ENCYCLOPÆDIA BRITANNICA;

OR, A

DICTIONARY

OF

ARTS, SCIENCES,

AND

MISCELLANEOUS LITERATURE;

Conſtructed on a PLAN,

BY WHICH

THE DIFFERENT SCIENCES AND ARTS

Are digeſted into the FORM of Diſtinct

TREATISES OR SYSTEMS,

COMPREHENDING

The HISTORY, THEORY, and PRACTICE, of each,
according to the Lateſt Diſcoveries and Improvements;

AND FULL EXPLANATIONS GIVEN OF THE

VARIOUS DETACHED PARTS OF KNOWLEDGE,

WHETHER RELATING TO

NATURAL and ARTIFICIAL Objects, or to Matters ECCLESIASTICAL,
CIVIL, MILITARY, COMMERCIAL, *&c.*

Including ELUCIDATIONS of the moſt important Topics relative to RELIGION, MORALS,
MANNERS, and the OECONOMY of LIFE:

TOGETHER WITH

A DESCRIPTION of all the Countries, Cities, principal Mountains, Seas, Rivers, *&c.*
throughout the WORLD;

A General HISTORY, *Ancient* and *Modern*, of the different Empires, Kingdoms, and States;

AND

An Account of the LIVES of the moſt Eminent Perſons in every Nation,
from the earlieſt ages down to the preſent times.

Compiled from the writings of the beſt Authors, in ſeveral languages; the moſt approved Dictionaries, as well of general ſcience as of its particular branches; the Tranſactions, Journals, and Memoirs, of Learned Societies, both at home and abroad; the MS. Lectures of Eminent Profeſſors on different ſciences: and a variety of Original Materials, furniſhed by an Extenſive Correſpondence.

THE THIRD EDITION, IN EIGHTEEN VOLUMES, GREATLY IMPROVED.

ILLUSTRATED WITH FIVE HUNDRED AND FORTY-TWO COPPERPLATES.

VOL. XIV.

INDOCTI DISCANT, ET AMENT MEMINISSE PERITI.

EDINBURGH,
PRINTED FOR A. BELL AND C. MACFARQUHAR.
MDCCXCVII.

Entered in Stationers Hall in Terms of the Act of Parliament.

ENCYCLOPÆDIA BRITANNICA.

Passiflora. PASSIFLORA, or PASSION FLOWER: A genus of the pentandria order, belonging to the gynandria class of plants; and in the natural method ranking under the 34th order, *Cucurbitaceæ*. The calyx is pentaphyllous; there are five petals; the nectarium a crown; the berry is pedicillated. There are near 30 different species; all of them natives of warm foreign countries, only one of which is sufficiently hardy to succeed well in the open ground here; all the others requiring the shelter of a green house or stove, but chiefly the latter. The most remarkable are,

1. The cærulea, or blue-rayed common palmated passion-flower, hath long, slender, shrubby, purplish-green stalks, branchy, and ascending upon support by their claspers 30 or 40 feet high; with one large palmated leaf at each joint, and at the axillas large spreading flowers, with whitish-green petals, and a blue radiated nectarium; succeeded by a large, oval, yellowish fruit. It flowers from July until October; the flowers are very large, conspicuous, and their composition is exceedingly curious and beautiful. The general structure of the singular flowers of this plant is, they come out at the axillas on pedunculi about three inches long, which they terminate, each flower having just close under the calyx a three-lobed involucrum-like appendage; a five-lobed calyx, and a five-petalous coroila, the size, figure, and colour of the calyx, &c. the petals arranging alternately with the calicinal lobes; the whole, including the involucrum, calyx, and corolla, make just 13 lobes and petals, all expanded flat: and within the corolla is the nectarium, composed of a multitude of thread-like fibres, of a blue and purple colour, disposed in circular rays round the column of the fructification; the outer ray is the longest, flat, and spreading on the petals; the inner is short, erect, and narrows towards the centre: in the middle is an erect cylindric club-shaped column or pillar, crowned with the roundish germen, having at its base five horizontal spreading filaments, crowned with incumbent yellow antheræ, that move about every way; and from the side of the germen arise three slender spreading styles, terminated by headed stigmas: the germen afterwards gradually becomes a large oval fleshy fruit, ripening to a yellowish colour.—These wonderful flowers are only of one day's duration, generally opening about 11 or 12 o'clock, and frequently in hot sunny weather burst open with elasticity, and continue fully expanded all that day: and the next they gradually close, assuming a decayed-like appearance, and never open any more; the evening puts a period to their existence, but they are succeeded by new ones daily on the same plant.—This plant and flowers are held in great veneration in some foreign Catholic countries, where the religious make the leaves, tendrils, and different parts of the flower, to represent the instruments of our blessed Saviour's passion; hence the name *passiflora*. Passiflora, Passion.

2. The incarnata, incarnated, or flesh coloured Italian passion-flower, hath a strong perennial root; slender, herbaceous stalks, rising upon support four or five feet high; leaves composed of three sawed lobes, each leaf attended by a twining tendril; and at the axillas long slender pedunculi, terminated each by one whitish flower, having a greenish calyx, and a reddish or purple radiated nectarium, surrounding the column of the fructification, which succeed to a large, round, fleshy fruit, ripening to a beautiful orange colour.—The flowers of this species are also very beautiful, though of short duration, opening in the morning, and night puts a period to their beauty; but they are succeeded by a daily supply of new ones.—The fruit of this sort is also very ornamental, as ripening to a fine reddish orange colour; but these rarely attain perfection here, unless the plants are placed in the stove; therefore when there is such accommodation, it highly merits that indulgence, where it will exhibit both flowers and green and ripe fruit, all at the same time, in a beautiful manner.

3. The vespertilio, or bat's-wing passion-flower, hath slender, striated, branchy stalks; large, bilobate, or two-lobed leaves, the base roundish and glandular, the lobes acute, widely divaricated like a bat's wings, and dotted underneath; and axillary flowers, having white petals and rays. The leaves of this species have a singular appearance, the two lobes being expanded six or seven inches wide, resembling the wings of a bat upon flight; hence the name *vespertilio*.

As all the species are natives of warm climates, in this country they are mostly of a tender quality, except the first sort, which succeeds very well in the full ground, in a warm situation; only their young branches are sometimes killed in very severe winters; but plenty of new ones generally rise again in spring following: the others, denominated *stove kinds*, must always be retained in that repository.

PASSION, is a word of which, as Dr Reid observes, the meaning is not precisely ascertained either in common discourse or in the writings of philosophers. In its original import, it denotes every *feeling* of the mind occasioned by an extrinsic cause; but it is generally used to signify some *agitation* of mind, opposed to that state of tranquillity in which a man is most master

Paſſion. maſter of himſelf. That it was thus uſed by the Greeks and Romans, is evident from Cicero's rendering πάθος, the word by which the philoſophers of Greece expreſſed it; by *perturbatio* in Latin. In this ſenſe of the word, paſſion cannot be itſelf a *diſtinct* and *independent* principle of action; but only an occaſional degree of vehemence given to thoſe diſpoſitions, deſires, and affections, which are at all times preſent to the mind of man; and that this is its proper ſenſe, we need no other proof than that paſſion has always been conceived to bear analogy to a ſtorm at ſea or to a tempeſt in the air.

With reſpect to the number of paſſions of which the mind is ſuſceptible, different opinions have been held by different authors. Le Brun, a French writer on painting, juſtly conſidering the expreſſion of the paſſions as a very important as well as difficult branch of his art, has enumerated no fewer than twenty, of which the ſigns may be expreſſed by the pencil on canvaſs. That there are ſo many different ſtates of mind producing different effects which are viſible on the features and the geſtures, and that thoſe features and geſtures ought to be diligently ſtudied by the artiſt, are truths which cannot be denied; but it is abſurd to conſider all theſe different ſtates of mind as *paſſions*, ſince tranquillity is one of them, which is the reverſe of paſſion.

The common diviſion of the paſſions into *deſire* and *averſion*, *hope* and *fear*, *joy* and *grief*, *love* and *hatred*, has been mentioned by every author who has treated of them, and needs no explication; but it is a queſtion of ſome importance in the philoſophy of the human mind, whether theſe different paſſions be each a degree of an original and innate diſpoſition, diſtinct from the diſpoſitions which are reſpectively the foundations of the other paſſions, or only different modifications of one or two general diſpoſitions common to the whole race.

The former opinion is held by all who build their ſyſtem of metaphyſics upon a number of diſtinct internal ſenſes; and the latter is the opinion of thoſe who, with Locke and Hartley, reſolve what is commonly called inſtinct into an early aſſociation of ideas. (See Instinct). That without deliberation mankind inſtantly feel the paſſion of fear upon the apprehenſion of danger, and the paſſion of anger or reſentment upon the reception of an injury, are truths which cannot be denied: and hence it is inferred, that the ſeeds of theſe paſſions are innate in the mind, and that they are not generated, but only ſwell to magnitude on the proſpect of their reſpective objects. In ſupport of this argument, it has been obſerved that children, without any knowledge of their danger, are inſtinctively afraid on being placed on the brink of a precipice; and that this paſſion contributes to their ſafety long before they acquire, in any degree equal to their neceſſities, the exerciſe of their rational powers. Deliberate anger, cauſed by a voluntary injury, is acknowledged to be in part founded on reaſon and reflection; but where anger impels one ſuddenly to return a blow, even without thinking of doing miſchief, the paſſion is inſtinctive. In proof of this, it is obſerved, that inſtinctive anger is frequently raiſed by bodily pain, occaſioned even by a ſtock or a ſtone, which inſtantly becomes an object of reſentment, that we are violently inclined to cruſh to atoms. Such conduct is certainly not rational, and therefore it is ſuppoſed to be neceſſarily inſtinctive. Paſſion.

With reſpect to other paſſions, ſuch as the luſt of power, of fame, or of knowledge, innumerable inſtances, ſays Dr Reid, occur in life, of men who ſacrifice to them their eaſe, their pleaſure, and their health. But it is abſurd to ſuppoſe that men ſhould ſacrifice the end to what they deſire only as means of promoting that end; and therefore he ſeems to think that theſe paſſions muſt be innate. To add ſtrength to this reaſoning, he obſerves, that we may perceive ſome degree of theſe principles even in brute animals of the more ſagacious kind, who are not thought to deſire means for the ſake of ends which they have in view.

But it is in accounting for the paſſions which are diſintereſted that the advocates for innate principles ſeem moſt completely to triumph. As it is impoſſible not to feel the paſſion of pity upon the proſpect of a fellow-creature in diſtreſs, they argue, that the baſis of that paſſion muſt be innate; becauſe pity, being at all times more or leſs painful to the perſon by whom it is felt, and frequently of no uſe to the perſon who is its object, it cannot in ſuch inſtances be the reſult of deliberation, but merely the exertion of an original inſtinct. The ſame kind of reaſoning is employed to prove that gratitude is the exerciſe of an innate principle. That good offices are, by the very conſtitution of our nature, apt to produce good will towards the benefactor, in good and bad men, in the ſavage and in the civilized, cannot ſurely be denied by any one in the leaſt acquainted with human nature. We are grateful not only to the benefactors of ourſelves as individuals, but alſo to the benefactors of our country; and *that*, too, when we are conſcious that from our gratitude neither they nor we can reap any advantage. Nay, we are impelled to be grateful even when we have reaſon to believe that the objects of our gratitude know not our exiſtence. This paſſion cannot be the effect of reaſoning, or of aſſociation founded on reaſoning; for, in ſuch caſes as thoſe mentioned, there are no principles from which reaſon can infer the propriety or uſefulneſs of the feeling. That *public ſpirit*, or the affection which we bear to our country, or to any ſubordinate community of which we are members, is founded on inſtinct; is deemed ſo certain, that the man deſtitute of this affection, if there be any ſuch, has been pronounced as great a monſter as he who has two heads.

All the diſintereſted paſſions are founded on what philoſophers have termed *benevolent affection*. Inſtead therefore of enquiring into the origin of each paſſion ſeparately, which would ſwell this article to no purpoſe, let us liſten to one of the fineſt writers as well as ableſt reaſoners of the age, treating of the origin of benevolent affection, "We may lay it down as a † *Eſſays on the active Powers of Man.* principle (ſays Dr Reid †), that all benevolent affections are in their nature agreeable; that it is eſſential to them to deſire the good and happineſs of their objects; and that their objects muſt therefore be beings capable of happineſs. A thing may be deſired either on its own account, or as the means in order to ſomething elſe. That only can properly be called an object of deſire which is deſired upon its own account; and

Paſſion.

and therefore I conſider as benevolent thoſe affections only which deſire the good of their object ultimately, and not as means in order to ſomething elſe. To ſay that we deſire the good of others, only to procure ſome pleaſure or good to ourſelves, is to ſay that there is no benevolent affection in human nature. This indeed has been the opinion of ſome philoſophers both in ancient and in later times. But it appears as unreaſonable to reſolve all benevolent affections into ſelf-love, as it would be to reſolve hunger and thirſt into ſelf-love. Theſe appetites are neceſſary for the preſervation of the individual. Benevolent affections are no leſs neceſſary for the preſervation of ſociety among men; without which men would become an eaſy prey to the beaſts of the field. The benevolent affections planted in human nature, appear therefore no leſs neceſſary for the preſervation of the human ſpecies than the appetites of hunger and thirſt." In a word, pity, gratitude, friendſhip, love, and patriotiſm, are founded on different benevolent affections; which our learned author holds to be original parts of the human conſtitution.

This reaſoning has certainly great force; and if authority could have any weight in ſettling a queſtion of this nature, we know not that name to which greater deference is due than the name of him from whom it is taken. Yet it muſt be confeſſed that the philoſophers, who conſider the affections and paſſions as early and deep-rooted aſſociations, ſupport their opinion with very plauſible arguments. On their principles we have endeavoured elſewhere to account for the paſſions of fear and love, (ſee INSTINCT and LOVE); and we may here ſafely deny the truth of what has been ſtated reſpecting fear, which ſeems to militate againſt that account. We have attended with much ſolicitude to the actions of children; and have no reaſon to think that they feel terror on the brink of a precipice till they have been repeatedly warned of their danger in ſuch ſituations by their parents or their keepers. Every perſon knows not only that they have no original or inſtinctive dread of fire, which is as dangerous to them as any precipice; but that it is extremely difficult to keep them from that deſtructive element till they are either capable of weighing the force of arguments, or have repeatedly experienced the pain of being burnt by it. With reſpect to ſudden reſentment, we cannot help conſidering the argument, which is brought in proof of its being inſtinctive, as proving the contrary in a very forcible manner. Inſtinct is ſome myſterious influence of God upon the mind exciting to actions of beneficial tendency: but can any benefit ariſe from wrecking our impotent vengeance on a ſtock or a ſtone? or is it ſuppoſable that a Being of infinite wiſdom would excite us to actions ſo extravagantly fooliſh? We learn from experience to defend ourſelves againſt rational or ſenſible enemies by retaliating the injuries which they inflict upon us; and if we have been often injured in any particular manner, the idea of that injury becomes in time ſo cloſely aſſociated with the means by which it has been conſtantly repelled, that we never receive ſuch an injury—a blow for inſtance—without being prompted to make the uſual retaliation, without reflecting whether the object be ſenſible or inſenſible. So far from being inſtinctive does reſentment appear to us, that we think an attentive obſerver may eaſily perceive how the ſeeds of it are gradually infuſed into the youthful mind; when the child, from being at firſt a timid creature ſhrinking from every pain, learns by degrees to return blow for blow and threat for threat.

Paſſion.

But inſtead of urging what appears to ourſelves of moſt weight againſt the inſtinctive ſyſtem, we ſhall lay before our readers a few extracts from a diſſertation on the Origin of the Paſſions by a writer whoſe elegance of language and ingenuity of inveſtigation do honour to the ſchool of Hartley.

"When an infant is born (ſays Dr Sayers*), there is every reaſon to ſuppoſe that he is born without ideas. Theſe are rapidly communicated through the medium of the ſenſes. The ſame ſenſes are alſo the means of conveying to him pleaſure and pain. Theſe are the hinges on which the paſſions turn: and till the child is acquainted with theſe ſenſations, it would appear that no paſſion could be formed in his mind; for till he has felt pleaſure and pain, how can he deſire any object, or wiſh for its removal? How can he either love or hate? Let us obſerve then the manner in which love and hatred are formed; for on theſe paſſions depend all the reſt. When a child endures pain, and is able to detect the cauſe of it, the idea of pain is connected in his mind with that of the thing which produced it; and if the object which occaſioned pain be again preſented to the child, the idea of pain aſſociated with it ariſes alſo. This idea conſequently urges the child to avoid or to remove the object; and thus ariſes the paſſion of diſlike or hatred. In the ſame manner, the paſſion of liking or love is readily formed in the mind of a child from the aſſociation of pleaſant ideas with certain objects which produced them.

* *Diſquiſitions Metaphyſical and Literary.*

"The paſſions of hope and fear are ſtates of the mind depending upon the good or bad proſpects of gratifying love or hatred; and joy or ſorrow ariſes from the final ſucceſs or diſappointment which attends the exertions produced by love or by hatred. Out of theſe paſſions, which have all a perceptible relation to our own good, and are univerſally acknowledged to be ſelfiſh, all our other paſſions are formed."

To account for the paſſions called *diſintereſted*, he obſerves, that in the hiſtory of the human mind we find many inſtances of our dropping an intermediate idea, which has been the means of our connecting two other ideas together; and that the aſſociation of theſe two remains after the link which originally united them has vaniſhed. Of this fact the reader will find ſufficient evidence in different articles of this work (See INSTINCT, n° 19, and METAPHYSICS, n° 101): and, to apply it to the diſintereſted paſſions, let us ſuppoſe, with Dr Sayers, that any individual has done to us many offices of kindneſs, and has conſequently much contributed to our happineſs; it is natural for us to ſeek with ſome anxiety for the continuance of thoſe pleaſures which he is able to communicate. But we ſoon diſcern, that the ſureſt way of obtaining the continuance of his friendly offices is to make them, as much as poſſible, a ſource of pleaſure to himſelf. We therefore do every thing in our power to promote his happineſs in return for the good he has conferred upon us, that thus we may attach him to us as much as we are able. Hitherto all is plainly ſelfiſh. We have been evidently endeavouring, for the ſake of our own future

Paſſion.

gratification, to promote the happineſs of this perſon: but obſerve the conſequence. We have thus, by contemplating the advantage to be derived to ourſelves from promoting the proſperity of our friend, learned to aſſociate a ſet of pleaſant ideas with his happineſs; but the link which has united them gradually eſcapes us, while the union itſelf remains. Continuing to aſſociate pleaſure with the well-being of our friend, we endeavour to promote it for the ſake of his *immediate* gratification, without looking farther; and in this way his happineſs, which was firſt attended to only as a means of future enjoyment, finally becomes an end. Thus then the paſſion which was originally ſelfiſh, is at length *diſintereſted*; its gratification being completed merely by its ſucceſs in promoting the happineſs of another."

In this way does our author account for the origin of gratitude; which at laſt becomes a habit, and flows ſpontaneouſly towards every man who has either been or intended to be our benefactor. According to him, it is eaſy to obſerve alſo, that from aſſociating pleaſure with the happineſs of an individual when we procure it ourſelves, it muſt of courſe ſoon follow, that we ſhould experience pleaſure from a view of his happineſs any way produced; ſuch happineſs raiſing at all times pleaſant ideas when it is preſented to our minds. This is another feature of a diſintereſted affection, to feel delight from the mere increaſe of happineſs in the object whom we love.

"It may be objected, perhaps, that parents ſeem to have an *inſtinctive* diſintereſted love of their offſpring: but ſurely the love of a parent (A) for a new-born infant is not uſually equal to that for a child of four or five years old. When a child is firſt born, the proſpect and hopes of future pleaſure from it are ſufficient to make a parent anxious for its preſervation. As the child grows up, the hope of future enjoyment from it muſt increaſe: hence would pleaſure be aſſociated with the well-being of the child, the love of which would of courſe become in due time diſintereſted."

Our author does not analyſe *pity*, and trace it to its ſource in ſelfiſhneſs; but he might eaſily have done it, and it has been ably done by his maſter. Pity or compaſſion is the uneaſineſs which a man feels at the miſery of another. It is generated in every mind during the years of childhood; and there are many circumſtances in the conſtitution of children, and in the mode of their education, which make them particularly ſuſceptible of this paſſion. The very appearance of any kind of miſery which they have experienced, or of any ſigns of diſtreſs which they underſtand, excite in their minds painful feelings, from the remembrance of what they have ſuffered, and the apprehenſion of their ſuffering it again. We have ſeen a child a year old highly entertained with the noiſe and ſtruggles made by its elder brother when plunged naked into a veſſel filled with cold water. This continued to be the caſe for many days, till it was thought proper to plunge the younger as well as the elder; after which the daily entertainment was ſoon at an end. The little creature had not been itſelf plunged above twice till it ceaſed to find diverſion in its brother's ſufferings.—On the third day it cried with all the ſymptoms of the bittereſt anguiſh upon ſeeing its brother plunged, though no preparation was then made for plunging itſelf: but ſurely this was not diſintereſted ſympathy, but a feeling wholly ſelfiſh, excited by the remembrance of what it had ſuffered itſelf, and was apprehenſive of ſuffering again. In a ſhort time, however, the painful feelings accompanying the ſight of its brother's ſtruggles, and the ſound of his cries, were doubtleſs ſo aſſociated with that ſight and that ſound, that the appearance of the latter would have brought the former along with them, even though the child might have been no longer under apprehenſion of a plunging itſelf. This aſſociation, too, would ſoon be transferred to every boy in the ſame circumſtances, and to ſimilar ſounds and ſtruggles, from whatever cauſe they might proceed.

Thus, as Dr Hartley obſerves §, "when ſeveral children are educated together, the pains, the denials of pleaſure, and the ſorrows which affect one, generally extend to all in ſome degree, often in an equal one. When their parents, companions, or attendants are ſick or afflicted, it is uſual to raiſe in their minds the naſcent ideas of pains and miſeries by ſuch words and ſigns as are ſuited to their capacities. They alſo find themſelves laid under many reſtraints, on account of the ſickneſs or affliction of others; and when theſe and ſuch like circumſtances have raiſed in their minds deſires to remove the cauſes of their own internal feelings, *i. e.* to eaſe the miſeries of others, a variety of internal feelings and deſires become ſo blended and aſſociated together, as that no part can be diſtinguiſhed ſeparately from the reſt, and the child may properly be ſaid to have compaſſion. The ſame ſources of compaſſion remain, though with ſome alteration, during our whole progreſs through life. This is ſo evident, that a reflecting perſon may plainly diſcern the conſtituent parts of his compaſſion while they are yet the mere internal and, as one may ſay, ſelfiſh feelings abovementioned; and before they have put on the nature of com-

§ *Obſervations on Man.*

(A) That this is true of the father is certain; but it may be queſtioned whether it be equally true of the mother. A woman is no ſooner delivered of her infant, than ſhe careſſes it with the utmoſt poſſible fondneſs. We believe, that if ſhe were under the neceſſity of making a choice between her child of four years, and her infant an hour old, ſhe would rather be deprived of the latter than of the former; but we are not convinced that this would proceed from a leſs degree of affection to the infant than to the child. She knows that the child has before his fourth year eſcaped many dangers which the infant muſt encounter, and may not eſcape; and it is therefore probable that her choice would be the reſult of prudent reflection. Though we are not admirers of that philoſophy which ſuppoſes the human mind a bundle of inſtincts, we can as little approve of the oppoſite ſcheme, which allows it no inſtincts at all. The στοργη of a mother to her new-born infant is undoubtedly inſtinctive, as the only thing which at that moment can be aſſociated with it in her mind is the pain ſhe has ſuffered in bringing it to the world.

Paſſion. compaſſion, by coaleſcence with the reſt. Agreeably to this method of reaſoning, it may be obſerved, that perſons whoſe nerves are eaſily irritable, and thoſe who have experienced great trials and afflictions, are in general more diſpoſed to compaſſion than others; and that we are moſt apt to pity others in thoſe diſeaſes and calamities which we either have felt or of which we apprehend ourſelves to be in danger."

The origin of patriotiſm and public ſpirit is thus traced by Dr Sayers: "The pleaſures which our country affords are numerous and great. The wiſh to perpetuate the enjoyment of thoſe pleaſures, includes the wiſh to promote the ſafety and welfare of our country, without which many of them would be loſt. All this is evidently ſelfiſh; but, as in the progreſs of gratitude, it finally becomes diſintereſted. Pleaſant ideas are thus ſtrongly connected with the welfare of our country, after the tie which firſt bound them together has eſcaped our notice. The proſperity which was at firſt deſirable as the means of future enjoyment, becomes itſelf an end: we feel delight in ſuch proſperity, however produced; and we look not beyond this immediate delight. It is thus not difficult to obſerve in what manner a general and diſintereſted benevolence takes place in a mind which has already received pleaſure from the happineſs of a few: the tranſition is eaſy towards aſſociating it with *happineſs in general*, with the happineſs of any being, whether produced by ourſelves or by any other cauſe whatever."

From this reaſoning, our author concludes, that all our paſſions may be traced up to original feelings of regard for ourſelves. "Thus (in the forcible language of a learned writer ‡ of the ſame ſchool) does ſelf-love, under the varying appearance of natural affection, domeſtic relation, and the connections of ſocial habitude, at firſt work blindly on, obſcure and deep, in dirt: But as it makes its way, it continues riſing, till it emerges into light; and then ſuddenly expiring, leaves behind it the faireſt iſſue,"—benevolent affection.

‡ *Warburton.*

> Self-love forſook the path it firſt purſu'd,
> And found the private in the public good.

Thus have we ſtated the two oppoſite theories reſpecting the origin of paſſions in the mind, and given our readers a ſhort ſpecimen of the reaſonings by which they are ſupported by their reſpective patrons. Were we called upon to decide between them, we ſhould be tempted to ſay, that they have both been carried to extremes by ſome of their advocates, and that the truth lies in the middle between them. "It is impoſſible * but that creatures capable of pleaſant and painful ſenſations, ſhould love and chooſe the one, and diſlike and avoid the other. No being who knows what happineſs and miſery are, can be ſuppoſed indifferent to them, without a plain contradiction. Pain is not a *poſſible* object of deſire, nor happineſs of *averſion*." To prefer a greater good though diſtant, to a leſs good that is preſent; or to chooſe a preſent evil, in order to avoid a greater future evil—is indeed wiſe and rational conduct; but to chooſe evil ultimately, is abſolutely impoſſible. Thus far then muſt be admitted, that every being poſſeſſed of ſenſe and intellect, neceſſarily deſires his own good as ſoon as he knows what it is; but if this knowledge be not innate, neither can the deſire. Every human being comes into the world with a capability of knowledge, and of courſe with a capability of affections, deſires, and paſſions; but it ſeems not to be conceivable how he can actually love, or hate, or dread any thing, till he know whether it be good, or ill, or dangerous. If, therefore, we have no innate ideas, we cannot poſſibly have innate deſires or averſions. Thoſe who contend that we have, ſeem to think, that without them reaſon would be inſufficient, either for the preſervation of the individual or the continuation of the ſpecies; and ſome writers have alleged, that if our affections and paſſions were the mere reſult of early aſſociations, they would neceſſarily be more capricious than we ever find them. But this objection ſeems to ariſe from their not rightly underſtanding the theory of their antagoniſts. The diſciples of Locke and Hartley do not ſuppoſe it poſſible for any man in ſociety to prevent ſuch aſſociations from being formed in his mind as ſhall neceſſarily produce deſires and averſions; far leſs do they think it poſſible to form aſſociations of ideas utterly repugnant, ſo as to deſire that as good which his ſenſes and intellect have experienced to be evil. Aſſociations are formed by the very ſame means, and at the very ſame time, that ideas and notions are impreſſed upon the mind; but as pain is never miſtaken for pleaſure by the ſenſes, ſo an object which has given us only pain, is never aſſociated with any thing that makes it deſirable. We ſay an object that has given us only pain, becauſe it is poſſible to form ſuch an aſſociation between life and the loſs of a limb, as to make us grateful to the ſurgeon by whom it was amputated. Aſſociations being formed according to the ſame laws by which knowledge is acquired, it by no means follows that paſſions reſulting from them ſhould be more capricious than they are found to be; and they certainly are ſufficiently capricious to make us ſuſpect that the greater part of them has this origin, rather than that they are all infuſed into the mind by the immediate agency of the Creator. If man be a being formed with no innate ideas, and with no other inſtinctive principles of action than what are abſolutely neceſſary to preſerve his exiſtence and perpetuate the ſpecies, it is eaſy to perceive why he is placed in this world as in a ſtate of probation, where he may acquire habits of virtue to fit him for a better. It is likewiſe eaſy to perceive why ſome men are better than others, and why ſome are the ſlaves of the moſt criminal paſſions. But all this is unintelligible, upon the ſuppoſition that the ſeeds of every paſſion are innate, and that man is a compound of reaſon and of inſtincts ſo numerous and various as to ſuit every circumſtance in which he can be placed.

* *Dr Price's Review, &c.*

If paſſions, whatever be their origin, operate inſtantaneouſly, and if they be formed according to fixed laws, it may be thought a queſtion of very little importance whether they be inſtinctive or acquired.—This was long our own opinion; but we think, that upon maturer reflection we have ſeen reaſon to change it. If paſſions be the reſult of early aſſociations, it is of the utmoſt conſequence that no improper aſſociations be formed in the minds of children, and that none of their unreaſonable deſires be gratified. Upon this theory it ſeems indeed to depend almoſt wholly upon education, whether a child ſhall become a calm, benevolent, ſteady, and upright man; or a paſſionate, capricious,

Paſſion. pricious, ſelfiſh, miſcreant. By teaching him to reſent every petty injury, the ſeeds of iraſcibility are ſown in his mind, and take ſuch root, that before the age of manhood he becomes intolerable to all with whom he muſt converſe. By exciting numberleſs deſires in his youthful mind, and inſtantly gratifying them, you make him capricious, and impatient of diſappointment; and by repreſenting other children as in any degree inferior to him, you inſpire him with the hateful paſſion of pride. According to the inſtinctive theory, education can only augment or diminiſh the ſtrength of paſſions; according to the other theory, it is the ſource of by far the greater part of them. On either ſuppoſition, parents ſhould watch with ſolicitude over the actions of their children; but they will ſurely think themſelves obliged to be doubly watchful, if they believe, that through their neglect their children may acquire hateful paſſions, to which, if properly educated, they might have remained ſtrangers thro' their whole lives. And let it be remembered, that this ſolicitude ſhould begin at an early period; becauſe the mind is ſuſceptible of deep aſſociations much ſooner than is ſometimes imagined. Without this ſuſceptibility, no language could be learned; and therefore a child by the time he learns to ſpeak, may have planted in his mind the ſeeds of paſſions, on the juſt regulation and ſubordination of which depends in a great meaſure the happineſs of mankind. See *Moral Philoſophy*, Part I. Chap. 1, & 2. Part III. n° 216.

Paſſions and Emotions, difference between them. See *Emotions and Paſſions*.

External Signs of Emotions and Paſſions. So intimately connected are the ſoul and body, that every agitation in the former produces a viſible effect upon the latter. There is, at the ſame time, a wonderful uniformity in that operation; each claſs of emotions and paſſions being invariably attended with an external appearance peculiar to itſelf. Theſe external appearances, or ſigns, may not improperly be conſidered as a natural language, expreſſing to all beholders emotions and paſſions as they ariſe in the heart. Hope, fear, joy, grief, are diſplayed externally: the character of a man can be read in his face; and beauty, which makes ſo deep an impreſſion, is known to reſult, not ſo much from regular features and a fine complexion, as from good-nature, good-ſenſe, ſprightlineſs, ſweetneſs, or other mental quality, expreſſed upon the countenance. Though perfect ſkill in that language be rare, yet what is generally known is ſufficient for the ordinary purpoſes of life. But by what means we come to underſtand the language, is a point of ſome intricacy. It cannot be by ſight merely; for upon the moſt attentive inſpection of the human viſage, all that can be diſcerned are, figure, colour, and motion, which, ſingly or combined, never can repreſent a paſſion nor a ſentiment: the external ſign is indeed viſible; but to underſtand its meaning, we muſt be able to connect it with the paſſion that cauſes it; an operation far beyond the reach of eye-ſight. Where then is the inſtructor to be found that can unveil this ſecret connection? If we apply to experience, it is yielded, that from long and diligent obſervation, we may gather, in ſome meaſure, in what manner thoſe we are acquainted with expreſs their paſſions externally: but with reſpect to ſtrangers, we are left in the dark; and yet we are not puzzled about the meaning of theſe external expreſſions in a ſtranger, more than in a boſom-companion. Further, had we no other means but experience for underſtanding the external ſigns of paſſion, we could not expect any uniformity, nor any degree of ſkill, in the bulk of individuals: yet matters are ſo much better ordered, that the external expreſſions of paſſion form a language underſtood by all, by the young as well as the old, by the ignorant as well as the learned: We talk of the plain and legible characters of that language; for undoubtedly we are much indebted to experience, in deciphering the dark and more delicate expreſſions. Where then ſhall we apply for a ſolution of this intricate problem, which ſeems to penetrate deep into human nature? Undoubtedly if the meaning of external ſigns be not derived to us from ſight, nor from experience, there is no remaining ſource whence it can be derived but from nature. Paſſion.

We may then venture to pronounce, with ſome degree of confidence, that man is provided by nature with a ſenſe or faculty that lays open to him every paſſion by means of its external expreſſions. And we cannot entertain any reaſonable doubt of this, when we reflect, that the meaning of external ſigns is not hid even from infants: an infant is remarkably affected with the paſſions of its nurſe expreſſed on her countenance; a ſmile cheers it, a frown makes it afraid: but fear cannot be without apprehending danger; and what danger can the infant apprehend, unleſs it be ſenſible that its nurſe is angry? We muſt therefore admit, that a child can read anger in its nurſe's face; of which it muſt be ſenſible intuitively, for it has no other mean of knowledge. We do not affirm, that theſe particulars are clearly apprehended by the child; for to produce clear and diſtinct perceptions, reflection and experience are requiſite: but that even an infant, when afraid, muſt have ſome notion of its being in danger, is evident. *Elements of Criticiſm.*

That we ſhould be conſcious intuitively of a paſſion from its external expreſſions, is conformable to the analogy of nature: the knowledge of that language is of too great importance to be left upon experience; becauſe a foundation ſo uncertain and precarious, would prove a great obſtacle to the formation of ſocieties. Wiſely therefore is it ordered, and agreeably to the ſyſtem of providence, that we ſhould have nature for our inſtructor.

Such is the philoſophy of Lord Kames, to which objections unanſwerable may be made. It is part of the inſtinctive ſyſtem of metaphyſics, which his Lordſhip has carried farther than all who wrote before him, and perhaps farther than all who have ſucceeded him in this department of ſcience. That a child intuitively reads anger in its nurſe's face, is ſo far from being true, that for ſome ſhort time after birth it is not terrified by the moſt menacing geſtures. It is indeed abſolutely incapable of fear till it has ſuffered pain, (ſee INSTINCT); and could we conſtantly careſs it with what is called an *angry look*, it would be cheered by that look, and frightened at a ſmile. It feels, however, the *effects* of anger, and is ſoon capable of obſerving the peculiarity of feature with which that paſſion is uſually accompanied; and theſe two become in a ſhort time ſo linked together in its tender mind, that

Paſſion.

that the appearance of the one neceſſarily ſuggeſts to it the reality of the other.

Should it be ſaid that a loud and ſudden noiſe ſtartles a child immediately after birth, and that, therefore, the infant muſt be inſtinctively afraid, the fact may be admitted, without any neceſſity of admitting the inference. The nerves of an infant are commonly very irritable, and the ſtrong impulſe on the *auditory* nerves may agitate its whole frame, without inſpiring it with the paſſion of fear. The loud noiſe is, in all probability, not the ſign of approaching danger, but the immediate cauſe of real pain, from which the infant ſhrinks, as it would from the prick of a pin, or the ſcorching of a candle. But we have ſaid enough in the article immediately preceding, and in others which are there quoted, to ſhow how the paſſions may be formed by aſſociations even in early infancy, and yet operate as if they were inſtinctive. This being the caſe, we ſhall through the remainder of this article ſuffer his Lordſhip to ſpeak his own language, without making any further remarks upon it. We are induced to do this for two reaſons; of which the firſt is, that many of our readers will probably prefer his theory to ours; and the ſecond is, that his concluſions reſpecting the ſigns and language of paſſion hold equally good from either theory.

We perfectly agree with him, that manifold and admirable are the purpoſes to which the external ſigns of paſſion are made ſubſervient by the Author of our nature.

1. The ſigns of internal agitation diſplayed externally to every ſpectator, tend to fix the ſignification of many words. The only effectual means to aſcertain the meaning of any doubtful word, is an appeal to the thing it repreſents: and hence the ambiguity of words expreſſive of things that are not objects of external ſenſe; for in that caſe an appeal is denied. Paſſion, ſtrictly ſpeaking, is not an object of external ſenſe: but its external ſigns are: and by means of theſe ſigns, paſſions may be appealed to with tolerable accuracy: thus the words that denote our paſſions, next to thoſe that denote external objects, have the moſt diſtinct meaning. Words ſignifying internal action and the more delicate feelings, are leſs diſtinct. This defect, with regard to internal action, is what chiefly occaſions the intricacy of logic: the terms of that ſcience are far from being ſufficiently aſcertained, even after much care and labour beſtowed by an eminent writer*; to whom, however, the world is greatly indebted, for removing a mountain of rubbiſh, and moulding the ſubject into a rational and correct form. The ſame defect is remarkable in criticiſm, which has for its object the more delicate feelings; the terms that denote theſe feelings being not more diſtinct than thoſe of logic.

* *Locke.*

2. Society among individuals is greatly promoted by that univerſal language. Looks and geſtures give direct acceſs to the heart; and lead us to ſelect, with tolerable accuracy, the perſons who are worthy of our confidence. It is ſurpriſing how quickly, and for the moſt part how correctly, we judge of character from external appearance.

3. After ſocial intercourſe is commenced, theſe external ſigns, which diffuſe through a whole aſſembly the feelings of each individual, contribute above all other means to improve the ſocial affections. Language, no doubt, is the moſt comprehenſive vehicle for communicating emotions: but in expedition, as well as in power of conviction, it falls ſhort of the ſigns under conſideration; the involuntary ſigns eſpecially, which are incapable of deceit. Where the countenance, the tones, the geſtures, the actions, join with the words in communicating emotions, theſe united have a force irreſiſtible. Thus all the pleaſant emotions of the human heart, with all the ſocial and virtuous affections, are, by means of theſe external ſigns, not only perceived, but felt. By this admirable contrivance, converſation becomes that lively and animating amuſement, without which life would at beſt be inſipid: one joyful countenance ſpreads cheerfulneſs inſtantaneouſly through a multitude of ſpectators.

Paſſion.

4. Diſſocial paſſions, being hurtful by prompting violence and miſchief, are noted by the moſt conſpicuous external ſigns, in order to put us upon our guard: thus anger and revenge, eſpecially when ſudden, diſplay themſelves on the countenance in legible characters. The external ſigns, again, of every paſſion that threatens danger, raiſe in us the paſſion of fear: which frequently operating without reaſon or reflection, moves us by a ſudden impulſe to avoid the impending danger.

5. Theſe external ſigns are remarkably ſubſervient to morality. A painful paſſion, being accompanied with diſagreeable external ſigns, muſt produce in every ſpectator a painful emotion: but then, if the paſſion be ſocial, the emotion it produces is attractive, and connects the ſpectator with the perſon who ſuffers. Diſſocial paſſions only are productive of repulſive emotions, involving the ſpectator's averſion, and frequently his indignation. This artful contrivance makes us cling to the virtuous, and abhor the wicked.

6. Of all the external ſigns of paſſion, thoſe of affliction or diſtreſs are the moſt illuſtrious with reſpect to a final cauſe, and deſervedly merit a place of diſtinction. They are illuſtrious by the ſingularity of their contrivance; and alſo by inſpiring ſympathy, a paſſion to which human ſociety is indebted for its greateſt bleſſing, that of providing relief for the diſtreſſed. A ſubject ſo intereſting deſerves a leiſurely and attentive examination. The conformity of the nature of man to his external circumſtances is in every particular wonderful: his nature makes him prone to ſociety; and ſociety is neceſſary to his well-being, becauſe in a ſolitary ſtate he is a helpleſs being, deſtitute of ſupport, and in his diſtreſſes deſtitute of relief: but mental ſupport, the ſhining attribute of ſociety, is of too great moment to be left dependent upon cool reaſon; it is ordered more wiſely, and with greater conformity to the analogy of nature, that it ſhould be enforced even inſtinctively by the paſſion of ſympathy. Here ſympathy makes a capital figure; and contributes, more than any other means, to make life eaſy and comfortable. But however eſſential the ſympathy of others may be to our well-being, one beforehand would not readily conceive how it could be raiſed by external ſigns of diſtreſs: for conſidering the analogy of nature, if theſe ſigns be agreeable, they muſt give birth to a pleaſant emotion leading every beholder to be pleaſed with human woes: if diſagreeable, as they undoubtedly are, ought they not naturally

Paſſion. naturally to repel the ſpectator from them, in order to be relieved from pain? Such would be the reaſoning beforehand; and ſuch would be the effect were man purely a ſelfiſh being. But the benevolence of our nature gives a very different direction to the painful paſſion of ſympathy, and to the deſire involved in it: inſtead of avoiding diſtreſs, we fly to it in order to afford relief; and our ſympathy cannot be otherwiſe gratified but by giving all the ſuccour in our power. Thus external ſigns of diſtreſs, though diſagreeable, are attractive: and the ſympathy they inſpire is a powerful cauſe, impelling us to afford relief even to a ſtranger, as if he were our friend or relation.

It is a noted obſervation, that the deepeſt tragedies are the moſt crowded: which in an overly view will be thought an unaccountable bias in human nature. Love of novelty, deſire of occupation, beauty of action, make us fond of theatrical repreſentations; and when once engaged, we muſt follow the ſtory to the concluſion, whatever diſtreſs it may create. But we generally become wiſe by experience; and when we foreſee what pain we ſhall ſuffer during the courſe of the repreſentation, is it not ſurpriſing that perſons of reflection do not avoid ſuch ſpectacles altogether? And yet one who has ſcarce recovered from the diſtreſs of a deep tragedy, reſolves coolly and deliberately to go to the very next, without the ſlighteſt obſtruction from ſelf-love. The whole myſtery is explained by a ſingle obſervation: That ſympathy, though painful, is attractive; and attaches us to an object in diſtreſs, inſtead of prompting us to fly from it. And by this curious mechaniſm it is, that perſons of any degree of ſenſibility are attracted by affliction ſtill more than by joy.

To conclude: the external ſigns of paſſion are a ſtrong indication, that man, by his very conſtitution, is framed to be open and ſincere. A child, in all things obedient to the impulſes of nature, hides none of its emotions; the ſavage and clown, who have no guide but pure nature, expoſe their hearts to view, by giving way to all the natural ſigns. And even when men learn to diſſemble their ſentiments, and when behaviour degenerates into art, there ſtill remain checks, that keep diſſimulation within bounds, and prevent a great part of its miſchievous effects: the total ſuppreſſion of the voluntary ſigns during any vivid paſſion, begets the utmoſt uneaſineſs, which cannot be endured for any conſiderable time: this operation becomes indeed leſs painful by habit; but luckily the involuntary ſigns cannot, by any effort, be ſuppreſſed nor even diſſembled. An abſolute hypocriſy, by which the character is concealed and a fictitious one aſſumed, is made impracticable; and nature has thereby prevented much harm to ſociety. We may pronounce, therefore, that Nature, herſelf ſincere and candid, intends that mankind ſhould preſerve the ſame character, by cultivating ſimplicity and truth, and baniſhing every ſort of diſſimulation that tends to miſchief.

Influence of Paſſion with reſpect to our Perceptions, Opinions, and Belief. So intimately are our perceptions, paſſions, and actions, connected, it would be wonderful if they ſhould have no mutual influence. That our actions are too much influenced by paſſion, is a known truth; but it is not leſs certain, though not ſo well known, that paſſion hath alſo an influence upon our perceptions, opinions, and belief. For example, the opinions we form of men and things are generally directed by affection: An advice given by a man of figure hath great weight; the ſame advice from one in a low condition is deſpiſed or neglected: a man of courage under-rates danger; and to the indolent the ſlighteſt obſtacle appears inſurmountable. All this may be accounted for by the ſimple principle of aſſociation. Paſſion.

There is no truth more univerſally known, than that tranquillity and ſedateneſs are the proper ſtate of mind for accurate perception and cool deliberation; and for that reaſon, we never regard the opinion even of the wiſeſt man, when we diſcover prejudice or paſſion behind the curtain. Paſſion hath ſuch influence over us, as to give a falſe light to all its objects. Agreeable paſſions prepoſſeſs the mind in favour of their objects; and diſagreeable paſſions, not leſs againſt their objects: A woman is all perfection in her lover's opinion, while in the eye of a rival beauty ſhe is awkward and diſagreeable: when the paſſion of love is gone, beauty vaniſhes with it;—nothing is left of that genteel motion, that ſprightly converſation, thoſe numberleſs graces, which formerly, in the lover's opinion, charmed all hearts. To a zealot every one of his own ſect is a ſaint, while the moſt upright of a different ſect are to him children of perdition: the talent of ſpeaking in a friend, is more regarded than prudent conduct in any other. Nor will this ſurpriſe any one acquainted with the world; our opinions, the reſult frequently of various and complicated views, are commonly ſo ſlight and wavering, as readily to be ſuſceptible of a bias from paſſion.

With that natural bias another circumſtance concurs, to give paſſion an undue influence on our opinions and belief; and that is a ſtrong tendency in our nature to juſtify our paſſions as well as our actions, not to others only, but even to ourſelves. That tendency is peculiarly remarkable with reſpect to diſagreeable paſſions: by its influence, objects are magnified or leſſened, circumſtances ſupplied or ſuppreſſed, every thing coloured and diſguiſed, to anſwer the end of juſtification. Hence the foundation of ſelf deceit, where a man impoſes upon himſelf innocently, and even without ſuſpicion or a bias.

We proceed to illuſtrate the foregoing obſervations by proper examples.

Gratitude, when warm, is often exerted upon the children of the benefactor; eſpecially where he is removed out of reach by death or abſence. The paſſion in this caſe being exerted for the ſake of the benefactor, requires no peculiar excellence in his children: but the practice of doing good to theſe children produces affection for them, which never fails to advance them in our eſteem. By ſuch means, ſtrong connections of affection are often formed among individuals, upon the ſlight foundation now mentioned.

Envy is a paſſion, which, being altogether unjuſtifiable, cannot be excuſed but by diſguiſing it under ſome plauſible name. At the ſame time, no paſſion is more eager than envy to give its object a diſagreeable appearance: it magnifies every bad quality, and fixes on the moſt humbling circumſtances:

Paſſion.

Caſſius. I cannot tell what you and other men
Think of this life; but for my ſingle ſelf,
I had as lief not be, as live to be
In awe of ſuch a thing as I myſelf.
I was born free as Cæſar, ſo were you;
We both have fed as well; and we can both
Endure the winter's cold as well as he.
For once, upon a raw and guſty day,
The troubled Tyber chafing with his ſhores,
Cæſar ſays to me, Dar'ſt thou, Caſſius, now
Leap in with me into this angry flood,
And ſwim to yonder point?—Upon the word,
Accoutred as I was, I plunged in,
And bid him follow; ſo indeed he did.
The torrent roar'd, and we did buffet it
With luſty ſinews; throwing it aſide,
And ſtemming it with hearts of controverſy.
But ere we could arrive the point propos'd,
Cæſar cry'd, Help me, Caſſius, or I ſink.
I, as Æneas, our great anceſtor,
Did from the flames of Troy upon his ſhoulder
The old Anchiſes bear; ſo from the waves of Tyber
Did I the tired Cæſar: and this man
Is now become a god; and Caſſius is
A wretched creature, and muſt bend his body
If Cæſar careleſsly but nod on him.
He had a fever when he was in Spain;
And when the fit was on him, I did mark
How he did ſhake. 'Tis true, this god did ſhake;
His coward lips did from their colour fly;
And that ſame eye whoſe bend doth awe the world
Did loſe its luſtre: I did hear him groan;
Ay, and that tongue of his, that bade the Romans
Mark him, and write his ſpeeches in their books,
Alas! it cry'd—Give me ſome drink, Titinius,—
As a ſick girl. Ye gods, it doth amaze me,
A man of ſuch a feeble temper ſhould
So get the ſtart of the majeſtic world,
And bear the palm alone. *Julius Cæſar, act.* 1. *ſc.* 3.

Glo'ſter, inflamed with reſentment againſt his ſon Edgar, could even force himſelf into a momentary conviction that they were not related:

O ſtrange faſten'd villain!
Would he deny his letter?—I never got him.
King Lear, act 2. *ſc.* 3.

When by great ſenſibility of heart, or other means, grief becomes immoderate, the mind, in order to juſtify itſelf, is prone to magnify the cauſe; and if the real cauſe admit not of being magnified, the mind ſeeks a cauſe for its grief in imagined future events:

Buſhy. Madam, your majeſty is much too ſad:
You promis'd, when you parted with the king,
To lay aſide ſelf-harming heavineſs,
And entertain a cheerful diſpoſition.
Queen. To pleaſe the king, I did; to pleaſe myſelf,
I cannot do it. Yet I know no cauſe
Why I ſhould welcome ſuch a gueſt as grief;
Save bidding farewell to ſo ſweet a gueſt
As my ſweet Richard: yet again, methinks,
Some unborn ſorrow, ripe in Fortune's womb,
Is coming tow'rd me; and my inward ſoul
With ſomething trembles, yet at nothing grieves,
More than with parting from my lord the king.
Richard II. *act* 2. *ſc.* 5.

Paſſion.

Reſentment at firſt is vented on the relations of the offender, in order to puniſh him: but as reſentment, when ſo outrageous, is contrary to conſcience, the mind, to juſtify its paſſion, is diſpoſed to paint theſe relations in the blackeſt colours; and it comes at laſt to be convinced, that they ought to be puniſhed for their own demerits.

Anger, raiſed by an accidental ſtroke upon a tender part of the body, is ſometimes vented upon the undeſigning cauſe. But as the paſſion in that caſe is abſurd, and as there can be no ſolid gratification in puniſhing the innocent, the mind, prone to juſtify as well as to gratify its paſſion, deludes itſelf into a conviction of the action's being voluntary. The conviction, however, is but momentary; the firſt reflection ſhows it to be erroneous: and the paſſion vaniſheth almoſt inſtantaneouſly with the conviction. But anger, the moſt violent of all paſſions, has ſtill greater influence: it ſometimes forces the mind to perſonify a ſtock or a ſtone if it happen to occaſion bodily pain, and even to believe it a voluntary agent, in order to be a proper object of reſentment. And that we have really a momentary conviction of its being a voluntary agent, muſt be evident from conſidering, that without ſuch conviction the paſſion can neither be juſtified nor gratified: the imagination can give no aid; for a ſtock or a ſtone imagined inſenſible, cannot be an object of puniſhment, if the mind be conſcious that it is an imagination merely without any reality (A). Of ſuch perſonification, involving a conviction of reality, there is one illuſtrious inſtance. When the firſt bridge of boats over the Helleſpont was deſtroyed by a ſtorm, Xerxes fell into a tranſport of rage, ſo exceſſive, that he commanded the ſea to be puniſhed with 300 ſtripes; and a pair of fetters to be thrown into it, enjoining the following words to be pronounced: "O thou ſalt and bitter water! thy maſter hath condemned thee to this puniſhment for offending him without cauſe; and is reſolved to paſs over thee in deſpite of thy inſolence: with reaſon all men neglect to ſacrifice to thee, becauſe thou art both diſagreeable and treacherous." *Herodot.* lib. 7.

Shakeſpeare exhibits beautiful examples of the irregular influence of paſſion in making us believe things to be otherwiſe than they are. King Lear, in his diſtreſs, perſoniſies the rain, wind, and thunder; and in order to juſtify his reſentment, believes them to be taking part with his daughters:

Lear.

(A) We have already ſhown how a man may be inſtigated to wreck his vengeance on a ſtock or a ſtone, without ever conſidering whether it be ſenſible or inſenſible: (See Passion). If the ſtory of Xerxes be true, he may have conſidered the ſea as ſenſible and animated, without dreaming that a ſtock or a ſtone is ſo. The ſea was a god among many of the pagans, and was conſidered as ſuch by Xerxes, or he could not have applauded men for not ſacrificing to it.

Paſſion.

Lear. Rumble thy bellyful, ſpit fire, ſpout rain!
Nor rain, wind, thunder, fire, are my daughters.
I tax not you, ye elements, with unkindneſs;
I never gave you kingdoms, call'd you children;
You owe me no ſubſcription. Then let fall
Your horrible pleaſure.—Here I ſtand, your brave;
A poor, infirm, weak, and deſpis'd old man!
But yet I call you ſervile miniſters,
That have with two pernicious daughters join'd
Your high-engender'd battles 'gainſt a head
So old and white as this. Oh! oh! 'tis foul!
Act 3 ſc. 2.

King Richard, full of indignation againſt his favourite horſe for carrying Bolingbroke, is led into the conviction of his being rational:

Groom. O, how it yearn'd my heart, when I beheld
In London ſtreets, that coronation-day,
When Bolingbroke rode on Roan Barbary,
That horſe that thou ſo often haſt beſtrid,
That horſe that I ſo carefully have dreſſed.
K. Rich. Rode he on Barbary? tell me, gentle friend,
How went he under him?
Groom. So proudly as he had diſdain'd the ground.
K. Rich. So proud that Bolingbroke was on his back!
That jade had eat bread from my royal hand.
This hand hath made him proud with clapping him.
Would he not ſtumble? would he not fall down,
(Since pride muſt have a fall), and break the neck
Of that proud man that did uſurp his back?
Richard II. act 5. ſc. 11.

Hamlet, ſwelled with indignation at his mother's ſecond marriage, was ſtrongly inclined to leſſen the time of her widowhood, the ſhortneſs of the time being a violent circumſtance againſt her; and he deludes himſelf by degrees into the opinion of an interval ſhorter than the real one:

Hamlet.——————That it ſhould come to this!
But two months dead! nay, not ſo much; not two—
So excellent a king, that was, to this,
Hyperion to a ſatyr: ſo loving to my mother,
That he permitted not the wind of heav'n
Viſit her face too roughly. Heav'n and earth!
Muſt I remember—why, ſhe would hang on him,
As if increaſe of appetite had grown
By what it fed on: yet, within a month——
Let me not think—Frailty, thy name is *Woman!*
A little month! or ere thoſe ſhoes were old,
With which ſhe follow'd my poor father's body,
Like Niobe, all tears——why ſhe, ev'n ſhe—
(O heav'n! a beaſt, that wants diſcourſe of reaſon,
Wou'd have mourn'd longer) married with mine uncle,
My father's brother; but no more like my father
Than I to Hercules. Within a month!—
Ere yet the ſalt of moſt unrighteous tears
Had left the flushing in her galled eyes,
She married——Oh, moſt wicked ſpeed! to poſt
With ſuch dexterity to inceſtuous ſheets!
It is not, nor it cannot, come to good,
But break my heart, for I muſt hold my tongue.
Act 1. ſc. 3.

The power of paſſion to falſify the computation of time is remarkable in this inſtance; becauſe time, which hath an accurate meaſure, is leſs obſequious to our deſires and wiſhes, than objects which have no preciſe ſtandard of leſs or more.

Paſſion.

Good news are greedily ſwallowed upon very ſlender evidence; our wiſhes magnify the probability of the event, as well as the veracity of the relater; and we believe as certain what at beſt is doubtful:

Quel, che l' huom vede, amor li fa inviſibile
E l' inviſibil fa veder amore.
Queſto credutо fu, che 'l miſer ſuole
Dar facile credenza a' quel, che vuole.
Orland. Furioſ. cant. 1. ſt. 56.

For the ſame reaſon, bad news gain alſo credit upon the ſlighteſt evidence: fear, if once alarmed, has the ſame effect with hope, to magnify every circumſtance that tends to conviction. Shakeſpeare, who ſhows more knowledge of human nature than any of our philoſophers, hath in his Cymbeline repreſented this bias of the mind; for he makes the perſon who alone was affected with the bad news, yield to evidence that did not convince any of his companions. And Othello is convinced of his wife's infidelity from circumſtances too ſlight to move any perſon leſs intereſted.

If the news intereſt us in ſo low a degree as to give place to reaſon, the effect will not be altogether the ſame: judging of the probability or improbability of the ſtory, the mind ſettles in a rational conviction either that it is true or not. But even in that caſe, the mind is not allowed to reſt in that degree of conviction which is produced by rational evidence: if the news be in any degree favourable, our belief is raiſed by hope to an improper height; and if unfavourable, by fear.

This obſervation holds equally with reſpect to future events: if a future event be either much wiſhed or dreaded, the mind never fails to augment the probability beyond truth.

That eaſineſs of belief, with reſpect to wonders and prodigies, even the moſt abſurd and ridiculous, is a ſtrange phenomenon; becauſe nothing can be more evident than the following propoſition, That the more ſingular any event is, the more evidence is required to produce belief: a familiar event daily occurring, being in itſelf extremely probable, finds ready credit, and therefore is vouched by the ſlighteſt evidence; but to overcome the improbability of a ſtrange and rare event, contrary to the courſe of nature, the very ſtrongeſt evidence is required. It is certain, however, that wonders and prodigies are ſwallowed by the vulgar, upon evidence that would not be ſufficient to aſcertain the moſt familiar occurrence. It has been reckoned difficult to explain that irregular bias of mind; but we are now made acquainted with the influence of paſſion upon opinion and belief; a ſtory of ghoſts or fairies, told with an air of gravity and truth, raiſeth an emotion of wonder, and perhaps of dread; and theſe emotions impoſing on a weak mind, impreſs upon it a thorough conviction contrary to reaſon.

Opinion and belief are influenced by propenſity as well as by paſſion. An innate propenſity is all we have to convince us that the operations of nature are uniform: influenced by that propenſity, we often raſhly think, that good or bad weather will never have an end; and in natural philoſophy, writers, influenced by the ſame propenſity, ſtretch commonly their analogical reaſon-

Paſſion. reaſonings beyond juſt bounds. See METAPHYSICS, n° 133, 134.

Opinion and belief are influenced by affection as well as by propenſity. The noted ſtory of a fine lady and a curate viewing the moon through a teleſcope is a pleaſant illuſtration: "I perceive (ſays the lady) two ſhadows inclining to each other; they are certainly two happy lovers:" "Not at all (replies the curate), they are two ſteeples of a cathedral."

Language of PASSION. Among the particulars that compoſe the ſocial part of our nature, a propenſity to communicate our opinions, our emotions, and every thing that affects us, is remarkable. Bad fortune and injuſtice affect us greatly; and of theſe we are ſo prone to complain, that if we have no friend nor acquaintance to take part in our ſufferings, we ſometimes utter our complaints aloud, even where there are none to liſten.

But this propenſity operates not in every ſtate of mind. A man immoderately grieved, ſeeks to afflict himſelf, rejecting all conſolation: immoderate grief accordingly is mute; complaining is ſtruggling for conſolation.

It is the wretch's comfort ſtill to have
Some ſmall reſerve of near and inward wo,
Some unſuſpected hoard of inward grief,
Which they unſeen may wail, and weep, and mourn,
And glutton-like alone devour.
Mourning Bride, act 1. *ſc.* 1.

When grief ſubſides, it then, and no ſooner, finds a tongue: we complain, becauſe complaining is an effort to diſburden the mind of its diſtreſs. This obſervation is finely illuſtrated by a ſtory which Herodotus records, *b.* 3. Cambyſes, when he conquered Egypt, made Pſammeticus the king priſoner; and for trying his conſtancy, ordered his daughter to be dreſſed in the habit of a ſlave, and to be employed in bringing water from the river; his ſon alſo was led to execution with a halter about his neck. The Egyptians vented their ſorrow in tears and lamentations: Pſammeticus only, with a downcaſt eye, remained ſilent. Afterward meeting one of his companions, a man advanced in years, who, being plundered of all, was begging alms, he wept bitterly, calling him by his name. Cambyſes, ſtruck with wonder, demanded an anſwer to the following queſtion: "Pſammeticus, thy maſter Cambyſes is deſirous to know, why, after thou hadſt ſeen thy daughter ſo ignominiouſly treated, and thy ſon led to execution, without exclaiming or weeping, thou ſhouldſt be ſo highly concerned for a poor man, noway related to thee?" Pſammeticus returned the following anſwer: "Son of Cyrus, the calamities of my family are too great to leave me the power of weeping; but the misfortunes of a companion, reduced in his old age to want of bread, is a fit ſubject for lamentation."

Surpriſe and terror are ſilent paſſions, for a different reaſon: they agitate the mind ſo violently, as for a time to ſuſpend the exerciſe of its faculties, and among others the faculty of ſpeech.

Love and revenge, when immoderate, are not more loquacious than immoderate grief. But when theſe paſſions become moderate, they ſet the tongue free, and, like moderate grief, become loquacious. Moderate love, when unſucceſsful, is vented in complaints; when ſucceſsful, is full of joy expreſſed by words and geſtures. Paſſion.

As no paſſion hath any long uninterrupted exiſtence, nor beats always with an equal pulſe, the language ſuggeſted by paſſion is not only unequal but frequently interrupted: and even during an uninterrupted fit of paſſion, we only expreſs in words the more capital ſentiments. In familiar converſation, one who vents every ſingle thought, is juſtly branded with the character of *loquacity*; becauſe ſenſible people expreſs no thoughts but what make ſome figure: in the ſame manner, we are only diſpoſed to expreſs the ſtrongeſt impulſes of paſſion, eſpecially when it returns with impetuoſity after interruption.

It is elſewhere obſerved* that the ſentiments ought to be tuned to the paſſion, and the language to both. Elevated ſentiments require elevated language: tender ſentiments ought to be clothed in words that are ſoft and flowing: when the mind is depreſſed with any paſſion, the ſentiments muſt be expreſſed in words that are humble, not low. Words being intimately connected with the ideas they repreſent, the greateſt harmony is required between them: to expreſs, for example, an humble ſentiment in high ſounding words, is diſagreeable by a diſcordant mixture of feelings; and the diſcord is not leſs when elevated ſentiments are dreſſed in low words: * See the article *Sentiments.*

Verſibus exponi tragicis res comica non vult.
Indignatur item privatis ac prope ſocco
Dignis carminibus narrari cœna Thyeſtæ.
Horat. Ars poet. l. 89.

This, however, excludes not figurative expreſſion, which, within moderate bounds, communicates to the ſentiment an agreeable elevation. We are ſenſible of an effect directly oppoſite, where figurative expreſſion is indulged beyond a juſt meaſure: the oppoſition between the expreſſion and the ſentiment makes the diſcord appear greater than it is in reality.

At the ſame time, figures are not equally the language of every paſſion: pleaſant emotions, which elevate or ſwell the mind, vent themſelves in ſtrong epithets and figurative expreſſion; but humbling and diſpiriting paſſions affect to ſpeak plain:

Et tragicus plerumque dolet ſermone pedeſtri.
Telephus et Peleus, cum pauper et exul uterque,
Projicit ampullas et ſeſquipedalia verba,
Si curat cor ſpectantis tetigiſſe querela.
Horat. Ars poet. 95.

Figurative expreſſion, being the work of an enlivened imagination, cannot be the language of anguiſh or diſtreſs. Otway, ſenſible of this, has painted a ſcene of diſtreſs in colours finely adapted to the ſubject: there is ſcarce a figure in it, except a ſhort and natural ſimile with which the ſpeech is introduced. Belvidera, talking to her father of her huſband:

Think you ſaw what paſt at our laſt parting;
Think you beheld him like a raging lion,
Pacing the earth, and tearing up his ſteps,
Fate in his eyes, and roaring with the pain
Of burning fury; think you ſaw his one hand
Fix'd on my throat, while the extended other
Graſp'd a keen threat'ning dagger: oh, 'twas thus
We laſt embrac'd, when, trembling with revenge,

Paſſion. He dragg'd me to the ground, and at my boſom
Preſented horrid death; cry'd out, My friends!
Where are my friends? ſwore, wept, rag'd, threaten'd,
For he yet lov'd, and that dear love preſerv'd me [lov'd;
To this laſt trial of a father's pity.
I fear not death, but cannot bear a thought
That that dear hand ſhould do th' unfriendly office.
If I was ever then your care, now hear me;
Fly to the ſenate, ſave the promis'd lives
Of his dear friends, ere mine be made the ſacrifice.
Venice Preſerv'd, act 5.

To preſerve the foreſaid reſemblance between words and their meaning, the ſentiments of active and hurrying paſſions ought to be dreſſed in words where ſyllables prevail that are pronounced ſhort or faſt; for theſe make an impreſſion of hurry and precipitation. Emotions, on the other hand, that reſt upon their objects, are beſt expreſſed by words where ſyllables prevail that are pronounced long or ſlow. A perſon affected with melancholy, has a languid and ſlow train of perceptions. The expreſſion beſt ſuited to that ſtate of mind, is where words, not only of long, but of many ſyllables, abound in the compoſition; and for that reaſon, nothing can be finer than the following paſſage:

In thoſe deep ſolitudes, and awful cells,
Where heav'nly-penſive Contemplation dwells,
And ever-muſing Melancholy reigns.
POPE, *Eloiſa to Abelard.*

To preſerve the ſame reſemblance, another circumſtance is requiſite, that the language, like the emotion, be rough or ſmooth, broken or uniform. Calm and ſweet emotions are beſt expreſſed by words that glide ſoftly: ſurpriſe, fear, and other turbulent paſſions, require an expreſſion both rough and broken.

It cannot have eſcaped any diligent inquirer into nature, that, in the hurry of paſſion, one generally expreſſes that thing firſt which is moſt at heart; which is beautifully done in the following paſſage:

Me, me; adſum qui feci: in me convertite ferrum,
O Rutuli, mea fraus omnis. *Æneid.* ix. 427.

Paſſion has often the effect of redoubling words, the better to make them expreſs the ſtrong conception of the mind. This is finely imitated in the following examples.

——— ——— Thou ſun, ſaid I, fair light!
And thou enlighten'd earth, ſo freſh and gay!
Ye hills and dales, ye rivers, woods, and plains!
And ye that live, and move, fair creatures! tell,
Tell, if ye ſaw, how came I thus, how here.—
Paradiſe Loſt, b. viii 273.

———— Both have ſinn'd! but thou
Againſt God only; I, 'gainſt God and thee:
And to the place of judgment will return;
There with my cries importune Heav'n, that all
The ſentence, from thy head remov'd, may light
On me, ſole cauſe to thee of all this wo;
Me! me! only juſt object of his ire.
Paradiſe Loſt, b. x. 930.

In general, the language of violent paſſion ought to be broken and interrupted. Soliloquies ought to be ſo in a peculiar manner: language is intended by nature for ſociety; and a man when alone, though he always clothes his thoughts in words, ſeldom gives his words utterance, unleſs when prompted by ſome ſtrong emotion; and even then by ſtarts and intervals only. Shakeſpeare's ſoliloquies may be juſtly eſtabliſhed as a model; for it is not eaſy to conceive any model more perfect. Of his many incomparable ſoliloquies, the two following only ſhall be quoted, being different in their manner. Paſſion.

Hamlet. Oh, that this too, too ſolid fleſh, would
Thaw, and reſolve itſelf into a dew! [melt,
Or that the Everlaſting had not fix'd
His canon 'gainſt ſelf-ſlaughter! O God! O God!
How weary, ſtale, flat, and unprofitable,
Seem to me all the uſes of this world!
Fie on't! O fie! 'tis an unweeded garden,
That grows to ſeed: things rank and groſs in nature
Poſſeſs it merely.——That it ſhould come to this!
But two months dead! nay, not ſo much; not two—
So excellent a king, that was, to this,
Hyperion to a ſatyr: ſo loving to my mother,
That he permitted not the winds of heav'n
Viſit her face too roughly. Heav'n and earth!
Muſt I remember—why, ſhe would hang on him,
As if increaſe of appetite had grown
By what it fed on: yet, within a month——
Let me not think—Frailty, thy name is *Woman!*
A little month! or ere theſe ſhoes were old,
With which ſhe follow'd my poor father's body,
Like Niobe, all tears ———why ſhe, ev'n ſhe ——
(O heav'n! a beaſt, that wants diſcourſe of reaſon,
Would have mourn'd longer—) married with mine
uncle,
My father's brother; but no more like my father
Than I to Hercules. Within a month! ——
Ere yet the ſalt of moſt unrighteous tears
Had left the flushing in her galled eyes,
She married———Oh, moſt wicked ſpeed, to poſt
With ſuch dexterity to inceſtuous ſheets!
It is not, nor it cannot come to good.
But break, my heart, for I muſt hold my tongue.
Hamlet, act 1. ſc. 3.

"*Ford.* Hum! ha! is this a viſion? is this a dream? "do I ſleep? Mr Ford, awake; awake, Mr Ford; "there's a hole made in your beſt coat, Mr Ford! "this 'tis to be married! this 'tis to have linen and "buck baſkets? Well, I will proclaim myſelf what "I am; I will now take the leacher; he is at my "houſe; he cannot 'ſcape me; 'tis impoſſible he "ſhould; he cannot creep into a halfpenny purſe, "nor into a pepper-box. But leſt the devil that "guides him ſhould aid him, I will ſearch impoſſible "places; tho' what I am I cannot avoid, yet to be "what I would not, ſhall not make me tame."
Merry Wives of Windſor, act 3. ſc. laſt.

Theſe ſoliloquies are accurate and bold copies of nature: in a paſſionate ſoliloquy one begins with thinking aloud, and the ſtrongeſt feelings only are expreſſed; as the ſpeaker warms, he begins to imagine one liſtening, and gradually ſlides into a connected diſcourſe.

How far diſtant are ſoliloquies generally from theſe models? So far indeed as to give diſguſt inſtead of pleaſure.

Paſſion. pleaſure. The firſt ſcene of Iphigenia in Tauris diſcovers that princeſs, in a ſoliloquy, gravely reporting to herſelf her own hiſtory. There is the ſame impropriety in the firſt ſcene of Alceſtes, and in the other introductions of Euripides, almoſt without exception. Nothing can be more ridiculous; it puts one in mind of a moſt curious device in Gothic paintings, that of making every figure explain itſelf by a written label iſſuing from its mouth. The deſcription which a paraſite, in the Eunuch of Terence (*act* 2. *ſc.* 2.) gives of himſelf, makes a ſprightly ſoliloquy: but it is not conſiſtent with the rules of propriety; for no man, in his ordinary ſtate of mind and upon a familiar ſubject, ever thinks of talking aloud to himſelf. The ſame objection lies againſt a ſoliloquy in the Adelphi of the ſame author (*act* 1. *ſc.* 1.) The ſoliloquy which makes the third ſcene act third of his *Heicyra*, is inſufferable; for there Pamphilus, ſoberly and circumſtantially, relates to himſelf an adventure which had happened to him a moment before.

Corneille is unhappy in his ſoliloquies: Take for a ſpecimen the firſt ſcene of Cinna.

Racine is extremely faulty in the ſame reſpect. His ſoliloquies are regular harangues, a chain completed in every link, without interruption or interval: that of Antiochus in Berenice (*act* 1. *ſc.* 2) reſembles a regular pleading, where the parties *pro* and *con* diſplay their arguments at full length. The following ſoliloquies are equally faulty: *Bajazet*, *act* 3. *ſc.* 7.; *Mithridate*, *act* 3. *ſc.* 4.; and *act* 4. *ſc.* 5.; *Iphigenia*, *act* 4. *ſc.* 8.

Soliloquies upon lively or intereſting ſubjects, but without any turbulence of paſſion, may be carried on in a continued chain of thought. If, for example, the nature and ſprightlineſs of the ſubject prompt a man to ſpeak his thoughts in the form of a dialogue, the expreſſion muſt be carried on without break or interruption, as in a dialogue between two perſons; which juſtifies Falſtaff's ſoliloquy upon honour:

"What need I be ſo forward with Death, that "calls not on me? Well, 'tis no matter, Honour pricks "me on. But how if Honour prick me off, when I "come on? how then? Can honour ſet a leg? No. Or "an arm? No. Or take away the grief of a wound? "No. Honour hath no ſkill in ſurgery then? No. "What is Honour? A word.—What is that word *ho-*"*nour?* Air; a trim reckoning.—Who hath it? He "that dy'd a Wedneſday. Doth he feel it? No. "Doth he hear it? No. Is it inſenſible then? Yea, "to the dead. But will it not live with the living? "No. Why? Detraction will not ſuffer it. There-"fore I'll none of it; honour is a mere ſcutcheon: "and ſo ends my catechiſm."

Firſt Part, Henry IV. act. 5. *ſc.* 2.

And even without dialogue a continued diſcourſe may be juſtified, where a man reaſons in a ſoliloquy upon an important ſubject; for if in ſuch a caſe it be at all excuſable to think aloud, it is neceſſary that the reaſoning be carried on in a chain; which juſtifies that admirable ſoliloquy in *Hamlet* upon life and immortality, being a ſerene meditation upon the moſt intereſting of all ſubjects. And the ſame conſideration will juſtify the ſoliloquy that introduces the 5th act of Addiſon's *Cato*.

Language ought not to be elevated above the tone of the ſentiment. Paſſion.

Zara. Swift as occaſion, I
Myſelf will fly; and earlier than the morn
Wake thee to freedom. Now 'tis late; and yet
Some news few minutes paſt arriv'd, which ſeem'd
To ſhake the temper of the king——Who knows
What racking cares diſeaſe a monarch's bed?
Or love, that late at night ſtill lights his lamp,
And ſtrikes his rays through duſk, and folded lids,
Forbidding reſt, may ſtretch his eyes awake,
And force their balls abroad at this dead hour.
I'll try. *Mourning Bride, act* 3. *ſc.* 4.

The language here is undoubtedly too pompous and laboured for deſcribing ſo ſimple a circumſtance as abſence of ſleep. In the following paſſage, the tone of the language, warm and plaintive, is well ſuited to the paſſion, which is recent grief: but every one will be ſenſible, that in the laſt couplet ſave one the tone is changed, and the mind ſuddenly elevated to be let fall as ſuddenly in the laſt couplet:

Il déteſte à jamais ſa coupable victoire,
Il renonce à la cour, aux humains, à la gloire;
Et ſe fuiant lui-même, au milieu des deſerts,
Il va cacher ſa peine au bout de l'univers;
Là, ſoit que le ſoleil rendît le jour au monde,
Soit qu'il finît ſa courſe au vaſte ſein de l'onde,
Sa voix faiſoit redire aux echos attendris,
Le nom, le triſte nom, de ſon malheureux fils.
Henriade, chant. viii. 229.

Light and airy language is unſuitable to a ſevere paſſion.

Imagery and figurative expreſſion are diſcordant, in the higheſt degree, with the agony of a mother, who is deprived of two hopeful ſons by a brutal murder. Therefore the following paſſage is undoubtedly in a bad taſte:

Queen. Ah, my poor princes! ah, my tender babes!
My unblown flowers, new appearing ſweets!
If yet your gentle ſouls fly in the air,
And be not fixt in doom perpetual,
Hover about me with your airy wings,
And hear your mother's lamentation.
Richard III. act 4. *ſc.* 4.

Again:

K. Philip. You are as fond of grief as of your child.
Conſtance. Grief fills the room up of my abſent child,
Lies in his bed, walks up and down with me,
Puts on his pretty looks, repeats his words,
Remembers me of all his gracious parts,
Stuffs out his vacant garment with his form;
Then have I reaſon to be fond of grief.
King John, act 3. *ſc.* 9.

Thoughts that turn upon the expreſſion inſtead of the ſubject, commonly called *a play of words*, being low and childiſh, are unworthy of any compoſition, whether gay or ſerious, that pretends to any degree of elevation.

In the *Amynta* of Taſſo, the lover falls into a mere play of words, demanding how he who had loſt himſelf, could find a miſtreſs. And for the ſame reaſon, the

Paſſion. the following paſſage in Corneille has been generally condemned:

Chimene. Mon pere eſt mort, Elvire, et la premiere épée
Dont s'eſt armée Rodrigue a ſa trame coupée.
Pleurez, pleurez, mes yeux, et fondez-vous en eaux,
La moitié de ma vie a mis l'autre au tombeau,
Et m'oblig. a venger, apres ce coup funeſte,
Celle que je n'ai plus, ſur celle que me reſte.
Cid, act 3. *ſc.* 3.

To die is to be baniſh'd from myſelf:
And Sylvia is myſelf: baniſh'd from her,
Is ſelf from ſelf; a deadly baniſhment!
Two Gentlemen of Verona, act 3. *ſc.* 3.

Counteſs. I pray thee, Lady, have a better cheer:
If thou engroſſeſt all the griefs as thine,
Thou robb'ſt me of a moiety
All's well that ends well, act 3. *ſc.* 3.

K. Henry. O my poor kingdom, ſick with civil blows!
When that my care could not with-hold thy riots,
What wilt thou do when riot is thy care?
O, thou wilt be a wilderneſs again,
Peopled with wolves, thy old inhabitants.
Second Part, Henry IV. act 4. *ſc.* 11.

Cruda Amarilli, che col nome ancora
D'amar, ahi laſſo, amaramente inſegni.
Paſtor Fido, act 1. *ſc.* 2.

Antony, ſpeaking of Julius Cæſar:

O world! thou waſt the foreſt of this hart;
And this, indeed, O world, the heart of thee.
How like a deer, ſtricken by many princes,
Doſt thou here lie! *Julius Cæſar, act* 3. *ſc.* 3.

Playing thus with the ſound of words, which is ſtill worſe than a pun, is the meaneſt of all conceits. But Shakeſpeare, when he deſcends to a play of words, is not always in the wrong; for it is done ſometimes to denote a peculiar character, as in the following paſſage:

K. Philip. What ſay'ſt thou, boy? look in the lady's face.
Lewis. I do, my Lord, and in her eye I find
A wonder, or a wond'rous miracle;
The ſhadow of myſelf form'd in her eye;
Which being but the ſhadow of your ſon,
Becomes a ſon, and makes your ſon a ſhadow.
I do proteſt, I never lov'd myſelf
Till now infixed I beheld myſelf
Drawn in the flatt'ring table of her eye.
Faulconbridge. Drawn in the flatt'ring table of her eye!
Hang'd in the frowning wrinkle of her brow!
And quarter'd in her heart! he doth eſpy
Himſelf Love's traitor: this is pity now,
That hang'd, and drawn, and quarter'd there ſhould be
In ſuch a love ſo vile a lout as he.
King John, act 2. *ſc.* 5.

A jingle of words is the loweſt ſpecies of that low wit, which is ſcarce ſufferable in any caſe, and leaſt of all in an heroic poem: and yet Milton in ſome inſtances has deſcended to that puerility: Paſſions.

And brought into the world a world of wo.
——Begirt th'Almighty throne
Beſeeching or beſieging ——
Which tempted our attempt——
At one ſlight bound high overleap'd all bound.
——————With a ſhout
Loud as from numbers without number.

One ſhould think it unneceſſary to enter a caveat againſt an expreſſion that has no meaning, or no diſtinct meaning; and yet ſomewhat of that kind may be found even among good writers.

Sebaſtian. I beg no pity for this mould'ring clay.
For if you give it burial, there it takes
Poſſeſſion of your earth:
If burnt and ſcatter'd in the air; the winds
That ſtrow my duſt, diffuſe my royalty,
And ſpread me o'er your clime; for where one atom
Of mine ſhall light, know there Sebaſtian reigns.
Dryden, *Don Sebaſtian King of Portugal, act* 1.

Cleopatra. Now, what news, my Charmion?
Will he be kind? and will he not forſake me?
Am I to live or die? nay, do I live?
Or am I dead? for when he gave his anſwer,
Fate took the word, and then I liv'd or dy'd.
Dryden, *All for Love, act* 2.

If ſhe be coy, and ſcorn my noble fire,
If her chill heart I cannot move;
Why, I'll enjoy the very love,
And make a miſtreſs of my own deſire.
Cowley, *poem inſcribed* "The Requeſt."

His whole poem inſcribed *My Picture* is a jargon of the ſame kind.

——————'Tis he, they cry, by whom
Not men, but war itſelf is overcome.
Indian Queen.

Such empty expreſſions are finely ridiculed in the *Rehearſal.*

Was't not unjuſt to raviſh hence her breath,
And in life's ſtead to leave us nought but death?
Act 4. *ſc.* 1.

Paſſions, in medicine, make one of the non-naturals, and produce very ſenſible effects. Joy, anger, and fear, are the principal In the two firſt, the ſpirits are hurried with too great vivacity; whereas, in fear or dread, they are as it were curbed and concentrated: whence we may conclude, that they have a very bad effect upon health; and therefore it will be beſt to keep them within bounds as much as poſſible, and to preſerve an inward ſerenity, calmneſs, and tranquillity.

Paſſions, in painting, are the external expreſſions of the different diſpoſitions and affections of the mind; but particularly their different effects upon the ſeveral features of the face: for though the arms, and indeed every part of the body *, ſerve likewiſe, by their quick, languid, and variouſly diverſified motions, to expreſs the paſſions of the ſoul; yet, in painting, this difference

* See *Oratory*, n° 37.

Paſſions. is moſt conſpicuous in the face. See PAINTING, p. 620. and DRAWING, § 8.

As we have given engravings of Le Brun's drawings of the paſſions, we ſhall here ſubjoin the account which he has given of each of theſe heads. See Plates CCCLXXVIII and CCCLXXIX.

1. The effects of *attention* are, to make the eye-brows ſink and approach the ſides of the noſe; to turn the eye-balls toward the object that cauſes it; to open the mouth, and eſpecially the upper part; to decline the head a little, and fix it without any other remarkable alteration.

2. *Admiration* cauſes but little agitation in the mind, and therefore alters but very little the parts of the face; nevertheleſs the eye-brow riſes; the eye opens a little more than ordinary; the eye-ball placed equally between the eye lids appears fixed on the object; the mouth half opens, and makes no ſenſible alteration in the cheeks.

3. The motions that accompany *admiration with aſtoniſhment* are hardly different from thoſe of ſimple admiration, only they are more lively and ſtronger marked; the eye-brows more elevated; the eyes more open; the eye-ball further from the lower eye-lid, and more ſteadily fixed: The mouth is more open, and all the parts in a much ſtronger emotion.

4. Admiration begets eſteem, and this produces *veneration*, which, when it has for its object ſomething divine or beyond our comprehenſion, makes the face decline, and the eye-brows bend down; the eyes are almoſt ſhut and fixed: the mouth is ſhut. Theſe motions are gentle, and produce but little alterations in the other parts.

5. Although *rapture* has the ſame object as veneration, only conſidered in a different manner, its motions are not the ſame; the head inclines to the left ſide; the eye-balls and eye-brows riſe directly up; the mouth half opens, and the two corners are alſo a little turned up: the other parts remain in their natural ſtate.

6. The paſſion of *deſire* brings the eye-brows cloſe together and forwards toward the eyes, which are more open than ordinary; the eye-ball is inflamed, and places itſelf in the middle of the eye; the noſtrils riſe up, and are contracted towards the eyes; the mouth half opens, and the ſpirits being in motion give a lively glowing colour.

7. Very little alteration is remarked in the face of thoſe that feel within themſelves the *ſweetneſs of joy*, or *joy with tranquillity*. The forehead is ſerene; the eye-brow without motion, elevated in the middle; the eye pretty open and with a laughing air; the eye-ball lively and ſhining; the corners of the mouth turn up a little; the complexion is lively; the cheeks and lips are red.

8. *Laughter*, which is produced by joy mixed with ſurpriſe, makes the eye-brows riſe towards the middle of the eye, and bend towards the ſides of the noſe; the eyes are almoſt ſhut, and ſometimes appear wet, or ſhed tears, which make no alteration in the face; the mouth half open, ſhows the teeth; the corners of the mouth drawn back, cauſe a wrinkle in the cheeks, which appear ſo ſwelled as to hide the eyes in ſome meaſure; the noſtrils are open, and all the face is of a red colour. Paſſions.

9. *Acute pain* makes the eye-brows approach one another, and riſe towards the middle; the eye-ball is hid under the eye-brows; the noſtrils riſe and make a wrinkle in the cheeks; the mouth half opens and draws back: all the parts of the face are agitated in proportion to the violence of the pain.

10. *Simple bodily pain* produces proportionally the ſame motions as the laſt, but not ſo ſtrong: The eye-brows do not approach and riſe ſo much; the eye-ball appears fixed on ſome object; the noſtrils riſe, but the wrinkles in the cheeks are leſs perceivable; the lips are further aſunder towards the middle, and the mouth is half open.

11. The dejection that is produced by *ſadneſs* makes the eye-brows riſe towards the middle of the forehead more than towards the cheeks; the eye-ball appears full of perturbation; the white of the eye is yellow; the eye-lids are drawn down, and a little ſwelled; all about the eyes is livid; the noſtrils are drawn downward; the mouth is half open, and the corners are drawn down; the head careleſsly leaning on one of the ſhoulders: the face is of a lead colour; the lips pale.

12. The alterations that *weeping* occaſions are ſtrongly marked: The eye-brows ſink down towards the middle of the forehead; the eyes are almoſt cloſed, wet, and drawn down towards the cheeks; the noſtrils ſwelled; the muſcles and veins of the forehead appear; the mouth is ſhut, and the ſides of it are drawn down, making wrinkles on the cheeks; the under lip puſhed out, preſſes the upper one: all the face is wrinkled and contracted; its colour is red, eſpecially about the eye-brows, the eyes, the noſe, and the cheeks.

13. The lively attention to the misfortunes of another, which is called *compaſſion*, cauſes the eye-brows, to ſink towards the middle of the forehead; the eye-ball to be fixed upon the object; the ſides of the noſtrils next the noſe to be a little elevated, making wrinkles in the cheeks; the mouth to be open; the upper lip to be lifted up and thruſt forwards; the muſcles and all the parts of the face ſinking down and turning towards the object which excites the paſſion.

14. The motions of *ſcorn* are lively and ſtrong: The forehead is wrinkled; the eye-brow is knit; the ſide of it next the noſe ſinks down, and the other ſide riſes very much; the eye is very open, and the eye-ball is in the middle; the noſtrils riſe, and draw towards the eyes, and make wrinkles in the cheeks; the mouth ſhuts, its ſides ſinking down, and the under-lip is puſhed out beyond the upper one.

15. An object deſpiſed ſometimes cauſes *horror*, and then the eye-brow knits, and ſinks a great deal more. The eye-ball, placed at the bottom of the eye, is half covered by the lower eye-lid; the mouth is half open, but cloſer in the middle than the ſides, which being drawn back, makes wrinkles in the cheeks; the face grows pale, and the eyes become livid; the muſcles and the veins are marked.

16. The violence of *terror or fright* alters all the parts of the face; the eye-brow riſes in the middle; its

Passions ‖ Passive.

its muſcles are marked, ſwelled, preſſed one againſt the other, and ſunk towards the noſe, which draws up as well as the noſtrils; the eyes are very open; the upper eye lid is hid under the eye-brow; the white of the eye is encompaſſed with red; the eye ball fixes toward the lower part of the eye; the lower part of the eye lid ſwells and becomes livid; the muſcles of the noſe and cheeks ſwell, and theſe laſt terminate in a point toward the ſides of the noſtrils; the mouth is very open, and its corners very apparent; the muſcles and veins of the neck ſtretched; the hair ſtands on end; the colour of the face, that is, the end of the noſe, the lips, the ears, and round the eyes, is pale and livid; and all ought to be ſtrongly marked.

17. The effects of *anger* ſhow its nature. The eyes become red and inflamed; the eye-ball is ſtaring and ſparkling; the eye-brows are ſometimes elevated and ſometimes ſunk down equally; the forehead is very much wrinkled, with wrinkles between the eyes; the noſtrils are open and enlarged: the lips preſſing againſt one another, the under one riſing over the upper one leaves the corners of the mouth a little open, making a cruel and diſdainful grin.

18. *Hatred or jealouſy* wrinkles the forehead; the eye-brows are ſunk down and knit; the eye-ball is half hid under the eye-brows, which turn towards the object; it ſhould appear full of fire, as well as the white of the eye and the eye-lid; the noſtrils are pale, open, more marked than ordinary, and drawn backward ſo as to make wrinkles in the cheeks; the mouth is ſo ſhut as to ſhow the teeth are cloſed; the corners of the mouth are drawn back and very much ſunk; the muſcles of the jaw appear ſunk; the colour of the face is partly inflamed and partly yellowiſh; the lips pale or livid.

19. As *deſpair* is extreme, its motions are ſo likewiſe; the forehead wrinkles from the top to the bottom; the eye-brows bend down over the eyes, and preſs one another on the ſides of the noſe; the eye ſeems to be on fire, and full of blood; the eye-ball is diſturbed, hid under the eye-brow, ſparkling and unfixed; the eye-lid is ſwelled and livid; the noſtrils are large, open, and lifted up; the end of the noſe ſinks down; the muſcles, tendons, and veins are ſwelled and ſtretched; the upper part of the cheeks is large, marked, and narrow towards the jaw; the mouth drawn backwards is more open at the ſides than in the middle; the lower lip is large and turned out; they gnaſh their teeth; they foam; they bite their lips, which are pale; as is the reſt of the face; the hair is ſtrait and ſtands on end.

Passion-Flower. See PASSIFLORA.

Passion-Week, the week immediately preceding the feſtival of Eaſter; ſo called, becauſe in that week our Saviour's paſſion and death happened. The Thurſday of this week is called *Maunday Thurſday*; the Friday, *Good-Friday*; and the Saturday, the *Great Sabbath*.

PASSIVE, in general, denotes ſomething that ſuffers the action of another, called an *agent* or *active power*. In grammar, the verb or word that expreſſes this paſſion is termed a *paſſive verb*: which, in the learned languages, has a peculiar termination; as *amor*, *doceor*, &c. in Latin; that is an *r* is added to the actives *amo*, *doceo*: and, in the Greek, the inflection is made by changing ω into ομαι; as τυπτω τυπτομαι, &c. But, in the modern languages, the paſſive inflection is performed by means of auxiliary verbs, joined to the participle of the paſt tenſe; as, "I am praiſed," in Latin *laudor*, and in Greek τυπτομαι; or, "I am loved," in Latin *amor*, and in Greek φιλουμαι. Thus it appears, that the auxiliary verb *am*, ſerves to form the paſſives of Engliſh verbs: and the ſame holds of the French; as, *Je ſuis loué*, "I am praiſed;" *j'ai eté loué*, "I have been praiſed," &c. See GRAMMAR. Paſſive.

Passive Title, in Scots law. See LAW, Part III. N° clxxx. 30.

Passive Obedience, a political doctrine which has been much miſrepreſented, and is, of courſe, very obnoxious to the friends of freedom. Some nonjurors, in the end of the laſt and in the beginning of the paſſing century, imagining that monarchy is the only lawful form of government, and that hereditary monarchy is the only lawful ſpecies of that government, have coupled with paſſive obedience the ridiculous notion of a divine, hereditary, indefeaſible right of certain families to govern with deſpotic ſway all other families of the ſame nation. The abſurdity of this notion needs not to be dwelt upon; but it may not be improper to obſerve, that it has nothing to do with paſſive obedience.

As taught by the ableſt reaſoners, who think that they are ſupported by holy ſcripture, paſſive obedience is as much a duty under republican as under monarchical governments; and it means no more, but that private individuals are bound by the moſt ſolemn moral ties not to reſiſt the ſupreme power whereſoever placed in any nation. The ſupreme power can only be the legiſlature; and no man or body of men, who have not the power of enacting and abrogating laws can, on this principle, claim paſſive obedience from any ſubject. Whether the principle be well or ill founded, the abſurdity which commonly attaches to the phraſe *paſſive obedience*, originates from the miſtaken loyalty of the adherents of the houſe of Stuart, who to aggravate the illegality of the revolution, were wont to repreſent James II. as ſupreme over both houſes of parliament, and of courſe over all law. That ſuch reveries were fooliſh, we need no other evidence than the ſtatute-book, which ſhows, that in the office of legiſlation, the king, lords, and commons, are coordinate; and that when any one of theſe powers ſhall take upon itſelf to counteract the other two, the duty of paſſive obedience will oblige the ſubject to ſupport the legiſlature. That reſiſtance to the legiſlature, if lawful on any occaſion, can be ſo only to oppoſe the moſt violent tyranny, has been ſhown by Mr Hume with great cogency of argument, and is indeed a propoſition ſelf-evident. That it can never be lawful on any occaſion, Biſhop Berkeley endeavoured to prove by a chain of reaſoning which it would be difficult to break. We enter not into the controverſy, but refer our readers to *Hume's Eſſays* and *Berkeley's Paſſive Obedience and Nonreſiſtance*, or, as it was intitled by a late editor, *the Meaſure of Submiſſion to civil Government*. We ſhall only obſerve, that there is a great difference between *active* and *paſſive* obedience; and that many who conſider themſelves as bound on *no account* whatever to *reſiſt* the ſupreme power, would yet *ſuffer death* rather than do an immoral action in obedience to any law of earthly origin.

Passive Prayer, among the *myſtic divines*, is a total ſuſpenſion or ligature of the intellectual faculties; in virtue whereof, the ſoul remains of itſelf, and as to its own power, impotent with regard to the producing of any effects. The paſſive ſtate, according to Fenelon, is only paſſive in the ſame ſenſe as contemplation is, *i. e.* it does not exclude peaceable, diſintereſted acts, but only unquiet ones, or ſuch as tend to our own intereſt. In the paſſive ſtate, the ſoul has not properly any activity, any ſenſation, of its own: it is a mere infinite flexibility of the ſoul, to which the feebleſt impulſe of grace gives motion.

PASSOVER, a ſolemn feſtival of the Jews, inſtituted in commemoration of their coming out of Egypt; becauſe the night before their departure, the deſtroying angel, who put to death the firſt-born of the Egyptians, paſſed over the houſes of the Hebrews without entering therein, becauſe they were marked with the blood of the lamb which was killed the evening before, and which for this reaſon was called the *paſchal lamb*. This feaſt was called *paſcha* by the old Greeks and Romans; not we preſume from πασχω "I ſuffer," as Chryſoſtom, Irenæus, and Tertullian, ſuppoſe, but from the Hebrew word *peſuph*, *paſſage*, *leap*. The following is what God ordained concerning the paſſover of the Jews, (Exod. xii.) The month of the coming forth from Egypt was looked upon from this time to be the firſt month of the ſacred or eccleſiaſtical year, and the fourteenth day of this month, between the two veſpers, that is, between the ſun's decline and his ſetting: or rather, according to our manner of reckoning, between two o'clock in the afternoon and ſix o'clock in the evening at the equinox, they were to kill the paſchal lamb, and to abſtain from leavened bread. The day following being the fifteenth, counting from ſix o'clock of the foregoing evening, which concluded the fourteenth, was the grand feaſt of the paſſover, which continued ſeven days. But it was only the firſt and the ſeventh day that were ſolemn. The lamb that was killed ought to be without any defect, a male, and yeaned that year. If no lamb could be found, they might take a kid. They killed a lamb or a kid in every family; and if the number of thoſe that lived in the houſe was not ſufficient to eat a lamb, they might join two houſes together. With the blood of the paſchal lamb they ſprinkled the door-poſts and lintel of every houſe, that the deſtroying angel, at the ſight of the blood, might paſs over them, and ſave the Hebrew children. They were to eat the lamb the ſame night that followed the ſacrifice; they eat it roaſted, with unleavened bread, and a ſallad of wild lettuce. The Hebrew ſays literally, with bitter things, as ſuppoſe muſtard, or any thing of this nature to give a reliſh. It was forbid to eat any part of it raw, or boiled in water, nor were they to break a bone, (Exod. xii. 46. Numb. ix. 12. John xix. 36.); and if any thing remained to the day following, it was thrown into the fire. They that eat it were to be in the poſture of travellers, having their reins girt, their ſhoes on their feet, their ſtaves in their hands, and eating in a hurry. But this laſt part of the ceremony was but little obſerved, at leaſt it was of no obligation, but only upon that night they came forth out of Egypt. For the whole eight days of the paſſover no leavened bread was to be uſed; and whoever ſhould eat any, was threatened to be cut off from his people. With regard to the ceremonies which are obſerved in relation to the bread, ſee the article Bread, p. 531. col. 2. Paſſover.

They kept the firſt and laſt day of the feaſt, yet ſo as that it was allowed to dreſs victuals, which was forbidden on the Sabbath-day. The obligation of keeping the paſſover was ſo ſtrict, that whoever ſhould neglect to do it, was condemned to death, (Numb. ix. 13.) But thoſe who had any lawful impediment, as a journey, ſickneſs, or any uncleanneſs, voluntary or involuntary; for example, thoſe that had been preſent at a funeral, or by any other accident had been defiled, were to defer the celebration of the paſſover till the ſecond month of the eccleſiaſtical year, or to the fourteenth day of the month Jiar, which anſwers to April and May. It was thus the Lord ordered Moſes, upon the occaſion of the inquiry of ſome Iſraelites, who had been obliged to pay their laſt offices to ſome of their relations, and who being thus polluted, were not capable of partaking of the paſchal ſacrifice, (2 Chr. xxx. 1, 2, &c.) The modern Jews obſerve in general the ſame ceremonies that were practiſed by their anceſtors, in the celebration of the paſſover. On the fourteenth of Niſan, the firſt-born faſt in memory of God's ſmiting the firſt-born of the Egyptians. The morning prayers are the ſame with thoſe ſaid on other feſtivals. They take the roll of the pentateuch out of the cheſt, and read as far as the end of the twelfth chapter of Exodus, and what is contained in the eighteenth chapter of Numbers, relating to the paſſover. The matron of the family then ſpreads a table, and ſets on it two unleavened cakes, and two pieces of the lamb, a ſhoulder boiled and another roaſted, to put them in mind that God delivered them with a ſtretched out arm. To this they add ſome ſmall fiſhes, becauſe of the leviathan; a hard egg, becauſe of the ziz; ſome meal, becauſe of the behemoth, (theſe three animals being appointed for the feaſt of the elect in the other life); and peas and nuts for the children, to provoke their curioſity to aſk the reaſon of this ceremony. They likewiſe uſe a kind of muſtard, which has the appearance of mortar, to repreſent their making bricks in Egypt. The father of the family ſits down with his children and ſlaves, becauſe on this day all are free. Being ſet down, he takes bitter herbs, and dips them in the muſtard, then eats them, and diſtributes to the reſt. Then they eat of the lamb, the hiſtory and inſtitution of which is at that time recited by the maſter of the family. The whole repaſt is attended with hymns and prayers. They pray for the prince under whoſe dominion they live, according to the advice of Jeremiah (xxix. 7.), "Seek the peace of the city whither I have cauſed you to be carried away captives, and pray unto the Lord for it: for in the peace thereof ſhall ye have peace." See the article Feast, &c. The ſame things are put in practice the two following days; and the feſtival is concluded by the ceremony hadala or diſtinction. This ceremony is performed at the cloſing of the Sabbath-day, at which time the maſter of the houſe pronounces certain benedictions, accompanied with certain formalities, requeſting that every thing may ſucceed well the week following. After going out of the ſynagogue, they then eat leavened bread for the laſt time. (Leo of

Paſſover, Paſſport.

Modena, p. iii. c. 3. and the Rabbins) While the temple was ſtanding, they brought their lambs thither, and ſacrificed them, offering the blood to the prieſt, who poured it out at the foot of the altar. The paſſover was typically predictive of Chriſt our chriſtian paſſover, (1 Cor. v. 7.) As the deſtroying angel paſſed over the houſes marked with the blood of the paſchal lamb, ſo the wrath of God paſſes over them whoſe ſouls are ſprinkled with the blood of Chriſt. The paſchal lamb was killed before Iſrael was delivered, ſo it is neceſſary Chriſt ſhould ſuffer before we could be redeemed. It was killed before Moſes's law or Aaron's ſacrifices were enjoined, to ſhow that deliverance comes to mankind by none of them; but only the true paſſover, that Lamb of God ſlain from the foundation of the world, (Rom. iii. 25. Heb. ix. 14.) It was killed the firſt month of the year, which prefigured that Chriſt ſhould ſuffer death in this month, (John xviii. 28.) It was killed in the evening, (Exod. xii. 6.) So Chriſt ſuffered in the laſt days, and at this time of the day, (Matt. xxvii. 46. Heb. i. 2.) At even alſo the ſun ſets, which ſhows that it was the Sun of Righteouſneſs who was to ſuffer and die, and that at his paſſion univerſal darkneſs ſhould be upon the whole earth, (Luke xxiii. 44.) The paſſover was roaſted with fire, to denote the ſharp and dreadful pains which Chriſt ſhould ſuffer, not only from men, but from God alſo. It was to be eaten with bitter herbs, not only to put them in remembrance of their bitter bondage in Egypt, but alſo to typify our mortification to ſin, and readineſs to undergo afflictions for Chriſt, (Col. i. 24.) Many erroneouſly imagine, that the paſſover was inſtituted in memory of the Iſraelites paſſing the Red Sea; though it is certain the feaſt was held, and had its name, before the Iſraelites took a ſtep of their way out of Egypt, and conſequently ſeveral days before their paſſing the Red Sea. Beſides the paſſover celebrated on the fourteenth of the firſt month, there was a ſecond paſſover held on the fourteenth of the ſecond month after the equinox, inſtituted by God in favour of travellers and ſick perſons, who could not attend at the firſt, nor be at Jeruſalem on the day. The Greeks, and even ſome of the catholic doctors, from the thirteenth, eighteenth, and nineteenth, chapters, of St John, take occaſion to conclude, that Jeſus anticipated the day marked for the paſſover in the law; but the authority of three evangeliſts ſeems to evince the contrary. See Whitby's Diſſertation on this ſubject, in an appendix to the fourteenth chapter of St Mark. F. Lamy ſuppoſes, that our Lord did not attend at the paſſover the laſt year of his life; which ſentiment has drawn upon him abundance of oppoſers. F. Hardouin aſſerts, that the Galileans celebrated the paſſover on one day, and the Jews on another.

PASSPORT, or Pass, a licence or writing obtained from a prince or governor, granting permiſſion and a ſafe conduct to paſs through his territories without moleſtation: Alſo a permiſſion granted by any ſtate to navigate in ſome particular ſea, without hinderance or moleſtation from it. It contains the name of the veſſel, and that of the maſter, together with her tonnage and the number of her crew, certifying that ſhe belongs to the ſubjects of a particular ſtate, and requiring all perſons at peace with that ſtate to ſuffer her to proceed on her voyage without interruption. Paſſport || Paſte.

The violation of ſafe-conducts or paſſports expreſsly granted by the king or by his ambaſſadors to the ſubjects of a foreign power in time of mutual war, or committing acts of hoſtility againſt ſuch as are in amity, league, or truce with us, who are here under a general implied ſafe-conduct, are breaches of the public faith, without which there can be no intercourſe or commerce between one nation and another; and ſuch offences may, according to the writers upon the law of nations, be a proper ground of a national war. And it is enacted by the ſtatute 31 Hen. VI. cap. 4. ſtill in force, that if any of the king's ſubjects attempt or offend upon the ſea, or in any port within the king's obeyſance, or againſt any ſtranger in amity, league, or truce, or under ſafe-conduct, and eſpecially by attacking his perſon, or ſpoiling him, or robbing him of his goods; the lord-chancellor, with any of the juſtices of either the king's-bench or common-pleas, may cauſe full reſtitution and amends to be made to the party injured. Paſquier ſays, that *paſſport* was introduced for *paſſe-par-tout*. Balzac mentions a very honourable paſſport given by an emperor to a philoſopher in theſe terms: "If there be any one on land or ſea hardy enough to moleſt Potamon, let him conſider whether he be ſtrong enough to wage war with Cæſar."

Passport is uſed likewiſe for a licence granted by a prince for the importing or exporting merchandizes, moveables, &c. without paying the duties. Merchants procure ſuch paſſports for certain kinds of commodities; and they are always given to ambaſſadors and miniſters for their baggage, equipage, &c.

Passport is alſo a licence obtained for the importing or exporting of merchandizes deemed contraband, and declared ſuch by tariffs, &c. as gold, ſilver, precious ſtones, ammunition of war, horſes, corn, wool, &c. upon paying duties.

PASSUS, among the Romans, a meaſure of length, being about four feet ten inches, or the thouſandth part of a Roman mile. The word properly ſignifies, the ſpace betwixt the feet of a man walking at an ordinary rate. See Measure.

PASTE, in cookery, a ſoft compoſition of flour, wrought up with proper fluids, as water, milk, or the like, to ſerve for caſes or coffins, therein to bake meats, fruits, &c. It is the baſis or foundation of pyes, tarts, patties, paſties, and other works of paſtry. It is alſo uſed in confectionary, &c. for a preparation of ſome fruit, made by beating the pulp thereof with ſome fluid or other admixture, into a ſoft pappy conſiſtence, ſpreading it into a diſh, and drying it with ſugar, till it becomes as pliable as an ordinary paſte. It is uſed occaſionally alſo for making the cruſts and bottoms of pyes, &c. Thus, with proper admixtures, are made almond paſtes, apple paſtes, apricot paſtes, cherry, currant, lemon, plum, peach, and pear paſtes.

Paste is likewiſe uſed for a preparation of wheaten flour, boiled up and incorporated with water; uſed by various artificers, as upholſterers, ſaddlers, bookbinders, &c. inſtead of glue or ſize, to faſten or cement their cloths, leathers, papers, &c. When paſte is uſed by bookbinders, or for paper-hangings to rooms, they mix a fourth, fifth, or ſixth, of the weight of the flour of powdered reſin; and where it is wanted ſtill more tenacious,

Paſtes || Paſtime.

nacious, gum arabic or any kind of ſize may be added. Paſte may be preſerved, by diſſolving a little ſublimate, in the proportion of a dram to a quart, in the water employed for making it, which will prevent not only rats and mice, but any other kind of vermin and inſects, from preying upon it.

PASTES, in the glaſs trade, or the imitation or counterfeiting of gems in glaſs, ſee GEM, p. 603.

PASTEBOARD, a kind of thick paper, formed of ſeveral ſingle ſheets paſted one upon another. The chief uſe of paſteboard is for binding books, making letter-caſes, &c. See PAPER.

PASTERN *of a* HORSE, in the manege, is the diſtance betwixt the joint next the foot and the coronet of the hoof. This part ſhould be ſhort, eſpecially in middle-ſized horſes; becauſe long paſterns are weak, and cannot ſo well endure travelling.

PASTERN-Joint, the joint next a horſe's foot.

PASTIL, or PASTEL, among painters, a kind of paſte made of different colours ground up with gum-water, in order to make CRAYONS.

PASTIL, in pharmacy, is a dry compoſition of ſweet-ſmelling reſins, aromatic woods, &c. ſometimes burnt to clear and ſcent the air of a chamber.

PASTIME, a ſport, amuſement, or diverſion. Paſtimes of ſome kind ſeem to be abſolutely neceſſary, and to none more than to the man of ſtudy; for the moſt vigorous mind cannot bear to be always bent. Conſtant application to one purſuit, if it deeply engage the attention, is apt to unhinge the mind, and to generate madneſs; of which the Don Quixote of Cervantes, and the aſtronomer of Johnſon, are two admirably conceived inſtances. But though paſtime is neceſſary to relieve the mind, it indicates great frivolity when made the buſineſs of life; and yet the rich and the great, who are not obliged to labour for the means of ſubſiſtence, too often rove from paſtime to paſtime with as conſtant aſſiduity as the mechanic toils for his family, or as the philoſopher devotes himſelf to the cultivation of ſcience. When thoſe paſtimes tend to give elaſticity to the mind or ſtrength to the body, ſuch conduct is not only allowable, but praiſeworthy; but when they produce effects the reverſe of theſe, it is both hurtful and criminal. The gaming-table, the maſquerade, the midnight aſſembly of any ſort, muſt of neceſſity enfeeble both the body and the mind; and yet ſuch are the faſhionable amuſements of the preſent day, to which many a belle and many a beau ſacrifice their beauty, their health, their quiet, and their virtue. Paſtime.

Far different were the paſtimes of our wiſer anceſtors: Remote from vice and effeminacy, they were innocent, manly, and generous exerciſes. From the ancient records of this country, it appears, that the ſports, amuſements, pleaſures, and recreations, of our anceſtors, as deſcribed by Fitz-Stephen (A), added ſtrength and agility to the wheels of ſtate-mechaniſm, while they had a direct tendency towards utility. For moſt of theſe ancient recreations are reſolvable into the public defence of the ſtate againſt the attacks of a foreign enemy. The play at ball, derived from the Romans, is firſt introduced by this author as the common exerciſe of every ſchool-boy. The performance was in a field, where the reſort of the moſt ſubſtantial and conſiderable citizens, to give encouragement and countenance to this feat of agility, was ſplendid and numerous. The intention of this amuſement at this period of time was to make the juvenile race active, nimble, and vigorous; which qualities were requiſite whenever their aſſiſtance ſhould be wanted in the protection of their country. The next ſpecies of paſtime indeed does not ſeem to have this tendency; but it was only, as it ſeems, an annual cuſtom: This was cock-fighting. The author tells us, that in the afternoon of Shrove-Tueſday, on which day this cuſtom prevailed, they concluded the day in throwing the ball: which ſeems to inſinuate, that the cock-fighting was merely in conformity to ancient uſage, and limited only to part of the day, to make way for a more laudable performance. We may reaſonably ſuppoſe, although this author is entirely ſilent upon this head, that while cock-fighting was going on, cock-throwing was the ſport of the loweſt claſs of people, who could not afford the expence of the former (B). Another ſpecies of manly exerciſe was truly martial, and intended to qualify the adventurers for martial diſcipline. It is related by Fitz-Stephen thus: "Every Friday in Lent, a company of young men comes into the field on horſeback, attended and conducted by the beſt horſemen: then march forth the ſons of the citizens, and other young men, with diſarmed lances and ſhields; and there practiſe feats of war. Many courtiers likewiſe, when the king is near the ſpot, and attendants upon noblemen, do repair to theſe exerciſes; and while the hope of victory does inflame their minds, they ſhow by good proof how ſerviceable they would be in martial affairs."

(A) Otherwiſe called William Stephanides, a monk of Canterbury, who lived in the reign of King Stephen, to the time of Richard I. He wrote a Latin treatiſe, in which he gives an account of the ſeveral paſtimes which were countenanced in his time. Bale in his writings draws a pleaſing portrait of him. He is likewiſe ſketched in ſtrong and forcible outlines of praiſe and commendation by Leland. Bale ſays thus of him: "The time which other people uſually miſemployed in an idle and frivolous manner, he conſecrated to inquiries which tended to increaſe the fame and dignity of his country: in doing which, he was not unworthy of being compared to Plato; for, like him, he made the ſtudy of men and heaven his conſtant exerciſe."

(B) There were places ſet apart for the battles of theſe animals, as at this day, where no one was admitted without money. Theſe places, or *pits* commonly called, were ſchools, as at this day, in which people were inſtructed in the doctrines of chance, loſs and gain, betting and wagers, and particularly in the liberal art of *laying two to one*. Cock-throwing has been laudably aboliſhed; for it was a ſpecies of cruelty towards an innocent and uſeful animal; and ſuch a cruelty as would have kindled compaſſion in the heart of the rankeſt barbarian.

Paſtime. This evidently is of Roman deſcent, and immediately brings to our recollection the *Ludus Troja*, ſuppoſed to be the invention, as it was the common exerciſe, of Aſcanius. The common people, in this age of maſculine manners, made every amuſement where ſtrength was exerted the ſubject-matter of inſtruction and improvement: inſtructed to exert their bodily ſtrength in the maintenance of their country's rights; and their minds improved, by ſuch exertion, into every manly and generous principle.

In the vacant intervals of induſtry and labour, commonly called the holy-days, indolence and inactivity, which at this day mark this portion of time, were found only in thoſe whoſe lives were diſtempered with age or infirmity. The view which Fitz-Stephen gives us of the Eaſter-holydays is animated. "In Eaſter-holydays they fight battles upon the water. A ſhield is hanged upon a pole, fixed in the middle of the ſtream. A boat is prepared without oars, to be borne along by the violence of the water; and in the fore-part thereof ſtandeth a young man, ready to give charge upon the ſhield with his lance. If ſo be that he break his lance againſt the ſhield, and doth not fall, he is thought to have performed a worthy deed. If without breaking his lance he runs ſtrongly againſt the ſhield, down he falleth into the water; for the boat is violently forced with the tide: but on each ſide of the ſhield ride two boats, furniſhed with young men, who recover him who falleth ſoon as they may. In the holydays all the ſummer the youths are exerciſed in leaping, dancing, ſhooting, wreſtling, caſting the ſtone, and practiſing their ſhields; and the maidens trip with their timbrels, and dance as long as they can well ſee. In winter, every holyday before dinner, the boars prepared for brawn are ſet to fight, or elſe bulls or bears are baited."

Theſe were the laudable purſuits to which leiſure was devoted by our forefathers, ſo far back as the year 1130. Their immediate ſucceſſors breathed the ſame generous ſpirit. In the year 1222, the 6th year of Henry III. we find, that certain maſters in exerciſes of this kind made a public profeſſion of their inſtructions and diſcipline, which they imparted to thoſe who were deſirous of attaining excellence and victory in theſe honourable atchievements. About this period, the perſons of better rank and family introduced the play of *Tennis* (c); and erected courts or oblong edifices for the performance of the exerciſe. Paſtime.

About the year 1253, in the 38th year of Henry III. the *Quintan* was a ſport much in faſhion in almoſt every part of the kingdom. This contrivance conſiſted of an upright poſt firmly fixed in the ground, upon the top of which was a croſs piece of wood, moveable upon a ſpindle; one end of which was broad like the flat part of an halberd, while at the other end was hung a bag of ſand. The exerciſe was performed on horſeback. The maſterly performance was, when, upon the broad part being ſtruck with a lance, which ſometimes broke it, the aſſailant rode ſwiftly on, ſo as to avoid being ſtruck on the back by the bag of ſand, which turned round inſtantly upon the ſtroke given with a very ſwift motion. He who executed this feat in the moſt dexterous manner was declared victor, and the prize to which he became intitled was a peacock. But if, upon the aim taken, the contender miſcarried in ſtriking at the broadſide, his impotency of ſkill became the ridicule and contempt of the ſpectators.

Dr Plott, in his Natural Hiſtory of Oxfordſhire, tells us, that this paſtime was in practice in his time at Deddington in this county. "They firſt (ſays this author) fixed a poſt perpendicularly in the ground, and then placed a ſmall piece of timber upon the top of it, faſtened on a ſpindle, with a board nailed to it on one end, and a bag of ſand hanging at the other. Againſt this board they anciently rode with ſpears: now as I ſaw it at Deddington only with ſtrong ſtaves, which violently bringing about the bag of ſand, if they make not good ſpeed away, it ſtrikes them in the neck or ſhoulders, and ſometimes perhaps ſtrikes them down from their horſes; the great deſign of the ſport being to try the agility both of man and horſe, and to break the board; which, whoever did, was accounted conqueror: for whom heretofore there was ſome reward always appointed." (d)

Matthew Paris, ſpeaking of this manly diverſion, ſays,

(c) The word *Tennis* ſeems to owe its original to the French language: if ſo, the game is of French production. Yet the word *tenez* will hardly be found to afford incontrovertible evidence upon this ſubject. For the holding or keeping poſſeſſion of the ball is no part of the game, but rather a circumſtance caſually attending it: ſince, during the performance of it, the ball is in continual motion, ſo there can be no *tenez* at this juncture. Perhaps a place in France called *Tennois* (as there is a town which differs only in a letter, called *Sennois*, in the diſtrict of Champagne) was the place where the balls were firſt made, and the game firſt introduced.

(d) This was certainly an exerciſe derived from a military inſtitution of the Romans, though not inſtrumentally the ſame. Whoever conſiders the form and diſpoſition of the Roman camps, which were formed into a ſquare figure, will find there were four principal gates or paſſages. Near the *Quæſtorium*, or Quæſtor's apartment, was the *Forum*, or what is now called a ſuttling-houſe, and from being near the Quæſtor's ſtation called *Quæſtorium forum*. At this part was a fifth gate *Quintana*, where the ſoldiers were inſtructed in the diſcipline of the *Palaria*, which was to aim at and ſtrike their javelins againſt an upright poſt fixed in the ground, as a kind of *proluſion* to a real engagement with an enemy. By the frequent practice of this exerciſe, ſometimes called *exercitium ad palum* by Roman writers, the ſoldiers at length acquired not only a dexterity and addreſs in the management of their arms, but a conſtant and regular exactneſs in the direction of them. *Titus Livius Patavinus*, cap. 2. *Pancirollus Rerum Memoral.* lib. ii. tit. 21. *Vulturius in Auguſtanis Monumentis*, lib. ii. p. 237.

Upon the irruption of the *Iſtri* into the Roman camps, which they plundered, ſays Livius, *ad Quæſtorium forum, quintanamque pervenerunt.*

Paſtime. ſays, "The London youths made trial of their ſtrength on horſeback, by running at the *Quintan*; in doing which, whoever excelled all the reſt was rewarded with a peacock." This ſport is continued to this day in Wales; and being in uſe only upon marriages, it may be conſidered as a votive paſtime, by which theſe heroic ſpirits ſeem to wiſh, that the male iſſue of ſuch marriage may be as ſtrong, vigorous, and active, as thoſe who are at that time engaged in the celebration of this feſtive exertion of manhood. Virtuous exerciſes of this kind would be too rude and barbarous for the attendants on pleaſure in the preſent age. The hand would tremble at the weight of the javelin; and the heart would pant upon the apprehenſion of perſonal inſecurity. While theſe exertions of triumphant proweſs continued, the ſordid degeneracy of diſpoſition, the ſupple baſeneſs of temper, were unknown: for the love of country, as the Roman orator has wiſely obſerved, *included all other virtues*. But if we guard the palace of honour, like the brazen caſtle of Danae, with every poſſible ſecurity, importunate corruption will be ever waiting at the gate, to ſeize an opportunity of intruſion. Theſe feats of honourable conteſt were ſucceeded by the gilded banners of exhibition, and all the long train of dependents in the intereſt of indolence: for the writers of theſe times inform us, that the ſoft pleaſures of the ſtage forced the paſſes to public favour in the year 1391, and likewiſe in the year 1409; ſo that utility, which before ſtood on the right hand of pleaſure, was now ordered to withdraw for a ſeaſon. The drama, it ſeems, was attempted by a ſet of uſeleſs and inſignificant perſons called *pariſh-clerks*; who, becauſe they had the knowledge of the alphabet, ignorantly preſumed that this included every other ſpecies of knowledge. The ſubject was truly ſerious, the creation of the world; but the performance muſt have been ludicrous. It was, however, honoured with the attendance of noble perſonages; and royalty itſelf deigned to caſt a favourable eye upon it, for the king and queen were preſent. Theſe interludes laſted no longer than the time requiſite for the former confederacy of utility and pleaſure to reſume its powers; as when the pliable bow by being too much bent is put out of ſhape, and by its elaſticity recovers its former poſition. The lance, the ſhield, the ball, and the equeſtrian proceſſion, came forward again, and put the dramatic uſurper to flight. After this period, theſe objects of generous pleaſure ſeem to have had their audience of leave, and one general object, indeed no leſs manly than the former, to have filled their ſtations, which was archery. This had a continuance to the reign of Charles I. for we find in many hoſpitals founded in that reign, among the articles of benefaction recorded upon their walls, this ſingular proviſion, *arms for the boys*, which ſignified *bows and arrows*.

There are many places at this day, formerly reſort- Paſtime.
ed to, for the practice of this noble art, diſtinguiſhed by appellations which indicate their ancient uſage: ſuch as Brentford Butts, Newington Butts, and many others of the like denomination. It appears from 33 Hen VIII. that by the intruſion of other pernicious games, archery had been for a long time diſuſed; to revive which this ſtatute was made. It ſeems that the bows of the beſt kind were made of yew; and that this wood might be readily obtained for this purpoſe, yew-trees were planted in churchyards. The ſons of thoſe only who were perſons of fortune and faſhion, if under 17 years of age, were permitted to uſe ſuch bows. The words of the ſtatute are ſingular, and ran thus: "No perſon under ſeventeen years, except he, or his father or mother, have lands or tenements to the yearly value of ten pounds, or be worth in value or moveables the ſum of forty marks ſterling, ſhall ſhoot with any bow of yew, which ſhall be bought for him, after the feaſt of our Lady next coming, under the pain to loſe and forfeit ſix ſhillings and eightpence." Two obſervations ariſe here upon theſe words. One, that the yew-wood, not being ſo common as other wood, might probably be ſoon found deficient, as it was the beſt wood for making bows, if not reſtrained in the uſe of it to particular ages and perſons, as young people wantonly deſtroy what is put into their hands for uſeful purpoſes. The other obſervation is, that the age of 17 is by this ſtatute diſtinguiſhed as the age of diſcretion, when young people are more attentive and conſiderate in things of private concern; an age in theſe times which few ever arrive at, and ſome never. This ſtatute makes proviſion of other kinds of wood for the common people in the following manner: "To the intent that every perſon may have bows of mean price, be it enacted, that every bowyer ſhall, for every bow that he maketh of yew, make four other bows, meet to ſhoot with, of elm, wich, haſill, aſh, or other wood apt for the ſame, under pain to loſe and forfeit for every ſuch bow ſo lacking the ſum of three ſhillings and fourpence." It ſeems there was a ſpecies of yew at this time called *elk*, which wood was ſtronger and more pliant than the common yew mentioned in this ſtatute, and the price of it fixed. "Moreover, no bowyer ſhall ſell or put to ſale to any of the king's ſubjects, any bow of yew of the tax called *elk*, above the price of three ſhillings and fourpence, under the pain to forfeit twenty ſhillings for every bow ſold above the ſaid price."

From theſe ſeveral conſiderations which occur in this ſtatute, we can trace three reſplendent qualities, courage, ſtrength, and agility; which three united, inſpired two more, generoſity and magnanimity. Upon the decline of this and other poliſhed (E) amuſements, a ſavage deformity of manners ſprung up, but ſpangled

(E) How widely different the conceptions of politeneſs at this day from what they were in the moſt refined ages of Greece and Rome! Theſe two ſtates agreed in fixing the ſtandard of this accompliſhment upon the fitneſs and propriety of things. We bend to an arbitrary impoſture of language, truſting to the ſenſe and meaning of our oppoſite Gallic neighbours, as if this iſland was at all times to be the foot-ball of that continent. To define politeneſs in its ancient and true ſenſe, it is a manly exertion of conduct, founded upon every noble and virtuous principle. Gallic politeneſs is an effeminate impotence of demeanor, founded upon fallacy, evaſion, and every inſidious artifice. There can be no ſecurity, no happineſs, no proſperity, awaiting this kingdom,

Paſtime. ſpangled here and there with the oppoſite character of lazy opulence, which began now to erect her velvet ſtandard in defiance of chaſte and regular manners.

Towards the beginning of James I.'s reign, military proweſs ſeems to have ſounded a retreat (F). He, to gratify the importunity of the common people, and at the ſame time to obviate his own fears upon a refuſal, publiſhed a book of ſports, in which the people had been ſome time before uſually indulged on Sunday evenings, but which had been lately prohibited. Theſe ſports conſiſted of dancing, ſinging, wreſtling, church ales, and other profanations of that day.

Charles, his ſucceſſor wiſely, in the very entrance of his reign, aboliſhed theſe ſports. The act of Charles ſtates the ſeveral amuſements in part; by which we may conjecture what was the remainder as ſtated in the book of ſports by James. It is neceſſary to tranſcribe that part of the act relating to this ſubject. "Foraſmuch as there is nothing more acceptable to God, than the true and ſincere worſhip of Him, and ſervice according to His holy will, and that the holy keeping of the Lord's day is a principal part of the ſervice of God, which in many places of this realm hath been, and now is, prophaned and neglected by a diſorderly ſort of people, in exerciſing and frequenting bear-baiting, bull-baiting, interludes, and common-plays, and other unlawful exerciſes and paſtimes, neglecting divine ſervice both in their own pariſhes and elſewhere: Be it enacted, that from and after forty days next after the end of this ſeſſion of parliament, there ſhall be no meetings, aſſemblies, or concourſe of people, out of their own pariſhes, on the Lord's day, within this realm of England, or any the dominions thereof, for any ſports or paſtimes whatſoever: nor any bear-baiting, bull-baiting, interludes, common plays, or other unlawful exerciſes or paſtimes, uſed by any perſon or perſons within their own pariſhes: and that every perſon and perſons offending in any of the ſaid premiſes, ſhall forfeit for every offence the ſum of three ſhillings and fourpence; the ſame to be employed and converted to the uſe of the poor of the pariſh where ſuch offence ſhall be committed." All this was perhaps proper, and ſhowed the diſtinguiſhed piety of this unfortunate monarch. But in this age likewiſe ended the manly ſports of Britons, and nothing was introduced that could compenſate for the loſs.

All theſe luſory arts, conſidered as vehicles of pleaſure, from the variety of their inventions, repreſent pleaſure as a fleeting phantom: evincing at the ſame time the ſtability of happineſs as ſpringing from internal order. Even reflex acts, pregnant with future hopes of ſolace and ſocial recreation, have more true feelings in expectancy than thoſe which ariſe from the object in poſſeſſion. Nay, pleaſure is found frequently in the imagination only: for Ixion's diſappointment frequently awaits us when we advance to embrace this Juno of our deſires.

Upon the whole, happineſs, the only thing of intrinſic value, muſt ariſe in the heart, and be ſomething more ſolid than what mere amuſement can poſſibly ſupply. Amuſements or paſtimes ought to be conſidered only as neceſſary relaxations from ſeverer and more uſeful employment; and in this point of view they may be ſolely purſued; but they become criminal when they occupy the place of the buſineſs of life. Paſtime.

PASTINACA, the Parsnep: A genus of the digynia order, belonging to the pentandria claſs of plants; and in the natural method ranking under the 45th order, *Umbellatæ*. The fruit is an elliptical compreſſed plane; the petals are involuted and entire. There are only two ſpecies of this genus; the principal of which is the *paſtinaca ſativa*, or garden-parſnep; which is an exceeding fine eſculent root. It is to be propagated by ſowing the ſeeds in February or March, in a rich mellow ſoil, which muſt be deep dug, that the roots may be able to run deep without hinderance.

It is a common practice to ſow carrots at the ſame time, upon the ſame ground with the parſneps; and if the carrots are deſigned to be drawn young, there is no harm in it. The parſneps, when they are grown up a little, muſt be thinned to a foot diſtance, and carefully kept clear of weeds. They are fineſt taſted juſt at the ſeaſon when the leaves are decayed: and ſuch as are deſirous to eat them in ſpring ſhould have them taken up in autumn, and preſerved in ſand. When the ſeeds are to be ſaved, ſome very ſtrong and fine plants ſhould be left four feet diſtance; and towards the end of Auguſt, or in the beginning of September, the ſeeds will be ripe: they muſt then be carefully gathered, and dried on a coarſe cloth. They ſhould always be ſown the ſpring following; for they do not keep well.

Hints have been given and experiments made by agricultural ſocieties, reſpecting parſneps, in order to raiſe them for winter food to cattle. It has long been a cuſtom in ſome parts of Brittany, to ſow parſneps in the open field for the food of cattle; as we are informed by the firſt volume of the Tranſactions of a Society inſtituted in that province, for the encouragement of the œconomical and commercial intereſts of their country. "It is of great importance (ſay they) that parſneps ſhould be univerſally cultivated; becauſe they afford an excellent and wholeſome food for all kinds of cattle during the winter, and may be uſed to great advantage to fatten them. Our hogs have no other food in all that ſeaſon, and our bullocks and oxen thrive well upon it. Our cows fed with parſneps give more milk than with any other winter fodder, and that milk yields better butter than the milk of cows nouriſhed with any other ſubſtance. Our horſes fatten with this food; though ſome pretend that it renders them leſs mettleſome, and hurts their legs and eyes. Cattle eat theſe roots raw at firſt ſliced lengthwiſe;

---

kingdom, ſo long as we fawn to faſhions that diſgrace humanity, and to manners which conſiſt of more than Punic perfidy.

(F) It hath been confidently aſſerted by ſome hiſtorians, that James was, during his whole life, ſtruck with terror upon the ſight of a drawn ſword; which was the reaſon of his great unwillingneſs in beſtowing the honour of knighthood. For at this juncture, he had ſuch a tremor upon him, that inſtead of laying the ſword upon the ſhoulder of the perſon to be knighted, he frequently would be obſerved almoſt to thruſt the point of it into the face of the party: which occaſioned thoſe about him to aſſiſt him in the direction of his hand.

lengthwiſe; and when they begin not to reliſh them, they are cut in pieces, put into a large copper, preſſed down there, and boiled with only ſo much water as fills up the chaſms between them. They then eat them very greedily, and continue to like them." See PANAX and OPOPANAX.

PASTOPHORI, amongſt the ancients, were prieſts whoſe office it was to carry the images, along with the ſhrines of the gods, at ſolemn feſtivals, when they were to pray to them for rain, fair weather, or the like. The Greeks had a college of this order of prieſts in Sylla's time. The cells or apartments near the temples, where the paſtophori lived, were called *paſtophoria*. There were ſeveral lodging-rooms for the prieſts of a ſimilar kind in the temple of Jeruſalem.

PASTORAL, in general, ſomething that relates to ſhepherds: hence we ſay, paſtoral life, manners, poetry, &c.

Paſtoral life may be conſidered in three different views; either ſuch as it now actually is; when the ſtate of ſhepherds is reduced to be a mean, ſervile, and laborious ſtate; when their employments are become diſagreeable, and their ideas groſs and low: or ſuch as we may ſuppoſe it once to have been, in the more early and ſimple ages, when it was a life of eaſe and abundance; when the wealth of men conſiſted chiefly in flocks and herds, and the ſhepherd, though unrefined in his manners, was reſpectable in his ſtate: or, laſtly, ſuch as it never was, and never can in reality be, when, to the eaſe, innocence, and ſimplicity of the early ages, we attempt to add the poliſhed taſte, and cultivated manners, of modern times. Of theſe three ſtates, the firſt is too groſs and mean, the laſt too refined and unnatural, to be made the ground-work of paſtoral poetry. Either of theſe extremes is a rock upon which the poet will ſplit, if he approach too near it. We ſhall be diſguſted if he give us too much of the ſervile employments and low ideas of actual peaſants, as Theocritus is cenſured for having ſometimes done; and if, like ſome of the French and Italian writers of paſtorals, he makes his ſhepherds diſcourſe as if they were courtiers and ſcholars, he then retains the name only, but wants the ſpirit of paſtoral poetry.

PASTORAL Poetry. See POETRY, Part II. Sect IV.

PASTRY, that branch of cookery which is chiefly taken up in making pies, paſties, cakes, &c. See PASTE.

Dr Cullen obſerves, that paſte is very hard and indigeſtible without butter; and even with it, is apt to produce heart burn and aceſcency. Perhaps this is increaſed by the burned butter, from a certain ſenſibility in the ſtomach, which occaſions all empyreumatic oils to be long retained, and ſo turn ranceſcent and acid.

PASTURE, or *PASTURE-Land*, is that reſerved for feeding cattle.

Paſture land is of ſuch advantage to huſbandry, that many prefer it even to corn-land, becauſe of the ſmall hazard and labour that attends it; and as it lays the foundation for moſt of the profit that is expected from the arable land, becauſe of the manure afforded by the cattle which are fed upon it. Paſture ground is of two ſorts; the one is meadow land, which is often overflowed; and the other is upland, which lies high and dry. The firſt of theſe will produce a much greater quantity of hay than the latter, and will not require manuring or dreſſing ſo often: but then the hay produced on the upland is much preferable to the other; as is alſo the meat which is fed in the upland more valued than that which is fatted in rich meadows; though the latter will make the fatter and larger cattle, as is ſeen by thoſe which are brought from the low rich lands in Lincolnſhire. But where people are nice in their meat, they will give a much larger price for ſuch as hath been fed on the downs, or in ſhort upland paſture, than for the other, which is much larger. Beſides this, dry paſtures have an advantage over the meadows, that they may be fed all the winter, and are not ſo ſubject to poach in wet weather; nor will there be ſo many bad weeds produced; which are great advantages, and do in a great meaſure recompenſe for the ſmallneſs of the crop. Paſture.

We have already mentioned the advantages of meadow land, or ſuch as is capable of being overflowed with water, and given directions for draining and improving low paſture land, under the article MEADOW; therefore ſhall not repeat that here, but juſt mention ſome methods for improving of upland paſture.

The firſt improvement of upland paſture is, by fencing it, and dividing it into ſmall fields of four, five, ſix, eight, or ten, acres each, planting timber trees in the hedge-rows, which will ſereen the graſs from the dry pinching winds of March, which will prevent the graſs from growing in large open lands; ſo that if April proves a dry month, the land produces very little hay; whereas in the ſheltered fields, the graſs will begin to grow early in March, and will cover the ground, and prevent the ſun from parching the roots of the graſs, whereby it will keep growing, ſo as to afford a tolerable crop if the ſpring ſhould prove dry. But in fencing of land the incloſure muſt not be made too ſmall, eſpecially where the hedge-rows are planted with trees; becauſe, when the trees are advanced to a conſiderable height, they will ſpread over the land; and where they are cloſe, will render the graſs ſour; ſo that inſtead of being of an advantage, it will greatly injure the paſture.

The next improvement of upland paſture is, to make the turf good, where, either from the badneſs of the ſoil, or for want of proper care, the graſs hath been deſtroyed by ruſhes, buſhes, or mole hills. Where the ſurface of the land is clayey and cold, it may be improved by paring it off, and burning it; but if it is an hot ſandy land, then chalk, lime, marle, or clay, are very proper manures to lay upon it; but this ſhould be laid in pretty good quantities, otherwiſe it will be of little ſervice to the land.

If the ground is over-run with buſhes or ruſhes, it will be of great advantage to the land to grub them up towards the latter part of ſummer, and after they are dried to burn them, and ſpread the aſhes over the ground juſt before the autumnal rains; at which time the ſurface of the land ſhould be levelled, and ſown with graſs-ſeed, which will come up in a ſhort time, and make good graſs the following ſpring. So alſo, when the land is full of mole-hills, theſe ſhould be pared off, and either burnt for the aſhes, or ſpread im-

Pasture. mediately on the ground when they are pared off, observing to sow the bare patches with grass seed just as the autumnal rains begin.

Where the land has been thus managed, it will be of great service to roll the turf in the months of February and March with an heavy wood roller; always observing to do it in moist weather, that the roller may make an impression; this will render the surface level, and make it much easier to mow the grafs than when the ground lies in hills; and will alfo caufe the turf to thicken, fo as to have what the people ufually term a *good bottom.* The grafs likewife will be the fweeter for this hufbandry, and it will be a great help to deftroy bad weeds.

Another improvement of upland paftures is, the feeding of them; for where this is not practifed, the land muft be manured at leaft every third year; and where a farmer hath much arable land in his poffeffion, he will not care to part with his manure to the pafture. Therefore every farmer fhould endeavour to proportion his pafture to his arable land, efpecially where manure is fcarce, otherwife he will foon find his error; for the pafture is the foundation of all the profit which may arife from the arable land.

Whenever the upland paftures are mended by manure, there fhould be a regard had to the nature of the foil, and a proper fort of manure applied: as for inftance, all hot fandy land fhould have a cold manure; neat's dung and fwine's dung are very proper for fuch lands; but for cold lands, horfe dung, afhes, and other warm manures, are proper. And when thefe are applied, it fhould be done in autumn, before the rains have foaked the ground, and rendered it too foft to cart on; and it fhould be carefully fpread, breaking all the clods as fmall as poffible, and then harrowed with bufhes, to let it down to the roots of the grafs. When the manure is laid on at this feafon, the rains in winter will wafh down the falts, fo that the following fpring the grafs will receive the advantage of it.

There fhould alfo be great care taken to deftroy the weeds in the pafture every fpring and autumn: for, where this is not practifed, the weeds will ripen their feeds, which will fpread over the ground, and thereby fill it with fuch a crop of weeds as will foon overbear the grafs, and deftroy it; and it will be very difficult to root them out after they have gotten fuch poffeffion, efpecially ragwort, and fuch other weeds as have down adhering to their feeds.

The grafs which is fown in thefe upland paftures feldom degenerate, if the land is tolerably good: whereas the low meadows, which are overflowed in winter, in a few years turn to an harfh rufhy grafs, though the upland will continue a fine fweet grafs for many years without renewing.

There is no part of hufbandry of which the farmers are in general more ignorant than that of the pafture: moft of them fuppofe, that when old pafture is plowed up, it can never be brought to have a good fward again; fo their common method of managing their land after ploughing, is to fow with their crop of barley fome grafs feeds as they call them; that is, either the red clover, which they intend to ftand two years after the corn is taken off the ground, or rye-grafs mixed with trefoil; but as all thefe are at moft but biennial plants, whofe roots decay foon after their feeds are perfected, fo the ground, having no crop upon it, is a[illegible] for corn, and this is the conftant round in which the lands are employed by the better fort of farmers.

Pasture. But whatever may have been the practice of thefe people, it is certainly poffible to lay down lands which have been in tillage with grafs, in fuch a manner as that the fward fhall be as good, if not better, than any natural grafs, and of as long duration. But this is never to be expected in the common method of fowing a crop of corn with the grafs feeds; for, wherever this has been practifed, if the corn has fucceeded well, the grafs has been very poor and weak; fo that if the land has not been very good, the grafs has fcarcely been worth faving; for the following year it has produced but little hay, and the year after the crop is worth little, either to mow or feed. Nor can it be expected to be otherwife, for the ground cannot nourifh two crops; and if there were no deficiency in the land, yet the corn, being the firft and moft vigorous of growth, will keep the grafs from making any confiderable progrefs; fo that the plants will be extremely weak, and but very thin, many of them which come up in the fpring being deftroyed by the corn; for whenever there are roots of corn, it cannot be expected there fhould be any grafs. Therefore the grafs muft be thin; and if the land is not in good heart to fupply the grafs with nourifhment, that the roots may branch out after the corn is gone, there cannot be any confiderable crop of clover; and as their roots are biennial, many of the ftrongeft plants will perifh foon after they are cut; and the weak plants, which had made but little progrefs before, will be the principal part of the crop for the fucceeding year; which is many times not worth ftanding.

Therefore, when ground is laid down for grafs, there fhould be no crop of any kind fown with the feeds; or at left the crop fhould be fown very thin, and the land fhould be well ploughed and cleaned from weeds, otherwife the weeds will come up the firft, and grow fo ftrong as to overbear the grafs, and if they are not pulled up, will entirely fpoil it. The beft feafon to fow the grafs feeds upon dry land, when no other crop is fown with them, is about the middle of September or fooner, if there is an appearance of rain: for the ground being then warm, if there happen fome good fhowers of rain after the feed is fown, the grafs will foon make its appearance, and get fufficient rooting in the ground before winter: fo will not be in danger of having the roots turned out of the ground by froft, efpecially if the ground is well rolled before the froft comes on, which will prefs it down, and fix the earth clofe to the roots. Where this hath not been practifed, the froft has often loofened the ground fo much, as to let in the air to the roots of the grafs, and done it great damage; and this has been brought as an objection to the autumnal fowing of grafs; but it will be found to have no weight if the above direction is practifed: nor is there any hazard of fowing the grafs at this feafon, but that of dry weather after the feeds are fown; for if the grafs comes up well, and the ground is well rolled in the end of October, or the beginning of November, and repeated again the beginning of March, the fward will be clofely joined at bottom, and a good crop of hay may be expected

 the

Paſture. the ſame ſummer. But where the ground cannot be prepared for ſowing at that ſeaſon, it may be performed the middle or latter end of March, according to the ſeaſon's being early or late; for, in backward ſprings, and in cold land, we have often ſowed the graſs in the middle of April with ſucceſs; but there is danger, in ſowing late, of dry weather, and eſpecially if the land is light and dry; for we have ſeen many times the whole ſurface of the ground removed by ſtrong winds at that ſeaſon; ſo that the ſeeds have been driven in heaps to one ſide of the field. Therefore, whenever the ſeeds are ſown late in the ſpring, it will be proper to roll the ground well ſoon after the ſeeds are ſown, to ſettle the ſurface, and prevent its being removed.

The ſorts of ſeeds which are the beſt for this purpoſe, are, the beſt ſort of upland hay-ſeeds, taken from the cleaneſt paſtures, where there are no bad weeds; if this ſeed is ſifted to clean it from rubbiſh, three buſhels will be ſufficient to ſow an acre of land. The other ſort is the *trifolium pratenſe album*, which is commonly known by the names *white Dutch clover*, or *white honeyſuckle graſs*. Eight pounds of this ſeed will be enough for one acre of land. The graſs ſeed ſhould be ſown firſt, and then the Dutch clover-ſeed may be afterwards ſown; but they ſhould not be mixed together, becauſe the clover ſeeds being the heavieſt will fall to the bottom, and conſequently the ground will be unequally ſown.

When the ſeeds are come up, if the land ſhould produce many weeds, theſe ſhould be drawn out before they grow ſo tall as to overbear the graſs; for where this has been neglected, the weeds have taken ſuch poſſeſſion of the ground as to keep down the graſs, and ſtarve it; and when theſe weeds have been ſuffered to remain until they have ſhed their ſeeds, the land has been ſo plentifully ſtocked with them as entirely to deſtroy the graſs; therefore it is one of the principal parts of huſbandry never to ſuffer weeds to grow on the land.

If the ground is rolled two or three times at proper diſtances after the graſs is up, it will preſs down the graſs, and cauſe it to make a thicker bottom: for, as the Dutch clover will put out roots from every joint of the branches which are near the ground, ſo, by preſſing down of the ſtalks, the roots will mat ſo cloſely together, as to form a ſward ſo thick as to cover the whole ſurface of the ground, and form a green carpet, and will better reſiſt the drought. For if we do but examine the common paſtures in ſummer, in moſt of which there are patches of this white honeyſuckle graſs growing naturally, we ſhall find theſe patches to be the only verdure remaining in the fields. And this, the farmers in general acknowledge, is the ſweeteſt feed for all ſorts of cattle; yet never had any notion of propagating it by ſeeds, nor has this been long practiſed in England.

As the white clover is an abiding plant, ſo it is certainly the very beſt ſort to ſow, where paſtures are laid down to remain; for as the hay-ſeeds which are taken from the beſt paſtures will be compoſed of various ſorts of graſs, ſome of which may be but annual, and others biennial; ſo, when thoſe go off, there will be many and large patches of ground left bare and naked, if there is not a ſufficient quantity of the white clover to ſpread over and cover the land. Therefore a good ſward can never be expected where this is not ſown; for in moſt of the natural paſtures, we find this plant makes no ſmall ſhare of the ſward; and it is equally good for wet and dry land, growing naturally upon gravel and clay in moſt parts of England: which is a plain indication how eaſily this plant may be cultivated to great advantage in moſt ſorts of land throughout this kingdom. Paſture in Patagonia.

Therefore the true cauſe why the land which has been in tillage is not brought to a good turf again, in the uſual method of huſbandry, is, from the farmers not diſtinguiſhing which graſſes are annual from thoſe which are perennial: for if annual or biennial graſſes are ſown, theſe will of courſe ſoon decay; ſo that, unleſs where ſome of their ſeeds may have ripened and fallen, nothing can be expected on the land but what will naturally come up. Therefore this, with the covetous method of laying down the ground with a crop of corn, has occaſioned the general failure of increaſing the paſture in many parts of Britain, where it is now much more valuable than any arable land.

After the ground has been ſown in the manner before directed, and brought to a good ſward, the way to preſerve it good is, by conſtantly rolling the ground with an heavy roller, every ſpring and autumn, as hath been before directed. This piece of huſbandry is rarely practiſed by farmers; but thoſe who do, find their account in it, for it is of great benefit to the graſs. Another thing ſhould alſo be carefully performed, which is, to cut up docks, dandelion, knapweed, and all ſuch bad weeds, by their roots every ſpring and autumn; this will increaſe the quantity of good graſs, and preſerve the paſtures in beauty. Dreſſing of theſe paſtures every third year is alſo a good piece of huſbandry; for otherwiſe it cannot be expected the ground ſhould continue to produce good crops. Beſides this, it will be neceſſary to change the ſeaſons of mowing, and not to mow the ſame ground every year, but to mow one ſeaſon and feed the next; for where the ground is every year mown, it muſt be conſtantly dreſſed, as are moſt of the graſs grounds near London, otherwiſe the ground will be ſoon exhauſted.

PATÆCI, in mythology, images of gods which the Phœnicians carried on the prows of their gallies. Herodotus, lib. iv. calls them παταικοι. The word is Phœnician, and derived from *pethica*, i. e. *titulus*. See Boechart's Chanaan, lib. ii. cap. 3. But Scaliger does not agree. Morin derives it from πατταξ, *monkey*, this animal having been an object of worſhip among the Egyptians, and hence might have been honoured by their neighbours. Mr Elſner has obſerved, that Herodotus does not call the patæci *gods*; but that they obtained this dignity from the liberality of Heſychius and Suidas, and other ancient lexicographers, who place them at the ſtern of ſhips; whereas Herodotus placed them at the prow. Scaliger, Bochart, and Selden, have taken ſome pains about this ſubject.—Mr Morin has alſo given us a learned diſſertation on this head in the *Memoires de l'Acad. des Inſcript. & Belles Lettres*, tom. i.; but Mr Elſner thinks it defective in point of evidence.

PATAGONIA, a country of South America, comprehending all that country extending from Chili

Patagonia. and Paraguay to the utmoſt extremity of South America; that is, from 35° almoſt to 54° of latitude: being ſurrounded by the countries juſt mentioned, the South and North Seas, and the Straits of Magellan, which ſeparate it from the iſland called *Terra del Fuego*, and extend about 116 leagues in length from ſea to ſea, but only from half a league to three or four in breadth.

This country had the name of *Terra Magellanica*, from Ferdinand Magellan, a Portugueſe officer in the ſervice of the Catholic king, who is reported to have ſailed through the ſtraits that alſo bear his name, from the North to the South Sea, in the year 1519.

The lofty mountains of the Andes, which are covered with ſnow a great part of the year, traverſing the country from north to ſouth, the air is ſaid to be much colder than in the north under the ſame parallels of latitude. Towards the north, it is ſaid to be covered with wood, and ſtored with an inexhauſtible fund of large timber; whereas, to the ſouthward, not ſo much as a ſingle tree fit for any mechanical purpoſe is to be ſeen: yet there is good paſture, and incredible numbers of wild horned cattle and horſes, which were firſt brought hither by the Spaniards, and have increaſed amazingly. Freſh water, we are told by ſome writers, is very ſcarce; but if that were really the caſe, it is difficult to conceive how the preſent inhabitants and ſuch multitudes of cattle could ſubſiſt. The eaſt coaſt is moſtly low land, with few or no good harbours: one of the beſt is Port St Julian.

Patagonia is inhabited by a variety of Indian tribes; as the Patagons, from which the country takes its name; the Pampas, the Coſſares, &c. of whom we know very little. Only it appears, from the accounts of former voyagers, lately confirmed by Commodore Byron and his crew, and the teſtimonies of other navigators, that ſome of them are of a gigantic ſtature, and clothed with ſkins; but it would ſeem that there are others who go almoſt quite naked, notwithſtanding the inclemency of the climate. Some of them alſo, that live about the Straits, if we may credit the navigators who have paſſed that way into the South Sea, are perfect ſavages: but thoſe with whom Commodore Byron and his people converſed, are repreſented as of a more gentle, humane diſpoſition; only, like other ſavages, they live on fiſh and game, and what the earth produces ſpontaneouſly.

The Spaniards once built a fort upon the Straits, and left a garriſon in it, to prevent any other European nation paſſing that way into the South Sea: but moſt of the men periſhed by famine, whence the place obtained the name of *Port Famine;* and no people have attempted to plant colonies here ever ſince.

About the middle of the Strait is a promontory called *Cape Froiſard*, which is the moſt ſoutherly on the continent of South America.

On the coaſts of Patagonia lie a great number of iſlands, or cluſters of iſlands. On the weſt coaſts are the iſlands Maidre de Dios, Santa Trinidad, Santa Cruz, the iſles of the Chunians and Huillans, the Sarmientos, and many others; to the number of 80 in all, as ſome ſay. Of thoſe on the ſouth coaſt, the moſt conſiderable are *Terra del Fuego*, and *Staten Land*. See theſe articles.

A vaſt deal has been ſaid reſpecting the ſtature of the Patagonians, by people of different nations, and Patagonia. on various occaſions. We ſhall inſert the following letter from Mr Charles Clarke, who was on board Byron's ſhip in 1764, and gave this account to Dr Matty.

"We had not got above 10 or 12 leagues into the ſtraits of Magellan, from the Atlantic Ocean, before we ſaw ſeveral people, ſome on horſeback, ſome on foot, upon the north ſhore (continent), and with the help of our glaſſes could perceive them beckoning to us to come on ſhore, and at the ſame time obſerved to each other, that they ſeemed to be of an extraordinary ſize: However, we continued to ſtand on, and ſhould have paſſed without taking the leaſt farther notice of of them, could we have proceeded; but our breeze dying away, and the tide making againſt us, we were obliged to anchor; when the Commodore ordered his boat of 12 oars, and another of ſix, to be hoiſted out, manned and armed. In the firſt went the Commodore, in the other Mr Cummins, our firſt lieutenant, and myſelf. At our firſt leaving the ſhip, their number did not exceed 40; but as we approached the ſhore, we perceived them pouring down from all quarters, ſome galloping, others running, all making uſe of their utmoſt expedition. They collected themſelves into a body juſt at the place we ſteered off for. When we had got within 12 or 14 yards of the beach, we found it a diſagreeable flat ſhore, with very large ſtones, which we apprehended would injure the boats; ſo looked at two or three different places to find the moſt convenient for landing. They ſuppoſed we deferred coming on ſhore through apprehenſions of danger from them; upon which they all threw open the ſkins which were over their ſhoulders, which was the only clothing they had, and conſequently the only thing they could ſecret any kind of arms with, and many of them lay down cloſe to the water's edge.—The Commodore made a motion for them to go a little way from the water, that we might have room to land, which they immediately complied with, and withdrew 30 or 40 yards; we then landed, and formed each man with his muſket, in caſe any violence ſhould be offered. As ſoon as we were formed, the Commodore went from us to them, then at about 20 yards diſtance: they ſeemed vaſtly happy at his going among them, immediately gathered round him, and made a rude kind of noiſe, which I believe was their method of ſinging, as their countenances beſpoke it a ſpecies of jollity. The Commodore then made a motion to them to ſit down, which they did in a circle, with him in the middle, when Mr Byron took ſome beads and ribbons; which he had brought for that purpoſe, and tied about the womens necks, with which they ſeemed infinitely pleaſed. We were ſtruck with the greateſt aſtoniſhment at the ſight of people of ſuch a gigantic ſtature, notwithſtanding our previous notice with glaſſes from the ſhip. Their body was increaſed, by the time we got in there, to the number of 500, men, women, and children. The men and women both rid in the ſame manner; the women had a kind of belt to cloſe their ſkins round the waiſt, which the men had not, as theirs were only flung over their ſhoulders, and tied with two little ſlips, cut from the ſkin, round the neck. At the time of the Commodore's motion for them to retire farther up the beach, they all

Patagonia. all dismounted, and turned their horses loose, which were gentle, and stood very quietly. The Commodore having disposed of all his presents, and satisfied his curiosity, thought proper to retire; but they were vastly anxious to have him go up into the country to eat with them. That they wanted him to go with them to eat, we could very well understand by their motion, but their language was wholly unintelligible to us.—There was a very great smoke to which they pointed about a mile from us, where there must have been several fires; but some intervening hills prevented our seeing any thing but the smoke. The Commodore returned the compliment, by inviting them on board the ship; but they would not favour him with their company; so we embarked, and returned to the ship. We were with them near two hours at noon-day, within a very few yards, tho' none had the honour of shaking hands but Mr Byron and Mr Cummins; however, we were near enough, and long enough with them, to convince our senses, so far as not to be cavilled out of the very existence of those senses at that time, which some of our countrymen and friends would absolutely attempt to do. They are of a copper colour, with long black hair, and some of them are certainly nine feet, if they do not exceed it. The Commodore, who is very near six feet, could but just reach the top of one of their heads, which he attempted on tip-toes, and there were several taller than him, on whom the experiment was tried. They are prodigious stout, and as well and as proportionally made as ever I saw people in my life. That they have some kind of arms among them, is, I think, indisputable, from their taking methods to convince us they had none at that time about them. The women, I think, bear much the same proportion to the men as our Europeans do; there was hardly a man there less than eight feet, most of them considerably more. The women, I believe, run from seven and an half to eight feet.—Their horses were stout and bony, but not remarkably tall; they are, in my opinion, from 15 to 15½ hands. They had a great number of dogs, about the size of a middling pointer, with a fox nose. They continued on the beach till we got under way, which was two hours after we got on board. I believe they had some expectations of our returning again; but as soon as they saw us getting off, they betook themselves to the country.

"The country of Patagonia is rather hilly, though not remarkably so. You have here and there a ridge of hills, but no very high ones. We lay some time at Port Desire, which is not a great way to the northward of the Straits, where we traversed the country many miles round. We found fire-brands in different places, which convinced us there had been people, and we suppose them to have been the Patagonians. The soil is sandy, produces nothing but a coarse harsh grass, and a few small shrubs, of which Sir John Naborough remarked, he could not find one of size enough to make the helve of a hatchet; which observation we found very just. It was some time in the winter we made this visit to our gigantic friends. I am debarred being so particular as I could wish, from the loss of my journals, which were demanded by their Lordships of the Admiralty immediately upon our return."

That the whole of this account is true, we cannot Patagonia. assert; but that the writer has been misled in some respects, and misinformed with regard to some of his facts, is at least probable: for Captain Wallis, who went out to the Straits of Magellan after Byron's return, gives a different turn to many of the observations; and with respect to the stature of the people, he differs very materially. We shall give the following epitome of his remarks on what occurred to him.—He had three ships with him, which entered the Straits on the 16th December 1766, and came to an anchor in a bay south of Cape Virgin Mary, where they were immediately accosted by a whole troop of Patagonians, who made signs for them to come on shore. The Captain, having made previous dispositions for the security of his men in case of an attack, manned all the boats belonging to the three ships, and with a party of marines landed on the beach where those giants had assembled. The commanders of the three ships, and most of their officers, were of this party. On their leaping ashore, the Indians seemed to welcome them; and being by signs desired to retreat, they all fell back, and made room for the marines to form. When they were drawn up, Captain Wallis advanced, and by signs directed the Indians to seat themselves in a semicircle, which they readily understood and obeyed. He then distributed among them knives, scissars, buttons, beads, combs, and particularly ribbons, with which he complimented the women, who received them with a mixture of pleasure and respect. He then gave them to understand that he had still more valuable articles to bestow, and showed them axes and bill-hooks; but, at the same time, pointed to some gaunicoes and ostriches, intimating that he expected some of those in return: but they either did not, or would not, understand him; so that no traffic took place.

The whole company that were assembled on this occasion, had each a horse, with a saddle and bridle. The saddle had a sort of stirrups, and the bridle was made of thongs of leather very well put together, for the purpose of guiding the horses. The women, as well as the men, rode astride. The men, in general, wore each a wooden spur; but one of them had a large pair of Spanish spurs, brass stirrups, and a Spanish scimitar. Their horses were nimble and spirited, but small in proportion to their riders, seemingly not above 14 hands high. Their dogs were of the Spanish breed. The Captain, having purposely provided himself with measuring rods, found that the tallest man among them measured only six feet seven inches high; several were within an inch or two as tall; but the ordinary size was from five feet ten inches to six feet. It is pity that none of our voyagers thought of measuring the whole size of one of those gigantic men. They tell us, indeed, that they are well made, that they are proportionally large, and that they are robust and bony; but they give us no criterion to judge of their bulk, nor one instance of their extraordinary strength. As they are represented not only peaceable, but remarkably tractable, some trials might have been made of the weight they could have lifted, and how much they could exceed in that respect the strongest man in the ships. This, in a great measure, would have determined the point, which is yet left doubtful by the different relations that are given by the different voyagers

Patagonia.

who have seen these people, no two of them agreeing in the same description. All agree, however, that their hair is black, and harsh like bristles; that they are of a dark-copper colour, and that their features are rather handsome than ugly; that they clothe themselves decently with the skins of gaunicoes; that they paint themselves variously; and there is reason to suspect, that by that variety they distinguish their tribes. Those seen by Commodore Byron were painted round both eyes, no two of them alike; those seen by Captain Wallis had only a red circle round the left eye; and those seen by Bougainville had no circle round the eyes, but had their cheeks painted red. This may account for the different reports of voyagers concerning their stature: it is not impossible, nay, it is very probable, that they may vary in this particular, according to their tribes; as is seen in the Highlands of Scotland, where one clan of the Campbells is remarkably tall, and another of the Frasers remarkably short. Were it not for some such natural discrimination, there could not be so wide a difference in the descriptions of gentlemen, who, having no ends to serve either in falsifying one another's reports, or in imposing upon the public, cannot be supposed to mistake wilfully.

One remarkable observation made by our voyagers must not be omitted; and that is, that though our people could distinguish but one word of their language, which the English pronounce *chiewow*, and the French *shiawa*, yet the Patagonians could repeat whole sentences after our men more distinctly than almost any European foreigner of what nation soever. This appears the more singular, as, among the islanders between the Tropics, it was hardly possible to make them articulate any of our words. Sydney Parkinson, in a specimen he has given us, says, that though the English remained at Otaheitee three months, the nearest the natives could approach the sound of *Cooke* was *Toote*; *Banks*, *Opane*; *Solander*, *Tolano*; *Gore*, *Towara*; *Monkhouse*, *Mata*; and so of the rest: whereas the Patagonians presently got by heart this sentence of invitation, *Come ashore, Englishmen!* which they showed they well understood, by repeating it afterwards whenever the ships came so near the shore as to be within call.

Another very remarkable particular is, that they had none of the characters of a ferocious people; there was no offensive weapon among them, except the scimitar already mentioned. The men, indeed, had a kind of sling, which they use in hunting, consisting of two round stones of about a pound weight each, connected together by a thong. These stones were fastened to the extremities of the thong; and, when they threw them, they held one stone in the hand, and swung the other about the head. "They are so expert in the management of this double-headed shot (says the writer of the voyage), that they will hit a mark not bigger than a shilling with both these stones at the distance of fifteen yards; but their method of availing themselves of their dexterity against the guanicoe and ostrich is, to sling the stones so as to entangle their legs, by which means they are retarded in their flight, and easily overtaken. Bougainville speaks of these slings as common among other Indian nations in South America; but we do not remember to have seen this assertion confirmed by any other voyager.

These people certainly dress differently as well as paint differently; for the dress described by Bougainville is very unlike the dress of those seen by the English voyagers. Captain Wallis invited some of them on board his ship: but, among all the wonders that were shown them, none seemed to attract their notice so much as the looking glasses: they looked in the glasses and at each other; they laughed and gazed, and gazed again and laughed; in short, there was no end to their merriment when in possession of this article of curiosity. They eat whatever was given them, but would drink nothing but water. In this they differ from all the tribes of Indians in North America, who are immoderately fond of spirituous liquors. They admired the European sheep, hogs, and poultry; but did not seem over-desirous of any thing they saw except clothes. When the marines were exercised to entertain them, they appeared disconcerted; an old man among them made signs, by striking his breast, and tumbling down and lying as if he had been dead upon deck, that he knew the effect of their guns; and none of them seemed easy till the firing was over. When the Captain had satisfied his own curiosity, and, as he imagined, theirs, he gave them to understand that he was going to sail, and that they must depart; which they were very unwilling to do. However, having given each of them a canvas bag, with some needles ready threaded, a knife, a pair of scissars, a few beads, a comb, and a looking-glass, he dismissed them, with great reluctance on their part, particularly on that of the old man's, who by very significant signs expressed his desire to stay till sunset.

Patagonia. Patan.

PATAGONULA, in botany; a genus of the monogynia order, and of the pentandria class of plants. The characters are these: the cup is an extremely small perianthium, divided into five segments, and remains after the flower is fallen; the flower consists of a single petal, with almost no tube, the margin of which is divided into five acute oval segments; the stamina are five filaments of the length of the flower; the antheræ simple; the germen of the pistil is oval and pointed; the style is slender and slightly bifid, its ramifications are also bifid; this is of the same length with the stamina, and remains when the flower is fallen; the stigmata are simple; the fruit is an oval and pointed capsule, standing on a large cup, made up of five long segments emarginated or rimmed round their edges; the seeds of this plant are yet unknown; but the construction of the cup, in which the capsule stands, is alone a sufficient distinction for this genus. There is but a single species.

PATAN, a kingdom of Asia, in the East Indies, and in the peninsula of Malacca, and on the eastern coast between the kingdoms of Siam and Paha. The inhabitants are partly Mahometans and partly Gentoos; but they are all very voluptuous. The air is wholesome, though very hot; and they have no seasons but the winter and summer. The former is more properly the rainy season; and contains the months of November, December, and January. The woods are full of elephants and many wild animals. Some voyagers pretend that this country is governed by a queen, who never marries, but may have as many gallants as she pleases. They have some trade with the Chinese; and the principal town is of the same name, which is one

Patan || Patella.

of the ſtrongeſt in theſe parts, having a well defended harbour.

PATAN, a town of Aſia, and capital of a province of the ſame name, in the dominions of the Great Mogul; it is very little known. E. Long. 109. 0. N. Lat. 27. 30.

PATAVINITY, among critics, denotes a peculiarity of Livy's diction; derived from Patavium or Padua, the place of his nativity; but wherein this patavinity conſiſts, they are by no means agreed.

Aſinius Pollio, according to Quintilian, taxed Livy with patavinity. But what he meant by this cenſure we believe no man can ſay. Morhof believes it to be a ſingular turn of expreſſion, and ſome phraſes peculiar to the Padueſe. All we certainly know about it is, that it was a fault in the language of Livy, not in the ſentiments or manners. In all probability, it is one of thoſe delicacies that are loſt in a dead language. Dan. Georg. Morhof publiſhed a treatiſe *De Patavinitate Liviana*, at Kiel, in 1685, where he explains, very learnedly, the urbanity and peregrinity of the Latin tongue.

PATARA, (Livy, Mela); the capital of Lycia, to the eaſt of the mouth of the river Xanthus; famous for a temple and oracle of Apollo, thence called *Patareus*, three ſyllables only; but *Patarænus*, (Horace). For the ſix winter months, Apollo gave anſwers at Patara; and for the ſix ſummer at Delos, (Virgil, Servius): theſe are the *Lyciæ Sortes* of Virgil. The town was ſituated in a peninſula, called *Lictorum Cherſoneſus*, (Stephanus). Acts xxi. 1. St Paul in his paſſage from Philippi to Jeruſalem, came to Miletus, hence to Coos, then to Rhodes, and from Rhodes to Patara; where having found a ſhip that was bound for Phœnicia, he went on board and arrived at Jeruſalem, to be at the feaſt of Pentecoſt.

PATAVIUM (Tacitus, Strabo), a town of the Tranſpadana, ſituated on the left or north bank of the Medoacus Minor; founded by Antenor the Trojan, (Mela, Virgil, Seneca); *Patavini*, the people, (Livy); who himſelf was a native, and by Aſinius Pollio charged with patavinity. Now *Padua*, in the territory and to the weſt of Venice. E. Long. 12. 15. N. Lat. 45. 30.

PATAY, a town of France, in the province of Orleannois, remarkable for the defeat of the Engliſh in 1429, and where Joan of Arc did wonders. E. Long. 1. 43. N. Lat. 48. 5.

PATE, in fortification, a kind of platform, reſembling what is called an *horſe's ſhoe*.

PATEE, or PATTEE, in heraldry, a croſs, ſmall in the centre, and widening to the extremities, which are very broad.

PATELLA, or KNEE-PAN, in anatomy. See there, n° 59.

PATELLA, or LIMPET, a genus of inſects belonging to the order of vermes teſtacea; the animal being of the ſnail kind. The ſhells are of that claſs which is called *univalves*; they have no *contour*, and are in the form of little pointed cones. They are always attached to ſome hard body. Their ſummit is ſometimes acute, ſometimes obtuſe, flatted, turned back, or perforated. The rock or other hard body to which they are always found adhering, ſerves as a kind of ſecond or under ſhell to preſerve them from injury; and for this reaſon Aldrovandus and Rondelet have claſſed them among the bivalves; but in this error they have not been followed by any other writer. Fabius Columna diſtinguiſhes four ſorts of the lepas or limpets: *lepas vulgaris*, a ſort very common at Naples, of an oval figure and aſh colour. *Lepas major exotica*, which comes from Spain, the ſhell is hard, thick, and ribbed in angles, and the rim is denticulated. The *lepas agreſtis*, or *ſylveſtris*, which is a ſmall ſhell, irregularly oval, of an aſh colour, marked with radii and zones croſſing each other, and perforated at the top by an aperture which ſerves the fiſh for a vent. And the *patella regalis, quia regis menſa ſit digna*; this is of a mother-of-pearl colour within, and is ribbed and perforated in many places: theſe ſhells have been found on the back of the ſea-tortoiſe, or turtle, and on a large pinna marina. The diſtinguiſhing mark or characteriſtic of the lepas is to have but one convex ſhell, which adheres by its rim to a rock, or ſome other hard ſubſtance. There are 36 ſpecies of this genus, which are principally diſtinguiſhed by peculiarities in their ſhells. Of ſome of theſe ſhells we have given engravings in Plate CCCLXXXII. of which we add the following deſcription: Patella.

The limpet marked 1. has large yellow furrows and ridges from the centre to the circumference, which is indented; the eye is perfectly white, and ſhaped liked a nipple.

That marked 2. is perfectly ſmooth, but radiated with brown ſtreaks, and perforated in the ſummit.

Fig. 3. is ribbed, and indented at the circumference; its coat is ſpotted with brown, in a zig-zag form, and its eye is of a ruby colour.

Fig. 4. is a ſmall brown ſhell, the ribs or ſtriæ of which are armed with ſmall white points.

Fig. 5. is ſtriated with radii, reaching from the eye to the circumferenee, which are croſſed by other ſtreaks nearly parallel to the circumference; it is of the uſual colour, and its eye is perforated.

Fig. 6. This is white, ſhaped ſomething like an hand-bell, and has within a protuberance ſomewhat reſembling a clapper.

Fig. 7. is a ſeven-ſided limpet, divided at each angle by ridges from the ſummit, which form a ſtar on a white ground, variegated with black ſpots.

Fig. 8. is a ſmall ribbed ſhell, of a brown colour, and rough; it has a chamber, and a beak-faſhioned eye placed at one of its extremities.

Fig. 9. is the fineſt ſhell of this ſpecies: its ſize, the fine mother-of-pearl colour on the inſide, and the beauty of its red ſpots without, which have the appearance of tortoiſe-ſhell, give it the pre-eminence over all others. It is called the *Tortoiſe ſhell buckler*.

The wild limpet, or patella fera, is a name very improperly applied by Rondilitius and Aldrovand to the *aures marinæ*, or *concha veneris*, which certainly is not of the patella kind.

PATELLA, in the Hiſtory of Inſects, a name given by Liſter and other authors to a little huſk or ſhell, found on the bark of the cherry, plum, roſe, and other trees, containing an animal within, and uſeful in colouring. Theſe patellæ are of the form of globes, except when they adhere to the tree, and are for the moſt part of a ſhining cheſnut colour. The huſk itſelf ſtrikes a very fine crimſon colour on paper, and within it is found a white maggot which is of no value: this, in time, hatches into a very ſmall but beautiful bee. The ſize of this bee is about half that of an ant.

Patella ‖ Patera.

ant. They have a ſting like bees, and three ſpots placed in a triangle on the forehead, which are ſuppoſed to be eyes. They are of a black colour, and have a large round whitiſh or pale yellow ſpot on the back. The upper pair of wings are ſhaded and ſpotted, but the under pair are clear. It might be worth while to try the ſhells or huſks in order to diſcover whether the colour they yield might not be uſeful. It is to be remarked, that the deepeſt coloured huſks afford the fineſt and deepeſt purple: they muſt be uſed while the animal in them is in the maggot form; for when it is changed into the bee ſtate the ſhell is dry and colourleſs. Liſter, who firſt obſerved theſe patellæ, went ſo far on comparing them with the common kermes, as to aſſert that they were of the ſame nature with that production: but his account of their being the workmanſhip of a bee, to preſerve her young maggot in, is not agreeable to the true hiſtory of the kermes; for that is an inſect of a very peculiar kind. He has in other inſtances been too juſtly cenſured for his precipitancy of judging of things, and perhaps has fallen into an error by means of it here. It is very poſſible that theſe patellæ may be the ſame ſort of animals with the kermes, but then it produces its young within this ſhell or huſk, which is no other than the ſkin of the body of the mother animal; but as there are many flies whoſe worms or maggots are lodged in the bodies of other animals, it may be that this little bee may love to lay its egg in the body of the proper inſect, and the maggot hatched from that egg may eat up the proper progeny, and, undergoing its own natural changes there, iſſue out at length in form of the bee. This may have been the caſe in ſome few which Dr Liſter examined; and he may have been miſled by this to ſuppoſe it the natural change of the inſect.

PATENT, in general, denotes ſomething that ſtands open or expanded: thus a leaf is ſaid to be patent, when it ſtands almoſt at right angles with the ſtalk.

PATENT, or *Letters Patent*. See LETTER.

PATER NOSTER, the *Lord's Prayer*, ſo called from the two firſt words thereof in Latin.

Pater Noſter, iſlands of Aſia, in the Eaſt Indian ſea, ſo called becauſe of the great number of rocks, which ſailors have likened to the beads with which the Papiſts tell their pater-noſter. They abound in corn and fruits, and are very populous.

Pater Patratus, was the name of the firſt and principal perſon the college of heralds called *Feciales*. Some ſay the Pater Patratus was a conſtant officer and perpetual chief of that body; and others ſuppoſe him to have been a temporary miniſter, elected upon account of making peace or denouncing war, which were both done by him. See FECIALES.

PATERA, among antiquaries, a goblet or veſſel uſed by the Romans in their ſacrifices; wherein they offered their conſecrated meats to the gods, and wherewith they made libations. See SACRIFICE and LIBATION.

The word is Latin, formed from *pateo*, "I am open;" *quod pateat*, "becauſe it has a great aperture;" in contradiſtinction to bottles, &c. which have only narrow necks, or whoſe aperture is leſs than the body of the veſſel.

On medals the patera is ſeen in the hands of ſeveral deities; and frequently in the hands of princes, to mark the ſacerdotal authority joined with the imperial, &c. Paterculus.

Hence F. Joubert obſerves, that beſide the patera, there is frequently an altar upon which the patera ſeems to be pouring its contents.

The patera was of gold, ſilver, marble, braſs, glaſs, or earth; and they uſed to incloſe it in urns with the aſhes of the deceaſed, after it had ſerved for the libations of the wine and liquors at the funeral.

The patera is an ornament in architecture, frequently ſeen in the Doric freeze, and the tympans of arches; and they are ſometimes uſed by themſelves, to ornament a ſpace; and in this caſe it is common to hang a ſtring of huſks or drapery over them: ſometimes they are much inriched with foliage, and have a maſk or a head in the centre.

PATERCULUS (Caius Velleius), an ancient Roman hiſtorian, who flouriſhed in the reign of Tiberius Cæſar, was born in the year of Rome 735. His anceſtors were illuſtrious for their merit and their offices. His grandfather eſpouſed the party of Tiberius Nero, the emperor's father; but being old and infirm, and not able to accompany Nero when he retired from Naples, he ran himſelf through with his ſword. His father was a ſoldier of rank, and ſo was Paterculus himſelf. He was a military tribune when Caius Cæſar, a grandſon of Auguſtus, had an interview with the king of the Parthians, in an iſland of the river Euphrates, in the year 753. He commanded the cavalry in Germany under Tiberius; and accompanied that prince for nine years ſucceſſively in all his expeditions. He received honourable rewards from him; but we do not find that he was preferred to any higher dignity than the prætorſhip. The praiſes he beſtows upon Sejanus give ſome probability to the conjecture, that he was looked upon as a friend of this favourite, and conſequently that he was involved in his ruin. His death is placed by Mr Dodwell in the year of Rome 784, when he was in his 50th year.

He wrote an Abridgement of the Roman Hiſtory in two books, which is very curious. His purpoſe was only to deduce things from the foundation of Rome to the time wherein he lived; but he began his work with things previous to that memorable era: for, though the beginning of his firſt book is wanting, we yet find in what remains of it, an account of many cities more ancient than Rome. He promiſed a larger hiſtory; and no doubt would have executed it well: for during his military expeditions he had ſeen, as he tells us, the provinces of Thrace, Macedonia, Achaia, Aſia Minor, and other more eaſterly regions; eſpecially upon the ſhores of the Euxine ſea, which had furniſhed his mind with much entertaining and uſeful knowledge. In the Abridgement which we have, many particulars are related that are nowhere elſe to be found; and this makes it the more valuable. The ſtyle of Paterculus, though miſerably diſguiſed through the careleſſneſs of tranſcribers, and impoſſible to be reſtored to purity for want of manuſcripts, is yet manifeſtly worthy of his age, which was the time of pure Latinity. The greateſt excellence of this hiſtorian lies in his manner of commending and blaming thoſe he ſpeaks of; which he does in the fineſt terms and moſt delicate expreſſions. He is, however, condemned, and indeed with the greateſt

terculus ‖ athetic.

greateſt reaſon, for his partiality to the houſe of Auguſtus; and for making the moſt extravagant eulogies, not only upon Tiberius, but even upon his favourite *Sejanus*: whom, though a vile and cruel monſter, Paterculus celebrates as one of the moſt excellent perſons the Roman commonwealth had produced. Lipſius, though he praiſes him in other reſpects, yet cenſures him moſt ſeverely for his inſincerity and partiality. "Velleius Paterculus (ſays he) raiſes my indignation: he repreſents Sejanus as endowed with all good qualities. The impudence of this hiſtorian! But we know that he was born, and died, to the deſtruction of mankind. After many commendations, he concludes, that Livia was a woman more reſembling the gods than men: and as to Tiberius, he thinks it a crime to ſpeak otherwiſe of him than as of an immortal Jove. What ſincere and honeſt mind can bear this? On the other hand, how artfully does he every where conceal the great qualities of Cæſar Germanicus! how obliquely does he ruin the reputation of Agrippina and others, whom Tiberius was thought to hate! In ſhort, he is nothing but a court-proſtitute. You will ſay, perhaps, it was unſafe to ſpeak the truth at thoſe times: I grant it; but if he could not write the truth, he ought not to have written lies: none are called to account for ſilence." La Mothe le Vayer has made a very juſt remark upon this occaſion: "The ſame fault (ſays he) may be obſerved in many others, who have written the hiſtory of their own times, with a deſign to be publiſhed while they lived."

It is ſtrange, that a work ſo elegant and worthy to be preſerved, and of which, by reaſon of its ſhortneſs, copies might be ſo eaſily taken, ſhould have been ſo near being loſt. One manuſcript only has had the luck to be found, as well of this author among the Latins as of Heſychius among the Greeks: in which, ſays a great critic of our own nation, "The faults of the ſcribes are found ſo numerous, and the defects ſo beyond all redreſs, that notwithſtanding the pains of the learned and moſt acute critics for two whole centuries, theſe books ſtill are, and are like to continue, a mere heap of errors." No ancient author but Priſcian makes mention of Paterculus: the moderns have done him infinitely more juſtice, and have illuſtrated him with notes and commentaries. He was firſt publiſhed, from the manuſcript of Morbac, by Rhenanus, at Baſil in 1520: afterwards by Lipſius at Leyden in 1581; then by Gerard Voſſius in 1639; next by Boeclerus at Straſburg in 1642; then by Thyſius and others; and, laſtly, by Peter Burman at Leyden, 1719, in 8vo. To the Oxford edition in 1693, 8vo, were prefixed the *Annales Velleiani* of Mr Dodwell, which ſhow deep learning and a great knowledge of antiquity.

PATH, in general, denotes the courſe or track marked out or run over by a body in motion.

For the path of the moon, &c. ſee Astronomy, n° 359, 360.

PATHETIC, whatever relates to the paſſions, or that is proper to excite or awake them. The word comes from the Greek πάθος, *paſſion* or *emotion*. See Passion.

Pathetic, in muſic, ſomething very moving, expreſſive, or paſſionate; capable of exciting pity, compaſſion, anger, or other paſſions. Thus we ſpeak of the pathetic ſtyle, a pathetic figure, pathetic ſong, &c. The chromatic genus, with its greater and leſſer ſemitones, either aſcending or deſcending, is very proper for the pathetic; as is alſo an artful management of diſcords; with a variety of motions, now briſk, now languiſhing, now ſwift, now ſlow.

Pathognemonic ‖ Patience.

Nieuwentyt ſpeaks of a muſician at Venice who ſo excelled in the pathetic, that he was able to play any of his auditors into diſtraction: he ſays alſo, that the great means he made uſe of was the variety of motions, &c.

PATHOGNOMONIC, among phyſicians, an appellation for a ſymptom, or concourſe of ſymptoms, that are inſeparable from a diſtemper, and are found in that only, and in no other.

PATHOLOGY, that part of medicine which explains the nature of diſeaſes, their cauſes and ſymptoms. See Medicine.

PATHOS, a Greek term, literally ſignifying paſſion.

PATHROS, a city and canton of Egypt, of which the prophets Jeremiah and Ezekiel make mention; Jerem. xliv. 1. 15. Ezek. xxix. 14. xxx. 14. We do not very well know its ſituation, though Pliny and Ptolemy the geographer ſpeak of it by the name of Phaturis; and it appears to have been in Upper Egypt. Iſaiah (xii. 2.) calls it Pathros; and it is the country of the Pathruſim, the poſterity of Mizraim, of whom Moſes ſpeaks, Gen. x. 14. Ezekiel threatens them with an entire ruin. The Jews retired thither notwithſtanding the remonſtrances of Jeremiah; and the Lord ſays by Iſaiah, that he will bring them back from thence.

PATIENCE, that calm and unruffled temper with which a good man bears the evils of life, from a conviction that they are at leaſt permitted, if not ſent, by the beſt of Beings, who makes all things work together for good to thoſe who love and fear him.

The evils by which life is embittered may be reduced to theſe four: 1. Natural evils, or thoſe to which we are by nature ſubject as men, and as periſhable animals. The greateſt of theſe are, the death of thoſe whom we love, and of ourſelves. 2. Thoſe from which we might be exempted by a virtuous and prudent conduct, but which are the inſeparable conſequences of imprudence or vice, which we ſhall call puniſhments; as infamy proceeding from fraud, poverty from prodigality, debility and diſeaſe from intemperance. 3. Thoſe by which the fortitude of the good are exerciſed; ſuch as the perſecutions raiſed againſt them by the wicked. To theſe may be added, 4. The oppoſition againſt which we muſt perpetually ſtruggle, ariſing from the diverſity of ſentiments, manners, and characters of the perſons among whom we live.

Under all theſe evils patience is not only neceſſary but uſeful: it is neceſſary, becauſe the laws of nature have made it a duty, and to murmur againſt natural events is to affront providence; it is uſeful, becauſe it renders our ſufferings lighter, ſhorter, and leſs dangerous.

Is your reputation ſullied by invidious calumnies? rejoice that your character cannot ſuffer but by falſe imputations. You are arraigned in a court of judicature, and are unjuſtly condemned: paſſion has influenced both your proſecutor and your judge, and you cannot forbear repining that you ſuffer although innocent.

Patience. nocent. But would it have been better that you should have suffered being guilty? Would the greatest misfortune that can befal a virtuous man be to you a consolation? The opulence of a villain, the elevated station to which he is raised, and the honours that are paid to him, excite your jealousy, and fill your bosom with repinings and regret. What! say you, are riches, dignity, and power, reserved for such wretches as this? Cease these groundless murmurs. If the possessions you regret were real benefits, they would be taken from the wicked and transferred to you. What would you say of a successful hero, who, having delivered his country, should complain that his services were ill requited, because a few sugar-plums were distributed to some children in his presence, of which they had not offered him a share? Ridiculous as this would appear, your complaints are no better founded. Has the Lord of all no reward to confer on you but perishable riches and empty precarious honour?

It is fancy, not the reason of things, that makes life so uneasy to us. It is not the place nor the condition, but the mind alone, that can make any body happy or miserable.

He that values himself upon conscience, not opinion, never heeds reproaches. When we are evil spoken of, if we have not deserved it, we are never the worse; if we have, we should mend.

Tiberius the Roman emperor, at the beginning of his reign, acted in most things like a truly generous, good natured, and clement prince. All slanderous reports, libels, and lampoons upon him and his administration, he bore with extraordinary patience; saying, "That in a free state the thoughts and tongues of every man ought to be free:" and when the senate would have proceeded against some who had published libels against him, he would not consent to it; saying, "We have not time enough to attend to such trifles: if you once open a door to such informations, you will be able to do nothing else; for under that pretence every man will revenge himself upon his enemies by accusing them to you." Being informed that one had spoken detractingly of him: "If he speaks ill of me," says he, "I will give him as good an account of my words and actions as I can; and if that is not sufficient, I will satisfy myself with having as bad an opinion of him as he has of me." Thus far even Tiberius may be an example to others.

Men will have the same veneration for a person that suffers adversity without dejection, as for demolished temples, the very ruins whereof are reverenced and adored.

A virtuous and well-disposed person, is like to good metal; the more he is fired, the more he is refined; the more he is opposed, the more he is approved: wrongs may well try him and touch him, but cannot imprint in him any false stamp.

The man therefore who possesses this virtue (patience), in this ample sense of it, stands upon an eminence, and sees human things below him: the tempest indeed may reach him; but he stands secure and collected against it upon the basis of conscious virtue, which the severest storms can seldom shake, and never overthrow.

Patience, however, is by no means incompatible with sensibility, which, with all its inconveniences, is to be cherished by those who understand and wish to maintain the dignity of their nature. To feel for others, disposes us to exercise the amiable virtue of charity, which our religion indispensably requires. It constitutes that enlarged benevolence which philosophy inculcates, and which is indeed comprehended in Christian charity. It is the privilege and the ornament of man; and the pain which it causes is abundantly recompensed by that sweet sensation which ever accompanies the exercise of beneficence. Patience || Patin.

To feel our own misery with full force is not to be deprecated. Affliction softens and improves the heart. Tears, to speak in the style of figure, fertilize the soil in which the virtues grow. And it is the remark of one who understood human nature, that the faculties of the mind, as well as the feelings of the heart, are meliorated by adversity.

But in order to promote these ends, our sufferings must not be permitted to overwhelm us. We must oppose them with the arms of reason and religion; and to express the idea in the language of the philosopher, as well as the poet, of Nature, every one, while he is compelled to feel his misfortunes like a man, should resolve also to bear them like a man.

Resign'd in ev'ry state,
With patience bear, with prudence push your fate;
By suffering well our fortune we subdue,
Fly when she frowns, and when she calls pursue.

PATIGUMO (a corruption of the words *pate-de-guimauve)*; the name of a sort of paste or cakes much used on the continent as an agreeable and useful remedy for catarrhal defluxions, and supposed by Dr Percival to consist of gum-arabic combined with sugar and the whites of eggs (see the article HUNGER, p. 715, col. 1.) But we have been informed that the powdered substance of the marshmallow is the chief ingredient of the composition.

PATIN (Guy), professor of physic in the royal college of Paris, was born in 1602. He made his way into the world merely by the force of his genius, being at first corrector of a printing-house. He was a man of great wit and erudition: he spoke with the gravity of a Stoic, but his expressions were very satirical. He hated bigotry, superstition, and knavery; had an upright soul, and a well-disposed heart. He was a most tender father, courteous to every body, and polite in the highest degree. He died in 1672, and did not owe his reputation to any writings published in his lifetime upon physic; but his letters which appeared after his death have rendered his name very famous. He left a son mentioned in the ensuing article.

PATIN (Charles), who made a great figure in the world, and excelled in the knowledge of medals. He was born in Paris in 1633; and made so surprising a progress, that he maintained theses in Greek and Latin, on all parts of philosophy, in 1647. He studied the law in compliance to an uncle, and was admitted an advocate in the parliament of Paris; but could not lay aside that of physic, for which he always had an inclination. He therefore quitted the law, and devoted himself to physic; in which, after taking the doctor's degree, he applied himself to practice with great success. He afterwards travelled into Germany, Holland, England, Switzerland, and Italy. In 1676 he was appointed

Patkul. appointed profeſſor of phyſic in Padua; and three years after was created a knight of St Mark. He died in that city in 1694. His works are many, and well known to the learned world. His wife too, and his daughters, were authoreſſes.

PATKUL (John Reinhold), was born of a noble family in Livonia, a northern province belonging to the crown of Sweden. The Livonians having been ſtript of their privileges, and great part of their eſtates, by Charles XI. Patkul was deputed to make their complaint; which he did with ſuch eloquence and courage, that the king, laying his hand upon his ſhoulder, ſaid, 'You have ſpoken for your country as a brave man ſhould, and I eſteem you for it.'

Charles, however, who added the baſeneſs of hypocriſy to the ferocity of a tyrant, was determined to puniſh the zeal and honeſty which he thought fit to commend; and a few days afterwards cauſed Patkul to be declared guilty of high treaſon, and condemned to die. Patkul, however, found means to eſcape into Poland, where he continued till Charles was dead. He hoped that his ſentence would have been then reverſed, as it had been declared unjuſt even by the tyrant that procured it: but being diſappointed in this expectation, he applied to Auguſtus king of Poland, and ſolicited him to attempt the conqueſt of Livonia from the Swedes; which, he ſaid, might be eaſily effected, as the people were ready to ſhake off their yoke, and the king of Sweden was a child incapable of compelling their ſubjection.

Auguſtus poſſeſſed himſelf of Livonia in conſequence of this propoſal; and afterwards, when Charles XII. entered the province to recover it, Patkul commanded in the Saxon army againſt him. Charles was victorious; and Patkul, ſome time afterwards, being diſguſted at the haughty behaviour of General Fleming, Auguſtus's favourite, entered into the ſervice of the Czar, with whom Auguſtus was in ſtrict alliance, and a little before Charles compelled Auguſtus to abdicate the throne of Poland, and his ſubjects to elect Staniſlaus in his ſtead. The Czar ſent Patkul, with the title of his ambaſſador, into Saxony, to prevail with Auguſtus to meet him at Grodno, that they might confer on the ſtate of their affairs. This conference took place; and immediately afterwards the Czar went from Grodno to quell a rebellion in Aſtracan. As ſoon as the Czar was gone, Auguſtus, to the ſurpriſe of all Europe, ordered Patkul, who was then at Dreſden, to be ſeized as a ſtate criminal. By this injurious and unprecedented action, Auguſtus at once violated the law of nations, and weakened his own intereſt; for Patkul was not only an ambaſſador, but an ambaſſador from the only power that could afford him protection. The cauſe, however, was this: Patkul had diſcovered that Auguſtus's miniſters were to propoſe a peace to Charles upon any terms; and had therefore formed a deſign to be beforehand with them, and procure a ſeparate peace between Charles and his new maſter the Czar. The deſign of Patkul was diſcovered; and, to prevent its ſucceſs, Auguſtus ventured to ſeize his perſon, aſſuring the Czar that he was a traitor, and had betrayed them both.

Auguſtus was ſoon after reduced to beg a peace of Charles at any rate; and Charles granted it upon certain conditions, one of which was, that he ſhould deliver up Patkul. This condition reduced Auguſtus to a very diſtreſsful dilemma: the Czar, at this very time, reclaimed Patkul as his ambaſſador; and Charles demanded, with threats, that he ſhould be put into his hands. Auguſtus therefore contrived an expedient by which he hoped to ſatisfy both: he ſent ſome guards to deliver Patkul, who was priſoner in the caſtle of Konigſtein, to the Swediſh troops; but by ſecret orders, privately diſpatched, he commanded the governor to let him eſcape. The governor, though he received this order in time, yet diſappointed its intention by his villainy and his avarice. He knew Patkul to be very rich; and having it now in his power to ſuffer him to eſcape with impunity, he demanded of Patkul a large ſum for the favour: Patkul refuſed to buy that liberty which he made no doubt would be gratuitouſly reſtored, in conſequence of the Czar's requiſition and remonſtrance; and, in the mean time, the Swediſh guards arrived with the order for his being delivered up to them. By this party he was firſt carried to Charles's head quarters at Altranſtadt, where he continued three months, bound to a ſtake with a heavy chain of iron. He was then conducted to Caſimir, where Charles ordered him to be tried; and he was by his judges found guilty. His ſentence depended upon the king; and after having been kept a priſoner ſome months, under a guard of Mayerfeldt's regiment, uncertain of his fate, he was, on the 8th of September 1707, towards the evening, delivered into the cuſtody of a regiment of dragoons, commanded by Colonel Nicholas Hielm. On the next day, the 29th, the colonel took the chaplain of his regiment aſide, and telling him that Patkul was to die the next day, ordered him to acquaint him with his fate, and prepare him for it. About this very time he was to have been married to a Saxon lady of great quality, virtue, and beauty, a circumſtance which renders his caſe ſtill more affecting. What followed in conſequence of the colonel's order to the miniſter (A) will be related in his own words.

Patkul.

"Immediately after evening ſervice I went to his priſon, where I found him lying on his bed. The firſt compliments over, I entered upon the melancholy duty of my profeſſion, and turning to the officer who had him in charge, told him the colonel's orders were, that I ſhould be alone with his priſoner. The officer having withdrawn, Patkul graſping both my hands in his, cried out with moſt affecting anxiety and diſtreſs, My dear paſtor! what are you to declare? what am I to hear? I bring you, replied I, the ſame tidings that the prophet brought to king Hezekiah, *Set thine houſe in order, for thou muſt die.* To morrow by this time thou ſhalt be no longer in the number of the living! At this terrible warning he bowed himſelf upon his bed, and burſt into tears. I attempted to comfort him, by ſaying that he muſt, without all doubt, have often meditated on this ſubject: Yes, cried he, I know, alas! too well, that we muſt all die; but the death prepared for me will be cruel and inſupportable. I aſſured him that the manner of his death

(A) The name of this clergyman was Lorens Hagar.

Patkul. death was to me totally unknown; but, believing that he would be prepared for it, I was sure his soul would be received into the number of happy spirits. Here he rose up, and folding his hands together, Merciful Jesus! let me then die the death of the righteous! A little after, with his face inclined to the wall, where stood his bed, he broke out into this soliloquy: Augustus! O Augustus, what must be thy lot one day! Must thou not answer for all the crimes thou hast committed? He then observed that he was driven out from his country, by a sentence against his life, pronounced for doing what the king himself encouraged him to do, saying to him one day in terms of much kindness, 'Patkul, maintain the rights of your country like a man of honour, and with all the spirit you are capable of.' That flying into an enemy's country was also unavoidable, as the country of an ally would not have afforded him protection; but that he was in Saxony a wretched exile, not a counsellor or adviser; that before his arrival every thing was already planned, the alliance with Muscovy signed, and the measures with Denmark agreed upon. 'My inclination (said he, after a pause) were always to serve Sweden, though the contrary opinion has prevailed. The elector of Brandenburg owed his title of *king of Prussia* to the services I did him; and when, in recompense, he would have given me a considerable sum of money, I thanked him, and rejected the offer; adding, that the reward I most wished for was to regain the king of Sweden's favour by his intercession. This he promised, and tried every possible method to succeed, but without success. After this I laboured so much for the interest of the late emperor in his Spanish affairs, that I brought about what scarce any other man could have effected. The emperor as an acknowledgment gave me an assignment for 50,000 crowns, which I humbly laid at his feet, and only implored his imperial majesty's recommendation of me to my king's favour: this request he immediately granted, and gave his orders accordingly, but in vain. Yet, not to lose any opportunity, I went to Moscow while the Swedish ambassadors were at that court; but even the mediation of the Czar had no effect. After that I distributed among the Swedish prisoners at Moscow at least 100,000 crowns, to show the ardent desire I had, by all ways, to regain the favour of their sovereign. Would to heaven I had been equally in earnest to obtain the grace of God.'—At these words another shower of tears fell from his eyes, and he remained for some moments silent, and overwhelmed with grief. I used my best endeavours to comfort him with the assurance that this grace would not be denied him, provided he spent the few hours still left in earnestly imploring it; for the door of heaven's mercy was never shut, though that of men might be cruelly so. 'This (replied he), this is my consolation; for thou art God and not man to be angry for ever.' He then inveighed bitterly against Augustus, and reproached himself for having any connection with a wretch who was wholly destitute of all faith and honour, an atheist, without piety, and without virtue. 'While he was at Warsaw (said he), and heard the king was advancing to attack him, he found himself extremely distressed. He was absolutely without money, and therefore obliged to dismiss some of his troops. He had recourse to my assistance, and intreated me, for the love of God, to borrow whatever sum I could. I procured him 400,000 crowns; 50,000 of which, the very next day, he squandered on trinkets and jewels, which he gave in presents to some of his women. I told him plainly my thoughts of the matter; and by my importunity prevailed, that the Jews should take back their toys, and return the money they had been paid for them. The ladies were enraged; and he swore that I should one time or other suffer for what I had done: there indeed he kept his word; would to God he had always done so with these he employed!' I now left him for a short time, and at seven in the evening I returned; and the officer being retired, he accosted me with a smiling air, and an appearance of much tranquillity, 'Welcome, dear sir, the weight that lay heavy on my heart is removed, and I already feel a sensible change wrought in my mind. I am ready to die: death is more eligible than the solitude of a long imprisonment. Would to heaven only that the kind of it were less cruel. Can you, my dear sir, inform me in what manner I am to suffer? I answered, that it had not been communicated to me; but that I imagined it would pass over without noise, as only the colonel and myself had notice of it. 'That (replied he) I esteem as a favour; but have you seen the sentence? or must I die, without being either heard or condemned? My apprehensions are of being put to intolerable tortures.' I comforted him in the kindest manner I could; but he was his own best comforter from the Word of God, with which he was particularly acquainted; quoting, among many other passages, the following in Greek, *We must enter into the kingdom of heaven through many tribulations.* He then called for pen and ink, and intreated me to write down what he should dictate. I did so, as follows:

'*Testamentum, or my last will as to the disposition of my effects after my death.*—1. His majesty King Augustus, having first examined his conscience thoroughly, will be so just as to pay back to my relations the sum he owes me; which, being liquidated, will amount to 50,000 crowns; and as my relations are here in the service of Sweden, that monarch will probably obtain it for them.'

"At this he said, let us stop here a little; I will quickly return to finish this will; but now let us address ourselves to God by prayer. Prayers being ended, 'Now (cried he) I find myself yet better, yet in a quieter frame of mind: Oh! were my death less dreadful, with what pleasure would I expiate my guilt by embracing it!—Yes (cried he, after a pause), I have friends in different places, who will weep over my deplorable fate. What will the mother of the king of Prussia say? What will be the grief of the Countess Levolde who attends on her? But what thoughts must arise in the bosom of *her* to whom my faith is plighted? Unhappy woman! the news of my death will be fatal to her peace of mind. My dear pastor, may I venture to beg one favour of you?' I assured him he might command every service in my power. 'Have the goodness then (said he, pressing my hand), the moment I am no more, to write—Alas! how will you set about it? a letter to Madam Einsiedlern, the lady I am promised to—Let her know that I die her's; inform her fully of my unhappy fate! Send her my last Patkul.

Patkul. last and eternal farewel! My death is in truth disgraceful; but my manner of meeting it will, I hope, by heaven's and your assistance, render it holy and blessed. This news will be her only consolation. Add farther, dear Sir, that I thanked her with my latest breath for the sincere affection she bore me: May she live long and happy: This is my dying wish.'—I gave him my hand in promise that I would faithfully perform all he desired.

"Afterwards he took up a book: 'This (said he) is of my own writing. Keep it in remembrance of me, and as a proof of my true regard for religion. I could wish it might have the good fortune to be presented to the king, that he may be convinced with what little foundation I have been accused of atheism.' Taking it from his hand, I assured him that my colonel would not fail to present it as soon as opportunity offered.

"The rest of his time was employed in prayer, which he went through with a very fervent devotion. On the 30th of September I was again with him at four in the morning. The moment he heard me he arose, and rendering thanks to God, assured me he had not slept so soundly for a long time. We went to prayers; and in truth his piety and devout frame of mind were worthy of admiration. About six he said he would begin his confession, before the din and clamour of the people without could rise to disturb his thoughts. He then kneeled down, and went through his confession in a manner truly edifying. The sun beginning to appear above the horizon, he looked out of the window, saying, *Salve festa dies!* 'This is my wedding-day. I looked, alas! for another, but this is the happier: for to-day shall my soul be introduced by her heavenly bridegroom into the assembly of the blessed!' He then asked me, whether I yet knew in what way he was to die? I answered, that I did not. He conjured me, by the sacred name of Jesus, not to forsake him; for that he should find in my company some consolation even in the midst of tortures. Casting his eye on the paper that lay on the table, 'This will (said he) can never be finished.' I asked him, whether he would put his name to what was already written? 'No (replied he, with a deep sigh), I will write that hated name no more. My relations will find their account in another place; salute them from me.' He then addressed himself again to God in prayer, and continued his devotions till the lieutenant entered to conduct him to the coach. He wrapped himself up in his cloak, and went forward a great pace, guarded by 100 horsemen. Being arrived at the place of execution, we found it surrounded by 300 foot soldiers; but at the sight of the flakes and wheels, his horror is not to be described. Clasping me in his arms, 'Beg of God (he exclaimed) that my soul may not be thrown into despair amidst these tortures! I comforted, I adjured him, to fix his thoughts on the death of Jesus Christ, who for our sins was nailed to a cross.

"Being now on the spot where he was to suffer, he bid the executioner to do his duty well, and put into his hands some money which he got ready for that purpose. He then stretched himself out upon the wheel; and while they were stripping him naked, he begged me to pray that God would have mercy on him, and bear up his soul in agony. I did so; and turning to all the spectators, said to them, Brethren, join with me in prayer for this unhappy man. 'Yes (cried he), assist me all of you with your supplications to heaven.' Here the executioner gave him the first stroke. His cries were terrible: 'O Jesus! Jesus! have mercy upon me.' This cruel scene was much lengthened out, and of the utmost horror; for as the headsman had no skill in his business, the unhappy victim received upwards of 15 several blows, with each of which were intermixed the most piteous groans and invocations of the name of God. At length, after two strokes given on the breast, his strength and voice failed him. In a faltering dying tone, he was just heard to say, 'Cut off my head!' and the executioner still lingering, he himself placed his head on the scaffold: After four strokes with an hatchet, the head was separated from the body, and the body quartered. Such was the end of the renowned Patkul."

Patkul, Patmos.

Charles XII. has been very generally and severely censured for not pardoning him, and we are not inclined to vindicate the sovereign. Yet it must be remembered, that Patkul was guilty of a much greater crime than that which drew upon him the displeasure of Charles XI. He incited foreign powers to attack his country when under the government of a boy, hoping, as he said himself, that it would in such circumstances become an easy conquest. He was therefore a rebel of the worst kind; and where is the absolute monarch that is ready to pardon such unnatural rebellion? Let it be remembered, too, that Charles, among whose faults no other instance of cruelty has been numbered, certainly thought that, in ordering the execution of Patkul, he was discharging his duty. That monarch, it is known, believed in the possibility of discovering the philosopher's stone. Patkul, when under sentence of death, contrived to impose so far upon the senate at Stockholm, as to persuade them that he had, in their presence, converted into gold a quantity of baser metal. An account of this experiment was transmitted to the king, accompanied with a petition to his majesty for the life of so valuable a subject; but Charles, blending magnanimity with his severity, replied with indignation, that he would not grant to interest what he had refused to the calls of humanity and the intreaties of friendship.

PATMOS (anc. geog.), one of the Sporades (Dionysius); 30 miles in compass (Pliny); concerning which we read very little in authors. It was rendered famous by the exile of St John and the Revelation showed him there. The greatest part of interpreters think that St John wrote them in the same place during the two years of his exile; but others think that he did not commit them to writing till after his return to Ephesus. The island of Patmos is between the island of Icaria and the promontory of Miletus. Nothing has done it more honour than to have been the place of the banishment of St John. It is now called *Patino*, or *Pactino*, or *Patmol*, or *Palmosa*. Its circuit is five and twenty or thirty miles. It has a city called *Patmos*, with a harbour, and some monasteries of Greek monks. It is at present in the hands of the Turks. It is considerable for its harbours; but the inhabitants derive little benefit from them, because the corsairs have obliged them to quit the town and retire to a hill on which St John's convent stands. This convent is a citadel consisting of several irregular towers, and is a

Patna ‖ Patræ.

substantial building seated on a very steep rock. The whole island is very barren, and without wood; however, it abounds with partridges, rabbits, quails, turtles, pigeons, and snipes. All their corn does not amount to 1000 barrels in a year. In the whole island there are scarce 300 men: but there are above 20 women to one man, who expect that all strangers who land in the island should carry some of them away. To the memory of St John is an hermitage on the side of a mountain, where there is a chapel not above eight paces long and five broad. Over head they show a chink in the rock, through which they pretend that the Holy Ghost dictated to St John. E. Long. 26. 84. N. Lat. 37. 24.

PATNA, a town of Asia, in the dominions of the Great Mogul, to the north of the kingdom of Bengal, where the English have factories for saltpetre, borax, and raw silk. It is the capital of the province of Bahar, a dependency of Bengal, in the empire of Indostan, situated in a pleasant country, 400 miles east of Agra. It extends seven miles in length on the banks of the Ganges, and is about half a mile in breadth.—Mr Rennel gives strong reasons for supposing it to be the ancient PALIBOTHRA. The town is large and populous, but the houses are built at a distance from each other. E. Long. 85. 40. N. Lat. 45. 25.

PATOMACK, a large river of North America, in Virginia, which rises in the Alleghany mountains, separates Virginia from Maryland, and falls into Chesapeak bay. It is about seven miles broad, and is navigable for near 200 miles.

PATONCE, in heraldry, is a cross, flory at the ends; from which it differs only in this, that the ends, instead of turning down like a fleur-de-lis, are extended somewhat in the pattee form. See FLORY.

PATRÆ, a city of Achaia. This place was visited by Dr Chandler, who gives the following account of it. "It has been often attacked by enemies, taken, and pillaged. It is a considerable town, at a distance from the sea, situated on the side of a hill, which has its summit crowned with a ruinous castle. This made a brave defence in 1447 against Sultan Morat, and held out until the peace was concluded, which first rendered the Morea tributary to the Turks. A dry flat before it was once the port, which has been choked with mud. It has now, as in the time of Strabo, only an indifferent road for vessels. The house of Nicholas Paul, Esq; the English consul, stood on part of the wall either of the theatre or the odéum. By a fountain was a fragment of a Latin inscription. We saw also a large marble bust much defaced; and the French consul showed us a collection of medals. We found nothing remarkable in the citadel. It is a place of some trade, and is inhabited by Jews as well as by Turks and Greeks. The latter have several churches. One is dedicated to St Andrew the apostle, who suffered martyrdom there, and is of great sanctity. It had been recently repaired. The site by the sea is supposed that of the temple of Ceres. By it is a fountain. The air is bad, and the country round about over-run with the low shrub called *glycyrrhiza* or liquorice."

Of its ancient state, the same author speaks thus: "Patræ assisted the Ætolians when invaded by the Gauls under Brennus; but afterwards was unfortunate, reduced to extreme poverty, and almost abandoned. Augustus Cæsar reunited the scattered citizens, and made it a Roman colony, settling a portion of the troops which obtained the victory of Actium, with other inhabitants from the adjacent places. Patræ reflourished and enjoyed dominion over Naupactus, Œanthéa, and several cities of Achaia. In the time of Pausanias, Patræ was adorned with temples and porticoes, a theatre, and an odéum which was superior to any in Greece but that of Atticus Herodes at Athens. In the lower part of the city was a temple of Bacchus Æsymnetes, in which was an image preserved in a chest, and conveyed, it was said, from Troy by Eurypylus; who, on opening it, became disordered in his senses. By the port were temples; and by the sea, one of Ceres, with a pleasant grove and a prophetic fountain of unerring veracity in determining the event of any illness. After supplicating the goddess with incense, the sick person appeared, dead or living, in a mirror suspended so as to touch the surface of the water. In the citadel of Patræ was a temple of Diana Laphria, with her statue in the habit of a huntress of ivory and gold, given by Augustus Cæsar when he laid waste Calydon and the cities of Ætolia to people Nicopolis. The Patrensians honoured her with a yearly festival, which is described by Pausanias who was a spectator. They formed a circle round the altar with pieces of green wood, each 16 cubits long, and within heaped dry fuel. The solemnity began with a most magnificent procession, which was closed by the virgin-priestess in a chariot drawn by stags. On the following day, the city and private persons offered at the altar fruits, and birds, and all kinds of victims, wild-boars, stags, deer, young wolves, and beasts full grown; after which the fire was kindled. He relates, that a bear and another animal forced a way through the fence, but were reconducted to the pile. It was not remembered that any wound had ever been received at this ceremony, though the spectacle and sacrifice were as dangerous as savage. The number of women at Patræ was double that of the men. They were employed chiefly in a manufacture of flax which grew in Elis, weaving garments, and attire for the head."

Patræ ‖ Patrica.

PATRANA, or PASTRANA, a town of New Castile in Spain, with the title of a duchy. It is seated between the rivers Tajo and Tajuna, in W. Long. 2. 45. N. Lat. 40. 26.

PATRAS, an ancient and flourishing town of European Turkey, in the Morea, capital of a duchy, with a Greek archbishop's see. It is pretty large and populous; and the Jews, who are one-third part of the inhabitants, have four synagogues. There are several handsome mosques and Greek churches. The Jews carry on a great trade in silk, leather, honey, wax, and cheese. There are cypress trees of a prodigious height, and excellent pomegranates, citrons, and oranges. It has been several times taken and retaken, and it is just now in the hands of the Turks. It is seated in E. Long. 21. 45. N. Lat. 38. 17.

PATRICA, a town of Italy, in the territory of the church, and in the Campagna of Rome, towards the sea-coast, and eight miles east of Ostia. About a mile from this place is a hill called *Monte de Livano*, which some have thought to be the ancient Lavinium founded by Æneas.

PATRES

Patres, Patriarch.

PATRES CONSCRIPTI. See CONSCRIPT and SENATOR.

PATRIARCH, PATRIARCHA, one of thoſe firſt fathers who lived towards the beginning of the world, and who became famous by their long lines of deſcendants. Abraham, Iſaac, and Jacob, and his twelve ſons, are the patriarchs of the Old Teſtament; Seth, Enoch, &c. were antediluvian patriarchs,

The authority of patriarchal government exiſted in the fathers of families, and their firſt-born after them, exerciſing all kinds of eccleſiaſtical and civil authority in their reſpective houſeholds; and to this government, which laſted till the time of the Iſraelites dwelling in Egypt, ſome have aſcribed an abſolute and deſpotic power, extending even to the puniſhment by death. In proof of this, is produced the curſe pronounced by Noah upon Canaan (Gen. ix. 25.); but it muſt be obſerved, that in this affair Noah ſeems to have acted rather as a prophet than a patriarch. Another inſtance of ſuppoſed deſpotic power is Abraham's turning Hagar and Ithmael out of his family (Gen. xxi. 9, &c.); but this can hardly be thought to furniſh evidence of any ſingular authority veſted in the patriarchs, as ſuch, and peculiar to thoſe ages. The third inſtance brought forward to the ſame purpoſe is that of Jacob's denouncing a curſe upon Simeon and Levi (Gen. xlix. 7.), which is maintained by others to be an inſtance of prophetic inſpiration more than of patriarchal power. The fourth inſtance is that of Judah with regard to Tamar (Gen. xxxviii. 24.); with regard to which it is remarked, that Jacob, the father of Judah, was ſtill living; that Tamar was not one of his own family; and that ſhe had been guilty of adultery, the puniſhment of which was death by burning; and that Judah on this occaſion might ſpeak only as a proſecutor.

On the whole, however, it is difficult to ſay which of theſe opinions are moſt agreeable to truth. Men who believe the origin of civil government, and the obligation to obedience, to ariſe from a ſuppoſed original contract, either real or implied, will be naturally led to weaken the authority of the patriarchs: and thoſe again who eſteem government to be a divine inſtitution, will be as apt to raiſe that authority to the higheſt pitch that either reaſon or ſcripture will permit them. It cannot be denied, that authority exiſted in fathers, and deſcended to their firſt-born, in the firſt ages of the world; and it is neither unnatural nor improbable to imagine, that the idea of hereditary power and hereditary honours was firſt taken from this circumſtance. But whether authority has deſcended through father and ſon in this way to our times, is a circumſtance that cannot in one inſtance be aſſerted, and can be denied in a thouſand. The real ſource of the dignity and of the authority of modern times ſeems to have been, ſkill in the art of war, and ſucceſs in the conduct of conqueſts.

Jewiſh PATRIARCH, a dignity, reſpecting the origin of which there are a variety of opinions. The learned authors of the Univerſal Hiſtory think, that the firſt appearance and inſtitution of thoſe patriarchs happened under Nerva the ſucceſſor of Domitian. It ſeems probable that the patriarchs were of the Aaronic or Levitical race; the tribe of Judah being at that time too much depreſſed, and too obnoxious to the Romans to be able to aſſume any external power. But of whatever tribe they were, their authority came to be very conſiderable. Their principal buſineſs was to inſtruct the people; and for this purpoſe they inſtituted ſchools in ſeveral cities. And having gained great reputation for their extraordinary learning, zeal, and piety, they might, in time, not only bring a great concourſe of other Jews from other parts, as from Egypt and other weſtern provinces of their diſperſion, but likewiſe prove the means of their patriarchal authority's being acknowledged there. From them they ventured at length to levy a kind of tribute, in order to defray the charges of their dignity, and of the officers (A) under them, whoſe buſineſs it was to carry their orders and deciſions through the other provinces of their diſperſion, and to ſee them punctually executed by all, that ſome ſhadow of union at leaſt might be kept up among the weſtern Jews. They likewiſe nominated the doctors who were to preſide over their ſchools and academies; and theſe were in proceſs of time ſtyled *chiefs* and *princes*, in order to raiſe the credit of that dignity, or to imply the great regard which their diſciples were to pay to them. Theſe chiefs became at length rivals of the patriarchs; and ſome of them poſſeſſed both dignities at once; an uſurpation which cauſed not only great confuſion amongſt them, but oftentimes very violent and bloody conteſts. However, as the Jewiſh Rabbies have trumped up a much older era for this patriarchal dignity, and have given us a ſucceſſion of them down to the fifth century, in which it was aboliſhed, it will not be amiſs to give our readers the ſubſtance of what they have written of the riſe and progreſs of this order of men; and at the ſame time to ſhow them the abſurdity and falſehood of that pretended ſucceſſion to this imaginary dignity.

According to them, the firſt patriarch was Hillel, ſurnamed the *Babylonian*, becauſe he was ſent for from thence to Jeruſalem about 100 years before the ruin of their capital, or 30 years before the birth of Chriſt, to decide a diſpute about the keeping of Eaſter, which on that year fell out on the Sabbath-day; and it was on account of his wiſe deciſion that he was raiſed to that dignity, which continued in his family till the ſaid fifth century. He was likewiſe looked upon as a ſecond Moſes, becauſe he lived like him 40 years in obſcurity, 40 more in great reputation for learning and ſanctity, and 40 more in poſſeſſion of this patriarchal dignity. They make him little inferior to that lawgiver in other of his excellencies, as well as in the great authority he gained over the whole Jewiſh nation. The wonder will be, how Herod the Great, who was ſo jealous of his own power, could ſuffer a ſtranger to be raiſed to ſuch a height of it, barely for having decided a diſpute which muſt in all likelihood have been adjudged by others long before that time.

However, Hillel was ſucceeded by his ſon Simeon, whom many Chriſtians pretend to have been the venerable old perſon of that name, who received the divine infant in his arms. The Jews give him but a very.

(A) Theſe were called *Apoſtoli* or *Legati*.

Patriarch. very obſcure patriarchate; though the authors above quoted make him, moreover, chief of the ſanhedrim; and Epiphanius ſays, that the prieſtly tribe hated him ſo much for giving ſo ample a teſtimony to the divine child, that they denied him common burial. But it is hardly credible that St Luke ſhould have ſo careleſsly paſſed over his two-fold dignity, if he had been really poſſeſſed of them, and have given him no higher title than that of a juſt and devout man.

He was ſucceeded by Jochanan, not in right of deſcent, but of his extraordinary merit, which the Rabbies, according to cuſtom, have raiſed to ſo ſurpriſing a height, that, according to them, if the whole heavens were paper, all the trees in the world pens, and all the men writers, they would not ſuffice to pen down all his leſſons. He enjoyed his dignity but two years, according to ſome, or five according to others: and was the perſon who, obſerving the gates of the temple to open of their own accord, cried out, "O temple, temple! why art thou thus moved! We know that thou art to be deſtroyed, ſeeing Zechariah hath foretold it, ſaying, 'Open thy gates, O Lebanus, and let the flames conſume thy cedars.'" Upon this he is further reported to have complimented Veſpaſian, or rather, as ſome have corrected the ſtory, Titus, with the title of *king*, aſſuring him that it was a royal perſon who was to deſtroy that edifice; on which account they pretend that general gave him leave to remove the ſanhedrim to Japhne.

The Jewiſh writers add, that he likewiſe erected an academy there, which ſubſiſted till the death of Akiba; and was likewiſe the ſeat of the patriarch; and conſiſted of 300 ſchools, or claſſes of ſcholars. Another he erected at Lydda, not far from Japhne, and where the Chriſtians have buried their famed St George. He lived 120 years, and being aſked, what he had done to prolong his life? he gave this wiſe anſwer; I never made water nearer a houſe of prayer than four cubits: I never diſguiſed my name: I have taken care to celebrate all feſtivals: and my mother hath even ſold my head ornaments to buy wine enough to make me merry on ſuch days; and left me at her death 300 hogſheads of it, to ſanctify the Sabbath.—The doctors that flouriſhed in his time were no leſs conſiderable, both for their number and character; particularly the famed Rabbi Chanina, of whom the Bath Col was heard to ſay, that the world was preſerved for the ſake of him; and R. Nicodemus, whom they pretend to have ſtopped the courſe of the ſun, like another Joſhua.

He was ſucceeded by Gamaliel, a man, according to them, of unſufferable pride; and yet of ſo univerſal authority over all the Jews, not only in the weſt, but over the whole world, that the very monarchs ſuffered his laws to be obeyed in their dominions, not one of them offering to obſtruct the execution of them. In his days flouriſhed Samuel the Leſs, who compoſed a prayer full of the bitterſt curſes againſt heretics, by which they mean the Chriſtians; and which are ſtill in uſe to this day. Gamaliel was no leſs an enemy to them; and yet both have been challenged, the former as the celebrated maſter of our great apoſtle, the other as his diſciple in his unconverted ſtate.

Simon II. his ſon and ſucceſſor, was the firſt martyr who died during the ſiege of Jeruſalem. The people ſo regretted his death, that an order was given, inſtead of 10 bumpers of wine, which were uſually drank at the funeral of a ſaint, to drink 13 at his, on account of his martyrdom. Theſe bumpers were in time multiplied, they tell us, to ſuch ſhameful height, that the ſanhedrim was forced to make ſome new regulations to prevent that abuſe. Patriarch.

Theſe are the patriarchs which, the Rabbies tell us, preceded the deſtruction of the temple; and we need no farther confutation of this pretended dignity, than the ſilence of the ſacred hiſtorians, who not only make not the leaſt mention of it, but aſſure us all along that they were the high-prieſts who preſided in the ſanhedrim; and before whom all caſes relating to the Jewiſh religion were brought and decided. It was the high-prieſt who examined and condemned our Saviour; that condemned St Stephen; that forbad the apoſtles to preach in Chriſt's name; and who ſat as judge on the great apoſtle at the head of that ſupreme court. The ſame may be urged from Joſephus, who muſt needs have known and mentioned this pretended dignity, if any ſuch there had been; and yet is ſo far from taking the leaſt notice of it, that, like the evangeliſts, he places the pontiffs alone at the head of all the Jewiſh affairs; and names the high-prieſt Ananus as having the care and direction of the war againſt the Romans;—which is an evident proof that there were then no ſuch patriarchs in being.

To all this let us add, that if there had been any ſuch remarkable ſucceſſion, the Talmudiſts would have preſerved it to future ages; whereas, neither they, nor any of the ancient authors of the Jewiſh church, make any mention of it; but only ſome of their doctors, who have written a conſiderable time after them, as of writers to whom little credit can be given in points of this nature; eſpecially as there are ſuch unſurmountable contradictions between them, as no authors either Jewiſh or Chriſtian have, with all their pains, been hitherto able to reconcile.

Their ſucceſſion, according to the generality of thoſe rabbies ſtands as follows:

1. Hillel the Babylonian. 2. Simeon the ſon of Hillel. 3. Gamaliel the ſon of Simeon. 4. Simeon II. the ſon of Gamaliel. 5. Gamaliel II. the ſon of Simeon II. 6. Simeon III. the ſon of Gamaliel II. 7. Judah the ſon of Simeon III. 8. Gamaliel III. the ſon of Judah. 9. Judah II. the ſon of Gamaliel III. 10. Hillel II. ſon of Judah II. 11. Judah III. ſon of Hillel II. 12. Hillel III. ſon of Judah III. 13. Gamaliel IV. ſon of Hillel III.

According to Ganz Tzemach David, who hath reduced them to 10, they are,

1. Hillel the Babylonian. 2. Simeon the ſon of Hillel. 3. Rabb Gamaliel Rebona. 4. R. Simeon the ſon of Gamaliel. 5. Rabban Gamaliel his ſon. 6. R. Jehudah the prince. 7. Hillel the prince, his ſon. 8. Rabban Gamaliel the Old. 9. Simeon III. 10. R. Judah, Naſi or prince.

On the whole, it cannot be doubted but that their firſt riſe was in Nerva's time, however much Jewiſh pride may have prompted them to falſify, and to aſſert their origin to have been more ancient than it really was. Nor have the Jews been faithful in giving an account of the authority of theſe men. They have exaggerated their power beyond all bounds, for the purpoſe of repelling

Patriarchs. repelling the arguments of Chriſtians: for their power was certainly more ſhowy than ſubſtantial. In time, however, they certainly impoſed upon the people; and what power they did poſſeſs (which the Romans only allowed to be in religious matters, or in ſuch as were connected with religion) they exerciſed with great rigour. Their pecuniary demands, in particular, became very exorbitant; and was the cauſe of their ſuppreſſion in the year 429.

Patriarchs, among Chriſtians, are eccleſiaſtical dignitaries, or biſhops, ſo called from their paternal authority in the church. The power of patriarchs was not the ſame in all, but differed according to the different cuſtoms of countries, or the pleaſures of kings and councils. Thus the patriarch of Conſtantinople grew to be a patriarch over the patriarchs of Epheſus and Cæſarea, and was called the *œcumenical and univerſal patriarch;* and the patriarch of Alexandria had ſome prerogatives which no other patriarch but himſelf enjoyed, ſuch as the right of conſecrating and approving every ſingle biſhop under his juriſdiction.

The patriarchate has been ever eſteemed the ſupreme dignity in the church: the biſhop had only under him the territory of the city of which he was biſhop; the metropolitan ſuperintended a province, and had for ſuffragans the biſhops of his province; the primate was the chief of what was then called a *dioceſe* (A), and had ſeveral metropolitans under him; and the patriarch had under him ſeveral dioceſes, compoſing one exarchate, and the primates themſelves were under him.

Uſher, Pagi, De Marca, and Morinus, attribute the eſtabliſhment of the grand patriarchates to the apoſtles themſelves; who, in their opinion, according to the deſcription of the world then given by geographers, pitched on the three principal cities in the three parts of the known world; viz. Rome in Europe, Antioch in Aſia, and Alexandria in Africa: and thus formed a trinity of patriarchs. Others maintain that the name patriarch was unknown at the time of the council of Nice; and that for a long time afterwards patriarchs and primates were confounded together, as being all equally chiefs of dioceſes, and equally ſuperior to metropolitans, who were only chiefs of provinces. Hence Socrates gives the title patriarch to all the chiefs of dioceſes, and reckons ten of them. Indeed, it does not appear that the dignity of patriarch was appropriated to the five grand ſees of Rome, Conſtantinople, Alexandria, Antioch, and Jeruſalem, till after the council of Chalcedon in 451; for when the council of Nice regulated the limits and prerogatives of the three patriarchs of Rome, Antioch, and Alexandria, it did not give them the title of patriarchs, though it allowed them the pre-eminence and privileges thereof; thus when the council of Conſtantinople adjudged the ſecond place to the biſhop of Conſtantinople, who till then was only a ſuffragan of Heraclea, it ſaid nothing of the patriarchate. Nor is the term *patriarch* found in the decree of the council of Chalcedon, whereby the fifth place is aſſigned to the biſhop of Jeruſalem; nor did theſe five patriarchs govern all the churches. Patriarchs.

There were beſides many independent chiefs of dioceſes, who, far from owning the juriſdiction of the grand patriarchs, called themſelves *patriarchs;* ſuch as that of Aquileia; nor was Carthage ever ſubject to the patriarch of Alexandria. Moſheim * imagines that the biſhops, who enjoyed a certain degree of pre-eminence over the reſt of their order, were diſtinguiſhed by the Jewiſh title of patriarchs in the fourth century. The authority of the patriarchs gradually increaſed, till, about the cloſe of the fifth century, all affairs of moment within the compaſs of their patriarchate came before them, either at firſt hand or by appeals from the metropolitans. They conſecrated biſhops; aſſembled yearly in council the clergy of their reſpective diſtricts; pronounced a deciſive judgment in thoſe caſes where accuſations were brought againſt biſhops; and appointed vicars or deputies, clothed with their authority, for the preſervation of order and tranquillity in the remoter provinces. In ſhort, nothing was done without conſulting them; and their decrees were executed with the ſame regularity and reſpect as thoſe of the princes.

* *Eccleſ. Hiſt.* vol. 1. p. 284.

It deſerves to be remarked, however, that the authority of the patriarchs was not acknowledged through all the provinces without exception. Several diſtricts, both in the eaſtern and weſtern empires, were exempted from their juriſdiction. The Latin church had no patriarchs till the ſixth century; and the churches of Gaul, Britain, &c. were never ſubject to the authority of the patriarch of Rome, whoſe authority only extended to the ſuburbicary provinces. There was no primacy, no exarchate

(A) The word dioceſe was then of very different import from what it bears now. Under the article Episcopacy, it was obſerved, that the firſt founders of churches regulated their extent and the juriſdiction of their biſhops by the diviſions of the Roman empire into civil juriſdictions. One of theſe diviſions was into provinces and dioceſes. A province compriſed the cities of a whole region ſubjected to the authority of one chief magiſtrate, who reſided in the metropolis or chief city of the province. A dioceſe was a ſtill larger diſtrict, comprehending within it ſeveral provinces, ſubject to the controul of a chief magiſtrate, whoſe reſidence was in the metropolis of the dioceſe. The juriſdiction of the biſhops of the Chriſtian church was eſtabliſhed upon this model. The authority of a private biſhop extended only over the city in which he reſided, together with the adjacent villages and ſurrounding tract of country. This diſtrict was called παροικια, though it comprehended many pariſhes in the modern ſenſe of that word. Under Arcadius and Honorius the empire was divided into thirteen dioceſes: 1. The Oriental dioceſe, containing fifteen provinces; 2. The dioceſe of Egypt, ſix provinces; 3. The Aſiatic dioceſe, ten provinces; 4. The Pontic dioceſe, ten provinces; 5. The dioceſe of Thrace, ſix provinces; 6. The dioceſe of Macedonia, ſix provinces; 7. The dioceſe of Decia, five provinces; 8. The Italic dioceſe, ſeventeen provinces; 9. The dioceſe of Illyricum, ſix provinces; 10. The dioceſe of Africa, ſix provinces; 11. The Spaniſh dioceſe, ſeven provinces; 12. The Gallican dioceſe, ſeventeen provinces; 13. The Britannic dioceſe, five provinces. Each of theſe provinces comprehended many παροικιαι, and each παροικια many modern pariſhes. See *Bingham's Origines Sacræ*, Book ix.

Patriarchal || Patrick

archate nor patriarchate, owned here; but the biſhops, with the metropolitans, governed the church in common. Indeed, after the name patriarch became frequent in the weſt, it was attributed to the biſhops of Bourges and Lyons; but it was only in the firſt ſignification, viz. as heads of dioceſes. Du Cange ſays, that there have been ſome abbots who have borne the title of patriarchs.

PATRIARCHAL CROSS, in heraldry, is that where the ſhaft is twice croſſed; the lower arms being longer than the upper ones.

PATRICIAN, a title given, among the ancient Romans, to the deſcendants of the hundred, or, as ſome will have it, of the two hundred firſt ſenators choſen by Romulus; and by him called *patres*, "fathers." Romulus eſtabliſhed this order after the example of the Athenians; who were divided into two claſſes, viz. the εὐπατρίδας *patricios*, and δημοτικους *populares*. Patricians, therefore, were originally the nobility; in oppoſition to the plebeians. They were the only perſons whom Romulus allowed to aſpire to the magiſtracy; and they exerciſed all the functions of the prieſthood till the year of Rome 495. But the cognizance and character of theſe ancient families being almoſt loſt and extinguiſhed by a long courſe of years, and frequent changes in the empire, a new kind of patricians were afterwards ſet on foot, who had no pretenſions from birth, but whoſe title depended entirely on the emperor's favour. This new patriciate, Zozimus tells us, was erected by Conſtantine, who conferred the quality on his counſellors, not becauſe they were deſcended from the ancient fathers of the ſenate, but becauſe they were the fathers of the republic or of the empire. This dignity in time became the higheſt of the empire. Juſtinian calls it *ſummam dignitatem*. In effect, the patricians ſeem to have had the precedence of the *conſulares*, and to have taken place before them in the ſenate; though F. Faber aſſerts the contrary. What confounds the queſtion is, that the two dignities often met in the ſame perſon; becauſe the patriciate was only conferred on thoſe who had gone through the firſt offices of the empire, or had been conſuls. Pope Adrain made Charlemagne take the title of patrician before he aſſumed the quality of emperor; and other popes have given the title to other kings and princes by reaſon of its eminence.

PATRICIAN is alſo a title of honour often conferred on men of the firſt quality in the time of our Anglo-Saxon kings. See THANE.

Patrician Deities, *Patricii Dii*, in mythology, were Janus, Saturn, the Genius, Pluto, Bacchus, the Sun, the Moon, and the Earth.

PATRICIANS, in eccleſiaſtical writers, were ancient ſectaries, who diſturbed the peace of the church in the beginning of the third century: thus called from their founder *Patricius*, preceptor of a Marcionite called *Symmachus*. His diſtinguiſhing tenet was, that the ſubſtance of the fleſh is not the work of God, but that of the devil: on which account his adherents bore an implacable hatred to their own fleſh; which ſometimes carried them ſo far as to kill themſelves. They were alſo called TATIANITES, and made a branch of the ENCRATITÆ.

PATRICK (St), the apoſtle of Ireland, and ſecond biſhop of that country. He was born April 5th A. D. 373, of a good family, at Kirk Patric near Dumbarton, in what is now called Scotland, but then comprehended under the general name of Britain.—His baptiſmal name *Succath*, ſignifies, in the Britiſh language, "valiant in war." On ſome inroad of certain exiles from Ireland he was taken priſoner, and carried into that kingdom, where he continued ſix years in the ſervice of Milcho, who had bought him of three others, when Patric acquired the new name of *Cothraig*, or *Ceathar-Tigh*, i. e. *four families*. In this time he made himſelf maſter of the Iriſh language, and at laſt made his eſcape, and returned home on board a ſhip. About two years after, he formed a deſign of converting the Iriſh, either in conſequence of a dream, or of reflection on what he had obſerved during his acquaintance with them. The better to qualify himſelf for this undertaking, he travelled to the continent, where he continued 35 years, purſuing his ſtudies under the direction of his mother's uncle St Martin, biſhop of Tours, who had ordained him deacon; and after his death with St German, biſhop of Auxerre, who ordained him prieſt, and gave him his third name *Maxon* or *Maginim*. Patric

An ancient author, Henricus Antiſiodorenſis, who wrote a book concerning the miracles of St German, conſiders it as the higheſt honour of that prelate to have been the inſtructor of St Patrick: "As the glory of a father ſhines in the government of his ſons, out of the many diſciples in religion who are reported to have been his ſons in Chriſt; ſuffice it briefly to mention one by far the moſt famous, as the ſeries of his actions ſhows, Patrick the particular apoſtle of Ireland, who being under his holy diſcipline 18 years, derived no little knowledge in the inſpired writings from ſuch a ſource. The moſt godly divine pontiff, conſidering him alike diſtinguiſhed in religion, eminent for virtue, and ſtedfaſt in doctrine; and thinking it abſurd to let one of the beſt labourers remain inactive in the Lord's vineyard, recommended him to Celeſtine, Pope of Rome, by his preſbyter Segetius, who was to carry to the apoſtolic ſee a teſtimonial of eccleſiaſtical merit of this excellent man. Approved by his judgment, ſupported by his authority, and confirmed by his bleſſing, he ſet out for Ireland; and being peculiarly deſtined to that people as their apoſtle, inſtructed them at that time by his doctrine and miracles; and now does and will forever diſplay the wonderful power of his apoſtleſhip." Laſtly, Pope Celeſtine conſecrated him biſhop, and gave him his moſt familiar name *Patricius*, expreſſive of his honourable deſcent; and to give luſtre and weight to the commiſſion which he now charged him with to convert the Iriſh. Palladius had been here a year before him on the ſame deſign, but with little ſucceſs: the ſaints Kieran, Ailbe, Declan, and Ibar, were precurſors both to Palladius and Patrick. But the great office of apoſtle of Ireland was reſerved for our prelate, who landed in the country of the Evolein, or at Wicklow, A. D. 441. His firſt convert was Sinell, eighth in deſcent from Cormac king of Leinſter; but not meeting with encouragement, he proceeded to Dublin, and thence to Ulſter, where he founded a church (afterwards the famous abbey of Saul, in the county of Down), remarkable for its poſition, being made out of a barn, and its greateſt length reaching from north to ſouth. After labouring ſeven years indefatigably in his great work, he return-

Patrick. ed to Britain, which he delivered from the hereſies of Pelagius and Arius; engaged ſeveral eminent perſons to aſſiſt him; viſited the Iſle of Man, which he converted in 440, when the biſhopric was founded; and, A. D. 448 returned to the ſee of Armagh (A), which he had founded three years before; and in 13 years more completed the converſion of the whole iſland (B). After giving an account of his commiſſion at Rome, he once more returned hither, and ſpent the remainder of his life between the monaſteries of Armagh and Saul, ſuperintending and enforcing the great plan of doctrine and diſcipline which he had eſtabliſhed. After having eſtabliſhed ſchools, or an academy here, he cloſed his life and miniſtry at Saul abey, in the 120th year of his age, March 17. A. D. 493, and was buried at Down afterwards, in the ſame grave with St Brigot and St Columb, in the ſame place. Reſpecting his burial place, however, there have been great diſputes; and it has been as great a ſubject of debate with the religious, as Homer's birth-place was formerly among the cities of Greece. Thoſe of Down lay claim to it, on the authority of the following verſes:

Theſe three in Down lie in tomb one,
Briget, Patricius, and Columba pious.

Thoſe of Glaſtenbury in England, from the old monuments of their church: And ſome Scots affirm him to have been both born and buried among them at Glaſgow. His genuine works were collected and printed by Sir James Ware, 1656. His immediate ſucceſſor in this ſee was St Binen or Begnus.

Order of St PATRICK, an inſtitution which took place in Ireland in the year 1783. On the fifth of February, in that year, the king ordered letters patent to be paſſed under the great ſeal of the kingdom of Ireland, for creating a ſociety or brotherhood, to be called *knights of the illuſtrious order of St Patrick*, of which his majeſty, his heirs, and ſucceſſors, ſhall perpetually be ſovereigns, and his majeſty's lieutenant-general and general-governor of Ireland, &c. for the time being, ſhall officiate as grand-maſters; and alſo for appointing Prince Edward, and ſeveral of the prime nobility of Ireland, knights companions of the ſaid illuſtrious order.

PATRICK (Simon), a very learned Engliſh biſhop, was born at Gainſborough in Lincolnſhire in 1626. In 1644 he was admitted into Queen's college, Cambridge, and entered into holy orders. After being for ſome time chaplain to Sir Walter St John, and vicar of the church at Batterſea in Surry, he was preferred to the rectory of St Paul's, Covent-garden, in London, where he continued all the time of the plague in 1665 among his pariſhioners, to their great comfort. In 1668 he publiſhed his *Friendly Debate* between a Conformiſt and a Nonconformiſt. This was anſwered by the Diſſenters, whom he had much exaſperated by it; but by his moderation and candour toward them afterwards, they were perfectly reconciled to him, and he brought over many of them to the communion of the eſtabliſhed church. In 1678 he was made dean of Peterborough, where he was much beloved. In 1682, Dr Lewis de Moulin, who had been a hiſtory-profeſſor at Oxford, and written many bitter books againſt the church of England, ſent for Dr Patrick upon his ſick-bed, and made a ſolemn declaration of his regret on that account, which he ſigned, and it was publiſhed after his death. During the reign of King James, the dean's behaviour ſhowed that he had nothing more at heart than the Proteſtant religion; for which he ventured all that was dear to him, by preaching and writing againſt the errors of the church of Rome. In 1687 he publiſhed a prayer compoſed for that difficult time, when perſecution was expected by all who ſtood firm to their religion. The year after the Revolution, the dean was appointed biſhop of Chicheſter, and was employed with others of the new biſhops to ſettle the affairs of the church in Ireland. In 1691 he was tranſlated to the ſee of Ely, in the room of the deprived Biſhop Turner. He died in 1707, after having publiſhed various works; among which the moſt diſtinguiſhed are his Paraphraſes and Commentaries on the Holy Scriptures, three volumes folio. Theſe, with Lowth on the Proverbs, Arnold on the Apocrypha, and Whitby on the New Teſtament, make a regular continued commentary in Engliſh on all the ſacred books.

Patrick, Patrimony.

PATRIMONY, a right or eſtate inherited by a perſon from his anceſtors.

The term *patrimony* has been alſo given to church-eſtates or revenues; in which ſenſe authors ſtill ſay, the patrimony of the church of Rimini, Milan, &c. The church of Rome hath patrimonies in France, Africa, Sicily, and many other countries. To create the greater reſpect to the eſtates belonging to the church, it was uſual to give their patrimonies the names of the ſaints they held in the higheſt veneration: thus the eſtate of the church of Ravenna was called the *patrimony of St Apollinarius*; that of Milan, the *patrimony*

(A) At Armagh St Patrick founded, A. D. 445 or 447, a priory of Auguſtine canons, dedicated to St Peter and St Paul, much enriched by the archbiſhops; reſtored by Imar O Hedegan in the 12th century. It was granted, A. D. 1611, to Sir Toby Caulfield, knight. St Patrick alſo founded there a houſe of canoneſſes of the ſame order, under his ſiſter Lupita, called *Templena firta*, or the "houſe of miracles."

We are told, that Armagh was made a metropolitical ſee in honour of St Patrick; in conſequence of which it was held in the higheſt veneration not only by biſhops and prieſts, but alſo by kings and biſhops, as the venerable Bede informs us.

(B) There is a cave in the county of Donegal or Tir-connel, near the ſource of the Liffey, which, it is pretended, was dug by Ulyſſes, in order to hold converſations with infernals. The preſent inhabitants call it *Ellan n' Fradetory*, or the "Iſland of Purgatory, and Patrick's Purgatory." They affirm, with a pious credulity, that St Patrick the apoſtle of Ireland, or ſome abbot of that name, obtained of God by his earneſt prayers, that the pains and torments which await the wicked after this life might be here ſet forth to view, in order the more eaſily to recover the Iriſh from their ſinful ſtate and heatheniſh errors.

Patriotism. *of St Ambrose;* and the estates of the Roman church were called the *patrimony of St Peter in Abruzzo*, the *patrimony of St Peter in Sicily*, and the like.

What is now called *St Peter's patrimony* is only the duchy of Castro, and the territory of Orvietto. See Castro, &c.

PATRIOTISM, a love of one's country, which is one of the noblest passions that can warm and animate the human breast. It includes all the limited and particular affections to our parents, children, friends, neighbours, fellow-citizens, and countrymen. It ought to direct and limit their more confined and partial actions within their proper and natural bounds, and never let them encroach on those sacred and first regards we owe to the great public to which we belong. Were we solitary creatures, detached from the rest of mankind, and without any capacity of comprehending a public interest, or without affections leading us to desire and pursue it, it would not be our duty to mind it, nor criminal to neglect it. But as we are parts of the public system, and are not only capable of taking in large views of its interests, but by the strongest affections connected with it, and prompted to take a share of its concerns, we are under the most sacred ties to prosecute its security and welfare with the utmost ardour, especially in times of public trial.

"Zeal for the public good (says Mr Addison) is the characteristic of a man of honour and a gentleman, and must take place of pleasures, profits, and all other private gratifications: that whosoever wants this motive, is an open enemy, or an inglorious neuter to mankind, in proportion to the misapplied advantages with which nature and fortune have blessed him." This love of our country does not import an attachment to any particular soil, climate, or spot of earth, where perhaps we first drew our breath, though those natural ideas are often associated with the moral ones; and, like external signs or symbols, help to ascertain and bind them; but it imports an affection to that moral system or community, which is governed by the same laws and magistrates, and whose several parts are variously connected one with the other, and all united upon the bottom of a common interest. Wherever this love of our country prevails in its genuine vigour and extent, it swallows up all sordid and selfish regards; it conquers the love of ease, power, pleasure, and wealth; nay, when the amiable partialities of friendship, gratitude, private affection, or regards to a family, come in competition with it, it will teach us to sacrifice all, in order to maintain the rights, and promote and defend the honour and happiness of our country. To pursue therefore our private interests in subordination to the good of our country; to be examples in it of virtue, and obedient to the laws; to choose such representatives as we apprehend to be the best friends to its constitution and liberties; and if we have the power, to promote such laws as may improve and perfect it; readily to embrace every opportunity for advancing its prosperity; cheerfully to contribute to its defence and support; and, if need be, to die for it:—these are among the duties which every man, who has the happiness to be a member of our free and Protestant constitution, owes to his country.

The constitution of man is such, that the most selfish passions, if kept within their proper bounds, have a tendency to promote the public good. There is no passion of more general utility than patriotism; but its origin may unquestionably be termed *selfish*. The love of one's relations and friends is the most natural expansion of self-love: this affection connects itself too with local circumstances, and sometimes cannot easily be separated from them. It often varies, as relationship or place varies; but acquires new power when the whole community becomes its object. It was therefore with singular propriety that the poet said, "Self-love and social are the same." Under the article Calais we have already given the outlines of the transactions of its siege by Edward III. during which the inhabitants displayed a degree of *patriotism* truly wonderful. History scarcely contains a more distinguished instance of true patriotic virtue than on this occasion. We shall therefore give a fuller account of this remarkable affair, as one of the best examples that can possibly be selected of the virtue we have been explaining. The inhabitants, under Count Vienne their gallant governor, made an admirable defence against a well disciplined and powerful army. Day after day the English effected many a breach, which they repeatedly expected to storm by morning; but, when morning appeared, they wondered to behold new ramparts raised nightly, erected out of the ruins which the day had made. France had now put her sickle into her second harvest since Edward with his victorious army sat down before the town. The eyes of all Europe were intent on the issue. The English made their approaches and attacks without remission; but the citizens were as obstinate in repelling all their efforts. At length, famine did more for Edward than arms. After the citizens had devoured the lean carcases of their half-starved cattle, they tore up old foundations and rubbish in search of vermin: they fed on boiled leather, and the weeds of exhausted gardens; and a morsel of damaged corn was accounted matter of luxury. In this extremity they resolved to attempt the enemy's camp. They boldly sallied forth; the English joined battle; and, after a long and desperate engagement, Count Vienne was taken prisoner; and the citizens, who survived the slaughter, retired within their gates. On the captivity of their governor, the command devolved upon Eustace Saint Pierre, the mayor of the town, a man of mean birth, but of exalted virtue. Eustace soon found himself under the necessity of capitulating, and offered to deliver to Edward the city, with all the possessions and wealth of the inhabitants, provided he permitted them to depart with life and liberty. As Edward had long since expected to ascend the throne of France, he was exasperated to the last degree against these people, whose sole valour had defeated his warmest hopes; he therefore determined to take an exemplary revenge, though he wished to avoid the imputation of cruelty. He answered by Sir Walter Mauny, that they all deserved capital punishment, as obstinate traitors to him, there true and notable sovereign; that, however, in his wonted clemency, he consented to pardon the bulk of the plebeians, provided they would deliver up to him six of their principal citizens with halters about their necks, as victims of due atonement for that spirit of rebellion with which they had inflamed the common people. All the remains of this desolate city were convened in the great square; and like men arraigned at a tribunal from whence there was no appeal, expected

Patriot

Rapin's Hist. E. Edw. I.

Patriotism. ed with throbbing hearts the ſentence of their conqueror. When Sir Walter had declared his meſſage, conſternation and pale diſmay was impreſſed on every face: each looked upon death as his own inevitable lot; for how ſhould they deſire to be ſaved at the price propoſed? Whom had they to deliver up, ſave parents, brothers, kindred, or valiant neighbours, who had ſo often expoſed their lives in their defence? To a long and dead ſilence, deep ſighs and groans ſucceeded, till Euſtace Saint Pierre aſcending a little eminence, thus addreſſed the aſſembly: "My friends and fellow-citizens, you ſee the condition to which we are reduced; we muſt either ſubmit to the terms of our cruel and enſnaring conqueror, or yield up our tender infants, our wives, and chaſte daughters, to the bloody and brutal luſts of the violating ſoldiery. We well know what the tyrant intends by his ſpecious offers of mercy. It does not ſatiate his vengeance to make us merely miſerable, he would alſo make us criminal: he would make us contemptible; he will grant us life on no condition, ſave that of our being unworthy of it. Look about you, my friends, and fix your eyes on the perſon whom you wiſh to deliver up as the victims of your own ſafety. Which of theſe would you appoint to the rack, the ax, or the halter? Is there any here who has not watched for you, who has not fought for you, who has not bled for you? Who, through the length of this inveterate ſiege, has not ſuffered fatigues and miſeries a thouſand times worſe than death, that you and yours might ſurvive to days of peace and proſperity? Is it your preſervers, then, whom you would deſtine to deſtruction? You will not, you cannot, do it. Juſtice, honour, humanity, make ſuch a treaſon impoſſible. Where then is our reſource? Is there any expedient left, whereby we may avoid guilt and infamy on one hand, or the deſolation and horrors of a ſacked city on the other? There is, my friends, there is one expedient left; a gracious, an excellent, a god-like expedient! Is there any here to whom virtue is dearer than life! Let him offer himſelf an oblation for the ſafety of his people! he ſhall not fail of a bleſſed approbation from that power, who offered up his only Son for the ſalvation of mankind." He ſpoke—but an univerſal ſilence enſued. Each man looked round for the example of that virtue and magnanimity in others, which all wiſhed to approve in themſelves, though they wanted the reſolution. At length Saint Pierre reſumed: "It had been baſe in me, my fellow-citizens, to promote any matter of damage to others, which I myſelf had not been willing to undergo in my own perſon. But I held it ungenerous to deprive any man of that preference and eſtimation, which might attend a firſt offer on ſo ſignal an occaſion: for I doubt not but there are many here as ready, nay, more zealous for this martyrdom than I can be, however modeſty and the fear of imputed oſtentation may withhold them from being foremoſt in exhibiting their merits. Indeed the ſtation to which the captivity of Count Vienne has unhappily raiſed me, imports a right to be the firſt in giving my life for your ſakes. I give it freely, I give it cheerfully. Who comes next? Your ſon! exclaimed a youth, not yet come to maturity.—Ah, my child! cried St Pierre; I am then twice ſacrificed.—But no—I have rather begotten thee a ſecond time.—Thy years are few, but full, my ſon; the victim of virtue has reached the utmoſt purpoſe and goal of mortality. Who next, my friends? This is the hour of heroes.—Your kinſman, cried John de Aire! Your kinſman, cried James Wiſſant! Your kinſman, cried Peter Wiſſant!—"Ah! (exclaimed Sir Walter Mauny, burſting into tears), why was I not a citizen of Calais?" The ſixth victim was ſtill wanting, but was quickly ſupplied by lot, from numbers who were now emulous of ſo ennobling an example. The keys of the city were then delivered to Sir Walter. He took the ſix priſoners into his cuſtody. He ordered the gates to be opened, and gave charge to his attendants to conduct the remaining citizens with their families through the camp of the Engliſh. Before they departed, however, they deſired permiſſion to take their laſt adieu of their deliverers.—What a parting! what a ſcene! they crowded with their wives and children about St Pierre and his fellow-priſoners. They embraced, they clung around, they fell proſtrate before them. They groaned; they wept aloud; and the joint clamour of their mourning paſſed the gates of the city, and was heard throughout the camp. At length Saint Pierre and his fellow victims appeared under the conduct of Sir Walter and his guard. All the tents of the Engliſh were inſtantly emptied. The ſoldiers poured from all parts, and arranged themſelves on each ſide to behold, to contemplate, to admire this little band of patriots as they paſſed. They murmured their applauſe of that virtue which they could not but revere even in enemies; and they regarded thoſe ropes which they had voluntarily aſſumed about their necks as enſigns of greater dignity than that of the Britiſh Garter. As ſoon as they had reached the royal preſence, "Mauny (ſays the king), are theſe the principal inhabitants of Calais?" "They are (ſays Mauny); they are not only the principal men of Calais, they are the principal men of France, my lord, if virtue has any ſhare in the act of ennobling." "Were they delivered peaceably, (ſays Edward)? Was there no reſiſtance, no commotion among the people?" "Not in the leaſt, my lord. They are ſelf-delivered, ſelf-devoted, and come to offer up their ineſtimable heads as an ample equivalent for the ranſom of thouſands."

The king, who was highly incenſed at the length and difficulty of the ſiege, ordered them to be carried away to immediate execution; nor could all the remonſtrances and intreaties of his courtiers divert him from his cruel purpoſe. But what neither a regard to his own intereſt and honour, what neither the dictates of juſtice, nor the feelings of humanity, could effect, was happily accompliſhed by the more powerful influence of conjugal affection. The queen, who was then big with child, being informed of the particulars reſpecting the ſix victims, flew into her huſband's preſence, threw herſelf on her knees before him, and, with tears in her eyes, beſought him not to ſtain his character with an indelible mark of infamy, by committing ſuch a horrid and barbarous deed. Edward could refuſe nothing to a wife whom he ſo tenderly loved, and eſpecially in her condition; and the queen, not ſatisfied with having ſaved the lives of the ſix burghers, conducted them to her tent, where ſhe applauded their virtue, regaled them with a plenti-

Patriotiſm. ful repaſt, and having made them a preſent of money and clothes, ſent them back to their fellow-citizens.

The love of their country, and of the public good, ſeems to have been the predominant paſſion of the Spartans. Pedaretus having miſſed the honour of being choſen one of the three hundred who had a certain rank of diſtinction in the city, went home extremely pleaſed and ſatisfied; ſaying, "He was overjoyed there were three hundred men in Sparta more honourable than himſelf." *Plutarch's Life of Lycurgus.*

The patriotiſm of the Romans is well known, and has been juſtly admired. We ſhall content ourſelves at preſent with the following example; a zeal and patriotic devotion ſimilar to which is perhaps ſcarcely equalled, and certainly is not exceeded, in hiſtory.

Dion. lib. viii. p. 570. and *Rollin's Rom. Hiſt* v. i. p. 306. Rome, under the conſuls Cæſo Fabius and T. Virginius, had ſeveral wars to ſuſtain, leſs dangerous than troubleſome, againſt the Æqui, Volſci, and Veientes. To put a ſtop to the incurſions of the laſt, it would have been neceſſary to have eſtabliſhed a good garriſon upon their frontiers to keep them in awe. But the commonwealth, exhauſted of money, and menaced by abundance of other enemies, was not in a condition to provide for ſo many different cares and expences. The family of the Fabii ſhowed a generoſity and love of their country that has been the admiration of all ages. They applied to the ſenate, and by the mouth of the conſul demanded as a favour that they would be pleaſed to transfer the care and expences of the garriſon neceſſary to oppoſe the enterprizes of the Veientes to their houſe, which required an aſſiduous rather than a numerous body, promiſing to ſupport with dignity the honour of the Roman name in that poſt. Every body was charmed with ſo noble and unheard-of an offer; and it was accepted with great acknowledgment. The news ſpread over the whole city, and nothing was talked of but the Fabii. Every body praiſed, every body admired and extolled them to the ſkies. "If there were two more ſuch families in Rome," ſaid they, "the one might take upon them the war againſt the Volſci, and the other againſt the Æqui, whilſt the commonwealth remained quiet, and the forces of particulars ſubdued the neighbouring ſtates."

Early the next day the Fabii ſet out, with the conſul at their head, robed, and with his inſignia. Never was there ſo ſmall, and at the ſame time ſo illuſtrious, an army ſeen; for which we have the authority of Livy. Three hundred and ſix ſoldiers, all patricians, and of the ſame family, of whom not one but might be judged worthy of commanding an army, march againſt the Veii full of courage and alacrity, under a captain of their own name, Fabius. They were followed by a body of their friends and clients, animated by the ſame ſpirit and zeal, and actuated only by great and noble views. The whole city flocked to ſee ſo fine a fight; praiſed thoſe generous ſoldiers in the higheſt terms; and promiſed them conſulſhips, triumphs, and the moſt glorious rewards. As they paſſed before the capitol and the other temples, every body implored the gods to take them into their protection; to favour their departure and undertaking, and to afford them a ſpeedy and happy return. But thoſe prayers were not heard. When they arrived near the river Crimera, which is not far from Veii, they built a fort upon a very rough and ſteep mountain for the ſecurity of the troops, which they ſurrounded with a double foſſe, and flanked with ſeveral towers. This ſettlement, which prevented the enemy from cultivating their ground, and ruined their commerce with ſtrangers, incommoded them extremely. The Veientes not finding themſelves ſtrong enough to ruin the fort which the Romans had erected, applied to the Hetrurians, who ſent them very conſiderable aid. In the mean time the Fabii, encouraged by the great ſucceſs of their incurſions into the enemy's country, made farther progreſs every day. Their exceſſive boldneſs made the Hetrurians conceive thoughts of laying ambuſcades for them in ſeveral places. During the night they ſeized all the eminences that commanded the plain, and found means to conceal a great number of troops upon them. The next day they diſperſed more cattle about the country than they had done before. The Fabii being apprized that the plains were covered with flocks and herds, and defended by only a very ſmall number of troops, they quitted their fort, leaving in it only a ſufficient number to guard it. The hopes of a great booty quickened their march. They arrived at the place in order of battle; and were preparing to attack the advanced guard of the enemy, when the latter, who had their orders, fled without ſtaying till they were charged. The Fabii, believing themſelves ſecure, ſeized the ſhepherds, and were preparing to drive away the cattle. The Hetrurians then quitted their ſkulking places, and fell upon the Romans from all ſides, who were moſt of them diſperſed in purſuit of their prey. All they could do was to rally immediately; and that they could not effect without great difficulty. They ſoon ſaw themſelves ſurrounded on all ſides, and fought like lions, ſelling their lives very dear. But finding that they could not ſuſtain this kind of combat long, they drew up in a wedge, and advancing with the utmoſt fury and impetuoſity, opened themſelves a paſſage through the enemy that led to the ſide of the mountain. When they came thither, they halted, and fought with freſh courage, the enemy leaving them no time to reſpire. As they were upon the higher ground, they defended themſelves with advantage, notwithſtanding their ſmall number; and beating down the enemy, who ſpared no pains in the attack, they made a great ſlaughter of them. But the Veientes having gained the top of the mountain by taking a compaſs, fell ſuddenly upon them, and galled them exceedingly from above with a continual ſhower of darts. The Fabii defended themſelves to their laſt breath, and were all killed to a man. The Roman people were highly affected with the loſs of this illuſtrious band of patriots. The day of their defeat was ranked amongſt their unfortunate days, called *nefaſti*, on which the tribunals were ſhut up, and no public affair could be negociated, or at leaſt concluded. The memory of theſe public ſpirited patricians, who had ſo generouſly ſacrificed their lives and fortunes for the ſervice of the ſtate, could not be too much honoured. Patriotiſm. Patripaſſians.

PATRIPASSIANS, PATRIPASSIANI, in church-hiſtory, a Chriſtian ſect, who appeared about the latter end of the ſecond century; ſo called, from their aſcribing the paſſion to the Father; for they aſſerted the unity of God in ſuch a manner as to deſtroy all di-

ſtinctions

roclus, atrol. ſtinctions of perſons, and to make the Father and Son preciſely the ſame; in which they were followed by the Sabellians and others. The author and head of the Patripaſſians was Praxeas, a philoſopher of Phrygia in Aſia. Swedenbourg and his followers ſeem to hold the ſame faith

PATROCLUS, a Grecian chief at the Trojan war. He was the ſon of Menœtius, by Sthenele, whom ſome call *Philomela* or *Polymela*. The murder of Clyſonymus, the ſon of Amphidamas, by accident, in the time of his youth, made him fly from Opus, where his father reigned. He went to the court of Peleus king of Phthia. He was cordially received, and contracted the moſt intimate friendſhip with Achilles the king's ſon. When the Greeks went to the Trojan war, Patroclus went with them at the expreſs deſire of his father, who had viſited the court of Peleus; and he accordingly embarked with ten ſhips from Phthia. He was the conſtant companion of Achilles; lodged in the ſame tent; and when he refuſed to appear in the field of battle, becauſe he had been offended by Agamemnon, Patroclus imitated his example, and by his abſence was the cauſe of much evil to the Greeks. At laſt, however, Neſtor prevailed upon him to return to the war, and Achilles permitted him to appear in his armour. The bravery of Patroclus, together with the terror which the ſight of the arms of Achilles inſpired, ſoon routed the victorious armies of the Trojans, and obliged them to fly to the city for ſafety. He would have broken down the walls; but Apollo, who intereſted himſelf for the Trojans, oppoſed him; and Hector, at the inſtigation of that god, diſmounted from his chariot to attack him as he attempted to ſtrip one of the Trojans whom he had ſlain. This engagement was obſtinate; but Patroclus was at length overpowered by the valour of Hector, and the interpoſition of Apollo. His arms became the property of the conqueror; and Hector would have ſevered his head from his body had not Ajax and Menelaus prevented it. His body was at laſt recovered, and carried to the Grecian camp, where Achilles received it with the loudeſt lamentations. His funerals were obſerved with the greateſt ſolemnity. Achilles ſacrificed near the burning pile twelve young Trojans, four of his horſes, and two of his dogs; and the whole was concluded by the exhibition of funeral games, in which the conquerors were liberally rewarded by Achilles. The death of Patroclus, as deſcribed by Homer, gave riſe to new events. Achilles forgot his reſentment againſt Agamemnon, and entered the field to avenge the fall of his friend; and his anger was gratified only by the ſlaughter of Hector, who had more powerfully kindled his wrath by appearing at the head of the Trojan armies in the armour which had been taken from the body of Patroclus. The patronymic of Actorides is often applied to Patroclus, becauſe Actor was father to Menœtius.

PATROL, in war, a round or march made by the guards or watch in the night time, to obſerve what paſſes in the ſtreets, and to ſecure the peace and tranquillity of a city or camp. The patrol generally conſiſts of a body of five or ſix men, detached from a body on guard, and commanded by a ſerjeant.

They go every hour of the night, from the beating of the tattoo until the reveille: they are to walk in the ſtreets in garriſons, and all over the camp in the field, to prevent diſorders, or any number of people from aſſembling together: they are to ſee the lights in the ſoldiers barracks put out, and to take up all the ſoldiers they find out of their quarters. Sometimes patrols conſiſt of an officer and 30 or 40 men, as well infantry as cavalry; but then the enemy is generally near at hand, and conſequently the danger greater.

Patron, Patronage.

PATRON, among the Romans, was an appellation given to a maſter who had freed his ſlave. As ſoon as the relation of maſter expired, that of patron began: for the Romans, in giving their ſlaves their freedom, did not deſpoil themſelves of all rights and privileges in them; the law ſtill ſubjected them to conſiderable ſervices and duties towards their patrons, the neglect of which was very ſeverely puniſhed.

Patron was alſo a name which the people of Rome gave to ſome great man, under whoſe protection they uſually put themſelves; paying him all kinds of honour and reſpect, and denominating themſelves his clients; while the patron, on his ſide, granted them his credit and protection. They were therefore mutually attached and mutually obliged to each other; and by this means, in conſequence of reciprocal ties, all thoſe ſeditions, jealouſies, and animoſities, which are ſometimes the effect of a difference of rank, were prudently avoided: for it was the duty of the patron to adviſe his clients in points of law, to manage their ſuits, to take care of them as of his own children, and ſecure their peace and happineſs. The clients were to aſſiſt their patrons with money on ſeveral occaſions; to ranſom them or their children when taken in war; to contribute to the portions of their daughters; and to defray, in part, the charges of their public employments. They were never to accuſe each other, or take contrary ſides; and if either of them was convicted of having violated this law, the crime was equal to that of treaſon, and any one was allowed to kill the offender with impunity. This patronage was a tie as effectual as any conſanguinity or alliance, and had a wonderful effect towards maintaining union and concord among the people for the ſpace of 600 years; during which time we find no diſſenſions nor jealouſies between the patrons and their clients, even in the times of the republic when the populace frequently mutinied againſt thoſe who were moſt powerful in the city.

PATRON, in the church of Rome, a ſaint whoſe name a perſon bears, or under whoſe protection he is put, and whom he takes particular care to invoke; or a ſaint in whoſe name a church or order is founded.

PATRON, in the canon or common law, is a perſon who, having the advowſon of a parſonage, vicarage, or the like ſpiritual promotion, belonging to his manor, hath on that account the gift and diſpoſition of the benefice, and may preſent to it whenever it becomes vacant. The patron's right of diſpoſing of a benefice originally ariſes either from the patron or his anceſtors, &c. being the founders or builders of the church; from their having given lands for the maintenance thereof; or from the church's being built on their ground; and frequently from all three together.

PATRONAGE, or ADVOWSON, a ſort of incorporeal hereditament, conſiſting in the right of preſentation to a church or eccleſiaſtical benefice. Advowſon, *advocatio*, ſignifies *in clientelam recipere*, the taking

Patronage. Blackstone's Commentaries.

taking into protection; and therefore is synonymous with patronage, *patronatus*: and he who has the right of advowson is called the *patron of the church*. For when lords of manors first built churches on their own demesnes, and appointed the tithes of those manors to be paid to the officiating ministers, which before were given to the clergy in common (from whence arose the division of parishes), the lord who thus built a church, and endowed it with glebe or land, had of common right a power annexed of nominating such minister as he pleased (provided he were canonically qualified) to officiate in that church, of which he was the founder, or lower, maintainer, or, in one word, the patron.

Advowsons are either advowsons *appendant*, or advowsons *in gross*. Lords of manors being originally the only founders, and of course the only patrons, of churches, the right of patronage or presentation, so long as it continues annexed to the possession of the manor, as some have done from the foundation of the church to this day, is called an *advowson appendant*: and it will pass, or be conveyed, together with the manor, as incident and appendant thereto, by a grant of the manor only, without adding any other words. But where the property of the advowson has been once separated from the property of the manor by legal conveyance, it is called an *advowson in gross*, or at large, and never can be appendant any more; but it is for the future annexed to the person of its owner, and not to his manor or lands.

Advowsons are also either *presentative*, *collative*, or *donative*. An advowson presentative, is where the patron hath a right of presentation to the bishop or ordinary, and moreover to demand of him to institute his clerk if he finds him canonically qualified: and this is the most usual advowson. An advowson collative, is where the bishop and patron are one and the same person: in which case the bishop cannot present to himself; but he does, by the one act of collation, or conferring the benefice, the whole that is done in common cases, by both presentation and institution. An advowson donative, is when the king, or any subject by his licence, doth found a church or chapel, and ordains that it shall be merely in the gift or disposal of the patron; subject to his visitation only, and not to that of the ordinary; and vested absolutely in the clerk by the patron's deed of donation, without presentation, institution, or induction. This is said to have been anciently the only way of conferring ecclesiastical benefices in England; the method of institution by the bishop not being established more early than the time of Archbishop Becket in the reign of Henry II. and therefore, though pope Alexander III. in a letter to Becket, severely inveighs against the *prava consuetudo*, as he calls it, of investiture conferred by the patron only, this however shows what was then the common usage. Others contend that the claim of the bishops to institution is as old as the first planting of Christianity in this island; and in proof of it they allege a letter from the English nobility to the pope in the reign of Henry the third, recorded by Matthew Paris, which speaks of presentation to the bishop as a thing immemorial. The truth seems to be, that, where the benefice was to be conferred on a mere layman, he was first presented to the bishop in order to receive ordination, who was at liberty to examine and refuse him: but where the clerk was already in orders, the living was usually vested in him by the sole donation of the patron; till about the middle of the 12th century, when the pope and his bishops endeavoured to introduce a kind of feudal dominion over ecclesiastical benefices, and, in consequence of that, began to claim and exercise the right of institution universally, as a species of spiritual investiture.

Patronymic

However this may be, if, as the law now stands, the true patron once waives this privilege of donation, and presents to the bishop, and his clerk is admitted and instituted, the advowson is now become for ever presentative, and shall never be donative any more. For these exceptions to general rules and common right are ever looked upon by the law in an unfavourable view, and construed as strictly as possible. If therefore the patron, in whom such peculiar right resides, does once give up that right, the law, which loves uniformity, will interpret it to be done with an intention of giving it up for ever; and will therefore reduce it to the standard of other ecclesiastical livings. See further, LAW, Part III. Sect. v. N° clix. 5—10.

Arms of PATRONAGE, in heraldry, are those on the top of which are some marks of subjection and dependence: thus the city of Paris lately bore the fleurs-de-lis in chief, to show her subjection to the king; and the cardinals, on the top of their arms, bear those of the pope, who gave them the hat, to show that they are his creatures.

PATRONYMIC, among grammarians, is applied to such names of men or women as are derived from those of parents or ancestors.

Patronymics are derived, 1. From the father; as Pelides, *i. e.* Achilles the son of Peleus. 2. From the mother; as Philyrides, *i. e.* Chiron the son of Philyra. 3. From the grandfather on the father's side; as Æacides, *i. e.* Achilles the grandson of Æacus. 4. From the grandfather by the mother's side; as Atlantiades, *i. e.* Mercury the grandson of Atlas. And, 5. From the kings and founders of nations; as Romulidæ, *i. e.* the Romans, from their founder king Romulus.

The termination of Greek and Latin patronymics are chiefly four, viz. *des*, of which we have examples above; *as*, as Thaumantias, *i. e.* Iris the daughter of Thaumas; *is*, as Atlantis, *i. e.* Electra the daughter of Atlas; and *ne*, as Nerine, the daughter of Nereus. Of these terminations *des* is masculine; and *as*, *is*, and *ne*, feminine: *des* and *ne* are of the first declension, *as* and *is* of the third.

The Russians, in their usual mode of address, never prefix any title or appellation of respect to their names; but persons of all ranks, even those of the first distinction, call each other by their Christian names, to which they add a patronymic. These patronymics are formed in some cases by adding Vitch (the same as our Fitz, as Fitzherbert, or the son of Herbert) to the Christian name of the father; in others by Of or Ef; the former is applied only to persons of condition, the latter to those of inferior rank. Thus,

Ivan Ivanovitch, Ivan Ivanof, is Ivan the son of Ivan: Peter Alexievitch, Peter Alexeof, Peter the son of Alexèy.

The female patronymic is Efna or Ofna, as Sophia Alex-

Alexeefna, or Sophia the daughter of Alexey; Maria Ivanofna, or Maria the daughter of Ivan.

Great families are alſo in general diſtinguiſhed by a ſurname, as thoſe of Romanof, Galitzin, Sheremetof, &c.

PATROS, mentioned by Jeremiah and Ezekiel, appears from the context to be meant of a part of Egypt. Bochart thinks it denotes the Higher Egypt: the Septuagint tranſlate it the country of *Pathures*; in Pliny we have the *Nomes Phaturites* in the Thebais; in Ptolemy, *Pathyris*, probably the metropolis. From the Hebrew appellation *Patros* comes the gentilitious name *Pathruſim*, Moſes.

PATRU (Oliver), a counſellor in parliament, and dean of the French academy, was born at Paris in 1624. He had an excellent faculty both of ſpeaking and writing. Upon his admiſſion into the French academy in 1640, he made an oration of thanks, that gave riſe to the cuſtom of admiſſory ſpeeches, which are ſtill in uſe in that ſociety. Mr de Vaugilas owns himſelf much indebted to him for his aſſiſtance in compoſing his remarks on the French tongue, of which he was by far the greateſt maſter in France; ſo that he was conſulted as an oracle by all the beſt writers of that nation.

Patru was eſtimable for the qualities of his heart, as well as for thoſe of the head: was honeſt, generous, ſincere; and preſerved a gayneſs of character, which no ill fortune could alter or affect. For this famous advocate, in ſpite of all his great talents, lived almoſt in a ſtate of indigence. The love of the belles lettres made him neglect the law; and the barren glory of being an oracle to the beſt French writers had more charms for him, than all the profits of the bar. Hence he became ſo poor, as to be reduced to the neceſſity of ſelling his books, which ſeemed dearer to him than his life; and would actually have ſold them for an under-price, if Boileau had not generouſly advanced him a larger ſum, with this further privilege, that he ſhould have the uſe of them as long as he lived. His death was preceded by a tedious illneſs, during which he received a preſent of 500 crowns from Colbert, as a mark of the eſteem which the king had for him. He died the 16th of January 1681. The prodigious care and exactneſs with which he retouched and finiſhed every thing he wrote, did not permit him to publiſh much. His miſcellaneous works were printed at Paris in 1670, 4to; the third edition of which, in 1714, 4to, was augmented with ſeveral pieces. They conſiſt of Pleadings, Orations, Letters, Lives of ſome of his Friends, Remarks upon the French Language, &c

PATTANS, Patans, or Afghans, a very warlike race of men, who had been ſubjects of the vaſt empire of Bochara. They revolted under their governor Abſtagi, in the 10th century, and laid the foundation of the empire of Ghizni or Gazna. In the Diſſertation prefixed to vol. III. of Dow's Hiſtory, we have this account of the Pattans.

"They are divided into diſtinct communities, each of which is governed by a prince, who is conſidered by his ſubjects as the chief of their blood, as well as their ſovereign. They obey him without reluctance, as they derive credit to their family by his greatneſs. They attend him in his wars with the attachment which children have to a parent; and his government, though ſevere, partakes more of the rigid diſcipline of a general than the caprice of a deſpot. Rude, like the face of their country, and fierce and wild as the ſtorms which cover their mountains, they are addicted to incurſions and depredations, and delight in battle and plunder. United firmly to their friends in war, to their enemies faithleſs and cruel, they place juſtice in force, and conceal treachery under the name of addreſs" Pattans, Pau.

The empire, which took its riſe from the revolt of the Pattans, under a ſucceſſion of warlike princes roſe to a ſurpriſing magnitude. In the beginning of the 11th century, it extended from Iſpahan to Bengal, and from the mouths of the Indus to the banks of the Jaxertes, which comprehends at leaſt half of the continent of Aſia. They had fled to the mountains on the borders of Perſia, that they might eſcape the ſword, or avoid ſubmitting to the conquerors of India; and there they formed their ſtate, which the Moguls were never able thoroughly to ſubdue. Indeed they ſometimes exerciſed depredations on the adjacent countries; nor was it poſſible for the Moguls either to prevent it or to extirpate them. They were ſenſible that the climate and ſoil of the delicious plains would only ſerve to rob them of that hardineſs they contracted in the hills to which they were confined; they, therefore, for a long time gave no indications of a deſire to exchange them for more pleaſing abodes, or a more acceſſible ſituation. This enabled them to brave the victorious army of Nadir Shah, whoſe troops they quietly ſuffered to penetrate into Hindoſtan, and waited his return with the ſpoils of that country.—They then haraſſed his army in the ſtraits and defiles of the mountains, and proved themſelves ſuch abſolute maſters of the paſſes, that they forced him to purchaſe from them his paſſage into Perſia.

In the beginning of the preſent century, they had ſpread themſelves over the adjoining province of Kandabar; and ſuch was the imbecility of the Perſian empire at that time, that many other provinces and tributary ſtates were alſo induced to revolt. When the king or ſhah of that time, whoſe name was *Huſſein*, oppoſed the growing power of this warlike people, he was totally defeated, and Iſpahan was beſieged and obliged to ſurrender, after having ſuffered dreadful calamities, to an army conſiſting of only 30,000 men. In conſequence of this, they brought about a revolution in Perſia, and ſubjected it to themſelves. This ſovereignty, however, they only held for ſeven years and 21 days, having fallen a ſacrifice to the enterpriſing ſpirit of Kouli Khan, or Nadir Shah. See Persia, and in the Appendix Afghans.

PAU, a town of France, in the province of Gaſcony and territory of Bearne, with a parliament, a mint, and a caſtle. "The city of Pau (ſays Wraxal*) will be for ever memorable in hiſtory, ſince it was the birth-place of Henry IV. That immortal prince was born in the caſtle, then the uſual reſidence of the kings of Navarre. It ſtands on one of the moſt romantic and ſingular ſpots I have ever ſeen, at the weſt end of the town, upon the brow of a rock which terminates perpendicularly. Below runs the Gave, a river or rather a torrent which riſes in the Pyrenees, and empties itſelf into the Adour. On the other ſide, about two miles

* *Tour thro' France.*

Pau. miles off, is a ridge of hills covered with vineyards, which produce the famous *Vin de Jorençon*, so much admired; and beyond all, at the distance of nine leagues, appear the Pyrenees themselves, covering the horizon from east to west, and bounding the prospect. The castle, though now in a state of decay, is still habitable; and the apartments are hung with tapestry, said to be the work of Jane queen of Navarre, and mother of Henry IV. Gaston IV. Count de Foix, who married Leonora heiress of the crown of Navarre, began the edifice in 1464; but his successor Henry d'Albret completed and enlarged it about the year 1519, when he made choice of the city of Pau for his residence, and where, during the remainder of his reign, he held his little court. In a chamber, which by its size was formerly a room of state, is a fine whole length portrait of that Jane queen of Navarre whom I have just mentioned. Her dress is very splendid, and resembles those in which our Elizabeth is usually painted. Her head-dress is adorned with pearls; round her neck she wears a ruff; and her arms, which are likewise covered with pearls, are concealed by her habit quite down to the wrist. At her waist hangs by a chain a miniature portrait. The fingers of her right hand play on the strings of a guittar; and in her left she holds an embroidered handkerchief. The painter has drawn her as young, yet not in the first bloom of youth. Her features are regular, her countenance thin, but rather inclining to long; the eyes hazel, and the eye-brows finely arched. Her nose is well formed though large, and her mouth pretty. She was a great princess, of high spirit, and undaunted magnanimity. Her memory is not revered by the French historians, because she was the protectress of the Huguenots and the friend of Cologni; but the actions of her life evince her distinguished merit.

"In one of the adjoining chambers, is another portrait of Henry IV. himself when a boy; and on the second floor is the apartment in which he was born. The particulars of his birth are in themselves so curious, and as relating to so great and good a prince, are so peculiarly interesting, that I doubt not you will forgive my enumerating them, even though you should have seen them elsewhere.—His mother Jane had already lost two sons, the duke de Beaumont and the count de Marle. Henry d'Albret, her father, anxious to see an heir to his dominions, enjoined her (when she accompanied her husband Anthony of Bourbon to the wars of Picardy against the Spaniards), if she proved with child, to return to Pau, and to lie in there, as he would himself superintend the education of the infant from the moment of its birth. He threatened to disinherit her if she failed to comply with this injunction. The princess, in obedience to the king's command, being in the ninth month of her pregnancy, quitted Compiegne in the end of November, traversed all France in 15 days, and arrived at Pau, where she was delivered of a son on the 13th December 1553. She had always been desirous to see her father's will, which he kept in a golden box; and he promised to show it to her, provided she admitted of his being present at her delivery, and would during the pains of her labour sing a song in the Bearnois language. Jane had courage enough to perform this unusual request; and the king being called on the first news of her illness, she immediately sung a Bearnois song, beginning, 'Notre Dame du bout du pont, aidez moi en cette heure.'—As she finished it, Henry * was born. The king instantly performed his promise, by giving her the box, together with a golden chain, which he tied about her neck; and taking the infant into his own apartment, began by making him swallow some drops of wine, and rubbing his lips with a root of garlic. They still show a tortoise shell which served him for a cradle, and is preserved on that account. Several of the ancient sovereigns of Navarre resided and died in the castle of Pau. François Phœbus, who ascended the throne in 1479 died here in 1483."

Pau is a handsome city, well built, and contains near 6000 inhabitants. It is a modern place, having owed its existence entirely to the castle, and to the residence of the kings of Navarre. W. Long. 0. 4. N. Lat. 43. 15.

PAVAN, or PAVANE, a grave dance used among the Spaniards, and borrowed from them: wherein the performers make a kind of wheel or tail before each other, like that of *pavo*, "a peacock;" from whence the name is derived. The pavane was formerly in great repute; and was danced by gentlemen with cap and sword; by those of the long robe in their gowns, by princes with their mantles, and by the ladies with their gown tails trailing on the ground. It was called the *grand ball*, from the solemnity with which it was performed. To moderate its gravity, it was usual to introduce several flourishes, passades, capers, &c. by way of episodes. Its tablature or score is given at large by Thoinot Arbeau in his Orchesographia.

PAVETTA, in botany: A genus of the monogynia order, belonging to the tetrandria class of plants; and in the natural method ranking under the 47th order, *Stellatæ*. The corolla is monopetalous and funnel-shaped above: the stigma carved; the berry dispermous.

PAVIA, an ancient and celebrated town of Italy, in the duchy of Milan, and capital of the Pavesan, with an university and bishop's see. It was anciently called *Ticinum*, from its situation on that river, and lies 20 miles to the southward of Milan. It was formerly the capital of the Longobardic kingdom, and is still remarkable for the broadness of its streets, the beauty and richness of some of its churches, and for its university, founded by Charlemagne, and for several other literary institutions. Here is a bishop's see, which was once the richest in Italy, but is now dependent on the pope; and upon the whole the city is gone to decay, its trade being ruined through the exactions of the government. The few objects within it worth the public attention belong to the clergy or monks; and the church and convent of the Carthusians are inexpressibly noble, the court of the convent being one of the finest in the world, and surrounded by a portico supported by pillars, the whole a mile in circumference. It is defended by strong walls, large ditches, good ramparts, excellent bastions, and a bridge over the river Tasin. In the centre of the town is a strong castle, where the duke of Milan was wont to reside. There are a great number of magnificent castles, and some colleges. It was taken by the duke of Savoy in 1706; by the French

* See *France*.

lion, French in 1733; by the French and Spaniards in 1745; ing. but retaken by the Auſtrians in 1746. E. Long. 9. 5. N. Lat. 45. 10.

PAVILION, in architecture, ſignifies a kind of turret or building, uſually inſulated, and contained under a ſingle roof; ſometimes ſquare, and ſometimes in form of a dome: thus called from the reſemblance of its roof to a tent.

Pavilions are ſometimes alſo projecting pieces, in the front of a building, marking the middle thereof; ſometimes the pavilion flanks a corner, in which caſe it is called *an angular pavilion*. The Louvre is flanked with four pavilions: the pavilions are uſually higher than the reſt of the building. There are pavilions built in gardens, commonly called *ſummer-houſes*, *pleaſure-houſes*, &c. Some caſtles or forts conſiſt only of a ſingle pavilion.

Pavilion, in military affairs, ſignifies a tent raiſed on poſts, to lodge under in the ſummer-time.

Pavilion, is alſo ſometimes applied to flags, colours, enſigns, ſtandards, banners, &c.

Pavilion, in heraldry, denotes a covering in form of a tent, which inveſts or wraps up the armories of divers kings and ſovereigns, depending only on God and their ſword.

The pavilion conſiſts of two parts; the top, which is the chapeau, or coronet; and the curtain, which makes the mantle.

None but ſovereign monarchs, according to the French heralds, may bear the pavilion entire, and in all its parts. Thoſe who are elective, or have any dependence, ſay the heralds, muſt take off the head, and retain nothing but the curtains.

Pavilions, among jewellers, the underſides and corners of the brilliants, lying between the girdle and the collet.

PAVING, the conſtruction of ground floors, ſtreets, or highways, in ſuch a manner that they may be conveniently walked upon. In Britain, the pavement of the grand ſtreets, &c. are uſually of flint, or rubble-ſtone; courts, ſtables, kitchens, halls, churches, &c. are paved with tiles, bricks, flags, or fire ſtone; ſometimes with a kind of free-ſtone and rag-ſtone.

In ſome ſtreets, *e. gr.* of Venice, the pavement is of brick: churches ſometimes are paved with marble, and ſometimes with moſaic-work, as the church of St Mark at Venice. In France, the public roads, ſtreets, courts, &c. are all paved with gres or gritt, a kind of free-ſtone.

In Amſterdam and the chief cities of Holland, they call their brick pavement the *burgher-maſters pavement*, to diſtinguiſh it from the ſtone or flint pavement, which uſually takes up the middle of the ſtreet, and which ſerves for carriages; the brick which borders it being deſtined for the paſſage of people on foot.

Pavements of free-ſtone, flint, and flags, in ſtreets, &c. are laid dry, *i. e.* in a bed of ſand; thoſe of courts, ſtables, ground-rooms, &c. are laid in a mortar of lime and ſand; or in lime and cement, eſpecially if there be vaults or cellars underneath. Some maſons, after laying a floor dry, eſpecially of brick, ſpread a thin mortar over it; ſweeping it backwards and forwards to fill up the joints. The ſeveral kinds of pavement are as various as the materials of which they are compoſed, and whence they derive the name by which they are diſtinguiſhed; as, Paving.

1. *Pebble-paving*, which is done with ſtones collected from the ſea-beach, moſtly brought from the iſlands of Guernſey and Jerſey: they are very durable, indeed the moſt ſo of any ſtone uſed for this purpoſe. They are uſed of various ſizes, but thoſe which are from ſix to nine inches deep, are eſteemed the moſt ſerviceable. When they are about three inches deep, they are denominated *bolders* or *bowlers*; theſe are uſed for paving court-yards, and other places not accuſtomed to receive carriages with heavy weights; when laid in geometrical figures, they have a very pleaſing appearance.

2. *Rag-paving* was much uſed in London, but is very inferior to the pebbles; it is dug in the vicinity of Maidſtone in Kent, from which it has the name of *Kentiſh rag-ſtone*; there are ſquared ſtones of this material for paving coach-tracks and foot-ways.

3. *Purbeck pitchens*; ſquare ſtones uſed in footways; they are brought from the iſland of Purbeck, and alſo frequently uſed in court-yards; they are in general from ſix to ten inches ſquare, and about five inches deep.

4. *Squared paving*, for diſtinction by ſome called *Scotch paving*, becauſe the firſt of the kind paved in the manner that has been and continues to be paved, came from Scotland; the firſt was a clear cloſe ſtone, called *blue whyna*, which is now diſuſed, becauſe it has been found inferior to others ſince introduced in the order they are hereafter placed.

5. *Granite*, a hard material, brought alſo from Scotland, of a reddiſh colour, very ſuperior to the blue whynn quarry, and at preſent very commonly uſed in London.

6. *Guernſey*, which is the beſt, and very much in uſe; it is the ſame ſtone with the pebble before ſpoken of, but broken with iron hammers, and ſquared to any dimenſions required of a priſmoidical figure, ſet with its ſmalleſt baſe downwards. The whole of the foregoing paving ſhould be bedded and paved in ſmall gravel.

7. *Purbeck-paving*, for footways, is in general got in large ſurfaces about 2½ inches thick; the blue ſort is the hardeſt and the beſt of this kind of paving.

8. *Yorkſhire paving*, is an exceeding good material for the ſame purpoſe, and is got of almoſt any dimenſions of the ſame thickneſs as the Purbeck. This ſtone will not admit the wet to paſs through it, nor is it affected by the froſt.

9. *Ryegate*, or *fire-ſtone paving*, is uſed for hearths, ſtoves, ovens, and ſuch places as are liable to great heat, which does not affect the ſtone if kept dry.

10. *Newcaſtle flags*, are ſtones about two feet ſquare, and 1¼ or two inches thick; they anſwer very well for paving out-offices: they are ſomewhat like the Yorkſhire.

11. *Portland paving*, with ſtone from the iſland of Portland; this is ſometimes ornamented with black marble dots.

12. *Swedland paving*, is a black ſlate dug in Leiceſterſhire, and looks well for paving halls, or in party-coloured paving.

13. *Marble paving*, is moſtly variegated with different marbles, ſometimes inlaid in moſaic.

14. *Flat brick paving*, done with brick laid in ſand, mortar,

Paving, Paul.

mortar, or groute, as when liquid lime is poured into the joints.

15. *Brick-on-edge paving*, done with brick laid edgewiſe in the ſame manner.

16. Bricks are alſo laid flat or edgewiſe in herring-bone.

17. Bricks are alſo ſometimes ſet endwiſe in ſand, mortar, or groute.

18. Paving is alſo performed with paving bricks.

19. With ten inch tiles.

20. With foot tiles.

21. With clinkers for ſtables and outer offices.

22. With the bones of animals, for gardens, &c.

And, 23. We have knob-paving, with large gravel-ſtones, for porticoes, garden-ſeats, &c.

Pavements of churches, &c. frequently conſiſt of ſtones of ſeveral colours; chiefly black and white, and of ſeveral forms, but chiefly ſquares and lozenges, artfully diſpoſed. Indeed, there needs no great variety of colours to make a ſurpriſing diverſity of figures and arrangements. M. Truchet, in the Memoirs of the French Academy, has ſhown by the rules of combination, that two ſquare-ſtones, divided diagonally into two colours, may be joined together chequerwiſe 64 different ways: which appears ſurpriſing enough; ſince two letters or figures can only be combined two ways.

The reaſon is, that letters only change their ſituation with regard to the firſt and ſecond, the top and bottom remaining the ſame; but in the arrangement of theſe ſtones, each admits of four ſeveral ſituations, in each whereof the other ſquare may be changed 16 times, which gives 64 combinations.

Indeed, from a farther examination of theſe 64 combinations, he found there were only 32 different figures, each figure being repeated twice in the ſame ſituation, though in a different combination; ſo that the two only differed from each other by the tranſpoſition of the dark and light parts.

PAUL, formerly named SAUL, was of the tribe of Benjamin, a native of Tarſus in Cilicia, a Phariſee by profeſſion; firſt a perſecutor of the church, and afterwards a diſciple of Jeſus Chriſt, and apoſtle of the Gentiles. It is thought he was born about two years before our Saviour, ſuppoſing that he lived 68 years, as we read in a homily which is in the ſixth volume of St Chryſoſtom's works. He was a Roman citizen (Acts xxii. 27, 28.), becauſe Auguſtus had given the freedom of the city to all the freemen of Tarſus, in conſideration of their firm adherence to his intereſts. His parents ſent him early to Jeruſalem, where he ſtudied the law at the feet of Gamaliel a famous doctor (*id.* xxii. 3.) He made very great progreſs in his ſtudies, and his life was always blameleſs before men; being very zealous for the whole obſervation of the law of Moſes (*id.* xxvi. 4, 5.) But his zeal carried him too far; he perſecuted the church, and inſulted Jeſus Chriſt in his members (1 Tim. i. 13.); and when the protomartyr St Stephen was ſtoned, Saul was not only conſenting to his death, but he even ſtood by and took care of the clothes of thoſe that ſtoned him (Acts vii. 58, 59.) This happened in the 33d year of the common era, ſome time after our Saviour's death. Paul.

At the time of the perſecution that was raiſed againſt the church, after the death of St Stephen, Saul was one of thoſe that ſhowed moſt violence in diſtreſſing the believers (Gal. i. 13. and Acts xxvi. 11.) He entered into their houſes, and drew out by force both men and women, loaded them with chains, and ſent them to priſon (Acts viii. 3. and xxii. 4.) He even entered into the ſynagogues, where he cauſed thoſe to be beaten with rods that believed in Jeſus Chriſt, compelling them to blaſpheme the name of the Lord. And having got credentials from the high-prieſt Caiaphas, and the elders of the Jews, to the chief Jews of Damaſcus, with power to bring to Jeruſalem all the Chriſtians he ſhould find there, he went away full of threats, and breathing nothing but blood (Acts ix. 1, 2, 3, &c.) But as he was upon the road, and now drawing near to Damaſcus, all on a ſudden about noon, he perceived a great light to come from heaven, which encompaſſed him and all thoſe that were with him. This ſplendor threw them on the ground; and Saul heard a voice that ſaid to him, "Saul, Saul, why perſecuteſt thou me?" It was Jeſus Chriſt that ſpoke to him. To whom Saul anſwered, "Who art thou, Lord?" And the Lord replied to him, "I am Jeſus of Nazareth whom thou perſecuteſt; it is hard for thee to kick againſt the pricks." Saul, all in conſternation, aſked, "Lord, what is it that thou wouldſt have me do?" Jeſus bid him ariſe and go to Damaſcus, where the will of the Lord ſhould be revealed to him.

Saul then roſe from the ground, and felt that he was deprived of ſight; but his companions led him by the hand, and brought him to Damaſcus, where he continued three days blind, and without taking any nouriſhment. He lodged at the houſe of a Jew named Judas. On the third day, the Lord commanded a diſciple of his, named Ananias, to go to find out Saul, to lay his hands upon him, and to cure his blindneſs. And as Ananias made excuſes, ſaying that this man was one of the moſt violent perſecutors of the church, the Lord ſaid to him, Go and find him, becauſe this man is an inſtrument that I have choſen, to carry my name before the Gentiles, before kings, and before the children of Iſrael; for I will ſhow him how many things he muſt ſuffer for my name. Ananias went therefore, and found Saul, laid his hand upon him, and reſtored him to his ſight; then riſing, he was baptized, and filled with the Holy Ghoſt. After this he continued ſome days with the diſciples that were at Damaſcus, preaching in the ſynagogues, and proving that Jeſus was the Meſſiah (A)

From Damaſcus he went into Arabia (Gal. i. 17.), probably

(A) The converſion of ſuch a man, at ſuch a time, and by ſuch means, furniſhes one of the moſt complete proofs that have ever been given of the divine origin of our holy religion. That Saul, from being a zealous perſecutor of the diſciples of Chriſt, became all at once a diſciple himſelf, is a fact which cannot be controverted without overturning the credit of all hiſtory. He muſt therefore have been converted in the miraculous

Paul. probably into the neighbourhood of Damaſcus, being then under the government of Aretas king of Arabia; and having remained there for a little while, he returned to Damaſcus, where he began again to preach the goſpel. The Jews could not bear to ſee the progreſs that the goſpel made here; and ſo reſolved to put him to death: and they gained to their ſide the governor of Damaſcus, who was to apprehend him, and to deliver him to them. Of this Saul had early notice; and knowing that the gates of the city were guarded night and day to prevent him from making his eſcape, he was let down over the wall in a baſket. And coming to Jeruſalem to ſee Peter (Gal. i. 38.), the diſciples were afraid to have any correſpondence with him, not believing him to be a convert. But Barnabas having brought him to the apoſtles, Saul related to them the manner of his converſion, and all that had followed in conſequence of it. Then he began to preach both to the Jews and Gentiles; and ſpoke to them with ſuch ſtrength of argument, that not being able to withſtand him in reaſoning, they reſolved to kill him. For this reaſon, the brethren brought him to Cæſarea of Paleſtine, from whence he came, probably by ſea, into his own country Tarſus in Cilicia. Paul.

There he continued about five or ſix years, from the year of Chriſt 37 to the year 43; when Barnabas coming to Antioch by the order of the apoſtles, and there having found many Chriſtians, went to Tarſus to ſee Saul, and brought him with him to Antioch (Acts xi. 20, 25, 26.); where they continued together a whole year, preaching to and inſtructing the faithful. During this time, there happened a great famine in Judea (*id. ib.* 27, 28, &c.), and the Chriſtians of Antioch having made ſome collections to aſſiſt their brethren at Jeruſalem, they made choice of Paul and Barnabas to go thither with their offering. They arrived there in the year of Chriſt 44; and having acquitted themſelves of their commiſſion, they returned again to Antioch. They had not been there long before God warned them by the prophets he had in this church, that he had appointed them to carry his word into other places. Then the church betook themſelves to faſting and praying, and the prophets Simeon, Lucius, and Manaen, laid their hands on

---

culous manner in which he himſelf ſaid he was, and of courſe the Chriſtian religion be a divine revelation; or he muſt have been either an impoſtor, an enthuſiaſt, or a dupe to the fraud of others. There is not another alternative poſſible.

If he was an impoſtor; who declared what he knew to be falſe, he muſt have been induced to act that part by ſome motive: (See MIRACLE). But the only conceivable motives for religious impoſture are, the hopes of advancing one's temporal intereſt, credit, or power; or the proſpect of gratifying ſome paſſion or appetite under the authority of the new religion. That none of theſe could be St Paul's motive for profeſſing the faith of Chriſt crucified, is plain from the ſtate of Judaiſm and Chriſtianity at the period of his forſaking the former and embracing the latter faith. Thoſe whom he left were the diſpoſers of wealth, of dignity, of power, in Judea: thoſe to whom he went were indigent men, oppreſſed, and kept from all means of improving their fortunes. The certain conſequence therefore of his taking the part of Chriſtianity was the loſs not only of all that he poſſeſſed, but of all hopes of acquiring more; whereas, by continuing to perſecute the Chriſtians, he had hopes riſing almoſt to a certainty of making his fortune by the favour of thoſe who were at the head of the Jewiſh ſtate, to whom nothing could ſo much recommend him as the zeal which he had ſhown in that perſecution. As to credit or reputation, could the ſcholar of Gamaliel hope to gain either by becoming a teacher in a college of fiſhermen? Could he flatter himſelf, that the doctrines which he taught would, either in or out of Judea, do him honour, when he knew that "they were to the Jews a ſtumbling block, and to the Greeks fooliſhneſs?" Was it then the love of power that induced him to make this great change? Power! over whom? over a flock of ſheep whom he himſelf had aſſiſted to deſtroy, and whoſe very Shepherd had lately been murdered! Perhaps it was with the view of gratifying ſome licentious paſſion, under the authority of the new religion, that he commenced a teacher of that religion! This cannot be alleged; for his writings breathe nothing but the ſtricteſt morality, obedience to magiſtrates, order, and government, with the utmoſt abhorrence of all licentiouſneſs, idleneſs, or looſe behaviour, under the cloke of religion. We nowhere read in his works, that ſaints are above moral ordinances; that dominion is founded in grace; that monarchy is deſpotiſm which ought to be aboliſhed; that the fortunes of the rich ought to be divided among the poor; that there is no difference in moral actions; that any impulſes of the mind are to direct us againſt the light of our reaſon and the laws of nature; or any of thoſe wicked tenets by which the peace of ſociety has been often diſturbed, and the rules of morality often broken, by men pretending to act under the ſanction of divine revelation. He makes no diſtinctions like the impoſtor of Arabia in favour of himſelf; nor does any part of his life, either before or after his converſion to Chriſtianity, bear any mark of a libertine diſpoſition. As among the Jews, ſo among the Chriſtians, his converſation and manners were blameleſs.—It has been ſometimes objected to the other apoſtles, by thoſe who were reſolved not to credit their teſtimony, that, having been deeply engaged with Jeſus during his life, they were obliged, for the ſupport of their own credit, and from having gone too far to return, to continue the ſame profeſſions after his death; but this can by no means be ſaid of St Paul. On the contrary, whatever force there may be in that way of reaſoning, it all tends to convince us, that St Paul muſt *naturally* have continued a Jew, and an enemy to Chriſt Jeſus. If *they* were engaged on one ſide, *he* was as ſtrongly engaged on the other. If ſhame withheld them from changing ſides, much more ought it to have ſtopped him; who, from his ſuperior education, muſt have been vaſtly more ſenſible to that kind of ſhame than the mean and illiterate fiſhermen of Galilee. The only other difference

Paul. them, and sent them to preach whither the Holy Ghost should conduct them. And it was probably about this time, that is, about the year of Christ 44, that Paul being wrapt up into the third heaven, saw there ineffable things, and which were above the comprehension of man (2 Cor. xii. 2, 3, 4, and Acts xiii. 4, 5, 6, &c.)

Saul and Barnabas went first into Cyprus, where they began to preach in the synagogues of the Jews. When they had gone over the whole island, they there found a Jewish magician called Bar-jesus, who was with the proconsul Sergius Paulus; and who resisted them, and endeavoured to prevent the proconsul from embracing Christianity: whereupon St Paul struck him with blindness; by which miracle the proconsul, being an eye-witness of it, was converted to the Christian faith.

From this conversion, which happened at the city of Paphos, in the year of Christ 45, many think, that the apostle first began to bear the name of *Paul*, which St Luke always gives him afterwards, as is supposed in memory of his converting Sergius Paulus. Some believe that he changed his name upon his own conversion; and Chrysostom will have this change to take place at his ordination, when he received his mission at Antioch; while others say, he took the name *Paul* only when he began to preach to the Gentiles: and, finally, several are of opinion, that he went by the names of both *Saul* and *Paul*, like many other Jews who had one Hebrew name and another Greek or Latin one. Paul.

From the isle of Cyprus, St Paul and his company went to Perga in Pamphylia, where John Mark left them, to return to Jerusalem: but making no stay at Perga, they came to Antioch in Pisidia; where going into the synagogue, and being desired to speak, St Paul made them a long discourse, by which he showed, that Jesus Christ was the Messiah foretold by the prophets, and declared by John the Baptist; that he had been unjustly put to death by the malice and jealousy of the Jews; and that he rose again the third day. They heard him very attentively; and he was desired to discourse

---

was, that *they*, by quitting their Master after his death, might have preserved themselves; whereas *he*, by quitting the Jews, and taking up the cross of Christ, certainly brought on his own destruction.

As St Paul was not an impostor, so it is plain he was not an enthusiast. Heat of temper, melancholy, ignorance, and vanity, are the ingredients of which enthusiasm is composed; but from all these, except the first, the apostle appears to have been wholly free. That he had great fervour of zeal, both when a Jew and when a Christian, in maintaining what he thought to be right, cannot be denied; but he was at all times so much master of his temper, as, in matters of indifference, to "become all things to all men," with the most pliant condescension, bending his notions and manners to theirs, as far as his duty to God would permit; a conduct compatible neither with the stiffness of a bigot nor with the violent impulses of fanatical delusion. That he was not melancholy, is plain from his conduct in embracing every method which prudence could suggest to escape danger and shun persecution, when he could do it without betraying the duty of his office or the honour of his God. A melancholy enthusiast courts persecution; and when he cannot obtain it, afflicts himself with absurd penances: but the holiness of St Paul consisted only in the simplicity of a godly life, and in the unwearied performance of his apostolical duties. That he was ignorant, no man will allege who is not grossly ignorant himself; for he appears to have been master not only of the Jewish learning, but also of the Greek philosophy, and to have been very conversant even with the Greek poets. That he was not credulous, is plain from his having resisted the evidence of all the miracles performed on earth by Christ, as well as those that were afterward worked by the apostles; to the fame of which, as he lived in Jerusalem, he could not possibly have been a stranger. And that he was as free from vanity as any man that ever lived, may be gathered from all that we see in his writings, or know of his life. He represents himself as the least of the apostles, and not meet to be called an apostle. He says that he is the chief of sinners; and he prefers, in the strongest terms, universal benevolence to faith, and prophecy, and miracles, and all the gifts and graces with which he could be endowed. Is this the language of vanity or enthusiasm? Did ever fanatic prefer virtue to his own religious opinions, to illuminations of the spirit, and even to the merit of martyrdom?

Having thus shown that St Paul was neither an impostor nor an enthusiast, it remains only to be inquired, whether he was deceived by the fraud of others: but this inquiry needs not be long, for who was to deceive him? A few illiterate fishermen of Galilee? It was *morally* impossible for such men to conceive the thought of turning the most enlightened of their opponents, and the cruellest of their persecutors, into an apostle, and to do this by a fraud in the very instant of his greatest fury against them and their Lord. But could they have been so extravagant as to conceive such a thought, it was *physically* impossible for them to execute it in the manner in which we find his conversion to have been effected. Could they produce a light in the air, which at mid-day was brighter than the sun? Could they make Saul hear words from out of that light which were not heard by the rest of the company? Could they make him blind for three days after that vision, and then make scales fall off from his eyes, and restore him to sight by a word? Or, could they make him and those who travelled with him believe, that all these things had happened, if they had not happened? Most unquestionably no fraud was equal to all this.

Since then St Paul was neither an impostor, an enthusiast, nor deceived by the fraud of others, it follows, that his conversion was miraculous, and that the Christian religion is a divine revelation. See *Lyttleton's Observations on the Conversion of St Paul*; a treatise to which it has been truly said, that infidelity has never been able to fabricate a specious answer, and of which this note is a very short and imperfect abridgement.

course again on the same subject the next Sabbath-day; and several, both Jews and Gentiles, followed them, to receive particular instructions more at leisure. On the Sabbath day following, almost all the city met together to hear the word of God: but the Jews, seeing the concourse of people, were moved with envy at it; opposed, with blasphemies, what St Paul said; and not being able to bear the happy progress of the gospel in this country, they raised a persecution against the two apostles: whereupon Paul and Barnabas, shaking off the dust upon their feet against them, came from Antioch in Pisidia to Iconium. Being come thither, they preached in their synagogue, and converted a great number, both of Jews and Gentiles; and God confirmed their commission by a great number of miracles (Acts xiv. 1, 2, &c.) In the mean time, the unbelieving Jews, having incensed the Gentiles against Paul and Barnabas, and threatening to stone them, they were obliged to retire to Lystra and Derbe, cities of Lycaonia, where they preached the gospel. At Lystra, there was a man who had been lame from his mother's womb. This man fixing his eyes on St Paul, the apostle bid him rise, and stand upon his feet: whereupon he presently rose up, and walked; the people, seeing this miracle, cried out, that the gods were descended among them in the shape of men. They called Barnabas *Jupiter*, and Paul *Mercury*, because of his eloquence, and being the chief speaker. The priest of Jupiter brought also garlands and bulls before the gate, to offer sacrifices to them: but Paul and Barnabas tearing their clothes, and casting themselves into the middle of the multitude, cried out to them, Friends, what do you do? we are men as well as yourselves; and we are preaching to you to turn away from these vain superstitions, and to worship only the true God, who has made heaven and earth. But whatever they could say, they had much ado to restrain them from offering sacrifices to them.

In the mean time, some Jews of Antioch in Pisidia and of Iconium coming to Lystra, animated the people against the apostles. They stoned Paul, and drew him out of the city, thinking him to be dead. But the disciples gathering together about him, he rose up among them, entered again into the city, and the day after left it with Barnabas to go to Derbe. And having here preached the gospel also, they returned to Lystra, to Iconium, and to Antioch of Pisidia. Passing throughout Pisidia, they came to Pamphylia, and having preached the word of God at Perga, they went down into Attalia. From hence they set sail for Antioch in Syria, from whence they had departed a year before. Being arrived there, they assembled the church together, and told them the great things God had done by their means, and how he had opened to the Gentiles a door of salvation; and here they continued a good while with the disciples.

St Luke does not inform us of the actions of St Paul from the 45th year of Christ to the time of the council at Jerusalem, which was held in the 50th year of Christ. There is great likelihood that it was during this interval that St Paul preached the gospel from Jerusalem to Illyricum, as he informs us in his epistle to the Romans (xv. 19.); and this without making any stay in those places where others had preached before him. He does not acquaint us with the particulars of these journeys, nor with the success of his preaching; but he says in general, that he had suffered more labours than any other, and had endured more prisons. He was often very near death itself, sometimes upon the water and sometimes among thieves. He run great dangers, sometimes from the Jews and sometimes among false brethren and perverse Christians; he was exposed to great hazards, as well in the cities as in the deserts: he suffered hunger, thirst, nakedness, cold, fastings, watchings (2 Cor. xi. 23—27.), and the fatigues inseparable from long journeys, which were undertaken without any prospect of human succour; in this very different from the good fortune of others who lived by the gospel, who received subsistence from those to whom they preached it, and who were accompanied always by religious women, who ministered to them in their necessary occasions. He made it a point of honour to preach gratis, working with his hands that he might not be chargeable to any one (1 Cor. ix. 1—15.); for he had learned a trade, as was usual among the Jews, which trade was to make tents of leather for the use of those that go to war (Acts xviii. 3.) Paul.

St Paul and St Barnabas were at Antioch when some persons coming from Judea (Acts xv. 1, 2, &c.) pretended to teach, that there was no salvation without circumcision, and without the observation of the other legal ceremonies. Epiphanius and Philaster say, that he that maintained this was Cerinthus and his followers. Paul and Barnabas withstood these new doctors; and it was agreed to send a deputation to the apostles and elders at Jerusalem about this question. Paul and Barnabas were deputed; and being arrived at Jerusalem, they reported to the apostles the subject of their commission. Some of the Pharisees that had embraced the faith, asserted, that the Gentiles that were converted ought to receive circumcision, and to observe the rest of the law. But the apostles and elders assembling to examine into this matter, it was by them decreed, that the Gentiles, who were converted to Christianity, should not be obliged to submit to the yoke of the law, but only to avoid idolatry, fornication, and the eating of things strangled, and blood.

St Paul and St Barnabas were then sent back to Antioch with letters from the apostles, which contained the decision of the question, and the resolution of that august assembly. The apostles also deputed Jude surnamed *Barsabas* and Silas, who were principal brethren, to go to Antioch with Paul and Barnabas to give their testimony also of what had been decreed at Jerusalem. Being arrived at Antioch, they assembled the faithful, read to them the apostles letter, and acquainted them, that it had been resolved to discharge them from the yoke of the ceremonial law. Some time after this, St Peter coming to Antioch and joining himself to the converted Gentiles, he lived with them without scruple; but some brethren happening to arrive there from Jerusalem, he separated himself from the Gentile converts, and did no longer eat with them: for which conduct St Paul publicly censured him (Gal. ii. 11—16.) St Paul (*id.* ii. 2, 3, &c.) in the same journey to Jerusalem declared openly to the faithful there the doctrine he preached among the Gentiles; and besides, discoursed of it in private among the chief of them in presence of Barnabas and Titus.

St

Paul. St Peter, St James, and St John, with whom he had these conversations, could find nothing either to be added or amended in so pure and so sound a doctrine and demeanour. They saw with joy the grace that God had given him; they acknowledged that he had been appointed the apostle of the Gentiles, as St Peter had been of the circumcision. They concluded that Paul and Barnabas should continue to preach among the Gentiles; and only recommended to them to take care concerning the collections for the poor; that is to say, to exhort the converted Christians among the Gentiles, to assist the faithful brethren in Judea, who were in necessity; whether it were because they had sold and distributed their goods, or because they had been taken away from them (Heb. x. 34.) Paul.

After Paul and Barnabas had continued some days at Antioch, St Paul proposed to Barnabas to return and visit the brethren through all the cities wherein they had planted the gospel, to see in what condition they were. Barnabas consented to the proposal; but insisted upon taking John Mark along with them. This was opposed by Paul, which produced a separation between them. Barnabas and John Mark went together to Cyprus; and St Paul, making choice of Silas, crossed over Syria and Cilicia, and came to Derbe, and afterwards to Lystra (Acts xvi. 1, 2, &c.) Here they found a disciple called *Timothy*, whom St Paul took with him, and circumcised him that he might not offend the Jews of that country. When therefore they had gone over the provinces of Lycaonia, Phrygia, and Galatia, the Holy Ghost would not allow them to preach the gospel in the proconsular Asia, which contained Ionia, Æolia, and Lydia. They therefore went on to Mysia, and coming to Troas, St Paul had a vision in the night. A man, habited like a Macedonian, presented himself before him, and said, Pass into Macedonia and come and succour us. Immediately he set out on this journey, not doubting but that God had called him into this country.

Embarking therefore at Troas, they sailed to Neapolis. Thence they came to Philippi, where upon the sabbath-day they went near the river side, where the Jews had a place of devotion, and where they found some religious women, among whom was Lydia, who was converted and baptized, and invited the apostle and his company to lodge at her house. Another day, as they went to the same place of devotion, they happened to meet a maid servant possessed with a spirit of divination, who followed St Paul and his company, crying out, that these men were the servants of the most high God, who declared to the world the way of salvation. This she did for several days together; at last St Paul, turning himself towards her, said to the spirit, I command thee in the name of Jesus Christ to come out of the body of this woman: upon which it immediately left her. But the masters of this damsel, who made much money by her, drew Paul and Silas before the magistrates, and accused them of attempting to introduce a new religion into the city. For this the magistrates ordered them to be whipt with rods upon the back and shoulders, and afterwards sent them to prison.

Towards midnight, as Paul and Silas were singing hymns and praises to God, on a sudden there was a great earthquake, so that the foundations of the prison were shaken, and all the doors flew open at the same time, and the fetters of the prisoners burst asunder. The gaoler being awakened at this noise, and seeing all the doors open, he drew his sword with an intention to kill himself, imagining that all the prisoners had made their escape. But Paul cried out to him, that he should do himself no mischief, for they were all safe. Then the gaoler entering and finding all the prisoners there, he brought out Paul and Silas from this place, asking them what he must do to be saved? Paul and Silas instructing him and all his family, gave them baptism. After this the gaoler set before them something to eat; and when the morning was come, the magistrates sent him word that he might release his prisoners, and let them go about their business. But Paul returned this answer to the magistrates; Ye have publicly whipped us with rods, being Roman citizens; ye have thrown us into prison; and now ye would privately dismiss us: But it shall not be so, for you yourselves shall come to fetch us out. The magistrates hearing that they were Roman citizens, came to excuse themselves; and having brought them out of prison, they desired them to depart out of their city. Paul and Silas went first to the house of Lydia, where having visited and comforted the brethren, they departed from Philippi. Paul.

Then passing through Amphipolis and Apollonia, they came to Thessalonica the capital city of Macedonia, where the Jews had a synagogue (Acts xvii. 1, &c.) Paul entered therein, according to his custom, and there preached the gospel to them for three Sabbath-days successively. Some Jews and several proselytes believed in Jesus Christ, and united themselves to Paul and Silas: but the greatest part of the Jews being led away by a false zeal, raised a tumult in the city, and went to the house of Jason where St Paul lodged. But not finding him there, they took Jason and led him before the magistrates, where they accused him of harbouring in his house people that were disobedient to the ordinances of the emperor, and who affirmed that there was another king besides him, one Jesus whom they preached up. But Jason having given security to answer for the people who were accused, he was dismissed to his own house; and the night following the brethren conducted Paul and Silas out of the city, who went to Berea, where they began to preach in the synagogue. The Jews of Berea heard them gladly, and many of them were converted; as also several of the Gentiles and many women of distinction that were not Jewesses.

The Jews of Thessalonica being informed that Paul and Silas were at Berea, came thither and animated the mob against them; so that St Paul was forced to withdraw, leaving Silas and Timothy at Berea to finish the work he had so happily begun. Those who conducted St Paul embarked along with him, and brought him as far as Athens (Theod. in 1 Thessal.), where he arrived in the fifty-second year of Jesus Christ. As soon as he was got thither, he sent back those that had brought him, with orders to tell Silas and Timothy, that he desired them to follow him to Athens as soon as possible. In the mean time, he went into a synagogue of the Jews and preached to them as often as he had opportunity; and disputing with the philosophers who were frequent in that place, they

they at last brought him before the Areopagus, accusing him of introducing a new religion. St Paul being come before the judges, pleaded in his own defence, that among other marks of superstition which he had found in that city, he had observed an altar inscribed, "To the unknown God." It was therefore this God whom they confessed that they knew not, that he came to make known to them. Afterwards he spoke to them of God the creator of heaven and earth, of the superintendence of a providence, of the last judgment, and of the resurrection of the dead. But after they had heard of the resurrection, some made scorn of him, and others desired to hear him another time. However some of them embraced the Christian faith, of which number was Dionysius a senator of the Areopagus, and a woman called *Damaris*, and several others with them.

St Timothy came from Berea to Athens according to the request of St Paul, and informed him of the persecution with which the Christians of Thessalonica were then afflicted. This obliged the apostle to send him into Macedonia, that he might comfort them and keep them stedfast (1 Thessal. iii. 1, 2, &c.) After this St Paul left Athens and went to Corinth, where he lodged with one Aquila a Jew, and by trade a tent-maker (Acts xviii. 1, 2, &c.) With this Aquila the apostle worked, as being of the same trade himself. But, however, he did not neglect the preaching of the gospel, which he performed every day in the synagogue; showing both to the Jews and Gentiles that Jesus was the Messiah. There he made several converts; and he tells us himself (1 Cor. i. 14—17. and xvi. 15.) that he baptized Stephanus and his whole house, with Crispus and Gaius. About the same time Silas and Timothy came to Corinth, and acquainted him with the good state of the faithful at Thessalonica; and soon after this, he wrote his first epistle to the Thessalonians, which is the first of all the epistles that he wrote; and not long after he wrote his second epistle to that church.

St Paul, now finding himself encouraged by the presence of Silas and Timothy, went on with the work of his ministry with new ardour, declaring and proving that Jesus Christ was the true Messiah. But the Jews opposing him with blasphemous and opprobrious words, he shook his clothes at them, and said, "Your blood be upon your own head; from henceforth I shall go to the Gentiles." He then quitted the house of Aquila, and went to lodge with one Titus Justus, who was originally a Gentile, but one that feared God. In the mean time the Lord appeared to St Paul in a vision, told him, that in Corinth he had much people; and this was the reason why the apostle continued there eight months.

But Gallio the pro-consul of Achaia being at Corinth, the Jews of that city rose up against Paul and carried him before Gallio, accusing him of attempting to introduce a new religion among them: however, Gallio sent them away, telling them he would not meddle with disputes that were foreign to his office. Paul continued some time longer at Corinth; but at last he set out for Jerusalem, where he had a mind to be present at the feast of Pentecost. Before he went on shipboard, he cut off his hair at Cenchrea, because he had completed his vow of Nazariteship, in which he had engaged himself. He arrived at Ephesus with Aquila and Priscilla, from whence he went to Cæsarea of Palestine, and thence to Jerusalem. Here having performed his devotions, he came to Antioch, where he stayed some time; and then passing from thence, he made a progress through all the churches of Galatia and Phrygia successively; and having gone over the higher provinces of Asia, he returned to Ephesus, where he abode three years; that is, from the year of Christ 54 to the year 57 (Acts xix. 1, 2, &c.) Paul.

St Paul having arrived at Ephesus, he found there some disciples that had been initiated by Apollos, who had only baptized them with the baptism of John. St Paul instructed them, baptized them with the baptism of Jesus Christ, and laid his hands on them; whereupon they received the Holy Ghost, the gifts of languages and of prophecy. The apostle afterwards went into the synagogue, and preached to the Jews for three months, endeavouring to convince them that Jesus Christ was the Messiah: but as he found them very obstinate, he separated himself from them, and taught daily in the school of one Tyrannus. He performed there several miracles, insomuch, that the linen that had but touched his body, being afterwards applied to the sick, they were presently cured of their diseases, or delivered from the devils that possessed them. He also suffered much there, as well from the Jews as from the Gentiles; and he himself informs us (1 Cor. xv. 31, 32.), that after the manner of men he fought with beasts at Ephesus; that is to say, that he was exposed to wild beasts in the amphitheatre, so that it was expected he should have been devoured by them; but God miraculously delivered him: though some are of opinion, that the fight here mentioned by St Paul was nothing else but the scuffle he had with Demetrius the silver-smith and his companions, who were disappointed in their attempt of putting the apostle to death. It was during his abode at Ephesus that the apostle wrote his epistle to the Galatians.

After this St Paul proposed, at the instigation of the Holy Ghost, to pass through Macedonia and Achaia, and afterwards to go to Jerusalem, saying, that after he had been there, he must also see Rome; and having sent Timothy and Erastus before to Macedonia, he tarried some time in Asia. During this time, he received intelligence that domestic troubles had risen in the church of Corinth, and that abuses had begun to creep in; which made him resolve to write his first epistle to that church.

Soon after this, taking leave of the disciples, he departed for Macedonia (Acts xx. 1, 2, &c.) He embarked at Troas, took Timothy with him, and together passed into Macedonia (2 Cor. ii. 12. and vii. 5—15.) Titus came thither to him, and acquainted him with the good effects that his letter had produced among the Corinthians; and told him, that the collections that had been made by the church of Corinth for the faithful in Palestine were now ready; which engaged Paul to write a second letter to the Corinthians. St Paul, having passed through Macedonia, came into Greece or Achaia, and there continued three months. He visited the faithful of Corinth;

Paul. and having received their alms, as he was upon the point of returning into Macedonia, he wrote his epiſtle to the Romans.

At laſt he left Greece and came into Macedonia, in the year of Chriſt 58, intending to be at Jeruſalem at the feaſt of Pentecoſt. He ſtaid ſome time at Philippi, and there celebrated the feaſt of the paſſover. From hence he embarked and came to Troas, where he continued a week. On the firſt day of the week the diſciples being aſſembled to break bread, as St Paul was to depart the day following, he made a diſcourſe to them which held till midnight. During this time a young man called Eutychus, happening to ſit in a window and fall aſleep, fell down three ſtories high, and was killed by the fall. St Paul came down to him, and embraced him, and reſtored him to life again. Then he went up again, broke bread and eat it, and continued his diſcourſe till day-break, at which time he departed. Thoſe of his company took ſhip at Troas; but as for himſelf he went on foot as far as Aſſos, otherwiſe called *Apollonia*, and then embarked along with them at Mitylene. From hence he came to Miletus, whither the elders of the church of Epheſus came to ſee him; for he had not time to go to them, becauſe he was deſirous of being at Jeruſalem at the feaſt of Pentecoſt.

When theſe elders were arrived at Miletus, St Paul diſcourſed with them, and told them that he was going to Jeruſalem without certainly knowing what ſhould happen to him; however he did not doubt but that he had much to ſuffer there, ſince in all cities the Holy Ghoſt had given him to underſtand, that chains and afflictions waited for him at Jeruſalem. Nevertheleſs, he declared to them, that all this did not terrify him, provided he could but fulfil his miniſtry. After having exhorted them to patience, and having prayed along with them, he went on board, going ſtraight to Coos, then to Rhodes, and thence to Patara (Acts xxi. 1, 2, &c.), where finding a ſhip that was bound for Phœnicia, they went on board and arrived ſafe at Tyre. Here they made a ſtop for ſeven days, and then going on, they arrived at Ptolemais, and thence at Cæſarea, where they found Philip the evangeliſt, who was one of the ſeven deacons. While St Paul was there, the prophet Agabus arrived there alſo from Judea; and having taken St Paul's girdle, he bound his own hands and feet with it, ſaying, "Thus ſhall the Jews of Jeruſalem bind the man that owns this girdle, and ſhall deliver him up to the Gentiles." But St Paul's conſtancy was not ſhaken by all theſe predictions, and he told them, that he was ready, not only to ſuffer bonds, but death itſelf, for the name of Chriſt.

When he was come to Jeruſalem, the brethren received him with joy; and the day following he went to ſee St James the leſs, biſhop of Jeruſalem, at whoſe houſe all the elders aſſembled. Paul gave them an account of what God had done among the Gentiles by his miniſtry. Then St James informed him, that the converted Jews were ſtrangely prejudiced againſt him, becauſe they were informed he taught the Jews that lived among the Gentiles and out of Paleſtine, that they ought to renounce the law of Moſes, and no longer circumciſe their children. Therefore, continued St James, we muſt aſſemble them here together, where you may ſpeak to them yourſelf, and undeceive them. Paul. Moreover do this, that your actions may verify your words: join yourſelf to four men that are here, and who have taken upon them a vow of Nazariteſhip; and that you may ſhare in the merit of their action, contribute to the charge of their purification, and purify yourſelf alſo, that you may offer with them the offerings and ſacrifices ordained for the purification of a Nazarite. See NAZARITE.

St Paul exactly followed this advice of St James, and on the next day went into the temple, where he declared to the prieſts, that in ſeven days theſe four Nazarites would complete their vow of Nazariteſhip; and that he would contribute his ſhare of the charges. But towards the end of theſe ſeven days, the Jews of Aſia having ſeen him in the temple, moved all the people againſt him, laid hold of him, and cried out, "Help, ye Iſraelites, this is he that teaches every where againſt the law, and againſt the temple, and has brought Gentiles into the temple, and profaned this holy place." At the ſame time they laid hold on him, ſhut the gates of the temple, and would have killed him, had not Lyſias the tribune of the Roman garriſon there run to his reſcue, taken him out of their hands, and brought him into the citadel. St Paul being upon the ſteps, deſired the tribune to ſuffer him to ſpeak to the people, who followed him thither in a great multitude. The tribune permitted him, and St Paul, making a ſign with his hand, made a ſpeech in Hebrew (Acts xxii.), and related to them the manner of his converſion, and his miſſion from God to go and preach to the Gentiles. At his mentioning the Gentiles, the Jews began to cry out, "Away with this wicked fellow out of the world, for he is not worthy to live."

Immediately the tribune made him come into the caſtle, and ordered that he ſhould be examined by whipping him, in order to make him confeſs the matter why the Jews were ſo incenſed againſt him. Being now bound, he ſaid to the tribune, "Is it lawful for you to whip a Roman citizen before you hear him?" The tribune hearing this, cauſed him to be unbound, and calling together the prieſts and the ſenate of the Jews, he brought Paul before them, that he might know the occaſion of this tumult of the people. Then Paul began to ſpeak to them to this purpoſe, (Acts xxiii.): "Brethren, I have lived in all good conſcience before God until this day." At which words, Ananias, ſon of Nebedeus, who was the chief-prieſt, ordered the by-ſtanders to give him a blow in the face. At which St Paul ſaid to him, "God ſhall ſmite thee, thou whited wall; for ſitteſt thou to judge me after the law, and commandeſt me to be ſmitten contrary to the law?" Thoſe that were preſent ſaid to him, "Revileſt thou God's high-prieſt?" St Paul excuſed himſelf by ſaying, that he did not know he was the high prieſt, "For it is written, thou ſhalt not ſpeak evil of the ruler of thy people." Then perceiving that part of the aſſembly were Sadducees and part Phariſees, he cried out, "Brethren, I am a Phariſee, the ſon of a Phariſee; of the hope and reſurrection of the dead I am called in queſtion."

Then the aſſembly being divided in intereſts and opinions, and the clamour increaſing more and more, the tribune ordered the ſoldiers to fetch him away out

aul. of the aſſembly, and bring him into the caſtle. The following night the Lord appeared to Paul, and ſaid to him, "Take courage, for as you have bore teſtimony of me at Jeruſalem, ſo muſt you alſo at Rome." The day following, more than 40 Jews engaged themſelves by an oath, not to eat or drink till they had killed Paul. They came, therefore, and made known their deſign to the prieſts and chiefs of the people, ſaying to them, "To-morrow cauſe Paul to appear before you, as if you would inquire more accurately into his affair, and before he can come to you, we will lie in wait for him and kill him." But St Paul, being informed of this conſpiracy by his ſiſter's ſon, acquainted the tribune with it; who gave orders that the night following he ſhould be ſent to Cæſarea, to Felix the governor, who had his ordinary reſidence there. Felix having received letters from Lyſias, and being informed that St Paul was of Cilicia, he told him he would hear him when his accuſers ſhould arrive.

Five days after, Ananias the high-prieſt and ſome of the ſenators came to Cæſarea, bringing with them Tertullus the orator, to plead againſt Paul. Tertullus accuſed him of being a ſeditious perſon, a diſturber of the public peace; one who had put himſelf at the head of a ſect of Nazarenes, and who made no ſcruple even to profane the temple, (*id.* xxiv.) But St Paul eaſily refuted theſe calumnies, and defied his accuſers to prove any of the articles they had exhibited againſt him: he ended his diſcourſe by ſaying, "That for the doctrine of the reſurrection from the dead, his adverſaries would have him condemned." Felix put off the further hearing of this cauſe till another time; and, ſome days afterwards, came himſelf with his wife Druſilla to hear Paul; and being in hopes that the apoſtle would purchaſe his freedom with a ſum of money, he uſed him well, often ſent for him, and had frequent converſations with him.

Two years having paſſed thus away, Felix made way for his ſucceſſor Portius Feſtus; but being willing to oblige the Jews, he left Paul in priſon. Feſtus being come to Jeruſalem, the chief prieſts deſired to ſend for Paul, with a deſign to fall upon him by the way. But Feſtus told them, they might come to Cæſarea, where he would do them juſtice. Hither the Jews came, and accuſed Paul of ſeveral crimes, of which they were able to prove nothing, (*id.* xxv.) Feſtus then propoſed to the apoſtle to go to Jeruſalem, and be tried there; but he anſwered, "That he was now at the emperor's tribunal, where he ought to be tried; and that he appealed to Cæſar:" whereupon Feſtus, having conferred with his council, told him, that therefore to Cæſar he ſhould go.

Some days after, King Agrippa and his wife Berenice coming to Cæſarea, deſired to hear Paul; who pleaded his cauſe with ſuch ability, that Agrippa exclaimed, "Almoſt thou perſuadeſt me to be a Chriſtian." See AGRIPPA.

As ſoon, therefore, as it was reſolved to ſend Paul into Italy, he was put on board a ſhip at Adramyttium, a city of Myſia; and having paſſed over the ſeas of Cilicia and Pamphylia, they arrived at Myra in Lycia, where, having found a ſhip that was bound for Italy, they went on board, (*id.* xxvii.) But the ſeaſon being far advanced (for it was at leaſt the latter end of September), and the wind proving contrary, they with much difficulty arrived at the Fair Haven, a port in the iſle of Crete. St Paul adviſed them to winter there: however, others were of opinion they had better go to Phenice, another harbour of the ſame iſland; but as they were going thither, the wind drove them upon a little iſland called *Clauda*, where the mariners, fearing to ſtrike upon ſome bank of ſand, they lowered their maſt, and ſurrendered themſelves to the mercy of the waves. Three days after this, they threw overboard the tackling of the ſhip. Neither ſun nor ſtars had appeared now for 14 days. In this extreme danger, an angel appeared to St Paul, and aſſured him, that God had given him the lives of all that were in the ſhip with him; which were in all 276 ſouls. St Paul told them of his viſion, exhorted them to take courage, and promiſed them that they ſhould all come alive into an iſland; and that the veſſel only ſhould be loſt. On the 14th night the ſeamen caſt out the lead, and thought by their ſounding that they approached near to ſome land. They were attempting to ſave themſelves by going into the boat; but St Paul told the centurion and the ſoldiers, that except the ſailors continued in the ſhip, their lives could not be ſaved. Then the ſoldiers cut the ropes of the boat, and let her drive. About day-break, St Paul perſuaded them to take ſome nouriſhment, aſſuring them that not a hair of their heads ſhould periſh. After his example, they took ſome food, and when they had eat, they lightened their veſſel, by throwing the corn into the ſea. Day being come, they perceived a ſhore, where they reſolved, if poſſible, to bring the ſhip to. But the veſſel having ſtruck againſt a neck of land that run out into the ſea, ſo that the head remained fixed, and the ſtern was expoſed to the mercy of the waves; the ſoldiers, fearing leſt any of the priſoners ſhould make their eſcape by ſwimming, were for putting them all to the ſword. But the centurion would not ſuffer them, being willing to ſave Paul; and he commanded thoſe that could ſwim to throw themſelves firſt out of the veſſel; and the reſt got planks, ſo that all of them came ſafe to ſhore. Then they found that the iſland was called *Melita* or *Malta*; the inhabitants of which received them with great humanity, (Acts xxvii. 1, 2, 3, &c.) Paul.

They being all very wet and cold, a great fire was lighted to dry them; and Paul having gathered up a handful of ſticks, and put them upon the fire, a viper leaped out of the fire, and took hold of his hand. Then the barbarous people ſaid to one another, "Without doubt this man is a murderer; and though he has been ſaved from the ſhipwreck, yet divine vengeance ſtill purſues him, and will not ſuffer him to live." But Paul, ſhaking the viper into the fire, received no injury from it. The people, ſeeing this, changed their opinion of him, and took him for a god; which opinion of theirs was more confirmed, by his curing the father of Publius, the chief man of the iſland, of a fever and bloody-flux. After this miracle, they all brought out their ſick to him, and they were healed. See MELITA.

At the end of three months they embarked again; and arrived, firſt at Syracuſe, then at Rhegium, and laſtly at Puteoli. Here St Paul found ſome Chriſtians, who detained him for ſeven days; then he ſet out for Rome. The brethren of this city, having been informed

Paul. formed of St Paul's arrival, came out to meet him as far as Appii-forum, and the Three Taverns. And when he was come to Rome, he was allowed to dwell where he pleased, having a soldier to guard him, who was joined to him with a chain. Three days afterwards, St Paul desired the chief of the Jews there to come to him. He related to them in what manner he had been seized in the temple of Jerusalem, and the necessity he was under of appealing to Cæsar. The Jews told him, that as yet they had received no information about his affair; and, as for Christianity, they knew nothing of it, but only that it was spoken against everywhere; however, that they should be very willing to have some account of that doctrine from him. A day was appointed for this purpose; when St Paul preached to them concerning the kingdom of God, endeavouring to convince them from Moses and the prophets, that Jesus was the Messiah. Some of them believed what he had said to them, while others disbelieved; so that they returned from him divided among themselves.

Paul dwelt for two whole years at Rome, from the year of Christ 61 to the year 63, in a lodging that he hired: where he received all that came to him, preaching the kingdom of God, and the religion of Jesus Christ, without any interruption.

Hitherto we have had the Acts of the Apostles for our guide, in compiling the history of St Paul; what we shall add hereafter, will be mostly taken from his own Epistles. His captivity did not a little contribute to the advancement of religion; for he converted several persons even of the emperor's court, (Philip. i. 12—18. and iv. 22.) The Christians of Philippi, in Macedonia, hearing that St Paul was a prisoner at Rome, sent Epaphroditus their bishop to him, to bring him money, and otherwise to assist him in their name, (Phil. ii. 25.) Epaphroditus fell sick at Rome; and when he went back to Macedonia, the apostle sent by him his Epistle to the Philippians.

It is not known by what means St Paul was delivered from his prison, and discharged from the accusation of the Jews. There is great probability that they durst not appear against him before the Emperor, as not having sufficient proof of what they laid to his charge. However that may be, it is certain that he was set at liberty, after having been two years a prisoner at Rome. He wrote also, during this imprisonment, his Epistles to Philemon and the Colossians.

He was still in the city Rome, or at least in Italy, when he wrote his Epistle to the Hebrews. St Paul, having got out of prison, went over Italy; and, according to some of the fathers, passed into Spain; then into Judea; went to Ephesus, and there left Timothy (Heb. xiii. 24. and 1 Tim. i. 3.); preached in Crete, and there fixed Titus, to take care to cultivate the church he had planted in that place. Probably he might also visit the Philippians, according to the promise he had made them, (Phil. i. 23, 26. and ii. 24.); and it is believed, that it was from Macedonia that he wrote the First Epistle to Timothy.—Some time after, he wrote to Titus, whom he had left in Crete; he desires him to come to Nicopolis, from whence, probably, he sent this letter. The year following, that is, the 63d year of the Christian era, the apostle went into Asia, and came to Troas, (2 Tim. iv. 13) Thence he went to visit Timothy at Ephesus, and from that to Miletus, (2 Tim. iv. 20) Lastly, he went to Rome; and St Chrysostom says, that it was reported, that having converted a cup-bearer and a concubine of Nero, this so provoked the Emperor, that he caused St Paul to be apprehended, and clapped into prison. It was in this last place of confinement that he wrote his Second Epistle to Timothy, which Chrysostom looks upon as the apostle's last testament. See TIMOTHY and TITUS. Paul.

This great apostle at last consummated his martyrdom, the 29th of June, in the 66th year of Jesus Christ, by having his head cut off, at a place called the *Salvian Waters*. He was buried on the way of Ostium, and a magnificent church was built over his tomb, which is in being to this day. *Calmet's Dict.* &c.

PAUL (St), *Cave or Grotto of*, in the island of Malta, where St Paul and his company took shelter from the rains, when the viper fastened on his arm. Upon this spot there is a church built by the famed Adolf de Vignacourt, grand-master of the order, in the year 1606, a very handsome, though but a small, structure. On the altar piece is a curious painting, representing the apostle's shaking off the viper, surrounded with men, women, and children, in attitudes of admiration and surprise, and in the old Maltese garb; and the whole very well executed. On the top of the painting is the following inscription:

Vipera ignis acta calore frustra Pauli
Manum invadit; is insulæ benedicens
Anguibus & herbis adimit omne virus.
M.DC.V.

PAUL, first bishop of Narbonne, or Sergius Paulus the proconsul, converted and made bishop by St Paul, was descended from one of the best families of Rome. It is said the apostle called himself *Paul*, from his name. The Spaniards will have him to be their apostle, which is not improbable; and it is said he died a martyr at Narbonne.

PAUL V. by birth a Roman, was first clerk of the chamber, and afterwards nuncio to Clement VIII. in Spain, who honoured him with a cardinal's hat. He was advanced to the papal chair the 16th of May 1605, after Leo XI. The ancient quarrel between the secular and ecclesiastical jurisdictions, which in former times had occasioned so much bloodshed, revived in the reign of this pontiff. The senate of Venice had condemned by two decrees, 1. The new foundations of monasteries made without their concurrence. 2. The alienation of the estates both ecclesiastical and secular. The first decree passed in 1603, and the second in 1605. About the same time a canon and abbot, accused of rapine and murder, were arrested by order of the senate, and delivered over to the secular court; a circumstance which could not fail to give offence to the court of Rome. Clement VIII. thought it proper to dissemble or take no notice of the affair; but Paul V who had managed the Genoese upon a similar occasion, flattered himself with the hopes that the Venetians would be equally pliant. However, he was disappointed; for the senate maintained that they held their power to make laws of God only; and therefore they refused to revoke their decrees and deliver up the ecclesiastical

Paul. ecclesiastical prisoners into the hands of the nuncio, as the pope demanded. Paul, provoked at this behaviour, excommunicated the doge and senate; and threatened to put the whole state under an interdict, if satisfaction was not given him within the space of 24 hours. The senate did no more than protest against this menace, and forbid the publication of it throughout their dominions. A number of pamphlets, from both sides, soon announced the animosity of the two parties. The Capuchins, the Theatins, and Jesuits, were the only religious orders who observed the interdict. The senate shipped them all off for Rome, and the Jesuits were banished for ever. Meantime his holiness was preparing to make the refractory republic submit to his spiritual tyranny by force of arms. He levied troops against the Venetians; but he soon found his design baulked, as the cause of the Venetians appeared to be the common cause of all princes. He had recourse, therefore, to Henry IV. to settle the differences: and this prince had all the honour of bringing about a reconciliation between the contending parties. His ambassadors at Rome and Venice began the negociation, and Cardinal de Joyeuse finished it in 1607. It was agreed upon, that this cardinal should declare at his entry into the senate, that the censures of the church were to be taken off, or that he would remove them; and that the doge should at the same time surrender to him the deeds of revocation and protest. It was also stipulated, that all the religious who were banished, except the Jesuits, should be restored to their former privileges. In fine, the Venetians promised to send an ambassador extraordinary to Rome, in order to thank the pope for the favour he had done them; but they would not allow the legate to speak of his holiness granting them absolution. Paul was wise enough to overlook the whole matter, but endeavoured to put an end to another dispute, which had been long agitated in the congregations *de auxiliis*. He caused it to be intimated in form to the disputants and counsellors, that, as the congregations were now dissolved, it was his express order that the contending parties should no longer continue to censure one another. Some authors have affirmed that Paul V. had drawn out a bull against the doctrine of Molina, which only wanted to be promulged; but for this fact there appears to be no other evidence than the draught of this bull, which we meet with in the end of the history of the above mentioned congregations. Paul was strongly solicited, but in vain, to make *the immaculate conception of the holy virgin* an article of faith. He contented himself with barely forbidding the contrary doctrine to be publicly taught, that he might not offend the Dominicans, who, at that time, maintained that she was conceived, like other human creatures, in original sin. His holiness afterwards applied himself to the embellishing of Rome, and was at great pains to collect the works of the most eminent painters and engravers. Rome is indebted to him for its most beautiful fountains, especially that where the water spouts out from an antique vase taken from the thermæ or hot-baths of Vespasian, and that which they call *aqua Paola*, an ancient work of Augustus, restored by Paul V. He brought water into it by an aqueduct 35 miles in length, after the example of Sixtus V. He completed the frontispiece of St Peter, and the magnificent palace of Mount Cavallo. He Paul. applied himself in a particular manner to the recovering and repairing ancient monuments, which he made to advance, as much as the nature of them would admit, the honour of Christianity; as appears from an elegant inscription placed upon a column of porphyry, taken from the temple of Peace, and bearing a beautiful statue of the Virgin, at the side of the church of St Mary the elder:

"Impura falsi templa
Quondam numinis
Jubente moesta perferebam Cæsare:
Nunc læta veri
Perferens matrem Dei
Te, Paule, nullis obticebo sæculis."

His pontificate was honoured with several illustrious embassies. The kings of Japan, Congo, and other Indian princes, sent ambassadors to him. He took care to supply them with missionaries, and to found bishopricks in these countries newly brought over to the faith. He showed the same attention to the Maronites and other eastern Christians. He sent legates to different orthodox princes, both to testify his esteem for them, and to confirm them in their zeal for religion. He died the 28th of January 1621, aged 69; after having confirmed the French Oratory, the Ursulines, the Order of Charity, and some other institutions. Bold in his claims, but of narrow views, he distinguished himself more by his piety and knowledge than by his politics. It has been remarked, that he never passed a single day of his popedom without celebrating mass. He enjoined all the religious in the prosecution of their studies to have regular professors for Latin, Greek, Hebrew, and Arabic; if there were any among themselves properly qualified; or if that was not the case, to take the assistance of laymen for that purpose, until there were some of their own order who had learning enough to instruct their brethren. It was very difficult to carry this decree into execution; and indeed it was always very imperfectly observed.

Paul (Father), whose name, before he entered into the monastic life, was Peter Sarpi, was born at Venice, August 14. 1552. His father followed merchandise, but with so little success, that at his death he left his family very ill provided for; but under the care of a mother whose piety was likely to bring the blessing of providence upon them, and whose wise conduct supplied the want of fortune by advantages of greater value. Happily for young Sarpi she had a brother, master of a celebrated school, under whose direction he was placed by her. Here he lost no time, but cultivated his abilities, naturally of the first rate, with unwearied application. He was born for study, having a natural aversion to pleasure and gaiety, and a memory so tenacious that he could repeat 30 verses upon once hearing them. Proportionable to his capacity was his progress in literature: at 13, having made himself master of school learning, he turned his studies to philosophy and the mathematics, and entered upon logic under Capella of Cremona, who, though a celebrated master of that science, confessed himself in a very little time unable to give his pupil any farther instructions.

Paul. As Capella was of the order of the Servites, his ſcholar was induced by his acquaintance with him to engage in the ſame profeſſion, though his uncle and his mother repreſented to him the hardſhips and auſterities of that kind of life, and adviſed him with great zeal againſt it. But he was ſteady in his reſolutions, and in 1566 took the habit of the order, being then only in his 14th year, a time of life in moſt perſons very improper for ſuch engagements, but in him attended with ſuch maturity of thought, and ſuch a ſettled temper, that he never ſeemed to regret the choice he then made, and which he confirmed by a ſolemn public profeſſion in 1572. Paul.

At a general chapter of the Servites held at Mantua, Paul (for ſo we ſhall now call him) being then only 20 years old, diſtinguiſhed himſelf ſo much in a public diſputation by his genius and learning, that William duke of Mantua, a great patron of letters, ſolicited the conſent of his ſuperiors to retain him at his court, and not only made him public profeſſor of divinity in the cathedral, and reader of caſuiſtical divinity and canon law in that city, but honoured him with many proofs of his eſteem. But Father Paul finding a court life not agreeable to his temper, quitted it two years afterwards, and retired to his beloved privacies, being then not only acquainted with the Latin, Greek, Hebrew, and Chaldee languages, but with philoſophy, the mathematics, canon and civil law, all parts of natural philoſophy, and chemiſtry itſelf; for his application was unintermitted, his head clear, his apprehenſion quick, and his memory retentive.

Being made a prieſt at 22, he was diſtinguiſhed by the illuſtrious Cardinal Borromeo with his confidence, and employed by him on many occaſions, not without the envy of perſons of leſs merit, who were ſo far exaſperated as to lay a charge againſt him before the Inquiſition, for denying that the Trinity could be proved from the firſt chapter of Geneſis; but the accuſation was too ridiculous to be taken notice of. After this he paſſed ſucceſſively through the dignities of his order, of which he was choſen provincial for the province of Venice at 26 years of age; and diſcharged this poſt with ſuch honour, that in 1579 he was appointed, with two others, to draw up new regulations and ſtatutes for his order. This he executed with great ſucceſs; and when his office of provincial was expired, he retired for three years to the ſtudy of natural and experimental philoſophy and anatomy, in which he is ſaid to have made ſome uſeful diſcoveries. In the intervals of his employment he applied himſelf to his ſtudies with ſo extenſive a capacity, as left no branch of knowledge untouched. By him Acquapendente, the great anatomiſt, confeſſes that he was informed how viſion is peformed; and there are proofs that he was not a ſtranger to the circulation of the blood. He frequently converſed upon aſtronomy with mathematicians, upon anatomy with ſurgeons, upon medicine with phyſicians, and with chemiſts upon the analyſis of metals, not as a ſuperficial inquirer, but as a complete maſter. He was then choſen procurator general of his order; and during his reſidence at Rome was greatly eſteemed by Pope Sixtus V. and contracted an intimate friendſhip with Cardinal Bellarmine and other eminent perſons.

But the hours of repoſe, that he employed ſo well, were interrupted by a new information in the Inquiſition; where a former acquaintance produced a letter written by him in cyphers, in which he ſaid, "that he deteſted the court of Rome, and that no preferment was obtained there but by diſhoneſt means." This accuſation, however dangerous, was paſſed over on account of his great reputation; but made ſuch impreſſions on that court, that he was afterwards denied a biſhopric by Clement VIII. After theſe difficulties were ſurmounted, F. Paul again retired to his ſolitude; where he appears, by ſome writings drawn up by him at that time, to have turned his attention more to improvements in piety than learning. Such was the care with which he read the ſcriptures, that, it being his cuſtom to draw a line under any paſſage which he intended more nicely to conſider, there was not a ſingle word in his New Teſtament but was underlined. The ſame marks of attention appeared in his Old Teſtament, Pſalter, and Breviary.

But the moſt active ſcene of his life began about the year 1615; when Pope Paul V. exaſperated by ſome decrees of the ſenate of Venice that interfered with the pretended rights of the church, laid the whole ſtate under an interdict. The ſenate, filled with indignation at this treatment, forbad the biſhops to receive or publiſh the pope's bull; and, convening the rectors of the churches, commanded them to celebrate divine ſervice in the accuſtomed manner, with which moſt of them readily complied: but the Jeſuits and ſome others refuſing, were by a ſolemn edict expelled the ſtate. Both parties having proceeded to extremities, employed their ableſt writers to defend their meaſures. On the pope's ſide, among others, Cardinal Bellarmine entered the liſts, and, with his confederate authors, defended the papal claims with great ſcurrility of expreſſion, and very ſophiſtical reaſonings; which were confuted by the Venetian apologiſts in much more decent language, and with much greater ſolidity of argument. On this occaſion F. Paul was moſt eminently diſtinguiſhed by his Defence of the Rights of the ſupreme Magiſtrate, his Treatiſe of Excommunication, tranſlated from Gerſon, with an Apology, and other writings; for which he was cited before the Inquiſition at Rome: but it may be eaſily imagined that he did not obey the ſummons.

The Venetian writers, whatever might be the abilities of their adverſaries, were at leaſt ſuperior to them in the juſtice of their cauſe. The propoſitions maintained on the ſide of Rome were theſe: That the pope is inveſted with all the authority of heaven and earth: that all princes are his vaſſals, and that he may annul their laws at pleaſure: that kings may appeal to him, as he is temporal monarch of the whole earth: that he can diſcharge ſubjects from their oaths of allegiance, and make it their duty to take up arms againſt their ſovereign: that he may depoſe kings without any fault committed by them, if the good of the church requires it: that the clergy are exempt from all tribute to kings, and are not accountable to them even in caſes of high-treaſon: that the pope cannot err: that his deciſions are to be received and obeyed on pain of ſin, though all the world ſhould judge them to be falſe: that the pope is God upon earth: that his ſentence and that of God are the ſame: and that to call his power in queſtion is to call in queſtion the power of God; maxims equally ſhocking, weak,

Paul. weak, pernicious, and abſurd; which did not require the abilities or learning of F. Paul to demonſtrate their falſehood and deſtructive tendency. It may be eaſily imagined that ſuch principles were quickly overthrown, and that no court but that of Rome thought it for its intereſt to favour them. The pope, therefore, finding his authors confuted and his cauſe abandoned, was willing to conclude the affair by treaty; which, by the mediation of Henry IV. of France, was accommodated upon terms very much to the honour of the Venetians. But the defenders of the Venetian rights were, though comprehended in the treaty, excluded by the Romans from the benefit of it: ſome, upon different pretences, were impriſoned; ſome ſent to the galleys; and all debarred from preferment. But their malice was chiefly aimed againſt F. Paul, who ſoon found the effects of it; for as he was going one night to his convent, about ſix months after the accommodation, he was attacked by five ruffians armed with ſtilettoes, who gave him no leſs than fifteen ſtabs, three of which wounded him in ſuch a manner that he was left for dead. The murderers fled for refuge to the nuncio, and were afterwards received into the pope's dominions; but were purſued by divine juſtice, and all, except one man who died in priſon, periſhed by violent deaths.

This, and other attempts upon his life, obliged him to confine himſelf to his convent, where he engaged in writing the Hiſtory of the Council of Trent; a work unequalled for the judicious diſpoſition of the matter, and artful texture of the narration; commended by Dr Burnet as the compleateſt model of hiſtorical writing; and celebrated by Mr Wotton as equivolent to any production of antiquity; in which the reader finds "liberty without licentiouſneſs, piety without hypocriſy, freedom of ſpeech without neglect of decency, ſeverity without rigour, and extenſive learning without oſtentation."

In this, and other works of leſs conſequence, he ſpent the remaining part of his life to the beginning of the year 1622, when he was ſeized with a cold and fever, which he neglected till it became incurable. He languiſhed more than twelve months, which he ſpent almoſt wholly in a preparation for his paſſage into eternity; and among his prayers and aſpirations was often heard to repeat, "Lord! now let thy ſervant depart in peace." On Sunday the eighth of January of the next year, he roſe, weak as he was, to maſs, and went to take his repaſt with the reſt; but on Monday was ſeized with a weakneſs that threatened immediate death; and on Thurſday prepared for his change, by receiving the viaticum, with ſuch marks of devotion as equally melted and edified the beholders. Through the whole courſe of his illneſs to the laſt hour of his life he was conſulted by the ſenate in public affairs, and returned anſwers in his greateſt weakneſs with ſuch preſence of mind as could only ariſe from the conſciouſneſs of innocence.

On Saturday, the day of his death, he had the paſſion of our bleſſed Saviour read to him out of St John's goſpel, as on every other day of that week, and ſpoke of the mercy of his Redeemer, and his confidence in his merits. As his end evidently approached, the brethren of his convent came to pronounce the laſt prayers, with which he could only join in his thoughts, being able to pronounce no more than theſe words, *Eſto perpetua*, "Mayeſt thou laſt for ever;" which was underſtood to be a prayer for the proſperity of his country. Thus died F. Paul, in the 71ſt year of his age; hated by the Romans as their moſt formidable enemy, and honoured by all the learned for his abilities, and by the good for his integrity. His deteſtation of the corruption of the Roman church appears in all his writings, but particularly in this memorable paſſage of one of his letters: "There is nothing more eſſential than to ruin the reputation of the Jeſuits. By the ruin of the Jeſuits, Rome will be ruined; and if Rome is ruined, religion will reform of itſelf." He appears, by many paſſages in his life, to have had a high eſteem for the church of England; and his friend F. Fulgentio, who had adopted all his notions, made no ſcruple of adminiſtering to Dr Duncombe, an Engliſh gentleman that fell ſick at Venice, the communion in both kinds, according to the Common Prayer which he had with him in Italian. He was buried with great pomp at the public charge, and a magnificent monument was erected to his memorial.

Paul, in ſea language, is a ſhort bar of wood or iron, fixed cloſe to the capſtern or windlas of a ſhip, to prevent thoſe engines from rolling back or giving way when they are employed to heave in the cable, or otherwiſe charged with any great effort.

PAULIANISTS, Paulianistæ, a ſect of heretics, ſo called from their founder Paulus Samoſatenus, a native of Samoſata, elected biſhop of Antioch in 262. His doctrine ſeems to have amounted to this: that the Son and the Holy Ghoſt exiſt in God in the ſame manner as the faculties of reaſon and activity do in man; that Chriſt was born a mere man; but that the reaſon or wiſdom of the Father deſcended into him, and by him wrought miracles upon earth, and inſtructed the nations; and, finally, that, on account of this union of the Divine Word with the man Jeſus, Chriſt might, though improperly, be called God. It is alſo ſaid, that he did not baptize in the name of the Father and the Son, &c.; for which reaſon the council of Nice ordered thoſe baptized by him to be re-baptized.

Being condemned by Dionyſius Alexandrinus in a council, he abjured his errors, to avoid depoſition; but ſoon after he reſumed them, and was actually depoſed by another council in 269. —— He may be conſidered as the father of the modern Socinians; and his errors are ſeverely condemned by the council of Nice, whoſe creed differs a little from that now uſed, under the ſame name, in the church of England. The creed agreed upon by the Nicene fathers, with a view to the errors of Paulus Samoſatenus, concludes thus: τους δε λεγοντας ην ποτε ουκ ην και πριν γεννηθηναι, ουκ ην, &c. τουτους αναθεματιζει η καθολικη και αποστολικη εκκλησια.—— "But thoſe who ſay there was a time when he was not, and that he was not before he was born, the catholic and apoſtolic church anathematizes." To thoſe who have any veneration for the council of Nice this muſt appear a very ſevere, and perhaps not unjuſt, cenſure of ſome other modern ſects as well as of the Socinians.

Paul II Paulicians.

PAULICIANS, a branch of the ancient Manichees, ſo called from their founder, one Paulus, an Armenian, in the ſeventh century; who, with his brother John, both of Samoſata, formed this ſect: though others

Paulicians. are of opinion, that they were thus called from another Paul, an Armenian by birth, who lived under the reign of Juſtinian II. In the ſeventh century a zealot called Conſtantine revived this drooping ſect, which had ſuffered much from the violence of its adverſaries, and was ready to expire under the ſeverity of the imperial edicts, and that zeal with which they were carried into execution. The Paulicians, however, by their number, and the continuance of the emperor Nicephorus, became formidable to all the Eaſt.

But the cruel rage of perſecution, which had for ſome years been ſuſpended, broke forth with redoubled violence under the reigns of Michael Curopalates and Leo the Armenian, who inflicted capital puniſhment on ſuch of the Paulicians as refuſed to return into the boſom of the church. The empreſs Theodora, tutoreſs of the Emperor Michael, in 845, would oblige them either to be converted or to quit the empire: upon which ſeveral of them were put to death, and more retired among the Saracens; but they were neither all exterminated nor baniſhed.

Upon this they entered into a league with the Saracens; and chooſing for their chief an officer of the greateſt reſolution and valour, whoſe name was Carbeas, they declared againſt the Greeks a war which was carried on for fifty years with the greateſt vehemence and fury. During theſe commotions, ſome Paulicians, towards the concluſion of this century, ſpread abroad their doctrines among the Bulgarians; many of them, either from a principle of zeal for the propagation of their opinions, or from a natural deſire of flying from the perſecution which they ſuffered under the Grecian yoke, retired, about the cloſe of the eleventh century, from Bulgaria and Thrace, and formed ſettlements in other countries. Their firſt migration was into Italy; whence, in proceſs of time, they ſent colonies into almoſt all the other provinces of Europe, and formed gradually a conſiderable number of religious aſſemblies, who adhered to their doctrine, and who were afterwards perſecuted with the utmoſt vehemence by the Roman pontiffs. In Italy they were called *Patarini*, from a certain place called *Pataria*, being a part of the city of Milan, where they held their aſſemblies; and *Gathari* or *Gazari*, from Gazaria, or the Leſſer Tartary. In France they were called *Albigenſes*, though their faith differed widely from that of the Albigenſes whom Proteſtant writers generally vindicate. (See Albigenses). The firſt religious aſſembly the Paulicians had formed in Europe is ſaid to have been diſcovered at Orleans in 1017, under the reign of Robert, when many of them were condemned to be burnt alive. The ancient Paulicians, according to Photius, expreſſed the utmoſt abhorrence of Manes and his doctrine. The Greek writers compriſe their errors under the ſix following particulars: 1. They denied that this inferior and viſible world is the production of the ſupreme Being; and they diſtinguiſh the Creator of the world and of human bodies from the moſt high God who dwells in the heavens: and hence ſome have been led to conceive that they were a branch of the Gnoſtics rather than of the Manichæans. 2. They treated contemptuouſly the Virgin Mary; or, according to the uſual manner of ſpeaking among the Greeks, they refuſed to adore and worſhip her. 3. They refuſed to celebrate the inſtitution of the Lord's ſupper. 4. They loaded the croſs of Chriſt with contempt and reproach; by which we are only to underſtand, that they refuſed to follow the abſurd and ſuperſtitious practice of the Greeks, who paid to the pretended wood of the croſs a certain ſort of religious homage. 5. They rejected, after the example of the greateſt part of the Gnoſtics, the books of the Old Teſtament; and looked upon the writers of that ſacred hiſtory as inſpired by the Creator of this world, and not by the ſupreme God. 6. They excluded preſbyters and elders from all part in the adminiſtration of the church.

Paulina || Paulinus.

PAULINA, a Roman lady, wife of Saturnius governor of Syria, in the reign of the Emperor Tiberius. Her conjugal peace was diſturbed, and violence was offered to her virtue, by a young man named Mundus, who fell in love with her, and had cauſed her to come to the temple of Iſis by means of the prieſts of that goddeſs, who declared that Anubis wiſhed to communicate to her ſomething of moment. Saturnius complained to the emperor of the violence which had been offered to his wife; and the temple of Iſis was overturned, and Mundus baniſhed, &c.—There was beſides a *Paulina*, wife of the philoſopher Seneca. She attempted to kill herſelf when Nero had ordered her huſband to die. The emperor, however, prevented her; and ſhe lived ſome few years after in the greateſt melancholy.

PAULINIA, in botany: A genus of the trigynia order, belonging to the octandria claſs of plants; and in the natural method ranking under the 23d order, *Trihilatæ*. Its characters are theſe: the flowers has a permanent empalement, compoſed of four ſmall oval leaves; it has four oblong oval petals, twice the ſize of the empalement: and eight ſhort ſtamina with a turbinated germen, having three ſhort ſlender ſtyles, crowned by ſpreading ſtigmas; the germen turns to a large three-cornered capſule with three cells, each containing one almoſt oval ſeed. Linnæus reckons ſeven, and Miller nine, ſpecies, natives of the Weſt Indies.

PAULINUS, a biſhop who flouriſhed in the early part of the 7th century. He was the apoſtle of Yorkſhire, having been the firſt archbiſhop of York. This dignity ſeems to have been conferred on him about the year 626. He built a church at Almonbury, and dedicated it to St Alban, where he preached to and converted the Brigantes. Camden mentions a croſs at Dewſborough, which had been erected to him with this inſcription, *Paulinus hic prædicavit et celebravit*. York was ſo ſmall about this time, that there was not ſo much as a ſmall church in it in which King Edwin could be baptized. Conſtantius is ſaid to have made it a biſhopric. Pope Honorius made it a metropolitan ſee. We are told that Paulinus baptized in the river Swale, in one day, 10,000 men, beſides women and children, on the firſt converſion of the Saxons to Chriſtianity, beſides many at Halyſtone. At Walſtone, in Northumberland, he baptized Segbert king of the Eaſt Saxons. Bede ſays, "Paulinus coming with the king and queen to the royal manor called *Ad-Gebrin* (now Yeverin), ſtaid there 36 days with them, employed in the duties of catechizing and baptizing. In all this time he did nothing from morning to night but inſtruct the people, who flocked to him from all the villages and places, in the doctrine of Chriſt and ſalvation; and, after they were inſtructed, baptizing them

them in the neighbouring river Glen." According to the ſame Bede, "he preached the word in the province of Lindiſſi; and firſt converted the governor of the city of Lindocollina, whoſe name was Blecca, with all his family. In this city he built a ſtone church of exquiſite workmanſhip, whoſe roof being ruined by long neglect or the violence of the enemy, only the walls are now ſtanding." He is alſo ſaid to have founded a collegiate church of prebends near Southwell, in Nottinghamſhire, dedicated to the Virgin Mary. This church he is ſaid to have built when he baptized the Coritani in the Trent.

PAULO (Marco), a celebrated traveller, was ſon to Nicholas Paulo, a Venetian, who went with his brother Matthew, about the year 1255, to Conſtantinople, in the reign of Baudoin II. Nicholas, at his departure, left his wife big with child; and ſhe brought to the world the famous Marco Paulo, the ſubject of this memoir. The two Venetians, having taken leave of the emperor, croſſed the Black Sea, and travelled into Armenia; whence they paſſed over land to the court of Barka, one of the greateſt lords of Tartary, who loaded them with honours. This prince having been defeated by one of his neighbours, Nicholas and Matthew made the beſt of their way through the deſerts, and arrived at the city where Kublai, grand khan of the Tartars, reſided. Kublai was entertained with the account which they gave him of the European manners and cuſtoms; and appointed them ambaſſadors to the pope, in order to demand of his holineſs a hundred miſſionaries. They came accordingly to Italy, obtained from the Roman pontiff two Dominicans, the one an Italian the other an Aſiatic, and carried along with them young Marco, for whom Kublai expreſſed a ſingular affection. This young man, having learned the different dialects of Tartary, was employed in embaſſies which gave him the opportunity of traverſing Tartary, China, and other eaſtern countries. At length, after a reſidence of ſeventeen years at the court of the grand khan, the three Venetians returned to their own country, in the year 1295, with immenſe fortunes. A ſhort time after his return, Marco ſerving his country at ſea againſt the Genoeſe, his galley, in a great naval engagement, was ſunk, and himſelf taken priſoner, and carried to Genoa. He remained there many years in confinement; and, as well to amuſe his melancholy as to gratify thoſe who deſired it from him, he ſent for his notes from Venice, and compoſed the hiſtory of his own and his father's voyages in Italian, under this title, *Delle maravigliе del mondo da lui vidute*, &c.; the firſt edition of which appeared at Venice, in 8vo, 1496. His work was tranſlated into different languages, and inſerted in various collections. The editions moſt eſteemed are the Latin one publiſhed by Andrew Muller at Cologne, in 4to, 1671; and that in French, to be found in the collection of voyages publiſhed by Bergeron, at the Hague, 1735, in 2 vols 4to. In the writings of Marco Paulo, there are ſome things true and others highly incredible. It is indeed difficult to believe, that as ſoon as the grand khan was informed of the arrival of two Venetian merchants, who were come to ſell theriaca (or treacle) at his court, he ſent before them an eſcort of 40,000 men, and afterwards diſpatched theſe Venetians ambaſſadors to the Pope, to beſeech his holineſs to ſend him a hundred miſſionaries. It is equally difficult to believe that the pope, who doubtleſs had an ardent zeal for the propagation of the faith, inſtead of a hundred, ſhould have ſent him only two miſſionaries. There are therefore ſome errors and exaggerations in Marco Paulo's narrative; but many other things which were afterward verified, and which have been of ſervice to ſucceeding travellers, prove that in ſeveral reſpects his relation is valuable. He not only gave better accounts of China than had been before received; but likewiſe furniſhed a deſcription of Japan, of many of the iſlands of the Eaſt Indies, of Madagaſcar, and the coaſts of Africa; ſo that from his work it might be eaſily collected, that a direct paſſage by ſea to the Indies was not only poſſible, but practicable. It may be worth while to add, that, in the opinion of the authors of the Univerſal Hiſtory, what he wrote from his own knowledge is both curious and true, ſo that where he has erred his father and uncle muſt have deceived him. Paulus, Pavo.

PAULUS Æmilius. See *Æmilius Paulus*.

PAVO, the PEACOCK, in ornithology; a genus belonging to the order of gallinæ. The head is covered with feathers which bend backwards; the feathers of the tail are very long, and beautifully variegated with eyes of different colours. Latham enumerates eight ſpecies:

1. The criſtatus, or common peacock of Engliſh authors, has a compreſſed creſt and ſolitary ſpurs.— It is about the ſize of a common turkey; the length from the tip of the bill to the end of the tail being three feet eight inches. The bill is nearly two inches long, and is of a brown colour. The irides are yellow. On the crown there is a ſort of creſt, compoſed of 24 feathers, which are not webbed except at the ends, which are gilded green. The ſhafts are of a whitiſh colour; and the head, neck, and breaſt, are of a green gold colour. Over the eye there is a ſtreak of white, and beneath there is the ſame. The back and rump are of a green gold colour, gloſſed over with copper: the feathers are diſtinct, and lie over each other like ſhells. "Above the tail ſprings an inimitable ſet of long beautiful feathers, adorned with a variegated eye at the end of each; theſe reach conſiderably beyond the tail; and the longeſt of them in many birds are four feet and a half in length. This beautiful train, or tail as it is falſely called, may be expanded quite to a perpendicular upwards at the will of the bird. The true tail is hid beneath this group of feathers, and conſiſts of 18 grey brown feathers, one foot and a half long, marked on the ſides with rufous grey: the ſcapulars and leſſer wing coverts are reddiſh cream-colour, variegated with black: the middle coverts deep blue, gloſſed with green gold: the greateſt and baſtard wing rufous: the quills are alſo rufous; ſome of them variegated with rufous, blackiſh, and green: the belly and vent are greeniſh black: the thighs yellowiſh: the legs ſtout; thoſe of the *male* furniſhed with a ſtrong ſpur three quarters of an inch in length; the colour of them grey brown." *Latham's Synoſſis of Birds.*

The female is rather leſs than the male. The train is very ſhort, being much ſhorter than the tail, and ſcarcely longer than its coverts; neither are the feathers furniſhed with eyes. The creſt on the head is ſimilar to that on the head of the male: the ſides of the head have a greater portion of white: the throat and neck

Pavo. are green: the reſt of the body and wings are cinereous brown: the breaſt is fringed with white: the bill is the ſame: the irides are lead-colour: the legs are as in the male; but the ſpur is generally wanting, though in ſome birds a rudiment of one is ſeen. In ſome male birds, all the wing coverts and ſcapulars are of a fine deep blue green, very gloſſy; but the outer edge of the wing and quills are of the common colour.

This bird, now ſo common in Europe, is of eaſtern origin, being a native of India. They are found wild in the iſlands of Ceylon and Java in the Eaſt Indies, and at St Helena, at Barbuda, and other Weſt India iſlands. They are not natural to China; but they are found in many places of Aſia and Africa. They are, however, nowhere ſo large or ſo fine as in India, in the neighbourhood of the Ganges, from whence, by degrees, they have ſpread into all parts, increaſing in a wild ſtate in the warmer climes; but wanting ſome care in the colder regions. In ours, this bird does not come to its full plumage till the third year. The female lays five or ſix greyiſh white eggs; in hot climates 20, the ſize of thoſe of a turkey. Theſe, if let alone, ſhe lays in ſome ſecret place, at a diſtance from the uſual reſort, to prevent their being broken by the male, which he is apt to do if he find them. The time of ſitting is from 27 to 30 days. The young may be fed with curd, chopped leeks, barley-meal, &c. moiſtened; and are fond of graſhoppers, and ſome other inſects. In five or ſix months they will feed as the old ones, on wheat and barley, with what elſe they can pick up in the circuit of their confinement. They ſeem to prefer the moſt elevated places to rooſt on during night; ſuch as high trees, tops of houſes, and the like. Their cry is loud and inharmonious; a perfect contraſt to their external beauty. They are caught in India, by carrying lights to the trees where they rooſt, and having painted repreſentations of the bird preſented to them at the ſame time; when they put out the neck to look at the figure, the ſportſman ſlips a nooſe over the head, and ſecures his game (A). In moſt ages they have been eſteemed as a ſalutary food. Hortenſius gave the example at Rome, where it was carried to the higheſt luxury, and ſold dear (B): and a young pea-fowl is thought a dainty even in the preſent times.

The life of this bird is reckoned by ſome at about 25 years; by others 100.

2. The variegated peacock, is nothing elſe but a mixed breed between the common and white peacock; and of courſe varies very conſiderably in colour.

3. The white peacock is, as its name imports, entirely white, not excepting even the eyes of the train, which it is nevertheleſs eaſy to trace out. This variety is in Latham's opinion more common in England than elſewhere. We are informed by the ſame author, that two inſtances have occurred to him of the females of this ſpecies having the external marks of the plumage of the male. Pavo

4. The pavo muticus is about the ſize of the creſted peacock; but the bill is larger and aſh-coloured: the irides are yellow, and round the eyes is red; on the top of the head is an upright creſt four inches long, and ſhaped ſomewhat like an ear of corn. The colour is green mixed with blue. The top of the neck and head are greeniſh, marked with ſpots of blue, which have a ſtreak of white down the middle of each: the back is greeniſh blue: the breaſt is blue and green gold mixed: the belly, ſides, and thighs are aſh-colour, marked with black ſpots, ſtreaked with white on the belly: the wing coverts and ſecondaries are not unlike the back: the greater quills are green, tranſverſely barred with black lines, but growing yellowiſh towards the ends, where they are black: the upper tail coverts are fewer than thoſe of the common peacock, but much longer than the tail; they are of a cheſnut brown, with white ſhafts, and have at the end of each a large ſpot gilded in the middle, then blue, and ſurrounded with green: the legs are aſh-coloured, and not furniſhed with ſpurs, or they have been overlooked by thoſe who have ſeen them.

The female is ſmaller than the male; and differs in having the belly quite black, and the upper tail coverts much ſhorter: the tail is green, edged with blue, and white ſhafts. It inhabits Japan, and is only known to Europe by means of a painting, ſent by the emperor of Japan to the pope.

So beautiful a ſpecies of birds as the peacock could not long remain a ſtranger in the more diſtant parts in which they were produced; for ſo early as the days of Solomon, we find, among the articles imported in his Tarſhiſh navies, apes and peacocks. A monarch ſo converſant in all branches of natural hiſtory, "who ſpoke of trees, from the cedar of Lebanon, even unto the hyſſop that ſpringeth out of the wall; who ſpoke alſo of beaſts and of fowl," would certainly not neglect furniſhing his officers with inſtructions for collecting every curioſity in the countries they voyaged to, which gave him a knowledge that diſtinguiſhed him from all the princes of his time. Ælian relates, that they were brought into Greece from ſome barbarous country; and that they were held in ſuch high eſteem, that a male and female were valued at Athens at 1000 drachmæ, or 32 l. 5 s. 10 d. Their next ſtep might be to Samos; where they were preſerved about the temple of Juno, being the birds ſacred to that goddeſs; and Gellius, in his *Noctes Atticæ*, c. 16. commends the excellency of the Samian peacocks. It is therefore probable, that they were brought there originally for the purpoſes of ſuperſtition, and afterwards cultivated for the uſes of luxury. We are alſo told, when Alexander was in India, he found

(A) Tavernier's Travels, vol. iii. p. 57. The inhabitants of the mountains on both ſides of the Ganges catch them with a birdlime, prepared from the milky juice of two ſorts of trees (*ficus religioſa & Indica.*—Lin.), boiled with oils into a conſiſtence; which proves ſufficiently tenacious to entangle them, or the largeſt birds.—*Phil. Tranſ.* vol. lxxi. p. 376.

(B) They muſt have been in plenty notwithſtanding, or the Emperor Vitellius could not have got ſufficient for his large diſh, called the *Buckler of Minerva*, which, hiſtory ſays, was filled with the livers of ſcari, tongues of flamingoes, and brains of pheaſants and peacocks.

found vaſt numbers of wild ones on the banks of the Hyarotis; and was ſo ſtruck with their beauty, as to appoint a ſevere puniſhment on any perſon that killed them.

Peacocks creſts, in ancient times, were among the ornaments of the kings of England. Ernald de Aclent was fined to king John in 140 palfries, with ſackbuts, lorains, gilt ſpurs, and peacocks creſts, ſuch as would be for his credit. See Plate CCCLXXXI.

5. The pavo bicalcaratus, is larger than the common pheaſant. The bill is black, but from the noſtrils to the tip of the upper mandible red. The irides are yellow. The feathers on the crown of the head are ſufficiently long to form a creſt, of a dull brown colour. The ſpace between the bill and eyes is naked, with a few ſcattered hairs: the ſides of the head are white: the neck is bright brown, ſtriated across with duſky brown: the upper parts of the back, ſcapulars, and wing coverts, are dull brown, dotted with paler brown and yellowiſh; beſides which, each feather is marked near the end with a roundiſh large ſpot of a gilded purple colour, changing into blue and green in different lights: the lower part of the back and rump are dotted with white: all the under parts are brown, ſtriated tranſverſely with black: the quills are duſky; the ſecondaries are marked with the ſame ſpot as the reſt of the wing: the upper tail coverts are longer than the tail, and each marked at the end with a ſpot like the wing feathers, each of which is ſurrounded firſt with a circle of black, and ultimately with an orange one: the legs and claws are brown, and on the back part of each leg are two ſpurs, one above the other.

The female is a third ſmaller than the male. The head, neck, and under parts are brown; the head ſmooth: the upper parts are alſo brown, and the feathers marked with a dull blue ſpot, ſurrounded with dirty orange: the feathers which cover the tail are ſimilar; but marked at the end with an obſcure dull oval ſpot of blue: the legs have no ſpurs.

This ſpecies is of Chineſe origin, and ſome of them have been brought from China to England alive, and have been for ſome time in the poſſeſſion of Dr James Monro. The male is now in the Leverian Muſeum, in the fineſt preſervation.

Sonnerat obſerves, that the bird from whence his deſcription was taken had two ſpurs on one leg, and three on the other. This muſt ſurely be a *luſus naturæ*; eſpecially as he ſays, it is the ſame as that in *Edw.* pl. 67.

6. The pavo tibetanus, is about the ſize of a pintado, being about two feet and nearly two inches long. The bill is above an inch and a half long, and cinereous: the irides are yellow: the head, neck and under parts are aſh coloured, marked with blackiſh lines: the wing coverts, back and rump, are grey, with ſmall white dots; beſides which, on the wing coverts and back are large round ſpots of a fine blue, changing in different lights to violet and green gold: the quills and upper tail coverts are alſo grey, marked with blackiſh lines; the quills have two round blue ſpots on each, like thoſe of the coverts; on the outer webs, and on each tail feather, there are four of the ſame, two on each ſide the web; the middle coverts are the longeſt, the others ſhorten by degrees: the legs are grey, furniſhed with two ſpurs behind, like the laſt ſpecies: the claws are blackiſh. This ſpecies inhabits the kingdom of Thibet. The Chineſe give it the name of *Chin-tchien-Khi*. Pavo II Pauſanias.

Pavo, in ichthyology. See *Peacock-fiſh*.

Pavo, in aſtronomy, a conſtellation in the ſouthern hemiſphere, unknown to the ancients, and not viſible in our latitude. It conſiſts of 14 ſtars, of which the names and ſituations are as follow:

	Signs	Longitud. °	′	″	Latitude South. °	′	″	Magnitude
The eye of the peacock	♑	20	0	3	36	11	18	2

PAVOR, a Roman deity, whoſe worſhip was introduced by Tullus Hoſtilius, who, in a panic, vowed a ſhrine to him, and one to Pallor, *Paleneſs*; and therefore they are found on the coins of that family.

PAURÆDASTYLÆ, in natural hiſtory, the name of a genus of perfect cryſtals with double pyramids, and no intermediate column, compoſed of 12 planes, or two hexangular pyramids joined baſe to baſe.

PAUSANIA, in Grecian antiquity, a feſtival in which were ſolemn games, wherein nobody contended but free-born Spartans; in honour of Pauſanias the Spartan general, under whom the Greeks overcame the Perſians in the famous battle of Platæa.

PAUSANIAS, a Spartan king and general, who ſignalized himſelf at the battle of Platæa againſt the Perſians. The Greeks, very ſenſible of his ſervices, rewarded his merit with a tenth of the ſpoils taken from the Perſians. He was afterwards appointed to command the Spartan armies, and he extended his conqueſts in Aſia; but the haughtineſs of his behaviour created him many enemies; and the Athenians ſoon obtained a ſuperiority in the affairs of Greece.—Pauſanias, diſſatisfied with his countrymen, offered to betray Greece to the Perſians, if he received in marriage as the reward of his perfidy the daughter of their king. His intrigues were diſcovered by means of a young man who was intruſted with his letters to Perſia, and who refuſed to go, on recollecting that ſuch as had been employed in that office before had never returned. The letters were given to the Ephori of Sparta, and the perfidy of Pauſanias was thus diſcovered. He fled for ſafety to a temple of Minerva; and as the ſanctity of the place ſecured him from the violence

Pauſanias || Peace.

of his purſuers, the ſacred building was ſurrounded with heaps of ſtones, the firſt of which was carried there by the indignant mother of the unhappy man. He was ſtarved to death in the temple, and died about 474 years before the Chriſtian era. There was a feſtival and ſolemn games inſtituted to his honour, in which only free-born Spartans contended. There was alſo an oration ſpoken in his praiſe, in which his actions were celebrated, particularly the battle of Platæa, and the defeat of Mardonius. See PAUSANIA.

PAUSANIAS, a learned Greek hiſtorian and orator, in the ſecond century, under the reign of Antoninus the philoſopher, was the diſciple of Herodus Atticus. He lived for a long time in Greece; and afterwards went to Rome, where he died at a great age. He wrote an excellent deſcription of Greece, in ten books; in which we find not only the ſituation of places, but the antiquities of Greece, and every thing moſt curious and worthy of knowledge. Abbe Gedoin has given a French tranſlation of it, in 2 vols 4to.

PAUSE, a ſtop or ceſſation in ſpeaking, ſinging, playing, or the like. One uſe of pointing in grammar is to make proper pauſes, in certain places.—There is a pauſe in the middle of each verſe; in an hexaſtich, it is called a *reſt* or *repoſe*. See POETRY, and READING.

PAW, in the manege. A horſe is ſaid to paw the ground, when, his leg being either tired or painful, he does not reſt it upon the ground, and fears to hurt himſelf as he walks.

PAWN, a pledge or gage for ſurety of payment of money lent. It is ſaid to be derived *a pugno, quia res quæ fignori dantur, pugno vel manu traduntur.* The party that pawns goods hath a general property in them; they cannot be forfeited by the party that hath them in pawn for any offence of his, nor be taken in execution for his debt; neither may they otherwiſe be put in execution till the debt for which they are pawned is ſatisfied.

If the pawn is laid up, and the pawnee robbed, he is not anſwerable; though if the pawnee uſe the thing, as a jewel, watch, &c. that will not be the worſe for wearing, which he may do, it is at his peril; and if he is robbed, he is anſwerable to the owner, as the uſing occaſioned the loſs, &c.

If the pawn is of ſuch a nature that the keeping is a charge to the pawnee, as a cow or a horſe, &c. he may milk the one and ride the other, and this ſhall go in recompence for his keeping.

Things which will grow the worſe by uſing, as apparel, &c. he may not uſe.

PEA, in botany. See PISUM.

PEACE *(Temple of)*, a celebrated temple at Rome, which was conſumed by fire A. D. 191; produced, as ſome writers ſuppoſe, by a ſlight earthquake, for no thunder was heard at the time. Dio Caſſius, however, ſuppoſes that it began in the adjoining houſes. Be that as it will, the temple, with all the ſurrounding buildings, were reduced to aſhes. That magnificent ſtructure had been raiſed by Veſpaſian after the deſtruction of Jeruſalem, and enriched with the ſpoils and ornaments of the temple of the Jews. The ancients ſpeak of it as one of the moſt ſtately buildings in Rome. There men of learning uſed to hold their aſſemblies, and lodge their writings, as many others depoſited their jewels, and whatever elſe they eſteemed of great value. It was likewiſe made uſe of as a kind of magazine for the ſpices that were brought by the Roman merchants out of Egypt and Arabia; ſo that many rich perſons were reduced to beggary, all their valuable effects and treaſures being conſumed in one night, with the temple.

Peach || Peak.

PEACH, in botany. See AMYGDALUS.

PEACOCK, in ornithology. See PAVO.

PEACOCK-Fiſh. Pinna ani radiis 55, caudali falcata. The body of this fiſh is of various colours; the fin of the anus has 55 ſtreaks, and its tail is in the form of a creſcent. The head is without ſcales; it is brown upon the upper part, yellow above the eyes, and of a ſilver colour on the ſides. The back is round, and adorned with beautiful blue ſtreaks in a ſerpentine form; and the belly bright as ſilver. The fins of the breaſt are round, and, like thoſe of the belly, have a yellow ground with a grey border; that of the back is of a violet colour; that of the anus is ſtraw coloured; and, laſtly, that of the tail is yellow on the ſides, red towards the middle, and bordered with a deep blue. We are as yet ignorant of its length.

There is a variety of this fiſh found only in the Indian ſeas, and therefore called the *Indian peacock fiſh*; which is thus deſcribed in the language of Linnæus: *Pavo pinna caudali forcipata: ſpinis dorſalibus* 14: *ocello cæruleo pone oculos.* It has the fin of its tail forked; 14 ſharp points or prickles on the back, with a round blue ſtreak behind the eyes.

The body of this fiſh is of an elliptical form; the head is covered with ſcales to the tip of the ſnout; the two jaws are armed with long and ſharp teeth; the ball of the eye is black, and the iris of a white colour, with a mixture of green. At the inſertion of the fins of the belly is found a bony ſubſtance. The head, back, and ſides, are of a yellow colour, more or leſs deep, and covered with lines or ſtreaks of ſky blue. Theſe colours are ſo agreeably mixed, that they reſemble the elegance of the peacock's tail.

PEAK OF DERBYSHIRE, a chain of very high mountains in the county of Derby in England, famous for the mines they contain, and for their remarkable caverns. The moſt remarkable of theſe are Pool's-hole and Elden-hole. The former is a cave at the foot of a high hill called *Coltmoſs*, ſo narrow at the entrance that paſſengers are obliged to creep on all-fours; but it ſoon opens to a conſiderable height, extending to above a quarter of a mile, with a roof ſomewhat reſembling that of an ancient cathedral. By the petrifying water continually dropping in many parts of the cave are formed a variety of curious figures and repreſentations of the works both of nature and art. There is a column here as clear as alabaſter, which is called *The Queen of Scots Pillar*, becauſe Queen Mary is ſaid to have proceeded thus far when ſhe viſited the cavern. It ſeems the curioſity of that princeſs had led her thus far into this dark abode; and indeed there are few travellers who care to venture farther; but others, determined to ſee the end of all, have gone beyond it. After ſliding down the rock a little way, is found the dreary cavity turned upwards: following its courſe, and climbing from crag to crag, the traveller arrives at a great height, till the rock, cloſing over his head

on

on all ſides, puts an end to any further ſubterraneous journey. Juſt at turning to deſcend, the attention is caught by a chaſm, in which is ſeen a candle glimmering at a vaſt depth underneath. The guides ſay, that the light is at a place near Mary Queen of Scots pillar, and no leſs than 80 yards below. It appears frightfully deep indeed to look down; but perhaps does not meaſure any thing like what it is ſaid to do. If a piſtol is fired by the Queen of Scots pillar, it will make a report as loud as a cannon. Near the extremity there is a hollow in the roof, called the *Needle's Eye*; in which if a candle is placed, it will repreſent a ſtar in the firmanent to thoſe who are below. At a little diſtance from this cave is a ſmall clear ſtream conſiſting of hot and cold water, ſo near each other, that the finger and thumb of the ſame hand may be put, the one into the hot water and the other into the cold.

Elden-hole is a dreadful chaſm in the ſide of a mountain; which, before the latter part of the laſt century, was thought to be altogether unfathomable. In the time of Queen Elizabeth, a poor man was let down into it for 200 yards; but he was drawn up in a frenzy, and ſoon after died. In 1682, it was examined by Captain Collins, and in 1699 by Captain Sturmy, who publiſhed their accounts in the Philoſophical Tranſactions. The latter deſcended by ropes fixed at the top of an old lead-ore pit, four fathoms almoſt perpendicular, and from thence three fathoms more obliquely; between two great rocks. At the bottom of this he found an entrance into a very ſpacious cavern, from whence he deſcended along with a miner for 25 fathoms perpendicular. At laſt they came to a great river or water, which he found to be 20 fathoms broad and eight fathoms deep. The miner who accompanied him, inſiſted that this water ebbed and flowed with the ſea; but the Captain diſproved this aſſertion, by remaining in the place from three hours flood to two hours ebb, during which time there was no alteration in the height of the water. As they walked by the ſide of this water, they obſerved a hollow in the rock ſome feet above them. The miner went into this place, which was the mouth of another cavern; and walked for about 70 paces in it, till he juſt loſt ſight of the Captain. He then called to him, that he had found a rich mine; but immediately after came running out and crying, that he had ſeen an evil ſpirit; neither could any perſuaſions induce him to return. The floor of theſe caverns is a kind of white ſtone enamelled with lead ore, and the roofs are encruſted with ſhining ſpar. On his return from this ſubterraneous journey, Captain Sturmy was ſeized with a violent headach, which, after continuing four days, terminated in a fever, of which he died in a ſhort time.

Several years ago this cavern was viſited by the late Mr James Ferguſon: who tells us, that it conſiſts of two hollows one over another; but that the mouth of the lowermoſt is now ſtopped up by planks of timber laid acroſs it, on which is a heap of ſtones thrown in at the upper mouth with a deſign to fill up the cavern entirely; which, however, will probably be never accompliſhed on account of its vaſt ſize.

Peak of Teneriffe. See Teneriffe.

PEAN, in heraldry, is when the field of a coat of arms is ſable, and the powderings or. Pean

PEAR, in botany. See Pyrus. ‖ Pearce.

Pear-Glaſs. See *Vitrea Lacryma.*

PEARCE (Dr), lord biſhop of Rocheſter, was the ſon of a diſtiller in High Holborn. He married Miſs Adams, the daughter of a diſtiller in the ſame neighbourhood, with a conſiderable fortune, who lived with him 52 years in the higheſt degree of connubial happineſs. He had his education in Weſtminſter ſchool, where he was diſtinguiſhed by his merit, and elected one of the king's ſcholars. In 1710, when he was 20 years old, he was elected to Trinity College, Cambridge. During the firſt years of his reſidence at the univerſity, he ſometimes amuſed himſelf with lighter compoſitions, ſome of which are inſerted in the Guardian and Spectator. In 1716, he publiſhed his edition of *Cicero de Oratore*, and, at the deſire of a friend, luckily dedicated it to Lord Chief Juſtice Parker (afterwards Earl of Macclesfield), to whom he was a ſtranger. This incident laid the foundation of his future fortune; for Lord Parker ſoon recommended him to Dr Bentley, maſter of Trinity, to be made one of the fellows; and the doctor conſented to it on this condition, that his lordſhip would promiſe to *unmake* him again as ſoon as it lay in his power to give him a living. In 1717, Mr Pearce was ordained at the age of 27; having taken time enough, as he thought, to attain a ſufficient knowledge of the ſacred office. In 1718, Lord Parker was appointed chancellor, and invited Mr Pearce to live with him in his houſe as chaplain. In 1719, he was inſtituted into the rectory of Stapleford Abbots, in Eſſex; and in 1720, into that of St Bartholomew, behind the Royal Exchange, worth 400 l. *per annum*. In 1723, the lord chancellor preſented him to St Martin's in the Fields. His Majeſty, who was then at Hanover, was applied to in favour of St Claget, who was then along with him; and the doctor actually kiſſed hands upon the occaſion: but the chancellor, upon the king's return, diſputed the point, and was permitted to preſent Mr Pearce.—Mr Pearce ſoon attracted the notice and eſteem of perſons in the higheſt ſtations and of the greateſt abilities. Beſide Lord Parker, he could reckon amongſt his patrons or friends, Lord Macclesfield, Mr Pulteney (afterwards Earl of Bath), archbiſhop Potter, Lord Hardwicke, Sir Iſaac Newton, and other illuſtrious perſonages.—In 1724, the degree of doctor of divinity was conferred on him by archbiſhop Wake. The ſame year he dedicated to his patron, the earl of Macclesfield, his edition of *Longinus on the Sublime*, with a new Latin verſion and notes.

When the church of St Martin's was rebuilt, Dr Pearce preached a ſermon at the conſecration, which he afterwards printed, and accompanied with an eſſay on the origin and progreſs of temples, traced from the rude ſtones which were firſt uſed for altars to the noble ſtructure of Solomon, which he conſiders as the firſt temple completely covered. His obſervations on that building which is called the *Temple of Dagon* removes part of the difficulty which preſents itſelf in the narration of the manner in which Samſon deſtroyed it.

The deanery of Winchester becoming vacant, Dr

Pearce. Pearce was appointed dean in 1739; and in the year 1744 he was elected prolocutor of the lower houſe of convocation for the province of Canterbury. His friends now began to think of him for the epiſcopal dignity; but Mr Dean's language rather declined it. However, after ſeveral difficulties had been ſtarted and removed, he conſented to accept the biſhopric of Bangor, and promiſed Lord Hardwicke to do it with a good grace. He accordingly made proper acknowledgments of the royal goodneſs, and was conſecrated Feb. 12. 1748. Upon the declining ſtate of health of Dr Wilcocks, biſhop of Rocheſter, the biſhop of Bangor was ſeveral times applied to by archbiſhop Herring to accept of Rocheſter, and the deanery of Weſtminſter, in exchange for Bangor; but the biſhop then firſt ſignified his deſire to obtain leave to reſign and retire to a private life. His lordſhip, however, upon being preſſed, ſuffered himſelf to be prevailed upon.—"My Lord (ſaid he to the Duke of Newcaſtle), your grace offers theſe dignities to me in ſo generous and friendly a manner, that I promiſe you to accept them." Upon the death of Biſhop Wilcocks he was accordingly promoted to the ſee of Rocheſter and deanery of Weſtminſter in 1756. Biſhop Sherlock died in 1761, and Lord Bath offered his intereſt for getting the biſhop of Rocheſter appointed to ſucceed him in the dioceſe of London; but the biſhop told his lordſhip, that he had determined never to be biſhop of London or archbiſhop of Canterbury.

In the year 1763, his lordſhip being 73 years old, and finding himſelf leſs fit for the buſineſs of his ſtations as biſhop and dean, informed his friend Lord Bath of his intention to reſign both, and live in a retired manner upon his private fortune. Lord Bath undertook to acquaint his majeſty; who named a day and hour, when the biſhop was admitted alone into the cloſet. He told the king, that he wiſhed to have ſome interval between the fatigues of buſineſs and eternity; and deſired his majeſty to conſult proper perſons about the propriety and legality of his reſignation. In about two months the king informed him, that Lord Mansfield ſaw no objection; and that Lord Northington, who had been doubtful, on farther conſideration thought that the requeſt might be complied with. Unfortunately for the biſhop, Lord Bath applied for Biſhop Newton to ſucceed. This alarmed the miniſtry, who thought that no dignities ſhould be obtained but through their hands. They therefore oppoſed the reſignation; and his majeſty was informed that the biſhops diſliked the deſign. His majeſty ſent to him again; and at a third audience told him, that he muſt think no more of reſigning. The biſhop replied, "Sir, I am all duty and ſubmiſſion;" and then retired.

In 1768 he obtained leave to reſign the deanery; in 1773, he loſt his lady; and after ſome months of lingering decay, he died at Little Ealing, June 29. 1774.

This eminent prelate diſtinguiſhed himſelf in every part of his life by the virtues proper to his ſtation. His literary abilities, and application to ſacred and philological learning, appear by his works; the principal of which are, A letter to the clergy of the church of England, on occaſion of the biſhop of Rocheſter's commitment to the Tower, 2d edit. 1722. Miracles of Jeſus vindicated, 1727 and 1728. A review of the text of Milton, 1733. Two letters againſt Dr Middleton, occaſioned by the doctor's letter to Waterland, on the publication of his treatiſe, intitled, *Scripture Vindicated*, 3 edit. 1752. And ſince his death, a commentary with notes on the four Evangeliſts and the Acts of the Apoſtles, together with a new tranſlation of St Paul's firſt Epiſtle to the Corinthians, with a paraphraſe and notes, have been publiſhed, with his life prefixed, from original MSS. in 2 vols 4to. Pearce Pearch

The following character of this excellent biſhop was publiſhed in the Gentleman's Magazine for 1775, and was written, as we are told, by a contemporary and friend: "The world has not loſt for many years a more reſpectable member of ſociety than the late Dr Pearce; nor the clergy a more pious and learned prelate. In his younger days, before he became a graduate, he publiſhed that excellent edition of Longinus, ſtill admired and quoted by the beſt critics. What is ſaid of Longinus himſelf by our excellent Engliſh poet, is as applicable to the editor: 'He is himſelf the great ſublime he draws;' for very few of his order ever arrived to that perfection in eloquence, for which he was ſo juſtly celebrated. His diction was ſimple, nervous, and flowing; his ſentiments were juſt and ſublime; more ſublime than the heathen critic, in proportion to the ſuperior ſublimity of the Chriſtian revelation. Yet he was never puffed up with the general applauſes of the world, but of an humble deportment, reſembling the meek Jeſus as far as the weakneſs of human nature can reſemble a character without ſin. His countenance was always placid, and diſplayed the benevolence of his heart, if his extenſive charity had not proved it to a demonſtration. His thirſt of knowledge prompted him to a very ſtudious life, and that rendered both his complexion and conſtitution delicate; yet it held out by the bleſſing of Providence beyond the 85th year of his age; which is the more extraordinary, conſidering the midnight lamp had caſt a paleneſs over his complexion: yet with all his learning and knowledge, his humility and modeſty reſtrained him from many publications, which the world may hope for from his executors; one particularly in divinity, which has been the object of his contemplation for many years paſt. With a view to complete that work, and to retire from the buſtle of the world, he ſtruggled ſo hard to reſign his biſhopric, &c. After poſſeſſing the eſteem and veneration of all who knew him for a long ſeries of years, either as rector of a very large pariſh, or as a dignitary of the church, he has left the world in tears; and gone to receive the infinite reward of his piety and virtue".

PEARCH, in ichthyology. See PERCA.

The pearch affords good ſport for the angler. The beſt time for their biting is when the ſpring is over, and before the heats of ſummer come on. At this time they are very greedy; and the angler, with good management, may take at one ſtanding all that are in the hole, be they ever ſo many.

The proper baits are a minow or young frog; but the worm called the *brandling*, well ſcoured, is alſo excellent at all times of the year. When the pearch bites, he ſhould always have a great deal of time allowed him to ſwallow the bait.

The pearch will bite all day long, if the weather be cloudy; but the beſt time is from eight to ten in the morning, and from three till ſix in the afternoon.

The

rch, arl.

The pearch is very abſtemious in winter, and will ſeldom bite in this ſeaſon of the year; if he does at all, it is in the middle of the day: at which time indeed all fiſh bite beſt at that ſeaſon.

If the bait be a minow, which is the bait that affords moſt diverſion to the angler, it muſt be faſtened to the hook alive, by putting the hook through the upper lip or back-fin; it muſt be kept at about mid-water, and the float muſt be a quill and a cork, that the minow alone may not be able to ſink it.

The line muſt be of ſilk, and ſtrong, and the hook armed with a ſmall and fine wire, that if a pike ſhould take the bait, as is not unfrequently the caſe, he may be taken. The way to carry the minows or ſmall gudgeons alive for baits is this: A tin pot is to be provided, with holes in the lid, and filled with water; and the fiſh being put in this, the water is to be changed once in a quarter of an hour by the holes, without taking off the lid at any time, except when the bait is to be taken out.

A ſmall caſting net, made for theſe little fiſh, ſhould be taken out with the pearch-tackle; and one or two caſts of this will take baits enough for the day, without any farther trouble. When the bait is a frog, the hook is to be faſtened to the upper part of the leg. The beſt place for the fiſhing for pearch is in the turn of the water near ſome gravelly ſcour. A place of this kind being pitched upon, it ſhould be baited over-night with lobworms chopped to pieces; and in the morning, on going to it, the depth is to be regularly plumbed, and then the hook is to be baited with the worm or other bait; and as it drags along, the pearch will ſoon ſeize upon it.

Pearch-Glue, the name of a kind of glue, of remarkable ſtrength and purity, made from the ſkins of pearches.

PEARL, in natural hiſtory, a hard, white, ſhining body, uſually roundiſh, found in a teſtaceous fiſh reſembling an oyſter

Pearls, though eſteemed of the number of gems by our jewellers, and highly valued, not only at this time but in all ages, proceed only from a diſtemper in the creature that produces them, analogous to the bezoars and other ſtony concretions in ſeveral animals of other kinds.

The fiſh in which theſe are uſually produced is the Eaſt Indian pearl-oyſter, as it is commonly called. Beſides this ſhell, there are many others that are found to produce pearls; as the common oyſter, the muſcle, and ſeveral others; the pearls of which are often very good; but thoſe of the true Indian berberi, or pearl-oyſter, are in general ſuperior to all. The ſmall or ſeed-pearls, alſo called *ounce pearls*, from their being ſold by the ounce and not by tale, are vaſtly the moſt numerous and common: but, as in diamonds, among the multitudes of ſmall ones, there are ſmaller numbers and larger found, ſo in pearls there are larger and larger kinds; but as they increaſe in ſize, they are proportionably leſs frequent; and this is one reaſon of their great price. We have Scotch pearls frequently as big as a little tare, ſome as big as a large pea, and ſome few of the ſize of a horſe-bean; but theſe are uſually of a bad ſhape, and of little value in proportion to their weight. Philip II. of Spain had a pearl perfect in its ſhape and colour, and of the ſize of a pigeon's egg. The fineſt, and what is called the true ſhape of the pearl, is a perfect round; but if pearls of a conſiderable ſize are of the ſhape of a pear, as is not unfrequently the caſe, they are not leſs valued, as they ſerve for ear-rings and other ornaments. Their colour ought to be a pure white; and that not a dead and lifeleſs, but a clear and brilliant one: they muſt be perfectly free from any foulneſs, ſpot, or ſtain; and their ſurfaces muſt be naturally ſmooth and gloſſy; for they bring their natural poliſh with them, which art is not able to improve. Pearl.

All pearls are formed of the matter of the ſhell, and conſiſt of a number of coats ſpread with perfect regularity one over another, in the manner of the ſeveral coats of an onion, or like the ſeveral ſtrata of the ſtones found in the bladders or ſtomachs of animals, only much thinner.

Manner of Fiſhing for Pearls in the Eaſt Indies.—There are two ſeaſons for pearl-fiſhing: the firſt is in March and April, and the laſt in Auguſt and September; and the more rain there falls in the year, the more plentiful are theſe fiſheries. At the beginning of the ſeaſon there are ſometimes 250 barks on the banks; the larger barks have two divers, and the ſmaller one. As ſoon as the barks arrive at the place where the fiſh lie, and have caſt anchor, each diver binds a ſtone, ſix inches thick and a foot long, under his body; which ſerves him as a ballaſt, prevents his being driven away by the motion of the water, and enables him to walk more ſteadily under the waves. They alſo tie another very heavy ſtone to one foot, by which they are very ſpeedily ſent to the bottom of the ſea: and as the oyſters are uſually firmly faſtened to the rocks, they arm their hands with leather mittens, to prevent their being wounded in pulling them violently off; but this taſk ſome perform with an iron rake. In the laſt place, each diver carries down with him a large net in the manner of a ſack, tied to his neck by a long cord, the other end of which is faſtened to the ſide of the bark. This net is to hold the oyſters gathered from the rock, and the cord is to pull up the diver when his bag is full, or when he wants air.

In this equipage he ſometimes precipitates himſelf ſixty feet under water; and as he has no time to loſe, he no ſooner arrives at the bottom, than he begins to run from ſide to ſide, tearing up all the oyſters he meets with, and cramming them into his budget.

At whatever depth the divers are, the light is ſo great, that they eaſily ſee whatever paſſes in the ſea: and, to their great conſternation, ſometimes perceive monſtrous fiſhes, from which all their addreſs in muddying the water, &c. will not always ſave them, but they unhappily become their prey: and of all the dangers of the fiſhery, this is one of the greateſt and moſt uſual. The beſt divers will keep under water near half an hour, and the reſt do not ſtay leſs than a quarter. During this time they hold their breath without the uſe of oils or any other liquors; only acquiring the habit by long practice. When they find themſelves ſtraitened, they pull the rope to which the bag is faſtened, and hold faſt by it with both hands: when thoſe in the bark, taking the ſignal, heave them up into the air, and unload them of

their

Pearl. their fifh; which is fometimes 500 oyfters, and fometimes not above 50. Some of the divers need a moment's refpite to recover breath; others jump in again inftantly, continuing this violent exercife without intermiffion for feveral hours. Pearl.

On the fhore they unload their barks, and lay their oyfters in an infinite number of little pits dug in the fand four or five feet fquare, raifing heaps of fand over them to the height of a man; and in this condition they are left till the rain, wind, and fun, have obliged them to open, which foon kills them: upon this the flefh rots and dries, and the pearls, thus difengaged, fall into the pit on their taking out the fhells. After clearing the pits of the groffer filth, they fift the fand feveral times in order to find the pearl; but, whatever care they take, they always lofe a great many. After cleaning and drying the pearls, they are paffed through a kind of fieve, according to their fizes; the fmalleft are then fold as feed-pearls, and the reft put up to auction, and fold to the higheft bidder.

Though thofe ornaments are met with in all quarters of the globe, the moft efteemed have always been thofe of Afia and the eaft coaft of Africa. In the kingdom of Madura, which lies on the eaft of Malabar, there are many pearl fifheries. Tutukurin or Tutucorin is the principal, if not the only, city on the fifhery coaft. At the time the Portugueſe were maſters in thefe parts, the taking of oyfters in the ſtraits betwixt the iſland of Ceylon and the continent, was ſtyled, by way of excellence, the *fifhery*, and very deſervedly; for though ſome prefer the pearls taken near the iſland of Baharen in the Perſian gulf, and thofe likewife found on the coaſt of China at Hainan, yet it might be very eaſily proved, from the compariſon of the annual amount of thofe fiſheries within this period, that they were very ſeldom ſuperior to this of which we are ſpeaking. It was one of the wiſeſt points in the Portugueſe policy, that, though they were really in poſſeſſion of this beneficial commerce, yet they choſe to diſſemble it, and took all imaginable precautions in order to make the natives believe that they were perfectly free, and that their interpoſition was not ſo much the effects of authority as of good-will; it was for this reaſon that they never pretended to erect any fort either at Tutucorin or at Calipatnam, two towns upon the continent, from whence moſt of the fiſhers and their barks came, and that they ſuffered the ancient cuſtoms to take place. *Mod. Univ. Hiſt.*

The ſeaſon of the fiſhery was the latter end of April or beginning of May, ſometimes ſooner, ſometimes later, according to the weather. The direction of it was left entirely to the ſovereign of the country, called the *naik*; and the Portugueſe, in quality of the protectors of the ſea, ſent two frigates to defend the fiſhing-veſſels from the Malabar and Maldive pirates. The time which this pearl-fiſhing laſted was about a fortnight, of the beginning of which the naik gave public notice; and, the day being come, there repaired to the place aſſigned ſeveral thouſands of people of all ſexes and ages, and an indefinite number of fiſhing veſſels, and divers from five or ſix hundred to a thouſand or more. Upon a ſignal given the boats put to ſea; and, having choſe their proper ſtations, the divers plunged and brought up the oyſters in little baſkets upon their heads; with which the boats being ſufficiently laden, they were carried on ſhore, where the people who remained there for that purpoſe buried them in the ſand, till, by the heat of the ſun, the fiſh was corrupted and conſumed, and the pearls eaſily taken out. The whole conduct of the firſt day's fiſhery belonged to the naik; and, after that deduction, what was caught every day was ſeparated, and particularly diſtinguiſhed, but went to the common profit. The whole number of the people employed at ſea and on ſhore amounted frequently to 50,000 or 60,000 ſouls; and the pavilions and tents ſet up for their accommodation made a fine appearance at a diſtance. When the pearls were extracted, cleanſed, and dried, they paſſed them through a kind of ſieves, by which their ſizes were diſtinguiſhed. When all was over, the naik appointed a time and place for the public market; in conſequence of which there was a kind of fair, that laſted commonly from the cloſe of June till the beginning of September. The ſmalleſt, which are what we call *ſeed pearl*, they ſold by weight, and all the reſt according to their reſpective ſizes and beauty, from a few ſhillings up to ten or twenty pounds, and ſometimes more a-piece; but there were few buyers, except the Portugueſe merchants, who, bringing ready money, had got bargains, and thus all parties were pleaſed. The Portugueſe aſſumed the protection of this fiſhery very ſoon after they ſettled in the Indies, and held it till the year 1658, when, in conſequence of their loſſes in Ceylon and elſewhere, it fell into the hands of the Dutch, who have remained in poſſeſſion of it ever ſince.

The Dutch have changed this method, as we are informed by a perſon very well acquainted with their affairs. The courſe into which they have put it is, in few words, this: the camp is ſometimes held on the coaſt of Madura, upon the continent; ſometimes on the iſland of Manar, which is in the hands of the Dutch, who, notwithſtanding, follow the example of the Portugueſe, and lay claim to no higher title than that of protectors of the fiſhery, in which quality their commiſſary is ever in the camp, as well as the naik or ſovereign of the country, who is alſo the rajah of Tanjour. The oyſters caught every day are put up in tuns or barrels, of which, when a certain number are full, they put them up to ſale by way of auction; and the merchants bid according as they have an opinion of the oyſters for the ſeaſon: but the middle price is between 30 and 40 ſhillings ſterling per caſk. When a merchant has bought ſuch a lot as this, he carries it to his quarters; and after a certain number of days he proceeds to opening the oyſters, but always in the air, for the ſtench is ſo great as to be almoſt inſupportable. They open them over tubs, into which they pour what comes out of the oyſter, as alſo that muddy water that remains in the caſk; next they draw it out into cullenders of ſeveral ſizes, and at length perhaps they find four or five ſhillings worth of pearls, ſometimes to the value of ten or twelve pounds; ſo that it is a perfect lottery, by which ſome few becoming rich, it betrays numbers into beggary. This pearl-fiſhery, we are told, brings the Dutch company an annual tribute of 20,000 l.

There are a variety of rivers great and ſmall in Eaſtern Tartary conſiderable for pearl-fiſhery; but

thoſe

these pearls, though much esteemed by the Tartars, would be little valued by Europeans, on account of their defects in shape and colour. The Emperor Kang-hi had several chaplets or strings of these pearls, each containing 100, which were very large, and exactly matched. There are many rivulets in Livonia which produce pearls almost equal in size and clearness to the Oriental ones. There are several fisheries both on the eastern and western coasts of Africa; the most considerable of which lie round some small islands, over-against the kingdom of Sofala; but the people thus employed, instead of exposing the oysters to the warmth of the sun, which would induce them to open, lay them upon the embers; by which absurd method, those pearls which they catch contract a dull kind of redness, which robs them of their natural lustre as well as of their value. Pearl-fishing is performed by the women as well as the men; both being equally expert. In the sea of California also there are very rich pearl-fisheries. In Japan likewise there are found pearls of great price. Pearls are met with in all parts of the Red Sea in the Indian Ocean, on the low part of the coast of Arabia Felix named *Baharen*, adjoining to the Persian Gulf. They are likewise found on the low coast about Gunibroom to the eastward of the Persian Gulf; and many of the finest kind are met with on the coasts of Ceylon. They are most plentiful in the Baharen, between the coast of Arabia Felix and Ormus, whence they are transported to Aleppo, then sent to Leghorn, and then circulated through Europe.

It has been very commonly supposed, that pearls are found in a kind of oysters; and such the pearl fishes are called in part of the above account extracted from the Universal History; but Mr Bruce absolutely denies this, and informs us that there is no such fish as an oyster to be met with in the Red Sea in particular. They are indeed found in bivalve shells, of which there are three kinds commonly sought after by the pearl fishers. One of these is a kind of muscle now very rare; but whether more plentiful formerly than at present is not known; they are principally found in the north end of the Red Sea and on the Egyptian side; and Mr Bruce informs us, that the only place in which he ever met with them was about Coffair, and to the northward of it, where there was an ancient port called *Myos Hermos*, "which (says Mr Bruce) commentators have called the port of the *Mouse*, when they should have translated it the harbour of the *Muscle*."

The second sort of shell is called *Pinna*. It is broad and semicircular at the top, decreasing gradually until it turns sharp at the lower end, where the hinge is. The outside is rough and figured, of a beautiful red colour, and sometimes three feet long, and extremely brittle; the inside lined with that beautiful substance called *nacre*, or mother-of-pearl.

The third kind of Pearl-shell is the only one which can be said to bear any resemblance to the oyster; though even this is evidently of a different genus.

In a general view of the writings of Linnæus by Richard Pulteney, M. D. p. 42. it is said that Linnæus made a remarkable discovery relating to the generation of pearls: in the river pearl-muscle *(mya margaritifera)* a shell fish found in several rivers of Great Britain and Ireland; that this fish will bear removal remarkably well; and that in some places they form reservoirs for the purpose of keeping it, and taking out the pearl, which in a certain period will be renewed again. The discovery was a method which Linnæus found of putting these muscles into a state of producing pearls at his pleasure, though the final effect did not take place for several years; but that in five or six years after the operation, the pearl would have acquired the size of a vetch. Dr Pulteney regrets that we are unacquainted with the means by which Linnæus accomplished this extraordinary operation, which was considered as important, since it is certain the author was rewarded with a munificent premium from the states of the kingdom on that account. Pearl.

The colours of pearls are different according to the shells in which they are found. The first kind often produces those of a fine shape and excellent lustre, but seldom of that very fine colour which enhances their price. The second kind produces pearls having the reddish cast of the inner shell of the pinna, called *mother of pearl*; which seems to confirm the opinion of Reaumur, that the pearls are formed from the glutinous fluid which makes the first rudiments of the shell; and this kind of pearl is found to be more red as it is formed nearer the broad part of the shell, which is redder than the other end. Mr Bruce is of opinion, that the pearl found in this shell is the *penim* or *peninim* of Scripture; and that this name is derived from its redness. "On the contrary (says he), the word *pinna* has been idly imagined to be derived from *penna*, a feather; as being broad and round at the top, and ending at a point, or like a quill below. The English translation of the Scripture, erroneous and inaccurate in many things more material, translates this *peninim* by rubies, without any foundation or authority but because they were both red, as are bricks or tiles, and many other things of base materials. The Greeks have translated it literally *pina* or *pinna*, and the shell they call *pinnicus*; and many places occur in Strabo, Theophrastus, Elian, and Ptolemy, which are mentioned as famous for this kind of pearl. I should imagine also, that by Solomon saying it is the most precious of all productions, he means that this species of pearl was the most valued or the best known in Judæa; for though we learn from Pliny that the excellency of pearls was their whiteness, yet we know that the pearls of a yellowish cast are those esteemed in India to this day, as the *peninim* or reddish pearl was in Judea in the days of Solomon. In Job, where all the variety of precious stones are mentioned, the translator is forced, as it were unwillingly, to render *peninim* pearls, as he ought indeed to have done in many other places where it occurs."

The third sort of shell produces pearls of extreme whiteness, which Bochart says are called *darra* or *dora* in Arabic; which seems to be a general term for all kinds of pearls in Scripture, whereas the *peninim* is one in particular. But though the character of this pearl be extreme whiteness, we are told by Pliny that there are shades or differences of it. The clearest, he says, are those of the Red Sea; but the pearls of India have the colour of the flakes or divisions of the lapis specularis. The most excellent are those like a solution

Pearl. of alum, limpid, milky-like, and even with a certain almoſt imperceptible caſt of a fiery colour. Theophraſtus tells us, that theſe pearls are tranſparent, as the deſcription of Pliny would lead us to imagine; but it is not ſo: and if they were, it is apprehended they would loſe all their beauty and value, and approach too much to glaſs. The value of theſe commodities depends upon their ſize, regularity of form, whether round or not, weight, ſmoothneſs, colour, and the different ſhades of that colour. The pearl fiſhers ſay, that when the ſhell is ſmooth and perfect, they never expect to find any pearls, but always do ſo when it has begun to be deformed and diſtorted. Hence it would ſeem, that as the fiſh turned older, the veſſels containing the juice for forming the ſhell, and keeping it in its vigour, grew weak and ruptured; and thence, from this juice accumulating in the fiſh, the pearl was formed, and the ſhell brought to decay, as ſuppoſed by Mr Reaumur. If this be the caſe, it ought to be known by the form of the ſhell whether the pearl is large or ſmall; and thus the ſmaller ones being thrown back into the ſea, a conſtant crop of large pearls might be obtained.

Pliny ſays that pearls are the moſt valuable and excellent of all precious ſtones; and from our Saviour's comparing the kingdom of heaven to a pearl, it would ſeem that they really were held in ſuch high eſtimation at that time. Mr Bruce, however, is of opinion, that this extraordinary value was put only upon the very large kind; of which we are told, that Servilia, the mother of Marcus Brutus, preſented one to Cæſar of the value of 50,000l. of our money; and Cleopatra diſſolved one worth 250,000l. in vinegar, which ſhe drank at a ſupper with Mark Antony.

It is generally ſaid that the pearl ſhells grow on rocks, which, together with the method of catching them, we have already mentioned. Some ſay they are taken with nets: from whence Mr Bruce controverts the idea of their growing on rocks; for nobody, he ſays, would employ nets to gather fiſh from among rocks. He tells us, that all kinds of them are found in the deepeſt and ſtilleſt water, and ſofteſt bottom; the parts of moſt of them being too fine to bear the agitation of the ſea among the rocks. It is obſerved that they produce the moſt beautiful pearls in thoſe places of the ſea where a quantity of freſh water falls. "Thus (ſays Mr Bruce), in the Red Sea, they are always moſt eſteemed that were fiſhed from Suakem ſouthward, that is, in thoſe parts correſponding to the country anciently called *Berberia* and *Azamia*; on the Arabian Coaſt, near the iſland Camaran, where there is abundance of freſh water; and in the iſland of Fooſht. As it is a fiſh that delights in repoſe, I imagine it avoids this part of the Gulf, as lying open to the Indian Ocean, and agitated by variable winds."

Mr Bruce mentions a muſcle found in the ſalt ſprings of the Nubian deſert; in many of which he found thoſe excreſcences which might be called pearls, but all of them ill formed, foul, and of a bad colour, Pearl. though of the ſame conſiſtence, and lodged in the ſame part of the body as thoſe in the ſea. "The muſcle, too (ſays our author), is in every reſpect ſimilar, I think larger. The outer ſkin or covering of it is of a vivid green. Upon removing this, which is the epidermis, what next appears is a beautiful pink, without gloſs, and ſeemingly of a calcareous nature. Below this, the mother-of-pearl, which is undermoſt, is a white without luſtre, partaking much of the blue and very little of the red; and this is all the difference I obſerved between it and the pearl-bearing muſcle of the Red Sea."

"In Scotland, eſpecially to the northward (A), in all rivers running from lakes, there are found muſcles that have pearls of more than ordinary merit, though ſeldom of large ſize. They were formerly tolerably cheap, but lately the wearing of real pearls coming into faſhion, thoſe of Scotland have increaſed in price greatly beyond their value, and ſuperior often to the price of oriental ones when bought in the eaſt. The reaſon of this is a demand from London, where they are actually employed in work, and ſold as oriental. But the excellency of all glaſs or paſte manufactory, it is likely, will keep the price of this article, and the demand for it, within bounds, when every lady has it in her power to wear in her ears, for the price of ſixpence, a pearl as beautiful in colour, more elegant in form, lighter and eaſier to carry, and as much bigger as ſhe pleaſes, than the famous one of Cleopatra and Servilia. In Scotland, as well as in the eaſt, the ſmooth and perfect ſhell rarely produces a pearl; the crooked and diſtorted ſhell ſeldom wants one.

The mother-of-pearl manufactory is brought to the greateſt perfection at Jeruſalem. The moſt beautiful ſhell of this kind is that of the peninim already mentioned; but it is too brittle to be employed in any large pieces of workmanſhip; whence that kind named *dora* is moſt uſually employed; and great quantities of this are daily brought from the Red Sea to Jeruſalem. Of theſe, all the fine works, the crucifixes, the wafer-boxes, and the beads, are made, which are ſent to the Spaniſh dominions in the New World, and produce a return incomparably greater than the ſtaple of the greateſt manufactory in the Old.

Very little is known of the natural hiſtory of the pearl fiſh. Mr Bruce ſays, that, as far as he has obſerved, they are all ſtuck upright in the mud by an extremity; the muſcle by one end, the pinna by the ſmall ſharp point, and the third by the hinge or ſquare part which projects from the round. "In ſhallow and clear ſtreams (ſays Mr Bruce), I have ſeen ſmall furrows or tracks upon the ſandy bottom, by which you could trace the muſcle from its laſt ſtation; and theſe not ſtraight, but deviating into traverſes and triangles, like the courſe of a ſhip in a contrary wind laid down upon a map, probably in purſuit of food. The general belief is, that the muſcle is conſtantly ſtationary in a ſtate of repoſe, and cannot transfer itſelf from place to

(A) There has been in theſe parts (*i. e.* at Perth) a very great fiſhery of pearl got out of the freſh-water muſcles. From the year 1761 to 1764, 10,000l. worth were ſent to London, and ſold from 10s. to 1l. 16s. per ounce. We were told that a pearl had been taken there that weighed 33 grains. But this fiſhery is at preſent exhauſted, from the avarice of the undertakers: it once extended as far as Loch-Tay.

to place. This is a vulgar prejudice, and one of thoſe facts that are miſtaken for want of ſufficient pains or opportunity to make more critical obſervations. Others, finding the firſt opinion a falſe one, and that they are endowed with power of changing place like other animals, have, upon the ſame foundation, gone into the contrary extreme, ſo far as to attribute ſwiftneſs to them, a property ſurely inconſiſtent with their being fixed to rocks. Pliny and Solinus ſay that the muſcles have leaders, and go in flocks; and that their leader is endowed with great cunning to protect himſelf and his flock from the fiſhers; and that, when he is taken, the others fall an eaſy prey. This, however, we may juſtly look upon to be a fable; ſome of the moſt accurate obſervers having diſcovered the motion of the muſcle, which indeed is wonderful, and that they lie in beds, which is not at all ſo, have added the reſt, to make their hiſtory complete." Our author informs us, that the muſcles found in the ſalt ſprings of Nubia likewiſe travel far from home, and are ſometimes ſurpriſed, by the ceaſing of the rains, at a greater diſtance from their beds than they have ſtrength and moiſture to carry them. He aſſures us, that none of the pearl-fiſh are eatable; and that they are the only fiſh he ſaw in the Red Sea that cannot be eaten.

Artificial PEARLS. Attempts have been made to take out ſtains from pearls, and to render the foul opaque-coloured ones equal in luſtre to the oriental. Abundance of proceſſes are given for this purpoſe in books of ſecrets and travels; but they are very far from anſwering what is expected from them. Pearls may be cleaned indeed from any external foulneſſes by waſhing and rubbing them with a little Venice ſoap and warm water, or with ground rice and ſalt, with ſtarch and powder-blue, plaſter of Paris, coral, white vitriol and tartar, cuttle-bone, pumice-ſtone, and other ſimilar ſubſtances; but a ſtain that reaches deep into the ſubſtance of pearls is impoſſible to be taken out. Nor can a number of ſmall pearls be united into a maſs ſimilar to an entire natural one, as ſome pretend.

There are, however, methods of making artificial pearls, in ſuch manner as to be with difficulty diſtinguiſhed from the beſt oriental. The ingredient uſed for this purpoſe was long kept a ſecret; but it is now diſcovered to be a fine ſilver like ſubſtance found upon the under ſide of the ſcales of the blay or bleak fiſh. The ſcales, taken off in the uſual manner, are waſhed and rubbed with freſh parcels of fair water, and the ſeveral liquors ſuffered to ſettle: the water being then poured off, the pearly matter remains at the bottom, of the conſiſtence of oil, called by the French *eſſence d'orient*. A little of this is dropped into a hollow bead of bluiſh glaſs, and ſhaken about ſo as to line the internal ſurface; after which the cavity is filled up with wax, to give ſolidity and weight. Pearls made in this manner are diſtinguiſhable from the natural only by their having fewer blemiſhes.

*Mother-of-*PEARL, the ſhell, not of the pearl oyſter, but of the *mytilus margaretifera*. See MYTILUS.

Pearl-Aſh, a kind of fixed alkaline ſalt, prepared chiefly in Germany, Ruſſia, and Poland, by melting the ſalts out of the aſhes of burnt wood; and having reduced them again to dryneſs, evaporating the moiſture, and calcining them for a conſiderable time in a furnace moderately hot. The goodneſs of pearl-aſhes muſt be diſtinguiſhed by the uniform and white appearance of them: they are nevertheleſs ſubject to a common adulteration, not eaſy to be diſtinguiſhed by the mere appearance, which is done by the addition of common ſalt. In order to find out this fraud, take a ſmall quantity of the ſuſpected ſalt; and after it has been ſoftened by lying in the air, put it over the fire in a ſhovel: if it contains any common ſalt, a crackling and kind of ſlight exploſion will take place as the ſalt grows hot. Pearl, Pearſon.

Pearl-aſhes are much uſed in the manufacture of glaſs, and require no preparation, except where very great tranſparency is required, as in the caſe of looking-glaſs, and the beſt kind of window-glaſs. For this purpoſe diſſolve them in four times their weight of boiling water: when they are diſſolved, let the ſolution be put into a clean tub, and ſuffered to remain there 24 hours or more. Let the clear part of the fluid be then decanted off from the ſediment, and put back into the iron pot in which the ſolution was made; in this let the water be evaporated till the ſalts be left perfectly dry. Keep thoſe that are not deſigned for immediate uſe in ſtone jars, well ſecured from moiſture and air.

Mr Kirwan, who has tried a courſe of experiments on the alkaline ſubſtances uſed in bleaching, &c. (ſee *Iriſh Tranſ.* for 1789), tells us, that in 100 parts of the Dantzick pearl-aſh, the vegetable alkali amounted to ſomewhat above 63. His pearl-aſh he prepares by calcining a ley of vegetable aſhes dried into a ſalt to whiteneſs. In this operation, he ſays, "particular care ſhould be taken that it ſhould not melt, as the extractive matter would not be thoroughly conſumed, and the alkali would form ſuch a union with the earthy parts as could not eaſily be diſſolved." He has "added this caution, as Dr Lewis and Mr Doſſie have inadvertently directed the contrary." We apprehend, however, that here is a little inaccuracy; and that it was not for pearl-aſh, but for the unrefined pot-aſh, that theſe gentlemen directed fuſion. The fact is, that the American pot-aſhes, examined by them, had unqueſtionably ſuffered fuſion: which was effected in the ſame iron pot in which the evaporation was finiſhed, by rather increaſing the fire at the end of the proceſs: by this management, one of the moſt troubleſome operations in the whole manufacture, the ſeparation of the hard ſalt from the veſſels with hammers and chiſſels, was avoided; and though the extractive matter was not conſumed, it was burnt to an indiſſoluble coal; ſo that the ſalt, though black itſelf, produced a pale or colourleſs ſolution, and was uncommonly ſtrong. Mr Kirwan has alſo given tables of the quantities of aſhes and ſalt obtained from different vegetables; and he concludes from them, 1. "That in general weeds yield much more aſhes, and their aſhes much more ſalt, than woods; and that, conſequently, as to ſalts of the vegetable alkali kind, neither America, Trieſte, nor the northern countries, poſſeſs any advantage over us. 2. That of all weeds, ſumitary produces moſt ſalt, and next to it wormwood; but if we attend only to the quantity of ſalt in a given weight of aſhes, the aſhes of wormwood contain moſt. *Trifolium fibrinum* alſo produces more aſhes and ſalt than fern." See POTASH.

PEARSON (John), a very learned Engliſh biſhop in

Pearſon, Peaſant.

in the 17th century, was born at Snoring in 1613. After his education at Eton and Cambridge, he entered into holy orders in 1639, and was the ſame year collated to the prebend of Netherhaven in the church of Sarum. In 1640 he was appointed chaplain to the lord keeper Finch, and by him preſented to the living of Torrington in Suffolk. In 1650 he was made miniſter of St Clement's, Eaſt cheap, in London. In 1657, he and Mr Gunning had a diſpute with two Roman Catholics upon the ſubject of ſchiſm; a very unfair account of which was printed at Paris in 1658. Some time after, he publiſhed at London An Expoſition of the Creed, in folio, dedicated to his pariſhioners of St Clement's, Eaſt-cheap, to whom the ſubſtance of that excellent work had been preached ſeveral years before, and by whom he had been deſired to make it public. The ſame year he likewiſe publiſhed The Golden Remains of the ever memorable Mr John Hales of Eton; to which he prefixed a preface, containing, of that great man, with whom he had been acquainted for many years, a character drawn with great elegance and force. Soon after the Reſtoration, he was preſented by Juxon, then biſhop of London, to the rectory of St Chriſtopher's in that city; created doctor of divinity at Cambridge, in purſuance of the king's letters mandatory; inſtalled prebendary of Ely; archdeacon of Surry; and made maſter of Jeſus college in Cambridge: all before the end of the year 1660. March 25th 1661, he was appointed Margaret profeſſor of divinity in that univerſity; and, the firſt day of the enſuing year, was nominated one of the commiſſioners for the review of the liturgy in the conference at the Savoy. April 14th 1662, he was admitted maſter of Trinity college in Cambridge; and, in Auguſt, reſigned his rectory of St Chriſtopher's and prebend of Sarum.—In 1667 he was admitted a Fellow of the Royal Society. In 1672 he publiſhed at Cambridge, in 4to, *Vindiciæ Epiſtolarum S. Ignatii*, in anſwer to Monſ. Daillé; to which is ſubjoined, *Iſaaci Voſſii epiſtolæ duæ adverſus Davidem Blondellum.* Upon the death of the celebrated Wilkins, Pearſon was appointed his ſucceſſor in the ſee of Cheſter, to which he was conſecrated February 9th 1672-3. In 1682, his *Annales Cyprianici, ſive tredecim annorum, quibus S. Cyprian. inter Chriſtianos verſatus eſt, hiſtoria chronologica*, was publiſhed at Oxford, with Fell's edition of that Father's works. Pearſon was diſabled from all public ſervice by ill health a conſiderable time before his death, which happened at Cheſter, July 16th 1686.

PEASANT, a hind, one whoſe buſineſs is in rural labour.

It is amongſt this order of men that a philoſopher would look for innocent and ingenuous manners. The ſituation of the peaſantry is ſuch as ſecludes them from the devaſtations of luxury and licentiouſneſs; for when the contagion has once reached the receſſes of rural retirement, and corrupted the minds of habitual innocence, that nation has reached the ſummit of vice, and is haſtening to that decay which has always been the effect of vicious indulgence. The peaſantry of this country ſtill in a great meaſure retain that ſimplicity of manners and ruſtic innocence which ought to be the characteriſtic of this order of ſociety; and, in many parts, their condition is ſuch as, were all its advantages ſufficiently known, would create envy in the minds of thoſe who have toiled through life, amidſt the buſtle of the world, in queſt of that happineſs which it could not confer. Pea

O fortunatos nimium, ſua ſi bona norint,
Agricolas.—— Virgil.

In other countries the peaſants do not enjoy the ſame liberty as they do in our own, and are conſequently not ſo happy. In all feudal governments they are abject ſlaves, entirely at the diſpoſal of ſome petty deſpot. This was the caſe in Poland, where the native peaſants were ſubject to the moſt horrid ſlavery, though thoſe deſcended of the Germans, who ſettled in Poland during the reign of Boleſlaus the Chaſte and Caſſimir the Great, enjoyed very diſtinguiſhed privileges. Amongſt the native ſlaves, too, thoſe of the crown were in a better condition than thoſe of individuals. See POLAND.

The peaſants of Ruſſia (Mr Coxe tells us) are a hardy race of men, and of great bodily ſtrength. Their cottages are conſtructed with tolerable propriety, after the manner of thoſe in Lithuania; but they are very poorly furniſhed. The peaſants are greedy of money, and, as the ſame author informs us, ſomewhat inclined to thieving. They afford horſes to travellers, and act the part of coachmen and poſtilions. "In their common intercourſe they are remarkably polite to each other: they take off their cap at meeting; bow ceremoniouſly and frequently, and uſually exchange a ſalute. They accompany their ordinary diſcourſe with much action, and innumerable geſtures; and are exceedingly ſervile in their expreſſions of deference to their ſuperiors: in accoſting a perſon of conſequence, they proſtrate themſelves, and even touch the ground with their heads. We were often ſtruck at receiving this kind of eaſtern homage, not only from beggars, but frequently from children, and occaſionally from ſome of the peaſants themſelves. *Coxe's vels into land, Ru ſia, Swe and Den mark.*

"The peaſants are well clothed, comfortably lodged, and ſeem to enjoy plenty of wholeſome food. Their rye-bread, whoſe blackneſs at firſt diſguſts the eye, and whoſe ſourneſs the taſte, of a delicate traveller, agrees very well with the appetite: as I became reconciled to it from uſe, I found it at all times no unpleaſant morſel, and, when ſeaſoned with hunger, it was quite delicious: they render this bread more palatable, by ſtuffing it with onions and groats, carrots or green corn, and ſeaſoning it with ſweet oil. The rye-bread is ſometimes white, and their other articles of food are eggs, ſalt-fiſh, bacon, and muſhrooms; their favourite diſh is a kind of hodge podge, made of ſalt, or ſometimes freſh meat, groats, rye-flour, highly ſeaſoned with onions and garlick, which latter ingredients are much uſed by the Ruſſians. Beſides, muſhrooms are ſo exceedingly common in theſe regions, as to form a very eſſential part of their proviſion. I ſeldom entered a cottage without ſeeing great abundance of them; and in paſſing through the markets, I was often aſtoniſhed at the prodigious quantity expoſed for ſale: their variety was no leſs remarkable than their number; they were of many colours, amongſt which I particularly noticed white, black, brown, yellow, green, and pink. The common drink of the peaſants is quaſs, a fermented liquor, ſomewhat like ſweet-wort, made by pouring warm water on rye-

t. or barley-meal; and deemed an excellent antiſcorbutic. They are extremely fond of whiſky, a ſpirituous liquor diſtilled from malt, which the pooreſt can occaſionally command, and which their inclination often leads them to uſe to great exceſs."

Theſe people are extremely backward in the mechanic arts, though, where they have much intercourſe with other nations, this does not appear, and therefore does not proceed from natural inability; indeed we have already given an inſtance of one peaſant of Ruſſia, who ſeems to poſſeſs very ſuperior talents. See NEVA.

The dreſs of theſe people is well calculated for the climate in which they live: they are particularly careful of their extremities. On their legs they wear one or two pair of thick worſted ſtockings; and they envelope their legs with wrappers of coarſe flannel or cloth ſeveral feet in length, and over theſe they frequently draw a pair of boots, ſo large as to receive their bulky contents with eaſe. The lower ſort of people are groſsly ignorant; of which we ſhall give a very ſurpriſing inſtance in the words of Mr Coxe:— "In many families, the father marries his ſon while a boy of ſeven, eight, or nine years old, to a girl of a more advanced age, in order, as it is ſaid, to procure an able-bodied woman for the domeſtic ſervice: he cohabits with this perſon, now become his daughter-in-law, and frequently has ſeveral children by her. In my progreſs through Ruſſia, I obſerved in ſome cottages, as it were, two miſtreſſes of a family; one the peaſant's real wife, who was old enough to be his mother; and the other, who was nominally the ſon's wife, but in reality the father's concubine. Theſe inceſtuous marriages, ſanctified by inveterate cuſtom, and permitted by the pariſh-prieſts, were formerly more common than they are at preſent; but as the nation becomes more refined, and the prieſts ſomewhat more enlightened; and as they have lately been diſcountenanced by government, they are daily falling into diſuſe; and, it is to be hoped, will be no longer tolerated (A)."

The peaſants of Ruſſia, like thoſe of Poland, are divided into thoſe of the crown and thoſe of individuals; the firſt of which are in the beſt condition; but all of them undergo great hardſhips, being ſubject to the deſpotic will of ſome cruel overſeer. They may obtain freedom, 1. By manumiſſion on the death of their maſter, or otherwiſe: 2. By purchaſe; and, laſtly, By ſerving in the army or navy. The Empreſs has redreſſed ſome of the grievances of this claſs of her ſubjects. The hardineſs of the peaſants ariſes in a great meaſure from their mode of education and way of life, and from the violent changes and great extremes of heat and cold to which they are expoſed. Peaſant.

"The peaſants of Finland differ widely from the Ruſſians in their look and dreſs: they had for the moſt part fair complexions, and many of them red hair: they ſhave their beards, wear their hair parted at the top, and hanging to a conſiderable length over their ſhoulders (B). We could not avoid remarking, that they were in general more civilized than the Ruſſians; and that even in the ſmalleſt villages we were able to procure much better accommodations than we uſually met with in the largeſt towns which we had hitherto viſited in this empire."

The peaſants of Sweden (Mr Coxe informs us) are more honeſt than thoſe in Ruſſia; in better condition, and poſſeſſing more of the conveniencies of life, both with reſpect to food and furniture. "They are well clad in ſtrong cloth of their own weaving. Their cottages, though built with wood, and only of one ſtory, are comfortable and commodious. The room in which the family ſleep is provided with ranges of beds in tiers (if I may ſo expreſs myſelf), one above the other: upon the wooden teſters of the beds in which the women lie, are placed others for the reception of the men, to which they aſcend by means of ladders. To a perſon who has juſt quitted Germany, and been accuſtomed to tolerable inns, the Swediſh cottages may perhaps appear miſerable hovels; to me, who had been long uſed to places of far inferior accommodation, they ſeemed almoſt palaces. The traveller is able to procure many conveniences, and particularly a ſeparate room from that inhabited by the family, which could ſeldom be obtained in the Poliſh and Ruſſian villages. During my courſe through thoſe two countries, a bed was a phenomenon which ſeldom occurred, excepting in the large towns, and even then not always completely equipped; but the pooreſt huts of Sweden were never deficient in this article of comfort: an evident proof that the Swediſh peaſants are more civilized than thoſe of Poland and Ruſſia.— After having witneſſed the ſlavery of the peaſants in thoſe two countries, it was a pleaſing ſatisfaction to find myſelf again among freemen, in a kingdom where there is a more equal diviſion of property; where there is no vaſſalage; where the loweſt order enjoy a ſecurity of their perſons and property; and where the advantages reſulting from this right are viſible to the commoneſt obſerver."

(A) "The truth of this fact, which fell under my own obſervation, and which I authenticated by repeated inquiries from all ranks of people, is ſtill further confirmed by the following paſſage in the Antidote to the Journey into Siberia, although the author gives another reaſon for thoſe early marriages. 'The peaſants and common people not only marry their ſons at 14 and 15 years of age, but even at eight or nine, and that for the ſake of having a workwoman the more in the perſon of the ſon's wife: By the ſame rule, they try to keep their daughters ſingle as long as poſſible, becauſe they don't chooſe to loſe a workwoman. Theſe premature marriages are of very little uſe to the ſtate; for which reaſon, methods to get the better of this cuſtom have been ſought for, and, I hope, will ſoon take place: the biſhops are attentive to prevent theſe marriages as much as poſſible, and have of late ſucceeded greatly in their endeavours. It is only the inhabitants of ſome of the provinces in Ruſſia that ſtill retain this bad cuſtom."

(B) The Ruſſians have generally dark complexions and hair: they alſo wear their beards, and cut their hair ſhort.

Peat. The peafants of Holland and Switzerland are all in a very tolerable condition; not fubject to the undifputed controul of a hireling maſter, they are freemen, and enjoy in their ſeveral ſtations the bleſſings of freedom In Bohemia, Hungary, and a great part of Germany, they are legally ſlaves, and ſuffer all the miſeries attending ſuch a condition. In Spain, Savoy, and Italy, they are little better. In France, their ſituation was ſuch as to warrant the firſt Revolution; but by carrying matters too far, they are now infinitely worſe than they were at any former period

PEAT, a well known inflammable ſubſtance, uſed in many parts of the world as fuel. There are two ſpecies:

1. A yellowiſh-brown or black peat, found in mooriſh grounds in Scotland, Holland, and Germany.—When freſh, it is of a viſcid conſiſtence, but hardens by expoſure to the air. It conſiſts, according to Kirwan, of clay mixed with calcareous earth and pyrites; ſometimes alſo it contains common ſalt. While ſoft, it is formed into oblong pieces for fuel, after the pyritaceous and ſtony matters are ſeparated. By diſtillation it yields water, acid, oil, and volatile alkali; the aſhes containing a ſmall proportion of fixed alkali; and being either white or red according to the proportion of pyrites contained in the ſubſtance.

The oil which is obtained from peat has a very pungent taſte; and an empyreumatic ſmell, leſs fetid than that of animal ſubſtances, more ſo than that of mineral bitumens: it congeals in the cold into a pitchy maſs, which liquefies in a ſmall heat: it readily catches fire from a candle, but burns leſs vehemently than other oils, and immediately goes out upon removing the external flame: it diſſolves almoſt totally in rectified ſpirit of wine into a dark browniſh red liquor.

2. The ſecond ſpecies is found near Newbury in Berkſhire. In the Philoſophical Tranſactions for the year 1757, we have an account of this ſpecies; the ſubſtance of which is as follows:

Peat is a compoſition of the branches, twigs, leaves, and roots of trees, with graſs, ſtraw, plants, and weeds, which having lain long in water, is formed into a maſs ſo ſoft as to be cut through with a ſharp ſpade. The colour is a blackiſh brown, and it is uſed in many places for firing. There is a ſtratum of this peat on each ſide the Kennet, near Newbury in Berks, which is from about a quarter to half a mile wide, and many miles long. The depth below the ſurface of the ground is from one foot to eight. Great numbers of entire trees are found lying irregularly in the true peat. They are chiefly oaks, alders willows, and firs, and appear to have been torn up by the roots: many horſes heads, and bones of ſeveral kinds of deer; the horns of the antelope, the heads and tuſks of boars, and the heads of beavers, are alſo found in it. Not many years ago an urn of a light brown colour, large enough to hold about a gallon, was found in the peat-pit in Speen moor, near Newbury, at about 10 feet from the river, and four feet below the level of the neighbouring ground. Juſt over the ſpot where the urn was found, an artificial hill was raiſed about eight feet high; and as this hill conſiſted both of peat and earth, it is evident that the peat was older than the urn. From the ſide of the river ſeveral ſemicircular ridges are drawn round the hill, with trenches between them. The urn was broken to ſhivers by the peat-diggers who found it, ſo that it could not be critically examined; nor can it be known whether any thing was contained in it. Peat.

With peat alſo may be claſſed that ſubſtance called in England ſtone-turf; which hardens after its firſt expoſure to the air, but afterwards crumbles down.—The other common turf conſiſts only of mould interwoven with the roots of vegetables; but when theſe roots are of the bulbous kind, or in large proportion, they form the worſt kind of turf. "Although it may appear incredible (ſays M. Magellan), it is nevertheleſs a real fact, that, in England, pit-turf is advantageouſly employed in Lancaſhire to ſmelt the iron-ore of that county. Mr Wilkinſon brother-in-law to Dr Prieſtley, makes uſe of pit-turf in his large ſmelting furnaces. I have ſeen in the poſſeſſion of Mr S. More, ſecretary to the Society of Arts, a kind of black tallow, extracted by the ſaid Mr Wilkinſon from pit-turf. It was very ſoft, and nearly of the ſame conſiſtence with butter. It burnt very rapidly, with a ſmoky flame in the fire; but the ſmell was very diſagreeable, like that of pit-turf." The great cauſe of the differences of peat moſt likely ariſes from the different mineral admixtures. Some ſorts of peat yield in burning a very diſagreeable ſmell, which extends to a great diſtance; whilſt others are inoffenſive.—Some burn into grey or white, and others into red ferrugineous aſhes. The aſhes yield, on elixation, a ſmall quantity of alkaline ſalt, with ſometimes one and ſometimes another ſalt of the neutral kind.

The ſmoke of peat does not preſerve or harden fleſh like that of wood; and the ſoot, into which it condenſes, is more diſpoſed to liquefy in moiſt weather.

Peat aſhes, properly burnt for a manure, are noble improvers both of corn and graſs land: but the ſubſtance from which they ſhould be got is an under ſtratum of the peat, where the fibres and roots of the earth, &c. are well decayed. Indeed the very beſt are procured from the loweſt ſtratum of all. This will yield a large quantity of very ſtrong aſhes, in colour (when firſt burnt) like vermilion, and in taſte very ſalt and pungent. Great care and caution ſhould be uſed in burning theſe aſhes, and alſo in preſerving them afterwards. The method of burning them is much the ſame as burning charcoal. The peat muſt be collected into a large heap, and covered ſo as not to flame out, but ſuffered to conſume ſlowly, till the whole ſubſtance is burnt to an aſh. The aſhes thus burnt are held in moſt eſteem; but the peat-aſhes burnt in common firing are in many places uſed for the ſame purpoſes, and ſold at the ſame prices.

Peat aſhes are found excellent in ſweetening ſour meadow land, deſtroying ruſhes, and other bad kinds of graſs, and in their ſtead producing great quantities of natural graſs. They burn great quantities of peat-aſhes in ſome parts of Berkſhire and Lancaſhire, and eſteem them one of the beſt dreſſings for their ſpring crops.

The ſulphureous and ſaline particles with which the aſhes abound have a moſt happy effect in promoting vegetation; and if uſed with diſcretion, the increaſe procured by them is truly wonderful.

All.

Peat. All aſhes are of a hot, fiery, cauſtic nature: they muſt therefore be uſed with caution. With reſpect to peat-aſhes, almoſt the only danger proceeds from laying them on in too great quantities at improper ſeaſons. Nothing can be better than they are for dreſſing low damp meadows, laying to the quantity of from fifteen to twenty Winchester buſhels on an acre: it is beſt to ſow them by hand, as they will then be more regularly ſpread. This ſhould be done in January or February at lateſt, that the aſhes may be waſhed in towards the roots of the graſs by the firſt rains that fall in the ſpring.

If they were ſpread more forward in the year, and a ſpeedy rain ſhould not ſucceed, being hot in their nature, they would be apt to burn up the graſs, inſtead of doing it any ſervice. The damper and ſtiffer the ſoil, the more peat-aſhes ſhould be laid on it; but in graſs lands the quantity ſhould never exceed thirty Winchester buſhels, and on light warm lands leſs than half that quantity is fully ſufficient.

On wheat crops theſe aſhes are of the greateſt ſervice, but they muſt be laid on with the utmoſt diſcretion. Were they to be ſpread in any quantity before the winter, after the ſowing the corn, they would make the wheat too rank, and do more harm than good; was the ſpreading this manure, on the contrary, deferred till the ſpring, the corn could not poſſibly during the winter ſeaſon be benefited by it. About the beginning of November, before the hard froſts ſet in, ſeems to be the proper ſeaſon for this purpoſe: and it will be found neceſſary to ſow on every acre of heavy clayey wheat land about eight Winchester buſhels of theſe aſhes; on lighter warmer lands in wheat, four will be ſufficient for this ſeaſon. The winter dreſſing is thought by practical farmers to be of great ſervice: triſling as the quantity may ſeem, it warms the root of the plants, brings it moderately forward, preſerves its verdure, and diſpoſes it to get into a growing ſtate the firſt fine weather after Chriſtmas.

About the latter end of February, or the beginning of March, on heavy lands in wheat, another dreſſing of aſhes, by ſowing of them on every acre eight buſhels more, will do much good; on light lands, in this ſecond dreſſing, ſix buſhels may be allowed.

Theſe aſhes laid on in the ſpring are of the greateſt ſervice, without any probability of danger: if rain falls within a few days after the dreſſing is laid on, it is waſhed in, and has a happy effect on the ſucceeding crop, co-operating with the manure that was laid on in November; if, on the contrary, dry weather for a long continuance ſucceeds, the firſt winter dreſſing has its full effect, and the quantity laid on in the ſpring is in fact ſo ſmall, that there is very little probability of its burning or hurting the crop. This excellent manure is alſo of great uſe in the turnip huſbandry on many accounts, particularly as it much contributes to preſerve the young crop from being devoured by the fly.

But one of the principal advantages derived from theſe aſhes, not yet mentioned, is the very great ſervice they are of to every kind of artificial paſture.

Saintfoin receives great benefit from this manure, and ſo does clover, rye graſs, and trefoil, provided it is laid on with diſcretion: the proper ſeaſon is about the month of February. The quantity muſt be regulated by the nature of the crop and ſoil; but it ought ſcarcely in any inſtance to exceed thirty Winchester buſhels. Clover, with the help of this manure, grows with great luxuriance, inſomuch that there have often been two large crops of hay from the ſame field in a year, and good autumn ſeed afterwards. They have an excellent effect on tares or vetches: to peaſe they ſeem to be hurtful. Peat || Pebbles.

The effects of this manure will be viſible at leaſt three years, nor does it, like ſome others, leave the land in an impoveriſhed ſtate, when its virtues are exhauſted and ſpent. Peat-aſhes are not, however, ſo certain a manure for barley and oats as for the winter corn: for as theſe are quick growers, and occupy the land but a few months, this warm manure is often apt to puſh them forward too faſt, and make them run too much to coarſe ſtraw, yielding only a lean immature grain. Oats, however, are not ſo apt to be damaged by it as barley.

Peat-aſhes approach, in their effects on the ſeveral crops on which they are laid, to coal-ſoot; but two-thirds of the quantity that is uſed of ſoot will be ſufficient of the aſhes, as they are in a much ſtronger degree impregnated with a vegetative power; and they are beſides in moſt places eaſier procured in quantities, and at a cheaper rate.

Peat-aſhes are almoſt, as we have already obſerved, a general manure ſuited to every ſoil. On cold clay they warm the too compact particles, diſpoſe it to ferment, crumble, and of courſe fertilize, and, in fine, not only aſſiſt it in diſcloſing and diſpenſing its great vegetative powers, but alſo bring to its aid a conſiderable proportion of ready prepared aliment for plants. On light lands theſe aſhes have a different effect: here the pores are too large to be affected, or farther ſeparated by the ſalts or ſulphur contained in them; but, being cloſely attached to the ſurfaces of the large particles of which this earth is generally compoſed, this manure diſpoſes them, by means of its ſalts, to attract the moiſture contained in the air: by this operation, the plants which grow on theſe porous ſoils are prevented from being ſcorched up and burnt; and if they want, which they generally do, more nouriſhment than the land is of itſelf capable of affording, this is readily and abundantly ſupplied by this uſeful manure. In large farms it is very uſual to ſee all the home-fields rich and well mended by the yard dung, &c whereas the more diſtant lands are generally poor, impoveriſhed, and out of heart, for want of proper manure being applied in time. See CHEMISTRY, n° 1448.

PEAUCIER, in anatomy, a name given by Winſlow, in his Treatiſe on the Head, and by ſome of the French writers, to the muſcle called by Aloinus *latiſſimus colli*; and by others *detrahens quadratus*, and *quadratus genæ*. Santorini has called the part of this which ariſes from the cheek *muſculus riſorius novus*; and ſome call the whole *platyſma myoides*.

PEBBLES, the name of a genus of foſſils, diſtinguiſhed from the flints and homocroa by their having a variety of colours. Theſe are defined to be ſtones compoſed of a cryſtalline matter debaſed by earths of various kinds in the ſame ſpecies, and then ſubject to veins, clouds, and other variegations, uſually formed by incruſtation round a central nucleus, but ſometimes the effect of a ſimple concretion; and veined like the agates, by the diſpoſition which the motion of the

Pebbles. the fluid they were formed in gave their differently coloured ſubſtances.

The variety of pebbles is ſo great, that an haſty deſcriber would be apt to make almoſt as many ſpecies as he ſaw ſpecimens. A careful examination will teach us, however, to diſtinguiſh them into a certain number of eſſentially different ſpecies, to which all the reſt may be referred as accidental varieties. When we find the ſame colours, or thoſe reſulting from a mixture of the ſame, ſuch as nature frequently makes in a number of ſtones, we ſhall eaſily be able to determine that theſe are all of them the ſame ſpecies, though of different appearances; and that whether the matter be diſpoſed of in one or two, or in 20 cruſts, laid regularly round a nucleus; or thrown irregularly, without a nucleus, into irregular lines; or laſtly, if blended into an uniform maſs.

Theſe are the three ſtates in which every pebble is found; for if it has been naturally and regularly formed by incruſtation round a certain nucleus, we find that always the ſame in the ſame ſpecies, and the cruſts not leſs regular and certain. If the whole has been more haſtily formed, and the reſult only of one ſimple concretion, if that has happened while its different ſubſtances were all moiſt and thin, they have blended together and made a mixed maſs of the joint colour of them all. But if they have been ſomething harder when this has happened, and too far concreted to diffuſe wholly among one another, they are found thrown together into irregular veins. Theſe are the natural differences of all the pebbles; and having regard to theſe in the ſeveral variegations, all the known pebbles may be reduced to 34 ſpecies.

In all the ſtrata of pebbles there are conſtantly found ſome which are broken, and of which the pieces lie very near one another; but as bodies of ſuch hardneſs could not be broken without ſome conſiderable violence, their preſent ſituation ſeems to indicate that they have ſuffered that great violence in or near the places where they now lie. Beſide theſe, we often meet with others which have as plainly had pieces broken off from them, though thoſe pieces are nowhere to be found; whence it ſeems equally plain, that whatever has been the cauſe of their fracture, they have been brought broken, as we find them, from ſome other place, or elſe that the pieces broken from them muſt at ſome time or other have been carried from this place to ſome other diſtant one.

Several of theſe broken pebbles have their edges and corners ſo ſharp and even, that it ſeems evident they never can have been toſſed about or removed ſince the fracture was made; and others have their ſides and corners ſo rounded, blunted, and worn away, that they ſeem to have been roughly moved and rolled about among other hard bodies, either with great violence, or for a very long continuance; ſince ſuch hard bodies could not have been reduced to the condition in which we now ſee them without long friction. It may be ſuppoſed by ſome, that theſe ſtones never were broken, but have been naturally formed of this ſhape; but it will be eaſily ſeen, by any one who accurately ſurveys their veins or coats, which ſurround the nucleus, like the annular circles of a tree, that they muſt have been originally entire; and this will be the more plain if they are compared with a ſtone broken by art. Such pebbles as are found in ſtrata near the ſurface of the earth, are much more brittle than thoſe which lie in deeper ſtrata; and the more clear and tranſparent the ſand is which is found among pebbles, the more beautiful the pebbles are generally obſerved to be. Pebbles || Peccant.

The uſe of theſe ſtones, and their diſpoſition in the earth, is a ſubject of great wonder; and may ſerve as one of the numerous proofs of an over-ruling Providence in the diſpoſition of all natural bodies. The ſurface of the earth is compoſed of vegetable mould, made up of different earths mixed with the putrid remains of animal and vegetable bodies, and of the proper texture and compages for conducting the moiſture to the roots of trees and plants. Under this are laid the ſands and pebbles which ſerve as a ſort of drain to carry off the redundant moiſture deeper into the earth, where it may be ready to ſupply the place of what is conſtantly riſing in exhalations; and leſt the ſtrata of ſand ſhould be too thick, it is common to find thin ones of clay between, which ſerve to put a ſtop to the deſcent of the moiſture, and keep it from paſſing off too ſoon; and leſt theſe thin ſtrata of clay ſhould yield and give way, and by their ſoftneſs when wetted give leave to the particles of ſand to blend themſelves with, and even force their way through them, there are found in many places thin coats of a poor iron ore, placed regularly above and below the clay; and by theſe means not only ſtrengthening and ſupporting the clay, but effectually keeping the ſand from making its way into it. There are many people of opinion, that the ſwallowing of pebbles is very beneficial to health, in helping the ſtomach to digeſt its food; and a pebble-poſſet is an old woman's medicine in the colic in many parts of England. They uſually order the ſmall white ſtones to be picked out of gravel walks for this purpoſe, and eat them in large quantities in ſome ſort of ſpoon meat, of which milk is an ingredient.

The thing that has given occaſion to this practice ſeems to have been, that people obſerve the birds to pick up the gravel, and that they are never well unleſs they have frequent recourſe to this to help their digeſtion: but this is no ſimilar caſe at all, for the gizzard or ſtomach of a bird is made very ſtrong, becauſe the creature hath no teeth to chew its food; and this gizzard is lined with a rough coat, by the help of which and theſe ſtones the food they ſwallow whole is ſo ground as to yield its juices to the nouriſhment of the animal. But the ſtomach of man is formed ſo very differently, that it can never require thoſe aſſiſtances to the comminution of food. Many people have, however, accuſtomed themſelves to ſwallow not only theſe ſmall white ſtones, but large pebbles, even to the ſize of a walnut each; and theſe will often paſs ſafely; and people who have long accuſtomed themſelves to ſwallow them, boaſt of receiving no injury from them: we can never know, however, that the death of ſuch perſons is not owing to them at laſt; and as they can do no good, it is beſt always to avoid them. There are, indeed, inſtances on record in which they have undoubtedly done much miſchief.

PECARY, in zoology. See TAJACU.

PECCANT, in medicine, an epithet given to the humours of the body, when they offend either in quantity or quality, *i. e.* when they are either morbid, or in too great abundance. Moſt diſeaſes ariſe from peccant humours,

echem || Peck.

humours, which are either to be corrected by alteratives and ſpecifics, or elſe to be evacuated.

PECHEM, in the materia medica, a name given by the modern Greek writers to the root called *behem* by Avicenna and Serapion. Many have been at a loſs to know what this root pechem was; but the virtues aſcribed to it are the ſame with thoſe of the behem of the Arabians; its deſcription is the ſame, and the diviſion of it into white and red is alſo the ſame as that of the behem. Nay, the word *pechem* is only formed of *behem* by changing the *b* into a *p*, which is very common, and the aſpirate into *χ*, or *ch*, which is as common. Myrepſus, who treats of this root, ſays the ſame thing that the Arabian Avicenna ſays of behem, namely, that it was the fragments of a woody root, much corrugated and wrinkled on the ſurface, which was owing to its being ſo moiſt whilſt freſh, that it always ſhrunk greatly in the drying.

PECHYAGRA, a name given by authors to the gout affecting the elbow.

PECHYS, a name uſed by ſome anatomical writers for the elbow.

PECHYTYRBE, an epithet uſed by ſome medical writers for the ſcurvy.

PECK, a meaſure of capacity, four of which make a buſhel.

Peck (Francis), was born at Stamford in Lincolnſhire, May 4th 1692, and educated at Cambridge, where he took the degrees of B. and M. A. He was the author of many works, of which the firſt is a poem, intitled, "Sighs on the Death of queen Anne;" printed probably about the time of her death in 1714. Two years afterwards he printed "Το τυοσ'αιον; or an Exerciſe on the Creation, and an Hymn to the Creator of the World; written in the expreſs words of the ſacred text, as an Attempt to ſhow the Beauty and Sublimity of the Holy Scriptures, 1716, 8vo." In 1721, being then curate of King's Clifton in Northamptonſhire, he iſſued propoſals for printing the Hiſtory and Antiquities of his native town, which was publiſhed in 1727, in folio, under the title of "*Academia tertia Anglicana*; or the Antiquarian Annals of Stamford in Lincoln, Rutland, and Northamptonſhires; containing the Hiſtory of the Univerſity, Monaſteries, Gilds, Churches, Chapels, Hoſpitals, and Schools there, &c." inſcribed to John Duke of Rutland. This work was haſtened by "An Eſſay on the ancient and preſent State of Stamford, 1726, 4to," written by Francis Hargrave, who, in his preface, mentions the difference which had ariſen between him and Mr Peck, on account of the former's publication unfairly foreſtalling that intended by the latter. Mr Peck is alſo therein very roughly treated, on account of a ſmall work he had formerly printed, intitled, "The Hiſtory of the Stamford Bull-running." Mr Peck had before this time obtained the rectory of Godeby near Melton in Leiceſterſhire, the only preferment he ever enjoyed. In 1729, he printed on a ſingle ſheet, "Queries concerning the Natural Hiſtory and Antiquities of Leiceſterſhire and Rutland," which were afterwards reprinted in 1740; but although the progreſs he had made in the work was very conſiderable, yet it never made its appearance. In 1732 he publiſhed the firſt volume of "*Deſiderata Curioſa*; or, a Collection of divers ſcarce and curious Pieces relating chiefly to Matters of Engliſh Hiſtory; conſiſting of choice tracts, memoirs, letters, wills, epitaphs, &c. tranſcribed, many of them, from the originals themſelves, and the reſt from divers ancient MS. copies, or the MS. collations of ſundry famous antiquaries and other eminent perſons, both of the laſt and preſent age: the whole, as nearly as poſſible, digeſted into order of time, and illuſtrated with ample notes, contents, additional diſcourſes, and a complete index." This volume was dedicated to Lord William Manners, and was followed, in 1735, by a ſecond volume, dedicated to Dr Reynolds biſhop of Lincoln. In 1735 Mr Peck printed in a 4to pamphlet, "A complete catalogue of all the diſcourſes written both for and againſt popery in the time of King James II. containing in the whole an account of 457 books and pamphlets, a great number of them not mentioned in the three former catalogues; with references after each title, for the more ſpeedy finding a further account of the ſaid diſcourſes and their authors in ſundry writers, and an alphabetical liſt of the writers on each ſide." In 1739 he was the editor of "Nineteen Letters of the truly reverend and learned Henry Hammond, D. D. (author of the Annotations on the New Teſtament, &c.) written to Mr Peter Stainnough and Dr Nathaniel Angelo, many of them on curious ſubjects, &c." Theſe were printed from the originals, communicated by Mr Robert Marſden archdeacon of Nottingham, and Mr John Worthington. The next year, 1740, produced two volumes in 4to, one of them intitled, "Memoirs of the Life and Actions of Oliver Cromwell, as delivered in three panegyrics of him written in Latin; the firſt, as ſaid, by Don Juan Roderiguez de San Menefes, Conde de Penguiao, the Portugal ambaſſador; the ſecond, as aſſirmed by a certain jeſuit, the lord ambaſſador's chaplain; yet both, it is thought, compoſed by Mr John Milton (Latin ſecretary to Cromwell), as was the third; with an Engliſh verſion of each. The whole illuſtrated with a large hiſtorical preface; many ſimilar paſſages from the Paradiſe Loſt, and other works of Mr John Milton, and notes from the beſt hiſtorians. To all which is added, a collection of divers curious hiſtorical pieces relating to Cromwell, and a great number of other remarkable perſons (after the manner of *Deſiderata Curioſa*, v. i. and ii.)" The other, "New Memoirs of the Life and poetical Works of Mr John Milton; with, firſt, an examination of Milton's ſtyle; and ſecondly, explanatory and critical notes on divers paſſages in Milton and Shakeſpeare, by the editor. Thirdly, Baptiſtes; a ſacred dramatic poem in defence of liberty, as written in Latin by Mr George Buchanan, tranſlated into Engliſh by Mr John Milton, and firſt publiſhed in 1641, by order of the houſe of commons. Fourthly, the Parallel, or Archbiſhop Laud and Cardinal Wolſey compared, a Viſion by Milton. Fifthly, the Legend of Sir Nicholas Throckmorton, knt. chief butler of England, who died of poiſon, *anno* 1570, an hiſtorical poem by his nephew Sir Thomas Throckmorton, knt. Sixth, Herod the Great, by the editor. Seventh, the Reſurrection, a poem in imitation of Milton, by a friend. And eighth, a Diſcourſe on the Harmony of the Spheres, by Milton; with prefaces and notes." Theſe were the laſt publications which he

Peck.

Pecten.

he gave the world. When theſe appeared, he had in contemplation no leſs than nine different works; but whether he had not met with encouragement for thoſe which he had already produced, or whether he was rendered incapable of executing them by reaſon of his declining health, is uncertain; but none of them ever were made public. He concluded a laborious, and, it may be affirmed, an uſeful life, wholly devoted to antiquarian purſuits, Aug. 13th 1743, at the age of 61 years.

PECORA, in zoology, the fifth order of the claſs mammalia, in the Linnean ſyſtem. See ZOOLOGY.

PECQUET (John), was a phyſician in Dieppe, and died at Paris in 1674. He was phyſician in ordinary to the celebrated Fouquet, whom he entertained at his ſpare hours with ſome of the moſt amuſing experiments in natural philoſophy. He acquired immortal honour to himſelf by the diſcovery of a lacteal vein, which conveys the chyle to the heart; and which from his name is called *le Reſervoir de Pecquet*. This diſcovery was a freſh proof of the truth of the circulation of the blood: though it met with oppoſition from many of the learned, particularly from the famous Riolan, who wrote a treatiſe againſt the author of it, with this title: *Adverſus Pecquetum & Pecquetianos*. The only works which we have of Pecquet, are, 1. *Experimenta nova Anatomica*, publiſhed at Paris, 1654. 2. A Diſſertation, *De Thoracis Lacteis*, publiſhed at Amſterdam, 1661. He was a man of a lively and active genius; but his ſprightlineſs ſometimes led him to adopt dangerous opinions. He recommended, as a remedy for all diſeaſes, the uſe of brandy. This remedy, however, proved fatal to himſelf, and contributed to ſhorten his days, which he might have employed to the advantage of the public.

PECTEN, the SCALLOP; a genus of ſhell-fiſh, the characters of which are theſe: The animal is a tethys; the ſhell bivale and unequal; the hinge toothleſs, having a ſmall ovated hollow. This ſhell-fiſh is one of the ſpinners, having the power of ſpinning threads like the muſcles: but they are much ſhorter and coarſer than even thoſe of that fiſh; ſo that they can never be wrought into any kind of work like the longer and finer threads of the pinna marina. The uſe of the threads which are ſpun by the ſcallop is to fix the creature to any ſolid body near its ſhell. All theſe proceed, as in the muſcle, from one common trunk. It is an evident proof that the fiſh has a power of fixing itſelf at pleaſure to any ſolid body by means of theſe threads, that after ſtorms the ſcallops are often found toſſed upon rocks, where there were none the day before; and yet theſe are fixed by their threads, as well as thoſe which had remained ever ſo long in their place. They form their threads in the very ſame manner which the muſcle; only their organ which ſerves for ſpinning is ſhorter, and has a wider hollow, whence the threads are neceſſarily thicker and ſhorter.

Mr Barbut divides the genus oſtrea into four families; which he thus names according to their characters. 1. The winged equilateral pectens. 2. The pectens, that have one ear inwardly, ſpring by being ciliated. 3 The pectens that have their valves more gibbous on one ſide than on the other. 4. The rough ones, commonly called *oyſters*. Of the locomotive powers of the pecten, we have already treated under the article *Animal Motion*, which ſee p. 411. col. 2. Pecten.

The pectens, ſuch as the ſole pecten, the ducal mantle pecten, the knotted, and others, ſeem to be in general inhabitants of the Indian ſeas; ſome of them frequent thoſe of Africa and the South Seas. The moſt remarkable ſpecies is the *maximus* or great ſcallop, being the ſame with what Barbut calls the *ducal-mantle pecten*. It has 14 rays, very prominent and broad, and ſtriated both above and below. They are rugged and imbricated with ſcales. They grow to a large ſize; are found in beds by themſelves; are dredged up, and barrelled for ſale. The ancients ſay that they have a power of removing themſelves from place to place by vaſt ſprings or leaps. This ſhell was uſed both by the Greeks and Latins as a food. When dreſſed with pepper and cummin, it was taken medicinally. The ſcallop was commonly worn by pilgrims on their hat, or the cape of their coat, as a mark that they had croſſed the ſea in their way to the Holy Land, or ſome diſtant object of devotion.

The name *pecten* ſeems to have been given to theſe animals, from the longitudinal ſtriæ with which their ſurface is covered, which reſemble ſomewhat the teeth of a comb; and hence alſo the Greek name κτεις. By the general character of this ſhell, it evidently includes cockles as well as ſcallops, which are the pectens without ears, and having leſs flat or elated ſhells. They are called by all authors by a name which is only a diminutive of *pecten*, *pectunculus*. The having ears indeed is the common mark of diſtinction between the pectens and the cockles, which laſt uſually have none; yet the genera are not diſtinct, as ſome have imagined: for there are ſhells univerſally allowed to be pectens or ſcallops, which have no ears, and others as univerſally allowed to be pectuncles or cockles which have. Hence then appears the error of Liſter, who made them two diſtinct genera, and gave the ears and the equal convexity of both ſhells as the great characteriſtics of them: which, though they be good marks to diſtinguiſh the ſpecies by, are far from being ſo unalterable as to found different genera upon.

Barbut, we have ſeen, ranks the pectens under the genus oſtrea; but he ſays, that though the generic character of the hinge agrees in both, the animal inhabiting the pectens is very different from that of the oyſter; for which reaſon Linnæus has divided the genus into ſections. The pectines by ſome are eſteemed as delicious a food as the oyſter. They differ very materially in a variety of circumſtances. The pectens, as we have already obſerved, ſail on the ſurface of the water; and beſides, if they are attacked by a foe, they let down the membrane which nature has provided them for a ſail, and drop to the bottom. "Behold (ſays Barbut) the ſplendor of the pectines, which rival the glowing colours of the papilionaceous tribe, as numerous as they are beautiful, flirting from place to place, and may well be called the papiliones of the ocean. What ſuperior qualities does not the pectines enjoy above the oſtrea edulis, which, conſtantly confined to its native bed, ſeems wholly deſtined to afford food to other creatures, not having any means of defence, but its ſhelly caſtle, which is frequently attacked and ſtormed by its numerous enemies? This creature is not only uſeful to man as a dainty food, but the ſhell being levigated

Pecten. vigated into a ſubtle powder, is employed as an abſorbent in heart-burns and other like complaints ariſing from acidities in the firſt paſſages; the hollow ſhells are generally made choice of, as containing more than the thinner flat ones, of the fine white earth, in proportion to the outer rough coat, which laſt is found to be conſiderably impregnated with ſea-ſalt."

The grand mark of diſtinction between the pectens and oyſter ſeems to be the locomotive faculty. It was long ſuppoſed, that the oyſter poſſeſſed no power of motion, that it always remained in the place in which nature or accident had placed it, and that its life differed little from that of vegetables. Experience, however, has taught us to reject theſe premature concluſions. We ſhall here lay before our readers at length, though perhaps a little out of its place, what Abbé Dicquemare has obſerved with reſpect to this circumſtance, the concluſions of whoſe remarks we have given in another place. See *Animal Motion*, p. 411. col. 2.

Journal de Phyſique. "Paſſing one day (ſays the Abbé) along the ſea-ſhore, I obſerved an oyſter lying in a ſhallow place, and ejecting with conſiderable force a quantity of water. It immediately occurred to me, that, if this happened at a ſufficient depth, the reſiſtance of the water would have forced the oyſter from its place To be ſatisfied of this, I took ſeveral middle ſized oyſters with a light ſhell, and placed them on a ſmooth horizontal ſurface, in a ſufficient quantity of pure ſea-water. Some hours elapſed, and the night came on before any thing remarkable appeared; but next day I found one of the oyſters in a place and ſituation different from that in which I had lett it; and as nothing could have diſcompoſed it, I could not doubt but that it had moved by its own powers. I continued, however, to attend my charge; but, as if they meant to conceal their ſecret, the oyſters always operated in my abſence. At laſt, as I was exploring the coaſt of Lower Normandy, I perceived in an oyſter-bed one of them changing place pretty quickly. On my return, therefore, to Havre, I made new diſpoſitions to diſcover the means by which the motions of oyſters are performed, and I ſucceeded. This animal ejects the water by that part of the ſhell which is diametrically oppoſite to the hinge; it can alſo throw it out at the ſides, at each extremity of the hinge, or even from the whole opening at once. For this purpoſe, it can vary the action of its internal mechaniſm; but the ſoft parts are not the only organs that perform this function; in certain caſes the ſhells aſſiſt in forcing out the water.

"When an oyſter thus ſuddenly, forcibly, and repeatedly, ſquirts forth a quantity of water, it repulſes thoſe of its enemies that endeavour to inſinuate themſelves within the ſhells while they are open: but this is effectual only againſt its weakeſt foes; for there are ſome ſo formidable by their ſtrength or their addreſs, that a great number of oyſters periſh in this way. The animal, therefore, endeavours with all its force to repel them; it does more, it retreats backwards, or ſtarts aſide in a lateral direction. All of them, however, are not placed in circumſtances favourable for theſe motions. They are often ſituated in the crevices of rocks, between ſtones, or among other oyſters, ſome in ſand, and ſome in mud; ſo that their ſtrength, or powers of motion, are exerted in vain. It is probable, however, Pecten. that they have the faculty of operating their own relief from theſe circumſtances, and that they may be accidentally aſſiſted by other bodies. It muſt, however, be acknowledged, that the means of relief cannot be numerous or conſiderable in ſuch as are attached to other oyſters, to a body heavier than themſelves, or to a rock; but ſuch ſituations are the moſt uncommon in the oyſter-beds that I am acquainted with on the French coaſts in the Channel. Perhaps, indeed, a very angular or heavy ſhell may be ſufficient to render an oyſter immoveable. This is undoubtedly the caſe with ſuch of them as have been obliged by worms, or other more formidable enemies, ſo to increaſe their ſhells as to make them thick and unwieldy. But we do not know whether theſe animals, in unfavourable circumſtances, may not be able to ſupply thoſe manœuvres that I have mentioned by others that I have not as yet been able to obſerve. An oyſter that has never been attached, may fix itſelf by any part of the margin of either of its valves, and that margin will become the middle, or nearly ſo, if the oyſter is young. I would not be ſurpriſed that oyſters, which have been fixed to a rock from the beginning, ſhould be able to detach themſelves. I have ſeen them operate upon their ſhells in ſo many different ways, and with ſuch admirable contrivance, when thoſe ſhells have been pierced by their enemies (among whom I muſt be ranked), that I do not think it at all impoſſible for them to quit the place to which they are attached. It will eaſily be imagined how delicate and difficult ſuch obſervations and experiments muſt be, conſidering the ſenſibility of the animal, the delicacy of its organs, the tranſparency of the matter that forms the layers of its ſhells, the opacity of the ſhells themſelves, the viciſſitudes of the ſea, and the ſeaſons, &c. But it was of uſe to ſhow, that, contrary to the opinion generally entertained by the learned as well as by fiſhermen, oyſters are endowed with a locomotive faculty, and by what means that faculty is exerted. I muſt add, that thoſe which firſt ſhowed me theſe motions, were brought from the coaſts of Bretagne, put into a bed at La Hogue, then at Courſeulle, whence they were carried to Havre; and that, as all theſe tranſportations were made in a dry carriage, the oyſters could not be in perfect vigour. It was neceſſary alſo to ſhow, that theſe animals have much more ſenſation and more induſtry than is generally attributed to them.

"It is not often that a ſagacious obſerver of nature is ſeduced from his object by the pride of appearing above it, or the deſire of generalization. To think of graſping the whole of nature, when we are unable to conſider in the whole the firſt and moſt intereſting of her kingdoms, is a vain illuſion. Yet ſome have endeavoured to confound the kingdoms, while they have taken the liberty of dividing the higheſt of them into beings differently animalized. Under the pretence of having a better idea of it, they lopped off all the extremities; that is to ſay, they rid themſelves of every thing they were not well acquainted with, or that threw difficulties in their way. This, to be ſure, was very convenient, but very unſuitable to the proceeding of an enlarged mind, and very unfit to inform us with regard to the œconomy of nature. The organization of the oyſter, though very different from that

Pectoral ‖ Peculiar.

with which we are beſt acquainted, may be comprehended under our conſiderations of the animal œconomy in general. Thoſe authors are not ſo enlightened as they imagine, who repreſent the oyſter as an animal deprived of ſenſation, as an intermediate being between animals and vegetables, as a plant, and even in ſome reſpects as inferior to a plant. It is thus that the oyſter has been made a foundation for many an abſurd hypotheſis with reſpect to the nature of animals. But let us quit the conſideration of theſe faithleſs pictures, and attend to the original.

"The oyſter is conſcious of its exiſtence, and conſcious alſo that ſomething exiſts exterior to itſelf. It chooſes, it rejects; it varies its operations with judgement, according to circumſtances; it defends itſelf by means adequate and complicated; it repairs its loſſes; and it can be made to change its habits. Oyſters newly taken from places which the ſea had never left, inconſiderately open their ſhells, loſe the water they contain, and die in a few days: but thoſe that have been taken from the ſame place, and thrown into beds or reſervoirs from which the ſea occaſionally retires, where they are incommoded by the rays of the ſun, or by the cold, or where they are expoſed to the injuries of man, learn to keep themſelves cloſe when they are abandoned by the water, and live a much longer time." See Ostrea.

PECTORAL, a ſacerdotal habit or veſtment, worn by the Jewiſh high-prieſt. The Jews called it *Hhoſchen*, the Greeks λογιον, the Latins *rationale* and *pectorale*, and in our verſion of the Bible it is called *breaſtplate*. It conſiſted of embroidered ſtuff, about a ſpan ſquare, and was worn upon the breaſt, ſet with twelve precious ſtones, ranged in four rows, and containing the names of the twelve tribes. It was faſtened to the ſhoulder by two chains and hooks of gold. God himſelf preſcribed the form of it. See Breastplate.

Pectorale, a breaſtplate of thin braſs, about 12 fingers ſquare, worn by the poorer ſoldiers in the Roman army, who were rated under 1000 drachmæ. See Lorica.

Pectoral, an epithet for medicines good in diſeaſes of the breaſt and lungs.

PECTORALIS, in Anatomy. See there, *Table of the Muſcles*.

PECULATE, in civil law, the crime of embezzling the public money, by a perſon intruſted with the receipt, management, or cuſtody thereof. This term is alſo uſed by civilians for a theft, whether the thing be public, fiſcal, ſacred, or religious.

PECULIAR, in the canon law, ſignifies a particular pariſh or church that has juriſdiction within itſelf for granting probates of wills and adminiſtrations, exempt from the ordinary or biſhop's courts. The king's chapel is a royal peculiar, exempt from all ſpiritual juriſdiction, and reſerved to the viſitation and immediate government of the king himſelf. There is likewiſe the archbiſhop's peculiar: for it is an ancient privilege of the ſee of Canterbury, that wherever any manors or advowſons belong to it, they forthwith become exempt from the ordinary, and are reputed peculiars: there are 57 ſuch peculiars in the ſee of Canterbury.

Beſides theſe, there are ſome peculiars belonging to deans, chapters, and prebendaries, which are only exempted from the juriſdiction of the archdeacon: theſe are derived from the biſhop, who may viſit them, and to whom there lies an appeal.

Peculium ‖ Pedantry.

Court of Peculiars, is a branch of, and annexed to, the court of Arches. It has a juriſdiction over all thoſe pariſhes diſperſed through the province of Canterbury in the midſt of other dioceſes, which are exempt from the ordinary's juriſdiction, and ſubject to the metropolitan only. All eccleſiaſtical cauſes, ariſing within theſe peculiar or exempt juriſdictions, are originally cognizable by this court: from which an appeal lay formerly to the pope, but now by the ſtat. 25 H. VIII. c. 19. to the king in chancery.

PECULIUM, the ſtock or eſtate which a perſon, in the power of another, whether male or female, either as his or her ſlave, may acquire by his induſtry. Roman ſlaves frequently amaſſed conſiderable ſums in this way. The word properly ſignifies the advanced price which a ſlave could get for his maſter's cattle, &c. above the price fixed upon them by his maſter, which was the ſlave's own property.

In the Romiſh church, peculium denotes the goods which each religious reſerves and poſſeſſes to himſelf.

PEDALS, the largeſt pipes of an organ, ſo called becauſe played and ſtopped with the foot. The pedals are made ſquare, and of wood; they are uſually 13 in number. They are of modern invention, and ſerve to carry the ſounds of an octave deeper than the reſt. See Organ.

PEDAGOGUE, or Pædagogue, a tutor or maſter, to whom is committed the diſcipline and direction of a ſcholar, to be inſtructed in grammar and other arts. The word is formed from the Greek παιδων αγωγος, *puerorum ductor*, "leader of boys."

M. Fleury obſerves, that the Greeks gave the name *pædagogus* to ſlaves appointed to attend their children, lead them, and teach them to walk, &c. The Romans gave the ſame denomination to the ſlaves who were intruſted with the care and inſtruction of their children.

PEDANT, a ſchoolmaſter or pedagogue, who profeſſes to inſtruct and govern youth, teach them the humanities, and the arts. See Pedagogue.

Pedant is alſo uſed for a rough, unpoliſhed man of letters, who makes an impertinent uſe of the ſciences, and abounds in unſeaſonable criticiſms and obſervations.

Dacier defines a pedant, a perſon who has more reading than good ſenſe. See Pedantry.

Pedants are people ever armed with quibbles and ſyllogiſms, breathe nothing but diſputation and chicanery, and purſue a propoſition to the laſt limits of logic.

Malebranche deſcribes a pedant as a man full of falſe erudition, who makes a parade of his knowledge, and is ever quoting ſome Greek or Latin author, or hunting back to a remote etymology.

St Evremont ſays, that to paint the folly of a pedant, we muſt repreſent him as turning all converſation to ſome one ſcience or ſubject he is beſt acquainted withal.

There are pedants of all conditions, and all robes. Wiequefort ſays, an ambaſſador, always attentive to formalities and decorums, is nothing elſe but a political pedant.

PEDANTRY, or Pedantism, the quality or manner of a pedant. See Pedant.

To

Pedarian || Pediæan.

To ſwell up little and low things, to make a vain ſhow of ſcience, to heap up Greek and Latin, without judgment, to tear thoſe to pieces who differ from us about a paſſage in Suetonius or other ancient authors, or in the etymology of a word, to ſtir up all the world againſt a man for not admiring Cicero enough, to be intereſted for the reputation of an ancient as if he were our next of kin, is what we properly call *pedantry*.

PEDARIAN, in Roman antiquity, thoſe ſenators who ſignified their votes by their feet, not with their tongues; that is, ſuch as walked over to the ſide of thoſe whoſe opinion they approved of, in diviſions of the ſenate.

Dr Middleton thus accounts for the origin of the word. He ſays, that though the magiſtrates of Rome had a right to a place and vote in the ſenate both during their office and after it, and before they were put upon the roll by the cenſors, yet they had not probably a right to ſpeak or debate there on any queſtion, at leaſt in the earlier ages of the republic. For this ſeems to have been the original diſtinction between them and the ancient ſenators, as it is plainly intimated in the formule of the conſular edict, ſent abroad to ſummon the ſenate, which was addreſſed to all ſenators, and to all thoſe who had a right to vote in the ſenate. From this diſtinction, thoſe who had only a right to vote were called in ridicule *pedarian*; becauſe they ſignified their votes by their feet, not their tongues, and upon every diviſion of the ſenate went over to the ſide of thoſe whoſe opinion they approved. It was in alluſion to this old cuſtom, which ſeems to have been wholly dropt in the latter ages of the republic, that the mute part of the ſenate continued ſtill to be called by the name of *pedarians*, as Cicero informs us, who in giving an account to Atticus of a certain debate and decree of the ſenate upon it, ſays that it was made with the eager and general concurrence of the pedarians, though againſt the authority of all the conſulars.

PEDATURA, a term uſed, in Roman antiquity, for a ſpace or proportion of a certain number of feet ſet out. This word often occurs in writers on military affairs: as in Hyginus de Caſtrametatione we meet with *meminerimus itaque ad computationem cohortis equitatæ milliariæ pedaturam ad milletrecentos ſexaginta dari debere*; which is thus explained: The pedatura, or ſpace allowed for a *cohors equitata* or provincial cohort, conſiſting of both horſe and foot, could not be the ſame as the pedatura of an uniform body of infantry, of the ſame number, but muſt exceed it by 360 feet; for the proportion of the room of one horſeman to one foot ſoldier he aſſigns as two and a half to one.

PEDERASTS, the ſame with Sodomites.

PEDESTAL, in architecture, the loweſt part of an order of columns, being that part which ſuſtains the column, and ſerves it as a foot or ſtand. See Column.

PEDIÆAN, in Grecian antiquity. The city of Athens was anciently divided into three different parts; one on the deſcent of an hill; another on the ſea-ſhore; and a third in a plain between the other two. The inhabitants of the middle region were called Πεδιακοι, *Pediæans*, formed from πεδιον, "plain," or "flat;" or as Ariſtotle will have it, *Pediaci*: thoſe of the hill, Diacrians; and thoſe of the ſhore, Paralians.

Pedicle, Pediculus.

Theſe quarters uſually compoſed ſo many different factions. Piſiſtratus made uſe of the Pediæans againſt the Diacrians. In the time of Solon, when a form of government was to be choſen, the Diacrians choſe it democratic; the Pediæans demanded an ariſtocracy; and the Paralians a mixed government.

PEDICLE, among botaniſts, that part of a ſtalk which immediately ſuſtains the leaf of a flower or a fruit, and is commonly called a *footſtalk*.

PEDICULUS, the Louse, in zoology, a genus of inſects belonging to the order of aptera. It has ſix feet, two eyes, and a ſort of ſting in the mouth; the feelers are as long as the thorax; and the belly is depreſſed and ſublobated. It is an oviparous animal. They are not peculiar to man alone, but infeſt other animals, as quadrupeds and birds, and even fiſhes and vegetables; but theſe are of peculiar ſpecies on each animal, according to the particular nature of each, ſome of which are different from thoſe which infeſt the human body. Nay, even inſects are infeſted with vermin which feed on and torment them. Several kinds of beetles are ſubject to lice; but particularly that kind called by way of eminence the *louſy beetle*. The lice on this are very numerous, and will not be ſhook off. The earwig is often infeſted with lice, juſt at the ſetting on of its head: theſe are white, and ſhining like mites, but they are much ſmaller; they are round-backed, flat-bellied, and have long legs, particularly the foremoſt pair. Snails of all kinds, but eſpecially the large naked ſorts, are very ſubject to lice; which are continually ſeen running about them, and devouring them. Numbers of little red lice, with a very ſmall head, and in ſhape reſembling a tortoiſe, are often ſeen about the legs of ſpiders, and they never leave the animal while he lives; but if he is killed, they almoſt inſtantly forſake him. A ſort of whitiſh lice is found on humble-bees; they are alſo found upon ants; and fiſhes are not leſs ſubject to them than other animals.

Kircher tells us, that he found lice alſo on flies, and M. de la Hire has given a curious account of the creature which he found on the common fly. Having occaſion to view a living fly with the microſcope, he obſerved on its head, back, and ſhoulders, a great number of ſmall animals crawling very nimbly about, and often climbing up the hairs which grow at the origin of the fly's legs. He with a fine needle took up one of theſe, and placed it before the microſcope uſed to view the animalcules in fluids. It had eight legs; four on each ſide. Theſe were not placed very diſtant from each other; but the four towards the head were ſeparated by a ſmall ſpace from the four towards the tail. The feet were of a particular ſtructure, being compoſed of ſeveral fingers, as it were, and fitted for taking faſt hold of any thing; but the two neareſt the head were alſo more remarkable in this particular than thoſe near the tail; the extremities of the legs for a little way above the feet were dry and void of fleſh like the legs of birds, but above this part they appeared plump and fleſhy. It had two ſmall horns upon its head, formed of ſeveral hairs arranged cloſely together; and there were ſome other cluſters of hairs by the ſide of theſe

Pediculus. horns, but they had not the same figure; and towards the origin of the hinder legs there were two other such clusters of hairs which took their origin at the middle of the back. The whole creature was of a bright yellowish red; the legs, and all the body, except a large spot in the centre, were perfectly transparent. In size, he computed it to be about $\frac{1}{200}$th part of the head of the fly; and he observes, that such kind of vermin are rarely found on flies.

The louse which infests the human body makes a very curious appearance through a microscope. It has such a transparent shell or skin, that we are able to discover more of what passes within its body that in most other living creatures. It has naturally three divisions, the head, the breast, and the tail part. In the head appear two fine black eyes, with a horn that has five joints, and is surrounded with hairs standing before each eye; and from the end of the nose or snout there is a pointed projecting part, which serves as a sheath or case to a piercer or sucker, which the creature thrusts into the skin to draw out the blood and humours which are its destined food; for it has no mouth that opens in the common way. This piercer or sucker is judged to be 700 times smaller than a hair, and is contained in another case within the first, and can be drawn in or thrust out at pleasure. The breast is very beautifully marked in the middle; the skin is transparent, and full of little pits; and from the under part of it proceed six legs, each having five joints, and their skin all the way resembling shagreen, except at the ends where it is smoother. Each leg is terminated by two claws, which are hooked, and are of an unequal length and size. These it uses as we would a thumb and middle finger; and there are hairs between these claws as well as all over the legs. On the back part of the tail there may be discovered some ring-like divisions, and a sort of marks which look like the strokes of a rod on the human skin; the belly looks like shagreen, and towards the lower end it is very clear, and full of pits: at the extremity of the tail there are two semicircular parts all covered over with hairs, which serve to conceal the anus. When the louse moves its legs, the motion of the muscles, which all unite in an oblong dark spot in the middle of the breast, may be distinguished perfectly, and so may the motion of the muscles of the head when it moves its horns. We may likewise see the various ramifications of the veins and arteries, which are white, with the pulse regularly beating in the arteries. But the most surprising of all the sights is the peristaltic motion of the guts, which is continued all the way from the stomach down to the anus.

If one of these creatures, when hungry, be placed on the back of the hand, it will thrust its sucker into the skin, and the blood which it sucks may be seen passing in a fine stream to the fore-part of the head; where, falling into a roundish cavity, it passes again in a fine stream to another circular receptacle in the middle of the head; from thence it runs through a small vessel to the breast, and then to a gut which reaches to the hinder part of the body, where in a curve it turns again a little upward; in the breast and gut the blood is moved without intermission, with a great force; especially in the gut, where it occasions such a contraction of the gut as is very surprising. In the upper part of the crooked ascending gut above-mentioned, the propelled blood stands still, and seems to undergo a separation, some of it becoming clear and watery, while other black particles are pushed forward to the anus. If a louse is placed on its back, two bloody darkish spots appear; the larger in the middle of the body, the lesser towards the tail; the motions of which are followed by the pulsation of the dark bloody spot, in or over which the white bladder seems to lie. This motion of the systole and diastole is best seen when the creature begins to grow weak; and on pricking the white bladder, which seems to be the heart, the creature instantly dies. The lower dark spot is supposed to be the excrement in the gut. Pediculus.

Lice have been supposed to be hermaphrodites: but this is erroneous; for Mr Lieuwenhoeck observed, that the males have stings in their tails, which the females have not. And he supposes the smarting pain which those creatures sometimes give, to be owing to their stinging with these stings when made uneasy by pressure or otherwise. He says, that he felt little or no pain from their suckers, though six of them were feeding on his hand at once.

In order to know the true history and manner of breeding of these creatures, Mr Lieuwenhoeck put two female lice into a black stocking, which he wore night and day. He found, on examination, that in six days one of them had laid above 50 eggs; and, upon dissecting it, he found as many yet remaining in the ovary: whence he concludes, that in 12 days it would have laid 100 eggs. These eggs naturally hatch in six days, and would then probably have produced 50 males, and as many females; and these females coming to their full growth in 18 days, might each of them be supposed after 12 days more to lay 100 eggs; which eggs, in six days more, might produce a young brood of 5000: so that in eight weeks, one louse may see 5000 of its own descendents.

Signior Rhedi, who has more attentively observed these animals than any other author, has given several engravings of the different species of lice found on different animals. Men, he observes, are subject to two kinds; the common louse and the crab-louse. He observes also, that the size of the lice is not at all proportioned to that of the animal which they infest; since the starling has them as large as the swan.

Some kinds of constitutions are more apt to breed lice than others: and in some places of different degrees of heat, they are certain to be destroyed upon people who in other climates are over-run with them. It is an observation of Oviedo, that the Spanish sailors, who are generally much afflicted with lice, always lose them in a certain degree of latitude in their voyages to the East Indies, and have them again on their returning to the same degree. This is not only true of the Spaniards, but of all other people who make the same voyage; for though they set out ever so lousy, they have not one of those creatures by the time they come to the tropic. And in the Indies there is no such thing as a louse about the body, though the people be ever so nasty. The sailors continue free from these creatures till their return; but in going back, they usually begin to be lousy after they arrive at the latitude of the Madeira islands. The extreme sweats, which the working people naturally fall into

between

Pediculus

between the latitude of Madeira and the Indies, drown and deſtroy the lice; and have the ſame effect as the rubbing over the louſy heads of children with butter and oil. The ſweat, in theſe hot climates, is not rank as in Europe, and therefore it is not apt to breed lice; but when people return into latitudes where they ſweat rank again, their naſtineſs ſubjects them to the ſame viſitations of theſe vermin as before. The people in general in the Indies are very ſubject to lice in their heads, tho' free from them on their bodies. The reaſon of this is, that their heads ſweat leſs than their bodies, and they take no care to comb and clean them. The Spaniſh negroes waſh their heads thoroughly once every week with ſoap, to prevent their being louſy. This makes them eſcape much better than the other negroes who are ſlaves there; for the lice grow ſo numerous in their heads, that they often eat large holes in them.

Cleanlineſs is doubtleſs the grand ſecret by which to keep clear from lice, eſpecially when we wear woollen clothes. It is alſo neceſſary where there is any danger, to take nouriſhing, ſucculent food, and to uſe wholeſome drink. J. Mercurial adviſes frequent purges as a cure in the pedicular diſeaſe: it is neceſſary alſo to rub with garlic and muſtard, to take treacle inwardly, alſo ſalted and acid food, to bathe, and to foment the body with a decoction of lupines, or of gall nuts; but the moſt effectual remedies are ſulphur and tobacco, mercurial ointment, black pepper, and vinegar. Monkeys and ſome Hottentots, we are told, eat lice; and are thence denominated *phthirophages*. On the coaſt of the Red Sea it is reported, that there is a nation of ſmall ſtature and of a black colour, who uſe locuſts for the greateſt part of their food, prepared only with ſalt. On ſuch food thoſe men live till 40, and then die of a pedicular or louſy diſeaſe. A kind of winged lice devour them, their body putreſies, and they die in great torment. It is alſo a fact that the negroes on the weſt coaſt of Africa take great delight in making their women clear their bodies of lice, and thoſe latter devour them with greedineſs as faſt as they find them.

In ancient medicine lice were eſteemed aperient febrifuge, and proper for curing a pale complexion. The natural repugnance to thoſe ugly creatures (ſays Lemery) perhaps contributed more to baniſh the fever than the remedy itſelf. In the jaundice five or ſix were ſwallowed in a ſoft egg. In the ſuppreſſion of urine, which happens frequently to children at their birth, a living louſe is introduced into the urethra, which, by the tickling which it occaſions in the canal, forces the ſphincter to relax, and permits the urine to flow. A bug produces the ſame effect. Farriers have alſo a cuſtom (ſays M. Bourgeois) of introducing one or two lice into the urethra of horſes when they are ſeized with a retention of urine, a diſeaſe pretty common among them. But, according to the Continuation of the Materia Medica, to uſe the pedicular medicine with the greateſt advantage, one would need to be in Africa, where thoſe inſects are carefully ſought after and ſwallowed as a delicious morſel. The great diſtinction between thoſe which infeſt mankind is into the head and body louſe. The former is hard and high coloured, and the latter leſs compact and more of an aſhen colour. If it were poſſible to give a reaſon why ſome families of the ſame ſpecies ſtick to the head and others to the clothes, &c. it would alſo in all probability be poſſible to underſtand the nature of many contagious diſeaſes.

Pediluvium

PEDILUVIUM, or BATHING *of the* FEET. The uſes of warm bathing in general, and of the pediluvium in particular, are ſo little underſtood, that they are often prepoſterouſly uſed, and ſometimes as injudiciouſly abſtained from.

In the Edinburgh Medical Eſſays, we find an ingenious author's opinion of the warm pediluvium, notwithſtanding that of Borelli, Boerhaave, and Hoffman, to the contrary, to be, That the legs becoming warmer than before, the blood in them is warmed: this blood rarifying, diſtends the veſſels; and in circulating imparts a great degree of warmth to the reſt of the maſs; and as there is a portion of it conſtantly paſſing through the legs, and acquiring new heat there, which heat is in the courſe of circulation communicated to the reſt of the blood, the whole maſs rarifying, occupies a larger ſpace, and of conſequence circulates with greater force. The volume of the blood being thus increaſed, every veſſel is diſtended, and every part of the body feels the effects of it; the diſtant parts a little later than thoſe firſt heated. The benefit obtained by a warm pediluvium is generally attributed to its making a derivation into the parts immerſed, and a revulſion from thoſe affected, becauſe they are relieved; but the cure is performed by the direct contrary method of operating, viz. by a greater force of circulation through the parts affected, removing what was ſtagnant or moving too ſluggiſhly there. Warm bathing is of no ſervice where there is an irreſoluble obſtruction, though, by its taking off from a ſpaſm in general, it may ſeem to give a moment's eaſe; nor does it draw from the diſtant parts, but often hurts by puſhing againſt matter that will not yield with a ſtronger impetus of circulation than the ſtretched and diſeaſed veſſels can bear: ſo that where there is any ſuſpicion of ſcirrhus, warm bathing of any ſort ſhould never be uſed. On the other hand, where obſtructions are not of long ſtanding, and the impacted matter is not obſtinate, warm baths may be of great uſe to reſolve them quickly. In recent colds, with ſlight humoral peripneumonies, they are frequently an immediate cure. This they effect by increaſing the force of the circulation, opening the ſkin, and driving freely through the lungs that lentor which ſtagnated or moved ſlowly in them. As thus conducing to the reſolution of obſtructions, they may be conſidered as ſhort and ſafe fevers; and in uſing them we imitate nature, which by a fever often carries off an obſtructing cauſe of a chronical ailment. Borelli, Boerhaave, and Hoffman, are all of opinion, that the warm pediluvium acts by driving a larger quantity of blood into the parts immerſed. But arguments muſt give way to facts: the experiments related in the Medical Eſſays ſeem to prove to a demonſtration, that the warm pediluvium acts by rarifying the blood.

A warm pediluvium, when rightly tempered, may be uſed as a ſafe cordial, by which circulation can be rouſed, or a gentle fever raiſed; with this advantage over the cordials and ſudorifics, that the effect of them may be taken off at pleaſure.

Pediment || Pedro.

Pediluvia are ſometimes uſed in the ſmall-pox; but Dr Stevenſon thinks their frequent tumultuous operations render that ſuſpected, and at beſt of very doubtful effect; and he therefore prefers Monſ. Martin of Lauſanne's method of bathing the ſkin, not only of the legs, but of the whole body, with a ſoft cloth dipped in warm water, every four hours, till the eruption; by which means the puſtules may become univerſally higher, and conſequently more ſafe.

PEDIMENT. See ARCHITECTURE, p. 240, &c.

PEDLAR, a travelling foot-trader. See HAWKERS.

In Britain (and formerly in France) the pedlars are deſpiſed; but it is otherwiſe in certain countries. In Spaniſh America, the buſineſs is ſo profitable, that it is thought by no means diſhonourable; and there are many gentlemen in Old Spain, who, when their circumſtances are declining, ſend their ſons to the Indies to retrieve their fortunes in this way. Almoſt all the commodities of Europe are diſtributed through the ſouthern continent of America by means of theſe pedlars. They come from Panama to Paita by ſea; and in the road from the port laſt mentioned, they make Peura their firſt voyage to Lima. Some take the road through Caxamalia; others through Truxillo, along ſhore from Lima. They take their paſſage back to Panama by ſea, and perhaps take with them a little cargo of brandy. At Panama they again ſtock themſelves with European goods, returning by ſea to Paita, where they are put on ſhore; there they hire mules and load them, the Indians going with them in order to lead them back. Their travelling expences are next to nothing; for the Indians are brought under ſuch ſubjection, that they find lodging for them, and provender for their mules, frequently thinking it an honour done them for their gueſts to accept of this for nothing, unleſs the ſtranger now and then, out of generoſity or compaſſion, makes a ſmall recompence.

In Poland, where there are few or no manufactures, almoſt all the merchandiſe is carried on by pedlars, who are ſaid to be generally Scotſmen, and who, in the reign of king Charles II. are ſaid to have amounted to no fewer than 53,000.

PEDOMETER, or PODOMETER, formed from πους, *pes*, "foot," and μετρον, "meaſure," way-wiſer; a mechanical inſtrument, in form of a watch, conſiſting of various wheels with teeth, catching in one another, all diſpoſed in the ſame plane; which, by means of a chain or ſtring faſtened to a man's foot, or to the wheel of a chariot, advance a notch each ſtep, or each revolution of the wheel; ſo that the number being marked on the edge of each wheel, one may number the paces, or meaſure exactly the diſtance from one place to another. There are ſome of them which mark the time on a dial-plate, and are in every reſpect much like a watch, and are accordingly worn in the pocket like a watch.

PEDRO (Don) of Portugal, duke of Coimbra, was the fourth child and ſecond ſurviving ſon of King John of Portugal, and was born March the 4th 1394. His father gave him an excellent education, which, joined to ſtrong natural abilities and much application, rendered him one of the moſt accompliſhed princes of his time. He was not only very learned himſelf, but a great lover of learning, and a great patron of learned men. It was chiefly with a view to improve his knowledge that he ſpent four years in travelling through different countries in Europe, Aſia, and Africa, with a train ſuitable to his quality; of which travels there is a relation ſtill extant, but ſo loaded with fabulous circumſtances, that it wounds the reputation it was deſigned to raiſe. At his return he eſpouſed Iſabella, daughter to the count of Urgel, and grand-daughter to Don Pedro, the fourth king of Portugal, which was eſteemed a very great advancement of his fortune. He was elected into the moſt noble order of the Garter, April 22. 1417, in the fifth year of the reign of his couſin Henry V. grandſon of John of Gaunt, by the father's ſide, as our duke of Coimbra was by the mother. In 1440 he was declared regent during the minority of his couſin Don Alonſo V. ſon of king Edward, who died by the plague. He found ſome difficulty at firſt in the diſcharge of his office, both from the queen-mother and others. But upon the whole, his adminiſtration was ſo mild and ſo juſt, that the magiſtrates and people of Liſbon concurred in demanding his leave to erect a ſtatue to him. The regent thanked them, ſaid he ſhould be unwilling to ſee a work of their's demoliſhed; and that he was ſufficiently rewarded by this public teſtimony of their affections. The queen dowager wiſhed to raiſe diſturbances in Portugal by aiming to recover the regency to herſelf; but the ſteadineſs of the regent's adminiſtration, the attachment of the beſt part of the nobility to him, and his enjoying, in ſo abſolute a degree, the confidence of the people; not only ſecured the interior tranquillity of the ſtate, but raiſed the credit likewiſe of the crown of Portugal to a very great height in the ſentiments of its neighbours: for in the courſe of his regency he had made it his continual ſtudy to purſue the public good; to eaſe the people in general, and the inhabitants of Liſbon in particular, of ſeveral impoſitions; to maintain the laws in their full vigour; to give the king an excellent education; and if that had been at all practicable, to diffuſe a perfect unanimity through the court, by aſſuaging the malice and envy of his enemies. The king when he came of age, and the *cortes* or parliament, expreſſed their entire ſatisfaction with the regent's adminiſtration; and all parties entirely approved of the king's marriage with Donna Iſabella, the regent's daughter, which was celebrated in 1446. The enmity of his enemies, however, was not in the leaſt abated by the regent's being out of office. They ſtill perſecuted him with their unjuſt calumnies, and unfortunately made the king hearken to their falſehoods. The unfortunate duke, when ordered to appear before the king, was adviſed to take with him an eſcort of horſe and foot. In his paſſage he was proclaimed a rebel, and quickly after he was ſurrounded by the king's troops. Soon after he was attacked, and in the heat of action he was killed: nor was the envy of his enemies even then ſatiated; his body was forbid burial; and was at length taken away privately by the peaſants. His virtue, however hated in courts, was adored by the uncorrupt part of his countrymen. At length, tho', by an inſpection of his papers, the king ſaw, when it was too late, the injuſtice that had been done the man who had behaved ſo well in ſo high and difficult an office; and whoſe papers only diſcovered ſigns of further benefit

Pedro.

to

duncle, ecbles.

to the king and his dominions. In consequence of these discoveries, the duke's adherents were declared loyal subjects, all prosecutions were ordered to cease, and the king desired the body of Coimbra to be transported with great pomp from the castle of Abrantes to the monastery of Batalha; where it was interred in the tomb which he had caused to be erected for himself. The royal name of Don Pedro occurs often in the history of Portugal, and many who bore the name were singularly distinguished either for internal abilities, or external splendor. See PORTUGAL.

PEDUNCLE, in botany. See PEDICLE.

PEEBLES, or TWEEDALE, a county of Scotland, extending 25 miles in length and 18 in breadth. It is bounded on the east by Ettrick Forest, on the south by Annandale, on the west by Clydesdale, and on the north by Mid Lothian. Tweedale is a hilly country, well watered with the Tweed, the Yarrow, and a great number of smaller streams that fertilize the valleys, which produce good harvests of oats and barley, with some proportion of wheat. All the rivers of any consequence abound with trout and salmon. The lake called *West-Water Loch* swarms with a prodigious number of eels. In the month of August, when the west wind blows, they tumble into the river Yarrow in such shoals, that the people who wade in to catch them run the risk of being overturned. There is another lake on the borders of Annandale, called *Loch-gennen*, which forms a cataract over a precipice 250 paces high: here the water falls with such a momentum as to kill the fish underneath. About the middle of this country is the hill or mountain of Braidalb, from the top of which the sea may be seen on each side of the island. Tweedale abounds with limestone and freestone. The hills are generally as green as the downs in Sussex, and feed innumerable flocks of sheep, that yield great quantities of excellent wool. The country is well shaded with woods and plantations, abounds with all the necessaries of life, and is adorned with many fine seats and populous villages. The earls of March were hereditary sheriffs of Tweedale, which bestows the title of *marquis* on a branch of the ancient house of Hay, earls of Errol, and hereditary high constables of Scotland. The family of Tweedale is, by the female side, descended from the famous Simon de Fraser, proprietor of great part of this country, who had a great share in obtaining the triple victory at Roslin. The chief, and indeed the only town of consequence in Tweedale, is PEEBLES, a small inconsiderable royal borough, and seat of a presbytery, pleasantly situated on the banks of the Tweed, over which there is at this place a stately stone bridge of five arches. In the neighbourhood of Peebles, near the village of Romana, on the river Lene, we see the vestiges of two Roman castella, or stationary forts; and a great many terraces on the neighbouring hills, which perhaps have served as itinerary encampments. In the shire of Tweedale there are many ancient and honourable families of the gentry. Among these, Douglas of Cavers, who was hereditary sheriff of the county, still preserves the standard and the iron mace of the gallant lord Douglas, who fell in the battle of Otterburn, just as his troops had defeated and taken Henry Percy, surnamed *Hotspur*. In the churchyard of Drumelzier, belonging to an ancient branch of the Hay-family, the famous Merlin is supposed to lie buried. There was an old traditional prophecy, that the two kingdoms should be united when the waters of the Tweed and the Pansel should meet at his grave. Accordingly, the country people observe that this meeting happened in consequence of an inundation at the accession of James VI. to the crown of England.

Peek || Peer.

PEEK, in the sea-language, is a word used in various senses. Thus the anchor is said to be a-peek, when the ship being about to weigh comes over her anchor in such a manner that the cable hangs perpendicularly between the hause and the anchor.

To heave a-peek, is to bring the peek so as that the anchor may hang a-peek. A ship is said to ride a-peek, when lying with her main and fore-yards hoisted up, one end of her yards is brought down to the shrouds, and the other raised up on end; which is chiefly done when she lies in rivers, lest other ships falling foul of the yards should break them. Riding a-broad peek, denotes much the same, excepting that the yards are only raised to half the height.

Peek is also used for a room in the hold, extending from the bitts forward to the stern: in this room men of war keep their powder, and merchant-men their victuals.

PEEL, in the Isle of Man, formerly Holm-town, has a fort in a small island, and a garrison well supplied with cannon. In it are the ancient cathedral, the lord's house, with some lodgings of the bishops, and some other remains of antiquity.

PEER, in general, signifies an equal, or one of the same rank and station: hence in the acts of some councils, we find these words, *with the consent of our peers, bishops, abbots*, &c. Afterwards the same term was applied to the vassals or tenants of the same lord, who were called *peers*, because they were all equal in condition, and obliged to serve and attend him in his courts; and peers *in fiefs*, because they all held fiefs of the same lord.

The term *peers* is now applied to those who are impannelled in an inquest upon a person for convicting or acquitting him of any offence laid to his charge: and the reason why the jury is so called, is because, by the common law and the custom of this kingdom, every person is to be tried by his peers or equals; a lord by the lords, and a commoner by commoners. See the article JURY.

PEER of the Realm, a noble lord who has a seat and vote in the House of Lords, which is also called the *House of Peers*.

These lords are called *peers*, because though there is a distinction of degrees in our nobility, yet in public actions they are equal, as in their votes in parliament, and in trying any nobleman or other person impeached by the commons, &c. See PARLIAMENT.

House of PEERS, or *House of Lords*, forms one of the three estates of parliament. See LORDS and PARLIAMENT.

In a judicative capacity, the house of peers is the supreme court of the kingdom, having at present no original jurisdiction over causes, but only upon appeals and writs of error; to rectify any injustice or mistake of the law committed by the courts below. To this authority they succeeded of course upon the dissolution

Peers || Pegasus.

of the *Aula Regia*. For as the barons of parliament were conſtituent members of that court, and the reſt of its juriſdiction was dealt out to other tribunals, over which the great officers who accompanied thoſe barons were reſpectively delegated to preſide, it followed, that the right of receiving appeals, and ſuperintending all other juriſdictions, ſtill remained in that noble aſſembly, from which every other great court was derived. They are therefore in all caſes the laſt reſort, from whoſe judgment no farther appeal is permitted; but every ſubordinate tribunal muſt conform to their determinations: The law repoſing an entire confidence in the honour and conſcience of the noble perſons who compoſe this important aſſembly, that they will make themſelves maſters of thoſe queſtions upon which they undertake to decide; ſince upon their deciſion all property muſt finally depend. See LORDS, NOBILITY, &c.

PEERS, in the anti-revolution government of France, were twelve great lords of that kingdom; of which ſix were dukes and ſix counts; and of theſe, ſix were eccleſiaſtics and ſix laymen: thus the archbiſhop of Rheims, and the biſhop of Laon and Langres, were dukes and peers; and the biſhops of Chalon on the Marn, Noyons, and Beauvais, were counts and peers. The dukes of Burgundy, Normandy, and Aquitain, were lay peers and dukes; and the counts of Flanders, Champaign, and Toulouſe, lay peers and counts. Theſe peers aſſiſted at the coronation of kings, either in perſon or by their repreſentatives, where each performed the functions attached to his reſpective dignity: but as the ſix lay peerages were all united to the crown, except that of the count of Flanders, ſix lords of the firſt quality were choſen to repreſent them: But the eccleſiaſtical peers generally aſſiſted in perſon. The title of peer was lately beſtowed on every lord whoſe eſtate was erected into a peerage; the number of which, as it depended entirely on the king, was uncertain.

PEERESS, a woman who is noble by deſcent, creation, or marriage. For, as we have noblemen of ſeveral ranks, ſo we may have noblewomen; thus king Henry VIII. made Anne Bullen marchioneſs of Pembroke; king James I. created the Lady Compton, wife to Sir Thomas Compton, counteſs of Buckingham, in the lifetime of her huſband, without any addition of honour to him; and alſo the ſame king made the Lady Finch, viſcounteſs of Maidſtone, and afterwards counteſs of Winchelſea, to her and the heirs of her body: and king George I. made the Lady Schulenberg, ducheſs of Kendal.

If a peereſs, by deſcent or creation, marries a perſon under the degree of nobility, ſhe ſtill continues noble: But if ſhe obtains that dignity only by marriage, ſhe loſes it, on her afterwards marrying a commoner; yet by the courteſy of England, ſhe generally retains the title of her nobility.

A counteſs or baroneſs may not be arreſted for debt or treſpaſs; for though in reſpect of their ſex, they cannot ſit in parliament, they are nevertheleſs peers of the realm, and ſhall be tried by their peers, &c.

PEWIT, in ornithology. See LARUS.

PEGASUS, among the poets, a horſe imagined to have wings; being that whereon Bellerophon was fabled to be mounted when he engaged the Chimera. See CHIMERA. Pegaſus || Pegu.

The opening of the fountain Hippocrene on mount Helicon is aſcribed to a blow of Pegaſus's hoof. It was feigned to have flown away to heaven, where it became a conſtellation. Hence

PEGASUS, in aſtronomy, the name of a conſtellation of the northern hemiſphere, in form of a flying horſe. See ASTRONOMY, n° 406.

PEGMARES, a name by which certain gladiators were diſtinguiſhed, who fought upon moveable ſcaffolds called *pegmata*, which were ſometimes unexpectedly raiſed, and by this means ſurpriſed the people with gladiators in hot contention. They were ſometimes ſo ſuddenly lifted up as to throw the combatants into the air; and ſometimes they were let down into dark and deep holes, and then ſet on fire, thus becoming the funeral-piles of theſe miſerable wretches; and roaſting them alive to divert the populace.

PEGU, a very conſiderable kingdom of Aſia, beyond the Ganges. The country properly ſo called is but about 350 miles in length from north to ſouth, and as much in breadth from eaſt to weſt. It is ſituated on the eaſtern ſide of the bay of Bengal, nearly oppoſite to Arixa, and to the north-eaſt of the coaſt of Coromandel. It is bounded on the north by the kingdoms of Arrakan and Ava; on the eaſt by the Upper and Lower Siam; on the ſouth by part of Siam and the ſea; and on the weſt by the ſea and part of Arrakan.

The kingdom of Pegu is ſaid to have been founded about 1100 years ago. Its firſt king was a ſeaman; concerning whom and his ſucceſſors we know nothing till the diſcovery of the Eaſt Indies by the Portugueſe in the beginning of the 16th century. In 1518 the throne of Pegu was poſſeſſed by one Breſſagukan, with whom Antony Correa the Portugueſe ambaſſador ſolemnly concluded a peace in 1519. This monarch was poſſeſſed of a very large and rich empire, nine kingdoms being in ſubjection to him, whoſe revenues amounted to three millions of gold. We hear no farther account of his tranſactions after the concluſion of the treaty with the Portugueſe. In 1539 he was murdered on the following occaſion: Among other princes who were his tributaries was Para Mandera, king of the Barmas. Theſe people inhabited the high lands called *Pangavirau*, to the northward of the kingdom of Pegu. Their prince, by one of the terms of his vaſſalage, was obliged to furniſh the king of Pegu with 30,000 Barmas, to labour in his mines and other public works. As the king uſed frequently to go and ſee how his works went forward, and in theſe journeys took along with him none but his women, the Barmas obſerving theſe viſits frequently repeated, formed a deſign of robbing the queen and all the concubines of their jewels; and purſuant to this deſign, the next time the king viſited the works, they murdered him, and having ſtripped the ladies, fled to their own country.

By this enormity all Pegu was thrown into confuſion: but, inſtead of revenging the death of their king, the people divided everywhere into factions; ſo that Dacha Rupi, the lawful heir to the crown, found himſelf unable to maintain his authority. Of theſe commotions, the king of the Barmas taking the ad-

Pegu vantage, not only ſhook off the yoke, but formed a deſign of conquering the kingdom of Pegu itſelf—With this view he invaded the country with an army of more than a million of foot, and 5000 elephants; beſides a great fleet which he ſent down the river Ava towards Bagou or Pegu, the capital of the empire; while he himſelf marched thither by land. Juſt at this time Ferdinand de Mirales arrived at Pegu from Goa with a large galleon richly laden on account of the king of Portugal. As ſoon as Dacha Rupi heard of his coming, he ſent to deſire his aſſiſtance againſt the enemy. This he obtained by great preſents and promiſes: and Mirales, ſetting out in a galliot, joined the king's ſhips. Had the numbers been any thing near an equality, the ſuperior ſkill of Mirales would undoubtedly have gained the victory: But the fleet of the Barmas covered the whole river, though as large as the Ganges, while that of Dacha Rupi could ſcarce be obſerved in compariſon with them. Mirales did every thing that man could do, and even held out alone after the natives had deſerted him; but at laſt, oppreſſed and overwhelmed with numbers, he was killed, with all his men.

Thus Para Mandara became maſter of all Pegu; after which he attacked the tributary kingdoms. In 1544 he beſieged Martavan, the capital of a kingdom of the ſame name, then very great and flouriſhing. The land-forces which he brought againſt it conſiſted of 700,000 men, while by ſea he attacked it with a fleet of 1700 ſail; 100 of which were large galleys, and in them 700 Portugueſe commanded by John Cayero, who had the reputation of being a valiant and experienced officer. The ſiege, however, continued ſeven months, during which time the Barmas loſt 120,000 men; but at laſt the beſieged king, finding himſelf ſtraitened for want of proviſions, and unable to withſtand ſo great a power, offered terms of capitulation. The beſiegers would admit of no terms, upon which the diſtreſſed king applied to the Portugueſe in the ſervice of his enemy; for by their aſſiſtance he doubted not to be able to drive away the Barmas. Accordingly, he ſent one Seixas to Cayero, intreating him to receive himſelf, his family, and treaſure, on board the four ſhips he had under his command; offering, on that condition, to give half his riches to the king of Portugal, to become his vaſſal, and pay ſuch tribute as ſhould be agreed upon. Cayero conſulted the principal officers, and in their preſence aſked Seixas what he thought the treaſure might amount to. Seixas anſwered, that out of what he had ſeen, for he had not ſeen all, two ſhips might be loaded with gold, and four or five with ſilver. This propoſal was too advantageous to be ſlighted; but the reſt of the officers envying the great fortune which Cayero would make, threatened to diſcover the whole to the king of Barma if he did not reject it. The unhappy king of Martavan had now no other reſource but to ſet fire to the city, make a ſally, and die honourably with the few men he had with him: but even here he was diſappointed; for by the deſertion of 4000 of his troops the enemy were apprized of his deſign, and prevented it. Thus betrayed, he capitulated with the Barma king for his own life and the lives of his wife and children, with leave to end his days in retirement. All this was readily granted, but the conqueror intended to perform no part of his promiſe. The city was plundered and burnt, by which above 60,000 perſons periſhed, while at leaſt an equal number were carried into ſlavery. Six thouſand cannon were found in the place; 100,000 quintals of pepper, and an equal quantity of other ſpices. The day after this deſtruction, 21 gibbets were erected on an hill adjoining to the city; on which the queen, her children, and ladies, were executed, by hanging them up alive by the feet: however, the queen expired with anguiſh before ſhe ſuffered ſuch a cruel indignity. The king, with 50 of his chief lords, was caſt into the ſea, with ſtones about their necks. This monſtrous cruelty ſo provoked the tyrant's ſoldiers, that they mutinied, and he was in no ſmall danger of ſuffering for it: however, he found means to pacify them; after which he proceeded to beſiege Prom, the capital of another kingdom. Here he increaſed his army to 900,000 men. The queen by whom it was governed offered to ſubmit to be his vaſſal; but nothing would ſatisfy the Barma monarch leſs than her ſurrender at diſcretion, and putting all her treaſure into his hands. This ſhe, who knew his perfidy, refuſed to do; on which the city was fiercely aſſaulted, but greatly to the diſadvantage of the Barmas, who loſt near 100,000 men. However, the city was at laſt betrayed to him, when Mandara behaved with his uſual cruelty. Two thouſand children were ſlain, and their bodies cut in pieces and thrown to the elephants; the queen was ſtripped naked, publicly whipped, and then tortured, till ſhe died; the young king was tied to her dead body, and both together caſt into a river, as were alſo 300 other people of quality.

While the tyrant was employed in fortifying the city, he was informed, that the prince of Ava had ſailed down the river Queytor with 400 rowing veſſels having 30,000 ſoldiers on board; but that, hearing of the queen's diſaſter, he ſtopped at Meletay, a ſtrong fortreſs about 12 leagues north of Prom, where he waited to be joined by his father the king of Ava with 80,000 men. On this news the Barma king ſent his foſter-brother Chaumigrem along the river-ſide with 200,000 men, while he himſelf followed with 100,000 more. The prince in this emergency burnt his barks, forming a vanguard of the mariners, and, putting his ſmall army in the beſt poſition he could, expected the enemy. A moſt deſperate engagement enſued, in which only 800 of the prince's army were left, and 115,000 out of 200,000 Barmas who oppoſed him were killed. The 800 Avans retired into the fort: but Mandara coming up ſoon after, and being enraged at the terrible havock made in his army, attacked the fortreſs moſt violently for ſeven days; at the end of which time, the 800, finding themſelves unable to hold out any longer, ruſhed out in a dark and rainy night, in order to ſell their lives at as dear a rate as poſſible. This laſt effort was ſo extremely violent, that they broke through the enemy's troops in ſeveral places, and even preſſed ſo hard on the king himſelf that he was forced to jump into the river. However, they were at laſt all cut off, but not before they had deſtroyed 12,000 of their enemies.

Mandara having thus become maſter of the fort, commanded it to be immediately repaired; and ſailed up the river to the port of Ava, about a league from

Pegu. the capital, where he burnt between 2000 and 3000 veſſels, and loſt in the enterpriſe about 8000 men. The city itſelf he did not think proper to inveſt, as it had been newly fortified, was defended by a numerous garriſon, and an army of 80,000 men was advancing to its relief. The king alſo, apprehenſive of Mandara's power, had implored the protection of the emperor Siam: offering to become his tributary on condition that he would aſſiſt him with his forces in recovering the city of Prom. To this the emperor readily aſſented; which news greatly alarmed the Barma monarch, ſo that he diſpatched ambaſſadors to the Kalaminham or ſovereign of a large territory adjacent, requeſting him to divert the emperor from his purpoſe. On the ambaſſadors return from this court, it appeared that the treaty had already taken effect; but as the ſeaſon was not yet arrived for invading Ava, Chaumigrem the king's foſter-brother was ſent with 150,000 men to reduce Sebadi or Savadi the capital of a ſmall kingdom about 130 leagues north-eaſt from Pegu. The general, however, failed in his attempt; and afterwards endeavouring to revenge himſelf on a town in the neighbourhood, he was ſurpriſed by the enemy and put to flight.

In the meantime, the empire of Siam fell into great diſtractions; the king, together with the heir to the crown, were murdered by the queen, who had fallen in love with an officer, whom ſhe married after her huſband's death. However, both of them were ſoon after killed at an entertainment; and the crown was given to a natural brother of the late king, but a coward and a tyrant. On this Mandara reſolved to invade the country; and, his principal courtiers concurring in the ſcheme, he collected an army of 80,000 men, with no fewer than 20,000 elephants. In this army were 1000 Portugueſe, commanded by one James Suarez, who already had a penſion of 200,000 ducats a-year from the king of Pegu, with the title of his brother, and governor of the kingdom. With this formidable army he ſet out in April 1548. His firſt atchievement was the taking of a fortreſs on the borders of the enemy's country; before which, being ſeveral times repulſed, and having loſt 3000 of his men, he revenged himſelf by putting all the women to the ſword. He next beſieged the capital itſelf; but though the ſiege was continued for five months, during which time the moſt violent attacks were made upon it, the aſſailants were conſtantly repulſed with great loſs. However, it was ſtill reſolved to continue the ſiege; and a mount of earth was raiſed, on which were placed 40 pieces of cannon, ready to batter it anew, when, in October, advice was received of a rebellion having broke out in Pegu.

The perſon who headed the rebels on the preſent occaſion was Shoripam Shay, near a kin to the former monarch ſlain twelve years before. He was a religious perſon, of great underſtanding, and eſteemed a ſaint. As he was a famous preacher, he made a ſermon, in which he ſet forth the tyranny of the Barmas in ſuch a manner, that he was immediately taken out of the pulpit, and proclaimed king by the people, who, as a token of ſovereignty, gave him the title of *Shemindoo*. The firſt act of ſovereignty which he exerted was to cut in pieces 15,000 Barmas, and ſeize on the treaſure: and ſo agreeable was this change of government to all ranks of people, that in Pegu. three weeks time all the ſtrong holds of Pegu fell into his hands.

On this news the king immediately raiſed the ſiege in which he was engaged, and in 17 days got to Martavan. Here he was informed, that Shemindoo had polled 500,000 men in different places, in order to intercept his paſſage; at the ſame time that he had the mortification to find 50,000 of his beſt troops deſerted. To prevent a greater deſertion, after 14 days ſtay, he departed from Martavan, and ſoon met Shemindoo at the head of 600,000 men. A deſperate engagement followed; in which Shemindoo was entirely defeated, with the loſs of 300,000 men. Of the Barma troops were ſlain 60,000; among whom were 280 Portugueſe.

The morning after this victory, the tyrant marched to the city; the inhabitants of which ſurrendered, on condition of having their lives and effects ſpared. The kingdom being thus again brought under his ſubjection, his next ſtep was to puniſh the principal perſons concerned in the rebellion: their heads he cut off, and confiſcated their eſtates, which amounted to no leſs than ten millions of gold. Others ſay, that he put all without diſtinction to the ſword, excepting only 12,000, who took ſhelter in James Suarez's houſe; that alone affording an aſylum from the general ſlaughter. The plunder was incredible, Suarez alone getting three millions. All theſe cruelties, however, were inſufficient to ſecure the allegiance of the tyrant's ſubjects: for in leſs than three months news was brought that the city of Martavan had revolted; and that the governor had not only declared for Shemindoo, but murdered 2000 Barmas. Mandara then ſummoned all the lords of the kingdom to meet him with their force, within 15 days, at a place called *Mouchau*, not far from his capital, whither he himſelf went with 300 men, to wait their arrival. But in the meantime he received intelligence that the ſhemin or governor of Zatan, a city of ſome conſequence, had ſubmitted to Shemindoo, and alſo lent him a large ſum of gold. The ſhemin was immediately ſent for in order to be put to death: but he, ſuſpecting Mandara's deſign, excuſed himſelf by pretending ſickneſs; after which, having conſulted with his friends, he drew together about 600 men; and having with theſe privately advanced to the place where the king was, he killed him, with the few attendants that were about him at the time. The guards in the court being alarmed with the noiſe, a ſkirmiſh enſued with the ſhemin's men, in which about 800 were ſlain on both ſides, moſt of them Barmas. The ſhemin then retreated to a place called *Pontel*; whither the people of the country, hearing of the death of the king, who was univerſally hated, reſorted to him. When he had aſſembled about 5000 men, he returned to ſeek the troops which the late king had with him; and finding them diſperſed in ſeveral places, eaſily killed them all. With the Barmas were ſlain 80 out of 300 Portugueſe. The remainder ſurrendered, with Suarez their leader; and were ſpared, on condition of their remaining in the ſervice of the ſhemin.

The ſhemin, now finding his forces daily increaſe, aſſumed the title of *king*; and, to render himſelf the more popular, gave out that he would exterminate the

gu. the Barmas ſo effectually, as not to leave one in all the kingdom. It happened, however, that one of thoſe who were with the late king at the time he was murdered, eſcaped the general ſlaughter; and, ſwimming over the river, informed Chaumigrem of the king's death. He had with him 180,000 men, all of them natives of Pegu, excepting 30,000 Barmas. He knew very well, that if the natives had known that the king was dead, he and all his Barmas would have inſtantly been put to the ſword. Pretending, therefore, that he had received orders to put garriſons into ſeveral places, Chaumigrem diſpatched all the natives into different parts; and thus got rid of thoſe whom he had ſo much cauſe to fear. As ſoon as they were marched, he turned back upon the capital, and ſeized the king's treaſure, together with all the arms and ammunition. He then ſet fire to the magazines, arſenals, palace, ſome of whoſe apartments were ceiled with gold, and 2000 rowing veſſels which were on the river. Then deſtroying all the artillery, he fled with the 30,000 Barmas to his own country, being purſued in vain by the natives of Pegu.

Thus the ſhemin of Zatan was left in quiet poſſeſſion of the kingdom; but, by his repeated acts of tyranny and cruelty, he ſo diſguſted his ſubjects, that many fled to foreign countries, while others went over to Shemindoo, who began now to gather ſtrength again. In the mean time, James Suarez, the Portugueſe whom we have often mentioned, loſt his life by attempting to raviſh a young woman of diſtinction; the ſhemin being unable to protect him, and obliged to give him up to the mob, who ſtoned him to death. The ſhemin himſelf did not long ſurvive him; for, being grown intolerable by his oppreſſions, moſt of his followers abandoned him, and he was beſieged in his capital by Shemindoo with an army of 200,000 men, and ſoon after ſlain in a ſally: ſo that Shemindoo now ſeemed to be fully eſtabliſhed on the throne. But in the mean time Chaumigrem, the foſter-brother to the deceaſed king, hearing that Pegu was very ill provided with the means of defence, invaded the kingdom with an army of 300,000 men. Shemindoo met him with three times their number; but his men, being all natives of Pegu, were inferior in ſtrength, notwithſtanding their numbers, to the enemy. The conſequence was, that Shemindoo was defeated with prodigious ſlaughter, and Chaumigrem cauſed himſelf to be proclaimed king of Pegu. Shortly after, Shemindoo himſelf was taken; and, after being treated with the utmoſt cruelty, was beheaded.

The hiſtory of Chaumigrem is very imperfect. However, we know that he was a very great conqueror, and not at all inferior in cruelty to his predeceſſors. He reduced the empire of Siam and Arrakan, and died in 1583; being ſucceeded by his ſon named *Pranjinoko*, then about 50 years of age. When this prince aſcended the throne, the kingdom of Pegu was in its greateſt height of grandeur; but by his tyranny and obſtinacy he loſt all that his father had gained. He died in 1599, and after his death the kingdom of Pegu became ſubject to Arrakan. For ſome time paſt it has been tributary to the more powerful kingdom of Ava; the ſovereigns of which country have hitherto been extremely cautious of permitting Europeans to obtain any ſettlement among them.

The air of Pegu is very healthy, and preſently recovers ſick ſtrangers. The ſoil alſo is very rich and fertile in corn, rice, fruit, and roots; being enriched by the inundations of the river Pegu, which are almoſt incredible, extending above 30 leagues beyond its channel. It produces alſo good timber of ſeveral kinds. The country abounds with elephants, buffaloes, goats, hogs, and other animals, particularly game; and deer is ſo plenty in September and October, that one may be bought for three or four pence: they are very fleſhy, but have no fat. There is ſtore of good poultry; the cocks are vaſtly large, and the hens very beautiful. As for fiſh, there are many ſorts, and well taſted. In Pegu are found mines, not only of gold, iron, tin, and lead, or rather a kind of copper or mixture of copper and lead, but alſo of rubies, diamonds, and ſapphires. The rubies are the beſt in the world; but the diamonds are ſmall, and only found in the craws of poultry and pheaſants. Beſides, only one family has the privilege of ſelling them; and none dare open the ground to dig for them. The rubies are found in a mountain in the province of Kablan, or Kapelan, between the city of Pegu and the port of Sirian. Pegu.

The inhabitants are of an olive, or rather a tawny complexion. The women are branded by ſome travellers as having ſhook off all modeſty, on account of their expoſing ſome parts of their bodies which ought to be concealed from ſight. Some alſo tell us, that the men wear bells, which at a certain age, *viz.* 25 or 30, or, according to others, when they are capable of making uſe of women, are inſerted on each ſide the virile member between the ſkin and the fleſh, which is opened for that purpoſe, and healed in ſeven or eight days. The Peguers may be ranked among the moſt ſuperſtitious of all mankind. They maintain and worſhip crocodiles; and will drink nothing but the waters of the ditches where thoſe monſtrous animals harbour. By thus expoſing themſelves to the manifeſt hazard of their lives, they have frequently the misfortune to be devoured. They have five principal feſtivals in the year, called *ſapans*, which they celebrate with extraordinary magnificence. In one of them the king and queen make a pilgrimage about 12 leagues from the city, riding on a triumphal car, ſo richly adorned with jewels, that it may be ſaid without an hyperbole that they carry about with them the value of a kingdom. This prince is extremely rich; and has in the chapel of his palace idols of ineſtimable value, ſome of them being of maſſy gold and ſilver, and adorned with all ſorts of precious ſtones. The talapoins, or prieſts of this country, have no poſſeſſions; but ſuch is the reſpect paid them by the people, that they are never known to want. They preach to them every Monday not to commit murder; to take from no perſon any thing belonging to him; to do no hurt; to give no offence; to avoid impurity and ſuperſtition; but above all, not to worſhip the devil: but theſe diſcourſes have no effect in the laſt reſpect. The people, attached to manicheiſm, believe that all good comes from God; that the devil is the author of all the evil that happens to men; and that therefore they ought to worſhip him, that he may not afflict them. This is a common notion among the Indian idolaters.

The inhabitants of Pegu are accuſed by ſome authors with being ſlovenly in their houſes, and naſty in their

Pegu. diet, on account of their ſeaſoning their victuals with ſi'o', a compoſition made of ſtinking fiſh, reduced to a conſiſtency like muſtard, ſo nauſeous and offenſive that none but themſelves can endure the ſmell of it. Balbi ſays, he could ſooner bear the ſcent of ſtinking carrion; and yet with this they ſeaſon their rice, and other ſoups, inſtead of oil or butter. As they have no wheat in this country, their bread is rice made into cakes. Their common drink is water, or a liquor diſtilled from cocoa nut water. They are a ſpirited and warlike people: open, generous, and hoſpitable; and have neither the indolence nor the jealouſy of moſt other eaſtern nations.

The men here, as in moſt eaſtern countries, buy their wives, or pay their parents a dowry for them. They have an old cuſtom; which is to offer their daughters to ſtrangers, and hire them out for a time: ſome ſay they hire out their wives in the ſame manner. Theſe marriages for a time are well regulated, and often prove very beneficial to the occaſional huſband. Moſt of the foreigners who trade hither, marry a wife for the time of their ſtay. In caſe of a ſeparation, the father is obliged to take care of the boys, and the mother of the girls. We are told that no woman is looked upon the worſe, but rather the better, for having had ſeveral European huſbands: nay, we are told, that no perſon of fa hion in Pegu, from the gentleman to the king, will marry a maiden, till ſome acquaintance or ſtranger has had the firſt night's lodging with her.

In Pegu, the inheritance of all land is in the king: he is likewiſe the heir of all his ſubjects who die without iſſue; but in caſe they have children, two-thirds go to them, and the reſt to his majeſty.

In the government of this country, deſpotiſm prevails in its full extent, and deſpotiſm too of the very worſt kind; for the inhabitants are under the abſolute power of a ſet of petty tyrants, who are themſelves nothing more than ſlaves to the king of Ava. As they have little or no emolument, except what they can raiſe by extortion, it is exerciſed in the moſt unlimited manner. They take cognizance of all diſputes between individuals that come to their ears, without the caſe being laid before them by either of the parties; and on whatever ſide the cauſe is determined, there is a never-failing charge brought in againſt both, for juſtice, as they expreſs it; and this price of juſtice is often three or four times greater than the value of the matter in agitation.

But the inconveniences that this government labours under are not only thoſe of deſpotiſm; the unhappy ſubjects feel thoſe of anarchy too. There are about twenty perſons concerned in the government of Rangoon, who, though one is ſubordinate to another, and though matters of the firſt conſequence are determined in a council of the whole, can yet act ſeparately; and any one member of this body can by his own authority give out orders, which no inhabitant of Pegu dares to diſobey. Thoſe orders may be contrary to the ſenſe of the whole body; in which caſe they are, indeed, reverſed in council: but then there are inſtances, and "I myſelf, (ſays a late traveller,*) obſerved one, of ſuch orders being notwithſtanding repeated more than once by the ſame perſon, and obeyed each time, till they were again reverſed: nor was any redreſs obtained by the party aggrieved, or any effectual meaſures taken to prevent ſuch a contempt of authority for the future." Pegu.

When a perſon falls ſick, we are told that they generally make a vow to the devil, from whom they believe all evil comes. Then a ſcaffold is built, and victuals are ſpread on the top of it to ſolace Old Nick, and render him propitious. This feaſt is accompanied with lighted candles and muſic; and the whole is managed by an undertaker called the *devil's father*.

The commodities exported from this country are gold, ſilver, rubies, muſk, benjamin, long-pepper, tin, lead, copper; lakka, or gum-lac, whereof they make hard wax; rice; rice-wine; and ſome ſugar-canes, of which they would have plenty, but that the elephants eat them. It may be obſerved, that under the name of *rubies*, the Peguers comprife topazes, ſapphires, amethyſts, and other ſtones; which they diſtinguiſh by ſaying the blue, the violet, and the yellow rubies. The true ruby is red, tranſparent, or ſparkling, inclining near the ſurface to the violet of the amethyſt. Cotton cloths from Bengal and Coromandel, with ſome ſtriped ſilks, are beſt for the Pegu market, and ſilver of any ſort will go off there: for the king, in return for his eight and a half *per cent.* duty on it, allows the merchants to melt it down, and put what copper alloy they pleaſe in it. They wear none of our European commodities in Pegu but hats and ribbons. The gentry will give extravagant prices for fine beaver hats, which they wear without any cocks. They are no leſs fond of ribbons flowered with gold and ſilver, which they wear round their hats.

As to the religion of the Peguers, it is the ſame at bottom with that which prevails over the reſt of India and Tibet; only varies in dreſs ſomewhat in different countries, according to the humour or intereſt of the prieſts. They hold the exiſtence of one ſupreme God, of whom they make no image; but they have many inferior created gods, whoſe images are ſet up in the temples for the laity to worſhip. Not content with theſe, we are told they worſhip the devil alſo. Many are ſeen to run about the ſtreets every morning, with rice in one hand and a torch in the other, crying aloud, that they are going to give the devil his breakfaſt, that he may not hurt them all the day. Beſides the manichean doctrine of two principles, one the author of good and the other of evil, from whence their worſhipping the devil has its riſe, they believe an eternal ſucceſſion of worlds without creation. The Peguers hold the doctrine of the Metempſychoſis, or tranſmigration of the human ſoul, which, after paſſing through the bodies of various animals, ſhall attain to the perfection and felicity of their gods; which in effect is no other than a ſtate of annihilation. They have a ſtrong opinion of the ſanctity of apes and crocodiles, inſomuch that they believe the perſons to be perfectly happy who are devoured by them. Their temples are of a conic form, and ſome of them a quarter of a mile round. They obſerve a great many feſtivals, ſome of which are called *ſapan*. The images of their inferior gods are in a ſitting poſture, with their legs acroſs, and toes of equal length: their arms and hands very ſmall in proportion to their bodies; their faces longer than human; their ears long, and the lappets very thick. The congregation bow to them when they come in and when

* *Hunter's conciſe account of the kingdom of Pegu.*

Peguntium Peirce.

when they go out; and that is all the worſhip which they pay to them. The prieſts of Pegu, called *talapoins*, are a ſort of mendicant friars. They obſerve celibacy; and eat but once a-day; living in the woods, in a ſort of neſts or cages built on the tops of trees for fear of the tygers. They preach frequently, lead very innocent lives, and are very hoſpitable and humane.

The king of Pegu's revenues ariſe chiefly from the rent of lands, of which he is the ſole proprietor. Another branch of it are the duties paid for the commodities imported or exported. In a word, he is judged the richeſt monarch in the world, next to the emperor of China

PEGUNTIUM (anc. geog.), Ptolemy; *Piguntioe*, (Pliny); a town or citadel of Dalmatia, on the Adriatic, oppoſite to the iſland Brattia, ſcarce five miles off, and 40 miles to the eaſt of Salonae. According to Fortis, a mountain, a large hollow, and ſubmarine ſprings are ſeen here. "This hollow (ſays he) ſeems to have been excavated by ſome ancient river. The ſprings which bubble up from under the ſea are ſo conſiderable, that they might paſs for the riſing again of a river ſunk under ground. Vrullia has the ſame derivation as the word *Vril*, which in Sclavonian ſignifies a fountain; and this etymology, rendering the name of Vrullia the *Berullia* of Porphyrogenitus analagous to that of Peguntium, ſince πηγη and Vril are ſynonymous, induces me to believe, that the caſtle named Peguntium by ancient geographers was ſituated in this place, and not at the mouth of the Cettina. No remarkable veſtiges of antiquity now exiſt on the ſpot; yet it is evident, by the quantity of fragments of vaſes, tiles, and ſepulchral inſcriptions now and then dug up, that this tract of coaſt was well inhabited in the Roman times. The principal cauſe why the tracts of ancient habitations cannot be diſcovered about Vrullia, is the ſteepneſs of the hill above it, and the quantity of ſtones brought down from thence by the waters. The mouth of the hollow of Vrullia is dreaded by ſeamen, on account of the ſudden impetuous guſts of wind that blow from thence, and in a moment raiſe a kind of hurricane in the channel between the Primorie and the iſland of Brazza, to the great danger of barks ſurpriſed by it."

Travels into Dalmatia.

PEINE FORT ET DURE, (Lat. *pana fortis et dura*), ſignifies a ſpecial puniſhment inflicted on thoſe who, being arraigned of felony, refuſe to put themſelves on the ordinary trial, but ſtubbornly ſtand mute; it is vulgarly called *preſſing to death*. See ARRAIGNMENT.

PEIRCE (James), an eminent diſſenting miniſter, was born at Wapping, in London, in the year 1674, and was educated at Utrecht and Leyden; after which he ſpent ſome time at Oxford, in order to enjoy the benefit of frequenting the Bodleian library. He then for two years preached the Sunday-evening's lecture at the meeting houſe in Miles-Lane, London, and then ſettled at Cambridge. In 1713 he was removed to a congregation at Exeter, where he continued till the year 1718: when the Calviniſts among the diſſenters propoſing a ſubſcription to articles of faith to be ſigned by all the diſſenting miniſters in the kingdom, ſeveral articles were propoſed to him and Mr John Hallet, another diſſenting miniſter at Exeter, in order to their ſubſcribing them, they both refuſed, imagining this proceeding of their diſſenting brethren to be an unworthy impoſition on religious liberty and private judgment; for which they were ejected from their congregation. Upon this, a new meeting was opened for them at Exeter, of which Mr Peirce continued miniſter till his death, in 1726. He was a man of the ſtricteſt virtue, exemplary piety, and great learning. He wrote, 1. *Exercitatio philoſophica de Homœmeria Anaxagorea*. 2. Thirteen pieces on the Controverſy between the Church of England and the Diſſenters. 3. Ten pieces on the Controverſy about the Ejectment at Exeter. 4. Six pieces on the Doctrine of the Trinity. 5. A Paraphraſe and Notes on the Epiſtles of St Paul to the Coloſſians, Philippians, and Hebrews. 6. An Eſſay in favour of giving the Euchariſt to Children. 7. Fourteen Sermons. Peirce

PEIRESC (Nicolas Claude Fabri), born in 1580, was deſcended from an ancient and noble family, ſeated originally at Piſa in Italy. At ten years of age, he was ſent to Avignon, where he ſpent five years in the Jeſuits college, in the ſtudy of what in Scotland and on the Continent is called *humanity*. From Avignon he was, in 1595, removed to Aix, and entered upon the ſtudy of philoſophy. In the interim, he attended the proper maſters for dancing, riding, and handling arms; in all which, though he performed the leſſons regularly, it was with reluctance: for this being done only to pleaſe an uncle, whoſe heir he was to be, he never practiſed by himſelf, eſteeming all the time loſt that was not ſpent in the purſuits of literature. During this period, his father being preſented with a medal of the emperor Arcadius, which was found at Belgenſer, Peireſc begged the favour of it; and, charmed with deciphering the characters in the exergue, and reading the emperor's name, he carried the medal with a tranſport of joy to his uncle; who for his encouragement gave him two more, together with ſome books upon the ſubject. This is the epoch of his application to antiquities, for which he became afterwards ſo famous. In 1596, he was ſent to finiſh his courſe of philoſophy under the Jeſuits at Tournon, where he turned his attention particularly to coſmography, as being neceſſary to the underſtanding of hiſtory, abating, however, nothing of his application to antiquity, in which he was much aſſiſted by Petrus Rogerus, one of the profeſſors, and a ſkilful medalid: nor did he omit the ſtudy of humanity in general, wherein he was the maſter and inſtructor of a brother who was with him. But to do all this he was obliged to ſit up late at nights; and ſo much labour and attention, as he was naturally of a tender conſtitution, increaſed the weakneſs of his ſtomach formerly contracted, and for which he had uſed a kind of digeſtive powder. Being recalled by his uncle in 1597, he returned to Aix, and entered there upon the ſtudy of the law; which he proſecuted, however, ſo as to find leiſure to viſit and converſe frequently with Peter A. R. Bagarr, a moſt ſkilful antiquary, who was afterwards made maſter of the jewels to Henry IV.

The following year he went again to Avignon, to carry on his courſe of law under one Peter David; who, being well ſkilled likewiſe in antiquities, was pleaſed to ſee Peireſc join this ſtudy to that of the law. But Ghibertus of Naples, auditor to Cardinal Aquaviva, fed his curioſity the moſt, in ſhowing him ſome rarities, ſuch as he had never ſeen before. Ghibertus alſo lent him Goltzius's Treatiſe upon Coins, and adviſed

Peireſc. vifed him to go into Italy, eſpecially to Rome, where he would meet with curioſities to ſatisfy his moſt ardent wiſhes. Accordingly, his uncle having procured a proper governor, he and his brother ſet out upon that tour Sept. 1599; and paſſing through Florence, Bononia, and Ferrara, when he had ſtayed a few days at Venice, he fixed his reſidence at Padua, in order to complete his courſe of law. But once a quarter, going to Venice to get caſh for bills of exchange, he took theſe opportunities of introducing himſelf to the moſt diſtinguiſhed literati there; and was particularly careſſed by F. Contarin, procurator of St Mark, who was poſſeſſed of a curious cabinet of medals, and other antiquities, without knowing the value of them. This was fully ſhown to him by Peireſc, who likewiſe explained the Greek inſcriptions upon his medals, and the monumental ſtones. After a year's ſtay at Padua, he ſet out for Rome, and arrived there Oct. 1600, in order to be in time for ſeeing the jubilee: to celebrate which, the Porta Sancta would be opened in the beginning of the next year. He paſſed ſix months in this city, viewing the numberleſs curioſities there, and in cultivating the friendſhip of Galileo, by whom he was much beloved. This friendſhip led him to carry his reſearches into aſtronomy and natural philoſophy; and he was preſent when Fabricius ab Aquapendente, out of a parcel of eggs upon which a hen was ſitting, took one every day, to obſerve the gradual formation of the chick from firſt to laſt. From this time it was generally acknowledged, that he had taken the helm of learning into his hand, and began to guide the commonwealth of letters.

Having now ſpent almoſt three years in Italy, he began to prepare for his departure; and in the end of 1602, having packed up all the rarities, gems, &c. which he had procured, and put them into the road to Marſeilles, he left Padua, and, croſſing the Alps to Geneva, went to Lyons; where receiving money, he made a handſome preſent to his governor, who took the route of Paris. From Lyons he went to Montpellier, to improve himſelf in the law under Julius Parius. From Montpellier he diſpatched more rarities to his uncle, who ſending for him home, he arrived at Aix in November; but, bringing Parius along with him, he obtained leave to return to Montpellier in a few days. He waited upon Parius back again, under whom he continued purſuing his law ſtudies till the end of 1603, when he returned to Aix, at the earneſt requeſt of his uncle, who, having reſigned to him his ſenatorial dignity, had ever ſince the beginning of the year laboured to get the king's patent. The degree of doctor of law was a neceſſary qualification for that dignity. Peireſc, therefore, having kept the uſual exerciſe, took that degree Jan. 18. 1604, when the aforeſaid patent was given in to the ſenate, and ordered to be recorded: yet Peireſc procured leave not to be preſently entered into the liſt of ſenators. The bent of his inclination was not ſo much to buſineſs as to advance arts and ſciences, and to aſſiſt all the promoters of learning. For this purpoſe, he reſolved to lead a ſingle life; ſo that when his father had concluded a match for him with a reſpectable lady, he begged to be excuſed.

In 1605, he accompanied G. Varius, firſt preſident of the ſenate at Aix, who was very fond of him, to Paris; whence, having viſited every thing curious, he croſſed the water, in company with the king's ambaſſador, 1606, to England. Here he was very graciouſly received by king James I.; and having ſeen Oxford, and viſited Camden, Sir Robert Cotton, Sir Henry Saville, and other learned men, he paſſed over to Holland; and after viſiting the ſeveral towns and univerſities, with the literati in each, he went through Antwerp to Bruſſels, and thence back to Paris, to ſee the ceremony of the Dauphin's baptiſm; which being ſolemnized Aug. 24. he returned home in September 1606, being expected for the ordering of the family affairs. Peireſc.

Preſently after this, he purchaſed the barony of Rians; and at the ſolicitation of his uncle, having approved himſelf before that aſſembly, he was received a ſenator on the 1ſt of July 1607. Jan. 1608 he loſt his uncle; and the following year, falling himſelf into a dangerous fever, recovered by eating muſk-melons before ſupper, for which he had conceived a longing. He was ordered by his phyſician to eat them before his meals without bread, and to drink a glaſs of pure wine upon them. He continued this method all his life afterwards; and grew ſo fond of them, that, though he could abſtain from any other meat as he liſted, yet towards them he profeſſed he was unable to maſter himſelf. He frequently experienced, that in the muſk-melon ſeaſon he was never troubled with the gravel. In 1618, having procured a faithful copy of "the Acts of the Monaſtery of Maren in Switzerland," he publiſhed a ſecond edition of that work. As it was written in defence of the royal line of France againſt Theodoric Pieſpordius, who had attempted to prove the title of the Auſtrian family to the French crown by right of ſucceſſion, he was, upon this publication, nominated the ſame year, by Louis XIII. abbot of Sancta Maria Aquiſtrienſis. He ſtayed in France till 1623; when, upon a meſſage from his father, now grown old and ſickly, he left Paris, where he had ſpent ſeven years and ſome months. He arrived at Aix in October; and not long after preſented to the court a patent from the king, permitting him to continue in the function of his ancient dignity, and to exerciſe the office of a ſecular or lay perſon, notwithſtanding that, being an abbot, he had aſſumed the character of a churchman. To this the court of parliament not aſſenting, decreed unanimouſly, that, being already admitted into the firſt rank, he ſhould abide perpetually therein; not returning, as the cuſtom of the court was, to the inferior auditory, wherein trials are uſually had of criminal caſes. In 1625, he buried his father, who had been long afflicted with the gout. In 1627, he prevailed with the archbiſhop of Aix to eſtabliſh a poſt thence to Lyons, and ſo to Paris and all Europe; by which the correſpondence conſtantly held with the literati everywhere was much facilitated. In 1629, he began to be much tormented with the ſtrangury and hæmorrhoides; and in 1631, having completed the marriage of his nephew Claudius with Margaret Alreſia, a noblewoman of the county of Avignon, he beſtowed upon him the barony of Rianty, together with a grant of his ſenatorial dignity, only reſerving the function to himſelf for three years. But the parliament not waiting his ſurrendry of it, he reſented that affront ſo heinouſly, that he procured, in 1635, letters patent from the king to be reſtored, and

to exercise the office for five years longer, which happened to be till his death: for being seized, June 1637, with a fever that brought on a stoppage of urine, this put an end to his life on the 24th of that month, in his 57th year.

The character of Peiresc may be summed up in a few words. His person was of a middle size, and of a thin habit: his forehead large, and his eyes grey; a little hawk-nosed; his cheeks tempered with red; the hair of his head yellow, as also his beard, which he used to wear long; his whole countenance bearing the marks of uncommon and rare courtesy and affability. In his diet he affected cleanliness, and in all things about him; but nothing superfluous or costly. His clothes were suitable to his dignity; yet he never wore silk. In like manner, the rest of his house was adorned according to his condition, and very well furnished; but he neglected his own chamber. Instead of tapestry, there hung the pictures of his chief friends and of famous men, besides innumerable bundles of commentaries, transcripts, notes, collections from books, epistles, and such like papers. His bed was exceeding plain, and his table continually loaded and covered with papers, books, letters, and other things; as also all the seats round about, and the greatest part of the floor. These were so many evidences of the turn of his mind; in respect to which, the writer of his eulogy compares him to the Roman Atticus; and Bayle, considering his universal correspondence and general assistance to all the literati in Europe, dashed it out luckily enough, when he called him "the attorney general of the literary republic." The works which he published are, "Historia provinciæ Galliæ Narbonensis;" "Nobilium ejusdem provinciæ familiarum Origines, et separatim Fabriciæ;" "Commentarii rerum omnium memoria dignarum sua ætate gestarum;" "Liber de ludicris naturæ operibus;" "Mathematica & astronomica varia;" "Observationes mathematicæ;" "Epistolæ ad S. P. Urbanum VIII. cardinales Barberinos, &c.;" "Authores antiqui Græci et Latini de ponderibus et mensuris;" "Elogia et epitaphia;" "Inscriptiones antiquæ et novæ;" "Genealogia domus Austriacæ;" "Catalogus librorum biblioth. reg.;" "Poemata varia;" "Nummi Gallici, Saxonici, Britannici, &c.;" "Linguæ orientales, Hebræa, Samaritana, Arabica, Egyptiaca, et Indices librorum harum linguarum;" "Observationes in varios auctores." It is remarkable, that though Peiresc bought more books than any man of his time, yet his collection left was not large. The reason was, that, as fast as he purchased, he kept continually making presents of them to such learned men as he knew they would be useful to.

PEKIN, the capital city of the empire of China, in Asia, where the emperor generally resides. It is situated in a very fertile plain, 20 leagues distant from the great wall. This name, which signifies the *northern court*, is given to it, to distinguish it from another considerable city called *Nanking*, or the *southern court*. The emperor formerly resided in the latter; but the Tartars, a restless and warlike people, obliged this prince to remove his court to the northern provinces, that he might more effectually repel the incursions of those barbarians, by opposing to them a numerous militia which he generally keeps around his person. It is an exact square, and divided into two parts; namely, that which contains the emperor's palace, which is in the new city, or, as it is called, the Tartar's city, because it is inhabited by Tartars ever since they conquered this empire; the other, called the *Old City*, is inhabited by the Chinese. The circuit of both these together is 52 Chinese lys, each of which contains 240 geometrical paces; being, without the suburbs, full six leagues in circumference, according to the most accurate measurement made by order of the emperor. Pekin.

Those who have paid attention to the population of this place, reckon the number of inhabitants at 2,000,000, though there are others that double that number.

Grosier tells us, "that the height and enormous thickness of the walls of the Tartar city excite admiration; twelve horsemen might easily ride abreast upon them; they have spacious towers raised at intervals, a bow-shot distant from one another, and large enough to contain bodies of reserve in case of necessity. The city has nine gates, which are lofty and well arched. Over them are large pavilion-roofed towers divided into nine stories, each having several apertures or portholes: the lower story forms a large hall for the use of the soldiers and officers who quit guard, and those appointed to relieve them. Before each gate a space is left of more than 360 feet: this is a kind of place of arms, inclosed by a semicircular wall equal in height and thickness to that surrounding the city. The great road, which ends here, is commanded by a pavilion roofed tower like the first, in such manner, that, as the cannon of the former can batter the houses of the city, those of the latter can sweep the adjacent country. The streets of Pekin are straight, about 120 feet wide, a full league in length, and bordered with shops. It is astonishing to see the immense concourse of people that continually fills them, and the confusion caused by the prodigious number of horses, camels, mules, and carriages, which cross or meet each other. Besides this inconvenience, one is every now and then stopped by crowds, who stand listening to fortune-tellers, jugglers, ballad-singers, and a thousand other mountebanks and buffoons, who read and relate stories calculated to promote mirth and laughter, or distribute medicines, the wonderful effects of which they explain with all the eloquence peculiar to them. *Grosier's Description of China.*

"People of distinction oblige all their dependents to follow them. A mandarin of the first rank is always accompanied in his walks by his whole tribunal; and, to augment his equipage, each of the inferior mandarins in his suit is generally attended by several domestics. The nobility of the court, and princes of the blood, never appear in public without being surrounded by a large body of cavalry; and, as their presence is required at the palace every day, their train alone would be sufficient to create confusion in the city. It is very singular, that in all this prodigious concourse no women are ever seen: hence we may judge how great the population of China must be, since the number of females in this country, as well as everywhere else, is superior to that of the other sex.

"As there is a continual influx of the riches and merchandize of the whole empire into this city, the number of strangers that resort hither is immense. They are carried in chairs, or ride on horseback; the latter is more common: but they are always attended by a guide, acquainted with the streets, and who knows

Pekin. knows the houſes of the nobility and principal people of the city. They are alſo provided with a book, containing an account of the different quarters, ſquares, remarkable places, and of the reſidence of thoſe in public offices. In ſummer there are to be ſeen ſmall temporary ſhops, where people are ſerved with water cooled by means of ice; and one finds everywhere eating-houſes, with refreſhments of tea and fruits. Each kind of proviſion has a certain day and place appointed for its being expoſed to ſale

"The governor of Pekin, who is a Mantchew Tartar, is ſtyled Governor of the Nine Gates. His juriſdiction extends not only over the ſoldiers, but alſo over the people in every thing that concerns the police. No police can be more active; and it is ſurpriſing to ſee, among an infinite number of Tartars and Chineſe mixed together, the greateſt tranquillity prevail. It is rare, in a number of years, to hear of houſes being robbed, or people aſſaſſinated. All the principal ſtreets have guard-rooms, and ſoldiers patrol night and day, each having a ſabre hanging from his girdle, and a whip in his hand, to correct, without diſtinction, thoſe who excite quarrels or cauſe diſorder. The lanes are guarded in the ſame manner; and have latticed gates, which do not prevent thoſe from being ſeen who walk in them: they are always kept ſhut during the night, and ſeldom opened even to thoſe who are known; if they are, the perſon to whom this indulgence is granted muſt carry a lanthorn, and give a ſufficient reaſon for his going out. In the evening, as ſoon as the ſoldiers are warned to their quarters by beat of drum, two centinels go and come from one guard-room to another, making a continual noiſe with a kind of callanet, to ſhow that they are not aſleep. They permit no one to walk abroad in the night-time. They even examine thoſe whom the emperor diſpatches on buſineſs; and if their reply gives the leaſt cauſe of ſuſpicion, they have a right to convey them to the guard-room. The ſoldiers in each of the guard-rooms are obliged to anſwer every time the centinels on duty call out.

"It is by theſe wiſe regulations, obſerved with the greateſt ſtrictneſs, that peace, ſilence, and ſafety reign throughout the whole city. The governor is alſo obliged to go the round; and the officers ſtationed on the walls, and in the towers over the gates (in which are kept large kettle-drums that are beat every time the guard is relieved), are continually diſpatching ſub-alterns to examine the quarters belonging to the gates where they are poſted. The leaſt neglect is puniſhed next morning, and the officer who was on guard is caſhiered. This police, which prevents nocturnal aſſemblies, would appear no doubt extraordinary in Europe, and in all probability would not be much reliſhed by our young men of fortune and ladies of quality. But the Chineſe think juſtly: they conſider it to be the duty of the magiſtrates of a city to prefer good order and public tranquillity to vain amuſements, which generally occaſion many attempts againſt the lives and property of the citizens. It is true, the ſupport of this police coſts the emperor a great deal; for part of the ſoldiers we have mentioned are maintained for this purpoſe only. They are all infantry, and their pay is generally very high. Their employment conſiſts not only in watching for thoſe who may occaſion diſturbance in the day time, or walk abroad during the night; they muſt alſo take care that the ſtreets are kept clean and ſwept every day; that they are watered morning and evening in time of dry weather; and that every nuiſance is removed. They have orders alſo to aſſiſt in this labour themſelves; and to clear the kennels, that the water may have a free courſe."

The walls of the emperor's palace, including that and the gardens, are about two miles in length. "Although (ſays Groſier) the Chineſe architecture has no reſemblance to that of Europe, the imperial palace of Pekin does not fail to ſtrike beholders by its extent, grandeur, and the regular diſpoſition of its apartments, and by the ſingular ſtructure of its pavilion-roofs, ornamented at each corner with a carved plat-band, the lower extremity of which is turned upwards. Theſe roofs are covered with varniſhed tiles of ſo beautiful a yellow colour, that, at a diſtance, they make as ſplendid an appearance as if they were gilded. Below the upper roof there is another of equal brilliancy, which hangs ſloping from the wall, ſupported by a great number of beams, daubed over with green varniſh, and interſperſed with gilt figures. This ſecond roof, with the projection of the firſt, forms a kind of crown to the whole edifice. The palace is a ſmall diſtance from the ſouth gate of the Tartar city. The entrance to it is through a ſpacious court, to which there is a deſcent by a marble flaireaſe, ornamented with two large copper lions, and a baluſtrade of white marble. This baluſtrade runs in the form of a horſe-ſhoe, along the banks of a rivulet, that winds across the palace with a ſerpentine courſe, the bridges over which are of marble. At the bottom of this firſt court ariſes a façade with three doors: that in the middle is for the emperor only; the mandarins and nobles paſs through thoſe on each ſide. Theſe doors conduct to a ſecond court, which is the largeſt of the palace: it is about 300 feet in length, and 50 in breadth. An immenſe gallery runs round it, in which are magazines, containing rich effects, which belong to the emperor as his private property; for the public treaſure is entruſted to a ſovereign tribunal called *Houpou*. The firſt of theſe magazines is filled with plate and veſſels of different metals; the ſecond contains the fineſt kinds of furs; the third, dreſſes lined with ſable, ermine, minever, and foxes ſkins, which the emperor ſometimes gives in preſents to his officers; the fourth is the depoſitory of jewels, pieces of curious marble, and pearls fiſhed up in Tartary; the fifth, conſiſting of two ſtories, is full of wardrobes and trunks, which contain the ſilk ſtuffs uſed by the emperor and his family; the reſt are filled with bows, arrows, and other pieces of armour taken from the enemy or preſented by different princes.

"The royal hall, called *Tai-hotien*, or the Hall of the Grand Union, is in this ſecond court. It is built upon a terrace about 18 feet in height, incruſted with white marble, and ornamented with baluſtrades of excellent workmanſhip. Before this hall all the mandarins range themſelves, when they go, on certain days, to renew their homage, and perform thoſe ceremonies that are appointed by the laws of the empire. This hall is almoſt ſquare, and about 130 feet in length. The ceiling is carved, varniſhed green, and loaded with gilt dragons. The pillars which ſupport the

roof within are six feet in circumference towards the base, and are coated with a kind of mastich varnished red; the floor is partly covered with coarse carpets, after the Turkish manner; but the walls have no kind of ornament, neither tapestry, lustres, nor paintings.

"The throne, which is in the middle of the hall, consists of a pretty high alcove, exceedingly neat. It has no inscription but the character *ching*, which the authors of this relation have interpreted by the word *holy*: but it has not always this signification; for it answers better sometimes to the Latin word *eximius*, or the English words *excellent*, *perfect*, *most wise*. Upon the platform opposite to this hall stand large vessels of bronze, in which incense is burnt when any ceremony is performing. There are also chandeliers shaped like birds and painted different colours, as well as the wax-candles that are lighted up in them. This platform is extended towards the north, and has on it two lesser halls; one of them is a rotunda that glitters with varnish, and is lighted by a number of windows. It is here that the emperor changes his dress before or after any ceremony. The other is a saloon, the door of which opens to the north: through this door the emperor must pass, when he goes from his apartment to receive on his throne the homage of the nobility; he is then carried in a chair, by officers dressed in long red robes bordered with silk, and caps ornamented with plumes of feathers. It would be difficult to give an exact description of the interior apartments which properly form the palace of the emperor, and are set apart for the use of his family. Few are permitted to enter them but women and eunuchs."

The temples and the towers of this city are so numerous, that it is difficult to count them. Provisions of all kinds are exceeding plentiful, they being, as well as the merchandises, brought from other parts by means of canals cut from the rivers, and always crowded with vessels of different sizes, as well as from the adjacent country. An earthquake which happened here in 1731 buried above 100,000 persons in the ruins of the houses which were thrown down. E. Long. 116. 41. N. Lat. 39. 54.

We have already, under the article OBSERVATORY, mentioned the famous observatory in this city, of which we shall give this further account from the Universal Vol. vii. History. "The Chinese had thought nothing in the universe could equal in magnificence this famous place; and one of the most celebrated mathematicians of the royal academy of Paris hath made no scruple to represent it as one of the greatest prodigies of art and ingenuity, of beauty and magnificence; and yet, when this celebrated structure came to be viewed by more proper and unbiassed judges, it appears to have been of little worth as to its ancient machines, and less as to its situation; and that all that is now valuable in it is owing to the improvements made by Father Verbiest a Flemish Jesuit, who caused a new set of instruments to be made, with extraordinary care, neatness, and precision. Pekin Pelagius.

"This fabric stands in a court of a moderate extent, and is built in the form of a square tower, contiguous to the city wall on the inside, and raised but ten or twelve feet above its bulwark. The ascent up to the top is by a very narrow staircase; and on the platform above were placed all the old instruments, which, though but few, took up the whole room, till Father Verbiest introduced his new apparatus, which he disposed in a more convenient order. These are large, well cast, and embellished; and were the neatness of the divisions answerable to the work, and the telescopes fastened to them according to the new method, they would be equal to those of Europe; but the Chinese artificers were, it seems, either too negligent, or incapable of following his directions. As to the old instruments, they were, by order of the emperor Kang-hi, set aside as useless, and laid in the hall near the tower, where they may be seen through a cross-barred window, all covered with rust, and buried in oblivion.

"In this famed observatory there are five mathematicians employed night and day, each in a proper apartment on the top of the tower, to observe all that passes over their heads: one of them is gazing towards the zenith, and the others towards the four points of the compass, that nothing may escape their notice. Their observations extend not only to the motions of the heavenly bodies, but to fires, meteors, winds, rain, thunder, hail, storms, and other phenomena of the atmosphere; and these are carefully entered in their journals, and an account of them is brought every morning to the surveyor of the mathematics, and registered in his office."

PELAGIANS, a Christian sect who appeared about the fifth or end of the fourth century. They maintained the following doctrines. 1. That Adam was by nature mortal, and, whether he had sinned or not, would certainly have died. 2. That the consequences of Adam's sin were confined to his own person. 3. That new-born infants are in the same situation with Adam before the fall. 4. That the law qualified men for the kingdom of heaven, and was founded upon equal promises with the gospel. 5. That the general resurrection of the dead does not follow in virtue of our Saviour's resurrection. 6. That the grace of God is given according to our merits. 6. That this grace is not granted for the performance of every moral act; the liberty of the will, and information in points of duty, being sufficient, &c. The founder of this sect was

PELAGIUS, a native of Great Britain; but whether of England, Scotland, or Wales, is as uncertain as it is immaterial (A). He was born towards the close of the fourth century, and educated in the monastery

(A) Dr Henry thinks he was born in North Wales; that his real name was Morgan, of which Pelagius is a translation; and that he was born on the 13th of November A. D. 354, the same day with his great antagonist St Austin. The same learned historian gives us the following account of Pelagius and his great coadjutor Celestius. "He received a learned education in his own country, most probably in the great monastery of Bangor near Chester, to the government of which he was advanced A. D. 404. He was long esteemed and loved by St Jerome and St Austin, who kept up a friendly correspondence with him by letters before

Pelagius. of Banchor, in Wales, of which he became a monk, and afterwards abbot. In the early part of his life he went over to France, and thence to Rome, where he had the infolence to promulgate certain opinions fomewhat different from thofe of the infallible church. His morals being irreproachable, he gained many difciples; and the dreadful herefy made fo rapid a progrefs, that, for the falvation of fouls, it became neceffary for the pope to exert his power. Pelagius, to avoid the danger, in the year 409 paffed over to Sicily, attended by his friend and pupil Celeftius. In 411 they landed in Africa, continued fome time at Hippo, and were prefent at the famous conference between the Catholics and Donatifts which was held at Carthage in 412. From thence they travelled to Egypt; and from Egypt, in 415, to Paleftine, where they were graciouſly received by John bifhop of Jerufalem. In the fame year Pelagius was cited to appear before a council of feventeen bifhops, held at Diofpolis. They were fatisfied with his creed, and abfolved him of herefy. The African bifhops, however, being difpleafed with their proceedings, appealed to the Roman pontiff: he firft approved, and afterwards condemned, the opinions of Pelagius, who, with his pupil Celeftius, was publicly excommunicated; and all the bifhops who refufed to fubfcribe the condemnation of the Pelagian herefy were immediately deprived. What became of him after this period is entirely unknown; but it feems very probable that he retired to Banchor, and died abbot of that monaftery. He wrote, 1. *Expofitionum in epift. Paulinas*, lib. xiv. 2. *Epiftola ad Demetriadem de virginitate.* 3. *Explanationis fymboli ad Damafum.* 4. *Epiftola ad* Pela
viduam ducæ. 5. *De libero arbitrio.* Thefe and many other fragments are fcattered among the works of St Jerome. They are alfo collected by Garnerius, and publifhed in Append. op. Mercatoris, p. 373. *Cave.*

PELAGOSA, an ifland in the Adriatic, which, together with feveral rocks that appear above water near it, are the remains of an ancient volcano. "I will not affure you (fays Fortis) that it was thrown *Trav.*
up out of the fea like feveral other iflands in the *to Da*
Archipelago, though there is fome ground to fufpect this to have been the cafe; becaufe we find no precife mention of it in the moft ancient geographers. It fhould feem that it ought not to be confufed with the Domedee, from which it is 30 miles diftant; yet it is not impoffible that they have reckoned it among them. The lava which forms the fubftance of this ifland, is perfectly like the ordinary lava of Vefuvius, as far as I could difcover in paffing near it. If a naturalift fhould land there, and vifit on purpofe the higheft parts of the ifland, perhaps we might then know whether it has been thrown up by a fubmarine volcano, as the ifland near Santerini was in our age; or if we ought to believe it the top of fome ancient volcanic mountain, of which the roots and fides have been covered by the waters, which divided Africa from Spain, forming the ftraits of Gibraltar; an invafion that no one can doubt of who has examined the bottoms and fhores of our fea. The Liffan fifhermen fay, that Pelagofa is fubject to frequent and violent earthquakes; and the afpect of the ifland proves, at

---

before they difcovered the heretical pravity of his opinions; for Pelagius, being a cautious and artful man, for fome time vented his peculiar notions as the fentiments of others, without difcovering that they were his own. At length, however, he threw off the mafk, and openly publifhed and defended his doctrines at Rome about the beginning of the fifth century. This involved him in many troubles, and drew upon him the indignation of his former friends St Jerome and St Auguftin, who wrote againft him with great acrimony. He is acknowledged, even by his adverfaries, to have been a man of good fenfe and great learning, and an acute difputant, though they load him with the moft bitter reproaches for his abufe of thefe talents. His perfonal blemifhes are painted in very ftrong colours; and he is reprefented by thefe good fathers, in the heat of their zeal, as a very ugly fellow, 'broad-fhouldered, thick-necked, fat headed, lame of a leg, and blind of an eye.' Even the moft northern parts of this ifland (Britain) produced fome men of learning in this period. Celeftius, the difciple and friend of Pelagius, was a Scotfman, who made a prodigious noife in the world by his writings and difputations about the beginning of the fifth century. He defended and propagated the peculiar opinions of his mafter Pelagius with fo much learning, zeal, and fuccefs, that thofe who embraced thefe opinions were frequently called Celeftians. Before he became acquainted with thefe doctrines he wrote feveral books, which were univerfally admired for their orthodoxy, learning, and virtuous tendency. After he had fpent his youth in his own country in a ftudious privacy, he travelled for his further improvement to Rome, where he became acquainted with Rufinus and Pelagius, and was by them infected with their hereſies. From that time he became the moft indefatigable and undaunted champion of thefe hereſies, and thereby brought upon himſelf the indignation of the orthodox fathers of thefe days, who gave him many very bad names in their writings. St Jerome, whofe commentaries on the Ephefians he had prefumed to criticife, calls him 'an ignorant, ſtupid fool, having his belly ſwelled and diſtended with Scots pottage; a great, corpulent, barking dog, who was fitter to kick with heels than to bite with his teeth; a Cerberus, who, with his maſter Pluto (Pelagius), deſerved to be knocked on the head, that they might be put to eternal ſilence.' Such were the flowers of rhetoric which theſe good fathers employed againſt the enemies of the orthodox faith! But candour obliges us to obſerve, that this was perhaps more the vice of the age in which they lived than of the men. Both Pelagius and Celeſtius were very great travellers; having viſited many different countries of Aſia and Africa, as well as Europe, with a view to elude the perſecutions of their enemies, and to propagate their opinions. It is no inconſiderable evidence of their ſuperior learning and abilities, that their opinions gained great ground in all the provinces both of the eaſtern and weſtern empire, in ſpite of the writings of many learned fathers, and the decrees of many councils againſt them. 'The Pelagian and Celeſtian hereſy (ſays Photius) not only flouriſhed in great vigour in the Weſt, but was alſo propagated into the Eaſt.'

at firſt ſight, that it has ſuffered many revolutions; for it is rugged, ruinous, and ſubverted."

PELAIAH, a Levite (Nehem. viii. 7. x. 10.) He was one of the principal Levites that returned from captivity, and was one of thoſe that ſigned the covenant that Nehemiah renewed with the Lord.

PELALIAH, ſon of Amazi and father of Jeroham, of the family of Paſhur ſon of Malchiah, of all whom mention has been made: he was of the race of the prieſts (Nehem. xi. 12.)

PELASGI. See PELASGIOTIS.

PELASGIA (Pliny); the ancient name of *Leſbos*; ſo called from the Pelaſgi, its firſt inhabitants (Diodorus Siculus.) Alſo the ancient name of *Peloponneſus*, from Pelaſgius, a native of the country (Nicolaus Damaſcenus, Ephorus).

PELASGICUM (Pauſanias, Pliny); the north wall of Athens; ſo called from the builders, the Pelaſgi. There was an execration pronounced on any that ſhould build houſes under this wall; becauſe the Pelaſgi, while dwelling there, entered into a conſpiracy againſt the Athenians (Thucydides).

PELASGIOTIS, a third part of Theſſaly, (Strabo); ſo called from a very ancient people, the Pelaſgi, called *Pelaſgiotæ* (Ptolemy); who formerly, together with the Æolians, occupied Theſſaly, and thence that part was called *Pelaſgicum Argos*; beſides many other parts of Greece. Their name *Pelaſgi*, or *Pelargi*, denoting ſtorks, was given them from their wandering roving life (Strabo). The poets extend the appellation to Greeks in general. *Pelaſgus*, the epithet. Some of the inhabitants of Crete were called *Pelaſgi* (Homer); who thus alſo calls the neighbouring people to the Cilicians in Troas. The Pelaſgi were originally of Arcadia, (Heſiod); but Æſchylus makes Argos, near Mycenæ, their country. The Pelaſgiotis was ſituated between Pieria and Macedonia to the north and weſt, Theſſaliotis to the ſouth, and Magneſia to the eaſt, (Strabo, Pliny.)

PELATÆ, were free-born citizens, among the Athenians, who by poverty were reduced to the neceſſity of ſerving for wages. During their ſervitude they had no vote in the management of public affairs, as having no eſtate to qualify them; but this reſtriction was removed whenever they had releaſed themſelves from their ſervile ſituation, which they were allowed to do when able to ſupport themſelves. While they continued ſervants, they had alſo a right to change their maſters. We find them ſometimes diſtinguiſhed by the name of *Thetæ*.

PELATIAH, ſon of Hananiah, and father of Iſhi, of the tribe of Simeon. He ſubdued the Amalekites upon the mountain of Seir (1 Chron. iv. 42.) The time of this action is unknown.

PELATIAH, ſon of Benaiah, a prince of the people, who lived in the time of Zedekiah king of Judah, and oppoſed the wholeſome advice given by Jeremiah, to ſubmit to king Nebuchadnezzar. Ezekiel (xi. 1, 2, 3, 4.) being a captive in Meſopotamia, had a viſion, in which he ſaw five and twenty men at the door of the temple of Jeruſalem, among which were Jaazaniah the ſon of Azur, and Pelatiah the ſon of Benaiah, who were the moſt remarkable. Then the Lord ſaid to him, "Son of man, theſe are the men that have thoughts of iniquity, and who are forming pernicious deſigns againſt this city, ſaying; Have not the houſes been built a long time? Jeruſalem is the pot, and we are the fleſh. Thus ſaith the Lord: You have made great havock in this city, and have filled its ſtreets with dead bodies. Theſe men are the fleſh, and the city is the pot. But as for you, I will make you come forth from the middle of this city, and I will make you periſh by the hand of your enemies." As he was prophecying in this manner, Pelatiah the ſon of Benaiah died.

PELE (Stephanus). There were two towns of this name in Theſſaly; the one ſubject to Eurypylus, the other to Achilles; both extinct. *Peleus* the gentilitious name *(id.)*

PELEG, ſon of Eber, was born in the year of the world 1757. The ſcripture ſays his father gave him the name of Peleg, ſignifying diviſion, becauſe in his time the earth began to be divided (Gen. xi. 16. x. 25.); whether it was that Noah had begun to diſtribute the earth among his deſcendants, ſome years before the building of Babel; or that Peleg came into the world the ſame year that Babel was begun, and at the diviſion of languages; or that Eber by a ſpirit of prophecy gave his ſon the name of *Peleg* ſome years before the tower of Babel was begun, is not abſolutely certain. That which here perplexes the interpreters is, firſt, that Peleg came into the world not above 100 years after the deluge. But it ſhould ſeem, that the number of men was not then ſufficient for ſuch an undertaking as that of Babel. Secondly, Joktan the brother of Peleg had already thirteen ſons at the time of this diſperſion, which happened after the confuſion of Babel (Gen. x. 26, 27, 28, &c.) Peleg being born in the thirty-fourth year of Eber (Gen. xi. 16.), it is impoſſible his brother Joktan ſhould have ſuch a number of children at the birth of Peleg. It ſeems therefore that he was not born at the time of the diſperſion. To this may be anſwered, that Moſes has there enumerated the names of the thirteen ſons of Joktan (in Gen. x. 26.) by way of anticipation, though they were not born till a good while after the confuſion at Babel: but as they poſſeſſed a very large country, it was convenient to take notice of them, and to name them among the other deſcendants of Noah, who divided the provinces of the eaſt among themſelves. However this may have been, at the age of thirty years Peleg begat Reu; and he died at the age of 239.

PELETHITES. The Pelethites and Cherethites were famous under the reign of King David. They were the moſt valiant men in the army of that prince, and had the guard of his perſon. See Ezekiel xxv. 16. Zephaniah ii. 5. 1 Samuel xxx. 14. 2 Samuel xv. 18. xx. 7. *Patrick's Comm. Pool's Annot.* and *Delany's Hiſt. of the Life of David.*

PELETHRONII, a name or epithet given to the Lapithæ, either becauſe they inhabited the town of Pelethronium at the foot of mount Pelion in Theſſaly, or becauſe one of their number bore the name of *Pelethronius*. It is to them, we are told, that mankind are indebted for the invention of the bit with which they tamed their horſes with ſo much dexterity.

PELETHRONIUM (Nicander and Scholiaſt); a town of Theſſaly, ſituated in a flowery part of mount Pelion; and hence the appellation *thronus*, ſignifying "flowers."

Peleus. "flowers." Lucan says the Centaurs were natives of that place; to whom Virgil assigns mount Othrys. Most authors, however, ascribe the breaking of horses to the Centaurs. Some make the Lapithæ and Centaurs the same; others a different people; allowed however to be both of Thessaly. Their story is greatly involved in fable. See LAPITHUS.

PELEUS, in fabulous history, a king of Thessaly, son of Æacus and Endeis, the daughter of Chiron. He married Thetis one of the Nereids, and was the only mortal man who ever married an immortal. He was concerned in the murder of his brother Phocus, and was therefore obliged to leave his father's dominions. He fled to the court of Eurytus the son of Actor, who reigned at Phthia, or according to the opinion of Ovid, the truth of which is questioned, to Ceyx king of Trachinia. He was purified of his murder by Eurytus, with the usual ceremonies, and the king gave him his daughter Antigone in marriage. After this, as Peleus and Eurytus went to the chace of the Calydonian boar, the father-in-law was accidentally killed by an arrow which his son-in-law had aimed at the beast. This unfortunate accident obliged him to banish himself from the court of Phthia, and he went to Iolchos, where he was also purified of the murder of Eurytus by Acastus the king of the country. His residence at Iolchos was short: Astydamia the wife of Acastus fell in love with him; but when she found him insensible to her passionate declarations, she accused him of attempts upon her virtue. The king her husband partly believed the accusations of his wife; but not willing to violate the laws of hospitality, by putting him instantly to death, he ordered his officers to conduct him to mount Pelion, on pretence of hunting, and there to tie him to a tree and to leave him a prey to the wild beasts of the place. The orders of Acastus were faithfully obeyed; but Jupiter knowing the innocence of his grandson Peleus, ordered Vulcan to set him at liberty. As soon as he had been delivered from danger, Peleus assembled his friends in order to punish the ill treatment which he had received from Acastus. He took Iolchos by force, drove the king from his possessions, and put to death the wicked Astydamia. On the death of Antigone, Peleus made love to Thetis, of whose superior charms Jupiter himself had been enamoured. His pretensions were rejected; for as he was but a mortal, the goddess fled from him with the utmost abhorrence, and the more effectually to evade his inquiries, she generally assumed the shape of a bird, or a tree, or of a tygress. Peleus's passion was fanned by refusal; he offered a sacrifice to the gods; and Proteus informed him, that to obtain Thetis he must surprise her while she was asleep in her grotto, near the shores of Thessaly. This advice was immediately attended to; and Thetis, unable to escape from the grasp of Peleus, at last consented to marry him. Their nuptials were celebrated with the greatest solemnity, all the gods attending and making them each the most valuable presents. The goddess of Discord was the only one of the deities who was absent; and she punished this seeming neglect by throwing an apple into the midst of the assembly of the gods, with the inscription of *Detur pulchriori*. The celebrated Achilles was the fruit of this marriage, whose education was early entrusted to the Centaur Chiron, and afterwards to Phœnix, the son of Amyntor. Achilles, it is well known, went to the Trojan war, at the head of his father's troops; and Peleus gloried in having a son who was superior to all the Greeks in valour and intrepidity. His death, however, was the source of great grief to Peleus; but Thetis, to comfort her husband, promised him immortality, and ordered him to retire into the grottoes of the island of Leuce, where he should see and converse with the manes of his son. Peleus had a daughter called *Polydora*, by Antigone. Peleus Island

PELEW ISLANDS, a cluster of small islands situated between the latitudes of 5° and 7° north, and the longitudes 134° and 136° east. Various conjectures have been formed respecting the time of their first discovery by Europeans. Mr Keate, the editor of the only voyage in which we have any account of their climate, soil, and produce, together with the manners of their inhabitants, thinks they were first noticed by the Spaniards from the Philippines, and by them named *Palos* from the number of trees growing in them resembling the masts of ships. This conjecture has been vehemently opposed by a critic, who affirms that the whole of Mr Keate's introduction is erroneous, and that the islands in question were first discovered by a French Jesuit named *Pere Papin*. The Jesuit, he imagines, was directed to them by one of the inhabitants, who had found his way to the Moluccas, where he was baptized. They are said to have been again noticed by *P. Centova* in 1724, who saw at Agdine, the capital of the Marian islands, some of the inhabitants; and from their account gives a description not very favourable of these harmless islanders. Centova's description is to be found in the 15th volume, and the relation of the discovery by P. Pepin in the 11th volume, of *Lettres Edifiantes et Curieux*, published at Paris 1781.

The latest and most authentic account of them, however, is given from the Journals of Captain Wilson of the Antelope, a packet belonging to the East India company, which was wrecked upon one of them in August 1783. This ship was fitted out in England by the court of directors in the summer 1782, as was then generally understood, for a secret expedition. Whatever may have been her destination, as she was proceeding from Macao in squally weather, the man who, on the night of the 10th of August, had the look out, suddenly called out *Breakers!* But the sound of the word had scarce reached the ears of the officer on deck, before the ship struck and stuck fast; and in less than an hour bulged and filled with water. Having secured the gunpowder, small arms, bread, and such other provisions as were liable to be spoiled by water, Captain Wilson, after many difficulties, effected a landing. The crew of the Antelope consisted of 33 Europeans beside the captain, and 16 Chinese; and the only possible means by which they could be delivered from an island, which at first appeared to them uninhabited, was by building a ship capable of transporting them to the nearest European settlement in that quarter of the globe. Whilst they were meditating upon this undertaking, the natives appeared on the second day after their arrival; and their intercourse with them was facilitated by means which appear

pear as ſingular as they were providential. Captain Wilſon had a ſervant recommended to him at Macao, who ſpoke both the Malay and Engliſh languages perfectly well; and they had not been long at Pelew before they had the good fortune to meet with a Malay, who had been thrown by a tempeſt upon this very ſpot about a year before, and had made himſelf acquainted with the language of the country; ſo that by this extraordinary event each party had an interpreter who could readily explain their wants and deſires, and by that means prevent a number of miſconceptions which might have ariſen from making uſe of ſigns and geſtures only. Pelew Iſlands.

The natives are all of a deep copper colour, going perfectly naked. They are of a middling ſtature, very ſtraight, muſcular, and well formed; but their legs, from a little above their ancles to the middle of their thighs, are tatooed ſo very thick, as to appear dyed of a far deeper colour than the reſt of their ſkin. Their hair is of a fine black, long, and rolled up behind, in a ſimple manner, cloſe to the back of their heads, which appeared both neat and becoming; but few of them had beards, it being the general cuſtom to pluck them out by the roots.

They began by ſtroking the bodies and arms of the Engliſh, or rather their waiſtcoats and coat ſleeves, as if they doubted whether the garment and the man were not of the ſame ſubſtance; and as the Malay explained the circumſtances to them, our people were greatly ſurpriſed at the quickneſs with which they ſeemed to comprehend every information he gave them. The next thing they noticed was our people's white hands, and the blue veins of their wriſts; the former of which they ſeemed to conſider as artificial, and the other as the Engliſh manner of tatooing. After being ſatisfied in this particular, they expreſſed a further wiſh to ſee their bodies; and, among other things, were greatly ſurpriſed at finding hair on their breaſts, it being conſidered by them as a great mark of indelicacy, as it is their cuſtom to eradicate it from every part of the body in both ſexes.

They afterwards walked about, teſtifying great curioſity at every thing they ſaw, but at the ſame time expreſſing a fear that they might be thought too intruding. As our people were conducting them to the tents, one of the natives picked up a bullet, which had been caſually dropped on the ground, and immediately expreſſed his ſurprize, that a ſubſtance ſo ſmall to the eye ſhould be ſo very ponderous to the touch; and on their entering the tent, a large Newfoundland dog, and a ſpaniel which had been tied up there to prevent their being loſt, ſet up a moſt violent barking, and the natives a noiſe but little leſs loud, which at firſt it was not eaſy to account for. They ran in and out of the tent, and ſeemed to wiſh that they might be made to bark again. This the Malay ſoon explained to be the effect of their joy and ſurpriſe, as theſe were the firſt large animals they had ever ſeen, there being no quadrupeds of any ſpecies on theſe iſlands, except a very few grey rats in the woods.

After ſome time it was agreed on by Captain Wilſon and his people, that ſome of the crew ſhould be ſent to the king of the place, in order to ſolicit his friendſhip, and intreat his permiſſion to build a veſſel that might carry them back to their own country. This buſineſs was allotted to the captain's brother; and during his abſence, Raa Kook, the king's brother, and ſeveral of the natives, remained with our people. This amiable chief ſeemed to place an entire confidence in thoſe he was among; he endeavoured to accommodate himſelf to their manners; would ſit at table as they did, inſtead of ſquatting on his hams; and inquired particularly into the principles and cauſes of every thing he obſerved about him, lending his perſonal aſſiſtance in all that was going forward, and even deſiring the cook to let him aid him in blowing the fire. Pelew Iſlands.

In order to conciliate their affections, Captain Wilſon had preſented Arra Kooker, another of the king's brothers, with a pair of trowſers; but having conceived a greater paſſion for a white ſhirt, one was immediately given to him; which he had no ſooner put on, than he began to dance and jump about with ſo much joy, that every body was diverted by his ſingular geſtures, and the contraſt which the linen formed with his ſkin. This prince was about 40, of a ſhort ſtature, but ſo plump and fat that he was nearly as broad as he was long. He poſſeſſed an abundant ſhare of good humour, and a wonderful turn for mimickry; and had beſides a countenance ſo lively and expreſſive, that though our people at this time were ſtrangers to almoſt all he ſaid, yet his face and geſtures made them accurately comprehend whatever he was deſcribing.

After three or four days, Abba Thulle the king arrived with a great retinue. He was received with every mark of reſpect by the ſhip's company, who were exerciſed before him, and fired three volleys in different poſitions. The ſurprize of the natives, their hooting, hallooing, jumping, and chattering, produced a noiſe almoſt equal to the diſcharge of the muſkets; and when one of the men ſhot a bird, which was done to diſplay the effect of their arms, the ſurprize it occaſioned was wonderful. Some of the natives ran for it, and carried it to the king, who examined it with great attention, but was unable to comprehend how it could be wounded, not having ſeen any thing paſs out of the gun.

Raa Kook expreſſed great impatience to ſhow the king whatever had impreſſed his own mind; and taking his brother by the hand, led him to a grindſtone which was fixed behind one of the tents. He immediately put it in motion, as he had frequently done before; at the rapidity of which the king was greatly aſtoniſhed, particularly when he was informed that it would ſharpen iron. Captain Wilſon ordered a hatchet to be brought and ground, that they might more readily perceive its operation, when Raa Kook eagerly ſeized the handle, and began turning it, appearing highly delighted to let his brother ſee how well he underſtood it. The whole appeared like ſomething ſupernatural; but the circumſtance which moſt bewildered their ideas was, how the ſparks of fire could come, and how a ſtone ſo well wetted could become ſo ſoon dry.

The king then viſited the different tents, and inquired about every thing he ſaw: all was novelty, and of courſe intereſted his attention. When he got to the tent where the Chineſe men were, who had been brought with them from Macao, Raa Kook, whoſe re-

tentive

Pelew Islands. tentive mind never loſt a ſingle trace of any thing he had been informed of, acquainted the king that theſe were a people quite different from the Engliſh, and that he had learnt there were many other nations beſides theſe interſperſed through the world, ſome of which fought with guns and other with boarding-pikes, an inſtrument which he held very cheap in compariſon with the former.

When the king heard his brother diſcourſing about a variety of nations, who all ſpoke differently, and had before him the example of the Chineſe, whoſe language was not the ſame with the Engliſh, he appeared inſtantly thoughtful and ſerious, as if ſtruck by conceptions which had never before croſſed his mind. He remained a while penſive and bewildered; and this circumſtance impreſſed on every one at the time an idea that there was every reaſon to imagine that there had never been a communication between thoſe people and any other nation: and indeed it is evident, that if Pere Papia did really viſit them in 1710, they had before 1783 loſt the remembrance of every trace of European manners. This indeed is not ſurpriſing, as they had no other record than knots ſimilar to the quipes of Peru at the landing of the Spaniards.

Raa Kook would now ſhow his brother the kitchen, which was in the hollow of a rock, a little above the cove. It was at the time when the cook was preparing dinner; and though the implements were exceedingly ſcanty, an iron pot, a tea kettle, a tin ſauce-pan, with a poker, a pair of tongs, and a frying-pan, were here of ſufficient conſequence to excite admiration; nor were the bellows now forgotten by Raa Kook, who taking them up, as he explained their uſe to the king, ſeemed ambitious to let his brother ſee what an adept he was at blowing. The little bald cook, who was always cloſe ſhaven, and never wore any thing on his head, was likewiſe pointed out to the king as an object of merriment and curioſity.

Sometime after this the king requeſted five of Captain Wilſon's men to attend him in a war he was going to make againſt the inhabitants of a neighbouring iſland called *Oroolong*, who, as he ſaid, had done him an injury. But before this requeſt was made known, he had long ſtruggled with a delicacy of ſentiment which no one would have expected to find in regions ſo diſjoined from the reſt of mankind. This was no other than that it might prove a temporary inconvenience to the unfortunate ſtrangers who had ſought his protection, and might be conſidered by them as an ungenerous proceeding. It was, however, no ſooner made known, than Captain Wilſon inſtantly complied; and every face, which had before been clouded with doubt and apprehenſion, became immediately brightened and gay.

In this enterpriſe little more was done than braving their enemies, ſtripping ſome cocoa-nut trees of their fruit, and carrying off a number of yams and other proviſions; but in another, which was undertaken againſt the iſland of Artingall, they were more ſucceſsful, and ſhowed ſigns of the ſame ſanguinary diſpoſition which ſome demon has infuſed into the whole human race. Nine priſoners of war who had been taken upon this occaſion were cruelly put to death; and notwithſtanding the Engliſh ſtrongly remonſtrated againſt this proceeding, all the arguments they could uſe were of no avail. In juſtification of their conduct, they alleged the neceſſity of doing it for their own ſecurity, declaring that they had formerly only detained them as menial ſervants, but that they always found means to get back to their own country, and return with ſuch a force as frequently made great depredations. Pelew Islands.

Having given this general account of the character and conduct of theſe hitherto unknown people, we now proceed to lay before our readers what we have learned of their government, cuſtoms, manners, and arts, together with a deſcription of the face of their country. In this the editor of Captain Wilſon's voyage muſt be our guide; and if our narrative do not ſatisfy the man of ſcience, it is to be obſerved, that the Antelope was not a ſhip ſent out purpoſely to explore undiſcovered regions, nor were there people on board properly qualified to eſtimate the manners of a new race of men; they had amongſt them no philoſophers, botaniſts, or draughtſmen, experienced in ſuch ſcientific purſuits as might enable them to examine with judgment every object which preſented itſelf. Diſtreſs threw them upon theſe iſlands; and while they were there, all their thoughts were occupied on the means of liberating themſelves from a ſituation of all others the moſt afflicting to the mind, that of being cut off for ever from the ſociety of the reſt of the world.

It, however, clearly appears, from their uniform teſtimony, that at Pelew the king was conſidered as the firſt perſon in the government.

"He was looked up to as the father of his people; and though diveſted of all external decorations of royalty, had every mark of diſtinction paid to his perſon. His *rupacks* or chiefs approached him with the greateſt reſpect; and his common ſubjects, whenever they paſſed near him, or had occaſion to addreſs him, put their hands behind them, and crouched towards the ground. Upon all occurrences of moment, he convened the rupacks and officers of ſtate; their councils were always held in the open air, where the king firſt ſtated the buſineſs upon which he had aſſembled them, and ſubmitted it to their conſideration. Each rupack delivered his opinion, but without riſing from his ſeat; and when the matter before them was ſettled, the king ſtanding up put an end to the council.

"When any meſſage was brought him, whether in council or elſewhere, if it came by one of the common people, it was delivered at ſome diſtance in a low voice to one of the inferior rupacks, who, bending in an humble manner at the king's ſide, delivered it in the ſame manner with his face turned aſide. His commands appeared to be abſolute, though he acted in no important buſineſs without the advice of his chiefs; and every day in the afternoon, whether he was at Pelew or with the Engliſh, he went to ſit in public for the purpoſe of hearing any requeſts, or of adjuſting any difference or diſpute which might have ariſen among his ſubjects."

But theſe, according to our editor, ſeldom happened; for as their real wants were but few, and they ſaw nothing to create artificial ones, every one was chiefly occupied with his own humble purſuits; and as far as the ſhip's crew, who remained among them about three months, could decide, they appeared to conduct themſelves towards each other with the greateſt civility and benevolence; never wranglingor entering into quarrel-

elew ands.

Pelew Islands.

ſome contentions, as is cuſtomary among thoſe who call themſelves a poliſhed and enlightened people. Even when children ſhowed a diſpoſition of this kind, they ſtrongly marked their diſpleaſure, by ſtifling with rebuke their little animoſities.

The character of the king is thus drawn by the editor: "The excellent man who reigned over theſe ſons of nature, ſhowed himſelf in every part of his conduct firm, noble, generous, and benevolent; there was a dignity in all his deportment, a gentleneſs in all his manners, and a warmth and ſenſibility about his heart, that won the love of all who approached him. Nature had beſtowed on him a contemplative mind, which he had improved by thoſe reflections that good ſenſe dictated and obſervation confirmed. The happineſs of his people ſeemed to be always in his thoughts. In order more effectually to ſtimulate them to uſeful labour, he had himſelf learnt all the few arts they poſſeſſed, and was looked on in ſome of them to be the beſt workman in his dominions. Placed as he was by Providence in its obſcurer ſcenes, he lived beloved by his chiefs, and revered by his people; over whom, whilſt he preſerved a dignity which diſtinguiſhed his ſuperior ſtation, he reigned more as the father than the ſovereign. The eyes of his ſubjects beheld their naked prince with as much awe and reſpect as thoſe are viewed with who govern poliſhed nations, and are decorated with all the dazzling parade and ornaments of royalty; nor was the purple robe or the ſplendid diadem neceſſary to point out a character which the maſterly hand of nature had rendered ſo perfect."

Next in power to the king was his brother Raa Kook, who was official general of all his forces. It was his duty to ſummon the rupacks to attend the king for whatever purpoſe they were wanted. He was alſo his preſumptive heir; the ſucceſſion of Pelew not going to the king's children till it had paſſed through his brothers; ſo that after the demiſe of Abba Thulle, the ſovereignty would have deſcended to Raa Kook; on his demiſe to Arra Kooker; and on the death of this laſt it would have reverted to Qui Bill, the king's eldeſt ſon, when Lee Boo, his ſecond ſon, of whom we have much to ſay, would have become the hereditary general.

The office of firſt miniſter is deſcribed as follows: "The king was always attended by a particular chief or rupack, who did not appear to poſſeſs any hereditary office, but only a delegated authority. He was always near the king's perſon, and the chief who was always firſt conſulted; but whether his office was religious or civil, or both, our people could not learn with any certainty. He was not conſidered as a warrior, or ever bore arms, and had only one wife, whereas the other rupacks had two. The Engliſh were never invited to his houſe, or introduced into it, although they were conducted to thoſe of almoſt every other chief."

Of the rupacks it is obſerved, "That they could only be regarded as chiefs or nobles; they were not all of the ſame degree, as was plain by a difference in the *bone* (A) they wore: they generally attended the king, and were always ready at his command to accompany him on any expedition with a number of canoes properly manned, and armed with darts and ſpears, who were to remain with him till they had his permiſſion to return home with their dependents. In this part of their government we may trace an outline of the feudal ſyſtem; but from the few opportunities our people had of inveſtigating points of internal government, it appeared that the titles of *rupacks* were perſonal badges of rank and diſtinction; nor did they apprehend they were hereditary honours, unleſs in the reigning family, who muſt of neceſſity be of this claſs."

As to property, it was underſtood, "That the people poſſeſſed only ſuch as aroſe from their work and labour, but no abſolute one in the ſoil, of which the king appeared to be general proprietor. A man's houſe, furniture, or canoe, was conſidered as his private property, as was alſo the land allotted him, as long as he occupied and cultivated it, but whenever he removed with his family to another place, the ground he held reverted to the king, who gave it to whom he pleaſed, or to thoſe who ſolicited to cultivate it."

All that part of the iſland which they had an opportunity of ſeeing is ſaid to have been well cultivated. It was covered with trees of various kinds and ſizes, many of which muſt have been very large, as they made canoes of their trunks, ſome of which were capable of carrying 28 or 30 men. Among the timber trees was noticed the ebony, and a tree which when pierced or wounded yielded a thick white liquor of the conſiſtence of cream. "They had alſo a ſpecies of the manchineel tree, in cutting down of which our people frequently got bliſtered and ſwelled; the inhabitants pointed out the cauſe, ſaying it was owing to their being ſprinkled by the ſap. This they reckoned among the unlucky trees, and adviſed our people againſt the uſe of it."

But the moſt ſingular tree noticed at Pelew, was one in its ſize and manner of branching not unlike our cherry-tree, but in its leaves reſembling the myrtle. Its peculiarity was, that it had no bark, but only an outward coat of about the thickneſs of a card, which was darker than the inſide, though equally cloſe in texture. Its colour was nearly that of mahogany, and the wood was ſo extremely hard, that few of the tools which the Engliſh had could work it. They alſo found cabbage-trees, the wild bread-fruit, and another tree whoſe fruit ſomething reſembled an almond. But yams and cocoa nuts, being their principal articles of ſuſtenance, claimed their chief attention.

The iſland Coorooraa, of which Pelew is the capital, likewiſe produced plantains, bananas, Seville oranges and lemons, but neither of them in any conſiderable quantity. None of the iſlands which the Engliſh viſited had any kind of grain. As to birds, they had plenty of common cocks and hens, which, though not domeſticated, kept running about near their houſes and plantations; and what appears extremely ſingular is, that the natives had never made any uſe of them, till

(A) This was a mark of rank worn upon the wriſt, with which Captain Wilſon was inveſted by the king; but what animal it came from our people could not learn.

Pelew Islands.

till our people told them they were excellent eating. Pigeons they accounted a great dainty; but none but thofe of a certain dignity were permitted to eat of them. The Engliſh left them two geeſe, which were the only remains of their live ſtock.

From the deſcription of the country it appears to be very mountainous; but ſome of the valleys are repreſented as extenſive and beautiful, affording many delightful proſpects. The ſoil being very rich, produces a great abundance of graſs, which, as there are no cattle to eat it, grows very high, and was ſcorched and burnt up by the ſun. Our people ſaw no river at Pelew; their ſupplies of freſh water being obtained from ſmall ſtreams and ponds, of which there are a great many.

From this account of the ſcanty produce of theſe iſlands, it is evident that no luxury reigned among their inhabitants, whoſe principal article of food appears to be fiſh; they had no ſalt, nor did they make uſe of ſauce or any ſeaſoning in any thing they eat. Their drink was alſo as ſimple as their diet; it principally conſiſted of the milk of the cocoa nut; but upon particular occaſions they uſed a kind of ſweet drink and ſherbet, which latter had the addition of ſome juice of orange.

The iſlands appeared to be populous, though to what extent could not be aſcertained. Their houſes were raiſed about three feet from the ground, upon ſtones which appeared as if hewn from the quarry. The interior part of them was without any diviſion, the whole forming one great room, which roſe in a ridge like our barns, the outſide being thatched thick and cloſe with bamboos or palm leaves. All their implements, utenſils, weapons of war, and canoes, are much of the ſame kind with thoſe which were found in the South Sea iſlands.

In their marriages they allow a plurality of wives, though in general not more than two. When a woman is pregnant, the utmoſt attention is paid to her; but upon other occaſions no more reſpect is ſhown to one ſex than the other. "One of our people endeavouring to make himſelf agreeable to a lady belonging to one of the rupacks, by what we ſhould call a marked affiduity, Arra Kooker, with the greateſt civility, gave him to underſtand that it was not right to do ſo."

They have places particularly appropriated to ſepulture; their graves being made nearly the ſame as they are in our country churchyards. The corpſe is attended only by women, who at the place of interment make a great lamentation. The men, however, aſſemble round the body before it is carried to the grave, on which occaſion they preſerve a ſolemn ſilence; "their minds, from principles of fortitude or philoſophy, being armed to meet the events of mortality with manly ſubmiſſion, diveſted of the external teſtimony of human weakneſs."

On the article of religion our editor obſerves, "That, among all the race of men whom navigation has brought to our knowledge, few appear to be without a ſenſe of ſomething like religion, however it may be mixed with idolatry or ſuperſtition. And yet our people, during their continuance with the natives of Pelew, never ſaw any particular ceremonies, or obſerved any thing that had the appearance of public worſhip. But though there was not found on any of the iſlands they viſited any place appropriated to religious rites, it would perhaps be going too far to declare that the people of Pelew had abſolutely no idea of religion. Independent of external teſtimony, there may be ſuch a thing as the religion of the heart, by which the mind may in awful ſilence be turned to contemplate the God of Nature; and though unbleſſed by thoſe lights which have pointed to the Chriſtian world an unerring path to happineſs and peace, yet they might, by the light of reaſon only, have diſcovered the efficacy of virtue, and the temporal advantages ariſing from moral rectitude.

"Superſtition is a word of great latitude, and vaguely defined: though it hath in enlightened ages been called the offspring of ignorance, yet in no time hath it exiſted without having ſome connection with religion. Now the people of Pelew had beyond all doubt ſome portion of it, as appeared by the wiſh expreſſed by the king when he ſaw the ſhip building, that the Engliſh would take out of it ſome particular wood, which he perceived they had made uſe of, and which he obſerved was deemed an ill omen, or unpropitious.

"They had alſo an idea of an evil ſpirit, that often counteracted human affairs. A very particular inſtance of this was ſeen when Mr Barker, a moſt valuable member in the Engliſh ſociety, fell backwards from the ſide of the veſſel, whilſt he was on the ſtocks: Raa Kook, who happened to be preſent, obſerved that it was owing to the unlucky wood our people had ſuffered to remain in the veſſel, that the evil ſpirit had occaſioned this miſchief to Mr Barker."

They likewiſe appeared to entertain a ſtrong idea of divination, as was evident from the ceremonies they practiſed before they undertook any enterpriſe of moment. A few occurrences, which are mentioned in the courſe of the narrative, would alſo lead us to believe that they could not be altogether unacquainted with the nature of religious worſhip; for when they were preſent at the public prayers of the Engliſh, they expreſſed no ſurpriſe at what was doing, but ſeemed deſirous to join in them, and conſtantly preſerved the moſt profound ſilence. The general even refuſed to receive a meſſage from the king which arrived during divine ſervice. And upon another occaſion, when Captain Wilſon told Lee Boo, that good men would live again above, he replied, with great earneſtneſs, "All ſame Pelew; bad men ſtay in earth; good men go into ſky; become very beautiful;" holding his hand up, and giving a fluttering motion to his fingers. Some later voyagers, however, have affirmed, that theſe people, notwithſtanding their ſuperſtition, have no notion whatever of a Deity; a circumſtance to which it is extremely difficult to give full credit.

The moſt wonderful circumſtance in the hiſtory of this people, except that laſt mentioned, are the acuteneſs of their underſtanding, their hoſpitality, and the implicit confidence which they placed in utter ſtrangers. That their manners were pleaſing, and their ſociety not diſagreeable, is evident from the conduct of Madan Blanchard, one of the ſeamen, who, when the veſſel was built and ready to take her departure with his Captain and his companions, was left behind at his own particular requeſt. That they had the fulleſt confidence in Captain Wilſon and his crew, is put beyond

yond a doubt by the behaviour of the king and Raa Kook when their gueſts were to leave them. Raa Kook ſolicited his brother's permiſſion to accompany the Engliſh, but from prudential motives was refuſed. The ſovereign, however, reſolved to entruſt his ſecond ſon Lee Boo to Captain Wilſon's care, that he might improve his mind, and learn ſuch things as at his return would benefit his country.

The inſtructions which he gave the young man, and the fortitude which he ſhowed upon this occaſion, would have done honour to the moſt enlightened mind. Upon delivering him to Captain Wilſon, he uſed theſe expreſſions: "I would with you to inform Lee Boo of all things which he ought to know, and make him an Engliſhman. The ſubject of parting with my ſon I have frequently revolved; I am well aware that the diſtant countries he muſt go through, differing much from his own, may expoſe him to dangers, as well as diſeaſes, that are unknown to us here, in conſequence of which he may die; I have prepared my thoughts to this: I know that death is to all men inevitable; and whether my ſon meets this event at Pelew or elſewhere is immaterial. I am ſatisfied, from what I have obſerved of the humanity of your character, that if he is ſick you will be kind to him; and ſhould that happen, which your utmoſt care cannot prevent, let it not hinder you, or your brother, or your ſon, or any of your countrymen, returning here; I ſhall receive you, or any of your people, in friendſhip, and rejoice to ſee you again." How noble! This is the language of a king, a father, and a philoſopher, who would have been delighted to ſee his ſon with European accompliſhments. But, alas! the ſubſequent hiſtory of this amiable youth muſt force a tear from the eye of every reader whoſe heart is not callous to the genuine feelings of nature and humanity. As ſoon as they arrived at Macao, the houſe into which he firſt entered, and the different articles of furniture, fixed him in ſilent admiration; but what ſtruck his imagination moſt was the upright walls and flat ceilings of the rooms, being utterly unable to comprehend how they could be ſo formed. When he was introduced to the ladies of the family, his deportment was ſo eaſy and polite, that it could be exceeded by nothing but his abundant good nature; and at his departure, his behaviour left on the mind of every one preſent the impreſſion, that, however great the ſurpriſe might be which the ſcenes of a new world had awakened in him, it could hardly be exceeded by that which his own amiable manners and native poliſh would excite in others.

They were now conducted to the houſe of an Engliſh gentleman, who introduced them into a large hall, which was lighted up, with a table in the middle, covered for ſupper, and a ſideboard handſomely decorated. Here a new ſcene burſt at once upon Le Boo's mind; he was all eye, all admiration. The veſſels of glaſs particularly rivetted his attention; but when he ſurveyed himſelf in a large pier glaſs at the upper end of the hall, he was in raptures with the deception. It was in truth, to him, a ſcene of magic, a fairy tale.

Soon after the people of the veſſel came on ſhore, ſome of them went to purchaſe things they were in want of; in doing which they did not forget Lee Boo, who was a favourite with them all. Among the trinkets they brought him was a ſtring of large glaſs beads, the firſt ſight of which almoſt threw him into an ecſtacy: he hugged them with a tranſport which could not have been exceeded by the intereſted poſſeſſor of a ſtring of oriental pearls. His imagination ſuggeſted to him that he held in his hand all the wealth the world could afford him. He ran with eagerneſs to Captain Wilſon to ſhow him his riches, and begged he would get him a Chineſe veſſel to carry them to the king his father, that he might ſee what the Engliſh had done for him; adding, that if the people faithfully executed their charge, he would at their return preſent them with one or two beads as a reward for their ſervices. Pelew Iſlands.

Having no quadrupeds at Pelew, the ſheep, goats, and other cattle, which he met with at Macao, were viewed with wonder; but ſoon after, ſeeing a man paſs the houſe on horſeback, he was ſo much aſtoniſhed, that he wanted every one to go and look at the ſtrange ſight. After the matter, however, was explained to him, he was eaſily perſuaded to get upon horſeback himſelf; and when he was informed what a noble, docile, and uſeful animal it was, he beſought the captain to ſend one to his uncle Raa Kook, as he was ſure it would be of great ſervice to him.

Omitting a number of other particulars of this kind, which excited his curioſity and ſhowed the excellent diſpoſition of his heart, we ſhall follow him to England, the country from which he was never to return. Here he had not been long before he was ſent to an academy to be inſtructed in reading and writing, which he was extremely eager to attain, and moſt aſſiduous in learning. His temper was mild and compaſſionate in the higheſt degree: but it was at all times governed by diſcretion and judgment. If he ſaw the young aſking relief, he would rebuke them with what little Engliſh he had, telling them it was a ſhame to beg when they were able to work; but the infirmities of old age he could never withſtand, ſaying, "Muſt give poor old man, old man no able to work."

He always addreſſed Mr Wilſon by the name of Captain, but never would call Mrs Wilſon by any other name than mother, looking on that as a mark of the greateſt reſpect; and ſuch was the gratitude of his heart for the kindneſs they ſhowed him, that if any of the family were ill, he always appeared unhappy, would creep ſoftly up to the chamber, and ſit ſilent by the bedſide for a long time together without moving, peeping gently from time to time between the curtains, to ſee if they ſlept or lay ſtill.

He was now proceeding with haſty ſtrides in gaining the Engliſh language, writing, and accounts, when he was overtaken by that fatal diſeaſe, the ſmall-pox, which the greateſt pains had been taken to guard him againſt; and notwithſtanding the utmoſt care and attention of his phyſician, he fell a victim to this ſcourge of the human race.

Upon this trying occaſion, his ſpirit was above complaining, his thoughts being all engroſſed by the kindneſs of his benefactors and friends. He told his attendant, that his father and mother would grieve very much, for they knew he was ſick. This he repeated ſeveral times, "and begged him to go to Pelew, and tell Abba Thulle that Lee Boo take much drink to make ſmall-pox go away, but he die; that the captain

Pelew Islands, Pelias

and mother very kind; all Engliſh very good men; much ſorry he could not ſpeak to the king the number of fine things the Engliſh had got." Then he reckoned up the preſents which had been given him, deſiring that they might be properly diſtributed among the Chiefs, and requeſting that particular care might be taken of two glaſs pedeſtals, which he begged might be preſented to his father.

We have given this ſhort hiſtory of Lee Boo, becauſe it exhibits in a ſtrong light the manners of the natives of the Pelew iſlands, to which we know nothing ſimilar in the hiſtory of man from the ſavage ſtate to that of civilization. They appear to have had no communication with any other people, and were yet neither treacherous, cruel, nor cowardly. They are a ſtriking inſtance of the weakneſs of all the philoſophic theories by which mankind are uſually traced from their origin through the ſeveral ſtages of ſavagiſm, barbariſm, and civilization, down to the period of refinement, ending in effeminacy.

Since the publication of Captain Wilſon's voyage we have ſome further accounts of theſe iſlands, all confirming what we were firſt told of the gentleneſs of the people. Two armed ſhips were, by order of the court of directors, fitted out at Bombay in 1790, for the purpoſe of ſurveying the iſlands of Pelew, and furniſhing the natives with domeſtic animals, and ſuch other things as might add to the comforts of life. Among the preſents to the king were ſwords and other European implements of war; of which it is at leaſt poſſible that he and his people might have been equally happy had they remained for ever in total ignorance. The foundation of a fort was likewiſe laid on one of the iſlands, and poſſeſſion of it taken in the name of the Engliſh; we muſt with no remote view of enſlaving the people, or of driving them from their native country. It has been likewiſe announced in a late publication, that Captain M'Clue, who commanded the armed ſhips, was ſo delighted with the manners of the king and his ſubjects, that he has reſolved to paſs the remainder of his days on thoſe iſlands at the early age of 34; and we hope he will prove a father to the people.

PELIAS (fab. hiſt.), twin-brother of Neleus, was ſon of Neptune by Tyro, daughter of Salmoneus. His birth was concealed by his mother, who wiſhed her father to be ignorant of her incontinence. He was expoſed in the woods, but his life was preſerved by ſhepherds; and he received the name of *Pelias*, from a ſpot of the colour of *lead* in his face. Some time after Tyro married Cretheus, ſon of Æolus, king of Iolchos, and became mother of three children, of whom Æſon was the eldeſt. Pelias viſited his mother, and was received in her family; and after the death of Cretheus, he unjuſtly ſeized the kingdom, which belonged not to him, but to the children of Tyro by the deceaſed king. To ſtrengthen himſelf in his uſurpation, Pelias conſulted the oracle; and when he was told to beware of one of the deſcendants of Æolus, who ſhould come to his court with one foot ſhod and the other bare, he privately removed the ſon of Æſon, after he had openly declared that he was dead. Theſe precautions proved vain. Jaſon, the ſon of Æſon, who had been educated by Chiron, returned to Iolchos, when come to years of maturity; and having loſt one of his ſhoes in croſſing the river Anaurus or the Evenus, Pelias immediately perceived that this was the perſon whom he had ſo much dreaded. His unpopularity prevented him from acting with violence to a ſtranger, whoſe uncommon dreſs and commanding aſpect had raiſed admiration in the people. But his aſtoniſhment was greatly excited, when he ſaw Jaſon arrive at his palace, with his friends and his relations, and boldly demand the kingdom which he had uſurped. Pelias, conſcious that his complaints were well founded, endeavoured to divert his attention, and told him that he would voluntarily reſign the crown to him, if he went to Colchis to avenge the death of Paryxus, the ſon of Athamas, whom Æetes had cruelly murdered. He further declared, that the expedition would be attended with the greateſt glory, and that nothing but the infirmities of old age had prevented himſelf from vindicating the honour of his country, and the injuries of his family, by puniſhing the aſſaſſin. This ſo warmly recommended, was with equal warmth accepted by the young hero, and his intended expedition was made known all over Greece. While Jaſon was abſent in the Argonautic expedition, Pelias murdered Æſon and all his family; but, according to the more received opinion of Ovid, Æſon was ſtill living when the Argonauts returned, and he was reſtored to the flower of youth by the magic of Medea. This change in the vigour and the conſtitution of Æſon aſtoniſhed all the inhabitants of Iolchos; and the daughters of Pelias, who have received the patronymic of Peliades, expreſſed their deſire to ſee their father's infirmities vaniſh by the ſame powerful magic. Medea, who wiſhed to avenge the injuries which her huſband Jaſon had received from Pelias, raiſed the deſires of the Peliades, by cutting an old ram to pieces, and boiling the fleſh in a cauldron, and then turning it into a fine young lamb. After they had ſeen this ſucceſsful experiment, the Peliades cut their father's body to pieces, after they had drawn all the blood from his veins, on the aſſurance that Medea would replenith them by her wonderful power. The limbs were immediately put into a cauldron of boiling water; but Medea ſuffered the fleſh to be totally conſumed, and refuſed to give the promiſed aſſiſtance, and the bones of Pelias did not even receive a burial. The Peliades were four in number, Alceſte, Piſidice, Pelopea, and Hippothoe, to whom Hyginus adds Meduſa. Their mother's name was Anaxibia, the daughter of Bias or Philomache, the daughter of Amphion. After this parricide, the Peliades fled to the court of Admetus, where Acaſtus, the ſon-in-law of Pelias, purſued them, and took their protector priſoner. The Peliades died, and were buried in Arcadia.

PELICAN, in ornithology. See PELICANUS.

PELICAN, in chemiſtry, is a glaſs alembic conſiſting of one piece. It has a tubulated capital, from which two oppoſite and crooked beaks paſs out, and enter again at the belly of the cucurbit. This veſſel has been contrived for a continued diſtillation and cohobation, which chemiſts call *circulation*. The volatile parts of ſubſtances put into this veſſel riſe into the capital, and are obliged to return through the crooked beaks into the cucurbit; and this without interruption, or luting and unluting the veſſels.

Although the pelican ſeems to be a very convenient

Pelicanus

inſtrument, it is nevertheleſs little uſed, and even much neglected at preſent; either becauſe the modern chemiſts have not ſo much patience as the ancient chemiſts had for making long experiments; or becauſe they find that two matraſſes, the mouth of one of which is inſerted into the mouth of the other, produce the ſame effect.

PELICANUS, in ornithology, a genus belonging to the order of anſeres. The bill is ſtraight, without teeth, and crooked at the point; the face is naked, and the feet are palmated. Mr Latham enumerates no leſs than 30 different ſpecies of this genus, beſides varieties. The moſt remarkable ſeem to be theſe that follow:

1. The carbo, or corvorant, ſometimes exceeds ſeven pounds in weight: the length three feet four; the extent four feet two; the bill duſky, five inches long, deſtitute of noſtrils; the baſe of the lower mandible is covered with a naked yellow ſkin, that extends under the chin, and forms a ſort of pouch; a looſe ſkin of the ſame colour reaches from the upper mandible round the eyes and angles of the mouth; the head and neck are of a ſooty blackneſs, but under the chin of the male the feathers are white; and the head in that ſex is adorned with a ſhort, looſe, pendant creſt; in ſome the creſt and hind-part of the head are ſtreaked with white. The coverts of the wings, the ſcapulars, and the back, are of a deep green, edged with black, and gloſſed with blue; the quill-feathers and tail duſky; the legs are ſhort, ſtrong, and black; the middle claw ſerrated on the inſide; the irides are of a light aſh-colour.

Theſe birds occupy the higheſt parts of the cliffs that impend over the ſea: they make their neſts of ſticks, ſea-tang, graſs, &c. and lay ſix or ſeven white eggs of an oblong form. In winter they diſperſe along the ſhores, and viſit the freſh waters, where they make great havoc among the fiſh. They are remarkably voracious, having a moſt ſudden digeſtion, promoted by the infinite quantity of ſmall worms that fill their inteſtines. The corvorant has the rankeſt and moſt diſagreeable ſmell of any bird, even when alive. Its form is diſagreeable; its voice hoarſe and croaking, and its qualities baſe. Theſe birds, however, have been trained to fiſh like falcons to fowl. Whitelock tells us, that he had a caſt of them manned like hawks, and which would come to hand. He took much pleaſure in them; and relates, that the beſt he had was one preſented him by Mr Wood, maſter of the corvorants to Charles I. It is well known that the Chineſe make great uſe of theſe birds, or a congenerous ſort, in fiſhing; and that not for amuſement, but profit.

2. The graculus, or ſhag, called in the north of England the *crane*, is much inferior in ſize to the corvorant: the length is 27 inches; the breadth three feet ſix; the weight three pounds three quarters. The bill is four inches long, and more ſlender than that of the preceding: the head is adorned with a creſt two inches long, pointing backward; the whole plumage of the upper part of this bird is of a fine and very ſhining green; the edge of the feathers a purpliſh black; but the lower part of the back, the head, and neck, wholly green; the belly is duſky; the tail of a duſky hue, tinged with green; the legs are black, and like thoſe of the corvorant. Pelicanus.

Both theſe kinds agree in their manners, and breed in the ſame places; and, what is very ſtrange in web-footed birds, will perch and build in trees: both ſwim with their head quite erect, and are very difficult to be ſhot; for, like the grebes and divers, as ſoon as they ſee the flaſh of the gun, they pop under water, and never riſe but at a conſiderable diſtance.

3. The baſſanus, gannet, or ſolan gooſe, weighs ſeven pounds; the length is three feet one inch; the breadth ſix feet two inches. The bill is ſix inches long, ſtraight almoſt to the point, where it inclines down; and the ſides are irregularly jagged, that it may hold its prey with more ſecurity: about an inch from the baſe of the upper mandible is a ſharp proceſs pointing forward; it has no noſtrils; but in their place a long furrow, that reaches almoſt to the end of the bill: the whole is of a dirty white, tinged with aſh-colour. The tongue is very ſmall, and placed low in the mouth; a naked ſkin of a fine blue ſurrounds the eyes, which are of a pale yellow, and are full of vivacity: this bird is remarkable for the quickneſs of its ſight. Martin tells us, that *ſolan* is derived from an Iriſh word expreſſive of that quality.

From the corner of the mouth is a narrow ſlip of black bare ſkin, that extends to the hind part of the head; beneath the chin is another, that, like the pouch of the pelican, is dilatable, and of ſize ſufficient to contain five or ſix entire herrings; which in the breeding ſeaſon it carries at once to its mate or young.

The young birds, during the firſt year, differ greatly in colour from the old ones; being of a duſky hue, ſpeckled with numerous triangular white ſpots; and at that time reſemble in colours the ſpeckled diver. Each bird, if left undiſturbed, would only lay one egg in the year; but if that be taken away, they will lay another; if that is alſo taken, then a third; but never more that ſeaſon. Their egg is white, and rather leſs than that of the common gooſe; the neſt is large, and formed of any thing the bird finds floating on the water, ſuch as graſs, ſea plants, ſhavings, &c. Theſe birds frequent the Iſle of Aliſa, in the Frith of Clyde; the rocks adjacent to St Kilda; the Stalks of Souliſkerry, near the Orkneys; the Skelig Iſles, off the coaſts of Kerry, Ireland; and the Baſs Iſle, in the Frith of Edinburgh: the multitudes that inhabit theſe places are prodigious. Dr Harvey's elegant account of the latter, will ſerve to give ſome idea of the numbers of theſe, and of the other birds that annually migrate to that little ſpot.

"There is a ſmall iſland, called by the Scotch *Baſs Iſland*, not more than a mile in circumference; the ſurface is almoſt wholly covered during the months of May and June with neſts, eggs, and young birds; ſo that it is ſcarcely poſſible to walk without treading on them: and the flocks of birds in flight are ſo prodigious as to darken the air like clouds; and their noiſe is ſuch, that you cannot without difficulty hear your next neighbour's voice. If you look down upon the ſea from the top of the precipice, you will ſee it on every ſide covered with infinite numbers of birds of different kinds, ſwimming and hunting for their prey:

Pelicans. if in failing round the iſland you ſurvey the hanging cliffs, you may ſee in every cragg or fiſſure of the broken rocks innumerable birds of various ſorts and ſizes, more than the ſtars of heaven when viewed in a ſerene night: if from afar you ſee the diſtant flocks, either flying to or from the iſland, you would imagine them to be a vaſt ſwarm of bees."

Nor do the rocks of St Kilda ſeem to be leſs frequented by theſe birds; for Martin aſſures us, that the inhabitants of that ſmall iſland conſume annually no leſs than 22,600 young birds of this ſpecies, beſides an amazing quantity of their eggs, theſe being their principal ſupport throughout the year: they preſerve both eggs and fowls in pyramidal ſtone buildings, covering them with turf aſhes to preſerve them from moiſture. This is a dear bought food, earned at the hazard of their lives, either by climbing the moſt difficult and narrow paths, where (to appearance) they can barely cling, and that too at an amazing height over the raging ſea; or elſe, being lowered down from above, they collect their annual proviſion, thus hanging in midway air; placing their whole dependence on the uncertain footing of one perſon, who holds the rope by which they are ſuſpended at the top of the precipice. The young birds are a favourite diſh with the North Britons in general: during the ſeaſon, they are conſtantly brought from the Baſs Iſle to Edinburgh, ſold at 20d. a piece, are roaſted, and ſerved up a little before dinner as a whet.

Mr Macaulay, miſſionary from the general aſſembly to St Kilda, gives the following account of them in that iſland: "Theſe rocks are in ſummer totally covered with ſolan geeſe and other fowls, and appear at a diſtance like ſo many mountains covered with ſnow. The neſts of the ſolan geeſe, not to mention thoſe of other fowls, are ſo cloſe, that when one walks between them, the hatching fowls on either ſide can always take hold of one's cloths; and they will often ſit until they are attacked, rather than expoſe their eggs to the danger of being deſtroyed by the ſea-gulls; at the ſame time, an equal number fly about, and furniſh food for their mates that are employed in hatching; and there are, beſides, large flocks of barren fowls of the different tribes that frequent the rocks of St Kilda. Pelicans

"The ſolan geeſe equal almoſt the tame ones in ſize. The common amuſement of the herring-fiſhers ſhow the great ſtrength of this fowl. The fiſhers fix a herring upon a board which has a ſmall weight under it, to ſink it a little below the ſurface of the ſea: the ſolan gooſe, obſerving the fiſh, darts down upon it perpendicularly, and with ſo much force, that he runs his bill irrecoverably through the board, and is taken up directly by the fiſhers.

"The ſolan geeſe repair to St Kilda in the month of March, and continue there till after the beginning of November. Before the middle of that month they, and all the other ſea fowls that are fond of this iſland, retire much about the ſame time into ſome other favourite regions; ſo that not a ſingle fowl belonging to their element is to be ſeen about St Kilda from the beginning of winter down to the middle of February. Before the young ſolan geeſe fly off, they are larger than their mothers, and the fat on their breaſts is ſometimes three inches deep. Into what quarter of the world theſe tribes of wild fowl repair, after winter ſets in, whether into the northern ocean, the native country and winter quarters of herrings in general, or into ſome other region near the ſun, or whether they be of the ſleeping kind, they who pry into the myſteries of natural hiſtory, or have converſed much with writers of voyages, can beſt explain (A). I ſhall only pretend to ſay, that theſe different nations of the feathered kind

(A) The continuance of theſe birds is longer or ſhorter in the iſlands according as the inhabitants take or leave their firſt egg; but, in general, the time of breeding, and that of their departure, ſeems to coincide with the arrival of the herring, and the migration of that fiſh (which is their principal food) out of thoſe ſeas. It is probable therefore that theſe birds attend the herring and pilchard during their whole circuit round the Britiſh iſlands; the appearance of the former being always eſteemed by the fiſhermen as a ſure preſage of the approach of the latter. It migrates, we are told, in queſt of food as far ſouth as the mouth of the Tagus, being frequently ſeen off Liſbon during the month of September, or, as ſome ſay, December. Of the extenſive migrations of this ſpecies we have the following more particular account in Pennant's Arctic Zoology: "It inhabits the coaſt of Newfoundland, where it breeds, and migrates ſouthward as far as South Carolina. In Europe, it is common on the coaſt of Norway and Iceland; but as it never voluntarily flies over land, is not ſeen in the Baltic. It wanders for food as far as the coaſt of Liſbon and Gibraltar, where it has been ſeen in December, plunging for ſardinæ. Straggles as high as Greenland. In northern Aſia, it has been once ſeen by Steller off Bering's iſle; but has been frequently met with in the ſouthern hemiſphere, in the Pacific Ocean: particularly in numbers about New Zealand and New Holland. Captain Cook alſo ſaw them in his paſſage from England to the Cape of Good Hope, and remoter from land than they had been ſeen elſewhere. Among thoſe obſerved in the South Sea, is the variety called *ſula*, with a few black feathers in the tail and among the ſecondaries. They are found not only on the Ferne iſlands, but on our coaſts, one having been brought to me a few years ago which had fallen down wearied with its flight." In the month of Auguſt, the ſame accurate naturaliſt has obſerved in Caithneſs their northern migrations: he has ſeen them paſſing the whole day in flocks, from five to fifteen in each: in calm weather they fly high; in ſtorms they fly low, and near the ſhore; but never croſs over the land, even when a bay with promontories intervenes, but follow, at an equal diſtance, the courſe of the bay, and regularly double every cape. Many of the parties made a ſort of halt for the ſake of fiſhing: they ſoared to a vaſt height, then darting headlong into the ſea, made the water foam and ſpring up with the violence of their deſcent, after which they purſued their route. Our author inquired whether they ever were obſerved to return ſouthward in the ſpring, but was anſwered in the negative; ſo it appears that they annually encircle the whole iſland.

canus kind are taught to chooſe the propereſt habitations and feeding places, and to ſhift their quarters ſeaſonably, by the unerring hand of God.

"From the account given above of the multitudes of ſea-fowls that ſeek their food on this coaſt, we may juſtly conclude that there muſt be inexhauſtible ſtores of fiſh there. Let us for a moment confine our attention to the conſumption made by a ſingle ſpecies of fowls. The ſolan gooſe is almoſt inſatiably voracious; he flies with great force and velocity, toils all the day with very little intermiſſion, and digeſts his food in a very ſhort time; he diſdains to eat any thing worſe than herring or mackarel, unleſs it be in a very hungry place, which he takes care to avoid or abandon. We ſhall take it for granted that there are 100,000 of that kind around the rocks of St Kilda; and this calculation is by far too moderate, as no leſs than 20,000 of this kind are deſtroyed every year, including the young ones. We ſhall ſuppoſe, at the ſame time, that the ſolan geeſe ſojourn in theſe ſeas for about ſeven months of the year; that each of them deſtroys five herrings in a day; a ſubſiſtence infinitely poor for ſo greedy a creature, unleſs it were more than half ſupported at the expence of other fiſhes. Here we have 100,000,000 of the fineſt fiſh in the world devoured annually by a ſingle ſpecies of the St Kilda ſea-fowls.

"If, in the next place, it be conſidered, that much the greateſt part of the other tribes have much the ſame appetite for herring, and purſue it from place to place, in the ſeveral migrations it makes from one ſea to another, the conſumption muſt be prodigiouſly great. Taking theſe into the account, and allowing them the ſame quantity of food, and of the ſame kind, by reaſon of their vaſt ſuperiority in point of numbers, tho' their ſtomachs are conſiderably weaker; we ſee there are no leſs than 200,000,000 of herrings ſwallowed up every year by the birds of a very ſmall diſtrict of rocks, which occupy ſo inconſiderable a ſpace in the Deucaledonian ocean.

"Should all the articles of this account be ſuſtained, articles which ſeem no leſs juſt than plain, and ſhould our curioſity lead us into a new calculation, allowing between 600 and 700 to every barrel, it is evident that more than 330,000 barrels are annually carried away by ſuch creatures."

Theſe birds are well known on moſt of the coaſts of England, but not by the name of the *Solan gooſe*. In Cornwall and in Ireland they are called *gannets*; by the Welſh, *gan*. Mr Ray ſuppoſed the Corniſh gannet to be a ſpecies of large gull: a very excuſable miſtake; for during his ſix months reſidence in Cornwall, he never had an opportunity of ſeeing that bird, except flying; and in the air it has the appearance of a gull. On that ſuppoſition he gave our fowl the title of *cataracta*, a name borrowed from Ariſtotle, and which admirably expreſſes the rapid deſcent of this bird on its prey. Mr Moyle firſt detected this miſtake; and the Rev. Dr William Borlaſe, by preſenting us with a fine ſpecimen of this bird, confirms the opinion of Mr Moyle; at the ſame time giving the following natural hiſtory of the bird.

"The gannet comes on the coaſts of Cornwall in the latter end of ſummer, or beginning of autumn; hovering over the ſhoals of pilchards that come down to us through St George's Channel from the northern ſea. The gannet ſeldom comes near the land, but is conſtant to its prey, a ſure ſign to the fiſhermen that the pilchards are on the coaſts; and when the pilchards retire, generally about the end of November, the gannets are ſeen no more. The bird now ſent was killed at Chandour, near Mountſbay, Sept. 30. 1762, after a long ſtruggle with a water-ſpaniel, aſſiſted by the boatmen; for it was ſtrong and pugnacious. The perſon who took it obſerved that it had a tranſparent membrane under the eye-lid, with which it covered at pleaſure the whole eye, without obſcuring the ſight or ſhutting the eye-lid; a gracious proviſion for the ſecurity of the eyes of ſo weighty a creature, whoſe method of taking its prey is by darting headlong on it from a height of 150 feet or more into the water. About four years ago, one of theſe birds flying over Penzance, (a thing that rarely happens), and ſeeing ſome pilchards lie on a fir-plank, in a cellar uſed for curing fiſh, darted itſelf down with ſuch violence, that it ſtruck its bill quite through the board (about an inch and a quarter thick), and broke its neck."

Pelicanus.

Theſe birds are ſometimes taken at ſea by a deception of the like kind; the fiſhermen faſtening a pilchard to a board, as in St Kilda they faſten herrings, and which in the ſame manner decoys the unwary gannet to its own deſtruction.

In the *Cataracta* of Juba may be found many characters of this bird: he ſays, that the bill is toothed; that its eyes are fiery; and that its colour is white: and in the very name is expreſſed its furious deſcent on its prey. The reſt of his accounts favour of fable. —We are uncertain whether the gannet breeds in any other parts of Europe beſides our own iſlands; except, as Mr Ray ſuſpects, the ſula (deſcribed in Cluſius's Exotics, which breeds in Feroe Iſles) be the ſame bird.

4. The ſula, or booby, is ſomewhat leſs than a gooſe; the baſis of the bill yellow, and of bare feathers; the eyes of a light-grey colour; the lower part of the bill of a light brown. The colours of the body are brown and white; but varied ſo in different individuals, that they cannot be deſcribed by them. Their wings are very long; their legs and feet pale yellow, ſhaped like thoſe of corvorants. They frequent the Bahama iſlands, where they breed all months in the year, laying one, two, or three eggs, on the bare rock. While young, they are covered with a white down, and continue ſo till they are almoſt ready to fly. They feed on fiſh like the reſt of this genus; but have a very troubleſome enemy of the man of-war bird, which lives on the ſpoils obtained from other ſea-birds, particularly the booby. As ſoon as this rapacious enemy perceives that the booby has taken a fiſh, he flies furiouſly at him, upon which the former dives to avoid the blow; but as he cannot ſwallow his prey below water, he is ſoon obliged to come up again with the fiſh in his bill as before, when he ſuffers a new aſſault; nor does his enemy ceaſe to perſecute him till he lets go the fiſh, which the other immediately carries off.

5. The great booby, called by Linnæus *pelicani Baſſani puſſus*, frequents the rivers and ſea-coaſts of Florida, purſuing and devouring fiſhes like others of the genus. Mr Cateſby informs us, that he has ſeen

Pelicanus. veral times found them disabled, and sometimes dead, on the shore; whence he thinks that they meet with sharks or other voracious fishes, which destroy them. The bird is about the size of a goose; the head and neck remarkably prominent; the back of a brown colour; the belly dusky white; the feet black, and shaped like those of a corvorant; the head elegantly spotted with white; the wings extend six feet when spread. Both this species and the last have a joint in the upper mandible of the bill, by which they can raise it considerably from the lower one without opening the mouth.

Latham's Synopsis of Birds.

6. The aquilus, or man-of-war bird, is in the body about the size of a large fowl; in length three feet, and in breadth 14. The bill is slender, five inches long, and much curved at the point; the colour is dusky; from the base a reddish dark coloured skin spreads on each side of the head, taking in the eyes: from the under mandible hangs a large membranaceous bag attached some way down the throat, as in the pelican, and applied to the same uses; the colour of this is a fine deep red, sprinkled on the sides with a few scattered feathers: the whole plumage is brownish-black, except the wing coverts, which have a rufous tinge: the tail is long, and much forked; the outer feathers are 18 inches or more in length; the middle ones from seven to eight: the legs are small, all the toes are webbed together, and the webs are deeply indented; the colour of them is dusky-red.

The female differs in wanting the membranaceous pouch under the chin; and in having the belly white: in other things is greatly like the male.

The frigate pelican, or man-of-war bird (B), as it is by some called, is chiefly, if not wholly, met with between the tropics, and ever out at sea, being only seen on the wing. It is usual with other birds, when fatigued with flying, to rest themselves on the surface of the water; but nature, from the exceeding length of wing ordained to this, has made the rising therefrom utterly impossible, at least writers not only so inform us, but every one whom we have talked with avers the same; though perhaps this is no defect of nature, as it scarcely seems to require much rest; at least, from the length of wing, and its apparent easy gliding motion (much like that of the kite), it appears capable of sustaining very long flights; for it is often seen above 100, and not unfrequently above 200, leagues from land. It has indeed been known to settle on the masts of ships; but this is not a frequent circumstance, though it will often approach near, and hover about the top-mast flag. Sometimes it soars so high in the air as to be scarcely visible, yet at other times approaches the surface of the sea, where, hovering at some distance, the moment he spies a fish, it darts down on it with the utmost rapidity, and seldom without success, flying upwards again as quick as it descended. It is also seen to attack* gulls and other birds which have caught a fish, when it obliges them to disgorge it, and then take care to seize it before it falls into the water. It is an enemy to the flying-fish; for, on their being attacked beneath by the dolphin and other voracious fish, to escape their jaws, these semi-volatiles leap out of the water in clusters making use of their long fins as wings to buoy them up in the air, which they are enabled to do so long as they remain wet; but the moment they become dry are useless, and drop into their proper element again: during their flight, the frigate darts in among the shoal, and seizes one or two at least. These birds know the exact place where the fish are to rise from the bubbling of the water, which directs them to the spot; in this they are accompanied by gulls and other birds, who act in concert with them. Pelican

These birds, which, though not uncommon everywhere within the tropics, yet are less frequent in some places than others, were seen by Cook in 30½ deg. In the old route of navigators, they are mentioned frequently as being met with at Ascension Island, Ceylon, East Indies, and China(c). Dampier saw them in great plenty in the island of Aves in the West Indies. Other navigators talk of them as frequenting various places of the South Sea, about the Marquesas, Easter Isles, and New Caledonia, also at Otaheitee, though at this last place not in such plenty as in many others. They are said to make nests on trees, if there be any within a proper distance; otherwise on the rocks. They lay one or two eggs of a flesh colour, marked with crimson spots. The young birds are covered with greyish white down: the legs are of the same colour, and the bill is white. There is a variety of this species, which is less, measuring only two feet nine inches in length: the extent from wing to wing is five feet and a half. The bill is five inches long, and red; the base of it, and bare space round the eye, are of the same colour; the nostrils are sufficiently apparent, and appear near the base: the shape of the bill is as in the larger one: the head, hind part of the neck, and upper parts of the body and wings, are ferruginous brown; the throat, fore part of the neck, and breast, are white; the tail is greatly forked as in the other; the legs are of a dirty yellow.

"In my collection (says Latham) is a bird very similar to this, if not the same: general colour of the plumage full black; breast and belly mottled with ash-colour; the inner ridge of the wing the same; the bill has the long furrow, as is seen in the greater one: but the nostrils are sufficiently apparent, being about half an inch in length, rather broader at that part near the base. This has a large red pouch at the chin and throat, as in the former species. It is most likely that mine is the male bird, as others, suspected to be of the opposite sex, have little or no traces of the jugular pouch. This supposition seems justified from a pair in the Hunterian museum, in both of which the plumage is wholly black; the one has a large pouch, the other

* See the account of the sula or booby species above.

(B) It is also called *taillur*, or tailor, by the French, from the motion of its tail representing a pair of shears when opened; and when on the wing, it opens and shuts them frequently, in the manner of using that instrument.—*Ulloa, Voy.* ii. p. 304.

(c) Thought by Osbeck to be one of the sorts of birds used in fishing by the Chinese.

canus. other deſtitute of it. Some have ſuppoſed that the greater and leſſer frigates are the ſame bird, in different periods of age."

7. The onocrotalus, or pelican of Aſia, Africa, and America; though Linnæus thinks that the pelican of America may poſſibly be a diſtinct variety. This creature, in Africa, is much larger in the body than a late LXXX. ſwan, and ſomewhat of the ſame ſhape and colour. Its four toes are all webbed together; and its neck in ſome meaſure reſembles that of a ſwan: but that ſingularity in which it differs from all other birds is in the bill and the great pouch underneath. This enormous bill is 15 inches from the point to the opening of the mouth, which is a good way back behind the eyes. At the baſe the bill is ſomewhat greeniſh, but varies towards the end, being of a reddiſh blue. It is very thick in the beginning, but tapers off to the end, where it hooks downwards. The under chap is ſtill more extraordinary; for to the lower edges of it hang a bag, reaching the whole length of the bill to the neck, which is ſaid to be capable of containing 15 quarts of water. This bag the bird has a power of wrinkling up into the hollow of the under-chap; but by opening the bill, and putting one's hand down into the bag, it may be diſtended at pleaſure. The ſkin of which it is formed will then be ſeen of a bluiſh aſh colour, with many fibres and veins running over its ſurface. It is not covered with feathers, but with a ſhort downy ſubſtance as ſmooth and as ſoft as ſattin, and is attached all along to the under edges of the chap, is fixed backward to the neck of the bird by proper ligaments, and reaches near half way down. When this bag is empty, it is not ſeen; but when the bird has fiſhed with ſucceſs, it is then incredible to what an extent it is often ſeen dilated. For the firſt thing the pelican does in fiſhing is to fill up the bag; and then it returns to digeſt its burden at leiſure. When the bill is opened to its wideſt extent, a perſon may run his head into the bird's mouth, and conceal it in this monſtrous pouch, thus adapted for very ſingular purpoſes. Yet this is nothing to what Ruyſch aſſures us, who avers that a man has been ſeen to hide his whole leg, boot and all, in the monſtrous jaws of one of theſe animals. At firſt appearance this would ſeem impoſſible, as the ſides of the under chap, from which the bag depends, are not above an inch aſunder when the bird's bill is firſt opened; but then they are capable of great ſeparation; and it muſt neceſſarily be ſo, as the bird preys upon large fiſhes, and hides them by dozens in its pouch. Tertre affirms, that it will hide as many fiſh as will ſerve 60 hungry men for a meal.

This pelican was once alſo known in Europe, particularly in Ruſſia; but it ſeems to have deſerted our coaſts. This is the bird of which ſo many fabulous accounts have been propagated; ſuch as its feeding its young with its own blood, and its carrying a proviſion of water for them in its great reſervoir in the deſert. But the abſurdity of the firſt account anſwers itſelf; and as for the latter, the pelican uſes its bag for very different purpoſes than that of filling it with water

Clavigero, in his Hiſtory of Mexico, ſays that "there are two ſpecies, or rather varieties, of this bird in Mexico; the one having a ſmooth bill, the other a notched one. Although the Europeans are acquainted with this bird, I do not know whether they are equally well acquainted with the ſingular circumſtance of its aſſiſting the ſick or hurt of its own ſpecies; a circumſtance which the Americans ſometimes take advantage of to procure fiſh without trouble. They take a live pelican, break its wing, and after tying it to a tree, conceal themſelves in the neighbourhood; there they watch the coming of the other pelicans with their proviſions, and as ſoon as they ſee theſe throw up the fiſh from their pouch, run in, and after leaving a little for the captive bird, they carry off the reſt." Pelicanus.

This amazing pouch may be conſidered as analogous to the crop in other birds; with this difference, that as theirs lie at the bottom of the gullet, ſo this is placed at the top. Thus, as pigeons and other birds macerate their food for their young in their crops, and then ſupply them; ſo the pelican ſupplies its young by a more ready contrivance, and macerates their food in its bill, or ſtores it for its own particular ſuſtenance.

The ancients were particularly fond of giving this bird admirable qualities and parental affections: ſtruck, perhaps, with its extraordinary figure, they were willing to ſupply it with as extraordinary appetites; and having found it with a large reſervoir, they were pleaſed with turning it to the moſt tender and parental uſes. But the truth is, the pelican is a very heavy, ſluggiſh, voracious bird, and very ill fitted to take thoſe flights, or to make thoſe cautious proviſions for a diſtant time, which we have been told they do.

The pelican, ſays Labat, has ſtrong wings, furniſhed with thick plumage of an aſh-colour, as are the reſt of the feathers over the whole body. Its eyes are very ſmall, when compared with the ſize of its head; there is a ſadneſs in its countenance, and its whole air is melancholy. It is as dull and reluctant in its motions as the flamingo is ſprightly and active. It is ſlow of flight; and when it riſes to fly, performs it with difficulty and labour. Nothing, as it would ſeem, but the ſpur of neceſſity, could make theſe birds change their ſituation, or induce them to aſcend into the air: but they muſt either ſtarve or fly.

They are torpid and inactive to the laſt degree, ſo that nothing can exceed their indolence but their gluttony; it is only from the ſtimulations of hunger that they are excited to labour; for otherwiſe they would continue always in fixed repoſe. When they have raiſed themſelves about 30 or 40 feet above the ſurface of the ſea, they turn their head with one eye downwards, and continue to fly in that poſture. As ſoon as they perceive a fiſh ſufficiently near the ſurface, they dart down upon it with the ſwiftneſs of an arrow, ſeize it with unerring certainty, and ſtore it up in their pouch. They then riſe again, though not without great labour, and continue hovering and fiſhing, with their head on one ſide as before.

This work they continue with great effort and induſtry till their bag is full, and then they fly to land to devour and digeſt at leiſure the fruits of their induſtry. This, however, it would appear, they are not long in performing; for towards night they have another hungry call, and they again inſtantly go to labour. At night, when their fiſhing is over, and the toil of the day crowned with ſucceſs, theſe lazy birds retire a little way from the ſhore; and, though with the webbed feet and clumſy figure of a gooſe, they will be contented to perch nowhere but upon trees among the light and airy

Pelecanus

airy tenants of the foreſt. There they take their repoſe for the night; and often ſpend a great part of the day, except ſuch times as they are fiſhing, ſitting in diſmal ſolemnity, and, as it would ſeem, half aſleep. Their attitude is with the head reſting upon their great bag, and that reſting upon their breaſt. There they remain without motion, or once changing their ſituation, till the calls of hunger break their repoſe, and till they find it indiſpenſably neceſſary to fill their magazine for a freſh meal. Thus their life is ſpent between ſleeping and eating; and our author adds, that they are as foul as they are voracious, as they are every moment voiding excrements in heaps as large as one's fiſt.

The ſame indolent habits ſeem to attend them even in preparing for incubation, and defending their young when excluded. The female makes no preparation for her neſt, nor ſeems to chooſe any place in preference to lay in; but drops her eggs on the bare ground, to the number of five or ſix, and there continues to hatch them. Attached to the place, without any deſire of defending her eggs or her young, ſhe tamely ſits and ſuffers them to be taken from under her. Now and then ſhe juſt ventures to peck, or to cry out when a perſon offers to beat her off.

She feeds her young with fiſh macerated for ſome time in her bag; and when they cry, flies off for a new ſupply. Labat tells us, that he took two of theſe when very young, and tied them by the leg to a poſt ſtuck into the ground, where he had the pleaſure of ſeeing the old one for ſeveral days come to feed them, remaining with them the greateſt part of the day, and ſpending the night on the branch of a tree that hung over them. By theſe means they were all three become ſo familiar, that they ſuffered themſelves to be handled; and the young ones very kindly accepted whatever fiſh he offered them. Theſe they always put firſt into their bag, and then ſwallowed at their leiſure.

It ſeems, however, that they are but diſagreeable and uſeleſs domeſticks; their gluttony can ſcarcely be ſatisfied; their fleſh ſmells very rancid, and taſtes a thouſand times worſe than it ſmells. The native Americans kill vaſt numbers; not to eat, for they are not fit even for the banquet of a ſavage, but to convert their large bags into purſes and tobacco-pouches. They beſtow no ſmall pains in dreſſing the ſkin with ſalt and aſhes, rubbing it well with oil, and then forming it to their purpoſe. It thus becomes ſo ſoft and pliant, that the Spaniſh women ſometimes adorn it with gold and embroidery to make work-bags of.

Yet, with all the ſeeming hebetude of this bird, it is not entirely incapable of inſtruction in a domeſtic ſtate. Father Raymond aſſures us, that he has ſeen one ſo tame and well educated among the native Americans, that it would go off in the morning at the word of command, and return before night to its maſter, with its great pouch diſtended with plunder: a part of which the ſavages would make it diſgorge, and a part they would permit it to reſerve for itſelf.

"The pelican," as Faber relates, "is not deſtitute of other qualifications. One of thoſe which was brought alive to the duke of Bavaria's court, where it lived 40 years, ſeemed to be poſſeſſed of very uncommon ſenſations. It was much delighted in the company and converſation of men, and in muſic both vocal and inſtrumental; for it would willingly ſtand," ſays he, "by thoſe that ſung or ſounded the trumpet; and ſtretching out its head, and turning its ear to the muſic, liſtened very attentively to its harmony, though its own voice was little pleaſanter than the braying of an aſs." Geſner tells us, that the emperor Maximilian had a tame pelican which lived for above 80 years, and that always attended his army on their march. It was one of the largeſt of the kind, and had a daily allowance by the emperor's orders. As another proof of the great age to which the pelican lives, Aldrovandus makes mention of one of theſe birds that was kept ſeveral years at Mechlin, and was verily believed to be 50 years old.—We often ſee theſe birds at our ſhews about town.

Pelicanus

Mr Edwards, in his Hiſtory of Birds, deſcribes the pelican of America from one, the body of which was ſent him ſtuffed and dried. From the point of the bill to the angles of the mouth meaſured 13 inches, and the wing when cloſed meaſured 18 inches. The pouch when dry appeared of the conſiſtence and colour of a brown dry ox's bladder, having fibres running its whole length, and blood-veſſels croſſing them; and proceeding from the ſides of the lower part of the bill, which opened into this pouch, its whole length. The greater bone of the wing being broken, was found to be light, hollow, void of marrow, and the ſides of it thin as parchment. Sir Hans Sloane writes thus of it (ſee *Nat. Hiſt. of Jamaica*, vol. ii. p. 322.): "This ſeems to be the ſame with the white pelican, only of a darker colour. They are frequent in all the ſeas of the hot Weſt Indies. They fiſh after the ſame manner as man-of-war birds, and come into the ſheltered bays in ſtormy weather, where they very often perch on trees: they fly over the ſea as gulls, and take the fiſh when they ſpy them, by falling down upon them, and they then riſe again and do the like. They are not reckoned good food. When they are ſeen at ſea, it is a ſign of being near land." Wafer, in his voyage and deſcription of the iſthmus of America, ſays, "The pelican is not found on the South Sea ſide of the iſthmus, but they abound on the northern ſide: They are of a dark grey colour, and under the throat hangs a bag: the old ones are not eaten, but the young are good meat." Mr Edwards, in another place, gives the deſcription of a pelican, which he ſays is double the bigneſs of the largeſt ſwan. His drawing was made from the pelican ſhown at London in 1745, which was brought by Capt. Pelly from the Cape of Good Hope, where they are larger than anywhere elſe. The body, legs, and feet, very much reſemble the pelican of America; and it differs little but in the head and neck, which laſt is very long, like a ſwan's; the bill is ſtraighter, and the upper part only hooked at the end; the pouch is ſhaped ſomething different, hanging more down in the middle. Mr Edwards thus deſcribes it. "From the point of the bill to the angle of the mouth is 20 inches of our Engliſh meaſure, which is ſix inches more than any natural hiſtorian has found it; the academy of Paris having meaſured one which was about 14 inches, Paris meaſure I ſuppoſe; and our countryman, Willoughby, meaſured one brought from Ruſſia, which he makes 14 inches Engliſh. I thought it ſomething incredible in Willoughby's deſcription, that a man

lican
ll
lla.

should put his head into the pouch under the bill, till I saw it performed in this bird by its keeper, and am sure a second man's head might have been put in with it at the same time."

The Academy of Paris think the bird they have described is the pelican of Aristotle, and the Onocrotalus of Pliny. They are also confirmed in the opinion that this is a long-lived bird; for, out of a great number kept at Versailles, none had died for more than 12 years, being the only animals kept in the menagery of which some have not died in that time. Some authors say they live 60 or 70 years.

Capt. Keeling, in his voyage to Sierra Leona, says the pelicans there are as large as swans, of a white colour, with exceeding long bills; and M. Thevenot, in his travels to the Levant, observes, that the pelicans about some part of the Nile near the Red Sea swim by the bank side like geese, in such great numbers that they cannot be counted. Father Morolla, in his voyage to Congo, says pelicans are often met with in the road to Singa, and are all over black, except on their breast, which is of a flesh colour like the neck of a turkey. He adds further, that father Francis de Pavia informed him, that on his journey to Singa he observed certain large white birds, with long beaks, necks, and feet, which, whenever they heard the least sound of an instrument, began immediately to dance, and leap about the rivers, where they always resi'le, and whereof they were great lovers: this, he said, he took a great pleasure to contemplate, and continued often upon the banks of the rivers to observe.

It would extend our article beyond all proportion, were we to touch on each individual species of this extensive genus, together with their accidental varieties. But as the genus is unquestionably very curious, we shall here subjoin a list of books, which such of our readers as desire it may have recourse to for further information: *Edward's History of Birds; Natural History of Jamaica; Mem. de l'Academie Royale des Sciences, depuis* 1666 *jusqu'à* 1699, tom. 3. troisieme partie, p. 186.; *Willoughby; Pennant's British* and *Arctic Zoology;* and *Latham's Synopsis of Birds;* the last of which is the fullest and most scientifical of any we have yet seen.

PELION (Diodorus Siculus, &c.), *Pelios, mons* understood, (Mela, Virgil, Horace, Seneca), a mountain of Thessaly near Ossa, and hanging over the Sinus Pelasgicus, or Pegasicus; its top covered with pines, the sides with oaks, (Ovid). Said also to abound in wild ash, (Val. Flaccus). From this mountain was cut the spear of Achilles, called *pelias*, which none but himself could wield, (Homer). Dicearchus, Aristotle's scholar, found this mountain 1250 paces higher than any other of Thessaly, (Pliny). *Pelius*, Cicero; *Peliacus*, (Catullus), the epithet.

PELLA (anc. geog.), a town situated on the confines of Emathia, a district of Macedonia, (Ptolemy); and therefore Herodotus allots it to Bottiæa, a maritime district on the Sinus Thermaicus. It was the royal residence, situated on an eminence, verging to the southwest, encompassed with unpassable marshes summer and winter: in which, next the town, a citadel like an island rises, placed on a bank or dam, a prodigious work, both supporting the wall and securing it from any hurt by means of the circumfluent water. At a distance, it seems close to the town, but is separated from it by the Ludias, running by the walls, and joined to it by a bridge, (Livy): distant from the sea 120 stadia, the Ludias being so far navigable, (Strabo). Mela calls the town *Pelle*, though most Greek authors write *Pella*. The birth-place of Philip, who enlarged it; and afterwards of Alexander, (Strabo, Mela). Continued to be the royal residence down to Perses, (Livy). Called *Pella Colonia*, (Pliny); *Colonia Julia Augusta*, (Coin). It afterwards came to decline, with but few and mean inhabitants, (Lucian). It is now called Τα Παλατια, the *Little Palace*, (Holstenius): *Pellæus*, both the gentilitious name and the epithet, (Lucian, Juvenal, Martial.)—Another PELLA, (Polybius, Pliny); a town of the Decapolis, on the other side the Jordan; abounding in water, like its cognominal town in Macedonia; built by the Macedonians, (Strabo); by Seleucus, (Eusebius); anciently called *Butis*, (Stephanus); *Apamea*, (Strabo); situated 35 miles to the north-east of Gerasa, (Ptolemy). Thither the Christians, just before the siege of Jerusalem by Titus, were divinely admonished to fly, (Eusebius). It was the utmost boundary of the Peræa, or Transjordan country, to the north, (Josephus).

PELLETIER (James), a doctor of physic, and an eminent mathematician, was born at Mans in 1517, and died at Paris in 1582. He was an excellent Latin and French poet, a good orator, physician, and grammarian. He wrote *Oeuvres Poetiques, Commentaires Latins sur Euclide, &c.*

PELLETS, in heraldry, those roundles that are black; called also *ogresses* and *gunstones*, and by the French *torteaux de sable.*

PELLICLE, among physicians, denotes a thin film or fragment of a membrane. Among chemists it signifies a thin surface of crystals uniformly spread over a saline liquor evaporated to a certain degree.

PELLISON, or PELLISON FONTANIER, (Paul), one of the finest geniuses of the 17th century, was the son of James Pellison counsellor at Castres. He was born at Beziers in 1624, and educated in the Protestant religion. He studied with success the Latin, Greek, French, Spanish, and Italian tongues, and applied himself to the reading the best authors in these languages; after which he studied the law at Castres with reputation. In 1652 he purchased the post of secretary to the king, and five years after became first deputy to M. Fouquet. He suffered by the disgrace of that minister; and in 1661 was confined in the Bastile, from whence he was not discharged till four years after. During his confinement he applied himself to the study of controversy; and in 1670 abjured the Protestant religion. Louis XIV. bestowed upon him an annual pension of 2000 crowns; and he likewise enjoyed several posts. In 1676 he had the abbey of Giment, and some years after the priory of St Orens at Auch. He died in 1693. His principal works are, 1. The History of the French Academy. 2. Reflections on religious Disputes, &c. in 4 vols 12mo. 3. The History of Louis XIV. 5. Historical Letters and Miscellanies, in 3 vols 12mo.

Pelletier
ll
Peloria.

PELOPIA, a festival observed by the Eleans in honour of Pelops. A ram was sacrificed on the occasion, which both priests and people were prohibited

Peloponnesus || Pelusium.

from partaking of, on pain of excommunication from Jupiter's temple: the neck only was allotted to the officer who provided wood for the sacrifice. This officer was called Συλλεκτης; and white poplar was the only wood made use of at this solemnity.

PELOPONNESUS, (Dionysius), a large peninsula to the south of the rest of Greece; called, as it were, *Pelopis nesus* or *insula*, though properly not an island, but a peninsula; yet wanting but little to be one, viz. the isthmus of Corinth, ending in a point like the leaf of the platane or plane-tree. Anciently called *Apia* and *Pelasgia*: a peninsula second to no other country for nobleness; situated between two seas, the Egean and Ionian, and resembling a platane leaf, on account of its angular recesses or bays, (Pliny, Strabo, Mela). Strabo adds from Homer, that one of its ancient names was *Argos*, with the epithet *Achaicum*, to distinguish it from Thessaly, called *Pelasgicum*. Divided into six parts; namely, Argolis, Laconica, Messenia, Elis, Achaia, and Arcadia, (Mela). Now called the *Morea*.

PELOPS, in fabulous history, the son of Tantalus king of Phrygia, went into Elis, where he married Hippodamia the daughter of Œnomaus king of that country; and became so powerful, that all the territory which lies beyond the Isthmus, and composes a considerable part of Greece, was called *Peloponnesus*, that is, the *island of Pelops*, from his name and the word Νησος.

PELTA, a small, light, manageable buckler, used by the ancients. It was worn by the Amazons. The pelta is said by some to have resembled an ivy leaf in form; by others it is compared to the leaf of an Indian fig-tree; and by Servius to the moon in her first quarter.

PELTARIA, in botany: A genus of the siliculosa order, belonging to the tetradynamia class of plants; and in the natural method ranking under the 39th order, *Siliquosæ*. The silicula is entire, and nearly orbiculated, compressed-plane, and not opening.

PELUSIUM (anc. geog.), a noble and strong city of Egypt, without the Delta, distant 20 stadia from the sea; situated amidst marshes; and hence its name and its strength. Called the *key* or *inlet of Egypt* (Diodorus, Hirtius); which being taken, the rest of Egypt lay quite open and exposed to an enemy. Called *Sin* (Ezekiel). *Pelusiacus* the epithet (Virgil, Diodorus). From its ruins arose Damietta. E. Long. 32°. N. Lat. 31°.

Letters on Egypt.

Mr Savary gives us the following account of this place: "The period of its foundation, as well as that of the other ancient cities of Egypt, is lost in the obscurity of time. It flourished long before Herodotus. As it commanded the entrance of the country on the side of Asia, the Pharaohs rendered it a considerable fortress: one of them raised a rampart of 30 leagues in length from the walls of this town to Heliopolis. But we find from the history of nations that the long wall of China, those which the weakness of the Greek emperors led them to build round Constantinople, and many others, built at an immense expence, were but feeble barriers against a warlike people: these examples have taught us, that a state, to be in security against a foreign yoke, must form warriors within itself, and that men must be opposed to men. This rampart, which covered Pelusium, did not stop Cambyses, who attacked it with a formidable army. The feeble character of the son of Amasis, unable to prevent the desertion of 200,000 Egyptians, who went to found a colony beyond the cataracts, had not force sufficient to oppose that torrent which broke in upon his country. Cambyses, after a bloody battle, wherein he cut his enemies to pieces, entered Pelusium in triumph. That memorable day, which saw the desertion of one part of the Egyptian militia and the ruin of the other, is the true epoch of the subjugation of that rich country. Since that period, it has passed under the yoke of the Persians, the Macedonians, the Romans, the Greeks, the Arabs, and the Turks. A continued slavery of more than 2000 years seems to secure them an eternal bondage.

Pelusium

"Herodotus, who visited Pelusium some years after the conquest of Cambyses, relates an anecdote which I cannot omit: 'I surveyed (says he) the plain where the two armies had fought. It was covered with human bones collected in heaps. Those of the Persians were on one side, those of the Egyptians on the other, the inhabitants of the country having taken care to separate them after the battle. They made me take notice of a fact which would have appeared very astonishing to me without their explanation of it. The skulls of the Persians, which were slight and fragile, broke on being lightly struck with a stone; those of the Egyptians, thicker and more compact, resisted the blows of flint. This difference of solidity they attributed to the custom the Persians have of covering their heads from their infancy with the tiara, and to the Egyptian custom of leaving the heads of their children bare and shaved, exposed to the heat of the sun. This explanation appeared satisfactory to me.' Mr Savary assures us that the same customs still subsist in Egypt, of which he frequently had ocular demonstration.

"Pelusium (continues he), after passing under the dominion of Persia, was taken by Alexander. The brave Antony, general of cavalry under Gabinius, took it from his successors, and Rome restored it to Ptolemy Auletes. Pompey, whose credit had established this young prince on the throne of Egypt, after the fatal battle of Pharsalia took refuge at Pelusium. He landed at the entrance of the harbour; and on quitting his wife Cornelia and his son, he repeated the two following verses of Sophocles, 'The free man who seeks an asylum at the court of a king will meet with slavery and chains.' He there found death. Scarcely had he landed on the shore, when Theodore the rhetorician, of the isle of Chio, Septimius the courtier, and Achillas the eunuch, who commanded his troops, wishing for a victim to present to his conqueror, stabbed him with their swords. At the sight of the assassins Pompey covered his face with his mantle, and died like a Roman. They cut off his head, and embalmed it, to offer it to Cæsar, and left his body naked on the shore. It was thus that this great man, whose warlike talents had procured the liberty of the seas for the Romans, and added whole kingdoms to their extended empire, was basely slain in setting foot on the territory of a king who owed to him his crown. Philip his freedman, collecting together, under favour of the night, the wreck of a boat, and stripping off his own cloak to cover the sad remains of his master, burnt

Pelvis || Pembroke-shire.

them according to the cuſtom. An old ſoldier, who had ſerved under Pompey's colours, came to mingle his tears with thoſe of Philip, and to aſſiſt him in performing the laſt offices to the manes of his general.—Peluſium was often taken and pillaged during the wars of the Romans, the Greeks, and the Arabs. But in ſpite of ſo many diſaſters, ſhe preſerved to the time of the Cruſades her riches and her commerce. The Chriſtian princes having taken it by ſtorm, ſacked it. It never again roſe from its ruins; and the inhabitants went to Damietta." See DAMIETTA.

PELVIS, in anatomy. See there, n° 3—43.

PEMBROKE (Mary Counteſs of). See HERBERT.

PEMBROKE, in Pembrokeſhire, in England, is the principal town in the county. It is ſituated upon a creek of Milford-Haven, and in the moſt pleaſant part of Wales, being about 256 miles diſtant from London. It is the county-town, and has two handſome bridges over two ſmall rivers which run into a creek, forming the weſt ſide of a promontory. It is well inhabited, has ſeveral good houſes, and but one church. There is alſo a cuſtom-houſe in it. There are ſeveral merchants in it, who, favoured by its ſituation, employ near 200 ſail on their own account; ſo that, next to Caermarthen, it is the largeſt and richeſt town in South Wales. It has one long ſtraight ſtreet, upon a narrow part of a rock; and the two rivers ſeem to be two arms of Milford-Haven, which ebbs and flows cloſe up to the town. It is governed by a mayor, bailiffs, and burgeſſes; and was in former times fortified with walls, and a magnificent caſtle ſeated on a rock at the weſt end of the town. In this rock, under the chapel, is a natural cavern called *Wogan*, remarked for having a very fine echo: this is ſuppoſed to have been a ſtore-room for the garriſon, as there is a ſtaircaſe leading into it from the caſtle: it has alſo a wide mouth towards the river. This ſtructure being burnt a few years after it was erected, it was rebuilt. It is remarkable for being the birth-place of Henry VII. and for the brave defence made by the garriſon for Charles I.

PEMBROKESHIRE, a county of Wales, bounded on all ſides by the Iriſh ſea, except on the eaſt, where it joins to Caermarthenſhire, and on the north-eaſt to Cardiganſhire. It lies the neareſt to Ireland of any county in Wales; and extends in length from north to ſouth 35 miles, and from eaſt to weſt 29, and is about 140 in circumference. It is divided into ſeven hundreds, contains about 420,000 acres, one city, eight market-towns, two foreſts, 145 pariſhes, about 2300 houſes, and 25,900 inhabitants. It lies in the province of Canterbury, and dioceſe of St David's. It ſends three members to parliament, viz. one for the ſhire, one for Haverfordweſt, and one for the town of Pembroke.

The air of Pembrokeſhire, conſidering its ſituation, is good; but it is in general better the farther from the ſea. As there are but few mountains, the ſoil is generally fruitful, eſpecially on the ſea coaſts; nor are its mountains altogether unprofitable, but produce paſture ſufficient to maintain great numbers of ſheep and goats. Its other commodities are corn, cattle, pit-coal, marl, fiſh, and fowl. Among theſe laſt are falcons, called here *peregrins*. Amongſt the birds common here are migratory ſea-birds, that breed in the Iſle of Ramſey, and the adjoining rocks called *The Biſhop and his Clerks*. About the beginning of April ſuch flocks of birds, of ſeveral ſorts, reſort to theſe rocks, as appear incredible to thoſe who have not ſeen them. They come to them in the night-time, and alſo leave them then; for, in the evening, the rocks may be ſeen covered with them, and the next morning not one be ſeen at all. In like manner, not a ſingle bird ſhall appear in the evening, and the next morning the rocks ſhall be covered with them. They alſo generally make a viſit about Chriſtmas, ſtaying a week or longer; and then take their leave till breeding-time. Among theſe birds are the eligug, razor-bill, puffin, and harry-bird. The eligug lays only one egg, which, as well as thoſe of the puffin and razor-bill, is as big as a duck's, but longer, and ſmaller at one end. She never leaves it till it is hatched, nor then till the young one is able to follow her; and ſhe is all this time fed by the male. This and the razor-bill breed upon the bare rocks, without any kind of neſt. The puffin and harry-bird breed in holes, and commonly in the holes of rabbits; but ſometimes they dig holes for themſelves with their beaks. The harry-birds are never ſeen on land but when taken. All the four kinds cannot raiſe themſelves to fly away when they are on land, and therefore they creep or waddle to the cliffs, and throwing themſelves off, take wing. The eligug is the ſame bird which they call in Cornwall a *liddaw*, and in Yorkſhire a *ſcout*. The razor-bill is the *merre* of Cornwall. The puffin is the *arctic duck* of Cluſius, and the harry-bird the *ſhire-water* of Sir Thomas Brown. The inhabitants of this county make a very pleaſant durable fire of culm, which is the duſt of coal made up into balls with a third part of mud. The county is well watered by the rivers Clethy, Dougledye, Cledhew, and Teive; which laſt parts it from Cardiganſhire. There is a diviſion of the county ſtyled *Rhos* in the Welch, by which is meant a large green plain. This is inhabited by the deſcendants of the Flemings, placed there by Henry I. to curb the Welch, who were never able to expel them, though they often attempted it. On the coaſts of this county, as well as on thoſe of Glamorganſhire and the Severn Sea, is found a kind of alga or laver, the *lactuca marina* of Camden, being a marine plant or weed. It is gathered in ſpring; of which the inhabitants make a ſort of food, called in Welch *lhavan*, and in Engliſh *black-butter*. Having waſhed it clean, they lay it to ſweat between two flat ſtones, then ſhred it ſmall, and kned it well, like dough for bread, and then make it up into great balls or rolls, which is by ſome eat raw, and by others fryed with oatmeal and butter. It is accounted excellent againſt all diſtempers of the liver and ſpleen; and ſome affirm that they have been relieved by it in the ſharpeſt fits of the ſtone.

Pembroke-ſhire, Pen.

PEN, a town of Somerſetſhire, in England, on the north-eaſt ſide of Wincaunton, where Kenwald a Weſt Saxon king ſo totally defeated the Britons, that they were never after able to make head againſt the Saxons; and where, many ages after this, Edmund Ironſide gained a memorable victory over the Danes, who had before, *i. e.* in 1001, defeated the Saxons in that ſame place.

PEN, a little inſtrument, uſually formed of a quill, ſerving to write withal.

Pen. Pens are alſo ſometimes made of ſilver, braſs, or iron.

Dutch Pens are made of quills that have paſſed thro' hot aſhes, to take off the groſſer fat and moiſture, and render them more tranſparent.

Fountain Pen, is a pen made of ſilver, braſs, &c. contrived to contain a conſiderable quantity of ink, and let it flow out by gentle degrees, ſo as to ſupply the writer a long time without being under the neceſſity of taking freſh ink.

The fountain-pen is compoſed of ſeveral pieces, as in Plate CCCLXXXII. where the middle piece F carries the pen, which is ſcrewed into the inſide of a little pipe, which again is ſoldered to another pipe of the ſame bigneſs as the lid G; in which lid is ſoldered a male ſcrew, for ſcrewing on the cover, as alſo for ſtopping a little hole at the place and hindering the ink from paſſing through it. At the other end of the piece F is a little pipe, on the outſide of which the top-cover H may be ſcrewed. In the cover there goes a port-crayon, which is to be ſcrewed into the laſt-mentioned pipe, in order to ſtop the end of the pipe, into which the ink is to be poured by a funnel. To uſe the pen, the cover G muſt be taken off, and the pen a little ſhaken, to make the ink run more freely.

There are, it is well known, ſome inſtruments uſed by practical mathematicians, which are called *pens*, and which are diſtinguiſhed according to the uſe to which they are principally applied; as for example, the drawing pen, &c. an inſtrument too common to require a particular deſcription in this place. But it may be proper to take ſome notice of the geometric pen, as it is not ſo well known, nor the principles on which it depends ſo obvious.

The *geometric Pen* is an inſtrument in which, by a circular motion, a right line, a circle, an ellipſe, and other mathematical figures, may be deſcribed. It was firſt invented and explained by John Baptiſt Suardi, in a work intitled *Nouvo Iſtromenti per la Deſcrizzione di diverſe Curve Antichi e Moderne*, &c. Several writers had obſerved the curves ariſing from the compound motion of two circles, one moving round the other; but Suardi firſt realized the principle, and firſt reduced it to practice. It has been lately introduced with ſucceſs into the ſteam-engine by Watt and Bolton. The number of curves this inſtrument can deſcribe is truly amazing; the author enumerates not leſs than 1273, which (he ſays) can be deſcribed by it in the ſimple form. We ſhall give a ſhort deſcription of it from Adam's Geometrical and Graphical Eſſays.

"Plate CCCLXXXII. fig. 10. repreſents the geometric pen; A, B, C, the ſtand by which it is ſupported; the legs A, B, C are contrived to fold one within the other for the convenience of packing. A ſtrong axis D is fitted to the top of the frame; to the lower part of this axis any of the wheels (as *i*) may be adapted; when ſcrewed to it they are immoveable. EG is an arm contrived to turn round upon the main axis D; two ſliding boxes are fitted to this arm; to theſe boxes any of the wheels belonging to the geometric pen may be fixed, and then ſlid ſo that the wheels may take into each other and the immoveable wheel *i*: it is evident, that by making the arm EG revolve round the axis D, theſe wheels will be made to revolve alſo, and that the number of their revolutions will depend on the proportion between the teeth. *Fg* is an arm carrying the pencil; this arm ſlides backwards and forwards in the box *cd*, in order that the diſtance of the pencil from the centre of the wheel *h* may be eaſily varied; the box *cd* is fitted to the axis of the wheel *h*, and turns round with it, carrying the arm *fg* along with it: it is evident, therefore, that the revolutions will be fewer or greater in proportion to the difference between the numbers of the teeth in the wheels *h* and *i*; this bar and ſocket are eaſily removed for changing the wheels. When two wheels only are uſed, the bar *fg* moves in the ſame direction with the bar EG; but if another wheel is introduced between them, they move in contrary directions. Pen || Pencil.

"The number of teeth in the wheels, and conſequently the relative velocity of the epicycle or arm *fg*, may be varied *in infinitum*. The numbers we have uſed are 8, 16, 24, 32, 40, 48, 56, 64, 72, 80, 88, 96.

"The conſtruction and application of this inſtrument is ſo evident from the figure, that nothing more need be pointed out than the combinations by which various figures may be produced. We ſhall take two as examples:

"The radius of EG (fig. 11.) muſt be to that of *fg* as 10 to 5 nearly; their velocities, or the number of teeth in the wheels, to be equal; the motion to be in the ſame direction.

"If the length of *fg* be varied, the looped figure delineated at fig. 12. will be produced. A circle may be deſcribed by equal wheels, and any radius but the bars muſt move in contrary directions.

"*To deſcribe by this circular motion a ſtraight line and an ellipſis.* For a ſtraight line, equal radii, the velocity as 1 to 2, the motion in a contrary direction; the ſame data will give a variety of ellipſes, only the radii muſt be unequal; the ellipſes may be deſcribed in any direction." See fig. 13.

Pen, or *Penſtock*. See Penstock.

Sea-Pen. See Pennatula.

PENANCE, a puniſhment, either voluntary or impoſed by authority, for the faults a perſon has committed. Penance is one of the ſeven ſacraments of the Romiſh church. Beſides faſting, alms, abſtinence, and the like, which are the general conditions of penance, there are others of a more particular kind; as the repeating a certain number of ave-marys, paternoſters, and credos, wearing a hair-ſhirt, and giving one's ſelf a certain number of ſtripes. In Italy and Spain it is uſual to ſee Chriſtians almoſt naked, loaded with chains and a croſs, and laſhing themſelves at every ſtep.

PENATES, in Roman antiquity, a kind of tutelar deities, either of countries or particular houſes; in which laſt ſenſe they differed in nothing from the lares. See Lares.

The penates were properly the tutelar gods of the Trojans, and were only adopted by the Romans, who gave them the title of *penates*.

PENCIL, an inſtrument uſed by painters for laying on their colours. Pencils are of various kinds, and made of various materials; the largeſt ſorts are made of boars briſtles, the thick ends of which are bound to a ſtick, bigger or leſs according to the uſes

they are deſigned for: theſe, when large, are called *bruſhes*. The finer ſorts of pencils are made of camels, badgers, and ſquirrels hair, and of the down of ſwans; theſe are tied at the upper end with a piece of ſtrong thread, and incloſed in the barrel of a quill.

All good pencils, on being drawn between the lips, come to a fine point.

PENCIL, is alſo an inſtrument uſed in drawing, writing, &c. made of long pieces of black-lead or red chalk, placed in a groove cut in a ſlip of cedar; on which other pieces of cedar being glued, the whole is planed round, and one of the ends being cut to a point, it is fit for uſe.

Black-lead in fine powder, ſtirred into melted ſulphur, unites with it ſo uniformly, and in ſuch quantity, in virtue perhaps of its abounding with ſulphur, that though the compound remains fluid enough to be poured into moulds, it looks nearly like the coarſer ſorts of black-lead itſelf. Probably the way which Prince Rupert is ſaid to have had, mentioned in the third volume of Dr Birch's Hiſtory of the Royal Society, of making black-lead run like a metal in a mould, ſo as to ſerve for black-lead again, conſiſted in mixing with it ſulphur or ſulphureous bodies.

On this principle the German black-lead pencils are ſaid to be made; and many of thoſe which are hawked about by certain perſons among us are prepared in the ſame manner: their melting or ſoftening, when held to a candle, or applied to a red-hot iron, and yielding a bluiſh flame, with a ſtrong ſmell like that of burning brimſtone, betrays their compoſition; for black-lead itſelf yields no ſmell or fume, and ſuffers no apparent alteration in that heat. Pencils made with ſuch additions are of a very bad kind; they are hard, brittle, and do not caſt or make a mark freely either on paper or wood, rather cutting or ſcratching them than leaving a coloured ſtroke.

The true Engliſh pencils (which Vogel in his mineral ſyſtem, and ſome other foreign writers, imagine to be prepared alſo by melting the black-lead with ſome additional ſubſtances, and caſting it into a mould) are formed of black-lead alone ſawed into ſlips, which are fitted into a groove made in a piece of wood, and another ſlip of wood glued over them: the ſofteſt wood, as cedar, is made choice of, that the pencil may be the eaſier cut; and a part at one end, too ſhort to be conveniently uſed after the reſt has been worn and cut away, is left unfilled with the black-lead, that there may be no waſte of ſo valuable a commodity. Theſe pencils are greatly preferable to the others, though ſeldom ſo perfect as could be wiſhed, being accompanied with ſome degree of the ſame inconveniences, and being very unequal in their quality, on account of different ſorts of the mineral being fraudulently joined together in one pencil, the fore-part being commonly pretty good, and the reſt of an inferior kind. Some, to avoid theſe imperfections, take the finer pieces of black lead itſelf, which they ſaw into ſlips, and fix for uſe in port-crayons: this is doubtleſs the ſureſt way of obtaining black-lead crayons, whoſe goodneſs can be depended on.

PENDANT, an ornament hanging at the ear, frequently compoſed of diamonds, pearls, and other jewels.

PENDANTS, in heraldry, parts hanging down from the label, to the number of three, four, five, or ſix at moſt, reſembling the drops in the Doric freeze. When they are more than three, they muſt be ſpecified in blazoning. Pendants || Pendulum.

PENDANTS of a Ship, are thoſe ſtreamers, or long colours, which are ſplit and divided into two parts, ending in points, and hung at the head of maſts, or at the yard arm ends.

PENDENE-Vow, in Cornwall, in England, on the north coaſt, by Morvath. There is here an unfathomable cave under the earth, into which the ſea flows at high-water. The cliffs between this and St Ives ſhine as if they had ſtore of copper, of which indeed there is abundance within-land.

PENDENNIS, in Cornwall, at the mouth of Falmouth-haven, is a peninſula of a mile and a half in compaſs. On this Henry VIII. erected a caſtle, oppoſite to that of St Maw's, which he likewiſe built. It was fortified by Queen Elizabeth, and ſerved then for the governor's houſe. It is one of the largeſt caſtles in Britain, and is built on a high rock. It is ſtronger by land than St Maw's, being regularly fortified, and having good outworks.

PENDULOUS, a term applied to any thing that hends or hangs downwards.

PENDULUM, a vibrating body ſuſpended from a fixed point. For the hiſtory of this invention, ſee the article CLOCK.

The theory of the pendulum depends on that of the inclined plane. Hence, in order to underſtand the nature of the pendulum, it will be neceſſary to premiſe ſome of the properties of this plane; referring, however, to *Inclined PLANE*, and Section VI. in the article MECHANICS, for the demonſtration.

I. Let AC (fig. 1.) be an inclined plane, AB its perpendicular height, and D any heavy body: then the force which impels the body D to deſcend along the inclined plane AC, is to the abſolute force of gravity as the height of the plane AB is to its length AC; and the motion of the body will be uniformly accelerated. Plate CCCLXXX.

II. The velocity acquired in any given time by a body deſcending on an inclined plane AC, is to the velocity acquired in the ſame time by a body falling freely and perpendicularly as the height of the plane AB to its length AC. The final velocities will be the ſame; the ſpaces deſcribed will be in the ſame ratio; and the times of deſcription are as the ſpaces deſcribed.

III. If a body deſcend along ſeveral contiguous planes, AB, BC, CD, (fig. 2.) the final velocity, namely, that at the point D, will be equal to the final velocity in deſcending through the perpendicular AE, the perpendicular heights being equal. Hence, if theſe planes be ſuppoſed indefinitely ſhort and numerous, they may be conceived to form a curve; and therefore the final velocity acquired by a body in deſcending through any curve AF, will be equal to the final velocity acquired in deſcending through the planes AB, BC, CD, or to that in deſcending through AE, the perpendicular heights being equal.

IV. If from the upper or lower extremity of the vertical diameter of a circle a cord be drawn, the time

Pendulum. time of descent along this cord will be equal to the time of descent through the vertical diameter; and therefore the times of descent through all cords in the same circle, drawn from the extremity of the vertical diameter, will be equal.

V. The times of descent of two bodies through two planes equally elevated will be in the subduplicate ratio of the lengths of the planes. If, instead of one plane, each be composed of several contiguous planes similarly placed, the times of descent along these planes will be in the same ratio. Hence, also, the times of describing similar arches of circles similarly placed will be in the subduplicate ratio of the lengths of the arches

VI. The same things hold good with regard to bodies projected upward, whether they ascend upon inclined planes or along the arches of circles.

The point or axis of suspension of a pendulum is that point about which it performs its vibrations, or from which it is suspended.

The centre of oscillation is a point in which, if all the matter in a pendulum were collected, any force applied at this centre would generate the same angular velocity in a given time as the same force when applied at the centre of gravity.

The length of a pendulum is equal to the distance between the axis of suspension and centre of oscillation.

Plate CCCLXXX. Let PN (fig. 3.) represent a pendulum suspended from the point P; if the lower part N of the pendulum be raised to A, and let fall, it will by its own gravity descend through the circular arch AN, and will have acquired the same velocity at the point N that a body would acquire in falling perpendicularly from C to N, and will endeavour to go off with that velocity in the tangent ND; but being prevented by the rod or cord, will move through the arch NB to B, where, losing all its velocity, it will by its gravity descend through the arch BN, and, having acquired the same velocity as before, will ascend to A. In this manner it will continue its motion forward and backward along the arch ANB, which is called an *oscillatory* or *vibratory* motion; and each swing is called a *vibration*.

Prop. I. If a pendulum vibrates in very small circular arches, the times of vibration may be considered as equal, whatever be the proportion of the arches.

Let PN (fig 4.) be a pendulum; the time of describing the arch AB will be equal to the time of describing CD; these arches being supposed very small.

Join AN, CN; then since the times of descent along all cords in the same circles, drawn from one extremity of the vertical diameter, are equal; therefore the cords AN, CN, and consequently their doubles, will be described in the same time; but the arches AN, CN being supposed very small, will therefore be nearly equal to their cords: hence the times of vibrations in these arches will be nearly equal.

Prop. II. Pendulums which are of the same length vibrate in the same time, whatever be the proportion of their weights.

This follows from the property of gravity, which is always proportional to the quantity of matter, or to its inertia. When the vibrations of pendulums are compared, it is always understood that the pendulums describe either similar finite arcs, or arcs of evanescent magnitude, unless the contrary is mentioned. Pend

Prop. III. If a pendulum vibrates in the small arc of a circle, the time of one vibration is to the time of a body's falling perpendicularly through half the length of the pendulum as the circumference of a circle is to its diameter.

Let PE (fig. 5.) be the pendulum which describes the arch ANC in the time of one vibration; let PN be perpendicular to the horizon, and draw the cords AC, AN; take the arc E*e* infinitely small, and draw EFG, *efg* perpendicular to PN, or parallel to AC; describe the semicircle BGN, and draw *er*, *gs* perpendicular to EG: now let t = time of descending through the diameter 2PN, or through the cord AN: Then the velocities gained by falling through 2PN, and by the pendulum's descending through the arch AE, will be as $\sqrt{2PN}$ and $\sqrt{BF}$; and the space described in the time t, after the fall through 2PN, is 4PN. But the times are as the spaces divided by the velocities.

Therefore $\frac{4PN}{\sqrt{2PN}}$ or $2\sqrt{2PN} : t :: \frac{Ee}{\sqrt{BF}}$: time of describing $Ee = \frac{t \times Ee}{2\sqrt{2PN \times BF}}$. But in the similar triangles PEF, E*er*, and KGF, G*gs*,

As $PE = PN : EF :: Ee : er = \frac{EF}{PN} \times Ee$;

And $KG = KD : FG :: Gg : Gs = \frac{FG}{KD} \times Gg$.

But $er = Gs$; therefore $\frac{EF}{PN} \times Ee = \frac{FG}{KD} \times Gg$.

Hence $Ee = \frac{PN \times FG}{KD \times EF} \times Gg$.

And by substituting this value of E*e* in the former equation, we have the time of describing $Ee = \frac{t \times PN \times FG \times Gg}{2KD \times EF \times \sqrt{BF} \times 2PN}$: But by the nature of the circle $FG = \sqrt{BF \times FN}$, and $EF = \sqrt{PN + PF \times FN}$. Hence, by substitution, we obtain the time of describing $Ee = \frac{t \times PN \times \sqrt{BF \times FN} \times Gg}{2KD \times \sqrt{PN + PF \times FN} \times \sqrt{BF} \times 2PN} = \frac{t \times \sqrt{PN} \times Gg}{2KD \times \sqrt{PN + PF} \times \sqrt{2}} = \frac{t \times \sqrt{2PN} \times Gg}{4KD \times \sqrt{PN + PF}} = \frac{t \times \sqrt{2PN}}{2BN \times \sqrt{2PN - NF}} \times Gg$. But NF, in its mean quantity for all the arches G*g*, is nearly equal to NK; therefore the time of describing $Ee = \frac{t \times \sqrt{2PN}}{2BN \times \sqrt{2PN - NK}} \times Gg$. Whence the time of describing the arch AED $= \frac{t \times \sqrt{2PN}}{2BN \times \sqrt{2PN - NK}} \times BGN$; and the time of describing the whole arch ADC, or the time of one vibration, is $= \frac{t \times \sqrt{2PN}}{2BN \times \sqrt{2PN - NK}} \times 2BGN$. But when the arch ANC is very small, NK vanishes, and then

dulum. then the time of vibration in a very small arc is $= \frac{t\times\sqrt{2PN}}{2BN\times\sqrt{2PN}} \times 2BGN = \frac{1}{2}t\times\frac{2BGN}{BN}$. Now if t be the time of descent through 2 PN; then since the spaces described are as the squares of the times, $\frac{1}{2}t$ will be the time of descent through $\frac{1}{2}$PN: therefore the diameter BN is to the circumference 2BGN, as the time of falling through half the length of the pendulum is to the time of one vibration.

Prop. IV. The length of a pendulum vibrating seconds is to twice the space through which a body falls in one second, as the square of the diameter of a circle is to the square of its circumference.

Let d = diameter of a circle = 1, c = circumference = 3.14159, &c. t to the time of one vibration, and p the length of the corrupody pendulum; then by last proposition $c : d :: 1'' : \frac{d}{c}$ = time of falling through half the length of the pendulum. Let s = space described by a body falling perpendicularly in the first second: then since the spaces described are in the subduplicate ratio of the times of description, therefore $1'' : \frac{d}{c} :: \sqrt{s} : \sqrt{\frac{1}{2}p}$. Hence $c^2 : d^2 : : 2s : p$.

It has been found by experiment, that in latitude $51\frac{1}{2}^\circ$ a body falls about 16.11 feet in the first second: hence the length of a pendulum vibrating seconds in that latitude is $= \frac{32.22}{3.14159^2} = 3$ feet 3.174 inches.

Prop. V. The times of the vibrations of two pendulums in similar arcs of circles are in a subduplicate ratio of the lengths of the pendulums.

late Let PN, PO (fig. 6.) be two pendulums vibrating in
LXXX. the similar arcs AB, CD; the time of a vibration of the pendulum PN is to the time of a vibration of the pendulum PO in a subduplicate ratio of PN to PO.

Since the arcs AN, CO are similar and similarly placed, the time of descent through AN will be to the time of descent through CO in the subduplicate ratio of AN to CO: but the times of descent through the arcs AN and CO are equal to half the times of vibration of the pendulums PN, PO respectively. Hence the time of vibration of the pendulum PN in the arch AB is to the time of vibration of the pendulum PO in the similar arc CD in the subduplicate ratio of AN to CO: and since the radii PN, PO are proportional to the similar arcs AN, CO, therefore the time of vibration of the pendulum PN will be to the time of vibration of the pendulum PO in a subduplicate ratio of PN to PO.

If the length of a pendulum vibrating seconds be 39.174 inches, then the length of a pendulum vibrating half seconds will be 9.793 inches. For $1'' : \frac{1}{2}'' :: \sqrt{39.174} : \sqrt{x}$; and $1 : \frac{1}{2} :: 39.174 : x$. Hence $x = \frac{39.174}{4} = 9.793$.

Prop. VI. The lengths of pendulums vibrating in the same time, in different places, will be as the forces of gravity.

For the velocity generated in any given time is directly as the force of gravity, and inversely as the quantity of matter *. Now the matter being supposed the same in both pendulums, the velocity is as the force of gravity; and the space passed through in a given time will be as the velocity; that is, as the gravity. Pendulum.

* See Mechanics, p. 774.

Cor. Since the lengths of pendulums vibrating in the same time in small arcs are as the gravitating forces, and as gravity increases with the latitude on account of the spheroidal figure of the earth and its rotation about its axis; hence the length of a pendulum vibrating in a given time will be variable with the latitude, and the same pendulum will vibrate slower the nearer it is carried to the equator.

Prop. VII. The time of vibrations of pendulums of the same length, acted upon by different forces of gravity, are reciprocally as the square roots of the forces.

For when the matter is given, the velocity is as the force and time; and the space described by any given force is as the force and square of the time. Hence the lengths of pendulums are as the forces and the squares of the times of falling through them. But these times are in a given ratio to the times of vibration; whence the lengths of pendulums are as the forces and the squares of the times of vibration. Therefore, when the lengths are given, the forces will be reciprocally as the square of the times, and the times of vibration reciprocally as the square roots of the forces.

Cor. Let p = length of pendulum, g = force of gravity, and t = time of vibration. Then since $p = g\times t^2$. Hence $g = p\times\frac{1}{t^2}$; and $t = \sqrt{p\times\frac{1}{g}}$.

That is, the forces in different places are directly as the lengths of the pendulums, and inversely as the square roots of the times of vibration; and the times of vibration are directly as the square roots of the lengths of the pendulums, and inversely as the square roots of the gravitating forces.

Prop. VIII. A pendulum which vibrates in the arch of a cycloid describes the greatest and least vibrations in the same time.

This property is demonstrated only on a supposition that the whole mass of the pendulum is concentrated in a point: but this cannot take place in any really vibrating body; and when the pendulum is of finite magnitude, there is no point given in position which determines the length of the pendulum; on the contrary the centre of oscillation will not occupy the same place in the given body, when describing different parts of the tract it moves through, but will continually be moved in respect of the pendulum itself during its vibration. This circumstance has prevented any general determination of the time of vibration in a cycloidal arc, except in the imaginary case referred to.

There are many other obstacles which concur in rendering the application of this curve to the vibration of pendulums designed for the measures of time the source of errors far greater than those which by its peculiar property it is intended to obviate; and it is now wholly disused in practice.

Although the times of vibration of a pendulum in dif-

Pendulum. different arches be nearly equal, yet from what has been said, it will appear, that if the ratio of the leaſt of theſe arches to the greateſt be conſiderable, the vibrations will be performed in different times; and the difference, though ſmall, will become ſenſible in the courſe of one or more days. In clocks uſed for aſtronomical purpoſes, it will therefore be neceſſary to obſerve the arc of vibration; which if different from that deſcribed by the pendulum when the clock keeps time, there a correction muſt be applied to the time ſhown by the clock. This correction, expreſſed in ſeconds of time, will be equal to the half of three times the difference of the ſquare of the given arc, and of that of the arc deſcribed by the pendulum when the clock keeps time, theſe arcs being expreſſed in degrees *; and ſo much will the clock gain or loſe according as the firſt of theſe arches is leſs or greater than the ſecond.

* *Simſon's Fluxions*, p. 541.

Thus, if a clock keeps time when the pendulum vibrates in an arch of 3°, it will loſe $10\frac{1}{2}$ ſeconds daily in an arch of 4 degrees.

For $4^2 - 3^2 \times \frac{1}{4} = 7 \times \frac{1}{4} = 10\frac{1}{2}$ ſeconds.

The length of a pendulum rod increaſes with heat; and the quantity of expanſion anſwering to any given degree of heat is experimentally found by means of a pyrometer ‡; but the degree of heat at any given time is ſhown by a thermometer: hence that inſtrument ſhould be placed within the clock-caſe at a height nearly equal to that of the middle of the pendulum; and its height, for this purpoſe, ſhould be examined at leaſt once a day. Now by a table conſtructed to exhibit the daily quantity of acceleration or retardation of the clock anſwering to every probable height of the thermometer, the correſponding correction may be obtained. It is alſo neceſſary to obſerve, that the mean height of the thermometer during the interval ought to be uſed. In Six's thermometer this height may be eaſily obtained; but in thermometers of the common conſtruction it will be more difficult to find this mean.

‡ See *Pyrometer*.

It had been found, by repeated experiments, that a braſs rod equal in length to a ſecond pendulum will expand or contract $\frac{1}{10000}$ part of an inch by a change of temperature of one degree in Fahrenheit's thermometer; and ſince the times of vibration are in a ſubduplicate ratio of the lengths of the pendulum, hence an expanſion or contraction of $\frac{1}{7200}$ part of an inch will anſwer nearly to one ſecond daily: therefore a change of one degree in the thermometer will occaſion a difference in the rate of the clock equal to one ſecond daily. Whence, if the clock be ſo adjuſted as to keep time when the thermometer is at 55°, it will loſe 10 ſeconds daily when the thermometer is at 65°, and gain as much when it is at 45°.

Hence the daily variation of the rate of the clock from ſummer to winter will be very conſiderable. It is true indeed that moſt pendulums have a nut or regulator at the lower end, by which the bob may be raiſed or lowered a determinate quantity; and therefore, while the height of the thermometer is the ſame, the rate of the clock will be uniform. But ſince the ſtate of the weather is ever variable, and as it is impoſſible to be raiſing or lowering the bob of the pendulum at every change of the thermometer, therefore the correction formerly mentioned is to be applied. This correction, however, is in ſome meaſure liable to a ſmall degree of uncertainty; and in order to avoid it altogether, ſeveral contrivances have been propoſed by conſtructing a pendulum of different materials, and ſo diſpoſing them that their effects may be in oppoſite directions, and thereby counterbalance each other; and by this means the pendulum will continue of the ſame length. Pendul

Mercurial PENDULUM. The firſt of theſe inventions is that by the celebrated Mr George Graham. In this, the rod of the pendulum is a hollow tube, in which a ſufficient quantity of mercury is put. Mr Graham firſt uſed a glaſs tube, and the clock to which it was applied was placed in the moſt expoſed part of the houſe. It was kept conſtantly going, without having the hands or pendulum altered, from the 9th of June 1722 to the 14th of October 1725, and its rate was determined by tranſits of fixed ſtars. Another clock made with extraordinary care, having a pendulum about 60 pounds weight, and not vibrating above one degree and a half from the perpendicular, was placed beſide the former, in order the more readily to compare them with each other, and that they might both be equally expoſed. The reſult of all the obſervations was this, that the irregularity of the clock with the quickſilver pendulum exceeded not, when greateſt, a ſixth part of that of the other clock with the common pendulum, but for the greateſt part of the year not above an eighth or ninth part; and even this quantity would have been leſſened, had the column of mercury been a little ſhorter: for it differed a little the contrary way from the other clock, going faſter with heat and ſlower with cold. To confirm this experiment more, about the beginning of July 1723 Mr Graham took off the heavy pendulum from the other clock, and made another with mercury, but with this difference, that inſtead of a glaſs tube he uſed a braſs one, and varniſhed the inſide to ſecure it from being injured by the mercury. This pendulum he uſed afterwards, and found it about the ſame degree of exactneſs as the other. Mercur Pendulu *Phil. Tranſ.* 1726, n° 392.

The *Gridiron* PENDULUM is an ingenious contrivance for the ſame purpoſe. Inſtead of one rod, this pendulum is compoſed of any convenient odd number of rods, as five, ſeven, or nine; being ſo connected, that the effect of one ſet of them counteracts that of the other ſet; and therefore, if they are properly adjuſted to each other, the centres of ſuſpenſion and oſcillation will always be equidiſtant. Fig. 7. repreſents a gridiron pendulum compoſed of nine rods, ſteel and braſs alternately. The two outer rods, AB, CD, which are of ſteel, are faſtened to the croſs pieces AC, BD by means of pins. The next two rods, EF, GH, are of braſs, and are faſtened to the lower bar BD, and to the ſecond upper bar EG. The two following rods are of ſteel, and are faſtened to the croſs bars EG and IK. The two rods adjacent to the central rod being of braſs, are faſtened to the croſs pieces IK and LM; and the central rod, to which the ball of the pendulum is attached, is ſuſpended from the croſs piece LM, and paſſes freely through a perforation in each of the croſs bars IK, BD. From this diſpoſition of the rods, it is evident that, by the expanſion of the extreme rods, the croſs piece BD, and the two rods attached to it, will deſcend: but ſince theſe rods are expanded by the ſame heat, the croſs piece EG will conſequently Gridiron Pendulu Plat ccc

ly

Pendulum. ly be raised, and therefore also the two next rods; but because these rods are also expanded, the cross bar IK will descend; and by the expansion of the two next rods, the piece LM will be raised a quantity sufficient to counteract the expansion of the central rod. Whence it is obvious, that the effect of the steel rods is to increase the length of the pendulum in hot weather, and to diminish it in cold weather, and that the brass rods have a contrary effect upon the pendulum. The effect of the brass rods must, however, be equivalent not only to that of the steel rods, but also to the part above the frame and spring, which connects it with the cock, and to that part between the lower part of the frame and the centre of the ball.

3. Thiout. Another excellent contrivance for the same purpose is described in a French author on clock-making. It was used in the north of England by an ingenious artist about 40 years ago. This invention is as follows: A bar of the same metal with the rod of the pendulum, and of the same dimensions, is placed against the back part of the clock-case: from the top of this a part projects, to which the upper part of the pendulum is connected by two fine pliable chains or silken strings, which just below pass between two plates of brass, whose lower edges will always terminate the length of the pendulum at the upper end. These plates are supported on a pedestal fixed to the back of the case. The bar rests upon an immoveable base at the lower part of the case; and is inserted into a groove, by which means it is always retained in the same position. From this construction, it is evident that the extension or contraction of this bar, and of the rod of the pendulum, will be equal, and in contrary directions. For suppose the rod of the pendulum to be expanded any given quantity by heat; then, as the lower end of the bar rests upon a fixed point, the bar will be expanded upwards, and raise the upper end of the pendulum just as much as its length was increased; and hence its length below the plates will be the same as before.

Of this pendulum, somewhat improved by Mr Crosthwaite watch and clockmaker, Dublin, we have the following description in the Transactions of the Royal Irish Academy, 1788.—"A and B (fig. 8.) are two Plate CCLXXX. rods of steel forged out of the same bar, at the same time, of the same temper, and in every respect similar. On the top of B is formed a gibbet C; this rod is firmly supported by a steel bracket D, fixed on a large piece of marble E, firmly set into the wall F, and having liberty to move freely upwards between cross staples of brass, 1, 2, 3, 4, which touch only in a point in front and rear (the staples having been carefully formed for that purpose); to the other rod is firmly fixed by its centre the lens G; of 24 pounds weight, although it should in strictness be a little below it. This pendulum is suspended by a short steel spring on the gibbet at C; all which is entirely independent of the clock. To the back of the clock-plate I are firmly screwed two cheeks nearly cycloidal at K, exactly in a line with the centre of the verge L. The maintaining power is applied by a cylindrical steel-stud, in the usual way of regulators, at M. Now, it is very evident, that any expansion or contraction that takes place in either of these exactly similar rods, is instantly counteracted by the other; whereas in all *compensation* pendulums composed of different materials, however just calculation may seem to be, that can never be the case, as not only different metals, but also different bars of the same metal that are not manufactured at the same time, and exactly in the same manner, are found by a good pyrometer to differ materially in their degrees of expansion and contraction, a very small change affecting one and not the other."

Fir Pendulum. The expansion or contraction of straight-grained fir wood lengthwise, by change of temperature, is so small, that it is found to make very good pendulum rods. The wood called *sapadillo* is said to be still better. There is good reason to believe, that the previous baking, varnishing, gilding, or soaking of these woods in any melted matter, only tends to impair the property that renders them valuable. They should be simply rubbed on the outside with wax and a cloth. In pendulums of this construction the error is greatly diminished, but not taken away.

Angular Pendulum. *Angular Pendulum*, is formed of two pieces or legs like a sector, and is suspended by the angular point. This pendulum was invented with a view to diminish the length of the common pendulum, but at the same time to preserve or even increase the time of vibration. In this pendulum, the time of vibration depends on the length of the legs, and on the angle contained between them conjointly, the duration of the time of vibration increasing with the angle. Hence a pendulum of this construction may be made to oscillate in any given time. At the lower extremity of each leg of the pendulum is a ball or bob as usual. It may be easily shown, that in this kind of a pendulum, the squares of the times of vibration are as the secants of half the angle contained by the legs: hence if a pendulum of this construction vibrates half seconds when its legs are close, it will vibrate whole seconds when the legs are opened, so as to contain an angle equal to 151° 2½'.

Conical or Circular Pendulum. *The Conical or Circular Pendulum*, is so called from the figure described by the string or ball of the pendulum. This pendulum was invented by Mr Huygens, and is also claimed by Dr Hook.

In order to understand the principles of this pendulum, it will be necessary to premise the following lemma, *viz.* the times of all the circular revolutions of a heavy globular body, revolving within an inverted hollow paraboloid, will be equal whatever be the radii of the circles described by that body.

In order, therefore, to construct the pendulum so that its ball may always describe its revolutions in a paraboloid surface, it will be necessary that the rod of the pendulum be flexible, and that it be suspended in such a manner as to form the evolute of the given parabola. Hence, let KH (fig. 9.) be an axis perpendicular to the horizon, having a pinion at K moved by the last wheel in the train of the clock; and a hardened steel point at H moving in an agate pivot, to render the motion as free as possible. Now, let it be required that the pendulum shall perform each revolution in a second, then the paraboloid surface it moves in must be such whose *latus rectum* is double the length of the common half second pendulum. Let O be the focus of the parabola MEC, and MC the *latus rectum*; and make AE=MO=¼MC=the length of a common half second pendulum. At the point A of the verge, let a thin plate AB be fixed at one end, and at the other end B let it be fastened to a bar or arm BD perpendi-

Pendulum || Penelope.

pendicular to DH, and to which it is fixed at the point D. The figure of the plate AB is that of the evolute of the given parabola MEC.

The equation of this evolute, being alſo that of the ſemicubical parabola, is $\frac{27}{16}p\,x^2 = y^3$.—Let $\frac{27}{16}p = P$; then $P\,x^2 = y^3$, and in the focus $P = 2y$. In this caſe $2x^2 = y^2 = \frac{4}{9}P^2$: hence $x^2 = \frac{1}{9}P^2$, and $x = P\sqrt{\frac{1}{9}} = \frac{27}{16}$ $p\sqrt{\frac{1}{9}}$ = the diſtance of the focus from the vertex A.—By aſſuming the value of x, the ordinates of the curve may be found; and hence it may be eaſily drawn.

The ſtring of the pendulum muſt be of ſuch a length that when one end is fixed at B, it may lie over the plate AB, and then hang perpendicular from it, ſo that the centre of the bob may be at E when at reſt. Now, the verge KH being put into motion, the ball of the pendulum will begin to gyrate, and thereby conceive a centrifugal force which will carry it out from the axis to ſome point F, where it will circulate ſeconds or half ſeconds, according as the line AE is 9.8 inches, or 2¼ inches, and AB anſwerable to it.

One advantage poſſeſſed by a clock having a pendulum of this conſtruction is, that the ſecond hand moves in a regular and uniform manner, without being ſubject to thoſe jerks or ſtarts as in common clocks; and the pendulum is entirely ſilent.

Theory has pointed out ſeveral other pendulums, known by the names of *Elliptic*, *Horizontal*, *Rotulary*, &c. pendulums. Theſe, however, have not as yet attained that degree of perfection as to ſupplant the common pendulum.

Beſides the uſe of the pendulum in meaſuring time, it has alſo been ſuggeſted to be a proper ſtandard for meaſures of length. See the article MEASURE.

PENEA, in botany: A genus of the monogynia order, belonging to the tetrandria claſs of plants; and in the natural method ranking with thoſe of which the order is doubtful. The calyx is diphyllous; the corolla campanulated; the ſtyle quadrangular; the capſule tetragonal, quadrilocular, and octoſpermous.

PENELOPE, in fabulous hiſtory, the daughter of Icarus, married Ulyſſes, by whom ſhe had Telemachus. During the abſence of Ulyſſes, who was gone to the ſiege of Troy, and who ſtaid 20 years from his dominions, ſeveral princes, charmed with Penelope's beauty, told her that Ulyſſes was dead, offered to marry her, and preſſed her to declare in their favour. She promiſed compliance on condition they would give her time to finiſh a piece of tapeſtry ſhe was weaving; but at the ſame time ſhe undid in the night what ſhe had done in the day, and by this artifice eluded their importunity till Ulyſſes's return.

Plate CCCLXXXI.

PENELOPE, in ornithology: A genus of birds of the order of *gallinæ*, the characters of which are: The beak is bare at the baſe; the head is covered with feathers; the neck is quite bare; the tail conſiſts of twelve principal feathers; and the feet are for the moſt part bare. Linnæus, in the *Syſtema Naturæ*, enumerates ſix ſpecies. 1. *Meleagris ſatyra*, or horned pheaſant. Latham calls it the horned turkey. This ſpecies is larger than a fowl, and ſmaller than a turkey. The colour of the bill is brown; the noſtrils, forehead, and ſpace round the eyes, are covered with ſlender black hairy feathers; the top of the head is red. Behind each eye there is a fleſhy callous blue ſubſtance like a horn, which tends backward. On the fore-part of the neck and throat, there is a looſe flap of a fine blue colour, marked with orange ſpots, the lower part of which is beſet with a few hairs; down the middle it is ſomewhat looſer than on the ſides, being wrinkled. The breaſt and upper part of the back are of a full red colour. The neck and breaſt are inclined to yellow. The other parts of the plumage and tail are of a rufous brown, marked all over with white ſpots, encompaſſed with black. The legs are ſomewhat white, and furniſhed with a ſpur behind each. A head of this bird, Mr Latham tells us, was ſent to Dr Mead from Bengal, together with a drawing of the bird, which was called *napaul-pheaſant*. It is a native of Bengal. Penelopea. Latham's Synopſis.

2. The *meleagris criſtata*, called by Ray *penelope jacupeme*, and by Edwards the *guan*, or *quan*, is about the ſize of a fowl, being about two feet ſix inches long.—The bill is two inches long, and of a black colour; the irides are of a dirty orange colour; the ſides of the head are covered with a naked purpliſh blue ſkin, in which the eyes are placed: beneath the throat, for an inch and a half, the ſkin is looſe, of a fine red colour, and covered only with a few hairs. The top of the head is furniſhed with long feathers, which the bird can erect as a creſt at pleaſure; the general colour of the plumage is browniſh black, gloſſed over with copper in ſome lights; but the wing coverts have a greeniſh and violet gloſs. The quills moſtly incline to a purple colour; the fore-part of the neck, breaſt, and belly, are marked with white ſpots; the thighs, under tail coverts, and the tail itſelf, are browniſh black; the legs are red; the claws black. Some of theſe birds have little or no creſt, and are thence ſuppoſed to be females.—They inhabit Braſil and Guiana, where they are often made tame. They frequently make a noiſe not unlike the word *jacu*. Their fleſh is much eſteemed.

3. *Crax Cumanenſis*, called by Latham, &c. *yacou*. It is bigger than a common fowl. The bill is black; the head feathers are long, pointed, and form a creſt, which can be erected at pleaſure. The irides are of a pale rufous colour; the ſpace round the eyes is naked, ſimilar to that of a turkey. It has alſo a naked membrane, or kind of *wattle*, of a dull black colour.—The blue ſkin comes forward on the bill, but is not liable to change colour like that of the turkey. The plumage has not much variation; it is chiefly brown, with ſome white markings on the neck, breaſt, wing coverts, and belly; the tail is compoſed of twelve feathers, pretty long, and even at the end; the legs are red. This ſpecies inhabits Cayenne, but is a very rare bird, being met with only in the inner parts, or about the Amazons country, though in much greater plenty up the river Oyapoc, eſpecially towards Camoupi; and indeed thoſe which are ſeen at Cayenne are moſtly tame ones, for it is a familiar bird, and will breed in that ſtate, and mix with other poultry. It makes the neſt on the ground, and hatches the young there, but is at other times moſtly ſeen on trees. It frequently erects the creſt, when pleaſed, or taken notice of, and likewiſe ſpreads the tail upright like a fan, in the manner of the turkey. It has two kinds of cry; one like

that

A. Bell Prin. Wal. Sculptor fecit

Penelope. that of a young turkey, the other lower and more plaintive; the firſt of theſe is thought by the Indians to expreſs the word *couyovoit*, the other *yacou*.

4. The *pipile*, or, as it is called, *crax pipile*, is black in the belly, and the back brown ſtained with black. The fleſh on the neck is of a green colour. It is about the bigneſs of the former, and has a hiſſing noiſe.—The head is partly black and partly white, and is adorned with a ſhort creſt. The ſpace about the eyes, which are black, is white; the feet are red. It inhabits Guiana.

5. The *marail* is about the ſize of a fowl, and ſhaped ſomewhat like it. The bill and irides are blackiſh; the ſpace round the eyes is bare, and of a pale red; the chin, throat, and fore-part of the neck, are ſcarcely covered with feathers; but the throat itſelf is bare, and the membrane elongated to half an inch or more; both this and the ſkin round the eyes change colour, and become deeper and thicker when the bird is irritated. The head feathers are longiſh, ſo as to appear like a creſt when raiſed up, which the bird often does when agitated; at which time it alſo erects thoſe of the whole body, and ſo diſfigures itſelf as to be ſcarce known: the general colour of the plumage is a greeniſh black; the fore-part of the neck is tipped with white; the wings are ſhort; the tail is long, conſiſting of 12 feathers, which are even at the end, and commonly pendent, but can be lifted up, and ſpread out like that of the turkey; the legs and toes are of a bright red; the claws are crooked, and ſomewhat ſharp. In a collection (ſays Latham) from Cayenne was a bird, I believe, of this very ſpecies. It was 28 inches long; the bill is like that of a fowl, brown, and rather hooked; round the eye bare; the head is creſted; the feathers of the fore-part of the neck are tipped with white; the breaſt and belly are rufous brown; the reſt of the plumage is greeniſh brown; the tail is 11 inches long, and rounded at the end; the quills juſt reach beyond the rump; the legs are brown, and the claws hooked. This ſpecies is common in the woods of Guiana, at a diſtance from the ſea, though it is much leſs known than could be imagined; and found in ſmall flocks for the moſt part, except in breeding-time, when it is only ſeen by pairs, and then frequently on the ground, or on low ſhrubs; at other times on high trees, where it roofts at night. The female makes her neſt on ſome low buſhy tree, as near the trunk as poſſible, and lays three or four eggs. When the young are hatched, they deſcend with their mother, after 10 or 12 days. The mother acts as other fowls, ſcratching on the ground like a hen, and brooding the young, which quit their nurſe the moment they can ſhift for themſelves. They have two broods in a year; one in December or January, the other in May or June. The beſt time of finding theſe birds is morning or evening, being then met with on ſuch trees whoſe fruit they feed on, and are diſcovered by ſome of it falling to the ground. The young birds are eaſily tamed, and ſeldom forſake the places where they have been brought up: they need not be houſed, as they prefer the roofting on tall trees to any other place. Their cry is not inharmonious, except when irritated or wounded, when it is harſh and loud. Their fleſh is much eſteemed.

Buffon ſuppoſes this bird to be the female of the yacou, or at leaſt a variety; but that this cannot be, the anatomical inſpection will at once determine. The windpipe of this bird has a ſingular conſtruction, paſſing along the neck to the entrance of the breaſt, where it riſes on the outſide of the fleſh, and, after going a little way downwards, returns, and then paſſes into the cavity of the lungs. It is kept in its place on the outſide by a muſcular ligament, which is perceivable quite to the breaſt-bone. This is found to be the caſe in both male and female, and plainly proves that it differs from the yacou, whoſe windpipe has no ſuch circumvolution in either ſex.

Penestica || Peniel.

If this be the bird mentioned by Fermin, in his Hiſtory of Guiana, p. 176. he ſays that the creſt is cuneiform, and of a black and white colour; and obſerves that they are ſcarce at Surinam; but it does not ſeem quite certain whether he means this ſpecies or the yacou.

Bancroft mentions a bird of Guiana by the name of *Marrodee*, which he ſays is wholly of a browniſh black: the bill the ſame; and the legs grey. Theſe, he ſays, are common, and make a noiſe not unlike the name given it, perching on trees. The Indians imitate their cry ſo exactly, as to lead to the diſcovery of the place the birds are in, by their anſwering it. The fleſh of them is like that of a fowl: it is therefore moſt likely the marail.

6. The *vociferating penelope*. The bill of this bird is of a greeniſh colour: the back is brown, the breaſt green, and the belly is of a whitiſh brown. Latham calls it the *crying curaſſaw*. It is about the bigneſs of a crow.

PENESTICA, (Antonine), a town of the Helvetii, ſituated between the Lacus Lauſonius and Salodurum; called *Peteniſca* by Peutinger. Thought now to be *Biel*, (Cluverius); the capital of a ſmall territory in Swiſſerland.

PENEUS, (Strabo); a river running through the middle of Theſſaly, from weſt to eaſt, into the Sinus Thermaicus, between Olympus and Oſſa, near Tempe of Theſſaly, riſing in mount Pindus, (Ovid, Val. Flaccus).

PENETRALE, a ſacred room or chapel in private houſes, which was ſet apart for the worſhip of the houſehold gods among the ancient Romans. In temples alſo there were *penetralia*, or apartments of diſtinguiſhed ſanctity, where the images of the gods were kept, and certain ſolemn ceremonies performed.

PENGUIN, or Pinguin. See Pinguin.

PENICILLUS, among ſurgeons, is uſed for a tent to be put into wounds or ulcers.

PENIEL, or Penuel, a city beyond Jordan, near the ford or brook Jabbok. This was the occaſion of its name. Jacob, upon his return from Meſopotamia, (Gen. xxxii. 24, &c.) made a ſtop at the brook Jabbok: and very early the next morning, after he had ſent all the people before, he remained alone, and behold an angel came, and wreſtled with him till the day began to appear. Then the angel ſaid to Jacob, Let me go, for the morning begins to appear. Jacob anſwered, I ſhall not let you go from me till you have given me your bleſſing. The angel bleſſed him then in the ſame place, which Jacob thence called Peniel, ſaying, I have ſeen God face to face, yet continue alive.

In following ages the Iſraelites built a city in this place, which was given to the tribe of Gad. Gideon,

Peninnah || Penitents

returning from the purſuit of the Midianites, overthrew the tower of Penuel, (Judges viii. 17), and put all the inhabitants of the city to death, for having refuſed ſuſtenance to him and his people, and having anſwered him in a very inſulting manner. Jeroboam the ſon of Nebat rebuilt the city of Peniel, (1 Kings xii. 25.) Joſephus ſays, that this prince there built himſelf a palace.

PENINNAH, the ſecond wife of Elkanah, the father of Samuel. Peninnah had ſeveral children, (1 Sam. i. 2, 3, &c.), but Hannah, who afterwards was mother of Samuel, was for a great while barren: Peninnah, inſtead of giving the glory to God, the author of fruitfulneſs, was elevated with pride, and inſulted her rival Hannah. But the Lord having viſited Hannah, Peninnah was thereupon humbled; and ſome interpreters think, that God took away her children from her, or at leaſt that ſhe had no more after this time, according to the words of the ſong of Hannah, (1 Sam ii. 5.), "The barren hath born ſeven, and ſhe that hath many children is waxed feeble."

PENINSULA, in geography, a portion or extent of land joining to the continent by a narrow neck or iſthmus, the reſt being encompaſſed with water. See Plate CCXII.

PENIS, in anatomy. See there, p. 738. col. 2. &c.

PENITENCE, is ſometimes uſed for a ſtate of repentance, and ſometimes for the act of repenting. See REPENTANCE. It is alſo uſed for a diſcipline, or puniſhment attending repentance; more uſually called *penance*. It alſo gives title to ſeveral religious orders, conſiſting either of converted debauchees, and reformed proſtitutes, or of perſons who devote themſelves to the office of reclaiming them. Of this latter kind is the

Order of PENITENCE *of St Magdalen*, eſtabliſhed about the year 1272 by one Bernard, a citizen of Marſeilles, who devoted himſelf to the work of converting the courtezans of that city. Bernard was ſeconded by ſeveral others; who, forming a kind of ſociety, were at length erected into a religious order by Pope Nicholas III. under the rule of St Auguſtine. F. Geſnay ſays, that they alſo made a religious order of the penitents, or women they converted, giving them the ſame rules and obſervances which they themſelves kept.

Congregation of PENITENCE *of St Magdalen at Paris*, owed its riſe to the preaching of F. Tiſſeran, a Franciſcan, who converted a vaſt number of courtezans about the year 1492. Louis duke of Orleans gave them his houſe for a monaſtery; or rather, as appears by their conſtitutions, Charles VIII. gave them the hotel called *Bochaigne*, whence they were removed to St George's chapel, in 1572. By virtue of a brief of Pope Alexander, Simon biſhop of Paris, in 1497, drew them up a body of ſtatutes, and gave them the rule of St Auguſtine. It was neceſſary, before a woman could be admitted, that ſhe had firſt committed the ſin of the fleſh. None were admitted who were above 35 years of age. Till the beginning of the laſt century, none but penitents were admitted; but ſince its reformation by Mary Alvequin, in 1616, none have been admitted but maids, who, however, ſtill retain the ancient name penitents.

PENITENTS, an appellation given to certain fraternities penitents diſtinguiſhed by the different ſhape and colour of their habits. Theſe are ſecular ſocieties, who have their rules, ſtatutes, and churches, and make public proceſſions under their particular croſſes or banners. Of theſe there are more than a hundred, the moſt conſiderable of which are as follow: the white penitents, of which there are ſeveral different ſorts at Rome, the moſt ancient of which was conſtituted in 1264; the brethren of this fraternity every year give portions to a certain number of young girls, in order to their being married: their habit is a kind of white ſackcloth, and on the ſhoulder is a circle, in the middle of which is a red and white croſs. Black penitents, the moſt conſiderable of which are the brethren of mercy, inſtituted in 1488 by ſome Florentines, in order to aſſiſt criminals during their impriſonment, and at the time of their death: on the day of execution, they walk in proceſſion before them, ſinging the ſeven penitential pſalms and the litanies; and after they are dead, they take them down from the gibbet and bury them; their habit is black ſackcloth. There are others whoſe buſineſs it is to bury ſuch perſons as are found dead in the ſtreets: theſe wear a death's head on one ſide of their habit. There are alſo blue, grey, red, green, and violet penitents; all which are remarkable for little elſe beſides the different colours of their habits. Penitents || Penitentiary.

Mabillon tells us, that at Turin there are a ſet of penitents kept in pay to walk through the ſtreets in proceſſion, and cut their ſhoulders with whips, &c.

Penitents, or *Converts of the Name of Jeſus*, a congregation of religious at Seville in Spain, conſiſting of women who had led a licentious life, founded in 1550. This monaſtery is divided into three quarters: one for profeſſed religious; another for novices; a third for thoſe who are under correction. When theſe laſt give ſigns of a real repentance, they are removed into the quarter of the novices, where, if they do not behave themſelves well, they are remanded to their correction. They obſerve the rule of St Auguſtine.

Penitents of Orvieto, are an order of nuns, inſtituted by Antony Simoncelli, a gentleman of Orvieto in Italy. The monaſtery he built was at firſt deſigned for the reception of poor girls, abandoned by their parents, and in danger of loſing their virtue. In 1662 it was erected into a monaſtery, for the reception of ſuch as, having abandoned themſelves to impurity, were willing to take up, and conſecrate themſelves to God by ſolemn vows. Their rule is that of the Carmelites.

Theſe religious have this in peculiar, that they undergo no noviciate. All required is, that they continue a few months in the monaſtery in a ſecular habit; after which they are admitted to the vows.

PENITENTIAL, an eccleſiaſtical book retained among the Romaniſts; in which is preſcribed what relates to the impoſition of penance and the reconciliation of penitents. See PENANCE.

There are various penitentials, as the Roman penitential, that of the venerable Bede, that of Pope Gregory III. &c.

PENITENTIARY, in the ancient Chriſtian church, a name given to certain preſbyters or prieſts, appointed in every church to receive the private confeſſions of the people, in order to facilitate public diſcipline, by acquainting them what ſins were to be expiated

plated by public penance, and to appoint private penance for such private crimes as were not proper to be publicly censured.

Penitentiary, at the court of Rome, is an office in which are examined and delivered out the secret bulls, graces, or dispensations relating to cases of conscience, confessions, &c.

Penitentiary, is also an officer, in some cathedrals, vested with power from the bishop to absolve, in cases reserved to him. The pope has at present his grand penitentiary, who is a cardinal, and the chief of the other penitentiary priests established in the church of Rome, who consult him in all difficult cases. He presides in the penitentiary, dispatches dispensations, absolutions, &c. and has under him a regent and 24 proctors, or advocates of the sacred penitentiary.

PENMAN-Mawr, a mountain in Caernarvonshire, 1400 feet high. It hangs perpendicularly over the sea, at so vast a height, that few spectators are able to look down the dreadful steep. On the side which is next the sea, there is a road cut out of the side of the rock, about six or seven feet wide, which winds up a steep ascent, and used to be defended on one side only by a slight wall, in some parts about a yard high, and in others by only a bank, that scarce rose a foot above the road. The sea was seen dashing its waves 40 fathoms below, with the mountain rising as much above the traveller's head. This dangerous road was a few years ago secured by a wall breast-high, to the building of which the city of Dublin largely contributed, it being in the high road to Holyhead.

PENN (Sir William), was born at Bristol in 1621, and inclined from his youth to maritime affairs. He was made captain at 21 years of age, rear-admiral of Ireland at 23, vice-admiral of Ireland at 25, admiral to the Straits at 29, vice-admiral of England at 31, and general in the first Dutch war at 32. Whence returning in 1655, he was chosen representative for the town of Weymouth; and in 1660 was made commissioner of the admiralty and navy, governor of the town and fort of Kinsale, vice-admiral of Munster, and a member of that provincial council. In 1664 he was chosen great captain-commander under the duke of York, and distinguished himself in an engagement against the Dutch fleet; after which he took leave of the sea, but continued in his other employments till 1669. He died in 1670.

Penn (William), an eminent writer among the Quakers, and the planter and legislator of Pensylvania, was the son of the above Sir William Penn, and was born at London in 1644. In 1660, he was entered a gentleman commoner of Christ-church, in Oxford; but having before received an impression from the preaching of one Thomas Loe a Quaker, withdrew with some other students from the national worship, and held private meetings, where they preached and prayed amongst themselves. This giving great offence to the heads of the college, Mr Penn, though but 16 years of age, was fined for nonconformity; and continuing his religious exercises, was at length expelled his college. Upon his return home, he was, on the same account, treated with great severity by his father, who at last turned him out of doors; but his resentment afterwards abating, he sent him to France in company with some persons of quality; where he continued a considerable time, and returned not only well skilled in the French language, but a polite and accomplished gentleman. About the year 1666, his father committed to his care a considerable estate in Ireland. Being found in one of the Quakers meetings in Cork, he, with many others, was thrown into prison; but, on his writing to the earl of Orrery, was soon discharged. However, his father being informed he still adhered to his opinions, sent for him to England, and finding him inflexible to all his arguments, turned him out of doors a second time. About the year 1668, he became a public preacher among the Quakers; and that year was committed close prisoner to the Tower, where he wrote several treatises. Being discharged after seven months imprisonment, he went to Ireland, where he also preached amongst the Quakers. Returning to England, he was in 1670 committed to Newgate, for preaching in Gracechurch-street meeting-house, London; but being tried at the sessions-house in the Old Bailey, he was acquitted. In September the same year, his father died; and being perfectly reconciled to him, left him both his paternal blessing and a plentiful estate. But his persecutions were not yet at an end; for in 1671 he was committed to Newgate for preaching at a meeting in Wheeler-street, London; and during his imprisonment, which continued six months, he also wrote several treatises. After his discharge, he went into Holland and Germany; and in the beginning of the year 1672, married and settled with his family at Rickmansworth in Hertfordshire. The same year he published several pieces; and particularly one against Reeve and Muggleton. In 1677, he again travelled into Holland and Germany in order to propagate his opinions; and had frequent conversations with the princess Elizabeth, daughter to the queen of Bohemia, and sister to the princess Sophia, mother to king Geo. I. In 1681, king Charles II. in consideration of the services of Mr Penn's father, and several debts due to him from the crown at the time of his decease, granted Mr Penn and his heirs the province lying on the west side of the river Delaware in North America, which from thence obtained the name of *Pensylvania*. Upon this Mr Penn published a brief account of that province, with the king's patent; and proposing an easy purchase of lands, and good terms of settlement for such as were inclined to remove thither, many went over. These having made and improved their plantations to good advantage, the governor, in order to secure the planters from the native Indians, appointed commissioners to purchase the land he had received from the king of the native Indians, and concluded a peace with them. The city of Philadelphia was planned and built; and he himself drew up the fundamental constitutions of Pensylvania in 24 articles. In 1681, he was elected a member of the Royal Society; and the next year he embarked for Pensylvania, where he continued about two years, and returned to England in August 1684. Upon the accession of King James to the throne, he was taken into a great degree of favour with his Majesty, which exposed him to the imputation of being a Papist; but from which he fully vindicated himself. However, upon the Revolution, he was examined before the council in 1688, and obliged to give security for his appearance on the first day of next term, which was afterwards continued. He was several times discharged

Penn.

Penn, Pennatula

charged and examined; and at length warrants being iſſued out againſt him, he was obliged to conceal himſelf for two or three years. Being at laſt permitted to appear before the king and council, he repreſented his innocence ſo effectually that he was acquitted. In Auguſt 1699, he, with his wife and family, embarked for Penſylvania; whence he returned in 1701, in order to vindicate his proprietary right, which had been attacked during his abſence. Upon Queen Anne's acceſſion to the crown, he was in great favour with her, and was often at court. But, in 1707, he was involved in a lawſuit with the executors of a perſon who had been formerly his ſteward; and, though many thought him aggrieved, the court of chancery did not think proper to relieve him; upon which account he was obliged to live within the rules of the Fleet for ſeveral months, till the matter in diſpute was accommodated. He died in 1718.

At one period of his life, Penn lodged in a houſe in Norfolk-ſtreet in the Strand. In the entrance to it he had a peeping-hole, through which he could ſee any perſon that came to him. A creditor one day ſent in his name, and having been made to wait more than a reaſonable time, he knocked for the ſervant, whom he aſked, "Will not thy maſter ſee me?" "Friend (anſwered the ſervant) he has ſeen thee, but he does not like thee."

Mr Penn's friendly and pacific manner of treating the Indians produced in them an extraordinary love for him and his people; ſo that they have maintained a perfect amity with the Engliſh in Penſylvania ever ſince. He was the greateſt bulwark of the Quakers; in whoſe defence he wrote numberleſs pieces. Beſides the above works, he wrote a great number of others; the moſt eſteemed of which are, 1. His Primitive Chriſtianity revived. 2. His defence of a paper, intitled *Goſpel Truths, againſt the Exceptions of the Biſhop of Cork.* 3. His Perſuaſive to Moderation. 4. His Good Advice to the Church of England, Roman Catholic, and Proteſtant Diſſenter. 5. The Sandy Foundation ſhaken. 6. No Croſs, no Crown. 7. The great Caſe of Liberty of Conſcience debated. 8. The Chriſtian Quaker and his Teſtimony ſtated and vindicated. 9. A Diſcourſe of the general Rule of Faith and Practice, and Judge of Controverſy. 10. England's Preſent Intereſt conſidered. 11. An Addreſs to Proteſtants. 12. His Reflections and Maxims. 13. His Advice to his Children. 14. His Riſe and Progreſs of the People called *Quakers.* 15. A Treatiſe on Oaths. Moſt of theſe have paſſed ſeveral editions, ſome of them many. The letters between William Penn and Dr Tillotſon, and William Penn and William Popple, Eſq; together with Penn's letters to the princeſs Elizabeth of the Rhine, and the counteſs of Hornes, as alſo one to his wife on his going to Penſylvania, are inſerted in his works, which were firſt collected and publiſhed in 2 vols folio; and the parts ſince ſelected and abridged into 1 vol. folio, are very much and deſervedly admired for the good ſenſe they contain.

PENNATULA, or SEA-PEN, in natural hiſtory, a genus of zoophyte, which, though it ſwims about freely in the ſea, approaches near to the gorgonia. This genus hath a bone along the middle of the inſide, which is its chief ſupport; and this bone receives the ſupply of its oſſeous matter by the ſame polype mouths that furniſh it with nouriſhment. Linnæus reckons ſeven ſpecies. The name *zoophytes* under which this genus is ranked, it is well known ſignifies, that the creature partakes both of the animal and vegetable nature; but ſome have ſuppoſed it to be nothing more but a fucus or ſea plant. It is certainly an animal, however, and as ſuch is free or locomotive. Its body generally expands into proceſſes on the upper parts, and theſe proceſſes or branches are furniſhed with rows of tubular denticles: they have a polype head proceeding from each tube.

The ſea-pen is not a coralline, but diſtinguiſhed from it by this ſpecific difference, corals, corallines, alcyoonia, and all that order of beings, adhere firmly by their baſes to ſubmarine ſubſtances, but the ſea-pen either ſwims about in the water or floats upon the ſurface.

The Honourable Dr Coote Moleſworth lately ſent one of theſe animals to the ingenious Mr Ellis, the author of many curious papers on the nature of corallines, which was taken in a trawl in 72 fathoms water, near the harbour of Breſt in France: the ſame ſpecies are frequently found in the ocean from the coaſt of Norway to the Mediterranean ſea, ſometimes at conſiderable depths, and ſometimes floating on the ſurface. Mr Ellis's deſcription of that ſent him by Dr Moleſworth is as follows:

Its general appearance greatly reſembles that of a quill feather of a bird's wing (ſee Plate CCCLXXXVIII. fig. 1.); it is about four inches long, and of a reddiſh colour; along the back there is a groove from the quill part to the extremity of the feathered part, as there is in a pen; the feathered part conſiſts of fins proceeding from the ſtem, as expreſſed in the figure. The fins move the animal backward and forward in the water, and are furniſhed with ſuckers or mouths armed with filaments, which appear magnified as fig. 2. There is no perforation at the bottom, and therefore Mr Ellis is of opinion, that the exuvia of the animals upon which it feeds are diſcharged by the ſame apertures at which the food is taken in; and in this it is not ſingular, Nature having obſerved the ſame œconomy in the Greenland polype, deſcribed by Mr Ellis in his Eſſay on Corallines. Each ſucker has eight filaments, which are protruded when prey is to be caught; but at other times they are drawn back into their caſes, which are furniſhed at the end with *ſpiculæ*, that cloſe together round the entrance, and defend this tender part from external injuries.

Dr Bohadſch of Prague had an opportunity of obſerving one of theſe animals alive in the water, and he gives the following account of what he ſaw: "A portion of the ſtem contracted, and became of a ſtrong purple colour, ſo as to have the appearance of a ligature round it; this apparent ligature, or zone, moved upwards and downwards ſucceſſively through the whole length of the ſtem, as well the feathered as the naked part; it began at the bottom, and moving upwards to the other extremity, it there diſappeared, and at the ſame inſtant appeared again at the bottom, and aſcended as before; but as it aſcended through the feathered or pinnated part, it became paler. When this zone is much conſtricted, the trunk above it ſwells, and acquires the form of an onion; the conſtriction

friction of the trunk gives the colour to the zone, for the intermediate parts are paler in porportion as the zone becomes deeper. The end of the naked trunk is sometimes curved like a hook; and at its extremity there is a sinus or chink, which grows deeper while the purple ring is ascending, and shallower as it is coming down. The fins have four motions, upward and downward, and backward and forward, from right to left, and from left to right. The fleshy filaments, or claws, move in all directions; and with the cylindrical part from which they proceed are sometimes protruded from the fins, and sometimes hidden with them.

Upon dissecting this animal the following phenomena were discovered. When the trunk was opened lengthwise, a saltish liquor flowed out of it, so viscid as to hang down an inch. The whole trunk of the stem was found to be hollow, the outward membrane being very strong, and about a tenth part of an inch thick: within this membrane appeared another much thinner; and between these two membranes, in the pinnated part of the trunk, innumerable little yellowish eggs, about the size of a white poppy-seed, were seen floating in a whitish liquor; about three parts of the cavity within the inner membrane is filled by a kind of yellowish bone: this bone is about two inches and an half long, and one twentieth of an inch thick; in the middle it is four square, but towards the ends it grows round and very taper, that end being finest which is next the pinnated part of the trunk. This bone is covered in its whole length with a clear yellowish skin, which at each end runs out into a ligament; one is inserted in the top of the pinnated trunk, and the other in the top of the naked trunk: by the help of the upper ligament the end of the bone is either bent into an arch, or disposed in a straight line. The fins are composed of two skins; the outward one is strong and leathery, and covered over with an infinite number of crimson streaks; the inner skin is thin and transparent: the suckers are also in the same manner composed of two skins, but the outward skin is something softer. Both the fins and suckers are hollow, so that the cavity of the suckers may communicate with those of the fins, as the cavity of the fins does with that of the trunk.

Dr Shaw, in the History of Algiers, says, that these animals are so luminous in the water, that in the night the fishermen discover fishes swimming about in various depths of the sea by the light they give: From this extraordinary quality Linnæus calls this species of the sea-pen, *pennatula phosphorea*, and remarks, after giving the synonems of other authors, *Habitat in oceano fundum illuminans.*

There are other kinds of sea-pens, or species of this animal, which have not a resemblance to a pen. There is the kidney shaped sea-pen (see fig. 3.), the feather of the peacock fish (see fig. 4.), the pennatula filosa of Linnæus (see fig. 5.), his pennatula sagita (see fig. 6.), his pennatula mirabilis (see fig. 7.), and the finger-shaped sea-pen (see fig. 8.). The kidney-shaped sea-pen was discovered some time ago on the coast of South Carolina, and sent to Mr Ellis by John Gregg, Esq; of Charlestown. It is of a fine purple colour; the kidney part is about an inch from end to end, and about half an inch wide in the narrowest part; a tail proceeds from the middle of the body, which is roundish, and about an inch long; is also full of rings like an earth-worm, and along the middle both of the upper and under part of it there is a small groove which runs from one end to the other, but there is no perforation at either extremity. The upper part of the body is convex, and about an inch thick; the whole surface is covered with small yellow starry openings, through which little suckers are protruded, each furnished with six tentacula, or filaments, like what are observed on some corals; the under part of the body is quite flat, and is full of ramifications of fleshy fibres, which proceeding from the insertion of the tail, as a common centre, branch out so as to communicate with the starry openings on the exterior edge and upper surface of the animal. Of all the pennatulæ yet known the feather-shaped one, or as it is called the *silver sea-pen* (see fig. 1), is the largest as well as the most specious in its appearance. It is of a beautiful silvery white, elegantly striated on each of the feather-like processes with lines or streaks of the deepest black. It is very rare, and is a native of the Indian seas. There is a very fine specimen of this species in the British Museum.

Penni, Penny.

PENNI (Giovanni Francisco), born at Florence in 1488, was the disciple of Raphael, who observing his genius and integrity, intrusted his domestic concerns entirely to his management; by which means he got the appellation of *il fatore*, or the "steward," which he retained ever after. The genius of Penni was universal; but his greatest pleasure was in painting landscapes and buildings: he was an excellent designer, and coloured extremely well in oil, distemper, and fresco. He painted portraits in an exquisite style; and had such happy natural talents, that Raphael left him heir to his fortune in partnership with Julio Romano his fellow-disciple. After Raphael's death, Penni painted many pictures at Rome, particularly in the palace of Chigi, so exactly in the style of his master, that they might not undeservedly have been imputed to him: he finished, in conjunction with Julio and Pierino del Vaga, the celebrated designs of the battles of Constantine, and others, which Raphael had left imperfect; but differing with them about a copy of the transfiguration, which the pope intended for the king of France, they separated. Penni went to Naples; but the air of that country disagreeing with his constitution, he died soon after in 1528. He had a brother called *Lucca Penni*, who worked at Genoa and other parts of Italy in conjunction with Pierino del Vaga, who married his sister; he went thence to England, where he worked for Henry VIII. and for several merchants; was employed by Francis I. at Fountainbleau; but at last quitted the pencil, and devoted himself to engraving.

PENNY, or Peny, in commerce, an ancient English coin, which had formerly considerable course; but is now generally dwindled into an imaginary money, or money of account. Camden derives the word from the Latin *pecunia*, "money."

The ancient English penny, penig, or pening, was the first silver coin struck in England; nay, and the only one current among our Saxon ancestors: as is agreed by Camden, Spelman, Dr Hicks, &c.

The penny was equal in weight to our three-pence; five of them made one shilling, or scilling Saxon; 30 a mark or mancuse, equal to our 7 *s.* 6*d.*

Till the time of King Edw. I. the penny was struck with a cross, so deeply indented in it, that it might be

easily

Penny, Penrith.

eaſily broke, and parted, on occaſion, into two parts, thence called *half-pennies*; or into four, thence called *fourthings*, or *farthings*.—But that prince coined it without indenture; in lieu of which, he firſt ſtruck round halfpence and farthings.

He alſo reduced the weight of the penny to a ſtandard; ordering that it ſhould weigh 32 grains of wheat, taken out of the middle of the ear.—This penny was called the *penny ſterling*.—Twenty of theſe pence were to weigh an ounce; whence the penny became a weight as well as a coin. See STERLING and *Penny-Weight*.

The penny Perling is now nigh diſuſed as a coin; and ſcarce ſubſiſts, but as a money of account, containing the twelfth part of a ſhilling, or the 140th part of a pound.

PENNY, in ancient ſtatutes, &c. is uſed for all ſilver money. And hence the *ward-penny*, *aver-penny*, *hundred-penny*, *tithing-penny*, and *brothal-penny*.

Penny-Weight, a Troy weight, containing 24 grains; each grain weighing a grain of wheat gathered out of the middle of the ear, well dried. The name took its riſe hence, that this was anciently the weight of one of our ancient ſilver pennies. See PENNY.

Twenty of theſe penny-weights make an ounce Troy.

PENRITH, an ancient town of the county of Cumberland in England, ſeated under a hill called *Penrith-Fell*, near the rivers Eamont and Lowther. It is a great thoroughfare for travellers; but has little other trade, except tanning, and a ſmall manufacture of checks. Formerly it had a caſtle, but it is now in ruins. In the church-yard is a monument of great antiquity, conſiſting of two ſtone-pillars 11 feet 6 inches high, and 5 in circumference in the lower part, which is rounded; the upper is ſquare, and tapers to a point; in the ſquare part is ſome fret-work, and the relievo of a croſs; and on the interior ſide of one is the ſaint repreſentation of ſome animal. But theſe ſtones are mortiſed at their lower part into a round one: they are about 15 feet aſunder, and the ſpace between them is incloſed on each ſide with two very large but thin ſemicircular ſtones; ſo that there is left between pillar and pillar a walk of two feet in breadth. Two of theſe leſſer ſtones are plain, the others have certain figures, at preſent ſcarce intelligible. Not far from theſe pillars is another called the *giant's thumb*, five feet eight inches high, with an expanded head, perforated on both ſides; from the middle the ſtone riſes again into a leſſer head, rounded at top; but no part has a tendency to the figure of a croſs, being in no part mutilated. The pillars are ſaid to have been ſet up in memory of Sir Owen Cæſarius, a famous warrior buried here, who killed ſo many wild bears, which much infeſted this county, that the figures of bears, cut out in ſtone, on each ſide of his grave, were ſet there in remembrance of the execution he made among thoſe beaſts; and it is likewiſe ſaid his body extended from one pillar to the other. In the market-place there is a town-houſe of wood, beautified with bears climbing up a ragged ſtaff. There is a memorandum on the north ſide of the veſtry without, that, in 1598, 2266 perſons died here of the plague. There is a charity ſchool in this place for 20 boys, and another for 30 girls, maintained by 55l. a year, by the ſacrament-money and pariſh-ſtock. In 1715 the Scotch Highlanders entered this town, and quartered in it for a night, in their way to Preſton, without doing much harm; but in the laſt rebellion, in 1745, they were, it is ſaid, very rapacious and cruel. Its handſome ſpacious church has been lately rebuilt, and the roof ſupported by pillars, whoſe ſhafts are of one entire reddiſh ſtone, dug out of a neighbouring quarry. On the eaſt part of the pariſh, upon the north bank of the river Eamont, there are two caves or grottoes, dug out of the ſolid rock, and ſufficient to contain 100 men. The paſſage to them is very narrow and dangerous; and it is poſſible that its perilous acceſs may have given it the name of *Iſis Pardis*; though the vulgar tell ſtrange ſtories of one Iſis, a giant, who lived there in former times, and, like Cacus of old, uſed to ſeize men and cattle, and draw them into his den to devour them. But it is highly probable, that theſe ſubterraneous chambers were made for a ſecure retreat in time of ſudden danger; and the iron gates, which were taken away not long ago, ſeem to confirm that ſuppoſition. W. Long. 3. 16. N. Lat. 54. 35.

PENROSE (Thomas), was the ſon of the Reverend Mr Penroſe, rector of Newbury, Berks, a man of high character and abilities, deſcended from an ancient Corniſh family, beloved and reſpected by all who knew him. Mr Penroſe, jun. being intended for the church, purſued his ſtudies with ſucceſs, at Chriſt-church, Oxon, until the ſummer of 1762, when his eager turn to the naval and military line overpowering his attachment to his real intereſt, he left his college, and embarked in the unfortunate expedition againſt Nova Colonia, in South America, under the command of Captain Macnamara. The iſſue was fatal. The Clive (the largeſt veſſel) was burnt; and though the Ambuſcade eſcaped (on board of which Mr Penroſe, acting as lieutenant of marines, was wounded), yet the hardſhips which he afterwards ſuſtained in a prize ſloop, in which he was ſtationed, utterly ruined his conſtitution. Returning to England with ample teſtimonials of his gallantry and good behaviour, he finiſhed, at Hertford College, Oxon, his courſe of ſtudies; and having taken orders, accepted the curacy of Newbury, the income of which, by the voluntary ſubſcription of the inhabitants, was conſiderably augmented. After he had continued in that ſtation about nine years, it ſeemed as if the clouds of diſappointment, which had hitherto overſhadowed his proſpects, and tinctured his poetical eſſays with gloom, were clearing away; for he was then preſented by a friend, who knew his worth and honoured his abilities, to a living worth near 500l. *per annum*. It came, however, too late; for the ſtate of Mr Penroſe's health was now ſuch as left little hope, except in the aſſiſtance of the waters of Briſtol. Thither he went; and there he died in 1779, aged 36 years. In 1768 he married Miſs Mary Slocock of Newbury, by whom he had one child, Thomas, who was educated at Winton College.

Mr Penroſe was reſpected for his extenſive erudition, admired for his eloquence, and equally beloved and eſteemed for his ſocial qualities. By the poor, towards whom he was liberal to his utmoſt ability, he was venerated to the higheſt degree. In oratory and compoſition his talents were great. His pencil was ready as his pen, and on ſubjects of humour had uncommon merit. To his poetical abilities the public, by their

reception of his Flights of Fancy, &c. have given a favourable teſtimony. To ſum up the whole, his figure and addreſs were as pleaſing as his mind was ornamented.

PENRYN, a town of Cornwall, in England, ſeated on a hill at the entrance of Falmouth-haven by Pendennis caſtle. It conſiſts of about 300 houſes; and the ſtreets are broad and well paved. There are ſo many gardens and orchards in it, that it reſembles very much a town in a wood. It is well watered with rivulets, and has an arm of the ſea on each ſide of it, with a good cuſtomhouſe and quay, and other neat buildings. It drives a conſiderable trade in pilchards, and in the Newfoundland fiſhery. It was anciently governed by a portreeve; but James I. made it a corporation, conſiſting of a mayor, 11 aldermen, 12 common councilmen, with a recorder, ſteward, &c. an office of record every three weeks, with a priſon, and power to try felons in their juriſdiction. And he granted, that the mayor and two aldermen ſhould be juſtices of the peace, and that they ſhould have a guildhall. There was once a monaſtery in this place, which was a cell to Kirton; and there are ſtill to be ſeen a tower, and part of the garden walls, the ruins of a collegiate church. It has neither church nor chapel, but belongs to the pariſh of Gluvias, a quarter of a mile off. It has ſent members to parliament ever ſince the firſt year of Queen Mary; and James II. granted it a new charter, whereby their election was veſted in the magiſtracy only; but it was never made uſe of, all the inhabitants that pay ſcot and lot, who are not much above 100, being the electors. Mr Rymer gives a very remarkable account how Penryn was once ſaved by a company of ſtrolling players. He ſays, that towards the latter end of the 16th century the Spaniards were landing to burn the town juſt as the players were ſetting Samſon upon the Philiſtines; which performance was accompanied with ſuch drumming and ſhouting, that the Spaniards thought ſome ambuſh was laid for them, and ſcampered back to their ſhips. Queen Elizabeth founded a free-ſchool in this place. W. Long. 5. 35. N. Lat. 50. 23.

PENSACOLA, a ſettlement in North America, ſituated at the mouth of a river on the gulf of Mexico. It was eſtabliſhed by the French, and ceded to Great Britain in 1763. Its firſt diſcoverer was Sebaſtian Cabot in 1497.

The year 1781, ſo diſaſtrous to Britain in other reſpects, was alſo remarkable for the reduction of Penſacola by the Spaniards under Don Bernardo Galvez. Great preparations for this expedition had been making at the Havannah; but it was for ſome time retarded by a dreadful hurricane which attacked the Spaniſh fleet, and by which four ſhips of the line, beſides others of inferior force, were loſt, together with the people on board, to the amount of more than 2000. By this diſaſter the remainder were obliged to put back to the Havannah to repair; but as ſoon as the fleet was again judged capable of putting to ſea, an embarkation was made of near 8000 men, with Don Bernardo at their head, together with five ſhips of the line, who arrived at Penſacola on the 9th of March 1781. This force was ſoon augmented by ten ſhips of the line and ſix frigates; while General Campbell, the Britiſh governor, could oppoſe ſuch a formidable armament with few more than 1000 men, conſiſting of ſome regulars and ſeamen, with the inhabitants. The entrance of the harbour, which was the principal object of defence, was guarded by two ſmall armed veſſels, but they were inſufficient to ſecond the batteries that had been erected for its protection; and theſe, without the aſſiſtance of ſome ſhips of force, were incapable of reſiſting a vigorous attack. Notwithſtanding this prodigious odds, however, the Spaniards met with the moſt determined oppoſition. Every inch of ground was diſputed with the greateſt reſolution. The harbour was not forced without the greateſt difficulty, nor could the veſſels be taken that defended it; the companies belonging to them, after ſetting them on fire, retired on ſhore. Penſacola, Entrance.

The Spaniards, now in poſſeſſion of the harbour, inveſted the place in form, and made their approaches in a cautious and regular manner; while, on the other hand, the beſieged were no leſs active and vigilant in their own defence. Sallies were made occaſionally with great ſucceſs, at the ſame time that an uninterrupted fire was kept up in ſuch a manner as not only greatly to annoy, but even to ſtrike the beſiegers with aſtoniſhment. This incenſed the Spaniſh general the more, as he knew that the garriſon could expect no relief, and therefore that all their efforts could only prolong the date of their ſurrender. The reſiſtance was the more mortifying, as he was perfectly conſcious of the bravery of his troops; and he had artillery fit, as his officers expreſſed themſelves, "to be employed againſt Gibraltar." With all theſe advantages, however, ſo reſolute was the defence of the garriſon, that after the ſiege had continued for two months, very little hope could be entertained of its ſpeedy termination. As they deſpaired therefore of making any effectual impreſſion by means of their cannon, they erected a battery of mortars, with which they bombarded a redoubt that commanded the main avenue to the place; and in this they were favoured by an unexpected accident. On the 8th of May a ſhell burſt open the door of the powder magazine under the redoubt, by which it was blown up, with the loſs of near 100 men killed and wounded. Fortunately for the garriſon, however, two flank-works ſtill remained entire, from both which ſo heavy a fire was kept up, that though an aſſault was immediately given, the aſſailants were repulſed with great ſlaughter. This afforded leiſure to the garriſon to carry off the wounded men, with ſome of the artillery, and to ſpike up the reſt. As the enemy, however, ſoon recovered themſelves, and prepared for a general ſtorm, it was thought proper to abandon the flank works, and retire into the body of the place. The poſſeſſion of theſe outworks, however, gave the enemy ſuch advantages, that the place was no longer tenable. Their ſituation, on a riſing ground, enabled them to command the battery oppoſite to their chief approach with ſmall arms, and to ſingle out the men at their guns. A capitulation therefore became abſolutely neceſſary, which was obtained on honourable terms. The town, with the whole province of Weſt Florida, was confirmed to the Spaniards by the treaty of 1783. W. Long. 87. 20. N. Lat. 30. 22.

PENSANCE, a town of Cornwall, in England, at the bottom of Mountſbay, about ten miles from the Land's End. It was burnt in 1595 by the Spaniards,

Penſiles, Penſilvania.

who, with four galleys, ſurpriſed this part of the coaſt, and ſet fire to ſeveral villages and farms: but it was ſoon after rebuilt, made one of the coinage towns, and has now a conſiderable trade. It lies in the pariſh of Malvern, noted for its reſtorative ſpring, very effectual in the cure of lameneſs as well as the cholic, &c. It is well built and populous, and has many ſhips belonging to it. The ſhore abounds ſo with lead, tin, and copper ore, that the veins thereof appear on the utmoſt extent of land at low-water mark.

PENSILIS HORTI, *Hanging Gardens*, in antiquity. See BABYLON, n° 5.

PENSILVANIA, late one of the principal Britiſh colonies in North America, had its name from the famous Quaker William Penn, ſon of Sir William, commander of the Engliſh fleet in Oliver Cromwell's time, and in the beginning of Ch. II.'s reign, who obtained a grant of it in the year 1679; is bounded on the eaſt by Delaware bay and river, and the Atlantic ocean; on the north by the country of the Iroquois, or five nations; and on the ſouth and weſt by Maryland. Its extent from north to ſouth is about 200 miles; but its breadth varies greatly, from 15, and even leſs, to near 200.

The air in Penſilvania is ſweet and clear. The fall, or autumn, begins about the 20th of October, and laſts till the beginning of December, when the winter ſets in, which continues till March, and is ſometimes extremely cold and ſevere; but the air is then generally dry and healthy. The river Delaware, though very broad, is often frozen over. From March to June, that is, in the ſpring, the weather is more inconſtant than in the other ſeaſons. In the months of July, Auguſt, and September, the heats would be almoſt intoleruble, if they were not mitigated by frequent cool breezes. The wind during the ſummer is generally ſouth-weſt; but in the winter blows for the moſt part from the north-weſt, over the ſnowy frozen mountains and lakes of Canada, which occaſions the exceſſive cold during that ſeaſon. On the whole, the climate of this ſtate differs not materially from that of Connecticut, except that on the weſt ſide of the mountains the weather is much more regular. The inhabitants never feel thoſe quick tranſitions from cold to heat, by a change of the wind from north to ſouth, as thoſe ſo frequently experience who live eaſtward of the mountains and near the ſea. The hot ſouthwardly winds get chilled by paſſing over the long chain of Allegany mountains.

Longevity, when toleral lyaſcertained, is doubtleſs the trueſt mark of the healthineſs of any country; but this ſtate, which has not been ſettled above 100 years, is not ſufficiently old to determine from facts the ſtate of longevity. Among the people called Quakers, who are the oldeſt ſettlers, there are inſtances of longevity, occaſioned by their living in the old cultivated counties, and the temperance impoſed on them by their religion. There are fewer long-lived people among the Germans than among other nations, occaſioned by their exceſs of labour and low diet. They live chiefly upon vegetables and watery food, that affords too little nouriſhment to repair the waſte of their ſtrength by hard labour. Nearly one half of the children born in Philadelphia die under two years of age, and chiefly with a diſeaſe in the ſtomach and bowels. Very few die at this age in the country. Penſilva

As to the face of this country, towards the coaſt, like the adjacent colonies, it is flat, but riſes gradually to the Apalachian mountains on the weſt. As much as nearly one third of this ſtate may be called mountainous; particularly the counties of Bedford, Huntingdon, Cumberland, part of Franklin, Dauphin, and part of Bucks and Northampton, through which paſs, under various names, the numerous ridges and ſpurs, which collectively form what we chooſe to call, for the ſake of clearneſs, *the great range of Allegany mountains*. There is a remarkable difference between the country on the eaſt and weſt ſide of the range of mountains we have juſt been deſcribing. Between theſe mountains and the lower falls of the rivers which run into the Atlantic, not only in this, but in all the ſouthern ſtates, are ſeveral ranges of ſtones, ſand, earths, and minerals, which lie in the utmoſt confuſion. Beds of ſtone, of vaſt extent, particularly of limeſtone, have their ſeveral layers broken in pieces, and the fragments thrown confuſedly in every direction. Between theſe lower falls and the ocean is a very extenſive collection of ſand, clay, mud, and ſhells, partly thrown up by the waves of the ſea, partly brought down by floods from the upper county, and partly produced by the decay of vegetable ſubſtances. The country weſtward of the Allegany mountains, in theſe reſpects, is totally different. It is very irregular, broken, and variegated, but there are no mountains; and when viewed from the moſt weſtern ridge of the Allegany, it appears to be a vaſt extended plain. All the various ſtrata of ſtone appear to have lain undiſturbed in the ſituation wherein they were firſt formed. The layers of clay, ſand, and coal, are nearly horizontal. Scarcely a ſingle inſtance is to be found to the contrary. Every appearance, in ſhort, tends to confirm the opinion, that the original cruſt, in which the ſtone was formed, has never been broken up on the weſt ſide of the mountains, as it evidently has been eaſtward of them.

The chief rivers are three, Delaware, Suſquehanna, and Skoolkil. The Delaware, riſing in the country of the Iroquois, takes its courſe ſouthward; and after dividing this province from that of New Jerſey, falls into the Atlantic ocean between the promontories or capes May and Henlopen, forming at its mouth a large bay, called from the river *Delaware Bay*. This river is navigable above 200 miles. The Suſquehanna riſes alſo in the country of the Iroquois, and running ſouth through the middle of the province, falls into the bay of Cheſapeake, being navigable a great way for large ſhips. The Skoolkil has its ſource in the ſame country as the other two, and alſo runs ſouth, almoſt parallel to them; till at length, turning to the eaſtward, it falls into the Delaware at the city of Philadelphia. It is navigable for boats above 100 miles. Theſe rivers, with the numerous creeks and harbours in Delaware bay, capable of containing the largeſt fleets, are extremely favourable to the trade of this province.

As to the ſoil, produce, and traffic of Penſilvania, we refer the reader to the articles NEW-YORK and the JERSEYS, ſince what is there ſaid on thoſe heads is equally applicable to this province; and if there is any difference, it is on the ſide of this province. They have

Pensilvania. have some rice here, but in no great quantities; and some tobacco, but it is not equal to that of Virginia. From the premiums offered by the society of arts in London, it appears that the soil and climate of this province are looked upon as proper for the cultivation of some species of vines. The trade carried on from hence and the other colonies to the French and Dutch islands and Surinam, was greatly to the disadvantage of Britain, and very destructive to the sugar-colonies: for they take molasses, rum, and other spirits, with a great many European goods, from these foreigners; carrying them horses, provisions, and lumber in return; without which the French could not carry on their sugar-manufactures to that advantage they do.

New York, the Jerseys, and Pensilvania, were discovered, with the rest of the continent of North America, in the reign of Henry VII. by Sebastian Cabot, for the crown of England; but Sir Walter Raleigh was the first adventurer that attempted to plant colonies on these shores, in the reign of Queen Elisabeth; and, in honour of that princess, gave all the eastern coast of North America the name of *Virginia*. Mr Hudson, an Englishman, sailing to that part of the coast which lies between Virginia and New England, in the beginning of the reign of James I. and being about to make a settlement at the mouth of Hudson's river, the Dutch gave him a sum of money to dispose of his interest in this country to them. In the year 1608 they began to plant it; and, by virtue of this purchase, laid claim to all those countries which are now denominated *New York*, *New Jersey*, and *Pensilvania*; but there remaining some part of this coast which was not planted by the Hollanders, the Swedes sent a fleet of ships thither, and took possession of it for that crown; but the Dutch having a superior force in the neighbourhood, compelled the Swedes to submit to their dominion, allowing them, however, to enjoy the plantations they had settled. The English not admitting that either the Dutch or Swedes had any right to countries first discovered and planted by a subject of England, and part of them at that time possessed by the subjects of Great Britain, under charter from Queen Elisabeth and King James I. King Charles II. during the first Dutch war in 1664, granted the countries of New York, the Jerseys, and Pensilvania, of which the Dutch had usurped the possession, to his brother James Duke of York; and Sir Robert Carr being sent over with a squadron of men of war and land forces, and summoning the Dutch governor of the city of New Amsterdam, now New York, to surrender, he thought fit to obey the summons, and yield that capital to the English: the rest of the places in the possession of the Dutch and Swedes followed his example; and these countries were confirmed to the English by the Dutch at the next treaty of peace between the two nations. The Duke of York afterwards parcelled them out to under proprietors; selling, in particular, to William Penn the elder, in 1683, the town of Newcastle, *alias* Delaware, and a district of 12 miles round the same; to whom, his heirs and assigns, by another deed of the same date, he made over all that tract of land from 12 miles south of Newcastle to the Whore hills, otherwise called *Cape Henlopen*, now divided into the two counties of Kent and Sussex, which, with Newcastle district, are commonly known by the name of the *Three Lower Counties upon Delaware River*. All the rest of the under-proprietors, some time after, surrendered their charters to the crown; whereby New York and the Jerseys became royal governments; but Penn retained that part of the country which had been sold to him by the Duke of York, together with what had been granted to him before in 1680-1, which now constitutes the province of Pensilvania. As soon as Penn had got his patent, he began to plant the country. Those who went over from England were generally Dissenters and Quakers, whose religion is established by law here, but with a toleration of all other Protestant sects. The Dutch and Swedes, who were settled here before Mr Penn became proprietor, choosing still to reside in this country, as they did in New York and the Jerseys, obtained the same privileges as the rest of his majesty's subjects; and their descendants are now in a manner the same people with the English, speaking their language, and being governed by their laws and customs. Mr Penn, however, not satisfied with the title granted him by King Charles II. and his brother, bought the lands also of the Indians for a valuable consideration, or what they esteemed such (though 20 miles were purchased, at first, for less than an acre about Philadelphia would pay now), paying them in cloth, tools, and utensils, to their entire satisfaction; for they had not hands to cultivate the hundredth part of their lands, and if they could have raised a product, there was nobody to buy: the purchase, therefore, was all clear gain to them; and, by the coming of the English, their paltry trade became so profitable, that they soon found their condition much altered for the better; and are now as well clothed and fed as the European peasantry in many places. Pensilvania.

Pensilvania is one of the most flourishing colonies in North America, having never had any quarrel with the natives. Whenever they desire to extend their settlements, they purchase new lands of the sachems, never taking any by force; but the Indians now set a very high price upon their lands, in comparison of what they did at first, and will hardly part with them at any rate. In an estimate of the proprietary estate of the province, published above 40 years ago, we find, that the proprietaries, who alone can purchase lands here from the natives, had bought seven millions of acres for no more than 7501. sterling, which the proprietaries afterwards sold at the rate of 151. for every 100 acres. The Indian council at Onandago, however, disapproved of their deputies parting with so much land; and, in the year 1755, obliged the proprietaries to reconvey great part of the same to the Indians.

A dispute subsisted a long time between the proprietaries of this province and Lord Baltimore, proprietary of Maryland, about the right to certain lands; which was at last amicably adjusted, though greatly in favour of the Penns.

About the year 1704 there happened some alteration in the constitution of the province. The establishment that took place, and subsisted till the American war broke out, consisted of a governor, council, and assembly, each with much the same power and privileges as in the neighbouring colony of New York. The lieutenant governor and council were appointed

Penſilvania. by the proprietors Thomas and Richard Penn, with his majeſty's approbation; but if the laws enacted here were not repealed within ſix months after they had been preſented to the king for his approbation or diſallowance, they were not repealable by the crown after that time. Penſilvania

By the preſent conſtitution of Penſilvania, which was eſtabliſhed in September 1776, all legiſlative powers are lodged in a ſingle body of men, which is ſtyled, *The general aſſembly of repreſentatives of the freemen of Penſilvania*. The qualification required to render a perſon eligible to this aſſembly is, two years reſidence in the city or county for which he is choſen. The qualifications of the electors are, full age, and one year's reſidence in the ſtate, with payment of public taxes during that time. But the ſons of freeholders are intitled to vote for repreſentatives, without any qualification except full age. No man can be elected as a member of the aſſembly more than four years in ſeven. The repreſentatives are choſen annually on the ſecond Tueſday in October, and they meet on the fourth Monday of the ſame month. The ſupreme executive power is lodged in a preſident, and a council conſiſting of a member from each county. The preſident is elected annually by the joint ballot of the aſſembly and council, and from the members of council. A vice-preſident is choſen at the ſame time. The counſellors are choſen by the freemen every third year; and having ſerved three years, they are ineligible for the four ſucceeding years. The appointments of one third only of the members expire every year; by which rotation no more than one third can be new members.

With reſpect to population, Morſe informs us, that in 1787 the inhabitants in Penſilvania were reckoned at 360,000. It is probable they are now more numerous, perhaps 400,000. If we fix them at this, the population for every ſquare mile will be only nine; by which it appears that Penſilvania is only one fifth as populous as Connecticut. But Connecticut was ſettled nearly half a century before Penſilvania; ſo that in order to do juſtice to Penſilvania in the compariſon, we muſt anticipate her probable population 50 years hence. Theſe inhabitants conſiſt of emigrants from England, Ireland, Germany, and Scotland. The Friends and Epiſcopalians are chiefly of Engliſh extraction, and compoſe about one third of the inhabitants. They live principally in the city of Philadelphia, and in the counties of Cheſter, Philadelphia, Bucks, and Montgomery. The Iriſh are moſtly Preſbyterians. Their anceſtors came from the north of Ireland, which was originally ſettled from Scotland; hence they have ſometimes been called Scotch Iriſh, to denote their double deſcent. But they are commonly and more properly called Iriſh, or the deſcendants of people from the north of Ireland. They inhabit the weſtern and frontier counties, and are numerous. The Germans compoſe one quarter at leaſt, if not a third, of the inhabitants of Penſilvania. They inhabit the north parts of the city of Philadelphia, and the counties of Philadelphia, Montgomery, Bucks, Dauphin, Lancaſter, York, and Northampton; moſtly in the four laſt. They conſiſt of Lutherans (who are the moſt numerous ſect), Calviniſts, Moravians, Mennoniſts, Tunkers (corruptly called Dunkers), and Swingfelters, who are a ſpecies of Quakers. Theſe are all diſtinguiſhed for their temperance, induſtry, and economy. The Germans have uſually 15 of 69 members in the aſſembly: and ſome of them have ariſen to the firſt honours in the ſtate, and now fill a number of the higher offices. Yet the lower claſs are very ignorant and ſuperſtitious. It is not uncommon to ſee them going to market with a little bag of ſalt tied to their horſes manes, for the purpoſe, they ſay of keeping off the witches.

The Baptiſts (except the Mennoniſt and Tunker Baptiſts, who are Germans) are chiefly the deſcendants of emigrants from Wales, and are not numerous. A proportionate aſſemblage of the national prejudices, the manners, cuſtoms, religions, and political ſentiments of all theſe, will form the Penſilvania character. As the leading traits in this character, thus conſtituted, we may venture to mention induſtry, frugality bordering in ſome inſtances on parſimony, enterpriſe, a taſte and ability for improvements in mechanics, in manufactures, in agriculture, in commerce, and in the liberal ſciences; temperance, plainneſs, and ſimplicity in dreſs and manners: pride and humility in their extremes; inoffenſiveneſs and intrigue; in regard to religion, variety and harmony; liberality, and its oppoſites, ſuperſtition and bigotry; and in politics an unhappy jargon. Such appear to be the diſtinguiſhing traits in the collective Penſilvanian character.

Of the great variety of religious denominations in Penſilvania, the Friends or Quakers are the moſt numerous. They were the firſt ſettlers of Penſilvania in 1682 under William Penn, and have ever ſince flouriſhed in the free enjoyment of their religion. They neither give titles nor uſe compliments in their converſation or writings, believing that *whatſoever is more than yea, yea, and nay, nay, cometh of evil*. They conſcientiouſly avoid, as unlawful, kneeling, bowing, or uncovering the head to any perſon. They diſcard all ſuperfluities in dreſs or equipage; all games, ſports, and plays, as unbecoming the Chriſtian. *Swear not at all*, is an article of their creed literally obſerved in its utmoſt extent. They believe it unlawful to fight in any caſe whatever; and think that if their enemy *ſmite them on the one cheek, they ought to turn to him the other alſo*. They are generally honeſt, punctual, and even punctilious in their dealings; provident for the neceſſities of their poor; friends to humanity, and of courſe enemies to ſlavery; ſtrict in their diſcipline; careful in the obſervance even of the punctilios in dreſs, ſpeech, and manners, which their religion enjoins; faithful in the education of their children; induſtrious in their ſeveral occupations. In ſhort, whatever peculiarities and miſtakes thoſe of other denominations have ſuppoſed they have fallen into, in point of religious doctrines, they have proved themſelves to be good citizens. Next to the Quakers, the Preſbyterians are the moſt numerous. There are upwards of 60 miniſters of the Lutheran and Calviniſt religion, who are of German extraction, now in this ſtate; all of whom have one or more congregations under their care; and many of them preach in ſplendid and expenſive churches; and yet the firſt Lutheran miniſter, who arrived in Penſilvania about 40 years ago, was alive in 1787, and probably is ſtill, as was alſo the ſecond Calviniſtical miniſter.

Plate CCCLXXXI.

A. Bell Prin. Wal. Sculptor fecit.

minister. The Lutherans do not differ in any thing essential from the Episcopalians, nor do the Calvinists from the Presbyterians.

The Moravians are of German extraction. Of this religion there are about 1300 souls in Pensilvania, viz. between 500 and 600 in Bethlehem, 450 in Nazareth, and upwards of 300 at Litiz in Lancaster county. They call themselves the *United Brethren of the Protestant Episcopal church.* They are called *Moravians*, because the first settlers in the English dominions were chiefly migrants from Moravia. See HERNHUTTERS, and UNITAS *Fratrum*; and for the Mennonites, see MENNONITES. They were introduced into America by Count Zindzendorf, and settled at Bethlehem, which is their principal settlement in America, as early as 1741. For the Tunkers, see TUNKERS.

There are a great many literary, humane, and other useful societies, in Pensilvania; more, it is said, than in any of the United Provinces. There are several universities and colleges at Philadelphia and other places: See PHILADELPHIA. Lancaster, Carlisle, and Pittsburgh, are the chief towns after Philadelphia.

Pensilvania is divided into seven counties; four of which are called the *Upper* and three the *Lower*. Of the upper, viz. Buckingham, Philadelphia, Chester, and Lancaster, the three first are the lands included in King Charles II.'s grant, and designed *Pensilvania*; the lower, viz. those of Newcastle, Kent, and Sussex, were called *Nova Belgia* before the duke of York sold them, as we observed above, to Mr Penn. The upper counties end at Marcus Hook, four miles below Chester town, where the lower begin, and run along the coast near 100 miles. Each of these counties had a sheriff, with a quarterly and monthly session, and assizes twice a year.

In the Philosophical Transactions for 1757, there is an account of a copper spring in Pensilvania. This spring rises from a copper mine, and will dissolve iron in less time by three-fourths than the waters of Wicklow in Ireland, lately described by Dr William Henry and Dr Bond. From the solution of iron in these waters, about half the quantity of pure copper is procured by melting it in a crucible: but though these waters melt iron sooner than the Irish waters, yet the solution does not produce so great a proportion of copper; for the pure copper procured from the solution of iron in the Irish waters is to the solution as 16 to 20. In the neighbourhood of this spring, which supplies 800 hhds. in 24 hours, are many ores of vitriol and sulphur; the water is of a pale green colour, of an acid, sweet, austere, inky, and nauseous taste. It is very heavy; for the hydrometer, which was immersed in it, stood at the same height as in a solution of one ounce six drams of English vitriol in a quart of water. A very small quantity of the solution of pot ashes instantly precipitates the metallic parts of this water in three different colours; ochre at the top, green in the middle, and white at bottom; a clean knife kept in it a few minutes, is covered with a bright copper colour. But besides a large proportion of copper, this water contains also a large proportion of vitriol of iron. A pint of it exhaled by a slow fire left 400 grains of solid contents, which appeared to be chiefly saline; for 196 grains of it, dissolved and filtered, did not leave above four grains of indissoluble matter. It appears therefore, that the proportion of vitriolic parts in this water is six drams to a pint; consequently it is a stronger solution of vitriol than sea-water is of marine salt. So that, besides the copper to be obtained by a solution of iron, it will afford great quantities of vitriol, and the great plenty both of water and fuel will make the establishment of a copperas work extremely cheap and commodious. This water mixed with common water is frequently used as an emetic and cathartic by the country people, and is found very efficacious in the cure of cutaneous disorders and sore eyes. Pensilvania.

Amongst the other curiosities of this province may be reckoned another spring about 14 feet deep and about 100 square, in the neighbourhood of Reading. A full mill stream issues from it. The waters are clear and full of fishes. From appearances it is probable that this spring is the opening or outlet of a very considerable river, which a mile and an half or two miles above this place sinks into the earth, and is conveyed to this outlet in a subterranean channel. In the northern parts of Pensilvania there is a creek called *Oil creek*, which empties into the Allegany river. It issues from a spring, on the top of which floats an oil similar to that called Barbadoes tar, and from which one man may gather several gallons in a day. The troops sent to guard the western posts halted at this spring, collected some of the oil, and bathed their joints with it. This gave them great relief from the rheumatic complaints with which they were affected. The waters, of which the troops drank freely, operated as a gentle purge.

There are three remarkable grottoes or caves in this state: one near Carlisle, in Cumberland county; one in the township of Durham, in Buck's county; and the other at Swetara, in Lancaster county. Of the two former there are no particular descriptions. The latter is on the east bank of Swetara river, about two miles above its confluence with the Susquehannah. Its entrance is spacious, and descends so much as that the surface of the river is rather higher than the bottom of the cave. The vault of this cave is of solid limestone rock, perhaps 20 feet thick. It contains several apartments, some of them very high and spacious. The water is incessantly percolating through the roof, and falls in drops to the bottom of the cave. These drops petrify as they fall, and have gradually formed solid pillars, which appear as supports to the roof. Thirty years ago there were ten such pillars, each six inches in diameter, and six feet high; all so ranged that the place they inclosed resembled a sanctuary in a Roman church. No royal throne ever exhibited more grandeur than this *lusus naturæ*. The resemblances of several monuments are found indented in the walls on the sides of the cave, which appear like the tombs of departed heroes. Suspended from the roof is *the bell* (which is nothing more than a stone projected in an unusual form), so called from the sound that it occasions when struck, which is similar to that of a bell. Some of the stalactites are of a colour like sugarcandy, and and others resemble loaf sugar; but their beauty is much defaced by the country people. The water, which percolates through the roof, so much of it as is not petrified in its course, runs down the declivity, and

Penſion || Penſioner.

and is both pleaſant and wholeſome to drink. There are ſeveral holes in the bottom of the cave, deſcending perpendicularly, perhaps into an abyſs below, which renders it dangerous to walk without a light. At the end of the cave is a pretty brook, which, after a ſhort courſe, loſes itſelf among the rocks. Beyond this brook is an outlet from the cave by a very narrow aperture. Through this the vapours continually paſs outwards with a ſtrong current of air, and aſcend, reſembling at night the ſmoke of a furnace. Part of theſe vapours and fogs appear on aſcending to be condenſed at the head of this great alembic, and the more volatile parts to be carried off, through the aperture communicating with the exterior air before mentioned, by the force of the air in its paſſage.

PENSION, a ſum of money paid annually for ſervices or conſiderations already paſt. The yearly payment of each member to the houſes of the inns of courts are likewiſe named *penſions*; and the yearly aſſembly of the ſociety of Gray's Inn, to conſult on the affairs of the houſe, is alſo called a *penſion*.

PENSIONARY, or PENSIONER, a perſon who has an appointment or yearly ſum, payable during life, by way of acknowledgment, charged on the eſtate of a prince, company, or particular perſon.

Grand PENSIONARY, an appellation given to the firſt miniſter of the States of Holland. The grand penſionary is chairman in the aſſemblies of the ſtates of that province: he propoſes the matters to be conſulted on; collects the votes; forms and pronounces the reſolutions of the ſtates; opens letters; confers with foreign miniſters, &c. His buſineſs is alſo to inſpect the finances, to maintain the authority of the ſtates, and to ſee that the laws are obſerved; and he is perpetual deputy of the ſtates general of the United Provinces. His commiſſion is, however, given him only for five years; after which it is deliberated whether or not it ſhall be renewed; but there is no inſtance of its being revoked; therefore death only puts an end to the functions of this important miniſter.

PENSIONARY, is alſo the firſt miniſter of the regency of each city in Holland. His office is to give his advice in affairs relating to the government, either of the ſtate in general, or of the city in particular; and in aſſemblies of the ſtates of the province, he is ſpeaker in behalf of his city. The function, however, of theſe penſionaries is not everywhere alike; in ſome cities they only give their advice, and are never found in aſſemblies of the magiſtrates, except when expreſsly called thither: in others they attend conſtantly; and in others they make the propoſitions on the part of the burgomaſters, draw up their concluſions, &c. They are called *penſionaries*, becauſe they receive an appointment or penſion.

PENSIONER, in general, denotes a perſon who receives a penſion, yearly ſalary, or allowance. Hence

The Band of Gentlemen PENSIONERS, the nobleſt ſort of guard to the king's perſon, conſiſts of 40 gentlemen, who receive a yearly penſion of 100 l.

This honourable band was firſt inſtituted by King Henry VIII. and their office is to attend the king's perſon, with their battle-axes, to and from his chapel-royal, and to receive him in the preſence-chamber, or coming out of his privy-lodgings; they are alſo to attend at all great ſolemnities, as coronations, St George's feaſt, public audiences of ambaſſadors, at the ſovereign's going to parliament, &c. Penſi || Pentad tylos

They are each obliged to keep three double horſes and a ſervant, and ſo are properly a troop of horſe. They wait half a time quarterly; but on Chriſtmas-day, Eaſter-day, Whitſunday, &c. and on extraordinary occaſions, they are all obliged to give their attendance. They have likewiſe the honour to carry up the ſovereign's dinner on the coronation-day and St George's feaſt; at which times the king or queen uſually confer the honour of knighthood on two ſuch gentlemen of the band as their captain preſents.

Their arms are gilt battle-axes; and their weapons, on horſeback, in time of war, are cuiraſſiers arms, with ſword and piſtols. Their ſtandard in time of war is, argent, a croſs gules. Their captain is always a nobleman, who has under him a lieutenant, a ſtandard-bearer, a clerk of the check, ſecretary, paymaſter, and harbinger.

PENSIONER, in the univerſity of Cambridge and in that of Dublin, has a very peculiar meaning; for thoſe ſtudents, either under-graduates or bachelors of arts, are called *penſioners* who live wholly at their own expence, and who receive no emolument whatever from the college of which they are members. They are divided into two kinds, the *greater* and the *leſs*; the former of which are generally called *fellow-commoners*, becauſe they eat with the fellows of their college; the latter are always called *penſioners*, and eat with the ſcholars, who are thoſe ſtudents of the college, either under graduates or bachelors who are upon the foundation, who receive emoluments from the ſociety, and who are capable of being elected fellows. See SERVITOR and SIZAR.

PENSTOCK, a ſluice or flood-gate, ſerving to retain or let go at pleaſure the water of a mill pond, or the like.

PENTACEROS, in natural hiſtory, a name given by Linkius and ſome other authors to a kind of *ſtella marina* or ſea ſtar-fiſh, compoſed of five principal rays, with ſeveral tranſverſe hairy or downy proceſſes.

PENTACHORD (compounded of πεντε *five*, and χορδη *ſtring*), an ancient muſical inſtrument with five ſtrings. The invention of the pentachord is referred to the Scythians; the ſtrings were of bullock's leather, and they were ſtruck with a plectrum made of goats horn.

PENTACROSTIC, in poetry, a ſet of verſes ſo diſpoſed, as that there are always five acroſtics of the ſame name, in five diviſions of each verſe. See ACROSTIC.

PENTACTINODOS, in natural hiſtory, a name given by ſome authors to thoſe ſpecies of ſtar-fiſh which are compoſed of a body divided into five rays.

PENTADACTYLON, FIVE FINGERS, in botany, a name given by ſome authors to the *ricinus* or *palma Chriſti*, from the figure of its leaf.

PENTADACTYLOS PISCIS, the *five fingered fiſh*, in ichthyology, the name of a fiſh common in all the ſeas about the Eaſt Indies, and called by the Dutch there *vuf vinger viſch*. Plate CCCLXX.

It has this name from five black ſtreaks which it has on each ſide, reſembling the prints of five fingers. Its head is flat, compreſſed at the bottom, plain in the ſides, and inclined in the fore-part. The noſe is thick, obtuſe, and round; the lower jaw at its extremity bent and

and rounded; the noſtrils are double; the balls of the eyes oval; the iris of a ſilver colour; the firſt fin of the back is ſmall, the ſecond is more elevated; thoſe of the breaſt are inſerted obliquely, that of the anus is greatly extended, and that of the tail much ſloped. The whole body is covered with ſcales of a moderate ſize, thin, flexible, and ſlightly indented on their hinder edge; the back is reddiſh, the ſides of a ſilver colour, and the fins white. The fiſh is deſcribed by ſome as about nine inches long; by others as a foot and a half. It is a dry but not ill-taſted fiſh.

PENTÆDROSTYLA, in natural hiſtory, the name of a genus of ſpars: (See SPAR). The bodies of this genus are ſpars in form of pentagonal columns, terminated by pentangular pyramids at one end, and regularly affixed at the other to ſome ſolid body.

PENTAGON, in geometry, a figure of five ſides and five angles. See GEOMETRY.

In fortification, pentagon denotes a fort with five baſtions.

PENTAGONOTHECA, in botany, the name given by Vaillant to the plant called by Linnæus, Plumier, Houſton, and others, *piſonia*.

PENTAGRAPH, an inſtrument deſigned for drawing figures in what proportion you pleaſe, without any ſkill in the art.

The inſtrument is otherwiſe called a *parallelogram*. The common pentagraph (Plate CCCLXXXIII. fig. 14.) conſiſts of four braſs or wooden rulers, two of them from 15 to 18 inches long, the other two half that length. At the ends, and in the middle, of the longer rulers, as alſo at the ends of the ſhorter, are holes, upon the exact fixing whereof the perfection of the inſtrument chiefly depends. Thoſe in the middle of the long rulers are to be at the ſame diſtance from thoſe at the end of the long ones and thoſe of the ſhort ones; ſo that when put together they may always make a parallelogram.

The inſtrument is fitted together for uſe by ſeveral little pieces, particularly a little pillar, N° 1. having at one end a ſcrew and nut, whereby the two long rulers are joined; and at the other a little knot for the inſtrument to ſlide on. The piece, N° 2. is a rivet with a ſcrew and nut, wherewith each ſhort ruler is faſtened to the middle of each long one. The piece, N° 3. is a pillar, one end whereof, being hollowed into a ſcrew, has a nut fitted to it. At the other end is a worm to ſcrew into the table; when the inſtrument is to be uſed, it joins the ends of the two ſhort rulers. The piece, N° 4. is a pen, porte-crayon, or pencil, ſcrewed into a little pillar. Laſtly, the piece, N° 5. is a braſs point, moderately blunt, ſcrewed likewiſe into a little pillar.

Uſe of the PENTAGRAPH, or *Parallelogram*. 1. To copy a deſign in the ſame ſcale or bigneſs as the original: ſcrew the worm N° 3. into the table; lay a paper under the pencil N° 4. and the deſign under the point N° 5. This done, conducting the point over the ſeveral lines and parts of the deſign, the pencil will draw or repeat the ſame on the paper.

2. If the deſign be to be reduced—*e. gr.* into half the ſpace, the worm muſt be placed at the end of the long ruler, N° 4. and the paper and pencil in the middle. In this ſituation conduct the braſs point over the ſeveral lines of the deſign, as before; and the pencil at the ſame time will draw its copy in the proportion required; the pencil here only moving half the lengths that the point moves. Pentagraph ‖ Pentapetes.

Hence, on the contrary, if the deſign be to be enlarged by one half, the braſs point, with the deſign, muſt be placed in the middle, at N° 3. the pencil and paper at the end of the long ruler, and the worm at the other.

3. To enlarge or reduce in other proportions, there are holes drilled at equal diſtances on each ruler, *viz.* all along the ſhort ones, and half way of the long ones, in order for placing the braſs point, pencil, and worm, in a right line therein; *i. e.* if the piece carrying the point be put in the third hole, the two other pieces muſt be put in its third hole.

If, then, the point and deſign be placed at any hole of the great rulers, and the pencil with the paper at any hole of the ſhort ruler, which forms the angle therewith, the copy will be leſs than half the original. On the contrary, if it be placed at one of the holes of that ſhort ruler, which is parallel to the long ruler, the copy will be greater than half the original.

The conſtruction of this inſtrument requires a degree of accuracy which moſt of our inſtrument-makers are ſtrangers to; for which reaſon there are very few of the inſtruments that ſucceed. Few will do any thing tolerably but ſtraight lines; and many of them not even thoſe.

In order to prove that the figure deſcribed by a pentagraph is ſimilar to the given figure, let C (fig. 15.) be the fixed centre of motion; P the pencil for tracing the given figure PP, and *p* the pencil which traces the other figure *pp*; *p*, &c. muſt be ſo adjuſted, that *p*, C, and P, may lie in one ſtraight line; then, ſince $Bp : Ap :: BP : AC$, whatever be the ſituation of the pentagragh, the angles PCP and *p*C*p* are vertical; and therefore PC*p* will in every poſition of the inſtrument be a right line: but $PC : pC :: BA : Ap$, in each of the two poſitions in the figure, and conſequently the triangles PCP, *p*C*p*, are ſimilar; and $PP : pp (:: PC : pC) :: BA : Ap$, or in a given ratio. Hence it appears, that, by moving the pencil *p*, Ap may be equal to BA, or leſs in any proportion; and conſequently *pp* may be equal to PP, or leſs, in the ſame proportion.

PENTAMETER, in ancient poetry, a kind of verſe, conſiſting of five feet, or metres, whence the name. The two firſt feet may be either dactyls or ſpondees at pleaſure; the third is always a ſpondee; and the two laſt anapeſtes: ſuch is the following verſe of Ovid.

1 2 3 4 5

Carmini|bus vi|ves tem|pus in o|mne meis.

A pentameter verſe ſubjoined to an hexameter, conſtitutes what is called *elegiac*. See ELEGIAC.

PENTANDRIA (from πεντε *five*, and ανηρ *a man or huſband*); the name of the fifth claſs in Linnæus's ſexual method, conſiſting of plants which have hermaphrodite flowers, with five ſtamina or male organs. See BOTANY, p. 430.

PENTAPETALOUS, an appellation given to flowers which conſiſt of five petals or leaves.

PENTAPETES, in botany: A genus of the dodecandria order, belonging to the monodelphia claſs of plants; and in the natural method ranking under the

Pentapolis
ll
Pentateuch.

37th order, *Columniferæ*. The calyx is quinquepartite; the ſtamina are 20 in number, of which five are caſtrated and long; the capſule quinquelocular and polyſpermous. There is but one ſpecies known in the gardens of this country, *viz.* the phœnicia, with halbert-pointed, ſpear-ſhaped, ſawed leaves. It is an annual plant, a native of India, and riſes to the height of two or three feet, adorned with fine ſcarlet flowers, conſiſting of one petal cut into five ſegments. In the centre of the flower ariſes a ſhort thick column, to which adhere 15 ſhort ſtamina. It is a tender plant, and muſt be brought up in the hot-houſe.

PENTAPOLIS. This name is given to the five cities, Sodom, Gomorrah, Adamah, Zeboim, and Zoar (Wiſdom x. 6.) They were all five condemned to utter deſtruction, but Lot interceded for the preſervation of Zoar, otherwiſe called *Bala*. Sodom, Gomorrah, Adamah, and Zeboim, were all conſumed by fire from heaven, and in the place where they ſtood was made the lake Aſphaltites, or the lake of Sodom.

PENTAPOLIS (Ptolemy), a diſtrict of Cyrenaica; ſituated on the Mediterranean; denominated from its five cities; namely, Berenice, Arſinoe, Ptolemais, Cyrene, and Apollonia.

Pentapolis of the Philiſtines (Joſephus); taking name from five principal cities, Gaza, Gath, Aſcalon, Azotus, and Ekron.

PENTATEUCH. This word, which is derived from the Greek Πεντατευχος, from πεντε *five*, and τευχος an *inſtrument or volume*, ſignifies the collection of the five inſtruments or books of Moſes, which are Geneſis, Exodus, Leviticus, Numbers, and Deuteronomy: each of which books we have given an account of under their ſeveral names.

There are ſome modern critics who have diſputed Moſes's right to the pentateuch. They obſerve that the author ſpeaks always in the third perſon. "Now the man Moſes was very meek above all the men which were upon the face of the earth. The Lord ſpake unto Moſes, ſaying, &c. Moſes ſaid to Pharaoh, &c." Thus they think he would never have ſpoken of himſelf; but would at leaſt ſometimes have mentioned himſelf in the firſt perſon. Beſides this, ſay they, the author of the pentateuch ſometimes abridges his narration like a writer who collected from ſome ancient memoirs. Sometimes he interrupts the thread of his diſcourſe; for example, he makes Lamech the bigamiſt to ſay (Gen. iv. 23.), "Hear my voice, ye wives of Lamech, hearken unto my ſpeech; for I have ſlain a man to my wounding, and a young man to my hurt," without informing us before-hand to whom this is related. Theſe obſervations, for example (Gen. xii. 6.), "And the Canaanite was then in the land," cannot be reconciled to the age of Moſes, ſince the Canaanites continued to be the maſters of Paleſtine all the time of Moſes. The paſſage out of the book of the wars of the Lord, quoted in the book of Numbers (xxi. 14.), ſeems to have been clapped in afterwards, as alſo the firſt verſes of Deuteronomy. The account of the death of Moſes, which is at the end of the ſame book, cannot certainly belong to this legiſlator; and the ſame judgment may be made of other paſſages, wherein it is ſaid, that the places mentioned lay beyond Jordan; that the bed of Og was at Ramah to this day; that the havoth of Jair, or the cities of Jair, were known to the author, though probably they had not that name till after Moſes's time (Numb. xxxii. 41. Deut. iii. 14.)

Pentat
ll
Pente

It is obſerved alſo in the text of the pentateuch, that there are ſome places that are defective; for example, in Exodus (xii. 8.), we ſee Moſes ſpeaking to Pharaoh, where the author omits the beginning of his diſcourſe. The Samaritan inſerts in the ſame place what is wanting in the Hebrew. In other places, the ſame Samaritan copy adds what is deficient in the Hebrew text; and what it contains more than the Hebrew ſeems ſo well connected with the reſt of the diſcourſe, that it would be difficult to ſeparate them. Laſtly, they believe that they obſerve certain ſtrokes in the pentateuch which can hardly agree with Moſes, who was born and bred in Egypt; as what he ſays of the earthly paradiſe, of the rivers that watered it, and ran through it; of the cities of Babylon, Erech, Reſen, and Calneh; of the gold of Piſon, of the Bdellium, of the ſtone of Sohem, or onyx-ſtone, which was to be found in that country. Theſe particulars, obſerved with ſuch curioſity, ſeem to prove, that the author of the pentateuch lived beyond the Euphrates. Add what he ſays concerning the ark of Noah, of its conſtruction, of the place where it reſted, of the wood wherewith it was built, of the bitumen of Babylon, &c. But in anſwer to all theſe objections, we may obſerve in general, from an eminent writer* of our own country, that theſe books are by the moſt ancient writers aſcribed to Moſes; and it is confirmed by the authority of heathen writers themſelves, that they are of his writing: beſides this, we have the unanimous teſtimony of the whole Jewiſh nation, ever ſince Moſes's time, from the firſt writing of them. Divers texts of the pentateuch imply that it was written by Moſes, and the book of Joſhua, and other parts of ſcripture, import as much; and though ſome paſſages have been thought to imply the contrary, yet this is but a late opinion, and has been ſufficiently confuted by ſeveral learned men. The Samaritans receive no other ſcriptures but the pentateuch, rejecting all the other books which are ſtill in the Jewiſh canon.

* *Jenkin's Reaſonableneſs of Chriſtianity.*

PENTATHLON, in antiquity, a general name for the five exerciſes performed at the Grecian games, *viz.* wreſtling, boxing, leaping, running, and playing at the diſcus.

PENTECOST, a ſolemn feſtival of the Jews; ſo called, becauſe it was celebrated on the 50th day after the 16th of Niſan, which was the ſecond day of the paſſover. The Hebrews called it *the feaſt of weeks*, becauſe it was kept ſeven weeks after the paſſover. They then offered the firſt fruits of the wheat harveſt, which was then completed: beſides which they preſented at the temple ſeven lambs of that year, one calf, and two rams, for a burnt offering; two lambs for a peace offering; and a goat for a ſin offering (Levit. xxiii. 15, 16. Exod. xxxiv. 22. and Deut. xvi. 9, 10.) The feaſt of the pentecoſt was inſtituted among the Iſraelites, firſt to oblige them to repair to the temple of the Lord, there to acknowledge his abſolute dominion over the whole country, and to offer him the firſt-fruits of their harveſt; and, ſecondly, that they might call to mind, and give thanks to God, for the law which he had given them from mount Sinai, on the 50th day after their coming out of Egypt.

The modern Jews celebrate the pentecoſt for two days. They deck the ſynagogue and their own houſes with garlands of flowers. They hear a ſermon or oration in praiſe of the law, which they ſuppoſe to have been delivered on this day. The Jews of Germany make a very thick cake, conſiſting of ſeven layers of paſte, which they call *Sinai*. The ſeven layers repreſent the ſeven heavens, which they think God was obliged to aſcend from the top of this mountain. See *Leo of Modena et Buxtorf's ſynag. Jud.*

It was on the feaſt of pentecoſt that the Holy Ghoſt miraculouſly deſcended on the apoſtles of our Lord, who were aſſembled together after his aſcenſion in a houſe at Jeruſalem (Acts ii.)

PENTHESILEA, queen of the Amazons, ſucceeded Orythia, and gave proofs of her courage at the ſiege of Troy, where ſhe was killed by Achilles. Pliny ſays that ſhe invented the battle-ax.

PENTHORUM, in botany; a genus of the pentagynia order, belonging to the pentandria claſs of plants. The calyx is quinqueſid; there are either five petals or none; the capſule is five-pointed and quinquelocular.

PENTLAND or PICTLAND FRITH, is a narrow ſtrait of ſix miles between the mainland of Scotland and the Orkney iſles. This ſtrait is the great thoroughfare of ſhipping between the eaſtern and weſtern ſeas, the terror of the boldeſt mariners, and the grave of thouſands; where the winter's ſtorms afford many natives on the oppoſite ſhores a better livelihood than they could obtain by fiſhing or huſbandry. They ſearch from place to place, and from one cavern to another, in the hopes of finding timber, caſks, and other floating articles of the wrecked veſſels, of whom ſix or eight are thus ſacrificed ſometimes in one night. The navigation of this paſs is rendered more dangerous by the iſland of Stroma, and two rocks called the *Skerries*, lying near the middle of it. See PICTLAND.

PENULA, among the ancient Romans, was a coarſe garment or cloak worn in cold or rainy weather. It was ſhorter than the lacerna, and therefore more proper for travellers. It was generally brown, and ſucceeded the toga after the ſtate became monarchical. Auguſtus aboliſhed the cuſtom of wearing the penula over the toga, conſidering it as too effeminate for Romans; and the ædiles had orders to ſuffer none to appear in the circus or forum with the lacerna or penula. Writers are not agreed as to the preciſe difference between theſe two articles of dreſs; but we are told that they were chiefly worn by the lower orders of people. See LACERNA.

PENULTIMA, or *PENULTIMATE Syllable*, in grammar, denotes the laſt ſyllable but one of a word; and hence the antepenultimate ſyllable is the laſt but two, or that immediately before the penultima.

PENUMBRA, in aſtronomy, a partial ſhade obſerved between the perfect ſhadow and the full light in an eclipſe. It ariſes from the magnitude of the ſun's body: for were he only a luminous point, the ſhadow would be all perfect; but, by reaſon of the diameter of the ſun, it happens, that a place which is not illuminated by the whole body of the ſun, does yet receive rays from a part thereof.

PEON, in the language of Hindoſtan, means a foot ſoldier, armed with ſword and target. In common uſe it is a footman, ſo armed, employed to run before a palanquin. *Piadah* is the proper word, from which *peon* is a corruption. Peon Pepper.

PEOR a famous mountain beyond Jordan, which Euſebius places between Heſhbon and Livias. The mountains Nebo, Piſgah, and Peor, were near one another, and probably made but the ſame chain of mountains. It is very likely that Peor took its name from ſome deity of the ſame name, which was worſhipped there; for Peor, Phegor, or Baal-peor, was known in this country. See Numb. xxv. 3. Deut. iv. 3. Pſal. cv. 28.

PEOR, was a city of the tribe of Judah, which is not read in the Hebrew, nor in the Vulgate, but only in the Greek of the Septuagint (Joſh. xv. 60.) Euſebius ſays it was near Bethlehem, and Jerom adds, that in his time it was called *Paora*.

PEPIN DE HERISTAL, or LE GROS, mayor of the palace under Clovis III. Childebert, and Dagobert. The power of theſe mayors in France was ſo great, that they left the ſovereign only the empty title, and in the end ſeized on the throne itſelf.

PEPIN le Brief, or *le Petit*, grandſon to Pepin le Gros, and firſt king of the ſecond race of French monarchs, was mayor of the palace to Childeric III. a weak prince: he contrived to confine him and his ſon Thierri in different monaſteries; and then, with the aſſiſtance of pope Stephen III. he uſurped the ſovereign power. He died in 768, aged 54.

PEPLIS, in botany: A genus of the monogynia order, belonging to the hexandria claſs of plants; and in the natural method ranking under the 17th order, *Calycanthemæ*. The perianthium is campanulated; the mouth cleft in 12 parts: there are ſix petals inſerted into the calyx; the capſule is bilocular.

PEPLUS, a long robe worn by the women in ancient times, reaching down to the feet, without ſleeves, and ſo very fine, that the ſhape of the body might be ſeen through it. The Athenians uſed much ceremony in making the peplus, and dreſſing the ſtatue of Minerva with it. Homer makes frequent mention of the peplus of that goddeſs.

PEPPER, PIPER, in natural hiſtory, an aromatic berry of a hot dry quality, chiefly uſed in ſeaſoning. We have three kinds of pepper at preſent uſed in the ſhops, the black, the white, and the long pepper.

Black pepper is the fruit of the piper, and is brought from the Dutch ſettlements in the Eaſt Indies. See PIPER.

The common white pepper is factitious, being prepared from the black in the following manner: they ſteep this in ſea-water, expoſed to the heat of the ſun for ſeveral days, till the rind or outer bark looſens; they then take it out, and, when it is half dry, rub it till the rind falls off; then they dry the white fruit, and the remains of the rind blow away like chaff. A great deal of the heat of the pepper is taken off by this proceſs, ſo that the white kind is more fit for many purpoſes than the black. However, there is a ſort of native white pepper produced on a ſpecies of the ſame plant; which is much better than the factitious, and indeed little inferior to the black.

The long pepper is a dried fruit, of an inch or an inch and an half in length, and about the thickneſs of a large gooſe quill: it is of a browniſh grey colour,

Pepper, Peppermint.

cylindrical in figure, and ſaid to be produced on a plant of the ſame genus.

Pepper is principally uſed by us in food, to aſſiſt digeſtion: but the people in the Eaſt Indies eſteem it as a ſtomachic, and drink a ſtrong infuſion of it in water by way of giving them an appetite: they have alſo a way of making a fiery ſpirit of fermented freſh pepper with water, which they uſe for the ſame purpoſes. They have alſo a way of preſerving the common and long pepper in vinegar, and eating them afterwards at meals.

Jamaica PEPPER, or *Pimento*. See PIMENTO.

PEPPER-*Mint*. See MENTHA.

PEPPER-*Pot*. See CAPSICUM.

PEPPER-*Water*, a liquor prepared in the following manner, for microſcopical obſervations: put common black pepper, groſsly powdered, into an open veſſel ſo as to cover the bottom of it half an inch thick, and put to it rain or river-water, till it covers it an inch; ſhake or ſtir the whole well together at the firſt mixing, but never diſturb it afterwards: let the veſſel be expoſed to the air uncovered; and in a few days there will be ſeen a pellicle or thin ſkin ſwimming on the ſurface of the liquor, looking of ſeveral colours.

This is a congeries of multitudes of ſmall animals; and being examined by the microſcope, will be ſeen all in motion: the animals, at firſt ſight, are ſo ſmall as not to be diſtinguiſhable, unleſs to the greateſt magnifiers; but they grow daily till they arrive at their full ſize. Their numbers are alſo continually increaſing, till the whole ſurface of the liquor is full of them, to a conſiderable depth. When diſturbed, they will ſometimes all dart down to the bottom; but they ſoon after come up to the ſurface again. The ſkin appears ſooneſt in warm weather, and the animals grow the quickeſt: but in the ſevereſt cold it will ſucceed, unleſs the water freezes.

About the quantity of a pin's head of this ſcum, taken up on the nib of a new pen, or the tip of a hair-pencil, is to be laid on a plate of clear glaſs; and if applied firſt to the third magnifier, then to the ſecond, and finally to the firſt, will ſhow the different animalcules it contains, of ſeveral kinds and ſhapes as well as ſizes.

PEPPERMINT-TREE, in botany; the *Eucalyptus piperita*.

In a journal of a voyage to New South Wales, by John White, Eſq; we have a plate of this tree, with the following account of it: "This tree grows to the height of more than 100 feet, and is above 30 feet in circumference. The bark is very ſmooth, like that of the poplar. The younger branches are long and ſlender, angulated near the top; but as they grow older, the angles diſappear. Their bark is ſmooth, and of a reddiſh brown. The leaves are alternate, lanceolate, pointed, very entire, ſmooth on both ſides, and remarkably unequal or oblique at their baſe; the veins alternate, and not very conſpicuous. The whole ſurface of both ſides of the leaves is marked with numerous minute reſinous ſpots in which the eſſential oil reſides. The footſtalks are about half an inch in length, round on the under ſide, angular above, quite ſmooth. The flowers we have not ſeen. What Mr White has ſent us the ripe capſules of this tree (although not attached to the ſpecimens of the leaves) grow in cluſters, from ſix to eight in each, ſeſſile and conglomerated. Theſe cluſters are ſupported on angular alternate footſtalks, which form a kind of panicle. Each capſule is about the ſize of an hawthorn berry, globular, but as it were cut off at the top, rugged on the outſide, hard and woody, and of a dark-brown colour. At the top is a large oriſice, which ſhows the internal part of the capſule divided into four cells, and having a ſquare column in the centre, from which the partitions of the cell ariſe. Theſe partitions extend to the rim of the capſule, and terminate in four ſmall projections, which look like the teeth of a calyx. The ſeeds are numerous, ſmall, and angular.

Plate ccclxxxviii

Pepper-mint ‖ Perambulator

"The name of *peppermint tree* has been given to this plant by Mr White, on account of the very great reſemblance between the eſſential oil drawn from its leaves and that obtained from the peppermint (*mentha piperita*) which grows in England. This oil was found by Mr White to be much more efficacious in removing all cholicky complaints than that of the Engliſh peppermint, which he attributes to its being leſs pungent and more aromatic. A quart of the oil has been ſent by him to Mr Wilſon.

"The tree above deſcribed appears to be undoubtedly of the ſame genus with that cultivated in ſome greenhouſes in England, which Mr L'Heritier has deſcribed in his *Sertum Anglicum* by the name of *Eucalyptus obliqua*, though it is commonly called in the gardens *Metroſideros obliqua*; but we dare not aſſert it to be the ſame ſpecies, nor can this point be determined till the flowers and every part of both be ſeen and compared; we have compared the beſt ſpecimens we could procure of each, and find no ſpecific difference. The eucalyptus obliqua has, when dried, an aromatic flavour, ſomewhat ſimilar to our plant. We have remarked, indeed, innumerable minute white ſpots, beſides the reſinous ones, on both ſurfaces of the leaves in ſome ſpecimens of the garden plant, which are not to be ſeen in ours; and the branches of the former are rough, with ſmall ſcaly tubercles. But how far theſe are conſtant, we cannot tell. The obliquity in the leaves, one ſide being ſhorter at the baſe than the other, as well as ſomewhat narrower all the way up, as in the *Begonia nitida* of the *Hortus Kewenſis*, is remarkable in both plants.

"The figure repreſents a branch of the peppermint tree in leaf: on one ſide of it part of a leaf ſeparate, bearing the gall of ſome inſect; on the other the fruit above deſcribed."

PERA, one of the ſuburbs of Conſtantinople, where ambaſſadors and Chriſtians uſually reſide. See CONSTANTINOPLE.

PERAMBULATOR, in ſurveying, an inſtrument for meaſuring diſtances, called alſo *pedometer*, *way-wiſer*, and *ſurveying-wheel*. See PEDOMETER.

Plate ccclxxv

It conſiſts of a wheel AA, two feet ſeven inches and a half in diameter; conſequently half a pole, or eight feet three inches, in circumference. On one end of the axis is a nut, three quarters of an inch in diameter, and divided into eight teeth; which, upon moving the wheel round, fall into the eight teeth of another nut *c*, fixed on one end of an iron-rod Q, and thus turn the rod once round in the time the wheel makes one revolution. This rod, lying along a groove in the ſide of the carriage of the inſtrument, under the doted line, has at its other end a ſquare hole, into which is fitted the end *b* of a ſmall cylinder P. This

cylinder is disposed under the dial-plate of a movement, at the end of the carriage B, in such a manner as to be moveable about its axis: its end *a* is cut into a perpetual screw, which falling into the 32 teeth of a wheel perpendicular thereto, upon driving the instrument forward, that wheel makes a revolution each 16th pole. On the axis of this wheel is a pinion with six teeth, which, falling into the teeth of another wheel of 60 teeth, carries it round every 160th pole, or half a mile.

This last wheel, carrying a hand or index round with it over the divisions of a dial-plate, whose outer limb is divided into 160 parts, corresponding to the 160 poles, points out the number of poles passed over. Again, on the axis of this last wheel is a pinion, containing 20 teeth, which falling into the teeth of a third wheel which hath 40 teeth, drives it once round in 320 poles, or a mile. On the axis of this wheel is a pinion of 12 teeth, which, falling into the teeth of a fourth wheel having 72 teeth, drives it once round in 12 miles.

This fourth wheel, carrying another index over the inner limb of the dial-plate, divided into 12 for miles, and each mile subdivided into halves, quarters, and furlongs, serves to register the revolutions of the other hand, and to keep account of the half miles and miles passed over as far as 12 miles.

The use of this instrument is obvious from its construction. Its proper office is in the surveying of roads and large distances, where a great deal of expedition, and not much accuracy, is required. It is evident, that driving it along and observing the hands, has the same effect as dragging the chain and taking account of the chains and links.

Its advantages are its hardiness and expedition; its contrivance is such, that it may be fitted to the wheel of a coach, in which state it performs its office, and measures the road without any trouble at all.

PERCA, the Perch; a genus of fishes belonging to the order of thoracici. The head is furnished with scaly and serrated opercula; there are seven rays in the membrane of the gills; and the fins on the back are prickly. There are 38 species, principally distinguished by peculiarities in the back fin. The most remarkable are,

1. The fluviatilis, or common perch, hath a deep body, very rough scales, and the back much arched. The colours are beautiful; the back and part of the sides being of a deep green, marked with five broad black bars pointing downwards; the belly is white, tinged with red; the ventral fins of a fine scarlet; the anal fins and tail of the same colour, but rather paler. In a lake called *Llyn Raithlyn*, in Merionethshire in Wales, is a very singular variety of this fish; the back part is quite hunched, and the lower part of the backbone next the tail strangely distorted: in colour and other respects it resembles the common perch, which are as numerous in this lake as the deformed fish. They are not peculiar to this water; for Linnæus takes notice of them in a lake at Fahlun in his country. It is said that they are also met with in the Thames near Marlow.

The perch was much esteemed as food by the Romans, nor is it less admired at present as a firm and delicate fish; and the Dutch are particularly fond of it when made into a dish called *water-souchy*. It is a gregarious fish; and loves deep holes and gentle streams; is exceedingly voracious, and an eager biter: if the angler meets with a shoal of them, he is sure of taking every one.—It is a common notion that the pike will not attack this fish, on account of the spiny fins which the perch erects on its approach. This may be true of large fish; but it is well known that small perches are the most tempting bait which can be laid for the pike. The perch is very tenacious of life, and has been known to survive a journey of 60 miles in dry straw. It seldom grows to a large size, though Mr Pennant mentions one that weighed nine pounds; but this, he tells us, is very uncommon. Perca, Perception.

2. The labrax, or basse, is a very voracious, strong, and active fish. Ovid calls them *rabidi lupi*, a name continued to them by after writers; and they are said to grow to the weight of fifteen pounds. The irides are silvery; the mouth large; the teeth are situated in the jaws, and are very small: in the roof of the mouth is a triangular rough space, and just at the gullet are two others of a roundish form. The scales are of a middling size, are very thick set, and adhere closely. The body is formed somewhat like that of a salmon. The colour of the back is dusky, tinged with blue. The belly is white. In young fish the space above the side-line is marked with small black spots.—It is esteemed a very delicate fish.

3. The perca marina, or sea-perch, is about a foot long: the head large and deformed; eyes great; teeth small and numerous. On the head and covers of the gills are strong spines. The colour red, with a black spot on the covers of the gills, and some transverse dusky lines on the sides. It is a fish held in some esteem at the table.

4. The cernua, or ruffe, is found in several of the English streams: it is gregarious, assembling in large shoals, and keeping in the deepest part of the water. It is of a much more slender form than the perch, and seldom exceeds six inches in length. The teeth are very small, and disposed in rows. It has only one dorsal fin, extending along the greatest part of the back; the first rays, like those of the perch, are strong, sharp, and spiny; the others soft. The body is covered with rough compact scales. The back and sides are of a dirty green, the last inclining to yellow, but both spotted with black. The dorsal fin is spotted with black; the tail marked with transverse bars.

5. The nilotica, or perch of the Nile, is taken about Cairo. The flesh has a sweet and exquisite flavour, and is not hard, but very white. It is one of the best fishes in the Nile; and as it is of the largest size in Egypt, it adorns a table if brought upon it entire and well fried. See *Pilot-Fish*.

PERCEPTION, is a word which is so well understood, that it is difficult for the lexicographer to give any explanation of it. It has been called the first and most simple act of the mind by which it is conscious of its own ideas. This definition, however, is improper, as it confounds perception with consciousness; although the objects of the former faculty are things without us, those of the latter the energies of our own minds. Perception is that power or faculty by which, through the medium of the senses, we have

Perception. the cognizance of objects diſtinct and apart from ourſelves, and learn that we are but a ſmall part in the ſyſtem of nature. By what proceſs the ſenſes give us this information, we have endeavoured to ſhow elſewhere, (See METAPHYSICS, Part I. Chap. i.); and we ſhould not again introduce the ſubject, but to notice a ſingular opinion of a very able writer, whoſe work has been given to the public ſince our article alluded to had aſſed from the preſs.

Dr Sayers, who is an ornament to that ſchool in which we are ſtrongly inclined to enliſt ourſelves, has endeavoured to prove that no man can perceive two objects, or be conſcious of two ideas at the ſame inſtant. If this be true, not only our theory of time (ſee METAPHYSICS, Part II. Chap. vii.) is groſsly abſurd, but even memory itſelf ſeems to be an imaginary faculty. If a man be not conſcious of his preſent exiſtence, at the very inſtant when he thinks of a paſt event, or reviews a ſeries of paſt tranſactions, it is difficult, to us indeed impoſſible, to conceive what idea he can have of time, or what he can mean when he ſays that he remembers a thing. But let us examine the reaſoning by which the ingenious author endeavours to eſtabliſh his opinion.

† *Diſquiſitions Metaphyſical and Literary.*

"If we reflect (ſays he †) upon the ſurpriſing velocity with which ideas paſs through the mind, and the remarkable rapidity with which the mind turns itſelf, or is directed from one object of contemplation to another, this might alone give us ſome ſuſpicion that we may probably be miſtaken in ſuppoſing ideas to be ſynchronouſly perceived. Other arguments may be adduced to ſtrengthen this ſuſpicion. It will be granted, I believe, that the mind, whether immaterial or the reſult of organization, has certainly a wholeneſs or unity belonging to it, and that it is either not compoſed of parts, or that no one of the parts from which it originates is itſelf mind: in this caſe, it is difficult to conceive how two ideas ſhould be impreſſed upon the mind at the ſame inſtant; for this would be ſuppoſing that part of the mind could receive one idea, and part another, at the ſame time; but if the parts do not perceive ſingly, this is evidently impoſſible. If, on the other hand, this ſelf-diviſion of the mind does not take place, then if two ideas are nevertheleſs to be perceived at the ſame inſtant, it would ſeem that thoſe ideas muſt be ſo blended with each other, that neither of them could appear diſtinct. If we examine the manner in which a complex idea is perceived, we ſhall find very clearly, that the whole of ſuch an idea is never preſent to the mind at once. In thinking of a centaur, for inſtance, can we at the ſame moment be thinking of the parts of a man and the parts of a horſe? Can we not almoſt detect the gliding of the mind from the one to the other? In contemplating the complex idea of gold, are the ideas of its colour, ductility, hardneſs, and weight, all preſent to the mind at the ſame inſtant? I think, if we accurately attend to it, we ſhall find a perceptible time has elapſed before this complex idea has been perfectly formed in our mind: but if all the parts of a complex idea cannot be recalled at the ſame inſtant, is it not reaſonable to infer that theſe parts are alſo ſingly impreſſed, and not all originally perceived at the ſame inſtant?"

This reaſoning is plauſible, but perhaps not convincing. Surely we have all been conſcious of bodily pain or pleaſure with our eyes open, and been offended by diſagreeable ſmells at the very inſtant that we looked at objects beautifully coloured. That our ideas paſs through the mind with great velocity, and that the mind can rapidly turn itſelf from one ſubject of contemplation to another, are truths which cannot be controverted; but inſtead of leading us to ſuppoſe that two or more objects cannot be ſynchronouſly perceived, or two or more ideas ſynchronouſly apprehended, they appear to furniſh a complete proof of the reverſe of all this. For we beg leave to aſk how we come to know that ideas paſs with velocity through the mind, if we be not all the while conſcious of ſomething that is permanent? If we can contemplate but one idea at once, it is plainly impoſſible that two or more can be compared together; and therefore we cannot poſſibly ſay that any particular train has paſſed through the mind with a degree of velocity greater or leſs than that which we have uſually experienced; nay, we cannot ſay that we have ever experienced a train of ideas at all, or even been conſcious of a ſingle idea, beſides the immediate object of preſent apprehenſion. That the mind is an individual, we moſt readily grant; but that it ſhould therefore be incapable of having *two* ideas ſynchronouſly excited in it, is a propoſition for which the author has brought no evidence. That it is difficult to conceive *how* this is done, we acknowledge; but not that it is more difficult than to conceive how a *ſingle* idea is excited in the mind; for of the mode in which mind and matter mutually operate upon each other, we can form no conception. We know that objects make an impreſſion on the organs of ſenſe; that this impreſſion is by the nerves communicated to the brain, and that the agitation of the brain excites ſenſation in the mind: but in *what way* it excites ſenſation we know not; and therefore have no reaſon to ſuppoſe that two or more different agitations may not excite two or more ſynchronous ſenſations, as well as one agitation excites one ſenſation. That the agitation given to the brain operates on the mind, is known by experience; but experience gives us no information reſpecting the *mode* of that operation. If the mind be, as our author and we ſuppoſe, one individual, it cannot, as mind, be either diviſible or extended; and therefore it is certain that the operation in queſtion cannot be, in the proper ſenſe of the word, impreſſion. Hence we have no right to infer, if two objects be perceived at once, either that the idea of the one muſt be impreſſed on a part of the mind different from that which receives the impreſſion of the other, or that the two impreſſions muſt be ſo blended with each other, that neither of them could appear diſtinct; for this would be to reaſon from one mode of operation to another; with which, upon acknowledged principles, it can have nothing in common.

Perception.

By far the greater part of our ideas are reliſts of *viſible* ſenſations; and of every thing which we can actually ſee at once, we may at once contemplate the idea. That we could at once perceive a centaur, if ſuch a being were preſented to us, cannot ſurely be doubted by any one who has ever looked at a man on horſeback; and therefore that we can at the ſame moment contemplate the whole idea of a centaur, is a fact of which conſciouſneſs will not permit us to doubt.—If, indeed, we chooſe to analyze this complex idea into

tion to its component parts, it is self-evident that the mind must glide from the one to the other, because the very aw. analysis consists in the separation of the parts, of which, if after that process we think of them, we must think in succession: but that we may have at the same instant, either an actual or ideal view of all the parts of the centaur united, is a proposition so evident as to admit of no other proof than an appeal to experience. In contemplating what the author calls the complex idea of gold, it cannot be denied that the ideas of its colour, ductility, hardness, and weight, are never all present to the mind at the same instant: but the reason is obvious. These are not all *ideas*, in the proper sense of the word, but some of them are ideas, and some notions, acquired by very different processes and very different faculties. Colour is an idea of sensation, immediately suggested through the organ of sight; ductility is a relative notion, acquired by repeated experiments; and gold might be made the object of every sense, without suggesting any such notion. The writer of this article never saw an experiment made on the ductility of gold, and has therefore a very obscure and indistinct notion of that property of the metal; but he is conscious, that he can perceive, at the same instant, the yellow colour and circular figure of a guinea, and have a very distinct, though relative notion, of its hardness.

We conclude, therefore, that the mind is capable of two or more synchronous perceptions, or synchronous ideas; that, during every train which passes through it, it is conscious of its own permanent existence; and that if it were limited to the apprehension of but one idea at once, it could have no remembrance of the past, or anticipation of the future, but would appear to itself, could it make any comparison, to pass away like a flash of lightning.

PERCH, in land-measuring, a rod or pole of 16½ feet in length, of which 40 in length and 4 in breadth make an acre of ground. But, by the customs of several counties, there is a difference in this measure. In Staffordshire it is 24 feet; and in the forest of Sherwood 25 feet: the foot being there 18 inches long; and in Herefordshire a perch of ditching is 21 feet, the perch of walling 16½ feet, and a pole of denshiered ground is 12 feet, &c.

PERCHE, a territory of Orleannois in France, 35 miles long, and 30 broad; bounded on the north by Normandy; on the south, by Maine and Dunois; on the east, by Beauce; and on the west, by Maine. It takes its name from a forest, and is pretty fertile. The inhabitants carry on a pretty good trade; and the principal town is Bellesme.

PERCOLATION, the same with FILTRATION. See CHEMISTRY, n° 568.

PERCUSSION, in mechanics, the impression a body makes in falling or striking upon another; or the shock of two bodies in motion.

PERDICIUM, in botany: A genus of the polygamia superflua order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositæ*. The receptacle is naked; the pappus is simple; the florets bilabiate.

PERDIX. See TETRAO.

PEREASLAW, a strong populous town of Poland, in the palatinate of Kiovia, situated on the river Tribecz; in E. Long. 32. 44. N. Lat. 49. 46.

PERENNIALS, or PERENNIAL FLOWERS, in botany, a term applied to those plants whose roots will abide many years, whether they retain their leaves in winter or not. Those which retain their leaves are called *evergreens*; but such as cast their leaves are named *deciduous*, or *perditols*.

PERFECT, something to which nothing is wanting, or that has all the requisites of its nature and kind.

PERFECT Cadence, in music. See CADENCE.

PERFECT Tense, in grammar. See PRETERITE.

PERFECTION, the state or quality of a thing PERFECT.

Perfection is divided, according to Chauvinus, into physical, moral, and metaphysical.

Physical or natural perfection, is that whereby a thing has all its powers and faculties, and those too in full vigour; and all its parts both principal and secondary, and those in their due proportion, constitution, &c. in which sense man is said to be perfect when he has a sound mind in a sound body. This perfection is by the schools frequently termed ἐντελέχεια, because a thing is enabled thereby to perform all its operations.

Moral perfection is an eminent degree of virtue or moral goodness, to which men arrive by repeated acts of piety, beneficence, &c. This is usually subdivided into absolute or inherent, which is actually in him to whom we attribute it; and imputative, which exists in some other, and not in him it is attributed to.

Metaphysical, transcendental, or essential perfection, is the possession of all the essential attributes, or of all the parts necessary to the integrity of a substance; or it is that whereby a thing has or is provided of every thing belonging to its nature. This is either absolute, where all imperfection is excluded, such is the perfection of God; or *secundum quid*, and in its kind.

PERFORANS MANUS, *PERFORANS Pedis* } See ANATOMY, *Table of the Muscles*.
PERFORATUS MANUS. *PERFORATUS Pedis.* }

PERFUME, denotes either the volatile effluvia from any body affecting the organ of smelling, or the substance emitting those effluvia; in which last sense the word is most commonly used. The generality of perfumes are made up of musk, ambergris, civet, rose and cedar woods, orange-flowers, jessamines, jonquils, tuberoses, and other odoriferous flowers. Those drugs commonly called aromatics, such as storax, frankincense, benzoin, cloves, mace, &c. enter the composition of a perfume; some are also composed of aromatic herbs or leaves, as lavender, marjoram, sage, thyme, hyssop, &c. Perennials || Perfume.

The use of perfumes was frequent among the Hebrews, and among the orientals in general, before it was known to the Greeks and Romans. In the time of Moses perfumes must have been known in Egypt, since he speaks of the art of the perfumer, and gives the composition of two kinds of perfumes (Exod. xxx. 25.), of which one was to be offered to the Lord upon the golden altar which was in the holy place; and the other

Perfume ll Pergamum.

other was appointed for the anointing of the high prieſt and his ſons (*ibid.* 34, &c.), as alſo of the tabernacle, and all the veſſels that were uſed in divine ſervice.

The Hebrews had alſo perfumes which they made uſe of in embalming their dead. The compoſition is not known, but it is certain that they generally made uſe of myrrh, aloes, and other ſtrong and aſtringent drugs, proper to prevent putrefaction (John xix. 49.) See the article EMBALMING.

Beſides the perfumes for theſe purpoſes, the ſcripture mentions other occaſions whereon the Hebrews uſed perfumes. The ſpouſe in the Canticles (i. 3.) commends the ſcent of the perfumes of her lover; and her lover in return ſays, that the ſcent of the perfumes of his ſpouſe ſurpaſſes the moſt excellent odours (*id.* iv. 10—14.) He names particularly the ſpikenard, the calamus, the cinnamon, the myrrh, and the aloes, as making a part of theſe perfumes. The voluptuous woman deſcribed by Solomon (Prov. vii. 17.) ſays, that ſhe had perfumed her bed with myrrh, aloes, and cinnamon. The epicures in the book of Wiſdom (ii. 7.) encourage one another to the luxuriant uſe of odours and coſtly perfumes.

Iſaiah (lvii. 9.) reproaches Judea, whom he deſcribes as a ſpouſe faithleſs to God, with being painted and perfumed to pleaſe ſtrangers, "Thou wenteſt to the king with ointment, and didſt increaſe thy perfumes." Ezekiel (xxiii. 41.) ſeems to accuſe the Jews with having profaned the odours and perfumes, the uſe of which was reſerved to ſacred things, by applying them to their own uſe.

They came afterwards to be very common among the Greeks and Romans, eſpecially thoſe compoſed of muſk, ambergris, and civet. The *nardus* and *malobathrum* were held in much eſtimation, and were imported from Syria. The *unguentum nardinum* was variouſly prepared, and contained many ingredients. *Malobathrum* was an Indian plant. Perfumes were alſo uſed at ſacrifices to regale the gods; at feaſts, to increaſe the pleaſures of ſenſation; at funerals, to overpower cadaverous ſmells, and pleaſe the manes of the dead; and in the theatres, to prevent the offenſive effluvia, proceeding from a crowd, from being perceived.

Since people are become ſenſible of the harm they do to the head, perfumes are generally diſuſed among us; however, they are ſtill common in Spain and Italy.

PERGAMA (Virgil), the citadel of Troy; which, becauſe of its extraordinary height, gave name to all high buildings (Servius). Others ſay the walls of Troy were called *Pergama*.

PERGAMUM, (Pliny); called alſo *Pergamea*, (Virgil); *Pergamia*, (Plutarch); a town of Crete, built by Agamemnon in memory of his victory, (Velleius). Here was the burying-place of Lycurgus, (Ariſtoxenus, quoted by Plutarch). It was ſituated near Cydonia (Servius); to what point not ſaid: but Scylax helps him out, who places the Dactynnean temple of Diana, which ſtood near Cydonia (Strabo), to the north of the territory of Pergamia.—Another PERGAMUM (Pliny, Strabo); a town of Myſia, ſituated on the Caicus, which runs by it. It was the royal reſidence of Eumenes, and of the kings of the Attali (Livy). There an ancient temple of Æſculapius ſtood; an aſylum (Tacitus). The ornament of Pergamum was the royal library, vying with that of Alexandria in Egypt; the kings of Pergamum and Egypt rivalling each other in this reſpect (Pliny). Strabo aſcribes this rivalry to Eumenes. Plutarch reckons up 200,000 volumes in the library at Pergamum. Here the *membranæ pergamenæ*, whence the name *parchment*, were invented for the uſe of books, (Varro, quoted by Pliny). The country of Galen, and of Oribaſius chief phyſician to Julian the Apoſtate (Eunapius), called by ſome the *ape of Galen*. Here P. Scipio died (Cicero). Attalus ſon of Eumenes dying without iſſue, bequeathed his kingdom to the Roman people, who reduced it to a province, (Strabo). *Pergamæus*, the epithet (Martial). Here was one of the nine *conventus juridici*, or aſſemblies of the *Aſia Romana*, called *Pergamenus*, and the ninth in order (Pliny); which he alſo calls *juriſdictio Pergamena*. Pergamus

PERGAMUS, an ancient kingdom of Aſia, formed out of the ruins of the empire of Alexander the Great. It commenced about the year 283. The firſt ſovereign was one Philetærus an eunuch, by birth a Paphlagonian, of a mean deſcent, and in his youth a menial ſervant to Antigonus one of Alexander's captains. He afterwards ſerved Lyſimachus king of Macedon and Thrace, who appointed him keeper of his treaſures lodged in Pergamus. While he held this employment, having fallen under the diſpleaſure of Arſinoe wife to Lyſimachus, ſhe found means to make a quarrel between him and his maſter; upon which Philetærus ſeized on the caſtle of Pergamus, together with the treaſures entruſted to his care, amounting to 90,000 talents. At firſt he offered his ſervice, together with his treaſure, to Seleucus king of Syria: but both Seleucus and Lyſimachus dying ſoon after, he kept poſſeſſion of the town and treaſure alſo till his death; which happened 20 years after his revolt from Lyſimachus.

Philetærus left the city of Pergamus to his brother, or, according to ſome, to his brother's ſon Eumenes I. and he, laying hold of the opportunity offered by the diſſenſions among the Seleucidæ, poſſeſſed himſelf of many ſtrong-holds in the province of Aſia; and having hired a body of Galatians, defeated Antiochus, as he was returning from a victory gained over his brother Seleucus Callinicus. By this victory he obtained poſſeſſion of the greater part of Aſia: however, he did not long enjoy his acquiſitions; for he died next year of immoderate drinking, a vice to which he was greatly addicted.

Eumenes was ſucceeded by Attalus I. nephew of Philetærus, and the firſt who took upon him the title of king of Pergamus. He defeated the Gauls, who were deſirous of ſettling in his territory; and, according to Livy, was the firſt of the Aſiatic princes who refuſed to pay a contribution to theſe barbarians. When Seleucus Ceraunus was engaged in other wars, he invaded his territories, and conquered all the provinces on this ſide of Mount Taurus; but was ſoon driven out of his new acquiſitions by Seleucus and his grandfather Achæus, who entering into an alliance againſt him, deprived him of all his newly acquired territories, and even beſieged him in his capital. Upon this

Attalus

Attalus invited to his aſſiſtance the Gauls who had ſettled in Thrace; and with their help not only obliged the enemy to raiſe the ſiege of Pergamus, but quickly recovered all the provinces he had loſt. After this he invaded Ionia and the neighbouring provinces, where ſeveral cities voluntarily ſubmitted to him. The Teians, Colophonians, with the inhabitants of Egea and Lemnos, ſent deputies declaring themſelves ready to acknowledge him for their ſovereign; the Carſenes, on the other ſide the river Lycus, opened their gates to him, having firſt expelled the governor ſet over them by Achæus. From thence he advanced to Apia, and encamping on the banks of the river Megithus, received homage from the neighbouring nations. But here the Gauls, being frightened by an eclipſe of the moon, refuſed to proceed farther; which obliged Attalus to return to the Helleſpont, where he allowed his allies to ſettle, giving them a large and fruitful territory, and promiſing that he would always aſſiſt and protect them to the utmoſt of his power

Attalus having thus ſettled his affairs with equal honour and advantage to himſelf, entered into an alliance with Rome, and afterwards joined them in their war againſt Philip king of Macedon. Here he had the command of the Rhodian fleet; with which he not only drove the Macedonians quite out of the ſeas, but having landed his men, he, in conjunction with the Athenians, invaded Macedon, and obliged Philip to raiſe the ſiege of Athens, which he had greatly diſtreſſed; for which ſervices the Athenians not only heaped on him all the favours they could, but called one of their tribes by his name; an honour they had never beſtowed on any foreigner before.

Attalus, not contented with all he had yet done againſt Philip, attempted to form a general confederacy of the Greeks againſt him. But while he was haranguing the Bœotians to this purpoſe, and exhorting them with great vehemence to enter into an alliance with the Romans againſt their common enemy, he fell down ſpeechleſs. However, he came to himſelf again, and deſired to be carried by ſea from Thebes to Pergamus, where he died ſoon after his arrival, in the 72d year of his age and 43d of his reign.

This prince was a man of great generoſity, and ſuch an enthuſiaſt in learning and learned men, that he cauſed a grammarian named *Daphidas* to be thrown into the ſea from the top of a high rock, becauſe he ſpoke diſreſpectfully of Homer.

Attalus was ſucceeded by his eldeſt ſon Eumenes II. He was exceedingly attached to the Romans, inſomuch that he refuſed the daughter of Antiochus the Great in marriage, leſt he ſhould thus have been led into a difference with that people. He alſo gave notice to the Roman ſenate of the tranſactions of Ariarathes king of Cappadocia, who was making great preparations both by ſea and land. Nor did Eumenes ſtop here; for when he ſaw the war about to break out between Antiochus and the Romans, he ſent his brother Attalus to Rome to give information of the proceedings of Antiochus. The ſenate heaped honours both on Eumenes and his brother; and in the war which followed, gave the command of their fleet to the king of Pergamus in conjunction with C. Livius Salinator. The victory gained on this occaſion was in a great meaſure owing to Eumenes, who boarded ſome of the enemy's ſhips in perſon, and during the whole action behaved with uncommon bravery. Some time afterwards Eumenes, entering the territories of Antiochus with a body of 5000 men, ravaged all the country about Thyatira and returned with an immenſe booty. But in the mean time Antiochus invading Pergamus in his turn, ravaged the whole country, and even laid ſiege to the capital. Attalus, the king's brother, held out with an handful of men till the Achæans, who were in alliance with Eumenes, ſent 1000 foot and 100 horſe to his aſſiſtance. As this ſmall body of auxiliaries were all choſen men, and commanded by an experienced officer, they behaved with ſuch bravery that the Syrians were obliged to raiſe the ſiege At the battle of Magneſia, too, Eumenes behaved with the greateſt bravery; not only ſuſtaining the firſt attack of the enemy's elephants, but driving them back again on their own troops, which put their ranks in diſorder, and gave the Romans an opportunity of giving them a total defeat by attacking them opportunely with their horſe. In conſequence of this defeat, Antiochus was obliged to conclude a peace with the Romans on ſuch terms as they pleaſed to preſcribe; one of which was, that he ſhould pay Eumenes 400 talents, and a quantity of corn, in recompence for the damage he had done him. Pergamus.

Eumenes now thought of obtaining ſome reward from the Romans equivalent to the ſervices he had done them. Having gone to Rome, he told the ſenate, that he was come to beg of them that the Greek cities which had belonged to Antiochus before the commencement of the late war, might now be added to his dominions; but his demand was warmly oppoſed by the ambaſſadors from Rhodes, as well as by deputies from all the Greek cities in Aſia. The ſenate, however, after hearing both parties, decided the matter in favour of Eumenes, adding to his dominions all the countries on this ſide of Mount Taurus which belonged to Antiochus; the other provinces lying between that mountain and the river Mæander, excepting Lycia and Caria, were beſtowed on the Rhodians. All the cities, which had paid tribute to Attalus, were ordered to pay the ſame to Eumenes; but ſuch as had been tributary to Antiochus were declared free.

Soon after this Eumenes was engaged in a war with Pruſias king of Bithynia, who made war upon him by the advice of Hannibal the celebrated Carthaginian general. But Eumenes, being aſſiſted by the Romans, defeated Pruſias in an engagement by ſea, and another by land; which ſo diſheartened him, that he was ready to accept of peace on any terms. However, before the treaty was concluded, Hannibal found means to draw Philip of Macedon into the confederacy, who ſent Philocles, an old and experienced officer, with a conſiderable body of troops to join Pruſias. Hereupon Eumenes ſent his brother Attalus to Rome with a golden crown, worth 15,000 talents, to complain of Pruſias for making war on the allies of the Roman people without any provocation. The ſenate accepted the preſent, and promiſed to adjuſt every thing to the ſatisfaction of their friend Eumenes, whom they looked upon to be the moſt ſteady ally they had in Aſia. But in the mean time Pruſias, having ventured another ſea-fight, by a contrivance of Hannibal's, gained a complete

Pergamus. complete victory. The Carthaginian commander adviſed him to fill a great many earthen veſſels with various kinds of ſerpents and other poiſonous reptiles, and in the heat of the fight to throw them into the enemies ſhips ſo as to break the pots and let the ſerpents looſe. All the ſoldiers and ſeamen were commanded to attack the ſhip in which Eumenes was, and only to defend themſelves as well as they could againſt the reſt; and that they might be in no danger of miſtaking the ſhip, an herald was ſent before the engagement with a letter to the king. As ſoon as the two fleets drew near, all the ſhips of Pruſias, ſingling out that of Eumenes, diſcharged ſuch a quantity of ſerpents into it, that neither ſoldiers nor ſailors could do their duty, but were forced to fly to the ſhore, leſt they ſhould fall into the enemy's hands. The other ſhips, after a faint reſiſtance, followed the king's example, and were all driven athore with great ſlaughter, the ſoldiers being no leſs annoyed by the ſtings of the ſerpents, than by the weapons of the enemy. The greateſt part of the ſhips of Eumenes were burnt, ſeveral taken, and the others ſo much ſhattered that they became quite unſerviceable. The ſame year Pruſias gained two remarkable victories over Eumenes by land, both of which were entirely owing to ſtratagems of Hannibal. But, while matters were thus going on to the diſadvantage of Eumenes, the Romans interfered, and by their deputies not only put an end to the differences between the two kings, but prevailed on Pruſias to betray Hannibal; upon which he poiſoned himſelf, as hath been related under the article HANNIBAL.

Eumenes being thus freed from ſuch a dangerous enemy, engaged in a new war with the kings of Cappadocia and Pontus, in which alſo he proved victorious. His friendſhip for the Romans he carried to ſuch a degree of enthuſiaſm, that he went in perſon to Rome to inform them of the machinations of Perſes king of Macedon. He had before quarrelled with the Rhodians, who ſent ambaſſadors to Rome to complain of him. But as the ambaſſadors happened to arrive while the king himſelf was preſent in the city, the Rhodian ambaſſadors could not obtain any hearing, and Eumenes was diſmiſſed with new marks of favour. This journey, however, had almoſt proved fatal to him; for, on his return, as he was going to perform a ſacrifice at Delphi, two aſſaſſins, ſent by Perſes, rolled down two great ſtones upon him as he entered the ſtraits of the mountains. With one he was dangerouſly wounded on the head and with the other on the ſhoulder. He fell with the blows from a ſteep place, and thus received many other bruiſes; ſo that he was carried on board his ſhip when it could not well be known whether he was dead or alive. His people, however, ſoon finding that he was ſtill alive, conveyed him to Corinth, and from Corinth to Ægina, having cauſed their veſſels to be carried over the Iſthmus.

Eumenes remained at Ægina till his wounds were cured, which was done with ſuch ſecrecy, that a report of his death was ſpread all over Aſia, and even believed at Rome; nay, his brother Attalus was ſo convinced of the truth of this report, that he not only aſſumed the government, but even married Stratonice the wife of Eumenes. But in a ſhort time Eumenes convinced them both of his being alive, by returning Pergamus to his kingdom. On the receipt of this news, Attalus reſigned the ſovereignty in great haſte, and went to meet his brother; carrying an halberd, as one of his guards. Eumenes received both him and the queen with great tenderneſs, nor did he ever ſay any thing which might tend to make them uneaſy; only it is ſaid he whiſpered in his brother's ear when he firſt ſaw him, "Be in no haſte to marry my wife again till you are ſure that I am dead."

The king being now more than ever exaſperated againſt Perſes, joined the Romans in their war againſt him; but during the courſe of it he ſuddenly cooled in his affection towards thoſe allies whom he had hitherto ſerved with ſo much zeal, and that to ſuch a degree, that he admitted ambaſſadors from Perſes, and offered to ſtand neuter if he would pay him 1000 talents, and for 1500, to influence the Romans to grant him a ſafe and honourable peace. But theſe negociations were broke off without effect, by reaſon of the diſtruſt which the two kings had of one another. Eumenes could not truſt Perſes unleſs he paid him the money beforehand; while, on the other hand, Perſes did not care to part with the money before Eumenes had performed what he promiſed; neither could he be induced to pay the ſum in queſtion, though the king of Pergamus offered to give hoſtages for the performance of his promiſe. What the reaſon of ſuch a ſudden change in the diſpoſition of Eumenes was, is nowhere told; however, the fact is certain. The negociations above-mentioned were concealed from the Romans as long as poſſible; but they ſoon came to be known: after which the republic began to entertain no ſmall jealouſy of their old friend, and therefore heaped favours on his brother Attalus, without taking any notice of the king himſelf. Eumenes had ſent him to Rome to congratulate the ſenate on the happy iſſue of the war with Perſes, not thinking that his practices had been diſcovered. However, the ſenate, without taking any notice of their diſaffection to Eumenes at firſt, entertained Attalus with the greateſt magnificence; then ſeveral of the ſenators who viſited him proceeded to acquaint him with their ſuſpicions of the king, and deſired Attalus to treat with them in his own name, aſſuring him, that the kingdom of Pergamus would be granted him, if he demanded it, by the ſenate. Theſe ſpeeches had at firſt ſome effect; but Attalus, being of an honeſt diſpoſition, and aſſiſted by the advice of a phyſician called *Stratius*, a man of great probity, reſolved not to comply with their deſire. When he was admitted to the ſenate, therefore, he firſt congratulated them on the happy iſſue of the Macedonian war, then modeſtly recounted his own ſervices; and laſtly, acquainted them with the motive of his journey; intreated them to ſend ambaſſadors to the Gauls, who by their authority might ſecure his brother from any danger of their hoſtilities; and he requeſted them alſo, that the two cities of Ænus and Maronea might be beſtowed on himſelf. The ſenate, imagining that Attalus deſigned to chooſe ſome other day to ſue for his brothers's kingdom, not only granted all his requeſts, but ſent him richer and more magnificent preſents than they had ever done before. Upon this Attalus immediately ſet out on his return to Pergamus; which ſo provoked the ſenators, that they

declared the cities free which they had promiſed to Attalus, thus rendering ineffectual their promiſe which they were aſhamed openly to revoke; and as for the Gauls, who were on all occaſions ready to invade the kingdom of Pergamus, they ſent ambaſſadors to them, with inſtructions to behave in ſuch a manner as would rather tend to encourage them in their deſign than diſſuade them from it.

Eumenes, being alarmed at thoſe proceedings, reſolved to go in perſon to Rome, in order to juſtify himſelf. But the ſenate, having already condemned him in their own minds, reſolved not to hear his vindication. For this reaſon, as ſoon as they heard of his deſign, they made an act that no king ſhould be permitted to enter the gates of Rome. Eumenes, however, who knew nothing of this act, ſet forward on his journey, and landed at Brunduſium; but no ſooner did the Roman ſenate get intelligence of his arrival there, than they ſent a quæſtor acquainting him with the decree of the ſenate; and telling him at the ſame time, that if he had any buſineſs to tranſact with the ſenate, he was appointed to hear it, and tranſmit it to them; but if not, that the king muſt leave Italy without delay. To this Eumenes replied, that he had no buſineſs of any conſequence to tranſact, and that he did not ſtand in need of any of their aſſiſtance; and without ſaying a word more, went on board his ſhip, and returned to Pergamus.

On his return home, the Gauls, being encouraged by the cold reception which he had met with at Rome, invaded his territories, but were repulſed with great loſs by the king, who afterwards invaded the dominions of Pruſias, and poſſeſſed himſelf of ſeveral cities. This produced new complaints at Rome; and Eumenes was accuſed, not only by the ambaſſadors of Pruſias, but alſo by thoſe of the Gauls and many cities in Aſia, of keeping a ſecret correſpondence with Perſes king of Macedon. This laſt charge was confirmed by ſome letters which the Romans themſelves had intercepted; ſo that Eumenes found it impoſſible to keep up his credit any longer at Rome, though he ſent his brothers Athenæus and Attalus thither to intercede for him. The ſenators, in ſhort, had conceived the moſt implacable hatred againſt him, and ſeemed abſolutely bent on his deſtruction, when he died, in the 39th year of his reign, leaving his kingdom and his wife to his brother Attalus. He left one ſon, but he was an infant, and incapable of governing the kingdom; for which reaſon Eumenes choſe rather to give the preſent poſſeſſion of the crown to his brother, reſerving the ſucceſſion to his ſon, than to endanger the whole by committing the management of affairs to his ſon's tutors.

Attalus, in the beginning of his reign, found himſelf greatly diſtreſſed by Pruſias king of Bithynia, who not only overthrew him in a pitched battle, but advanced to the very walls of Pergamus, ravaging the country as he marched along; and at laſt reduced the royal city itſelf. The king, however, ſaved himſelf by a timely flight, and diſpatched ambaſſadors to Rome, complaining of the bad uſage of Pruſias. The latter endeavoured to defend himſelf, and to throw the blame on Attalus. But, after a proper inquiry was made into the matter, Pruſias was found to be entirely in the wrong; in conſequence of which, he was at laſt obliged to conclude a peace with his adverſary on the following terms. 1. That he ſhould immediately deliver up to Attalus 20 ſhips with decks. 2. That he ſhould pay 500 talents to Attalus within the ſpace of 20 years. 3. That he ſhould pay 100 talents to ſome of the other Aſiatic nations by way of reparation for the damages they had ſuſtained from him. And, 4. Both parties ſhould be content with what they had before the beginning of the war. Pergamus.

Some time after this, Pruſias having made an unnatural attempt on the life of his ſon Nicomedes, the latter rebelled, and, with the aſſiſtance of Attalus, drove his father from the throne, and, as is ſaid, even murdered him in the temple of Jupiter. The Romans took no notice of theſe tranſactions, but ſhowed the ſame kindneſs to Attalus as formerly. The laſt enterpriſe in which we find Attalus engaged, was againſt Andriſcus the pretended ſon of Perſes king of Macedon, where he aſſiſted the Romans; after which he gave himſelf up entirely to eaſe and luxury, committing ſtate affairs entirely to his miniſters: and thus continued to his death, which happened in the 82d year of his age, about 138 B. C.

Attalus II. was ſucceeded by Attalus III. the ſon of Eumenes; for the late king, conſidering that he only held the crown as a truſt for his nephew, paſſed by his own children in order to give it to him, tho' he appears to have been by no means worthy of it. He is ſaid to have been deprived of his ſenſes thro' the violence of his grief for his mother's death; and indeed, throughout his whole reign, he behaved more like a madman than any thing elſe. Many of his ſubjects of the higheſt quality were cut off with their wives and children, upon the moſt groundleſs ſuſpicions; and for theſe executions he made uſe of mercenaries hired out from among the moſt barbarous nations. Thus he proceeded till he had cut off all the beſt men in the kingdom; after which he fell into a deep melancholy, imagining that the ghoſts of thoſe whom he had murdered were perpetually haunting him. On this he ſhut himſelf up in his palace, put on a mean apparel, let his hair and beard grow, and ſequeſtered himſelf from all mankind. At laſt he withdrew from the palace, and retired into a garden, which he cultivated with his own hands, and filled with all ſorts of poiſonous herbs. Theſe he uſed to mix with wholeſome pulſe, and ſend packets of them to ſuch as he ſuſpected. At laſt, being weary of this amuſement, and living in ſolitude, becauſe nobody durſt approach him, he took it in his head to follow the trade of a founder, and make a brazen monument. But, while he laboured at melting and caſting the braſs, the heat of the ſun and furnace threw him into a fever, which in ſeven days put an end to his tyranny, after he had ſat on the throne five years.

On the death of the king, a will was found, by which he left the Roman people heirs of all his goods; upon which they ſeized on the kingdom, and reduced it to a province of their empire by the name of *Aſia Proper*. But Ariſtonicus, a ſon of Eumenes by an Epheſian courteſan, reckoning himſelf the lawful heir to the crown, could by no means be ſatisfied with this uſurpation of the Romans, and therefore aſſembled a conſiderable army to maintain his pretenſions. The people in general, having been accuſtomed to a mo-

Pergamus narchy, dreaded a republican form of government; in consequence of which, they assisted Aristonicus, and soon put him in a condition to reduce the whole kingdom. The news, however, were soon carried to Rome; and Licinius Crassus, the pontifex maximus, was sent into the east, with orders to enforce obedience to the king's will. Historians take no notice of any forces which were sent along with this commander; whence it is supposed, that he depended on assistance from the Asiatics, who were in alliance with Rome, or from the Egyptians. But when he came thither, he found both the Syrians and Egyptians so reduced, that he could not expect any assistance from them. However, he was soon supplied with troops in plenty by the kings of Pontus, Bithynia, Cappadocia, and Paphlagonia; but managed matters so ill, that he was entirely defeated and taken prisoner. Those who took him, designed to carry him to Aristonicus; but he, not able to endure the disgrace, would have laid violent hands on himself if he had not been disarmed. However, being allowed to keep a rod for managing the horse on which he sat, he struck a Thracian soldier who stood near him so violently with it, that he beat out one of his eyes; upon which the other drew his sword, and run him thro' on the spot. His head was brought to Aristonicus, who exposed it to public view; but the body was honourably buried.

Aristonicus had no great time to enjoy the fruits of his victory. Indeed he behaved very improperly after it; for, instead of preparing to oppose the next army, which he might have been assured the Romans would send against him, he spent his time in feasting and revelling. But he was soon roused out of his lethargy by Perpenna the new consul, who having assembled with incredible expedition the troops of the allies, came unexpectedly upon him, obliged him to venture an engagement at a disadvantage, and entirely defeated him. Aristonicus fled to a city called *Stratonice*; but was so closely pursued by the conqueror, that the garrison, having no method of supplying themselves with provisions, delivered up their leader, as well as a philosopher named *Blosius*, who had been the companion and counsellor of Aristonicus. The philosopher behaved with great resolution after being taken, and openly defended his siding with Aristonicus, because he thought his cause just. He exhorted the latter to prevent the disgrace and misery of captivity by a voluntary death; but Aristonicus, looking upon death as a greater misery than any captivity, suffered himself to be treated as his conquerors pleased.

In the mean time, a new consul, named *Manius Aquilius*, being arrived from Rome, sent a most haughty message to Perpenna, requiring him immediately to deliver up Aristonicus, as a captive belonging to his triumph when the war should be ended. With this demand Perpenna refused to comply, and his refusal had almost produced a civil war. However, this was prevented by the death of Perpenna, which happened soon after the dispute commenced. The Pergamenians, notwithstanding the defeat and captivity of their leader, still held out with such obstinacy, that Aquilius was obliged to besiege, and take by force, almost every city in the kingdom. In doing this, he took a very effectual, though exceeding cruel method. Most of the cities in the kingdom had no other water than what was brought from a considerable distance in aqueducts. These Aquilius did not demolish, but poisoned the water, which produced the greatest abhorrence of him throughout all the east. At last, however, the whole country being reduced, Aquilius triumphed, the unhappy Aristonicus was led in chains before his chariot, and probably ended his miserable life in a dungeon. The country remained subject to the Romans while their empire lasted, but is now in the hands of the Turks. The city is half ruined, and is still known by the name of *Pergamus*. It is inhabited by about 3000 Turks, and a few families of poor Christians. E. Long. 27. 27. N. Lat. 30. 3.

PERGUNNAH, in the language of Hindostan, means the largest subdivision of a province, whereof the revenues are brought to one particular *head Cutchery*, from whence the accounts and cash are transmitted to the general *Cutchery* of the province.

PERIAGOGE, in rhetoric, is used where many things are accumulated into one period which might have been divided into several.

PERIAGUA, a sort of large canoe made use of in the Leeward islands, South America, and the gulf of Mexico. It is composed of the trunks of two trees hollowed and united together; and thus differs from the canoe, which is formed of one tree.

PERIANDER, tyrant of Corinth and Corcyra, was reckoned among the seven wise men of Greece; though he might rather have been reckoned among the most wicked men, since he changed the government of his country, deprived his countrymen of their liberty, usurped the sovereignty, and committed the most shocking crimes. In the beginning of his reign he behaved with mildness; but after his having sent to the tyrant of Syracuse to consult him on the safest method of government, he abandoned himself to cruelty. The latter, having heard Periander's envoys, took them into a field, and, instead of answering them, pulled up before them the ears of corn which exceeded the rest in height. Periander, on being told of this action, understood what was meant by it. He first secured himself by a good guard, and then put the most powerful Corinthians to death. He abandoned himself to the most enormous crimes; committed incest with his mother, kicked to death his wife Melissa, daughter of Procles king of Epidaurus, notwithstanding her being with child; and was so enraged at Lycophron, his second son, for lamenting his mother's death, that he banished him into the island of Corcyra. Yet he passed for one of the greatest politicians of his time; and Heraclides tells us, that he forbad voluptuousness; that he imposed no taxes, contenting himself with the custom arising from the sale and the import and export of commodities; that, tho' wicked himself, he hated the wicked, and caused all pimps to be drowned; lastly, that he established a senate, and settled the expence of its members. He died 585 B. C.

PERIANTHIUM, (from περὶ "round," and ἄνθος "the flower,") the flower-cup properly so called, the most common species of calyx, placed immediately under the flower, which is contained in it as in a cup. See BOTANY, p. 433, col. 1.

PERICARDIUM, in anatomy, a membranous bag filled with water, which contains the heart in man and

and many other animals. It is formed by a duplicature of the mediaſtinum, or membrane which divides the thorax into two unequal parts. See ANATOMY, n° 121.

PERICARPIUM, (from περὶ "round," and καρπὸς "fruit,") the ſeed veſſel; an entrail of the plant big with ſeeds, which it diſcharges when ripe. The ſeed-veſſel is in fact the developed ſeed bud, and may very properly be compared to the fecundated ovary in animals; for it does not exiſt till after the fertilizing of the ſeeds by the male-duſt, and the conſequent fall of the flower. All plants, however, are not furniſhed with a ſeed-veſſel; in ſuch as are deprived of it, the receptacle or calyx performs its functions by incloſing the ſeeds, as in a matrix, and accompanying them to perfect maturity.

PERICHORUS, in antiquity, a name given by the Greeks to their profane games or combats, that is, to ſuch as were not conſecrated to any of the gods.

PERICLES, was one of the greateſt men that ever flouriſhed in Greece. He was educated with all imaginable care; and beſide other maſters, he had for his tutors Zeno, Eleates, and Anaxagoras. He learned from the laſt of theſe to fear the gods without ſuperſtition, and to account for an eclipſe from a natural cauſe. Many were unjuſt enough to ſuſpect him of atheiſm, becauſe he had perfectly ſtudied the doctrine of that philoſopher. He was a man of undoubted courage; and of ſuch extraordinary eloquence, ſupported and improved by knowledge, that he gained almoſt as great an authority under a republican government as if he had been a monarch; but yet he could not eſcape the ſatirical ſtrokes of the comic poets. His diſſoluteneſs with the women was one of the vices with which he was chiefly charged. He died the third year of the Peloponneſian war, after long ſickneſs, which had weakened his underſtanding. Aſpaſia, Pericles's favourite, was a learned woman of Miletus: ſhe taught Socrates rhetoric and politics. As Pericles cared not much for his wife, he willingly gave her up to another, and married Aſpaſia, whom he paſſionately loved.

PERICRANIUM, in anatomy, a thick ſolid coat or membrane covering the outſide of the cranium or ſkull. See ANATOMY, n° 4.

PERIGEE, in aſtronomy, that point of the ſun or moon's orbit wherein they are at the leaſt diſtance from the earth, in which ſenſe it ſtands oppoſed to apogee.

PERIGEUX, an ancient epiſcopal town of France, capital of the province of Perigord, ſeated on the river Iſle, in E. Long. 0. 33 N. Lat. 45. 18. It is remarkable for the ruins of the temple of Venus, and an amphitheatre.

PERIGORD, a province of France, which makes part of Guienne, bounded on the north by Angoumois and a part of Marche, and on the eaſt by Quercy and Limoſin; on the ſouth by Agenois and Bazadois; and on the weſt, by Bourledois, Angoumois, and a part of Saintonge. It is about 83 miles in length, and 60 in breadth. It abounds in iron mines, and the air is pure and healthy. Perigeux is the capital town.

Perigord-Stone, an ore of manganeſe, of a dark grey colour, like the baſaltes or trapp. It may be ſcraped with a knife, but is extremely difficult to be broken. It is found of no regular figure, is very compact, heavy, and as black as charcoal. Its appearance is glittering and ſtriated, like the ore of antimony; its particles being diſpoſed in the form of needles, croſſing one another without any agglutination, inſomuch that ſome are looſe as iron-filings when ſtuck to a loadſtone, reſembling the ſcoria from a blackſmith's furnace. By calcination it becomes harder and of a reddiſh-brown colour, but is not attracted by the magnet. It has a conſiderable ſpecific gravity, does not melt *per ſe*, but with borax runs into a glaſs of the colour of an amethyſt. It is ſcarcely affected by nitrous acid without the addition of ſugar. It ſeems alſo to contain ſome argil and iron. It is met with in Gaſcony and Dauphiny in France, and in ſome parts of England. It is employed by the French potters and enamellers in the glaſſy varniſh of their earthen wares.

PERIGRAPHE, a word uſually underſtood to expreſs a careleſs or inaccurate delineation of any thing; but in Veſalius it is uſed to expreſs the white lines or impreſſions that appear on the muſculus rectus of the abdomen.

PERIHELIUM, in aſtronomy, that part of a planet or comet's orbit wherein it is in its leaſt diſtance from the ſun, in which ſenſe it ſtands in oppoſition to aphelium.

PERIMETER, in geometry, the bounds or limits of any figure or body. The perimeters of ſurfaces or figures are lines; thoſe of bodies are ſurfaces. In circular figures, inſtead of perimeter, we ſay circumference, or periphery.

PERINÆUM, or PERINEUM, in anatomy, the ſpace between the anus and the parts of generation, divided into two equal lateral diviſions by a very diſtinct line, which is longer in males than in females.

PERINSKIOLD (John), a learned Swediſh writer, born at Stregneſia in Sudermania, in 1654, ſtudied under his father, who was profeſſor of eloquence and poetry, and afterwards became well ſkilled in the antiquities of the north. He was made profeſſor at Upſal, ſecretary antiquary of the king of Sweden, and counſellor of the chancery of antiquities. He died in 1720. His principal works are: 1. A Hiſtory of the Kings of Norway. 2. A Hiſtory of the Kings of the North. 3. An Edition of John Meſſenius on the Kings of Sweden, Norway, and Denmark, in 14 vols folio, &c. All Perinſkiold's works are excellent, and highly eſteemed.

PERIOD, in aſtronomy, the time taken up by a ſtar or planet in making a revolution round the ſun; or the duration of its courſe till it return to the ſame part of its orbit. See PLANET.

The different periods and mean diſtances of the ſeveral planets are as follow:

	Days	h.	′	″	mean Diſt.
Saturn	10579	6	36	26	953800
Jupiter	4332	12	20	35	520110
Mars	686	23	27	30	152309
Earth	365	6	9	30	100000
Venus	224	16	49	24	72333
Mercury	87	23	15	53	36710

There is a wonderful harmony between the diſtances

Period. of the planets from the sun, and their periods round him; the great law whereof is, that the squares of the periodical times of the primary planet, are to each other as the cubes of their distances from the sun: and likewise, the squares of the periodical times of the secondaries of any planet are to each other as the cubes of their distances from that primary. This harmony among the planets is one of the greatest confirmations of the Copernican hypothesis. See ASTRONOMY, n° 414.

For the periods of the moon, see ASTRONOMY, n°422, and observe *Index* to astronomy.

The periods of several comets are now pretty well ascertained. See ASTRONOMY, n° 171, &c.

PERIOD, in chronology, denotes a revolution of a certain number of years, or a series of years, whereby, in different nations, and on different occasions, time is measured; such are the following.

Calippic PERIOD, a system of seventy-six years. See CALIPPIC, and ASTRONOMY, n° 11, &c.

Dionysian PERIOD, or *Victorian Period*, a system of 532 lunæ-solar and Julian years; which being elapsed, the characters of the moon fall again upon the same day and feria, and revolve in the same order, according to the opinion of the ancients.

This period is otherwise called the *great paschal cycle*, because the Christian church first used it to find the true time of the pascha or easter. The sum of these years arise by multiplying together the cycles of the sun and moon.

Hipparchus's PERIOD, is a series of 304 solar years, returning in a constant round, and restoring the new and full moons to the same day of the solar year, according to the sentiment of Hipparchus. This period arises by multiplying the Calippic period by four.—Hipparchus assumed the quantity of the solar year to be 365 days 5 hours 55′ 12″; and hence concluded, that in 104 years Calippus's period would err a whole day. He therefore multiplied the period by four, and from the product cast away an entire day. But even this does not restore the new and full moons to the same day throughout the whole period; but they are sometimes anticipated 1 day 8 hours 23′ 29″ 20‴. See ASTRONOMY, n° 14.

Julian PERIOD. See JULIAN.

PERIOD, in grammar, denotes a small compass of discourse, containing a perfect sentence, and distinguished at the end by a point, or full stop, thus (.); and in members or divisions marked by commas, colons, &c.

Father Buffier observes two difficulties in the use of the period, or point; i. e. in distinguishing it from the colon, or double point; and in determining justly the end of a period, or perfect sentence. It is remarked, that the supernumerary members of a period, separated from the rest by colons and semicolons, usually commence with a conjunction: yet it is true these same conjunctions sometimes rather begin new periods than supernumerary members of old ones. It is the sense of things, and the author's own discretion, that must make the proper distinction which of the two in effect it is. No rules will be of any service, unless this be admitted as one, that when what follows the conjunction is of as much extent as what precedes it, it is usually a new period; otherwise not.

The second difficulty arises hence, that the sense appears perfect in several short detached phrases, wherein it does not seem there should be periods; a thing frequent in free discourse: as, *We are all in suspense: make your proposals immediately: you will be to blame for detaining us longer.* Where it is evident, that simple phrases have perfect senses like periods, and ought to be marked accordingly; but that the shortness of the discourse making them easily comprehended, the pointing is neglected.

De Colonia defines period a short but perfect sentence, consisting of certain parts or members, depending one on another, and connected together by some common vinculum. The celebrated definition of Aristotle is, a period is a discourse which has a beginning, a middle, and an end, all visible at one view. Rhetoricians consider period, which treats of the structure of sentences, as one of the four parts of composition. The periods allowed in oratory are three: A period of two members, called by the Greeks *dicolos*, and by the Latins *bimembris*; a period of three members, *tricolos*, *trimembris*; and a period of four, *quadrimembris*, *tetracolos*. See PUNCTUATION.

PERIOD, in numbers, is a distinction made by a point or comma, after every sixth place, or figure; and is used in numeration, for the readier distinguishing and naming the several figures or places; which see under NUMERATION.

PERIOD, in medicine, is applied to certain diseases which have intervals, and returns, to denote an entire course or circle of such disease; or its progress from any state through all the rest till it return to the same again.

Galen describes period as a time composed of an intension and remission; whence it is usually divided into two parts, the paroxysm or exacerbation, and remission.

In intermitting fevers, the periods are usually stated and regular; in other diseases, as the epilepsy, gout, &c. they are vague or irregular.

PERIOD, in oratory. See there, n° 47.

PERIODIC, or PERIODICAL, something that terminates and comprehends a period; such is a periodic month; being the space of time wherein the moon dispatches her period.

PERIOECI, *περίοικοι*, in geography, such inhabitants of the earth as have the same latitudes, but opposite longitudes, or live under the same parallel and the same meridian, but in different semicircles of that meridian, or in opposite points of the parallel. These have the same common seasons throughout the year, and the same phenomena of the heavenly bodies; but when it is noon-day with the one, it is midnight with the other, there being twelve hours in an east and west direction. These are found on the globe by the hour-index, or by turning the globe half round, that is, 180 degrees either way.

PERIOSTEUM, or PERIOSTIUM, in anatomy, a nervous vascular membrane, endued with a very quick sense, immediately surrounding, in every part, both the internal and external surfaces of all the bones in the body, excepting only so much of the teeth as stand above the gums, and the peculiar places on the bones, in which the muscles are inserted. It is hence divided into the external and internal periosteum; and where

is

Peripatetics. it externally furrounds the bones of the ſkull, it is generally called the *pericranium*. See ANATOMY, n° 4.

PERIPATETICS, philoſophers, followers of Ariſtotle, and maintainers of the peripatetic philoſophy; called alſo *Ariſtotelians*. Cicero ſays, that Plato left two excellent diſciples, Xenocrates and Ariſtotle, who founded two ſects, which only differed in name: the former took the appellation of *Academics*, who were thoſe that continued to hold their conferences in the Academy, as Plato had done before; the others, who followed Ariſtotle, were called *Peripatetics*, from περιπατω, "I walk;" becauſe they diſputed walking in the Lyceum.

Ammonius derives the name Peripatetic from Plato himſelf, who only taught walking; and adds, that the diſciples of Ariſtotle, and thoſe of Xenocrates, were equally called Peripatetics; the one Peripatetics of the Academy, the other Peripatetics of the Lyceum: but that in time the former quitted the title Peripatetic for that of Academic, on account of the place where they aſſembled; and the latter retained ſimply that of Peripatetic. The greateſt and beſt part of Ariſtotle's philoſophy was borrowed from Plato. Serranus aſſerts, and ſays he could demonſtrate, that there is nothing exquiſite in any part of Ariſtotle's philoſophy, dialectics, ethics, politics, phyſics, or metaphyſics, but is found in Plato. And of this opinion are many of the ancient authors, ſuch as Clemens Alexandrinus, &c. Gale attempts to ſhow, that Ariſtotle borrowed a good deal of his philoſophy, both phyſical, about the firſt matter, and metaphyſical about the firſt being, his affections, truth, unity, goodneſs, &c. from the Scriptures; and adds from Clearchus, one of Ariſtotle's ſcholars, that he made uſe of a certain Jew, who aſſiſted him therein.

Ariſtotle's philoſophy preſerved itſelf *in puris naturalibus* for a long time: in the earlier ages of Chriſtianity, the Platonic philoſophy was generally preferred; but this did not prevent the doctrine of Ariſtotle from forcing its way into the Chriſtian church. Towards the end of the fifth century, it roſe into great credit; the Platonics interpreting in their ſchools ſome of the writings of Ariſtotle, particularly his dialectics, and recommending them to young perſons. This appears to have been the firſt ſtep to that univerſal dominion which Ariſtotle afterwards obtained among the learned, which was at the ſame time much promoted by the controverſies which Origen had occaſioned. This father was zealouſly attached to the Platonic ſyſtem; and therefore, after his condemnation, many, to avoid the imputation of his errors, and to prevent their being counted among the number of his followers, openly adopted the philoſophy of Ariſtotle. Nor was any philoſophy more proper for furniſhing thoſe weapons of ſubtle diſtinctions and captious ſophiſms, which were uſed in the Neſtorian, Arian, and Eutychian controverſies. About the end of the ſixth century, the Ariſtotelian philoſophy, as well as ſcience in general, was almoſt univerſally decried; and it was chiefly owing to Boethius, who explained and recommended it, that it obtained a higher degree of credit among the Latins than it had hitherto enjoyed. Towards the end of the ſeventh century, the Greeks abandoned Plato to the monks, and gave themſelves up entirely to the direction of Ariſtotle; and in the next century, the Peripatetic philoſophy was taught everywhere in their public ſchools, and propagated in all places with conſiderable ſucceſs. John Damaſcenus very much contributed to its credit and influence, by compoſing a conciſe, plain, and comprehenſive view of the doctrines of the Stagirite, for the inſtruction of the more ignorant, and in a manner adapted to common capacities. Under the patronage of Photius, and the protection of Bardas, the ſtudy of philoſophy for ſome time declined, but was revived again about the end of the ninth century. About the middle of the 11th century, a revolution in philoſophy commenced in France; when ſeveral famous logicians, who followed Ariſtotle as their guide, took nevertheleſs the liberty of illuſtrating and modelling anew his philoſophy, and extending it far beyond its ancient limits. In the 12th century, three methods of teaching philoſophy were in uſe by different doctors: the firſt was the ancient and plain method, which confined its reſearches to the philoſophical notions of Porphyry, and the dialectic ſyſtem, commonly attributed to St Auguſtine, and in which were laid down this general rule, that philoſophical inquiries were to be limited to a ſmall number of ſubjects, leſt, by their becoming too extenſive, religion might ſuffer by a profane mixture of human ſubtilty with its divine wiſdom. The ſecond method was called the Ariſtotelian, becauſe it conſiſted in explications of the works of that philoſopher, ſeveral of whoſe books, being tranſlated into Latin, were almoſt everywhere in the hands of the learned. The third was termed the free method, employed by ſuch as were bold enough to ſearch after truth, in the manner the moſt adapted to render their inquiries ſucceſsful, without rejecting the ſuccours of Ariſtotle and Plato. A reformed ſyſtem of the Peripatetic philoſophy was firſt introduced into the ſchools in the univerſity of Paris, from whence it ſoon ſpread throughout Europe; and has ſubſiſted in ſome univerſities even to this day, under the name of *ſchool philoſophy*. The foundation thereof is Ariſtotle's doctrine, often miſunderſtood, but oftener miſapplied: whence the retainers thereto may be denominated *Reformed Peripatetics*. Out of theſe have ſprung, at various times, ſeveral branches; the chief are, the THOMISTS, SCOTISTS, and NOMINALISTS. See theſe articles.

The Peripatetic ſyſtem, after having prevailed with great and extenſive dominion for many centuries, began rapidly to decline towards the cloſe of the 17th, when the diſciples of Ramus attacked it on the one hand, and it had ſtill more formidable adverſaries to encounter in Deſcartes, Gaſſendi, and Newton. See PHILOSOPHY.

PERIPATON, in antiquity, the name of that walk in the Lyceum where Ariſtotle taught, and whence the name of Peripatetics given to his followers.

PERIPETIA, in the drama, that part of a tragedy wherein the action is turned, the plot unravelled, and the whole concludes. See CATASTROPHE.

PERIPHERY, in geometry, the circumference of a circle, ellipſis, or any other regular curvilinear figure. See GEOMETRY.

PERIPHRASIS, circumlocution, formed of περι "about," and φραζω "I ſpeak," in rhetoric, a circuit or tour of words, much affected by orators, to avoid common and trite manners of expreſſion. The peri-

Peripatetics || Periphraſis.

Periploca, Peri; neumony.

phrasis is of great use on some occasions; and it is often necessary to make things be conceived which are not proper to name. It is sometimes polite to suppress the names, and only intimate or design them. These turns of expression are also particularly serviceable in oratory; for the sublime admitting of no direct citations, there must be a compass taken to insinuate the authors whose authority is borrowed. A periphrasis, by turning round a proper name to make it understood, amplifies and raises the discourse; but care must be taken it be not too much swelled, nor extended *mal à propos*; in which case it becomes flat and languid.—See Circumlocution and Oratory.

PERIPLOCA, Virginian silk, in botany: A genus of the digynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 30th order, *Contortæ*. The nectarium surrounds the genitals, and sends out five filaments. There are five species, four of which are natives of warm climates, and can only be raised there. The fifth, however, is sufficiently hardy for this climate. The periploca is a fine climbing plant, that will wind itself with its ligneous branches about whatever tree, hedge, pale, or pole is near it; and will arise, by the assistance of such support, to the height of above 30 feet; and where no tree or support is at hand to wind about, it will knit or entangle itself together in a most complicated manner. The stalks of the older branches, which are most woody, are covered with a dark brown bark, whilst the younger shoots are more mottled with the different colours of brown and grey, and the ends of the youngest shoots are often of a light green. The stalks are round, and the bark is smooth. The leaves are the greatest ornament to this plant; for they are tolerably large, and of a good shining green colour on their upper surface, and cause a variety by exhibiting their under surface of an hoary cast. Their figure is oblong, or rather more inclined to the shape of a spear, as their ends are pointed, and they stand opposite by pairs on short footstalks. Their flowers afford pleasure to the curious examiner of nature. Each of them singly has a star-like appearance; for though it is composed of one petal only, yet the rim is divided into segments, which expand in such a manner as to form that figure. Their inside is hairy, as is also the nectarium which surrounds the petal. Four or five of the flowers grow together, forming a kind of umbel. They are of a chocolate colour, are small, and will be in blow in July and August, and sometimes in September. In the country where this genus grows naturally, they are succeeded by a long taper pod, with compressed seeds, having down to their tops.

Dictionary of Plants, &c.

The propagation of this climber is very easy: for if the cuttings are planted in a light moist soil, in the autumn or in the spring, they will readily strike root. Three joints at least should be allowed to each cutting: they should be the bottom of the preceding summer's shoot; and two of the joints should be planted deep in the soil. Another, and a never-failing method, is by layers; for if they are laid down in the ground, or a little soil only loosely thrown over the young preceding summer's shoots, they will strike root at the joints, and be good plants for removing the winter following.

PERIPNEUMONY, Περιπνευμονία, formed from περὶ "about," and πνεύμων "lungs," in medicine, an inflammation of some part of the thorax, properly of the lungs; attended with an acute fever, and a difficulty of breathing. See Medicine, n° 184.

Peririh terium || Perjur

PERIRRHANTERIUM, a vessel of stone or brass which was filled with holy water, and with which all those were sprinkled who were admitted by the ancients to their sacrifices. Beyond this vessel no profane person was allowed to pass. We are told by some, that it was placed in the *Adytum*, or inmost recess of the temple; others say it was placed at the door, which indeed seems to be the most likely opinion. It was used both by Greeks and Romans, and has been evidently borrowed, like many other Pagan ceremonies, by the Church of Rome. The Hebrews also had a vessel for purification.

PERISCII, in geography, the inhabitants of either frigid zone, between the polar circles and the poles, where the sun, when in the summer signs, moves only round about them, without setting; and consequently their shadows in the same day turn to all the points of the horizon.

PERISTALTIC, a vermicular spontaneous motion of the intestines, performed by the contraction of the circular and longitudinal fibres of which the fleshy coats of the intestines are composed; by means whereof the chyle is driven into the orifices of the lacteal veins, and the fæces are protruded towards the anus.

PERISTYLE, in ancient architecture, a building encompassed with a row of columns on the inside.

PERITONÆUM, in anatomy, is a thin, smooth, and lubricous membrane, investing the whole internal surface of the abdomen, and containing most of the viscera of that part as it were in a bag. See Anatomy, n° 89.

PERITROCHIUM, in mechanics, denotes a wheel, or circle, concentric with the base of a cylinder, and moveable together with it about its axis. See Mechanics.

PERJURY, in law, is defined by Sir Edward Coke to be a crime committed when a lawful oath is administered, in some judicial proceeding, to a person who swears wilfully, absolutely, and falsely, in a matter material to the issue or point in question. In ancient times it was in some places punished with death; in others it made the false swearer liable to the punishment due to the crime he had charged the innocent person with; in others a pecuniary mulct was imposed. But though it escaped human, yet it was thought, amongst the ancients in general, that the divine vengeance would most certainly overtake it; and there are many severe inflictions from the hand of God upon record, as monuments of the abhorrence in which this atrocious crime is held by the Deity. The souls of the deceased were supposed to be employed in punishing perjured persons. Even the inanimate creation was thought to take revenge for this crime. The Greeks supposed that no person could swear falsely by Styx without some remarkable punishment; and that no person guilty of perjury could enter the cave of Palæmon at Corinth without being made a memorable example of divine justice. In Sicily, at the temple of the Palici, there were fountains called *Delli*, from which issued boiling water, with flames and balls of fire; and we are told that if any person swore falsely near them, he was instantly struck dumb, blind, lame,

or

rjury. or dead, or was ſwallowed up by the waters. But although perjury was thus held in general abhorrence, notwithſtanding the credit which was given to ſuch accounts of divine inflictions, it was ſo much practiſed by the Greeks, that *Græca fides* became a proverb. Lovers perjuries, however, were ſuppoſed to paſs unnoticed, or to be very ſlightly puniſhed with blackneſs of the nails, a decayed tooth, or ſome ſmall diminution of beauty.

The ancient philoſophers, however, were ſo afraid of perjury, that even an oath before a judge was never admitted but for want of other proof. Plato's precept was, "Not to adminiſter an oath wantonly, but on deep grounds, and with the ſtricteſt caution." Ulpian gives his opinion thus: "Some are forward to take oaths from a contempt of religion: others, from an extraordinary awe of the Divine Majeſty, carry their fear to an unreaſonable ſuperſtition; ſo make an equitable deciſion of a judge neceſſary." "No man will perjure himſelf (ſays Ariſtotle) who apprehends vengeance from Heaven and diſgrace among men." Clinias was ſo very ſcrupulous, that rather than take an oath (though lawfully), he ſuffered the loſs of three talents. Perjury, in the time of Philo Judeus, was abominated and capitally puniſhed among the Jews; though ſince they have much degenerated, having been poiſoned with the books of the Talmud, which ſays, "He who breaks his promiſſory oath, or any vows he enters into by the year, if he has a mind ſhould be ineffectual and invalid, let him riſe the laſt day of the year, and ſay, Whatever promiſes, oaths, and vows I may think fit to make in the year following, let them be null, void, and of no effect." Tract. iii. part 3. of the *Talmud*, in the treatiſe *Nedharim*, ch. 4. And the modern Jews uſe the ſame artifice, thinking they may then lawfully deceive the Chriſtians See *Hieron. ex Dictis Talmud*, c. 3. and *Magiſter Joannes de Concor. Legum*, tit. iv. c. 7.

In our law, no notice is taken of any perjury but ſuch as is committed in ſome court of juſtice having power to adminiſter an oath; or before ſome magiſtrate or proper officer inveſted with a ſimilar authority, in ſome proceedings relative to a civil ſuit or a criminal proſecution: for it eſteems all other oaths unneceſſary at leaſt, and therefore will not puniſh the breach of them. For which reaſon it is much to be queſtioned, how far any magiſtrate is juſtifiable in taking a voluntary affidavit in any extrajudicial matter, as is now too frequent upon every petty occaſion; ſince it is more than poſſible that, by ſuch idle oaths, a man may frequently, *in foro conſcientiæ*, incur the guilt, and at the ſame time evade the temporal penalties of perjury. The perjury muſt alſo be corrupt (that is, committed *malo animo*), wilful, poſitive, and abſolute; not upon ſurpriſe, or the like: it alſo muſt be in ſome point material to the queſtion in diſpute; for if it only be in ſome trifling collateral circumſtance, to which no regard is paid, it is no more penal than in the voluntary extrajudicial oaths before mentioned Subornation of perjury is the offence of procuring another to take ſuch a falſe oath, as conſtitutes perjury in the principal. The puniſhment of perjury and ſubornation, at common law, has been various. It was anciently death; afterwards baniſhment, or cutting out the tongue; then forfeiture of goods; and now it is fine and impriſonment, and never more to be capable of bearing teſtimony. But the ſtatute 5 Eliz. c. 9. (if the offender be proſecuted thereon) inflicts the penalty of perpetual infamy, and a fine of 40l. on the ſuborner; and in default of payment, impriſonment for ſix months, and to ſtand with both ears nailed to the pillory. Perjury itſelf is thereby puniſhed with ſix months impriſonment, perpetual infamy, and a fine of 20l. or to have both ears nailed to the pillory. But the proſecution is uſually carried on for the offence at common law; eſpecially as, to the penalties before inflicted, the ſtatute 2 Geo. II. c. 25. ſuperadds a power for the court to order the offender to be ſent to the houſe of correction for a term not exceeding ſeven years, or to be tranſported for the ſame period; and makes it felony, without benefit of clergy, to return or eſcape within the time. It has ſometimes been wiſhed, that perjury, at leaſt upon capital accuſations whereby another's life has been or might have been deſtroyed, was alſo rendered capital, upon a principle of retaliation; as it was univerſally by the laws of France. And certainly the odiouſneſs of the crime pleads ſtrongly in behalf of the French law. But it is to be conſidered, that there they admitted witneſſes to be heard only on the ſide of the proſecution, and uſed the rack to extort a confeſſion from the accuſed. In ſuch a conſtitution, therefore, it was neceſſary to throw the dread of capital puniſhment into the other ſcale, in order to keep in awe the witneſſes for the crown; on whom alone the priſoner's fate depended: ſo naturally does one cruel law beget another. But corporal and pecuniary puniſhments, exile, and perpetual infamy, are more ſuited to the genius of the Engliſh law; where the fact is openly diſcuſſed between witneſſes on both ſides, and the evidence for the crown may be contradicted and diſproved by thoſe of the priſoner. Where indeed the death of an innocent perſon has actually been the conſequence of ſuch wilful perjury, it falls within the guilt of deliberate murder, and deſerves an equal puniſhment; which our ancient law in fact inflicted. But the mere attempt to deſtroy life by other means not being capital, there is no reaſon that an attempt by perjury ſhould; much leſs that this crime ſhould, in all judicial caſes, be puniſhed with death. For to multiply capital puniſhments leſſens their effect, when applied to crimes of the deepeſt dye; and, deteſtable as perjury is, it is not by any means to be compared with ſome other offences, for which only death can be inflicted; and therefore it ſeems already (except perhaps in the inſtance of deliberate murder by perjury) very properly puniſhed by our preſent law; which has adopted the opinion of Cicero, derived from the law of the twelve tables, *Perjurii pœna divina, exitium; humana, dedecus.* See Oath.

PERIWIG. See Perruke.

PERIZONIUS (James), a very learned and laborious writer, was born at Dam in 1651. He became profeſſor of hiſtory and eloquence at the univerſity of Franeker, when, by his merit and learning, he made that univerſity flouriſh. However, in 1693, he went to Leyden, where he was made profeſſor of hiſtory, eloquence, and the Greek tongue; in which employment he continued till his death, which happened in 1715. He wrote many Diſſertations, and other learned and curious works, particularly *Origines Babylonicæ et Ægyptiacæ*,

Perjury
||
Perizonius.

Perizzites || Permio.

Ægyptiacæ, 2 vols 8vo, &c. But the part of his labours which is the moſt generally known, and perhaps the moſt uſeful, is the notes which he wrote upon *Sanctii Minerva*. That work, as publiſhed by Perizonius, certainly ſuggeſted the idea of Harris's Hermes; and we heſitate not to ſay, that our countryman has made hardly any improvement on the ſyſtem of his maſter.

PERIZZITES, the ancient inhabitants of Paleſtine, mingled with the Canaanites. There is alſo great probability that they themſelves were Canaanites; but having no fixed habitations, ſometimes diſperſed in one country and ſometimes in another, they were for that reaſon called *Perizzites*, which ſignifies *ſcattered* or *diſperſed*. *Pherazoth* ſtands for *hamlets* or *villages*. The Perizzites did not inhabit any certain portion of the land of Canaan; there were ſome of them on both ſides the river Jordan, in the mountains, and in the plains. In ſeveral places of Scripture the Canaanites and Perizzites are mentioned as the two chief people of the country. It is ſaid, for example, that in the time of Abraham and Lot the Canaanite and Perizzite were in the land (Gen. xiii. 7.) The Iſraelites of the tribe of Ephraim complained to Joſhua that they were too much pent up in their poſſeſſion (Joſh. xvii. 15.): he bid them go, if they pleaſed, into the mountains of the Perizzites, and Rephaims or giants, and there clearing the land, to cultivate and inhabit it. Solomon ſubdued the remains of the Canaanites and Perizzites which the children of Iſrael had not rooted out, and made them tributary to him (1 Kings ix. 20, 21. and 2 Chr. viii. 7.) There is ſtill mention made of the Perizzites in the time of Ezra (ix. 1.), after the return from the captivity of Babylon; and ſeveral Iſraelites had married wives from that nation.

PERKIN. See Cyderkin, and Husbandry, n° 238.

PERMEABLE, a term applied to bodies of ſo looſe a texture as to let ſomething paſs through them.

PERMSKI, or Permia, a town of the Ruſſian empire, and capital of a province of the ſame name, ſeated on the river Kama between the Dwina and the Oby; E. Long. 55. 50. N. Lat. 70. 26. The province is bounded on the north by the Samoiedes, on the weſt by Zirania and Ulatka, and on the eaſt by Siberia.

PERMUTATION, in commerce, the ſame with bartering. In the canon-law, permutation denotes the actual exchange of one benefice for another.

PERNAMBUCO, a province of Brazil, in South America, bounded on the north by Tamera, on the eaſt by the ocean, on the ſouth by Seregippa, and on the weſt by Tapuyers. It is about 200 miles in length and 150 in breadth. The Dutch became maſters of it in 1630, but the Portugueſe ſoon retook it from them. It produces a great quantity of ſugar, and the beſt Brazil wood.

PERNIO, a kibe or chilblain, is a little ulcer, occaſioned by cold in the hands, feet, heels, noſe, and lips. It will come on when warm parts are too ſuddenly expoſed to cold, or when parts from being too cold are ſuddenly expoſed to a conſiderable warmth; and has always a tendency to gangrene, in which it frequently terminates. It moſt commonly attacks children of a ſanguine habit and delicate conſtitution; and may be prevented or removed by ſuch remedies as invigorate the ſyſtem, and are capable of removing any tendency to gangrene in the conſtitution.

Peronæus || Perorati

PERONÆUS, in anatomy, is an epithet applied to ſome of the muſcles of the perone or fibula. See Anatomy, *Table of the Muſcles*.

PERONES, a ſort of high ſhoes which were worn not only by country people, but by men of ordinary rank at Rome. In the early times of the commonwealth they were worn even by ſenators; but at laſt they were diſuſed by perſons of figure, and confined to ploughmen and labourers. They were very rudely formed, conſiſting only of hides undreſſed, and reaching to the middle of the leg. Virgil mentions the perones as worn by a company of ruſtic ſoldiers on one foot only.

PERONNE, a ſtrong town of France, in Picardy, capital of Santerre. It is ſaid never to have been taken, though often beſieged. It is ſeated on the river Somme, in E. Long. 3. 1. N. Lat. 44. 50.

PERORATION, in rhetoric, the epilogue or laſt part of an oration, wherein what the orator had inſiſted on through his whole diſcourſe is urged afreſh with greater vehemence and paſſion. The peroration conſiſts of two parts. 1. Recapitulation; wherein the ſubſtance of what was diffuſed throughout the whole ſpeech is collected briefly and curſorily, and ſummed up with new force and weight. 2. The moving the paſſions; which is ſo peculiar to the peroration, that the maſters of the art call this part *ſedes affectuum*. The paſſions to be raiſed are various, according to the various kinds of oration. In a panegyric, love, admiration, emulation, joy, &c. In an invective, hatred, contempt, &c. In a deliberation, hope, confidence, or fear. The qualities required in the peroration are, that it be very vehement and paſſionate, and that it be ſhort; becauſe, as Cicero obſerves, tears ſoon dry up. Theſe qualities were well obſerved by Cicero, who never had an equal in the management of this part of an orator's province; for peroration was his maſterpiece.

"Concerning peroration (ſays Dr Blair), it is needleſs to ſay much, becauſe it muſt vary ſo conſiderably, according to the ſtrain of the preceding diſcourſe. Sometimes the whole pathetic part comes in moſt properly at the peroration. Sometimes, when the diſcourſe has been entirely argumentative, it is fit to conclude with ſumming up the arguments, placing them in one view, and leaving the impreſſion of them full and ſtrong on the mind of the audience. For the great rule of a concluſion, and what nature obviouſly ſuggeſts, is, to place that laſt on which we chooſe that the ſtrength of our cauſe ſhould reſt. *Lectures Belles Lettres.*

"In all diſcourſes, it is a matter of importance to hit the preciſe time of concluding, ſo as to bring our diſcourſe juſt to a point; neither ending abruptly and unexpectedly, nor diſappointing the expectation of the hearers when they look for the cloſe, and continuing to hover round and round the concluſion till they become heartily tired of us. We ſhould endeavour to go off with a good grace; not to end with a languiſhing and drawling ſentence, but to cloſe with dignity and ſpirit, that we may leave the minds of the hearers

warm

Perotis
ll
Perrault

warm, and dismiss them with a favourable impression of the subject and of the speaker."

PEROTIS, in botany: A genus of the digynia order, belonging to the triandria class of plants; and in the natural method ranking under the 4th order, *Gramina*. There is no calyx: the corolla consists of a bivalvular gluma; the valves are oblong, acute, somewhat unequal, and terminating in a sharp beard: it has three capillary stamina; the antheræ incumbent; the styli capillary, and shorter than the corolla; the stigma feathery and divaricated. The corolla serves as a perianthium, including a single seed of an oblong linear shape.—Of this there is only one species; viz. plumosus, a native of America, and lately introduced into Kew Garden.

PERPENDICULAR, in geometry, a line falling directly on another line, so as to make equal angles on each side. See GEOMETRY.

PERPETUAL, something that endures always, or lasts for ever.

Perpetual Motion. See MOVEMENT.

PERPIGNAN, a considerable town of Roussillon, in France, with a strong citadel, an university, and a bishop's see. It is seated on the river Tet; over which there is an handsome bridge, partly in a plain, and partly on a hill. E. Long. 0. 43. N. Lat. 45. 18.

PERQUISITE, in a general sense, something gained by a place over and above the settled wages.

PERQUISITE, in law, is any thing gotten by a man's own industry, or purchased with his money; in contradistinction to what descends to him from his father or other ancestor.

PERRAULT (Claude), the son of an advocate in parliament, was born at Paris in 1613; and was bred a physician, though he never practised but among his relations, friends, and the poor. He discovered early a particular taste for the sciences and fine arts; of which he acquired a consummate knowledge without the assistance of a master: he excelled in architecture, painting, sculpture, mathematics, physics, and all those arts that relate to designing and mechanics. The entrance into the Louvre, which was designed by him, is, according to the judgment of Voltaire, one of the most august monuments of architecture in the world. M. Colbert put him upon translating Vitruvius into French; which he performed, and published it in 1673, folio, with figures from his own drawings; which are said to have been more exactly finished than the plates themselves. When the academy of sciences was established, he was one of its first members, and was chiefly depended on for mechanics and natural philosophy. His works are, *Memoires pour servir à l'Histoire naturelle des Animaux*, folio, 1676, with figures; *Essais de Physique*, 4 vols 12mo, 1688; *Recueil des plusieurs machines de nouvelle invention*, 4to, 1700, &c. He died in 1688.

PERRAULT (Charles), the brother of Claude, was born at Paris in 1626, with as great a genius for arts, and a greater for letters, than his brother. Colbert chose him first clerk of the buildings, of which he was superintendant, and afterward made him comptroller-general of the finances under him. He was one of the first members of the academy of the belles lettres and inscriptions, and was received into the French academy in 1671. His poem, *La Peinture*, printed in 1668, was universally admired: that intitled *La siecle de Louis le Grand*, in which he exalted the modern authors above the ancient, was a prelude to a war with all the learned. After he had disengaged himself from this contest, he applied himself to draw up elogies of several great men of the 17th century, with their portraits, of which he has collected 102. There are other esteemed works of Perrault.—Besides these there were two other brothers, *Peter* and *Nicholas*, who made themselves known in the literary world.

Perron, Perror.

PERRON (James Davy Du), a cardinal distinguished by his abilities and learning, was born in the canton of Bern in 1556. He was educated by Julian Davy, his father, a very learned Calvinist, who taught him Latin and the mathematics; after which, he by himself became acquainted with the Greek and Hebrew, philosophy, and the poets. Philip Desportes, abbot of Tyron, made him known to Henry III. king of France, who conceived a great esteem for him. Some time after, Du Perron abjured Calvinism, and afterwards embraced the ecclesiastical function; and having given great proofs of his wit and learning, he was chosen to pronounce the funeral oration of Mary queen of Scots. After the murder of Henry III. he retired to the house of Cardinal de Bourbon, and took great pains in bringing back the Protestants to the church of Rome. Among others, he gained over Henry Spondanus, afterwards bishop of Pamiers. He also chiefly contributed to engage Henry IV. to change his religion; and that prince sent him to negociate his reconciliation to the holy see, in which he succeeded. Du Perron was consecrated bishop of Evereaux while he resided at Rome. On his return to France, he wrote, preached, and disputed against the reformed: particularly against Du Plessis Mornay, with whom he had a public conference in the presence of the king at Fontainbleau. He was made cardinal in 1604 by pope Clement VIII. at the solicitation of Henry IV. who afterwards nominated him to the archbishopric of Sens. The king at length sent him to Rome with Cardinal Joyeuse, in order to terminate the disputes which had arisen between Paul V. and the Venetians. It is said that this pope had such an high opinion of the address of the cardinal Du Perron, that he used to say, "Let us pray to God to inspire the cardinal Du Perron, for he will persuade us to do whatever he pleases." After the death of Henry IV. he retired into the country, where he put the last hand to his works; and, setting up a printing house, corrected every sheet himself. He died at Paris in 1618. His works were collected after his death, and published at Paris in 3 vols folio.

PERROT (Nicholas), Sieur d'Ablancourt, one of the first geniuses of his age, was born at Chalons in 1606. After studying philosophy about three years, he was sent to Paris to follow the law. At eighteen years of age he was admitted advocate of parliament, and frequented the bar; but he soon conceived a distaste for it, and therefore discontinued his practice. This displeased an uncle, but whose favour he recovered by quitting the Protestant religion. He could not, however, be prevailed upon to take orders in the Romish church; and some years after, he had a desire to return to the religion he had abjured. But, that he might not do any thing rashly, he resolved to study philosophy and divinity. For that purpose he

Perruke. chose for his master Mr Stuart a Scotsman and Lutheran, a man of great learning. Almost three years he spent in the most assiduous study; and then set out from Paris to Champagne, where he abjured the Roman Catholic, and once more embraced the Protestant religion. In 1637 he was admitted a member of the French academy; a little after which he undertook a translation of Tacitus. Whilst he was engaged in that laborious task, he retired to his small estate of Ablancourt, and lived there till his death in 1664. He was a man of fine understanding, of great piety and integrity, and of universal learning. Moreri has given a catalogue of his works, the greatest part of which consist of translations, which seemed rather originals.

PERRUKE, Peruke, or *Periwig*, was anciently a name for a long head of natural hair; such, particularly, as there was care taken in the adjusting and trimming of. Menage derives the word rather fancifully from the Latin *pilus* "hair." It is derived, according to this critic, thus, *pilus*, *pelus*, *pelutus*, *peluticus*, *pelutica*, *perutica*, *peruca*, *perruque*. The Latins called it *coma*; whence part of Gaul took the denomination of *Gallia Comata*, from the long hair which the inhabitants wore as a sign of freedom. An ancient author says, that Absalom's perruke weighed 200 shekels.

The word is now used for a set of false hair, curled, buckled, and sewed together on a frame or cawl; anciently called *capillamentum* or "false perruke." It is doubted whether or not the use of perrukes of this kind was known among the ancients. It is true, they used false hair: Martial and Juvenal make merry with the women of their time, for making themselves look young with their borrowed hair; with the men who changed their colours according to the seasons; and with the dotards, who hoped to deceive the Destinies by their white hair. But these seem to have scarce had any thing in common with our perrukes; and were at best only composed of hair painted, and glued together. Nothing can be more ridiculous than the description Lampridius gives of the emperor Commodus's perruke: it was powdered with scrapings of gold, and oiled (if we may use the expression) with glutinous perfumes for the powder to hang by. In effect, the use of perrukes, at least in their present mode, is not much more than 160 years old; the year 1629 is reckoned the epocha of long perrukes, at which time they began to appear in Paris; from whence they spread by degrees through the rest of Europe. At first it was reputed a scandal for young people to wear them, because the loss of their hair at that age was attributed to a disease the very name whereof is a reproach; but at length the mode prevailed over the scruple, and persons of all ages and conditions have worn them, foregoing without any necessity the conveniences of their natural hair. It was, however, some time before the ecclesiastics came into the fashion: the first who assumed the perruke were some of the French clergy, in the year 1660; nor is the practice yet well authorised. Cardinal Grimaldi in 1684, and the bishop of Lavaur in 1688, prohibited the use of the perruke to all priests without a dispensation or necessity. M. Thiers has an express treatise, to prove the perruke indecent in an ecclesiastic, and directly contrary to the decrees and canons of councils. A priest's head, embellished with artificial hair curiously adjusted, he esteems a monster in the church, nor can he conceive any thing so scandalous as an abbot with a florid countenance, heightened with a well-curled perruke. Perry.

PERRY (Captain John), was a famous engineer, who resided long in Russia, having been recommended to the czar Peter while in England, as a person capable of serving him on a variety of occasions relating to his new design of establishing a fleet, making his rivers navigable, &c. His salary in this service was 300 l. per annum, besides travelling expences and subsistence money on whatever service he should be employed, together with a further reward to his satisfaction at the conclusion of any work he should finish. After some conversation with the czar himself, particularly respecting a communication between the rivers Volga and Don, he was employed on that work for three summers successively; but not being well supplied with men, partly on account of the ill success of the czar's arms against the Swedes at the battle of Narva, and partly by the discouragement of the governor of Astracan, he was ordered at the end of 1707 to stop, and next year was employed in refitting the ships at Veronise, and 1709 in making the river of that name navigable; but after repeated disappointments, and a variety of fruitless applications for his salary, he at last quitted the kingdom, under the protection of Mr Whitworth, the English ambassador, in 1712: (See his narrative in the Preface to *The State of Russia*). In 1721 he was employed in stopping with success the breach at Dagenham, in which several other undertakers had failed; and the same year about the harbour at Dublin, to the objections against which he then published an Answer. He was author of The State of Russia, 1716, 8vo, and An Account of the stopping of Dagenham Breach, 1721, 8vo; and died Feb. 11. 1733.

Perry, the name of a very pleasant and wholesome liquor extracted from pears, in the same manner as cyder is from apples. See the article Cyder; and Husbandry, n° 227—238.

The best pears for perry, or at least the sorts which have been hitherto deemed the fittest for making this liquor, are so excessively tart and harsh, that no mortal can think of eating them as fruit; for even hungry swine will not eat them, nay hardly so much as smell them. Of these the Bosbury pear, the Bareland pear, and the horse pear, are the most esteemed for perry in Worcestershire, and the squash pear, as it is called, in Gloucestershire; in both which counties, as well as in some of the adjacent parts, they are planted in the hedge rows and most common fields. There is this advantage attending pear-trees, that they will thrive on land where apples will not so much as live, and that some of them grow to such a size, that a single pear tree, particularly of the Bosbury and the squash kind, has frequently been known to yield, in one season, from one to four hogsheads of perry. The Bosbury pear is thought to yield the most lasting and most vinous liquor. The John pear, the Harpary pear, the Drake pear, the Mary pear, the Lullum pear, and several others of the harshest kinds, are esteemed the best for perry, but the redder or more tawney they are, the more they are preferred. Pears, as well as apples, should be full ripe before they are ground.

Dr

Perry || Perfees.

Dr Beale, in his general advertiſements concerning cyder, ſubjoined to Mr Evelyn's Pomona, diſapproves of Palladius's ſaying, that perry will keep during the winter, but that it turns ſour as ſoon as the weather begins to be warm; and gives, as his reaſons for being of a contrary opinion, that he had himſelf taſted at the end of ſummer, a very briſk, lively, and vinous liquor, made of horſe pears; that he had often tried the juice of the Boſbury pear, and found it both pleaſanter and richer the ſecond year, and ſtill more ſo the third, though kept only in common hogſheads, and in but indifferent cellars, without being bottled; and that a very honeſt, worthy, and ingenious gentleman in his neighbourhood, aſſured him, as of his own experience, that it will keep a great while, and grow much the ſtronger for keeping, if put into a good cellar and managed with due care. He imputes Palladius's error to his poſſibly ſpeaking of common eatable pears, and to the perry's having been made in a very hot country: but he would have aſcribed it to a more real cauſe, perhaps, had he pointed out the want of a thorough regular fermentation, to which it appears plainly that the ancients were entire ſtrangers; for all their vinous liquors were medicated by boiling before they were laid up in order to be kept.

PERSECUTION, is any pain or affliction which a perſon deſignedly inflicts upon another; and in a more reſtrained ſenſe, the ſufferings of Chriſtians on account of their religion.

Hiſtorians uſually reckon ten general perſecutions, the firſt of which was under the emperor Nero, 31 years after our Lord's aſcenſion; when that emperor having ſet fire to the city of Rome, threw the odium of that execrable action on the Chriſtians, who under that pretence were wrapped up in the ſkins of wild beaſts, and worried and devoured by dogs; others were crucified, and others burnt alive. The ſecond was under Domitian, in the year 95. In this perſecution St John the apoſtle was ſent to the iſle of Patmos, in order to be employed in digging in the mines. The third began in the third year of Trajan, in the year 100, and was carried on with great violence for ſeveral years. The fourth was under Antoninus the philoſopher, when the Chriſtians were baniſhed from their houſes, forbidden to ſhow their heads, reproached, beaten, hurried from place to place, plundered, impriſoned, and ſtoned. The fifth began in the year 197, under the emperor Severus. The ſixth began with the reign of the emperor Maximinus in 235. The ſeventh, which was the moſt dreadful perſecution that had ever been known in the church, began in the year 250, in the reign of the emperor Decius, when the Chriſtians were in all places driven from their habitations, ſtripped of their eſtates, tormented with racks, &c. The eighth began in the year 257, in the fourth year of the reign of the emperor Valerian. The ninth was under the emperor Aurelian, A. D. 274; but this was very inconſiderable: and the tenth began in the 19th year of Diocleſian, A. D. 303. In this dreadful perſecution, which laſted ten years, houſes filled with Chriſtians were ſet on fire, and whole droves were tied together with ropes and thrown into the ſea. See TOLERATION.

PERSEES, the deſcendants of a colony of ancient Perſians, who took refuge at Bombay, Surat, and in the vicinity of thoſe cities, when their own country was conquered 1100 years ago by the Mahometan Arabs. They are a gentle, quiet, and induſtrious people, loved by the Hindoos, and living in great harmony among themſelves. The conſequence is, that they multiply exceedingly, whilſt their countrymen in the province of Keman are viſibly diminiſhing under the yoke of the Mahometan Perſians. Of the manners and cuſtoms of this amiable race, we have the following account in Heron's elegant tranſlation of Niebuhr's Travels. Perſees.

"The Perſees (ſays he) make common contributions for the aid of their poor, and ſuffer none of their number to aſk alms from people of a different religion. They are equally ready to employ their money and credit to ſcreen a brother of their fraternity from the abuſes of juſtice. When a Perſee behaves ill, he is expelled from their communion. They apply to trade, and exerciſe all ſorts of profeſſions.

"The Perſees have as little knowledge of circumciſion as the Hindoos. Among them, a man marries only one wife, nor ever takes a ſecond, unleſs when the firſt happens to be barren. They give their children in marriage at ſix years of age; but the young couple continue to live ſeparate, in the houſes of their parents, till they attain the age of puberty. Their dreſs is the ſame as that of the Hindoos, except that they wear under each ear a tuft of hair, like the modern Perſians. They are much addicted to aſtrology, altho' very little ſkilled in aſtronomy.

"They retain the ſingular cuſtom of expoſing their dead to be eaten by birds of prey, inſtead of interring or burning them. I ſaw (continues our author) on a hill at Bombay a round tower, covered with planks of wood, on which the Perſees lay out their dead bodies. When the fleſh is devoured, they remove the bones into two chambers at the bottom of the tower.

"The Perſees, followers of the religion of Zerduſt or Zoroaſter, adore one God only, eternal and almighty. They pay, however, a certain worſhip to the ſun, the moon, the ſtars, and to fire, as viſible images of the inviſible divinity. Their veneration for the element of fire induces them to keep a ſacred fire conſtantly burning, which they feed with odoriferous wood, both in the temples and in the houſes of private perſons, who are in eaſy circumſtances. In one of their temples at Bombay, I ſaw a fire which had burnt unextinguiſhed for two centuries. They never blow out a light, leſt their breath ſhould foil the purity of the fire. See POLYTHEISM.

"The religion of the Perſees enjoins purifications as ſtrictly as that of the Hindoos. The diſciples of Zerduſt are not, however, obliged to abſtain from animal food. They have accuſtomed themſelves to refrain from the fleſh of the ox, becauſe their anceſtors promiſed the Indian prince who received them into his dominions never to kill horned cattle. This promiſe they continue to obſerve under the dominion of Chriſtians and Mahometans. The horſe is by them conſidered as the moſt impure of all animals, and regarded with extreme averſion.

"Their feſtivals, denominated *Ghumbars*, which return frequently, and laſt upon each occaſion five days, are all commemorations of ſome part of the work of creation. They celebrate them not with ſplendour, or

Perſes. Perſepolis. with any particular ceremonies, but only dreſs better during theſe five days, perform ſome acts of devotion in their houſes, and viſit their friends."

The Perſees were till lately but very little known: the ancients ſpeak of them but ſeldom, and what they ſay ſeems to be dictated by prejudice. On this account Dr Hyde, who thought the ſubject both curious and intereſting, about the end of laſt century attempted a deeper inveſtigation of a ſubject which till then had been but very little attended to. He applied to the works of Arabian and Perſian authors, from whom, and from the relations of travellers, together with a variety of letters from perſons in India, he compiled his celebrated work on the religion of the Perſees. Other accounts have been given by different men, as accident put information in their way. But the moſt diſtinguiſhed is by M. Anquetil du Perron, who undertook a voyage to diſcover and tranſlate the works attributed to Zoroaſter. Of this voyage he drew up an account himſelf, and read it before the Royal Academy of Sciences at Paris in May 1761. A tranſlation of it was made and publiſhed in the Gentleman's Magazine for 1762, to which we refer our readers. The account begins at p. 373, and is concluded at p. 614. Remarks were afterwards made on Du Perron's account by a Mr Yates. See the ſame Magazine for 1766, p. 529.

PERSEPOLIS, formerly the capital of Perſia, ſituated in N. Lat. 30. 30. E. Long. 84. now in ruins, but remarkable for the moſt magnificent remains of a palace or temple that are to be found throughout the world.—This city ſtood in one of the fineſt plains in Perſia, being 18 or 19 leagues in length, and in ſome places two, in ſome four, and in others ſix leagues in breadth. It is watered by the great river Araxes, now Bendemir, and by a multitude of rivulets beſides. Within the compaſs of this plain, there are between 1000 and 1500 villages, without reckoning thoſe in the mountains, all adorned with pleaſant gardens, and planted with ſhady trees. The entrance of this plain on the weſt ſide has received as much grandeur from nature, as the city it covers could do from induſtry or art. It conſiſts of a range of mountains ſteep and high, four leagues in length, and about two miles broad, forming two flat banks, with a riſing terrace in the middle, the ſummit of which is perfectly plain and even, all of native rock. In this there are ſuch openings, and the terraces are ſo fine and ſo even, that one would be tempted to think the whole the work of art, if the great extent, and prodigious elevation thereof, did not convince one that it is a wonder too great for aught but nature to produce. Undoubtedly theſe banks were the very place where the advanced guards from Perſepolis took poſt, and from which Alexander found it ſo difficult to diſlodge them. One cannot from hence deſcry the ruins of the city, becauſe the banks are too high to be overlooked; but one can perceive on every ſide the ruins of walls and of edifices, which heretofore adorned the range of mountains of which we are ſpeaking. On the weſt and on the north this city is defended in the like manner: ſo that, conſidering the height and evenneſs of theſe banks, one may ſafely ſay, that there is not in the world a place ſo fortified by nature.

Plate CCCLXXXIX.

The mountain Rehamut, in the form of an amphitheatre, encircles the palace, which is one of the moſt beautiful pieces of architecture remaining of all antiquity. Authors and travellers have been exceedingly minute in their deſcriptions of thoſe ruins; and yet ſome of them have expreſſed themſelves ſo differently from others, that, had they not agreed with reſpect to the latitude and longitude of the place, one would be tempted to ſuſpect that they had viſited different ruins. Theſe ruins have been deſcribed by Garcias de Silva Figueroa, Pietro de la Valle, Chardin, Le Brun, and Mr Francklin. We ſhall adopt the lateſt deſcription, as being exceedingly diſtinct, and given by a traveller intelligent and unaſſuming. The aſcent to the columns is by a grand ſtaircaſe of blue ſtone containing 104 ſteps. Perſepolis.

"The firſt object that ſtrikes the beholder on his entrance, are two portals of ſtone, about 50 feet in height each; the ſides are embelliſhed with two ſphinxes of an immenſe ſize, dreſſed out with a profuſion of bead-work, and, contrary to the uſual method, they are repreſented ſtanding. On the ſides above are inſcriptions in an ancient character, the meaning of which no one hitherto has been able to decypher

"At a ſmall diſtance from theſe portals you aſcend another flight of ſteps, which lead to the grand hall of columns. The ſides of this ſtaircaſe are ornamented with a variety of figures in baſſo relievo; moſt of them have veſſels in their hands: here and there a camel appears, and at other times a kind of triumphal car, made after the Roman faſhion; beſides theſe are ſeveral led horſes, oxen, and rams, that at times intervene and diverſify the proceſſion. At the head of the ſtaircaſe is another baſſo relievo, repreſenting a lion ſeizing a bull; and cloſe to this are other inſcriptions in ancient characters. On getting to the top of this ſtaircaſe, you enter what was formerly a moſt magnificent hall; the natives have given this the name of *chehul minàr*, or forty pillars; and though this name is often uſed to expreſs the whole of the building, it is more particularly appropriated to this part of it. Although a vaſt number of ages have elapſed ſince the foundation, 15 of the columns yet remain entire; they are from 70 to 80 feet in height, and are maſterly pieces of maſonry: their pedeſtals are curiouſly worked, and appear little injured by the hand of time. The ſhafts are enfluted up to the top, and the capitals are adorned with a profuſion of fretwork.

"From this hall you proceed along eaſtward, until you arrive at the remains of a large ſquare building, to which you enter through a door of granite. Moſt of the doors and windows of this apartment are ſtill ſtanding; they are of black marble, and poliſhed like a mirror: on the ſides of the doors, at the entrance, are bas-reliefs of two figures at full length; they repreſent a man in the attitude of ſtabbing a goat: with one hand he ſeizes hold of the animal by the horn, and thruſts a dagger into his belly with the other; one of the goat's feet reſts upon the breaſt of the man, and the other upon his right arm. This device is common throughout the palace. Over another door of the ſame apartment is a repreſentation of two men at full length; behind them ſtands a domeſtic holding a ſpread umbrella: they are ſupported by large round ſtaffs, appear

pear to be in years, have long beards, and a profuſion of hair upon their heads.

"At the ſouth-weſt entrance of this apartment are two large pillars of ſtone, upon which are carved four figures; they are dreſſed in long garments, and hold in their hands ſpears 10 feet in length. At this entrance alſo the remains of a ſtaircaſe of blue ſtone are ſtill viſible. Vaſt numbers of broken pieces of pillars, ſhafts, and capitals, are ſcattered over a conſiderable extent of ground, ſome of them of ſuch enormous ſize, that it is wonderful to think how they could have been brought whole, and ſet up together. Indeed, every remains of theſe noble ruins indicate their former grandeur and magnificence, truly worthy of being the reſidence of a great and powerful monarch."

Theſe noble ruins are now the ſhelter of beaſts and birds of prey. Beſides the inſcription above-mentioned, there are others in Arabic, Perſian, and Greek. Dr Hyde obſerves, that the inſcriptions are very rude and unartful; and that ſome, if not all of them, are in praiſe of Alexander the Great; and therefore are later than that conqueror. See the article RUINS.

PERSEVERANCE, in theology, a continuance in a ſtate of grace to a ſtate of glory.

About this ſubject there has been much controverſy in the Chriſtian church. All divines, except Unitarians, admit, that no man can ever be in a ſtate of grace without the co-operation of the ſpirit of God; but the Calviniſts and Arminians differ widely as to the nature of this co-operation. The former, at leaſt ſuch as call themſelves the *true diſciples of Calvin*, believe, that thoſe who are once under the influence of divine grace can never fall totally from it, or die in mortal ſin. The Arminians, on the other hand, contend, that the whole of this life is a ſtate of probation; that without the grace of God we can do nothing that is good; that the Holy Spirit aſſiſts, but does not overpower, our natural faculties; and that a man, at any period of his life, may reſiſt, grieve, and even quench, the ſpirit. See THEOLOGY.

PERSEUS was the moſt ancient of all the Greek heroes. He founded the city of Mycenæ, of which he became afterwards king, and where he and his poſterity reigned for 100 years. He flouriſhed, according to moſt chronologiſts, 1348 B. C. but, according to Sir Iſaac Newton, only 1028.

PERSEUS, in aſtronomy. See there, n° 406.

PERSIA, a moſt ancient and celebrated empire of Aſia, extending in length from the mouth of the river Araxes to that of the river Indus, about 1840 of our miles, and in breadth from the river Oxus, to the Perſian gulph, about 1080 of the ſame miles. It is bounded on the north by the Caſpian Sea, the river Oxus, and mount Caucaſus; on the eaſt, by the river Indus and the dominions of the Great Mogul; on the ſouth, by the Perſian gulph and the Indian ocean; and on the weſt, by the dominions of the Grand Signior.

We learn from Sir William Jones, the illuſtrious preſident of the Aſiatic Society, that Perſia is the name of only one province of this extenſive empire, which by the preſent natives, and all the learned *Muſſulmans* who reſide in the Britiſh territories in India, is called *Irân*. It has been a practice not uncommon in all ages to denominate the whole of a country from that part of it with which we are beſt acquainted; and hence have the Europeans agreed to call Irân by the name of that province of which Shirauz is the capital: See SHIRAUZ. The fame learned writer is confident that Irân, or Perſia in its largeſt extent, comprehended within its outline the lower Aſia, which, ſays he, was unqueſtionably a part of the *Perſian*, if not of the old Aſſyrian empire. "Thus may we look on Iran as the nobleſt peninſula on this habitable globe: and if M. Bailly had fixed on it as the *Atlantis* of PLATO, he might have ſupported his opinion with far ſtronger arguments than any that he has adduced in favour of *Nova Zembla*. If, indeed, the account of the Atlantis be not purely an Egyptian fable, I ſhould be more inclined, ſays Sir William, to place them in Irân than in any region with which I am acquainted." Perſia.

The moſt ancient name, however, of this country was that of *Elam*, or, as ſome write it, *Æ'lam*, from Elam the ſon of Shem, from whom its firſt inhabitants are deſcended. Herodotus calls its inhabitants *Cephenes*; and in very ancient times the people are ſaid to have called themſelves *Artæi*, and the country where they dwelt *Artæa*. In the books of Daniel, Eſdras, &c. it is called by the names of *Pars*, *Pharas*, or *Fars*, whence the modern name of *Perſia*; but whence thoſe names have been derived, is now uncertain. 3 Various names of the country.

That Perſia was originally peopled by Elam the ſon of Shem, has been very generally admitted; but the truth is, that of the ancient hiſtory of this diſtinguiſhed empire very little is perfectly known. For this ignorance, which at firſt ſeems ſtrange, ſatisfactory reaſons may eaſily be aſſigned; of which the principal are the ſuperficial knowledge of the *Greeks* and *Jews*, and the loſs of Perſian archives or hiſtorical compoſitions. "That the Grecian writers before XENOPHON had *no* acquaintance with *Perſia*, and that their accounts of it are wholly fabulous, is a paradox too extravagant to be ſeriouſly mentioned; but (ſays Sir William Jones) their connection with it in war or peace had been generally confined to bordering kingdoms under feudatory princes; and the firſt *Perſian* emperor, whoſe life and character they ſeem to have known with tolerable accuracy, was the great CYRUS." Our learned author, however, is ſo far from conſidering Cyrus as the firſt Perſian monarch, that he thinks it evident a powerful monarchy had ſubſiſted in Irân for ages before the acceſſion of that hero; that this monarchy was called the *Mahâbâdian* dynaſty; and that it was in fact the oldeſt monarchy in the world. The evidence upon which the preſident reſts this opinion, is the work of a Mahometan traveller, compiled from the books of ſuch Perſians as fled from their country upon the innovation in religion made by Zoroaſter: and if theſe books, of which a few ſtill remain, be genuine, and the Mahometan a faithful compiler, facts of which Sir William has not the ſmalleſt doubt, the evidence is certainly ſufficient to bear the ſuperſtructure which he has raiſed upon it. 4 Opinions reſpecting its firſt population.

If the Perſian monarchy was thus ancient, it is natural to ſuppoſe that Perſia or Irân was the original ſeat of the human race, whence colonies were ſent out or emigrated of themſelves to people the reſt of the habitable globe. This ſuppoſition is actually made by our ingenious author, who ſtrongly confirms it by remarka 5 Perhaps the original ſeat of the human race.

7

Perſia. marks on the moſt ancient language of Perſia, which he ſhows to have been the parent of the *Sanſcrit*, as well as of the Greek, Latin, and Gothic (ſee PHILOLOGY). He therefore holds, as a propoſition firmly eſtabliſhed, "that *Iràn* or Perſia, in its largeſt ſenſe, was the true centre of population, of knowledge, of languages, and of arts; which inſtead of travelling weſtward only, as it has been fancifully ſuppoſed, or eaſtward, as might with equal reaſon have been aſſerted, were expanded in all directions to all the regions of the world." He thinks it is from good authority that the Saxon Chronicle brings the firſt inhabitants of Britain from Armenia; that the Goths have been concluded to come from Perſia; and that both the Iriſh and old Britons have been ſuppoſed to have proceeded from the borders of the Caſpian: for all theſe places were comprehended within the ancient Iràn.

6 Accounts of the birth, &c. of Cyrus.

Of this firſt Perſian monarchy we have no hiſtorical accounts; and muſt therefore, after having thus mentioned it, deſcend at once to the era of Cyrus. This prince is celebrated both by ſacred and profane hiſtorians; but the latter are at no ſmall variance concerning his birth and acceſſion to the throne. According to Herodotus, Aſtyages, the laſt king of the Medes, being warned in a dream, that the ſon who was to be born of his daughter Mandane, ſhould one day be lord of Aſia, reſolved to marry her, not to a Mede, but to a Perſian. Accordingly he choſe for her huſband one Cambyſes, a man of a peaceable diſpoſition, and of no very high ſtation. However, about a year after they were married, Aſtyages was frightened by another dream, which made him reſolve to diſpatch the infant as ſoon as it ſhould be born. Hereupon the king ſent for his daughter, and put her under confinement, where ſhe was ſoon after delivered of a ſon. The infant was committed to the care of one Harpagus, with ſtrict orders to deſtroy it in what manner he thought proper. But he, having acquainted his wife with the command he had received, by her advice gave it to a ſhepherd, deſiring him to let it periſh by expoſing it. But the ſhepherd, out of compaſſion, expoſed a ſtill-born child which his wife happened to be then delivered of, and brought up the ſon of Mandane as his own, giving him the name of CYRUS.

When the young prince had attained the age of ten years, as he was one day at play with other children of the ſame age, he was choſen king by his companions; and having, in virtue of that dignity, divided them into ſeveral orders and claſſes, the ſon of Artembares, a lord of eminent dignity among the Medes, refuſed to obey his orders; whereupon Cyrus cauſed him to be ſeized, and whipped very ſeverely. The boy ran crying to his father; and he immediately haſtened to the king's palace, loudly complaining of the affront his ſon had received from the ſon of a ſlave, and intreating Aſtyages to revenge, by ſome exemplary puniſhment, the indignity offered to him and his family. Aſtyages, commanding both the herdſman and his ſon to be brought before him, aſked the latter, how he, who was the ſon of ſo mean a man, had dared to abuſe the ſon of one of the chief lords of the kingdom? Cyrus replied, that he had done no more than he had a right to do; for the boys of the neighbourhood having choſen him king, becauſe they thought him moſt worthy of that dignity, and performed what he, veſted with that character, had commanded, the ſon of Artembares alone had ſlighted his orders, and for his diſobedience had ſuffered the puniſhment he deſerved. In the courſe of this converſation Aſtyages happening to recollect, that his grandſon, whom he had ordered to be deſtroyed, would have been about the ſame age with Cyrus, began to queſtion the ſhepherd concerning his ſuppoſed ſon, and at laſt obtained from him a confeſſion of the whole truth.

Aſtyages having now diſcovered Cyrus to be his grandſon, ſent for Harpagus, who alſo confeſſed that he had not ſeen Mandane's ſon deſtroyed, but had given him to the ſhepherd; at which Aſtyages was ſo much incenſed, that, having invited Harpagus to an entertainment, he cauſed him to be ſerved with the fleſh of his own ſon. When he had done, the king aſked him whether he liked his victuals; and Harpagus anſwering, that he had never taſted any thing more delicious, the officers appointed for that purpoſe brought in a baſket, containing the head, hands, and feet of his ſon, deſiring him to uncover the baſket, and take what he liked beſt. He did as they deſired, and beheld the mangled remains of his only child without betraying the leaſt concern, ſo great was the command which he had over his paſſions. The king then aſked him, whether he knew with what kind of meat he had been entertained. Harpagus replied, that he knew very well, and was always pleaſed with what his ſovereign thought fit to ordain; and having thus replied, with a ſurpriſing temper he collected the mangled parts of his innocent ſon, and went home.

Aſtyages having thus vented his rage on Harpagus, began next to conſult what he ſhould do with Cyrus. The magi, however, eaſed him of his fears with regard to him, by aſſuring him, that as the boy had been once choſen king by his companions, the dream had been already verified, and that Cyrus never would reign in any other ſenſe. The king, being well pleaſed with this anſwer, called Cyrus, and, owning how much he had been wanting in the affection which he ought to have had towards him, defired him to prepare for a journey into Perſia, where he would find his father and mother in circumſtances very different from thoſe of the poor ſhepherd and his wife with whom he had hitherto lived. Cyrus, on his arrival at his father's houſe, was received with the greateſt joy. When he grew up, he ſoon became popular on account of his extraordinary parts; till at laſt his friendſhip was courted by Harpagus, who had never forgot the cruel treatment he received from Aſtyages. By his means a conſpiracy was formed againſt Aſtyages; who being overthrown in two ſucceſſive engagements, was taken priſoner and confined for life.

The account given by Xenophon of the riſe of Cyrus is much more conſonant to Scripture; for he tells us, that Babylon was conquered by the united forces of the Medes and Perſians. According to him, Cyrus was the ſon of Cambyſes king of the Medes, and Mandane the daughter of Aſtyages king of Perſia. He was born a year after his uncle Cyaxares, the brother of Mandane. He lived till the age of twelve with his parents in Perſia, being educated after the manner of the country, and inured to fatigues and military exerciſes. At this age he was taken to the court of Aſtyages, where he reſided four years; when the re-

8 volt

volt of the Medes and Perſians from the Babylonians happened, and which ended in the deſtruction of the Babyloniſh empire, as related under the article BABYLON.

While Cyrus was employed in the Babyloniſh war, before he attacked the metropolis itſelf, he reduced all the nations of Aſia Minor. The moſt formidable of theſe were the Lydians, whoſe king Crœſus aſſembled a very numerous army, compoſed of all the other nations in that part of Aſia, as well as of Egyptians, Greeks, and Thracians. Cyrus being informed of theſe vaſt preparations, augmented his forces to 196,000 men, and with them advanced againſt the enemy, who were aſſembled near the river Pactolus. After long marches, he came up with them at Thymbra, not far from Sardis, the capital of Lydia. Beſides the horſe and foot, which amounted to 196,000, as already obſerved, Cyrus had 300 chariots armed with ſcythes, each chariot drawn by four horſes abreaſt, covered with trappings that were proof againſt all ſorts of miſſive weapons: he had likewiſe a great number of chariots of a larger ſize, upon each of which was placed a tower about 18 or 20 feet high, and in each tower were lodged 20 archers. Theſe towers were drawn by 16 oxen yoked abreaſt. There was moreover a conſiderable number of camels, each mounted by two Arabian archers, the one looking towards the head, and the other towards the hinder part of the camel. The army of Crœſus conſiſted of 420,000 men. The Egyptians, who alone were 120,000 in number, being the main ſtrength of the army, were placed in the centre. Both armies were drawn up in an immenſe plain, which gave room for the extending of the wings on either ſide; and the deſign of Crœſus, upon which alone he founded his hopes of victory, was to ſurround and hem in the enemy's army.

When the two armies were in ſight of each other, Crœſus, obſerving how much his front exceeded that of Cyrus, made the centre halt, but commanded the two wings to advance, with a deſign to incloſe the Perſian army, and begin the attack on both ſides at once. When the two detached bodies of the Lydian forces were ſufficiently extended, Crœſus gave the ſignal to the main body, which marched up to the front of the Perſian army, while the two wings attacked them in flank; ſo that Cyrus's army was hemmed in on all ſides, and, as Xenophon expreſſes it, was incloſed like a ſmall ſquare drawn within a great one. This motion, however, did not at all alarm the Perſian commander; but, giving his troops the ſignal to face about, he attacked in flank thoſe forces that were going to fall upon his rear ſo vigorouſly, that he put them into great diſorder. At the ſame time a ſquadron of camels was made to advance againſt the enemy's other wing, which conſiſted moſtly of cavalry. The horſes were ſo frightened at the approach of theſe animals, that moſt of them threw their riders, and trod them under foot; which occaſioned great confuſion. Then Artageſes, an officer of great valour and experience, at the head of a ſmall body of horſe, charged them ſo briſkly, that they could never afterwards rally; and at the ſame time the chariots, armed with ſcythes, being driven in among them, they were entirely routed. Both the enemy's wings being thus put to flight, Cyrus commanded his chief favourite Abradates to fall upon the centre with the large chariots above-mentioned. The firſt ranks, conſiſting moſtly of Lydians, not being able to ſtand ſo violent a charge, immediately gave way; but the Egyptians, being covered with their bucklers, and marching ſo cloſe that the chariots had not room to penetrate their ranks, a great ſlaughter of the Perſians enſued. Abradates himſelf was killed, his chariot overturned, and the greateſt part of his men were cut in pieces. Upon his death, the Egyptians, advancing boldly, obliged the Perſian infantry to give way, and drove them back quite to their engines. There they met with a new ſhower of darts and javelins from their machines; and at the ſame time the Perſian rear advancing ſword in hand, obliged their ſpearmen and archers to return to the charge. In the mean time Cyrus, having put to flight both the horſe and foot on the left of the Egyptians, puſhed on to the centre, where he had the misfortune to find his Perſians again giving ground; and judging that the only way to ſtop the Egyptians, who were purſuing them, would be to attack them in the rear, he did ſo; and at the ſame time the Perſian cavalry coming up to his aſſiſtance, the fight was renewed with great ſlaughter on both ſides. Cyrus himſelf was in great danger; for his horſe being killed under him, he fell among the midſt of his enemies: but the Perſians, alarmed at the danger of their general, threw themſelves headlong on their opponents, reſcued him, and made a terrible ſlaughter; till at laſt Cyrus, admiring the valour of the Egyptians, offered them honourable conditions: letting them know at the ſame time, that all their allies had abandoned them. They accepted the terms offered them; and having agreed with Cyrus that they ſhould not be obliged to carry arms againſt Crœſus, they engaged in the ſervice of the conqueror, and continued faithful to him ever after.

Perſia.

Sardis taken, and the Lydian empire overthrown.

The next morning Cyrus advanced towards Sardis, and Crœſus marched out to oppoſe him at the head of the Lydians only; for his allies had all abandoned him. Their ſtrength conſiſted moſtly in cavalry: which Cyrus being well appriſed of, he ordered his camels to advance; by whom the horſes were ſo frightened, that they became quite ungovernable. However, the Lydians diſmounted, and for ſome time made a vigorous reſiſtance on foot; but were at laſt driven into the city, which was taken two days after: and thus the Lydian empire was totally deſtroyed.

Reduces Babylon.

After the conqueſt of Sardis, Cyrus turned his arms againſt Babylon itſelf, which he reduced in the manner related under that article. Having ſettled the civil government of the conquered kingdoms, Cyrus took a review of all his forces, which he found to conſiſt of 600,000 foot, 120,000 horſe, and 2000 chariots armed with ſcythes. With theſe he extended his dominion all over the nations to the confines of Ethiopia, and to the Red Sea; after which he continued to reign peaceably over his vaſt empire till his death, which happened about 529 before Chriſt. According to Xenophon, he died a natural death; but others tell us, that, having engaged in a war with the Scythians, he was by them overthrown and cut in pieces with his whole army, amounting to 200,000 men. But this is very improbable, ſeeing all authors agree that the tomb of Cyrus was extant at Paſargada in Perſia in the time of Alexander the Great; which it could not have been

His death.

Perſia. if his Lady had remained in the poſſeſſion of the Scythians, as theſe authors aſſert.

In the time of Cyrus, the Perſian empire extended from the river Indus to the Ægean Sea. On the north it was bounded by the Euxine and Caſpian Seas, and on the South by Ethiopia and Arabia. That monarch kept his reſidence for the ſeven cold months at Babylon, by reaſon of the warmth of that climate; three months in the ſpring he ſpent at Suſa, and two at Ecbatan during the heat of ſummer. On his death bed he appointed his ſon Cambyſes to ſucceed him in the empire; and to his other ſon, Smerdis, he gave ſeveral conſiderable governments. The new monarch immediately ſet about the conqueſt of Egypt; which he accompliſhed in the manner related in the hiſtory of that country.

12 Cambyſes conquers Egypt. Having reduced Egypt, Cambyſes next reſolved to turn his arms againſt the Carthaginians, Hammonians, and Ethiopians. But he was obliged to drop the firſt of theſe enterprizes, becauſe the Phœnicians refuſed to ſupply him with ſhips againſt the Carthaginians, who were a Phœnician colony. However, he ſent ambaſſadors into Ethiopia with a deſign to get intelligence of the ſtate and ſtrength of the country. But the Ethiopian monarch, being well appriſed of the errand on which they came, treated them with great contempt. In return for the preſents ſent him by Cambyſes, he ſent his own bow; and adviſed the Perſians to make war upon the Ethiopians when they could bend ſuch a ſtrong bow as eaſily as he did, and to thank the gods that the Ethiopians had no ambition to extend their dominions beyond their own country.

13 His unſucceſsful expedition againſt Ethiopia and the Hammonians. Cambyſes was no ſooner informed of this anſwer by his ambaſſadors than he flew into a violent paſſion; and ordered his army immediately to begin their march, without conſidering that they were neither furniſhed with proviſions nor any other neceſſary. When he arrived at Thebes in Upper Egypt, he detached 50,000 men, with orders to deſtroy the temple of Jupiter Ammon: but all theſe periſhed in the deſert; not a ſingle perſon arriving either at the oracle, or returning to Thebes. The reſt of the army, led by Cambyſes himſelf, experienced incredible hardſhips; for, not being provided with any neceſſaries, they had not marched a fifth part of the way when they were obliged to kill and eat their beaſts of burthen. When theſe failed, the ſoldiers fed on graſs and roots, as long as any could be found; and at laſt were reduced to the dreadful neceſſity of eating one another; every tenth man, on whom the lot fell, being condemned to ſerve as food for his companions. The king, however, obſtinately perſiſted in his deſign; till, being apprehenſive of the danger he himſelf was in, he retreated to Thebes, after having loſt the greateſt part of his army.

14 He murders his brother. Cambyſes was a man of a very cruel and ſuſpicious temper, of which he gave many inſtances; and the following proved indirectly the cauſe of his death.—We have already obſerved that the king of Ethiopia ſent his bow in return for the preſents brought to him by the ambaſſadors of Cambyſes. The only man in the Perſian army who could bend this bow was Smerdis the king's brother; and this inſtance of his perſonal ſtrength ſo alarmed the tyrant, that, without any crime alleged, he cauſed him to be murdered. This gave occaſion to one Smerdis, a magian, who greatly reſembled the other Smerdis in looks, to aſſume the name of the deceaſed prince, and to raiſe a rebellion againſt Cambyſes, who was generally hated for his cruelty; and this he could the more eaſily do, as the chief management of affairs had been committed to this Smerdis during the king's abſence. Cambyſes, on receiving the news of this revolt, immediately ordered his army to march, in order to ſuppreſs it; but as he was mounting his horſe, his ſword, ſlipping out of its ſcabbard, wounded him in the thigh. On this accident, he aſked the name of the city where he was; and being told that it was Ecbatan, he ſaid in the preſence of all his attendants, "Fate has decreed that Cambyſes the ſon of Cyrus ſhall die in this place." For, having conſulted the oracle of Butus, which was very famous in that country, he was told that he ſhould die at Ecbatan. This he had always underſtood of Ecbatan in Media, and had therefore reſolved to avoid it. Being now, however, convinced that his end approached, he aſſembled the chief Perſian lords who ſerved in the army, and having told them that his brother was certainly dead, he exhorted them never to ſubmit to the impoſtor, or ſuffer the ſovereignty again to paſs from the Perſians to the Medes, to which nation Smerdis belonged, but to uſe their utmoſt endeavours to place one of their own blood on the throne.

His As the king's wound mortified, he lived but a few days after this; but the aſſembly ſuppoſing that he had ſpoken only out of hatred to his brother, quietly ſubmitted to the impoſtor, who was thus for a time eſtabliſhed on the throne. Indeed, from his conduct during the ſhort time which he enjoyed the kingdom, he appears to have been not at all undeſerving of a crown. He began with granting to all his ſubjects an Reig exemption from taxes and military ſervice for three Smer years, and treated all of them in the moſt beneficent mag manner. To ſecure himſelf on the throne the more effectually, he married Atoſſa the daughter of Cyrus; thinking, that in caſe of a diſcovery he might hold the empire by her title. She had before been married to her brother Cambyſes, on a deciſion of the magi that a king of Perſia might do as he pleaſed; and by virtue of this deciſion Smerdis alſo married her as her brother. The extreme caution of Smerdis, however, promoted His the diſcovery of his impoſture. He had married all nature his predeceſſor's wives, among whom was one Phedy- vere ma, the daughter of Otanes a Perſian nobleman of the firſt rank. Otanes, who ſuſpected that the king was not Smerdis the ſon of Cyrus, ſent a truſty meſſenger to his daughter, deſiring to know whether he was ſo or not; but Phedyma, having never ſeen this Smerdis, could not give any anſwer. Her father then deſired her to inquire at Atoſſa, who could not but know her own brother. However, he was again diſappointed; for Phedyma acquainted him that all the king's wives were lodged in diſtinct and ſeparate apartments, without being allowed to ſee each other. This greatly increaſed the ſuſpicions of Otanes; upon which he ſent his daughter a third meſſage, deſiring her, the next time ſhe ſhould be admitted to the king's bed, to take an opportunity of feeling whether he had ears or not: for Cyrus had formerly cauſed the ears of Smerdis the magian to be cut off for ſome crime of which he had

been

been guilty; so that, if the king had ears, she might then be assured that he was Smerdis the son of Cyrus. The event showed that the suspicions of Otanes were just; and Phedyma having acquainted her father that the king had no ears, a conspiracy was immediately formed against him. While the conspirators were debating about the proper means of carrying their designs into execution, Darius the son of Hystaspes happening to arrive at Susa where his father was governor, they all agreed to make him privy to their design. He told them, at their first meeting, that he thought nobody in the empire but himself had known that Smerdis the son of Cyrus was dead, and the throne usurped by one of the magi; that he had come with a design to kill the usurper without imparting his design to any one, that the glory of such an action might be entirely his own. But since others were apprised of the imposture, he insisted that the usurper should be dispatched without delay. Otanes, on the other hand, was for putting off the enterprise till some better opportunity offered; but Darius protested, that if they did not make the attempt that very day, he would prevent any one from accusing him, by disclosing the whole matter to the impostor himself.

In the mean time, Smerdis and his brother had by great promises prevailed on Prexaspes (the executioner of the true Smerdis) to bind himself by an oath not to discover the fraud they had put on the Persians, and even to make a public speech, declaring that the present king of Persia was really the son of Cyrus. At the time appointed, he began his discourse with the genealogy of Cyrus, putting his hearers in mind of the great favours the nation had received from that prince. After having extolled Cyrus and his family, to the great astonishment of all present, he confessed the whole transaction with regard to the death of Smerdis; telling the people, that the apprehensions of the danger he must inevitably run by publishing the imposture had constrained him to conceal it so long; but now, not being able any longer to act such a dishonourable part, he acknowledged that he had been compelled by Cambyses to put his brother to death with his own hand, and that the person who possessed the throne was Smerdis the magian. He then begged pardon of the gods and men for the crime he had committed; and fulminating many imprecations against the Persians if they failed to recover the sovereignty, he threw himself headlong from the top of the tower on which he stood, and died on the spot.

In the mean time the conspirators, who were advancing towards the palace, were informed of what had happened; and Otanes was again for deferring the execution of their enterprise: but Darius insisting upon the danger of delay, they proceeded boldly to the palace; and being admitted by the guards, who did not suspect them, they killed both the usurper and his brother; after which they exposed their heads to the people, and declared the whole imposture. The Persians at this were so enraged, that they fell on the whole sect, and killed every one of the magi they could meet with; and had not the slaughter been stopped by night, not one of the order would have been left alive. The day on which this slaughter happened was afterwards celebrated by the Persians with the greatest solemnity, and called by the name of *Magophonia*, or *the slaughter of the Magi*. On that festival the magi durst not appear abroad, but were obliged to shut themselves up in their houses. Smerdis the magian reigned only eight months. Persia.

When the tumult was a little subsided, the conspirators, who were seven in number, met together in order to elect a new king, or to determine what form of government they should next introduce. Otanes was for a republic: but being over-ruled by the rest, he declared, that as he was determined not to be a king, neither would he be ruled by one; and therefore insisted that he and his family should ever afterwards remain free from subjection to the royal power. This was not only granted, but it was further agreed by the other six, that whoever was chosen should every year present Otanes with a Median vest, a mark of great distinction among the Persians, because he had been the chief author of the enterprise. They further agreed to meet at a certain place next morning at sunrise on horseback, and that he whose horse first neighed should be king. This being overheard by Oebores, who had the care of Darius's horses, he led a mare over-night to the place, and brought his master's horse to her. The next morning, the horse remembering the place, immediately neighed for the mare; and the five lords dismounting, saluted Darius as their king. 20 Darius Hystaspes chosen king.

Darius Hystaspes was elected king of Persia in the year 522 B. C. Immediately after his accession, he promoted the other six conspirators to the first employments in the kingdom, married the two daughters of Cyrus, Atossa and Artystona, Parmys the daughter of the true Smerdis, and Phedyma the daughter of Otanes, who had detected the imposture of the magian. He then divided the whole empire into 20 satrapies or governments, and appointed a governor over each division, ordering them to pay him an annual tribute. The inhabitants of Colchis, with some others, were enjoined only to make annual presents, and the Arabians to furnish every year such a quantity of frankincense as equalled the weight of 1000 talents. Thus Darius received the yearly tribute of 14,560 Euboic talents, upwards of 2,800,000 pounds sterling.

Under Darius, the building of the temple of Jerusalem, which had been obstructed by Cambyses and Smerdis, went on successfully, and the Jewish state was entirely restored. The most remarkable of Darius's other transactions were his expeditions against Babylon; against Scythia, India, and Greece. The expedition against Babylon took place in the year 517 B. C. when the people, unable to bear the oppression of the Persians, and likewise discontented because the seat of government was removed from their city to Susa in Persia, took the opportunity of the troubles which happened in the reigns of Cambyses and Smerdis, to store their city with all kind of provisions sufficient to serve them for many years; after which they broke out into an open rebellion, and this quickly brought upon them Darius with all his forces. The Babylonians perceiving themselves shut up by so numerous an army, turned all their thoughts towards the supporting of a long siege, which they imagined would tire out the king's troops. To prevent the consumption of their provisions, they took the most barbarous and cruel resolution that ever was put in execution by any nation. They agreed among themselves to get rid of all unne- 21 Revolt of the Babylonians.

Perſia. ceſſary mouths; and therefore, gathering together all the old men, women, and children, they ſtrangled them without diſtinction; every one being allowed only to keep the wife he liked beſt, and a maid-ſervant to do the work of the houſe. The ſiege continued for a year and eight months; nor was there any likelihood of its being ended, when Zopyrus, one of Darius's chief commanders, put him in poſſeſſion of it by the following ſtratagem. He cut off his noſe and ears, and having mangled his body with ſtripes in a moſt cruel manner, he fled to the Babylonians thus diſfigured, pretending that he had been ſo treated by Darius for adviſing him to raiſe the ſiege. Being intruſted with the command of ſome forces, he cut off ſeveral parties of the Perſian army, whom Darius thus ſacrificed in order to raiſe the character of Zopyrus the higher among the Babylonians. In this manner he ſo much eſtabliſhed his credit, that at laſt he was made commander in chief of all the Babyloniſh forces, and the guard of the city committed entirely to his care; and no ſooner was this done than he delivered it up to Darius, who, to prevent their rebelling a ſecond time, beat down the walls of that metropolis to the height of 50 cubits. Three thouſand of the moſt active in the rebellion were impaled; the reſt pardoned. As they had deſtroyed moſt of their women, the neighbouring nations were commanded to furniſh them with wives, and 50,000 women were ſent to that city, by which means it was prevented from being depopulated. Zopyrus was rewarded with the higheſt honours, and had the whole revenues of Babylon beſtowed on him for life.

22 His unſucceſsful expedition againſt the Scythians.

After the reduction of Babylon Darius undertook a Scythian expedition, directed againſt thoſe nations which lie between the Danube and the Tanais. His pretext for this war was, to revenge the calamities which theſe nations had brought upon Aſia about 120 years before, when they invaded and ſubdued Media; keeping it in ſubjection for the ſpace of 28 years, as we have related under that article. In this expedition he was attended with an army of 700,000 men. With theſe he marched to the Thracian Boſphorus; which having paſſed on a bridge of boats, he reduced all Thrace. From Thrace he advanced to the Danube, where he had appointed his fleet to meet him. This river he paſſed on another bridge of boats, and entered Scythia. His enemies, however, were too wiſe to oppoſe ſuch a formidable power in the open field; and therefore retired before him, waſting the country as they went along, till at laſt the king, ſenſible of the danger he was in, reſolved to give over the enterpriſe and return home. In order to do ſo with ſafety, he lighted a great number of fires in the night-time, and decamped; leaving behind him the old men and the ſick, who fell into the hands of their enemies. The Scythians perceiving that Darius was gone, detached a conſiderable body to the bridge over the Danube; and as they were well acquainted with the roads, they got thither before the Perſians. The Scythians had ſent expreſſes before hand to perſuade the Ionians, whom Darius had left to guard the bridge, to break it down and retire to their own country; and this they preſſed the more earneſtly, that as the time preſcribed by Darius was now expired, they were at liberty to return home, without breaking their word or being wanting in their duty. Miltiades, prince of the Cherſoneſus of Thrace, was for embracing ſo favourable an opportunity of cutting off Darius's retreat, and ſhaking off the Perſian yoke at once: all the other commanders agreed with him, except Hyſtiæus prince of Miletus; who repreſented to the Ionian chiefs, that their power was connected with that of Darius, ſince it was under his protection that each of them was lord in his own city; and that the cities of Ionia would not fail to depoſe them and recover their liberty, if the Perſian power ſhould ſink or decline. This ſpeech made a deep impreſſion on the reſt, and it was at laſt determined that they ſhould wait for Darius; and in order to deceive the Scythians, they began to break down the bridge, but adviſed them to return back and defeat Darius. They did ſo, but miſſed him; and he having thus ſafely eſcaped ſo great a danger, immediately repaſſed the Boſphorus, and took up his winter quarters at Sardis, leaving Megabyzus, one of his chief generals, to complete the conqueſt of Thrace.

The king having ſufficiently refreſhed his troops, who had ſuffered extremely in the Scythian expedition, began to think of extending his dominions eaſtward; and, in order to facilitate his deſign, reſolved in the firſt place to diſcover thoſe countries. With this view, he cauſed a fleet to be built and equipped at Caſpatyrus, a city on the river Indus. The command of this fleet he gave to one Scylax, a Grecian of Caryandia a city of Caria, who was well verſed in maritime affairs. Him he ordered to ſail down the current, and make the beſt diſcoveries he could of the countries lying on either ſide of the river, till he arrived at the ſouthern ocean; from whence he was to ſteer his courſe weſtward, and that way return to Perſia. Scylax, having exactly obſerved his inſtructions, and ſailed down the river Indus, entered the Red Sea by the ſtraits of Babelmandel, and on the 30th month from his firſt ſetting out, landed at the ſame place from whence Nechu king of Egypt formerly ſent out the Phœnicians who circumnavigated Africa. From hence Scylax returned to Suſa, where he gave a full account of his diſcoveries; upon which Darius, marching into India at the head of a powerful army, reduced that large country, and made it a province of the Perſian empire, drawing from thence an annual tribute of 360 talents of gold.

He c quers

Soon after the expedition of Darius againſt India happened the revolt of the Ionians, which gave occaſion to his expedition into Greece; an account of which is given under the articles Attica, Greece, Sparta, &c. The ill ſucceſs which attended him here, however, was ſo far from making him drop the enterpriſe, that it only made him the more intent on reducing the Grecians; and he reſolved to head his army in perſon, having attributed his former bad ſucceſs to the inexperience of his generals. But while he was employed in making the neceſſary preparations for this purpoſe, he received intelligence that the Egyptians had revolted, ſo that he was obliged to make preparations for reducing them alſo; and before this could be done, the king died, after having reigned 36 years, leaving the throne to his ſon Xerxes.

Revol the Io &c.

This prince aſcended the throne of Perſia in the year 485 B. C.; and his firſt enterpriſe was to reduce the Egyptians; which he effectually did, bringing them

Expedi of Xer againſt Egypt Greece

Perſia. them into a worſe ſtate of ſlavery than they ever had experienced before. After this he reſolved on an expedition into Greece; the unfortunate event of which is related under the article ATTICA. By his misfortunes in the Grecian expedition, he became at laſt ſo diſpirited, that he thenceforth abandoned all thoughts of war and conqueſts; but growing tyrannical, and oppreſſing his ſubjects, he was murdered in his bed, in the year 464 B. C. and 21ſt of his reign; and was ſucceeded by his third ſon Artaxerxes, ſurnamed *Longimanus* on account of the great length of his arms.

26 xes ſuc- led by axerxes ngima-

This prince is named *Ahaſuerus* in Scripture, and is the ſame who married Eſther, and during the whole of his reign ſhowed the greateſt kindneſs to the Jewiſh nation. In the beginning of his reign he was oppoſed by Hyſtaſpes the ſecond ſon of Xerxes, whom, however, he overcame, though not without conſiderable difficulty. After this he applied himſelf to the ſettlement of the affairs of government, and reforming many abuſes which had crept in; and then, being fully eſtabliſhed on the throne, he appointed feaſts and rejoicings to be made for 180 days in the city of Suſa; at one of which he reſolved to divorce his queen for diſobedience; and afterwards married Eſther, as we find it recorded in the ſacred writings.

In the fifth year of the reign of Artaxerxes the Egyptians revolted anew, and, being aſſiſted by the Athenians, held out for ſix years; but were again obliged to ſubmit, and continued in ſubjection during the whole of his reign. Nothing elſe remarkable happened during the life of Artaxerxes Longimanus, who died in the 41ſt year of his reign; and was ſucceeded by Xerxes II. the only ſon he had by his queen, though by his concubines he had 17. Xerxes having drunk immoderately at an entertainment immediately after his acceſſion, retired to a chamber in order to refreſh himſelf with ſleep; but here he was murdered by Sogdianus, the ſon of Artaxerxes by one of his concubines, after he had reigned 45 days.

27 xes II.

28 dianus.

Sogdianus was ſcarce ſeated on the throne when he put to death Bagorazus, the moſt faithful of all his father's eunuchs; by which, and the murder of his ſovereign, he became generally odious. Upon this, ſenſible of the dangerous ſituation in which he was, he ſent for one of his brothers named *Ochus*, whom he ſuſpected, with a deſign to murder him the moment he arrived. Ochus, however, underſtanding his deſign, put off, by ſeveral pretences, his coming, till he had drawn together a powerful army, with which he advanced to the confines of Perſia. Here he openly declared, that his deſign was to revenge his brother's death; which brought over to him many of the nobility and governors of provinces, by whom he was immediately proclaimed king. Sogdianus, ſeeing himſelf thus deſerted, contrary to the advice of all his friends, came to an accommodation with Ochus; who no ſooner had him in his power than he cauſed him to be ſuffocated among aſhes; a puniſhment invented on purpoſe for him.

29 chus.

Ochus being firmly ſettled on the throne by the death of Sogdianus, changed his name to Darius; and is by hiſtorians commonly called *Darius Nothus*, or *The Baſtard*. But Arſites, another of the brothers, ſeeing in what manner Sogdianus had got the better of Xerxes, and been afterwards driven out by Ochus, began to entertain thoughts of treating him in the ſame manner. He was not, however, ſo ſucceſsful; for, being defeated in an engagement, he ſurrendered himſelf in hopes of mercy, but was immediately put to death by ſuffocation in aſhes. Several other perſons were executed: but theſe ſeverities did not procure him the repoſe which he expected; for his whole reign was diſturbed with violent commotions in various parts of the empire. One of the moſt dangerous was raiſed by Piſuthna governor of Lydia; but he being deſerted by his Greek mercenaries, was at laſt overcome, and put to death: however, his ſon Amorgas continued to infeſt the maritime provinces of Aſia Minor for two years; till he alſo was taken priſoner by Tiſſaphernes, the new governor of Lydia, who put him to death. Other inſurrections quickly followed this: but the greateſt misfortune which befel Darius during the whole courſe of his reign was the revolt of the Egyptians, who could not be reduced. Before his death he inveſted Cyrus his youngeſt ſon with the ſupreme government of all the provinces of Aſia Minor. This was done through the perſuaſions of his mother Paryſatis, who had an abſolute ſway over her huſband; and ſhe procured this command for him, that he might thereby be enabled to contend for the kingdom after his father's death. She even inſiſted that the king ſhould declare him heir to the crown before he died; but this he could not by any means be induced to do. He died in the year 405 B. C. and was ſucceeded by his ſon Artaxerxes, by the Greeks ſurnamed *Mnemon* on account of his extraordinary memory.

Perſia.

30 Artaxerxes Mnemon.

31 Revolt of Cyrus the Younger.

The moſt remarkable tranſaction which happened during the reign of this prince was the revolt of his brother Cyrus. This young prince had been raiſed to ſo great power through the intereſt of his mother, on purpoſe that he might revolt, as we have already ſeen. He began with gaining over the cities under the government of Tiſſaphernes; which quickly produced a war with that governor. Cyrus then began to aſſemble troops, which he pretended were deſigned only againſt Tiſſaphernes. As he had given great aſſiſtance to the Lacedemonians in their wars againſt the Athenians, he now in return demanded aſſiſtance from them; which requeſt they very readily complied with, ordering their fleet immediately to join him, and to obey in every thing the commands of Tamos his admiral. At laſt Cyrus, having collected an army of 13,000 Greek mercenaries and 100,000 regular troops of other nations, ſet out from Sardis, directing his march towards Upper Aſia; the army being entirely ignorant of the expedition on which they were going. When they arrived at Tarſus, the Greeks, ſuſpecting that they were marching againſt the king, refuſed to proceed any further; but Cyrus having gained them over with preſents and promiſes, they ſoon went on with ſatisfaction. Having arrived at Cunaxa in the province of Babylon, Cyrus found his brother with 900,000 men ready to engage him. Whereupon, leaping out of his chariot, he commanded his troops to ſtand to their arms and fall into their ranks; which was done with great expedition, no time being allowed the ſoldiers to refreſh themſelves. Clearchus, the commander of the Peloponneſian troops, adviſed Cyrus not to charge in perſon, but to remain in

32 Battle of Cunaxa.

Perſia. the rear of the Greek battalions; but this advice he rejected with indignation, ſaying, that he ſhould thus render himſelf unworthy of the crown for which he was fighting. As the king's army drew near, the Greeks fell upon them with ſuch fury, that they routed the wing oppoſite to them almoſt at the firſt onſet; upon which Cyrus was with loud ſhouts proclaimed king by thoſe who ſtood next to him. But he, in the mean time, perceiving that Artaxerxes was wheeling about to attack him in flank, advanced againſt him with 600 choſen horſe, killed Artageſes captain of the king's guards with his own hand, and put the whole body to flight. In this encounter, diſcovering his brother, he ſpurred on his horſe, and, coming up to him, engaged him with great fury; which in ſome degree turned the battle into a ſingle combat. Cyrus killed his brother's horſe, and wounded him on the ground; but he immediately mounted another horſe, when Cyrus attacked him again, gave him a ſecond wound, and had already lifted up his hand to give him a third, when the guards, perceiving the danger in which their king was, diſcharged their arrows at once againſt his antagoniſt, who at the ſame time throwing himſelf headlong upon his brother, was pierced through by his javelin. He fell dead upon the ſpot; and all the chief lords of his court, reſolving not to ſurvive him, were ſlain in the ſame place.

In the mean time, the Greeks having defeated the enemy's left wing commanded by Tiſſaphernes, and the king's right wing having put to flight Cyrus's left, both parties, being ignorant of what had paſſed elſewhere, imagined that they had gained the victory. But Tiſſaphernes acquainting the king that his men had been put to flight by the Greeks, he immediately rallied his troops, in order to attack them. The Greeks, under the command of Clearchus, eaſily repulſed them, and purſued them to the foot of the neighbouring hills. As night was drawing near, they halted at the foot of the hill, much ſurpriſed that neither Cyrus himſelf, nor any meſſenger from him, had appeared; for as yet they knew nothing of his death and the defeat of the reſt of the army. They determined therefore to return to their camp, which they did accordingly; but found there that the greateſt part of their baggage had been plundered, and all their proviſions taken, which obliged them to paſs the night in the camp without any ſort of refreſhment. The next morning, as they were ſtill expecting to hear from Cyrus, they received the news of his death, and the defeat of that part of the army. Whereupon they ſent deputies to Ariæus, who was commander in chief of all the other forces of Cyrus, offering him, as conquerors, the crown of Perſia. Ariæus rejected the offer, and acquainting them that he intended to ſet out early in the morning on his return to Ionia, adviſed them to join him in the night. They followed his directions, and, under the conduct of Clearchus, began their march, arriving at his camp about midnight, whence they ſet out on their return to Greece. They were at a vaſt diſtance from their own country, in the very heart of the Perſian empire, ſurrounded by a victorious and numerous army, and had no way to return again but by forcing their way through an immenſe track of the enemy's country. But their valour and reſolution mattered all theſe difficulties; and, in ſpite of a

33 Retreat of ten thouſand Greeks.

powerful army, which purſued and haraſſed them all the way, they made good their retreat for 2325 miles through the provinces belonging to the enemy, and got ſafe to the Greek cities on the Euxine ſea. This retreat (the longeſt that was ever made through an enemy's country) was conducted at firſt by Clearchus; but he being cut off through the treachery of Tiſſaphernes, Xenophon was choſen in his room, who at laſt brought his men ſafe into Greece: but for a full account of that famous retreat, ſee the article XENOPHON. Perſi

34 War wi the Lac monian

The war with Cyrus was ſcarce ended, when another broke out with the Lacedemonians, on the following account. Tiſſaphernes being appointed to ſucceed Cyrus in all his power, to which was added all which he himſelf poſſeſſed formerly, began to oppreſs the Greek cities in Aſia in a moſt cruel manner. On this they ſent ambaſſadors to Sparta, deſiring the aſſiſtance of that powerful republic. The Spartans having ended their long war with the Athenians, willingly laid hold of the preſent opportunity of breaking again with the Perſians, and therefore ſent againſt them an army under the command of Thimbro, who, being ſtrengthened by the forces which returned under Xenophon, took the field againſt Tiſſaphernes. But Thimbro being ſoon recalled upon ſome complaints, Dercyllidas, a brave officer and experienced engineer, was appointed to ſucceed him; and he carried on the war to much more advantage than his predeceſſor. On his arrival in Aſia, finding that Tiſſaphernes was at variance with another governor named *Pharnabazus*, he concluded a truce with the former, and marching againſt Pharnabazus, drove him quite out of Æolis, and took ſeveral cities in other parts. The latter, however, immediately repaired to the Perſian court, where he made loud complaints againſt Tiſſaphernes, but gave the king a moſt ſalutary advice, which was to equip a powerful fleet, and give the command of it to Conon the Athenian, the beſt ſea-officer of his time, by which means he would obſtruct the paſſage of further recruits from Greece; and thus ſoon put an end to the power of the Lacedemonians in Aſia. This advice being approved of, the king ordered 500 talents for the equipment of a fleet, with directions to give Conon the command of it

In the mean time, Dercyllidas, with all his valour and ſkill, ſuffered himſelf to be drawn into ſuch a diſadvantageous ſituation, that he muſt inevitably have been deſtroyed with his whole army, had it not been through the cowardice of Tiſſaphernes, who having experienced the Grecian valour at the battle of Cunaxa, could not by any means be induced to attack them. The Lacedemonians, however, having heard that the Perſian monarch was fitting out a great fleet againſt them, reſolved to puſh on the war as vigorouſly as poſſible; and for this purpoſe ſent over Ageſilaus one of their kings, and a moſt experienced commander, into Aſia. This expedition was carried on with ſuch ſecrecy, that Ageſilaus arrived at Epheſus before the Perſians had the leaſt notice of his deſigns. Here he took the field with 10,000 foot and 4000 horſe, and falling upon the enemy while they were totally unprepared, carried every thing before him. Tiſſaphernes deceived him into a truce till he had leiſure to aſſemble his forces, but gained little by his treachery;

Perſia. ery; for Ageſilaus deceived him in his turn, and while Tiſſaphernes marched his troops into Caria, the Greeks invaded and plundered Phrygia.

Early in the ſpring, Ageſilaus gave out that his deſign was to invade Lydia; but Tiſſaphernes, who remembered the laſt year's ſtratagem, now taking it for granted that Ageſilaus would really invade Caria, made his troops again march to the defence of that province. But Ageſilaus now led his army into Lydia as he had given out, and approached Sardis; upon which Tiſſaphernes recalled his forces from their former rout, with a deſign to relieve the place. But Caria being a very mountainous country, and unfit for horſe, he had marched thither only with the foot, and left the horſe behind on the borders of that province. Whence, on their marching back to the relief of Sardis, the horſe being ſome days march before the foot, Ageſilaus took the advantage of ſo favourable an opportunity, and fell upon them before the foot could come to their aſſiſtance. The Perſians were routed at the very firſt onſet; after which Ageſilaus over-ran the whole country, enriching both himſelf and his army with the ſpoils of the conquered Perſians.

By this continued ill fortune Artaxerxes was ſo much provoked againſt Tiſſaphernes, that he ſoon after cauſed him to be put to death.

On the death of Tiſſaphernes, Tithrauſtes, who was appointed to ſucceed him, ſent large preſents to Ageſilaus, in hopes of perſuading him to abandon his conqueſts; but finding that commander was not by any means to be induced to relinquiſh the war, he ſent Timocrates of Rhodes into Greece, with large ſums of money to corrupt the leading men in the cities, and rekindle a war againſt the Lacedemonians. This ſtratagem produced the intended effect; for the cities of Thebes, Argos, Corinth, and others, entering into a confederacy, obliged them to recal Ageſilaus to the defence of his own country.

35 Ageſilaus obliged to leave Aſia.

After the departure of Ageſilaus, which happened in the year 354 B. C. the Lacedemonian power received a ſevere blow at Cnidos, where their fleet was entirely defeated by that of Artaxerxes under Conon, 50 of their ſhips being taken in the engagement; after which, Conon and Pharnabazus being maſters of the ſea, ſailed round the iſlands and coaſts of Aſia, taking the cities there which had been reduced by the Lacedemonians. Seſtos and Abydos only held out, and reſiſted the utmoſt efforts of the enemy, though they had been beſieged both by ſea and land.

36 Lacedemonians defeated.

Next year Conon having aſſembled a powerful fleet, again took Pharnabazus on board, and reduced the iſland of Melos, from whence he made a deſcent on the coaſts of Lyconia, pillaging all the maritime provinces, and loading his fleet with an immenſe booty. After this, Conon obtained leave of him to repair to Athens with 80 ſhips and 50 talents, in order to rebuild the walls of that city; having firſt convinced Pharnabazus, that nothing could more effectually contribute to the weakening of the power of Sparta than putting Athens again in a condition to rival its power. He no ſooner arrived at Piræus the port of Athens, but he began to work; which, as he had a great number of hands, and was ſeconded by the zeal of all thoſe that were well inclined to the Athenians, was ſoon completed, and the city not only reſtored to its former ſplendor, but rendered more formidable than ever. The Lacedemonians were now reduced to the neceſſity of accepting ſuch terms of peace as they could procure. The terms were, that all the Greek cities in Aſia ſhould be ſubject to the king of Perſia, as alſo the iſlands of Cyprus and Clazomena; that the iſlands of Scyros, Lemnos, and Imbros, ſhould be reſtored to the Athenians, and all the cities of Greece, whether ſmall or great, ſhould be declared free; and by the ſame treaty, Artaxerxes engaged to join thoſe who accepted the terms he propoſed, and to aſſiſt them to the utmoſt of his power againſt ſuch as ſhould reject them. Perſia.

37 Are obliged to make peace with the Perſians.

Artaxerxes, being now diſengaged from the Grecian war, turned his arms againſt Evagoras king of Cyprus. This man was deſcended from the ancient kings of Salamine, the capital city of the iſland of Cyprus. His anceſtors had held that city for many ages in quality of ſovereigns; but were at laſt driven out by the Perſians, who, making themſelves maſters of the whole iſland, reduced it to a Perſian province. Evagoras, however, being a man of an enterpriſing genius, ſoon became weary of living in ſubjection to a foreign power, drove out the Perſian governor, and recovered his paternal kingdom. Artaxerxes attempted to drive him out of it; but, being diverted by the Greek war, was obliged to put off the enterprize. However, Conon, by means of Cteſias chief phyſician to Artaxerxes, got all differences accommodated, and Artaxerxes promiſed not to moleſt him in the poſſeſſion of his ſmall kingdom. But Evagoras ſoon becoming diſcontented with ſuch a narrow poſſeſſion, gradually reduced under his ſubjection almoſt the whole of the iſland. Some, however, there were, who held out againſt him, and theſe immediately applied to Artaxerxes for aſſiſtance; and he, as ſoon as the war with Greece was at an end, ſent all his force againſt Evagoras, intending to drive him quite out of the iſland. The Athenians, however, notwithſtanding the favours lately conferred upon them by the king of Perſia, could not forbear aſſiſting their old ally in ſuch a dreadful emergency. Accordingly, they ſent him ten men of war under the command of Philocrates; but the Lacedemonian fleet, commanded by Talentias brother to Ageſilaus, falling in with them near the iſle of Rhodes, ſurrounded them ſo that not one ſhip could eſcape. The Athenians, determined to aſſiſt Evagoras at all events, ſent Chabrias with another fleet and a conſiderable body of land forces; and with the aſſiſtance of theſe he quickly reduced the whole iſland. But in a ſhort time, the Athenians being obliged, in conſequence of the treaty concluded with the Perſians, to recal Chabrias, Artaxerxes attacked the iſland with an army of 300,000 men, and a fleet of 300 ſhips. Evagoras applied to the Egyptians, Libyans, Arabians, Tyrians, and other nations, from whom he received ſupplies both of men and money; and fitted out a fleet, with which he ventured an engagement with that of Artaxerxes. But being defeated, and obliged to ſhut himſelf up in Salamine, he was cloſely beſieged by ſea and land. Here at laſt he was obliged to capitulate, and abandon to the Perſians the whole of the iſland except Salamine, which he held as a king tributary to Artaxerxes.

38 Cyprus reduced.

The Cyprian war being ended, Artaxerxes turned his

Perſia.

his arms againſt the Caduſians, whoſe country lay between the Euxine and Caſpian ſeas. But theſe nations were too well accuſtomed to war to be overcome by the Perſians; and therefore the king was obliged to abandon the project, after having loſt a great number of his troops and all the horſes which he took out with him. In his Egyptian expedition, which happened immediately after the Caduſian war, he was attended with little better ſucceſs; which, however, was owing to the bad conduct of his general Pharnabazus. This commander being entruſted with the management of the Egyptian war, ſent an ambaſſador to Athens, complaining that Chabrias had engaged in the ſervice of an enemy of the king of Perſia, with whom the ſtate of Athens was in alliance, and threatening the republic with his maſter's reſentment if proper ſatisfaction was not given: at the ſame time he demanded Iphicrates, another Athenian, and the beſt general of his time, to command the Greek mercenaries in the Perſian ſervice. This the Athenians complied with; and Iphicrates having muſtered his troops, ſo exerciſed them in all the arts of war, that they became afterwards very famous among the Greeks under the name of *Iphicrateſian ſoldiers*. Indeed he had ſufficient time to inſtruct them; for the Perſians were ſo ſlow in their preparations, that two whole years elapſed before they were ready to take the field. At the ſame time Artaxerxes, that he might draw the more mercenaries out of Greece, ſent ambaſſadors to the different ſtates in it, declaring it to be his will and pleaſure that they ſhould live at peace with each other, on the terms of the treaty lately concluded: which declaration was received with pleaſure by all the ſtates except Thebes, who aſpired at the ſovereignty of Greece; and accordingly refuſed to conform to it. All things, however, at laſt being ready for the expedition, the troops were muſtered at the city then called *Acre*, and ſince *Ptolemais*; where they were found to conſiſt of 200,000 Perſians under the command of Pharnabazus, and 20,000 Greeks led by Iphicrates. The fleet conſiſted of 300 galleys, beſides a vaſt number of other veſſels which followed with proviſions. The fleet and army began to move at the ſame time; and that they might act in concert, they ſeparated as little as poſſible. It was propoſed, that the war ſhould begin with the ſiege of Peluſium; but Nectanebus, the revolted king of Egypt, had provided ſo well for the defence of the place, that it was thought expedient to drop the enterprize, and make a deſcent at one of the mouths of the Nile. In this they ſucceeded: for the Egyptians not expecting them at that place, had not taken ſuch care to fortify it as at Peluſium. The fortreſs of conſequence was eaſily taken, and all the Egyptians in it put to the ſword. After this, Iphicrates was for embarking the troops without loſs of time, and attacking Memphis the capital of Egypt. Had this opinion been followed before the Egyptians recovered from the conſternation into which they were thrown, it is highly probable that the whole country might have been reduced at once: but Pharnabazus would undertake nothing before the reſt of the forces were come up. Iphicrates then, in the utmoſt vexation at loſing ſo favourable an opportunity, preſſed Pharnabazus to allow him to attack the place with the Greek mercenaries only; but he refuſed this alſo, from a mean jealouſy of the honour which Iphicrates might acquire; and in the mean time the Egyptians recovered ſufficient courage to put themſelves in ſuch a poſture of defence, that they could not be attacked with any probability of ſucceſs; and at the ſame time the Nile overflowing as uſual, obliged them to return to Phœnice. The expedition was again undertaken 12 years after, but without ſucceſs.

39 Unſucceſsful expedition againſt the Caduſians and Egyptians.

Perſia.

The laſt years of the reign of Artaxerxes were greatly diſturbed by diſſenſions in his family; which at laſt broke his heart, and he died in the 94th year of his age, and 46th of his reign. He was ſucceeded by one of his ſons named *Ochus*, who behaved with ſuch cruelty, that almoſt one half of his dominions revolted as ſoon as he came to the throne. But, by reaſon of the diſſenſions of the rebels among themſelves, all of them were reduced, one after another; and among the reſt, the Sidonians, finding themſelves betrayed, burnt themſelves to the number of 40,000, together with their wives and children.

40 Ochus ſucceeds Artaxerxes.

Ochus, having quelled all the inſurgents, immediately ſet himſelf about reducing Egypt, and for this purpoſe procured a reinforcement of other 10,000 mercenaries from Greece. On his march, he loſt a great number of his men drowned in the lake Serbonis, which lies between Phœnice and Egypt, extending about 30 miles in length. When the ſouth wind blows, the whole ſurface of this lake is covered with ſand, in ſuch a manner that no one can diſtinguiſh it from the firm land. Several parties of Ochus's army were loſt in it for want of proper guides; and it is ſaid that whole armies have ſometimes periſhed in the ſame place. When he arrived in Egypt, he detached three bodies to invade the country in different parts; each being commanded by a Perſian and a Greek general. The firſt was led by Lachares the Theban, and Roſaces governor of Lydia and Ionia; the ſecond by Nicoſtratus the Theban and Ariſtazanes; the third by Mentor the Rhodian and Bagoas an eunuch. The main body of the army he kept with himſelf, and encamped near Peluſium, with a deſign to watch the events of the war there. The event was ſucceſsful, as we have related under the article EGYPT; and Ochus having reduced the whole country, diſmantled their ſtrongholds, plundered the temples, and returned to Babylon loaded with booty.

41 Reduces Egypt.

The king, having ended this war with ſuch ſucceſs, conferred very high rewards on his mercenaries and others who had diſtinguiſhed themſelves. To Mentor the Rhodian he gave 100 talents, and other preſents to a great value; appointing him alſo governor of all the coaſts of Aſia, and committing to his care the whole management of the war which he was ſtill carrying on againſt ſome provinces that had revolted in the beginning of his reign, and all theſe either by ſtratagem, or by force, he at laſt reduced; reſtoring the king's authority in all theſe places.—Ochus then, finding himſelf free from all troubles, gave his attention to nothing but his pleaſures, leaving the adminiſtration of affairs entirely to Bagoas the eunuch, and to Mentor. Theſe two agreed to ſhare the power between them; in conſequence of which the former had the provinces of Upper Aſia, and the latter all the reſt. Bagoas,

Perſia.

goas, being by birth an Egyptian, had a great zeal for the religion of his country, and endeavoured, on the conqueſt of Egypt, to influence the king in favour of the Egyptian ceremonies; but, in ſpite of all his endeavours, Ochus not only refuſed to comply, but killed the ſacred bull, the emblem of the Egyptian god Apis, plundered the temples, and carried away their ſacred records. This Bagoas ſuppoſed to be the higheſt guilt which a human creature could commit; and therefore poiſoned his maſter and benefactor in the 21ſt year of his reign. Nor did his revenge ſtop here; for he kept the king's body, cauſing another to be buried in its ſtead; and becauſe the king had cauſed his attendants eat the fleſh of Apis, Bagoas cut his body in pieces, and gave it ſo mangled to be devoured by cats, making handles for ſwords of his bones. He then placed Arſes the youngeſt of the deceaſed king's ſons on the throne, that he might the more eaſily preſerve the whole power to himſelf.

42 Ochus murdered by Bagoas.

Arſes did not long enjoy even the ſhadow of power which Bagoas allowed him, being murdered in the ſecond year of his reign by that treacherous eunuch, who now conferred the crown on Darius Codomannus, a diſtant relation of the royal family. Neither did he incline to let him enjoy the crown much longer than his predeceſſor; for, finding that he would not ſuffer himſelf to be guided by him in all things, the treacherous Bagoas brought him a poiſonous potion; but Darius got rid of him by his own artifice, cauſing him to drink the poiſon which he brought. This eſtabliſhed Darius in the throne as far as ſecurity from internal enemies could do ſo; but in a very little time his dominions were invaded, and, we may ſay, the ſame moment conquered, by Alexander the Great. The particulars of that heroe's conqueſt are related under the article MACEDON; we ſhall therefore here only take notice of the fate of Darius himſelf, with which the Perſian empire concluded for many ages. After the battle of Arbela, which was deciſive in favour of Alexander, the latter took and plundered Perſepolis, from whence he marched into Media, in order to purſue Darius, who had fled to Ecbatan the capital of that province. This unhappy prince had ſtill an army of 30,000 foot, among whom were 4000 Greeks, who continued faithful to the laſt. Beſides theſe, he had 4000 ſlingers and 3000 horſe, moſt of them Bactrians, and commanded by Beſſus governor of Bactria. When Darius heard that Alexander was marched to Ecbatan, he retired into Bactria, with a deſign to raiſe another army; but ſoon after, changing his mind, he determined to venture a battle with the forces he ſtill had left. On this Beſſus governor of Bactria, and Nabarzanes a Perſian lord of great diſtinction, formed a conſpiracy againſt him, propoſing to ſeize his perſon, and, if Alexander purſued them, to gain his friendſhip and protection by betraying their maſter into his hands; but if they eſcaped, their deſign was to murder him, and uſurp the crown. The troops were eaſily gained over, by repreſenting to them the deſperate ſituation of Darius's affairs; but Darius himſelf, though informed of their proceedings, and ſolicited to truſt his perſon among the Greeks, refuſed to give credit to the report, or follow ſuch a ſalutary counſel. The conſequence of this was, that he was in a few days ſeized by the traitors; who, out of reſpect to the royal dignity, bound him with golden chains, and ſhutting him up in a covered cart, fled with him towards Bactria. The cart was covered with ſkins, and ſtrangers appointed to drive it without knowing who the priſoner was. Beſſus was proclaimed commander in chief in the room of Darius by the Bactrian horſe; but Artabazus and his ſons, with the forces they commanded, and the Greeks, under the command of one *Patron*, retired from the body of the army under Beſſus, and marched over the mountains towards Parthiene. In the mean time Alexander arriving at Ecbatan, was informed that Darius had left the place five days before. He then diſpatched orders to Clitus, who had fallen ſick at Suſa, to repair, as ſoon as he recovered, to Ecbatan, and from thence to follow him into Parthia with the cavalry and 6000 Macedonians, who were left in Ecbatan. Alexander himſelf with the reſt of the army purſued Darius; and the 11th day arrived at *Rhages*, having marched in that ſpace of time 3300 furlongs. Moſt of thoſe who accompanied him died through the fatigue of ſo long a march; inſomuch that, on his arrival at Rhages, he could ſcarce muſter 60 horſemen. Finding that he could not come up with Darius, who had already paſſed the Caſpian ſtraits, he ſtaid five days at Rhages, in order to refreſh his army and ſettle the affairs of Media. From thence he marched into Parthia, and encamped at a ſmall diſtance from the Caſpian ſtraits, which he paſſed the next day without oppoſition. He had ſcarce entered Parthia, when he was informed that Beſſus and Nabarzanes had conſpired againſt Darius, and deſigned to ſeize him. Hereupon, leaving the main body of the army behind with Craterus, he advanced with a ſmall troop of horſe lightly armed; and having marched day and night without ever halting, except for a few hours, he came on the third day to a village where Beſſus with his Bactrians had encamped the day before. Here he underſtood that Darius had been ſeized by the traitors; that Beſſus had cauſed him to be ſhut up in a cloſe cart, which he had ſent before, that he might be the more ſure of his perſon; and that the whole army except Artabazus and the Greeks, who had taken another rout, obeyed Beſſus. Alexander therefore taking with him a ſmall body of light-armed horſe, for the others could not poſſibly proceed further, at laſt came in ſight of the barbarians, who were marching in great confuſion. His unexpected appearance ſtruck them, though far ſuperior in number, with ſuch terror, that they immediately betook themſelves to flight; and becauſe Darius refuſed to follow them, Beſſus and thoſe who were about him diſcharged their darts at the unfortunate prince, leaving him wallowing in his blood. After this they all fled different ways, and were purſued with great ſlaughter by the Macedonians. In the mean time the horſes that drew the cart in which Darius was, ſtopped of their own accord, for the drivers had been killed by Beſſus, near a village about four furlongs from the highway. Thither Polyſtratus a Macedonian, being preſſed with third in the purſuit of the enemy, was directed by the inhabitants to a fountain to refreſh himſelf, not far from the place where they ſtopped. As he was filling his helmet with water, he heard the groans of a dying man; and looking round him, diſcovered a cart with a team of horſes, unable to move

46 And murdered.

Perſia.

move by reaſon of the many wounds they had received. When he drew near, he perceived Darius lying in the cart, and very near his end, having ſeveral darts ſticking in his body. However, he had ſtrength enough left to call for ſome water, which Polyſtratus readily brought him. Darius, after drinking, turned to the Macedonian, and with a faint voice told him, that, in the deplorable ſtate to which he was reduced, it was no ſmall comfort to him that his laſt words would not be loſt: he then charged him to return his hearty thanks to Alexander for the kindneſs he had ſhown to his wife and family, and to acquaint him, that, with his laſt breath, he beſought the gods to proſper him in all his undertakings, and make him ſole monarch of the univerſe. He added, that it did not ſo much concern him as Alexander to purſue and bring to condign puniſhment thoſe traitors who had treated their lawful ſovereign with ſuch cruelty, that being the common cauſe of all crowned heads. Then, taking Polyſtratus by the hand, "Give Alexander your hand, ſays he, as I give you mine, and carry him, in my name, the only pledge I am able to give, in this condition, of my gratitude and affection." Having uttered theſe words, he expired in the arms of Polyſtratus. Alexander coming up a few minutes after, bewailed his death, and cauſed his body to be interred with the higheſt honours. The traitor Beſſus being at laſt reduced to extreme difficulties, was delivered up by his own men naked and bound into the hands of the Macedonians; on which Alexander gave him up to Oxathres the brother of Darius, to ſuffer what puniſhment he ſhould think proper. Plutarch tells us that he was executed in the following manner: Several trees being by main force bent down to the ground, and one of the traitor's limbs tied to each of them, the trees, as they were ſuffered to return to their natural poſition, flew back with ſuch violence, that each carried with it the limb that was tied to it.

47 His murderers purſued.

48 Revolt of the Parthians.

Thus ended the empire of Perſia, 209 years after it had been founded by Cyrus. After the death of Alexander the Perſian dominions became ſubject to Seleucus Nicator, and continued ſubject to him for 62 years, when the Parthians revolted, and conquered the greateſt part of them. To the Parthians they continued ſubject for 475 years; when the ſovereignty was again reſtored to the Perſians, as related under the article PARTHIA.

49 Perſian empire again reſtored by Artaxares.

The reſtorer of the Perſian monarchy was Artaxerxes, or Artaxares, who was not only a private perſon, but of ſpurious birth. However, he poſſeſſed great abilities, by which means he executed his ambitious projects. He was no ſooner ſeated on the throne than he took the pompous title of *king of kings*, and formed a deſign of reſtoring the empire to its ancient glory. He therefore gave notice to the Roman governors of the provinces bordering on his dominions, that he had a juſt right, as the ſucceſſor of Cyrus, to all the Leſſer Aſia; which he therefore commanded them immediately to quit, as well as the provinces on the frontiers of the ancient Parthian kingdom, which were already his. The conſequence of this was a war with Alexander Severus the Roman emperor. Concerning the event of this war there are very different accounts. It is certain, however, that, on account of his exploits againſt Artaxares, Alexander took the titles of *Parthicus* and *Perſicus*; though, it would ſeem, with no great reaſon, as the Perſian monarch loſt none of his dominions, and his ſucceſſors were equally ready with himſelf to invade the Roman territories.

Perſia.

50 Succeeded by Sapor, who takes Valerian the Roman emperor priſoner;

Artaxares dying after a reign of 12 or 15 years, was ſucceeded by his ſon Sapor; a prince of great abilities both of body and mind, but fierce, haughty, untractable, and cruel. He was no ſooner ſeated on the throne than he began a new war with the Romans. In the beginning he was unſucceſsful: being obliged, by the young emperor Gordian, to withdraw from the Roman dominions, and was even invaded in his turn; but, in a ſhort time, Gordian being murdered by Philip, the new emperor made peace with him upon terms very advantageous to the Perſians. He was no ſooner gone than Sapor renewed his incurſions, and made ſuch alarming progreſs, that the emperor Valerian, at the age of 70, marched againſt him in perſon with a numerous army. An engagement enſued, in which the Romans were defeated, and Valerian taken priſoner. Sapor purſued his advantages with ſuch inſolence of cruelty, that the people of the provinces took arms, firſt under Calliſtus a Roman general, and then under Odenatus prince of Palmyrene. Thus they not only protected themſelves from the inſults of the Perſians, but even gained many great victories over them, and drove Sapor with diſgrace into his own dominions. In his march he is ſaid to have made uſe of the bodies of his unfortunate priſoners to fill up the hollow roads, and to facilitate the paſſage of his carriages over ſuch rivers as lay in his way. On his return to Perſia, he was ſolicited by the kings of the Caduſians, Armenians, Bactrians, and other nations, to ſet Valerian at liberty; but to no purpoſe. On the contrary, he uſed him the worſe; treated him daily with indignities, ſet his foot upon his neck when he mounted his horſe, and, as is affirmed by ſome, flayed him alive after ſome years confinement; and cauſed his ſkin to be tanned, which he kept as a monument of his victory over the Romans. This extreme inſolence and cruelty was followed by an uninterrupted courſe of misfortune. Odenatus defeated him in every engagement, and even ſeemed ready to overthrow his empire; and after him Aurelian took ample vengeance for the captivity of Valerian. Sapor died in the year of Chriſt 273 after having reigned 31 years; and was ſucceeded by his ſon Hormiſdas, and he by Varanes I. Concerning both theſe princes we know nothing more than that the former reigned a year and ten days, and the latter three years; after which he left the crown to Varanes II. who ſeems to have been ſo much awed by the power of the Romans, that he durſt undertake nothing. The reſt of the Perſian hiſtory, to the overthrow of the empire by the Saracens, affords nothing but an account of their continued invaſions of the Roman empire, which more properly belongs to the hiſtory of ROME: and to which therefore we refer. The laſt of the Perſian monarchs, of the line of Artaxares, was Iſdigertes, or Jezdegerd, as he is called by the Arabian and Perſian hiſtorians, who was cotemporary with Omar the ſecond caliph after Mahomet. He was ſcarce ſeated on the throne, when he found himſelf attacked by a powerful army of Saracens under the command of one Sad, who invaded the country through Chaldea. The Perſian general took all imaginable pains to haraſs the Arabs on their

51 And treats him cruelly.

52 The Perſian empire overthrown by the Saracens.

Perſia. march; and having an army ſuperior to them in numbers, employed them continually in ſkirmiſhes; which were ſometimes favourable to him and ſometimes otherwiſe. But Sad, perceiving that this lingering war would deſtroy his army, determined to haſten forward, and force the enemy to a general engagement. The Perſians declined this for a long time; but at length, finding a convenient plain where all their forces might act, they drew up in order of battle, and reſolved to wait for the Arabs. Sad having diſpoſed his men in the beſt order he could, attacked the Perſians with the utmoſt fury. The battle laſted three days and three nights; the Perſians retiring continually from one poſt to another, till at laſt they were entirely defeated; and thus the capital city, and the greateſt part of the dominions of Perſia, fell into the hands of the Arabs. The conquerors ſeized the treaſures of the king; which were ſo vaſt, that, according to a Mahometan tradition, their prophet gave the Saracen army a miraculous view of thoſe treaſures before the engagement, in order to encourage them to fight.

After the loſs of this battle, Jezdegerd retired into Choraſſan, where he maintained himſelf as king, having under his ſubjection two other provinces, named *Kerman* and *Segeſtan*. But after he had reigned in this limited manner for 19 years, one of the governors of the few towns he had left betrayed it, and called in the Turks. This place was called *Merou*, ſeated on the river Gihon or Odus. Jezdegerd immediately marched againſt the rebels and their allies. The Perſians were defeated; and the unfortunate monarch, having with much difficulty reached the river, found there a little boat, and a fiſherman to whom it belonged. The king offered him a bracelet of precious ſtones; but the fellow, equally brutal and ſtupid, told him that his fare was five farthings, and that he would neither take more nor leſs. While they diſputed, a party of the rebel horſe came up, and knowing Jezdegerd, killed him in the year 652.

Jezdegerd left behind him a ſon named *Firouz*, and a daughter named *Dara*. The latter eſpouſed Boſſenay, whom the rabbinical writers have dignified with the title of the *head of the captivity*; and who, in fact, was the prince of the Jews ſettled in Chaldea. As for Firouz, he ſtill preſerved a little principality; and when he died, left a daughter named *Mah Afrid*, who married Walid the ſon of the caliph Abdalmalek, by whom ſhe had a ſon named *Yezid*, who became caliph, and conſequently ſovereign of Perſia; and ſo far was this prince from thinking himſelf above claiming the title derived from his mother, that he conſtantly ſtyled himſelf *the ſon of Khoſrou king of Perſia, the deſcendant of the caliph Maroan, and among whoſe anceſtors on the ſide of the mother were the Roman emperor and the khacan.*

53 ate of rſia un- r the ogul inces.

Perſia continued to be ſubject to the Arabs till the decline of the Saracen empire, when it was ſeized by various uſurpers, till the time of Jenghiz Khan, who conquered it as well as almoſt all the reſt of Aſia. After his death, which happened in the year 1227, Perſia, together with the neighbouring countries, were governed by officers appointed by his ſucceſſors, who reigned at Karakorom, in the eaſtern parts of Tartary, till the year 1253, when it became once more the ſeat of a mighty empire under Hulaku the Mogul, who in 1256 aboliſhed the khalifat, by taking the city of Bagdad, as related under that article. After the death of Hulaku, his ſon Abaka ſucceeded to his extenſive dominions; and his firſt care was to ſhut up all the avenues of his empire againſt the other princes of the race of Jenghiz Khan, who reigned in different parts of Tartary. His precautions, however, were of little avail; for in the very beginning of his reign he was invaded by Barkan Khan, of the race of Jagatay the ſon of Jenghiz Khan, from Great Bukharia, with an army of 300,000 men. Abaka was but indifferently prepared to oppoſe ſuch a formidable power; but, happily for him, his antagoniſt died before the armies came to an engagement, upon which the invaders diſperſed and returned to Tartary. In the year 1264, Armenia and Anatolia were ravaged by the Mamlucks from Egypt, but were obliged to fly from Abaka; who thus ſeemed to be eſtabliſhed in the poſſeſſion of an empire almoſt as extenſive as that of the ancient Perſian kings. His tranquillity, however, was of ſhort duration; for in 1268 his dominions were invaded by Borak Khan, a prince likewiſe of the race of Jagatay, with an army of 100,000 men. He quickly reduced the province of Choraſſan, where he met with little oppoſition, and in 1269 advanced as far as Aderbijan, where Abaka had the bulk of his forces. A bloody battle enſued; in which Abaka was victorious, and Borak obliged to fly into Tartary, with the loſs of all his baggage and great part of his army. Abaka died in 1282, after a reign of 17 years, not without ſuſpicion of being poiſoned; and was ſucceeded by his brother Ahmed Khan. He was the firſt of the family of Jenghiz Khan who embraced Mahometaniſm; but neither he nor his ſucceſſors appear to have been in the leaſt verſed in the arts of government; for the Perſian hiſtory, from this period, becomes only an account of inſurrections, murders, rebellions, and poiſonings, till the year 1335, when it ſplit all to pieces, and was poſſeſſed by a great number of petty princes; all of whom were at perpetual war with each other till the time of Timur Beg, or Tamerlane, who once more reduced them all under one juriſdiction. Perſia.

54 Under Tamerlane and his ſucceſſors.

After the death of Tamerlane, Perſia continued to be governed by his ſon Shah Rukh, a wiſe and valiant prince: but immediately after his death fell into the ſame confuſion as before; being held by a great number of petty tyrants, till the beginning of the 16th century, when it was conquered by Shah Iſmael Safi, or Sefi; of whoſe family we have the following account. His father was Sheykh Hayder or Haydr, the ſon of Sultan Juneyd, the ſon of Sheykh Ibrahim, the ſon of Sheykh Ali, the ſon of Sheykh Muſa, the ſon of Sheykh Sefi, who was the 13th in a direct line from Ali the ſon-in-law of the prophet Mahomet. When Tamerlane returned from the defeat of Bajazet the Turkiſh ſultan, he carried with him a great number of captives out of Karamania and Anatolia, all of whom he intended to put to death on ſome remarkable occaſion; and with this reſolution he entered Ardebil, or Ardevil, a city of Aderbijan, about 25 miles to the eaſt of Taurus, where he continued for ſome days. At this time lived in that city the Sheykh Safi or Sefi above-mentioned, reputed by the inhabitants to be a ſaint; and, as ſuch, much reverenced by them. The fame of Safi's ſanctity ſo much moved Tamerlane, that he paid him frequent viſits; and, when he was about to depart, promiſed to grant whatever favour he ſhould aſk. Sheykh Safi, who had been informed of Tamer-

55 Conquered by Iſmael Sefi.

Perſia. lane's deſign to put the captives to death, requeſted of the conqueror that he would ſpare the lives of thoſe unfortunate men. Tamerlane, deſirous of obliging him, not only granted this requeſt, but delivered them up to him to be diſpoſed of as he thought fit; upon which the Sheykh furniſhed them with clothes and other neceſſaries as well as he could, and ſent them home to their reſpective countries. This generous action proved very beneficial to the family; for the people were ſo much affected with ſuch an extraordinary inſtance of virtue, that they repaired in great numbers to Safi, bringing with them conſiderable preſents; and this ſo frequently, that few days paſſed in which he was not viſited by many. Thus the deſcendants of the Sheykh made a conſpicuous figure till the year 1486, when they were all deſtroyed by the Turkmans except Iſmael, who fled to Ghilan, where he lived under the protection of the king of that country; after which he became conſpicuous on the following occaſion.

There was at that time, among the Mahometans, a vaſt number of people diſperſed over Aſia; and among theſe a particular party who followed that of Haydr the father of Iſmael, which Sheykh Safi, one of his anceſtors, had brought into great reputation. Iſmael, who had aſſumed the ſurname of *Sofi*, or *Sage*, finding that Perſia was all in confuſion, and hearing that there was a great number of the Heyderian ſect in Karamania, removed thither. There he collected 7000 of his party, all devoted to the intereſt of his family; and while he was yet only 14 years of age, conquered Shirwan. After this he purſued his conqueſts; and as his antagoniſts never united to oppoſe him, had conquered the greateſt part of Perſia, and reduced the city of Bagdad by the year 1510. However, his conqueſts on the weſt ſide were ſoon ſtopped by the Turks; for, in 1511, he received a great defeat from Selim I. who took Tauris; and would probably have cruſhed the empire of Iſmael in its infancy, had he not thought the conqueſt of Egypt more important than that of Perſia. After his defeat by Selim, Iſmael never undertook any thing of conſequence. He died in 1523, leaving the crown to his eldeſt ſon Thamaſp I.

The new ſhah was a man of very limited abilities, and was therefore invaded by the Turks almoſt inſtantly on his acceſſion to the throne. However, they were obliged to retreat by an inundation, which overflowed their camp, and which frightened them with its red colour, probably ariſing from the nature of the ſoil over which it paſſed. Thamaſp, however, reduced Georgia to a province of the Perſian empire; that country being in his time divided among a number of petty princes, who, by reaſon of their diviſions, were able to make little oppoſition.

56 Reign of Shah Abbas the Great.

The reigns of the ſucceeding princes afford nothing remarkable till the time of Shah Abbas I. ſurnamed the *Great*. He aſcended the throne in the year 1584; and his firſt care was to recover from the Turks and Tartars the large provinces they had ſeized which formerly belonged to the Perſian empire. He began with declaring war againſt the latter, who had ſeized the fineſt part of Choraſſan. Accordingly, having raiſed a powerful army, he entered that province, where he was met by Abdallah Khan the chief of the Uſbeck Tartars. The two armies lay in ſight of each other for ſix months; but at length Abbas attacked and defeated his enemies, forcing them, for that time, to abandon Choraſſan. Here he continued for three years; and on his leaving that place, fixed the ſeat of government at Iſpahan, where it has continued ever ſince. His next expedition was againſt the Turks. Underſtanding that the garriſon of Tauris was in no expectation of an enemy, he formed a deſign of ſurpriſing the place; and having privately aſſembled a few forces, he marched with ſuch celerity, that he reached a paſs called *Shibli*, very near Tauris, in ſix days, though it is uſually 18 or 20 days journey for the caravans. Here the Turks had poſted a few ſoldiers, rather for the purpoſe of collecting the cuſtoms on ſuch commodities as were brought that way, than of defending the paſs againſt an enemy. Before they came in ſight of this paſs, Abbas and ſome of his officers left the reſt of the army, and rode briſkly up to the turnpike. Here the ſecretary of the cuſtomhoule, taking them for merchants, demanded the uſual duties. Abbas replied, that the perſon who had the purſe was behind, but at the ſame time ordered ſome money to be given him. But while the ſecretary was counting it, he was ſuddenly ſtabbed by the Shah's order; and the officers who were with him ſuddenly falling upon the few ſoldiers who were there, obliged them to ſubmit; after which he entered the paſs with his army. The governor of Tauris marched out with all the troops he could collect on ſo ſhort a warning; but being inferior to the Perſians, he was utterly defeated, and himſelf taken priſoner; after which the city was obliged to ſubmit, as alſo a number of places in the neighbourhood. One city only, called *Orumi*, being very ſtrongly ſituated, refuſed all the efforts of Abbas; but was at laſt taken by the aſſiſtance of the Curds, whom he gained over by promiſing to ſhare the plunder of the place with them. But inſtead of this, he formed a deſign to cut them all off at once; fearing that they might at another time do the Turks a ſervice of the ſame nature that they had done to him juſt now. For this reaſon he invited their chiefs to dine with him; and having brought them to a tent, the entrance to which had ſeveral turnings, he ſtationed on the inſide two executioners, who cut off the heads of the gueſts as ſoon as they entered.

After this Shah Abbas conſiderably enlarged his dominions, and repelled two dangerous invaſions of the Turks. He attempted alſo to promote commerce, and civilize his ſubjects; but ſtained all his great actions by his abominable cruelties, which he practiſed on every one who gave him the leaſt cauſe of offence; nay, frequently without any cauſe at all. He took the Iſle of Ormus from the Portugueſe, who had kept it ſince 1507, by the aſſiſtance of ſome Engliſh ſhips in 1622; and died ſix years after, aged 70.

The princes who ſucceeded Shah Abbas the Great, were remarkable only for their cruelties and debaucheries, which occaſioned a revolution in 1716, when the Shah Huſſein was dethroned by the Afghans, a people inhabiting the country between Perſia and India; who being oppreſſed by the miniſters, revolted under the conduct of one Mereweis. The princes of the Afghan race continued to enjoy the ſovereignty for no more than 16 years, when Aſhraff the reigning ſhah was dethroned by one of his officers*. On this Thamaſp,

57 Hiſtory of Khouli Khan.

* See Tahmaſp.

Persia. Tirmaasp, otherwise called *Prince Thamas*, the only survivor of the family of Abbas, assembling an army, invited into his service Nadir Khan, who had obtained great reputation for his valour and conduct. He was the son of a Persian nobleman, on the frontiers of Usbeck Tartary; and his uncle, who was his guardian, keeping him out of possession of the castle and estate, which was his inheritance, he took to robbing the caravans; and, having increased his followers to upwards of 5000 men, became the terror of that part of the country, and especially of his uncle, who had seized his estate. His uncle therefore resolved to make his peace with him, and with that view invited him to the castle, where he entertained him in a splendid manner; but Nadir Khan ordered his throat to be cut next night, and all his people to be turned out of the castle. No sooner had Nadir Khan got the command of the Persian army, than he attacked and defeated the usurper Esriff, put him to death, and recovered all the places the Turks and Russians had made themselves masters of during the rebellion; and then prince Thamas seemed to be established on the throne: but Nadir Khan, to whom Thamas had given the name of *Thamas Kouli Khan*, that is, *the Slave of Thamas*, thinking his services not sufficiently rewarded, and pretending that the king had a design against his life, or at least to set him aside, conspired against his sovereign, and put him to death, as is supposed: after which, he usurped the throne, styling himself *Shah Nadir*, or *King Nadir*.

He afterwards laid siege to Candahor, of which a son of Mereweis had possessed himself. While he lay at this siege, the court of the Great Mogul being distracted with factions, one of the parties invited Shah Nadir to come to their assistance, and betrayed the Mogul into his hands. He thereupon marched to Delhi, the capital of India, and summoned all the viceroys and governors of provinces to attend him, and bring with them all the treasures they could raise; and those that did not bring as much as he expected, he tortured and put to death. Having thus amassed the greatest treasure that ever prince was master of, he returned to Persia, giving the Mogul his liberty, on condition of his resigning the provinces on the west side of the Indus to the crown of Persia. He afterwards made a conquest of Usbeck Tartary, and plundered Bochara the capital city. Then he marched against the Dagistan Tartars; but lost great part of his army in their mountains, without fighting. He defeated the Turks in several engagements; but laying siege to Bagdad, was twice compelled to raise the siege. He proceeded to change the religion of Persia to that of Omar, hanged up the chief priests, put his own son to death, and was guilty of such cruelty, that he was at length assassinated by his own relations, anno 1747. A contest upon this ensued between these relations for the crown, which has rendered Persia a scene of the most horrible confusion for upwards of 40 years.

58 ferent tenders the one of sia. The reader will form some notion of the troubles of this unhappy country from the following series of pretenders to the throne between the death of Nadir and the accession of Kerim Khan. We give it from Francklin's Observations "1st, Adil Shah.—2d, Ibraheem Shah.—3d, Shah Rokh Shah.—4th, Suleeman Shah.—5th, Ismaeel Shah.—6th, Azad Khan Afghan.—7th, Hassun Khan Kejar.—8th, Ali Merdan Khan Bukhteari.—9th, Kerim Khan Zund. Persia.

"Their reigns, or more properly the length of time they respectively governed with their party, were as follows: Adil Shah, nine months. Ibraheem Shah, six months. Shah Rokh Shah, after a variety of revolutions, at length regained the city of Meschid: he is now alive (1787), and above 80 years of age, reigning in Khorasan, under the direction of his son Nassir Ullah Meerza. Suleeman Shah and Ismaeel Shah in about forty days were both cut off, almost as soon as they were elevated. Azad Khan Afghan, one of Kerim Khan's most formidable rivals and competitors, was subdued by him, brought prisoner to Shirauz, and died there a natural death. Hussun Khan Kejar, another of Kerim Khan's competitors, was besieging Shirauz, when his army suddenly mutinied and deserted him. The mutiny was attributed to their want of pay. A party sent by Kerim Khan took him prisoner. His head was instantly cut off, and presented to Kerim Khan. His family were brought captives to Shirauz. They were well treated, and had their liberty given them soon after, under an obligation not to quit the city. Ali Merdan Khan was killed by a musket-shot as he was walking on the ramparts of Mesched encouraging his men. Kerim Khan Zund, by birth a Curdistan, was a most favourite officer of Nadir Shah, and at the time of his death was in the southern provinces. Shirauz and other places had declared for him. He found means at last, after various encounters with doubtful success, completely to subdue all his rivals, and finally to establish himself as ruler of all Persia. He was in power about 30 years; the latter part of which he governed Persia under the appellation of *vakeel* or *regent*, for he never would receive the title of Shah. He made Shirauz the chief city of his residence, in gratitude for the assistance he had received from its inhabitants and those of the southern provinces. He died in the year 1779, regretted by all his subjects, who esteemed and honoured him as the glory of Persia.

59 Kerim Khan enjoyed a reign of near 30 years.

60 Twenty-two officers take possession of the citadel. "When the death of Kerim Khan was announced in the city, much confusion arose; two and twenty of the principal officers of the army, men of high rank and family, took possession of the ark, or citadel, with a resolution to acknowledge Abul Futtah Khan (the eldest son of the late Vakeel) as their sovereign, and to defend him against all other pretenders; whereupon

61 Zikea Khan Zikea Khan, a relation of the late Vakeel by the mother's side, who was possessed of immense wealth, enlisted a great part of the army into his pay, by giving them very considerable bounties. Zikea Khan was of the tribe of Zund (or the Lackeries); a man remarkably proud, cruel, and unrelenting. Having assembled a large body of troops, he immediately marched them to the citadel, and laid close siege to it for the space of three days; at the expiration of which, finding he could not take it by force, he had recourse to treachery. To each of the principal khans he sent a written paper, by which he swore upon the Koran, that if they would come out and submit to him, not a hair of their heads should be touched, and that they should have their effects secured to them. Upon this a consultation was held by them; and it appearing that they could not subsist many days longer, they agreed to

62 Besieges the citadel.

63 Employs treacherous means to induce the officers out, and was successful.

Perſia. ſurrender themſelves, firmly relying on the promiſes that had been made them. Zikea Khan, in the mean time, gave private orders for the khans to be ſeized, and brought ſeparately before him as they came out of the citadel. His orders were ſtrictly obeyed, and theſe deluded men were all maſſacred in his preſence: he was ſeated the whole time, feaſting his eyes on the cruel ſpectacle.

63 Murdered. "Zikea Khan's tyranny became ſoon intolerable, and he was cut off by his own body-guard, when Abul Futtah Khan, who was at the time in the camp, was proclaimed king by the unanimous voice of the troops, whom he immediately led back to Shirauz. On his arrival he was acknowledged as ſovereign by all ranks of people, and took quiet poſſeſſion of the government.

65 Mahomed Sadick Khan attempts to ſeize the government, "Mahomed Sadick Khan, only brother of the late Kerim Khan, who had during that prince's life filled the high office of beglerbeg of Fars, and had been appointed guardian of his ſon Abul Futtah Khan, was at this period governor of the city of Buſſora, which had been taken by the Perſians, previous to the vakeel's death. Upon hearing the news of his brother's deceaſe he became ambitious of reigning alone, and from that inſtant formed ſchemes for the deſtruction of his nephew; but as it was neceſſary for him to be on the ſpot for the advancement of his views, he determined to withdraw the Perſian garriſon from Buſſora, who were all devoted to his intereſt: accordingly he evacuated that place, and marched immediately for Shirauz.

"The news of Sadick Khan's approach threw the inhabitants of Shirauz into the greateſt conſternation: their minds were variouſly agitated on the occaſion; ſome, from his known public character, expected he would honeſtly fulfil the commands of his deceaſed brother; others, who had been witneſſes to the confuſion of former times, on ſimilar occaſions, rightly imagined that he would ſet up for himſelf; and indeed this proved to be the caſe: for having entered Shirauz a very few days after, he cauſed Abul Futtah Khan to be ſeized, deprived of ſight, and put into cloſe confinement.

66 Which he effects. "After this event, Sadick Khan openly aſſumed the government. As ſoon as the intelligence reached Ali Murad Khan, who was at Iſpahan, that lord inſtantly rebelled: deeming himſelf to have an equal right to the government with Sadick Khan, as in fact he had, he could ill brook the thought of being obedient to him, and openly declared himſelf a competitor for the empire. Perſia was by this means again involved in all the horrors of a civil war. Ali Murad Khan indeed took poſſeſſion of Shirauz, aſſumed the government, and gave to the empire the flattering proſpect of being ſettled under the government of one man; but this proſpect was ſoon obſcured by the power and credit acquired by Akau Mahomed Khan."

67 Akau Mahomed Khan collects troops, and is proclaimed at Mazanderan and Ghilan. On the night following Kerim Khan's death, this man found means to make his eſcape from Shirauz, and fled to the northward, where collecting ſome troops, he ſoon made himſelf maſter of Mazanderan and Ghilan, and was proclaimed nearly about the time that Ali Murad Khan had taken Shirauz. "It is remarkable (ſays our author), that from his firſt entering into competition for the government, he has been ſucceſsful in every battle which he has fought. He is an eunuch, having been made ſo whilſt an infant, by the command of Nadir Shah, but poſſeſſes great perſonal bravery." Perſia.

Ali Murad Khan, hearing of the ſucceſs of Akau Mahomed Khan, determined to go againſt him; but as he was previouſly proceeding to Iſpahan to ſuppreſs a rebellion, he fell ſuddenly from his horſe and expired on the ſpot.

68 Jaafar Khan aſſerts his pretenſion to the government. "At this period Jaafar Khan, the eldeſt and only ſurviving ſon of Sadick Khan, was governor of Khuma: he deemed this a favourable opportunity to aſſert his pretenſions to the government, and immediately marched with what few troops he had to Iſpahan: ſoon after his arrival he was joined by the greater part of the malcontents, who were then in arms. In this ſituation he remained ſome time; but Akau Mahomed Khan coming down upon him with his army, he was obliged to riſk his fate in a battle, and, being defeated, fled with the ſmall remains of his troops, taking the road to Shirauz. Soon after finding himſelf ſtrengthened by an increaſe of his army, he determined to venture a ſecond engagement with his opponent Akau Mahomed Khan; and for this purpoſe marched with his army towards Iſpahan: the two armies met near Yezdekhaſt, when a battle enſued, and Akau Mahomed Khan's ſuperior fortune again prevailing, Jaafar Khan was defeated, and retired to Shirauz, which he quitted on the 25th of June 1787, and ſhortly after marched his army to the northward, but returned in October without having effected any thing." Such was the ſtate of Perſia in 1788. Mr Francklin, from whoſe excellent *Obſervations on a Tour made in the years* 1786-7 theſe particulars are moſtly extracted, ſays that Jaafar Khan is the moſt "likely, in caſe of ſucceſs againſt his opponent, to reſtore the country to a happy and reputable ſtate; but it will require a long ſpace of time to recover it from the calamities into which the different revolutions have brought it:—a country, if an oriental metaphor may be allowed, once blooming as the garden of Eden, fair and flouriſhing to the eye;—now, ſad reverſe! deſpoiled and leafleſs by the cruel ravages of war, and deſolating contention."

69 Is defeated by Akau Mahomed Khan.

70 Air and climate of Perſia. As to the air and climate of this country, conſidering the great extent thereof, it cannot but be very different, according to the ſituation of its ſeveral parts; ſome being frozen with cold, whilſt others are burnt with heat at the ſame time of the year. The air, wherever it is cold, is dry; but where it is extremely hot, it is ſometimes moiſt. All along the coaſt of the Perſian Gulph, from weſt to eaſt, to the very mouth of the river Indus, the heat for four months is ſo exceſſive, that even thoſe who are born in the country, unable to bear it, are forced to quit their houſes, and retire to the mountains; ſo that ſuch as travel in theſe parts, at that ſeaſon, find none in the villages but wretched poor creatures, left there to watch the effects of the rich, at the expence of their own health. The extreme heat of the air, as it is inſupportable, ſo it makes it prodigiouſly unwholeſome; ſtrangers frequently falling ſick there, and ſeldom eſcaping. The eaſtern provinces of Perſia, from the river Indus to the borders of Tartary, are ſubject to great heats, though not quite ſo unwholeſome as on the coaſts of the Indian Ocean and the Perſian Gulph; but in the northern provinces, on the coaſt of the Caſpian Sea, the heat

sia. heat is full as great, and, though attended with moiſture, as unwholeſome as on the coaſt before mentioned. From October to May, there is no country in the world more pleaſant than this; but the people carry indelible marks of the malign influence of their ſummers, looking all of them of a faint yellow, and having neither ſtrength nor ſpirits; though, about the end of April, they abandon their houſes, and retire to the mountains, which are 25 or 30 leagues from the ſea. But this moiſtneſs in the air is only in theſe parts; the reſt of Perſia enjoys a dry air, the ſky being perfectly ſerene, and hardly ſo much as a cloud ſeen to fly therein. Though it ſeldom rains, it does not follow that the heat admits of no mitigation; for in the night, notwithſtanding there is not a cloud to be ſeen, and the ſky is ſo clear, that the ſtars alone afford a light ſufficient to travel by, a briſk wind ſprings up, which laſts until within an hour of the morning, and gives ſuch a coolneſs to the air, that a man can bear a tolerable warm garment. The ſeaſons in general, and particularly in the middle of this kingdom, happen thus: the winter, beginning in November, and laſting until March, is very ſharp and rude, attended with froſt and ſnow; which laſt deſcends in great flakes on the mountains, but never in the plains. The climate of Shirauz, the capital of Perſia Proper, is repreſented by a traveller who lately viſited it, as one of the moſt agreeable in the world, the extremes of heat and cold being ſeldom felt. "During the ſpring of the year the face of the country appears uncommonly beautiful. The flowers, of which they have a great variety, and of the brighteſt hues, the fragrant herbs, ſhrubs, and plants, the roſe, the ſweet baſil, and the myrtle, all here contribute to refreſh and perfume the natural mildneſs of the air. The nightingale of the garden (called by the Perſians *boolbul hezar daſtaan*), the goldfinch, and the linnet, by their melodious warblings at this delightful ſeaſon of the year, ſerve to add to the ſatisfaction of the mind, and to inſpire it with the moſt pleaſing ideas. The beauties of nature are here depicted in their fulleſt extent; the natural hiſtorian and the botaniſt would here meet with ample ſcope for purſuing their favourite inveſtigations. With ſuch advantages, added to the ſalubrity of the air, how can it be wondered at that the inhabitants of Shirauz ſhould ſo confidently aſſert the pre-eminence of their own city to any other in the world?—or that ſuch beauties ſhould fail of calling forth the poetical exertions of a Hafiz, a Sàdi, or a Jàmi? Their mornings and evenings are cool, but the middle of the day is very pleaſant. In ſummer the thermometer ſeldom riſes above 73 in the day-time, and at night it generally ſinks as low as 62. The autumn is the worſt ſeaſon of the year, that being the time when the rains begin to fall, and during the autumnal months it is conſidered by natives as the moſt unhealthy; colds, fluxes, and fevers being very general. In winter a vaſt deal of ſnow falls, and very thick, but ice is rarely to be found, except on the ſummits of the mountains, or towards Iſpahan, and the more northern parts of Perſia. One thing which is moſt to be eſteemed in this country, and renders it preferable to any other part of the world, is their nights, which are always clear and bright; and the dew, that in moſt places is of ſo pernicious and dangerous a nature, is not of the leaſt ill conſequence here: there is none at all in ſummer, and in the other ſeaſons it is of ſuch a nature, that if the brighteſt ſcimitar ſhould be expoſed to it all the night, it would not receive the leaſt ruſt; a circumſtance I have myſelf experienced. This dryneſs in the air cauſes their buildings to laſt a great while, and is undoubtedly one of the principal reaſons that the celebrated ruins of Perſepolis have endured for ſo many ages, and, comparatively ſpeaking, in ſo perfect a ſtate." The great dryneſs of the air exempts Perſia from thunder and earthquakes. In the ſpring, indeed, there ſometimes falls hail; and, as the harveſt is then pretty far advanced, it does a great deal of miſchief. The rainbow is ſeldom ſeen in this country, becauſe there riſe not vapours ſufficient to form it; but in the night there are ſeen rays of light ſhooting thro' the firmament, and followed as it were by a train of ſmoke. The winds, however briſk, ſeldom ſwell into ſtorms or tempeſts; but, on the other hand, they are ſometimes poiſonous and infectious on the ſhore of the Gulph, as all travellers agree. Mr Tavernier ſays, that at Gomiroon people often find themſelves ſtruck by a ſouth wind, in ſuch a manner that they cry, "I burn!" and immediately fall down dead. M. le Brun tells us, that he was aſſured while he was there, that the weather was ſometimes ſo exceſſively ſultry as to melt the ſeals of letters. At this time the people go in their ſhirts, and are continually ſprinkled with cold water; and ſome even lie ſeveral hours naked in the water. Among the inconveniences conſequent from this malign diſpoſition of the air, one of the moſt terrible is the engendering, in the arms and legs, a kind of long ſmall worms, which cannot be extracted without great danger of breaking them; upon which a mortification enſues.

I ate of uz.

Perſia.

72 Soil.

The ſoil of Perſia is in general ſtony, ſandy, barren, and everywhere ſo dry, that, if it be not watered, it produces nothing, not even graſs; but, where they can turn the water into their plains and valleys, it is not unfruitful. There is a great difference in point of fertility in the different provinces of the empire; and thoſe of Media, Iberia, Hyrcania, and Bactria, are now in a great meaſure what they were formerly, and ſurpaſs moſt of the others in their productions. All along the Perſian Gulph, the ſoil is ſtill more barren, cattle leſs plenty, and every thing in a worſe condition than anywhere elſe.

73 Produce, &c.

Though there is ſcarce a province in Perſia which does not produce wine, yet the wine of ſome provinces is much more eſteemed than that of others; but Schiras, or, as it is written by Mr Francklin, *Shirauz*, wine is univerſally allowed to be the very beſt in Perſia: inſomuch, that it is a common proverb there, That to live happily one muſt eat the bread of Yezd, and drink the wine of Schiras.

The grain moſt common in Perſia is wheat; which is wonderfully fair and clean. As for barley, rice, and millet, they only make bread of them in ſome places, as in Courdeſtan, when their wheat-bread is exhauſted before the return of harveſt. They do not cultivate in this country either oats or rye; except where the Armenians are ſettled, who make great uſe of the latter in Lent. Rice is the univerſal aliment of all ſorts of people in Perſia; for this reaſon they are extremely careful in its cultivation; for, after they have ſown it

in

Perſia. in the ſame manner as other grain, they in three months time tranſplant it, root by root, into fields, which are well watered, otherwiſe it would never attain that perfection in which we find it there; ſince it is ſofter, ſooner boiled, and more delicious, than the ſame grain in any other part of the world. Perhaps its taſte is, in ſome meaſure, heightened by a practice they make uſe of to give it a gloſſy whiteneſs, *viz.* by cleanſing it, after it is beaten out of the huſks, with a mixture of flour and ſalt. Corn ripens exceedingly in this country; ſo that in ſome parts they have a threefold crop in the year. The Perſian bread is generally very thin, white, and good; and commonly cheap enough.

Metals of all ſorts have been found in Perſia. Since the reign of Shah Abbas the Great, iron, copper, and lead, have been very common; but there are no gold or ſilver mines open at preſent; though, as Perſia is a very mountainous country, ſuch might very probably be found, if pains were taken to ſearch them out. There are ſilver mines in Kirman and Mazanderan, and one not far from Spauhawn; but they cannot be worked for want of wood. Minerals are alſo found in Perſia in abundance; eſpecially ſulphur, ſaltpetre, ſalt, and alum. Nothing is more common in this country than to meet with plains, ſometimes 10 leagues in length, covered entirely with ſalt, and others with ſulphur or alum. In ſome places ſalt is dug out of mines, and even uſed in building houſes. Marble, freeſtone, and ſlate, are found in great plenty about Hammadan. The marble is of four colours, *viz.* white, black, red and black, and white and black. Perſia yields two ſorts of petroleum, or naphthe; namely, black and white. In the neighbourhood of Tauris they find azure; but it is not ſo good as that brought from Tartary. Among the moſt valuable productions of Perſia are the precious ſtones called *turqueiſes*, of which there are ſeveral rocks or mines.

The horſes of Perſia are the moſt beautiful of the Eaſt, though they are not ſo much eſteemed as thoſe of Arabia; ſo great, however, is the demand for them, that the fineſt ones will fetch from 90l. to 450l. ſterling. They are higher than the Engliſh ſaddle horſes; ſtraight before, with a ſmall head, legs wonderfully ſlender, and finely proportioned; they are mighty gentle, good travellers, very light and ſprightly, and do good ſervice till they are 18 or 20 years old. The great numbers of them ſold into Turkey and the Indies, though none can be carried out of the kingdom without ſpecial licence from the king, is what makes them ſo dear. Next to horſes we may reckon mules, which are much eſteemed here, and are very fine; and next to theſe we may juſtly place aſſes, of which they have in this country two ſorts; the firſt bred in Perſia, heavy and doltiſh, as aſſes in other countries are; the other originally of an Arabian breed, the moſt docile and uſeful creature of its kind in the world. They are uſed wholly for the ſaddle; being remarkable for their eaſy manner of going, and are very ſure-footed, carrying their heads lofty, and moving gracefully. Some of them are valued at 20l. ſterling. The mules here are alſo very fine; they pace well, never fall, and are ſeldom tired. The higheſt price of a mule is about 45l. ſterling. Camels are alſo numerous in Perſia, and very ſerviceable: they call them *keebty-krouch konion*, i. e. "the ſhips of the land;" becauſe the inland trade is carried on by them as the foreign is by ſhips. Of theſe camels there are two ſorts, the northern and ſouthern: the latter, which is much the ſmaller, but ſwifter, will carry a load of about 700 weight, and trot as faſt as a horſe will gallop; the other will travel with a load of 1200 or 1300 weight; both are profitable to their maſters, as coſting little or nothing to keep. They travel without halter or reins; grazing on the road from time to time, notwithſtanding their load. They are managed entirely by the voice; thoſe who direct them making uſe of a kind of ſong, and the camel moving briſker, or at its ordinary pace, as they keep a quicker or ſlower time. The camels ſhed their hair ſo clean in the ſpring, that they look like ſcalded ſwine; but then they are pitched over, to keep the flies from ſtinging them. The camels hair is the moſt profitable fleece of all the tame beaſts: fine ſtuffs are made of it; and in Europe, hats, with a mixture of a little beaver. Per

As beef is little eaten in Perſia, their oxen are generally employed in ploughing, and other ſorts of labour. Hogs are nowhere bred in Perſia, if we except a province or two on the borders of the Caſpian Sea. Sheep and deer are very common throughout all Perſia.

Of wild beaſts, the number is not great in that country, becauſe there are few foreſts; but where there are any, as in Hyrcania, now called *Tabriſtan*, abundance of lions, bears, tigers, leopards, porcupines, wild boars, and wolves, are to be found; but the laſt are not ſo numerous as any of the other ſpecies.

There are but few inſects in this country; which may be aſcribed to the dryneſs of the climate. In ſome provinces, however, there is an infinite number of locuſts or graſhoppers, which fly about in ſuch clouds as to darken the air. In certain parts of the Perſian dominions they have large black ſcorpions, ſo venomous, that ſuch as are ſtung by them die in a few hours. In others they have lizards, frightfully ugly, which are an ell long, and as thick as a large toad, their ſkins being as hard and tough as that of the ſea-dog: they are ſaid to attack and kill men ſometimes; but that may be doubted. The ſouthern provinces are infeſted with gnats; ſome with long legs, like thoſe we call *midges*; and ſome white, and as ſmall as fleas, which make no buzzing, but ſting ſuddenly, and ſo ſmartly, that the ſting is like the prick of a needle. Among the reptiles is a long ſquare worm, called by the inhabitants *hazar-pey*, i. e. "thouſand feet," becauſe its whole body is covered with feet; it runs prodigiouſly faſt; and its bite is dangerous, and even mortal, if it gets into the ear.

There are in Perſia all the ſeveral ſorts of fowls which we have in Europe, but not in ſuch great plenty; excepting, however, wild and tame pigeons, of which vaſt numbers are kept all over the kingdom, chiefly on account of their dung: which is the beſt manure for melons. It is a great diverſion among the lower ſort of people in town and country to catch pigeons, though it be forbidden: for this purpoſe they have pigeons ſo taught, that, flying in one flock, they ſurround ſuch wild ones as they find in the field, and bring them back with them to their maſters. The partridges of this country are the largeſt and fineſt in the world, being generally of the ſize of our fowls. Geeſe, ducks, cranes, herons,

herons, and many other ſorts of water-fowl, are common here; as are likewiſe nightingales, which are heard all the year, but chiefly in the ſpring; martlets, which learn whatever words are taught them; and a bird called *noura*, which chatters inceſſantly, and repeats whatever it hears. Of birds of a larger ſize, the moſt remarkable is the pelican, by the Perſians called *tacab*, *i. e.* "water-carrier;" and alſo *miſe*, *i. e.* "ſheep;" becauſe it is as large as one of thoſe animals*. There are in Perſia various birds of prey. Some of their falcons are the largeſt and fineſt in the world: the people take great pains to teach them to fly at game; the Perſian lords being great lovers of falconry, and the king having generally 800 of this ſort of birds, each of which has a perſon to attend it.

There is perhaps no country in the world which, generally ſpeaking, is more mountainous than Perſia; but many of them yield neither ſprings nor metals, and but few of them are ſhaded with trees. It is true, ſome of the chief of them are ſituated on the frontiers, and ſerve as a kind of natural ramparts, or bulwarks, to this vaſt empire. Among the latter are the mountains of Caucaſus and Ararat, ſometimes called the *mountains of Dagheſtan*, which fill all the ſpace between the Euxine and Caſpian ſeas: thoſe called *Taurus*, and the ſeveral branches thereof, run through Perſia from Natolia to India, and fill all the middle of the country.

As to rivers, except the Araxes, which riſes in the mountains of Armenia, and falls into the Kur or Cyrus before it reaches the Caſpian Sea, there is not one navigable ſtream in this country. The Oxus divides Perſia on the north-eaſt from Uſbeck Tartary. The Indus alſo may now be reckoned among the rivers of Perſia, as the provinces lying to the weſt of that river are now in poſſeſſion of that crown: this river is ſaid to run a courſe of more than 1000 miles, and overflows all the low grounds in April, May, and June.

The ſeas on the ſouth of Perſia are, the Gulph of Perſia or Baſſora, the Gulph of Ormus, and the Indian Ocean. The only ſea on the north is the Caſpian, or Hyrcanian ſea; which is more properly a lake, having no communication with any other ſea. Theſe ſeas, together with the lakes and rivers, ſupply Perſia with plenty of fiſh. The Caſpian ſea contains very fine fiſh on one ſide; and the Perſian Gulph on the other is believed to have more fiſh than any other ſea in the world. On the coaſts of this gulph is taken a ſort of fiſh, for which they have no particular name: its fleſh is of a red colour, very delicious, and ſome of them weigh 200 or 300 pounds. The river-fiſh are chiefly barbels; but far from being good. Thoſe of the lakes are carps and ſhads. In the river at Spauhawn are a great number of crabs, which crawl up the trees, and live night and day under the leaves, whence they are taken; and are eſteemed very delicious food.

In his voyage from Gombroon up the Perſian Gulph, Mr Ives makes mention of ſeveral iſlands, named Kiſme, Polloar, Kyes, Inderabie, Shittewar, and Buſheel. Some of theſe were quite barren; on others there were a few trees and buſhes, with little fiſhing towns, and a few ſmall veſſels lying along ſhore. The date trees were thinly ſcattered among the hills; but tho' a ſmall portion of green might here and there be diſcovered, yet ſuch was the barrenneſs of theſe iſlands in general, that it was for ſome time a matter of ſurpriſe how ſheep and goats could poſſibly ſubſiſt upon them. On cloſer examination, however, it was found, that the ſoil produced a kind of ſmall-leaved juicy mallows, on which theſe animals principally feed. The Perſian coaſt, as they ſailed along, afforded a moſt romantic proſpect, appearing at firſt to be one continued rock, rent and torn aſunder by earthquakes; but it was afterwards diſcovered, that ſome part of it was only ſand hardened by the rains and ſun. Perſia.

Narban Point terminates in a long and low piece of land, which runs off into the gulph from the foot of the Perſian hills. Between this point and the main land is a channel, in which a ſhip of 900 tons burden might eaſily ride. The Portugueſe had formerly a ſettlement here, the remains of which are ſtill to be ſeen. A large river empties itſelf into the ſea at this place; and Mr Ives obſerves, that "Providence ſeems here to have allotted a ſpot of ground amidſt unhoſpitable rocks and deſerts, capable of affording the kind production of vegetables for man and beaſt." The adjacent country is ſubject to the Arabs.

Through all the Perſian Gulph Mr Ives remarks, that the ſpring-water on the iſlands is much better than that on the continent; and the water neareſt the ſea on the iſlands has greatly the advantage over that which is found in the middle parts. This holds good, however, only in thoſe parts which are near the ſea; for about 12 miles up the country, both on the Perſian and Arabian ſide of the gulph, the water is very good. At the iſland called Bareen or Baharen, divers go down to the bottom of the ſea, at certain known depths, and come up again with their veſſels filled with freſh water. This freſh water is found in holes or little natural wells, ſome fathoms below the ſurface of the ſea. The Arabs have certain marks on the iſland to teach them where to dive for the freſh water. Mr Ives was aſſured by an Arabian merchant, that he himſelf had diſcovered a ſpring upon the ſhore, by which one of theſe wells was ſerved. He put into this ſpring a bit of a heavy ſtick; and in two or three days an Arabian diver brought it to him again from the bottom of one of theſe holes.

76 Trade.

The Engliſh, and other nations, trade with the Perſians ſeveral ways, particularly by the gulph of Ormus at Gombroon, and by the way of Turkey. A trade alſo was not many years ſince opened by the Engliſh with Perſia through Ruſſia and the Caſpian Sea; but that is now diſcontinued, having been prohibited by the court of Ruſſia, who were apprehenſive that the Engliſh would teach the Perſians to build ſhips, and diſpute the navigation of the Caſpian Sea with them. The principal commodities and manufactures of Perſia are, raw and wrought ſilks, mohair camblets, carpets, leather; for which, and ſome others, the European merchants exchange chiefly woollen manufactures; but the trade is carried on altogether in European ſhipping, the Perſians having ſcarce any ſhips of their own, and the Ruſſians the ſole navigation of the Caſpian Sea. There is not a richer or more profitable trade in the world, than that which is carried on between Gombroon and Surat in the Eaſt Indies; and the Engliſh Eaſt India company frequently let out their ſhips to tranſport the merchandiſe of the Banians and Armenians from Perſia to India. The ſhah, or ſo-

Perſia. vereign of Perſia, is the chief merchant; and he uſually employs his Armenian ſubjects to traffic for him in every part of the world. The king's agents muſt have the refuſal of all merchandiſe, before his ſubjects are permitted to trade. It is computed that Perſia produces yearly upwards of 22,000 bales of ſilk, chiefly in the provinces of Ghilan and Mazanderan, each bale weighing 263 pounds. Vaſt quantities of Perſian ſilk uſed to be imported into Europe, eſpecially by the Dutch, Engliſh, and Ruſſians, before the civil wars began. The goods exported from Perſia to India are, tobacco, all ſorts of fruits, pickled and preſerved, eſpecially dates, marmalade, wines, diſtilled waters, horſes, Perſian feathers, and Turkey leather of all ſorts and colours, a great quantity whereof is alſo exported to Muſcovy and other European countries. The exports to Turkey are, tobacco, galls, thread, goats hair, ſtuffs, mats, box-work, and many other things. As there are no polls in the eaſt, and trading by commiſſion, with the uſe of bills of exchange, is little known, traffic muſt proceed in a very aukward heavy manner, in comparifon of that of Europe.

77 Money. The moſt current money of Perſia are the abaſſees, worth about 1 s. 4 d. ſterling; they are of the fineſt ſilver. An abaſſee is worth two mahmoudes; a mahmoude, two ſhahees; and a ſhahee, ten ſingle or five double caſbeghes: theſe laſt pieces are of braſs, the others of ſilver; for gold is not current in trade. The ſhahees are not very common; but mahmoudes and caſbeghes are current everywhere. Horſes, camels, houſes, &c. are generally ſold by the toman, which is an imaginary coin, worth 200 ſhahees, or 50 abaſſees; and they uſually reckon their eſtates that way. Such a one, they ſay, is worth ſo many tomans, as we ſay pounds in England.

78 Government. Perſia is an abſolute monarchy, the lives and eſtates of the people being entirely at the diſpoſal of their prince. The king has no council eſtabliſhed, but is adviſed by ſuch miniſters as are moſt in favour; and the reſolutions taken among the women of the haram frequently defeat the beſt laid deſigns. The crown is hereditary, excluding only the females. The ſons of a daughter are allowed to inherit. The laws of Perſia exclude the blind from the throne; which is the reaſon that the reigning prince uſually orders the eyes of all the males of the royal family, of whom he has any jealouſy, to be put out. The king has generally a great many wives, which it would be death for any one, beſides the eunuchs, who have the ſuperintendance of them, to look at, or even ſee by accident; wherefore, when he travels, notice is given to all men to quit the road, nay their very houſes, and to retire to a great diſtance.

The prime miniſter is called *attemaet doulet*, which ſignifies the director of the empire, and alſo *vizir azem*, or the great ſupporter of the empire; as he alone almoſt ſuſtains the whole weight of the adminiſtration. This miniſter's chief ſtudy is to pleaſe his maſter, to ſecure to himſelf an aſcendant over his mind, and to avoid whatever may give him any uneaſineſs or umbrage. With this view, he never fails to flatter him, to extol him above all the princes upon earth, and to throw a thick veil over every thing that might help to open his eyes, or diſcover to him the weakneſs of the ſtate. He even takes particular care to keep the king in utter ignorance, to hide from him, or at leaſt to ſoften, all unwelcome news; and, above all, to exalt immoderately every the leaſt advantage he obtains over his enemies. As he takes theſe methods, which indeed are and muſt be taken, more or leſs, by the miniſters of every deſpotic prince, to ſecure the favour and confidence of his maſter; ſo the inferior officers and governors of provinces are obliged to employ all the means in their power to ſecure the prime miniſter's, they depending no leſs upon him than he does upon the king. There is a gradation of deſpotiſm and ſlavery, down from the prime miniſter to the loweſt retainer to the court, or dependent on the government. Children are ſometimes in Perſia required by the king to cut off the ears and noſe, and even to cut the throats of their parents: and theſe orders cannot be objected to, without endangering their own lives. Indeed their baſeneſs and mercenarineſs are ſuch, that they will perpetrate ſuch atrocious deeds without the leaſt ſcruple or difficulty, when they have a promiſe or expectation of poſſeſſing their poſts. The prime miniſters, notwithſtanding the precarious footing on which they ſtand, in effect of their abilities or good fortune, ſometimes continue in their employments during life, or, if removed, are only baniſhed to ſome city, where they are allowed to ſpend the remainder of their days in a private ſtation. Per

Next to the prime miniſter are the nadir, or grand-maſter of the houſehold; the mehter, or groom of the chambers, who is always a white eunuch; the mir-akhor-baſhe, or maſter of the horſe; the mir ſhikar-baſhe, or great huntſman and falconer; the divan-beggi, or chief juſtice, to whom there lies an appeal from the deroga, or the lieutenant of police, in every town; the vacka-nuviez, or recorder of events, or firſt ſecretary of ſtate; the muſtau-ſhe-elmenalcek, or maſter of the accounts and finances of the kingdom; the numes-humbaſhes, or the king's chief phyſicians; the ſhickada-fibaſhe, or inſpector of the palace, and regulator of rank at court; and the khans, or governors of provinces, under whom are other governors, called *ſoltans*, appointed alſo by the king.

Civil matters are all determined by the cazi, and eccleſiaſtical ones (particularly divorces) by the ſheick-el-ſelleum, or head of the faith; an officer anſwering to the muſti among the Turks; under him are the ſheick-el, ſelom, and cadi, who decide in all matters of religion, and make all contracts, teſtaments, and other public deeds, being appointed by the king in all the principal towns; and next to theſe are the pichnamas, or directors of the prayers; and the moullabs, or doctors of the law.

Juſtice is carried on in Perſia in a very ſummary manner; the ſentence, whatever it may be, being always put into execution on the ſpot. Theft is generally puniſhed with the loſs of noſe and ears; robbing on the road, by ripping up the belly of the criminal, in which ſituation he is expoſed upon a gibbet in one of the moſt public parts of the city, and there left until he expires in torment.

There is no nobility in Perſia, or any reſpect ſhown to a man on account of his family, except to thoſe who are of the blood of their great prophet or patriarchs; but every man is eſteemed according to the poſt he poſſeſſes; and when he is diſmiſſed, he loſes

his honour, and he is no longer distinguished from the vulgar

With respect to the forces of Persia, their two bodies, called the *Kortshies* and *Goulans*, that serve on horseback, are well kept and paid, and may amount, the former to about 22,000, and the latter to about 18,000. The Kortshies are descended from an ancient but foreign race; and the Goulans are either Georgian renegadoes or slaves, or the children of slaves of all nations. The infantry, called *Tangtchies*, are picked out from among the most robust and vigorous of the peasants, and compose a body of 40,000 or 50,000. The Persians have few fortified towns, and had no ships of war, till Kouli Khan built a royal navy, and among them had a man of war of 80 guns; but since the death of that usurper, we hear no more of their fleet.

The arms of the king of Persia are a lion couchant, looking at the sun as he rises over his back. His usual title is *Shaw* or *Patshaw*, the "disposer of kingdoms." They add also to the king's titles those of *sultan*, and *chan* or *cham*, which is the title of the Tartar sovereigns. To acts of state the Persian monarch does not subscribe his name; but the grant runs in this manner, viz. *This act, or edict, is given by him whom the universe obeys.*

The ancient Persians are known to have been exceedingly voluptuous and effeminate. After the conquest of the empire by Alexander, the Greek discipline and martial spirit being in part communicated to them, they became much more formidable; and hence the Parthians were found to be a match not only for the Syro-Macedonian princes, but even for the Romans. Of their manners we know little or nothing, but that to their valour and military skill they joined in a surprising degree all the luxury and dissipation of the ancient Persians.

The modern Persians, like the Turks, plundering all the adjacent nations for beauties to breed by, are men of a good stature, shape, and complexion; but the Gaures, or ancient Persians, are homely, ill-shaped, and clumsy, with a rough skin, and olive complexions. In some provinces, not only the complexions but the constitutions of the inhabitants, suffer greatly by the extreme heat and unwholesomeness of the air. The Persian women, too, are generally handsome and well-shaped, but much inferior to those of Georgia and Circassia. The men wear large turbans on their heads, some of them very rich, interwoven with gold and silver; a vest, girt with a sash; and over it a loose garment, something shorter; with sandals, or slippers, on their feet. When they ride, which they do every day, if it be but to a house in the same town, they wear pliant boots of yellow leather; the furniture of their horses is extremely rich, and the stirrups generally of silver: whether on horseback or on foot, they wear a broad sword and a dagger in their sash. The dress of the women does not differ much from that of the men; only their vests are longer, and they wear stiffened caps on their heads, and their hair down.

With respect to outward behaviour, says an intelligent traveller, "The Persians are certainly the Parisians of the East. Whilst a rude and insolent demeanor peculiarly marks the character of the Turkish nation towards foreigners and Christians, the behaviour of the Persians would, on the contrary, do honour to the most civilized nations: they are kind, courteous, civil, and obliging, to all strangers, without being guided by those religious prejudices so very prevalent in every other Mahometan nation; they are fond of inquiring after the manners and customs of Europe, and in return very readily afford any information in respect to their own country. The practice of hospitality is with them so grand a point, that a man thinks himself highly honoured if you will enter his house and partake of what the family affords; whereas, going out of a house without smoking a calean, or taking any other refreshment, is deemed in Persia a high affront." Persia.

Their usual drink is water and sherbet, as in other Mahometan countries, wine being prohibited; but of all Mahometan nations, they pay the least regard to this prohibition. Many of them drink wine publicly, and almost all of them in private (excepting those who have performed the pilgrimage to Mecca, and men of religion): they also are very liable to be quarrelsome when inebriated, which is often attended with fatal consequences. They eat opium, but in much less quantities than the Turks; and indeed in every thing they say or do, eat or drink, they make a point to be as different from this nation as possible, whom they detest to a man, beyond measure; esteeming Jews and Christians superior to them, and much nearer to salvation.

80 Anecdotes of their religion.

Every one knows, that the religion of the Persians is Mahometan; and that they are of the sect of Ali, for whom they entertain the most extravagant veneration. Mr Franeklin heard one of his guides on the road reprove another for the expression *O God! O Ali!* "No, no (said his zealous companion), *Ali first, God second!*" This attachment is the source of their hatred to the Turks, and of many strange customs among themselves, which we have not room to enumerate; a few, however, must be mentioned.

"Their mode of living is as follows: They always rise at daybreak, in order to perform their devotions. Their first prayer is denominated *numaz soobh*, or the morning prayer; it is said before sunrise, after which they eat a slight meal called *nàshta* or breakfast; this consists of grapes, or any other fruits of the season, with a little bread, and cheese made of goat's milk; they afterwards drink a cup of very strong coffee without milk or sugar; then the calean or pipe is introduced. The Persians, from the highest to the lowest ranks, all smoke tobacco.

"Their second hour of prayer is called *numaz zòhur*, or mid-day prayer, and is always repeated when the sun declines from the meridian. Their dinner, or *chàsht*, which is soon after this prayer, consists of curds, bread, and fruits of various kinds; animal food not being usual at this meal.

"The third hour of prayer is called *numaz àsur*, or the afternoon prayer, said about four o'clock.

"The fourth hour of prayer is *numaz shàm*, or evening prayer, which is said after sun set; when this is finished, the Persians eat their principal meal, called *shàmi* or supper. This generally consists of a pilau, dressed with rich meat sauces, and highly seasoned with various spices: sometimes they eat *kibcàb* or roast meat. When the meal is ready, a servant brings notice thereof, and at the same time presents a ewer and water; they

Perſia. they then waſh their hands, which is an invariable cuſtom with the Perſians both before and after eating. They eat very quick, conveying their food to their mouths with their fingers; the uſe of knives and forks being unknown in Perſia. Sherbets of different ſorts are introduced, and the meal concludes with a deſert of delicious fruits. The ſupper being finiſhed, the family ſit in a circle, and entertain each other by relating pleaſant ſtories (of which they are exceſſively fond), and alſo by repeating paſſages from the works of their moſt favourite poets, and amuſing themſelves at various kinds of games. The fifth and laſt prayer is ſtyled *numaz akhir*, the laſt prayer; or ſometimes *numaz ſhèb*, or the night prayer, repeated about an hour after ſupper."

81 Remarkable law reſpecting marriage. The moſt remarkable law among the Perſians reſpects marriage. A man may divorce his wife when he chooſes, without aſſigning any other reaſon for the divorce than that it is his pleaſure. If he ſhould change his mind, he may again marry her, divorce her a ſecond time, and a third time marry her; but here this privilege ſtops. No man is allowed to marry the woman whom he has thrice divorced. A widow is obliged to mourn four months for her deceaſed huſband before ſhe can be married to another; but a concubine may form a new connection the inſtant that her keeper expires.

82 Ceremony of naming their children. At the naming of children in Perſia, Mr Francklin informs us that the following ceremony is obſerved: "The third or fourth day after the child is born, the friends and relations of the woman who has lain-in aſſemble at her houſe, attended by muſic and dancing girls hired for the occaſion; after playing and dancing ſome time, a mullah or prieſt is introduced, who, taking the child in his arms, demands of the mother what name ſhe chooſes the infant ſhould be called by; being told, he begins praying, and after a ſhort time applies his mouth cloſe to the child's ear, and tells him diſtinctly three times (calling him by name) to remember and be obedient to his father and mother, to venerate his Koran and his prophet, to abſtain from thoſe things which are unlawful, and to practiſe thoſe things which are good and virtuous. Having repeated the Mahometan profeſſion of faith, he then redelivers the child to his mother; after which the company are entertained with ſweetmeats and other refreſhments, a part of which the females preſent always take care to carry away in their pockets, believing it to be the infallible means of their having offſpring themſelves."

83 Intellectual excellence. The Perſians excel more in poetry than any other ſort of literature; and aſtrologers are now in as great reputation in Perſia as the magi were formerly. Their books are all manuſcripts, the art of printing having not yet been introduced among them: they excel indeed in writing, and have eight different hands. They write from the right hand to the left, as the Arabs do. In their ſhort hand, they uſe the letters of the alphabet; and the ſame letters, differently pointed, will have 20 different ſignifications. In ſhort, the Perſians are born with as good natural parts as any people in the Eaſt, but make a bad uſe of them; being great diſſemblers, cheats, liars, and flatterers, and having a ſtrong propenſity to voluptuouſneſs, luxury, idleneſs, and indolence; vices indeed to which the Aſiatics in general are much addicted. Perſia || Perſimo

PERSIAN WHEEL. See HYDROSTATICS.

PERSICA, the PEACH, is by Linnæus referred to the ſame claſs and genus with amygdalus; however, as they are ſo commonly reckoned to be different genera, we have thought proper to diſtinguiſh them. There are a great variety of peach-trees planted in the gardens, ſome of which are preſerved only for the beauty of their flowers, but moſt of them for the ſake of the fruit. Of thoſe remarkable for the beauty of their flowers the principal are, 1. The vulgaris, or common peach-tree, with double flowers, which is a very great ornament in gardens, producing very large double flowers of a beautiful red or purple colour, and growing to a conſiderable ſize. 2. The humilis, or dwarf-almond. 3. The africana, or double-flowering dwarf-almond. Theſe two reach not above the height of three or four feet, though their flowers are of equal beauty with the former.

Of the peach-trees cultivated for the ſake of their fruit there are a great number, to deſcribe which particularly would exceed the proper bounds of this article. They are raiſed from the ſtones of the fruit, which ſhould be planted in autumn on a bed of light dry earth, about three inches deep and four inches aſunder. In the winter the beds ſhould be covered with mulch to protect them from the froſt. In this bed they ſhould remain for a year: when they are to be taken up and planted in a nurſery, where they are to remain one or two years; after which they muſt be removed to the places where they are to continue.

PERSICANA, in botany. See POLYGONUM.

PERSICUS SINUS, in anc. geogr. (Mela, Pliny); a part of the ſea which the Romans called *Mare Rubrum*, and the Greeks *Mare Erythræum*; waſhing Arabia Felix on the eaſt, between which and Carmania, entering into the land, it waſhes Perſis on the ſouth. Its large mouth conſiſts of ſtraight ſides, like a neck, and then the land retiring equally a vaſt way, and the ſea ſurrounding it in a large compaſs of ſhore, there is exhibited the figure of a human head (Mela). Theophraſtus calls this bay *Sinus Aralicus*, a name it equally claims with *Perſicus*, only for diſtinction ſake *Perſicus* is appropriated to it by others.

PERSIMON. See DIOSPYROS.—From the perſimon is made a very palatable liquor in the following manner: As ſoon as the fruit is ripe, a ſufficient quantity is gathered, which is very eaſy, as each tree is well ſtocked with them. Theſe perſimon apples are put into a dough of wheat or other flour, formed into cakes, and put into an oven, in which they continue till they are quite baked and ſufficiently dry, when they are taken out again: then, in order to brew the liquor, a pot full of water is put on the fire, and ſome of the cakes are put in: theſe become ſoft by degrees as the water grows warm, and crumble in pieces at laſt; the pot is then taken from the fire, and the water in it well ſtirred about, that the cakes may mix with it: this is then poured into another veſſel, and they continue to ſteep and break as many cakes as are neceſſary for a brewing: the malt is then infuſed, and they proceed as uſual with the brewing. Beer thus prepared is reckoned much preferable to other beer. They likewiſe

erfis, erſius. wiſe make brandy of this fruit in the following manner: having collected a ſufficient quantity of perſimons in autumn, they are altogether put into a veſſel, where they lie for a week till they are quite ſoft: then they pour water on them, and in that ſtate they are left to ferment of themſelves, without promoting the fermentation by any addition. The brandy is then made in the common way, and is ſaid to be very good, eſpecially if grapes (in particular of the ſweet ſort), which are wild in the woods, be mixed with the perſimon fruit. Some perſimons are ripe at the end of September, but moſt of them later, and ſome not before November and December, when the cold firſt overcomes their acrimony. The wood of this tree is very good for joiners-inſtruments, ſuch as planes, handles to chiſels, &c. but if after being cut down it lies expoſed to ſunſhine and rain, it is the firſt wood which rots, and in a year's time there is nothing left but what is uſeleſs. When the perſimon trees get once into a field, they are not eaſily got out of it again, as they ſpread ſo much.

PERSIS, a Roman lady, whom St Paul ſalutes in his epiſtle to the Romans (xvi. 12.), and whom he calls his beloved ſiſter. He ſays ſhe has laboured much for the Lord, and ſtill labours. Nothing elſe of her life is come to our knowledge, nor do we know that ſhe is honoured by any church; which is ſomething ſingular.

PERSIUS (Flaccus Aulus), a Latin poet in the reign of Nero, celebrated for his ſatires. He was born, according to ſome, at Volterra in Tuſcany; and according to others, at Tigulia, in the gulf Della Specia, in the year 34. He was educated till 12 years old at Volterra; and afterwards continued his ſtudies at Rome under Palæmon the grammarian, Virginius the rhetorician, and Cornutus the Stoic philoſopher, who contracted a friendſhip for him. Perſius conſulted that illuſtrious friend in the compoſition of his verſes. Lucian alſo ſtudied with him under Cornutus; and appeared ſo charmed with his verſes, that he was inceſſantly breaking out into acclamations at the beautiful paſſages in his ſatires: an example rarely ſeen in poets of equal rank. He was a ſteady friend, a good ſon, an affectionate brother and parent. He was chaſte, meek, and modeſt: which ſhows how wrong it is to judge of a man's morals by his writings; for the ſatires of Perſius are not only licentious, but ſharp and full of bitterneſs. He wrote but ſeldom; and it was ſome time before he applied himſelf regularly to it.

Perſius was of a weak conſtitution, and troubled with a bad ſtomach, which was the cauſe of his death in the 30th year of his age. Six of his ſatires remain; in their judgments of which the critics have been much divided, excepting as to their obſcurity, Perſius being indeed the moſt obſcure of all the Latin poets. As a poet, he is certainly inferior to Horace and Juvenal; and all the labours of Iſaac Caſaubon, who has written a moſt learned and elaborate commentary upon him, cannot make him equal to either of them as a ſatiriſt, though in virtue and learning he exceeded them both. He was a profeſſed imitator of Horace; yet had little of Horace's wit, eaſe, and talent at ridicule. His ſtyle is grand, figurative, poetical, and ſuitable to the dignity of the Stoic philoſophy: and hence he ſhines moſt in recommending virtue and integrity: here it is that ſatire becomes him. He was too grave to court the muſes with ſucceſs: but he had a great ſoul, ſuſceptible of noble ſentiments, which give a grace but to indifferent poetry. His cotemporaries thought highly of him. Quintilian allows, that Perſius, although he wrote but one book of ſatires, acquired a great deal of true glory, *Multum et veræ gloriæ quamvis uno libro Perſius meruit:* and Martial ſays much the ſame thing, *Sæpius in libro memoratur Perſius uno*, &c.

Perſon. PERSON, an individual ſubſtance of a rational intelligent nature. Thus we ſay, an ambaſſador repreſents the perſon of his prince; and that, in law, the father and ſon are reputed the ſame perſon.

The word *perſon*, *perſona*, is thought to be borrowed *a perſonando*, from perſonating or counterfeiting; and is ſuppoſed to have firſt ſignified a maſk: becauſe, as Boethius informs us, *in larva concava ſonus volvatur:* and hence the actors who appeared maſked on the ſtage were ſometimes called *larvati* and ſometimes *perſonati*. He likewiſe ſays, that as the ſeveral actors repreſented each a ſingle individual perſon, *viz.* Œdipus, or Chremes, or Hecuba, or Medea; for this reaſon, other people, who were at the ſame time diſtinguiſhed by ſomething in their form, character, &c. whereby they might be known, came likewiſe to be called by the Latins *perſonæ*, and by the Greeks προσωπα. Again, as actors rarely repreſented any but great and illuſtrious characters, the word came at length to import the mind, as being that whoſe diſpoſitions conſtitute the character. And thus men, angels, and even God himſelf, were called *perſons*. Things merely corporeal, as a ſtone, a plant, or a horſe, were called *hypoſtaſes* or *ſuppoſita*, but never *perſons*. Hence the learned ſuppoſe, that the ſame name *perſon* came to be uſed to ſignify ſome dignity, whereby a *perſon* is diſtinguiſhed from another; as a father, huſband, judge, magiſtrate, &c. In this ſenſe we are to underſtand that of Cicero: "Cæſar never ſpeaks of Pompey but in terms of honour and reſpect: he does many hard and injurious things, however, againſt his perſon."

Perſon we have already defined to mean an individual ſubſtance of a reaſonable nature. Now a thing may be individual two ways: 1. Logically, becauſe it cannot be predicated of any other; as Cicero, Plato, &c. 2. Phyſically; in which ſenſe a drop of water, ſeparated from the ocean, may be called an individual. Perſon is an individual nature in each of theſe ſenſes: logically, according to Boethius, becauſe *perſon* is not ſpoken of univerſals, but only of ſingulars and individuals; we do not ſay the *perſon* of an animal or a man, but of Cicero and Plato: and phyſically, ſince Socrates's hand or foot are never conſidered as perſons. This laſt kind of individual is denominated two ways: poſitively, when the perſon is ſaid to be the whole principle of acting; for to whatever thing action is attributed, that the philoſophers call a *perſon*: and negatively, as when we ſay, with the Thomiſts, &c. that a perſon conſiſts in this, that it does not exiſt in another as a more perfect being. Thus a man, though he conſiſts of two different things, *viz.* body and ſpirit, is not two perſons; becauſe neither part of itſelf is a complete principle of action, but one perſon, ſince the manner of his conſiſting of body and ſpirit is ſuch as conſtitutes one whole principle of action; nor does he exiſt in any other as a more perfect being; as, for

Perſon ‖ Perſonifying.

example, Socrates's foot does in Socrates, or a drop of water in the ocean.

PERSON, in grammar, a term applied to ſuch nouns or pronouns as, being either prefixed or underſtood, are the nominatives in all inflections of a verb; or it is the agent or patient in all finite or perſonal verbs. See GRAMMAR

PERSONAL, any thing that concerns, or is reſtrained to, the perſon: thus it is a maxim in ethics, that all faults are perſonal.

PERSONAL Action, in law, is an action levied directly and ſolely againſt the perſon; in oppoſition to a real or mixed action. See ACTION.

PERSONAL Goods, or *Chattels*, in law, ſignifies any moveable thing belonging to a perſon, whether alive or dead. See CHATTELS.

PERSONAL Identity. See METAPHYSICS, Part III. Chap. iii.

PERSONAL Verb, in grammar, a verb conjugated in all the three perſons; thus called in oppoſition to an imperſonal verb, or that which has the third perſon only.

PERSONALITY, in the ſchools, is that which conſtitutes an individual a diſtinct perſon.

PERSONATÆ, is the name of the 40th order in Linnæus's Fragments of a Natural Method, conſiſting of a number of plants whoſe flowers are furniſhed with an irregular gaping or grinning petal, which in figure ſomewhat reſembles the ſnout of an animal. The bulk of the genera of this natural order arrange themſelves under the claſs and order didynamia angioſpermia of the Sexual Method.

The reſt, although they cannot enter into the artificial claſs juſt mentioned, for want of the claſſic character, the inequality of the ſtamina; yet, in a natural method, which admits of greater latitude, may be arranged with thoſe plants which they reſemble in their habit and general appearance, and particularly in the circumſtances expreſſed in that title.

PERSONIFYING, or PERSONALIZING, the giving an inanimate being the figure, ſentiments, and language of a perſon.

Dr Blair, in his Lectures on Rhetoric, gives this account of perſonification. "It is a figure, the uſe of which is very extenſive, and its foundation laid deep in human nature. At firſt view, and when conſidered abſtractly, it would appear to be a figure of the utmoſt boldneſs, and to border on the extravagant and ridiculous. For what can ſeem more remote from the track of reaſonable thought, than to ſpeak of ſtones and trees, and fields and rivers, as if they were living creatures, and to attribute to them thought and ſenſation, affections and actions? One might imagine this to be no more than childiſh conceit, which no perſon of taſte could reliſh. In fact, however, the caſe is very different. No ſuch ridiculous effect is produced by perſonification when properly employed; on the contrary, it is found to be natural and agreeable, nor is any very uncommon degree of paſſion required in order to make us reliſh it. All poetry, even in its moſt gentle and humble forms, abounds with it. From proſe it is far from being excluded; nay, in common converſation, very frequent approaches are made to it. When we ſay, the ground *thirſts* for rain, or the earth *ſmiles* with plenty; when we ſpeak of ambition's being *reſtleſs*, or a diſeaſe being *deceitful*; ſuch expreſſions ſhow the facility with which the mind can accommodate the properties of living creatures to things that are inanimate, or to abſtract conceptions of its own forming. Perſonifying

"Indeed, it is very remarkable, that there is a wonderful proneneſs in human nature to animate all objects. Whether this ariſes from a ſort of aſſimilating principle, from a propenſion to ſpread a reſemblance of ourſelves over all other things, or from whatever other cauſe it ariſes, ſo it is, that almoſt every emotion which in the leaſt agitates the mind beſtows upon its object a momentary idea of life. Let a man, by an unwary ſtep, ſprain his ankle, or hurt his foot upon a ſtone, and in the ruffled diſcompoſed moment he will ſometimes feel himſelf diſpoſed to break the ſtone in pieces, or to utter paſſionate expreſſions againſt it, as if it had done him an injury. If one has been long accuſtomed to a certain ſet of objects, which have made a ſtrong impreſſion on his imagination; as to a houſe, where he has paſſed many agreeable years; or to fields, and trees, and mountains, among which he has often walked with the greateſt delight; when he is obliged to part with them, eſpecially if he has no proſpect of ever ſeeing them again, he can ſcarce avoid having ſomewhat of the ſame feeling as when he is leaving old friends. They ſeem endowed with life. They become objects of his affection; and, in the moment of his parting, it ſcarce ſeems abſurd to him to give vent to his feeling in words, and to take a formal adieu.

"So ſtrong is that impreſſion of life which is made upon us, by the more magnificent and ſtriking objects of nature eſpecially, that I doubt not in the leaſt of this having been one cauſe of the multiplication of divinities in the heathen world. The belief of dryads and naiads, of the genius of the wood and the god of the river, among men of lively imaginations, in the early ages of the world, eaſily aroſe from this turn of mind. When their favourite rural objects had often been animated in their fancy, it was an eaſy tranſition to attribute to them ſome real divinity, ſome unſeen power or genius which inhabited them, or in ſome peculiar manner belonged to them. Imagination was highly gratified, by thus gaining ſomewhat to reſt upon with more ſtability; and when belief coincided ſo much with imagination, very ſlight cauſes would be ſufficient to eſtabliſh it.

"From this deduction may be eaſily ſeen how it comes to paſs that perſonification makes ſo great a figure in all compoſitions where imagination or paſſion have any concern. On innumerable occaſions it is the very language of imagination and paſſion; and therefore deſerves to be attended to, and examined with peculiar care. There are three different degrees of this figure, which it is neceſſary to remark and diſtinguiſh, in order to determine the propriety of its uſe. The firſt is, when ſome of the properties or qualities of living creatures are aſcribed to inanimate objects; the ſecond, when thoſe inanimate objects are introduced as acting like ſuch as have life; and the third, when they are repreſented either as ſpeaking to us, or as liſtening to what we ſay to them."

The ingenious profeſſor goes on to inveſtigate the nature of perſonification at conſiderable length. We ſhall

Perſonifying.

ſhall give his caution for the uſe of it in proſe compoſitions, in which he informs us this figure requires to be uſed with great moderation and delicacy. "The ſame liberty is not allowed to the imagination there as in poetry. The ſame aſſiſtances cannot be obtained for raiſing paſſion to its proper height by the force of numbers and the glow of ſtyle. However, addreſſes to inanimate objects are not excluded from proſe; but have their place only in the higher ſpecies of oratory. A public ſpeaker may on ſome occaſions very properly addreſs religion or virtue; or his native country, or ſome city or province, which has ſuffered perhaps great calamities, or been the ſcene of ſome memorable action. But we muſt remember, that as ſuch addreſſes are among the higheſt efforts of eloquence, they ſhould never be attempted unleſs by perſons of more than ordinary genius: for if the orator fails in his deſign of moving our paſſions by them, he is ſure of being laughed at. Of all frigid things, the moſt frigid are the aukward and unſeaſonable attempts ſometimes made towards ſuch kinds of perſonification, eſpecially if they be long continued. We ſee the writer or ſpeaker toiling and labouring to expreſs the language of ſome paſſion which he neither feels himſelf nor can make us feel. We remain not only cold, but frozen; and are at full leiſure to criticiſe on the ridiculous figure which the perſonified object makes, when we ought to have been tranſported with a glow of enthuſiaſm. Some of the French writers, particularly Boſſuet and Fleehier, in their ſermons and funeral orations, have attempted and executed this figure not without warmth and dignity. Their works are exceedingly worthy of being conſulted for inſtances of this and of ſeveral other ornaments of ſtyle. Indeed the vivacity and ardour of the French genius is more ſuited to this bold ſpecies of oratory, than the more correct but leſs animated genius of the Britiſh, who in their proſe works very rarely attempt any of the high figures of eloquence."

Perſonifying.

PERSPECTIVE.

PERSPECTIVE is the art of drawing on a plane ſurface true reſemblances or pictures of objects, as the objects themſelves appear to the eye from any diſtance and ſituation, real or imaginary.

It was in the 16th century that *Perſpective* was revived, or rather reinvented. It owes its birth to painting, and particularly to that branch of it which was employed in the decorations of the theatre, where landſcapes were properly introduced, and which would have looked unnatural and horrid if the ſize of the objects had not been pretty nearly proportioned to their diſtance from the eye. We learn from Vitruvius, that Agatharchus, inſtructed by Æſchylus, was the firſt who wrote upon this ſubject; and that afterwards the principles of this art were more diſtinctly taught by Democritus and Anaxagoras, the diſciples of Agatharchus. Of the theory of this art, as deſcribed by them, we know nothing; ſince none of their writings have eſcaped the general wreck that was made of ancient literature in the dark ages of Europe. However, the revival of painting in Italy was accompanied with a revival of this art.

The firſt perſon who attempted to lay down the rules of perſpective was Pietro del Borgo, an Italian. He ſuppoſed objects to be placed beyond a tranſparent tablet, and endeavoured to trace the images which rays of light, emitted from them, would make upon it. But we do not know what ſucceſs he had in this attempt, becauſe the book which he wrote upon this ſubject is not now extant. It is, however, very much commended by the famous Egnazio Dante; and, upon the principles of Borgo, Albert Durer conſtructed a machine, by which he could trace the perſpective appearance of objects.

Balthazar Peruſſi ſtudied the writings of Borgo, and endeavoured to make them more intelligible. To him we owe the diſcovery of points of diſtance, to which all lines that make an angle of 45 degrees with the ground-line are drawn. A little time after, Guido Ulbaldi, another Italian, found that all the lines that are parallel to one another, if they be inclined to the ground-line, converge to ſome point in the horizontal line; and that through this point alſo, a line drawn from the eye, parallel to them, will paſs. Theſe principles put together enabled him to make out a pretty complete theory of perſpective.

Great improvements were made in the rules of perſpective by ſubſequent geometricians: particularly by profeſſor Graveſende, and ſtill more by Dr Brook Taylor, whoſe principles are in a great meaſure new, and far more general than any before him.

In order to underſtand the principles of perſpective, it will be proper to conſider the plane on which the repreſentation is to be made as tranſparent, and interpoſed between the eye of the ſpectator and the object to be repreſented. Thus, ſuppoſe a perſon at a window looks through an upright pane of glaſs at any object beyond it, and, keeping his head ſteady, draws the figure of the object upon the glaſs with a black lead pencil, as if the point of the pencil touched the object itſelf; he would then have a true repreſentation of the object in perſpective as it appears to his eye.

In order to this two things are neceſſary: firſt, that the glaſs be laid over with ſtrong gum-water, which, when dry, will be fit for drawing upon, and will retain the traces of the pencil; and, ſecondly, that he looks through a ſmall hole in a thin plate of metal, fixed about a foot from the glaſs, between it and his eye, and that he keeps his eye cloſe to the hole; otherwiſe he might ſhift the poſition of his head, and conſequently make a falſe delineation of the object.

Having traced out the figure of the object, he may go over it again with pen and ink; and when that is dry, put a ſheet of paper upon it, and trace it thereon with a pencil: then taking away the paper and laying it on a table, he may finiſh the picture by giving it the colours, lights, and ſhades, as he ſees them in the

the object itself; and then he will have a true reſemblance of the object.

To every perſon who has a general knowledge of the principles of optics, this muſt be ſelf-evident: For as viſion is occaſioned by pencils of rays coming in ſtraight lines to the eye from every point of the viſible object, it is plain that, by joining the points in the tranſparent plane, through which all thoſe pencils reſpectively paſs, an exact repreſentation muſt be formed of the object, as it appears to the eye in that particular poſition, and at that determined diſtance: and were pictures of things to be always firſt drawn on tranſparent planes, this ſimple operation, with the principle on which it is founded, would comprife the whole theory and practice of perſpective. As this, however, is far from being the caſe, rules muſt be deduced from the ſciences of optics and geometry for drawing repreſentations of viſible objects on opaque planes; and the application of theſe rules conſtitutes what is properly called the *art* of perſpective.

Previous to our laying down the fundamental principles of this art, it may not be improper to obſerve, that when a perſon ſtands right againſt the middle of one end of a long avenue or walk, which is ſtraight and equally broad throughout, the ſides thereof ſeem to approach nearer and nearer to each other as they are further and further from his eye; or the angles, under which their different parts are ſeen, become leſs and leſs according as the diſtance from his eye increaſes; and if the avenue be very long, the ſides of it at the fartheſt end will ſeem to meet: and there an object that would cover the whole breadth of the avenue, and be of a height equal to that breadth, would appear only to be a mere point. See OPTICS, n° 219, 220.

Having made theſe preliminary obſervations, we now proceed to the practice of perſpective, which is built upon the following

(Fundamental) THEOREM I.

Let *a b c d* (fig. 1. Plate CCCLXXXIII.) repreſent the ground-plan of the figure to be thrown into perſpective, and *e f g h* the tranſparent plane through which it is viewed by the eye at E. Let theſe planes interſect in the ſtraight line *k l*. Let B be any point in the ground plan, and B E a ſtraight line, the path of a ray of light from that point to the eye. This will paſs through the plane *e f g h* in ſome point *b*; or B will be ſeen through that point, and *b* will be the picture, image, or repreſentation of B.

If BA be drawn in the ground plan, making any angle BAK with the common interſection, and EV be drawn parallel to it, meeting the picture-plane or perſpective-plane in V, and VA be drawn, the point *b* is in the line VA ſo ſituated that BA is to EV as *b*A to *b*V.

For ſince EV and BA are parallel, the figure BA*b*VE*b*B is in one plane, cutting the perſpective-plane in the ſtraight line VA; the triangles BA*b*, EV*b*, are ſimilar, and BA : EV = *b*A : *b*V.

Cor. 1. If B be beyond the picture, its picture *b* is above the interſection *k b*; but if B be between the eye and the picture, as at B', its picture *b'* is below *k b*.

2. If two other parallel lines BA', ES, be drawn, and A', S, be joined, the picture of B is in the interſection of the lines AV and A'S.

3. The line BA is repreſented by *b*A, or *b*A is the picture of BA; and if AB be infinitely extended, it will be repreſented by AV. V is therefore called the *vaniſhing point* of the line AB.

4. All lines parallel to AB are repreſented by lines converging to V from the points where theſe lines interſect the perſpective plane; and therefore V is the vaniſhing point of all ſuch parallel lines.

5. The pictures of all lines parallel to the perſpective plane are parallel to the lines themſelves.

6. If through V be drawn HVD parallel to *k l*, the angle EVH is equal to BAK.

Remark. The propoſition now demonſtrated is not limited to any inclination of the picture-plane to the ground-plane; but it is uſual to conſider them as perpendicular to each other, and the ground-plane as horizontal. Hence the line *k l* is called the *ground line*, and OH the *horizon-line*; and VK, perpendicular to both, is called the *height of the eye*.

If ES be drawn perpendicular to the picture-plane, it will cut it in a point S of the horizon-line directly oppoſite to the eye. This is called the *point of ſight*, or *principal point*.

7. The pictures of all vertical lines are vertical, and the pictures of horizontal lines are horizontal, becauſe theſe lines are parallel to the perſpective plane.

8. The point of ſight S is the vaniſhing point of all lines perpendicular to the perſpective plane.

The above propoſition is a ſufficient foundation for the whole practice of perſpective, whether on direct or inclined pictures, and ſerves to ſuggeſt all the various practical conſtructions, each of which has advantages which ſuit particular purpoſes. Writers on the ſubject have either confined themſelves to one conſtruction, from an affectation of ſimplicity or fondneſs for ſyſtem; or have multiplied precepts, by giving every conſtruction for every example, in order to make a great book, and give the ſubject an appearance of importance and difficulty. An ingenious practitioner will avoid both extremes, and avail himſelf of the advantage of each conſtruction as it happens to ſuit his purpoſe. We ſhall now proceed to the practical rules, which require no conſideration of interſecting planes, and are all performed on the perſpective plane by means of certain ſubſtitutions for the place of the eye and the original figure. The general ſubſtitution is as follows:

Let the plane of the paper be firſt ſuppoſed to be the ground-plan, and the ſpectator to ſtand at F (fig 2.) Let it be propoſed that the ground-plan is to be repreſented on a plane ſurface, ſtanding perpendicularly on the line GKI of the plan, and that the point K is immediately oppoſite to the ſpectator, or that FK is perpendicular to GL: then FK is equal to the diſtance of the ſpectator's eye from the picture.

Now ſuppoſe a piece of paper laid on the plan with its ſtraight edge lying on the line GL; draw on this paper KS perpendicular to GL, and make it equal to the height of the eye above the ground-plan. This may be much greater than the height of a man, becauſe the ſpectator may be ſtanding on a place much raiſed above the ground-plan. Obſerve alſo that KS

muſt

muſt be meaſured on the ſame ſcale on which the ground plan and the diſtance FK were meaſured. Then draw HSO parallel to GL. This will be a horizontal line, and (when the picture is ſet upright on GL) will be on a level with the ſpectator's eye, and the point S will be directly oppoſite to his eye. It is therefore called the *principal point*, or *point of ſight*. The diſtance of his eye from this point will be equal to FK. Therefore make SP (in the line SK) equal to FK, and P is the projecting point or ſubſtitute for the place of the eye. It is ſometimes convenient to place P above S, ſometimes to one ſide of it on the horizontal line, and in various other ſituations; and writers, ignorant of, or inattentive to, the principles of the theory, have given it different denominations, ſuch as *point of diſtance*, *point of view*, &c. It is merely a ſubſtitute for the point E in fig. 1. and its moſt natural ſituation is below, as in this figure.

The art of perſpective is conveniently divided into ICHNOGRAPHY, which teaches how to make a perſpective draught of figures on a plane, commonly called the ground-plan; and SCENOGRAPHY, which teaches how to draw ſolid figures, or ſuch figures as are raiſed above this plan.

Fundamental PROB. I. *To put into perſpective any given point of the ground plan.*

Firſt general conſtruction.

Plate CLXXXIII. From B and P (fig. 2.) draw any two parallel lines BA, PV, cutting the ground-line and horizon-line in A and V, and draw BP, AV, cutting each other in *b*; *b* is the picture of B.

For it is evident that BA, PV, of this figure are analogous to BA and EV of fig. 1. and that BA : PV = *b*A : *b*V.

If BA' be drawn perpendicular to GL, PV will fall on PS, and need not be drawn. AV will be A'S. —This is the moſt eaſy conſtruction, and is nearly the ſame with Ferguſon's.

Second general conſtruction.

Draw two lines BA, BA", and two lines PV, PD, parallel to them, and draw AV, A"D, cutting each other in *b*: *b* is the picture of B by Cor. 2 —This conſtruction is the foundation of all the rules of perſpective that are to be found in the books on this ſubject. They appear in a variety of forms, owing to the ignorance or inattention of the authors to the principles. The rule moſt generally adhered to is as follows:

Draw BA (fig. 3.) perpendicular to the ground-line, and AS to the point of ſight, and ſet off Aβ equal to BA. Set off SD equal to the diſtance of the eye in the oppoſite direction from S that β is from A, where B and E of fig. 1. are on oppoſite ſides of the picture; otherwiſe ſet them the ſame way. D is called the point of diſtance Draw βD, cutting AS in B. This is evidently equivalent to drawing BA and PS perpendicular to the ground-line and horizon line, and Bβ and PD making an angle of 45° with theſe lines, with the additional puzzle about the way of ſetting off Aβ and SD, which is avoided in the conſtruction here given.

This uſual conſtruction, however, by a perpendicular and the point of diſtance, is extremely ſimple and convenient; and two points of diſtance, one on each ſide of S, ſerve for all points of the ground plan. But the firſt general conſtruction requires ſtill fewer lines, if BA be drawn perpendicular to GL, becauſe PV will then coincide with PS.

Third general conſtruction.

Draw BA from the given point B perpendicular to the ground line, and AS to the point of ſight From the point of diſtance D ſet off D*d* equal to BA, on the ſame or the contrary ſide as S, according as B is on the ſame or the contrary ſide of the picture as the eye. Join *d*, A, and draw D*b* parallel to *d*A. *b* is the picture of B. For SD, D*d*, are equal to the diſtances of the eye and given point from the picture, and SD : D*d* = *b*S : *b*A.

This conſtruction does not naturally ariſe from the original lines, but is a geometrical conſequence from their poſition and magnitude; and it is of all others the moſt generally convenient, as the perpendicular diſtances of any number of points may be arranged along SD without confuſion, and their direct ſituations transferred to the ground-line by perpendiculars ſuch as BA; and nothing is eaſier than drawing parallels, either by a parallel ruler or a bevel-ſquare, uſed by all who practiſe drawing.

PROB. 2. *To put any ſtraight line* BC (fig. 4.) *of the ground plan in perſpective.*

Find the pictures *b*, *c*, of its extreme points by any of the foregoing conſtructions, and join them by the ſtraight line *b c*.

Perhaps the following conſtruction will be found very generally convenient.

Produce CB till it meet the ground-line in A, and draw PV parallel to it, and AV, and PB. PC, cutting AV in *b*, *c*. V is its vaniſhing point, by Cor. 3. of the fundamental theorem.

It muſt be left to the experience and ſagacity of the drawer to ſelect ſuch conſtructions as are moſt ſuitable to the multiplicity of the figures to be drawn.

PROB 3. *To put any rectilineal figure of the ground-plan in perſpective.*

Put the bounding lines in perſpective, and the problem is ſolved.

The variety of conſtructions of this problem is very great, and it would fill a volume to give them all. The moſt generally convenient is to find the vaniſhing points of the bounding lines, and connect theſe with the points of their interſection with the ground-line. For example, to put the ſquare ABCD (fig. 5.) into perſpective.

Draw from the projecting point PV, PW, parallel to AB, BC, and let AB, BC, CD, DA, meet the ground-line in α, ×, β, δ, and draw αV, δV, ×W, βW, cutting each other in *a b c d*, the picture of the ſquare ABCD. The demonſtration is evident.

This conſtruction, however, runs the figure to great diſtances on each ſide of the middle line when any of the lines of the original figure are nearly parallel to the ground-line.

The following conſtruction (fig. 6.) avoids this inconvenience.

Let D be the point of diſtance. Draw the perpendiculars Aα, Bβ, Cγ Dδ, and the lines A*e*, B*f*, C*g*, D*h*, parallel to PD. Draw Sα, Sβ, Sγ, Sδ, and D*e*, D*f*, D*g*, D*h*, cutting the former in *a*, *b*, *c*, *d*, the angles of the picture.

It is not neceſſary that D be the point of diſtance, only the lines A*e*, B*f*, &c. muſt be parallel to PD.

Remark.

Remark. In all the foregoing conſtructions the neceſſary lines (and even the finiſhed picture) are frequently confounded with the original figure. To avoid this great inconvenience, the writers on perſpective direct us to tranſpoſe the figure; that is, to transfer it to the other ſide of the ground line, by producing the perpendiculars $A\alpha$, $B\beta$, $C\gamma$, $D\delta$, till $\alpha A'$, $\beta B'$, &c. are reſpectively equal to $A\alpha$, $B\beta$, &c.; or, inſtead of the original figure, to uſe only its tranſpoſed ſubſtitute $A'B'C'D'$. This is an extremely proper method. But in this caſe the point P must alſo be tranſpoſed to P′ above S, in order to retain the firſt or moſt natural and ſimple conſtruction, as in fig. 7.; Plate CCCLXXXIII where it is evident, that when $BA=AB'$, and $SP=SP'$, and $B'P'$ is drawn, cutting AS in b, we have $bA : bS = BA : P'S, = BA : PS$, and b is the picture of B: whence follows the truth of all the ſubſequent conſtructions with the tranſpoſed figure.

PROB. 4. *To put any curvilineal figure to the ground-plan into perſpective.*

Put a ſufficient number of its points in perſpective by the foregoing rules, and draw a curve line through them.

It is well known that the conic ſections and ſome other curves, when viewed obliquely, are conic ſections or curves of the ſame kinds with the originals, with different poſitions and proportions of their principal lines, and rules may be given for deſcribing their pictures founded on this property. But theſe rules are very various, unconnected with the general theory of perſpective, and more tedious in the execution, without being more accurate than the general rule now given. It would be a uſeleſs affectation to inſert them in this elementary treatiſe.

We come in the next place to the delineation of figures not in a horizontal plane, and of ſolid figures. For this purpoſe it is neceſſary to demonſtrate the following

THEOREM II.

The length of any vertical line ſtanding on the ground plane is to that of its picture as the height of the eye to the diſtance of the horizon line from the picture of its foot.

Let BC be the vertical line ſtanding on B, and let EF be a vertical line through the eye. Make BD equal to EF, and draw DE, CE, BE. It is evident that DE will cut the horizon line in ſome point d, CE will cut the picture plane in e, and BE will cut it in b, and that $b\,c$ will be the picture of BC, and is vertical, and that BC is to $b\,c$ as BD to $b\,d$, or as EF to $b\,d$.

Cor. The picture of a vertical line is divided in the ſame ratio as the line itſelf. For $BC : BM = b\,c : b\,m$.

PROB. 5. *To put a vertical line of a given length in perſpective ſtanding on a given point of the picture.*

Through the given point b (Fig. 8.) of the picture, draw $S\,b\,A$ from the point of ſight, and draw the vertical line AD, and make AE equal to the length or height of the given line. Join ES, and draw $b\,c$ parallel to AD, producing $b\,c$, when neceſſary, till it cut the horizontal line in d, and we have $b\,c : b\,d, = AD : AE$, that is, as the length of the given line to the height of the eye, and $b\,d$ is the diſtance of the horizon-line from the point b, which is the picture of the foot of the line. Therefore (Theor. 2.) $b\,c$ is the required picture of the vertical line.

This problem occurs frequently in views of architecture; and a compendious method of ſolving it would be peculiarly convenient. For this purpoſe, draw a vertical line XZ at the margin of the picture, or on a ſeparate paper, and through any point Y of the horizon-line draw VX. Set off XY, the height of the vertical line, and draw VY. Then from any points b, r, on which it is required to have the pictures of lines equal to XY, draw $b\,S$, $r\,t$, parallel to the horizon line, and draw the verticals $S\alpha$, $t\upsilon$: theſe have the lengths required, which may be transferred to b and r. This, with the third general conſtruction for the baſe points, will ſave all the confuſion of lines which would ariſe from conſtructing each line apart.

PROB. 6. *To put any ſloping line in perſpective.*

From the extremities of this line, ſuppoſe perpendiculars making the ground plane in two points, which we ſhall call the baſe points of the ſloping line. Put theſe baſe points in perſpective, and draw, by laſt problem, the perpendiculars from the extremities. Join theſe by a ſtraight line. It will be the picture required.

PROB. 7. *To put a ſquare in perſpective, as ſeen by a perſon not ſtanding right againſt the middle of either of its ſides, but rather nearly even with one of its corners.*

In fig. 9. let ABCD be a true ſquare, viewed by an obſerver, not ſtanding at o, directly againſt the middle of its ſide AD, but at O almoſt even with its corner D, and viewing the ſide AD under the angle AOD; the angle $A\,o\,D$ (under which he would have ſeen AD from o) being 60 degrees.

Make AD in fig. 10. equal to AD in fig. 9. and draw SP and OO parallel to AD. Then, in fig. 10. let O be the place of the obſerver's eye, and SO be perpendicular to SP; then S ſhall be the point of ſight in the horizon SP.

Take SO in your compaſſes, and ſet that extent from S to P: then P ſhall be the true point of diſtance, taken according to the foregoing rules.

From A and D draw the ſtraight lines AS and DS; draw alſo the ſtraight line AP, interſecting DS in C.

Laſtly, to the point of interſection C draw BC parallel to AD; and ABCD in fig. 10. will be a true perſpective repreſentation of the ſquare ABCD in fig. 9. The point M is the centre of each ſquare, and AMC and BMD are the diagonals.

PROB. 8. *To put a reticulated ſquare in perſpective, as ſeen by a perſon ſtanding oppoſite to the middle of one of its ſides.*

A reticulated ſquare is one that is divided into ſeveral little ſquares, like net-work, as fig. 11. each ſide of which is divided into four equal parts, and the whole ſurface into four times four (or 16) equal ſquares.

Having divided this ſquare into the given number of leſſer ſquares, draw the two diagonals $A\,x\,C$ and $B\,x\,D$.

Make AD in fig. 12. equal to AD in fig. 11. and divide it into four equal parts, as $A\,e$, $e\,g$, $g\,i$, and $i\,D$.

Draw $S\varepsilon'$ for the horizon, parallel to AD, and, through

through the middle point *g* of AD, draw OS perpendicular to AD and SP.—Make S the point of ſight, and O the place of the obſerver's eye.

Take SP equal to SO, and P ſhall be the true point of diſtance.—Draw AS and DS to the point of ſight, and AP to the point of diſtance, interſecting DS in C: then draw BC parallel to AD, and the outlines of the reticulated ſquare ABCD will be finiſhed.

From the diviſion-points *e*, *g*, *i*, draw the ſtraight lines *e f*, *g h*, *i k*, tending towards the point of ſight S; and draw BD for one of the diagonals of the ſquare, the other diagonal AC being already drawn.

Through the points *r* and *s*, where theſe diagonals cut *e f* and *i k*, draw *l m* parallel to AD. Through the centre-point *x*, where the diagonals cut *g h*, draw *n o* parallel to AD.—Laſtly, through the points *v* and *w*, where the diagonals cut *e f* and *i k*, draw *p q* parallel to AD; and the reticulated perſpective ſquare will be finiſhed.

This ſquare is truly repreſented, as if ſeen by an obſerver ſtanding at O, and having his eye above the horizontal plane ABCD on which it is drawn; as if OS was the height of his eye above that plane: and the lines which form the ſmall ſquares within it have the ſame letters of reference with thoſe in fig. 11. which is drawn as it would appear to an eye placed perpendicularly above its centre *x*.

Prob. 9. *To put a circle in perſpective.*

If a circle be viewed by an eye placed directly over its centre, it appears perfectly round, but if it be obliquely viewed, it appears of an elliptical ſhape. This is plain by looking at a common wine-glaſs ſet upright on a table.

Make a true reticulated ſquare, as fig. 11. Plate CCCLXXXIII. of the ſame diameter as you would have the circle; and ſetting one foot of your compaſſes in the centre *x*, deſcribe as large a circle as the ſides of the ſquare will contain. Then, having put this reticulated ſquare into perſpective, as in fig. 12. obſerve through what points of the croſs lines and diagonals of fig. 11. the circle paſſes; and through the like points in fig. 12. draw the ellipſis, which will be as true a perſpective repreſentation of the circle, as the ſquare in fig. 12. is of the ſquare in fig. 11.

This is Mr Ferguſon's rule for putting a circle in perſpective; but the following rules by *Wolf* are perhaps more univerſal.

If the circle to be put in perſpective be ſmall, deſcribe a ſquare about it. Draw firſt the diagonals of the ſquare, and then the diameters *b a* and *d g* (fig. 1. Plate CCCLXXXIV.) cutting one another at right angles; draw the ſtraight lines *f g* and *b c* parallel to the diameter *d e*. Through *b* and *f* and likewiſe *c* and *g* draw ſtraight lines meeting DE, the ground line of the picture in the points 3 and 4. To the principal point V draw the ſtraight lines 1 V, 3 V, 4 V, 2 V, and to the points of diſtance L and K, 2 L and 1 K. Laſtly, join the points of interſection *a*, *b*, *d*, *f*, *h*, *g*, *e*, *c*, by the arcs *a b*, *b d*, *d f*, and *a b d f h g e c a* will be the circle in perſpective.

If the circle be large ſo as to make the foregoing practice inconvenient, biſect the ground line AB, deſcribing, from the point of biſection as a centre, the ſemicircle AGB (fig. 2. Plate CCCLXXXIV.), and from any number of points in the circumference C, F, G, H, I, &c. draw to the ground line the perpendiculars C 1, F 2, G 3, H 4, I 5, &c.: From the points A, 1, 2, 3, 4, 5, B, draw ſtraight lines to the principal point or point of ſight V, likewiſe ſtraight lines from B and A to the points of diſtance L and K. Through the common interſections draw ſtraight lines as in the preceding caſe; and you will have the points *a*, *c*, *f*, *g*, *h*, *i*, *b*, repreſentatives of A, C, F, G, H, I, B. Then join the points *a*, *c*, *f*, &c. as formerly directed, and you have the perſpective circle *a c f g h i b i h g f c a*.

Hence it is apparent how we may put not only a circle but alſo a pavement laid with ſtones of any form in perſpective. It is likewiſe apparent how uſeful the ſquare is in perſpective; for, as in the ſecond caſe, a true ſquare was deſcribed round the circle to be put in perſpective, and divided into ſeveral ſmaller ſquares, ſo in this third caſe we make uſe of the ſemicircle only for the ſake of brevity inſtead of that ſquare and circle.

Prob. 10. *To put a reticulated ſquare in perſpective, as ſeen by a perſon not ſtanding right againſt the middle of either of its ſides, but rather nearly even with one of its corners.*

In fig. 13. Plate CCCLXXXIII, let O be the place of an obſerver, viewing the ſquare ABCD almoſt even with its corner D.—Draw at pleaſure SP for the horizon, parallel to AD, and make SO perpendicular to SP: then S ſhall be the point of ſight, and P the true point of diſtance, if SP be made equal to SO.

Draw AS and DS to the point of ſight, and AP to the point of diſtance, interſecting DS in the point C; then draw BC parallel to AD, and the outlines of the perſpective ſquare will be finiſhed. This done, draw the lines which form the leſſer ſquares, as taught in *Prob.* 8. and the work will be completed.—You may put a perſpective circle in this ſquare by the ſame rule as it was done in fig. 12.

Prob. 14. *To put a cube in perſpective, as if viewed by a perſon ſtanding almoſt even with one of its edges, and ſeeing three of its ſides.*

In fig. 16. Plate CCCLXXXIII. let AB be the breadth of either of the ſix equal ſquare ſides of the cube AG; O the place of the obſerver, almoſt even with the edge CD of the cube, S the point of ſight, SP the horizon parallel to AD, and P the point of diſtance taken as before.

Make ABCD a true ſquare; draw BS and CS to the point of ſight, and BP to the point of diſtance, interſecting CS in G.—Then draw FG parallel to BC, and the uppermoſt perſpective ſquare ſide BFGC of the cube will be finiſhed.

Draw DS to the point of ſight, and AP to the point of diſtance, interſecting DS in the point I: then draw GI parallel to CD; and, if the cube be an opaque one, as of wood or metal, all the outlines of it will be finiſhed; and then it may be ſhaded as in the figure.

But if you want a perſpective view of a tranſparent glaſs cube, all the ſides of which will be ſeen, draw AH toward the point of ſight, FH parallel to BA, and HI parallel to AD: then AHID will be the ſquare baſe of the cube, perſpectively parallel to the top BFGC; ABFH will be the ſquare ſide of the cube, parallel to CGID, and FGIH will be the ſquare ſide parallel to ABCD.

As to the ſhading part of the work, it is ſuch mere childrens play, in compariſon of drawing the lines

which form the ſhape of any object, that no rules need be given for it. Let a perſon ſit with his left ſide toward a window, and he knows full well, that if any ſolid body be placed on a table before him, the light will fall on the left-hand ſide of the body, and the right-hand ſide will be in the ſhade.

Prob. 15. *To put any ſolid in perſpective.*

Put the baſe of the ſolid, whatever it be, in perſpective by the preceding rules. From each bounding point of the baſe, raiſe lines repreſenting in perſpective the altitude of the object; by joining theſe lines and ſhading the figure according to the directions in the preceding problem, you will have a ſcenographic repreſentation of the object. This rule is general; but as its application to particular caſes may not be apparent, it will be proper to give the following example of it.

Prob. 16. *To put a cube in perſpective as ſeen from one of its angles.*

Since the baſe of a cube ſtanding on a geometrical plane, and ſeen from one of its angles, is a ſquare ſeen from one of its angles, draw firſt ſuch a perſpective ſquare: then raiſe from any point of the ground-line DE (Fig. 3. Plate CCCLXXXIV.) the perpendicular HI equal to the ſide of the ſquare, and draw to any point V in the horizontal line HR the ſtraight lines VI and VH. From the angles *d b* and *c* draw the dotted lines *d* 2 and *c* 1 parallel to the ground line DE. Perpendicular to theſe dotted lines, and from the points 1 and 2, draw the ſtraight lines L 1 and M 2. Laſtly, ſince HI is the altitude of the intended cube in *a*, L 1 in *c* and *b*, M 2 in *d*, draw from the point *a* the ſtraight line *f a* perpendicular to *a* E, and from the points *b* and *c*, *b g* and *c e*, perpendicular to *b c* 1, and *a b d c* being according to rule, make *a f* = HI, *b g* = *c e* = L 1, and *b d* = M 2. Then, if the points *g*, *h*, *e*, *f*, be joined, the whole cube will be in perſpective.

Prob. 17. *To put a ſquare pyramid in perſpective, as ſtanding upright on its baſe, and viewed obliquely.*

In fig. 4. n° 1. of Plate CCCLXXXIV. let AD be the breadth of either of the four ſides of the pyramid ATCD at its baſe ABCD; and MT its perpendicular height. Let O be the place of the obſerver, S his point of ſight, SE his horizon, parallel to AD and perpendicular to OS; and let the proper point of diſtance be taken in SE produced toward the left hand, as far from S as O is from S.

Draw AS and DS to the point of ſight, and DL to the point of diſtance, interſecting AS in the point B. Then, from B, draw BC parallel to AD; and ABCD ſhall be the perſpective ſquare baſe of the pyramid.

Draw the diagonal AC, interſecting the other diagonal BD at M, and this point of interſection ſhall be the centre of the ſquare baſe.

Draw MT perpendicular to AD, and of a length equal to the intended height of the pyramid: then draw the ſtraight outlines A T, CT, and DT; and the outlines of the pyramid (as viewed from O) will be finiſhed; which being done, the whole may be ſo ſhaded as to give it the appearance of a ſolid body.

If the obſerver had ſtood at *o*, he could have only ſeen the ſide ATD of the pyramid; and two is the greateſt number of ſides that he could ſee from any other place of the ground. But if he were at any height above the pyramid, and had his eye directly over its top, it would then appear as in N° 2. and he would ſee all its four ſides E, F, G, H, with its top *t* juſt over the centre of its ſquare baſe ABCD; which would be a true geometrical and not a perſpective ſquare.

Prob. 18. *To put two equal ſquares in perſpective, one of which ſhall be directly over the other, at any given diſtance from it, and both of them parallel to the plane of the horizon.*

In fig. 5. Plate CCCLXXXIV. let ABCD be a perſpective ſquare on a horizontal plane, drawn according to the foregoing rules, S being the point of ſight, SP the horizon (parallel to AD), and P the point of diſtance.

Suppoſe AD, the breadth of this ſquare, to be three feet; and that it is required to place juſt ſuch another ſquare EFGH directly above it, parallel to it and two feet from it.

Make AE and DH perpendicular to AD, and two thirds of its length: draw EH, which will be equal and parallel to AD; then draw ES and HS to the point of ſight S, and EP to the point of diſtance P, interſecting HS in the point G: this done, draw FG parallel to EH; and you will have two perſpective ſquares ABCD and EFGH, equal and parallel to one another, the latter directly above the former, and two feet diſtant from it; as was required.

By this method ſhelves may be drawn parallel to one another, at any diſtance from each other in proportion to their length.

Prob. 19. *To put a truncated pyramid in perſpective.*

Let the pyramid to be put in perſpective be quinquangular. If from each angle of the ſurface whence the top is cut off, a perpendicular be ſuppoſed to fall upon the baſe, theſe perpendiculars will mark the bounding points of a pentagon, of which the ſides will be parallel to the ſides of the baſe of the pyramid within which it is inſcribed. Join theſe points, and the interior pentagon will be formed with its longeſt ſide parallel to the longeſt ſide of the baſe of the pyramid. From the ground-line EH (Fig. 6. Plate CCCLXXXIV.) raiſe the perdendicular IH, and make it equal to the altitude of the intended pyramid. To any point V draw the ſtraight lines IV and HV, and by a proceſs ſimilar to that in Problem 16. determine the ſcenographical altitudes *a*, *b*, *c*, *d*, *e*. Connect the upper points *f*, *g*, *h*, *i*, *k*, by ſtraight lines; and draw *l k*, *f m*, *g n*, and the perſpective of the truncated pyramid will be completed.

Cor. If in a geometrical plane two concentric circles be deſcribed, a truncated cone may be put in perſpective in the ſame manner as a truncated pyramid.

Prob. 20. *To put in perſpective a hollow priſm lying on one of its ſides.*

Let ABDEC (fig. 7. n° 1.) be a ſection of ſuch a priſm. Draw HI parallel to AB, and diſtant from it the breadth of the ſide on which the priſm reſts; and from each angle internal and external of the priſm let fall perpendiculars to HI. The parallelogram will be thus divided by the ichnographical proceſs below the ground-line, ſo as that the ſide AB of the real priſm will be parallel to the correſponding ſide of the ſcenographic view of it.—To determine the altitude of the internal and external angles. From H (n° 2.) raiſe HI perpendicular to the ground-line, and on it

mark

mark off the true altitudes H 1, H 2, H 3, H 4, and H 5. Then if from any point V in the horizon be drawn the ſtraight lines VH, V 1, V 2, V 3, V 4, V 5 or VI; by a proceſs ſimilar to that of the preceding problem, will be determined the height of the internal angles, viz. $1=a\,a$, $2=b\,b$, $4=d\,d$; and of the external angles, $3=c\,c$, and $5=e\,e$; and when theſe angles are formed and put in their proper places, the ſcenograph of the priſm is complete.

PROB. 21. *To put a ſquare table in perſpective, ſtanding on four upright ſquare legs of any given length with reſpect to the breadth of the table.*

In fig. 5. Plate CCCLXXXIV. let ABCD be the ſquare part of the floor on which the table is to ſtand, and EFGH the ſurface of the ſquare table, parallel to the floor.

Suppoſe the table to be three feet in breadth, and its height from the floor to be two feet; then two thirds of AD or EH will be the length of the legs *i* and *k*; the other two (*l* and *m*) being of the ſame length in perſpective.

Having drawn the two equal and parallel ſquares ABCD and EFGH, as ſhown in Prob. 10. let the legs be ſquare in form, and fixed into the table at a diſtance from its edges equal to their thickneſs. Take A *a* and D *d* equal to the intended thickneſs of the legs, and *a b* and *d c* alſo equal thereto. Draw the diagonals AC and BD, and draw ſtraight lines from the points *a*, *b*, *c*, *d*, towards the points of ſight S, and terminating at the ſide BC. Then, through the points where theſe lines cut the diagonals, draw the ſtraight lines *n* and *o*, *p* and *q*, parallel to AD; and you will have formed four perſpective ſquares (like ABCD in fig. 4. n° 1.) for the baſes of the four legs of the table: and then it is eaſy to draw the four upright legs by parallel lines, all perpendicular to AD; and to ſhade them as in the figure.

To repreſent the intended thickneſs of the table-board, draw *e h* parallel to EH, and HG toward the point of ſight S: then ſhade the ſpaces between theſe lines, and the perſpective figure of the table will be finiſhed.

PROB. 22. *To put five ſquare pyramids in perſpective, ſtanding upright on a ſquare pavement compoſed of the ſurfaces of* 81 *cubes.*

In fig. 8. Plate CCCLXXXIV. let ABCD be a perſpective ſquare drawn according to the foregoing rules; S the point of ſight, P the point of diſtance in the horizon PS, and AC and BD the two diagonals of the ſquare.

Divide the ſide AD into 9 equal parts (becauſe 9 times 9 is 81) as A *a*, *a b*, *b c*, &c. and from theſe points of diviſion, *a*, *b*, *c*, *d*, &c. draw lines toward the point of ſight S, terminating at the furthermoſt ſide BC of the ſquare. Then, through the points where theſe lines cut the diagonals, draw ſtraight lines parallel to AD, and the perſpective ſquare ABCD will be ſubdivided into 81 leſſer ſquares, repreſenting the upper ſurfaces of 81 cubes, laid cloſe to one another's ſides in a ſquare form.

Draw AK and DL, each equal to A *a*, and perpendicular to AD; and draw LN toward the point of ſight S: then draw KL parallel to AD, and its diſtance from AD will be equal to A *a*.—This done, draw *a l*, *b m*, *c n*, *d o*, *e p*, *f q*, *g r*, and *h s*, all parallel to AK; and the ſpace ADLK will be ſubdivided into nine equal ſquares, which are the outer upright ſurfaces of the nine cubes in the ſide AD of the ſquare ABCD.

Draw LN toward the point of ſight S; and from the points where the lines, which are parallel to AD in this ſquare meet the ſide CD thereof, draw ſhort lines to LN, all parallel to DL, and they will divide that ſide into the outer upright ſurfaces of the nine cubes which compoſe it: and then the outſides of all the cubes that can be viſible to an obſerver, placed at a proper diſtance from the corner D of the ſquare, will be finiſhed.

As taught in Prob. 17. place the pyramid AE upright on its ſquare baſe A *t v a*, making it as high as you pleaſe; and the pyramid DH on its ſquare baſe *h u w* D, of equal height with AE.

Draw EH from the top of one of theſe pyramids to the top of the other; and EH will be parallel to AD.

Draw ES and HS to the point of ſight S, and HP to the point of diſtance P, interſecting ES in F.

From the point F, draw FG parallel to EH: then draw EG, and you will have a perſpective ſquare EFGH (parallel to ABCD) with its two diagonals EG and FH, interſecting one another in the centre of the ſquare at I. The four corners of this ſquare, E, F, G, H, give the perſpective heights of the four pyramids AE, BF, CG, and DH; and the interſection I of the diagonals gives the height of the pyramid MI, the centre of whoſe baſe is the centre of the perſpective ſquare ABCD.

Laſtly, place the three pyramids BF, CG, MI, upright on their reſpective baſes at B, C, and M; and the required perſpective repreſentation will be finiſhed, as in the figure.

PROB. 23. *To put upright pyramids in perſpective, on the ſides of an oblong ſquare or parallelogram; ſo that their diſtances from one another ſhall be equal to the breadth of the parallelogram.*

In moſt of the foregoing operations we have conſidered the obſerver to be ſo placed, as to have an oblique view of the perſpective objects: in this, we ſhall ſuppoſe him to have a direct view of fig. 8. Plate CCCLXXXIV. that is, ſtanding right againſt the middle of the end AD which is neareſt to his eye, and viewing AD under an angle of 60 degrees.

Having cut AD in the middle, by the perpendicular line S *s*, take S therein at pleaſure for the point of ſight, and draw ES for the horizon, parallel to AD.—Here S *s* muſt be ſuppoſed to be produced downward, below the limits of the plate, to the place of the obſerver; and SE to be produced towards the left hand beyond E, far enough to take a proper point of diſtance therein, according to the foregoing rules.

Take A *d* at pleaſure, and D *g* equal to A *d*, for the breadths of the ſquare baſes of the two pyramids AE and DF next the eye: then draw AS and *d* S, and likewiſe DS and *g* S, to the point of ſight S; and DG on to the point of diſtance, interſecting AS in G: then, from G draw GI parallel to AD, and you will have the firſt perſpective ſquare AGID of the parallelogram ABCD.

From I draw IH to (or toward) the point of diſtance, interſecting AS in H: then, from H draw

HK parallel to AD, and you will have the ſecond perſpective ſquare GHK I of the parallelogram.—Go on in this manner till you have drawn as many perſpective ſquares up toward S as you pleaſe.

Through the point *e*, where DG interſects *g* S, draw *b f* parallel to AD; and you will have formed the two perſpective ſquare baſes A *b c d* and *e f* D *g* of the two pyramids at A and D.

From the point *f* (the upper outward corner of *e f* D *g*) draw *f h* toward the point of diſtance, till it meets AS in *h*; then, from this point of meeting, draw *h m* parallel to GI, and you will have formed the two perſpective ſquares G *h i k* and *l m* I *n*, for the ſquare baſes of the two pyramids at G and I.

Proceed in the ſame manner to find the baſes of all the other pyramids, at the corners of the reſt of the perſpective ſquares in the parallelogram ABCD, as ſhown by the figure.—Then,

Having placed the firſt two pyramids at A and D upright on their ſquare baſes, as ſhown in Prob 9. and made them of any equal heights at pleaſure, draw ES and FS from the tops of theſe pyramids to the point of ſight S: place all the reſt of the pyramids upright on their reſpective baſes, making their tops touch the ſtraight lines ES and FS; and all the work, except the ſhading part, will be finiſhed.

Prob. 24 *To put a ſquare pyramid of equal ſized cubes in perſpective.*

Fig. 2. Plate CCCLXXXV. repreſents a pyramid of this kind; conſiſting as it were of ſquare tables of cubes, one table above another; 81 in the loweſt, 49 in the next, 25 in the third, 9 in the fourth, and 1 in the fifth or uppermoſt. Theſe are the ſquare numbers of 9, 7, 5, 3, and 1.

If the artiſt is already maſter of all the preceding operations, he will find leſs difficulty in this than in attending to the following deſcription of it: for it cannot be deſcribed in a few words, but may be executed in a very ſhort time.

In fig. 1. having drawn PS for the horizon, and taken S for the point of ſight therein (the obſerver being at O) draw AD parallel to PS for the ſide (next the eye) of the firſt or lowermoſt table of cubes. Draw AS and DS to the point of ſight S, and DP to the point of diſtance P, interſecting AS in the point B. Then, from B, draw BC parallel to AD, and you will have the ſurface ABCD of the firſt table.

Divide AD into nine equal parts, as A *a*, *a b*, *b c*, *c d*, &c. then make AK and DL equal to A *a*, and perpendicular to AD. Draw KL parallel to AD, and from the points of equal diviſion at *a*, *b*, *c*, &c. draw lines to KL, all parallel to AK. Then draw *b* S to the point of ſight S, and from the diviſion-points *a*, *b*, *c*, &c. draw lines with a black lead pencil, all tending towards the point of ſight, till they meet the diagonal BD of the ſquare.

From theſe points of meeting draw black lead lines to DC, all parallel to AD; then draw the parts of theſe lines with black ink which are marked 1, 2, 3, 4, &c. between *b* E and DC.

Having drawn the firſt of theſe lines *β q* with black ink, draw the parts *a i*, *b k*, *c l*, &c. (of the former lines which met the diagonal BD) with black ink alſo; and rub out the reſt of the black lead lines, which would otherwiſe confuſe the following part of the work. Then, draw LF toward the point of ſight S; and, from the points where the lines 1, 2, 3, 4, &c. meet the line DC, draw lines down to LF, all parallel to DL; and all the viſible lines between the cubes in the firſt table will be finiſhed.

Make *i* G equal and perpendicular to *β i*, and *q* M equal and parallel to *i* G: then draw GM, which will be equal and parallel to *i q*. From the points *k l*, *m n*, &c. draw *k n*, *l o*, *m p*, &c. all parallel to *i* G, and the outſides of the ſeven cubes in the ſide G *q* of the ſecond table will be finiſhed.

Draw GS and MS to the point of ſight S, and MP to the point of diſtance P, interſecting GS in H; then, from the point of interſection H, draw HI parallel to AD; and you will have the ſurface GHIM of the ſecond table of cubes.

From the points *n*, *o*, *p*, *q*, &c. draw black lead lines toward the point of ſight S, till they meet the diagonal MH of the perſpective ſquare ſurface GHIM; and draw *s* M, with black ink, toward the point of ſight.

From thoſe points where the lines drawn from *n*, *o*, *p*, *q*, &c. meet the diagonal MH, draw black lead lines to MI, all parallel to AD; only draw the whole firſt line *γ* 1 with black ink, and the parts 2, 3, 4, &c. and *n t*, *o u*, *p w*, &c. of the other lines between *γ* N and MI, and GM and *γ* 1, with the ſame; and rub out all the reſt of the black lead lines, to avoid further confuſion. Then, from the points where the ſhort lines 1, 2, 3, &c. meet the line MI, draw lines down to *q* E, all parallel to M *q*, and the outer ſurfaces of the ſeven cubes in the ſide ME will be finiſhed; and all theſe laſt lines will meet the former parallels 2, 3, 4, &c. in the line *q* E.

Make *t* O equal and perpendicular to *γ t*, and *y* P equal and parallel to *t* O; then draw OP, which will be equal and parallel to *t y*.—This done, draw OS and PS to the point of ſight S, and PP to the point of diſtance P in the horizon. Laſtly, from the point Q, where PP interſects OS, draw QR parallel to OP; and you will have the outlines OQRP of the ſurface of the third perſpective table of cubes.

From the points *u*, *w*, *ω*, *x* draw upright lines to OP, all parallel to *t* O, and you will have the outer ſurfaces of the five cubes in the ſide O *y* of this third table.

From the points where theſe upright lines meet OP, draw lines toward the point of ſight S, till they meet the diagonal PQ; and from theſe points of meeting draw lines to PR, all parallel to OP, making the parts 2, 3, 4, 5, of theſe lines with black ink which lie between ZY and PR. Then, from the points where theſe lines meet PR, draw lines down to *y* N; which will bound the outer ſurfaces of the five cubes in the ſide PN of the third table.

Draw the line *δ* 1 with black ink; and, at a fourth part of its length between *δ* and Z, draw an upright line to S, equal in length to that fourth part, and another equal and parallel thereto from Z to V: then draw SV parallel to *δ* Z, and draw the two upright and equidiſtant lines between *δ* Z and SV, and you will have the outer ſurfaces of the three cubes in the ſide SZ of the fourth table.

Draw SS and VS to the point of ſight S in the horizon, and VP to the point of diſtance therein, interſecting

terfecting SS in T: then draw TU parallel to SV, and you have STUV, the furface of the fourth table; which being reticulated or divided into 9 perfpective fmall fquares, and the uppermoft cube W placed on the middlemoft of the fquares, all the outlines will be finifhed; and when the whole is properly fhaded, as in fig. 2. the work will be done.

PROB. 25. *To repreſent a double-croſs in perſpective.*

In fig. 3. Plate CCCLXXXV. let ABCD and EFGH be two perfpective fquares, equal and parallel to one another, the uppermoft directly above the lowermoft, drawn by the rules already laid down, and as far afunder as is equal to the given height of the upright part of the croſs; S being the point of fight, and P the point of diftance, in the horizon PS taken parallel to AD.

Draw AE, DH, and CG; then AEHD and DHGC fhall be the two viſible ſides of the upright part of the croſs; of which, the length AE is here made equal to three times the breadth EH.

Divide DH into three equal parts, HI, IK, and KD. Through theſe points of diviſion, at I and K, draw MO and PR parallel to AD; and make the parts MN, IO, PQ, KR, each equal to HI: then draw MP and OR parallel to DH.

From M and O, draw MS and OS to the point of fight S; and from the point of diftance P draw PN cutting MS in T: from T draw TU parallel to MO, and meeting OS in U; and you will have the uppermoft furface MTUO of one of the croſs pieces of the figure.——From R, draw RS to the point of fight S; and from U draw UV parallel to OR; and OUVR fhall be the perfpective fquare end next the eye of that croſs-part.

Draw PM*x* (as long as you pleaſe) from the point of diftance P, through the corner M; lay a ruler to N and S, and draw XN from the line P*x*:—then lay the ruler to I and S, and draw YZS.—Draw XY parallel to MO, and make XW and YB equal and perpendicular to XY: then draw WB parallel to XY, and WXYB fhall be the ſquare viſible end of the other croſs part of the figure.

Draw BK toward the point of fight S; and from U draw UP to the point of diftance P, interſecting YS in Z: then, from the interſection Z, draw Z*a* parallel to MO, and Z*b* parallel to HD, and the whole delineation will be finifhed.

This done, ſhade the whole, as in fig. 4. and you will have a true perſpective repreſentation of a double croſs.

PROB 26. *To put three rows of upright ſquare objects in perſpective, equal in ſize, and at equal diſtances from each other, on an oblong ſquare plane, the breadth of which ſhall be of any aſſigned proportion to the length thereof.*

Fig. 5. Plate CCCLXXXV. is a perſpective repreſentation of an oblong ſquare plane, three times as long as it is broad, having a row of nine upright ſquare objects on each ſide, and one of the ſame number in the middle; all equally high, and at equal diſtances from one another, both long-wiſe and croſs-wiſe, on the ſame plane.

In fig. 6. PS is the horizon, S the point of fight, P the point of diſtance, and AD (parallel to PS) the breadth of the plane.

Draw AS, NS, and DS, to the point of fight S; the point N being in the middle of the line AD: and draw DP to the point of diſtance P, interſecting AS in the point B: then, from B draw BC parallel to AD, and you have the perſpective ſquare ABCD.

Through the point *i*, where DB interſects NS, draw *a e* parallel to AD; and you will have ſubdivided the perſpective ſquare ABCD into four leſſer ſquares, as A *a i* N, N *i e* D, *a* B *k i*, and *i k* C *e*.

From the point C (at the top of the perſpective ſquare ABCD) draw CP to the point of diſtance P, interſecting AS in E; then, from the point E draw LF parallel to AD; and you will have the ſecond perſpective ſquare BEFC.

Through the point *l*, where CE interſects NS, draw *b f* parallel to AD; and you will have ſubdivided the ſquare BEFC into the four ſquares B *b l k*, *k l f* C, *b* E *m l*, and *l m* F *f*.

From the point F (at the top of the perſpective ſquare BEFG) draw FP to the point of diſtance P, interſecting AS in I; then from the point I draw IK parallel to AD; and you will have the third perſpective ſquare EIKF.

Through the point *n*, where FI interſects NS, draw *c g* parallel to AD; and you will have ſubdivided the ſquare EIKF into four leſſer ſquares, E *c n m*, *m n g* F, *c* I *o n*, and *n o* K *g*.

From the point K (at the top of the third perſpective ſquare EIKF) draw KP to the point of diſtance P, interſecting AS in L; then from the point L draw LM parallel to AD; and you will have the fourth perſpective ſquare ILMK.

Through the point *p*, where KL interſects NS, draw *d h* parallel to AD; and you will have ſubdivided the ſquare ILMK into the four leſſer ſquares I *d p o*, *o p h* K, *d* L *q p*, and *p q* M *h*.

Thus we have formed an oblong ſquare ALMD, whoſe perſpective length is equal to four times its breadth, and it contains 16 equal perſpective ſquares.—If greater length was ſtill wanted, we might proceed further on toward S.

Take A 3, equal to the intended breadth of the ſide of the upright ſquare object AQ (all the other ſides being of the ſame breadth), and AO for the intended height. Draw O 18 parallel to AD, and make D 8 and 4 7 equal to A 3; then draw 3 S, 4 S, 7 S, and 8 S to the point of fight S: and among them we ſhall have the perſpective ſquare baſes of all the 27 upright objects on the plane.

Through the point 9, where DB interſects 8 S, draw 1 10 parallel to AD, and you have the three perſpective ſquare baſes A 1 2 3, 4 5 6 7, 8 9 10 D, of the three upright ſquare objects at A, N, and D.

Through the point 21, where *e b* interſects 8 S, draw 14, 11 parallel to AD; and you will have the three perſpective ſquares *a* 14 15 16 17 18 19 20, and 21 11 *e* 22, for the baſes of the ſecond croſs row of objects; namely, the next beyond the firſt three at A, N, and D.

Through the point *x*, where CE interſects 8 S, draw a line parallel to BC; and you will have three perſpective ſquares, at B, *k*, and C, for the baſes of the third row of objects; one of which is ſet up at B.

Through the point *x*, where *f c* interſects 8 S, draw a line parallel to *b f*; and you will have three perſpective ſquares, at *b*, *l*, and *x*, for the baſes of the fourth croſs row of objects.

Go on in this manner, as you ſee in the figure, to

find the reſt of the ſquare baſes, up to LM; and you will have 27 upon the whole oblong ſquare plane, on which you are to place the like number of objects, as in fig. 5.

Plate CCCLXXXV. Having aſſumed AO for the perſpective height of the three objects at A, N, and D (fig. 6.) next the obſerver's eye, and drawn O 18 parallel to AD, in order to make the objects at N and D of the ſame height as that at O; and having drawn the upright lines 4 15, 7 W, 8 X, and D 22, for the heights N and D; draw OS and RS, 15 S and WS, XS and 22 S, all to the point of ſight S: and theſe lines will determine the perſpectively equal heights of all the reſt of the upright objects, as ſhown by the two placed at *a* and B.

To draw the ſquare tops of theſe objects, equal and parallel to their baſes, we need only give one example, which will ſerve for all.

Draw 3 R and 2 Q parallel to AO, and up to the line RS; then draw PQ parallel to OR, and OPQR ſhall be the top of the object at A, equal and parallel to its ſquare baſe A 1 2 3.—In the ſame eaſy way the tops of all the other objects are formed.

When all the reſt of the objects are delineated, ſhade them properly, and the whole perſpective ſcheme will have the appearance of fig. 5.

Prob. 27. *To put a ſquare box in perſpective, containing a given number of leſſer ſquare boxes of a depth equal to their width.*

Let the given number of little ſquare boxes or cells be 16, then 4 of them make the length of each ſide of the four outer ſides *a b*, *b c*, *c d*, *d a*, as in fig. 7. and the depth *a f* is equal to the width *a e*. Whoever can draw the reticulated ſquare, by the rules laid down towards the beginning of this article, will be at no loſs about putting this perſpective ſcheme in practice.

Prob. 28. *To put ſtairs with equal and parallel ſteps in perſpective.*

In fig. 1. of Plate CCCLXXXVI. let *a b* be the given breadth of each ſtep, and *a i* the height thereof. Make *b c*, *c d*, *d e*, &c. each equal to *a b*; and draw all the upright lines *a i*, *b l*, *c n*, *d p*, &c. perpendicular to *a b* (to which the horizon *s*S is parallel); and from the points *i*, *l*, *n*, *p*, *r*, &c. draw the equidiſtant lines *i* B, *l* C, *n* D, &c. parallel to *a b*; theſe diſtances being equal to that of *i* B from *a b*.

Draw *x i* touching all the corner-points *l*, *n*, *p*, *r*, *t*, *v*; and draw 2 16 parallel to *x i*, as far from it as you want the length of the ſteps to be.

Toward the point of ſight S draw the lines *a* 1, *i* 2, *k* 3, *l* 4, &c. and draw 16 15, 14 13, 12 11, 10 9, 8 7, 6 5, 4 3, and 2 1, all parallel to A*b*, and meeting the lines *w* 15, *u* 13, *s* 11, &c. in the points 15, 13, 11, 9, 7, 5, 3, and 1: then from theſe points draw 15 14, 13 12, 11 10, 9 8, 7 6, 5 4, and 3 2, all parallel to *b a*; and the outlines of the ſteps will be finiſhed. From the point 16 draw 16 A parallel to *b a*, and A*x* 16 will be part of the flat at the top of the uppermoſt ſtep. This done, ſhade the work as in fig. 2. and the whole will be finiſhed.

Prob. 29. *To put ſtairs with flats and openings in perſpective, ſtanding on a horizontal pavement of ſquares.*

In fig. 3. of Plate CCCLXXXVI. having made S the point of ſight, and drawn a reticulated pavement AB with black lead lines, which may be rubbed out again; at any diſtance from the ſide AB of the pavement which is neareſt to the eye, and at any point where you chooſe to begin the ſtair at that diſtance, as *a*, draw G*a* parallel to BA, and take *a b* at pleaſure for the height of each ſtep.

Take *a b* in your compaſſes, and ſet that extent as many times upward from F to E as is equal to the firſt required number of ſteps O, N, M, L, K; and from theſe points of diviſion in EF draw 1 *b*, 2 *d*, 3 *f*, 4 *h*, and E *k*, all equidiſtant from one another, and parallel to F*a*: then draw the equidiſtant upright lines *u b*, *t d*, *u f*, *v h*, *w k*, and *l m*, all perpendicular to F*a*: then draw *m b*, touching the outer corners of theſe ſteps at *m*, *k*, *h*, *f*, *d*, and *b*; and draw *n s* parallel to *m b*, as far from it as you want the length of the ſteps K, L, M, N, O to be.

Towards the point of ſight S draw *m n*, *l 5*, *k o*, *i 6*, *h p*, *f q*, *d r*, and *b s*. Then (parallel to the bottom-line BA) through the points *n*, *o*, *p*, *q*, *r*, *s*, draw *n* 8; 5, 14; 6, 15; 7, 16; 1, 17; and *s s*: which done, draw *n 5* and *o 6* parallel to *l m*, and the outlines of the ſteps K, L, M, N, O will be finiſhed.

At equal diſtances with that between the lines marked 8 and 14, draw the parallel lines above marked 9 10 11 12 and 13; and draw perpendicular lines upwards from the points *n*, *o*, *p*, *q*, *r*, *s*, as in the figure.

Make H*m* equal to the intended breadth of the flat above the ſquare opening at the left hand, and draw HW toward the point of ſight S, equal to the intended length of the flat; then draw WP parallel to H*m*, and the outlines of the flat will be finiſhed.

Take the width of the opening at pleaſure, as from F to C, and draw CD equal and parallel to FE. Draw GH parallel to CD, and the ſhort lines marked 33, 34, &c. juſt even with the parallel lines 1, 2, &c. From the points where theſe ſhort lines meet CD draw lines toward the point of ſight S till they meet DE; then from the points where the lines 38, 39, 40, &c. of the pavement meet C*y*, draw upright lines parallel to CD; and the lines which form the opening will be finiſhed.

The ſteps P, Q, R, S, T, and the flat U above the arch V, are done in the ſame manner with thoſe in fig. 1. as taught in Prob. 28. and the equidiſtant parallel lines marked 18, 19, &c. are directly even with thoſe on the left-hand ſide of the arch V, and the upright lines on the right-hand ſide are equidiſtant with thoſe on the left.

From the points where the lines 18, 19, 20, &c. meet the right-hand ſide of the arch, draw lines toward the point of ſight S; and from the points where the pavement lines 29, 30, 31, 32, meet the line drawn from A towards the point of ſight, draw upright lines toward the top of the arch.

Having done the top of the arch, as in the figure, and the few ſteps to the right hand thereof, ſhade the whole as in fig. 4. and the work will be finiſhed.

Prob. 30. *To put upright conical objects in perſpective, as if ſtanding on the ſides of an oblong ſquare, at diſtances from one another equal to the breadth of the oblong.*

In fig. 5. of Plate CCCLXXXVI. the baſes of the upright cones are perſpective circles inſcribed in ſquares of the ſame diameter; and the cones are ſet upright

on

on their baſes by the ſame rules as are given for pyramids, which we need not repeat here.

In moſt of the foregoing operations we have conſidered the obſerver's eye to be above the level of the tops of all the objects, as if he viewed them when ſtanding on high ground. In this figure, and the firſt and ſecond of the next plate, we ſhall ſuppoſe him to be ſtanding on low ground, and the tops of the objects to be above the level of his eye.

Plate CCLXXVI. In fig. 5. let AD be the perſpective breadth of the oblong ſquare ABCD; and let A*a* and D*d* (equal to A*a*) be taken for the diameters of the circular baſes of the two cones next the eye, whoſe intended equal heights ſhall be AE and DF.

Having made S the point of ſight in the horizon parallel to AD, and found the proper point of diſtance therein, draw AS and *a*S to contain the baſes of the cones on the left-hand ſide, and DS and *d*S for thoſe on the right.

Having made the two firſt cones at A and D of equal height at pleaſure, draw ES and FS from their tops to the point of ſight, for limiting the perſpective heights of all the reſt of the cones. Then divide the parallelogram ABCD into as many equal perſpective ſquares as you pleaſe; find the baſes of the cones at the corners of theſe ſquares, and make the cones thereon, as in the figure.

If you would repreſent a ceiling equal and parallel to ABCD, ſupported on the tops of theſe cones, draw EF, then EFGH ſhall be the ceiling; and by drawing *e f* parallel to EF, you will have the thickneſs of the floor-boards and beams, which may be what you pleaſe.

This ſhows how any number of equidiſtant pillars may be drawn of equal heights to ſupport the ceiling of a long room, and how the walls of ſuch a room may be repreſented in perſpective at the backs of theſe pillars. It alſo ſhows how a ſtreet of houſes may be drawn in perſpective.

PROB. 31. *To put a ſquare hollow in perſpective, the depth of which ſhall bear any aſſigned proportion to its width.*

Fig. 1. of Plate CCCLXXXVII. is the repreſentation of a ſquare hollow, of which the depth AG is equal to three times its width AD; and S is the point of ſight over which the obſerver's eye is ſuppoſed to be placed, looking perpendicularly down into it, but not directly over the middle.

Draw AS and DS to the point of ſight S; make ST the horizon parallel to AD, and produce it to ſuch a length beyond T that you may find a point of diſtance therein not nearer S than if AD was ſeen under an angle of 60 degrees

Draw DU to the point of diſtance, interſecting AS in B; then from the point B draw BC parallel to AD; and you will have the firſt perſpective ſquare ABCD, equal to a third part of the intended depth.

Draw CV to the point of diſtance, interſecting AS in E; then from the point E draw EF parallel to AD; and you will have the ſecond perſpective ſquare BEFC, which, added to the former one, makes two-thirds of the intended depth.

Draw FW to the point of diſtance, interſecting AS in G; then from the point G draw GH parallel to AD; and you will have the third perſpective ſquare EGHF, which, with the former two, makes the whole depth AGHD three times as great as the width AD, in a perſpective view.

Divide AD into any number of equal parts, as ſuppoſe 8; and from the diviſion-points *a*, *b*, *c*, *d*, &c. draw lines toward the point of ſight S, and ending at GH; then through the points where the diagonals BD, EC, GF, cut theſe lines, draw lines parallel to AD; and you will have the parallelogram AGHD reticulated, or divided into 192 ſmall and equal perſpective ſquares.

Make AI and DM equal and perpendicular to AD; then draw IM, which will be equal and parallel to AD; and draw IS and MS to the point of ſight S.

Divide AI, IM, and MD, into the ſame number of equal parts as AD is divided; and from theſe points of diviſion draw lines toward the point of ſight S, ending reſpectively at GK, KL, and LH.

From thoſe points where the lines parallel to AD meet AG and DH draw upright lines parallel to AI and DM; and from the points where theſe lines meet IK and LM draw lines parallel to IM; then ſhade the work, as in the figure.

PROB. 32. *To repreſent a ſemicircular arch in perſpective, as if it were ſtanding on two upright walls, equal in height to the height of the obſerver's eye.*

After having gone through the preceding operation, this will be more eaſy by a bare view of fig. 2 in Plate CCCLXXXVII. than it could be made by any deſcription; the method being ſo much like that of drawing and ſhading the ſquare hollow.—We need only mention, that *a*T*t*EA and DF*c t d* are the upright walls on which the ſemicircular arch is built; that S is the point of ſight in the horizon T *t*, taken in the centre of the arch; that *d* in fig. 1. is the point of diſtance; and that the two perſpective ſquares ABCD and BEFC make the parellelogram AEFD of a length equal to twice its breadth AD.

PROB. 33. *To repreſent a ſquare in perſpective, as viewed by an obſerver ſtanding directly even with one of its corners.*

In fig. 3. of Plate CCCLXXXVII. let A 9 BC be a true ſquare, viewed by an obſerver ſtanding at ſome diſtance from the corner C, and juſt even with the diagonal C 9.

Let *p*SP be the horizon, parallel to the diagonal AB; and S the point of ſight, even with the diagonal C 9. Here it will be proper to have two points of diſtance *p* and P, equidiſtant from the point of ſight S.

Draw the ſtraight line 1 17 parallel to AB, and draw A 8 and B 10 parallel to CS. Take the diſtance between 8 and 9 in your compaſſes, and ſet it off all the way in equal parts from 8 to 1, and from 10 to 17.—The line 1 17 ſhould be produced a good way further both to right and left hand from 9, and divided all the way in the ſame manner.

From theſe points of equal diviſion, 8, 9, 10, &c. draw lines to the point of ſight S, and alſo to the two points of diſtance *p* and P, as in the figure.

Now it is plain, that *a c b* 9 is the perſpective repreſentation of A9BC, viewed by an obſerver even with the corner C and diagonal C 9.—But if there are other ſuch ſquares lying even with this, and having the ſame poſition with reſpect to the line 1 17, it is evident that the obſerver, who ſtands directly even with the

corner C of the firſt ſquare, will not be even with the like corners G and K of the others; but will have an oblique view of them over the ſides FG and IK, which are neareſt his eye: and their perſpective repreſentations will be *e g f* 6 and *h k i* 3, drawn among the lines in the figure: of which, the ſpaces taken up by each ſide lie between three of the lines drawn toward the point of diſtance *p*, and three drawn to the other point of diſtance P.

PROB. 34. *To repreſent a common chair, in an oblique inverſe view.*

The original lines to the point of ſight S, and points of diſtance *p* and P, being drawn as in the preceding operation, chooſe any part of the plane, as *l m n* 13, on which you would have the chair L to ſtand.—There are juſt as many lines (namely two) between *l* and *m* or 13 and *n*, drawn toward the point of diſtance *p*, at the left hand, as between *l* and 13, or *m* and *n*, drawn to the point of diſtance P on the right: ſo that *l m*, *m n*, *n* 13, and 13 *l*, form a perſpective ſquare.

From the four corners *l*, *m*, *n*, 13, of this ſquare raiſe the four legs of the chair to the perſpective perpendicular height you would have them: then make the ſeat of the chair a ſquare equal and parallel to *l m n* 13, as taught in Prob. 18. which will make the two ſides of the ſeat in the direction of the lines drawn toward the point of diſtance *p*, and the fore and back part of the ſeat in direction of the lines drawn to the other point of diſtance P. This done, draw the back of the chair leaning a little backward, and the croſs bars therein tending toward the point of diſtance P. Then ſhade the work as in the figure; and the perſpective chair will be finiſhed.

PROB. 35. *To preſent an oblong ſquare table in an oblique perſpective view.*

In fig. 3. of Plate CCCLXXXVII. M is an oblong ſquare table, as ſeen by an obſerver ſtanding directly even with C 9 (ſee *Prob.* 33.), the ſide next the eye being perſpectively parallel to the ſide *a c* of the ſquare *a c b* 9.—The forementioned lines drawn from the line 1 17 to the two points of diſtance *p* and P, form equal perſpective ſquares on the ground plane.

Chooſe any part of this plane of ſquares for the feet of the table to ſtand upon; as at *p*, *q*, *r*, and *s*, in direction of the lines *o p* and *r s* for the two long ſides, and *t s* and *q r* for the two ends; and you will have the oblong ſquare or parallelogram *q r s t* for the part of the floor or ground-plane whereon the table is to ſtand: and the breadth of this plane is here taken in proportion to the length as 6 to 10; ſo that, if the length of the table be ten feet, its breadth will be ſix.

On the four little perſpective ſquares at *q*, *r*, *s*, and *t*, place the four upright legs of the table, of what height you pleaſe, ſo that the height of the two next the eye, at *o* and *p*, ſhall be terminated by a ſtraight line *u w* drawn to the point of diſtance P. This done, make the leaf M of the table an oblong ſquare, perſpectively equal and parallel to the oblong ſquare *q r s t* on which the feet of the table ſtands. Then ſhade the whole, as in the figure, and the work will be finiſhed.

If the line 1 17 was prolonged to the right and left hand, and equally divided throughout (as it is from 1 to 17), and if the lines which are drawn from *p* and to the right and left hand ſides of the plate were prolonged till they came to the extended line 1 17, they would meet it in the equal points of diviſion. In forming large plans of this ſort, the ends of ſlips of paper may be paſted to the right and left edges of the ſheet on which the plan is to be formed.

Of the Anamorpheſis, or reformation of diſtorted images.

By this means pictures that are ſo miſhapen, as to exhibit no regular appearance of any thing to the naked eye, ſhall, when viewed by reflection, preſent a regular and beautiful image. The inventor of this ingenious device is not known. Simon Stevinus, who was the firſt that wrote upon it, does not inform us from whom he learned it. The principles of it are laid down by S. Vauzelard in his *Perſpective Conique et Cylindrique*; and Gaſpar Schott profeſſes to copy Marius Bettinus in his deſcription of this piece of artificial magic.

It will be ſufficient for our purpoſe to copy one of the ſimpleſt figures of this writer, as by this means the myſtery of this art will be ſufficiently unfolded. Upon the cylinder of paper, or paſteboard, ABCD, draw whatever is intended to be exhibited, as the letters IHS. Then with a needle make perforations along the whole outline; and placing a candle, G, behind this cylinder, mark upon the ground plane the ſhadow of them, which will be diſtorted more or leſs, according to the poſition of the candle or the plane, &c. This being done, let the picture be an exact copy of this diſtorted image, let a metallic ſpeculum be ſubſtituted in the place of the cylinder, and let the eye of the ſpectator have the ſame poſition before the cylinder that the candle had behind it. Then looking upon the ſpeculum, he will ſee the diſtorted image reſtored to its proper ſhape. The reformation of the image, he ſays, will not eaſily be made exact in this method, but it will be ſufficiently ſo to anſwer the purpoſe. Plate CCCLXXXVII fig. 6.

Other methods, more exact and geometrical than this, were found out afterwards: ſo that theſe pictures could be drawn by certain rules, without the uſe of a candle. Schott quotes one of theſe methods from Bettinus, another from Herigonius, and another from Kircher, which may be ſeen in his *Magia*, vol. i. p. 162, &c. He alſo gives an account of the methods of reforming pictures by ſpeculums of conical and other figures.

Inſtead of copying any of theſe methods from Schott or Bettinus, we ſhall preſent our readers with that which Dr Smith hath given us in his Optics, vol. i. p. 250, as, no doubt, the beſt, and from which any perſon may eaſily make a drawing of this kind. The ſame deſcription anſwers to two mirrors, one of which, fig. 7. is convex, and the other, fig. 8. is concave.

In order to paint upon a plane a deformed copy ABCDEKIHGF of an original picture, which ſhall appear regular, when ſeen from a given point O, elevated above the plane, by rays reflected from a poliſhed cylinder, placed upon the circle *l n p*, equal to its given baſe; from the point R, which muſt be ſuppoſed to be perpendicularly under O, the place of the eye, draw two lines R *a*-R *e*; which ſhall either touch the baſe of the cylinder, or elſe cut off two ſmall equal ſegments from the ſides of it, according as the copy is intended to be more or leſs deformed. Then, taking the eye, raiſed above R, to the given height RO, ſome-

Fig. 5.

A. Bell Prin. Wal. Sculptor fecit.

ſomewhat greater than that of the cylinder, for a luminous point, deſcribe the ſhadow *a e k f* (of a ſquare *a e x z*, fig. 36. or parallelogram ſtanding upright upon its baſe *a e*, and containing the picture required) anywhere behind the arch *l n p*. Let the lines drawn from R to the extremities and diviſions of the baſe *a*, *b*, *c*, *d*, *e*, cut the remoteſt part of the ſhadow in the points *f*, *g*, *h*, *i*, *k*, and the arch of the baſe in *l*, *m*, *n*, *o*, *p*; from which points draw the lines *l* AF, *m* BG, *n* CH, *o* DI, *p* EK, as if they were rays of light that came from a focus R, and were reflected from the baſe *l n p*; ſo that each couple, as *l* A, *l* R, produced, may cut off equal ſegments from the circle. Laſtly, tranſfer the lines *l a f*, *m b g*, &c. and all their parts, in the ſame order, upon the reſpective lines *l* AF, *m* BG, &c. and having drawn regular curves, by eſtimation, through the points A, B, C, D, E, through F, G, H, I, K, and through every intermediate order of points; the figure ACEKHF, ſo divided, will be the deformed copy of the ſquare, drawn and divided upon the original picture, and will appear ſimilar to it, when ſeen in the poliſhed cylinder, placed upon the baſe *l n p*, by the eye in its given place O.

The practical methods of drawing theſe images ſeem to have been carried to the greateſt perfection by J. Leopold, who, in the Acta Lipſienſia for the year 1712, has deſcribed two machines, one for the images to be viewed with a cylindrical, and the other with a conical, mirror. The perſon poſſeſſed of this inſtrument has nothing to do but to take any print he pleaſes, and while he goes over the outlines of it with one pen, another traces the anamorphoſis.

By methods of this kind, groves of trees may be cut, ſo as to repreſent the appearance of men, horſes, and other objects from ſome one point of view, which are not at all diſcernible in any other. This might eaſily be effected by one perſon placing himſelf in any particular ſituation, and giving directions to other perſons what trees to lop, and in what manner. In the ſame method it has been contrived, that buildings of circular and other forms, and alſo whole groups of buildings, conſiſting of walls at different diſtances, and with different poſitions to one another, ſhould be painted ſo as to exhibit the exact repreſentation of particular objects, which could only be perceived in one ſituation. Bettinus has illuſtrated this method by drawings in his *Apiaria*.

It may appear a bold aſſertion to ſay, that the very ſhort ſketch now given of the art of perſpective is a ſufficient foundation for the whole practice, and includes *all* the expeditious rules peculiar to the problems which moſt generally occur. It is, however, true, and the intelligent reader will ſee, that the two theorems on which the whole reſts, include every poſſible caſe, and apply with equal facility to pictures and originals in any poſition, although the examples are ſelected of perpendicular pictures, and of originals referred to horizontal planes, as being the moſt frequent. The ſcientific foundation being ſo ſimple, the ſtructure need not be complex, nor ſwell into ſuch volumes as have been publiſhed on the ſubject: volumes which, by their ſize, deter from the peruſal, and give the ſimple art the appearance of intricate myſtery; and, by their prices, defeat the deſign of their authors, viz. the diſſemination of knowledge among the practitioners. The treatiſes on perſpective acquire their bulk by long and tedious diſcourſes, minute explanations of common things, or by great numbers of examples; which indeed do make ſome of theſe books valuable by the variety of curious cuts, but do not at all inſtruct the reader by any improvements made in the art itſelf. For it is evident, that moſt of thoſe who have treated this ſubject have been more converſant in the practice of deſigning than in the principles of geometry; and therefore when, in their practice, the caſes which have offered have put them on trying particular expedients, they have thought them worth communicating to the public as improvements of the art; and each author, fond of his own little expedient (which a ſcientific perſon would have known for an eaſy corollary from the general theorem), have made it the principle of a practical ſyſtem—and in this manner narrowing inſtead of enlarging the knowledge of the art; and the practitioner, tired of the bulk of the volume, in which a ſingle maxim is tediouſly ſpread out, and the principle on which it is founded kept out of his ſight, contents himſelf with a remembrance of the maxim (not underſtood), and keeps it ſlightly in his eye, to avoid groſs errors. We can appeal to the whole body of painters and draughtſmen for the truth of this aſſertion; and it muſt not be conſidered as an imputation on them of remiſſneſs or negligence, but as a neceſſary conſequence of the ignorance of the authors from whom they have taken their information. This is a ſtrong term, but it is not the leſs juſt. Several mathematicians of eminence have written on perſpective, treating it as the ſubject of pure geometry, as it really is; and the performances of Dr Brook Taylor, Graveſande, Wolf, De la Caille, Emerſon, are truly valuable, by preſenting the art in all its perſpicuous ſimplicity and univerſality. The works of Taylor and Emerſon are more valuable, on account of the very ingenious and expeditious conſtructions which they have given, ſuited to every poſſible caſe. The merit of the firſt author has been univerſally acknowledged by all the Britiſh writers on the ſubject, who never fail to declare that their own works are compoſed on the principle of Dr Brook Taylor: but any man of ſcience will ſee that theſe authors have either not underſtood them, or aimed at pleaſing the public by fine cuts and uncommon caſes; for, without exception, they have omitted his favourite conſtructions, which had gained his predilection by their univerſality, and attached themſelves to inferior methods, more uſually expedient perhaps, or inventions (as they thought) of their own. What has been given in this article is not *profeſſed* to be according to the principles of Dr Brook Taylor, becauſe the principles are not peculiar to him, but the neceſſary reſults of the theory itſelf, and inculcated by every *mathematician* who had taken the trouble to conſider the ſubject. They are ſufficient not only for directing the ordinary practice, but alſo for ſuggeſting modes of conſtruction for every caſe out of the common track. And a perſon of ingenuity will have a laudable enjoyment in thus, without much ſtretch of thought, inventing rules for himſelf; and will be better pleaſed with ſuch fruits of his own ingenuity, than in reading the tedious explanations of examples deviſed by

by another. And for this purpoſe we would, with Dr Taylor, "adviſe all our readers not to be contented with the ſcheme they find here; but, on every occaſion, to draw new ones of their own, in all the variety of circumſtances they can think of. This will take up more time at firſt, but they will find the vaſt benefit and pleaſure of it by the extenſive notions it will give them of the nature of the principles."

The art of perſpective is neceſſary to all arts where there is any occaſion for deſigning; as architecture, fortification, carving, and generally all the mechanical arts; but it is more particularly neceſſary to the art of painting, which can do nothing without it. A figure in a picture, which is not drawn according to the rules of perſpective, does not repreſent what is intended, but ſomething elſe. Indeed we heſitate not to ſay, that a picture which is faulty in this particular, is as blameable, or more ſo, than any compoſition in writing which is faulty in point of orthography, or grammar. It is generally thought very ridiculous to pretend to write an heroic poem, or a fine diſcourſe, upon any ſubject, without underſtanding the propriety of the language in which we write; and to us it ſeems no leſs ridiculous for one to pretend to make a good picture without underſtanding perſpective: Yet how many pictures are there to be ſeen, that are highly valuable in other reſpects, and yet are entirely faulty in this point? Indeed this fault is ſo very general, that we cannot remember that we ever have ſeen a picture that has been entirely without it; and what is the more to be lamented, the greateſt maſters have been the moſt guilty of it. Thoſe examples make it to be the leſs regarded; but the fault is not the leſs, but the more to be lamented, and deſerves the more care in avoiding it for the future. The great occaſion of this fault, is certainly the wrong method that is generally uſed in educating of perſons in this art: for the young people are generally put immediately to drawing; and when they have acquired a facility in that, they are put to colouring. And theſe things they learn by rote, and by practice only; but are not at all inſtructed in any rules of art. By which means, when they come to make any deſigns of their own, though they are very expert at drawing out and colouring every thing that offers itſelf to their fancy; yet for want of being inſtructed in the ſtrict rules of art, they do not know how to govern their inventions with judgment, and become guilty of ſo many groſs miſtakes; which prevent themſelves, as well as others, from finding that ſatisfaction they otherwiſe would do in their performances. To correct this for the future, we would recommend it to the maſters of the art of painting, to conſider if it would not be neceſſary to eſtabliſh a better method for the education of their ſcholars, and to begin their inſtructions with the technical parts of painting, before they let them looſe to follow the inventions of their own uncultivated imaginations.

The art of painting, taken in its full extent, conſiſts of two parts; the inventive, and the executive. The inventive part is common with poetry, and belongs more properly and immediately to the original deſign (which it invents and diſpoſes in the moſt proper and agreeable manner) than to the picture, which is only a copy of that deſign already formed in the imagination of the artiſt. The perfection of this art of painting depends upon the thorough knowledge the artiſt has of all the parts of his ſubject; and the beauty of it conſiſts in the happy choice and diſpoſition that he makes of it: And it is in this that the genius of the artiſt diſcovers and ſhows itſelf, while he indulges and humours his fancy, which here is not confined. But the other, the executive part of painting, is wholly confined and ſtrictly tied to the rules of art, which cannot be diſpenſed with upon any account; and therefore in this the artiſt ought to govern himſelf entirely by the rules of art, and not to take any liberties whatſoever. For any thing that is not truly drawn according to the rules of perſpective, or not truly coloured or truly ſhaded, does not appear to be what the artiſt intended, but ſomething elſe. Wherefore, if at any time the artiſt happens to imagine that his picture would look the better, if he ſhould ſwerve a little from theſe rules, he may aſſure himſelf, that the fault belongs to his original deſign, and not to the ſtrictneſs of the rules; for what is perfectly agreeable and juſt in the real original objects themſelves, can never appear defective in a picture where thoſe objects are exactly copied.

Therefore to offer a ſhort hint of thoughts we have ſome time had upon the method which ought to be followed in inſtructing a ſcholar in the executive part of painting; we would firſt have him learn the moſt common effections of practical geometry, and the firſt elements of plain geometry and common arithmetic. When he is ſufficiently perfect in theſe, we would have him learn perſpective. And when he has made ſome progreſs in this, ſo as to have prepared his judgement with the right notions of the alterations that figures muſt undergo, when they come to be drawn on a flat, he may then be put to drawing by view, and be exerciſed in this along with perſpective, till he comes to be ſufficiently perfect in both. Nothing ought to be more familiar to a painter than perſpective; for it is the only thing that can make the judgment correct, and will help the fancy to invent with ten times the eaſe that it could do without it.

We earneſtly recommend to our readers the *careful* peruſal of Dr Taylor's Treatiſe, as publiſhed by Colſon in 1749, and Emerſon's publiſhed along with his Optics. They will be ſurpriſed and delighted with the inſtruction they will receive; and will then truly eſtimate the ſplendid volumes of other authors and ſee their frivolity.

P E R

Perſpective. PERSPECTIVE is alſo uſed for a kind of picture or painting, frequently ſeen in gardens, and at the ends of galleries; deſigned expreſsly to deceive the ſight by repreſenting the continuation of an alley, a building, landſcape, or the like.

Aerial PERSPECTIVE, is ſometimes uſed as a general deno-

Perſpective. denomination for that which more reſtrictedly is called *aerial perſpective*, or the art of giving a due diminution or degradation to the ſtrength of light, ſhade, and colours of objects, according to their different diſtances, the quantity of light which falls upon them, and the medium through which they are ſeen; the *chiaro obſcuro*, or *clair obſcure*, which conſiſts in expreſſing the different degrees of light, ſhade, and colour of bodies, ariſing from their own ſhape, and the poſition of their parts with reſpect to the eye and neighbouring objects, whereby their light or colours are affected; and keeping, which is the obſervance of a due proportion in the general light and colouring of the whole picture, ſo that no light or colour in one part may be too bright or ſtrong for another. A painter, who would ſucceed in *aerial perſpective*, ought carefully to ſtudy the effects which diſtance, or different degrees or colours of light, have on each particular original colour, to know how its hue or ſtrength is changed in the ſeveral circumſtances that occur, and to repreſent it accordingly. As all objects in a picture take their meaſures in proportion to thoſe placed in the front, ſo, in *aerial perſpective*, the ſtrength of light, and the brightneſs of the colours of objects cloſe to the picture, muſt ſerve as a meaſure, with reſpect to which all the ſame colours at ſeveral diſtances muſt have a proportional degradation in like circumſtances.

Bird's eye view in PERSPECTIVE, is that which ſuppoſes the eye to be placed above any building, &c. as in the air at a conſiderable diſtance from it. This is applied in drawing the repreſentations of fortifications, when it is neceſſary not only to exhibit one view as ſeen from the ground, but ſo much of the ſeveral buildings as the eye can poſſibly take in at one time from any ſituation. In order to this, we muſt ſuppoſe the eye to be removed a conſiderable height above the ground, and to be placed as it were in the air, ſo as to look down into the building like a bird that is flying. In repreſentations of this kind, the higher the horizontal line is placed, the more of the fortification will be ſeen, and *vice verſa*.

PERSPECTIVE Machine, is an inſtrument by which any perſon, without the help of the rules of art, may delineate the true perſpective figures of objects. Mr Ferguſon has deſcribed a machine of this ſort of which he aſcribes the invention to Dr Bevis.

Fig. 4. of Plate CCCLXXXVII. is a plane of this machine, and fig. 5. is a repreſentation of it when made uſe of in drawing diſtant objects in perſpective.

In fig. 4. *a b e f* is an oblong ſquare board, repreſented by ABEF in fig. 5. *x* and *y* (X and Y) are two hinges on which the part *c l d* (CLD) is moveable. This part conſiſts of two arches or portions of circles *c m l* (CML) and *d n l* (DNL) joined together at the top *l* (L), and at bottom to the croſs bar *d c* (DC), to which one part of each hinge is fixed, and the other part to a flat board, half the length of the board *a b e f* (ABEF), and glued to its uppermoſt ſide. The centre of the arch *c m l* is at *d*, and the centre of the arch *d n l* is at *c*.

On the outer ſide of the arch *d n l* is a ſliding piece *n* (much like the nut of the quadrant of altitude belonging to a common globe), which may be moved to any part of the arch between *d* and *l*: and there is ſuch another ſlider *o* on the arch *c m l*, which may be ſet to any part between *c* and *l*.—A thread *c p n* (CPN) is ſtretched tight from the centre *c* (C) to the ſlider *n* (N), and ſuch another thread is ſtretched from the centre *d* (D) to the ſlider *o* (O); the ends of the threads being faſtened to theſe centres and ſliders. Perſpective.

Now it is plain, that, by moving theſe ſliders on their reſpective arches, the interſection *p* (P) of the threads may be brought to any point of the open ſpace within the arches.—In the groove *k* (K) is a ſtraight ſliding bar *i* (I), which may be drawn further out, or puſhed further in at pleaſure.

To the outer end of this bar I (fig. 5.) is fixed the upright piece HZ, in which is a groove for receiving the ſliding piece Q. In this ſlider is a ſmall hole *r* for the eye to look through, in uſing the machine: and there is a long ſlit in HZ, to let the hole *r* be ſeen through when the eye is placed behind it, at any height of the hole above the level of the bar I.

How to delineate the perſpective figure of any diſtant object, or objects, by means of this machine.

Suppoſe you wanted to delineate a perſpective repreſentation of the houſe *q s r p* (which we muſt imagine to be a great way off, without the limits of the plate), place the machine on a ſteady table, with the end EF of the horizontal board ABEF toward the houſe, ſo that, when the Gothic-like arch DLC is ſet upright, the middle part of the open ſpace (about P) within it may be even with the houſe when you place your eye at Z and look at the houſe through the ſmall hole *r*. Then fix the corners of a ſquare piece of paper with four wafers on the ſurface of that half of the horizontal board which is neareſt the houſe; and all is ready for drawing.

Set the arch upright, as in the figure; which it will be when it comes to the perpendicular ſide *t* of the upright piece *s t* fixed to the horizontal board behind D. Then place your eye at Z, and look through the hole *r* at any point of the houſe, as *q*, and move the ſliders N and O till you bring the interſection of the threads at P directly between your eye and the point *q*: then put down the arch flat upon the paper on the board, as at ST, and the interſection of the threads will be at W. Mark the point W on the paper with the dot of a black lead pencil, and ſet the arch upright again as before: then look through the hole *r*, and move the ſliders N and O till the interſection of the threads comes between your eye and any other point of the houſe, as *p*: then put down the arch again to the paper, and make a pencil mark thereon at the interſection of the threads, and draw a line from that mark to the former one at W; which line will be a true perſpective repreſentation of the corner *p q* of the houſe.

Proceed in the ſame manner, by bringing the interſection of the threads ſucceſſively between your eye and other points of the outlines of the houſe, as *r*, *s*, &c. and put down the arch to mark the like points on the paper, at the interſection of the threads: then connect theſe points by ſtraight lines, which will be the perſpective outlines of the houſe. In like manner find points for the corners of the door and windows, top of the houſe, chimneys, &c. and draw the finiſhing lines from point to point: then ſhade the whole, making the lights and ſhades as you ſee them on the houſe itſelf, and you will have a true perſpective figure of it.—Great care muſt be taken, during the whole time, that

Perſpective, Perſpiration.

the poſition of the machine be not ſhifted on the table; and to prevent ſuch an inconvenience, the table ſhould be very ſtrong and ſteady, and the machine fixed to it either by ſcrews or clamps.

In the ſame way, a landſcape, or any number of objects within the field of view through the arch, may be delineated, by finding a ſufficient number of perſpective points on the paper, and connecting them by ſtraight or curved lines as they appear to the eye. And as this makes every thing in perſpective equally eaſy, without taking the trouble to learn any of the rules for drawing, the operations muſt be very pleaſing and agreeable. Yet as ſcience is ſtill more ſo, we would by all means recommend it to our readers to learn the rules for drawing particular objects; and to draw landſcapes by the eye, for which, we believe, no perſpective rules can be given. And although any thing may be very truly drawn in perſpective by means of this machine, it cannot be ſaid that there is the leaſt degree of ſcience in going *that* way to work.

The arch ought to be at leaſt a foot wide at bottom, that the eye at Z may have a large field of view through it: and the eye ſhould then be, at leaſt, 10½ inches from the interſection of the threads at P when the arch is ſet upright. For if it be nearer, the boundaries of view at the ſides near the foot of the arch will ſubtend an angle at Z of more than 60 degrees, which will not only ſtrain the eye, but will alſo cauſe the outermoſt parts of the drawing to have a diſagreeable appearance.—To avoid this, it will be proper to draw back the ſliding bar I, till Z be 14½ inches diſtant from P; and then the whole field of view, through the foot wide arch, will not ſubtend an angle to the eye at Z of more than 45 degrees; which will give a more eaſy and pleaſant view, not only of all the objects themſelves, but alſo of their repreſentations on the paper whereon they are delineated. So that, whatever the width of the arch be, the diſtance of the eye from it ſhould be in this proportion: As 12 is to the width of the arch, ſo is 14½ to the diſtance of the eye (at Z) from it.

If a pane of glaſs, laid over with gum water, be fixed into the arch, and ſet upright when dry, a perſon who looks through the hole *r* may delineate the objects upon the glaſs which he ſees at a diſtance through and beyond it, and then tranſfer the delineation to a paper put upon the glaſs, as mentioned in the beginning of the article PERSPECTIVE.

Mr Peacock likewiſe invented three ſimple inſtruments for drawing architecture and machinery in perſpective, of which the reader will find ſketches and deſcriptions in the 75th volume of the Philoſophical Tranſactions. We do not inſert theſe deſcriptions here, becauſe we do not think the inſtruments ſuperior to that deſcribed by Ferguſon, and becauſe we wiſh that our readers who have occaſion to *draw* may make themſelves ſo much maſters of the art of perſpective, as to be above the aid of ſuch mechanical contrivances.

Perspective Glaſs, or *Graphical Perſpective*. See DIOPTRICS.

PERSPIRATION, in medicine, the evacuation of the juices of the body through the pores of the ſkin. Perſpiration is diſtinguiſhed into ſenſible and inſenſible; and here ſenſible perſpiration is the ſame with ſweating, and inſenſible perſpiration that which eſcapes the notice of the ſenſes; and this laſt is the idea affixed to the word *perſpiration* when uſed alone. Perſpicuity, Perth.

PERSPICUITY, properly ſignifies the property which any thing has of being eaſily ſeen through; hence it is generally applied to ſuch writings or diſcourſes as are eaſily underſtood.

PERSPICUITY, in compoſition. See ORATORY, n° 43.

PERTH, a county of Scotland, including Menteith, Braidalbin, Athol, Stratherne, part of Gowrie, and Perth Proper; is bounded by Badenoch and Lochaber on the north and north-weſt; by Marr on the north-eaſt; by Argyle and Lennox on the weſt and ſouth weſt; having Clackmannanſhire, part of Stirlingſhire, and the Forth to the ſouth; the ſhires of Kinroſs and Fife to the ſouth eaſt, and Angus to the eaſt. It extends above 70 miles in length, and near 60 at its greateſt breadth, exhibiting a variety of Highlands and Lowlands; mountains, hills, dales, and ſtraths, diverſified with paſture-grounds, corn fields, and meadows; rivers, lakes, foreſts, woods, plantations, incloſures, towns, villages, and a great number of elegant ſeats, beautifully ſituated, belonging to noblemen and gentlemen. The chief rivers of Perthſhire are the Tay, the Teith, and the Erne, beſides a great number of ſubordinate ſtreams. The river Teith is famous for its ſalmon-fiſhery, and its ſteep cataract, near the Blair of Drummond, the noiſe of which is ſo loud, as to deafen thoſe who approach it. The river Erne riſes from Loch-Erne, a lake ſeven miles long, in the mountainous country of Stratherne: this river, after a courſe of 34 miles from weſt to eaſt, during which it receives many ſtreams and rivulets, falls into the Tay at Abernethy.

Freeſtone, lead, iron, and copper ores, with ſome lapis calaminaris, are found in different parts of Perthſhire. The ſoil, being generally rich and well manured, produces excellent wheat, and all kinds of grain. The hilly country abounds with paſture for the black cattle, horſes, ſheep, goats, and deer. The heaths, woods, and foreſts, are ſtored with variety of game; the rivers teem with ſalmon and trout; the gardens and orchards are ſtored with all kinds of herbs, roots, apples, pears, cherries, plums, and almoſt every ſpecies of fruit found in South Britain. The houſes and attire, even of the commonalty, are neat and decent; and every peaſant can produce a good quantity of linen, and great ſtore of blankets, made in his own family. Indeed, this is the caſe through all the Lowlands of Scotland. Flax is reared by every huſbandman; and being dreſſed at home, is ſpun by the females of his family into thread for linen; this is woven by country weavers, of whom there is a great number through all the Low Country, and afterwards bleached or whitened by the good-wife and her ſervants; ſo that the whole is made fit for uſe at a very ſmall expence. They likewiſe waſh, card, ſpin, and weave their wool into tartan for plaids, kerſies, and coarſe ruſſet-cloth, for common wearing, beſides great part of it which is knit into caps, ſtockings, and mitts. Plaids, made of the fineſt worſted, are worn either plain or variegated, as veils, by women of the lower, and even of the middle rank; nay, ſome years ago, ladies of faſhion wore ſilken plaids with an undreſs: this

erth. this is a loose piece of drapery, gathered about the head, shoulders, and waist, on which it is crossed, so as to leave the hands at liberty, and produces a very good effect to the eye of the spectator. The Lowlanders of Perthshire are civilized, hospitable, and industrious: the commerce of the country consists chiefly in corn, linen, and black cattle: there are, moreover, some merchants who trade to foreign countries.—For an account of the different divisions of this county above-mentioned, see the articles as they occur in the order of the alphabet.

Perth Proper, stretching 20 miles in length, and at some places 15 in breadth, is bounded on the north east, by the Carse of Gowrie; on the east, by Angus; on the west, by Stratherne; on the north, by Athol; and on the south, by the Frith of Tay. This is likewise a fruitful country, populous and well cultivated, abounding with gentlemen who possess opulent estates; with farmers who understand agriculture; and with manufacturers who turn their industry to great account. North eastward from Perth to Brechin lies the vale of Strathmore, one of the most fertile districts in Scotland, which gives the title of *Earl* to the noble family of Lyon.

Perth, the capital of the county of that name, is an agreeable, populous town, situated 20 miles within land, on the south bank of the river Tay. It was otherwise called *St Johnston's*, from a church dedicated to St John, as the patron of the place. It is a royal borough, second in dignity to the metropolis, the seat of a large presbytery, and gave the title of *Earl* to the family of Drummond, which is now forfeited. James Drummond, 4th earl, was created duke of Perth by James II. for adhering to whose interests he was outlawed. His two grandsons were attainted in 1745. No less than 14 national councils have been held at Perth between 1201 and 1459. But the oldest was at Scone, A. D. 906. Perth, in the reign of Edward I. of England, was possessed by the English, who secured it with fortifications: but after an obstinate resistance, they were expelled by Robert Bruce. In the year 1715, the rebels made it a place of arms, and retired to it, after the battle of Dumblane; but they were in a little time dislodged by the duke of Argyle, and retreated northwards with the pretender. They possessed it also in 1745. The pretender was proclaimed king, new magistrates were appointed, and an attempt was made to fortify it. The town is populous and handsome; the streets are well paved, and tolerably clean at all times; and the houses, though not stately, make a very decent appearance. Both the streets and houses are, for the greater part, disposed in a regularity of plan, which proves them not to be of the most remote antiquity. It is indeed true, that the level situation, being singularly favourable to regularity, might, even from the first, give this an advantage over many of our old boroughs. Several streets run in a direction parallel with the river, as far as a right can bear this relation to a curve line, nearly between east and west: these are again intersected by others extending between north and south. It would seem that anciently particular streets were inhabited, each by a particular class of artisans. The names still preserved seem to indicate as much. The shop-keepers or merchants occupied one street; the hammermen a second; and other crafts occupied, in the same manner, each a separate street. Many of the houses in that street called the *Water-Gate*, seem to be very old buildings. Towards the southern end of the Water-Gate stands the famous palace of the Gowrie family. The house, and the very room, where the attempt of the Gowries to seize or assassinate the king was supposed to have been made, is now converted into barracks for a train of artillery; but the back-stair, down which the Ruthvens were thrown, is pulled down. This strange event, however magnified or attested by contemporary writers, is made up of so many improbabilities, or circumstances for which no reason can be assigned, that Sir David Dalrymple, in republishing the account printed by authority, 1600, preparatory to his further observations on it, seems justified in absolutely discrediting a fact which passed for problematical with so many persons at the very time. Dr Robertson supposes it a plot of Elizabeth to get James into her power. Mr Cant having discussed the whole story of the conspiracy in his Muse's Threnodie, p. 185—261, concludes, "that as this would have been a very impolitic measure, the best way of accounting for it is by James's known hatred to the Puritans, and wish to get rid of two popular characters." The king had been seized and forced from his favourites by the father of the Ruthvens 12 years before (1582), and though he affected to forgive him, took the first opportunity to condemn and execute him as a traitor, 1584. Mr Camden was too good a courtier to speak with impartiality of any part of this weak monarch's conduct. Though the name of *Gowrie* was abolished, the title of *Ruthven* was revived in the person of Sir Thomas Ruthven of Freeland, whom Charles II. 1651, created Lord Ruthven: but the honour, on the death of his son David in 1704, devolved on Isabel surviving daughter of his second sister, who married Sir Francis Ruthven, and was succeeded, 1732, by his son James. Perth. *Gough's Camden.*

The castle of Perth stood near the red bridge, which terminated the narrow street called *Skinner gate*. At the end of the Castle-street another narrow street leads west to the Black-friars called *Couvre feu row*, where the curfew bell was. The kings of Scotland before James II. were crowned at Scone, and resided at Perth as the metropolis of the nation. James resided and was educated in the castle of Edinburgh, and was crowned there 1437. The parliaments and courts of justice were removed from Perth to Edinburgh, but Perth kept its priority till 22 James III. 1482.

The church in which John Knox harangued is still standing, and is now divided into three; named the *east*, the *middle*, and the *west* kirks. The east kirk was lately very handsomely modernised within. There is an old hospital, a considerable building, the founding of which is ascribed to James VI. The townhouse shuts up the eastern end of the High-street. A monastery of Carthusians was here established by King James I. of Scotland, who lost his life on the very spot, by the treachery of Athol and his accomplices. The king was buried in a very stately monument in this place, which was called *monasterium vallis virtutis*, one of the most magnificent buildings in the kingdom, which with the rest was destroyed by the populace. James VI. created George Hay commendator

Perth. tor of the Carthuſian priory, giving him all its emoluments, with a vote and ſeat in parliament; but theſe not being ſufficient to ſupport the title, he ſurrendered it back to the king. The only remains of this magnificent ſtructure is to be ſeen in the carved ſtones with which the ſouth-eaſt porch of St John's church is built, now greatly decayed. The king's garment full of ſtabs was preſerved here after the reformation.

The town was anciently provided with a ſtone-bridge over the river, which an inundation ſwept away; but a new and very fine one has lately been built, the moſt beautiful ſtructure of the kind in North Britain, and was deſigned and executed by Mr Smeaton. Its length is 900 feet; the breadth (the only blemiſh) 22 within the parapets. The piers are founded 10 feet beneath the bed of the river, upon oaken and beechen piles, and the ſtones laid in puzzalane, and cramped with iron. There are nine arches, of which the centre is 75 feet in diameter. This noble work opens a communication with all the different great roads of the kingdom, and was completed at the expence of 26,000l. Of this the commiſſioners of forfeited eſtates, by his majeſty's permiſſion, gave 11,000 l. Perth 2000l. private ſubſcribers 4756 l. the royal boroughs 500 l. But ſtill this great work would have met with a check for want of money, had not the earl of Kinnoul, with his characteriſtic public ſpirit, advanced the remaining ſum, and taken the ſecurity of the tolls, with the hazard only to himſelf. The whole expence has now been defrayed, and the toll has ceaſed.

Pennant's Tour, 1792. "The Tay (ſays a late traveller), over which this bridge is thrown, and on the ſouthern bank of which the city of Perth ſtands, is truly a noble river. It riſes in Braidalbin, on the frontiers of Lorne. Before it has advanced many miles from its ſource, its ſtream is conſiderably augmented by the acceſſion of ſeveral ſmall rills. Soon after, it diffuſes its waters into a ſmall lake called Loch Dochart; and indeed the river itſelf there bears rather the name of the Dochart. Continuing its courſe from Loch Dochart, it ſoon again expands into another lake. Out of this it proceeds to Killin, ſtill bearing, if I remember right, the name of the Dochart. Here it meets with another river which flows hither by a more north-eaſterly courſe. The waters are diffuſed into the famous Loch Tay, 16 miles in length. Iſſuing from this ſpacious lake at Kenmore, the Tay is ſoon after increaſed by the acceſſion of the Lyon. It proceeds onward in an eaſtern direction through Athol, receiving as it advances all the waters in the country, till at Logierait it is joined by the large river of Tummel. Here it bends to the ſouth, and advancing about 8 miles reaches Dunkeld; whence taking a more northern direction, it continues its courſe towards Perth; being as it advances ſtill augmented by the acceſſion of various tributary ſtreams, the moſt conſiderable of which is the Almond. At Perth it turns to the ſouth-eaſt, and receiving as it proceeds the waters of the Erne, paſſes by Abernethy, once the capital of the Pictiſh kingdom. Soon after this, it expands itſelf to the breadth of three miles. Contracting its breadth, as it approaches Dundee, it there opens into the German ocean.

"Such is the noble river; on the ſouthern bank of which, where it has increaſed into a vaſt body of water, and not a great many miles above where it diſcharges itſelf into the ocean, Perth is advantageouſly ſituated. A perſon acquainted with the general character of great rivers, and with their influence in determining the aſpect and the fertility of the diſtricts thro' which they paſs, might readily, without farther knowledge of the local circumſtances than what is conveyed in this account of the courſe of the Tay, and of the ſituation of Perth upon it, conclude the city to ſtand amid delightful ſcenery, and to enjoy moſt of the advantages which natural circumſtances afford, for the promotion of trade and induſtry."

Perth, Pertinax

This town has but one pariſh, which has two churches, beſides meetings for ſeparatiſts, who are very numerous. One church, which belonged to a monaſtery, is very ancient: not a veſtige of the laſt is now to be ſeen; for the diſciples of Knox made a general deſolation of every edifice that had given ſhelter to the worſhippers of the church of Rome: it being one of his maxims, to pull down the neſts, and then the rooks would fly away.

The flouriſhing ſtate of Perth is owing to two accidents: the firſt, that of numbers of Cromwell's wounded officers and ſoldiers chooſing to reſide here, after he left the kingdom, who introduced a ſpirit of induſtry among the people; the other cauſe was the long continuance of the earl of Marr's army here in 1715, which occaſioned vaſt ſums of money being ſpent in the place. But this town, as well as all Scotland, dates its proſperity from the year 1745; the government of this part of Great Britain having never been ſettled till a little after that time.

That this town does not owe its origin to William I. 1210, as Boethius ſays, is evident from its being mentioned as a conſiderable place in the foundation charter of Holyroodhouſe by David I. 1128.

The trade of Perth is conſiderable. It exports annually 150,000 l. worth of linen, from 24,000 to 30,000 bolls of wheat and barley to London and Edinburgh, and a very large quantity of cured ſalmon. That fiſh is taken there in vaſt abundance; 3000 have been caught in one morning; weighing, one with another, 16 pounds; the whole capture 48,000 pounds. The fiſhery begins on St Andrew's day, and ends Auguſt 26th old ſtyle. The rents of the fiſheries amount to conſiderably upwards of 3000 l. per annum. Smelts come up this river in May and June. See PEARLS. W. Long. 3. 27. N. Lat. 56. 22.

Perth Amboy. See *New Jersey*.

PERTINAX, was an illuſtrious Roman emperor after the death of Commodus. He was deſcended of a mean family; and like his father, who was either a ſlave or the ſon of a manumitted ſlave, he for ſome time followed the employment of drying wood and making charcoal. His poverty did not, however, prevent him from receiving a liberal education. For ſome time he was employed in teaching a number of pupils the Greek and the Roman languages in Etruria. He left this laborious profeſſion and became a ſoldier, and by his valour and intrepidity gradually roſe to offices of the higheſt truſt in the army, and was made conſul by M. Aurelius for his ſervices. He was afterwards entruſted with the government of Mœſia, and at length he preſided over the city of Rome as governor. When Commodus was murdered, Pertinax was univerſally choſen to ſucceed to the imperial dignity;

Pertinax. nity; and his refusal, on the plea of old age and increasing infirmities, did not prevent his being saluted emperor and Augustus. He complied with reluctance; but his mildness, his economy, and popularity, convinced the senate and the people of the prudence and the justice of their choice. He forbad his name to be inscribed on such places or edifices as were part of the imperial domains, and asserted that they belonged not to him but to the public. He melted all the silver statues which had been raised to his predecessor, and he exposed to sale all his concubines, horses, arms, and all the instruments of his pleasure and extravagance. With the money raised from these relics he enriched the empire, and was enabled to abolish all the taxes which Commodus had laid on the rivers, ports, and highways, through the empire. These patriotic actions gained him the affection of the worthiest and most discerning of his subjects; but the extravagant, luxurious, and vicious, raised their clamours against him; and when the emperor attempted to introduce among the pretorian guards such discipline as was absolutely necessary to preserve the peace and tranquillity of Rome, the flames of rebellion were kindled, and the minds of the soldiers totally alienated. Pertinax was apprized of their mutinying, but he refused to fly at the hour of danger. He scorned the advice of such of his friends as wished him to withdraw from the impending storm; and he unexpectedly appeared before the seditious troops, and without fear or concern boldly asked them, whether they who were bound by duty to defend the person of their prince and emperor, were come to betray him and to shed his blood? His undaunted courage and intrepidity would have had the desired effect, and the soldiers had begun to retire, when one of the most seditious of them advanced and darted his javelin at the emperor's breast, exclaiming, *The soldiers send you this.* The rest instantly followed the example; and Pertinax, muffling up his head, and calling upon Jupiter to avenge his death, remained unmoved, and was immediately dispatched. His head was cut off and carried upon the point of a spear in triumph to the camp. This abominable murder happened in the 193d year of the Christian era.

It was no sooner known that Pertinax had been murdered, than the enraged populace flocked from all quarters of the city; and uttering dreadful menaces against the authors of his death, ran up and down the streets in quest of them. The senators were no less concerned for his death than the people; the more, because they were now convinced, that the soldiers would suffer none to reign but tyrants. However, as they had more to lose than the common people, they did not offer to revenge his death; but either shut themselves up in their own houses, or in those of the soldiers of their acquaintance, thinking themselves there most safe. Such was the unfortunate and much-lamented end of Publius Helvius Pertinax, after he had lived 66 years 7 months and 26 or 28 days; and reigned, according to Dio Cassius, 87 days, that is, from the 1st of January to the 28th of March. His body together with his head, was interred with great pomp by Didius Julianus, his successor, in the burying place of his wife's family. The emperor Septimius Severus, with the title of emperor, assumed the name of Pertinax, which he knew would above any thing else recommend him to the army in Illyricum, and to the Roman people. He punished with great severity all those who had been accessary to his death, disbanded the prætorian guards, honoured his memory with a most magnificent funeral, at which was carried the effigies of the deceased prince, pronounced his panegyric, and caused him to be ranked in the number of the gods, appointing the son chief priest to his father. The day of his accession to the empire was yearly celebrated with the Circensian games; and his birthday, for many years after, with other sports. He performed great things, says Herodian, during his short administration, and would have restored the empire to its former lustre, had he been indulged with a longer reign.

Pertinent, Peru.

PERTINENT OF LANDS, in Scots law. See LAW, N° clxvii. 6. p. 670.

PERU, a country of South America, is bounded on the north by Popayan, on the east by Amazonia, on the south by Chili, and on the west by the Pacific ocean; extending from 1° 40′ north to 26° 10′ south latitude, and between 56° and 81° west longitude from Greenwich; being about 1800 miles in length, but its greatest breadth does not much exceed 390.

How discovered by the Spaniards.

This country was discovered by the Spaniards; and the first intelligence they had of it was on the following occasion. Nunez de Balboa having been raised to the government of the small colony at Santa Maria in Darien by the suffrages of his companions, was very desirous of having that authority confirmed by the court of Spain. For this purpose he endeavoured to recommend himself to the Spanish ministry by some important service; that is, by extorting from the Indians as much gold and silver as he could. He therefore made frequent inroads into the adjacent country, subdued several of the caciques or petty princes, and collected a considerable quantity of gold. In one of these expeditions, the Spaniards contended so violently about the division of some gold which they had taken, that they were on the point of coming to blows with one another. A young cacique who was present, astonished at such contention about a thing of which he knew not the use, tumbled the gold out of the balance with indignation, and turning to the Spaniards, told them, that since they valued gold so very highly, he would conduct them to a country where the most common utensils were made of that metal. The Spaniards eagerly catched at this hint; and upon further questioning the cacique, were informed, that at the distance of six days journey, towards the south, from the place where they were at that time, they should discover another ocean, near which this desirable country was situated; but if they intended to attack that powerful state, they must assemble a much greater number of forces than had hitherto appeared on the continent.

Balboa was transported at the news. He immediately concluded, that the ocean mentioned by the cacique was that which Columbus had so long sought for in vain, and that the rich territory described to him must be part of the East Indies. He was therefore impatient till he should arrive at that happy country, in comparison with the discovery of which all former exploits almost vanished into nothing. In order therefore to procure a force sufficient to ensure success

Peru.

in his enterprise, he first secured the friendship of the neighbouring caciques, and then dispatched some of his officers to Hispaniola, with a large quantity of gold as a proof of his past success, and an earnest of what he expected. By this means he secured the friendship of the governor, and procured a considerable reinforcement. But though he now imagined himself sufficiently strong to attempt the discovery, there were still prodigious difficulties to be surmounted.

2 Difficulties he had to overcome.

The isthmus of Darien, though not above 60 miles in breadth, has a chain of lofty mountains running through its whole extent. Being situated between two vast oceans, the Atlantic and Pacific, the climate is excessively moist, insomuch that it rains for two-thirds of the year. In consequence of this the valleys are marshy, and so frequently overflowed, that the inhabitants find it necessary in some places to build their houses upon trees, in order to be elevated at some distance from the damp soil, and the odious reptiles engendered in the waters. There are also many large rivers very difficult to be crossed; and as the country at that time was only inhabited by a few wandering savages, the enterprise of Balboa was looked upon as the most difficult that had been undertaken by any Spanish adventurer.

On this arduous task Balboa set out on the 1st day of September 1513, about the time that the periodical rains began to abate. He had only 190 Spaniards along with him; but all of them were hardy veterans, inured to the climate of America, and very much attached to their leader. A thousand Indians attended in order to carry their provisions and other necessaries; and they had along with them some of those fierce dogs so terrible to the natives of America.

Balboa proceeded by sea, and without difficulty, to the territories of a cacique whose friendship he had gained; but as soon as he began to advance into the interior parts of the country, he met with all the difficulties above-mentioned. Some of the caciques also, at his approach, fled with all their people to the mountains, carrying off or destroying whatever could afford subsistence to an army. Others collected their force in order to oppose him: however, Balboa continued unmoved in spite of all difficulties; and at last,

3 Balboa first gets a sight of the South Sea.

after a most painful journey of 25 days, he arrived at the South Sea; when, with the most extravagant transports of joy, he went into it up to the middle, and took possession of the ocean in his master's name, vowing to defend it against all the enemies of Spain.

That part of the South Sea which Balboa now discovered, he called the *Gulf of St Michael*; which name it still retains, and is situated to the east of Panama. From some of the neighbouring caciques he extorted provisions and gold by force; others sent him presents voluntarily; and he had the satisfaction to hear, that the adjacent coasts abounded with pearl-oysters. The inhabitants were also unanimous in declaring, that there was to the southward a very rich and populous country, where the people had tame animals, which they endeavoured to describe to him, meaning the Peruvian sheep. But, however impatient he might be to visit this empire, he considered it as highly improper to venture thither with a handful of men exhausted by labour and disease. He therefore led back his followers to Santa Maria, in order to refresh them after their fatigues; and from thence he sent an account to the court of Spain of the important discovery he had made, demanding a reinforcement of 1000 men, in order to conquer the country he had newly discovered. But here his hopes were all blasted at once.

Peru.

4 He is deprived of his command.

The king indeed determined to prosecute the discovery, but refused to continue Balboa in his government, appointing Pedrarias Davila to supersede him, and giving him the command of 15 stout vessels, with 1200 soldiers, to ensure his success.

Balboa, though much mortified by his disgrace, submitted to the king's pleasure without repining. It was not long, however, before he met with an additional misfortune; the new governor tried him for some pretended irregularities committed before his arrival, and fined him of almost all he was worth. In the mean time the Spaniards, paying no regard to the treaties concluded by Balboa with the Indians, plundered and destroyed all indiscriminately, insomuch that the whole country, from the gulph of Darien to the lake Nicaragua, was desolated. The new comers had also arrived at the most unlucky time of the year, namely, about the middle of the wet season, when the excessive rains produced the most violent and fatal diseases. To this was joined an extreme scarcity of provisions; so that in the space of a month above 600 Spaniards perished in the utmost misery.

Balboa failed not to send violent remonstrances to Spain against the conduct of the new governor; and he, on the other hand, accused his antagonist of having deceived the king by false accounts of the country, and magnifying his own exploits beyond measure. At last the king, sensible of his error in superseding Balboa, appointed him adelantado, or lieutenant-governor of the countries on the South Sea, with very extensive privileges and authority; enjoining Pedrarias to support him in all his enterprises, and to consult with him in every thing which he himself undertook. It was impossible, however, to extinguish the envy of Pedrarias; and therefore, though a reconciliation took place in appearance, even so far, that Pedrarias agreed to give his daughter in marriage to Balboa, yet he soon after had him condemned and executed on pretence of disloyalty, and an intention to revolt from the king.

5 And put to death.

On the death of Balboa, the thoughts of conquering Peru were for a time laid aside; however, it still remained an object of desire to all the Spanish adventurers in America. Accordingly, several armaments were fitted out with a design to explore and take possession of the countries to the east of Panama; but, either through the difficulties which attended the undertaking itself, or the bad conduct of the adventurers, all of them proved unsuccessful, until at last it became a general opinion, that Balboa's scheme had been entirely visionary.

6 A new expedition set on foot.

Still, however, there were three persons settled at Panama, on whom the common opinion made so little impression, that they determined to go in quest of this country, looked upon to be chimerical by the generality of their neighbours. Their names were *Francisco Pizarro*, *Diego de Almagro*, and *Hernando Luque*. Pizarro and Almagro were soldiers of fortune, and Luque was an ecclesiastic, who acted both as priest and schoolmaster at Panama. Their confederacy was authorised

Peru.

by Pedrarias governor of Panama; and each engaged to employ his whole fortune in the adventure. Pizarro, being the leaſt wealthy of the three, engaged to take upon himſelf the greateſt ſhare of the fatigue and danger, and to command in perſon the armament which was to go firſt upon the diſcovery. Almagro offered to conduct the ſupplies of proviſions and reinforcements of troops which might be neceſſary; and Luque was to remain at Panama, in order to negociate with the governor, and to ſuperintend whatever was carrying on for the general intereſt.

7 eets with l ſucceſs irſt.

In 1524, Pizarro ſet ſail from Panama with a ſingle veſſel of ſmall burthen, and 112 men; and ſo little was he or his countrymen at that time acquainted with the climate of America, that the moſt improper ſeaſon of the whole year was choſen for his departure; the periodical winds, which were then ſet in, being directly oppoſite to the courſe which he propoſed to ſteer. The conſequence of this was, that after beating about for 70 days, with much danger and fatigue, he had advanced ſcarce as far to the ſouth-eaſt as a ſkilful navigator will now make in three days. He touched at ſeveral places of Terra Firma; but finding that country exceedingly inhoſpitable and unhealthy, he was obliged to retire to Chuchama, oppoſite to the Pearl Iſlands, where he hoped to receive ſome reinforcements from Panama. Here he was found by Almagro, who had ſet out in queſt of him with a reinforcement of 70 men, and had ſuffered diſtreſſes very much reſembling thoſe of Pizarro himſelf. In particular, he had loſt an eye in a combat with the Indians. However, he had advanced as far as the river of St Juan in the province of Popayan, where the country ſhowing a better aſpect, and the inhabitants more friendly, our projectors again began to indulge themſelves in hopes, and determined by no means to abandon their ſcheme.

Almagro returned to Panama, in hopes of recruiting their ſhattered troops. But the bad accounts of the ſervice gave his countrymen ſuch an unfavourable idea of it, that Almagro could levy no more than 80 men, and theſe with great difficulty. Slender as this reinforcement was, however, the adventurers did not heſitate at renewing their enterpriſe. The diſaſters and diſappointments they met with in this new attempt, were ſcarce inferior to thoſe they had already experienced, when part of the armament at laſt reached the bay of St Matthew on the coaſt of Quito, and landed at Tacamez, to the ſouth of the river of Emeralds, where they met with a more fertile and champaign country than any they had yet ſeen; the natives alſo were more civilized, and clothed in garments of cotton or woollen ſtuff, adorned with trinkets of gold and ſilver. But notwithſtanding theſe favourable appearances, Pizarro did not think fit to attack ſuch a powerful empire with an handful of ſoldiers already exhauſted; and therefore retired to a ſmall iſland called *Gallo*, with part of the troops; from whence he diſpatched Almagro to Panama, in hopes of obtaining a reinforcement.

The reception which Almagro met with was by no means agreeable. Some of the adventurers had informed their friends of the many dangers and loſſes which they had ſuſtained; which not only diſheartened people from engaging in the ſervice, but weighed ſo much with Pedro de los Rios, the ſucceſſor of Pedrarias, that he prohibited the raiſing of new recruits, and even diſpatched a veſſel to bring home Pizarro and his companions from the iſland of Gallo. Almagro and Luque, though much mortified with this diſappointment, privately adviſed Pizarro not to relinquiſh an enterpriſe on which they had built all their hopes. He therefore poſitively refuſed to obey the orders of the governor, and employed all his addreſs in perſuading his men not to abandon him. But the calamities to which they had been expoſed had ſuch an effect upon them, that when he drew a line upon the ſand with his ſword, telling ſuch as wiſhed to return that they might paſs over it, only 13 had reſolution to remain with him.

Peru.

8 Pizarro abandoned by all his men but thirteen.

Pizarro with his little troop now fixed their reſidence on the iſland of Gorgona, which they conſidered as a ſafer retreat than Gallo, as being farther removed from the coaſt and uninhabited, ſo that they might with the greater ſecurity wait for ſupplies. Here they continued five months in the moſt unwholeſome climate imaginable, and at laſt had come to a reſolution of committing themſelves to ſea on a float, when a veſſel arrived from Panama to their relief. This was the effect of the continued ſolicitations of Almagro and Luque; who, though they could not prevail upon the governor to favour the undertaking, had ſucceeded ſo far as to induce him to ſend a ſmall veſſel to the relief of Pizarro and his unfortunate aſſociates. However, the more effectually to ſhow his diſapprobation of Pizarro's ſcheme, the governor refuſed to allow one landman to go on board of the ſhip which he ſent.—The hopes of the adventurers, however, were now again revived, and Pizarro eaſily induced them to reſume their ſcheme. Inſtead of returning to Panama, therefore, they ſailed to the ſouth-eaſt, and in 20 days after the diſcovery of Gorgona they diſcovered the coaſt of Peru. Having touched at ſome places of leſs note, they at length arrived at Tumbez, remarkable for its ſtately temple, and a palace of the Incas or ſovereigns of the country. Here they found that what had been told them concerning the riches of the country was true; not only ornaments and ſacred veſſels being made of gold and ſilver, but even ſuch as were for common uſe. Yet to attempt the conqueſt of this opulent empire with their ſlender force, would have been madneſs: they contented themſelves therefore with viewing it, procuring two of the beaſts of burthen called *Llamas*, to which they gave the name of ſheep, ſome veſſels of gold and ſilver, and two young men, whom they propoſed to inſtruct in the Caſtilian language. With theſe Pizarro arrived at Panama in the year 1527, near three years after he had ſet out from that place in his expedition.

9 Goes on with his ſcheme at all adventures.

10 Hiſtory of the Incas of Peru.

The empire of Peru thus diſcovered, is ſaid to have been originally poſſeſſed by independent tribes, juſtly reckoned among the moſt ſavage even in America; living more like wild beaſts than men. For ſeveral ages they lived in this manner, when ſuddenly there appeared on the banks of a lake called *Titiaca*, a man and woman of majeſtic form, and clothed in decent garments. They declared themſelves to be the children of the ſun, ſent by their beneficent parent to inſtruct and reclaim mankind.

The names of theſe two extraordinary perſonages were *Manco Capac* and *Mama Ocla*. At their perſua-

Peru.

sion, several of the dispersed savages united, and, receiving their commands as heavenly injunctions, followed them to Cuzco, where they settled, and began to lay the foundations of a city. Manco Capac instructed the men in agriculture, and other useful arts; while Mama Ocla taught the women to spin and weave; after which Manco turned his attention towards the introducing of proper laws and regulations into his new state.

Thus, according to the Indian tradition, was founded the empire of the Incas, or lords of Peru. At first its extent was small, the territory of Manco Capac reaching not above eight leagues from Cuzco his capital. Within these narrow limits, however, he exercised the most perfect despotism, and the same was maintained by his successors, all of whom were not only obeyed as monarchs, but reverenced as deities. Their blood was held to be sacred, and, by prohibiting intermarriages with the people, was never contaminated by mixing with that of any other race. The family, thus separated from the rest of the nation, was distinguished by peculiarities in dress and ornaments, which it was unlawful for others to assume. Among the Peruvians, however, it is said, that this high degree of veneration was made use of by the monarchs only to promote the good of their subjects. If we may believe the accounts given by their countrymen, the Peruvian monarchs extended their empire not with a view to increase their own power and wealth, but from a desire of diffusing the blessings of civilization, and the knowledge of the arts which they possessed, among the barbarous people whom they reduced, and, during a succession of 12 monarchs, not one deviated from this character.

Carver's Modern General Traveller.

The Peruvians were taught by Manco to adore the Creator of heaven and earth, whom they denominated *Paca Camac*, that intelligence which animated the world. They seldom built temples or offered sacrifices to him, but worshipped him in their hearts. One temple, however, dedicated to *The unknown God*, the Spaniards found at their arrival, erected in a valley, thence named *the valley of Paca Camac*. The sacrifices instituted in honour of the sun consisted chiefly of lambs; besides which they offered all sorts of cattle, fowls, and corn, and even burnt their finest cloths on the altar by way of incense. They had also drink offerings made of maize or Indian corn, steeped in water. Nor were those oblations the only acts of adoration in general use among them. When they first drank after their meals, they dipped the tip of their finger into the cup, and lifting up their eyes with great devotion, gave the sun thanks for their liquor, before they presumed to take a draught of it.

11 Religion of the Peruvians.

Besides the worship of the sun, they paid some kind of veneration to the images of several animals and vegetables that had a place in their temples. Those were generally the images brought from the conquered nations, where the people worshipped all sorts of creatures, animate or inanimate; it being the custom, when a province was subdued to remove all their idols to the temple of the sun at Cuzco.

Exclusive of the solemnities at every full moon, four grand festivals were celebrated annually. The first of those, called *Raymi*, was held in the month of June, immediately after the summer solstice, and was kept not only in honour of the sun, but of their first Inca, Manca Capac, and Coya Mama Ocla, his wife and sister, whom the Incas considered as their first parents, descended immediately from the sun, and sent by him into the world to reform and polish mankind. At this festival, all the viceroys, generals, governors, and nobility, were assembled at the capital city of Cuzco; and the emperor, or Inca, officiated in person as high-priest; though on other occasions the sacerdotal function was discharged by the regular pontiff, who was usually either the uncle or brother of the Inca.

Peru.

The morning of the festival being come, the Inca, accompanied by his near relations, drawn up in order according to their seniority, went barefoot in procession, at break of day, to the market-place, where they remained looking attentively towards the east in expectation of the rising sun. The luminary no sooner appeared, than they fell prostrate on their faces in the most profound veneration, and universally acknowledged it to be their god and father.

The vassal princes, and nobility, that were not of the blood royal, assembled in another square, and performed the like ceremony. Out of a large flock of sheep the priests then chose a black lamb, which they offered in sacrifice, first turning its head towards the east. From the entrails of the victim, on this occasion, they superstitiously drew prognostics relating to peace and war, and other public events.

That the Peruvians believed in the immortality of the soul, appears from the practice of the Incas, who constantly inculcated to the people, that on leaving this world, they should enter into a state of happiness provided for them by their god and father the sun.

12 They were acquainted with astronomy before the arrival of the Spaniards.

Before the arrival of the Spaniards in America, the Peruvians were acquainted with some points of astronomy. They had observed the various motions of the planet Venus, and the different phases of the moon. The common people divided the year only by the seasons; but the Incas, who had discovered the annual revolution of the sun, marked out the summer and winter solstices by high towers, which they erected on the east and west of the city of Cuzco. When the sun came to rise directly opposite to four of those towers, on the east side of the city, and to set against those of the west, it was then the summer solstice; and in like manner, when it rose and set against the other towers, it was the winter solstice. They had also erected marble pillars in the great court before the temple of the sun, by which they observed the equinoxes. This observation was made under the equator, when the sun being directly vertical, the pillars cast no shade. At those times they crowned the pillars with garlands of flowers and odoriferous herbs, and celebrating a festival, offered to their adored luminary rich presents of gold and precious stones.

They distinguished the months by the moon, and their weeks were called quarters of the moon; but the days of the week they marked only by the ordinal numbers, as first, second, &c. They were astonished at the eclipses of the sun and moon. When the former hid his face, they concluded it was on account of their sins, imagining that this phenome-

Peru.

non portended famine, war, and peſtilence, or ſome other terrible calamity. In a ſimilar ſtate of the moon, they apprehended that ſhe was ſick, and when totally obſcured, that ſhe was dying. At this alarming criſis they ſounded their trumpets, and endeavoured by every kind of noiſe to rouſe the lunar planet from her ſuppoſed lethargy; teaching their children to cry out, and call upon *mama quilla*, or "mother moon," that ſhe would not die and leave them to periſh.

They made no predictions from any of the ſtars, but conſidered dreams, and the entrails of beaſts which they offered in ſacrifice, as inſtructive objects of divination. When they ſaw the ſun ſet, they imagined that he plunged into the ocean, to appear next morning in the eaſt.

13 They had eachers of morality;

Among a people wholly void of letters, the ſpeculative eſſays of the underſtanding muſt have been very rude and imperfect. They had, however, among them amentas, or philoſophers, who delivered moral precepts, and likewiſe cultivated poetry. Comedies and tragedies compoſed by thoſe bards were acted on their feſtivals before the king and the royal family, the performers being the great men of the court, and the principal officers of the army. The amentas alſo compoſed ſongs and ballads; but if we may judge from the rudeneſs of the muſic with which they are ſaid to have been accompanied, they were far from being agreeable to a poliſhed ear.

14 And were ot unacquainted vith painting and tatuary.

That the Peruvians were not unacquainted with painting and ſtatuary, appears from the furniture and ornaments of their temples and palaces; but in all the implements of mechanic arts they were extremely deficient. Though many goldſmiths were conſtantly employed, they had never invented an anvil of any metal, but in its ſtead made uſe of a hard ſtone. They beat their plate with round pieces of copper in place of hammers; neither had they any files or graving tools. Inſtead of bellows for melting their metals, they uſed copper pipes, of a yard long, almoſt of the form of a trumpet. Having no tongs to take their heated metal out of the fire, they made uſe of a ſtick or copper bar. Their carpenters had no other tools than hatchets made of copper or flint; nor had they learned the uſe of iron; though the country affords mines of that metal. Inſtead of nails, they faſtened their timber with cords or the tough twigs of trees. A thorn, or a ſmall bone, ſerved them for a needle; and inſtead of thread, the ſinews of animals, or the fibres of ſome plant. Their knives were made of flint or copper.

15 Progreſs of he Spaiards facitated by a ivil war mong the atives;

When the Spaniards firſt viſited this country, they found it agitated by a civil war. Huana Capac, the 12th monarch from the founder of the ſtate, was ſeated on the throne; who is repreſented as a prince no leſs conſpicuous for his abilities in war than for his pacific virtues. By him the kingdom of Quito was ſubdued, which almoſt doubled the extent of the dominions and power of the Peruvian empire. Notwithſtanding the ancient and fundamental law againſt polluting the blood of the Inca with any foreign alliance, Huana married the daughter of the conquered monarch, by whom he had a ſon named *Atahualpa*, commonly written *Atabalipa*, to whom, at his death in 1529, he left the kingdom of Quito, beſtowing the reſt of his dominions upon Huaſcar his eldeſt ſon by a mother of the royal race. This produced a civil war, in which Atabalipa proved victorious, and afterwards attempted to ſecure himſelf on the throne by putting to death all the deſcendants of Manco Capac, ſtyled *the children of the Sun*, whom he could ſeize either by force or ſtratagem; however, from a political motive, he ſpared the life of his rival Huaſcar, who had the misfortune to be taken priſoner in an engagement, that, by iſſuing out orders in his name, he might more eaſily eſtabliſh his own authority, and cover the illegality of his birth. Peru.

This conteſt had ſo much engaged the attention of the Peruvians, that they never once attempted to check the progreſs of the Spaniards. It was ſome time, however, before Pizarro was informed of this conteſt, ſo much in his favour. The firſt intelligence which he received of it was a meſſage from Huaſcar, aſking his aſſiſtance againſt Atabalipa, whom he repreſented as a rebel and an uſurper. Pizarro perceived the importance of the intelligence, and therefore determined to puſh forward, while inteſtine diſcord put it out of the power of the Peruvians to attack him with their whole force. Being obliged to divide his troops, in order to leave a garriſon in St Michael, which might ſerve for a place of retreat in caſe of a diſaſter, he began his march with only 62 horſemen and 102 foot-ſoldiers, 20 of whom were armed with croſs-bows, and only three with muſkets. He directed his courſe towards Caxamalca, a ſmall town at the diſtance of 12 days march from St Michael, where Atabalipa was encamped with a conſiderable body of troops. Before he had proceeded far, an officer diſpatched by the Inca met him with a valuable preſent from that prince, accompanied with a proffer of his alliance, and his aſſurances of a friendly reception at Caxamalca. Pizarro, according to the uſual artifice of his countrymen in America, pretended to come as the ambaſſador of a very powerful monarch, and declared that he was now advancing with intention to offer Atabalipa his aid againſt thoſe enemies who diſputed his title to the throne.

16 And by their ignorance of the motives of the Spaniards.

As the object of the Spaniards in entering their country was altogether incomprehenſible to the Peruvians, they had formed various conjectures concerning it, without being able to decide whether they ſhould conſider their new gueſts as beings of a ſuperior nature, who had viſited them from ſome beneficent motive, or as formidable avengers of their crimes, and enemies to their repoſe and liberty. The continual profeſſions of the Spaniards, that they came to enlighten them with the knowledge of truth, and lead them in the way of happineſs, favoured the former opinion; the outrages which they committed, their rapaciouſneſs and cruelty, were awful confirmations of the latter. While in this ſtate of uncertainty, Pizarro's declaration of his pacific intentions ſo far removed all the Inca's fears, that he determined to give him a friendly reception. In conſequence of this reſolution, the Spaniards were allowed to march in tranquillity acroſs the ſandy deſert between St Michael and Motupè, where the moſt feeble effort of an enemy, added to the unavoidable diſtreſſes which they ſuffered in paſſing through that comfortleſs region, muſt have proved fatal to them. From Motupè they advanced towards the mountains which encompaſs the low country of Peru, and paſs-

Peru. ed through a defile ſo narrow and inacceſſible, that a few men might have defended it againſt a numerous army. But here likewiſe, from the ſame inconſiderate credulity of the Inca, the Spaniards met with no oppoſition, and took quiet poſſeſſion of a fort erected for the ſecurity of that important ſtation. As they now approached near to Caxamalca, Atabalipa renewed his profeſſions of friendſhip; and, as an evidence of his ſincerity, ſent them preſents of greater value than the former. Peru.

On entering Caxamalca, Pizarro took poſſeſſion of a large court, on one ſide of which was a houſe which the Spaniſh hiſtorians call a palace of the Inca, and on the other a temple of the ſun, the whole ſurrounded with a ſtrong rampart or wall of earth. When he had poſted his troops in this advantageous ſtation, he diſpatched Hernando Soto, and his brother Ferdinand, to the camp of Atabalipa, which was about a league diſtant from the town. He inſtructed them to confirm the declaration which he had formerly made of his pacific diſpoſition, and to deſire an interview with the Inca, that he might explain more fully the intention of the Spaniards in viſiting his country. They were treated with all the reſpectful hoſpitality uſual among the Peruvians in the reception of their moſt cordial friends, and Atabalipa promiſed to viſit the Spaniſh commander next day in his quarters. The decent deportment of the Peruvian monarch, the order of his court, and the reverence with which his ſubjects approached his perſon and obeyed his commands, aſtoniſhed thoſe Spaniards, who had never met in America with any thing more dignified than the petty cacique of a barbarous tribe. But their eyes were ſtill more powerfully attracted by the vaſt profuſion of wealth which they obſerved in the Inca's camp. The rich ornaments worn by him and his attendants, the veſſels of gold and ſilver in which the repaſt offered to them was ſerved up, the multitude of utenſils of every kind formed of thoſe precious metals, opened proſpects far exceeding any idea of opulence that a European of the 16th century could form.

On their return to Caxamalca, while their minds were yet warm with admiration and deſire of the wealth which they had beheld, they gave ſuch a deſcription of it to their countrymen, as confirmed Pizarro in a reſolution which he had already taken. From his own obſervation of American manners during his long ſervice in the New World, as well as from the advantages which Cortes had derived from ſeizing Montezuma, he knew of what conſequence it was to have the Inca in his power. For this purpoſe, he formed a plan as daring as it was perfidious. Notwithſtanding the character he had aſſumed of an ambaſſador from a powerful monarch, who courted an alliance with the Inca, and in violation of the repeated offers which he had made to him of his own friendſhip and aſſiſtance, he determined to avail himſelf of the unſuſpicious ſimplicity with which Atabalipa relied on his profeſſions, and to ſeize his perſon during the interview to which he had invited him. He prepared for the execution of his ſcheme with the ſame deliberate arrangement, and with as little compunction, as if it had reflected no diſgrace on himſelf or his country. He divided his cavalry into three ſmall ſquadrons, under the command of his brothers Ferdinand, Soto, and Benalcazar; his infantry was formed into one body, except 20 of moſt tried courage, whom he kept near his own perſon to ſupport him in the dangerous ſervice which he reſerved for himſelf; the artillery, conſiſting of two field-pieces, and the croſs-bow men, were placed oppoſite to the avenue by which Atabalipa was to approach. All were commanded to keep within the ſquare, and not to move until the ſignal for action was given.

17 Perfidious ſcheme of Pizarro to ſeize the Inca.

Early in the morning the Peruvian camp was all in motion. But as Atabalipa was ſolicitous to appear with the greateſt ſplendour and magnificence in his firſt interview with the ſtrangers, the preparations for this were ſo tedious, that the day was far advanced before he began his march. Even then, leſt the order of the proceſſion ſhould be deranged, he moved ſo ſlowly, that the Spaniards became impatient and apprehenſive that ſome ſuſpicion of their intention might be the cauſe of this delay. In order to remove this, Pizarro diſpatched one of his officers with freſh aſſurances of his friendly diſpoſition. At length the Inca approached. Firſt of all appeared 400 men in an uniform dreſs, as harbingers to clear the way before him. He himſelf, ſitting on a throne or couch, adorned with plumes of various colours, and almoſt covered with plates of gold and ſilver enriched with precious ſtones, was carried on the ſhoulders of his principal attendants. Behind him came ſome chief officers of his court, carried in the ſame manner. Several bands of ſingers and dancers accompanied this cavalcade; and the whole plain was covered with troops, amounting to more than 30,000 men.

As the Inca drew near the Spaniſh quarters, father Vincent Valverede, chaplain to the expedition, advanced with a crucifix in one hand, and a breviary in the other, and in a long diſcourſe explained to him the doctrine of the creation, the fall of Adam, the incarnation, the ſufferings and reſurrection of Jeſus Chriſt, the appointment of St Peter as God's vicegerent on earth, the tranſmiſſion of his apoſtolical power by ſucceſſion to the popes, the donation made to the king of Caſtile by pope Alexander of all the regions in the New World. In conſequence of all this, he required Atabalipa to embrace the Chriſtian faith, to acknowledge the ſupreme juriſdiction of the pope, and to ſubmit to the king of Caſtile as his lawful ſovereign; promiſing, if he complied inſtantly with this requiſition, that the Caſtilian monarch would protect his dominions, and permit him to continue in the exerciſe of his royal authority; but if he ſhould impiouſly refuſe to obey this ſummons, he denounced war againſt him in his maſter's name, and threatened him with the moſt dreadful effects of his vengeance.

This ſtrange harangue, unfolding deep myſteries, and alluding to unknown facts, of which no power of eloquence could have conveyed at once a diſtinct idea to an American, was ſo lamely tranſlated by an unſkilful interpreter, little acquainted with the idiom of the Spaniſh tongue, and incapable of expreſſing himſelf with propriety in the language of the Inca, that its general tenor was altogether incomprehenſible to Atabalipa. Some parts in it, of more obvious meaning, filled him with aſtoniſhment and indignation. His reply, however, was temperate. He began with obſerving, that he was lord of the dominions over which

he reigned by hereditary ſucceſſion; and added, that he could not conceive how a foreign prieſt ſhould pretend to diſpoſe of territories which did not belong to him; that if ſuch a prepoſterous grant had been made, he, who was the rightful poſſeſſor, refuſed to confirm it; that he had no inclination to renounce the religious inſtitutions eſtabliſhed by his anceſtors; nor would he forſake the ſervice of the ſun, the immortal divinity whom he and his people revered, in order to worſhip the God of the Spaniards, who was ſubject to death; that with reſpect to other matters contained in his diſcourſe, as he had never heard of them before, and did not now underſtand their meaning, he deſired to know where he had learned things ſo extraordinary. "In this book," anſwered Valverede, reaching out to him his breviary. The Inca opened it eagerly; and turning over the leaves, lifted it to his ear: "This," ſays he, "is ſilent; it tells me nothing;" and threw it with diſdain to the ground. The enraged monk, running towards his countrymen, cried out, "To arms, Chriſtians, to arms; the word of God is inſulted; avenge this profanation on thoſe impious dogs."

Pizarro, who during this long conference had with difficulty reſtrained his ſoldiers, eager to ſeize the rich ſpoils of which they had now ſo near a view, immediately gave the ſignal of aſſault. At once the martial muſic ſtruck up, the cannon and muſkets began to fire, the horſe ſallied out fiercely to the charge, the infantry ruſhed on ſword in hand. The Peruvians, aſtoniſhed at the ſuddenneſs of an attack which they did not expect, and diſmayed with the deſtructive effects of the fire-arms, and the irreſiſtible impreſſion of the cavalry, fled with univerſal conſternation on every ſide, without attempting either to annoy the enemy or to defend themſelves. Pizarro, at the head of his choſen band, advanced directly towards the Inca; and though his nobles crowded around him with officious zeal, and fell in numbers at his feet, while they vied one with another in ſacrificing their own lives, that they might cover the ſacred perſon of their ſovereign, the Spaniards ſoon penetrated to the royal ſeat: and Pizarro ſeizing the Inca by the arm, dragged him to the ground, and carried him as a priſoner to his quarters. The fate of the monarch increaſed the precipitate flight of his followers. The Spaniards purſued them towards every quarter, and, with deliberate and unrelenting barbarity, continued to ſlaughter wretched fugitives, who never once offered at reſiſtance. The carnage did not ceaſe until the cloſe of day. Above 4000 Peruvians were killed. Not a ſingle Spaniard fell, nor was one wounded but Pizarro himſelf, whoſe hand was ſlightly hurt by one of his own ſoldiers, while ſtruggling eagerly to lay hold on the Inca.

The plunder taken on this occaſion was immenſe, but the Spaniards were ſtill unſatisfied; which being obſerved by the Inca, he endeavoured to apply himſelf to their ruling paſſion, avarice, in order to obtain his liberty; and therefore offered ſuch a ranſom as aſtoniſhed them, even after all they knew concerning the opulence of the country. The apartment in which he was confined was 22 feet in length and 16 in breadth; and all this ſpace he engaged to fill with veſſels of gold as high as he could reach. This propoſal was eagerly caught by Pizarro, and a line was drawn upon the walls to mark the ſtipulated height.

Peru.

Atabalipa, charmed with the thoughts of liberty, immediately ſet about performing his part of the agreement, and diſpatched meſſengers into all parts of the empire, in order to collect the immenſe quantity of gold which he had promiſed; and though the unfortunate monarch was now in the hands of his enemies, ſuch was the veneration which his ſubjects had for him, that his orders were obeyed with as great alacrity as though he had been at full liberty; while he, in the mean time, flattering himſelf with the hopes of being ſoon releaſed, made no preparations for expelling the invaders from his dominions.

In a ſhort time Pizarro received intelligence that Almagro was arrived at St Michael with a reinforcement equal to the force he had with him. This was a matter of great joy to the Spaniards, and no ſmall vexation to Atabalipa, who now conſidered his kingdom as in danger of being totally over-run by theſe ſtrangers, whoſe force he neither knew, nor the means they had of tranſporting themſelves. For this reaſon he determined to put his brother Huaſcar to death, leſt he ſhould join the ſtrangers againſt him. To this he was the rather inclined, as he had got information that the captive prince had been making applications to them, and had offered them a much larger ſum than what was ſtipulated for the Inca's ranſom; and in conſequence of this determination the unfortunate prince loſt his life.

In the mean time the Indians daily arrived at Caxamalca with vaſt quantities of treaſure; the ſight of which ſo much inflamed the Spaniards, that they inſiſted upon an immediate diviſion: and this being complied with, there fell to the ſhare of each horſeman 8000 peſos, at that time not inferior to the value of as many pounds ſterling in the preſent century, and half as much to each foot-ſoldier. Pizarro and his officers receiving ſhares proportionable to their dignity. A fifth part was reſerved for the emperor, together with ſome veſſels of curious workmanſhip as a preſent. In conſequence of this immenſe acquiſition of wealth, many of the Spaniards became clamorous for their diſcharge; which was readily granted by their general, as well knowing that the diſplay of their riches would not fail to allure adventurers more hardy, though leſs opulent, to his ſtandard.

20
After this diviſion of the ſpoil, Atabalipa was very importunate with Pizarro in order to recover his liberty; but the Spaniard, with unparalleled treachery and cruelty, had now determined to put him to death. To this he was urged by Almagro's ſoldiers, who, though they had received an equal ſhare with the reſt, were ſtill unſatisfied. The Inca's ranſom had not been completed; and they were apprehenſive, that whatever ſums might afterwards be brought in, the troops of Pizarro would appropriate them to themſelves as part of that ranſom. They inſiſted with Pizarro, therefore, to put him to death, that all the adventurers might for the future be on an equal footing. Accounts were likewiſe received that troops were aſſembling in the remote provinces of the empire, which Pizarro ſuſpected to be done by the Inca's orders. Theſe accounts were heightened by one Philippillo an Indian interpreter, who had conceived a paſſion for one of the unhappy monarch's wives; and for that reaſon wiſhed to have him put to death. Atabalipa himſelf,

Pizarro reſolves to put the Inca to death.

Peru. too, had the misfortune to haſten his own ruin by his conceiving a contemptuous notion of Pizarro, which he had not the precaution to conceal. He had, ſince they were firſt diſcovered by him, admired the European arts of reading and writing, and wiſhed much to know whether he ſhould regard it as a natural or acquired talent. In order to determine this, he deſired one of the ſoldiers who guarded him to write the name of God upon the nail of his thumb. This he ſhowed to ſeveral Spaniards ſucceſſively, aſking its meaning; and, to his ſurpriſe, they all returned the ſame anſwer. At length Pizarro entered; and, on preſenting it to him, he bluſhed, and was obliged to own his ignorance; which inſpired the Inca with the contemptuous notion of him above-mentioned.

21 Atabalipa accuſed and condemned,

In order, however, to give ſome ſhow of juſtice to ſuch a deteſtable action, and that he might be exempted from ſtanding ſingly as the perpetrator, Pizarro reſolved to accuſe the Inca of ſome capital crime, and inſtitute a court of judicature for the purpoſe of trying him. For this purpoſe, he appointed himſelf and Almagro, with two aſſiſtants, as judges, with full powers to acquit or condemn: an attorney-general was named to carry on the proſecution in the king's name; counſellors were choſen to aſſiſt the priſoner in his defence; and clerks were ordained to record the proceedings of court. Before this ſtrange tribunal a charge was exhibited ſtill more amazing. It conſiſted of various articles: that Atabalipa, though a baſtard, had diſpoſſeſſed the lawful owner of the throne, and uſurped the regal power; that he had put his brother and lawful ſovereign to death; that he was an idolater, and had not only permitted, but commanded the offering up of human ſacrifices; that he had a great number of concubines; that ſince his impriſonment, he had waſted and embezzled the royal treaſures, which now belonged of right to the conquerors; and that he had excited his ſubjects to take up arms againſt the Spaniards. On theſe heads of accuſation they proceeded to try the ſovereign of a great empire, over whom they had no juriſdiction. To all theſe charges the Inca pleaded not guilty. With reſpect to the death of his brother, he alleged, that the Spaniards could take no cognizance of the fact. With regard to the taxes which he had levied, and the wars he had carried on, they were nothing to the Spaniards; and as to the conſpiracy againſt the Spaniards, he utterly denied it. He called heaven and earth to witneſs the integrity of his conduct, and how faithfully he had performed his engagements, and the perfidy of his accuſers. He deſired to be ſent over to Spain to take his trial before the emperor; but no regard was paid to his intreaties. He was condemned to be burnt alive; which cruel ſentence was mitigated, as a great favour, to ſtrangling; and the unhappy monarch was executed without mercy.

22 And ſtrangled.

The death of the Inca was followed by a revolution in the Spaniſh affairs, who now became generally odious. Hideous cries were ſet up by his women as the funeral proceſſion paſſed by their apartment; many offered to bury themſelves alive with him; and on being hindered, ſtrangled themſelves out of grief and vexation. The whole town of Caxamalca was filled with lamentation, which quickly extended itſelf over the whole kingdom. Friends and enemies accuſed the Spaniards of inhumanity and treachery. Loads of gold that were coming to Caxamalca by order of the deceaſed Inca were now ſtopped; and the loſs of the treaſure was the firſt unfortunate conſequence which the Spaniards felt from their late iniquitous conduct. The two factions of Indians united againſt Pizarro; and many of the Spaniards not only exclaimed againſt the cruelty of the judges, but would even have mutinied, had not a ſenſe of the impending danger kept them quiet. At Cuzco the friends of the emperor Huaſcar proclaimed Manco Capac the legitimate brother of the late Inca, determining to ſupport him to the laſt againſt all the machinations of his enemies. Pizarro, in the mean time, ſet up Taparpa, the ſon of Atabalipa, cauſing him to be treated with all the honours due to an emperor. Immediately he ſet out for Cuzco, the gaining of which was abſolutely neceſſary for his deſign. An army of Indians occupied the paſſes, and reſolved to diſpute his progreſs. The conteſt, however, was ſoon decided; the Spaniſh cavalry bore down every thing before them, and great numbers of Indians were ſlain. The conquerors gained a conſiderable booty; and Pizarro diſpatched Almagro to reduce Cuzco, while he himſelf founded a new colony in the fruitful valley of Xauna; which, however, was not permanent, being afterwards removed to the place where Lima now ſtands.

23 A general revolt of the Peruvians.

While Pizarro was thus employed, another commander, named *Ferdinando Soto*, was detached with 60 horſe to make the beſt of his way to Cuzco, and clear the road for the march of the remainder of the army. He was oppoſed by a formidable collection of Indians, who had fortified themſelves in order to defend a paſs againſt him: for which reaſon, fearing leſt his ſtrength might be unequal, he ſent a meſſage to Pizarro, deſiring that the Inca might join him, thinking that his preſence would awe the Peruvians, and prevent the further effuſion of blood; but his expectations were fruſtrated by the death of the Inca, which happened about this time; ſo that there was now a neceſſity for having recourſe to arms; for as the Spaniards ſet up no perſon in his room, the title of Manco Capac was univerſally acknowledged.

In the mean time, a new ſupply of ſoldiers arriving from Spain, Benalcazar, governor of St Michael, undertook an expedition againſt Quito, where, according to the report of the natives, Atabalipa had left the greateſt part of his treaſure. He accompliſhed his purpoſe with very great difficulty, having a country covered with rocks and mountains to paſs, and being oppoſed by large bodies of the natives. But when he got poſſeſſion of the city, to his extreme mortification, he found that the inhabitants had carried off all their gold and ſilver; for they being now acquainted with the ruling paſſion of the Spaniards, had taken care to diſappoint it, by removing the treaſures which they knew very well had been the cauſe of the expedition.

Chili ſubdued by Almagro.

About the ſame time Alvarado governor of Guatimala, invaded the province of Chili. In this expedition his troops endured ſuch hardſhips, and ſuffered ſo much from the cold among the Andes, that a fifth part of the men and all the horſes died, and at the ſame time the reſt were ſo much diſpirited and emaciated, that they became quite unfit for ſervice. What

was

was worſt of all, when they had arrived at the end of their journey, they met with a body of Spaniards drawn up in hoſtile array to oppoſe them. Theſe had been ſent againſt him by Pizarro, who claimed Chili as part of his juriſdiction, and were now joined by Benalcazar, with the troops under his command. Alvarado, however, advanced boldly to the attack; but, on the interpoſition of ſome moderate men in each party, the difference was accommodated. Alvarado engaged to return to his government, upon his being paid 100,000 peſos to defray the expence of his armament. However, moſt of his followers remained in the country, and enliſted in the ſervice of Pizarro.

In the mean time Ferdinand Pizarro, the brother of the general, had landed in Spain, where he produced ſuch immenſe quantities of gold and ſilver as aſtoniſhed the court, even after all they had ſeen of the wealth of their new-diſcovered territories. The general's authority was confirmed to him with new powers and privileges, and the addition of 70 leagues extending along the coaſt, to the ſouthward of the territory granted in his former patent. Almagro had the title of *adelantado* or *governor* conferred upon him, with juriſdiction over 200 leagues of a country lying ſouthward from the province alloted to Pizarro; he himſelf was made a knight of the order of St Jago.

Of theſe tranſactions ſome accounts were received at Peru before the arrival of Ferdinand Pizarro himſelf; and no ſooner did Almagro hear that he had obtained the royal grant of an independent government, than, pretending that Cuzco, the capital of all Peru, lay within his juriſdiction, he attempted to ſeize it. Pizarro was no leſs ready to oppoſe him; and a very dangerous civil war was about to take place, when the quarrel was made up, on condition that Almagro ſhould attempt the conqueſt of Chili; and if he did not find there an eſtabliſhment equivalent to his expectations, Pizarro ſhould yield up to him part of Peru.

By this reconciliation Pizarro was left at liberty to ſettle the internal policy of his province, which, though little qualified for a legiſlator, he attempted, by dividing the country into various diſtricts, appointing magiſtrates to preſide in each, and eſtabliſhing ſuch regulations concerning the adminiſtration of juſtice, the royal revenue, &c. as occurred to him. The ſeat of government he removed from Cuzco to Lima, which he named *Ciudad des los Reyes*, and which name it ſtill retains among the Spaniards in all legal and formal deeds. Its other name, *Lima*, is a corruption of *Rimac*, the name of the valley in which the city ſtands.

In the mean time Almagro had ſet out on his expedition to Chili; the event of which has been related under the article CHILI; and while he was thus employed, Pizarro encouraged ſome of his moſt diſtinguiſhed officers to invade thoſe provinces of the empire which had not yet been viſited by the Spaniards. This he did with a view to keep them employed, and prevent tumults; but it was attended with very terrible conſequences. No ſooner did Manco Capac the Inca perceive the ſecurity of the Spaniards in thus dividing their forces, than he ſeized the opportunity of making one vigorous effort to redreſs the wrongs of himſelf and his countrymen, and expel the invaders, who had tyrannized in ſuch a cruel manner. Though ſtrictly guarded by the Spaniards, he found means to communicate his intentions to the chief men of his nation, whom he joined in the year 1536, under pretence of celebrating a feſtival which he had obtained liberty from Pizarro to attend. Upon this the ſtandard of war was immediately erected, and a moſt formidable army, according to the Spaniſh hiſtorians, of 200,000 men collected. Many Spaniards were maſſacred in their habitations, and ſeveral detachments entirely cut off; and while this vaſt army laid ſiege to Cuzco, another formidable body inveſted Lima, and kept the governor cloſely ſhut up. The greateſt effort, however, was made againſt Cuzco, which was defended by Pizarro and his two brothers, with only 170 men. The ſiege laſted nine months; many of the Spaniards were killed; among whom was Juan Pizarro, the general's brother, and the beſt beloved of them all. The reſt were reduced to the moſt deſperate ſituation, when Almagro appeared ſuddenly in the neighbourhood of Cuzco. He had received ſuch accounts of the inſurrection in Peru, as would at any rate have determined him to return to the aſſiſtance of Pizarro; but beſides this, he had now received the royal patent, creating him governor of Chili, and deemed it certain beyond all contradiction, that Cuzco lay within his juriſdiction; for which reaſon he haſtened to prevent it from falling into the hands of the Peruvians. On his arrival his aſſiſtance was ſolicited by both parties. The Inca made many advantageous propoſals; but at length deſpairing of obtaining any cordial union with a Spaniard, he attacked him in the night by ſurpriſe with a great body of choſen troops. But the Spaniſh valour and diſcipline prevailed againſt all the numbers of their enemies; and the Peruvians were repulſed with ſuch ſlaughter, that a great part of the remainder diſperſed, and Almagro advanced to the gates of Cuzco without oppoſition. Pizarro's brothers took meaſures to oppoſe his entrance; but prudence for the preſent reſtrained both parties from entering into a civil war while they were ſurrounded with enemies; and therefore each leader endeavoured to corrupt the followers of his antagoniſt. In this Almagro had the advantage; and ſo many of Pizarro's troops deſerted in the night, that Almagro was encouraged to advance towards the city, where he ſurpriſed the centinels; and inveſting the houſe where the two brothers were lodged, he compelled them, after an obſtinate defence, to ſurrender at diſcretion; and Almagro's authority over Cuzco was immediately recognized as authentic.

Peru.

27 A dreadful inſurrection of the Peruvians.

28 They are defeated, and diſperſed.

In this fray only two or three perſons were killed; but matters ſoon began to wear a more ſerious aſpect. Francis Pizarro, having diſperſed the Peruvians who inveſted Lima, and received conſiderable reinforcements from other provinces, ordered 500 men under the command of Alonſo de Alvarado to march to Cuzco, in hopes of relieving his brothers, if they were not already cut off. They advanced to a ſmall diſtance from the capital, before they knew that they had a more formidable enemy than the Indians to encounter. When they ſaw their countrymen drawn up on the banks of a river to oppoſe them, they were greatly ſurpriſed; however, Almagro, who wiſhed rather to gain them than to fight, began with attempting to ſeduce their leader. Alvarado could not by any means be gained over;

29 Civil war between Pizarro and Almagro.

Peru. ever; but being inferior in military ſkill, Almagro attacked him by ſurpriſe, entirely defeated and diſperſed his army, taking himſelf and ſome of his principal officers priſoners.

This victory ſeemed deciſive; and Almagro was adviſed to make it ſo by putting to death Gonzalo and Ferdinand Pizarro, Alvarado, and ſome others whom he could not hope to gain. This advice, however, he declined from motives of humanity, and a deſire of making his adverſary appear the aggreſſor. For theſe reaſons, inſtead of marching directly againſt Pizarro, he retired quietly to Cuzco; which gave his adverſary time to recollect himſelf from the diſorder into which the news of ſo many diſaſters had thrown him. He began again to practiſe upon Almagro thoſe arts which had before proved ſucceſsful; and Almagro again ſuffered himſelf to be deceived by pretended offers of pacification. The negociations for this purpoſe were protracted for ſeveral months; and while Almagro was employed in detecting and eluding the fraudulent intentions of the governor, Gonzalo Pizarro and Alvarado found means to corrupt the ſoldiers who guarded them, and not only made their own eſcape, but perſuaded 60 of Almagro's men to accompany them. There now remained only Ferdinand Pizarro in the hands of Almagro; and he was delivered by another act of treachery. The general propoſed that all points of controverſy ſhould be ſubmitted to the deciſion of their ſovereign; and that Ferdinand Pizarro ſhould be inſtantly ſet at liberty, and return to Spain, together with ſome other officers whom the general propoſed to ſend over to ſhow the juſtice of his claims. Though the intention of Pizarro by making this propoſal was evident, Almagro was deceived by it, and releaſed thoſe whom Pizarro wanted; which he had no ſooner done, than the latter threw off all diſguiſe, and openly declared, that arms alone muſt now decide the matter between them. He therefore immediately ſet out for Cuzco with an army of 700 men, to which Almagro had only 500 to oppoſe. From the weakneſs of his forces, probably, Almagro did not attempt to guard ſome ſtrong paſſes, through which Pizarro had to march, but waited patiently for his adverſary in a plain open country.

30 Almagro defeated and taken priſoner,

In the mean time, Pizarro advanced without any obſtruction from his enemy; and an engagement ſoon happened, in which Almagro was defeated and taken priſoner. The conquerors behaved with great cruelty, maſſacring a great number of officers, and treating Almagro himſelf with great ſeverity. The Indians had aſſembled in great numbers to ſee the battle, with an intention to join the vanquiſhed party; but were ſo much overawed by the Spaniards, that they retired quietly after the battle was over, and thus loſt the only opportunity they ever had of expelling their tyrants.—Almagro, after having for ſome months languiſhed in priſon, was at length formally tried, and condemned to die by Pizarro. Notwithſtanding his conſummate bravery, for which he was remarkable, this hardy veteran could not bear the deliberate approach of death, but condeſcended to uſe intreaties to ſave his life. The Pizarros, however, continued inflexible; and he was firſt ſtrangled in priſon, and then publicly beheaded. He left one ſon by an Indian woman, whom he appointed his ſucceſſor, by virtue of a power granted him by the emperor. Peru.

31 And ſtrangled.

As during theſe diſſenſions all intercourſe with Spain ceaſed, it was ſome time before the accounts of the civil war were received at court. The firſt intelligence was given by ſome of Almagro's ſoldiers, who had left America on the ruin of their cauſe; and they did not fail to repreſent the injuſtice and violence of Pizarro in the ſtrongeſt colours, which ſtrongly prejudiced the emperor againſt him. In a ſhort time, however, Ferdinand Pizarro arrived, and endeavoured to give matters a new turn. The emperor was uncertain which of them he ought to believe; and therefore thought it neceſſary to ſend over ſome perſon with ample powers to inquire into the merits of the cauſe, and to determine certainly who was in the wrong. If he found the governor ſtill alive, he was to aſſume only the title of judge, in order to have the appearance of acting in concert with him; but if he was dead, the viceroy might then produce his commiſſion appointing him Pizarro's ſucceſſor in the government. This complaiſance to Pizarro, however, proceeded more from a dread of his power than from any other thing; for in the mean time, his brother Ferdinand was arreſted at Madrid, and confined to a priſon, where he remained above 20 years. The perſon nominated to this important truſt was Chriſtoval Vaca de Caſtro.

32 Peru divided by Pizarro among his aſſociate

While this gentleman was preparing for his voyage, Pizarro, conſidering himſelf as the unrivalled maſter of Peru, proceeded to parcel out its territories among the conquerors; and had this diviſion been made with any degree of impartiality, the extent of country which he had to beſtow was ſufficient to have gratified his friends, and to have gained his enemies. But Pizarro conducted this tranſaction, not with the equity and candour of a judge attentive to diſcover and to reward merit, but with the illiberal ſpirit of a party-leader. Large diſtricts, in parts of the country moſt cultivated and populous, were ſet apart as his own property, or granted to his brothers, his adherents, and favourites. To others, lots leſs valuable and inviting were aſſigned. The followers of Almagro, amongſt whom were many of the original adventurers, to whoſe valour and perſeverance Pizarro was indebted for his ſucceſs, were totally excluded from any portion in thoſe lands, towards the acquiſition of which they had contributed ſo largely. As the vanity of every individual ſets an immoderate value upon his own ſervices, and the idea of each, concerning the recompence due to them, roſe gradually to a more exorbitant height in proportion as their conqueſts extended, all who were diſappointed in their expectations exclaimed loudly againſt the rapaciouſneſs and partiality of the governor. The partiſans of Almagro murmured in ſecret, and meditated revenge.

Rapid as the progreſs of the Spaniards in South America had been ſince Pizarro landed in Peru, their avidity of dominion was not yet ſatisfied. The officers to whom Ferdinand Pizarro gave the command of different detachments, penetrated into ſeveral new provinces; and though ſome of them were expoſed to great hardſhips in the cold and barren regions of the Andes, and others ſuffered diſtreſs not inferior amidſt the wood and marſhes of the plains, they made diſcoveries

Peru. veries and conquefts which extended their knowledge of the country, as well as added to their power. Pedro de Valdivia re-aſſumed Almagro's ſcheme of invading Chili; and, notwithſtanding the fortitude of the natives in defending their poſſeſſions, made ſuch progreſs in the conqueſt of the country, that he founded the city of St Jago, and gave a beginning to the eſtabliſhment of the Spaniſh dominion there. But of all the enterpriſes undertaken about this period, that of Gonzales Pizarro was the moſt remarkable. The governor, who ſeems to have reſolved that no perſon in Peru ſhould poſſeſs any ſtation of diſtinguiſhed eminence or authority but thoſe of his own family, had deprived Benalcazar, the conqueror of Quito, of his command in that kingdom, and appointed his brother Gonzales to take the government of it. He inſtructed him to attempt the diſcovery and conqueſt of the country to the eaſt of the Andes; which, according to the information of the Indians, abounded with cinnamon and other valuable ſpices. Gonzales, not inferior to any of his brothers in courage, and no leſs ambitious of acquiring diſtinction, eagerly engaged in this difficult ſervice. He ſet out from Quito at the head of 340 ſoldiers, near one half of whom were horſemen, with 4000 Indians to carry their proviſions. In forcing their way through the defiles, or over the ridges of the Andes, exceſs of cold and fatigue, to neither of which they were accuſtomed, proved fatal to the greater part of the wretched attendants. The Spaniards, tho' more robuſt, and inured to a variety of climates, ſuffered conſiderably, and loſt ſome men; but when they deſcended into the low country, their diſtreſs increaſed. During two months it rained inceſſantly, without any interval of fair weather long enough to dry their clothes. The vaſt plains upon which they were now entering, either altogether without inhabitants, or occupied by the rudeſt and leaſt induſtrious tribes in the New World, yielded little ſubſiſtence. They could not advance a ſtep but as they cut a road through woods, or made it through marſhes. Such inceſſant toil, and continual ſcarcity of food, ſeem more than ſufficient to have exhauſted and diſpirited any troops. But the fortitude and perſeverance of the Spaniards in the 16th century were inſuperable. Allured by frequent but falſe accounts of rich countries before them, they perſiſted in ſtruggling on, until they reached the banks of the Coca or Napo, one of the large rivers whoſe waters pour into the Maragnon, and contribute to its grandeur. There, with infinite labour, they built a bark, which they expected would prove of great utility, both in conveying them over rivers, in procuring proviſions, and in exploring the country. This was manned with 50 ſoldiers, under the command of Francis Orellana, the officer next in rank to Pizarro. The ſtream carried them down with ſuch rapidity, that they were ſoon far a-head of their countrymen, who followed ſlowly and with difficulty by land.

At this diſtance from his commander, Orellana, a young man of an aſpiring mind, began to fancy himſelf independent; and, tranſported with the predominant paſſion of the age, he formed the ſcheme of diſtinguiſhing himſelf as a diſcoverer, by following the courſe of the Maragnon until it joined the ocean, and by ſurveying the vaſt regions through which it flows. This ſcheme of Orellana's was as bold as it was treacherous. For, if he be chargeable with the guilt of having violated his duty to his commander, and with having abandoned his fellow-ſoldiers in a pathleſs deſert, where they had hardly any hopes of ſucceſs, or even of ſafety, but what were founded on the ſervice which they expected from the bark, his crime is, in ſome meaſure, balanced by the glory of having ventured upon a navigation of near 2000 leagues, through unknown nations, in a veſſel haſtily conſtructed with green timber, and by very unſkilful hands, without proviſions, without a compaſs, or a pilot. But his courage and alacrity ſupplied every defect. Committing himſelf fearleſsly to the guidance of the ſtream, the Napo bore him along to the ſouth, until he reached the great channel of the Maragnon. Turning with it towards the coaſt, he held on his courſe in that direction. He made frequent deſcents on both ſides the river, ſometimes ſeizing by force of arms the proviſions of the fierce ſavages ſeated on its banks, and ſometimes procuring a ſupply of food by a friendly intercourſe with more gentle tribes. After a long ſeries of dangers, which he encountered with amazing fortitude, and of diſtreſſes which he ſupported with no leſs magnanimity, he reached the ocean, where new perils awaited him. Theſe he likewiſe ſurmounted, and got ſafe to the Spaniſh ſettlement in the iſland Cubagua; from thence he ſailed to Spain. The vanity natural to travellers who viſit regions unknown to the reſt of mankind, and the art of an adventurer, ſolicitous to magnify his own merit, concurred in prompting him to mingle an extraordinary proportion of the marvellous in the narrative of his voyage. He pretended to have diſcovered nations ſo rich, that the roofs of their temples were covered with plates of gold; and deſcribed a republic of women ſo warlike and powerful, as to have extended their dominion over a conſiderable tract of the fertile plains which he had viſited. Extravagant as thoſe tales were, they gave riſe to an opinion, that a region abounding with gold, diſtinguiſhed by the name of *El Dorado*, and a community of Amazons, were to be found in this part of the New World; and ſuch is the propenſity of mankind to believe what is wonderful, that it has been ſlowly, and with difficulty, that reaſon and obſervation have exploded thoſe fables. The voyage, however, even when ſtripped of every romantic embelliſhment, deſerves to be recorded, not only as one of the moſt memorable occurrences in that adventrous age, but as the firſt event that led to any certain knowledge of thoſe immenſe regions that ſtretch eaſtward from the Andes to the ocean.

No words can deſcribe the conſternation of Pizarro, when he did not find the bark at the confluence of the Napo and Maragnon, where he had ordered Orellana to wait for him. He would not allow himſelf to ſuſpect that a man, whom he had entruſted with ſuch an important command, could be ſo baſe and ſo unfeeling as to deſert him at ſuch a juncture. But imputing his abſence from the place of rendezvous to ſome unknown accident, he advanced above 50 leagues along the banks of the Maragnon, expecting every moment to ſee the bark appear with a ſupply of proviſions. At length he came up with an officer whom Orellana had left to periſh in the deſert, becauſe he had the courage to remonſtrate againſt his perfidy. From him he learned the extent of Orellana's crime; and his followers perceived at once their own deſperate ſituation, when deprived of their only reſource. The ſpirit of the ſtout-

eſt hearted veteran ſunk within him; and all demanded to be led back inſtantly. Pizarro, though he aſ-

35 Extreme diſtreſs of Gonzales Pizarro and his men.

ſumed an appearance of tranquillity, did not oppoſe their inclination. But he was now 1200 miles from Quito; and in that long march the Spaniards encountered hardſhips greater than thoſe they had endured in their progreſs outward, without the alluring hopes which then ſoothed and animated them under their ſufferings. Hunger compelled them to feed on roots and berries, to eat all their dogs and horſes, to devour the moſt loathſome reptiles, and even to gnaw the leather of their ſaddles and ſword belts. Four thouſand Indians, and 210 Spaniards, periſhed in this wild and diſaſtrous expedition, which continued near two years; and as 50 men were aboard the bark with Orellana, only 80 got back to Quito. Theſe were naked like ſavages, and ſo emaciated with famine, or worn out with fatigue, that they had more the appearance of ſpectres than of men.

36 A conſpiracy formed againſt the governor;

But, inſtead of returning to enjoy the repoſe which his condition required, Pizarro, on entering Quito, received accounts of a fatal event that threatened calamities more dreadful to him than thoſe through which he had paſſed. From the time that his brother made that partial diviſion of his conqueſts which has been mentioned, the adherents of Almagro, conſidering themſelves as proſcribed by the party in power, no longer entertained any hope of bettering their condition. Great numbers in deſpair reſorted to Lima, where the houſe of young Almagro was always open to them: and the ſlender portion of his father's fortune, which the governor allowed him to enjoy, was ſpent in affording them ſubſiſtence. The warm attachment with which every perſon who ſerved under the elder Almagro devoted himſelf to his intereſts, was quickly transferred to his ſon, who was now grown up to the age of manhood, and poſſeſſed all the qualities which captivate the affections of ſoldiers. Of a graceful appearance, dexterous at all martial exerciſes, bold, open, generous, he ſeemed to be formed for command; and as his father, conſcious of his own inferiority from the total want of education, had been extremely attentive to have him inſtructed in every ſcience becoming a gentleman, the accompliſhments which he had acquired heightened the reſpect of his followers, as they gave him diſtinction and eminence among illiterate adventurers. In this young man the Almagrians found a point of union which they wanted; and looking up to him as their head, were ready to undertake any thing for his advancement. Nor was affection for Almagro their only incitement; they were urged on by their own diſtreſſes. Many of them, deſtitute of common neceſſaries, and weary of loitering away life, a burden to their chief, or to ſuch of their aſſociates as had ſaved ſome remnant of their fortune from pillage and confiſcation, longed impatiently for an occaſion to exert their activity and courage, and began to deliberate how they might be avenged on the author of all their miſery. Their frequent cabals did not paſs unobſerved; and the governor was warned to be on his guard againſt men who meditated ſome deſperate deed, and had reſolution to execute it. But, either from the native intrepidity of his mind, or from contempt of perſons whoſe poverty rendered their machinations of little conſequence, he diſregarded the admonitions of his friends. "Be in no pain (ſaid he careleſsly) about my life; it is perfectly ſafe, as long as every man in Peru knows that I can in a moment put him to death who dares to harbour a thought againſt it." This ſecurity gave the Almagrians full leiſure to digeſt and ripen every part of their ſcheme; and Juan de Herrada, an officer of great abilities, who had the charge of Almagro's education, took the lead in their conſultations, with all the zeal which that connection inſpired, and with all the authority which the aſcendant that he was known to have over the mind of his pupil gave him.

37 Who is murdered.

On Sunday, the 26th of June, at mid-day, the ſeaſon of tranquillity and repoſe in all ſultry climates, Herrada, at the head of 18 of the moſt determined conſpirators, ſallied out of Almagro's houſe in complete armour; and drawing their ſwords, as they advanced haſtily towards the governor's palace, cried out, "Long live the king, but let the tyrant die." Their aſſociates, warned of their motions by a ſignal, were in arms at different ſtations ready to ſupport them. Though Pizarro was uſually ſurrounded by ſuch a numerous train of attendants as ſuited the magnificence of the moſt opulent ſubject of the age in which he lived, yet as he was juſt riſen from table, and moſt of his own domeſtics had retired to their own apartments, the conſpirators paſſed through the two outer courts of the palace unobſerved. They were at the bottom of the ſtaircaſe, before a page in waiting could give the alarm to his maſter, who was converſing with a few friends in a large hall. The governor, whoſe ſteady mind no form of danger could appal, ſtarting up, called for arms, and commanded Franciſco de Chaves to make faſt the door. But that officer, who did not retain ſo much preſence of mind as to obey this prudent order, running to the top of the ſtaircaſe, wildly aſked the conſpirators what they meant, and whither they were going? Inſtead of anſwering, they ſtabbed him to the heart, and burſt into the hall. Some of the perſons who were there threw themſelves from the windows; others attempted to fly; and a few drawing their ſwords, followed their leader into an inner apartment. The conſpirators, animated with having the object of their vengeance now in view, ruſhed forward after them. Pizarro, with no other arms than his ſword and buckler, defended the entry, and, ſupported by his half-brother Alcantara and his little knot of friends, maintained the unequal conteſt with intrepidity worthy of his paſt exploits, and with the vigour of a youthful combatant. "Courage (cried he), companions, we are yet enow to make thoſe traitors repent of their audacity." But the armour of the conſpirators protected them, while every thruſt they made took effect. Alcantara fell dead at his brother's feet; his other defendants were mortally wounded. The governor, ſo weary that he could hardly wield his ſword, and no longer able to parry the many weapons furiouſly aimed at him, received a deadly thruſt full in his throat, ſunk to the ground, and expired.

As ſoon as he was ſlain, the aſſaſſins ran out into the ſtreets, and waving their bloody ſwords, proclaimed the death of the tyrant. Above 200 of their aſſociates having joined them, they conducted young Almagro in ſolemn proceſſion through the city; and aſſembling the magiſtrates and principal citizens, com-

pelled them to acknowledge him as lawful ſucceſſor to his father in his government. The palace of Pizarro, together with the houſes of ſeveral of his adherents, were pillaged by the ſoldiers; who had the ſatisfaction at once of being avenged on their enemies, and of enriching themſelves by the ſpoils of thoſe through whoſe hands all the wealth of Peru had paſſed.

The new governor marched into the heart of the empire, in order to reduce ſuch places as refuſed to acknowledge his authority. A multitude of ruffians joined him on his march. His army breathed nothing but vengeance and plunder: every thing gave way before it. If the military talents of the general had equalled the ardour of his troops, the war had ended here. Unhappily for Almagro, he had loſt his conductor John de Herrada. His inexperience made him fall into the ſnares that were laid for him by Pedro Alvares, who had put himſelf at the head of the oppoſite party. He loſt, in attempting to unravel his plots, that time that he ought to have employed in fighting. In theſe circumſtances, an event, which no one could have foreſeen, happened to change the face of affairs.

The licentiate Vaca di Caſtro, who had been ſent from Europe to try the murderers of old Almagro, arrived at Peru. As he was appointed to aſſume the government in caſe Pizarro was no more, all who had not ſold themſelves to the tyrant haſtened to acknowledge him. Uncertainty and jealouſy, which had for too long a time kept them diſperſed, were no longer an obſtacle to their re-union. Caſtro, who was as reſolute as if he had grown old in the ſervice, did not ſuffer their impatience to languiſh, but inſtantly led them againſt the enemy. The two armies engaged at Chapas on the 16th of September 1542, and fought with inexpreſſible obſtinacy. Victory, after having wavered a long time, at the cloſe of the day decided in favour of that party whoſe cauſe was the moſt juſt. Thoſe among the rebels who were moſt guilty, dreading to languiſh under diſgraceful tortures, provoked the conquerors to murder them, crying out, like men in deſpair, *It was I who killed Pizarro.* Their chief was taken priſoner, and died on the ſcaffold.

While theſe ſcenes of horror were tranſacting in America, the Spaniards in Europe were employed in finding out expedients to ternate them; though no meaſures had been taken to prevent them. Peru had only been made ſubject to the audience of Panama, which was too remote to ſuperintend the maintenance of good order, and had too little influence to make its decrees reſpected. A ſupreme tribunal was then eſtabliſhed at Lima for the diſpenſation of juſtice, which was to be inveſted with authority ſufficient to enforce and to reward a due obedience to the laws. Blaſco Nunez Vela, who preſided in it as viceroy, arrived in 1544, attended by his ſubordinates in office, and found every thing in the moſt dreadful diſorder.

To put an end to theſe tumults which now ſubſiſted, would have required a profound genius, and many other qualities which are ſeldom united. Nunez had none of theſe advantages. Nature had only given him probity, firmneſs and ardour; and he had taken no pains to improve theſe gifts. With theſe virtues, which were almoſt defects in his ſituation, he began to fulfil his commiſſion, without regard to places, perſons, or circumſtances. Peru.

Contrary to the opinion of all intelligent perſons, who wiſhed that he ſhould wait for freſh inſtructions from Europe, he publiſhed ordinances, which declared that the lands the conquerors had ſeized ſhould not paſs to their deſcendants, and which diſpoſſeſſed thoſe who had taken part in the civil commotions. All the Peruvians who had been enſlaved by monks, biſhops, and perſons belonging to the government, were declared free. Thoſe who belonged to other maſters were to be freed from their ſhackles at the death of their oppreſſors. They could no longer be compelled to bury themſelves in the mines, nor could any kind of labour be exacted from them without payment. Their tribute was fixed. The Spaniards who travelled on foot were deprived of the right of taking three Indians to carry their baggage; and thoſe who travelled on horſeback, of the right of taking five. The caciques were diſcharged from the obligation of furniſhing the traveller and his retinue with proviſions gratis. Other tyrannical eſtabliſhments alſo would ſoon have been proſcribed; and the conquered people were on the eve of being ſheltered under the protection of laws, which would at leaſt have tempered the rigours of the right of conqueſt, if even they had not entirely repaired the injuſtice of them; but it ſhould ſeem that the Spaniſh government was only to be unfortunate in the good it attempted to effect. 42 Bad conduct of the viceroy Nunez Vela.

A change ſo unexpected filled thoſe with conſternation who ſaw their fortunes wreſted from them, or who loſt the flattering hope of tranſmitting them to their poſterity. Even thoſe who were not affected by theſe intereſted views, being accuſtomed to look upon the Indians as the inſtruments and victims of their avarice, had no conception that any other ideas could prevail concerning them. From aſtoniſhment they proceeded to indignation, murmuring, and ſedition. The viceroy was degraded, put in irons, and baniſhed to a deſert iſland, till he could be conveyed to Spain.

Gonzales Pizarro was then returned from his hazardous expedition, which had employed him long enough to prevent him from taking a part in thoſe revolutions which had ſo rapidly ſucceeded each other. The anarchy he found prevailing at his return, inſpired him with the idea of ſeizing the ſupreme authority. His fame and his forces made it impoſſible that this ſhould be refuſed him; but his uſurpation was marked with ſo many enormities, that Nunez was regretted. He was recalled from exile, and ſoon collected a ſufficient number of forces to enable him to take the field. Civil commotions were then renewed with extreme fury by both parties. No quarter was aſked or given on either ſide. The Indians took part in this as they had done in the preceding wars; ſome ranged themſelves under the ſtandard of the viceroy, others under the banners of Gonzales. From 15,000 to 20,000 of theſe unhappy wretches, who were ſcattered about in each army, dragged up the artillery, levelled the roads, carried the baggage, and deſtroyed one another. Their conquerors had taught them to be ſanguinary. After a variety of advantages for a long time alternately obtained, fortune at length favoured the rebellion under 43 He is overcome and killed by Gonzales Pizarro.

Peru. the walls of Quito in the month of January, in the year 1545; and Nunez with the greateſt part of his men were maſſacred.

Pizarro took the road of Lima, where they were deliberating on the ceremonies with which they ſhould receive him. Some officers wiſhed that a canopy ſhould be carried for him to march under, after the manner of kings. Others, with adulation ſtill more extravagant, pretended that part of the walls of the town, and even ſome houſes, muſt be pulled down; as was the cuſtom at Rome, when a general obtained the honours of a triumph. Gonzales contented himſelf with making his entrance on horſeback, preceded by his lieutenant, who marched on foot. Four biſhops accompanied him, and he was followed by the magiſtrates. The ſtreets were ſtrewn with flowers, and the air reſounded with the noiſe of bells and various muſical inſtruments. This homage totally turned the head of a man naturally haughty, and of confined ideas. He ſpoke and acted in the moſt deſpotic manner.

Had Gonzales poſſeſſed judgment and the appearance of moderation, it would have been poſſible for him to render himſelf independent. The principal perſons of his party wiſhed it. The majority would have beheld this event with indifference, and the reſt would have been obliged to conſent to it. Blind cruelties, inſatiable avarice, and unbounded pride, altered theſe diſpoſitions. Even thoſe, whoſe intereſts were connected with thoſe of the tyrant, wiſhed for a deliverer.

42 An end put to the troubles by Pedro di la Gaſca.

Such a deliverer arrived from Europe in the perſon of the licentiate Pedro di la Gaſca. The ſquadron and the provinces of the mountains immediately declared for a perſon who was inveſted with a lawful authority to govern them. Thoſe who lived concealed in deſerts, caverns, and foreſts, quitted their retreats to join him. Gonzales, who ſaw no reſource left to ſupport him but in ſome great atchievement, took the road of Cuzco, with a reſolution to give battle. At ſome leagues diſtance from this place he met the royal army, and attacked it on the 9th of June 1548. One of his lieutenants, ſeeing him abandoned at the firſt charge by his beſt ſoldiers, adviſed him to throw himſelf into the enemy's battalions, and periſh like a Roman: but this weak man choſe rather to ſurrender, and end his life on a ſcaffold. Carvajal, a more able warrior, and more ferocious than himſelf, was quartered. This man, when he was expiring, boaſted that he had maſſacred with his own hand 1400 Spaniards and 20,000 Indians.

Such was the laſt ſcene of a tragedy, of which every act has been marked with blood. The government was moderate enough not to continue the proſcriptions; and the remembrance of the horrid calamities they had ſuffered kept the Spaniards in the bounds of ſubjection. What ſtill remained of that commotion that had been raiſed in their minds, inſenſibly ſunk into a calm; and the country hath remained in quiet ever ſince.

43 Hard ſtate of the Peruvians.

With regard to the Peruvians, the moſt cruel meaſures were taken to render it impoſſible for them to rebel. Tupac Amaru, the heir of their laſt king, had taken refuge in ſome remote mountains, where he lived in peace. There he was ſo cloſely ſurrounded by the troops which had been ſent out againſt him, that he was forced to ſurrender. The viceroy Francis de Toledo cauſed him to be accuſed of ſeveral crimes that he had not committed, and for which he was beheaded in 1571. All the other deſcendants of the Incas ſhared the ſame fate, under pretence that they had conſpired againſt their conquerors. The horror of theſe enormities excited ſo univerſal an indignation both in the Old and the New World, that Philip II. thought himſelf obliged to diſavow them; but the infamous policy of this prince was ſo notorious, that no credit was given to this appearance of his juſtice and humanity.

Peru

44 Extent of the empire

The empire of Peru, at the time it was ſubdued, extended along the South Sea, from the river of Emeralds to Chili, and on the land ſide to Popayan, according to ſome geographers. It contained within its extent that famous chain of mountains which riſes in the Terra Magellanica, and is gradually loſt in Mexico, in order to unite, as it ſhould ſeem, the ſouthern parts of America with the northern.

Payne's geography.

It is now divided into three grand diviſions or audiences; Quito, Lima, or Los Reyes, and Los Charcos. As to its climate, mines, ſoil, and produce, they differ greatly in different parts of the country.

45 Province Quito.

The extenſive province of Quito is bounded on the north by Popayan, and includes a part of that government, alſo by Santa Fe de Bogota; on the ſouth by the governments of Piura and Chachapoyas; on the eaſt it extends over the whole government of Maynas and the river of the Amazons to the meridian, which divides the Spaniſh from the Portugueſe dominions; and on the weſt it is bounded by the South Sea; extending, according to Antonio de Ulloa, 600 leagues in length, and about 200 in its greateſt breadth; but this greatly exceeds the computation of all other geographers. He however obſerves, that it muſt be owned a great part of thoſe vaſt dominions are either inhabited by nations of Indians, or have not hitherto been ſufficiently peopled by the Spaniards, if indeed they have been thoroughly known; and that all the parts that can properly be ſaid to be peopled, and actually ſubject to the Spaniſh government, are thoſe intercepted by the two Cordilleras of the Andes, which, in compariſon to the extent of the country, may be termed a ſtreet or lane, 15 leagues, or ſometimes more, from eaſt to weſt; to this muſt be added ſeveral detached governments, ſeparated by the very extenſive tracts inhabited by free Indians.

46 Climate ſeaſons, of this province.

The climate of Quito differs from all others in the ſame parallel, ſince even in the centre of the torrid zone, or although under the equinoctial, the heat is not only very tolerable, but even in ſome places the cold is painful; while others enjoy all the advantages of a perpetual ſpring, the fields being conſtantly covered with verdure, and enamelled with flowers of the moſt lively colours. The mildneſs of the climate, free from the extremes of heat and cold, and the conſtant equality of the day and night, render this country, which from its ſituation might be thought to be parched by the conſtant heat of the ſun, and ſcarcely inhabitable, both pleaſant and fertile; for nature has here diſpenſed her bleſſings with ſo liberal a hand, that this country in ſeveral reſpects ſurpaſſes thoſe of the temperate zones, where the viciſſitudes of winter and ſummer, and the change

Peru. change from heat to cold, cauſe the extremes of both to be more ſenſibly felt. However, in different parts of the country, the air is very different; in one part are mountains of a ſtupendous height and magnitude, with their ſummits covered with ſnow. The plains are temperate, the valleys hot, and, according to the high or low ſituation of the country, are found all the variety of gradations in temperature poſſible to be conceived between the extremes of heat and cold.

Quito, the capital, in 0° 13′ ſouth latitude, and 77° 50′ weſt longitude from Greenwich, is ſo happily ſituated, that neither heat nor cold are troubleſome, though both may be felt in its neighbourhood; and what renders this equality more delightful is, that it is conſtant throughout the whole year, the difference between the ſeaſons being ſcarce perceptible. Indeed the mornings are cool, the remainder of the day warm, and the nights of an agreeable temperature. See QUITO.

The winds, which are pure and ſalubrious, blow for the moſt part from north to ſouth, but never with any violence, though they ſometimes ſhift their quarters, but without any regard to the ſeaſon of the year. Such ſignal advantages reſulting from the climate, ſoil, and aſpect of this country, would be ſufficient to render it the moſt enviable ſpot upon earth, as it is ſuppoſed to be the moſt elevated, if, whilſt enjoying theſe delights, the inhabitants were not haraſſed by terror, and expoſed to continual danger; for here tremendous tempeſts of thunder and lightning prevail, which are ſufficient to appal the ſtouteſt heart; whilſt earthquakes frequently ſpread univerſal apprehenſions, and ſometimes bury cities in ruins.

The diſtinction of winter and ſummer conſiſts in a very minute difference; the interval between the month of September and thoſe of April, May, or June, is here called the winter ſeaſon, and the other months compoſe the ſummer. In the former ſeaſon the rain chiefly prevails, and in the latter the inhabitants frequently enjoy whole days of fine weather; but whenever the rains are diſcontinued for above a fortnight, the inhabitants are in the utmoſt conſternation, and public prayers are offered up for their return. On the other hand, when they continue a ſhort time without intermiſſion, the like fears prevail, and the churches are again crowded with ſupplicants to obtain fine weather; for a long drought produces dangerous diſeaſes, and a continual rain, without intervals of ſunſhine, deſtroys the fruits of the earth. The city of Quito, however, enjoys one peculiar advantage in being free from muſketoes and other troubleſome inſects, ſuch as fleas and venemous reptiles, except the *nigua*, or *pique*, which is a very ſmall inſect ſhaped like a flea, but hardly viſible to the ſight. See CHEGOE.

47 Fertility, &c. The fertility of the ſoil here is incredible, for the fruits and beauties of the ſeveral ſeaſons are viſible at the ſame time; and the curious European obſerves with a pleaſing admiration, that while ſome herbs of the field are fading, others of the ſame kind are ſpringing up; while ſome flowers loſe their beauty, others blow to continue the enamelled proſpect: thus, when the fruits of the trees have attained their maturity, and the leaves begin to change their colour, freſh leaves bloſſom, and fruits are ſeen in their proper gradations in ſize and ripeneſs on the ſame tree. The ſame inceſſant fertility is conſpicuous in the corn, both reaping and ſowing being carried on at the ſame time: ſo that the declivities of the neighbouring hills exhibit all the beauties of the four ſeaſons in one aſſemblage. Though all this is generally ſeen, yet there is a ſettled time for the grand harveſt: yet ſometimes the moſt favourable ſeaſon for ſowing in one place is a month or two after that of another, though their diſtance does not exceed three or four leagues. Thus in different ſpots, and ſometimes in one and the ſame, ſowing and reaping are performed throughout the whole year, the forwardneſs or retardment naturally ariſing from the different ſituations, ſuch as mountains, riſing grounds, plains, and valleys; and the temperature being different in each, the beſt times for performing the ſeveral operations of huſbandry muſt alſo differ. Peru.

The *chirimoya* is conſidered as one of the moſt delicious fruits in the world. Its dimenſions are various, being from one to five inches in diameter. Its figure is imperfectly round, flatted towards the ſtalk, where it forms a kind of navel; but all the other parts are nearly circular. It is covered with a thin ſoft ſhell, which adheres ſo cloſely to the pulp as not to be ſeparated from it without a knife. The outward coat is green, variegated with prominent veins, forming all over it a kind of net-work. The pulp is white, and contains a large quantity of juice reſembling honey, of a ſweet taſte, mixed with a gentle acid of a moſt exquiſite flavour. The ſeeds are formed in ſeveral parts of the pulp, and are ſomewhat flat. The tree is high and tufted, the ſtem large and round, but with ſome inequalities, full of elliptic leaves, terminating in a point. The bloſſom differs little from the colour of the leaves, which is a darkiſh green; and though far from being beautiful, is remarkable for its incomparable fragrance.

The *granadilla* in its ſhape reſembles an hen's egg, but is larger. The outſide of the ſhell is ſmooth, gloſſy, and of a faint carnation colour, and the inſide white and ſoft. The ſhell contains a viſcous liquid ſubſtance full of very ſmall and delicate grains, leſs hard than thoſe of the pomegranate. This medullary ſubſtance is ſeparated from the ſhell by a fine and tranſparent membrane. Its fruit has a delightful ſweetneſs blended with acidity, very cordial and refreſhing, and ſo wholeſome, that there is no danger of eating to exceſs.

The *frutilla*, or Peruvian ſtrawberry, is very different from that of Europe in ſize; for though they are here generally not above an inch in length, they are much larger in other parts of Peru; but their taſte, though juicy, and not unpalatable, is not equal to thoſe in Europe.

48 Inhabitants. The country is obſerved to abound more in women than in men, which is the more remarkable, as thoſe cauſes which induce men to leave their country, as travelling, commerce, and war, naturally bring over more men from Europe than women. But there are many families in which there are a number of daughters, without one ſon among them. The women enjoy a better ſtate of health than the men, which may be owing in ſome meaſure to the climate, and more particularly to the early intemperance and voluptuouſneſs of the other ſex.

The Creoles are well made, of a proper ſtature, and of a lively and agreeable countenance. The Meſtizos are alſo in general well made, often taller than the ordinary

Peru. dinary size, very robust, and have an agreeable air. The Indians, both men and women, are commonly low of stature, though strong and well proportioned: but more natural defects are to be found among them than in any of the rest. Some are remarkably short, some idiots, lame, or blind. Their hair is generally thick and long, which they wear loose on their shoulders; but the Indian women plait theirs behind with a ribbon, and cut that before a little above the eye brows, from one ear to the other. The greatest disgrace that can be offered to an Indian of either sex is to cut off their hair; for whatever corporal punishment their masters think proper to inflict on them, they bear with patience; but this affront they never forgive; and accordingly the government has interposed, and limited this punishment to the most enormous crimes. The colour of the hair is generally a deep black: it is lank, harsh, and as coarse as that of a horse. On the contrary, the male Mestizos, in order to distinguish themselves from the Indians, cut off their hair; but the females do not adopt that custom.

49 Their dress. The Mestizos in general wear a blue cloth, manufactured in this country; but though they are the lowest class of Spaniards, they are very ambitious of distinguishing themselves as such, either by the colour or fashion of the clothes they wear.

The Mestizo women affect to dress in the same manner as the Spanish, though they cannot equal the ladies in the richness of their stuffs. The meaner sort wear no shoes; but, like the men of the same rank, go barefooted.

The dress of the Indians consists of white cotton drawers, which hang down to the calf of the leg, where they are loose, and edged with a lace suitable to the stuff. The use of a shirt is supplied by a black cotton frock, made in the form of a sack, with three openings at the bottom, one in the middle for the head, and others at the corners for the arms; thus covering their naked bodies down to the knees. Over this is a serge cloak, with a hole in the middle for putting the head through, and a hat made by the natives. This is their general dress, which they never lay aside, even while they sleep; and they have no additional clothing for their legs or feet. The Indians, who have acquired some fortune, particularly the barbers and phlebotomists, distinguish themselves from their countrymen by the fineness of their drawers, and by wearing a shirt, which, though without sleeves, has a lace four or five fingers in breadth, fastened round like a kind of ruff or band. They are fond of silver or gold buckles to their shoes, though they wear no stockings; and instead of a mean serge cloak, wear one of fine cloth, which is often adorned with gold or silver lace.

There are two kinds of dresses worn by the Indian women, made in the same plain manner with those worn by the men in general, the whole consisting of a short petticoat and a veil of American baize. But the dress of the lowest class of Indian women is only a bag of the same make and stuff as that of the men, which they fasten on their shoulders with two large pins: it reaches down to the calf of the leg, and is fastened round the waist with a kind of girdle. Instead of a veil, they wear about the neck a piece of the same coarse stuff, dyed black; but their arms and legs are naked. Peru.

50 Food and drink, &c. The people have dishes unknown in Europe; but are particularly fond of cheese; and have excellent butter in the neighbourhood of Quito. Sweetmeats are very much admired.

Rum is commonly drank here by persons of all ranks, but their favourite liquor is brandy. The disorders arising from the excessive use of spirituous liquors are chiefly seen among the Mestizos: and the lower class of women, both among the Creoles and Mestizos, are also extremely addicted to the same species of debauchery.

Another liquor much used in this country is mate, which is made of an herb known in all these parts of America by the name of Paraguay, as being the produce of that country. Some of it is put into a calabash tipped with silver, called here *mate*, with sugar and some cold water. After it has continued there some time, the calabash is filled with boiling water, and they drink the liquor through a pipe fixed in the calabash. It is also usual to squeeze into the liquor a small quantity of the juice of lemons or Seville oranges, mixed with some perfumes from odoriferous flowers. This is their usual drink in the morning fasting, and many use it also at their evening regale. The manner of drinking it appears very indelicate, the whole company taking it successively through the same pipe, it being carried several times round the company till all are satisfied. This among the Creoles is the highest enjoyment: so that when they travel, they never fail to carry with them a sufficient quantity of it, and till they have taken their dose of mate they never eat.

The vice of gaming is here carried to an extravagant height, to the ruin of many families, some losing their stocks in trade, others the very clothes from their backs, and afterward those belonging to their wives, which they hazard, stimulated by the hope of recovering their own.

The common people, the Indians, and even the domestics, are greatly addicted to stealing. The Mestizos, though arrant cowards, do not want audacity in this way; for though they will not venture to attack any one in the street, it is a common practice to snatch off a person's hat, and immediately seek their safety in flight. This acquisition is sometimes of considerable value; the hats worn by persons of rank, and even by the wealthy citizens when dressed, being of white beaver, worth fifteen dollars, beside the hatband of gold or silver lace, fastened with a gold buckle set with diamonds or emeralds. Robberies on the highway are seldom heard of.

51 Language. In Quito, and all the towns and villages of its province, different dialects are spoken, Spanish being no less common than the Inga, the language of the country. The Creoles use the latter as much as the former, but both are considerably adulterated by borrowed words and expressions. The first language generally spoken by children is the Inga; for the nurses being Indians, many of them do not understand a word of Spanish, and thus they afterward learn a jargon composed of both languages.

52 Honour paid the dead. The sumptuous manner of performing the last offices for the dead, demonstrates how far the power of habit

Peru.

habit is capable of prevailing over reaſon and prudence, for their oſtentation is ſo great in this particular, that many families of credit are ruined by prepoſterouſly endeavouring to excel others; and the people here may be ſaid to toil and ſcheme to lay up wealth, to enable their ſucceſſors to laviſh honours upon a body inſenſible of all pageantry.

53 Commerce.

The commerce of the province of Quito is chiefly carried on by Europeans ſettled here, and others who occaſionally arrive. The manufactures of this province are only cottons, ſome white and ſtriped baize, and cloths, which meet with a good market at Lima, for ſupplying the inward provinces of Peru. The returns are made partly in ſilver, and partly in fringes made of gold and ſilver thread, and wine, brandy, oil, copper, tin, lead, and quickſilver. On the arrival of the galleons at Carthagena, theſe traders reſort thither to purchaſe European goods, which, at their return, they conſign to their correſpondents all over the province. The coaſts of New Spain ſupply this province with indigo, of which there is a very large conſumption at the manufactures, blue being univerſally the colour which this people adopt for their apparel. They alſo import, by way of Guayaquila, iron and ſteel both from Europe and the coaſt of Guatemala.

54 Diſpoſition of the inhabitants.

The diſpoſition of the Indians in the province of Quito is extremely remarkable, and they appear to have no reſemblance to the people found there by thoſe who firſt diſcovered the country. They at preſent poſſeſs a tranquillity not to be diſturbed either by fortunate or unfortunate events. In their mean apparel they are as contented as a prince clothed in the moſt ſplendid robes. They ſhow the ſame diſregard to riches; and even the authority and grandeur within their reach is ſo little the object of their ambition, that to all appearance it ſeems to be the ſame to an Indian whether he be created an alcalde or obliged to perform the office of a common executioner.

Their ſloth is ſo great, that ſcarcely any thing can induce them to work. Whatever therefore is neceſſary to be done is left to the Indian women, who are much more active; they ſpin and make the half ſhirts and drawers which form the only apparel of their huſbands; they cook the proviſions, grind barley, and brew the beer called *chicha*; while the huſband ſits ſquatting on his hams, the uſual poſture of the Indians, looking at his buſy wife. The only domeſtic ſervice they do is to plough their little ſpot of land, which is ſowed by the wife. When they are once ſeated on their hams, no reward can induce them to ſtir; ſo that if a traveller has loſt his way, and happens to come to one of their cottages, they charge their wives to ſay that they are not at home. Should the paſſenger alight and enter the cottage, the Indian would ſtill be ſafe; for having no light but what comes through a hole in the door, he could not be diſcovered; and ſhould the ſtranger even ſee the Indian, neither entreaties nor rewards would prevail on him to ſtir a ſtep with him. Peru.

They are lively only in parties of pleaſure, rejoicings, entertainments, and eſpecially dancing; but in all theſe the liquor muſt circulate briſkly, and they continue drinking till they are entirely deprived both of ſenſe and motion.

It is remarkable that the Indian women, whether maids or married, and Indian young men before they are of an age to contract matrimony, are never guilty of this vice: it being a maxim among them, that drunkenneſs is the privilege of none but maſters of families, who, when they are unable to take care of themſelves, have others to take care of them.

The women preſent the chicha (A) to their huſbands in calabaſhes, till their ſpirits are raiſed; then one plays on a pipe and tabor, while others dance. Some of the beſt voices among the Indian women ſing ſongs in their own language, and thoſe who do not dance, ſquat down in the uſual poſture till it comes to their turn. When tired with intemperance, they all lie down together, without regarding whether they be near the wife of another or their own ſiſter or daughter. Theſe feſtivities ſometimes continue three or four days, till the prieſt coming among them, throws away all the chicha, and diſperſes the Indians, leſt they ſhould procure more.

Their funerals are likewiſe ſolemnized with exceſſive drinking. The houſe is filled with jugs of chicha, for the ſolace of the mourners and other viſitors; the latter even go out into the ſtreets, and invite all of their nation who happen to paſs by to come in and drink to the honour of the deceaſed. This ceremony laſts four or five days, and ſometimes more, ſtrong liquor being their ſupreme enjoyment.

55 Their manner of contracting marriages.

The Indians in the audience of Quito are ſaid to act contrary to all other nations in their marriages; for they never make choice of a woman who has not been firſt enjoyed by others, which they conſider as a certain indication of her perſonal attractions. After a young man has made choice of a woman, he aſks her of her father, and having obtained his conſent, they begin to cohabit together as man and wife, and aſſiſt the father-in-law in cultivating the land. At the end of three or four months, and frequently of a year, the huſband leaves his bride or wife without any ceremony; and perhaps expoſtulates with his father-in-law for endeavouring to deceive him, by impoſing upon him his daughter, whom nobody elſe had thought worthy of making a bedfellow. But if no diſguſt ariſes in the man on this account or any other, after paſſing three or four months in this commerce, which they call *amanarſe*, or to habituate one's ſelf, they then marry. This cuſtom is ſtill very common, though the whole body of the clergy have uſed all their endeavours to put a ſtop to it. Accordingly they always abſolve

(A) This is a liquor made from maize by the following proceſs. The maize, after being ſoaked in water till it begin to grow, is dried in the ſun, then parched a little, and at laſt ground. The flour, after it has been well kneaded, is put with water into a large veſſel, and left for two or three days to ferment. Its taſte is nearly that of the moſt indifferent kind of cyder. It is a refreſhing, nouriſhing, and aperitive liquor; but it will not keep above eight days without turning ſour.

Peru.

abſolve them of that ſin before they give them the nuptial benediction.

56 Appearance of the country in this province.

It has been obſerved, that the dependencies of the juriſdictions of Quito are ſeated between the two Cordilleras of the Andes, and that the air is more or leſs cold, and the ground more or leſs ſterile, according to the height of the mountains. Theſe barren tracks are called deſerts; for though all the Cordilleras are dry, ſome are much more ſo than others; and the continual ſnow and froſts render ſome parts of them incapable of producing a ſingle plant, and conſequently they are uninhabitable by man or beaſt.

Some of theſe mountains, which appear to have their baſes reſting on other mountains, riſe to a moſt aſtoniſhing height, and, reaching far above the clouds, are here, although in the midſt of the torrid zone, covered with perpetual ſnow. From experiments made with a barometer on the mountain of Cotopaxi, it appeared that its ſummit was elevated 6252 yards above the ſurface of the ſea, ſomething above three geographical miles, which greatly exceeds the height of any other mountain in the known world.

Cotopaxi became a volcano about the time when the Spaniards firſt arrived in this country. A new eruption happened in 1743, which had been for ſome days preceded by a continual interior rumbling noiſe; after which an aperture was made in its ſummit, as alſo three others near the middle of its declivity; theſe parts, when the eruption commenced, were buried under prodigious maſſes of ſnow. The ignited ſubſtances which were ejected being mingled with a conſiderable quantity of ſnow and ice, melting amidſt the flames, were carried down with ſuch amazing rapidity, that the plain from Callo to Latacunga was overflowed, and all the houſes with their wretched inhabitants were ſwept away in one general and inſtantaneous deſtruction. The river of Latacunga was the receptacle of this dreadful flood, till becoming ſwollen above its banks, the torrent rolled over the adjacent country, continuing to ſweep away houſes and cattle, and rendered the land near the town of the ſame name as the river one vaſt lake. Here, however, the inhabitants had ſufficient warning to ſave their lives by flight, and retreated to a more elevated ſpot at ſome diſtance. During three days the volcano ejected cinders, while torrents of lava with melted ice and ſnow poured down the ſides of the mountain. The eruption continued for ſeveral days longer, accompanied with terrible roarings of the wind, ruſhing through the craters which had been opened. At length all was quiet, and neither ſmoke nor fire were to be ſeen; until in May 1744 the flames forced a paſſage through ſeveral other parts on the ſides of the mountain; ſo that in clear nights the flames, being reflected by the tranſparent ice, exhibited a very grand and beautiful illumination. On the 13th of November following, it ejected ſuch prodigious quantities of fire and lava, that an inundation equal to the former ſoon enſued, and the inhabitants of the town of Latacunga for ſome time gave themſelves over for loſt.

The moſt ſouthern mountains of the Cordilleras is that of Mecas or Sangay, which is of a prodigious height, and the far greateſt part of it covered with ſnow; yet from its ſummit iſſues a continual fire, attended with exploſions which are plainly heard at 40 leagues diſtance. The country adjacent to this volcano is entirely barren, being covered with cinders ejected from its mouth. In this mountain riſes the river Sangay, which being joined by the Upano, forms the Payra, a large river which diſcharges itſelf into the Maranon. Peru.

Pichincha, though famous for its great height, is 1278 yards lower than the perpendicular height of Cotopaxi, and was formerly a volcano, but the mouth or crater on one of its ſides is now covered with ſand and calcined matter; ſo that at preſent neither ſmoke nor fire iſſue from it. When Don George Juan and Don Antonio de Ulloa were ſtationed on it for the purpoſe of making aſtronomical obſervations, they found the cold on the top of this mountain extremely intenſe, the wind violent, and they were frequently involved in ſo thick a fog, or, in other words, a cloud, that an object at ſix or eight paces diſtance was ſcarcely diſcernible. The air grew clear, by the clouds moving nearer to the earth, and on all ſides ſurrounding the mountain to a vaſt diſtance, repreſenting the ſea with the mountain ſtanding like an iſland in the centre. When this happened, they heard the dreadful noiſe of the tempeſts that diſcharged themſelves on Quito and the neighbouring country. They ſaw the lightning iſſue from the clouds, and heard the thunder roll far beneath them. While the lower parts were involved in tempeſts of thunder and rain, they enjoyed a delightful ſerenity; the wind was abated, the ſky clear, and the enlivening rays of the ſun moderated the ſeverity of the cold. But when the clouds roſe, their thickneſs rendered reſpiration difficult: ſnow and hail fell continually, and the wind returned with all its violence; ſo that it was impoſſible entirely to overcome the fear of being, together with their hut, blown down the precipice on whoſe edge it was built, or of being buried in it by the conſtant accumulations of ice and ſnow. Their fears were likewiſe increaſed by the fall of enormous fragments of rocks. Though the ſmalleſt crevice viſible in their hut was ſtopped, the wind was ſo piercing that it penetrated through; and though the hut was ſmall, crowded with inhabitants, and had ſeveral lamps conſtantly burning, the cold was ſo great, that each individual was obliged to have a chafing diſh of coals, and ſeveral men were conſtantly employed every morning to remove the ſnow which fell in the night. By the ſeverities of ſuch a climate their feet were ſwelled, and ſo tender that walking was attended with extreme pain, their hands covered with chilblains, and their lips ſo ſwelled and chopt that every motion in ſpeaking drew blood.

57 Province Lima.

The next diviſion of Peru is the audience of Lima, which is bounded on the north by Quito, on the eaſt by the Cordilleras of the Andes, on the ſouth by the audience of Los Charcos, and on the weſt by the Pacific Ocean, it being about 770 miles in length from north to ſouth, but of an unequal breadth.

58 Climate, ſoil, &c. in this province.

The climate and ſoil of this country is uncommonly various; in ſome places it is exceedingly hot, in others inſupportably cold, and in the city of Lima, where rain never falls, it is always temperate. The ſeaſons vary within the compaſs of a few miles, and in certain parts of the audience all the viciſſitudes of weather are experienced in 24 hours. It is extremely remarkable that no rains fall or rivers flow on the ſea-coaſts, tho'

the country is refreſhed by thick fogs, and the heat abated by denſe clouds that never condenſe into ſhowers. This phenomenon has drawn the attention of many naturaliſts, without their being able ſatisfactorily to account for it.

Spring begins toward the cloſe of the year, that is about the end of November or the beginning of December, when the vapours which fill the atmoſphere during the winter ſubſide, and the ſun, to the great joy of the inhabitants, again appears, and the country then begins to revive, which, during the abſence of his rays, had continued in a ſtate of languor. This is ſucceeded by ſummer, which, though hot from the perpendicular direction of the ſun's rays, is far from being inſupportable; the heat, which indeed would otherwiſe be exceſſive, being moderated by the ſouth winds, which always blow at this ſeaſon, though with no great force. Winter begins at the latter end of June or the beginning of July, and continues till November or December, when the ſouth winds begin to blow ſtronger, and to produce a certain degree of cold, not indeed equal to that in countries where ice and ſnow are known, but ſo keen that the light dreſſes are laid by, and cloth or other warm ſtuffs worn. During the winter the earth is covered with ſo thick a fog, as totally to intercept the rays of the ſun; and the winds, by blowing under the ſhelter of this fog, retain the particles they contracted in the frozen zone. In this ſeaſon only the vapours diſſolve into a very ſmall dew, which everywhere equally moiſtens the earth; by which means all the hills, which during the other parts of the year offer nothing to the ſight but rocks and waſtes, are clothed with verdure and enamelled with flowers of the moſt beautiful colours. Theſe dews never fall in ſuch quantities as to impair the roads or incommode the traveller; a very thin ſtuff will not ſoon be wet through; but the continuance of the miſts during the whole winter, without being exhaled by the ſun, fertilizes every part of the country.

Lima is as free from tempeſts as from rain; ſo that thoſe of the inhabitants who have neither viſited the mountains nor travelled into other parts, are abſolute ſtrangers to thunder and lightning, and are therefore extremely terrified when they firſt hear the former or ſee the latter. But it is very remarkable, that what is here entirely unknown ſhould be ſo common 30 leagues to the eaſt of Lima; it being no farther to the mountains, where violent rains and tempeſts of thunder and lightning are as frequent as at Quito.

But though the capital is freed from the terror of theſe tempeſts, it is ſubject to what is much more dreadful. Earthquakes happen here ſo frequently, that the inhabitants are under continual apprehenſions of being, from their ſuddenneſs and violence, buried in the ruins of their own houſes: yet theſe earthquakes, though ſo ſudden, have their preſages, one of the principal of which is a rumbling noiſe in the bowels of the earth about a minute before the ſhocks are felt, that ſeems to pervade all the adjacent ſubterraneous part; this is followed by diſmal howlings of the dogs, who ſeem to preſage the approaching danger. The beaſts of burden paſſing the ſtreets ſtop, and by a natural inſtinct ſpread open their legs, the better to ſecure themſelves from falling. On theſe portents the terrified inhabitants fly from their houſes into the ſtreets with ſuch precipitation, that if it happens in the night they appear quite naked; the urgency of the danger at once baniſhing all ſenſe of delicacy or ſhame. Thus the ſtreets exhibit ſuch odd and ſingular figures as might afford matter of diverſion, were it poſſible to be diverted in ſo terrible a moment. This ſudden concourſe is accompanied with the cries of children waked out of their ſleep, blended with the lamentations of the women, whoſe agonizing prayers to the ſaints increaſe the common fear and confuſion. The men are alſo too much affected to refrain from giving vent to their terror; ſo that the whole city exhibits a dreadful ſcene of conſternation and horror. Peru.

The earthquakes that have happened at the capital are very numerous. The firſt ſince the eſtabliſhment of the Spaniards was in 1582; but the damage was much leſs conſiderable than in ſome of the ſucceeding. Six years after Lima was again viſited by another earthquake, ſo dreadful, that it is ſtill ſolemnly commemorated every year. In 1609 another happened, which overturned many houſes. On the 27th of November 1630, ſuch prodigious damage was done in the city by an earthquake, that, in acknowledgment of its not having been entirely demoliſhed, a feſtival on that day is annually celebrated. Twenty-four years after, on the 3d of November, the moſt ſtately edifices in the city, and a great number of houſes, were deſtroyed by an earthquake; but the inhabitants retiring, few of them periſhed. Another dreadful one happened in 1678; but one of the moſt terrible was on the 28th of October 1687. It began at four in the morning, and deſtroyed many of the fineſt public buildings and houſes, in which a great number of the inhabitants periſhed; but this was little more than a prelude to what followed; for two hours after the ſhock returned with ſuch impetuous conculſions, that all was laid in ruins, and the inhabitants felt themſelves happy in being only ſpectators of the general devaſtation, by having ſaved their lives, though with the loſs of all their property. During this ſecond ſhock, the ſea retiring conſiderably, and then returning in mountainous waves, entirely overwhelmed Callao, which is at five miles diſtance from Lima, and all the adjacent country, together with the miſerable inhabitants. From that time ſix earthquakes have happened at Lima previous to that of 1746. This laſt was on the 28th of October, at half an hour after ten at night, when the concuſſions began with ſuch violence, that in little more than three minutes the greateſt part, if not all the buildings in the city, were deſtroyed, burying under their ruins thoſe inhabitants who had not made ſufficient haſte into the ſtreets and ſquares, the only places of ſafety. At length the horrible effects of the firſt ſhock ceaſed; but the tranquillity was of ſhort duration, the concuſſions ſwiftly ſucceeding each other. The fort of Callao alſo ſunk into ruins; but what it ſuffered from the earthquake in its building was inconſiderable, when compared to the dreadful cataſtrophe which followed; for the ſea, as is uſual on ſuch occaſions, receding to a conſiderable diſtance, returned in mountainous waves, foaming with the violence of the agitation, and ſuddenly buried Callao and the neighbouring country in its flood. This, however, was not entirely effected by the firſt ſwell of the waves; for the ſea retiring farther, returned with ſtill greater impetuoſity, and covered both

Peru. the walls and other buildings of the place; so that what even had escaped the first inundation was totally overwhelmed by those succeeding mountainous waves. Twenty-three ships and vessels, great and small, were then in the harbour, 19 of which were sunk, and the other 4, among which was a frigate named St Fermin, were carried by the force of the waves to a considerable distance up the country. This terrible inundation and earthquake extended to other parts on the coast, and several towns underwent the same fate as the city of Lima; where the number of persons who perished within two days after it began, amounted, according to the bodies found, to 1300, beside the maimed and wounded, many of whom lived only a short time in great torture.

The country of Lima enjoys great fertility, producing all kinds of grain and a prodigious variety of fruit. Here industry and art supply that moisture which the clouds with-hold. The ancient Incas of Peru caused small canals to be formed, in order to conduct the waters of the rivers to every part of the country. The Spaniards, finding these useful works executed to their hands, had only to keep them in order; and by these are watered spacious fields of barley, large meadows, plantations, vineyards, and gardens, all yielding uncommon plenty. Lima differs from Quito, where the fruits of the earth have no determined season; for here the harvest is gathered in, and the trees drop their leaves in the proper season.

Although the summer here is hot, yet venomous creatures are unknown; and the same may be said of the territory called *Valles*, though here are some ports, as Tumbez and Piura, where the heat is almost as great as that of Guayaquil. This singularity can therefore proceed from no other cause than the natural drought of the climate.

59 Divisions of the audience of Lima.

The audience of Lima is divided into four bishopries, Truxillo, Guamanga, Cusco, and Arequipa. The diocese of Truxillo lies to the north of the archiepiscopal diocese of Lima, and like all the others is divided into several jurisdictions. The city of Truxillo is seated in 8° 6′ south latitude, in a pleasant situation, though in a sandy soil.

In the diocese of Guamanga is a rich quicksilver mine, from which the inhabitants of a neighbouring town procure their whole subsistence; the coldness of the air in that place checking the growth of all kinds of grain and fruit, so that they are obliged to purchase them from their neighbours. The quicksilver mines wrought here supply all the silver mines in Peru with the necessary mineral, and notwithstanding the prodigious quantities already extracted, no diminution is perceived.

Cusco, which gives name to another diocese, is the most ancient city Peru, being of the same date with the empire of the Incas, and was founded by them as the capital of the empire. On the mountain contiguous to the north part of the city are the ruins of a famous fort built by the Incas; whence it appears that their design was to inclose the whole mountain with a prodigious wall, of such construction as to render its ascent absolutely impracticable to an enemy, in order to prevent all approach to the city. This wall was entirely of freestone, and strongly built, some of the stones being of a prodigious magnitude. The city of Cusco is nearly equal to that of Lima. See Cusco.

In this bishopric are several mines of gold and silver, that are extremely rich. Peru.

The fourth diocese of the audience of Lima is Arequipa, which contains the city of the same name, one of the largest in all Peru. It is delightfully seated in a plain; the houses are well built of stone, and are generally lofty, commodious, finely decorated on the outside, and neatly furnished within. The temperature of the air is extremely agreeable, the cold being never excessive, nor the heat troublesome; so that the fields are always clothed with verdure, and enamelled with flowers, as in a perpetual spring. But these advantages are allayed by its being frequently exposed to dreadful earthquakes; for by these convulsions of nature it has been four times laid in ruins. The city is, however, very populous, and among its inhabitants are many noble families.

In this bishopric are several gold and silver mines, and in some parts are large vineyards, from which considerable quantities of wine and brandy are made. Among the other productions is Guinea pepper, in which the jurisdiction of Africa in this diocese carries on a very advantageous trade, the annual produce of these plantations bringing in no less than 60,000 dollars *per annum*. The pods of this pepper are about a quarter of a yard in length, and when gathered are dried in the sun and packed up in bags of rushes, each bag containing an aroba or a quarter of a hundred weight, and thus they are exported to all parts. Other places of this jurisdiction are famous for vast quantities of large and excellent olives, far exceeding the finest produced in Europe, they being nearly the size of a hen's egg.

60 The audience of Charcas.

The audience of Charcas, the last division of Peru, is equal in extent to that of Lima; but many of its parts are not so well inhabited, some being full of vast deserts and impenetrable forests, while others have extensive plains intercepted by the stupendous height of the Cordilleras: the country is inhabited only in such parts as are free from those inconveniences. It is bounded on the north by the diocese of Cusco, and reaches southward to Buenos Ayres; on the east it extends to Brasil; and on the west it reaches to the Pacific Ocean, particularly at Atacama. The remainder of the province borders on the kingdom of Chili.

61 Divisions &c. of the audience.

This audience is divided into the archbishopric of Plata, and five bishoprics. We shall begin with the former.

The famous mountain of Potosi is known all over the commercial world for the immense quantity of silver it has produced. The discovery of this amazing treasure happened at the commencement of the year 1545, by a mere accident, which we shall mention afterwards. At a small distance from it are the hot medicinal baths, called *Don Diego*, whither some resort for health and others for diversion.

62 How the country was at first settled by the Spaniards.

At the time when the first conquests were made, when emigrations were most frequent, the country of the Incas had a much greater reputation for riches than New Spain; and, in reality, for a long time much more considerable treasures were brought away from it. The desire of partaking of them must necessarily draw thither, as was really the case, a greater number of Castilians. Though almost all of them went over thither with the hope of returning to their country to enjoy

eru. enjoy the fortune they might acquire, yet the majority settled in the colony. They were induced to this by the softness of the climate, the salubrity of the air, and the goodness of the provisions. Mexico presented not the same advantages, and did not give them reason to expect so much independence as a land infinitely more remote from the mother-country.

Cusco attracted the conquerors in multitudes. They found this capital built on a ground that was very irregular, and divided into as many quarters as there were provinces in the empire. Each of the inhabitants might follow the usages of his native country; but every body was obliged to conform to the worship established by the founder of the monarchy. There was no edifice that had any grandeur, elegance, or convenience; because the people were ignorant of the first elements of architecture. The magnificence of what they called the *palace of the sovereign*, *of the princes of the blood*, and *of the great men of his empire*, consisted in the profusion of the metals that were lavished in decorating them. The temple of the Sun was distinguished above all other edifices; its walls were incrusted or sheathed with gold and silver, ornamented with divers figures, and loaded with the idols of all the nations whom the Incas had enlightened and subdued.

As it was not a solicitude for their own preservation which occupied the Spaniards at first, they had no sooner pillaged the immense riches which had been amassed at Cusco for four centuries, than they went in great numbers in 1534, under the order of Sebastian de Benalcazar, to undertake the destruction of Quito. The other towns and boroughs of the empire were over-run with the same spirit of rapine; and the citizens and the temples were plundered in all parts.

Those of the conquerors, who did not take up their residence in the settlements which they found already formed, built towns on the sea-coasts, where before there were none: for the sterility of the soil had not permitted the Peruvians to multiply much there; and they had not been induced to remove thither from the extremity of their country, because they sailed very little. Paita, Truxillo, Callao, Pisca, and Arica, were the roads which the Spaniards deemed most convenient for the communication they intended to establish among themselves and with the mother-country. The different positions of these new cities determined the degree of their prosperity.

Those which were afterwards built in the inland parts of the country were not erected in regions which presented a fertile soil, copious harvests, excellent pastures, a mild and salubrious climate, and all the conveniences of life. These places, which had hitherto been so well cultivated by a numerous and flourishing people, were now totally disregarded. Very soon they exhibited only a deplorable picture of a horrid desert; and this wildness must have been more melancholy and hideous than the dreary aspect of the earth before the origin of societies. The traveller, who was led by accident or curiosity into these desolate plains, could not forbear abhorring the barbarous and bloody authors of such devastations, while he reflected that it was not owing even to the cruel illusions of glory, and to the fanaticism of conquest, but to the stupid and abject desire of gold, that they had sacrificed so much more real treasure, and so numerous a population.

This insatiable thirst of gold, which neither tended to subsistence, safety, nor policy, was the only motive for establishing new settlements, some of which have been kept up, while several have decayed, and others have been formed in their stead. The fate of them all has corresponded with the discovery, progress, or declension, of the mines to which they were subordinate. Peru.

63 Manner of living of the natives.

Fewer errors have been committed in the means of procuring provisions. The natives had hitherto lived hardly on any thing else but maize, fruits, and pulse, for which they had used no other seasoning except salt and pimento. Their liquors, which were made from different roots, were more diversified: of these the chica was the most usual; but the conquerors were not satisfied either with the liquors or with the food of the people they had subdued. They imported vines from the Old World, which soon multiplied sufficiently in the sands of the coasts at Ica, Pisca, Nasca, Moquequa, and Truxillo, to furnish the colony with the wine and brandy it wanted. Olives succeeded still better; and yielded a great abundance of oil, which was much superior to that of the mother-country. Other fruits were transplanted with the same success. Sugar succeeds so well, that none of any other growth can be compared to that which is cultivated in those parts, where it never rains. In the inland country wheat and barley were sown; and at length all the European quadrupeds were soon found grazing at the foot of the mountains.

This was a considerable step; but there still remained much more to be done. After they had provided for a better and a greater choice of subsistence, the next care of the Spaniards was to have a dress more commodious and more agreeable than that of the Peruvians. These were, however, better clothed than any other American nation. They owed this superiority to the advantage which they alone possessed, of having the LAMA and PACOS, domestic animals which served them for this use. See CAMELUS.

After the conquest, all the Indians were obliged to wear clothes. As the oppression under which they groaned did not allow them to exercise their former industry, they contented themselves with the coarser cloths of Europe, for which they were made to pay an exorbitant price. When the gold and silver which had escaped the rapacity of the conquerors were exhausted, they thought of re-establishing their national manufactures. These were some time after prohibited, on account of the deficiency which they occasioned in the exports of the mother-country. The impossibility which the Peruvians found of purchasing foreign stuffs and paying their taxes, occasioned permission to be given at the end of ten years for their re-establishment. They have not been discontinued since that time; and have been brought to as great a degree of perfection as it was possible they could be under a continual tyranny.

64 Manufactures, &c.

With the wool of the vicuna, a species of wild pacos, they make, at Cusco and in its territory, stockings, handkerchiefs, and scarfs. These manufactures would have been multiplied, if the spirit of destruction had not fallen on animals as well as on men. The same wool, mixed with that of the sheep imported thither from Europe, which have exceedingly degenerated,

Peru. ſerves for carpets, and makes alſo tolerably fine cloth. Fleeces of inferior quality are employed in ſerges, druggets, and in all kinds of coarſe ſtuffs.

The manufactures ſubſervient to luxury are eſtabliſhed at Arequipa, Cuſco, and Lima. In theſe three towns is made a prodigious number of gold toys and plate, for the uſe of private perſons, and alſo for the churches. All theſe manufactures are but coarſely wrought, and mixed with a great deal of copper. We ſeldom diſcover more taſte in their gold and ſilver laces and embroideries which their manufactures alſo produce. This is not altogether the caſe in regard to their lace, which, when mixed with that of Europe, looks very beautiful. This laſt manufacture is commonly in the hands of the nuns, who employ in it the Peruvian girls, and the young Meſtees of the towns, who for the moſt part before marriage paſs ſome years in the convent.

Other hands are employed in painting and gilding leather for rooms, in making with wood and ivory pieces of inlaid work and ſculpture, and in drawing figures on the marble that is found at Cucuca, or on linen imported from Europe. Theſe different works, which are almoſt all manufactured at Cuſco, ſerve for ornaments for houſes, palaces, and temples: the drawing of them is not bad, but the colours are neither exact nor permanent. If the Indians, who invent nothing, but are excellent imitators, had able maſters and excellent models, they would at leaſt make good copyiſts. At the cloſe of the laſt century, ſome works of a Peruvian painter, named *Michael de St Jacques*, were brought to Rome; and the connoiſſeurs diſcovered marks of genius in them.

65 Of the mines of gold and ſilver.

Though the Peruvians were unacquainted with coin, they knew the uſe of gold and ſilver; for they employed them in different kinds of ornaments. Independent of what the torrents and accident procured them of theſe metals, ſome mines had been opened of little depth. The Spaniards have not tranſmitted to us the manner in which theſe rich productions were drawn from the boſom of the earth. Their pride, which has deprived us of ſo much uſeful knowledge, undoubtedly made them think, that, in the inventions of a people whom they called *barbarous*, there was nothing that was worthy to be recorded.

The difference as to the manner in which the Peruvians worked their mines, did not extend to the mines themſelves. The conquerors opened them on all ſides. At firſt the gold mines tempted the avarice of the greater number. Fatal experience diſcouraged thoſe whom paſſion had not blinded. They clearly ſaw, that, for ſome enormous fortunes raiſed in this manner, great numbers, who had only moderate fortunes, were totally ruined. Theſe mines ſunk into ſuch diſcredit, that, in order to prevent them from being abandoned, the government was obliged to take the 20th part of their produce, inſtead of the fifth which it at firſt received.

The mines of ſilver were more common, more equal, and richer. They even produced ſilver of a ſingular ſpecies, rarely found elſewhere. Towards the ſea-coaſt, great lumps of this metal are found in the ſands.

There are a great number of other mines which are infinitely more important, and are found in the rocks and on the mountains. Several of them gave falſe hopes. Such, in particular, was that of Ucuntaya, diſcovered in 1713. This was only an incruſtation of almoſt maſſive ſilver, which at firſt yielded ſeveral millions, but was ſoon exhauſted. Peru.

Others which were deeper have been alike deſerted. Their produce, though equal to what it was originally, was not ſufficient to ſupport the expence of working them, which augmented every day. The mines of Quito, Cuſco, and Arequipa, have experienced that revolution which awaits many of the reſt.

There are greater numbers of very rich mines which the waters have invaded. The diſpoſition of the ground, which from the ſummit of the Cordilleras goes continually ſhelving to the South Sea, muſt neceſſarily render theſe events more common at Peru than in other places. This inconvenience, which with greater care and ſkill might often have been prevented or diminiſhed, has been in ſome inſtances remedied.

Joſeph Salcedo, about the year 1660, had diſcovered, not far from the town of Puna, the mine of Laycacota. It was ſo rich, that they often cut the ſilver with a chiſel. Proſperity had ſo elevated the mind of the proprietor, that he permitted all the Spaniards who came to ſeek their fortune in this part of the New World, to work ſome days on their own account, without weighing or taking any account of the preſents he made them. This generoſity drew around him an infinite number of people, whoſe avidity made them quarrel with each other, and the love of money made them take up arms and fall upon one another; and their benefactor, who had neglected no expedient to prevent and extinguiſh their ſanguinary contentions, was hanged as being the author of them. Whilſt he was in priſon, the water got poſſeſſion of his mine. Superſtition ſoon made it imagined that this was a puniſhment for the horrid act they had perpetrated againſt him. This idea of divine vengeance was revered for a long time; but at laſt, in 1740, Diego de Baena aſſociated with other opulent people to avert the ſprings which had deluged ſo much treaſure. The labours which this difficult undertaking required, were not finiſhed till 1754. The mine yields as much now as it did at firſt. But mines ſtill richer than this have been diſcovered. Such, for example, is that of Potoſi, which was found in the ſame country where the Incas worked that of Porco.

An Indian, named *Hualpa*, in 1545, purſuing ſome deer, in order to climb certain ſteep rocks laid hold of a buſh, the roots of which looſened from the earth, and brought to view an ingot of ſilver. The Indian had recourſe to it for his own uſe; and never failed to return to his treaſure every time that his wants or his deſires ſolicited him to it. The change that had happened in his fortune was remarked by one of his countrymen, and he diſcovered to him the ſecret. The two friends could not keep their counſel and enjoy their good fortune. They quarrelled; on which the indiſcreet confident diſcovered the whole to his maſter, Villaroell, a Spaniard who was ſettled in the neighbourhood. Upon this the mine became known, and was worked; and a great number of them were found in its vicinity; the principal of which are in the northern part of the mountain, and their direction is from north to ſouth. The moſt intelligent people of Peru have obſerved,

observed, that this is in general the direction of the richeſt mines.

The fame of what was paſſing at Potoſi ſoon ſpread abroad; and there was quickly built at the foot of the mountain a town, conſiſting of 60,000 Indians and 10,000 Spaniards. The ſterility of the ſoil did not prevent its being immediately peopled. Corn, fruit, flocks, American ſtuffs, European luxuries, arrived there from every quarter. Induſtry, which everywhere follows the current of money, could not ſearch for it with ſo much ſucceſs as at its ſource. It evidently appeared that in 1738 theſe mines produced annually near 978,000 l. without reckoning the ſilver which was not regiſtered, and what had been carried off by fraud. From that time the produce has been ſo much diminiſhed, that no more than one-eighth part of the coin which was formely ſtruck is now made.

At the mines of Potoſi, and all the mines of South America, the Spaniards, in purifying their gold and ſilver, uſe mercury, with which they are ſupplied from Guança Velica. The common opinion is, that this mine was diſcovered in 1564. The trade of mercury was then ſtill free: it became an excluſive trade in 1571. At this period all the mines of mercury were ſhut; and that of Guança Velica alone was worked, the property of which the king reſerved to himſelf. It is not found to diminiſh. This mine is dug in a prodigiouſly large mountain, 60 leagues from Lima. In its profound abyſs are ſeen ſtreets, ſquares, and a chapel, where the myſteries of religion on all feſtivals are celebrated. Millions of flambeaux are coutinually kept to enlighten it.

Private people at their own expence work the mine of Guança Velica. They are obliged to deliver to government, at a ſtipulated price, all the mercury they extract from it. As ſoon as they have procured the quantity which the demands of one year require, the work is ſuſpended. Part of the mercury is ſold on the ſpot, and the reſt is ſent to the royal magazines throughout all Peru; from whence it is delivered out at the ſame price it is ſold for in Mexico. This arrangement, which has occaſioned many of the mines to drop, and prevented others from being opened, is inexcuſable in the Spaniſh ſyſtem. The court of Madrid, in this reſpect, merits the ſame reproaches as a miniſtry in other countries would incur, that would be blind enough to lay a duty on the implements of agriculture.

The mine of Guança Velica generally affects thoſe who work in it with convulſions: this and the other mines, which are not leſs unhealthy, are all worked by the Peruvians. Theſe unfortunate victims of an inſatiable avarice are crowded all together and plunged naked into theſe abyſſes, the greateſt part of which are deep, and all exceſſively cold. Tyranny has invented this refinement in cruelty, to render it impoſſible for any thing to eſcape its reſtleſs vigilance. If there are any wretches who long ſurvive ſuch barbarity, it is the uſe of cocoa that preſerves them.

In the Cordilleras, near the city of Paz, is a mountain of remarkable height, called *Illimani*, which doubtleſs contains immenſe riches; for a crag of it being ſome years ago ſevered by a flaſh of lightning, and falling on a neighbouring mountain, ſuch a quantity of gold was found in the fragments, that for ſome time that metal was ſold at Paz for eight pieces of eight *per* ounce; but its ſummit being perpetually covered with ice and ſnow, no mine has been opened in the mountain. Peru || Pescara.

The city of La Paz is of a middling ſize, and from its ſituation among the breaches of the Cordilleras, the ground on which it ſtands is unequal, and it is alſo ſurrounded by mountains. When the river Titicaca is increaſed, either by the rains, or the melting of the ſnow on the mountains, its current forces along large maſſes of rocks with ſome grains of gold, which are found after the flood has ſubſided. Hence ſome idea may be formed of the riches incloſed in the bowels of theſe mountains; a remarkable proof of which appeared in the year 1730, when an Indian, waſhing his feet in the river, diſcovered ſo large a lump of gold, that the marquis de Caſtle Fuerte gave twelve thouſand pieces of eight for it, and ſent it as a preſent to the king of Spain.

Balſam of Peru. See Myroxilon.

PERUGIA, a town of Italy, in the pope's territories, and capital of Perugino. It is an ancient, handſome, populous, and large city, with a ſtrong citadel, an univerſity, and a biſhop's ſee. The churches, and many other buildings as well public as private, are very handſome. It is ſeated on a hill, in E. Long. 12. 30. N. Lat. 43. 6.

PERUGINO, a province of Italy, in the territory of the church, bounded on the weſt by Tuſcany, on the ſouth by Orvietano, on the eaſt by the duchies of Spoleto and Urbino, and on the north by the county of Citta Caſtellana. It is one of the ſmalleſt provinces in the territory of the church. The air is very pure, and the ſoil fertile in corn and good wine; beſides, the lake Perugia ſupplies them with plenty of fiſh. The capital town is Perugia. The lake is eight miles from the city, and is almoſt round, being about five miles in diameter; in it there are three iſlands. This province is about 25 miles in length, and near as much in breadth.

Perugino. See Montanini.

PERUKE. See Perruke.

PERUVIAN bark. See Cinchona, and *Jeſuits Bark.*

PERUVIANA, a general name given to that vaſt peninſula, extending itſelf from the iſthmus of Darien to Cape Horn, in the form of a triangle, of which the *Terra Magellanica* and the Cape form the vertex. It includes the whole of South America, although, as is well known, all the countries included within theſe limits do not acknowledge the dominion of the crown of Spain. See *Terra Firma.*

PESARO, a town of Italy, in the territory of the pope, and duchy of Urbino, with a biſhop's ſee. It is a large place, whoſe ſtreets are paved with bricks. The caſtle is very well fortified, the harbour excellent, and the cathedral church magnificent. The environs are remarkable for producing good figs, of which they ſend large quantities to Venice. It is ſeated on an eminence at the mouth of the river Fogha, on the Gulph of Venice. E. Long. 13. 0. N. Lat. 43. 56.

PESCARA, a very ſtrong town in the kingdom of Naples, and in the Hither Abruzzo; ſeated at the mouth of a river of the ſame name, which falls into the

Peſcenius || Petaliſm

the Gulph of Venice. E. Long. 15. 2. N. Lat. 42. 27.

PESCENIUS NIGER. See NIGER.

PESCHIERA, a ſmall but ſtrong town of Italy, in the Veroneſe, with a caſtle, and a ſtrong fort; ſeated on the river Mincio, or Menzo, which proceeds from the lake Garda. E. Long. 11. 4. N. Lat. 45. 27.

PESENAS, an ancient town of France, in Languedoc, and in the dioceſe of Agde; delightfully ſeated on the river Pein, 12 miles north-eaſt of Beſeirs, and eight north of Agde. E. Long. 3. 34. N. Lat. 43 28.

PESSARY, in medicine, a ſolid ſubſtance compoſed of wool, lint, or linen, mixed with powder, oil, wax, &c. made round and long like a finger, in order to be introduced into the exterior neck of the matrix, for the cure of ſeveral uterine diſorders.

PEST, a town of Upper Hungary, and capital of a county of the ſame name, ſeated on the Danube, in a fine plain, over-againſt Buda, 85 miles ſouth-eaſt of Preſburg. E. Long. 18. 25. N. Lat. 47 24.

PESTILENCE, in medicine, the ſame with the PLAGUE.

PETAGUEL, a territory of South America, in Braſil, bounded on the north by Dele; on the eaſt by the ſea; on the ſouth by the captainſhip of Rio-Grande; and on the weſt by Tupuys. It contains mines of ſilver.

PETAL, in botany, one of the coloured leaves which compoſe the flower.

PETALISM, a mode of deciding on the guilt of citizens ſimilar to the Athenian OSTRACISM. It was introduced in Syracuſe about the year before Chriſt 460, in order to prevent the tyranny of the richer citizens, who had often about that time aimed at the diadem. To prevent, therefore, the evils daily ariſing from thence, and to bring down the aſpiring minds of the wealthy citizens, the Syracuſans were forced to make a law not unlike that of the Athenian oſtraciſm; for as at Athens every citizen was to write on a ſhell the name of the perſon whom they conceived to be the moſt likely, on account of his wealth and adherents, to aſpire to the crown; ſo at Syracuſe they were to write on a leaf the names of ſuch as they apprehended powerful enough to uſurp the ſovereignty. When the leaves were counted, he who had the moſt ſuffrages againſt him was, without any farther inquiry, baniſhed for five years. This new-contrived method of impairing the eſtates, and weakening the intereſt of the overgrown citizens, was called *petaliſm*, from the Greek word *petalon*, which ſignifies "a leaf." This law was attended with many evil conſequences; for thoſe who were moſt capable of governing the commonwealth were driven out, and the adminiſtration of public affairs committed to the meaneſt of the people; nay, many of the chief citizens, who were able to render their country great ſervice, fearing to fall under penalties of this law, withdrew from the city, and lived private in the country, not concerning themſelves with public affairs: whence all the employments being filled with men of no merit or experience, the republic was on the brink of ruin, and ready to fall into a ſtate of anarchy and confuſion. The law therefore of petaliſm, upon more mature deliberation, was repealed ſoon after it had been firſt enacted, and the reins of government were again put into the hands of men who knew how to manage them.

Petard || Petau.

PETARD, in the art of war. See GUNNERY, n° 56, and Plate CCXXIV.

PETAU (Denis), or *Dionyſius PETAVIUS*, a French Jeſuit of great erudition, born at Orleans in 1583. His father was a man of literature, and obſerving ſtrong parts and an excellent genius for letters in his ſon, he took every means in his power to improve them. He uſed to tell his ſon, that he ought to qualify himſelf ſo, as to be able to attack and confound "the giant of the Allophylæ;" meaning that moſt eminent ſcholar Joſeph Scaliger, whoſe abilities and learning were allowed to have done great honour and much ſervice to the reformed. Young Petavius ſeems to have entered readily into his father's views; for he ſtudied moſt intenſely, and afterwards levelled much of his erudition againſt Scaliger. He joined the ſtudy of the mathematics to that of the belles lettres; and afterwards applied himſelf to a courſe of philoſophy, which he began in the college of Orleans, and finiſhed at Paris. He afterwards maintained theſes in Greek, which was as familiar to him as Latin; and the Latin, it is ſaid, he underſtood better than he did his own native language. When he was pretty well advanced, he had free acceſs to the king's library, which he often viſited on account of the Latin and Greek manuſcripts. Among other advantages which accompanied his literary purſuits, was the friendſhip of Iſaac Caſaubon, whom Henry IV. called to Paris in 1600. It was at Caſaubon's inſtigation, that Petavius, though then but very young, undertook an edition of The Works of Syneſius. In this edition he corrected the Greek from the manuſcripts, tranſlated that part which yet remained to be tranſlated into Latin, and wrote notes upon the whole. He was but 19 years of age when he was made profeſſor of philoſophy in the univerſity of Bourges; and he ſpent the two following years in ſtudying the ancient philoſophers and mathematicians. In 1604, when Morel, profeſſor of Greek at Paris, publiſhed The Works of Chryſoſtom, ſome part of Petavius's labours on Syneſius were added to them: from the title of which we learn, that he then took the name of *Patus*, which he afterwards changed into *Petavius*. His own edition of The Works of Syneſius did not appear till 1612.

He entered into the ſociety of the Jeſuits in 1605, and did great credit to it by his vaſt and profound erudition. He became a zealous advocate for the church of Rome; and there was no way of ſerving it more agreeable to him than that of criticiſing and abuſing its adverſaries. He was moſt bitter againſt Scaliger; nor did he even ſpare his friend Caſaubon whenever he came in his way.—Petavius excelled particularly in the dark ſcience of chronology; the learned world in general being obliged to him for ſome exact and nice diſquiſitions on this ſubject. His chief work, which is in great repute to this day, he intitled, *Rationarium Temporum*. It is an abridgement of univerſal hiſtory, from the earlieſt times to 1632, in chronological order, with references to proper authorities. It was improved, and ſeveral additions made to it, by Perizonius, and others after his death. This eminent father, after a very laborious life, died at Paris in the end of the year

year 1652, aged 69. Gaſſendus, in his life of Pereſchius, ſays he was the moſt conſummate ſcholar the Jeſuits ever had; an opinion very likely to be true, when we conſider that he often contended ſucceſsfully with Scaliger, Salmaſius, and others, whoſe abilities have been univerſally acknowledged. His judgment, however, was not equal to his erudition, and his controverſial writings are full of fourneſs and ſpleen. We have the following character of a great work of Petavius by an author of much celebrity, but who perhaps is as much biaſſed on the ſide of infidelity as he thinks this learned Jeſuit was in favour of the church of Rome. The *Dogmata Theologica* of Petavius are a work of incredible labour and compaſs: the volumes which relate ſolely to the incarnation (two folios, 5th and 6th, of 837 pages) are divided into 16 books—the firſt of his hiſtory, the remainder of controverſy and doctrine. The Jeſuit's learning is copious and correct; his Latinity is pure, his method clear, his argument profound and well connected: but he is the ſlave of the fathers, the ſcourge of heretics, and the enemy of truth and candour, as often as they are inimical to the Catholic cauſe.

PETAW, an ancient town of Germany, in the circle of Auſtria, and in Stiria. It is a handſome place, and is ſeated on the river Drave, 35 miles north-eaſt of Cilley, and 109 ſouth of Vienna. E. Long. 15. 36. N. Lat. 46. 40.

PETCHELI, a province of Aſia, in China, and the chief in the whole empire; bounded on the eaſt by the ſea, on the north by the great wall, on the weſt by Chanſi, and on the ſouth by Chantong and Honan. "This province contains nine cities of the firſt claſs, which have ſeveral others under their juriſdiction; theſe are about 40 in number, leſs conſiderable indeed, but all ſurrounded with walls and ditches. Petcheli has few mountains. Its ſoil is ſandy, and produces very little rice; but all other kinds of grain abound there, as well as the greater part of the fruit-trees we have in Europe. It pays an annual tribute to the emperor, which, according to Father Martini, conſiſts of 601,153 bags of rice, wheat, and millet; 224 pounds of linſeed; 45,135 of ſpun ſilk; 13,748 of cotton; 8,737,248 truſſes of ſtraw for the horſes belonging to the court, and 180,870 meaſures of ſalt, each containing 124 pounds; which is proportionably much inferior to that paid by other provinces.

"It is remarked that the people of this province have not the ſame aptitude for acquiring the ſciences as thoſe who inhabit the ſouthern provinces of the empire; but they are more robuſt and warlike, and better calculated to endure the hardſhips and fatigue of war. This is the caſe with the Chineſe of all the other northern countries.

"The face of the country here being flat and level, permits the uſe of a kind of carriage, the conſtruction of which appears to be rather ſingular. Father Martini, one of the firſt miſſionaries in China, thus deſcribes it: 'They uſe, in the province of Petcheli, a kind of chariot with one wheel, and conſtructed in ſuch a manner, that there is room in the middle for only one perſon, who ſits as if on horſeback; the driver puſhes behind, and, by means of wooden levers, makes the chariot advance with ſafety and expedition. This has perhaps given riſe to the report of chariots driven in that country by the wind, which the Chineſe direct over land with ſails, as they do ſhips at ſea.' A French miſſionary, who traverſed this province in 1768, ſeems to have made uſe of the ſame kind of carriage. 'We quitted the canal (ſays he) to travel in carts, which is cuſtomary in this part of China; but it is diſagreeable beyond deſcription. The cart is amazingly clumſy, and has a great reſemblance to the carriage of a gun: there is room in it for only one perſon, who is frequently obliged to ſit croſs-legged, as our taylors do in Europe; it jolts prodigiouſly; and, while the traveller is expoſed to the ſcorching rays of the ſun, ſuch clouds of duſt ſometimes ariſe as almoſt ſuffocate him.' Petcheli

"The temperature of the air of this province does not ſeem to agree with its latitude. Although Petcheli extends no farther than to the 42d degree of north latitude, yet all the rivers there are ſo much frozen during four months in the year, that horſes and waggons with the heavieſt loads may ſafely paſs them. It deſerves to be remarked, that the whole body of ice is formed in one day, and that ſeveral are neceſſary to thaw only the ſurface. What may appear no leſs extraordinary is, that during theſe ſevere froſts one does not feel that ſharp and pinching cold which accompanies the production of ice in Europe. Theſe phenomena cannot be accounted for, but by attributing them to the great quantity of nitre which is found diſperſed throughout this province, and to the ſerenity of the ſky, which, even during winter, is ſeldom obſcured by a cloud. The phyſical explanation, which we have given of this ſingular temperature, is fully confirmed by experiments lately made by Father Amiot at Peking, which convinced him, that in this capital and neighbourhood, as far as ſeven or eight leagues around, the water, air, and earth, equally abound with nitre.

"With regard to the water, the facility with which it freezes, the ſolidity of the ice and its duration, evidently announce the preſence of nitre. A tub filled with water, placed near one of Rheamur's thermometers, had its ſurface immediately frozen, when the mercury ſtood only one degree above the freezing point; and when it ſtood three degrees below freezing, the water became a ſolid maſs of ice, if the diameter of the veſſel did not exceed a foot and a half, and the depth of the water four or five inches. This water, when the weather was fine, continued in the ſame ſtate of congelation as long as the mercury in the thermometer did not riſe higher than three degrees above 0; when the mercury roſe higher, it then began to diſſolve, but ſo ſlowly, that two or three days were ſcarcely ſufficient to reſtore it to its former fluidity." Groſier goes on to relate other experiments of Father Amiot, which were made with a view to diſcover the cauſe of the water's freezing ſo in this temperate climate; and he then proceeds to tell us, that "if the waters of the province of Petcheli contain much nitre, it is no leſs certain, that the air which one breathes there is abundantly impregnated with it. The following are indubitable proofs of it: 1ſt, Notwithſtanding unwholeſome food, ſuch as the fleſh of the greater part of domeſtic animals that have died of old age or diſeaſe, which the people of this province

Petcheli is Peter.

greedily devour, notwithſtanding filth and all the inconveniences reſulting from low, damp, and confined lodgings, where all the individuals of the ſame family are, as it were, heaped one upon another, the plague never makes its appearance in Petcheli; and the people are ſeldom attacked by any of thoſe epidemical diſtempers which are ſo common in Europe. 2dly, Proviſions of every kind may be kept at Peking a long while, without being ſubject to corruption. Raiſins are eaten there freſh even in May, apples and pears till midſummer; wild boars, ſtags, deer, roebucks, rabbits, hares, pheaſants, ducks, geeſe, and all kinds of game brought from Tartary to Peking after the commencement of winter; fiſh of every ſpecies, tranſported from the rivers of Leaotong—will keep without the aſſiſtance of ſalt, in their ſtate of congelation, for two or three months, although they are expoſed every day in the markets, carried from the markets to private houſes, and from private houſes brought back to the markets until they are all ſold, which does not happen before the end of March. It is certain, that theſe facts announce an antiſeptic quality in the air, which muſt undoubtedly proceed from the great quantity of nitre contained in it.

"3dly, The earth which forms the ſoil of Petcheli abounds no leſs with nitre; whole fields may be ſeen in the neighbourhood of Peking which are covered with it. Every morning at ſunriſe the country in certain cantons appears as white as if ſprinkled by a gentle fall of ſnow. If a quantity of this ſubſtance be ſwept together, a great deal of kien, nitre, and ſalt, may be extracted from it. The Chineſe pretend, that this ſalt may be ſubſtituted for common ſalt; however this may be, it is certain, that, in the extremity of the province towards Siuen-hoa-fou, poor people and the greater part of the peaſants make uſe of no other. With regard to the kien procured from the earth, they uſe it for waſhing linen, as we do ſoap. Although the land of Petcheli is replete with nitrous particles, it does not, however, form dry deſerts; it is cultivated with care, and becomes fruitful by inceſſant labour. The earth is frozen in winter to the depth of two or three feet, and does not become ſoft before the end of March. This may ſufficiently explain why the froſt kills plants in the neighbourhood of Peking, which Mr Linnæus raiſed in Sweden, although it is 20 degrees farther north than the capital of the Chineſe empire."

PETECHIÆ, in medicine, a name given to thoſe ſpots, whether red or of any other colour, which appear in malignant fevers.

PETELIA. See STRONGOLI.

PETER (St), the apoſtle, born at Bethſaida, was ſon of John, Jona, or Joanna, and brother of St Andrew (John i. 42, 43.) His firſt name was Simon or Simeon; but when our Saviour called him to the apoſtleſhip, he changed his name into Cephas, that is, in Syriac, a *ſtone* or a *rock*; in Latin, *petra*, whence *Peter*. He was a married man; and had his houſe, his mother in law, and his wife, at Capernaum, upon the lake of Genneſareth (Mark i. 29. Mat. viii. 14. Luke iv. 38.) St Andrew, having been firſt called by Jeſus Chriſt, met his brother Simon, and told him (John i. 41.) we have found the Meſſiah, and then brought him to Jeſus. Jeſus beholding him, ſaid to him, You are Simon ſon of Jona; henceforth you ſhall be called *Cephas*, that is, *ſtone* or *rock*. After having paſſed one day with our Saviour, they returned to their ordinary occupation, which was fiſhing. Yet it is thought they were preſent with him at the marriage of Cana in Galilee. This happened in the 30th year of the vulgar Chriſtian era. Peter

Towards the end of the ſame year, Jeſus Chriſt being on the ſhore of the lake of Genneſareth, ſaw Peter and Andrew buſy about their fiſhery, and waſhing their nets (Luke v. 1, 2, 3.) He entered into their boat, and bid Peter throw out his nets into the ſea, in order to fiſh. Peter obeyed him, though he had already fiſhed the whole night without catching any thing. They took ſo many fiſhes at this draught, that their own veſſel, and that of James and John ſons of Zebedee, were filled with them. Then Peter threw himſelf at the feet of Jeſus, and ſaid to him, Depart from me, Lord, for I am a ſinner. Then Jeſus ſaid to them, Follow me, and I will make you fiſhers of men. He ſaid the ſame thing to James and John; and immediately they quitted their boats and nets, and followed our Saviour.

Some time after, Jeſus coming to Capernaum entered into the houſe of St Peter, where his mother-in law lay ſick of a fever. He immediately healed her, and ſhe began to miniſter to him (Luke iv. 38. and Mat. viii. 14.) A little while before the feaſt of the paſſover of the following year, being the 32d of the vulgar era, after Jeſus returned into Galilee, he made choice of twelve apoſtles, among which St Peter has always the firſt place (Mat. x. 2. Luke vi. 13.) One night that Jeſus Chriſt walked upon the waters of the lake of Genneſareth, St Peter aſked him leave to come and meet him (Mat. xiv. 28, 29.) Jeſus gave him leave; but he ſeeing a great wave coming, was afraid, and therefore began to ſink. Then Jeſus held him up, and ſaid, O man of little faith, why was you afraid? Afterwards landing on the other ſide of the lake, and the multitude that he had fed the day before beyond the lake being come to him at Capernaum, he ſpoke to them of his body and of his blood which he was to give to his diſciples to eat and drink. This ſo offended the multitude, that ſeveral of them quitted him thereupon. He therefore aſked his apoſtles if they alſo would leave him; to which Peter replied, To whom ſhall we go, Lord; for thou haſt the words of eternal life (John vi. 53, 54, &c.) One day, as our Saviour was near Cæſarea Philippi, he aſked his apoſtles whom the world took him for? they anſwered, that ſome ſaid he was John the Baptiſt; others, Elias; and others Jeremiah, or one of the prophets. But whom do you ſay I am? ſays Jeſus Chriſt. Simon Peter anſwered, Thou art Chriſt, the ſon of the living God. Jeſus then ſaid unto Peter, Bleſſed art thou, Simon Barjona; for fleſh and blood hath not revealed it unto thee, but my father which is in heaven (Mat. xvi. 13, 14, &c.) And I ſay unto thee, that, as thou art Peter, ſo upon this rock will I build my church, and the gates of hell ſhall not prevail againſt it; and I will give unto thee the keys of the kingdom of heaven, and whatſoever thou ſhalt bind on earth ſhall be bound in heaven, and whatſoever thou ſhalt looſe upon earth ſhall be looſed in heaven. About ſix or eight days after this, our Saviour taking Peter, James, and John,

eter. up a high mountain, apart from the other disciples, showed them a glimpse of his glory, and was transfigured before them (Mat. xvii. 1, 2, &c. and Luke ix. 28.) Whereupon Peter, seeing Moses and Elias together with Jesus, cried out to them in an ecstacy, Lord, it is good for us to be here! if you please, we will make three tents; one for you, one for Moses, and one for Elias.

Jesus returning from thence to Capernaum, those that gathered the tribute-money came to Peter, and said, Does not your master pay tribute? Whereupon Jesus ordered Peter to throw his line into the sea, and that he should find wherewith to pay the toll for them two in the mouth of the first fish he should take. Peter obeyed; and finding a piece of money in the mouth of the fish, he gave it to the tribute-gatherers, as he was directed. One day, as Jesus was discoursing concerning the forgiveness of injuries (Mat. xviii. 21, 22.), St Peter asked him, how often they must forgive, and whether it was sufficient to pardon an offender seven times? Jesus told him, I say, you must pardon not only as far as seven times, but even seventy times seven. Upon another occasion (Mat xix. 27—29.), as our Saviour was speaking of the danger of riches, Peter said to him, Lord, we have left all things to follow thee; what reward shall we have for it? Jesus answered him, I tell you in truth, that you who have left all things to follow me shall receive an hundred fold even in this world, and in the other eternal life; and at the last day, when the Son of man shall come to judge the world, you shall sit upon twelve thrones to judge the twelve tribes of Israel.

On the Tuesday before our Saviour's passion, Peter showed him the fig-tree he had cursed the evening before, which was now dried up and withered (Mark xi. 12—21.); and the day following, as they sat upon the mountain of Olives, he, with the other apostles, asked Jesus when the temple was to be destroyed (Mat. xxiv 1, 2, &c. Mark xiii. 1, 2, &c. Luke xxii.) On Thursday he was sent with St John to prepare all things for the passover; and at evening, when Jesus was come into the city with his apostles, and, being set down at table, began to speak of him that should betray him, Peter made signs to John to ask him who this should be (John xiii. 24.) After supper, the disciples entered into a dispute which should be the greatest among them: whereupon Jesus Christ, laying aside his garments betook himself to wash their feet, to give them an example of humility in his own person. St Peter at first made some difficulty, and would not suffer his master to wash his feet: but Jesus telling him, that if he did not wash his feet, he could have no part in him; St Peter replied, Lord, wash not only my feet, but my hands and head also (John xiii. 6—10.)

Some time after, Jesus said to him (Luke xxii. 31, 32, &c.), Peter, Satan has desired to sift you as men sift wheat; but I have prayed for you, that your faith may not fail: and when you are converted, confirm your brethren. By this he warned St Peter of his fall, that was just at hand, and of his renouncing him; from which, by the assistance of God, he was afterwards to recover. St Peter then asked him, where he was going? and said, he was ready to follow him everywhere, not only to prison, but to death itself. But Christ declared to him, that he would be so far from following him to death that he would abjure him three times that very night before the cock should crow, or before break of day. When supper was ended, he went to the garden of Olives, where, taking Peter, James, and John, he went with them apart, that they might be witnesses of his agony. Peter, though before he had showed so much resolution, yet fell asleep with the rest; which occasioned Jesus to say to him, Do you sleep, Simon? Could you not watch with me one hour? (Mark xiv. 37. Mat. xxvi. 40, &c.) Peter.

Judas being come with the soldiers to seize Jesus, Peter drew his sword, and cut off the right ear of one called Malchus, who was servant to the high-priest: but Jesus bid him put up his sword into the scabbard; and told him, that all those that fought with the sword should perish by the sword: and at the same time healed Malchus's ear (John xviii. 10, &c.) Peter followed Jesus afar off, as far as the house of Caiaphas, and was let in by means of another disciple, who was known in the family. The soldiers and servants that had brought Jesus, having lighted a fire in the middle of the hall, Peter mingled among them to warm himself also; when a maid-servant, having looked earnestly upon him, said, Surely this man was with Jesus of Nazareth. But Peter made answer, I know not what you say, for I do not so much as know the man. Presently after he went out into the porch, when immediately the cock crew. A little while after another maid said to those that were present, This man was with Jesus of Nazareth. But Peter denied it with an oath. About an hour after, one of the company affirmed that Peter was a disciple of Jesus. Others insisted upon the same thing; and said, that surely he was one of them, for his very speech betrayed him to be a Galilean. Lastly, one of them, being a kinsman of Malchus whose ear Peter had cut off, affirmed the same thing; and asked him, Did not I see you with him in the garden? Peter again denied it with an oath, protesting that he did not know the man. And at the same time the cock crowed the second time. Then Jesus, being in the same hall, and not far from Peter, looked upon him; and Peter then remembering what Jesus had said to him, that before cock-crow he should deny him thrice, he went out of Caiaphas's house, and wept bitterly (Mat xxvi. 73, 75. Mark xiv. 34, 72.)

Very probably he remained in secret, and in tears, all the time of our Saviour's passion, that is, all Friday and Saturday following; but on Sunday morning, Jesus being risen, and Mary having been at the tomb, and not finding the body of Jesus, she came in haste into the city, to tell Peter and John that they had taken away their master, and that she could not find where they had put him. Peter and John made haste thither, and John coming first, did not go into the sepulchre. Peter then coming up to him, presently stooped down, and saw the linen clothes wherein the body had been wrapt. He went then into the sepulchre, and John with him; after which they returned to Jerusalem, not knowing what had come to pass. But soon after Jesus appeared to the holy women, who had come first to the sepulchre, and bid them give his apostles notice of his resurrection. And the same day

Peter. our Saviour alſo appeared to Peter, to comfort him, and aſſure him that his repentance had been acceptable to him.

Some days after, St Peter being returned into Galilee as Jeſus had commanded him, and going to fiſh in the ſea of Galilee, or in the lake of Genneſareth, with ſome other of the apoſtles, Jeſus appeared to them on the ſhore, and bid them throw out their nets on the right ſide of the veſſel. They threw them out, and took ſuch a multitude of fiſhes that they could not draw up their nets again. Then St John ſaid to Peter, It is the Lord. Peter immediately girded up himſelf, for he was naked, and ſwimming to ſhore he came to Jeſus: then drawing their nets to ſhore, Jeſus dined with them. After dinner, Jeſus ſaid to Peter, Simon, ſon of Jona, do you love me more than theſe? He anſwered, Yea, Lord, you know that I love you. Jeſus ſays to him, Then feed my lambs. He put the ſame queſtion to him again; and Peter making the ſame anſwer, our Lord ſaid to him again, Feed my ſheep. This he repeated a third time; at which St Peter was troubled, and ſaid, You know, Lord, that I love you. Jeſus replied to him, "Feed my ſheep. I tell you for a truth, that when you were young, you girded yourſelf and went where you pleaſed; but now you are old, another ſhall gird you, and lead you where you would not go." This he ſaid to let him know what death he was to die. At the ſame time, Peter ſeeing St John the Evangeliſt, ſaid to our Saviour, Lord, what muſt become of him? Jeſus anſwered, "If I will that he tarry till I come, what does that concern you? Do you follow me." Thus he refuſed to declare in what manner St John ſhould end his life.

After that Jeſus Chriſt had aſcended into heaven, and that the apoſtles had been witneſſes of his aſcenſion, they returned to Jeruſalem, to wait there for the Holy Ghoſt, whom our Saviour had promiſed to ſend them; and being aſſembled together in a houſe, they continued there in prayer, and in the union of charity, till the time that the Holy Ghoſt deſcended upon them, in the form of tongues of fire. During this interval, St Peter propoſed to the apoſtles, and to the reſt of the aſſembly, to fill up the place that the traitor Judas had left vacant in the apoſtleſhip. The propoſal was agreed to by all; and two perſons were propoſed, Joſeph Barſabas and Matthias: upon this laſt the lot fell; and from that time he was admitted one of the apoſtles. The tenth day after the aſcenſion of our Saviour, being the day of Pentecoſt, the Holy Ghoſt having deſcended upon the apoſtles, and upon all the faithful that were aſſembled with them, and having repleniſhed them with ſupernatural gifts, and eſpecially with the gift of tongues, all thoſe who were witneſſes of this miracle expreſſed their admiration at it; and there being upon that day at Jeruſalem a great many Jews from ſeveral provinces of the eaſt, they could not comprehend by what means theſe men, who were Galileans, ſhould ſpeak the languages of all theſe pagan nations (Acts ii. 1, 2, &c.) Some of them ſaid, that the apoſtles were full of new wine. But St Peter ſtanding up, told them, that what they heard and ſaw was not the effect of drunkenneſs, but was the completion of the promiſe that the Holy Ghoſt had made by the prophet Joel (ii. 28.), to ſend his ſpirit upon all fleſh, and to give the ſpirit of prophecy to young and old, to men and women. He afterwards ſpoke to them of Jeſus Chriſt, and told them that he was the true Meſſiah, that he was riſen from the dead as the ſcripture had foretold he ſhould; declaring that himſelf and the other apoſtles were witneſſes of his reſurrection; of his aſcenſion into heaven, and of the miſſion of the Holy Ghoſt, the viſible effects of which they ſaw with their own eyes in the gifts of languages wherewith they had been repleniſhed. Peter.

Then thoſe that heard him were touched with compunction, and aſked the apoſtles, Brethren, what ſhall we do? Peter anſwered them, Repent, and be baptized, and you ſhall receive the Holy Ghoſt. Then he inſtructed them, baptized them, and that very day three thouſand perſons were added to the church (Acts iii. 1, 2, &c.) Some days after, St Peter and John, going to the temple at the hour of prayers, met at a gate of the temple a man who had been lame from his birth, ſo that he was carried about. This man ſeeing Peter and John, aſked alms of them: upon which Peter ſaid to him, Silver or gold I have not; but ſuch as I have I give thee: In the name of Jeſus of Nazareth, riſe up and walk. Preſently the man got up, and went into the temple along with them, lifting up his voice, and glorifying God. He held St Peter, telling the people then aſſembled all that happened unto him. Then Peter, taking this occaſion, told the people, that it was not by his own power that he had performed the miracle they ſo much wondered at, but that it was by the power of Jeſus Chriſt that this man was healed. He then laid before them the great crime they had committed, in putting Jeſus Chriſt to death, who was the Saviour of the world, and the Meſſiah; and after he had ſhewn them by all the prophecies that Chriſt was to die thus, he exhorted them to repentance, and to make a proper uſe of the death of Chriſt.

He was thus ſpeaking to the people, when the prieſts and Sadducees coming upon them, laid hold on Peter and John, and put them in priſon, until the day following, it being now late (Acts iv. 1, 2, &c.) But the number of thoſe that were converted this day at the ſecond preaching of St Peter was about five thouſand. The day following, the rulers, magiſtrates, and chief prieſts being aſſembled on this occaſion, ordered the apoſtles to be brought before them; and then aſked them, by whoſe authority they performed the miracle of healing the lame man? St Peter anſwered, that it was in the name of Jeſus of Nazareth, whom they had crucified, and whom God raiſed again from the dead. The aſſembly were ſurpriſed at the boldneſs of the apoſtles upon this occaſion: but came to a reſolution to diſmiſs them, charging them at the ſame time to teach no more in the name of Jeſus; and threatening them if they ſhould perſiſt in diſobedience to theſe orders. The two apoſtles returned to their brethren, and related to them all that had paſſed; which having heard, the brethren raiſed their voices to heaven, begging God to give them ſtrength and courage to declare his word with perfect liberty; and having finiſhed their prayers, the place ſhook wherein they were aſſembled, and they were again filled with the Holy Ghoſt.

At this time many of the faithful ſold their eſtates, and brought the money to the apoſtles (*id.* v. 1, 2, &c.) Of this number was a man called Ananias, with

eter. his wife Sapphira, who, by a private agreement between themſelves, concealed a part of the money for which they had ſold their land, and brought the reſt to St Peter, as if it were the whole ſum. Ananias came firſt; and St Peter ſaid to him, Ananias, how came Satan to ſeduce you, and to prevail with you to lie to the Holy Ghoſt, by concealing part of the price of your land? It is not men that you thought to impoſe on, but God. Immediately Ananias fell down dead, and they carried him out and buried him. About three hours after his wife Sapphira came in, and St Peter ſaid to her almoſt the ſame things he had before ſaid to her huſband, and immediately ſhe fell down alſo, and gave up the ghoſt. This affair inſuſed a great awe in the whole church, and amongſt all thoſe that heard of it. (See Acts v.)

The number of believers conſiderably increaſed every day; ſo that they even brought out the ſick into the ſtreets, and laid them where Peter was to paſs, that at leaſt his ſhadow might cover ſome of them, by which means they were healed of their diſtempers. Then the high-prieſt and his aſſociates, that is, the Phariſees, cauſed the apoſtles to be apprehended and put into priſon. But an angel brought them forth, and bid them go into the temple, and there boldly declare all the words of life which God had taught them. This they performed: upon which the princes and prieſts cauſed them to be brought before them; and having demanded why they had diſobeyed their orders, in continuing to ſpeak ſtill in the name of Jeſus Chriſt, Peter and the apoſtles anſwered, that it was more neceſſary to obey God than man. This anſwer provoked them very much, and they were going to condemn them to death, when Gamaliel prevailed with them to change their reſolution, by repreſenting to them, that if this matter proceeded from God, it was in vain for them to oppoſe it; but if otherwiſe, then it ſhould ſoon vaniſh of itſelf. So they diſmiſſed the apoſtles, after giving them thirty-nine ſtripes a-piece, and charged them to ſpeak no more in the name of Jeſus Chriſt.

After the martyrdom of St Stephen, a perſecution was carried on againſt the faithful at Jeruſalem, and they were obliged to take ſhelter in ſeveral places. The apoſtles alone continued at Jeruſalem (Acts viii. 1, 2, 3, &c.) St Philip the deacon going to Samaria, the Samaritans received the word of the Lord, and ſeveral of them were baptized. Then St Peter and St John repaired thither alſo, to give them the Holy Ghoſt; which St Philip, being only a deacon, had not power to do. Simon the magician was alſo baptized among others; and admiring the power that the apoſtles had, of conferring the Holy Ghoſt, would have bought the ſame power of the apoſtles, and accordingly offered money to St Peter. But Peter with indignation replied to him, Thy money and thou periſh together, who thinkeſt the gifts of God can be bought with money! Thou haſt no part with us, nor haſt any pretenſions to this miniſtry, for thy heart is not right before God. Repent therefore of this wickedneſs, and pray to God if perhaps he will pardon the wicked thoughts of thy heart. After this Peter and John returned again to Jeruſalem. See Acts viii.

The fire of perſecution being now pretty well extinguiſhed, St Peter departed from Jeruſalem (Acts ix. 32, &c.), and viſiting the diſciples from city to city, he came alſo to ſee the ſaints that dwelt at Lydda. Here he found a man called Æneas, who had been paralytic for eight years. St Peter ſaid to him, Æneas, riſe up; Jeſus Chriſt the Lord cures you. He preſently got up; and all that dwelt at Lydda that ſaw the miracle were converted to the Lord. There was alſo at Joppa a certain holy woman, named Tabitha, who happening to die while St Peter was at Lydda, the diſciples ſent to deſire him to come to them. Whereupon St Peter came, and entering into the chamber where Tabitha lay dead, he cauſed every body to go out, and betook himſelf to prayers. Then turning himſelf towards the corpſe, he ſaid, Tabitha, ariſe. At which inſtant ſhe opened her eyes, and ſeeing St Peter, ſhe ſat up. This miracle was much famed at Joppa, and was the occaſion that many were converted. St Peter ſtayed there a good while, taking up his lodging with one Simon a tanner. Peter.

Now there was at Cæſarea of Paleſtine a centurion called Cornelius, a man that feared God (Acts x. 1, 2, 3.), and to whom it was revealed by an angel, that he ſhould ſend to Joppa to Peter, who ſhould tell him what he had to do. Cornelius immediately ſent two of his ſervants; and while they were upon the road, the Lord ſent a viſion to Peter, to prepare him to go to this man without any ſcruple, although he was not a Jew; for as yet the door of the goſpel had not been opened to the Gentiles. St Peter, then being at the top of the houſe, fell into a trance, and ſaw, as it were, a great ſheet of linen let down from heaven, which was full of all kinds of animals and reptiles, both clean and unclean. He had this viſion three times, and heard a voice, ſaying, Ariſe Peter, kill and eat. But Peter anſwered, Lord, I have never eaten any thing unclean. The voice replied, Call not that unclean which God has purified. After which the ſheet was again taken up into heaven. At the ſame time, the men came in that had been ſent by Cornelius. They acquainted him with what had happened to their maſter, and deſired him to go along with them to Cæſarea. The day following St Peter ſet out thither, and was accompanied by ſome of the brethren of Joppa. (See Acts x.)

When Peter was returned to Jeruſalem, the faithful of the circumciſion ſaid to him, why have you gone unto the uncircumciſed, and why did you eat with them? but Peter having related to them all that paſſed, they were ſatisfied, and glorified God who had given the gift of repentance leading to life as well to the Gentiles as to the Jews. It is thought, that a little after this Peter went to Antioch, where he founded the Chriſtian church of which he was biſhop (Gal. ii. 11.) It is believed that he continued here ſeven years, though not conſtantly: for during this time, he went to Jeruſalem, and to the provinces of Aſia Minor, to Bithynia, Cappadocia, and Pontus, as is concluded from the epiſtle that he afterwards addreſſed to the faithful of theſe provinces. From thence he went to Rome, in the 42d year of the Chriſt an era; and it is thought that at his leaving Antioch he there fixed St Ignatius in his place. Euſebius thinks, that the chief occaſion of his going to Rome was to oppoſe Simon Magus, who by his deceits had perverted a great number of perſons. However, the preſence of St Peter, and the true miracles that he oppoſed to the tricks

Peter. of Simon, ruined, or much diminiſhed, the reputation of this impoſtor.

St Peter, leaving Rome, came to Jeruſalem at the paſſover, in the 44th year of the Chriſtian era, when Herod Agrippa began to perſecute the church. That prince put St James the Greater, brother of John, to the ſword (Acts xii. 1, &c.); and perceiving that his death was agreeable to the Jews, he moreover cauſed Peter to be apprehended and put in priſon, with a deſign of executing him publicly after the paſſover. But the very night that Herod thought of putting him to death, as Peter, loaded with chains, was aſleep between two ſoldiers, the angel of the Lord awakened him, broke off his chains, opened the priſon door, and brought him out the length of a ſtreet. Then the angel leaving him, he came to the houſe of Mary the mother of John, where many of the faithful were aſſembled at prayers, and having knocked at the door, a damſel named Rhoda came to open it; but when ſhe heard Peter's voice, inſtead of opening the door, ſhe ran in a tranſport of joy to acquaint the family that Peter was at the door. Thoſe that heard her could not believe it, and ſaid, it was his angel, and not himſelf: but continuing to knock, and being let in, he informed them of what had happened to him.

He then left Jeruſalem; but we are not told what became of him till the time of the council held at Jeruſalem in the year 51. It is thought that before this time he made his ſecond journey to Rome, from whence he wrote his firſt epiſtle.

St Peter was obliged to leave Rome in the year 51 by order of the emperor Claudius, who had baniſhed all Jews from thence, becauſe of the tumults they continually raiſed there, excited by one Chreſtus, as Suetonius ſays, meaning probably by this name Jeſus Chriſt. The apoſtle then returned into Judea, where was held the council of Jeruſalem; in which, after a ſtrict examination of the matter propoſed to Peter and the apoſtles, he ſpoke to them with much wiſdom, ſaying (Acts xv. 7, 8, &c.), that God having given his Holy Ghoſt and the gift of faith to the Gentiles as well as to the Jews, they ought not to impoſe the yoke of the legal obſervances on the new converts, which (as he ſays) neither we nor our fathers have been able to bear. But we believe, that it is through the grace of Jeſus Chriſt that both we and they ſhall be ſaved. St James the Leſs biſhop of Jeruſalem, ſeconded this opinion of St Peter; and the council came to this concluſion, That no new obligation ſhould be impoſed on the Gentiles, but only that they ſhould be required to abſtain from fornication, from the uſe of blood, and from meats offered to idols. The reſolution of this council was written to the faithful of Antioch, becauſe it was there this queſtion was firſt ſtarted.

Some time after, St Peter coming to Antioch (Gal. ii. 11, &c.), he eat and drank with the Gentiles without regarding that diſtinction of meats enjoined by the law. But after that when ſome of the faithful of Jeruſalem came to Antioch, being converted Jews, St Peter, out of fear to offend them, ſeparated himſelf from the converted Gentiles, and would no longer eat with them as before. St Paul, fearing that what St Peter did might be interpreted as if he had a deſire to oblige the Gentiles to judaize and to ſubmit themſelves to the yoke of the law, and ſo to revoke and annul what he himſelf had determined in the council of Jeruſalem, he withſtood Peter to his face, and openly expoſtulated with him, telling him, he was much in the wrong to endeavour to oblige the Gentiles, at leaſt tacitly by his own manner of acting, to live as the Jews do; and St Peter received this reprehenſion with ſilence and humility. Peter.

The particulars of St Peter's life are little known from the firſt year of the vulgar era, in which the council of Jeruſalem was held, till his laſt journey to Rome, which was ſome time before his death. Then being acquainted by revelation that the time of his death was not far off (2 Pet. i. 14.), he had a mind to write to the faithful that had been converted by him, to put them in mind of the truths he had before taught them. He ſent them therefore his ſecond epiſtle.

St Peter and St Paul came to Rome about the ſame time, in the year of Chriſt 65, where they performed many miracles, and made many converts. Simon Magus by his tricks continued here to deceive the people, pretending himſelf to be the Meſſiah, and even attempting to aſcend into heaven: for having cauſed himſelf to be carried up into the air by his dæmons, in a fiery chariot, St Peter and St Paul betook themſelves to their prayers; and then the impoſtor, being forſaken by his dæmons, fell down upon the ground, which fall ſome time afterwards occaſioned his death. See SIMON MAGUS.

Soon after this, St Peter was taken up and thrown into priſon, where it is ſaid he continued for nine months; at laſt he was crucified at Rome in the Via Oſtia; with his head downwards, as he himſelf had deſired of his executioners. This he did out of a ſenſe of humility, for fear it ſhould be thought, as St Ambroſe ſays, that he affected the glory of Jeſus Chriſt, and the more to augment the pain of his execution.

It is ſaid, that the body of St Peter was at firſt buried in the catacombs, two miles from Rome, from whence it was afterwards tranſported to the Vatican, where it has lain ever ſince. His feſtival is celebrated with that of St Paul on the 29th of June. St Peter died in the 66th year of the vulgar era, after having been biſhop of Rome for about 24 or 25 years. His age might be about 74 or 75 years. It is generally agreed, that St Linus was his ſucceſſor. The following is the portraiture that Nicephorus gives us of St Peter, which he has probably taken from the ancient pictures that were preſerved of this apoſtle. He was not fat, but pretty tall and upright, having a fair and peliſh countenance. The hair of his head and beard was thick, frizzled, and not long. His eyes were black, and blood-ſhot; his eye-brows protuberant and lofty; his noſe ſomething long, and rather flat than ſharp.

The two epiſtles of St Peter are addreſſed to thoſe Jewiſh converts who were ſcattered throughout Pontus, Galatia, &c. not only upon the perſecution raiſed at Jeruſalem, but upon former diſperſions of the Jews into thoſe places on ſeveral other occaſions. The firſt epiſtle is principally deſigned to comfort and confirm them under thoſe fiery trials and manifold temptations they were then ſubject to, and to direct and inſtruct them how to behave in the ſeveral ſtates and relations both of the civil and the Chriſtian life, that

r. they might not be engaged in thoſe rebellions againſt Cæſar and his officers, then tormented among the Jews; and that they might ſtop the mouths of thoſe who ſpoke againſt them as evil doers. In the ſecond epiſtle, he proſecutes the ſame ſubject, to prevent their apoſtacy from the faith, on account of any perſecutions they were liable to. He likewiſe guards them againſt the corrupt principles of the gnoſtics, and thoſe who ſcoffed at the promiſe of Chriſt's coming, as if it would never be verified.

all's ...laſ- ...nded. St Peter's ſtyle, ſays a modern author, expreſſes the noble vehemence and fervour of his ſpirit, the full knowledge he had of Chriſtianity, and the ſtrong aſſurance he had of the truth and certainty of his doctrine; and he writes with the authority of the firſt man in the college of the apoſtles. He writes with that quickneſs and rapidity of ſtyle, with that noble neglect of ſome of the formal conſequences and niceties of grammar, ſtill preſerving its true reaſon, and natural analogy (which are always marks of a ſublime genius), that you can ſcarce perceive the pauſes of his diſcourſe and diſtinction of his periods. The great Joſeph Scaliger calls St Peter's firſt epiſtle majeſtic; and we hope he was more judicious than to exclude the ſecond, though he did not name it.

A noble majeſty, and becoming freedom, is what diſtinguiſhes St Peter; a devout and judicious perſon cannot read him without ſolemn attention and awful concern. The conflagration of this lower world, and future judgment of angels and men, in the third chapter of the ſecond, is deſcribed in ſuch ſtrong and terrible terms, ſuch awful circumſtances, that in the deſcription we ſee the planetary heavens and this our earth wrapped up with devouring flames, hear the groans of an expiring world, and the cruſhes of nature tumbling into univerſal ruin.

The authority of the ſecond epiſtle of St Peter was for ſome time doubted of, as Origen, Euſebius, St Jerome, and others have obſerved. What made the ancients call it in queſtion, is the difference of its ſtyle from the firſt. The third chapter, which deſcribes the cataſtrophe of the viſible world, made Grotius think this epiſtle was wrote after the taking of Jeruſalem; becauſe that was not to happen till after the deſtruction of that city; upon which he conjectures, that Simeon biſhop of Jeruſalem is the author of this epiſtle, and that the inſcription which carries St Peter's name is corrupted. But the beſt critics admit this epiſtle to be the genuine work of St Peter, who diſcovers himſelf, where he ſays, that he was preſent at our Lord's tranſfiguration; and where he tells the Jews, this was the ſecond letter he had written to them. The reader may ſee this queſtion fully diſcuſſed, and the authority of this epiſtle eſtabliſhed beyond all doubt, by the learned Dr Sherlock, in his *Diſſertation* on the authority of the Second Epiſtle of St Peter.

St Peter has been made the author of ſeveral books; ſuch were, his Acts, his Goſpel, his Revelation, his work about preaching, and another about judgment. There is extant a large hiſtory of St Peter, called the *Recognitions*, aſcribed to St Clement.

Peter of Blois, a learned man of the 12th century, was born about the year 1125, at the city of Blois in France, from whence he derived his name. His parents being opulent, gave him a learned education. In his youth, when he ſtudied in the univerſity of Paris, he was exceſſively fond of poetry; and when he was a little further advanced in life, he became no leſs fond of rhetoric, to the ſtudy of which he applied with the greateſt ardour. From Paris he removed to Bononia in Italy, to acquire the civil and canon law; in the knowledge of both which he very much excelled. He appears from his writings to have cultivated medicine, and ſeveral branches of the mathematics, with no little care and ſucceſs. The ſtudy of theology was the chief delight and buſineſs of his life, in which he ſpent the greateſt part of his time, and made the greateſt progreſs. But unfortunately it was that ſcholaſtic theology, which conſiſted in vain attempts to prove and explain the many abſurd opinions which then prevailed in the church, by the ſubtleties of Ariſtotelian logic. In attempting to explain in this manner the moſt abſurd of all opinions that ever exiſted amongſt mankind, he was the very firſt perſon who employed the famous word *tranſubſtantiation*, which was ſoon after adopted by the church of Rome, and hath ever ſince made ſo great a noiſe. Being appointed preceptor to William II. king of Sicily in 1167, he obtained the cuſtody of the privy ſeal; and, next to the archbiſhop of Palermo, the prime miniſter, had the greateſt influence in all affairs. But his power was not of long duration; for the archbiſhop being baniſhed in 1168, our author ſoon after left the court of Sicily, and returned into France. He was not long, however, without a royal patron, being invited into England by Henry II. who employed him as his private ſecretary, made him archdeacon of Bath, and gave him ſome other benefices. When he had ſpent a few years at court, he conceived a diſguſt at that way of life (of which he hath drawn a very unpleaſing picture in one of his letters), and retired into the family of Richard archbiſhop of Canterbury, who had made him his chancellor about the year 1176. In this ſtation he continued to the death of the archbiſhop in 1183, enjoying the higheſt degree of favour with that prelate, though he uſed much freedom in reproving him for his remiſſneſs in the government of the church. Our author remained in the ſame ſtation in the family of archbiſhop Baldwin, who ſucceeded Richard, acting both as his ſecretary and chancellor. He was alſo ſent by that prelate on an embaſſy to Rome in 1187, to plead his cauſe before Pope Urban III. in the famous controverſy between him and the monks of Canterbury about the church of Hackington. After the departure of his friend and patron Baldwin for the Holy Land in 1190, our author was involved in various troubles in his old age, the cauſes of which are not diſtinctly known; and died about the end of the 12th century. He appears from his works, which may be juſtly reckoned among the moſt valuable monuments of the age in which he flouriſhed, to have been a man of great integrity and ſincere piety, as well as of a lively inventive genius and uncommon erudition. His printed works conſiſt of 134 letters, which he collected together at the deſire of Henry II.; of 65 ſermons, delivered on various occaſions; and of 17 tracts on different ſubjects.

Peter the Hermit. See Croisade and Hermit.

Peter I. juſtly ſtyled *Peter the Great*, czar, and afterwards

Peter. afterwards emperor, of Ruſſia, founder of the Ruſſian empire; for though the country was well known, and of great antiquity, yet it had no extent of power, of political influence, or of general commerce, in Europe, till his time. He was born in 1672; and was proclaimed czar when but ten years of age, in excluſion of John his elder brother, who, being of a ſickly conſtitution, was at the ſame time very weak in his underſtanding. The princeſs Sophia, his half ſiſter, made an inſurrection in favour of John; and to put an end to the civil war, it was at laſt agreed that the two brothers ſhould jointly ſhare the imperial dignity. Peter had been very ill brought up, not only through the general defects of the Ruſſian education, but likewiſe through the arts of the princeſs Sophia, who ſurrounded him with every thing that might ſtifle his natural deſire of knowledge, deprave his mind, and enervate it with pleaſures. Notwithſtanding this, his inclination for military exerciſes diſcovered itſelf in his tendereſt years. He formed a company of 50 men, commanded by foreign officers, clothed and exerciſed after the German manner. He entered himſelf into the loweſt poſt, that of a drummer; and never roſe otherwiſe than as a ſoldier of fortune. Herein his deſign was to teach his nobility, that merit, not birth, was the only title to military employments. He reinforced his company with ſeveral others, till at laſt he had got together a conſiderable body of ſoldiers. As he then had no war on his hands, he exerciſed them in all ſorts of mock-engagements, and by this means ſecured to himſelf a body of well-diſciplined troops. The ſight of a Dutch veſſel, which he had met with on a lake belonging to one of his pleaſure-houſes, made ſuch an impreſſion on his mind, that he conceived the almoſt impracticable deſign of forming a navy. His firſt care was to get ſome Hollanders to build ſome ſmall veſſels at Moſcow; and he paſſed two ſucceſſive ſummers on board Engliſh or Dutch ſhips, which ſet out from Archangel, that he might inſtruct himſelf in every branch of naval affairs (A). In 1696 czar John died, and Peter was now ſole maſter of the empire. In 1698 he ſent an embaſſy to Holland; and went *incognito* in the retinue, and viſited England as well as Holland, in order to inform himſelf fully in the art of ſhip-building. At Amſterdam he worked in the yard as a private ſhip-carpenter, under the name of *Peter Michaelof*; but he has been often heard to ſay, that if he had never gone to England, he had ſtill remained ignorant of that art. In 1700 he had got together a body of ſtanding forces, conſiſting of 30,000 foot; and now the vaſt project he had formed diſplayed itſelf in all its parts. He opened his dominions, which till then had been ſhut up, having firſt ſent the chief nobility of his empire into foreign countries to improve themſelves in knowledge and learning. He invited into Ruſſia all the foreigners he could meet with, who were capable of inſtructing his ſubjects in any manner, and offered them great encouragement to ſettle in his dominions. This raiſed many diſcontents; and the deſpotic authority he exerted on that occaſion was ſcarcely powerful enough to ſuppreſs them. In 1700, being ſtrengthened by the alliance of Auguſtus king of Poland, he made war on Charles XII. king of Sweden. His firſt ill ſucceſs did not deter him; for he uſed to ſay, I know that my armies muſt be overcome for a great while; but even this will at laſt teach them to conquer. He afterwards gained conſiderable advantages; and founded Peterſburg in 1703. In 1709 he gained a complete victory over the Swedes at Pultowa. In 1712 he was incloſed by the Turks on the banks of the Pruth; and ſeemed inevitably loſt, had not the czarina Catherine bribed the grand viſir, and the czar's prudence completed his deliverance. In 1716 he made a tour through Germany and Holland, and viſited the royal academy of ſciences at Paris. It would be endleſs to enumerate all the various eſtabliſhments for which the Ruſſians are obliged to him. He formed an army according to the manner of the politeſt and moſt experienced nations: he fitted out fleets in all the four ſeas which border upon Ruſſia: he cauſed many ſtrong fortreſſes to be raiſed after the beſt plans; and made convenient harbours: he introduced arts and ſciences into his dominions, and freed religion from many ſuperſtitious abuſes: he made laws, built cities, cut canals, &c.; was generous in rewarding, impartial in puniſhing; faithful, laborious, and humble; yet was not free from a certain roughneſs of temper natural to his nation. He had indeed cured himſelf of exceſs in drinking; but he has been branded with ſeveral other vices, particularly cruelty. He publiſhed the unfortunate hiſtory of his ſon prince Alexis (B); towards whom ſome blame his ſeverity, while others think

(A) The following circumſtance, it is ſaid, in ſome meaſure determined Peter to attempt thoſe reformations which he afterwards accompliſhed. Great events have been ſometimes the effect of little cauſes; and it is at leaſt poſſible, that without the occurrence we are going to relate, Ruſſia might ſtill have been in a ſtate of barbariſm. A young Geneveſe, called *Le Fort*, about 1695, went to Moſcow with the Daniſh ambaſſador. The czar Peter, who was then 19 years old, fell in company with this Geneveſe, who had ſoon learnt the Ruſſian tongue, and ſpoke almoſt all the tongues of Europe. Le Fort ingratiated himſelf with the prince, entered into his ſervice, and ſoon afterwards into his familiarity. He made him comprehend that there was a different manner of living and reigning from what had unhappily obtained throughout his vaſt and miſerable empire. A prince muſt be born with an uncommon greatneſs of ſoul to liſten readily to a ſtranger, and to be able to diveſt himſelf of the prejudices of a throne and of his country. The czar was ſenſible that neither himſelf nor his people were yet to be reckoned among men; and that he had an empire to form, but could have no aſſiſtance at home. From that time he took a reſolution to leave his dominions; and ſet out, like another Prometheus, to borrow celeſtial fire for animating his countrymen.

(B) Alexis, like his father, is ſaid to have married a ſlave, and, like him, quitted Moſcovy ſecretly, but had not the ſame ſucceſs in his undertakings; and the being but a bad imitator of his father, coſt him his life. He became an example of the moſt terrible ſeverity that ever was given from the tribunal of the throne: but, what

is

think it no more than was neceſſary. He perfectly knew the honour due to perſons of merit; and not only heaped honours upon them during their life, but gave them marks of eſteem even after their death. He died of the ſtrangury in 1725, and left the world with the magnanimity of a hero and the piety of a Chriſtian. Peter.

Peter was tall of ſtature, and of a bold and majeſtic aſpect, though ſometimes disfigured by convulſions, which altered his features. This deformity was aſcribed to poiſon, given him, as it is ſaid, by his ſiſter Sophia; but it was indeed no other than wine and brandy, which he often drank to exceſs, relying too much on the ſtrength of his conſtitution. He converſed with perſons in all ſtations, from the mechanic to the general of an army; and his converſation was neither like that of a barbarian who makes no diſtinction between men, nor of a popular prince who ſeeks to pleaſe all the world, but that of a perſon who aims at inſtruction. He loved women as much as the king of Sweden, his rival, dreaded them, and all were equally agreeable to him as well in bed as at Loard; he valued himſelf on drinking large draughts, rather than ſipping delicious wines. We are told that kings and legiſlators ſhould never ſuffer themſelves to be tranſported by paſſion; but never was any man more paſſionate than Peter the Great, nor more mercileſs. In a king this is more than an infirmity for which we make amends by confeſſing it; but it was generally remarked of Peter, and he himſelf ſaid to a magiſtrate of Holland, at his ſecond voyage, "I have reformed my nation, and have not been able to reform myſelf." It is true, the cruelties with which he is reproached were not novelties at the court of Moſcow, any more than at that of Morocco: it was not uncommon to ſee a czar, with his own royal hand, inflict 100 laſhes of a bull's pizzle on the naked ſhoulders of a prime officer of the crown, or of a lady of the palace, for failing in their duty, by getting drunk; or to try the goodneſs of his ſabre, by ſtriking off the head of a criminal. Peter had himſelf performed ſome of thoſe ceremonies of his country; Le

---

is much to the honour of the empreſs Catherine, ſhe had no hand in the misfortunes of that prince, who was born of another woman, and loved nothing that his father loved. Catherine was not in the leaſt ſuſpected of acting the cruel ſtepmother. The great crime of the unfortunate Alexis was his being too much a Ruſſian, and his diſapproving every thing that was grand and immortal, and projected by his father for the glory of the nation. One day, hearing ſome Moſcovites lamenting the inſupportable fatigues they were to undergo in the building of Peterſburg, he ſaid, "Take courage, this city will not ſtand long." When he was called to attend his father in a journey of 600 or 700 leagues, which the czar often made, he feigned ſickneſs. He took violent purges for a diſtemper which he had not; and ſuch quantities of medicines, with exceſſive drinking of brandy, impaired his health and his wits. At firſt he had an inclination to learning, was acquainted with geometry and hiſtory, and had learnt the German tongue: but he hated war, and would never learn it; for which he was moſt reproached by his father. They had married him in 1711 to the princeſs of Wolfenbuttle, ſiſter of the empreſs conſort to Charles VI. This marriage was unfortunate; the princeſs was often abandoned for a debauch in brandy, and for Afroſina, a Finland wench, of a large ſtature, well made, and very agreeable. It is reported that the princeſs died of chagrin, if it be poſſible for chagrin to prove mortal; and that afterwards the czarowitz ſecretly eſpouſed Afroſina in 1713, when the empreſs Catherine had juſt brought him a brother, at which he had no reaſon to be uneaſy.

The miſunderſtandings between the father and the ſon became every day more ſerious; till at length the father, about the year 1716, threatened the prince to diſinherit him; and the prince told him that he intended to go into a monaſtery.

The czar, in 1717, renewed his journeys, as well with a view to politics as curioſity. He came at laſt into France. If the ſon had entertained an inclination to revolt, if he had actually had a party formed in his favour, now was the time to declare himſelf; but inſtead of remaining in Ruſſia, making himſelf popular, and creating dependents, he took a journey in his turn, having with much difficulty ſcraped together ſome thouſands of ducats which he had ſecretly borrowed. He threw himſelf under the protection of the emperor Charles VI. brother of his deceaſed wife. They kept him for ſome time *incognito* at Venice, from whence he paſſed to Naples, where he reſided almoſt a year, while neither his father nor any perſon in Ruſſia knew the place of his retreat.

While the ſon kept himſelf thus concealed, the father was at Paris, where he was received with all the reſpect paid him in other places, but with a gallantry nowhere to be found but in France. If he went to viſit a manufactory, and one piece of work attracted his ſight more than another, he was preſented with it the next day. He went to dine at the Duke d'Antin's at Petitbourg, where the firſt thing he ſaw was his own picture at full length, in the ſame habit that he wore. When he was at the royal mint of medals, they ſtruck all kinds before him, and preſented him with them; at laſt they ſtruck one which they let drop on purpoſe at his feet, and left him to take it up. He there ſaw himſelf perfectly engraven with theſe words, *Peter the Great*. The reverſe was a Fame, and round her in letters *Vires acquirit eundo*; an alluſion no leſs juſt than flattering to a prince who really acquired new merit by travelling.

After he had ſeen this country, where every thing diſpoſes men to gentleneſs and indulgence, he returned to his own, and reſumed his ſeverity. He had engaged his ſon to return from Naples to Peterſburg, from whence that young prince was conducted to Moſcow before the czar his father; who began with depriving him of his ſucceſſion to the throne, by making him ſign a ſolemn act of renunciation at the end of January 1718, in conſideration of which act the father promiſed the ſon to ſpare his life.

It

Peter. Le Fort, however (see note A), had authority enough over him at times to stay his hand even when lifted up to strike, but he had not Le Fort always near him.

The Czar's first marriage is thus related in the memoirs of Peter Henry Bruce, Esq. "It took place in 1690, when he was only 18. He was married to Ottokessa Lapuchin, a boyar's daughter, by whom he had prince Alexis; some time after he turned her away, and shut her up in a monastery, on suspicion of disloyalty to his bed. It was said, that in one of her jealous fits she charged prince Menzikoff with carrying the czar to drabs of his former acquaintance, who had been his customers for cakes; upbraiding him with his first occupation: and that Menzikoff ever after bore an irreconcileable enmity to both her and her son. After the divorce, one Miss Mons, a very beautiful young lady, born at Moscow, of foreign parents, was much in favour with the czar; but when he was abroad, Mr Keyserling, then residing at Moscow as envoy from the king of Prussia, paid his addresses to, and married her. When the czar returned, he was so much offended at Keyserling, that he ordered him to leave Moscow, which occasioned his immediate recall by the king his master, who sent another in his room. It was believed, if his public character had not protected him, he would have severely felt his majesty's displeasure.

"The czar was some time after smitten with the charms of another beautiful young lady, the daughter of a foreign merchant in this city: he first saw her in her father's house, where he dined one day. He was so much taken with her appearance, that he offered her any terms she pleased, if she would live with him; which this virtuous young woman modestly refused: but dreading the effects of his authority, she put on a resolution, and left Moscow in the night, without communicating her design even to her parents. Having provided a little money for her support, she travelled on foot several miles into the country, till she arrived at a small village where her nurse lived with her husband and their daughter, the young lady's foster-sister, to whom she discovered her intention of concealing herself in the wood near that village: and to prevent any discovery, she set out the same night, accompanied by the husband and daughter. The husband being a timber-man by trade, and well acquainted with the wood, conducted her to a little dry spot in the middle of a morass, and there he built a hut for her habitation. She had deposited her money with her nurse to procure little necessaries for her support, which were faithfully conveyed to her at night by the nurse or her daughter, by one of whom she was constantly attended in the night-time.

"The next day after her flight, the czar called at her father's to see her, and finding the parents in anxious concern for their daughter, and himself disappointed, fancied it a plan of their own concerting. He became angry, and began to threaten them with the effects of his displeasure if she was not produced: nothing was left to the parents but the most solemn protestations, with tears of real sorrow running down their

---

It was not altogether improbable that such an act would have been some time or other annulled. The czar, therefore, in order to give it more force, forgetting that he was a father, and only remembering that he was the founder of an empire, which his son might overturn, and involve in its ancient barbarity, ordered a public process to be drawn up against that unfortunate prince, for some concealment, with which he was charged, in the confession that they had exacted of him.

An assembly was held of the bishops, inferior ecclesiastics, and professors; who found in the Old Testament, that those who curse their father or their mother should be put to death; that David indeed had pardoned Absalom, who had rebelled against him, but that Absalom was never pardoned by God. Such was their opinion, without drawing any conclusion; but it was in effect signing a warrant for his death. Alexis had not in fact cursed his father, neither had he ever revolted like Absalom; he had never lain publicly with the king's concubines, but he had left the kingdom without his father's permission, and had written letters to his friends, in which he only signified that he hoped they would one day be mindful of him in Russia. But whatever might be his case, of 124 lay judges, who were appointed to sit on him, there was not one that judged his offences less than capital; and those who could not write, made others sign for them. It is reported in Europe, that the czar had got translated from Spanish into Russian the criminal process against Don Carlos, that unfortunate prince whom his father Philip II. had confined in a prison, where the heir of that great monarchy ended his days. But there was nothing like a process carried on against Don Carlos, nor was it ever known whether that prince died a natural or a violent death. Peter, the most despotic of princes, wanted not an example. Certain it is that the prince died the day after the sentence, and that the czar had at Moscow one of the best apothecary's shops in Europe. It is probable, however, that the prince Alexis, the heir of the most extensive empire in the world, being condemned unanimously by his father's subjects, which were one day to be his own, might die of the sudden shock and change given to the body at the apprehension of so strange and dismal a sentence. The father went to see his son in his last agonies; and it is said he shed tears. *Infelix utcunque ferent ea fata nepotes.* These tears, however, did not prevent the wheels from being covered with the broken limbs of his son's friends. He beheaded his own brother-in-law Count Lapuchin, brother to his wife Ottokessa Lapuchin whom he had divorced, and uncle to prince Alexis. The prince's confessor had also his head cut off. If Moscovy has been civilized, she has, it must be confessed, paid dear for her politeness.

The remainder of the czar's life was nothing but a series of grand projects, labours, and exploits, that seemed to efface the memory of his excessive severities, which were perhaps necessary. He made frequent speeches to his court and to his council. In one he told them that he had sacrificed his son to the welfare of his dominions.

Peter. their cheeks, to convince him of their innocence, and ignorance of what was become of her; assuring him of their fears that some fatal disaster must have befallen her, as nothing belonging to her was missing, except what she had on at the time. The czar, satisfied of their sincerity, ordered great search to be made for her, with the offer of a considerable reward to the person who should discover what was become of her, but to no purpose: the parents and relations, apprehending she was no more, went into mourning for her.

"Above a year after this she was discovered by an accident. A colonel who had come from the army to see his friends, going a-hunting into that wood, and following his game through the morass, he came to the hut, and looking into it saw a pretty young woman in a mean dress. After inquiring of her who she was, and how she came to live in so solitary a place, he found out at last that she was the lady whose disappearance had made so great a noise: in the utmost confusion, and with the most fervent intreaties, she prayed him on her knees that he would not betray her; to which he replied, that he thought her danger was now past, as the czar was then otherwise engaged, and that she might with safety discover herself, at least to her parents, with whom he would consult how matters should be managed. The lady agreed to this proposal; and he set out immediately, and overjoyed her parents with the happy discovery: the issue of their deliberations was to consult Madame Catherine (as she was then called) in what manner the affair should be opened to the czar. The colonel went also upon this business, and was advised by Madame to come next morning and she would introduce him to his majesty, when he might make the discovery and claim the promised reward. He went according to appointment; and being introduced, told the accident by which he had discovered the lady, and represented the miserable situation in which he found her, and what she must have suffered by being so long shut up in such a dismal place, from the delicacy of her sex. The czar showed a great deal of concern that he should have been the cause of all her sufferings, declaring that he would endeavour to make her amends. Here Madame Catherine suggested, that she thought the best amends his majesty could make, was to give her a handsome fortune and the colonel for a husband, who had the best right, having caught her in pursuit of his game. The czar, agreeing perfectly with Madame Catherine's sentiments, ordered one of his favourites to go with the colonel, and bring the young lady home; where she arrived to the inexpressible joy of her family and relations, who had all been in mourning for her. The marriage was under the direction and at the expence of the czar, who himself gave the bride to the bridegroom; saying, that he presented him with one of the most virtuous of women; and accompanied his declaration with very valuable presents, besides settling on her and her heirs three thousand rubles a-year. This lady lived highly esteemed by the czar, and every one who knew her. Besides the concurring reports of other people, I had the story from her own mouth."

On the whole, that Peter I. was a great man, few will deny who know what real greatness is. A minute account of the life of this distinguished emperor would make a large volume; we have been able to give but the mere outlines of it: the anecdotes, however, at the end, show in some degree the nature of the man; at all events they show one important truth, that it is a more difficult thing to reform one's self than to reform a kingdom; to conquer one's passions, than to conquer the world. The Russians, however, if there is any good in civilization, owe to him every thing: and they seem to be sensible of it; for a very pompous oration was delivered to his memory by Michael Lomonosoff, before the Academy of Sciences at St Petersburgh, on the 26th of April 1755. For a minuter account of his improvements, &c. see Russia, Petersburg, and Catherine I. Peter.

Peter the Wild Boy. This extraordinary creature occasioned great speculation among the learned; but we do not know that any satisfactory causes have been assigned for the striking difference betwixt him and other human beings.

The following account of him is extracted from the parish-register of North church, in the county of Hertford. "Peter, commonly known by the name of *Peter the Wild Boy*, lies buried in this churchyard, opposite to the porch. In the year 1725 he was found in the woods near Hamelen, a fortified town in the electorate of Hanover, when his Majesty George I. with his attendants, was hunting in the forest of Hertswold. He was supposed to be then about 12 years of age, and had subsisted in those woods upon the bark of trees, leaves, berries, &c. for some considerable length of time. How long he had continued in that wild state is altogether uncertain; but that he had formerly been under the care of some person, was evident from the remains of a shirt collar about his neck at the time when he was found. As Hamelen was a town where criminals were confined to work upon the fortifications, it was then conjectured at Hanover that Peter might be the issue of one of those criminals, who had either wandered into the woods and could not find his way back again, or being discovered to be an idiot was inhumanly turned out by his parents, and left to perish or shift for himself. In the following year, 1726, he was brought over to England by the order of Queen Caroline then princess of Wales, and put under the care of Dr Arbuthnot with proper masters to attend him. But notwithstanding there appeared to be no natural defect in his organs of speech, after all the pains that had been taken with him he could never be brought distinctly to articulate a single syllable, and proved totally incapable of receiving any instruction. He was afterwards intrusted to the care of Mrs Titchbourn, one of the queen's bed chamber women, with a handsome pension annexed to the charge. Mrs Titchbourn usually spending a few weeks every summer at the house of Mr James Fenn, a yeoman farmer at Axter's End in this parish, Peter was left to the care of the said Mr Fenn, who was allowed 35 l. a-year for his support and maintenance. After the death of James Fenn he was transferred to the care of his brother Thomas Fenn, at another farm-house in this parish called Broadway, where he lived with the several successive tenants of that farm, and with the same provi-

Peter

sion allowed by government to the time of his death, Feb. 22. 1785, when he was supposed to be about 72 years of age.

"Peter was well made, and of the middle size. His countenance had not the appearance of an idiot, nor was there any thing particular in his form, except that two of the fingers of his left hand were united by a web up to the middle joint. He had a natural ear for music, and was so delighted with it, that if he heard any musical instrument played upon, he would immediately dance and caper about till he was almost quite exhausted with fatigue: and though he could never be taught the distinct utterance of any word, yet he could easily learn to hum a tune. All those idle tales which have been published to the world about his climbing up trees like a squirrel, running upon all fours like a wild beast, &c. are entirely without foundation; for he was so exceedingly timid and gentle in his nature, that he would suffer himself to be governed by a child. There have been also many false stories propagated of his incontinence; but, from the minutest inquiries among those who constantly lived with him, it does not appear that he ever discovered any natural passion for women, though he was subject to the other passions of human nature, such as anger, joy, &c. Upon the approach of bad weather he always appeared sullen and uneasy. At particular seasons of the year he showed a strange fondness for stealing away into the woods, where he would feed eagerly upon leaves, beech-mast, acorns, and the green bark of trees, which proves evidently that he had subsisted in that manner for a considerable length of time before he was first taken. His keeper therefore at such seasons generally kept a strict eye over him, and sometimes even confined him, because if he ever rambled to any distance from his home he could not find his way back again: and once in particular, having gone beyond his knowledge, he wandered as far as Norfolk, where he was taken up, and being carried before a magistrate, was committed to the house of correction in Norwich, and punished as a sturdy and obstinate vagrant, who would not (for indeed he could not) give any account of himself: but Mr Fenn having advertised him in the public papers, he was released from his confinement, and brought back to his usual place of abode.

"Notwithstanding the extraordinary and savage state in which Peter was first found greatly excited the attention and curiosity of the public; yet, after all that has been said of him, he was certainly nothing more than a common idiot without the appearance of one. But as men of some eminence in the literary world have in their works published strange opinions and ill-founded conjectures about him, which may seem to stamp a credit upon what they have advanced; that posterity may not through their authority be hereafter misled upon the subject, this short and true account of Peter is recorded in the parish-register by one who constantly resided above 30 years in his neighbourhood, and had daily opportunities of seeing and observing him."

Peter

Perhaps it may not be disagreeable to our readers if we present them with Lord Monboddo's account of this extraordinary creature (A). "It was in the beginning of June 1782 (says his Lordship) that I saw him in a farm-house called Broadway, within about a mile of Berkhamsted, kept there upon a pension which the king pays. He is but low of stature, not exceeding five feet three inches; and although he must now be about 70 years of age, has a fresh healthy look. He wears his beard; his face is not at all ugly or disagreeable; and he has a look that may be called sensible and sagacious for a savage. About 20 years ago he was in use to elope, and to be missing for several days; and once, I was told, he wandered as far as Norfolk; but of late he has been quite tame, and either keeps in the house or sauntera about the farm. He has been the 13 last years where he lives at present; and before that he was 12 years with another farmer, whom I saw and conversed with. This farmer told me, that he had been put to school somewhere in Hertfordshire, but had only learned to articulate his own name Peter, and the name of King George, both which I heard him pronounce very distinctly. But the woman of the house where he now is (for the man happened not to be at home) told me, that he understood every thing that was said to him concerning the common affairs of life; and I saw that he readily understood several things that she said to him while I was present. Among other things, she desired him to sing Nancy Dawson; which he did, and another tune which she named. He never was mischievous, but had always that gentleness of nature which I hold to be characteristical of our nature, at least till we became carnivorous, and hunters or warriors. He feeds at present as the farmer and his wife do; but, as I was told by an old woman (one Mrs Collop, living at a village in the neighbourhood called Hempstead, who remembered to have seen him when he first came to Hertfordshire, which she computed to be 55 years before the time I saw her), he then fed very much upon leaves, and particularly upon the leaves of cabbage, which he eat raw. He was then, as she thought, about 15 years of age, walked upright, but could climb trees like a squirrel. At present he not only eats flesh, but has also got the taste of beer, and even of spirits, of which he inclines to drink more than he can get. And the old farmer above-mentioned, with whom he lived 12 years before he came to this last farmer, told me, that he had acquired that taste before he came to him, which is about 25 years ago. He has also become very fond of fire, but has not yet acquired a liking for money; for though he takes it, he does not keep it, but gives it to his landlord or landlady, which I suppose is a lesson that they have taught him.

(A) This eccentric writer, in support of his hypothesis, that man in a state of nature is a mere animal, without clothes, houses, the use of fire, or even speech, adduces the oran-outang, or man in the woods, and this Peter the wild man and others, as examples. He denies the want of the organs of speech as an objection, and insists they only want the artificial use of them.

him. He retains so much of his natural instinct, that he has a fore-feeling of bad weather, growling and howling, and showing great disorder, before it comes.

"These are the particulars concerning him which I observed myself, or could learn by information from the neighbourhood." From all these facts put together his lordship makes the following observations:

"1st, Whatever doubts there may be concerning the humanity of the oran-outang, it was never made a question but that Peter was a man.

"2dly, That he was, as the Dean [Swift] says, of a father and mother like one of us. This, as I have said, was the case of two savages found in the dismal swamps in Virginia, of the one found in the island of Diego Garcia, and of him that was discovered by M. le Roy in the Pyrenees, and in general of all the savages that have been found in Europe within these last 300 years; for I do not believe, that for these 2000 years past there has been a race of such savages in Europe.

"3dly, I think there can be no reason to doubt of what was written from Hanover, and published in the newspapers, that he was found going upon all four, as well as other solitary savages that have been found in Europe. It is true that others have been found erect; which was the case of the two found in the dismal swamp of Virginia, likewise of the man of the Pyrenees, and of him in the island of Diego Garcia: but these I suppose were not exposed till they had learned to walk upright; whereas Peter appears to have been abandoned by his parents before he had learned that lesson, but walked as we know children do at first.

"4thly, I think it is evident that he is not an idiot, not only from his appearance, as I have described it, and from his actions, but from all the accounts that we have of him, both those printed and those attested by persons yet living; for as to the printed accounts, there is not the least information of that kind in any of them, except in one, viz. Wye's letter, n° 8. wherein is said, that some imputed his not learning to speak to want of understanding; which I should think showed rather want of understanding in those who thought so, when it is considered that at this time he had not been a year out of the woods, and I suppose but a month or two under the care of Dr Arbuthnot, who had taken the charge of his education. The Dean indeed tells us, that he suspected he was a pretender, and no genuine wild man, but not a word of his being an idiot. And as to the persons living, not one with whom I have conversed appeared to have the least suspicion of that kind; though it is natural that men who were not philosophers, and knew nothing of the progress of man from the mere animal to the intellectual creature, nor of the improvement of our understanding by social intercourse and the arts of life, but believed that man when he came to a certain age has from nature all the faculties which we see him exert, and particularly the faculty of speech, should think him an idiot, and wanting even the capacity of acquiring understanding. I knew an officer of dragoons, a man of very good sense, who was quartered where Peter then lived for some months, and saw him almost every day, and who assured me that he was not an idiot, but showed common understanding, which was all that could be expected from one no better educated than he. Peter.

"Lastly, those who have considered what I have said (B) of the difficulty of articulation, will not be surprised that a man who had lived a savage for the first 14 or 15 years of his life, should have made so little progress in that art. I cannot, however, have the least doubt, that if he had been under the care of Mr Braidwood of Edinburgh, he would have learned to speak, though with much more difficulty than a man who had been brought up tame among people who had the use of speech, and who consequently must know the advantage of it. And I can have as little doubt that Mr Braidwood could have taught the oran-outang in Sir Ashton Lever's collection, who learned to articulate a few words, so as to speak plainly enough."

St Peter, Le Port, a market-town of England, in the south-east part of Guernsey, in Hampshire, in the British channel, consisting of only one long and narrow street. The mouth of the harbour is well set with rocks, and is on each side defended by a castle, one called the *old castle*, and the other *castle-cornet*. The governor of the island generally resides here, who has the command of the garrison in this and all the other castles. The harbour has a good road, from whence ships may sail with any wind, and from the road pass under the guns of the castle to the pier, close up to the town. The pier is a noble work, formed of vast stones, joined together with great art and regularity; it is not only a security to the ships, but, being contiguous to the town, is handsomely paved at the top with large smooth flag-stone, guarded with parapets, and, being of a great length and breadth, forms a pleasant walk, affording a free prospect of the sea and the neighbouring islands. Cornet-castle, which commands both the town and the harbour, stands on a rock, separated from the land by an arm of the sea, no less than 600 yards wide, and not fordable but at low water in great spring-tides.

St Peter's Island, in the lake of Bienne in Switzerland, remarkable for being one of the retreats of Rousseau; whence it has also got the name of *Rousseau's Island*. It lies towards the south side of the lake, and produces a great variety of shrubs and trees, particularly large oaks, beech, and Spanish chestnut. The southern shore slopes gradually to the lake, and is covered with herbage; the remaining borders are steep and rocky; their summits in a few places thinly covered with shrubs; in others their perpendicular sides are clothed to the water's edge with hanging woods. The views from the different parts of the island are

(B) Lord Monboddo, far from thinking speech or articulation natural to man, rather wonders how he can by any teaching or imitation attain to the ready performance of such various and complicated operations. Add to this, when the organs are completely formed to one language, how hard it is to make them answer another.

Peter, Peterborough.

beautiful and diverſified; that to the north being the moſt extenſive and pleaſing. It commands the proſpect of the lake, which is of an oval form; its cultivated borders, interſperſed with villages and caſtles, with the towns of Nidau and Bienne ſtanding upon the farther extremity. Agreeable walks are carried through the woods, and terminate in a circular pavilion placed in the centre of the iſland. Before the troubles in France, on Sunday, and particularly the vintage-time, this iſland was filled with parties who amuſed themſelves with wandering about the woods or dancing in the circular pavilion. How they employ themſelves now it is not ſo eaſy to ſay, as it was overrun and ſubjected by the forces of that unhappy nation, and of courſe tainted with their deſtructive principles. It was retaken by the Spaniards, and properly belongs to the king of Sardinia. There is only one farm-houſe on the iſland, in an apartment of which Rouſſeau was lodged.

Peter-Pence, was an annual tribute of one penny, paid at Rome out of every family at the feaſt of St Peter. And this Ina the Saxon king, when he went in pilgrimage to Rome about the year 740, gave to the pope partly as alms and partly in recompence of a houſe erected in Rome for Engliſh pilgrims. And this continued to be paid generally until the time of King Henry VIII. when it was enacted, that from henceforth no perſon ſhall pay any penſions, Peter-pence, or other impoſitions, to the uſe of the biſhop or ſee of Rome.

PETERBOROUGH, a city of Northamptonſhire, about 82 miles from London. It is the leaſt city except perhaps Ely, and unqueſtionably the pooreſt biſhopric, though one of the oldeſt towns in England. It had a monaſtery dedicated to St Peter, and founded as early as the year 655, to which the abbot of Croyland and his monks flying for protection in the year 870, they were overtaken and murdered in a court of this monaſtery called the *monks churchyard*, becauſe they were all buried here; and to this day is to be ſeen the tombſtone with their effigies, which had been erected over their common grave. Soon after this the Danes deſtroyed both the monaſtery and friars, ſo that it lay deſtitute for above 100 years. The monks were, however, reſtored, and lived very ſumptuouſly, with a mitred abbot at their head, till the reformation, when Henry VIII. converted it into a biſhop's ſee. The cathedral, which is ſaid to be more than 1000 years old, though apparently more modern, is a moſt noble Gothic fabric, and was much more ſo before it was defaced in the civil wars. The weſt front, which is 156 feet broad, is very ſtately; and beſides columns curiouſly adorned, is ſupported by three of the talleſt arches in Britain. The windows of the cloiſters are finely ſtained with ſcripture-hiſtory and the ſucceſſion of its abbots. There are in the church monuments of Queen Catharine, wife of Henry VIII and of Mary queen of Scots; and the figure of one Mr Scarlet the ſexton, who buried them, and lived to 90, after he had buried all the houſekeepers of the town twice over. There is but one pariſh church beſides the cathedral. The city is governed by a mayor, recorder, and aldermen, by a charter of Henry VIII. All its officers are elected by the dean and chapter, conſiſting of ſix prebendaries, who are all lords of the manor. Beſides the dean and chapter, who are an eccleſiaſtical corporation diſtinct from the biſhop, there are eight petty canons, four ſtudents in divinity, one epiſtler, one goſpeller, a ſubdean, ſubtreaſurer, and chanter, eight choriſters, eight ſinging men, two chancellors, beſides a ſteward, organiſt, &c. a grammar ſchool, and two charity-ſchools. The river Nen, over which there is here a wooden bridge, is navigable by barges to Northampton, 50 miles further, which bring coal, corn, &c. and by which they export in ſome years 6000 quarters of malt, beſides other goods, eſpecially the woollen manufactures either of cloth or ſtockings, in which the poor are employed. The air of Peterborough is ſaid not to be very wholeſome, by reaſon of the neighbouring fens; but the water of the river is freſh and good, the higheſt ſpring tide never coming up within five miles of the town; and there is plenty of excellent water in their wells. The ſtreets are very poor, and the houſes but mean; there is, however, a handſome market-houſe, over which are kept the aſſizes and ſeſſions. Its juriſdiction extends over 32 towns and hamlets, wherein the civil magiſtrates appointed by the royal commiſſion are veſted with the ſame power as judges of aſſize, and hold their quarterly ſeſſions in this city.

Peter

PETERHEAD, a town in Scotland, in the county of Aberdeen, lies about 30 miles north-eaſt of that city. It ſtands on the moſt eaſterly point in Scotland, and from thence due weſt that kingdom is broadeſt.

Peterhead is the neareſt land to the northern continent of Europe, and lies within 300 miles of the *cape*, which is called the *Naze of Norway*. Through this channel the grand body of the herrings paſs in their annual migrations from Shetland and the north ſeas to the more ſouthern latitudes, attended with the all-devouring cod and ling; on which account Peterhead, or, as it is ſometimes called, *Buchanneſs*, hath always been the ſecond ſtation of the Dutch buſſes after leaving the Shetland iſlands. Tradition ſays, that ſome hundred years ago the Dutch offered Lord Mareſchal, then the proprietor of the coaſt, to cover a ſmall iſland called *Inch Keith* with ſilver for the property of it to carry on their fiſheries, which for obvious reaſons could not be accepted. Be that as it may, the Dutch ſtill frequent the coaſt in July and Auguſt, and ſometimes 100 ſail are ſeen within ſight of land, buſily employed in the herring and white fiſheries. The natives, to whom this treaſure properly belongs, have lately made ſome attempts towards the white fiſhery, of which they cure and vend chiefly at the London market 4000 barrels of delicate ſmall cod and ling annually. They alſo fit out ſome veſſels for the Hebride fiſhery off Barrahead for the Barcelona market; and they claim the merit of having taught the iſlanders how to take and cure the large fiſh which abound on their coaſts. They have often gained the higheſt premiums allowed by government for curing white fiſhes.

Few harbours in Great Britain are of more importance to navigation than this of Peterhead, as, in caſe of violent ſtorms from the eaſterly points, large veſſels embayed betwixt this and the mouth of the Forth have not a port that they can ſafely take at every time of the tide, that of Aberdeen excepted. If therefore they cannot make their way to ſea in the teeth of a ſtrong eaſterly wind, or double this headland that they may gain the Murray frith, they muſt inevitably come

on

terhead, terhoff. on ſhore. This harbour lies on a ſpacious bay, where veſſels of any burden may ride in all other winds, and is therefore the general rendezvous of the ſhipping which frequent the northern ſeas, where they caſt anchor on clean ground, and ride ſafely till the ſtorms have abated. But though nature hath done ſo much for the benefit of navigation, ſomething is left for the exerciſe of human aid. The harbour can at preſent contain in perfect ſafety 40 or 50 ſail of veſſels drawing 12 feet water, and is capable of being extended ſo as to admit a greater number of ſhips drawing 20 feet; by which means not only caſual merchantmen but ſmall ſhips of war with their convoys would find this a moſt deſirable refuge when purſued by ſuperior force. The harbour is defended by a good battery. A conſiderable trade is carried on from this place directly to the Baltic for deals, iron, hemp, tar, and other articles. There is alſo a manufacture of ſewing thread, which employs many young girls. A mineral well in the ſummer-months gives great gaiety to the place; its ſalutary virtues have long, and we believe very juſtly, been celebrated. The waters of this ſpring are powerfully diuretic, and are thought to be efficacious in removing complaints in the bowels. There are here many elegant houſes for the accommodation of ſtrangers. There is alſo a ball-room, under which there are two ſalt-water baths. Theſe baths are much frequented in nervous diſorders: their effect in ſtrengthening the conſtitution is often ſurpriſing. Owing to the open peninſulated ſituation, the air of this place is eſteemed peculiarly pure and healthful; even the fogs riſing from the ſea are thought to be medicinal: the town is therefore much enlivened by the concourſe of company who frequent it on theſe accounts. Upon the whole, the town is neat and well built, the houſes are handſome, and the ſtreets tolerably ſpacious and very clean; and it has every appearance of a thriving, plentiful, and happy place.

PETERHOFF, in Ruſſia, is ſituated about 20 miles from Peterſburg, and is diſtinguiſhed for its palace and gardens. The palace was begun by Peter I. and finiſhed by Elizabeth. As it is placed upon an eminence, it commands a moſt ſuperb view of Cronſtadt, Peterſburg, the intervening gulf, and the oppoſite coaſt of Carelia. The palace is moſt magnificently furniſhed, and the ſuite of apartments are truly princely. The preſence-chamber is richly ornamented with portraits of the ſovereigns of the houſe of Romanof, who have reigned in Ruſſia ſince 1613.

" Tra- vol. i. 5. "The gardens of Peterhoff (ſays an intelligent traveller) have been celebrated for their taſte and elegance; and from the number of jet d'eaus, fountains, baſons, caſcades, parterres, &c. they have been compared to thoſe of Verſailles: and indeed in one reſpect they are far ſuperior; for the water-works of the latter only play upon particular occaſions, while thoſe of Peterhoff are perennial. Theſe gardens, which at the time of their formation were greatly admired in this country, though not congenial to the taſte of the empreſs, are ſuffered to remain in their preſent ſtate; as during ſummer her majeſty principally reſides at Tzarſkoe-Selo, where the grounds are diſpoſed in a more modern and pleaſing manner." A vaſt number of ſilver dolphins and gilded ſtatues are ſcattered through them; but the moſt remarkable figures are thoſe of two gladiators placed in a baſon of water. Theſe are repreſented, not with the ſword and buckler, the ancient implements of war, but with a brace of piſtols. Theſe they point to each other in a threatening poſture, while the water guſhes impetuouſly from the barrels. In that part of the garden which lies between the palace and the gulf, cloſe to the water, is a building which was the favourite retreat of Peter I. It is preſerved, together with its furniture, entirely in its original ſtate with a kind of religious veneration. Its plainneſs ſhows the frugal ſimplicity in which that monarch was accuſtomed to live. In the ſame celebrated gardens there is a remarkable building called the *mountain for ſledges*, and often by travellers the *flying mountain*. "It ſtands (ſays Mr Coxe) in the middle of an oblong area, incloſed by an open colonnade, with a flat roof, which is railed for the convenience of holding ſpectators. The circumference of this colonnade is at leaſt half a mile. In the middle of the area ſtands the flying mountain, ſtretching nearly from one end to the other. It is a wooden building, ſupported upon pillars, repreſenting an uneven ſurface of ground, or a mountain compoſed of three principal aſcents, gradually diminiſhing in height, with an intermediate ſpace to reſemble valleys: from top to bottom is a floored way, in which three parallel grooves are formed. It is thus uſed: a ſmall carriage containing one perſon being placed in the centre groove upon the higheſt point, goes with great rapidity down one hill; the velocity which it acquires in its deſcent carries it up a ſecond; and it continues to move in a ſimilar manner until it arrives at the bottom of the area, where it rolls for a conſiderable way on the level ſurface, and ſtops before it attains the boundary: it is then placed in one of the ſide grooves, and drawn up by means of a cord fixed to a windlaſs. To a perſon unacquainted with the mechaniſm, this entertainment would appear tremendous; but as the grooves always keep the carriage in its right direction, there is not the leaſt danger of being overturned. At the top of the mountain is an handſome apartment for the accommodation of the court and principal nobility; there is alſo room for many thouſand ſpectators within the colonnade and upon its roof. Near the flying mountain is a ſpacious amphitheatre, in which tournaments are uſually exhibited."

Peterhoff ‖ Peterſburg.

PETERS (Father), a Jeſuit, was confeſſor and counſellor to James II. king of England. This prince diſmiſſed him in 1688, becauſe he was conſidered as the author of thoſe troubles in which the kingdom was then involved. "He was (ſays Biſhop Burnet) the moſt violent of the king's adviſers, and the perſon moſt liſtened to. Though he had the honour of being nobly deſcended, he was a man of no extenſive erudition, and was eminent only for his bigotry and forwardneſs." Though Burnet is not always to be believed, yet certain it is, from the teſtimony of other hiſtorians, that Father Peters was by no means a perſon properly qualified to direct King James in the critical ſituation in which he then ſtood.

PETERSBURG (St), a city of the province of Ingria in Ruſſia, and capital of the whole empire. It is ſituated in N. Lat 59. 26. 23. and E. Long. 30. 25. from the firſt meridian of Greenwich. It was founded in the year 1703 by Czar Peter the Great, whoſe ambi-

Peterſburg. ambition it was to have a fleet on the Baltic; for which reaſon he determined to found a city which might become the centre of trade throughout all his dominions. The ſpot he pitched upon was a low, fenny, uncultivated iſland, formed by the branches of the river Neva, before they fall into the gulph of Finland. In the ſummer this iſland was covered with mud; and in winter became a frozen pool, rendered almoſt inacceſſible by dreary foreſts and deep moraſſes, the haunts of bears, wolves, and other ſavage animals. Having taken the fort of Nattebourg, and the town of Neiſchanz, in the year 1703, this mighty conqueror aſſembled in Ingria above 300,000 men, Ruſſians, Tartars, Coſſacks, Livonians, and others, even from the moſt diſtant parts of his empire, and laid the foundation of the citadel and fortifications, which were finiſhed in four months, almoſt in deſpite of nature. He was obliged to open ways through foreſts, drain bogs, raiſe dykes, and lay cauſeways, before he could pretend to found the new city. The workmen were ill provided with neceſſary tools and implements, ſuch as ſpades, pick-axes, ſhovels, planks, and wheel-barrows: they were even obliged to fetch the earth from a great diſtance in the ſkirts of their garments, or in little bags made of old mats and rags ſewed together. They had neither huts nor houſes to ſhelter them from the ſeverity of the weather: the country, which had been deſolated by war, could not accommodate ſuch a multitude with proviſions; and the ſupplies by the lake Ladoga were often retarded by contrary winds. In conſequence of theſe hardſhips, above 100,000 men are ſaid to have periſhed: nevertheleſs the work proceeded with incredible vigour and expedition; while Peter, for the ſecurity of his workmen, formed a great camp, in ſuch a manner, that his infantry continued in Finland, and his cavalry were quartered in Ingria. Some Swediſh cruizers being deſcried in the neighbourhood, the Czar poſted a body of troops in the iſle of Rutzari, by whom the Swedes were repulſed, and the work met with no farther interruption. The buildings of the city kept pace with the fortreſs, which is the centre of the town, ſurrounded on all ſides by the Neva; and in little more than a year, above 30,000 houſes were erected. At preſent there may be about double that number in Peterſburg, though many of them are paultry and inconſiderable. In order to people this city, Peter invited hither merchants, artificers, mechanics, and ſeamen, from all the different countries of Europe: he demoliſhed the town of Nieuſchantz, and brought hither not only the materials of the houſes, but the inhabitants themſelves. A thouſand families were drawn from Moſcow; he obliged his nobility to quit their palaces and their villas in and about Moſcow, and take up their reſidence at Peterſburg, in a much more cold and comfortleſs climate. Finally, reſolving to remove hither the trade of Archangel, he iſſued an ordonnance, importing, that all ſuch merchandiſe as had been conveyed to Archangel, in order to be ſold to foreigners, ſhould now be ſent to Peterſburg, where they ſhould pay no more than the uſual duties. Theſe endeavours and regulations have rendered this one of the greateſt and moſt flouriſhing cities in Europe. The Ruſſian boyars and nobility have built magnificent palaces, and are now reconciled to their ſituation. At firſt many houſes were built of timber; but theſe being ſubject to ſudden conflagrations in ſpite of all the precautions that could be taken, the Czar, in the year 1714, iſſued an order, that all new houſes ſhould be walled with brick and covered with tiles. The fort is an irregular hexagon, with oppoſite baſtions. This, together with all the reſt of the fortifications, was in the beginning formed of earth only; but in the ſequel they were faced with ſtrong walls, and provided with caſemates, which are bomb proof. In the curtain of the fort, on the right hand ſide, is a noble diſpenſary, well ſupplied with excellent medicines, and enriched with a great number of porcelain vaſes from China and Japan. From one of the gates of the fort a draw-bridge is thrown over an arm of the river, in which the Czar's galleys and other ſmall veſſels are ſheltered in the winter. The moſt remarkable building within the fort is the cathedral, built by the direction of an Italian architect. Peterſburg is partly built on little iſlands, ſome of which are connected by draw-bridges; and partly on the continent. In the higheſt part, on the bank of the Neva, the Czar fixed his habitation, or ordinary reſidence, built of freeſtone, and ſituated ſo as to command a proſpect of the greater part of the city. Here likewiſe is a royal foundery; together with the ſuperb houſes of many noblemen. The marſhy ground on which the city is built, being found extremely ſlippery, dirty, and incommodious, the Czar ordered every inhabitant to pave a certain ſpace before his own door. In the year 1716, Peter, taking a fancy to the iſland Waſili-Oſterno, which he had given as a preſent to prince Menzikoff, reſumed the grant, and ordered the city to be extended into this quarter. He even obliged the boyars, or nobles, to build ſtone-houſes on this ſpot, though they were already in poſſeſſion of others on the ſide of Ingria: accordingly this is now the moſt magnificent part of the city. On the other ſide of a branch of the Neva ſtands the Czar's country or ſummer palace, provided with a fine garden and orangery. On the bank of the ſame river is the ſlaboda, or ſuburbs, in which the Germans generally chooſe their habitation. Peterſburg is very much ſubject to dangerous inundations. In the year 1715, all the baſtions and draw-bridges were either overwhelmed or carried away. The breadth, depth, and rapidity of the Neva, have rendered it extremely difficult, if not impracticable, to join the iſlands and the continent by bridges. Beſides, Peter was averſe to this expedient for another reaſon: reſolved to accuſtom his ſubjects to navigation, he not only rejected the project of a bridge, but alſo ordered that no boat ſhould paſs between the iſlands and continent, except by the help of ſails only. In conſequence of this ſtrange regulation, many lives were loſt: but at length he gained his point; and by habituating his ſluggiſh Muſcovites to the dangers of the ſea, in a little time produced a breed of hardy ſailors. The adjacent country is ſo barren, that the town muſt be ſupplied with proviſions from a great diſtance; conſequently they are extremely dear. Here are woods in plenty, conſiſting of pine, fir, alder, birch, poplar, and elm; but the oak and the beech are generally brought from Caſan. In winter the weather is extremely cold, and hot in the ſummer. In June the length of the night does not exceed three hours, during which the natives Peterſburg.

burg. tives enjoy a continued twilight: but in December the ſun is not viſible more than three hours above the horizon.

The Czar Peter, who was indefatigable in his endeavours to improve and civilize his ſubjects, neglected nothing which he thought could contribute to theſe purpoſes. He condeſcended even to inſtitute and regulate aſſemblies at Peterſburg: theſe were opened at five in the afternoon, and the houſe was ſhut at ten: between theſe hours the faſhionable people of both ſexes met without ceremony, danced, converſed, or played either at cards or at cheſs, this laſt being a favourite diverſion among the Ruſſians. There was likewiſe an apartment appointed for drinking brandy and ſmoking tobacco. Plays and operas were likewiſe introduced for the ſame purpoſes; but as Peter had little reliſh, and leſs taſte, for thoſe entertainments, they were performed in a very aukward manner in his lifetime: however, ſince his death theſe performances have been brought to a greater degree of art and decorum.

This great northern legiſlator eſtabliſhed, in the neighbourhood of Peterſburg, manufactures of linen, paper, ſaltpetre, ſulphur, gunpowder, and bricks, together with water-mills for ſawing timber. He inſtituted a marine academy, and obliged every conſiderable family in Ruſſia to ſend at leaſt one ſon or kinſman, between the ages of ten and eighteen, to this ſeminary, where he was inſtructed in navigation, learned the languages, was taught to perform his exerciſes, and to live under the ſevereſt diſcipline. To crown his other plans of reformation, he granted letters patent for founding an academy, upon a very liberal endowment; and though he did not live to execute this ſcheme, his empreſs, who ſurvived him, brought it to perfection. It was modelled on the plans of the royal ſociety in London, and the academy of France. Mr Bullfinger opened it in the year 1726, with an eloquent ſpeech on the deſign and utility of an academy of ſciences; and the profeſſors, who have always diſtinguiſhed themſelves by their merit and erudition, publiſhed an annual collection of their tranſactions; a taſk the more eaſy, as they have the benefit of printing-preſſes, well managed, at Peterſburg.

Peter the Great has been much cenſured for transferring the ſeat of the empire from Moſcow to St Peterſburg; the former of which lay nearer to the centre of his dominions. But theſe objections will have but little weight with thoſe who conſider the conſequences of the removal. The new city is nearer than Moſcow was to the more civilized parts of Europe; and from an intercourſe with them the manners of the Ruſſians have been improved, and the nobility in particular have loſt much of their feudal importance. Above all, the grand object of Peter, that of having a formidable navy in the Baltic, has certainly been obtained, and the Empreſs of Ruſſia is now the arbitreſs of the north, and in ſome degree the mediatrix of all Europe. In ſhort, the erection of St Peterſburg was perhaps one of the beſt acts of Peter's reign, and has in its conſequences been the moſt beneficial. Indeed it is at leaſt probable, that if through any revolution the ſeat of government ſhould be again transferred to Moſcow, we ſhould nowhere ſee the traces of thoſe memorable improvements, which the paſſing century has given birth to, but in the annals of hiſtory; and Ruſſia would again, in all probability, elapſe into her original barbariſm. Peterſburg.

The erection of ſuch a city as Peterſburg in ſo ſhort a time is truly wonderful. Mr Coxe ſays his mind was filled with aſtoniſhment, when he reflected that ſo late as the beginning of this century the ground on which it ſtands was one vaſt moraſs, occupied by a very few fiſhermens huts. The preſent diviſions of the town, ſome of which we have already mentioned, are called, 1. The Admiralty quarter; 2. The Vaſſili Oſtrof or Iſland; 3. The Fortreſs; 4. The Iſland of St Peterſburg; and, 5. The various ſuburbs of Livonia, of Moſcow, of Alexander Nevſki, and Wiburgh.

The preſent Empreſs has done ſo much for this city, that ſhe may not improperly be called its ſecond foundreſs. It is, nevertheleſs, ſtill an infant place, and, as Mr Wraxhall obſerves, "only an immenſe outline, which will require future empreſſes, and almoſt future ages, to complete."

"The ſtreets in general, ſays a late traveller, are broad and ſpacious; and three of the principal ones, which meet in a point at the Admiralty, and reach to the extremities of the ſuburbs, are at leaſt two miles in length. Moſt of them are paved; but a few are ſtill ſuffered to remain floored with planks. In ſeveral parts of the metropolis, particularly in the Vaſſili Oſtrof, wooden houſes and habitations, ſcarcely ſuperior to common cottages, are blended with the public buildings; but this motley mixture is far leſs common than at Moſcow, where alone can be formed any idea of an ancient Ruſſian city. The brick houſes are ornamented with a white ſtucco, which has led ſeveral travellers to ſay that they are built with ſtone; whereas, unleſs I am greatly miſtaken, there are only two ſtone ſtructures in all Peterſburg. The one is a palace, building by the empreſs upon the banks of the Neva, called *the marble palace*; it is of hewn granite, with marble columns and ornaments; the other is the church of St Iſaac, conſtructed with the ſame materials, but not yet finiſhed." Coxe's Travels.

"The manſions of the nobility are many of them vaſt piles of building, but are not in general upon ſo large and magnificent a ſcale as ſeveral I obſerved at Moſcow: they are furniſhed with great coſt, and in the ſame elegant ſtyle as at Paris or London. They are ſituated chiefly on the ſouth ſide of the Neva, either in the Admiralty quarter, or in the ſuburbs of Livonia and Moſcow, which are the fineſt parts of the city." See Neva.

"Peterſburg, although it is more compact than the other Ruſſian cities, and has the houſes in many ſtreets contiguous to each other, yet ſtill bears a reſemblance to the towns of this country, and is built in a very ſtraggling manner. By an order lately iſſued from government, the city has been incloſed within a rampart, the circumference whereof is 21 verſts, or 15 Engliſh miles."

The ſame accurate obſerver calculates the number of inhabitants at Peterſburg, and makes the medium number 130,000.

We have already ſaid that Peterſburg is very liable to be inundated. An inundation of a very alarming nature took place when Mr Coxe was there in September

Peterſburg. tember 1777, of which the following account was given in Journal St Peterſburg, September 1777: "In the evening of the 9th, a violent ſtorm of wind blowing at firſt S. W. and afterwards W. raiſed the Neva and its various branches to ſo great an height, that at five in the morning the waters poured over their banks, and ſuddenly overflowed the town, but more particularly the Vaſſili Oſtrof and the iſland of St Peterſburg. The torrent roſe in ſeveral ſtreets to the depth of four feet and an half, and overturned, by its rapidity, various buildings and bridges. About ſeven, the wind ſhifting to N. W. the flood fell as ſuddenly; and at mid day moſt of the ſtreets, which in the morning could only be paſſed in boats, became dry. For a ſhort time the river roſe 10 feet 7 inches above its ordinary level."

Mr Kraft, profeſſor of experimental philoſophy to the Imperial Academy of Sciences, has written a judicious treatiſe upon the inundation of the Neva, from which the following obſervations were extracted by Mr Coxe. "Theſe floods are leſs alarming than formerly, as the ſwelling of the river to about ſix feet above its uſual level, which uſed to overflow the whole town, have no longer any effect, excepting upon the lower parts of Peterſburg; a circumſtance owing to the gradual raiſing of the ground by buildings and other cauſes.

"Upon tracing the principal inundations, the profeſſor informs us, that the moſt ancient, of which there is any tradition, happened in 1691, and is mentioned by Weber, from the account of ſome fiſhermen inhabiting near Nieſchants, a Swediſh redoubt upon the Neva, about three miles from the preſent fortreſs of Peterſburg. At that period the waters uſually roſe every five years; and the inhabitants of that diſtrict no ſooner perceived the particular ſtorms which they had been taught from fatal experience to conſider as forerunners of a flood, than they took their hovels to pieces, and, joining the timbers together in the form of rafts, faſtened them to the ſummits of the higheſt trees, and repaired to the mountain of Duderof, which is diſtant ſix miles from their place of abode, where they waited until the waters ſubſided.

"The higheſt inundations, excepting the laſt of 1777, were thoſe of the 1ſt of November 1726, when the waters roſe 8 feet 2 inches; and on the 2d of October 1752, when they roſe 8 feet 5 inches.

"From a long courſe of obſervations the profeſſor draws the following concluſion. The higheſt floods, namely, thoſe which riſe about ſix feet, have generally happened in one of the four laſt months of the year: no ſenſible effect is ever produced by rain or ſnow; a ſwell is ſometimes occaſioned by the accumulation of maſſes of ice at the mouth of the Neva; but the principal cauſes of the overflowing of that river are derived from violent ſtorms and winds blowing ſouth weſt or north weſt, which uſually prevail at the autumnal equinox; and the height of the waters is always in proportion to the violence and duration of thoſe winds. In a word, the circumſtances moſt liable to promote the overflowings of the Neva, are when, at the autumnal equinox, three or four days before or after the full or new moon, that luminary being near her perigæum, a violent north-weſt wind drives the waters of the northern ocean, during the influx of the tide, into the Baltic, and is accompanied, or inſtantaneouſly ſucceeded, by a ſouth weſt wind in that ſea and the gulf of Finland. All theſe circumſtances concurred at the inundation of 1777: it happened two days before the autumnal equinox, four before the full moon, two after her paſſing through the perigæum, and by a ſtorm at ſouth-weſt, which was preceded by ſtrong weſt winds in the northern ocean, and ſtrong north winds at the mouth of the Baltic." Peterſ

See *Notices et Remarques ſur les debordemens de la Neva à St Peterſbourg, accompagnées d'une carte repreſentant la crue et la diminution des eaux*, &c. in Nov. Ac. Pet. for 1777, P. II. p. 47. to which excellent treatiſe we would refer the curious reader for further information.

All our readers have unqueſtionably heard of the equeſtrian ſtatue of Peter I. in bronze. We ſhall give an account of that extraordinary monument in Mr Coxe's own words. "It is (ſays he) of a coloſſal ſize, and is the work of Monſieur Falconet, the celebrated French ſtatuary, caſt at the expence of Catherine II. in honour of her great predeceſſor, whom ſhe reveres and imitates. It repreſents that monarch in the attitude of mounting a precipice, the ſummit of which he has nearly attained. He appears crowned with laurel, in a looſe Aſiatic veſt, and ſitting on a houſing of bear-ſkin: his right hand is ſtretched out as in the act of giving benediction to his people; and his left holds the reins. The deſign is maſterly, and the attitude is bold and ſpirited. If there be any defect in the figure, it conſiſts in the flat poſition of the right hand; and, for this reaſon, the view of the left ſide is the moſt ſtriking, where the whole appearance is graceful and animated. The horſe is rearing upon its hind legs; and its tail, which is full and flowing, ſlightly touches a bronze ſerpent, artfully contrived to aſſiſt in ſupporting the vaſt weight of the ſtatue in due equilibrium. The artiſt has, in this noble eſſay of his genius, repreſented Peter as the legiſlator of his country, without any alluſion to conqueſt and bloodſhed; wiſely preferring his civil qualities to his military exploits. The contraſt between the compoſed tranquillity of Peter (though perhaps not abſolutely characteriſtic) and the fire of the horſe, eager to preſs forwards, is very ſtriking. The ſimplicity of the inſcription correſponds to the ſublimity of the deſign, and is far preferable to a pompous detail of exalted virtues, which the voice of flattery applies to every ſovereign without diſtinction. It is elegantly finiſhed in braſs characters, on one ſide in Latin, and on the oppoſite in Ruſſian. *Petro primo Catharina ſecunda* 1782, i. e. Catharine II. to Peter I.

"The ſtatue, when I was at Peterſburgh, was not erected, but ſtood under a large wooden ſhed near the Neva, within a few yards of its enormous pedeſtal. When Falconet had conceived the deſign of his ſtatue, the baſe of which was to be formed by an huge rock, he carefully examined the environs of Peterſburg, if, among the detached pieces of granite which are ſcattered about theſe parts, one could be found of magnitude correſpondent to the dimenſions of the equeſtrian figure. After conſiderable reſearch, he diſcovered a ſtupendous maſs half buried in the midſt of a moraſs. The expence and difficulty of tranſporting it were no obſtacles to Catherine II. By her order the

urg. the moraſs was immediately drained, a road was cut through a foreſt, and carried over the marſhy ground; and the ſtone, which after it had been ſomewhat reduced weighed at leaſt 1500 tons, was removed to Peterſburg. This more than Roman work was, in leſs than ſix months from the time of its firſt diſcovery, accompliſhed by a windlaſs, and by means of large friction-balls alternately placed and removed in grooves fixed on each ſide of the road. In this manner it was drawn, with forty men ſeated upon its top, about four miles to the banks of the Neva; there it was embarked in a veſſel conſtructed on purpoſe to receive it, and thus conveyed about the ſame diſtance by water to the ſpot where it now ſtands. When landed at Peterſburg, it was 42 feet long at the baſe, 36 at the top, 21 thick, and 17 high; a bulk greatly ſurpaſſing in weight the moſt boaſted monuments of Roman grandeur, which, according to the fond admirers of antiquity, would have baffled the ſkill of modern mechanics, and were alone ſufficient to render conſpicuous the reign of the moſt degenerate emperors.

"The pedeſtal, however, though ſtill of prodigious magnitude, is far from retaining its original dimenſions, as, in order to form a proper ſtation for the ſtatue, and to repreſent an aſcent, the ſummit whereof the horſe is endeavouring to attain, its bulk has been neceſſarily diminiſhed. But I could not obſerve, without regret, that the artiſt has been deſirous to improve upon nature; and, in order to produce a reſemblance of an abrupt broken precipice, has been too laviſh of the chiſſel. Near it was a model in plaſter, to the ſhape of which the workmen were faſhioning the pedeſtal. It appeared to me, that in this model the art was too conſpicuous; and that the effect would have been far more ſublime, if the ſtone had been left as much as poſſible in its rude ſtate, a vaſt unwieldy ſtupendous maſs. And indeed, unleſs I am greatly miſtaken, the pedeſtal, when finiſhed according to this plan, will have ſcarcely breadth ſufficient to afford a proper baſe for a ſtatue of ſuch Coloſſal ſize.

"The ſtatue was erected on the pedeſtal on the 27th of Auguſt 1782. The ceremony was performed with great ſolemnity, and was accompanied with a ſolemn inauguration. At the ſame time the empreſs iſſued a proclamation, in which, among other inſtances of her clemency, ſhe pardons all criminals under ſentence of death; all deſerters, who ſhould return to their reſpective corps within a limited time; and releaſes all criminals condemned to hard labour, provided they had not been guilty of murder."

Mr Coxe informs us, that the weather is extremely changeable in this capital, and the cold is at times extreme; againſt which the inhabitants take care to provide (ſee PEASANT), though ſome of them nevertheleſs unfortunately fall victims to it. "As I traverſed the city, ſays Mr Coxe, on the morning of 12th January, I obſerved ſeveral perſons whoſe faces had been bitten by the froſt: their cheeks had large ſcars, and appeared as if they had been ſinged with an hot iron. As I was walking with an Engliſh gentleman, who, inſtead of a fur cap, had put on a common hat, his ears were ſuddenly frozen: he felt no pain, and would not have perceived it for ſome time, if a Ruſſian, in paſſing by, had not informed him of it, and aſſiſted him in rubbing the part affected with ſnow, by which means it was inſtantly recovered. This, or friction with flannel, is the uſual remedy; but ſhould the perſon in that ſtate approach the fire, or dip the part in warm water, it immediately mortifies and drops off.—The common people continued at their work as uſual, and the drivers plied in the ſtreets with their ſledges ſeemingly unaffected by the froſt; their beards were incruſted with clotted ice, and the horſes were covered with iſicles. Peterſburg || Petit.

"It ſometimes happens that coachmen or ſervants, while they are waiting for their maſters, are frozen to death. In order to prevent as much as poſſible theſe dreadful accidents, great fires of whole trees, piled one upon another, are kindled in the court-yard of the palace and the moſt frequented parts of the town. As the flames blazed above the tops of the houſes, and caſt a glare to a conſiderable diſtance, I was frequently much amuſed by contemplating the picturеſque groups of Ruſſians, with their Aſiatic dreſs and long beards, aſſembled round the fire. The centinels upon duty, having no beards, which are of great uſe to protect the glands of the throat, generally tie handkerchiefs under their chins, and cover their ears with ſmall caſes of flannel."

PETERSBURG, in America, is a ſea-port town in Virginia, 25 miles ſouthward of Richmond, ſeated on the ſouth ſide of the Appamatox river, about 12 miles above its junction with James River, and contained nearly 300 houſes in 1787, in two diviſions; one is upon a clay, cold ſoil, and is very dirty; the other upon a plain of ſand or loam. There is no regularity, and very little elegance in Peterſburg. It is merely a place of buſineſs. The Free Maſons have a hall tolerably elegant; and the ſeat of the Bowling family is pleaſant and well built. It is very unhealthy. About 2200 hogſheads of tobacco are inſpected here annually. Like Richmond, Williamſburg, Alexandria, and Norfolk, it is a corporation; and what is ſingular, Peterſburg city comprehends part of three counties. The celebrated Indian queen, Pocahonta, from whom deſcended the Randolph and Bowling families, formerly reſided at this place.

PETERSFIELD, is a handſome town of Hampſhire in England, and ſends two members to parliament. It is ſeated in W. Long. 1. 5. N. Lat. 51. 5.

PETERWARADIN, a fortified town in Sclavonia, and one of the ſtrongeſt frontier places the houſe of Auſtria has againſt the Turks, ſeated on the Danube between the Drave and the Save. E. Long. 20. 0. N. Lat. 45. 20.

PETIOLE, in botany, the ſlender ſtalks that ſupport the leaves of a plant.

PETIT, or PETITE, a French word ſignifying *little* or *ſmall*.

Petite Guerre, denotes the operations of detached parties and the war of poſts. See WAR, Part III.

Petit Sergeanty. See SERGEANTY.

Petit Treaſon. See TREASON.

PETIT (John), a doctor of the Sorbonne, very early gained to himſelf a character by his knowledge, and thoſe eloquent orations which he pronounced before the univerſity of Paris. He was employed in the famous embaſſy which was ſent from France to Rome, for the purpoſe of healing the ſchiſm in 1407; but he ſoon loſt all the honour which he had acquired. John

Petit. Sans Peur, duke of Burgundy, having treacherouſly contrived to aſſaſſinate Louis of France, duke of Orleans, only brother to Charles VI. John Petit, entirely devoted to the views of the murderer, maintained in a public diſputation, at Paris, the 8th of March 1408, that the murder was lawful. He had the effrontery to aſſert, that "it is allowable to employ fraud, treaſon, and every other method, however baſe, in order to get rid of a tyrant; and that no faith ought to be kept with him." He dared to add further, that "the man who ſhould commit ſuch an action, not only deſerved to be exempted from puniſhment, but to receive a reward." This ſanguinary doctrine was loudly exclaimed againſt; but the duke of Burgundy's powerful influence ſheltered Petit for ſome time. Some eminent writers, however, of that period, with Gerſon at their head, denounced the doctrine to John de Montaigu, biſhop of Paris, who condemned it as heretical the 23d November 1414. It was likewiſe condemned by the council of Conſtance the year following at the inſtigation of Gerſon; but no notice was taken either of Petit's name or his writings. In fine, the king, on the 16th of September 1416, ordered the parliament of Paris to pronounce a ſevere decree againſt this dangerous performance; and it was alſo cenſured by the univerſity. But the duke of Burgundy, in 1418, had intereſt enough to compel the grand vicars of the biſhop of Paris, who then lay ſick at St Omer's, to retract the ſentence which that prelate had paſt in 1414. Petit died three years before, *i. e.* in 1411, at Heſdin; and his apology in favour of the duke of Burgundy, with all the particulars of that infamous tranſaction, may be ſeen in the fifth volume of the laſt edition of Gerſon's works. Father Pinchinat, of the order of St Francis, and author of the Dictionary of Hereſies, in 4to, has endeavoured to vindicate his order from a charge brought by ſome writers who have called Petit a *Cordelier* or *Franciſcan friar*. "He proves very clearly (ſays Abbé Prevot) that he was a ſecular prieſt; and adds, that upon the ſame evidence, Father Mercier, a Cordelier, had a warm diſpute in 1717 with M. Dupin, who had given this title to Petit in his Collection of Cenſures. He repreſented to him (ſays he), before a meeting of the Faculty, the falſity of ſuch a claim, and the injury which he offered to the order of St Francis. Dupin, convinced of his error, candidly owned that he was led into it by following ſome infidel writers, and promiſed to retract it in the new edition of the Cenſures, which was publiſhed in 1720. M. Fleury, who had committed the ſame miſtake, promiſed alſo to make amends for it by a ſolemn recantation; but dying before he had an opportunity of doing that piece of juſtice to the Cordeliers, the continuator of his Eccleſiaſtical Hiſtory, who had not ſuch opportunities of information, fell into the ſame fault." (*Pour & contre*, tom. x. p. 23.) If we take the opinion of L'Advocat's Dictionary, it would appear no fault was committed; for it gives a liſt of the penſioners of the dukes of Burgundy, in order to prove that John Petit was a Cordelier. Indeed, it is highly probable that if Dupin, Fleury, and Father Fabré, did not alter their opinion, it was owing to a firm perſuaſion that they had committed no error.

Petit (John Lewis), an eminent ſurgeon, born at Paris in 1674. He had ſo early an inclination to ſurgery, that Mr Littre, a celebrated anatomiſt, being in his father's houſe, he regularly attended that gentleman's lectures, from his being ſeven years of age. He was received maſter in ſurgery in the year 1700; and acquired ſuch reputation in the practice of that art, that in 1726 the king of Poland ſent for him to his court, and in 1734 the king of Spain prevailed on him to go into that kingdom. He reſtored the health of thoſe princes; and they endeavoured to detain him by offering him great advantages, but he choſe rather to return to France. He was received into the academy of ſciences in 1715; became director of the royal academy of ſurgery; made ſeveral important diſcoveries; and invented new inſtruments for the improvement of ſurgery. He died at Paris in 1750. He wrote an excellent Treatiſe on the Diſeaſes of the Bones, the beſt edition of which is that of 1723; and many learned Diſſertations in the Memoirs of the Academy of Sciences, and in the firſt volume of the Memoirs of Surgery.

PETITIO PRINCIPII, in logic, the taking a thing for true, and drawing concluſions from it as ſuch, when it is really falſe; or at leaſt wants to be proved before any inferences can be drawn from it.

PETITION, a ſupplication made by an inferior to a ſuperior, and eſpecially to one having juriſdiction. It is uſed for that remedy which the ſubject hath to help a wrong done by the king, who hath a prerogative not to be ſued by writ: In which ſenſe it is either general, That the king do him right; whereupon follows a general indorſement upon the ſame, *Let right be done the party:* Or it is ſpecial, when the concluſion and indorſement are ſpecial, for this or that to be done, &c.

By ſtatute, the ſoliciting, labouring, or procuring the putting the hands or conſent of above twenty perſons to any petition to the king or either houſe of parliament, for alterations in church or ſtate, unleſs by aſſent of three or more juſtices of the peace of the county, or a majority of the grand jury at the aſſizes or ſeſſions, &c. and repairing to the king or parliament to deliver ſuch petition with above the number of ten perſons, is ſubject to a fine of 100l. and three months impriſonment, being proved by two witneſſes within ſix months, in the court of *B. R.* or at the aſſizes, &c. And if what is required by this ſtatute be obſerved, care muſt be taken that petitions to the king contain nothing which may be interpreted to reflect on the adminiſtration; for if they do, it may come under the denomination of a libel: and it is remarkable, that the petition of the city of London for the ſitting of a parliament was deemed libellous, becauſe it ſuggeſted that the king's diſſolving a late parliament was an obſtruction of juſtice; alſo the petition of the ſeven biſhops, ſent to the Tower by James II. was called a libel, &c. To ſubſcribe a petition to the king, *to frighten him into a change of his meaſures, intimating, that if it be denied many thouſands of his ſubjects will be diſcontented*, &c. is included among the contempts againſt the king's perſon and government, tending to weaken the ſame, and is puniſhable by fine and impriſonment.

PETITORY ACTION, in Scots law. See LAW, N° clxxxiii, 18. 20.

PETITOT (John), a curious painter in enamel, was

itot
ll
ra.

was born at Geneva in 1607. He ſtudied the art with ſuch application, that he arrived to a degree of perfection that may almoſt be accounted inimitable. He was wonderfully patient in finiſhing his works, though he had the addreſs to conceal his labour: however, he only painted the heads and hands of the figures: the hair, grounds, and drapery, being executed by Bordier his brother-in-law. Theſe two artiſts had the credit of aſſociating and labouring together for fifty years, without the leaſt miſunderſtanding happening between them. It is aſſerted by an ingenious French writer, that Petitot and Bordier derived the knowledge of the moſt curious and durable colours proper for enamelling, from Sir Theodore Mayerne at London, who recommended Petitot to Charles I. He had the honour to paint the portraits of that monarch and the whole royal family, and continued in England until Charles's unhappy end: he then went to Paris, where he was highly favoured by Louis XIV. and acquired an ample fortune. Being a Proteſtant, the revocation of the edict of Nantz obliged him to retire to Geneva; but ſettling ſoon after at Veray in the canton of Bern, he paſſed the remainder of his life in eaſe and affluence. He died in 1691; and had 17 children: of whom one took to painting, and ſettled at London, where he gained good reputation; but was much inferior to his father.

Petitot may be called the inventor of painting portraits in enamel. Though his friend Bordier made ſeveral attempts before him, and Sir Theodore Mayerne had facilitated the means of employing the moſt beautiful colours; yet Petitot completed the works, which under his hand acquired a ſoftneſs and livelineſs of colouring that will never change, and will ever render his works valuable. He made uſe of gold and ſilver plates, and ſeldom enamelled on copper. When he firſt came in vogue, his price was 20 louis's a head, which he ſoon raiſed to 40. It was his cuſtom to take a painter with him, who painted the picture in oil; after which Petitot ſketched out his work, which he always finiſhed after the life. When he painted the king of France, he took thoſe pictures for his copies that moſt reſembled him; and the king afterwards gave him a ſitting or two to finiſh his work.

PETIVERIA, in botany: A genus of the tetragynia order, belonging to the hexandria claſs of plants; and in the natural method ranking under the 12th order, *Holoraceæ*. The calyx is tetraphyllous; there is no corolla; and but one ſeed, with reflexed awns at the top.

PETRA (Cæſar, Lucian), a town of Greece, on the coaſt of Illyricum, near Dyrrhachium, and not far from the mouth of the river Panyaſus.—Another PETRA, (Livy); a town of Mædica, a diſtrict of Thrace, lying towards Macedonia; but in what part of Macedonia, he does not ſay.

PETRA (Ptolemy), *Petræa* (Silius Italicus), *Petrina* (Italicus), in both which laſt *urbs* is underſtood; an inland town of Sicily, to the ſouth-weſt of Engyum, Now *Petraglia* (Cluverius).

PETRA Jecktael (2 Kings xiv.), a town of the Amalekites; near the Adſcenſus Scorpionis (Judges i.) and the valley of Salt in the ſouth of Judæa: afterwards in the poſſeſſion of the Edomites, after deſtroying the Amalekites.

PETRA Recem, or *Rekem*, ſo called from Rekem king of the Midianites, ſlain by the Iſraelites (Num. xxxi.) Formerly called *Arce*, now *Petra*; the capital of Arabia Petræa (Joſephus). Ptolemy places it in Long. 66. 45. from the Fortunate Iſlands, and Lat. 30. 20. It declines therefore 80 miles to the ſouth of the parallel of Jeruſalem, and 36 miles, more or leſs, from its meridian to the eaſt. Joſephus ſays, that the mountain on which Aaron died ſtood near Petra; which Strabo calls the capital of the Nabatæi; at the diſtance of three or four days journey from Jericho. This Petra ſeems to be the Sela of Iſaiah xvi. 1. and xlii. 11. the Hebrew name of *Petra* "a rock:" Though ſome imagine Petra to be no older than the time of the Macedonians. Petra. Petrarch.

PETRARCH (Francis), a celebrated Italian poet, was born at Arezzo in 1304, and was the ſon of Petrarco di Parenzo. He ſtudied grammar, rhetoric, and philoſophy, for four years at Carpentras; from whence he went to Montpelier, where he ſtudied the law under John Andreas and Cino of Piſtoia, and probably from the latter received a taſte for Italian poetry. As Petrarch only ſtudied the law out of complaiſance to his father, who on his viſiting him at Bologna had thrown into the fire all the Latin poets and orators except Virgil and Cicero; he, at 22 years of age, hearing that his father and mother were dead of the plague at Avignon, returned to that city to ſettle his domeſtic affairs, and purchaſed a country-houſe in a very ſolitary but agreeable ſituation, called *Vaucluſe*; where he firſt knew the beautiful Laura, with whom he fell in love, and whom he has immortaliſed in his poems. He at length travelled into France, the Netherlands, and Germany; and at his return to Avignon entered into the ſervice of Pope John XXII. who employed him in ſeveral important affairs. Petrarch was in hopes of being raiſed to ſome conſiderable poſts: but being diſappointed, he applied himſelf entirely to poetry; in which he met with ſuch applauſe, that in one and the ſame day he received letters from Rome and the chancellor of the univerſity of Paris, by which they invited him to receive the poetic crown. By the advice of his friends, he preferred Rome to Paris, and received that crown from the ſenate and people on the 8th of April 1341. "The ceremony of his coronation (ſays Gibbon) was performed in the Capitol, by his friend and patron the ſupreme magiſtrate of the republic. Twelve patrician youths were arrayed in ſcarlet; ſix repreſentatives of the moſt illuſtrious families, in green robes, with garlands of flowers, accompanied the proceſſion; in the midſt of the princes and nobles, the ſenator, count of Anguillara, a kinſman of the Colonna, aſſumed his throne; and at the voice of an herald Petrarch aroſe. After diſcourſing on a text of Virgil, and thrice repeating his vows for the proſperity of Rome, he knelt before the throne, and received from the ſenator a laurel crown, with a more precious declaration, 'This is the reward of merit.' The people ſhouted, 'Long life to the Capitol and the poet!' A ſonnet in praiſe of Rome was accepted as the effuſion of genius and gratitude; and after the whole proceſſion had viſited the Vatican, the profane wreath was ſuſpended before the ſhrine of St Peter. In the act or diploma which was preſented to Petrarch, the

Petrarch. title and prerogatives of poet-laureat are revived in the Capitol after the lapſe of 1300 years; and he receives the perpetual privilege of wearing, at his choice, a crown of laurel, ivy, or myrtle; of aſſuming the poetic habit; and of teaching, diſputing, interpreting, and compoſing, in all places whatſoever, and on all ſubjects of literature. The grant was ratified by the authority of the ſenate and people; and the character of citizen was the recompenſe of his affection for the Roman name. They did him honour, but they did him juſtice. In the familiar ſociety of Cicero and Livy, he had imbibed the ideas of an ancient patriot; and his ardent fancy kindled every idea to a ſentiment, and every ſentiment to a paſſion." His love of ſolitude at length induced him to return to Vaucluſe; but, after the death of the beautiful Laura, Provence became inſupportable to him, and he returned to Italy in 1352; when, being at Milan, Galeas Viceconti made him counſellor of ſtate. Petrarch ſpent almoſt all the reſt of his life in travelling to and from the different cities in Italy. He was archdeacon of Parma, and canon of Padua; but never received the order of prieſthood. All the princes and great men of his time gave him public marks of their eſteem; and while he lived at Arcqua, three miles from Padua, the Florentines deputed Boccace to go to him with letters, by which they invited him to Florence, and informed him, that they reſtored to him all the eſtate of which his father and mother had been deprived during the diſſenſions between the Guelphs and Gibelines. He died a few years after at Arcqua, in 1374. He wrote many works that have rendered his memory immortal; theſe have been printed in four volumes folio. His life has been written by ſeveral authors. Amongſt theſe there was one by Mrs Suſanna Dobſon, in 2 volumes 8vo, collected and abridged from the French. In this work we have the following elegant and juſt character of Petrarch.

"Few characters, perhaps, have ſet in a ſtronger light the advantage of well-regulated diſpoſitions than that of Petrarch, from the contraſt we behold in one particular of his life, and the extreme miſery he ſuffered from the indulgence of an affection, which, though noble and delightful when juſtly placed, becomes a reproach and a torment to its poſſeſſor when once directed to an improper object. For, let us not deceive ourſelves or others; though (from the character of Laura) they are acquitted of all guilt in their perſonal intercourſe, yet, as ſhe was a married woman, it is not poſſible, on the principles of religion and morality, to clear them from that juſt cenſure which is due to every defection of the mind from thoſe laws which are the foundation of order and peace in civil ſociety, and which are ſtamped with the ſacred mark of divine authority.

"In this particular of his character, therefore, it is ſincerely hoped that Petrarch will ſerve as a warning to thoſe unhappy minds, who, partaking of the ſame feelings under the like circumſtances, but not yet ſuffering his miſery, may be led, by the contemplation of it, by a generous regard to the honour of human nature, and by a view to the approbation of that all-ſeeing Judge who penetrates the moſt ſecret receſſes of the heart, to check every unhappy inclination in its birth, and deſtroy, while yet in their power, the ſeeds of thoſe paſſions which may otherwiſe deſtroy them.

"As to the cavils or cenſures of thoſe who, incapable of tenderneſs themſelves, can neither enjoy the view of it when preſented in its moſt perfect form, nor pity its ſufferings when, as in this work, they appear unhappily indulged beyond the bounds of judgment and tranquillity; to ſuch minds I make no addreſs, well convinced, that, as no callous heart can enjoy, neither will it ever be in danger of being miſled, by the example of Petrarch in this tender but unfortunate circumſtance of his character.

"To ſuſceptible and feeling minds alone Petrarch will be ever dear. Such, while they regret his failings, and conſider them as warnings to themſelves, will love his virtues; and, touched by the glowing piety and heart-felt contrition which often impreſſed his ſoul, will ardently deſire to partake with him in thoſe pathetic and ſublime reflections which are produced in grateful and affectionate hearts, on reviewing their own lives, and contemplating the works of God.

"Petrarch had received from nature a very dangerous preſent. His figure was ſo diſtinguiſhed as to attract univerſal admiration. He appears, in his portraits, with large and manly features, eyes full of fire, a blooming complection, and a countenance that beſpoke all the genius and fancy which ſhone forth in his works. In the flower of his youth, the beauty of his perſon was ſo very ſtriking, that wherever he appeared, he was the object of attention. He poſſeſſed an underſtanding active and penetrating, a brilliant wit, and a fine imagination. His heart was candid and benevolent, ſuſceptible of the moſt lively affections, and inſpired with the nobleſt ſentiments of liberty.

"But his failings muſt not be concealed. His temper was, on ſome occaſions, violent, and his paſſions headſtrong and unruly. A warmth of conſtitution hurried him into irregularities, which were followed with repentance and remorſe.—No eſſential reproach, however, could be caſt on his manners, till after the 23d year of his age. The fear of God, the thoughts of death, the love of virtue, and thoſe principles of religion which were inculcated by his mother, preſerved him from the ſurrounding temptations of his earlier life."

A reſemblance has been traced, in ſeveral inſtances, between this admired poet and our late famous Yorick.—Both, we know, had great wit and genius, and no leſs imprudence and eccentricity; both were canons, or prebendaries, the Italian of Padua, &c. and the Engliſhman of York; they both "ran over France, without any buſineſs there." If the biſhop of Lombes patronifed and correſponded with the one, a prelate ‡ of the Engliſh church, now deceaſed, deſired, in a letter, to *Shandyiſe* ‖ with the other. In their attachments to Laura and Eliza, both married women, theſe two prebendaries were equally warm, and equally innocent. And, even after death, a moſt remarkable circumſtance has attended them both; ſome perſons, we are told, ſtole Petrarch's bones, in order to ſell them; and, in like manner, Yorick's body, it is confidently affirmed, was alſo ſtolen, and his ſkull has been exhibited at Oxford.

‡ Dr Gibert, York. ‖ His Grace owner ſion.

PETRE,

PETRE, or SALTPETRE, in chemiſtry. See CHEMISTRY, nº 724, &c.

PETREA, in botany: A genus of the angioſpermia order, belonging to the didynamia claſs of plants; and in the natural method ranking under the 47th order, *Perſonatæ*. The calyx is quinquepartite, very large, and coloured; the corolla rotaceous; the capſule bilocular, and ſituated in the bottom of the calyx; the ſeeds ſolitary. There is only one ſpecies, a native of New Spain. It riſes to the height of 15 or 16 feet, with a woody ſtalk covered with grey bark, ſending out ſeveral long branches. Theſe have a whiter bark than the ſtem, and are garniſhed with leaves at each joint, which, on the lower part of the branches, are placed by three round them; but, higher up, they are rough, and have a rough ſurface. The flowers are produced at the ends of the branches, in looſe bunches nine or ten inches long, each flower ſtanding on a ſlender flower-ſtalk about an inch long: the empalement of the flower is compoſed of five narrow obtuſe leaves about an inch long, which are of a fine blue colour, and much more conſpicuous than the petals, which are white, and not more than half the length of the empalement. The plant is propagated by ſeeds procured from the places where they are natives, and of which very few are good; for though Dr Houſton, the diſcoverer of the plant, ſent parcels of ſeeds to ſeveral perſons in England, only two plants were produced from the whole. The ſeeds muſt be ſown in a good hot-bed; and when the plants come up, they ſhould all be planted in a ſeparate ſmall pot filled with light loamy earth, and plunged into a hot-bed of tanners bark, where they ſhould afterwards conſtantly remain.

PETREL, in ornithology. See PROCELLARIA.

PETRIDIA, in natural hiſtory, a genus of ſcrupi, of a plain, uniform texture; of no great variety of colours, and emulating the external form of pebbles.

PETRIFACTION, in phyſiology, denotes the converſion of wood, bones, and other ſubſtances, principally animal or vegetable, into ſtone. Theſe bodies are more or leſs altered from their original ſtate, according to the different ſubſtances they have lain buried among in the earth; ſome of them having ſuffered very little change, and others being ſo highly impregnated with cryſtalline, ſparry, pyritical, or other extraneous matter, as to appear mere maſſes of ſtone or lumps of the matter of the common pyrites; but they are generally of the external dimenſions, and retain more or leſs of the internal figure, of the bodies into the pores of which this matter has made its way. The animal ſubſtances thus found petrified are chiefly ſea-ſhells; the teeth, bony palates, and bones, of fiſh; the bones of land-animals, &c. Theſe are found variouſly altered, by the inſinuation of ſtony and mineral matter into their pores; and the ſubſtance of ſome of them is now wholly gone, there being only ſtony, ſparry, or other mineral matter remaining in the ſhape and form.

Reſpecting the manner in which petrifaction is accompliſhed, we know but little. It has been thought by many philoſophers, that this was one of the rare proceſſes of nature; and accordingly ſuch places as afforded a view of it, have been looked upon as great curioſities. However, it is now diſcovered, that petrifaction is exceedingly common; and that every kind of water carries in it ſome earthy particles, which being precipitated from it, become ſtone of a greater or leſſer degree of hardneſs; and this quality is moſt remarkable in thoſe waters which are much impregnated with ſelenitic matter. Of late, it has alſo been found by ſome obſervations on a petrifaction in Eaſt Lothian in Scotland, that iron contributes greatly to the proceſs: and this it may do by its precipitation of any aluminous earth which happens to be diſſolved in the water by means of an acid; for iron has the property of precipitating this earth, though it cannot precipitate the calcareous kind. The calcareous kinds of earth, however, by being ſoluble in water without any acid, muſt contribute very much to the proceſs of petrifaction, as they are capable of a great degree of hardneſs by means only of being joined with fixed air, on which depends the ſolidity of our common cement or mortar uſed in building houſes. Petrifaction.

Vide Phil. Tranſ. v.69. part 2, p. 35.

The name *petrifaction* belongs only, as we have ſeen, to bodies of vegetable or animal origin; and in order to determine their claſs and genus, or even ſpecies, it is neceſſary that their texture, their primitive form, and in ſome meaſure their organization, be ſtill diſcernible. Thus we ought not to place the ſtony kernels, moulded in the cavity of ſome ſhell, or other organized body, in the rank of petrifactions properly ſo called.

Petrifactions of the vegetable kingdom are almoſt all either gravelly or ſiliceous; and are found in gullies, trenches, &c. Thoſe which ſtrike fire with ſteel are principally found in ſandy fiſſures; thoſe which effervеſce in acids are generally of animal origin, and are found in the horizontal beds of calcareous earth, and ſometimes in beds of clay or gravel; in which caſe the nature of the petrifaction is different. As to the ſubſtances which are found in gypſum, they ſeldom undergo any alteration, either with reſpect to figure or compoſition, and they are very rare.

Organized bodies, in a ſtate of petrifaction, generally acquire a degree of ſolidity of which they were not poſſeſſed before they were buried in the earth, and ſome of them are often fully as hard as the ſtones or matrices in which they are enveloped. When the ſtones are broken, the fragments of petrifactions are eaſily found, and eaſily diſtinguiſhed. There are ſome organized bodies, however, ſo changed by petrifaction, as to render it impoſſible to diſcover their origin. That there is a matter more or leſs agitated, and adapted for penetrating bodies, which crumbles and ſeparates their parts, draws them along with it, and diſperſes them here and there in the fluid which ſurrounds them, is a fact of which nobody ſeems to entertain any doubt. Indeed we ſee almoſt every ſubſtance, whether ſolid or liquid, inſenſibly conſume, diminiſh in bulk, and at laſt, in the lapſe of time, vaniſh and diſappear.

A petrified ſubſtance, ſtrictly ſpeaking, is nothing more than the ſkeleton, or perhaps image, of a body which has once had life, either animal or vegetable, combined with ſome mineral. Thus petrified wood is not in that ſtate wood alone. One part of the compound or maſs of wood having been deſtroyed by local cauſes, has been compenſated by earthy and ſandy ſubſtances, diluted and extremely minute, which the

Petrifaction.

waters ſurrounding them had depoſited while they themſelves evaporated. Theſe earthy ſubſtances, being then moulded in the ſkeleton, will be more or leſs indurated, and will appear to have its figure, its ſtructure, its ſize, in a word, the ſame general characters, the ſame ſpecific attributes, and the ſame individual differences. Farther, in petrified wood, no veſtige of ligneous matter appears to exiſt. We know that common wood is a body in which the volume of ſolid parts is greatly exceeded by that of the pores. When wood is buried in certain places, lapidific fluids, extremely divided and ſometimes coloured, inſinuate themſelves into its pores and fill them up. Theſe fluids are afterwards moulded and condenſed. The ſolid part of the wood is decompoſed and reduced into powder, which is expelled without the maſs by aqueous filtrations. In this manner, the places which were formerly occupied by the wood are now left empty in the form of pores. This operation of nature produces no apparent difference either of the ſize or of the ſhape; but it occaſions, both at the ſurface and in the inſide, a change of ſubſtance, and the ligneous texture is inverted; that is to ſay, that which was pore in the natural wood, becomes ſolid in that which is petrified; and that which was ſolid or full in the firſt ſtate, becomes porous in the ſecond. In this way, ſays M. Muſard, petrified wood is much leſs extended in pores than ſolid parts, and at the ſame time forms a body much more denſe and heavy than the firſt. As the pores communicate from the circumference to the centre, the petrifaction ought to begin at the centre, and end with the circumference of the organic body ſubjected to the action of the lapidific fluids. Such is the origin of petrifactions. They are organized bodies which have undergone changes at the bottom of the ſea or the ſurface of the earth, and which have been buried by various accidents at different depths under the ground.

In order to underſtand properly the detail of the formation of petrified bodies, it is neceſſary to be well acquainted with all their conſtituent parts. Let us take wood for an example. Wood is partly ſolid and partly porous. The ſolid parts conſiſt of a ſubſtance, hard, ligneous, and compact, which forms the ſupport of the vegetable; the porous parts conſiſt of veſſels or interſtices which run vertically and horizontally acroſs the ligneous fibres, and which ſerve for conducting air, lymph, and other fluids. Among theſe veſſels, the trachiæ which riſe in ſpiral forms, and which contain only air, are eaſily diſtinguiſhed. The cylindric veſſels, ſome of which contain lymph, and others the *ſuccus proprius*, are full only during the life of the vegetable. After its death they become vacant by the evaporation and abſence of the fluids with which they were formerly filled. All theſe veſſels, whether aſcending or deſcending, unite with one another, and form great cavities in the wood and in the bark. According to Malpighi and Duhamel, the ligneous fibres are themſelves tubular, and afford a paſſage to certain liquors; in ſhort, the wood and bark are interſperſed with utriculi of different ſhapes and ſizes. The augmentation of the trunk in thickneſs, according to Malpighi, is accompliſhed by the annual addition of a new exterior covering of fibres and of trachiæ. Others think that a concentric layer of ſap-wood is every year hardened, whilſt a new one is forming from the bark. But it is on all ſides agreed that the concentric layers of wood are diſtinct from one another, becauſe at the point of contact betwixt any two of them, the new veſſels, as well as new fibres, are more apparent and perceptible than they are in any other place. Having made theſe preliminary remarks on the ſtructure of vegetables, we ſhall now proceed to give an abridged account of the manner in which M. Mongez explains their petrifaction.

In proportion to the tenderneſs and bad quality of wood, it imbibes the greater quantity of water; therefore this ſort will unqueſtionably petrify more eaſily than that which is hard. It is thought that all the petrified wood ſo often found in Hungary has been originally ſoft, ſuch as firs or poplars. Suppoſe a piece of wood buried in the earth; if it be very dry, it will ſuck up the moiſture which ſurrounds it like a ſponge. This moiſture, by penetrating it, will dilate all the parts of which it is compoſed. The trachiæ, or air-veſſels, will be filled firſt, and then the lymphatic veſſels and thoſe which contain the *ſuccus proprius*, as they are likewiſe empty. The water which forms this moiſture keeps in diſſolution a greater or a leſs quantity of earth; and this earth, detached, and carried along in its courſe, is reduced to ſuch an attenuated ſtate, that it eſcapes our eyes and keeps itſelf ſuſpended, whether by the medium of fixed air or by the motion of the water. Such is the lapidific fluid. Upon evaporation, or the departure of the menſtruum, this earth, ſand, or metal, again appears in the form of precipitate or ſediment in the cavities of the veſſels, which by degrees are filled with it. This earth is there moulded with exactneſs: The lapſe of time, the ſimultaneous and partial attraction of the particles, make them adhere to one another; the lateral ſuction of the ſurrounding fibres, the obſtruction of the moulds, and the hardening of the moulded earth, become general; and there conſiſts nothing but an earthy ſubſtance which prevents the ſinking of the neighbouring parts. If the depoſit is formed of a matter in general pretty pure, it preſerves a whiter and clearer colour than the reſt of the wood; and as the concentric layers are only perceptible and diſtinct in the wood, becauſe the veſſels are there more apparent on account of their ſize, the little earthy cylinders, in the ſtate of petrified wood, muſt be there a little larger, and conſequently muſt repreſent exactly the turnings and ſeparations of theſe layers. At the place of the utriculi, globules are obſerved, of which the ſhapes are as various as the moulds wherein they are formed. The anaſtomoſes of the proper and lymphatic veſſels, form beſides points of ſupport or reunion for this ſtony ſubſtance.

With regard to holes formed by worms in any bits of wood, before they had been buried in the earth, the lapidific fluid, in penetrating theſe great cavities, depoſits there as eaſily the earthy ſediment, which is exactly moulded in them. Theſe vermiform cylinders are ſomewhat leſs in bulk than the holes in which they are found, which is owing to the retreat of the more refined earth and to its drying up.

Let any one repreſent to himſelf this collection of little cylinders, vertical, horizontal, inclined in different directions, the ſtony maſſes of utriculi and of anaſtomoſes,

fac-n. tomoſes, and he will have an idea of the ſtony ſubſtance which forms the ground-work of petrifaction. Hitherto not a ſingle ligneous part is deſtroyed; they are all exiſting, but ſurrounded on every ſide with earthy depoſits; and that body which, during life, was compoſed of ſolid and of empty parts, is now entirely ſolid: its deſtruction and decompoſition do not take place till after the formation of theſe little depoſits. In proportion as the water abandons them, it penetrates the ligneous ſubſtance, and deſtroys it by an inſenſible fermentation. The woody fibres being decompoſed, form in their turn voids and interſtices, and there remains in the whole piece nothing but little ſtony cylinders. But in proportion as theſe woody fibres diſappear, the ſurrounding moiſture, loaded with earth in the ſtate of diſſolution, does not fail to penetrate the piece of wood, and to remain in its new cavities. The new depoſit aſſumes exactly the form of decompoſed fibres; it envelopes in its turn the little cylinders which were formed in their cavities, and ends by incorporating with them. We may ſuppoſe here, that in proportion as it decompoſes, there is a reaction of the ligneous part againſt the lapidific fluid: from this reaction a colour ariſes which ſtains more or leſs the new depoſit; and this colour will make it eaſily diſtinguiſhable from that which has been laid in the inſide of the veſſels. In all petrified wood this ſhade is generally perceptible.

We have then, ſays M. Mongez, four diſtinct epochs in the proceſs by which nature converts a piece of wood into ſtone, or, to ſpeak more juſtly, by which ſhe ſubſtitutes a ſtony depoſit in its place: 1. Perfect vegetable wood, that is to ſay, wood compoſed of ſolid and of empty parts, of ligneous fibres, and of veſſels. 2. Wood having its veſſels obſtructed and choaked up by an earthy depoſit, while its ſolid parts remain unaltered. 3. The ſolid parts attacked and decompoſed, forming new cavities betwixt the ſtony cylinders, which remain in the ſame ſtate, and which ſupport the whole maſs. 4. Theſe new cavities filled with new depoſits, which incorporate with the cylinders, and compoſe nothing elſe but one general earthy maſs repreſenting exactly the piece of wood.

Among the petrifactions of vegetables called *dendrolites*, are found parts of ſhrubs, ſtems, roots, portions of the trunk, ſome fruits, &c. We muſt not, however, confound the impreſſions of moſſes, ferns, and leaves, nor incruſtations, with petrifactions.

Among the petrifactions of animals, we find ſhells, cruſtaceous animals, polyparii, ſome worms, the bony parts of fiſhes and of amphibious animals, few or no real inſects, rarely birds and quadrupeds, together with the bony portions of the human body. The cornua ammonis are petrified ſerpents; and with regard to figured and accidental bodies, theſe are *luſus naturæ*.

In order, ſays M. Bertrand, in his *Dictionnaire des Foſſiles*, that a body ſhould become petrified, it is neceſſary that it be, 1. Capable of preſervation under ground: 2. That it be ſheltered from the air and running water (the ruins of Herculaneum prove that bodies which have no connection with free air, preſerve themſelves untouched and entire). 3. That it be ſecured from corroſive exhalations. 4. That it be in a place where there are vapours or liquids, loaded either with metallic or ſtony particles in a ſtate of diſſolution, and which, without deſtroying the body, penetrate it, impregnate it, and unite with it in proportion as its parts are diſſipated by evaporation. Petrifaction.

It is a queſtion of great importance among naturaliſts, to know the time which Nature employs in petrifying bodies of an ordinary ſize.—It was the wiſh of the late emperor, Duke of Lorraine, that ſome means ſhould be taken for determining this queſtion. M. le Chevalier de Baillu, director of the cabinet of natural hiſtory of his imperial majeſty, and ſome other naturaliſts, had, ſeveral years ago, the idea of making a reſearch which might throw ſome light upon it. His imperial majeſty being informed by the unanimous obſervations of modern hiſtorians and geographers, that certain pillars which are actually ſeen in the Danube in Gervia, near Belgrade, are remains of the bridge which Trajan conſtructed over that river, preſumed that theſe pillars having been preſerved for ſo many ages behoved to be petrified, and that they would furniſh ſome information with regard to the time which nature employs in changing wood into ſtone. The emperor thinking this hope well founded, and wiſhing to ſatisfy his curioſity, ordered his ambaſſador at the court of Conſtantinople to aſk permiſſion to take up from the Danube one of the pillars of Trajan's bridge. The petition was granted, and one of the pillars was accordingly taken up; from which it appeared that the petrifaction had only advanced three fourths of an inch in the ſpace of 1500 years. There are, however, certain waters in which this tranſmutation is more readily accompliſhed.—Petrifactions appear to be formed more ſlowly in earths that are porous and in a ſlight degree moiſt than in water itſelf.

When the foundations of the city of Quebec in Canada were dug up, a petrified ſavage was found among the laſt beds to which they proceeded. Although there was no idea of the time at which this man had been buried under the ruins, it is however true, that his quiver and arrows were ſtill well preſerved. In digging a lead-mine in Derbyſhire in 1744, a human ſkeleton was found among ſtags horns. It is impoſſible to ſay how many ages this carcaſe had lain there. In 1695 the entire ſkeleton of an elephant was dug up near Tonna in Thuringia. Some time before this epoch the petrified ſkeleton of a crocodile was found in the mines of that country. We might cite another fact equally curious which happened at the beginning of the laſt century. John Munte, curate of Slægarp in Scania, and ſeveral of his pariſhioners, wiſhing to procure turf from a drained marſhy ſoil, found, ſome feet below ground, an entire cart with the ſkeletons of the horſes and carter. It is preſumed that there had formerly been a lake in that place, and that the carter attempting to paſs over on the ice, had by that means probably periſhed. In fine, wood partly foſſil and partly coaly has been found at a great depth, in the clay of which tile was made for the Abbey of Fontenay. It is but very lately that foſſil wood was diſcovered at the depth of 75 feet in a well betwixt Iſſi and Vauvres near Paris. This wood was in ſand betwixt a bed of clay and pyrites, and water was found four feet lower than the pyrites. M. de Laumont, inſpector general of the mines, ſays (*Journal de Phyſique*, Mai 1736), that in the lead-mine at Pontpéan near Rennes, is a fiſſure, perhaps the only one of its kind. In that fiſſure, ſea-

ſhells,

Petrifaction.

shells, rounded pebbles, and an entire beech, have been found 240 feet deep. This beech was laid horizontally in the direction of the fissure. Its bark was converted into pyrites, the sap-wood into jet, and the centre into coal.

A great many pieces of petrified wood are found in different counties of France and Savoy. In Cohourg in Saxony, and in the mountains of Misnia, trees of a considerable thickness have been taken from the earth, which were entirely changed into a very fine agate, as also their branches and their roots. In sawing them, the annual circles of their growth have been distinguished. Pieces have been taken up, on which it was distinctly seen that they had been gnawed by worms; others bear visible marks of the hatchet. In fine, pieces have been found which were petrified at one end, while the other still remained in the state of wood fit for being burned. It appears then that petrified wood is a great deal less rare in nature than is commonly imagined.

Cronstedt has excluded petrifactions from any place in the body of his system of mineralogy, but takes notice of them in his appendix. He distinguishes them by the name of *Mineralia Larvata*, and defines them to be "mineral bodies in the form of animals or vegetables." The most remarkable observations concerning them, according to Mr Kirwan, who differs in some particulars from Mongez, are as follow. 1. Those of shells are found on or near the surface of the earth; those of fish deeper; and those of wood deeper still. Shells in substance are found in vast quantities, and at considerable depths. 2. The substances most susceptible of petrifaction are those which most resist the putrefactive process; of which kind are shells, the harder kinds of wood, &c.; while the softer parts of animals, which easily putrefy, are seldom met with in a petrified state. 3. They are most commonly found in strata of marl, chalk, limestone, or clay: seldom in sandstone, still more seldom in gypsum; and never in gneiss, granite, basaltes, or schoerl. Sometimes they are found in pyrites, and ores of iron, copper, and silver; consisting almost always of that kind of earth or other mineral which surrounds them; sometimes of silex, agate, or cornelian. 4. They are found in climates where the animals themselves could not have existed. 5. Those found in slate or clay are compressed and flattened.

The different species of petrifactions, according to Cronstedt, are,

I. *Terræ Larvatæ;* extraneous bodies changed into a limy substance or calcareous changes. These are, 1. Loose or friable. 2. Indurated. The former are of a chalky nature in form of vegetables or animals; the second filled with solid limestone in the same forms. Some are found entirely changed into a calcareous spar. All of them are found in France, Sweden, and other countries in great plenty.

On these petrifactions Cronstedt observes, that shells and corals are composed of limy matter even when still inhabited by their animals, but they are classed among the petrifactions as soon as the calcareous particles have obtained a new arrangement; for example, when they have become sparry; filled with calcareous earth either hardened or loose, or when they lie in the strata of the earth. "These, says he, form the greatest part of the fossil collections which are so industriously made, often without any regard to the principal and only use they can be of, viz. that of enriching zoology. Mineralogists are satisfied with seeing the possibility of the changes the limestone undergoes in regard to its particles; and also with receiving some insight into the alteration which the earth has been subject to from the state of the strata which are now found in it." The calcined shells, where the petrifactions are of a limy or chalky nature, answer extremely well as a manure; but the indurated kind serve only for making grottoes. Gypseous petrifactions are extremely rare; however, Chardin informs us that he had seen a lizard inclosed in a stone of that kind in Persia.

Petrifaction.

II. Larvæ, or bodies changed into a flinty substance. These are all indurated, and are of the following species. 1. Cornelians in form of shells from the river Tomm in Siberia. 2. Agate in form of wood; a piece of which is said to be in the collection of the Count de Tessin. 3. Coralloids of white flint *(Millepora)* found in Sweden. 4. Wood of yellow flint found in Italy, in Turkey near Adrianople, and produced by the waters of Lough-neagh in Ireland.

III. *Larvæ Argillaceæ;* where the bodies appear to be changed into clay. These are found either loose and friable, or indurated. Of the former kind is a piece of porcelain clay met with in a certain collection, with all the marks of the root of a tree upon it. Of the latter kind is the osteocolla; which is said to be the roots of the poplar-tree changed, and not to consist of any calcareous substance. A sort of fossile ivory, with all the properties of clay, is said likewise to be found in some places.

IV. *Larvæ Insalitæ;* where the substances are impregnated with great quantities of salts. Human bodies have been twice found impregnated with vitriol of iron in the mine of Falun, in the province of Dalarne in Sweden. One of them was kept for several years in a glass case, but at last began to moulder and fall to pieces. Turf and roots of trees are likewise found in water strongly impregnated with vitriol. They do not flame, but look like a coal in a strong fire; neither do they decay in the air.

V. Bodies penetrated by mineral inflammable substances. 1. By pit-coal, such as wood; whence some have imagined coal to have been originally produced from wood. Some of these substances are fully saturated with the coaly matter; others not. Among the former Cronstedt reckons jet; among the latter the substance called *mumia vegetabilis*, which is of a loose texture, resembling amber, and may be used as such. 2. Those penetrated by asphaltum or rock-oil. The only example of these given by our author is a kind of turf in the province of Skone in Sweden. The Egyptian mummies, he observes, cannot have any place among this species, as they are impregnated artificially with asphaltum, in a manner similar to what happens naturally with the wood and coaly matter in the last species. 3. Those impregnated with sulphur which has dissolved iron, or with *pyrites*. Human bodies, bivalve and univalve shells and insects, have been all found in this state; and the last are found in the alum slate at Andrarum, in the province of Skone in Sweden.

VI. *Larvæ metalliferæ;* where the bodies are impregnated with metals. These are, 1. Covered with native silver; which is found on the surface of shells

in England. 2. Where the metal is mineralised with copper and sulphur. Of this kind is the fahlertz or grey silver ore, in the shape of ears of corn, and supposed to be vegetables, found in argillaceous slate at Frankenberg and Tahlitteren in Hesse. 3. *Larvæ cuprifera*, where the bodies are impregnated with copper. To this species principally belong the Turquoise or Turkey stones, improperly so called; being ivory and bones of the elephant or other animals impregnated with copper. See Turquoise. At Simore in Languedoc there are bones of animals dug up, which, during calcination, assume a blue colour; but according to Cronstedt it is not probable that these owe their colour to copper. 3. With mineralised copper. Of these our author gives two examples. One is where the copper is mineralised with sulphur and iron, forming a yellow marcasitical ore. With this some shells are impregnated which lie upon a bed of loadstone in Norway. Other petrifactions of this kind are found in the form of fish in different parts of Germany. The other kind is where the copper is impregnated with sulphur and silver. Of this kind is the grey silver ore, like ears of corn, found in the slate quarries at Hesse. 4. *Larvæ ferriferæ*, with iron in form of a calx, which has assumed the place or shape of extraneous bodies. These are either loose or indurated. Of the loose kind are some roots of trees found at the lake Langelma in Finland. The indurated kinds are exemplified in some wood found at Orbissan in Bohemia. 5. Where the iron is mineralised, as in the pyritaceous larvæ, already described.

VII. Where the bodies are tending to decomposition, or in a way of destruction. Among these, our author enumerates Mould and Turf, which see; as also Cement, Mortar, Rock, Sand, Selenitæ, Stone, and Water. See likewise the article Fossil, Plates CC and CCI, and Mountain.

We shall add the following description of a very curious animal petrifaction. The Abbé de Sauvages, celebrated for his refined taste and knowledge in natural history, in a tour through Languedoc, between Alais and Uzes, met with a narrow vein of no more than two toises wide, which crosses the road, and is bordered on one side by a grey dirty soil, and on the other by a dry sandy earth, each of a vast extent, and on a level with the narrow vein which separates them. In this narrow vein only are contained petrified shells, cemented together by a whitish marl. They are in prodigious plenty; among which there is one species which the Abbé does not remember to have known to have been anywhere described, and may probably be a new acquisition to natural history.

This shell has the shape of a horn, somewhat incurvated towards the base. (See figure 9. Plate CCCLXXXVIII.) It seems composed of several cups, let into each other, which are sometimes found separate. They have all deep channels, which extend, as in many other shells, from the base to the aperture; the projecting ribs which form these channels are mostly worn away, being rarely to be found entire. Sometimes several are grouped together; and as a proof that they are not a fortuitous assemblage caused by the petrifaction, they are fixed together through their whole length, in such sort, that their base and aperture are regularly turned the same way. The Abbé should have referred this to the genus which Linnæus and the Marquis d'Argenville named *dentalis*, had they not been let into each other. He found some of them whose aperture or hollow was not stopped up by the petrifaction, and seemed as cones adapted to one another (fig. 10.), forming a row of narrow cells, separated by a very thin partition: this row occupied not more than one half of the cavity of the shell. Petrified City

Our article has already extended to such a length as to preclude any further additions: we cannot, however, finish it without observing, that fossil bones are very common in Dalmatia. They are of various kinds, and in their nature, apparently very extraordinary; but we have found no tolerable account or probable conjecture of their origin. Vitaliano Donati of Padua, in his *Saggio sopra la storia naturale dell' Adriatico*, was the first who took notice of them; and Fortis, in his travels into Dalmatia, has given a copious account of them. They are most common in the islands of *Cherso* and *Ossero*. See Fortis's Travels into Dalmatia, page 440—465, and our article Vitaliano.

PETRIFIED City. The story of a petrified city is well known all over Africa, and has been believed by many considerable persons even in Europe. Louis XIV. was so fully persuaded of its reality, that he ordered his ambassador to procure the body of a man petrified from it at any price. Dr Shaw's account of this affair is as follows: "About 40 years ago (now more than 70), when M. le Maire was the French consul at Tripoli, he made great inquiries, by order of the French court, into the truth of the report concerning a petrified city at Râs Sem; and amongst other very curious accounts relating to this place, he told me a remarkable circumstance, to the great discredit, and even confutation, of all that had been so positively advanced with regard to the petrified bodies of men, children, and other animals.

"Some of the janizaries, who, in collecting tribute, traverse the district of Ras Sem, promised him, that, as an adult person would be too cumbersome, they would undertake, for a certain number of dollars, to bring him from thence the body of a little child. After a great many pretended difficulties, delays, and disappointments, they produced at length a little Cupid, which they had found, as he learned afterwards, among the ruins of Leptis; and, to conceal the deceit, they broke off the quiver, and some other of the distinguishing characteristics of that deity. However, he paid them for it, according to promise, 1000 dollars, which is about 150 l. sterling of our money, as a reward for their faithful service and hazardous undertaking; having run the risk, as they pretended, of being strangled if they should have been discovered in thus delivering up to an infidel one of those unfortunate Mahometans, as they take them originally to have been.

"But notwithstanding this cheat and imposition had made the consul desist from searching after the petrified bodies of men and other animals; yet there was one matter of fact, as he told me, which still very strangely embarrassed him, and even strongly engaged him in favour of the current report and tradition. This was some little loaves of bread, as he called them, which had been brought to him from that place. His reasoning, indeed, thereupon, provided the pretended matter of fact had been clear and evident, was just and

Petrified City.

satisfactory; for where we find loaves of bread, there, as he urged, some persons must have been employed in making them, as well as others for whom they were prepared. One of these loaves he had, among other petrifications, very fortunately brought with him to Cairo, where I saw it, and found it to be an echinites of the discoid kind, of the same fashion with one I had lately found and brought with me from the deserts of Marah. We may therefore reasonably conclude, that there is nothing to be found at Ras Sem, unless it be the trunks of trees, echinites, and such petrifications as have been discovered at other places.

"M. le Maire's inquiries, which we find were supported by the promise and performance of great rewards, have brought nothing further to light. He could never learn that any traces of walls, or buildings, or animals, or utensils, were ever to be seen within the verge of these pretended petrifications. The like account I had from a Sicilian renegado, who was the janizary that attended me whilst I was in Egypt; and as in his earlier years he had been a soldier of Tripoli, he assured me that he had been several times at Ras Sem. This I had confirmed again in my return from the Levant by the interpreter of the British factory at Tunis, who was likewise a Sicilian renegado; and being the libertus or freedman of the bashaw of Tripoli, was preferred by him to be the bey or viceroy of the province of Darna, where Ras Sem was immediately under his jurisdiction. His account was likewise the same; neither had he ever seen, in his frequent journeys over this district, any other petrifications than what are above-mentioned. So that the petrified city, with its walls, castles, streets, shops, cattle, inhabitants, and utensils, were all of them at first the mere inventions of the Arabs, and afterwards propagated by such persons, who, like the Tripoli ambassador, and his friend above mentioned, were credulous enough to believe them.

"However, there is one remarkable circumstance relating to Ras Sem that deserves well to be recorded. When the winds have blown away the billows of sand which frequently cover and conceal these petrifications, they discover, in some of the lower and more depressed places of this district, several little pools of water, which is usually of so ponderous a nature, that, upon drinking it, it passes through the body like quicksilver. This perhaps may be that petrifying fluid which has all along contributed to the conversion of the palm-trees and the echini into stone: for the formation not only of these, but of petrifications of all kinds, may be entirely owing to their having first of all lodged in a bed of loam, clay, sand, or some other proper nidus or matrix, and afterwards gradually been acted upon and pervaded by such a petrifying fluid as we may suppose this to be."

To this account it may not be amiss to subjoin the memorial of Caffem Aga, the Tripoli ambassador at the court of Britain. The city, he says, is situated two days journey south from Onguela, and 17 days journey from Tripoli by caravan to the south-east. "As one of my friends (says the ambassador) desired me to give him in writing an account of what I knew touching the petrified city, I told him what I had heard from different persons, and particularly from the mouth of one man of credit who had been on the spot: that is to say, that it was a very spacious city, of a round form, having great and small streets therein, furnished with shops, with a vast castle magnificently built: that he had seen there several sorts of trees, the most part olives and palms, all of stone, and of a blue or rather lead colour: that he saw also figures of men in a posture of exercising their different employments; some holding in their hands stuffs, others bread, every one doing something, even women suckling their children, and in the embraces of their husbands, all of stone: that he went into the castle by three different gates, though there were many more, where he saw a man lying upon a bed of stone: that there were guards at the gates with pikes and javelins in their hands: in short, that he saw in this wonderful city many sorts of animals, as camels, oxen, horses, asses, sheep, and birds, all of stone, and the colour above-mentioned."

We have subjoined this account, because it shows in striking colours the amazing credulity of mankind, and the avidity with which they swallow the marvellous and the difficulty of discovering the truth respecting places or things at a distance from us.

PETROBRUSSIANS, a religious sect, which had its rise in France and the Netherlands about the year 1110. The name is derived from *Peter Bruys*, a Provençal, who made the most laudable attempt to reform the abuses and remove the superstition that disgraced the beautiful simplicity of the gospel. His followers were numerous; and for 20 years his labour in the ministry was exemplary and unremitted. He was, however, burnt in the year 1130 by an enraged populace set on by the clergy.

The chief of Bruys's followers was a monk named *Henry*; from whom the Petrobrussians were also called *Henricians*. Peter the Venerable, abbot of Clugny, has an express treatise against the Petrobrussians; in the preface to which he reduces their opinions to five heads. 1. They denied that children before the age of reason can be justified by baptism, in regard it is our own faith that saves by baptism. 2. They held that no churches should be built, but that those that already are should be pulled down; an inn being as proper for prayers as a temple, and a stable as an altar. 3. That the cross ought to be pulled down and burnt, because we ought to abhor the instruments of our Saviour's passion. 4. That the real body and blood of Christ are not exhibited in the eucharist, but merely represented by their figures and symbols. 5. That sacrifices, alms, prayers, &c. do not avail the dead. F. Langlois objects Manicheism to the Petrobrussians; and says, they maintained two gods, the one good, the other evil: but this we rather esteem an effect of his zeal for the catholic cause, which determined him to blacken the adversaries thereof, than any real sentiment of the Petrobrussians.

PETROJOANNITES, were followers of Peter John, or Peter Joannis, *i. e.* Peter the son of John, who flourished in the 12th century. His doctrine was not known till after his death, when his body was taken out of his grave and burnt. His opinions were, that he alone had the knowledge of the true sense wherein the apostles preached the gospel; that the reasonable soul is not the form of man; that there is no grace infused by

by baptiſm; and that Jeſus Chriſt was pierced with a lance on the croſs before he expired.

PETROLEUM *, or ROCK OIL; a thick oily ſubſtance exuding out of the earth, and collected on the ſurface of wells in many parts of the world. It is found on ſome in Italy, and in a deſerted mine in the province of Dalarne in Sweden. In this laſt place it collects itſelf in ſmall hollows of lime-ſtone, like reſin in the wood of the pine-tree. It is found trickling from the rocks, or iſſuing from the earth, in many parts of the duchy of Modena, and in various parts of France, Switzerland, Germany, and Scotland, as well as in Aſia. It is alſo found not only on the ſurface of wells as already mentioned, but mixed with earth and ſand, from whence it may be ſeparated by infuſion in water. It is of a pungent and acrid taſte, and ſmells like the oil of amber, but more agreeable. It is very light and very pellucid; but, though equally bright and clear under all circumſtances, it is liable to a very great variety in its colour. It is naturally almoſt colourleſs, and in its appearance greatly reſembles the moſt pure oil of turpentine: this is called *white petroleum*, though it has no more colour than water. It is ſometimes tinged of a browniſh, reddiſh, yellowiſh, or faint greeniſh colour; but its moſt frequent colour is a mixture of the reddiſh and blackiſh, in ſuch a degree that it looks black when viewed behind the light, but purple when placed between the eye and a candle or window. It is rendered thinner by diſtillation with water, and leaves a reſinous reſiduum; when diſtilled with a volatile alkali, the latter acquires the properties of ſuccinated ammoniac, and contains the acid of amber. It is the moſt frequent of all the liquid bitumens, and is perhaps the moſt valuable of them all in medicine. It is to be choſen the pureſt, lighteſt, and moſt pellucid that can be had, ſuch as is of the moſt penetrating ſmell and is moſt inflammable. Monet informs us that ſome kinds of it are of the denſity of nut oil. It is inſoluble in ſpirit of wine; which, though it be the great diſſolvent of ſulphur, has no effect upon petroleum, not even with ever ſo long a digeſtion. It will not take fire with the dephlegmated acid ſpirits; as oil of cloves and other of the vegetable eſſential oils do: and in diſtillation, either by balneum mariæ or in ſand, it will neither yield phlegm nor acid ſpirit; but the oil itſelf rites in its own form, leaving in the retort only a little matter, thick as honey, and of a browniſh colour.

The finer kinds reſemble naphtha. Kirwan is of opinion that naphtha is converted into petroleum by a proceſs ſimilar to what takes place in eſſential oils when expoſed to the atmoſphere; in which caſe the oil abſorbs not only the pure, but alſo the phlogiſticated, part of the atmoſphere: in conſequence of which ſeveral alterations take place in them.

Mr Bouldoc made ſeveral experiments with the white petroleum of Modena; an account of which he gave to the Paris academy.

It eaſily took fire (A) on being brought near a candle, and that without immediately touching the flame; and when heated in any veſſel it will attract the flame of a candle, though placed at a great height above the veſſel; and the vapour it ſends up taking fire, the flame will be communicated to the veſſel of heated liquor, and the whole will be conſumed. It burns in the water; and when mixed with any liquor ſwims on the ſurface of it, even of the higheſt rectified ſpirit of wine, which is $\frac{1}{4}$th heavier than pure petroleum. It readily mixes with all the eſſential oils of vegetables, as oil of lavender, turpentine, and the reſt, and ſeems very much of their nature: nor is this very ſtrange, ſince the alliance between theſe bodies is probably nearer than is imagined, as the eſſential oils of vegetables may have been originally mineral ones, and drawn up out of the earth into the veſſels of the plants. Petroleum.

The diſtinguiſhing characteriſtic of the petroleum is its thickneſs, reſembling inſpiſſated oil: when pure it is lighter than ſpirit of wine; but, though ever ſo well rectified, it becomes in time thick and black as before. Petroleum, when ſhaken, yields a few bubbles; but they ſooner ſubſide than in almoſt any other liquor, and the liquor reſumes its clear ſtate again almoſt immediately. This ſeems owing to the air in this fluid being very equally diſtributed to all its parts, and the liquor being compoſed of particles very evenly and nicely arranged. This extenſibility of the oil is alſo amazing. A drop of it will ſpread over ſeveral feet of water, and in this condition it gives a great variety of colours; that is, the ſeveral parts of which this thin film is compoſed act as ſo many priſms. The moſt ſevere froſt never congeals petroleum into ice; and paper wetted with it becomes tranſparent as when wetted with oil; but it does not continue ſo, the paper becoming opaque again in a few minutes as the oil dries away.

There are three varieties of it according to Mongez. 1. The yellow, found at Modena in Italy; very light and volatile. 2. The reddiſh, or yellowiſh red; ſome of which is collected at Gabian in Languedoc and in Alſace. 3. The heavy, black, or brown kind, which is the moſt common, and met with in England, France, Germany, and ſome other countries. It generally runs out either from chinks or gaps of rocks, or is mixed with the earth, and guſhes out of it; or it ſwims on the water of ſome fountains, as already mentioned. According to Dr Lippert, a kind of roſin is produced by mixing petroleum with ſmoking nitrous acid. The taſte of this ſubſtance is very bitter, but the ſmell reſembles that of muſk. The vitriolic acid, according to the ſame author, produces a reſin ſtill more bitter, but without any aromatic ſmell. Cronſtedt enumerates the following ſpecies.

1. *Maltha*, or Barbadoes tar, a thick ſubſtance reſembling ſoft pitch. It is found in ſeveral parts of Europe and Aſia; particularly Sweden, Germany, and Switzerland; on the coaſt of the Dead Sea in

(A) Alonſo Barba, in his book of metals, gives a very melancholy inſtance of the power of petroleum of taking fire at a diſtance. He tells us, that a certain well, yielding petroleum on the ſurface of its water, being to be repaired, the workmen took down into the well with him a lantern and a candle in it: there were ſome holes in the lantern, through which the petroleum at a conſiderable diſtance ſucked out the flame of the candle, and, taking fire, burſt up with the noiſe of a cannon, and tore the man to pieces.

Petroleum

Paleſtine; in Perſia, in the chinks of rocks, and in ſtrata of gypſum and limeſtone, or floating upon water. It is found alſo in America, and at Colebrook dale in England. Kirwan tells us, that petroleum expoſed for a long time to the air forms this ſubſtance. It is of a viſcid conſiſtence; and of a brown, black, or reddiſh black colour. Sometimes it is inodorous, but generally of a more or leſs diſagreeable ſmell, particularly when burned. It melts eaſily, and burns with much ſmoke and ſoot, leaving either aſhes or a flag according to the heterogeneous matter it contains. It contains a portion of the acid of amber. It gives a bitter ſalt with mineral alkali, more difficult of ſolution than common ſalt, and which, when treated with charcoal, does not yield any ſulphur.

II. *Elaſtic Petrol*; a very ſingular kind of foſſil met with in ſome parts of England. This, in colour and conſiſtency, exactly reſembles the CAOUTCHOUC, or elaſtic gum-reſin, commonly called *Indian rubber*, found in South America, and uſed for rubbing out the traces of black lead pencils from paper. It is of a dark brown colour, almoſt black; and in ſome pieces has a yelloviſh brown caſt like the ſame gum-reſin. It can ſcarce be diſtinguiſhed from the caoutchouc with regard to its elaſtic property, excepting that the coheſion of its parts is not ſo great. It burns with a ſmoky flame, and melts likewiſe into a thick oily fluid; but emits a diſagreeable ſmell like the *Foſſil Pitch* or Barbadoes tar. "On the whole (ſays M. Petu Magellan), this foſſile ſeems to confirm the opinion of thoſe mineralogiſts who believe that theſe oily combuſtibles derive their origin from the vegetable kingdom. It ſeems worth trying whether pieces of aſphaltum, buried in damp beds of ſparry rubbiſh or other kinds of earth, would take the ſame elaſtic conſiſtence." This ſubſtance was found in the year 1785 near Caſtelton in Derbyſhire, but in very ſmall quantities. Some of the ſpecimens were of a cylindrical form, like bits of ſmall branches or ſtalks of vegetables; tho' much more flexible, being perfectly elaſtic.

III. *Hardened rock-oil*, or foſſil pitch, an inflammable ſubſtance dug out of the ground in many parts of the world, and known by the names of *petroleum induratum*, *pix montana*, *indenpech*, *berghartz*, &c. There are two ſpecies. 1. The aſphaltum (B), or pure foſſil pitch, found on the ſhores of the Dead Sea and of the Red Sea; alſo in Sweden, Germany, and France: See ASPHALTUM. It is a ſmooth, hard, brittle, inodorous ſubſtance, of a black or brown colour when looked at; but on holding it up betwixt the eye and the light, appears of a deep red. It ſwims in water; breaks with a ſmooth and ſhining ſurface; melts eaſily; and, when pure, burns without leaving any aſhes; but, if impure, leaves aſhes, or a flag. M. Monet aſſerts that it contains ſulphur, or at leaſt the vitriolic acid. It is ſlightly and partially acted upon by ſpirit-of-wine and

---

(B) This ſpecies is found in great quantity in a bituminous lake or plain in the iſland of Trinidad, of which Mr Anderſon gives the following copious account in the 79th volume of the Philoſophical Tranſactions.

"A moſt remarkable production of nature in the iſland of Trinidad, is a bituminous lake, or rather plain, known by the name of *Tar Lake*; by the French called *La Bray*, from the reſemblance to, and anſwering the intention of, ſhip-pitch. It lies in the leeward ſide of the iſland, about half-way from the Bocas to the ſouth end, where the mangrove ſwamps are interrupted by the ſand-banks and hills; and on a point of land which extends into the ſea about two miles, exactly oppoſite to the high mountains of Paria, on the north ſide of the gulf.

"This cape, or headland, is about 50 feet above the level of the ſea, and is the greateſt elevation of land on this ſide of the iſland. From the ſea it appears a maſs of black vitrified rocks; but, on a cloſe examination, it is found a compoſition of bituminous ſcoriæ, vitrified ſand, and earth, cemented together: in ſome parts beds of cinders only are found. In approaching this cape, there is a ſtrong ſulphureous ſmell, ſometimes diſagreeable. This ſmell is prevalent in many parts of the ground to the diſtance of eight or ten miles from it.

This point of land is about two miles broad, and on the eaſt and weſt ſides, from the diſtance of about half a mile from the ſea, falls with a gentle declivity to it, and is joined to the main land on the ſouth by the continuation of the mangrove ſwamps; ſo that the bituminous plain is on the higheſt part of it, and only ſeparated from the ſea by a margin of wood which ſurrounds it, and prevents a diſtant proſpect of it. Its ſituation is ſimilar to a ſavannah, and like them, it is not ſeen till treading upon its verge. Its colour and even ſurface preſent at firſt the aſpect of a lake of water; but it is poſſible it got the appellation of *Lake* when ſeen in the hot and dry weather, at which time its ſurface to the depth of an inch is liquid; and then from its cohefive quality it cannot be walked upon.

"It is of a circular form, about three miles in circumference. At my firſt approach it appeared a plain, as ſmooth as glaſs, excepting ſome ſmall clumps of ſhrubs and dwarf trees that had taken poſſeſſion of ſome ſpots of it; but when I had proceeded ſome yards on it, I found it divided into areolæ of different ſizes and ſhapes: the chaſms or diviſions anaſtomoſed through every part of it; the ſurface of the areolæ perfectly horizontal and ſmooth; the margins undulated, each undulation enlarged to the bottom till they join the oppoſite. On the ſurface, the margin or firſt undulation is diſtant from the oppoſite from four to ſix feet, and the ſame depth before they coaleſce; but where the angles of the areolæ oppoſe, the chaſms or ramifications are wider and deeper. When I was at it all theſe chaſms were full of water, the whole forming one true horizontal plane, which rendered my inveſtigation of it difficult and tedious, being neceſſitated to plunge into the water a great depth in paſſing from one areolæ to another. The trueſt idea that can be formed of its ſurface will be from the areolæ and their ramifications on the back of a turtle. Its more common conſiſtence and appearance is that of pit-coal, the colour rather greyer. It breaks into ſmall fragments of

oleum. and ether. Beſides the countries above-mentioned, Brunnich informs us that the aſphaltum comes from Porto Principe in the iſland of Cuba in the Weſt Indies. It is likewiſe found, according to Fourcroy, in many parts of China; and is uſed for a covering to ſhips by Arabs and Indians. 2. The *pix montana impura* contains a great quantity of earthy matter, which is left in the retort after diſtillation, or upon the charcoal if burnt in the open fire. It coheres like a flag, and is of the colour of black-lead; but in a ſtrong heat this earth is ſoon volatiliſed, ſo that its nature is not yet well known. During the diſtillation a liquid ſubſtance falls into the receiver, which is found to be of the ſame nature with rock-oil. The ſubſtance itſelf is found in Sweden and ſeveral other countries. The piſaſphaltum is of a mean conſiſtence between the aſphaltum and the common petroleum. Mongez ſays that it is the ſame with the bitumen collected from a well named *De la Pege*, near Clermont Ferrand in France. Petroleum.

The people of mount Ciaro, in Italy, have ſome years ſince found out a much eaſier way of finding petroleum than that which they formerly had been uſed to. This mountain abounds with a ſort of greyiſh ſalt, which lies in large horizontal beds, mingled with ſtrata of clay, and large quantities of a ſpar of that kind called

---

a cellular appearance, and gloſſy, with a number of minute and ſhining particles interſperſed through its ſubſtance; it is very friable, and, when liquid, is of a jet black colour. Some parts of the ſurface are covered with a thin and britile ſcoria, a little elevated.

"As to its depth, I can form no idea of it; for in no part could I find a ſubſtratum of any other ſubſtance: in ſome parts I found calcined earth mixed with it.

"Although I ſmelt ſulphur very ſtrong on paſſing over many parts of it, I could diſcover no appearance of it, or any rent or crack through which the ſteams might iſſue; probably it was from ſome parts of the adjacent woods: for although ſulphur is the baſis of this bituminous matter, yet the ſmells are very different, and eaſily diſtinguiſhed, for its ſmell comes the neareſt to that of pitch of any thing I know. I could make no impreſſion on its ſurface without an axe: at the depth of a foot I found it a little ſofter, with an oily appearance, in ſmall cells. A little of it held to a burning candle makes a hiſſing or crackling noiſe like nitre, emitting ſmall ſparks with a vivid flame, which extinguiſh the moment the candle is removed. A piece put in the fire will boil up a long time without ſuffering much diminution: after a long time's ſevere heat, the ſurface will burn and form a thin ſcoria, under which the reſt remains liquid. Heat ſeems not to render it fluid, or occupy a larger ſpace than when cold; from which, I imagine, there is but little alteration on it during the dry months, as the ſolar rays cannot exert their force above an inch below the ſurface. I was told by one Frenchman, that in the dry ſeaſon the whole was an uniform ſmooth maſs; and by another, that the ravine contained water fit for uſe during the year. But neither can I believe: for if, according to the firſt aſſertion, it was an homogeneous maſs, ſomething more than an external cauſe muſt affect it to give it the preſent appearances; nor without ſome hidden cauſe can the ſecond be granted. Although the bottoms of theſe ramified channels admit not of abſorption, yet from their open expoſure, and the black ſurface of the circumjacent parts, evaporation muſt go on amazingly quick, and a ſhort time of dry weather muſt ſoon empty them; nor from the ſituation and ſtructure of the place is there a poſſibility of ſupply but from the clouds. To ſhow that the progreſs of evaporation is inconceivably quick here, at the time I viſited it there were, on an average, two-thirds of the time inceſſant torrents of rains; but from the afternoon being dry, with a gentle breeze (as is generally the caſe during the rainy ſeaſon in this iſland), there evidently was an equilibrium between the rain and the evaporation; for in the courſe of three days I ſaw it twice, and perceived no alteration on the height of the water, nor any outlet for it but by evaporation.

"I take this bituminous ſubſtance to be the *bitumen aſphaltum Linnæi*. A gentle heat renders it ductile; hence, mixed with a little greaſe or common pitch, it is much uſed for the bottoms of ſhips, and for which intention it is collected by many; and I ſhould conceive it a preſervative againſt the borer, ſo deſtructive to ſhips in this part of the world.

"Beſides this place, where it is found in this ſolid ſtate, it is found liquid in many parts of the woods; and at the diſtance of 20 miles from this about two inches thick in round holes of three or four inches diameter, and often at cracks or rents. This is conſequently liquid, and ſmells ſtronger of tar than when indurated, and adheres ſtrongly to any thing it touches; greaſe is the only thing that will diveſt the hands of it.

"The ſoil in general, for ſome diſtance round La Bray, is cinders and burnt earths; and where not ſo, it is a ſtrong argillaceous ſoil; the whole exceedingly fertile, which is always the caſe where there are any ſulphurous particles in it. Every part of the country, to the diſtance of 30 miles round, has every appearance of being formed by convulſions of nature from ſubterraneous fires. In ſeveral parts of the woods are hot ſprings; ſome I tried, with a well graduated thermometer of Fahrenheit, were 20° and 22° hotter than the atmoſphere at the time of trial. From its poſition to them, this part of the iſland has certainly experienced the effects of the volcanic eruptions, which have heaped up thoſe prodigious maſſes of mountains that terminate the province of Paria on the north; and no doubt there has been, and ſtill probably is, a communication between them. One of theſe mountains oppoſite to La Bray in Trinidad, about 30 miles diſtant, has every appearance of a volcanic mountain: however, the volcanic efforts have been very weak here, as no traces of them extend above two miles from the ſea in this part of the iſland, and the greater

part,

Petromyzon.

called by the Germans *felnitez*; which is the common sort, that ferments with acids, and readily dissolves in them, and calcines in a small fire. They pierce these slates in a perpendicular direction till they find water; and the petroleum which had been dispersed among the cracks of those slates is then washed out by the water, and brought from all the neighbouring places to the hole or well which they have dug, on the surface of the water of which it swims after eight or ten days. When there is enough of it got together, they lade it from the top of the water with brass basons; and it is then easily separated from what little water is taken up with it. These wells or holes continue to furnish the oil in different quantities for a considerable time; and when they will yield no more, they pierce the slates in some other place.

It is never used among us as a medicine; but the French give it internally in hysteric complaints, and to their children for worms: some also give it from 10 to 15 drops in wine for suppressions of the menses. This, however, is rather the practice of the common people than of the faculty.

PETROMYZON, the LAMPREY, a genus of fishes belonging to the class of amphibia nantes. It has seven spiracula at the side of the neck, no gills, a fistula on the top of the head, and no breast or belly fins. There are three species, distinguished by peculiarities in their back fins.

1. The marinus, or sea lamprey, is sometimes found so large as to weigh four or five pounds. It greatly resembles the eel in shape; but its body is larger, and its snout longer, narrower, and sharper, at the termination. The opening of the throat is very wide; each jaw is furnished with a single row of very small teeth; in the middle of the palate are situated one or two other teeth, which are longer, stronger, and moveable towards the inside of the throat; the inferior part of the palate presents moreover a row of very small teeth, which reaches to the bottom of the throat, where we find four long notched bones; two short fistulous processes are observable at the extremity of the snout, and there are two others thicker but still shorter above the eyes. Willoughby supposes that the latter are the organ of hearing, and the former the organ of smell. His opinion with regard to the auditory faculty of this fish is founded on what we read in ancient authors, that the fishermen attracted the lampreys by whistling, and that Crassus had tamed one of them to such a degree that it knew his voice and obeyed his call.

Petromyzon.

The eyes of the lamprey are small, and covered with a transparent light blue membrane; the pupil is bordered with a circle of a colour resembling gold; near the gills, which are four in number, there is a round hole on both sides, through which it discharges the water. The lamprey has no fins on his belly or breast; on the back we observe a fin, which begins pretty near the head, extends to the tail which it turns round, and is afterwards continued to the anus: this fin is covered by the skin of the body, to which it adheres but loosely; the skin is smooth, of a red blackish colour, and streaked with yellow; the lamprey always lives in the water with winding motions like those of a serpent, which is common to it, with all the anguilliform fishes.

The lamprey lives on flesh. During the cold it lies concealed in the crevices of sea rocks, and consequently is fished for only at certain seasons. It lives in a state of hostility with the poulpe, a kind of sea polypus, which shuns the combat as long as it can; but when it finds the impossibility of escape, it endeavours to surround the lamprey with its long arms. The latter slips away, and the poulpe becomes its prey. The lobster, we are told, avenges the poulpe, and destroys the lamprey in its turn. See CANCER.

Rondelet says, that the fishermen consider the bite of the lamprey as venomous and dangerous, and never touch it while alive but with pincers. They beat it on the jaws with a stick, and cut off its head. The same naturalist observes, that its ashes are a cure for its bite and for the king's evil. When any one has been

---

part of it has had its origin from a very different cause to that of volcanoes; but they have certainly laid the foundation of it, as is evident from the high ridge of mountains which surrounds its windward side to protect it from the depredations of the ocean, and is its only barrier against that overpowering element, and may properly be called the skeleton of the island.

"From every examination I have made, I find the whole island formed of an argillaceous earth, either in its primitive state or under its different metamorphoses. The bases of the mountains are composed of *schistus argillaceus* and *calcum lithomargo*; but the plains or lowlands remaining nearly in the same moist state as at its formation, the component particles have not experienced the vicissitudes of nature so much as the more elevated parts, consequently retain more of their primitive forms and properties. As argillaceous earth is formed from the sediment of the ocean, from the situation of Trinidad to the continent its formation is easily accounted for, granting first the formation of the ridge of mountains that bound its windward side, and the high mountains on the continent that nearly join it: for the great influx of currents into the gulf of Paria from the coasts of Brazil and Andalusia must bring a vast quantity of light earthy particles from the mouth of the numerous large rivers which traverse these parts of the continent: but the currents being repelled by these ridges of mountains, eddies and smooth water will be produced where they meet and oppose; and therefore the earthy particles would subside, and form banks of mud, and by fresh accumulations added, would soon form dry land: and from these causes it is evident such a tract of country as Trinidad must be formed. But these causes still exist, and the effect from them is evident; for the island is daily growing on the leeward side, as may be seen from the mud-beds that extend a great way into the gulf, and there constantly increase. But from the great influx from the ocean at the southern end of the island, and its egress to the Atlantic again, through the Bocas, a channel must ever exist between the continent and Trinidad." See TRINIDAD.

my- been bit by a lamprey, the moſt effectual method is to cut out the part affected. Lampreys are very dexterous in ſaving themſelves: when taken with a hook, they cut the line with their teeth; and when they perceive themſelves caught in a net, they attempt to paſs through the meſhes. They fiſh for lampreys only on the pebbly edges of ſea-rocks; ſome of theſe pebbles are drawn together to make a pit as far as the water edge, or perhaps a little blood is thrown in, and the lamprey is immediately obſerved to put forth its head between two rocks. As ſoon as the hook, which is baited with crab or ſome other fiſh, is preſented to it, it ſwallows it greedily, and drags it into its hole. There is then occaſion for great dexterity to pull it out ſuddenly; for if it is allowed time to attach itſelf by the tail, the jaw would be torn away before the fiſh could be taken. This ſhows that its ſtrength reſides in the end of its tail; the reaſon of which is, that the great bone of this fiſh is reverſed, ſo that the bones, which in all other fiſhes are bent towards the tail, are here turned in a contrary direction, and aſcend towards the head. After the lamprey is taken out of the water, it is not killed without a great deal of trouble: the beſt way is to cut the end of its tail, or perhaps to cruſh it with repeated blows on the ſpine, in order to prevent it from leaping. This ſhows that in the lamprey animal life extends to the end of the ſpinal marrow.

M. de Querhoent removes our fears concerning the ſuppoſed poiſon of the lamprey. This ſpecies of fiſh, he tells us, abounds on the coaſts of Africa and at the Antilles iſles; it is found likewiſe on the coaſt of Brazil, at Surinam, and in the Eaſt Indies. When taken with a hook, we muſt have the precaution to kill it before we take it off, otherwiſe it darts upon the fiſher and wounds him ſeverely. Its wounds, however, are not venomous, M. de Querhoent having ſeen ſeveral ſailors who were bit by it, but experienced no diſagreeable conſequences. Lampreys are likewiſe found in great abundance at Aſcenſion Iſland, but particularly in the ſeas of Italy: their fleſh when dried is excellent; and boiling gives to the vertebræ the colour of gridelin.

The fleſh of the lamprey is white, fat, ſoft, and tender; it is pretty agreeable to the taſte, and almoſt as nouriſhing as that of the eel; thoſe of a large ſize are greatly ſuperior to the ſmall ones. We know that the moſt wealthy of the Romans kept them in fiſh ponds at a great expence. Vedius Pollio, the friend of Auguſtus, who is diſtinguiſhed in hiſtory for his ſavage gluttony, on ſuppoſition that lampreys fed on human fleſh were more delicate, ordered his ſlaves when accuſed of the ſlighteſt faults to be thrown into his fiſh-ponds. We are no leſs ſurpriſed, in reading the ancient authors, to perceive the extraordinary attachment which the celebrated orators Hortenſius and Craſſus, men in other reſpects ſo grave and ſenſible, had to this animal. One of them ſhed tears at the loſs of a lamprey; the other improved upon this puerility, and wore mourning at the death of his favourite. It is remarkable, that this fiſh, which is proper to the ſea, and never comes into the rivers, can live and fatten in freſh water. For the advancement of natural hiſtory, it were to be wiſhed, that ſome perſon who lives near the ſea ſhore would make obſervations, in order to diſcover whether the lamprey is viviparous: its ſcales are ſo imperceptible, that they have been overlooked by moſt ichthyologiſts. Petromyzon ‖ Petronius.

Mr Pennant is of opinion, that the ancients were unacquainted with this fiſh; at leaſt, he ſays, it is certain, that which Dr Arbuthnot and other learned men render the word *lamprey*, is a ſpecies unknown in our ſeas, being the *muræna* of Ovid, Pliny, and others, for which we want an Engliſh name. This fiſh, the *lupus* (our baſſe), and the *myxo* (a ſpecies of mullet), formed that pride of Roman banquets the *tripatinam*, ſo called, according to Arbuthnot, from their being ſerved up in a machine with three bottoms. The words *lampetra* and *petromyzon* are but of modern date, invented from the nature of the fiſh; the firſt *a lambendo petras*, the other from πετρος and μυζαω, becauſe they are ſuppoſed to lick or ſuck the rocks.

2 The fluviatilis, or leſſer lamprey, ſometimes grows to the length of 10 inches. The mouth is formed like that of the preceding. On the upper part is a large bifurcated tooth: on each ſide are three rows of very minute ones: on the lower part are ſeven teeth, the exterior of which on one ſide is the largeſt. The irides are yellow. As in all the other ſpecies, between the eyes on the top of the head is a ſmall orifice, of great uſe to clear its mouth of the water that remains on adhering to the ſtones; for through that orifice it ejects the water in the ſame manner as cetaceous fiſh. On the lower part of the back is a narrow fin, beneath that riſes another, which at the beginning is high and angular, then grows narrow, ſurrounds the tail, and ends near the anus. The colour of the back is brown or duſky, and ſometimes mixed with blue; the whole underſide ſilvery. Theſe are found in the Thames, Severn, and Dee; are potted with the larger kind; and are by ſome preferred to it, as being milder taſted. Vaſt quantities are taken about Mortlake, and ſold to the Dutch for bait for their cod-fiſhery. Above 430,000 have been ſold in a ſeaſon at 40s. per 1000; and of late, about 100,000 have been ſent to Harwich for the ſame purpoſe. It is ſaid that the Dutch have the ſecret of preſerving them till the turbot fiſhery.

3. The bronchialis, or lampern, is ſometimes found of the length of eight inches, and about the thickneſs of a ſwan's quill; but they are generally much ſmaller. The body is marked with numbers of tranſverſe lines, that paſs croſs the ſides from the back to the bottom of the belly, which is divided from the mouth to the anus by a ſtraight line. The back fin is not angular like that of the former, but of an equal breadth. The tail is lanceolated, and ſhort at the end. They are frequent in the rivers near Oxford, particularly the Iſis; but not peculiar to that county, being found in others of the Engliſh rivers, where, inſtead of concealing themſelves under the ſtones, they lodge themſelves in the mud, and never are obſerved to adhere to any thing like other lampreys.

PETRONIUS was a renowned Roman ſenator. When governor of Egypt, he permitted Herod, king of the Jews, to purchaſe in Alexandria any quantity of corn which he ſhould judge neceſſary for the ſupply of his ſubjects, who were afflicted with a ſevere famine. When Tiberius died, Caius Caligula, who ſucceeded him, took from Vitellius the government of Syria, and gave

Petronius. it to Petronius, who discharged the duties of his office with dignity and honour. From his inclination to favour the Jews, he run the risk of losing the emperor's friendship and his own life; for when that prince gave orders to have his statue deposited in the temple of Jerusalem, Petronius, finding that the Jews would rather suffer death than see that sacred place profaned, was unwilling to have recourse to violent measures; and therefore preferred a moderation, dictated by humanity, to a cruel obedience. (We must not confound him with another of the same name, *viz.* Petronius Granius, who was a centurion in the eighth legion, and served under Cæsar in the Gallic war). In his voyage to Africa, of which country he had been appointed quæstor, the ship in which he sailed was taken by Scipio, who caused all the soldiers to be put to the sword, and promised to save the quæstor's life, provided that he would renounce Cæsar's party. To this proposal Petronius replied, that "Cæsar's officers were accustomed to grant life to others, and not to receive it;" and, at the same time, he stabbed himself with his own sword.

Petronius Arbiter (Titus), a great critic and polite writer of antiquity, the favourite of Nero, supposed to be the same mentioned by Tacitus in the 16th book of his Annals. He was proconsul of Bithynia, and afterwards consul, and appeared capable of the greatest employments. He was one of Nero's principal confidents, and in a manner the superintendant of his pleasures; for that prince thought nothing agreeable or delightful but what was approved by Petronius. The great favour shown him drew upon him the envy of Tigellinus, another of Nero's favourites, who accused him of being concerned in a conspiracy against the emperor; on which Petronius was seized, and was sentenced to die. He met death with a striking indifference, and seems to have tasted it nearly as he had done his pleasures. He would sometimes open a vein and sometimes close it, conversing with his friends in the meanwhile, not on the immortality of the soul, which was no part of his creed, but on topics which pleased his fancy, as of love verses, agreeable and passionate airs; so that it has been said "his dying was barely ceasing to live." Of this disciple of Epicurus, Tacitus gives the following character: "He was (says he) neither a spendthrift nor a debauchee, like the generality of those who ruin themselves; but a refined voluptuary, who devoted the day to sleep, and the night to the duties of his office, and to pleasure." This courtier is much distinguished by a satire which he wrote, and secretly conveyed to Nero; in which he ingeniously describes, under borrowed names, the character of this prince. Voltaire is of opinion that we have no more of this performance but an extract made by some obscure libertine, without either taste or judgment. Peter Petit discovered at Traw in Dalmatia, in 1665, a considerable fragment, containing the sequel of Trimalcion's Feast. This fragment, which was printed the year after at Padua and at Paris, produced a paper war among the learned. While some affirmed that it was the work of Petronius, and others denied it to be so, Petit continued to assert his right to the discovery of the manuscript, and sent it to Rome, where it was acknowledged to be a production of the 15th century. The French critics, who had attacked its authenticity, were silent from the moment it was deposited in the royal library. It is now generally attributed to Petronius, and found in every subsequent edition of the works of that refined voluptuary. The public did not form the same favourable opinion of some other fragments, which were extracted from a manuscript found at Belgrade in 1688, and printed at Paris by Nodot in 1694, tho' they are ascribed by the editor Charpentier, and several other learned men, to Petronius; yet, on account of the Gallicisms and other barbarous expressions with which they abound, they have generally been considered as unworthy of that author. His genuine works are, 1. A Poem on the civil war between Cæsar and Pompey, translated into prose by Abbé de Marolles, and into French verse by President Bouhier, 1737, in 4to. Petronius, full of fire and enthusiasm, and disgusted with Lucan's flowery language, opposed Pharsalia to Pharsalia; but his work, though evidently superior to the other in some respects, is by no means in the true style of epic poetry. 2. A Poem on the Education of the Roman Youth. 3. Two Treatises; one upon the Corruption of Eloquence, and the other on the Causes of the Decay of Arts and Sciences. 4. A Poem on the Vanity of Dreams. 5. The Shipwreck of Lucas. 6. Reflections on the Inconstancy of Human Life. And, 7. Trimalcion's Banquet. To this last performance morality is not much indebted. It is a description of the pleasures of a corrupted court; and the painter is rather an ingenious courtier than a person whose aim is to reform abuses. The best editions of Petronius are those published at Venice, 1499, in 4to; at Amsterdam, 1669, in 8vo, *cum notis variorum*; Ibid. with Beschius's notes, 1677, in 24to; and 1700, 2 vols in 24to. The edition of *variorum* was reprinted in 1743, in 2 vols 4to, with the learned Peter Burman's commentaries. Petronius died in the year 65 or 66.

Petronius (Maximus) was born in the year 395 of an illustrious family, being at first a senator and consul of Rome. He put on the imperial purple in 455, after having effected the assassination of Valentinian III. In order to establish himself upon the throne, he married Eudoxia the widow of that unfortunate prince; and, as she was ignorant of his villany, he confessed to her, in a transport of love, that the strong desire he had of being her husband, had made him commit this atrocious crime. Whereupon Eudoxia privately applied to Genserie, king of the Vandals, who coming into Italy with a very powerful army, entered Rome, where the usurper then was. The unhappy wretch endeavoured to make his escape; but the soldiers and people, enraged at his cowardice, fell upon him, and overwhelmed him with a shower of stones. His body was dragged through the streets of the city for three days; and, after treating it with every mark of disgrace, they threw it into the Tiber the 12th of June the same year, 455. He reigned only 77 days. He had some good qualities. He loved and cultivated the sciences. He was prudent in his councils, circumspect in his actions, equitable in his judgments; a facetious companion, and steady friend. He had the good fortune to win the affections of every body, while he remained a private character; but as a prince, he was so much the more detestable, in that, after he had obtained the throne by villany, he kept possession of it only by violence.

PETROSA OSSA, in anatomy, a name given to the fourth and fifth bones of the cranium, called also *ossa temporum* and *ossa squamosa*; the substance whereof, as their first and last names express, is squamose and very hard.

PETROSELINUM (APIUM PETROSELINUM, Lin.) *Parsley*. This plant is commonly cultivated for culinary purposes. The seeds have an aromatic flavour, and are occasionally used as carminatives, &c. The root of parsley is one of the five aperient roots, and with this intention is sometimes made an ingredient in apozems and diet-drinks: if liberally used, it is apt to occasion flatulencies; and thus, by distending the viscera, produces a contrary effect to that intended by it: the taste of this root is somewhat sweetish, with a light degree of warmth and aromatic flavour.

PETTEIA, in the ancient music, a term to which we have no one corresponding in our language.

The melopœia, or the art of arranging sounds in succession so as to make melody, is divided into three parts, which the Greeks call *lepsis*, *mixis*, and *chresis*; the Latins *sumptio*, *mixtio*, and *usus*; and the Italians *presa*, *mescolamento*, and *uso*. The last of these is called by the Greeks πεττεία, and by the Italians *pettia*; which therefore means the art of making a just discernment of all the manners of ranging or combining sounds among themselves, so as they may produce their effect, *i. e.* may express the several passions intended to be raised. Thus it shows what sounds are to be used, and what not; how often they are severally to be repeated; with which to begin, and with which to end; whether with a grave sound to rise, or an acute one to fall, &c. The petteia constitutes the manners of the music; chooses out this or that passion, this or that motion of the soul, to be awakened; and determines whether it be proper to excite it on this or that occasion. The petteia, therefore, is in music much what the manners are in poetry.

It is not easy to discover whence the denomination should have been taken by the Greeks, unless from πεττεία, their game of chess; the musical petteia being a sort of combination and arrangement of sounds, as chess is of pieces called πεττοὶ, *calculi*, or "chess-men."

PETTY (Sir William), son of Anthony Petty a clothier, was born at Rumsey, a little haven-town in Hampshire, in 1623; and while a boy took great delight in spending his time among the artificers there, whose trades he could work at when but twelve years of age. Then he went to the grammar-school there: at 15 he was master of the Latin, Greek, and French tongues, and of arithmetic and those parts of practical geometry and astronomy useful to navigation. Soon after he went to Caen in Normandy, and Paris, where he studied anatomy, and read Vesalius with Mr Hobbes. Upon his return to England, he was preferred in the king's navy. In 1643, when the war between the king and parliament grew hot, he went into the Netherlands and France for three years; and having vigorously prosecuted his studies, especially in physic, at Utrecht, Leyden, Amsterdam, and Paris, he returned home to Rumsey. In 1647, he obtained a patent to teach the art of double writing for seventeen years. In 1648, he published at London "Advice to Mr Samuel Hartlib, for the advancement of some particular parts of learning." At this time he adhered to the prevailing party of the kingdom; and went to Oxford, where he taught anatomy and chemistry, and was created a doctor of physic. In 1650, he was made professor of anatomy there; and soon after a member of the college of physicians in London. The same year he became physician to the army in Ireland; where he continued till 1659, and acquired a great fortune. After the restoration, he was introduced to king Charles II. who knighted him in 1661. In 1662, he published "A Treatise of taxes and contributions." Next year he was greatly applauded in Ireland for his invention of a double-bottomed ship. He died at London of a gangrene in the foot, occasioned by the swelling of the gout, in 1687.

The character of his genius is sufficiently seen in his writings, which were much more numerous than those we have mentioned above. Amongst these, it is said, he wrote the history of his own life, which unquestionably contained a full account of his political and religious principles, as may be conjectured from what he has left us upon those subjects in his will. In that he has these remarkable words: "As for legacies to the poor, I am at a stand; and for beggars by trade and election, I give them nothing: as for impotents by the hand of God, the public ought to maintain them: as for those who can get no work, the magistrates should cause them to be employed; which may be well done in Ireland, where are fifteen acres of improveable land for every head: as for prisoners for crimes by the king, or for debt by their prosecutors, those who compassionate the sufferings of any object, let them relieve themselves by relieving such sufferers; that is, give them alms (A), &c. I am contented, that I have assisted all my poor relations, and put many into a way of getting their own bread, and have laboured in public works and inventions, and have sought out real objects of charity; and do hereby conjure all who partake of my estate, from time to time to do the same at their peril. Nevertheless, to answer custom, and to take the sure side, I give twenty pounds to the most wanting of the parish wherein I die." As for his religion, he says, "I die in the profession of that faith, and in the practice of such worship, as I find established by the laws of my country; not being able to believe what I myself please, nor to worship God better than by doing as I would be done unto, and observing the laws of my country, and expressing my love and honour to Almighty God, by such signs and tokens as are understood to be such by the people with whom I live." He died possessed of a very large fortune, as appears by his will; where he makes his real estate about

(A) In the town of Rumsey there is a house which was given by him for the maintenance of a charity-school: the rent of which is still applied to that use.

Petty ll Peucedanum

about 6500 l. *per annum*, his perſonal eſtate about 45,000 l. his bad and deſperate debts 30,000 l. and the demonſtrable improvements of his Iriſh eſtate, 4000 l. *per annum*; in all, at ſix *per cent.* intereſt, 15,000 l. *per annum*. This eſtate came to his family, who were afterwards ennobled

The variety of purſuits in which Sir William Petty was engaged, ſhows him to have had a genius capable of any thing to which he choſe to apply it; and it is very extraordinary, that a man of ſo active and buſy a ſpirit could find time to write ſo many things as it appears he did.

PETTY, any thing little or diminutive, when compared with another.

Petty Bag, an office in chancery; the three clerks of which record the return of all inquiſitions out of every county, and make all patents of comptrollers, gaugers, cuſtomers, &c.

Petty-Chaps, in ornithology. See MOTACILLA.

Petty-Fogger, a little tricking ſolicitor or attorney, without either ſkill or conſcience.

PETTY, or *Petit, Larceny*. See LARCENY.

Petty-Patees, among confectioners, a ſort of ſmall pies, made of a rich cruſt filled with ſweet meats.

Petty-Singles, among falconers, are the tues of a hawk.

Petty-Tally, in the ſea language, a competent allowance of victuals, according to the number of the ſhip's company.

PETTY, or *Petit, Treaſon*. See TREASON.

PETUNSE, in natural hiſtory, one of the two ſubſtances whereof porcelain or china-ware is made. The petunſe is a coarſe kind of flint or pebble, the ſurface of which is not ſo ſmooth when broken as that of our common flint See PORCELAIN.

PETWORTH, in Suſſex in England, five miles from Midhurſt and the Suſſex Downs, and 49 from London, is a large, populous, and handſome town. It is adorned with ſeveral ſeats of gentlemen, particularly the magnificent ſeat of the Percies, earls of Northumberland, many of whom lie buried in a ſeparate vault of its church. The rectory, the richeſt in the county, is ſaid to be worth 600 l. or 700 l. a year, and is in the Duke of Somerſet's gift: in whoſe armory in this place, there is a ſword which, by circumſtances, appears to have been the weapon of the famous Henry Hotſpur, though it is not ſo unwieldy as other ancient ſwords generally are.

PEUCEDANUM, or SULPHUR WORT: A genus of the digynia order, belonging to the pentandria claſs of plants; and in the natural method ranking under the 45th order *Umbellatæ*. The fruit is lobated, ſtriated on both ſides, and ſurrounded by a membrane; the involucra are very ſhort. There are three ſpecies; none of which have any remarkable properties excepting the officinale, or common hog's fennel, growing naturally in the Engliſh ſalt marſhes. This riſes to the height of two feet, with channelled ſtalks, which divide into two or three branches, each crowned with an umbel of yellow flowers, compoſed of ſeveral ſmall circular umbels. The roots, when bruiſed, have a ſtrong fetid ſcent like ſulphur, and an acrid, bitteriſh, unctuous taſte. Wounded in the ſpring, they yield a conſiderable quantity of yellow juice, which dries into a gummy reſin, and retains the ſtrong ſmell of the root. This ſhould ſeem to be poſſeſſed of ſome medicinal virtues, but they have never been aſcertained with any preciſion. The expreſſed juice was uſed by the ancients in lethargic diſorders. Peut Pey

PEUTEMAN (Peter) was born at Rotterdam in 1650, and was a good painter of inanimate objects; but the moſt memorable particular relative to this artiſt was that incident which occaſioned his death.

He was requeſted to paint an emblematical picture *Diſt. Paint.* of mortality, repreſenting human ſkulls and bones, ſurrounded with rich gems and muſical inſtruments, to expreſs the vanity of this world's pleaſures, amuſements, or poſſeſſions: and that he might imitate nature with the greater exactneſs, he went into an anatomy room, where ſeveral ſkeletons hung by wires from the ceiling, and bones, ſkulls, &c. lay ſcattered about; and immediately prepared to make his deſigns.

While he was thus employed, either by fatigue, or by intenſe ſtudy, inſenſibly he fell aſleep; but was ſuddenly rouſed by a ſhock of an earthquake, which happened at that inſtant, on the 18th of September 1692. The moment he awoke, he obſerved the ſkeletons move about as they were ſhaken in different directions, and the looſe ſkulls roll from one ſide of the room to the other; and being totally ignorant of the cauſe, he was ſtruck with ſuch a horror, that he threw himſelf down ſtairs, and tumbled into the ſtreet half dead. His friends took all poſſible pains to efface the impreſſion made on his mind by that unlucky event, and acquainted him with the real cauſe of the agitation of the ſkeletons; yet the tranſaction ſtill affected his ſpirits in ſo violent a manner, that it brought on a diſorder, which in a very ſhort time ended his days. His general ſubjects were either allegorical or emblematical alluſions to the ſhortneſs and miſery of human life.

PEWIT, SEA CROW, or *Mire-crow*, in ornithology. See LARUS.

PEWTER, a factitious metal uſed in making domeſtic utenſils, as plates, diſhes, &c.—The baſis of the metal is tin: which is converted into pewter by mixing at the rate of an hundred weight of tin with 15 pounds of lead and ſix pounds of braſs.—Beſides this compoſition, which makes the common pewter, there are other kinds, compounded of tin, regulus of antimony, biſmuth, and copper, in ſeveral proportions.

PEYRERE (Iſaac la) was born at Bourdeaux, of proteſtant parents. He entered into the ſervice of the Prince of Conde, who was much pleaſed with the ſingularity of his genius. From the peruſal of St Paul's writings he took into his head to aver, that Adam was not the firſt of the human race; and, in order to prove this extravagant opinion, he publiſhed in 1655 a book, which was printed in Holland in 4to and in 12mo, with this title, *Præadamitæ, ſive exercitatio ſuper verſibus* 12, 13, 14. *cap.* 15. *Epiſtolæ Pauli ad Romanos*. This work was burnt at Paris, and the author impriſoned at Bruſſels, through the influence of the archbiſhop of Maline's grand vicar. The Prince of Conde having obtained his liberty, he travelled to Rome in 1656, and there gave in to Pope Alexander VII. a ſolemn renunciation both of Calviniſm and Preadamiſm. His converſion was not thought to be ſincere, at leaſt with regard to this laſt hereſy. His deſire to be the head of a new ſect is evident; and his book diſcovers his

ere. ambition; for he there pays many compliments to the Jews, and invites them to attend his lectures. Upon his return to Paris, notwithstanding the earnest solicitations of his holiness to remain at Rome, he went again into the Prince of Conde's service in the quality of librarian. Some time after he retired to the seminary *des Vertus*, where he died the 30th of January 1676, at the age of 82, after the sacraments of the church had been administered to him. Father Simon says, that when he was importuned in his last moments to retract the opinion which he had formed respecting the Preadamites, his answer was, *Hi quæcunque ignorant, blasphemant.* His having no fixed sentiments of religion is supposed to proceed more from a peculiar turn of mind than a corruption of the heart; for good nature, simplicity of manners, and humanity, seem to have formed his character. "He was, says Niceron, a man of a very equal temper, and most agreeable conversation. He was a little too fond, however, of indulging his wit, which sometimes bordered on raillery; but he took care never to hurt or wound the feelings of his neighbour. As to his learning, it was extremely limited. He knew nothing either of Greek or Hebrew; and yet he ventured to give a new interpretation of several passages of the sacred volume. He piqued himself on his knowledge of the Latin; but excepting a few poets which he had read, he was by no means an adept in that language. His style is very unequal; sometimes too swelling and pompous, at other times low and grovelling." Besides the work already mentioned, he has left behind him, I. A treatise as singular as it is scarce, intitled, *Du rappel des Juifs*, 1643, in 8vo. The recal of the Israelites, in the opinion of this writer, will be not only of a spiritual nature, but they will be reinstated in the temporal blessings which they enjoyed before their rejection. They will again take possession of the holy land, which will resume its former fertility. God will then raise up to them a king more just, and more victorious, than any of their former sovereigns had been. Now, though all this is doubtless to be understood spiritually of Jesus Christ, yet our author is of opinion, that it ought also to be understood of a temporal prince, who shall arise for the purpose of effecting the temporal deliverance of the Jews; and that this prince shall be no other than the king of France, for the following reasons, which, it is believed, will carry conviction to few minds: 1. Because the two titles of *Most Christian*, and of *Eldest Son of the Church*, are ascribed to him by way of excellence. 2. Because it is presumable, if the kings of France possess the virtue of curing the evil or scrofula, which can only afflict the bodies of the Jews; that they will likewise have the power of curing their obstinate incredulity and the other inveterate diseases of their souls. 3. Because the kings of France have for their arms a *fleur de luce*; and because the beauty of the church is in scripture compared to the beauty of lilies. 4. Because it is probable that France will be the country whither the Jews shall first be invited to come and embrace the Christian faith, and whither they shall retreat from the persecution of the nations that have dominion over them; for France is a land of freedom, it admits of no slavery, and whoever touches it is free. Peyrere, after explaining his strange system, proposes a method of converting the Jews to Christianity; a method, says Niceron, which will not be acceptable to many. He proposes to reduce the whole of religion to a bare faith or belief in Jesus Christ; taking it for granted, without any shadow of proof, that "it is as difficult to comprehend the articles of our faith, as to observe the ceremonies of Moses.—From this scheme (says he) there would result a double advantage to the church; the reunion of the Jews, and of all those Christians who are separated from the body of the church." Peyrere, when he wrote this book, was a Calvinist; but his Calvinism too nearly resembled the Deism of our age. He confessed himself that his reason for quitting the Protestants was on account of their being the first and principal opposers of his book concerning the Preadamites. II. A curious and entertaining account of Greenland, printed in 8vo, 1647. When he was asked, on occasion of this work, why there were so many witches in the north? he replied, "It is because part of the property of these pretended conjurers, when condemned to suffer death, is declared to belong to their judges." III. An equally interesting account of Iceland, 1663, 8vo. IV. A letter to Philotimus, 1658, in 8vo, in which he explains the reasons of his recantation, &c. We find in Moreri the following epitaph of him, written by a poet of his own times.

Peyrere, Peyronius.

La Peyrere ici git, ce bon Israelite,
Huguenot, Catholique, enfin Preadamite:
Quatre religions lui plurent à la fois,
Et son indifference étoit si peu commune,
Qu'après quatre-vingts ans qu'il eut à faire un choix,
Le bon homme partit, & n'en choisit pas une.

PEYRONIUS (Francis de la) for a long time practised surgery at Paris with such distinguished eclat, that he obtained for himself the appointment of first surgeon to Louis XV. He improved this favourable situation with his majesty, and procured to his profession those honours which had the effect to quicken its progress, and those establishments which contributed to extend its benefits. The Royal College of Surgery at Paris was founded by his means in 1731, was enlightened by his knowledge, and encouraged by his munificence. At his death, which happened at Versailles the 24th of April 1747, he bequeathed to the society of surgeons in Paris two thirds of his effects, his estate of Marigni, which was sold to the king for 200,000 livres, and his library. This useful citizen also left to the society of surgeons at Montpellier two houses, situated in that town, with 100,000 livres, for the purpose of erecting there a chirurgical amphitheatre. He appointed the same society universal legatee for the third of his effects; and all these legacies contain clauses whose sole object is to promote the public good, the perfection and improvement of surgery; for which he always solicited the protection of the court. At the time of the famous dispute between the physicians and surgeons, he entreated the Chancellor d'Agueſſan to build up a brazen wall between the two bodies. "I will do so, replied the minister, but on what side of the wall shall we place the sick:" Peyronius afterwards behaved with more moderation.—He was a philosopher without any ostentation; but his philosophy was tempered by a long acquaintance with the world and with the court. The acuteness and delicacy of

Pezay || Pezron.

his underſtanding, joined to his natural vivacity, rendered his converſation agreeable; and all theſe advantages were crowned with a quality ſtill more valuable, an uncommon degree of ſympathy for thoſe in diſtreſs. He was no ſooner known to be at his eſtate in the country, than his houſe was filled with ſick people, who came to him from the diſtance of 7 or 8 leagues round about. He had once a plan of eſtabliſhing, on this ſpot, an hoſpital, to which he intended to retire, that he might devote the remainder of his life to the ſervice of the poor.

PEZAY (N Maſſon, marquis of), born at Paris, very early applied himſelf to the ſtudy of letters, and afterwards went into the army. He was made a captain of dragoons; and had the honour of giving ſome leſſons on tactics to the ill-fated Louis XVI. Being appointed inſpector general of ſome coaſting veſſels, he repaired to the maritime towns, and executed his commiſſion with more care and attention than was to have been expected from a votary of the muſes. But as, at the ſame time, he ſhowed too much haughtineſs, a complaint was brought againſt him to the court, and he was baniſhed to his country ſeat, where he died ſoon after, in the beginning of 1778. He was the intimate friend and companion of Dorat. He had ſtudied, and ſucceſsfully imitated, his manner of writing; but his poems have more delicacy, and are leſs diſfigured with trifling converſations of gallantry. He has left behind him, 1. A tranſlation of Catullus, which is not much eſteemed. 2. Les Soirées Helvetiennes, Alſaciennes, & Franc-Comtoiſes, in 8vo, 1770; a work very agreeably diverſified, full of charming landſcapes, but written with too little accuracy. 3. Les Soirées Provençales, in manuſcript, which are ſaid to be nowiſe inferior in merit to the foregoing ones. 4. La Roſiere de Salency; a paſtoral in three acts, and which has been performed with ſucceſs on the Italian theatres. 5. Les campagnes de Mailebois, in 3 vols 4to, and a volume of maps.

PEZENAS, a place in France about 24 miles from Montpellier. The ſoil about it is ſandy. The rock is limeſtone. The fields are open, and produce corn, wine, and oil. There are to be ſeen at this place the extenſive ruins of a caſtle, which formerly belonged to the Montmorency family. This ſtrong fortreſs was hewn out of the rock on which it ſtands, and appears to have been complicated and full of art. The walls are lofty, and above 8 feet in thickneſs. The rock, which is perpendicular, is a maſs of ſhells, ſuch as turbinæ, oyſters, cockles, with a calcareous cement. From hence the circumjacent plain, decked with luxuriant verdure, and ſhut in by rugged mountains, affords a moſt delightful proſpect. E. Long. 3. 35. N. Lat. 43. 18.

PEZIZA, cup-muſhroom, in botany; a genus of the natural order of fungi, belonging to the cryptogamia claſs of plants. The fungus campanulated and ſeſſile. Linnæus enumerates 8 ſpecies.

PEZRON (Paul), a very learned and ingenious Frenchman, born at Hennebon in Brittany in 1639, and admitted into the order of Citeaux in 1660. He was a great antiquary, and was indefatigable in tracing the origin of the language of the Goths; the reſult of which was, that he was led to eſpouſe a ſyſtem of the world's being much more ancient than modern chronologers have ſuppoſed. This he communicated to the public in a treatiſe printed at Paris in 1687, 4to, intitled, *The antiquity of Time, reſtored and defended againſt the Jews and modern chronologers.* This book of Pezron's was extremely admired for the ingenuity and learning in it; yet cauſed no ſmall alarm among the religious, againſt whom he nevertheleſs defended his opinions. He went through ſeveral promotions, the laſt of which was to the abbey of Charmoye, to which he was nominated by the king; and died in 1706.

Pha || Phæd

PHACA, in botany: A genus of the decandria order, belonging to the diadelphia claſs of plants; and in the natural method ranking under the 32d order, *Papilionaceæ*. The legumen is ſemibilocular.

PHÆA, a famous ſow which infeſted the neighbourhood of Cromyon. Theſeus deſtroyed it as he was travelling from Trœzene to Athens to make himſelf known to his father. Some imagine that the boar of Calydon ſprang from this ſow. According to ſome authors, Phæa was a woman who proſtituted herſelf to ſtrangers, whom ſhe murdered, and afterwards plundered.

PHÆACIA, one of the names of the iſland Corcyra, (Homer, Stephanus). *Phæaces* the people, (Ovid), noted for their indolence and luxury: hence Horace uſes *Phæax* for a perſon indolent and ſleek; and hence aroſe their inſolence and pride, (Ariſtotle). The iſland was famous for producing large quantities of the fineſt flavoured apples, (Ovid, Juvenal, Propertius).

PHÆDON, a diſciple of Socrates, who had been ſeized by pirates in his youth; and the philoſopher, who ſeemed to diſcover ſomething uncommon and promiſing in his countenance, bought his liberty for a ſum of money, and ever after eſteemed him. Phædon, after Socrates's death, returned to Elis his native country, where he founded a ſect of philoſophers who compoſed what was called the *Eliac ſchool*. The name of Phædon is affixed to one of Plato's dialogues.

PHÆDRA (fab. hiſt.) was a daughter of Minos and Paſiphae; ſhe married Theſeus, by whom ſhe was the mother of Acamas and Demophoon. They had already lived for ſome time in conjugal felicity, when Venus, who hated all the deſcendants of Apollo, becauſe he had diſcovered her amours with Mars, inſpired Phædra with the ſtrongeſt paſſion for Hippolytus the ſon of Theſeus, by the amazon Hippolyte. This paſſion ſhe long attempted to ſtifle, but in vain; and therefore, in the abſence of Theſeus, ſhe addreſſed Hippolytus with all the impatience of deſponding love. He rejected her with horror and diſdain. She, however, incenſed by the reception ſhe had met, reſolved to puniſh his coldneſs and refuſal; and at the return of Theſeus ſhe accuſed Hippolytus of attempts upon her virtue. He liſtened to her accuſation; and without hearing Hippolytus's defence, he baniſhed him from his kingdom, and implored Neptune, who had promiſed to grant three of his requeſts, to puniſh him in an exemplary manner. As Hippolytus fled from Athens, his horſes were ſuddenly terrified by a ſea monſter, which Neptune had ſent on the ſhore; and he was thus dragged through precipices and over rocks, trampled under the feet of his horſes, and cruſhed under the wheels of his chariot. When his tragical end was known at Athens, Phædra confeſſed her crime, and hung herſelf

drus ll eton.

self in despair, unable to survive one whose death her extreme guilt had occasioned. The death of Hippolytus, and the infamous passion of Phædra, is the subject of one of the tragedies of Euripides and of Seneca. She was buried at Trœzene, where her tomb was still to be seen in the age of the geographer Pausanias, near the temple of Venus, which she had built to render the goddess favourable to her incestuous passion. Near her tomb was a myrtle, whose leaves were full of small holes, which, it was reported, Phædra had done with a hair pin, when the vehemence of her passion had rendered her melancholy and almost desperate. She was represented in a painting in Apollo's temple at Delphi, as suspended in the air, while her sister Ariadne stood near to her, and fixed her eyes upon her.

PHÆDRUS, an ancient Latin writer, who composed five books of fables, in Iambic verse. He was a Thracian; and was born, as there is reason to conclude, some years before Julius Cæsar made himself master of the Roman empire. How he came into the service of Augustus is not known: but his being called *Augustus's freedman* in the title of the book, shows that he had been that emperor's slave. The fables of Phædrus are valued for their wit and good sense, expressed in very pure and elegant language: and it is remarkable that they remained buried in libraries altogether unknown to the public, until they were discovered and published by Peter Pithou, or Pithœus, a learned French gentleman, toward the close of the 16th century.

Phædrus (Thomas) was a professor of eloquence at Rome, early in the 16th century. He was canon of Lateran, and keeper of the library in the Vatican. He owed his rise to the acting of Seneca's Hippolitus, in which he performed the part of Phædra; from whence he ever after got the name of Phædrus. Erasmus, who tells this, says he had it from cardinal Raphael Georgianus, in whose court-yard, before the palace, that tragedy was acted. The cause of his death was very remarkable; for as he was riding through the city on a mule, he met a cart drawn by wild oxen, and was thrown by his mule, who took fright at them. Though corpulent, the cart fortunately passed over him without doing him any hurt, as he fell in the space between the wheels; but fright and the fall together spoiled the whole mass of his blood so much, that he contracted a distemper, of which, after languishing some time, he died under the age of 50. If he had lived, he would most probably have become an author; and perhaps, adds Bayle, have confirmed what has been observed of him, that his tongue was better than his pen. The observation was made by Erasmus, who tells us, that he knew and loved him; and owns that he was called the Cicero of his time. Janus Parrhasius, his colleague, was much grieved at his death, and gave the titles of several works, which were almost ready for public view.

PHÆNOMENON, in philosophy, denotes any remarkable appearance, whether in the heavens or earth, and whether discovered by observation or experiment.

PHAETON, in fabulous history, was the son of the Sun, or Phœbus and Clymene, one of the Oceanides. He was son of Cephalus and Aurora, according to Hesiod and Pausanias; or of Tithonus and Aurora, according to Apollodorus. He is, however, more generally acknowledged to be the son of Phœbus and Clymene. He was naturally of a lively disposition, and a handsome figure. Venus became enamoured of him, and entrusted him with the care of one of her temples. This distinguishing favour of the goddess rendered him vain and aspiring; and when Epaphus, the son of Io, had told him, to check his pride, that he was not the son of Phœbus, Phaeton resolved to know his true origin, and at the instigation of his mother he visited the palace of the sun. He begged Phœbus, that if he really were his father he would give him incontestable proofs of his paternal tenderness, and convince the world of his legitimacy. Phœbus received him with great tenderness, and swore by Styx to grant whatever he requested as a proof of his acknowledging him for his son. The youth boldly asked the direction of the chariot of the sun for one day. His father, grieved and surprised at this demand, used all his arguments to dissuade him from the rash attempt; but all was in vain: and being by his oath reduced to submit to his obstinacy, entrusted him with the reins, after he had directed him how to use them. The young adventurer was however soon sensible of his madness. He was unable to guide the fiery steeds; and loosing the reins, Jupiter, to prevent his consuming the heavens and earth, struck him with a thunderbolt, and hurled him from his seat into the river Eridanus or Po. His sisters Phaethusa, Lambetia, and Phœbe, lamenting his loss upon its banks, were changed by the gods into black poplar trees; and Cycnus king of Liguria, also grieving at his fate, was transformed into a swan. Phaeton.

The poets say, that while Phaeton was driving the chariot of his father, the blood of the Ethiopians was dried up; and their skin became black; a colour which is still preserved among the greatest part of the inhabitants of the torrid zone. The territories of Libya were also, they tell us, parched up, on account of their too great vicinity to the sun; and ever since, Africa, unable to recover her original verdure and fruitfulness, has exhibited a sandy country and uncultivated waste. According to those who explain this poetical fable, Phaeton was a Ligurian prince, who studied astronomy, and in whose age the neighbourhood of the Po was visited with uncommon heats.

Phaeton, in ornithology, a genus of birds belonging to the order of anseres; the characters of which are: The bill is sharp, straight, and pointed; the nostrils are oblong, and the hinder toe is turned forward. There are two species, *viz.*

1. The demersus, or red-footed pinguin, has a thick, arched, red bill; the head, hind-part of the neck, and the back, of a dusky purplish hue, and breast and belly white; brown wings, with the tips of the feathers white; instead of a tail, a few black bristles; and red legs. It is found on Pinguin isle, near the Cape of Good Hope, is common all over the South Seas, and is about the size of a goose.

2. The ethereus, or tropic bird, is about the size of a partridge, and has very long wings. The bill is red, with an angle under the lower mandible. The eyes are encompassed with black, which ends in a point toward

Phaëton. wards the back of the head. Three or four of the larger quill feathers, towards their ends, are black, tipped with white; all the reſt of the bird is white, except the back, which is variegated with curved lines of black. The legs and feet are of a vermilion red. The toes are webbed. The tail conſiſts of two long ſtraight narrow feathers, almoſt of equal breadth from their quills to their points. See Plate CCCLXXXIX.

"The name *tropic bird* (ſays Latham), given to this genus, ariſes from its being chiefly found within the tropic circles; but we are not to conclude, that they never ſtray voluntarily, or are driven beyond them; for we have met with a few inſtances to prove the contrary (A). It is, however, ſo generally found within the tropical limits, that the ſight of this bird alone is ſufficient to inform the mariner of a very near approach to if not his entrance therein. It has alſo been thought to portend the contiguity of land (B); but this has often proved fallacious, as it is not unfrequently found at very great diſtances therefrom. The flight of this bird is often to a prodigious height; but at other times it is ſeen, along with the frigate pelican, booby, and other birds, attending the flying fiſhes at their riſe from the water, driven from their native element into the air by their watery enemies, the ſhark (C), porpoiſe, albicore, bonito, and dolphin, which purſue them beneath, and prey upon them. Theſe birds are ſometimes obſerved to reſt on the ſurface of the water, and have been now and then ſeen in calm weather upon the backs of the drowſy tortoiſes, ſupinely floating in the ſea, ſo that they have been eaſily taken by the long boat manned. On ſhore they will perch on trees; and are ſaid to breed in the woods, on the ground beneath them. They have been met with in plenty on the iſlands of St Helena, Aſcenſion, Mauritius, New Holland, and various places in the South Seas; but in no place ſo numerous as at Palmerſton Iſland, where theſe birds, as well as the frigates, were in ſuch plenty, that the trees were abſolutely loaded with them, and ſo tame, that they ſuffered themſelves to be taken off the boughs with the hand. At Otaheite, and in the Friendly iſles, the natives give them the names of *haingoo* and *toolaice*.

"As the tropic bird ſheds the long tail feathers every year, the inhabitants of ſuch iſles as they frequent, collect and make uſe of them by way of ornament in various manners; they are worn in the caps of the Sandwich iſlanders, being in great plenty at Tahoora, as alſo in various parts of their dreſs; but in none more conſpicuous than in the mourning garment of Otaheite, in which iſland numbers are picked up in the mountainous parts, where it alſo breeds. The fleſh cannot be called good, but was found ſufficiently acceptable to thoſe who had long been confined to ſalt proviſions, and in which circumſtance the ſailors did not deſpiſe it." Phaëton.

There is a variety of this bird called by Latham the *white tropic bird*. It is leſs than the one we have already deſcribed, and is found in as many places as it. The plumage of this bird is in general of a ſilvery white. The yellow tropic bird is a further variety of the ſame ſpecies, the plumage being of a yellowiſh white. Theſe differences, Mr Latham thinks, ariſe merely from age, if they are not the diſtinguiſhing mark of ſex.

3. The black-billed tropic bird is ſmaller than any of the former. The bill is black; the plumage on the upper part of the body and wings is ſtriated, partly black and partly white; before the eye there is a large creſcent of black, behind it is a ſtreak of the ſame; the forehead and all the under parts of the body are of a pure white colour; the quills and tail are marked as the upper parts, but the ends of the firſt are white, and moſt of the feathers of the laſt are marked with duſky black at the tips; the ſides over the thighs are ſtriated with black and white; the legs are black. One of theſe was found at Turtle and Palmerſton iſlands, in the South Seas, and is in the poſſeſſion of Sir Joſeph Banks.

4. The red-tailed tropic bird is in length about two feet ten inches, of which the two tail feathers alone meaſure one foot nine inches. The bill is red; the plumage white, tinged of an elegant pale roſe-colour; the creſcent over the eyes is ſomewhat abrupt in the middle; the ends of the ſcapulars are marked with black. This bird is diſtinguiſhed from others by two middle long tail feathers, which are of a beautiful deep red colour, except the ſhafts and baſe, which are black; the ſides over the thighs are duſky; and the legs are black.

"This ſpecies (ſays Latham) is met with frequently at large as the others, but does not ſeem to be ſo far ſpread. Our navigators met with them in various places, though they were ſeldom ſeen by them on ſhore except in the breeding ſeaſon, which is in September and October. They are found in great numbers in the iſland of Mauritius, where they make the neſt in hollows in the ground under the trees; the eggs are two in number, of a yellowiſh white marked with rufous ſpots.

(A) "Dr Forſter obſerves, that they are never ſeen beyond 28 degrees of latitude; but others talk of their ſpreading far beyond it. In lat. 32. 45. *Ell. Narr.* ii. p. 64.—33. 10. N *Cook's laſt Voy.* iii. p. 178.—38. 34. S. *Park. Voy* p. 132.—38. 29. S. *Hawkeſ. Voy.* iii. p. 77. This is mentioned as not being common; but Kalm ſays he met with theſe in 40 degrees north. See *Trav.* i. p. 22.—And a friend of mine aſſured me, that he ſaw one in latitude 47½ north; but at the ſame time obſerved, that it was the firſt inſtance he had ever known of ſuch a circumſtance.

(B) "*Ulloa's Voy.* ii. p. 301. He obſerves, that they ſeldom are met with above eight or ten leagues from land.

(C) "*Squalus conductor, delphinus phocæna, ſcomber thynnus, ſcomber pelamis, delphinus coryphæna.* See *Phil. Tranſ.* vol. lxviii. p. 800. It is there obſerved, that the flying fiſh is able to fly 60 or more yards at one ſtretch, and repeat it a ſecond or even a third time, only the ſlighteſt momentary touch of the ſurface that can be conceived intervening; and it is common in theſe flights for them to fly againſt ſhips, or fall on the deck.

ſpots. The ſame author gives an account of the introduction of paradiſe grackles into the iſland of Bourbon, from whence they ſpread into that of Mauritius; at firſt intended for the very uſeful purpoſe of deſtroying the locuſts and graſhoppers, which ſwarmed there to a great degree: the reſult of their prodigious increaſe, and the unlooked for conſequence of it, he has likewiſe mentioned. Theſe birds, we are told, are great enemies to the tropic birds, ocular demonſtration of which was had by M. de Querhoent; for, being ſeated beneath a tree in which were perched a number of the grackles, he obſerved a tropic bird come to its hole, in order to go to the neſt; but the grackles attacked the bird all at once, and obliged it to fly off; it then returned with its conſort in company, but without effect, as they were both driven away, as the ſingle one had been before; when the grackles returned to their tree, and the ſpectator left them in that ſituation.

"This ſpecies of tropic bird has been met with in ſeveral places of the South Seas; very common at Palmerſton and Turtle iſlands; at Hervey's iſland in the greateſt plenty, and of which conſiderable numbers were killed for proviſions; and here alſo they make the neſts in the ſame manner as at Mauritius. The name it is known by at Otaheite and the Friendly iſles is *tawagge* and *totto*." See DIOMEDEA and PINGUIN.

PHAGEDÆNA, in medicine, denotes a corroding ulcer.

PHAGEDENIC MEDICINES, thoſe uſed to eat off proud or fungous fleſh; ſuch as are all the cauſtics.

PHAGEDENIC Water, in chemiſtry, denotes a water made from quicklime and ſublimate; and is very efficacious in the cure of phagedenic ulcers. To prepare this water, put two pounds of freſh quicklime in a large earthen pan, and pour upon it about ten pounds of rain-water; let them ſtand together for two days, ſtirring them frequently: at laſt leave the lime to ſettle well, then pour off the water by inclination, filtrate it, and put it up in a glaſs bottle, adding to it an ounce of corroſive ſublimate in powder; which from white becomes yellow, and ſinks to the bottom of the veſſel. The water being ſettled, is fit for uſe in the cleanſing of wounds and ulcers, and to eat off ſuperfluous fleſh, and eſpecially in gangrenes; in which caſe may be added to it a third or fourth part of ſpirit of wine.

PHALÆNA, the MOTH, in zoology, a genus of inſects belonging to the order of lepidoptera. The feelers are cetaceous, and taper gradually towards the points; the wings are often bent backwards.

Barbut divides this genus into eight families, and we are told that there are no leſs than 460 ſpecies. The names of the ſeveral families are given by Barbut as follows: 1. The attaci, whoſe wings incline downwards and are ſpread open: they have pectinated antennæ without a tongue, or pectinated antennæ with a ſpiral tongue, or cetaceous antennæ with a ſpiral tongue. 2. The bombyces, whoſe wings cover the body in a poſition nearly horizontal, and which have pectinated antennæ. They are either clingues, which want the tongue, or have it ſo ſhort as not to be manifeſtly ſpiral; their wings are either reverſed or deflected: or ſpirilingues, which have a ſpiral tongue; and are either læves with ſmooth backs, or criſtatæ dorſo with a kind of creſt or tuft of hair on the back. 3. The noctuæ, whoſe wings are incumbent as in the bombyces, from which they differ chiefly in the formation of the antennæ, which are cetaceous. The noctuæ are either clingues, wanting tongues, or ſpirilingues having ſpiral tongues. 4. The geometræ, whoſe wings when at reſt are extended horizontally: the antennæ in one ſubdiviſion of this ſection are pectinated, in another cetaceous; the under wings in each of theſe diviſions are either angulated, or round with entire edges. 5. The tortrices. The wings are exceeding obtuſe, their exterior margin is curve, and declines towards the ſides of the body. They have ſhort palpi. 6 The pyralides. The inner margins of the wings in this ſection are laid one over the other; the wings themſelves decline a little towards the ſides of the body, and in ſhape reſemble a delta; they have conſiderable palpi of different forms. 7. The tineæ. The wings are wrapped up or folded round the body, ſo as to give the inſect a cylindrical form; the forehead is ſtretched out or advanced forwards. 8. The alucitæ. The wings of this diviſion are ſplit, or divided into branches almoſt to their baſe. Phalæna.

The caterpillars of this genus vary much as to ſize, and conſiderably as to their ſhape and number of feet. It is remarkable, that caterpillars of almoſt every ſpecies of this genus are found with 10, 12, 14, and 16 feet. The laſt are the moſt common and the largeſt; thoſe of 10 and 12 feet are called *geometræ*. "Amongſt the geometræ caterpillars (ſays Barbut) there are ſome very ſingular, whether for their colour, or the tubercula which they bear, or laſtly for the difference of their attitudes. Many reſemble ſmall branches or bits of dry wood; and that reſemblance may be a means of ſaving many of thoſe inſects from the voraciouſneſs of birds, who do not ſo eaſily diſcern them. Other caterpillars are very hairy, while ſeveral are quite ſmooth; the latter have a cleanlier look, whereas the hairy ones have ſomething hideous, and may even be hurtful when touched.

"All the caterpillars of phalænæ, after having ſeveral times caſt their ſlough, ſpin their cod, in which they are transformed to chryſalids. But the texture of the cod, the fineneſs of the thread of which it is compoſed, and the different matters joined to the threads, are infinitely various.

"The chryſalids of phalænæ are generally oblong ovals, not angulous as thoſe of butterflies, nor ſo ſoon transformed to perfect inſects. They remain a much longer time within the cod, the greateſt part not coming forth till the enſuing year. Some I have met with that remained in that ſtate during two or three years ſucceſſively. Heat or cold contribute greatly to forward or put back their final metamorphoſis; a fact which may be aſcertained by procuring them a certain degree of moderate heat, by which means one may ſee phalænæ brought forth upon one's mantle-piece in the depth of winter.

"The phalænæ or perfect inſects ſprung from thoſe cods, are generally more clumſy and heavy than butterflies; their colours are likewiſe more brown, dim, and obſcure, though there are ſome phalænæ whoſe colours are very lively and brilliant. Several of them

Phalæna. fly only in the evening, keeping quiet and close under leaves in the day-time; and this has induced some authors to give them the name of *night butterflies*. In summer evenings they find their way into rooms, attracted by the lights round which they are seen to hover. And indeed a sure method of catching a great number of phalænæ is to hunt them by night in a bower with a lantern. They all resort to the light of the lantern, about which great numbers of them may be caught.

"A remarkable circumstance has been observed of these phalænæ, which is, that the females of some of them are without wings. By their looks they never would be taken for phalænæ. They have the appearance of a large, short, six-legged, creeping animal, while their male is winged and active. Yet this heavy creature is a real phalæna, easily distinguished by its antennæ. It even has wings, but so short that they are no more than small protuberances placed at the extremity of the thorax, and that appear quite useless. Those phalænæ whose females are destitute of wings are generally in the number of those whose antennæ are pectinated. The unwinged females have antennæ similar to those of the males, but with shorter beards only. Their body is also charged with scales, the characteristic of insects of this order."

To describe every species of this extensive genus would be impossible; we shall therefore only take notice of a very few, of which we have given engravings.

The phalæna attacus pavonia minor. See N° 1. Plate CCCLXXXIX. The wings of this insect, says Barbut, are brown, undulated, and variegated, having some grey in the middle, and a margin one line broad; in its colour yellowish grey. The under part has more of the grey cast, but the extremities of the wings before the margin have a broad band of brown. The four wings, as well above as beneath, have each a large eye, which eyes are black encompassed with a dun-coloured circle, and above that with a semicircle of white, then another of red, and lastly the eye is terminated by a whole circle of black. Across the middle of the eye is drawn transversely a small whitish line. The caterpillar is green, has 16 feet with rose-colour tubercula, charged with long hairs terminated by a small knob; besides which, it has dun-colour or reddish rings. It is found upon fruit-trees.

Phalæna alucita pentadactyla, N° 2. The eyes of this species are black; the body is of a pale yellow. The wings are snow white, and the insect keeps them stretched asunder when at rest. The superior are divided in two, or rather appear composed of two stumps of bird's feathers united at the base. The inferior ones are likewise divided into three threads or bristles, which are furnished on both sides with fine fringes. The caterpillar is of a green colour, dotted with black, and charged with a few hairs. It feeds upon grass, changes to a chrysalis in or about September, and appears a moth in August, frequenting woods.

Phalæna noctua elinguis humuli, N° 3. In this species the wings of the male are of a snowy white; of the female yellowish, with streaks of a deeper hue; the shoulders, abdomen, &c. in both sexes, are deep yellow. The antennæ are pectinated and shorter than the thorax. The caterpillar feeds upon the roots of burdock, hops, &c. changes into a chrysalis in May, appears in the winged state in June, frequenting low marshy grounds where hops grow. Phalæ

Phalæna noctua pronuba spirilinguis, N° 4. The thorax, head, antennæ, feet, and upper wings, are of a brown colour, more or less dark, sometimes so deep as to be nearly black, but often of a bluish cast. The upper wings are moreover somewhat clouded, and have two black spots, one on the middle, the other towards the outward angle of the lower part of the wing. The under ones are of a beautiful orange colour, with a broad black band near the lower edge of the wing, of which it follows the direction. The caterpillar is smooth; to be found on several plants, but particularly upon the thlaspi and some other cruciferous plants. It keeps in concealment during the day, and only feeds by night. Its metamorphosis is performed underground, and some varieties of colour are observable amongst these caterpillars; some being green, others brown; which latter yield males, the former females.

Phalæna tortrix prasinana. The superior wings of this species are of a fine green colour, having two diagonal yellow bars on each, the body and inferior wings are whitish, shaded with yellowish green. The caterpillar is a pale yellowish green, ornamented with small brown specks or spots, the tail being forked and tipt with orange red colour; feeds on the oak, changes to a chrysalis in September, and assumes the fly-state about May, frequenting woods.

PHALANGIUM, in zoology, a genus of insects belonging to the order of aptera. They have eight feet, two eyes on the top of the head placed very near each other, and other two on the sides of the head: the feelers resemble legs, and the belly is round. There are nine species.

Mr Barbut only describes one species, *viz.* the phalangium opilis of Linnæus. His description is as follows: "Its body is roundish, of a dusky brown on the back, with a duskier spot of a rhomboidal figure near the middle of it. The belly is whitish; the legs are extremely long and slender. On the back part of the head there stands a little eminence, which has on it a kind of double crest, formed as it were of a number of minute spines; the eyes are small and black, and are two in number. It is commonly called the *shepherd spider*.

"This species of spider multiplies singularly. They are great spinners. In autumn the stubble is quite covered with the threads of these spiders, by means of which they travel with ease, and ensnare their prey. However, those threads are thought rather to be the produce of a species of tick called *autumnal-weaver*. A small degree of attention discovers an amazing multitude of those ticks almost imperceptible, and that is their work. The threads, when united, appear of a beautiful white, wave about in the air, and are known in the country by the name of *virgin's threads*. Some naturalists think, that those threads, floating in the air, serve the insect as sails to waft it through the air, and as a net to entrap insects on the wing; for remnants of prey, say they, are discoverable in them. As to those parcels in which nothing is seen, they are only essays rejected by those travelling insects. The analogy between the phalangium and the crab, and the facility with

ngosis lanx. with which it parts with its legs to save the rest of the body, has raised a presumption that its legs might grow again, as do those of crabs and lobsters. Country people have an opportunity to endeavour at ascertaining the truth of these observations."

PHALANGOSIS, in surgery, is a tumor and relaxation of the eye-lids, often so great as to deform the eye, and considerably to impede vision. Sometimes the eye-lid when in this state subsides or sinks down, occasioned perhaps either by a palsy of the muscle which sustains and elevates the eye-lid, or else from a relaxation of the cutis above, from various causes. Sometimes an œdematous or aqueous tumor is formed on the eye-lids, so as almost entirely to exclude vision; but this last case should be distinguished from the other, and may be easily remedied by the use of internal and topical medicines, such as purges and diuretics given inwardly, and a compress dipped in warm spirit of wine and lime-water. But in the paralytic or relaxed case, the use of cordial and nervous medicines must be proposed internally; and outwardly, balsam of Peru and Hungary water are to be employed. If all these fail, the remaining method of cure is to extirpate a sufficient quantity of the relaxed cutis; and then, after healing up the wound, the remainder will be sufficiently shortened.

PHALANX, in Grecian antiquity, a square battalion of soldiers, with their shields joined and pikes crossing each other; so that it was next to impossible to break it.

The Macedonian phalanx is supposed by some to have had the advantage, in valour and strength, over the Roman legion. Its number was 8000 men. But the word *phalanx* is used for a party of 28, and several other numbers; and even sometimes for the whole body of foot. See LEGION.

PHALANX is applied, by anatomists, to the three rows of small bones which form the fingers. In natural history it is a term which Dr Woodward and some other writers of fossils have used to express an arrangement of the columns of that sort of fossil coralloide body found frequently in Wales, and called ward's *lithostrotion*. of Foss. In the great variety of specimens we find of this, some have the whole phalanx of columns cracked through, and others only a few of the external ones; but these cracks never remain empty, but are found filled up with a white spar, as the smaller cracks of stone usually are. This is not wonderful, as there is much spar in the composition of this fossil; and it is easily washed out of the general mass to fill up these cracks, and is then always found pure, and therefore of its natural colour, white.

The lithostrotion, or general congeries of these phalanges of columns, is commonly found immersed in a grey stone, and found on the tops of the rocky cliffs about Milford in Wales. It is usually erect, though somewhat inclining in some specimens, but never lies horizontal. It seems to have been all white at first, but to have been since gradually tinctured with the matter of the stone in which it lies. The single columns, which form each phalanx, are usually round or cylindric, though sometimes flatted and bent; some of them are also naturally of an angular figure; these, however, are not regular in the number of their angles, some consisting of three sides, some of five, and some of seven; some are hexangular also, but these are scarce. They are from five or six to sixteen inches in length; and the largest are near half an inch over, the least about a quarter of an inch; the greater number are very equal to one another in size; but the sides of the columns being unequal, the same column measures of a different thickness when measured different ways; the phalanges or congeries of these are sometimes of a foot or more in diameter. Phalaris.

The columns are often burst, as if they had been affected by external injuries; and it is evident that they were not formed before several other of the extraneous fossils; for there are found sometimes shells of sea-fishes and entrochi immersed and bedded in the bodies of the columns. It appears plainly from hence, that when these bodies were washed out of the sea, and tossed about in the waters which then covered the tops of these cliffs, this elegant fossil, together with the stony bed in which it is contained, were so soft, that those other bodies found entrance into their very substance, and they were formed as it were upon them. This fossil takes an elegant polish, and makes in that state a very beautiful appearance, being of the hardness of the common white marble, and carrying the elegant structure visible in the smallest lineaments.

PHALARIS, a remarkable tyrant, born at Crete, where his ambitious designs occasioned his banishment: he took refuge in Agrigentum, a free city of Sicily, and there obtained the supreme power by stratagem. The circumstance which has chiefly contributed to preserve his name in history is his cruelty; in one act of which he gave, however, an example of strict justice. It is thus related: Perillus, a brass-founder at Athens, knowing the cruel disposition of Phalaris, contrived a new species of punishment for him to inflict on his subjects. He cast a brazen bull, bigger than the life, with an opening in the side to admit the victims; who being shut up in the body, a fire was kindled under it to roast them to death; and the throat was so contrived, that their dying groans resembled the roaring of a bull. The artist brought it to the tyrant, expecting a great reward. Phalaris admired the invention and workmanship, but ordered the inventor to be put into it to make the first trial. In allusion to which, Ovid says,

Neque enim lex æquior ulla,
Quam necis artifices arte perire sua.

The end of this detestable tyrant is differently related; but it is very generally believed, with Cicero, that he fell by the hands of the Agrigentines; and, as some suppose, at the instigation of Pythagoras. Ovid tells us, that his tongue was cut out; and that he was then put into the bull to perish by the same slow fire by which means he had murdered so many before. Others say that he was stoned to death; and all agree that his end was violent. He reigned, Eusebius says, 28 years; others say 16. After all, there is great uncertainty both as to his life, death, and history. Many of the circumstances related of him, as they are collected by Mr Boyle, depend upon the authenticity of those epistles which go under the name of the tyrant; and which have been justly questioned, and with great probability rejected, as the spurious production of some modern sophist. See BENTLEY, p. 177. col. 2.

Phalaris || Phallus.

PHALARIS, or *Canary-graſs*, in botany; a genus of the trigynia order, belonging to the triandria claſs of plants. The calyx is bivalved, carinated, and equal in length, containing the corolla. There are ten ſpecies, of which the moſt remarkable are the canarienſis, or manured Canary-graſs; and the arundinacea, or reed Canary-graſs. Theſe are both natives of Britain. The firſt grows by the road ſides; and is frequently cultivated for the ſake of the ſeeds, which are found to be the beſt food for the Canary and other ſmall birds. The ſecond grows on the banks of rivers. It is uſed for thatching ricks or cottages, and endures much longer than ſtraw. In Scandinavia they mow it twice a-year, and their cattle eat it. There is a variety of this cultivated in our gardens with beautifully ſtriped leaves. The ſtripes are generally green and white; but ſometimes they have a purpliſh caſt. This is commonly called *painted lady-graſs*, or *ladies treſſes*.

PHALERÆ, among the ancient Romans, were military rewards beſtowed for ſome ſignal act of bravery. Authors do not agree whether the Phaleræ were a ſuit of rich trappings for a horſe, or golden chains ſomething like the torques, but ſo formed as to hang down to the breaſt and diſplay a greater profuſion of ornament. The laſt opinion appears to have the greater prevalence, but perhaps both are true.

PHALEREUS (Nepos), a village and port of Athens; this laſt neither large nor commodious, for which reaſon Themiſtocles put the Athenians on building the Piræeus; both joined to Athens by long walls. The Phalereus lay nearer the city (Pauſanias). Demetrius Phalereus, the celebrated ſcholar of Theophraſtus, was of this place; to whom the Athenians erected above 300 ſtatues; which were afterwards deſtroyed by his enemies, on his flight to Ptolemy king of Egypt (Strabo). Here Demoſthenes was wont to declaim, to accuſtom his voice to ſurmount the noiſe and roaring of the ſea; a juſt and lively emblem of popular aſſemblies.

PHALEUCIAN VERSE, in ancient poetry, a kind of verſe conſiſting of five feet; the firſt of which is a ſpondee, the ſecond a dactyl, and the three laſt trochees.

PHALLUS, the MOREL, in botany; a genus of the order of fungi, belonging to the cryptogamia claſs of plants. The fungus is reticulated above and ſmooth below. There are two ſpecies.

1. The eſculentus, or eſculent morel, is a native of Britain, growing in woods, groves, meadows, paſtures, &c. The ſubſtance, when recent, is wax like and friable; the colour a whitiſh yellow, turning browniſh in decay: the height of the whole fungus, about four or five inches. The ſtalk is thick and clumſy, ſomewhat tuberous at the baſe, and hollow in the middle. The pileus is either round or conical; at a medium about the ſize of an egg, often much larger; hollow within: its baſe united to the ſtalk; and its ſurface cellular, or latticed with irregular ſinuſes. The magnified ſeeds are oval. It is much eſteemed at table both recent and dried, being commonly uſed as an ingredient to heighten the flavour of ragouts. We are informed by Gleditſch, that morels are obſerved to grow in the woods of Germany in the greateſt plenty in thoſe places where charcoal has been made. Hence the good women who collect them to ſell, receiving a hint how to encourage their growth, have been accuſtomed to make fires in certain places of the woods, with heath, broom, vaccinium, and other materials, in order to obtain a more plentiful crop. This ſtrange method of cultivating morels being however ſometimes attended with dreadful conſequences, large woods having been ſet on fire and deſtroyed by it, the magiſtrate thought fit to interpoſe his authority, and the practice is now interdicted.

2. The impudicus, ſtinking morel, or ſtinkhorns, is alſo a native of Britain, and found in woods and on banks. It ariſes from the earth under a veil or volva, ſhaped exactly like a hen's egg, and of the ſame colour, having a long fibrous radicle at its baſe. This egg like volva is compoſed of two coats or membranes, the ſpace between which is full of a thick, viſcid, tranſparent matter, which, when dry, glues the coats together, and ſhines like varniſh. In the next ſtage of growth, the volva ſuddenly burſts into ſeveral lacerated permanent ſegments, from the centre of which ariſes an erect, white, cellular, hollow ſtalk, about five or ſix inches high and one thick, of a wax like friable ſubſtance, and moſt fetid cadaverous ſmell, conical at each end, the baſe inſerted in a white, concave, membranaceous turbinated cup, and the ſummit capped with a hollow, conical pileus, an inch long, having a reticulated cellular ſurface, its baſe detached from the ſtalk, and its ſummit umbilicated, the umbilicus ſometimes perforated and ſometimes cloſed. The under ſide of this pileus is covered with a clear, viſcid, gelatinous matter, ſimilar to that found between the membranes of the volva: and under this viſcid matter, concealed in reticulated receptacles, are found the ſeeds, which when magnified appear ſpherical. As ſoon as the volva burſts, the plant begins to diffuſe its intolerable odours, which are ſo powerful and widely expanded, that the fungus may be readily diſcovered by the ſcent only, before it appears to the ſight. At this time, the viſcid matter between the coats of the volva grows turbid and fuſcous; and when the plant attains its full maturity, the clear viſcid ſubſtance in the pileus becomes gradually diſcoloured, putrid, and extremely fetid, and ſoon afterwards turns blackiſh, and, together with the ſeeds and internal part of the pileus itſelf, melts away. The fetid ſmell then begins to remit, the fungus fades, and continues for a ſhort time ſapleſs and coriaceous, and at laſt becomes the food of worms. The cadaverous ſcent of this fungus greatly allures the flies; which, lighting upon the pileus, are entrapped in the viſcid matter, and periſh. We are informed by Gleditſch, that the vulgar people in Thuringia call the unopened volvæ by the ridiculous name of *ghoſts* and *dæmon's eggs*; and that they collect and dry them either in the ſmoke or open air, and when reduced to powder, uſe them in a glaſs of ſpirits as an aphrodiſiac.

PHALLUS, among the Egyptians, was the emblem of fecundity. It was very fervently worſhipped by women, eſpecially by thoſe who were barren. This cuſtom was introduced among the Greeks, and feſtivals in honour of it were called *phallica*. See MYSTERIES, n° 38, &c. Among the Hindoos a ſimilar emblem called *lingam* is uſed, and for ſimilar purpoſes. See HINDOOS, n° 4.

PHALTI, or PHALTIEL, ſon of Laiſh. He married

nanatic ‖ haon.

ried Michal, after Saul had taken her from David; but David afterwards took her away from Phalti (1 Sam. xxv. 44. 2. Sam. iii. 15.) Some interpreters are of opinion Phalti did not meddle with Michal all the time she continued in his house, for fear that both of them should incur the penalty of death, to be inflicted on adulterers (Levit. xx. 10.), because Michal had not been legally divorced; but these reasons are frivolous. Saul looked upon David as a rebel to his king, and an outlaw, whose goods and wives belonged to him, and which he could absolutely dispose of. He would not have given Michal to Phalti, nor would he have received her, if he had not thought he might use her as his wife. If Michal had no children by Phalti, by whom then were those children that the scripture says she had, since it is known she had none by David? See 2 Sam. xxi. 8. and vi. 23.

PHANATIC, or FANATIC, a visionary; one who fancies he sees spectres, spirits, apparitions, or other imaginary objects, even when awake; and takes them to be real. See PHANTASY and FANATIC.

Such are phrenetics, necromancers, hypochondriac persons, lycanthropi, &c. See PHRENETIC, HYPOCHONDRIAC, LYCANTHROPI.

Hence the word is also applied to enthusiasts, pretenders to revelation, new lights, prophecies, &c. See ENTHUSIAST, and SECOND *Sight*.

PHANTASIA was the daughter of Nicarchus of Memphis in Egypt. It has been supposed that she wrote a poem on the Trojan war, and another on the return of Ulysses to Ithaca, from which compositions Homer copied the greatest part of his Iliad and Odyssey, when he visited Memphis, where they were deposited.

PHANTASM, a term sometimes used in a synonymous sense with idea, or notion retained in the mind, of an external object.

PHANTASY, or FANCY, the *Imagination*; the second of the powers or faculties of soul, by which the species of objects received by the external organs of sense are retained, recalled, further examined, and either compounded or divided. See IMAGINATION; and METAPHYSICS, Part I. Chap. ii.

Others define the phantasy to be that internal sense or power, whereby the ideas of absent things are formed, and represented to the mind as if they were present. In melancholics and madmen this faculty is very strong, representing many extravagant and monstrous things, and framing its images as lively as those of sensation: whence the visions and deceptions those persons are liable to.

PHANUEL, of the tribe of Asher, the father of a holy widow and prophetess called Anna, who was in the temple when our Saviour was presented there by his parents (Luke ii. 36, 37, 38.)

PHAON, a young man of Mytilene, in the island of Lesbos, received from Venus, as fable reports, an alabaster vase filled with an essence which had the virtue of conferring beauty. He had no sooner anointed his body with it than he became the most beautiful of men. The ladies of Mytilene fell desperately in love with him; and the celebrated Sappho threw herself down a precipice because he would not encourage her passion. He is said to have been killed by a husband who surprised him with his wife. We have in Ovid a letter from Sappho to Phaon, which Mr Pope has translated into English verse.

Phara ‖ Pharaohs

PHARA (anc. geog.), a village between Egypt and Arabia Petræa; or, according to Ptolemy, at a promontory situated between the Sinus Heroopolites and Elaniticus of the Red Sea; where Ismael is said to have dwelt. In Hebrew it is *Paran*, and in most interpreters; *Pharan*, Septuagint and Vulgate. *Pharanitæ*, the people (Ptolemy.) *Paran* or *Pharan*, the name of the wilderness in its neighbourhood, adjoining to Kadesh.

PHARÆ (anc. geog.), a town of Achaia in Peloponnesus, on the river Pierus, 70 stadia from the sea, and to the south of Patræ 150 stadia. Another, of Crete (Pliny); a colony from the *Pharæ* of Messenia (Stephanus.) A third *Pharæ*, or *Pheræ* (Strabo, Ptolemy); *Phara*, æ, (Polybius); a town of Messenia, on the river Nedo (Strabo); on the north side of the Sinus Messenius, and to the north-west of Abea. Anciently read *Pharis* in Homer (Pausanias, Statius), though now read *Phare*. *Pharita* is the name of the people.

PHARAMOND is the name which is given by the generality of historians to the first king of France. He is said to have reigned at Treves, and over a part of France, about the year 420; and to have been succeeded by his son Clodion: but the account which is given of these two princes is very uncertain. It is probable Pharamond was properly no more than a general of an army, the head of a military society of Franks, who were masters of their persons and their fortunes. Gregory of Tours seems to have been of this opinion. "It is not generally known (says he) who was the first king of the French. Sulpitius Severus, who mentions several things respecting that nation, takes no notice of its first monarch; he only says that it had generals." Be that as it may, the institution of the famous Salique law (so named from the Salians, the most illustrious of the Franks) is generally attributed to Pharamond. "This law fixed the punishment of crimes, and various points of police. There is no just ground for believing that it expressly settled the right of succession to the crown: it only says, that, with relation to the Salic land, women have no share of heritage, without restricting it to the royal family in particular; for all those were generally called *Salic lands* which were held by right of conquest; and it is easy to conceive that a nation of soldiers, whose general was their king, would not submit to be governed by a woman. A long custom, supported by the principles of the nation, came in time to be the established law of the kingdom." (See *M Abbé Millot, Elem. de l'Histoire de France*, tom. i.)

PHARAOH, a common name of the kings of Egypt. Josephus says, that all the kings of Egypt, from Minæus the founder of Memphis, who lived several ages before Abraham, have always had the name of Pharaoh, down to the times of Solomon, for more than 3300 years. He adds, that in the Egyptian language the word *Pharaoh* signifies a *king*; and that those princes did not assume this name but when they ascended the throne, at which time they quitted also their former name. From hence it comes to pass,

Pharaoh. says Josephus, that Herodotus names none of the kings of Egypt after Minæus the builder of Memphis, though he had 330 kings for his successors, because they had all the name of Pharaoh; but because this name did not pass to women also, he names an Egyptian queen Nicaule who succeeded them. Lastly, I find, adds Josephus, from the ancient records of our nation, that from the age of Solomon no king of Egypt had any longer the name of Pharaoh.

But Josephus is not very accurate in this passage. True it is, Herodotus says, that Mines, or Minæus, was the first king of Egypt, and founder of Memphis; that there were 330 kings after him in Egypt; that after them there was a queen called Nicotris, and not Nicaule, as Josephus writes it; but it is not true that these kings had no other name but Pharaoh. Herodotus says expressly, that in the books of the Egyptian priests were read the names and the catalogue of 330 kings; that in this number of 330 there were 18 Ethiopians, and a woman that was a foreigner called Nicotris, and that all the others were Egyptians. These princes therefore had every one his proper name mentioned in the catalogue of the Egyptian kings. So likewise we see in the fragments of Manetho, that every king of Egypt had a name peculiar to him; and we find the name Pharaoh only in Scripture.

What Josephus adds concerning queen Nicaule, or Nicotris, whom he pretends to be the same as the queen of Sheba, of whom mention is made in Scripture (1 Kings x. 1, 2, &c.), is entirely fabulous; and as to what he says, that since the time of Solomon the kings of Egypt have no longer had the name of Pharaoh, is manifestly false, since we still find this name in the second book of Kings, under Hezekiah (2 Kings xviii. 21.); under Josiah (xxiii. 29, 30, 33, &c.), where this name is joined to Necho, which was the proper name of this prince; under Jehoiakim (xxiii. 35.); and in the prophets Isaiah, Jeremiah, and Ezekiel, who are much later than Solomon. It is very probable that the Egyptians gave the name of Pharoah to their kings as long as the Egyptian language was in common use, and as long as their kings were of their own nation: but after the conquest of Egypt by Alexander the Great, and that the Grecians introduced their language with their government, the name of Pharaoh was known no longer among them. The first prince known to us by the name of Pharaoh was he in whose time Abraham went down to Egypt, when Sarah, who passed only for Abraham's sister, was by the command of Pharaoh brought to his palace in order to become his wife. See Abraham. But the Lord smote Pharaoh and his family with great infirmities, and gave him to know that she was Abraham's wife; whereupon Pharaoh sent for Abraham, restored him his wife, and at the same time gave orders that he should be conducted out of Egypt, with every thing that belonged to him. See Sarah.

The second Pharaoh spoke of by the Scripture is he that reigned when Joseph arrived there. This prince or his successor had the mysterious dream of the fat and lean kine, and the seven full and barren ears of corn, which Joseph explained so well to his satisfaction, that he made him governor of his house and of all Egypt, reserving only to himself the name of a king. This is the same Pharaoh that sent for and entertained the patriarch Jacob and his family in Egypt, and gave them the land of Goshen for their habitation. See Joseph and Jacob. Pharaoh.

The third Pharaoh known in holy writ is he that persecuted the Israelites. Moses tells us that he was a new king, and had no knowledge of Joseph (Exod. i. 8.) This prince, observing that the Israelites were become very numerous and powerful, resolved to depress them by hardship and labour; and set cruel and pitiless taskmasters over them. But the more he oppressed them, the faster they multiplied; insomuch that he gave orders to the Egyptian midwives, who assisted the Hebrew women in their labour, to put all the male children to death, and to save alive the females only. But this command was not strictly executed. The midwives feared the Lord, and preserved alive not only the female children, but the males also.

Pharaoh, seeing this project did not succeed to his wishes, published a decree (Exod. i. 22.) that all the male children born of Hebrew women should be thrown into the Nile, and that only the females should be spared. This order was rigorously executed; yet by the providence of God Moses was preserved, and even brought up in Pharaoh's own court, by his own daughter, who by chance had found the child, as he was exposed upon the Nile.

Moses being grown up, and having killed an Egyptian who had abused an Hebrew, was obliged to fly from Egypt to avoid that death that Pharaoh had threatened him with.

Several years after, being about 80 years old, he returned again by an order from God, and performed mighty miracles before Pharaoh. See Moses. There is a good deal of probability that this Pharaoh before whom Moses appeared, and in whose sight he smote Egypt with so many plagues, was a different person from him who would have laid hands on him after he had slain the Egyptian. This same Pharaoh having at last been compelled to send away the Hebrews, and to suffer them to go out of Egypt, soon repented of the leave he had given, and pursued them at the head of his army with his chariots. But he was drowned in the Red Sea, wherein he had rashly entered in the eagerness of his pursuit. Some historians pretend to give us the name of this Pharaoh; some, as Appion, call him Amosis or Amasis; Eusebius calls him Chenchris; Usher calls him Amenophis; but we may assure ourselves that there can be nothing certain in all this.

The fifth Pharaoh known to us is he that gave protection to Hadad son of the king of Edom, who gave him to wife the sister of his own queen, enriched him with lands, and brought up his son Genubah in his own court. Hadad returned to Idumea after the death of David.

The sixth Pharaoh is he that gave his daughter in marriage to Solomon king of the Hebrews (1 Kings iii. 1.); and having taken Gezer, he set it on fire, drove the Canaanites out of it, and gave it for a present to Solomon, in lieu of a dowry for his daughter, whom he had married to this prince (1 Kings ix. 16.)

The seventh is Shishak, who entertained Jeroboam in his dominions, a rebellious subject of Solomon, and offered him a refuge in opposition to the king his master. The same Shishak declared war against Rehoboam the son and successor of Solomon, besieged and took

on. took Jerusalem, carried away all the king's treasures, and those of the house of God, and particularly the golden bucklers that Solomon had made. See SHISHAK.

The eighth is that Pharaoh with whom Hezekiah made a league against Sennacherib king of Assyria, in the year of the world 3290. See SENNACHERIB. This Pharaoh is probably the same whom Herodotus names Sethon, priest of Vulcan, who came to meet Sennacherib before Pelusium, and to whose assistance Vulcan sent an army of rats, which gnawed the bow-strings and the thongs of the bucklers of Sennacherib's soldiers.

The ninth is Pharaoh-Necho, or Nechos, son of Psammiticus, who made war with Josiah, and subdued him. Herodotus also mentions this prince. See NECHO, and EGYPT, n° 11.

The tenth is Pharaoh Hophrah, who entered into an alliance with Zedekiah king of Judah, and attempted to come to his assistance against Nebuchadnezzar king of Chaldea. It was against this Pharaoh that Ezekiel pronounced several of his prophecies (See Ezek xxix. xxx. xxxi. xxxii) He is called Apries in Herodotus, l. ii. c. 161. He is also mentioned in Habakkuk ii. 15, 16. See also Isaiah xix. xx. and Jeremiah xlvi. 16, &c. See APRIES, and EGYPT, n° 13, &c.

PHARAON is the name of a game of chance, the principal rules of which are: the banker holds a pack consisting of 52 cards; he draws all the cards one after the other, and lays them down alternately at his right and left hand; then the ponte may at his pleasure set one or more stakes upon one or more cards, either before the banker has begun to draw the cards, or after he has drawn any number of couples. The banker wins the stake of the ponte when the card of the ponte comes out in an odd place on his right hand, but loses as much to the ponte when it comes out in an even place on his left hand. The banker wins half the ponte's stake when it happens to be twice in one couple. When the card of the ponte being but once in the stock happens to be the last, the ponte neither wins nor loses; and the card of the ponte being but twice in the stock, and the last couple containing his card twice, he then loses his whole stake. De Moivre has shown how to find the gain of the banker in any circumstance of cards remaining in the stock, and of the number of times that the ponte's cards is contained in it. Of this problem he enumerates four cases, *viz.* when the ponte's card is once, twice, three, or four times in the stock. In the first case, the gain of the banker is $\frac{1}{n}$, n being the number of cards in the stock. In the second case, his gain is $\frac{n-2}{n \times n-1} \times y + \frac{2}{n \times n-1}$, or $\frac{\frac{1}{2}n+1}{n \times n-1}$, supposing $y=\frac{1}{2}$. In the third case, his gain is $\frac{3y}{2 \times n-1}$, or $\frac{3}{n \times n-1}$, supposing $y=\frac{1}{2}$. In the fourth case, the gain of the banker, or the loss of the ponte, is $\frac{2n-5}{n-1 \times n \quad 3} y$, or $\frac{2n-5}{2 \times n \quad 1 \times n-3}$, supposing $y=\frac{1}{2}$. De Moivre has calculated a table, exhibiting this gain or loss for any particular circumstance of the play; and he observes, that at this play the least disadvantage of the ponte, under the same circumstances of cards remaining in the stock, is when the card of the ponte is but twice in it, the next greater when three times, the next when once, and the greatest when four times. He has also demonstrated, that the whole gain *per cent.* of the banker, upon all the money that is adventured at this game, is 2 l. 19 s. 10 d. See De Moivre's Doctrine of Chances, p. 77, &c. p. 105, &c. Pharez, Pharisees.

PHAREZ, son of Judah and Tamar (Gen. xxxviii. 27, 28, &c.) Tamar being just ready to lie in, found herself with child of twins. One of them appeared first, and putting his arm out, he immediately drew it back again. The midwife tied a scarlet thread upon his arm, to distinguish him for the first-born: but having withdrawn his hand, his brother got before him into the world: whereupon he was called by his mother *Pharez*, i. e. *one breaking forth*; as the other with the thread on his hand was called *Zarah*. The sons of Pharez were Hezron and Hamul (Numb xxvi. 20, 21.) F. Calmet, upon this article, explains the text as if Pharez, and not Zarah, had put out his hand, and drew it in again.

PHARISEES, a famous sect of the Jews, who distinguished themselves by their zeal for the traditions of the elders, which they derived from the same fountain with the written word itself; pretending that both were delivered to Moses from Mount Sinai, and were therefore both of equal authority From their rigorous observance of these traditions, they looked upon themselves as more holy than other men: and therefore separated themselves from those whom they thought sinners or profane, so as not to eat or drink with them; and hence, from the Hebrew word *pharis*, which signifies "to separate," they had the name of *Pharisees* or *Separatists*.

This sect was one of the most ancient and most considerable among the Jews; but its original is not very well known (A): however, it was in great repute in the

(A) The Jesuit Serrarius places their first rise about the time of Esdras; because it was then that the Jews first began to have interpreters of their traditions. Maldonat, on the other hand, will not have this sect to have arisen among the Jews till a little before the time of Christ. Others, perhaps with more probability, refer the origin of the Pharisees to the time of the Maccabees.

Dr Lightfoot thinks, that Pharisaism rose up gradually, from a period which he does not assign, to the maturity of a sect. It is certain, from the account given by Josephus, that in the time of John Hyrcanus, the high priest and prince of the Asmonean line, about 108 years before Christ, the sect was not only formed, but made a considerable figure; and that it had advanced to a high degree of popularity and power about 80 years before Christ. Jos. Ant. lib. xiii. cap 10. § 5, 6. cap. 15. § 5. & cap. 16. § 1. According to Basnage, Hist. of the Jews, book ii. cap. 9. § 2. one Aristobulus, an Alexandrian Jew, and a Peripatetic philosopher, who

Pharifees. the time of our Saviour; and muſt have had its original at the ſame time with the traditions, and they grew up together, till at length they had gained ground ſo far, that the traditional law ſwallowed up the written, and theſe who were propagators of it the whole bulk of the Jewiſh nation.

The extraordinary pretences of the Phariſees to righteouſneſs drew after them the common people, who held them in the higheſt eſteem and veneration. Our Saviour frequently, however, charges them with hypocriſy, and making the law of God of no effect through their traditions (Matt. ix. 2. xv. 1—6. xxiii 13—33, and Luke xi. 39—52.) Several of theſe traditions are particularly mentioned in the goſpel; but they had a vaſt number more, which may be ſeen in the Talmud, the whole ſubject whereof is to dictate and explain thoſe traditions which this ſect impoſed to be believed and obſerved

The Phariſees, contrary to the opinion of the Sadducees, held a reſurrection from the dead, and the exiſtence of angels and ſpirits (Acts xxiii 8.) But, according to Joſephus, this reſurrection of theirs was no more than a Pythagorean reſurrection, that is, of the ſoul only, by its tranſmigration into another body, and being born anew with it. From this reſurrection they excluded all that were notoriouſly wicked, being of opinion that the ſouls of ſuch perſons were tranſmitted into a ſtate of everlaſting woe. As to leſſer crimes, they held they were puniſhed in the bodies which the ſouls of thoſe who committed them were next ſent into.

Joſephus, however, either miſtook the faith of his countrymen, or, which is more probable, wilfully miſrepreſented it, to render their opinions more reſpected by the Roman philoſophers, whom he appears to have on every occaſion been deſirous to pleaſe. The Phariſees had many pagan notions reſpecting the ſoul; but Biſhop Bull, in his *Harmonia Apoſtolica*, has clearly proved, that they held a reſurrection of the body, and that they ſuppoſed a certain bone to remain uncorrupted, to furniſh the matter of which the reſurrection body was to be formed. They did not, however, believe that all mankind were to be raiſed from the dead. A reſurrection was the privilege of the children of Abraham alone, who were all to riſe on Mount Zion; their incorruptible bones, wherever they might be buried, being carried to that mountain below the ſurface of the earth The ſtate of future felicity, in which the Phariſees believed, was very groſs: They imagined, that men in the next world, as well as in the preſent, were to eat and drink, and enjoy the pleaſures of love, each being reunited to his former wife. Hence the Sadducee, who believed in no reſurrection, and ſuppoſed our Saviour to teach it as a Phariſee, very ſhrewdly urged the difficulty of diſpoſing of the woman who had in this world been the wife of ſeven huſbands. Had the reſurrection of Chriſtianity been the Phariſaical reſurrection, this difficulty would have been inſurmountable; and accordingly we find the people, and even ſome of the Phariſees themſelves, ſtruck with the manner in which our Saviour removed it. Phar

This ſect ſeems to have had ſome confuſed notions, probably derived from the Chaldeans and Perſians, reſpecting the pre-exiſtence of ſouls; and hence it was that Chriſt's diſciples aſked him concerning the blind man (John ix 2.), 'Who did ſin, this man or his parents, that he was born blind?' And when the diſciples told Chriſt, that ſome ſaid he was Elias, Jeremias, or one of the prophets (Mat. xvi. 14.), the meaning can only be, that they thought he was come into the world with the ſoul of Elias, Jeremias, or ſome other of the old prophets, tranſmigrated into him. With the Eſſenes, they held abſolute predeſtination; and with the Sadducees free-will: but how they reconciled theſe ſeemingly incompatible doctrines is nowhere ſufficiently explained. The ſect of the Phariſees was not extinguiſhed by the ruin of the Jewiſh commonwealth. The greateſt part of the modern Jews are ſtill of this ſect; being as much devoted to traditions or the oral law as their anceſtors were. See the articles CABBALISTS, CARAITES, ESSENES, SADDUCEES, &c.

PHARMACA, among the ancients, meant medicated or enchanted compoſitions of herbs, minerals, &c. ſome of which, when taken inwardly, were ſuppoſed to cauſe blindneſs, madneſs, love, &c. others infected by touch; ſuch was the garment ſent by Medea to Creuſa, prepared *ſecundum artem*; and others operated upon perſons at a diſtance. *Pharmaca ſoteria* were employed as antidotes againſt theſe miſchievous compoſitions: Thus the herb moly preſerved Ulyſſes from the magical influence of Circe. The laurel, the rhamnus, the flea-bane, the jaſper-ſtone, were uſed for ſimilar purpoſes. See *Potter's Grec. Ant.*

PHARMACI, were two perſons who were employed in the luſtration or purification of cities. Some ſay they were both men; but others maintain, that a man to repreſent the males, and a woman to repreſent the females, performed this office. They performed ſacrifice, and wore figs about their necks called ὄσχοι, thoſe of the man were blackiſh, and thoſe of the woman white. Figs were an emblem of fertility, which they doubtleſs prayed for on theſe ſolemn occaſions.

PHARMACOCHEMIA, means that part of the chemical art which treats of the preparation of medicines. It is ſo named by way of diſtinction from that chemiſtry which is wholly employed about the tranſmutation of metals by means of the philoſopher's ſtone; this being called *ſpagirico-chemia*.

PHARMACOLOGY, is a treatiſe of medicines, or the art of preparing them, judging of them, &c.

PHARMACOPŒIA (from φάρμακον *remedy*, and ποιέω *to make*), means a diſpenſatory, or a treatiſe deſcribing the preparations of the ſeveral kinds of medicines. with their uſes, manner of application, &c.

We have various pharmacopœias, as thoſe of Bauderon, Quercetan, Zwelfer, Charas, Bates, Salmon, Lemery,

---

who flouriſhed about 125 years before Chriſt, and wrote ſome allegorical commentaries on the ſcripture, was the author of thoſe traditions by an adherence to which the Phariſees were principally diſtinguiſhed from other ſects.

Lemery, Lewis, &c. The lateſt and moſt in eſteem are the Edinburgh and London diſpenſatories See PHARMACY.

PHARMACOPOLA, or PHARMACOPŒUS, an *apothecary*; or a perſon who prepares and ſells medicines. (See APOTHECARY). The word is ſeldom uſed but by way of ridicule. It is formed from φαρμακον and πωλεω, *to ſell*. See Horace, Satire 2. lib. i. ver. 1. Pharmacum.

PHARMACUM, φαρμακον, a medicament or medicine; whether of a ſalutary or poiſonous quality.

PHARMACY.

PHARMACY(A), is the art of preparing, preſerving, and compounding, ſubſtances, for the purpoſes of medicine. This art has been commonly divided into two branches, *Galenical* and *Chemical* pharmacy. But for this diviſion there is no foundation in nature: and accordingly proceſſes in one pharmacopœia referred to the head of Chemical, are in another referred to the head of Galenical. There can be no doubt, that even the moſt ſimple pharmaceutical preparations are to a certain extent chemical. Hence this diviſion, founded on prejudice, and ſupported merely by a veneration for antiquity, is now baniſhed from almoſt every modern pharmacopœia.

Pharmacy has alſo been divided into *Theoretical* and *Practical*; the firſt, conſiſting not merely of ſpeculative opinions, but of a knowledge of facts and principles, tending to explain the *rationale* of proceſſes; the latter, comprehending the mere manual labour employed in proceſſes.

The former of theſe may therefore be juſtly ſtyled *Scientific Pharmacy*. And there can be no doubt that an acquaintance with it is eſſentially neceſſary to the phyſician as well as the apothecary: for without it he muſt often err in the forms of preparations and compoſitions which he employs; and muſt be often deceived in the effects reſulting from compoſitions, when he infers their properties from the known powers of the ingredients in their ſeparate ſtate.

The theory of pharmacy therefore is the ſame with that of chemiſtry; as are alſo the operations, which remain to be diſcuſſed here only in as far as they are made ſubſervient to the medicinal art, diſtinct from that which is purely chemical. The objects of pharmacy, however, are much more limited than thoſe of chemiſtry; the latter comprehending, in the utmoſt latitude of the word, almoſt every ſubſtance in nature; while pharmacy regards only ſuch bodies in the vegetable, animal, and mineral kingdoms, as, by their effects on the human frame, tend to preſerve health, or to reſtore it when loſt. 2 Objects of pharmacy.

PART I. ELEMENTS OF PHARMACY.

CHAP. I. *A general View of the Properties and Relations of Medicinal Subſtances.*

SECT. I. *VEGETABLES.*

VEGETABLES are organized bodies, furniſhed with a variety of veſſels for reception, tranſmiſſion, and perſpiration of different fluids. Analogous to animals, they are produced from ſeeds and eggs, and are endowed with functions, by which the aliment they imbibe is changed into new forms, into ſolids and fluids, peculiar to particular plants, and to different parts of the ſame plant.

The analogy between the vegetable and animal kingdoms will appear ſtill more ſtriking, when we conſider that the former exhibit, though in a leſs degree, all the phenomena of ſenſibility and motion.

The *pabulum* of vegetables, like that of moſt animals, is of a mixed nature; and is compoſed of the neceſſary union of water, heat, and light, and leſs neceſſarily of air and earth: the office of theſe two laſt elements ſeems to be that of filtres, or vehicles for conveying the other principles in proper form.

From varieties in the ſtate and proportion of theſe ſeveral agents, a very multiplied diverſity takes place in the external form, quantity, and quality, of one and the ſame vegetable: hence the difference of plants from the ſoil, climate, ſeaſon, and other ſimilar circumſtances. The influence of heat and light, or what is probably the ſame thing, the abſorption of the inflammable principle, is perhaps the moſt important article in the aliment of vegetables. This principle, whether derived from the ſolar rays, from putrid matters employed in manure, or from the putrefaction of the wild growth, aſſiſted by calcareous earths and other ſeptics, is found at all times to modify, in a peculiar manner, the form, the quantity, and even the ſenſible and inherent properties, of vegetables. It is of importance however to remark, that the ſoundneſs and ſpecific principles of vegetables are not invariably the more complete in proportion to the vigour of their growth; high health, which is always a dangerous ſtate in the conſtitution of animals, is often the means 5 Influence of ſoil, climate, heat, and light, on vegetables.

(A) For this article we are indebted to the liberality of Mr Creech bookſeller in Edinburgh, who, with his well known zeal for the cultivation of ſcience, and, regardleſs of the advantage to be expected from his copy-right, has permitted us to inſert into this work the third and much improved edition of the Edinburgh New Diſpenſatory.

Elements.

means of perverting or deſtroying the economy of vegetable life. Thus the finer aromatics, which naturally inhabit the dry and ſandy ſoils, when tranſplanted into a moiſt and rich one, or, in other words, when placed in mould abounding with the *fomites* of inflammable principle, grow with rapidity and vigour, and have their bulk conſiderably increaſed; but loſe very much of their fragrance, as if their active principles were exhauſted by the luxuriance of their growth.

6 Plants differ in the different periods of their growth.

Plants are alſo found to differ conſiderably in the different periods of their growth. Thus, ſome herbs in their infancy abound moſt with odoriferous matter; others again yield little or none till they have attained to a more advanced age. Many fruits, in their immature ſtate, contain an auſtere acid juice, which by maturation is changed into a ſweet one: others, as the orange, are firſt warm and aromatic, and afterwards by degrees become filled with a ſtrong acid. The common grain, and ſundry other ſeeds, when beginning to vegetate, are in taſte remarkably ſweet: yet the kernels of certain fruits prove, at the ſame period, extremely acid. The roots of ſome of our indigenous plants, whoſe juice is, during the ſummer, thin and watery, if wounded early in the ſpring, yield rich balſamic juices, which, expoſed to a gentle warmth, ſoon concrete into ſolid gummy-reſins, ſuperior to many of thoſe brought from abroad. In open expoſures, dry ſoils, and fair warm ſeaſons, aromatic plants become ſtronger and more fragrant, while thoſe of an oppoſite nature become weaker. To theſe particulars, therefore, due regard ought to be had in collecting plants for medicinal uſes.

7 Different parts of the ſame plant of different qualities from each other.

It may be proper to obſerve alſo, that the different parts of one plant are often very different in quality from each other. Thus the bitter herb wormwood riſes from an aromatic root; and the narcotic poppy-head includes ſeeds which have no narcotic power. Theſe differences, though very obvious in the common culinary plants, do not ſeem to have been ſufficiently obſerved or attended to, in thoſe plants that have been admitted as articles of the materia medica.

8 Vegetables obnoxious to diſeaſe and death.

Without any obvious dependence on the circumſtances above-mentioned, vegetables are, like animals, alſo obnoxious to diſeaſes and death; which, whether occaſioned by intenſe cold, by inſects, lightning, or other cauſes, always maintain a ſtriking analogy to the affections of animals. The principal difference between animals and vegetables is, that the ſeveral parts of vegetables do not conſtitute ſuch a mutually depending ſyſtem as thoſe of the more perfect animals: Hence it is, that a very conſiderable part of a plant may be diſeaſed or dead, while the reſt enjoys perfect good life and health. Though the phyſiology of vegetables is hitherto inſufficient for forming any complete doctrines of the cauſes and cure of their ſeveral diſeaſes; yet, in many caſes, it might be uſeful to attend to the formation of a pathology of the vegetable kingdom: in the ſtate even of our preſent knowledge, it is of importance in the ſtudy of pharmacy to be aware that ſuch diſeaſes really exiſt, and are capable of changing or deſtroying the active principles of many of our moſt valuable herbs. In the plants more evidently ſenſitive, the diſeaſes exhibit a very cloſe analogy to many of thoſe of animals: ſeveral of the remote cauſes are ſuch as are known to obſtruct perſpiration, to induce general debility, or otherwiſe diſorder the animal economy. The diſeaſes alſo are evidently marked by a diminution of their ſenſitive and moving principle; and perhaps, in conſequence of this diminution, their ſolids, their ſap, and other fluids, ſhrivel and decay, and the whole plant aſſumes new forms, and is impregnated with inert, or fraught with noxious principles. Analogous alſo to animals, the plant, when deprived of the living principle, runs into all thoſe changes common to what is called *inanimate matter*. We ſhall now proceed to examine the changes to which vegetables are ſubject.

I. *Productions from Vegetables by* Fermentation.

9 Fermentation.

Fermentation is a ſpontaneous motion excited in dead vegetables and animals, which is peculiar to thoſe organic ſubſtances in conſequence of the principle of vegetable or animal life. See Fermentation.

The circumſtances favouring fermentation are in general, a certain degree of fluidity, a certain degree of heat, and the contact of the air.

There are, however, ſeveral ſubſtances, of themſelves not ſuſceptible of fermentation, which nevertheleſs may be brought into that ſtate by the admixture of thoſe that are; as by adding to them, along with a proper quantity of water, a portion of the yeſt or head thrown up to the ſurface of fermenting liquors. Without this expedient many vegetables would run immediately into the acetous, and ſome of them into the putrefactive, fermentations. It is alſo found, that though acetous and putrefactive ferments are unable to ſtop the vinous fermentation, they are however capable of aſſimilating the liquor to their own nature in a more perfect form: and hence it is, that in the manufactures of wine, rum, and vinegar, it is found uſeful to keep the veſſels well ſeaſoned with the liquor intended to be prepared. Three different kinds or ſtages of fermentation have been generally diſtinguiſhed by chemiſts. The vinous, which furniſhes alcohol, or what is commonly called *ſpirit*; the acetous, which affords vinegar; and the putrefactive, which yields volatile alkali. Being generally conſtant in ſucceſſion to each other, the whole proceſs will be beſt underſtood by conſidering each of them apart. All vegetable ſubſtances are not capable of the vinous fermentation: the conditions neceſſary to its production are, a ſaccharo-mucilaginous matter; a fluidity ſomewhat viſcous, the proper degree of which is beſt learned from experience; a heat from 40 to 96 of Fahrenheit's thermometer; and the acceſs of the external air.

10 Three different ſtages of fermentation.

11 Vinous fermentation.

The phenomena exhibited in the vinous fermentation are, a briſk tumultuary motion, the liquor loſes its tranſparency and homogeneous appearance, its bulk and heat are conſiderably increaſed, the ſolid parts are buoyed up to the top, and a great quantity of a permanently elaſtic fluid is diſengaged. This fluid or gas being heavier than atmoſpheric air, floats in ſeparate maſſes near the ſurface of the liquor; and is eaſily diſtinguiſhable from common air by extinguiſhing flame and animal life, precipitating lime from limewater, cryſtalliſing and rendering mild the cauſtic

caustic alkali: is the gas sylvestre of Helmont, and the fixed air, aerial acid, or carbonic acid of modern chemists. After some time the tumultuary motion in the liquor is suddenly checked, perhaps from the generation of the alcohol; a fine ley is also precipitated; and the floating matter, if not purposely prevented, subsides to the bottom of the vessel. In the wines produced from the grape, a large quantity of saline concrete is incrusted on the sides and bottom of the casks; and this is commonly known by the name of *tartar*, the properties of which we shall afterwards examine. At the termination of these phenomena, the vegetable matter has assumed new properties; and from being a mild, sweet, or gently acidulous infusion, is now become the brisk, pungent, and inebriating liquor, called *wine* or *vinous liquor*.

Fermented or vinous liquors are prepared from a great variety of substances: the saccharine substances, or those rendered so by a beginning vegetation, are in general fittest for the purpose; a multitude of collateral circumstances are also necessary for the proper management of the process; and in vinous liquors great diversities are observable. These differences are not only observable in wines produced from different substances, but also in those prepared from one and the same vegetable. These diversities may be referred to the different conditions of the substance to be fermented, to the states of fluidity and heat, and to the degree of fermentation to which the subject has been carried. This last is principally modified by the preceding causes, and not unfrequently by very minute and apparently trifling circumstances in the conduct of the operator. Hence the numerous varieties in the vinous liquors produced from the grape, which have been more peculiarly denominated *wines*. It is an important part of pharmacy to inquire into these differences with care and attention.

The diversity in vinous liquors is still more obvious in those produced from different vegetables. Many of the native qualities of the substances, as colour, taste, flavour, &c. often remain in the wine; not being totally subdued by that degree of fermentation necessary for rendering the liquor vinous. Hence the remarkable difference of wines produced from the grape and the graminous seeds: the wine produced from these last has been more strictly called *beer*; and is well known to differ from wines produced from apples, pears, apricots, or any other fruit.

1. Of the Product of the Vinous Fermentation.

The product of all these fermented vegetables is, as we have just now mentioned, the pungent and intoxicating liquor called *wine*. It is proper, however, in pharmacy, to inquire into the different principles which enter its composition. As the wine furnished by grapes is the most valuable and generally known, we shall take it as an example: Grape-wine, then, is composed of a large quantity of water, of alcohol, of tartar, and of a colouring matter. It is proper, however, that we should lay down the proofs of such a combination in wine, and explain the methods by which it may be decomposed and separated into the constituent parts above-mentioned.

For this purpose, recourse is generally had to the assistance of the fire. The liquor is put into an alembic; and as soon as it boils, a white milky fluid, of a pungent smell and taste, distils into the recipient. This fluid is called *aquavitæ*, or, in common language, *spirit*: it is compounded of water and certain matters capable of suspension in water, of alcohol, and of a small proportion of oil; which last communicates to it a milky colour: the yellow colour, afterwards assumed, is partly owing to the same oil, and partly to a solution of the extractive matter of the wooden casks in which the aquavitæ has been kept. This aquavitæ, like wine, always partakes more or less of the flavour of the vegetable from whence it has been prepared; but by farther distillation, and other processes, it is freed of its water, and of the native principles of the vegetable matter which the watery parts had kept in solution; when thus prepared, it is a pure *alcohol* or *inflammable spirit*, which is always the same from whatever vegetable the wine was produced. Elements.

After all the aquavitæ has been drawn off, the residuum now ceases to be wine; it is of a chocolate colour, of an acid and austere taste; it has now assumed a heterogeneous appearance, and a great quantity of saline crystals is observed in the liquor; these crystals are the *tartar*. By the above processes, then, we have fully decomposed *wine*: but it is to be observed, that by this analysis we have not separated the different parts of wine in their original and entire state; nor are we hitherto acquainted with any method of regenerating the wine by recombining the aquavitæ with the residuum: some product of the fermentation is therefore changed or destroyed; and this product is probably some peculiar modification of fixed air or aerial acid. The residuum, when evaporated, assumes the form and consistence of an extract; the colouring part may be abstracted by rectified spirit of wine, but is not separable from it by the addition of water: it seems therefore to be of a gummi-resinous nature, and extracted from the grape by means of the alcohol generated during the fermentation.

15 Water, colouring matter, alcohol, &c.

From this analysis, then, it is obvious, that wine is composed of water, colouring matter, alcohol, and a something that is changed or lost. We shall reserve the particular examination of alcohol and tartar to the proper places assigned them in this work; and we hope that from this general survey of the subject, the properties of wine, as a solvent of several medicinal substances to be afterwards examined, will be much more readily understood. Before we go farther, it is proper to add, that the *ley* precipitated from wine during fermentation, is a compound of stones, pieces of grape, tartar, and vitriolated tartar: the two first are inert bodies; the two last we shall particularly examine in their proper order. We are now prepared to consider the nature and product of the next kind or stage of fermentation, viz. the

2. Acetous Fermentation.

16 Process of acetous fermentation.

To understand the process of the acetous fermentation, we must leave for the present our analysis of the product of the vinous fermentation, and return to the wine in its most perfect and entire state. It is proper to observe, that though, after the liquor has become vinous, a partial cessation of the more obvious

Elements. phenomena takes place, yet the wine ſtill ſuffers a ſlow and imperceptible degree of fermentation. We are not then to conſider the liquor as being in a quieſcent ſtate, but as conſtantly approaching to the next ſtage, viz. the *acetous fermentation*, which we are now to conſider. This kind of inſenſible fermentation, or what we may call the intermediate change, ſeems to be neceſſary to the perfection of the wine. Its degree, however, is to be regulated under certain limitations: when too much checked, as by cold, thunder, or ſuch like cauſes, the wine becomes vapid; when too much encouraged by heat, contact of air, &c. it approaches too far to the acetous change: but in order that the vinous ſhall proceed fully to the acetous fermentation, ſeveral circumſtances are required; and theſe are in general the ſame that were before neceſſary to the vinous ſtage. Theſe conditions are, a temperate degree of heat, a quantity of unfermented mucilage, an acid matter, ſuch as tartar, and the free acceſs of external air. When thus ſituated, the liquor ſoon paſſes into the acetous fermentation: but during this ſtage the phenomena are not ſo remarkable as in the vinous; the motion of air is now leſs conſiderable, a groſs unctuous matter ſeparates to the bottom, the liquor loſes its vinous taſte and flavour, becomes ſour, and on diſtillation affords no inflammable ſpirit. It is now the acetous acid or vinegar; and when ſeparated by diſtillation from the unctuous ley, may be preſerved a conſiderable length of time without undergoing the putrid change: to this laſt, however, it always approaches in the ſame manner as the vinous conſtantly verges to the acetous fermentation; and this will much more readily happen if the acid be allowed to remain with the unctuous feculent matter above-mentioned. When thus ſituated, the vinegar quickly loſes its tranſparency, aſſumes a blackiſh colour, loſes its ſourneſs and agreeable odour, has an offenſive taſte and ſmell, and, when diſtilled at a certain period of the proceſs, yields volatile alkali.

17 Vinegar.

The liquor is now arrived to the laſt ſtage, viz.

3. The Putrefactive Fermentation.

From the preceding phenomena, it is obvious, that the ſame ſubſtance which is capable of the vinous and acetous, is alſo capable of the putrefactive, fermentation. It is perhaps impoſſible to induce the firſt without a mixture of the ſecond; or the ſecond without a mixture of the third. Hence every wine is a little acid; and there are few vinegars without ſome diſpoſition towards putrefaction, or without volatile alkali, neutralized by the acid which predominates. Nothwithſtanding this ſeeming continuation of one and the ſame proceſs, the putrefaction of vegetables has its particular phenomena. The vegetable matter, if in a fluid ſtate, becomes turbid, and depoſits a large quantity of feculent matter; a conſiderable number of air-bubbles are raiſed to the top; but their motion is not ſo briſk in the putrefactive as in the vinous, or even the acetous fermentation: neither the bulk nor heat of the liquor ſeems to be increaſed; but an acrid pungent vapour is perceived by the ſmell, and which, by chemical trials, is found to be the volatile alkali; by degrees this pungent odour is changed into one leſs pungent, but much more nauſeous. If the ſame train of phenomena have taken place in a vegetable conſiſting of parts ſomewhat ſolid, its cohesion is broke down into a ſoft pulpy maſs; this maſs, on drying, entirely loſes its odour, leaving a black cherry-like reſiduum, containing nothing but earthy and ſaline ſubſtances.

18 Phenomena of putrefactive fermentation.

It is proper to obſerve, that though the circumſtances favouring the putrefactive are the ſame with thoſe requiſite to the vinous and acetous fermentations, yet theſe ſeveral conditions are not ſo indiſpenſable to the former as to the two latter ſtages. All vegetables have more or leſs tendency to putrefaction, and a great number of them are capable of the acetous fermentation: but the proportion of thoſe capable of the vinous is not conſiderable; and theſe laſt will run into the putrid in circumſtances in which they cannot undergo the vinous or even the acetous fermentations. Thus flour made into a ſoft paſte will become ſour; but it muſt be perfectly diſſolved in water to make it fit for the vinous ſtage; whereas mere dampneſs is ſufficient to make it paſs to the putrid fermentation: beſides the condition of fluidity, a leſs degree of heat, and a more limited acceſs of air, are ſufficient for producing the putrefactive fermentation.

It is therefore probable, that all vegetables, in whatever ſtate they may be, are liable to a kind of putrefaction: in ſome the change is ſlow and gradual, but never fails at length to break down the texture and cohesion of the moſt ſolid.

We formerly obſerved, that the vapours ſeparated during the vinous fermentation were fixed air or aerial acid; and it is indeed true, that in the incipient ſtate of this fermentation a quantity of gas is ſtill evolved, and along with it a quantity of alkaline air: in the advanced ſtate, however, we find theſe vapours of a different nature; they now tarniſh ſilver, and render combinations of lead with the vegetable acids black. When produced in large quantity, and much confined, as happens in ſtacks of hay put up wet, they burſt into actual flame, conſuming the hay to aſhes: on other occaſions, the eſcape of theſe vapours diſcovers itſelf by an emiſſion of light, as in the luminous appearance of rotten wood when placed in the dark. From the above phenomena it is evident, that theſe vapours abound with the principle of inflammability; and their odour probably depends on this principle looſely combined with the water, or ſome other parts of the volatiliſed matter. This gas is therefore different from that ſeparated during the vinous fermentation; it is the phlogiſticated, and ſometimes the inflammable air of Dr Prieſtley, or the hydrogen of Lavoiſier. See table of chemical nomenclature, &c. Chemistry, page 598.

19 Hydrogen

We have thus, for the ſake of clearneſs, and in order to comprehend the whole of the ſubject, traced the phenomena of fermentation through its different ſtages: it is proper, however, to obſerve, that though every vegetable that has ſuffered the vinous will proceed to the acetous and putrefactive fermentations, yet the ſecond ſtage is not neceſſarily preceded by the firſt, nor the third by the ſecond; or in other words, the acetous fermentation is not neceſſarily confined to thoſe ſubſtances which have undergone the vinous, nor the putrefactive to thoſe which have undergone the acetous fermentation. Thus it is, that gums diſſolved in water paſs to the

nts. acetous without undergoing the vinnus fermentation; and glutinous matter seems to run into putrefaction without showing any previous acescence: and farther, these changes frequently happen although the matter lie under those conditions which are favourable to the preceding stages.

From the foregoing sketch, the importance of this subject in the study of Pharmacy will be obvious at first sight: it cannot, however, afford us any useful information on the native principles of vegetables; but it presents to us new products, the importance of which is well known in chemistry, in medicine, and in arts. The necessity of being well acquainted with the several facts (for of theory we know none satisfactory), will appear in the pharmaceutical history and preparation of many of our most valuable drugs. We are next to consider a set of no less complicated operations, *viz.*

Elements.

II. *Productions from vegetables by* Fire.

hi- fire. In order to analyse, or rather to decompose, vegetables by the naked fire, any given quantity of dry vegetable matter is put into a retort of glass or earth. Having filled the vessel about one half or two thirds, we place it in a reverberatory furnace, adapting it to a proper receiver. To collect the elastic fluids, which, if confined, would burst the vessels (and which, too, it is proper to preserve, as being real products of the analysis), we use a perforated receiver with a crooked tube, the extremity of which is received into a vessel full of water, or of mercury, and inverted in a bason containing the same fluid: by this contrivance, the liquid matters are collected in the receiver, and the aeriform fluids pass into the inverted vessel. If the vegetable is capable of yielding any saline matter in a concrete state, we interpose between the retort and the receiver another vessel, upon whose sides the salt sublimes. These things being properly adjusted, we apply at first a gentle heat, and increase it gradually, that we may observe the different products in proper order. At first an insipid watery liquor passes over, which is chiefly composed of the water of vegetation; on the heat being a little farther increased, this watery liquor, or phlegm, becomes charged with an oily matter, having the odour of the vegetable, if it possessed any in its entire state; along with this oil we also obtain an acid resembling vinegar, and which communicates to the oil somewhat of a saponaceous nature; on the heat being carried still farther, we procure more acid, with an oil of a dark colour, and the colour gradually deepens as the distillation advances. The oil now ceases to retain the peculiar odour of the vegetable; and being scorched by the heat, sends forth a strong disagreeable smell like tar: it is then called *empyreumatic oil*. About this time also some elastic vapours rush into the inverted vessel; these generally consist of inflammable or fixed airs, and very often of a mixture of both; the volatile salt now also sublimes, if the vegetable was of a nature to furnish it. By the time the matter in the retort has acquired a dull red heat, nothing further will arise: we then stop; and allowing the vessel to cool, we find a mass of charcoal, retaining more or less the form and appearance of the vegetable before its decomposition.

We have thus described, in the order of their succession, the several products obtained from the generality of vegetables when analysed in close vessels and in a naked fire.

It is, however, to be understood, that the proportion of these principles turns out very various; the more succulent yield more water, and the more solid afford a greater quantity of the other principles. Independently also of this difference, the nature of the products themselves are found to differ in different vegetables: thus in the cruciform plants, and in the emulsive and farinaceous seeds, the saline matter which comes over with the water and oil is found to be alkaline; sometimes it is ammoniacal, from the combination of the acid with the volatile alkali passing over at the end of the process; it is also probable, that the acids of vegetables are not all of the same nature, though they exhibit the same external marks. When volatile alkali is obtained, it is always found in the mild effervescing state; it is procured, however, from a few vegetables only; it is seldom in a concrete form, being generally dissolved in the phlegm; and as it ordinarily makes its appearance about the end of the process, it is probable that its formation is owing to some peculiar combination of the oil and fixed alkali. The plants containing much oily combustible matter seem to be those which more peculiarly yield inflammable air, while the mucilages appear to be as peculiarly fitted for affording the fixed air or aerial acid. The chemical properties of charcoal seem to be always the same from whatever vegetable it has been produced: on a minute examination (which, however, is not the business of pharmacy), it is found to consist of fixed air, the principle of inflammability, a small quantity of earth, saline matter, and a little water. The whole of the analysis then amounts to air, water, earth, and the principle of inflammability; for by repeated distillations the oil is resolved into water, the principle of inflammability, and a little earth; the saline matter also is a product arising from a combination of the earthy matter with water or the principle of inflammability, in some shape or other, or perhaps with both. That these combinations take place, has at least been the opinion of the chemists.

21 Different in different vegetables, though

22 all composed of air, water, earth, &c.

We formerly said that charcoal was partly composed of saline matter; it therefore remains that we should next decompose the charcoal, in order to obtain or separate the articles next to be mentioned.

The fixed Salts of Vegetables.

When vegetable charcoal has been burnt, there remains a quantity of ashes or cinders of a blackish grey or white colour: these, when boiled or infused in water, communicate to it a pungent saline taste; the salt thus held in solution may, by evaporation, be reduced to a concrete state: this saline matter, however, is generally found to be mixed with ferruginous earthy and other impurities, and likewise with a number of neutral salts of different kinds. In this mixed condition it is the

Potashes used in Commerce.

23 Potashes, how procured.

This salt, or rather compound of different salts, is procured by burning large quantities of wood of any kind; and this process is called *incineration*: the predominating salt, however, is alkaline; and as the neu-

Elements. tral salts are obtained to better advantage by other means, they are generally neglected in the purification of potashes. Potashes, then, freed from its impurities, and separated from the other salts by processes to be hereafter mentioned, is now

The fixed vegetable Alkali.

24 Fixed vegetable alkali, characters of. Alkalis in general are distinguished by a pungent taste, the very reverse of that of fourness; by their destroying the acidity of every sour liquor; and by their changing the blue and red colours of vegetables to a green: they attract more or less the moisture of the air, and some of them deliquate. The fixed alkalis, which we shall at present consider more particularly, are fusible by a gentle heat: by a greater degree of heat they are dissipated; their fixity, therefore, is only relative to the other kind of alkalis, *viz.* the volatile: they dissolve and form glass with earths: and, lastly, when joined with acids to the point of saturation, they form what are called *Neutral Salts*.

These characters will afford some necessary and preliminary knowledge of these substances in general; and we shall afterwards find that they are sufficient to distinguish them from all other saline bodies: it is necessary, however, to examine them more minutely, for our analysis has not yet reached so far as to present them in their simplest state. Previous to the discoveries of Dr Black, the vegetable fixed alkali (which we at present speak of particularly), when separated from the foreign matters with which it is mixed in the ashes, was considered to be in its purest state: we shall afterwards find that it is still a compound body, and is really a neutral salt, compounded of pure alkali, and fixed air or the aerial acid. We presume, then, that the particular history of its chemical and medicinal properties will be better understood when we come to those processes by which it is brought to its most pure and simple state: See CHEMISTRY. We shall only therefore observe for the present, that fixed vegetable alkali, not only in its pure state, but also when neutralised by aerial acid, seems always to be one and the same thing, from whatever vegetable it has been produced. Those of some sea-plants must, however, be excepted: the saline matter obtained from these last is, like the former, in a mixed and impure state; it differs, however, from potashes, in containing an alkali of somewhat different properties. The cinder of sea-plants containing this alkali is called

Soda.

25 Soda, or natron, whence produced. Soda, then, as we have just now hinted, is produced by the incineration of the kali and other sea-plants: And from this impure and mixed mass of cinder, is obtained the marine, mineral, or muriatic alkali, or natron, as it is now denominated by the London College. This alkali has acquired these names, because it is the base of the common marine or sea-salt: it differs from the vegetable alkali in being more easily crystallizable; when dried, it does not like the former attract humidity sufficient to form a liquid; it is somewhat less pungent to the taste, and, according to Bergman, has less attraction for acids than the vegetable alkali.

It is, however, to be observed, that this alkali, when deprived of fixed air, that is to say, when brought to its purest state, can scarcely, if at all, be distinguished from the vegetable alkali; and indeed the true distinction can only be formed from their combinations, each of them affording with the same acid very different neutral salts. It belonged to this place to mention some of the characters of alkalis in general, and also some of those marks by which the vegetable and mineral alkalis are distinguished from each other: but for a more particular history of their chemical and medicinal properties, we refer to an account of the pharmaceutical preparations. As the volatile alkali is rarely produced from vegetables, but is generally obtained from animal matter, we shall consider that kind of alkali when we come to analyse the animal kingdom.

Of Vegetable Earth.

26 Vegetable earth, what it is. After all the saline matter contained in the ashes of vegetables has been washed off by the processes before mentioned, there yet remains one insipid earthy-like powder, generally of a whitish colour, insoluble in water, and from which some iron may be attracted by the magnet. It is said to have formed alum with the vitriolic acid; a kind of selenite has also been obtained, but somewhat different from that produced by the union of the same acid with calcareous earth; this residuum of burnt vegetables differs also from calcareous earth, in not being susceptible of becoming quicklime by calcination. It has been found that this residuum, instead of an earth, is a calcareous phosphoric salt, similar to that obtained from the bones of animals.

We have thus finished our analysis of vegetables by the naked fire; and have only to observe, that, like the analysis by fermentation, it can afford us no useful information on the native principles of the vegetable itself.

When chemistry began first to be formed into a rational science, and to examine the component parts and internal constitution of bodies, it was imagined, that this resolution of vegetables by fire, discovering us all their active principles, unclogged and unmixed with each other, would afford the surest means of judging of their medicinal powers. But on prosecuting these experiments, it was soon found that they were insufficient for that end: that the analyses of poisonous and esculent plants agreed often as nearly as the analyses of one plant: that by the action of a burning heat, two principles of vegetables are not barely separated, but altered, transposed, and combined into new forms; insomuch that it was impossible to know in what form they existed, and with what qualities they were endowed, before these changes and transpositions happened. If, for example, 32 ounces of a certain vegetable substance are found to yield ten ounces and a half of acid liquor, above one ounce and five drams of oil, and three drams and a half of fixed alkaline salt: what idea can this analysis give of the medicinal qualities of *gum Arabic?*

III. *Substances naturally contained in vegetables, and separable by Art without Alteration of their native Qualities.*

27 It has been supposed, that there is one general fluid or blood which is common to all vegetables, and from which the fluids peculiar to particular plants and their parts are prepared by a kind of secretion: To this sup-

posed general fluid botanists have given the name of *sap*. This opinion is rendered plausible from the analogy in many other respects between vegetable and animal substances: and indeed if we consider the water of vegetation as this general fluid, the opinion is perhaps not very far from the truth; but the notion has been carried much farther than supposing it to be mere water; and the opinion of naturalists on this subject does not seem to be well supported by experience. It is difficult to extract this sap without any mixture of their constituent parts. But in a few vegetables, from which it distils by wounding their bark, we find this supposed general blood possessing properties not a little various: Thus the juice effused from a wounded birch is considerably different from that poured out from an incision in the vine.

1. Gross Oils.

Vegetables, like animals, contain an oil in two different states. That is, in several vegetables a certain quantity of oil is superabundant to their constitution, is often lodged in distinct reservoirs, and does not enter into the composition of their other principles: in most vegetables, again, another quantity of oil is combined, and makes a constituent part of their principles. Of this last we formerly spoke in our analysis of vegetables by fire; and it is the former we mean to consider, under the three following heads.

Gross oils abound chiefly in the kernels of fruits, and in certain seeds; from which they are commonly extracted by expression, and are hence distinguished by the name of *expressed oils*. They are contained also in all the parts of all vegetables that have been examined, and may be forced out by vehemence of fire; but here their qualities are much altered in the process by which they are extracted or discovered, as we have seen under the foregoing head.

These oils, in their common state, are not dissoluble either in vinous spirits or in water, though by means of certain intermedia they may be united both with the one and the other. Thus a skilful interposition of sugar renders them miscible with water into what are called *lohochs* and *oily draughts*; by the intervention of gum or mucilage they unite with water into a milky fluid: by alkaline salts they are changed into a soap, which is miscible both with water and spiritous liquors, and is perfectly dissolved by the latter into an uniform transparent fluid. The addition of any acid to the soapy solution absorbs the alkaline salt; and the oil, which of course separates, is found to have undergone this remarkable change, that it now dissolves without any intermedium in pure spirit of wine.

Expressed oils exposed to the cold lose their fluidity greatly: some of them, in a small degree of cold, congeal into a consistent mass. Kept for some time in a warm air, they become thin and highly rancid: their soft, lubricating, and relaxing quality is changed into a sharp acrimonious one: and in this state, instead of allaying, they occasion irritation; instead of obtunding corrosive humours, they corrode and inflame. These oils are liable to the same noxious alteration while contained in the original subject: hence arises the rancidity which the oily seeds and kernels, as almonds and those called the *cold seeds*, are so liable to contract in keeping. Nevertheless, on triturating these seeds or kernels with water, the oil, by the intervention of the other matter of the subject, unites with the water, into an emulsion or milky liquor, which, instead of growing rancid, turns sour on standing.

It appears then that some kind of fermentation goes on in the progress of oils in the rancid state; and it would seem from some experiments by Mr Macquer, that an acid is evolved, which renders them more soluble in spirit of wine than before.

In the heat of boiling water, and even in a degree of heat as much exceeding this as the heat of boiling water does that of the human body, these oils suffer little dissipation of their parts. In a greater heat they emit a pungent vapour, seemingly of the acid kind; and when suffered to grow cold again, they are found to have acquired a greater degree of consistence than they had before, together with an acrid taste. In a heat approaching to ignition, in close vessels, the greatest part of the oil arises in an empyreumatic state, a black coal remaining behind.

2. Gross sebaceous matter.

36 Properties of sebaceous matter.

From the kernels of some fruits, as that of the chocolate nut, we obtain, instead of a fluid oil, a substance of a butyraceous consistence; and from others, as the nutmeg, a solid matter as firm as tallow. These concretes are most commodiously extracted by boiling the substance in water: the sebaceous matter, liquefied by the heat, separates and arises to the surface, and resumes its proper consistence as the liquor cools.

The substances of this class have the same general properties with expressed oils, but are less disposed to become rancid in keeping than most of the common fluid oils. It is supposed by the chemists, that their thick consistence is owing to a larger admixture of an acid principle: for, in their resolution by fire, they yield a vapour more sensibly acid than the fluid oils; and fluid oils, by the admixture of concentrated acids, are reduced to a thick or solid mass.

3. Essential Oils.

37 Essential oils, whence obtained.

Essential oils are obtained only from those vegetables, or parts of vegetables, that are considerably odorous. They are the direct principle in which the odour, and oftentimes the warmth, pungency, and other active powers of the subject, reside; whence their name of *essences* or *essential oils*.

Essential oils are secreted fluids; and are often lodged in one part of the plant, while the rest are entirely void of them. Sometimes they are found in separate spaces or receptacles; and are there visible by the naked eye: thus, in the rind of lemons, oranges, citrons, and many others, there are placed everywhere small pellucid vesicles, which, by pressing the peel near to the flame of a candle, squirt out a quantity of essential oil, forming a stream of lambent flame: hence, too, an oleosaccharum may be made, by rubbing the exterior surface of these peels with a piece of lump sugar, which at once tears open these vesicles, and absorbs their contained oil.

Essential oils unite with rectified spirit of wine, and compose with it one homogeneous transparent fluid; though some of them require for this purpose a much larger

Elements.

larger proportion of the ſpirit than others. The difference of their ſolubility perhaps depends on the quantity of diſengaged acid; that being found by Mr Macquer not only to promote the ſolution of eſſential oils, but even of thoſe of the unctuous kind. Water alſo, though it does not diſſolve their whole ſubſtance, may be made to imbibe ſome portion of their more ſubtile matter, ſo as to become conſiderably impregnated with their flavour; by the admixture of ſugar, gum, the yolk of an egg, or alkaline ſalts, they are made totally diſſoluble in water. Digeſted with volatile alkali, they undergo various changes of colour, and ſome of the leſs odorous acquire conſiderable degrees of fragrance; while fixed alkali univerſally impairs their odour.

32 Their properties.

The ſpecific gravity of moſt of theſe oils is leſs than that of water: ſome of them, however, are ſo heavy as to ſink in water; but theſe varieties ſhall be noticed when we come to their preparation.

In the heat of boiling water, theſe oils totally exhale; and on this principle they are commonly extracted from ſubjects that contain them; for no other fluid, which naturally exiſts in vegetables, is exhalable by that degree of heat, excepting the aqueous moiſture, from which the greateſt part of the oil is eaſily ſeparated. Some of theſe oils ariſe with a much leſs heat, a heat little greater than that in which water begins viſibly to evaporate. In their reſolution by a burning heat, they differ little from expreſſed oils.

Eſſential oils, expoſed for ſome time to a warm air, ſuffer an alteration very different from that which the expreſſed undergo. Inſtead of growing thin, rancid, and acrimonious, they gradually become thick, and at length harden into a ſolid brittle concrete; with a remarkable diminution of their volatility, fragrancy, pungency, and warm ſtimulating quality. In this ſtate, they are found to conſiſt of two kinds of matter; a fluid oil, volatile in the heat of boiling water, and nearly of the ſame quality with the original oil; and of a groſſer ſubſtance which remains behind, not exhalable without a burning heat, or ſuch as changes its nature, and reſolves it into an acid, an empyreumatic oil, and a black coal.

The admixture of a concentrated acid inſtantly produces, in eſſential oils, a change nearly ſimilar to that which time effects. In making theſe kinds of mixtures, the operator ought to be on his guard; for when a ſtrong acid, particularly that of nitre, is poured haſtily into an eſſential oil, a great heat and ebullition enſue, and often an exploſion happens, or the mixture burſts into flame. The union of expreſſed oils with acids is accompanied with much leſs conflict.

4. Concrete eſſential oil.

33 Concrete eſſential oil.

Some vegetables, as roſes and elecampane root, inſtead of a fluid eſſential oil, yield a ſubſtance poſſeſſing the ſame general properties, but of a thick or ſebaceous conſiſtence. This ſubſtance appears to be of as great volatility and ſubtility of parts as the fluid oils: it equally exhales in the heat of boiling water, and concretes upon the ſurface of the collected vapour. The total exhalation of this matter, and its concreting again into its original conſiſtent ſtate, without any ſeparation of it into a fluid and a ſolid part, diſtinguiſhes it from eſſential oils that have been thickened or indurated by age or by acids.

5. Camphor.

34 Camphor diſtinguiſhing characters of

Camphor is a ſolid concrete, obtained chiefly from the woody parts of certain Indian trees. See CAMPHORA (B). It is volatile like eſſential oils, and ſoluble both in oils and inflammable ſpirits: it unites freely with water by the intervention of gum, but very ſparingly and imperfectly by the other intermedia that render oils miſcible with watery liquors. It differs from the ſebaceous as well as fluid eſſential oils, in ſuffering no ſenſible alteration from long keeping; in being totally exhalable, not only by the heat of boiling water, but in a warm air, without any change or ſeparation of its parts, the laſt particle that remains unexhaled appearing to be of the ſame nature with the original camphor; in its receiving no empyreumatic impreſſion, and ſuffering no reſolution, from any degree of fire to which it can be expoſed in cloſe veſſels, though readily combuſtible in the open air; in being diſſolved by concentrated acids into a liquid form; and in ſeveral other properties which it is needleſs to ſpecify in this place.

6. Aroma,

Or ſpiritus rector, is the name given to the odorous principle of vegetables. Theſe bodies differ greatly from one another in the quantity, ſtrength, and volatility of the odorous principle which they contain. It is generally found united with volatile oils; but it is ſoluble in alcohol and water as well as in theſe. The ſlighteſt degree of heat is ſufficient to diſengage the aroma of plants. To obtain it, the plant muſt be diſtilled in a balneum mariæ, and its vapours received into a cold capital, which may condenſe and afterwards conduct them in a fluid ſtate into the receiver. The product is pure odoriferous water, and is known by the name of eſſential or diſtilled water. This liquor is to be conſidered as a ſolution of the aroma or odorous principle in water. When aromatic water is heated, it loſes its ſmell in conſequence of the odorous principle being more volatile than the fluid in which it was diſſolved. This principle is alſo diſſipated by expoſure to the air. Many facts would induce us to believe, that the principle of ſmell is one of the elementary principles of volatile oils; but we are as yet almoſt completely ignorant of its chemical nature, properties, and combinations.

35 Odorous principle.

7. Reſin.

Eſſential oils, indurated by age or acids, are called *reſins*. When the indurated maſs has been expoſed to the heat of boiling water, till its more ſubtile part, or the pure eſſential oil that remained in it, has exhaled, the groſs matter left behind is likewiſe called *reſin*. We find,

36 Character of reſin.

(B) It may likewiſe be procured from moſt of the volatile oils, by volatilizing the oil in a temperature a few degrees below that which is ſufficient to elevate the camphor.

ents. fin l, in many vegetables, refins analogous both to one and the other of thefe concretes; fome containing a fubtile oil, feparable by the heat of boiling water; others containing nothing that is capable of exhaling in that heat.

Refins in general diffolve in rectified fpirit of wine, though fome of them much lefs eafily than others: it is chiefly by means of this diffolvent that they are extracted from the fubjects in which they are contained. They diffolve alfo in oils both expreffed and effential; and may be united with watery liquors by means of the fame intermedia which render the fluid oils mifcible with water. In a heat lefs than that of boiling water, they melt into an oily fluid; and in this ftate they may be incorporated one with another. In their refolution by fire, in clofe veffels, they yield a manifeft acid, and a large quantity of empyreumatic oil.

8. Gum.

7 di- ilving ters Gum differs from the foregoing fubftances in being uninflammable; for though it may be burnt to a coal, and thence to afhes, it never yields any flame. It differs remarkably alfo in the proportion of the principles into which it is refolved by fire; the quantity of empyreumatic oil being far lefs, and that of an acid far greater. In the heat of boiling water, it fuffers no diffipation: nor does it liquefy like refins; but continues unchanged, till the heat be fo far increafed as to fcorch or turn it to a coal.

By a little quantity of water, it is foftened into a vifcous adhefive mafs, called *mucilage*: by a larger quantity it is diffolved into a fluid, which proves more or lefs glutinous according to the proportion of gum. It does not diffolve in vinous fpirits, or in any kind of oil: nevertheleſs, when foftened with water into a mucilage, it is eafily mifcible both with the fluid oils and with refins; which by this means become foluble in watery liquors along with the gum, and are thus excellently fitted for medicinal purpofes.

This elegant method of uniting oils with aqueous liquors, which has been kept a fecret in few hands, appears to have been known to Dr Grew. "I took (fays he) oil of aniſeeds, and pouring it upon *another body*, I fo ordered it, that it was thereby turned into a perfect milk-white balfam or butter; by which means the oil became mingleable with any vinous or watery liquor, eafily and inſtantaneouſly diſſolving therein in the form of a milk. And note, this is done without the leaſt alteration of the ſmell, taſte, nature, or operation of the ſaid oil. By ſomewhat the ſame means any other ſtillatitious oil may be transformed into a milk-white butter, and in like manner be mingled with water or any other liquor; which is of various uſe in medicine, and what I find oftentimes very convenient and advantageous to be done." (*Grew of Mixture, chap. v. inſt.* i. § 7.) This inquiry has lately been further proſecuted in the firſt volume of the Medical Obſervations publiſhed by a ſociety of phyſicians in London; where various experiments are related, for rendering oils, both eſſential and expreſſed, and different unctuous and reſinous bodies, ſoluble in water by the mediation of gum. Mucilages have alſo been uſed for ſuſpending crude mercury, and ſome other ponderous and inſoluble ſubſtances: the mercury is by this means not a little divided; but it is found that the particles are very apt to run together or ſubſide, if a pretty conſtant agitation be not kept up.

As oily and reſinous ſubſtances are thus united to water by the means of gum, ſo gums may in like manner be united to ſpirit of wine by the intervention of reſins and eſſential oils; though the ſpirit does not take up near ſo much of the gum as water does of the oil or reſin.

Acid liquors, though they thicken pure oils, or render them conſiſtent, do not impede the diſſolution of gum, or of oils blended with gum. Alkaline ſalts, on the contrary, both fixed and volatile, though they render pure oils ſoluble in water, prevent the ſolution of gum, and of mixtures of gum and oil. If any pure gum be diſſolved in water, the addition of any alkali will occaſion the gum to ſeparate, and fall to the bottom in a conſiſtent form; if any oily or reſinous body was previouſly blended with the gum, this alſo ſeparates, and either ſinks to the bottom, or riſes to the top, according to its gravity.

9. Gum-reſin.

By gum-reſin is underſtood a mixture of gum and reſin. Many vegetables contain mixtures of this kind, in which the component parts are ſo intimately united, with the interpoſition perhaps of ſome other matter, that the compound, in a pharmaceutical view, may be conſidered as a diſtinct kind of principle; the whole maſs diſſolving almoſt equally in aqueous and in ſpirituous liquors; and the ſolutions being not turbid or milky, like thoſe of the groſſer mixtures of gum and reſin, but perfectly tranſparent. Such is the aſtringent matter of biſtort root, and the bitter matter of gentian. It were to be wiſhed that we had ſome particular name for this kind of matter; as the term *gum reſin* is appropriated to the groſſeſt mixtures, in which the gummy and reſinous parts are but looſely joined, and eaſily ſeparable from each other. 38 Gum-reſin, of what compounded.

We ſhall afterwards find that it will be convenient to imitate this natural combination by art. As the effects of medicines very generally depend on their ſolubility in the ſtomach, it is often neceſſary to bring their more inſoluble parts, ſuch as reſinous and oily matters, into the ſtate of gum-reſin: this is done, as we have mentioned in the former article, by the mediation of mucilage. By this management theſe matters become much more ſoluble in the ſtomach; and the liquor thus prepared is called an emulſion, from its whitiſh colour, reſembling that of milk.

10. Saline Matter.

Of the ſaline juices of vegetables there are different kinds, which have hitherto been but little examined: the ſweet and the acid ones are the moſt plentiful and the beſt known.

There have lately, however, been diſcovered a conſiderable variety of ſalts in different vegetables. The mild fixed alkali, which was formerly conſidered as a product of the fire, has been obtained from almoſt all plants by macerating them in acids; the vegetable alkali is the moſt common, but the mineral is alſo found in the marine plants. Beſides the fixed alkali, ſeveral other ſalts have been detected in different vegetables; ſuch as vitriolated tartar, common ſalt, Glauber's ſalt, nitre, febrifuge ſalt, and ſelenite. From ſome- 39 Various ſalts in vegetables,

Elements. some experiments, too, the volatile alkali has been ſuppoſed to exiſt ready formed in many plants of the cruciform or tetradynamian tribe.

It is, however, to be underſtood, that though ſome of theſe ſalts are really products of vegetation, others of them are not unfrequently adventitious, being imbibed from the ſoil without any change produced by the functions of the vegetable.

The juices of vegetables, expoſed to a heat equal to that of boiling water, ſuffer generally no other change than the evaporation of their watery parts; the ſaline matter remaining behind, with ſuch of the other fixed parts as were blended with it in the juice. From many plants, after the exhalation of great part of the water, the ſaline matter gradually ſeparates in keeping, and concretes into little ſolid maſſes, leaving the other ſubſtances diſſolved or in a moiſt ſtate; from others, no means have yet been found of obtaining a pure concrete ſalt.

40 Particularly the ſweet and the ſour.

The ſalts more peculiarly native and eſſential to vegetables are the ſweet and the ſour; theſe two are frequently blended together in the ſame vegetable, and ſometimes paſs into each other at different ages of the plant. Of the ſour ſalts ſeveral kinds are known in pharmacy and in the arts; ſuch as thoſe of ſorrel, of lemons, oranges, citrons, &c. The ſaccharine ſalts are alſo obtained from a great number of vegetables; they may in general be eaſily diſcovered by their ſweet taſte: the ſugar-cane is the vegetable from which this ſaline matter is procured in greateſt quantity, and with moſt profit in commerce. For its medicinal and chemical properties, ſee MATERIA MEDICA, Art. VII.

The ſweet and ſour ſalts above-mentioned diſſolve not only in water, like other ſaline bodies, but many of them, particularly the ſweet, in rectified ſpirit alſo. The groſs oily and gummy matter, with which they are almoſt always accompanied in the ſubject, diſſolves freely along with them in water, but is by ſpirit in great meaſure left behind. Such heterogeneous matters as the ſpirit takes up, are almoſt completely retained by it, while the ſalt concretes; but of thoſe which water takes up, a conſiderable part always adheres to the ſalt. Hence eſſential ſalts, as they are called, prepared in the common manner from the watery juices of vegetables, are always found to partake largely of the other ſoluble principles of the ſubject; while thoſe extracted by ſpirit of wine are more pure. By means of rectified ſpirit, ſome productions of this kind may be freed from their impurities. Perfect ſaccharine concretions obtained from many of our indigenous ſweets may be thus purified.

41 Saline matter of benzoin.

There is another kind of ſaline matter obtained from ſome reſinous bodies, particularly from benzoin, which is of a different nature from the foregoing, and ſuppoſed by ſome of the chemiſts to be a part of the eſſential oil of the reſin, coagulated by an acid, with the acid more predominant or more diſengaged than in the other kinds of coagulated or indurated oils. Theſe concretes diſſolve both in water and in vinous ſpirits, though difficultly and ſparingly in both: they ſhow ſeveral evident marks of acidity, have a ſmell like that of the reſin from which they are obtained, exhale in a heat equal to that of boiling water, or a little greater, and are inflammable in the fire.

11. Farina or flour.

This ſubſtance partakes of the nature of gum, but has more taſte, is more fermentable, and much more nutritive. It abounds in very many vegetables, and is generally depoſited in certain parts, ſeemingly for the purpoſe of its being more advantageouſly accommodated to their nouriſhment and growth. Several of the bulbous and other roots, ſuch as thoſe of potatoes, briony, thoſe from which caſſava is extracted, ſalep, and many others, contain a great quantity of white *faeculæ* reſembling and really poſſeſſing the properties of farina. The plants of the leguminous tribe, ſuch as peas and beans, are found alſo to abound with this matter. But the largeſt quantity of farina reſides in grains, which are therefore called *farinaceous*. Of this kind are wheat, rye, barley, oats, rice, and other ſimilar plants.

42 Farina, what compounded.

At firſt ſight farina appears to be one homogeneous ſubſtance: it is, however, found to be a compound of three different and ſeparable parts. To illuſtrate this, we ſhall take as an example the farina of wheat, being the vegetable which affords it in greateſt quantity, and in its moſt perfect ſtate. To ſeparate theſe different parts we form a paſte with any quantity of flour and cold water; we ſuſpend this paſte in a bag of muſlin or ſuch like cloth; we next let fall on it a ſtream of cold water from ſome height, and the bag may now and then be very gently ſqueezed; the water in its deſcent carries down with it a very fine white powder, which is received along with the water in a veſſel placed below the bag: the proceſs muſt be continued till no more of this white powder comes off, which is known by the water that paſſes through the bag ceaſing to be of a milky colour. The proceſs being now finiſhed, the farina is found to be ſeparated into three different ſubſtances: the glutinous or vegeto-animal part remains in the bag; the amylum or ſtarch is depoſited from the water which has been received in the veſſel placed below the bag; and, laſtly, a mucous matter is held diſſolved in the ſame water from which the ſtarch has been depoſited: this mucous part may be brought to the conſiſtence of honey, by evaporating the water in which it is kept in ſolution.

Theſe ſeveral parts are found alſo to differ remarkably in their ſenſible and chemical properties. The vegeto-animal part is of a whitiſh grey colour, is a tenacious, ductile, and elaſtic matter, partly poſſeſſing the texture of animal membranes. Diſtilled in a retort, it yields, like all animal matters, a true volatile alkali; and its coal affords no fixed alkali. It is not only inſoluble, but even indiffuſible, in water; both which appear from its remaining in the bag after long-continued lotions. Like gums, it is inſoluble in alcohol, in oils, or ether; but it is alſo inſoluble in water, and yields on diſtillation products very different from thoſe afforded by gums: it is therefore of an animal nature, and approaches perhaps nearer to the coagulable lymph of animals than to any other ſubſtance.

The fixed alkali, by means of heat, diſſolves the gluten vegeto-animale; but when it is precipitated from this ſolution by means of acids, it is found to have loſt its elaſticity. The mineral acids, and eſpecially the nitrous,

nitrous, are alſo capable of diſſolving the vegeto-animal part of the farina.

The ſtarch, amylum, or the amylaceous matter, makes the principal part of the farina. As we before noticed, it is that fine powder depoſited from the water which has pervaded the entire farina: it is of a greyiſh white colour, but can be rendered much whiter by making it undergo a certain degree of fermentation. Starch is inſoluble in cold water; but in hot water it forms a tranſparent glue: hence the neceſſity of employing cold water in ſeparating it from the vegeto-animal part. Diſtilled in a retort, it yields an acid phlegm; and its coal affords, like other vegetables, a fixed alkaline ſalt. As ſtarch forms the greateſt part of the farina, it is probably the principal nutritive conſtituent in bread.

The mucous, or rather the mucoſo-ſaccharine matter, is only in a very ſmall quantity in bread. This ſubſtance on diſtillation is found to exhibit the phenomena of ſugar. The uſe of this matter ſeems to be that of producing the vinous fermentation: and we may obſerve once for all, that the preparation of good bread probably depends on a proper proportion of the three different parts above deſcribed; viz. that the vinous fermentation is promoted by the mucoſo-ſaccharine part, the acetous by the ſtarch, and the putrid by the gluten vegeto-animale. From different ſtates or degrees of theſe ſeveral ſtages of fermentation the qualities of good bread are probably derived.

12. Of the Colouring Matter of Vegetables.

The colouring matter of vegetables ſeems to be of an intermediate nature between the gummy and reſinous parts. It is in many plants equally well extracted by water, and by rectified ſpirit: it is alſo, however, procurable in the form of a lake, not at all ſoluble in either of theſe menſtrua. It would ſeem that the colouring matter, ſtrictly ſo called, has hitherto eluded the reſearches of chemiſts. It is only the *baſe* or *nidus*, in which the real colouring matter is embodied, that chemiſtry has as yet reached; and on the chemical properties of this *baſe*, colours are capable of being extracted by different menſtrua, and of being variouſly accommodated to the purpoſes of dying. The ſubſtance from which the colours of vegetables are immediately derived, is without doubt a very ſubtile body. Since plants are known to loſe their colour when excluded from the light of the ſun, there is reaſon to think that the immediately colouring ſubſtance is primarily derived from the matter of the ſun, ſomewhat elaborated by vegetable life.

Many of theſe dyes are evolved or variouſly modified by chemical operations. Thus a colouring matter is ſomewhat depoſited in the form of a *faecula* during the putrefaction of the vegetable; in others it is evolved or changed by alum, by acids, or by alkali. We may alſo obſerve, that any part of the vegetable may be the baſe of the colouring matter. This appears from the ſolubility of the different dyes in their proper menſtrua; and in theſe ſolutions we have not been able to ſeparate the real colouring matter from the baſe in which it is inviſcerated. After all, then, we muſt conclude, that a full inveſtigation of this ſubject more properly belongs to the ſublimer parts of CHEMISTRY, than to the buſineſs in which we are at preſent engaged. Elements

The colouring drugs are conſidered in their proper places.

In finiſhing our hiſtory of the vegetable kingdom, it only remains that we ſhould offer ſome

General Obſervations on the foregoing Principles.

44 Practical obſervations on vegetables.

1. ESSENTIAL oils, as already obſerved, are obtainable only from a few vegetables: but groſs oil, reſin, gum, and ſaline matter, appear to be common, in greater or leſs proportion, to all; ſome abounding more with one and others with another.

2. The ſeveral principles are in many caſes intimately combined; ſo as to be extracted together from the ſubject, by thoſe diſſolvents, in which ſome of them ſeparately could not be diſſolved. Hence watery infuſions and ſpirituous tinctures of a plant, contain reſpectively more ſubſtances than thoſe of which water or ſpirit is the proper diſſolvent.

3. After a plant has been ſufficiently infuſed in water, all that ſpirit extracts from the reſiduum may be conſidered as conſiſting wholly of ſuch matter as directly belongs to the action of ſpirit. And, on the contrary, when ſpirit is applied firſt, all that water extracts afterwards may be conſidered as conſiſting only of that matter of which water is the direct diſſolvent.

4. If a vegetable ſubſtance, containing all the principles we have enumerated, be boiled in water, the eſſential oil, whether fluid or concrete, and the camphor, and volatile eſſential ſalt, will gradually exhale with the ſteam of the water, and may be collected by receiving the ſteam in proper veſſels placed beyond the action of the heat. The other principles not being volatile in this degree of heat, remain behind: the groſs oil and ſebaceous matter float on the top: the gummy and ſaline ſubſtance, and a part of the reſin, are diſſolved by the water, and may be obtained in a ſolid form by ſtraining the liquor, and expoſing it to a gentle heat till the water has exhaled. The reſt of the reſin, ſtill retained by the ſubject, may be extracted by ſpirit of wine, and ſeparated in its proper form by exhaling the ſpirit. On theſe foundations moſt of the ſubſtances contained in vegetables may be extracted, and obtained in a pure ſtate, however they may be compounded together in the ſubject.

5. Sometimes one or more of the principles is found naturally diſengaged from the others, lying in diſtinct receptacles within the ſubject, or extravaſated and accumulated on the ſurface. Thus, in the dried roots of angelica, cut longitudinally, the microſcope diſcovers veins of reſin. In the flower cups of hypericum, and the leaves of the orange-tree, tranſparent points are diſtinguiſhed by the naked eye: which, at firſt view, ſeem to be holes, but on a cloſer examination are found to be little veſicles filled with eſſential oil. In the bark of the fir, pine, larch, and ſome other trees, the oily receptacles are extremely numerous, and ſo copiouſly ſupplied with the oily and reſinous fluid, that they frequently burſt, eſpecially in the warm climates, and diſcharge their contents in great quantities. The acacia tree in Egypt, and the plum and cherry among ourſelves, yield almoſt pure gummy exudations. From

Elements. a ſpecies of aſh is ſecreted the ſaline ſweet ſubſtance manna; and the only kind of ſugar with which the ancients were acquainted, appears to have been a natural exudation from the cane.

6. The foregoing principles are, as far as is known, all that naturally exiſt in vegetables; and all that art can extract from them, without ſuch operations as change their nature, and deſtroy their original qualities. In one or more of theſe principles, the colour, ſmell, taſte, and medicinal virtues, of the ſubject, are almoſt always found concentrated.

7. In ſome vegetables the whole medicinal activity reſides in one principle. Thus, in ſweet almonds, the only medicinal principle is a groſs oil; in horſe-radiſh root, an eſſential oil; in jalap root, a reſin; in marſh mallow root, a gum; in the leaves of ſorrel, a ſaline acid ſubſtance.

8. Others have one kind of virtue reſiding in one principle, and another in another. Thus Peruvian bark has an aſtringent reſin and a bitter gum; wormwood a ſtrong flavoured eſſential oil and a bitter gum reſin.

9. The groſs inſipid oils and ſebaceous matters, the ſimple inſipid gums, and the ſweet and acid ſaline ſubſtances, ſeem to agree both in their medicinal qualities and in their pharmaceutic properties.

10. But eſſential oils, reſins, and gum-reſins, differ much in different ſubjects. As eſſential oils are univerſally the principle of odour in vegetables, it is obvious that they muſt differ in this reſpect as much as the ſubjects from which they are obtained. Reſins frequently partake of the oil, and conſequently of the differences depending on it; with this further diverſity, that the groſs reſinous part often contains other powers than thoſe which reſide in oils. Thus from wormwood a reſin may be prepared, containing not only the ſtrong ſmell and flavour but likewiſe the whole bitterneſs of the herb; from which laſt quality the oil is entirely free. The bitter, aſtringent, purgative, and emetic virtue of vegetables, reſide generally in different ſorts of reſinous matter, either pure or blended with gummy and ſaline parts; of which kind of combinations there are many ſo intimate, that the component parts can ſcarcely be ſeparated from each other, the whole compound diſſolving almoſt equally in aqueous and ſpirituous menſtrua.

11. There are ſome ſubſtances alſo, which, from their being totally ſoluble in water, and not in ſpirit, may be eſteemed to be mere gums; but which, nevertheleſs, poſſeſs virtues never to be found in the ſimple gums. Such are the aſtringent gum called *acacia*, and the purgative gum extracted from aloes.

12. It is ſuppoſed that vegetables contain certain ſubtile principles different in different plants, of too great tenuity to be collected in their pure ſtate, and of which oils, gums, and reſins, are only the matrices or vehicles. This inquiry is foreign to the purpoſes of pharmacy, which is concerned only about groſſer and more ſenſible objects. When we obtain from an odoriferous plant an eſſential oil, containing in a ſmall compaſs the whole fragrance of a large quantity of the ſubject, our intentions are equally anſwered, whether the ſubſtance of the oil be the direct odorous matter, or whether it has diffuſed through it a fragrant principle more ſubtile than itſelf. And when this oil in long keeping loſes its odour, and becomes a reſin, it is equal in regard to the preſent conſiderations, whether the effect happens from the avolation of a ſubtile principle, or from a change produced in the ſubſtance of the oil itſelf. Eleme

Sect. II. *Animals.*

45 The nat of anim ſubſtanc

From the hiſtory we have already given of the vegetable kingdom, our details on animal ſubſtances may in many particulars be conſiderably abridged. All animals are fed on vegetables, either directly or by the intervention of other animals. No part of their ſubſtance is derived from any other ſource except water. The ſmall quantity of ſalt uſed by man and ſome other animals, is only neceſſary as a ſeaſoning or ſtimulus to the ſtomach. As the animal then is derived from the vegetable matter, we accordingly find that the former is capable of being reſolved into the ſame principles as thoſe of the latter. Thus, by repeated diſtillations, we obtain from animal ſubſtances, water, oil, air, an eaſily deſtructible ſalt, and charcoal. Theſe ſecondary principles are by farther proceſſes at length reſoluble into the ſame proximate principles which we found in vegetables, *viz.* water, air, earth, and the principle of inflammability. But though the principles of vegetable and animal ſubſtances are fundamentally the ſame, yet theſe principles are combined in a very different manner. It is exceedingly rare that animal ſubſtances are capable of the vinous or acetous fermentations; and the putrefactive, into which they run remarkably faſt, is alſo different in ſome particulars from the putrefaction of vegetables; the eſcape of the phlogiſton in the form of light is more evident, and the ſmell is much more offenſive, in the putrefaction of animal than of vegetable ſubſtances. The putrefaction of urine is indeed accompanied with a peculiar fetor, by no means ſo intolerable as that of other animal matters: this we ſuppoſe to be owing to the pungency derived from the volatile alkali, and alſo to the urine containing leſs inflammable matter than the blood and many other fluids. When analyſed by a deſtructive heat, animals afford products very different from thoſe of vegecables: the empyreumatic oil has a particular and much more fetid odour; and the volatile ſalt, inſtead of being an acid, as it is in moſt vegetables, is found in animals to be a volatile alkali. Chemiſts have ſpoken of an acid procurable from animal ſubſtances; and indeed certain parts of animal bodies are found to yield a ſalt of this kind; but it by no means holds with animal ſubſtances in general; and though the proofs to the contrary were even concluſive, it is confeſſedly in ſo ſmall a quantity as not to deſerve any particular regard. In ſome animals, however, an acid exiſts, uncombined and ready formed in their bodies. This is particularly manifeſt in ſome inſects, eſpecially ants, from which an acid reſembling the acetous has been procured by boiling them in water. The ſolid parts of animal bodies, as the muſcles, teguments, tendons, cartilages, and even the bones, when boiled with water, give a gelatinous matter or glue reſembling the vegetable gums, but much more adheſive. We muſt, however, except the horny parts and the hair, which ſeem to be little ſoluble either in water or in the liquors of the ſtomach. The acids, the alkalis, and quicklime, are alſo found to be powerful ſolvents of animal matters. It is from the ſolid

parts

nents. parts that the greateſt quantity of volatile alkali is obtained; it ariſes along with a very fetid empyreumatic oil, from which it is in ſome meaſure ſeparated by repeated rectifications. This ſalt is partly in a fluid, and partly in a concrete ſtate; and from its having been anciently prepared in the greateſt quantity from the horns of the hart, it has been called *ſalt* or *ſpirit of hartſhorn*. Volatile alkali is, however, procurable from all animals, and from almoſt every part of animal bodies except fat. Though we are ſometimes able to procure fixed alkali from an animal cinder, yet it is probable that this ſalt did not make any part of the living animal, but rather proceeded from the introduction of ſome ſaline matter, incapable of being aſſimilated by the functions of the living creature.

46 e fluid of als. In ſpeaking of the fluid parts of animals, we ſhould firſt examine the general fluid, or blood, from whence the reſt are ſecreted. The blood, which at firſt ſight appears to be an homogeneous fluid, is compoſed of ſeveral parts, eaſily ſeparable from each other, and which the microſcope can even perceive in its uncoagulated ſtate. On allowing it to ſtand at reſt, and to be expoſed to the air, it ſeparates into what are called the *craſſamentum* and the *ſerum*. The craſſamentum, or cruor, chiefly conſiſts of the red globules, joined together by another ſubſtance, called the *coagulable lymph*: the chemical properties of theſe globules are not as yet underſtood; but they ſeem to contain the greateſt quantity of the iron found in the blood. The ſerum is a yellowiſh ſubviſcid liquor, having little ſenſible taſte or ſmell: at a heat of 160 of Fahrenheit, it is converted into a jelly. This coagulation of the ſerum is alſo owing to its containing a matter of the ſame nature with that in the craſſamentum, viz. the coagulable lymph: whatever then coagulates animal blood, produces that effect on this concreſcible part. Several cauſes, and many different ſubſtances, are capable of effecting this coagulation; ſuch as contact of air, heat, alcohol, mineral acids, and their combinations with earths, as alum, and ſome of the metallic ſalts. The more perfect neutral ſalts are found to prevent the coagulation, ſuch as common ſalt and nitre.

Of the fluids ſecreted from the blood, there are a great variety in men and other animals. The excrementitious and redundant fluids are thoſe which afford in general the greateſt quantity of volatile alkali and empyreumatic oil: there are alſo ſome of the ſecreted fluids, which, on a chemical analyſis, yield products in ſome degree peculiar to themſelves. Of this kind is the urine, which is found to contain in the greateſt abundance the noted ſalt formed from the phoſphoric acid and volatile alkali. The fat, too, has been ſaid to differ from the other animal matters, in yielding by diſtillation a ſtrong acid, but no volatile alkali. There is alſo much variety in the quantity and ſtate of the combination of the ſaline and other matters in different ſecreted fluids. But for a fuller inveſtigation of this and other parts of the ſubject, we refer to ANATOMY, CHEMISTRY, and PHYSIOLOGY; with which it is more immediately connected than with the elements of pharmacy.

47 and Cani- Animal oils and fats, like the groſs oils of vegetables, are not of themſelves ſoluble either in water or vinous ſpirits: but they may be united with water by the intervention of gum or mucilage. Moſt of them may be changed into ſoap, by fixed alkaline ſalts; and be thus rendered miſcible with ſpirit as well as water. Elements.

48 Miſcellaneous obſervations on ſeveral animal ſubſtances.

The odorous matter of ſome odoriferous animal-ſubſtances, as muſk, civet, caſtor, is, like eſſential oil, ſoluble in ſpirit of wine, and volatile in the heat of boiling water. Carthuſer relates, that from caſtor an actual eſſential oil has been obtained in a very ſmall quantity, but of an exceedingly ſtrong diffuſive ſmell.

The veſicating matter of cantharides, and thoſe parts of ſundry animal ſubſtances in which their peculiar taſte reſides, are diſſolved by rectified ſpirit, and ſeem to have ſome analogy with reſins and gummy reſins.

The gelatinous principle of animals, like the gum of vegetables, diſſolves in water, but not in ſpirit or in oils: like gums alſo, it renders oils and fats miſcible with water into a milky liquor.

Some inſects, particularly the ant, are found to contain an acid juice, which approaches nearly to the nature of vegetable acids.

There are, however, ſundry animal juices, which differ greatly, even in theſe general kinds of properties, from the correſponding ones of vegetables. Thus animal ſerum, which appears analogous to vegetable gummy juices, has this remarkable difference, that though it mingles uniformly with cold or warm water, yet on conſiderably heating the mixture, the animal-matter ſeparates from the watery fluid, and concretes into a ſolid maſs. Some phyſicians have been apprehenſive, that the heat of the body, in certain diſeaſes, might riſe to ſuch a degree, as to produce this dangerous or mortal concretion of the ſerous humours: but the heat requiſite for this effect is greater than the human body appears capable of ſuſtaining, being nearly about the middle point between the greateſt human heat commonly obſerved and that of boiling water.

The ſoft and fluid parts of animals are ſtrongly diſpoſed to run into putrefaction; they putrefy much ſooner than vegetable matters; and when corrupted, prove more offenſive.

This proceſs takes place, in ſome degree, in the bodies of living animals, as often as the juices ſtagnate long, or are prevented, by an obſtruction of the natural emunctories, from throwing off their more volatile and corruptible parts.

During putrefaction, a quantity of air is generated; all the humours become gradually thinner, and the fibrous parts more lax and tender. Hence the tympany, which ſucceeds the corruption of any of the viſcera, or the imprudent ſuppreſſion of dyſenteries by aſtringents; and the weakneſs and laxity of the veſſels obſervable in ſcurvies, &c.

The craſſamentum of human blood changes by putrefaction into a dark livid-coloured liquor; a few drops of which tinge the ſerum with a tawny hue, like the ichor of ſores and dyſenteric fluxes, as alſo the white of the eye, the ſaliva, the ſerum of blood drawn from a vein, and the liquor that oozes from a bliſter in deep ſcurvies and the advanced ſtate of malignant fevers.

The putrid craſſamentum changes a large quantity of recent urine to a flame-coloured water, ſo common in fevers and in the ſcurvy. This mixture, after ſtanding an hour or two, gathers a cloud reſembling what is ſeen in the crude water of acute diſtempers, with ſome

Elements

oily matter on the surface like the scum which floats on scorbutic urine.

The serum of the blood deposites, in putrefaction, a sediment resembling well-digested pus, and changes to a faint olive-green. A serum so far putrefied as to become green, is perhaps never to be seen in the vessels of living animals; but in dead bodies this serum is to be distinguished by the green colour which the flesh acquires in corrupting. In salted meats, this is commonly ascribed to the brine, but erroneously; for that has no power of giving this colour. but only of qualifying the taste, and in some degree, the ill effects of corrupted aliments. In foul ulcers and other sores, where the serum is left to stagnate long, the matter is likewise found of this colour, and is then always acrimonious.

The putrefaction of animal substances is prevented or retarded by most saline matters, even by the fixed and volatile alkaline salts, which have generally been supposed to produce a contrary effect. Of all the salts that have been made trial of, sea-salt seems to resist putrefaction the least; in small quantities it even accelerates the process. The vegetable bitters, as chamomile flowers, are much stronger antiseptics, not only preserving flesh long uncorrupted, but likewise somewhat correcting it when putrid: the mineral acids have this last effect in a more remarkable degree. Vinous spirits, aromatic and warm substances, and the acrid plants, falsely called *alkalescent*, as scurvy-grass and horse-radish, are found also to resist putrefaction. Sugar and camphor are found to be powerfully antiseptic. Fixed air, or the aerial acid, is likewise thought to resist putrefaction; but above all the vapours of nitrous acid, in the form of air (the nitrous air of Dr Priestley), is found to be the most effectual in preserving animal bodies from corruption. The list of the septics, or of those substances that promote putrefaction, is very short; and such a property has only been discovered in calcareous earths and magnesia, and a very few salts, whose bases are of these earths.

It is observable, that notwithstanding the strong tendency of animal matters to putrefaction, yet broths made from them, with the admixture of vegetables, instead of putrefying turn sour. Sir John Pringle has found, that when animal flesh in substance is beaten up with bread or other farinaceous vegetables, and a proper quantity of water, into the consistence of a pap, this mixture likewise, kept in a heat equal to that of the human body, grows in a little time sour; while the vegetable matters, without the flesh, suffer no such change.

It was observed in the preceding section, that some few vegetables, in the resolution of them by fire, discover some agreement in the matter with bodies of the animal kingdom; yielding a volatile alkaline salt in considerable quantity, with little or nothing of the acid or fixed alkali, which the generality of vegetables afford. In animal substances also, there are some exceptions to the general analysis: from animal fats, as we before observed, instead of a volatile alkali, an acid liquor is obtained; and their empyreumatic oil wants the peculiar offensiveness of the other animal oils.

Sect. III. *Minerals.*

I. Oils *and* Bitumens.

49 Oils of mineral kingdom

In the mineral kingdom is found a fluid oil called *naphtha* or *petroleum*, floating on the surface of waters, or issuing from clefts of rocks, particularly in the eastern countries, of a strong smell, very different from that of vegetable or animal oils, limpid almost as water, highly inflammable, not soluble in spirit of wine, and more averse to union with water than any other oils.

There are different sorts of these mineral oils, more or less tinged, of a more or less agreeable, and a stronger or weaker, smell. By the admixture of concentrated acids, which raise no great heat or conflict with them, they become thick, and at length consistent; and in these states are called *bitumens*.

These thickened or concreted oils, like the corresponding products of the vegetable kingdom, are generally soluble in spirit of wine, but much more difficultly, more sparingly, and for the most part only partially; they liquefy by heat, but require the heat to be considerably stronger than vegetable products. Their smells are various; but all of them, either in the natural state, when melted or set on fire, yield a peculiar kind of strong scent, called from them *bituminous*.

50 Bitumen

The solid bitumens are, amber, jet, asphaltum, or bitumen of Judea, and fossil or pit coal. All these bitumens, when distilled, give out an odorous phlegm, or water, more or less coloured and saline; an acid, frequently in a concrete state; an oil, at first resembling the native petrolea, but soon becoming heavier and thicker; and, lastly, a quantity of volatile alkali is obtained: the residuum is a charry matter, differing in its appearances according to the nature of the bitumen which had been analysed.

From the observations of several naturalists, it is probable that all bitumens are of vegetable and animal origin; that the circumstances by which they differ from the resinous and other oily matters of vegetables and animals, are the natural effects of time, or of an alteration produced on them by mineral acids; or perhaps they are the effect of both these causes combined. This opinion is the more probable, since bitumens, on a chemical analysis, yield oil and volatile alkali; neither of which are found in any other minerals.

II. Earths.

51 Of vegetable, animal, and mineral earths.

The little impropriety of joining the vegetable and animal earths to the mineral, must be overlooked for the sake of bringing both under one synoptical view. Under the mineral earths are included stones; these being no other than earths in an indurated state.—The different kinds of these bodies hitherto taken notice of are the following.

1*st*, *Earths soluble in the nitrous, marine, and vegetable acids, but not at all, or exceeding sparingly, in the vitriolic acid. When previously dissolved in other acids, they are precipitated by the addition of this last, which thus unites with them into insipid, or nearly insipid concretes, not dissoluble in any liquor.*

Of

Of this kind are,

1. The mineral calcareous earth: *diſtinguiſhed by its being convertible in a ſtrong fire, without addition, into an acrimonious calx called quicklime.* This earth occurs in a variety of forms in the mineral kingdom: the fine ſoft chalk, the coarſer limeſtones, the hard marbles, the tranſparent ſpars, the earthy matter contained in waters, and which ſeparating from them incruſtates the ſides of the caverns, or hangs in iſicles from the top, receiving from its different appearances different appellations. How ſtrongly ſoever ſome of theſe bodies have been recommended for particular medicinal purpoſes, they are fundamentally no other than different forms of this calcareous earth; ſimple pulverization depriving them of the ſuperficial characters by which they were diſtinguiſhed in the maſs. Moſt of them generally contain a greater or leſs admixture of ſome of the indiſſoluble kinds of earth; which, however, affects their medicinal qualities no otherwiſe than by the addition which it makes to their bulk. Chalk appears to be one of the pureſt; and is therefore in general preferred. They all burn into a ſtrong quicklime: in this ſtate a part of them diſſolves in water, which thus becomes impregnated with the aſtringent and lithontriptic powers that have been erroneouſly aſcribed to ſome of the earths in their natural ſtate.

During the calcination of calcareous earths, a large quantity of elaſtic vapour is diſcharged: the abſence of this fluid is the cauſe of the cauſticity of quicklime, and of its ſolubility in water in the form of lime-water. For a more full inquiry into this ſubject, ſee FIXED AIR, &c.

2. The animal calcareous earth: *burning into quicklime like the mineral.* Of this kind are oyſter-ſhells and all the marine ſhells that have been examined; though with ſome variation in the ſtrength of the quicklime produced from them.

3. The earth of bones and horns: *not at all burning into quicklime.* This kind of earth is more difficult of ſolution in acids than either of the preceding. It is accompanied in the ſubjects with a quantity of gelatinous matter, which may be ſeparated by long boiling in water, and more perfectly by burning in the open air. The earth may be extracted alſo from the bone or horn, though difficultly, by means of acids; whereas vegetables and the ſoft parts of animals yield their pure earth by burning only.

2d, Earths ſoluble with eaſe in the vitriolic as well as other acids, and yielding, in all other combinations therewith, ſaline concretes ſoluble in water.

1. Magneſia alba: *compoſing with the vitriolic acid a bitter purgative ſalt.* This earth has not yet been found naturally in a pure ſtate. It is obtained from the purging mineral waters and their ſalts; from the bitter liquor which remains after the cryſtallization of ſea-ſalt from ſea-water; and from the fluid which remains uncryſtallized in the putrefaction of ſome ſorts of rough nitre. The aſhes of vegetables appear to be nearly the ſame kind of earth.

2. Aluminous earth: *compoſing with the vitriolic acid a very aſtringent ſalt.* This earth alſo has not been found naturally pure. It is obtained from alum; which is no other than a combination of it with the vitriolic acid; it may likewiſe be extracted, by ſtrong boiling in that acid, from clays and boles.

3d, Earths which by digeſting in acids, either in the cold or in a moderate warmth, are not at all diſſolved.

1. Argillaceous earth: *becoming hard, or acquiring an additional hardneſs, in the fire.* Of this kind of earth there are ſeveral varieties, differing in ſome particular properties: as the purer *clays*, which when moiſtened with water form a very viſcous maſs, difficultly diffuſible through a larger quantity of the fluid, and ſlowly ſubſiding from it; *boles*, leſs viſcous, more readily miſcible with water, and more readily ſubſiding; and *ochres*, which have little or nothing of the viſcoſity of the two foregoing, and are commonly impregnated with a yellow or red ferruginous calx.

2. Cryſtalline earth: *naturally hard, ſo as to ſtrike ſparks with ſteel; becoming friable in a ſtrong fire.* Of this kind are flints, cryſtals, &c. which appear to conſiſt of one and the ſame earth, differing in the purity, hardneſs, and tranſparency of the maſs.

3. Gypſeous earth: *reducible by a gentle heat into a ſoft powder, which unites with water into a maſs, ſomewhat viſcous and tenacious while moiſt, but quickly drying and becoming hard. A greater heat deprives the powder of this property, without occaſioning any other alteration.* Such are the tranſparent *ſelenites*; the fibrous ſtony maſſes improperly called *Engliſh talc*; and the granulated *gypſa* or *plaſter of Paris* ſtones. Though theſe bodies, however, have been commonly thought to be mere earths, of a diſtinct kind from the reſt, they appear, both from analytical and ſynthetical experiments, to be no other than combinations of the mineral calcareous earth with vitriolic acid.

4. Talky earth: *ſcarcely alterable by a vehement fire.* The maſſes of this earth are generally of a fibrous or leafy texture; more or leſs pellucid, bright or glittering, ſmooth and unctuous to the touch; too flexible and elaſtic to be eaſily pulveriſed; ſoft, ſo as to be cut with a knife. In theſe reſpects ſome of the gypſeous earths nearly reſemble them, but the difference is readily diſcovered by fire; a weak heat reducing the gypſeous to powder, while the ſtrongeſt makes no other alteration in the talky, than ſomewhat diminiſhing their flexibility, brightneſs, and unctuoſity.

III. METALS.

52 Metals, perfect and imperfect.

Of metals, the next diviſion of mineral bodies, the moſt obvious characters are, their peculiar bright aſpect, perfect opacity, and great weight; the lighteſt of them is fix, and the heavieſt upwards of 19 times heavier than an equal bulk of water.

To underſtand the writers in chemiſtry, it is proper to be informed, that metals are ſubdivided into the *perfect*, the *imperfect*, and the *ſemimetals*.

Thoſe poſſeſſed of ductility and malleability, and which are not ſenſibly altered by very violent degrees of heat, are called *perfect metals*: Of theſe there are three; gold, ſilver, and platina. It is, however, probable, that the mark of their indeſtructibility by fire is only relative: and indeed modern chemiſts have been able, by a very intenſe degree of heat, to bring gold into the ſtate of a *calx*, or ſomething very nearly reſembling it.

Elements.

Thoſe metallic ſubſtances which poſſeſs the diſtinctive properties of the perfect metals, but in a leſs degree, are called the *imperfect metals*: Theſe are, copper, iron, tin, lead.

Laſtly, thoſe bodies having the metallic characters in the moſt imperfect ſtate, that is to ſay, thoſe which have no ductility and the leaſt fixity in the fire, are diſtinguiſhed by the name of *ſemi-metals*: Theſe are, regulus of antimony, biſmuth, zinc, regulus of cobalt, nickel, and regulus of arſenic; which laſt might be rather conſidered as the boundary between the metallic and the ſaline bodies.

Mercury has been generally ranked in a claſs by itſelf.

All metallic bodies, when heated in cloſe veſſels, melt or *fuſe*. This *fuſion* takes place at different degrees of heat in different metals; and it does not appear that this proceſs produces any change in the metals, provided it be conducted in cloſe veſſels. Metals, expoſed to the combined action of air and fire, are converted into an earth-like ſubſtance called *calx*: by this proceſs, which we call *calcination*, the metal ſuffers remarkable changes. From the diſtinctive marks we have before given of the metallic bodies, it will be obvious, that the perfect metals are moſt ſlowly, the imperfect more quickly, and the ſemi-metals moſt eaſily and ſooneſt, affected in this operation. This earth-like powder, or *calx*, is found to poſſeſs no metallic aſpect, but is conſiderably heavier than the metal before its calcination: it has no longer any affinity with metallic bodies, nor even with the metal from which it has been produced.

Beſides this method of calcining metals by air and fire, they may likewiſe be brought into the ſtate of a calx, by diſſolving them in acids, from which they may be afterwards freed by evaporating the acid, or by adding to the ſolution an alkaline ſalt. Metals are alſo ſometimes dephlogiſticated by detonation with nitre. This change in their obvious properties is generally accompanied with a remarkable alteration in their medicinal virtues: thus quickſilver, which taken into the body in its crude ſtate and undivided, ſeems inactive; proves, when calcined by fire, even in ſmall doſes, a ſtrong emetic and cathartic, and in ſmaller ones, a powerful alterative in chronical diſorders; while regulus of antimony, on the contrary, is changed by the ſame treatment, from a high degree of virulence to a ſtate of inactivity.

Calces of mercury and arſenic exhale in a heat below ignition: thoſe of lead and biſmuth, in a red or low white heat, run into a tranſparent glaſs; the others are not at all vitreſcible, or not without extreme vehemence of fire. Both the calces and glaſſes recover their metallic form and qualities again by the ſkilful addition of any kind of inflammable ſubſtance that does not contain a mineral acid. This recovery of the metallic calces into the metallic form is called *reduction*. During this proceſs an elaſtic aerial fluid eſcapes, which is found to be *pure air*.

Is the converſion of metals into calces owing to the diſcharge of phlogiſton, or to the abſorption of pure air? And is the reduction to be aſcribed to the abſorption of phlogiſton, or to the eſcape of pure air? And again, Is the calcination to be explained by the diſcharge of phlogiſton and conſequent precipitation of pure air? And is the reduction effected by the abſorption of phlogiſton, either furniſhed by inflammable bodies or precipitated in conſequence of the diſcharge of pure air? On theſe queſtions there is much diſpute among modern chemiſts: We thought it only neceſſary to ſtate them here, as a full inquiry into the ſubject is by no means the province of pharmacy. We, however, think it prudent to retain the doctrine of Stahl: and we do this the more readily, becauſe it has been followed in our article CHEMISTRY, and becauſe it is abundantly clear in its illuſtration of the pharmaceutical proceſſes. We do not mean, however, to reject any modern diſcovery which may ſerve to illuſtrate our ſubjects. Elemc

All metallic bodies diſſolve in acids; ſome only in particular acids, as ſilver and lead in the nitrous: ſome only in compoſitions of acids, as gold in a mixture of the nitrous and marine: and others, as iron and zinc, in all acids. Some likewiſe diſſolve in alkaline liquors, as copper: and others, as lead, in expreſſed oils. Fuſed with a compoſition of ſulphur and fixed alkaline ſalt, they are all, except zinc, made ſoluble in water.

All metallic ſubſtances, diſſolved in ſaline liquors, have powerful effects in the human body, though many of them appear in their pure ſtate to be inactive. Their activity is generally in proportion to the quantity of acid combined with them: Thus lead, which in its crude form has no ſenſible effect, when united with a ſmall portion of vegetable acid into ceruſs, diſcovers a low degree of the ſtyptic and malignant quality, which it ſo ſtrongly exerts when blended with a larger quantity of the ſame acid into what was called *ſaccharum ſaturni*, but now more properly *ſal plumbi*, or *plumbum acetatum*: and thus mercury, with a certain quantity of the marine acid, forms the violent corroſive ſublimate, which by diminiſhing the proportion of acid becomes the mild medicine called *mercurius dulcis*.

IV. Acids.

53 Obſerva tions on various acids.

The ſalts of this order are very numerous; but as we are at preſent treating of *Minerals*, it is only therefore the *mineral* or *foſſil* acids we mean to ſpeak of in this place.

Theſe are diſtinguiſhed by the names of the concretes from which they have been principally extracted; the *vitriolic* from vitriol, the *nitrous* from nitre or ſaltpetre; and the *marine* or *muriatic* from common ſea-ſalt. The form they are generally in, is that of a watery fluid: They have all a remarkable attraction for water: They imbibe the humidity of the air with rapidity and the generation of heat. Although heat be produced by their union with water, yet when mixed with ice in a certain manner, they generate a prodigious degree of cold. Acids change the purple and blue colours of vegetables to a red: they reſiſt fermentation; and laſtly, they impreſs that peculiar ſenſation on the tongue called *ſourneſs*, and which their name imports. But it is to be obſerved, that they are all highly corroſive, inſomuch as not to be ſafely touched, unleſs largely diluted with water, or united with ſuch ſubſtances as obtund or ſuppreſs their acidity. Mixed haſtily with vinous ſpirits, they raiſe a violent ebullition and heat, accompanied with a copious diſcharge of noxious fumes: a part of the acid unite;

ents. unites intimately with the vinous ſpirit into a new compound, void of acidity, called *dulcified ſpirit*. It is obſervable, that the marine acid is much leſs diſpoſed to this union with ſpirit of wine than either of the other two; nevertheleſs, many of the compound ſalts reſulting from the combination of earthy and metallic bodies with this acid, are ſoluble in that ſpirit, while thoſe with the other acids are not. All theſe acids effervesce ſtrongly with alkaline ſalts both fixed and volatile, and form with them neutral ſalts; that is, ſuch as diſcover no marks either of an acid or alkaline quality.

The nitrous and marine acids are obtained in the form of a thin liquor; the acid part being blended with a large proportion of water, without which it would be diffuſed into an incoercible vapour: the vitriolic ſtands in need of ſo much leſs water for its condenſation as to aſſume commonly an oily conſiſtence (whence it is called *oil of vitriol*), and in ſome circumſtances even a ſolid one. Alkaline ſalts, and the ſoluble earths and metals, abſorb from the acid liquors only the pure acid part: ſo that the water may now be evaporated by heat, and the compound ſalt left in a dry form.

From the coalition of the different acids with the three different alkalis, and with the ſeveral ſoluble earths and metallic bodies, reſult a variety of ſaline compounds; the principal of which ſhall be particulariſed in the ſequel of this article.

The vitriolic acid, in its concentrated liquid ſtate, is much more ponderous than the other two; it emits no viſible vapour in the heat of the atmoſphere, but imbibes moiſture which increaſes its weight: the nitrous and marine emit copious corroſive fumes, the nitrous yelloviſh red, and the marine white ones. If bottles containing the three acids be ſtopt with cork, the cork is found in a little time tinged black with the vitriolic, corroded into a yellow ſubſtance by the nitrous, and into a whitiſh one by the marine.

It is above laid down as a character of one of the claſſes of earths, that the vitriolic acid precipitates them when they are previouſly diſſolved in any other acid: it is obvious, that on the ſame principle this particular acid may be diſtinguiſhed from all others. This character ſerves not only for the acid in its pure ſtate, but likewiſe for all its combinations that are ſoluble in water. If a ſolution of any compound ſalt, whoſe acid is the vitriolic, be added to a ſolution of chalk in any other acid, the vitriolic acid will part from the ſubſtance with which it was before combined, and join itſelf to the chalk, forming therewith a compound; which, being no longer ſoluble in the liquor, renders the whole milky for a time, and then gradually ſubſides.

This acid may be diſtinguiſhed alſo, in compound ſalts, by another criterion not leſs ſtrongly marked: If any ſalt containing it be mixed with powdered charcoal, and the mixture expoſed in a cloſe veſſel to a moderately ſtrong fire, the acid will unite with the directly inflammable part of the charcoal, and compoſe therewith a genuine ſulphur. Common brimſtone is no other than a combination of the vitriolic acid with a ſmall proportion of inflammable matter. With any kind of inflammable matter which is not volatile in cloſe veſſels, as the coal of vegetables, of animals, or of bitumens, this acid compoſes always the ſame identical ſulphur. Elements.

The nitrous acid alſo, with whatever kind of body it be combined, is both diſtinguiſhed and extricated by means of any inflammable ſubſtance being brought to a ſtate of ignition with it. If the ſubject be mixed with a little powdered charcoal and made red hot, a deflagration or fulmination enſues, that is, a bright flame with a hiſſing noiſe; and the inflammable matter and the acid being thus conſumed or diſſipated together, there remains only the ſubſtance which was before combined with the acid, and the ſmall quantity of aſhes afforded by the coal.

Theſe properties of the nitrous acid deflagrating with inflammable ſubſtances, and of the vitriolic forming ſulphur with them, ſerve not only as criteria of the reſpective acids in the various forms and diſguiſes, but likewiſe for diſcovering inflammable matter in bodies, when its quantity is too ſmall to be ſenſible on other trials.

All theſe acids will be more particularly examined when we come to treat of each of them apart. There are, however, a few other mineral acids which are of importance to be known: theſe are, *aqua regia; acid of borax; ſparry acid;* and, laſtly, *fixed air*, which has of late been called *aërial acid*, or *acid of chalk*.

Aqua regia has been generally prepared by a mixture of certain proportions of the nitrous and muriatic acids. It is of little avail in pharmacy whether we conſider it as a diſtinct acid, or only as a modification of the muriatic. It has been found, that the muriatic acid when diſtilled with *manganeſe* (a peculiar foſſile ſubſtance, ſhowing a remarkable attraction to phlogiſton), ſuffers a change which renders it capable of diſſolving gold and platina. Whether this change be produced by the acid acquiring a redundance of pure air, or by its being deprived of phlogiſton, it is not our buſineſs to decide. This experiment, however, renders it probable, that the nitrous acid in the common aqua regia is only ſubſervient to accompliſhing the ſame change in the muriatic acid which is produced by diſtilling that acid with manganeſe.

As aqua regia has been only uſed in the nicer operations in chemiſtry, and in the art of aſſaying, we think it unneceſſary to ſay more of it in this place.

The *acid of borax*, or *ſedative ſalt of Homberg*, may be extracted from borax, a neutral ſalt, whoſe baſe is mineral alkali. It has alſo been found native in the waters of ſeveral lakes in Tuſcany. It is a light, cryſtallized, concrete ſalt; its taſte is ſenſibly acid; it is difficultly ſoluble in water; but the ſolution changes blue vegetable colours to a red. With vitrifcent earths it fuſes into a white glaſs: it unites with the other alkalis, with magneſia, and with quicklime. The ſalts reſulting from theſe combinations are very imperfectly known. The ſalt has been called *ſedative*, from its ſuppoſed virtues as an anodyne and refrigerant remedy; but modern phyſicians have very little faith in this once celebrated drug.

The *ſparry acid* is ſo called from its being extracted from a foſſil called *ſparry fluor*, or *vitreous ſpar*. It is not yet determined whether it be a diſtinct acid; and as it has not yet been employed for any purpoſe in pharmacy, we think it would be improper to attempt any farther account of it here.

Beſides

Elements.

Beſides the acids above-mentioned, there have alſo been diſcovered acids ſeemingly of a particular nature, in amber, in arſenic, and in black-lead: but as theſe have not hitherto been applied to any uſe in pharmacy, they cannot properly have a place in this article.

We now come to the laſt, but perhaps the moſt generally diffuſed, acid in nature: this is the aerial acid, or

Fixed Air.

54 Nature of fixed air, &c.

In our pharmaceutical hiſtory of this body, we ſhall only make uſe of the two names *fixed air* and *aerial acid*, being thoſe moſt generally uſed, and which in our opinion are moſt applicable to our own ſubject. Fixed air is a permanently elaſtic fluid, being only *fixed* when in a ſtate of combination with calcareous earth or other ſubſtances from which it may be extricated. It has received many different names, according to the ſubſtances from which it is diſengaged, and to the different opinions concerning its nature: it is the *gas ſilveſtre* of Helmot, the *fixed air* of Dr Black, the *acid of chalk*, *calcareous gas*, *mephitic gas*, *mephitic acid*, and *aerial acid*, of many modern chemiſts. In accommodating our account of it to the purpoſes of pharmacy, it is moſt convenient to conſider it as an acid. The aerial acid may be extricated by heat, or by other acids, from all calcareous earths; that is, from all thoſe earths which by calcination are converted into quicklime; ſuch as chalk, marble, limeſtone, ſea-ſhells, &c. It is likewiſe extricated from mild, fixed, and volatile alkalis, and from magneſia alba. Thus, if the vitriolic, or almoſt any other acid, be added to a quantity of calcareous earth or mild alkali, a briſk effervefcence immediately enſues: the fixed air, or aerial acid, is diſcharged in bubbles; and the other acid takes its place. If this proceſs be conducted with an apparatus to be afterwards deſcribed, the aerial acid, now ſeparated from the calcareous earth, may be received and preſerved in cloſe veſſels. When thus diſengaged, it aſſumes its real character, viz. that of a *permanently elaſtic fluid*. Fixed air is alſo ſeparated in great quantity during the vinous fermentation of vegetable matters. When a calcareous earth is deprived of this acid by heat, it is converted into the cauſtic ſubſtance *quicklime*. When alkalis, fixed or volatile, are deprived by any means of their aerial acid, they are rendered much more cauſtic, incapable of cryſtallization, or of effervefcing with other acids. They are alſo in this *deaerated* ſtate much more powerful in diſſolving other bodies. By recombining this acid with quicklime, calcined magneſia, or alkali, any of which had been deprived of it, theſe ſubſtances again aſſume their former weight and properties. Theſe bodies, then, when combined with aerial acid, are called *mild*; as *mild calcareous earth*, *mild alkali*, &c.: and when deprived of this acid they are called *cauſtic*; as *cauſtic calcareous earths*, *cauſtic alkali*, &c.: but as magneſia is not rendered cauſtic by calcination, there would perhaps be leſs danger in calling them *aerated* and *deaerated*. The aerial acid is more diſpoſed to unite with cauſtic calcareous earth (quicklime) than with any other ſubſtance; next to that, its attraction is for fixed alkali, then for magneſia, and laſtly for volatile alkali. We ſhall afterwards find that theſe relative powers of the different ſubſtances to unite with this acid, lay the foundation of many important proceſſes in pharmacy. Elements.

When we pour a ſmall quantity of the aerial acid into lime-water, the liquor inſtantly aſſumes a white colour, and the lime gradually precipitates, leaving the water clear and taſteleſs: the lime in this experiment has abſorbed the acid, and has therefore become *mild* or *aerated* earth. The aerial acid is capable of being abſorbed by water, and the water thus impregnated precipitates lime in lime-water; but if a certain larger quantity of this impregnated water be added, the lime is rediſſolved, and the liquor recovers its tranſparency. Water impregnated with aerial acid is capable of diſſolving iron; and in this way are formed native and artificial chalybeate waters. Zinc is alſo ſoluble in the ſame liquor. This acid is eaſily expelled from the water by removing the preſſure of the atmoſphere, by boiling, and even by time alone, if the veſſel be not kept cloſe ſhut. Fixed air extinguiſhes flame, vegetable and animal life, and ought therefore to be cautiouſly managed: like other acids it changes the blue colours of vegetables to a red, and communicates an acidulous taſte to the water impregnated with it. The attraction of the aerial acid, even to quicklime, is but feeble; as we know of no other acids whatever that are not able to diſengage it.

From theſe ſeveral facts it will appear obvious, that *mild* or *effervefcing alkalis*, whether fixed or volatile, are really neutral ſalts, compounded of the aerial acid and pure alkali: like other acids, it unites with theſe bodies, diminiſhes their cauſticity, and effects their cryſtallization. In ſpeaking, therefore, of *pure alkali*, we ought to confine ourſelves to thoſe in the *cauſtic* or *deaerated* ſtate; or, in other words, to thoſe which are deprived of their fixed air or aerial acid, with which they formed a compound ſalt. Many other properties of this acid might be mentioned, but we have now noticed all thoſe which we thought were concerned in the buſineſs of pharmacy. We ſhall have occaſion to recur to the ſubject when we come to the preparation of ſeveral compound drugs.

Let us next take a view of what paſſes in the combinations of acids with different ſubſtances.

If a fixed alkaline ſalt be united with a vegetable acid, as vinegar, and formed into a neutral ſalt, on adding to this compound ſome marine acid, the acetous acid will be diſengaged, ſo as to exhale totally in a moderate heat, leaving the marine in poſſeſſion of the alkali: the addition of the nitrous will in like manner diſpoſſeſs the marine, which now ariſes in its proper white fumes, though without ſuch an addition it could not be extricated from the alkali by any degree of heat: on the addition of the vitriolic acid, the nitrous gives way in its turn, exhaling in red fumes, and leaving only the vitriolic acid and the alkali united together.

Again, if any metallic body be diſſolved in an acid, the addition of any earthy body that is diſſoluble in that acid will precipitate the metal: a volatile alkaline ſalt will in like manner precipitate the earth: and a fixed alkali will diſlodge the volatile; which laſt being readily exhaled by heat, the remaining ſalt will be the ſame as if the acid and fixed alkali had been joined together at firſt, without the intervention of any of the other bodies.

The

Elements.

55
The power in bodies on which theſe various tranſpoſitions and combinations depend, is called by the chemiſts *affinity* or *elective attraction*; a term, like the Newtonian *attraction*, deſigned to expreſs not the cauſe, but the effect. When an acid ſpontaneouſly quits a metal to unite with an alkali, they ſay *it has a greater affinity* or *attraction* to the alkali than to the metal: and when, on the contrary, they ſay it has a greater affinity to fixed alkali than to the volatile, they mean only that it will unite with the fixed in preference to the volatile; and that if previouſly united with a volatile alkali, it will forſake this for a fixed one.

The doctrine of the affinities of bodies is of a very extenſive uſe in chemical pharmacy: many of the officinal proceſſes, as we ſhall ſee hereafter, are founded on it: ſeveral of the preparations turn out very different from what would be expected by a perſon unacquainted with theſe properties of bodies; and ſeveral of them, if, from an error in the proceſs, or other cauſes, they prove unfit for the uſe intended, may be rendered applicable to other purpoſes, by ſuch tranſpoſitions of their component parts as are pointed out by the knowledge of their affinities.

We ſhall therefore ſubjoin a table of the principal affinities obſerved in pharmaceutical operations formed from that of the famous Bergman. See other tables for more general purpoſes in the article CHEMISTRY.

Elements.

56
Explanation of the table of ſingle attractions.

The table is to be thus underſtood. The ſubſtance printed in capitals, on the top of each ſeries, has the greateſt affinity with that immediately under it, a leſs affinity with the next, and ſo on to the end of the ſeries: that is, if any of the remote bodies has been combined with the top one, the addition of any of the intermediate bodies will diſunite them; the intermediate body uniting with the uppermoſt body of the ſeries, and throwing out the remote one. Thus, in the firſt ſeries of the affinities of the vitriolic acid, a fixed alkali being placed between the acid and iron, it is to be concluded, that wherever vitriolic acid and iron are mixed together, the addition of any fixed alkaline ſalt will unite with the acid, and occaſion the iron to be ſeparated. Where ſeveral ſubſtances are expreſſed in one ſeries, it is to be underſtood, that any of thoſe bodies which are nearer to the uppermoſt, will in like manner diſengage from it any of thoſe which are more remote.

CASES OF DOUBLE ELECTIVE ATTRACTIONS.

BY WATER.

	Give	
1. Epſom ſalt with Mild vegetable alkali,		1. Vitriolated tartar and Common magneſia.
2. Vitriolic ammoniac with Mild mineral alkali,		2. Glauber's ſalt and Mild volatile alkali.
3. Vitriolated tartar with Nitrous ſelenite,		3. Vitriolic ſelenite and Saltpetre.
4. Vitriolated tartar with Mercurial nitre,		4. Vitriol of mercury and Saltpetre.
5. Saltpetre with Luna cornea,		5. Lunar cauſtic and Cubic nitre.
6. Vitriolated tartar with Luna cornea,		6. Vitriol of ſilver and Febrifugal ſalt.
7. Regenerated tartar with Mercurial nitre,		7. Acetous mercurial ſalt and Saltpetre.

BY HEAT.

	Give	
1. Vitriolic ammoniac with Common ſalt,		1. Common ſal ammoniac and Glauber's ſalt.
2. Vitriolic ammoniac with Regenerated tartar,		2. Acetous ammoniacal ſalt and Vitriolated tartar.
3. Vitriol of mercury with Common ſalt,		3. Glauber's ſalt and Corroſive ſublimate.
4. Crude antimony with Corroſive ſublimate,		4. Butter of antimony and Fictitious cinnabar.

CHAP. II. *Of the Pharmaceutical Apparatus.*

57 The application of fire of great importance in pharmaceutical preparations.

ONE of the principal parts of the pharmaceutical apparatus conſiſts in contrivances for containing and applying fire, and for directing and regulating its power. Of theſe contrivances called *furnaces*, there are different kinds, according to the conveniency of the place, and the particular purpoſes they are intended to anſwer. We ſhall here endeavour to give a general idea of their ſtructure, and of the principles on which they are built; and for particulars refer the reader to FURNACE; and CHEMISTRY, page 450.

FURNACES.

58 Furnace for open fire.

The moſt ſimple furnace is the common ſtove, otherwiſe called the *furnace for open fire*. This is uſually made of an iron hoop, five or ſix inches deep; with a grate or ſome iron bars acroſs the bottom, for ſupporting the fuel. It either ſtands upon feet, ſo as to be moveable from place to place; or is fixed in brick-work. In this laſt caſe, a cavity is left under the grate, for receiving the aſhes that drop through it; and an aperture or door, in the forepart of this aſh-pit, ſerves both for allowing the aſhes to be occaſionally raked out, and for admitting air to paſs up through the fuel. This furnace is deſigned for ſuch operations as require only a moderate heat; as infuſion, decoction, and the evaporation of liquids.

59 Wind furnace.

A deeper hoop or body, cylindrical, parallelopipedal, widening upwards, elliptical, or of other figures; formed of, or lined with, ſuch materials as are capable of ſuſtaining a ſtrong fire; with a grate and aſh-pit beneath, as in the preceding; and communicating at the top with a perpendicular pipe, or chimney; makes a *wind furnace*.

60 The heat of the fire increaſed in theſe furnaces by the perpendicular height of the chimney.

The greater the perpendicular height of the chimney, the greater will be the draught of air through the furnace, and the more intenſely will the fire burn; provided the width of the chimney is ſufficient to allow a free paſſage to all the air that the furnace can receive through the grate; for which purpoſe, the area of the aperture of the chimney ſhould be nearly equal to the area of the interſtices of the grate.

Hence, where the chimney conſiſts of moveable pipes, made to ſit upon each other at the ends, ſo that the length can be occaſionally increaſed or diminiſhed, the vehemence of the fire will be increaſed or diminiſhed in the ſame proportion.

61 Another method of increaſing the heat.

In furnaces whoſe chimney is fixed, the ſame advantage may be procured on another principle. As the intenſity of the fire depends wholly upon the quantity of air ſucceſſively paſſing through and animating the burning fuel, it is obvious, that the moſt vehement fire may be ſuppreſſed or reſtrained at pleaſure, by cloſing more or leſs either the aſh-pit door by which the air is admitted, or the chimney by which it paſſes off; and that the fire may be more or leſs raiſed again, by more or leſs opening thoſe paſſages. A moveable plate, or regiſter, in any convenient part of the chimney, affords commodious means of varying the width of the paſſage, and conſequently of regulating the heat. This is moſt conveniently accompliſhed by keeping the aſh-pit door entirely ſhut, and regulating the heat by a range of holes in a damping plate; each hole is provided with a proper pin, whereby we may ſhut it at pleaſure. Theſe holes may be made to bear a certain proportion to each other; the ſmalleſt being conſidered as one, the next to it in ſize muſt have twice the opening, the next to that double of the ſecond, &c.; and ſo on to the number of ſeven or eight; and by combining theſe holes variouſly together, we can admit any quantity of air from 1 to 128; as 1. 2. 4. 8. 16. 32. 64. 128. See FURNACE, p. 507.

There are two general kinds of theſe wind-furnaces; one, with the chimney on the top, over the middle of the furnace; the other with the chimney on one ſide, and the mouth clear.

In the firſt, either the upper part of the furnace is contracted to ſuch an aperture, that the chimney may ſit upon it; or it is covered with an arched dome, or with a flat plate, having a like aperture in the middle. As in this diſpoſition of the chimney, the inſide of the furnace cannot be come at from above, a door is made in the ſide, a little above the grate, for ſupplying the fuel, inſpecting the matter in the fire, &c. Elements.

For performing fuſions in this furnace, the crucible, or melting veſſel, is placed immediately among the fuel, with a ſlip of brick, or ſome other like ſupport, between it and the grate, to keep the cold air, which enters underneath, from ſtriking on its bottom.

When deſigned as a reverberatory, that is for diſtillation in long-necked coated glaſs retorts, two iron bars are placed acroſs, above the fire, for ſupporting the veſſel, whoſe neck comes out at an aperture made for that purpoſe in the ſide. This aperture ſhould be made in the ſide oppoſite to the door above-mentioned; or at leaſt ſo remote from it, that the receiver, fitted on the neck of the diſtilling veſſel without the furnace, may not lie in the operator's way when he wants to ſtir the fire or throw in freſh fuel.

The other kind of wind-furnace communicates, by an aperture in its back part near the top, either with an upright pipe of its own, or with the chimney of the room; in which laſt caſe, all other paſſages into the chimney muſt be cloſed. Here the mouth of the furnace ſerves for a door, which may be occaſionally covered with a plate or tile. Of this kind is the furnace moſt commonly uſed for fuſion in a crucible.

This laſt conſtruction, by leaving the mouth of the furnace clear, affords the conveniency of letting into it a boiling or evaporating pan, a copper ſtill, an iron pot, for diſtilling hartſhorn, an iron ſand-pot, or other like veſſels, of ſuch a ſize that they may be ſupported on the furnace by their rims. The mouth being thus occupied by the veſſels, a door muſt be made in the ſide for ſupplying and ſtirring the fuel.

When a furnace of this kind is deſigned only for a ſand-bath, it is moſt commodious to have the ſand placed on a long iron plate, furniſhed with a ledge of freeſtone or brick-work at each ſide. The mouth of the furnace is to be cloſely covered by one end of this plate; and the canal by which the furnace communicates with its chimney, is to be lengthened and carried along under the plate, the plate forming the upper ſide of the canal. In this kind of ſand-bath, digeſtions, &c. requiring different degrees of heat, may be carried on at once; for the heat decreaſes gradually from the end over the furnace to the other.

When large veſſels, as ſtills and iron pots for diſtilling hartſhorn and aquafortis, are fixed in furnaces, a conſiderable part of the bottom of the veſſel is commonly made to reſt upon ſolid brick-work.

The large ſtill, whoſe bottom is narrow in proportion to its height, and whoſe weight, when charged with liquor, requires great part of it to be thus ſupported, expoſes but a ſmall ſurface to the action of the fire underneath. To make up for this diſadvantage, the heat, which riſes at the further end of a long narrow grate, is conveyed all round the ſides of the veſſel by a ſpiral canal, which communicates at top with a common chimney.

The pots for diſtilling hartſhorn and aquafortis in the larger way, have part of their great weight borne up by three ſtrong pins or trunions at equal diſtances round the pot towards the middle reaching into a brick-work: ſo that leſs ſupport being neceſſary underneath, a greater ſurface of the wide bottom lies expoſed to the immediate action of the fire.

If a furnace, communicating with its chimney by a lateral canal, as in the ſand-furnace above-mentioned, be carried to a conſiderable height above the part where this canal enters it, and if it be filled with fuel to the top, and cloſely covered, the fuel will burn no higher than up to the upper ſide of the canal through which the air paſſes off; and in proportion as this lower part of the fuel conſumes, it will be ſupplied by that above, which falls down in its place. Hence in this furnace, called an *athanor*, a conſtant heat may be kept up for a conſiderable length of time without attendance.

The tower of the athanor, or that part which receives the fuel, is commonly made to widen a little downwards, that the coals may fall the more freely: but not ſo much as that the part on fire at bottom may be too ſtrongly preſſed. A ſmall aperture is made oppoſite to the canal or flue, or a number of openings according to the ſize of the furnace and the degree of heat required, for ſupplying the air, which is more conveniently admitted in this manner than through the grate, as the interſtices of the grate are in time choaked up by the aſhes.

This furnace is deſigned only for heating bodies exterior to it. Its canal or flue, as in the ſand-furnace already deſcribed, paſſes under a ſand-bath or water-bath; at the farther end of which it riſes perpendicularly to ſuch a height, as may occaſion a ſufficient draught of air through the fire.

The flue may be ſo wide as to correſpond to the whole height of the fire-place. A regiſter or ſliding plate, placed between the flue and the furnace, enables us to increaſe or diminiſh this height, and conſequently the quantity of fire, at pleaſure. If the ſpace beneath the flue be incloſed to the ground, the heat in this cavity will be conſiderable enough to be applicable to ſome uſeful purpoſes.

63

Of the materials of which furnaces are made.

With regard to the materials of furnaces, the fixed ones are built of bricks, cemented together by ſome good loam or clay. Any kind of loam or clayey compoſition that is of a proper degree of tenacity, which, when made into a paſte with water and well-worked, does not ſtick to the fingers, and which, when thoroughly dried, neither cracks nor melts in a vehement fire, is fit for uſe. The purer and more tenacious clays require to have their tenacity leſſened by an admixture of ſand, or rather of the ſame kind of clay burnt and groſsly powdered.

Smaller portable furnaces are made of ſtrong iron or copper plates, lined, to the thickneſs of an inch or more, with the ſame kind of clayey compoſition; which for this uſe may be beaten with ſome horſe-dung, chopped ſtraw, or cut hair or tow.

Very commodious portable furnaces, for a buſineſs of moderate extent, may be formed of the larger kind of common black lead melting-pots, by cutting a door at the bottom of the pot for the aſh-pit, another above this for the fire-place, and introducing a circular iron grate of ſuch a ſize as may reſt between the two doors.

For

Elements. For a more particular account of the method of preparing furnaces, see FURNACE.

BATHS.

64 Of two kinds of baths, and the peculiar advantages of each. Where a ſtrong degree of heat is requiſite, as in the fuſion of metals, &c the veſſel containing the ſubject matter is placed among the burning fuel, or immediately over it: this is called *operating in a naked fire*. Where a ſmaller heat is ſufficient, and the veſſel employed is either of glaſs, or of the more tender kinds of earthen ware, the ſand-bath or water-bath is uſed to defend the veſſel from the immediate action of the fire, and to render the heat leſs fluctuating.

Both theſe baths have their peculiar advantages and inconveniences. In water, the heat is equal through every part of the fluid: whereas in ſand it varies in different parts of one perpendicular line, decreaſing from the bottom to the top. Water cannot be made to receive, or to tranſmit to veſſels immerſed in it, above a certain degree of heat, viz. that which is ſufficient to make it boil; and hence it ſecures effectually againſt any danger of an exceſs of heat in thoſe operations wherein the product would be injured by a heat greater than that of boiling water: but this advantage renders it uſeleſs for proceſſes which require a greater heat, and for which ſand or other ſolid intermedia are neceſſarily employed. There is this convenience alſo in the ſand-bath, that the heat may be readily diminiſhed or increaſed about any particular veſſel, by raiſing it higher out of the ſand or ſinking it deeper; that different ſubjects may be expoſed to different degrees of heat from one fire; and that it keeps the veſſels ſteady. The ſand made choice of ſhould be a large coarſe grained kind, ſeparated from the finer parts by waſhing, and from little ſtones by the ſieve.

COATING of GLASSES, LUTES.

65 In ſome operations glaſs veſſels are uſed in a naked fire. Some proceſſes require to be performed with glaſs veſſels in a naked fire. For theſe purpoſes, veſſels made of the thinneſt glaſs ſhould be choſen; for theſe bear the fire without cracking, much better than thoſe which are thicker, and in appearance ſtronger.

All glaſſes, or other veſſels that are apt to crack in the fire, muſt be cautiouſly nealed, that is, heated by ſlow degrees: and when the proceſs is finiſhed, they ſhould be as ſlowly cooled, unleſs where the veſſel is to be broken to get out the preparation, as in ſome ſublimations: in this caſe it is more adviſable to expoſe the hot glaſs ſuddenly to the cold air, which will ſoon occaſion it to crack, than to endanger throwing down the ſublimated matter among the feces by a blow.

66 Of the coating of glaſs veſſels. As a defence from the violence of the fire, and to prevent the contact of cold air on ſupplying freſh fuel, &c. the glaſs is to be coated over, to the thickneſs of about half-a-crown, with Windſor loam, ſoftened with water into a proper conſiſtence, and beaten up with ſome horſe-dung, or with the other clayey compoſitions above mentioned.

Theſe compoſitions ſerve alſo as a lute, for ſecuring the junctures of the veſſels in the diſtillation of the volatile ſalts and ſpirits of animals: for the diſtillation of acid ſpirits, the matter may be moiſtened with a ſolution of fixed alkaline ſalt inſtead of water. For moſt other purpoſes, a piece of wet bladder, or paſte of flour and water, or of linſeed meal (that is, the cake left after the expreſſion of oil of linſeed), are ſufficient lutes. Ele

Sometimes clay and chalk are mixed up into a paſte, and ſpread upon ſlips of paper; and ſometimes gum-arabic is uſed inſtead of the clay, and mixed up in the ſame manner.

Wet bladders contract ſo ſtrongly by drying, that they not unfrequently break the veſſels: and the fat lute of Mr Macquer, which is a compoſition of clay and chalk with oil, is too cloſe for moſt operations. Where very elaſtic ſteams are to be condenſed, we are often obliged, even where the common lutes are employed, to leave or make an opening which may be occaſionally ſtopped by a plug: by this means we give paſſage to a part of theſe vapours, which prevents the burſting of the veſſels and facilitates the condenſation of the reſt. If we wiſh to collect incondenſible vapours, we receive them into a jar inverted under a baſon of water, or quickſilver, as is uſually done in the analyſis of vegetables by fire.

Beſides theſe, there are alſo required ſome other kinds of lutes for joining veſſels together in operations requiring a ſtrong heat, and for lining furnaces; for which ſee CHEMISTRY, n 604, 605.

VESSELS.

In this place, we ſhall only give the operator a few general cautions with regard to the *matter* of the veſſels deſigned for containing the ſubject; and refer their deſcription, to the account of the operations in which they are employed. See likewiſe CHEMISTRY, n°557, &c.

Caut reſpe the m of ot veſſe Metalline veſſels poſſeſs the advantage of being able to bear ſudden alterations of heat and cold, and of being very ſtrong, ſo as to be capable of confining elaſtic ſteams; but, except thoſe made of gold or ſilver, they are readily corroded by acids, even by the mild ones of the vegetable kingdom. Copper veſſels are corroded alſo by alkaline liquors, and by ſome neutral ones, as ſolutions of ſal ammoniac. It is obſervable, that vegetable acids do not act upon this metal by boiling, ſo much as by ſtanding in the cold; for even lemon juice may be boiled in a clean copper veſſel, without receiving from it any taſte or ill quality; whereas, in the cold, it ſoon diſſolves ſo much as to contract a pernicious taint. The tin, with which copper-veſſels are uſually lined, gives likewiſe a ſenſible impregnation to acid juices; and this impregnation alſo is probably not innocent, more eſpecially as a quantity of lead is commonly mixed with the tin. From the want of tranſparency in theſe veſſels, we are alſo deprived of the advantage of ſeeing the different changes during the operation.

The earthen veſſels poſſeſs none of the deſirable qualities for chemical operations, except that of ſuſtaining very violent degrees of heat, without being melted or otherwiſe changed. Theſe veſſels are leſs liable to external cracks from ſudden applications of heat and cold, when they are made with a certain proportion of ſand, than with pure clay. Black lead, too, mixed with the clay, makes the veſſels ſuſtain violent degrees and ſudden alterations of heat ſurpriſingly well: crude clay, reduced to a kind of ſand by violent heat, and then mixed with raw clay, is alſo found to furniſh veſſels excellently fitted for thoſe operations

where

where ſand might be corroded: but of all kinds of earthen ware, the moſt perfect is porcelain, compoſed of the fineſt clay mixed with a ſtony matter capable of melting in a violent heat. This, however, is too coſtly an article for general uſe. Reaumur diſcovered a method of imitating porcelain, by melting the coarſer kinds of glaſs with a mixture of ſand and clay: this has been found to be nearly of the colour of porcelain, to be much ſtronger than glaſs, and to bear the moſt ſudden changes of heat and cold that we have occaſion to apply. There has not hitherto been any manufacture of this ware, and of courſe it has not come into general uſe.

The common earthen veſſels are of a looſe porous texture; and hence are apt to imbibe a conſiderable quantity of certain liquids, particularly of thoſe of the ſaline kind; which ſoon diſcover that they have penetrated the veſſel, by ſhooting into ſaline efflorescences on the outſide. Thoſe which are *glazed* have their glazing corroded by acids: by vinegar, and the acid juices of fruits, as well as by the ſtronger acids of the mineral kingdom. And as this glazing conſiſts chiefly of vitrified lead, the impregnation which it communicates to theſe liquors is of a very dangerous kind. If vinegar be boiled for ſome time in a glazed earthen veſſel, it will yield, on being inſpiſſated, a pure ſal plumbi, that is, a ſalt compoſed of lead and the acetous acid.

The veſſels called, from their hardneſs and compactneſs, *ſtone ware*, are in a good meaſure free from the inconveniences of the coarſer earthen ones. Their glazing being a part of the clay itſelf, ſuperficially vitrified by means of the fumes of common ſalt, appears to be proof againſt acids.

Glaſs veſſels ſuffer no corroſion, and give no taint, in any of the pharmaceutic operations. When, therefore, they are made of a proper thinneſs, when they are well annealed, and when blown into a ſpherical form ſo that the heat may be equally applied, they are preferable to all others, where great and ſudden changes of heat and cold are not to take place, and where ſtrength is not required: what is called the *flint glaſs*, which contains a quantity of lead in its compoſition, is the beſt for chemical purpoſes.

Weights.

Two different kinds of weights are made uſe of in this country; one in the merchandiſe of gold and ſilver; the other for almoſt all other goods. The firſt we call Troy, the latter Avoirdupois weight.

The goldſmiths divide the Troy pound into twelve ounces; the ounce into 20 pennyweights; and the pennyweight into 24 grains. The Avoirdupois pound is divided into 16 ounces; and the ounce into 16 parts, called *drams*.

The pound of the London and Edinburgh diſpenſatories is that of the goldſmiths, divided in the following manner:

The pound The ounce The dram The ſcruple	contains	twelve ounces. eight drams. three ſcruples. twenty grains.

The grain is equal to the goldſmith's grain.

The medical or Troy pound is leſs than the Avoirdupois, but the ounce and the dram greater. The Troy pound contains 5760 grains: the Avoirdupois 7000 grains. The Troy ounce contains 480 grains; the Avoirdupois only $437\frac{1}{2}$. The Troy dram 60; the Avoirdupois dram ſomewhat more than 27. Eleven drams Avoirdupois are nearly equal to five drams Troy; 12 ounces Avoirdupois to nearly 11 ounces Troy; and 19 pounds Avoirdupois are equal to ſomewhat more than 23 pounds Troy. Elements.

Theſe differences in our weights have occaſioned great confuſion in the practice of pharmacy. As the druggiſts and grocers ſell by the Avoirdupois weight, the apothecaries have not in general kept any weights adjuſted to the Troy pound greater than two drams, uſing Avoirdupois ounces. By this means it is apparent, that in all compoſitions, where the ingredients are preſcribed, ſome by pounds and others by ounces, they are taken in a wrong proportion to each other; and the ſame happens where any are directed in leſſer denominations than the ounce, as theſe ſubdiviſions uſed by the apothecaries are made to a different ounce.

Measures.

69 The meaſures employed in pharmacy are the common wine meaſures.

A gallon The pint The ounce	contains	eight pints (*libræ.*) ſixteen ounces. eight drams.	

The meaſures uſed in pharmacy the ſame with thoſe commonly uſed for wine.

Though the pint is called by Latin writers *libra* or pound, there is not any known liquor of which a pint meaſure anſwers to that weight. A pint of the higheſt rectified ſpirit of wine exceeds a pound by above half an ounce; a pint of water exceeds it by upwards of three ounces; and a pint of oil of vitriol weighs more than two pounds and a quarter.

The Edinburgh College, ſenſible of the many errors from the promiſcuous uſe of weights and meaſures, and of their different kinds, have in the laſt edition of their Pharmacopœia entirely rejected meaſures, and employ the Troy weight in directing the quantity either of ſolid or fluid ſubſtances. They have, however, taken all poſſible care that the proportion of the ſimples and ſtrength of the compounds ſhould neither be increaſed nor diminiſhed by this alteration. This change in the Edinburgh Pharmacopœia muſt be very particularly adverted to. And it is, we think, to be regretted, that the London College have not in the laſt edition of their Pharmacopœia followed the ſame plan.

70 A table of the weights of certain meaſures of different fluids may on many occaſions be uſeful, both for aſſiſting the operator in regulating their proportions in certain caſes, and ſhowing the comparative gravities of the fluids themſelves. We here inſert ſuch a table for a pint, an ounce, and a dram meaſure, of thoſe liquids whoſe gravity has been determined by experiments that can be relied on. The wine gallon contains 231 cubic inches; whence the pint contains $28\frac{7}{8}$, the ounce $1\frac{19}{128}$, and the dram $\frac{7}{128}$ of a cubic inch.

A table of the weights of certain meaſures of different fluids may be frequently uſeful.

Chap. III. *Of the Pharmaceutical Operations.*

Sect. I. *Solution.*

Solution is an intimate commixture of solid bodies with fluids into one seemingly homogeneous liquor. The dissolving fluid is called a *menstruum* or *solvent*; and the body dissolved is called the *solvend*.

Objections have been made, and perhaps with propriety, to these terms; as it is supposed that the two bodies uniting in solution act reciprocally on each other: there is, however, no danger from the words themselves, if we do not derive them from a mistaken theory. Solution cannot take place, unless one of the bodies, at least, be in a fluid state; and this fluidity is effected either by water or fire: hence solution is said to be performed in the *humid* or in the *dry way*. Thus, for instance, if any quantity of brimstone be dissolved in a solution of fixed alkali, the brimstone is said to be dissolved in the *humid way*: but if the brimstone be dissolved by melting it in a pan with the dry alkali, the solution is said to be done in the *dry way*. The hepar sulphuris is the same in both. Another kind of solution resembling that by the dry way, is, however, to be carefully distinguished from it: if, for example, a piece of Glauber's salt is put into a pan over the fire, the salt very soon assumes a liquid state; but on continuing the heat, it loses its fluidity, and becomes a white powder: this powder is the salt freed from its water, and it is found to be very refractory. This liquidity depended on the water of crystallization being enabled by the heat to keep the salt in solution, and the salt ceased to be fluid as soon as its crystallizing water was evaporated. This kind of solution, then, differs not from the first, or humid way.

If one of the two bodies to be united is transparent, the solution, if complete, is a transparent compound: this is the case in solutions of alkalis and calcareous earths in acids. But if the solution be opaque and milky, as is the case with soap and water, it is then considered as incomplete.

The principal menstrua used in pharmacy are, *water*, *vinous spirits*, *oils*, *acid* and *alkaline liquors*.

Water is the menstruum of all salts, of vegetable gums, and of animal gellies. Of salts, it dissolves only a determinate quantity, though of one kind of salt more than another; and being thus *saturated*, leaves any additional quantity of the same salt untouched.

Experiments have been made for determining the quantities of water which different salts require for the dissolution. Mr Eller has given a large set in the Memoirs of the Royal Academy of Sciences of Berlin for the year 1750, from which the following table is extracted.

Eight ounces by weight of distilled water dissolved.

	oz.	dr.	gr.
Of refined sugar	24	0	0
Green vitriol	9	4	0
Blue vitriol	9	0	0
White vitriol	4	4	0
Epsom salt	4	0	0
Purified nitre	4	0	0
Soluble tartar	4	0	0
Common salt	3	4	0
Sal gemmæ	3	4	0

Sal

Sal catharticus Glauberi	3	4	0
Seignette's ſalt -	3	0	0
Alum - -	2	4	0
Sal ammoniac -	2	4	0
Vitriolated tartar -	1	4	0
Salt of hartſhorn -	1	4	0
Sugar of lead -	1	2	0
Cream of tartar	1	0	0
Borax - -	0	4	20

Though great care appears to have been taken in making theſe experiments, it is not to be expected that the proportions of the ſeveral ſalts, ſoluble in a certain quantity of water, will always be found exactly the ſame with thoſe above ſet down. Salts differ in their ſolubility according to the degree of their purity, perfection, and dryneſs: the vitriols, and the artificial compound ſalts in general, differ remarkably in this reſpect, according as they are more or leſs impregnated with the acid ingredient. Thus vitriolated tartar; perfectly neutralized, is extremely difficult of ſolution: the matter which remains in making Glauber's ſpirit of nitre is no other than a vitriolated tartar; and it diſſolves ſo difficultly, that the operator is obliged to break the retort in order to get it out; but on adding more of the vitriolic acid, it diſſolves with eaſe. Hence many have been tempted to uſe an over-proportion of acid in this preparation: and we frequently find in the ſhops, under the name of vitriolated tartar, this acid ſoluble ſalt. The degree of heat occaſions alſo a remarkable difference in the quantity of ſalt taken up: in very cold weather, 8 ounces of water will diſſolve only about one ounce of nitre; whereas in warm weather, the ſame quantity will take up three ounces or more. To theſe circumſtances are probably owing, in part, the remarkable differences in the proportionable ſolubilities of ſalts, as determined by different authors. It is obſervable that common ſalt is leſs affected in its ſolubility by a variation of heat than any other; water in a temperate ſtate diſſolving nearly as much of it as very hot water: and accordingly this is the ſalt in which the different experiments agree the beſt. In the experiments of Hoffmann, Neumann, and Petit, the proportion of this ſalt, on a reduction of the numbers, comes on exactly the ſame, viz. three ounces of the ſalt to eight of water; Dr Brownrigg makes the quantity of ſalt a little more; Dr Grew, a dram and a ſcruple more; and Eller, as appears in the above table, four drams more: ſo that in the trials of ſix different perſons, made probably in different circumſtances, the greateſt difference is only one ſixth of the whole quantity of ſalt; whereas in ſome other ſalts there are differences of twice or thrice the quantity of the ſalt. In the experiments from which the table is drawn, the water was of the temperature of between 40 and 42 degrees of Fahrenheit's thermometer, or above freezing by about one-ſeventh of the interval between freezing and the human heat.

Some ſalts omitted by Eller are here ſubjoined; the firſt is taken from Dr Grew, and the other four from Neumann.

Eight ounces of water diſſolved,

	oz.	dr.	gr.
Of fixed alkaline ſalt	above 8	0	0
Sal diureticus -	8	0	0
Sugar-candy, both brown and white	9	0	0
Sugar of milk - -	0	2	40
Eſſential ſalt of ſorrel -	0	1	20

Elements.

Though water takes up only a certain quantity of one kind of ſalt, yet when ſaturated with one, it will ſtill diſſolve ſome portion of another; and when it can bear no more of either of theſe, it will ſtill take up a third, without letting go any of the former. The principal experiments of this kind which have been made relative to pharmaceutic ſubjects, are exhibited in the following table; of which the two firſt articles are from Grew, and the others from Eller.

Water, 32 parts by weight,

Fully ſatured with	diſſolved afterwards			
Nitre	Sal ammoniac	10		
Common ſalt	Nitre	10	Sal ammoniac	2
Nitre	Fixed alkali	7	Common ſalt	2
Common ſalt	Nitre, near	2	Fixed alkali	2½
Volatile alkali	Nitre	4	Sugar	2
Sal ammoniac	Common ſalt	2½		
Soluble tartar	Nitre	2		
Vitriolated tartar	Fixed alkali	2		
Glauber's ſalt	Nitre	1	Sugar	1
Epſom ſalt	Sugar	6	-	
Borax	Fixed alkali	2		

In regard to the other claſs of bodies for which water is a menſtruum, viz. thoſe of the gummy gelatinous kind, there is no determinate point of ſaturation: the water unites readily with any proportions of them, forming with different quantities liquors of different conſiſtence. This fluid takes up likewiſe, when aſſiſted by trituration, the vegetable gummy reſins, as amoniacum and myrrh; the ſolutions of which, though *imperfect*, that is, not tranſparent, but turbid and of a milky hue, are nevertheleſs applicable to valuable purpoſes in medicine. It mingles with vinous ſpirits, with acid and alkaline liquors, not with oils, but imbibes ſome of the more ſubtile parts of eſſential oils, ſo as to become impregnated with their ſmell and taſte.

73 Rectified ſpirit of wine, or alcohol, the menſtruum of the eſſential oils and reſins of vegetables.

Rectified *ſpirit of wine*, or rather *alcohol*, is the menſtruum of the eſſential oils and reſins of vegetables; of the pure diſtilled oils, and ſeveral of the colouring and medicinal parts of animals; of ſome mineral bituminous ſubſtances, as of ambergris; and of ſoaps, though it does not act upon the expreſſed oil and fixed alkaline ſalt, of which ſoap is compoſed: whence, if ſoap contains any ſuperfluous quantity of either the oil or ſalt, it may by means of this menſtruum be excellently purified. It diſſolves, by the aſſiſtance of heat, volatile alkaline ſalts; and more readily the neutral ones, compoſed either of fixed alkali and the acetous acid, as the ſal diureticus, or of the volatile alkali and the nitrous acid, as alſo the ſalt of amber, &c. It mingles with water and with acids; not with alkaline lixivia.

74 Oils diſſolve various ſubſtances.

Oils diſſolve vegetable reſins and balſams, wax, animal-fats, mineral bitumens, ſulphur, and certain metallic ſubſtances, particularly lead. The expreſſed oils are, for moſt of theſe bodies, more powerful menſtrua than thoſe obtained by diſtillation; as the former are more capable of ſuſtaining, without injury, a ſtrong heat, which is in moſt caſes neceſſary to enable them to act. It is ſaid, that one ounce of ſulphur will diſſolve in three ounces of expreſſed oil, particularly linſeed

Elements.

seed oil; but requires six ounces of essential oil, as turpentine.

75 All acids dissolve alkaline salts, alkaline earths, and metallic substances.

All acids dissolve alkaline salts, alkaline earths, and metallic substances. The different acids differ greatly in their action upon these last; one dissolving only some particular metals; and another, others.

The *vegetable* acids dissolve a considerable quantity of zinc, iron, copper, lead, and tin; and extract so much from the metallic part of antimony, as to become powerfully emetic: they dissolve lead more readily, if the metal be previously calcined by fire, than in its metallic state.

The *marine* acid dissolves zinc, iron, and copper; and though it scarcely acts on any other metallic substance in the common way of making solutions, it may nevertheless be artfully combined with them all except gold. The corrosive sublimate, and antimonial caustic of the shops, are combinations of it with mercury and the metallic part of antimony, effected by applying the acid, in the form of fume, to the subjects, at the same time also strongly heated.

The *nitrous* acid is the common menstruum of all metallic substances, except gold and the metallic part of antimony; of which two, the proper solvent is a mixture of the nitrous and marine acids, called *aqua regia*.

The *vitriolic* acid, diluted with water, easily dissolves zinc and iron. In its concentrated state, and assisted by a boiling heat, it may be made to corrode, or imperfectly dissolve, most of the other metals.

The aerial acid dissolves iron, zinc, and calcareous earth; and those solutions must be conducted without heat.

76 Alkaline lixivia dissolves oils, resinous substances, and sulphur.

Alkaline *lixivia* dissolve oils, resinous substances, and sulphur. Their power is greatly promoted by the addition of quicklime; instances of which occur in the preparation of soap, and in the common caustic. Thus acuated, they reduce the flesh, bones, and other solid parts of animals, into a gelatinous matter. This increased acrimony in alkaline salts is owing to the abstraction of their fixed air; that acid having a greater attraction for quicklime than for alkalis.

Solutions made in water and in spirit of wine possess the virtues of the body dissolved; while oils generally sheath its activity, and acids and alkalis vary its quality. Hence watery and spirituous liquors are the proper menstrua of the native virtues of vegetable and animal matters.

Most of the foregoing solutions are easily effected, by pouring the menstruum on the body to be dissolved, and suffering them to stand together for some time exposed to a suitable warmth. A strong heat is generally requisite to enable oils and alkaline liquors to perform their office; nor will acids act on some metallic bodies without its assistance. The action of watery and spirituous menstrua is likewise expedited by a moderate heat; though the quantity which they afterwards keep dissolved is not, as some suppose, by this means increased: all that heat occasions these to take up, more than they would do in a longer time in the cold, will, when the heat ceases, subside again. This at least is most commonly the case, though there may be some instances of the contrary.

The action of acids on the bodies which they dissolve, is generally accompanied with heat, effervescence, and a copious discharge of fumes. The fumes which arise during the solution of some metals in the vitriolic acid, prove inflammable: hence in the preparation of the artificial vitriols of iron and zinc, the operator ought to be careful, especially where the solution is made in a narrow mouthed vessel, lest by the imprudent approach of a candle the exhaling vapour be set on fire. This vapour is the inflammable air of Dr Priestley and other modern chemists. Elements.

There is another species of solution, in which the moisture of the air is the menstruum. Fixed alkaline salts, and those of the neutral kind, composed of alkaline salts and the vegetable acids, or of soluble earths and any acid, except the vitriolic, and some metallic salts, on being exposed for some time to a moist air, gradually attract its humidity, and at length become liquid. Some substances, not dissoluble by the application of water in its grosser form, as the butter of antimony, are easily liquefied by this slow action of the aerial moisture. This process is called *deliquation*.

Sect. II. *Extraction.*

77 Those liquors which dissolve substances are also useful for extracting them from admixtures of other matter.

The liquors which dissolve certain substances in their pure state, serve likewise to *extract* them from admixtures of other matter. Thus ardent spirit, the menstruum of essential oils and resins, takes up the virtues of the resinous and oily vegetables, as water does those of the mucilaginous and saline; the inactive earthy parts remaining untouched by both. Water extracts likewise from many plants, substances which by themselves it has little effect upon; even essential oils being, as we have formerly observed, rendered soluble in that fluid by the admixture of gummy and saline matter, of which all vegetables participate in a greater or less degree. Thus many of the aromatic plants, and most of the bitters and astringents, yield their virtues to this menstruum.

78 Methods performing extraction.

Extraction is performed, by *macerating* or *steeping* the subject in its appropriated menstruum in the cold: or *digesting* or *circulating* them in a moderate warmth; or *infusing* the plant in the boiling liquor, and suffering them to stand in a covered vessel till grown cold; or actually *boiling* them together for some time. If the vegetable matter is itself succulent and watery, it is sometimes only necessary to express the juice, and evaporate it to the proper consistence.

The term *digestion* is sometimes used for maceration; and in this case the process is directed to be performed *without heat*: where this circumstance is not expressed, digestion always implies the use of heat. Circulation differs from digestion only in this, that the steam, into which a part of the liquor is resolved by the heat, is, by means of a proper disposition of the vessels, condensed and conveyed back again upon the subject. Digestion is usually performed in a matrass (or bolt-head), Florence flask, or the like; either of which may be converted into a circulatory vessel, by inverting another into the mouth, and securing the juncture with a piece of wet bladder. A single matrass, if its neck be very long and narrow, will answer the purpose as effectually; the vapour cooling and condensing before it can rise to the top: in a vessel of this kind, even spirit of wine, one of the most volatile liquors we know, may be boiled without any considerable loss: the use of this instru-

Elements.

inſtrument is likewiſe free from an inconvenience which may in ſome caſes attend the other, of the uppermoſt veſſel being burſt or thrown off. As the long necked matraſſes here recommended are difficultly filled or emptied, and likewiſe very dear, a long glaſs pipe may be occaſionally luted to the ſhorter ones.

Heat greatly expedites extraction; but by this means proves as injurious to ſome ſubſtances, by occaſioning the menſtruum to take up their groſſer and more ungrateful parts, as it is neceſſary for enabling it to extract the virtues of others. Thus guaiacum and logwood impart little to aqueous liquors without a boiling heat; whilſt even a ſmall degree of warmth proves greatly prejudicial to the fine bitter of carduus benedictus. This plant, which infuſed in boiling, or digeſted in ſenſibly hot water, gives out a naufeous taſte, ſo offenſive to the ſtomach as to promote vomiting, yields to the cold element a grateful balſamic bitter.

As heat promotes the diſſolving power of liquids; ſo cold, on the other hand, diminiſhes it. Hence tinctures or extractions made by a conſiderable heat, depoſite in cold weather a part of their contents, and thus become proportionally weaker: a circumſtance which deſerves particular regard.

Sect. III. *Depuration.*

79

There are different methods of depurating or purifying liquors from their feculencies, according as the liquor itſelf is more or leſs tenacious, or the feculent matter of greater or leſs gravity.

Thin fluids readily depoſite their more ponderous impurities upon ſtanding at reſt for ſome time in a cool place; and may then be decanted or poured off clear, by inclining the veſſel.

Glutinous, unctuous, or thick ſubſtances, are to be liqueſied by a ſuitable heat; when the groſſer feculencies will fall to the bottom, the lighter ariſing to the ſurface to be *deſpumated* or ſcummed off.

Where the impurities are neither ſo ponderous as to ſubſide freely to the bottom, nor ſo light as to ariſe readily to the ſurface, they may be ſeparated in great meaſure by *colature* through ſtrainers of linen, woollen, or other cloth; and more perfectly by *filtration* through a ſoft bibulous kind of paper made for the purpoſe.

The grey paper, which covers pill-boxes as they come from abroad, is one of the beſt for this purpoſe: it does not eaſily break when wetted, or tinge the liquor which paſſes through it, which the reddiſh ſort called *bloſſom paper* frequently does. The paper is ſupported by a funnel or piece of canvas fixed in a frame. When the funnel is uſed, it is convenient to put ſome ſtraws or ſmall ſticks between the paper and its ſides, to prevent the weight of the liquor from preſſing the paper ſo cloſe to it, as not to allow room for the fluid to tranſude. In ſome caſes a funnel made of wire is put between the paper and the glaſs funnel. There is alſo a kind of glaſs funnel with ridges down its ſides made on purpoſe for this uſe.

Glutinous and unctuous liquors, which do not eaſily paſs through the pores of a filter or ſtrainer, are clarified by beating them up with whites of eggs; which concreting and growing hard when heated, and entangling the impure matter, ariſe with it to the ſurface: the mixture is to be gently boiled till the ſcum begins to break, when the veſſel is to be removed from the fire, the cruſt taken off, and the liquor paſſed thro' a flannel bag.

Decantation, colature, and filtration, are applicable to moſt of the medicated liquors that ſtand in need of purification. Deſpumation and clarification very rarely have place; ſince theſe, along with the impurities of the liquor, frequently ſeparate its medicinal parts. Thus, if the decoction of poppy heads, for making diacodium, be ſolicitouſly ſcummed or clarified, the medicine will loſe almoſt all that the poppies communicated; and inſtead of a mild opiate, turns out little other than a plain ſyrup of ſugar.

It may be proper to obſerve, that the common ſorts of filtering paper are apt to communicate a diſagreeable flavour: and hence in filtering fine bitters or other liquors, whoſe gratefulneſs is of primary conſequence, the part which paſſes through firſt ought to be kept apart for inferior purpoſes.

Sect. IV. *Cryſtallization.*

80

Causes, nature, and method of cryſtallization.

Water, aſſiſted by heat, diſſolves a larger proportion of moſt ſaline ſubſtances than it can retain when grown cold; hence, on the abatement of the heat, a part of the ſalt ſeparates from the menſtruum, and concretes at the ſides and bottom of the veſſel. The concretions, unleſs too haſtily formed by the ſudden cooling of the liquor, or diſturbed in their coaleſcence by agitation, or other ſimilar cauſes, prove tranſparent and of regular figures, reſembling in appearance the natural ſpring-cryſtals.

Salts, diſſolved in a large quantity of water, may in like manner be recovered from it in their cryſtalline form, by boiling down the ſolution, till ſo much of the fluid has exhaled as that the remainder will be too little to keep the ſalt diſſolved when grown perfectly cold. It is cuſtomary to continue the evaporation till the ſalt ſhows a diſpoſition to concrete even from the hot water, by forming a pellicle on that part which is leaſt hot, *viz.* on the ſurface. If large, beautiful, and perfectly figured cryſtals are required, this point is ſomewhat too late: for if the ſalt thus begins to coaleſce whilſt conſiderably hot, on being removed into a cold place its particles will run too haſtily and irregularly together: the pellicle at the ſame time falling down through the liquor, proves a farther diſturbance to the regularity of the cryſtallization.

In order to perform this proceſs in perfection, the evaporation muſt be gentle, and continued no longer than till ſome drops of the liquor, let fall on a cold glaſs-plate, diſcover cryſtalline filaments. When this mark of ſufficient exhalation appears, the veſſel is to be immediately removed from the fire into a leſs warm but not cold place, and covered with a cloth to prevent the acceſs of cold air, and conſequently the formation of a pellicle.

The fixed alkalis, eſpecially the mineral, when fully ſaturated with fixed air or the aerial acid, aſſume a cryſtalline form; but theſe cryſtals are not ſo perfect as when the ſame alkalis are united with the other acids; the volatile alkalis cannot cryſtallize, becauſe they eſcape before the menſtruum exhales.

Some even of the other neutral ſalts, particularly thoſe of which certain metallic bodies are the baſis, are ſo ſtrongly retained by the aqueous fluid, as not to exhibit any appearance of cryſtallization, unleſs ſome other

other substance be added, with which the water has a greater affinity. The Table of Affinity shows that spirit of wine is such a substance; by the prudent addition of which, these kinds of salt separate freely from the menstruum and form large and beautiful crystals scarcely obtainable by any other means.

The operator must be careful not to add too much of the spirit; lest, instead of a gradual and regular crystallization, the basis of the salt be hastily precipitated in a powdery form. One twentieth part of the weight of the liquor will in most cases be a sufficient, and in some too large a quantity.

Different salts require different quantities of water to keep them dissolved: and hence, if a mixture of two or more be dissolved in this fluid, they will begin to separate and crystallize at different periods of the evaporation. Upon this foundation, salts are freed not only from such impurities as water is not capable of dissolving and carrying through the pores of a filter, but likewise from admixtures of each other; that which requires most water to dissolve shooting first into crystals.

It is proper to remark, that a salt, when crystallizing, still retains and combines with a certain portion of water: this water is not essential to the salt as a salt, but is essential to a salt as being crystallized; it is therefore called by the chemists the *water of crystallization*. The quantity of this water varies in different salts: In some of them, as in Glauber's salt, alum, and copperas, it makes up about one half of their weight; in others, as in nitre, common salt, and especially selenites, it is in very small quantity. As salts unite to the water of their crystallization by their attraction for water alone, we accordingly find that this water is perfectly pure, and contains, in complete crystals, no substance foreign to the salt. Salts not only differ in the quantity of water necessary to their solution, but some of them are also soluble with equal facility in cold as in hot water. Sometimes then we employ evaporation; sometimes cooling; and at other times both these expedients are used alternately, to separate different salts dissolved in the same liquor. It is obvious, then, that those which are nearly or equally soluble in cold as in boiling water, can only be crystallized by evaporation; those again, which are much more soluble in boiling than in cold water, are to be separated by cooling. Of the first of these is common or marine salt; of the latter is nitre or saltpetre. It remains, then, that we should know how to separate these two salts, when both of them happen to be dissolved in the same water; this method consists in alternate evaporation and cooling. If in such a solution a pellicle appears in the boiling liquor before crystals can be formed in the cooling, we then conclude that the common salt predominates: In this case we evaporate the water, and separate the common salt as fast as it is formed, till the liquor on cooling shows crystals of nitre: we then allow the nitre to crystallize by cooling. After all the nitre which had been dissolved by the heat alone has now separated by cooling, we resume the evaporation, and separate the common salt till the cooling liquor again shows crystals of nitre. We thus repeat the same series of operations, by which means these two salts may be alternately crystallized; the one by evaporation, the other by cooling, till they are perfectly separated from each other. If in the beginning of the operation the liquor had, upon trial, given crystals of nitre by cooling, before any pellicle appeared on its surface when boiling, this would have indicated that the nitre was predominant in the solution; the nitre in this case would have been crystallized, first by cooling, till the quantity of nitre exceeding that of the common salt having been separated, the common salt would next have crystallized in its turn by evaporation. The example we have now given may be applied to other salts, or to a number of salts which may happen to be dissolved in the same liquor. For though there are few so completely soluble in cold water as common salt, and few so scantily as nitre; yet there are scarcely two salts which either precisely show the same solubility or the same appearance of their crystals. It is obvious, too, that by crystallization we discover the peculiar predominant salt in any solution of mixed saline matter; but as one salt always takes down a small portion of another, it is necessary to redissolve the first products, and repeat the crystallization, in order to render the separation complete.

We see, then, that though the crystal appearance and form does not alter the salt itself, yet that this process affords an elegant method of discovering compound solutions of salts, of judging of their purity, and lastly of separating different salts very completely from each other. Crystallization, then, is one of the most important agents in pharmacy, and ought to be well understood. We shall attempt to explain the particular management in crystallizing particular salts, when we come to treat of each of them separately.

Sect. V. *Precipitation.*

81 Nature of precipitation; and various methods of performing this operation.

By this operation bodies are recovered from their solutions by means of the addition of some other substance, with which either the menstruum or the body dissolved have a greater affinity than they have with each other.

Precipitation, therefore, is of two kinds; one, where the substance superadded unites with the menstruum, and occasions that before dissolved to be thrown down; the other, in which it unites with the dissolved body, and falls along with it to the bottom. Of the first, we have an example in the precipitation of sulphur from alkaline lixivia by the means of acids; of the second, in the precipitation of mercury from aquafortis by sea-salt, or its acid.

The subjects of this operation, as well those which are capable of being precipitated as those which precipitate them, will readily appear from inspection of the Table of Affinity. See Chemistry, page 438. The manner of performing it is so simple, as not to stand in need of any particular directions; no more being required than to add the precipitant by degrees as long as it continues to occasion any precipitation. When the whole of the powder has fallen, it is to be well *edulcorated*, that is, washed in several fresh parcels of water, and afterwards dried for use.

Where metals are employed as precipitants, as in the purification of martial vitriol from copper by the addition of fresh iron, they ought to be perfectly clean and free from any rusty or greasy matter; otherwise they will not readily, if at all, dissolve, and consequently

ly the precipitation will not ſucceed; for the ſubſtance to be precipitated ſeparates only by the additional one diſſolving and taking its place. The ſeparated powder often, inſtead of falling to the bottom, lodges upon the precipitant; from which it muſt be occaſionally ſhaken off, for reaſons ſufficiently obvious.

Though in this operation the precipitated powder is generally the part required for uſe, yet ſome advantage may frequently be made of the liquor remaining after the precipitation. Thus when fixed alkaline ſalt is diſſolved in water, and ſulphur diſſolved in this lixivium, the addition of acids ſeparates and throws down the ſulphur only in virtue of the acid uniting with and neutralizing the alkali by which the ſulphur was held diſſolved; conſequently, if the precipitation be made with the vitriolic acid, and the acid gradually dropt in till the alkali be completely ſatiated, that is, as long as it continues to occaſion any precipitation or turbidneſs, the liquor will yield, by proper evaporation and cryſtallization, a neutral ſalt, compoſed of the vitriolic acid and fixed alkali, that is, vitriolated tartar. In like manner, if the precipitation be made with the nitrous acid, a true nitre may be recovered from the liquor; if with the marine, the ſalt called *ſpiritus ſalis marini congulatus*; and if with the acid of vinegar, the *ſal diureticus*.

Sect. VI. *Evaporation.*

Evaporation, the third method of recovering ſolid bodies from their ſolutions, is effected by the means of heat; which evaporating the fluid part, that is, forcing it off in ſteam, the matter which was diſſolved therein is left behind in its ſolid form.

The general rules for evaporation are, to place the matter in a flat, ſhallow, wide veſſel, ſo that a large ſurface of the liquor may be preſented to the air; for it is only from the ſurface that evaporation takes place. The degree of heat ought to be proportioned to the volatility of the ſubſtance to be evaporated, and to the degree of the fixity of the matter to be left: thus, the leſs fixed the matter to be left is, and the more ſtrongly it adheres to the volatile parts, the leſs the degree of heat ought to be; and in ſuch caſes, too, a forcible current of air is ſometimes ſcarcely admiſſible: on the contrary, when the matter to be evaporated is not very volatile, and when the matter to be left is very fixed, and does not adhere ſtrongly to the volatile part, the evaporation may be urged by a ſtrong heat, aided by a current of air directed upon the ſurface of the liquor.

This proceſs is applicable to the ſolutions of all theſe ſubſtances which are leſs volatile than the menſtruum, or which will not exhale by the heat requiſite for the evaporation of the fluid; as the ſolutions of fixed alkaline ſalts; of the gummy, gelatinous, and other inodorous parts of vegetables and animals in water; and of many reſinous and odorous ſubſtances in ſpirit of wine.

Water extracts the virtues of ſundry fragrant aromatic herbs, almoſt as perfectly as rectified ſpirit of wine; but the aqueous infuſions are far from being equally ſuited to this proceſs with thoſe made in ſpirit, water carrying off the whole odour and flavour of the ſubject which that lighter liquor leaves entire behind it. Thus a watery infuſion of mint loſes in evaporation the ſmell, taſte, and virtues, of the herb; whilſt a tincture drawn with pure ſpirit yields on the ſame treatment a thick balſamic liquor, or ſolid gummy reſin, extremely rich in the peculiar qualities of the mint. Elements.

In evaporating theſe kinds of liquors, particular care muſt be had, towards the end of the proceſs, that the heat be very gentle; otherwiſe the matter as it grows thick will burn to the veſſel, and contract a diſagreeable ſmell and taſte: this burnt flavour is called *empyreuma*. The liquor ought to be kept ſtirring during the evaporation; otherwiſe a part of the matter concretes on the ſurface expoſed to the air, and forms a pellicle which impedes the farther evaporation.

Sect. VII. *Diſtillation.*

83
The nature of diſtillation, with obſervations on the manner of performing it.

In the foregoing operation fluids are rareſied by heat into ſteam or vapour, which is ſuffered to exhale in the air, but which it is the buſineſs of diſtillation to collect and preſerve. For this purpoſe the ſteam is received in proper veſſels, luted to that in which the ſubject is contained; and being there cooled, condenſes into a fluid form again.

There are two kinds of diſtillation; by the one, the more ſubtile and volatile parts of liquors are elevated from the groſſer; by the other, liquids incorporated with ſolid bodies are forced out from them with vehemence by fire.

To the firſt belong the diſtillation of the pure inflammable ſpirit from vinous liquors; and of ſuch of the active parts of vegetables as are capable of being extracted by boiling water or ſpirit, and at the ſame time of ariſing along with their ſteam.

As boiling water extracts or diſſolves the eſſential oils of vegetables, while blended with the other principles of the ſubject, without ſaturation, but imbibes only a determinate, and that a ſmall proportion of them, in their pure ſtate; as theſe oils are the only ſubſtances contained in common vegetables, which prove totally volatile in that degree of heat; and as it is in them that the virtues of aromatics, and the peculiar odour and flavour of all plants, reſide;—it is evident, that water may be impregnated by diſtillation, with the more valuable parts of many vegetables: that this impregnation is limited, the oil ariſing in this proceſs pure from thoſe parts of the plant which before rendered it ſoluble in water without limitation; hence the greateſt part of the oil ſeparates from the diſtilled aqueous liquor, and, according to its greater or leſs gravity, either ſinks to the bottom or ſwims on the ſurface: that conſequently infuſions and diſtilled waters are very different from each other: that the firſt may be rendered ſtronger by pouring the liquor on freſh parcels of the ſubject; but that the latter cannot be in like manner improved by cohobating or redilling them from freſh ingredients.

As the oils of many vegetables do not freely diſtil with a leſs heat than that in which water boils; as rectified ſpirit of wine is not ſuſceptible of this degree of heat; and as this menſtruum totally diſſolves theſe oils in their pure ſtate; it follows, that ſpirit elevates far leſs from moſt vegetables than water; but that nevertheleſs the diſtilled ſpirit, by keeping all that it does elevate perfectly diſſolved, may, in ſome caſes, prove as ſtrong of the ſubject as the diſtilled water. The more gentle the heat, and the ſlower the diſtillation goes on, the volatile parts are the more perfectly ſeparated in their native ſtate.

Elements. It may be obſerved, that as the parts which are preſerved in evaporation cannot ariſe in diſtillation, the liquor remaining after the diſtillation, properly depurated and inſpiſſated, will yield the ſame extracts as thoſe prepared from the tincture or decoction of the ſubject made on purpoſe for that uſe; the one of theſe operations collecting only the volatile parts, and the other the more fixed; ſo that where one ſubject contains medicinal parts of both kinds, they may thus be obtained diſtinct, without one being injured by the proceſs which collects the other.

The ſubjects of the ſecond kind of diſtillation are, the groſs oils of vegetables and animals, the mineral acid ſpirits, and the metallic fluid quickſilver; which as they require a much ſtronger degree of heat to elevate them than the foregoing liquors can ſuſtain, ſo they likewiſe condenſe without ariſing ſo far from the action of the fire. The diſtillation of theſe is performed in low glaſs veſſels, called, from their neck being bent to one ſide, *retorts*: to the farther end of the neck a receiver is luted, which ſtanding without the furnace, the vapours ſoon condenſe in it, without the uſe of a refrigeratory: nevertheleſs, to promote this effect, ſome are accuſtomed, eſpecially in warm weather, to cool the receiver, by occaſionally applying wet clothes to it, or keeping it partly immerſed in a veſſel of cold water.

The vapours of ſome ſubſtances are ſo ſluggiſh, or ſtrongly retained by a fixed matter, as ſcarce to ariſe even over the low neck of the retort. Theſe are moſt commodiouſly diſtilled in ſtraight-necked earthen veſſels called *longnecks*, laid on their ſides, ſo that the vapour paſſes off laterally with little or no aſcent: a receiver is luted to the end of the neck without the furnace. In this manner, the acid ſpirit of vitriol is diſtilled. The matter which remains in the retort or longneck, after the diſtillation, is vulgarly called *caput mortuum*.

In theſe diſtillations, a quantity of elaſtic air is frequently generated; which, unleſs an exit be allowed, blows off or burſts the receiver. The danger of this may in good meaſure be prevented, by ſlowly raiſing the fire; but more effectually by leaving a ſmall hole in the luting, to be occaſionally opened or ſtopt with a wooden plug; or inſerting at the junCture an upright pipe of ſuch a height, that the ſteam of the diſtilling liquor may not be able to riſe to the top; but it is ſtill better done by fitting to the apparatus other veſſels, by which their vapours may be condenſed. For the proceſs of diſtilling, and the apparatus made uſe of, ſee DISTILLATION; and CHEMISTRY, n° 574.

SECT. VIII. *Sublimation.*

84 Of the ſublimation of ſolids. As all fluids are volatile by heat, and conſequently capable of being ſeparated, in moſt caſes, from fixed matters, by the foregoing proceſs; ſo various ſolid bodies are ſubjected to a ſimilar treatment. Fluids are ſaid to *diſtil*, and ſolids to *ſublime*; though ſometimes both are obtained in one and the ſame operation. If the ſubliming matter concretes into a maſs, it is commonly called a *ſublimate*; if into a powdery form, *flowers*.

The principal ſubjects of this operation are, volatile alkaline ſalts; neutral ſalts, compoſed of volatile alkalis and acids, as ſal ammoniac; the ſalt of amber, and flowers of benzoin; mercurial preparations; and ſulphur. Bodies of themſelves not volatile, are frequently made to ſublime by the mixture of volatile ones: thus iron is carried up by ſal ammoniac in the preparation of the *flores martiales*, or *ferrum ammoniacale*. Elem

The fumes of ſolid bodies in cloſe veſſels riſe but little way, and adhere to that part of the veſſel where they concrete. Hence a receiver or condenſer is leſs neceſſary here than in the preceding operation; a ſingle veſſel, as a matraſs, or tall phial, or the like, being frequently ſufficient.

SECT. IX. *Expression.*

85 On the preſſion juices, THE preſs is chiefly made uſe of for forcing out the juices of ſucculent herbs and fruits, and the inſipid oils of the unctuous ſeeds and kernels.

The harder fruits, as quinces, require to be previouſly well beat or ground; but herbs are to be only moderately bruiſed. The ſubject is then included in a hair bag, and preſſed between wooden plates, in the common ſcrew-preſs, as long as any juice runs from it.

The expreſſion of oils is performed nearly in the ſame manner as that of juices: only here, iron-plates are ſubſtituted for the wooden ones there made uſe of. The ſubject is well pounded, and included in a ſtrong canvas bag, between which and the plates of the preſs a haircloth is interpoſed.

The inſipid oils of all the unctuous ſeeds are obtained, uninjured, by this operation, if performed without the uſe of heat; which, though it greatly promotes the extraction of the oil, at the ſame time impreſſes an ungrateful flavour, and increaſes its diſpoſition to grow rancid.

The oils expreſſed from aromatic ſubſtances generally carry with them a portion of their eſſential oil; hence the ſmell and flavour of the expreſſed oils of nutmegs and mace. They are very rarely found impregnated with any of the other qualities of the ſubject: oil of muſtard-ſeed, for inſtance, is as ſoft and void of acrimony as that of the almond, the pungency of the muſtard remaining entire in the cake left after the expreſſion.

SECT. X. *Exsiccation.*

86 Two methods of exſiccating drying moiſt bodies. THERE are two general methods of exſiccating or drying moiſt bodies; in the one, their humid parts are exhaled by heat; in the other, they are imbibed or abſorbed by ſubſtances whoſe ſoft and ſpongy texture adapts them to that uſe. Bodies intimately combined with, or diſſolved in a fluid, as recent vegetables and their juices, require the firſt; ſuch as are only ſuperficially mixed, as when earthy or indiſſoluble powders are ground with water, are commodiouſly ſeparated from it by the ſecond.

Vegetables and their parts are uſually exſiccated by the natural warmth of the air: the aſſiſtance of a gentle artificial heat may, nevertheleſs, in general, be not only ſafely, but advantageouſly, had recourſe to. By a moderate fire, even the more tender flowers may be dried, in a little time, without any conſiderable loſs either of their odour or lively colour; which would both be greatly injured or deſtroyed by a more ſlow exſiccation in the air. Some plants, indeed, particu-

larly thoſe of the acrid kind, as horſe-radiſh, ſcurvy-graſs, and arum, loſe their virtues by this proceſs, however carefully performed; but far the greater number retain them unimpaired, and often improved.

The thicker vegetable juices may be exſiccated by the heat of the ſun; or, where this is not ſufficient, by that of a water-bath, or an oven moderately warm. The thinner juices may be gently boiled till they begin to thicken, and then treated as the foregoing. The proceſs, termed *inſpiſſation* or *evaporation*, has been ſpoken of already. The juices of ſome plants, as arum root, briony root, orris root, wild cucumbers, &c. ſeparate, upon ſtanding for ſome time, into a thick part, which falls to the bottom; and a thin aqueous one, which ſwims above it: this laſt is to be poured off, and the firſt exſiccated by a gentle warmth. Preparations of this kind have been uſually called *fæculæ*; that of the cucumber, to be ſpoken of in its place, is the only one which practice now retains.

Indiſſoluble bodies, mixed with water into a thick conſiſtence, may be eaſily freed from the greateſt part of it, by dropping them on a *chalkſtone*, or ſome powdered chalk preſſed into a ſmooth maſs, which readily imbibes their humidity. Where the quantity of fluid is large, as in the edulcoration of precipitates, it may be ſeparated by decantation or filtration.

We before obſerved, that one of the principal circumſtances favouring fermentation, was a certain degree of moiſture. Exſiccation is therefore employed to diſſipate humidity, and render vegetables thereby leſs liable to thoſe changes produced by a kind of inſenſible fermentation.

Sect. XI. *Comminution.*

Comminution is the bare reduction of ſolid coherent bodies into ſmall particles or powder. The methods of effecting this are various, according to the texture of the ſubject.

Dry friable bodies, or ſuch as are brittle and not very hard, and mixtures of theſe with ſomewhat moiſt ones, are eaſily pulveriſed in a mortar.

For very light dry ſubſtances, reſins, and the roots of tenacious texture, the mortar may in ſome caſes be previouſly rubbed with a little ſweet oil, or a few drops of oil be occaſionally added: this prevents the finer powder of the firſt from flying off, and the others from cohering under the peſtle. Camphor is commodiouſly powdered by rubbing it with a little rectified ſpirit of wine.

Tough ſubſtances, as woods, the peels of oranges and lemons, &c. are moſt conveniently raſped; and ſoft oily bodies, as nutmegs, paſſed through a grater.

The comminution of the harder minerals, as calamine, cryſtal, flint, &c. is greatly facilitated by extinction; that is, by heating them red-hot, and quenching them in water: by repeating this proceſs a few times, moſt of the hard ſtones become eaſily pulveriſable. This proceſs, however, is not to be applied to any of the alkaline or calcareous ſtones; leſt, inſtead of an inſipid powder, we produce an acrimonious calx or lime.

Some metals, as tin, though ſtrongly cohering in their natural ſtate, prove extremely brittle when heated, inſomuch as to be eaſily divided into ſmall particles by dexterous agitation. Hence the officinal method of pulveriſing tin, by melting it, and at the inſtant of its beginning to return into a ſtate of ſolidity, briſkly ſhaking it in a wooden box. The comminution of metals, in this manner, is termed by the metallurgiſts *granulation*.

On a ſimilar principle, certain ſalts, as nitre, may be reduced into powder in large quantity, by diſſolving them in boiling water, ſetting the ſolution over a moderate fire, and keeping the ſalt conſtantly ſtirring during its exſiccation, ſo as to prevent its particles, diſjoined by the fluid, from reuniting together into larger maſſes.

Powders are reduced to a great degree of fineneſs by triturating, or rubbing them, for a length of time, in a mortar. Such as are not diſſoluble in water, or injured by the admixture of that fluid, are moiſtened with it into the conſiſtence of a paſte, and levigated or ground in a flat ſmooth marble or iron plate; or where a large quantity is to be prepared at a time, in mills made for that uſe.

Comminution, though one of the moſt ſimple operations of pharmacy, has, in many caſes, very conſiderable effect. The reſinous purgatives, when finely triturated, are more eaſily ſoluble in the animal fluids, and conſequently prove more cathartic, and leſs irritating, than in their groſſer ſtate. Crude antimony, which, when reduced to a tolerably fine powder, diſcovers little medicinal virtue, if levigated to a great degree of ſubtility, proves a powerful medicine in many chronical diſorders.

By comminution, the heavieſt bodies may be made to float in the lighteſt fluids (c), for a longer or ſhorter time, according to their greater or leſs degree of tenuity. Hence we are furniſhed with an excellent criterion of the fineneſs of certain powders, and a method of ſeparating the more ſubtile parts from the groſſer, diſtinguiſhed by the name of *elutrition* or *waſhing over*.

(c) Some attribute this effect to a diminution of the ſpecific gravity of the body; and, at the ſame time, ſuppoſe the peculiar virtues of certain medicines, particularly mercury, to be in great meaſure owing to their gravity. If theſe hypotheſes were juſt, it ſhould follow, that the mercurial preparations, by being finely comminuted, would loſe proportionably of their efficacy; and ſo indeed mercurius dulcis, for inſtance, has been ſuppoſed to do. But experience ſhows, that this is far from being the caſe; and that comminution by no means leſſens but rather increaſes its power: when reduced to a great degree of ſubtility, it paſſes readily into the habit, and operates, according to its quantity, as an alterative or a ſialogogue; while in a groſſer form, it is apt to irritate the ſtomach and bowels, and run off by the inteſtines, without being conveyed into the blood.

Sect. XII. *Fusion.*

88 Fusion the reduction of solid bodies into a fluid state by fire.

Fusion is the reduction of solid bodies into a state of fluidity by fire. Almost all natural substances, the pure earths and the solid parts of animals and vegetables excepted, melt in proper degrees of fire; some in a very gentle heat, while others require its utmost violence.

Turpentine, and other soft resinous substances, liquefy in a gentle warmth; wax, pitch, sulphur, and the mineral bitumens, require a heat too great for the hand to support: fixed alkaline salt, common salt, nitre, require a red or almost white heat to melt them; and glass, a full white heat.

Among metallic substances, tin, bismuth, and lead, flow long before ignition: antimony likewise melts before it is visibly red hot, but not before the vessel is considerably so: the regulus of antimony demands a much stronger fire. Zinc begins to melt in a red heat; gold and silver require a low white heat; copper a bright white heat; and iron an extreme white heat.

One body, rendered fluid by heat, becomes sometimes a menstruum for another, not fusible of itself in the same degree of fire. Thus red-hot silver melts on being thrown into melted lead less hot than itself: and thus if steal, heated to whiteness, be taken out of the furnace, and applied to a roll of sulphur, the sulphur instantly liquefying, occasions the steel to melt with it; hence the *chalybs cum sulphure* of the shops. This concrete, nevertheless, remarkably impedes the fusion of some other metals, as lead; which when united with a certain quantity of sulphur is scarce to be perfectly melted by a very strong fire. Hence the method, described in its place, of purifying zinc; a metal upon which sulphur has no effect from the lead so frequently mixed with it.

Sulphur is the only unmetallic substance which mingles in fusion with metals. Earthy, saline, and other like matters, even the calces and glasses prepared from metals themselves, float distinct upon the surface, and form what is called *scoria* or dross. Where the quantity of this is large in proportion to the metal, it is most commodiously separated by pouring the whole into a conical mould: the pure metal or *regulus*, though small in quantity, occupies a considerable height in the lower narrow part of the cone; and when congealed, may be easily freed from the scoriæ by a hammer. The mould should be previously greased, or rather smoked, to make the metal come freely out; and thoroughly dried and heated, to prevent the explosion which sometimes happens from the sudden contact of melted metals with moist bodies.

Sect. XIII. *Calcination.*

89 Calcination reduces bodies by means of fire from a coherent to a powdery state, and changes their quality.

By calcination is understood the reduction of solid bodies, by the means of fire, from a coherent to a powdery state, accompanied with a change of their quality; in which last respect this process differs from comminution.

To this head belong the burning of vegetable and animal matters, otherwise called *ustion*, *incineration*, or *concremation*; and the change of metals into a powder, which in the fire either does not melt or vitrifies, that is, runs into glass.

The metals which melt before ignition, are calcined by keeping them in fusion for some time. The free admission of air is essentially necessary to the success of this operation; and hence, when the surface of the metal appears covered with calx, this must be taken off or raked to one side, otherwise the remainder excluded from the air will not undergo the change intended. If any coal, or other inflammable matter which does not contain a mineral acid, be suffered to fall into the vessel, the effect expected from this operation will not be produced, and part of what is already calcined will be revived or reduced; that is, it will return into its metallic form again.

Those metals which require a strong fire for fusion, calcine with a much less heat than is sufficient to make them flow. Hence the burning or scorification of soft iron or copper vessels as are long exposed to a considerable fire without defence from the air. Gold and silver are not calcinable by any degree of fire.

In calcination, the metals visibly emit fumes: nevertheless the weight of the calx proves greater than that of the metal employed. The antimonial regulus gains about one eleventh part of its weight; zinc sometimes one tenth; tin above one sixth; and lead in its conversion into minium often one fourth.
