may not be necessary as in the ardent, or even putrid malignant fevers; yet they should be sufficient to carry on the work of dilution, support the sweats, and supply the blood with fresh and wholesome fluids, in place of that noxious matter which is continually passing off. In this view also a thin chicken-broth is of service, both as food and physic, especially towards the decline of the disease; and for the same reason thin jellies of hartshorn, sago, panada, are useful, adding a little wine to them, and the juice of Seville orange or lemon.

It is observable, that the sick are never so easy as when they are in a gentle sweat; for this soon removes the hurry of spirits, exacerbations of heat, &c. But profuse sweats should never be encouraged, much less attempted, by very strong heating medicines, especially in the beginning or advance of the fever; for they too much exhaust the vital powers, and are followed by a vast dejection of spirits, tremors, startings of the tendons, and sometimes end in rigors, cold clammy sweats, syncope, or a comatose disposition. Sometimes irregular partial heats and flushes succeed, with great anxiety, restlessness, delirium, difficulty of breathing, and a vast load and oppression in the præcordia, so as to incline the less cautious observer to think there may be something peripneumonic in it; but even here we must beware of bleeding, as the pulse will be found very small and unequal, tho' very quick. Nor is bleeding contra-indicated only by the weakness and fluttering

Febres fluttering of the pulse, but also by the pale, limpid, and watery urine which is commonly attendant. These symptoms denote the load, anxiety, and oppression on the præcordia to proceed from an affection of the nervous system, and not from a peripneumonic obstruction or inflammation. The breathing in this case, though thick and laborious, is not hot, but a kind of sighing or sobbing respiration, nor is there often any kind of cough concomitant; so that it has been conjectured to proceed from some spasm on the vitals. Here therefore the nervous cordial medicines are indicated, and blisters to the thighs, legs, or arms. Dr Huxham commonly used the following bolus and saline draught.

R. Pulv. contrayerv. comp. gr. xv.
Croc. Angl. gr. iij.
Confect. Ralegh. ℈j.
Syr. Croci q. s. M. *f. Bolus.*

R. Sal. C. C. ℈ss.
Succ. limon. ℥iij.
Aq. alexit. simpl. ℥iss. M. *Peracta effervescentia, adde Sp. lavend. c. Syr. croc.* ana ℥iss. *M. f. Haust.*

If great tremors and subsultus tendinum came on, he substituted half a scruple of musk instead of the contrayerva in the bolus, with advantage. One or other of these, or similar prescriptions, are to be taken every fifth, sixth, or eighth hour, and a temperate cordial julep may be now and then given out of thin wine or cyder whey, or, which is in many cases better, out of mustard-whey; which last is by no means a contemptible medicine. The saline draught made as above, is much more apt to pass through the pores of the skin than when made with salt of wormwood, which rather moves through the urinary passages.

The above-mentioned difficulty of breathing, anxiety, and oppression, many times precede a miliary eruption, which often appears on the seventh, ninth, or eleventh day of the fever, and sometimes later. Indeed great anxiety and oppression on the præcordia always precede pustular eruptions of any kind in all sorts of fevers. This eruption should be promoted by soft easy cordials and proper diluents; to which should be sometimes added some gentle aromatics. These tend to calm the universal uneasiness commonly complained of, and also very effectually promote a diaphoresis, or breathing kindly sweats, with which the miliary eruptions freely and easily advance. But however advantageous these commonly are, profuse sweats are seldom or never so, even though attended with a very large eruption. Two or three crops of these miliary pustules have been known to succeed one another, following profuse sweats, not only without advantage, but with great detriment to the patients, as they were thereby reduced to an extreme degree of weakness; so that they may justly be reckoned symptomatical rather than any thing else, and the consequent eruption is often merely the symptom of a symptom; for the miliary glands of the skin appear very turgid, and mimic a rash, after profuse sweating, even in the most healthy.

In these profuse colliquative sweatings a little generous red wine (diluted somewhat, if necessary may be given with the greatest advantage; as it presently moderates the sweats, supports the patient, and keeps up the miliary papulæ if they happen to attend. Towards the decline of the fever also, where the sweats are abundant and weakening, small doses of the tincture of the bark with saffron and snake-root were given with the greatest advantage, frequently interposing a dose of rhubarb to carry off the putrid colluvies in the first passages; which withal makes the remissions or intermissions that often happen in the decline of nervous diseases more distinct and manifest, and gives a fairer opportunity of throwing in the bark; for in the proper exhibition of this medicine we are to place our chief hope of curing both the nervous and putrid malignant fevers. Typhus.

Defcription. This difeafe has been fuppofed to differ from the former in degree only; and there are many circumftances which would lead us to conclude, that both frequently originate from a contagion precifely of the fame nature. In the fame manner we fee, during different feafons, and in different circumftances, various degrees of malignity in fmall-pox. Though every inftance of the difeafe depends on the introduction of a peculiar and fpecific contagion into the body, yet this contagion in particular epidemics evidently poffeffes peculiar malignancy. The fame is probably the cafe with the typhoid fever: But whether this obfervation be well founded or not, there cannot be a doubt that the typhus gravior or putrid fever is a difeafe of the moft dangerous nature, as, befides the extreme debility of the nervous fyftem, there is a rapid tendency of the fluids to putrefaction, which fometimes cuts off the patient in a few days, nay, in the warm climates, in 12 or 14 hours; or if the patient recovers, he is for a long time, even in this country, in an exceedingly weak ftate, and requires many weeks to recover his former health.

The putrid fevers, according to Huxham, make their attack with much more violence than the flow nervous ones; the rigors are fometimes very great, though fometimes fcarce felt; the heats much fharper and permanent; yet, at firft, fudden, tranfient, and remittent: the pulfe more tenfe and hard, but commonly quick and fmall; though fometimes flow, and feemingly regular for a time, and then fluttering and unequal. The head-ach, naufea, and vomiting, are much more confiderable even from the beginning. Sometimes a fevere fixed pain is felt in one or both temples, or over one or both eye-brows; frequently in the bottom of the orbits of the eyes. The eyes always appear very dull, heavy, yellowifh, and very often a little inflamed. The countenance feems bloated, and more dead-coloured than ufual. Commonly the temporal arteries throb much, and a tinnitus aurium is very troublefome: a ftrong vibration alfo of the carotid arteries frequently takes place in the advance of the fever, though the pulfe at the wrift may be fmall, nay even flow: this is a certain fign of an impending delirium, and generally proceeds from fome confiderable obftructions in the brain.

Typhus.

The proftration of fpirits, weaknefs, and faintnefs, are often furprifingly great and fudden, though no inordinate evacuation happens; and this too fometimes when the pulfe feems tolerably ftrong. The refpiration is moft commonly laborious, and interrupted with a kind of fighing or fobbing, and the breath is hot and offenfive.

Few or none of thefe fevers are without a fort of lumbago, or pain in the back and loins; always an univerfal wearinefs or forenefs is felt, and often much pain in the limbs. Sometimes a great heat, load, and pain, affect the pit of the ftomach, with perpetual vomiting of porraceous or black choler, and a moft troublefome fingultus; the matter difcharged is frequently of a very naufeous fmell. The tongue, though only white at the beginning, grows daily more dark and dry; fometimes of a fhining livid colour, with a kind of dark bubble at top; fometimes exceeding black; and fo continues for many days together; nor is the tinct to be got off many times for feveral days, even after a favourable crifis: at the height of the difeafe, it generally becomes very dry, ftiff, and black, or of a dark pomegranate colour. Hence the fpeech is very inarticulate, and fcarce intelligible. The thirft in the increafe of the fever is commonly very great, fometimes unquenchable; and yet no kind of drink pleafes, but all feem bitter and mawkifh; at other times, however, no thirft is complained of, tho' the mouth and tongue are exceedingly foul and dry; this is always a dangerous fymptom, and ends in a frenzy or coma. The lips and teeth, efpecially near the height, are furred up with a very black tenacious fordes. At the onfet of the fever, the urine is often crude, pale, and vapid, but grows much higher-coloured in the advance, and frequently refembles a ftrong lixivium, or citrine urine, tinged with a fmall quantity of blood; it is without the leaft fediment or cloud, and fo continues for many days together: by degrees it grows darker, like dead ftrong high-coloured beer, and fmells very rank and offenfive. In petechial fevers, the urine hath often been feen almoft black and very *fetid.* The ftools, efpecially near the height, or in the decline of the fever, are for the moft part intolerably fetid, green, livid, or black, frequently with fevere gripes and blood. When they are more yellow or brown, the lefs the danger; but the higheft when they run off infenfibly, whatever their colour may be. It is likewife a very bad fymptom when the belly continues tenfe, fwollen, and hard, after profufe ftools; for this is generally the confequence of an inflammation or mortification of the inteftines. A gentle diarrhœa is often very beneficial, and fometimes feems to be the only way which nature takes to carry off the morbific matter.

Some-

Febres Typhus.

Sometimes black, livid, dun, or greenish spots appear, which always indicate a high degree of malignity; however, the more florid the spots are, the less danger is to be feared. It is also a good sign when the black or violet petechiæ become of a brighter colour. The large, black, or livid spots, are almost always attended with profuse hæmorrhagies; and the small, dusky, brown spots, like freckles, are not much less dangerous than the livid or black; though they are seldom accompanied with fluxes of blood: excessively profuse, cold, clammy sweats are often concomitant, by which also they sometimes vanish, though without any advantage to the patient. The eruption of the petechiæ is uncertain; sometimes they appear on the fourth or fifth day, though sometimes not till the eleventh, or even later. The *vibices*, or large dark, blue, or greenish marks, seldom appear till very near the fatal period. Frequently also we meet with an efflorescence like the measles in malignant fevers, but of a much more dull and livid hue; in which the skin, especially on the breast, appears as it were marbled or variegated. This in general is an ill symptom, and is often attended with fatal consequences.

Sometimes about the 11th or 14th day, on the occurrence of profuse sweats, the petechiæ disappear, and vast quantities of white miliary pustules break out. This is seldom found of any considerableadvantage; but an itching, smarting, red rash, commonly gives great relief; and so do the large, fretting, watery bladders, which many times rise upon the back, breast, shoulders, &c. A scabby eruption likewise about the lips and nose is certainly one of the salutary symptoms; and the more hot and angry it is, so much the better. But of much more uncertain and dangerous event are the brown-coloured aphthæ; nor are those that are exceeding white and thick, like lard, of a very promising aspect. They are soon succeeded by great difficulty of swallowing, pain and ulceration of the fauces, œsophagus, &c. and with an incessant singultus: the whole *primæ viæ* become at last affected; a bloody dysentery comes on, followed by a sphacelation of the intestines; as is evident from the black, fanious, and bloody stools, extremely fetid and infectious. Vibices, or large, black, and bluish marks resembling bruises, are frequently seen towards the close of the fever; and, when attended with lividity and coldness of the extremities, are certain tokens of approaching death. In some cases, the blackness hath been known to reach almost to the elbows, and the hands have been dead-cold for a day or two before the death of the patient.

Such are the general appearances of the putrid malignant fever in this country, among those who enjoy a free air, and are not crowded together, or exposed to the causes of infection: but in jails, hospitals, or other places where the sick are crowded, and in some measure deprived of the benefit of the free air, the symptoms are, if possible, more terrible. Sir John Pringle, who had many opportunities of observing it, tells us, that the jail or hospital fever, in the beginning, is not easy to be distinguished from a common fever. The first symptoms are slight interchanges of heat and cold, a trembling of the hands, sometimes a sense of numbness in the arms, weakness of the limbs, loss of appetite; and the disorder increasing towards night, the body grows hot, the sleep is interrupted, and not refreshing. With these symptoms, for the most part, there is some pain or confusion in the head; the pulse at first is a little quicker than natural, and the patients find themselves too much indisposed to go about business, though too well to be wholly confined. When the fever advances, the above-mentioned symptoms are in a higher degree; and in particular the patient complains of a lassitude, nausea, pains in his back, a more constant pain and confusion in his head, attended with an uncommon dejection of spirits. At this time the pulse is never sunk, but beats quick, and often varies in the same day both as to strength and fulness. It is little affected by bleeding once, if a moderate quantity of blood be taken away; but if the evacuation be large, and especially if it be repeated, to answer a false indication of inflammation, the pulse, increasing in frequency, is apt to sink in force, and often irrecoverably, whilst the patient becomes delirious. But withal we must observe, that, in every case, independent of evacuations, the pulse sooner or later sinks, and then gives certain intelligence of the nature of the disease. The appearance of the blood is various; for though it be commonly little altered, yet sometimes it will be sizy, not only on the first attack, but after the fever is formed. The worst appearance is when the crassamentum is dissolved; though this does not happen till the advanced state of the fever: though indeed this seems not easy to be ascertained, as blood has been so seldom taken away at that time. The urine is also various. Sometimes it is of a reddish or flame colour, which it preserves a long time; but it is oftener pale, and changes from time to time in colour as well as crudity, being sometimes clear, sometimes clouded: towards the end, upon a favourable crisis, it becomes thick, but does not always deposit a sediment. If the sick lie warm, and have had no preceding flux, the belly is generally bound; but when they lie cold, as they often do in field-hospitals, the pores of the skin being shut, a diarrhœa is a common symptom, but is not critical. In the worst cases, a flux appears in the last stage; then the stools are involuntary, colliquative, ichorous, or bloody, and have a cadaverous smell; the effects of a mortification of the bowels, and the signs of approaching death. When the hospitals are filled with dysenteric patients, some of the nurses will be infected with the flux only, and others with this fever, ending in these bloody and gangrenous stools.

In the beginning the heat is moderate; and even in the advanced state, on first touching the skin, it seems inconsiderable; but upon feeling the pulse for some time, we are sensible of an uncommon ardour (the *calor mordicans*, as it has been called), leaving an unpleasant sensation on the fingers for a few minutes after. A day or two before death, if care be not taken, the extremities become cold, and the pulse is then hardly to be felt. The skin is generally dry and parched; though sometimes there are longer or shorter sweats, especially in the beginning. Such as are produced by medicine are of no use, except on the first attack, at which time they will often remove the fever; and natural sweats are never critical till the distemper begins to decline. These last are rarely profuse,

Febres

profuse, but gentle, continued, and equally diffused over the body: sometimes the disease will terminate by an almost imperceptible moisture of the skin; the sweats are usually fetid, and offensive even to the patient himself.

The tongue is commonly dry; and, without constant care of the nurse, becomes hard and brown, with deep chops: but this symptom is common to most fevers. At other times, though rarely, the tongue is soft and moist to the last, but with a mixture of a greenish or yellowish colour. The thirst is sometimes great, but more frequently moderate. In the advanced state, the breath is offensive, and a blackish furring gathers about the roots of the teeth.

Some are never delirious, but all lie under a stupor or confusion; few retain their senses till death: many lose them early, and from two causes; either from immoderate bleeding, or the premature use of warm and spirituous medicines. They rarely sleep; and, unless delirious, have more of a dejected and thoughtful look than what is commonly seen in other fevers. The face is late in acquiring either a ghastly or a very morbid appearance; yet the eyes are always muddy, and generally the white is of a reddish cast as if inflamed. The confusion of the head generally rises to a delirium, especially at night; but, unless by an unseasonable hot regimen, it seldom turns to rage, or to those high flights of imagination common in other fevers. When the delirium comes to that height, the face is flushed, the eyes red, the voice is quick, and the patient struggles to get up But when that symptom is owing to large evacuations, or only to the advanced state of the disease, the face appears meagre; the eye-lids in slumbers are only half shut; and the voice, which is commonly low and slow, sinks to a degree scarce to be heard. From the beginning there is generally a great dejection and failure of strength. A tremor of the hands is more common than a starting of the tendons; or if the subsultus occurs, it is in a lesser degree than in many other fevers. In every stage of the disease, as the pulse sinks, the delirium and tremor increase; and in proportion as the pulse rises, the head and spirits are relieved. Sometimes in the beginning, but for the most part in the advanced state, the patient grows dull of hearing, and at last almost deaf. When the fever is protracted, with a slow and low voice, the sick have a particular craving for something cordial, and nothing is so cordial or so acceptable as wine. They long for no food, yet willingly take a little panada if wine be added. But such as are delirious, with a quick voice, wild looks, a subsultus tendinum, or violent actions, though their pulse be sunk, yet bear neither hot medicines, wine, nor the common cordials.

Vomiting, and complaints of a load and sickness at stomach, though usual symptoms, are not essential to the disease; nor are pleuritic stitches, difficulty in breathing, or flying pains, to be referred so much to it as to the constitution of the patient, or to a preceding cold.

A petechial efflorescence is a frequent, though not an inseparable, attendant of this fever. It sometimes appears of a brighter or paler red, at other times of a livid colour, but never rises above the skin. The spots are small; but generally so confluent, that at a little distance the skin appears only somewhat redder than ordinary, as if the colour was uniform; but upon a nearer inspection there are interstices seen. For the most part this eruption is so little conspicuous, that unless it be looked for attentively, it may escape notice. The spots appear thickest on the back and breast, less on the legs and arms, and Sir John Pringle never remembers to have seen any on the face. As to the time of their appearance, he agrees entirely with Dr Huxham. These spots are never critical, nor are they reckoned among the mortal symptoms; but only concur with other signs to ascertain the nature of the disease. The nearer they approach to purple, the more they are to be dreaded. In a few cases, instead of spots, purple streaks and blotches were observed. Sometimes the petechiæ did not appear till after death; and there was one case in which, after bleeding, the petechiæ were seen only on the arm below the ligature, and nowhere else on the skin.

Typhus.

The hospital fever, though accounted one of the continued kind, yet has generally some exacerbation at night, with a remission and often partial sweats in the day; and after a long continuance it is apt to change into a hectic, or an intermitting form. The length of the disease is uncertain. Sometimes it terminated either in death or recovery, in seven days after the patient took to his bed; but in the hospitals it generally continued from 14 to 20, and some died or recovered after four weeks. From the time of the sinking of the pulse until death or a favourable crisis, there is perhaps less change to be seen from day to day in this than in most other fevers. When its course is long, it sometimes terminates in suppurations of the parotid or axillary glands; and when these do not appear, it is probable that the fever is kept up by the formation of some internal abscess. The parotid glands themselves do not suppurate, but only some of the lymphatic glands that lie over them. Sir John Pringle observed one instance of a swelling of this kind on both sides, without any previous indisposition, when the person, not suspecting the cause, and applying discutient cataplasms, was, upon the tumor subsiding, seized with the hospital-fever. Many patients after the crisis of this fever complain of a pain in the limbs and want of rest; and almost all of them mention great weakness, confusion in their head, vertigo, and a noise in their ears.

Ten of the bodies of those who died of this distemper in Houghton's regiment were opened. In some, all the cavities were examined; in others, only the brain or the bowels. In some of them, the brain appeared to be suppurated. The first of this kind Sir John Pringle met with at Ghent; but the man being brought into the hospital from the barracks no earlier than two days before he died, he could only conjecture from the symptoms and the imperfect accounts he had of him, that his death was owing to a fever of this kind, after lingering near a month in it. About three ounces of purulent matter were found in the ventricles of the brain, and the whole cortical and medullary substance was uncommonly flaccid and tender; nay, some of the same kind of matter was found in the substance of the upper part of the cerebellum: yet this person, with some stupor and deafness, had his senses till the night before he died; so far, at least, that he answered distinctly when roused and spoken to; but about that time

Febres — time the muscles of his face began to be convulsed. Of two other instances of men who undoubtedly died of this fever, in one the cerebrum was suppurated, in the other the cerebellum. In the former case, the patient was under a stupor, with deafness from the beginning; but was never delirious, nor altogether insensible. His pulse sunk early; and about ten days before his death his head began to swell, and continued very large till within two days before he died, when it subsided a little. For several days before his end, he would taste nothing but cold water, and during his illness he lay constantly upon one side. The head being opened, an abscess as large as an egg was found in the substance of the fore-part of the right hemisphere of the brain, full of thin matter like whey. At that time five more, ill of the same fever, had the like swelling of their heads, but recovered. In the other case, the abscess in the cerebellum was about the size of a small pigeon's egg, and contained also a thin ichorous matter: nor had this patient ever been so thoroughly insensible as not to answer reasonably when spoken to. Two days before he died his urine turned pale.

These suppurations, however, were not constant; for another who died about the same time, and had been ill about the same number of days with the like symptoms, the pale water excepted, had no abscess either in the brain or cerebellum. And two were opened afterwards, in whom the cortical substance of the brain had an inflammatory appearance, but no suppuration In one of them the large intestines were corrupted: that man went off with a looseness; and just before he died, an ichorous matter was discharged from his nose. In the military hospital at Ipswich, one who unexpectedly died of this fever after having been seemingly in a fair way of recovery, had no suppuration in his brain; but in another, who died after an abscess in both orbits, the brain was found flaccid, and about two ounces of a thin serum in the ventricles.

Causes of, and persons subject to, this disorder. The cause of this fever, as well as that of the slow nervous fever, is an infection or contagion from some diseased animal-body, or from corrupted vegetables; and therefore is very little, if at all, different from those pestilential disorders which have arisen after battles, when great numbers of dead bodies were allowed to lie above ground, and infect the air with their effluvia. This is confirmed by an observation of Forestus, who was eye-witness to a distemper of this kind (which indeed he calls a *plague*) owing to the same cause, attended with buboes and a high degree of contagion. The same author also gives an account of a malignant fever breaking out at Egmont in North-Holland, occasioned by the rotting of a whale which had been left on the shore. We have a like observation of a fever affecting the crew of a French ship, by the putrefaction of some cattle which they had killed on the island of Nevis in the West Indies. These men were seized with a pain in their head and loins, great weakness, and a disorder of the stomach, accompanied with fever. Some had carbuncles; and on others purple spots appeared after death.

Galen assigns two causes for pestilential fevers: 1. The great heat of the weather, when the humours happen to be in a more putrescent state than usual. 2. A putrid state of the air, arising either from a multitude of dead bodies left unburied, as after a battle, or from the evaporation of corrupted lakes and marshes.

Typhus — One of the most remarkable diseases incident to an army is related by Diodorus, as breaking out among the Carthaginians at the siege of Syracuse. That author not only relates some of its most distinguishing symptoms, but reasons well about its cause. He observes, that pains in the back and eruptions (φλυκταιναι) were common; that some had bloody stools; that others were seized with a delirium, so as to run about and beat all that came in their way; that the physicians knew no cure; and that it was the more fatal as the sick were abandoned by every body on account of the contagion. As to the cause, the author takes notice of the multitude of people confined within a narrow compass; of the situation of the camp in a low and wet ground; of the scorching heats in the middle of the day, succeeded by the cold and damp air from the marshes in the night-time; to these he adds, the putrid steams arising first from the marshes, and afterwards from the bodies of those who lay unburied.—This distemper seems to have been a compound of the marsh and pestilential fever.

Forestus remarks, that, from the putrefaction of the water only, the city of Delft, where he practised, was scarce ten years together free from the plague or some pestilential distemper. He adds, that the magistrates, upon his representation of the cause, erected a wind-mill for moving and refreshing the water. At that time Holland was much more subject to inundations and the stagnation of water than at present. In 1694, a fever broke out at Rochfort in France, which, on account of the uncommon symptoms and great mortality, was at first believed to be the plague. But M. Chirac, who was sent by the court to inquire into its nature, found the cause to arise from some marshes that had been made by an inundation of the sea; and observed, that the corrupted steams, which smelled like gun-powder, were carried to the town by the wind, which had long blown from that quarter. About two-thirds of those who were taken ill died. In such as were opened, the brain was found either inflamed or loaded with blood; the fibres of the body were uncommonly tender; and the bowels had either suppurated or were mortified.

It is needless to mention more instances of pestilential fevers being brought on by the steams of corrupted substances, whether animal or vegetable. In general it may be remarked, that the putrefaction of these substances in a dry air is more apt to bring on a fever of the continued form; but in a moist air hath a greater tendency to produce remitting fevers. But it must also be observed, that, even in cases where the most malignant fevers prevail, all persons are not equally disposed to receive the infection, though equally exposed to it with others. Some, through mere vigour of body and mind, cannot be infected with the most contagious diseases; while, on the other hand, those whose bodies are debilitated by a former disease, by study, low diet, or want, or those who have laboured under any of the depressing passions of the mind for some time, seldom or never escape. Men, therefore, who have been weakened by accidents (as those who have undergone a mercurial salivation) are very apt to fall into this distemper. Those who are taken into crowded hospitals, ill of the small-pox,

Febres Typhus.

however good the fort may be, fall readily into this fever, and run a greater rifk of dying of it than others. The fecond fever is attended with double danger, feeing the patient has been fo much weakened by the firft. A fure fign of the corruption of the air in an hofpital is when many of the nurfes fall fick.

Prognofis. In thefe fevers we cannot draw a prognoftic from any fymptom by itfelf: and perhaps all of them together are more fallible than in others. Generally the following are good: To have little delirium; the ftrength little impaired; turbid urine in the decline of the difeafe; and at that time a gentle fweat or moifture diffufed over the body, or even the fkin foft and the tongue moift; or to have fome loofe ftools fucceeded by a diaphorefis; the pulfe to rife by wine or cordials, with an abatement of the ftupor, tremor, and other affections of the brain. Deafnefs is rather a good fign. A fediment in the urine, without other changes to the better, is no fure fign of recovery; and fome have recovered in whofe water there was no fediment.—The bad figns are, a fubfultus tendinum; the eyes much inflamed and ftaring; the fpeech quick, and the found of the voice altered; a high delirium; perpetual watchfulnefs; conftant ficknefs at the ftomach, and vomitings; frequent ftools, with a finking pulfe, and the diforder of the head increafed; coldnefs of the extremities, and a tremulous motion of the tongue. It is obferved to be among the worft figns when the patient complains of blindnefs; when he fwallows with difficulty, or cannot put out his tongue when defired to do it; when he can lie on his back only, and pulls up his knees; or when infenfible he endeavours to uncover his breaft, or makes frequent attempts to get out of bed without affigning any reafon. If to any of thefe are added ichorous, cadaverous, and involuntary ftools, it is a fign of a mortification of the bowels and approaching death. It will not feem ftrange to find moft of thefe prognoftics common to the advanced ftate of other fevers, when we confider, that from whatever caufe fevers begin, by a long continuance the humours are corrupted, and the brain and nerves affected much in the fame manner as in thofe which arife from infection.

Prevention and cure. As diftempers of the putrid kind never arife without an infection received from fome quarter or other, the methods of prevention muft evidently be reduced to two general heads. 1. To avoid receiving the infection into the body; and, 2. To put the body in fuch a fituation as may enable it to refift the infection when received. On both thefe methods fcarce any writer hath equalled Dr Lind of Haflar, whofe opinions and directions therefore we fhall give pretty fully.

As putrid difeafes are very common and violent in the hot countries, it is very neceffary for Europeans who vifit thefe climates to be well informed, in the firft place, of the figns of an unhealthy country, that they may be upon their guard as foon as they enter any foreign region. Thefe figns are by our author enumerated as follows.

1. A fudden and great alteration in the air, at funfet, from intolerable heat to a chilling cold. This is perceived as foon as the fun is down, and is for the moft part accompanied with a very heavy dew: it fhows an unhealthy fwampy foil, the nature of which is fuch, that no fooner the fun-beams are withdrawn, than the vapours emitted from it render the air damp, raw, and chilling, in the moft fultry climates; fo that even under the equator, in fome unhealthy places, the night-air is very cold to an European conftitution.

2. Thick noifome fogs, chiefly after funfet, arifing from the valleys, and particularly from the mud, flime, or other impurities. In hot countries, the fmell of thefe fogs may be compared to that of a new-cleaned ditch. Difeafes therefore, arifing from this caufe, generally take place in the night, or before fun rifing.

3. Numerous fwarms of flies, gnats, and other infects which attend ftagnated air and unhealthy places covered with wood.

4. When all butchers meat foon corrupts, and in a few hours becomes full of maggots; when metals are quickly corroded on being expofed to the air; and when a corpfe becomes intolerably offenfive in lefs than fix hours; thefe are proofs of a clofe, hot, and unwholefome country. And in fuch places, during exceffive heats and great calms, it is not altogether uncommon for Europeans, efpecially fuch as are of a grofs habit of body, to be feized at once with the moft alarming and fatal fymptoms of what is called the *yellow fever*, without even any previous complaint of ficknefs or other fymptoms of the difeafe. There has firft been perceived an uneafy itching fenfation, commonly in the legs; and upon pulling down the ftockings, ftreams of thin diffolved blood followed, a ghaftly yellow colour quickly diffufed itfelf over the whole body, and the patient has been carried off in lefs than forty-eight hours.

5. A fort of fandy foil, commonly a fmall, loofe, white fand, as that at Penfacola, Whydah, and the ifland of Bonavifta, which is found by experience to be injurious to health. The peftiferous vapour arifing, during the fummer months and in the heat of the day, from fuch a fandy foil, is beft characterifed by its effects in the extenfive defarts of Afia and Africa. It there conftitutes what is called the *Samiel-wind*; a blaft which, in the parched defart, proves inftantly fatal both to man and beaft: but when it paffes over a foil well covered with grafs and vegetables, has its effects greatly mitigated; it is, however, even then, productive of ficknefs: thus the foutherly winds, while they blow from the defarts of Libya during the fummer, at Algiers, Tunis, and Tripoli, produce an unhealthy feafon; and at Madras the winds, which, in the months of April and May, pafs over a large tract of fand, are always hot, difagreeable, and unwholefome.

During thefe land-winds, fudden gufts of a more hot and fuffocating nature are often obferved to come from thefe fands once or twice, or even more frequently, in a day, which feem to be this vapour in a purer form. Thefe gufts pafs very quickly, and affect perfons who happen to ftand with their faces towards them in the fame manner as the hot air which iffues from a burning furnace, or from a heated oven, and obliges them immediately to turn away from it in order to recover breath. The effect of this hot fuffocating blaft or vapour on the human body, even when mitigated by paffing through a moift atmofphere, is the fame as that of intenfe cold; it fhuts up every pore of the fkin, and entirely ftops the perfpiration of fuch

as

Febres. as are exposed to it. These blasts come only in the day-time, and always from the desarts. Water is the only known corrector or antidote against them: hence, coarse thick clothes, kept constantly wet, and hung up at the windows or doors, greatly mitigate their violence. A house so built as to have no windows or doors towards the desarts, is an excellent protection against their pernicious effects. The hot land-winds constantly blow at Madras and other places on the coast of Coromandel, at that season, from midnight till noon: the sea-breezes then begin, which relieve the difficulty in breathing, and the obstructed perspiration which the former occasioned.

That the heat of these land-winds, as also of the sudden gusts which accompany them, proceed from large tracts of sand heated by the sun, is evident from the increased heat and suffocating quality of those winds, in proportion as the day advances, and as the heat of the season is increased. The opposite winds, blowing from each side of the Balagate-mountains, are a farther proof of this. These mountains, running from north to south, divide the hither Peninsula of India into two unequal parts, and separate what is called the *Malabar* from the *Coromandel* coast. To the former they are very near, but at a great distance from the latter. The winds blowing from those hills are on the Malabar-coast always remarkably cool; but on the coast of Coromandel, in the months of April, May, June, and July, are extremely hot and suffocating, as they pass over a large tract of intermediate sand, heated during those months by an almost vertical sun. Hence the Malabar coast is always covered with an agreeable verdure; whereas the Coromandel coast, during the continuance of these hot winds, seems a barren wilderness, nothing appearing green except the trees. On the contrary, the winds that pass over these sands, after being wet with the rains, are the coldest which blow at Madras. Bottles of liquor inclosed in bags of coarse cloth, kept constantly wet, and suspended in the shade, where those hot winds may have access to them, become as cold as if they had been immersed in a solution of nitre; an effect owing undoubtedly to the constant evaporation of water from the surface.

It is an observation of the natives on the coast of Coromandel, which is confirmed by the experience of many Europeans, that the longer the hot land-winds blow, the healthier are the ensuing months; these winds, as they express it, purifying the air. Are not the winds therefore the cause why the air on the coast of Coromandel, except during their continuance, is more healthy than in other parts of India where these winds do not blow? Does not this also suggest a very probable reason, why the plague in Egypt generally ceases in the beginning of June; the periodical hot winds which come from the desarts of Nubia and Ethiopia having then rendered the air of Egypt pure and wholesome? Many have ascribed that effect to the north-winds; as the plague not only ceases when they blow, but all infected goods, household-furniture, and wearing apparel, are then said to become entirely free from the contagion: these, however, cannot be the cause, as the most destructive plague is abated in its violence, if not wholly eradicated, before they set in. With equal propriety we may reject the opinion that the overflowing of the Nile is productive Typhus. of that salutary effect, as the plague generally ceases before the increase of that river is perceptible.

Thus the plague, the greatest calamity which can afflict mankind, seems to be destroyed by those hot winds, which are otherwise so pernicious to animal and vegetable life. And although, during the continuance of these winds, the most fruitful fields wear the aspect of a parched desart, yet no sooner the rains fall, but vegetation is restored, the plants revive, and a beautiful verdure is again spread over the face of the country.

Having thus given an account of the signs of an unhealthy country, Dr Lind next proceeds to mention such employments as are particularly dangerous to Europeans on their first arrival. One of these is the cutting down of trees, shrubs, &c. or *clearing the ground*, as it is called. Of the unhealthiness of this employment he gives two instances. At the conclusion of the late peace, the captain of a ship of war went on shore at the island of Dominica, with 12 of his men, to cut down the wood, and to clear a piece of ground which he intended to have purchased: but, in a few days, sickness obliged him to desist from this dangerous work; the captain and 11 of his men being seized with violent fevers, which terminated in obstinate intermittents, and of which several died. The survivors suffered so much in their constitutions, that, even after they came to England, the return of an east-wind was apt to bring on a violent fit of the ague. The Ludlow-Castle, a ship of war of 40 guns, in a voyage to the coast of Guinea, also lost 25 of her men at Sierra Leona, who were employed in cutting down wood for the ship. This is an occupation which has often proved destructive to Europeans in those climates, and in which they ought never to be employed, especially during the rainy season; there being numberless instances of white persons, when cutting down the woods at that season, who have been taken ill in the morning, and dead before night.

Another evil, less known, and less suspected, but no less dangerous, is the sending of Europeans in open boats after sunset, where the soil is swampy, or where there are great night fogs. The single duty alone of fetching fresh-killed butchers meat at night for the use of our ships companies in the East and West Indies, has destroyed every year several thousand seamen. In those parts of the world, butchers meat must be brought on board at night immediately after it is killed, otherwise it will not be fit for use the next day; but a contract made with the natives to send it on board at that time, which might be done for a trifling sum, would be the means of preserving many useful lives. During the sickly season at Batavia, a boat belonging to the Medway, which attended on shore every night, was three times successively manned, not one having survived that service. They were all taken ill in the night, when on shore, or when returning on board; so that at length the officers were obliged to employ none but the natives on that business. Great numbers of men have perished from being employed in this manner at Bengal, where the European ships often anchor in the most unhealthy spots of the river; and even when the great night-fogs arise, after the rainy season, the men are often obliged to perform such night services in

Febres Typhus.

boats. Now since it is so dangerous for Europeans in unhealthy countries, particularly during a season of sickness, to be exposed in an open boat to the foggy night-air, it must appear, that sending them unsheltered, in open boats, far up rivers, in unhealthy southern climates, for the sake of wood, water, trade, or other purposes, must be attended with the most destructive and fatal consequences.

Burying the dead in swampy countries is another occupation which has proved fatal to many, and which ought to be entrusted to negroes or the natives of the country. The effluvia from the ground when newly opened, whether from graves or ditches, are far more dangerous than from the same swampy soil when the surface is undisturbed; nay, in some places, it has been found almost certain death for an European to dig a grave, unless long seasoned to the country. In such a place, the attendance of friends at funerals ought to be dispensed with.

In all cases where it is practicable, the ships which visit these unhealthy countries should anchor at as great a distance as possible from shore; or if obliged to anchor near marshy grounds or swamps, especially during summer or in hot weather, and when the wind blows directly from thence, the gun-ports which would admit the noxious land-breeze ought to be kept shut, especially at night. Or if the ship rides with her head to the wind, a thick sail ought to be put upon the fore-mast, along which the smoke from the fire-place might be made constantly to play and ascend. If the sail should occasion a little smoke between decks, this inconvenience will be sufficiently compensated by its keeping off the direct stream of the swampy shore effluvia; which now being obliged to form a curve before they reach the more distant parts of the vessel, must needs be greatly diverted and scattered.

The best preservative against the mischievous impressions of a putrid fog, or of a marshy exhalation, is a close, sheltered, and covered place; such as the lower apartments in a ship, or a house in which there are no doors or windows facing the swamps. If in such places a fire be kept either at the doors and other inlets to a house, or in the chambers, as is practised in some unhealthy countries during the rainy or foggy season, it will prove an excellent and effectual protection against the injuries of a bad air. On board of ships also fires may be made at the hatchways; and of the good effects of this we have the following example. When the Edgar, a ship of war of 60 guns, was upon the coast of Guinea in the year 1768, her men were very sickly, and many of them died: however it was observed, that in a sloop of war, which was constantly in company with her, few were taken ill, and not one died during the whole voyage. This could be ascribed to no other cause, but that in the sloop the fire-place for cooking victuals was on the same level with the deck where the men lay; and every morning when the fire was lighted, especially when there was but little wind, the smoke from the cook-room spread itself all over the ship, and particularly over those parts where the men lay; but from the construction of the fire-place of the Edgar, no smoke from it ever came between her decks.

Persons on board any ship whatever, are much more safe, and their situation is much preferable to that of those who make distant inland excursions in small boats upon the rivers, and who are for the most part ignorant of the cause of those maladies which destroy them. The intolerable heat at noon often obliges such persons to go in a manner half-naked; while a free and plentiful perspiration issues from every pore. A near approach to putrid swamps at this time is apt to produce an immediate sickness, vomiting, and afterwards a low nervous or malignant fever. But if they happen to pass them at night, or lie near them in an open boat, the air from those swamps is perceived to be quite chill and cold; in so much that warm thick clothing becomes absolutely requisite to guard the body against the impressions of so great an alteration in the air, and against its cold and inclement quality: for the effects of it then, even on the most healthy and vigorous constitution, is frequently a chilling cold fit of an ague, terminating in a fever with delirium, bilious vomitings, a flux, or even death itself.

But where such exposure becomes unavoidable, the only method is then to defend the body as much as possible against the pernicious miasmata with which the air abounds.—All those who are employed in cutting down woods, or in other laborious and dangerous services in hot climates, during the heat of the day ought to have their heads covered with a bladder dipt in vinegar, and to wash their mouths often with the same liquor; never to swallow their spittle, but rather to chew a little rhubarb or some other bitter, and spit it out frequently; to stop their nostrils with a small bit of linen or tow dipped in camphorated vinegar; and to infuse some bark, garlic, and rhubarb, in brandy, of which a dram is to be taken, either by itself or diluted with water morning and evening.

In the evening before sunset they should leave off work, and not return to their labour in the morning till the sun has dispersed the unwholesome dews and vapours. Those who must of necessity remain on shore, and sleep in dangerous places, must take care not to sleep upon the ground exposed to the dews, but in hammocks in a close tent, standing upon a dry sand, gravel, or chalk, near the sea shore, and where there is no subterraneous water for at least four feet below the surface of the ground. The door of this tent should be made to open towards the sea; and the back part of it, which receives the land breeze, must be well secured by double canvas, or covered with branches of trees. But in such circumstances, a hut, when it can be procured, is preferable to a tent, especially if it be well thatched, so as to prove a defence both against the excessive heat of the sun by day, and the noxious dews which fall at night. Here the men may be enjoined to smoke tobacco. When the air is thick, moist, and chill, the earth being overspread with cold dew, a constant fire must be kept in and about the tent or hut, as the most excellent means of purifying such unwholesome air, and of preserving the health of those who either sleeping or waking are exposed to its influence. The centinels who guard the water-casks, ought likewise at such a time to have a fire burning near them. All old and forsaken habitations, natural caves and grottos in the earth, where the men may be induced to take up their abode, must before their admission be perfectly dried and purified

with

Fevers. with fufficient fires. Fire and fmoke are undoubtedly the great purifiers of all tainted and unwholefome air, and the moft excellent prefervatives againft its noxious influence. It is the cuftom of the negroes in Guinea, and alfo of fome Indians (who both fleep for the moft part on the ground), to have a fire, producing a little fmoke, conftantly burning in their huts where they fleep. This not only corrects the moifture of the night, but alfo, by occafioning more fmoke than heat, renders the damp from the earth lefs noxious; of which Dr Lind gives the following remarkable inftance. A Guinea fhip being up one of the rivers for the fake of trade, it was found to be very dangerous to fleep on fhore; without which their trade could not be fo conveniently carried on. Firft the captain, then the mate, and two or three of the feamen, were taken ill; each of them the morning after they had lain on fhore. By thefe accidents the men were greatly intimidated from lying afhore; till the furgeon boldly offered to try the experiment on himfelf. Next morning when he waked, he found himfelf feized, as the reft, with a giddinefs and pain in the head, &c. He immediately acquainted one of the negroes with his condition, who carried him to his hut, and fet him down in the fmoke of it; when his fhiverings and giddinefs foon left him. He then took a dram of the bark bitter; and found himfelf greatly relieved, efpecially by breathing fome time in the fmoke.—Thus inftructed by the negro, he ordered a large fire to dry the hut he flept in; and afterwards had every night a fmall fire fufficient to raife a gentle fmoke, without occafioning a troublefome heat: and by this means he and feveral others, ufing the fame precautions, flept many nights on fhore without any inconvenience.

Fire and fmoke indeed are found to be certain correctors, or rather deftroyers, of infection in all cafes, whether arifing from the noxious effluvia of marfhes, or from the contagion of difeafed bodies. Even thofe moft extraordinary and fatal damps called *harmattans*, are unable to refift the falutary effects of fmoke. In other cafes, Dr Lind remarks, that, under fome circumftances, the fource of an infection in a fick chamber or any other place, may be removed or deftroyed by accidental means, for which we cannot account, and which we often cannot afcertain. But it oftener happens, that it is very difficultly rooted out; and that exact cleanlinefs, with the benefit of a pure air, often proves infufficient to remove the evil. Smoke, however, has never been known to fail. It is not to be doubted, that, excepting the true plague, there has been an infection fully as peftilential and as mortal in fome fhips as in any other place whatever; yet it has never been heard, that any fhip, after having been carefully fmoked, did not immediately become healthy: and if afterwards they turned fickly, it was eafy to trace that ficknefs from other infected fhips, jails, and the like places.

There are three methods practifed for purifying veffels after the men have been removed out of them. The firft is by burning of tobacco. A quantity of tobacco is fpread on feveral fires, made with fuch old pieces of rope as are called *junk*. Thefe are difperfed into different places of the fhip, and their heat and fmoke afterwards clofely confined below for a confiderable time.—The fecond method is by charcoal fires ftrewed with brimftone. The heat and fteam of thefe burning materials muft alfo be long and clofe fhut up: but, although this fume, properly applied, has been found by experience to purify moft effectually tainted apartments, fhips, clothes, &c. yet there are fome kinds of vermin which it will not deftroy, particularly lice. The third method of purification is performed by the addition of arfenic to the materials of the fecond procefs, in the following manner. After carefully ftopping up all the openings and every fmall crevice of the fhip (as was alfo neceffary in the preceding proceffes), a number of iron pots, properly fecured, are to be placed in the *hold*, *orlope*, *gun-deck*, &c. Each of thefe are to contain a layer of charcoal at the bottom, then a layer of brimftone, and fo alternately three or four layers of each, upon which the arfenic is to be fprinkled, and on the top of it fome oakum dipped in tar is to be laid to ferve as a match. The men, upon fetting fire to the oakum, muft fpeedily leave the place, fhutting clofe the hatchway by which they came up.

Typhus.

From the known and experienced efficacy of thefe proceffes, it appears, that fire and fmoke are the moft powerful agents for annihilating infection; and, it may be prefumed, even the plague itfelf. This is in fome meafure agreeable to what we learn from the ancient records of phyfic. But the prepofterous ufe, or rather abufe, of fire on fuch occafions, has caufed its effects to be difregarded by fome, and to be fufpected of mifchief by others. The modern practice of burning large fires in the open air, in the ftreets, and about the walls of towns infected with the plague or other contagion, is founded on principles groundlefs and erroneous; and has therefore been found by experience not only unfuccefsful, but hurtful. But though this muft be allowed, it doth not thence by any means follow, that when once a houfe hath been infected, and the patients removed from it, the doors and windows at the fame time being fhut, that fuch fires will then prove hurtful; or that, by this method of purification, all the feeds of contagion will not be effectually deftroyed. Whenever, therefore, perfons die of a fpotted fever, a malignant fore throat, the fmall-pox, or any diftemper found to be communicable from the fick to others, the corpfe ought quickly after death to be removed into another room; that in which the perfon died fhould be well aired, by having the windows opened, till a charcoal-fire be kindled, with fome rolls of fulphur upon it; after which, both doors and windows fhould be kept fhut for a confiderable time, not lefs than eight or ten hours, till the room be thoroughly fmoked. In feveral fhips, where there are the faireft opportunities of trying and judging things of this nature, the contagion of the fmall-pox has been entirely ftopped by wood-fires, fprinkled with brimftone, kept burning and clofely confined in the infected place. In a word, a judicious and proper application of fire and fmoke is the beft means for the deftruction and utter extinction of the moft malignant fources of difeafe; and they are befides the greateft purifiers of all bad and tainted air.

Next to the fmoke of wood for purifying a tainted air, that of gun-powder is to be efteemed the beft; and it has this further good property, that it is entirely inoffenfive to the lungs The cafcarilla-bark, when burning, gives a moft agreeable fcent to the chamber of the fick; fo is at leaft an elegant prefervative, and may prevent

Febres prevent bad ſmells from taking effect. The ſteam of camphorated vinegar warmed, is ſtill more powerful for this purpoſe. But, beſides correcting the ill quality of the air, and purifying the chamber, another good effect is produced from ſuch ſteams and ſmoke as are inoffenſive to the lungs. As ſoon as the vapour becomes denſe, the nurſes and patients become deſirous of the admiſſion of freſh air by the door or windows. Now it is certain, that the air in the chambers of the ſick cannot be too often changed, provided the patient be well covered, and the curtains of his bed, if neceſſary, be drawn cloſe. No argument is ſo forcible to obviate the danger of foul air in a room or ward (occaſioned by the obſtinacy of nurſes or relations), as ordering it to be frequently fumigated or ſmoked: A practice more frequent in other countries than in this, but of great benefit to the ſick.

Laſtly, with regard to the method of purifying goods, moveables, clothes, &c. which are ſuppoſed to harbour infection, it muſt be obſerved, that the uſual cuſtom of only unpacking and expoſing ſuch materials to the open air, is in many inſtances inſufficient to deſtroy the latent ſeeds of diſeaſe. It is certain indeed, that in moſt caſes the contagious particles are more readily and fatally communicated from the clothes of a ſick perſon than from his body. The ſpreading abroad, therefore, of contaminated clothes to dry or to be aired, without a previous fumigation of them, may be of dangerous and fatal conſequence. All ſuch ſuſpected ſubſtances ſhould be firſt fumigated in a cloſe place, and in the ſame manner as an infected chamber, after which they may be ſpread abroad and expoſed to the air. In infectious diſeaſes, eſpecially fevers, the linen of the ſick, or ſuch clothes about them as will admit of being waſhed, ought never at firſt to be put in warm water, as it is dangerous to receive the ſteam that may hence ariſe. It is neceſſary to ſteep them firſt either in cold water or in cold ſoap-lees for ſeveral hours, that the filth may be waſhed off.

We muſt now proceed to give an account of the method of cure, after theſe methods of preventing the infection from being received into the body have either been neglected or proved ineffectual. Here it is of the utmoſt importance to take the diſeaſe in the very beginning, before it hath time to corrupt the fluids to ſuch a degree as to endanger life. In theſe ſlight degrees of infection, a vomit properly adminiſtered, eſpecially if ſucceeded by a bliſter, never fails to remove the diſorder, and prevent the fever which would otherwiſe unavoidably follow. Of this Dr Lind gives the following inſtances. A lady afflicted with the bilious cholic, had intolerably fetid diſcharges of corrupted matters upwards and downwards. A gentlewoman, only in paſſing the room, was immediately ſeized with a retching and ſickneſs, which continued 24 hours. The nurſe who attended was ſuddenly ſeized with a giddineſs and vomiting from the bad ſmell, which, as ſhe expreſſed it, reached into her ſtomach. The vomiting became more ſevere at night, accompanied with a purging and frequent ſhiverings. By means of an emetic both evacuations were ſtopped: notwithſtanding which, for ſome days afterwards, ſhe continued to have frequent tremors, and a violent head-ach, with a low irregular pulſe; and did not recover ſo ſoon as the patient.

Such ſlight degrees of infection have been often obſerved to be derived from patients of a groſs habit of body, when labouring under inflammatory diſtempers, and even other complaints. A man was ſent to Haſlar Hoſpital, ſuppoſed to have a fever. He was furiouſly delirious, with a quick full pulſe. Notwithſtanding plentiful evacuations, this delirium continued for two months with ſhort intervals; when the caſe was found to be plainly maniacal. A nurſe, upon raiſing this perſon up in her arms, perceived an intolerably bad ſmell, and was inſtantly ſeized with ſhiverings, ſickneſs, and head-ach. Finding herſelf very ill, ſhe took a vomit in ſix hours afterwards, and paſſed the night in profuſe ſweats by means of a ſudorific draught. Next morning the violence of the head-ach was but little abated; upon every attempt to move, ſhe complained of a burning heat and pain in her forehead, and became giddy. Her inclination to drink was frequent, and her pulſe low and quick. A bliſter was immediately applied to the back; as ſoon as the bliſter took effect, the head-ach and thirſt entirely left her, and the pulſe was calm. Next day ſhe aroſe and was well.

Typhus. Many ſimilar inſtances of infection have been obſerved from putting the dead into their coffins. In particular, one man, who, from performing that duty to his meſſmate, was ſo ill, even after the operation of the vomit, as to require a bliſter. In the courſe of one week two nurſes were infected by a perſon in the ſmall-pox. Both were ſeized in like manner with ſhiverings, ſickneſs, and head-ach; the one upon receiving the patient's breath, the other upon making his bed. In one, a pain darted into her breaſt; in the other, into the breaſt and in the ſmall of the back. The complaints of the former were ſpeedily removed by a vomit, though ſhe continued to have irregular returns of ſhiverings for three days afterwards. But in the latter, though the head-ach, ſickneſs, and rigors, were greatly abated by the vomit, yet a conſtant heat and thirſt, with a low pulſe, and a violent pain in the breaſt, indicated the neceſſity of applying a bliſter to the affected parts, which next morning removed all her complaints.

A perſon is often immediately ſenſible of his having received an infection from the firſt attack: they generally compare the firſt impreſſion to an earthy, diſagreeable ſmell, reaching down, as they expreſs it, into their ſtomach, as from a grave newly opened, but not quite ſo raw as the cadaverous ſtench; and the effects of it, ſhivering and ſickneſs, are inſtantaneous. It is a ſmell difficult to deſcribe; but is well known to the nurſes and attendants about the ſick, as it uſually accompanies fevers of extreme malignity, and, with the peculiar diſcharges from the bliſtered parts, may be reckoned among the moſt conſtant ſymptoms of a bad fever. Some compare the ſmell to that of rotten ſtraw. It often reſembles the diſagreeable ſmell of a perſon labouring under the confluent ſmall-pox at their turn, though not ſo ſtrong. One perſon, on receiving the infection, was ſenſible of ſomething like an electric ſhock through his body. But many are not ſenſible of any effect from an infection at firſt; and an infection from a fever will ſometimes continue for many days, nay, weeks, diſcovering itſelf chiefly by irregular ſhiverings, ſometimes ſo ſevere as to oblige the patients to have re-

Febres recourse to their beds once or twice a-day; sometimes every other day. Among a number thus affected, it also appears, that such as are put into unseasoned chambers, or have sat down on the cold ground, lain in raw damp apartments, &c. are immediately seized with a sickness at stomach, sometimes with a dangerous purging, and often with fevers accompanied with bad symptoms, which others have entirely escaped.

It now remains to consider the proper method of curing putrid fevers, on the supposition that the infection has been allowed to operate till the blood becomes radically tainted, and of consequence the nervous system affected to such a degree, that its power cannot be restored by any of the simple medicines above-mentioned. Here all authors agree, that a change of air, when it can be effected, is absolutely necessary, and often contributes more towards the removing of the disease than all the medicines that can be exhibited. The utility of this change will appear from what hath been formerly said; and we shall only further allege one instance from Dr Lind, in which the effects of bad air appear to a degree almost incredible. "It is remarkable (says he), that in the last war, the English ships which touched at Batavia suffered more by the malignant and fatal diseases of that climate, than they did in any other part of India, if we except a fatal scurvy which once raged in that fleet at sea. Soon after the capture of Manila, the Falmouth, a ship of 50 guns, went to Batavia, where she remained from the latter end of July to the latter end of January; during which time she buried 100 soldiers of the 79th regiment and 75 of the ships company; not one person in the ship having escaped a fit of sickness, except her commander Captain Brereton. The Panther, a ship of 60 guns, was there in the years 1762 and 1764; and both times during the rainy season. In the former of these years, she buried 70 of her men; and 92 of them were very ill when she left the place In the year 1764, during a short stay, 25 of her men died. The Medway, which was in company with her, lost also a great number of men. Nor was the sickness at that time confined to the ships; the whole city afforded a scene of disease and death: streets crowded with funerals, bells tolling from morning to night, and horses jaded with dragging the dead in hearses to their graves. At that time a slight cut of the skin, the least scratch of a nail, or the most inconsiderable wound, turned quickly to a spreading putrid ulcer, which in 24 hours consumed the flesh even to the bone This fact is so extraordinary, that, upon a single testimony, credit would hardly be given to it; yet on board the Medway and Panther they had the most fatal experience of it, and suffered much from it."

But where a change of air is impracticable or ineffectual, and where the fever hath already made some progress, Sir John Pringle generally took away some blood if the pulse was full When the symptoms run high, a plentiful evacuation of that kind seemed indicated; yet it was observed that large bleedings generally did harm, by sinking the pulse, and affecting the head. Nor was a moderate bleeding to be repeated without caution; even those whose blood was sizy, unless their lungs were inflamed, were the worse for a second bleeding. If the head only suffered, it was much safer to use leeches than to open a vein in the arm; but in the delirium with a sunk pulse, even leeches were hurtful. Many recovered without letting blood, but few who lost much of it.

Typhus.

Vomits also must be used with caution; for though they may be of use by way of prevention, yet in the advanced state of the disease, when the patient has all along complained of a sickness at stomach, they are evidently unsafe. Here the antiseptic quality of fixed air is of much use, and the neutral draughts given in the act of effervescence are generally attended with happy effects. Nay, clysters of fixed air itself have been found very serviceable. Even in very bad stages of the distemper, where a putrid and colliquative looseness has taken place, clysters of fixed air have been known to alleviate the symptoms. We must not, however, put too much confidence in medicines of this kind. Mild astringent cordials, especially wine and Peruvian bark, are the only resources in these disorders. Concerning the former, Sir John Pringle observes, in the low state of these fevers, and in great sinkings, which either come after unseasonable bleedings or long want of nourishment, it was a most grateful and efficacious cordial, to which nothing was comparable. The common men had an allowance, from a quarter to half a pint in a day, of a strong kind, made into whey, or added to the panada which was their ordinary food. But to others out of the hospital, he usually prescribed Rhenish or a small French wine, whereof some consumed near a quart per day, and part of that undiluted. Nay, so great was the virtue of wine in this stage of the fever, that several were known to recover from the lowest condition, when, refusing the bark on account of its taste, they took nothing but a little panada with wine and a volatile diaphoretic mixture every two or three hours by turns. Perhaps there is no rule more necessary in this state, than not to let the patient when low remain long without taking something cordial and nourishing; as many have been observed past recovery, by being suffered to pass a whole night without any support about the time of the crisis. In the advanced state of this fever the sick are remarkably low; and therefore Hoffman advises in such cases, that they should be constantly kept in bed, and not permitted even to sit up in it. In the last stage of this fever, as well as in that of the sea-scurvy, it would seem that the force of the heart was too small to convey the blood to the brain, except when the body is in an horizontal posture.

But, however necessary wine and the bark may be in the low stage of this fever, we must remember, that these remedies are to be administered only as antiseptics and supporters of the *vis vitæ*, without aiming at thoroughly raising the pulse or relieving the head, or at forcing a sweat by them, before nature points that way, and which Sir John Pringle seldom observed before the 14th day. For though the patient may die before that time if he has been largely bled, or if the cordial medicines have been given him too freely, yet such means as he made use of were not powerful enough to bring on a crisis sooner.

In the low state of the hospital-fever, a stupor was a constant attendant, which was very apt, in the evening, to change to a slight delirium. If this was all, as being in the common course, nothing was done. But if the delirium increased upon using wine, if the

eyes

Febres Typhus.

eyes looked wild, or the voice became quick, there was reason to apprehend a phrenitis; and accordingly it was observed, that at such times all internal heating medicines aggravated the symptoms; and in these cases blisters were of the greatest service. Fomentations of vinegar and warm water for the feet, our author is of opinion would answer better than either sinapisms or blisters, provided they were long enough and often enough applied In the inflammatory fevers, he has known these fomentations have little effect for the first hour, and yet succeed afterwards. For internal medicine, the bark was omitted for some time, but the patient was continued with an acidulated drink, *viz.* barley-water and vinegar; and treated also with camphire, *pulvis contrayervæ compositus*, and nitre, as was usual in the beginning of the fever. If the delirium was of the low kind, a decoction of the bark and wine were the only remedies: for in no instance was the delirium perfectly removed till the time of the crisis. It must also be observed, that a delirium may arise in putrid fevers from two opposite errors; one from large and repeated bleedings, and the other from wine and the cordial medicines being taken too early. It appears therefore how nice the principles are that regard the cure; as neither a hot nor a cool regimen will answer with every patient, or in every state of the disease.

If a diarrhœa came on in the decline of the fever, it was moderated, but not suppressed, by adding an opiate to the usual medicines. For though the looseness may be considered as critical; yet as the sick were too low to bear evacuations, there was a necessity for restraining it in some measure; and it has often been observed, that when it has been treated in this manner, about the usual time of the crisis, the patient has fallen into a gentle sweat, which has carried off the disease. In the worst cases of this fever, and especially when it coincides with the dysentery, the stools are frequently bloody; in which dangerous state, if any thing could be done, it was attempted by medicines of the same kind. In proportion to the putrid nature of the stools, opiates and astringents were used with the greater caution.

If the disease terminate in a suppuration upon one of the parotid glands (for the gland itself does not suppurate), the abscess was opened without waiting for a fluctuation, which might never happen; the pus being often here so viscid, that after it was ripe the part felt nearly as hard as if the suppuration had not begun.

Almost every patient, after the fever, complained of want of rest, frequently of a vertigo or confusion of the head, of a continuation of the deafness, or of other symptoms commonly called *nervous*. An opiate was then given at night; and in the day some strengthening medicines, such as the bark and the elixir of vitriol. In these cases, the bark was found not only to be the best strengthener, but the surest preservative against a return of the disease. For this last intention the convalescent was ordered about three drachms a-day for six or seven days together; and afterwards, if he remained longer in the hospital, some smaller quantity daily. But if there was any appearance of a hectic fever from an inward abscess, the case was treated accordingly. Upon comparing some of the remaining symptoms of those who recovered, with the condition of the brain in those who died and were opened, Sir John Pringle was induced to think, that some part even of that substance might suppurate, and yet the person recover.

Sometimes the patient falls into an irregular intermittent; which, if not of a hectic nature from an internal abscess, may proceed from neglecting to clear the *primæ viæ*. For it is easy to conceive, that after a long fever of such a putrid nature, often attended with langour of the bowels, the fæces may be so much accumulated, and so corrupted, as to occasion new disorders. In such cases, after proper evacuation by a purge, the bark was almost an infallible remedy.

The *Yellow* Fever.

Typhus cum flavedine cutis.
Typhus icteroides, *Sauv.* sp. 7.
Febris flava Indiæ Occidentalis, Warren. Malignant fever of Barbadoes, *Hillary's* Diseases of Barbadoes. *Lining* on the yellow fever of South Carolina, Edin. phys. and liter. Essays, vol. ii. *Mackittrick* de febre flava Indiæ Occidentalis, Edin. 1766. 168

Description. This is one of the most fatal diseases to which the inhabitants of warm climates are subject, and is the same with that called, from one of its worst symptoms, the *black vomit*, which is so terribly destructive in some of the warm parts of America, particularly at Carthagena. According to Dr Hillary, the yellow or putrid bilious fever most commonly seizes the patient at first with a faintness, then with a sickness at stomach, accompanied mostly with a giddiness of the head; soon after with a slight chillness and horror, very rarely with a rigor, which is soon followed by a violent heat and high fever, attended with acute darting pains in the head and back. A flushing in the face, with an inflamed redness and a burning heat in the eyes, great anxiety and oppression about the præcordia, are the pathognomonic signs of the distemper; especially when attended with sickness at stomach, violent retchings, and bilious yellow vomitings, with frequent sighing. The pulse is now generally very quick, high, soft, and sometimes throbbing, but never hard: in some it is very quick, soft, low, and oppressed; the respiration quick, full, and sometimes difficult; the skin very hot, and sometimes dry, though more frequently moist. Blood taken from the patient, even at the very beginning of the disease, is often of an exceeding florid red colour; much rarefied and thin, and without the least appearance of size; and the crassamentum, when it has stood till it is cold, will scarce cohere, but fluctuates; the serum is very yellow.

Most of the abovementioned symptoms continually increase, and are much aggravated: the retching and vomiting become almost incessant; the anxiety great, and sighing frequent; great restlessness; continual tossing; no ease in any posture; little sleep, and that disturbed and uneasy, and without any refreshment to the sick: and when they are fainting, they turn yellow about the face and neck, instead of turning pale; and as the fainting goes off, they recover their natural colour. These symptoms generally continue to the third day, though sometimes not longer than the first or second, in others to the end of the fourth: the first shows the greater dissolution of the blood, and the greater malignity of the disease; the last, the contrary; which

which the improper manner of treating the disease sometimes hastens and increases, or the proper method retards. This may be called the first stadium of the disease, and generally ends on the third day.

Blood taken from the sick on the second or third day, is much more dissolved, the serum more yellow, and the crassamentum florid, loose, scarce cohering, but undulates like sizy water when shaken, and sometimes has dark blackish spots on its surface, showing a strong gangrenescent diathesis.

About the third day, the pulse, which was quick and full before, now generally sinks greatly, and become very low: though sometimes it remains very quick, yet in others it is not much quicker than when the patient is in health, but is always low; the vomiting becomes almost incessant if not so before, and the matter thrown up is black; the patient then becomes comatose, with interrupted deliria. The thirst in some is very great, in others but little; the pulse still low and quick, attended with cold clammy sweats, and sometimes with deliquia. The eyes, which were inflamed and red before, and began to be of a more duskish colour, now turn yellow; and this yellowness also soon after appears round the mouth, eyes, temples, and neck, and in a short time diffuses itself all over the body. But this yellowness is so far from being always an encouraging prognostic, as some would have it, that it most commonly proves a mortal symptom. Sometimes indeed, though seldom, this suffusion of bile upon the surface has proved critical; but then it did not come on till the eighth or ninth day, nor appear till the coma and all the other bad symptoms began to abate; and then in proportion as the yellowness increases, all the bad symptoms decrease. But the case is most commonly quite the reverse; especially when the yellowness comes soon on: and then it is not only symptomatical, but ushers in the most fatal symptoms of the disease, viz. a deep coma, a low, vermicular, and intermitting pulse, great hæmorrhages from various parts of the body, a delirium with laborious and interrupted respiration, great anxiety, deep sighing, restlessness, a subsultus tendinum, coldness of the extreme parts first, and then all over the body, a faltering of the speech, tremors, and convulsions, which are soon after followed by death. So that from the first appearance of the yellowness we may say the patient is in the last stage of the disease, whether it terminates in death or recovery.

It has been observed, that, in some strong sanguine constitutions, when the patients have not been bled to a sufficient quantity in the beginning of the disease, the pulse has continued full, strong, and rapid, but never hard; the face flushed, eyes inflamed; the tongue dry, with great thirst and heat, till the second or last stage of the fever is come on, when the pulse has suddenly sunk, and death soon after ensued. Yet in others, who seemed to be of a plethoric habit, the tongue has been moist all along, though they have been delirious most of the time, and the heat of their skin and the strength and quickness of their pulse have continued, after the first stage of the disease was over, pretty near to that of their natural state in health, till within a few hours of their death; and when they have had a coma on them, one who is not well acquainted with the nature of this disease would, from their pulse, heat, breathing, and other symptoms, have taken them to be in a natural sleep. Others, when the pulse has begun to sink, and the fatal period seemed to be just approaching, to the great surprise of all present have recovered their senses, sat up, and talked pretty cheerfully for an hour or two, and in the midst of this seeming security have been suddenly seized with convulsions, which carried them off immediately.

In the latter stage of this fever, the blood is so attenuated and dissolved, that we frequently see it flowing not only out of the nose and mouth, but from the eyes, and even through the pores of the skin; also great quantities of black, half-baked, or half-mortified blood, are frequently voided both by vomiting and by stool, with great quantities of yellow and blackish putrid bile by the same passages; and the urine, which was before of a high icteritious colour, is now almost black, and is frequently mixed with a considerable quantity of half-dissolved blood. The pulse, which was much sunk before, now becomes very low, unequal, and intermitting; the breathing difficult and laborious; and the anxiety inexpressible: an oppression with a burning heat about the præcordia comes on, tho' the extremities are cold, and often covered with cold clammy sweats: a constant delirium follows; and then a total loss of the outward senses as well as the judgement, with livid spots in many parts of the body, especially about the præcordia; and sometimes gangrenes in other parts of the body, which are very soon succeeded by death.

In a short time after death, the body appears much more full of livid, large, mortified spots, particularly about the præcordia and hypochondres, especially the right; which parts seem, even from the first seizure, to be the principal seat of this terrible disease; and, upon opening the bodies of those who die of it, we generally find the gall-bladder and biliary ducts turgid, and filled with a putrid blackish bile; and the liver, stomach, and adjoining parts, full of livid or blackish mortified spots; and the whole corpse soon putrifies after death, and can be kept but a few hours above ground.

Dr Lind is of opinion, that the remarkable dissolution of the blood, the violent hæmorrhages, black vomit, and the other symptoms which characterize the yellow fever, are only accidental appearances in the common fever of the West Indies; that they are to be esteemed merely as adventitious, in the same manner as purple spots and bloody urine are in the small-pox, or as an hiccough in the dysentery: like these they only appear when the disease is attended with a high degree of malignity, and therefore always indicate great danger. This opinion, he thinks, is confirmed by an observation of Dr Wind's, that in 1750 the crew of a Dutch ship of war were distressed by the yellow fever, accompanied with the black vomit; but when the ship left the harbour, and changed the noxious land-air for one more healthy, the fever continued, but was not accompanied with the black vomit.

Diseases similar to this fever, Dr Lind informs us, may arise in any part of the world where the air is intensely hot and unwholesome; and therefore he treats as chimerical the notion of its being imported from one part of the world to another. An example of this happened at Cadiz in Spain, in the months of September and October 1764, when exceffive heat, and want of rain for fome months, gave rife to violent, epidemic, bilious diforders, refembling thofe of the Weft Indies, of which 100 perfons often died in a day. At this time the winds blew principally from the fouth, and after fun-fet there fell an unufual and very heavy dew.

This difeafe began commonly with alternate flight chills and heats, naufea, pains of the head, back, loins, and at the pit of the ftomach. Thefe fymptoms were often followed, in lefs than 24 hours, with violent retchings, and vomiting of a green or yellow bile, the fmell of which was very offenfive. Some threw up an humour as black as ink, and died foon after in violent convulfions and in a cold fweat. The pulfe was fometimes funk, fometimes quick, but often varying. After the firft day, the furface of the body was generally either cold, or dry and parched. The head-ach and ftupor often ended in a furious delirium, which quickly proved fatal. The dead bodies having been examined by order of the court of Madrid, the ftomach, mefentery, and inteftines, were found covered with gangrenous fpots. The orifice of the ftomach appeared to have been greatly affected, the fpots upon it being ulcerated. The liver and lungs feemed to be putrid, both from their texture and colour. The ftomach contained a quantity of an atrabilious liquor, which, when poured on the ground, produced a fenfible effervefcence; and, when mixed with fpirit of vitriol, a violent ebullition enfued. The dead bodies fo quickly turned putrid, that at the end of fix hours their fetor was intolerable; and, in fome of them, worms were found already lodged in the ftomach. His Majefty's fhip the Tweed being at that time in Cadiz bay, feveral of her men were taken ill when on fhore, but by being carried on board all of them recovered. Neither did the black vomit, or any other deadly fymptom of that fever, make its appearance in any of the fhips.

It has been a matter of much difpute, whether the yellow fever is of an infectious nature or not. Some time ago it became an object of confideration before the Right Hon. the Lords Commiffioners of Trade and Plantations, where it was urged, among other reafons, for not removing the feat of government and juftice in the ifland of Jamaica from Spanifh Town to Kingfton, that there was danger from Greenwich hofpital, fituated near Kingfton, of an infection from the yellow fever being frequently communicated to that town. On this affair a phyfician was confulted, who had long practifed in that ifland, and who gave it as his opinion, that from the yellow fever in that ifland there was no infection. This was the opinion not only of that gentleman, but of many others who had an opportunity of being well acquainted with this fever in Jamaica. Dr Lind, however, gives a remarkable inftance of its being of an infectious nature.—A gentleman dying at Barbadoes of a yellow fever, his wearing apparel and linen, packed up in a cheft, were fent to his friends at Philadelphia; where, upon opening the cheft, the family was taken ill; and the clothes being unluckily hung abroad to be aired, they prefently diffufed the contagion of the yellow fever over the whole town, by which 200 perfons died. Thefe contradictions, Dr Lind thinks, can only be reconciled, by fuppofing the yellow fever in the Weft Indies to be fometimes of an infectious nature and fometimes not.

In the defcription of the fame fever by Dr Lining, as it appears in South Carolina, there are feveral particulars confiderably different from that by Dr Hillary. According to the former, people complained for a day or two before the attack, of a head-ach, pain in the loins and extremities, efpecially in the knees and calves of the legs, lofs of appetite, debility, and a fpontaneous laffitude. Some, however, were feized fuddenly, without any fuch previous fymptoms. After a chillinefs and horror, with which this difeafe generally invades, a fever fucceeded. The pulfe was very frequent, till near the termination of the fever, and was generally full, hard, and confequently ftrong: in fome, it was fmall and hard; in others, foft and fmall; but in all thofe cafes, it frequently varied in its fullnefs and hardnefs. Towards the termination of the fever, the pulfe became fmaller, harder, and lefs frequent. In fome there was a remarkable throbbing in the carotids and in the hypochondria; in the latter of which it was fometimes fo great, that it caufed a conftant tremulous motion of the abdomen. The heat generally did not exceed 102 degrees of Fahrenheit's thermometer; in fome it was lefs; it varied frequently, and was commonly nearly equal in all parts, the heat about the præcordia being feldom more intenfe than in the extremities when thefe were kept covered. In the firft day of the difeafe, fome had frequent returns of a fenfe of chillinefs, though there was not any abatement of their heat. In a few, there happened fo great a remiffion of the heat for fome hours, when at the fame time the pulfe was foft and lefs frequent, and the fkin fo moift, that one from thefe circumftances might reafonably have hoped that the fever would only prove a remittent or intermittent. About the end of the fecond day, the heat began to abate. The fkin was fometimes (though rarely) dry; but oftener, and indeed generally, it was moift, and difpofed to fweat. On the firft day, the fweating was commonly profufe and general; on the fecond day, it was more moderate: but on both thefe, there happened frequent and fhort remiffions of the fweatings; at which times the febrile heat increafed, and the patient became more uneafy. On the third day, the difpofition to fweat was fo much abated, that the fkin was generally dry; only the forehead and backs of the hands continued moift. The refpiration was by no means frequent or difficult; but was foon accelerated by motion, or the fatigue of drinking a cup of any liquid. The tongue was moift, rough, and white, even to its tip and edges. On the fecond day, its middle in fome was brown. On the third day, the whitenefs and roughnefs of the tongue began to abate. The thirft in very few was great. A naufea, vomiting, or frequent retchings to vomit, efpecially after the exhibition of either medicines or food, came on generally the third day, as the fever began to leffen; or rather as the fulnefs of the pulfe, heat, and difpofition to fweat, began to abate. Some indeed, but very few, on the firft day, had a vomiting, either bilious or phlegmatic. Very few complained of anxiety or oppreffion about the præcordia

Febres Typhus

dia or hypochondria, nor was there any tenfion or hardnefs about the latter. On the firft day they generally dozed much, but were afterwards very watchful. Reftleffnefs and almoft continual jactations came on the fecond day. A great defpondeney attended the fick, and the ftrength was greatly proftrated from the firft attack. The pain in the head, loins, &c. of which they had complained before the attack, were greatly increafed, and in fome the pain in the forehead was very acute and darting; but thofe pains went generally off the fecond day. The face was flufhed; and the eyes were hot, inflamed, and unable to bear much light. On the firft day, many of them at times were a little delirious, but afterwards not until the recefs of the fever. The blood faved at venefection had not any inflammatory cruft; in warm weather, it was florid like arterial blood, and continued in one foft homogeneous-like mafs, without any feparation of the ferum after it was cold. When there was any feparation, the craffamentum was of a very lax texture. The ftools, after the firft day, were fetid, inclined to a black colour, and were very rarely bilious, foft, or liquid, excepting when forced by art; for an obftinate coftivenefs attended the febrile ftate. The urine was difcharged in a large quantity, was pale, fometimes limpid, and rarely of a higher than a ftraw colour, except when the weather was very warm, and then it was more faturated, of a deep colour, and difcharged in fmaller quantities. It had a large cloud, except when it was very pale or limpid; but more generally it had a copious white fediment, even on the firft day of the fever. On the fecond day, the urine continued to be difcharged very copioufly; in fome it was then turbid, and depofited a more copious fediment than on the firft day: this fediment was fometimes of a brownifh colour; in which cafe it was generally followed by bloody urine, either about the end of the fecond or beginning of the third day.—The colour and quantity of the urine, difcharged in equal times, were remarkably variable, being now limpid, then of a deeper colour, now difcharged in a larger, then in a fmaller quantity; which could not be afcribed to any change made either in the quantity or quality of the drink, &c.

The fever accompanied with thofe fymptoms terminated on the third day, or generally in lefs than 72 hours from the firft attack, not by any affimilation or coction and excretion of the morbid matter: for if by the latter, there would have been fome critical difcharge by fweat, urine, ftool, or otherwife, none of which happened; and if by the former, nothing then would have remained but great debility. This fever, however, did not terminate in either of thefe falutary ways, excepting in fome, who were happy enough to have the difeafe conquered in the beginning by proper evacuations, and by keeping up a plentiful fweat, till the total folution of the fever, by proper mild diaphoretics and diluents. But thofe who had not that good fortune, however tranquil things might appear at this period (as great debility, and a little yellownefs in the white of the eyes, feemed then to be the chief complaint, excepting when the vomiting continued), yet the face of affairs was quickly changed: for this period was foon fucceeded by the fecond *ftadium*; a ftate, though without any fever, much more terrible than the firft: the fymptoms in which were the following. The pulfe, immediately after the recefs of the fever, was very little more frequent than in health, but hard and fmall. However, though it continued fmall, it became, foon afterwards, flower and very foft; and this foftnefs of the pulfe remained as long as the pulfe could be felt. In many, in this ftage of the difeafe, the pulfe gradually fubfided, until it became fcarce perceptible; and this, notwithftanding all the means ufed to fupport and fill it; and when this was the cafe, the icteritious-like fuffufion, the vomiting, delirium, reftleffnefs, &c. increafed to a great degree. In fome, the pulfe, after being exceedingly fmall and fcarce perceptible, recovered confiderably its fullnefs; but that favourable appearance was generally of but fhort continuance. The heat did not exceed the natural animal-heat; and when the pulfe fubfided, the fkin became cold, and the face, breaft, and extremities acquired fomewhat of a livid colour. The fkin was dry when the weather was cold, but was moift and clammy when the weather was hot. The refpiration was natural, or rather flow. The tongue was moift, and much cleaner than in the former ftage; its tip and edges, as alfo the gums and lips, were of a more florid red colour than ufual. Very few complained of thirft, though they had a great defire for cold liquors. The vomiting or retching to vomit increafed, and in fome was fo conftant that neither medicines nor aliment of any kind were retained. Some vomited blood; others only what was laft exhibited, mixed with phlegm; and others again had what is called the *black vomit* (A). The retching to vomit continued a longer or fhorter time according to the ftate of the pulfe; for as that became fuller, and the heat greater, the retching to vomit abated, and *è contra*. The inquietude was very obftinate; and when they dozed, their flumbers were but fhort and unrefrefhing. There were fome who were drowfy; but thefe always awaked, after the fhorteft flumbers, with a great dejection of fpirits and ftrength.

2 The

(A) That which is called the *black vomit* at firft fight appears to be black; but on a more careful examination, it was obferved that this colour proceeded from a great quantity of fmall flakey black fubftances which floated in the liquor thrown up by vomiting; but the colour of this liquor was much the fame with that which the patient had laft drank, and was by no means black. Thofe black flakey fubftances are the bile mixed with, or adhering to the mucus which lined the ftomach. For, upon diffection of thofe who died of this difeafe, it was always obferved that the mucus of the ftomach was abraded, and the bile in its cyftis was black and fometimes very vifcid. In a lad who died of this difeafe in the beginning of the fourth day, and who was immediately opened, the bile was not only black, but had the confiftence of thick venice-turpentine, and was exceedingly tough. On the infide of the ftomach, there were feveral carbuncles or gangrenous fpecks. And in all thofe who were diffected, and had died of this difeafe, the fame appearances were not only always obferved, but likewife the blood was very fluid, and the veffels of the vifcera were much diftended.

Febres

The jactations or restlessness were surprising: it was frequently scarce possible to keep the patients in bed; though, at the same time, they did not complain of any anxiety or uneasiness; but if asked how they did, the reply was, *Very well.* The debility was so great, that, if the patient was raised erect in the bed, or, in some, if the head was only raised from the pillow, while a cup of drink was given, the pulse sunk immediately, and became sometimes so small, that it could scarce be felt; at this time, they became cold, as in a horripilatio, but without the anserine like skin: their lips and skin, especially about the neck, face, and extremities, together with their nails, acquired a livid colour. The delirium returned and increased; it was generally constant in those whose pulse was small and subsiding. The inflammation of the tunica conjunctiva or white of the eyes increased much, but without pain. A yellowness in the white of the eyes, if it did not appear before in the febrile state, became now very observable, and that icteritious-like colour was soon diffused over the whole surface of the body, and was continually acquiring a deeper saffron-like colour. In some indeed no yellowness was observable, excepting in the white of the eyes, until a little before death, when it increased very quickly, especially about the breast and neck. There were many small specks, not raised above the skin, which appeared very thick in the breast and neck, but less so in the extremities, and were of a scarlet, purple, or livid colour. In women the menstrua flowed, and sometimes excessively, though not at their regular period.

There was such a putrid dissolution of the blood in this stadium of the disease, that, besides the vomiting of blood formerly mentioned, and the bloody urine soon to be taken notice of, there were hæmorrhagies from the nose, mouth, ears, eyes, and from the parts which were blistered with cantharides. Nay, in the year 1739 and 1745, there were one or two instances of an hæmorrhagy from the skin, without any apparent puncture or loss of any part of the scarf-skin.

An obstinate costiveness continued in some; in others, the stools were frequent and loose; in some they were black, liquid, large, and greatly fatiguing; in others, when the stools were moderate, even though they were black, they gave great relief; in others, again, the stools nearly resembled tar in smoothness, tenacity, colour, and consistence.

The urine was discharged in a large quantity, in proportion to the drink retained by the patient: it was pale if the patient was not yellow; but if yellow, then it was of a deep saffron-colour: in either case, it had a sediment, or at least a large cloud, which remained at the bottom of the glass; in some, it was very turbid; in others it was bloody: and the quantity of blood discharged with the urine bore always some proportion to the state of the pulse; when that became fuller, the quantity of blood in the urine was diminished; when the pulse subsided, the bloody urine increased, and even returned after it had ceased some days, soon after the pulse became smaller. This stage of the disease continued sometimes seven or eight days before the patient died.

When this stadium of the disease terminated in health, it was by a recess or abatement of the vomiting, hæmorrhagies, delirium, inquietude, jactations, and icteritious-like suffusion of the skin and white of the eyes; while, at the same time, the pulse became fuller, and the patient gained strength, which, after this disease, was very slowly. But when it terminated in death, those symptoms not only continued, but sooner or later increased in violence, and were succeeded with the following, which may be termed the third *stadium* of the disease, which quickly ended in death. The pulse, though soft, became exceedingly small and unequal; the extremities grew cold, clammy, and livid; the face and lips, in some, were flushed; in others, they were of a livid colour; the livid specks increased so fast, that in some the whole breast and neck appeared livid; the heart palpitated strongly; the heat about the præcordia increased much; the respiration became difficult, with frequent sighing; the patient now became anxious, and extremely restless; the sweat flowed from the face, neck, and breast; blood flowed from the mouth, or nose, or ears, and in some from all those parts at once; the deglutition became difficult; the hiccoughs and subsultus of the tendons came on, and were frequent; the patients trifled with their fingers, and picked the naps of the bed-clothes; they grew comatous, or were constantly delirious. In this terrible state, some continued eight, ten, or twelve hours before they died, even after they had been so long speechless, and without any perceptible pulsation of the arteries in the wrists; whereas, in all other acute diseases, after the pulse in the wrists ceases, death follows immediately. When the disease was very acute, violent convulsions seized the unhappy patient, and quickly brought this stadium to its fatal end. After death, the livid blotches increased fast, especially about the face, breast, and neck, and the putrefaction began very early, or rather increased very quickly.

Typhus.

This was the progress of this terrible disease through its several stadia. But in hot weather, and when the symptoms in the first stage were very violent, it passed through those stages with such precipitation that there was but little opportunity of distinguishing its different stadia, the whole tragedy having been finished in less than 48 hours. It was remarkable, that, 1. The infection was increased by warm and lessened by cold weather. 2. The symptoms in the several stadia were more or less violent, according to the heat or coolness of the weather. In hot days, the symptoms were not only more violent, but in those who seemed in moderate weather to be on the recovery, or at least in no danger, the symptoms were all so greatly heightened, when the weather grew considerably warmer, as frequently to become fatal. In cool days, the symptoms were not only milder, but many who were apparently in great danger in hot days were saved from the very jaws of death by the weather becoming happily cooler. 3. The disease was generally more fatal to those who lay in small chambers not conveniently situated for the admission of fresh air, to those of an athletic and full habit, to strangers who were natives of a cold climate, to those who had the greatest dread of it, and to those who before the attack of the disease had overheated themselves by exercise in the sun, or by excessive drinking of strong liquors; either of which indeed

Febres indeed seemed to render the body more susceptible of the infection. Lastly, the disease proved most certainly fatal to valetudinarians, or to those who had been weakened by any previous disease.

Although from the description which has now been given of the yellow fever, it may appear to be in many particulars very different from the remittent fever of warm climates; yet it is the opinion of many late writers of great accuracy, particularly of Dr John Hunter in his Observations on the Diseases of the Army in Jamaica, that it is to be considered only as a more dangerous form of the same disease. And there can be no doubt that the remittent fever not only appears in different seasons and situations with very different degrees of severity; but also that while the remittent fever prevails in its usual form in the West India islands, some individuals, particularly those who are newly arrived, will be affected with very remarkable yellowness, as well as bilious and black vomitings.

Causes of, and persons subject to, this disease. The yellow fever attacks principally Europeans, especially those who have but lately arrived in the hot climates. Negroes are entirely exempt from it, though the mulattoes and tawnies are as liable to be seized with it as the whites themselves. The cause of the disease seems to be a particular kind of contagion; but Dr Lind seems to be of opinion, that the immediate cause of the symptoms is a disposition in the glutinous part of the blood to separate from the others, and to become purulent. In some persons who have been bled in the yellow fever, the blood hath been observed prodigiously viscid; the crassamentum covered with a yellow gluten half an inch in thickness, and impenetrable to the finger unless cut by the nail; the serum being at the same time of the consistence of a thin syrup, and of a deep yellow tinge. This serum tasted bitter, and was taken for a composition of soot. The appearances on dissection, with his conclusions from them, we shall give in his own words: "In a man who died on the eleventh day of a yellow fever, whose body emitted no bad smell 36 hours after death, and was still yellow, I found all the bowels of the abdomen sound; the liver and spleen were remarkably so; as also the stomach and intestines. There was no suffusion of the bile either in the intestines or stomach. The gall-bladder, of the natural size, contained the usual quantity of bile, somewhat thicker than common, and grumous(B).

"Upon examining further, this disease was found to have lain wholly on the left side, where, within the breast, was found near a quart of yellowish water, in which were many large flakes of yellowish gluten, appearing, by comparison, precisely the same with the thick pellicle which had covered the blood taken from his arm. These flakes bore in several places a resemblance to a membranous substance beginning to be converted into a purulent jelly. The pleura, both on its inside and outside, as also its continuation, the investing membrane of the lungs (which in some parts was greatly thickened), were covered with cakes of this gluten, hanging in some places loosely, in others adhering more strongly: and all in different states of yellow or purulent corruption. The right cavity of the breast, and all the other parts of his body, were found entirely free from disease.

Typhus.

"His complaints had been chiefly in his breast; and a small quantity of blood, taken from him two days before his death, was covered with an impenetrable, yellow, thick gluten; the red portion below it being quite loose.

"In those fevers, I have also seen the disease entirely confined to the heart and pericardium. In one who died the tenth day of the fever, without having been yellow, a quantity of pus and purulent crusts were found mixed with the water of the pericardium. The heart in different places was excoriated; and, together with the inside of the pericardium, was lined with a thick membranous cake, similar to that already mentioned on the lungs and pleura. In some places this cake had a purulent, in others a gelatinous, appearance, exactly resembling the coagulum of the blood. His complaints had been, a great oppression on the breast, and an extreme difficulty of breathing. In a third person, who died on the thirteenth day of the fever, above two quarts of pus and purulent jelly were found in the cavity of the belly. The source of such an extraordinary quantity of matter was not from any preceding inflammation, nor any imposthume, that we could discover; but from innumerable ulcerations on the surface of the intestines, omentum, mesentery, and peritoneum. Neither did those ulcerations (or excoriations, as they rather appeared in several places) seem to be the primary fountains of the matter, but to have been occasioned by its acrimony.

"This purulent appearance seems to arise merely from an extravasation of one of the component parts of the blood, the gluten or coagulable lymph. Blood taken from persons in a fever, and frequently even from persons in perfect health, after standing in a clean vessel for a short time, commonly separates into three distinct portions; *viz.* the serum, or water of the blood, the red concreted mass, and a viscid pellicle termed the *size*, which spreads itself on the top of the red concretion. Some time ago, when making experiments with the blood taken from persons in the scurvy, I was surprised to find it often covered with that sizy crust. This induced me to extend my experiments to large quantities of blood from different subjects, which I had opportunities of inspecting at once in so large an hospital. For this purpose I one morning ordered ten patients in the scurvy to be bled, taking two ounces from each. A larger quantity was taken, for its inspection, from two men in health. That day I had occasion to prescribe bleeding to a woman in labour, two hours before her delivery; to a girl of sixteen years of age afflicted with a lunacy proceeding from the chlorosis; to three patients in the rheumatism; and to a person labouring under an obstruction of the liver.

1 "From

(B) In others who died in this yellow state, the bile in the gall-bladder was found of a thick ropy consistence like pitch, but the liver never appeared in the least affected. Dr Lind at first in several bodies opened the head only; but afterwards judged that all the cavities ought to be inspected.

Febres

"From a nice comparison, and an examination of the different blood, I found in general, that the more size there was on the top, and the thicker and more viscid this white pellicle showed itself, the concretion below it was of a more loose coherence. This was not so observable when only some slight white streaks appeared on the top. But when much size had separated itself, the red mass became very soft at the bottom of the vessel, and less compact in its different parts, in proportion to their distance from the surface, towards which this whitish portion had ascended.

"From this and from other experiments it appears, that this crust or pellicle is the natural gluten or cement of the blood (called by some the *coagulable lymph*), which becomes strongly disposed, in certain circumstances and diseases, to separate itself. And whereas the serum and red concretion are easily incorporated together, it will be found, that this glue, after its separation, becomes immiscible with either. We have, by gentle drying, converted it into a perfectly tough elastic membrane; and, by the means of a small portion of the red mass being left adhering to it, into a substance resembling muscular flesh; and it is capable of undergoing various changes into corruption, in the same manner as either of these.

"Now, I can see no reason why this gluten, in its morbid state, may not separate itself from the circulating blood, and be deposited in the cavities of the body, as readily as the serum does in dropsies; the former having always a less disposition than the latter to incorporate with the mass.

"In dissecting persons who died of fevers in London and Minorca, and where no infection was suspected, appearances similar to these have also fallen under the inspection of those accurate anatomists Drs Hunter and Cleghorn. Hence it may be presumed very difficult to distinguish fevers that are produced by infection, from some others. I cannot, however, be induced to think, as those gentlemen seem to do, that these preternatural substances which were found in the cavities of the body are the consequence, but rather that they are the cause, of the inflammation and excoriations. I believe these substances to be at first diseased extravasated gluten, and conjecture their different states greatly to depend upon the different times at which they were deposited.

"I have remarked, in a variety of dead bodies, three different kinds of extravasation; these occurred in such as had died of the scurvy, of consumption, and of fevers. In the former of those diseases, red coagulated blood is found extravasated in almost all parts of the body, not only into the tela cellulosa, but into the bellies of the muscles, particularly of the legs and thighs, which often become quite stuffed and even distorted with large grumous masses. The intestines and mesentery are often spotted also with extravasated blood; and I have seen large ecchymoses on the stomach. Those appearances at first sight resembled so many distinct mortifications; and by this appearance some anatomists have been deceived; but, upon a nice examination, the texture of the parts is found to be sound and firm. There is likewise, in that disease, sometimes, an extravasation of water, chiefly collected in, and always when in the legs confined to, the tela cellulosa.

Typhus.

"But whereas, in the limbs of scorbutic persons, it is extremely difficult to make a good dissection by reason of such quantities of extravasated blood that every where obstruct the operator; so, on the contrary, the lower extremities of those who have died consumptive, with swelled legs, are, of all other subjects, in the best state to afford a satisfactory view of the muscles. The water inclosed in their legs having insinuated itself, by passing the tela cellulosa, into the spaces between the muscles, the muscles are easily separated from each other; and their several origins and insertions may be distinctly traced by means of their having been cleansed and washed by the water in the investing cellular membrane. Thus there are extravasations of three sorts; *viz.* first, the grumous mass in the scurvy; and this I have often remarked where no serum was observed. Secondly, the serum alone in anasarcous swellings. The third and last is what was taken notice of in those who died of fevers, being the gluten of the blood, accompanied for the most part with some serum; both of them altogether confined in the large cavities of the body.

"I conjecture, that in those fevers there is always an ulcerous or purulent disposition in the blood; and that this gluten or coagulable lymph is greatly diseased. I have frequently seen it have a true purulent appearance soon after it was drawn off, when the patient seemed not very ill.

"And I further conjecture, that the mischief often lies within the breast; as also that the great benefit derived from the very early application of blisters, in a great measure flows from so many ulcerations and vents being timely provided for the free discharge of those purulent and tainted particles from the body.

"If an infection depends, as many have imagined, on the admission of certain foreign particles into the blood, this gluten seems to be its more immediate seat, and to be primarily affected by it; and a discharge of this, as though by washing those particles out of the body, tends in a great measure to remove the disease.

"It is an observation of the best practical writers, that issues and setons are most excellent preservatives against receiving an infection, nay, even that of the plague itself. And indeed a suppuration and plentiful discharge from a proper ulcer, whether produced by nature or by art, seems to open a channel the best appropriated for an exit out of the body to some of the most malignant poisons. Thus the most favourable crisis in the plague, and in most pestilential fevers, happens when nature excites tumors kindly suppurating in the groin or arm-pits, by whose beneficial and plentiful discharge the deadly poison is expelled from the constitution.

"I have observed it to be amongst the most certain characteristics of the worst fevers, that the blisters either do not rise and fill, or discharge such yellow, greenish, fetid, and highly offensive stuff, that even experienced nurses could give a pretty certain conjecture from the blisters, of the different degrees of malignity in the fever. We have more than once endeavoured to conceal the bad state of some patients in the hospital; but a discovery was always made of their condition in the wash-house, from the linen sent there stained with the discharges from the blistered parts.

And

Typhus.

And indeed a careful inſpection of the ſtate and diſcharge from the bliſters, together with their effects, furniſhes us, in thoſe diſeaſes, with ſome of the moſt certain diagnoſtics of their nature and prognoſtics of their event."

Prognoſis. This diſtemper, where it attacks with violence, is generally fatal; the prognoſis therefore muſt be commonly unfavourable, and always uncertain; neither can any thing more be ſaid on this ſubject, than that an abatement of the ſymptoms already enumerated affords a favourable prognoſtic, and an increaſe of them the contrary.

Cure. The cure of this terrible diſeaſe, according to Dr Hillary, is very eaſy and ſimple. His indications are, 1. To moderate the too great and rapid motion of the fluids, and abate the too great heat and violence of the fever in the two firſt days of the diſeaſe, as much and as ſafely as we can. 2. To evacuate and carry out of the body as much of the putrid bile and other humours, and as expeditiouſly and ſafely as poſſible. 3. To put a ſtop to the putreſcent diſpoſition of the fluids, and to prevent the gangrenes from coming on, by ſuitable antiſeptics.

The firſt indication is anſwered by bleeding, which, in the firſt ſtage of this fever, is abſolutely neceſſary in ſome degree: the quantity to be taken away muſt be determined by the age and ſtrength of the patients, the degree of plethora, fulneſs of the pulſe, &c. When called in at the beginning, he orders 12, 14, 16, 18, or 20 ounces of blood to be taken away on the firſt or ſecond day: and if the patient's pulſe riſe after the firſt bleeding, or if the fever ſtill continue high and the pulſe full, he repeats the bleeding once on the days above-mentioned. But bleeding a third time is ſeldom or never required; neither is bleeding on the third day almoſt ever neceſſary; and when it is performed on that day, it ought to be done with the greateſt caution and judgment: neither ſhould a vein be opened after the third day in this fever, unleſs ſome very extraordinary ſymptoms and circumſtances require it; which ſeldom or never happen. On that day, indeed, the pulſe generally ſinks, and the blood is in ſuch a diſſolved ſtate, that bleeding muſt be accounted highly pernicious. Nevertheleſs, it is indiſpenſably neceſſary in the beginning of the diſtemper: and if omitted at that time, the violent heat and motion of the blood increaſe the putreſcence of the humours to ſuch a degree as to bring on the fatal conſequences much ſooner than would otherwiſe have happened.

After bleeding, we come to the ſecond indication of cure, namely, to evacuate as much of the bilious and putrid humours as ſoon and as ſafely as we can. The great irritation of the ſtomach, by the putrid bilious humours conſtantly attending this fever, with almoſt continual retchings and violent vomitings, ſeem to indicate the giving of an emetic: but the ſtomach is always obſerved to be ſo violently ſtimulated and irritated and moſt commonly inflamed by the acrimony of the putreſcent bile, that any emetic, even the moſt mild and gentle, given in the ſmalleſt doſe, brings on an inceſſant vomiting, which continues, in ſpite of all remedies, till a mortification and death enſue. Inſtead of this, it is proper to give large draughts of warm water, which, without any additional ſtimulus to the coats of the ſtomach, evacuates its acrid and putrid contents, commonly with great relief to the patient: the warm water alſo acts as an emollient fotus to the inflamed coats of the ſtomach; and thus abates the inflammation, and prevents the gangrene and mortification from coming on.

After the patient has by this means vomited ſeven or eight times or oftener, and diſcharged a great quantity of yellow and blackiſh bilious matter as they often do, a grain or a grain and a half of thebaic extract is given in order to procure ſome reſpite from the violent retching, vomiting, and anxiety. The perſon is deſired to take nothing into his ſtomach for two hours after this, by which means it is ſeldom or never rejected; and thus all the ſymptoms are conſiderably abated, the retching and vomiting either totally ceaſe or are very much leſſened, ſo that medicines may now be exhibited which the ſtomach would not have retained before. Theſe are cooling acid juleps, or other antiſeptic remedies; but neither nitre nor any of its preparations will commonly be found to ſtay on the ſtomach; nor are the nitrous medicines, or even the common anti-emetic draughts, proper to be given in this diſeaſe, even though they ſhould agree with the ſtomach, on account of their attenuating property.

If the patient has not a ſtool or two after drinking the warm water and vomiting, it is neceſſary to give a gentle purging clyſter; and when ſix or eight hours reſt have been obtained, a gentle antiphlogiſtic and antiſeptic purge, in order to evacuate by ſtool as much of the bilious matter as we poſſibly can. Or if the patient has a purging before, which ſometimes though very rarely happens, a doſe of toaſted rhubarb is given, and an antiſeptic anodyne after it has operated, to abate and check the too great purging, but not to ſtop it, as this evacuation has been always obſerved to be of ſervice, provided it be not too violent.

After this indication is completely anſwered, the next is to exhibit ſuch proper antiſeptic medicines as may ſtop the putreſcent diſpoſition of the fluids. Here the Peruvian bark would ſeem to be the moſt proper remedy; but unluckily the ſtomachs of the patients in this diſeaſe are ſo much irritated, and ſo apt to reject every thing, that the bark cannot be retained in any form whatever. In this caſe Dr Percival recommends columbo-root, the infuſion of which is found to be a powerful antiemetic and antiputreſcent medicine, and might perhaps ſo far alter the ſtate of the ſtomach as to make it bear the bark. Dr Hillary, however, who was ignorant of the virtues of columbo, ſubſtituted the *radix ſerpentariæ Virginianæ* with ſucceſs. A ſlight infuſion of this root not only ſat eaſily on the ſtomach of the patients, but moderately raiſed the pulſe and fever, both of which are now too low. The following receipt was found the moſt agreeable and efficacious.

℞. Rad. ſerpent. Virginian. ℥ii.
Croc. Ang. ʒſs. M. et infunde vaſe clauſo in aq. bul. q. per horam unam ut col. ℥vi. Adde aq. menth. ſimp. ℥ii. Vin. Maderienſ. ℥iv. Syr. croc. vel ſyr. e mecon. ℥i. By the uſe of this medicine, and ſoft light nouriſhment taken in ſmall quantities, the pulſe is uſually kept up

Febres

Typhus.

up and the distemper goes off. But if, after taking this a little while, we find that the pulse does not rise, but on the contrary that a coldness of the extreme parts comes on, the medicines must be made more warming, by increasing the quantity of the snake-root and saffron, or by adding *vinum croceum*, *confectio cardiaca*, or the like, but not by the use of volatile spirits and salts, which hurt by their stimulating and dissolving qualities. Blisters our author reprobates in the strongest terms, and affirms that he has seen the place where a blister was applied turned perfectly black and sphacelated; so that if the spine and end of the ribs had not hindered, a large square passage would have been opened into the cavity of the thorax, had the patient lived a few hours after it.

At the same time that the strength of the patient is kept up by the medicines above-mentioned, or by others similar, he gave repeated gentle purgatives every second or third day, and sometimes, when the symptoms were very urgent, every day, for four or five days successively. But if proper methods be taken in the beginning of the disease, it is seldom that such a repetition of purging is necessary; and the Doctor gives the following remarkable instance of the efficacy of this method of treating the disease: "A young man about 24 years of age, surgeon to a Guinea ship, was brought into a house where I was visiting a patient; he was of a sanguine robust constitution, and a lover of spirituous liquors, and had been drunk three days and nights successively, and in that condition had run several races on the hot sea-shore, near noon, with the sailors, in the heat of the sun; and to complete his folly, lay the last night, after that exercise, in the open air under a tamarind-tree all the night, where he was seized in the morning with all the symptoms of this fever, in the most violent manner that I have ever seen any one. In this condition he was brought to the house where I was: his retching and vomiting were so incessant, that he could not get time to say yes, or no, to the questions which I asked, without waiting some time for it, each time; his eyes were red and inflamed, attended with a burning heat, as usual in the beginning of this fever; and he had all the other symptoms which attend the first attack of this fever in the most violent manner, which I need not repeat. I ordered ℥xvi. of blood to be taken from him, which was very florid, thin, and much dissolved; and then directed him to drink warm water freely, and to vomit eight or ten times; and after that to take *extract. Thebaic.* gr. jss. and take nothing for two hours after it. But I being gone, and he finding that he vomited with more ease, less sickness and retching, with the warm water, than he did before, and being much alarmed at his having this fever, he drank three gallons of the water, and brought up great quantities of yellow and blackish bilious matter with it, and washed his stomach effectually. He then took the *extr. thebaic.* and slept three or four hours after it; and the vomiting ceased: he took some panada, and four hours after that the purge of manna and tamarinds, &c. which gave him eight stools, and carried a good deal more of the putrid bilious matter off downwards; and got some rest after it: he then took of an antiseptic julep often, and light nourishment, a little acid, at the intervals; and repeated the purge on the third day, as directed. Being called out of the town, I did not see him till the fourth morning after; he said that he had followed my directions; and I found him free from the fever and all its symptoms, but weak and low, and his skin a little yellow, but much less so than usual, unless when the bilious matter is thus carried off. I ordered him to take *elix. vitrioli acid. gut.* lx. three or four times a-day for a few days, in an infusion of mint-leaves with a little snake-root, made as tea; which he did, and soon recovered perfectly well in seven or eight days time.

"This patient being seized in so violent a manner, and recovering in so short a time, and so near to the rule which the elegant Celsus recommends, *Citò, tutò, et jucundè*, not only confirmed the above manner of reasoning on the cause and nature of this disease to be right, but made me determine to follow the same method as near as I possibly could ever since, and I must add, with the same good success also, when I am called so early in the disease that I can strictly pursue it: which is too seldom the case; for in general the physician is not called till the fourth or fifth day, or after, when the putrid acrid bilious matter is a great part of it carried into the blood, which it has so dissolved and brought its whole mass into a colliquated, putrid, gangrenescent state, that the best of methods, and the most efficacious medicines, however judiciously timed and applied, are precarious and uncertain; or sometimes it is so far advanced, that the ablest physician can do no more than tell the relations of the sick that it is too late, and that they can live but a few hours: for I know no disease in which the recovery of the patient so much depends upon the right or wrong method of treating it, at the very first attack or beginning of the disease, as this fever does: for by thus discharging and carrying the putrid, acrimonious, bilious matter, out of the body before much of it is carried into the blood, not only most of the bad symptoms which attend the second state of the fever are prevented from coming on, but the hæmorrhagies, and the yellowness of the skin, &c. also, and the fever soon taken off too; for I have never seen any hæmorrhagy come on, and but little yellowness, or in some none, when they were thus treated.

"And when the last stage of this fever is come on before we are called in, provided that it is not at the very latter end of it, I have always found that this method of gentle purging, whenever the before-mentioned symptoms indicate it, and a liberal use of the antiseptic medicines in the intervals, has been so successful, that I have seen but two patients that have died in this fever during the eight years past in which I treated it in this manner; and one of them was so weak that he could not take a spoonful of any thing, and so near his end that he died about two hours after without taking any medicine; and the other killed himself by drinking a gallon of cold water in less than three hours time (after taking half an ounce of manna in the morning), which struck such a coldness into his whole body that he died; though I have visited several every year, and in some years a great many: therefore I take the liberty of recommending this method to others, and wish it to be as successful to all."

To the genus of *typhus* also belong all those fevers attended with very profuse and debilitating sweats, and which

Febres which have sometimes, not without good reason, been accounted plagues; such as the English sweating sickness, Miliaris sudatoria, *Sauv.* sp. 5. Ephemera sudatoria, *Sauv.* sp. 7. Ephemera Britannica, *Caius de ephem. Britan.*

THIS is a contagious distemper, being a complication of a synocha and typhus; for the description and cure of which, we must of consequence refer to what hath been already said concerning these diseases.

The *Hectic* FEVER.

170 Hectica, *Sauv.* gen. 83. *Lin.* 24. *Vog.* 80. *Sag.* 684.

THIS disease is reckoned by Dr Cullen to be merely symptomatic; as indeed seems very probable, since it very generally accompanies absorptions of pus into the blood from internal suppurations, or indeed from such as are external, provided they be very large or of a bad kind.

Description. The best, indeed the only proper, description of this disorder we have is that by Dr Heberden. According to him, the appearance of the hectic fever is not unlike that of the genuine intermittent; from which, however, the disease is very different in its nature, while at the same time it is much more dangerous. In the true intermittent, the three stages of cold, heat, and sweat, are far more distinctly marked, the whole fit is much longer, the period which it observes is more constant and regular, and the intermissions are more perfect, than in the hectic fever. For in the latter, even in the clearest remission, there is usually a feverish quickness perceptible in the pulse, which seldom fails to exceed the utmost limit of a healthy one by at least 10 strokes in a minute.

The chillness of the hectic fever is sometimes succeeded by heat, and sometimes immediately by a sweat without any intermediate state of heat. The heat will sometimes come on without any remarkable chillness preceding; and the chillness has been observed to go off without being followed either by heat or sweat. The duration of these stages is seldom the same for three fits together; and as it is not uncommon for one of them to be wanting, the length of the whole fit must vary much more than in the true intermittent; but in general it is much shorter.

A patient subjected to hectic fever is little or nothing relieved by the coming on of the sweat; but is often as anxious and restless under it as during the chillness or heat. When the sweat is over, the fever will sometimes continue; and in the middle of the fever the chillness will return; which is a most certain mark of this disease.

The hectic fever will return with great exactness, like an intermittent, for two or perhaps three fits; but Dr Heberden informs us, that he does not remember ever to have known it keep the same period for four fits successively. The paroxysm will now and then keep off for 10 or 12 days; and at other times, especially when the patient is very ill, it will return so frequently on the same day, that the chillness of a new fit will follow immediately the sweat of the former. It is not unusual to have many threatenings of a shivering in the same day; and some degree of drowsiness is apt to attend the cessation of a fit. Hectica.

The urine in a true intermittent is clear in the fits and turbid in the intervals; but in the hectic fever it is liable to all kinds of irregularity. It will be equally clear or turbid in both stages; or turbid in the fits and clear in the intervals; and sometimes it will be, as in a true intermittent, clear during the fever, and thick at the going off.

Hectic patients often complain of pains like those of the rheumatism, which either affect by turns almost every part of the body, or else return constantly to the same part; which is often at a great distance from the seat of the principal disorder, and, as far as is known, without any peculiar connection with it. Those pains are so violent in some patients, as to require a large quantity of opium. As far as Dr Heberden has observed, they are most common, where the hectic arises from some ulcer open to the external air, as in cancers of the face, breast, &c. Joined with this fever, and arising probably from one common cause, he has been surprised to see swellings of the limbs, neck, or trunk of the body, rise up almost in an instant, as if the part was all at once grown fatter. These swellings are not painful, hard, or discoloured, and they continue for several hours.

Dr Heberden has seen this fever attack those who seemed in tolerable health, in a sudden and violent manner, like a common inflammatory one; and like that, also, in a very short time bring them into imminent danger of their lives; after which it has begun to abate, and to afford hopes of a perfect recovery. But though the danger might be over for the present, and but little of a fever remain; yet that little has soon demonstrated, that it was kept up by some great mischief within, and, proving unconquerable by any remedies, has gradually undermined the health of the patient, and never ceased except with his life. This manner of its beginning, however, is extraordinary. It much oftener dissembles its strength at first; and creeps on so slowly, that the subjects of it, though they be not perfectly well, yet for some months hardly think themselves ill; complaining only of being sooner tired with exercise than usual, of want of appetite, and of falling away. But gentle as the symptoms may seem, if the pulse be quicker than ordinary, so as to have the artery to beat 90 times and perhaps 120 times in a minute, there is the greatest reason to be apprehensive of the event. In no disorder, perhaps, is the pulse of more use to guide our judgment than in the hectic fever: yet even here we must be upon our guard, and not trust entirely to this criterion; for one in about 20 patients, with all the worst signs of decay from some incurable cause, which irresistibly goes on to destroy his life, will show not the smallest degree of quickness, nor any other irregularity of the pulse, to the day of his death.

Causes, &c. This fever will supervene whenever there is a great collection of matter formed in any part of the body; but it more particularly attends upon the inflam-

Febres Hectica.

inflammation of a scirrhous gland, and even upon one that is slight and only just beginning; the fever growing worse in proportion as the gland becomes more inflamed, ulcered, or gangrenous. And such is the lingering nature of those glandular disorders, that the first of those stages will continue for many months, and the second for some years.

If this scirrhous inflammation be external, or in the lungs, or some of the abdominal viscera, where the disturbance of their functions plainly points out the seat of the disorder, no doubt can be entertained concerning the cause of the fever. But if the part affected be not obvious to the senses, and its precise functions be not known, the hectic, which is there only part of the train of another disease, may be mistaken for the primary or only one.

Lying-in women, on account of the violence sustained in delivery, generally die when affected with this fever. Women of the age of near 50 and upwards are particularly liable to it. For, upon the cessation of their natural discharge, the glands of the breasts, ovaries, or womb, too commonly begin to grow scirrhous, and proceed to be cancerous. Not only these, but the glandular parts of all the abdominal viscera, are disposed to be affected at this particular time, and to become the seats of incurable disorders.

The injuries done to the stomach and liver by hard drinking are attended with similar symptoms, and terminate in the same manner.

Dr Heberden observes, that the slightest wound by a fine pointed instrument is known upon some occasions to bring on the greatest disturbances, and the most alarming symptoms, nay even death itself. For not only the wounded part will swell and be painful, but by turns almost every part of the body; and very distant parts have been known to come even to suppuration. These symptoms are constantly accompanied with this irregular intermittent, which lasts as long as any of them remain.

Prognosis. This anomalous fever is never less dangerous than when it belongs to a kindly suppuration, into which all the diseased parts are melted down, and for which there is a proper outlet.

The symptoms and danger from some small punctures, with their concomitant fever, most frequently give way in a few days; though in some persons they have continued for two or three months, and in others have proved fatal.

The inflammation of internal scirrhous glands, or of those in the breasts sometimes goes off, and the fever, which depended upon it, ceases; but it much oftener happens, that it proceeds to cancerous and gangrenous ulcers, and terminates only in death. Death is also, almost universally, the consequence of hectic fever from tubercles of the lungs, which have in general at least been considered as glandular bodies in a scirrhous state.

Cure. It is not to be expected that the same remedies will in every case be adapted to a fever which, arising from very different causes, is attended with such a variety of symptoms. A mixture of asafetida and opium has in some persons seemed singularly serviceable in this fever, when brought on by a small wound; but in most other cases the principal if not the sole attention of the physician must be employed in relieving the symptoms, by tempering the heat, by preventing both costiveness and purging, by procuring sleep, and by checking the sweats. If, at the same time, continues Dr Heberden, he put the body into as good general health as may be, by air, exercise, and a proper course of mild diet, he can perhaps do nothing better than to leave all the rest to nature. In some few fortunate patients, nature appears to have such resources, as may afford reason for entertaining hopes of cure, even in very bad cases. For some have recovered from this fever attended with every symptom of an abdominal viscus incurably diseased, after all probable methods of relief from art had been tried in vain, and after the flesh and strength were so exhausted as to leave scarce any hopes from nature. In those deplorable circumstances, there has arisen a swelling not far from the probable seat of the disorder, and yet without any discoverable communication with it. This swelling has come to an abscess; in consequence of which the pulse has soon returned to its natural state, as have also the appetite, flesh, and strength. What nature has performed in those rare cases, Dr Heberden acquaints us, he has often endeavoured to imitate, by making issues or applying blisters near the seat of the disease; but he cannot say with the same success.

It seems at present, Dr Heberden observes, the opinion of many practitioners, that the gangrenes will be stopped, and suppuration become more kindly, by the use of Peruvian bark; and therefore this remedy is always either advised or permitted in the irregular fever joined with suppurations and gangrenes. But he affirms he does not remember ever to have seen any good effect from the bark in this fever unattended with an apparent ulcer; and even in gangrenes it so often fails, that in successful cases, where it has been administered, there must be room for suspicion that the success was owing to another cause. Dr Heberden acknowledges at the same time, that he never saw any harm from the bark, in these, or indeed in any other cases, except a slight temporary purging or sickness, where it has happened to disagree with the stomach, or where the latter has been loaded by taking the medicine too fast, especially in dry boluses wrapped in wafer-paper.

In hectic illnesses, where all other means have proved ineffectual, a journey to Bath is usually proposed by the friends, and wished for by the sick; but Dr Heberden justly observes, that, besides the fatigue and many inconveniences of a journey to a dying person, the Bath waters are peculiarly hurtful in this fever, which they never fail to increase, and thereby aggravate the sufferings and hasten the death of the patient.

ORDER II. PHLEGMASIÆ. 171

Phlegmasiæ membranosæ et parenchymatosæ, *Sauv.* Class III. Ord. I. II. *Sag.* 605.
Morbi febriles phlogistici, *Lin.* Class III.
Febres continuæ compositæ inflammatoriæ, V.
Morbi acuti febriles, *Boerh.* 770.
Febres inflammatoriæ, *Hoffm.* II. 105. *Junck.* 61.

The phlegmasiæ, or topical inflammations, are a very numerous assemblage of diseases. Their great

very

Phlegmasiæ. characteristics are, the general symptoms of fever, and a topical inflammation, attended with the lesion of some important function. And in most instances, when blood is drawn, it is found upon coagulation to be covered with a buffy coat. Under this order, many important genera are comprehended, each requiring a separate consideration.

172 GENUS VII. PHLOGOSIS.

173 Sp. I. PHLOGOSIS PHLEGMONE.

Phlegmone auctorum, *Sauv.* gen. 15. *Lin.* 39. *Vog.* 351.
Inflammatio, *Lin.* 231. *Boerh.* 370. *Junck.* 20.

This disease is a synocha fever, accompanied with an inflammation of some particular part either external or internal, and consequently it varies very much in its form and the degree of danger attending it, according to the situation and functions of the part affected with topical inflammation. To this species, therefore, belong the following diseases.

Furunculus, *Sauv.* gen. 18. *Vog.* 352.
Terminthus, *Vog.* 381.
Pupula, *Lin.* 275. *Sauv.* p. 6.
Varus, *Vog.* 436. *Lin.* 269. *Sauv.* p. 7.
Bacchia, *Lin.* 270.
Gutta Rosea, *Sauv.* gen. 4.
Gutta rosacea, *Vog.* 437.
Hordeolum, *Sauv.* gen. 27. *Lin.* 276. *Vog.* 434.
Otalgia, *Sauv.* gen. 197. *Lin.* 44. *Vog.* 148.
Dolor otalgicus, *Hoffm.* II. 336.
Parulis, *Vog.* 362.
Mastodynia, *Sauv.* gen. 210. *Vog* 153.
Paronychia, *Sauv.* gen. 21. *Lin.* 258 *Vog.* 345.
Arthrocace, *Sauv.* gen. 78. *Lin.* 256.
Pædarthrocace, *Vog* 419.
Spina ventosa, *Boerh.* 526.
Phimosis, *Sauv.* gen. 22. *Lin.* 297. *Vog.* 348.
Paraphimosis, *Vog.* 349.

For the cure of inflammations, Dr Cullen lays down the following indications. 1. To remove the remote causes when they are evident and continue to operate. 2. To take off the phlogistic diathesis affecting the whole system, or the particular part. 3. To take off the spasm of the particular part by remedies applied to the whole system or to the part itself.

The means of removing the remote causes will readily occur, from considering the particular nature and circumstances of the different kinds. Acrid matters must be removed, or their action must be prevented, by the application of demulcents. Compressing and overstretching powers must be taken away; and from their several circumstances, the means of doing so will be obvious.

The means of taking off the phlogistic diathesis of the system are the same with those already mentioned under the cure for synocha. The means of taking off the spasm also from the particular part, are much the same with those already mentioned. Only it is to be remembered, that topical bleedings, such as cupping with scarifications, applying leeches, &c. are in this case much more indicated; and that some of the other remedies are to be directed more particularly to the part affected, as shall be more fully considered when we treat of those diseases attended with particular inflammations.

When a tendency to suppuration is perceived, the proper indication is to promote the production of perfect pus as much as possible. For this purpose various remedies, supposed to possess a specific power, have been proposed: but it does not appear that any of them are possessed of a virtue of this kind; and, in Dr Cullen's opinion, all that can be done is to favour the suppuration by such applications as may support a moderate heat in the part, by some tenacity confine the perspiration, and by an emollient quality may weaken the cohesion of the teguments, and favour their erosion. As all abscesses are occasioned by the effusion of fluids, and as in the case of certain effusions a suppuration becomes not only unavoidable but desirable, it may be supposed that most of the means of procuring a resolution by diminishing the force of circulation, &c. ought to be avoided. But as we observe on the one hand, that a certain degree of increased impetus, or of the original symptoms of inflammation, is necessary to produce a proper suppuration; so it is then especially necessary to avoid those means of resolution which may diminish too much the force of circulation. And on the other hand, as the impetus of the blood, when violent, is found to prevent the proper suppuration; so, in such cases, though a tendency to suppuration may have begun, it may be proper to continue those means of resolution which moderate the force of the circulation. With respect to the opening of abscesses when completely formed, see the article SURGERY.

When an inflammation has taken a tendency to gangrene, that event is to be prevented by every possible means; and these must be different according to the nature of the several causes: but after a gangrene has in some degree taken place, it can be cured only by the separation of the dead from the living parts. This in certain circumstances can be performed, and most properly, by the knife. In other cases it can be done by exciting a suppuratory inflammation on the verge of the living part, whereby its cohesion with the dead part may be every where broken off, so that the latter may fall off by itself. While this is doing, it is proper to prevent the further putrefaction of the part, and its spreading wider. For this purpose various antiseptic applications have been proposed: but Dr Cullen is of opinion, that while the teguments are entire, these applications can hardly have any effect; and therefore, that the fundamental procedure must be to scarify the part so as to reach the living substance, and, by the wounds made there, to excite the suppuration required. By the same incisions also we give access to antiseptics, which may both prevent the progress of the putrefaction in the dead, and excite the inflammation necessary on the verge of the living parts

When the gangrene proceeds from the loss of tone, and when this communicated to the neighbouring parts prevents that inflammation which, as we have said, is requisite to the separation of the dead parts from the living, it will be necessary to obviate this loss of tone by tonic medicines given internally; and for this purpose the Peruvian bark has been found to be most effectual. But when the gangrene arises from the violence of inflammation, the bark may not only fail of proving a remedy, but may do harm: for its power as a tonic is especially suited to those cases of gangrene which proceed from an original loss of tone, as in the case

Phlogosis.

Phlegmasiæ

case of palsy and œdema; or in those cases where a loss of tone takes place while the original inflammatory symptoms are removed.

On the other hand, Mr Bell is of opinion, that incisions made with a view to admit the operation of antiseptic remedies in gangrenes, as well as the remedies themselves, must be pernicious from the irritation they occasion, and from the danger of wounding blood-vessels, nerves, or tendons, and also by allowing a free passage for the putrescent fluids into the parts not yet affected. And unless they be carried so deep as to reach the sound parts, applications of the antiseptic kind can never have any effect in answering the purpose for which they were intended. The same author also remarks, that all the advantages commonly observed from the great number of applications recommended for gangrene, are obtained with more ease, and generally too with more certainty, from the use of some gentle stimulating embrocation; which, by exciting a slight irritation upon the surface, especially when assisted by a free use of the Peruvian bark, produces for the most part such a degree of inflammation as is wished for. With this view he has frequently known a weak solution of sal ammoniac, a drachm of the salt to two ounces of vinegar and six of water, form a mixture of a very proper strength for every purpose of this kind. But the degree of stimulus can easily be either increased or diminished according to circumstances, by using a larger or smaller proportion of the salt.

Whenever, either by the means recommended, or by a natural exertion of the system, a slight inflammation appears between the diseased and sound parts, we may in general, with tolerable certainty, expect, that in due time the parts will be separated; and when a full suppuration is once fairly established, there can be little doubt that the mortified parts will be soon and easily removed.

A complete separation being effected, the remaining sore is to be treated in the manner described under the article SURGERY; with a proper attention, at the same time, to the support of the general system by the continuance of a nourishing diet, and the bark with such quantities of wine as may seem necessary.

With regard to the bark, however, it is proper to take notice of another case of mortification in which it is likewise unsuccessful, as well as in that attended with an high degree of inflammation; and that is, in those mortifications of the toes and feet, common in old people, or which arise from any cause increasing the rigidity of the vessels to such a degree as to prevent the motion of the fluids through them. In this case Mr Pott has discovered, that all kinds of warm applications are very unsuccessful; but that by the free use of opium, together with sedatives and relaxants externally applied, he has frequently seen the tumefaction of the feet and ancles subside, the skin recover its natural colour, and all the mortified parts separate in a very short time, leaving a clean sore. But as to scarifications, or any other attempt to separate artificially the mortified from the sound parts, he thinks them very prejudicial, by giving pain; which is generally of itself violent in this disease, and which seems to have a great share in producing the other evils.

The other terminations of inflammation either do not admit of any treatment except that of preventing them by resolution, or properly belong to the article SURGERY.

Phlogosis.

Sp. II. PHLOGOSIS ERYTHEMA. 174

Erythema, *Sauv.* gen. 11.

Erythema a punctura, *Sauv.* sp. 9.
  Erysipelas a vespis, *Sauv.* sp. 19.
  Psydracia a vespis, *Sauv.* sp. 2.
Erythema cum phlegmone.
  Erysipelas phlegmonodes auctorum.
Erythema cum œdemate.
  Erysipelas symptomaticum, *Sauv.* sp. 6.

The word *erythema* doth not apply to any primary disease, but to a great number of those cutaneous inflammations denominated by another general term, *viz.* the *erysipelas*, or "St Anthony's fire;" and which being commonly symptomatic, of some other inflammation or disorder, are to be removed only by removing the primary disease: the erythema is found scarcely to bear any kind of warm application to itself; and is very apt, if treated as a primary disease, to terminate in a gangrene of the part affected, or some other disorder still more dangerous. The difference between the *phlegmon* or preceding species, and *erythema*, according to Dr Cullen, is, that, in the former, the inflammation seems particularly to affect the vessels on the internal surface of the skin, communicating with the lax adjacent cellular texture; whence a more copious effusion, and that too of serum convertible into pus, takes place. In the erythema the affection is of the vessels on the external surface of the skin communicating with the *rete mucosum*, which does not admit of any effusion but what separates the cuticle and gives occasion to the formation of a blister, while the smaller size of the vessels admits only of the effusion of a thin fluid very seldom convertible into pus. For the cure of the fever attended with erythema or *erysipelas*, see below; and for the external treatment of erythema, see the article SURGERY.

GENUS VIII. OPHTHALMIA. 175
Inflammation of the Eyes.

Ophthalmia ſcrophuloſa, *Sauv.* ſp. 9.
Ophthalmia ſyphilitica, *Sauv.* ſp. 11.
Ophthalmia febricoſa, *Sauv.* ſp. 23.

From reading this long liſt of diſtinctions which authors have invented in the ophthalmia, it is evident, that by far the greateſt part of them are ſymptomatic, or merely the conſequences of other diſorders preſent in the habit; and therefore the remedies muſt be directed towards the removal of theſe primary diſorders; and when they are gone the opthalmia will be removed of courſe. Dr Cullen obſerves, that the inflammation of the eye may be conſidered as of two kinds; according as it is ſeated in the membranes of the ball of the eye, when it is named *ophthalmia membranarum*; or as it is ſeated in the ſebaceous glands placed in the tarſus, or edges of the eye-lids, in which caſe it may be termed *ophthalmia tarſi*. Theſe two kinds are very frequently connected together, as the one may excite the other; but they are ſtill to be diſtinguiſhed according as the one or the other may happen to be the primary affection.

1. The inflammation of the *membranes* of the eye affects eſpecially, and moſt frequently, the adnata, and appears in a turgeſcence of its veſſels; ſo that the red veſſels which are naturally there, become not only increaſed in ſize, but many more appear than in a natural ſtate. This turgeſcence of the veſſels is attended with pain, eſpecially upon the motion of the ball of the eye; and this irritation, like every other, applied to the ſurface of the eye, produces an effuſion of tears from the lacrymal gland.

The inflammation commonly, and chiefly, affects the adnata ſpread on the anterior part of the bulb of the eye; but uſually ſpreads alſo along the continuation of the adnata on the inſide of the palpebræ; and as that is extended on the tarſus palpebrarum, the excretories of the ſebaceous glands opening there are alſo frequently affected. When the affection of the adnata is conſiderable, it may be communicated to the ſubjacent membranes of the eye, and even to the retina itſelf; which thereby acquires ſo great ſenſibility, that every impreſſion of light becomes painful. The inflammation of the membranes of the eye is in different degrees, according as the adnata is more or leſs affected, or according as the inflammation is either of the adnata alone, or of the ſubjacent membranes alſo; and upon theſe differences, different ſpecies have been eſtabliſhed; but they ſeem all to differ only in degree, and are to be cured by the ſame remedies more or leſs employed.

The proximate cauſe of ophthalmia is not different from that of inflammation in general; and the different circumſtances of ophthalmia may be explained by the difference of its remote cauſes, and by the different parts of the eye which it happens to affect; as may be underſtood from what has been already ſaid. We ſhall therefore proceed to give an account of the method of cure.

The great objects to be aimed at in the treatment of ophthalmia, are, in the firſt place, the reſolution of the inflammation which has already taken place; and, ſecondly, the removal of thoſe conſequences which frequently ariſe from the inflammation, eſpecially if it have been of long ſtanding. But beſides theſe, while it has appeared from former obſervation, that there is a peculiar diſpoſition to the diſeaſe, practices may often be ſucceſsfully employed to combat this diſpoſition, and thus prevent the return of the affection.

The ophthalmia membranarum requires the remedies proper for inflammation in general; and when the deeper-ſeated membranes are affected, and eſpecially when a pyrexia is preſent, large general bleedings may be neceſſary. But this laſt is ſeldom the caſe; and, for the moſt part, the ophthalmia is an affection merely local, accompanied with little or no pyrexia. General bleedings therefore have little effect upon it, and the cure is chiefly to be obtained by topical bleedings, that is, blood drawn from the veſſels near the inflamed part; and opening the jugular vein, or the temporal artery, may be conſidered as in ſome meaſure of this kind. It is commonly ſufficient to apply a number of leeches round the eye; but it is perhaps ſtill better to draw blood by cupping and ſcarifying upon the temples. In many caſes, the moſt effectual remedy is to ſcarify the internal ſurface of the inferior eye-lid, and to cut the turgid veſſels upon the adnata itſelf.

Beſides blood-letting, purging, as a remedy ſuited to inflammation in general, has been conſidered as peculiarly adapted to inflammation in any part of the head, and therefore to ophthalmia; and it is ſometimes uſeful: but, for the reaſons given before with reſpect to general bleeding, purging in the caſe of ophthalmia does not prove uſeful in any proportion to the evacuation excited.—For relaxing the ſpaſm in the part, and taking off the determination of the fluids to it, bliſtering near the part has commonly been found uſeful. When the inflammation does not yield to the application of bliſters after topical bleeding, great benefit is often obtained by ſupporting a diſcharge from the bliſtered part, under the form of an iſſue, by which means a more permanent determination of blood from the part is obtained.

It is probably alſo on the ſame principle that the good effects obtained from the uſe of errhine medicines in obſtinate caſes of ophthalmia are to be accounted for. By theſe errhines, in particular, which occaſion

Phlegmasiæ and support for some time a great discharge from the nose, great benefit has often been obtained. The powder of asarabacca, or the infusion of hippocastanum, snuffed up the nose at bed-time in proper doses, are often productive of the best effects, when many other remedies have been tried in vain.

Ophthalmia, as an external inflammation, admits of topical applications. All those, however, which increase the heat and relax the vessels of the part, prove hurtful; and the admission of cool air to the eye, and the application of cooling and astringent medicines, which at the same time do not produce irritation, prove useful. Of all these the solution of acetated lead, assiduously applied, is perhaps the best. In the cure of this distemper, indeed, all irritation must carefully be avoided, particularly that of light; and the only certain means of doing this is by keeping the patient in a very dark chamber.

2. In the *ophthalmia tarsi*, the same medicines may be necessary, as have been already recommended, for the ophthalmia membranarum. However, as the ophthalmia tarsi may often depend upon an acrimony deposited in the sebaceous glands of the part, so it may require various internal remedies according to the variety of the acrimony in fault; for which we must refer to the consideration of scrophula, syphilis, or other diseases with which this ophthalmia may be connected; and where these shall not be evident, certain remedies more generally adapted to the evacuation of acrimony, such as mercury, may be employed. In the ophthalmia tarsi, it almost constantly happens that some ulcerations are formed on the tarsus. These require the application of mercury and copper, which alone may sometimes cure the whole affection; and they may be useful even when the disease depends upon a fault of the whole system.

Both in the ophthalmia membranarum, and in the ophthalmia tarsi, it is necessary to obviate that glueing together of the eye-lids which commonly happens in sleep; and which may be done by insinuating a little of any mild unctuous medicine between the eye-lids before the patient shall go to sleep.

The slighter kinds of inflammations from the dust or the sun, may be removed by fomenting with warm milk and water, adding a small portion of brandy; and by anointing the borders of the eye-lids with *unguentum tutiæ*, or the like, at night, especially when those parts are excoriated and sore. But in bad cases, after the inflammation has yielded a little to evacuations, the *cataplasma aluminis* of the London pharmacopœia spread on lint, and applied at bed-time, has been found the best external remedy. Before the use of the latter, the solution of white vitriol is prescribed with advantage; and in violent pains it is of service to foment frequently with a decoction of white poppy-heads. One of the most common and most disagreeable consequences of ophthalmia, is an offuscation of the cornea, so far obstructing the passage of light as to diminish or prevent vision. This is sometimes so considerable as to admit of removal by operation: but in slighter cases it may often be removed by the application of different gentle escharotics; and in this way, without the least danger of any inconvenience, good effects are often obtained, from gently introducing into the eye at bed-time a powder consisting of equal parts of crystals of tartar and sugar. Ophthalmia.

Where there is a disposition to frequent returns of this affection, the Peruvian bark is often employed with success in combating it: But nothing in general answers better than frequent and regular cold bathing of the eyes.

Genus IX. PHRENITIS. 176

Phrenzy, or *Inflammation of the Brain*.

Phrenitis, *Sauv.* gen. 101. *Lin.* 25. *Sag.* gen. 301. *Boerh.* 771. *Hoffm.* II. 131. *Junck.* 63.
Phrenismus. *Vog.* 45.
Cephalitis, *Sauv.* gen. 109. *Sag.* gen. 310.
Sphacelismus, *Lin.* 32.
Phrenitis vera, *Sauv.* sp. 1. *Boerh.* 771.
Phrenitis idiopathica, *Junck.* 63.
Cephalalgia inflammatoria, *Sauv.* sp. 9.
Cephalitis spontanea, *Sauv.* sp. 3.
Cephalitis siriasis, *Sauv.* sp. 4.
Siriasis, *Vog.* 34.
Cephalitis Littriana, *Sauv.* sp. 5.

Dr Cullen observes, that the true phrenitis, or inflammation of the membranes or substance of the brain, is very rare as an original disease: but, as a symptom of others, much more frequent; of which the following kinds are enumerated by different authors.

Phrenitis synochi pleuriticæ, *Sauv.* sp. 2.
Phrenitis synochi sanguineæ, *Sauv* sp. 4.
Phrenitis calentura, *Sauv.* sp 11.

Description. The signs of an impending phrenitis are, immoderate and continual watchings; or if any sleep be obtained, it is disturbed with dreams and gives no refreshment; acute and lasting pains, especially in the hind part of the head and neck; little thirst; a great and slow respiration, as if proceeding from the bottom of the breast, the pulse sometimes small and slow, sometimes quick and frequent; a suppression of urine; and forgetfulness. The distemper when present may be known by the following signs: The veins of the head swell, and the temporal arteries throb much; the eyes are fixed, sparkle, and have a fierce aspect; the speech is incoherent, and the patient behaves very roughly to the by-standers, with furious attempts to get out of bed, not indeed continually, but returning as it were by paroxysms; the tongue is dry, rough, yellow, or black; there is a coldness of the external parts; a proneness to anger; chattering of the teeth; a trembling of the hands, with

Tegma fix with which the ſick ſeem to be gathering ſomething, and actually do gather the naps off the bed-clothes.

Cauſes of, and perſons ſubject to, this diſorder. People of a hot and bilious habit of body, and ſuch as are of a paſſionate diſpoſition, are apt to be affected with phrenitis. In the ſame danger are thoſe who uſe much ſpices, or are given to hot and ſpirituous liquors; who have been expoſed more than uſual to the ſun, or obliged to undergo immoderate ſtudies or watchings; who are ſubject to head-achs, or in whom ſome cuſtomary hemorrhages have been ſtopped; or the diſeaſe may ariſe from ſome injury offered to the head externally. Dr Pringle obſerves, that the phrenitis, when conſidered as an original diſeaſe, is apt to attack ſoldiers in the ſummer-ſeaſon when they are expoſed to the heat of the ſun, and eſpecially when aſleep and in liquor. A ſymptomatic phrenitis is alſo more frequent in the army than elſewhere, on account of the violence done to all fevers when the ſick are carried in waggons from the camp to an hoſpital, where the very noiſe or light alone would be ſufficient, with more delicate natures, to raiſe a phrenzy. From theſe and ſimilar cauſes, a ſtate of active inflammation, affecting ſome parts within the cranium, is produced: and there can be no doubt, that from this all the ſymptoms of the diſeaſe ariſe, and particularly that peculiar delirium which characteriſes it. But in what manner local diſeaſes, even of the brain itſelf, produce affections of the mind, we are ſtill totally in the dark.

Prognoſis. Every kind of phrenitis, whether idiopathic or ſymptomatic, is attended with a high degree of danger; and, unleſs removed before the fourth day, a gangrene or ſphacelus of the meninges readily takes place, and the patient dies delirious. The following are the moſt fatal ſymptoms: A continual and furious delirium, with watching; thin watery urine, white fæces, the urine and ſtools running off involuntarily, or a total ſuppreſſion of theſe excretions; a ready diſpoſition to become ſtupid, or to faint; trembling, rigor, chattering of the teeth, convulſions, hiccough, coldneſs of the extremities, trembling of the tongue, ſhrill voice, a ſudden ceſſation of pain, with apparent tranquillity. The following are favourable: Sweats, apparently critical, breaking out; a ſeeming effort of nature to terminate the diſeaſe by a diarrhœa; a large hemorrhagy from the noſe; ſwellings of the glands behind the ears; hæmorrhoids.

Cure. From what has been ſaid of the theory of this diſeaſe, the cure muſt entirely depend on obtaining a reſolution of the inflammation. The objects chiefly to be aimed at with this view are, 1. The removal of ſuch exciting cauſes as continue to operate. 2. The diminution of the momentum of the blood in the circulating ſyſtem in general. 3. The diminution of impetus at the brain in particular: and, 4. The avoiding circumſtances which tend either to accelerate the motion of the blood or to give determination to the head.

Different practices may be uſed with theſe intentions; but here the moſt powerful remedies are to be immediately employed. Large and repeated bleedings are eſpecially neceſſary, and theſe too taken from veſſels as near as poſſible to the part affected. The opening the temporal artery has been recommended, and with ſome reaſon: but as the practice is attended with ſome inconveniences, perhaps the opening of the jugular veins may prove more effectual; with which, however, may be joined the drawing of blood from the temples by cupping and ſcarifying. It is alſo probable, that purging may be of more uſe in this than in ſome other inflammatory affections, as it may operate by revulſion. For the ſame purpoſe of revulſion, warm pediluvia are a remedy, but rather ambiguous. The taking off the force of the blood in the veſſels of the head by an erect poſture is generally uſeful. Bliſtering is alſo uſeful, but chiefly when applied near to the part affected. In ſhort, every part of the antiphlogiſtic regimen is here neceſſary, and particularly the admiſſion of cold air. Even cold ſubſtances applied to the head have been found uſeful; and the application of ſuch refrigerants as vinegar is certainly proper. Opiates are thought to be hurtful in every inflammatory ſtate of the brain. On the whole, however, it muſt be remarked, that practitioners are very uncertain with regard to the means proper to be uſed in this diſeaſe; and the more ſo, that the ſymptoms by which the diſeaſe is commonly judged to be preſent, appear ſometimes without any internal inflammation; and on the other hand, diſſections have ſhown that the brain has been inflamed, where few of the peculiar ſymptoms of inflammation had appeared before. Phrenitis.

Sp. I. CYNANCHE TONSILLARIS. 178
The *Inflammatory Quinsy.*

Cynanche tonſillaris, *Sauv.* ſp. 1.
Anginæ inflammatoria, ſp. 5. *Boerh.* 805.

Deſcription. This is an inflammation of the mucous membrane of the fauces, affecting principally that congeries of mucous follicles which forms the tonſils; and from thence ſpreading along the velum and uvula, ſo as frequently to affect every part of the mucous membrane. The diſeaſe appears by ſome tumor and redneſs of the parts; is attended with a painful and difficult deglutition; a troubleſome clamminеſs of the mouth and throat; a frequent but difficult excretion of mucus; and the whole is accompanied with pyrexia. The inflammation and tumor are commonly at firſt moſt conſiderable in one tonſil; and afterwards, abating in that, increaſe in the other. This diſeaſe is not contagious.

Cauſes of, and perſons ſubject to, this diſorder. This diſeaſe is commonly occaſioned by cold externally applied, particularly about the neck. It affects eſpecially the young and ſanguine; and a diſpoſition to it is often acquired by habit. It occurs eſpecially in the ſpring and autumn, when viciſſitudes of heat and cold frequently take place.

Prognoſis. This ſpecies of quinſy terminates frequently by reſolution, ſometimes by ſuppuration, but hardly ever by gangrene; though in ſome caſes ſloughy ſpots appear on the fauces: the prognoſis therefore is generally favourable.

Cure. As the principal morbid affection in this diſeaſe, on which all its characteriſing ſymptoms immediately

Phlegmasiæ

mediately depend, is the active inflammation in the tonsils and neighbouring parts, the object first and principally to be aimed at in the cure is to obtain a resolution of this inflammation. Sometimes, however, it is necessary to have recourse to practices, with the view of obviating urgent symptoms before a resolution can be effected: and in other cases, where a resolution cannot be obtained, it must be the aim of the practitioner to promote a speedy and favourable suppuration. After suppuration has taken place, the proper means of promoting a discharge of the purulent matter will conclude the cure. Here some bleeding may be necessary; but large and general evacuations are seldom beneficial. The opening of the ranular veins seems to be an insignificant remedy, according to Dr Cullen, but is recommended as efficacious by Sir John Pringle: more benefit, however, may in general be derived from leeches to the external fauces. The inflammation may be often relieved by moderate astringents, and particularly by acids applied to the parts affected. In many cases, nothing has been found to give more relief than the vapour of warm water received into the fauces.

Besides these, blistering, and still more frequently rubefacient medicines, are applied with success, as well as antiphlogistic purgatives; and every part of the antiphlogistic regimen is to be observed, except the application of cold. Sir John Pringle recommends a thick piece of flannel moistened with two parts of common sweet oil, and one of spirit of hartshorn (or in a larger proportion, if the skin will bear it), to be applied to the throat, and renewed once every four or five hours. By this means the neck, and sometimes the whole body, is put into a sweat, which after bleeding either carries off or lessens the inflammation. When the disease takes a tendency to suppuration, nothing will be more useful than the taking into the fauces the steams of warm water. Benefit is also obtained from poultices applied to the external fauces. When the abscess is attended with much swelling, if it break not spontaneously, it ought to be opened by a lancet; and this does not require much caution, as even the inflammatory state may be relieved by some scarification of the tonsils. When this disease runs very rapidly to such a height as to threaten suffocation, it is sometimes necessary to have recourse to bronchotomy as the only mean of saving the life of the patient. But there is reason to believe that this operation has sometimes been employed where it was not necessary: and we may safely venture to say, that it is but seldom requisite; insomuch that Dr Cullen tells us, he has never in his practice seen any case requiring bronchotomy.

History and description. This distemper is not particularly described by the ancient physicians; though perhaps the Syrian and Egyptian ulcers mentioned by Aretæus Cappadox, and the pestilent ulcerated tonsils we read of in Aetius Amideus, were of this nature. Some of the scarlet fevers mentioned by Morton seem also to have approached near to it. In the beginning of the last century, a disease exactly similar to this is described by the physicians of that time, as raging with great violence and mortality in Spain and some parts of Italy; but no account of it was published in this country till the year 1748, when a very accurate one was drawn up by Dr Fothergill, and in 1752 by Dr Huxham. The latter observes, that this disease was preceded by long, cold, and wet seasons; by which probably the bodies of people were debilitated, and more apt to receive contagion, which possibly also might be produced by the stagnant and putrid waters.

The attack of this disease was very different in different persons. Sometimes a rigor, with fulness and soreness of the throat, and painful stiffness of the neck, were the first symptoms complained of. Sometimes alternate chills and heats, with some degree of giddiness, drowsiness, or head-ach, ushered in the distemper. It seized others with much more feverish symptoms; great pain of the head, back, and limbs; a vast oppression of the præcordia, and continual sighing. Some grown persons went about for some days in a drooping state, with much uneasiness and anxiety, till at last they were obliged to take to their beds.—Thus various was the disease, says Dr Huxham, at the onset. But it commonly began with chills and heats, load and pain of the head, soreness of throat, and hoarseness; some cough, sickness at stomach, frequent vomiting and purging, in children especially, which were sometimes very severe; though a contrary state was more common to the adult. There was in all a very great dejection of spirits, very sudden weakness, great heaviness on the breast, and faintness, from the very beginning. The pulse in general was quick, small, and fluttering, though sometimes heavy and undulating. The urine was commonly pale, thin, and crude; however, in many grown persons, it was passed in small quantities and high-coloured, or like turbid whey. The eyes were heavy, reddish, and as it were weeping; the countenance very often full, flushed, and bloated, though sometimes pale, and sunk.

How slight soever the disorder might appear in the day-time, at night the symptoms became greatly aggravated, and the feverish habit very much increased, nay, sometimes a delirium occurred on the very first night; and this exacerbation constantly returned thro' the whole course of the disease. Indeed, when it was considerably on the decline, our author says he has been often pretty much surprised to find his patient had

had paſſed the whole night in a phrenzy, whom he had left tolerably cool and ſedate in the day.

Some few hours after the ſeizure, and ſometimes cotemporary with it, a ſwelling and ſoreneſs of the throat was perceived, and the tonſils became very tumid and inflamed, and many times the parotid and maxillary glands ſwelled very much, and very ſuddenly, even at the very beginning; ſometimes ſo much as even to threaten ſtrangulation. The fauces alſo very ſoon appeared of a high florid red, or rather of a bright crimſon, colour, very ſhining and gloſſy; and moſt commonly on the uvula, tonſils, velum palatinum, and back part of the pharynx, ſeveral whitiſh or aſh-coloured ſpots appeared ſcattered up and down, which oftentimes increaſed very faſt, and ſoon covered one or both the tonſils, uvula, &c. thoſe in the event proved ſloughs of ſuperficial ulcers (which ſometimes, however, eat very deep into the parts). The tongue at this time, though only white and moiſt at the top, was very foul at the root, and covered with a thick yellowiſh or brown coat. The breath alſo now began to be very nauſeous; which offenſive ſmell increaſed hourly, and in ſome became at length intolerable, and that too ſometimes even to the patients themſelves.

The ſecond or third day every ſymptom became much more aggravated, and the fever much more conſiderable; and thoſe that had ſtruggled with it tolerably well for 30 or 40 hours, were forced to ſubmit. The reſtleſſneſs and anxiety greatly increaſed, as well as the difficulty in ſwallowing. The head was very giddy, pained, and loaded; there was generally more or leſs of a delirium; ſometimes a pervigilium and perpetual phrenzy, though others lay very ſtupid, but often ſtarting and muttering to themſelves. The ſkin was very hot, dry, and rough; there was very rarely any diſpoſition to ſweat. The urine was pale, thin, crude; often yellowiſh and turbid. Sometimes a vomiting was urgent, and ſometimes a very great looſeneſs, in children particularly. The ſloughs were now much enlarged, and of a darker colour, and the ſurrounding parts tended much more to a livid hue. The breathing became much more difficult; with a kind of a rattling ſtertor, as if the patient was actually ſtrangling, the voice being exceeding hoarſe and hollow, exactly reſembling that from venereal ulcers in the fauces: this noiſe in ſpeaking and breathing was ſo peculiar, that any perſon in the leaſt converſant with the diſeaſe might eaſily know it by this odd noiſe; from whence indeed the Spaniſh phyſicians gave it the name of *garotillo*, expreſſing the noiſe made by perſons when they are ſtrangled with a rope. Our author never obſerved in one of them the ſhrill barking noiſe that we frequently hear in inflammatory quinſies. The breath of all the diſeaſed was very nauſeous; of ſome inſufferably fetid, eſpecially in the advance of the diſtemper to a criſis; and many about the fourth or fifth day ſpit off a vaſt quantity of ſtinking purulent mucus tinged ſometimes with blood; and ſometimes the matter was quite livid, and of an abominable ſmell The noſtrils likewiſe in many were greatly inflamed and excoriated, continually dripping down a moſt ſharp ichor or ſanious matter, ſo exceſſively acrid, that it not only corroded the lips, cheeks, and hands of the children that laboured under the diſeaſe, but even the fingers and arms of the very nurſes that attended them: as this ulceration of the noſtrils came on, it commonly cauſed an almoſt inceſſant ſneezing in the children; but few adults were affected with it, at leaſt to any conſiderable degree. It was ſurpriſing what quantities of matter ſome children diſcharged this way, which they would often rub on their face, hands, and arms, and bliſter them all over. A ſudden ſtoppage of this rheum from the mouth and noſtrils actually choaked ſeveral children; and ſome ſwallowed ſuch quantities of it, as occaſioned excoriations of the inteſtines, violent gripings, dyſentery, &c. nay, even excoriations of the anus and buttocks. Not only the noſtrils, fauces, &c. were greatly affected by this extremely ſharp matter, but the wind-pipe itſelf was ſometimes much corroded by it, and pieces of its internal membrane were ſpit up, with much blood and corruption; and the patients lingered on for a conſiderable time, and at length died tabid; though there were more frequent inſtances of its falling ſuddenly and violently on the lungs, and killing in a peripneumonic manner.

Dr Huxham was aſtoniſhed ſometimes to ſee ſeveral ſwallow with tolerable eaſe, though the tumor of the tonſils and throat, the quantity of thick mucus, and the rattling noiſe in breathing, were very terrible; which he thinks pretty clearly ſhows, that this malignant quinſy was more from the acrimony and abundance of the humours than the violence of the inflammation.

Moſt commonly the angina came on before the exanthemata; but many times the cuticular eruption appeared before the ſore-throat, and was ſometimes very conſiderable, though there was little or no pain in the fauces: on the contrary, a very ſevere angina ſeized ſome patients that had no manner of eruption; and yet, even in theſe caſes, a very great itching and deſquamation of the ſkin ſometimes enſued; but this was chiefly in grown perſons, very rarely in children. In general, however, a very conſiderable efflореſcence broke out on the ſurface of the body, particularly in children; and it moſt commonly happened the ſecond, third, or fourth day: ſometimes it was partial, ſometimes it covered almoſt the whole body, though very ſeldom the face: ſometimes it was of an eryſipelatous kind; ſometimes more puſtular: the puſtules frequently eminent, and of a deep fiery red colour, particularly on the breaſt and arms; but oftentimes they were very ſmall, and might be better felt than ſeen, and gave a very odd kind of roughneſs to the ſkin. The colour of the effloreſcence was commonly of a crimſon hue, or as if the ſkin had been ſmeared over with juice of raſberries, and this even to the fingers ends; and the ſkin appeared inflamed and ſwoln, as it were; the arms, hands, and fingers, were often evidently ſo, and very ſtiff, and ſomewhat painful. This crimſon colour of the ſkin ſeemed indeed peculiar to this diſeaſe. Though the eruption ſeldom failed of giving ſome manifeſt relief to the patient, as to anxiety, ſickneſs at ſtomach, vomiting, purging, &c. yet there was obſerved an univerſal fiery eruption on ſome perſons, without the leaſt abatement of the ſymptoms, nay almoſt every ſymptom ſeemed more aggravated, particularly the fever, load at breaſt, anxiety, delirium; and our author knew more than one or two patients die in the moſt raging phrenzy, covered with the moſt univerſal fiery raſh he ever ſaw: ſo that, as in the

Phlegmasiæ

the highly confluent small-pox, it seemed only to denote the quantity of the disease, as he terms it.

He had under his care a young gentleman, about 12 years of age, whose tongue, fauces, and tonsils, were as black as ink, and he swallowed with extreme difficulty; he continually spit off immense quantities of a black, sanious, and very fetid matter, for at least eight or ten days:—about the seventh day, his fever being somewhat abated, he fell into a bloody dysentery, though the bloody, sanious, fetid expectoration still continued, with a most violent cough. He at length indeed got over it, to the very great surprise of every one that saw him. Now, in this patient, a severe and universal rash broke out upon the second and third day; and the itching of his skin was so intolerable, that he tore it all over his body in a most shocking manner: yet this very great and timely eruption very little relieved his fever and phrenzy, or prevented the other dreadful symptoms mentioned,

An early and kindly eruption, however, was most commonly a very good omen; and, when succeeded by a very copious desquamation of the cuticle, one of the most favourable symptoms that occurred; but when the eruption turned of a dusky or livid colour, or prematurely or suddenly receded, every symptom grew worse, and the utmost danger impended, especially if purple or black spots appeared up and down, as sometimes happened; the urine grew limpid, and convulsions came on, or a fatal suffocation soon closed the tragedy.

The disease was generally at the height about the fifth or sixth day in young persons, in the elder not so soon; and the crisis many times was not till the 11th or 12th, and then very imperfect: some adults, however, were carried off in two or three days; the distemper either falling on the lungs, and killing in a peripneumonic manner; or on the brain, and the patient either died raving or comatose. In some, the disease brought on a very troublesome cough, purulent expectoration, hæmoptoë, and hectic; in which they lingered on for several weeks, and then died tabid.

If a gentle easy sweat came on the third or fourth day; if the pulse became more slow, firm, and equal; if the sloughs of the fauces cast off in a kindly manner, and appeared at the bottom tolerably clean and florid; if the breathing was more soft and free, and some degree of vigour and quickness returned in the eyes; all was well, and a salutary crisis followed soon by a continuance of the sweat, and a turbid, subsiding, farinaceous urine, a plentiful expectoration, and a very large desquamation of the cuticle. But if a rigor came on, and the exanthemata suddenly disappeared or turned livid; if the pulse grew very small and quick, and the skin remained hot and parched as it were, the breathing more difficult, the eyes dead and glassy, the urine pale and limpid, a phrenzy or coma succeeded, with a coldish clammy sweat on the face or extremities; life was despaired of; especially if a singultus and choaking or gulping in the throat attended, with sudden, liquid, involuntary, livid stools, intolerably fetid. In some few patients Dr Huxham observed, some time before the fatal period, not only the face bloated, sallow, shining, and greasy as it were, but the whole neck very much swoln, and of a cadaverous look; and even the whole body became in some degree œdematous; and the impression of a finger would remain fixed in a part, the skin not rising again as usual; an indication that the blood stagnated in the capillaries, and that the elasticity of the fibres was quite lost.

Cynanche.

Medical writers are still much divided in opinion, whether the cynanche maligna is to be considered as the same disease with the scarlatina anginosa, afterwards to be treated of, or not. This question will afterwards come to be more fully discussed. At present we may only observe, that although ulcerous sore throats of a malignant nature often appear sporadically, yet that the disease above described appears only as an epidemic, and is always the consequence of contagion.

Prognosis. This may be easily gathered from the above description. The malignant and putrid tendency of the disease is evident, and an increase of the symptoms which arise from that putrescent disposition of the body must give an unfavourable prognostic; as, on the contrary, a decrease of these, and an apparent increase of the *vis vitæ*, are favourable: in general, what is observed to be favourable in the nervous and putrid malignant fevers, is also favourable in this, and *vice versa*.

Causes. Since the accurate accounts given by Dr Fothergill and Huxham of the epidemics which prevailed about 50 years ago, this disease has frequently been observed at times epidemic in almost every different part of Britain. Like small-pox, measles, and chin-cough, it seems in every case to be the effect of a peculiar and specific contagion. It has been observed to prevail, equally generally in every situation, and at every season; and on exposure to the contagion, no age, sex, or condition, is exempted from it. But the having once had the disease, seems in this affection to afford the same security against future contagion as in the small-pox: at least instances, where it can be said that the same individual has been twice affected with it, are both very rare and very doubtful, as well as in small-pox.

Cure. Like other febrile contagions, the malignant ulcerous sore throat is terminated only by a natural course; and the chief business of the practitioner is to combat unfavourable occurrences. In this the septic tendency of the disease is chiefly to be kept in view. The debility with which it is attended renders all evacuations by bleeding and purging improper, except in a few instances where the debility is less, and the inflammatory symptoms more considerable. The fauces are to be preserved from the effects of the acrid matter poured out upon them, and are therefore to be frequently washed out by antiseptic gargles or injections; and the putrescent state of the whole system should be guarded against and corrected by internal antiseptics, especially by the Peruvian bark given in the beginning and continued through the course of the disease. Great benefit is also often derived from the liberal use of the mineral acids. Both the vitriolic and muriatic, in a state of proper dilution, have been highly extolled by different medical writers, and are productive of the best effects in actual practice, when they can be introduced to a sufficient extent. Emetics, both by vomiting and nauseating, prove useful. When any considerable tumor occurs, blisters applied exter-

Cynanche. externally will be of service, and in any case may be proper to moderate the inflammation.

Very lately, the internal use of the capsicum annuum, or Cayenne pepper as it is commonly called, has been highly celebrated in this affection; and it is particularly said to have been employed with singular success in the West Indies.

The best description of this disease we have in Dr Cullen's Practice of Physic. He informs us, that it consists in an inflammation of the glottis, larynx, or upper part of the trachea, whether it affect the membranes of these parts or the muscles adjoining. It may arise first in these parts, and continue to subsist in them alone; or it may come to affect these parts from the cynanche tonsillaris, or maligna, spreading into them.

In either way it has been a rare occurrence, and few instances of it have been marked and recorded by physicians. It is to be known by a peculiar croaking sound of the voice, by difficult respiration, with a sense of straitening about the larynx, and by a pyrexia attending it.

From the nature of these symptoms, and from the dissection of the bodies of persons who died of this disease, there is no doubt of its being of an inflammatory kind. It does not, however, always run the course of inflammatory affections; but frequently produces such an obstruction of the passage of the air, as suffocates, and thereby proves suddenly fatal.

It particularly proves fatal, in consequence of the trachea being obstructed by a membranous substance lining the inside of it, and very nearly approaching in appearance to the inflammatory exudation often discovered on the intestinal canal in those dying of enteritis.

If we judge rightly of the nature of this disease, it will be obvious, that the cure of it requires the most powerful remedies of inflammation to be employed upon the very first appearance of the symptoms. When a suffocation is threatened, whether any remedies can be employed to prevent it, is not yet determined by sufficient experience: but it is evident, that in certain cases the life of the patient can be preserved only by the removal of that matter which obstructs the passage of air through the trachea.

The accounts which books have hitherto given us of inflammations of the larynx, and the parts connected with it, amount to what we have now said; and many instances are recorded of the disease happening in adult persons: but there is a peculiar affection of this kind happening to infants, which has been little taken notice of till lately. Dr Home is the first who has given any distinct account of this disease; but, since he wrote, several other authors have taken notice of it, and have given different opinions concerning it.

This disease seldom attacks infants till after they have been weaned. After this period, the younger they are, the more they are liable to the disease. The frequency of it becomes less as children become more advanced; and there are few instances of children above 12 years of age being affected with it. It attacks children of the midland countries, as well as those who live near the sea; but it occurs much more frequently at certain places than at others. It does not appear to be contagious; and its attacks are frequently repeated in the same child. It is often manifestly the effect of cold applied to the body; and therefore appears most frequently in the winter and spring seasons. It very commonly comes on with the ordinary symptoms of a catarrh; but sometimes the peculiar symptoms of the disease show themselves at the very first.

These peculiar symptoms are the following: A hoarseness, with some shrillness and ringing sound, both in speaking and coughing, as if the noise came from a brazen tube. At the same time, there is a sense of pain about the larynx, some difficulty of respiration, with a whizzing sound in inspiration, as if the passage of the air were straitened. The cough which attends it, is commonly dry; and if any thing be spit up, it is a matter of a purulent appearance, and sometimes films resembling portions of a membrane. With all these symptoms, there is a frequency of pulse, a restlessness, and an uneasy sense of heat. When the internal fauces are viewed, they are sometimes without any appearance of inflammation; but frequently a redness, and even swelling, appears; and sometimes there is an appearance of matter like to that rejected by coughing, together with the symptoms now described, and particularly with great difficulty of breathing, and a sense of strangling in the fauces, by which the patient is sometimes suddenly taken off.

Many dissections have been made of infants who had died of this disease, and almost constantly there has appeared a preternatural substance, apparently membranous, lining the whole internal surface of the upper part of the trachea, and extending in the same manner

Phlegmasiæ

manner downwards into some of its ramifications. This preternatural membrane may be easily separated, and sometimes has been found separated in part, from the subjacent proper membrane of the trachea. This last is commonly found entire, that is, without any appearance of erosion or ulceration; but it frequently shows the vestiges of inflammation, and is covered by a matter resembling pus, like to that rejected by coughing; and very often a matter of the same kind is found in the bronchiæ, sometimes in considerable quantity.

From the remote causes of this disease; from the catarrhal symptoms commonly attending it; from the pyrexia constantly present with it; from the same kind of preternatural membrane being found in the trachea when the cynanche maligna is communicated to it; and from the vestiges of inflammation on the trachea discovered upon dissection; we must conclude, that this disease consists in an inflammatory affection of the mucous membrane of the larynx and trachea, producing an exudation analogous to that found on the surface of inflamed viscera, and appearing partly in a membranous crust, and partly in a fluid form resembling pus.

Though this disease consists in an inflammatory affection, it does not commonly end either in suppuration or gangrene. The troublesome circumstance of it seems to consist in a spasm of the muscles of the glottis, threatening suffocation.

When this disease terminates in health, it is by resolution of the inflammation, by ceasing of the spasm of the glottis, by an expectoration of the matter exuding from the trachea, and of the crusts formed there, and frequently it ends without any expectoration, or at least with such only as attends an ordinary catarrh. But in some instances, a salutary termination has very speedily taken place, in consequence of the discharge of the membranous substance from the trachea, even under its proper tubular form.

When the disease ends fatally, it is by a suffocation seemingly depending upon a spasm affecting the glottis; but sometimes, probably, depending upon a quantity of matter filling the bronchiæ, or obstructing the trachea.

As we suppose the disease to be an inflammatory affection, so we attempt the cure of it by the usual remedies of inflammation. Bleeding, both general and topical, has often given immediate relief, and, by being repeated, has entirely cured the disease. Blistering also, near to the part affected, has been found useful. Upon the first attack of the disease, vomiting, immediately after bleeding, seems to be of considerable use, and sometimes suddenly removes the disease. But emetics are still more useful in advanced periods. By the employment of these, the matter obstructing the trachea, and inducing spasmodic affections, has often been successfully removed, when the situation of the patient seemed to be almost desperate. And as in the progress of the disease fresh effusions of this matter are very apt to take place, the frequent repetition of emetics becomes necessary. It is often necessary to have recourse to those operating the most expeditiously, such as vitriolated zinc even in large doses. In every stage of the disease, the antiphlogistic regimen is necessary, and particularly the frequent use of laxative glysters. Though we suppose that a spasm affecting the glottis is often fatal in this disease, antispasmodic medicines have not in general been found of great service. Some, however, have strongly recommended the use of asafœtida under the form of injection; others place great confidence in oil, or oily mixtures, taken by the mouth: but more immediate benefit is derived from tepid bathing, and the employment of vitriolic ether, both externally and internally.

Cynanche.

Anginæ inflammatoriæ, sp 4. *Boerh.* 804.

This is not materially different from the cynanche tonsillaris; only that the inflammation is said to begin in the pharynx, though Dr Cullen says he never knew an instance of it. The symptoms are almost the same, and the cure is precisely so with that of the cynanche tonsillaris.

This is a disease well known to the vulgar, but little taken notice of by medical writers. It is often epidemic, and manifestly contagious. It comes on with the usual symptoms of pyrexia, which is soon after attended with a considerable tumor of the external fauces and neck. The swelling appears first as a glandular moveable tumor at the corner of the lower jaw; but it soon becomes uniformly diffused over a great part of the neck, sometimes on one side only, but more commonly on both. The swelling continues to increase till the fourth day; but from that period it declines, and in a few days more goes off entirely. As the swelling of the fauces recedes, it not unfrequently happens that some tumor affects the testicles in the male sex, or the breasts in the female. These tumors are sometimes large, hard, and somewhat painful; but are seldom either very painful or of long continuance. The pyrexia attending this disease is commonly slight, and goes off with the swelling of the fauces; but sometimes, when the swelling of the testicles does not succeed to that of the fauces, or when the one or the other has been suddenly repressed, the pyrexia becomes more considerable, is often attended with delirium, and has sometimes proved fatal.

As this disease commonly runs its course without either dangerous or troublesome symptoms, so it hardly requires any remedies. An antiphlogistic regimen, and avoiding cold, are all that will be commonly necessary. But when, upon the receding of the swellings, the pyrexia comes to be considerable, and threatens an affection of the brain, it will be proper, by warm fomentations,

ma- mentations, to bring back the ſwelling; and by vomit-
e ing, bleeding, or bliſtering, to obviate the conſequences of its abſence.

Under the general head of *Pneumonia*, Dr Cullen comprehends all inflammations of the thoracic viſcera, or membrane lining the inſide of that cavity; as the ſymptoms do not ſufficiently diſtinguiſh the ſeat of the affection, nor does a difference in the ſituation of the affected place make any difference in the cure. Pneumonia.

Deſcription. Pneumonic inflammation, however various in the ſeat, always diſcovers itſelf by pyrexia, difficult breathing, cough, and pain in ſome part of the thorax. It almoſt always comes on with a cold ſtage, and is accompanied with the other ſymptoms of pyrexia; though in ſome few inſtances the pulſe may not be more frequent, nor the heat of the body increaſed beyond what is natural. Sometimes the pyrexia is from the beginning accompanied with the other ſymptoms; but frequently it is formed ſome hours before them, and particularly before the pain be felt. The pulſe for the moſt part is frequent, full, ſtrong, hard, and quick; but, in a few inſtances, eſpecially in the advanced ſtate of the diſeaſe, it is weak, ſoft, and at the ſame time irregular. The difficulty of breathing is moſt conſiderable in inſpiration, both becauſe the lungs do not eaſily admit of a full dilatation, and becauſe the dilatation increaſes the pain attending the diſeaſe. The difficulty of breathing is alſo greater when the patient is in one poſture of the body rather than another. It is generally greater when he lies on the ſide affected; though ſometimes the contrary happens. Very often the patient cannot lie eaſy upon either ſide, and can find eaſe only when lying on the back; and ſometimes he cannot breathe eaſily, except when in ſomewhat of an erect poſture. The cough, in different caſes, is more or leſs urgent or painful It is ſometimes dry, or without any expectoration, eſpecially in the beginning of the diſeaſe; but more commonly it is, even from the beginning, moiſt, and the matter ſpit up various both in conſiſtence and colour, and frequently it is ſtreaked with blood. The pain is alſo different in different caſes, and felt in different parts of the thorax, but moſt frequently in one ſide. It has been ſaid to affect the right ſide more frequently than the left; but this is uncertain, and we are ſure that the left ſide has been very often affected. Sometimes it is felt as if it was under the ſternum; ſometimes in the back between the ſhoulders; and when in the ſides, its place has been higher or lower, more forward or backward; but the place of all moſt frequently affected is about the ſixth or ſeventh rib, near the middle of its length, or a little more forward. The pain is often ſevere and pungent; but ſometimes more dull and obtuſe, with a ſenſe of weight rather than of pain. It is moſt eſpecially ſevere and pungent when occupying the place laſt mentioned. For the moſt part it continues fixed in one part, but ſometimes ſhoots from the ſide to the ſcapula on one hand, or to the ſternum and clavicle on the other.

Dr Cullen ſuppoſes that the diſeaſe is always ſeated, or at leaſt begins, in ſome part of the pleura, taking that membrane in its greateſt extent, as now commonly underſtood; that is, as covering not only the internal ſurface of the cavity of the thorax, but alſo as forming the mediaſtinum, and as extended over the pericardium, and over the whole ſurface of the lungs. But as the ſymptoms never clearly indicate where

Phlegmasiæ

where the seat of the disease is, there is but little foundation for the different names by which it has been distinguished. The term *pleurisy* is improperly limited to that inflammation which begins in and chiefly affects the pleura costalis. This our author thinks is a rare occurrence; and that the pneumonia much more frequently begins in the pleura investing the lungs, producing all the symptoms which belong to what hath been called the *pleuritis vera*. The word *peripneumony* has been applied to an inflammation beginning in the parenchyma, or cellular texture of the lungs, and having its seat chiefly there. But to Dr Cullen it seems very doubtful if any acute inflammation of the lungs, or any disease which has been called *peripneumony*, be of that kind. It seems probable, that every acute inflammation begins in membranous parts; and in every dissection of persons who have died of peripneumony, the external membrane of the lungs, or some part of the pleura, has appeared to have been considerably affected. An inflammation of the pleura covering the upper surface of the diaphragm, has been distinguished by the appellation of *paraphrenitis*, as supposed to be attended with the peculiar symptoms of delirium, *risus sardonicus*, and other convulsive motions: but it is certain, that an inflammation of that portion of the pleura, and affecting also even the muscular substance of the diaphragm, has often taken place without any of the symptoms above-mentioned; and neither the dissections which have fallen under Dr Cullen's observation, nor any accounts of dissections, support the opinion that an inflammation of the pleura covering the diaphragm is attended with delirium more commonly than any other pneumonic inflammation.—It is to be observed, however, that though the inflammation may begin in one particular part of the pleura, the morbid affection is commonly communicated to the whole extent of the membrane.

The pneumonic inflammation, like others, may terminate by resolution, suppuration, or gangrene: but it has also a termination peculiar to itself; namely, when it is attended with an effusion of blood into the cellular texture of the lungs, which, soon interrupting the circulation of the blood through the viscus, produces a fatal suffocation. This indeed appears to be the most common termination of pneumonic inflammation when it ends fatally; for upon the dissection of almost every person who has died of this disease, it appears that such an effusion had happened. From the same dissections we learn, that pneumonic inflammation commonly produces an exsudation from the internal surface of the pleura, which appears partly as a soft viscid crust, often of a compact membranous form, covering every where the surface of the pleura, and particularly those parts where the lungs adhere to the pleura costalis, or mediastinum; and this crust seems always to be the cement of such adhesion. The same exsudation shows itself also by a quantity of a serous fluid commonly found in the cavity of the thorax; and some exsudation or effusion is usually found to have been made into the cavity of the pericardium. It seems likewise probable, that an effusion of this kind is sometimes made into the cavity of the bronchiæ; for in some persons who have died after labouring under a pneumonic inflammation for a few days only, the bronchiæ have been found filled with a considerable quantity of serous and thickish fluid, which must be considered rather as the effusion abovementioned, having had its thinner parts taken off by respiration, than as a pus so suddenly formed in the inflamed part. It is, however, not improbable, that this effusion, as well as that made into the cavities of the thorax and pericardium, may be a matter of the same kind with that which in other inflammations is poured into the cellular texture of the parts inflamed, and there converted into pus; but in the thorax and pericardium it does not always put on this appearance, because the crust covering the surface prevents the absorption of the thinner part. This absorption, however, may be compensated in the bronchiæ, by the drying power of the air; and therefore the effusion into them may assume a more purulent appearance. In many cases of pneumonic inflammation, when the expectoration is very copious, it is difficult to suppose that the whole proceeds from the mucous follicles of the bronchiæ; and it seems probable that a great part of it may come from the effused serous fluid just mentioned; and this too will account for the appearance of the expectoration being so often purulent. Perhaps the same thing will account for that purulent matter found in the bronchiæ, which Mr de Haen says he had often observed when there was no ulceration in the lungs, and which he accounts for in a very strange manner, namely, by supposing a pus formed in the circulating blood.

Pneumonia.

Dr Cullen is of opinion, that the effusion into the bronchiæ above-mentioned often concurs with the effusion of red blood into the cellular substance of the lungs to occasion the fatal suffocation which frequently terminates peripneumony: that the effusion of serum alone may have this effect: and that the serum poured out in a certain quantity, rather than any debility in the powers of expectoration, is the cause of that cessation of spitting which precedes the fatal event; for in many cases the expectoration has ceased, when no other symptoms of debility have appeared, and when, upon dissection, the bronchiæ have been full of liquid matter. Nay, it is even probable, that in some cases such an effusion may take place without any symptoms of violent inflammation; and in other cases the effusion taking place may seem to remove the symptoms of inflammation which had appeared before, and thus account for those unexpected fatal terminations which have sometimes happened.

Pneumonic inflammation seldom terminates by resolution, without being attended with some evident evacuation. An hæmorrhagy from the nose happening on some of the first days of the disease has sometimes put an end to it; and it is said, that an evacuation from the hæmorrhoidal veins, a bilious evacuation by stool, and an evacuation of urine with a copious sediment, have severally had the same effect; but such occurrences have been rare. The evacuation most frequently attending, and seeming to have the greatest effect in promoting resolution, is an expectoration of a thick, white, or yellowish matter, a little streaked with blood, copious, and brought up without much or violent coughing. Very frequently the resolution of this disease is attended with, and perhaps produced by, a sweat, which is warm, fluid, copious, over the whole body, and attended with an abatement of the frequency of the

Pneumonia. the pulse, heat of the body, and other febrile symptoms. Although, from the history now given, it appears that pleurisy and peripneumony cannot with propriety be considered as different diseases, yet it is certain that in different cases this affection occurs with an assemblage of symptoms separate and distinct. Thus even Dr Cullen himself, in his Nosology, has defined pleuritis to consist in pyrexia, attended with pungent pain of the side, painful respiration, difficulty of lying down, particularly on the affected side, and distressing cough, in the beginning dry, but afterwards humid, and often with bloody expectoration. While again he has defined peripneumony to consist in pyrexia, attended with a dull pain under the sternum and between the shoulders, anxiety, difficulty of breathing, humid cough, expectoration generally bloody, a soft pulse, and a tumid livid appearance of the countenance. It is highly probable, that the first of these sets of symptoms chiefly arises from a state of active inflammation, and the second from effusion. Thus, in certain cases, the symptoms may appear perfectly separate and distinct; but more frequently both inflammation and effusion are united; and thus the symptoms in both definitions are in general combined in the same patient.

Causes of, and persons subject to, this disorder. The remote cause of pneumonic inflammation is commonly cold applied to the body, obstructing perspiration, and determining to the lungs, while at the same time the lungs themselves are exposed to the action of cold. These circumstances operate chiefly when an inflammatory diathesis prevails in the system; and therefore those principally affected with this disease are persons of the greatest vigour, in cold climates, in the winter season, and particularly in the spring, when vicissitudes of heat and cold are frequent. This disease, however, may arise in any season when such varieties take place. Other remote causes also may have a share in producing this distemper; such as every means of obstructing, straining, or otherwise injuring, the pneumonic organs. The pneumonic inflammation has sometimes been so much an epidemic, that it hath been suspected of depending on a specific contagion; but Dr Cullen never met with an instance of its being contagious.

Prognosis. In pneumonic inflammations, a violent pyrexia is always dangerous. The danger, however, is chiefly denoted by the difficulty of breathing. When the patient can lie on one side only; when he can lie on neither side, but only on his back; when he cannot breathe with tolerable ease, except when the trunk of his body is erect; when even in this posture the breathing is very difficult, and attended with a turgescence and flushing of the face, with partial sweats about the head and neck, and an irregular pulse; these circumstances mark the difficulty of breathing in different degrees; and consequently, in proportion, the danger of the disease. A frequent violent cough, aggravating the pain, is always the symptom of an obstinate disease; and as the disease is seldom or never resolved without some expectoration, so a dry cough must always be an unfavourable symptom

The proper characteristics of the expectoration have been already laid down; and though an expectoration which has not these marks must indicate a doubtful state of the disease, yet the colour alone can give no certain prognostic. An acute pain, very much interrupting inspiration, is always the mark of a violent disease; but not of a more dangerous disease than an obtuse pain attended with very difficult respiration.

When the pains, which had at first affected one side only, shall afterwards spread into the other; or when, leaving the side first affected, they pass entirely into the other; these are always marks of a dangerous disease. A delirium coming on during a pneumonic inflammation is always a symptom denoting much danger.

When pneumonic disorders terminate fatally, it is on one or other of the days of the first week, from the third to the seventh. This is the most common case: but, in a few instances, death has happened at a later period. When the disease is violent, but admitting of resolution, this also happens frequently in the course of the first week; but in a more moderate disease the resolution is often put off to the second week. The disease generally suffers a remission on some of the days from the third to the seventh: which, however, may be often fallacious, as the disease sometimes returns again with as much violence as before; and in such a case with great danger. Sometimes it disappears on the third day, while an erysipelas makes its appearance on some external part; and if this continue fixed, the pneumonic inflammation does not recur. If the disease continue beyond the 14th day, it will terminate in a suppuration, or PHTHISIS. The termination by gangrene is much more rare than has been imagined: and when it does occur, it is usually joined with the termination by effusion: the symptoms of the one being hardly distinguishable from those of the other.

Cure. This must proceed upon the general plan mentioned under SYNOCHA; but, on account of the importance of the part affected, the remedies must be employed early, and as fully as possible: and these are chiefly directed with one of three views, viz. for obtaining a resolution of the inflammation in the thorax, for mitigating the urgent symptoms before a resolution can be effected, and for counteracting or obviating the consequences of the disease. Venesection is the remedy chiefly to be depended on; and may be done in either arm, as the surgeon finds most convenient; and the quantity taken away ought in general to be as large as the patient's strength will allow. The remission of pain, and the relief of respiration, during the flowing of the blood, may limit the quantity to be then drawn; but if these symptoms of relief do not appear, the bleeding should be continued to a considerable extent, unless symptoms of a beginning syncope come on. It is seldom that one bleeding, however large, will cure this disease; and though the pain and difficulty of breathing may be much relieved by the first bleeding, these symptoms commonly and after no long interval recur, often with as much violence as before. In this case the bleeding is to be repeated even on the same day, and perhaps to the same quantity as before. Sometimes the second bleeding may be larger than the first. There are persons who, by their constitution, are ready to faint even upon a small bleeding; and in such persons this may prevent the drawing so much blood at first as a pneumonic inflammation may require: but as the same persons are found

Phlegmasiæ

found to bear after-bleedings better than the first, this allows the second and subsequent bleedings to be larger, and to such a quantity as the symptoms of the disease may seem to require.

Bleedings are to be repeated according to the state of the symptoms, and they will be more effectual when practised in the course of the first three days than afterwards; but they are not to be omitted though four days of the disease may already have elapsed. If the physician has not been called in time, or the first bleedings have not been sufficiently large, or even though they should have procured some remission, yet upon the return of the urgent symptoms, bleeding may be repeated at any time within the first fortnight, or even after that period, if a suppuration be not evident, or if after a seeming solution the disease shall have returned.

With respect to the quantity of blood which may be taken away with safety, no general rules can be given; as it must be very different according to the state of the disease, and the constitution of the patient. In an adult male of tolerable strength, a pound avoirdupois of blood is a full bleeding. Any quantity above 20 ounces is a large, and any quantity below 12 is a small, bleeding. An evacuation of four or five pounds, in the course of two or three days, is generally as much as most patients will bear; but if the intervals between the bleedings, and the whole of the time during which the bleedings have been employed, have been long, the quantity taken upon the whole may be greater.

When a large quantity of blood hath been taken from the arm, and it is doubtful if more can be taken in that manner with safety, some blood may still be taken by cupping and scarifying. This will especially be proper, when the recurrence of the pain, rather than the difficulty of breathing, becomes the urgent symptom; and then the cupping and scarification should be made as near as possible to the pained part.

An expectoration sometimes takes place very early in this disease; but if the symptoms continue urgent, the bleedings must be repeated notwithstanding the expectoration: but in a more advanced state, and when the symptoms have suffered a considerable remission, we may then trust the cure to the expectoration alone. It is not observed that bleeding, during the first days of the disease, stops expectoration; on the contrary, it hath been often found to promote it; and it is only in a more advanced state of the disease, when the patient has been already exhausted by large evacuations and a continuance of his illness, that bleeding seems to put a stop to expectoration; and even then, this stoppage seems not to take place so much from the powers of expectoration being weakened by bleeding, as by its favouring the serous effusion in the bronchiæ, already taken notice of.

Besides bleeding, every part of the antiphlogistic regimen ought here to be carefully employed: the patient must keep out of bed as much as he can bear; must have plenty of warm diluting drinks, impregnated with vegetable acids, accompanied with nitre or some other cooling neutral salt; and the belly also ought to be kept open by emollient glysters or cooling laxative medicines. Vomiting in the beginning is dangerous; but in a somewhat advanced state of the disease emetics have been found the best means of promoting expectoration. Fomentations and poultices to the pained part have been found useful; but blistering is found to be much more effectual. A blister, however, ought not to be applied till at least one bleeding hath been premised, as venesection is less effectual when the irritation of a blister is present. If the disease be moderate, a blister may be applied immediately after the first bleeding; but in violent cases, where it may be presumed that a second bleeding may soon be necessary after the first, it will be proper to delay the blister till after the second bleeding, when it may be supposed that the irritation occasioned by the blister will be over before another bleeding becomes necessary. It may frequently be of use in this disease to repeat the blistering; and in that case the plasters should always be applied somewhere on the thorax, for when applied to more distant parts they have little effect. The keeping the blistered parts open, and making what is called a *perpetual blister*, has much less effect than a repeated blistering.

Pneumonia.

Many methods have been proposed for promoting expectoration, but none appear to be sufficiently effectual; and some of them, being acrid stimulant substances, are not very safe. The gums usually employed seem to be too heating; the squills less so; but they are not very powerful, and sometimes inconvenient, by the constant nausea they occasion. The volatile alkali may be of service as an expectorant, but it ought to be reserved for an advanced state of the disease. Mucilaginous and oily demulcents appear to be useful, by allaying that acrimony of the mucus which occasions too frequent coughing; and which coughing prevents the stagnation and thickening of the mucus, and thereby its becoming mild. The receiving into the lungs the steams of warm water, impregnated with vinegar, has often proved useful in promoting expectoration; and, for this purpose, the machine called the INHALER, lately invented by Dr Mudge of Plymouth, promises to be of great service. But of all others, the antimonial emetics, given in nauseating doses, promise to be the most powerful for promoting expectoration. The kermes mineral hath been greatly recommended; but doth not seem to be more efficacious than emetic tartar or antimonial wine; and the dose of the kermes is much more uncertain than that of the others.

Though this disease often terminates by a spontaneous sweating, this evacuation ought not to be excited by art, unless with much caution. When, after some remission of the symptoms, spontaneous sweats arise, they may be encouraged; but it ought to be without much heat, and without stimulant medicines. If, however, the sweats be partial and clammy only, and a great difficulty of breathing still remain, it will be very dangerous to encourage them.

Physicians have differed much with regard to the use of opiates in pneumonic affections. It appears, however, that, in the beginning of the disease, and before bleeding and blistering have produced some remission of the pain, and of the difficulty of breathing, opiates have a bad tendency, by their increasing the difficulty of breathing and other inflammatory symptoms. But in a more advanced state of the disease, when the difficulty of breathing has abated, and when the urgent symptom is a cough, proving the chief cause of the continuance of pain and want of rest, reft, opiates may be employed with great advantage and fafety. The interruption of the expectoration which they feem to occafion, is for a fhort time only; and they feem often to promote it, as they occafion a ftagnation of what was by frequent coughing diffipated infenfibly: and therefore give the appearance of what phyficians have called *concocted matter*.

Opium combined with calomel has of late been highly extolled in this and other inflammatory difeafes by Dr Hamilton of Lynn-Regis; who has given a full account of the fuccefs attending his practice with this remedy, for the fpace of 16 years, in the 9th volume of the Edinburgh Medical Commentaries. And fince his recommendation, the fame remedy has often been employed by others with great benefit.

16 *Vomica*, or *Abfcefs* of the *Lungs*.

Vomica, *Boerh.* 835, *Junck.* 35.
Pleurodyne vomica, *Sauv.* fp. 21.

This fometimes follows pneumonia, though the cafe is not frequent. The fymptoms of it fo much refemble the phthifis, that it can moft properly be treated of under that head.

17 Empyema.

This is another confequence of a pneumonia terminating unfavourably, and is occafioned by the effufion of a quantity of purulent matter into the cavity of the thorax, producing a lingering and painful diforder, very often incurable.

Defcription. The firft fign of an empyema is a ceffation of the pain in the breaft, which before was continual: this is followed by a fenfation of weight on the diaphragm; and a fluctuation of matter, fometimes making a noife that may be heard by the byftanders: the acute fever is changed into a hectic, with an exacerbation at night: a continual and troublefome dry cough remains. The refpiration is exceedingly difficult, becaufe the lungs are prevented by the matter from fully expanding themfelves The patient can lie eafily on that fide where the matter is effufed, but not on the other, becaufe then the weight of the matter on the mediaftinum produces uneafinefs. The more the hectic heat is augmented, the more is the body emaciated, and its ftrength decayed. In fome there is danger of fuffocation when they ftoop down, which goes off when they alter that pofture of the body; and in fome there is a purulent fpitting.—Thefe fymptoms are accompanied with great anxiety, palpitations of the heart, and faintings. Sometimes the patients have a fenfation like a hot vapour afcending from the cavity of the thorax to their mouth. Others, in a more advanced ftate of the difeafe, have a putrid tafte in the mouth. At the fame time, profufe night-fweats wafte the body, and greatly weaken the patient. The face at firft grows red on that fide where the matter lies, at laft the Hippocratic face comes on, and the eyes become hollow. The pulfe, efpecially on the affected fide, is quick, but more frequently intermitting. Sometimes the nails are crooked, and puftules appear on the thorax; and frequently, according to the teftimony of Hippocrates, the feet fwell, and, on the affected fide of the breaft, there is an inflation and fwelling of the fkin.

Empyema.

Caufes, &c. An empyema may arife either from the burfting of a vomica of the lungs, or from a fuppuration taking place after the inflammatory ftage of the pneumonia; or fometimes from a fuppuration in the cafe of a quinfy, when the inflammation had extended to the afpera arteria, from whence arifes a kind of bloody fpittle, and the patients are afflicted with an empyema, unlefs they die on the 7th day of the difeafe, according to the obfervation of Hippocrates. It may arife alfo from external violence, as wounds of the thorax, &c. blood extravafated, corrupted, or changed into pus Like the vomica, it is a rare diftemper, but may attack all thofe fubject to pneumonia.

Prognofis. Very few recover after an empyema has been once formed, efpecially if the operation of paracentefis be neglected. After this operation is performed, if a great quantity of bloody fetid pus be difcharged, if the fever continue, and if the patient fpit up a purulent, pale, frothy, livid, or green matter, with a decay of ftrength, there is no hope: But when a fmall quantity of pus, of a white colour, not very fetid, is difcharged; when the fever and thirft prefently ceafe, the appetite returns, and fæces of a good confiftence are difcharged, the ftrength alfo returning in fome degree; there is then hope of a perfect recovery. If the matter be not dried up in feven weeks time, the difeafe readily changes to a fiftulous ulcer, which is very difficult to cure. An empyema affecting both fides of the thorax is more dangerous than that which affects only one.

Cure. This confifts in evacuating the purulent matter contained in the cavity of the thorax, which is beft done by the operation of paracentefis. See the article Surgery. Afterwards the ulcer is to be treated with abftergent and confolidating medicines, and the fame internal ones are to be given as in a Phthisis.

Gen. XIII. CARDITIS. 188

Inflammation of the Heart.

Carditis, *Sauv.* gen. 111. *Vog.* 54.
Pericarditis, *Vog.* 53.
Carditis fpontanea, *Sauv.* fp. 1. *Senac.* Traité de Cœur, lib. iv. chap. 7. *Meckel*, Mem. de Berlin, 1756.
Eryfipelas pulmonis, *Lomm.* Obferv. lib. ii.

Defcription. This difeafe is attended with all the fymptoms of pneumonia, but in a higher degree; it is befides faid to be accompanied with hydrophobic fymptoms, fainting, palpitation of the heart, a feeming madnefs, a funk and irregular pulfe, watery eyes, and a dejected countenance, with a dry and black tongue. On diffection, the heart and pericardium are found very much inflamed, and even ulcerated, with many polypous concretions.

Caufes, &c. The fame as in the pneumonia.

Prognofis. In the carditis the prognofis is more unfavourable than in the pneumonia; and indeed, unlefs the difeafe very quickly terminates, it muft prove fatal, on account of the conftant and violent motion of the heart, which exafperates the inflammation, and increafes all the fymptoms.

Cure. Here bleeding is neceffary in as great a

Phlegmasiæ degree as the patient can possibly bear, together with blistering, and the antiphlogistic regimen likewise carried to a greater height than in the pneumonia; but the general method is the same as in other inflammatory diseases.

Cardialgia inflammatoria, *Sauv.* sp. 13. *Tralles*, de opio, sect. ii p. 231.

THESE diseases Dr Cullen has thought proper to consider all under the general head of GASTRITIS, as there are no certain signs by which they can be distinguished from each other, and the method of cure must be the same in all.

Description. The inflammation of the stomach is attended with great heat and pain in the epigastric region, extreme anxiety, an almost continual and painful hiccough, with a most painful vomiting of every thing taken into the stomach. Sometimes a temporary madness ensues; and there is an instance in the Edinburgh Medical Essays of the disorder being attended with an hydrophobia. The pulse is generally more sunk than in other inflammations, and the fever inclines to the nature of a typhus. The disorder is commonly of the remitting kind, and during the remissions the pulse frequently intermits. During the height of the disease, a mortal phrenzy frequently supervenes. The disease terminates on the fourth, seventh, ninth day, or from the eleventh to the fifteenth; and is more apt to end in a gangrene than pneumonic inflammations, and more frequently in a scirrhus than in an abscess.

Causes, &c. The inflammation of the stomach may arise from any acrid substance taken into it; from a vehement passion; too large draughts of cold liquor, especially when the person is very hot; from a surfeit; a stoppage of perspiration; repulsion of the gout; inflammations of the neighbouring viscera; or from external injuries, such as wounds, contusions, &c.— It affects chiefly those of a plethoric habit and hot bilious constitution. Gastritis

Prognosis. This disease is always very dangerous, and the prognosis doubtful, which also must always be in proportion to the severity of the symptoms. A cessation of pain, coldness about the præcordia, great debility, with a languid and intermitting pulse, with an abatement of the hiccough, denote a gangrene and speedy death. From the sensibility of the stomach also, and its great connection with the rest of the system, it must be obvious, that an inflammation of it, by whatever causes produced, may be attended with fatal consequences; particularly, by the great debility it produces, it may prove suddenly fatal, without running through the usual course of inflammations.—Its tendency to admit of resolution may be known by its having arisen from no violent cause, by the moderate state of the symptoms, and by a gradual remission of these symptoms in the course of the first or at most of the second week of the disease. The tendency to gangrene may be suspected from the symptoms continuing with unremitting violence notwithstanding the use of proper remedies, and a gangrene already begun may be known by the symptoms above-mentioned, particularly great debility and sudden cessation of pain. The tendency to suppuration may be known by the symptoms continuing but in a moderate degree for more than one or two weeks, and by a considerable remission of the pain while a sense of weight and anxiety still remain. When an abscess has been formed, the frequency of the pulse is first abated: but soon after it increases, with frequent cold shivering, and an exacerbation in the afternoon and evening; followed by night-sweats, and other symptoms of hectic fever. These at length prove fatal, unless the abscess open into the cavity of the stomach, the pus be evacuated by vomiting, and the ulcer soon healed.

Cure. It appears from dissections, that the stomach may very often be inflamed when the characteristic marks of it have not appeared; and therefore we are often exposed to much uncertainty in the cure. But when we have sufficient evidence that a state of active inflammation has taken place in the stomach, the principal object to be aimed at is to obtain a resolution. Before, however, this can be accomplished, it will often be necessary to employ measures with the view of obviating urgent symptoms. When the symptoms appear in the manner above described, the cure is to be attempted by large and repeated bleedings employed early in the disease; and from these we are not to be deterred by the weakness of the pulse, for it will commonly become fuller and softer after the operation. A blister ought also to be applied to the region of the stomach; and the cure will be assisted by fomentations of the whole abdomen, and by frequent emollient and laxative glysters. The irritability of the stomach in this disease will admit of no medicines being thrown into it; and if any can be supposed necessary, they must be exhibited in glysters. Diluting drinks may be tried; but they must be of the very mildest kind, and given in very small quantities at a time. Opiates, in whatever manner exhibited, cannot be retained in the stomach during the first days of the disease; but when the violence of the disease shall have abated, and when the pain and

vomiting

Phlegmasiæ vomiting recur at intervals only, opiates given in glysters may frequently be employed with advantage; and after bleeding and blisters no remedy is more effectual either in allaying the pain or vomiting. As soon as the stomach will retain any laxative, gentle refrigerant cathartics, taken by the mouth, such as the soda phosphorata, soda tartarisata, or the like, are productive of great benefit. A tendency to gangrene in this disease is to be obviated only by the means just now mentioned; and when it does actually supervene, it admits of no remedy. A tendency to suppuration is to be obviated by the same means employed early in the disease. After a certain period it cannot be prevented by any means whatever; and, when actually begun, must be left to nature; the only thing that can be done by art being to avoid all irritation.

194 B. *Gastritis Erysipelatosa*, or the *Erysipelatous Gastritis.*

Description. This species of inflammation takes place in the stomach much more frequently than the former. From dissections it appears that the stomach has been often affected with inflammation, when neither pain nor fever had given any notice of it; and such is justly looked upon to have been of the erysipelatous kind. This kind of inflammation also is especially to be expected from acrimony of any kind applied to the stomach; and would certainly occur much more frequently, were not the interior surface of this organ commonly defended by mucus exsuding in large quantity from the numerous follicles placed immediately under the villous coat. On many occasions, however, the exsudation of mucus is prevented, or the liquid poured out is of a less viscid kind, so as to be less fitted to defend the subjacent nerves; and it is in such cases that acrid matters may readily produce an erysipelatous affection of the stomach.

In many cases, however, this kind of inflammation cannot be discovered, as it takes place without pain, pyrexia, or vomiting: but in some cases it may; namely, when it spreads into the œsophagus, and appears on the pharynx and on the whole internal surface of the mouth. When therefore an erysipelatous inflammation affects the mouth and fauces, and there shall be at the same time in the stomach an unusual sensibility to all acrids, and also a frequent vomiting, there can be little doubt of the stomach's being affected in the same manner. Even when no inflammation appears in the fauces, if some degree of pain be felt in the stomach, if there be a want of appetite, an anxiety and frequent vomiting, an unusual sensibility with regard to acrids, some thirst, and frequency of pulse, there will then be room to suspect an inflammation in the stomach; and such symptoms, after some time, have been known to discover their cause by the inflammation rising to the fauces or mouth. Inflammation of this kind is often disposed to pass from one place to another on the same surface, and, in doing so, to leave the place it had at first occupied. Such an inflammation has been known to spread successively along the whole tract of the alimentary canal; occasioning, when in the intestines, diarrhœa, and in the stomach vomitings; the diarrhœa ceasing when the vomitings came on, and the vomitings on the coming on of the diarrhœa.

Causes, &c. An erysipelatous inflammation may arise from acrid matters taken into the stomach; or from some internal causes not yet well known. It frequently occurs in putrid diseases, and in those recovering from fevers.

Cure. When the disease is occasioned by acrid matters taken internally, and these may be supposed still present in the stomach, they are to be washed out by drinking a large quantity of warm and mild medicines, and exciting vomiting. At the same time, if the nature of the acrimony and its proper corrector be known, this should be thrown in; or if a specific corrector be not known, some general demulcents should be employed.

These measures, however, are more suited to prevent than to cure inflammation after it has taken place. When this last may be supposed to have happenpened, if it be attended with a sense of heat, with pain and pyrexia, according to the degree of these symptoms, the measures proposed for the cure of the other kind are to be more or less employed. When an erysipelatous inflammation of the stomach has arisen from internal causes, if pain and pyrexia occur, bleeding may be employed in persons not otherwise weakened; but in case of its occurring in putrid diseases, or where the patients are already debilitated, bleeding is inadmissible; all that can be done being to avoid irritation, and only throwing into the stomach what quantity of acids and acescent aliments it shall be found able to bear. In some conditions of the body in which this disease is apt to occur, the Peruvian bark and bitters may seem to be indicated; but an erysipelatous state of the stomach will seldom allow them to be used.

Genus XVI. ENTERITIS, 195

Inflammation of the *Intestines.*

Enteritis, *Sauv.* gen. 105. *Lin.* 29. *Vog.* 57. *Sag.* gen. 307.
Intestinorum inflammatio, *Boerh.* 959.
Febris intestinorum inflammatoria ex mesenterio, *Hoffm.* II. 170.

Sp. I. *Enteritis Phlegmonodæa*, or the *Acute Enteritis.* 196

Enteritis iliaca, *Sauv.* sp. 1.
Enteritis colica, *Sauv.* sp. 2. *Boerh.* 963.

Description. This disease shows itself by a fixed pain in the abdomen, attended with fever, vomiting, and costiveness. The pain is often felt in different parts of the abdomen, but more frequently spreads over the whole, and is particularly violent about the navel.

Causes, &c. Inflammations of the intestines may arise from the same causes as those of the stomach; though commonly the former will more readily occur from cold applied to the lower extremities, or to the belly itself. It is also found supervening on the spasmodic colic, incarcerated hernia, and volvulus.

Prognosis. Inflammations of the intestines have the same terminations with those of the stomach, and the prognosis in both cases is much the same.

Cure. The cure of enteritis is in general the same with that of gastritis: but in this disease there is commonly more opportunity for the introduction of liquids, of acid, acescent, and other cooling remedies, and even of laxatives; but as a vomiting frequently attends the enteritis, care must be taken not to excite that vomiting by the quantity or quality of any thing thrown

Phlegmasiæ

thrown into the stomach. With regard to the suppuration and gangrene of the intestines following the enteritis, the observations made respecting these terminations of gastritis are equally applicable in this disease.

197 Sp. II. *Enteritis Erysipelatosa*, or *Erysipelatous Enteritis.*

Concerning this nothing farther can be said, than what hath been already delivered concerning the gastritis.

198 Genus XVII. HEPATITIS.
Inflammation of the Liver.

Hepatitis, *Sauv.* gen. 113. *Lin.* 35. *Vog.* 58. *Sag.* gen. 312. *Boerh.* 914. *Hoffm.* II. 14. *Junck.* 65.

Description. The inflammation of the liver is thought to be of two kinds, acute and chronic; but the latter very often does not discover itself except by an abscess found in the liver after death, and which is supposed to have been occasioned by some degree of inflammation; for this reason the chronic inflammation often escapes observation, and we shall here only treat of the acute hepatitis.

The acute hepatitis is attended with considerable fever; a frequent, strong, and hard pulse; high coloured urine; an acute pain in the right hypochondrium, increased by pressing upon the part. The pain is very often in such a part of the side as to make it appear like a pleurisy; and frequently, like that, is increased on inspiration. The disease is also commonly attended with a cough, which is generally dry, but sometimes moist; and when the pain thus resembles a pleurisy, the patient cannot lie easily except upon the side affected. The pain is frequently extended to the clavicle, and to the top of the shoulder; and is attended sometimes with hiccough, and sometimes with vomiting. Some have added jaundice, or a yellowness of the eyes, to the symptoms of this distemper; but experience shows that it has often occurred without any such symptom.

When hepatitis is of the chronic kind, depending more on an accumulation and effusion in the liver, than in an increased action of its small vessels, the patient complains rather of a sense of weight than of pain; and the fever is by no means either acute or constant: but it often returns in paroxysms somewhat resembling the attacks of an intermittent. This disease is very slow in its progress, frequently continuing for many months, and at last terminating in a very considerable suppuration. In most cases, however, it may be discovered by careful examination of the region of the liver externally. By this means, a considerable enlargement of that viscus may in general be discovered.

Causes, &c. The remote causes of hepatitis are not always to be discerned, and many have been assigned on a very uncertain foundation. It has been supposed that the disease may be an affection either of the extremities of the hepatic artery, or those of the vena portarum; and the supposition is by no means improbable. The opinion, however, most commonly adopted is, that the acute hepatitis is an affection of the external membrane of the liver, and the chronic kind an affection of the parenchyma of that viscus. The acute disease may be seated either on the convex or concave surface of the liver; and in the former case a more pungent pain and hiccough may be produced, and the respiration is more considerably affected. In the latter there occurs less pain; and a vomiting is produced, commonly by some inflammation communicated to the stomach. The inflammation on the concave surface of the liver may be readily communicated to the gall-bladder and biliary ducts: and this, perhaps, is the only case of idiopathic hepatitis attended with jaundice.

Hepatitis.

Prognosis. The inflammation of the liver, like others, may end by resolution, suppuration, or gangrene; and the tendency to the one or to the other of those events may be known from what has been already mentioned concerning the prognosis in gastritis. The resolution of hepatitis is often the consequence of, or is attended with, evacuations of different kinds. A hæmorrhage, sometimes from the nose, and sometimes from the hæmorrhoidal vessels, gives a solution of the disease. Sometimes the same thing is accomplished by a bilious diarrhœa; and sometimes the resolution is attended with sweating, and an evacuation of urine depositing a copious sediment. Sometimes it may be cured by an erysipelas appearing in some external part. When the disease has ended in suppuration, the pus collected may be discharged by the biliary ducts; or, if the suppurated part does not adhere any where closely to the neighbouring parts, it may be discharged into the cavity of the abdomen: but if, during the first state of inflammation, the affected part of the liver shall have formed a close adhesion to some of the neighbouring parts, the discharge after suppuration may be various, according to the different seat of the abscess. When seated on the convex part of the liver, if the adhesion be to the peritonæum lining the common teguments, the pus may make its way through these, and be discharged outwardly: or if the adhesion shall have been to the diaphragm, the pus may penetrate through this, and into the cavity of the lungs; from whence it may be discharged by coughing. When the abscess is seated on the concave part of the liver, in consequence of adhesions, the pus may be discharged into the stomach or intestines; and into these last, either directly, or by the intervention of the biliary ducts. Upon a consideration of all these different circumstances therefore, together with the general principles of inflammation, must the prognosis of this disease be established.

Cure. For the cure of hepatitis, we must have recourse to the general means of removing other inflammatory disorders. Bleeding is to be used according to the degree of fever and pain. Blisters are to be applied: fomentations of the external parts, emollient glysters, gentle laxatives, diluents and refrigerants, are also useful. The cure, however, particularly in warm climates, where the disease is much more common than it is in Britain, is chiefly trusted to mercury. Not only in cases of the chronic kind, but in acute hepatitis also, after an attempt has been made to alleviate the urgent symptoms by bleeding and blistering, recourse is immediately had to this powerful mineral. It is employed by different practitioners, and in different cases, under various forms. Some are very

Phlegmasiæ

very fond of the use of calomel. But the preference is in general given, and perhaps with justice, to friction with mercurial ointment over the region of the liver. But under whatever form it may be employed, it is necessary that it should be introduced to such an extent as to keep the patient on the verge of salivation for some length of time; the duration being regulated by the circumstances of the case.

From the liberal use of mercury, there can be no doubt that a successful resolution has been obtained in many cases, which would otherwise have infallibly terminated in suppuration. But notwithstanding the most careful employment of it in some cases, suppuration will ensue; and then it is very doubtful whether any benefit will be derived from the continuance of it. But when a suppuration has been formed, and the abscess points outwardly, the part must be opened, the pus evacuated, and the ulcer healed according to the ordinary methods in use for healing abscesses and ulcers in other parts.

199 Genus XVIII. SPLENITIS.

Inflammation of the Spleen.

Splenitis, *Sauv.* gen. 114. *Lin.* 36. *Vog.* 59. *Junck.* 67. *Sag.* gen. 313.

Lienis inflammatio, *Boerh.* 958. & *Van Swieten.* Comm.

Splenitis phlegmonodæa, *Sauv.* sp. 1. *Forest*, l. xx. obs. 6. *De Haen*, apud *Van Swieten*, p. 958.

Pleuritis splenica, *Sauv.* sp. 19.

Splenalgia suppuratoria, *Sauv.* sp. 3.

Description. This disease, according to *Juncker*, comes on with a remarkable shivering succeeded by a most intense heat and very great thirst; a pain and tumor are perceived in the left hypochondrium, and the paroxysms for the most part assume a quartan form. When the patients expose themselves for a little to the free air, their extremities immediately grow very cold. If an hæmorrhagy happens, the blood flows out of the left nostril. The other symptoms are the same with those of the hepatitis. Like the liver, the spleen often is also subject to a chronic inflammation, which often happens after agues, and is called the *ague cake*, though that name is also frequently given to a scirrhous tumor of the liver succeeding intermittents.

Causes, &c. The causes of this distemper are in general the same with those of other inflammatory disorders; but those which determine the inflammation to that particular part more than another, are very much unknown. It attacks persons of a very plethoric and sanguine habit of body rather than others.

Prognosis. What has been said of the inflammation of the liver applies also to that of the spleen, tho' the latter is less dangerous than the former. Here also a vomiting of black matter, which in other acute diseases is such a fatal omen, sometimes proves critical, according to the testimony of Juncker. Sometimes the hæmorrhoids prove critical; but very often the inflammation terminates by scirrhus.

Cure. This is not at all different from what has been already laid down concerning the hepatitis.

200 Genus XIX. NEPHRITIS.

Inflammation of the Kidneys.

Nephritis, *Sauv.* gen. 115. *Lin.* 37. *Vog.* 65. *Sag.* gen. 314.

Nephritis vera, *Sauv.* sp. 1.

Nephritis.

Description. The nephritis has the same symptoms in common with other inflammations; but its distinguishing mark is the pain in the region of the kidney, which is sometimes obtuse, but more frequently pungent. The pain is not increased by the motion of the trunk of the body so much as a pain of the rheumatic kind affecting the same region. It may also frequently be distinguished by its shooting along the course of the ureter, and it is often attended with a drawing up of the testicle, and a numbness of the limb on the side affected; though indeed these symptoms most commonly attend the inflammation arising from a calculus in the kidney or ureter. The disease is also attended with frequent vomiting, and often with costiveness and colic pains. The urine is most commonly of a deep red colour, and is voided frequently and in a small quantity at a time. In more violent cases the urine is commonly colourless.

Causes, &c. The remote causes of this disease may be various; as external contusion, violent or long-continued riding; strains of the muscles of the back incumbent on the kidneys; various acrids in the course of circulation conveyed to the kidneys; and perhaps some other internal causes not yet well known: the most frequent is that of calculous matter obstructing the *tubuli uriniferi*, or calculi formed in the pelvis of the kidneys, and either sticking there or falling into the ureter.

Prognosis. This is not different from that of other inflammatory diseases.

Cure. When any of those causes operating as inducing the inflammation still continue to act, the first object in the cure must be the removal of these: but the principal intention to be had in view, is the resolution of the inflammation which has already taken place. But when, notwithstanding efforts for this purpose, the disease terminates in suppuration, it must be the endeavour of the practitioner to promote the discharge of purulent matter, and the healing of the ulceration in the kidney.

These different objects are principally accomplished by bleeding, external fomentation, frequent emollient glysters, antiphlogistic purgatives, and by the free use of mild and demulcent liquids. The use of blisters is scarce admissible, or at least will require great care to avoid any considerable absorption of the cantharides.

The other species of nephritis enumerated by authors are only symptomatic.

Genus XX. CYSTITIS. 201

Inflammation of the Bladder.

Cystitis, *Sauv.* gen. 108. *Lin.* 31. *Vog.* 66. *Sag.* gen. 309.

Inflammatio vesicæ, *Hoffm.* II. 157.

The Cystitis from *Internal Causes*. 202

Cystitis spontanea, *Sauv.* sp. 1.

The Cystitis from *External Causes*. 203

Cystitis a cantharidibus, *Sauv.* sp. 2.

Cystitis traumatica, *Sauv.* sp. 3.

 The

Phlegmasiæ

The inflammation of the bladder from internal causes is a very rare distemper; and when it does at any time occur, is to be cured in the same manner with other inflammations, avoiding only the use of cantharides. When the disease arises from the internal use of these flies, camphor is recommended, besides other cooling medicines, and particularly cooling and emollient glysters.

Genus XXI. HYSTERITIS.

204 *Inflammation* of the UTERUS.

Hysteritis, *Lin.* 38. *Vog.* 63.
Metritis, *Sauv.* gen. 107. *Sag.* gen. 315.
Inflammatio et febris uterina, *Hoffm* II. 156.

Description. This disease is often confounded with that called the *puerperal* or *child-bed fever*; but is essentially distinct from it, as will be shown in its proper place. The inflammation of the uterus is often apt to terminate by gangrene: there is a pain in the head, with delirium; and the uterine region is so exceedingly tender, that it cannot bear the most gentle pressure without intolerable pain. When the *fundus uteri* is inflamed, there is great heat, throbbing, and pain, above the pubes; if its posterior part, the pain is more confined to the loins and rectum, with a tenesmus; if its anterior part, it shoots from thence towards the neck of the bladder, and is attended with a frequent irritation to make water, which is voided with difficulty; and if its sides or the ovaria are affected, the pains will then dart into the inside of the thighs.

Causes, &c. Inflammations of the uterus, and indeed of the rest of the abdominal viscera, are very apt to take place in child-bed women; the reason of which seems to be the sudden change produced in the habit, and an alteration in the course of the circulating blood by the contraction of the uterus after delivery. The pressure of the gravid uterus being suddenly taken off from the *aorta descendens* after delivery, the resistance to the impulse of the blood passing through all the vessels derived from it, and distributed to the contiguous viscera, will be considerably lessened: it will therefore rush into those vessels with a force superior to their resistance; and, by putting them violently on the stretch, may occasion pain, inflammation, and fever. This contraction of the uterus also renders its vessels impervious to the blood which had freely passed through them for the service of the child during pregnancy; and consequently a much larger quantity will be thrown upon the contiguous parts, which will still add to their distension, and increase their tendency to inflammation.

Prognosis. An inflammation of the uterus generally may be expected to produce an obstruction of the lochia; but the fever produced seldom proves fatal, unless the inflammation be violent, and end in a gangrene.

Cure. This is to be attempted by the same general means already recommended, and the management of this disorder entirely coincides with that of the puerperal fever.

Description. The rheumatism is particularly distinguished by pains affecting the joints, and for the most part the joints alone; but sometimes also the muscular parts. Very often they shoot along the course of the muscles

Phlegmasiæ. muscles from one joint to another, and are always much increased by the action of the muscles belonging to the joint or of joints affected. The larger joints are those most frequently affected, such as the hip-joint and knees of the lower extremities, and the shoulders and elbows of the upper ones. The ancles and wrists are also frequently affected; but the smaller joints, such as those of the toes or fingers, seldom suffer. Sometimes the disease is confined to one part of the body, yet very frequently it affects many parts of it; and then it begins with a cold stage, which is immediately succeeded by the other symptoms of pyrexia, and particularly by a frequent, full, and hard pulse. Sometimes the pyrexia is formed before any pains are perceived; but more commonly pains are felt in particular parts before any symptoms of pyrexia occur. When no pyrexia is present, the pain may be confined to one joint only; but when any considerable pyrexia takes place, though the pain may chiefly be felt in one joint, yet it seldom happens that the pains do not affect several joints, often at the very same time, but for the most part shifting their place, and having abated in one joint they become more violent in another. They do not commonly remain long in the same joint, but frequently shift from one to another, and sometimes return to joints formerly affected; and in this manner the disease often continues for a long time. The fever attending these pains has an exacerbation every evening, and is most considerable during the night, when the pains also become more violent; and it is at the same time that the pains shift their place from one joint to another. These seem to be also increased during the night by the body being covered more closely, and kept warmer.

A joint, after having been for some time affected with pain, commonly becomes also affected with some swelling and redness, which is painful to the touch. It seldom happens that a swelling coming on does not take off the pain entirely, or secure the joint against a return of it. This disease is commonly attended with more or less sweating, which occurs early, but is seldom free or copious, and seldom either relieves from the pains or proves critical. The urine is high coloured, and in the beginning without sediment. This, however, does not prove entirely critical, for the disease often continues long after such a sediment has appeared in the urine. The blood is always sizy. The acute rheumatism differs from all other inflammatory diseases, in not being liable to terminate in suppuration: this almost never happens; but the disease sometimes produces effusions of a transparent gelatinous fluid into the sheathes of the tendons: but if these effusions be frequent, it is certain that the liquor must very frequently be absorbed; for it very seldom happens, that considerable or permanent tumors have been produced, or such as required to be opened and to have the contained fluid evacuated. Such tumors, however, have sometimes occurred, and the opening made in them has produced ulcers very difficult to heal.

Sometimes the rheumatism will continue for several weeks; but it seldom proves fatal, and it is rare that the pyrexia continues to be considerable for more than two or three weeks. While the pyrexia abates in its violence, if the pains of the joints continue, they are less violent; more limited in their place, being confined commonly to one or a few joints only; and are less ready to change their place. Rheumatismus.

It is often a very difficult matter to distinguish rheumatism from gout: but in rheumatism there in general occurs much less affection of the stomach; it affects chiefly the larger joints, and several of these are often affected with severe pain at the same time: it occurs at an earlier period of life than gout; it is not observed to be hereditary; and it can in general be traced to some obvious exciting cause, particularly to the action of cold.

Causes, &c. This disease is frequent in cold, and more uncommon in warm, climates. It appears most frequently in autumn and spring; less frequently in winter, while the frost is constant; and very seldom during the heat of summer. It may, however, occur at any season, if vicissitudes of heat and cold be for the time frequent. For the most part, the acute rheumatism arises from the application of cold to the body when unusually warm; or when the cold is applied to one part of the body, whilst the other parts are kept warm; or lastly, when the application of the cold is long continued, as when moist or wet clothes are applied to any part of the body.—These causes may affect persons of all ages; but the rheumatism seldom appears either in very young or in elderly persons, and most commonly occurs from the age of puberty to that of 35. These causes may also affect persons of any constitution, but they most commonly affect those of a sanguine temperament.

With respect to the proximate cause of rheumatism, there have been various opinions. It has been imputed to a peculiar acrimony; of which, however, there is no evidence; and the consideration of the remote causes, the symptoms, and cure, render it very improbable. A disease of a rheumatic nature, however, may be occasioned by an acrid matter applied to the nerves, as is evident from the tooth-ach, a rheumatic affection generally arising from a carious tooth. Pains arising from deep-seated suppurations may also resemble the rheumatism; and many cases have occurred in which such suppurations occasioned pains resembling the lumbago and ischias; but from what hath been already said, it seems improbable that ever any rheumatic case should end in suppuration.

The proximate cause of rheumatism hath by many been supposed to be a lentor in the fluids obstructing the vessels of the part; but in the former part of this treatise, sufficient reasons have been already laid down for rejecting the doctrine of lentor. While we cannot therefore find either evidence or reason for supposing that the rheumatism depends on any change in the state of the fluids, we must conclude that the proximate cause of it is the same with that of other inflammations not depending upon a direct stimulus.

In the case of rheumatism, it is supposed that the most common remote cause of it, that is, cold applied, operates especially on the vessels of the joints, these being less covered by a cellular texture than those of the intermediate parts of the limbs. It is farther supposed, that the application of cold produces a constriction of the extreme vessels, and at the same time an increase of tone or phlogistic diathesis in the course of them, from which arises an increased impetus of the

Phlegmasiæ

the blood, and at the same time a resistance to the free passage of it, and consequently inflammation and pain. It is also supposed, that the resistance formed, excites the *vis medicatrix* to a further increase of the impetus of the blood; and to support this, a cold stage arises, a spasm is formed, and a pyrexia and phlogistic diathesis are produced in the whole system.

Hence the cause of rheumatism appears to be exactly analogous to that of inflammations depending on an increased afflux of blood to a part while it is exposed to the action of cold. But there seems to be further in this disease some peculiar affection of the muscular fibres. These seem to be under some degree of rigidity; and therefore less easily admit of motion, and are pained upon the exertions of it. This also seems to be the affection which gives opportunity to the propagation of pains from one joint to another, and which are most severely felt in the extremities terminating in the joints, because beyond these the oscillations are not propagated. This affection of the muscular fibres explains the manner in which strains and spasms produce rheumatic affections; and, on the whole, shows, that with an inflammatory affection of the sanguiferous system, there is also in rheumatism a peculiar affection of the muscular fibres, which has a considerable share in producing the phenomena of the disease. And it would even appear, that in what has commonly been called *acute rheumatism*, in contradistinction to the chronic, of which we are next to treat, there exists not only a state of active inflammation in the affected parts, but also of peculiar irritability; and that this often remains after the inflammation is very much diminished or has even entirely ceased. Hence a renewal of the inflammation and recurrence of the pain take place from very slight causes; and in the treatment of the disease both the state of inflammation and irritability must be had in view.

Cure. For counteracting the state of active inflammation, the chief aim of the practitioner must be to diminish the general impetus of the circulation, and the impetus at the part particularly affected. For counteracting the state of irritability, he must endeavour to remove the disposition to encreased action in the vessels; to prevent the action of causes exciting painful sensations; and to obviate their influence on the part. The cure therefore requires, in the first place, an antiphlogistic regimen, and particularly a total abstinence from animal-food, and from all fermented or spirituous liquors; substituting a mild vegetable or milk diet, and the plentiful use of soft diluting liquors. On this principle also, blood-letting is the chief remedy of acute rheumatism. The blood is to be drawn in large quantity; and the bleeding is to be repeated in proportion to the frequency, fulness, and hardness of the pulse, and the violence of the pain. For the most part, large and repeated bleedings during the first days of the disease seem to be necessary, and accordingly have been very much employed: but to this some bounds are to be set; for very profuse bleedings occasion a slow recovery, and if not absolutely effectual, are ready to produce a chronic rheumatism.

To avoid that debility of the system which general bleedings are apt to occasion, the urgent symptom of pain may be often relieved by topical bleedings; and when any swelling or redness have come upon a joint, the pain may very certainly be relieved by topical bleedings: but as the pain and continuance of the disease seem to depend more upon the phlogistic diathesis of the whole system than upon the affection of particular parts, so topical bleedings will not supply the place of the general bleedings proposed above.

Rheumatismus.

To take off the phlogistic diathesis prevailing in this disease, purging may be useful, if procured by medicines which do not stimulate the whole system, as neutral salts, and other medicines which have a refrigerant power. Purging, however, is not so useful as bleeding in removing the phlogistic diathesis; and when the disease has become general and violent, frequent stools are inconvenient, and even hurtful, by the motion and pain which they occasion.

Next to blood-letting, nothing is of so much service, both in alleviating the pains in this disease and in removing the phlogistic diathesis, as the use of sudorifics: and of all the medicines belonging to this class, what has commonly been known by the name of Dover's powder, a combination of powder of ipecacuan and opium, is the most convenient and the most effectual. Copious sweating, excited by this medicine, and supported for 10 or 12 hours by tepid diluents, such as decoction of the woods, or the like, will in most instances produce a complete remission of the pain: and by this practice, combined with blood-letting and proper regimen, the disease may often be entirely removed.

If, however, after complete intermissions from pain for some length of time have been obtained by these means, it be found that there is a great tendency to a return of the pains without any obvious cause, recourse may be had with very great benefit to the use of the Peruvian bark. By the early use of this, where a complete intermission from pain is obtained, the necessity of repeated blood-letting and sweating is often superseded; but where a complete remission cannot be obtained, it has been suspected by some to be hurtful: and in these cases, when blood-letting and sudorifics have been pushed as far as may be thought prudent without being productive of the desired effect, very great benefit is often obtained from the use of calomel combined with opium, as recommended in the Edinburgh Medical Commentaries by Dr Hamilton of Lynn-Regis.

In this disease, external applications are of little service. Fomentations in the beginning of the disease rather aggravate than relieve the pains. The rubefacients and camphire are more effectual: but they commonly only shift them from one part to another, and do not prove any cure of the general affection. Blistering may also be very effectual in removing the pain from a particular part; but will be of little use, except where the pains are much confined to one place.

ARTHRODYNIA, or *Chronic Rheumatism*. 209
Rheumatismus chronicus Auctorum.

Description. When the pyrexia attending the acute rheumatism has ceased; when the swelling and redness of the joints are entirely gone, but pains still continue to affect certain joints, which remain stiff, feel uneasy upon

Phlegmasiæ

upon motion, changes of weather, or in the night-time only, the disease is then called the *chronic rheumatism*, as it often continues for a very long time.

The limits between the acute and chronic rheumatisms are not always exactly marked. When the pains are still ready to shift their place; when they are especially severe in the night-time; when, at the same time, they are attended with some degree of pyrexia, and with some swelling, and especially some redness, of the joints; the disease is to be considered as partaking of the nature of the acute rheumatism. But when there is no longer any degree of pyrexia remaining; when the pained joints are without redness; when they are cold and stiff; when they cannot easily be made to sweat; or when, while a free and warm sweat is brought out on the rest of the body, it is only clammy and cold on the pained joints; and when, further, the pains of these are increased by cold, and relieved by heat, applied to them; the case is to be considered as that of a purely chronic rheumatism: or perhaps more properly the first of the conditions now described may be termed the state of irritability, and the second the state of atony.

The chronic rheumatism, or rather the atonic, may affect different joints; but is especially apt to affect those which are surrounded with many muscles, and those of which the muscles are employed in the most constant and vigorous exertions. Such is the case of the vertebræ of the loins, the affection of which is named *lumbago;* or of the hip-joint, when the disease is named *ischias* or *sciatica*.

Violent strains and spasms occurring on sudden and somewhat violent exertions, bring on rheumatic affections, which at first partake of the acute, but very soon change into the nature of the chronic, rheumatism.—Such are frequently the lumbago, and other affections, which seem to be more seated in the muscles than in the joints. The distinction of the rheumatic pains from those resembling them which occur in the siphylis and scurvy must be obvious, either from the seat of the pains, or from the concomitant symptoms peculiar to those diseases. The distinction of the rheumatism from the gout will be more fully understood from what is laid down under the genus Podagra.

Causes, &c. The phenomena of the purely chronic rheumatism lead us to conclude, that its proximate cause is an atony both of the blood-vessels and of the muscular fibres of the part affected, together with such a degree of rigidity and contraction in the latter as frequently attend them in a state of atony: and indeed this atony, carried to a certain extent, gives rise to a state of paralysis, with an almost total loss of motion in the affected limbs. The paralytic state of rheumatism therefore may be pointed out as a fourth condition of the disease, often claiming the attention of the practitioner.

Cure. From the view just now given of the proximate cause of chronic rheumatism, the chief indication of cure must be, to restore the activity and vigour of the part, which is principally to be done by increasing the tone of the moving fibres, but which may sometimes also be aided by giving condensation to the simple solid. When, however, the disease has degenerated into the state of paralysis, the objects to be aimed at are, the restoration of a due condition to the nervous energy in the part affected; the obtaining free circulation of blood through the vessels of the part; and the removal of rigidity in membranes and ligaments.

Rheumatismus.

For answering these purposes, a great variety of remedies, both external and internal, are had recourse to. The chief of the external are, the supporting the heat of the part, by keeping it constantly covered with flannel; the increasing the heat of the part by external heat, applied either in a dry or humid form; the diligent use of the flesh-brush, or other means of friction; the application of electricity in sparks or shocks; the application of cold water by affusion or immersion; the application of essential oils of the most warm and penetrating kind; the application of salt brine; the employment of the warm bath or of the vapour baths, either to the body in general or to particular parts; and, lastly, the employment either of exercise of the part itself as far as it can easily bear, or by riding or other modes of gestation.

The internal remedies are, Large doses of essential oils drawn from resinous substances, such as turpentine. Substances containing such oils, as guaiac. Volatile alkaline salts. These or other medicines are directed to procure sweat; and calomel, or some other preparation of mercury, in small doses, may be continued for some time. Besides these, there are several others recommended. The cicuta, aconitum, and hyosciamus, have in particular been highly extolled; and an infusion of the rhododendron chrysanthum is said to be employed by the Siberians with very great success. An account of the Siberian mode of practice is given by Dr Matthew Guthrie of Petersburgh, in the fifth volume of the Edinburgh Medical Commentaries, and has been followed with success at other places.

Odontalgia gravidarum, *Sauv.* sp. 2.
Odontalgia hysterica, *Sauv.* sp. 3.
Odontalgia stomachica, *Sauv.* sp. 9.

Description. This well-known disease makes its attack by a most violent pain in the teeth, most frequently in the *molares*, more rarely in the *incisorii*, reaching sometimes up to the eyes, and sometimes backward into the cavity of the ear. At the same time there is a manifest determination to the head, and a remarkable tension and inflation of the vessels takes place, not only in the parts next to that where the pain is seated, but over the whole head.

Causes, &c. The toothach is sometimes merely a rheumatic affection, arising from cold, but more frequently from a carious tooth. It is also a symptom of pregnancy, and takes place in some nervous disorders; it may attack persons at any time of life, tho' it is most frequent in the young and plethoric.

Phlegmasiæ

Cure. Many empirical remedies have been proposed for the cure of the tooth-ach, but none have in any degree answered the purpose. When the affection is purely rheumatic, blistering behind the ear will almost always remove it; but when it proceeds from a carious tooth, the pain is much more obstinate. In this case it has been recommended to touch the pained part with a hot iron, or with oil of vitriol, in order to destroy the aching nerve; to hold strong spirits in the mouth; to put a drop of oil of cloves into the hollow of the tooth, or a pill of equal parts of opium and camphire: but one of the most useful applications of this kind is strong nitrous acid, diluted with three or four times its weight of spirit of wine, and introduced into the hollow of a tooth from which great pain arises, either by means of an hair pencil or a little cotton. The Peruvian bark has also been recommended, and perhaps with more justice, on account of its tonic and antiseptic powers; but very often all these remedies will fail, and the only infallible cure is to draw the tooth. See Surgery.

215 Sp. IV. The *Misplaced* GOUT.

Description. What we call a *paroxysm of the gout* is principally constituted by an inflammatory affection of some of the joints. This sometimes comes on suddenly, without any warning, but is generally preceded by several symptoms; such as the ceasing of a sweating which the feet had been commonly affected with before; an unusual coldness of the feet and legs; a frequent numbness, alternating with a sense of prickling along the whole of the lower extremities; frequent cramps of the muscles of the legs; and an unusual turgescence of the veins.

While these symytoms take place in the lower extremities, the body is affected with some degree of torpor and languor, and the functions of the stomach in particular are more or less disturbed. The appetite is diminished; and flatulency, or other symptoms of indigestion, are felt. These symptoms take place for several days, sometimes for a week or two, before a paroxysm comes on; but commonly, upon the day immediately preceding it, the appetite becomes keener than usual.

Podagra.

The circumstances of paroxysms are chiefly the following. They come on most commonly in the spring, and sooner or later according as the vernal heat succeeds sooner or later to the winter's cold; and, perhaps, sooner or later also, according as the body may happen to be more or less exposed to vicissitudes of heat and cold.

The attacks are sometimes felt first in the evening, but more commonly about two or three o'clock in the morning. The paroxysm begins with a pain affecting one foot, most commonly in the ball or first joint of the great toe, but sometimes in other parts of the foot. With the attack of this pain, there is commonly more or less of a cold shivering; which, as the pain increases, gradually ceases; and is succeeded by a hot stage of pyrexia, which continues for the same time with the pain itself. From the first attack, the pain becomes, by degrees, more violent, and continues in this state with great restlessness of the whole body till next midnight, after which it gradually remits; and, after it has continued for 24 hours from the commencement of the first attack, it commonly ceases almost entirely; and, with the coming on of a gentle sweat, allows the patient to fall asleep. The patient, upon coming out of this sleep in the morning, finds the pained part affected with some redness and swelling, which, after having continued for some days, gradually abate.

When a paroxysm has thus come on, although the violent pain after 24 hours be considerably abated, the patient is not entirely relieved from it. For some days he has every evening a return of more considerable pain and pyrexia, and these continue with more or less violence till morning. After going on in this manner for several days, the disease sometimes goes entirely off, not to return till after a long interval.

When the disease, after having thus remained for some time in a joint, ceases entirely, it generally leaves the person in very perfect health, enjoying greater ease and alacrity in the functions of both body and mind than he had for a long time before experienced.

At the beginning of the disease, the returns of it are sometimes only once in three or four years: but as it advances, the intervals become shorter, and at length the attacks are annual; afterwards they come twice each year; and at length recur several times during the course of autumn, winter, and spring; and as, when the fits are frequent, the paroxysms become also longer, so, in the advanced state of the disease, the patient is hardly ever tolerably free from it, except perhaps for two or three months in summer.

The progress of the disease is also marked by the parts which it affects. At first, it commonly affects one foot only; afterwards every paroxysm affects both feet, the one after the other; and as the disease proceeds, it not only affects both feet at once, but, after having ceased in the foot which was secondly attacked, returns again into the first, and perhaps a second time also into the other. Its changes of places are not only from one foot to another, but from the feet into other joints, especially those of the upper and lower extremities; so that there is hardly a joint of the body which,

Phlegmasiæ

which, on one occasion or other, is not affected. It sometimes affects two different joints at the very same time; but more commonly it is at any one time severe in a single joint only, and passes in succession from one joint to another; so that the patient's affliction is often protracted for a long time.

When the disease has often returned, and the paroxysms have become very frequent, the pains are commonly less violent than they were at first; but the patient is more affected with sickness, and the other symptoms of the atonic gout, which shall be hereafter mentioned.

After the first paroxysm of the disease, the joints which have been affected are entirely restored to their former suppleness and strength: but after the disease has recurred very often, the joints affected do neither so suddenly nor entirely recover their former state, but continue weak and stiff; and these effects at length proceed to such a degree, that the joints lose their motion entirely.

In many persons, but not in all, after the disease has frequently recurred, concretions of a chalky nature are formed upon the outside of the joints, and for the most part immediately under the skin. The matter seems to be deposited at first in a fluid form, afterwards becoming dry and firm. In their firm state, these concretions are a hard earthy substance, very entirely soluble in acids. After they have been formed, they contribute, with other circumstances, to destroy the motion of the joint.

In most persons who have laboured under the gout for many years, a nephritic affection comes on, and discovers itself by all the symptoms which usually attend calculous concretions in the kidneys, and which we shall have occasion to describe in another place. All that is necessary to be observed here is, that the nephritic affection alternates with paroxysms of the gout; and that the two affections, the nephritic and the gouty, are hardly ever present at the same time. This also may be observed, that children of gouty or nephritic parents commonly inherit one or other of these diseases; but whether the principal disease of the parent may have been either gout or nephritis alone, some of the children have the one and some the other. In some of them, the nephritic affection occurs alone, without any gout supervening; and this happens to be frequently the case with the female children of gouty parents.

In the whole of the history already given, we have described the most common form of the disease, and which therefore, however diversified in the progress of it, may be still called the regular state of the gout.—Upon some occasions, however, the disease assumes different appearances: but as we suppose the disease to depend always upon a certain diathesis, or disposition of the system; so every appearance which we can perceive to depend upon that same disposition, we still consider as a symptom and case of the gout. The principal circumstance, in what we term the *regular gout*, is the inflammatory affection of the joints; and whatever symptoms we can perceive to be connected with, or to depend upon, the disposition which produces that inflammatory affection, but without its taking place or being present at the same time, we name the *irregular gout*.

Podagra.

Of such irregular gout there are three different states, which may be named the *atonic*, the *retrocedent*, and the *misplaced* gout.

The first is, when the gouty diathesis prevails in the system; but, from certain causes, does not produce the inflammatory affection of the joints. In this case, the morbid symptoms which appear, are chiefly affections of the stomach, such as loss of appetite, indigestion, and its various attendants of sickness, nausea, vomiting, flatulency, acid eructations, and pains in the region of the stomach. These symptoms are frequently accompanied with pains and cramps in several parts of the trunk and the upper extremities of the body, which are relieved by the discharge of wind from the stomach. Together with these affections of the stomach, there commonly occurs a costiveness; but sometimes a looseness, with colic pains. These affections of the alimentary canal are often attended with all the symptoms of hypochondriasis, such as dejection of mind, a constant and anxious attention to the slightest feelings, an imaginary aggravation of these, and an apprehension of danger from them.

In the same atonic gout, the viscera of the thorax also are sometimes affected, and palpitations, faintings, and asthma, occur.

In the head also occur headachs, giddiness, apoplectic and paralytic affections.

When the several symptoms now mentioned occur in habits having the marks of a gouty disposition, this may be suspected to have laid the foundation of them; and especially when either, in such habits, a manifest tendency to the inflammatory affection has formerly appeared, or when the symptoms mentioned are intermixed with and are relieved by some degree of the inflammatory gout. In such cases there can be no doubt of considering the whole as a state of the gout.

Another state of the disease we name the *retrocedent* gout. This occurs when an inflammatory state of the joints has, in the usual manner, come on, but without arising to the ordinary degree of pain and inflammation; or at least without these continuing for the usual time, or without their receding gradually in the usual manner; these affections of the joints suddenly and entirely cease, while some internal part becomes affected. The internal part most commonly attacked is the stomach; which then is affected with anxiety, sickness, vomiting, or violent pain: but sometimes the internal part is the heart, which gives occasion to a syncope; sometimes it is the lungs, which are affected with asthma; and sometimes it is the head, giving occasion to apoplexy or palsy. In all these cases there can be no doubt that the symptoms are all a part of the same disease, however different the affection may seem to be in the parts which it attacks.

The third state of irregular gout, which we name the *misplaced*, is when the gouty diathesis, instead of producing the inflammatory affection of the joints, produces an inflammatory affection of some internal part, and which appears from the same symptoms that attend the inflammations of those parts arising from other causes.

Whether the gouty diathesis does ever produce such inflammation of the internal parts without having first produced it in the joints, or whether the inflammation of

Phlegmasiæ

of the internal part be always a translation from the joints previously affected, we dare not determine; but, even supposing the latter to be always the case, we think the difference of the affection of the internal part must still distinguish the *misplaced* from what we have named the *retrocedent gout*.

With regard to the misplaced gout, Dr Cullen, whom we here follow, tells us, that he never met with any cases of it in his practice, nor does he find any distinctly marked by practical writers, except that of a pneumonic inflammation.

There are two cases of a translated gout; the one of which is an affection of the neck of the bladder, producing pain, strangury, and a *catarrhus vesicæ*: the other is an affection of the rectum, sometimes indicated by pain alone in that part, and sometimes by hæmhorrhoidal symptoms. In gouty persons such affections have been known to alternate with inflammatory affections of the joints; but whether these belong to the retrocedent or to the misplaced gout, our author pretends not to determine.

It is commonly supposed, that there are some cases of rheumatism which are scarcely to be distinguished from the gout: but these, Dr Cullen thinks, are but few; and that the two diseases may be for the most part distinguished with great certainty, by observing the predisposition, the antecedent circumstances, the parts affected, the recurrences of the disease, and its connection with the system; which circumstances, for the most part, appear very differently in the two diseases.

Causes, &c. The gout is generally an hereditary disease: but some persons, without any hereditary disposition, seem to acquire it; and in some an hereditary disposition may be counteracted from various causes. It attacks the male sex especially; but it sometimes, tho' more rarely, attacks also the female. The females liable to it are those of the more robust and full habits; and it very often happens to those before the menstrual evacuation hath ceased. Dr Cullen hath also found it occurring in several females whose menstrual evacuations were more abundant than usual.

The gout seldom attacks eunuchs; and when it does, seems to fall upon those who happen to be of a robust habit, to lead an indolent life, and to live very full. It attacks especially men of robust and large bodies, who have large heads, are of full and corpulent habits, and whose skins are covered with a thicker *rete mucosum*, which gives a coarser surface. To speak in the style of the ancient physicians, the gout will seldom be found to attack those of a sanguine, or such as are of a purely melancholic temperament; but very readily those of a *cholerico-sanguine* temperament. It is, however, very difficult to treat this matter with precision. The gout seldom attacks persons employed in constant bodily labour, or those who live much upon vegetable aliment. It does not commonly attack men till after the age of 35; and generally not till a still later period. There are indeed instances of the gout appearing more early; but these are few in comparison of the others. When the disease does appear early in life, it seems to be in those who have the hereditary disposition very strong, and to whom the remote causes hereafter mentioned have been applied in a very confiderable degree.

Podagra.

As the gout is an hereditary disease, and affects men particularly of a certain habit, its remote causes may be considered as predisponent and occasional. The predisponent cause, as far as expressed by external appearances, has been already marked; and physicians have been very confident in assigning the occasional causes: but in a disease depending so much upon a predisposition, the assigning occasional causes must be uncertain; as in the predisposed the occasional causes may not always appear, and in persons not predisposed they may appear without effect; and this uncertainty must particularly affect the case of the gout.

The occasional causes of the disease seem to be of two kinds. First, those which induce a plethoric state of the body. Secondly, those which in plethoric habits, induce a state of debility. Of the first kind are a sedentary, indolent manner of life, and a full diet of animal-food. Of the second kind of occasional causes which induce debility are excess in venery; intemperance in the use of intoxicating liquors; indigestion, produced either by the quantity or quality of the aliments; much application to study or business, night-watching, excessive evacuations; the ceasing of usual labour; a sudden change from a very full to a very spare diet; the large use of acids and acescents; and lastly, cold applied to the lower extremities. The former seem to act by increasing the predisposition; the latter are commonly the exciting causes, both of the first attacks, and of the repetitions of the disease.

With respect to the proximate cause of the gout, it has generally been thought that it depends on a certain morbific matter always present in the body; and that this matter, by certain causes, thrown upon the joints or other parts, produces the several phenomena of the disease.

This doctrine, however ancient and generally received, appears to Dr Cullen to be very doubtful. For,

First, there is no direct evidence of any morbific matter being present in persons disposed to the gout. There are no experiments or observations which show that the blood or other humours of gouty persons are in any respect different from those of others. Previous to attacks of the gout, there appear no marks of any morbid state of the fluids; for the disease generally attacks those persons who have enjoyed the most perfect health, and appear to be in that state when the disease comes on. At a certain period of the disease, a peculiar matter indeed appears in gouty persons; but this, which does not appear in every instance, and which appears only after the disease has subsisted for a long time, seems manifestly to be the effect, not the cause, of the disease. Further, though there be certain acrids which, taken into the body, seem to excite the gout, it is probable that these acrids operate otherwise in exciting the disease, than by affording the material cause of it. In general, therefore, Dr Cullen thinks there is no proof of any morbific matter being the cause of the gout.

Secondly, the suppositions concerning the particular nature of the matter producing the gout, have been so various, and so contradictory, as to allow us to conclude, that there is truly no proof of the existence of

Phlegmasiæ

of any of them. With respect to many of these suppositions, they are so inconsistent with chemical philosophy, and with the laws of the animal œconomy, that they must be entirely rejected

Thirdly, the supposition of a morbific matter as the cause, is not consistent with the phenomena of the disease, particularly with its frequent and sudden translations from one part to another.

Fourthly, the supposition is further rendered improbable by this, that, if a morbific matter did exist, its operation should be similar in the several parts which it attacks: whereas it seems to be very different, being stimulant, and exciting inflammation, in the joints; but sedative and destroying the tone in the stomach: which, upon the supposition of the same particular matter acting in both cases, is not to be explained by any difference in the part affected.

Fifthly, Some facts alledged in proof of a morbific matter, are not sufficiently confirmed; such as those which would prove the disease to be contagious. There is, however, no proper evidence of this, the facts given being not only few, but exceptionable, and the negative observations innumerable

Sixthly, Some arguments brought in favour of a morbific matter are founded upon a mistaken explanation. The disease has been supposed to depend upon a morbific matter, because it is hereditary. But the inference is not just: for most hereditary diseases do not depend upon any morbific matter, but upon a particular conformation of the structure of the body transmitted from the parent to the offspring; and this last appears to be particularly the case in the gout. It may be also observed, that hereditary diseases depending upon a morbific matter, appear always much more early in life than the gout commonly does.

Seventhly, The supposition of a morbific matter being the cause of the gout, has been hitherto useless, as it has not suggested any successful method of cure. Particular theories of gout have often corrupted the practice, and have frequently led from those views which might have been useful, and from that practice which experience had approved. Further, though the supposition of a morbific matter has been generally received, it has been as generally neglected in practice. When the gout has affected the stomach, nobody thinks of correcting the matter supposed to be present there, but merely of restoring the tone of the moving fibres.

Eighthly, The supposition of a morbific matter is quite superfluous: for it explains nothing, without supposing that matter to produce a change in the state of the moving powers; and a change in the state of the moving powers, produced by other causes, explains every circumstance without the supposition of a morbific matter; and it may be observed, that many of the causes exciting the gout, do not operate upon the state of the fluids, but directly and solely upon that of the moving powers.

Lastly, Dr Cullen contends that the supposition of a morbific matter is superfluous; because, without that, the disease can be explained, he thinks, in a manner more consistent with its phenomena, with the laws of the animal œconomy, and with the method of cure which experience has approved. We now proceed to give this explanation; but, before entering upon it, we must premise some general observations which Dr Cullen states.

Podagra.

The first observation is, That the gout is a disease of the whole system, or depends upon a certain general conformation and state of the body, which manifestly appears from the facts above mentioned. But the general state of the system depends chiefly upon the state of its primary moving powers; and therefore the gout may be supposed to be an affection of these chiefly.

The second observation is, That the gout is manifestly an affection of the nervous system; in which the primary moving powers of the whole system are lodged. The occasional or exciting causes are almost all such as act directly upon the nerves and nervous system; and the greater part of the symptoms of the atonic or retrocedent gout are manifestly affections of the same system. This leads us to seek for an explanation of the whole of the disease, in the laws of the nervous system, and particularly in the changes which may happen in the balance of its several parts.

The third observation is, That the stomach, which has so universal a consent with the rest of the system, is the internal part that is the most frequently, and often very considerably, affected by the gout. The paroxysms of the disease are commonly preceded by an affection of the stomach; many of the exciting causes act first upon the stomach, and the symptoms of the atonic and retrocedent gout are most commonly and chiefly affections of the same organ. This observation leads us to remark, that there is a balance subsisting between the state of the internal and that of the external parts; and, in particular, that the state of the stomach is connected with that of the external parts, so that the state of tone in the one may be communicated to the other.

These observations being premised, Dr Cullen offers the following pathology of the gout.

In some persons there is a certain vigorous and plethoric state of the system, which at a certain period of life is liable to a loss of tone in the extremities. This is in some measure communicated to the whole system, but appears more especially in the functions of the stomach. When this loss of tone occurs while the energy of the brain still retains its vigour, the *vis medicatrix naturæ* is excited to restore the tone of the parts; and accomplishes it, by exciting an inflammatory affection in some part of the extremities. When this has subsisted for some days, the tone of the extremities and of the whole system is restored, and the patient returns to his ordinary state of health.

This is the course of things in the ordinary form of the disease, which we name the *regular gout;* but there are circumstances of the body, in which this course is interrupted or varied. Thus, when the atony has taken place, if the reaction do not succeed, the atony continues in the stomach, or perhaps in other internal parts; and produces that state which Dr Cullen, for reasons now obvious, named the *atonic gout.*

A second case of variation in the course of the gout is, when to the atony the reaction and inflammation have to a certain degree succeeded, but from causes either internal or external the tone of the extremities and perhaps of the whole system is weakened; so that the inflammatory state, before it had either proceeded to the degree, or continued for the time, requisite for

2

restoring

Phlegmasiæ. restoring the tone of the system, suddenly and entirely ceases: whence the stomach, and other internal parts, relapse into the state of atony; and perhaps have that increased by the atony communicated from the extremities: all which appears in what has been termed the *retrocedent state of the gout*.

A third case of variation from the ordinary course of the gout, is, when to the atony, usually preceding, an inflammatory reaction fully succeeds, but has its usual determination to the joints by some circumstances prevented; and is therefore directed to some internal part, where it produces an inflammatory affection, and that state of things which we have named the *misplaced gout*.

Though this theory of Dr Cullen's be supported with much ingenuity, yet we may confidently venture to assert, that on this subject he has been less successful in establishing his own opinion, than in combating those of others; and this theory, as well as others formerly proposed, is liable to numerous and unsurmountable objections. According to the hypothesis, a vigorous and plethoric habit should in every case exist prior to the appearance of gout; which is by no means consistent with fact: nor is it true that a vigorous and plethoric habit is liable at a certain age to a loss of tone in the extremities; which is another necessary condition in the hypothesis. Loss of tone often occurs in the extremities without exerting any peculiar influence on the stomach; and why a loss of tone in the stomach should excite the *vis medicatrix naturæ*, to restore it by exciting an inflammatory affection in some part of the extremities, is very inconceivable. Were the hypothesis true, every dyspeptic patient should infallibly be affected with gout; which, however, is by no means the case. In short, every step in the theory is liable to unsurmountable objections; and it by no means, any more than former hypotheses, explains the phenomena of the disease, particularly what Dr Cullen has himself so accurately pointed out, the connection of gouty with calculous complaints.

A very ingenious work has lately been published by an anonymous author, entitled "a Treatise on Gravel and upon Gout;" in which the sources of each are investigated, and effectual means of preventing or removing these diseases recommended. In this treatise an attempt is made to prove, that both diseases depend upon a peculiar concreting acid, the acid of calculi, or the *lithic acid*, as it has been styled by some. He supposes this acid, constantly present to a certain degree in the circulating fluids, to be precipitated by the introduction of other acids; and in this manner he explains the influence of acid wines and other liquors, as claret, cyder, &c. inducing gout; for he considers the circumstance chiefly constituting the disease as being an inflammation in parts of which the functions have been interrupted by the redundant acid precipitated. Although this theory be supported with much ingenuity, yet it is also liable to many objections. The sudden attack of the affection; its sudden transition from one part of the body to another; the instant relief of one part when another comes to be affected; and the various anomalous forms which the disease puts on, having an exact resemblance to different affections; are altogether irreconcileable to the idea of its depending on any fixed obstruction at a particular part arising from concreting acid. Nor does the plan of prevention and cure which he proposes, and which consists chiefly in abstinence from acid and in the destruction of acid, by any means correspond in every particular to be best established facts respecting the treatment of gout; to which we next proceed.

Podagra. *Cure*. In entering upon this, we must observe, in the first place, that a cure has been commonly thought impossible; and we acknowledge it to be very probable, that the gout, as a disease of the whole habit, and very often depending upon original conformation, cannot be cured by medicines, the effects of which are always very transitory, and seldom extend to the producing any considerable change of the whole habit.

It would perhaps have been happy for gouty persons if this opinion had been implicitly received by them; as it would have prevented their having been so often the dupes of self-interested pretenders, who have either amused them with inert medicines, or have rashly employed those of the most pernicious tendency. Dr Cullen, who has treated of the cure of the disease with great judgment, as he has done the theory with much ingenuity, is much disposed to believe the impossibility of a cure of the gout by medicines; and more certainly still inclined to think, that, whatever may be the possible power of medicines, yet no medicine for curing the gout has hitherto been found. Although almost every age has presented a new remedy, all hitherto offered have, very soon after, been either neglected as useless, or condemned as pernicious

But, though unwilling to admit the power of medicines, yet he contends, that a great deal can be done towards the cure of the gout by a regimen: and he is firmly persuaded, that any man who, early in life, will enter upon the constant practice of bodily labour, and of abstinence from animal-food, will be preserved entirely from the disease.

Whether there be any other means of radically curing the gout, the Doctor is not ready to determine. There are histories of cases of the gout, in which it is said, that by great emotions of mind, by wounds, and by other accidents, the symptoms have been suddenly relieved, and never again returned; but how far these accidental cures might be imitated by art, or would succeed in other cases, is at least extremely uncertain.

The practices proper and necessary in the treatment of the gout, are to be considered under two heads: *First*, As they are to be employed in the intervals of paroxysms; or, *secondly*, As during the time of these. In the intervals of paroxysms, the indications are, to prevent altogether the return of paroxysms; or at least to render them less frequent, and more moderate. During the time of paroxysms, the indications are, to moderate the violence and shorten the duration of them as much as can be done with safety.

It has been already observed, that the gout may be entirely prevented by constant bodily exercise, and by a low diet; and Dr Cullen is of opinion, that this prevention may take place even in persons who have a hereditary disposition to the disease. Even when the disposition has discovered itself by several paroxysms of inflammatory gout, he is persuaded that labour and abstinence will absolutely prevent any returns of it for the

Phlegmasiæ

the rest of life. These, therefore, are the means of answering the first indication to be pursued in the intervals of paroxysms.

Exercise in persons disposed to the gout, in Dr Cullen's opinion, has effect by answering two purposes: One of these is the strengthening of the tone of the extreme vessels; and the other, the guarding against a plethoric state. For the former, if exercise be employed early in life, and before intemperance has weakened the body, a very moderate degree of it will answer the purpose; and, for the latter, if abstinence be at the same time observed, little exercise will be necessary.

With respect to exercise, this in general is to be observed, that it should never be violent; for, if violent, it cannot be long continued, and must always endanger the bringing on an atony in proportion to the violence of the preceding exercise.

It is also to be observed, that the exercise of gestation, though considerable and constant, will not, if it be entirely without bodily exercise, answer the purpose in preventing the gout. For this end, therefore, the exercise must be in some measure that of the body; and must be moderate, but at the same time constant and continued through life.

In every case and circumstance of the gout in which the patient retains the use of his limbs, bodily exercise, in the intervals of paroxysms, will be always useful; and in the beginning of the disease, when the disposition to it is not yet strong, exercise may prevent a paroxysm which otherwise might have come on. In more advanced states of the disease, however, when there is some disposition to a paroxysm, much walking will bring it on; either as it weakens the tone of the lower extremities, or as it excites an inflammatory disposition in them: and thus it seems to be that strains or contusions often bring on a paroxysm of the gout.

Abstinence, the other part of the proper regimen for preventing the gout, is of more difficult application. If an abstinence from animal food be entered upon early in life, while the vigour of the system is yet entire, Dr Cullen has no doubt of its being both safe and effectual: but if the motive for this diet shall not have occurred till the constitution has been broken by intemperance, or by the decline of life, a low diet may then endanger the bringing on an atonic state.

Further, if a low diet be entered upon only in the decline of life, and be at the same time a very great change from the former manner of living, the withdrawing of an accustomed stimulus of the system may readily throw this into an atonic state.

The safety of an abstemious course may be greater or less according to the management of it. It is animal food which especially disposes to the plethoric and inflammatory state, and that food is to be therefore especially avoided; but, on the other hand, vegetable aliment of the lowest quality is in danger of weakening the system too much by not affording sufficient nourishment, and more particularly of weakening the tone of the stomach by its acescency. It is therefore a diet of a middle nature that is to be chosen; and milk is precisely of this kind, as containing both animal and vegetable matter.

As approaching to the nature of milk, and as being a vegetable matter containing the greatest portion of nourishment, the farinaceous seeds are next to be chosen, and are the food most proper to be joined with milk.

Podagra.

With respect to drink, fermented liquors are useful only when they are joined with animal food, and that by their acescency; and their stimulus is only necessary from custom. When, therefore, animal food is to be avoided, fermented liquors are unnecessary; and by increasing the acescency of vegetables, these liquors may be hurtful. The stimulus of fermented or spirituous liquors is not necessary to the young and vigorous, and when much employed impairs the tone of the system. These liquors, therefore, are to be avoided, except so far as custom and the declining state of the system may have rendered them necessary. For preventing or moderating the regular gout, water is the only proper drink.

With respect to an abstemious course, it has been supposed, that an abstinence from animal food and fermented liquors, or the living upon milk and farinacea alone for the space of one year, might be sufficient for a radical cure of the gout: and it is possible that, at a certain period of life, in certain circumstances of the constitution, such a measure might answer the purpose. But this is very doubtful: and it is more probable, that the abstinence must, in a great measure, be continued, and the milk-diet be persisted in, for the remainder of life. It is well known, that several persons who had entered on an abstemious course, and had been thereby delivered from the gout, have, however, upon returning to their former manner of full living, had the disease return upon them with as much violence as before, or in a more irregular and more dangerous form.

It has been alleged, that, for preventing the return of the gout, blood-letting or scarifications of the feet, frequently repeated, and at stated times, may be practised with advantage; but of this Dr Cullen tells us he has had no experience; and the benefit of the practice is not, as far as we know, confirmed by the observation of any other practitioner.

Exercise and abstinence are the means of avoiding the plethoric state which gives the disposition to the gout; and are therefore the means proposed for preventing the paroxysms, or at least for rendering them less frequent and more moderate. But many circumstances prevent the steadiness necessary in pursuing these measures: and therefore, in such cases, unless great care be taken to avoid the exciting causes, the disease may frequently return: and, in many cases, the preventing of paroxysms is chiefly to be obtained by avoiding those exciting causes already enumerated.

A due attention in avoiding these different causes will certainly prevent fits of the gout; and the taking care that the exciting causes be never applied in a great degree, will certainly render fits more moderate when they do come on. But, upon the whole, it will appear, that a strict attention to the general conduct of life, is in this matter necessary; and therefore, when the predisposition has taken place, it will be extremely difficult to avoid the disease.

Dr Cullen is firmly persuaded, that, by obviating the predisposition, and by avoiding the exciting causes, the gout may be entirely prevented: but, as the mea-

Phlegmasiæ

fures neceffary for this purpofe will, in moft cafes, be purfued with difficulty, and even with reluctance, men have been very defirous to find a medicine which might anfwer the purpofe without any reftraint on their manner of living. To gratify this defire, phyficians have propofed, and, to take advantage of it, empirics have feigned, many remedies. Of what nature feveral of thefe remedies have been, it is difficult to fay: but of thofe which are unknown, we conclude, from their having been only of temporary fame, and from their having foon fallen into neglect, that they have been either inert or pernicious, and therefore fhall make no inquiry after them; and fhall now remark only upon one or two known remedies for the gout which have been lately in vogue.

One of thefe is what has been named in England the *Portland powder*. This is not a new medicine, but is mentioned by Galen, and, with fome little variation in its compofition, has been mentioned by the writers of almoft every age fince that time. It appears to have been at times in fafhion, and to have again fallen into neglect; and Dr Cullen thinks that this laft has been owing to its having been found to be, in many inftances, pernicious. In every inftance which he has known of its exhibition for the length of time prefcribed, the perfons who had taken it were indeed afterwards free from any inflammatory affection of the joints; but they were affected with many fymptoms of the atonic gout; and all, foon after finifhing their courfe of the medicine, have been attacked with apoplexy, afthma, or dropfy, which proved fatal.

Another remedy which has had the appearance of preventing the gout, is an alkali in various forms; fuch as the fixed alkali, both mild and cauftic, lime-water, foap, and abforbent earths; and of late the alkaline aerated water has been more fafhionable than any other. Since it became common to exhibit thefe medicines in nephritic and calculous cafes, it has often happened that they were given to thofe who were at the fame time fubject to the gout; and it has been obferved, that under the ufe of thefe medicines, gouty perfons have been longer free from the fits of their difeafe. That, however, the ufe of thefe medicines has entirely prevented the returns of gout, Dr Cullen does not know; becaufe he never pufhed the ufe of thofe medicines for a long time, being apprehenfive that the long-continued ufe of them might produce a hurtful change in the ftate of the fluids.

As the preventing the gout depends very much on fupporting the tone of the ftomach, and avoiding indigeftion; fo coftivenefs, by occafioning this, is very hurtful to gouty perfons. It is therefore neceffary for fuch perfons to prevent or remove coftivenefs, and by a laxative medicine, when needful; but it is at the fame time proper, that the medicine employed fhould be fuch as may keep the belly regular, without much purging. Aloetics, rhubarb, magnefia alba, oleum ricini, or flowers of fulphur, may be employed, as the one or the other may happen to be beft fuited to particular perfons.

Thefe are the feveral meafures to be purfued in the intervals of the paroxyfms; and we are next to mention the meafures proper during the time of them.

As during the time of paroxyfms the body is in a feverifh ftate, no irritation fhould then be added to it; every part, therefore, of the antiphlogiftic regimen, except the application of cold, ought to be ftrictly obferved.

Podagra.

Another exception to the general rule may occur when the tone of the ftomach is weak, and when the patient has been before much accuftomed to the ufe of ftrong drink; for then it may be allowable, and even neceffary, to give fome animal-food and a little wine.

That no irritation is to be added to the fyftem during the paroxyfms of gout, except in the cafes mentioned, is agreed upon among phyficians: but it is a more difficult matter to determine, whether, during the time of paroxyfms, any meafures may be purfued to moderate the violence of reaction and of inflammation. Dr Sydenham has given it as his opinion, that the more violent the inflammation and pain, the paroxyfm will be the fhorter, as well as the interval between the prefent and the next paroxyfm longer: and, if this opinion be admitted as juft, it will forbid the ufe of any remedies which might moderate the inflammation; which is, to a certain degree, undoubtedly neceffary for the health of the body. On the other hand, acute pain preffes for relief; and although a certain degree of inflammation may feem abfolutely neceffary, it is not certain but that a moderate degree of it may anfwer the purpofe; and it is even probable, that in many cafes the violence of inflammation may weaken the tone of the parts, and thereby invite a return of paroxyfms. It feems to be in this way, that, as the difeafe advances, the paroxyfms become more frequent.

From thefe laft confiderations, it feems probable, that, during the time of paroxyfms, fome meafures may be taken to moderate the violence of the inflammation and pain, and particularly, that in firft paroxyfms, and in the young and vigorous, blood-letting at the arm may be practifed with advantage: but this practice cannot be repeated often with fafety; becaufe blood-letting not only weakens the tone of the fyftem, but may alfo contribute to produce plethora. However, bleeding by leeches on the foot, and upon the inflamed part, may be practifed and repeated with greater fafety; and inftances have been known of its having been employed with fafety to moderate and fhorten paroxyfms; but how far it may be carried, we have not had experience enough to determine.

Befides blood-letting and the antiphlogiftic regimen, it has been propofed to employ remedies for moderating the inflammatory fpafm of the part affected, fuch as warm bathing and emollient poultices. Thefe have fometimes been employed with advantage and fafety; but, at other times, have been found to give occafion to a retroceffion of the gout.

Bliftering is a very effectual means of relieving and difcuffing a paroxyfm of the gout; but has alfo frequently had the effect of rendering it retrocedent. The ftinging with nettles is analogous to bliftering; and probably would be attended with the fame danger. The burning with moxa, or other fubftance, is a remedy of the fame kind; but though not found hurtful, there is no fufficient evidence of its proving a radical cure.

Camphire, and fome aromatic oils, have the power of

Phlegmasiæ

of allaying the pain, and of removing the inflammation from the part affected: but these remedies commonly make the inflammation only shift from one part to another, and therefore with the hazard of its falling upon a part where it may be more dangerous; and they have sometimes rendered the gout retrocedent.

From these reflections it will appear, that some danger must attend every external application to the parts affected during a paroxysm; and that therefore the common practice of committing the person to patience and flannel alone, is established upon the best foundation. Opiates give the most certain relief from pain; but, when given in the beginning of gouty paroxysms, it has by some been thought that they occasion these to return with greater violence. When, however, the paroxysms shall have abated in their violence, but still continue to return, so as to occasion painful and restless nights, opiates may be given with safety and advantage; especially in the case of persons advanced in life, and who have been often affected with the disease. When, after paroxysms have ceased, some swelling and stiffness still remain in the joints, these symptoms are to be discussed by the diligent use of the flesh-brush. Purging immediately after a paroxysm will be always employed with the hazard of bringing it on again.

Thus far of the REGULAR gout. We now proceed to consider the management of the disease when it has become IRREGULAR.

In the *atonic* gout, the cure is to be accomplished by carefully avoiding all debilitating causes; and by employing, at the same time, the means of strengthening the system in general, and the stomach in particular.

For strengthening the system in general, Dr Cullen recommends frequent exercise on horseback, and moderate walking. Cold bathing also may answer the purpose; and may be safely employed, if it appear to be powerful in stimulating the system, and be not applied when the extremities are threatened with any pain.

For supporting the tone of the system in general, when threatened with atonic gout, some animal food ought to be employed, and the more acescent vegetables ought to be avoided. In the same case, some wine also may be necessary; but it should be in moderate quantity, and of the least acescent kinds, and if every kind of wine shall be found to increase the acidity of the stomach, ardent spirits and water must be employed.

For strengthening the stomach, bitters and the Peruvian bark may be employed; but care must be taken that they be not constantly employed for any great length of time.

The most effectual medicine for strengthening the stomach is iron, which may be employed under various preparations; but the best appears to be the rust in fine powder, which may be given in large doses.

For supporting the tone of the stomach, aromatics may be employed; but should be used with caution, as the frequent and copious use of them have an opposite effect; and they should therefore be given only in compliance with former habits, or for palliating present symptoms.

When the stomach happens to be liable to indigestion, gentle vomits may be frequently given, and proper laxatives should be always employed to obviate or to remove costiveness.

Podagra.

In the atonic gout, or in persons liable to it, to guard against cold is especially necessary; and the most certain means of doing this, is by repairing to a warm climate during the winter season. In the more violent cases, blistering the lower extremities may be useful; but that remedy should be avoided when any pain threatens the extremities. In persons liable to the atonic gout, issues may be established in the extremities as in some measure a supplement to the disease.

A second case of the irregular gout, is the *retrocedent*.

When this affects the stomach and intestines, relief is to be instantly attempted by the free use of strong wines, joined with aromatics, and given warm; or, if these shall not prove powerful enough, ardent spirits must be employed, and are to be given in a large dose. In moderate attacks, ardent spirits, impregnated with garlic or with asafœtida, may be employed; or, even without the ardent spirits, a solution of asafœtida, with the volatile alkali, may answer the purpose. Opiates are often an effectual remedy; and may be joined with aromatics, as in the electuarium opiatum; or they may be usefully joined with volatile alkali and camphire. Musk has likewise proved useful in this disease.

When the affection of the stomach is accompanied with vomiting, this may be encouraged, by taking draughts of warm wine, at first with water, and afterwards without it; having at length recourse, if necessary, to some of the remedies above mentioned, and particularly the opiates.

In like manner, if the intestines be affected with diarrhœa, this is to be at first encouraged by taking plentifully of weak broth; and when this shall have been done sufficiently, the tumult is to be quieted by opiates.

When the retrocedent gout shall affect the lungs, and produce asthma, this is to be cured by opiates, by antispasmodics, and perhaps by blistering on the back or breast.

When the gout, leaving the extremities, shall affect the head, and produce pain, vertigo, apoplexy, or palsy, our resources are very precarious. The most probable means of relief is, blistering the head; and, if the gout shall have receded very entirely from the extremities, blisters may be applied to these also. Together with these blisterings, aromatics, and the volatile alkali, may be thrown into the stomach.

The third case of the irregular gout is the *misplaced*; that is, when the inflammatory affection of the gout, instead of falling upon the extremities, falls upon some internal part. In this case, the disease is to be treated by blood-letting, and by such other remedies as would be proper in an idiopathic inflammation of the same parts.

Whether the translation so frequently made from the extremities to the kidneys, is to be considered as an instance of the misplaced gout, seems uncertain: but Dr Cullen is disposed to think it something different; and therefore is of opinion, that, in the *nephralgia calculosa* produced upon this occasion, the remedies of inflammation are to be employed no farther than they may

Phlegmasiæ

may be otherwise sometimes necessary in that disease, arising from other causes than the gout.

To this dissertation on the gout, taken from the works of our late learned professor, we cannot help subjoining a very uncommon case published by Dr Samuel Pye in the London Medical Transactions, where the gout would seem to have been occasioned by a morbific matter, and to have been cured by the evacuation of it.

"Mr Major Rook, surgeon and apothecary in Upper Shadwell, of about 45 years of age, a sober, temperate man, of a good habit of body, accustomed to no disease but the gout; the returns of the fits whereof had never been more frequent than once in 12 or 14 months, about the month of June 1752 was seized with a very severe paroxysm of the gout. As I had known some extraordinary effects proceeding from a vegetable diet in that distemper, particularly in one gentleman, who, by a total abstinence from all manner of food except cow's milk, and that without bread, had cured himself of this disease; and who, at the time I mentioned the case to my friend, was in the 13th year of his milk-diet; I persuaded Mr Rook to try what vegetables would do for him: he readily complied, and entered upon it immediately, with a resolution, that, if it answered his expectation, he would renounce fish and flesh for ever.

"But after the most religious abstinence from animal food of every kind for eleven weeks, being visited by a gentle attack in both feet, he returned immediately to his animal food. This paroxysm continued but 48 hours; but in March 1753 was succeeded by a very severe one in both feet.

"The pain in his feet, heels, and ankles, increased with great violence for about 10 or 12 days; till at length he was in the most extreme agonies; such as he had never felt before, and such as almost made him mad. In the height of this extremity, the pains (it is his own expression) from the feet, heels, and ankles, flew as quick as lightning directly to the calves of his legs; but remaining there not half a minute, and not in the least abating of their extreme violence (though the feet, heels, and ankles, were left entirely free from pain), from the calves, after a short stay of about half a minute, the pains ascended with the same velocity as before to both the thighs, at the same time leaving the calves of the legs free from pain: from the thighs, in less than the space of one minute, and as quick as before, they arrived at the abdomen; and after giving the patient one most severe twitch in the bowels, they reached the stomach: here the pains and here the fit ended, upon the patient's vomiting up about a pint and a half of a green aqueous liquor, but so extremely corrosive, that he compared it to the strongest mineral acid.

"This extraordinary crisis happened at about two in the morning: immediately after this discharge he fell asleep, and slept till seven or eight, and waked perfectly easy in every part, no signs of the distemper remaining but the swelling and tenderness of his feet; both of which went off gradually, so that in two days he was able to walk about his business.

"The next fit seized him in February 1754, in the common way; but was less violent than the former, and continued for about six weeks; during which time he had three increased paroxysms, or distinct smart fits, which held him about two hours each; in the last of which he had the same critical discharge, by vomiting of the same corrosive matter, preceded by the same uncommon symptoms as in the fit of 1753. But mending every hour, he was able the very next day to walk, and attend his patients, with more ease than after the first mentioned fit; for the swelling abated much sooner, and in three days disappeared.

Podagra.

"I have said, that this last fit was attended with three distinct paroxysms, the last of which ended as above: yet to show the disposition of nature, in this case, to throw off the offending humour in this her new way, it is remarkable, that in the two first of these increased paroxysms of pain, the patient declared to me that he never had the least ease till he had vomited; but as there was no translation of the pain before these vomitings, there was none of that corrosive matter to be dischaged; nothing but the common contents of the stomach was to be seen. These vomitings, however, procured the patient some ease; but the fit of the gout went on till the third paroxysm was over, which ended as has been related.

"As the crisis in this case is uncommon, I must take notice of a symptom or two, which were no less extraordinary, in both these fits of the gout.

"A most profuse sweat attended the patient every morning during the whole course of the fits; which was so very offensive, and at the same time his breath so uncommonly stinking, that neither the patient himself, nor those who waited on him, were ever sensible of the like.

"His linen was tinged as with saffron; and his urine very high coloured, of almost as deep a red as claret: but, upon the critical vomitings, every one of these symptoms disappeared with the disease.

"On the 9th of December 1755, he was attacked again in one foot. The symptoms, however, were so very mild, that he took no notice of them to his family till the 12th: from that day the pain was aggravated, and the swelling greatly increased, by walking and riding in a coach. On the 17th it became extremely violent, particularly in the heel; when it instantaneously left the parts affected, and in the same manner and with equal velocity (as in the two former fits), it flew into the calves of his legs, thighs, and abdomen; and when it had reached the stomach, it caused him to vomit the same kind of corrosive acid as in the two former fits; and though the quantity was no more than a tea-spoonful, he became perfectly well in two days.

"The same symptoms of fetid urine, and offensive sweats, attended the patient in this short paroxysm as in those of 1753 and 1754; the sweat continued but two nights, and the urine fetid only 48 hours.

"As Mr Rook had experienced so great and happy effects from the former critical vomitings, he was greatly disappointed upon finding the quantity evacuated so very small; for which reason he immediately attempted to increase it, by drinking three pints of warm water (which was at hand), but in vain; for neither that, nor the use of his finger, could provoke to an evacuation, which was begun and finished by nature: for though the quantity evacuated was so very small, yet as it was equally corrosive, and produced the same effect, Phlegmasiæ effect, the discharge must be accounted as truly critical as the others were.

"During the first of these fits, in the year 1752, a hard tumor had appeared on the side of the metatarsus near the middle of the right foot, which continued till after the third critical vomiting; when it was resolved, and totally disappeared, upon the discharge of a viscid matter like the white of an egg, with a few small chalk-stones from the end of the middle toe of the same foot. This discharge happened about four or five days before the patient was seized with a regular fit in April 1755. But it is to be remarked, that this last fit continued three or four weeks, and went off in the common way, without any of the critical discharges of vomiting, urine, or sweat; but left on one hand three, and on the other two, fingers loaded with chalk stones; with this peculiar symptom, that when the weather was cold those fingers were affected with a most exquisite pain, which was always removed by heat.

"But not long after this last mentioned fit, a large quantity of chalk-stones were extracted from the bottom of the left foot, near the ball of the great toe, and that from time to time for about three or four months. On the 19th of January 1756 (the wound occasioned by the chalk-stones being still open), he was seized with a fever, without any symptom of the gout: the fever went off on the third day, with the same kind of critical sweat and urine as always accompanied the acid vomitings in the fore mentioned fits. On the fourth day from the attack of the fever, a fit of the gout came on, with the common symptoms, in both feet; which continued with violence for about a week, with frequent retching and vomiting, but without bringing up more than the common contents of the stomach. At this time an uncommon itching in the bottom of the foot and ball of the great toe from whence the chalk-stones had been extracted, tormented the patient for five or six hours; upon his gently rubbing the part, he was very sensible of a fluctuation of some matter, which soon appeared to flow at first in small quantities from the open orifice in the ball of the toe: upon pressing the part, about a tea-cup full of a liquid chalky matter was collected. The next morning the patient made a large opening with an imposthume knife, which produced more than half a pint of a bloody serous matter, full of chalk stones, which proved as truly critical as the vomitings of the corrosive acid did in the cases above mentioned; for the orifice from whence the chalk stones first issued, was very soon healed, and the gentleman continues in perfect health."

216 GENUS XXV. ARTHROPUOSIS.

Lumbago psoadica, *Sauv.* sp. 6. *Fordyce*, Practice of Physic, P. II. p. 70.
Lumbago apostematosa, *Sauv.* sp. 12.
Lumbago ab arthrocace, *Sauv.* sp. 17.
Ischias ex abscessu, *Sauv.* sp. 6.
Morbus coxarius, *De Haen*, Rat. Med. Vol. I. c. xxxii.

THIS is a disease very much resembling the rheumatism; but differing both from it and the gout, in that it occasions suppurations, which they seldom or never do. It frequently, according to Sauvages, attacks the psoas muscle; and occasions excruciating pains, and then collections of matter. Arthropuosis.

The only cure is, if suppuration cannot be prevented, to lay open the part where the matter is contained, which would otherwise be absorbed, and occasion a fatal hectic.

Description. The erysipelas of the face, where this affection very frequently appears, comes on with a cold shivering, and other symptoms of pyrexia. The hot stage of this is frequently attended with a confusion of the head, and some degree of delirium; and almost always with drowsiness, and perhaps coma. The pulse is always frequent, and commonly full and hard.—When these symptoms have continued for one, two, or at most three days, an *erythema* appears on some part of the face. This at first is of no great extent; but gradually spreads from the part it first occupied to the other parts of the face, till it has affected the whole; and frequently from the face it spreads over the hairy scalp, or descends on some part of the cheek. As the redness spreads, it commonly leaves, or at least is abated in the parts it had before occupied. All the parts which the redness affects are also affected with some swelling, which continues for some time after the redness has abated. The whole face becomes considerably turgid; and the eye-lids are often so much swelled as entirely to shut up the eyes. When the redness and swelling have continued for some time, there commonly arise, sooner or later, blisters of a larger or smaller size on several parts of the face. These contain a thin colourless liquor, which sooner or later runs out. The surface of the skin, in the blistered places, sometimes becomes livid and blackish; but this seldom goes deeper, or discovers any degree of gangrene affecting the skin. On the parts of the face not affected with blisters, the cuticle suffers, towards the end of the disease, a considerable desquamation. Sometimes the tumor of the eye-lids ends in a suppuration.

The inflammation coming upon the face does not produce any remission of the fever which had before prevailed; and sometimes the fever increases with the spreading and increasing inflammation. The inflammation

Exanthemata.

tion commonly continues for eight or ten days; and, for the same time, the fever and symptoms attending it also continue. In the progress of the disease, the delirium and coma attending it sometimes go on increasing, and the patient dies apoplectic on the seventh, ninth, or eleventh day of the disease. In such cases it has been commonly supposed, that the disease is translated from the external to the internal parts. But Dr Cullen thinks that the affection of the brain is merely a communication from the external affection, as this continues increasing at the same time with the internal. When the fatal event does not take place, the inflammation, after having affected the whole face, and perhaps the other external parts of the head, ceases, and with that the fever also; and, without any other crisis, the patient returns to his ordinary health. This disease is not commonly contagious; but as it may arise from an acrid matter externally applied, so it is possible that the disease may sometimes be communicated from one person to another. Persons who have once laboured under this disease are liable to returns of it.

Prognosis. The event of this disease may be foreseen from the state of the symptoms which denote more or less the affection of the brain. If neither delirium nor coma come on, the disease is seldom attended with any danger; but when these symptoms appear early in the disease, and are in a considerable degree, the utmost danger is to be apprehended.

Cure. The erysipelas of the face is to be cured, according to the opinion of most practitioners, much in the same manner as phlegmonic inflammations; by blood-letting, cooling purgatives, and by employing every part of the antiphlogistic regimen. Many observations, however, would lead us to conclude, that in not a few cases the concomitant fever has here a tendency to the typhoid type; and therefore evacuations apparently serviceable in the first instance have afterwards a bad effect. The evacuations of blood-letting and purging are to be employed more or less according to the urgency of symptoms; particularly those which mark an affection of the brain. As the pyrexia continues, and often increases with the inflammation of the face, so the evacuations abovementioned are to be employed at any time of the disease. When, however, the fever, in place of marks of the phlogistic diathesis particularly a full, hard, and strong pulse, is attended with symptoms of great debility, and with a small pulse easily compressible; evacuations, particularly under the form of blood-letting, must be used with very great caution. Even in such cases, however, the use of refrigerant cathartics may still be persisted in with more safety and greater advantage. But whether evacuants have been employed or not, when symptoms of debility run to a great height, and marks of a putrescent tendency appear, recourse must be had to wine and the Peruvian bark. In cases which at the commencement require evacuation, these are often in the after periods employed with very great benefit.

In this, as in other diseases of the head, when that part happens to be the seat of erysipelas, it is proper to put the patient, as often as he can easily bear it, into somewhat of an erect posture; and as in this disease there is always an external affection, so various external applications have been proposed to be made to the part affected; but almost all of them are of doubtful effect.

Erysipelas.

An erysipelas frequently appears on other parts of the body besides the face, and such other erysipelatous inflammations frequently end in suppuration; but these cases are seldom dangerous. At coming on they are sometimes attended with drowsiness, and even with some delirium; but this seldom happens, and these symptoms do not continue after the inflammation is formed; and Dr Cullen does not remember to have seen an instance of the translation of an inflammation from the limbs to an internal part; and though these inflammations of the limbs be attended with pyrexia, they seldom require the same evacuations as the erysipelas of the face.

History. Of this distemper Dr Cullen declines giving any particular history, because he never saw it; from the accounts of other authors, however, he is of opinion, that the circumstances peculiarly characteristic of it, especially of its more violent and dangerous states, are, 1. The great loss of strength in the animal functions, which often appears early in the disease. 2. The stupor, giddiness, and consequent staggering, which resembles drunkenness, or the head-ach and various delirium all of them denoting a great disorder in the functions of the brain. 3. Anxiety, palpitation, syncope, and especially the weakness and irregularity of the pulse, denoting a considerable disturbance in the action of the heart. 4. Nausea and vomiting, particularly the vomiting of bile, which shows an accumulation of vitiated bile in the gall-bladder and biliary ducts, and from thence derived into the intestines and stomach; and which denote a considerable spasm, and loss of tone in the extreme vessels on the

 surface

Exanthemata

surface of the body. 5. The buboes and carbuncles, which denote an acrimony prevailing in the fluids; and, lastly, The petechiæ, hæmorrhages, and colliquative diarrhœa, which denote a putrescent tendency prevailing in a great degree in the mass of blood.

To these characteristics of the plague enumerated by Dr Cullen, we shall add one mentioned by Sir John Pringle, which, though perhaps less frequent than the others, yet seems worthy of notice. It is this, That in the plague there is an extraordinary enlargement of the heart and liver. In nine dissections of bodies dead of the plague at Marseilles, this extraordinary enlargement of the heart is taken notice of in all of them, and of the liver in seven of them. The account was sent to the Royal Society by M. Didier, one of the physicians to the king of France, and has been published in the Philosophical Transactions In the first case, the author takes notice, that "the heart was of an extraordinary bigness; and the liver was of double the natural size.—Case 2. The heart was of a prodigious bigness, and the liver much enlarged.—Case 3. The heart double the natural bigness.—Case 4. The heart was very large, and the liver was bigger and harder than ordinary.—Case 5. The heart was of a prodigious bigness.—Case 6. The heart was larger than in its natural state; the liver also was very large.—Case 7. The heart was of a prodigious size, and the liver was very large.—Case 8. The heart was much larger than natural, and the liver of a prodigious size.—Case 9. The heart was double the natural bigness, and the liver was larger than ordinary."—This preternatural enlargement Dr Pringle thinks is owing to the relaxation of the solid parts, by which means they become unable to resist the impetus of blood, and therefore are easily extended; as in the case of infancy, where the growth is remarkably quick. And a similar enlargement he takes notice of in the scurvy, and other putrid diseases.

A very elaborate work has lately been published on the subject of the plague by Dr Patrick Russel, formerly physician to the British factory at Aleppo. In this work, a very full history is given of the various forms and varieties of the disease. He makes particular observations on the following symptoms, which, in addition to the pestilential eruptions, he considers as the most important concomitants of plague, *viz.* fever, delirium, coma, impediment or loss of speech, deafness, muddiness of the eyes, white tongue, state of the pulse, respiration, anxiety, pain at the heart, inquietude, debility, fainting, convulsion, appearances of the urine, perspiration, vomiting, looseness, and hæmorrhagy; and he concludes these remarks with some observations on the occurrence of the plague with pregnant women. To point out more distinctly the stable varieties of the disease, he arranges the pestilential cases which fell under his observation at Aleppo under six classes: and he concludes his description with a very minute and particular account of the pestilential eruptions, appearing under the form either of buboes, carbuncles, or other exanthemata The presence of the two first, he observes, either separately or conjunctly, leaves the nature of the distemper unequivocal. But fatal has been the error of rashly pronouncing a distemper not to be a plague from their absence. Buboes affected the inguinal, axillary, parotid, maxillary, and cervical glands. But the first were the most commonly affected, and the two latter seldom observed to swell, without either the parotid swelling at the time or soon after. Of the carbuncles, Dr Russel describes five different varieties. The other exanthemata, which he observed sometimes, though less frequently, attending the plague, were petechiæ, a marbled appearance of the skin, an erysipelatous redness, streaks of a reddish purple or livid colour, vibices or weals, and large blue or purple spots, the *maculæ magnæ* of authors. In some cases, an extraordinary concurrence of eruptions took place, which was chiefly observed among children under 10 years of age

Pestis.

Causes, &c. From a consideration of the symptoms above-mentioned, Dr Cullen concludes, that the plague is owing to a specific contagion, often suddenly producing the most considerable debility in the nervous system or moving powers, and a general putrescency in the fluids. Dr Russel also considers the disease as being universally the consequence of what may be called *pestilential contagion*; and has judiciously repelled the objections which have been brought against this doctrine.

Prevention. Here we must refer to all those methods of preventing and removing the incipient contagion of putrid fevers, which have been so fully enumerated. Dr Cullen is persuaded that the disease never arises in the northern parts of Europe, but in consequence of being imported from some other country. The magistrate's first care therefore ought to be to prevent the importation; and this may generally be done by a due attention to bills of health, and to the proper performance of quarantines.—With respect to the latter, he is of opinion, that the quarantines of persons may with safety be much less than 40 days; and if this were allowed, the execution of the quarantine would be more exact and certain, as the temptation to break it would be in a great measure avoided. With respect to the quarantine of goods, it cannot be perfect unless the suspected goods be unpacked, duly ventilated, and other means be employed for correcting the infection they may carry; and if all this be properly done, it is probable that the time commonly prescribed for quarantine may be also shortened.

A second measure in the way of prevention is required, when an infection has reached and prevailed in any place, to prevent that infection from spreading into others. This can only be done by preventing the inhabitants or the goods of any infected place from going out of it till they have undergone a proper quarantine.

The third measure, and which ought to be employed with great care, is, to prevent the infection from spreading among the inhabitants of a place in which it has arisen. And in this case, a great deal may be done by the magistrate, 1 By allowing as many of the inhabitants as are free from infection, and are not necessary to the service of the place, to go out of it. 2. By discharging all assemblies, or unnecessary intercourse of the people. 3. By ordering some necessary communications to be performed without contact. 4. By making such arrangements and provisions

visions as may render it easy for the families remaining to shut themselves up in their own houses. 5. By allowing persons to quit houses where an infection appears, upon condition that they go into lazarettoes. 6. By ventilating and purifying, or destroying, at the public expence, all infected goods. 7. By avoiding hospitals, and providing separate apartments for infected persons.

The fourth and last part of the business of prevention respects the conduct of persons necessarily remaining in infected places, especially those obliged to have some communication with persons infected. Those obliged to remain in places infected, but not to have any near communication with the sick, must avoid all near communication with other persons or their goods; and it is probable, that a small distance will serve, if, at the same time, there be no stream of air to carry the effluvia of persons or goods to some distance. Those who are obliged to have a near communication with the sick ought to avoid any of the debilitating causes which render the body susceptible of infection, as a spare diet, intemperance in drinking, excess in venery, cold, fear, or other depressing passions of the mind. A full diet of animal food is also to be avoided, because it increases the irritability of the body, and favours the operation of contagion; and indigestion, whether from the quantity or quality of the food, contributes very much to the same.

Besides these, it is probable that the moderate use of wine and spirituous liquors, moderate exercise, and the cold bath, may be of use; tonic medicines also, of which the Peruvian bark is deservedly accounted the chief, may likewise be used with some probability of success. If any thing is to be expected from antiseptics, Dr Cullen thinks camphor preferable to any other. In general, however, every one is to be indulged in the medicine of which he has the best opinion, provided it is not evidently hurtful. Whether issues be useful in preserving from the effects of contagion, is a matter of doubt. Dr Russel in his treatise enters very fully into the consideration of the means of prevention, both with respect to quarantines, lazarettoes, and bills of health. He is of opinion, that the present laws on these subjects are in many respects defective: and he thinks, that a set of new regulations would have the best chance of a deliberate and impartial discussion in the senate, if the inquiry were taken at a time free from all apprehension of immediate danger.

Cure. Here, according to Dr Cullen, the indications are the same as in fever in general, but are not all equally important. The measures for moderating the violence of reaction, which operate by diminishing the action of the heart and arteries, have seldom, he thinks, any place here, excepting that the antiphlogistic regimen is generally proper. Some physicians have recommended bleeding, and Sydenham even seems to think it an effectual cure; but Dr Cullen supposes, that for the most part it is unnecessary, and in many cases might do much hurt. Dr Russel, however, who on this subject speaks from experience and actual observation, is of a different opinion. With most of his patients, a single bleeding was employed with advantage; and even where the sick under his inspection were bled oftener than once, he did not find that the low state was thereby hurried on. Purging has also been recommended; and in some degree it may be useful in drawing off the putrescent matter frequently present in the intestines; but a large evacuation this way may certainly be hurtful.

The moderating the violence of reaction, as far as it can be done, by taking off the spasm of the extreme vessels, is a measure, in Dr Cullen's opinion, of the utmost necessity in the cure of the plague; and the whole of the means formerly mentioned, as suited to this indication, are extremely proper. The giving an emetic, at the first approach of the disease, would probably be of great service; and it is probable, that, at some other periods of the disease, emetics might be useful, both by evacuating bile abounding in the alimentary canal, and by taking off the spasm of the extreme vessels. Indeed Baron Ash, and some other of the Russian practitioners, represent the early and repeated use of emetics as the only effectual mode of cure.

From some principles with respect to fever in general, and with respect to the plague in particular, Dr Cullen is of opinion, that after the exhibition of the first vomit, the body should be disposed to sweat; but this sweat should be raised only to a moderate degree, though it must be continued for 24 hours or more if the patient bears it easily. The sweating is to be excited and conducted according to the rules laid down under SYNOCHA; and must be promoted by the plentiful use of diluents rendered more grateful by vegetable acids, or more powerful by being impregnated with some portion of neutral salts. To support the patient under the continuance of the sweat, a little weak broth, acidulated with the juice of lemons, may be given frequently, and sometimes a little wine if the heat of the body be not considerable. If sudorific medicines are judged necessary, opiates will be found most effectual and safe; but they should not be combined with aromatics, and probably may be more effectual if joined with a portion of emetics and of neutral salts. But if, notwithstanding the use of emetics and sudorifics in the beginning, the disease should still continue, the cure must turn upon the use of means for obviating debility and putrescency; and for this purpose tonic medicines, especially the Peruvian bark, and cold drink, are the most proper. For the treatment of buboes and carbuncles, see the article SURGERY.

Description. In the distinct small-pox, the disease begins with a synocha or inflammatory fever. It generally comes on about mid-day, with some symptoms of a cold stage, and commonly with a considerable langour and drowsiness. A hot stage is soon formed, and becomes more considerable on the second and third day. During this course children are liable to frequent startings from their slumbers; and adults, if they are kept in bed, are disposed to much sweating. On the third day, children are sometimes affected with one or two epileptic fits. Towards the end of the third day the eruption commonly appears, and gradually increases during the fourth; appearing first on the face, and successively on the inferior parts, so as to be completed over the whole body on the fifth day. From the third day the fever abates, and against the fifth it entirely ceases. The eruption appears first in small red spots hardly eminent, but by degrees rising into pimples There are generally but few on the face; but, even when more numerous, they are separate and distinct from one another. On the fifth or sixth day, a small vesicle, containing an almost colourless fluid, appears on the top of each pimple. For two days these vesicles increase in breadth only, and there is a small hollow pit in their middle, so that they are not raised into spheroidical pustules till the eighth day. These pustules from their first formation continue to be surrounded with an exactly circular inflamed margin, which when they are numerous diffuses some inflammation over the neighbouring skin, so as to give somewhat of a damask-rose colour to the spaces between the pustules As the pustules increase in size, the face swells considerably if they are numerous on it; and the eye-lids particularly are so much swelled, that the eyes are entirely shut. As the disease proceeds, the matter in the pustules becomes by degrees more opaque and white, and at length assumes a yellowish colour. On the 11th day the swelling of the face is abated, and the pustules seem quite full. On the top of each a darker spot appears; and at this place the pustule, on the 11th day, or soon after, is spontaneously broken, and a portion of the matter oozes out; in consequence of which the pustule is shrivelled, and subsides; while the matter oozing out dries, and forms a crust upon its surface. Sometimes only a little of the matter oozes out, and what remains in the pustule becomes thick and even hard. After some days, both the crusts and the hardened pustules fall off, leaving the skin which they covered of a brownish red colour; nor doth it resume its natural colour till many days after. In some cases, where the matter of the pustules has been more liquid, the crusts formed from it are later in falling off, and the part they covered suffers some desquamation, which occasions a small hollow or pit in it.

On the legs and hands the matter is frequently absorbed; so that at the height of the disease, these pustules appear as empty as vesicles. On the 10th and 11th days, as the swelling of the face subsides, a swelling arises in the hands and feet; but which again subsides as the pustules come to maturity. When the pustules on the face are numerous, some degree of pyrexia appears on the 10th and 11th days; but disappears again after the pustules are fully ripened, or perhaps remains in a very slight degree till the pustules on the feet have finished their course; and it is seldom that any fever continues longer in the distinct small-pox. When the pustules are numerous on the face, upon the sixth or seventh day some uneasiness of the throat, with a hoarseness of the voice, comes on, and a thin liquid is poured out from the mouth. These symptoms increase with the swelling of the face; and the liquids of the mouth and throat becoming thicker are with difficulty thrown out; and there is at the same time some difficulty in swallowing, so that liquids taken in to be swallowed are frequently rejected or thrown out by the nose. But all these affections of the fauces are abated as the swelling of the face subsides.

In the confluent small-pox all the symptoms abovementioned are much more severe. The eruptive fever particularly is more violent; the pulse is more frequent and more contracted, approaching to that state of pulse which is observed in typhus The coma is more considerable, and there is frequently a delirium. Vomiting also frequently attends, especially at the beginning of the disease. In very young infants epileptic fits are sometimes frequent on the first days of the disease, and sometime prove fatal before any eruption appears, or they usher in a very confluent and putrid small pox. But at the same time, it has been justly remarked by Dr Sydenham, and other accurate observers, that epileptic attacks more frequently precede distinct and mild than malignant and confluent small-pox. The eruption appears in the confluent more early on the third day, and it is frequently preceded or accompanied with an erysipelatous efflorescence. Sometimes the eruption appears in clusters, like the measles. When the eruption is completed, the pimples are always more numerous upon the face, and at the same time smaller and less eminent. Upon the eruption the fever suffers some remission, but never goes off entirely; and after the fifth or sixth day it increases again, and continues to be considerable throughout the remaining part of the disease. The vesicles formed on the

Exanthemata

the top of the pimples appear fooner; and while they increafe in breadth, they do not retain a circular, but are every way of an irregular figure. Many of them run into one another, infomuch that very often the face is covered with one vefícle rather than with a number of puftules. The vefícles, as far as they are anyway feparated, do not arife to a fpheroidal form, but remain flat, and fometimes the whole of the face is of an even furface. When the puftules are in any meafure feparated, they are not bounded by an inflamed margin, but the part of the fkin that is free from puftules is commonly pale and flaccid. The liquor that is in the puftules changes from a clear to an opaque appearance, and becomes whitifh or brownifh, but never acquires the yellow colour and thick confiftence that appears in the diftinct fmall-pox. The fwelling of the face, which only fometimes attends the diftinct fmall pox, always attends the confluent kind; it alfo comes on more early, and arifes to a greater height, but abates confiderably on the tenth or eleventh day. At this time the puftules or vefícles break and fhrivel; pouring out at the fame time a liquor, which is formed into brown or black crufts, which do not fail off for a long time after. Thofe of the face, in falling off, leave the fkin fubject to a defquamation, which pretty certainly produces pittings. On the other parts of the body the puftules of the confluent fmall-pox are more diftinct than on the face; but never acquire the fame maturity and confiftence of pus as in the properly diftinct kind — The falivation, which fometimes only attends the diftinct fmall-pox, very conftantly attends the confluent; and both the falivation and the affection of the fauces above-mentioned are, efpecially in adults, in a higher degree. In infants a diarrhœa comes frequently in place of a falivation.

In this kind of fmall-pox there is often a very confiderable putrefcency of the fluids, as appears from petechiæ, from ferous vefícles, under which the fkin fhows a difpofition to gangrene, and from bloody urine or other hæmorrhages; all of which fymptoms frequently attend this difeafe. In the confluent fmall-pox alfo, the fever, which had only fuffered a remiffion from the eruption to the maturation, at or immediately after this period is frequently renewed again with confiderable violence. This is what has been called the *fecondary fever*, and is of various duration and event.

Caufes, &c. It is evident that the fmall-pox is originally produced by a contagion; and that this contagion is a ferment with refpect to the fluids of the human body, which affimilates a great part of them to its own nature; or, at leaft, we have every reafon to believe that a fmall quantity of contagious matter introduced, is fomehow multiplied and increafed in the circulating fluids of the animal body. This quantity paffes again out of the body, partly by infenfible perfpiration, and partly by being depofited in puftules: The caufes which determine more of the variolous matter to pafs by perfpiration, or to form puftules, are probably certain circumftances of the fkin, which determine more or lefs of the variolous matter to ftick in it, or to pafs freely through it. The circumftance of the fkin, which feems to determine the variolous matter to ftick in it, is a certain ftate of inflammation depending much on the heat of it: thus we have many inftances of parts of the body, from being more heated, having a greater number of puftules than other parts. Thus parts covered with plafters, efpecially thofe of the ftimulant kind, have more puftules than others. —Certain circumftances alfo, fuch as adult age, and full living, determining to a phlogiftic diathefis, feem to produce a greater number of puftules, and *vice verfa*. It is therefore probable, that an inflammatory ftate of the whole fyftem, and more particularly of the fkin, gives occafion to a greater number of puftules; and the caufes of this may produce moft of the other circumftances of the confluent fmall-pox, fuch as the time of eruption, the continuance of the fever, the effufion of a more putrefcent matter, and lefs fit to be converted into pus, together with the form and other circumftances of the puftules.

Variola.

Prognofis. The more exactly the difeafe retains the form of the diftinct kind, it is the fafer; and the more completely the difeafe takes the form of the confluent kind, it is the more dangerous. It is only when the diftinct kind fhows a great number of puftules on the face or otherwife, by fever or putrefcency, approaching to the circumftances of the confluent, that the diftinct kind is attended with any danger.

In the confluent kind the danger is always very confiderable; and the more violent and permanent the fever is, the greater the danger; and efpecially in proportion to the increafe of the fymptoms of putrefcency. When the putrid difpofition is very great, the difeafe fometimes proves fatal before the eighth day; but in moft cafes death happens on the eleventh, and fometimes not till the fourteenth or feventeenth day.

Though the fmall-pox may not prove immediately fatal, the more violent kinds are often followed by a morbid ftate of the body, fometimes of very dangerous event. Thefe confequences, according to Dr Cullen, may be imputed fometimes to an acrid matter produced by the preceding difeafe, and depofited in different parts; and fometimes to an inflammatory diathefis produced and determined to particular parts of the body.

Cure. The art of medicine hath never yet afforded a method of preventing the eruption of the fmall-pox after the contagion is received; all that can be done is, to render the difeafe more mild, which is generally effected by INOCULATION. It is not to be fuppofed that 225
the mere giving of the infection artificially could make any difference in the nature of the difeafe, was it not that certain precautions are commonly ufed in the cafe of thofe who are inoculated, which cannot be ufed in the cafe of thofe who receive them naturally — Thefe meafures, according to Dr Cullen, are chiefly the following.

1. The choofing for the fubject of inoculation perfons otherwife free from difeafe, and not liable from their age or otherwife to any incidental difeafe.

2. The choofing that time of life which is moft favourable to a mild difeafe.

3. The choofing for the practice a feafon moft favourable to a mild difeafe.

4. The

Exanthemata
Variola.

4. The preparing the perfon to be inoculated, by enjoining abftinence from animal-food for fome time before inoculation.

5. The preparing the perfon by courfes of mercurial and antimonial medicines.

6. The taking care at the time of inoculation to avoid cold, intemperance, fear, or other circumftances which might aggravate the future difeafe.

7. After thefe preparations and precautions, the choofing a fit matter to be employed in inoculation, by taking it from a perfon of a found conftitution, and free from any difeafe, or fufpicion of it; by taking it from a perfon who has had the fmall-pox of the moft benign kind; and laftly, by taking the matter from fuch perfon as foon as it has appeared in the puftules, either on the part inoculated, or on other parts of the body.

8. The introducing, by inoculation, but a fmall portion of the contagious matter.

9. After inoculation, the continuing of vegetable diet, and the employment of mercurial and antimonial medicines, and at the fame time employing frequent purging.

17. Both before and after inoculation, taking care to avoid external heat, either from the fun, artificial fires, warm chambers, much clothing, or being much in bed; and, on the contrary, expofing the perfon to a free and cool air.

11. Upon the appearance of the eruptive fever, the rendering that moderate by the employment of purgatives; by the ufe of cooling and antifeptic acids; and efpecially by expofing the perfon frequently to a cool, and even a cold air, at the fame time giving freely of cold drink.

12. After the eruption, the continuing the application of cold air, and the ufe of purgatives, during the courfe of the difeafe, till the puftules are fully ripened.

On thefe meafures Dr Cullen obferves, that, as the common infection may often feize perfons under a difeafed ftate, which may render the fmall-pox more violent, it is evident that inoculation muft have a great advantage by avoiding fuch concurrence. But as the avoiding of this may in the mean time frequently leave perfons expofed to the common infection, it is well worth while to inquire what are the difeafed ftates which fhould reftrain from the practice of inoculation. This is not yet fufficiently afcertained: for it hath been obferved, that the fmall pox has often occurred with a difeafed ftate of the body, without being thereby rendered more violent; and it hath alfo been obferved, that fome difeafes of the fkin are equally innocent. Dr Cullen is of opinion, that they are difeafes of the febrile kind, or fuch ailments as induce or aggravate a febrile ftate, that efpecially give the concurrence which is moft dangerous with the fmall-pox. He is alfo of opinion, that though a perfon be in a difeafed ftate, if that ftate be of uncertain nature and effect, and at the fame time the fmall-pox are very common in the neighbourhood, fo that it muft be extremely difficult to guard againft the common infection, it will always be fafer to give the fmall-pox by inoculation than to leave the perfon to take them by the common infection.

Though inoculation has been practifed with fafety upon perfons of all ages, yet there is reafon to conclude, that adults are more liable to a violent difeafe than perfons of younger years. At the fame time it is obferved, that children, in the time of their firft dentition, are liable, from the irritation of that, to have the fmall-pox rendered more violent; and that infants, before the time of dentition, upon receiving the contagion of the fmall-pox, are liable to be afflicted with epileptic fits, which frequently prove fatal. Hence it is evident, that though circumftances may admit and approve of inoculation at any age, yet for the moft part it will be advantageous to choofe perfons after the firft dentition is over, and before the time of puberty. But, in large cities in particular, if the operation be delayed till after dentition, the patient muft run many rifks of accidental infection, and thus many will be cut off by the natural fmall-pox who might have been faved by more early inoculation. Accordingly, in towns efpecially, it is now the common practice to inoculate infants when only three or four months old; and indeed accidents fo rarely happen, that it is almoft impoffible to conceive that greater fuccefs can be obtained at any other period of life.

The operation of inoculation may be performed at any feafon of the year; yet as it is certain that the cold of winter may increafe the inflammatory, and the heats of fummer increafe the putrefcent, ftate of the fmall-pox, it is highly probable that inoculation may have fome advantage from avoiding the extremes either of cold or heat.

As the ufe of animal-food may increafe both the inflammatory and putrefcent ftate of the human body, fo it muft render perfons, in receiving the contagion of the fmall-pox, lefs fecure againft a violent difeafe; and therefore inoculation may derive fome advantage by enjoining abftinence from animal-food for fome time before the operation is performed: but Dr Cullen is of opinion, that a longer time is neceffary than what is commonly prefcribed.

Mercurial and antimonial preparations may have fome effect in determining to a more free perfpiration, and therefore may be of fome ufe in preparing a perfon for the fmall-pox; but there are many obfervations which render their ufe doubtful. The quantity of both thefe medicines, particularly the antimony, commonly employed, is too inconfiderable to have any effects. Mercurials indeed have been often employed more freely; but even their falutary effects have not been evident, and they have fometimes been manifeftly productive of mifchief. It is therefore much to be doubted, whether inoculation really derives any benefit from thefe preparatory courfes or not.

It has been often obferved, in the cafe of almoft all contagions, that cold, intemperance, fear, and fome other circumftances, concurring with the application of the contagion, have greatly aggravated the future difeafe; it muft undoubtedly be the fame in the cafe of the fmall-pox: and it is certain that inoculation muft derive a great advantage, perhaps its principal one, from avoiding the concurrences above-mentioned.

It has commonly been fuppofed, that inoculation derives fome advantage from the choice of the matter employed in it; but it is very doubtful if any choice

Exanthemata

Variola.

be here neceſſary, or can be of any benefit in determining the ſtate of the diſeaſe. It is not indeed probable that there is any difference of contagion producing the ſmall-pox; for there are innumerable inſtances of the contagion ariſing from a perſon who labours under the diſtinct ſmall-pox producing the confluent kind, and the contrary. Since the practice of inoculation hath been introduced, it has alſo been obſerved, that the ſame variolous matter would in one perſon produce the diſtinct and in another the confluent ſmall-pox. It is therefore highly probable, that the difference of the ſmall-pox does not much depend upon any difference of the contagion, but upon ſome difference in the ſtate of the perſons to whom it is applied, or in the ſtate of certain circumſtances concurring with the application of the contagion.

Some have ſuppoſed, that inoculation has an advantage over the natural infection, by introducing only a ſmall portion of contagious matter into the body; but this is by no means well aſcertained. It is not known what quantity of contagion is introduced into the body by the common infection of the ſmall-pox; and it is probable the quantity is not great: nor, though it were larger than that thrown in by inoculation, is it certain what the effects would be. A certain quantity of ferment may be neceſſary to excite fermentation in a given maſs; but when that quantity is given, the fermentation and aſſimilation are extended to the whole maſs; and we do not find that a greater quantity than is juſt neceſſary, either increaſes the activity of the fermentation, or more certainly ſecures the aſſimilation of the whole. In the caſe of the ſmall-pox, a conſiderable difference in the quantity of the contagion introduced hath not ſhown any effects in modifying the diſeaſe.

Purging has the effect of diminiſhing the activity of the ſanguiferous ſyſtem, and of obviating the inflammatory ſtate of it; and therefore it is probable, that the frequent uſe of cooling purgatives gives a conſiderable advantage to the practice of inoculation; and probably this is alſo obtained by diminiſhing the determination to the ſkin. It ſeems alſo probable, that mercurials and antimonials are uſeful only as they make part of the purging courſe.

It is probable that the ſtate of the ſmall-pox depends very much upon the ſtate of the eruptive fever, and particularly in avoiding the inflammatory ſtate of the ſkin; and therefore it is alſo probable, that the meaſures taken for moderating the eruptive fever, and inflammatory ſtate of the ſkin, are the greateſt improvement which has been made in the practice of inoculation. The tendency of purging, and the uſe of acids to this purpoſe, is ſufficiently obvious: and upon the ſame grounds we ſhould ſuppoſe that blood-letting might be uſeful; but probably this has been omitted, and perhaps other remedies might be ſo, ſince we have found a more powerful and effectual one in the application of cold air and the uſe of cold drink.

It hath been the practice of inoculators to continue the uſe of purgatives and the application of cold air after the eruption; but it cannot be ſaid to give any particular advantages to inoculation, and the employment of purgatives ſeems often to have led to an abuſe. When the ſtate of the eruption is determined, when the number of puſtules is very ſmall, and the fever has entirely ceaſed, the ſafety of the diſeaſe may be ſaid to be aſcertained, and further remedies abſolutely ſuperfluous: in ſuch caſes therefore the uſe of purgatives is unneceſſary, and may be hurtful.

It remains now only to conſider the treatment of the ſmall-pox, when the ſymptoms are violent, as may ſometimes happen, even after inoculation and every remedy and precaution have been uſed. The cauſe of this is not aſcertained, but it ſeems to be a putreſcent tendency of the fluids. When therefore, from the prevailing of ſmall-pox as an epidemic, and more eſpecially when it is known that a perſon not formerly affected with the diſeaſe has been expoſed to the infection, if ſuch perſon ſhould be attacked with the ſymptoms of fever, there can be little doubt that it is the fever of the ſmall-pox, and therefore he is to be treated in every reſpect as if he had received the diſeaſe by inoculation. He is to be freely expoſed to cool air, to be purged, and to have cooling acids given liberally. If theſe meaſures moderate the fever, nothing more is neceſſary: but if the nature of the fever be uncertain; or if, with ſuſpicions of the ſmall-pox, the fever be violent; or even if, knowing the diſtemper to be the ſmall-pox, the meaſures above-mentioned do not moderate the fever ſufficiently; veneſection will be proper; and more eſpecially if the perſon be an adult, of a plethoric habit, and accuſtomed to full living. In the ſame circumſtances it will always be proper to give a vomit; which is uſeful in the beginning of all fevers, and eſpecially in this, where a determination to the ſtomach appears by pain and ſpontaneous vomiting.

It frequently happens, eſpecially in infants, that, during the eruptive fever of the ſmall-pox, convulſions occur. Of theſe, if only one or two fits appear on the evening preceding the eruption, they give a prognoſtic of a mild diſeaſe, and require no remedy: but if they occur more early, are violent, and frequently repeated, they are very dangerous, and require a ſpeedy remedy; and here bleeding and bliſtering are of no ſervice, the only effectual medicine is an opiate given in a large doſe.

Theſe are the remedies neceſſary during the eruptive fever; and if, upon the eruption, the puſtules on the face are diſtinct, and their number few, the diſeaſe requires no further remedies. But when, upon the eruption, the number of pimples on the face is conſiderable, when they are not diſtinct; and eſpecially if, upon the fifth day, the fever does not ſuffer a conſiderable remiſſion; the diſeaſe ſtill requires a great deal of attention.

If, after the eruption, the fever ſhall ſtill continue, the avoiding of heat and the continuing to expoſe the body to a cool air will ſtill be proper. If the fever be conſiderable, with a full hard pulſe, in an adult perſon, a bleeding will be neceſſary, and more certainly a cooling purgative: but it will be ſeldom neceſſary to repeat the bleeding, as a loſs of ſtrength very ſoon comes on; but the repetition of a purgative, or the frequent uſe of laxative glyſters, is commonly advantageous.

When a loſs of ſtrength, with other marks of a putreſcent tendency of the fluids, appears, the Peruvian bark muſt be given in ſubſtance, and in large quantity.

Exanthemata

quantity. In the same case, the use of acids and of nitre is advantageous, and commonly it is proper also to give wine very freely. From the fifth day of the disease throughout the whole course of it, it is proper to give an opiate once or twice a-day; taking care at the same time to obviate costiveness, by purgatives or by laxative glysters. From the eighth to the eleventh day of a violent disease, it will be proper to lay on blisters successively on different parts of the body, and that without regard to the parts being covered with pustules. Blisters are also to be applied to the external fauces, in case of difficult deglutition, and viscid saliva and mucus, which are thrown out with difficulty, at the same time that detergent gargles are to be diligently used. During the whole course of this disease, when a considerable fever is present, antimonial medicines, in nauseating doses, have by some been alleged to be employed with advantage; and in this way they have often the effect of moving the belly. But the great distress which patients suffer from a state of constant nausea is hardly to be borne; and every advantage which can be had from this practice may be obtained by easier means.

The remedies above-mentioned are frequently proper from the fifth day till the suppuration be finished. But after that period the fever is sometimes continued and increased; or sometimes, when there was little or no fever before, a fever now arises and continues with considerable danger; this is called the *secondary fever*, and requires a particular treatment.

When the secondary fever follows the distinct small-pox, and the pulse is full and hard, the case is to be treated as an inflammatory affection, by bleeding and purging; but the secondary fever which follows the confluent kind is to be considered as a putrid disease, and bleeding is improper. Some purging may be necessary, but the remedies to be chiefly depended upon are the Peruvian bark and acids. When the secondary fever first appears, whether after a distinct or confluent small-pox, it is useful to exhibit an antimonial emetic in nauseating doses, but in such a manner as to produce some vomiting. For avoiding the pits which frequently follow the small-pox, no method hitherto proposed seems to be sufficiently certain.

On the subject of inoculation, Baron Dimsdale, a very celebrated writer, informs us, that were it left to his choice, he would decline inoculating children under two years old; because within that period they are exposed to all the dangers of dentition, fevers, fluxes, convulsions, and other accidents, sufficiently difficult in themselves to manage in such tender subjects.

In regard to constitution, Baron Dimsdale observes, that greater liberties may be taken than were formerly judged admissible. Persons afflicted with various chronic complaints, of scrophulous, scorbutic, and arthritic habits; persons of unwieldy corpulency, and of intemperate, irregular lives; have all passed through this disease with as much facility as the most temperate, healthy, and regular. But those who labour under any acute or critical disease, or its effects, are obviously unfit and improper subjects. So likewise are those in whom are evident marks of corrosive acrimonious humours, or who have an evident debility of the whole frame from inanition or any other cause. All such require to be treated in a particular manner pre-

Variola

vious to the introduction of this disease. Constitutions disposed to frequent returns of intermittents, seem likewise justly exceptionable; especially as the preparatory regimen may in some habits increase this tendency. Baron Dimsdale, however, has known instances of severe ague-fits attacking persons between the insertion of the matter and the eruption of the small-pox, and even during maturation, when the Peruvian bark has been given liberally and with much success; the principal business, in the mean time, suffering no injury or interruption

Among the circumstances generally considered as more or less propitious to inoculation, the season of the year has been reckoned a matter of some importance. Spring and autumn have been generally recommended, as being the most temperate seasons; the cold of winter and the summer-heats having been judged unfavourable for this purpose But Baron Dimsdale remarks, that experience does not justify those opinions; for, according to the best observation he has been able to make, inoculated persons have generally had more pustules in spring than at any other time of the year; and epidemic diseases being commonly most frequent in autumn, especially fluxes, intermittents, and ulcerated sore throats (all which are liable to mix more or less with the small-pox), the autumn, upon this account, does not seem to be the most favourable season in general.

Baron Dimsdale's opinion is, that considering the surprising and indisputable benefits arising at all times to patients in the small-pox, from the free admission of fresh cool air and evacuations, we may safely inoculate at all seasons, provided care be taken to screen the patients as much as possible from heat in summer, and to prevent them from keeping themselves too warm and too much shut up, as they are naturally disposed to do, from the weather in winter. When seasons, however, are marked with any peculiar epidemics, of such a kind especially as may render a mild disease more untractable, it may perhaps be most prudent not to inoculate while such diseases are prevalent.

In directing the preparatory regimen, Baron Dimsdale principally aims at the following points, viz. To reduce the patient, if in high health, to a lower and more secure state; to strengthen the constitution, if too low; to correct what appears vitiated; and to clear the stomach and bowels, as much as may be, from all crudities and their effects. With this view he orders such of his patients as constitute the first class above-mentioned, and who are by much the majority, to live in the following manner: To abstain from all animal food, including broths, and likewise butter and cheese; from all fermented liquors, excepting small beer, which is allowed sparingly; and from all spices, and whatever is endued with a manifest heating quality. The diet is to consist of pudding, gruel, sago, milk, rice-milk, fruit-pyes, greens, roots, and vegetables of any of the kinds in season, prepared or raw. Eggs, though not to be eaten alone, are allowed in puddings, and butter in pye-crust. The patients are to be careful that they do not eat such a quantity as to overload their stomachs, even of this kind of food. Tea, coffee, or chocolate, are permitted for breakfast, to those who choose or are accustomed to them.

In

Exanthemata

In this manner they are to proceed about nine or ten days before the operation; during which period, at nearly equal distances, they are directed to take three doses of the following powder, either made into pills or mixed with a little syrup or jelly, at bed-time, and a dose of Glauber's salts dissolved in thin water-gruel, each succeeding morning.

The powder is composed of eight grains of calomel, the same quantity of the compound powder of crab's-claws, and one eighth part of a grain of emetic tartar. Instead of the latter, Baron Dimsdale has sometimes substituted two grains of precipitated sulphur of antimony. In order to facilitate the division of the doses, a large quantity is prepared at once, and great care taken that the several ingredients be well mixed

This quantity is usually sufficient for a healthy strong man; and the dose must be lessened for women or children, according to their age and strength, as well as for persons advanced in years.

The first dose is generally ordered at the commencement of the course; the second, three or four days after; and the third about the eighth or ninth day. The Baron chooses to inoculate the day after the last dose has been taken. On the days of purging, broths are allowed, and the patients are desired to abstain from unprepared vegetables.

What has been said concerning the preparation, must be considered as proper only for the young or middle-aged, in a good state of health: but among those who are desirous of inoculation, are often found tender, delicate, and weakly women; men of bad stamina, valetudinarians by constitution, by illness, or intemperance; also aged persons, and children; and for all such a very different treatment must be directed. Here a milder course of medicine, rather of the alterative than purgative kind, is preferable; and in many instances, an indulgence in some light animal-food, with a glass or two of wine in case of lowness, is not only allowable, but necessary to support a proper degree of strength, especially in advanced age.

Children, whose bowels are often tender, and ought not be ruffled by strong purges, yet require a mild mercurial, and bear it well. Besides emptying the bowels of crudities, it is a good security against worms and their effects, which sometimes produce very alarming and even fatal disorders.

Inattention to the particular state of health of those who are entering upon the preparatory course, has been productive of great mischief. This is chiefly observable respecting the indiscreet use of mercurials, by which a salivation has often been raised, to the risk of impairing good constitutions, and the ruin of such as were previously weak and infirm. The distinctions and treatment necessary, will be obvious to those who are acquainted with the animal economy and medical practice.

The time of menstruation has generally been the guide in respect to the inoculation of women, that the whole of the disease may be over within the menstrual period. Baron Dimsdale informs us, that he observes this rule, when he can choose his time without any inconvenience, and he inoculates soon after the evacuation ceases; tho' he has no reason to decline performing the operation at any time.

Variola.

Women with child have likewise been inoculated, and done well; but the state of pregnancy seems unfavourable to the process, which ought therefore not to be hazarded without some urgent reason. Baron Dimsdale has not inoculated any woman whom he knew to be pregnant; but on some who concealed their pregnancy he has performed the operation, without producing a miscarriage; the hope of which event, he suspects, had rendered them desirous of the process. One of those had a child born nine weeks after inoculation, at the full time, with distinct marks of the disease, though the mother had very few pustules.

The manner most commonly practised in this country for communicating the small-pox by inoculation, has of late been the following: A thread was drawn through a ripe pustule, and well moistened with matter. A piece of this thread was insinuated into a superficial incision made in one or both arms, near the part where issues are usually fixed; and being covered with a plaster, was there left for a day or two.

Very different methods of inoculation, however, are pursued; two of which Baron Dimsdale has frequently practised and describes; but he informs us, that the following has proved so invariably successful, as to induce him to give it the preference.

The patient to be infected being in the same house, and, if no objection be made to it, in the same room, with one who has the disease, a little of the variolous matter is taken from the place of insertion, if the subject be under inoculation; or a pustule, if in the natural way, on the point of a lancet, so that both sides of the point are moistened.

With this lancet an incision is made in that part of the arm where issues are usually placed, deep enough to pass through the scarf-skin, and just to touch the skin itself; and in length as short as possible, not more than one eighth of an inch.

The little wound being then stretched open between the finger and thumb of the operator, the incision is moistened with the matter, by gently touching it with the flat side of the infected lancet. This operation is generally performed in both arms, and sometimes in two places in one arm, a little distant from each other. For as Baron Dimsdale has not observed any inconvenience from two or three incisions, he seldom trusts to one; that neither he nor his patient may be under any doubt about the success of the operation from its being performed in one place only.

Baron Dimsdale has also tried the following method, with the same success as that above described; but he does not so much approve of it, because he has been credibly informed that it has sometimes failed in the practice of others. A lancet being moistened with the variolous fluid in the same manner as in the other, is gently introduced, in an oblique manner, between the scarf and true skin, and the finger of the operator is applied on the point, in order to wipe off the infection from the lancet, when it is withdrawn. In this method, as well as in the former, a little blood will sometimes appear; but Baron Dimsdale neither draws blood with design, nor does he think there is any necessity of wiping it off before the matter is introduced.

In both these ways of inoculating, neither plaster, bandage, Exanthemata. Variola.

bandage, nor covering is applied, nor in any respect necessary.

Baron Dimsdale informs us, that those methods of producing this disease have never once failed him; and experience has sufficiently proved that there is no danger from additional infection by the natural disease at the same time. He therefore makes no scruple of having the person to be inoculated, and the person from whom the infection is to be taken, in the same room; nor has he ever observed any ill consequence attending this practice. But he advises the inoculated patients (though perhaps there be no necessity for that precaution) to be afterwards separated from places of infection till certain signs of success appear, when all restraint is removed, there being then no danger from accumulation.

Baron Dimsdale remarks, that it seems to be of no consequence whether the infecting matter be taken from the natural or inoculated small-pox. He has used both, and never has been able to discover the least difference, either respecting the certainty of infection, the progress, or the event. He therefore takes the infection from either, as opportunity offers, or at the option of the patients or their friends.

Neither is it of any consequence whether the matter be taken before, or at the crisis of, the distemper. It is generally supposed, that the small-pox is not infectious till after the matter has acquired a certain degree of maturity; and in the common method of inoculation this is so much attended to, that when the operation has proved ineffectual, the failure has been ascribed to the unripeness of the matter.

But, as the author remarks, it appears very clearly from the present practice of inoculation, that so soon as any moisture can be taken from the infected part of an inoculated patient, previous to the appearance of any pustules, and even previous to the eruptive fever, this moisture is capable of communicating the small-pox with the utmost certainty. Baron Dimsdale has taken a little clear fluid from the elevated pellicle on the incised part, even so early as the fourth day after the operation; and has at other times used matter fully digested at the crisis, with equal success. In general, however, he prefers taking the matter for infection during the eruptive fever, as he supposes it at that time to have its utmost activity.

In all cases, when he takes matter from an inoculated person, it is from the place where it was inserted; as he is always sure to find infection there if the disease succeeds, and always of sufficient energy.

It may appear strange that no bandage, dressing, or application whatsoever, is used to the part infected; but that the most simple incision being made, and moistened with the smallest particle of the recent fluid matter, the whole is committed to nature. This method, however, the Baron observes, is perfectly right: because the application of either plaster or unguent, as is the usual practice, will occasion an inflammation on some skins; and, in all, tend to disfigure the natural appearance of the incision, and prevent our forming a proper judgment of the progress of the infection.

If neither an inoculated patient be at hand, nor any one in the neighbourhood has a distinct kind of the natural disease, a thread may be used as in the common manner, provided it be very recently infected; but Baron Dimsdale is of opinion, that the thread ought to be used as soon as possible after being charged with the infecting matter.

The method of inoculation recommended by Baron Dimsdale is now almost universally adopted; or at least if any change has taken place, the operation is, if possible, still more simplified. Without the trouble of bringing to the same house both the person from whom the contagion is to be taken and the person to whom it is to be given, the operator in general carries the matter about with him on what is called a *reservoir lancet*. For this purpose a common lancet may be employed; but one, the blade of which is accurately inclosed in a metallic case, so constructed as to prevent the access of the air, and at the same time not to rub off the matter, is certainly preferable. The infectious matter on this lancet is gently moistened by holding it for a few seconds over the steam of warm water; and by rubbing on it the point of another lancet, as much is taken off as is sufficient for giving the disease, which is done by introducing this infected point under the scarf-skin, in the manner Baron Dimsdale has recommended. Where fresh matter can be had, it is always preferable: but where this cannot be obtained, a lancet may be infected from a dry pustule, though kept for many months, by moistening it in warm water; particularly if care has been taken to preserve it from the action of external air by keeping it in a close phial.

A due attention to the progress of infection, discoverable by the part where the operation was performed, is a necessary circumstance; because a just prognostic may thence be sometimes formed of the future state of the distemper, and indications may be taken from the different appearances on the arm, that will enable us to prevent inconveniences.

Baron Dimsdale observes, that the former method of covering the place of incision with a plaster, and continuing upon it dressings of one sort or other, prevented much useful information of this kind. They precluded any judgment by the touch, and sometimes rendered that by the eye equivocal.

The day after the operation is performed, though it takes effect, little alteration is discoverable. On the second day, if the part be viewed with a lens, there generally appears a kind of orange-coloured stain about the incision, and the surrounding skin seems to contract. At this time Baron Dimsdale usually gives the following medicine at going to bed, either mixed with a little of any kind of jelly, or more frequently made into a pill.

Calomel, and compound powder of crab's-claws, of each three grains; emetic tartar, one-tenth of a grain.

A quantity of this medicine should be carefully prepared at once, in order to make the division more exact.

On the fourth or fifth day, upon applying the finger, a hardness is perceptible to the touch. The patient feels an itching on the part, which appears slightly inflamed; and under a kind of vesication is seen a little clear fluid, the part resembling a superficial burn. About the sixth, most commonly some pain and stiffness is felt in the axilla; a circumstance which not only foretels the near approach of the eruptive symptoms, but

Exanthemata | Variola.

but is a ſign of a favourable progreſs of the diſeaſe. Sometimes on the ſeventh, oftener on the eighth day, ſymptoms of the eruptive fever appear; ſuch as ſlight remitting pains in the head and back, ſucceeded by tranſient ſhiverings and alternate heats, which continue in a greater or leſs degree till the eruption be perfected. At this time alſo it is uſual for the patient to complain of a very diſagreeable taſte in his mouth, the breath is always fetid, and there enſues a ſmell peculiar to the variolous eruptive fever.

The inflammation in the arms at this time ſpreads faſt; and, upon viewing it with a good glaſs, the inciſion for the moſt part appears ſurrounded with an infinite number of ſmall confluent puſtules, which increaſe in ſize and extent as the diſeaſe advances. On the tenth or eleventh day, a circular or oval efflorefcence is uſually diſcovered ſurrounding the inciſion, and extending ſometimes near half round the arm, but more frequently to about the ſize of a ſhilling; and being under the cuticle, is ſmooth to the touch and not painful. This appearance alſo is favourable. It accompanies eruption; every diſagreeable ſymptom ceaſes; and at the ſame time it certainly indicates the whole affair to be over, the pain and ſtiffneſs in the axilla alſo going off.

The feveriſh ſymptoms are for the moſt part ſo mild, as ſeldom to require any aſſiſtance, except a repetition of the ſame medicine that was directed on the ſecond night after the operation; and next morning the following laxative draught ſhould be given, to procure three or four ſtools.

Infuſion of ſenna two ounces, manna half an ounce, tincture of jalap two drachms.

Theſe are given as ſoon as the eruptive ſymptoms are perceivable, if they ſeem to indicate any uncommon degree of vehemence.

It has been obſerved, that by attending to the progreſs of infection, we may in general be able to prognoſticate with ſome degree of certainty the iſſue of the diſtemper. Particular incidents will ever happen, but not ſufficient to invalidate the propriety of general rules.

If the appearances already deſcribed are obſerved early, a very favourable event may be expected; but it happens in ſome caſes, that the ſucceſs of the inoculation is barely perceptible, the colour about the wound remaining pale, inſtead of changing to red or inflamed; the edges of the inciſion ſpread but little, they remain almoſt entirely flat, and are attended neither with itching nor uneaſineſs of any kind. Nay, ſometimes on the fifth, and even the ſixth day, the alteration is ſo little as to render it doubtful whether the infection has taken place.

When matters are in this ſtate, Baron Dimſdale obſerves the appearance is unfavourable, implying a late and more untoward diſeaſe: To prevent which, he directs the powder or pill to be taken every night; and in caſe it fails to operate by ſtool, or there be the leaſt diſpoſition to coſtiveneſs, an ounce of Glauber's ſalts, or more commonly the laxative draught already mentioned, is given in the morning, once or twice, as the caſe may require. This courſe forwards the inflammation, which is always a deſirable circumſtance; it being in general obſerved, that an early progreſs on the arm, and an early commencement of the eruptive complaints, portend that the diſtemper will be mild and favourable; and on the contrary, when both are late, the ſymptoms he tells us are uſually more irregular and unfavourable.

Further experience, however, has by no means fully confirmed his opinion in this particular. On the contrary, even where the progreſs of infection in the arm has been uncommonly ſlow, a diſeaſe in the mildeſt poſſible form has ſucceeded. There is therefore no good reaſon why a practitioner ſhould be alarmed at an uncommonly ſlow progreſs, or ſhould in ſuch inſtances employ more internal remedies than he would do in other caſes. And ſome, whoſe practice in inoculation has been very extenſive, have even remarked, that when infants are inoculated, they have never obſerved epileptic acceſſions, the moſt alarming forerunners of the diſeaſe, in thoſe caſes where the progreſs of the arm has been ſlow.

The management recommended by Baron Dimſdale at the period of eruption differing eſſentially from that of former practitioners, and being a matter of great importance, he gives the following explicit directions on this head, adviſing that they may be purſued with firmneſs and moderation.

Inſtead of the patient being confined to his bed or his room, when the ſymptoms of the eruptive fever come on, he is directed, as ſoon as the purging medicine has operated, to keep abroad, as much as he can bear, in the open air, be it ever ſo cold; always taking care not to ſtand ſtill, but to walk about moderately while abroad. He is alſo directed, if thirſty, to drink cold water.

Baron Dimſdale obſerves, that this treatment ſeems as hard at firſt to the patients as it muſt appear ſingular to thoſe who are unacquainted with ſuch practice; but the effects are ſo ſalutary, ſo conſtantly confirmed by experience, and an eaſy progreſs through every ſtage of the diſeaſe depends ſo much upon it, that he admits of no exception, unleſs the weather be extremely ſevere and the conſtitution very delicate. He adds, it is indiſputably true, that, in the few inſtances where the ſymptoms of eruption have run very high, the patients being averſe to any motion, and fearing the cold as the greateſt evil; yet when, under thoſe circumſtances, he has perſuaded them to riſe out of bed, and go out of doors, though led ſometimes by two aſſiſtants, and has allowed them to drink as much cold water as they choſe, they have not ſuffered the leaſt unfavourable accident: on the contrary, after they have been prevailed upon to comply with thoſe directions, they find their ſpirits revived; an inclination for nouriſhment returns; they reſt well; a gentle ſweat ſucceeds, accompanied with a favourable eruption; and the fever ſeems to be entirely extinguiſhed.

Cool regimen during the eruptive fever is now almoſt univerſally adopted; but like other uſeful remedies it has not unfrequently been abuſed: And practitioners ought never to forget, that inoculated patients are not, more than the reſt of the human ſpecies, exempted from injuries from cold, which is unqueſtionably a powerful cauſe of diſeaſe. Unleſs, therefore, in caſes where very conſiderable morbid heat is induced by the eruptive fever, by which a temporary defence is unqueſtionably afforded againſt the action of external

Exanthemata. Variola.

external cold, the bad effects which may result from it are never to be overlooked. And there is even reason to believe, as may indeed be inferred from Baron Dimsdale's observations, that the disease is more moderated by the action of pure and free air than by cold. Accordingly inoculation is performed with very great success even in the warmest seasons and situations of warm climates.

In general, the complaints in this state are very moderate, and attended with so little illness that the patient eats and sleeps well the whole time. A few pustules appear, sometimes equally disposed; sometimes the inflammations on the arms spread, and are surrounded with a few pustules, which gradually advance to maturity; during which time, for the most part, the eruption proceeds kindly, and there is much more difficulty to restrain the patients within due bounds, and prevent their mixing with the public, thereby spreading the infection, than there was at first to prevail upon them to go abroad. During this time medicine is seldom wanted; the coolest air seems the best cordial; and if any uncommon languor happens, a bason of small broth, or a glass of wine, is allowed in the day, or some white-wine whey at bed-time; which are indeed at any time allowed to tender, aged, or weakly persons.

With these exceptions, the patients are hitherto kept very scrupulously to the diet at first directed. But after the eruption is completed, they are, if occasion requires, indulged in a little well-boiled meat of the lightest kind, as chicken, veal, or mutton.

The above-mentioned regimen, the cooling alterative purges, and the free use of cool air at the season of eruption, almost universally prevent either alarming symptoms or a large crop of pustules. Baron Dimsdale has seen a few with such a quantity of pustules, though distinct, that he has neither advised nor allowed them to go out of the house. But the generality of his patients, when the eruptions are few, amuse themselves abroad, within proper limits, with the pustules upon them.

This practice, however, the Baron neither enjoins nor maintains to be necessary; but he has not been able to observe that any inconvenience has arisen from it. He also informs us, that, how strange soever it may appear, those who are most adventurous, seem to enjoy better spirits, and are more free from complaints, than others who are inclined to keep within doors.

Those who have the disease in the slightest manner first described, viz. without any appearance of eruption but on the inoculated part, are soon permitted to go about their usual affairs: and many instances have happened of very industrious poor men, who have immediately returned to their daily labour, with a caution not to intermix with those who have not had the distemper, for fear of spreading it; and with injunctions to take, two or three times, of the purge already directed, or as many doses of Glauber's salts. Those who have the disease in a greater degree, are confined somewhat longer; and, if there be the least disposition to costiveness, a very mild laxative is now and then exhibited; as the progress to maturation appears rather to be advanced than retarded by such means.

When the maturation is completed, and there is nothing farther to fear from the distemper, Baron Dimsdale allows his patients gradually to change their course of diet, from the perfectly cooling kind, to one a little more generous; recommending strictly to all a return to their ordinary animal-diet, with much caution and restraint upon their appetites, both in respect of food and fermented liquors.

He observes it is not often that we are under the necessity of making any application to the part where the insertion of the variolous matter was made. It most commonly heals up, and is covered with a scab, about the time when, in a natural way, all the small-pox would have been dried up. But in some cases the incisions continue to discharge a purulent matter a longer time. In these instances it is sufficient to cover the part with the white cerate, or any other mild emplastic substance, which may at once prevent the linen from adhering to the sore, and defend it from the air. As in these cases the part remains unhealed from some peculiar cause in the habit, it will be necessary to give gentle purgatives, and proper alteratives, as particular exigencies may require.

After describing the usual progress of the small-pox from inoculation, Baron Dimsdale remarks that there are frequent deviations from this course, which may embarrass an unexperienced practitioner, and create a real difficulty, as well as apprehensions of danger. He therefore proceeds to relate the means for removing those symptoms, and the doubts respecting the event.

The symptom he first notices, and which, though it very rarely happens, sometimes gives much trouble, is great sickness, accompanied with vomiting, in the eruptive state of the disease. For this complaint it is always necessary in the first place to clear the stomach; which may be effected, either by ordering the patient to drink plentifully of warm liquids to promote vomiting; or perhaps more properly, by giving to an adult one grain of tartarised antimony, mixed with ten grains of compound powder of crab's-claws; taking care to diminish the dose for very young and weak subjects.

This usually throws off some bilious matter by vomit, sometimes procures stools, or occasions a moderate sweat, and generally administers relief. If, however, no stools should follow from this medicine, and the sickness should remain, a gentle laxative almost certainly procures a respite, and the appearance of the eruption entirely removes the complaint.

Another deviation, of yet greater consequence, which sometimes happens towards the time of the eruption, and is often, though not always, accompanied with great sickness, is an erysipelatous efflorescence. If this shows itself on the skin partially, and here and there in patches, it is not very alarming, and soon wears off. But sometimes the whole surface of the body is covered with a rash intimately mixed with the variolous eruption, and so much resembling the most malignant kind of confluent small-pox as scarcely to be distinguished from it. In some such cases, accompanied with petechiæ and livid spots, Baron Dimsdale has been much alarmed; not being able by inspection only, though assisted by glasses, to determine whether what he saw was an inoffensive rash, or tokens of the greatest malignity. Very strict attention, however, has

Exanthemata | Variola.

enabled him to diſtinguiſh the difference clearly; and for aſſiſting others in ſuch a diſcrimination, he makes the following remarks.

The real and eſſential difference is to be gathered from the concomitant ſymptoms. In the eryſipelatous or variolous raſh, there is not ſo much fever, nor is the reſtleſſneſs or pain of the head or loins ſo conſiderable, neither is there that general proſtration of ſtrength; all which are uſual attendants on a confluent ſmall-pox, eſpecially when accompanied with ſuch putrid appearances. Beſides, upon a careful examination, there may ſometimes be diſcerned a few diſtinct puſtules, larger than the reſt, mixed with the raſh, which are the real ſmall-pox. In thoſe caſes the patients are ordered to refrain from cold water, or any thing cold; and to keep within doors, but not in bed. If any ſickneſs yet remains, a little white-wine whey, or other temperate cordial, is adviſed; and this method has been ſo generally ſucceſsful, as to prevent any alarming complaint. After two or three days, the ſkin changes from a florid to a duſky colour, a few diſtinct puſtules remain, and advance properly to maturation, without any farther trouble enſuing from this formidable appearance.

This raſh has often been miſtaken for the confluence it ſo much reſembles; and has afforded occaſion for ſome practitioners, either ignorantly or diſingenuouſly, to pretend, that, after a very copious eruption of the confluent pox, they can by a ſpecific medicine diſcharge the greater part of the puſtules, leaving only as many diſtinct ones as may ſatisfy the patient that he has the diſeaſe.

Baron Dimſdale informs us, that raſhes of the kind above deſcribed frequently happen during the preparation (whether owing to the regimen, or medicine, or both, he does not determine), and cauſe the operation to be poſtponed. But he has obſerved, that in ſuch caſes they are apt to return at the time of the eruption of the ſmall-pox.

In general, as has been already ſaid, the ſymptoms which precede eruption commence at the end of the ſeventh or on the eighth day incluſive from the operation; but it often happens that they appear much ſooner, and ſometimes much later than this period. Baron Dimſdale has ſeen ſome caſes in which the diſeaſe has come on ſo ſuddenly after infection, and with ſo little complaint or uneaſineſs, that the whole affair has been terminated, purges taken, and the patient returned home perfectly well, in a week; before others, inoculated at the ſame time, from the ſame patient, and under the ſame circumſtances, have begun to complain.

In this caſe, the inoculated part ſhows early certain marks of infection, ſometimes on the very next day, or the day after, when the inciſion will often appear conſiderably inflamed and elevated. The patient about this time frequently makes ſome of the following complaints, viz. chillneſs, itchings, and ſlight pricking pains in the part, and ſometimes on the ſhoulder; giddineſs, drowzineſs, and a ſlight head-ach, ſometimes attended with a feveriſh heat, but often without any. The account which patients themſelves give of their feelings is, in ſome, as if they had drank too much, and in others, as if they had caught a cold. Thoſe complaints ſeldom laſt 24 hours, often not ſo long, and with frequent intermiſſions; never, ſo far as our author remembers, riſing to a degree that requires confinement. During the continuance of thoſe complaints, the inflammation of the arm advances apace, and feels hard to the touch; but upon their wearing off, the inflamed appearances gradually diminiſh, and the part dries to a common ſmall ſcab; the ſkin, that was before red, turns livid, and the diſeaſe entirely vaniſhes. In ſome inſtances, thoſe ſymptoms attack much later; even on the ſeventh or eighth day, when an eruption might be expected in conſequence of them, yet none appears; but the arm gets well very ſoon, and the diſeaſe is at an end.

In this irregular ſort of the diſorder there have, however, been ſome examples where a few eruptions have appeared, and probably in conſequence of the inoculation: yet the puſtules have not looked like the true ſmall-pox, neither have they maturated like them, nor laſted longer than three days; about which time, for the moſt part, they have dried away.

When this irregular kind of the diſeaſe firſt occurred in Baron Dimſdale's practice, he was in doubt whether the patients were quite ſecure from any future attacks of the diſtemper. In order to be ſatisfied of this point, he inoculated them a ſecond time, cauſing them to aſſociate with perſons in every ſtage of the diſeaſe, and to try all other means of catching the infection. This method has been practiſed with the generality of ſuch patients ever ſince, yet without a ſingle inſtance of its producing any diſorder. Baron Dimſdale, therefore, now makes no ſcruple of pronouncing them perfectly ſafe; and experience has enabled him to foretel, for the moſt part, in two or three days after the operation, whether the diſeaſe will paſs in this ſlight manner.

Upon the ſecond inoculation, however, the inciſed parts are uncommonly inflamed for a day or two, juſt in the ſame manner as has in numerous inſtances been obſerved, as well in thoſe who, though certain of having had the ſmall-pox in the natural way, have ſubmitted to inoculation for the ſake of experiment, as in others, who, being doubtful whether they have had the diſeaſe or not, have been inoculated in order to be ſatisfied. But in all ſuch caſes, the parts ſoon became well; nor did any of thoſe appearances which have been deſcribed as the conſtant attendants on inoculation, as pain in the head, giddineſs, marks of infection in the arm, &c. enſue. Neither can thoſe appearances ever be produced upon a perſon who has had the ſmall-pox before, either in the natural way or by inoculation.

Another irregularity deſerving notice is, that ſometimes upon the abatement of the fever and other ſymptoms, after the appearance of ſeveral puſtules, and when the eruptive ſtage of the diſeaſe ſeems completed, it nevertheleſs happens that freſh eruptions come out, and continue doing ſo daily, for four, five, or even ſix days ſucceſſively; preceded ſometimes by a ſlight pain in the head, though more frequently they appear without any new diſturbance. Thoſe are generally few, of ſhort duration, and ſeldom come to maturity. Baron Dimſdale, however, has ſeen four caſes, in which, after a ceſſation of complaints, and an appearance of few puſtules, the eruptive ſtage of the diſeaſe was thought to be over, yet in two or three days a-

Exanthemata

Variola.

a fresh fit of fever has attacked the patients, and after a short illness a quantity of new pustules has broke out far exceeding the first number, and those remained and matured completely.

Some of the Baron's own patients, and, as he has been credibly informed, those of other inoculators, have had considerable eruptions of this kind after they returned home; which have probably given occasion for the reports of several having had the disease in the natural way after inoculation. But in confirmation that those reports are ill-grounded, he observes, that in all the cases of this sort which have occurred in his own practice, or, as far as he can learn, in that of others, the second or latter crop of pustules has always happened within the time usually allowed for the progress of the small-pox from inoculation; before the inflammation on the arm has ceased, and sooner than we can suppose them to have been produced by infection received in the natural way. When this has happened, it has been to persons in whom, after a slight eruption and abatement of symptoms, the disease has prematurely been judged to be quite over, and they have therefore been permitted to return to their families.

An appearance, more alarming and more dangerous than any of those which have already been taken notice of, is the occurrence of epileptic fits. For although it has been remarked, that these are often the forerunners of a mild disease, both in cases of accidental and likewise of intentional contagion; yet it is undeniable, that in not a few instances they have of themselves proved fatal. Wherever, therefore, an epileptic fit occurs, it naturally claims the attention of the practitioner. The occurrence of future fits is best prevented by the employment of tincture of opium, taking off the tendency to inordinate action by giving at least a temporary diminution of irritability; and on the same principle, when during a fit the patient is able to swallow, nothing is more effectual either in shortening the fit or diminishing its severity, than a dose of laudanum accommodated to the age and condition of the patient. Considerable benefit may be derived from any volatile alkaline spirit, such as spirit of hartshorn, the favourite remedy of Dr Sydenham in such cases. But the best effects may be obtained from the use of the tepid bath, which is not only of service in such cases from its action as an antispasmodic, but which also, by producing relaxation of the skin, facilitates and promotes the eruption. And even allowing that, as some imagine, the number of pustules should be increased by heat applied in this manner; yet much less is to be dreaded from thence than from the continuance of the fits.

Baron Dimsdale next considers the consequences that arise from this very cool and repelling method, and how far the patient's future state of health may be affected by a practice so opposite to what was formerly employed.

It has been the general opinion, that in most or all eruptive complaints, especially the small-pox, the rational method of cure was to forward, by every gentle means, the efforts of nature in producing an eruption; and on the contrary, that there was danger in checking it, either by cold air, cold drink, or any considerable evacuations. For this purpose the use of warm diluents, and the lying in bed, especially if the fever and symptoms run high, or at least confining to the house, have been generally approved and recommended. Experience, however, has now sufficiently confirmed the advantage of a different kind of treatment.

While the old methods prevailed of conducting inoculation, the patients, particularly children, after passing through the disease in a very favourable manner, were frequently liable to abscesses in the axilla and other parts, tedious ophthalmies, and troublesome ulcerations in the place of insertion; which though they could not be foreseen nor prevented, yet often gave more pain and vexation to the patients, and trouble to the operator, than the disease itself had done. But on inquiry into the state of those who have been treated in the cool way, or according to the new method, Baron Dimsdale affirms, that in more than 1500 there has been only one who has had so much as a boil in the axilla; and this was a child who had in the same arm an issue, which was at that time dried up. He has seen only two very small superficial boils in others near the place of insertion; and those seemed to be occasioned rather by an irritation from the discharge than by any other cause, and were all soon healed with very little trouble.

In a few instances also, there has been a slough in the incised part, which has caused a sore of short duration; but not one instance of an ulcer of any continuance. Such little breakings out too, and scabs, as frequently succeed the mild natural small-pox, sometimes, though rarely, happen to those inoculated in the new way; and, as they are of little consequence, are generally cured by the same method, the use of a few gentle purges.

In regard to ophthalmies from this kind of practice, Baron Dimsdale has never known an instance of one truly deserving that name The coats of the eye have been a little inflamed in a very few, but they soon became clear, without any means used for that purpose. He knows but two cases where he thought the inflammation great enough to require bleeding; and not one where a blister was necessary. Those complaints, therefore, which were formerly so frequent and troublesome, seem to be much reduced by the new method, the great utility of which is now universally acknowledged.

When the benefits of inoculation have now been demonstrated to be so great, it is truly surprising that the practice has not yet become general. Even its wonderful success, however, particularly when contrasted with the natural small-pox, has not been sufficient to remove every prejudice against it; and in many parts of Britain, the lower class are deterred from it by scruples even of a religious nature, by which means the state annually sustains a very considerable loss. It is, however, but just to observe, that in many parts both the medical practitioners and the clergy have done all in their power to remove every difficulty. At Edinburgh, the colleges of physicians and surgeons annually make an offer of their assistance and advice *gratis* to all the poor who submit to this operation during certain months; and a most respectable clergyman has been at the expence of publishing a plain and sensible discourse, not only calculated to remove every religious doubt or scruple which can be entertained on

Exanthemata

this head, but alfo clearly demonftrating to parents, that they have themfelves to blame for the death of their children if they neglect to employ the means with which Providence has furnifhed them for preferving the lives of their offspring.

226 Genus XXIX. VARICELLA.

Chicken-pox.

Varicella, *Vog.* 42.
Variola lymphatica, *Sauv.* fp. 1.
Anglis, *The Chicken pox*, Edin. Med. Effays, vol. ii. art. 2. near the end. *Heberden*, Med. Tranfac. art. 17.

This is in general a very flight difeafe; and is attended with fo little danger, that it would not merit any notice, if it were not apt to be confounded with the fmall-pox, and thus give occafion to an opinion that a perfon might have the fmall-pox twice in his life; or they are apt to deceive into a falfe fecurity thofe who have never had the fmall-pox, and make them believe that they are fafe when in reality they are not. This eruption breaks out in many, according to Dr Heberden, without any illnefs or previous fign; in others it is preceded by a little degree of chillnefs, laffitude, cough, broken fleep, wandering pains, lofs of appetite, and feverifh ftate for three days.

In fome patients the chicken-pox make their firft appearance on the back; but this perhaps is not conftant. Moft of them are of the common fize of the fmall-pox, but fome are lefs. Dr Heberden never faw them confluent, nor very numerous. The greateft number was about 12 in the face, and 200 over the reft of the body.

On the firft day of the eruption they are reddifh. On the fecond day there is at the top of moft of them a very fmall bladder, about the fize of a millet-feed. This is fometimes full of a watery and colourlefs, fometimes of a yellowifh liquor, contained between the cuticle and fkin. On the fecond, or, at the fartheft, on the third day from the beginning of the eruption, as many of thefe pocks as are not broken feem arrived at their full maturity; and thofe which are fulleft of that yellow liquor very much refemble what the genuine fmall-pox are on the fifth or fixth day, efpecially where there happens to be a larger fpace than ordinary occupied by the extravafated ferum. It happens to moft of them, either on the firft day that this little bladder arifes, or on the day after, that its tender cuticle is burft by the accidental rubbing of the clothes, or by the patient's hands to allay the itching which attends this eruption. A thin fcab is then formed at the top of the pock, and the fwelling of the other part abates, without its ever being turned into pus, as it is in the fmall-pox. Some few efcape being burft; and the little drop of liquor contained in the veficle at the top of them, grows yellow and thick, and dries into a fcab. On the fifth day of the eruption they are almoft all dried and covered with a flight cruft. The inflammation of thefe pocks is very fmall, and the contents of them do not feem to be owing to fuppuration, as in the fmall-pox, but rather to what is extravafated under the cuticle by the ferous veffels of the fkin, as in a common blifter. No wonder, therefore, that this liquor appears fo foon as on the fecond day; and that, upon the cuticle being broken, it is prefently fucceeded by a flight fcab: hence too, as the true fkin is fo little affected, no mark or fcar is likely to be left, unlefs in one or two pocks, where, either by being accidentally much fretted, or by fome extraordinary fharpnefs of the contents, a little ulcer is formed in the fkin. Varicella.

The patients fcarce fuffer any thing throughout the whole progrefs of this illnefs, except fome languidnefs of ftrength and fpirits and appetite; all which is probably owing to the confining of themfelves to their chamber.

Two children were taken ill of the chicken-pox, whofe mother chofe to be with them, though fhe had never had this illnefs. Upon the eighth or ninth day after the pocks were at their height in the children, the mother fell ill of this diftemper then beginning to fhow itfelf. In this inftance the infection lay in the body much about the fame time that it is known to do in the fmall-pox.

Remedies are not likely to be much wanted in a difeafe attended with hardly any inconvenience, and which in fo fhort a time is certainly cured of itfelf.

The principal marks by which the chicken-pox may be diftinguifhed from the fmall-pox are,

1. The appearance, on the fecond or third day from the eruption, of that veficle full of ferum upon the top of the pock.

2. The cruft, which covers the pocks on the fifth day; at which time thofe of the fmall-pox are not at the height of their fuppuration.

Foreign medical writers hardly ever mention the name of this diftemper: and the writers of our own country fcarce mention any thing more of it than its name. Morton fpeaks of it as if he fuppofed it to be a very mild genuine fmall-pox. But thefe two diftempers are furely totally different from one another, not only on account of their different appearances abovementioned, but becaufe thofe who have had the fmall-pox are capable of being infected with the chicken-pox; but thofe who have once had the chicken-pox are not capable of having it again, though to fuch as have never had this diftemper, it feems as infectious as the fmall-pox. Dr Heberden wetted a thread in the moft concocted pus-like liquor of the chicken-pox which he could find; and after making a flight incifion, it was confined upon the arm of one who had formerly had it; the little wound healed up immediately, and fhowed no figns of any infection.

From the great fimilitude between the two diftempers, it is probable, that, inftead of the fmall-pox, fome perfons have been inoculated from the chicken-pox; and that the diftemper which has fucceeded, has been miftaken for the fmall-pox by hafty or unexperienced obfervers.

There is fometimes feen an eruption, concerning which Dr Heberden is in doubt whether it be one of the many unnoticed cutaneous difeafes, or only a more malignant fort of chicken-pox.

This diforder is preceded for three or four days by all the fymptoms which forerun the chicken-pox; but in a much higher degree. On the fourth or fifth day the eruption appears, with very little abatement of the fever: the pains likewife of the limbs and back ftill continue, to which are joined pains of the gums. The pocks

Exanthemata

pocks are redder than the chicken-pox, and spread wider; and hardly rise so high, at least not in proportion to their size. Instead of one little head or vesicle of a serous matter, these have from four to ten or twelve. They go off just like the chicken-pox, and are distinguishable from the small-pox by the same marks; besides which, the continuance of the pains and fever after the eruption, and the degree of both these, though there be not above 20 pocks, are circumstances never happening in the small-pox.

Description. This disease begins with a cold stage, which is soon followed by a hot, with the ordinary symptoms of thirst, anorexia, anxiety, sickness, and vomiting; and these are more or less considerable in different cases. Sometimes from the beginning the fever is sharp and violent: often, for the first two days, it is obscure and inconsiderable; but always becomes violent before the eruption, which commonly happens on the fourth day. This eruptive fever, from the beginning of it, is always attended with hoarseness, a frequent hoarse dry cough, and often with some difficulty of breathing. At the same time, the eye-lids are somewhat swelled; the eyes are a little inflamed, and pour out tears; and with this there is a coryza, and frequent sneezing. For the most part, a constant drowsiness attends the beginning of this disease. The eruption, as we have said, commonly appears upon the fourth day, first on the face, and successively on the lower parts of the body. It appears first in small red points; but, soon after, a number of these appear in clusters, which do not arise in visible pimples, but, by the touch, are found to be a little prominent. This is the case on the face; but, in other parts of the body, the prominency, or roughness, is hardly to be perceived. On the face, the eruption retains its redness, or has it increased for two days; but on the third, the vivid redness is changed to a brownish red; and in a day or two more the eruption entirely disappears, while a mealy desquamation takes place. During the whole time of the eruption, the face is somewhat turgid, but seldom considerably swelled. Sometimes, after the eruption has appeared, the fever ceases entirely: but this is seldom the case; and more commonly the fever continues or is increased after the eruption, and does not cease till after the desquamation. Even then the fever does not always cease, but continues with various duration and effect. Though the fever happen to cease upon the eruption's taking place, it is common for the cough to continue till after the desquamation, and sometimes much longer. In all cases, while the fever continues, the cough also continues, generally with an increase of the difficulty of breathing; and both of these symptoms sometimes arise to a degree which denotes a pneumonic affection. This may happen at any period of the disease; but very often it does not come on till after the desquamation of the eruption.

Rubeola.

After the same period, also, a diarrhœa frequently comes on, and continues for some time.

It is common for measles, even when they have not been of a violent kind, to be followed by inflammatory affections, particularly ophthalmia and phthisis. If blood be drawn from a vein in the measles, with circumstances necessary to favour the separation of the gluten, this always appears separated, and lying on the surface of the crassamentum, as in inflammatory diseases. For the most part, the measles, even when violent, are without any putrid tendency; but in some cases, such a tendency appears both in the course of the disease, and especially after the ordinary course of it is finished.

Causes. The measles are occasioned by a peculiar kind of contagion, the nature of which is not understood; and which, like that of the small-pox, affects a person only once in his life.

Prognosis. From the description of this distemper already given, it appears that the measles are attended with a catarrhal affection, and with an inflammatory diathesis to a considerable degree; and therefore the danger of them is to be apprehended chiefly from the coming on of a pneumonic inflammation.

Cure. In measles, as well as in small-pox, the disease from its nature must necessarily run a determined course; and therefore the sole aim of a practitioner is to conduct this course in the easiest manner, by preventing and obviating urgent symptoms.

From the consideration mentioned in the prognosis, it will be obvious, that the remedies especially necessary are those which may obviate and diminish the inflammatory diathesis; and therefore, in a particular manner, blood-letting. This remedy may be employed at any time in the course of the disease, or after the ordinary course of it is finished. It is to be employed more or less, according to the urgency of the symptoms of fever, cough, and dyspnœa; and generally may be employed very freely. But as the symptoms of pneumonic inflammation seldom come on during the eruptive fever, and as this is sometimes violent immediately before the eruption, though a sufficiently mild disease be to follow; bleeding is seldom very necessary during the eruptive fever, and may often be reserved for the times of greater danger which are perhaps to follow.

In all cases of measles, where there are no marks of putrescency, and where there is no reason, from the known nature of the epidemic, to apprehend putrescency, bleeding is the remedy most to be depended upon:

Exanthemata

upon: but affiftance may alfo be drawn from cooling purgatives; and particularly from bliftering on the fides or between the fhoulders. The dry cough may be alleviated by the large ufe of demulcent pectorals, mucilaginous, oily, or fweet. It may, however, be obferved, with refpect to thefe demulcents, that they are not fo powerful in involving and correcting the acrimony of the mafs of blood as has been imagined; and that their chief operation is by befmearing the fauces, and thereby defending them from the irritation of acrids, either arifing from the lungs or diftilling from the head. For moderating and quieting the cough in this difeafe, opiates certainly prove the moft effectual means, whenever they can be fafely employed. In the meafles, in which an inflammatory ftate prevails in a confiderable degree, opiates have indeed by fome been fuppofed to be inadmiffible: but experience abundantly demonftrates, that the objection made to their ufe is merely hypothetical; and even in cafes where, from a high degree of pyrexia and of dyfpnœa, there is reafon to fear the prefence, or at leaft the danger, of pneumonic inflammation, opiates are highly ufeful; after bleeding, to obviate or abate the inflammatory ftate, has been duly employed: in fuch cafes, while the cough and watchfulnefs are the urgent fymptoms, opiates may be fafely exhibited, and with great advantage. In all the exanthemata, there is an acrimony diffufed over the fyftem, which gives a confiderable irritation; and, for obviating the effects of this, opiates are ufeful, and always proper, when no particular contra-indication prevails.

When the defquamation of the meafles is finifhed, though then there fhould be no diforder remaining, phyficians have thought it neceffary to purge the patient feveral times, with a view to draw off what have been called the *dregs of this difeafe*; that is, a portion of the morbific matter which is fuppofed to remain long in the body. Dr Cullen does not reject this fuppofition; but at the fame time cannot believe that the remains of the morbific matter, diffufed over the whole mafs of blood, can be wholly drawn off by purging; and therefore thinks, that, to avoid the confequence of the meafles, it is not the drawing off the morbific matter which we need to ftudy, fo much as to obviate and remove the inflammatory ftate of the fyftem which had been induced by the difeafe. With this laft view indeed, purging may ftill be a proper remedy; but bleeding, in proportion to the fymptoms of inflammatory difpofition, is ftill more fo.

From our late experience of the ufe of cold air in the eruptive fever of the fmall-pox, fome phyficians have been of opinion that the practice may be transferred to the meafles; but this point has not yet been determined by fufficiently extenfive experience. We are certain, that external heat may be very hurtful in the meafles, as in moft other inflammatory difeafes; and therefore, that the body ought to be kept in a moderate temperature during the whole courfe of the difeafe: but how far, at any period of the difeafe, cold air may be applied with fafety, is ftill uncertain. Analogy, though fo often the refource of phyficians, is frequently fallacious; and further, though the analogy with the fmall-pox might lead to the application of cold air during the eruptive fever of the meafles, the analogy with catarrh feems to be againft the practice.

Rubeola.

When the eruption is upon the fkin, there are many inftances of cold air making it difappear, and thereby producing much diforder in the fyftem; and there are alfo frequent inftances of this diforder's being removed by reftoring the heat of the body, and thereby again bringing out the eruption.

Upwards of 20 years ago, inoculation for the meafles was propofed, and practifed in feveral inftances with fuccefs, by Dr Home of Edinburgh. His method of communicating the infection was, by applying to an incifion in each arm cotton moiftened with the blood of a patient labouring under the meafles; but with others who have made fimilar trials, the attempt has not yet fucceeded. And attempts have been made to inoculate this difeafe by means of the fluid difcharged under the form of tears, the fquamæ falling from the furface, and the like; but there is reafon to believe, that where it was imagined the infection had thus been communicated, the contagion was only carried about the perfon inoculating, and communicated in the ordinary way.

From inoculation of the meafles, it is imagined that feveral advantages may be obtained; and among others, it is thought the forenefs of the eyes may be mitigated, the cough abated, and the fever rendered lefs fevere. But the practice was never much in fafhion, and now is fcarce ever heard of.

Hiftory and Defcription. This difeafe is faid to have been unknown to the ancients, and that it appeared for the firft time in Saxony about the middle of the laft century. It is faid to have fince fpread from thence into all the other countries of Europe; and, fince the period mentioned, to have appeared in many

Exanthemata

many countries in which it had never appeared before.

From the time of its having been first taken notice of, it has been described and treated of by many different writers; and by all of them, till very lately, has been considered as a peculiar idiopathic disease. It is said to have been constantly attended with peculiar symptoms. It comes on with a cold stage, which is often considerable. The hot stage, which follows, is attended with great anxiety, and frequent sighing. The heat of the body becomes great, and soon produces profuse sweating, preceded, however, with a sense of pricking, as of pin-points in the skin; and the sweat is of a peculiar rank and disagreeable odour. The eruption appears sooner or later in different persons, but at no determined period of the disease. It seldom or never appears upon the face; but appears first upon the neck and breast, and from thence often spreads over the whole body.

The eruption named *miliary* is said to be of two kinds; the one named the *red*, the other the *white miliary*. The former, which in English is strictly named a *rush*, is commonly allowed to be a symptomatic affection; and as the latter is the only one that has any pretensions to be considered as an idiopathic disease, it is this only that we shall more particularly describe and treat of under this genus.

What is then called the *white miliary eruption*, appears at first like the red, in very small red pimples, for the most part distinct, but sometimes clustered together. Their little prominence is better distinguished by the finger than by the eye. Soon after the appearance of this eruption, and, at least, on the second day, a small vesicle appears upon the top of the pimples. At first the vesicle is whey-coloured; but soon becomes white, and stands out like a little globule on the top of the pimple. In two or three days, these globules break, or are rubbed off; and are succeeded by small crusts, which soon after fall off in small scales. While one set of pimples take this course, another set arise to run the same; so that the disease often continues upon the skin for many days together. Sometimes when one crop of this eruption has disappeared, another, after some interval, is produced. And it has been further observed, that in some persons there is such a disposition to this disease, that they have been affected with it several times in the course of their lives.

This disease is said to affect both sexes, and persons of all ages and constitutions; but it has been observed at all times to affect especially, and most frequently, lying-in women.

It is often accompanied with violent symptoms, and has frequently proved fatal. The symptoms, however, attending it are very various; and they are, upon occasions, every one attending febrile diseases; but no symptom, or concourse of symptoms, are steadily the same in different persons, so as to give any specific character to the disease. When the disease is violent, the most common symptoms are phrenetic, comatose, and convulsive affections, which are also symptoms of all fevers treated by a very warm regimen.

While there is such a variety of symptoms appearing in this disease, it is not to be expected that any one particular method of cure can be proposed; and, accordingly, we find in different writers different methods and remedies prescribed; frequent disputes about the most proper; and those received and practised by some, opposed and deserted by others.

Miliaria.

It appears, however, to Dr Cullen, very improbable, that this was really a new disease, when it was first considered as such. There are very clear traces of it in authors who wrote long before that period; and though there were not, we know that ancient descriptions were often inaccurate and imperfect, particularly with respect to cutaneous affections; and we know also that those affections which commonly appeared as symptomatic only, were often neglected, or confounded together under a general appellation.

The antecedent symptoms of anxiety, sighing, and pricking of the skin, which have been spoken of as peculiar to this disease, are, however, common to many others; and perhaps to all those in which sweatings are forced out by a warm regimen. Of the symptoms said to be concomitant of this eruption, there are none which can be affirmed to be constant and peculiar but that of sweating. This, indeed, always precedes and accompanies the eruption; and, while the miliary eruption attends many different diseases, it never, however, appears in any of these but after sweating; and in persons labouring under the same diseases it does not appear, if in such persons sweating be avoided. It is therefore probable, that the eruption is the effect of sweating: and that it is the effect of a matter not before prevailing in the mass of blood, but generated under particular circumstances in the skin itself. That it depends upon particular circumstances of the skin, is also probable from its being observed that the eruption seldom or never appears upon the face, although it affects the whole of the body besides; and that it comes upon those places especially which are more closely covered; and that it can be brought out upon particular places by external applications.

It is to be observed, that this eruptive disease differs from the other exanthemata in many circumstances, especially the following; that it is not contagious, and therefore never epidemic; that the eruption appears at no determined period of the disease; that the eruption has no determined duration; that successive eruptions frequently appear in the course of the same fever, and that such eruptions frequently recur in the course of the same person's life. All this renders it very probable, that, in the miliary fever, the morbific matter is not a subsisting contagion communicated to the blood, and thence, in consequence of fever and assimilation, thrown out upon the surface of the body, but a matter occasionally produced in the skin itself by sweating.

This conclusion is further rendered probable from hence, that, while the miliary eruption has no symptoms or concourse of symptoms peculiar to itself, it, upon occasions, accompanies almost every febrile disease, whether inflammatory or putrid, if these happen to be attended with sweating; and from thence it may be presumed, that the miliary eruption is a symptomatic affection only, produced in the manner we have said.

But as this symptomatic affection does not always accompany every instance of sweating, it may be proper to inquire, what are the circumstances which especially

Exanthemata

cially determine this eruption to appear? And to this Dr Cullen gives no full and proper anſwer. He cannot ſay that there is any one circumſtance which in all caſes gives occaſion to this eruption; nor can he ſay what different cauſes, in different caſes, may give occaſion to it. There is only one obſervation that can be made to the purpoſe of this inquiry; and it is, that theſe perſons ſweating, under febrile diſeaſes, are eſpecially liable to the miliary eruption, who have been previouſly weakened by large evacuations, particularly of blood. This will explain why it happens to lying-in women more frequently than to any other perſons; and to confirm this explanation, he has obſerved, that the eruption has happened to other women, though not in child-bed, but who had been much ſubjected to a frequent and copious menſtruation, and to an almoſt conſtant *fluor albus*. He has alſo obſerved it to have happened to men in fevers, after wounds from which they had ſuffered a great loſs of blood.

Further, that this eruption is produced by a certain ſtate of debility, is, he thinks, probable, from its ſo often attending fevers of the putrid kind, which are always attended with great debility. It is true, that it alſo ſometimes attends inflammatory diſeaſes, when it cannot be accounted for in the ſame manner; but he believes it may be obſerved, that it eſpecially attends thoſe inflammatory diſeaſes in which the ſweats have been long protracted, or frequently repeated, and which have thereby produced a debility, and perhaps a debilitating putrid diatheſis.

That, however, the miliary eruption is not neceſſarily or even generally connected with a certain ſtate of debility, is abundantly evident from its being entirely wanting in by much the greater number of inſtances of typhoid fever, and in a variety of other diſeaſes where every poſſible degree of debility occurs: And that it is not connected with any certain ſtate of debility, ſtill farther appears, both from the condition of thoſe affected with it in different inſtances, which in point of ſtrength is very various; and likewiſe from the continuance of freſh eruptions with the ſame individual, although during that time in very different ſtates with reſpect to debility. It appears, therefore, much more probable, that it depends on ſome peculiar ſtate of the ſurface, induced by the concurring influence of certain prediſpoſing and occaſional cauſes.

It appears ſo clearly that this eruption is always a ſymptomatic and factitious affection, that Dr Cullen is perſuaded it may be, in moſt caſes, prevented merely by avoiding ſweats. Spontaneous ſweatings, in the beginning of diſeaſes, are very rarely critical; and all ſweatings not evidently critical, ſhould be prevented, or at leaſt moderated; and the promoting them, by increaſing external heat, is commonly very pernicious. Even critical ſweats ſhould hardly be encouraged by ſuch means. If, therefore, ſpontaneous ſweats ariſe, they are to be checked by the coolneſs of the chamber; by the lightneſs and looſeneſs of the bed-cloaths; by the perſons laying out their arms and hands; and by their taking cold drink: and in this way Dr Cullen thinks he has frequently prevented miliary eruptions, which were otherwiſe likely to have appeared, particularly in puerperal women.

But it may happen, when theſe precautions have been neglected, or from other circumſtances, that a miliary eruption does actually appear; and the queſtion will then be put, how the caſe is to be treated? This is a queſtion of conſequence; as there is reaſon to believe that the matter here generated is often of a virulent kind; it is often the offspring of putreſcency; and, when treated by increaſing the external heat of the body, it ſeems to acquire a virulence which produces thoſe ſymptoms mentioned above, and proves certainly fatal.

Miliaria

It has been an unhappy opinion with moſt phyſicians, that eruptive diſeaſes were ready to be hurt by cold; and that it was therefore neceſſary to cover up the body very cloſely, and thereby increaſe the external heat. We now know that this is a miſtaken opinion; that increaſing the external heat of the body is very generally miſchievous; and that ſeveral eruptions not only admit, but require the application of cold air. Dr Cullen is perſuaded, therefore, that the practice which formerly prevailed in the caſe of miliary eruptions, of covering up the body cloſely, and both by external means and internal remedies encouraging the ſweatings which accompany this eruption, was highly pernicious, and commonly fatal. He is therefore of opinion, that even when a miliary eruption has appeared, in all caſes in which the ſweating is not manifeſtly critical, we ſhould employ all the means of ſtopping the ſweating that are mentioned above; and he has ſometimes had occaſion to obſerve, that even the admiſſion of cool air was ſafe and uſeful.

This is, in general, the treatment of miliary eruptions: but at the ſame time, the remedies ſuited to the primary diſeaſe are to be employed; and therefore, when the eruption happens to accompany inflammatory affections, and the fulneſs and hardneſs of the pulſe or other ſymptoms ſhow an inflammatory ſtate preſent, the caſe is to be treated by blood-letting, purging, and other antiphlogiſtic remedies.

Upon the other hand, when the miliary eruption attends diſeaſes, in which debility and putreſcency prevail, it will be proper to avoid all evacuations, and to employ tonic and antiſeptic remedies, particularly the Peruvian bark, cold drink, and cold air.

The moſt diſtreſſing circumſtance attending this affection, is the almoſt unſupportable ſickneſs at ſtomach which frequently occurs, and which is often obſerved to precede freſh eruptions taking place during the courſe of the diſeaſe. With the view of counteracting and alleviating this ſymptom, recourſe is had to wine and other cordial medicines. But with many patients nothing is found to have ſo much influence as the uſe of camphor, particularly when introduced gradually in ſmall doſes, under the form of the *miſtura camphorata* of the London pharmacopœia, or of the *emulſio camphorata* of that of Edinburgh.

We ſhall conclude this ſubject with obſerving, that the venerable octogenarian practitioner, de Fiſcher, when treating of this ſubject, in laying down the indications of cure, has given this as one of them: "Excretionis periphericæ non primariam habere rationem."

GENUS XXXII. SCARLATINA. 230

Sp. I. The Mild Scarlet Fever.

Scarlatina febris, *Sauv.* ſp. 1. *Sydenham*, ſect. vi. cap. 2.

Sp. II. The Scarlet Fever with *Ulcerated Sore Throat.*

Scarlatina anginoſa. *Withering* on the Scarlet Fever.

The mild ſcarlet fever is deſcribed by Sydenham, who tells us that he can ſcarce account it a diſeaſe; and indeed nothing more ſeems to be neceſſary in the treatment of it than an antiphlogiſtic regimen, avoiding the application of cold air and cold drink. The diſeaſe however ſometimes rages epidemically, and is attended with very alarming ſymptoms, bearing no ſmall reſemblance to the cynanche maligna, in which caſe it is called *ſcarlatina anginoſa.*—The beſt deſcription of this diſtemper has been publiſhed by Dr Withering in the year 1778. This diſeaſe made its appearance, we are told, at Birmingham and the neighbouring villages, about the middle of May 1778. It continued in all its force and frequency to the end of October; varying, however, in ſome of its ſymptoms, as the air grew colder. In the beginning of November it was rarely met with; but towards the middle of that month, when the air became warmer, it increaſed again, and in ſome meaſure reſumed thoſe appearances it poſſeſſed in the ſummer-months, but which it had loſt during the cold winds in October.

It affected children more than adults; but ſeldom occurred in the former under two years of age, or in the latter if they had paſſed their fiftieth year.

Deſcription. With various general ſymptoms of fever, the patient at firſt complains of a dejection of ſpirits, a ſlight ſoreneſs or rather ſtiffneſs in the neck, with a ſenſe of ſtraitneſs in the muſcles of the neck and ſhoulders, as if they were bound with cords. The ſecond day of the fever this ſoreneſs in the throat increaſes, and the patients find a difficulty in ſwallowing; but the difficulty ſeems leſs occaſioned by the pain excited in the attempt, or by the ſtraitneſs of the paſſage, than by an inability to throw the neceſſary muſcles in action. The ſkin feels hot and dry, but not hard; and the patients experience frequent, ſmall, pungent pains, as if touched with the point of a needle. The breath is hot and burning to the lips, and thirſt makes them wiſh to drink; but the tendency to ſickneſs, and the exertions neceſſary in deglutition, are ſo unpleaſant, that they ſeldom care to drink much at a time. They have much uneaſineſs alſo from want of reſt during the night. In the morning of the third day, the face, neck, and breaſt, appear redder than uſual: in a few hours this redneſs becomes univerſal; and increaſes to ſuch a degree of intenſity, that the face, body, and limbs, reſemble a boiled lobſter in colour, and are evidently ſwollen. Upon preſſure the redneſs vaniſhes, but ſoon returns again. The ſkin is ſmooth to the touch, nor is there the leaſt appearance of pimples or puſtules. The eyes and noſtrils partake more or leſs of the general redneſs; and in proportion to the intenſity of this colour in the eyes, the tendency to delirium prevails.

Things continue in nearly this ſtate for two or three days longer, when the intenſe ſcarlet gradually abates, a brown colour ſucceeds, and the ſkin becoming rough, peels off in ſmall ſcales. The tumefaction ſubſides at the ſame time, and the patients gradually recover their ſtrength and appetite.

During the whole courſe of the diſeaſe, the pulſe is quick, ſmall, and uncommonly feeble; the urine ſmall in quantity; the ſub-maxillary glands ſomewhat enlarged and painful to the touch. The velum pendulum palati, the uvula, the tonſils, and gullet, as far as the eye can reach, partake of the general redneſs and tumefaction; but although collections of thick mucus, greatly reſembling the ſpecks or ſloughs in the putrid ſore throat, ſometimes occur, yet thoſe are eaſily waſhed off, and real ulcerations of thoſe parts were never obſerved.

Theſe are the moſt uſual appearances of this diſorder; but it too frequently aſſumes a much more fatal form. In ſome children the delirium commences in a few hours after the firſt attack; the ſkin is intenſely hot; the ſcarlet colour appears on the firſt or ſecond day, and they die very early on the third. Others again, who ſurvive this rapid termination, inſtead of recovering, as is uſual, about the time the ſkin begins to get its natural colour, fall into a kind of lingering, and die at laſt in the courſe of ſix or eight weeks.

In adults, circular livid ſpots were frequently obſerved about the breaſt, knees, and elbows; alſo large blotches of red, and others of white intermixed, and often changing places.

In the month of October, when the air becomes colder, the ſcarlet colour of the ſkin was both leſs frequent and leſs permanent. Many patients had no appearance of it at all; whilſt others, eſpecially adults, had a few minute red pimples, crowned with white pellucid heads The inſide of the throat was conſiderably tumefied; its colour a dull red, ſometimes tending to a livid. The pulſe beat in general 130 or 140 ſtrokes in a minute; was ſmall, but hard, and ſometimes ſufficiently ſo to juſtify the opening of a vein; and the blood thus taken away, in every inſtance when cool, appeared ſizy, and the whole craſſamentum firm.

Happy would it be, Dr Withering obſerves, if the baneful influence of this diſorder terminated with the febrile ſymptoms. But in ten or fifteen days from the ceſſation of the fever, and when a complete recovery might be expected, another train of ſymptoms occur, which at laſt frequently terminate fatally. The patients, after a few days amendment, feel a ſomething that prevents their farther approach to health; an unaccountable languor and debility prevails, a ſtiffneſs in the limbs, an accelerated pulſe, diſturbed ſleep, diſreliſh to food, and a ſcarcity of urine. Theſe ſymptoms, we are told, are ſoon ſucceeded by ſwellings of a real dropſical nature, forming ſometimes an anaſarca, and on other occaſions an aſcites; and not unfrequently ſcarlatina has proved fatal, from ſupervening hydrothorax in conſequence of the effuſion of water into the cheſt. It is unneceſſary to remark, that when this happens, a fatal termination is more ſudden than from any other modification of dropſy.

Exanthemata

Scarlatina.

Dr Withering, after examining the accounts given of this diſeaſe by different authors, proceeds to the diagnoſis. It may be diſtinguiſhed, he obſerves, from the petechial fever, by the eruption in the latter appearing ſeldom before the fourth day, by the regularity and diſtinctneſs of the ſpots, and by its principally occupying the neck, the back, and the loins. On the other hand, in the ſcarlet fever, the eruption generally appears about the third day; conſiſts either of broad blotches, or elſe one continued redneſs, which ſpreads over the face and the whole body.

In the fever called *purpura*, the puſtules are prominent, keep their colour under preſſure, and never appear early in the diſeaſe; whereas in the ſcarlet fever, the eruption appears more early, is not prominent, but perfectly ſmooth to the touch, and becomes quite white under preſſure.

Although the *purple fever* and *ſcarlatina* may be connected by ſome general cauſe, yet our author takes occaſion to obſerve, that they cannot be mere modifications of the ſame eruption: for examples occur, he ſays, of the ſame perſon being firſt ſeized with one of theſe diſorders, and afterwards with the other; but he never met with an inſtance of the ſame perſon having the ſcarlet fever twice; and he believes it to be as great an improbability as a repetition of the ſmall-pox.

This diſorder is particularly diſtinguiſhed from the *meaſles*, we are told, by the want of that cough, watery eye, and running at the noſe, which are known to be the predominant ſymptoms in the early ſtate of the meaſles, but are never known to exiſt in the ſcarlatina.

From the *eryſipelas* this diſeaſe is diſtinguiſhable, by the limited ſeat of the former, together with its not being contagious.

The *ulcerated ſore throat*, however, is more difficult to diſtinguiſh from this diſeaſe than any other; and yet the diſtinction is a matter of the greateſt importance, as the method of treatment, according to Dr Withering, ought to be extremely different.—But although, in a number of circumſtances, theſe two diſeaſes bear a very great reſemblance, yet, with a little attention, the one may in general, he thinks, be diſtinguiſhed from the other. From Dr Fothergill's account of the ſore throat attended with ulcers, our author has made out the following characteriſtical circumſtances of the two diſeaſes, contraſted to one another.

	Scarlatina Anginoſa.	Angina Gangrenoſa.
Seaſon.	Summer . . Autumn.	Spring . . Winter.
Air.	Hot . . Dry.	Warm . . Moiſt.
Places.	High . . Dry . . . Gravelly.	Cloſe. . Low . . Damp. . Marſhy.
Subjects.	Vigorous. Both ſexes alike. . Robuſt in moſt danger. . . .	Delicate . . Women and female children. Robuſt adults not in danger.
Skin.	Full ſcarlet . . . . ſmooth . . If pimply, the pimples white at the top . . Always dry and hot.	Red tinge . . pimply. . The pimples redder than the interſtices . . bedewed with ſweat towards morning.
Eyes.	Shining, equable, intenſe redneſs, rarely watery.	Inflamed and watery, or ſunk and dead.
Throat.	In ſummer, tonſils, &c. little tumefied; no ſlough . . In autumn, more ſwelled. Integuments ſeparating . . Sloughs white.	Tonſils, &c. conſideraly. ſwelled and ulcerated . . . Sloughs dark brown.
Breath.	Very hot, but not fetid.	Offenſive to the patients and aſſiſtants.
Voice.	In ſummer, natural.	Flat and rattling.
Bowels.	Regular at the acceſſion.	Purging at the acceſſion.
Blood.	Buffy. . Firm.	Florid . . Tender.
Termination.	The 3d, 5th, 8th, or 11th day.	No ſtated period
Nature.	Inflammatory.	Putrid.

It is not pretended, Dr Withering remarks, that all the above contraſted ſymptoms will be met with in every caſe. It is enough, he obſerves, that ſome of them appear; and that if conjoined with the conſideration of the prevailing conſtitution, they enable us to direct that mode of treatment which will moſt contribute to the relief of the ſick.

But notwithſtanding the attention which Dr Withering has beſtowed upon this ſubject, we are ſtill inclined to think, that the diſeaſe which he has ſo accurately deſcribed under the title of *ſcarlatina anginoſa*, is in reality the ſame affection with the malignant ulcerous ſore throat of Huxham and Fothergill. During different epidemics, this diſeaſe, like ſmall-pox and meaſles in different ſeaſons, is conſiderably varied in its appearance. But ſtill there occurs ſuch a ſimilarity as clearly marks the ſameneſs of the affection. And indeed this, as in the caſe of the ſmall-pox, is abundantly demonſtrated, by infection from one contagion giving protection againſt ſucceeding ones, although the appearances be much varied. This has particularly appeared at Edinburgh, where the diſeaſe has of late prevailed as an epidemic on three different years, viz. 1774-5, 1782-3, and 1789-90. During the firſt of theſe, in the greater part of patients, the ſore throats were of a very gangrenous and malignant nature: during the ſecond, the diſeaſe more commonly appeared under the form of what might be called *ſimple ſcarlatina:* and during the third epidemic, the contagion was, if we may be allowed the expreſſion, of an intermediate nature. But it is farther to be remarked, that during every one of thoſe epidemics, when ſeveral children of a family were at the ſame time ſubjected to the infection, in one the diſeaſe would have been attended with almoſt all the ſymptoms mentioned in the column of *ſcarlatina anginoſa*, with reſpect to ſkin, eyes, throat, breath, bowels, termination of the affections, &c. In another, would have occurred all the ſymptoms with reſpect to thoſe particulars which he has mentioned under the column of *angina gangrenoſa*. While at the ſame time, in numberleſs inſtances, even in the ſame patient, the diſeaſe at its commencement has ſhown evident marks of an inflammatory, and at its termination of a putrid tendency. And there cannot be a doubt, that both the ſcarlatina

Exanthemata

anginosa, and angina gangrenosa, as described by Fothergill and Huxham, have occurred in every season and situation, and have affected persons of every age and constitution not before subjected to either disease.

Causes. Dr Withering affirms, that the immediate cause of this disease is a poison of a peculiar kind, communicable by contagion.

2. That this poison first takes possession of the mucous membrane lining the fauces and the nose; and either by its action upon the secretory glands, or upon the mucus itself, assimilates that mucus to its own nature.

3. That it is from this beginning, and from this only, that it spreads to the stomach, &c. and at length acts upon the system at large.

4. That its first action upon the nerves is of a sedative or debilitating nature.

5. That in consequence of certain laws of the nervous system, when the debilitating effects operate upon the sensorium commune, a reaction takes place; and that this reaction is, *cæteris paribus*, proportioned to the debilitating power.

6. That, in consequence of this reaction of the nervous system, the vibratory motion of the capillary blood-vessels dependent thereon is greatly increased; an unusually large quantity of blood is accumulated in those vessels; the heart and large blood-vessels are deprived of their customary proportion; and hence, though stimulated to more frequent contraction, the pulse must necessarily be feeble.

7. That as violent exertions are followed by debility, upon the cessation of the fever, the capillary vessels, which had acted with such unusual violence, are left in a state of extreme debility, and are long in recovering their tone; hence it is that so many patients afterwards become dropsical.

Dr Withering next proceeds to the consideration of the different remedies, which either are at present in common use or have been recommended as proper in this disease.

Cure. Blood-letting has been recommended by authors; but such was the state of the pulse in this disorder, at least during the summer-months, that it was not in any instance thought advisable to take away blood. In some cases, indeed, where the fiery redness of the eyes seemed to demand the use of leeches, they were had recourse to, but never with any advantage. In the harvest months, when the pulse was more firm, and when suffocation seemed to be threatened from the swelling in the fauces, blood-letting was sometimes advised; but still with less advantage than one would have expected in almost any other situation.

Vomiting.] This, our author observes, seems to be the remedy of nature; and he is surprised how it should have been omitted by several authors who have gone before him. Vomiting, he says, most amply fulfils the indications arising both from a consideration of the cause and of the effects; and a liberal use of the remedy he holds forth as the true foundation for successful practice in scarlet fever and sore throat. His common form of emetic is a combination of tartar emetic and ipecacuanha, given in pretty smart doses; and these are to be repeated at least once in 48 hours, and in the worst cases so often as twice in 24 hours.

Scarlatina.

Purging.] The action of purgatives is considered by Dr Withering as altogether repugnant to the curative indications in this disease: for the poisons, as formerly remarked, being received into the system by the fauces, the operation of a purge, instead of discharging it, can only promote its diffusion along the alimentary canal; and in fact, we are told, that when even a spontaneous purging supervenes in this disease, the patients sink so amazingly fast, that it is not within the reach of art to support them. When, however, a considerable quantity of acrid matter passing from the fauces into the stomach, makes its way to the rectum, a considerable degree of looseness often takes place. And although evacuations from the system in general by means of cathartics may be hurtful, yet patients often obtain great relief from a free discharge of this matter; and by discharging it, purgatives have the effect even of preventing an evacuation from the system, which would otherwise take place.

Sudorifics. Cordials. Alexipharmics.] None of these remedies were found beneficial. With respect to cordials, Dr Withering observes, that altho' they seem to be indicated by the great loss of strength and feeble pulse, yet the certain consequence of their use always was, an increase of restlessness, of the delirium, and of the heat.

Diuretics.] These were found very beneficial. The vegetable fixed alkali is recommended as the most proper article of this kind: a dram or two may be easily swallowed every 24 hours, by giving a small quantity in every thing the patient drinks. Diuretics, however, have been found principally serviceable by practitioners in general in those cases where the urine is observed to be scanty, and where dropsical symptoms have taken place.

Peruvian bark.] No medicine, we are told, ever had a fairer trial in any disease than the Peruvian bark had in this epidemic; for the feeble pulse, great prostration of strength, with here and there a livid spot, were thought to be such undeniable evidences of a putrid tendency, that the bark was poured down not with a sparing hand. But this was only at first; for these livid spots and the sloughs in the throat being found to be the effects of inflammation instead of putrefaction, and the bark instead of diminishing, rather increasing these symptoms, it was at last entirely laid aside by Dr Withering in his practice. But although Peruvian bark may not have been successful with a particular epidemic at a particular place; yet from the concurring testimony of many practitioners, it is very commonly found to be productive of good effects: And there is perhaps no remedy in which greater dependence is in general put, particularly in the advanced periods of the disease, where the fœtor is considerable.

Upon the same principles that the bark was prescribed, fixable air was at first likewise advised, but with no evident effects either one way or another. Dulcified acids were also had recourse to, but with no advantage.

Opiates.] These, although recommended by some authors

Exanthemata

authors for the removal of inquietude and watchfulnefs, yet in this epidemic, inftead of effecting thefe purpofes, always increafed the diftrefs of the patient.

Blifters.] In the fummer appearance of the difeafe, blifters were univerfally detrimental; they never failed to haften the delirium; and if the cafe was of the worft kind, they too often confirmed its fatal tendency. But although this may have been the cafe during the epidemic which Dr Withering defcribes, it has by no means been generally obferved. On the contrary, by the early application of blifters to the external fauces, both the glandular fwellings and likewife the difcharge from the mouth and fauces have been much diminifhed; and practitioners have believed, not without probable reafon, that the after affections of the throat were lefs confiderable than would otherwife have been the cafe. Dr Withering allows, that in the autumnal feafon, when the inflammation was lefs generally diffufed through the body, they were lefs detrimental; but he thinks that they did not here produce any beneficial effects.

Injected gargles of contrayerva decoction, fweetened with oxymel of fquills, &c. were found very beneficial in bringing always large quantities of vifcid ropy ftuff from the fauces.

The immerfion of the feet and legs in warm water, although it did no harm, yet did not either procure fleep or abate the delirium, as it frequently does in other kinds of fever.

As in fummer it was found difficult to keep the patients fufficiently cool, they were ordered to lie upon a matrefs inftead of a feather-bed; a free circulation of air was kept up; and where the patient's ftrength would admit of it, they were ordered frequently out of doors. Animal food and fermented liquors were denied them, and nothing allowed but tea, coffee, chocolate, milk and water, gruel, barley-water, and fuch articles.

With refpect to the dropfical diforder which fo frequently fucceeds to this complaint, it was never obferved, Dr Withering remarks, when the preceding fymptoms had been properly treated.

When called upon to patients in the dropfical ftate, he began his practice by a dofe of calomel at night, and a purgative in the morning. When a febrile pulfe attended the other fymptoms, emetics were ufeful, as well as the faline draughts and other neutral falts. When great debility, comatofe or peripneumonic fymptoms occurred, blifters were found very ferviceable: but when dropfical fymptoms were the principal caufe of complaint, fmall dofes of rhubarb and calomel were advifed; recourfe was alfo had to diluted folutions of fixed alkalies, fquills, Seltzer waters, and other diuretics.

When the urine flows freely, fteel and other tonics are recommended; together with gentle exercife, high-feafoned food, wine, and the wearing of flannel in contact with the fkin.

Dr Withering concludes his effay with an enumeration of feveral cafes, treated according to the principles above laid down. The fuccefsful termination of thefe cafes demonftrates the propriety of the practice which he has recommended; at leaft for the epidemic under the form in which it then appeared.

Febris fcarlatina, et febris urticata, *Meyferey*, Mal. des armées, 291 et feq.

Defcription. This difeafe has its Englifh name from the refemblance of its eruption to that made by the ftinging of nettles. Thefe little elevations upon the fkin in the nettle-rafh often appear inftantaneoufly, efpecially if the fkin be rubbed or fcratched, and feldom ftay many hours in the fame place, and fometimes not many minutes. No part of the body is exempt from them; and where many of them rife together, and continue an hour or two, the parts are often confiderably fwelled; which particularly happens in the face, arms, and hands. Thefe eruptions will continue to infeft the fkin, fometimes in one place and fometimes in another, for one or two hours at a time, two or three times every day, or perhaps for the greateft part of the 24 hours.—In fome perfons they laft only a few days, in others many months; nay, fometimes the difeafe has lafted for years with very fhort intervals.

But though the eruption of the urticaria refembles, as already obferved, that produced by the ftinging of nettles, it is fometimes accompanied with long wheals, as if the part had been ftruck with a whip. Whatever be the fhape of thefe eminences, they always appear folid, without having any cavity or head containing either water or any other liquor: and this affords an eafy mark whereby this difeafe may be diftinguifhed from the itch. For it often happens, that the infufferable itching with which this eruption is attended, provokes the patient to fcratch the parts fo violently, that a fmall part of the cuticle on the top of thefe little tumors is rubbed off; a little fcab fucceeds; and, when the fwelling is gone down, there is left an appearance hardly to be diftinguifhed from the itch, but by the circumftance juft now mentioned. The nettle-rafh alfo further differs from the itch, in not being infectious.

Caufes, &c. Dr Heberden is inclined to afcribe this diftemper to fome mechanical caufe outwardly applied to the fkin. He obferves, that moft people fuffer in a fimilar manner from the real ftinging of nettles. Cowhage, or, as it is corruptly called, *cow-itch*, a fort of phafeolus, or French bean, the pod of which is covered over with a kind of down or hair, and the effect of which upon the fkin is much the fame as that of nettles; and almoft any hairs cut equally fhort, and fprinkled upon the fkin, whenever they happen to ftick in it, will make the part itch or fmart in fuch a manner as to give great uneafinefs; it is alfo a confiderable time before the fkin can be cleared of the finer ones, when once they are ftrewed upon it.

Reaumur, in the fourth memoir of his Hiftory of Infects, defcribes a fpecies of caterpillars to which be-long

Exanthemata

long a fort of hairs almoft invifible to the naked eye, which are eafily detached, and frequently float in the air round their neft, though it have not been at all difturbed. The touch of thefe hairs has a fimilar effect with the cow-itch; that is, they occafion intolerable itchings, with little bumps and rednefs, arifing fometimes to a flight inflammation. Thefe he found would continue four or five days, if the animal or the neft had been much handled; and though they had not been touched at all, yet, by only walking near their nefts, the fame effects would be brought on, but for a fhorter time. Thefe hairs affect the fkin in this manner by fticking in it, as he could perceive with a glafs of a great magnifying power; for with one of a fmall power they were not vifible. The uneafy fenfations caufed by thefe fmall wounds, not only, as he fays, laft feveral days, but move from one part of the body to another; fo that they will ceafe upon one wrift, and immediately begin on the other; from the wrift they will go to the fingers or the face, or even to the parts of the body which are covered. He fuppofes, that the motions of the body, when much of this fine down lies near or upon the fkin, may drive it from one part to another, or change what was lying there inoffenfively to a fituation fit to make it penetrate into the fkin. Neither cold water, nor oil, nor fpirit of wine, with which the parts affected were bathed, had any effect in removing the itching. He thinks the moft efficacious remedy which he tried for this complaint was, to rub the parts ftrongly with parfley, which inftantly leffened the fenfations, and after two or three hours, entirely freed the patient from them. It is alfo well known, that many fpecies of caterpillars, by only walking over the hands, will produce fomething like this effect on the parts which they touch, and undoubtedly from the fame caufe.

Dr Heberden afks, Is it impoffible that the nettle-rafh fhould arife from the fame caufes, or from others fimilar, which we mifs by looking too deeply for them in the blood and humours? Such (fays he) may have been its origin in fome inftances, where it has lafted only a few days; but where this affection has continued for fome years, in perfons who change their linen every day, and who bathe frequently all the time, it can hardly be afcribed to fuch an external caufe. He has obferved it frequently to arife from cantharides: but though it has continued many weeks after the removal of the blifter, yet it might be fufpected that this arofe from the fine fpiculæ of the cantharides fticking all this time about the fkin; it being cuftomary to ftrew much of the dry powder of the cantharides over the blifter-plafter, whence it may readily be carried to other parts of the body. But it is certain that fimilar effects will fometimes follow the internal ufe of wild valerian root, or the eating of fifh not fufficiently dreffed; mufcles, fhrimps, and even honey, and the kernels of fruits, will alfo fometimes produce fymptoms of a fimilar kind. But whatever be its caufe, Dr Heberden never faw any reafon to fuppofe that the nettle-rafh had in any way vitiated the humours to fuch a degree as to require the ufe of internal remedies; and if the itching could be certainly and expeditioufly allayed, there would be no occafion for any farther cure. He concludes this hiftory of the diforder with a cafe communicated to him by Dr Monfey, phyfician of Chelfea-college, and in which the difeafe appeared with uncommon violence.

Urticaria.

W. A. aged near 30, of a thin fpare habit, was feized with a diforder attended with fymptoms of a very uncommon kind. Whenever he went into the air, if the fun fhined bright, he was feized with a tickling of his flefh on thofe parts expofed to the fun: this tickling, by his continuing in the air, increafed to a violent itching, attended with great heat and pain; the fkin would then be almoft as red as vermilion, and thicken like leather; and this remained till he went out of the open air, and then abated in about 15 or 20 minutes. This happened only when the fun was above the horizon; at other times he was what he called *quite well*.—But it was not owing to the heat of the fun; for the fun in winter affected him full as much, if not more, and the heat of the fire had no fuch effect. Thus he was confined to the houfe for 10 years. He tried feveral hofpitals, and had advices from many phyficians, without the leaft abatement of his complaints. At laft it was agreed by a confultation of phyficians, that he fhould try dipping in falt-water; which he did at Yarmouth for 13 weeks, without any vifible amendment. One hot day, having pulled off his clothes and gone into the fea in the middle of the day, the heat diffufed itfelf fo violently all over his body, that, by the time he had put on his clothes, his eye-fight began to fail, and he was compelled to lie down upon the ground to fave himfelf from falling. The moment he lay down, the faintnefs went off: upon this he got up again; but had no fooner arifen, than he found himfelf in the former condition: he therefore lay down again, and immediately recovered. He continued alternately getting up and lying down, till the diforder began to be exhaufted, which was in about half an hour; and he was frequently obliged to have recourfe to the fame expedient.

Having at laft accidentally met with Dr Monfey, this phyfician queftioned him concerning the caufe of the diforder; but nothing could be gueffed at, excepting that the patient owned he had one winter lived entirely upon bullock's liver and porter, from inability to purchafe better victuals. A comrade lived with him at that time, on the fame provifions; and he alfo was affected in a fimilar manner, though in a lefs degree, and had recovered. This patient was then firft put upon a courfe of Dover's fweating powder without any effect, and afterwards tried a courfe of nitrous ones with the fame bad fuccefs. At laft Dr Monfey determined to try the effect of mercury, which happily proved effectual in removing this obftinate and uncommon diftemper. The patient began with taking five grains of calomel for three nights running, and a cathartic next morning. In this courfe he went on for near a fortnight, at the end of which he found himfelf very fenfibly relieved. This encouraged him to go on rather too boldly, by which means a flight falivation enfued; however, that went off foon, and in about fix weeks he was quite well.—Some time after, he was threatened with a return of his diforder; but this was effectually relieved by a dofe of calomel, which he had afterwards occafion to repeat for the fame reafon, and with the fame fuccefs;

Exanthemata

success; but at last the disorder seemed to be radically cured, by his having no further symptoms of a relapse.

Pemphigus Helveticus, *Sauv.* sp. 3. *Langhans* in Act. Helvet. vol. ii. p. 260. et in *Beschreibuug* des Siementhals, Zurich 1753.

This is a very rare disease, insomuch that Dr Cullen declares he never saw it. He declines taking the descriptions of foreign physicians; we shall therefore content ourselves with giving an instance of this very uncommon distemper, as it was observed in the infirmary at Aberdeen, and was treated by the late Dr David Stuart, then physician to that hospital, who soon after published an account of it in the Edinburgh Medical Commentaries. A private soldier of the 73d regiment, aged eighteen years, formerly a pedlar, and naturally of a healthy constitution, was received into the hospital at Aberdeen on the 25th of April. About twenty days before that, he had been seized with the measles when in the country; and, in marching to town, on the second day of their eruption, he was exposed to cold; upon which they suddenly disappeared.

Having arrived at Aberdeen, he was quartered in a damp, ill-aired, under ground apartment. He then complained of sickness at stomach, great oppression about the præcordia, head-ach, lassitude, and weariness, on the least exertion; with stiffness and rigidity of his knees and other joints. The surgeon of the regiment visited him: he was purged, but with little benefit. About ten days before, he observed on the inside of his thighs a number of very small, distinct, red spots, a little elevated above the surface of the skin, and much resembling the first appearance of small-pox. This eruption gradually spread itself over his whole body, and the pustules continued every day to increase in size.

Upon being received into the hospital, he complained of head-ach, sickness at stomach, oppression about the præcordia, thirst, sore throat, with difficulty of swallowing; his tongue was foul, his skin felt hot and feverish; pulse from 110 to 120, rather depressed; belly costive; eyes dull and languid, but without delirium. The whole surface of his skin was interspersed with vesicles, or phlyctænæ, of the size of an ordinary walnut; many of them were larger, especially on the arms and breast. In the interstices, between the vesicles, the appearance of the skin was natural, nor was there any redness round their base; the distance from one to another was from half an inch to a handbreadth or more. In some places two or three were joined together, like the pustules in the confluent small-pox. A few vesicles had burst of themselves, and formed a whitish scab or crust. These were mostly on the neck and face; others showed a tolerably laudable pus. However, by far the greatest number were perfectly entire, turgid, and of a bluish colour. Upon opening them, it was evident that the cuticle elevated above the cutis, and distended with a thin, yellowish, semipellucid serum, formed this appearance. Nor was the surface of the cutis ulcerated or livid; but of a red florid colour, as when the cuticle is separated by a blister, or superficial burning. No other person laboured under a similar disease, either in the part of the country from which he came, or when he resided in Aberdeen.

Pemphigus.

This case was treated in the following manner. The largest of the vesicles were snipped, and dressed with *unguent. e lap. calaminari.* In the evening he was vomited with a solution of tartar emetic, given in small quantities and at intervals. This also procured two loose stools. And he was ordered for drink, water-gruel acidulated with lemon-juice.

"April 16. He still complained of sickness, some oppression about his breast, and sore throat; he had slept little during the night; his tongue was foul and blackish; his skin, however, was not so hot as the preceding day; his urine was high-coloured, but had the appearance of separation; his pulse 90, and soft; most of the sores on the trunk of the body looked clean. Others, particularly where the vesicles were confluent, seemed beginning to ulcerate, and to have a bluish sublivid appearance. They were dressed afresh with cerate, and he was ordered the following medicines:

R. Decoct. Cort. Peruvian. ℥vi. Vini rubr. Lusitan. ℥iii. M. Hujus mixturæ capiat ℥ß. tertia quaque hora.

"His acidulated drink was continued; and on account of the very offensive smell on approaching near him, some vinegar was placed in a bason before the bed, and sprinkled on the floor; and the room was kept properly aired.

"April 17. His sores looked tolerably clean, unless on his arms and thighs; where they were livid, a little ulcerated, and discharged a bloody ichor.

"His headach, sickness, &c. were mostly gone; his tongue was rather cleaner; pulse 68, and soft. As the decoction of the bark sat easily on his stomach, the following prescription was ordered:

R. Pulv. subtiliss. Cort. Peruv. ʒß. Vini rubri Lusitan. Aquæ fontan. āā ℥ss. M. ft. Haust. tertia quaque hora repetend.

The acidulated drink was continued, and fresh dressings applied to the sores.

"April 18. The little ulcers in his arms and thighs still discharged a bloody ichor, and looked ill; his other complaints were better; pulse 82. The bark had not nauseated him, and it was continued as well as his former drink.

"April 19. His sores looked much cleaner and better; the fever was gone, his pulse natural, and he had no complaint but weakness and a troublesome itching of the skin: The Peruvian bark, &c. were continued.

"April 20. Some of the ulcers still poured forth a bloody ichor; most of them, however, looked well, and had begun to heal—fever gone—medicines continued.

"From the 21st of April, he went on gaining strength, and his sores appeared to heal fast; he was desired to take

Exanthemata take only four doses every day; and by the 27th his sores, &c. were totally dried up—he had no complaint, and was dismissed cured."

Since the publication of this case of pemphigus by Dr Stuart, observations on this disease have been published by Dr Stephen Dickson of Dublin in the Transactions of the Royal Irish Academy. In these observations, an account is given of six different cases which Dr Dickson has had an opportunity of seeing. Judging from these, Dr Dickson thinks that Dr Cullen's definition of this disease requires correction; and that it ought to be defined, "a fever accompanied with the successive eruption, from different parts of the body, internal as well as external, of vesicles about the size of an almond, which become turgid with a faintly yellowish serum, and in three or four days subside."

From the cases which have fallen under Dr Dickson's observation, he concludes, that the disease varies considerably as to its mildness or malignity. In three of the cases which he has seen, the symptoms were extremely mild, but in the other three strong symptoms of putrescency were manifested, and the life of the patient was in great danger. With respect to the method of cure, he is of opinion, that the general symptoms of weakness, and tendency to putrefaction, obviously point out the proper treatment. Nourishment must be supplied, and the Peruvian bark and wine carefully administered; and when vesicles appear on internal parts, irritation must be guarded against by opiates, demulcents, and gentle laxatives.

Some additional observations on the subject of pemphigus have lately been published in the London Medical Journal by Mr Thomas Christie. From a case which Mr Christie describes, he is disposed to agree with Dr Dickson in thinking that sometimes at least pemphigus is not contagious. He remarks, however, that the pemphigus described by some foreign writers was extremely infectious; which he thinks this may lead to a division of the disease into the two species, the pemphigus simplex and complicatus; both of which, but especially the last, seem to vary much with respect to mildness and malignity.

Genus XXXV. APHTHA.
The Thrush.

233 Aphtha, *Sauv.* gen. 100. *Lin.* 9. *Sag.* 298. *Boerh.* 978. *Hoffm.* II. 478. *Junck.* 137.
Febris aphthosa, *Vog.* 44.

The only idiopathic species is the thrush to which infants are subject; (Aphtha lactucimen, *Sauv.* sp. 1.)

The aphthæ are whitish or ash-coloured pustules, invading the uvula, fauces, palate, tonsils, inside of the cheeks, gums, tongue, and lips. They for the most part begin at the uvula, sending forth a glutinous mucus, and the pustules covering all or the greatest number of the parts above-mentioned with a thick whitish crust adhering most tenaciously. This crust does not induce an eschar on the parts on which it lies by eating into them, but comes off in whole pieces after the pustules have arrived at maturity. This will often happen in a short time, so that the throat and internal parts of the mouth are frequently observed to be clean which a few years before were wholly covered with white crusts. Neither is this disease confined to the throat and fauces, but is said to affect the œsophagus, stomach, and all parts of the alimentary canal. Aphtha. Of this indeed there is no other proof, than that, after a great difficulty of swallowing, there is sometimes an immense quantity of aphthæ evacuated by stool and vomiting, such as the mouth could not be thought capable of containing.

Causes, &c. The aphthose fever seems to be produced by cold and moisture, as it is found only in the northern countries, and especially in marshy places; and in them the aphthæ often appear without any fever at all.

Prognosis. There is no symptom by which the coming out of aphthæ can be foretold, tho' they are common in many fevers; but they themselves are in general a bad symptom, and always signify a very tedious disorder: the danger denoted by them is in proportion to the difficulty of deglutition; and a diarrhœa accompanying them is likewise bad. This indeed generally carries off old people when they become affected with aphthæ. The dark-coloured aphthæ also are much more dangerous than such as are of a brown or ash colour; but it is a good sign when the appetite returns, and the dark-coloured ones are succeeded by others of a whiter colour. Neither are those which are unaccompanied with fever so dangerous as the other kind.

Cure. As the aphthæ are seldom a primary disease, we must generally endeavour to remove the disorder upon which they depend, after which they will fall off; but in the mean time we are not to neglect applications to the aphthæ themselves, such as detergent and softening gargles made of the decoction of figs, with the addition of honey of roses, a little vinegar, and some tincture of myrrh.

Order IV. HÆMORRHAGIÆ. 234
Hæmorrhagies.

Hæmorrhagiæ, *Vog.* Class II. Ord. I. *Hoffm.* II. 194. *Junck.* 5.
Sanguifluxus, *Sauv.* Class IX. Ord. I. *Sag.* Class V. Order I.

Genus XXXVI. EPISTAXIS. 235
Bleeding at the Nose.

Hæmorrhagia, *Sauv.* gen. 239. *Lin.* 173. *Sag.* gen. 174.
Hæmorrhagia narium, *Hoffm.* II. 196. *Junck.* 6.
Hæmorrhagia plethorica, *Sauv.* sp. 2. *Hoffm.* II. 193.

The other species enumerated by authors are all symptomatic.

Description. The milder species of this hæmorrhagy comes on more frequently in summer than in winter, and for the most part without giving any warning, or being attended with any inconvenience; but the less benign kind is preceded by several remarkable symptoms. These are, congestions of the blood sometimes in one part and sometimes in another, and which are often very troublesome in the sides of the head; there is a redness of the cheeks; an inflation of the face, and of the vessels of the neck and temples; a *tinnitus aurium*; a heavy pain of the eyes, with a prominence

Hæmorrhagiæ

minence, dryneſs, and ſparks; there is a vertiginous affection of the head, with an itching of the noſtrils, and a ſenſe of weight, eſpecially about the root of the noſe. In ſome the ſleep is diſturbed with dreams about blood, fire, &c. Frequently the belly is coſtive, there is a diminution of the quantity of urine, a ſuppreſſion of ſweat, coldneſs of the lower extremities, and tenſion of the hypochondria, eſpecially the right one.

Cauſes, &c. This hæmorrhagy may occur at any time of life; but moſt commonly happens to young perſons, owing to the peculiar ſtate of the ſyſtem at that time. Sometimes, however, it happens after the ακμην and during the ſtate of manhood, at which time it is to be imputed to a plethoric ſtate of the ſyſtem; to a determination of the blood, by habit, to the veſſels of the noſe; or to the particular weakneſs of theſe veſſels.

In all theſe caſes the diſeaſe may be conſidered as an arterial hæmorrhagy, and depending upon an arterial plethora; but it ſometimes occurs in the decline of life, and may then be conſidered as the ſign of a venous plethora in the veſſels of the head. It often happens at any period of life in certain febrile diſeaſes, which are altogether or partly of an inflammatory nature, and which ſhow a particular determination of the blood to the veſſels of the head As by this evacuation, other diſeaſes are often removed, it may on theſe occaſions be deemed truly *critical*. It happens to perſons of every conſtitution and temperament; but moſt frequently to the plethoric and ſanguine, and more commonly to men than women.

Prognoſis. In young people, the bleeding at the noſe may be conſidered as a ſlight diſeaſe, and ſcarce worth notice. But, even in young perſons, when it recurs very frequently and in great quantity, it is alarming; and is to be conſidered as a mark of an arterial plethora, which in the decline of life may give the blood a determination to parts from which the hæmorrhagy would be more dangerous. And this will require more particular attention as the marks of plethora and congeſtion preceding the hæmorrhagy are more conſiderable, and as the flowing of the blood is attended with a more conſiderable degree of febrile diſorder. Theſe conſequences are more eſpecially to be dreaded, when the epiſtaxis happens to perſons after their ακμην, returning frequently and violently. Even in the decline of life, however, it may be conſidered as in itſelf very ſalutary; but at the ſame time it is a mark of a dangerous ſtate of the ſyſtem, i. e. of a ſtrong tendency to a venous plethora in the head, and it has accordingly been often followed by apoplexy, palſy, &c. When it happens in febrile diſeaſes, and is in pretty large quantity, it may be generally conſidered as critical and ſalutary; but it is very apt to be too profuſe, and thus becomes dangerous. It ſometimes occurs during the eruptive fever of ſome exanthemata, and is in ſuch caſes ſometimes ſalutary; but if theſe exanthemata be accompanied with any putrid diſpoſition, this hæmorrhagy, as well as artificial blood-lettings, may have a very bad tendency.

Cure. The treatment in caſes of epiſtaxis may be referred to two heads. 1*ſt*, The treatment during the time of the diſcharge; and, 2*dly*, The treatment after the diſcharge is ſtopt, with the view of preventing the return of it. During the former of theſe periods, it is neceſſary in the firſt place to conſider whether the diſcharge ſhould be left to its natural courſe, or ſtopped by artificial means. In determining this queſtion, regard muſt be paid to the quantity of the diſcharge; the appearance of the blood; the conſtitution with which epiſtaxis occurs; the former habit of the patient; and the conſequences which reſult from the diſcharge. When, from due conſideration of theſe circumſtances, there is reaſon to fear that further evacuation would be attended with bad conſequences, though this diſeaſe has been generally thought very ſlight, it ſhould ſeldom be left to the conduct of nature; and in all caſes it ſhould be moderated by keeping the patient in cool air, by giving cold drink, by keeping the body and head erect, by avoiding any blowing of the noſe, ſpeaking, or other irritation; and if the blood has flowed for ſome time without ſhowing any tendency to ſtop, we are to attempt the ſuppreſſion of the hæmorrhagy, by preſſing the noſtril from which the blood flows, waſhing the face with cold water, or applying this to ſome other parts of the body. Theſe meaſures Dr Cullen judges to be proper even on the firſt attacks, and in young perſons where the diſeaſe is the leaſt hazardous: but they will ſtill be more requiſite if the diſeaſe frequently recurs without any external violence; if the returns happen to perſons diſpoſed to a plethoric habit; and more particularly if the ſigns of plethora appear in the ſymptoms preceding the diſcharge.

Epiſtaxis.

When the bleeding is ſo profuſe that the pulſe becomes weak and the face pale, every means muſt be uſed to put a ſtop to it, and that whether the patient be young or old. Beſides thoſe methods abovementioned, we muſt uſe aſtringents both internal and external; but the latter are the moſt powerful, and the choice of theſe may be left to the ſurgeon. The internal aſtringents are either vegetable or foſſil; but the vegetable aſtringents are ſeldom powerful in the cure of any hæmorrhagies except thoſe of the alimentary canal. The foſſil aſtringents are more active, but differ conſiderably in ſtrength from one another.—The chalybeates appear to have little ſtrength: the preparations of lead are more powerful; but cannot be employed, on account of their pernicious qualities, unleſs in caſes of the utmoſt danger. The *tinctura ſaturnina*, or *antiphthiſica*, is a medicine of very little efficacy, either from the ſmall quantity of lead it contains, or from the particular ſtate in which it is. The ſafeſt and at the ſame time the moſt powerful aſtringent ſeems to be alum

For ſuppreſſing this and other hæmorrhages, many ſuperſtitious remedies and charms have been uſed, and ſaid to have been employed with ſucceſs. This has probably been owing to the miſtake of the by-ſtanders, who have ſuppoſed that the ſpontaneous ceſſation of the hæmorrhagy was owing to their remedy. At the ſame time Dr Cullen is of opinion, that ſuch remedies have ſometimes been uſeful, by impreſſing the mind with horror or dread. Opiates have ſometimes proved ſucceſsful in removing hæmorrhagies; and when the fulneſs and inflammatory diatheſis of the ſyſtem have been previouſly taken off by bleeding, they may, in Dr Cullen's opinion, be uſed with ſafety and advantage. Ligatures have been applied upon the limbs, for retarding the return of the venous blood from

Hemorrhagiæ. from the extremities; but their use seems to be ambiguous. In the case of profuse hemorrhagies, no care is to be taken to prevent the patient from fainting, as this is often the most certain means of stopping them.

Description. This hemorrhagy commonly begins with a sense of weight and anxiety in the chest, some uneasiness in breathing, pain of the breast or other parts of the thorax, and some sense of heat under the sternum; and very often it is preceded by a saltish taste in the mouth. Immediately before the appearance of blood, a degree of irritation is felt at the top of the larynx. The person attempts to relieve this by hawking, which brings up a little florid and somewhat frothy blood. The irritation returns; and in the same manner blood of a similar kind is brought up, with some noise in the wind-pipe, as of air passing through a fluid. Sometimes, however, at the very first, the blood comes up with coughing, or at least somewhat of coughing, and accompanies the hawking above mentioned.

The blood is sometimes at first in very small quantity, and soon disappears; but in other cases, especially when it frequently recurs, it is in greater quantity, and often continues to appear at times for several days together. It is sometimes profuse, but rarely in such quantity as either by its excess or by a sudden suffocation to prove immediately mortal.

It is not always easy to discover whether the blood evacuated by the mouth proceeds from the internal surface of the mouth itself, from the fauces or adjoining cavities of the nose, from the stomach, or from the lungs. It is, however, very necessary to distinguish the different cases; and for this Dr Cullen offers the following considerations.

1. When the blood proceeds from some part of the internal surface of the mouth, it comes out without any hawking or coughing; and generally, upon inspection, the cause is evident.

2. When blood proceeds from the fauces, or adjoining cavities of the nose, it may be brought out by hawking, and sometimes by coughing. In this case there may be a doubt concerning its real source, and the patient may be allowed to please himself with the thoughts that the blood does not come from the lungs. But the physician must remember that the lungs are much more frequently the source of an hemorrhagy than the fauces. The latter seldom happens but to persons who have before been liable to an hemorrhagy from the nose, or to some evident cause of erosion; and in most cases, by looking into the fauces, the distillation of the blood from thence will be perceived.

Hæmoptysis.

3. When blood proceeds from the lungs, the manner in which it is brought up will commonly show from whence it comes; but, independent of that, it may also be known from the causes of hæmoptysis from the lungs, to be afterwards mentioned, having preceded.

4. When vomiting accompanies the throwing out of blood from the mouth, we may generally know the source from whence it proceeds, by considering that blood does not proceed so frequently from the stomach as from the lungs; that blood proceeding from the stomach commonly appears in greater quantity than from the lungs. The pulmonary blood also is usually of a florid colour, and mixed with a little frothy mucus only; but the blood from the stomach is of a darker colour, more grumous, and mixed with the other contents of the stomach. The coughing or vomiting, as the one or the other happens first to arise, may sometimes point out the source of the blood; and this hath also its peculiar antecedent signs and causes.

Causes, &c. An hæmoptysis may be produced at any time of life by external violence; and, in adult persons, while the arterial plethora prevails in the system, *i. e.* from the age of 16 to 35, an hæmoptysis may at any time be produced merely by a plethoric state of the lungs. More frequently, however, it arises from a faulty proportion between the capacity of the lungs and that of the rest of the body. Thus it is often an hereditary disease, which implies a peculiar and faulty conformation.

This disease especially happens to persons who discover the smaller capacity of their lungs by the narrowness of their chest, and by the prominence of their shoulders; which last is a mark of their having been long liable to a difficulty of respiration. In such cases, too, the disease very frequently happens to persons of a sanguine temperament, in whom particularly the arterial plethora prevails. It happens also to persons of a slender delicate make, of which a long neck is a mark; to persons of much sensibility and irritability, and therefore of quick parts; to persons who have formerly been liable to hemorrhagies from the nose; to those who have suffered a suppression of any usual hemorrhagy, the most frequent instance of which is in females, who have suffered a suppression of their menstrual flux; and, lastly, to persons who have suffered the amputation of any considerable limb.

All this constitutes the predisponent cause of hæmoptysis; and the disease may happen merely from the predisponent cause arising to a considerable height. But in those who are already predisposed, it is often brought on by the concurrence of various occasional and

Hemorrhagiæ. and exciting causes. One of these, and perhaps a frequent one, is external heat; which, even when in no great degree, brings on the disease in spring, and the beginning of summer, while the heat rarifies the blood more than it relaxes the solids, which had before been contracted by the cold of winter. Another exciting cause is a sudden diminution of the weight of the atmosphere, especially when concurring with any effort in bodily exercise. The effort too, alone, may often be the exciting cause in those who are already predisposed; and more particularly any violent exercise of respiration. In the predisposed, also, the disease may be occasioned by any degree of external violence.

Prognosis. Hæmoptysis may sometimes be no more dangerous than a hemorrhagy from the nose; as when it happens to females, in consequence of a suppression of their menses; when, without any marks of predisposition, it arises from external violence; or, from whatever cause arising, when it leaves no cough, dyspnœa, or other affection of the lungs, behind it. But, even in these cases, a danger may arise from too large a wound being made in the vessels of the lungs, from any quantity of red blood being left to stagnate in the cavity of the bronchiæ, and particularly from any determination of the blood being made into the vessels of the lungs, which by renewing the hemorrhagy may have these consequences.

Cure. In the treatment of this disease, with a view of stopping the discharge, it is first necessary to have recourse to those measures which tend to diminish the impetus by which the blood is expelled. This is to be effected by a removal of plethora when it exists; by diminishing the general impetus of circulation; by diminishing local increased action when it takes place in the vessels of the lungs; and by producing a determination of blood to other parts of the system remote from the lungs. But besides practices diminishing impetus, it is often also necessary to employ such as augment the resistance to the passage of blood through the ruptured vessels of the lungs. With these views a variety of practices may be employed, particularly blood-letting, refrigerants, sedatives, astringents, and the like.

On this subject Dr Cullen differs from those who prescribe chalybeates and the Peruvian bark in the cure of hæmoptysis. Both of these, he observes, contribute to increase the phlogistic diathesis then prevailing in the system, and the hæmoptysis from predispotion is always accompanied with such a diathesis. Instead of these, therefore, he recommends blood-letting in greater or smaller quantity, and more or less frequently repeated as the symptoms shall direct. At the same time cooling purgatives are to be employed, and every part of the antiphlogistic regimen is to be strictly enjoined. In the London Medical Observations, the use of nitre is greatly recommended by Dr Dickson, to whom its efficacy was made known by Dr Letherland, physician to St Thomas's hospital. The most commodious method of exhibiting it he found was in an electuary. Four ounces of conserve of roses were made into an electuary with half an ounce of nitre; of which the bulk of a large nutmeg was directed to be given, four, six, or eight times a day, according to the urgency of the case. The good effects of this, he tells us, have often astonished him; and when given early in the disease, he says he can depend as much upon it for the cure of an hæmoptysis, as on the bark for the cure of an intermittent. He agrees with Dr Cullen, however, that in those cases where there is any hardness in the pulse, and which almost always happens, there is a necessity for venesection. A cool regimen, and quiet of body and mind, are certainly useful; but Dr Cullen observes, that some kinds of gestation, such as sailing, and travelling in an easy carriage on smooth roads, have often proved a remedy. When the cough is very troublesome, it is absolutely necessary to exhibit frequently a small dose of an opiate. Dr Dickson also informs us, that the nitre joined with spermaceti, or *pulv. e tragacanth. comp.* has produced equally good effects with the electuary above mentioned; in the composition of which he at first considered the conserve only as a vehicle for the nitre, though he means not to insinuate that the former is totally destitute of efficacy.

Hæmoptysis.

When this hemorrhagy has resisted other modes of cure, and there is reason to apprehend, even from the mere quantity of blood evacuated, that the patient may sink under the discharge, blisters, particularly when applied to the breast, are often had recourse to with great advantage; and the vitriolic acid, properly diluted, both as an astringent and refrigerant, is often employed with very good effects.

PHTHISIS.

Phthisis confirmata *auctorum.*
Phthisis humida, *Sauv.* sp. 2.

Sometimes, notwithstanding all the care we can take, the hæmoptysis will degenerate into a phthisis pulmonalis, or consumption of the lungs; and sometimes an hæmoptysis will be the consequence of this dangerous disorder. It has been indeed supposed, that an ulceration of the lungs or phthisis was the natural and almost necessary consequence of an hæmoptysis: but, according to Dr Cullen, this is in general a mistake; for there are many instances of an hæmoptysis from external violence without being followed by any ulceration. The same thing has often been observed where the hæmoptysis arose from an internal cause; and this not only in young persons, when the disease returned for several times, but when it has often recurred during the course of a long life; and it may easily be conceived, that a rupture of the vessels of the lungs, as well as of the vessels of the nose, may be sometimes healed. The causes of phthisis, therefore, Dr Cullen reduces to five heads. 1. An hæmoptysis. 2. A suppuration of the lungs in consequence of a pneu-

Hæmorrhagiæ pneumonia. 3. A catarrh. 4. An asthma; and, 5. Tubercles.

1. When a phthisis arises from an hæmoptysis, it is probable that it is occasioned by particular circumstances; and what these circumstances are, may not always be easily known. It is possible, that merely the degree of rupture, or frequently repeated rupture, preventing the wound from healing, may occasion an ulcer; or it is possible, that red blood effused, and not brought up entirely by coughing, may, by stagnating in the bronchiæ, become acrid, and erode the parts. But these hypotheses are not supported by any certain evidence; and from many observations we are led to think, that several other circumstances must concur in producing the disease from hæmoptysis.

2. The second cause of an ulceration of the lungs mentioned above is a suppuration formed in consequence of pneumonia. When a pneumonia, with symptoms neither very violent nor very slight, has continued for many days, it is to be feared it will end in a suppuration: but this is not to be determined by the number of days; for, not only after the fourth, but even after the tenth day, there have been examples of a pneumonia ending by a resolution; and if the disease has suffered some intermission, and again recurred, there may be instances of a resolution happening at a much later period from the beginning of the disease than that just now mentioned. But, if a moderate disease, in spite of proper remedies employed, be protracted to the 14th day without any considerable remission, a suppuration is pretty certainly to be expected; and it will be more certain still, if no signs of resolution have appeared, or if an expectoration which had appeared shall have again ceased, and the difficulty of breathing has continued or increased, while the other symptoms have been rather abated.

That in a pneumonia, the effusion is made which may lay the foundation of a suppuration, may be concluded from the difficulty of breathing becoming greater when the patient is in a horizontal posture, or when the patient can lie more easily on the affected side. That, in such cases, a suppuration is actually begun, may be inferred from the patient's being frequently affected with slight cold shiverings, and with a sense of cold felt sometimes in one sometimes in another part of the body. We form the same conclusion also from the state of the pulse, which is commonly less frequent and softer, but sometimes quicker than before. That a suppuration is already formed, may be inferred from there being a considerable remission of the pain which had before subsisted; while with this the cough and especially the dyspnœa continue, and are rather increased. At the same time the frequency of the pulse is rather increased, the feverish state suffers considerable exacerbations every evening, and by degrees a hectic fever in all its circumstances comes to be formed.

In this state of symptoms, we conclude very confidently, that an abscess, or, as it is called, a *vomica*, is formed in some part of the pleura, and most frequently in that portion of it investing the lungs. Here purulent matter frequently remains for some time, as if enclosed in a cyst; but commonly not long before it comes to be either absorbed and transferred to some other part of the body, or breaks through into the cavity of the lungs, or into that of the thorax. In the latter case it produces the disease called *empyema*; but it is when the matter is poured into the cavity of the bronchiæ that it properly constitutes the phthisis pulmonalis. In the case of empyema, the chief circumstances of a phthisis are indeed also present: but we shall here consider only that case in which the abscess of the lungs gives occasion to a purulent expectoration.

Phthisis.

An abscess of the lungs, in consequence of pneumonia, is not always followed by a phthisis: for sometimes a hectic fever is not formed; the matter poured into the bronchiæ is a proper and benign pus, which frequently is coughed up very readily, and spit out; and though this purulent expectoration should continue for some time, if it be without hectic fever, the ulcer soon heals, and every morbid symptom disappears. This has so frequently happened, that we may conclude, that neither the access of the air, nor the constant motion of the lungs, will prevent an ulcer of these parts from healing if the matter of it be well-conditioned. An abscess of the lungs, therefore, does not necessarily produce the phthisis pulmonalis; and if it be followed by such a disease, it must be in consequence of particular circumstances which corrupt the purulent matter produced, render it unsuitable to the healing of the ulcer, and at the same time make it afford an acrimony, which, absorbed, produces a hectic fever and its consequences.

The corruption of the matter of such abscesses may be owing to several causes; as, 1. That the matter effused during the inflammation had not been a pure serum fit to be converted into a laudable pus, but had been joined with other matters which prevented that, and gave a considerable acrimony to the whole. Or, 2. That the matter effused and converted into pus, merely by long stagnation in a vomica, or by its connection with an empyema, had been so corrupted as to become unfit for the purpose of pus in the healing of the ulcer. These seem to be possible causes of the corruption of matter in abscesses, so as to make it the occasion of a phthisis in persons otherwise sound; but it is probable that a pneumonic abscess especially produces phthisis when it happens to persons previously disposed to that disease, and therefore only as concurring with some other causes of it

3. The third cause supposed to produce a phthisis is a catarrh; which, in many cases, seems in length of time to have the expectoration of mucus proper to it gradually changed to an expectoration of pus; and at the same time, by the addition of a hectic fever, the disease, which was at first a pure catarrh, is changed into a phthisis. But this supposition is, in the opinion at least of some physicians, liable to several difficulties. The catarrh is properly an affection of the mucous glands of the trachea and bronchiæ analogous to the coryza and less violent kinds of cynanche tonsillaris, which very seldom end in suppuration. And although a catarrh should be disposed to do so, the ulcer produced might readily heal up, as it does in the case of a cynanche tonsillaris; and therefore should not produce a phthisis.

Further, the catarrh, as purely the effect of cold, is generally a mild disease as well as of short duration; and, according to Dr Cullen, there are at most but very few of the numerous cases of it, which can be said

Hemorrhagiæ

to have ended in a phthisis. In all these cases in which this seems to have happened, he thinks it probable that the persons affected were peculiarly predisposed to phthisis; and the beginning of phthisis so often resembles a catarrh, that it may have been mistaken for such a disease. It often happens also, to increase the fallacy, that the application of cold, which is the most frequent cause of catarrh, is also frequently the exciting cause of the cough, which proves to be the beginning of a phthisis.

Many physicians have supposed that an acrimony of the fluids eroding some of the vessels of the lungs is a frequent cause of ulceration and phthisis; but this appears to Dr Cullen to be a mere supposition. He acknowledges, that in many cases an acrimony subsisting in some part of the fluids is the cause of the disease; but observes that it is at the same time probable, that this acrimony operates by producing tubercles, rather than by any direct erosion.

But notwithstanding these objections, experience affords numerous examples of cases in which a disease long subsisting under the form of catarrh has at last degenerated into phthisis, and proved fatal from supervening hectic fever. It must, however, at the same time be allowed, that catarrh, degenerating into a chronic state after subsisting for many years, has of itself often proved fatal without inducing phthisis.

4. If phthisis does not frequently follow catarrh, it is still more rarely a consequence of asthma. Innumerable examples are unquestionably afforded of that disease subsisting for many years without any symptom whatever of phthisis as a consequence of it. But at the same time, there are unquestionable examples of phthisis deriving its origin from asthma; which, however, probably happens only in cases where a peculiar state of the lungs at the same time takes place: But without the concurrence of asthma, this state would not of itself have been sufficient for inducing the affection.

5. Of all the causes formerly mentioned, phthisis most frequently arises from tubercles. Dr Simmons informs us, that he has had opportunities of inspecting the bodies of many people who died in this way, and never found them totally absent. He has likewise seen them in subjects of different ages, who had been troubled with no symptoms of an affection of the breast during their lifetime. In these, however, they were small, and few in number. This proves that they may exist without inconvenience till they begin to disturb the functions of the lungs by their size and number; or till some degree of inflammation be excited, either by accidental causes, or by certain changes that take place within their substance; for as yet we know but little of their true nature. These little tumors vary in their consistence; in some they are composed of a pulpy substance, and in others approach more to the nature of scirrhous. They are most commonly formed in consequence of a certain constitutional predisposition; but whatever is capable of occasioning a morbid irritability of the lungs seems also to be capable of generating them. Thus the spasmodic asthma frequently ends in tubercles and consumption; and it is not unusual for millers, stone-cutters, and others, to die consumptive, from their being so constantly exposed to dust, which in these cases probably acts by producing similar concretions: and Dr Kirkland observes, that scythe-grinders are subject to a disease of the lungs, from particles of sand mixing with iron-dust, which among themselves they call the *grinders rot*. Tubercles, however, in by much the greater number of instances, have their source from a scrophulous disposition; and some eminent physicians have supposed that the generality of pulmonary consumptions are of this kind. This notion, however, they have perhaps carried too far: they have probably been misled by these tuberculous concretions which, without good reason, have been supposed to be diseased glands, and of course analogous to the glandular affections we meet with in the scrophula. Tubercles may likewise sometimes be owing to the sudden repulsion of cutaneous eruptions, or of the matter of exanthemata, &c. or to other causes.

Phthisis.

The persons who are most liable to consumption are those of a fair complexion, fine and soft skin, florid cheeks, and a slender make; with high cheek-bones, hollow temples, long neck, shoulders standing out like wings, narrow chest, and a remarkable prominence of the processes of the os sacrum. To these marks we may add, that of *found teeth*, which, as the disease advances, usually become of a milky white colour, and more or less transparent. Of those who are carried off by this disease, Dr Simmons asserts, the greater number will be found never to have had a carious tooth. This circumstance, however, does not seem to us to hold so generally as Dr Simmons is disposed to imagine: and instances not unfrequently occur of patients dying of phthisis, although they have had many teeth subjected to caries; and some of these beginning even at an early period of life.

Persons of the above description often remain for a long time without feeling any other inconvenience than some oppression at the breast in moist weather, or in hot apartments. Their breathing is easily hurried, sometimes by the slightest motion; and they become languid, paler, and thinner. All this time, however, they feel no heat or painful sensation in the breast. As the evil increases, the patient begins to be attacked with a slight, frequent, and dry cough, which is most troublesome in the night-time. But this, by proper care, is often relieved; and the patient remains in this state for a considerable time, and even for many years, if he be sensible of his danger, and careful to guard against it by a suitable manner of living. More commonly, however, we find the cough increasing, and sometimes accompanied with more or less catarrh. This is usually ascribed to cold; and but too generally neglected, till the disease become alarming by its obstinacy and its affects. This may be considered as the *beginning*, or first period, of the disease. During this stage, the cough is sometimes dry from the first; and sometimes, when it begins in the form of a catarrh, is attended with more or less expectoration of mucus.

When the cough begins in the form of a catarrh, and appears to be occasioned by an increased secretion of a thin saltish mucus irritating the membrane of the trachea, all judicious practitioners agree in recommending an attention to regimen, the free use of diluting liquors, bland emulsions, small doses of nitre, the taking away a few ounces of blood if there be much in-

Hemorrhagiæ

inflammation, the inhaling the fteams of warm water by means of the machine contrived for that purpofe, and the occafional ufe of fuch a dofe of elixir paregoricum as will be fufficient to allay the irritation of the bronchiæ, and to promote a gentle moifture on the fkin. Thefe methods will generally be found to be efficacious, efpecially if the patient's chamber be of a moderate temperature, and he carefully avoid expofure to a cold, damp, or raw air, till the complaint be removed. In cafes in which the cough has been obftinate, and the inflammatory fymptoms confiderable, Dr Simmons has often experienced the great advantages of the warm bath, the heat of which did not exceed 92°. When this is had recourfe to, the patient fhould remain in it only a very few minutes, and go foon afterwards to bed; but not with a view to force a fweat by an increafed weight of bed-clothes, as is too often injudicioufly practifed.

Patients of a confumptive habit, who have had an attack of this kind at the beginning of winter, are particularly liable to a return of the complaint during the continuance of the cold feafon, on the flighteft occafion and with greater violence. A relapfe is therefore to be carefully guarded againft; and nothing will be found to do this more effectually than the ufe of focks and a flannel under-waiftcoat. The ufe of flannel has been condemned by feveral medical writers as increafing the infenfible perfpiration; but in the prefent cafe, to fay nothing of fome others in which it may be ufeful, it will in general be found to have the beft effects. It will prevent a too great determination to the lungs, and fhould not be left off till the approach of fummer. In fome few inftances in which flannel was found to have a difagreeable effect, a piece of dimity, worn over the breaft next the fkin, prevented the return of colds and coughs in perfons of a delicate habit, who had before been liable to them on the flighteft occafions. Shirts made of cotton cloth are much more effectual than linen in preferving an equable temperature of the furface, and guarding againft the action of external cold; while at the fame time they are much more pleafant to moft people than even the fineft flannel. In thefe cafes, circumftances that are feemingly of the moft trifling nature become of importance.

Sometimes the cough is occafioned by an immediate inflammation of fome part of the lungs, from fome of the ufual caufes of inflammation; and when this happens, no time is to be loft in removing it. To do this will perhaps require more than one bleeding, together with a ftrict attention to a cooling plan of diet, diluting drinks, the inhalation of warm fteams, and if convenient the ufe of the warm bath; but above all, the fpeedy application of a large blifter as near as may be to the fuppofed feat of the inflammation. The cough, in this cafe, will often remain after the original complaint is abated. A prudent ufe of opiates at bed-time, either by themfelves or combined with gummy and mucilaginous medicines, will then generally be ufeful as a fedative and antifpafmodic.

In this, as well as in the catarrhal cough juft now mentioned, many practitioners are too eager to adminifter the Peruvian bark, with the view, as they term it, of *bracing up* the patient: but this never fails to increafe the cough, and of courfe to do great and very often irreparable mifchief.

Phthifis.

And here it will not be foreign to our fubject to obferve, that a fymptomatic cough, which has its rife not from catarrh, or from an immediate inflammation of the lungs, but from their fympathy with the ftomach, has fometimes laid the foundation of phthifis, from its having been miftaken, and of courfe improperly treated. It feems to be owing to a redundancy or vitiated ftate of the bile, or to fome affection of the ftomach, which it is perhaps not eafy to define. It is fometimes a concomitant of other bilious fymptoms; and when this happens to be the cafe, it cannot eafily be miftaken; but we fometimes find it occurring fingly, and in general attacking perfons of a fedentary life. Dr Stoll of Vienna, who has noticed this cough, has very properly given it the name of *tuffis ftomachica*. This complaint is fo far from being relieved by bleeding, that it conftantly grows worfe after it, efpecially if the evacuation be in any confiderable quantity. The oily remedies feldom fail to exafperate this cough, which at firft is dry, frequent, and often extremely violent, but which feldom fails to give way to one or two gentle pukes, and the occafional ufe of mild cathartics. The cough, as in other cafes, often continues from habit after the caufe that gave rife to it has been removed, and may then be checked by opiates.

When the difeafe has been neglected, or our attempts to remove it in the beginning have failed, both of which circumftances but too frequently happen, the patient begins to complain of a forenefs, and of flight lancinating pains fhooting through the breaft, fometimes in the direction of the mediaftinum, and fometimes confined chiefly to one fide. The forenefs is pretty conftant, and much increafed by the cough. The pain in the fide often prevents the patient from lying on the fide affected; and this inability of lying, except on one fide, frequently occurs even when no fuch pain is felt. In this ftage of the difeafe, flufhing heats are felt in the palms of the hands and foles of the feet: the breathing is fhort and laborious; and it is not long before the patient begins to expectorate a thin and frothy phlegm, at firft in fmall quantities, coughed up with difficulty, and fome pain of the breaft, and now and then ftreaked with blood: this may be confidered as the *inflammatory period* of the difeafe, to which fucceeds the *fuppurative ftage*. In the latter, the expectoration becomes more copious and purulent, the breath proportionably offenfive, and the exacerbations of the hectic fever more confiderable: an increafed quicknefs of the pulfe comes on about the middle of the day; but the moft confiderable paroxyfm of the fever is at night, and at firft continues till towards morning, commonly till three or four o'clock, when it terminates in a fweat, which ufually begins upon the breaft. As the difeafe advances, thefe fweats become more profufe, and fometimes come on almoft as foon as the pulfe begins to quicken, but without affording any relief to the patient. During the exacerbations, we obferve a circumfcribed rednefs of the cheeks, while the reft of the face is pale, and appears as if it were not clean wafhed. The coftivenefs that commonly accompanies the beginning of the difeafe is ufually fucceeded by a diarrhœa; the fpitting leffens,

and

Hemorrhagiæ

and all the purulent matter ſeems to be carried downwards. The waſting of the fat and the loſs of nouriſhment occaſion the nails to curve inwards, the hair to fall off, and the eyes to ſink in their ſockets. In the mean time, the legs commonly ſwell; till at length death cloſes a ſcene which is melancholy to all but the patient himſelf, who in general continues ſenſible to the laſt moment, and even then indulges a vain hope of prolonging a miſerable exiſtence. In ſome caſes, and that not unfrequently, a delirium comes on towards the cloſe of the diſeaſe.

The hectic fever that attends this and ſome other chronic diſeaſes, is evidently the effect of acrimony, and moſt commonly of pus abſorbed and carried into the circulation. The nature of this acrimony, and the different irritability of different patients, are probably the ſources of the variety we obſerve in fevers of this denomination; a variety which is doubtleſs much greater than we are aware of. Thus we find that the matter of the ſmall-pox excites a fever of this kind; but this *ſecondary fever*, as it is called, differs from the hectic attendant on conſumptions; nor does the latter correſpond with that which ſometimes accompanies the ſuppuration of a cancerous ulcer. In the pulmonary conſumption, or at leaſt in the third ſtage of it, the fever induced often appears to be of the putrid kind, and has been denominated *febris hectica putrida* by the judicious Morton, who conſiders it as being combined with a peripneumonic or inflammatory fever, which recurs as often as freſh tubercles begin to inflame. For although we have named one period of the diſeaſe the *inflammatory*, and another the *ſuppurative period*, yet we are not to ſuppoſe that the latter is exempt from inflammation. While matter is poured into the bronchiæ, or abſorbed and carried into the ſyſtem from one part of the lungs, other parts are in a crude ſtate of inflammation, or advancing towards ſuppuration; ſo that, on examining the lungs of perſons who die conſumptive, we find ſome tubercles that are ſmall and juſt formed, ſome that are large and full of matter, and others that are in a ſtate of ulceration. This eaſily accounts for the occaſional combination of inflammatory ſymptoms with thoſe of the putrid hectic. When the matter abſorbed is a laudable pus, as in the caſe of a pſoas abſceſs, we find the form of the hectic fever differing from either of thoſe we have mentioned.

Cure. In theſe different periods of the diſeaſe, the curative indications are ſufficiently obvious. To prevent the formation of freſh tubercles; to obviate the inflammation of thoſe already formed; to promote their reſolution; to allay morbid irritability, the cough, and other troubleſome ſymptoms; and, above all, to check the tendency to the hectic ſtate, are the views that every rational phyſician propoſes to himſelf in the treatment of the genuine conſumption. We know of no medicines that can exert their ſpecific effects upon the lungs by diſſolving tuberculous concretions; nor is it probable, from what we know of the animal œconomy, that any ſuch will ever be diſcovered. Yet medicines that operate in a general manner upon the ſyſtem, may, by promoting abſorption, and diminiſhing the determination to the lungs, tend to diſperſe tubercles, or to prevent their formation. There are not wanting inſtances of wonderful recoveries in caſes where the evil was ſuppoſed to be beyond the power of phyſic; and in ſome, where nature was left to herſelf; ſo that a phyſician who has obſerved the various and powerful reſources nature has within herſelf, will be very cautious how he aſſerts that a diſeaſe is incurable.

Phthiſis.

The moſt formidable effects of ulcerated lungs are the abſorption and conſequent hectie. It ſeems evident, that, in many caſes, death is brought on by this, rather than by the lungs themſelves being rendered unfit for the purpoſes of reſpiration. So that if we can obviate the effects of the abſorption, diminiſh the preternatural determination to the lungs, and fulfil the other general indications juſt now mentioned, we may very often enable nature to recover herſelf. It may be alleged indeed, that the phyſician's art has hitherto proved very unſucceſsful in theſe caſes; but may not this be owing to the remedies that are employed being very often ſuch as are inimical to the cure?

The Peruvian bark is, perhaps, the moſt commonly employed of any, and often confided in as an ultimate reſource in theſe caſes. But beſides this, the elixir of vitriol, the balſams, and frequent bleedings, have each had their partizans. The uſe of bliſters and iſſues, opiates, a milk and vegetable diet, exerciſe, and change of air, are pretty generally recommended by all. Concerning the bark, Default long ago obſerved, that it had been productive of great miſchief in conſumptive caſes; and Dr Fothergill, in a paper lately publiſhed by him on this ſubject, very judiciouſly remarks, that the bark is ſo far from curing the hectic fever ariſing from diſtempered lungs, that, according to the beſt of his obſervations, it not only takes up that time which might probably have been better employed in the uſe of other medicines, but for the moſt part aggravates the diſeaſe beyond remedy. Indeed it has been the opinion of ſeveral attentive obſervers, that, whenever pus or any kind of matter excites an hectic fever, by being abſorbed and carried into the circulation, the Peruvian bark will never fail to exaſperate the complaint, eſpecially if it be accompanied with any degree of inflammatory diatheſis, unleſs the matter has a free outlet from the ſyſtem; as in the caſe of abſceſſes, for inſtance, in which we often find the bark productive of excellent effects. It is likewiſe well known to be uſed as a tonic, to obviate the effects of fluor albus, or any other immoderate evacuation in delicate perſons, which, by enfeebling the ſyſtem, very often lays the foundation of phthiſis: but the moment we have reaſon to ſuſpect that the lungs are ulcerated, eſpecially if this ulceration be attended with an inflammatory diſpoſition; or if the ſeparation of vitiated pus be the conſequence of a peculiar increaſed morbid action of the veſſels at the part, it ought to be laid aſide; and in the genuine tuberculous conſumption, perhaps it is at all times inadmiſſible.

Dr Fothergill, however, obſerves, that there are two cauſes of conſumptions, which often produce ſymptoms ſo ſimilar to thoſe of the genuine phthiſis, as ſometimes to have led him to make uſe of the bark in apparent tendencies to a genuine pulmonary conſumption with advantage.

One of theſe cauſes is, the ſuckling of children longer than is conſiſtent with the mother's ability.

This

Hemorrhagiæ

This cafe frequently occurs among the middling and lower claffes of females of conftitutions naturally delicate and tender. In fuch a ftate of weaknefs, fome flight cold brings on a cough, which increafes gradually, till at length it produces the true pulmonary confumption. Here the bark given early, in moderate dofes, and merely as a tonic remedy, is often of excellent ufe.

Another caufe is, any weakening difcharge, either from abfceffes, the greater operations of furgery, a copious and conftant *fluor albus*, or fimilar enfeebling evacuations. That the bark is, for the moft part, of ufe in thefe cafes, when the lungs are not inflamed, is indubitable; and if they be fo affected, but not beyond a certain degree, it is alfo efficacious in preventing the progrefs of the confumption.

In phthifical complaints fucceeding fuch fituations, a prudent trial of the bark feems neceffary. Small dofes of the decoction, either alone, or joined with the faline mixture or fuch other additions as the phyfician thinks proper, may be given. But if the breath becomes more tight and oppreffed, the cough dry, the pulfe more quick and hard, and efpecially if flight tranfitory pains or ftitches about the thorax are more frequently complained of, a perfeverance in the ufe of the bark will increafe the difeafe. If fuch alfo fhould be the appearances in the progrefs of the difeafe, or, from whatever caufe, if the bark be accompanied with fuch effects, the ufe of it ought to be with-held.

If, on the other hand, no pain, tightnefs, or oppreffion, is perceived, and there appears a manifeft abatement of the fymptoms, it will be advifable to proceed. The adminiftration of this medicine, however, requires a judicious obferver; and it ought neither to be given in the early inflammatory ftage of this difeafe, nor be continued in any fubfequent period, if it produce the effects above-mentioned.

By its tonic virtues it will often enable nature to conquer many difficulties. In confirmation of this remark, Dr Fothergill farther obferves, that he has feen it of ufe in promoting expectoration, when this became deficient from want of ftrength towards the end of peripneumonic fevers; but that it ftops this difcharge, changes flight wandering pains into fuch as are fixed, and increafes them with all their confequences, in a variety of cafes.

The elixir of vitriol, or the pure vitriolic acid properly diluted, though in many inftances a highly ufeful remedy, is often exhibited in confumptive cafes with no lefs impropriety than the bark. This medicine, from its aftringency, is obvioufly improper in the inflammatory ftate of the difeafe. But in the latter ftage, when a general tendency to putrefaction takes place, it is ferviceable in refifting the effect; it reftrains the colliquative fweats; and if the lungs be not injured paft reparation, it is allowed to be a very ufeful auxiliary.

Various are the opinions concerning the efficacy of Briftol-water in this difeafe. The experienced author laft mentioned informs us, that he has feen many perfons recover from pulmonary difeafes after drinking thefe waters, whofe cure feemed to be doubtful from any other procefs; and he thinks this circumftance, added to the general reputation of Briftol-waters in phthifical cafes, affords fufficient inducement to recommend the trial of them in the early ftages of fuch complaints. It is, however, before the approach of a confirmed phthifis that patients ought to repair to Briftol; otherwife a journey thither will not only be without benefit, but may even prove detrimental.

Phthifis

Some have imagined, that the journey, a better air, change of fituation and of objects, have contributed to the patient's recovery; and thefe may doubtlefs be of advantage. It feems, however, that the water drank frefh at the pump, actually contains principles conducive to the recovery of patients affected with phthifical complaints. It feems to poffefs a flight calcareous ftypticity, and perhaps the air it contains may alfo have an antifeptic quality. On the whole, it appears to be an efficacious medicine, and is often found of remarkable benefit to confumptive patients.

Change of air, particularly from good to bad, is of great confequence in all chronic difeafes of the lungs. In confumptive cafes, the air of all large cities is found to be particularly injurious.

A fea-voyage has been much recommended in the cure of this difeafe. The benefit of exercife has alfo been ftrongly urged by many writers; but, however falutary when properly ufed, it certainly ought to be regulated with difcretion. Dr Dickfon declares himfelf of opinion, that riding on horfeback in confumptive cafes is moft commonly hurtful, without fuch regulations as in general have been little regarded. For inftance, he has known a perfon who, by a ride of an hour or two in the morning, was very much recruited, and who, at another time, in the afternoon and evening, without undergoing more bodily motion, has returned faint and languid, and apparently worfe. This obfervation on the fame perfon has been fo frequently made, as to point out clearly the times when this exercife fhall not do hurt in confumptive cafes. In this difeafe, the pulfe, however calm in the morning, becomes more frequent in the afternoon and night, attended with heat and other feverifh fymptoms. Exercife therefore, at this time, can only add to the mifchief of the fever. For this reafon he prudently recommends to all hectic perfons, efpecially thofe who fhall travel to diftant places on account of a better air, or the benefit expected from any particular water, that their travelling fhould be flow, confined to a very few hours, and only in the morning.

Exercife on horfe-back feems to be chiefly beneficial in thofe cafes where confumption is a fecondary difeafe. For example, in the nervous atrophy; in the hypochondriacal confumption; or when it is the effect of long-continued intermittents, or of congeftions in any of the abdominal vifcera; or, in a word, whenever the confumption is not attended with an inflamed or ulcerated ftate of the lungs; long journeys on horfeback will be beneficial. Such a practife may likewife be highly ufeful in obviating an attack of phthifis, or in carrying off a dry hufky cough in a perfon of a confumptive habit, when there is reafon to fuppofe that no tubercles are as yet formed. On the other hand, in the confirmed phthifis, when the lungs are inflamed or ulcerated, much or violent exercife will be improper; and there have been inftances where the death of the patient was evidently accelerated by

it.

Hæmorrhagiæ

it. The exercife therefore fhould be gentle, proportioned to the ftrength of the patient, and employed only in the morning. In fine weather, an eafy open carriage is perhaps the moft eligible, not only on account of its being open to the air, but becaufe it affords that kind of agitation which is moft wanted in thefe cafes. For if we confider the different modes of exercife, we fhall find that walking, though the beft exercife in health, as it employs the moft mufcles, is the worft for the fickly, who fhould have the benefit of exercife without fatigue. Riding on horfeback agitates the vifcera more than walking, and is therefore preferable to it in many chronic difeafes; but when a preternatural determination to the lungs has taken place, it will be liable to increafe the evil, and may likewife be hurtful by the fatigue that attends it. For thefe reafons it will be prudent to begin with a carriage; and if the patient gain ftrength, and the difeafe abates, recourfe may afterwards be had to horfe-exercife.

The gentle motion of a coach has been often found of great utility in pulmonary complaints. Its efficacy feems to depend chiefly on its increafing the determination to the furface of the body. The naufea which this motion excites in fome perfons is an effect of this increafed determination. It has therefore been found beneficial in hæmoptyfis; and Dr Simmons mentions the cafe of a lady, who, after trying various remedies to no purpofe, was cured of this complaint by travelling feveral hundred miles through different parts of England in her own coach. At firft, whenever fhe tarried three or four days in any place, the diforder began to return again; but at length by perfevering in her journeys, it gradually went off. Default, who practifed at Bourdeaux about 40 years ago, tells us, he fent feveral confumptive patients to Bareges, and with good fuccefs; but that in thefe cafes his reliance was not fo much upon the Bareges waters, as upon the motion of the carriage and the change of air in a journey of more than 100 leagues.

It is now pretty generally acknowledged, that the good effects of fea-voyages in confumptive cafes depend more upon the conftant and uniform motion of the fhip, than upon any particular impregnation of the fea-air; although this from its coolnefs and purity may likewife be of great ufe, efpecially in the hot months, when fea-voyages are generally undertaken by confumptive patients. The ancients were no ftrangers to this remedy; and amongft the Romans it was no unufual thing for confumptive perfons to fail to Egypt. Pliny obferves, that this was done not for the fake of the climate, but merely on account of the length of the voyage.

Many of our Englifh phyficians have recommended a voyage to Lifbon in thefe cafes. When this is done, the proper feafon of the year fhould be carefully attended to. Dr Simmons knew a gentleman who went thither with fymptoms of incipient phthifis, and who experienced fome relief during the courfe of the voyage; but happening to arrive at Lifbon at the beginning of the rainy feafon, the difeafe was foon greatly increafed, and terminated fatally.

Another fpecies of motion has of late been extolled as highly ufeful in confumptive cafes. Dr James Carmichael Smyth of London, has lately publifhed an account of the effects of fwinging, employed as a remedy in the pulmonary confumption and hectic fever. In this treatife Dr Smyth contends, that fea-air, in place of being of advantage, is conftantly prejudicial to hectic and confumptive patients, and even to thofe who have a tendency to fuch complaints. He thinks, therefore, that the benefit derived from fea-voyages muft certainly be referred to fome other caufe. In ftating his fentiments on this fubject, he attempts to eftablifh a diftinction between exercife and motion. By exercife, he underftands mufcular action, or the exertion of the loco-motive powers of the body either alone or combined. This he reprefents as increafing the force and frequency of the heart's contraction, the velocity and momentum of the blood, the quicknefs of breathing, the heat, the irritability, and the tranfpiration of the whole body. By motion, in contradiftiction to exercife, he means fuch motion as is not neceffarily accompanied with any agitation or fucceffion of the body, and which is totally independent of any mufcular exertion. The effects of this, both on the heart, the lungs, and indeed on the fyftem in general, he confiders as of the fedative kind; thus it fufpends the action of coughing, and leffens the frequency of the pulfe. He is, therefore, led to refer the good effects of fea-voyages entirely to this caufe. And on thefe grounds he was led to conclude, that the motion given by fwinging might be of equal if not greater fervice. This conclufion, we are told, in the treatife above alluded to, experience in many cafes has fully confirmed. And he recommends it as a mode of cure which may be employed with advantage in every ftage of phthifis. While, however, the reafoning of Dr Smyth on this fubject feems to be liable to many objections, we are forry to add, that his obfervations in practice have by no means been confirmed by thofe of others, who have had recourfe to this mode of cure.

Phthifis.

The beft adapted diet in confumptive cafes is milk, particularly that of affes. It may however be remarked, that there are conftitutions in which this falutary nutriment feems to difagree. A propenfity to generate bile, or too ftrong a difpofition to acefcency from a weaknefs of the digeftive organs, both merit attention. Whey, either from cows or goats milk, appears to be more fuitable in the former cafe; and for correcting acidity, lime-water may be added to the milk. The method of adding rum or brandy to affes or cows milk, fhould be ufed with great caution: for when added beyond a certain quantity, as is often the cafe, they not only coagulate the milk, but heat the body; by which means the former difagrees with the patient, and the fpirit augments the difeafe.

In confumptive cafes, Dr Simmons obferves, that the patient's tafte fhould be confulted; and fays that a moderate ufe of animal-food, where the falted and high-feafoned kinds are avoided, is not to be denied. Shell-fifh, particularly oyfters, are ufeful, as well as fnails fwallowed whole, or boiled in milk.

Repeated bleedings, in fmall quantities, are confidered in confumptive cafes as highly advantageous: and in particular circumftances they undoubtedly are fo; for inftance, when the conftitution apparently abounds with blood; when the fluid drawn off is extremely fizy; when there is much pain in the breaft; and

Hæmorrhagiæ

and when venefection is followed by an abatement of every fymptom. In thefe cafes, bleeding is certainly proper, and ought to be repeated fo long as it feems to be attended with advantage. In very delicate conftitutions, however, even where the pulfe is quick, with fome degree of fulnefs, and the blood laft drawn confiderably fizy, it may not prove equally ferviceable.

It deferves to be remarked, that the inflammatory appearance of the blood is not alone a fufficient reafon for bleeding; but, in determining the propriety of this evacuation, all other circumftances fhould be confidered; fuch as the patient's age, ftrength, habit, and the ftate of the difeafe.

A remark which has been judicioufly made by Dr Fothergill, ought not to be omitted in the account of this difeafe. It is, that young delicate females, from the age of 15 or 16, and upwards, are often fubject to confumptions. When the difeafe has advanced confiderably, the *menfes*, if they have made their appearance, moft generally ceafe. This alarms their female friends, and they call upon the phyfician to ufe his utmoft endeavours for reftoring the difcharge; believing the ceffation of it to be the immediate caufe of the phthifical complaint. Induced by their folicitations, medicines have fometimes been adminiftered, which, without obtaining this end, have tended to aggravate the diftemper. This deficiency is often of no real difadvantage in thofe cafes; and in many the evacuation would prove injurious, by diminifhing the ftrength, which is already too much impaired. Even fmall bleedings at the regular periods have often done more harm than good. A fudden fuppreffion may require bleeding; but when the evacuation fails through want of ftrength, and from poverty of blood, the renewal of it increafes the difeafe.

Befides thefe remedies, Dr Simmons ftrongly recommends a frequent repetition of vomits. Many phyficians have fuppofed, that where there is any increafed determination to the lungs, vomits do mifchief: but Dr Simmons is perfuaded, that inftead of augmenting they diminifh this determination; and that much good may be expected from a prudent ufe of this remedy, than which none has a more general or powerful effect on the fyftem. If any remedy be capable of difperfing a tubercle, he believes it to be vomits The affections of the liver, that fometimes accompany pulmonary complaints, give way to repeated emetics fooner than to any other remedy. In feveral cafes where the cough and the matter expectorated, the flufhing heats, lofs of appetite, and other fymptoms, threatened the moft fatal event; the complaints were greatly relieved, and in others wholly removed, by the frequent ufe of emetics. Other fuitable remedies were indeed employed at the fame time; but the relief the patients generally experienced after the emetic, was a fufficient proof of its falutary operation. By this, however, he does not mean that vomits will be ufeful in every period of the difeafe, or in every patient. In general, it will be found that the earlier in the difeafe emetics are had recourfe to, the more likely they will be to do good and the lefs likely to do harm. The cafes in which emetics may be reckoned improper, are commonly thofe in which the difeafe is rapid in its progrefs; or in that ftage of it when there is great debility, with profufe colliquative fweats.

Phthifis.

In thefe cafes, when an emetic has been adminiftered twice a-week, and the cough is mitigated, the expectoration facilitated, and the other fymptoms relieved, both the patient and the phyfician will be encouraged to proceed, and to repeat the vomit every fecond day, or even every day, for feveral days together, as Dr Simmons has fometimes done when the good effects of it were obvious.

The choice of emetics to be employed in thefe cafes is by no means a matter of indifference. Carduus tea, camomile tea, warm water, and others that act by their bulk, and by exciting naufea, relax the tone of the ftomach when they are frequently repeated, and of courfe will be improper. More active emetics are therefore to be preferred; and here fome of the preparations of antimony might naturally be thought of. But the operation of thefe is not confined to the ftomach. They produce evacuations by ftool, and a difpofition to fweat; and are therefore improper in the pulmonary hectic. The mildnefs and excellence of ipecacuanha as an emetic, are well known; but in thefe cafes, Dr Simmons has often employed the blue vitriol, concerning the effects of which we meet with fome groundlefs affertions in feveral medical books. Its operation is confined to the ftomach; it acts almoft inftantaneoufly, and its aftringency feems to obviate the relaxation that is commonly fuppofed to attend the frequent ufe of emetics. In two cafes he experienced its good effects, after vomits of ipecacuanha had been given ineffectually. It fhould be adminiftered in the morning, and in the following manner:

Let the patient firft fwallow about half a pint of water, and immediately afterwards the vitriol diffolved in a cupful of water. The dofe of it muft be adapted to the age and other circumftances of the patient, and may be varied from two grains to ten, fifteen, or twenty. As fome perfons are much more eafily puked than others, it will be prudent to begin with a fmall dofe: not that any dangerous effects will be produced by a large one, for the whole of the medicine is inftantly rejected; but if the naufea be violent, and of long continuance, the patient may perhaps be difcouraged from repeating it. In general, the moment the emetic has reached the ftomach it is thrown up again. The patient muft then fwallow another half pint of water, which is likewife fpeedily rejected; and this is commonly fufficient to remove the naufea.

Dr Marryat, in his *New Practice of Phyfic*, prefcribes with great freedom what he calls the *dry vomit*, from its being directed to be taken without drinking. This medicine confifts of blue vitriol and the emetic tartar; but its good effects have not yet been afcertained by other practitioners.

Another remedy which Dr Simmons ftrongly recommends in confumptive cafes, both from his own obfervation and on the authority alfo of many other eminent practitioners, is gum myrrh. This given by itfelf to the extent of a fcruple or half a dram for a dofe, two or three times a-day, or, if there be much inflammatory tendency, combined with a proportion of nitre or of cream of tartar, has often been ferviceable

Hæmorrhagiæ

able in cases which were apparently instances of incipient phthisis even of the tuberculous kind. But when the disease is far advanced, or even decidedly marked, as far as our experience goes it has rarely if ever been productive of any benefit.

Beside the use of internal remedies in pulmonary affections, physicians have often prescribed the steams of resinous and balsamic substances to be conveyed into the lungs. The vapour of dulcified spirit of vitriol, dropt into warm water, has likewise been used in these cases, and is advertised as a nostrum under the name of *æther*. The inhaling of fixed air has also been spoken of as an useful practice. Dr Simmons has seen all of these methods tried at different times; but without being able to perceive any real advantages from them in the suppurative stage of the disease, where they might be expected to be of the greatest use; and in the beginning he has often found the two first to be too stimulating. He therefore preferred the simple vapour of warm water, and has experienced its excellent effects in several instances; but when the complaint has made any considerable progress, its utility is less obvious; and when the patients have been much weakened, he has seen it bring on profuse sweats, especially when used in bed, and therefore generally recommended it to be used in the day-time. Formerly he made use of a fumigating machine, described in the Gentleman's Magazine for 17 8, in which the air, inspired by the patient, is made to pass through hot water by means of a tube that communicates with the external air, and with the bottom of the vessel: but we have now a more elegant and (on account of the valve and mouth-piece) a more useful instrument of this kind, the inhaler, invented by the ingenious Dr Mudge.

Another remedy recommended by some as a specific in consumptions is the earth-bath. Van Swieten, in his Commentaries on Boerhaave, tells us, from the information of a person of credit, that in some parts of Spain they have a method of curing the phthisis pulmonalis by the use of this remedy; and he quotes the celebrated Solano de Luque in confirmation of this practice. Solano speaks of the *banos de tierra*, or earth-baths, as a very old and common remedy in Granada and some parts of Andalusia, in cases of hectic fever and consumptions; and relates several instances of their good effects in his own practice. The method he adopted on these occasions was as follows: He chose a spot of ground on which no plants had been sown, and there he made a hole large and deep enough to admit the patient up to the chin. The interstices of the pit were then carefully filled up with the fresh mould, so that the earth might every where come in contact with the patient's body. In this situation the patient was suffered to remain till he began to shiver or felt himself uneasy; and during the whole process, Solano occasionally administered food or some cordial medicine. The patient was then taken out, and, after being wrapped in a linen cloth, was placed upon a matrass, and two hours afterwards his whole body was rubbed with an ointment, composed of the leaves of the *solanum nigrum* and hog's lard. He observes, that a new pit must be made every time the operation is repeated; and advises the use of these baths only from the end of May to the end of October. Dr Fouquet, an ingenious French physician, has tried this remedy in two cases. In one, a confirmed phthisis, he was unsuccessful; but the remedy had not a fair trial. The patient, a man 30 years of age, had been for several months afflicted with cough, hectic fever, and profuse colliquative sweats. He was first put into the earth in the month of June; but soon complained of an uneasy oppression at his stomach, and was removed at the end of seven minutes. The second time he was able to remain in it half an hour, and when taken out was treated in the way prescribed by Solano. In this manner the baths were repeated five times, and the patient was evidently relieved; but having conceived a dislike to the process, he refused to submit to any further trials, and died some months afterwards. In the second case he was more fortunate: the patient, a girl 11 years of age, had been for three months troubled with a cough brought on by the measles, which was at length attended with a purulent expectoration, hectic fever, and night-sweats. She began the use of the earth-bath in August, and repeated it eight times in the space of 20 days. At the end of that time the fever and disposition to sweat had entirely ceased, and by the use of the common remedies the patient was perfectly restored. A physician at Warsaw has likewise prescribed the earth-bath with good success in cases of hectic fever. The Spaniards confine it entirely to such cases; but in some other parts of the world we find a similar method employed as a remedy for other diseases, and particularly for the sea-scurvy. Dr Priestley observes, that the Indians, he has been told, have a custom of burying their patients labouring under putrid diseases up to the chin in fresh mould, which is also known to take off the fœtor from flesh-meat beginning to putrefy. The rancidity of a ham, for example, may be corrected by burying it for a few hours in the earth. The efficacy of this remedy in the sea-scurvy has, it is said, frequently been experienced by the crews of our East India ships.

Phthisis.

Solano, who is fond of philosophizing in his writings, is of opinion, that the earth applied in this way absorbs the morbid taint from the system: but does it not seem more probable, that the effluvia of the earth, by being absorbed and carried into the circulation, corrects the morbid state of the fluids, and thus are equally useful in the sea-scurvy and in the pulmonary hectic? That the earth when moistened does emit a grateful odour is a fact generally known; and Baglivi long ago gave his testimony in favour of the grateful effects of the effluvia of fresh earth. He ascribes these good effects to the nitre it contains.

The earth-bath, both in consumptive cases and likewise in a variety of other affections, has of late been extensively employed in Britain by a celebrated empiric. But, as far as we can learn, in most cases it produced to the patient a very distressing sensation of cold; in some, it seemed to be productive of bad effects, probably in consequence of this cold; and we have not heard of any consumptive cases in which good effects were decidedly obtained from it.

With regard to the drains, such as blisters, issues, and setons, that are so frequently recommended in pulmonary complaints, there is less danger of abuse from them than from the practice of venesection. The discharge they excite is not calculated to weaken the patient

Hæmorrhagiæ

tient much; and the relief they have so often been found to afford, is a sufficient reason for giving them a trial. Blisters, as is well known, act in a twofold manner; by obviating spasm, and producing revulsion: Issues and setons act chiefly in the latter of these two ways; and in this respect their effects, though less sudden and less powerful at first, are more durable from the continuance of the discharge they occasion. It is perhaps hardly necessary to remark, that, if much service is to be expected from either of these remedies, they should be applied early in the disease. The ingenious Dr Mudge, who experienced the good effects of a large scapulary issue on his own person, very properly observes, that the discharge in these cases ought to be considerable enough to be felt. But it is seldom possible for us to prevail on the delicate persons, who are most frequently the victims of this disease, to submit to the application of a caustic between the shoulders. The discharge produced by a seton is by no means inconsiderable; and as in these cases there is generally some inflammatory stitch, some part of the breast that is more painful or more affected by a deep inspiration than the rest, a seton in the side, as near as can be to the seat of the inflammation, will be an useful auxiliary. Dr Simmons has seen it evidently of great use in several cases.

Description. The discharge of blood from small tumors on the verge of the anus constitutes what is called the *hæmorrhoids* or *piles.* They are distinguished into the *external* and *internal*, according to the situation of the tumors, either without or within the anus. Sometimes, however, these tumors appear without discharging any blood; and in this case they are called the *hæmorrhoides cœcæ* or *blind piles.* Sometimes the disease appears without the verge of the anus in distinct separate tumors; but frequently only one tumid ring appears, seeming as it were the anus pushed without the body. Sometimes these tumors appear without any previous disorder of the body: but more frequently, before the blood begins to flow, and sometimes even before the tumors are formed, various affections are perceived in different parts of the body; as headach, vertigo, stupor, difficulty of breathing, sickness, colic pains, pain of the back and loins, and frequently a considerable degree of pyrexia; while along with these symptoms there is a sense of fullness, heat, itching, and pain, in and about the anus. Sometimes the disease is preceded by a serous discharge from the anus; and sometimes this serous discharge, accompanied with swelling, seems to come in place of the discharge of blood, and to relieve the above-mentioned disorders of the system. This serous discharge hath therefore been named the *hæmorrhois alba.*

Hæmorrhois.

In this disease the quantity of blood discharged is different upon different occasions. Sometimes it flows only when the person goes to stool, and commonly follows the discharge of fæces. In other cases it flows without any discharge of fæces; and then generally in consequence of the disorders above-mentioned, when it is also commonly in larger quantity. This is often very considerable; and, by the repetition, so great, that we could hardly suppose the body to bear it but with the hazard of life. Indeed, though rarely, it has been so great as to prove suddenly fatal. These considerable discharges occur especially to persons who have been frequently liable to the disease. They often induce great debility, and frequently a leucophlegmatia or dropsy which proves fatal. Sometimes the tumors and discharges of blood in this disease recur exactly at stated periods. In the decline of life it frequently happens that the hæmorrhoidal flux, formerly frequent, ceases to flow; and in that case it generally happens that the persons are affected with apoplexy or palsy. Sometimes hæmorrhoidal tumors are affected with inflammation, which ends in suppuration, and gives occasion to the formation of fistulous ulcers in those parts.

The hæmorrhoidal tumors have often been considered as varices or dilatations of the veins; and in some cases varicous dilatations have appeared upon dissection. These, however, do not appear in the greater part of cases; and Dr Cullen is of opinion that they are usually formed by an effusion of blood into the cellular texture of the intestine near to its extremity. When recently formed, they contain fluid blood: but after they remain for some time they are usually of a firmer consistence, in consequence of the blood being coagulated.

Causes, &c. It would seem probable, that the hæmorrhoidal tumors are produced by some interruption of the free return of the blood from the rectum, by which a rupture of the extremities of the veins is occasioned. But considering that the hæmorrhagy occuring here is often preceded by pain, inflammation, and a febrile state, and with many other symptoms which show a connection of the topical affection with the state of the whole system, it is probable that the interruption of the blood in the veins produces

Hæmorrhagiæ. Hæmorrhois.

produces a considerable resistance to the motion of the blood through the arteries, and consequently that the discharge of blood is commonly from the latter. Some have thought, that a difference of the hœmorrhois, and of its effects upon the system, might arise from the difference of the hæmorrhoidal vessels from whence the blood issued. But Dr Cullen is of opinion, that we can scarce ever distinguish the vessels from which the blood flows, and that the frequent inosculations of both arteries and veins belonging to the lower extremity of the rectum, will render the effects of the hæmorrhagy much the same, from whatever source it proceeds.

With regard to the hæmorrhoids, however, he is of opinion, that they are, for the most part, merely a topical affection. They take place before the period of life at which a venous plethora happens. They happen to females, in whom a venous plethora determined to the hæmorrhoidal vessels cannot be supposed to occur; and they happen to both sexes, and to persons of all ages, from causes which do not affect the system, and are manifestly suited to produce a topical affection only.

These causes are, in the first place, the frequent voiding of hard and bulky fæces, which, by their long stagnation in the rectum, and especially when voided, must necessarily press upon the veins of that part, and interrupt the course of the blood in them. For this reason the disease so frequently happens to those who are habitually costive. From the same causes, the disease happens frequently to those who are subject to a prolapsus ani. In voiding the fæces, it almost always happens that the internal coat of the rectum is more or less protruded; and, during this protrusion, it sometimes happens that the sphincter ani is contracted: in consequence of this, a strong constriction is made, which preventing the fallen-out gut from being replaced, and at the same time preventing the return of blood from it, occasions a considerable swelling, and the formation of a tumid ring round the anus.

Upon the sphincter's being a little relaxed, as it is immediately after its strong contraction, the portion of the gut which had fallen out is commonly taken into the body again; but by the frequent repetition of the accident, the size and fulness of the ring formed by the prolapsed intestine is much increased. It is therefore more slowly and difficultly replaced; and in this consists the chief uneasiness of hæmorrhoidal persons. As the internal edge of this ring is necessarily divided by clefts, the whole often puts on the appearance of a number of distinct swellings; and it also frequently happens, that some portions of it are more considerably swelled, become more protuberant, and form those small tumors more strictly called *hæmorrhoids* or *piles*.

From considering that the pressure of the fæces, and other causes interrupting the return of venous blood from the lower extremity of the rectum, may operate a good deal higher up than that extremity, we may understand how tumors may be formed within the anus; and probably it also happens, that some of the tumors formed without the anus may continue when taken within the body, and even be increased by the causes just mentioned. Thus may the production of internal piles be explained, which, on account of their situation and bulk, are not protruded on the person's going to stool, and are therefore more painful.

The production of piles is particularly illustrated by this, that pregnant women are frequently affected with the disease.—This is to be accounted for, partly from the pressure of the uterus upon the rectum, and partly from the costive habit to which pregnant women are liable. Dr Cullen has known many instances of piles happening for the first time during the state of pregnancy; and there are few women who have born children, that are afterwards entirely free from piles. —Purgatives also, especially those of the more acrid kind, and particularly aloetics, are apt to produce the piles when frequently used; and as they stimulate particularly the larger intestines, they may be justly reckoned among the exciting causes of this disease.

Prognosis. Though the hæmorrhoids are commonly, as we have said, to be esteemed a topical disease, they may, by frequent repetition, become habitual and connected with the state of the whole system; and this will more readily happen in persons who have been once affected with the disease, if they be frequently exposed to a renewal of the causes which occasioned it. It happens also to persons much exposed to a congestion in the hæmorrhoidal vessels, in consequence of their being often in an erect position of the body, and in an exercise which pushes the blood into the depending vessels, while at the same time the effects of these circumstances are much favoured by the abundance and laxity of the cellular texture about the anus. It is to be particularly observed, that when an hæmorrhoidal affection has either been originally or has become a disease of the system, it then acquires a particular connection with the stomach; so that certain affections of the stomach excite the hæmorrhoidal disease, and certain states of this disease excite the disorders of the stomach.

It has been an almost universally received opinion, that the hæmorrhoidal flux is a salutary evacuation, which prevents many diseases that would otherwise have happened; and that it even contributes to give long life: and as this opinion has been strenuously adopted by Dr Stahl, it has had a very considerable influence on the practice of physic in Germany. But Dr Cullen maintains that we can never expect to reap much benefit from this flux, which at first is purely topical; and, granting that it should become habitual, it is never, he thinks, proper to be encouraged. It is a disagreeable disease; ready to go to excess, and thereby to prove hurtful, and sometimes even fatal. At best it is liable to accidents, and thus to unhappy consequences. He is therefore of opinion, that even the first approaches of the disease are to be guarded against; and that, though it should have proceeded for some time, it ought always to be moderated, and the necessity of it superseded

Cure. The general intentions of cure in cases of hœmorrhois are much varied, according to the circumstances of the affection at the time. When hæmorrhois exists in the state of tumor, the principal objects are to counteract inflammation, and to promote a discharge of blood from the part. When it is in the state

Hæmorrhagiæ

ſtate of evacuation, the chief intentions of cure are, to diminiſh the impetus of blood at the part affected, and to increaſe the reſiſtance to the paſſage of blood through the ruptured veſſels. And finally, when the diſeaſe exiſts in the ſtate of ſuppreſſion, the aims of the practitioner muſt chiefly be, to obviate the particular affections which are induced in conſequence of the ſuppreſſion; to reſtore the diſcharge, as a means of mitigating theſe and preventing others; or, when the diſcharge cannot with propriety or advantage be reſtored, to compenſate the want of it by vicarious evacuations.

With theſe various intentions in different caſes, a variety of different remedies may be employed with advantage.

When any evident cauſe for this diſeaſe is perceived, we ought immediately to attempt a removal of that cauſe. One of the moſt frequent remote cauſes is an habitual coſtiveneſs; which muſt be obviated by a proper diet, ſuch as the perſon's own experience will beſt direct; or if the management of diet be not effectual, the belly muſt be kept open by medicines, which may prove gently laxative, without irritating the rectum. In moſt caſes it will be of advantage to acquire a habit with regard to the time of diſcharge, and to obſerve it exactly. Another cauſe of the hæmorrhois to be eſpecially attended to is the prolapſus ani, which is apt to happen on a perſon's having a ſtool. If this ſhall occur to any conſiderable degree, and be not at the ſame time eaſily and immediately replaced, it moſt certainly produces piles, or increaſes them when otherwiſe produced. Perſons therefore who are liable to this prolapſus, ſhould, after having been at ſtool, take great pains to have the inteſtine immediately replaced, by lying down in an horizontal poſture, and preſſing gently upon the anus, till the reduction ſhall be completely obtained. When this prolapſus is occaſioned only by the voiding of hard and bulky fæces, it is to be removed by obviating the coſtiveneſs which occaſions it. But in ſome perſons it is owing to a laxity of the rectum; and in thoſe it is often moſt conſiderable on occaſion of a looſe ſtool. In theſe caſes, it is to be treated by aſtringents, and proper artifices are to be employed to keep the gut in its place.

When the diſeaſe has frequently recurred from neglect, and is thus in ſome meaſure eſtabliſhed, the methods above-mentioned are no leſs proper; but in this caſe ſome other meaſures muſt alſo be uſed. It is eſpecially proper to guard againſt a plethoric ſtate of the body; and therefore to avoid a ſedentary life, full diet, and intemperance in the uſe of ſtrong liquor, which in all caſes of hæmorrhagy is of the moſt pernicious conſequence.

Exerciſe of all kinds is of great ſervice in obviating and removing a plethoric ſtate of the body; but upon occaſion of the hæmorrhoidal flux, when this is immediately to come on, both walking and riding, as increaſing the determination of the blood into the hæmorrhoidal veſſels, are to be avoided. At other times, when no ſuch determination is already formed, theſe modes of exerciſe may be very properly employed.

Another method of removing plethora is by cold bathing; but this muſt be employed with caution. When the hæmorrhoidal flux is approaching, it may be dangerous to divert it; but during the intervals of the diſeaſe, cold bathing may be employed with ſafety and advantage; and in thoſe who are liable to a prolapſus ani, the frequent waſhing of the anus with cold-water may be uſeful.

Hæmorrhois.

Beſides general antiphlogiſtic regimen, in ſome caſes where the inflammation runs high, recourſe may be had with great advantage both to general blood-letting and to leeches applied at the anus. Relief is alſo often obtained from the external application of emollients, either alone or combined with different articles of the ſedative kind, as acetated ceruſe or opium, by which it is well known that pain in general, particularly when depending on increaſed ſenſibility, or augmented action of the veſſels, is powerfully allayed.

When the flux has actually come on, we are to moderate it as much as poſſible, by cauſing the patient lie on a horizontal poſture on a hard bed; by avoiding exerciſe in an erect poſture, uſing a cool diet, and avoiding external heat. But with reſpect to the further cure of this diſeaſe, we muſt obſerve, that there are only two caſes in which it is common for hæmorrhoidal perſons to call for medical aſſiſtance. The one i, when the affection is accompanied with much pain; and the other, when the piles are accompanied with exceſſive bleeding. In the firſt caſe, we muſt conſider whether the piles be external or internal. The pain of the external piles happens eſpecially when a conſiderable protruſion of the rectum has taken place; and while it remains unreduced, it is ſtrangled by the conſtriction of the ſphincter; and at the ſame time no bleeding happens to take off the ſwelling of the protruded portion of the inteſtine; and ſometimes an inflammation ſupervenes, which greatly aggravates the pain. In this caſe, emollient fomentations and poultices are ſometimes of ſervice, but the application of leeches is generally to be preferred.

In caſe of exceſſive bleeding, we are on all occaſions to endeavour to moderate the flux, even where the diſeaſe has occurred as a critical diſcharge; for if the primary diſeaſe ſhall be entirely and radically cured, the preventing any return of the hæmorrhois ſeems perfectly ſafe and proper. It is only when the diſeaſe ariſes from a plethoric habit, and from a ſtagnation of blood in the hypochondriac region, or when, though originally topical, it has by frequent repetition become habitual, and has thereby acquired a connection with the ſyſtem, that any doubt can ariſe about curing it entirely. In any of theſe caſes, however, Dr Cullen is of opinion that it will be proper to moderate the bleeding, leſt, by its continuance or repetition, the plethoric ſtate of the body, and the particular determination of the blood into the hæmorrhoidal veſſels, be increaſed, and the return of the diſeaſe be too much favoured. Dr Stahl is of opinion, that the hæmorrhoidal flux is never to be accounted exceſſive excepting when it occaſions great debility or leucophlegmatia: but Dr Cullen thinks, that the ſmalleſt approach towards producing either of theſe effects ſhould be conſidered as an exceſs which ought to be prevented from going farther; and even in the caſes of congeſtion and plethora, if the plethoric habit and tendency can be obviated and removed, the hæmorrhoidal flux may then with ſafety be entirely ſuppreſſed. In all caſes therefore of exceſſive bleeding, or any ap-

proach

Hæmorrhagiæ

proach to it, aftringents both internal and external may be fafely and properly applied; not indeed to induce an immediate and total fuppreffion; but to moderate the hæmorrhagy, and by degrees to fupprefs it altogether; while at the fame time meafures are to be taken for the removing the neceffity of its recurrence.

Menorrhagia rubra, *Cul.*
Menorrhagia immodica, *Sauv.* fp. 3.
Menorrhagia ftillatitia, *Sauv.* fp 2.

Defcription. The quantity of the menftrual flux is different in different women, and likewife in the fame woman at different times. An unufual quantity therefore is not always to be confidered as morbid: but when a large flow of the menfes has been preceded by headach, giddinefs, or dyfpnœa; has been ufhered in by a cold ftage, and is attended with much pain of the back and loins, with a frequent pulfe, heat and thirft; it may then be confidered as preternaturally morbid. On the other hand, when the face becomes pale, the pulfe weak, an unufual debility is felt in exercife, and the breathing is hurried by little labour; when the back becomes pained from any continuance in an erect pofture, when the extremities become frequently cold, and when at night the feet appear affected with œdematous fwelling: from all thefe fymptoms we may conclude, that the flow of the menfes has been immoderate, and has already induced a dangerous ftate of debility. The debility, induced in this cafe, often appears alfo by affections of the ftomach, an anorexia, and other fymptoms of dyfpepfia; by a palpitation of the heart, and frequent faintings; by a weaknefs of mind, liable to ftrong emotions from flight caufes, efpecially thofe prefented by furprife. A large flow of the menfes attended with barrennefs in married women, may generally be confidered as preternatural and morbid. Generally, alfo, that flow of the menfes may be confidered as immoderate, which is preceded and followed by a leucorrhœa.

Caufes, &c. The proximate caufe of the menorrhagia is either the effort of the uterine veffels preternaturally increafed, or a preternatural laxity of the extremities of the uterine arteries.—The remote caufes may be, 1. Thofe which increafe the plethoric ftate of the uterine veffels; as a full and nourifhing diet, much ftrong liquor, and frequent intoxications. 2. Thofe which determine the blood more copioufly and forcibly into the uterine veffels; as violent ftrainings of the whole body; violent fhocks from falls; ftrokes or contufions on the lower belly; violent exercife, particularly in dancing; and violent paffions of the mind. 3. Thofe which particularly irritate the veffels of the uterus: as excefs in venery; the exercife of venery in the time of menftruation; a coftive habit, giving occafion to violent ftraining at ftool; and cold applied to the feet. 4. Thofe which have forcibly overftrained the extremities of the uterine veffels; as frequent abortions, frequent child-bearing without nurfing, and difficult or tedious labours. Or, laftly, thofe which induce a general laxity; as living much in warm chambers, and drinking much of warm enervating liquors, fuch as tea, coffee, &c.

Menorrhagia

Cure. The treatment and cure of the menorrhagia, muft be different according to the different caufes of the difeafe. The practices employed, however, are chiefly ufed with one or two intentions; either with the view of reftraining the difcharge when prefent, or of preventing the return of an exceffive difcharge at the fucceeding period. The firft is chiefly to be accomplifhed by employing fuch practices as diminifh the force occafioning the difcharge of blood, or as augment the refiftance to its paffage through the veffels by which it is to be difcharged. The laft is in fome degree to be obtained by avoiding caufes which either increafe the general impetus of the blood, or the impetus at the uterus in particular; but principally by giving additional vigour to the uterine veffels.

In all cafes, the firft attention ought to be given to avoiding the remote caufes, whenever that can be done; and by fuch attention the difeafe may be often entirely cured. When the remote caufes cannot be avoided, or when the avoiding them has been neglected, and a copious menftruation has come on, it fhould be moderated as much as poffible, by abftaining from all exercife at the coming on or during the continuance of the menftruation; by avoiding even an erect pofture as much as poffible; by fhunning external heat, and of courfe warm chambers and foft beds; by ufing a light and cool diet; by taking cold drink, at leaft as far as former habits will allow; by avoiding venery; by obviating coftivenefs, or removing it by laxatives which give little ftimulus. The fex are commonly negligent, either in avoiding the remote caufes, or in moderating the firft beginnings of this difeafe. It is by fuch neglect that it fo frequently becomes violent and of difficult cure; and the frequent repetition of a copious menftruation may be confidered as a caufe of great laxity in the extreme veffels of the uterus.

When the coming on of the menftruation has been preceded by fome diforder in other parts of the body, and is accompanied with pains of the back, fomewhat like parturient pains, with febrile fymptoms, and when at the fame time the flow feems to be copious, a bleeding at the arm may be proper, but is not often neceffary; and it will in moft cafes be fufficient to employ, with great attention and diligence, thofe means already mentioned for moderating the difcharge.

When the immoderate flow of the menfes fhall feem

to

Hæmorrhagiæ

to be owing to a laxity of the veſſels of the uterus, as may be concluded from the general debility and laxity of the perſon's habit; from the remote cauſes that have occaſioned the diſeaſe; from the abſence of the ſymptoms which denote increaſed action in the veſſels of the uterus; from the frequent recurrence of the diſeaſe; and particularly from this, that the female in the intervals of menſtruation is liable to a leucorrhœa: in ſuch a caſe, the diſeaſe is to be treated, not only by employing all the means above mentioned for moderating the hemorrhagy, but alſo by avoiding all irritation, every irritation having a greater effect in proportion as the veſſels are more lax and yielding. If, in ſuch a caſe of laxity, it ſhall appear that ſome degree of irritation concurs, opiates may be employed to moderate the diſcharge; but in uſing theſe much caution is requiſite. If, notwithſtanding theſe meaſures having been taken, the diſcharge ſhall prove very large, aſtringents both external and internal may be employed. In ſuch caſes, Dr Cullen aſks, May ſmall doſes of emetics be of ſervice?

When the menorrhagia depends on the laxity of the uterine veſſels, it will be proper, in the intervals of menſtruation, to employ tonic remedies; as cold bathing and chalybeates. The exerciſes of geſtation alſo may be very uſeful, both for ſtrengthening the whole ſyſtem, and for taking off the determination of the blood to the internal parts.

Theſe remedies may be employed in all caſes of menorrhagia, from whatever cauſe it may have proceeded, if it ſhall have already induced a conſiderable degree of debility in the body.

Deſcription. The *fluor albus*, female weakneſs, or *whites*, as it is commonly called, is a diſeaſe of the womb and its contiguous parts; from which a pale coloured, greeniſh, or yellow fluid, is diſcharged, attended with loſs of ſtrength, pain in the loins, bad digeſtion, and a wan ſickly aſpect.

Leucorrhœa.

Cauſes, &c. The quantity, colour, and conſiſtence of the diſcharge, chiefly depend upon the time of its duration, the patient's habit of body, and the nature of the cauſe by which it was produced. Taking cold, ſtrong liquor, immoderate heat and moiſture, or violent exerciſe, are all obſerved to produce a bad effect, as to its quantity and quality.

Weakly women of lax ſolids, who have had many children, and long laboured under ill health, are of all the moſt ſubject to this diſagreeable diſeaſe; from which they unfortunately ſuffer more ſevere penance than others, as the niceſt ſenſations are often connected with ſuch a delicacy of bodily frame as ſubjects them to it.

In Holland it is very frequent, and in a manner peculiar to the place, from the dampneſs of its ſituation; the ſurrounding air being ſo overcharged with moiſture as to relax the body, ſtop perſpiration, and throw it upon the bowels or womb; producing in the firſt a diarrhœa or flux, in the laſt the *fluor albus* or female weakneſs.

The diſcharge often proceeds from the veſſels ſubſervient to menſtruation; becauſe, in delicate habits, where thoſe veſſels are weak, and conſequently remain too long uncontracted, the *fluor albus* ſometimes immediately follows the menſes, and goes off by degrees as they gradually cloſe. It alſo comes from the mucus glands of the womb, as is particularly evident in very young females of eight and ten years old; in whom, though very rarely, it has been obſerved, and where it muſt then neceſſarily have eſcaped from thoſe parts, as the uterine veſſels are not ſufficiently enlarged for its paſſage at ſo early a period.

Sometimes, as in women with child, it proceeds from the paſſage to the womb, and not from the womb itſelf; which, during pregnancy, is cloſely ſealed up, ſo that nothing can paſs from thence till the time of labour. The application of thoſe inſtruments called *peſſaries*, from the pain and irritation they occaſion, are alſo apt to bring on this diſcharge. Hence we may conclude, that this diſeaſe may happen although the blood be in a pure ſtate. Here the fault ſeems to be placed in the veſſels at the part, by which the fluids are vitiated and changed from their natural qualities.

The *fluor albus* has been ſuppoſed to ſupply the want of the menſes; becauſe where the firſt prevails, the laſt is generally either irregular or totally wanting: but it might more properly be ſaid, that the preſence of the *fluor albus*, which is a preternatural evacuation, occaſions the abſence of that which is natural; as is evident from the return of the menſes after the *fluor albus* has been cured. Indeed, when this diſcharge appears about the age of 13 or 14, and returns once a month, with ſymptoms like thoſe of the menſes, then it may be deemed ſtrictly natural, and therefore ought not to be ſtopped.

Prognoſis. The *fluor albus* may be diſtinguiſhed into two kinds. The firſt ariſes from a ſimple weakneſs, or the relaxation of the ſolids; which may either be *general*, where the whole bodily ſyſtem is enervated and unſtrung; or *partial*, where the womb only is thus affected, Hæmorrhage

affected, in consequence of hard labour, frequent miscarriages, a suppression or immoderate quantity of the menses, or a sprain of the back or loins.

In the first case, the discharge being generally mild, may be safely taken away. In the second, it may proceed from a vitiated or impure blood, where the body, from thence, is loaded with gross humours, which nature for her own security and relief thus endeavours to carry off. In such cases, the discharge is often of a reddish colour, like that from old ulcerous sores; being sometimes so sharp as to excoriate the contiguous parts, and occasion a smarting and heat of urine.

A deep-seated, darting pain, with a forcing down, attending such a discharge, is a very dangerous and alarming sign, and indicates an ulceration or cancerous state of the womb. This malignant state of the disease, if of long continuance, is extremely difficult of cure; and disposes the patient to barrenness, a bearing down, dropsy, or consumption.

Cure, &c. The causes of those two kinds of this disease being different, so they will require a very different method of cure. For this purpose, in the first case, nothing will be more proper than nourishing simple food; such as veal broths, jellies, fresh eggs, and milk diet. The acid fruits will also be proper; and the patient may take a restorative, strengthening infusion, which will give firmness to the body, and assist the weakened fibres of the womb in returning to their natural state.

The same method may be used with success, where the *fluor albus* follows the menses, as already observed.

The Tunbridge or Spa waters may be drank at the same time; and if necessary, an infusion of green tea, or pure smith's forge water, may be used with a womb-syringe as an injection twice a-day. Should the disease prove uncommonly obstinate, the patient may go into the cold bath every second day; and also drink lime-water with milk, which will expedite the cure, and prevent a relapse. Volatile liniment, and afterwards a strengthening plaster, may be applied to the small of the back.

By way of caution, the female should abstain from the immoderate use of tea; and be removed into a dry clear air; or if she be obliged to remain in one less proper, she may apply the flesh-brush, and wear a flannel shift next her skin, impregnated with the fumes of burning frankincense or any of the grateful aromatic gums. Cold spring-water pumped on the loins, or a blistering plaster applied to the bottom of the spine or back, are both very powerful in their effects, and have sometimes succeeded after other remedies had been tried in vain.

In the second sort of the disease, where the discharge is sharp and of long standing, it would be extremely dangerous to suppress it suddenly, either by astringents internally taken, or applied as injections, until the system be restored to a more sound and vigorous condition.

A purging potion may be taken twice a-week, and in the intervals an alterative pill night and morning. After this course has been continued a fortnight or three weeks, she may begin with the strengthening bitter infusion, or some other tonic, in the quantity of a tea-cupful twice a-day, or to a greater extent if the stomach will allow.

Leucorrhœa

The same sort of food and regimen will here be proper as in the first kind of the disease. The patient should abstain from malt liquors, and drink rice-water, in each pint of which half an ounce of gum-arabic has been dissolved; or if she be weak, and of a cold bloated habit of body, a little French brandy may be added occasionally.

When she begins to take the bitter infusion, it will be proper to use the Tunbridge or Pyrmont water for common drink; but if those cannot conveniently be had, the *artificial aërated water*, impregnated with iron and fixed air, will make an excellent substitute. If it should render her costive, and occasion head-ach, she may desist, and drink imperial water or a little senna-tea sweetened with manna, till those complaints be removed.

In short, as this is a malady of the most disagreeable kind, which by long continuance or neglect becomes difficult of cure and often produces an *ulceration of the womb*, *bearing down*, *barrenness*, a *dropsy*, or *consumption*; it were to be wished that women, on such occasions, would be more attentive to their own safety, by using all possible means, in due time, to prevent those disorders.

Dr Leake says he has attended more patients labouring under the *fluor albus* in the autumn than at any other season of the year, especially when the weather was uncommonly moist and cold: most of them were cured by change of diet, an increased perspiration, and the proper use of Peruvian bark with aromatics. He observed, that several about this time who escaped the disorder, were visited with bad colds, a defluxion on the throat, or a diarrhœa, which were removed by a similar treatment.

As women are sometimes connected with those who do not conscientiously regard their safety, it is a circumstance of the utmost consequence *to distinguish a fresh venereal infection from the fluor albus or whites:* for if the first be mistaken for the last, and be either neglected or improperly treated, the worst consequences may arise.

The following signs will best inform the patient whether there be occasion for her doubts or not.

A fresh infection, called *gonorrhœa*, is malignant and inflammatory; the *fluor albus* most commonly arises from relaxation and bodily weakness: and therefore the remedies proper in the first disorder would render the last more violent, by locking up and confining the infectious matter.

In the gonorrhœa, the discharge chiefly proceeds from the parts contiguous to the urinary passage, and continues whilst the menses flow; but in the *fluor albus* it is supplied from the cavity of the womb and its passage, and then the menses are seldom regular.

In the gonorrhœa, an itching, inflammation, and heat of urine, are the fore-runners of the discharge; the orifice of the urinary passage is prominent and painful, and the patient is affected with a frequent irritation to make water. In the *fluor albus*, pains in the loins, and loss of strength, attend the discharge; and if any inflammation or heat of urine follow, they happen in a less degree, and only after a long con-

Hæmorrhagiæ

tinuance of the discharge, which, becoming sharp and acrimonious, excoriates the surrounding parts.

In the gonorrhœa, the discharge suddenly appears without any evident cause; but in the *fluor albus*, it comes on more slowly, and is often produced by irregularities of the menses, frequent abortion, sprains, or long-continued illness.

In the gonorrhœa, the discharge is greenish or yellow, less in quantity, *and not attended with the same symptoms of weakness*. In the *fluor albus*, it is also often of the same colour, especially in bad habits of body, and after long continuance; but is usually more offensive, and redundant in quantity.

All the other kinds of hemorrhagy enumerated by medical writers, are by Dr Cullen reckoned to be symptomatic; as,

Catarrhus.

Description. The catarrh is an increased excretion of mucus from the mucous membrane of the nose, fauces, and bronchiæ, attended with pyrexia.

Practical writers and nosologists have distinguished the disease by different appellations, according as it happens to affect different parts of the mucous membrane, one part more or less than the other: but Dr Cullen is of opinion that the disease in those different parts is always of the same nature, and proceeds from the same cause in the one as in the other. Very commonly indeed those different parts are affected at the same time; and therefore there is little room for the distinction mentioned. The disease has been frequently treated of under the title of *tussis* or *cough*; and a cough, indeed, always attends the chief form of catarrh, that is, the increased excretion from the bronchiæ; but as it is so often also a symptom of many other affections, which are very different from one another, it is improperly used as a generic title.

The disease generally begins with some difficulty of breathing through the nose, and with a sense of some fulness stopping up that passage. This again is often attended with some dull pain and a sense of weight in the forehead, as well as a stiffness in the motion of the eyes. These feelings, sometimes at their very first beginning, and always soon after, are attended with the distillation of a thin fluid from the nose, and sometimes from the eyes; and these fluids are often found to be somewhat acrid, both by their taste and by their fretting the parts over which they pass. These symptoms constitute the coryza and gravedo of authors, and are commonly attended with a sense of lassitude over the whole body. Sometimes cold shiverings are felt; at least the body is more sensible than usual to the coldness of the air; and with all this the pulse is more frequent than ordinary, especially in the evenings.

These symptoms have seldom continued long before they are accompanied with some hoarseness, and a sense of roughness and soreness in the trachea, with some difficulty of breathing, expressed by a sense of straitness in the chest, and with a cough which seems to arise from some irritation felt at the glottis. This cough is generally at first dry and painful, occasioning pains about the chest, and more especially in the breast; sometimes, together with these symptoms, pains resembling those of the rheumatism are felt in several parts of the body, particularly about the neck and head. With all these symptoms, the appetite is impaired, some thirst arises, and a feverish lassitude is felt all over the body. These symptoms mark the height and violence of the disease; but commonly it does not continue long. By degrees the cough comes to be attended with a more copious excretion of mucus; which is at first thin, but gradually becoming thicker, is brought up with less frequent and less laborious coughing. The hoarseness and soreness of the trachea are also relieved or removed; and the febrile symptoms abating, the expectoration becomes again less, and the cough less frequent, till at length they cease altogether.

Such is generally the course of this disease, neither

tedious

tedious nor dangerous; but it is sometimes in both respects otherwise. The body affected with catarrh seems to be more than usually liable to be affected by cold air; and upon exposure of the body to fresh cold, the disease, which seemed to be yielding, is often brought back with greater violence than before, and is rendered not only more tedious than otherwise it would be, but also more dangerous by the supervening of other diseases. Some degree of the cynanche tonsillaris often accompanies the catarrh; and when this is aggravated by a fresh application of cold, the cynanche also becomes more violent and dangerous from the cough, which is present at the same time. When a catarrh has been occasioned by a violent cause, when it has been aggravated by improper management, and especially when it has been rendered more violent by fresh and repeated applications of cold, it often passes into a pneumonic inflammation, attended with the utmost danger.

Unless, however, such accidents as those happen, a catarrh, in sound persons not far advanced in life, is always a slight and safe disease: but, in persons of a phthisical disposition, a catarrh may readily produce a hemoptysis, or perhaps form tubercles in the lungs; and still more readily in persons who have tubercles already formed in the lungs, an accidental catarrh may occasion the inflammation of these tubercles, and in consequence produce a phthisis pulmonalis.

In elderly persons, a catarrh sometimes proves a dangerous disease. Many persons, as they advance in life, and especially after they have arrived at old age, have the natural mucus of the lungs poured out in greater quantity, and requiring a frequent expectoration. If, therefore, a catarrh happen to such persons, and increase the afflux of fluids to the lungs, with some degree of inflammation, it may produce the peripneumonia notha, or more properly chronic catarrh, a disease continuing often for many years, or at least regularly every winter; which in such cases is very often fatal.

Causes, &c. The proximate cause of catarrh seems to be an increased afflux of fluids to the mucous membrane of the nose, fauces, and bronchiæ, along with some degree of inflammation affecting the same. The latter circumstance is confirmed by this, that, in the case of catarrh, the blood drawn from a vein commonly exhibits the same inflammatory crust which appears in the case of phlegmasiæ. The remote cause of catarrh is most commonly cold applied to the body. This application of cold producing catarrh is generally evident and observed; and Dr Cullen is of opinion that it would always be so, were men acquainted with and attentive to the circumstances which determine cold to act upon the body.

The application of cold which occasions a catarrh, probably operates by stopping the perspiration usually made by the skin, and which is therefore determined to the mucous membrane of the parts above-mentioned. As a part of the weight which the body daily loses by insensible evacuation, is owing to an exhalation from the lungs, there is probably a connection between this exhalation and the cutaneous perspiration, so that the one may be increased according as the other is diminished; and therefore we may understand how the diminution of cutaneous perspiration, by the application of cold, may increase the afflux of fluids to the lungs, and thereby produce a catarrh.

Dr Cullen observes that there are some observations of Dr James Keil which may render this matter doubtful; but says there is a fallacy in those observations. The evident effects of cold in producing coryza, leave the matter, in general, without doubt; and there are several other observations which show a connection between the lungs and the surface of the body.

Whether from the suppression of perspiration, a catarrh be produced merely by an increased afflux of fluids, or whether in addition to this the matter of perspiration be at the same time determined to the mucous glands, and there excites a particular irritation, may be uncertain; but Dr Cullen thinks the latter supposition is most probable.

Although in the case of a common catarrh, which is in many instances sporadic, it may be doubtful whether any morbific matter be applied to the mucous glands; we are, however, certain that the symptoms of a catarrh do frequently depend upon such a matter being applied to these glands, as appears from the case of measles, chincough, and especially from the frequent occurrence of contagious and epidemical catarrh.

The phenomena of contagious catarrhs have been much the same with those of the others; and the disease has always been particularly remarkable for this, that it has been the most widely and generally spreading epidemic known. It has seldom appeared in any one country of Europe, without appearing successively in almost every different part of it; and, in some instances, it has been also transferred to America, and has been spread there in like manner, so far as we have had opportunities of being informed.

The catarrh from contagion appears with nearly the same symytoms as those above-mentioned. It seems often to come on in consequence of the application of cold. And indeed catarrh from cold and contagion are in every respect so similar, that when this epidemic rages, it is impossible to determine with a person having symptoms of catarrh after exposure to cold, whether the disease proceeds from the one cause or the other. In most instances, however, catarrh from contagion comes on with more cold shivering than the catarrh arising from cold alone; and the former does also not only sooner show febrile symptoms, but to a more considerable degree. Accordingly, it more speedily runs its course, which is commonly finished in a few days. It sometimes ends by a spontaneous sweat; and this, in some persons, produces a miliary eruption. It is, however, the febrile state of this disease especially that is finished in a few days; for the cough and other catarrhal symptoms do frequently continue longer, and often when they appear to be going off they are renewed by any fresh application of cold.

Prognosis. Considering the number of persons who are affected with catarrh, of either the one species or the other, and escape from it quickly without any hurt, it may be allowed to be a disease commonly free from danger; but it is not always to be treated as such, for

Profluvia. for in some persons it is accompanied with pneumonic inflammation. In the phthisically disposed, it often accelerates the coming on of phthisis; and in elderly persons it often proves fatal in the manner we have explained above, viz. by degenerating into its chronic state. But though chronic catarrh be often the termination of that species which arises from cold, we have not, in any case, observed it to arise as a consequence of a catarrh from contagion. This species of catarrh, however, is not unfrequently followed by phthisis; or rather where a phthisical tendency before existed, the affection has been begun and its progress accelerated from this cause.

Cure. The cure of catarrh is nearly the same, whether it proceeds from cold or contagion; only in the latter case remedies are commonly more necessary than in the former. In the cases of a moderate disease, it is commonly sufficient to avoid cold, or to abstain from animal-food for some days. In some cases, where the febrile symptoms are considerable, it is proper for that length of time to lie a-bed, and, by taking frequently some mild and diluent drink, a little warmed, to promote a very gentle sweat; and after this to take care to return very gradually only to the use of the free air. When the disease is more violent, not only the antiphlogistic regimen, exactly observed, but various remedies also, become necessary. To take off the phlogistic diathesis which always attends this disease, blood-letting, more or less, according as the symptoms shall require, is the proper remedy. After blood-letting, for restoring the determination of the fluids to the surface of the body, and at the same time for expediting the secretion of mucus in the lungs, which may take off the inflammation of its membrane, vomiting is the most effectual means. For the last-mentioned purpose, it has been supposed that squills, gum-ammoniac, the volatile alkali, and some other medicines, might be useful; but their efficacy has never been found considerable: and if squills have ever been very useful, it seems to have been rather by their emetic than by their expectorant powers. When the inflammatory affections of the lungs seem to be considerable, it is proper, besides blood-letting, to apply blisters to the back or sides.

As a cough is often the most troublesome circumstance of this disease, so demulcents may be employed to alleviate it. But after the inflammatory symptoms are much abated, if the cough still remains, opiates afford the most effectual means of relieving it; and, in the circumstances just now mentioned, they may be very safely employed. Very considerable advantage is often derived from employing opiates in such a manner as to act more immediately on the head of the wind-pipe. For this purpose, opium may often be advantageously conjoined with demulcents, melting slowly in the mouth. And perhaps no form is more convenient, or answers the purpose better, than the *trochisci glycyrrhizæ cum opio* of the Edinburgh Pharmacopœia, where purified opium is combined with extract of liquorice, gum Arabic, and other demulcents, to the extent of about a grain in a dram of the composition. After the inflammatory and febrile states of this disease are very much gone, the most effectual means of discussing all remains of the catarrhal affection is by some exercise of gestation diligently employed. Catarrhus.

Besides the remedies above-mentioned, Dr Mudge, in a treatise on this disease, recommends the steam of warm water as a most efficacious and safe remedy for a catarrh, and which indeed he seems to consider as little less than *infallible*. The method of breathing in these steams is described under the word INHALER; but he gives a caution to people in health, who may accidentally see his machine, not to make the experiment of breathing through cold water with it, or they will be almost certain of catching a severe cold. His directions for those troubled with the catarrh are as follow:

"In the evening, a little before bed-time, the patient, if of adult age, is to take three drachms, or as many tea-spoonfuls, of elixir paregoricum, in a glass of water: if the subject be younger, for instance under five years old, one tea-spoonful; or within that and ten years, two. About three quarters of an hour after, the patient should go to bed, and, being covered warm, the inhaler three parts filled with water nearly boiling (which, from the coldness of the metal, and the time it ordinarily takes before it is to be used by the patient, will be of a proper degree of warmth), and being wrapped up in a napkin, but so that the valve in the cover is not obstructed by it, is to be placed at the arm-pit, and the bed-clothes being drawn up and over it close to the throat, the tube is to be applied to the mouth, and the patient should inspire and expire through it for about twenty minutes or half an hour.

"It is very evident, as the whole act of respiration is performed through the machine, that in inspiration the lungs will be filled with air which will be hot, and loaded with vapour, by passing through the body of water; and in exspiration, all that was contained in the lungs will, by mixing with the steam on the surface of the water, be forced thro' the valve in the cover, and settle on the surface of the body under the bed-cloaths.

"The great use of this particular construction of the inhaler is this. First, as there is no necessity, at the end of every inspiration, to remove the tube from the mouth, in order to exspire from the lungs the vapour which had been received into them, this machine may therefore be used with as much ease by children as older people. And, secondly, as a feverish habit frequently accompanies the disorder, the valve in that respect also is of the utmost importance: for a sweat, or at least a free perspiration, not only relieves the patient from the restless anxiety of a hot, dry, and sometimes parched skin, but is also, of all evacuations, the most eligible for removing the fever; and it will be generally found, that, after the inhaler so constructed has been used a few minutes, the warm vapour under the cloaths will, by settling upon the trunk, produce a sweat, which will gradually extend itself to the legs and feet.

"In a catarrhous fever, or any feverish habit attending this cough, it would be proper to take a draught of warm thin whey a few minutes before the inhaler be used; and after the process is over, the sweat which it has produced may be continued by occasional

Profluvia

ſmall draughts of weak warm whey or barley-water. The ſweating is by no means ſo neceſſary to the cure of the catarrhous cough, as that the ſucceſs of the inhaler againſt that complaint at all depends upon it; yet I cannot help once more remarking, that when this diſorder happens to be accompanied with a feveriſh habit, the advantages of this particular conſtruction will be very important.

" After this reſpiratory proceſs is over, the patient uſually paſſes the night without the leaſt interruption from the cough, and feels no farther moleſtation from it than once or twice in the morning to throw off the trifling leakage which, unperceived, had dripped into the bronchiæ and veſicles during the night; the thinner parts of which being evaporated, what remains is ſoon got rid of with a very gentle effort.

" I cannot, however, take leave of this part of my ſubject, without pointedly obſerving, that if the patient means not to be diſappointed by my aſſurances or his own expectations, it is eſſentially neceſſary that the following remarks, with regard to the time and manner of uſing this proceſs, ſhould be ſtrictly attended to.

" Firſt, That as tender valetudinary people are but too well acquainted with the firſt notices of the diſorder, the remedy muſt, or ought to be, uſed the ſame evening; which will, in an ordinary ſeizure, be attended with an immediate cure: but if the ſoreneſs of the reſpiratory organs, or the petulance of the cough, ſhow the cold which has been contracted to have been very ſevere, the inhaler, without the opiate, ſhould be again repeated for the ſame time the next morning.

" Secondly, if the uſe of the inhaler, &c. be delayed till the ſecond night, it will be always right to repeat it again the next morning without the opiate, but with it if the ſeizure has been violent.

" And, laſtly, if the cough be of ſome days ſtanding, it will be always neceſſary to employ both parts of the proceſs at night and the ſucceeding morning, as the firſt ſimple inflammatory miſchief is now moſt probably aggravated by an additional one of a chronic tendency.

" But if, through the want of a timely application, or a total neglect of this or any other remedy, the cough ſhould continue to haraſs the patient, it is, particularly in delicate and tender conſtitutions, of the utmoſt conſequence to attempt the removal of it as ſoon as poſſible, before any floating acrimony in the conſtitution (from the perpetual irritation) receives an habitual determination to an organ ſo eſſential to life as the lungs.

" If the patient expectorate with eaſe and freedom a thick and well-digeſted inoffenſive phlegm, there is generally but little doubt of his ſpitting off the diſorder, with common care, in a few days; and till that be accompliſhed, a proper doſe of elixir paregoricum for a few ſucceſſive nights will be found very uſeful in ſuppreſſing the fatiguing irritation and ineffectual cough, occaſioned by a matter which, dripping in the early ſtate of the diſeaſe into the bronchiæ during the night, is commonly at that time too thin to be diſcharged by thoſe convulſive efforts.

" If, however, notwithſtanding a free and copious expectoration, the cough ſhould ſtill continue, and the diſcharge, inſtead of removing the complaint, ſhould itſelf, by becoming a diſeaſe, be a greater expence than the conſtitution can well ſupport, it is poſſible that a tender patient may ſpit off his life through a weak, relaxed pair of lungs, without the leaſt appearance of purulence, or any ſuſpicion of ſuppuration. In thoſe circumſtances, beſides, as was mentioned before, increaſing the general perſpiration by the ſalutary friction of a flannel waiſtcoat, change of ſituation, and more eſpecially long journeys on horſeback, conducted as much as poſſible through a thin, ſharp, dry air, will ſeldom fail of removing the complaint.

Catarrhus.

" But, on the contrary, if the cough ſhould, at the ſame time that it is petulant and fatiguing to the breaſt, continue dry, huſky, and without expectoration; provided there be reaſon to hope that no tubercles are forming, or yet actually formed, there is not perhaps a more efficacious remedy for it than half a drachm of gum ammoniacum, with 18 or 20 drops of liquid laudanum, made into pills, and taken at bedtime, and occaſionally repeated. This excellent remedy Sir John Pringle did me the honour to communicate to me; and I have accordingly found it, in a great many inſtances, amazingly ſucceſsful, and generally very expeditiouſly ſo; for it ſeldom fails to produce an expectoration, and to abate the diſtreſſing fatigue of the cough. In thoſe circumſtances I have likewiſe found the common remedy of ʒſs or ℈ij of *balſ. ſulph. aniſat.* taken twice a-day, in a little powdered ſugar or any other vehicle, a very efficacious one. I have alſo, many times, known a ſalutary revulſion made from the lungs by the ſimple application of a large plaſter, about five or ſix inches diameter, of Burgundy pitch between the ſhoulders; for the perſpirable matter, which is locked up under it, becomes ſo ſharp and acrid, that in a few days it ſeldoms fails to produce a very conſiderable itching, ſome little tendency to inflammation, and very frequently a great number of boils. This application ſhould be continued (the plaſter being occaſionally changed), for three weeks or a month, or longer, if the complaint be not ſo ſoon removed.

" And here I cannot help obſerving, that, though ſeemingly a trifling, it is however by no means a uſeleſs caution to the tender patient, not to expoſe his ſhoulders in bed, and during the night, to the cold; but when he lies down to take care they be kept warm, by drawing the bed-cloaths up cloſe to his back and neck.

" If, however, notwithſtanding theſe and other means, the cough, continuing dry or unattended with a proper expectoration, ſhould perſevere in haraſſing the patient; if, at laſt, it ſhould produce, together with a ſoreneſs, ſhooting pains through the breaſt and between the ſhoulders, attended alſo with ſhortneſs of the breath; and if, added to this, fluſhes of the cheeks after meals, ſcalding in the hands and feet, and other ſymptoms of a hectic, ſhould accompany the diſorder; there is certainly no time to be loſt, as there is the greateſt reaſon to apprehend that ſome acrimony in the habit is determined to the tender ſubſtance of the lungs, and that conſequently tubercular ſuppurations will follow. In this critical and dangerous ſituation, I think I can venture to ſay from long experience, that, accompanied with change of air and occaſional bleedings, the patient will find his greateſt ſecurity

Profluvia curity in a drain from a large fcapulary iffue, affifted by a diet of affes milk and vegetables."

Genus XLI. DYSENTERIA.

254 The Dysentery.

Dyfenteria, *Sauv.* gen. 248. *Lin.* 191. *Vog.* 107. *Sag.* 183. *Hoffm.* III. 151. *Junck.* 76.

Defcription. The dyfentery is a difeafe in which the patient has frequent ftools, accompanied with much griping, and followed by a tenefmus. The ftools, though frequent, are generally in fmall quantity; and the matter voided is chiefly mucus, fometimes mixed with blood. At the fame time, the natural fæces feldom appear; and when they do, it is generally in a compact and hardened form, often under the form of fmall hard fubftances known by the name of *fcybalæ*. This difeafe occurs efpecially in fummer and autumn, at the fame time with autumnal intermittent and remittent fevers; and with thefe it is often complicated. It comes on fometimes with cold fhiverings, and other fymptoms of pyrexia; but more commonly the fymptoms of the topical affection appear firft. The belly is coftive, with an unufual flatulence in the bowels. Sometimes, though more rarely, fome degree of diarrhœa is the firft appearance.—In moft cafes, the difeafe begins with griping, and a frequent inclination to go to ftool. In indulging this, little is voided, but fome tenefmus attends it. By degrees the ftools become more frequent, the griping more fevere, and the tenefmus more confiderable.—With thefe fymptoms there is a lofs of appetite, and frequently ficknefs, naufea, and vomiting, alfo affecting the patient. At the fame time there is always more or lefs of pyrexia prefent. It is fometimes of the remittent kind, and obferves a tertian period.—Sometimes the pyrexia is manifeftly inflammatory, and very often of a putrid kind. Thefe febrile ftates continue to accompany the difeafe during its whole courfe, efpecially when it terminates foon in a fatal manner. In other cafes, the febrile ftate almoft entirely difappears, while the proper dyfenteric fymptoms remain for a long time after. In the courfe of the difeafe, whether for a fhorter or a longer time, the matter voided by ftool is very various. Sometimes it is merely a mucous matter, without any blood, exhibiting that difeafe which is named by fome the *morbus mucofus*, and by others the *dyfenteria alba*. For the moft part, however, the mucus difcharged is more or lefs mixed with blood. This fometimes appears only in ftreaks among the mucus; but at other times is more copious, giving a tinct to the whole; and upon fome occafions a pure and unmixed blood is voided in confiderable quantity. In other refpects, the matter voided is varioufly changed in colour and confiftence, and is commonly of a ftrong and unufually fetid odour. It is probable, that fometimes a genuine pus is voided, and frequently a putrid fanies, proceeding from gangrenous parts. There are very often mixed with the liquid matter fome films of a membranous appearance, and frequently fome fmall maffes of a feemingly febaceous matter. While the ftools voiding thefe various matters are, in many inftances, exceedingly frequent, it is feldom that natural fæces appear in them; and when they do appear, it is, as we have faid, in the form of fcybala, that is, in fomewhat hardened, feparate balls. When thefe are voided, whether by the efforts of nature or as folicited by art, they procure a remiffion of all the fymptoms, and more efpecially of the frequent ftools, griping, and tenefmus. Dyfenteria.

Accompanied with thefe circumftances, the difeafe proceeds for a longer or a fhorter time When the pyrexia attending it is of a violent inflammatory kind, and more efpecially when it is of a very putrid nature, the difeafe often terminates fatally in a very few days, with all the marks of a fupervening gangrene. When the febrile ftate is more moderate, or difappears altogether, the difeafe is often protracted for weeks, and even for months; but, even then, after a various duration, it often terminates fatally, and generally in confequence of a return and confiderable aggravation of the inflammatory and putrid ftates. In fome cafes, the difeafe ceafes fpontaneoufly; the frequency of ftools, the griping, and tenefmus, gradually diminifhing, while natural ftools return. In other cafes, the difeafe, with moderate fymptoms, continues long, and ends in a diarrhœa, fometimes accompanied with lienteric fymptoms.

Caufes, &c. The remote caufes of this difeafe have been varioufly judged of. It generally arifes in fummer or autumn, after confiderable heats have prevailed for fome time, and efpecially after very warm and at the fame time very dry ftates of the weather; and the difeafe is much more frequent in warm than in cooler climates. It happens, therefore, in the fame circumftances and feafons which confiderably affect the ftate of the bile in the human body: but the cholera is often without any dyfenteric fymptoms, and copious difcharges of bile have been found to relieve the fymptoms of dyfentery; fo that it is difficult to determine what connection the difeafe has with the ftate of the bile.

It has been obferved, that the effluvia from very putrid animal-fubftances readily affect the alimentary canal, and, upon occafion, they certainly produce a diarrhœa; but whether they ever produce a genuine dyfentery, is not certain.

The dyfentery does often manifeftly arife from the application of cold, but the difeafe is always contagious; and, by the propagation of fuch contagion, independent of cold, or other exciting caufes, it becomes epidemic in camps and other places. It is, therefore, to be doubted if the application of cold ever produces the difeafe, unlefs where the fpecific contagion has been previoufly received into the body; and, upon the whole, it is probable that a fpecific contagion is to be confidered as being always the remote caufe of this difeafe.

Whether this contagion, like many others, be of a permanent nature, and only fhows its effects in certain circumftances which render it active, or if it be occafionally produced, we cannot determine. Neither, if the latter fuppofition be received, can we fay by what means it may be generated. As little do we know any thing of its nature, confidered in itfelf; or at moft, only this, that, in common with many other contagions, it is very often fomewhat of a putrid nature, and capable of inducing a putrefcent tendency in the human body. This, however, does not at all explain the peculiar effect of inducing thofe fymptoms which properly and effentially conftitute dyfentery. Of thefe fymptoms the proximate caufe is ftill obfcure.—

The

Profluvia The common opinion has been, that the disease depends upon an acrid matter thrown upon or somehow generated in the intestines, exciting their peristaltic motion, and thereby producing the frequent stools which occur in this disease. But this supposition cannot be adopted; for, in all the instances known, of acrid substances applied to the intestines, and producing frequent stools, they at the same time produce copious stools, as might be expected from acrid substances applied to any length of the intestines. This, however, is not the case in dysentery, in which the stools, however frequent, are generally in very small quantity, and such as may be supposed to proceed from the lower parts of the rectum only. With respect to the superior portions of the intestines, and particularly those of the colon, it is probable they are under a preternatural and considerable degree of constriction: for, as we have said above, the natural fæces are seldom voided; and when they are, it is in a form which gives reason to suppose they have been long retained in the cells of the colon, and consequently that the colon had been affected with a preternatural constriction. This is confirmed by almost all the dissections which have been made of the bodies of dysenteric patients; in which, when gangrene had not entirely destroyed the texture and form of the parts, large portions of the great guts have been found affected with a very considerable constriction.

The proximate cause of dysentery, or at least the chief part of the proximate cause, seems to consist in a preternatural constriction of the colon, occasioning, at the same time, those spasmodic efforts which are felt in severe gripings, and which efforts, propagated downwards to the rectum, occasion there the frequent mucous stools and tenesmus. But whether this explanation shall be admitted or not, it will still remain certain, that hardened fæces, retained in the colon, are the cause of the griping, frequent stools, and tenesmus: for the evacuation of these fæces, whether by nature or by art, gives relief from the symptoms mentioned; and it will be more fully and usefully confirmed by this, that the most immediate and successful cure of dysentery is obtained by an early and constant attention to the preventing the constriction, and the frequent stagnation of fæces in the colon.

Cure. In the early periods of this disease, the objects chiefly to be aimed at are the following: The discharge of acrid matter deposited in the alimentary canal; the counteracting the influence of this matter when it cannot be evacuated; the obviating the effects resulting from such acrid matter as can neither be evacuated nor destroyed; and, finally, the prevention of any further separation and deposition of such matter in the alimentary canal. In the more advanced periods of the disease, the principal objects are, the giving a proper defence to the intestines against irritating causes; the diminution of morbid sensibility of the intestinal canal; and the restoration of due vigour to the system in general, but to the intestines in particular.

The most eminent of our late practitioners, and of greatest experience in this disease, seem to be of opinion, that it is to be cured most effectually by purging, assiduously employed. The means may be various; but the most gentle laxatives are usually sufficient; and, as the medicine must be frequently repeated, these are the most safe, more especially as an inflammatory state so frequently accompanies the disease. Whatever laxatives produce an evacuation of natural fæces, and a consequent remission of the symptoms, will be sufficient to effectuate the cure. But if the gentle laxatives shall not produce the evacuation now mentioned, somewhat more powerful must be employed; and Dr Cullen has found nothing more proper or convenient than tartar emetic, given in small doses, and at such intervals as may determine its operation to be chiefly by stool. To the antimonialed tartar, however, employed as a purgative, the great sickness which it is apt to occasion, and the tendency which it has, notwithstanding every precaution, to operate as an emetic, are certainly objections. Another antimonial, at one time considered as an almost infallible remedy for this disease, the vitrum antimonii ceratum, is no less exceptionable, from the uncertainty and violence of its operation; and perhaps the safest and best purgatives are the different neutral salts, particularly those containing fossile alkali, such as the soda vitriolata tartarisata or phosphorata. Rhubarb, so frequently employed, is, he thinks, in several respects, amongst the most unfit purgatives; and indeed from its astringent quality, it is exceptionable at the commencement of the affection, unless it be conjoined with something to render its operation more brisk, such as mild muriated mercury, or calomel as it is commonly called. Dysenteria.

Vomiting has been held a principal remedy in this disease; and may be usefully employed in the beginning, with a view to both the state of the stomach and of the fever: but it is not necessary to repeat it often; and, unless the emetics employed operate also by stool, they are of little service. Ipecacuanha is by no means a specific; and it proves only useful when so managed as to operate chiefly by stool.

For relieving the constriction of the colon, and evacuating the retained fæces, glysters may sometimes be useful; but they are seldom so effectual as laxatives given by the mouth; and acrid glysters, if they be not effectual in evacuating the colon, may prove hurtful by stimulating the rectum too much.

The frequent and severe griping attending this disease, leads almost necessarily to the use of opiates; and they are very effectual for the purpose of relieving from the gripes: but, by occasioning an interruption of the action of the small intestines, they favour the constriction of the colon, and thereby aggravate the disease; and if, at the same time, the use of them supersede in any measure the employing purgatives, it is doing much mischief; and the neglect of purging seems to be the only thing which renders the use of opiates very necessary.

When the gripes are both frequent and severe, they may sometimes be relieved by the employment of the semicupium, or by fomentation of the abdomen continued for some time. In the same case, the pains may be relieved, and the constriction of the colon may be taken off, by blisters applied to the lower belly.

At the beginning of this disease, when the fever is any way considerable, blood-letting, in patients of tolerable

Profluvia tolerable vigour, may be proper and neceffary; and, when the pulfe is full and hard, with other fymptoms of an inflammatory difpofition, blood-letting ought to be repeated. But, as the fever attending dyfentery is often of the typhoid kind, or does, in the courfe of the difeafe, become foon of that nature, blood-letting muft be cautioufly employed.

From our account of the nature of this difeafe, it will be fufficiently obvious, that the ufe of aftringents in the beginning of it muft be very pernicious. But although aftringents may be hurtful at early periods of this affection, yet it cannot be denied, that where frequent loofe ftools remain after the febrile fymptoms have fubfided, they are often of great fervice for diminifhing morbid fenfibility, and reftoring due vigour to the inteftinal canal. Accordingly, on this ground a variety of articles have been highly celebrated in this affection; among others we may mention the quaffia, radix indica lopeziana, verbafcum, extractum catechu, and gum kino, all of which have certainly in particular cafes been employed with great advantage. And perhaps alfo, on the fame principles, we are to account for the benefit which has been fometimes derived from the nux vomica, a remedy highly extolled in cafes of dyfentery by fome of the Swedifh phyficians; but this article, it muft be allowed, often proves very powerful as an evacuant. Its effects, however, whatever its mode of operation may be, are too precarious to allow its ever being introduced into common practice; and in this country, it has, we believe, been but very rarely employed. Whether an acrid matter be the original caufe of the dyfentery, may be uncertain; but, from the indigeftion, and the ftagnation of fluids, which attend the difeafe, we may fuppofe that fome acrid matters are conftantly prefent in the ftomach and inteftines; and therefore that demulcents may be always ufefully employed. At the fame time, from the confideration that mild oily matters thrown into the inteftines in confiderable quantity always prove laxative, Dr Cullen is of opinion, that the oleaginous demulcents are the moft ufeful. Where, however, thefe are not acceptable to the patient's tafte, thofe of the mucilaginous and farinaceous kind, as the decoctum hordei, potio cretacea, &c. are often employed with advantage.

As this difeafe is fo often of an inflammatory or of a putrid nature, it is evident that the diet employed in it fhould be vegetable and acefcent. Milk, in its entire ftate, is of doubtful quality in many cafes; but even fome portion of the cream is often allowable, and whey is always proper.—In the firft ftages of the difeafe, the fweet and fubacid fruits are allowable, and even proper. It is in the more advanced ftages only that any morbid acidity feems to prevail in the ftomach, and to require fome referve in the ufe of acefcents. At the beginning of the difeafe, abforbents feem to be fuperfluous; and, by their aftringent and feptic powers, they may be hurtful; but in after periods they are often of advantage.

When this difeafe is complicated with an intermittent, and is protracted from that circumftance chiefly, it is to be treated as an intermittent, by adminiftering the Peruvian bark, which in the earlier periods of the difeafe is hardly to be admitted.

Apoplexia.

This difeafe appears under modifications fo various, as to require fome obfervations with refpect to each.

Sp. I. The *Sanguineous* APOPLEXY. 256

Defcription. In this difeafe the patients fall fuddenly down, and are deprived of all fenfe and voluntary motion, but without convulfions. A giddinefs of the head, noife in the ears, corrufcations before the eyes, and rednefs of the face, ufually precede. The diftinguifhing fymptom of the difeafe is a deep fleep, attended with violent fnorting; if any thing be put into the mouth, it is returned through the nofe; nor can any thing be fwallowed without fhutting the noftrils; and even when this is done, the perfon is in the utmoft danger of fuffocation. Sometimes apoplectic patients will open their eyes after having taken a large dofe of an emetic; but if they fhow no fign of fenfe, there is not the leaft hope of their recovery. Sometimes the apoplexy terminates in an hemiplegia; in which cafe it comes on with a diftortion of the mouth towards the found fide, a drawing of the tongue the fame way, and ftammering of the fpeech. Diffections fometimes fhow a rupture of fome veffels of the meninges, or even veffels of the brain itfelf; though fometimes, if we may believe Dr Willis, no

Comata defect is to be obferved either in the cerebrum or cerebellum.

Caufes, &c. The general caufe of a fanguineous apoplexy is a plethoric habit of body, with a determination to the head. The difeafe therefore may be brought on by whatever violently urges on the circulation of the blood; fuch as furfeits, intoxication, violent paffions of the mind, immoderate exercife, &c. It takes place, however, for the moft part, when the venous plethora has fubfifted for a confiderable time in the fyftem. For that reafon it commonly does not attack people till paft the age of 60; and that whether the patients are corpulent and have a fhort neck, or whether they are of a lean habit of body. Till people be paft the age of childhood, apoplexy never happens.

Prognofis. This difeafe very often kills at its firft attack; and few furvive a repetition of the fit; fo that thofe who make mention of people who have furvived feveral attacks of the apoplexy, have probably miftaken the epilepfy for this difeafe. In no difeafe is the prognofis more fatal; fince thofe who feem to be recovering from a fit, are frequently and fuddenly carried off by its return, without either warning of its approach or poffibility of preventing it. The good figns are when the difeafe apparently wears off, and the patient evidently begins to recover; the bad ones are when all the fymptoms continue and increafe.

Cure. The great object to be aimed at, is to reftore the connection between the fentient and corporeal parts of the fyftem; and when interruption to this connection proceeds from compreffion in the brain by blood, this is to be attempted, in the firft place, by large and repeated bleedings; after which, the fame remedies are to be ufed as in the ferous apoplexy, aftermentioned. The body is to be kept in a fomewhat erect pofture, and the head fupported in that fituation.

257 Sp. II. The *Serous Apoplexy*.

Cataphora fomnolenta, *Sauv*. fp. 1.
Lethargus literatorum, *Sauv*. 7. *Van Swieten* in Aphor. 1010. 2 γ and 3 α.

Defcription. In this fpecies the pulfe is weak, the face pale, and there is a diminution of the natural heat. On diffection, the ventricles of the brain are found to contain a larger quantity of fluid than they ought; the other fymptoms are the fame as in the former.

Caufes, &c. This may arife from any thing which induces a debilitated ftate of the body, fuch as depreffing paffions of the mind, much ftudy, watching, &c. It may alfo be brought on by a too plentiful ufe of diluting, acidulated drinks. It doth not, however, follow, that the extravafated ferum above mentioned in the ventricles of the brain is always the caufe of the difeafe, fince the animal-humours are very frequently obferved to ooze out in plenty through the coats of the containing veffels after death, though no extravafation took place during life.

Prognofis. This fpecies is equally fatal with the other; and what hath been faid of the prognofis of the fanguineous, may alfo be faid of that of the ferous, apoplexy. Apoplexia.

Cure. In this fpecies venefection can fcarcely be admitted: acrid purgatives, emetics, and ftimulating clyfters, are recommended to carry off the fuperabundant ferum; but in bodies already debilitated, they may perhaps be liable to the fame exceptions with venefection itfelf. Volatile falts, cephalic elixirs, and cordials, are alfo prefcribed; and in cafe of a hemiplegia fupervening, the cure is to be attempted by aperient ptifans, cathartics, and fudorifics; gentle exercife, as riding in a carriage; with blifters and fuch ftimulating medicines as are in general had recourfe to in affections originally of the paralytic kind.

Hiftory and defcription. This difeafe has been accurately treated within thefe few years by feveral eminent phyficians, particularly the late Dr Whytt, Dr Fothergill, and Dr Watfon; who concur in opinion, with refpect to the feat of the complaint, the moft of its fymptoms, and its general fatality. Out of twenty patients that had fallen under Dr Whytt's obfervation, he candidly owns that he had been fo unfortunate as to cure only one who laboured under the characteriftic fymptoms of the hydrocephalus; and he fufpects that thofe who imagine they have been more fuccefsful, had miftaken another diftemper for this. It is by all fuppofed to confift in a dropfy of the ventricles of the brain; and this opinion is fully eftablifhed by diffections. It is obferved to happen more commonly to healthy, active, lively children, than to thofe of a different difpofition.

Dr Whytt fuppofes that the commencement of this difeafe is obfcure; that it is generally fome months in forming; and that, after fome obvious urgent fymptoms rendering affiftance neceffary, it continues fome weeks before its fatal termination. This, in general, differs from what has hitherto been obferved by Dr Fothergill; the latter informing us, that he has feen children, who, from all appearance, were healthy and active, feized with this diftemper, and carried off in about 14 days. He has feldom been able to trace the commencement of it above three weeks.

Though the hydrocephalus be moft incident to children, it has been fometimes obferved in adults; as appears from a cafe related by Dr Huck, and from fome others.

When the difeafe appears under its moft common form, the fymptoms at different periods are fo various as to lead Dr Whytt to divide the difeafe into three ftages, which are chiefly marked by changes occurring in the condition of the pulfe. At the beginning it is quicker

quicker than natural; afterwards it becomes uncommonly slow; and towards the conclusion of the disease it becomes again quicker than natural, but at the same time very irregular.

Those who are seized with this distemper usually complain first of a pain in some part below the head; most commonly about the nape of the neck and shoulders; often in the legs; and sometimes, but more rarely, in the arms. The pain is not uniformly acute, nor always fixed to one place; and sometimes does not affect the limbs. In the latter case, the head and stomach have been found to be most disordered; so that when the pain occupied the limbs, the sickness or head-ach was less considerable; and when the head became the seat of the complaint, the pain in the limbs was seldom or never mentioned. Some had very violent sicknesses and violent head-achs alternately. From being perfectly well and sportive, some were in a few hours seized with those pains in the limbs, or with sickness, or head-ach, in a slight degree, commonly after dinner; but some were observed to droop a few days before they complained of any local indisposition. In this manner they continued three, four, or five days, more or less, as the children were healthy and vigorous. They then commonly complain of an acute deep-seated pain in the head, extending across the forehead from temple to temple; of which, and a sickness, they alternately complain in short and affecting exclamations; dosing a little in the intervals, breathing irregularly, and sighing much while awake. Sometimes their sighs, for the space of a few minutes, are incessant.

As the disease advances, the pulse becomes slower and irregular, the strokes being made both with unequal force and in unequal times, till within a day or two of the fatal termination of the disorder, when it becomes exceeding quick; the breathing being at the same time deep, irregular, and laborious. After the first access, which is often attended with feverish heats, especially towards evening, the heat of the body is for the most part temperate, till at last it keeps pace with the increasing quickness of the pulse. The head and præcordia are always hot from the first attack. The sleeps are short and disturbed, sometimes interrupted by watchfulness; besides which there are startings.

In the first stage of the disease there seems to be a peculiar sensibility of the eyes, as appears from the intolerance of light. But in the progress of the disease a very opposite state occurs: The pupil is remarkably dilated, and cannot be made to contract by the action even of strong light; such, for example, as by bringing a candle very near to it. In many cases there is reason to believe that total blindness occurs: Often also the pupil of one eye is more dilated than that of another, and the power of moving the eyes is also morbidly affected. Those children, who were never observed to squint before, often become affected with a very great degree of strabismus. The patients are unwilling to be disturbed for any purpose, and can bear no posture but that of lying horizontally. One or both hands are most commonly about their heads. The urine and stools come away insensibly. At length the eyelids become paralytic, great heat accompanied with sweat overspreads the whole body, respiration is rendered totally suspirious, the pulse increases in its trembling undulations beyond the possibility of counting, till the vital motions entirely cease; and sometimes convulsions conclude the scene.

Many of the symptoms above enumerated are so common to worm-cases, teething, and other irritating causes, that it is difficult to fix upon any which particularly characterise this disease. The most peculiar seem to be the pains in the limbs, with sickness and incessant head-ach; which, though frequent in other diseases of children, are neither so uniformly nor so constantly attendant as in this. Another circumstance observed to be familiar, if not peculiar to this distemper, is, that the patients are not only costive, but it is likewise with the greatest difficulty that stools can be procured. These are generally of a very dark greenish colour with an oiliness or a glassy bile, rather than the slime which accompanies worms; and they are, for the most part, extremely offensive. No positive conclusion can be drawn from the appearance of the urine; it being various, in different subjects, both in its colour and contents, according to the quantity of liquor they drink, and the time between the discharges of the urine. From their unwillingness to be moved, they often retain their water 12 or 15 hours, and sometimes longer. In complaints arising from worms, and in dentition, convulsions are more frequent than in this disorder. Children subject to fits are sometimes seized with them a few days before they die. Sometimes these continue 24 hours incessantly, and till they expire.

Causes. The causes of internal hydrocephalus are very much unknown. Some suppose it to proceed from a rupture of some of the lymphatic vessels of the brain. But this supposition is so far from being confirmed by any anatomical observation, that even the existence of such vessels in the brain is not clearly demonstrated. That lymphatics, however, do exist in the brain, cannot be doubted; and one of the most probable causes giving rise to an accumulation of water in the brain is a diminished action of these. Here, however, as well as in other places, accumulation may also be the consequence of augmented effusion; and in this way, an inflammatory disposition, as some have supposed, may give rise to the affection. But from whatever cause an accumulation of water in the ventricles of the brain may be produced, there can be no doubt that from this the principal symptoms of the disease arise, and that a cure is to be accomplished only by the removal of it. It is, however, probable, that the symptoms are somewhat varied by the position of the water, and that the affection of vision in particular is often the consequence of some morbid state about the *thalami nervorum opticorum*; at least, in many cases, large collections of water in the ventricles have occurred, without either strabismus, intolerance of light, or dilatation of the pupil. And in cases where these symptoms have taken place to a remarkable degree, while upon dissection after death but a very small collection of water was found in the ventricles, it has been observed that a peculiar tumid appearance was discovered about the optic nerves, which upon examination was found to arise from water in the cellular texture. This may have given compression producing a state of insensibility; but it may have been preceded, or it may even have originated from, some inflammatory af-

Comata

fection of these parts, producing the intolerance of light.

Prognosis and Cure. Till very lately this disorder was reckoned totally incurable; but of late it has been alleged, that mercury, if applied in time, will remove every symptom. This remedy was first thought of by Dr Dobson of Liverpool, and afterwards employed apparently with success by Dr Percival and others. The method of exhibiting this medicine in order to effect a cure, as well as the inutility of other medicines, will fully appear from the following cases.

Case I. By Dr Percival.

" September 4. 1777. Master H. a child at the breast, aged seven months, has laboured about a fortnight under a slow irregular fever. His eyes have been now and then a little distorted; he has been affected with some degree of stupor: his gums have been inflamed and tender; and his mouth uncommonly dry. No tooth has yet made its appearance. An emetic has been administered; a blister applied to his back; and his belly has been kept soluble by repeated small doses of magnesia. During the action of the blister, he was thought to be much better, but he soon relapsed into his former state.

" About three o'clock this morning he was convulsed: at nine I saw him; and from his countenance instantly suspected a dropsy of the brain. The symptoms confirmed my apprehensions. His skin was hot; yet his pulse beat only 78 strokes in a minute, which were irregular. The pupils of his eyes were considerably, but unequally, dilated; nor did they contract much when a lighted candle was suddenly held before them. He often squinted, especially with the right eye, and seemed to take no notice of any objects around him. He refused the breast, and seldom swallowed till the lips and tongue had been stimulated with a feather. During several days past, he had been frequently observed to rub the end of his nose when his hand was at liberty; and, notwithstanding his stupor, he had been uncommonly watchful. I examined his head, and found a manifest tumor of the bregma, which had never before been noticed. Convinced by all these circumstances that the child laboured under the hydrocephalus internus, and that he was now in the second stage of that disorder, I directed ten grains of the *unguentum mercuriale mitius* to be rubbed into his thighs every three hours, till the mouth should be affected, and a tea-spoonful of the following mixture to be given whenever the convulsive symptoms recurred.

R. *Salis ammon. vol.* ℈i. *Succi Lemon.* ʒvi. *Mosch. opt. mucilagine gum. Arabic. solut.* gr. vi. *Sacch. alb.* q. s. *ad gratiam. M.*

" Small blisters were applied on each side of the head, just below the bregma; and a folded rag, frequently moistened with brandy, was laid upon the tumor to promote absorption. An emetic had been given early in the morning, by which a large quantity of bile was discharged; and a vesicatory had also been applied to his leg.

" September 5. nine o'clock. The child has had frequent convulsions in the night; his right eye is much distorted; and it has been remarked, that he seldom moves the right hand. The pulse beat 1?0 strokes in a minute. Two scruples of the mercurial ointment have been used, and he has taken five grains of musk. A large discharge of serum has been produced by the blisters. Five o'clock, P. M. the tumor of the head is sensibly diminished; the child's mouth is now moist, and often filled with saliva; and his tongue appears to be swolen. His pulse beat 146 strokes in a minute. I directed another blister to be applied to the head.

Apoplexia.

" September 6. His convulsions have been much slighter; his eyes are frequently distorted; and the pupils of each are more contracted. The stupor is considerably abated; the child seems to take some notice, distinguishes taste, and swallows freely. The musk has been continued; and half a dram more of the mercurial ointment has been consumed. A clyster was injected last night, but ineffectually: I therefore prescribed a grain of jalap, mixed with an equal quantity of sugar, to be given every three hours, till a motion to stool succeeded.

" September 7. The child has passed the night more comfortably, but not free from convulsions. His head has sweated profusely, and the blisters have run much. The tumor of the bregma is considerably reduced. The jalap operated gently last night, and the mercurial unction has been twice repeated. There is an evident mitigation of all the symptoms

" September 8. About eleven o'clock last night, the child was attacked with severe convulsions, which recurred frequently till six o'clock this morning. He has had a short sleep, and is now composed. His pulse beats 140 strokes in a minute; his heat is moderate; and his skin soft and perspirable. The mercurial ointment has been again used; but, though his gums and tongue are sore and very moist, his breath is not offensive. I directed a grain of calomel to be immediately given, to procure a stool; and a blister to be applied to the occiput.

" September 10. He has passed two nights almost entirely free from convulsions Ten grains of the mercurial ointment have been again rubbed into his thighs. The dose of calomel occasioned three very offensive stools; and directions are given to repeat it, as he is again costive. The blister applied to the occiput, like the others, has produced a very copious discharge. The tumor of the head is now scarcely perceptible. Pulse 120.

" September 12. At 12 o'clock last night, the convulsions recurred with greater violence than ever, and still continue. Two teeth have almost protruded through the upper, and the same number through the lower gum. Pulse 160, tremulous, and irregular. I directed that the child should be immediately put into a warm bath, and that the following remedies should be administered.

R. *Infus. rad. valer. fortissimi* ℥ii.
Asafœtid. electæ ℈ß. M. f. *Enema statim injiciendum.*

R. *Tinct. valer. volat.* ʒii. *Dentur guttæ* jii. *Subinde e cochleari parvulo infusi rad. valer. sylv. sub forma theæ parati.*

" The convulsions continued, but with less violence; and the child expired about one o'clock in the afternoon."

On this case the Doctor makes the following observations.

" The deplorable case which I have related appears

Comata pears to have originated from the irregular action produced in the syſtem by dentition, and from the want of a due ſecretion of ſaliva in the mouth, by which the fluid diſcharges were probably increaſed in the ventricles of the brain. That theſe diſcharges were diminiſhed, and that the extravaſated water was abſorbed, by the powerful action of the mercury, may be preſumed from the mitigation of all the ſymptoms which ſucceeded the ſalivation. And I am inclined to believe, that the convulſions under which the child expired were more owing to the irritation of his gums by the protruſion of four teeth, than to any remaining water in the brain; for the tumor of the head had entirely diſappeared, and after death there was a manifeſt depreſſion of the bregma. During the ſpace of a week, 110 grains of the unguentum mercuriale mitius, which contains about 22 grains of mercury, was conſumed in the uſual way of friction. Perhaps half of this quantity might be abſorbed, and carried into the courſe of circulation; to which may be added, part of the two grains of the calomel adminiſtered internally. The ſymptoms of the ſalivation were not violent; and the effects of the mercury did not appear formidable or alarming, even to the parents of the child, who were appriſed of the nature of the diſorder, and fully approved of the trial of this new method of treating it."

Case II. By Dr Dobson.

"On the 13th of February 1775, I was called to the only ſon of Mr C. a gentleman of this place: the child was between three and four years of age; had been indiſpoſed about eight days; and had frequently complained of pain in his head and wearineſs, and pains in his limbs: had been ſick by fits, and ſometimes vomited; was feveriſh, and could not bear the light.

"I was much alarmed on hearing this account, as the *hydrocephalus internus* had already proved fatal to three children of this family, who had all been under my care. And that this had been the diſeaſe was evident, both from the ſymptoms and the appearances on diſſection. But my alarm was much farther increaſed on examining the little patient. The pulſe I found very frequent and irregular. The head hot, the cheeks fluſhed, the pupils dilated, and a great degree of ſtrabiſmus. There remained no doubt with reſpect to the nature of the diſeaſe.

"An emetic, ſome calomel powders, and a purgative, had been adminiſtered, without affording any relief. I directed the pediluvium, and emetic tartar, to be given in ſuch doſes as to excite nauſea.

"February 14th. The ſymptoms the ſame, with frequent ſtartings, diſturbed ſleep, and toſſing from ſide to ſide on the pillow. A bliſter was applied between the ſhoulders, the pediluvium repeated, and the emetic tartar continued.

"15th. Comatoſe, reſtleſs, and ſhrieking by fits. The pulſe ſlower than in health, and the eyes inſenſible even to the impreſſions of ſtrong light.

"As I had no hope of doing any thing effectual for the recovery of my patient, I paid my viſits, preſcribed, and gave directions with a foreboding and heavy heart. Anxiouſly, however, conſidering the caſe in different points of view, and fully convinced that it Apoplexia. was vain to purſue the uſual line of practice, it occurred to me, that mercurials, ſo far urged as to enter the courſe of circulation, and affect the ſalivary glands, might poſſibly reach the ſyſtem of abſorbents in the ventricles of the brain, and thus remove the extravaſated fluid.

"The ſhort continuance of the diſeaſe, and the apparent ſtrength of my patient, were favourable to the trial of this method. No time, however, was to be loſt. The parents were conſulted, and readily gave their ſanction to the propoſal; for they were convinced, that, unleſs ſome powerful ſteps were taken, this their only ſon muſt be numbered with thoſe of their children who had already fallen a ſacrifice to the diſeaſe.

"The mercurial courſe, therefore, was commenced, and urged on with caution and expedition. In 48 hours the breath began to be offenſive; the gums were reddiſh and ſwelled; and the ſymptoms of the diſeaſe, ſo far as could be diſtinguiſhed, were ſomewhat abated. In 48 hours more the ptyaliſm came on, and the diſeaſe was evidently declining. Between the 15th and 22d he took 20 grains of calomel, and one drachm of the ſtrongeſt mercurial ointment was likewiſe rubbed in well upon the legs and thighs. The doſe of calomel was one grain, mixed with a little ſugar, and repeated at ſuch intervals as the circumſtances of the caſe pointed out.

"After the 22d no more mercurials were adminiſtered; a moderate ptyaliſm continued for five or ſix days, then gradually ceaſed, and the diſeaſe was entirely removed. The bark was then given, as the beſt tonic remedy after the mercurial courſe, and as the beſt preſervative againſt a relapſe. The ſtrabiſmus, I obſerved, was the laſt ſymptom which diſappeared.

"From the 15th, no other medicines were uſed except mercurials. The three ſiſters of the above patient, who all died of this diſeaſe, were treated with bliſters; and to one of them they were applied in ſucceſſion to the head, behind the ears, and between the ſhoulders."

Case III. By Dr Percival.

"One of my own children, a girl, aged three years and three months, has lately been a ſevere ſufferer under this alarming malady. As ſoon as the characteriſtic ſymptoms of the diſeaſe clearly manifeſted themſelves, I laid aſide all other remedies, convinced, by repeated obſervation, of their inſufficiency; and truſted ſolely, though with much ſolicitude, to the internal and external uſe of mercury. In 48 hours, ſigns of amendment appeared, and her recovery was perfected in ſix days. During this ſpace of time, thirteen grains of calomel were adminiſtered, and ſeven ſcruples of *unguentum mercuriale fortius* carefully rubbed into her legs."

Case IV. By Mr John Mackie Surgeon in Huntington.

John Algood, aged 27, of a thin habit of body, accuſtomed for four or five years paſt to work in a tan yard in a very ſtooping poſture, was attacked in the beginning of May with an irregular intermitting fever, accompanied with much pain in his joints.

Comata

These complaints continued till about the middle of June, when he was feized with a violent and conftant pain in the back-part of his head, attended with great giddinefs, noife in his head and ears, dimnefs of fight, &c. and his fever became more continued. He lay in this ftate upwards of a month, without receiving any benefit from fome medicines which he took during this period.

Mr Mackie was called to him in the middle of July, and found him labouring under the following fymptoms: A fixed pain on the right fide and back part of his head, which was frequently fo acute as to make him quite outrageous, crying out, tearing his hair, beating himfelf on the head, &c. He had fuch a giddinefs, that, unlefs ftrongly held, he could not fupport himfelf a moment in an upright pofture. He could not bear the light; and, when he did venture to open his eyes, could not fee objects diftinctly. His pupils were uncommonly dilated; and his right eye feemed drawn outward, and rather contracted in its volume. He complained of a ftrange palpitating noife in his head and ears; and faid, he felt at times as if there was a weight of water falling from one fide of his head to the other. He was, in general, fenfible; but, on afking him two or three queftions together, he became confufed, and, like a perfon with an oppreffed brain, anfwered with hefitation, quite wide of the queftion, and often oppofite to what he meant. Along with thefe, he had a hot fkin, fmall quick pulfe, thirft, a foul tongue, urine in fmall quantity and high-coloured; he was emaciated, fick, coftive, and fweated much; had often a kind of ftupor, but very little fleep. Once in the 24 hours he had generally a remiffion (of three or four hours continuance) of the febrile fymptoms, but of none of the other complaints.

July 16th. Ordered three or four leeches to be applied to each temple immediately; an emetic to be taken in the evening, and a cooling purge to-morrow morning.

17th. In the evening found the leeches had taken away a good deal of blood, and the vomit and purge operated well. No change in the complaints, except that the ficknefs is a little abated. He fcreamed greatly on attempting to raife his head from the pillow.

Ordered his head to be fhaved, and a fharp blifter to be applied all over the occiput, large enough to cover the nape of the neck; alfo one on the infide of the leg. Internally,—R. *Nitri puri*, dr. fs. *Camphoræ*, gr. iv. M. f. *pulvis; quarta quaque hora fumendus durante febrili calore.* R. *Pulv. cort. Peruvian.* dr. i. *Pulv. rad. valerian. fylv.* dr. fs. M. f. *pulvis, exhibendus quamprimum remiffio appareat, & repetendus fi ultra horas tres pergat.* Thin milk-gruel and barley-water for drink.

July 19th. The blifters have difcharged much, and he has taken the medicines punctually; but the fever and other complaints remain as before. Pulfe very irregular; pain in the head and reftleffnefs extreme.

I left off the camphor; and in its ftead added to each nitrous powder, tartar emetic, gr. $\frac{1}{4}$ Dreffed the blifters with the *unguent. ad veficatoria.*

21ft. Two dofes of the bark and valerian were given during the two laft remiffions of the fever, which were full four hours each; but to-day there appears no kind of amendment. All the fymptoms continue much the fame. Shrieked out much, and talked incoherently. Has had no ftool fince he took his phyfic. Ordered a laxative glyfter to be thrown up directly, and the medicines to be continued as on the 19th.

Apoplexia.

23d. The glyfter procured two motions. Has fweated profufely through the laft 48 hours. Blifters have run freely. The two laft diurnal remiffions not quite fo diftinct. No abatement of the other complaints, The pain, giddinefs, ftupor, contortion of the eyes, &c. remain in as great a degree as ever.

Mr Mackie now left off all other medicines, and ordered ten grains of calomel, made into a bolus with conferve of rofes, to be taken at bed-time: at the fame time, a dram of the ftrong mercurial ointment was directed to be rubbed into the ankles; and both to be repeated every night.

25th. Found no alteration. Fever and other fymptoms the fame. Blifters heal, having been dreffed thefe two days with bafilicon. The calomel, and mercurial friction, ordered to be continued as on the 23d.

26th. Mr Mackie found him complaining much of being griped. Had two purging ftools in the laft 24 hours. His gums were a little tender, and his breath beginning to be tainted. In other refpects as ufual. Left off the calomel, and ordered a double quantity of the mercurial ointment to be rubbed into his thighs every night.

28th. He had had a calmer night than any for thefe two months paft. For the firft time, he faid the pain of his head was abated; he looked more compofed; his fkin felt cooler; his pulfe more full, and not fo quick. He complained of his mouth being fore, and his tongue fwelled; and had difcharged a good deal of faliva in the night. Only one dram of the ointment to be rubbed in, for the two next nights.

30th. He fpit about three quarts during the laft 48 hours, and complains of much heat in his mouth; but all his other complaints better. Pain in his head almoft gone, excepting now and then a fhoot. Giddinefs much abated. He faid he often felt a trickling kind of motion, as of water running along the infide of his temples; but this fenfation was without pain. He could fit up in bed, and feed himfelf; was fenfible, and in fpirits. Pulfe regular, and not above 70 in a minute. He has had a remiffion of upwards of fix hours to-day; ordered the ointment to be left off.

Aug. 1ft. Continues to fpit freely. Had yefterday a fmart return of the fever; which, however, only held him about 12 hours. To-day there is a perfect remiffion, and he is in every refpect much mended.—Has had fome hours good fleep. Complains very little of pain. Got out of bed for the firft time; fat up three hours; and could even bear the light without being difturbed by it. Complained of being hungry. Allowed plenty of milk-porridge and fmall broth.

3d. The fpitting keeps up to about a quart in the 24 hours. Found him out of bed to-day, and almoft without complaints. He faid his head was well; and that he only wanted ftrength, and to get rid of his fever and fore mouth. The remiffions were now almoft as long as the paroxyfms, being about 12 hours each. Has taken no medicine internally fince he left off the calomel, Comata calomel, and was costive. Ordered a dose of rhubarb; and after its operation a dram of the bark every four hours during the remissions.

6th The spitting begins to decline. He has had no fever for the last 24 hours. He sleeps well; and has an appetite, if the soreness of his mouth would let him eat. Headach and giddiness gone; but his pupils still continue much dilated. Ordered him another rhubarb-purge, and the bark to be continued every six hours.

9th. Has had no fever, or other complaints. Spitting inconsiderable; mouth better; aspect more natural; is able to walk about, and mends daily. Allowed him a more generous and substantial diet, and continued the bark twice a-day for another week.

From this time, he continued to get strength apace; had good nights, good appetite, a perfect freedom from headach and fever; and, on the 23d, went to work, being in every respect quite well, and has continued so ever since.

This patient did not seem to receive the smallest benefit from the blisters, or any thing else, till he took the mercury, which acted like a specific; and the fever seemed to be altogether symptomatic, as it easily yielded after the other complaints were removed.

Although it must be allowed, that the affection here described was in many respects an anomalous one, yet many of the circumstances render it in some degree probable that it depended on water in the head; and there are strong reasons for inferring that the mercury pushed so far as to excite salivation, was the means by which the cure was accomplished.

It is not wonderful that the publication of these cases should have led to the frequent employment of mercury in hydrocephalic affections. We are, however, sorry to add, that extensive employment of this remedy in such cases has by no means confirmed the favourable opinion which some were disposed to entertain of it. It has been found, that in many cases where mercury with hydrocephalic patients had been employed both internally and externally to a very great extent, no salivation was produced. Some, therefore, have even gone so far as to conclude, that salivation cannot be induced in this disease: and there is little reason to doubt, that, in the advanced periods of the disease, there occurs both an insensibility and diminished action of the absorbents, by which alone mercury can be introduced into the system; and likewise of the salivary organs, on which it must act before any obvious salivation can be induced. But, besides that mercury is often given in this disease even to a great extent without producing any obvious effect, we must also mention with regret, that in not a few cases of hydrocephalus, where mercury copiously exhibited at an early period produced salivation, the disease nevertheless has had a fatal termination; and it must be confessed, that an effectual remedy in this complaint still remains to be discovered.

At the same time, besides the cases already mentioned, mercury has also succeeded in several others which had every appearance of hydrocephalus; and as we are yet unacquainted with any remedy, not even excepting blisters, of which some are disposed to think very favourably, on which more dependence is to be put, the careful and regular employment of it should not be neglected in any instance of this affection, unless some circumstance occur strongly contraindicating its use. Apoplexia.

Sp. IV. Apoplexy *from Atrabilis.* 259

Apoplexia atrabiliaris, *Sauv.* sp. 12. *Preysinger.* sp. 6.

This takes place in the last stage of the diffusion of bile through the system, i. e. of the black jaundice, and in some cases the brain hath been found quite tinged brown. It cannot be thought to admit of any cure.

Sp. V. Apoplexy from *External Violence.* 260

Apoplexia traumatica, *Sauv.* sp. 2.
Carus traumaticus, *Sauv.* sp. 5.

The treatment of this disease, as it arises from some external injury, properly falls under the article Surgery.

The poisons which bring on an apoplexy when taken internally may be either of the stimulant or sedative kind, as spirituous liquors, opium, and the more virulent kinds of vegetable poisons. The vapours of mercury, or of lead, in great quantity, will sometimes produce a similar effect; though commonly they produce rather a paralysis, and operate slowly. The vapours of charcoal, or fixed air, in any form, breathed in great quantity, also produce an apoplexy, or a state very similar to it; and even cold itself produces a fatal sleep, though without the apoplectic snorting.—To enumerate all the different symptoms which affect the unhappy persons who have swallowed opium, or any of the stronger vegetable poisons, is impossible, as they are scarce to be found the same in any two patients. The state induced by them seems to differ somewhat from that of a true apoplexy; as it is commonly attended with convulsions, but has the particular distinguishing sign of apoplexy, namely, a very difficult breathing or snorting, more or less violent according to the quantity of poisonous matter swallowed.

Of the poisonous effects of fixed air, Dr Percival gives the following account. "All these noxious vapours, whether arising from burning charcoal, the fermenting grape, the Grotti di Cani, or the cavern of Pyrmont, operate nearly in the same manner. When accumulated and confined, their effects are often instantaneous:

Comata ſtantaneous: they immediately deſtroy the action of the brain and nerves, and in a moment arreſt the vital motions. When more diffuſed, their effects are ſlower, but ſtill evidently mark out a direct affection of the nervous ſyſtem.

"Thoſe who are expoſed to the vapours of the fermenting grape, are as inſtantly deſtroyed as they would be by the ſtrongeſt electrical ſhock. A ſtate of inſenſibility is the immediate effect upon thoſe animals which are thruſt into the Grotti di Cani, or the cavern of Pyrmont: the animal is deprived of motion, lies as if dead; and if not quickly returned into the freſh air, is irrecoverable. And if we attend to the hiſtories of thoſe who have ſuffered from the vapours of burning charcoal, we ſhall in like manner find, that the brain and moving powers are the parts primarily affected.

"A cook who had been accuſtomed to make uſe of lighted charcoal more than his buſineſs required, and to ſtand with his head over theſe fires, complained for a year of very acute pain in the head; and after this, was ſeized with a paralytic affection of the lower limbs, and a ſlow fever.

"A perſon was left reading in bed with a pan of charcoal in a corner of the room. On being viſited early the next morning, he was found with his eyes ſhut, his book open and laid on one ſide, his candle extinguiſhed, and to appearance like one in a deep ſleep. Stimulants and cupping-glaſſes gave no relief; but he was ſoon recovered by the free acceſs of freſh air.

"Four priſoners, in order to make their eſcape, attempted to deſtroy the iron work of their windows, by the means of burning charcoal. As ſoon as they commenced their operations, the fumes of the charcoal being confined by the cloſeneſs of the priſon, one of them was ſtruck dead; another was found pale, ſpeechleſs, and without motion; afterwards he ſpoke incoherently, was ſeized with a fever, and died. The other two were with great difficulty recovered.

"Two boys went to warm themſelves in a ſtove heated with charcoal. In the morning they were found deſtitute of ſenſe and motion, with countenances as compoſed as in a placid ſleep. There were ſome remains of pulſe; but they died in a ſhort time.

"A fiſherman depoſited a large quantity of charcoal in a deep cellar. Some time afterwards, his ſon, a healthy ſtrong man, went down into the cellar with a pan of burning charcoal and a light in his hand He had ſcarcely deſcended to the bottom, when his candle went out. He returned, lighted his candle, and again deſcended. Soon after, he called aloud for aſſiſtance. His mother, brother, and a ſervant, haſted to give him relief; but none of them returned. Two others of the village ſhared the ſame fate. It was then determined to throw large quantities of water into the cellar; and after two or three days, they had acceſs to the dead bodies.

"Cœlius Aurelianus ſays, that thoſe who are injured by the fumes of charcoal become cataleptic. And Hoffman enumerates a train of ſymptoms which in no reſpect correſpond with his idea of ſuffocation. Thoſe who ſuffer from the fumes of burning charcoal, ſays he, have ſevere pains in the head, great debility, faintneſs, ſtupor, and lethargy.

"It appears from the above hiſtories and obſervations, that theſe vapours exert their noxious effects on the brain and nerves. Sometimes they occaſion ſudden death; at other times, the various ſymptoms of a debilitated nervous ſyſtem, according as the poiſon is more or leſs concentrated. The olfactory nerves are firſt and principally affected, and the brain and nervous ſyſtem by ſympathy or conſent of parts. It is well known, that there is a ſtrong and ready conſent between the olfactory nerves and many other parts of the nervous ſyſtem. The effluvia of flowers and perfumes, in delicate or irritable habits, produce a train of ſymptoms, which, though tranſient, are analogous to thoſe which are produced by the vapours of charcoal; viz. vertigo, ſickneſs, faintneſs, and ſometimes a total inſenſibility. The female malefactor, whom Dr Mead inoculated by putting into the noſtrils doſſils of cotton impregnated with variolous matter, was, immediately on the introduction, afflicted with a moſt excruciating headach, and had a conſtant fever till after the eruption.

Apoplexia.

"The vapours of burning charcoal, and other poiſonous effluvia, frequently produce their prejudicial, and even fatal effects, without being either offenſive to the ſmell or oppreſſive to the lungs. It is a matter of importance, therefore, that the common opinion ſhould be more agreeable to truth; for where ſuffocation is ſuppoſed to be the effect, there will be little apprehenſion of danger, ſo long as the breaſt keeps free from pain or oppreſſion.

"It may be well to remember, that the poiſon itſelf is diſtinct from that groſs matter which is offenſive to the ſmell; and that this is frequently in its moſt active ſtate when undiſtinguiſhed by the ſenſe. Were the following cautions generally attended to, they might in ſome inſtances be the happy means of preſerving life. Never to be confined with burning charcoal in a ſmall room, or where there is not a free draught of air by a chimney or ſome other way. Never to venture into any place in which air has been long pent up, or which from other circumſtances ought to be ſuſpected; unleſs ſuch ſuſpected place be either previouſly well ventilated, or put to the teſt of the lighted candle. For it is a ſingular and well-known fact, that the life of flame is in ſome circumſtances ſooner affected and more expeditiouſly extinguiſhed by noxious vapours than animal-life. A proof of which I remember to have received from a very intelligent clergyman, who was preſent at a muſical entertainment in the theatre at Oxford. The theatre was crowded; and during the entertainment, the candles were obſerved to burn dim, and ſome of them went out. The audience complained only of faintneſs and langour; but had the animal effluvia been ſtill further accumulated or longer confined, they would have been extinguiſhed as well as the candles.

"The moſt obvious, effectual, and expeditious means of relief to thoſe who have unhappily ſuffered from this cauſe, are ſuch as will diſlodge and waſh away the poiſon, reſtore the energy of the brain and nerves, and renew the vital motions. Let the patient therefore be immediately carried into the open air, and let the air be fanned backwards and forwards to aſſiſt its action: let cold water be thrown on the face; let the face, mouth, and noſtrils, be repeatedly waſhed; and as ſoon

Comata as practicable, get the patient to drink some cold water. But if the case be too far gone to be thus relieved, let a healthy person breathe into the mouth of the patient; and gently force air into the mouth, throat, and nostrils. Frictions, cupping, bleeding, and blisters, are likewise indicated. And if, after the instant danger is removed, a fever be excited, the method of cure must be adapted to the nature and prevailing symptoms of the fever."

With regard to the poison of opium, Dr Mead recommends the following method of cure. Besides evacuations by vomiting, bleeding, and blistering, acid medicines and lixivial salts are proper. These contract the relaxed fibres, and by their diuretic force make a depletion of the vessels. Dr Mead says he hath given repeated doses of a mixture of salt of wormwood and juice of lemons, with extraordinary success. But nothing perhaps is of greater consequence, than to use proper means for the prevention of sleep, by rousing and stirring the patient, and by forcing him to walk about; for if he be once permitted to fall into a sound sleep, it will be found altogether impossible to awake him.

Of a kind somewhat akin to the poison of opium seems to be that of laurel-water, a simple water distilled from the leaves of the lauro-cerasus or common laurel. The bad effects of this were first observed in Ireland, where it had been customary to mix it with brandy for the sake of the flavour; and thus two women were suddenly killed by it. This gave occasion to some experiments upon dogs, in order to ascertain the malignant qualities of the water in question; and the event was as follows: All the dogs fell immediately into totterings and convulsions of the limbs, which were soon followed by a total paralysis, so that no motion could be excited even by pricking or cutting them. No inflammation was found upon dissection, in any of the internal membranes. The most remarkable thing was a great fulness and distension of the veins, in which the blood was so fluid, that even the lymph in its vessels was generally found tinged with red. The same effects were produced by the water injected into the intestines by way of clyster.

To make the experiment more fully, Dr Nicholls prepared some of this water so strong, that about a drachm of heavy essential oil remained at the bottom of three pints of it, which by frequent shaking was again quite incorporated with it. So virulent was this water, that two ounces of it killed a middle-sized dog in less than half a minute, even while it was passing down his throat. The poison appeared to reside entirely in the above-mentioned essential oil, which comes over by distillation, not only from the leaves of laurel, but from some other vegetables; for ten drops of a red oil distilled from bitter almonds, when mixed with half an ounce of water, and given to a dog, killed him in less than half an hour.

Volatile alkalies are found to be an antidote to this poison; of which Dr Mead gives the following instance. About an ounce of strong laurel-water was given to a small dog. He fell immediately into the most violent convulsions, which were soon followed by a total loss of his limbs. When he seemed to be expiring, a vial of good spirit of sal ammoniac was held to his nose, and a small quantity of the same forced down his throat: he instantly felt its virtue; Apoplexia. and by continuing the use of it for some time, he by degrees recovered the motion of his legs; and in two hours walked about with tolerable strength, and was afterwards quite well.

With regard to the pernicious effects of cold, there is no other way of counteracting them but by the application of external heat. We are apt to imagine, that the swallowing considerable quantities of ardent spirits may be a means of making us resist the cold, and preventing the bad effects of it from arising to such an height as to destroy life; but these do not appear to be in the least possessed of any such virtue in those countries liable to great excesses of cold. The Peruvian bark, by strengthening the solids, as well as increasing the motion of the fluids, is found to answer better than any other thing as a preservative: but when the pernicious effects have already begun to discover themselves, nothing but increasing by some means or other the heat of the body can possibly be depended upon: and even this must be attempted with great care; for as, in such cases, there is generally a tendency to mortification in some of the extremities, the sudden application of heat will certainly increase this tendency to such a degree as to destroy the parts. But for the external treatment of such mortifications, see the article SURGERY.

Sp. VII. APOPLEXY from *Passions* of the *Mind*. 262

Carus a pathemate, *Sauv.* sp. 11.
Asphyxia a pathemate, *Sauv.* sp. 7.
Ecstasis catoche, *Sauv.* sp. 1.
Ecstasis resoluta, *Sauv.* sp. 2.

APOPLEXIES from violent passions may be either sanguineous or serous, though more commonly of the former than the latter species. The treatment is the same in either case. Or they may partake of the nature of catalepsy; in which case the method of treatment is the same with that of the genuine catalepsy.

Sp. VIII. The *Cataleptic* APOPLEXY. 263

Catalepsis, *Sauv.* gen. 176. *Lin.* 129. *Vog.* 230. *Sag.* gen. 281. *Boerh.* 1036. *Junck.* 44.

Dr CULLEN says he has never seen the catalepsy except when counterfeited; and is of opinion that many of those cases related by other authors have also been counterfeited. It is said to come on suddenly, being only preceded by some langour of body and mind; and to return by paroxysms The patients are said to be for some minutes, sometimes (though rarely) for some hours, deprived of their senses, and all power of voluntary motions; but constantly retaining the position in which they were first seized, whether lying or sitting; and if the limbs be put into any other posture during the fit, they will keep the posture in which they are placed. When they recover from the paroxysm, they remember nothing of what passed during the time of it, but are like persons awaked out of sleep. —Concerning the cure of this disorder we find nothing that can be depended upon among medical writers.

Sp. IX. APOPLEXY from *Suffocation*. 264

Deſcription. The palſy under all the different forms here mentioned as particular ſpecies, ſhows itſelf by a ſudden loſs of tone and vital power in a certain part of the body. In the ſlighter degrees of the diſeaſe, it only affects a particular muſcle, as the ſphincter of the anus or bladder, thus occaſioning an involuntary diſcharge of excrements or of urine; of the muſcles of the tongue, which occaſions ſtammering, or loſs of ſpeech; of the muſcles of the larynx, by which the patient becomes unable to ſwallow ſolids, and ſometimes even liquids alſo.—In the higher degrees of the diſeaſe, the paralytic affection is diffuſed over a whole limb, as the foot, leg, hand, or arm; and ſometimes it affects a whole ſide of the body, in which caſe it is called *hemiplegia*; and ſometimes, which is the moſt violent caſe, it affects all the parts below the waſte, or even below the head, though this laſt be exceedingly rare. In theſe violent caſes, the ſpeech is either very much impeded, or totally loſt. Convulſions often take place in the ſound ſide, with the cynic ſpaſm or involuntary laughter, and other diſtortions of the face. Sometimes the whole paralytic part of the body becomes livid, or even mortifies before the patient's death; and ſometimes the paralytic parts gradually decay and ſhrivel up, ſo as to become much leſs than before. Whether the diſeaſe be more or leſs extended, many different varieties may be obſerved in its form. Sometimes there occurs a total loſs of ſenſe while motion is entire; in others a total loſs of motion with very ſlight or even no affection of ſenſe; and in ſome caſes, while a total loſs of motion takes place in one ſide, a total loſs of ſenſe has been obſerved on the other. This depends entirely on the particular nerves or branches of nerves in which the affection is ſituated; loſs of ſenſe depending on an affection of the ſubcutaneous nerves; and loſs of motion on an affection of theſe leading to the muſcles.

Cauſes, &c. Palſies moſt commonly ſupervene upon the different ſpecies of coma, eſpecially the apoplexy. They are alſo occaſioned by any debilitating power applied to the body, eſpecially by exceſſes in venery. Sometimes they are a kind of criſis to other diſtempers; as the colic of Poictou, and the apoplexy. The hemiplegia eſpecially often follows the laſt mentioned diſeaſe. Aged people, and thoſe who are by any other means debilitated, are ſubject to palſy; which will ſometimes alſo affect even infants, from the repulſion of exanthemata of various kinds. Palſies are alſo the infallible conſequences of injuries of the large nerves.

Prognoſis. Except in the ſlighter caſes of palſy, we have little room to hope for a cure; however, death does not immediately follow even the moſt ſevere paralytic affections. In an hemiplegia it is not uncommon to ſee the patients live ſeveral years; and even in the paraplegia, if death do not enſue within two or three weeks, it may not take place for a conſiderable time. It is a promiſing ſign when the patient feels a ſlight degree of painful itchineſs in the affected parts; and if a fever ſhould ariſe, it bids fair to cure the palſy. When the ſenſe of feeling remains, there is much more room to hope for a cure than where it is gone, as well as the power of motion. But when we obſerve the fleſh to waſte, and the ſkin to appear withered and dry, we may look upon the diſeaſe to be incurable. Convulſions ſupervening on a palſy are a fatal ſign.

Cure. Many remedies have been recommended in palſies; but it muſt be confeſſed, that, except in the ſlighter caſes, medicines ſeldom prove effectual; and before any ſcheme of cure can be laid down, every circumſtance relative to the patient's habit of body and previous ſtate of health ſhould be carefully weighed. If an hemiplegia or paraplegia ſhould come on after an apoplexy, attended with thoſe circumſtances which phyſicians have ſuppoſed to denote a viſcid ſtate of the blood, a courſe of the attenuant gums, with fixed alkaline ſalts, and chalybeate waters, may do ſervice; to which it will be proper to add frictions with the volatile liniment all down the ſpine: but in habits where the blood is rather inclined to the watery ſtate, it will be neceſſary to give emetics from time to time; to apply bliſters, and cut iſſues.

The natural hot baths are often found uſeful in paralytic caſes; and where the patients cannot avail themſelves of theſe, an artificial bath may be tried by diſſolving

Comata diſſolving ſalt of ſteel in water, and impregnating the water with fixed air. Frictions of the parts, and ſcourging them with nettles, have alſo been recommended, and may do ſervice, as well as volatile and ſtimulating medicines taken inwardly. And it is probably by operating in this manner, that the uſe of camphor, or a mercurial courſe continued for ſome length of time to ſuch a degree as gently to affect the mouth, have been found productive of a cure in obſtinate caſes of this affection. Of late years, an infuſion of the arnica montana or German leopard's bane, has been highly extolled in the cure of this diſeaſe by ſome foreign writers: but the trials made with it in Britain, particularly at Edinburgh, have been by no means equally ſucceſsful with thoſe related by Dr Collins, who has ſtrongly recommended this medicine to the attention of the public.

269 Sp. IV. The Palsy from *Poiſons*.

Paralyſis metallariorum, *Sauv.* ſp. 22.
Hemiplegia ſaturnina, *Sauv.* ſp. 14.

This kind of palſy ariſes moſt frequently from lead taken into the body, and is a conſequence of the colica pictonum, under which it is more particularly treated.

270 TREMOR, or Trembling.

Tremor, *Sauv.* gen. 129. *Lin.* 139. *Vog.* 184. *Sag.* 236.

This by Dr Cullen is reckoned to be always ſymptomatic either of palſy, aſthenia, or convulſions; and therefore need not be treated of by itſelf.

Aſphyxia traumatica, *Sauv.* ſp. 14.
Aſphyxia neophytorum, *Sauv.* ſp. 17.

Deſcription. A ſyncope begins with a remarkable anxiety about the heart; after which follows a ſudden extinction, as it were, not only of the animal powers and actions, but alſo of the vital powers, ſo that the patients are deprived of pulſe, ſenſe, and motion, all at once. In thoſe caſes which phyſicians have diſtinguiſhed by the name of *leipothymia*, the patient does not entirely loſe his ſenſes, but turns cold and pale; and the pulſe continues to beat, though weakly; the heart alſo ſeems to tremble rather than beat; and the reſpiration is juſt perceptible But in the true ſyncope or full aſphyxia, not the ſmalleſt ſign of life can be perceived; the face hath a death-like paleneſs, the extremities are cold, the eyes ſhut, or at leaſt troubled; the mouth ſometimes ſhut, and ſometimes gaping wide open; the limbs flaccid, and the ſtrength quite gone; as ſoon as they begin to recover, they fetch deep and heavy ſighs.

Cauſes, &c. Fainting is occaſioned moſt commonly by profuſe evacuations, eſpecially of blood; but it may happen alſo from violent paſſions of the mind, from ſurfeits, exceſſive pain, &c. People of delicate conſtitutions are very ſubject to it from ſlight cauſes; and ſometimes it will ariſe from affections of the heart and large veſſels not eaſy to be underſtood. Fainting is alſo a ſymptom of many diſorders, eſpecially of that fatal one called a *polypus of the heart*, of the plague, and many putrid diſeaſes.

Prognoſis. When fainting happens in the beginning of any acute diſtemper, it is by no means a good omen; but when it takes place in the increaſe or at the height of the diſeaſe, the danger is ſomewhat leſs; but in general, when fainting comes on without any evident cauſe, it is to be dreaded. In violent hæmorrhagies it is favourable; as the bleeding veſſels thus have time to contract and recover themſelves, and thus the patient may eſcape.

Cure. When perſons of a full habit faint through exceſs of paſſion, they ought to be blooded without delay, and ſhould drink vinegar or lemon-juice diluted with water; and, after the bowels are emptied by a clyſter, take a paregoric draught, and go to bed.

The paſſion of anger, in a peculiar manner, affects the biliary ſecretion, cauſes an oppreſſion at the ſtomach, with nauſea and retching to vomit, and a bitter taſte in the mouth, with giddineſs: theſe ſymptoms ſeem to indicate an emetic; which, however, in theſe caſes muſt be carefully avoided, as it might endanger the patient, by bringing on an inflammation of the ſtomach.

The general effects of a ſudden fright have been mentioned on a former occaſion. When theſe are ſo violent as to require medical aid, our firſt endeavours

Adynamiæ must be to take off the spasmodic constriction, and restore freedom to the circulation; by bleeding, if the habit be at all inclined to fulness; and by giving a mixture, with equal parts of the vinum antimoniale and tinctura opii camphorata, in some agreeable vehicle, which will bring on sleep and encourage perspiration. It was formerly mentioned, that convulsions, or even an epilepsy, may be brought on by frights; which should make people cautious of playing foolish tricks in this way.

When a surfeit, or any species of saburra, occasions a leipothymia, an emetic is the immediate remedy, as soon as the patient, by the help of acrid stimulants, shall be so far roused as to be able to swallow one: in these cases, tickling the fauces with a feather dipt in spirit of hartshorn, will be proper, not only to rouse the patient, but also to bring on vomiting.

A syncope is most commonly brought on by profuse discharges or evacuations, either of the blood or of the secreted humours.

In order to revive the patients, they ought to be laid along in a horizontal posture, in an airy place; the legs, thighs, and arms, are to be rubbed with hot flannels; very strong vinegar, or salt of hartshorn, or volatile alkaline spirit, are to be held to the nostrils, and rubbed into them; or, being properly diluted, poured down the throat; cold water is to be sprinkled on the face and neck; and when by these means the patient shall be sufficiently revived, wine boiled up with some grateful aromatic, is to be given in the proper quantity.

In the fainting consequent upon profuse uterine hæmorrhagies, it will be a safer practice to abstain from all heating and stimulant things; as life, in these cases, is preserved by the coagulation of the blood in the extremities of the open vessels; which might be prevented by the pouring in hot wine or volatile alkaline spirits.

When a syncope is the consequence of the too violent operation of either an emetic or cathartic, the tinctura thebaica, mixed with spiced wine, is the most efficacious remedy; but the opiate must be given gradually, and in very small doses.

A syncope, or even asphyxia, wherein the patient shall lie for several hours, is frequent in hysteric constitutions; and during the fit requires fetid antispasmodics, together with acrid stimulants: to prevent returns, nothing answers better than the Peruvian bark joined with chalybeates.

275. GENUS XLV. DYSPEPSIA.
Depraved DIGESTION.

Dyspepsia, *Vog.* 277.

Gastrodynia astringens, *Sauv.* sp. 9.
Gastrodynia atterens, *Sauv.* sp. 10.
Gastrodynia a frigore, *Sauv.* sp. 18.

Besides these there are a great number of symptomatic species.

Description. It is by no means easy to define exactly the distemper called *dyspepsia*, when considered as an original disease, as there are very few maladies which some way or other do not show themselves by an affection of the stomach; and much more difficult still must it be to enumerate all its symptoms. The most remarkable, however, and the most common, are the following: Want of appetite; distention of the stomach when no food has been taken for some time before; slight dejection of spirits: a gradual decay of the muscular strength; languor, and aversion from motion; the food which is taken without appetite is not well digested; the stomach and intestines are much distended with flatus, whence the patients are tormented with spasms, gripes, and sickness: frequently a limpid water, having an acid or putrid taste, is brought up; sometimes the food itself is thrown up by mouthfuls; and sometimes, though rarely, the same is swallowed again, after the manner of ruminating animals. While matters are in this situation, the heart sometimes palpitates, and the breath is quick, and drawn with difficulty; the head achs and is giddy; and sometimes both these symptoms are continual, and very violent, insomuch that the patient is not only tormented with pain, but staggers as if he was drunk. From the too great acescency or putrefaction of the aliment, a cardialgia or heartburn comes on; and in this situation a spontaneous diarrhœa sometimes carries off the disease; but in other cases there is an obstinate costiveness, attended with colic-pains. Frequently the pulse is quick, sometimes slow, but always weak: the circulation is so languid, that the blood can scarce reach the extreme vessels, or at least stagnates.

Adynamiæ stagnates in them, so that the face becomes livid, swelled, and has an unusual appearance: and at the same time that the circulation and nervous power are in this languid state, the perspiration becomes less copious; the skin becomes dry and corrugated; the natural heat, especially of the extremities, is much diminished; the tongue is white; and an universal laxity takes place, insomuch that the uvula and velum pendulum palati are sometimes enlarged to such a degree as to become extremely troublesome. The patient is either deprived of rest, or wakes suddenly out of his sleep, and is disturbed by frightful dreams; at the same time that the mind seems to be affected as well as the body, and he becomes peevish, fretful, and incapable of paying attention to any thing as usual. At last hectic symptoms come on, and the whole frame becomes so irritable, that the slightest cause excites an universal tremor, and sometimes violent vomiting and diarrhœa. Sometimes the salivary glands are so relaxed, that a salivation comes on as if excited by mercury; the serum is poured out into the cavity of the abdomen and cellular substance of the whole body, and the patient becomes affected with anasarca or ascites.

Causes, &c. The causes of dyspepsia may be any thing which debilitates the system in general, but in a particular manner affects the stomach. Such are opium taken in immoderate quantities, which hurts by its sedative and relaxing powers; spirituous liquors drunk to excess; tobacco, tea, coffee, or any warm relaxing liquor, taken in too great quantity; acid, unripe fruits; vomits or purges too frequently taken; an indolent sedentary life, &c. &c. All these act chiefly upon people of a weak and delicate habit; for the robust and hardy seldom labour under a dyspepsia, or at most a very slight one.

Prognosis. When a dyspepsia first occurs, it is frequently removed without great difficulty; when it is symptomatic, we must endeavour to cure the primary disease; and without this we cannot expect a complete removal of the affection: but when it frequently returns with symptoms of great debility, hectic fever, or dropsy, we have great reason to dread the event.

Cure. A radical cure of dyspepsia is only to be expected by removing from the stomach and system that debility on which the disease depends. On this ground, the objects chiefly to be aimed at in the cure are, 1st, The avoiding whatever will tend to diminish the vigour of the stomach; 2d, The employing such remedies as have influence in encreasing that vigour; and, in the third place, The obviating urgent symptoms, particularly those which tend to increase and support the affection. Of the avoiding causes, which tend to diminish the vigour of the stomach, after what has already been said of the causes inducing the disease, it is unnecessary to make any farther observations; and indeed every dyspeptic patient will be taught by experience what is to be done with this intention The medicines chiefly employed with the view of increasing vigour are those of the tonic kind: but, previous to their use, it will be necessary to evacuate the contents of the alimentary canal by vomits or purgatives. If there be a tendency to putrescency, antiseptics must then be exhibited; but more frequently there is a prevailing acidity, which creates an intolerable heart-burn. To palliate this symptom, magnesia alba may be given; which is much preferable to the common testaceous powders, as being purgative while dissolved in an acid, when the others are rather astringent. In the third volume of the Medical Observations, we have an account of two cases of dyspepsia attended with a very uncommon degree of cardialgia, in which magnesia was so successful, that we can scarce doubt of its efficacy in slighter degrees of the disorder. They were communicated by Dr Watson. Dyspepsia.

"A woman, aged 34, the mother of several children, was taken, in the fourth month of her pregnancy, with violent vomitings; which growing daily worse, notwithstanding the endeavours of her apothecary to restrain them, brought on at the end of a month such severe pains in the stomach, and spasms in her abdomen, as to occasion abortion. The vomitings were not lessened by this event, but grew worse, and frequently brought on general convulsions to such a degree, that she was many times supposed to be at the point of death.

"Scarce any medicine staid with her; she brought up almost instantly whatever was given her as nourishment, either in a solid or liquid form. She was exceedingly pale, and very much emaciated; her flesh was cold to the touch; and, though her urine was little in quantity, it was perfectly limpid. She had a continual thirst, and was, in a considerable degree, costive. Her pulse was low and quick, and she was frequently tormented with the hiccough. The pain in her stomach was severe and constant; and whatever she brought up was sharp to such a degree as to make her mouth and throat very sore. These parts upon examination appeared high-coloured, and in many places excoriated; and the pain she felt in her stomach upon swallowing any liquor that had the least degree of acrimony, or was more than luke-warm, made it probable the stomach itself, in its internal surface, was affected in the same manner.

"In this wretched state I was consulted; and must confess that I was much at a loss how to relieve a patient so debilitated, and whose stomach was in so diseased a state, that it seemed incapable of retaining any appropriated remedies long enough to correct the acrimony of the juices, and restore the secretions to a more mild and natural state. Anti-emetics of various kinds had been tried without effect, particularly saturated solutions of alkaline salt in juice of lemons. Stomachic medicines of the warm and aromatic kind she could not bear, on account of their poignancy; and, though nothing could so speedily correct the almost caustic acid of the gastric juice as solutions of alkaline salts, neither the fauces nor gullet could bear their acrimony.

"My expectations of relieving this patient, small as they were, depended upon my being able to neutralize, and thereby lessen, the stimulus of the acid of the stomach. To accomplish this was not very easy, as no medicine in small doses could in any considerable degree correct so intense an acid; and, in the present situation, it was difficult to get any medicine to stay long enough to exert its effects. To discharge however what acrid matter might be already accumulated in

Adynamiæ

in the ſtomach, I directed that the patient ſhould drink plentifully of ſmall, warm, unſalted mutton-broth, and vomit with it ſo long that it ſhould be diſcharged with no other taſte than that of broth. This was complied with, and a large quantity drank. The pain in her ſtomach ceaſed upon this for more than two hours, and was after that time apparently coming on with the ſame violence as before. Upon which I ordered a drachm of magneſia to be given in two ounces of veal-broth. This kept down, and eaſed her; I therefore directed the ſame doſe to be repeated as often as the pain returned, without any regard to the quantity that the whole might amount to, ſuppoſing that the pain continued ſevere. This was done; and in three days ſhe took three ounces of magneſia, of which very few doſes were vomited up, and ſhe was purged conſiderably.

"This medicine was continued in a ſomewhat leſs quantity for three days longer, in which ſhe took two ounces more of magneſia; by this time the vomitings ceaſed, the convulſions left her, ſhe had no pains in the ſtomach, and her mouth and fauces loſt their intenſely red colour and ſoreneſs; nor did even her eructations longer indicate any acidity.

"Beſides veal-broth ſhe was allowed boiled rice, and now and then ſome rice gruel with a ſmall quantity of brandy; and after a few days more ſhe could retain boiled chicken, and other light, ſolid, animal food.

"When her ſtomach was in this ſtate, ſhe took liberally of *decoct. cort. Peruvian.* with a ſmall portion of French brandy; by which and her nouriſhment ſhe recovered her ſtrength ſurpriſingly. To this medicine, as ſhe was during the latter part of her illneſs conſiderably anaſarcous, were added ſome preparations of ſteel; and in about a month ſhe perfectly recovered.

"When this patient's ſtomach was relieved, the thirſt, the general and partial ſpaſms, and other complaints, which were merely ſymptomatic, ſoon ceaſed; and what remained of her cure was by no means difficult.

"Since the above-recited caſe, I was conſulted in another almoſt in every reſpect ſimilar, except that the former began in pregnancy. The vomitings attended with acidity had continued more than a month; the patient's ſtomach rejected every kind of food and medicine; ſhe was debilitated to a great degree, and univerſally anaſarcous.

"Upon being ſent for, I directed for her magneſia, much in the ſame manner as for the former patient; and in a very few days her vomitings ceaſed, her ſtomach became ſtronger, and in leſs than a fortnight the anaſarca diſappeared. But it was a conſiderable time, as this perſon was more advanced in years than the former, before ſhe recovered her ſtrength, notwithſtanding my beſt endeavours for that purpoſe. She at length, however, perfectly recovered."

But although acidity may often be ſucceſsfully obviated in this manner, yet the beſt way of counteracting this ſymptom, as well as of obviating coſtiveneſs, flatulence, and a variety of others, is by reſtoring the tone of the ſtomach in particular, and indeed of the ſyſtem in general. With this intention, recourſe is had to a variety of tonics both from the mineral and vegetable kingdom; particularly chalybeates in different forms, gentian, colombo, and the like; but of all the tonics which can be employed in this affection, none are attended with greater benefit than exerciſe and cold bathing; and the proper and prudent employment of theſe is no leſs effectual in removing the diſeaſe, than in preventing the return of it after it is once removed.

Dyſpepſia.

Genus XLVI. HYPOCHONDRIASIS. 276
Hypochondriac Affection.

Hypochondriaſis, *Sauv.* gen. 220. *Lin.* 76. *Vog.* 218. *Sag.* 332.
Morbus hypochondriacus, *Boerh.* 1098.
Malum hypochondriacum, *Hoffm.* III. 65. *Junck* 36.

Although ſome of the noſological writers, particularly Sauvages, have conſidered this genus as conſiſting of different ſpecies, Dr Cullen is of opinion, that there is only one idiopathic ſpecies, the *hypochondriaſis melancholica.* He conſiders not only the hypochondriaſis hyſterica, phthiſica, and aſthmatica, but alſo the bilioſa, ſanguinea, and pituitoſa, as being only ſymptomatic; but he views the true melancholic hypochondriaſis as being a proper idiopathic diſeaſe, perfectly diſtinct from hyſteria, with which it has often been confounded.

Deſcription. The ſymptoms of hypochondriaſis are, ſtretching, preſſing, griping, and tormenting pains, under the ribs, and chiefly in the left ſide; which ſometimes are exaſperated, and become pungent, burning, or lancinating. Frequently there is an inflation of the left hypochondriacum, which ſometimes becomes ſtationary, and by Hippocrates was taken for a ſymptom of an enlarged ſpleen. When theſe ſymptoms take place in the right hypochondrium, they are commonly attended with colic-pains, uncertain flying heats, eſpecially in the head, with a tranſient redneſs of the face, and very frequently an œdematous ſwelling of the feet ſucceeds. To theſe are ſuperadded almoſt all the affections of the ſtomach occurring in dyſpepſia, beſides a variety of other ſymptoms, ſuch as palpitations, ſleepleſs nights, and the like. But beſides theſe, there occurs alſo a particular depreſſion of ſpirit and apprehenſion of danger, which may be conſidered as one of the great characteriſing ſymptoms of the diſeaſe.

Cauſes, &c. The general cauſes of the hypochondriac affection are ſaid to be a plethora, and preternatural thickneſs of the blood; ſuppreſſions of cuſtomary evacuations; high and full diet, together with a ſparing quantity of drink; an hereditary diſpoſition; indolence; atony of the inteſtines; violent paſſions of the mind, &c.

Prognoſis. The hypochondriac affection, when left to itſelf, is more troubleſome than dangerous; but, if improperly treated, it may bring on various diſeaſes of a more fatal tendency, ſuch as the melancholy, bloody urine and nephritis, jaundice, vertigo, palſy, apoplexy, &c.

Cure. This is to be attempted by ſuch medicines as counteract occaſional cauſes, and obviate urgent ſymptoms, Dynamiæ symptoms, which may be all comprehended under bleeding, gentle evacuants, chalybeates, the Peruvian bark, and exercise, especially riding on horseback, which in this disease is greatly preferable to any other. When the circumstances of the patient can afford it, a voyage to Spain, Portugal, or some of the warmer countries in Europe, will be of great service.

277 GENUS XLVII. CHLOROSIS.
GREEN SICKNESS.

Chlorosis, *Sauv.* gen. 309. *Lin.* 222. *Vog.* 305. *Sag.* gen. 135. *Boerh.* 1285. *Hoffm.* iii. 311. *Junck.* 86.

Of this genus also Dr Cullen thinks there is but one idiopathic species: viz. what some distinguish by the title of *chlorosis virginea*, others of *chlorosis amatoria*.

Description. This disease usually attacks girls a little after the time of puberty, and first shows itself by symptoms of dyspepsia. But a distinguishing symptom is, that the appetite is entirely vitiated, and the patient will eat lime, chalk, ashes, salt, &c. very greedily; while at the same time there is not only a total inappetence to proper food, but it will even excite nausea and vomiting. In the beginning of the disease, the urine is pale, and afterwards turbid; the face becomes pale, and then assumes a greenish colour; sometimes it becomes livid or yellow: the eyes are sunk, and have a livid circle round them; the lips lose their fine red colour; the pulse is quick, weak, and low, though the heat is little short of a fever, but the veins are scarcely filled; the feet are frequently cold, swell at night, and the whole body seems covered with a soft swelling; the breathing is difficult: nor is the mind free from affection as well as the body; it becomes irritated by the slightest causes; and sometimes the patients love solitude, become sad and thoughtful. There is a retention of the menses throughout the whole course of the disorder; and at last all the bad symptoms increasing, a leucophlegmasia, anasarca, atrophy, and death, succeed.

Causes. The cause of chlorosis is thought to be an atony of the muscular fibres of the alimentary canal, especially of the stomach, joined with a similar atony of the perspiratory vessels over the whole surface of the body, and the whole depending on an atony of those small arteries which pour out the menstrual blood. This atony may be occasioned by the same causes which bring on dyspepsia and hypochondriasis, but very frequently arises from love and other passions of the mind.

Prognosis. The chlorosis in all cases is tedious, though it does not generally prove fatal; but we can never promise a certain cure unless the menses make their appearance.

Cure. The remedies here in general are the same as in the dyspepsia and hypochondriasis; only in the chlorosis stronger purgatives may be made use of: those which stimulate the rectum are useful by stimulating also the vessels of the uterus; and for this reason indulgence in venery has sometimes been said to produce a cure, particularly with love-sick maids. The cold bath is also extremely proper.

Tetanus.

278 ORDER III. SPASMI.

Spasmi, *Sauv.* Class IV. *Vog.* Class V. *Sag.* Class VIII.
Motorii, *Lin.* Class VII.
Morbi spasmodici et convulsivi, *Hoffm.* III. 9.
Spasmi et convulsiones, *Junck.* 45, 54.
Epilepsia, *Boerh.* 1071, 1088.

GENUS XLVIII. The TETANUS. 279

Tetanus, *Sauv.* gen. 122. *Lin.* 127. *Vog.* 180. *Sag.* gen. 228.
Catochus, *Sauv.* gen. 123. *Lin.* 128. *Vog.* 183. *Sag.* gen. 229.
Opisthotonos, *Vog.* 181.
Episthotonos, *Vog.* 182.

On this distemper Dr Lionel Chalmers has published a dissertation in the first volume of the Medical Observations, which being superior to any thing that has appeared in other medical writers on the subject, we shall here lay before the reader.

"Of all the diseases to which man is subject, none deserves more to be considered than the opisthotonos and tetanus, either with regard to the variety of painful symptoms which almost without intermission distract the sick, or the danger of the diseases themselves, from which few recover, in comparison of the number they attack. In both, the vital actions are very imperfectly performed, most of those which are called *natural* being as it were suspended at once; and so far is the patient from being able to execute any voluntary motion, that the whole machine undergoes the most excruciating distortions, from the violent and unnatural contractions of the muscles. Happy it is for the inhabitants of the more temperate climates, that such diseases appear rarely among them; but in those countries which lie in the more southern and warmer latitudes, they are endemic, especially to negro slaves. In South Carolina, they show themselves at all seasons, but not so often in winter, more frequently in spring and autumn; and are most common in the summer, when people work abroad and are alternately exposed to the scorching heat of the sun and heavy showers, which often happen suddenly, and greatly alter the temperature of the air. Others are seized with the opisthotonos after sleeping without doors, that they may enjoy the deceitful refreshment of the cool night-air, when the weather is warm: one youth chose to cut off his hair and shave his head on a warm day in March, and went to bed without a cap; but the weather changed, and became cold in the night, and he was found rigid with that disease next morning.

"These diseases so rarely appear as originals in Europe, that a good history of them cannot be expected from the physicians who practise in that part of the world; nor has any thing like a full description been given of them by any ancient or modern author which I have seen. Hippocrates indeed takes notice of them in many places, and seems to regard them only as consequences of other diseases, or of wounds or ulcers of the nervous or tendinous parts, of which symptomatic kind of opisthotonos he gives three remarkable cases in *lib.* V. & VII. *de Morb. vulg.* and repeats

Spasmi

repeats them in another place; but the few symptoms he recounts do not show themselves with us. Galen, Cœlius Aurelianus, Aretæus, &c. seem only to have copied Hippocrates, with the addition of some supposititious symptoms, which really do not appear; and the little that Bontius says of it is very faulty.

"Among the numerous class of spasmodic diseases, there are three which distinguish themselves in a very particular manner, on which the names of *emprosthotonos*, *opisthotonos*, and *tetanus*, have been justly enough bestowed, as being expressive of the posture into which they throw and confine the patient. When therefore those muscles which bend the head, neck, and body forwards, suffer such involuntary, violent, and continued contractions, as to fix the chin to the breast, incurvate the spine and body, and retain the sick in this painful and prone posture, the disease is called *emprosthotonos*. When the posterior muscles are similarly affected, so that the head is drawn towards the spine, and the spine itself is recurvated, it has then the name of *opisthotonos*; although in fact, in this, all those muscles which act in deglutition, bend the head forwards, or turn it to either side, are equally contracted with those which raise the head and spine. The *tetanus* differs from, or rather is compounded of, both the others; for in this the patient is found rigid and inflexible, being as it were braced between the opposite contractions of the anterior and posterior muscles; yet even here the head is much retracted

"I never saw the *emprosthotonos*; and shall only speak of the *opisthotonos* and *tetanus*, the first being by far the most common, and in the last stage of which the tetanus frequently supervenes. And let it be observed, that the following description by no means respects such symptomatic contractions as often happen immediately before death, both in acute and chronic diseases; neither will it agree with that spurious *opisthotonos* or *tetanus* which appear sometimes in the first and second stages of quotidian intermittents in this country, however they may emulate the true diseases in some of their symptoms.

"Stad. I. The *opisthotonos*, contrary to what Bontius asserts, often comes on gradually and by slight approaches, the patient complaining rather of an uneasy stiffness in the back-part of the neck and about the shoulders, than of any acute pain, with some degree of a general lassitude. These increase, and become so troublesome when he attempts to turn his head, or to bend it forward, as to oblige him to walk very erect; for he can by no means look downward, nor to either side, without turning his whole body. He cannot open his jaws without pain; and has some difficulty in swallowing, which discourages him from attempting to eat. At times he feels a sudden and painful traction under the *cartilago ensiformis*, which strikes thro' to the back, and instantly increases the rigidity about the neck and shoulders, draws the head backward a little, and shuts the jaws closer. The pain under the *sternum* returns more frequently and with greater violence; and the other contractions become so strong, that the head from this time continues much retracted, and he now refuses nourishment, as swallowing is attended with great pain, and occasions a return of the spasm; which extends along the spine quite to the lower extremities, so that they will no longer support him, and he is under the necessity of going to bed.

Tetanus.

"In this manner passes over the first stage of the *opisthotonos*, which sometimes takes up three or four days; the patient, as well as those about him, mistaking the first appearances of it for that rheumatic complaint, which is commonly called a *crick in the neck*; but it sometimes forms itself much quicker, and invades the unfortunate person with the whole train of its mischievous symptoms in a few hours: in which case, the danger may truly be estimated from the violence of the first attack; for such generally die in 24, 36, or 48 hours, and very rarely survive the third day. But when it is less acute, few are lost after the ninth or eleventh; which number of days it would not be possible for them to complete, unless the violence of the disease was in a good measure subdued; although I had one who recovered, after having been subject to its tyrannical attacks daily for six weeks. In this stage the pulse is slow, and very hard, and the belly is bound; blood taken away seems not to be altered from the natural state, so that no indication can be deduced therefrom, and it only varies with regard to laxity or compaction, according to the age of the person and season of the year.

"Stad. II. The spasm under the sternum (which is the pathognomic symptom of this disease) becomes more violent, returning every 10 or 15 minutes; and never fails to be instantly succeeded by a stronger retraction of the head, with great rigidity and pain all round the neck, and along the spine to the lower extremities which are suddenly put to the stretch. The countenance is very pale and contracted; the jaws are that moment snapped together, and cannot afterwards be opened so wide as to receive the end of one's little finger; an attempt to do which, by way of experiment, surely hurries on the spasm. The mastoid, coracohyoid and sternohyoid muscles, as well as all the others concerned in deglutition, and the deltoid and pectorals, are most violently contracted, so that the shoulders are strongly raised forward, and the arms are stretched out or drawn across the body; but the wrists and fingers seem not to be affected.

"Such is the condition of the patient in the time of the spasm, which ceases in a few seconds: after which the shoulders and arms recline, and the inferior extremities relax; yet not so entirely, but that such a degree of rigidity for the most part remains as will not permit them to bend when this is attempted by another person; for as to the sick himself, he cannot at all move them. The muscles on the sides and forepart of the neck continue still contracted, although not so strongly; but their action is overcome by the number and strength of the posterior ones; so that the retraction of the head constantly remains. He breathes quick for some minutes, as if he had been excessively exercised; and the pulse is small, fluttering, and irregular, but both become more calm and slow. The face is sometimes pale in the intervals, but oftener flushed; and the whole countenance expresses strong appearances of the most melancholy distress, as well because of the dread he has of a return of the spasm, which he is sure will soon happen, as from the pain he suffers by the present contractions, and the more general asmi general and severe ones which he has so lately sustained. The tongue is stiff and torpid; but so far as it can be seen, is not foul. The belly is always bound, and cannot easily be loosened. In drinking, the liquid passes with great difficulty to the stomach, even in the smallest quantity; and if the spasm should seize him at that time, which an attempt to swallow for the most part occasions, the liquor returns through the nose with some force. The patients desire to lie still as much as possible; and avoid drinking, speaking, or being moved, either of which are apt to occasion a return of the spasm.

"STAD. III. In this last stage, the patient is reduced to the most calamitous and distressful circumstances: for he is on a continual rack, according to the most literal meaning of that word; the spasm returning oftener than once in a minute, is much more violent, and holds him longer, so that he has scarcely any remission. The anterior muscles of the whole body now suffer equal contractions with the posterior; but the last overcome the force of the others, so that the spine is strongly recurvated, and forms a hollow arch with the bed, and he rests on the back part of the head and the heels. The belly is flat, and is drawn inward; and the muscles are so rigidly contracted, that they will not give way to pressure, and do not seem in the least to yield to the descent of the diaphragm in inspiration; the several muscles about the neck, sides, and abdomen, being plainly distinguishable from each other. Although the lower extremities are always rigid in this state, yet are they so suddenly and violently distended in the time of the spasms, that were it not for the standers-by, he would be projected feet foremost off the bed; while others again are as it were pushed upward with such a spring, that the head is struck with great force against whatever happens to be in the way, the thighs and legs being in this case no less rigid than the other parts. The tongue is spasmodically darted out, and is often miserably torn, as the teeth are that moment snapped together; so that it is necessary to prevent this by keeping the handle of a spoon, wrapped round with soft rags, between the teeth, when this can be done. At the time that the tongue is thus thrust out, the muscular flesh, which lies between the arch of the lower jaw and head of the trachea, seems to be drawn upwards within the throat. The countenance is very much contracted, and he is in a foam of sweat, the heat being very great; and the pulse between the spasms is exceeding quick, small, and irregular, although the heart throbs so strongly, that its motions may be plainly seen, and a palpitating subsultory kind of undulation may not only be felt, but perceived all over the epigastric region. The eyes are watery and languid, and a pale or bloody froth bubbles out from between the lips. The jaws are for the most part locked fast, so that it is impossible to give drink or nourishment, nor could he swallow if any thing was put into his mouth. In this state they are commonly delirious: and as they cannot subsist many hours under so great a suspension of the vital and natural functions, a mortal anxiety ensues and releases them; oftener a continued and severe spasm finishes the tragedy, when it was before almost at an end: but most frequently a general convulsion puts a period to their sufferings; and whichever way this happens, they for the most part relax just before death.

Tetanus.

"In the *tetanus*, the general symptoms are nearly the same as in the opisthotonos, except that from the first attack, the lateral, abdominal, and other anterior muscles, are equally contracted with the posterior ones; and the arms become rigid as well as the lower extremities. The abdomen is always flat and rigid as in the last stage of the opisthotonos, and its contents seem to be thrust up into the thorax, which at the same time appears to be much dilated. There are here also some intervals between the spasms, in the time of which the cheeks are drawn towards the ears, so that all the teeth may be seen as in the spasmus cynicus. Deglutition is more free in this than in the other disease; yet so far is the sick from being equally balanced between the contractions of the opposite muscles, that the head is retracted and the spine is recurvated, although not quite so much as in the opisthotonos. And the spasm, which commences under the sternum, is likewise common to the tetanus, which terminates as the other, and on the same fatal days. But whoever recovers from either, labours long under a general atonia; and they cannot for some months raise themselves from a supine or recumbent posture without pain, nor without help for some time."

Prognosis and Cure. There has never been any thing like a crisis observed in these frightful cases, or favourable termination from the mere efforts of nature; and therefore all the physician's dependence must be upon art. As in cases of tetanic affections, the disease often arises from some particular irritation, the removal of this must necessarily be an important object in the cure: But where it cannot be removed, benefit may often be obtained by the prevention of its influence being communicated to the brain. When, however, that influence is communicated to the brain, a cure is to be expected only by diminishing and obviating it. This is principally brought about by the use either of those means which have a general tendency to diminish action, or of those which induce a different state of action. On these grounds the operation of those remedies which are employed with greatest success in this affection, may, we apprehend, be explained. Fortunately it has been found, that opium is capable of giving some relief, if administered in proper time, and if the disease happens not to be in the most violent degree: the warm bath must also be brought in aid; and the patients should lie horizontally in the bath, and while in it have the whole body extremely well rubbed: when taken out, they are not to be dried, but immediately put to bed wrapt in the softest blankets; and while they remain there, the belly ought either to be stuped, or two or three bladders filled with warm water kept constantly lying on it. The bowels at the same time must, if possible, be kept open, by solutions of manna and *sal polychrest*, or some other purging salt, mixed with *oleum ricini*; or if that should not be at hand, with oil of sweet almonds and a little tincture of sena. The opiates are to be given in large and frequently repeated doses; such as a grain of the *extractum thebaicum*, or 25 drops of the tincture, every second or third hour; and it will be safest not to trust to the thebaic tincture which is kept ready prepared in the shops, but order the necessary dose of solid opium, and either give it in pills or dissolve it in

Spasmi

ſome convenient liquid. If ſwallowing ſhould be difficult, or the jaws cloſed up, the opium muſt be given in clyſters; for during the whole courſe of the diſeaſe it will be of ſervice to order emollient clyſters to be injected from time to time, ſince theſe will anſwer not only as a relaxing fomentation, but alſo contribute to keep the inteſtinal canal perfectly free.

When the patients recover, they continue for a long time very relaxed and weak; and no wonder, ſince it is the nature of all ſpaſmodic affections to leave behind them extreme weakneſs and relaxation of the muſcular fibres. In order to perfect the recovery, a courſe of the Peruvian bark and the Peruvian balſam is to be tried; and the ſpine may be rubbed with ſpirituous liniments, or with a mixture of rum and Barbadoes tar: but theſe and all other ſtimulating things, either internally or externally, during the violence of the ſpaſms, muſt, in the opinion of ſome practitioners, be omitted, ſince all of them as well as bliſters have been alleged to exaſperate the diſeaſe.

This, in general, is the plan of treatment recommended by Dr Chalmers.

The ſame dreadful diſorders frequently attack young children in the warm climates. Dr Hillary tells us, that they will there ariſe from the ſame cauſes which uſually produce convulſions with children in Britain, *viz.* from a retention of the meconium or firſt excrement after birth; or from a glutinous matter which is too often found in the inteſtines of young children ſoon after the other is diſcharged; or from a cheeſy matter from the coagulation of the milk by an acid in the ſtomach; or from hard excrements; or from ſomething taken in by the mouth which is over acrid, or too hard to digeſt, which irritates their tender bowels, and ſo produces ſtartings and convulſive ſpaſms, with all the other ſymptoms which precede and accompany convulſions in young children in Britain. And this ſhows how much more readily and eaſily the nerves are affected and irritated in that warm climate, and the *tetanus* produced from a much leſs cauſe there, than it is in Britain, where it is but ſeldom ſeen. But theſe cauſes not being timely removed, their acrimony is increaſed, partly by the heat of the climate, and partly by the fever which they produce, which ſtill renders them more acrid, and ſo increaſes the irritation of their bowels, that it firſt brings on ſtartings, then convulſive ſpaſms, and regular convulſion fits; which, if not ſoon removed, uſually end in a perfect *tetanus* there, and the diſeaſe is but ſeldom cured in ſuch young children when it arrives at that ſtate: for when the child lies in this miſerable, rigid, immoveable condition, upon moving its hands or feet in the moſt gentle manner, or ſoftly touching any part of its body, or giving it the leaſt motion, even feeling its pulſe in the moſt gentle tender manner, or the leaſt noiſe, or even touching its clothes, will bring on the convulſive ſpaſms, and cauſe it to be ſtrongly convulſed backwards, or drawn into a rigid ſtraight line, ſtrongly extended and immoveable like a ſtatue, and will ſo remain immoveable out of either of thoſe poſtures for a conſiderable time, a minute or two; and when the diſeaſe is arrived at this degree, Dr Hillary thinks it is never cured. But if the phyſician be called in time, before the *tetanus* has come on (which is too ſeldom the caſe there), though he finds ſtrong convulſive ſpaſms have ſeized the child, or that it has had a convulſive fit or two, it may moſt commonly be relieved, the coming of the *tetanus* be prevented, and the life of the babe ſaved, as Dr Hillary has more than once ſeen, by removing and carrying off the irritating cauſe which ſtimulates their tender bowels, by ſuch gentle evacuations as are ſuitable to their age; and then quieting and compoſing the irritation of their nerves with proper anodynes, and correcting the remaining acrimony of the nutritious juices in the *primæ viæ*.

Tetanus.

To anſwer theſe intentions, the following method, with variations *pro re nata et pro ratione ætatis*, as the cauſe is different, has been found to anſwer the deſired effect the beſt: R. *Seri lactis* ℥ij. *Sapon. Venet.* ℈j. *Mannæ Calab.* ʒij. *vel* iij. *Ol. amygd. dul.* ℥ſs. *Ol. fæniculi dul. gut.* ij. *Balſ. Peruv. gut.* v. *Miſce, ft. enema quam primum injiciendum.*

And if the ſymptoms of the approaching *tetanus* will permit, he gives ſomething of the following nature to aſſiſt the operation of the clyſter, and to carry off the acrimony the ſooner: R. *Aq. fem. fæniculi* ℥iij. *Magneſ. albæ* ʒſs. *Ocul. cancr. præp.* ʒj. *Syr. e cichor. cum rheo, Roſar. ſolut. ana* ʒiij. *Miſce.* Or, R. *Aq. ſem. fæniculi* ʒiij. *Sapon. amygdal.* ʒſs. *Magneſ. albæ* ʒſs. *Syr. e cichor. cum rheo, Mannæ opt. ana* ʒij. *Ol. amygd. dul.* ʒiij. *Miſce: Exhibe cochl. parv. vel duo pro ratione ætatis omni ſemihora, vel omni hora, donec reſpond. alvus.*

Two or three ſtools being obtained by theſe, the following is exhibited in order to abate the convulſive twitchings, and prevent the *tetanus* from coming on: R. *Aq. ſem. fæniculi* ℥iij. *Magneſ. albæ* ʒſs. *Ocul. cancr. præp.* ʒj. *Moſchi orient. gr.* iij. *Spir. C. C. gut.* xv. *Syr. e mecon* ℥ſs. *Miſce: Exhibe cochl. parv.* (a child's ſpoonful) *ter quaterve de die, vel ſæpius, urgent. convulſ. vel ſpaſm.*

But if the ſymptoms ſhow that the *tetanus* is more immediately coming on, ſo that we have no time to wait till the operation of the clyſter and opening laxative be over, ſomething of the following nature muſt be immediately given; or the *tetanus* will come on, and moſt probably prove fatal to ſuch tender babes. R. *Aq. fæniculi* ʒiiij. *Moſchi orient. gr.* j. *Tinct. Thebaic. gut.* iiij. *Syr. e mecon.* ʒij. *Miſce pro duobus doſ. de quibus exhibe unam quam primum, et alteram ſi convul. ſpaſm. redeunt.*

This, Dr Hillary obſerves, may be thought a bold attempt, to give *tinct. Thebaica* to ſuch a tender young infant: but it is to be conſidered that the little patient will certainly die if the *tetanus* ſeize it, and that it will come on if this do not prevent it; and he has known a bold ignorant old midwife give four or five drops of that tincture to a very young infant without any prejudice more than its doſing three or four hours, though not in this caſe, but in one much leſs violent.

The clyſter may be given at the ſame time, and the opening laxative not long after it: though it may retard the operation of that for ſome time, yet it operates ſoon after, and gives relief; after which the other medicines, and fomenting the body and anointing it as before, may be uſed, if the phyſician finds it neceſſary; alſo a little of the laxative mixture may be given once or twice a-day, if the above julep does not anſwer

Spafmi

anfwer that intention of keeping the child's body open for a few days afterwards, which in this cafe is generally found neceffary to be obferved.

Thefe methods and medicines may be varied according to circumftances. For neither the fame method nor the fame medicines will anfwer in all cafes, though the difeafe be the fame; but they muft be changed as the caufes differ, or the conftitution of the fick, or the time of the difeafe, or as fome other circumftances may require: which is a thing of great importance, not only in this, but in the cure of moft other difeafes; wherefore it is mentioned here, chiefly to caution the practitioners in the Weft Indies.

When proper medicines are thus timely and judicioufly given in this cafe, they feldom fail to carry off the irritating caufe, quiet and eafe the nerves, remove the convulfions and fpafms; and confequently prevent the tetanus from coming on, and the death of the patient. But if calling in the phyfician be deferred till the tetanus has already ftrongly feized the child, as is too often the cafe here, neither warm bathing, fomenting, nor any other methods or medicines whatever, will remove it or its caufes, nor fave the life of the little tender patient.

Dr Chalmers gives an account of his having cured one child feized with a *tetanus*, by purging with an infufion of rhubarb; to which a few grains of mufk, and a little *ol. tartar. per deliq.* were added, together with the warm bath, and the frequent injection of glyfters made with an infufion of camomile flowers, to each of which was added a fmall portion of Caftile foap. It is much to be regretted, however, that in thofe cafes where the affiftance of the medical art is moft wanted, it moft generally fails. We have been affured by a gentleman who practifed for fome time in the warm parts of America, that out of 30 cafes of the tetanus he had feen, not one of the patients recovered, though he had given opium to the quantity of 20 grains thrice a-day; and others, he was affured, had taken 30 grains thrice a-day. In the beginning of the difeafe, the medicine produced a violent headach; but towards the end, it had no manner of effect whatever. In two patients, the difeafe came on from the flighteft caufes imaginable. The one accidentally fell in attempting to avoid a loaded cart, and put the heel of his fhoe upon one of his thumbs in rifing; the other, in avoiding the fame cart, flightly ruffled the fkin of his nofe. Both were feized with the tetanus; and both died, notwithftanding all poffible affiftance was given. The former had his thumb amputated without effect.

In the Edinburgh Phyfical and Literary Effays, Vol. III. Dr Donald Monro defcribes a new method of cure, communicated to him by a gentleman who was formerly a practitioner in Jamaica. While this gentleman practifed in that ifland, he had under his care a great number of cafes of tetanus attended with the locked-jaw. At firft, he ufed to give very freely of opium, mufk, and other medicines of this clafs; to bleed, and make other evacuations; while he ufed baths, fomentations, embrocations, and other external applications, but all without the leaft fuccefs; and, as he had loft a great many patients without being fo lucky as to make one cure, he began to believe that this diforder always proved fatal, and was not to be cured by medicine, notwithftanding what fome practitioners had alleged. However, having received an unexpected hint concerning the good effects of the mercurial ointment in fuch cafes, he refolved to try it; and ordered the firft patient that offered to be put into a warm room, and to be rubbed two or three times a-day with the ointment, till fuch time as a falivation was raifed; when he with pleafure obferved, that, as foon as the mercury began to affect the mouth, the convulfions of the mufcles of the jaws, as well as all the other fpafms and convulfions, ceafed, and the patient was freed of all his complaints. After this, he treated every cafe of this kind which came under his care in the fame manner, and cured twelve, which were all who applied to him for advice fo early in the diforder that there was time to bring the mercury to the mouth before the fatal period was expected. A few died, in whom the difeafe was fo far advanced before he faw them that there was not time to raife a falivation. None of the cafes which were under this gentleman's care in the Weft Indies were the confequences of wounds or capital operations; nor has he had any opportunity of trying it fince in cafes of the locked jaw, which fometimes follows capital operations, owing to his having given over practice: but he thinks, that, from the fimilarity of the complaint, there is no doubt that the mercurial frictions would be equally efficacious in fuch cafes, as when the diforder comes from catching cold or other fuch caufes.

Tetanus.

In the fecond volume of the Medical Tranfactions, we have an account of a cure performed by Dr William Carter of Canterbury, by means very different from any of thofe above related.—On the 17th of May 1767, the doctor was called to a ftrong healthy man, in the 21ft year of his age, and who had been confined to his bed for three weeks. What gave rife to his prefent diforder was a wound on the inner ankle of his right leg, which he had received fix weeks before from a joiner's chifel. At that time his mouth was fo far clofed, as to admit only the moft liquid nourifhment, which he conftantly fucked through his teeth: but his legs and jaw, and the whole length of the fpina dorfi, were quite immoveable, being as ftiff and rigid as thofe of a perfon long dead; his head was drawn backward, and he was frequently ftrongly convulfed. The motion indeed of both his arms was but a little impaired. From the beginning to the end, his fight, hearing, and memory, continued perfect; his appetite was good; and his fenfes, in the day-time, entire, though fometimes wandering in the night. As to his pulfe, that was regular; if it deviated at all from the pulfe of a perfon in health, it was rather flow than quick, and fomewhat fuller than natural. Such was the fituation of his patient; a detail of which had been given before the doctor fet out on his journey, which he undertook with a determined refolution to make ufe of the method recommended by Dr Silvefter, in the firft vol. of Medical Obfervations and Inquiries, publifhed in the year 1757, (and which has been related from Dr Chalmers and Dr Hillary.) But, on his arrival at the houfe, he found great quantities of the *extractum thebaicum* diffolved had

Spafmi had been already given him; and that, for the five laft days, he had taken no lefs than 28 grains of that medicine, with 50 grains of mufk, in the fpace of 24 hours, without any fenfible effect, except the bringing on a confufed fleep, out of which he frequently awoke in great hurries, attended with a violent pain in the head, which almoft deprived him of his fenfes. The doctor was afraid to extend the dofe; and foon determined to take fome other method, though at a lofs what method to purfue, as, during a courfe of almoft 30 years practice, nothing of the fame kind had ever fallen under his cognizance before. Reflecting, however, that this diforder had always been deemed of the fpafmodic kind, and that the good effects produced by the *extractum thebaicum* muft probably be owing to the relaxing and refolving faculty of that medicine, he directed a blifter to be applied between the fhoulders, the whole length of the fpine; the jaw to be anointed with the *oleum lateritium*; and a purge, confifting of the *tinctura facra, tinctura jalappi*, and the *fyrupus de rhamno cathartico*, to be given him. This was repeated three feveral times afterwards, at the diftance of three or four days between each dofe. On the intermediate days, he was ordered the *oleum fuccini*, the fœtid gum, and the *oleum amygdalinum*. Of the firft he took 30 drops, of the gum 20 grains, and of the laft four ounces, in 24 hours. By thefe means, and thefe only, the convulfions foon ceafed; and he grew daily better and better, till at the end of a fortnight he was able to walk about his room, and in lefs than three weeks became in all refpects well, fome fmall weaknefs in the parts only excepted. The jaw was relieved firft, after that the fpine, and laft of all the legs. A pain and uneafinefs in the places affected, neither of which he had felt before, were the forerunners of his approaching amendment.

From all this it feems reafonable to conclude, either that there is no certain remedy for tetanus in all cafes, or that the medicines which prove effectual in one conftitution will fail in another. Thus, it is poffible, that in cafes where opium proves ineffectual, mercury may be a remedy; and, on the contrary, where mercury fails, opium may be effectual; and even where both are ineffectual, the antifpafmodics recommended by Dr Carter may be of ufe. It is therefore neceffary for phyficians to be extremely careful to obferve the effects of the firft dofes of their remedies: for if the fymptoms fhow not the leaft appearance of remiffion after a large dofe of opium, it is improbable that it can be cured by a repetition of the medicine; and as no time can be loft with fafety, it will then be proper to apply mercurial ointment, or whatever elfe may be judged proper.—In the Edinburgh Medical Commentaries we have an account of the cold bath being ufed as a remedy, by Dr Thomas Cochrane, at that time phyfician at Nevis, now at Edinburgh. The patient was an Eaft Indian boy, who had been gored by a cow, and afterwards expofed to a rainy damp air for fome hours. Dr Cochrane afcribes his cure to the cold bath, which was applied by dafhing the water upon his body. But as the patient at the fame time got laudanum, at firft in the quantity of 200 drops a-day, and afterwards in ftill larger dofes; and had befides his throat and fhoulders anointed with warm oil of turpentine, was bled, and had lenient glyfters and laxatives; it is by no means eafy to fay what fhare the cold bath had in his cure. Dr Cochrane, however, fays he has heard of Tetanus. fome cafes being treated fuccefsfully by cold water and the Peruvian bark in St Euftatia and St Kitt's, and in another letter mentions his having ufed the cold bath in other cafes of tetanus with fuccefs. But fince Dr Cochrane's publication, a more full and fatisfactory account of the benefit of this practice has been communicated in a paper publifhed by Dr Wright, in the fixth volume of the London Medical Obfervations. Dr Wright gives a particular account of fix cafes, in which the beft effects were obtained from dafhing cold water upon the patient; and he obferves, that fince he firft ufed this method of cure he never failed in one inftance to effect a recovery, and that in a fhorter time than by any other method hitherto propofed. This practice has on fome occafions been adopted by practitioners in Britain, although here the difeafe is a much lefs frequent occurrence. It has particularly been employed with fuccefs by Dr Currie of Liverpool; and we hope that ftill more extenfive practice will confirm the benefit to be derived from it, although not in every inftance, yet in many cafes of this affection.

Very lately a different mode of cure in this affection has been recommended by Dr Rufh, profeffor of medicine in Philadelphia, in a paper intitled Obfervations on the Caufe and Cure of Tetanus, publifhed in the fecond volume of the Tranfactions of the American Philofophical Society. Dr Rufh, viewing tetanus as being a difeafe occafioned by relaxation, thinks the medicines indicated to cure it are fuch only as are calculated to remove this relaxation, and to reftore tone to the fyftem. On this ground he recommends the liberal ufe of wine and the Peruvian bark; and tells us, that he has employed them with fuccefs in actual practice. When the difeafe arifes from a wound of any particular place, he recommends ftimulants to the part affected; fuch as dilatation of the wound, and filling it with oil of turpentine. How far this practice will be confirmed by more extenfive experience, we cannot take upon us to determine. We may only obferve, that a very contrary practice has been recommended as highly fuccefsful by fome practitioners in Spain, where tetanic affections are a very frequent occurrence in confequence of flight accidents. There gentle emollients are ftrongly recommended, particularly immerfing the wounded part in tepid oil for the fpace of an hour or fo at a time, and repeating this application at fhort intervals. By this mode many cafes, after very alarming appearances had taken place, are faid to have been completely and fpeedily removed. While the practice is very fimple, it appears at the fame time in many refpects very rational, and may perhaps be confidered as well deferving a trial in the firft inftance.

GENUS XLIX. TRISMUS. 280
The LOCKED JAW.

Trifmus, *Sauv.* gen. 117. *Lin.* 124. *Sag.* gen. 223. Capiftrum, *Vog.* 208.

Sp. I. TRISMUS NASCENTIUM.
Locked Jaw in children under two months old.

Trifmus nafcentium, *Sauv.* fp. 1. *Heifter* Comp. Med. Pract. cap. xv. § 10. *Cleghorn* on the Difeafes of Minorca, Introd. p. 33. *Hofer* in Act. Helvet. tom. i. p. 65.

This

Spaſmi

This diſtemper is ſo cloſely connected with the tetanus, that it ought rather to be accounted a ſymptom of the tetanus than a primary diſeaſe. We have accordingly diſcuſſed it under TETANUS.

282 Sp. II. The TRISMUS from *Wounds or Cold.*

Triſmus traumaticus, *Sauv.* ſp. 2. *Lond. Med. Obſ.* Vol. I. art. 1. 7. Vol. II. 34. Vol. III. 31. Vol. IV. 7.
Angina ſpaſmodica, *Sauv.* ſp. 18. *Zwingeri* Act. Helvet. Tom. III. p. 319.
Convulſio a nervi punctura, *Sauv.* ſp. 2.
Triſmus catarrhalis, *Sauv.* ſp. 15. *Hillary's* Barbadoes, 221. *Lond. Med. Obſ.* Vol. IV. 7.

The internal remedies proper in all caſes of the locked jaw, from whatever cauſe it may proceed, have been already mentioned under TETANUS: the external treatment of wounded parts which may give occaſion to it belongs to the article SURGERY. But of this alſo we have offered ſome obſervations under the head of Tetanus; and, indeed, triſmus may be conſidered as being merely an incipient tetanus, or rather a ſlight degree of that diſeaſe.

283 GENUS L. CONVULSIO.
CONVULSIONS.

Convulſio, *Sauv.* gen. 128. *Lin.* 142. *Vog.* 191. *Sag.* gen. 235.
Convulſio univerſalis, *Sauv.* ſp. 11.
Hieranoſos, *Lin.* 144. *Vog.* 190.
Convulſio habitualis, *Sauv.* ſp. 12.
Convulſio intermittens, *Sauv.* ſp. 16.
Convulſio hemitotonos, *Sauv.* ſp. 15.
Convulſio abdominis, *Sauv.* ſp. 10.
Convulſio ab inanitione, *Sauv.* ſp. 1.
Convulſio ab onaniſmo, *Sauv.* ſp. 13.
Scelotyrbe feſtinans, *Sauv.* ſp. 2.

Deſcription. When convulſions attack only particular parts of the body, they are generally attended with ſome kind of paralyſis at the ſame time, by which means the affected parts are alternately convulſed and relaxed; a permanent convulſion, or unnatural contraction of particular muſcles, is called a *ſpaſm* or *cramp*. Theſe partial convulſions may attack almoſt any part of the body; and are not unfrequently ſymptomatic, in fevers, the cholera morbus, &c. The involuntary ſtartings of the tendons, the picking of the bed-clothes, &c. in acute diſeaſes, &c. are all of them convulſive diſorders. Convulſions, even when moſt generally extended, differ from epilepſy in not being attended with any mental affection or abolition of ſenſe, and not followed by the ſame torpid ſtate.

Cauſes. Convulſions, not only of particular parts, but alſo over the whole body, often take place from cauſes not very evident. Sometimes they ſeem to depend on a certain delicacy or irritability of the nervous ſyſtem, which is framed with ſuch exquiſite ſenſibility as to be ſtrongly affected by the ſlighteſt cauſes. Delicate women are often ſubject to hyſterical convulſions, and alſo hypochondriac people. Convulſions, however, often take their riſe from wounds, irritations of the ſtomach and inteſtines by worms, poiſons, violent cathartics and emetics, &c.; and very often they are ſymptomatic, as in dentition, the ſmall-pox, and many kinds of fevers. Convulſio.

Prognoſis. Except in ſome few caſes, convulſive diſorders are always to be dreaded; but leſs in young people than in ſuch as are advanced in life. Thoſe which attack girls under the age of puberty, will generally ceaſe on the appearance of the menſes; and boys have likewiſe a chance of being relieved as they advance in life: but in grown up people, unleſs the cauſe be very evident, a cure is hardly to be expected, eſpecially after the diſeaſe has been of long continuance.

Cure. The treatment is very much the ſame with that of epilepſy, afterwards to be conſidered: but a recovery is moſt frequently obtained by the removal of the exiſting cauſe.

GENUS LI. CHOREA. 284
ST VITUS'S DANCE.

Scelotyrbe, *Sauv.* gen. 136. *Sag.* 243.
Chorea, *Lin.* 139.
Scelotyrbe chorea Viti, *Sauv.* ſp. 1.
Chorea St Viti, *Sydenh.* Sched. Monit.

Deſcription. This diſeaſe ſhows itſelf firſt by a kind of lameneſs or inſtability of one of the legs, which the patients draw after them in a ridiculous manner: nor can they hold the arm of the ſame ſide ſtill for a moment; for if they lay it on their breaſt, or any other part of their body, it is immediately forced away by a convulſive motion. If they be deſirous of drinking, they uſe a number of odd geſticulations before they can bring the cup to their mouths, becauſe their arms are drawn this way and that by the convulſions which affect them.

Cauſes, &c. The general cauſe of St Vitus's dance is a debility of the ſyſtem; and hence we find it attacks only weakly boys, and more eſpecially girls, when under the age of puberty. But the particular cauſes determining the muſcles to be affected in ſuch and ſuch a manner are entirely unknown.

Prognoſis. As this diſorder ſcarce ever attacks any perſons but ſuch as are under the age of puberty, there is almoſt a certain proſpect of its being then cured, though generally the diſorder is eaſily removed before that time.

Cure. See EPILEPSY.

GENUS LII. RAPHANIA. 285

Vol. VII. obſ. 41. *Bruckmann.* Com. Norimb. 1743, p. 50.

Deſcription. According to Sauvages, this diſtemper begins with a laſſitude of the limbs, tranſient colds and ſhiverings, pain of the head, and anxieties of the præcordia. Then come on ſpaſmodic ſtartings of the fingers and feet; alſo of the tendons and muſcles, con-

Spasmi spicuous below the skin. The disease is attended with heat, fever, delirium, stupor, constriction of the breast, suffocating dyspnœa, loss of voice, horrid convulsions of the limbs, preceded by a formication, or sensation as of ants or other small insects creeping on the parts. In this state of the disease, the convulsive paroxysms are attended with most violent pains in the limbs, vomiting, or diarrhœa, with the passing of worms, thirst, and in young people an unnatural hunger. It continues from ten days to three months. About the eleventh or twentieth day, some are relieved by copious sweats, or purple exanthemata: while others fall into a tabes, with stupor, or stiffness of the joints.

Causes, &c. This disease is frequently epidemic in Suabia and other parts of Germany; where it is said to be produced by seeds of radishes, which are often mixed with rye in that country; and from this supposed cause the disease takes its name. It is also, however, a very common opinion, that this disease depends on the rye used in diet being of a bad quality, and particularly containing a large proportion of what is called *spurred rye*.

Cure. In this affection, also, the cure, as far as it has yet been discovered, is very much the same with that of epilepsy, the disease next to be considered.

Epilepsia. *Description.* The epilepsy often attacks suddenly and without giving any warning: but more frequently is preceded by a pain in the head, lassitude, some disturbance of the senses, unquiet sleep, unusual dread, dimness of sight, a noise in the ears, palpitation of the heart, coldness of the joints, and in some there is a sensation of formication, or a cold-air, &c. ascending from the lower extremities towards the head. In the fit, the persons fall suddenly to the ground (whence the name of the *falling-sickness*), frequently with a violent cry. The thumbs are shut up close in the palms of the hands, and are with difficulty taken out; the eyes are distorted, so that nothing but the whites are to be seen; all sensation is suspended, insomuch, that by no smell, noise, or otherwise, nor even by pinching the body, can they be brought to themselves; they froth at the mouth, with a hissing kind of noise; the tongue is frequently lacerated by the teeth, and there is a violent convulsive motion of the arms and legs. Sometimes, however, the limbs, instead of being agitated by convulsive motions, are all stiff, and the patients are as immoveable as a statue. In children the penis is erected; and in young men there is an emission of the semen, and the urine is often thrown out to a considerable distance. At length there is a remission of the symptoms, and the patients recover after a longer or shorter interval; when they complain of a pain, torpor, or heaviness of the head, with a lassitude of all the joints.

Causes, &c. The dissection of epileptic subjects has shown a variety of morbid appearances, which may be supposed to have contributed to the disease; such as, indurations in the brain or meninges; caries of the internal surface of the cranium; projections of the boney substance of the same, pressing upon the brain; collections of serum or purulent matter, and earthy concretions within the skull; besides many others which are recorded by Bonetus, Morgagni, and Lieutaud. But often the causes are impossible to be discovered; for even in those who have died of the disease, the brain and all other parts of the nervous system have been apparently found. The disease will attack strong as well as weak people; and in those who are subject to it, any considerable excess in drinking, a surfeit, violent passion, or venery, &c. will certainly bring on a fit. Some have epileptic paroxysms returning periodically after considerable intervals; and the disease has been thought to have some dependence on the phases of the moon.

Prognosis. If the epilepsy comes on before the time of puberty, there are some hopes of its going off at that time. But it is a bad sign when it attacks about the 21st year, and still worse if the fits grow more frequent; for then the animal-functions are often destroyed, as well as those of the mind, and the patient becomes stupid and foolish. Sometimes it will terminate in melancholy or madness, and sometimes in a mortal apoplexy or palsy. It has sometimes, however, been observed, that epilepsies have been removed by the appearance of cutaneous diseases, as the itch, small pox, measles, Spasmi measles, &c. While the disease is recent, therefore, we are not to despair of a cure; but if it be of long standing, or hereditary, there is very little reason to expect that it can be removed

Cure. From the symptoms occurring in epilepsy, which consist of involuntary convulsive motions, and an affection of the mental powers, there is reason to conclude, that the fit immediately depends on the induction of some peculiar action of the brain; but that convulsions may ensue from this cause, it would seem necessary that there should also occur a peculiar disposition to action in the moving fibres. On this ground then, we may suppose the cure to be chiefly expected on one of two principles; either by our being able to prevent the peculiar action of the brain, or to remove the disposition to action in the moving fibres. The first is chiefly to be accomplished by the removal of irritating causes, by preventing their influence from being propagated to the brain, when they are applied to remote parts; or by counteracting their influence, from inducing in the brain a state of action different from that to which they give rise. The second end is chiefly to be obtained by diminishing the mobility of the nervous energy, and by strengthening the tone of the moving fibres. It must, however, be allowed, that in all convulsive disorders, excepting those which are cured by nature about the time of puberty, the cure by artificial means is very difficult. Numberless specifics have been recommended, but all of them have failed of answering the expectation. When the cause can be discovered, that must be removed. In other cases, the cold bath, valerian root, castor, musk, opium, the fœtid gums, Peruvian bark, with the whole tribe of nervous and antispasmodic medicines, have been recommended: but none of these, or indeed any combination of them, have been found generally useful; though the slighter, or symptomatic cases, may often be removed by them.

Of late the *calx*, improperly called the *flowers*, of zinc, have obtained such reputation in convulsive disorders as to be received into the Edinburgh Pharmacopœia under the title of *zincum ustum*. They were proposed by Dr Gaubius as an antispasmodic, in his *Adversaria;* and their efficacy has since been confirmed by various observations. In an inaugural dissertation published by Dr Hart at Leyden, the medical virtues of the flowers of zinc are considered. He observes, that they have long been used externally, chiefly for inflammations of the eyes from acrid lymph. Glauber first proposed the internal use of them; and Gaubius discovered them to be the remedy of a celebrated empiric Luddemannus, which he styled his *luna fixata*. After this he exhibited them with success in convulsive and spasmodic diseases. Dr Hart supposes, that they act either as absorbents, or as possessing a specific virtue: but is a strong advocate for their efficacy, on whatever principles they may operate; and, in favour of his opinion, relates seven cases in which they proved successful. A girl of 17 years of age, was seized with a slight *chorea* from a fright; and when the disease had continued six days, she began to take the flowers of zinc, by which her disorder was removed in less than three weeks. Her cure required only 16 grains of the calx. In a few months the complaints returned, from the same cause; and were Epilepsia. removed by four grains of the medicine divided into ten doses.—A boy of about four years old, labouring under a real epilepsy, suspected to be hereditary, was cured by a grain of the flowers of zinc taken every day for some time.—A man 50 years old, thrown into convulsions from a violent passion, was cured by a grain of the calx taken every two hours. The disease had gone off upon venesection and the use of some other remedies; but returned again in two weeks, when it was finally removed by the zinc. The two last cases are related from Dr Gaubius, who affirms that he has used the flowers of zinc in cases of the chincough, hysteric hiccough, and spasmus cynicus; that they frequently did more than other medicines, but were by no means successful in every case. The other cures mentioned by Dr Hart are similar to those above-mentioned. But it does not appear that he ever saw a confirmed epilepsy cured by this medicine.

In the first volume of *Edinburgh Medical Commentaries*, we have an account by Mr Benjamin Bell, of a man afflicted with a confirmed epilepsy, who was considerably relieved by the flowers of zinc. He was about 35 years of age, and had been subject to the disease for 10 years. At first the paroxysms did not return oftener than once a month; but becoming gradually more frequent, they came at last to be in a manner continual, insomuch that he would have ten, eleven, or twelve attacks in a day, and very seldom had an interval of 24 hours. His memory and judgment were so much impaired, that he could scarce answer a question distinctly. He had used a great variety of medicines without any benefit. About three years before applying to Mr Bell, he had violent rheumatic pains in his limbs, which left such an extreme debility that he was never afterwards able to get out of bed without the assistance of two or three people.

On the 22d of October 1772, Mr Bell found him in the above mentioned condition, and prescribed as follows:

R. *Flor. Zinc.* gr. xxiv.

Ext. Gent. ℥i. M. f. mass. et divid. in pill. xxiv. cap. 1. m. & v.

He continued to take two pills a-day till the first of November, without any sensible benefit. The dose was then doubled, and continued till the 12th; when the fits, though equally violent, became less frequent. The medicine was gradually augmented to ten pills thrice a-day; and the consequence was, that his memory and understanding returned, the fits became much slighter and less frequently repeated, though the disease could not be radically subdued.

In a young man labouring under the epilepsy, in whom the fits were preceded by an *aura epileptica*, or sensation like air arising from the inside of the knee-joint, the disease was also relieved, but not cured.

Dr Percival relates some cases of epilepsy which seem to have been cured by the flowers of zinc; and in other cases, where the disease was not entirely removed by it, the spasms were nevertheless much mitigated. He did not observe that it promoted any evacuation; excepting that in some, upon being first taken, it occasioned a little sickness, which went off with a stool. He adds, that those apothecaries who do not prepare this

Spafmi

this medicine themfelves, are in great danger of being impofed upon, as it is fometimes a mere corrofion of the zinc by an acid, and even imperfectly wafhed.

The good effects of calcined zinc as an antifpafmodic are alfo attefted by Dr Haygarth of Chefter and Dr White of York. The former gives a teft of their goodnefs which may be of ufe to thofe who do not prepare them, namely, that the true flowers of zinc, when ftrongly heated, become yellow, but reaffume their white colour on being allowed to cool. The latter gives a cafe of hieranofos, or ftrange convulfions of almoft all the mufcles of the body, cured by zinc, after a number of other remedies had failed. The patient, however, had been formerly much relieved by Ward's antimonial pill.

In Dr Home's clinical experiments and hiftories, alfo, calcined zinc is mentioned as having been found ferviceable upon trial in the Royal Infirmary of Edinburgh. Of the other principal remedies which have been recommended for the epilepfy and other convulfive diforders allied to it, we have the following account by the fame author.

1. *The cold-bath* was tried in one who had a convulfive diforder of one fide, but the fymptoms were rendered much worfe by it.

2. *Venefection.* Not to be depended on in convulfions.

3. *Electricity.* In two convulfive cafes was of no fervice.

4. *Epifpaftics.* Do not feem to be powerful antifpafmodics.

5. *Valerian.* In nine convulfive cafes, for which this remedy hath been reckoned almoft a fpecific, it not only made no cure, but could fcarcely be reckoned to do any good. Dr Home fuppofes that it acts as a bitter tonic, fomething like the *ferpentaria Virginiana.* Though much ufed at prefent, he tells us it has always appeared to him a weak, often a hurtful, medicine.

6. *Mufk.* Six convulfive patients treated with large dofes of this remedy, were neither cured nor in the leaft relieved.

7. *Caftor* feems to be unworthy of the confidence formerly put in it. It is indeed poffeffed of a fedative power, and therefore may be ufeful in fpafmodic feverifh cafes.

8. *Afafœtida* has confiderable antifpafmodic powers, but is not always fuccefsful. It heats and quickens the pulfe; and is therefore improper in cafes attended with inflammation. It difagrees with fome from a peculiarity of conftitution; exciting pain in the ftomach, and vomiting; but this can be known only after the exhibition of the medicine.

9. *Cortex Peruvianus.* Of feven fpafmodic cafes, fix were either cured or mitigated. An epilepfy of eight years ftanding was very much relieved by taking the bark for a month, and one of two years ftanding by taking it for ten days. But the medicine is of a heating nature, and therefore is not to be employed in cafes attended with inflammatory fymptoms.

10. *Peony root* was given to two epileptic patients without the leaft fuccefs.

11. *Vifcus quercinus*, or mifletoe, was given in the quantity of two fcruples five times a-day to an epileptic patient, without fuccefs.

12. *Extractum hyofciami* was given to an epileptic patient, to one afflicted with the hemitotonos, and to one who laboured under the hyfteric affection, without the leaft good effect.

Epilepfia.

13. *Folia aurantiorum* were exhibited with the like bad fuccefs. Five drachms of the powdered leaves were taken at once without any fenfible effect.

14. *Cardamine pratenfis*, in three epileptic cafes, was not attended with any fuccefs.

15. *Opium* did no good.

16. *Cuprum ammoniacale* made no cure in four cafes of epilepfy in which it was tried.

That in many cafes all thefe remedies have been employed without fuccefs, is not to be denied: and indeed it may with confidence be afferted, that a great majority of cafes of epilepfy are incurable by any remedy that has yet been difcovered. At the fame time, as there is incontrovertible evidence that fome of them have fucceeded at leaft in certain cafes, the more powerful may always be confidered as deferving a fair trial. The cuprum ammoniacum, in particular, feems well intitled to the attention of practitioners; for though it be a medicine of great activity, yet under prudent adminiftration it may be employed even with very young fubjects without any hazard; and in feveral inveterate cafes, which had obftinately refifted other medicines, it has brought about a complete recovery.

Genus LIV. PALPITATIO. 290
Palpitation *of the* Heart.

Palpitatio, *Sauv.* gen. 130 *Lin.* 132. *Vog.* 213. *Sag.* 237. *Hoffm.* III. 83. *Junck.* 33.

The palpitation of the heart is fometimes fo violent, that it may be heard at a confiderable diftance. It may proceed from a bad conformation of the heart itfelf, or fome of the large veffels. It may alfo be occafioned by wounds or abfceffes in the heart; or it may proceed from polypous concretions or offifications of that vifcus, or from plethora, fear, or fpafmodic affections of the nervous fyftem. When it proceeds from difeafes of the heart or large veffels, it is abfolutely incurable. In fpafmodic cafes, the remedies above related may be ufed. If the patient be plethoric, bleeding will probably remove the diforder, at leaft for the prefent.

The

Spafmi

Sp. III. The *Plethoric* Asthma.

Afthma plethoricum, *Sauv.* fp. 15.

The afthma is a chronic difeafe, which may continue to give very great diftrefs, at intervals, for a confiderable number of years. Sir John Floyer, when he wrote his celebrated treatife, had laboured under repeated paroxyfms for 30 years.

The common diftinction is into *humid* and *dry*; the former is accompanied with an expectoration of mucus or purulent matter, but the latter is not. In the genuine humoral afthma, the patients are obliged to lean forward; the infpiration is fhort and fpafmodic; and the expiration very flow.

Afthmatic perfons have generally fome warning of the attack, from a languor, lofs of appetite, oppreffion, and fwelling of the ftomach from flatulence, which precede the fit; but it is ufually in the middle of the night that the violent difficulty of breathing comes on.

The duration of the paroxyfm is uncertain, as it will fometimes terminate in three or four hours, while at other times it fhall continue for as many days; nay, it has been known to laft three weeks without intermiffion. While it fubfifts, the patient is in very great diftrefs, not being able to lie in bed, nor fcarcely to fpeak or expectorate, fo great is the difficulty of breathing; and yet, notwithftanding all this apparent interruption to the free paffage of the blood through the lungs, an inflammation here feldom or never fupervenes a fit of the afthma. As the paroxyfm wears off, and the breathing becomes free, there is more or lefs of an expectoration of mucus; and the urine, from being pale and limpid, becomes high-coloured, and lets fall a copious fediment.

In order to obtain relief in the fit, we muft fometimes bleed, unlefs extreme weaknefs or old age fhould forbid, and repeat it according to the degrees of ftrength and fulnefs: a purging clyfter, with a folution of afafœtida, muft be immediately injected; and if the violence of the fymptoms fhould not fpeedily abate, it will be proper to apply a bliftering plafter to the neck or breaft.

In the height of the paroxyfm, an emetic might be followed by dangerous fymptoms, as it would increafe the accumulation of blood in the veffels of the head; but vomiting will often prevent a fit of the afthma, efpecially if the ftomach fhould chance to be loaded with any fort of faburra. A very ftrong infufion of roafted coffee has been found to give eafe in an afthmatic paroxyfm.

Sir John Pringle fays it is the beft abater of the paroxyfms of the periodic afthma that he has feen. The coffee ought to be of the beft Mocco, newly burnt, and made very ftrong immediately after grinding it. He commonly ordered an ounce for one difh; which is to be repeated frefh after the interval of a quarter or half an hour; and which is to be taken without milk or fugar. The medicine in general is mentioned by Mufgrave in his treatife *de Arthritide anomala*; but he firft heard of it from a phyfician in Litchfield, who had been informed by the old people of that place, that Sir John Floyer, during the latter part of his life, kept free from, or at leaft lived eafy under, his afthma, from the ufe of very ftrong coffee. This difcovery, it feems, he made after the publication of his book upon that difeafe. Dr Percival fays he has frequently directed coffee in the afthma with great fuccefs.

Afthma.

In the intervals of the fits, perfons fubject to the afthma, efpecially the humid fpecies, fhould take emetics from time to time. An infufion of tobacco is an emetic that has been faid to be very ferviceable in fome afthmatic cafes; but its operation is both fo diftreffing and fo dangerous, that it will never probably be introduced into common ufe as an emetic; and fmoking or chewing the fame has been known to prevent the frequency and feverity of the paroxyfms. Afthmatic patients may alfo ufe the *lac ammoniaci*, with a due proportion of *oxymel fcilliticum* and *vinum antimoniale*, with a view to promote expectoration; or the gum ammoniac, and others of fimilar virtues, may be formed into pills, and combined with foap, as mentioned for the dyfpnœa pituitofa; or a mafs may be compofed of afafœtida and balfam of Tolu, with fyrup of garlic; and thefe pills may be wafhed down by a medicated wine, impregnated with fquills, horfe-radifh root, and muftard-feed; or a ftrong bitter infufion, with a little antimonial wine.

In fome cafes crude mercury will be found ferviceable; in others flowers of fulphur, made into an electuary with honey or fyrup of garlic; and if, notwithftanding the ufe of thefe things, a coftive habit fhould prevail, it will be neceffary, from time to time, to give a few grains of pills of aloes and myrrh, foap and aloes, or a mafs of equal parts of rhubarb, fcammony, and foap.

The *dry* or *fpafmodic afthma*, during the extreme violence of the fit, is beft relieved by opiates; and fometimes very large dofes are required. But in order to obtain permanent relief, nothing is found to anfwer better than ipecacuanha in fmall dofes. Three, five, eight, or ten grains, according to the ftrength and conftitution of the patient, given every other day, have been productive of the happieft effects; acting fometimes as an evacuant, pumping up the vifcid phlegm; at others, as an antifpafmodic or fedative. Iffues are generally recommended in both fpecies, and will often be found ufeful.

Changes of weather are ufually felt very fenfibly by afthmatic people, who in general cannot live with tolerable eafe in the atmofphere of large cities; though we fhall fometimes meet with patients who agree better with this air, which is fo replete with grofs effluvia of various kinds, than with the pureft that can be found in country fituations. And fome are found who breathe with the moft eafe in a crowded room, with a fire and candles.

A light diet of meats that are eafy of digeftion, and not flatulent, is requifite for afthmatic people; and the exercife of riding is indifpenfably neceffary.

When the afthma is found to depend on fome other difeafe, whether it be the gout or an intermittent fever, or when it proceeds from the ftriking in of fome cutaneous eruption, regard muft always be had to the primary difeafe: thus, in the *afthma arthriticum*, finapifms to the feet, or bliftering, will be abfolutely neceffary, in order, if poffible, to bring on a fit of the gout. And when the dregs of an ague give rife to an afthma, which is termed *febriculofum*, and invades at regular intervals, we muft have recourfe to the Peruvian

Spasmi vian bark. The *asthma exanthematicum* will require blisters or issues, to give vent to the acrid matters which were repelled from the surface of the body; and courses of sulphureous waters, goat's whey, and sweetening diet-drinks, or perhaps mercurial alteratives, in order to correct the sharpness of the juices.

292 GENUS LVI. DYSPNŒA.
Habitual DIFFICULTY of BREATHING.

Dyspnœa, *Sauv.* gen. 144. *Lin.* 160. *Vog.* 267. *Sag.* 251. *Junck.* 32.

293 Sp. I. The *Catarrhal* DYSPNOEA.

Asthma catarrhale, *Sauv.* sp. 16.
Asthma pneumonicum, *Willis* Pharm. rat. P. II. sect. i. cap. 12.
Asthma pituitosum, *Hoffm.* III. sect. ii. cap. 2. § 3.
Asthma pneumodes, *Sauv.* sp. 17.

This is readily known by the symptoms of pneumonia and catarrh attending it, and to the removal of these symptoms the care of the physician must be principally directed.

294 Sp. II. The *Dry* DYSPNOEA.

Dyspnœa a tuberculis, a hydatibus, &c. *Sauv.* sp. 2. 4. 5. 20.
Orthopnœa a lipomate, *Sauv.* sp. 18.

This is generally accompanied with a phthisis pulmonalis; but Sauvages mentions one species of phthisis to which the dry dyspnœa seems more particularly to belong. The patients fall away by degrees, and have a great difficulty of breathing, continual thirst, and little or no spitting. When opened after death, their lungs are found not to be ulcerated, but shrivelled and contracted as if they had been smoke-dried. Goldsmiths and chemists are said to be subject to this disease by reason of the vapours they draw in with their breath. Sauvages doth not mention any particular remedy. Shortness of breath arising from *tubercles*, as they are termed, or a scirrhous enlargement of the lymphatic glands which are dispersed through the lungs, is commonly found in scrofulous habits, and may be distinguished by the concomitancy of those external swellings and appearances which particularly mark the scrofula. This species of dyspnœa generally ends in a phthisis. Courses of goat's whey, and of sea-water, have been known to do service; but it must be confessed, that a perfect cure is seldom obtained. Issues are of use in these cases, as they appear to prevent the ill effects of an over-fulness, if it should happen at any time to supervene.

295 Sp. III. DYSPNOEA from *Changes* in the *Weather*. (*Sauv.* sp. 12.)

This seems to be a disease entirely spasmodic, and the antispasmodics already related are accordingly indicated.

296 Sp. IV. The DYSPNOEA from *Earthy Substances* formed in the *Lungs*.

Sauvages mentions this disease as much more common in brutes than in the human race: but Dr Cullen mentions his having seen some instances of it; and we have several accounts by different authors of calculous matters being coughed up by people labouring under a dyspnœa, and threatened with consumption. In three cases of this kind which fell under Dr Cullen's inspection, there was no appearance of earthy or stony concretions in any other part of the body. The calcareous matter was coughed up frequently with a little blood, sometimes with mucus only, and sometimes with pus. In one of these cases, an exquisite phthisis came on, and proved mortal: in the other two the symptoms of phthisis were never fully formed; and after some time, merely by a milk-diet and avoiding irritation, the patients entirely recovered. Asthma.

Sauvages also greatly recommends milk in these cases, and soap for dissolving the concretions. The reason why brutes are more subject to these pulmonary calculi than mankind, is, that they very seldom cough, and thus the stagnating mucus or lymph concretes into a kind of gypseous matter.

Sp. V. The *Watery* DYSPNOEA. 297

Dyspnœa pituitosa, *Sauv.* sp. 1.
Orthopnœa ab hydropneumonia, *Sauv.* sp. 12.

This may arise from too great a defluxion of mucus on the lungs, or from an effusion of serum, as is mentioned under the pneumonia. The treatment of the disease may be gathered from what has been already said under the heads of pneumonia, catarrh, empyema, &c.

Sp. VI. The DYSPNOEA from *Corpulency*. 298

Othopnœa a pinguedine, *Sauv.* sp. 6.

There have been many instances of suffocation and death occasioned by too great corpulency. These fatal effects, however, may be almost always avoided if the persons have resolution to persist in an active and very temperate course of life; avoiding animal-food, much sleep, and using a great deal of exercise. In the third volume of the Medical observations, however, there is an extraordinary instance of internal obesity which neither showed itself externally, nor could be removed by any medicines.

Other species of dyspnœa have been considered under PHTHISIS. It is frequently symptomatic of diseases of the heart and large vessels, or swellings of the abdomen, &c.

GENUS LVII. PERTUSSIS. 299
CHINCOUGH.

Pertussis *Sydenham*, Ed. Leid. p. 200. 311. 312. *Huxham* de aere, ad. ann. 1732.
Tussis convulsiva, sive ferina, *Hoffm.* III. 111.
Tussis ferina, *Sauv.* sp. 10. *Sag.* sp. 10.
Tussis convulsiva, *Sauv.* sp. 11. *Sag.* sp. 11.
Amphimerina tussiculosa, *Sauv.* sp. 13.

Description. This disease comes on at first like a common cold; but is from the beginning attended with a greater degree of dyspnœa than is common in catarrh; and there is a remarkable affection of the eyes, as if they were swelled, and a little pushed out of their sockets. By degrees the fits of coughing become longer and more violent, till at last they are plainly convulsive, so that for a considerable time the patient cannot respire, and when at last he recovers his breath, inspiration is performed with a shrill kind of noise like the

Spasmi

the crowing of a cock. This kind of inspiration serves only as an introduction to another convulsive fit of coughing, which is in like manner followed by another inspiration of the same kind; and thus it continues for some time, very often till the patient vomit, which puts an end to the paroxysm at that time. These paroxysms are attended with a violent determination of the blood towards the head, so that the vessels become extremely turgid, and blood not unfrequently flows from the mouth and nose. The disease is tedious, and often continues for many months. It is not commonly attended with fever.

Causes, &c. The chincough is an infectious disorder, and very often epidemic: but the nature of the contagion is not understood; at least it is no farther understood than that of small-pox, measles, or similar epidemics. We well know that it is from a peculiar and specific contagion alone that this disease, as well as the others above-mentioned, can arise. But with regard to the nature of any of them, we are totally in the dark. It generally attacks children, or adults of a lax habit, making its attack frequently in the spring or autumn; at the same time, when this contagion is introduced into any town, village, or neighbourhood, it will rage epidemically at any season. Those alone are affected with this disease who have never before been subjected to it. For in this affection, as well as in small-pox, having had the disease once, gives defence against future contagion. Every individual, however, does not seem to be equally readily affected with this contagion; like other contagious diseases occurring only once in a lifetime, it may naturally be expected to be more frequent among children than at any other period of life. But many, though frequently exposed to contagion, are yet not affected with the disease: and those children who live upon unwholesome watery food, or breathe unwholesome air, are most liable to its attacks, and suffer most from them. In general it has been concluded, that whatever weakens the solids, or tends to bring on a dissolution of the fluids, predisposes to this disease.

Prognosis. The chincough is not very often fatal. During one epidemic, however, it is often observed to be much more dangerous and more severe than during another. This is also remarked with regard even to particular periods of the same epidemic; and it is also observed, that on certain families this disease is much more severe than on others. Its danger, however, is still more connected with the period of life at which it occurs. In children under two years of age it is most dangerous; and kills them by producing convulsions, suffocation, inflammation and suppuration of the brain or in the lungs, ruptures, and incurvation of the spine. In pregnant women it will produce abortion; and in adults inflammations of the lungs, and all the consequences of pneumonia, more frequently than in children. From a long continuance of the disease patients will become asthmatic, ricketty, and scrofulous. It is generally reckoned a good sign when a fit terminates by vomiting; for in this disease there seems to be a great increase of the secretion of mucus, and the vomiting affords great relief.

Cure. Pertussis is one of those diseases which after the contagion has exerted its influence can be terminated only by running a certain course: but it is much less limited in its course than small-pox and measles, and often it runs on to a very great length, or at least it is very difficult to distinguish certain sequelæ of this disease from the disease itself. And when it exists in the former of these states, it admits of an artificial termination. In the treatment of this affection, therefore, the objects at which a practitioner chiefly aims, are, in the first place, the obviating urgent symptoms, and forwarding the natural termination of the disease; and secondly, the inducing an artificial termination. With these intentions various practices are employed on different occasions. The most approved remedies are vomits, purges, bleeding, and the attenuating pectorals; for the other kinds generally do hurt: but large evacuations of any kind are pernicious. In the Medical Observations, Vol. III. Dr Morris recommends castor and the bark; but in cases attended with any degree of inflammation, the latter must certainly do hurt, and the former will generally be insignificant. Dr Butter, in a dissertation expressly on the subject, relates 20 cases of it cured by the extract of hemlock. He directs half a grain a-day for a child under six months old; one grain for a child from six months to two years; afterwards allowing half a grain for every year of the patient's age till he be 20: beyond that period, he directs ten grains to be given for the first day's consumption, gradually increasing the dose according to the effect. If the patient have not two stools a-day, he advises magnesia or the *lixivia vitriolata sulphurea* to be added to the hemlock mixture. By this method he says the peculiar symptoms of the disease are removed in the space of a week; nothing but a slight cough remaining. The use of hemlock, however, has by no means become universal in consequence of this publication, nor indeed has this remedy been found equally successful with others who have given it a fair trial. The remedy most to be depended upon in this disease is change of air. The patient, as soon as the disease is fully formed, ought to be removed to some other part of the country: but there is no occasion for going to a distant place; a mile or two, or frequently a smaller distance, will be sufficient; and in this new habitation, the frequency of the cough is almost instantly diminished to a most surprising degree. After remaining there for some time, however, the cough will often be observed to become again more frequent, and the other symptoms increased. In this case, another change of air, or even a return to the former habitation, becomes necessary. Manifest benefit has even been derived by changing a patient from one room of a house to another. But although change of air has thus been advantageous, it must also be remarked, that when it has been had recourse to at very early periods it has often done mischief, particularly by aggravating the febrile and inflammatory symptoms. If the disease be attended with fever, bleeding and other antiphlogistic remedies are proper. Dr Buchan recommends an ointment made of equal parts of garlic and hog's lard applied to the soles of the feet; but if it have any effect, it is probably merely as an *emplastrum calidum*. It ought to be put on a rag and applied like a plaster. Opiates may sometimes be

Pertussis.

Spasmi. be useful, but in general are to be avoided. They are chiefly serviceable where the cough is very frequent, with little expectoration. In these cases benefit has sometimes also been derived from vitriolic ether, and sometimes from the tincture of cantharides. An almost instantaneous termination has on some occasions been put to this disease by exciting a high degree of fear, or by inducing another febrile contagion: But the effects of both are too uncertain and too dangerous to be employed in practice.

Colica flatulenta, pituitosa, &c. *Sauv.* sp. 1. 2. 5. 6. 7. Ileus physodes, volvulus, inflammatorius, &c. *Ejusd.* sp. 1. 3. 5. 7. 8. 9.

Description. The colic is chiefly known by a violent pain in the abdomen, commonly about the umbilical region. The pain resembles various kinds of sensations, as of burning, twisting, boring, a ligature drawn very tight, &c. The belly is generally costive, though sometimes there is a violent evacuation of bilious matters upwards and downwards. In these cases the disease is sometimes accompanied from the beginning with a weak and intermitting pulse, cold sweats, and fainting. In some the disease comes on gradually, beginning with an habitual costiveness; and if purgatives be taken, they do not operate. The pain comes on generally after a meal, and soon occasions nausea and vomiting. Sometimes the disease is attended with pyrexia, violent thirst, and a full pulse; the vomiting becomes more violent, and excrementitious matters are thrown up with the most exquisite pain and tension of the abdomen; an hickup comes on, which continues obstinately; till at last a cessation of pain and fetid breath indicate a mortification of the intestines and approaching death. Sometimes the peristaltic motion of the intestines is so totally inverted, that all their contents are evacuated by the mouth, and even clysters will be vomited; which constitutes that disease commonly called the *iliac passion.*

Colica. *Causes*, &c. Colics may arise from any sudden check given to perspiration, as by violent cold applied to any part of the body, especially to the lower extremities and abdomen. Very frequently they are occasioned by austere, acid, or indigestible aliments taken into the stomach. By any of these, a violent colic, or indeed an iliac passion, may be occasioned; for Dr Cullen justly observes, that this last, though commonly accounted a different species of disease, differs from a colic in no other way than in being in every respect in a much higher degree. In those who have died of this disease and been dissected, the intestines have sometimes been found twisted; but more commonly there hath been an *intrasusception* of the intestine, that is, one part of the gut seems to have entered within the other. In the Edinburgh Medical Essays, Vol. III. we have a dissertation on the use of the warm bath in the bilious colic, in which the author derives the disorder from a spasmodic constriction of the intestine occasioned by the acrimony of the bile. By this, he says, the intestine is not only contracted into an unusual narrowness, but coats of it have been found, upon dissection, so closely joined, that no passage could be made downwards more than if they had been strongly tied by a ligature. The formation of the *intrasusceptio* he explains by quoting a passage from Peyerus, who made the following experiment on a frog. Having irritated the intestine of the animal in several different places, he observed it to contract at those places most violently, and to protrude its contents upwards and downwards wherever the relaxed state of the part would permit; by which means the contents were heaped together in different parts. Hence some parts of the intestine being dilated much more than enough, by reason of the great quantity of matter thrown into them, formed a kind of sack which readily received the constricted part into it. If this happen in the human body, there is the greatest danger of a mortification; because the part which is constricted, and at any rate disposed to inflammation, has that disposition very much increased by its confinement within the other, and by the pressure of the contents of the alimentary canal from the stomach downwards upon it. An iliac passion may also arise from the strangulation of part of the intestine in a hernia; and even a very small portion of it thus strangulated may occasion a fatal disease. In the Medical Observations, Vol. IV. however, we have an account of an iliac passion arising from a very different cause, which could neither have been suspected nor cured by any other way than the operation of *gastrotomy*, or opening the abdomen of the patient, in order to remove the cause of the disorder. The patient, a woman of about 20 years of age, died after suffering extreme torture for six days. The body being opened, some quantity of a dirty coloured fluid was found in the cavity of the abdomen. The jejunum and ileum were greatly distended with air. A portion of the omentum adhered to the mesentery, near that part where the ileum terminates in the cæcum. From this adhesion, which was close to the spine, there ran a ligamentous cord or process about two inches and a half long, unequally thick, in some places not thicker than a packthread; which by its other extremity adhered to the coats of the ileum, about two inches

Spasmi — inches above the cæcum. This cord formed a circle with the mesentery, large enough to admit a hen's egg to pass through it. The chord had formed a noose (in a manner difficult to be explained), which included a doubling of about two inches of the lower end of the ileum; and was drawn so tight, that it not only put a stop to the passage of every thing through the bowels, and brought on a gangrene of the strangulated part, but it had even cut through all the coats of the intestine on the opposite side to the mesentery, and made an aperture about an inch long. In the Memoirs of the Academy of Surgery are mentioned several similar cases.

Prognosis. The colic is never to be reckoned void of danger, as it may unexpectedly terminate in an inflammation and gangrene of the intestines. Those species of it which are attended with purging must be considered as much less dangerous than those in which the vomiting is very violent. The iliac passion, or that attended with the vomiting of feces, is always to be accounted highly dangerous; but if the passage through the intestines be free, even though their peristaltic motion should be inverted, and clysters evacuated by the mouth, there is much more hope of a cure, than when the belly is obstinately costive, and there is some fixed obstruction which seems to bid defiance to all remedies.

Cure. In the cure of the spasmodic colic, the recovery must ultimately depend on producing a resolution of the spasmodic affection. In order to accomplish this, it is in general necessary to evacuate the contents of the intestines, and to remove morbid irritability existing in that part of the system. But in order to preserve the life of the patient from the most imminent hazard, it is still more necessary to prevent and remove those inflammatory affections which often occur in this disease. As the chief danger in colics arises from an inflammation and consequent mortification of the intestines, it is essentially necessary, in the first place, to diminish the tendency to a pyrexia, if there should happen to be any. This is accomplished by bleeding, emollient injections, warm bathing, and cooling medicines taken inwardly. Dr Porter, in the essay abovementioned, strongly recommends the warm bath in those colics attended with violent evacuations of bile. He supposes it to do service by relaxing the constriction of the intestines, and thus preventing or removing the introsusceptio. In the mean time opiates may be given to ease the pain, while every method is tried, by cathartics and glysters of various kinds, to procure a stool. In obstinate cases, where stimulating cathartics have proved ineffectual, the milder kinds, such as manna, senna, oleum ricini, &c. will succeed; but where every thing of this kind fails, recourse must be had to some of the more extraordinary methods. Some have recommended the swallowing of leaden bullets, on a supposition that by their weight they would force through the obstruction into the gut; but these seem much more likely to create than to remove an obstruction. It is impossible they can act by their gravity, because the intestines do not lie in a straight line from the pylorus to the anus; and though this were actually the case, we cannot suppose that the weight of a leaden bullet could prove very efficacious in removing either a spasmodic constriction or an obstruction from any other cause. But when we consider, not only that the intestines consist of a great multitude of folds, but that their peristaltic motion (by which only the contents are forced through them) is inverted, the futility of this remedy must be evident. It might rather be supposed to aggravate the disease; as the lead, by its pressure, would tend to fix the introsusception more firmly, or perhaps push it still further on. The same thing may be said of quicksilver: not to mention the pernicious consequences to be apprehended from swallowing large quantities of this mineral, even if it should prove efficacious in relieving the patient for the present. There are, however, some late cases on record, particularly one by Mr William Perry, published in the sixteenth volume of the Edinburgh Medical Commentaries, in which the hydrargyrus, swallowed in great quantities, was attended with the happiest effects, after every other remedy had been tried in vain. Another method has been proposed, in the Medical Essays, for relieving the miserable patients in this disorder, which in many cases has been known to do service. The patient is to be taken out of bed, and made to walk about on the cold floor of a damp apartment. At the same time, porringers of cold water are to be dashed on his feet, legs, and thighs; and this must be continued for an hour or longer, if a stool be not procured before that time, though this will generally be the case much sooner. The exercise does not at all impair the patient's strength, but rather adds to it; and some very remarkable instances are adduced in the 6th volume of the Medical Essays, where this proved effectual after all other medicines had failed. In one person the disease had come on with an habitual costiveness, and he had been for a week tormented with the most violent pain and vomiting, which could be stopped neither by anodynes nor any other medicines, the sharpest clysters being returned unaltered, and all kinds of purgatives thrown up soon after they were swallowed; but by the abovementioned method, a stool was procured in 35 minutes, and the patient recovered. In some others the costiveness had continued for a much longer time.—Other remedies are, the blowing air into the intestines by means of a bellows, and the injecting clysters of the smoke of tobacco. But neither of these seem very capable of removing the disease. They can affect only the parts below the obstruction; while, to cure the disease, it is necessary that the obstructed parts themselves should be reached by the medicine, and therefore we have not many well-attested instances of their success. In some obstinate cases, however, benefit has certainly been derived from tobacco-smoke injections, and likewise from injections of tepid water to the extent of several pounds. For putting in practice these modes of cure, a particular apparatus have been contrived; and in cases even apparently desperate, neither should be neglected. The cold water gives a general and very considerable shock to the system, checks the perspiration, and thus drives the humours inward upon the intestines, by which they receive a much more effectual stimulus than can be supposed to arise from any kind of clyster. But when all methods have failed, the only chance the patient can have for life is by a manual operation.

In those colics which are attended with faintings, Colica.

Spafmi &c. from the beginning, and which generally attack hyfteric women and other debilitated perfons, all kinds of evacuations are pernicious; and the cure is to be attempted by anodynes and cordials, which will feldom fail of fuccefs. Even there alfo, however, it is neceffary that the belly fhould be moved; and for this purpofe injections, containing a folution of afafœtida, which operate powerfully as antifpafmodics, are preferable to moft other modes of cure.

Colica Pictonum *Citefii et fuccedentium auctorum.*

Another caufe to which violent colics are frequently to be afcribed, and which often gives occafion to them where it is very little fufpected, is lead, or fome folution or fume of it, received into the body. To this caufe is evidently owing the colics to which plumbers, lead-miners, and fmelters of lead, are fubject. To the fame caufe, though not fo apparent at firft fight, are we to afcribe the Devonfhire colic, where lead is received into the body diffolved in cyder, the common drink of the inhabitants of that country. This has been proved by experiment; for lead has been extracted from cyder in quantity fufficient to produce pernicious effects on the human body. The colic of Poictou, and what is called the *dry belly-ache* in the Weft Indies, are of the fame nature; for which reafon we give the following general defcription of the fymptoms of all thefe difeafes.

The patient is generally firft feized with an acute pain at the pit of the ftomach, which extends itfelf down with griping pains to the bowels. Soon after there is a diftenfion, as with wind; and frequent reachings to vomit, without bringing up any thing but fmall quantities of bile and phlegm. An obftinate coftivenefs follows, yet fometimes attended with a tenefmus, and the bowels feem to the patient as if they were drawn up towards the back; at other times they are drawn into hard lumps, or hard rolls, which are plainly perceptible to the hand on the belly, by ftrong convulfive fpafms. Sometimes the coats of the inteftines feem to be drawn up from the anus and down from the pylorus towards the navel. When a ftool is procured by artificial means, as clyfters, &c. the feces appear in little hard knots like fheep's dung, called *fcybalæ*, and are in fmall quantity. There is, however, ufually an obftinate coftivenefs; the urine is difcharged in fmall quantity, frequently with pain and much difficulty. The pulfe is generally low, though fometimes a little quickened by the violence of the pain; but inflammatory fymptoms very feldom occur. The extremities are often cold, and fometimes the violence of the pain caufes cold clammy fweats and fainting. The mind is generally much affected, and the fpirits are funk. The difeafe is often tedious, efpecially if improperly treated, infomuch that the patients will continue in this miferable ftate for twenty or thirty days fucceffively; nay, inftances have been known of its continuing for fix months. In this cafe the pains at laft become almoft intolerable: the patient's breath acquires a ftrong fetid fmell like excrements, from a retention of the feces, and an abforption of the putrid effluvia from them by the lacteals. Colica. At laft, when the pain in the bowels begins to abate, a pain comes on in the fhoulder-joints and adjoining mufcles, with an unufual fenfation and tingling along the fpinal marrow. This foon extends itfelf from thence to the nerves of the arms and legs, which become weak; and that weaknefs increafes till the extreme parts become paralytic, with a total lofs of motion, though a benumbed fenfation often remains. Sometimes, by a fudden metaftafis, the brain becomes affected, a ftupor and delirium come on, and the nervous fyftem is irritated to fuch a degree as to produce general convulfions, which are frequently followed by death. At other times, the periftaltic motion of the inteftines is inverted, and a true iliac paffion is produced, which alfo proves fatal in a fhort time. Sometimes the paralytic affection of the extremities goes off, and the pain of the bowels returns with its former violence; and on the ceffation of the pain in the inteftines, the extremities again become paralytic and thus the pain and palfy will alternate for a very long time.

Cure. Various methods have been attempted for removing this terrible difeafe. The obftinate coftivenefs which attends it, made phyficians at firft exhibit very ftrong purgatives and ftimulating clyfters. But thefe medicines, by increafing the convulfive fpafms of the inteftines, were found to be pernicious. Balfam of Peru, by its warm aromatic power, was found to fucceed much better; and Dr Sydenham accordingly prefcribed it in the quantity of 40 drops twice or thrice a day taken on fugar. This, with gentle purgatives, opiates, and fome drops of the hotter effential oils, continued to be the medicine commonly employed in this difeafe, till a fpecific was publifhed by Dr Lionel Chalmers of South Carolina. This receipt was purchafed by Dr Chalmers from a family where it had long been kept a fecret. The only unufual medicine in this receipt, and on which the efficacy of it chiefly if not wholly depends, is vitriolated copper. This muft be diffolved in water, in the quantity of one grain to an ounce, and the dofe of the folution is a wine-glafsful given fafting for nine fucceffive mornings. For the firft four or five days this medicine difcharges much æruginous bile both ways; but the excretions of this humour leffen by degrees; and before the courfe be ended, it has little other effect than to caufe fome degree of fqueamifhnefs, or promote a few bilious ftools, or perhaps may not move the patient at all. At the time of ufing this medicine the patients fhould live upon broth made of lean meat, gruel, or panada: but about the feventh or eighth day, they may be allowed bread and boiled chicken. Here the copper feems to do fervice by its tonic power; and for the fame reafon, alum, recommended by Dr Percival, moft probably cures the difeafe. He fays he has found this very efficacious in obftinate affections of the bowels, and that it generally proves a cure in the flighter cafes of the colica pictonum. It was given to the quantity of fifteen grains every fourth, fifth, or fixth hour; and the third dofe feldom failed to mitigate the pain, and fometimes entirely removed it. Among purgative medicines, the *oleum Ricini* is found to be the moft efficacious.

Sp. III.

Spasmi

304 Sp. III. The Colic from *Costiveness*.

Colica stercorea, *Sauv.* sp. 3.
Ileus a fæcibus induratis, *Sauv.* sp. 2.

For the treatment of this species, see above.

Sp. IV. The *Accidental Colic*.

Colica Japonica,—accidentalis,—lactentium,—a veneno, *Sauv.* sp. 10. 14. 18. 20.
Cholera sicca auriginosa a fungis venenatis, *ejusd.* sp. 2.

When colics arise from acrid poisonous matter taken into the stomach, the only cure is either to evacuate the poison itself by vomiting, or to swallow some other substance which may decompound it, and thus render it inactive. The most common and dangerous substances of this kind are corrosive mercury and arsenic. The former is easily decompounded by alkaline salts; and therefore a solution of lixivial salt, if swallowed before the poison has time to induce a mortification of the bowels, will prove a certain cure. Much more uncertain, however, is the case when arsenic is swallowed, because there is no certain and speedy solvent of that substance yet known. Milk has been recommended as efficacious; and lately a solution of *hepar sulphuris*. The latter may possibly do service; as arsenic unites readily with sulphur, and has its pernicious qualities more obtunded by that than by any other known substance: but indeed, even the solvent powers of this medicine are so weak, that its effects as well as those of others must be very uncertain.

Some kinds of fungi, when swallowed, are apt to produce colics attended with stupor, delirium, and convulsions; and the same sometimes happens from eating a large quantity of the shell-fish known by the name of muscles (the Mytulus). Some of the fungi, doubtless, may have an inherent poisonous quality; but generally they as well as the muscles act on a different principle. Their pernicious effects happen most commonly when they are taken on an empty stomach; and are then supposed to be occasioned by their adhering so close to its coats, that it cannot exert its powers, and the whole system is thrown into the utmost disorder. The malady may therefore be very easily prevented; but when once it has taken place, it cannot be removed till either a vomiting be excited, or the stomach has recovered itself in such a manner as to throw off the adhering matter.

305 Sp. V. Colic of *New-born Infants* from a *Retention* of the *Meconium*. (*Sauv.* sp. 19.)

This disorder would be prevented were children allowed immediately to suck their mothers, whose milk at first is purgative. But as this is not commonly done, the child is frequently troubled with colics. These, however, may be removed by a few grains of ipecacuanha, or a drop or two of antimonial wine. By these means the stomach is cleansed by vomiting, and the belly is generally loosened; but if this last effect does not happen, some gentle purge will be necessary.

306 Sp. VI. Colic from a *Callosity* of the *Colon*.

It is in a manner impossible to discover this distemper before the patient's death; and though it should, it does not admit of a cure.

Colica.

Sp. VII. The Colic from *Intestinal Calculi*. (*Sauv.* sp. 10. 15.) 307

When certain indigestible bodies, such as cherry-stones, plum-stones, small pieces of bones, &c. are swallowed, they frequently prove the basis of calculi, formed by an accretion of some kind of earthy matter; and being detained in some of the flexures of the intestines, often occasion very violent colics. These calculi do not discover themselves by any peculiar symptoms, nor do they admit of any particular method of cure. In the Medical Essays we have an instance of colics for six years, occasioned by calculi of this kind. The concretions were at last passed by stool; and their passage was procured by causing the patient drink a large quantity of warm water, with a view to promote the evacuation of bile, a redundancy of which was supposed to be the cause of her disorder.

Cholera spontanea, *Sauv.* sp. 1. *Sydenh.* sect. iv. cap. 2.
Cholera Indica, *Sauv.* sp. 7.

Sp. II. The *Accidental Cholera*, from acrid matters taken inwardly. 310

Cholera crapulosa, *Sauv.* sp. 11.
Cholera a venenis, *Sauv.* sp. 4. 5.

The cholera shows itself by excessive vomiting and purging of bilious matters, with violent pain, inflation and distension of the belly. Sometimes the patients fall into universal convulsions; and sometimes they are affected with violent spasms in particular parts of the body. There is a great thirst, a small and unequal pulse, cold sweats, fainting, coldness of the extremities, and hiccough; and death frequently ensues in 24 hours.

In this disease, as a larger quantity of bile is deposited in the alimentary canal, particularly in the stomach, the first object is to counteract its influence, and to promote an easy discharge of it. It is next necessary to restrain that increased secretion of bile, by which a fresh deposition in the alimentary canal would otherwise be soon produced. And, in the last place, measures must often be employed to restore a sound condition to the alimentary canal, which is frequently much weakened by the violence of the disease.

On these grounds, the cure of this distemper is effected by giving the patient a large quantity of warm water, or very weak broth, in order to cleanse the stomach of the irritating matter which occasions the disease, and injecting the same by way of clyster, till the pains begin to abate a little. After this, a large dose of laudanum is to be given in some convenient vehicle.

Spasmi

vehicle, and repeated as there is occasion. But if the vomiting and purging have continued for a long time before the physician be called, immediate recourse must be had to the laudanum, because the patient will be too much exhausted to bear any further evacuations. Sometimes the propensity to vomit is so strong, that nothing will be retained, and the laudanum itself thrown up as soon as swallowed. To settle the stomach in these cases, Dr Douglas, in the Medical Essays, recommends a decoction of oat-bread toasted as brown as coffee; and the decoction itself ought to be of the colour of weak coffee. He says he does not remember that this decoction was ever vomited by any of his patients. An infusion of mint-leaves or good simple mint-water is also said to be very efficacious in the same case.

The tincture of opium is sometimes retained when given in conjunction with a portion of the vitriolic acid properly diluted. But when it cannot be retained in a fluid form by the aid of any addition, it will sometimes sit upon the stomach when taken in a solid state.

After the violence of the disease is overcome, the alimentary canal, and the stomach in particular, requires to be braced and strengthened. With this view recourse is often had with advantage to different vegetable bitters, particularly to the use of the colombo root; which, while it strengthens the stomach, is also observed to have a remarkable tendency in allaying a disposition to vomiting, which often remains for a considerable time after the cholera may be said to be overcome.

311 Genus LXI. DIARRHOEA.

Looseness.

Diarrhœa, *Sauv.* gen. 253. *Lin.* 187. *Vog.* 105. *Sag.* gen. 189. *Junck.* 112.
Hepatirrhœa, *Sauv.* gen. 246.
Cholerica, *Lin.* 190.
Cœliaca, *Sauv.* gen. 255. *Lin.* 189. *Vog.* 109. *Sag.* gen. 199.
Lienteria, *Sauv.* gen. 256. *Lin.* 188. *Sag.* gen. 191. *Vog.* 108.
Pituitaria, & leucorrhois, *Vog.* 111. 112.

312 Sp. I. The *Feculent Diarrhoea.*

Diarrhœa stercorosa & vulgaris, *Sauv.* sp. 1. 2.

This is occasioned by the too great quantity of matter thrown into the alimentary canal; and what is discharged has not the appearance of excrements, but is much whiter, and of a thinner consistence. Voracious people who do not sufficiently chew their food, gormandizers, and even those who stammer in their speech, are said to be liable to this disease. In slighter cases it is removed without any medicine, or by a dose of rhubarb; but where the matters have acquired a putrid taint, the disorder may be exceedingly protracted and become dangerous. In this case lenient and antiseptic purgatives are to be made use of, after which the cure is to be completed by astringents.

313 Sp. II. The *Bilious Diarrhoea.*

(*Sauv.* sp. 8.)

This distemper shows itself by copious stools of a very yellow colour, attended with gripes and heat of the bowels, thirst, bitterness, and dryness of the mouth, yellowness of the tongue, and frequently follows an intermitting or bilious fever. When the fever is gone, the diarrhœa is to be removed by acidulated and cooling drinks, with small doses of nitre.

Diarrhœa.

Sp. III. The *Mucous Diarrhoea.* 314

Diarrhœa lactentium, *Sauv.* sp. 19.
Dysenteria Parisiaca, *Sauv.* sp. 3.
Diarrhœa ab hypercatharsi, *Sauv.* sp. 16.
Dysenteria a catharticis, *Sauv.* sp. 12.
Pituitaria, *Vog.* 111.
Leucorrhois, *Vog.* 112.
Diarrhœa pituitosa, *Sauv.* sp. 4.
Cœliaca mucosa, *Sauv.* sp. 3.
Diarrhœa serosa, *Sauv.* sp. 10.
a. Diarrhœa urinosa.

This kind of diarrhœa, besides the matters usually excreted, is attended with a copious dejection of the mucus of the intestines with great pain; while the patient daily pines away, but without any fever.—Persons of all ages are liable to it, and it comes on usually in the winter-time; but is so obstinate, that it will sometimes continue for years. In obstinate loosenesses of this kind, vomits frequently repeated are of the greatest service. It is also very beneficial to keep the body warm, and rub the belly with stimulating ointments; at the same time that astringent clysters, rhubarb, and stomachic medicines, are to be exhibited. Starch clysters are very often efficacious.—Some kinds of loosenefs are contagious; and Sir John Pringle mentions a soldier who laboured under an obstinate diarrhœa, who infected all those that used the same privy with himself. In the looseness which frequently followed a dysentery, the same author tells us that he began the cure with giving a vomit of ipecacuanha, after which he put the patients on a course of astringents. He used a mixture of three drachms of extract of logwood, dissolved in an ounce and a half of spirit of cinnamon, to which was added seven ounces of common water, and two drachms of tincture of catechu. Of this the patient took two spoonfuls once in four or five hours, and sometimes also an opiate at bed-time. He recommends the same medicine in obstinate diarrhœas of all kinds. A decoction of simarauba bark was also found effectual, when the dysenteric symptoms had gone off. Dr Huck, who used this article in North-America, also recommends it in diarrhœas. Two or three ounces of the simarauba are to be boiled in a pound and a half of water to a pound, and the whole quantity taken throughout the day. He began with the weakest decoction; and, when the stomach of the patient could easily bear it, he then ordered the strongest: but at the same time he acknowledges, that, unless the sick found themselves sensibly better within three days from the time they began the medicine, they seldom afterwards received any benefit from it. But when all astringents have failed, Sir John Pringle informs us, he hath known a cure effected by a milk and farinaceous diet; and he thinks in all cases the disorder would be much more easily removed, if the patients could be prevailed on to abstain entirely from spirituous liquors and animal-food. If the milk by itself should

Spasmi

turn sour on the stomach, a third part of lime-water may be added. In one case he found a patient receive more benefit from good butter-milk than from sweet-milk. The chief drinks are decoctions of barley, rice, calcined hartshorn, toast and water, or milk and water.

315 Sp. IV. The Coeliac Passion.

Cœlica chylosa, *Sauv.* sp. 1.
Cœlica lactea, *Sauv.* sp. 4.

There are very great differences among physicians concerning the nature of this disease. Sauvages says, from Aretæus, it is a chronic flux, in which the aliment is discharged half digested. It is attended with great pains of the stomach, resembling the pricking of pins; rumbling and flatus in the intestines; white stools, because deprived of bile, while the patient becomes weak and lean. The disease is tedious, periodical, and difficult to be cured. Sauvages adds, that none of the moderns seem to have observed the disease properly; that the excrements indeed are white, on account of a deficiency of the bile, but the belly is bound as in the jaundice. Dr Cullen says there is a dejection of a milky liquid of the nature of chyle; but this is treated by Vogel as a vulgar error. He accuses the moderns of copying from Aretæus, who mentions white fæces as a symptom of the distemper; from whence authors have readily fallen into the notion that they never appeared of any other colour in persons labouring under the cœliac passion. This error quickly produced another, which has been very generally received; namely, that the chyle was thrown out of the lacteals by reason of some obstruction there, and thus passed along with the excrements; of which he says there is not the least proof, and agrees with Aretæus that the whiteness is only occasioned by the want of bile. He endeavours to prove at length, that the cœliac passion can neither be occasioned by an obstruction of the lacteals, nor of the mesenteric glands; though he owns that such as have died of this disease and were dissected, had obstructions in the mysenteric glands; but he denies that all those in whom such obstructions occur, are subject to the cœliac passion. He considers the distemper as arising from a cachexy of the stomachic and intestinal juices; and directs the cure to be attempted by emetics, purgatives, antiseptics, and tonics, as in other species of diarrhœa.

316 Sp. V. The Lientery.

Lienteria spontanea, *Sauv.* sp. 2.

The lientery, according to Sauvages, differs from the cœliac passion only in being a slighter species of the disease. The aliment passes very quickly through the intestines, with scarce any alteration. The patients do not complain of pain, but are sometimes affected with an intolerable hunger. The cure is to be attempted by stomachics and tonics, especially the Peruvian bark. This disease is most common in the earlier periods of life; and then rhubarb in small quantities, particularly when combined with magnesia, is often productive of the best effects.

Diarrhœa.

Sp. VI. The *Hepatic Flux*.
Hepatirrhœa intestinalis, *Sauv.* sp. 2.

The hepatic diarrhœa is by Sauvages described as a flux of bloody serous matter like the washings of flesh, which percolates through the coats of the intestines by means of the anastomosing vessels. It is the cœliac passion of Trallianus; and which, according to Sauvages, rarely, if ever, occurs as a primary disease. It has, however, been observed to follow an inflammation of the liver, and then almost always proves fatal. 317

Genus LXII. DIABETES. 318
A profuse Discharge of Urine.

Diabetes, *Sauv.* gen. 263. *Lin.* 197. *Vog.* 115. *Sag.* gen. 190. *Junck.* 99 *Dobson*, Med. Observat. Vol. V. p. 298. *Home*'s Clinical Experiments, sect. xvi.

Diabetes legitimus, *Sauv.* sp. 1. *Aretæus* de Morb. diuturn. lib. ii. cap. 2.
Diabetes ex vino, *Sauv.* sp. 5. *Ephem. Germ.* D. I. A. II. Observ. 122.

Description. The diabetes first shows itself by a dryness of the mouth and thirst, white frothy spittle, and the urine in somewhat larger quantity than usual. A heat begins to be perceived in the bowels, which at first is a little pungent, and gradually increases. The thirst continues to augment by degrees, and the patient gradually loses the power of retaining his urine for any length of time. It is remarkable, that though the patients drink much, the quantity of urine always exceeds what is drank. In Dr Home's Clinical Experiments we have an account of two patients labouring under this disease: one of them drank between 10 and 12 English pints a-day without being satisfied. The quantity was greater in the forenoon than in the afternoon. In the other the case was reversed. He drank about four pints a-day, and more in the afternoon than the forenoon. The former passed from 12 to 1[illegible] pints of urine in the day: the latter, 11 or 12; so that his urine always exceeded his drink by eight, or at least seven pints. When the urine is retained a little while, there is a swelling of the loins, ilia, and testes: in this disease the strength gradually decays; the skin is dry and shrivelled; œdematous swellings arise in various parts of the body, but afterwards subside without relieving the disease in the least; and the patient is frequently carried off by convulsions.

The most singular phenomenon in this disease is, that the urine seems to be entirely or very much divested

Spasmi Diabetes.

vested of an animal-nature, and to be largely impregnated with a saccharine salt scarce distinguishable from that obtained from the sugar-cane. This discovery was first made by Dr Dobson of Liverpool, who made some experiments on the urine of a person labouring under a diabetes, who discharged 28 pints of urine every day, taking during the same time from 12 to 14 pounds of solid and liquid food. Some of this urine being set a-side, fell into a spontaneous effervescence, changed first into a vinous liquor, and afterwards into an acetous one, before it became putrid and offensive. Eight ounces of blood taken from the same patient, separated into crassamentum and serum; the latter being sweet to the taste, but less so than the urine. Two quarts of the urine, evaporated to dryness, left a white cake weighing four ounces two drachms and two scruples. This cake was granulated, and broke easily between the fingers: it smelled sweet like brown sugar; neither could it by the taste be distinguished from sugar, except that it left a slight sense of coolness on the tongue. The experiment was repeated after the patient was recovered to such a degree as to pass only 14 pints of urine a-day. There was now a strong urinous smell during the evaporation; and the residuum could not be procured in a solid form, but was blackish, and much resembled very thick treacle. In Dr Home's patients, the serum of the blood had no preternatural sweetness; in one of them the crassamentum was covered with a thick inflammatory crust. In one of these patients the urine yielded an ounce and a half, and in the other an ounce, of saccharine matter from each pound. It had, however, an urinous smell, and a saline taste mixed with the sweet one; and the urine of one fermented with yeast, we are told, into "tolerable small-beer." Both these patients had a voracious appetite, and perpetual gnawing sense of hunger; as had also Dr Dobson's patient. The insipid urine of those affected with diabetes has not been examined by physicians with sufficient accuracy to enable us to speak with confidence of its contents.

Causes. These are exceedingly obscure and uncertain; spasms of the nervous system, debility, and every thing inducing it, but especially strong diuretics and immoderate venery, have been accused as bringing on the diabetes. It has, however, occurred in persons where none of all these causes could be suspected; nor have the best physicians been able to determine it.—Dissections have only shown that the kidneys were in an enlarged and lax state. In one of Dr Home's patients who died, they smelled sour; which showed that the urine peculiar to diabetes came from the kidneys, and was not sent directly from the intestines by a retrograde motion of the lymphatics, as some imagine.

Prognosis. The diabetes is rarely cured, unless when taken at the very beginning, which is seldom done; and in a confirmed diabetes the prognosis must therefore be unfavourable.

Cure. As there is reason to believe that in this affection the morbid secretion of urine, which is both preternatural in point of quantity and of quality, arises from a morbid diminution of tone in the kidney, the great object in the cure must be the restoration of due tone to the secreting vessels of the kidney. But as even this diminished tone would not give rise to the peculiar vitiated secretion without a morbid sensibility of that organ, it is necessarily a second object to remove this morbid sensibility. But besides this, the morbid secretion of urine may also be counteracted both by a diminution of the determination of fluids to the kidney, and by preventing the occurrence of superfluous water in the general mass of blood.

On these grounds the principal hopes of a cure in this distemper are from astringent and strengthening medicines. Dr Dobson's patient was relieved by the following remedies; which, however, were frequently varied, as none of them produced their good effects for any length of time: The bark in substance, with small doses of rhubarb; decoction of the bark, with the acid elixir of vitriol; the cold infusion of the bark, of which he drank from a quart to two quarts daily; Dover's powder; alum-whey; lime-water; antimonials combined with *tinctura Thebaica*. The warm bath was used occasionally when the skin was remarkably hot and dry, and the patient complained of restlessness and anxiety. The tincture of cantharides was likewise tried; but he could never take more than 25 drops for a dose, without exciting great uneasiness in his bowels. The body was kept constantly open, either with rhubarb or the infusion of sena joined with rhubarb. His common drinks were rice-water, barley-water, lime-water, and milk; lime-water alone; sage, balm, or mint-tea; small-beer, simple water, and water acidulated with the vitriolic acid. In seven months, these remedies, in whatever manner varied, made no further progress in removing the disease. In Dr Home's patients, all these medicines, and many others, were tried without the least good effect; insomuch that he uses this remarkable expression: "Thus, these two patients have exhausted all that experience had ever recommended, and almost all that theory could suggest; yet, in both cases, the disease has resisted all the means of cure used." It is remarkable, that though septics were given to both, in such quantity as evidently to produce a putrescency in the *primæ viæ*, the urine remained unaltered both in quantity and quality.

But although this disease be frequently in its nature so obstinate as to resist every mode of cure, yet there can be no doubt that particular remedies have succeeded in different cases. Dr Brisbane relates several cases cured by the use of tincture of cantharides: and Dr M'Cormick has related some in the 9th volume of the Edinburgh Medical Commentaries, which yielded to Dover's powder after a variety of other remedies had been tried in vain.

Genus LXIII. HYSTERIA. Hysterics.

321

Hysteria, *Sauv.* gen. 135. *Lin.* 126. *Vog.* 219. *Sag.* gen. 242.

Malum hystericum, *Hoffm.* III. 50. *Junck.* 36.

Affectio hysterica, *Willis* de Morb. Convulsiv. cap. 5. 10. 11. *Sydenham* Diss. Epist. ad G. Cole, *Whytt* on Nervous Disorders.

Description. The hysteria is a convulsive disease, which comes on at uncertain intervals, sometimes longer and sometimes shorter, but at no stated time. The paroxysms commonly begin with a languor and debility

Spasmi

lity of the whole body; yawning, stretching, and restlessness. A sense of coldness also in the extremities, almost always precedes, and for the most part remains during the whole time of, the paroxysm. To this sometimes succeeds a sense of heat; and the two sensations alternate with each other in different parts of the body. The face is sometimes flushed and sometimes pale; and sometimes the paleness and flushing come alternately. There is a violent pain in the head; the eyes become dim, and pour out tears; there is a rumbling and inflation of the intestines; a sensation is felt like that of a globe ascending from the lower part of the abdomen or hypogastrium, which sometimes seems to roll along the whole alimentary canal. It ascends to the stomach, sometimes suddenly, sometimes slowly; and there produces a sense of inflation and weight, together with anxiety, nausea, and vomiting. At last it comes up to the throat, where it produces a sense of suffocation, and difficulty of breathing or swallowing. During this time there are the most violent pains both in the external and internal parts of the abdomen; the muscles are convulsed; the umbilicus is drawn inwards; and there are frequently such spasms of the intestines, that neither clysters can be injected, nor even flatus pass downwards. Sometimes the paroxysm remits after these symptoms have continued for a certain time, but more frequently the patients fall into fainting fits; sometimes they lie without motion, as if they were in a deep sleep; sometimes they beat their breasts violently and continually with their hands, and sometimes they are seized with general convulsions, and the disease puts on the appearance of an epilepsy. In some patients the extremities become cold and stiff, and the body has the appearance of one in a catalepsy. Sometimes a most violent beating pain takes place in some part of the head, as if a nail was driving into it, and all visible objects seem to turn round; grievous pains attack the loins, back, and bladder, and the patients make a surprising quantity of urine as limpid as water; which last is one of the surest signs of the disease. The mind is very much affected as well as the body. Sometimes the patients are tormented with vain fears; sometimes they will laugh, at other times cry immoderately; and sometimes their temper becomes so peevish and fretful, that they cannot enjoy a moment's quiet. The appearances which take place in this affection are indeed so much varied, that they can hardly be enumerated: they may, however, with propriety, be divided into hysteric fits, which very much resemble those of epilepsy, excepting that they are not attended with an abolition of the internal senses; and hysteric symptoms, such as the *globus hystericus*, *clavus hystericus*, and the like, which are chiefly known to constitute a part of this disease from being observed to alternate with fits.

Causes, &c. The general cause of hysteria is thought by the best physicians to consist in a too great mobility and irritability of the nervous system, and of consequence the disease may be brought on by whatever debilitates and renders the body irritable. Hence it most frequently attacks females of a weak and lax habit of body, though there are some instances of men also attacked by it. It generally comes on between the time of puberty and the age of 35, and makes its attacks during the time of menstruation more frequently

than at any other. It also more frequently seizes barren women and young widows, than such as are bearing children. Hysteria.

Prognosis. Though the appearance of this disease be so very terrible, it seldom proves mortal unless by wrong treatment: but notwithstanding this it is extremely difficult of cure, and rarely admits of any thing else than being palliated; for though it should seem to be conquered by medicine for a time, it very quickly returns, and that from the slightest causes.

Cure. The ends principally to be aimed at in the cure of this disease are, in the first place, the removal of particular convulsive or spasmodic affections immediately producing various appearances in the disease, whether under the form of proper hysteric fits, or merely of what may be called hysteric symptoms; and in the second place, the prevention of the return of symptoms after they have been removed, by the employment of proper remedies during those intervals from complaints which patients often have when labouring under this affection.

The most powerful remedy hitherto discovered in hysteric cases is opium, or the tincture of it called *laudanum*. By this commonly the most violent paroxysms are stopped, though it be insufficient to accomplish a radical cure. In Dr Home's Clinical Experiments we find an instance of a cure performed by venesection, though this remedy has been generally condemned in hysterical cases. Asafœtida seems to stand next in virtue to opium; though with some it disagrees, and occasions pains in the stomach and vomiting. Æther will also frequently remove an hysteric fit: but its effects are of short duration; and if it do not effect a cure soon after its exhibition, no service is to be expected either by perseverance in the use of it or by increasing the dose; and with some constitutions it disagrees to such a degree as to occasion convulsions. If the patient be seized with a violent fit, so that she can swallow nothing, which is frequently the case, it will be proper to apply some strong volatile alkali to her nose; or if that be not at hand, the vapour of burning feathers is sometimes very efficacious. In some instances benefit is derived from the sudden application of cold water to the face or hands; but still more frequently the application of water in a tepid state, particularly the warm pediluvium, is found to be of very great service in bringing about a favourable termination of different violent hysteric symptoms. A plaster of galbanum and asafœtida will also prove serviceable: but it must be remembered, that none of these things will prevent the return of the disease; and therefore a radical cure is to be attempted by exercise, the Peruvian bark, chalybeates, mineral waters, and other tonics; but particularly, where the state of the patient is such as to be able to bear it, by the use of the cold bath, which, where it does not disagree with the constitution, is often of the greatest service in preventing returns of this affection.

Genus LXIV. HYDROPHOBIA. 322
The *Dread* of Water.

323 Sp I. *Hydrophobia Rabiosa*, or Hydrophoby consequent on the *Bite* of a *Mad Animal*.
Hydrophobia vulgaris, *Sauv.* sp. 1.

It is the opinion of some, that Dr Cullen has done wrong in employing the term *hydrophobia* as a generic name, under which canine madness is included: and it must be allowed, that the dread of water, while it is not universal, is also a symptom occurring only late in the disease, at least in the greater part of cases. Perhaps his arrangement would have been less exceptionable, if, following Linnæus, he had adopted *rabies* as a generic term, and had distinguished this particular species by the epithet of *canina*, *contagiosa*, or the like. Disputes, however, about names, are in general not very important; and it is sufficient to observe, that the affection now to be treated of is canine madness, or that disease which arises from the bite of a mad animal.

Description. This disease commonly does not make its attack till a considerable time after the bite. In some few instances it has commenced in seven or eight days from the acident; but generally the patient continues in health for 20, 30, or 40 days, or even much longer. The bite, if not prevented, will in general be healed long before that time, frequently with the greatest ease; though sometimes it resists all kinds of healing applications, and forms a running ulcer which discharges a quantity of matter for many days. It has been said, that the nearer the wounded place is to the salivary glands, the sooner the symptoms of hydrophobia appear. The approach of the disease is known by the cicatrix of the wound becoming high, hard, and elevated, and by a peculiar sense of prickling at the part; pains shoot from it towards the throat: sometimes it is surrounded with livid or red streaks, and seems to be in a state of inflammation; though frequently there is nothing remarkable to be observed about it. The patient becomes melancholy, loves solitude, and has sickness at stomach. Sometimes the peculiar symptom of the disease, *the dread of water*, comes on all at once. We have an instance of one who, having taken a vomit of ipecacuanha for the sickness he felt at his stomach, was seized with the hydrophobia in the time he was drinking the warm water. Sometimes the disease begins like a common sore throat; and the soreness daily increasing, the hydrophobic symptoms show themselves like a convulsive spasm of the muscles of the fauces. In others, the mind seems to be primarily affected, and they have a real *dread* of water or any liquid before they try whether they can swallow it or not. Dr James, in his Treatise on Canine Madness, mentions a boy sent out to fill two bottles with water, who was so terrified by the noise of the liquid running into them, that he fled into the house crying out that he was bewitched. He mentions also the case of a farmer, who, going to draw some ale from a cask, was terrified to such a degree at its running into the vessel, that he ran out in a great haste with the spigot in his hand. But in whatever manner this symptom comes on, it is certain that the most painful sensations accompany every attempt to swallow liquids. Nay, the bare sight of water, of a looking-glass, of any thing clear or pellucid, will give the utmost uneasiness, or even throws the patient into convulsions.

Hydrophobia.

With regard to the affection of the mind itself in this disease, it does not appear that the patients are deprived of reason. Some have, merely by the dint of resolution, conquered the dread of water, though they never could conquer the convulsive motions which the contact of liquids occasioned: while this resolution has been of no avail; for the convulsions and other symptoms increasing, have almost always destroyed the unhappy patients.

In this disease there seems to be an extreme sensibility and irritability of the nervous system. The eyes cannot bear the light, or the sight of any thing white; the least touch or motion offends them, and they want to be kept as quiet and in as dark a place as possible. Some complain of the coldness of the air, frequently when it is really warm. Others complain of violent heat; and have a great desire for cold air, which yet never fails to increase the symptoms. In all there is a great flow of viscid saliva into the mouth; which is exceedingly troublesome to the patients, as it has the same effect upon their fauces that other liquids have. This therefore they perpetually blow off with violence, which in a patient of Dr Fothergill's occasioned a noise not unlike the hollow barking of a dog, and which he conjectures might have given rise to the common notion that hydrophobous patients bark like dogs. They have an insatiable thirst; but are unable to get down any drink, except with the utmost difficulty; though sometimes they can swallow bread soaked in liquids, slices of oranges, or other fruits. There is a pain under the *scrobiculus cordis*, as in the tetanus; and the patients mournfully point to that place as the seat of the disease. Dr Vaughan is of opinion that it is this pain, rather than any difficulty in swallowing, which distresses the patient on every attempt to drink. The voice is commonly plaintive and mournful; but Dr Vaughan tells us there is a mixture of fierceness and timidity in the countenance which he cannot describe, but by which he could know a hydrophobous person without asking any questions.

In this distemper, indeed, the symptoms are so various, that they cannot be enumerated; for we will seldom read two cases of hydrophobia which do not differ very remarkably in this respect. Some seem to have at times a furious delirium, and an inclination to spit at or bite the bystanders; while others show no such inclination, but will even suffer people to wipe the inside of their mouths with the corner of a handkerchief in order to clear away the viscid saliva which is ready to suffocate them. In some male patients there is an involuntary erection of the penis, and emission of the

Spasmi the semen; and the urine is forced away by the frequent return of the spasms. In a letter from Dr Wolf of Warsaw to Henry Baker, F. R. S dated Warsaw Sept. 26th, 1767, we have the following melancholy account of the cases of five persons who died of the hydrophobia: "None of them quite lost their right senses; but they were all talking without intermission, praying, lamenting, despairing, cursing, sighing, spitting a frothy saliva, screeching, sometimes belching, retching, but rarely vomiting. Every member is convulsed by fits, but most violently from the navel up to the breast and œsophagus. The fit comes on every quarter of an hour; the fauces are not red, nor the tongue dry. The pulse is not at all feverish; and when the fit is over nearly like a sound pulse. The face grows pale, then brown, and during the fit almost black; the lips livid; the head is drowsy, and the ears tingling; the urine limpid. At last they grow weary; the fits are less violent, and cease towards the end; the pulse becomes weak, intermittent, and not very quick; they sweat, and at last the whole body becomes cold. They compose themselves quietly as if to get sleep, and so they expire. The blood drawn a few hours before death appears good in every respect. A general observation was, that the lint and dressings of the wounds, even when dry, were always black, and that when the pus was very good in colour and appearance." In one of Dr Wolf's patients who recovered, the blood stunk intolerably as it was drawn from a vein; and one of Mr Vaughan's patients complained of an intolerable fetid smell proceeding from the wounded part, though nobody but himself could perceive it. In general, the violent convulsions cease a short time before death; and even the hydrophobia goes off, so that the patients can drink freely. But this does not always happen; for Mr Vaughan mentions the case of a patient, in whom, "when he had in appearance ceased to breathe, the spasmus cynicus was observable, with an odd convulsive motion in the muscles of the face; and the strange contrariety which took place in the action of these produced the most horrid assemblage of features that can well be conceived. Of this patient also it was remarkable, that in the last hours of his life he ceased to call for drink, which had been his constant request; but was perpetually asking for something to eat."

The hydrophobia seems to be a symptom peculiar to the human race; for the mad animals which communicate the infection, do not seem to have any dread of water. Dr Wolf, in the letter above quoted, says in general, that cattle bit at the same time and by the same animal (a mad wolf) which bit the persons whose cases he related, died nearly with the same frightful raging as the men; but says nothing of their having any hydrophobia: nay, Dr James and some others assert, that the hydrophobia is not always an attendant on rabies canina in the human race; and indeed it is certain that the disease has proved mortal after this terrible symptom has been removed. With regard to the symptoms of madness in dogs, they are very equivocal; and those particularly enumerated by some authors, are only such as might be expected in dogs much heated or agitated by being violently pursued and struck. One symptom indeed, if it could be depended upon, would determine the matter; namely, that all other dogs avoid and run away from one that is mad; and even large dogs will not attack one of the smallest size who is infected with this disease. Upon this supposition they point out a method of discovering whether a dog who hath been killed was really mad or not; namely, by rubbing a piece of meat along the inside of his mouth, and then offering it to a sound dog. If the latter eats it, it is a sign the dog was not mad; but if the other rejects it with a kind of howling noise, it is certain that he was. Dr James tell us, that among dogs the disease is infectious by staying in the same place; and that after a kennel has been once infected, the dogs put into it will be for a considerable time afterwards in danger of going mad also. A remedy for this, he says, is, to keep geese for some time in the kennel. He rejects as false the opinion that dogs when going mad will not bark; tho' he owns that there is a very considerable change in their bark, which becomes hoarse and hollow. Hydrophobia.

Causes, &c. In no disease whatever are we more at a loss to discover the causes than in the hydrophobia. In dogs, foxes, and wolves, it seems to come on spontaneously; though this is contested by some authors. It is said, that the causes commonly assigned, viz. heat, feeding upon putrid flesh, want of water, &c. are not sufficient for producing the distemper. It does not appear that madness is more frequent among dogs in the warm than in the cold climates; nay, in the island of Antigua, where the climate is very hot, and the water very scarce, this distemper has never, it is said, been observed. As to putrid aliment, it seems natural for dogs to prefer this to any other, and they have been known to subsist upon it for a long time without any detriment. For these reasons, they think the disease arises from a specific contagion, like the small pox and measles among the human race, which, being once produced by causes unknown, continues to be propagated by the intercourse which dogs have with each other, as the diseases just mentioned continue to be propagated among the human race by means of the intercourse which they have with one another.

With regard to the immediate cause among mankind, there is not the least doubt that the hydrophobia is occasioned by the saliva of the mad animal being mixed with the blood. It does not appear that this can operate through the cuticula; but, when that is rubbed off, the smallest quantity is sufficient to communicate the disease, and a slight scratch with the teeth of a mad animal has been found as pernicious as a large wound. It is certain also, that the infection has been communicated by the bites of dogs, cats, wolves, foxes, weasels, swine, and even cocks and hens, when in a state of madness. But it does not appear that the distemper is communicable from one hydrophobous person to another, by means of the bite, or any other way. Dr Vaughan inoculated a dog with the saliva of a hydrophobous child, but the animal continued free from disease for two months; and though the doctor promised to inform the public if it should happen to occur afterwards, nothing has hitherto appeared on that subject. A nurse also frequently kissed the child during this time of his disorder, but no bad consequence ensued.

When we attempt to investigate the nature of the

Spasm i | Hydrophobia.

caufe of the hydrophobia by diffections, our inquiries are commonly difappointed. In two bodies opened by Dr Vaughan, there was not the leaft morbid appearance; in the very fauces, where we might have expected that the difeafe would have fhown itfelf moft evidently, there was not the leaft appearance even of inflammation. The ftomach, inteftines, diaphragm, œfophagus, &c. were all in a natural ftate: neither do we find in authors of credit any certain accounts of morbid appearances in the bodies of hydrophobous perfons after death. Dr Vaughan therefore concludes, that the poifon acts upon the nervous fyftem; and is fo wholly confined to it, that it may be doubted whether the qualities of the blood are altered by it or not; and that it acts upon the nerves by impairing and difturbing their functions to fuch a degree as fpeedily to end in a total extinction of the vital principle. As to the difficulty in fwallowing generally believed to accompany dread of the water, he treats it as a mifreprefentation, as well as that the œfophagus with the mufcles fubfervient to deglutition are efpecially concerned in this difeafe. The principal foundation of the evil, he thinks, refts on a morbid fenfibility both of the external and internal fauces. For the fight of a liquid, or the application of any fubftance to the internal fauces, but more efpecially of a fluid, inftantly excites the moft painful feelings. Nay, the fame fymptoms are produced by touching the external fauces with a fluid, or by the contact of cold air with thefe parts; and nearly in as great a degree. But a folid or a fluid fubftance being conveyed into the œfophagus, the tranfit into the ftomach is accomplifhed with little or no impediment; fo that in fact the difficulty is furmounted before the patient be engaged in the action of fwallowing. Nor is the excruciating pain, which never fails to be the companion of every attempt to drink, felt in the *fauces* and *throat*: it is, he fays, at the *fcrobiculus cordis*; to which the fufferer applies his hand. From this laft circumftance, therefore, from the prefence of the *rifus fardonius*, from the mufcles of the abdomen being forcibly contracted, and from the fenfe of fuffocation which feems to threaten the patient with immediate death, Dr Vaughan has been led to think that in the hydrophobia a new fympathy was eftablifhed between the fauces, the diaphragm, and the abdominal mufcles.

Prognofis. When a perfon is bit, the prognofis with regard to the enfuing hydrophobia is very uncertain. All thofe who are bit do not fall into the difeafe; nay, Dr Vaughan relates that out of 30 bit by a mad dog, only one was feized with the hydrophobia. During the interval betwixt the bite and the time the difeafe comes on, there are no fymptoms by which we can judge whether it will appear or not. When once it hath made its appearance, the prognofis is exceedingly fatal.

Prevention and Cure. It has been generally allowed by practitioners, that though the hydrophobia may be prevented, yet it can feldom if ever be cured after it has made its appearance. The moft effential part of the treatment therefore depends on the proper ufe of means of prevention. The great objects to be aimed at in prevention, are, in the firft place, the complete removal of the contagious matter as foon as poffible; or, fecondly, means of deftroying it at the part, where there is even the flighteft reafon to believe that it has not been completely removed. Of all the means of removal, the complete cutting out the part to which the tooth has been applied, is unqueftionably the moft to be depended upon. This practice, therefore, fhould be had recourfe to as foon as poffible. The fooner it can be accomplifhed, the better. But as it has been obferved, that a peculiar fenfation at the part affected always precedes the acceffion of the difeafe, even when it takes place at a late period after the bite, there is good ground for believing that removal of the part may be of advantage even after a confiderable interval. But befides removal of the contagious matter, by cutting away the part to which it is attached, this fhould alfo be done by careful and long continued wafhing. This may be done, in moft inftances, before a proper opportunity can be had of having recourfe to the knife. Cold water fhould particularly be poured upon the wound from a confiderable height, that the matter may be wafhed away with fome force. Even after removal by the knife, careful wafhing is ftill a neceffary and proper precaution. And after both thefe, to prevent as far as can be the poffibility of any contagious matter lurking about the wounded part, it fhould not be allowed to heal, but a difcharge of matter fhould be fupported for the fpace of feveral weeks, by ointment with cantharides, or fimilar applications. By thefe means there is at leaft the beft chance of removing the matter at a fufficiently early period. And this mode of prevention feems to be of more confequence than all others put together which have hitherto been difcovered. But befides removal, prevention may alfo be obtained by the deftruction of the contagious matter at the part; and where there is the leaft reafon to think that a complete removal has not been obtained, thefe fhould always be had recourfe to. With this intention the actual cautery and burning with gun-powder have been employed. And the action of fire is probably one of the moft powerful agents that can be ufed for this purpofe. But recourfe has alfo been had to wafhing both with acids and with alkalies. Of the former kind, vinegar has been chiefly ufed, but more may probably be expected from the latter; and particularly from the cauftic alkali, fo far diluted that it can be applied with fafety: for from its influence as a folvent of animal mucus, it gives a better chance of a complete removal of the matter, independent of any influence in changing its nature. It has been thought alfo, that oil applied to the part may be of fervice. But if recourfe be had to it, more active meafures fhould at leaft be previoufly employed; and even then, fome are of opinion that it is of advantage to increafe the activity of the unctuous matter by combining it with mercury.

On thefe grounds, and by thefe means, we are inclined to think that the action of this contagion on the fyftem, after it has been applied by the bite of a rabid animal, may be moft effectually prevented. But after this action has once taken place, no remedy has yet been difcovered on which much dependence can be put. A very great variety of articles indeed have at different periods been held forth as infallible, both in the prevention and cure of this affection; but their reputation has, perhaps, univerfally been founded on their being given to people, who, though really bit

Spasmi / Hydrophobia.

bit by a mad dog, were yet not infected with the contagion. And this happily, either from the tooth being cleaned in making the bite, or not being covered with contagious matter, is by no means an unfrequent occurrence. Mankind, however, even from the earliest ages, have never been without some boasted specific, which has been held forth as an infallible remedy for this affection till fatal experience demonstrated the contrary. Dr Boerhaave has given a pretty full catalogue of those specifics from the days of Galen to his own time; and concludes, that no dependence is to be put in any of them. It is now, therefore, altogether unnecessary to take notice of burnt crabs, the hyæna's skin, mithridate with tin, liver of the rabid animal, or a variety of other pretended remedies for this disease, proved by experience to be totally inefficacious. But although no greater confidence is perhaps to be put on specifics of modern date, it will be proper that these should be mentioned.

Bathing in cold water, especially in the sea, and drinking sea-water for a certain time, have been prescribed, and by some accounted a certain preventive. When this was known to fail, a long course of antiphlogistic regimen, violent submersion in water, even to danger of drowning, and keeping the wounded place open with cauteries, were recommended.—To this extreme severity Dr Mead objected; and in his treatise on this subject endeavours to show, that in all ages the greatest success has been reaped from diuretics, for which reason he proposes the following powder: "Take ash-coloured ground-liverwort, half an ounce; black-pepper, two drachms: reduce them separately to powder, then mix them together." This powder was first published in the Philosophical Transactions, by Mr Dampier, in whose family it had been kept as a secret for many years. But this medicine, which was inserted in former editions of the London and Edinburgh pharmacopœias, under the name of *Pulvis Antilyssus*, has long lost its credit.

There is a famous East-India medicine, composed of 24 grains of native and as much factitious cinnabar, made into a powder with 16 grains of musk. This is called the *Tonquin* medicine, and must be taken into a tea-cupful of arrac or brandy; and is said to secure the patient for 30 days, at the expiration of which it is to be repeated; but if he has any symptoms of the disease, it must be repeated in three hours, which is said to be sufficient for a cure. The first dose is to be taken as soon after the bite as possible.

Another celebrated remedy is Palmarius's powder, composed of the leaves of rue, vervain, sage, polypody, wormwood, mint, mugwort, balm, betony, St John's-wort, and lesser centaury. These herbs must be gathered in their prime, dried separately in the shade, and then powdered. The dose is a drachm, or a drachm and an half, taken every day.

A remedy which might promise to be more efficacious than any of those hitherto mentioned is mercury. This hath been recommended in frictions, and to be taken inwardly in the form of calomel and turbith-mineral, in order if possible to raise a slight salivation, on which the efficacy was thought to depend. Besides this, venefection, opium, the bark, and camphor, have been tried in very large quantities; the warm bath; and, in short, every thing which human invention could suggest; but with what success, can best be judged from the following well authenticated cases.

In the beginning of December 1728, a young gentleman, aged 17, was bit by a dog in the middle-finger of the right-hand about the middle of the nail. In the beginning of January 1729, he complained of pain in that finger reaching along the back of the hand to the elbow. In the night between the sixth and seventh days of that month, he became hot and restless: emollient and anodyne fomentations were applied; but the pain became very sharp, and the hydrophobia came on in the night-time. He was blooded; but became worse every hour, and at last quite furious and outrageous. The bandage was thrown off from his arm, and he lost about 20 ounces of blood besides what had formerly been taken from him. This, however, made no abatement of the symptoms, and he died the same night.

In 1753, a woman, seized with the hydrophobia in consequence of the bite of a dog supposed to be mad, was treated in the following manner by Dr Nugent. First she was blooded to about 15 ounces; she took 16 grains of musk in powder, and alongst with it a pill of two grains of pure opium, every three hours. A plaster of galbanum, with half an ounce of pure opium, was laid to her neck and throat. She began to take these medicines on a Saturday morning, an hour or two after the dread of water had commenced. In the evening she was a little easier at intervals. The musk and opium pill were continued as before, and the hand that was bit was ordered to be chafed with warm salad oil several times a day. Only two papers of powder and two pills were taken in the night, for the last made her sick and vomit. She had little or no sleep, but lay pretty quiet. On Sunday, 20 ounces of blood were taken away, and a clyster with antimonial wine injected: the pills and powders were continued as before. On Sunday evening she could swallow liquids a little better, and she lay quiet most of the night. On Monday her swallowing was greatly better. The musk and opium were continued, and twelve ounces more of blood were taken from her; the plaster was renewed with only two drachms of opium, and the oil was used as before. At night she was better: her hand easy; and by a continuance of these remedies she recovered. This was the case which chiefly brought opium into reputation.

The following cases published by M. Dessault, a Frenchman, first brought mercury into reputation.—Four men were bitten by the same wolf, on the same day, at the same hour. They were dipped in salt-water, and came back persuaded that they had nothing to fear. Some days after, one of them felt a numbed pain about his scars, while the scars themselves grew hard and rose like an embroidery: he was soon after seized with the usual symptoms, as was also another. The son of the former likewise began to feel a pain about the cicatrices, and a swelling with hardness; as did also the fourth. They were ordered to rub a drachm and a half of the mercurial or blue ointment upon the cicatrices and about the whole arm. This was repeated three days successively, and then every other day: after the fifth friction, he allowed an interval of two days. Besides this, they took every day a drachm and an half of Palmarius's powder. After the third friction the cicatrices grew flat and soft, the pain went

Spasmi went off, their courage returned, and their mind resumed its former tranquillity.

But how far mercury, or indeed any thing else, is from being a *specific* in the hydrophobia, will appear from the following account of Dr Wolf's patients.—In the middle of April 1767, seventeen people and a great number of cattle were bitten in the neighbourhood of Warsaw by a mad wolf. One of these, an officer, was brought into the city that same day, and had the best advice of the surgeons and physicians in that place; besides which, he took the bark very copiously with camphor. He continued well till the seventh week, when he became hydrophobous, and died.

Eleven of the others applied to Dr Wolf on the ninth day. Their wounds were all deeply scarified; diligently washed and fomented with vinegar, salt, and theriaca; and kept open till the 80th day, in those who lived so long. Every two weeks they were blooded largely, and were purged every week with salts and jalap. Their diet was mostly vegetable, and their drink whey and water. They all eat as much as could be got of the herbs *matrisylva* and *anagallis flore puniceo*; and they all took often of the *pulvis Palmarii*. The *muscus cinereus terrestris* could not be got, or it would also have been prescribed. Besides the general treatment, two were rubbed daily with a drachm of mercurial ointment, and had their purges with calomel. Two took every day four ounces of vinegar, three drachms tincture of poppies, and half an ounce of *rob sambuci* every night. One took every day 16 grains of camphor, with four scruples of saltpetre, and at night half an ounce of *rob sambuci*.—Two took 24 grains of musk, with 50 grains of cinnabar. Other two took from 40 to 60 drops of spirit of sal ammoniac, prepared with quicklime; and the last took a scruple of crystallized salt of tartar made by the mixture of a little spirit of sal ammoniac with a solution of that salt.

One of the first who used the mercurial ointment was seized with the hydrophobia on the 22d day, immediately after being well purged with calomel. He was blooded copiously, plunged abundantly in cold water, and had several clysters administered, without effect. Two pounds of oil, and as much of drink, were poured down by force; also a drachm of salt of tartar and half a drachm of musk were given in three doses. He then began to drink freely, but died the third day. His companion then left off the use of mercury, and took 80 drops a-day of Dippel's animal oil, till he had taken six drachms of it; after which he went on with 100 drops daily of spirit of sal ammoniac made with alkali.

One of those who took the vinegar fell sick the 33d day. He was immediately blooded, and vomited with ipecacuanha. This man was too strong to make experiments on by force: he refused every thing, and died the third day. His companion, an old man, began to be seized in the same manner: he was purged with salts, took the *morsulæ balsami Peruviani*, and drank lemonade. He recovered, and used afterwards 100 drops of spirit of sal ammoniac daily. This was the patient formerly mentioned, whose blood had the fetid smell.

The man who used the camphor fell sick the 33d day. He was thrice copiously blooded, was plunged forcibly into the coldest water for the space of two hours, and was nearly drowned. He was clystered with effect. He himself forced down, with incredible aversion and labour, a great quantity of drink; by which he vomited more than 50 times abundance of frothy slime. He took several ounces of oil, and several boluses of castor and opium, of each four grains, without effect; and died the fourth day.

Hydrophobia.

A girl who used the musk with cinnabar, fell ill the 62d day, and died the third day after. No farther attempt was made to save her life, she being then at a distance. Her companion, a pregnant woman, then left off the musk, and took in its stead spirit of sal ammoniac.

A woman who had taken nothing, fell ill on the 40th day. She suffered terribly in the night, but less in the day-time. Besides the usual symptoms, she had great pain and swelling in her belly. In the space of two days she drank about two bottles of brandy, but would taste no other liquor The Doctor ordered her to mix an equal quantity of oil with her brandy, and to take every day two boluses of castor and opium.—She recovered: and at last took two doses of turbith-mineral, by which she was vomited and purged.

After the 80th day, all the surviving people took thrice the turbith-mineral, except the pregnant woman; and they afterwards continued their alkaline medicines to the 100th day.

On these cases Dr Wolf makes the following observations.—"Thus we see, that the bark, the mercury, the acids, the musk, the feeding on the most famous herbs, the sweating, the *cura antiphlogistica*, are no specifics. I don't know what to say to the alkalies: the danger is not yet over; and there are still four people who used nothing, in as good health as my patients."

The following case by Dr Raymond of Marseilles, shows the inefficacy of mercury even as a *preventive*.—On the 19th of July 1765, Mr Boyer, aged 25, of a bloated cachectic habit, was bit by a mad dog in the inferior part of the leg: the wound extended half way round, bled freely, and was like a great scratch. The patient's legs had been swelled for a considerable time before the accident; and there were also two ulcers in the other leg. Some hours after the accident, the actual cautery was applied to the wound. The Doctor was not present at this operation; but the part around the bite was rubbed with mercurial ointment immediately after, and the eschar was dressed with the same ointment. The eschar was separated on the first day, but the dressing was continued till the wound was cicatrised. The second day a bolus of four grains of turbith and eight grains of camphor was exhibited. This procured a considerable evacuation both by vomit and stool, and a spitting also came on. The third day the bitten leg was rubbed with mercurial ointment: in the space of a month the frictions were repeated five times on both legs, three drachms of mercurial ointment being used in each friction. During the same time the bolus was five times repeated; and this treatment kept up a slight salivation to the 40th day. The evening of the third day he took the *Tonquin medicine*, called also *Sir George Cobb's powder*, in a bolus; which vomited him briskly. This powder was repeated seven or eight times in the month, generally with the same effect. During the first seven or eight days he got four times,

Spasmi

times, in the morning, a drachm of the *anagallis flore puniceo*, fresh gathered and powdered. The 41st day, the turbith bolus was prescribed for the seventh time; he was bathed in the sea, and continued the bathing for two days more. On the 74th he was seized with the distemper; and died on the 76th, seemingly suffocated or strangled, his mouth covered with slaver, and his face bloated. He lost his senses not above half a quarter of an hour before his death. The pulse was quiet the whole time. The Doctor says he has reason to suspect the wound was not well cauterized.

Another instance is mentioned by the same author, of a pregnant woman bit by the same dog and on the same day with Mr Boyer, who was never seized with the distemper. She was treated in much the same manner with him, and salivated a little more. But she was bit through a shamoy leather shoe, which must necessarily have cleaned the animal's teeth of the poisonous saliva before they reached her skin, and to this we are naturally led to ascribe her safety. One of Dr Wolf's patients also was a pregnant woman, and was not seized with the distemper. Perhaps women in a state of pregnancy may be less liable to this distemper than others; but it is more probable that the contagion was not communicated.

The same author tells us, "there are many examples of the inefficacy of mercurial frictions. A surgeon of Marseilles treated a girl about 12 years of age bit by a mad dog, with mercurial frictions; applying them as in the *lues venerea*: yet she died of the hydrophobia on the 55th day. Her wound was not cauterized."

In the following case all the most powerful remedies were tried.—In the afternoon of the 29th of Aug. 1778, Dr Vaughan was called to a boy of eight years of age labouring under a hydrophobia. He had been bit on the wrist by a cat about a month before; of which the marks remained, but without any ulcer, or even the smallest appearance of inflammation. About the middle of the day before Dr Vaughan saw him, he began to complain of a pain in the part bitten, which ascended up the arm, and affected the temple on that side; soon after which he swallowed liquids with reluctance and difficulty. He was put into the warm bath for three quarters of an hour, during which time he was easier: he had a clyster of five ounces of fresh broth, and 30 drops of laudanum, injected immediately after his coming out of it; a liniment consisting of three drachms of strong mercurial ointment, with the same quantity of oil of amber, was rubbed upon the shoulders and back; two pills of a grain of flowers of zinc, and half a grain of *cuprum ammoniacum*, were taken every three or four hours; and a medicated atmosphere was prepared for him, by burning gum ammoniac in his room. As these remedies were not attended with any good effect, each dose of pills was ordered to contain two grains of *cuprum ammoniacum*, the same quantity of opium, three grains of flowers of zinc, and ten grains of asafœtida; whilst a solution of that fetid gum, with a drachm of laudanum, was administered as a clyster. These pills, though repeated every four hours, afforded not the smallest relief, nor did they show the least action on the frame. At last the Doctor resolved to put in practice the desperate remedy mentioned by Van Helmont, of throwing the patient into cold water, and keeping him there till he is almost drowned. With this view a large tub of cold water, well saturated with common salt, was prepared, into which the poor boy was plunged over head and ears, and there held until he ceased to struggle. He was then taken out again, and the same operation repeated until he became so quiet that the Doctor was under apprehensions that a total extinction of life would take place. He was then wrapped up in a blanket and put to bed, and he remained more quiet than he had formerly been; but all his former restlessness soon returned, his pulse sunk, and he died about two o'clock in the morning.

Hydrophobia.

Another celebrated antidote against the poison of a mad dog hath been known for some years by the name of the *Ormskirk medicine*. The true composition of this is kept a secret by the proprietors: however, it has been analysed, and the following composition published by Dr Heysham as perfectly similar to it in all respects.

"Take half an ounce of chalk, three drachms of Armenian bole, ten grains of alum, one drachm of elecampane in powder; mix them all together, and add six drops of oil of anise."

They must certainly be very credulous who can put confidence in such an insignificant medicine as a preservative against the hydrophobia: however, there is a possibility that there may be some unknown ingredient in the genuine powder; for it is difficult to analyse powders after the ingredients are thoroughly mixed together. The efficacy of the medicine therefore must depend on the virtues of that unknown ingredient, if any such there be. The following cases, however, too well determine that it is not *infallible*, as was at first pretended. In all probability, as well as many others, its reputation also is solely rested on its being exhibited in many cases where no contagion was communicated to the person bit, and while of course no disease could take place.

On the 14th of February 1774, Mr Bellamy of Holborn, aged 40, was bit by a cat, which was killed the same morning. The following day he took the celebrated Ormskirk medicine, sold by Hill and Berry in Hill-Street, Berkeley-Square, and conformed in every respect to the directions given by the vender. A servant-maid, who was bitten in the leg before her master was bitten, likewise took the same remedy. About the middle of April Mr Bellamy complained of a pain in his right knee, which he supposed to be rheumatic, and which continued and increased till the 7th of June, when he got some pills of calomel, ipecacuanha, and *pil. sapon.* from an apothecary, with Huxham's tincture of the bark in small doses. In six days more he had a titillation in the urethra, a contraction of the scrotum and penis to a degree of pain, and an emission of semen after making water, to which he had frequent calls. The medicines were discontinued; and on the 16th of that month the hydrophobia came on, and Dr Fothergill was called. Six ounces of blood were taken from his arm, and a bolus of a scruple of native cinnabar and half a scruple of musk was given every four hours. The distemper manifestly increased through the day. In the evening a clyster was injected, and several times repeated during the night; he had been put into the warm bath, and two drachms of strong mercurial ointment rubbed into his legs and thighs by himself.

Spasmi

himself. He was greatly relieved by the warm bath while he continued in it, but the symptoms returned with increased violence in the night. The next day, being greatly worse, he was blooded to as great a quantity as he could bear, had the warm bath and clysters repeated, and half an ounce of mercurial ointment rubbed into his thighs and legs. Pills of opium were prescribed, but he did not take them. He died the same night, at half an hour after 12. This patient was a man of great resolution, and could in part conquer his aversion at water. He seemed to have totally forgot the accident of the bite: and casually said, that he thought this disorder resembled the hydrophobia, without supposing that he was afflicted with that distemper at the time.—The bite on the girl's leg refused to heal, baffled the art of a young surgeon who attempted to cure it, and continued a running ulcer for a long time. She did not fall into the hydrophobia. Hence Dr Fothergill thinks it probable, that keeping the wounds made by the teeth of mad animals open for a long time, would probably be of service as a preventive; but in some of Dr Wolf's patients, these artificial drains appear not to have been attended with success.

On the 16th of November 1773, Thomas Nourse, a strong healthy boy of 14, was admitted into the Leicester infirmary; having been that day month bitten by a mad fox-hound. The wound was a large lacerated one on the cheek, and bled very freely on being inflicted. The day after he was bit he went to the sea, where he was dipped with all the severity usually practised under so disagreeable an operation. The *Ormskirk medicine* was also administered with all due care. It was bought of the person in Leicester who is deputed by the proprietor to sell it for him. A common adhesive plaster was applied to the part after sea-bathing; and in the course of a month, without any further trouble, the wound was healed; excepting a small portion, somewhat more than an inch in length, and in breadth about one-tenth. This yielded no discharge, and was quite in a cicatrizing state. Five days before his admission into the infirmary, he began to complain of a tightness over his temples, and a pain in his head: in two days the hydrophobia began to appear; and at its commencement he complained of a *boiling heat* in his stomach, which was continually ascending to the fauces. The disease was pretty strong when he came to the infirmary. He got a bolus of a scruple of musk with two grains of opium; then a composition of 15 grains of musk, one of turbith mineral, and five grains of opium, was directed to be taken every third hour; an ounce of the stronger mercurial ointment was to be rubbed on the cervical vertebræ and shoulders, and an embrocation of two ounces of laudanum, and half an ounce of *acetum saturninum*, was directed to be applied to the throat. But by this last he was thrown into convulsions, and the same effect followed though his eyes were first covered with a napkin. The embrocation was therefore changed for a plaster of three drachms of powdered camphor, half an ounce of opium, and six drachms *confectio Damocritis*. By these medicines the disease seemed to be somewhat suspended, but the symptoms returned with violence in the evening. His medicine was repeated at seven; and at eight five grains of opium were exhibited without musk or turbith. At nine, another ounce of mercurial ointment was rubbed upon the shoulders, and half an ounce of laudanum with six ounces of mutton-broth was injected into the intestines, but to no purpose. A larger dose of opium was then given, but with as little effect as the former, and he died the same night.

Hydrophobia.

In the month of September 1774, a farmer, aged 25, was bit by a mad dog, whose teeth made a slight wound in the fore-finger of the left hand. He was dipped, as usual, in the sea; and drank the sea-water for some time on the spot, which operated briskly as a purge. He continued well till the 6th of June following, when he first felt a pain in that hand and arm; for which he bathed in a river that evening, supposing that it had been a rheumatic complaint. The next day he was sick; and in the evening was seized with a violent vomiting, which continued all that night and till the middle of the next day, when it was succeeded by the hydrophobia. He was treated with the warm bath; had a purgative clyster injected; and as soon as it had operated, a second was given, consisting of four ounces of oil, and half an ounce of laudanum: half an ounce of strong mercurial ointment was rubbed on the fauces, and the part was afterwards covered with the *cataplasma e cymino*. to which was added an ounce of opium. An embrocation was applied to the region of the stomach with continued friction, consisting of half an ounce of spirit of sal ammoniac, ten drachms of oil olive, six drachms of oil of amber, and ten drachms of laudanum. Two ounces of strong mercurial ointment were rubbed upon the shoulders and back; and as a further means of kindling a ptyalism speedily, he received the smoke of cinnabar into the mouth by throwing a drachm of that substance now and then upon a hot iron: he was also directed to take every four hours a bolus of 15 grains of musk, three grains of turbith mineral, and four grains of opium. He was easier while in the warm bath, and during the application of the ointment; but died the same night about two o'clock.

Many other instances might be adduced of the inefficacy of this pretended specific: the danger of acquiescing in which, will, it is hoped, create a due degree of caution in those to whom they who are so unfortunate as to be bit by a mad animal may commit themselves. Another remedy may also be mentioned as having had the reputation of being sometimes successful in this disease; which is chiefly employed in different parts of India, particularly in the territory of Tanjore. The medicine to which we now allude contains indeed several articles which are altogether unknown in our materia medica: but it contains at least one very powerful substance well known to us, viz. arsenic. This medicine, known by the name of the Snake Pills, as being principally employed against the bite of the most venomous snakes, is directed to be prepared in the following manner:

Take white arsenic, of the roots of nelli navi, of nevi visham, of the kernels of the ner valum, of pepper, of quicksilver, each an equal quantity. The quicksilver is to be rubbed with the juice of the wild cotton till the globules are perfectly extinguished. The

Spasmi. | Hydrophobia.

The arsenic being first levigated, the other ingredients, reduced to a powder, are then to be added, and the whole beat together with the juice of the wild cotton to a consistence fit to be divided into pills.

Though these pills are principally used against the bite of the cobra de capello, yet they are said also to be successful in the cure of other venomous bites; and, for the prevention of rabies canina, one is taken every morning for some length of time. Of this remedy European practitioners have, we believe, as yet no experience; and if, in the accounts transmitted by East India practitioners, it cannot be said that we have authentic evidence of its want of success, it can as little be pretended that there is indubitable evidence of its efficacy in any instance; and it is by no means improbable, that it will be found equally inefficacious with others at one time considered as infallible.

Of the great variety of remedies which have had their day of reputation, there is not one which has not possessed the credit, some time or other, of preventing the noxious effects arising from the bite of a mad dog. A more adequate experience has with all of them discovered the deception. It was above observed, that the hydrophobia is by no means the infallible consequence of being bit by a mad animal; and that of between 20 and 30 persons who were bit by the dog which gave the fatal wound to one of Dr Vaughan's patients, not one felt the least ill effect but himself. "In the above number (says the Doctor) were some who took the Ormskirk Medicine; others went to the salt-water; and a part of them used no remedy, who yet fared equally well with the most attentive to their injury. The same thing has often happened before; and much merit, I doubt not, has been attributed to the medicine taken, from that celebrated one of *Sir George Cobb* down to the *infallible* one which my good *Lady Bountiful*'s receipt-book furnishes."

From all that has been said, the reader will judge how far the hydrophobia is capable of being subdued by any of the medicinal powers which have yet been tried. Some eminent physicians assert that it is totally incurable; and allege that the instances recorded by different authors of its cure have not been the genuine kind, but that which comes on spontaneously, and which is by no means so dangerous. Indeed two of Dr Wolf's patients recovered, where the disease seems to have been perfectly genuine: but in these the poison seemed to vent itself partly on some other place besides the nervous system. In one the blood was evidently infected, as it had an abominable fœtor; and the other had a violent pain and swelling in the belly. In all the others, it seemed to have attacked only the nervous system; which perhaps has not the same ability to throw off any offending matter as the vascular system.

There is, however, a possibility that the prodigious affections of the nerves may arise only from a vitiated state of the gastric juices; for it is well known, that the most terrible convulsions, nay the hydrophobia itself, will arise from an affection of the stomach, without any bite of a mad animal. This seems to be somewhat confirmed from one of Dr Wolf's patients, who, though he vomited more than 50 times, yet still threw up a frothy matter, which was therefore evidently secreted into the stomach, just as a continual vomiting of bilious matter shows a continual and extraordinary secretion of bile. Dr Wolf himself adopts this hypothesis so far as to say, that perhaps the *serum* may become frothy; but in blood drawn from a vein not the least fault appears either in the serum or crassamentum. He affirms, however, that the duodenum appears to be one of the parts first and principally affected; and as it is not inflamed, it would seem that the affection it sustains must arise from the vitiated state of its juices.

Be this as it will, however, in the hydrophobia, the stomach seems totally, or in a great measure, to lose the power which at other times it possesses. Two grains of *cuprum ammoniacum* were repeatedly given to a child of eight years of age without effect; but this dose would occasion violent vomiting in a strong healthy man. Something or other therefore must have prevented this substance from acting on the nervous coat of the stomach; and this we can only suppose to have been the exceedingly disordered state of the gastric juice, which occasioned such violent irritation through the whole body, that the weaker stimulus of the medicine was entirely lost. It would seem proper therefore to consider the stomach in hydrophobic cases as really containing a poisonous matter, which could not be expelled by vomiting, because it is renewed as fast as evacuated. The indication therefore must be, to change its nature by such medicines as are certainly more powerful than the poison; and this indication will naturally lead us to think of large doses of alkaline salts. These, it is certain, will destroy any animal substance with which they come in contact, and render even the poison of serpents inactive. By exhibiting a few doses of them, larger no doubt than what could be safely done on other occasions, we would be certain to change the state of the stomachic juices; and thus might free the patient from those intolerable spasms which always occasion death in such a short time. Dr Wolf seems inclined to think that volatile alkalies were of service; but the above hypothesis would incline us to use rather the fixed kind. At any rate, it seems vain for physicians to trust much to the power of opium, mercury, musk, or cinnabar, either singly or combined in any possible way. The bark has also failed, and the most celebrated specifics have been found ineffectual. Alkalies are the next most powerful remedies which the *materia medica* affords, and they cannot be more unsuccessful than the others have generally been.

Another remedy which seems adapted to change the nature of the gastric juices is ardent spirits. In one of Dr Wolf's patients two bottles of brandy seem to have effected a cure. The oil mixed with it was of no efficacy in other cases, and the opium and turbith seem not to have been exhibited till the worst was past. In this case the disease seems to have attacked the vascular as well as the nervous system.

In all the patients the warm bath seems to have been a palliative, and a very powerful one, and as such it ought never to be omitted, though we can by no means trust to it as a radical cure; and the above histories abundantly show, that though the warm bath and opium may palliate for a short time, the cause on which

Spaſmi

which the ſpaſms depend is ſtill going on and increaſing, till at laſt the ſymptoms become too ſtrong to be palliated even for a moment by any medicine however powerful. At any rate, the above mentioned hypotheſis ſuggeſts a new indication, which, if attended to, may perhaps lead to uſeful diſcoveries. In caſes where putreſcent bile is abundantly ſecreted, columbo root and vegetable acids are recommended to change the nature of the poiſon which the body is perpetually producing in itſelf. Where corroſive mercury hath been ſwallowed, alkaline ſalt is recommended to deſtroy the poiſon which nature cannot expel by vomiting; and why ſhould not ſomething be attempted to deſtroy the poiſon which the ſtomach ſeems to ſecrete in the hydrophobia, and which nature attempts to expel, though in vain, by violent efforts to vomit?

But whatever plan may be purſued in the hopes of curing this dreadful malady after any of the ſymptoms have made their appearance, we ought, in every inſtance of the accident that gives riſe to it, to direct our immediate care to *prevention*, as being perhaps the only real ground of hope: And the moſt certain and efficacious way of preventing the ill conſequences, is inſtantly (if it may be done) to cut out the piece in the place that happens to be bitten. Dr James, indeed, ſays, that he would have little opinion of cutting or cauteriſing, if ten minutes were ſuffered to elapſe from the receiving of the bite before the operation was performed. But in an inaugural diſſertation lately publiſhed at Edinburgh by Dr Parry, the author is of opinion that exciſion will be of uſe a conſiderable time after the bite is received. He adopts this opinion from what happens in the ſmall-pox, where the blood does not ſeem to receive the infection till ſome days after inoculation has been performed. A ſecond inflammation, he tells us, then takes place, and the infection is conveyed into the blood. In like manner, when the hydrophobous infection is about to be conveyed into the blood, according to him, the wound, or its cicatrix, begins again to be inflamed; and it is this ſecond inflammation which does all the miſchief. Exciſion, or the cautery, will therefore be effectual any time betwixt the bite and the ſecond inflammation of the wound. Without implicitly truſting to this doctrine, however, or conſidering it as in any degree aſcertained in what manner the poiſon diffuſes itſelf, by what marks its progreſs may be known, or how ſoon the ſyſtem may be irremediably tainted with its malignity, it is undoubtedly ſafeſt not to loſe unneceſſarily a moment's time in applying the knife. This, or a dilation of the wound if it be ſmall, Dr Vaughan conſiders as the only prophylactics that can be depended upon. In the latter caſe, he directs to fill the wound with gunpowder, and ſet fire to it; which would produce a laceration of the part, and poſſibly the action of ignited powder upon the poiſon may have its uſe. In all caſes, likewiſe, after theſe practices have been employed, the wound ſhould be prevented from healing for ſome length of time.

324 Sp. II. The *Spontaneous* Hydrophobia.

Hydrophobia ſpontanea, *Sauv.* ſp. 2.

This diſeaſe very much reſembles the former, ſo that it has undoubtedly been often miſtaken for it. It has been known to come on from an inflammation of the

Hydrophobia.

ſtomach, where it was cured by repeated and large blood-letting; in hyſteria, where it was cured by opium, muſk, or other antiſpaſmodics; and in putrid fevers, where it was cured by evacuating the inteſtinal canal of the putrid matters by repeated clyſters. A very good method of diſtinguiſhing the two is, that in the ſpontaneous hydrophobia the patient is much more delirious than in the genuine ſpecies. In the inſtance mentioned in the Medical Eſſays of this ſymptom attending the inflammation of the ſtomach, the patient *raved in the moſt extraordinary manner.* Dr Raymond ſays he remembers a ſpontaneous hydrophobia *attended with madneſs*; and in almoſt all the caſes of hydrophobia which are ſaid to have been cured, the patient was very delirious. Dr Nugent's patient was very frequently delirious, and dreaded *dogs* as well as water. In the Medical Tranſactions a caſe is communicated by W Wrightſon ſurgeon in Sedgefield, Durham, of *canine madneſs* ſucceſsfully treated. This madneſs indeed came on after the bite of a dog ſaid to be mad: but it appeared only four days after the accident happened, and was attended with ſymptoms very unlike any of thoſe abovementioned; for he ſuddenly ſtarted up in a fit of delirium, and ran out of the houſe, and after being brought in, caught hold of the hot bars of the grate which held the fire: Whereas, in the true hydrophobia, the patients dread the fire, light, or any thing which makes a ſtrong impreſſion on the ſenſes, exceedingly. It is probable, therefore, that this was only a ſpontaneous hydrophobia, eſpecially as it readily yielded to veneſection, 30 drops of laudanum, and pills of a grain and an half of opium given every three hours, ſome boluſes of muſk and cinnabar, &c. while in ſome of the former caſes as much opium was given to a boy as would have deprived of life the ſtrongeſt healthy man had he ſwallowed it; and yet this amazing quantity produced ſcarce any effect. This patient alſo dreaded the ſight of a dog.

Delirium maniacum, *Hoffm.* III. 251.

Although these distempers may be considered as distinct genera, yet they are so nearly allied, and so readily change into each other, that it sufficiently justifies the treating all of them together.

The distinguishing characteristic of madness, according to Dr Battie, is a *false perception*; and under this general character may be comprehended all kinds of what is called *madness*, from the most silly stupidity and idiotism to the most furious lunacy. Frequently the different kinds of madness are changed into each other by the casual excitement of some passion: thus, an idiot may become furiously mad, by being put in a violent passion; though this does not so often happen as the change of melancholy into the raving madness, and *vice versa*.

It is a very surprising circumstance, that mad people are not only less liable to be seized with infectious disorders than those who are in perfect health; but even when labouring under other diseases, if the patients chance to be seized with madness, they are sometimes freed from their former complaints. Of this kind Dr Mead relates two very remarkable instances.

On the other hand, it has been known, that an intermittent fever, supervening madness of long standing, has proved a cure for the madness; the senses having returned when the fever terminated. Dr Monro saw two instances of this himself; and mentions it as an observation of his predecessor in the care of Bethlem hospital.

Another remarkable circumstance is, that immoderate joy, long continued, as effectually disorders the mind as anxiety and grief. For it was observable in the famous South-Sea year, when so many immense fortunes were suddenly gained, and as suddenly lost, that more people had their heads turned, from the prodigious flow of unexpected riches, than from the entire loss of their whole substance.

Mad people, especially of the melancholic kind, sometimes obstinately persevere in doing things which must excite great pain: whence it should seem as if their minds were troubled with some distracting notions, which make them patiently bear the present distress, lest more severe tortures should be inflicted; or possibly they may think, that, by thus tormenting the body, they render themselves more acceptable to the divine Being, and expiate the heinous sins of which they may imagine themselves to have been guilty.

It is, however, also highly probable, that their feelings differ exceedingly from what they are in a natural state; at least they are every day observed to endure, apparently without the smallest uneasiness, watching, hunger, and cold, to an extent which in a state of health would not only be highly distressing, but to the greater part of individuals would even prove fatal. And this resistance of hunger, cold, and sleep, affords perhaps the best test for distinguishing cases of real insanity, from cases where the disease is only feigned, and appearances of it put on, to answer particular purposes; at least where this power of resistance is present, we have good reason to conclude that the affection is not feigned.

Cure. Although we be well acquainted with many of the remote causes of this disease, some of the principal of which have already been mentioned, yet we are still so ignorant of the influence of these upon the system, as giving a derangement of the mental faculties, that no general principles on which the cure may be conducted, can with any confidence be pointed out.

It may, however, be observed, that while some remedies seem to operate by producing an artificial termination of this complaint, many others have effect only as aiding a natural termination. And where a recovery from this disease does take place, it most frequently happens in consequence of a natural convalescence. All the species and degrees of madness which are hereditary, or that grow up with people from their early youth, are out of the power of physic; and so, for the most part, are all maniacal cases of more than one year's standing, let them arise from what source soever. Very often mere debility, the dregs of some particular disease, such as an ague, the small-pox, or a nervous fever, shall occasion different degrees of foolishness or madness. In these cases, the cure must not be attempted by evacuations; but, on the contrary, by nourishing diet, clear air, moderate exercise, and the use of wine: whereas, in almost all the other maniacal cases, which arise from different sources, and which come on in consequence of intemperate living, violent passions, or intense thinking, it is generally held, that evacuations of every kind are necessary, unless the constitution of the patient be such as absolutely forbids them.

Blood is most conveniently drawn either from the arm or jugulars; and if the weakness be such as renders it improper to take away much blood, we may apply cupping-glasses to the occiput.

Vomiting, in weakly people, must be excited by the vinum ipecacuanæ; but in the more robust by emetic tartar or antimonial wine: the most efficacious cathartics are the infusion or tincture of black hellebore, or infusion of sena quickened with tincture of jalap; but if there be suppression of the menses, or hæmorrhoidal discharge, then aloetic purges will be more proper; and in some instances cooling saline purgatives, such as lixiviated tartar, are of great service. In general, mad people require very large doses, both of the emetics and cathartics, before any considerable operation ensues.

Dr Monro assures us, that the evacuation by vomiting is infinitely preferable to any other: the prodigious quantity of phlegm with which the patients in this disease abound, he says, is not to be got the better of but by repeated emetics; and he observes, that the purges have not their right effect, or do not operate to so good purpose, until the phlegm be broken and

Mania.

and attenuated by frequent emetics. He mentions the cafe of a gentleman who had laboured under a melancholy for three years, from which he was relieved entirely by the ufe of vomits and a proper regimen. Increafing the difcharge by urine, is alfo of the greateft moment, efpecially when any degree of fever is prefent. The cutaneous difcharges are alfo to be promoted; for which purpofe the hot bath is of the higheft fervice in maniacal cafes. Hoffman afferts, that he has feen numerous inftances, both of inveterate melancholy and raging madnefs, happily cured by means of warm bathing; bleeding and nitrous medicines having been premifed. Camphor has alfo been highly commended; but, if we can believe Dr Locker of Vienna, not very defervedly. Having found very good effects from a folution of this medicine in vinegar, he took it for granted that all the fuccefs was owing to the camphor; therefore, in order to give it a fair trial, he felected feven patients, and gave it in large dofes of half a drachm twice a-day. This was continued for two months, and the doctor was furprifed to find that only one of his patients received any benefit. He then returned the other fix back to the camphorated julep made with vinegar, and in a few weeks four of them recovered the ufe of their reafon. This inclined him to think that the virtue depended folely on the vinegar, and accordingly he began to make the trial. Common vinegar was firft given: but after a little while he fixed on that which had been diftilled, and gave about an ounce and half of it every day; the patients having been previoufly prepared by bleeding and purging, which was repeated according as it was found neceffary. He gives a lift of eight patients who were cured by this method; fome in fix weeks, others in two months, and none of them took up more than three months in perfecting the cure. He does not indeed give the ages of the patients, nor mention the circumftances of the cafe; he only mentions the day on which the ufe of the vinegar was begun and the day on which they were difcharged; and he adds, that they all continued well at the time of his writing.

Dr Locker informs us, that this medicine acts chiefly as a fudorific; and he obferved, that the more the patients fweated, the fooner they were cured: it was alfo found to promote the menftrual difcharge in fuch as had been obftructed, or had too little of this falutary evacuation.

Both reafon and experience fhow the neceffity of confining fuch as are deprived of their fenfes; and no fmall fhare of the management confifts in hindering them to hurt themfelves or do mifchief to other perfons. It has fometimes been ufual to chain and to beat them: but this is both cruel and abfurd; fince the contrivance called the *ftrait waiftcoat* anfwers every purpofe of reftraining the patients without hurting them.

Thefe waiftcoats are made of ticken, or fome fuch ftrong ftuff; are open at the back, and laced on like a pair of ftays; the fleeves are made tight, and long enough to cover the ends of the fingers, where they are drawn clofe with a ftring like a purfe, by which contrivance the patient has no power of his fingers; and, when laid on his back in bed, and the arms brought acrofs the cheft, and faftened in that pofition by tying the fleeve-ftrings round the waift, he has no ufe of his hands. A broad ftrap of girth-web is then carried acrofs the breaft, and faftened to the bedftead, by which means the patient is confined on his back; and if he fhould be fo outrageous as to require further reftraint, the legs are fecured by ligatures to the foot of the bed; or they may be fecured by being both put into one bag not very wide, which may be more eafily fixed than the feet themfelves, at leaft without giving pain.

It is of great ufe in practice to bear in mind, that all mad people are cowardly, and can be awed even by the menacing look of a very expreffive countenance; and when thofe who have charge of them once imprefs them with the notion of fear, they eafily fubmit to any thing that is required. The phyfician, however, fhould never deceive them in any thing, but more efpecially with regard to their diftemper: for as they are generally confcious of it themfelves, they acquire a kind of reverence for thofe who know it; and by letting them fee that he is thoroughly acquainted with their complaint, he may very often gain fuch an afcendant over them that they will readily follow his directions.

It is a more difficult matter to manage thofe whofe madnefs is accompanied either with exceffive joy or with great dejection and defpondency, than thofe who are agitated with rage: and all that can be done is to endeavour to excite contrary ideas, by repreffing the immoderate fits of laughter in the one kind by chiding or threatening (taking care, however, not abfolutely to terrify them, which can never be done without danger, and has often added to the mifery of the unhappy fufferer); and difpelling the gloomy thoughts in the other, by introducing pleafing concerts of mufic, or any other fpecies of entertainment which the patients have been known to delight in while they had the ufe of their reafon.

Though bliftering the head has generally been directed, Dr Mead fays he has oftener found it to do harm than fervice: but he recommends iffues in the back; and advifes to keep the head always clofe fhaved, and to wafh it from time to time with warm vinegar. Opium has by many been forbidden in maniacal cafes, as fuppofing that it always increafes the difturbance; but there are inftances where large dofes of this medicine have been found to prove a cure, and perhaps if it were tried oftener we fhould find powerful effects from it: there certainly cannot much harm enfue from a few dofes, which may be immediately difufed if they fhould be found to exafperate the difeafe.

The diet of maniacal patients ought to be perfectly light and thin: their meals fhould be moderate; but they fhould never be fuffered to live too low, efpecially while they are under a courfe of phyfic: they fhould be obliged to obferve great regularity in their hours: even their amufements fhould be fuch as are beft fuited to their difpofition; and after the difeafe appears to be fubdued, chalybeate waters and the cold bath will be highly proper to ftrengthen their whole frame and fecure them againft a relapfe.

Ephialtes, *Sauv.* gen. 138. *Lin.* 163. *Sag.* 245.
Incubus, *Vog* 221. *Junck.* 50.

The greateft uneafinefs which people feel in fleep is that commonly called the *incubus* or *night-mare*. Thofe feized with it feem to have a weight on their breafts and about their præcordia. Sometimes they imagine they fee fpectres of various kinds which opprefs or threaten them with fuffocation. Neither does this uneafinefs continue only while they are afleep; for it is fome time after they awake before they can turn themfelves in their beds or fpeak; nay, fometimes, though rarely, the diftemper has proved mortal.—The incubus rarely feizes people except when the ftomach is oppreffed with aliments of hard digeftion, and the patient lies on his back. It is to be cured by eating light fuppers, and raifing the head high; or, if it become very troublefome, antifpafmodic medicines are to be adminiftered, and the body ftrengthened by chalybeates. The fame method is to be followed by thofe who are fubject to walking in their fleep; a practice which muft neceffarily be attended with the greateft danger: and fomnambulifm may juftly be confidered as merely a different modification of this difeafe. Accordingly Dr Cullen has diftinguifhed the one by the title of *oneirodynia activa*, and the other by that of *oneirodynia gravans*.

Genus LXIX. TABES.
Wasting of the *Body*.

Tabes, *Sauv.* gen. 275. *Lin.* 209. *Vog.* 306. *Sag.* 100.

This diforder is occafioned by the abforption of pus from fome ulcer external or internal, which produces an hectic fever. The primary indication therefore muft be to heal the ulcer, and thus take away the caufe of the difeafe. If the ulcer cannot be healed, the patient will certainly die in an emaciated ftate. But the proper treatment of the tabes proceeding from this caufe, falls to be confidered under the head of *Ulcer* in Surgery, and likewife under the genera Siphylis, Scrofula, Scorbutics, &c. difeafes in which ulcers are leaft a very common fymptom.

Atrophia.

333

Genus LXX. ATROPHIA.
Nervous Consumption.

Defcription. This affection confifts principally in a wafting of the body, without any remarkable fever, cough, or difficulty of breathing; but attended with want of appetite and a bad digeftion, whence the whole body grows languid, and waftes by degrees.—Dr Cullen, however, afferts, that fome degree of fever, or at leaft of increafed quicknefs of the pulfe, always attends this difeafe.

Caufes. Sometimes this diftemper will come on without any evident caufe. Sometimes it will arife from paffions of the mind; from an abufe of fpirituous liquors; from exceffive evacuations, efpecially of the femen, in which cafe the diftemper hath got the name of *tabes dorfalis*. It may arife from mere old age, or from famine.

Prognofis. This diftemper, from whatever caufe it may arife, is very difficult to cure, and often terminates in a fatal dropfy.

Cure. The general principles on which the treatment of this difeafe is to be regulated, very much depend on the caufe by which it is induced; and it is unneceffary to add, that this muft be removed as far as poffible. Next to this, the difeafe is moft effectually combated by the introduction of nutritious aliment into the fyftem, and by obtaining the proper affimilation and digeftion of this. With the firft of thefe intentions, recourfe muft be had to the diet that is moft nutritious, and at the fame time of eafieft digeftion. But from the condition of the ftomach commonly attending this difeafe, it is neceffary fmall quantities only fhould be taken at a time, and that it fhould be frequently repeated. With the fecond intention, ftomachic and nervous medicines are the articles chiefly at leaft to be depended upon in this cafe. The Peruvian bark, elixir of vitriol, and chalybeates, are excellent; and thefe fhould be conjoined with gentle exercife, as far as the ftrength and other circumftances of the patient will admit. In that fpecies of the diftemper occafioned by venereal exceffes, it is fo effentially neceffary to abftain from them, that without it the beft remedies will prove altogether ufelefs. But this is fo feldom complied with, that the tabes dorfalis almoft always proves mortal.

Genus LXXI. POLYSARCIA. 335
Corpulency.

Polyfarcia, *Sauv.* gen. 279. *Lin.* 213. *Vog.* 540. *Sag.* 160. Steatites, *Vog.* 390.

In a natural and healthy ftate, the fat, or animal oil, is not allowed to diffufe itfelf throughout the cellular interftices at large, but is confined to the places where fuch an oily fluid is neceffary, by a particular apparatus of diftinct veficles. But in fome conftitutions the oily part of the blood appears to exceed the requifite proportion, and eafily feparates from the other con-

Intumescentiæ

constituent parts; or there is an uncommon tendency to the separation of oily matter. In these cases it is apt to accumulate in such quantities, that we may suppose it to burst those vesicles which were originally destined to hinder it from spreading too far; or almost every cell of the membrana adiposa, many of which are in ordinary cases altogether empty, may be completely filled with fat.

The increase of the omentum particularly, and the accumulation of fat about the kidneys and mesentery, swell the abdomen, and obstruct the motions of the diaphragm; whence one reason of the difficulty of breathing which is peculiar to corpulent people; while the heart, and the large vessels connected therewith, are in like manner so encumbered, that neither the systaltic nor subsultory motion can be performed with sufficient freedom, whence weakness and slowness of the pulse: but when the whole habit is in a manner overwhelmed with an oily fluid, the enlargement of the cellular interstices will necessarily interrupt the general distribution and circulation throughout the nervous and vascular systems; impeding the action of the muscular fibres, and producing insensibility, somnolency, and death.

These cases are the more deplorable, as there is but little prospect of a cure. For the animal oil is of too gross a nature to be easily taken up by absorption; and we know, that when fluids are accumulated in the cellular system, there are only two ways in which they can be carried off or escape; namely, by the absorbents, which take their rise from the cellular interstices, and through the pores of the skin by transudation.

Another misfortune is, that the disease steals on so imperceptibly, that it becomes inveterate before people begin to think of pursuing the proper means of relief.

In this disease the cure must turn upon two points: First, on preventing the farther deposition of fat, by avoiding the introduction of superfluous aliment, particularly of fatty matters, into the system; and, secondly, on promoting and forwarding the absorption of fat. On these grounds, besides what may be done by proper regimen, a variety of articles have been recommended in the way of medicine.

Soap has been proposed as a remedy to melt down and facilitate the absorption of the fat in corpulent people; and Dr Fleming some years ago published a little treatise, wherein he recommends this medicine, and relates the case of a gentleman who is said to have received considerable benefit from it. But perhaps the soap-leys would be more powerful, and might be more easily taken, sheathed, as directed when recommended as a dissolvent of the stone.

Lieutaud advises to take *acetum scilliticum* in small doses, with frequent purging and brisk exercise. But it will seldom happen that the patients will be found sufficiently steady to persist in any of these courses, it being the nature of the disorder to render them irresolute and inattentive to their condition. Therefore the principal use of rules must be with a view to prevention; and persons who are disposed to corpulency should take care in time to prevent it from becoming an absolute disease, by using a great deal of exercise, not indulging in sleep, and abridging their meals, especially that of supper. Salted meats are less fattening than such as are fresh; and drinking freely of coffee is recommended to corpulent people.

Polysarcia.

But Dr Fothergill observes, that a strict adherence to vegetable diet reduces exuberant fat more certainly than any other means that he knows; and gives two cases wherein this regimen succeeded remarkably well. The famous Dr Cheyne brought himself down in this way, from a most unwieldy bulk to a reasonable degree of weight; as he himself informs us. It deserves, however, to be remarked, that every practice for the removal or prevention of fatness must be used with great caution and prudence: for not a few, anxious to prevent this affection, have had recourse to a regimen and to medicine which have proved fatal. This has particularly arisen from the excessive use of acids, probably operating by entirely destroying the action of the chylopoietic viscera.

GENUS LXXII. PNEUMATOSIS. 336
EMPHYSEMA, or *Windy Swelling*.

Pneumatosis, *Sauv.* gen. 280. *Vog.* 391. *Sag.* 107.
Emphysema, *Sauv.* gen. 13. *Lin.* 268. *Vog.* 392.
Leucophlegmatia, *Lin.* 214.

The emphysema sometimes comes on spontaneously; but more frequently is occasioned by wounds of the lungs, which, giving vent to the air, that fluid insinuates itself into the cellular texture, and often blows it up to a surprising degree. It must be observed, however, that it is only in cases of laceration of the lungs where this disease can take place; for in a simple wound, the effusion of blood always prevents the air from getting out. The cure is to be accomplished by scarifications and compresses; but in some cases only by the paracentesis of the thorax. When air introduced from the lungs is collected in a considerable quantity in the cavity of the thorax, the operation of the paracentesis is perhaps the only means of cure. Upon an opening being thus made, the air sometimes rushes out with incredible violence; and the patient receives at least immediate relief from circumstances the most distressing imaginable. In some instances it is followed even by a complete cure.

GENUS LXXIII TYMPANITES. 337
TYMPANY.

Tympanites, *Sauv.* gen 291. *Lin.* 219. *Vog.* 316. *Sag.* 118. *Boerh* 226. *Junck.* 87.
Affectio tympanitica, *Hoffm.* III. 339.
Meteorismus, *Sauv.* gen. 292.

This is an inflation of the abdomen, and is of two kinds: 1. That in which the flatus is contained in the intestines, in which the patient has frequent explosions of wind, with a swelling of the belly frequently unequal. 2. When the flatus is contained in the cavity of the abdomen; in which case the swelling is more equal, and the belly sounds when struck, without any considerable emission of flatus. Of these two, however, the former disease is by much the most common; insomuch, that many, even extensively engaged in practice, have never met with an instance of true abdominal tympanites. In both cases the rest of the body falls away.

Causes,

Tympanites.

Causes, &c. The tympany sometimes takes place in those who have been long troubled with flatulencies in the stomach and intestines. It happens frequently to women after abortion; to both sexes after the suppression of the hæmorrhoids; and sometimes from tedious febrile disorders injudiciously treated.

Prognosis. This disease is generally very obstinate, and for the most part proves fatal by degenerating into an ascites. Sometimes, if the patient be healthy and strong, the disease may terminate favourably, and that the more readily if it has followed from some disorder. A hectic consumption, dry cough, and emaciated countenance in a tympany, with a swelling of the feet, denote approaching death in a very short time.

Cure. With a view to the prevention of this affection; it is necessary, in the first place, to avoid, as far as it can be done, causes giving rise to an uncommon extrication of air, by preserving the proper tone of the alimentary canal. After this affection has taken place, the indications are, first, to expel the air already extricated and confined in different cavities; and, secondly, to prevent further accumulation. On these grounds different remedies are employed. The cure, however, is principally attempted by carminative, resolvent, and stomachic medicines, gentle laxatives, and at last tonics, especially chalybeates. In the Edinburgh Medical Essays, Vol. I. we have a very remarkable history of a tympany by Dr Monro senior. The patient was a young woman of 22 years of age, who fell into the distemper after having a tertian ague, in which she was badly treated. She became a patient in the Edinburgh Infirmary the 24th of March 1730; took several purgatives; and some doses of calomel; used the warm bath; and had an antihysteric plaster applied over the whole belly, but with very little effect. She was monstrously distended, insomuch that the skin seemed to be in danger of bursting: her breathing was much straitened; but the swelling sometimes gradually decreased without any evacuation. The returns and degree of this swelling were very uncertain; and when the belly was most detumefied, several unequal and protuberant balls could be felt over the whole abdomen, but especially at its sides. Her stomach was good, she had no thirst, and her urine was in proportion to the quantity she drank. She was very costive, had her menses at irregular periods, but no œdematous swellings appeared in the feet or any where else. In this situation she continued from the time of her admission till the 21st of June, during which interval she had only her menses twice. Throughout this space of time, the following circumstances were observed, 1. Several times, upon the falling of the swelling, she complained of a headach; once of pains throughout all her body, once of a giddiness, twice of a nausea and vomiting, and the last time threw up green bile; and once her stomach swelled greatly, whilst the rest of the abdomen subsided. 2. During the flowing of the menses she did not swell, but became very big upon their stopping. 3. Blood-letting and emetics, which were made use of for some accidental urgent symptoms, had no very sensible effect in making the tympany either better or worse. 4. She never had passage of wind either way, except a little belching some days before the first monthly evacuation.

Some time before the last eruption of the menses, the purgatives were given more sparingly; and antihysterics of the strongest kinds, such as asafœtida, oleum corn. cerv. &c. mixed with soap, were given in large doses, accompanied with the hotter antiscorbutics as they are called, as horse-radish and ginger-root infused in strong-ale with steel. The patient was ordered to use frequent and strong frictions to all the trunk of her body and extremities, and to use moderate exercise. Immediately before the menstrua began to flow, clysters of the same kind of medicines were injected. The menses were in sufficient quantity; but as soon as they ceased, her belly increased in its circumference four inches and a half, but soon subsided. She then complained of pains, which a gentle sweat carried off. Borborygmi were for the first time observed on the same day, June 25th; and having taken some *tinctura sacra* at night, she passed a small quantity of blood next day by stool. This was the first appearance of the return of the hæmorrhoids, to which she had been formerly subject

The two following days her saponaceous, antihysteric, and antiscorbutic medicines being still continued, she had such explosions of wind upwards and downwards, that none of the other patients would remain in the same room, nay scarce on the same floor with her. Her belly became less and softer than it had been from the first attack of the disease; her medicines, with a dose of syrup of buckthorn at proper intervals, still were continued, only the proportion of steel was increased; her flatulent discharge went on successfully, and she gradually recovered her former health.

Genus LXXIV. PHYSOMETRA. 338
Windy Swelling of the Uterus.

Physometra, *Sauv.* gen. 290. *Sag.* 119.
Hysterophyse, *Vog.* 317.

The treatment of this is not different from that of the tympany. It is however, upon the whole, a very rare disease; and when it takes place, very seldom if ever admits of a cure.

Genus LXXV. ANASARCA. 339
Watery Swelling over the Whole Body.

Anasarca, *Sauv.* gen. 281. *Lin.* 215. *Vog.* 313. *Sag.* 108. *Boerh.* 1225. *Hoffm.* III. 322. *Junck.* 87. *Monro* on the Dropsy. *Millman* Animadversiones de hydrope 1779.
Phlegmatia, *Sauv.* gen. 282.
Angina aquosa, *Boerh.* 791.

In this disease the feet first begin to swell, especially in the evening, after exercise, and when the patient has stood or sat long; which swelling rises frequently to the thighs. By lying in bed, the swelling becomes less, or even almost disappears. In the progress of the disease, the swelling often rises to the hips, loins, and belly, and at last covers the whole body. This disease, besides the other symptoms afterwards mentioned under Ascites, is attended with a remarkable

Intumescentiæ able difficulty of breathing. In the cure of this, as well as other species of dropsy, the general intentions are, first, the evacuation of the water already effused either by natural or artificial outlets; and, secondly, the prevention of it from accumulation, which is chiefly to be expected from supporting a due action of the absorbents, and from keeping up a proper discharge by the serous excretories.

The remedies employed with these intentions are much the same with what are employed against the more important genus of ascites. Only it may be here noticed, that in anasarca it is usual to scarify the feet and legs. By this means the water is often discharged: but the operator must be cautious not to make the incision too deep; they ought barely to penetrate through the skin; and especial care must be taken, by spirituous fomentations and proper digestives, to prevent a gangrene. Dr Fothergill observes, that the safest and most efficacious way of making these drains is by the instrument used for cupping, called a *scarificator*; and he always orders it to be so applied as to make the little wounds transversely; as they not only discharge better, but are also longer in healing, than when made longitudinally.

Notwithstanding every precaution, however, gangrene will often ensue; and it is upon the whole a much safer practice to evacuate the water by the natural outlets, the valvular lymphatic absorbents; and with this intention emetics and cathartics, but particularly diuretics, are often employed with success.

340 GENUS LXXVI. HYDROCEPHALUS.
WATER in the HEAD.

Hydrocephalus, *Sauv.* gen. 285. *Lin.* 216. *Boerh.* 1217.
Hydrocephalum, *Vog.* 384.

THIS differs from the hydrocephalus formerly treated of at some length under the title of Apoplexia Hydrocephalica, chiefly in the water being collected in the external parts of the head, whereas the former is entirely within the skull. In the fifth volume of the Medical Observations we have an account of a very extraordinary case of this kind. The patient was a child only of a few days old, and had a tumor on his head about the size of a common tea-cup, which had the appearance of a bladder distended with water; near the apex was a small opening, through which a bloody serum was discharged. In other respects the child was healthy. No application was used but a piece of linen dipt in brandy. The tumor continued to increase for many months; at the end of which time the membrane containing the water appeared equally thick with the other part of the scalp, except one place about the size of a shilling, which continued thin, and at times appeared as if it would burst. He continued in this situation for about 17 months, when the circumference of the head was 20 inches, the base $16\frac{1}{2}$, the middle $18\frac{1}{2}$, and from the base to the apex near $8\frac{1}{2}$. The water was then drawn off, and the child died in two days. Almost all other cases of this distemper have proved fatal; the sutures of the skull generally give way, and the whole external part of the head is equally enlarged: but in the instance just now given there was a deficiency of part of the bones. Although, however, in some instances where the head is thus enlarged to an enormous size, the water is exterior to the brain, and therefore intitled to the appellation of hydrocephalus exterior, yet much more frequently in those instances where there is a manifest separation of the bones of the cranium at the sutures, the water is still contained within the ventricles; and accordingly the disease may be much more properly distinguished into the *acute* and *chronic* hydrocephalus, than as is commonly done into the *internal* and *external*. Although the latter be much slower in its progress, sometimes subsisting even for years, yet it is equally difficult of cure with the former, and very often it proves fatal in a few days if the water be drawn off by an artificial opening, which may be very easily performed by a mere puncture with a common lancet, without either pain or any immediate hazard from the operation itself, although the water be lodged in the ventricles; for these are distended to an enormous size, and the substance of the brain almost totally destroyed, so that hardly any thing is to be punctured but membranes. Hydrocephalus.

GENUS LXXVII. HYDRORACHITIS. 341
SPINA BIFIDA.

Hydrorachitis, *Sauv.* gen. 287. *Morgagn.* de sed. XII. 9. *et seq.*
Spinola, *Lin* 289.
Spina bifida, *Vog.* 386.

This disease, which consists in a soft tumor on the lumbar vertebræ, attended with a separation of the vertebræ themselves, though generally considered as approaching to the nature of rachitis, is commonly referred to the article SURGERY, which may be consulted with regard to this affection.

GENUS LXXVIII. HYDROTHORAX. 342
DROPSY of the BREAST.

Hydrothorax, *Sauv.* gen. 150. *Vog.* 311. *Boerh.* 1219.

This affection, particularly with respect to its causes, is in many circumstances similar to other kinds of dropsy, particularly to ascites. But from the situation of the water which is here deposited in the cavity of the thorax, it may naturally be supposed that some peculiar symptoms will occur. Besides the common symptoms of dropsy, paleness of the countenance, scarcity of urine, and the like, this disease is, in some instances, attended with a fluctuation of water within the breast; which when it does occur may be considered as a certain distinguishing mark of this affection. But besides this, it is also distinguished by the remarkable affections of circulation and respiration with which it is attended.

The breathing is peculiarly difficult, especially in a recumbent posture; and in many instances patients cannot breath with tolerable ease, unless when sitting erect, or even stooping somewhat forwards. The pulse is very irregular, and has often remarkable intermissions. But the disease has been thought to be principally characterized by a sudden starting from sleep, in consequence of an almost inexpressible uneasy sensation

Intumescentiæ referred to the breaſt, and attended with ſtrong palpitation, which may probably ariſe from an affection either of circulation or of reſpiration.

That theſe ſymptoms are common attendants of this diſeaſe, is undeniable; and they are certainly the beſt characteriſtics of this affection with which we are yet acquainted: but it muſt be allowed that they are preſent in ſome caſes where there is no water in the breaſt; and that in other inſtances where the diſeaſe exiſts, they are either altogether wanting, or occur only to a very ſlight degree. Certain diagnoſtics, therefore, of this diſeaſe ſtill remain to be diſcovered.

When hydrothorax is preſent from the affection of the vital functions with which it is attended, it may readily be concluded that it is a dangerous diſeaſe, and in many inſtances it proves fatal. The cure, as far as it can be accompliſhed, is obtained very much on the ſame principles as in other dropſies. Here, however, probably from the uncertainty of the diagnoſtics, the artificial abſtraction of water, by paracenteſis of the thorax, is leſs frequently had recourſe to than in aſcites; though in ſome inſtances, after other means have failed, it has been ſaid not only to give relief of ſymptoms highly urgent, particularly dyſpnœa, but even to produce a complete cure. Benefit is often obtained from an artificial diſcharge of water by the application of bliſters to the breaſt: but in this, as well as other dropſies, a diſcharge is chiefly effected by the natural outlets, particularly from the uſe of cathartics and diuretics. In this ſpecies of dropſy, more perhaps than in any other, recourſe has been had to the uſe of the digitalis purpurea, or fox-glove, ſo ſtrongly recommended as a diuretic by Dr Withering in his Treatiſe reſpecting the uſe of it. There can be no doubt that this article, tho' ſometimes productive of inconvenience from the diſtreſſing ſickneſs and ſevere vomiting which it not unfrequently excites though uſed even but in ſmall doſes, often operates as a powerful diuretic, and produces a complete evacuation of water, after other articles have failed. From the effects mentioned above, however, as well as from its influence on the pulſe, which it renders much ſlower, it is neceſſary that it ſhould be employed with great caution and in ſmall doſes. A dram of the dried leaves of the digitalis, macerated for four hours in half a pint of warm water, forms an infuſion which may be given in doſes of an ounce, and the dried powder of the leaves in doſes of one or two grains: theſe doſes may be gradually increaſed, and repeated twice or oftener in the day; but this requires to be done with great caution, leſt ſevere vomiting, or other diſtreſſing ſymptoms, ſhould take place.

343

Genus LXXIX. ASCITES.
Dropsy of the Abdomen.

Aſcites, *Sauv.* gen. 288. *Lin.* 217. *Vog.* 314. *Sag.* gen. 115. *Boerh.* 1226. *Hoffm.* III. 322. *Junck.* 87. *D. Monro* on the Dropſy, 1765. *Milman*, Animadverſiones de Hydrope, 1779.

Deſcription. This diſeaſe aſſumes three different forms: 1. When the water immediately waſhes the inteſtines 2. When it is interpoſed between the abdominal muſcles and peritonæum; or, 3. When it is contained in facs and hollow veſicles; in which caſe it is called the *encyſted dropſy*. Some phyſicians of great reputation have aſſerted, that the water was often placed within the duplicature of the peritonæum: but this is alleged by Dr Milman to be a miſtake, as that membrane is looked upon by the beſt anatomiſts to be ſingle; and he thinks that the abovementioned phyſicians have been led into this error from obſerving the water collected in the cellular ſubſtance of the peritonæum. Aſcites.

In the beginning of an aſcites the patient becomes languid, breathleſs, and has an averſion at motion: his belly ſwells; and when ſtruck, the ſound of fluctuating water is perceptible; there is a difficulty of breathing when the belly is preſſed. There is an almoſt continual thirſt, which in the progreſs of the diſeaſe becomes very urgent; the urine is thick, in ſmall quantity, and red. The pulſe is ſmall and frequent; and as the belly ſwells, the other parts waſte away. A fever at laſt ariſes, which, conſtantly increaſing, in the end carries off the patient. Theſe ſymptoms are moſt urgent where the waters are in immediate contact with the inteſtines; in the other kinds the reſt of the body is leſs waſted; nor is there ſo great thirſt or difficulty of breathing.

Cauſes, &c. The immediate cauſe of dropſy is a greater effuſion of ſerum by the exhalant arteries than the abſorbents take up. This may be occaſioned either by too great a quantity of liquid thrown out by the former, or by an inability of the latter to perform their office. This commonly happens in people whoſe bodies are of a weak and lax texture, and hence women are more ſubject to this malady than men; chlorotic girls eſpecially are very apt to become dropſical.

Sometimes, however, this diſeaſe is occaſioned by a debility of the vital powers, by great evacuations of blood, or by acute diſeaſes accidentally protracted beyond their uſual period; and although this cauſe ſeems very different from a laxity of fibres, yet the dropſy ſeems to be produced in a ſimilar manner by both. For the vital powers being debilitated by either of theſe cauſes, naturally bring on a certain debility and laxity of the ſolids; and on the other hand a debility of the ſolids always brings on a debility of the vital powers; and from this debility of the vital powers in both caſes it happens, that thoſe humours which ought to be expelled from the body are not, but accumulate by degrees in its cavities. There is, however, this difference between the two kinds of dropſy ariſing from theſe two different cauſes, That in the one which ariſes from laxity the ſolid parts are more injured than in that which ariſes from a debility of the vital powers. In the former, therefore, the water ſeems to flow out from every quarter, and the body ſwells all over. But when the diſeaſe is occaſioned by a debility of the vital powers, though the ſolids be leſs damaged, yet the power of the heart being much diminiſhed, and the humours ſcarce propelled through the extreme veſſels, the thin liquids, by which in a healthy ſtate the body is daily recruited, are carried by their own weight either into the cavities or into the cellular texture. Hence thoſe aqueous effuſions which follow great evacuations of blood, or vio-

Intumescentiæ. Ascites.

lent loosenesses, begin in the more depending parts of the body, gradually ascending, till they arrive at the cavity of the abdomen, or even the thorax.

But another and much more sufficient cause for the production of dropsy is an obstruction of the circulation; and this may take place from polypi in the heart or large vessels, and hard swellings in the abdomen. Instances have been observed of a dropsy arising from steatomatous tumors in the omentum, and many more from a scirrhous liver or spleen, and from an infarction and obstruction of the mysenteric glands, by which means the lymph coming from the extremities is prevented from arriving at the heart. Scirrhosity of the liver, the most common cause of ascites, probably operates by augmenting effusion in consequence of its preventing the return of the venous blood, the greater part of the veins from the abdomen going to the formation of the vena portarum.

Lastly, whatever, either within or without the vessels, contracts or shuts up their cavities, produces a more copious and easy transmission of the thin humours through the exhalant arteries, at the same time that it prevents their return by the absorbent veins. This has been established by experiment. For Lower having perforated the right side of the thorax in a dog, tied the *vena cava*, and sewed up the wound. The animal languished for a few hours, and then died. On dissection, a great quantity of serum was found in the abdomen, as if he had long laboured under an ascites. In like manner, having tied the jugular veins of another dog, a surprising swelling took place in those parts above the ligatures, and in two days the creature died. On dissection, all the muscles and glands were vastly distended, and quite pellucid, with limpid serum. From these experiments, and some cases of the disease mentioned by different authors, it appears, that when the veins are obstructed so that they cannot receive the arterial blood, the serum is separated as by a filtre into the more open cavities and laxer parts of the body, while the thicker part stagnates and is collected in the proper blood-vessels.

The too great tenuity of the humours is very frequently accused as the cause of dropsy, and many authors have asserted that dropsy might arise merely from a suberabundance of water in the blood. For this some experiments are quoted, from which they would infer, that when a great quantity of aqueous fluid is introduced into the blood, the superfluous fluid ought by no means to pass through the extremities of the sanguiferous arteries into the veins in the common course of circulation, but by being effused into the cavities should produce a dropsy. But this can only happen when the vital powers are very much diminished; for, in a natural state, the superfluous quantity is immediately thrown out by the skin or the kidneys: and agreeable to this we have an experiment of Schultzius, who induced a dropsy in a dog by causing him drink a great quantity of water; but he had first bled him almost *ad deliquium*, so that the vital powers were in a manner oppressed by the deluge of water. In this manner do those become hydropic who are seized with the disease on drinking large quantities of water either when wearied with labour, or weakened by some kinds of diseases. Dr Fothergill relates an instance of a person who, being advised to drink plentifully of barley-water, in order to remove a fever, rashly drunk 12 pounds of that liquor every day for a month, and thus fell into an almost incurable distemper. But if this quantity had been taken only during the prevalence of the fever, he would in all probability have suffered no inconvenience, as is probable from what has been related concerning the *diæta aquea* used by the Italians.

It is moreover evident from experiments, that, in a healthy state, not only water is not deposited in the cavities, but that if it is injected into them it will be absorbed, unless some laxity of the solids has already taken place. Dr Musgrave injected into the right side of the thorax of a dog four ounces of warm water; whence a difficulty of breathing and weakness immediately followed. But these symptoms continually lessened, and in the space of a week the animal seemed to be in as good health as before. Afterwards he injected 16 ounces of warm water into the left cavity of the thorax in the same dog; the same effects followed, together with great heat, and strong pulsation of the heart; but he again recovered in the space of a week. Lastly, he injected 18 ounces of water into one side of the thorax, and only six into the other: the same symptoms followed, but vanished in a much shorter time; for within five days the dog was restored to perfect health. During this time, however, he observed that the creature made a greater quantity of urine than usual.

The remote causes of dropsy are many and various. Whatever relaxes the solids in such a manner as to give an occasion of accumulation to the serous fluids, disposes to the dropsy. A lazy indolent life, rainy wet weather, swampy or low soil, and every thing which conduces to vitiate the viscera, or insensibly to produce obstructions in them, paves the way for a dropsy. Hence those are ready to fall into the disease who use hard and viscid aliments, such as poor people in some countries who use coarse brown bread, and children who are fed with unwholesome aliments; and the same thing happens to those who drink immoderately of spirituous liquors.

Prognosis. When the dropsy arises from a scirrhus of the liver or spleen, or any of the other viscera, the prognosis must always be unfavourable, and also when it arises from disorders of the lungs. Neither is the case more favourable to those in whom the small vessels are ruptured, and pour out their liquids into the cavity of the abdomen. Those certainly die who have polypi in the vessels, or tumors compressing the veins and vessels of the abdomen. A dropsy arising from obstructions in the mensenteric glands is likewise difficult to cure, whether such obstructions arise from a bad habit of body, or from any other cause; if we can, however, by any means remove the disease of the glands, the dropsy easily ceases. But in those who fall into dropsy without any disease preceding, it is not quite so dangerous; and even though a disease has preceded, if the patient's strength be not greatly weakened, if the respiration be free, and the person be not affected with any particular pain, we may entertain great hopes of a cure. But where a great loss of blood is followed by a fever, and that by a dropsy, the patients almost always die, and that

Intumescentiæ

that in a short time: those, however, are very frequently cured who fall into this disease without any preceding hæmorrhagy.

Cure. In the cure of this disease authors chiefly mention two indications. 1. To expel the superfluous quantity of water; and, 2. To prevent its being again collected. But before we proceed to speak of the remedies, it is necessary to take notice, that by the animal-economy, if a great evacuation of a fluid takes place in any part of the body, all the other fluids in the body are directed towards that part, and those which lie as it were lurking in different parts will be immediately absorbed, and thrown out by the same passage. Hence the humours which in hydropic persons are extravasated into the different cavities of the body will be thrown into the intestines, and evacuated by purgatives; or by diuretics will be thrown upon the kidneys, and evacuated by urine. It is, however, not only necessary to excite these evacuations in order to remove this malady, but they must be assiduously promoted and kept up till the abundant humour is totally expelled. For this reason Sydenham has advised purgatives to be administered every day, unless, either through the too great weakness of the body, or the violent operation of the purgative, it shall be necessary to interpose a day or two now and then; because if any considerable intervals be allowed to take place between the exhibition of the purgatives, an opportunity is given to the waters of collecting again. In this method, however, there is the following inconvenience, that, when the waters are totally evacuated, the strength is at the same time so much exhausted, that the distemper commonly returns in a very short time. Hence almost our only hopes of curing a dropsy consist in gently evacuating the waters by means of diuretics. But the efficacy of these is generally very doubtful. Dr Friend hath long ago observed, that this part of medicine is of all others the most lame and imperfect; but a French physician, Mr Bacher, lately discovered, as he alleges, a method of making the diuretics much more successful. His reputation became at last so great, that the French king thought proper to purchase his secret for a great sum of money. The basis of his medicine was hellebore-root, the malignant qualities of which he pretended to correct in the following manner. A quantity of the dried roots of black hellebore were pounded, and then put into a glazed earthen vessel, and afterwards sprinkled with spirit of wine. They were suffered to stand for twelve hours, stirring them about twice or thrice during that space of time. They were then sprinkled again, and at last good Rhenish wine was poured on till it stood six fingers above the roots. The mixture was frequently agitated with a wooden spatula; and as the wine was imbibed by the roots, more was poured on, so as to keep it always at the same height for 48 hours. The whole was then put on the fire and boiled for half an hour, after which the decoction was violently pressed out; the same quantity of wine was added as at first, and the mixture boiled as before. After the second expression the woody residuum was thrown away as useless. Both the strained liquors are then mixed together with two parts of boiling water to one of the decoction. The whole is afterwards evaporated in a silver vessel to the consistence of a syrup. One part of the extract is again added with two parts of boiling water, and the whole inspissated as before.—By this means, says he, the volatile nauseous acrid particles are separated by evaporation, and the fixed ones remain corrected and prepared for medicinal uses; adding, towards the end, a ninth part of old brandy, and evaporating to the consistence of turpentine. Mr Bacher reasons a good deal on the way in which this process corrects the medicine; but tells us, that notwithstanding the improvement, his pills will not have the desired effect unless properly made up. For forming them, they ought to be mixed with matters both of an inviscating and indurating nature; yet so prepared that it will be readily soluble in the stomach, even of a person already debilitated. For answering these purposes, he chose myrrh and carduus benedictus, and then gives the following receipt for the formation of his pills

Ascites.

"Take of the extract of hellebore prepared as above directed, and of solution of myrrh, each one ounce; of powdered carduus benedictus three drachms and a scruple. Mix them together, and form into a mass, dividing it into pills of a grain and an half each." To these pills Mr Bacher gives the name of the *pilulæ tonicæ*, from an idea, that while they evacuate the water, they at the same time act as tonics; and thus from augmenting the action of the lymphatics, prevent the return of the disease. And if both these intentions could be effectually answered by the use of the same remedy, it would unquestionably be of great importance in practice.

The effects of these pills were, we are told, very surprising. Dr Daignan relates, that he gave them to 18 hydropic patients at once; and these he divided into three classes, according to the degree of the disease with which they were affected. The first class contained those who laboured under an anasarca following intermittent fevers. The second class contained those who had an anasarca, together with some degree of ascites, arising from tedious febrile disorders. All these were cured; but these two classes consisted of such cases as are most easily removed. But the third contained six who were seized with a most violent anasarca and ascites, after being much weakened by tedious disorders, and of consequence in whom the disease was very difficult to be cured. Even of these, however, four were cured, and the other two died. The body of one of these being dissected, both sides of the cavity of the thorax were found to be full of a blackish red water. The lungs were unsound; there was a polypous concretion in the right ventricle of the heart; the liver and spleen were hard, and of a preternatural bulk; and the glands of the mesentery were obstructed and infarcted. In the other, the liver and pancreas were scirrhous, and the spleen very hard.

The same medicines were given by De Horne to eight persons, six of whom had both an anasarca and ascites, but the other two only an ascites. Four of these recovered; three died without being freed from the dropsy; one in whom the dropsy was cured died in a short time after, having for some time before his death become speechless.

By these patients 10 of the pills were taken at once;

 and

Intumescentiæ

and the ſame doſe repeated to the third time, with an interval of an hour betwixt each doſe. At firſt they proved purgative, and then diuretic; by which laſt evacuation they finally cured the diſeaſe. But though Mr Bacher was firmly of opinion that his pills cured the dropſy by reaſon of the above-related correction; yet it is certain that, in the hands of other practitioners, theſe very pills have failed, unleſs they alſo made uſe of the ſame regimen recommended by that phyſician; while, on the other hand, it is alſo certain, that different medicines will prove equally efficacious in dropſical caſes, provided this regimen is made uſe of.

For a great number of ages it has been recommended to dropſical patients to abſtain as much as poſſible from drink, and thus to the torments of their diſeaſe was added that of an intolerable thirſt; and how great this torment was, we may underſtand from an example of a friend of king Antigonus, who, having been cloſely watched both by order of the phyſicians and alſo of the king, was ſo unable to bear the raging thirſt occaſioned by his diſeaſe, that he ſwallowed his own excrements and urine, and thus ſpeedily put an end to his life. Dr Milman ſhows at great length the pernicious tendency of this practice. He maintains that it is quite contrary to the ſentiments of Hippocrates and the beſt ancient phyſicians. He aſſerts, that unleſs plenty of diluting drink be given, the beſt diuretics can have no effect. He condemns alſo in the ſtrongeſt terms the practice of giving dropſical patients only dry, hard, and indigeſtible aliments. Theſe would oppreſs the ſtomach even of the moſt healthy; and how much more muſt they do ſo to thoſe who are already debilitated by labouring under a tedious diſorder? By what means alſo are theſe aliments to be diſſolved in the ſtomach when drink is with-held? In this diſeaſe the ſaliva is viſcid, and in ſmall quantity; from whence it may be reaſonably conjectured, that the reſt of the fluids are of the ſame nature, and the gaſtric juices likewiſe depraved. Thus the aliments lie long in the ſtomach; and if the viſcera were formerly free of obſtructions, they are now generated; the ſtrength fails; perſpiration and other excretions are obſtructed; the viſcid and pituitous humours produced by theſe kinds of food float about the præcordia, and increaſe the diſeaſe, while the ſurface of the body becomes quite dry. Nay, ſo much does this kind of diet conſpire with the diſeaſe, that 100 pounds of fluid will ſometimes be imbibed in a few days by hydropic perſons who take no drink. Even in health, if the body from any cauſe becomes dry, or deprived of a conſiderable part of its juices, as by hunger, labour, &c. it will imbibe a conſiderable quantity of moiſture from the air; ſo that we muſt impute the abovementioned extraordinary inhalation, in part at leaſt, to the denial of drink, and to the nature of the aliment given to the ſick. The following is the account given by Dr Milman of his practice in the Middleſex hoſpital.

If the patient be not very much debilitated, he is ſometimes treated with the purging waters, and a doſe of jalap and calomel alternately. On the intermediate days he gets a ſaline mixture, with 40 or 60 drops of *acetum ſcilliticum* every ſixth hour; drinking with the purgatives oat-gruel and ſome thin broths. That he might the better aſcertain what ſhare the liquids given along with the medicines had in producing a copious flow of urine, he ſometimes gave the medicines in the beginning of the diſtemper without allowing the drink: but though the ſwellings were uſually diminiſhed a little by the purgatives, the urine ſtill continued ſcanty, and the patients were greatly weakened. Fearing, therefore, leſt, by following this courſe, the ſtrength of the ſick might be too much reduced, he then began his courſe of diuretic medicines, giving large quantities of barley-water with a little *ſal diureticus*; by which means, ſometimes in the ſhort ſpace of 48 hours after the courſe was begun, the urine flowed out in very large quantity: but as ſaline drinks are very diſagreeable to the taſte, a drink was compoſed purpoſely for hydropic perſons, of half an ounce of cream of tartar diſſolved in two pounds of barley-water, made agreeably ſweet with ſyrup, adding one or two ounces of French brandy.

Aſcites.

To this compoſition Dr Milman was induced by the great praiſes given to cream of tartar by ſome phyſicians in hydropic caſes. In the *Acta Bononienſia*, 15 caſes of hydropic patients are narrated who were cured only by taking half an ounce of cream of tartar daily. But it is remarkable, that by theſe very patients the cream of tartar was taken for 20, 30, nay 40 days, often without any perceptible effect; yet when diſſolved in a large quantity of water, it ſhowed its ſalutary effects frequently within as many hours, by producing a plentiful flow of urine. This liquor is now the common drink of hydropic patients in the hoſpital abovementioned, of which they drink at pleaſure along with their medicines.

Among purgative medicines Dr Milman recommends the *radix ſenekæ*; but ſays the decoction of it, according to the Edinburgh Pharmacopœia, is too ſtrong, as he always found it excite vomiting when prepared as there directed, and thus greatly to diſtreſs the patients: but when only half an ounce or ſix drachms of the root are uſed to a pound of decoction, inſtead of a whole ounce as directed by the Edinburgh college, he finds it an excellent remedy; and though it may ſometimes induce a little vomiting, and frequently a nauſea, yet it ſeldom failed to procure nine or ten ſtools a-day, and ſometimes alſo proved diuretic. But we muſt take care not to be too free in the uſe of ſeneka, or any other purgative, if the patients be very weak; and therefore, after having uſed purgatives for ſome time, it will be proper to depend upon diuretics entirely for perfecting the cure; and of the ſucceſs of this method our author gives ſome very remarkable inſtances. But he obſerves, that after the dropſy is removed, the patients will ſometimes die without any evident cauſe; and of this it is proper that the phyſicians ſhould be aware. It is remarkable with what eaſe a flux of urine is induced in thoſe who have a ſcirrhous liver; while on the other hand, in one who had the meſenteric glands obſtructed, along with a ſcirrhoſity of the liver and vitiated ſtate of the lungs, the moſt powerful diuretics proved ineffectual. In ſome caſes Dr Milman thinks the kidneys may be ſo preſſed with the weight of the water, as to be unable to perform their office. With regard, however, to diuretics in general, it may be remarked, that the operation of none of them can be certainly depended upon. In particular conſtitutions, and at particular times, one will

be

Dropsy. be observed to succeed, after another, though commonly much more powerful, has been tried in vain. Accordingly various articles of this kind are often used in succession. Recourse is particularly often had to the roots of taraxacum, of colchicum, and of squills; the latter, especially when combined with calomel, is often found to be a very powerful diuretic. And indeed mercury in different forms, probably from acting as a deobstruent, is often of very great use in dropsical complaints. Among other diuretics, the lactuca virosa has of late been highly extolled by Dr Collins of Vienna, and the nicotiana tabaccum by Dr Fowler of York: but neither has been extensively introduced into practice, although we have known some instances in which the latter has been used with great advantage.

The water having been drawn off, we are to put the patient on a course of strengtheners; such as the Peruvian bark, with some of the warm aromatics, and a due proportion of rhubarb infused in wine and chalybeates. Gentle exercise, and frictions on the belly, with such a course of diet as shall be light and nourishing, are also to be enjoined: and it may be observed, that the use of tonic medicines is by no means to be delayed till a complete evacuation of the water can be obtained. On the contrary, by alternating, and even combining the use of evacuants and tonics, the influence of both is often very much promoted.

When the patient can by no other means be relieved, the operation of paracentesis must be had recourse to, which is described under the article SURGERY.

Physconia, *Sauv.* gen. 283. *Vog.* 325. *Sag.* gen. 110.
Hyposarca, *Lin.* 218.

This disease may arise from a variety of causes, as from a swelling of the liver, spleen, kidneys, uterus, omentum, ovarium, mesentery, intestines, &c. and sometimes it arises merely from fat. In the former cases, as the viscera are generally scirrhous and indurated, the distemper is for the most part incurable; neither is the prospect much better where the disease is occasioned by a great quantity of fat.

Description. This is one of the diseases peculiar to infancy. It seldom attacks children till they are nine months, nor after they are two years old; but it frequently happens in the intermediate space between these two periods. The disease shows itself by a flaccid tumor of the head and face, a loose flabby skin, a swelling of the abdomen, and falling away of the other parts, especially of the muscles. There are protuberances of the epiphyses of the joints; the jugular veins swell, while the rest decrease; and the legs grow crooked. If the child has begun to walk before he be seized with this disease, there is a slowness, debility, and tottering in his motion, which soon brings on a constant desire of sitting, and afterwards of lying down; insomuch that nothing at last is moveable but the neck and head. As they grow older, the head is greatly enlarged, with ample sutures; the thorax is compressed on the sides, and the sternum rises up sharp, while the extremities of the ribs are knotty. The abdomen is protuberant, and the teeth black and carious. In such patients as have died of this disease, all the solids appear soft and flaccid, and the fluids dissolved and mucous.

Causes. The rickets may proceed from scrofulous or venereal taints in the parents, and may be increased by those of the nurse. It is likewise promoted by feeding the child with aqueous and mucous substances, crude summer-fruits, fish, unleavened farinaceous aliment, and too great a quantity of sweet things.—Sometimes it follows intermittent fevers and chronic disorders; and in short, is caused by any thing which tends to debilitate the body, and induce a viscid and unhealthy state of the juices.

Prognosis. The rickets do not usually prove fatal by themselves, but if not cured in time, they make the person throughout life deformed in various ways; and often produce very pernicious disorders, such as carious bones in different parts of the body.

Cure. This is to be effected by mild cathartics, alteratives, and tonics, such as are used in other diseases attended with a debility of the system and a vitiated state of the blood and juices. In the Western Islands of Scotland, the medicine used for the cure of the rickets is an oil extracted from the liver of the skate-fish. The method of application is as follows: First, the wrists and ankles are rubbed with the oil in the evening: this immediately raises a fever of several hours duration. When the fever from the first rubbing subsides, the same parts are rubbed again the night following; and repeatedly as long as the rubbing of these parts continues to excite the fever.—When no fever can be excited by rubbing the wrists and ankles alone, they are rubbed again along with the knees and elbows. This increased unction brings on the fever again; and is practised as before, till it no longer has that effect. Then the vertebræ and sides are rubbed, along with the former parts; and this

Intumeſcentiæ.

this unction, which again brings on the fever, is repeated as the former When no fever can be any longer excited by this unction, a flannel-ſhirt dipped in the oil is put upon the body of the patient: this brings on a more violent and ſenſible fever than any of the former unctions; and is continued till the cure be completed, which it commonly is in a ſhort time.

A German phyſician, Dr Strack, has lately publiſhed a paper, in which he recommends the filings of iron as a certain remedy in the rickets. This diſeaſe, he obſerves, in general begins with children when they are about 16 months old. It is ſeldom obſerved with children before they be one year old, and ſeldom attacks them after they paſs two; and it is very generally worſe where it begins early than where it begins late.

For effecting a cure, it is, he affirms, a matter of the utmoſt conſequence to be able to diſtinguiſh, very early, whether a child will be afflicted with rickets or not. And this, he aſſures us, may be determined by the following ſymptoms: Paleneſs and ſwelling of the countenance; and in that part of the cheeks which ſhould naturally be red, a yellow colour approaching to that of ſulphur. When that is the caſe, he directs that a medicine ſhould be immediately had recourſe to which will retard the further progreſs of the diſeaſe and remove what has already taken place. For this purpoſe, he adviſes that five grains of the filings of iron, and as much rhubarb, ſhould be rubbed up with ten grains of ſugar, and given for a doſe every morning faſting, and every evening an hour before ſupper. But if conſiderable looſeneſs ſhould be produced, it will be neceſſary, at firſt, to perſiſt in the uſe of one doſe only every day.

After a month's continuance in this courſe, according to Dr Strack, there in general enſues a keen appetite for food, quick digeſtion, and a copious flow of urine; by means of which the fulneſs of the face and yellowneſs of the complexion are by degrees removed, while the natural colour of the countenance and firmneſs of the body in general are gradually reſtored. This practice, he aſſures us, has never failed of ſucceſs in any one inſtance; not even in thoſe children born of parents greatly afflicted with the rickets.

In addition to the uſe of chalybeates, great benefit is often alſo obtained in this diſeaſe from the uſe of the cold bath; which, under prudent adminiſtration, is perhaps one of the moſt effectual remedies for this complaint with which we are yet acquainted.

When the bones of rickety children begin to bend, they may ſometimes be reſtored to their natural ſhape by compreſſes, bolſters, and proper ſupports. See the article SURGERY.

GENUS LXXXIV. SCROFULA.
KING'S-EVIL.

Scrofula, *Sauv.* gen. 285. *Vog.* 367. *Sag.* 121. Struma, *Lin.* 284.

Scrofula.

Deſcription. This diſeaſe ſhows itſelf by hard, ſcirrhous, and often indolent tumors, which ariſe by degrees in the glands of the neck, under the chin, armpits, and different parts of the body, but moſt commonly in the neck, and behind the ears. In proceſs of time, the cellular ſubſtance, ligaments of the joints, and even the bones themſelves, are affected. In ſcrofula the ſwellings are much more moveable than thoſe of the ſcirrhous kind; they are generally ſofter, and ſeldom attended with much pain; they are tedious in coming to ſuppuration; are very apt to diſappear ſuddenly, and again to riſe in ſome other part of the body. We may likewiſe mention as characteriſtic circumſtances of this diſeaſe, a remarkable ſoftneſs of the ſkin, a kind of fulneſs of the face, generally with large eyes, and a very delicate complexion.

Cauſes. A variety of cauſes have been mentioned as tending to produce ſcrofula; viz. a crude indigeſtible food; bad water; living in damp, low ſituations; its being an hereditary diſeaſe, and in ſome countries endemic, &c. But whatever may in different circumſtances be the exciting or prediſpoſing cauſes of the ſcrofula, the diſeaſe itſelf either depends upon, or is at leaſt much connected with, a debility of the conſtitution in general, and probably of the lymphatic ſyſtem in particular, the complaint always ſhowing itſelf by ſome affections of the latter. And that debility has at leaſt a conſiderable influence in its production is probable, not only from the manifeſt nature of ſome of the cauſes ſaid to be productive of ſcrofula, but likewiſe from ſuch remedies as are found moſt ſerviceable in the cure, which are all of a tonic invigorating nature.

Prognoſis. The ſcrofula is a diſtemper which often eludes the moſt powerful medicines, and therefore phyſicians cannot with any certainty promiſe a cure. It is ſeldom, however, that it proves mortal in a ſhort time, unleſs it attacks the internal parts, ſuch as the lungs, where it frequently produces tubercles that bring on a fatal conſumption. When it attacks the joints, it frequently produces ulcers, which continue for a long time, and gradually waſte the patient; while in the mean time the bones become foul and corroded, and death enſues after a long ſcene of miſery. The prognoſis in this reſpect muſt be regulated entirely by the nature of the ſymptoms.

Cure It was long ſuppoſed that ſcrofula depended upon an acid acrimony of the fluids; and this, it is probable, gave riſe to the uſe of burnt ſponge, different kinds of ſoap, and other alkaline ſubſtances, as the beſt remedies for acidity. But although a ſourneſs of the ſtomach and *primæ viæ* does no doubt frequently occur in theſe complaints, yet this ſymptom ſeems to be entirely the conſequence of that general relaxation which in ſcrofula ſo univerſally prevails, and which does not render it in the leaſt neceſſary to ſuppoſe a general aceſcency of the fluids to take place; as the one very frequently, it is well kn wn, even in other complaints, occurs without the leaſt ſuſpicion of any acid acrimony exiſting in the other. This is alſo rendered very probable from the indolent nature of ſcrofulous tumors, which have been known to ſubſiſt for years without giving any uneaſineſs; which could not have been the caſe, if an acid, or any other acrimony, had prevailed in them.

In the treatment of ſcrofula, different morbid conditions,

ditions, exifting in different parts, require, according to circumftances, various means of cure: but, upon the whole, the remedies directed may be confidered as ufed with a view either to the tumors, to the ulcerations, or to the general ftate of the fyftem.

Gentle mercurials are fometimes of ufe as refolvents in fcrofulous fwellings; but nothing has fuch confiderable influence as a frequent and copious ufe of Peruvian bark. Cold bathing too, efpecially in the fea, together with frequent moderate exercife, is often of fingular fervice here; as is likewife change of air, efpecially to a warm climate.

In the fcrofulous inflammation of the eyes, or ophthalmia ftrumofa, the Peruvian bark has alfo been given with extraordinary advantage: and we meet with an inftance of its having cured the gutta rofacea in the face; a complaint which it is often difficult to remove, and which is extremely difagreeable to the fair fex.

From the various cafes related of tumefied glands, it appears, that when the habit is relaxed and the circulation weak, either from conftitution or accident, the bark is a moft efficacious medicine, and that it acts as a refolvent and difcutient. It will not, however, fucceed in all cafes; but there are few in which a trial can be attended with much detriment. Dr Fothergill obferves, that he has never known it avail much where the bones were affected, nor where the fcrofulous tumor was fo fituated as to be accompanied with much pain, as in the joints, or under the membranous coverings of the mufcles; for when the difeafe attacks thofe parts, the periofteum feldom efcapes without fome injury, by which the bone will of courfe be likewife affected. Here the Peruvian bark is of no effect: inftead of leffening, it rather increafes the fever that accompanies thofe circumftances: and, if it do not really aggravate the complaint, it feems at leaft to accelerate the progrefs of the difeafe.

Various are the modes in which the bark is adminiftered: Dr Fothergill makes ufe of a decoction, with the addition of fome aromatic ingredients and a fmall quantity of liquorice-root, as a form in which a fufficient quantity may be given without exciting difguft. But where it is eafily retained in the ftomach in fubftance, perhaps the beft form of exhibiting it is that of powder; and in this ftate it is often advantageoufly conjoined with powder of cicuta, an article poffeffing very great deobftruent powers.

The powder, however, foon becomes difagreeable to very young patients; and the extract feems not fo much to be depended upon as may have been imagined. In making the extract, it is expofed to fo much heat, as muft have fome effect upon its virtues, perhaps to their detriment In adminiftering it, likewife, if great care be not taken to mix it intimately with a proper vehicle, or fome very foluble fubftance, in weak bowels it very often purges, and thereby not only difappoints the phyfician, but injures the patient. A fmall quantity of the *cortex Winteranus* added gives the medicine a grateful warmth; and a little liquorice, a few raifins, gum arabic, or the like, added to the decoction before it be taken from the fire, by making the liquor vifcid enables it to fufpend more of the fine particles of the bark; by which procefs the medicine is not only improved in efficacy, but at the fame time rendered lefs difagreeable.

Scrofula.

In indolent fwellings of the glands from vifcid humours, fea-water alfo has been ftrongly recommended by Dr Ruffel.

Dr Fothergill alfo acquaints us, that the cicuta even by itfelf is not without a confiderable fhare of efficacy in removing fcrofulous diforders He mentions the cafe of a gentlemwoman, about 28 years of age, afflicted from her infancy with fcrofulous complaints, fevere ophthalmies, glandular fwellings, &c. cured by the *extractum cicutæ* taken conftantly for the fpace of a year. He obferves, however, that when given to children even in very fmall dofes, it is apt to produce fpafmodic affections; for which reafon he rarely exhibits it to them when very young, or even to adults of very irritable habits.

Dr Fothergill gives feveral other inftances of the fuccefs of cicuta in fcrofulous cafes, and even in one which feemed to be not far removed from a confirmed phthifis; but owns that it feldom had fuch good effects afterwards: yet he is of opinion, that where there are fymptoms of tubercles forming, a ftrumous habit, and a tendency to phthifis, the cicuta will often be ferviceable. It is anodyne, corrects acrimony, and promotes the formation of good matter. With regard to the quality of the medicine, he obferves, that the extract prepared from hemlock before the plant arrives at maturity, is much inferior to that which is made when the hemlock has acquired its full vigour, and is rather on the verge of decline: juft when the flowers fade, the rudiments of the feeds become obfervable, and the habit of the plant inclines to yellow. This, he thinks, is the proper time to collect the hemlock. It has then had the full benefit of the fummer heat; and the plants that grow in expofed places will generally be found more active than thofe that grow in the fhade. The lefs heat it undergoes during the preparation, the better. Therefore, if a confiderable quantity of the dry powder of the plant gathered at a proper feafon be added, lefs boiling will be neceffary, and the medicine will be the more efficacious. But let the extract be prepared in what manner foever it may, provided it be made from the genuine plant, at a proper feafon, and be not deftroyed by boiling, the chief difference obfervable in ufing it is, that a larger quantity of one kind is required to produce a certain effect than of another. Twenty grains of one fort of extract have been found equal in point of efficacy to thirty, nay near forty, of another; yet both of them made from the genuine plant, and moft probably prepared with equal fidelity. To prevent the inconveniences arifing from this uncertainty, it feems always expedient to begin with fmall dofes, and proceed ftep by ftep till the extract produces certain effects, which feldom fail to arife from a full dofe. Thefe effects are different in different conftitutions. But, for the moft part, a giddinefs affecting the head, and motions of the eyes as if fomething pufhed them outwards, are firft felt; a flight ficknefs, and trembling agitation of the body; a laxative ftool or two. One or all thefe fymptoms are the marks of a full dofe, let the quantity in weight be what it will. Here we muft ftop till none of thefe effects be felt; and in three or four days advance a few grains more. For it has been fuppofed by moft of thofe who have ufed this medicine to any good purpofe, that the cicuta feldom procures

any

Impetigines. any benefit, though given for a long time, unless in as large a dose as the patient can bear without suffering any of the inconveniences above mentioned. There is, however, reason to believe, that its effects as a discutient are in no degree dependent on its narcotic powers: and we are inclined to think, that recourse is often had to larger doses than are necessary; or at least that the same benefit might be derived from smaller ones continued for an equal length of time.

Patients commonly bear a greater quantity of the extract at night than at noon, and at noon than in the morning. Two drachms may be divided into thirty pills. Adults begin with two in the morning, two at noon, and three or four at night, with directions to increase each dose, by the addition of a pill to each, as they can bear it.

But after all, the best form under which the cicuta can, we think, be exhibited, is that of powder from the leaves. This, either in a state of powder or made into pills, may be given at first to the extent of four or five grains, and the dose gradually rising till it amount to 15 or 20 grains twice or thrice a day. Given to this extent, particularly when conjoined with the Peruvian bark, it has often been found of great service in scrofulous cases. At the same time it must be allowed, that such patients, after resisting every mode of cure, will have in some instances a spontaneous recovery in the progress of life, probably from the system acquiring additional vigour.

350

Genus LXXV. SYPHILIS.
Lues Venerea, or *French Pox*.

Syphilis, *Sauv.* gen. 3086. *Lin.* 6. *Vog.* 319. *Sag.* 126.

Lues venerea, *Boerh.* 1440. *Hoffm.* III. 413. *Junck.* 96. *Astruc* de lue Venerea.

Dr Astruc, who writes a very accurate history of the lues venerea, is fully convinced that it is a new disease, which never appeared in Europe till some time between the years 1494 and 1496, having been imported from America by the companions of Christopher Columbus; though this opinion is not without its opponents. Dr Sanches in particular has contended with much learning and ability, that it appeared in Europe at an earlier period: But it is at least certain, that it was altogether unknown to the medical practitioners of Greece and Rome, and that it was a very common disease in America when the Europeans first visited that country. But at whatever period it may have been introduced into Europe, or from whatever source it may have been obtained, there can be no doubt that, as well as small-pox or measles, syphilis depends on a peculiar specific contagion; on a matter *sui generis* which is alone capable of inducing this disease.

The venereal infection, however, cannot, like the contagious miasmata of the small-pox and some other diseases, be carried through the air, and thus spread from place to place: for unless it is transmitted from the parents to the children, there is no other way of contracting the disease but from actual contact with the infectious matter. Thus, when a nurse happens to labour under the disease, the infant that she suckles will receive the infection; as, on the other hand, when the child is infected, the nurse is liable to receive it: and there have even been instances known of lying-in women being infected very violently, from having employed a person to draw their breasts who happened to have venereal ulcers in the throat. It may be caught by touching venereal sores if the cuticle be abraded or torn; and in this way accoucheurs and midwives have sometimes been infected severely. Dr Macbride says, the most inveterate pox he ever saw was caught by a midwife, who happened to have a whitlow on one of her fingers when she delivered a woman ill of the lues venerea.

Syphilis.

But by far the most ready way of contracting this disease is by coition, the genital parts being much more bibulous than the rest of the body. When the disorder is communicated, the places where the morbific matter enters are generally those where it first makes its appearance; and as coition is the most usual way of contracting it, so the first symptoms commonly appear on or near the pudenda.

The patient's own account will, for the most part, help us to distinguish the disease: but there are sometimes cases wherein we cannot avail ourselves of this information, and where, instead of confessing, the parties shall conceal all circumstances; while, on the other hand, there are now and then people to be met with, who persuade themselves that symptoms are venereal, which in reality are owing to some other cause: and therefore it is of the utmost importance to inform ourselves thoroughly of the nature of those symptoms and appearances which may be considered as pathognomic signs of lues venerea.

In the first place, when we find that the local symptoms, such as chancres, buboes, phymosis, and the like, do not give way to the usual methods; or when these complaints, after having been cured, break out again without a fresh infection; we may justly suspect that the virus has entered the whole mass of fluids: but if at the same time ulcers break out in the throat, and the face is deformed by callous tubercles, covered with a brown or yellow scab, we may be assured that the case is now become a confirmed lues, which will require a mercurial course.

When eruptions of the furfuraceous and superficial kind are venereal, they are not attended with itching; and the scale being picked off, the skin appears of a reddish brown, or rather copper-colour, underneath; whereas leprous eruptions are itchy, throw off a greater quantity of scales, and rise in greater blotches, especially about the joints of the knees and elbows. Venereal tubercles or pustules are easily distinguished from carbuncles of the face, by not occupying the cheeks or the nose, nor as having a purulent apex, but are covered at top, either with a dry branny scurf like the superficial eruptions just now mentioned, or else with a hard dry scab of a tawney yellow hue; they particularly break out among the hair or near to it, on the forehead or on the temples.

Venereal ulcers affecting the mouth are distinguishable from those which are scorbutic in the following manner: 1. Venereal ulcers first affect the tonsils, fauces, and uvula; then the gums but these very rarely: on the contrary, scorbutic ulcers affect the gums first of all; then the fauces, tonsils, and uvula. 2. Venereal ulcers frequently spread to the nose; scorbutic ones almost never. 3. Venereal ulcers are callous in the

Impetigines the edges; scorbutic ones are not so 4. Venereal ulcers are circumscribed, and, for the most part, are circular, at least they are confined to certain places; scorbutic ones are of a more irregular form, spread wider, and frequently affect the whole mouth 5 Venereal ulcers are for the most part hollow, and generally covered at bottom with a white or yellow slough; but scorbutic ones are more apt to grow up into loose fungi. 6. Venereal ulcers are red in their circumference, but scorbutic ones are always livid. 7. Venereal ulcers frequently rot the subjacent bones, the scorbutic ones seldom or never. 8 And lastly, Venereal ulcers are most combined with other symptoms which are known to be venereal; scorbutic ones with the distinguishing signs of the scurvy, such as difficult breathing, listlessness, swelling of the legs, rotten gums, &c.

Another sure sign of the confirmed lues is often afforded from certain deep-seated nocturnal pains, particularly of the shins, arms, and head. As for any superficial wandering pains that have no fixed seat, and which affect the membranes of the muscles and ligaments of the joints, they, for they most part, will be found to belong to the gout or rheumatism, and can never be considered as venereal unless accompanied with some other evident signs; but with regard to the pains that are deeply seated, and always fixed to the same place, and which affect the middle and more solid part of the ulna, tibia, and bones of the cranium, and rage chiefly and with greatest violence in the forepart of the night, so that the patient can get no rest till morning approaches, these may serve to convince us that the disease has spread itself throughout the whole habit, whether they be accompanied with other symptoms of the lues or not. *Gummata* in the fleshy parts, *nodes* in the periosteum, *ganglia* upon the tendons, *tophi* upon the ligaments, *exostoses* upon the bones, and *fici* at the verge of the anus, are all of them signs of the confirmed lues: these are hard indolent swellings; but as they sometimes arise independently of any venereal infection, and perhaps may proceed from a scrofulous taint, unless they be accompanied or have been preceded by some of the more certain and evident symptoms of the lues, we must be cautious about pronouncing them venereal. When these swellings are not owing to the syphilitic virus, they are very seldom painful, or tend to inflame and suppurate; whereas those that are venereal usually do, and if they lie upon a bone generally bring on a caries.

These carious ulcers are most commonly met with upon the ulna, tibia, and bones of the cranium; and when accompanied with nocturnal pains, we can never hesitate about declaring their genuine nature. Frequent abortions, or the exclusion of scabby, ulcerated, half-rotten, and dead fetuses, happening without any manifest cause to disturb the fetus before its time, or to destroy it in the womb, may be reckoned as a sure sign that at least one of the parents is infected

These then are the principal and most evident signs of the confirmed lues. There are others which are more equivocal, and which, unless we can fairly trace them back to some that are more certain, cannot be held as signs of the venereal disease: Such are, 1. Obstinate inflammations of the eyes, frequently returning with great heat, itching, and ulceration of the eye-lids. 2. A singing and hissing noise in the ears, with ulcers or caries in the bones of the meatus auditorius. 3. Obstinate head-achs. 4. Obstinate cutaneous eruptions, of the itchy or leprous appearance, not yielding to the milder methods of treatment. 5. Swellings of the bones; and, 6. Wandering and obstinate pains. None of these symptoms, however, can be known to be venereal, except they happen to coincide with some one or other of the more certain signs.

Syphilis.

It may, perhaps, be considered as a singularity in this disease, that the diagnosis is often more difficult in the advanced than in the early periods of the affection. That is, with those who have been certainly subjected to syphilis, it is often very difficult to say whether certain symptoms, remaining after the ordinary modes of cure have been employed, be syphilitic or not. Very frequently, as appears from the sequel, nocturnal pains, ulcerations, and the like, remaining after a long course of mercury has been employed, are in no degree of a venereal nature, but are in reality to be considered as consequences rather of the remedy than of the disease; and are accordingly best removed by nourishing diet, gentle exercise, and tonics But as long as any symptoms of any kind remain, it is often impossible to convince some patients that they are cured; and it is often impossible for a physician with certainty to affirm that the disease is altogether overcome.

Upon the whole, we are first to distinguish and consider the several symptoms apart; and then, by comparing them with each other, a clear judgment may be formed upon the general review.

Prognosis. Being thoroughly convinced that the case is venereal, we are to consider, first of all, whether it be of a longer or shorter date; for the more recent it is, it will, *cæteris paribus*, be less difficult to remove. But there are other circumstances which will assist us in forming a prognostic as to the event. As,

1. The age of the patient. This disorder is more dangerous to infants and old people than to such as are in the flower and vigour of life, in whom some part of the virus may be expelled by exercise, or may be subdued in some degree by the strength of the constitution.

2. The sex. Though women are for the most part weaker than men, and therefore should seem less able to resist the force of any disease, yet experience shows that this is easier borne by them than by men; perhaps owing to the menstrual and other uterine discharges, by which a good share of the virus may be carried off immediately from the parts where it was first applied; for it is observable, that whenever these discharges are obstructed, or cease by the ordinary course of nature, all the symptoms of this disease grow worse.

3. The habit of body. Persons who have acrid juices will be liable to suffer more from the venereal poison than such as have their blood in a milder state; hence, when people of a scorbutic or scrofulous habit contract venereal disorders, the symptoms are always remarkably violent, and difficult to cure. And for the same reasons, the confirmed lues is much more to be dreaded in a person already inclined to an asthma, phthisis, dropsy, gout, or any other chronic distemper,

Impetigines per, than in one of a found and healthy conftitution. For as the original difeafe is increafed by the acceffion of the venereal poifon, fo the lues is aggravated by being joined to an old diforder. The more numerous the fymptoms, and the more they affect the bones, the more difficult the cure. Of all combinations the union of fyphilis with fcrofula is perhaps the moft difficult to overcome: but if the acrimony fhould feize on the nobler internal parts, fuch as the brain, the lungs, or the liver, then the difeafe becomes incurable, and the patient will either go off fuddenly in an apoplectic fit or fink under a confumption.

Cure. Viewing this difeafe as depending on a peculiar contagious matter introduced into the fyftem, and multiplied there, it is poffible to conceive that a cure may be obtained on one of three principles; either by the evacuation of the matter from the fyftem, by the deftruction of its activity, or by counteracting its influence in the fyftem. It is not impoffible that articles exift in nature capable of removing this complaint on each of thefe grounds: but we may venture at leaft to affert, that few fuch are yet difcovered. Notwithftanding numbers of pretended infallible remedies for fyphilis, mercury is perhaps the only article on which dependence is placed among European practitioners; and with regard to its mode of operation, all the three different opinions pointed out have been adopted and fupported by different theorifts.—But although many ingenious arguments have been employed in fupport of each, we are, upon the whole, inclined to think it more probable that mercury operates by deftroying the activity of the venereal virus, than that it has effect either by evacuating it, or by exciting a ftate of action, by which its influence is counteracted. Some practitioners have affirmed, that the difeafe may be totally extirpated without the ufe of mercury: but, excepting in flight cafes, it appears from the moft accurate obfervations, that this grand fpecific is indifpenfable; whether it be introduced through the pores of the fkin, in the form of ointments, plafters, wafhes, &c.; or given by the mouth, difguifed in the different fhapes of pills, troches, powders, or folutions.

Formerly it was held as a rule, that a falivation ought to be raifed, and a great difcharge excited. But this is now found to be unneceffary: for as mercury probably acts by fome fpecific power in fubduing and correcting the venereal virus, all that is required is to throw in a fufficient quantity of the medicine for this purpofe; and if it can be diverted from the falivary glands fo much the better, fince the inconveniences attending a fpitting are fuch as we fhould always wifh to avoid.

Mercury, when combined with any faline fubftance, has its activity prodigioufly increafed; hence the great variety of chemical preparations which have been contrived to unite it with different acids.

Corrofive fublimate is one of the moft active of all the mercurial preparations, infomuch as to become a poifon even in very fmall dofes. It therefore cannot fafely be given in fubftance; but muft be diffolved in order to render it capable of a more minute divifion. We may fee, by looking into Wifeman, that this is an old medicine, though feldom given by regular practitioners. How it came to be introduced into fo remote a part of the world as Siberia, is not eafily found out; but Dr Clerc, author of the *Hiftoire Naturelle de l'Homme Malade*, affures us, that the fublimate folution has been of ufe there time out of mind. Syphilis.

It appears to have been totally forgotten in other places, until of late years, when the Baron Van Swieten brought it into vogue; fo that at one period, if we credit Dr Locher, they ufed no other mercurial preparation at Vienna. The number of patients cured by this remedy alone in the hofpital of St Mark, which is under the care of this gentleman, from 1754 to 1761 inclufive, being 4880.

The way to prepare the folution is, to diffolve as much fublimate in any kind of ardent fpirit (at Vienna they ufe only corn-brandy) as will give half a grain to an ounce of folution. The dofe to a grown perfon is one fpoonful mixed with a pint of any light ptifan or barley-water, and this to be taken morning and evening: the patients fhould keep moftly in a warm chamber, and lie in bed to fweat after taking the medicine: their diet fhould be light; and they ought to drink plentifully throughout the day, of whey, ptifan, or barley-water. If the folution does not keep the belly open, a mild purge muft be given from time to time; for Locher obferves, that thofe whom it purges two or three times a-day, get well fooner than thofe whom it does not purge: he alfo fays, that it very feldom affects the mouth, but that it promotes the urinary and cutaneous difcharges. This courfe is not only to be continued till all the fymptoms difappear, but for fome weeks longer. The fhorteft time in which Locher ufed to let the patients out was fix weeks; and they were continued on a courfe of decoction of the woods for fome weeks after they left off the folution.

This method has been introduced both in Britain and Ireland, though by no means to the exclufion of others; but it appears, that the folution does not turn out fo infallible a remedy, either in thefe kingdoms, or in France, as they fay it has done in Germany. It was feldom if ever found to perform a radical cure, and the frequent ufe of it proved in many cafes highly prejudicial. It has therefore been fucceeded in practice, even at Vienna, by mercury exhibited in other forms; and, among thefe, by a remedy firft recommended by Dr Plenck, and fince improved by Dr Saunders; confifting of mercury united with mucilage of gum arabic, which is faid to render its exhibition perfectly mild and fafe. For particulars, we refer to Dr Saunders's treatife.

But a late French writer, fuppofed to be Dr Petit, in a fmall book, intitled *A parallel of the different methods of treating the venereal difeafe*, infifts, that there is neither certainty nor fafety in any other method than the repeated frictions with mercurial ointment.

If therefore it is determined to have recourfe to the mercurial frictions, the patient may with advantage be prepared by going into the warm bath fome days fucceffively; having been previoufly blooded if of a plethoric habit, and taking a dofe or two of fome proper cathartic.

The patient being fitted with the neceffary apparatus of flannels, is then to enter on the courfe.

If

Impetigines

If the person be of a robust habit, and in the prime of life, we may begin with two drachms of the *unguentum hydrargyri fortius*, (Ph. Lond.) which is to be rubbed in about the ankles by an assistant whose hands are covered with bladders: then having intermitted a day, we may expend two drachms more of the ointment, and rest for two days; after which, if no soreness of the mouth comes on, use only one drachm; and at every subsequent friction ascend till the ointment shall reach the trunk of the body; after which the rubbings are to be begun at the wrists, and from thence gradually extended to the shoulders. In order to prevent the mercury from laying too much hold of the mouth, it must be diverted to the skin, by keeping the patient in a constant perspiration from the warmth of the room, and by drinking plentifully of barley-water, whey, or ptisan; but if, nevertheless, the mercury should tend to raise a spitting, then, from time to time, we are either to give some gentle cathartic, or order the patient into a vapour or warm bath: and thus we are to go on, rubbing in a drachm of the ointment every second, third, or fourth night, according as it may be found to operate; and on the intermediate days either purging or bathing, unless we should choose to let the salivation come on; which, however, it is much better to avoid, as we shall thus be able to throw in a larger quantity of mercury.

It is impossible to ascertain the quantity of mercury that may be necessary to be rubbed in, as this will vary according to circumstances: but we are always to continue the frictions for a fortnight at least, after all symptoms of the disease shall have totally disappeared; and when we have done with the mercury, warm bathing, and sudorific decoctions of the woods, are to be continued for some time longer.

This is a general sketch of the methods of treatment for the confirmed lues; but for a complete history of the disease, and for ample directions in every situation, we refer to Astruc, and his abridger Dr Chapman.—We have to add, however, that a method of curing this disease by fumigation has been lately recommended in France; but it seems not to meet with great encouragement. One of the most recent proposals for the cure of the venereal disease is that of Mr Clare, and consists in rubbing a small quantity of mercury under the form of *mercurius muriatus mitis*, or *calomel* as it is commonly called, on the inside of the cheek; by which means it has been supposed that we will not only avoid the inconveniences of unction, but also the purgative effects that are often produced by this medicine when taken into the stomach. But after all, the introduction of mercury under the form of unction, as recommended by the latest and best writers in Britain on the venereal disease, Dr Swediaur, Mr John Hunter, and others, is still very generally preferred in Britain to any mode that has yet been proposed.

Where, after a long trial of mercury, distressing symptoms still remain, particularly obstinate ulcerations and severe pains, benefit has often been derived from the use of opium: but there is little reason to believe, as has been held by some, that of itself it affords an infallible cure of this disease; at least we are inclined to think, that all the facts hitherto brought in support of the cure of syphilis by opium are at the utmost very doubtful. Syphilis.

In obstinate ulcerations, remaining probably after the venereal virus has been overcome, and resisting the use of mercury, a complete cure has in many instances been obtained from the use of the root of the mezereon, the daphne mezereum of Linnæus. This article has been chiefly employed under the form of decoction; and it now appears that it is the basis of an article at one time highly celebrated in venereal complaints, under the title of *Lisbon diet-drink*. But, upon the whole, these sequelæ of this disease are perhaps more readily overcome by country air, gentle exercise, and nourishing diet, particularly a milk diet, than by the use of any medicine whatever. It must indeed be allowed, that for combating different sequelæ, various practices accommodated to the nature of these will on particular occasions be requisite. But into the consideration of these we cannot here propose to enter.

Genus LXXXVI. SCORBUTUS. 352
Scurvy.

Scorbutus, *Sauv.* gen. 391. *Lin.* 223. *Vog.* 318. *Sag.* 127. *Boerh.* 1148. *Hoffm.* III. 369. *Junck.* 91. *Lind* on the Scurvy. *Hulme* de Scorbuto. *Rouppe* de morbis Navigantium.

Description. The first indication of the scorbutic diathesis is generally a change of colour in the face, from the natural and healthy look to a pale and bloated complexion, with a listlessness, and aversion from every sort of exercise; the gums soon after become itchy, swell, and are apt to bleed on the slightest touch; the breath grows offensive; and the gums, swelling daily more and more, turn livid, and at length become extremely fungous and putrid, as being continually in contact with the external air; which in every case favours the putrefaction of substances disposed to run into that state, and is indeed absolutely requisite for the production of actual rottenness.

The symptoms of the scurvy, like those of every other disease, are somewhat different in different subjects, according to the various circumstances of constitution; and they do not always proceed in the same regular course in every patient. But what is very remarkable in this disease, notwithstanding the various and immense load of distress under which the patients labour, there is no sickness at the stomach, the appetite keeps up, and the senses remain entire almost to the very last: when lying at rest, they make no complaints, and feel little distress or pain; but the moment they attempt to rise or stir themselves, then the breathing becomes difficult, with a kind of straitness or catching, and great oppression, and sometimes they have been known to fall into a syncope. This catching of the breath upon motion, with the loss of strength, dejection of spirit, and rotten gums, are held as the essential or distinguishing symptoms of the disease. The skin is generally dry, except in the very last stage, when the patients become exceedingly subject to faintings, and then it grows clammy and moist: in some it has an anserine appearance; but much oftener it is smooth and shining; and, when examined, is found to be spread over with spots not rising above the surface, of a redish, bluish, livid, or purple colour, with

Impetigines a sort of yellow rim round them. At first these spots are for the most part small, but in time they increase to large blotches. The legs and thighs are the places where they are principally seen: more rarely on the head and face. Many have a swelling of the legs, which is harder, and retains the impression of the finger longer than the common dropsical or truly œdematous swellings. The slightest wounds and bruises, in scorbutic habits, degenerate into foul and untoward ulcers. And the appearance of these ulcers is so singular and uniform, that they are easily distinguished from all others. Scorbutic ulcers afford no good digestion, but give out a thin and fetid ichor mixed with blood, which at length has the appearance of coagulated gore lying caked on the surface of the sore, not to be separated or wiped off without some difficulty. The flesh underneath these sloughs feels to the probe soft and spongy, and is very putrid. Neither detergents nor escharotics are here of any service; for though such sloughs be with great pains taken away, they are found again at the next dressing, where the same sanguineous putrid appearance always presents itself. Their edges are generally of a livid colour, and puffed up with excrescences of proud flesh arising from below the skin. As the violence of the disease increases, the ulcers shoot out a soft bloody fungus, which often rises in a night's time to a monstrous size; and although destroyed by cauteries, actual or potential, or cut away with the knife, is found at next dressing as large as ever. It is a considerable time, however, before these ulcers, bad as they are, come to affect the benes with rottenness—These appearances will always serve to assure us that an ulcer is scorbutic; and should put us on our guard with respect to the giving mercurials, which are the most pernicious things that can be administered in these cases.

Scorbutic people, as the disease advances, are seldom free from pains; though they have not the same seat in all, and often in the same person shift their place. Some complain of universal pain in all their bones; but most violent in the limbs, and especially the joints: the most frequent seat of their pain, however, is some part of the breast. The pains of this disease seem to arise from the distraction of the sensible fibres by the extravasated blood being forced into the interstices of the periosteum and of the tendinous and ligamentous parts; whose texture being so firm, the fibres are liable to higher degrees of tension, and consequently of pain.

The states of the bowels are various: in some there is an obstinate costiveness; in others a tendency to a flux, with extremely fetid stools: the urine is also rank and fetid, generally high-coloured; and, when it has stood for some hours, throws up an oily scum on the surface. The pulse is variable: but most commonly slower and more feeble than in the time of perfect health. A stiffness in the tendons, and weakness in the joints of the knees, appear early in the disease: but as it grows more inveterate, the patients generally lose the use of their limbs altogether; having a contraction of the flexor-tendons in the ham, with a swelling and pain in the joint of the knee. Some have their legs monstrously swelled, and covered over with livid spots or ecchymoses; others have had tumors there; some, though without swelling, have the calves of the legs and the flesh of the thighs quite indurated. As persons far gone in the scurvy are apt to faint, and even expire, on being moved and brought out into the fresh air, the utmost care and circumspection are requisite when it is necessary to stir or remove them. Scorbutus.

Scorbutic patients are at all times, but more especially as the disease advances, extremely subject to profuse bleedings from different parts of the body; as from the nose, gums, intestines, lungs, &c. and likewise from their ulcers, which generally bleed plentifully if the fungus be cut away. It is not easy to conceive a more dismal and diversified scene of misery than what is beheld in the third and last stage of this distemper; it being then that the anomalous and more extraordinary symptoms appear, such as the bursting out of old wounds, and the dissolution of old fractures that have been long united.

Causes. The term *scurvy* has been indiscriminately applied, even by physicians, to almost all the different kinds of cutaneous foulness; owing to some writers of the last century, who comprehended such a variety of symptoms under this denomination, that there are few chronic distempers which may not be so called, according to their scheme: but the disease here meant is the true putrid scurvy, so often fatal to seamen, and to people pent up in garrisons without sufficient supplies of sound animal-food and fresh vegetables; or which is sometimes known to be endemic in certain countries, where the nature of the soil, the general state of the atmosphere, and the common course of diet, all combine in producing that singular species of corruption in the mass of blood which constitutes this disease; for the appearances, on dissecting scorbutic subjects, sufficiently show that the scurvy may, with great propriety, be termed a disease of the blood.

Dr Lind has, in a postscript to the third edition of his treatise on the scurvy, given the result of his observations drawn from the dissection of a considerable number of victims to this fatal malady, from which it appears that that true scorbutic state, in an advanced stage of the distemper, consists in numerous effusions of blood into the cellular interstices of most parts of the body, superficial as well as internal; particularly the gums and the legs; the texture of the former being almost entirely cellular, and the generally dependent state of the latter rendering these parts, of all others in the whole body, the most apt to receive, and retain the stagnant blood, when its crasis comes to be destroyed; and it loses that glutinous quality which, during health, hinders it from escaping thro' the pores in the coats of the blood-vessels or through exhalant extremities.

A dropsical indisposition, especially in the legs and breast, was frequently, but not always, observed in the subjects that were opened, and the pericardium was sometimes found distended with water: the water thus collected was often so sharp as to shrivel the hands of the dissector; and in some instances, where the skin happened to be broken, it irritated and festered the wound.

The fleshy fibres were found so extremely lax and tender, and the bellies of the muscles in the legs and thighs so stuffed with the effused stagnating blood, that it was always difficult, and sometimes impossible, to

Petigines to raise or separate one muscle from another. He says that the quantity of this effused blood was amazing; in some bodies it seemed that almost a fourth part of the whole mass had escaped from the vessels; and it often lay in large concretions on the periosteum, and in some few instances under this membrane immediately on the bone. And yet, notwithstanding this dissolved and depraved state of the external fleshy parts, the brain always appeared perfectly sound, and the viscera of the abdomen, as well as those in the thorax, were in general found quite uncorrupted. There were spots indeed, from extravasated blood, observed on the mesentery, intestines, stomach, and omentum; but these spots were firm, and free from any mortified taint; and, more than once, an effusion of blood, as large as a hand's breadth, has been seen on the surface of the stomach; and what was remarkable, that very subject was not known while living to have made any complaint of sickness, pain, or other disorder, in either stomach or bowels.

These circumstances and appearances, with many others that are not here enumerated, all prove to a demonstration a putrescent, or at least a highly depraved state of the blood: and yet Dr Lind takes no small pains to combat the idea of the scurvy's proceeding from animal putrefaction; a notion which, according to him, "may, and hath misled physicians to propose and administer remedies for it altogether ineffectual."

He also, in the preface to his third edition, talks of the mischief done by an attachment to delusive theories. He says, "it is not probable that a remedy for the scurvy will ever be discovered from a preconceived hypothesis, or by speculative men in the closet, who have never seen the disease, or who have seen at most only a few cases of it;" and adds, "that though a few partial facts and observations may, for a little, flatter with hopes of greater success, yet more enlarged experience must ever evince the fallacy of all positive assertions in the healing art."

Sir John Pringle, however, is of a very different opinion. He "is persuaded, after long reflection, and the opportunities he has had of conversing with those who to much sagacity had joined no small experience in nautical practice, that upon an examination of the several articles which have either been of old approved, or have of late been introduced into the navy, it will appear, that though these means may vary in form and in mode of operating, yet they all some way contribute towards preventing putrefaction; whether of the air in the closer parts of a ship, of the meats, of the water, of the clothes and bedding, or of the body itself."

What Dr Lind has above advanced is the more remarkable, as, in the two former editions of his book, he embraced the hypothesis of animal-putrefaction being the cause of the scurvy; and if these effusions of blood, from a destruction of its crasis and the dissolved state of the muscular fibres, together with the rotten condition of the mouth and gums, do not betray putrescency, it is hard to say what does, or what other name we shall bestow on this peculiar species of depravation which constitutes the scurvy.

The blood, no doubt, derives its healthy properties, and maintains them, from the due supplies of wholesome food; while the insoluble, superfluous, effete, and acrid parts, are carried off by the several discharges of stool, urine, and perspiration.

Scorbutus.

Our senses of taste and smell are sufficient to inform us when our food is in a state of soundness and sweetness, and consequently wholesome; but it is from chemistry that we must learn the principles on which these qualities chiefly depend.

Experiments of various kinds have proved, that the soundness of animal and vegetable substances depends very much, if not entirely, on the presence of their aerial principle; since rottenness is never observed to take place without an emission of fixed air from the putrefying substance: and even when putrefaction has made a considerable progress, if aerial acid can be transferred, in sufficient quantity, from some other substance in a state of effervescence or fermentation, into the putrid body, the offensive smell of this will be destroyed; and if it be a bit of rotten flesh with which the experiment is made, the firmness of its fibres will be found in some measure restored.

The experiments of Dr Hales, as well as many others made since his time, show that an aerial principle is greatly connected with, and remarkably abundant in, the gelatinous parts of animal bodies, and in the mucilage or farina of vegetables. But these are the parts of our food which are most particularly nutritive; and Dr Cullen, whose opinion on this as on every other medical subject must be allowed of the greatest weight, affirms, in his Lectures on the Materia Medica, that the substances on which we feed are nutritious only in proportion to the quantities of oil and sugar which they respectively contain. This oil and sugar are blended together in the gelatinous part of our animal-food, and in the mucilaginous and farinaceous part of esculent vegetables; and, while thus intimately combined, are not perceivable by our taste, though very capable of being developed and rendered distinct by the power of the digestive organs; for in consequence of the changes produced during digestion, the oily and the saccharine matter become manifest to our senses, as we may see and taste in the milk of animals, which is chiefly chyle a little advanced in its progress toward sanguification; the oil is observed to separate spontaneously, and from which a quantity of actual sugar may be obtained by a very simple process.

Thus much being premised, we can now readily comprehend how the blood may come to lose those qualities of smoothness, mildness, and tenacity which are natural to it. For if, in the first place, the fluids, and organs subservient to digestion should be so far distempered or debilitated that the nutritious parts of the food cannot be properly developed, the blood must be defrauded of its due supplies; which will also be the case if the aliment should not originally contain enough of oily and saccharine matter, or should be so circumstanced, from being dried or salted, as to hinder the ready extrication of the nutritious parts; or lastly, if the natural discharges should be interrupted or suspended so that the superfluous, acrid, and effete fluids are retained in the general mass; in all these instances the blood must of necessity run into proportionate degrees of depravation.

And hence we may understand how it may possibly happen, Impetigines happen, that when perfons are greatly weakened by fome preceding diforder, and at the fame time debarred the ufe of proper bodily exercife, the fcorbutic diathefis fhould take place, even though they enjoy the advantages of pure air and wholefome diet. But thefe are folitary cafes, and very rarely feen; for whenever the fcurvy feizes numbers, and can be confidered as an epidemic difeafe, it will be found to depend on a combination of the major part, or perhaps all, of the following circumftances:

1. A moift atmofphere, and more efpecially if cold be joined to this moifture. 2. Too long ceffation from bodily exercife, whether it be from conftraint, or a lazy flothful difpofition 3. Dejection of mind 4. Neglect of cleanlinefs, and want of fufficient clothing. 5. Want of wholefome drink, either of pure water or fermented liquors And, . Above all, the being obliged to liv continually on falted meats, perhaps not well cured, without a du proportion of the vegetables fufficient to correct the pernicious tendency of the falt, by fupplying the bland oil and faccharine matter requifite for the purpofes of nutrition.

Thefe general principles refpecting the caufes and nature of fcurvy, feem to afford a better explanation of the phenomena of the difeafe than any conjectures refpecting it that have hitherto been propofed. It muft, however, be allowed, that Dr Lind is by no means the only writer who is difpofed to confider this difeafe as not referable to the condition of the circulating fluids. In a late ingenious treatife on this fubject by Dr Milman, he ftrenuoufly contends, that the primary morbid affection in this complaint is a debilitated ftate of the folids arifing principally from want of aliment. But his arguments on this fubject, as well as thofe of Dr Lind, are very ably anfwered by a ftill later writer on this fubject, Dr Trotter, who has drawn his obfervations refpecting it from very extenfive experience, and who confiders it as clearly eftablifhed, by incontrovertible facts, that the proximate caufe of fcurvy depends on fome peculiar ftate of the blood.—Dr Trotter, in the fecond edition of his Obfervations on the Scurvy, from the refult of farther obfervation and later difcoveries in chemiftry, has attempted, with much ingenuity, to prove that the morbid condition of the blood, which takes place in fcurvy, arifes from the abftraction of vital air, or, as it is now generally called, *oxygene*; and this opinion, though ftill, perhaps, in fome particulars requiring farther confirmation, is, it muft be allowed, fupported by many plaufible arguments.

Prevention and Cure. The fcurvy may be prevented, by obviating and correcting thofe circumftances in refpect of the non-naturals which were mentioned as contributing to the difeafe, and laid down as caufes. It is therefore a duty highly incumbent on officers commanding at fea, or in garrifons, to ufe every poffible precaution; and, in the firft place, to correct the coldnefs and moifture of the atmofphere by fufficient fires: in the next, to fee that their men be lodged in dry, clean, and well ventilated births or apartments: thirdly, to promote cheerfulnefs, and enjoin frequent exercife, which alone is of infinite ufe in preventing the fcurvy: fourthly, to take care that the cloathing be proper, and cleanlinefs of perfon ftrictly obferved: fifthly, to fupply them with wholefome drink, either pure water or found fermented liquors; and if fpirits be allowed, to have them properly diluted with water and fweetened with melaffes or coarfe fugar: and laftly, to order the falted meats to be fparingly ufed, or fometimes entirely abftained from; and in their place, let the people live on different compofitions of the dried vegetables; frefh meat and recent vegetables being introduced as often as they can poffibly be procured.

Scorbutus.

A clofe attention to thefe matters will, in general, prevent the fcurvy from making its appearance at all, and will always hinder it from fpreading its influence far. But when thefe precautions have been neglected, or the circumftances fuch that they cannot be put in practice, and the difeafe hath actually taken place, our whole endeavour muft be to reftore the blood to its original ftate of foundnefs: and happily, fuch is the nature of this difeafe, that if a fufficiency of new matter, of the truly mild nutritious fort, and particularly fuch as abounds with vital air, fuch as recent vegetables, or different acid fruits, can be thrown into the circulation while the flefhy fibres retain any tolerable degree of firmnefs the patient will recover; and that in a furprifingly fhort fpace of time, provided a pure air, comfortable lodgings, fufficient cloathing, cleanlinefs, and exercife, lend their neceffary aid.

This being the cafe, the plan of treatment is to be conducted almoft entirely in the dietetic way; as the change in the mafs of blood, which it is neceffary to produce, muft be brought about by things that can be received into the ftomach by pints or pounds, and not by thofe which are adminiftered in drops or grains, drachms or ounces. For here, as there is no diforder of the nervous fyftem, we have no need of thofe active drugs which are indifpenfably neceffary in febrile or nervous difeafes; the fcorbutic diathefis being quite oppofite to that which tends to produce a fever or any fpecies of fpafmodic diforders; nay, Dr Lind fays, he has repeatedly found, that even the infection of an hofpital fever is long refifted by a fcorbutic habit.

It will now naturally occur to the reader, what thofe alimentary fubftances muft be which bid the faireft to reftore the blood to its healthy ftate; and he needs fcarcely to be told, that they are of thofe kinds which the ftomach can bear with pleafure though taken in large quantities, which abound in jelly or mucilage, and which allow thofe nutritious parts to be eafily developed; for though the vifcera in fcorbutic patients may be all perfectly found, yet we cannot expect that either the digeftive fluids or organs fhould poffefs the fame degrees of power, which enable them, during health, to convert the crude dry farinacea, and the hard falted flefh of animals, into nourifhment. We muft therefore fearch for the *antifcorbutic virtue* in the tender fweet flefh of herbivorous animals; in new milk; and in the mucilaginous acid juices of recent vegetables, whether they be fruits, leaves, or roots.

The four juices of lemons, oranges, and limes, have been generally held as antifcorbutics in an eminent degree, and their power afcribed to their acid; from an idea that acids of all kinds are the only correctors of putrefaction. But the general current of practical obfervations

Antiscorbutics. observations shows, and our experiments confirm it, that the virtue of these juices depends on their *aerial principle*; accordingly, while perfectly recent and in the mucilaginous state, and especially if mixed with wine and sugar, the juices of any one of these fruits will be found a most grateful and powerful antiscorbutic.

Dr Lind observing, "that the lemon-juice, when given by itself undiluted, was apt, especially if overdosed, to have too violent an operation, by occasioning pain and sickness at the stomach, and sometimes a vomiting; therefore found it necessary to add wine and sugar. A pint of Madeira wine, and two ounces of sugar, were put to four ounces and a half of juice, and this quantity was found sufficient for weak patients to use in 24 hours: such as were very weak sipped a little of this frequently according as their strength would permit; others who were stronger took about two ounces of it every two hours; and when the patients grew still stronger, they were allowed eight ounces of lemon-juice in 24 hours."

While this very pleasant mixture, which is both a cordial and an antiseptic, may be had, it would be needless to think of prescribing any other; but when the fresh juice cannot be procured, we must have recourse to such other things as may be obtained. But the various modes of combining and administering these, so as to render them perfectly agreeable to the stomach, must always be regulated by circumstances, and therefore it will be in vain to lay down particular directions; since all that we have to do is, to fix on such fruits and other fresh vegetables as can be most conveniently had and taken, and contrive to give them in those forms, either alone or boiled up with flesh-meat into soups, that will allow the patients to consume the greatest quantities.

The first promising alteration from such a course is usually a gentle diarrhœa; and if, in a few days, the skin becomes soft and moist, it is an infallible sign of recovery; especially if the patient gain strength, and can bear being stirred or carried into the open air without fainting.

But if the belly should not be loosened by the use of the fresh vegetables, nor the skin become soft and moist, then they must be assisted by stewed prunes, or a decoction of tamarinds with cream of tartar, in order to abate the costiveness; and by drinking a light decoction of the woods, and warm bathing, in order to relax the pores of the skin; for nothing contributes more to the recovery of scorbutic patients than moderate sweating.

With regard to particular symptoms, antiseptic mouth-waters composed of a decoction of the Peruvian bark and infusion of roses, with a solution of myrrh, must be used occasionally, in order to cleanse the mouth, and give firmness to the spongy gums. Swelled and indurated limbs, and stiffened joints, must be bathed with warm vinegar, and relaxed by the steam of warm water, repeatedly conveyed to them, and confined to the parts by means of close blankets: ulcers on the legs must never be treated with unctuous applications nor sharp escharotics; but the dressing should consist of lint or soft rags, dipt in a strong decoction of Peruvian bark.

This disease at no time requires, or indeed bears, large evacuations, either by bleeding or purging; and, as has been already mentioned, the belly must only be kept open by the fresh vegetables or the mildest laxatives. But we are always to be careful that scorbutic persons, after a long abstinence from greens and fruits, be not permitted to eat voraciously at first, lest they fall into a fatal dysentery. See Lutus.

All, however, that has now been laid down as necessary towards the cure, supposes the patients to be in situations where they can be plentifully furnished with all the requisites; but unhappily these things are not to be procured at sea, and often deficient in garrisons: therefore, in order that a remedy for the scurvy might never be wanting, Dr Macbride, in the year 1762, first conceived the notion, that the *infusion of malt*, commonly called *wort*, might be substituted for the common antiscorbutics; and it was accordingly tried.

More than three years elapsed before any account arrived of the experiments having been made: at length, ten histories of cases were received, wherein the wort had been tried, with very remarkable success; and this being judged a matter of great importance to the seafaring part of mankind, these were immediately communicated to the public in a pamphlet under the title of *An historical account of a new method of treating the scurvy at sea.*

This was in 1767; but after that time a considerable number of letters and medical journals, sufficient to make up a small volume, were transmitted to the author, particularly by the surgeons of his Majesty's ships who had been employed of late years for making discoveries in the southern hemisphere. Certain it is, that in many instances it has succeeded beyond expectation. In others it has fallen short: but whether this was owing to the untoward situation of the patients, or inattention on the part of the persons who were charged with the administration of the wort, not preparing it properly, or not giving it in sufficient quantity, or to its own want of power, must be collected from the cases and journals themselves.

During Captain Cook's third voyage, the most remarkable, in respect of the healthiness of the crew, that ever was performed, the wort is acknowledged to have been of singular use.

In a letter which this very celebrated and successful circumnavigator wrote to Sir John Pringle, he gives an account of the methods pursued for preserving the health of his people; and which were productive of such happy effects, that he performed "a voyage of three years and 18 days, through all the climates from 52° north to 71° south, with the loss of one man only by disease, and who died of a complicated and lingering illness, without any mixture of scurvy. Two others were unfortunately drowned, and one killed by a fall; so that out of the whole number 118 with which he set out from England, he lost only four.

He says, that much was owing to the extraordinary attention of the admiralty, in causing such articles to be put on board as either by experience or conjecture were judged to tend most to preserve the health of seamen; and with respect to the wort, he expresses himself as follows:

"We had on board a large quantity of *malt*, of which

Impetigines which was made *sweet wort*, and given (not only to those men who had manifest symptoms of the scurvy, but to such also as were, from circumstances, judged to be most liable to that disorder) from one or two to three pints in the day to each man, or in such proportion as the surgeon thought necessary, which sometimes amounted to three quarts in the 24 hours: this is without doubt one of the best antiscorbutic sea-medicines yet found out; and if given in time, will, with proper attention to other things, I am persuaded, prevent the scurvy from making any great progress for a considerable time: but I am not altogether of opinion that it will cure it, in an advanced state, at sea."

On this last point, however, the Captain and his Surgeon differ; for this gentleman positively asserts, and his journal (in Dr Macbride's possession) confirms it, that the infusion of malt did effect a cure in a confirmed case, and at sea.

The malt, being thoroughly dried, and packed up in small casks, is carried to sea, where it will keep sound, in every variety of climate, for at least two years: when wanted for use, it is to be ground in a hand-mill, and the infusion prepared from day to day, by pouring three measures of boiling water on one of the ground malt; the mixture being well mashed, is left to infuse for 10 or 12 hours, and the clear infusion then strained off. The patients are to drink it in such quantities as may be deemed necessary, from one to three quarts in the course of the 24 hours: a panado is also to be made of it, by adding biscuit, and currants or raisins; and this palatable mess is used by way of solid food. This course of diet, like that of the recent vegetables, generally keeps the bowels sufficiently open; but in cases where costiveness nevertheless prevails, gentle laxatives must be interposed from time to time, together with diaphoretics, and the topical assistants, fomentations and gargles, as in the common way of management

Captain Cook was also provided with a large stock of *sour krout*; (cabbage-leaves cut small, fermented and stopped in the second stage of fermentation.) A pound of this was served to each man, twice a-week, while they were at sea. Sour krout, since the trial made of it on board Captain Cook's ships, has been extensively used by direction of the British government in many other situations, where scorbutus has prevailed; and it has been found to be highly serviceable both in preventing and in curing the disease. It was particularly found during the late American war to be highly beneficial to the British troops besieged in Boston, who were at that time entirely fed on salt provisions sent from England. The scurvy at one period broke out among them with very alarming appearances; but by the seasonable arrival of a quantity of sour krout, it was effectually overcome. Care, however, must be bestowed, that this article be properly prepared and properly kept. When due attention is paid to these particulars, it may be preserved in good condition for many months; and is considered both by sailors and soldiers as a very acceptable addition to their salt provisions. But when served out to them in a putrid state, it is not only highly disagreeable to the taste, but probably also pernicious in its effects

Among other means of preventing scurvy, Captain Cook had also a liberal supply of *portable soup*; Scorbutus. of which the men had generally an ounce, three days in the week, boiled up with their pease; and sometimes it was served to them oftener; and when they could get fresh greens, it was boiled up with them, and made such an agreeable mess, that it was the means of making the people eat a greater quantity of greens than they would otherwise have done. And what was still of further advantage, they were furnished with sugar in lieu of butter or oil, which is seldom of the sweetest sort; so that the crew were undoubtedly great gainers by the exchange.

In addition to all these advantages of being so well provided with every necessary, either in the way of diet or medicine, Captain Cook was remarkably attentive to all the circumstances respecting cleanliness, exercise, sufficient cloathing, provision of pure water, and purification of the air in the closer parts of the ship.

From the effect of these different means, as employed by Captain Cook, there can be little doubt that they will with due attention be sufficient for the prevention and cure of the disease, at least in most situations: but besides these, there are also some other articles which may be employed with great advantage.

Newly brewed spruce-beer made from a decoction of the tops of the spruce-fir and melasses, is an excellent antiscorbutic: it acts in the same way that the wort does, and will be found of equal efficacy, and therefore may be substituted. Where the tops of the spruce-fir are not to be had, this beer may be prepared from the essence of spruce as it has been called, an article which keeps easily for a great length of time. But in situations where neither the one nor the other can be had, a most salutary mess may be prepared from oatmeal, by infusing it in water, in a wooden vessel, till it ferments, and begins to turn sourish; which generally happens, in moderately warm weather, in the space of two days.—The liquor is then strained off from the grounds, and boiled down to the consistence of a jelly, which is to be eat with wine and sugar, or with butter and sugar.

Nothing is more commonly talked of than a *land-scurvy*, as a distinct species of disease from that which has been now described; but no writer has yet given a description so clear as to enable us to distinguish it from the various kinds of cutaneous foulness and eruption, which indeed are vulgarly termed *scorbutic*, but which are a-kin to the itch or leprosy, and for the most part require mercurials. These, however, are very different diseases from the true scorbutus, which, it is well known, may prevail in certain situations on land as well as at sea, and is in no degree to be attributed to sea air.

GENUS LXXXVII. ELEPHANTIASIS. 352

Elephantiasis, *Sauv.* gen. 30?. *Vog.* 321. *Sag.* gen. 128.

Elephantia Arabum, *Vog.* 322.

The best account of this disease is that by Dr Heberden, published in the first volume of the Medical Transactions. According to him, frequently the first symptom is a sudden eruption of tubercles, or bumps of different sizes, of a red colour, more or less intense (attended

Impetigines (attended with great heat and itching), on the body, legs, arms, and face; ſometimes in the face and neck alone, at other times occupying the limbs only; the patient is feveriſh; the fever ceaſing, the tubercles remain indolent, and in ſome degree ſcirrhous, of a livid or copper colour, but ſometimes of the natural colour of the ſkin, or at leaſt very little altered; and ſometimes they after ſome months ulcerate, diſcharging a fetid ichorous humour in ſmall quantity, but never laudable pus.

The features of the face ſwell and enlarge greatly; the part above the eye-brows ſeems inflated; the hair of the eye-brows falls off, as does the hair of the beard; but Dr Heberden has never ſeen any one whoſe hair has not remained on his head. The *alæ naſi* are ſwelled and ſcabrous; the noſtrils patulous, and ſometimes affected with ulcers, which, corroding the cartilage and *ſeptum naſi*, occaſion the noſe to fall. The lips are tumid; the voice is hoarſe; which ſymptom has been obſerved when no ulcers have appeared in the throat, although ſometimes both the throat and gums are ulcerated. The ears, particularly the lobes, are thickened, and occupied by tubercles. The nails grow ſcabrous and rugoſe, appearing ſomething like the rough bark of a tree; and the diſtemper advancing, corrodes the parts gradually with a dry ſordid ſcab or gangrenous ulcer; ſo that the fingers and toes rot and ſeparate joint after joint. In ſome patients the legs ſeem rather poſts than legs, being no longer of the natural ſhape, but ſwelled to an enormous ſize, and indurated, not yielding to the preſſure of the fingers; and the ſuperficies is covered with very thin ſcales, of a dull whitiſh colour, ſeemingly much finer, but not ſo white as thoſe obſerved in the *lepra Græcorum*. The whole limb is overſpread with tubercles, interſperſed with deep fiſſures; ſometimes the limb is covered with a thick moiſt ſcabby cruſt, and not unfrequently the tubercles ulcerate. In others the legs are emaciated, and ſometimes ulcerated; at other times affected with tubercles without ulceration. The muſcular fleſh between the thumb and fore-finger is generally extenuated.

The whole ſkin, particularly that of the face, has a remarkably ſhining appearance, as if it was varniſhed or finely poliſhed. The ſenſation in the parts affected is very obtuſe, or totally aboliſhed; ſo that pinching, or puncturing the part, gives little or no uneaſineſs; and in ſome patients, the motion of the fingers and toes is quite deſtroyed. The breath is very offenſive; the pulſe in general weak and ſlow.

The diſeaſe often attacks the patient in a different manner from that above-deſcribed, beginning almoſt inſenſibly; a few indolent tubercles appearing on various parts of the body or limbs, generally on the legs or arms, ſometimes on the face, neck, or breaſt, and ſometimes in the lobes of the ears, increaſing by very ſlow degrees, without any diſorder, previous or concomitant, in reſpect of pain or uneaſineſs.

To diſtinguiſh the diſtemper from its manner of attacking the patient, Dr Heberden ſtyles the firſt by *fluxion* and the other by *congeſtion*. That by fluxion is often the attendant of a crapula, or ſurfeit from groſs foods; whereby, perhaps, the latent ſeeds of the diſorder yet dormant in the maſs of blood are excited; and probably from frequent obſervations of this kind (the laſt meal always having the blame laid on it), it is, that, according to the received opinion, either fiſh, (the tunny, mackarel, and ſhell-fiſh, in particular), melons, cucumbers, young garden-beans, or mulberries, eaten at the ſame meal with butter, cheeſe, or any preparation with milk, are ſuppoſed to produce the diſtemper, and are accordingly religiouſly avoided.

Elephantiaſis.

Violent commotions of the mind, as anger, fear, and grief, have more than once been obſerved to have given riſe to the diſorder; and more frequently, in the female ſex, a ſudden ſuppreſſion of an accuſtomed evacuation, by bathing the legs and feet in cold water at an improper ſeaſon.

The diſorder by fluxion is what is the ofteneſt endeavoured to be remedied by timely application; that by congeſtion, not being ſo conſpicuous, is generally either neglected or attempted to be concealed, until perhaps it be too late to be cured, at leaſt unleſs the patients would ſubmit to a longer courſe of medicine and ſtricter regimen of diet than they are commonly inclined to do.

Several incipient diſorders by fluxion have been known to yield to an antiphlogiſtic method, as bleeding, refrigerant ſalts, in the ſaline draughts, and a ſolution of cryſtals of tartar in water, for common drink, (by this means endeavouring to precipitate part of the peccant matter, perhaps too groſs to paſs the pores by the kidneys); and when once the fever is overcome, the Peruvian bark combined with ſaſſafras is the remedy principally to be relied on. The only topical medicine preſcribed by Dr Heberden, was an attenuating embrocation of brandy and alkaline ſpirit. By the ſame method ſome confirmed caſes have been palliated. But, excepting in one patient, he never ſaw or heard of a confirmed elephantiaſis radically cured. He adds, however, that he never met with another patient poſſeſſed with prudence and perſeverance enough to proſecute the cure as he ought.

GENUS LXXXVIII. LEPRA. The LEPROSY. 353

Lepra, *Sauv.* gen. 303. *Lin.* 262. *Sag.* 129.
Lepra *Græcorum*, *Vog.* 320.

THIS diſtemper is but little known to phyſicians in the weſtern parts of Europe. Wallis tells us, that it firſt begins with red pimples, or puſtules, breaking out in various parts of the body. Sometimes they appear ſingle; ſometimes a great number ariſe together, eſpecially on the arms and legs: as the diſeaſe increaſes, freſh pimples appear, which, joining the former, make a ſort of cluſters; all which enlarge their borders, and ſpread in an orbicular form. The ſuperficies of theſe puſtules are rough, whitiſh, and ſcaly; when they are ſcratched the ſcales fall off, upon which a thin ichor oozes out, which ſoon dries and hardens into a ſcaly cruſt. Theſe cluſters of puſtules are at firſt ſmall and few; perhaps only three or four in an arm or leg, and of the ſize of a ſilver penny. But if the diſeaſe be ſuffered to increaſe, they become more numerous, and the cluſters increaſe to the ſize of a crown-piece, but not exactly round. Afterwards it increaſes to ſuch a degree, that the whole body is covered with a leprous ſcurf. The cure of this diſtemper is very much the ſame

Impetigines ſame with that of the ELEPHANTIASIS. Here, however, recourſe is frequently had to antimonial and mercurial medicines, continued for a conſiderable length of time. In conjunction with theſe, warm bathing, particularly the vapour bath, has often been employed with advantage.

Although what can ſtrictly be called lepra is now, at leaſt, a very rare diſeaſe in this country, yet to this general head may be referred a variety of cutaneous affections which are here very common, and which in many inſtances prove very obſtinate. Theſe appear under a variety of different forms; ſometimes under that of red puſtules; ſometimes of white ſcurfs; ſometimes of ulcerations; and not unfrequently a tranſition takes place from one form to another, ſo that they cannot be divided into different genera from the external appearance. Theſe affections will often yield to the remedies already mentioned; but where antimonials and mercurials either fail, or from different circumſtances are conſidered as unadviſable, a cure may ſometimes be effected by others. In particular caſes, purging mineral waters, the decoction of elm bark, the infuſion of the œnanthe crocata, and various others, have been employed with ſucceſs. Different external applications alſo have ſometimes been employed with advantage. An article uſed in this way, known under the name of Gowland's lotion, with the compoſition of which we are unacquainted, has been much celebrated, and has been ſaid to be uſed with great ſucceſs, particularly againſt eruptions on the face and noſe.

354 GENUS LXXXIX. FRAMBOESIA.
The YAWS.

Frambœſia, *Sauv.* gen. 125. *Sag.* 125.

Deſcription. The deſcription which is given of this diſtemper by the anonymous author of a paper in the ſixth volume of the Edinburgh Medical Eſſays (art. 76.) differs, in ſome circumſtances, from one that Sauvages received from M. Virgile, an eminent ſurgeon of Montpelier, who practiſed 12 years in the iſland of St Domingo; and therefore he diſtinguiſhes the *frambœſia* into two ſpecies, *Guineenſis* and *Americana*.

The *frambœſia Guineenſis* is ſaid by the firſt mentioned writer to be ſo common on the coaſt of Guinea and other parts of Africa, that it ſeldom fails to attack each individual of both ſexes, one time or other, in the courſe of their lives; but moſt commonly during childhood or youth. "It makes its appearance in little ſpots on the cuticle, level with the ſkin, at firſt no larger than a pin's head, which increaſe daily, and become protuberant like pimples: ſoon after the cuticle frets off, and then, inſtead of finding pus or ichor, in this ſmall tumor, only white ſloughs or ſordes appear, under which is a ſmall red fungus, growing out of the cutis, increaſing gradually to very different magnitudes, ſome leſs than the ſmalleſt wood ſtrawberry, ſome as big as a raſpberry, and others exceeding in ſize even the largeſt mulberries; which berries they very much reſemble, being knobbed as they are." Theſe protuberances, which give the name to the diſeaſe, appear on all parts of the body: but the greateſt numbers, and the largeſt ſized, are generally found in the groins, and about the pudenda or anus, in the arm-pits, and on the face: when the yaws are very large, they are few in number; and when remarkably numerous, they are leſs in ſize. The patients, in all other reſpects, enjoy good health, do not loſe their appetite, and ſeem to have little other uneaſineſs than what the ſores occaſion. Frambœſia.

M. Virgile deſcribes the ſpecies of yaws that is common among the negroes of St Domingo, and which Sauvages has termed *frambœſia Americana*, as beginning from an ulcer that breaks out indiſcriminately in different parts of the body, though moſt commonly on the legs; at firſt ſuperficial, and not different from a common ulcer in any other circumſtances ſave its not healing by the uſual applications; ſooner or later, numerous fungous excreſcences break out on the ſurface of the body, as before deſcribed, like little berries, moiſt, with a reddiſh mucus. Beſides theſe, the ſoles of the feet and palms of the hands became raw, the ſkin fretting off, ſo as to leave the muſcles bare: theſe excoriations are ſometimes moiſt with ichor and ſometimes dry, but always painful, and conſequently very diſtreſſing. They are mentioned alſo by the author of the article in the Medical Eſſays; and both he and M. Virgile obſerve, that there is always one excreſcence, or yaw, of an uncommon ſize, which is longer in falling off than the others, and which is conſidered as the *maſter-yaw*, and ſo termed. An ingenious inaugural diſſertation on the ſubject of the yaws was lately publiſhed at Edinburgh by Dr Jonathan Anderſon Ludford, now phyſician in Jamaica. The author of that diſſertation conſiders Dr Cullen as improperly referring frambœſia to the claſs of cachexiæ. He thinks that this diſeaſe ought rather to be referred to the exanthemata; for, like the ſmall-pox, he tells us it has its acceſſion, height, and decline. It begins with ſome degree of fever, either more or leſs violent; it may be propagated by inoculation; and it attacks the ſame individual only once in the courſe of a lifetime, thoſe who once recover from the diſeaſe being never afterwards affected with it. Theſe particulars reſpecting frambœſia are reſted not merely on the authority of Dr Ludford, but are ſupported alſo by the teſtimony of Dr William Wright, a phyſician of diſtinguiſhed eminence, who, while he reſided in Jamaica, had, in the courſe of extenſive practice, many opportunities of obſerving this diſeaſe, and to whom Dr Ludford acknowledges great obligations for having communicated to him many important facts reſpecting it.

Dr Ludford conſiders the yaws as being in every inſtance the conſequence of contagion, and as depending on a matter *ſui generis*. He conſiders no peculiar prediſpoſition from diet, colour, or other circumſtances, as being in any degree neceſſary. He views the diſeaſe as chiefly ariſing from contact with the matter, in conſequence of ſleeping in the ſame bed, waſhing in the ſame veſſel with the infected, or the like. In ſhort, the yaws may be communicated by any kind of contact; nay, it is even believed that flies often convey the infection, when, after having gorged themſelves with the virulent matter by ſucking the ulcers of thoſe who are diſeaſed, they make punctures in the ſkin of ſuch as are ſound, and thus inoculate them; in conſequence of which the diſorder will ſoon appear, provided the *morbific diſpoſition* of body be preſent.

Prognoſis. The yaws are not dangerous, if the cure be

Frengine. be skilfully managed at a proper time; but if the patient has been prematurely salivated, or has taken any quantity of mercury, and his skin been suddenly cleared thereby, the cure will be very difficult, if not impracticable.

Cure. In attempting the cure of this disease, the four following indications are chiefly to be held in view:

1. To support the strength of the patient.
2. To promote excretion by the skin.
3. To correct the vitiated fluids.
4. To remove and counteract the injuries done either to the constitution in general, or to particular parts, by the disease.

With the first of these intentions, a liberal diet, consisting of a considerable quantity of animal food, with a considerable proportion of wine, and gentle exercise, are to be employed: but the cure is principally to be effected by mercurial salivation, after the virulent matter has been completely thrown out to the surface of the body by sudorifics. The following are the particular directions given on this head by the author of the article in the Medical Essays. The yaws being an infectious disease, as soon as they begin to appear on a negro, he must be removed to a house by himself; or, if it is not certain whether the eruption be the yaws or not, shut him up seven days, and look on him again, as the Jews were commanded to do with their lepers, and in that time you may be commonly certain.

As soon as you are convinced that it is the yaws, give a bolus of flowers of sulphur, with camphor and theriaca. Repeat this bolus every night for a fortnight or three weeks, or till the yaws come to the height; that is, when they neither increase in size or number: then throw your patient into a gentle salivation with calomel given in small doses, without farther preparation; five grains repeated once, twice, or thrice a-day, is sufficient, as the patient can bear it. If he spits a quart in 24 hours, it is enough. Generally, when the salivation is at this height, all the yaws are covered with a dry scaly crust or scab; which, if numerous, look terribly. These fall off daily in small white scales; and in ten or twelve days leave the skin smooth and clean. Then the calomel may be omitted, and the salivation permitted to go off of itself. A dram of corrosive sublimate dissolved in an ounce of rum or brandy, and the solution daubed on the yaws, will, it is said, in general clear the skin in two days time.

After the salivation, sweat the patient twice or thrice in a frame or chair with spirits of wine; and give an alterative electuary of æthiops and gum guaiac. He may likewise use the decoction of guiacum and sassafras fermented with melasses, for his constant drink while the electuary is taking, and a week or a fortnight after the electuary is finished

The master-yaw must be consumed an eighth or a tenth part of an inch below the skin, with *Mercur. corros. rub.* & *alum. ust. an. part. æqual.* and digested with *Ung. basil. flav.* ℥j. and *mercur. corros. rub.* ʒj. and cicatrized with lint pressed out of spirits of wine, and with the vitriol of copper.

After the yaws are cured, some patients are afflicted with carbuncles in their feet; which sometimes render them incapable of walking, unless with pain. The method of cure is, by bathing and paring, to destroy the cuticle, and then proceed as in the master-yaw. The gentle escharotics are to be preferred, especially here; and all imaginable care is to be taken to avoid the tendons and periosteum. Trichoma.

To children under six or seven years old, at the proper time of salivating, when the yaws are come to their full growth, give a grain or two of calomel in white sugar, once a-day, once in two days, or once in three days, so as only to keep their mouths a little sore till the yaws dry, and, falling off in white scales, leave the skin clean. This succeeds always, but requires a longer time than in adults.

In St Domingo they salivated by unction; but it does not appear that success always followed this practice. It is also usual in that island to give the solution of corrosive sublimate along with a decoction of sarsaparilla. Twelve ounces of this root, and 12 pounds of the coarsest sugar, macerated for 15 days in 12 quarts of water, is mentioned as a specific, and said to be the prescription of an English physician; the dose is four ounces every sixth hour.

Genus XC. TRICHOMA. 355
The Plica Polonica, or *Plaited Hair.*

Trichoma, *Sauv.* gen. 311. *Sag.* 137.
Plica, *Lin.* 313.
Plica sive Rhopalosis, *Vog.* 323.

This disorder is only met with in Poland and Lithuania, and consists of several blood-vessels running from the head into the ends of the hairs; which cleave together, and hang from the head in broad flat pieces, generally about an ell in length, but sometimes they are five or six yards long; one patient hath more or less of these, up to 20, and sometimes 30. They are painful to the wearer, and odious to every spectator. At the approach of winter an eruptive fever happens to many in these countries: the eruptions principally infest the head, and when at the height an ichorous humour flows from them. In this state they are too tender to admit of being touched, and the matter running down the hairs mats them together; the skin by degrees breaking, the ramifications of the capillary vessels following the course of the hair, or prolonged out of the skin, are increased to a vast length.

No method of relief is yet known; for if the discharge be checked, or the vessels cut off, the consequence is an increase of more miserable symptoms, and in the end death. Sennertus says, when all the morbid matter is thrown out of the body the plicæ fall off spontaneously. He further observes, that the only safe practice in this case is, to solicit the peccant matter to the hairs, to which it naturally tends; and that this is best answered by lotions of bear's-breech. Some say that a decoction of the herb club-moss, and its seeds, with which the head is to be washed, is a specific.

Genus XCI. ICTERUS. 356
The Jaundice.

Icterus, *Lin.* 224. *Vog.* 306. *Boerh.* 918. *Junck.* 90.

Cachexia icterica, *Hoffm.* III. 301.

 Description.

Impetigines. Icterus.

Description. The jaundice first shows itself by a listlessness and want of appetite, the patient becomes dull, oppressed, and generally costive. These symptoms have continued but a very short time, when a yellow colour begins to diffuse itself over the *tunica albuginea*, or white part of the eye, and the nails of the fingers; the urine becomes high coloured, with a yellowish sediment capable of giving a yellow tinct to linen; the stools are whitish or grey. In some there is a most violent pain in the epigastric region, which is considerably increased after meals. Sometimes the patient has a continual propensity to sleep; but in others there is too great watchfulness; and sometimes the pain is so great, that though the patient be sleepy he cannot compose himself to rest. The pains come by fits; and most women who have had the jaundice and born children, agree, that they are more violent than labour-pains. As the disease increases, the yellow colour becomes more and more deep; an itching is felt all over the skin; and even the internal membranes of the viscera, the bones, and the brain itself, become tinged, as hath been shown from dissections, where the bones have been found tinged sometimes for years after the jaundice has been cured.

In like manner, all the secretions are affected with the yellow colour of the bile, which in this disease is diffused throughout the whole mass of fluids. The saliva becomes yellowish and bitter; the urine excessively high-coloured, in such a manner as to appear almost black; nay, the blood itself is sometimes said to appear of a yellow colour when drawn from a vein; yet Dr Heberden says that he never saw the milk altered in its colour, even in cases of very deep jaundice. In process of time the blood begins to acquire a tendency to dissolution and putrefaction; which is known by the patient's colour changing from a deep yellow to a black or dark yellow. Hæmorrhagies ensue from various parts of the body, and the patients frequently die of an apoplexy; though in some the disease degenerates into an incurable dropsy; and there have not been wanting instances of some who have died of the dropsy after the jaundice itself had been totally removed.

Causes. As the jaundice consists in a diffusion of the bile throughout the whole system, it thence follows, that whatever may favour this diffusion is also to be reckoned among the causes of jaundice. Many disputes have arisen concerning the manner in which the bile is resorbed into the blood; but it is now generally agreed that it is taken up by the lymphatics of the gall-bladder and biliary ducts. Hence, a jaundice may arise from any thing obstructing the passage of the bile into the duodenum, or from any thing which alters the state of the lymphatics in such a manner as to make them capable of absorbing the bile in its natural state. Hence the jaundice may arise from scirrhi of the liver or other viscera pressing upon the biliary ducts, and obstructing the passage of the bile; from flatus distending the duodenum, and shutting up the entrance of the ductus communis choledochus into it; from the same orifice being plugged up by viscid bile, or other sordes; but by far the most frequent cause of jaundice is the formation of calculi, or more properly biliary concretions: for although they were long considered as being of a calcareous nature, yet more accurate experiments have now demonstrated, that they consist principally of a sebaceous matter; accordingly, while they are so light as to swim in water, they are also highly inflammable. These are found of almost all sizes, from that of a small pea to that of a walnut, or bigger: they are of different colours; and sometimes appear as if formed in the inward part by crystallization, but of lamellæ on the outer part; though sometimes the outward part is covered with rough and shining crystals, while the inward part is lamellated. These enter into the biliary ducts, and obstruct them, causing a jaundice, with violent pain for some time; and which can be cured by no means till the concretion is either passed entirely through the ductus communis or returned into the gall-bladder. Sometimes, in the opinion of many celebrated physicians, the jaundice is occasioned by spasmodic constrictions of the biliary ducts; but this is denied by others, and it is not yet ascertained whether these ducts are capable of being affected by spasm or not, as the existence of muscular fibres in them has not with certainty been discovered. It cannot, however, be denied, that violent fits of passion have often produced jaundice, sometimes temporary, but frequently permanent. This has been by some deemed a sufficient proof of the spasmodic contraction of the ducts; but their opponents suppose, that the agitation occasioned by the passion might push forward some biliary concretion into a narrow part of the duct, by which means a jaundice would certainly be produced, till the concretion was either driven backward or forward into the duodenum altogether. But even supposing the ducts themselves to be incapable of spasm, yet there can be no doubt that by a spasm of the intestines biliary concretions may be retained in the ducts; and indeed it is principally where the duct entering obliquely into the intestine forms as it were a species of valve that these concretions are retained.

In a very relaxed state of the body there is also an absorption of the bile, as in the yellow fever; and indeed in all putrid disorders there is a kind of yellowish tinct over the skin, though much less than in the true jaundice. The reason of this is, that in these disorders there is usually an increased secretion of bile, commonly of a thinner consistence than in a healthy state, while the orifices of the lymphatics are probably enlarged, and thus ready to absorb a fluid somewhat thicker than what they ought to take up in a healthy state; but these disorders are of short duration in comparison with the real jaundice, which sometimes lasts for many years. These affections, however, cannot with propriety in any case be considered as real instances of jaundice; for to constitute that disease, bile must not only be present in the blood, but wanting in the alimentary canal.

It is observable, that women are more subject to jaundice than men, which probably arises from their more sedentary life; for this, together with some of the depressing passions of the mind, are found to promote the accession of the disease, if not absolutely to produce it. Pregnant women also are frequently attacked by the jaundice, which goes off after their delivery.

Prognosis. As jaundice may arise from many different causes, some of which cannot be discovered during the patient's life, the prognosis must on this account be very uncertain. The only cases which admit of

Icterus. of a cure are thofe depending upon biliary concretions, or obftructions of the biliary ducts by vifcid bile; for the concretions are feldom of fuch a fize that the ducts will not let them pafs through, though frequently not without extreme pain. Indeed this pain, though fo violent, and almoft intolerable to the fick perfon, affords the beft prognofis; as the phyfician may readily affure his patient that there is great hope of his being relieved from it. The coming on of a gentle diarrhœa, attended with bilious ftools, together with the ceffation of pain, are figns of the difeafe being cured. We are not, however, always to conclude, becaufe the difeafe is not attended with acute pain, that it is therefore incurable; for frequently the paffage of a concretion through the biliary ducts is accompanied only with a fenfation of flight uneafinefs.

Cure. The great object to be aimed at in the cure of jaundice is unqueftionably the removal of the caufe which obftructs the paffage of bile into the inteftine: But before this can be accomplifhed, practices are often neceffary for alleviating urgent fymptoms; which may be done fometimes by fupplying the want of bile in the alimentary canal, fometimes by affording an exit for bilious matter from the general mafs of blood, but moft frequently by obviating the effects of diftenfion and obftruction to the circulation in the fyftem of the liver.

The meafures to be employed for the removal of the obftruction muft depend very much on the nature of the obftructing caufe.

When the jaundice arifes from indurated fwellings or fcirrhi of the vifcera, it is abfolutely incurable; neverthelefs, as thefe cannot always be difcovered, the phyfician ought to proceed in every cafe of jaundice as if it arofe from calculi. The indications here are, 1. To diffolve the concretions; and, 2. To prevent their formation a fecond time. But unhappily the medical art has not yet afforded a folvent for biliary concretions. They cannot even be diffolved when tried out of the body either by acids or alkalies, or any thing but a mixture of oil of turpentine and fpirit of wine; and thefe fubftances are by far too irritating to be given in fufficient quantity to affect a concretion in the biliary ducts. Boerhaave obferves, that difeafes of the liver are much more difficult to cure than thofe in any other part of the body; becaufe of the difficulty there is in getting at the part affected, and the tedious and round-about paffage the blood hath to it. The juice of common grafs has indeed been recommended as a fpecific in the jaundice, but on no very good foundation. Gliffon obferves, that black cattle are fubject to biliary concretions when fed with hay or dried ftraw in winter, but are cured by the fucculent grafs in the fpring; and Van Swieten tells a ftrange ftory of a man who cured himfelf of the jaundice by living almoft entirely on grafs, of which he devoured fuch quantities, that the farmers were wont to drive him out of their fields; but other practitioners have by no means found this in any degree effectual. The only method of cure now attempted in the jaundice is to expel the concretion into the inteftines; for which vomits and exercife are the principal medicines. The former are juftly reckoned the moft efficacious medicines, as they powerfully fhake all the abdominal and thoracic vifcera; and thus tend to diflodge any obftructing matter that may be contained in them. But if there be a tendency to inflammation, vomits muft not be exhibited till bleeding has been premifed. We muft alfo proceed with caution if the pain be very fharp; for in all cafes where the difeafe is attended with violent pain, it will be neceffary to allay it by opiates before the exhibition of an emetic. There is alfo danger, that, by a continued ufe of vomits, a concretion which is too large to pafs, may be fo impacted in the ducts, that it cannot even be returned into the gall-bladder, which would otherwife have happened. In all cafes, therefore, if no relief follows the exhibition of the fecond or third emetic, it will be prudent to forbear their farther ufe for fome time.

Of all kinds of exercife, that of riding on horfeback is moft to be depended upon in this difeafe. It operates in the fame manner with vomits, namely, by the concuffion it gives to the vifcera; and therefore the cautions neceffary to be obferved in the ufe of vomits are alfo neceffary to be obferved in the ufe of riding. Cathartics alfo may be of fervice, by cleanfing the *primæ viæ*, and foliciting a difcharge of the bile into the inteftines; but they muft not be of too draftic a nature, elfe they may produce incurable obftructions, by bringing forward concretions that are too large to pafs. Anodynes and the warm bath are ferviceable by their relaxing quality; and there can be no doubt that, from acting as powerful antifpafmodics, they often give an opportunity for the difcharge of concretions by very flight caufes, when they would otherwife be firmly retained. Soap has been fuppofed to do fervice as a folvent; but this is now found to be a miftake, and it acts in no other way than as a relaxant or as a gentle purgative.

But when all means of relief fail, as in cafes of fcirrhous, we can then only attempt to palliate the fymptoms, and preferve the patient's life as long as poffible. This is beft accomplifhed by diuretics; for thus a great quantity of bilious matter is evacuated, and the fyftem is freed from the bad confequences which enfue on its ftagnation in the habit. But even this is by no means equal to the common evacuation by ftool; nor can all the attempts to fupply the want of bile in the inteftines by bitters and other ftomachics reftore the patient to his wonted appetite and vigour. If the pain be very violent, we muft on all occafions have recourfe to opiates; or if the blood has acquired a tendency to diffolution, it muft be counteracted by proper antifeptics.

If the difeafe goes off, its return muft be prevented by a courfe of tonic medicines, particularly the Peruvian bark and antifeptics: but we can by no means be certain that the jaundice will not return, and that at any interval; for there may be a number of concretions in the gall-bladder, and though one hath paffed, another may very quickly follow, and produce a new fit of jaundice; and thus fome people have continued to be affected with the diftemper, at fhort intervals, during life.

In the Eaft-Indies, mercury has been lately recommended as exceedingly efficacious in diforders of the liver, efpecially thofe which follow intermitting and remitting fevers. Dr Monro, in his Obfervations on the means of preferving the health of foldiers, acquaints us, that he has feen fome icteric cafes which, he thought, Impetigines received benefit from taking a few grains of *mercurius dulcis* at night, and a purge next morning; and this repeated two or three times a-week.

Infants are fubject to a temporary jaundice, commonly called the *gum*, foon after birth, the caufe of which is not well underftood. It differs remarkably from the common jaundice; as, in the latter, the difeafe is firft difcoverable in the white of the eyes; but though the fkin of infants in the gum is all over yellow, their eyes always remain clear. The diforder goes off fpontaneoufly, or by the ufe of a gentle purgative or two.

357 CLASS IV. LOCALES.

Vitia, *Sauv*. Clafs I. *Lin*. Cl. XI. *Vog*. Cl. X. *Sag*. Cl. I.

Plagæ, *Sag*. Cl. II.
Morbi organici Auctorum.

358 Order I. DYSÆSTHESIÆ.

Dyfæfthefiæ, *Sauv*. Cl. VI. Ord. I. *Sag*. Cl. IX. Ord. I.

359 Genus XCII. CALIGO.
The Cataract.

Caligo, *Sauv*. gen. 153. *Vog*. 288. *Sag*. gen. 259.
Cataracta, *Lin*. 109.

A *cataract* is an obftruction of the pupil, by the interpofition of fome opaque fubftance which either diminifhes or totally extinguifhes the fight. It is generally an opacity in the cryftalline humour. In a recent or beginning *cataract*, the fame medicines are to be ufed as in the *gutta ferena*; and they will fometimes fucceed. But when this does not happen, and the cataract becomes firm, it muft be couched, or rather extracted; for which operation, fee Surgery.—Dr Buchan fays he has refolved a recent cataract by giving the patient fome purges with calomel, keeping a poultice of frefh hemlock conftantly upon the eye, and a perpetual blifter on the neck.

There is, however, but little reafon to fuppofe that thefe practices will frequently fucceed. A refolution can only be effected here by an abforption of the opaque matter; and where this is poffible, there is perhaps a better chance of its being effected by the agency of the electric fluid than by any other means. For this purpofe electricity is chiefly applied under the form of the *electric aura*, as it has been called; but even this is very rarely fuccefsful.

360 Genus XCIII. AMAUROSIS.
The Gutta Serena.

Amaurofis, *Sauv*. gen. 155. *Lin*. 110. *Vog*. 238. *Sag*. 261.

Amblyopia, *Lin*. 108. *Vog*. 236.

A *gutta ferena* is an abolition of the fight without any apparent caufe or fault in the eyes. In every cafe it depends on an affection of fome part of the optic nerve. But the affections which may produce this difeafe are of different kinds. When it is owing to a decay or wafting of the optic nerve, it does not admit Amaurofis. of a cure; but when it proceeds from a compreffion of the nerves by redundant humours, thefe may be in fome meafure drained off, and the patient relieved. For this purpofe, the body muft be kept open with the laxative mercurial pills. If the patient be young, and of a fanguine habit, he may be bled. Cupping with fcarifications on the back part of the head will likewife be of ufe. A running at the nofe may be promoted by volatile falts, ftimulating powders, &c. But the moft likely means of relieving the patient, are iffues or blifters kept open for a long time on the back part of the head, behind the ears, or on the neck; which have been known to reftore fight even after it had been for a confiderable time loft.—Should thefe fail, recourfe muft be had to a mercurial falivation; or, what will perhaps anfwer the purpofe better, 12 grains of the corrofive fublimate mercury may be diffolved in an Englifh pint and a half of brandy, and a table-fpoonful of it taken twice a-day, drinking half a pint of the decoction of farfaparilla after it.—Of late electricity has been much celebrated as efficacious, when no other thing could do fervice; and here it has in fome degree the fame chance of fuccefs as in other cafes of infenfibility, depending on an affection of the nerves, in fome of which it has certainly in particular cafes been of ufe.

In the amaurofis, Dr Porterfield obferves, that it is of the utmoft confequence to know of how long ftanding the difeafe has been; which is not always eafily done if one eye only be affected. This is a very effential point; becaufe an amaurofis of long ftanding is altogether incurable. Mr Boyle mentions the cafe of a man who had a cataract for feveral years without knowing it himfelf, though others did. He difcovered it at laft by happening to rub his found eye, and was furprifed to find himfelf in the dark. When a perfon therefore has a gutta ferena only in one of the eyes, he may think that the eye has but lately loft the power of fight; though this perhaps has been the cafe for feveral years. On the other hand, he may imagine that a recent difeafe of this kind is really of long ftanding. But by inquiring at what time he firft became fubject to miftakes in all actions that require the diftance to be exactly diftinguifhed, as in pouring liquor into a glafs, fnuffing a candle, threading a needle, we may difcover the age of the difeafe, and thence be affifted to form a more juft prognoftic with refpect to its cure. Dr Porterfield gives an inftance of his conjecturing in this manner concerning the cafe of a young lady who had difcovered a lofs of fight in one of her eyes only the day before. The difeafe was thought to be of long ftanding; but as the Doctor found that fhe had only been fubject to miftakes of the kind above mentioned for about a month, he drew a favourable prognoftic, and the difeafe was cured.

Genus XCIV. DYSOPIA.
Depraved Vision. 361

Amblyopia, *Sauv*. gen. 154. *Sag*. 258.

There are feveral fpecies referred to this genus by Dr Cullen, *viz*.

1. *Dyfopia* Tenebrarum; 2. *Dyfopia* Luminis.—The former of thefe is properly the *nyctalopia*, or night-blindnefs,

Dysæsthesiæ. blindness, of ancient authors. But amongst both the Greek and Latin writers, there is a direct opposition in the use of this word *nyctalopia*; some saying it signifies "those who *cannot* see by night," and others express by it "those who cannot see during the day, but during the *night*."—The difference in the account of this disorder, as to its appearing in the night or in the day, is reconciled by considering it as of the intermitting kind: the difference then will consist in the different times of its approach; so it may be called *periodical blindness*. Intermittents appearing in a variety of modes, and the success of the bark in some instances of this sort of blindness, both favour the opinion of its being an intermittent disease of the eyes; and this view has accordingly been taken of it by some late writers, particularly in some papers in the London Medical Observations, and Medical Transactions.

3. *Dysopia* Proximorum *(Presbytia)*, or the defect of those who *see only at too great distance*. 4. *Dysopia* Dissitorum *(Myopia)*, or the defect of those who are *shortsighted*.—These are disorders which depend on the original structure or figure of the eye, therefore admit of no cure. The inconveniences arising from them may, however, be in some measure remedied by the help of proper glasses. The former requires the aid of a convex, and the latter of a concave glass.

5. *Dysopia* Lateralis; a defect by which objects cannot be viewed distinctly but in an oblique position.—Thus, in viewing an object placed on the left, they turn their face and eye to the right, and *vice versa*.—This disorder may proceed from various causes both natural and accidental, some of which admit of no remedy. If it be occasioned by a partial adhesion of the eye-lids, the hand of the surgeon is required: if by a transverse position of the pupil, some mechanical contrivance is necessary. If it be owing to an *albugo* covering part of the pupil, or to a film rendering a portion of the cornea opaque, the remedies for these affections are to be here applied.

362 Genus XCV. PSEUDOBLEPSIS.
Imaginary Vision of Objects which do not exist.

Suffusio, *Sauv.* gen. 217. *Sag.* 329.
Phantasma, *Lin.* 73. *Sag.* 289.

This very often takes place when the body is diseased, and then the patient is said to be delirious. Sometimes, however, in these cases, it does not amount to delirium; but the person imagines he sees gnats or other insects flying before his eyes; or sometimes, that every thing he looks at has black spots in it, which last is a very dangerous sign. Sometimes also sparks of fire appear before the eyes; which appearances are not to be disregarded, as they frequently precede apoplexy or epilepsy. Sometimes, however, people have been affected in this manner during life without feeling any other inconvenience. Such a disorder can rarely if ever be cured.

363 Genus XCVI. DYSECŒA.
Deafness, or *Difficulty of Hearing*.

364 Genus XCVII. PARACUSIS.
Depravation of Hearing.

Paracusis, *Sauv.* gen. 159. *Sag.* 265.
Syrigmus, *Sauv.* gen. 219. *Sag.* 231.

The functions of the ear may be injured by wounds, ulcers, or any thing that hurts its fabric. The hearing may likewise be hurt by excessive noise; violent colds in the head; fevers; hard wax, or other substances sticking in the cavity of the ear; too great a degree of moisture or dryness of the ear. Deafness is very often the effect of old age, and is incident to most people in the decline of life. Sometimes it is owing to an original fault in the structure or formation of the ear itself. When this is the case it admits of no cure; and the unhappy person not only continues deaf, but generally likewise dumb, for life. Paracusis.

When deafness is the effect of wounds or ulcers of the ears, or of old age, it is not easily removed. When it proceeds from cold applied to the head, the patient must be careful to keep his head warm, especially in the night; he should likewise take some gentle purges, and keep his feet warm, and bathe them frequently in lukewarm water at bed-time. When deafness is the effect of a fever, it generally goes off after the patient recovers. If it proceed from dry wax sticking in the ears, it may be softened by dropping oil into them; afterwards they must be syringed with warm milk and water.

If deafness proceeds from dryness of the ears, which may be known by looking into them, half an ounce of the oil of sweet almonds, and the same quantity of camphorated spirit of wine, or tincture of asafœtida, may be mixed together, and a few drops of it put into the ear every night at bed-time, stopping them afterwards with a little wool or cotton. Some, instead of oil, put a small slice of the fat of bacon into each ear, which is said to answer the purpose very well.—When the ears abound with moisture, it may be drained off by an issue or seton, which should be made as near the affected parts as possible.

Some, for the cure of deafness, recommend the gall of an eel mixed with spirit of wine, to be dropped into the ear; others, equal parts of Hungary-water and spirit of lavender. Etmuller extols amber and musk; and Brookes says, he has often known hardness of hearing cured by putting a grain or two of musk into the ear with cotton-wool. Where, however, an application with considerable stimulant power is necessary, camphorated oil, with the addition of a few drops of volatile alkaline spirit, may be considered as one of the best. It is proper, however, to begin with a small quantity of the alkali, increasing it as the ear is found to bear it. In some instances, where deafness depends on a state of insensibility in the nerves, electricity, particularly under the form either of sparks or of the electric aura, has been employed with great success. But these and other applications must be varied according to the cause of the disorder.

Though such applications may sometimes be of service, yet they much oftener fail, and frequently they do hurt. Neither the eyes nor ears ought to be tampered with; they are tender organs, and require a very delicate touch. For this reason, what we would chiefly recommend in deafness, is to keep the head warm. From whatever cause this disorder proceeds, this is always proper; and more benefit has often been derived from it alone, in the most obstinate cases of deafness, than from any medicines whatever.

Genus

Dysæsthesiæ

GENUS XCVIII. ANOSMIA.
Defect of SMELLING.

365 Anosmia, *Sauv.* gen. 156. *Lin.* 113. *Vog.* 248. *Sag.* 262.

Causes. Morbid affections in the sense of smelling, may be considered with respect to their causes, as arising from one of two sources; either from some organic affection of the parts here principally concerned, or from a mere atonic state of the parts without any obvious affection. The sense of smelling may be diminished or destroyed by various diseases of the parts; as, the moisture, dryness, inflammation or suppuration of that membrane which lines the inside of the nose commonly called the *olfactory membrane*; the compression of the nerves which supply this membrane, or some fault in the brain itself at their origin. A defect, or too great a degree of solidity, of the small spongy bones of the upper jaw, the caverns of the forehead, &c. may likewise impair the sense of smelling. It may also be injured by a collection of fetid matter in those caverns, which keeps constantly exhaling from them. Few things are more hurtful to the sense of smelling than taking great quantities of snuff.

Cure. When the nose abounds with moisture, after gentle evacuations, such things as tend to take off irritation and coagulate the thin sharp serum may be applied; as the oil of anise mixed with fine flour, camphire dissolved in oil of almonds, &c. The vapours of amber, frankincense, gum-mastic, and benjamin, may likewise be received into the nose and mouth. For moistening the mucus when it is too dry, some recommend snuff made of the leaves of marjoram, mixed with oil of amber, and aniseed; or a sternutatory of calcined white vitriol, 12 grains of which may be mixed with two ounces of marjoram-water and filtrated. The steam or vapour of vinegar thrown upon hot iron received up the nostrils is likewise of use for softening the mucus, opening obstructions, &c.

If there be an ulcer in the nose, it ought to be dressed with some emollient ointment, to which, if the pain be very great, a little laudanum may be added. If it be a venereal ulcer, it is not to be cured without mercury. In that case, the solution of the corrosive sublimate in brandy may be taken, as directed in the gutta serena. The ulcer ought likewise to be washed with it; and the fumes of cinnabar may be received up the nostrils.

If there be reason to suspect that the nerves which supply the organs of smelling are inert or want stimulating, volatile salts, strong snuffs, and other things which occasion sneezing, may be applied to the nose. The forehead may likewise be anointed with balsam of Peru, to which may be added a little of the oil of amber.

366

GENUS XCIX. AGEUSTIA.
Defect of TASTING.

Ageustia, *Sauv.* gen. 157. *Sag.* 263.
Ageustia, *Lin.* 114.
Apogeusis, *Vog.* 449.
