The chief clans in Ross-shire are the Mackenzies, Rosses, Frazers, Mackays, Macraes, and the Munroes, all of whom speak Gaelic, and wear the Highland dress, esteeming the earl of Seaforth as their head, being the lineal descendant of Mackenzie Lord Seaforth, who was attainted for his concern in the rebellion. This county contains 30 parochial districts, sends one member to the British parliament, and by a census taken in 1801, it was found to contain 52,291 inhabitants, being an increase of 9798 since the return to Dr Webster in 1755. In 1811 the population was about 57,000. The following table exhibits a view of the population of this county according to its parishes at two different periods.

Parishes.	Population in 1755.	Population in 1790—1798.

Rostoff.

See ROSS-SHIRE SUPPLEMENT.

ROSTOCK, a town of Germany, in the circle of Upper Saxony, and duchy of Mecklenburg, with an university and a very good harbour. It is the best town in this country; and has good fortifications, with an arsenal. It was formerly one of the Hanseatic towns; it contained about 12,000 inhabitants in 1800. It is seated on a lake where the river Varne falls into it, and carries large boats. The government was formerly in the hands of 24 aldermen, elected out of the nobility, university, and principal merchants, who were called the Upper House, and a common council of 100 inferior citizens, who were summoned to give their advice upon extraordinary emergencies. The principal things worth seeing are the fortifications, the prince's palace, the stadthouse, the arsenal, and the public library. The town is famous for good beer, which they export in great quantities. Some years ago they had no less than 250 privileged brewers, who, it is said, brewed so many thousand tuns a-year, besides what particular persons brew for their own use. E. Long. 12. 55. N. Lat. 54. 8.

ROSTOFF, or Rostow, a large town of the Russian empire, in the government of Javoslaf, with an archbishop's see, seated on the lake Coteri, in E. Long. 40. 25. N. Lat. 57. 5.

ROSTRA, in antiquity, a part of the Roman forum, wherein orations, pleadings, funeral harangues, &c. were delivered.

ROSTRUM, literally denotes the beak or bill of a bird; and hence it has been figuratively applied to the beak or head of a ship.

ROSYCRUCIANS. See ROSICRUCIANS.

ROT, a very fatal disease incident to sheep, arising from wet seasons, and too moist pasture. It is very difficult.

Rota

ficult of cure, and is attended with the singular circumstance of a kind of animals being found in the blood-vessels. See SHEEP, diseases of, under FARRIERY.

ROTA, the name of an ecclesiastical court of Rome, composed of 12 prelates, of whom one must be a German, another a Frenchman, and two Spaniards; the other eight are Italians, three of whom must be Romans, and the other five a Bolognese, a Ferraran, a Milanese, a Venetian, and a Tuscan.—This is one of the most august tribunals in Rome, which takes cognizance of all suits in the territory of the church, by appeal; as also of all matters, beneficiary and patrimonial.

ROTA ARISTOTELICA, or *Aristotle's Wheel*, denotes a celebrated problem in mechanics, concerning the motion or rotation of a wheel about its axis, so called because Aristotle was the first who took notice of it.

The difficulty of it may be represented in the following manner. While the circle makes one revolution on its centre, advancing at the same time in a right line along a plane, it describes on that plane a right line which is equal to its circumference. Now, if this circle carry with it another smaller circle, concentric with it, like the nave of a coach wheel; then this smaller circle or nave, will describe a line in the time of the revolution, which shall be equal to that of the large wheel or circumference itself, because its centre advances in a right line, as fast as that of the wheel does, being in reality the same with it.

Aristotle attempted to solve this problem, but his solution can only be regarded as a good account of the difficulty.

It was next attempted by Galileo, who had recourse to an infinite number of infinitely small vacuities in the right line described by the two circles, and imagined that the little circle never applies its circumference to those vacuities; but in reality only applies it to a line equal to its own circumference, though it appears to have

applied it to a much larger. This, however, is nothing to the purpose.

According to Tacquet, the little circle making its rotation more slowly than the great one, does, on that account, describe a line longer than its own circumference; yet without applying any point of its circumference to more than one point of its base. This is no more satisfactory than the former.

After the fruitless endeavours of many great men, M. Dortous de Meyran, a French gentleman, had the good fortune to hit upon a solution which, after being fully examined by a committee of the Academy of Sciences, was declared to be satisfactory. The following is his solution.

The wheel of a coach is only acted on, or drawn in a right line; its rotation or circular motion arises purely from the resistance of the ground. Now this resistance is equal to the force which draws the wheel in a right line, as it defeats that direction, and therefore the causes of the two motions are equal. The wheel therefore describes a right line on the ground equal to its circumference.

On the contrary, the nave is drawn in a right line by the same force as the wheel, but it only turns round because the wheel does so, and can only turn in the same time with it. Hence, its circular velocity is less than that of the wheel, in the ratio of the two circumferences, and therefore its circular motion is less than the rectilinear one. Since it must describe a right line equal to that of the wheel, it can only do it by partly sliding and partly revolving, the sliding part being more or less as the nave itself is smaller or greater.

ROTACEÆ (from *rota*, "a wheel"), the name of the 20th order in Linnæus's Fragments of a Natural Method; consisting of plants with one flat, wheel-shaped petal, without a tube. See BOTANY.

ROTALA, a genus of plants belonging to the triandria class. See BOTANY *Index*.

ROTANG. See CALAMUS.

ROTATION.

1
Definition and interesting nature of the subject.

ROTATION, is a term which expresses the motion of the different parts of a solid body round an axis, and distinct from the progressive motion which it may have in its revolution round a distant point. The earth has a rotation round its axis, which produces the vicissitudes of day and night; while its revolution round the sun, combined with the obliquity of the equator, produces the varieties of summer and winter.

The mechanism of this kind of motion, or the relation which subsists between the intensity of the moving forces, modified as it may be by the manner of application, and the velocity of rotation, is highly interesting, both to the speculative philosopher and to the practical engineer. The precession of the equinoxes and many other astronomical problems of great importance and difficulty, receive their solutions from this quarter: and the actual performance of our most valuable machines cannot be ascertained by the mere principles of equilibrium, but

require a previous acquaintance with certain general propositions of rotatory motion.

It is chiefly with the view of assisting the engineer that we propose to deliver in this place a few fundamental propositions; and we shall do it in as familiar and popular a manner as possible, although this may cause the application of them to the abstruse problems of astronomy to be greatly deficient in the elegance of which they are susceptible.

When a solid body turns round an axis, retaining its shape and dimensions, every particle is actually describing a circle round this axis, and the axis passes through the centre of the circle, and is perpendicular to its plane. Moreover, in any instant of the motion, the particle is moving at right angles with the radius vector, or line joining it with its centre of rotation. Therefore, in order to ascertain the direction of the motion of any particle P (fig. 1.), we may draw a straight line PC from the particle perpendicular to the axis AB of rotation.

2
State of the particles in moving round an axis.

Plate
CCCLXVII.
fig. 1.

tation. This line will lie in the plane of the circle Pmn of rotation of the particle, and will be its radius vector; and a line PQ drawn from the particle perpendicular to this radius vector will be a tangent to the circle of rotation, and will have the direction of the motion of this particle.

3 The whole body being supposed to turn together, it is evident, that when it has made a complete rotation, each particle has described a circumference of a circle, and the whole paths of the different particles will be in the ratio of these circumferences, and therefore of their radii; and this is true of any portion of a whole turn, such as $\frac{1}{2}$, $\frac{1}{4}$, or 20 degrees, or any arch whatever; therefore the velocities of the different particles are proportional to their radii vectores, or to their distances from the axis of rotation.

And, lastly, all these motions are in parallel planes, to which the axis of rotation is perpendicular.

When we compare the rotations of different bodies in respect of velocity, it is plain that it cannot be done by directly comparing the velocity of any particle in one of the bodies with that of any particle of the other; for as all the particles of each have different velocities, this comparison can establish no ratio. But we familiarly compare such motions by the number of complete turns which they make in equal times, and we say that the second hand of a clock turns 60 times faster than the minute hand; now this comparison is equally just in any part of a turn as in the whole. While the minute hand moves round one degree, the second-hand moves 60; therefore, as the length or number of feet in the line uniformly described by a body in its progressive motion is a proper measure of its progressive velocity, so the number of degrees described by any particle of a whirling body in the circumference of its circle of rotation, or the angle described by any radius vector of that body, is a proper measure of its velocity of rotation. And in this manner may the rotation of two bodies be compared; and the velocity is with propriety termed ANGULAR VELOCITY.

6 An angle is directly as the length of the circumference on which it stands, and inversely as the radius of the circle, and may be expressed by the fraction of which the numerator is the arch, and the denominator the radius. Thus the angle PCp may be expressed by $\frac{Pp}{PC}$. This fraction expresses the portion of the radius which is equal to the arch which measures the angle; and it is converted into the usual denomination of degrees, by knowing that one degree, or the 360th part of the circumference, is $\frac{1}{57.296}$ of the radius, or that an arch of 57.296 degrees is equal to the radius.

7 When a solid body receives an impulse on any one point, or when that point is anyhow urged by a moving force, it cannot move without the other points also moving. And whatever is the motion of any particle, that particle must be conceived as urged by a force precisely competent to the production of that motion, by acting immediately on the particle itself. If this is not the particle immediately acted on by the external force, the force which really impels it is a force arising from the cohesion of the body. The particle immediately impelled by the external force is pressed towards its neigh-

bouring particles, or is drawn away from them; and, by this change of place, the connecting forces are brought into action, or are excited; they act on the particles adjoining, and change, or tend to change, their distances from the particles immediately beyond them; and thus the forces which connect this next series of particles are also excited, and another series of particles are made to exert their forces; and this goes on through the body till we come to the remote particle, whose motion we are considering. The forces which connect it with the adjoining series of particles are excited, and the particle is moved. We frequently say that the external moving force is propagated through the body to the distant particle; but this is not accurate. The particle is really and immediately moved by the forces which connect it with those adjoining. It will greatly assist our conception of the manner in which motion is thus produced in a distant particle, if we consider the particles as so many little balls, connected with each other by slender spiral springs like cork-screws. This would compose a mass which would be compressible, or which could be stretched, &c. And if we give an impulse to one of these balls, we shall set the whole assemblage in motion round any axis which we may suppose to support it. Now any one of these balls is really and immediately moved by the elasticity of the spiral wires which join it to its neighbours.

8 We are but little acquainted with the nature of these connecting forces. It can be learned only by the phenomena which are their effects. These are various, almost beyond description; but the mechanical philosopher has little to do with this variety. The distinctions which are the immediate causes of fluidity, of hardness, softness, elasticity, ductility, are not of very difficult conception. There is one general fact which is sufficient for our present purpose—the forces by which the particles of bodies act on each other are equal, and the consequences. This is a matter of unexcepted experience; and no other foundation can be given to it as a law of mechanical nature.

9 An immediate consequence of this law is, that when two external forces A and B are in equilibrium by the intervention of a solid body (or rather when a solid body is in equilibrium between two external forces), these forces are equal and opposite; for the force A is in fact an immediate equilibrium with the opposite forces exerted by the particle to which it is applied, and is therefore equal and opposite to the force resulting from the combination of all the forces which connect that particle with the series of particles immediately adjoining. This resulting force may with propriety be called the equivalent of the forces from the combination of which it results. The use of this term will greatly abbreviate language. This first set of connecting forces consists of a number of distinct forces corresponding to each particle of the series, and each force has an equal and opposite force corresponding to it: therefore the compound force by which the first series of particles acts on that to which the external force A is applied, is equal and opposite to the compound force which connects this first series with the next series. And the same thing must be said of each succeeding series of particles, till we come at last to the particle to which the external force B is immediately applied. The force exerted by this particle is equal and opposite to that external

Rotation

ternal force; and it is equal to the compound force exerted by the second series of particles on that side; therefore the forces A and B are equal and opposite.

10

It results from this proposition, that *when any number of external forces are applied to a solid body, and it is in equilibrio between them, they are such as would be in equilibrio if they were all applied to one point.* Let the forces a A, b B, c C (fig. 2.), be applied to three particles of the solid body. Therefore a A is immediately in equilibrio with an equal and opposite force, $\Lambda \alpha$, resulting from the composition of the force AD, which connects the particles A and B, and the force ΛE which connects A with C. In like manner b B is immediately in equilibrio with $B \beta$, the equivalent of the forces BF and BG; and c C is in immediate equilibrio with the equivalent $C \gamma$ of the forces CH and CI. We shall conceive it very clearly if we suppose the three forces $A a$, $B b$, $C c$, to be exerted by means of threads pulling at the solid body. The connecting parts between A and B, as also between A and C, are stretched. The lines AB and AC may be considered as elastic threads. Each thread is equally stretched through its whole length; and therefore if we take AD to represent the force with which the particle A is held back by the particle B, and if we would also represent the force with which B is held back by A, we must make BF equal to AD. Now (N^o 9.), the forces AD and IF are equal and opposite; so are the forces AE and CI; so are the forces CH and BG. Now it is evident, that if the six forces AD, BF, BG, CH, CI, AE, were applied to one particle, the particle would be in equilibrio; for each force is accompanied by an equal and opposite force: and if the force $A a$ were applied in place of AD, ΛE , the equilibrium would remain, because $A a$ is equivalent to AD and ΛE . The same is true of $B \beta$ and $C \gamma$. Therefore if the three forces $A a$, $B \beta$, $C \gamma$ were applied to one point, they would be in equilibrio. Consequently if the three forces a A, b B, c C, which are respectively equal and opposite to $A \alpha$, $B \beta$, $C \gamma$, are so applied, they will be in equilibrio. It is plain that this demonstration may be extended to any number of forces.

Fig. 2.

We may just remark by the bye, that if three forces are thus in equilibrio, they are acting in one plane; and, if they are not parallel, they are really directed to one point: for any one of them must be equal and opposite to the equivalent of the other two; and this equivalent is the diagonal of a parallelogram, of which the other two are the sides, and the diagonal and sides of any parallelogram are in one plane; and since they are in one plane, and any one of them is in equilibrio with the equivalent of the other two, it must pass through the same point with that equivalent, that is, through the point of concurrence of the other two.

These very simple propositions are the foundation of the whole theory of statics, and render it a very simple branch of mechanical science. It has been made abstruse by our very attempts to simplify it. Many elab-

orate treatises have been written on the fundamental property of the lever, and in them all it has been thought next to an insuperable difficulty to demonstrate the equilibrium of a straight lever when the parallel forces are inversely as their distances from the fulcrum.

We think the demonstrations of Archimedes, Fonnex, D'Alembert, and Hamilton, extremely ingenious; but they only bring the mind into such a state of conception that it cannot refuse the truth of the proposition; and, except Mr Hamilton's, they labour under the disadvantage of being applicable only to commensurable distances and forces. Mr Vince's, in the Philosophical Transactions for 1794, is the most ingenious of them all; and it is wonderful that it has not occurred long ago. The difficulty in them all has arisen from the attempt to simplify the matter by considering a lever as an inflexible straight line. Had it been taken out of this abstract form, and considered as what it really is, a natural body, of some size, having its particles connected by equal and opposite forces, all difficulty would have vanished.

That we may apply these propositions to explain the motion of rotation, we must recollect an unquestionable proposition in dynamics, that the force which produces any motion is equal and opposite to the force which would prevent it, when applied in the same place and in the same line, or which would extinguish it in the same time in which we suppose it to be produced. Therefore the force which is excited and made to act on any particle of a body by the action of an external force on another particle, so as to cause it to move round an axis, is equal and opposite to the force which, when applied to that particle in the opposite direction, would be in equilibrio with the external force.

The only distinct notion we can form of the magnitude of any moving force is the quantity of motion which it can produce by acting uniformly during some given time. This will be had by knowing the velocity which it will produce in a body of known bulk. Thus we know that the weight of ten pounds of matter acting on it for a second will cause it to fall 16 feet with an uniformly accelerated motion, and will leave it in a state such that it would move on for ever at the rate of 32 feet in a second; which we call communicating the velocity of 32 feet per second. In the same manner, the best way of acquiring a distinct conception of the rotatory effort of a moving force, is to determine the quantity of rotatory motion which it can produce by acting uniformly during some known time.

Let a solid body turn round an axis passing through the point C (fig. 3.) perpendicular to the plane of this figure. Let this rotation be supposed to be produced by an external force acting in the direction FP. Let this force be such, that if the body were free, that is, unconnected with any axis supported by fixed points, it would, by acting uniformly during a small moment of time, cause its centre of gravity G (A) to describe a line of a certain length parallel to FP. This we know

Rotation

11
Mechanical science has been rendered abstruse by attempts at simplification.

12
Mode of conceiving the magnitude of any moving force.

13

14
And of the quantity and effort of rotatory motions. Fig. 3.

(A) We take this term in its usual sense, as expressing that point where the sum of the equal gravitations of each particle may be supposed united. It is by no means (though commonly supposed) the point where the equivalent of the real gravitations of the particles may be supposed to act, and to produce the same motion as when acting

to be the effect of a moving force acting on any solid body in free space. The centre of gravity will always describe a straight line. Other particles may chance to movedifferently, if the body, besides its progressive motion, has also a motion of rotation, as is generally the case. Draw GI parallel to FP, and make GI to GC as the velocity which the external force would communicate to the centre of the body (if moving freely, unconnected with a supported axis), to the velocity which it communicates to it in the same time round the axis Cc. Also let m be the number of equal particles, or the quantity of matter in the body. Then mGI will express the quantity of motion produced by this force, and is a proper measure of it as a moving force; for GI is twice the space described during the given time with an uniformly accelerated motion.

But since the body cannot move any way but round the axis passing through C, the centre G will begin to move with the velocity and in the direction, GH, perpendicular to the line CG (N^o 2.). And any particle A can only move in the direction AL, perpendicular to CA. Moreover, the velocities of the different particles are as their radii vectores; and CG is actually equal to the line GH, which expresses the velocity of a particle in G. Therefore CA will in like manner express the velocity of the particle A. If A express its quantity of matter, A.CA will express its quantity of motion, and will represent the force which would produce it by acting uniformly during the moment of time.

We expressed the external moving force by $m.GI$. Part of it is employed in exciting the force A.CA, which urges the particle A. In order to discover what part of the external force is necessary for this purpose, draw CP perpendicular to FP. The preceding observations show us, that the force wanted at A is equal to the force which, when applied at P in the direction FP, would balance the force A.CA applied to A in the direction LA. Therefore (by the property of the lever ACP, which is impelled at right angles at A and P) we must have CP to CA as the force A.CA to the balancing pressure, which must be exerted at P, or at any point in the line FP. This pressure is therefore $\frac{A.CA.CA}{CP}$ or $\frac{A.CA^2}{CP}$. As we took $m.GI$ for the mea-

sure of the whole external force, GI being the velocity which it would communicate to the whole body moving in free space, we may take $G.i$ for the velocity which would be communicated to the whole body by the pressure $\frac{A.CA^2}{CP}$, and then this pressure will be

Vol. XVIII. Part I.

properly expressed by $m.G.i$. In like manner, mak may express the portion of the external force employed in communicating to another particle B the motion which it acquires; and so on with respect to all the particles of the body.

It must be desirable to see the manner in which the forces are really concerned in giving motion to the different particles.

Suppose the external force to act immediately on the external particle F. The line FC connecting this particle with the axis in C is either stretched or compressed by the effort of giving motion to a remote particle A. It is plain that, in the circumstances represented in the figure, the line FC is compressed, and the axis is pushed by it against its supports in the direction Cλ; and the body must, on this account, resist in the opposite direction Ff. The particle A is dragged out of its position, and made to begin its motion in the direction AL perpendicular to AC. This cannot be, unless by the connexion of the two lines AC, AF. A resists by its inertia, and therefore both AC and AF are stretched by dragging it into motion. By this resistance the line AC tends to contract itself again, and it pulls C in the direction Cc, and A in the direction Aa; and if we take Cc to represent the action on C, Aa must be taken equal to it. In like manner AF is stretched and tends to contract, pulling F in the direction Fφ and A in the direction Aα with equal forces. Thus the particle A is pulled in the directions Aa and Aα; the particle F is pulled in the direction Fφ, and pushed in the direction Ff; and C is pulled in the direction Cc, and pushed in the direction Cz. Aa and Aα have produced their equivalent AL, by which A is dragged into motion; Ff and Fφ produce their equivalent Fg, by which the external force is resisted, and Fg is equal and opposite to $m.Gi$; the forces Cc and Cz produce their equivalent Cd by which the axis is pressed on its supports, and this is resisted by an equal and opposite reaction of the supports in the direction dC. The forces therefore which excite in the body the motion A.AL are both external, viz. the impelling force gF, and the supporting force dC. AL therefore is not only the immediate equivalent of Aa and Aα, but also the remote equivalent of gF and dC. We may therefore ascertain the proportion of gF (that is, of $m.Gi$) to AL (that is, of A.AC), independent of the property of the lever. gF is to AL in the ratio compounded of the ratios of gF to Fφ or Aα, and of α to AL. But we shall obtain it more easily by considering gF as the equivalent of AL and dC. By what has been demonstrated above, the

P p directions

acting on each particle separately. It is this point only when all the particles gravitate alike, and in parallel directions. If the body were near the centre of the earth, for instance, the gravitations of the different particles would neither be nearly equal nor in parallel lines; and the place of its real centre of gravity, on which the equivalent of its whole gravitation may be supposed to act, would be very different from G. Were we to denominate the point G, as usually determined, by its mathematical properties, we would call it the CENTRE OF POSITION; because its distance from any plane, or its position with respect to any plane, is the average distance and position of all the particles. The true designation of G is "the point through which if any plane whatever be made to pass, and if perpendiculars to this plane be drawn from every particle, the sum of all the perpendiculars on one side of this plane is equal to the sum of all the perpendiculars on the other side."

If we were to denominate G by its mechanical properties, we would call it the CENTRE OF INERTIA; for this is equal in every particle, and in the same direction: and it is not in consequence of gravity, but of inertia, that the body describes with the point G a line parallel to FP. We wish this remark to be kept in mind.

Rotation.

directions of the three forces gF , AL , and dC must meet in one point E , and gF must be equal to the diagonal tE of the parallelogram $Ee\epsilon$, of which the sides Ee , $E\epsilon$ are respectively equal to AL and dC . Now tE is to Ee as the sine of the angle teE to the sine of the angle Ete , that is, as the sine of CEA to the sine of CEP , that is, as CA to CP , as we have already demonstrated by the property of the lever. We preferred that demonstration as the shortest, and as abundantly familiar, and as congenial with the general mechanism of rotatory motions. And the intelligent reader will observe, that this other demonstration is nothing but the demonstration by the lever expanded into its own elements. Having once made our readers sensible of this internal process of the excitement and operation of the forces which connect the particles, we shall not again have recourse to it.

17 It is evident that the sum of all the forces gF , or $m.Gi$, must be equal to the whole moving force $m.GI$. that $m.Pp$ may be $=m.GI$. That is, we must have $m.GI = \int \frac{A.CA^2}{CP}$; or, because CP is given when the position of the line FP is given, we must have $m.GI = \int \frac{A.CA^2}{CP}$, where both A and CA are variable quantities.

18 This equation gives us $m.GI.CP = \int A.CA^2$. Now we learn in mechanics that the energy of any force applied to a lever, or its power of producing a motion round the fulcrum, in opposition to any resistance whatever, is expressed by the product of the force by the perpendicular drawn from the fulcrum on the line of its direction. Therefore we may call $m.GI.CP$ the momentum (B), energy, or rotatory effort, of the force $m.GI$. And in like manner $\int A.CA^2$ is the sum of the momenta of all the particles of the body in actual rotation; and as this rotation required the momentum $m.GI.CP$ to produce it, this momentum balances, and therefore may express the energy of all the resistances made by the inertia of the particles to this motion of rotation. Or $\int A.CA^2$ may express it. Or, take p to represent the quantity of matter in any particle, and r to represent its radius vector, or distance from the axis of rotation, $\int p.r^2$ will express the momentum of inertia, and the equilibrium between the momentum of the external force $m.GI$, acting in the direction FP , and the combined momenta of the inertia of all the particles of the whirling body, is expressed by the equation $m.GI.CP = \int A.CA^2 = \int p.r^2$. The usual way of studying elementary mechanics gives us the habit of associating the word equilibrium with a state of rest; and this has made our knowledge so

imperfect. But there is the same equilibrium of the actual immediate pressures when motion ensues from the action. When a weight A descending raises a smaller weight B by means of a thread passing over a pulley, the thread is equally stretched between the acting and resisting weights. The strain on this thread is undoubtedly the immediate moving force acting on B , and the immediate resisting force acting on A .

The same equation gives us $GI = \frac{\int p.r^2}{m.CP}$.

Now $GI : CG = \frac{\int p.r^2}{m.CP} : CG = \int p.r^2 : m.CP.CG$; 19

but CG represents the velocity of the centre. Hence we derive this fundamental proposition $\int p.r^2 : m.CP.CG = GI : CG$; or, that $\int p.r^2$ is to $m.CP.CG$ as the velocity of the body moving freely to the velocity of the centre of gravity round the axis of rotation.

Therefore the velocity of the centre is $= \frac{m.GI.CP.CG}{\int p.r^2}$ 20

The velocity of any point B is $= \frac{m.GI.CP.CB}{\int p.r^2}$ 21

This fraction represents the length of the arch described by the point B in the same time that the body unconnected with any fixed points would have described GI .

Therefore the angular velocity (the arch divided by the radius) common to the whole body is $= \frac{m.GI.CP}{\int p.r^2}$ 22

It may be here asked, how this fraction can express an angle? It evidently expresses a number; for both the numerator and denominator are of the same dimensions, namely, surfaces. It therefore expresses the portion of the radius which is equal to the arch measuring the angle, such as $\frac{1}{2}$, $\frac{1}{3}$, $\frac{5}{2}$, &c. And to have this angle in degrees, we have only to recollect that the radius is 57,2958.

23 This angular velocity will be a maximum when the axis of rotation passes through the centre of gravity G . For draw from any particle A the line Aa' perpendicular to CG , and join AG . Then $CA^2 = GA^2 + CG^2 = 2CG \times Ga$. Therefore $\int CA^2 = \int GA^2 + \int CG^2 = \int 2CG \times Ga$. But by the nature of the centre of gravity, the sum of all the $+Ga$ is equal to that of all the $-Ga$; and therefore $\int 2GC + Ga$ is nothing; and therefore $\int CA^2 = \int GA^2 + m.CG^2$.

Therefore $\int CA^2$ or $\int p.r^2$ is smallest, and $\frac{m.GI.CP}{\int p.r^2}$

is greatest when $m.CG^2$ is nothing, or when CG is nothing; that is, when C and G coincide.

24 The absolute quantity of motion in the whirling body,

(B) The word *momentum* is very carelessly used by our mechanical writers. It is frequently employed to express the product of the quantity of matter and velocity, that is, the quantity of motion; and it is also used (with strict propriety of language) to express the power, energy, or efficacy of a force to produce motion in the circumstances in which it acts. We wish to confine it to this use alone. Sir Isaac Newton adhered rigidly to this employment of the term (indeed no man exceeds him in precision of expression), even when he used it to express the quantity of motion: for in these instances the energy of this quantity of motion, as modified by the circumstances of its action, was always in the ratio of the quantity of motion.

Rotation.

dy, or the sum of the motions of all its particles, is
 $\frac{m \cdot GI \cdot CP \cdot \int p r}{\int p r^2}$. For the motion of each particle is
 $\frac{m \cdot GI \cdot CP \cdot p r}{\int p r^2}$.

The resistance which a given quantity of matter makes to a motion of rotation is proportional to $\int p r^2$. For this must be measured by the forces which must be similarly applied in order to give it the same angular motion or angular velocity. Thus let one external force be $m \cdot GI$, and the other $m \cdot \gamma I$.—Let both be applied at the distance CP. Let r be the radius vector in the one body, and ξ in the other; now the angular velocities $\frac{m \cdot GI \cdot CP}{\int p r^2}$ and $\frac{m \cdot \gamma I \cdot CP}{\int p \xi^2}$ are equal by supposition. Therefore $m \cdot GI : m \cdot \gamma I = \int p r^2 : \int p \xi^2$.

As in the communication of motion to bodies in free space a given force always produces the same quantity of motion; so in the communication of motion to bodies obliged to turn round axes, a given force, applied at a given distance from the axes, always produces the same quantity of momentum. Whence it may easily be deduced (and we shall do it afterwards), that as in the communication of motion among free bodies the same quantity of motion is preserved, so in the communication of motion among whirling bodies the same quantity of whirling motion is preserved.

This is a proposition of the utmost importance in practical mechanics, and may indeed be considered as the fundamental proposition with respect to all machines of the rotatory kind when performing work; that is, of all machines which derive their efficacy from levers or wheels. There is a valuable set of experiments by Mr Smeaton in the Philosophical Transactions, Volume lxi. which fully confirm it. We shall give an example by and bye of the utility of the proposition, showing how exceedingly imperfect the usual theories of mechanics are which do not proceed on this principle.

With respect to the general proposition from which all these deductions have been made, we must observe, that the demonstration is not restricted to the time necessary for causing each particle to describe an arch equal to the radius vector. We assumed the radius vector as the measure of the velocity merely to simplify the notation. Both the progressive motion of the free body and the rotation of the whirling body are uniformly accelerated, when we suppose the external force to act uniformly during any time whatever; and the spaces described by each motion in the same time are in a constant ratio. The formulæ may therefore with equal propriety represent the momentary accelerations in the different cases.

It must also be observed, that it is not necessary to suppose that all the particles of the body are in one plane, and that the moving force acts in a line FP lying also in this plane. This was tacitly allowed, merely to make the present investigation (which is addressed chiefly to the practical mechanic) more familiar and easy. The equilibrium between the force $A \times CA$, which is immediately urging the particle A, and the force $m \cdot G i$ employed at P or F, in order to excite that force at A, would have been precisely the same although the lines AC and FP had been in different planes, pro-

vided only that these planes were parallel. This is known to every person in the least acquainted with the wheel and axle. But if the external moving force does not act in a plane parallel to the circles of rotation of the different particles, it must be resolved into two forces, one of which is perpendicular to these planes, or parallel to the axis of rotation, and the other lying in a plane of rotation. And it is this last only that we consider as the moving force; the other tends merely to push the body in the direction of its axis, but has no tendency to turn it round that axis. When we come to consider the rotation of a body perfectly free, it will be necessary to attend particularly to this circumstance. But there are several important mechanical propositions which do not require this.

The motion of any body is estimated by that of its centre of gravity, as is well known. The difference between the motion of the centre of a free body and the motion of the centre of a body turning round an axis, is evidently owing to the connexion which the parts of the body have with this axis, and to the action of the points of support on this axis. This action must be considered as another external force, combined with that which acts on the particle P, and therefore must be such as, if combined with it, would produce the very motion which we observe. That is, if we suppose the body unconnected with any fixed points, but as having its axis acted on by the same forces which these points exert, the body would turn as we observe it to do, the axis remaining at rest.

Therefore join I and H, and complete the parallelogram GIHK. It is plain that $m \cdot GK$ must represent the forces exerted by the axis on the fixed points.

If therefore GI should coincide with GH, and the point I with the point H, the force GK vanishes, and the body begins to turn round C, without exerting any pressure on the points of support; and the initial motion is the same as if the body were free. Or, the axis at C is then a spontaneous axis of conversion.

That this may be the case, it is necessary, in the first place, that the external force act in a direction perpendicular to CG; for GI is always parallel to FP: it being a leading proposition in dynamics, that when a moving force acts on any part whatever of a solid body, unconnected with fixed points, the centre of gravity will proceed in a straight line parallel to the direction of that force. In the next place GH

must be equal to GI; that is, $(N^0 21) \frac{m \cdot GI \cdot CP \cdot CG}{\int p r^2}$ is equal to GI, or $\frac{m \cdot CP \cdot CG}{\int p r^2} = 1$, and $CP = \frac{\int p r^2}{m \cdot CG}$.

The equation $CP = \frac{\int p r^2}{m \cdot CG}$ gives us $m \cdot CG \cdot CP = \int p r^2 = \int A \cdot CA^2$. But it was shown ($N^0 23$), that $\int A \cdot CA^2 = \int A \cdot GA^2 + m \cdot CG^2$. Therefore $\int A \cdot GA^2 = m \cdot CG \cdot CP - m \cdot CG \cdot CG = m \cdot CG (CP - CG)$, = $m \cdot CG \cdot CP$. Therefore we have (for another determination of the point of impulse P so as to annihilate all pressure on the axis) $GP = \frac{\int A \cdot GA^2}{m \cdot CG}$. This is generally the most easily obtained,

the mathematical situation of the centre of gravity being well known.

Rotation.
32

N.B. When $CP = \frac{\int p r^2}{m.CG}$, we shall always have the

velocity of the centre the same as if the body were free, but there will always be a pressure on the points of support, unless FP be also perpendicular to CG. In other positions of FP the pressure on the axis, or on its points of support, will be $m \text{ GI} \times 2 \sin. \text{GCP}$.

33
Advantage of annihilating or diminishing the pressure on the supports of the axis of motion.

It would be a desirable thing in our machines which derive their efficacy from a rotatory motion, to apply the pressures arising from the power and from the resistance opposed by the work in such a manner as to annihilate or diminish this pressure on the supports of the axis of motion. Attention to this theorem will point out what may be done; and it is at all times proper, nay necessary, to know what are the pressures in the points of support. If we are ignorant of this, we shall run the risk of our machine failing in those parts; and our anxiety to prevent this will make us load it with needless and ill disposed strength. In the ordinary theories of machines, deduced entirely from the principles of equilibrium, the pressure on the points of support (exclusive of what proceeds from the weight of the machine itself) is stated as the same as if the moving and resisting forces were applied immediately to these points in their own directions. But this is in all cases erroneous; and, in cases of swift motions, it is greatly so. We may be convinced of this by a very simple instance. Suppose a line laid over a pulley, and a pound weight at one end of it, and ten pounds at the other; the pressure of the axis on its support is eleven pounds, according to the usual rule; whereas we shall find it only $3\frac{7}{11}$. For, if we call the radius of the pulley 1, the momentum of the moving force is $10 \times 1 - 1 \times 1 = 9$; and the momentum of inertia is $10 \times 1^2 + 1 \times 1^2 = 11$. Therefore the angular velocity is $\frac{9}{11}$. But the distance CG of the centre of gravity from the axis of motion is also $\frac{9}{11}$, because we may suppose the two weights in contact with the circumference of the pulley. Therefore the velocity of the centre of gravity is $\frac{9}{11} \times \frac{9}{11} = \frac{81}{121}$ of its natural velocity. It is therefore diminished $\frac{40}{121}$ by the figure of the axis of the pulley, and the 11 pound press it with $\frac{40}{121}$ of their weight, that is, with $3\frac{7}{11}$ pounds.

34
Of knowing the momentum of inertia:

Since all our machines consist of inert matter, which requires force to put it in motion, or to stop it, or to change its motion, it is plain that some of our natural power is expended in producing this effect; and since the principles of equilibrium only state the proportion between the power and resistance which will preserve the machine at rest, our knowledge of the actual performance of a machine is imperfect, unless we know how much of our power is thus employed. It is only the remainder which can be stated in opposition to the resistance opposed by the work. This renders it proper to give some general propositions, which enable us to compute this with ease.

35
and consequently the force necessary to overcome it.

It would be very convenient, for instance, to know some point in which we might suppose the whole rotatory part of the machine concentrated; because then we could at once tell what the momentum of its inertia is, and what force we must apply to the impelled point of the machine, in order to move it with the desired velocity.

Fig. 3. Let S, fig. 3. be this point of a body turning round

the supported axis passing through C; that is, let S be such a point, that if all the matter of the body were collected there, a force applied at P will produce the same angular velocity as it would if applied at the same point of the body having its natural form.

The whole matter being collected at S, the expression $\frac{m \text{ GI} \cdot \text{CP}}{\int p \cdot r^2}$ of the angular velocity becomes $\frac{m \text{ GI} \cdot \text{CP}}{m \cdot \text{CS}^2}$ (N^o 22.); and these are equal by supposition. There-

fore $\int p r^2 = m \cdot \text{CS}^2$, and $\text{CS} = \sqrt{\frac{\int p r^2}{m}}$.

This point S has been called the CENTRE OF GYRATION.

In a line or slender rod, such as a working beam, or the spoke of a wheel in a machine, CS is $\sqrt{\frac{1}{3}}$ of its length.

In a circle or cylinder, such as the solid drum of a capstane, $\text{CS} = \sqrt{\frac{1}{2}}$ its radius, or nearly $\frac{7}{10}$. But if it turns round one of its diameters, $\text{CS} = \frac{1}{2}$ radius.

In the periphery of a circle, or rim of a wheel, $\text{CS} = \text{radius}$ nearly.

If it turn round a diameter, $\text{CS} = \sqrt{\frac{1}{2}}$ radius. The surface of a sphere, or a thin spherical shell, turning round a diameter, has $\text{CS} = \sqrt{\frac{2}{3}}$ radius, or nearly $\frac{4}{5}$ or $\frac{5}{6}$.

A solid sphere turning round a diameter has $\text{CS} = \sqrt{\frac{8}{5}}$ radius, or nearly $\frac{7}{11}$. This is useful in the problem of the precession of the equinoxes. We may observe by the way, that if we consider the whirling body as a system of several bodies with rigid or inflexible connections, we may consider all the matter of each of these bodies as united in its centre of gyration, and the rotation of the whole will be the same; for this does not change the value of $\frac{\int p r^2}{m}$.

There is another way of making this correction of the motion of a machine, or allowing for the inertia of the machine itself, which is rather simpler than the one now given. We can suppose a quantity of matter collected at the point to which the moving force is applied, such that its inertia will oppose the same resistance to rotation that the machine does in its natural form. Suppose the moving force applied at P, as before, and that instead of the natural form of the body a quantity of matter = $\frac{\int p r^2}{\text{CP}^2}$, collected at P; the moving force will

produce the same angular velocity as on the body, in its natural form. For the angular velocity in this case

must be $\frac{m \text{ GI} \cdot \text{CP}}{\int p r^2 \cdot \text{CP}^2}$ (N^o 22.) which is $= \frac{m \cdot \text{GI} \cdot \text{CP}}{\int p r^2}$, the

same as before.

A point O may be found, at such a distance from the axis, that if all the matter of the body were collected there, and an external force $m \cdot \text{GI}$ applied to it in a direction perpendicular or any how inclined to CO, it will produce the same angular velocity as when applied to the centre of gravity G, with the same inclination to the line CG.

In this case, the angular velocity must be $\frac{m \cdot \text{GI} \cdot \text{CO}}{m \cdot \text{CO}^2}$, (N^o 22.),

Rotation.

36
A simple mode of allowing for the inertia of machines.

37
Centre of oscillation

(N^o 22.), which is $= \frac{GI}{CO}$. This must be equal (by supposition) to the angular velocity where the same force $m.GI$ is applied in the same inclination to G .—

The angular velocity in this case must be $\frac{m.GI.CG}{\int p r^2}$.

Therefore we have $\frac{GI}{CO} = \frac{m.GI.CG}{\int p r^2}$, and $\frac{CO}{GI} = \frac{\int p r^2}{m.GI.CG}$, and $CO = \frac{\int p r^2}{m.CG}$. Also, as in N^o 31, $GO = \frac{\int A.GA^2}{m.CG}$.

This point O has several remarkable properties.

In the first place, it is the point of a common heavy body swinging round C by its gravity, where, if all its weight be supposed to be concentrated, it will perform its oscillations in the same time. For while the body has its natural form, the whole force of gravity may be supposed to be exerted on its centre of gravity. When the matter of the body is collected at O, the force of gravity is concentrated there also; and if CG have the same inclination to the horizon in the first case that CO has in the second, the action of gravity will be applied in the same angle of inclination, and the two bodies will acquire the same angular velocity; that is, they will descend from this situation to the vertical situation (that is, through an equal angle) in the same time. These two bodies will therefore oscillate in equal times. For this reason, the point O so taken in the line CG, which is the radius vector of the centre of inertia, that CO is equal to $\frac{\int A.CA^2}{m.CC}$, or $GO = \frac{\int A.GA^2}{m.CG}$, is called the CENTRE OF OSCILLATION of the body; and a heavy point suspended by a thread of the length CO is called its *equivalent* or *synchronous pendulum*, or the *simple pendulum*, corresponding to the body itself, which is considered as a *compound pendulum*, or as consisting of a number of simple pendulums, which, by their rigid connection disturb each other's motions.

That CO may be the equivalent pendulum, and O the centre of oscillation, O must be in the line CG, otherwise it would not rest in the same position with the body, when no force was keeping it out of its vertical position. The equation $CO = \frac{\int A.CA^2}{m.CG}$ only determines the distance of the centre of oscillation from the centre of suspension, or the length of the equivalent simple pendulum, but does not determine the precise point of the body occupied by the centre of oscillation; a circumstance also necessary in some cases.

Mathematicians have determined the situation of this point in many cases of frequent occurrence. Huyghens, in his *Horologium Oscillatorum*, and all the best writers of treatises of mechanics, have given the method of investigation at length. The general process is, to multiply every particle by the square of its distance from the axis of suspension, and to divide the sum of all these products by the product of the whole quantity of matter multiplied by the distance of its centre of gravity from the same axis. The quotient is the distance of the centre of oscillation, or the length of the equivalent

simple pendulum: for $CO = \frac{\int p.r^2}{m.CG}$.

a. If the body is a heavy straight line, suspended by one extremity, CO is $\frac{2}{3}$ of its length.

b. This is nearly the case of a slender rod of a cylindrical or prismatic shape. It would be exactly so if all the points of a transverse section were equally distant from the axis of suspension.

c. If the pendulum is an isosceles triangle suspended by its apex, and vibrating perpendicularly to its own plane, CO is $\frac{3}{4}$ of its height.

d. This is nearly true of a very slender triangle (that is, whose height many times exceeds its base) swinging round its vertex in any direction.

e. In a very slender cone or pyramid swinging from its vertex, CO is $\frac{3}{4}$ of its height nearly.

f. If a sphere, of which r is the radius, be suspended by a thread whose weight may be neglected and whose length is l , the distance between its centre of suspension and centres of oscillation is $a + r + \frac{r^2}{a+r}$; and the distance between its centres of bulk and oscillation is $\frac{r}{a+r}$. Thus, in a common second's pendulum, whose length at London is about $39\frac{1}{2}$ inches, the centre of oscillation will be found about $\frac{1}{100}$ of an inch below the centre of the ball, if it be two inches in diameter.

g. If the weight of the thread is to be taken into the account, we have the following distance between the centre of the ball and that of oscillation, where B is the weight of the ball, a the distance of the point of suspension and its centre, d the diameter of the ball, and w the weight of the thread or rod, $GO = \frac{(\frac{1}{2}w + \frac{2}{3}B)d^2 - \frac{1}{6}w(ad + a^2)}{(\frac{1}{2}w + B)a - \frac{1}{2}dw}$: or, if we consider the weight of the thread as an unit, and the weight of the ball as its multiple (or as expressed by the number of times it contains the weight of the thread),

$$GO = \frac{\frac{1}{6}a}{B + \frac{1}{2}}$$

As the point O, determined as above, by making

$CO = \frac{\int p r^2}{m.CG}$, is the centre of oscillation of the body

turning round C, so C is the centre of oscillation of the same body turning round O: for resuming $A.CA$ in place of $p r$, we have $\int A.CA^2 = m.CO.CG$. Now $\int A.CA^2 = \int A.OA^2 + \int A.OC^2 - \int A.OC.2Oa$, (Euclid, II. 12. 13.), or $m.CO.CG = \int A.OA^2 + \int A.OC^2 - \int A.OC.2Oa$. But $\int A.OC^2 = m.OC^2 = m.OC.OC$; and (by the nature of the centre of gravity) $\int A.OC.2Oa = m.OC.2OG$. Therefore we have $m.CO.CG = \int A.OA^2 + m.OC.OC - m.OC.2OG$; and $\int A.OA^2 = m.OC.CG + m.CO.2OG - m.CO.CO = m.CO(CG + 2OG - CO)$. But $CG + 2OG$ is equal to $CO + OG$, and $CG + 2OG - CO$ is equal to OG . Therefore $\int A.OA^2 = m.CO.OC$, and

$$CO = \frac{\int A.OA^2}{m.OC}$$

which is all that is wanted (according to N^o 39) to make C the centre of oscillation when O is the centre of suspension.

If the point of suspension, or axis of rotation, be any where in the circumference of a circle of which G is the centre, the point O will be in the circumference of another circle of which G is the centre: for, by N^o 38.

Rotation.

$GO = \frac{SA.GA^2}{m.CG}$. Now $\int A.GA^2$ is a fixed quantity; and therefore while CG is constant, OG will also be constant.

43 We may also observe, that the distance of the axis from the centre S of gyration is a mean proportional between its distance from the centre G of gravity and the centre O of oscillation: for we had (N^0 .)

$$CS^2 = \frac{\int p r^2}{m}, \text{ and } CO = \frac{\int p r^2}{m CG}, \text{ and therefore}$$

$$CO.CG = \frac{\int p r^2}{m}, = CS^2 \text{ and } CO : CS = CS : CG.$$

44 We see also that the distance CO is that at which an external force must be applied; so that there may not be any pressure excited in the axis upon its points of support, and the axis may be a spontaneous axis of conversion. This we learn, by comparing the value of CO with that of CP in art. 30. This being the case, it follows, that if an external force is applied in a direction passing through O , perpendicularly to CO , it will produce the same initial velocity of the centre as if the body were free: for as it exerts no pressure on the points of support, the initial motion must be the same as if they were not there.

45 If the external force be applied at a greater distance in the line CG , the velocity of the centre will be greater than if the body were free. In this case the pressure excited in the axis will be backward, and consequently the points of support will re-act forward, and this re-action will be equivalent to another external force conspiring with the one applied at O . Some curious consequences may be deduced from this.

46 Why this point is sometimes called the centre of percussion.

If the external force be applied to a point, in the line CG 'ying beyond C , the motion of the centre will be in the opposite direction to what it would have taken had the body been free, and so will be the pressures exerted by the points of support on the axis.

47 A force $m.GI$ applied at P produces the initial progressive motion $m.GH$; and any force applied at O , perpendicularly to CG , produces the same motion of the centre as if the body were free. Therefore a force $m.GH$ applied thus at O will produce a motion $m.GH$ in the centre, and therefore the same motion which $m.GI$ applied at P would produce; and it will produce the momentum $m.GI$ at P . Therefore if a force equal to the progressive motion of the body be applied at O , perpendicularly to CO , in the opposite direction, it will stop all this motion without exciting any strain on the axis or points of support. Therefore the equivalent of all the motions of each particle round C is conceived as passing through O in a direction perpendicular to CO ; and the blow given by that point to any body opposed to its motion is considered as equal to the compounded effect of the rotatory motion, or to the progressive motion of the body combined with its rotation.

48 Improperity of the term.

For such reasons O has been called the CENTRE OF PERCUSSION of the body turning round C . But the name of *centre of momentum*, or *rotatory effort*, would have been more proper.

We can feel this property of the point O when we give a smart blow with a stick. If we give it a motion round the joint of the wrist only, and strike smartly

with a point considerably nearer or more remote than two-thirds of its length, we feel a painful shock or wrench in the hand: but if we strike with that point which is precisely at two-thirds of its length, we feel no such disagreeable strain.

Rotation.

Mechanical writers frequently say, that O considered as the centre of percussion, is that with which the most violent blow is struck. But this is by no means true; O is that point of a body turning round C which gives a blow precisely equal to the progressive motion of the body, and in the same direction. As we have already said, it is the point where we may suppose the whole rotatory momentum of the body accumulated. Every particle of the body is moving in a particular direction, with a velocity proportional to its distance from the axis of rotation; and if the body were stopped in any point, each particle tending to continue its motion endeavours to drag the rest along with it. Whatever point we call the centre of percussion should have this property, that when it is stopped by a sufficient force, the whole motion and tendency to motion of every kind should be stopped; so that if at that instant the supports of the axis were annihilated, the body would remain in absolute rest.

49

The consideration of a very simple case will show that this point of stoppage cannot be taken indifferently. Suppose a square or rectangular board $CDD'C'$, fig. 4. advancing in the direction GH , perpendicular to its plane, without any rotation. Let G be the centre of gravity, and the middle of the board. It is evident, that if a force be applied at G , in the direction HG , and equal to the quantity of motion of the board, all motion will be stopped: for when the point G is stopped, no reason can be assigned why one part of the board shall advance more than another. The same thing must happen if the board be stopped by a straight edge put in its way, and passing through G : for example, in the line LGM , or $g G h$. But if this edge be so placed that the board shall meet it with the line IPK , then, because this line does not divide it equally, and because there is a greater quantity of motion in the part $CIKC'$ than in the part $IDD'K$, though the progressive motion may be stopped, the upper part will advance, and a motion of rotation will commence, of which IK will be the axis. Now suppose that the board, instead of having been moving along in the direction GH , every part with the same velocity had been swinging round the axis CC' like a pendulum, from the position $C d d' C'$, and that it is stopped by a straight edge meeting it in the line LGM parallel to CO' , in the moment that it has attained the vertical position $CDD'C'$; all its motion will not be stopped: for although LGM divides the board equally, there is more motion in the lower part $LDD'M$ than in the upper part $CLMC'$, because every particle of the lower part is describing larger circles and moving swifter. Therefore when the line LGM is stopped, there will be a tendency of the lower part to advance, and the pivots C and C' of the axis will be pressed backwards on their holes; and if the holes were at that instant removed, a rotation would commence, of which LM is the axis. The board must therefore be stopped in some line IPK below LGM , and so situated, that the sum of all the momenta on each side of it shall be equal. This alone

50 Centre of percussion how defined. Fig 4.

can

can hinder a rotation round the axis IPK. From what has been already demonstrated, it appears, that this will be prevented if the edge meets the board in a line IPK passing through O the centre of oscillation, which is situated in the line $g G h$ passing through the centre of gravity perpendicular to the axis CC'. This line IOK may therefore be called the *line* or *axis* of percussion.

But any point of this line will not do. It is evident that if the board should meet the fixed edge in the line $g GO h$, all motion will be stopped, for the motions on each side are equal, and neither can prevail. But if it be stopped in the line $p P q$, there is more motion in the part $p q D'C'$ than in the part $p q DC$; and if the supports at C and C' were that instant taken away, there would commence a rotation round the axis $p q$. Consequently, if the body were not stopped by an edge, but by a simple point at P, this rotation would take place. The motions above and below P would indeed balance each other, but the motions on the right and left sides of it would not. Therefore it is not enough for determining the centre of percussion that we have ascertained its distance $g O$ from the axis of rotation by the equation $g O = \frac{\int p r^2}{m \cdot g G}$. This equation only gives

us the line IOK parallel to CC', but not the point of percussion. This point (suppose it P) must be such that if any line $p P q$ be drawn through it, and considered as an axis round which a rotation may commence, it shall not commence, because the sum of all the momenta round this axis on the right side is equal to the sum of the momenta on the left. Let us investigate in what manner this condition may be secured.

Let there be a body in a state of rotation round the axis $D d$ (fig. 5.), and let G be its centre of gravity; and CGO a line through the centre of gravity perpendicular to the axis $DC d$. At the moment under consideration, the centre of gravity is moving in the direction GH, perpendicular to the radius vector GC, as also perpendicular to a plane passing through the lines $D d$ and CG. Let O be the centre of oscillation. Draw the line $n O$ parallel to $D d$. The centre of percussion must be somewhere in this line. For the point of percussion, wherever it is, must be moving in the same direction with the progressive motion of the body, that is, in a direction parallel to GH, that is, perpendicular to the plane DCG. And its distance from the axis $D d$ must be the same with that of the centre of oscillation. These conditions require it therefore to be in some point of $n O$. Suppose it at P. Draw $P p$ perpendicular to $D d$. P must be so situated, that all the momenta tending to produce a rotation round the line $p P$ may balance each other, or their sum total be nothing.

Now let A be any particle of the body which is out of the plane DCG, in which lie all the lines CGO, $p P$, $n O P$, &c. Draw its radius vector $A a$ perpendicular to $D a$ and draw $a n$ parallel to CG, and therefore perpendicular to $D a$. The plane $A a n$ is perpendicular to the plane $D a n$ (Euclid, XI. 4.). Draw AL perpendicular to $A a$, and $A l$ perpendicular to $a n$. Then, while the body is beginning to turn round $D d$, the incipient motion of the particle A is in the direction AL, perpendicular to its radius vector $A a$

This motion AL may be considered as compounded of the motion $A l$, perpendicular to the plane DCG, and the motion $l L$ in this plane. It is evident that it is $A l$ only which is opposed by the external force stopping the body at P, because $A l$ alone makes any part of the progressive motion of the centre of gravity in the direction GH.

We have hitherto taken the *radii vectores* for the measures of the velocities or motions of the particles. Therefore the quantity of motion or the moving force of A is $A \cdot A a$, and this is exerted in the direction AL, and may be conceived as exerted on any point in this line, and therefore on the point L. That is, the point L might be considered as urged in this direction with the force $A \cdot A a$, or with the two forces of which the force $A \cdot A a$ is compounded. The force in the direction AL is to the force in the direction $A l$ as AL to $A l$, or as $a A$ to $a l$, because the triangles $A l L$ and $a l A$ are similar. Therefore, instead of supposing the point L urged by the force $A \cdot A a$, acting in the direction AL, we may suppose it impelled by the force $A \cdot a l$, acting perpendicularly to the line $A l$, or to the plane DCG, and by the force $A \cdot A l$ acting in this plane, viz. in the direction $L n$. This last force has nothing to do with the percussion at P. Therefore we need consider the point L as only impelled by the force $A \cdot A l$. The momentum of this force, or its power to urge the plane DCG forward in the direction GH, by turning it round $D d$, must be $A \cdot a l \cdot a L$. ($N. B.$ This is equal to $A \cdot A a^2$, because $a l : a A :: a L : A$, and $A \cdot A a^2$, has been shown long ago to be the general expression of the rotatory momentum of a particle).

Draw $L m$ perpendicular to $P p$. If we consider $P p$ as an axis about which a motion of rotation may be produced, it is plain that the momentum of the point L to produce such a rotation will be $A \cdot a l \cdot L m$. In like manner, its momentum for producing a rotation round $n P$ would be $A \cdot a l \cdot L n$. In general, its momentum for producing rotation round any axis is equal to the product of the perpendicular force at L (that is, $A \cdot a l$) and the distance of L from this axis.

In order therefore that P may be the centre of percussion, the sum of all the forces $A \cdot a l \cdot L m$ must be equal to nothing; that is, the sum of the forces $A \cdot a l \cdot L m$ on one side of this axis $P p$ must be balanced by the sum of forces $A' \cdot a' l' \cdot L' m'$ on the other side. To express this in the usual manner, we must have $\int A \cdot a l \cdot n P = 0$. But $n P = n O - O P$. Therefore $\int A \cdot a l \cdot n O - \int A \cdot a l \cdot O P = 0$, and $\int A \cdot a l \cdot n O = \int A \cdot a l \cdot O P$. But OP is the same wherever the particle A is situated; and because G is the centre of gravity, the sum of all the quantities is $A \cdot a l$ is $m \cdot GC$, m being the quantity of matter of the body; that is, $\int A \cdot a l = m \cdot GC$, and $\int A \cdot a l \cdot O P = m \cdot GC \cdot O P$, $\int A \cdot a l \cdot n O$. Hence we derive the final equation $OP = \frac{\int A \cdot a l \cdot n O}{m \cdot GC}$.

Therefore the centre of percussion P of a body turning round the axis $D d$ is determined by these conditions: 1st, It is in the plane DCG passing through the axis and the centre of gravity; 2d, It is in a line $n O$ passing through the centre of oscillation, and parallel to the axis, and therefore its distance $P p$ from the axis of rotation

Rotation.

51

52
fig. 5.

53

Rotation. rotation is $\frac{f \Lambda A a^2}{m.CG}$; and, $3d$, Its distance OP from the centre of oscillation is $\frac{f \Lambda a l n O}{m.CG}$.

54 How both centres coincide. In order therefore that the centres of oscillation and percussion may coincide, or be one and the same, OP must vanish, or SA.aln O must be equal to nothing, that is, the sum of all the quantities $\Lambda a l n O$ on one side of the line CO must be equal to the sum of all the quantities $\Lambda' a' l' n' O$ on the other side.

55 Let D d Δ be a plane passing through the axis D d perpendicular to that other plane DCG through it, in which the centre of gravity is situated, and let C g γx be a third plane passing through the centre of gravity perpendicular to both the planes D d Δ and DCG. Draw l r and a α perpendicular to a L, and r $\dot{\alpha}$ perpendicular to c r, and then draw A α , $\Lambda \dot{\alpha}$ perpendicular to a α and r $\dot{\alpha}$. It is evident that A α and $\Lambda \dot{\alpha}$ are respectively equal to a l and l r, or to a l and n o; so that the two factors or constituents of the momentum of a particle A round the centre of percussion are the distances of the particles from the planes D d Δ and x c g γ , both of which are perpendicular to that plane through the axis in which the centre of gravity is placed.

We may see, from these observations, that the centres of oscillation and percussion do not necessarily coincide, and the circumstance which is necessary for their coincidence, viz. that $\int \Lambda A \alpha \Lambda \dot{\alpha}$ is equal to O. It is of importance to keep this in mind.

56 Further considerations of importance.

There occurs here another observation of great importance. Since every force is balanced by an equal force acting in the opposite direction, and since all motion progressive and rotatory is stopped by an external force applied at P in the direction q P, it follows that, if the body were at rest, and the same force be applied there, it will set the body in rotation round the axis D d, in the opposite direction, with the same angular velocity, and without any pressure on the pivots D and d. For whatever motion of the particle A, in the direction AL, was stopped by a part of the external force applied at P, the same motion will be produced by it in the quiescent particle A in the opposite direction LA. And as the pivots D and d had no motion in the case of the body turning round them, they will acquire no motion, or will have no tendency to motion, or no pressure will be exerted on them, in the last case. Therefore when an external force is applied at P in a direction perpendicular to the line P p, the line D d will become a momentary spontaneous axis of conversion, and the incipient motion of the body will perfectly resemble the rotation of the same body round a fixed axis D d.

57 There is another set of forces of which we have as yet taken no notice, viz. that part of each force AL which is directed along the plane DCG, and is represented by l L when the whole force is represented by AL, or by A l when the whole force is represented by A a. These forces being all in the plane DCG, and in the direction CG or GC, can have no effect on the rotation round any axis in that plane. But they tend, separately, to produce rotation round any axis passing through this plane perpendicularly. And the momentum of A to produce a rotation round an axis

perpendicular to this plane, in O for instance, must evidently be A.AL.nO, and round P it must be A.AL.nP, &c. We shall have occasion to consider these afterwards.

Rotation. 58 Of balls and cylinders rolling down inclined planes.

It is usual in courses of experimental philosophy to illustrate the motions of bodies on inclined planes and curved surfaces by experiments with balls rolling down these surfaces. But the motions of such rolling balls are by no means just representations of the motions they represent. The ball not only goes down the inclined plane by the action of gravity, but it also turns round an axis. Force is necessary for producing this rotation; and as there is no other source but the weight of the ball, part of this weight is expended on the rotation, and the remainder only accelerates it down the plane. The point of the ball which rests on the plane is hindered from sliding down by friction; and therefore the ball tumbles, as it were, over this point of contact, and is instantly caught by another point of contact, over which it tumbles in the same manner. A cylinder rolls down in the very same way; and its motion is nearly the same as if a fine thread had been lapped round it, and one end of it made fast at the head of the inclined plane. The cylinder rolls down by unwinding this thread.

The mechanism of all such motions (and some of them are important) may be understood by considering them as follows: Let a body of any shape be connected with a cylinder FCB (fig. 6.) whose axis passes through G the centre of gravity of the body. Suppose that body suspended from a fixed point A by a thread wound round the cylinder. This body will descend by the action of gravity, and it will also turn round, unwinding the thread. Draw the horizontal line OGC. It will pass through the point of contact C of the thread and cylinder, and C is the point round which it begins to turn in descending. Let O be its centre of oscillation corresponding to the momentary centre of rotation C. It will begin to descend in the same manner as if all its matter were collected in O: for it may be considered, in this instant, as a pendulum suspended at C. But in this case O will descend in the same manner as if the body were falling freely. Therefore the velocity of G (that is, the velocity of descent) will be to the velocity with which a heavy body would fall as CG to CO. Now since the points C, G, O, are always in a horizontal line, and the radius CG is given; as also CO (N^o 48.) the velocity of a body falling freely, and of the body unwinding from this thread, will always be in the same proportion of CO to CG, and so will the spaces described in any given time. And thus we can compare their motions in every case when we know the place of the centre of oscillation.

59 Mechanism of these motions. Fig. 6.

Cor. 1. The weight of the descending body will be to the tension of the thread as CO to GO: for the tension of the thread is the difference between the momentum of the rolling body and that of the body falling freely.

60

Observe, that this proportion between the weight of the body and the tension of the thread will be always the same: for it has been demonstrated already, N^o 42. that if C be in the circumference of a circle whose centre is G, O will be in the circumference of another circle

circle round the same centre, and therefore the ratio of CG to CO is constant.

Cor. 2. If a circular body FCB roll down an inclined plane by unfolding a thread, or by friction which prevents all sliding, the space described will be to that which the body would describe freely as CG to CO : for the tendency down the inclined plane is a determined proportion of the weight of the body. The motion of rotation in these cases, both progressive and whirling, is uniformly accelerated.

Something of the same kind obtains in common pendulous bodies. A ball hung by a thread not only oscillates, but also makes part of a rotation; and for this reason its oscillations differ from those of a heavy point hanging by the same thread, and the centre of oscillation is a little below the centre of the ball. A ball hung by a thread, and oscillating between cycloidal cheeks, does not oscillate like a body in a cycloid, because its centre of oscillation is continually shifting its place. Huyghens avoided this by suspending his pendulous body from two points, so that it did not change its attitude during its oscillation. If our spring-carriages were hung in this manner, having the four lower staples to which the straps are fixed as far asunder as the four upper staples at the ends of the springs, the body of the carriage would perform its oscillations without kicking up and down in the disagreeable manner they now do, by which we are frequently in danger of striking the glasses with our heads. The swings would indeed be greater, but incomparably easier; and we could hold things almost as steadily in our hand as if the carriage were not swinging at all.

This will suffice for an account of the rotation round fixed axes, as the foundation for a theory of machines actually performing work. The limits of our undertaking will not allow us to do any more than just point out the method of applying it.

Let there be any machine of the rotatory kind, i. e. composed of levers or wheels, and let its construction be such, that the velocity of the point to which the power is applied (which we shall call the *impelled point*) is to the velocity of the working point in the ratio of m to n . It is well known that the energy of this machine will be the same with that of an axis in peritrochio, of which the radii are m and n .

Let p express the actual pressure exerted on the impelled point by the moving power, and let r be the actual pressure or resistance exerted on the working point by the work to be performed. Let x be the inertia of the power, or the quantity of dead matter which must move with the velocity of the impelled point in order that the moving power may act. Thus the moving power may be the *weight* of a bucket of water in a water-wheel; then x is the quantity of matter in this bucket of water. Let y in like manner be the inertia of the work, or matter which must be moved with the velocity of the working point, in order that the work may be performed. Thus y may be a quantity of water which must be continually pushed along a pipe. This is quite different from the weight of the water, though it is proportional to it, and may be measured by it.

Let f be a pressure giving the same resistance when applied at the working-point with the friction of the machine, and let an^2 be the momentum of the machine's

inertia, viz. the same as if a proper quantity of matter a were attached to the working point, or to any point at the same distance from the axis.

This state of things may be represented by the wheel and axle PQS (fig. 7.) where x and y and a are represented by weights acting by lines. P is the impelled point, and R the working-point; CP is m and CR is n . The moving force is represented by PA, the resistance by RB, and the friction by BF.

It is evident that the momentum of the inertia of x , y , and a are the same as if they were for a moment attached to the points P and R.

Hence we derive the following expressions:

1. The angular velocity = $\frac{p m - r + f n}{x m^2 + y + a n^2}$
2. Velocity of the working-point = $\frac{p m n - r + f n^2}{x m^2 + y + a n^2}$
3. Work performed = $\frac{p m n r - r + f n^2 r}{x m^2 + y + a n^2}$. For the

work is proportional to the product of the resistance and the velocity with which it is overcome.

We shall give a very simple example of the utility of these formulae. Let us suppose that water is to be raised in a bucket by the descent of a weight, and that the machine is a simple pulley. Such a machine is described by Desaguliers*, who says he found it preferable to all other machines. The bucket dipped itself in the cistern. A chain from it went over a pulley, and at its extremity was a stage on which a man could step from the head of a stair. His preponderance brought down the stage and raised the bucket, which discharged its water into another cistern. The man quitted the stage, and walked up stairs, and there he found it ready to receive him, because the empty bucket is made heavier than the empty stage.

Now, if there be no water in the bucket, it is evident, that although the motion of the machine will be the quickest possible, there will be no work performed. On the other hand, if the loaded stage and the full bucket are of equal weight, which is the usual statement of such a machine in elementary treatises of mechanics, the machine will stand still, and no work will be performed. In every intermediate state of things the machine will move, and work will be performed. Therefore the different values of the work performed must be a series of quantities which increase from nothing to a certain magnitude, and then diminish to nothing again. The maxim which is usually received as a fundamental proposition in mechanics, viz. that what is gained in force by the intervention of a machine is lost in time, is therefore false. There must be a particular proportion of the velocities of the impelled and working-points, which will give the greatest performance when the power and resistance are given; and there is a certain proportion of the power and resistance which will have the same effect when the structure of the machine has previously fixed the velocities of the impelled and working-points.

This proportion will be found by treating the formula which expresses the work as a fluxionary quantity, and finding its maximum. Thus, when the ratio of the power and resistance is given, and we wish to know what must be the proportion of the velocities

Rotation.

67

Rotation. m and n , that we may construct the machine accordingly, we have only to consider n as the variable quantity in the third formula. This gives us

$$n = m \times \frac{\sqrt{x^2 \times r + f^2 + p^2 x a + y} - x r + f}{p a + y}$$

68

This is a fundamental proposition in the theory of working machines: but the application requires much attention. Some natural powers are not accompanied by any inertia worth minding; in which case x may be omitted. Some works, in like manner, are not accompanied by any inertia; and this is a very general case. In many cases the work exerts no contrary strain on the machine at rest, and r is nothing. In most instances the intensity of the power varies with the velocity of the impelled point, and is diminished when this increases; the resistance or actual pressure at the working-point frequently increases with the velocity of the working-point. All these circumstances must be attended to; but still they only modify the general proposition. These are matters which do not come within the limits of the present article. We only took this opportunity of showing how imperfect is the theory of machines in equilibrio for giving us any knowledge of their performance or just principles of their construction.

69

Common mode of estimating external impulsions.

One thing, however, must be particularly attended to in this theory. The forces which are applied to the body moveable round an axis are considered in the theory as pressures actually exerted on the impelled points of the body or machine, as when a weight is appended to a lever or wheel and axle, and, by descending uniformly, acts with its whole weight. In this case the weight multiplied by its distance from the axis will always express its momentum, and the rotation will (*ceteris paribus*) be proportional to this product. But in many important cases our machines are actuated by external impulsions. A body in motion strikes on the impelled point of the machine, and causes it to turn round its axis. It is natural for us to consider the quantity of motion of this impelling body as the measure of our moving force. Supposing n to be its quantity of matter, and V its velocity, nV appears a very proper measure of its intensity. And if it be applied at the distance CP from the axis of rotation, $nV.CP$ should express its energy, momentum, or power to turn the machine round C ; and we should express the angular velocity by $\frac{nV.CP}{\int p r^2}$. Accordingly, this is the manner in which calculations are usually made for the construction and performance of the machine, as may be seen in almost every treatise of mechanics.

70 shown to be erroneous.

But nothing can be more erroneous, as we shall show by a very simple instance. It should result from these principles that the angular velocity will be proportional to CP . Let us suppose our moving power to be a stream of water moving at the rate of ten feet per second, and that every second there passes 100 pounds of water. We should then call our moving force 1000. It is evident, that if we suppose the arm of the float-board on which it strikes to be infinitely long, the impelled point can never move faster than 10 feet in a second, and this will make the angular velocity infinitely small, instead of being the greatest of all. The rota-

tion will therefore certainly be greater if CP be shorter. We need not examine the case more minutely.

Rotation. 71 Distinction to be made between the quantity of motion and moving power of an impelling body.

We must therefore carefully distinguish between the quantity of motion of the impelling body and its moving power, as it is modified by its manner of acting. The moving power is the pressure actually exerted on the impelled point of the machine. Now the universal fact of the equality of action and reaction in the collision of bodies assures us, that their mutual pressure in their collision is measured by the change of motion which each sustains: for this change of motion is the only indication and measure of the pressure which we suppose to be its cause. A way therefore of ascertaining what is the real moving force on a machine actuated by the impulsion of a moving body, is to discover what quantity of motion is lost by the body or gained by the machine; for these are equal. Having discovered this, we may proceed according to the propositions of rotatory motion.

72 Fig. 8.

Therefore let AEF (fig. 8.) represent a body moveable round an axis passing through C , perpendicular to the plane of the figure. Let this body be struck in the point A by a body moving in the direction FA , and let BAD be a tangent to the two bodies in the point of collision. It is well known that the mutual actions of two solid bodies are always exerted in a direction perpendicular to the touching surfaces. Therefore the mutual pressure of the two bodies is in the direction AP perpendicular to AD . Therefore let the motion of the impelling body be resolved into the directions AP and AD . The force AD has no share in the pressure. Therefore let V be the velocity of the impelling body estimated in the direction AP , and let n be its quantity of matter. Its quantity of motion in the direction AP will be nV .

Did AP pass through C , it is evident that the only effect would be to press the axis on its supports. But AP , the direction of the pressure, being inclined to AC , the point A is forced aside, and in some small moment of time describes the little arch Aa round the centre C . The point P will therefore describe a small arch Pp , subtending an angle $PCp = ACa$. Draw ao perpendicular to AP , and ad perpendicular to AD . The triangles dAo , ACP are similar, and $Aa : Ao = AC : CP$. But the angles ACa , PCp being equal, the arches are as their radii, and $Aa : Pp = AC : CP = Ao : ao$, therefore $ap = Ao$.

Now since, in consequence of the impulse, A describes Aa in the moment of time, it is plain that Ao is the space through which the impelling body continues to advance in the direction of the pressure; and if V be taken equal to the space which it described in an equal moment before the stroke, v will express the remaining velocity, and $V - v$ is the velocity lost, and $n(V - v)$ is the quantity of motion lost by the impelling body, and is the true measure of the pressure exerted. This gives us the whole circumstances of the rotatory motion. The angular velocity will be $\frac{n(V - v).CP}{\int p r^2}$, and the velocity of the point A will be $\frac{n(V - v).CP.CA}{\int p r^2}$. Call this velocity u . The similarity of triangles gives us $CA : CP = Aa$ (or u) : Ao (or v) and $u = \frac{v.CA}{CP}$. There-

fore

ation. fore $\frac{V.CA}{CP} = \frac{n(V-r)CP.CA}{\int p r^2}$. From this we deduce

$$v = \frac{n.V.CP^2}{\int p r^2 + n.CP^2}$$

and thus we have obtained the value of v in known quantities; for n was given, or supposed known; so also was V : and since the direction FA was given, its distance CP from the axis is given; and the form of the body being known, we can find the value of $\int p r^2$. Now we have seen that v is also the velocity of the point P ; therefore we know the absolute velocity of a given point of the body or machine, and consequently the whole rotatory motion.

73 We have the angular velocity $= \frac{n.V.CP}{\int p r^2 + n.CP^2}$: we shall find this a maximum when $\int p r^2 = n.CP^2$; and in this case $CP = \sqrt{\frac{\int p r^2}{n}}$, and $v = \frac{1}{2}V$. So that the greatest velocity of rotation will be produced when the striking body loses $\frac{1}{2}$ of its velocity.

74 What we have now delivered is sufficient for explaining all the motions of bodies turning round fixed axes; and we presume it to be agreeable to our readers, that we have given the investigation of the centres of gyration, oscillation, and percussion. The curious reader will find the application of these theorems to the theory of machines in two very valuable dissertations by Mr Euler in the Memoirs of the Academy of Berlin, vol. viii. and x. and occasionally by other authors who have treated mechanics in a scientific and useful manner, going beyond the school-boy elements of equilibrium.

75 There remains a very important case of the rotation of bodies, without which the knowledge of the motion of solid bodies is incomplete; namely, the rotation of free bodies, that is, of bodies unconnected with any fixed points. We hardly see an instance of motion of a free body without some rotation. A stone thrown from the hand, a ball from a cannon, the planets themselves, are observed not only to advance, but also to whirl round. The famous problem of the precession of the equinoxes depends for its solution on this doctrine; and the theory of the working of ships has the same foundation. We can only touch on the leading propositions.

76 We need not begin by demonstrating, that when the direction of the external force passes through the centre of the body, the body will advance without any rotation. This we consider is familiarly known to every person versant in mechanics; nor is it necessary to demonstrate, that when the direction of the moving force does not pass through the centre of gravity, this centre will still advance in a direction parallel to that of the moving force, and with the same velocity as if the direction of the moving force had passed through it. This is the immediate consequence of the equality of action and reaction observed in all the mechanical phenomena of the universe.

But it is incumbent on us to demonstrate, that when the direction of the moving force does not pass through the centre of gravity, the body will not only advance in the direction of the moving force, but will also turn round an axis, and we must determine the position of this axis, and the relation subsisting between the progressive and rotatory motions.

The celebrated John Bernoulli was the first who considered this subject; and in his *Disquisitiones Mechanico-dynamicae*, he has demonstrated several propositions concerning the spontaneous axis of conversion, and the motions arising from eccentric external forces: and although he assumed for the leading principle a proposition, which is true only in a great number of cases, he has determined the rotation of spherical bodies with great accuracy.

This combination of bodies will be palpable in some simple cases, such as the following: Let two equal bodies A and B (fig. 9.) be connected by an inflexible rod (of which we may neglect the inertia for the present). Let G be the middle point, and therefore the centre of gravity. Let an external force act on the point P in the direction FP perpendicular to AB , and let AP be double of PB . Also let the force be such, that it would have caused the system to have moved from the situation AB to the situation ab , in an indefinitely small moment of time, had it acted immediately on the centre G . G would in this case have described Gg , A would have described Aa , and B would have described Bb , and ab would have been parallel to AB : for the force impressed on A would have been equal to the force impressed on B ; but because the force acts on P , the force impressed on A is but one half of that impressed on B by the property of the lever: therefore the initial motion or acceleration of A will be only half of the initial motion of B ; yet the centre G must still be at g . We shall therefore ascertain the initial motion of the system, by drawing through g a line $ag\beta$, so that Aa shall be $\frac{1}{2}$ of $B\beta$. This we shall do by making $AC = AB$, and drawing $Ca\beta$. Then $a\beta$ will be the position of the system at the end of the moment of time. Thus we see that the body must have a motion of rotation combined with its progressive motion.

77 Fig. 9.

And we deduce immediately from the premises that this rotation is performed round an axis passing through the centre of gravity G : for since the centre describes a straight line, it is never either above or below the axis of rotation, and is therefore always in it. This is a fundamental theorem, and our subsequent investigation is by this means greatly simplified, being thus reduced to two problems: 1. To determine in what direction the axis passes through the centre of gravity. 2. To determine the angular velocity of the rotation, or how far the centre must advance while the body makes one turn round the axis. This establishes the relation between the progressive and rotatory motions. It will contribute to our better conception of both these problems to see the result in the present simple case.

78 How motion is performed in these cases.

It is evident, in the first place, that the impressions made on A and B are in lines Aa , Bb parallel to FP and Gg ; and therefore the motions of the points A , G , and B , are made in one plane, viz. the plane FPG . The axis of rotation therefore must be a line drawn through G , perpendicular to this plane. If we give it any other position, one of the points A , B , or both of them, must quit this plane.

79

In the next place, in ba produced take $bc = BC$. Then supposing AC to be a rigid line connected with the system, it is evident that if there had been no rotation, the line BC would have kept parallel to its first position, and that at the end of the moment of time C

Q q 2 would

Rotation.

would have been at *c*. The point *C* therefore has had, by the rotation, a backward motion *cC*, relative to the centre *G* or *g*, and this motion is equal to the progressive motion *Gg* of the centre; therefore if we make *Gγ* equal to the circumference of a circle whose radius is *CG*, the body will make one rotation round the centre of gravity, while this centre moves along *Gγ*; and thus the relation is established between the two motions.

80 But further, the point *C* has, in fact, not moved out of its place. The incipient motion has therefore been such, that *C* has become a spontaneous centre of conversion. It is easy to see that this must always be the case, whatever may be the form of the rigid body or system of particles connected by inflexible and inextensible lines. Since the system both advances and turns round an axis passing through its centre of gravity, there must be some point in the system, or which may be conceived as connected with it by an inflexible line, which moves backward, by the rotation, as fast as the centre advances forward. A line drawn through this point parallel to the axis must in this instant be at rest, and therefore must be a spontaneous axis of conversion. And, in this instant, the combined motions of rotation round an axis passing through the centre of gravity and the motion of progression, are equivalent to, and actually constitute, an incipient simple motion of rotation round another axis parallel to the former, whose position may be ascertained. But it is necessary to establish this proposition and its converse on clearer evidence.

81
Fig. 10.

Therefore let *G* (fig. 10.) be the centre of gravity of a rigid system of particles of matter, such as we suppose a solid body to be. Let this system be supposed to turn round the axis *Gg*, while the axis itself is moving forward in the direction and with the velocity *GI*. Let the rotation be such, that a particle *A* has the direction and velocity *Ah*. Let us first suppose the progressive motion *GI* to be perpendicular to the axis *Gg*. It will therefore be parallel to the planes of the circles described round the axis by the different particles. Let *CGg* be a plane perpendicular to *GI*. It will cut the plane of the circle described by *A* in a straight line *cg*, and *g* will be the centre round which *A* is turning. Therefore *Ag* will be the radius vector of *A*, and *Ah* is perpendicular to *Ag*. Let *Ad* be perpendicular to *cg*, and in *Ad* take *Ae* equal to *GI* or *gi*. It is evident, that the absolute motion of *A* is compounded of the motions *Ae* and *Ah*, and is the diagonal *Af* of the parallelogram *Aefh*. In the line *gc*, which is perpendicular to *Gg*, take *gc* to *gA*, as *Ae* to *Ah*, and draw *cC* parallel to *gG*, and produce *hA* till it cut *cg* in *n*. We say that *Cc* is in this moment a spontaneous axis of conversion; for, because *An* is perpendicular to *Ag* and *Ad* to *Cg*, the angle *cgA* is equal to *dAn*, or *fhA*. Therefore, since *cg : gA = fh : hA*, the triangles *cgA* and *fhA* are similar, and the angle *gAc* is equal to *hAf*. Take away the common angle *gAf*, and the remaining angle *cAf* is equal to the remaining angle *hAg*, and *Af* is perpendicular to *Ac*, and the incipient motion of *A* is the same in respect of direction as if it were turning round the axis *cC*. Moreover, *Af* is to *fh* or *gi* as *Ac* to *cg*. Therefore, both the direction and velocity of the absolute motion of *A* is the same as if the body were turning round the fixed axis *cC*; and the combined motion *Ae* of progres-

sion, and the motion *Ah* of rotation round *Gg*, are equivalent to, and really constitute, a momentary simple motion of rotation round the axis *Cc* given in position, that is, determinable by the ratio of *Ae* to *Ah*.

82 On the other hand, the converse proposition is, that a simple motion of rotation round a fixed axis *Cc*, such that the centre *G* has the velocity and direction *GI* perpendicular to *CG*, is equivalent to, and produces a motion of rotation round an axis *Gg*, along with the progressive motion *GI* of this axis. This proposition is demonstrated in the very same way, from the consideration that, by the rotation round *Cc*, we have *cA : cg = Af : gi*. From this we deduce, that *Ah* is perpendicular to *Ag*, and that *fh : Ah = cg : gA*; and thus we resolve the motion *Af* into a motion *Ah* of rotation round *Gg*, and a motion *Ae* of progression common to the whole body.

83 But let us not confine the progressive motion to the direction perpendicular to the axis *Gg*. Let us suppose that the whole body, while turning round *Gg*, is carried forward in the direction and with the velocity *GK*. We can always conceive a plane *LGC*, which is perpendicular to the plane in which the axis *Gg* and the direction *GK* of the progressive motion are situated.— And the motion *GK* may be conceived as compounded of a motion *GI* perpendicular to this plane and to the axis; and a motion of translation *GL*, by which the axis slides along in its own direction. It is evident, that in consequence of the first motion *GI*, there arises a motion of rotation round *Cc*. It is also evident, that if, while the body is turning for a moment round *Cc*, this line be slid along itself in the direction *cC*, a motion equal to *GL* will be induced on every particle *A*, and compounded with its motion of rotation *AF*, and that if *fφ* be drawn equal and parallel to *GL*, *φ* will be the situation of the particle *A* when *G* is in *K*.

84 And thus it appears, that when the progressive motion is perpendicular to the axis of rotation passing through the centre of gravity, the two motions progressive and rotatory are equivalent to a momentary simple motion of rotation round a spontaneous axis of conversion, which is at rest; but when the progressive motion is inclined to the axis passing through the centre, the spontaneous axis of conversion is sliding in its own direction.

85 We may conceive the whole of this very distinctly and accurately by attending to the motion of a garden roller. We may suppose it six feet in circumference, and that it is dragged along at the rate of three feet in a second from east to west, the axis of the roller lying north and south. Suppose a chalk line drawn on the surface of the roller parallel to its axis. The roller will turn once round in two seconds, and this line will be in contact with the ground at the intervals of every six feet. In that instant the line on the roller now spoken of is at rest, and the motion is the same as if it were fixed, and the roller really turning round it. In short, it is then a spontaneous axis of conversion.

Now, suppose the roller dragged in the same manner and in the same direction along a sheet of ice, while the ice is floating to the south at the rate of four feet in a second. It is now plain that the roller is turning round an axis through its centre of gravity, while the centre is carried in the direction *f 36° 52' W.* at the rate of five

Rotation.

82

83

84

85
example
fixed.

five feet per second. It is also plain, that when the line drawn on the surface of the stone is applied to the ice, its only motion is that which the ice itself has to the southward. The motion is now a motion of rotation round this spontaneous axis of conversion, compounded with the motion of four feet per second in the direction of this axis. And thus we see that any complication of motion of rotation round an axis passing through the centre of gravity, and a motion of progression of that centre, may always be reduced to a momentary or incipient motion of rotation round another axis parallel to the former, compounded with a motion of that axis in its own direction.

The demonstration which we have given of these two propositions points out the method of finding the axis Cc , the incipient rotation round which is equivalent to the combined progressive motion of the body, and the rotation round the axis Gg . We have only to note the rotatory velocity Ah of some particle A , and its distance Ag from the axis, and the progressive velocity GI of the whole body, and then to make GC a fourth proportional to Ah , GI , and gA , and to place GC in a plane perpendicular to GI , which is perpendicular to Gg , and to place C on that side of Gg which is moving in the opposite direction to the axis.

In the simple case of this problem, which we exhibited in order to give us easy and familiar notions of the subject, it appeared that the retrograde velocity of rotation of the point C was equal to the progressive velocity of the centre. This must be the case in every point of the circumference of the circle of which CG , fig. 9. is the radius. Therefore, as the body advances, and turns round G , this circle will apply itself in succession to the line CK parallel to Gg ; and any individual point of it, such as C , will describe a cycloid of which this circle is the generating circle, CK the base, and CG half the altitude. The other points of the body will describe trochoids, elongated or contracted according as the describing points are nearer to or more remote from G than the point C is.

It is now evident that all this must obtain in every case, as well as in this simple one. And when we have ascertained the distance GC between the axis of rotation passing through the centre, and the momentary spontaneous axis of conversion passing through C , we can then ascertain the relation between the motions of rotation and progression. We then know that the body will make one rotation round its central axis, while its centre moves over a space equal to the circumference of a circle of a known diameter.

We must therefore proceed to the methods for determining the position of the point C . This must depend on the proportion between the velocity of the general progressive motion, that is, the velocity of the centre, and the velocity of some point of the body. — This must be ascertained by observation. In most cases which are interesting, we learn the position of the axis, the place of its poles, the comparative progressive velocity of the centre, and the velocity of rotation of the different points, in a variety of ways; and it would not much increase our knowledge to detail the rules which may be followed for this purpose. The circumstance which chiefly interests us at present is to know how these motions may be produced; what force is necessary, and how it must be applied, in order to produce a

given motion or rotation and progression; or what will be the motion which a given force, applied in a given manner, will produce.

We have already given the principles on which we may proceed in this investigation. We have shown the circumstances which determine the place of the centre of percussion of a body turning round a given fixed axis. This centre of percussion is the point of the body where all the inherent forces of the whirling body precisely balance each other, or rather where they unite and compose one accumulated progressive force, which may then be opposed by an equal and opposite external force. If, therefore, the body is not whirling, but at rest on this fixed axis, and if this external force be applied at the centre of percussion, now become a *point of impulsion*, a rotation will commence round the fixed axis precisely equal to what had been stopped by this external force, but in the opposite direction; or, if the external force be applied in the direction in which the centre of percussion of the whirling body was moving at the instant of stoppage, the rotation produced by this impulse will be the same in every respect. And we found that in the instant of application of this external force, either to stop or to begin the motion, no pressure whatever was excited on the supports of the axis, and that the axis was, in this instant, a spontaneous axis of conversion.

Moreover, we have shown, art. 84, that a rotation round any axis, whether fixed or spontaneous, is equivalent to, or compounded of, a rotation round another axis *parallel to it*, and passing through the centre of gravity, and a progressive motion in the direction of the centre's motion at the instant of impulse.

Now, as the position of the fixed axis, and the known disposition of all the particles of the body with respect to this axis, determines the place of the centre of percussion, and furnishes all the mathematical conditions which must be implemented in its determination, and the direction and magnitude of the force which is produced and exerted at the centre of percussion; so, on the other hand, the knowledge of the magnitude and direction of an external force which is exerted on the point of impulsion of a body not connected with any fixed axis, and of the disposition of all the parts of this body with respect to this point of impulsion, will furnish us with the mathematical circumstances which determine the position of the spontaneous axis of conversion, and therefore determine the position of the axis through the centre (parallel to the spontaneous axis of conversion), round which the body will whirl, while its centre proceeds in the direction of the external force.

The process, therefore, for determining the axis of progressive rotation is just the converse of the process for determining the centre of percussion.

John Bernoulli was the first who considered the motion of free bodies impelled by forces whose line of direction did not pass through their centre of gravity; and he takes it for granted, that since the body both advances and turns round an axis passing through the centre of gravity, this axis is perpendicular to the plane passing through the direction of the force, and through the point of impulsion and the centre of gravity. Other authors of the first name, such as Huyghens, Leibnitz, Roberval, &c. have thought themselves obliged to demonstrate this. Their demonstration is as follows:

Let

89
Mode of determining the axis of progressive rotation the converse of that for determining the centre of percussion.

Rotation. 57 appli- e on rle to re com- c cases.

Rotation.

Fig. 11.

Let a body whose centre of gravity is G (fig. 11.) be impelled at the point P by a force acting in the direction PQ not passing through the centre. The inertia of the whole body will resist in the same manner as if the whole matter were collected in G, and therefore the resistance will be propagated to the point P in the direction GP. The particle P, therefore, is impelled in the direction PQ, and resisted in the direction PA, and must therefore begin to move in some direction PB, which makes the diagonal of a parallelogram of which the sides have the directions PQ and PA. The diagonal and sides of a parallelogram are in one plane. P is therefore moving in the plane APQB or GPQ, and it is turning round an axis which passes through G.—Therefore this axis *must* be perpendicular to the plane GPQ.

90

Fig. 21.

It would require a series of difficult propositions to show the fallacy of this reasoning in general terms, and to determine the position of the axis through G. We shall content ourselves with a very simple case, where there can be no hesitation. Let A and A (fig. 12.) be two equal balls connected with the axis *ab* by inflexible lines *Aa*, *Bb*, perpendicular to *ab*. Let *Aa* be 1, and *Bb* 2. The centre of gravity G will evidently be in the line *cG* parallel to *Aa* and *Bb*, and in the middle of *ab*, and *cG* is $1\frac{1}{2}$. Let O be the centre of

oscillation. cO is $= \frac{A \cdot Aa^2 + B \cdot Bb^2}{A + B \cdot cG} = \frac{5}{4}$.

Draw *Am*, *Bn* perpendicular to *cG*, and suppose the balls transferred to *m* and *n*. The centre of oscillation will be still at O: and we see that if the system in this form were stopped at O, all would be in equilibrium. For the force with which the ball A arrives (by swinging round the axis) at *m*, is as its quantity of matter and velocity jointly, that is *A* . *Aa*, or 1. That of B arriving at *n* is *B* . *Bb*, or 2. The arm *mO* of the lever turning round O is $\frac{3}{4}$, and the arm *nO* is $\frac{1}{4}$. The forces, therefore, are reciprocally as the arms of the lever on which they act, and their momenta, or powers to turn the line *mn* round O, are equal and opposite, and therefore balance each other; and therefore, at the instant of stopping, no pressure is exerted at *c*. Therefore, if any impulse is made at O, the balls at *m* and *n* will be put in motion with velocities 1 and 2, and *c* will be a spontaneous centre of conversion. Let us see whether this will be the case when the balls are in their natural places A and B, or whether there will be any tendency to a rotation round the axis *cO*. The momentum of A, by which it tends to produce a rotation round *cO* is *A* . *Aa* . *Am*, = 1 × *Am*. That of B is *B* . *Bb* . *Bn*, = 2 × *Bn*. *Am* and *Bn* are equal, and therefore the momentum of B is double that of A, and there is a tendency of the system to turn round *cC*; and if, at the instant of stoppage, the supports of the axis *ab* were removed, this rotation round *cO* would take place, and the point *b* would advance, and *a* would recede, *c* only remaining at rest. Therefore, if an impulse were made at O, *ab* would not become a spontaneous momentary axis of conversion, and O is not the centre of percussion. This centre must be somewhere in the line *OP* parallel to *ab*, as at P, and so situated that the momenta *A* . *Aa* . *Aa* and *B* . *Bb* . *Bb* may be equal, or that *Aa* may be double of *Bb*, or *ap* double of *bp*. If an impulse be now made at P, the balls A B will be urged by forces as 1 and 2, and

therefore will move as if round the axis *ab*, and there will be no pressures produced at *a* and *b*, and *ab* will really become a momentary spontaneous axis of conversion.

Rotation.

Now join G and P. Here then it is evident that a body or system A, B, receiving an impulse at P perpendicular to the plane *acG*, acquires to itself a spontaneous axis of conversion which is not perpendicular to the line joining the point of impulsion and the centre of gravity. And we have shown, in art. 84. that this motion round *ab* is compounded of a progressive motion of the whole body in the direction of the centre, and a rotation round an axis passing through the centre parallel to *ab*. Therefore, in this system of free bodies, the axis of rotation is not perpendicular to the plane passing through the centre of gravity in the direction of the impelling force.

As we have already observed, it would be a laborious task to ascertain in general terms the position of the progressive axis of rotation. Although the process is the inverse of that for determining the centre of percussion when the axis of rotation is given, it is a most intricate business to convert the steps of this process. The general method is this: The momentum of a particle A (fig. 5.) by which it tends to change the position of the axis *Dd*, has for its factors *Aa* . *Al*, and *Aa*, which are its distances from three planes *Dd* . Δ , *DCO* *n*, and *Cg* . γ *z*, given in position. The sum of all these must be equal to nothing by the compensation of positive and negative quantities. We must find three other planes (of which only one is in some measure determined in position, being perpendicular to *DCO* *n*), so situated that the sums of similar products of the distances of the particles from them may in like manner be equal to nothing. This is a very intricate problem; so intricate, that mathematicians have long doubted and disputed about the certainty of the solutions. Euler, d'Alembert, Frisi, Landen, and others, have at last proved, that every body, however irregular its shape, has at least three axes passing through its centre of gravity, round which it will continue to revolve while proceeding forward, and that these are at right angles to each other; and they have given the conditions which must be implemented in the determination of these axes. But they still leave us exceedingly at a loss for means to discover the positions of the axes of a given body which have these conditions.

To solve this problem therefore in general terms, would lead to a disquisition altogether disproportioned to our work. We must restrict ourselves to those forms of body and situations of the point of impulsion which admit of the coincidence of the centres of oscillation and percussion; and we must leave out the cases where the axis has a motion in the direction of its length; that is, we shall always suppose the spontaneous axis of conversion to have no motion. Thus we shall comprehend the phenomena of the planetary motions, similar to the precession of our equinoctial points, and all the interesting cases of practical mechanics. The speculative mathematical reader will fill up the blanks of this investigation by consulting the writings of Euler and D'Alembert in the Berlin Memoirs, Frisi's Cosmographia, and the papers of Mr Landen, Mr Milner, and Mr Vince, in the Philosophical Transactions. But we hope, by means of a beautiful proposition on the com-

91
Difficulty of ascertaining its position in general terms.

position

position of rotatory motions, to enable every reader to discover the position of the axis of progressive rotation in every case which may interest him, without the previous solution of the intricate problem mentioned above.

Let $ABPCp b A$ (fig. 13.) be a section of a body through its centre of gravity G , so formed, that the part $ABPC$ is similar, and similarly placed with the part $A b p C$, so that the plane AC would divide it equally. Let this body be impelled at P in the direction HP , perpendicular to the plane AC . The axis round which it will turn will be perpendicular to $G \pi$. Suppose it at A . Then drawing AB and $A b$ to similar points, it is plain that $B \beta, b \beta$ are equal and opposite; these represent the forces which would raise or lower one end of the axis, as has been already observed. The axis therefore will remain perpendicular to $G \pi$.

Let the body be so shaped, that if the parts to the right and left of the point of impulse π (the impulse is here supposed not perpendicular to the plane AC , but in this plane) are equal and similarly placed; then the momenta round AC must balance each other, and the axis EF will have no tendency to go out of the plane $ABC b A$ perpendicular to the impulse.

Any body whose shape has these two properties will turn round an axis perpendicular to the plane which passes through the centre of gravity in the direction of the impelling force. This condition is always found in the planets when disturbed by the gravitation to a distant planet: for they are all figures of revolution. The direction of the disturbing or impelling force is always in a plane passing through the axis and the disturbing body.

With such limitations therefore we propose the following problem:

Let G (fig. 14.) be the centre of gravity of a body in free space, which is impelled by an external force f , acting in the line FP , which does not pass through the centre. Let m be the number of equal particles in the body, or its quantity of matter. Let the force f be such, that it would communicate to the body the velocity v ; that is, would cause the centre to move with the velocity v . It may be expressed by the quantity of motion which it produces, that is, by $m v$, and it would produce the velocity $m v$ on one particle. It is required to determine the whole motion, progressive and rotatory, which it will produce, and the space which it will describe during one turn round its axis.

Draw GI parallel and PGC perpendicular to FP , and let GI be taken for the measure of the progressive velocity v .

It has been demonstrated that the centre G will proceed in the direction GI with the velocity v , and that the body will at the same time turn round an axis passing through G , perpendicular to the plane of the figure, every particle describing circles in parallel planes round this axis, and with velocities of rotation proportional to their distances from it. There is therefore a certain distance GB , such that the velocity with which a particle describes its circumference is equal to the progressive velocity v . Let BCD be this circumference. When the particle describing this circumference is in the line CGP , and in that part of it which lies beyond P from G , its absolute velocity must be double that of

the centre G , but when it is in the opposite point C its retrograde velocity being equal to the progressive velocity of the centre, it must be at rest. In every position of the body, therefore, that point of the accompanying circumference which is at this extremity of the perpendicular drawn through the centre on the line of direction of the impelling force is at rest. It is at that instant a spontaneous centre of conversion, and the straight line drawn through it perpendicular to the plane of the figure is then a spontaneous axis of conversion, and every particle is in a momentary state of rotation round this axis, in directions perpendicular to the lines drawn to the axis at right angles, and with velocities proportional to these distances; and lastly, the body advances in the direction GI through a space equal to the circumference BCD , while it makes one turn round G .

Let A be one of the particles in the plane of the figure. Join AC, AG, AP . Draw $A b, A c, A d$ perpendicular to CP, CA, GA . The absolute motion $A c$ of A is compounded of the progressive motion $A b$ common to the whole body and equal to GI , and the motion $A d$ of rotation round the centre of gravity G . Therefore since $A b$ is equal to v , and $A c$ is the diagonal of a parallelogram given both in species and magnitude, it is also given, and (as appears also from the reasoning in art. 85.) it is to GI as CA to CG .

By the application of the force $m v$ in the direction FP , every particle of the body is dragged out of its place, and exerts a resistance equal to the motion which it acquires. A part of this force, which we may call $m v$, is employed in communicating the motion $A c$ to A . And, from what has been lately shown, $CG : CA = GI : A c$, and therefore $A c = \frac{v \cdot CA}{CG}$.

But farther (agreeably to what was demonstrated in art. 16.) we have $CP : CA = A c : m v$, $= \frac{v \cdot CA}{CG} : m v$,

and therefore $m v = \frac{v \cdot CA^2}{CG \cdot CP}$. Therefore the whole force employed in communicating to each particle the motion it really acquires, or $m v$, is equal to the fluent of the quantity $\frac{v \cdot CA^2}{CP \cdot CG}$, or $m v = \frac{v \cdot f \cdot CA^2}{CP \cdot CG}$ and $m \cdot CP \cdot CG = f \cdot CA^2$, which by art. 23. is equal to $f \cdot GA^2 + m \cdot CG$. Therefore we have $m \cdot CP \cdot CG - m \cdot CG = CG = f \cdot GA^2$, or $m \cdot GP \cdot CG = f \cdot GA^2$, and finally, $CG = \frac{f \cdot GA^2}{m \cdot GP}$.

Now the form of the body gives us $f \cdot GA^2$, and the position of the impelling force gives us $m \cdot GP$. Therefore we can compute the value of CG ; and if π be the periphery of a circle whose radius is unity, we have $\pi \cdot CG$ equal to the space which the body must describe in the direction GI , while it makes one rotation round its axis.

Cor. 1. The angular velocity, that is, the number of turns or the number of degrees which one of the radii will make in a given time, is proportional to the impelling force: for the length of CG depends only on the form of the body and the situation of the point of impulsion; while the time of describing π times this length is inversely as the force.

2. The angular velocity with any given force is as $\frac{GP}{CG}$;

95

96

97

98

Rotation. GP: for CG, and consequently the circumference $\pi \cdot CG$, described during one turn, is inversely as GP.

99 3. PC is equal to $\frac{\int PA^2}{m \cdot GP}$: for we have $\int PA^2 = \int GA^2 + m \cdot GP^2$. Therefore $\frac{\int PA^2}{m \cdot GP} = \frac{\int GA^2}{m \cdot GP} + \frac{m \cdot GP^2}{m \cdot GP} = CG + GP, = CP$.

100 4. If the point C is the centre of impulsion of the same body, P will be a spontaneous centre of conversion (see art. 41.).

101 5. A force equal and opposite to mv , or to f , applied at G, will stop the progressive motion, but will make no change in the rotation; but if it be applied at P, it will stop all motion both progressive and rotatory. If applied between P and G, it will stop the progressive motion, but will leave some motion of rotation. If applied beyond P it will leave a rotation in the opposite direction. If applied beyond G, or between G and C, it will increase the rotation. All this will be easily conceived by reflecting on its effect on the body at rest.

102 6. A whirling body which has no progressive motion cannot have been brought into this state by the action of a single force. It may have been put into this condition by the simultaneous operation of two equal and opposite forces. The equality and opposition of the forces is necessary for stopping all progressive motion. If one of them has acted at the centre, the rotatory motion has been the effect of the other only. If they have acted on opposite sides, they conspired with each other in producing the rotation; but have opposed each other if they acted on opposite sides.

In like manner, it is plain that a motion of rotation, together with a progressive motion of the centre in the direction of the axis, could not have been produced by the action of a single force.

103 7. When the space S which a body describes during one rotation has been observed, we can discover the point of impulse by which a single force may have acted in producing both the motions of progression and rotation: for $CG = \frac{S}{\pi}$, and $GP = \frac{\int GA^2}{m \cdot CG} = \frac{\pi \int GA^2}{m \cdot S}$.

In this manner we can tell the distances from the centre at which the sun and planets may have received the single impulses which gave them both their motions of revolution in their orbits and rotation round their axes.

104 Application of this doctrine to the heavenly motions.

It was found (art. 40. f) that the distance OG of the centre of oscillation or percussion of a sphere swinging round the fixed point C from its centre G, is $\frac{2}{3}$ of the third proportional to CG, and the radius of the sphere, or that $OG = \frac{2}{3} \frac{RG^2}{CG}$. Supposing the planets to be homogeneous and spherical, and calling the radius of the planet r , and the radius of its orbit R, the time of a rotation round its axis, t and the time of a revolution in its orbit T, and making 1 : π the ratio of radius to the periphery of a circle, we shall have πR for the circumference of the orbit, and $\pi R \frac{t}{T}$ for

the arch of this circumference described during one rotation round the axis. This is S in the above-mentioned formula. Then, diminishing this in the ratio of the circumference to radius, we obtain $CG = R \frac{t}{T}$,

and $OG = \frac{2}{3} \frac{r^2}{CG} = \frac{2}{3} \frac{T r^2}{t R}$. This is equivalent to $\frac{\pi \int GA^2}{m \cdot S}$, and easier obtained.

This gives us G v

For the Earth	=	$\frac{r}{157}$	} nearly.
Moon		$\frac{r}{555}$	
Mars		$\frac{r}{195}$	
Jupiter		$\frac{r}{2.8125}$	
Saturn		$\frac{r}{2.588}$	

We have not data for determining this for the sun. But the very circumstance of his having a rotation in 27 d. 7 h. 47 m. makes it very probable that he, with all his attending planets, is also moved forward in the celestial spaces, perhaps round some centre of still more general and extensive gravitation: for the perfect opposition and equality of two forces, necessary for giving a rotation without a progressive motion, has the odds against it of infinity to unity. This corroborates the conjectures of philosophers, and the observations of Herschel and other astronomers, who think that the solar system is approaching to that quarter of the heavens in which the constellation Aquila is situated.

8. As in the communication of progressive motion among bodies, the same quantity of motion is preserved before and after collision, so in the communication of rotation among whirling bodies the quantity of rotatory momentum is preserved. This appears from the general tenor of our formulæ: for if we suppose a body turning round an axis passing through its centre, without any progressive motion, we must suppose that the force mv , which put it in motion, has been opposed by an equal and opposite force. Let this be supposed to have acted on the centre. Then the whole rotation has been the effect of the other acting at some distance GP from the centre. Its momentum is $m v \cdot GP$. Had it acted alone, it would have produced a rotation compounded with a progressive motion of the centre with the velocity v ; and the body acquires a momentary spontaneous axis of conversion at the distance GC from the centre of gravity. The absolute velocity AC of any particle is $\frac{v \cdot AC}{CG}$; its momentum is $\frac{v \cdot AC^2}{GC}$, and the sum of all the momenta is $\int \frac{v \cdot AC^2}{CG}$, or $\frac{v \int AC^2}{CG}$, and this is equal to $m v \cdot GP$. But when the

progressive motion is stopped, A b, which was a constituent of the absolute motion of A, is annihilated, and nothing remains but the motion A d of rotation round G. But the triangles d A c and G A C were demonstrated

strated (N^o 31.) to be similar; and therefore AC: Ad = CA: GA. Therefore the absolute velocity of the particle, while turning round the quiescent centre of gravity G, is $\frac{v \cdot GA}{GC}$; its momentum is $\frac{v \cdot GA^2}{GC}$; the

sum of all the momenta is $\frac{v \int GA}{GC}$; and this is still

equal to $m v$. Observe, that now GC is not the distance of the centre of conversion from the centre of gravity, because there is now no such thing as the spontaneous axis of conversion, or rather it coincides with the axis of rotation. GC is the distance from the centre of a particle whose velocity of rotation is equal to v .

Now let the body be changed, either by a new distribution of its parts, or by an addition or abstraction of matter, or by both; and let the same force $m v$ act at the same distance GP from the centre. We shall still have $m v \cdot GP = \frac{v \int GA^2}{GC}$; and therefore the sum

of the momenta of the particles of the whirling body is still the same, viz. equal to the momentum of the force $m v$ acting by the lever GP. If therefore a free body has been turning round its centre of gravity, and has the distribution of its parts suddenly changed (the centre however remaining in the same place), or has a quantity of matter suddenly added or taken away, it will turn with such an angular velocity that the sum of the momenta is the same as before.

We have been so particular on this subject, because it affects the celebrated problem of the precession of the equinoxes; and Sir Isaac Newton's solution of it is erroneous on account of his mistake in this particular. He computes the velocity with which a quantity of matter equal to the excess of the terrestrial spheroid over the inscribed sphere would perform its librations if detached from the spherical nucleus. He then supposes it suddenly to adhere to the sphere, and to drag it into the same libratory motion; and he computes the libration of the whole mass, upon the supposition that the quantity of motion in the libratory spheroid is the same with the previous quantity of motion of the librating redundant ring or shell; whereas he should have computed it on the supposition that it was the quantity of momenta that remained unchanged.

The same thing obtains in rotations round fixed axes, as appears by the perfect sameness of the formulæ for both classes of motions.

This law, which, in imitation of the Leibnitzians, we might call the *conservatio momentorum*, makes it of importance to have expressions of the value of the accumulated momenta in such cases as most frequently occur. The most frequent is that of a sphere or spheroid in rotation round an axis or an equatorial diameter; and a knowledge of it is necessary for the solution of the problem of the precession of the equinoxes. See PRECESSION, N^o 33.

Let AP $a p$ (fig. 15.) be a sphere turning round the diameter P p , and let DD', dd' be two circles parallel to the equator A a , very near each other, comprehending between them an elementary slice of the sphere. Let CA be = a , CB = x , and BD = y , and let π be the circumference of a circle whose radius is 1. Lastly, let the velocity of the point A be v . Then

$v \frac{y}{a}$ is the velocity at the distance y from the axis, πy

is the quantity of matter in the circumference whose radius is y ; for it is the length of that circumference when expanded.

$\frac{v \pi y^2}{a}$, or $\frac{v y}{a} \times \pi y$, is the quantity of motion in this

circumference turning round the axis P p .

$\frac{v \pi y^3}{a}$ is the momentum of the same circumference.

$\frac{v \pi y^3 y}{a}$ is the fluxion of the momentum of the circle

whose radius is y , turning in its own plane round the axis.

$\frac{v \pi y^4}{4a}$ is the fluent, or the momentum of the whole

circle; and therefore it is the momentum of the circle DD'.

$\frac{v \pi y^4 \dot{x}}{4a}$ is the fluxion of the momentum of the he-

misphere; for Bb = \dot{x} , and this fraction is the momentum of the slice $d D D' d'$.

$y^2 = a^2 - x^2$, and $y^4 = a^4 - 2 a^2 x^2 + x^4$. There-

fore $\frac{v \pi}{2a} \times (a^4 x - 2 a^2 x^3 + x^5)$ is the fluxion of the

momentum of the whole sphere. Of this the fluent

for the segments whose heights are CB, or x , is $\frac{v \pi}{2a}$

$$(a^4 x - \frac{2a^2 x^3}{3} + \frac{x^5}{5})$$

Let x become a , and we have for the momentum of

the whole sphere $\frac{v \pi}{2a} (a^5 - \frac{2}{3} a^5 + \frac{1}{5} a^5) = v \pi (\frac{a^4}{2} -$

$$\frac{a^4}{3} + \frac{a^4}{10}) = v \pi \frac{4}{15} a^4.$$

Let us suppose that this rotation has been produced

by the action of a force $m u$; that is, a force which

would communicate the velocity u to the whole matter

of the sphere, had it acted in a direction passing through

its centre; and let us suppose that this force acted on

the equatorial point A at right angles to AC: its momentum is $m u a$, and this is equal to $v \pi \frac{4}{15} a^4$. Also,

we know that $m = \frac{2}{3} \pi a^3$. Therefore we have $u \cdot \frac{2}{3} \pi a^4 = v \frac{4}{15} \pi a^4$, $\frac{2}{3} u = \frac{4}{15} v$, and $v = \frac{5}{2} u$.

Let EPQ p be an oblate spheroid whose semi-axis

PC is a , and equatorial radius EC is b , and let v be the

velocity on the equator of the inscribed sphere. Then

since the momentum of the whirling circle DD is $\frac{v \pi y^4}{4a}$, the momenta of the sphere and spheroid are in

the quadruplicate ratio of their equatorial radii; and therefore that of the whole spheroid is $\frac{4}{15} \pi b^4 v$. And if w be the velocity at E corresponding to the velocity

v at A, so that $w = \frac{b}{a} v$, we have the momentum of

the spheroid, expressed in terms of the equatorial velocity at the surface, $\frac{4}{15} b^3 a w$.

If the same force $m u$ be made to act in the same manner

109

110

111

Rotation.

manner at E, its momentum $m u b$ is $= \frac{4}{15} b^3 a w$, and

$$v = \frac{15 m u}{4 \pi b^2 a}$$
 Therefore the angular velocities $\frac{u}{a}$, $\frac{v}{b}$,

which the same force $m u$ acting at A or E will produce
 in the sphere and the spheroid, are as $\frac{15 m u}{4 \pi a^4}$ and $\frac{15 m v}{4 b^3 a}$

that is, in the triplicate ratio of the equatorial diameter
 b to the polar axis a .

112

Lastly, if the oblate spheroid is made to turn round
 an equatorial diameter passing through C perpendicular
 to the plane of the figure, it is plain that every section
 parallel to the meridian E P Q p is an ellipse similar to
 this meridian. If this ellipse differs very little from the
 inscribed circle, as is the case of the earth in the problem
 of the precession of the equinoxes, the momentum of
 each ellipse may be considered as equal to that of a circle
 of the same area, or whose diameter is a mean propor-
 tional between the equatorial and polar diameters of the
 spheroid. This radius is to the radius of the circum-
 scribed circle as $\sqrt{b a}$ to b . Therefore the momenta
 of the section of the spheroid and of the circumscribed
 sphere are in the constant ratio of $b^2 a^2$ to b^4 ; or of a^2
 to b^2 . And if the velocity in the equator of this cir-
 cumscribed sphere be called w , the momentum of the
 sphere is $\frac{4}{15} \pi b^4 w$; and therefore that of the spheroid
 is $\frac{4}{15} \pi b^4 w$, agreeably to what was assumed in the
 article PRECESSION, N^o 33.

This value of the momentum of a spheroid round an
 equatorial diameter is only a very easy approximation;
 an exact value may be obtained by an infinite series.
 The whole matter of the spheroid may be considered as
 uniformly distributed on the surface of a similar spheroid
 whose diameter is $= \sqrt{\frac{1}{2}}$ of the diameter of the spheroid.
 It will have the same momentum, because a triangle in
 one of the ellipses, having an elementary arch of the
 circumference for its base, and the centre of the ellipse
 for its vertex, has its centre of gyration distant
 from the vertex $\sqrt{\frac{1}{2}}$ the length of the radius of the
 ellipse, and the problem is reduced to the finding the
 sum of all these lines. But even when the series for
 this sum involves the 3d power of the eccentricity, it is
 not more exact than the above approximation.

A similar proposition may be obtained for a prolate
 spheroid vibrating round an equatorial diameter, and
 applied to the conjectural shape of the moon, for ex-
 plaining her oscillations.

The reader must have observed that the preceding
 disquisitions refer to those motions only which result
 from the action of external forces and to the state of
 incipient motion. All circular motions, such as those
 of rotation, are accompanied by centrifugal forces. A
 central force is necessary for retaining every particle in
 its circular path; such forces must therefore be excited
 in the body, and can arise only from the forces of co-
 hesion by which its particles are held together. These
 forces are mutual, equal, and opposite; and as much as
 a particle A (fig. 5.) is retained by a force in the di-
 rection A a of the line which connects it with the fixed
 axis D d , or in the direction AG (fig. 10.), which
 connects it with the progressive axis; so much must the
 point a of the axis D d be urged in the opposite direc-
 tion $a A$, or so much must the whole body be urged in
 the direction GA. Every point therefore of the axis

D d , or of the axis through G in fig. 10. is carried in
 a variety of directions perpendicular to itself. These
 forces may or may not balance each other. If this bal-
 ance obtains with respect to the fixed axis, its supports
 will sustain no pressure but what arises from the external
 force: if not one support will be more pressed than the
 other; and if both were removed, the axis would change
 its position. The same must be affirmed of the axis
 through G in fig. 10. This, having no support, must
 change its position.

And thus it may happen, that the axis of rotation
 passing through G which has been determined by the
 preceding disquisitions, is not permanent either in re-
 spect of the body, or in respect of absolute space. These
 two rotations are essentially different. The way to con-
 ceive both is this. Suppose a spherical surface describ-
 ed round the body, having its centre in the centre of
 gravity; and suppose this surface to revolve and to pro-
 ceed forward along with the body: in short, let it be
 conceived as an immaterial surface attached to the body.
 The axis of rotation will pass through this surface in
 two points which we shall call its poles. Now, we say
 that the axis is permanent with respect to the body
 when it has always the same poles in this spherical sur-
 face. Suppose another spherical surface described round
 the same centre, and that this surface also accompanies
 the body in all its progressive motion, but does not turn
 with it. The axis is permanent with respect to abso-
 lute space when it has always the same poles in this sur-
 face: it is evident that these two facts are not insepa-
 rable. A boy's top spins on the same point and the
 same corporeal axis, while, towards the end of its mo-
 tion, we observe it directing this round and round to
 different quarters of the room. And when we make
 an egg or a lemon spin with great rapidity on its side
 on a level table, we see it gradually rise up, till it stand
 quite on end, spinning all the while round an axis point-
 ing to the zenith.

This change in the position of the axis is produced
 by the unbalanced actions of the centrifugal forces ex-
 erted by the particles. Suppose two equal balls A and
 B (fig. 16) connected by an inflexible rod whose middle
 point is G, the centre of gravity of the balls. This
 system may be made to turn round the material axis D d ,
 A describing the circle AEFA, and B describing the
 circle BHKB. The rod AB may also be conceived
 as moveable round the point G by means of a pin at
 right angles to the axis. Suppose the balls passing
 through the situations A and B; their centrifugal forces
 urge them at the same time in the directions CA and
 OB, which impulsions conspire to make the connecting
 rod recede from both ends of the axis D d . And thus
 the balls, instead of describing parallel circles round this
 axis, will describe parallel spirals, gradually opening the
 angles DGA, d GB more and more, till the balls ac-
 quire the position $\alpha \beta$ at right angles to the axis. They
 will not stop there, for each came into that position
 with an oblique motion. They will pass it; and were
 it not for the resistance of the air and the friction of
 the joint at G, they would go on till the ball A came
 to describe the circle BHK, and the ball B to describe
 the circle AEF. The centrifugal forces will now have
 exhausted by opposition all the motions which they had
 acquired during their passage from the position AB to
 the position $\alpha \beta$; and now they will again describe spirals

P. Frisi's
theorem.
Fig. 17.

ration. rals gradually opening, and then contracting, till the balls arrive at their original position A B, when the process will begin again. Thus they will continue a kind of oscillating rotation.

16 Thus the axis is continually changing with respect to the system of balls; but it is fixed in respect to absolute space, because the axis D d is supported. It does not yet appear that it has any tendency to change its position, because the centrifugal tendency of the balls is completely yielded to by the joint at G. The material axis has indeed sustained no change; but the real axis, or mathematical line round which the rotation was going on every moment, has been continually shifting its place. This is not so obvious, and requires a more attentive consideration. To show accurately the gradual change of position of the real axis of rotation would require a long discussion. We shall content ourselves with exhibiting a case where the position of the momentary axis is unquestionably different from D d, which we may suppose horizontal.

Take the balls in the position $\alpha\beta$. They came into this position with a spiral motion, and therefore each of them was moving obliquely to the tangents $\alpha\phi, \beta\gamma$ to the circle $\alpha\delta\beta\epsilon$, suppose in the directions $\alpha\theta, \beta\lambda$. They are therefore moving round the centre G in a plane $\theta\alpha\beta\lambda$, inclined to the plane $\phi\alpha\beta\gamma$ of the circle $\alpha\delta\beta\epsilon$. The momentary axis of rotation is therefore perpendicular to this oblique plane, and therefore does not coincide with D d.

117 the eva-
on of
axis. We cannot enter upon the investigation of this evagation of the axis, although the subject is both curious and important to the speculative mathematicians. A knowledge of it is absolutely necessary to a complete solution of the great problem of the precession. But when treating that article, we contented ourselves with showing that the evagation which obtains in this natural phenomenon is so exceedingly minute, that although multiplied many thousands of times, it would escape the nicest observation of modern astronomers; and that it is a thing which does not accumulate beyond a certain limit, much too small for observation, and then diminishes again, and is periodical. Euler, D'Alembert, Frisi, and De la Grange, have shown the momentary position of the real variable axis corresponding to any given time; and Landen has with great ingenuity and elegance connected these momentary positions, and given the whole paths of evagation. Mr Segnor was, we believe, the first who showed (in a Dissertation *De Motu Turbinum*, Halle, 1755), that in every body there were at least three lines passing through the centre of gravity at right angles to each other, forming the solid angle of a cube, round which the centrifugal forces were accurately balanced, and therefore a rotation begun round either of these three lines would be continued, and they are permanent axes of rotation. Albert Euler gave the first demonstration in 1760, and since that time the investigation of these axes has been extended and improved by the different authors already named. It is an exceedingly difficult subject; and we recommend the synthetical investigation by Frisi in his *Cosmographia* as the fittest for instructing a curious reader to whom the subject is new. We shall conclude this dissertation with a beautiful theorem, the enunciation of which we owe to P. Frisi, which has amazingly improved the whole theory, and gives easy and elegant

solutions of the most difficult problems. It is analogous to the great theorem of the composition of motions and forces.

If a body turn round an axis AG a (fig. 17.) passing through its centre of gravity G with the angular velocity a, while this axis is carried round another axis BG b with the angular velocity b, and if GD be taken to GK as a to b (the points B and E being taken on that side of the centre where they are moving towards the same side of the plane of the figure), and the line DE be drawn, then the whole and every particle of the body will be in a state of rotation round a third axis CG c, lying in the plane of the other two, and parallel to DE, and the angular velocity c round this axis will be to a and to b as DE is to GN and to GE.

For, let P be any particle of the body, and suppose a spherical surface to be described round G passing through P. Draw PR perpendicular to the plane of the figure. It is evident that PR is the common section of the circle of rotation $\dot{P}P$ i round the axis A a, and the circle KP k of rotation round the axis B b. Let I i, K k be the diameters of these circles of rotation, F and G their centres. Draw the radii PF and PO, and the tangents PM and PN. These tangents are in a plane MPN which touches the sphere in P, and cuts the plane of the axis in a line MN, to which a line drawn from the centre G of the sphere through the point R is perpendicular. Let PN represent the velocity of rotation of the point P round the axis B b, and P f its velocity of rotation round A a. Complete the parallelogram PN t f. Then P t is the direction and velocity of motion resulting from the composition of PN and P f. P t is in the plane MPN, because the diagonal of a parallelogram is in the plane of its sides PN and P f.

Let perpendiculars f F, t T, be drawn to the plane of the axes, and the parallelogram PN t f will be orthographically projected on that plane, its projection being a parallelogram RN t F. (F here falls on the centre by accident). Draw the diagonal RT. It is evident that the plane PR t T is perpendicular to the plane of the two axes, because PR is so. Therefore the compound motion P t is in the plane of a circle of revolution round some axis situated in the plane of the other two. Therefore produce TR, and draw GC cutting it at right angles in H, and let L P l be the circle, and PH a radius. P t is therefore a tangent, and perpendicular to PH, and will meet RT in some point Q of the line MN. The particle P is in a state of rotation round the axis CG c, and its velocity is to the velocities round A a or B b as P t to P f or PN. The triangle PRN and OPN are similar. For PN the tangent is perpendicular to the radius OP, and PR is perpendicular to ON. Therefore $OP : PN = PR : RN$, and $RN = \frac{PR \cdot PN}{OP}$.

But the velocity of P round the axis B b is OP b. Therefore $RN = \frac{PR \cdot OP \cdot b}{OP} = PR \cdot b$. In like manner $RF = PR \cdot a$. Therefore $RF : RN = a : b = GD : GE$. But $NT : RN = \text{sine NRT} : \text{sine NTR}$, and $GD : GE = \text{sine GED} : \text{sine GDE}$. Therefore $\text{sine NRT} : \text{sine NTR} = \text{sine GED} : \text{sine GDE}$. But $RNT = EGD$, for NR is perpendicular to EG and NT (being parallel

Rotation. to $1F$) is perpendicular to DG . Therefore TR is perpendicular to ED , and Cc is parallel to ED , and the rotation of the particle P is round an axis parallel to ED .

And since RN , RF , RT , are as the velocities b , a , c , round these different axes, and are proportional to EG , DG , DE , we have c to a or to b as ED to GD or GE , and the proposition is demonstrated.

119
Expressed
in general
terms.

This theorem may be thus expressed in general terms. If a body revolves round an axis passing through its centre of gravity with the angular velocity a , while this axis is carried round another axis, also passing through its centre of gravity, with the angular velocity b , these two motions compose a motion of every particle of the body round a third axis, lying in the plane of the other two, and inclined to each of the former axes in angles whose sines are inversely as the angular velocities round them; and the angular velocity round this new axis is to that round one of the primitive axes as the sine of inclination of the two primitive axes is to the sine of the inclination of the new axis to the other primitive axis.

When we say that we owe the enunciation of this theorem to P. Frisi, we grant at the same time that something like it has been supposed or assumed by other authors. Newton seems to have considered it as true, and even evident, in homogeneous spheres; and this has been tacitly acquiesced in by the authors who followed him in the problem of the precession. Inferior writers have carelessly assumed it as a truth. Thus Nollet, Gravesande, and others, in their contrivances for exhibiting experiments for illustrating the composition of vortices, proceeded on this assumption. Even authors of more scrupulous research have satisfied themselves with a very imperfect proof. Thus Mr Landen, in his excellent dissertation on rotatory motion, Philosophical Transactions, Vol. lxxvii. contents himself with showing, that by the equality and opposite directions of the motions round the axes Aa and Bb , the point C will be at rest, and from thence concludes that CGc will be the new axis of rotation. But this is exceedingly hasty (note also, that this dissertation was many years posterior to that of P. Frisi): For although the separate motions of the point C may be equal and opposite, it is by no means either a mathematical or a mechanical consequence that the body will turn round the axis Cc . In order that the point C may remain at rest, it is necessary that all tendencies to motion be annihilated: this is not even thought of in making the assumption. Frisi has shown, that in the motion of every particle round the axis Cc , there is involved a motion round the two axes Aa and Bb , with the velocities a and b ; and it is a consequence of this, and of this only, that the impulses which would separately produce the rotations of every particle round Aa and Bb will, either in succession or in conjunction, produce a rotation round Cc . Moreover, Mr Landen's not having attended to this, has led him, as we imagine, into a mistake respecting the velocity with which the axis changes its position; and though his process exhibits the path of evagation with accuracy, we apprehend that it does not assign the true times of the axes arriving at particular points of this path.

120
Conclusions
deduced
from this
proposition.

It follows from this proposition, that if every particle of a body, whether solid or fluid, receives in one instant a separate impulse, competent to the production of a motion of the particle round an axis with a cer-

tain angular velocity, and another impulse competent to the production of a motion round another axis with a certain velocity, the combined effect of all these impulses will be a motion of the whole system round a third axis given in position, with an angular velocity which is also given: and this motion will obtain without any separation or disunion of parts; for we see that a motion round two axes constitutes a motion round a third axis in every particle, and no separation would take place although the system were incoherent like a mass of sand, except by the action of the centrifugal forces arising from rotation. Mr Simpson therefore erred in his solution of the problem of the precession, by supposing another force necessary for enabling the particles of the fluid spheroid to accompany the equator when displaced from its former situation. The very force which makes the displacement produces the accompaniment, as far as it obtains, which we shall see presently is not to the extent that Mr Simpson and other authors who treat this problem have supposed.

For the same reason, if a body be turning round any axis, and every particle in one instant get an impulse precisely such as is competent to produce a given angular velocity round another axis, the body will turn round a third axis given in position, with a given angular velocity: for it is indifferent (as it is in the ordinary composition of motion) whether the forces act on a particle at once or in succession. The final motion is the same both in respect of direction and velocity.

Lastly, when a rigid body acquires a rotation round an axis by the action of an impulse on one part of it, and at the same time, or afterwards, gets an impulse on any part which, alone, would have produced a certain rotation round another axis, the effect of the combined actions will be a rotation round a third axis, in terms of this proposition; for when a rigid body acquires a motion round an axis, not by the simultaneous impulse of the precisely competent force on each particle, but by an impulse on one part, *there has been propagated to every particle* (by means of the connecting forces) an impulse precisely competent to produce the motion which the particle really acquires; and when a rigid body, already turning round an axis Aa (fig. 17.), receives an impulse which makes it actually turn round another axis Cc there *has been propagated to each particle* a force precisely competent to produce, not the motion, but the *change* of motion which takes place in that particle, that is, a force which, when compounded with the inherent force of its primitive motion, produces the new motion; that is (by this theorem), a force which alone would have caused it to turn round a third axis Bb , with a rotation making the other constituent of the actual rotation round Cc .

This must be considered as one of the most important propositions in dynamics, and gives a great extension to the doctrine of the composition of motion. We see that rotations are compounded in the same manner as other motions, and it is extremely easy to discover the composition. We have only to suppose a sphere described round the centre of the body; and the equator of this sphere corresponding to any primitive position of the axis of rotation gives us the direction and velocity of the particles situated in it. Let another great circle cut this equator in any point; it will be the equator of another rotation. Set off an arch of each from the

point

Rotation. point of intersection, proportional to the angular velocity of each rotation, and complete the spherical parallelogram. The great circle, which is the diagonal of this parallelogram, will be the equator of the rotation, which is actually compounded of the other two.

124 And thus may any two rotations be compounded. We have given an instance of this in the solution of the problem of the *PRECESSION of the Equinoxes*.

125 It appears plainly in the demonstration of this theorem that the axis *Cc* is a new line in the body. The change of rotation is not accomplished by a transference of the poles and equator of the former rotation to a new situation, in which they are again the poles and equator of the rotation; for we see that in the rotation round the axis *Cc*, the particle of the body which was formerly the pole *A* is describing a circle round the axis *Cc*. Not knowing this composition of rotations, Newton, Walmsley, Simpson, and other celebrated mathematicians, imagined, that the axis of the earth's rotation remained the same, but changed its position. In this they were confirmed by the constancy of the observed latitudes of places on the surface of the earth. But the axis of the earth's rotation really changes its place, and the poles shift through different points of its surface; but these different points are too near each other to make the change sensible to the nicest observation.

126 respecting the position of the axis of rotation. It would seem to result from these observations, that it is impossible that the axis of rotation can change its position in absolute space without changing its position in the body, contrary to what we experience in a thousand familiar instances; and indeed this is impossible by any one change. We cannot by the impulse of any one force make a body which is turning round the axis *Aa* change its position and turn round the same material axis brought into the position *Cc*. In the same way that a body must pass through a series of intermediate points, in going from one end of a line to the other, so it must acquire an infinite series of intermediate rotations (each of them momentary) before the same material axis passes into another position, so as to become an axis of rotation. A momentary impulse may make a great change of the position of the axis of rotation, as it may make in the velocity of a rectilineal motion. Thus although the rotation round *Aa* be indefinitely small, if another equally small rotation be impressed round an axis *Bb* perpendicular to *Aa*, the axis will at once shift to *Cc* half way between them; but a succession of rotations is necessary for carrying the primitive material axis into a new position, where it is again an axis. This transference, however, is possible, but gradual, and must be accomplished by a continuation of impulses totally different from what we would at first suppose. In order that *A* may pass from *A* to *C*, it is not enough that it gets an impulse in the direction *AC*. Such an impulse would carry it thither, if the body had not been whirling round *Aa* by the mere perseverance of matter in its state of motion; but when the body is already whirling round *Aa*, the particles in the circle *IPi* are moving in the circumference of that circle; and since that circle also partakes of the motion given to *A*, every particle in it must be incessantly deflected from the path in which it is moving. The continual agency of a force is therefore necessary for this purpose; and if this force be discontinued, the point

A will immediately quit the plane of the arch *AC*, along which we are endeavouring to move it, and will start up.

This is the theorem which we formerly said would enable us to overcome the difficulties in the investigation of the axis of rotation.

Thus we can discover what Mr Landen calls the evagations of the poles of rotation by the action of centrifugal forces: For in fig. 16. the known velocity of the ball *A* and the radius *AC* of its circle of rotation will give us the centrifugal force by which the balls tend to turn in the plane *DA**BD*. This gives the axis *Dd* a tendency to move in a plane perpendicular to the plane of the figure; and its separation from the poles *D* and *d* does not depend on the separation of the connecting rod *AB* from its present inclination to *Dd*, but on the angle which the spiral path of the ball makes with the plane of a circle of rotation round *Dd*. The distance of the new poles from *D* and *d* is an arch of a circle which measures the angle made by the spiral with the circle of rotation round the primitive axis. This will gradually increase, and the mathematical axis of rotation will be describing a spiral round *D* and *d*, gradually separating from these points, and again approaching them, and coinciding with them again, at the time that the balls themselves are most of all removed from their primitive situation, namely, when *A* is in the place of *B*.

The same theorem also enables us to find the incipient axis of rotation in the complicated cases which are almost inaccessible by means of the elementary principles of rotation.

Thus, when the centres of oscillation and percussion do not coincide, as we supposed in fig. 5. and 12. Suppose, first, that they do coincide, and find the position of the axis *ab*, and the angular velocity of the rotation. Then find the centre of percussion, the axis *Pp*, and the momentum round it, and the angular velocity which this momentum would produce. Thus we have obtained two rotations round given axes, and with given angular velocities. Compound these rotations by this theorem, and we obtain the required position of the true incipient axis of rotation, and the angular velocity, without the intricate process which would otherwise have been necessary.

If the body is of such a shape, that the forces in the plane *DCG* do not balance each other, we shall then discover a momentum round an axis perpendicular to this plane. Compound this rotation in the same manner with the rotation round *Dd*.

And from this simple view of the matter we learn (what would be difficult to discover in the other way), that when the centre of percussion does not coincide with that of rotation, the axis is in the plane *DC*, though not perpendicular to *PG*. But when there is a momentum round an axis perpendicular to this plane, the incipient axis of rotation is neither perpendicular to *PC*, nor in a plane perpendicular to that passing through the centre in the direction of the impelling force.

We must content ourselves with merely pointing out these tracts of investigation to the curious reader, and recommending the cultivation of this most fruitful theorem of Father Frisi.

These are by no means speculations of mere curiosity, interesting to none but mathematicians: the noblest art

133 Concluding remarks on scamanship which

Rotation
||
Rotondo.

which is practised by man must receive great improvement from a complete knowledge of this subject. We mean the art of SEAMANSHIP. A ship, the most admirable of machines, must be considered as a body in free space, impelled by the winds and waters, and continually moved round spontaneous axes of conversion, and incessantly checked in these movements. The trimming of the sails, the action of the rudder, the very disposition of the loading, all affect her versatility. An experienced seaman knows by habit how to produce and facilitate these motions, and to check or stop such as are inconvenient. Experience, without any reflection or knowledge how and why, informs him what position of the rudder produces a deviation from the course. A sort of common sense tells him, that, in order to make the ship turn her head away from the wind, he must increase the surface or the obliquity of the head sails, and diminish the power of the sails near the stern. A few other operations are dictated to him by this kind of common sense; but few, even of old seamen, can tell why a ship has such a tendency to bring her head up in the wind, and why it is so necessary to crowd the fore part of the ship with sails; fewer still know that a certain shifting of the loading will facilitate some motions in different cases; that the crew of a great ship running suddenly to a particular place shall enable the ship to accomplish a movement in a stormy sea which could not be done otherwise; and perhaps not one in

ten thousand can tell why this procedure will be successful. But the mathematical inquirer will see all this; and it would be a most valuable acquisition to the public, to have a manual of such propositions, deduced from a careful and judicious consideration of the circumstances, and freed from that great complication and intricacy which only the learned can unravel, and expressed in a familiar manner, clothed with such reasoning as will be intelligible to the unlearned; and though not accurate, yet persuasive. Mr Bouguer, in his *Traité du Navire*, and in his *Manceuvre des Vaisseaux*, has delivered a great deal of useful information on this subject; and Mr Bezout has made a very useful abstract of these works in his *Cours de Mathématique*. But the subject is left by them in a form far too abstruse to be of any general use: and it is unfortunately so combined with or founded on a false theory of the action and resistance of fluids, that many of the propositions are totally inconsistent with experience, and many maxims of seamanship are false. This has occasioned these doctrines to be neglected altogether. Few of our professional seamen have the preparatory knowledge necessary for improving the science; but it would be a work of immense utility, and would require great reputation to the person who successfully prosecutes it.

We shall mention under the article SEAMANSHIP the chief problems, and point out the mechanical principles by which they may be solved.

ROTHERAM, a town in the west riding of Yorkshire, seated on the river Don, near which there is a handsome stone-bridge. It is a well-built place, and the market is large for provisions. W. Long. 1. 10. N. Lat. 53. 25.

ROTHSAY, a town in the isle and county of Bute, in Scotland. It is the capital of the county, is a well-built town of small houses, contains above 5000 inhabitants, and is within these few years much improved. It has a good pier, and is seated at the bottom of a fine bay, whose mouth lies exactly opposite to Loch Steven in Cowal. Here is a fine depth of water, a secure retreat, and a ready navigation down the frith for an export trade. Magazines of goods for foreign parts might be most advantageously erected here. The spinning of yarn has been long carried on in Rothsay, and lately the cotton manufacture has been introduced. The herring fishery has been also long a great source of trade in this place. W. Long. 4. 45. N. Lat. 55. 50.

Rothsay gives to the prince of Scotland the title of Duke, which was formerly accompanied with suitable revenues, powers, and privileges. It was bestowed on the prince in 1398, when John of Gaunt, who is styled John Duke of Aquitaine and Lancaster, uncle to the king of England, and David, who was previously styled earl of Carrick, eldest son of the king of Scotland, met for the purpose of settling the borders, and terminating all matters in dispute. In this way it is supposed the title of Duke was introduced into Scotland.

ROTTBOELLIA, a genus of plants belonging to the triandria class. See *BOTANY Index*.

ROTONDO, or **ROTUNDO**, in *Architecture*, an ap-

pellation given to any building that is round both within and without; whether it be a church, a saloon, or the like. The most celebrated rotundo of the ancients is the pantheon at Rome. See *PANTHEON*.

ROTTEN-STONE, a mineral found in Derbyshire, and used by mechanics for all sorts of finer grinding and polishing, and sometimes for cutting stones. According to Ferber, it is a tripoli mixed with calcareous earth.

ROTTENNESS. See *PUTREFACTION*.

ROTTERDAM, is a city in the province of Holland, in E. Long. 4. 25. N. Lat. 51. 55. situated on the north bank of the river Maese, about 37 miles south of Amsterdam, nine south-east of the Hague, and 15 to the eastward of Briel. It is a large and populous city, of a triangular figure, handsomely built of brick, the streets wide and well paved. There are ten gates to the town, six of which are at the land side and four at the side of the Maese. It is supposed to take its name from the *Roter*, or *Rotter*, a little river that falls into the canals of this city, and from *Dam*, a dike. It is uncertain when it was first built; and though it is supposed to be very ancient, yet we find no mention made of it before the 13th century. In the year 1270 it was surrounded with ramparts, and honoured with several privileges; but 27 years after it was taken by the Flemings. In the year 1418, Brederode chief of the Haeks made himself master of it; since which time it has continued yearly to increase by means of the conveniency of its harbour. Its arms are vert, a pale argent, quarterly in a chief on the first and third, or, a lion spotted sable, on the second and fourth a lion spotted gules.

Rotterdam is not reckoned one of the principal cities

Roths
||
Rotterd

ties of the province, because it has not been always in its present flourishing condition. The Dutch call it the first of the second rank, whereas it ought to be esteemed the second of the first, being, next to Amsterdam, the most trading town in the United Provinces. Its port is very commodious; for the canals, which run through most parts of the town, bring the ships, some of 200 or 300 tons, up to the merchant's door; a conveniency for loading and unloading which is not to be found in other places. The great ships go up into the middle of the town by the canal into which the Maese enters by the old head, as it comes out by the new. A stranger, upon his first entering this place, is astonished at the beautiful confusion of chimneys intermixed with tops of trees with which the canals are planted, and streamers of vessels; insomuch that he can hardly tell whether it be fleet, city, or forest. The Haring Vliet is a very fine street; most of the houses are new, and built of hewn stone; but the grandest as well as most agreeable street in Rotterdam is the Bomb Quay, which lies parallel with the Maese; on one side it is open to the river, and the other is ornamented with a grand façade of the best houses in the city, inhabited chiefly by the English; they are five or six stories high, massy and very clumsy: wherever there is any attempt at ornament, it is the worst that can be conceived. One sees no Grecian architecture, except Doric entablatures, stuck upon the top of the upper story, without pilasters; Ionic volutes, turned often the wrong way, and an attempt at Corinthian capitals, without any other part of the order. The doors are large, and stuck with great knobs and clumsy carving; you ascend to them, not in front, but by three or four steps going up on each side, and you are assisted by iron rails of a most immense thickness. These houses are almost all window; and the window shutters and frames being painted green, the glass has all a green cast, which is helped by the reflection from the trees that overshadow their houses, which, were it not for this circumstance, would be intolerably hot, from their vicinity to the canals. Most of the houses have looking glasses placed on the outsides of the windows, on both sides, in order that they may see every thing which passes up and down the street. The stair-cases are narrow, steep, and come down almost to the door. In general, the houses rise with enormous steep roofs, turning the gable end to the street, and leaning considerably forward, so that the top often projects near two feet beyond the perpendicular. The Bomb Quay is so broad, that there are distinct walks for carriages and foot passengers, lined and shaded with a double row of trees.—You look over the river on some beautiful meadows, and a fine avenue of trees, which leads to the Pest-house: it seems to be an elegant building, and the trees round it are so disposed as to appear a thick wood. This street is at least half a mile in length, and extends from the old to the new head, the two places where the water enters to fill the canals of this extensive city. When water runs through a street, it then assumes the name of a canal, of which kind the Heeren-fleet has the pre-eminence; the houses are of free-stone, and very lofty; the canal is spacious, and covered with ships: at one end stands the English church, a neat pretty building, of which the bishop of London is ordinary.

This port is much more frequented by the British

merchants than Amsterdam, insomuch that after a frost, when the sea is open, sometimes 300 sail of British vessels sail out of the harbour at once. There is always a large number of British subjects who reside in this town, and live much in the same manner as in Great Britain. The reason of the great traffic between this place and England, is because the ships can generally load and unload, and return to England from Rotterdam, before a ship can get clear from Amsterdam and the Texel. Hence the English merchants find it cheaper and more commodious, after their goods are arrived at Rotterdam, to send them in boats over the canals to Amsterdam. Another great advantage they have here for commerce is, that the Maese is open, and the passage free from ice, much sooner in the spring than in the Y and Zuyder-sea, which lead to Amsterdam.

The glass-house here is one of the best in the seven provinces; it makes abundance of glass-toys and enamelled bowls, which are sent to India, and exchanged for china-ware, and other oriental commodities.

The college of admiralty here is called the *college of the Maese*, the chief of all Holland and the United Provinces. The lieutenant-general, admiral of Holland, is obliged to go on board of a Rotterdam ship in the Maese when he goes to sea, and then he commands the squadron of the Maese.

On the east side of the city there is a large bason and dock, where ship-carpenters are continually employed for the use of the admiralty, or of the East India company. But the largest ships belonging to the admiralty of Rotterdam are kept at Helvoetsluys, as the most commodious station that place being situated on the ocean; for it requires both time and trouble to work a large ship from the dock of Rotterdam to the sea.

Rotterdam has four Dutch churches for the established religion. There is one thing very remarkable in respect to the great church, that the tower which leaned on one side was set up straight in the year 1655, as appears by the inscription engraved on brass at the bottom of the tower withinside. In the choir of this church are celebrated, with no small solemnity, the promotions made in the Latin schools. Besides, there are two English churches, one for those of the church of England and the other for the Presbyterians; and one Scotch church; as likewise one Lutheran, two Arminian, two Anabaptist, four Roman Catholic chapels, and one Jewish synagogue.

Though the public buildings here are not so stately as those of Amsterdam and some other cities, yet there are several of them well worth seeing. The great church of St Lawrence is a good old building, where are many stately monuments of their old admirals. From the top of this church one may see the Hague, Delft, Leyden, Dort, and most of the towns of South Holland. There are several fine market-places, as three fish-markets, the great-market, the new-market, and the hogs-market. The stadthouse is an old building, but the chambers large and finely adorned. The magazines for fitting out their ships are very good structures. The exchange is a noble building, begun in the year 1720, and finished in 1736. Upon the great bridge in the market-place there is a fine brass statue erected to the great Erasmus, who was born in this city in 1467, and died at Basil in Switzerland. He is represented

Rotterdam
||
Roverc.

sented in a furred gown, and a round cap, with a book in his hand. The statue is on a pedestal of marble, surrounded with rails of iron. Just by, one may see the house where this great man was born, which is a very small one, and has the following distich written on the door:

*Ædibus his ortus, mundum decoravit, Erasmus,
Artibus, ingenio, religione, fide.*

Rotterdam is estimated to contain about 50,000 inhabitants.

ROTULA, in *Anatomy*, the small bone of the knee, called also *patella*. See ANATOMY.

ROTUNDUS, in *Anatomy*, a name given to several muscles otherwise called *teres*.

ROUAD. See ARADUS.

ROUANE, or ROANE, an ancient and considerable town in France, in the department of Loire, with the title of a duchy; seated on the river Loire, at the place where it begins to be navigable for boats. It is an entrepot for the commerce between Lyons, Paris, Orleans, &c. E. Long. 4. 9. N. Lat. 46. 2.

ROUCOU, in *Dyeing*, the same with ANOTTA and BIXA. See DYEING.

ROUEN, a city of France, and capital of the department of the Lower Seine, formerly capital of Normandy, with an archbishop's see, a college, and an academy. It is seven miles in circumference, and surrounded with six suburbs; and contained before the revolution 35 parishes, and 24 convents for men and women. The metropolitan church has a very handsome front, on which are two lofty steeples. The great bell is 13 feet high and 11 in diameter. The church of the Benedictine abbey is much admired by travellers. There is a great number of fountains. The number of the inhabitants in 1817 was 81,000. This is one of the most industrious towns in France. There are manufactures of cotton and woollen of a great variety of kinds, and some on an extensive scale. There are also manufactures of silk, wool cards, refined sugar, and chemical substances. It is seated on the river Seine; and the tide rises so high, that vessels of 200 tons may come up to the quay: but one of the greatest curiosities is the bridge, of 270 paces in length, supported by boats, and consequently is higher or lower according to the tide. It is paved, and there are ways for foot passengers on each side, with benches to sit upon; and coaches may pass over it at any hour of the day or night. It is often called *Roan* by English historians; and is 50 miles south-west of Amiens, and 70 north-west of Paris.

Though large, and enriched by commerce, Rouen is not an elegant place. The streets are almost all narrow, crooked, and dirty; the buildings old and irregular. It was fortified by St Louis in 1253, but the walls are now demolished. The environs, more particularly the hills which overlook the Seine, are wonderfully agreeable, and covered with handsome villas. E. Long. 1. 10. N. Lat. 49. 26.

ROVERE, or ROVEREDO, a strong town of the Tyrol, on the confines of the republic of Venice; seated on the river Adige, at the foot of a mountain, and on the side of a stream, over which there is a bridge, defended by two large towers and a strong castle, 10 miles south of Trent. The town is tolerably well built, and

governed by a chief magistrat, styled a *podestat*. There are several churches and convents, that contain nothing worthy of notice. The most remarkable thing, and what they call the great *wonder of Roveredo*, is its spinning-house for a manufacture of silk, in which they have a great trade here to the fairs of Bolzano. They have also a very good trade in wine. Between Trent and Roveredo is the strong fort of Belem, belonging to the house of Austria. It is situated on a rock, and commands the roads at the foot of the mountain. E. Long. 11. 3. N. Lat. 45. 53.

ROUERGUE, a province of France, in the government of Guienne; bounded on the east by the Cevennes and Gevaudan, on the west by Querci, on the north by the same and Auvergne, and on the south by Languedoc. It is 75 miles in length, and 50 in breadth; not very fertile, but feeds a number of cattle, and has mines of copper, iron, alum, vitriol, and sulphur. It is divided into a county, and the upper and lower marche. It now forms the department of Aveyron. Rhodéz is the capital town.

ROVIGNO, a town of Italy, in Istria, with two good harbours, and quarries of fine stone. It is seated in a territory which produces excellent wine, in a peninsula on the western coast. The population is estimated at 17,000. E. Long. 13. 53. N. Lat. 45. 14.

ROVIGO, is a town of Italy, in the territory of Venice, and capital of the Polesin di Rovigo, in E. Long. 12. 25. N. Lat. 45. 6. It is a small place, poorly inhabited, and encompassed with ruinous walls. Formerly it belonged to the duke of Ferrara, but has been subject to the Venetians since 1500, and is famous for being the birth-place of that learned man Cælius Rhodoginus. It was built upon the ruins of Adria, anciently a noble harbour one mile from Rovigo, that gave name to the gulf, but now a half drowned village, inhabited by a few fishermen.

ROUNDELAY, or ROUNDO, a sort of ancient poem, deriving its name, according to Menage, from its form, and because it still turns back again to the first verse, and thus goes round. The common roundelay consists of 13 verses, eight of which are in one rhyme and five in another. It is divided into couplets; at the end of the second and third of which the beginning of the roundelay is repeated; and that, if possible, in an equivocal or punning sense. The roundelay is a popular poem in France, but is little known among us. Marot and Voiture have succeeded the best in it. Rapin remarks, that if the roundelay be not very exquisite, it is intolerably bad. In all the ancient ones, Menage observes, that the verse preceding has a less complete sense, and yet joins agreeably with that of the close without depending necessarily thereon. This rule, well observed, makes the roundelay more ingenious, and is one of the finesses of the poem. Some of the ancient writers speak of the roundelay or roundel as a kind of air appropriated to dancing; and in this sense the term seems to indicate little more than dancing in a circle with the hands joined.

ROUND-HOUSE, a kind of prison for the nightly watch in London to secure disorderly persons till they can be carried before a magistrate.

Round-House, in a ship, the uppermost room or cabin on the stern of a ship, where the master lies.

ROUNDS,

Roverc.
||
Round-
House

Rounds,
roussillon.

ROUNDS, in military matters, a detachment from the main-guard, of an officer or a non-commissioned officer and six men, who go round the rampart of a garrison, to listen if any thing be stirring without the place, and to see that the centinels be diligent upon their duty, and all in order. In strict garrisons the rounds go every half-hour. The centinels are to challenge at a distance, and to rest their arms as the round passes. All guards turn out, challenge, exchange the parole, and rest their arms, &c.

ROUNDS are ordinary and extraordinary. The ordinary rounds are three; the town-major's round, the grand-round, and visiting-round.

Manner of going the ROUNDS. When the town-major goes his round, he comes to the main-guard, and demands a serjeant and four or six men to escort him to the next guard; and when it is dark, one of the men is to carry a light.

As soon as the centry at the guard perceives the round coming, he shall give notice to the guard, that they may be ready to turn out when ordered; and when the round is advanced within about 20 or 30 paces of the guard, he is to challenge briskly; and when he is answered by the serjeant who attends the round, *Town-major's round*, he is to say, *Stand round!* and rest his arms; after which he is to call out immediately, *Serjeant, turn out the guard, town-major's round.* Upon the centry calling, the serjeant is to turn out the guard immediately, drawing up the men in good order with shouldered arms, the officer placing himself at the head of it, with his arms in his hand. He then orders the serjeant and four or six men to advance towards the round, and challenge: the serjeant of the round is to answer, *Town-major's round*; upon which the serjeant of the guard replies, *Advance, serjeant, with the parole!* at the same time ordering his men to rest their arms. The serjeant of the round advances alone, and gives the serjeant of the guard the parole in his ear, that none else may hear it; during which period the serjeant of the guard holds the spear of his halbert at the other's breast. The serjeant of the round then returns to his post, whilst the serjeant of the guard leaving his men to keep the round from advancing, gives the parole to his officer. This being found right, the officer orders his serjeant to return to his men; says, *Advance, town-major's round!* and orders the guard to rest their arms; upon which the serjeant of the guard orders his men to wheel back from the centre, and form a lane, through which the town-major is to pass (the escort remaining where they were), and go up to the officer and give him the parole, laying his mouth to his ear. The officer holds the spear of his esponent at the town-major's breast while he gives him the parole.

The design of rounds is not only to visit the guards, and keep the centinels alert; but likewise to discover what passes in the outworks, and beyond them.

ROUSSILLON, a province of France, in the Pyrenees, bounded on the east by the Mediterranean sea, on the west by Cerdagne, on the north by Lower Languedoc, and on the south by Catalonia, from which it is separated by the Pyrenees. It is a fertile country, about 50 miles in length, and 25 in breadth, and remarkable for its great number of olive-trees. Now the department of Eastern Pyrenees.

VOL. XVIII. Part I.

Rousseau

ROUSSEAU, JAMES, an eminent painter, was born at Paris in the year 1630, and studied first under Swanvelt, who had married one of his relations; after which he improved himself by travelling into Italy, practising solely in perspective, architecture, and landscape. On his return home, he was employed at Marly. He distinguished himself very much in painting buildings, and by his knowledge of, and attention to the principles of perspective. Louis XIV. employed him to decorate his hall of devices at St Germain-en-Laie, where he represented the operas of Lulli. But being a Protestant, he quitted France on the persecution of his brethren, and retired to Switzerland. Louis invited him back; he refused, but sent his designs, and recommended a proper person to execute them. After a short stay in Switzerland, he went to Holland; whence he was invited to England by Ralph duke of Montague, to adorn his new house in Bloomsbury, where he painted much. Some of his pictures, both in landscape and architecture, are over doors at Hamptoncourt; and he etched some of his own designs. His perspectives having been most commonly applied to decorate courts or gardens, have suffered much from the weather. Such of them as remain are monuments of an excellent genius. The colours are durable and bright, and the choice of them most judicious. He died in Soho-square, about the year 1693, aged 63.

ROUSSEAU, John Baptist, a celebrated French poet, was born at Paris, in April 1671. His father, who was a shoemaker in good circumstances, made him study in the best colleges of Paris, where he distinguished himself by his abilities. He at length applied himself entirely to poetry, and soon made himself known by several short pieces, that were filled with lively and agreeable images, which made him sought for by persons of the first rank, and men of the brightest genius. He was admitted in quality of *élève*, or pupil, into the academy of Inscriptions and Belles Lettres, in 1701, and almost all the rest of his life attached himself to some great men. He attended Marshal Tallard into England, in quality of secretary, and here contracted a friendship with St Evremond. At his return to Paris, he was admitted into the politest company, lived among the courtiers, and seemed perfectly satisfied with his situation; when, in 1708, he was prosecuted for being the author of some couplets, in which the characters of several persons of wit and merit were blackened by the most atrocious calumnies. This prosecution made much noise; and Rousseau was banished in 1712 out of the kingdom, to which he was never more to return, by a decree of the parliament of Paris. However, he always steadily denied, and even on his death-bed, his being the author of these couplets.—From the date of this sentence he lived in foreign countries, where he found illustrious protectors. The count de Luc, ambassador of France, in Switzerland, took him into his family, and studied to render his life agreeable. He took him with him to the treaty of Baden in 1714, where he was one of the plenipotentiaries, and presented him to Prince Eugene, who entertaining a particular esteem for him, took him to Vienna, and introduced him to the emperor's court. Rousseau lived about three years with Prince Eugene; but having lost his favour by satirising one of his mistresses, he retired to Brussels, where he afterwards usually resided, and where he

Rousseau.

he met with much attention and much generosity, as we shall soon mention.—It was there that his disputes with Voltaire commenced, with whom he had become acquainted at the college of Louis the Great, who then much admired his turn for poetry. At that time Voltaire assiduously cultivated the acquaintance of Rousseau, and made him a present of all his works; and Rousseau, flattered by his respect, announced him as a man who would one day be a glory to the age. The author of the *Henriade* continued to consult him about his productions, and to lavish on him the highest encomiums, while their friendship daily increased. When they again met at Brussels, however, they harboured the blackest malice against one another. The cause of this enmity, as Rousseau and his friends tell the story, was a lecture which he had composed from his *Epistle to Julia*, now *Urania*. This piece frightened Voltaire, as it plainly discovered his rage against him. The young man, vexed at these calumnies, understood the whole as thrown out against him. This is what Rousseau asserts. But his adversaries, and the friends of the poet whom he cried down suspected him, perhaps rather rashly, of having employed sarcasms, because he thought that his own reputation was in danger of being eclipsed by that of his rival. What is very singular, these two celebrated characters endeavoured each of them to prepossess the public with a bad opinion of the other, which they themselves never entertained in reality, and to smother in their breast that esteem for each other which, in defiance of all their exertions, still held its place. Rousseau, from the period of this dispute, always represented Voltaire as a buffoon, as a writer possessing neither taste nor judgment, who owed all his success to a particular mode which he pursued. As a poet he considered him as inferior to Lucan, and little superior to Pradon. Voltaire treated him still worse. Rousseau, according to him, was nothing better than a plagiarist, who could make shift to rhyme, but could not make any reflections; that he had nothing but the talent of arranging words, and that he had even lost that in foreign countries. He thus addresses him, in a piece little known.

*Aussitôt le Dieu qui m'inspire
T'arracha le luth et la lyre
Qu'avoient déshonorés tes mains ;
Tu n'es plus qu'un reptile immonde,
Rebut du Parnasse et du monde
Enseveli dans tes venins.*

In consequence of the little esteem in which Rousseau was held at Brussels, he could never forget Paris. The grand-prior of Vendome, and the baron de Breteuil, solicited the regent duke of Orleans to allow him to return; which favour was obtained. But our poet, before he would make use of the *lettres de rapel* issued in his favour, demanded a review of his process, which he wished to be repealed, not as a matter of favour, but by a solemn judgment of court; but his petition was refused. He then came over, in 1721, to England, where he printed *A Collection of his Works*, in 2 vols. 12mo, at London. This edition, published in 1723, brought him near 10,000 crowns, the whole of which he placed in the hands of the Ostend company. The affairs of this company, however, soon getting into confusion, all those who had any money in their hands lost the whole

of it, by which unfortunate event Rousseau, when arrived at that age when he stood most in need of the comforts of fortune, had nothing to depend upon but the generosity of some friends. Boutet, public notary in Paris, was peculiarly generous and attentive to him. He found a still greater asylum in the duke d'Arenberg, whose table was open to him at all times; who being obliged in 1733 to go into the army in Germany, settled on him a pension of 1500 livres. But unfortunately he soon lost his good opinion, having been imprudent enough to publish in a journal (of which Voltaire accused him), that the duke d'Arenberg was the author of those verses for which he himself had been banished France. He was therefore dismissed from his table, and his pride would not allow him to accept of the pension after this rupture. Brussels now became insupportable to him; and the count de Luc, and M. de Senozan, receiver-general of the church revenue, being informed of his disappointments, invited him to come privately to Paris, in the hopes of procuring a diminution of the period of his banishment. Some time previous to this Rousseau had published two new letters; one to P. Brumoy, on tragedy; the other to Rollin, on history. It is said, he expected from his letter to Brumoy to get the favour of all the Jesuits; and from the one to Rollin, the patronage of the Jansenists. He had likewise written an Ode, in praise of Cardinal de Fleury, on Peace, which met with a favourable reception, although it was not equal to some of his former pieces. He imagined his return to Paris would be found no difficult matter. He attempted it, and found he could not obtain a pass for a single year. Some say, that Rousseau had irritated some persons in power, by an allegory, called *The Judgment of Pluto*; in which piece he describes one of the principal judges, whose skin Pluto had caused to be taken off and stretched out on the seat in the bench. This satire, joined to the secret machinations of enemies, rendered all the attempts of his friends to procure his return abortive. After having staid three months at Paris, he returned to Brussels in February 1740, at which place he died March 17. 1741, strongly impressed with religious sentiments. Immediately before he received the viaticum, he protested he was not the author of those horrid verses which had so much embittered his life; and this declaration, in the opinion of the virtuous part of mankind, will be considered as a sufficient proof of his innocence. Some have said that Rousseau was profane, troublesome, capricious, forward, vindictive, envious, a flatterer, and a satirist. Others again represent him as a man full of candour and openness, a faithful and grateful friend, and as a Christian affected with a sense of religion.—Amidst such widely varied accounts it is difficult to form an opinion of his character. Such of our readers as wish to know more of this great poet may consult the Dictionary of M. Chaupepie, written with as much precision as impartiality, who endeavours to give a just idea of his character. From what he says, it does not appear that Rousseau can be cleared from the accusation brought against him of having attacked his benefactors. We believe he may be much more easily freed from the imputation brought against him by some of having disowned his father: for what occasion had Rousseau to conceal the obscurity of his birth? It exalted his own merit.

Rousseau.

M. Seguy, in concert with M. the prince of la Tour Tassis, has given a very beautiful edition of his works, agreeable to the poet's last corrections. It was published in 1743, at Paris, in three vols. 4to, and in 4 vols. 12mo, containing nothing but what was acknowledged by the author as his own. It contains, 1. Four Books of Odes, of which the first are sacred odes, taken from the Psalms. "Rousseau (says Ferron) unites in himself Pindar, Horace, Anacreon, and Malherbe. What fire, what genius, what flights of imagination, what rapidity of description, what variety of affecting strokes, what a crowd of brilliant comparisons, what richness of rhymes, what happy versification; but especially what inimitable expression! His verses are finished in the highest style of perfection that French verse is capable of assuming." The lyric compositions of Rousseau are, in general, above mediocrity. All his odes are not, however, of equal merit. The most beautiful are those which he has addressed to count de Luc, to Malherbe, to Prince Eugene, to Vendome, to the Christian princes; his Odes on the death of the prince de Conti, on the battle of Peterwaradin; and the Ode to Fortune, although there are certainly some few weak stanzas to be met with in it. There is considerable neatness in the composition of the Ode to a Widow, in his stanzas to the Abbé de Chaulieu, in his addresses to Rossignol, in his Odes to Count de Bonneval, to M. Duche, and to Count de Sinzindorf; and it is to be lamented that he wrote so few pieces of this kind, from which his genius seemed to lead him with difficulty. 2. Two Books of Epistles, in verse. Although these do not want their beauties, yet there prevails too much of a misanthropic spirit in them, which takes away greatly from their excellence. He makes too frequent mention of his enemies and his misfortunes; he displays those principles which are supported less on the basis of truth than on those various passions which ruled his mind at the time. He puts forth his anger in paradoxes. If he be reckoned equal to Horace in his odes, he is far inferior in his epistles. There is much more philosophy in the Roman poet than in him. 3. *Cantatas*. He is the father of this species of poetry, in which he stands unrivalled. His pieces of this sort breathe that poetical expression, that picturesque style, those happy turns, and those easy graces, which constitute the true character of this kind of writing. He is as lively and impetuous as he is mild and affecting, adapting himself to the passions of those persons whom he makes to speak. "I confess (says M. de la Harpe) that I find the cantatas of Rousseau more purely lyric than his odes, although he rises to greater heights in these. I see nothing in his cantatas but bold and agreeable images. He always addresses himself to the imagination, and he never becomes either too verbose or too prolix. On the contrary, in some of the best of his odes, we find some languishing stanzas, ideas too long delayed, and verses of inexcusable meanness. 4. *Allegories*, the most of which are happy, but some of them appear forced. 5. *Epigrams*, after the manner of Martial and Marot. He has taken care to leave out of this edition those pieces which licentiousness and debauchery inspired. They bear, indeed, as well as his other pieces, the marks of genius; but such productions are calculated only to dishonour their authors, and corrupt the heart of those who read them. 5. A Book of *Poems on Various Subjects*,

which sometimes want both ease and delicacy. The most distinguished are two eclogues, imitated from Virgil. 6. Four comedies in verse; the *Flatterer*, whose character is well supported; the *Imaginary Forefathers*, a piece which had much less success, although it affords sufficiently good sentiment; the *Capricious Man*, and the *Dupe of Herself*, pieces of very inconsiderable merit. 7. Three comedies in prose; the *Coffee-house*, the *Magic Girdle*, and the *Madragore*, which are little better than his other theatrical pieces. The theatre was by no means his forte; he had a genius more suited for satire than comedy, more akin to Boileau's than Moliere's. 8. A *Collection of Letters*, in prose. In this edition he has selected the most interesting.—There is a larger collection in 5 volumes. This last has done at the same time both injury and honour to his memory. Rousseau in it speaks both in favour of and against the very same persons. He appears too hasty in tearing to pieces the characters of those who displease him. We behold in them a man of a steady character and an elevated mind, who wishes to return to his native country only that he might be enabled completely to justify his reputation. We see him again corresponding with persons of great merit and uncommon integrity, with the Abbé d'Olivet, Racine the son, the poets La Fosse and Duche, the celebrated Rollin, M. le Franc de Pompignan, &c. &c. We meet also with some anecdotes and exact judgments of several writers. A bookseller in Holland has published his port-folio, which does him no honour. There are, indeed, some pieces in this wretched collection which did come from the pen of Rousseau; but he is less to be blamed for them than they are who have drawn these works from that oblivion to which our great poet had consigned them. A pretty good edition of his *Select Pieces* appeared at Paris in 1741, in a small 12mo volume. His portrait, engraved by the celebrated Aved, his old friend, made its appearance in 1778, with the following motto from Martial:

Certior in nostro carmine vultus erit.

ROUSSEAU, John-James, was born at Geneva, June 28. 1712. His father was by profession a clock and watch maker. At his birth, which, he says, was the first of his misfortunes, he endangered the life of his mother, and he himself was for a long time after in a very weak and languishing state of health; but as his bodily strength increased, his mental powers gradually opened, and afforded the happiest presages of future greatness. His father, who was a citizen of Geneva, was a well-informed tradesman; and in the place where he wrought he kept a Plutarch and a Tacitus, and these authors of course soon became familiar to his son. A rash juvenile step occasioned his leaving his father's house. "Finding himself a fugitive, in a strange country, and without money or friends, he changed (says he himself) his religion, in order to procure a subsistence." Bornex, bishop of Anneci, from whom he sought an asylum, committed the care of his education to Madame de Warrens, an ingenious and amiable lady, who had in 1726 left part of her wealth, and the Protestant religion, in order to throw herself into the bosom of the church. This generous lady served in the triple capacity of a mother, a friend, and a lover, to the new proselyte, whom she regarded as her son. The necessity of procuring for himself

Rousseau. some settlement, however, or perhaps his unsettled disposition, obliged Rousseau often to leave this tender mother.

He possessed more than ordinary talents for music; and the abbé Blanchard flattered his hopes with a place in the royal chapel, which he, however, failed in obtaining for him; he was therefore under the necessity of teaching music at Chamberi. He remained in this place till 1741, in which year he went to Paris, where he was long in very destitute circumstances. Writing to a friend in 1743, he thus expresses himself: "Every thing is dear here, but especially bread." What an expression; and to what may not genius be reduced! Meanwhile he now began to emerge from that obscurity in which he had hitherto been buried. His friends placed him with M. de Montaigne, ambassador from France to Venice. According to his own confession, a proud misanthropy and a peculiar contempt of the riches and pleasures of this world, constituted the chief traits in his character, and a misunderstanding soon took place between him and the ambassador. The place of depute, under M. Dupin, farmer-general, a man of considerable parts, gave him some temporary relief, and enabled him to be of some benefit to Madame de Warrens his former benefactress. The year 1750 was the commencement of his literary career. The academy of Dijon had proposed the following question: "Whether the revival of the arts and sciences has contributed to the refinement of manners?" Rousseau at first inclined to support the affirmative. "This is the *pons asinorum* (says a philosopher, at that time a friend of his), take the negative side of the question, and I'll promise you the greatest success."

His discourse against the sciences, accordingly, having been found to be the best written, and replete with the deepest reasoning, was publicly crowned with the approbation of that learned body. Never was a paradox supported with more eloquence: it was not however a new one; but he enriched it with all the advantages which either knowledge or genius could confer on it. Immediately after its appearance, he met with several opponents of his tenets, which he defended; and from one dispute to another, he found himself involved in a formidable train of correspondence, without having ever almost dreamed of such opposition. From that period he decreased in happiness as he increased in celebrity. His "Discourse on the Causes of Inequality among Mankind, and on the Origin of Social Compacts," a work full of almost unintelligible maxims and wild ideas, was written with a view to prove that mankind are equal; that they were born to live apart from each other; and that they have perverted the order of nature in forming societies. He bestows the highest praise on the state of nature, and deprecates the idea of every social compact. This discourse, and especially the dedication of it to the republic of Geneva, are the *chef-d'œuvres* of that kind of eloquence of which the ancients alone had given us any idea. By presenting this performance to the magistrates, he was received again into his native country, and reinstated in all the privileges and rights of a citizen, after having with much difficulty prevailed on himself to abjure the Catholic religion. He soon, however, returned to France, and lived for some time in Paris. He afterwards gave himself up to retirement, to escape the shafts of criticism,

and follow after the regimen which the strangury, with which he was tormented, demanded of him. This is an important epoch in the history of his life, as it is owing to this circumstance, perhaps, that we have the most elegant works that have come from his pen. His "Letter to M. d'Alembert" on the design of erecting a theatre at Geneva, written in his retirement, and published in 1757, contains, along with some paradoxes, some very important and well handled truths. This letter first drew down upon him the envy of Voltaire, and was the cause of those indignities with which that author never ceased to load him. What is singular in him, is, that although so great an enemy to theatrical representations himself, he caused a comedy to be printed, and in 1752 gave to the theatre a pastoral (The Village Conjuror), of which he composed both the poetry and music, both of them abounding with sentiment and elegance, and full of innocent and rural simplicity. What renders the Village Conjuror highly delightful to persons of taste, is that perfect harmony of words and music which everywhere pervades it; that proper connection among the parties who compose it; and its being perfectly correct from beginning to end. The musician hath spoken, hath thought, and felt like a poet. Every thing in it is agreeable, interesting, and far superior to those common affected and insipid productions of our modern petit-dramas. His Dictionary of Music affords several excellent articles; some of them, however, are very inaccurate. "This work (says M. la Borde), in his Essay on Music, has need to be written over again, to save much trouble to those who wish to study it, and prevent them from falling into errors, which it is difficult to avoid, from the engaging manner in which Rousseau drags along his readers." The passages in it which have any reference to literature may be easily distinguished, as they are treated with the agreeableness of a man of wit and the exactness of a man of taste. Rousseau, soon after the rapid success of his Village Conjuror, published a Letter on French Music, or rather against French Music, written with as much freedom as liveliness. The exasperated partizans of French comedy treated him with as much fury as if he had conspired against the state. A crowd of insignificant enthusiasts spent their strength and outcries against him. He was insulted, menaced, and lampooned. Harmonic fanaticism went even to hang him up in effigy.

That interesting and tender style, which is so conspicuous throughout the Village Conjuror, animates several letters in the New Heloisa, in six parts, published 1761 in 12mo. This epistolary romance, of which the plot is ill-managed, and the arrangement bad, like all other works of genius, has its beauties as well as its faults. More truth in his characters and more precision in his details were to have been wished. The characters, as well as their style, have too much sameness, and their language is too affected and exaggerated. Some of the letters are indeed admirable, from the force and warmth of expression, from an effervescence of sentiments, from the irregularity of ideas which always characterise a passion carried to its height. But why is so affecting a letter so often accompanied with an unimportant digression, an insipid criticism, or a self-contradicting paradox? Why, after having shone in all the energy of sentiment, does he on a sudden turn unaffectionate? It is because none of the personages are truly interesting. That

That of St Preux is weak, and often forced. Julia is an assemblage of tenderness and pity, of elevation of soul and of coquetry, of natural parts and pedantry. Wolmar is a violent man, and almost beyond the limits of nature. In fine, when he wishes to change his style, and adopt that of the speaker, it may easily be observed that he does not long support it, and every attempt embarrasses the author and cools the reader. In the Heloisa, Rousseau's unlucky talent of rendering every thing problematical, appears very conspicuous; as in his arguments in favour of and against duelling, which afford an apology for suicide, and a just condemnation of it: in his facility in palliating the crime of adultery, and his very strong reasons to make it abhorred: on the one hand, in declamations against social happiness; on the other, in transports in favour of humanity; here, in violent rhapsodies against philosophers; there, by a rage for adopting their opinions: the existence of God attacked by sophistry, and Atheists confuted by the most irrefragable arguments; the Christian religion combated by the most specious objections, and celebrated with the most sublime eulogies.

His *Emilius* afterwards made more noise than the new *Heloisa*. This moral romance, which was published in 1762, in four vols. 12mo, treats chiefly of education. Rousseau wished to follow nature in every thing; and though his system in several places differs from received ideas, it deserves in many respects to be put in practice, and with some necessary modifications it has been so. His precepts are expressed with the force and dignity of a mind full of the leading truths of morality. If he has not always been virtuous, no body at least has felt it more, or made it appear to more advantage. Every thing which he says against luxury shows the vices and conceited opinions of his age, and is worthy at once of Plato or of Tacitus. His style is peculiar to himself. He sometimes, however, appears, by a kind of affected rudeness and asperity, to ape at the mode of Montaigne, of whom he is a great admirer, and whose sentiments and expressions he often clothes in a new dress. What is most to be lamented is, that in wishing to educate a young man as a Christian, he has filled his third volume with objections against Christianity. He has, it must be confessed, given a very sublime eulogium on the gospel, and an affecting portrait of its divine Author; but the miracles and the prophecies, which serve to establish his mission, he attacks without the least reserve. Admitting only natural religion, he weighs every thing in the balance of reason; and this reason being false, leads him into dilemmas very unfavourable to his own repose and happiness.

He dwelt from 1754 in a small house in the country near Montmorency; a retreat which he owed to the generosity of a farmer-general. The cause of his love for this retirement was, according to himself, "that invincible spirit of liberty which nothing could conquer, and in competition with which honours, fortune, and reputation, could not stand. It is true, this desire of liberty has occasioned less pride than laziness; but this indolence is inconceivable. Every thing startles it; the most inconsiderable reciprocities of social life are to it insupportable. A word to speak, a letter to write, a visit to pay, things necessary to be done, are to me punishments. Hear my reasons. Although the ordinary

intercourse between mankind be odious to me, intimate friendship appears to me very dear; because there are no mere ceremonies due to it; it agrees with the heart, and all is accomplished. Here, again, why I have always shunned kindnesses so much; because every act of kindness requires a grateful mind, and I find my heart ungrateful, from this alone, that gratitude is a duty. Lastly, that kind of felicity which is necessary for me, is not so much to do that which I wish, as not to do what I wish not to do." Rousseau enjoyed this felicity which he so much wished in his retirement. Without entirely adopting that too rigorous mode of life pursued by the ancient Cynics, he deprived himself of every thing that could in any measure add fuel to this wished for luxury, which is ever the companion of riches, and which inverts even custom itself. He might have been happy in this retreat, if he could have forgot this public, which he affected to despise; but his desire after a great name got the better of his self-love, and it was this thirst after reputation which made him introduce so many dangerous paragraphs in his *Emilia*.

The French parliament condemned this book in 1762, and entered into a criminal prosecution against the author, which forced him to make a precipitate retreat. He directed his steps towards his native country, which shut its gates upon him. Proscribed in the place where he first drew breath, he sought an asylum in Switzerland, and found one in the principality of Neuchâtel. His first care was to defend his *Emilia* against the mandate of the archbishop of Paris, by whom it had been anathematized. In 1763 he published a letter, in which he re-exhibits all his errors, set off with the most animated display of eloquence, and in the most insidious manner. In this letter he describes himself as "more vehement than celebrated in his researches, but sincere on the whole, even against himself; simple and good, but sensible and weak; often doing evil, and always loving good; united by friendship, never by circumstances, and keeping more to his opinions than to his interests; requiring nothing of men, and not wishing to be under any obligation to them; yielding no more to their prejudices than to their will, and preserving his own as free as his reason; disputing about religion without licentiousness; loving neither impiety nor fanaticism, but disliking precise people more than bold spirits," &c. From this specimen, the limitations he would appoint to this portrait may easily be discovered.

The letters of La Montaigne appeared soon after; but this work, far less eloquent, and full of envious discussions on the magistrates and clergy of Geneva, irritated the Protestant ministers without effecting a reconciliation with the clergy of the Romish church. Rousseau had solemnly abjured the latter religion in 1753, and, what is somewhat strange, had then resolved to live in France, a Catholic country. The Protestant clergy were not fully reconciled by this change; and the protection of the king of Prussia, to whom the principality of Neuchâtel belonged, was not sufficient to rescue him from that obloquy which the minister of Moutiers-Travers, the village to which he had retired, had excited against him. He preached against Rousseau, and his sermons produced an uproar among the people. On the night between the 6th and 7th September 1765, some fanatics, drove on by wine and the declamations of their minister, threw some stones at the windows of the

Rousseau.

the Genevan philosopher, who fearing new insults, in vain sought an asylum in the canton of Berne. As this canton was connected with the republic of Geneva, they did not think proper to allow him to remain in their city, being proscribed by that republic. Neither his broken state of health, nor the approach of winter, could soften the hearts of those obdurate Spartans. In vain, to prevent them from the fear they had of the spreading of his opinions, did he beseech them to shut him up in prison till the spring; for even this favour was denied him. Obligated to set out on a journey, in the beginning of a very inclement season, he reached Strasbourg in a very destitute situation. He received from Marshal de Contades, who then commanded in that place, every accommodation which could be expected from generosity, humanity, and compassion. He waited there till the weather was milder, when he went to Paris, where Mr Hume then was, who determined on taking him with him to England. After having made some stay in Paris, Rousseau actually set out for London in 1766. Hume, much affected with his situation and his misfortunes, procured for him a very agreeable settlement in the country. Our Genevan philosopher was not, however, long satisfied with this new place. He did not make such an impression on the minds of the English as he had done on the French. His free disposition, his obdurate and melancholy temper, were deemed no singularity in England. He was there looked upon as an ordinary man, and the periodical prints were filled with satires against him. In particular, they published a forged letter from the king of Prussia, holding up to ridicule the principles and conduct of this new Diogenes. Rousseau imagined there was a plot between Hume and some philosophers in France to destroy his glory and repose. He sent a letter to him, filled with the most abusive expressions, and reproaching him for his conduct towards him. From thistime he looked upon Hume as a wicked and perfidious person, who had brought him to England with no other view than to expose him to public ridicule; which foolish and chimerical idea was nourished by self-love and a restless disposition. He imagined that the English philosopher, amidst all his kindnesses, had something disagreeable in the manner of expressing them. The bad health of Rousseau, a strong and melancholy imagination, a too nice sensibility, a jealous disposition, joined with philosophic vanity, cherished by the false informations of his governess, who possessed an uncommon power over him; all these taken together, might tend to prepossess him with unfavourable sentiments of some innocent freedoms his benefactor might have taken with him, and might render him ungrateful, which he thought himself incapable of becoming. Meanwhile, these false conjectures and probabilities ought never to have had the weight with an honest mind to withdraw itself from its friend and benefactor. Proofs are always necessary in cases of this kind; and that which Rousseau had was by no means a certain demonstration. The Genevan philosopher, however, certainly returned to France. In passing through Amiens, he met with M. Gresset, who interrogated him about his misfortunes and the controversies he had been engaged in. He only answered, "You have got the art of making a parrot speak; but you are not yet possessed of the secret of making a bear speak." In the mean time, the magistrates of this city wished to confer

on him some mark of their esteem, which he absolutely refused. His disordered imagination viewed these flattering civilities as nothing else than insults, such as were lavished on Sancho in the island of Barataria. He thought one part of the people looked upon him as like Lazarille of Tormes, who, being fixed to the bottom of a tub, with only his head out of the water, was carried from one town to another to amuse the vulgar. But these wrong and whimsical ideas did not prevent him from aspiring after a residence in Paris, where, without doubt, he was more looked on as a spectacle than in any other place whatever. On the 1st July 1770, Rousseau appeared, for the first time, at the regency coffee-house, dressed in ordinary clothing, having for some time previous to this wore an Armenian habit. He was loaded with praises by the surrounding multitude. "It is somewhat singular (says M. Sennebier) to see a man so haughty as he returning to the very place from whence he had been banished so often. Nor is it one of the smallest inconsistencies of this extraordinary character, that he preferred a retreat in that place of which he had spoken so much ill." It is as singular that a person under sentence of imprisonment should wish to live in so public a manner in the very place where his sentence was in force against him. His friends procured for him, however, liberty of staying, on condition that he should neither write on religion nor politics: he kept his word; for he wrote none at all. He was contented with living in a calm philosophical manner, giving himself to the society of a few tried friends, shunning the company of the great, appearing to have given up all his whimsies, and affecting neither the character of a philosopher nor a *bel esprit*. He died of an apoplexy at Ermenonville, belonging to the marquis de Girardin, about ten leagues from Paris, July 2. 1178, aged 66 years. This nobleman has erected to his memory a very plain monument, in a grove of poplars, which constitutes part of his beautiful gardens. On the tomb are inscribed the following epitaphs:

*Ici repose
L'Homme de la Nature
Et de la Verité!*

Vitam impendere Vero.
Hic jacent Ossa J. J. Rousseau.*

* Hist.
to.

The curious who go to see this tomb likewise see the cloak which the Genevan philosopher wore. Above the door is inscribed the following sentence, which might afford matter for a whole book: "He is truly free, who, to accomplish his pleasure, has no need of the assistance of a second person." Rousseau, during his stay in the environs of Lyons, married Mademoiselle le Vasseur, his governess, a woman who, without either beauty or talents, had gained over him a great ascendancy. She waited on him in health and in sickness: But as if she had been jealous of possessing him alone, she drove from his mind, by the most perfidious insinuations, all those who came to entertain him; and when Rousseau did not dismiss them, she prevented their return by invariably refusing them admittance. By these means she the more easily led her husband into inconsistencies of conduct, which the originality of his character as well as of his opinions so much contributed to assist. Nature had perhaps but given him the em-
bryo

bryo of his character, and art had probably united to make it more singular. He did not incline to associate with any person; and as this method of thinking and living was uncommon, it procured him a name, and he displayed a kind of fantasticalness in his behaviour and his writings. Like Diogenes of old, he united simplicity of manners with all the pride of genius; and a large stock of indolence, with an extreme sensibility, served to render his character still more uncommon. "An indolent mind (says he), terrified at every application, a warm, bilious, and irritable temperament, sensible also in a high degree to every thing that can affect it, appear not possible to be united in the same person: and yet these two contrarieties compose the chief of mine. An active life has no charms for me. I would an hundred times rather consent to be idle than to do any thing against my will; and I have an hundred times thought that I would live not amiss in the Bastile, provided I had nothing to do but just continue there. In my younger days I made several attempts to get in there; but as they were only with the view of procuring a refuge and rest in my old age, and like the exertions of an indolent person, only by fits and starts, they were never attended with the smallest success. When misfortunes came, they afforded me a pretext of giving myself up to my ruling passion." He often exaggerated his misfortunes to himself as well as to others. He endeavoured particularly to render interesting by his description his misfortunes and his poverty, although the former were far less than he imagined, and notwithstanding he had certain resources against the latter. In other respects he was charitable, generous, sober, just, contenting himself with what was purely necessary, and refusing the means which might have procured him wealth and offices. He cannot, like many other sophists, be accused of having often repeated with a studied emphasis the word *Virtue*, without inspiring the sentiment. When he is speaking of the duties of mankind, of the principles necessary to our happiness, of the duty we owe to ourselves and to our equals, it is with a copiousness, a charm, and an impetuosity, that could only proceed from the heart. He said one day to M. de Buffon, "You have asserted and proved before J. J. Rousseau, that mothers ought to suckle their children." "Yes (says this great naturalist), we have all said so; but M. Rousseau alone forbids it, and causes himself to be obeyed." Another academician said, "that the virtues of Voltaire were without heart, and those of Rousseau without head." He was acquainted at an early age with the works of the Greek and Roman authors; and the republican virtues there held forth to view, the rigorous austerity of Cato, Brutus, &c. carried him beyond the limits of a simple estimation of them. Influenced by his imagination, he admired every thing in the ancients, and saw nothing in his contemporaries but enervated minds and degenerated bodies.

His ideas about politics were almost as eccentric as his paradoxes about religion. Some reckon his *Social Compact*, which Voltaire calls the *Unsocial Compact*, the greatest effort his genius produced. Others find it full of contradictions, errors, and cynical passages, obscure, ill arranged, and by no means worthy of his shining pen. There are several other small pieces wrote by him, to be found in a collection of his works published

in 25 vols. 8vo and 12mo, to which there is appended a very insignificant supplement in 6 vols. Rousseau.

The most useful and most important truths in this collection are picked out in his *Thoughts*; in which the confident sophist and the impious author disappear, and nothing is offered to the reader but the eloquent writer and the contemplative moralist. There were found in his port-folio his *Confessions*, in twelve books; the first six of which were published. "In the preface to these memoirs, which abound with characters well drawn, and written with warmth, with energy, and sometimes with elegance, he declares (says M. Palissot), like a peevish misanthrope, who boldly introduces himself on the ruins of the world, to declare to mankind, whom he supposes assembled upon the ruins, that in that innumerable multitude, none could dare to say, *I am better than that man*. This affectation of seeing himself alone in the universe, and of continually directing every thing to himself, may appear to some morose minds a fanaticism of pride, of which we have no examples, at least since the time of Cardan." But this is not the only blame which may be attached to the author of the *Confessions*. With uneasiness we see him, under the pretext of sincerity, dishonouring the character of his benefactress Lady Warren. There are innuendos no less offensive against obscure and celebrated characters, which ought entirely or partly to have been suppressed. A lady of wit said, that Rousseau would have been held in higher estimation for virtue, "had he died without his confession." The same opinion is entertained by M. Sennebier, author of the *Literary History of Geneva*: "His confessions (says he) appear to me to be a very dangerous book, and paint Rousseau in such colours as we would never have ventured to apply to him. The excellent analyses which we meet with of some sentiments, and the delicate anatomy which he makes of some actions, are not sufficient to counterbalance the detestable matter which is found in them, and the unceasing obloquies everywhere to be met with." It is certain, that if Rousseau has given a faithful delineation of some persons, he has viewed others through a cloud, which formed in his mind perpetual suspicions. He imagined he thought justly and spoke truly; but the simplest thing in nature, says M. Servant, if distilled through his violent and suspicious head, might become poison. Rousseau, in what he says of himself, makes such acknowledgements as certainly prove that there were better men than he, at least if we may judge him from the first six books of his memoirs, where nothing appears but his vices. They ought not perhaps to be separated from the six last books, where he speaks of the virtues which make reparation for them; or rather the work ought not to have been published at all, if it be true (which there can be little doubt of) that in his confessions he injured the public manners, both by the baseness of the vices he disclosed, and by the manner in which he united them with the virtues. The other pieces which we find in this new edition of his works are, 1. *The Reveries of a Solitary Wanderer*, being a journal of the latter part of his life. In this he confesses, that he liked better to send his children into hospitals destined for orphans, than to take upon himself the charge of their maintenance and education; and endeavours to palliate this error which nothing can exculpate. 2. *Considerations upon the Government*

Rousseau
Rowe.

vernment of Poland. 3. The Adventures of Lord Edward, a novel, being a kind of supplement to the new Heloisa. 4. Various Memoirs and Fugitive Pieces, with a great number of letters, some of which are very long, and written with too much study, but containing some eloquent passages and some deep thought. 5. Emilia and Sophia. 6. The Levite of Ephraim, poem in prose, in 4 cantos; written in a truly ancient style of simplicity. 7. Letters to Sara. 8. An Opera and a Comedy. 9. Translations of the first book of Tacitus's History, of the Episode of Olinda and Sophronia, taken from Tasso, &c. &c. Like all the other writings of Rousseau, we find in these posthumous pieces many admirable and some useful things; but they also abound with contradictions, paradoxes, and ideas very unfavourable to religion. In his letters especially we see a man chagrined at misfortunes, which he never attributes to himself, suspicious of every body about him, calling and believing himself a lamb in the midst of wolves; in one word, as like Pascal in the strength of his genius, as in his fancy of always seeing a precipice about him. This is the reflection of M. Servant, who knew him, assisted him, and caressed him during his retreat at Grenoble in 1768. This magistrate having been very attentive in observing his character, ought the rather to be believed, as he inspected it without either malice, envy, or resentment, and only from the concern he had for this philosopher, whom he loved and admired.

ROUT, in *Law*, is applied to an assembly of persons going forcibly to commit some unlawful act, whether they execute it or not. See **Riot**.

ROUTE, a public road, highway, or course, especially that which military forces take. This word is also used for the defeat and fight of an army.

ROWE, NICHOLAS, descended of an ancient family in Devonshire was born in 1673. He acquired a complete taste of the classic authors under the famous Dr Busby in Westminster school; but poetry was his early and darling study. His father, who was a lawyer, and designed him for his own profession, entered him a student in the Middle Temple. He made remarkable advances in the study of the law; but the love of the belles lettres, and of poetry in particular, stopt him in his career. His first tragedy, the Ambitious Stepmother, meeting with universal applause, he laid aside all thoughts of rising by the law. He afterward composed several tragedies; but that which he valued himself most upon, was his Tamerlane. The others are, the Fair Penitent, Ulysses, the Royal Convert, Jane Shore, and Lady Jane Grey. He also wrote a poem called the Biter, and several poems upon different subjects, which have been published under the title of Miscellaneous Works in one volume as his dramatic works have been in two. Rowe is chiefly to be considered (Dr Johnson observes) in the light of a tragic writer and a translator. In his attempt at comedy, he failed so ignominiously, that his Biter is not inserted in his works; and his occasional poems and short compositions are rarely worthy of either praise or censure, for they seem the casual sports of a mind seeking rather to amuse its leisure than to exercise its powers. In the construction of his dramas there is not much art; he is not a nice observer of the unities. He extends time, and varies place, as his convenience requires. To vary the place is not (in the opinion of the learned critic from whom these ob-

servations are borrowed) any violation of nature, the change be made between the acts; for it is no less easy for the spectator to suppose himself at Athens in the second act, than at Thebes in the first; but to change the scene, as is done by Rowe in the middle of an act, is to add more acts to the play, since an act is so much of the business as is transacted without interruption. For this licence, easily exercised by himself from difficulties; as in Lady Jane Gray, when we have been terrified with all the dreadful pomp of public execution, and are wondering how the heroine or the poet will proceed, no sooner has Jane pronounced some prophetic rhimes, than—pass and be gone—the scene closes, and Pembroke and Gardiner are turned out upon the stage. I know not (says Dr Johnson) that there can be found in his plays any deep search into nature, any accurate discriminations of kindred qualities, or nice display of passion in its progress; all is general and undefined. Nor does he much interest or affect the auditor, except in Jane Shore, who is always seen and heard with pity. Alicia is a character of empty noise, without resemblance to real sorrow or to natural madness. Whence then has Rowe his reputation? From the reasonableness and propriety of some of his scenes, from the elegance of his diction, and the suavity of his verse. He seldom moves either pity or terror, but he often elevates the sentiment; he seldom pierces the breast, but he always delights the ear, and often improves the understanding. Being a great admirer of Shakespear, he gave the public an edition of his plays; to which he prefixed an account of that great man's life. But the most considerable of Mr Rowe's performances was a translation of Lucan's *Pharalia*, which he just lived to finish, but not to publish; for it did not appear in print till 1728, ten years after his death.

Meanwhile, the love of poetry and books did not make him unfit for business; for nobody applied closer to it when occasion required. The duke of Queensberry, when secretary of state, made him secretary for public affairs. After the duke's death, all avenues were stopped to his preferment; and during the rest of Queen Anne's reign he passed his time with the Muses and his books. A story, indeed, is told of him, which shows that he had some acquaintance with her ministers. It is said, that he went one day to pay his court to the lord treasurer Oxford, who asked him, "If he understood Spanish well?" He answered, "No;" but thinking that his Lordship might intend to send him into Spain on some honourable commission, he presently added, "that he did not doubt but he could shortly be able both to understand and to speak it." The earl approving what he said, Rowe took his leave; and, retiring a few weeks to learn the language, waited again on the Earl to acquaint him with it. His Lordship asked him, "If he was sure he understood it thoroughly?" and Powe affirming that he did, "How happy are you, Mr Rowe," said the Earl, "that you can have the pleasure of reading and understanding the history of Don Quixote in the original?" On the accession of George I. he was made poet laureat, and one of the land surveyors of the customs in the port of London. The prince of Wales conferred on him the clerkship of his council; and the Lord Chancellor Parker made him his secretary for the presentations. He did not enjoy these promotions long; for he died Dec. 6. 1718, in his 45th year.

Mr Rowe was twice married, had a son by his first wife, and a daughter by his second. He was a handsome, genteel man; and his mind was as amiable as his person. He lived beloved; and at his death had the honour to be lamented by Mr Pope, in an epitaph which is printed in Pope's works, although it was not affixed on Mr Rowe's monument in Westminster-abbey, where he was interred in the poet's corner, opposite to Chaucer.

ROWE, *Elizabeth*, an English lady, eminent for her excellent writings both in prose and verse, born at Ilchester in Somersetshire in 1647, was the daughter of worthy parents, Mr Walter Singer and Mrs Elisabeth Portnel. She received the first serious impressions of religion as soon as she was capable of it. There being a great affinity between painting and poetry, this lady, who had a vein for the one, naturally had a taste for the other. She was also very fond of music; chiefly of the grave and solemn kind, as best suited to the grandeur of her sentiments and the sublimity of her devotion. But poetry was her favourite employment, her distinguishing excellence. So prevalent was her genius this way, that her prose is all poetical. In 1696, a collection of her poems was published at the desire of two friends. Her paraphrase on the xxxviiith chapter of Job was written at the request of Bishop Ken. She had no other tutor for the French and Italian languages than the honourable Mr Thynne, who willingly took the task upon himself. Her shining merit, with the charms of her person and conversation, had procured her a great many admirers. Among others, it is said, the famous Mr Prior made his addresses to her. But Mr Thomas Rowe was to be the happy man. This gentleman was honourably descended; and his superior genius, and insatiable thirst after knowledge, were conspicuous in his earliest years. He had formed a design to compile the lives of all the illustrious persons in antiquity omitted by Plutarch; which, indeed, he partly executed. Eight lives were published since his decease. They were translated into French by the abbé Belleguer in 1734. He spoke with ease and fluency; had a frank and benevolent temper, an inexhaustible fund of wit, and a communicative disposition. Such was the man who, charmed with the person, character, and writings, of our authoress, married her in 1710, and made it his study to repay the felicity with which she crowned his life. Too intense an application to study, beyond what the delicacy of his frame would bear, broke his health, and threw him into a consumption, which put a period to his valuable life in May 1715, when he was but just past the 28th year of his age. Mrs Rowe wrote a beautiful elegy on his death; and continued to the last moments of her life to express the highest veneration and affection for his memory. As soon after his decease as her affairs would permit, she indulged her inclination for solitude, by retiring to Frome, in Somersetshire, in the neighbourhood of which place the greatest part of her estate lay. In this recess it was that she composed the most celebrated of her works, *Friendship in Death*, and the *Letters Moral and Entertaining*. In 1736, she published, the *History of Joseph*; a poem which she had written in her younger years. She did not long survive this publication; for she died of an apoplexy, as was supposed, Feb. 20. 1736-7. In her cabinet were found letters to several of

Vol. XVIII. Part I.

her friends, which she had ordered to be delivered immediately after her decease. The Rev. Dr Isaac Watts, agreeably to her request, revised and published her devotions in 1737, under the title of *Devout Exercises of the Heart in Meditation and Soliloquy, Praise and Prayer*; and, in 1739, her *Miscellaneous Works*, in prose and verse, were published in 2 vols. 8vo, with an account of her life and writings prefixed.

As to her person, she was not a regular beauty, yet possessed a large share of the charms of her sex. She was of a moderate stature, her hair of a fine colour, her eyes of a darkish gray inclining to blue, and full of fire. Her complexion was very fair, and a natural blush glowed in her cheeks. She spoke gracefully; her voice was exceedingly sweet and harmonious; and she had a softness in her aspect which inspired love, yet not without some mixture of that awe and veneration which distinguished sense and virtue, apparent in the countenance, are wont to create.

ROWEL, among farriers, a kind of issue answering to what in surgery is called a *seton*. See *FARRIERY*, sect. v.

ROWLEY, a monk who is said to have flourished at Bristol in the 15th century, and to have been an author voluminous and elegant. Of the poems attributed to him, and published some time ago, various opinions have been entertained, which we have noticed elsewhere. They seem now to be almost forgotten. See *CHATTERTON*.

ROWLEY, *William*, who stands in the third class of dramatic writers, lived in the reign of King Charles I. and received his education at the university of Cambridge; but whether he took any degree there, is not evident; there being but few particulars preserved in regard to him more than his close intimacy and connection with all the principal wits and poetical geniuses of that age, by whom he was well beloved, and with some of whom he joined in their writings. Wood styles him "the ornament, for wit and ingenuity, of Pembroke-hall in Cambridge." In a word, he was a very great benefactor to the English stage, having, exclusive of his aid lent to Middleton, Day, Heywood, Webster, &c. left us five plays of his own composing, and one in which even the immortal Shakespeare afforded him some assistance.

ROWNING, JOHN, an English mathematician and philosopher of considerable ingenuity, was fellow of Magdalen college, Cambridge, and afterwards rector of Andover in Lincolnshire, in the gift of that society. He constantly attended the meetings of the Spalding society, and was a man of an extraordinary philosophical habit and turn of mind, while at the same time his dispositions were social and cheerful. His genius was peculiarly fitted for mechanical contrivances or inventions. He published a compendious system of Natural Philosophy at Cambridge, in the year 1738, in two vols. 8vo.; a work of much ingenuity, which has gone through several editions. He likewise inserted two pieces in the *Philosophical Transactions*, viz. a description of a barometer, wherein the scale of variation may be increased at pleasure; vol. xxxviii. p. 39.; and directions for making a machine for finding the roots of equations universally, together with the manner in which it is to be used; vol. lx. p. 240.

He died at his lodgings in Carey street, near Lincoln's

Roxburgh,
Roxburgh-
shire.

coln's-inn Fields, in the end of November 1771, at 72 years of age. Though a man both ingenious and pleasant, his external appearance was rather forbidding, as he was tall, stooped in the shoulders, and his countenance was down-looking and sallow.

ROXBURGHSHIRE, a county of Scotland, which is also known by the name of TEVIOTDALE, measures about 40 miles in length from north to south, and in breadth about 36 miles in a direction between east and west; containing 472,320 square acres. The centre of the county is computed to lie in 55°. 25'. N. Lat. and in 2°. 37'. W. Long. from the meridian of London. The counties of Northumberland and Cumberland form its boundary on the south; it is also bounded by the former county on the east, by Berwickshire on the north, and on the west by the counties of Dumfries, Se'kirk, and Edinburgh.

The external appearance of this county is regarded as upon the whole extremely beautiful, exhibiting an alternate succession of hills and dales, through which flow a considerable number of small rivers. The greater part of the hills are covered with a fine sward, producing valuable grasses for the feeding of sheep; and the county is divided into four different districts, the most mountainous part of it being denominated the district of Hawick; the second is that of Jedburgh; the third is the district of Kelso, and the fourth is known by the name of the district of Melrose, being composed of that part of the county which is situated to the northward of the rest.

The most remarkable hills in the county of Roxburgh are Minto, 858 feet above the level of the sea; Dunion 1021; Eldon 1330; Ruberslaw 1419; Carterfell 1602, Wisp 1803. These constitute a part of that extensive range generally known by the appellation of *Cheviot*, which is distant not above a mile from the most easterly point of Roxburgh. Whinstone is their chief constituent, in which veins of Scotch pebbles are usually interspersed. They are often covered with whinstone reduced to the state of powder by the action of the weather. The hills towards their summits are in general of a conical form, a circumstance which some think is favourable to the volcanic system;—that the globe at some remote period has suffered the most dreadful convulsions from the irresistible action of fire.

The county of Roxburgh is intersected by a multitude of streams, the most important of which are the Teviot, Jed, Tweed, Rule, Kale, Oxnam, Gala, Slitrig, Ale, Caster, Borthwick, Ednam, Bowmont, Allan, Leader, Ettrick, Hermitage, Liddel. The term *river* is rarely applied to any of these streams, except to the three first, viz. the Teviot, the Jed, and the Tweed, none of which are navigable but for small ferry boats. Some rivers in England, such as the Tyne, the Cocket, &c. have their origin in the more elevated parts of the county of Roxburgh.

In an agricultural point of view, Roxburghshire may be divided into land under tillage and under pasture, although a considerable portion of the latter may be reduced to arable land. The soils under tillage may be divided into light and clayey, the former of which is usually denominated *green*, and the latter *white soil*, because it is best adapted to the rearing of oats, wheat, and other white grains. What is called *till* in Roxburghshire, generally consists of a hard clay intermixed

with stones, by which it resembles coarse gravel. Most of the different species of till may be changed into a fertile soil in process of time, by being exposed to the action of the atmosphere, and mixed with lime and manure. Sweet, sour, and healthy, are the terms by which lands under pasture are usually distinguished, and these are conferred from a consideration of the nature of the soil, its grasses, and such other circumstances as indicate them to be favourable or unfavourable for the rearing of sheep. Much of these lands was, at a remote period, under wood and heath, the existence of the former being pointed out by the roots of trees still remaining in the ground. The soil in general is sharp and dry upon the hills; but some of the high moors and the grounds in the vicinity of rivers are wet and marshy.

There are different tracts of land in this county which still continue in a state of nature, a portion of which kind, measuring about four miles long and two broad, runs through part of the parishes of Ancrum and Roxburgh, chiefly of a light gravelly nature, covered with heath, bent, and other coarse grasses. The large district of Liddesdale is wholly under sheep-pasturage, with the exception of a few stripes on the banks of the Liddel and Hermitage. Indeed a cold wet soil, and exposed situation, and unfriendly climate, hold out few incentives to improvements in agriculture. In ancient times this must have been very different from what it is at present. The marks of the plough can still be traced on the summits of lofty mountains, where the production of crops at this day is wholly impracticable. The counties on the borders were not, at a remote period, possessed by individuals in large detached portions, but the people of a whole neighbourhood had their alternate ridges, in which case they became interested in defending the property of each other against invaders and plunderers. The wars of the border, however, were happily terminated by the union of England and Scotland under one sovereign, in consequence of which the holding of property in what was denominated *runrigg*, no longer possessed its ancient advantages, but was rather a disadvantage, as it created constant quarrels and disputes among farmers, and greatly retarded the improvement of the soil. Each individual, therefore, became anxious to have his lands detached from those of his neighbours, an advantageous change which was very soon and very generally adopted.

A Mr Dawson, the son of a farmer in Roxburghshire, having resided four years in the west riding of Yorkshire, and a year in Essex, thereby made himself well acquainted with the most approved methods of husbandry practised in England, and returned to his native country in the full assurance of being able to introduce into the agriculture of Scotland the most essential improvements. On his arrival in Roxburghshire in the year 1753, he immediately introduced the turnip husbandry, which he sowed in drills, and was certainly the first Scots farmer who introduced the cultivation of turnip into the open field. His neighbours being wholly ignorant of the agricultural knowledge which this young gentleman had acquired in England, began to predict his ruin as wholly inevitable; but he was not to be intimidated by their prophetic sentiments, and he went on resolutely in bringing his lands into the very best condition, which he fully effected by means of the turnip husbandry,

Roxburgh,
shire.

husbandry, by the sowing of artificial grasses, a practice then unknown in Scotland, and by the free and extensive use of lime. By such a procedure his neighbours saw him becoming rapidly opulent, and having followed his example with the most flattering success, they were constrained to alter their sentiments respecting his conduct as a farmer, and to hail him the father of the agriculture of the south of Scotland.

The rotation of crops now followed in this county has nothing in it of a peculiar nature, the arrangement on a dry soil being generally oats, turnips, barley with grasses, hay or pasture for one year, then barley as before. Where the soil is good and properly prepared, it is not uncommon with farmers to adopt the following rotation, viz. oats, turnips, oats, turnips, wheat or barley with grasses, and hay or pasture for one year. A part of Roxburghshire has been long celebrated for a species of oats which produce early crops, and which are known by the appellation of Blainsly oats, because they have been produced at Blainsly from time immemorial, which is a district in the parish of Melrose, and northern extremity of the county. These are often five shillings a boll dearer than common oats, and in no situation whatever are they known to degenerate. In some rich soils the produce is 16 or 18 for 1, and the lowest average produce is at least six for one. The general practice of feeding cattle with turnip has diminished the culture of pease and beans in this county, and there are so few potatoes reared that they cannot be regarded as forming a part of the farmer's crop. Extensive crops of hay are not in general cultivated in this county, there being but few cities in which an advantageous market could be found; and the use of it is in a great measure supplanted by that of turnip. Little more flax is reared than what is necessary for domestic purposes.

There is a circumstance worthy of observation, that the rearing of tobacco was, at one period, attempted in this county with remarkable success. It was introduced by a Mr Thomas Man, who had been for some time in America. Soon after the first experiments were made, a single acre of land produced a crop worth L.70 sterling; and the crop of 13 acres was sold on the ground for L.320; but in consequence of an act of parliament prohibiting the culture of it, the purchaser could not implement his bargain, and the farmer was obliged to sell it to government at the rate of fourpence a pound, in consequence of which it brought him no more than L.104 instead of L.320.

Great quantities of cattle are fed in this county, and about 260,000 sheep of the Cheviot breed in general, which are found to thrive remarkably in every part of the county. The horses are either of the English breed, or from Lanarkshire, which latter are deemed preferable for steady work in the plough. Although swine are not kept by the farmers as a part of their stock, yet great numbers of them are reared by tradesmen, cottagers, hinds, and others, the small breed being chiefly preferred, not exceeding eight or nine stones English each. Roxburghshire is also famous for the rearing of poultry, and immense quantities of eggs are sent from it to Berwick, to be shipped for the London market. Crows are here so numerous, that they frequently darken the air in their flight, and are extremely destructive to every species of grain. A great part of the county is uninclosed, and the fences made use of are the hedge

and ditch, although in some places upright stone dykes have the decided preference, where stones can be readily procured.

The orchards of Roxburgh county have been long celebrated for different kinds of fruit, and there are here two extensive nurseries for the rearing of trees. These last are at Hassendean burn in the parish of Minto, and at Hawick. The whole county, however, like that of Berwick, is extremely defective in mineral productions, and coal has nowhere been found. Limestone is no doubt met with in different places of it, but the want of fuel requisite for its calcination, induces farmers to bring it from Dalkeith or Edinburgh in their corn carts, which might otherwise return empty.

In the vicinity of Jedburgh there are two springs of chalybeate water, with indications of more in different parts of the parish, which have not yet been subjected to an examination or analysis, although the waters of *Tudhope well* have been regarded as antiscorbutic, and of use also in rheumatic disorders.

In this county there are many remains of antiquity, such as ancient strong buildings, and vestiges of camps. Different remains of encampments and fortifications are to be met with in the parish of Robertson, which in all probability have been the work of the Romans. Hermitage castle is situated upon the bank of the river of the same name, and is nearly 100 feet square, defended by a strong rampart and ditch. The inner part of it is a heap of ruins, but the walls are almost entire. This is probably the very castle mentioned by Smollet, which was built in Liddesdale by Alexander II. and which gave such offence to Henry III. of England that he made war on Alexander in the year 1240. There are several caves or recesses on the banks of the Ale water, not fewer than fifteen of which, it is said, may be still pointed out, in some of which the vestiges of chimneys or fire-places are very discernible. Although at first used by plunderers as places of safe retreat, they were no doubt afterwards employed by the poorer classes of the community as their ordinary habitations. Perhaps the abbey of Melrose is the most distinguished monument of antiquity to be met with in this county. See the article MELROSE.

Roxburghshire has given birth to some of the most eminent characters who have adorned the republic of letters, among whom we find Dr John Armstrong, a distinguished physician and poet; James Thomson, the far-famed author of the Seasons; the poet Gawin Douglas, at one time rector of Hawick, afterwards bishop of Dunkeld; and the celebrated George Augustus Eliot, afterwards Lord Heathfield.

Notwithstanding the difficulty of procuring fuel in this county, several manufactures have been carried on with a considerable degree of spirit and determined perseverance, the chief of which are carpets, inkle, cloth and stockings, in the manufacture of which nearly 300 packs of wool (each 12 stones) have been annually consumed. About 4000 pairs of stockings have been made in the same time, and 10 tons of linen yarn consumed in the making of inkle.

The population of this county in 1801, amounted to 33,682, and in 1811 to 37,230. The following is the population according to the parishes, taken from the Statistical History of Scotland. See ROXBURGHSHIRE SUPPLEMENT.

ROXENT-CAPE, or *Rock of Lisbon*, a mountain and remarkable promontory in Portugal, situated in the Atlantic ocean, at the north entrance of the Tagus, 22 miles north of Lisbon.

ROYAL, something belonging to a king: thus we say, royal family, royal assent, royal exchange, &c.

ROYAL Family. The first and most considerable branch of the king's royal family, regarded by the laws of England, is the queen.

1. The queen of England is either queen *regent*, queen *consort*, or queen *dowager*. The queen *regent*, *regnant*, or *sovereign*, is she who holds the crown in her own right; as the first (and perhaps the second) Queen Mary, Queen Elizabeth, and Queen Anne; and such a one has the same powers, prerogatives, right, dignities, and duties, as if she had been a king. This is expressly declared by statute 1 Mar. J. st. 3. c. i. But the queen *consort* is the wife of the reigning king; and she by virtue of her marriage is participant of divers prerogatives above other women.

And, first, she is a public person, exempt and distinct from the king; and not, like other married women, so closely connected as to have lost all legal or separate existence so long as the marriage continues. For the queen is of ability to purchase lands and to convey

them, to make leases, to grant copyholds, and do other acts of ownership, without the concurrence of her lord; which no other married woman can do: a privilege as old as the Saxon era. She is also capable of taking a grant from the king, which no other wife is from her husband; and in this particular she agrees with the *augusta* or *pissima regina conjux divi imperatoris* of the Roman laws; who, according to Justinian, was equally capable of making a grant to, and receiving one from, the emperor. The queen of England hath separate courts and officers distinct from the king's, not only in matters of ceremony, but even of law; and her attorney and solicitor general are entitled to a place within the bar of his majesty's courts, together with the king's counsel. She may likewise sue and be sued alone, without joining her husband. She may also have a separate property in goods as well as lands, and has a right to dispose of them by will. In short, she is in all legal proceedings looked upon as a *feme sole*, and not as a *feme covert*; as a single, not as a married woman. For which the reason given by Sir Edward Coke is this: because the wisdom of the common law would not have the king (whose continual care and study is for the public, and *circa ardua regni*) to be troubled and disquieted on account of his wife's domestic affairs; and therefore it vests in the queen a power of transacting her own concerns, without the intervention of the king, as if she were an unmarried woman.

The queen hath also many exemptions, and minute prerogatives. For instance: she pays no toll; nor is she liable to any amercement in any court. But in general, unless where the law has expressly declared her exempt, she is upon the same footing with other subjects; being to all intents and purposes the king's subject, and not his equal: in like manner as in the imperial law, *Augustus legibus solutus non est*.

The queen hath also some pecuniary advantages, which form her distinct revenue: as, in the first place, she is entitled to an ancient perquisite called *queen gold*, or *aurum reginæ*; which is a royal revenue belonging to every queen consort during her marriage with the king, and due from every person who hath made a voluntary offering or fine to the king, amounting to 10 merks or upwards, for and in consideration of any privileges, grants, licences, pardons, or other matter of royal favour conferred upon him by the king: and it is due in the proportion to one-tenth part more, over and above the entire offering or fine made to the king, and becomes an actual debt of record to the queen's majesty by the mere recording of the fine. As, if 100 merks of silver be given to the king for liberty to take in mortmain, or to have a fair, market, park, chase, or free-warren; there the queen is entitled to 10 merks in silver, or (what was formerly an equivalent denomination) to one merk in gold, by the name of *queen gold*, or *aurum reginæ*. But no such payment is due for any aids or subsidies granted to the king in parliament or convocation; or for fines imposed by courts on offenders against their will; nor for voluntary presents to the king, without any consideration moving from him to the subject; nor for any sale or contract whereby the present revenues or possessions of the crown are granted away or diminished.

The original revenue of our ancient queens, before and soon after the conquest, seems to have consisted in certain

certain reservations or rents out of the demesne lands of the crown, which were expressly appropriated to her majesty, distinct from the king. It is frequent in domesday book, after specifying the rent due to the crown, to add likewise the quantity of gold or other renders reserved to the queen. These were frequently appropriated to particular purposes: to buy wood for her majesty's use, to purchase oil for lamps, or to furnish her attire from head to foot, which was frequently very costly, as one single robe in the fifth year of Henry II. stood the city of London in upwards of 80 pounds: A practice somewhat similar to that of the eastern countries, where whole cities and provinces were specifically assigned to purchase particular parts of the queen's apparel. And for a farther addition to her income, this duty of queen gold is supposed to have been originally granted; those matters of grace and favour, out of which it arose, being frequently obtained from the crown by the powerful intercession of the queen. There are traces of its payment, though obscure ones, in the book of domesday, and in the great pipe-roll of Henry I. In the reign of Henry II. the manner of collecting it appears to have been well understood; and it forms a distinct head in the ancient dialogue of the exchequer written in the time of that prince, and usually attributed to Gervase of Tilbury. From that time downwards, it was regularly claimed and enjoyed by all the queen consorts of England till the death of Henry VIII.; though after the accession of the Tudor family, the collecting of it seems to have been much neglected: and there being no queen consort afterwards till the accession of James I. a period of near 60 years, its very nature and quantity then became a matter of doubt; and being referred by the king to the chief justices and chief baron, their report of it was so very unfavourable, that his consort Queen Anne, though she claimed it, yet never thought proper to exact it. In 1635, 11 Car. I. a time fertile of expedients for raising money upon dormant precedents in our old records (of which ship-money was a fatal instance), the king, at the petition of his queen Henrietta Maria, issued out his writ for levying it: but afterwards purchased it of his consort at the price of 10,000 pounds; finding it, perhaps, too trifling and troublesome to levy. And, when afterwards, at the Restoration, by the abolition of military tenures, and the fines that were consequent upon them, the little that legally remained of this revenue was reduced to almost nothing at all; in vain did Mr Prynne, by a treatise that does honour to his abilities as a painful and judicious antiquarian, endeavour to excite Queen Catherine to revive this antiquated claim.

Another ancient perquisite belonging to the queen consort, mentioned by all our old writers, and therefore only worthy notice, is this: that on the taking a whale on the coasts, which is a royal fish it shall be divided between the king and queen; the head only being the king's property; and the tail of it the queen's. *De stur-gione observetur, quod rex illum habeat integrum; de balena vero sufficit, si rex habeat caput, et regina caudam.* The reason of this whimsical division, as assigned by our ancient records, was, to furnish the queen's wardrobe with whale-bone.

But farther: though the queen is in all respects a subject, yet, in point of the security of her life and

person, she is put upon the same footing with the king. It is equally treason (by the statute 25 Edward III.) to imagine or compass the death of our lady the king's companion, as of the king himself; and to violate or defile the queen consort, amounts to the same high crime; as well in the person committing the fact, as in the queen herself if consenting. A law of Henry VIII. made it treason also for any woman who was not a virgin to marry the king without informing him thereof: but this law was soon after repealed; it trespassing too strongly, as well on natural justice as female modesty. If however the queen be accused of any species of treason, she shall (whether consort or dowager) be tried by the peers of parliament, as Queen Ann Boleyn was in 28 Hen VIII.

The husband of a queen regnant, as Prince George of Denmark was to Queen Anne, is her subject; and may be guilty of high treason against her: but, in the instance of conjugal fidelity, he is not subjected to the same penal restrictions. For which the reason seems to be, that if a queen consort is unfaithful to the royal bed, this may debase or bastardize the heirs to the crown; but no such danger can be consequent on the infidelity of the husband to a queen regnant.

2. A queen *dowager* is the widow of the king, and as such enjoys most of the privileges belonging to her as queen consort. But it is not high treason to conspire her death, or to violate her chastity; for the same reason as was before alleged, because the succession to the crown is not thereby endangered. Yet still, *pro dignitate regali*, no man can marry a queen dowager without special licence from the king, on pain of forfeiting his lands and goods. This Sir Edward Coke tells us, was enacted in parliament in 6 Henry VI. though the statute be not in print. But she, though an alien born, shall still be entitled to dower after the king's demise, which no other alien is. A queen dowager when married again to a subject, doth not lose her regal dignity, as peeresses-dowager do when they marry commoners. For Katherine, queen dowager of Henry V. though she married a private gentleman, Owen ap Meredith ap Theodore, commonly called *Owen Tudor*; yet, by the name of *Katherine queen of England*, maintained an action against the bishop of Carlisle. And so the dowager of Navarre marrying with Edmond the brother of King Edward I. maintained an action of dower by the name of *queen of Navarre*.

3. The prince of Wales, or heir apparent to the crown, and also his royal consort and the princess royal, or eldest daughter of the king, are likewise peculiarly regarded by the laws. For, by statute 25 Edw. III. to compass or conspire the death of the former, or to violate the chastity of either of the latter, are as much high treason as to conspire the death of the king or violate the chastity of the queen. And this upon the same reason as was before given; because the prince of Wales is next in succession to the crown, and to violate his wife might taint the blood-royal with bastardy; and the eldest daughter of the king is also alone inheritable to the crown on failure of issue male, and therefore more respected by the laws than any of her younger sisters; insomuch that upon this, united with other (feodal) principles, while our military tenures were in force, the king might levy an

Royal.

aid for marrying his eldest daughter, and her only. The heir apparent to the crown is usually made prince of Wales and earl of Chester, by special creation and investiture; but being the king's eldest son, he is by inheritance duke of Cornwall, without any new creation.

4. The rest of the royal family may be considered in two different lights, according to the different senses in which the term *royal family* is used. The larger sense includes all those who are by any possibility inheritable to the crown. Such, before the revolution, were all the descendants of William the Conqueror; who had branched into an amazing extent by intermarriages with the ancient nobility. Since the revolution and act of settlement, it means the Protestant issue of the princess Sophia; now comparatively few in number, but which in process of time may possibly be as largely diffused. The more confined sense includes only those who are in a certain degree of propinquity to the reigning prince, and to whom therefore the law pays an extraordinary regard and respect; but after that degree is past, they fall into the rank of ordinary subjects, and are seldom considered any farther unless called to the succession upon failure of the nearer lines. For though collateral consanguinity is regarded indefinitely with respect to inheritance or succession, yet it is and can only be regarded within some certain limits in any other respect, by the natural constitution of things and the dictates of positive law.

The younger sons and daughters of the king, and other branches of the royal family, who are not in the immediate line of succession, were therefore little farther regarded by the ancient law, than to give them a certain degree of precedence before all peers and public officers as well ecclesiastical as temporal. This is done by the statute 31 Henry VIII. c. 10. which enacts, that no person except the king's children shall presume to fix or have place at the side of the cloth of estate in the parliament chamber; and that certain great officers therein named shall have precedence, above all dukes, except only such as shall happen to be the king's son, brother, uncle, nephew (which Sir Edward Coke explains to signify grandson or *nepos*), or brother's or sister's son. But under the description of the king's *children*, his *grandsons* are held to be included, without having recourse to Sir Edward Coke's interpretation of *nephew*; and therefore when his late majesty King George II. created his grandson Edward, the second son of Frederick prince of Wales deceased, duke of York, and referred it to the house of lords to settle his place and precedence, they certified that he ought to have precedence next to the late duke of Cumberland, the then king's youngest son; and that he might have a seat on the left hand of the cloth of estate. But when, on the accession of his present majesty, these royal personages ceased to take place as the *children*, and ranked only as the *brother* and *uncle* of the king, they also left their seats on the side of the cloth of estate; so that when the duke of Gloucester, his majesty's second brother, took his seat in the house of peers, he was placed on the upper end of the earls bench (on which the dukes usually sit) next to his royal highness the duke of York. And in 1717, upon a question referred to all the judges by King George I. it was resolved, by the opinion of ten against the other

two, that the education and care of all the king's grandchildren, while minors, did belong of right to his majesty as king of this realm, even during their father's life. But they all agreed, that the care and approbation of their marriages, when grown up, belonged to the king their grandfather. And the judges have more recently concurred in opinion, that this care and approbation extend also to the presumptive heir of the crown; though to what other branches of the royal family the same did extend, they did not find precisely determined. The most frequent instances of the crown's interposition go no farther than nephews and nieces; but examples are not wanting of its reaching to more distant collaterals. And the statute of Henry VI. before mentioned, which prohibits the marriage of a queen-dowager without the consent of the king, assigns this reason for it: "because the disparagement of the queen shall give greater comfort and example to other ladies of estate, who are of the blood-royal, more lightly to disparage themselves." Therefore by the statute 28 Hen. VIII. c. 18. (repealed, among other statutes of treasons, by 1 Edw. VI. c. 12.) it was made high treason for any man to contract marriage with the king's children or reputed children, his sisters or aunts *ex parte paterna*, or the children of his brethren or sisters; being exactly the same degrees to which precedence is allowed by the statute 31 Hen. VIII. before mentioned. And now, by statute 12 Geo. III. c. 11. no descendant of the body of King Geo. II. (other than the issue of princesses married into foreign families) is capable of contracting matrimony, without the previous consent of the king signified under the great seal; and any marriage contracted without such a consent is void. Provided, that such of the said descendants as are not above 25, may, after a twelvemonth's notice given to the king's privy-council, contract and solemnize marriage without the consent of the crown; unless both houses of parliament shall, before the expiration of the said year, expressly declare their disapprobation of such intended marriage. And all persons solemnizing, assisting, or being present at any such prohibited marriage, shall incur the penalties of the statute of *præmunire*.

ROYAL Oak, a fair spreading tree at Boscobel, in the parish of Donnington in Staffordshire, the boughs of which were once covered with ivy; in the thick of which King Charles II. sat in the day-time with Colonel Careless, and in the night lodged in Boscobel house: so that they are mistaken who speak of it as an old hollow oak: it being then a gay flourishing tree, surrounded with many more. Its poor remains are now fenced in with a handsome wall, with this inscription in gold letters: *Felicissimam arborem quam in asyllum potentissimi regis Caroli II. Deus op. max. per quem reges regnant, hic crescere voluit, &c.*

ROYAL Society. See SOCIETY.

ROYALTIES, the rights of the king; otherwise called the *king's prerogative*, and the *regalia*. See PREROGATIVE and REGALIA.

ROYENIA, a genus of plants belonging to the decandria class; and in the natural method ranking under the 18th order, *Bicornes*. See BOTANY Index.

ROYSTON, a town of Hertfordshire in England, seated in E. Long. 0. 1. N. Lat. 52. 3. It is seated in a fertile vale full of inns; the market is very considerable for corn, and it contained 1309 inhabitants

in

in 1811. There was lately discovered, almost under the market place, a subterraneous chapel of one Rosia, a Saxon lady: it has several altars and images cut out of the chalky sides, and is in form of a sugar-loaf, having no entrance but at the top.

RUBBER, INDIA. See CAOUTCHOUC.

RUBENS, SIR PETER PAUL, the most eminent of the Flemish painters, was born in 1577; but whether at Antwerp or Cologne is uncertain. His father, who was a counsellor in the senate of Antwerp, had been forced by the civil wars to seek refuge in Cologne, and during his residence there Rubens is commonly said to have been born.

The genius of Rubens, which began to unfold itself in his earliest years, was cultivated with peculiar care, and embellished with every branch of classical and polite literature.

He soon discovered a strong inclination for designing; and used to amuse himself with that employment in his leisure hours, while the rest of his time was devoted to other studies. His mother, perceiving the bias of her son, permitted him to attend the instructions of Tobias Verhaecht a painter of architecture and landscape. He next became the pupil of Adam Van Oort, but he soon found that the abilities of this master were insufficient to answer his elevated ideas. His surly temper too was disgustful to Rubens, whose natural disposition was modest and amiable.

Anxious to find an artist whose genius and dispositions were congenial with his own, he became the disciple of Octavio Van Veen, generally known by the name of Otho Venius, a painter of singular merit, and who was not only skilled in the principles of his art, but also distinguished for learning and other accomplishments. Between the master and scholar a remarkable similarity appeared in temper and inclination; indeed, in the whole turn of their minds. It was this congeniality of sentiments which animated Rubens with that ardent passion for the art of painting which at length determined him to pursue it as a profession. From this time he gave up his whole mind to it; and so successful were his exertions, that he soon equalled his master.

In order to arrive at that perfection which he already beheld in idea, it became requisite to study the productions of the most eminent artists. For this purpose he travelled through Italy, visiting the most valuable collections of paintings and antique statues with which that country abounds.

Sandrat, who was intimately acquainted with Rubens, informs us, that he was recommended in the most honourable manner to the duke of Mantua by the archduke Albert, who had witnessed his talents in the finishing of some fine paintings designed for his own palace. At Mantua he was received by the duke with the most flattering marks of distinction, and had opportunities of improving himself, which he did not neglect. Here he carefully studied the works of Julio Romano. He next visited Rome, where he had an opportunity of examining the productions of Raphael. The paintings of Titian and Paolo Veronese called him to Venice, where he improved himself in the art of colouring.

He continued in Italy seven years. At length receiving intelligence that his mother was taken ill, he hastened to Antwerp: but his filial affection was not gratified with a sight of her; she died before his arrival.

He married soon after; but his wife dying at the end of four years, he retired from Antwerp for some time, and endeavoured to soothe his melancholy by a journey to Holland. At Utrecht he visited Hurlort, whom he greatly esteemed.

The fame of Rubens was now spread over Europe. He was invited by Mary of Medicis queen of Henry IV. of France to Paris, where he painted the galleries in the palace of Luxembourg. These form a series of paintings which delineate the history of Mary; and afford a convincing proof how well qualified he was to excel in allegorical and emblematical compositions. While at Paris he became acquainted with the duke of Buckingham, who was so taken with his great talents and accomplishments, that he judged him well qualified to explain to Isabella, the wife of Albert the archduke the cause of the misunderstanding which had taken place between the courts of England and Spain. In this employment Rubens acquitted himself with such propriety, that Isabella appointed him envoy to the king of Spain, with a commission to propose terms of peace, and to bring back the instructions of that monarch. Philip was no less captivated with Rubens: he conferred on him the honour of knighthood, and made him secretary to his privy council. Rubens returned to Brussels, and thence passed over into England in 1630 with a commission from the Catholic king to negotiate a peace between the two crowns. He was successful in his negotiation, and a treaty was concluded. Charles I. who then filled the British throne, could not receive Rubens in a public character on account of his profession; nevertheless, he treated him with every mark of respect. Having engaged him to paint some of the apartments of Whitehall, he not only gave him a handsome sum of money, but, as an acknowledgment of his merit, created him a knight; and the duke of Buckingham, his friend and patron, purchased of him a collection of pictures, statues, medals, and antiques, with the sum of L.10,000.

He returned to Spain, where he was magnificently honoured and rewarded for his services. He was created a gentleman of the king's bedchamber, and named secretary to the council of state in the Netherlands. Rubens, however, did not lay aside his profession. He returned to Antwerp, where he married a second wife called *Helena Forment*, who, being an eminent beauty, helped him much in the figures of his women. He died on 30th May 1640, in the 63d year of his age; leaving vast riches to his children. Albert his eldest son succeeded him in the office of secretary of state in Flanders.

As Rubens was possessed of all the ornaments and advantages that render a man worthy to be esteemed or courted, he was always treated as a person of consequence. His figure was noble, his manners engaging, and his conversation lively. His learning was universal. Though his favourite study must have occupied him much, yet he found time to read the works of the most celebrated authors, and especially the poets. He spoke several languages perfectly, and was an excellent statesman.

His house at Antwerp was enriched with every thing in the arts that was rare and valuable. It contained one spacious apartment, in imitation of the rotunda at Rome, adorned with a choice collection of pictures which

Rubens
||
Rubia

which he had purchased in Italy; part of which he sold to the duke of Buckingham.

His genius qualified him to excel equally in every thing that can enter into the composition of a picture. His invention was so fertile, that, if he had occasion to paint the same subject several times, his imagination always supplied him with something striking and new. The attitudes of his figures are natural and varied, the carriage of the head is peculiarly graceful, and his expression noble and animated.

He is by all allowed to have carried the art of colouring to its highest pitch; he understood so thoroughly the true principles of the chiaro-scuro, that he gave to his figures the utmost harmony, and a prominence resembling real life. His pencil is mellowed, his strokes bold and easy, his carnation glows with life, and his drapery is simple, but grand, broad, and hung with much skill.

The great excellence of Rubens appears in his grand compositions: for as they are to be viewed at a distance, he laid on a proper body of colours with uncommon boldness, and fixed all his tints in their proper places; so that he never impaired their lustre by breaking or torturing them; but touched them in such a manner as to give them a lasting force, beauty, and harmony.

It is generally allowed, that Rubens wanted correctness in drawing and designing; some of his figures being heavy and too short, and the limbs in some parts not being justly sketched in the outline. Though he had spent seven years in Italy in studying those antiques by which other celebrated artists had modelled their taste; though he had examined them with such minute attention as not only to perceive their beauties, but to be qualified to describe them in a Dissertation which he wrote on that subject: yet he seems never to have divested himself of that heavy style of painting, which, being peculiar to his native country, he had insensibly acquired. The astonishing rapidity too with which he painted, made him fall into inaccuracies, from which those works that he finished with care are entirely exempted.

Among his finished pieces may be mentioned the Crucifixion of Jesus Christ between the Two Thieves, which was very lately to be seen at Antwerp: but of all his works the paintings in the palace of Luxembourg best display his genius and his style.

It is the observation of Algarotti, that he was more moderate in his movements than Tintoretto, and more soft in his chiaro-scuro than Carravaggio; but not so rich in his compositions, nor so light in his touches, as Paolo Veronese; in his carnations less true than Titian, and less delicate than Vandyck. Yet he contrived to give his colours the utmost transparency and harmony, notwithstanding the extraordinary deepness of them; and he possessed a strength and grandeur of style which were entirely his own.

RUBIA, **MADDER**; a genus of plants belonging to the tetrandria class; and in the natural method ranking under the 47th order, *Stellatae*. See *BOTANY Index*; and for an account of the use of madder as a dye-stuff, see *DYEING Index*.

Madder-root is also used in medicine. The virtues attributed to it are those of a detergent and aperient; whence it has been usually ranked among the opening

roots, and recommended in obstructions of the viscera, particularly of the kidneys, in coagulations of the blood from falls or bruises, in the jaundice, and beginning dropsies.

This root, taken internally, tinges the urine of a deep red colour; and in the Philosophical Transactions we have an account of its producing a like effect upon the bones of animals who had it mixed with their food: all the bones, particularly the more solid ones, were said to be changed, both externally and internally, to a deep red; but neither the fleshy nor cartilaginous parts suffered any alterations: some of these bones macerated in water for many weeks together, and afterwards steeped and boiled in spirit of wine, lost none of their colour, nor communicated any tinge to the liquors. This root, therefore, was concluded to be possessed of great subtilty of parts, and its medical virtues hence to deserve inquiry. The same trials, however, made by others, have not been found to produce the same effects as those above mentioned.—Of late the root has come into great reputation as an emmenagogue.

RUBININSKA, one of the northern provinces of Russia, bounded by the province of Dwina on the north, by Syrianes on the east, by Belozera on the south, and by the lake Onega on the west.

RUBRIC, in the canon law, signifies a title or article in certain ancient law-books; thus called because written, as the titles of the chapters in our ancient bibles are, in red letters.

RUBUS, the **BRAMBLE**, or *Raspberry-bush*; a genus of plants belonging to the icosandria class; and in the natural method ranking under the 35th order, *Senticosæ*. See *BOTANY Index*. The principal species is the common raspberry, which, with its varieties, demands culture in every garden for their fruit; particularly the common red kind, white sort, and twice-bearing raspberry; all of which are great bearers; but for the general plantations, we choose principally the common red and the white kind, as being generally the greatest bearers of all; planting also a share of the twice-bearing sort, both as a curiosity and for the sake of its autumnal crops of fruit, which in favourable seasons ripen in tolerable perfection; observing to allow all the sorts some open exposure in the kitchen garden, though they will prosper in almost any situation.

The other species are considered as plants of variety, for hardy plantations in the shrubbery. Some of them are also very ornamental flowering plants; particularly the Virginian flowering raspberry, and the double-blossomed bramble, which answer well for ornamental compartments; and the white-berryed bramble, which is a great curiosity. All the other species and varieties serve to diversify large collections.

RUBY, a species of precious stone, belonging to the siliceous genus. See *MINERALOGY Index*. The ruby is of various colours; as, of a deep red colour inclining a little to purple; the *carbuncle* of Pliny; the spinell, of the colour of a bright corn poppy flower; the balass or pale red inclining to violet. Tavernier and Dutens inform us, that in the East Indies all coloured gems are named *rubies*, without regard to what their colours may be; and that the particular colour is added to the name of each in order to distinguish them from one another. The spinell rubies are above half the value of diamonds

Rubis
||
Ruby.

of the same weight; the balass is valued at 30 shillings per carat. Tavernier mentions 108 rubies in the throne of the Great Mogul, from 100 to 200 carats, and of a round one almost $2\frac{1}{2}$ ounces: there is also mention made by other travellers of rubies exceeding 200 carats in weight. According to Dutens, a perfect ruby, if it weigh more than $3\frac{1}{2}$ carats, is of greater value than a diamond of the same weight. If it weigh one carat, it is worth ten guineas; if two carats, 40 guineas; three carats, 150 guineas; if six carats, upwards of 1000 guineas.

Rubies, it is said, are artificially made from Brasilian topazes of a smoky appearance, by giving them a gradual heat in a crucible filled with ashes, until it be red hot.

Rock Ruby, the *amethystizontas* of the ancients, is found in Syria, Calcutta, Cananor, Cambaya, and Ethiopia. It is the most valued of all the varieties of garnets, and is frequently sold as a ruby under the name of *rubinus Russicum*.

RUCTATION, a ventosity arising from indigestion, and discharging itself at the mouth with a very disagreeable noise.

RUDBECK, OLAUS, a learned Swedish physician, born of an ancient and noble family in 1630. He became professor of medicine at Upsal, where he acquired great applause by his extensive knowledge; and died in 1702. His principal works are, 1. *Exercitatio anatomica, exhibens ductus novos hepaticos aquosos, et vasa glandularum serosa*, in 4to. He there asserts his claim to the discovery of the lymphatic vessels, against the pretensions of Thomas Bartholin. 2. *Athlantica, sive Manheim, vera Japheti posterorum sedes ac patria*, 4 vols. folio, is full of strange paradoxes supported with profound learning: he there endeavours to prove, that Sweden was the country whence all the ancient Pagan divinities and our first parents were derived; and that the Germans, English, French, Danes, Greeks, and Romans, with all other nations, originally came from thence.

RULBECKIA, a genus of plants belonging to the syngenesia class; and in the natural method ranking under the 49th order, *Compositae*. See *BOTANY INDEX*.

RUDDER, in *Navigation*, a piece of timber turning on hinges in the stern of the ship, and which, opposing sometimes one side in the water and sometimes another, turns or directs the vessel this way or that. See *HELM*.

In the seventh volume of the Transactions of the Society instituted at London for the Encouragement of Arts, Manufactures, and Commerce, there is explained a method of supplying the loss of a ship's rudder at sea. The invention, which is Capt. Pakenham's of the royal navy, has been approved by Admiral Cornwallis, the commissioners of the admiralty, by the society in whose transactions the account of it was first published, and who presented to Capt. Pakenham their gold medal, by the Trinity-house, by the managing owners of East India shipping, by the duke of Sudermania then regent of Sweden, and by the society for the improvement of naval architecture. The substitute here recommended for a lost rudder, says the inventor, is formed of those materials without which no ship goes to sea, and its construction is simple and speedy. Capt. Pakenham, however, did not give a particular account of his inven-

tion to the society whom he addressed, and to whom he sent a model of his invention, till such time as he had an opportunity of reducing the theory he had conceived to practice. On the 7th of July 1788, he made this trial with the Merlin of Newfoundland; and he declares that, during the different manœuvres of tacking and wearing, he could not discover the least variation between the operation of the machine and that of the ship's rudder: she was steered with the same ease by one man, and answered the helm in every situation fully as quick. Admiral Cornwallis certifies the same with respect to the Crown of 64 guns, which lost her rudder on the Kentish Knock, when with the substitute she was steered to Portsmouth with the utmost ease in a heavy gale, and, as the admiral asserts, it would have taken her to the East Indies.

The materials and construction are thus described in the Transactions. "N^o 1. A topmast inverted; the fid-hole to ship the tiller in, and secured with hoops from the anchor stocks; the heel forming the head of the rudder. N^o 2. The inner half of a jibb-boom. N^o 3. The outer half of a jibb-boom. N^o 4. A fish: the whole of these materials well bolted together:—in a merchantman her ruff-tree. N^o 5. A cap, with the square part cut out to fit the stern-post, and acting as a lower gudgeon, secured to the stern-post with hawsers, leading from the bolts of the cap, under the ship's bottom, into the hawse-holes, and hove well tort. N^o 6. A plank, or, if none on board, the ship's gangboards. N^o 7. Anchor-stocks, made to fit the topmast as partners, secured to the deck, and supplying the place of the upper gudgeon, and in a merchant ship the clamps of her windlass. N^o 8. A stern-post. N^o 9. Hoops from the anchor-stocks. N^o 10. Pigs of ballast, to sink the lower part. The head of the rudder to pass through as many decks as you wish."

On this the Captain makes the following remarks: "It might probably be supposed, that a difficulty would occur in bringing the jaws of the cap to embrace the stern-post; but this will at once be obviated, when it is remembered that the top-chains, or hawsers, leading from each end of the jaws, under the ship's bottom, are in fact a continuance of the jaws themselves. Nor can it be apprehended that the cap, when fixed, may be impelled from its station, either by the efforts of the sea, or the course of the ship through the water, though even the hawsers, which confine it in the first instance, should be relaxed:—the experiment proves, that the partners must be first torn away, or the main-piece broken off.

"Since the improved state of navigation, notwithstanding remedies have been found in general for the most disastrous accidents at sea, experience has evinced that nothing complete had been hitherto invented to supply the loss of a rudder. The first expedient within my knowledge were cables veered astern, with tackles leading from them to the ship's quarters. This practice was superseded by the invention of the machine usually called the *Ipswich machine*; but the construction of it is complex and unwieldy, and vessels are seldom found in possession of the materials which forms it. Commodore Byron, in the Journal of his Voyage round the World, says, that the Tamer, with every assistance from his own ship, was five days in constructing it. Besides, like the before-mentioned scheme, it can only operate to steer a

Rudder.

Plate

Rudder,
Ruddiman.

ship large (and that but very wildly), and of course, under the circumstance of a lee-shore, defeat the most skilful exertions of a seaman. Several other expedients have been adopted, which I shall not mention here, as the same defects equally appear in all.

“ Thus it was apparent, that ample room was left for the discovery of some more certain resource than any of the former; and the scheme which has suggested itself to me, will, I trust, be found fully to answer the purpose intended. The materials are such as scarcely any ship can venture to sea without; and the construction so speedy, easy, and simple, that the capacity of the meanest sailor will at once conceive it. I need not, from mathematical principles, show the certainty of its effect, as it is formed and managed in the same manner as a ship's common rudder: and as the common rudder is certainly of all inventions the best calculated for guiding a vessel through the water, it will of course follow, that whatever substitute the nearest resembles that, must be best adapted to supply its loss.”

RUDDIMAN, THOMAS, one of the most eminent grammarians which Scotland has produced, was born in October 1674 at Raggel, in the parish of Boyndie and county of Banff. His father James Ruddiman was a farmer, and strongly attached to the house of Stuart.

Mr Ruddiman was instructed in the principles of Latin grammar at the parish school of Boyndie, where his application was so vigorous, and his progress so rapid, that he quickly surpassed all his class fellows. His master George Morrison, who was a skilful and attentive teacher, being unwilling to check his ardour for learning, permitted him to follow the impulse of his genius, and to advance without waiting the slow progress of the other boys.

The pleasure which the youthful mind receives from vivid description, though wild and romantic, approaches to ecstasy, and often makes an impression which remains indelible. While at school, the first book which charmed the opening mind of Ruddiman was Ovid's *Metamorphoses*; nor did he cease to relish the beauties of this author when his judgment was mature, for during the rest of his life Ovid was his favourite poet.

At the age of sixteen he became anxious to pursue his studies at the university; but his father thinking him too young, opposed his inclination. Hearing of the competition trial, which was annually held at King's college, Aberdeen, for a certain number of bursaries on the foundation of that university, Ruddiman's ambition was kindled. Without the knowledge of his father, and with only a single guinea in his pocket, which his sister had privately given him, he set out for that place. On the road he was met by a company of gypsies, who robbed him of his coat, his shoes, his stockings, and his guinea. This misfortune did not damp his enterprising spirit: He continued his journey to Aberdeen, presented himself before the professors as a candidate; and, though he had neither clothes to give him a decent appearance nor friends to recommend him, he gained the first prize.

After attending the university four years, he obtained the degree of master of arts; an honour of which he was always proud. The thesis says, the disputation on this occasion lasted *ab aurora usque ad vesperum*, i. e. “from morning till night.” Though Ruddiman was only 20

years of age when he left the university, it appears from a book intitled *Rhetoricorum Libri tres*, composed before this period, but never published, that he had then read the Roman classics with uncommon attention and advantage.

He was soon after engaged as a tutor to the son of Robert Young, Esq. of Auldbar, the great grandson of Sir Peter Young, who under the direction of Buchanan had been preceptor of James VI. His income here must have been very small, or his situation unpleasant; for within a year he accepted the office of schoolmaster in the parish of Laurencekirk. The profession of schoolmaster in a country parish at that period could open no field for ambition, nor prospect of great emolument; for by an act of parliament passed in 1633, the salary appropriated to this office could not be increased above 200 merks Scots, or L.11, 2s. 2½d. sterling. In discharging the duties of this humble but important station, it is probable that he used Simson's *Rudimenta Grammatica*, which was then generally taught in the northern schools, and by which he himself had been instructed in the principles of Latin grammar.

When Ruddiman had spent three years and a half in this employment, the celebrated Dr Pitcairne happening to pass through Laurencekirk, was detained in that village by a violent storm. Pitcairne wanting amusement, inquired at the hostess if she could procure any agreeable companion to bear him company at dinner. She replied, that the schoolmaster, though young, was said to be learned, and, though modest, she was sure could talk. Pitcairne was delighted with the conversation and learning of his new companion, invited him to Edinburgh, and promised him his patronage.

When Ruddiman arrived in Edinburgh, the advocates library, which had been founded 18 years before by Sir George Mackenzie, attracted his curiosity and attention, and he was soon after appointed assistant-keeper under Mr Spottiswoode the principal librarian. His salary for executing this laborious office was L.8, 6s. 8d. He had besides a small honorary present from those who were admitted advocates for correcting their theses: he was also paid for copying manuscripts for the use of the library. And the faculty, before he had held the office two years, were so highly pleased with his conduct, that they made him a present of 50 pounds Scots, or L.4, 3s. 4d. sterling.

During the sitting of the court of session he attended the library from ten till three. But this confinement did not prevent him from engaging in other laborious duties: A part of his time was occupied in teaching young gentlemen the Latin language. Some he attended at their lodgings, some waited upon him, and some resided in his own house. An exact list of the names of those who attended him, expressing the date of their entry, and the sums which he was to receive from each, has been found in his pocket-book; a curious relic, which is still preserved.

When Ruddiman's merit as a scholar became better known, his assistance was anxiously solicited by those who were engaged in literary publications. Freebairne, a respectable bookseller of that period, prevailed upon him to correct and prepare for the press Sir Robert Sibbald's *Introductio ad historiam rerum à Romanis gestarum in ea Borealis Britanniae parte quae ultra murum Picticum est*. He received for his labour L.3 sterling.

At

Ru man. At the request of Mr Spottiswoode librarian, for 5l. sterling he contributed his aid to the publication of Sir Robert Spottiswoode's Practiques of the Laws of Scotland.

In 1707 he commenced auctioneer, an employment not very suitable to the dignified character of a man of letters; but to this occupation he was probably impelled by necessity; for upon balancing his accounts at the end of the preceding year, the whole surplus was 28l. 2s. with prospects of 236l. 7s. 6d. Scots. Ruddiman had a family; and seems to have been a stranger to that foolish pride which has seduced some literary men into the opinion, that it is more honourable to starve than have recourse to an occupation which men of rank and opulence are accustomed to despise. The same year he published an edition of *Voluseni de Animi Tranquillitate Dialogus*, to which he prefixed the life of Voluse-nus. Voluse-nus or Wilson was a learned Scotsman, and had the honour to be patronised by Cardinal Wolsey (See Wilson). In 1709 he published *Johnstoni Cantici Solomonis Paraphrasis Poetica*, and *Johnstoni Cantica* with notes, which he dedicated in verse to his friend and patron Dr Pitcairne. The edition consisted of 200 copies. The expence of printing amounted to 5l. 10s. sterling, and he sold them at a shilling each copy.

The philological talents of Ruddiman were next directed to a more important object, in which they became more conspicuous and useful. Freebairne the bookseller proposed to publish a new edition of the Scottish translation of Virgil's *Æneid* by Gawin Douglas bishop of Dunkeld. Of the contributions which some eminent characters of the age presented, the most valuable were supplied by Ruddiman. Freebairne acknowledged in general terms this obligation, but has not done him the justice to inform the reader what these valuable contributions were, and Ruddiman's modesty restrained him from publicly asserting his claim. From the pocket-book which has been already mentioned, it appears that Ruddiman corrected the work and wrote the glossary; and there is strong reason to believe that he was the author of the 42 general rules for assisting the reader to understand the language of Douglas. To those who wish to be acquainted with the ancient language of this island, the glossary will be a treasure, as it forms a compendious dictionary of the Anglo-Saxon. For this elaborate work Ruddiman was allowed 8l. 6s. 8d. sterling.

The reputation of Ruddiman had now extended to a distance. He was invited by the magistrates of Dundee to be rector of the grammar school of that town; but the faculty of advocates, anxious to retain him, augmented his salary to 30l. 6s. 8d. sterling, and he declined the offer.

In 1711 he assisted Bishop Sage in publishing Drummond of Hawthornden's works; and performed the same favour to Dr Abercrombie, who was then preparing for the press his *Martial Achievements*.

In 1713 he was deprived of his friend Dr Pitcairne. On this occasion he testified all the respect which friendship could inspire to the memory of his deceased patron and surviving family. He composed Pitcairne's epitaph, and conducted the sale of his library, which was disposed of to Peter the Great of Russia.

In 1714 the Rudiments of the Latin tongue were published. Eighteen or nineteen Latin grammars, composed by Scotchmen, had appeared before this period; yet such is the intrinsic value of this little treatise, that it soon superseded all other books on the subject, and is now taught in all the grammar schools in Scotland. It has also been translated into other languages.

He was next called upon to publish the works of Buchanan. The value of these he enhanced much by an elaborate preface, his *Tabula Regum Scotiae Chronologica* and *Propriorum Nominum Interpretatio*. The interpretation of proper names was highly requisite; for Buchanan has so disguised them in the Roman dress, that the original name is scarcely discernible; and the preface puts the reader on his guard against the chronological errors and factious spirit of the history. Ruddiman also added a learned dissertation, intitled *De Metricis Buchananæ Libellus*, and subjoined annotations critical and political on the History of Scotland. As he espoused the cause of Queen Mary, he raised against himself a host of enemies, and gave occasion to that celebrated controversy which has been carried on with much keenness and animosity, and with little intermission, even to the present times. For this work Ruddiman was promised 40l. sterling.

He had now been so long accustomed to superintend the press, that he was led to form the plan of erecting a printing-office himself (A). Accordingly, in the year 1715, he commenced printer in partnership with his brother Walter, who had been regularly bred to the business. Some years after he was appointed printer to the university, along with James Davidson bookseller.

The first literary society formed in Scotland was instituted in the year 1718. It probably derived its origin from the factious and turbulent spirit of the times. The learned, anxious perhaps to find some respite from the political dissensions of the day, endeavoured to procure it in elegant amusement; for one of the fundamental articles of the new association was, that the "affairs of church and state should not be introduced." Ruddiman and the masters of the high-school had the honour to found this society. They were afterwards joined by Lord Kaimes.

In 1725, the first part of his *Grammaticæ Latinae Institutiones*, which treated of etymology, was published. The second part, which explained the nature and principles of syntax, appeared in 1731. He also wrote a third part on prosody, which is said to be more copious and correct than any other publication on the subject. When urged to give it to the public, he said dryly, "The age has so little taste, the sale would not pay

U u 2 the

(A) It has long been an object of curiosity to ascertain the time at which the art of printing was introduced into Scotland. Mr Robertson, the late keeper of the records, discovered a patent of King James IV. which renders it certain that a printing-press was first established at Edinburgh during the year 1507, 30 years after Caxton had brought it into England. See PRINTING.

Ruddiman. the expense." Of this work he published an abridgement, to which he subjoined an abstract of his prosody.

Ruddiman next engaged in the management of a newspaper, an employment for which his genius and industry seemed to render him well qualified. But those who should expect either much information or amusement from this publication, would perhaps be greatly disappointed. The newspaper which he conducted was the *Caledonian Mercury*, and was established in 1720 by William Rolland a lawyer. Ruddiman acted only in the capacity of printer for five years; but upon the death of Mr Rolland in 1729, the property was transferred to him, or to his brother Walter and him conjointly. This paper continued in the family of Ruddiman till the year 1772, when it was sold by the trustees of his grand-children.

The *Caledonian Mercury* was at first printed three times a week, on Monday, Tuesday, and Thursday, in a small 4to of four pages, with two columns in each page, and 50 lines in each column; so that the whole paper contained only 400 lines. It now contains in its folio size 2480 lines.

Mr Ruddiman, after the death of Mr Spottiswoode librarian, remained for some time in his former station; but was at length appointed keeper of the library; though without any increase of salary; and some years after Mr Goodal, the defender of Queen Mary, succeeded him in the office of sub-librarian.

The assiduous application of Ruddiman, supported by such learning, was intitled to wealth, which now indeed flowed upon him in what was at that period deemed great abundance. On the first of October 1735, it appeared from an exact statement of his affairs, that he was worth L.1882 5s. 2d. sterling; and on the 20th of May, the ensuing year, his wealth had increased to L.1985 6s. 3d. sterling. In 1710 he valued his effects at L.24 14s. 9d. sterling.

In 1737 the schoolmasters and teachers in Edinburgh formed themselves into a society, in order to establish a fund for the support of their wives and children. Of this scheme Ruddiman was an active promoter, and was chosen treasurer. Perhaps it was this association which in 1742 gave the idea to the Scots clergy of forming their widows fund.

In 1790 he published *Selectus Diplomatum et Numismatum Scotiæ Thesaurus*. This work was projected and begun by Anderson (hence called *Anderson's Diplomata*), but was finished by Ruddiman. The preface, which is an excellent commentary on Anderson's performance, was written by Ruddiman, and displays a greater extent of knowledge than any of his other productions.

As Ruddiman had imbibed from his father those political principles which attached him to the family of Stuart, he probably did not remain an unconcerned spectator of the civil commotions which in 1745 agitated Scotland. He did not, however, take any active part in the rebellion. His principles, he has been heard to say, induced him to be a quiet subject and a good citizen. He retired to the country during the summer of 1745; and while his fellow-citizens were spilling each others blood, he was more happily engaged in writing *Critical Observations on Burman's Commentaries on Lucan's Pharsalia*. The *Caledonian Mercury* was in

the mean time marked with a jealous eye. His son, Ruddiman who had for some time been the principal manager of that newspaper, having copied a paragraph which was reckoned seditious from an English paper, was imprisoned. The solicitation of his father procured his release: but it was too late; for the unhappy young man had contracted a distemper in the tollbooth of Edinburgh which brought him to his grave.

During the last seventeen years of his life Ruddiman was almost incessantly engaged in controversy. To this he was in some measure compelled by the violent attacks which some critics of the times had successively made upon his works. He was first called upon by Benson, auditor in the exchequer, to determine the comparative merit of Buchanan and Johnston as poets. He gave a decided preference to Buchanan in perspicuity, purity, and variety of style; but, like a candid critic, allowed Johnston to be superior in the harmony of his numbers. His next antagonist was Logan, one of the ministers of Edinburgh, a weak illiterate man, but an obstinate polemic. The subject of contest was, whether the crown of Scotland was strictly hereditary, and whether the birth of Robert III. was legitimate? Ruddiman maintained the affirmative in both points, and certainly far surpassed his antagonist in the powers of reasoning. He proved the legitimacy of Robert by the public records of the kingdom with a force of argument which admits of no reply; but in discussing the first question (by which he was led to consider the contest between Bruce and Baliol) he was not so successful: for there are many instances in the history of Scotland in which the brother succeeded to the crown in preference to the son. He showed, however, that the Scottish crown was at no period properly elective; and that, according to the old licentious constitution of the kingdom, the right of Bruce, who was the nearest in blood to the royal stock, was preferable to the claim of Baliol though descended from the eldest daughter.

But the labours of Ruddiman did not end when the pen dropt from the feeble hand of Logan. He was soon called upon to repel the attacks of Love schoolmaster of Dalkeith, who maintained, in opposition to him, that Buchanan had neither repented of his treatment of Queen Mary, nor had been guilty of ingratitude to that princess. That Buchanan ever repented there is reason to doubt. Whether he was guilty of ingratitude, let the unbiassed determine, when they are assured by authentic records that Mary conferred on him a pension for life of 500 pounds Scots.

When Ruddiman had arrived at his eightieth year, and was almost blind, he was assailed by James Man, master of an hospital at Aberdeen, with a degree of rancour and virulence, united with some learning and ability, which must have touched him in a sensible manner, and alarmed his fears for his reputation after his decrease. He was called a *finished pedant*, a *ferocious calumniator*, and a *corrupter of Buchanan's works*. The venerable old man again put on his armour, entered the lists, and gained a complete victory. Man, with all his acuteness, could only point out twenty errors in two folio volumes. Some of these were typographical, some trifling, and some doubtful. Ruddiman, with much pleasantry, drew up against Man an account of 469 errors, consisting of 14 articles, of which two or three may be produced as a specimen. 1. Falsehoods and prevarications,

Rud nan, Rud heim. varications, 20. 2. Absurdities, 69. 3. Passages from classic authors which were misunderstood by Man, 10. The triumph which he gained over this virulent adversary he did not long enjoy; for he died at Edinburgh on the 19th of January 1757, in the 83d year of his age, and was buried in the Grey Friars churchyard without any monument to distinguish his grave.

He was three times married, but left behind him only one daughter, Alison, who was married in 1747 to James Stewart, Esq. He is supposed to have died worth L.3000 sterling.

He was of the middle size, of a thin and straight make, and had eyes remarkably piercing. Of his talents and learning his works afford the most satisfactory proofs. His memory was tenacious and exact. He could repeat long passages of his favourite poet Ovid, to the amount of 60 lines, and without omitting a word. He was so great a mas'ter in the Latin language, that he has perhaps been equalled by none since the days of Buchanan.

Ruddiman has left a character unstained by vice, and distinguished by many virtues. His piety was exemplary. He spent Sunday in religious employment; and we are informed had prayers read to him every morning by his amanuensis when the infirmities of age required such an assistant. He was frugal of his time, neither indolent nor fond of amusement; and so remarkably temperate, that it is said he was never intoxicated. Though often forced into controversy, and treated with insolence, he never descended to scurrility and abuse, nor cherished resentment against his enemies. His candour was much admired in one instance in the favourable character which he published in the Caledonian Mercury of his antagonist Love (B), after his decease. Upon the whole, it must be allowed that Ruddiman has been of great service to classical literature, and an honour to his native country.

RUDESHEIM, a rich village of the Rhinegau, situated about five miles from the city of Mentz, contains about 2500 inhabitants. The wine of this place is looked upon as without comparison the best of the Rhinegau, and consequently of all Germany. Baron Riesbeck says, he found it much more fiery than that of Hochheim; but that for pleasantness of taste there is no comparison betwixt them. The best Rudesheim, like the best Hochheimer, sells upon the spot for three guilders the bottle. "You can (says our author) have no tolerable wine here for one guilder, nor any very good for two; at least I should prefer the worst Burgundy I ever tasted to any Rudesheimer I met with either here or at Mentz for these prices. Indeed the wine of our host (a rich ecclesiastic) was far better than any we could get at the inn. It stands to reason, that the same vintage furnishes grapes of very different degrees of goodness; but besides this, it is in the Rhi-

negau as every where else. The best wines are generally sent abroad by the poor and middling inhabitants, and the worst kept for internal consumption; for the expense of the carriage being the same in both cases, strangers had much rather pay a double price for the good than have the bad. It is only rich people, such as our host was, who can afford to keep the produce of their land for their own drinking. Upon this principle, I have eaten much better Swiss cheeses out of Switzerland than in it, and have drank much better Rhenish in the inns of the northern parts of Germany than in the country where the wine grows. The position of the country also contributes to render the wine dearer than it would otherwise be. As the best wine grows in its more northern parts, the easy transport by the Rhine to Holland, and all parts of the world, raises its price above its real value. The place where the flower of the Rudesheim wine grows is precisely the neck of the land, formed by the winding of the Rhine to the north, after it has run to the westward from Mentz hither. This neck, which is a rock almost perpendicular, enjoys the first rays of the rising and the last of the setting sun. It is divided into small low terraces, which are carried up to the utmost top of the hill like steep stairs; these are guarded by small walls and earthen mounds, which are often washed away by the rain. The first vine was brought hither from France, and they still call the best grape the Orleanois. They plant the vine stocks very low, scarce ever more than four or five feet high. This way of planting the vine is favourable to the production of a great deal of wine, but not to its goodness, as the phlegmatic and harsh parts of it would certainly evaporate more, if the sap were refined through higher and more numerous canals. This is undoubtedly the reason why every kind of Rhenish has something in it that is harsh, sour, and watery. The harvest of the best vineyards, which are the lower ones, in the above mentioned neck of land, is often bought before-hand, at the advanced price of some ducats, by Dutch and other merchants. It must be a very rich stock to yield above four measures of wine.—You may easily imagine, that the cultivation of vineyards must be very expensive in this country, as the dung, which is extremely dear, must be carried up to the top of the mountains on the peasants shoulders."

RUDIMENTS, the first principles or grounds of any art or science, called also the elements thereof.

RUE. See RUTA, BOTANY Index.

RUE, *Charles de la*, a French orator and poet, was born at Paris in 1643. He was educated at the college of the Jesuits, where he afterwards became a professor of humanity and rhetoric. At an early age his talent for poetry disclosed itself. In 1667, when he was only 24 years old, he composed a Latin poem on the conquests of Louis XIV. which was so much esteemed by the

Rudesheim
||
Rue.

(B) The following character of Love was published in the Caledonian Mercury of the 24th of September 1750. "On Thursday morning died at Dalkeith, after a lingering illness, in the 55th year of his age, Mr John Love, rector of the grammar-school there; who, for his uncommon knowledge in classical learning, his indefatigable diligence, and strictness of discipline without severity, was justly accounted one of the most sufficient masters in this country." This character is doubtless just; though Love is now known to have been the schoolmaster satirized by Smollet in the beginning of his Roderick Random.

Rue
Ruff.

the celebrated Peter Corneille, that he translated it into French, presented it to the king, and at the same time passed so high encomiums on the superior merit of the original, that the author was received into the favour of that monarch, and ever after treated by him with singular respect.

De la Rue, anxious to preach the gospel to the Canadians, requested leave of absence from his superiors; but having destined him for the pulpit, they refused to comply with his request. Accordingly he commenced preacher, and became one of the most eminent orators of his age. In his discourses he would probably have been too lavish of his wit, if he had not been cautioned against it by a judicious courtier. "Continue (said he) to preach as you do. We will hear you with pleasure as long as you reason with us; but avoid wit. We value the wit contained in two verses of a song more than all that is contained in most of the sermons in Lent."

Respecting the delivery of sermons, he entertained an opinion quite opposite to the established practice of his countrymen. In France it was customary not to read sermons from the pulpit, but to recite them from memory. This he considered as a laborious task, not compensated by any advantages. On the contrary, he was of opinion that reading sermons was preferable.—The preacher, with his discourse before him, could read it with ease, free from that timidity and embarrassment which frequently attends the act of recollection; and he would save a considerable time which is usually spent in committing it to memory. In these sentiments many will not be disposed to acquiesce: but, without pretending to determine the question, it may be asserted, that a sermon, whether read or recited, if spoken in a serious manner, and with proper inflections and tones of voice, will produce all the effects for which a sermon is calculated.

De la Rue died at Paris on the 27th of May 1725, at the age of 82.

He was as amiable in society as he was venerable in the pulpit. His conversation was pleasant and instructive. His taste and knowledge enabled him to converse with ease, and to express himself with propriety on every subject. He charmed his superiors by his wit, and his inferiors by his affability. Though living amidst the bustle of the world, he was always prepared for the solitude of the closet and the retreat of the cloister. In the pulpit he poured forth the finest effusions of eloquence in the most animated and impressive manner.—He published Panegyrics, Funeral Orations, and Sermons. His best sermon is that intitled *Des Calumnies Publiques*, and his most admired funeral oration was composed on the Prince of Luxembourg. There are also tragedies of his writing, both in Latin and French, which were approved by Corneille. He was one of those who published editions of the classics for the use of the Dauphin. Virgil, which fell to his share, was published with notes, and a Life of the Poet, in 1675, 4to, and is a valuable and useful edition.

RUPELLIA, a genus of plants belonging to the didynamia class; and in the natural method ranking under the 40th order, *Personateæ*. See BOTANY Index.

RUFF, a species of PERCA. See ICHTHYOLOGY Index.

RUFF, a species of TRINGA. See ORNITHOLOGY Index.

RUFFHEAD, DR OWEN, was the son of his Majesty's baker in Piccadilly; who buying a lottery ticket for him in his infancy, which happened to be drawn a prize of 500l. this sum was applied to educate him for the law. He accordingly entered in the Middle Temple; and seconded so well the views of his father, that he became a good scholar and an acute barrister. While he was waiting for opportunities to distinguish himself in his profession, he wrote a variety of pamphlets on the politics of the day; and was afterwards distinguished by his accurate edition of *The Statutes at Large*, in 4to. He now obtained good business, though more as a chamber counsellor in framing bills for parliament than as a pleader; but his close application to study, with the variety of works he engaged in as an author, so impaired his constitution, that after the last exertion of his abilities to defend the conduct of administration toward Mr Wilkes, by a pamphlet entitled, "The Case of the late election for the county of Middlesex considered," he was prevented from receiving the reward of a place in the Treasury, by dying in 1769, at about 46 years of age. Some time before his death, Bishop Warburton engaged him to write his long promised *Life of Alexander Pope*; which, however, when executed, was very far from giving general satisfaction. The author attributed his ill success to the deficiency of his materials; while the public seemed rather to be of opinion that, as a lawyer, he ventured beyond his proper line, when he assumed the task of a critic in poetry.

RUFFLING, or RUFFING, a beat on the drum. Lieutenant-generals have three ruffles, major-generals two, brigadiers one, and governors one, as they pass by the regiment, guard, &c.

RUFINUS was born about the middle of the fourth century at Concordia, an inconsiderable town in Italy. At first he applied himself to the belles lettres, and particularly to the study of eloquence. To accomplish himself in this elegant art, he removed to Aquileia, a town at that time so celebrated, that it was called a second Rome. Having made himself acquainted with the polite literature of the age, he withdrew into a monastery, where he devoted himself to the study of theology. While thus occupied, St Jerome happened to pass through Aquileia. Rufinus formed an intimate friendship with him; but to his inexpressible grief was soon deprived of the company of his new friend, who continued his travels through France and Germany, and then set out for the east. Rufinus, unable to bear his absence, resolved to follow him. Accordingly he embarked for Egypt; and having visited the hermits who inhabit the deserts of that country, he repaired to Alexandria to hear the renowned Didymus. Here he was gratified with a sight of St Melania, of whose virtue and charity he had heard much. The sanctity of his manners soon obtained the confidence of St Melania, which continued without interruption during their residence in the east, a period of 30 years. The Arians, who swayed the ecclesiastical sceptre in the reign of Valens, persecuted Rufinus with great cruelty. They threw him into a dungeon, loaded him with chains, and after almost starving him to death, banished him to the deserts of Palestine. From this exile he was relieved by the pecuniary aid of St Melania, who employed her wealth in ransoming those confessors who had been condemned to prison or banishment.

Ruff head
Rufinus

anus
||
iins. St Jerome, supposing that Rufinus would immediately proceed to Jerusalem, wrote to one of his friends there, congratulating him on the prospect of so illustrious a visitor. To Jerusalem he went, and having built a monastery on the mount of Olives, he there assembled a great number of hermits, whom he animated to virtue by his exhortations. He converted many to the Christian faith, and persuaded more than 400 hermits who had taken part in the schism of Antioch to return to the church. He prevailed on many Macedonians and Arians to renounce their errors.

His attachment to the opinions of Origen set him at variance with St Jerome, who, being of a temper peculiarly irritable, not only retracted all the praises which he had lavished upon him, but loaded him with severe reproaches. Their disputes, which were carried to a very indecent height, tended to injure Christianity in the eyes of the weak. Theophilus, their mutual friend, settled their differences; but the reconciliation was of short continuance. Rufinus having published a translation of the principles of Origen at Rome, was summoned to appear before Pope Anastasius. But he made a specious apology for not appearing, and sent a vindication of his work, in which he attempted to prove that certain errors, of which Origen had been accused, were perfectly consistent with the opinions of the orthodox. St Jerome attacked Rufinus's translation. Rufinus composed an eloquent reply, in which he declared that he was only the translator of Origen, and did not consider himself bound to sanction all his errors. Most ecclesiastical historians say that Rufinus was excommunicated by Pope Anastasius; but for this no good evidence has been brought. In 407, he returned to Rome; but the year after, that city being threatened by Alaric, he retired to Sicily, where he died in 410.

His works are, 1. A Translation of Josephus; 2. A Translation of several works of Origen; 3. A Latin Version of Ten Discourses of Gregory Nazianzen, and Eight of Basil's; 4. Chromatius of Aquileia prevailed on him to undertake a Translation of the Ecclesiastical History of Eusebius, which engaged him almost ten years. He made many additions to the body of the work, and continued the history from the 20th year of Constantine to the death of Theodosius the Great. Many parts of this work are negligently written, many things are recorded as facts without any authority but common report, any many things of great importance are entirely omitted. 5. A Vindication of Origen. 6. Two Apologies addressed to St Jerome. 7. Commentaries on the prophets Hosea, Joel, and Amos. 8. Lives of the Hermits. 9. An Explanation of the Creed.

RUGEN, an island in the Baltic sea, on the coast of Pomerania, over against Stralsund, about 23 miles in length and 15 in breadth, with the title of a principality. It is strong both by art and nature, abounds in corn and cattle, and now belongs to Prussia. The chief town is Bergen. E. Long 14. 30. N. Lat. 54. 32.

RUINS, a term particularly used for magnificent buildings fallen into decay by length of time, and whereof there only remains a confused heap of materials. Such are the ruins of the tower of Babel, of the tower of Pelus, two days journey from Bagdat, in Syria, on the banks of the Euphrates; which are now no more than a heap of bricks, cemented with bitumen, and

whereof we only perceive the plan to have been square. Such also are the ruins of a famous temple, or palace, near Schiras, in Persia, which the antiquaries will have to have been built by Ahasuerus, and which the Persians now call Tchelminar, or Chelminar; *q. d.* the 40 columns; because there are so many columns remaining pretty entire, with the traces of others; a great quantity of basso-relievos, and unknown characters, sufficient to shew the magnificence of the antique architecture. The most remarkable ruins now existing of whole cities are those of PALMYRA and PERSEPOLIS, of the grandeur of which some idea may be formed from the views given in the plates referred to from these articles, to which may be added those of HERCULANEUM and POMPEII. The magnificent ruins still remaining in Rome, Athens, &c. of particular edifices, as temples, palaces, amphitheatres, aqueducts, baths, &c. it were endless to enumerate, and beyond the plan of this work to represent.

RUIZIA, a genus of plants belonging to the monadelphica class; and in the natural method ranking under the 37th order, *Columniferae*. See BOTANY *Index*.

RULE, in matters of literature, a maxim, canon, or precept, to be observed in any art or science.

RULE, in a monastic sense, a system of laws or regulations, according to which religious houses are governed, and which the religious make a vow, at their entrance, to observe. Such are the rules of the Augustines, Benedictines, Carthusians, Franciscans, &c. See AUGUSTINES, &c.

RULES of Court, in Law, are certain orders made from time to time in the courts of law, which attorneys are bound to observe, in order to avoid confusion; and both the plaintiff and defendant are at their peril also bound to pay obedience to rules made in court relating to the cause depending between them.

It is to be observed, that no court will make a rule for any thing that may be done in the ordinary course; and that if a rule be made, grounded upon an affidavit, the other side may move the court against it, in order to vacate the same, and thereupon shall bring into court a copy of the affidavit and rule. On the breach and contempt of a rule of court an attachment lies; but it is not granted for disobedience to a rule, when the party has not been personally served; nor for disobeying a rule made by a judge in his chamber, which is not of force to ground a motion upon, unless the same be entered.

A rule of court is granted every day the courts at Westminster sit, to prisoners of the King's-bench or Fleet prisons, to go at large about their private affairs.

RULE of Three. See ARITHMETIC and PROPORTION.

RULE, or Ruler, an instrument of wood or metal, with several lines delineated on it; of great use in practical mensuration. When a ruler has the lines of chords, tangents, sines, &c. it is called a *plane scale*.

RUM, a species of brandy or vinous spirits, distilled from sugar-canes.

Rum, according to Dr Shaw, differs from simple sugar-spirit, in that it contains more of the natural flavour or essential oil of the sugar-cane; a great deal of raw juice and parts of the cane itself being usually fermented in the liquor or solution of which the rum is prepared.

Rum.

prepared. The unctuous or oily flavour of rum is often supposed to proceed from the large quantity of fat used in boiling the sugar; which fat, indeed, if coarse, will usually give a stinking flavour to the spirit in our distillations of the sugar liquor or wash, from our refining sugar-houses; but this is nothing of kin to the flavour of the rum, which is really the effect of the natural flavour of the cane.

The method of making rum is this: When a sufficient stock of the materials are got together, they add water to them, and ferment them in the common method, though the fermentation is always carried on very slowly at first; because at the beginning of the season for making rum in the islands, they want yeast or some other ferment to make it work: but by degrees, after this, they procure a sufficient quantity of the ferment, which rises up as a head to the liquor in the operation; and thus they are able afterwards to ferment and make their rum with a great deal of expedition, and in large quantities.

When the wash is fully fermented, or to a due degree of acidity, the distillation is carried on in the common way, and the spirit is made up proof: though sometimes it is reduced to a much greater strength, nearly approaching to that of alcohol or spirit of wine; and it is then called *double-distilled rum*. It might be easy to rectify the spirit, and bring it to much greater purity than we usually find it to be of: for it brings over in the distillation a very large quantity of the oil; and this is often so disagreeable, that the rum must be suffered to lie by a long time to mellow before it can be used; whereas, if well rectified, it would grow mellow much sooner, and would have a much less potent flavour.

The best state to keep rum in, both for exportation and other uses, is doubtless that of alcohol or rectified spirit. In this manner it would be transported in one half the bulk it usually is, and might be let down to the common proof-strength with water when necessary: for the common use of making punch, it would likewise serve much better in the state of alcohol; as the taste would be cleaner, and the strength might always be regulated to a much greater exactness than in the ordinary way.

The only use to which it would not so well serve in this state, would be the common practice of adulteration among our distillers; for when they want to mix a large portion of cheaper spirit with the rum, their business is to have it of the proof-strength, and as full of the flavouring oil as they can, that it may drown the flavour of the spirits they mix with it, and extend its own. If the business of rectifying rum was more nicely managed, it seems a very practicable scheme to throw out so much of the oil, as to have it in the fine light state of a clear-spirit, but lightly impregnated with it: in this case it would very nearly resemble arack, as is proved by the mixing a very small quantity of it with a tasteless spirit, in which case the whole bears a very near resemblance to arack in flavour.

Rum is usually very much adulterated in Britain; some are so bare-faced as to do it with malt-spirit; but when it is done with molasses spirit, the tastes of both are so nearly allied, that it is not easily discovered. The best method of judging of it is by setting fire to a little of it; and, when it has burnt away all the inflamma-

ble part, examining the phlegm both by the taste and smell.

RUM is a considerable island, one of the Hebrides, or rather one continued rock, of nearly 30 miles in circumference. It is the property of Mr Maclean of Coll; contains 400 inhabitants; grazes cattle and sheep; pays above 200l. rent annually: but has neither kelp, freestone, nor lime.

RUMELIA, in *Geography*, the same with ancient Greece; now a part of Turkey in Europe.

RUMEN, the paunch, or first stomach of such animals as chew the cud; thence called *Ruminant Animals*. See ANATOMY, COMPARATIVE.

RUMEX, Dock, a genus of plants belonging to the hexandria class, and in the natural method ranking under the 12th order, *Holoracca*. See BOTANY *Index*.

RUMINANT, in *Natural History*, is applied to an animal which chews over again what it has eaten before: which is popularly called *chewing the cud*. Peyer, in a treatise *De Ruminantibus et Ruminacione*, shows that there are some animals which really ruminate; as oxen, sheep, deer, goats, camels, hares, and squirrels: and that there are others which only appear to do so, as moles, crickets, bees, beetles, crabs, mullets, &c. The latter class, he observes, have their stomachs composed of muscular fibres, by which the food is ground up and down as in those which really ruminate. Mr Ray observes, that ruminants are all four-footed, hairy, and viviparous; some with hollow and perpetual horns, others with deciduous ones.

RUMP OF THE SACRIFICE. Moses had ordained, that the rump and fat of the sheep that were offered for a peace-offering should be put upon the fire of the altar, (Lev. iii. 9. vii. 3. viii. 25. ix. 19.). The rump was esteemed the most delicate part of the animal.

RUMPHIA, a genus of plants belonging to the triandria class, and in the natural method ranking with those of which the order is doubtful. See BOTANY *Index*.

RUNCIMAN, ALEXANDER, an eminent Scottish painter, was born in Edinburgh in the year 1736. He was the son of an architect, a profession which has a strong affinity to that of painting. The opportunity he thus enjoyed of examining his father's drawings, gave him an early propensity to the art in general, which he very soon evinced by making sketches of any remarkable object, either of nature or art, that happened to come in his way. We are unacquainted with the gradual progress of his fertile genius; but it is not to be supposed that he long remained satisfied with the delineations of straight lines, while the fascinating beauties of landscape lay open to his inspection. Water that falls over a rugged precipice in the form of cascades, or the foaming surges of the deep when carried like hoar frost with impetuosity into the air, both astonish and delight by their awful grandeur. These objects, and such as these, would naturally fire the genius of Runciman at an early period.

He was bound an apprentice to John and Robert Norries in the year 1750; the former of whom was a landscape painter of very considerable eminence, and by his instructions our young artist made rapid progress. About the year 1755, when only 19 years of age, he began professionally to paint landscapes; from which it appeared that they were by no means first attempts, as they evinced

Rum

Runciman.

ced

ced his ardent application to study before he ventured to appear at the tribunal of the public. Yet, although these were excellent, they were nothing more than the dawn of that distinguished eminence to which he afterwards attained. His reputation as a painter of landscape continued to increase during five years; but such was the strength of his genius, and the amazing fertility of his invention, that he could not rest satisfied with eminence in a single department. About the year 1760 he successfully attempted historical painting, in which his mind had more ample scope than in portraying the solemn silence of a field, a humble cottage, or a shepherd void of ambition. Six years of his life were devoted to the study and practice of this important branch of the art, notwithstanding his situation was attended with numerous disadvantages. Great, however, as his attainments were in this department, he never could be satisfied with himself, till he had studied in Italy those masterly performances which it was his highest ambition to imitate.

He accordingly set out for Italy in the year 1766, when just 30 years of age, and during a residence of five years in that enchanting country, where specimens of his favourite art are met with in all their grandeur and perfection, he continued to copy the best pictures of the ancient masters, in consequence of which his taste was very much corrected and improved. His conceptions were also greatly enlarged, by the steady contemplation of so many sublime works of the greatest and most celebrated artists. The art of composition, which it is of the first consequence for an historical painter to understand, was only to be acquired from the study of its principles, as these are exemplified in such highly finished models; and to these he applied himself with indefatigable industry. He caught the rich yet chaste colouring of the Venetian school with such truth, that he was allowed to surpass all his competitors in this valuable quality.

In the year 1771, Runciman returned to his native country, in the full possession of such improvements as were to be expected from the opportunities he enjoyed, and also with a judgment very much matured. It will readily be granted that he had now some claim upon the patronage of his country, and we are happy to add that this was not withheld; for the Honourable Board of Trustees, and Sir James Clerk of Pennyquick, were among his patrons; and to Mr Robert Alexander in particular, a respectable merchant in Edinburgh, his country was more indebted for the fostering of his rising genius, than to the whole of its nobility.

An academy for the study of drawing and painting was established in Edinburgh by the honourable trustees for the encouragement of arts in Scotland, of which De la Cour and Pavillon, two French artists, of some ability, were successively chosen masters. When Pavillon died in 1771, an application was made to Runciman to take charge of the academy, the laborious and interesting duties of which he discharged much to his own honour and the benefit of his country.

His masterly work in the Hall of Ossian at Pennyquick, the seat of his patron Sir James Clerk, was projected and begun by him soon after his return to Edinburgh. Of this performance, the following account was given by a very eminent judge.

"The fate of old Ossian seems to have been peculiarly happy. Upon the eve of being deserted by tradi-

tion, his only preserver, and even by the language itself, the genius of Macpherson, interposed, received the charge, and gave him to the world.

"Fortunate in a translator, the Celtic bard has been equally so, in receiving his fame from the taste and judgment of a critic, blest with every valuable quality and character.

"To complete the honours of the poet, nothing was wanting, but the attendance of the sister art. It was therefore with uncommon pleasure, that I heard his being adopted by a native artist, under the patronage of a gentleman, distinguished by a fine taste and warm regard to the arts. The work, which is now finished, is the only *original performance* ever executed in Scotland."

The next able performance of Runciman was the picture of the Ascension, painted on the ceiling above the altar of the Episcopal Chapel, Cowgate, Edinburgh.

The fire and feeling displayed in his King Lear, were conceived and executed in a manner not inferior to those of Shakespeare; and the Andromeda, from which Legat took his highly finished engraving, will bear a comparison, in respect of colouring, with the works of Titian or Corregio. He appears to have regarded his own historical work of Agrippina landing the ashes of Germanicus her husband, as a capital performance, in the execution of which he bestowed more than ordinary pains; and posterity will determine that his opinion was just, as the ingenious Mr Brown bestowed upon it the highest encomiums.

While his health permitted (which the painting the hall of Ossian had much impaired), he continued to superintend the business of the academy, and devoted his leisure hours to the drawing of historical pieces. He enjoyed a competency from his office as teacher, which with the emoluments arising from his other works, made him independent. He never formed any matrimonial connection, but he had a natural son called John, who was bred to the occupation of a silversmith, and went afterwards to reside in London.

Runciman as a man, was possessed of great candour and simplicity of manners, having a happy talent for conversation, which made some of the most distinguished literary characters, such as Hume, Robertson, Kaimes, and Monboddo, extremely fond of his company; but the genuine worth of this eminent man, and his real goodness of heart, were only fully known to his most intimate friends. He could communicate information with great facility, and gave his best advice to young artists, with a view to further the progress of their improvement.

As a painter, his character has been elegantly drawn by a brother artist, the accomplished Mr John Brown, who was better qualified than most men to make a proper estimate of his merits. We shall lay this sketch before our readers in his own words.

"Mr Runciman was an artist by nature, eminently qualified to excel in all those nobler parts of the art, the attainment of which depends on the possession of the highest powers of the mind.—Though for a long period of years labouring under every possible disadvantage, he completed works, which upon the whole, are equal to the best of those of his contemporaries, and in some respects, it may be boldly asserted, that they are superior.—His fancy was fertile, his discernment of character

† X x keen,

Runciman
||
Rupert.

keen, his taste truly elegant, and his conceptions always great.—Though his genius seems to be best suited to the grand and serious, yet many of his works amply prove, that he could move with equal success in the less elevated line of the gay and pleasing. His chief excellence was composition, the noblest part of the art, in which it is doubted whether he had any living superior. With regard to the truth, the harmony, the richness, and the gravity of colouring; in that style, in short, which is the peculiar characteristic of the ancient Venetian, and the direct contrast to the modern English school, he was unrivalled. His works, it must be granted, like all those of the present times, were far from being perfect; but it was Mr Runciman's peculiar misfortune, that his defects were of such a nature, as to be obvious to the most unskilful."

The fine arts and his friends were deprived of this extraordinary painter, on October 21st 1785.

RUNDLET, or **RUNLET**, a small vessel, containing an uncertain quantity of any liquor, from 3 to 20 gallons.

RUNGS, in a ship, the same with the floor or ground timbers; being the timbers which constitute her floor; and are bolted to the keel, whose ends are rung-heads.

RUNG-Heads, in a ship, are made a little bending to direct the sweep or mold of the futtocks and navel-timbers; for here the lines begin which make the compass and bearing of the ship.

RUNIC, a term applied to the language and letters of the ancient Goths, Danes, and other northern nations. See **ALPHABET**.

RUNNER, in the sea-language, a rope belonging to the garnet and the two bolt-tackles. It is reeved in a single block joined to the end of a pendant; it has at one end a hook to hitch into any thing; and, at the other, a double block, into which is reeved the fall of the tackle, or the garnet, by which means it purchases more than the tackle would without it.

RUNNING-THRUSH, a disease in the feet of horses. See **FARRIERY Index**.

RUNNET, or **RENNET**, is the concreted milk found in the stomachs of sucking quadrupeds, which as yet have received no other nourishment than their mother's milk. In ruminating animals, which have several stomachs, it is generally found in the last, though sometimes in the next to it. If the rennet is dried in the sun, and then kept close, it may be preserved in perfection for years. Not only the rennet itself, but also the stomach in which it is found, curdles milk without any previous preparation. But the common method is, to take the inner membrane of a calf's stomach, to clean it well, to salt and hang it up in brown paper: when this is used the salt is washed off, then it is macerated in a little water during the night, and in the morning the infusion is poured into the milk to curdle it. But see more particularly the article **CHEESE** for a proper receipt to make rennet, upon which the quality of the cheese greatly depends.

RUPEE, a silver coin current in the East Indies, equal to about 2s. 6d. sterling.

RUPERT, or **ROBERT**. See **ROBERT**.

RUPERT, prince palatine of the Rhine, &c. son of Frederic prince elector palatine of the Rhine and Eli-

sabeth daughter of King James I. of England, was born in 1619. He gave proofs of his bravery at the age of 13; and in 1642 came over into England, and offered his service to King Charles I. his uncle, who gave him a command in his army. At Edgehill he charged with incredible bravery, and made a great slaughter of the parliamentarians. In 1643 he seized the town of Gloucester; obliged the governor of Litchfield to surrender; and having joined his brother Prince Maurice, reduced Bristol in three days, and passed to the relief of Newark. In 1644 he marched to relieve York, where he gave the parliamentarians battle, and entirely defeated their right wing; but Cromwell charged the marquis of Newcastle with such an irresistible force, that Prince Rupert was entirely defeated. After this the Prince put himself into Bristol, which surrendered to Fairfax after a gallant resistance. The king was so enraged at the loss of this city, so contrary to his expectation, that he recalled all Prince Rupert's commissions, and sent him a pass to go out of the kingdom. In 1648 he went to France, was highly complimented by that court, and kindly received by King Charles II. who sojourned there for the time. Afterward he was constituted admiral of the king's navy; attacked the Dutch ships, many of which he took; and having engaged with De Ruyter, obliged him to fly. He died in 1682, and was interred with great magnificence in King Henry VII's chapel, Westminster. Mr Grainger observes, that he possessed in a high degree that kind of courage which is better in an attack than a defence; and is less adapted to the land-service than that of the sea, where precipitate valour is in its element. He seldom engaged but he gained the advantage, which he generally lost by pursuing it too far. He was better qualified to storm a citadel, or even to mount a breach, than patiently to sustain a siege; and would have furnished an excellent hand to a general of a cooler head.

This prince is celebrated for the invention of prints in mezzotino, of which he is said to have taken the hint from a soldier's scraping his rusty fustil. The first print of this kind ever published was done by his highness, and may be seen in the first edition of Evelyn's *Sculptura*. The secret is said to have been soon after discovered by Sherwin an engraver, who made use of a loaded file for laying the ground. The prince, upon seeing one of his prints, suspected that his servant had lent him his tool, which was a channeled roller; but upon receiving full satisfaction to the contrary, he made him a present of it. The roller was afterwards laid aside; and an instrument with a crenelled edge, shaped like a shoemaker's cutting knife, was used instead of it. He also invented a metal called by his name, in which guns were cast; and contrived an excellent method of boring them, for which purpose a water-mill was erected at Hackney-marsh, to the great detriment of the undertaker, as the secret died with the illustrious inventor.

RUPERT'S Drops, a sort of glass-drops with long and slender tails, which burst to pieces on the breaking off those tails in any part; said to have been invented by Prince Rupert, and therefore called by his name. Concerning the cause of this surprising phenomenon scarcely any thing that bears the least appearance of probability has been offered. Their explosion, it is said, is attended

Rupert.

tended in the dark with a flash of light; and by being boiled in oil, the drops are deprived of their explosive quality.

RUPIN, or RAPIN, a town of Germany, in the marquisate of Brandenburg and capital of a duchy of the same name. It is divided into the Old and the New. The Old was nothing but an ancient castle, very well furnished, the late king of Prussia, before his father's death, residing there. New Rupin is seated on a lake, and become a considerable place of trade, with a manufactory of cloth. It is also noted for brewers. E. Long. 13. 23. N. Lat. 53. 0.

RUPPIA, a genus of plants, belonging to the tetrandria class; and in the natural method ranking under the 15th order, *Inundatae*. See BOTANY Index.

RUSCUS, KNEE-HOLLY, or *Butcher's Broom*; a genus of plants, belonging to the diccia class; and in the natural method ranking under the 11th order, *Sarmentaceae*. See BOTANY Index.

The most remarkable species is the *aculeatus*, or common butcher's broom, common in the woods in many parts of England. It has roots composed of many thick fibres which twine about each other; from which arise several stiff green stalks about three feet high, sending out from their sides several short branches, garnished with stiff, oval, heart-shaped leaves, placed alternately on every part of the stalk, ending with sharp prickly points. The flowers are produced in the middle, on the upper side of the leaves; they are small, and cut into six parts; of a purple colour, sitting close to the midrib. They appear in June; and the female flowers are succeeded by berries as large as cherries, of a sweetish taste, which ripen in winter; when they are of a beautiful red colour. As this plant grows wild in most parts of England, it is rarely admitted into gardens; but if some of the roots be planted under tall trees in large plantations, they will spread into large clumps; and as they retain their leaves in winter, at that season they will have a good effect.

RUSH. See JUNCUS, BOTANY Index.

RUSHWORTH, JOHN, the compiler of some useful collections respecting the affairs of state, was born in Northumberland about the year 1617, and was descended of honourable ancestors. After attending the university of Oxford for some time, he removed to Lincoln's Inn; but the study of law not suiting his genius, he soon deserted it, in order to seek a situation where he might more easily gratify his love for political information. He frequently attended the meetings of parliament, and wrote down the speeches both of the king and members. During the space of 11 years, from 1630 to 1640, when no parliament was held, he was an attentive observer of the great transactions of state in the star-chamber, the court of honour, and exchequer chamber, when all the judges of England assembled there on cases of great emergency. Nor did he neglect to observe with a watchful eye those events which happened at a distance from the capital. He visited the camp at Berwick, was present at the battle of Newborn, at the treaty of Rippon, and at the great council of York.

In 1640 he was appointed assistant to Henry Elynghe clerk to the house of commons, and thus had the best opportunities of being acquainted with their debates and proceedings. The commons considered him as a person

worthy of confidence. In particular, they trusted him with carrying their messages to the king while he remained at York. And when the parliament created Sir Thomas Fairfax their general, Rushworth was appointed his secretary, and discharged the office much to the advantage of his master. When Fairfax resigned his commission, his secretary returned to Lincoln's Inn, and was soon after (in 1651-2) chosen one of the committee that was appointed to deliberate concerning the propriety and means of altering or new modelling the common law. He was elected one of the representatives for Berwick-upon-Tweed to the parliament which Richard Cromwell assembled in 1658, and was re-elected by the same town to the parliament which restored Charles II. to the crown.

After the Restoration, he delivered to the king several books of the privy-council, which he had preserved in his own possession during the commotion which then agitated the country. Sir Orlando Bridgeman keeper of the great seal chose him his secretary in 1677, an office which he enjoyed as long as Sir Orlando kept the seals. In 1678 he was a third time chosen member for Berwick, and a fourth time in the ensuing parliament in 1679. He was also a member of the parliament which was convened at Oxford. The different offices he had held afforded him favourable opportunities of acquiring a fortune, or at least an independance; yet, whether from negligence or prodigality, he was never possessed of wealth. Having run himself into debt, he was arrested and committed to the King's Bench prison, Southwark, where he lingered for the last six years of his life in the most deplorable condition. His memory and judgment were much impaired, partly by age and partly by the too frequent use of spirituous liquors. He died on the 12th of May 1690.

His "Historical Collections of private Passages in State, weighty Matters in Law, remarkable Proceedings in Parliament," were published in folio at different times. The first part, comprehending the years between 1618 and 1629, appeared in 1659. The copy had been entrusted by Oliver Cromwell to Whitelock, with instructions to peruse and examine it. Upon perusing it he thought it necessary to make some alterations and additions. The second part was published in 1680; the third in 1692; the fourth and last, which comes down to the year 1648, was published in 1701; and altogether made seven volumes. These underwent a second edition in 1721; and the trial of the earl of Strafford was added, which made the eighth. This work has been much applauded by those who condemn the conduct of Charles I. and accused of partiality by those who favour the cause of that unhappy monarch. One person in particular, Dr John Nelson of Cambridge, in a Collection of the Affairs of State published by the command of Charles II. undertook to prove, "that Rushworth has concealed truth, endeavoured to vindicate the prevailing detractions of the late times, as well as their barbarous actions, and with a kind of rebound to libel the government at second-hand." This accusation seems to be carried too far. His principles indeed led him to show the king and his adherents in an unfavourable light, and to vindicate the proceedings of parliament; yet it cannot justly be affirmed that he has misrepresented or falsified any of the speeches or facts which he has admitted into his collection. Perhaps he may have omitted

Rushworth,
Russia.

some papers merely because they were unfavourable to the party which he had espoused; and is therefore not to be considered as an impartial historian who relates the whole truth, but as an honest lawyer, who states

all his facts fairly and candidly, but passes over such as are injurious to his client's cause.

RUSSELLIA, a genus of plants belonging to the pentandria class. See BOTANY Index.

Russell
Russi

R U S S I A.

1
Situation
and bound-
aries.

RUSSIA, the largest empire, and one of the most powerful states in the known world, is situated partly in Europe, partly in North America, but chiefly in Asia; where it occupies that immense tract of country which extends from the Uralian mountains and the Caspian on the west, to Bering's straits and the sea of Kamtschatka on the east, comprehending a great variety of tribes and nations, whose very names were, half a century ago, scarcely known to the west of Europe. This vast empire is bounded on the north by the *Arctic Ocean*; on the east by the *Northern Pacific* or *Eastern Ocean*; on the south by the extensive *Chinese* territories, the *Mogul empire*, the *Caspian sea*, and part of *Turkey*; and on the west by the *Austrian* dominions, the kingdoms of *Prussia* and *Sweden*, and the *Baltic*.

2
Extent,

If we examine the extent of the Russian empire, we shall find it stretching from the western part of the island of Ozel in the Baltic in 22° E. Long. from Greenwich, to the eastern promontory of the Tschutchki territory in 172° E. from the same meridian; thus including 150° of longitude; while, from its most northern promontory in N. Lat. 78°, to the most southern point of 39° N. it comprehends 39° of latitude. Mr Tooke, computing its extent in British miles, estimates it at 9200 in length, and 2400 in breadth. Its absolute superficial measure in square miles can scarcely be ascertained. That of the European part with the late addition of Finland is estimated at 1,640,000 square English miles, exclusive of the new kingdom of Poland; and the Asiatic part alone is so extensive as to exceed the whole of Europe.

3
Divisions,

The whole Russian empire is, by the natural boundary of the Uralian mountains, divided into European and Asiatic Russia; the former comprehending Russia Proper, Russian Lapland, Finland, Courland, Livonia, Russian Poland, the Taurican Chersonesus or Crim Tartary, and the country of the Kozaks, bordering on the sea of Azof; the latter including the country of the Samocids, the vast district of Siberia, the country of the Tschutchki, the country of the Mongul Tartars, and some other districts that will be noticed hereafter. The whole empire was, by Catharine II. divided into governments, denominated in general from the names of their capital cities. Of these governments, by far the greater number belong to European Russia, the vast tract of the Asiatic part having been divided into only two governments, viz. that of Tobolsk to the west, and Irkutsk to the east.

In enumerating the governments of European Russia, we shall begin with the north, where lies the extensive government of Archangel, stretching from the confines

of Sweden along the shores of the White sea and the Arctic ocean, to the Uralian chain. To the south of this, along the Asiatic frontier, as far as the sea of Azof, are situated the governments of Vologda, Perm, Vyatka, Kazan, Simbirsk, Saratof, and the territory of the Don Kozaks. To the west of these last, along the sea of Azof and the Black sea, lies the government of Catharinoslaf, including Taurida and the Crimea. On the western side of the empire extend the acquisitions derived from the partition of Poland; and along the eastern shores of the Baltic lie the governments of Riga, Revel, St Petersburg, Viborg, Kymenegard, Tavasthus, Abo, Kuopia Wasa, Uleabourg and Olonetz. The remaining governments which occupy the centre, are those of Novgorod, Tver, Kostroma and Yaroslavl, that lie chiefly to the north and east of the Volga; and those of Polotsk, Pskov, Smolensk, Moskva, Vladimir, Nizney-Novgorod, Moghilef, Kaluga, Toula, Reazan, Tambof, Penza, Orel, Sieverskof, Tchernigof, Koursk, Kief, Kharkof, and Voronetz, lying principally to the west of the Volga (A).

In the account which we are here to give of this extensive empire, which has of late made so conspicuous a figure among the states of Europe, we shall first consider what may be called the permanent features of the empire, as the face of the country, the soil, the mountains, rivers, lakes, and forests, the climate and seasons, and the most important natural productions; we shall then trace its origin and progress in the history of its transactions, from which we shall deduce its progressive geography; and we shall conclude with describing the more fluctuating circumstances, which constitute its political and civil geography.

In a tract of country so immense, which is calculated to include a seventh part of the known continent, and nearly a twenty-sixth part of the whole globe, its surface must present a great variety of appearances; but these are much more remarkable in Asiatic than in European Russia. The latter is distinguished chiefly by extensive plains, called *steppes*, that rival the deserts of Asia and Africa, presenting to the eye little more than a vast expanse of level sand, with very little appearance of vegetation. The chief situation of these steppes is towards the south, especially in the neighbourhood of the sea of Azof, where they extend in length above 400 British miles. In this part of the empire there are but few considerable elevations, and no mountains of importance, except on the eastern frontier, and towards the south, between the Don and the Volga. The whole country is well watered with rivers, and contains numerous

(A) In our orthography of the names of persons and places we have followed Mr Tooke, who has explained the principles of Russian orthography, in his *History of Russia*, vol. i. p. 130.

RUSSIA in EUROPE.

English Miles
0 50 100 150 200 300

Longitude East 40 From Greenwich 45 50

ous large and populous towns. In the north and east of Asiatic Russia, we see little more than extensive marshy plains, covered with almost perpetual snow, and crossed by broad rivers, which take their course to the Arctic ocean. In this part, and even towards the centre of Siberia, vegetation is so much checked by the severe cold, that few trees are to be seen; but towards the south there are vast forests of pine, fir, larch, and trees of a similar nature. In some parts of this division of the empire, especially about lake Baikal, the scenery is beautiful and picturesque. Here, too, the country abounds in steppes, which are still more extensive than those of the European part.

As these steppes are among the most striking peculiarities of the Russian empire, it may be proper to consider them rather minutely. These steppes resemble, in many respects, the sandy deserts of Africa; but though their soil is composed of the same materials, they are not so barren of vegetation, exhibiting here and there scattered patches of thin grass, and at distant intervals, small stunted thickets. In general they are destitute of wood, though in a few places we find small forests of birch trees. They abound with salt lakes, but streams of fresh water are uncommon. The most remarkable steppes are, as we have said, those of Asiatic Russia, and of these there are four that merit particular notice. One of these extends between the rivers Volga and Ural, and was formerly called the KALMUK steppe. On the north it skirts the floetz mountains that proceed from the Uralian chain, while to the south it borders on the Caspian. This sandy plain contains a few districts that are well adapted to the purposes of agriculture, but in general it is destitute of wood and fresh water. It abounds in salt lakes, and is very thinly inhabited. The second great steppe is that which extends between the Tobol and the Irtysh, and between this latter river and the Alay and the Oby, as far as the influx of the Irtysh into the Oby. This comprehends a most extensive territory, containing numerous forests of birch, pines, and firs, interspersed with salt lakes, and in most places well calculated for pasturage and agriculture. The greater part of this steppe lies in the government of Tobolsk. A third comprehends that large tract that lies beyond the river Tshulim, between the Oby and the Yenissy, as far as the shores of the Arctic ocean. In this steppe there is much wood, especially towards the south, where there are considerable forests. Eastward from this, between the Yenissy, the Tunguska, and the Lena, lies a fourth desert, resembling the last in its appearance, and the nature of its soil, but containing less wood. A great part of this steppe lies in the government of Irkutsk.

The mountains in Asiatic Russia are indeed more numerous, but are not remarkable for their height. The rivers are large and majestic, and are navigable for a considerable extent.

The soil is of course extremely various. That of the northern parts is marshy, and little susceptible of cultivation, but the south abounds in rich and fertile plains. The most fertile part of European Russia is that between the Don and the Volga, from the government of Voronezh to that of Simbirsk. Here the soil consists of a black mould, strongly impregnated with nitre, and is so rich, that the fields are never manured. The harvests are abundant, and the natural pastures render the sowing

of artificial grasses unnecessary. Most parts of Siberia are totally incapable of agriculture and improvement.

We have already remarked that Russia is rather a flat than a mountainous country, and this character is particularly applicable to the European part. The most elevated region of this division lies in the road between St Petersburg and Mosco, and is commonly called the mountain of Volday, though denominated by the natives *Vhisokaya Plostehade*, or the elevated ground. This mountain is flat at the top, is surrounded with large sand hills, interspersed with granite rocks, and has in its vicinity several lakes and groves. In this mountain are the sources of the rivers Duna, Volga, and Dniepr.

To the south-west, bounding the steppe of the Dniepr, lie the mountains of Taurida, which are rather romantic from their adjacent scenery, than remarkable for their height. Between them and the shores of the Black sea lie beautiful valleys, abounding with olives, figs, and pomegranates, while the steepest cliffs of the mountain are adorned with the red bark and evergreen foliage of the *arbutus*. These valleys are very productive in vineyards, and feed numerous flocks of sheep and goats.

The largest mountainous tract of European Russia is that of Olonetz, that lies between the Swedish frontiers and the White sea. This chain occupies a space of nearly 15°, or above 1000 British miles, running almost due north. This chain is of no great height, but its northern part is covered with perpetual snow. These mountains are very rich in mineral products, which will be noticed hereafter.

The Uralian mountains, that separate Europe from Asiatic Russia, have been sufficiently described in the article GEOLOGY, N° 131, 135.

The mountains of Asiatic Russia are more numerous and more important. They include the Altaic chain, the mountains of Savansk, of Yablonnoy, and Stanovoy, forming the southern boundary between the Russian and Chinese empires, and the classical range of Caucasus, extending between the Caspian and the Black sea. Of these, the Altaic chain has also been sufficiently described under GEOLOGY, N° 132; and as the other mountains to the south and east may be considered as a continuation of the same chain, they need not occupy our attention in the present article.

The ridge of Mount Caucasus divides Russia from Turkey to the west, and from Persia to the east, and extends between the Euxine and the Caspian for about 400 British miles. It is not of any considerable breadth, being in no part more than 20 or 30 miles across, and in some places not more than five or six. Its height is considerable, and its summits are covered with eternal ice and snow. The valleys at its foot abound in forest trees; and the bowels of the mountain contain veins of silver, lead and copper.

Among the mountains of the Russian empire we must not omit the volcanoes of Kamtschatka. The whole of this peninsula is divided lengthwise by a chain of lofty, rocky mountains, commonly covered with snow, and shooting into conical summits that very frequently emit smoke, and sometimes burst out into flame. We do not find, however, that they pour out lava, or water, like the European volcanoes. Many of them appear to be extinct,

Russia.

extinct, but their former volcanic state is evinced by the appearance of craters at their summits. In the neighbourhood of these volcanoes there are hot springs, not inferior in temperature to those of Iceland, and like them throwing up jets of water with a great noise, but to an considerable height.

8
Seas.

The seas that are connected with Russia are the Arctic ocean, and that part of the Pacific which has been called the eastern Archipelago, forming its northern and eastern boundaries; the inland seas of the Baltic, the Black sea, the sea of Azof, the Caspian, the sea of Aral, and the sea of Okhotsk. Some account of these, except the sea of Okhotsk, will be found under their respective articles in this work.

The sea of Okhotsk may be considered as a large gulf lying between the peninsula of Kamschatka to the east, and the country of the Tungousi to the west. Its entrance from the Pacific ocean is closed by a chain of small islands, called the Kourilskie islands, and within these are the two large islands of Ezso and Sackhalin. Its principal port is Okhotsk, at the mouth of the small river Okhota, and to the north-east it has a considerable branch called the sea of Pengina.

9
Bays and gulfs.

The shores of Russia are hollowed out into numerous indentations, forming several important bays and gulfs. The most remarkable of these are, the gulf of Finland in the Baltic, that of Archangel in the White sea, the bays of Oby and of Enissy in the Arctic ocean; the bay of Anadhir in the eastern Archipelago; the large gulf of the sea of Okhotsk, called the sea of Pengina, and the harbour of St Peter and St Paul in the southern extremity of Kamschatka.

10
Rivers.

This extensive empire is watered by numerous and important rivers, which traverse it in every direction. These we shall class, not according to the divisions of the empire through which they pass, but according to the seas or oceans into which they flow.

The rivers which flow into the Baltic are, the Duna and the Neva. Those which fall into the White sea are the Onega and the Dvina to the west, and the Kei-loi and the Mesan to the east. Into the Arctic ocean flow the Cara, the Petshora or Bolshaia Petshora, the Oby, which receives the Irtysh; the Tobol, the Yenissy, the Khatanga, the Lena, the Yana, the Indighirka, and the Kolyma. Those which flow into the eastern Pacific are, the Anadhir and the Kamschatka. Into the Caspian sea fall the Yemba or Emba, the Ural or Yaik, the Volga, receiving the Kamma, and the Okha and the Terek. Lastly, there flow into the Black sea, the Khuban, the Don, the Dniepr or Nieper, the Bog or Bogue, and the Dniestr or Niester. Of these rivers we have already given an account of the Don, the Dvina, the Irtysh, the Lena, the Nieper, the Niester, the Oby, and the Onega, under their respective titles, and an account of the Volga will be found under that head. We shall here add a brief view of the remaining rivers.

The Duna, sometimes called the western Dvina, rises between the provinces of Pskov and Smolensk, and takes a north-westerly course for about 500 miles, till it falls into the Baltic at Riga. This river has some con-

siderable and dangerous falls; and when the ice breaks up on the approach of warm weather, vast quantities of it are hurried down the stream, so as frequently to do much injury to the port of Riga.

Of those rivers which flow into the Arctic ocean, the Cara is one of the most inconsiderable, were it not that it completes the boundary between Europe and Asia to the north. It runs from the Uralian mountains to the sea of Karskoye, a distance of about 140 miles.

The Petshora rises in the Uralian mountains, in the government of Vologda, runs across the government of Archangel, and falls into the Arctic ocean at Poostozersk, after a course of about 450 miles.

The Tobol rises in the chain of mountains, that separate the government of Ufa from the country of the Kirghistzi, and empties itself into the Irtysh at Tobolsk, after receiving numerous tributary streams.

The Yenissy or Enyssi, is formed by the junction of two rivers, viz. the Kamsara and the Veikem or Baykema, which belong to China. It first enters the Russian dominions, where alone it has the name of Yenissy, at the mouth of the Bon-Kemtslyng, and after running northward, and forming a bay containing several islands, it falls into the Arctic ocean about 2° eastward of the mouth of the Oby.

The Khatanga rises from a lake in the government of Tobolsk, and falls into a large bay of the Frozen ocean, called Khatanskaia Guba. Its course is through a low and very marshy country.

The Yana rises from a little lake in about 64° N. Lat. and after making some small turns, runs northward to the Arctic ocean, forming five considerable arms that empty themselves into a capacious bay.

The Indighirka rises near the source of the Yana, but on the other side of the mountains. At its efflux into the Arctic ocean after a course of 1200 versts (n), it forms four great arms.

The Anadhir rises in the country of the Tschutchki. Its bed is sandy, its channel very broad, and its current slow. It is so shallow that it can scarcely be crossed by the common ferry boats of the country, though these draw no more than two feet of water. It takes its course through a flat country, which on the north side of the river is destitute of wood, but overgrown with moss, affording pasture to innumerable herds of rein deer; but on the south well wooded and abounding with verdure. It falls into a considerable bay a little south of the tropic of Cancer, called the bay of Anadhir.

The Kamschatka takes a short course from south to north, along the peninsula of that name, till, not far from its mouth, it turns to the south-east, and falls into a bay nearly opposite to Bhering's island.

The Amoor was formerly reckoned among the rivers of Russia, but was lately ceded entirely to China.

Of the rivers that fall into the Caspian sea we have to notice the Yemba, the Ural, and the Terek. The first of these rises in the most southern part of the Uralian chain, and is the most eastern of all the rivers that fall into the Caspian. It forms part of the boundary between the country of the Kirghishes and the Usinskoy government. The Ural or Yaik is a river of considerable

(n) A Russian verst is about two thirds of an English mile, or about 1174 yards.

able importance. It rises in the Uralian mountains, in the government of Ufa, and after passing by Orenburg, and receiving several streams, it flows into the Caspian at Gourief. Its name is said to have been changed from Yaik to Ural, on account of a dangerous insurrection of the tribes that inhabited its banks. The Terek originates in Mount Caucasus, on the highest ridges that form the frontiers of Georgia. Its course is rapid, and in the autumn the melted snows rush down from the mountains in such torrents into the plain beneath, as to swell this river eight or ten feet above its usual level, so that it overflows the adjacent country, and not unfrequently shifts its bed. It falls into the Caspian at Kizliar, after forming two branches, with a considerable island between them.

The Kuban and the Bogue are the only important rivers of those which flow into the Black sea, that have not been noticed in their places in the general alphabet of this work. Of these the Kuban, anciently denominated Hypanis, rises at the foot of Mount Caucasus, and is formed chiefly by the confluence of several tributary streams. It takes a direction nearly westward, running along the parallel of 45° N. Lat. and falls into the Black sea, opposite the isle of Taman, in the straits of Kafa. Its stream is smooth and gentle, not obstructed by waterfalls, and, though not deep, is well adapted to purposes of inland navigation. Its banks are fertile, and near its source are considerable forests.

The Bogue rises in Poland, and formerly constituted part of the boundary between that kingdom and the Russian empire, as at present towards its mouth it forms part of the frontier between Russia and Turkey. It falls into the Black sea at Otchakof.

The Russian empire, considering its size, does not abound in lakes. These are proportionally most numerous in European Russia, where we find the lake of Imandra in Russian Lapland; those of Ladoga, Onega, and Peipus, in the neighbourhood of St Petersburg; Bielo-Ozero, or the White lake, in the government of Novgorod; and those which give rise to the river Volga, the principal of which is Seliger, in the government of Tver.

The Asiatic lakes are not numerous; but one of them, the lake or sea of Baikal, is highly important from its magnitude, and from the commercial intercourse which it promotes between the adjacent provinces. The other lakes of this part of Russia are these of Altyn-Noor, or the Golden lake, and of Altyn or Telitzko.

Most of these lakes have been already noticed under their proper heads in the general alphabet; but as the account there given, excepting that of Baikal, differs in some respects from the description of them by the latest geographers, we shall here add the account of the Russian lakes given by Mr Tooke.

The lake of Ladoga is situated in the government of Vyborg, between the gulf of Finland and the lake of Onega, which in ancient times is said to have been denominated Nebo. It is reckoned one of the largest lakes in Europe, the length of it being about 175, and its breadth 105 versts. It produces a vast number of seals. On account of the perilous storms to which it is liable, and the several sand banks that are ever shifting their position, Peter the Great caused the famous Ladoga canal to be dug along its shore, from the Volkhof

into the Neva, which canal is 104 versts long, 10 sa-jènes* broad, 1½ sa-jène deep, and has 25 sluices. By the Neva the Ladoga is connected with the Baltic; by the Svir with the Onega; and by the Volkhof with the Ilmen. Into the canal flow the rivers Lipke, Nasia, Sheldika, Lava, and Kabona; into the lake, the rivers Pasha, Sias, Olæt, &c. whereas the Neva alone runs out of it. Both shores of the lake belong to Russia, and these have everywhere a flat coast and a sandy beach. On this shore it has also a few low fishery islands, and a sandy bottom. That part of the northern side which lies in the government of Olonetz has marble on its coast, whence some of those beautiful and durable kinds of Finnish marble are brought to St Petersburg. As the bed of this lake, for a great extent, is in the lowest part of the country, it receives, besides the above-mentioned rivers, the waters that come from the alum hills; all of which have no other outlet than the Neva.

The lake Onega is situated in the government of Olonetz, between the Ladoga and the White sea. Its length is between 180 and 200 versts, and its breadth from 60 to 80. Like the Ladoga, it contains a few islands consisting of marble, and in all other properties is much the same. With other rivers, the Vitegra falls into it on the south-east side, which river takes its rise not far from the Kofsha, and this river falls into the Bielo-ozero. On the Kofsha is the old Ladoga, and on the Vitegra, the old Vitegorskaia, which are only about 40 versts asunder. Now, as from the Onega the navigable river Svir runs into the Ladoga, and from the Bielo-ozero the Sheksna flows into the Volga, there needs only a canal to be cut the said distance of 40 versts, for connecting the Neva with the Volga, which would be much more convenient for the navigation here than the passage by Vishnoi-Volotshok, because there are no waterfalls, and therefore all the danger and trouble attending them in the present passage would be obviated.

The lake Peipus, called by the Russians Tshudskoe-ozero, lies between the governments of Pscove, Reval, Riga, and St Petersburg; is in length about 80 and in breadth about 60 versts. It is connected with the Pscove lake by a very broad channel, about 50 versts in length. From this lake proceeds the river Narova, communicating through the Embach with the Vertzerb, and from this latter runs the Fellin to the gulf of Riga, so that an inland navigation might easily be formed between lake Peipus and the Baltic, though at present the commodities conveyed along the Narova to Narva, must be carried a considerable way by land, owing to the numerous falls in that river. In this lake there are a few small islands, one of which has three villages upon it, and is well furnished with wood.

The Bielo-ozero, or White lake, is in the same government with the foregoing; is about 50 versts long and 30 broad, and receives into it several smaller streams. The only one that flows out of it is the Sheksna, which falls into the Volga. The water of this lake is clear, having a bottom partly clay and partly stony. The clay is generally of a white colour, and in stormy weather causes a strong white foam upon the surface of the water. It is doubtless from this circumstance that the lake first obtained the name Bielo, or white. It abounds with fish and crabs.

The lake Tshany is situated partly in the government

Russia.

Ilmen.

of Tobolsk, and partly in that of Kolhyvan. It communicates with the lakes Molski and Abishkan, is of very considerable circuit, and abounds in fish.

The lake Ilmen, formerly Moisk, lies in the government of Novgorod, being about 40 versts long and 30 broad. It receives the rivers Mista, Lovat, Skelton, &c. and gives birth to the Volkhof alone.

18
Altyr-
Noor.

The Altyr-Noor, or Teletzkoe-ozero, lies in the government of Kolhyvan, on a very considerable elevation of the Altai mountains, by which it is also entirely surrounded. Its length is computed at 126, and its greatest breadth at 84 versts. From this lake arises the famous river By, which, at its junction with the Katunia, takes the name of Oby.

19
Forests.

European Russia abounds in wood; and numerous extensive forests are seen in various districts, especially between St Petersburg and Mosco, and between Vladimir and Arzonas. It is supposed that the Riphæan forest, so celebrated in antiquity, occupied the southern part of European Russia, where now extends a plain covered with a thick and fertile coat of black mould. The forests in some part of Asiatic Russia are also immensely large, especially towards the south. On the west of the government of Irkutsk, an enormous, dark, and marshy forest of resinous trees, extends to the river Kan; but the northern and eastern parts of Siberia are bare of wood.

20
Climate and
seasons.

When we consider that the Russian empire occupies an extent from north to south of nearly 40°, we may rationally conclude that the climate and seasons of so vast a tract must be extremely diversified. Accordingly we find that while the northern regions are exposed to almost perpetual frosts, some of the southern districts enjoy the purest atmosphere and the mildest sky. While the former is doomed to the utmost sterility, the latter is so fertile as to produce in the most lavish abundance all the vegetable riches of the most favoured climates.

One of the latest writers on the climate of Russia, M. Hermann, has divided the empire into four regions, which are thus distinguished.

1. The very cold region, extending from 78° to 60° of north latitude. This region comprehends the governments of Vyborg, O'onez, Archangel, Tobolsk, the greater part of Irkutsk, Vologda, a part of Perme, Novgorod and St Petersburg.

2. The cold region, extending from 60° to 55°, and including the governments of Reval, Riga, Polotsk, Pscov, Tver, Mosco, Yaroslavl, Vladimir, Kostroma, Viatka, the greater part of Perme and Kazan, a part of Irkutsk, Kolhyvan, Ufa, Simbirsk, Nishney-Novgorod, Kaluga, and Smolensk.

3. The moderate region, extending from 55° to 50°, including the governments of Moghilef, Tchernigof, Orel, Kursk, Tula, Tambof, Penza, the greater part of Kief, Kharkof, Voronetsk, Riazan, Saratof, Kaluga, Simbirsk, Ufa, Kolhyvan, and a part of Irkutsk, Kazan, Nishney-Novgorod and Smolensk.

4. The hot region, extending from 50° to the most southern part of Russia, including Taurida, Ekatarinoslaf, the greater part of Caucasia, and a part of Kief, Kharkof, Voronetsk, Saratof, Ufa, Kolhyvan, and Irkutsk.

From the above enumeration we find that one of the Russian governments possesses all the varieties of climate and season, and that many of them are so divided as to

enjoy the advantages of two climates. We shall describe the nature of the climate and changes of the season, as they occur in each of these divisions, confining ourselves chiefly to the extremes of St Petersburg and Taurida, as being most interesting.

In many districts of the first region there is scarcely any summer; for the three or four months in which it does not snow, scarcely deserve that name. As in most parts of the globe, however, the eastern districts of this region are much colder and more barren than those on the western side; the fruits that come to maturity round St Petersburg, and in the government of Vyborg, are not found under the same latitude in Siberia. Even the weather of St Petersburg, however, is sufficiently rude, and the climate here is unsettled and unfriendly. In the winter of 1798 and 1799, the coldest ever known in that country, the mercury in Fahrenheit's thermometer stood at St Petersburg at 39° below 0, and even at Mosco, the same thermometer fluctuated during 35 successive days between -30° and -40°. The spring in this region (i. e. about St Petersburg), has in general much frost, snow, and rain; but the short summer is for the most part fair and fine. The longest day is here about 18½ hours, and the evening twilights are so uncommonly luminous, as readily to enable persons to read and write. The very sultry days are in general but few, and these are amply compensated by the cool evenings, nights and mornings. The autumn has seldom many bright days, but is for the most part cloudy, wet, and boisterous. The winter is always severe; and as the atmosphere is generally dry, even in snowy weather, this season is so healthy, that the small number of deaths is found to happen during winter. The shortest day is only five hours and a half, and though considerable light is reflected from the snow, yet when the atmosphere is cloudy, candles can be dispensed with but for a very short time. During this season the river Neva, the lakes in the vicinity of St Petersburg, and even the gulf of Finland, as far as the islands of the Baltic, are covered with ice nearly a yard in thickness. On an average, there are annually from 150 to 190 days of frost, during which the ground is frozen to the depth of nearly three feet.

This severity of climate, apparently so inimical to health and comfort, is considered by the inhabitants as one of their greatest blessings. By the extent of ice and snow, distances are shortened, or at least travelling is facilitated, so that people, horses, and carriages with the heaviest burdens, cross the Neva, and the other rivers, lakes, and canals, in all directions. Ice cellars here form a necessary of life, for by their means provisions of all kinds are preserved during summer. Hence every house is provided with one of them; and in the beginning of February they are filled with large blocks cut from the river. The ice also promotes the amusements of the inhabitants, as we shall shew in the sequel of this article. Indeed, so essential is this severity of season to the comfort of the inhabitants, that when the winter is unusually mild, the roads are nearly impassable, and the provisions, which are always preserved in a frozen state, can scarcely be kept from putrefaction.

In this region the aurora borealis is very frequent, and its coruscations peculiarly vivid; storms of thunder and

Russia

and lightning are neither numerous, violent, nor lasting; high winds are not predominant, and it seldom hails, though hoar-frosts are very common.

In the second region the summer is indeed short in many parts; but in most of them it is so warm, and the days are so long, that the fruits of the earth usually come to maturity in a shorter time than in other places. The winter in this region, especially in the governments of Irkutsk, Perme, Viætka, &c. is in general very severe.

In the third region the winter is also long and cold, especially in the governments of Irkutsk, Kolhyvan, and Ufa. This, however, is owing rather to the lofty mountains with which these districts abound, than from their high degree of latitude. The governments belonging to this region in European Russia, however, usually enjoy a short and mild winter, and a fine warm summer.

In the fourth region the winters are short, and, except in some parts of Irkutsk and Kolhyvan, not very cold; and the summer is warm, and in many parts very dry. One of the most delightful districts in this region is that of Taurida, of which M. Pallas has given the following animated description.

“One of the mildest and most fertile regions of the empire is the beautiful semi-circular and amphitheatrical vale formed by the Tauridan mountains along the shores of the Euxine. These valleys, which are blessed with the climate of Anatolia and the lesser Asia, where the winter is scarcely sensible, where the primroses and spring-saffron bloom in February and often in January, and where the oak frequently retains its foliage through the whole winter, are, in regard to botany and rural economy, the noblest tract in Taurida, and perhaps in the whole extent of the empire. Here, on all sides, thrive and flourish in open air the ever-verdant laurel, the olive tree, the fig, the lotus, the pomegranate, and the celtis, which perhaps are the remains of Grecian cultivation; with the manna-bearing ash, the turpentine tree, the tan-bark tree, the strawberry tree from Asia Minor, and many others. This last particularly covers the steepest cliffs of the shore, and beautifies them in winter by its perpetual foliage, and the red rind of its thick stem. In these happy vales the forests consist of fruit trees of every kind, or rather they form only a large orchard left entirely to itself. On the shores of the sea the caper-bushes propagate themselves spontaneously; without the assistance of art the wild or planted vine stems climb the loftiest trees, and, twining with the flowery five-leaved ivy, form festoons and hedges. The contrast of the orchards, and the rich verdure, with the beautiful wildness presented by the adjacent mountains and rocks, which in some places rise among the clouds, and in others are fallen in ruins; the natural fountains and cascades that agreeably present their rushing waters; lastly, the near view of the sea, where the sight is lost in the unbounded prospect; all these beauties together form so picturesque and delightful a whole, that even the enraptured muse or the poet or the painter would be unable to conceive a more captivating scene.

“In these enchanting valleys, to the benefit of the empire, which nowhere possesses so fine a climate, might the useful products of Asia Minor, and of the southern parts of Europe, be made indigenous. The superior

Vol. XVIII. Part I.

kinds of fruits may be produced here without trouble, and are for the most part so already. The best kinds of olive and fig trees may be cultivated here; and even the sesamum plant never decays. Orange, lemon, and citron trees, and particularly the cedrat, the most excellent species of them, would bear the winter extremely well with a little care. The vine would be constantly improving, if a judicious selection were but made of the stocks for planting, if greater attention were paid to the various effects of the soil and situation of the vineyards, and if more care were taken in working the must and keeping the wine. For the use of the apothecaries and manufacturers a number of excellent drugs and dyes might be produced, which are at present brought from the isles of the Archipelago, from Greece, from Asia Minor, and Persia; several of them are now seen here growing wild. Likewise many hard and useful kinds of wood especially coloured, fit for inlaid work, might here be propagated; perhaps in some tracts even the sugar cane would thrive*.”

The productions of Russia would afford an ample field for the investigation of the naturalist; and this part of its natural history has been fully illustrated by the enlightened travellers who were lately employed in the examination of the empire. We can here give only a brief sketch of the result of their inquiries.

In the central parts of European Russia are found most of the animals which are common to it with the rest of Europe. The finest horses here are those of Lithuania and Livonia, the former possessing great strength, the latter excelling in speed. The spirit and beauty of the Tartarian horses have been long celebrated; and in the Taurida, where this breed is much cultivated, these qualities have been improved by the introduction of Turkish and Arabian stallions. Near Archangel, the horses are small, and resemble those in the north of Britain. The country near Archangel is remarkable for fine pasturage, and an excellent breed of cattle; but indeed cattle abound in most parts of the empire. The sheep in the northern provinces are of a middle size, with short tails and coarse wool; but those in the south are long-tailed, and their wool is of a superior texture; but the best wool is procured from the district of Kazan. We have seen that the province of Taurida abounds in sheep, which constitute the chief riches of the inhabitants. Some opulent farmers in this district possess 50,000 sheep; and 1000 is by no means an uncommon flock. Goats and swine also abound throughout European Russia; and the rein-deer is not unknown in the most northern governments. In the north, too, are found the elk, the wolf, the lynx, and the sea bear; and in the most southern districts the camel is sometimes met with.

Asiatic Russia is remarkable for the rein-deer, which there performs the office of the horse, the cow, and the sheep. In the south are found the wild horse, and the wild ass; while the argali, or wild sheep, is often hunted in Siberia and the regions of Mount Caucasus present the furious bison. Here, too, are seen the ibex, and the chamois. Near Lake Baikal are found the stag, the musk animal, and the wild boar; and on the banks of the Yenissy is seen the beaver. Walrusse haunt the shores of the Arctic ocean, and seals are found in most of its bays and in etsy. In Siberia, in the provinces of Yakutsk and Nerschinsk, and in Kamtschatka,

Y y † schatka,

Russia.

schatka, the hunting of sables forms, during part of the year, the chief occupation of the inhabitants; and their skins, when procured perfectly entire, are said to be worth L.10 each. The skins of the black fox are also highly esteemed, as, according to Mr Tooke, one of them is sometimes sufficient to pay the tribute of a village. The bear is found in the neighbourhood of the Uralian mountains, and the civet cat in the Altai chain. The wild boar grows here to such a size, that its tusks are said sometimes to weigh 600 pounds*. The horses of the Mongul Tartars are of singular beauty, some of them being striped like the tiger, others spotted like the leopard. The stud of a noble Mongul sometimes contains 3000 or 4000 of these animals. The principal Nomadic hordes of Asiatic Russia, viz. the Tartars, Monguls, and Mandshurs, not infrequently regale on horse-flesh; but they do not, as is commonly reported, eat it raw. The cattle of this division of Russia are of a middling size, and are commonly employed for draught, and even sometimes for carriage.

* Pinkerton's Geography, vol. ii. p. 15.

The whole empire abounds with wild fowl and game of all sorts; and in the more solitary regions of Mount Caucasus, and on the Uralian and Altaian chains, there are numerous birds of prey. The external parts and provinces of the empire are well supplied with sea fish from the northern ocean, the Baltic, the White sea, the Black sea and the Caspian; and the numerous lakes and rivers yield immense quantities of salmon, trout, pike, sturgeon, and belluga (a large fish from whose roe is made the best caviare). Innumerable swarms of insects are hatched by the summer's heat in the sands, morasses, and forests; and are said to be so troublesome as to render great part of these regions almost uninhabitable.

22

Vegetables.

Merely to enumerate the chief vegetable productions of the Russian empire, would far exceed the limits of our plan. We shall therefore only mention the most important. In the forests are found the fir, the Scotch pine, the larch, the elm, the birch, the alder, the greater maple, the sycamore, the oak of various species, the black and white poplar, the ash, the hornbeam, the beech, the nettle-tree, the cedar, and the cypress. Of fruit trees and shrubs, the most remarkable are, the almond, the peach, the apricot, the medlar, the walnut, the mulberry, the olive, the fig, the vine, and the pomegranate. In some parts of Asiatic Russia, are found, besides, the quince, the date, the jujube, and the willow-leaved pear; and many other shrubs and plants, which in our climate require the aid of artificial heat, are, in the southern provinces of Russia, produced spontaneously.

23

Minerals.

Russia is not less rich in mineral productions, of which Siberia in particular contains a great variety. In the brief sketch of Russian mineralogy which we can here offer, we shall confine ourselves chiefly to the metallic mines. Of these there are few in European Russia, and those principally of iron. It appears that there was formerly a gold mine near the river Vigg in the north-western corner of the empire; and in the year 1739, gold was discovered in the same region, in the mountains of Olonetz; but the product was scarcely sufficient to indemnify the government for the expence of working the mine, not more than 57 pounds of gold having been procured within the year. The richest iron mines in European Russia, are about 60 miles from

Mosco; and in the government of Perme are worked mines, both of iron and copper.

Russia.

In Siberia there are valuable gold mines, especially those of Catharineburg, on the east of the Uralian mountains, in the latitude of about 57°, where an office for the management of the mines was established by Peter I. in 1719. Several mines of different metals extend to a considerable distance on the north and south of Catharineburg; and there are in this district above 100 founderies, chiefly for copper and iron. The principal gold mines in this district are those of Beresof, a few miles north-east of Catharineburg, near the river Pyshma, that falls into the Tobol. The gold is sometimes found native, but is generally mixed with various substances, especially silver. There are other mines in Kolhyvan and Nershinsk, chiefly of lead and silver, with a small proportion of gold. The former of these were discovered in 1704, and the latter in 1748. In the mines of Beresof is found the red lead of Siberia; and in the copper mines, about 30 miles south of Catharineburg, that particular ore called malachite, or stalactitic copper, is found in great perfection. There are also copper mines in the Altai mountains, where dendritic copper is met with. The richest iron mines in this part of Russia are in the neighbourhood of the Uralian chain. The large mass of native iron which we have mentioned under GEOLOGY, N^o 165. was found by Professor Pallas in Siberia, near mount Emor or Nemir, not far from the river Yenissy.

Rock salt is found in several parts of Siberia, especially near the Ileik, not far from Orenburgh. Coal is a rare production in Russia; but it is found near Lake Baikal, and in the steppe between the Don and the Volga. Sulphur, alum, sal ammoniac, nitre, and natron, are found in great abundance.

There are also found in Siberia various gems, which we must not omit to notice. These are discovered chiefly in the mountain Adunshollow, in the province of Nershinsk or Daouri, not far from the Chinese river Argoon. Here are found common topazes, the hyacinth, the Siberian emerald, the beryl, the onyx, and beautiful red and green jaspers. Near Catharineburg are the gem mines of Moursintsky, where are found the beryl and the chrysolite. Near Lake Baikal red garnets are very common; and there are also found lapis lazuli and the Laikalite of Kirwan. The opal is said to be found in the Altai mountains.

24

The mineral springs of Russia are found principally in the Asiatic part, especially in Kamtschatka. The only European mineral waters that merit particular notice are, a hot spring near Selo Klintschy, in the government of Perme; a noted chalybeate spring in the village of Vingova, in the district of Olonetz, distinguished by Peter the Great, and called by him St Peter's Well, and another chalybeate spring, or rather assemblage of springs strongly impregnated with iron, discovered in 1775, near Sarepta on the Volga. In the district of Perekop and the island of Taman, belonging to the government of Taurida, there are springs of naphtha. Springs impregnated with naphtha and petroleum are also found near lake Baikal. At Sarepta there is a sulphurous spring, and there are several others in Siberia. On the Terek, towards Mount Caucasus, are warm springs that serve as baths; and similar baths occur

Mineral waters.

25
Russia. occur in the province of Nerzhinsk, in the territory of the Kalmuks, to the south of the Altai mountains, and in the neighbourhood of Baikal. Chalybeate waters are found among the iron mines near Catharinburg, and a few occur in the province of Daouria.

The principal hot baths of Asiatic Russia are in Kamtschatka, and are formed by the hot springs noticed in N^o 7. The chief bath of this kind is in the southern part of the peninsula near Natchikin. The hot waters here fall in a rapid cascade, about 300 feet below which they are collected into a bason six or seven feet broad, and 18 inches deep. The water is extremely hot, and is said to contain vitriolic and nitrous salts.

Before we conclude what may be called the permanent geography of Russia, we must enumerate the islands that belong to this extensive empire, and particularly notice such of them as have not been described in other parts of this Encyclopedia.

In Europe the Russians possess the islands of Oesel and Dago in the Baltic, and the little island of Cronstadt at the entrance of the gulf of Finland, the islands of Novaya Zemlia, and several smaller islands in the Arctic ocean; and though the dreary island of Spitzbergen is generally considered as belonging to Denmark, it is at least equally shared by the Russians, some of whom regularly winter here, on account of the whale fishery.

In Asiatic Russia we may enumerate the Aleutian (Aleoutskie or Fox) islands, of which Bhering's island is the only one deserving particular notice; the Andrenovian islands, about 500 miles to the south-east of Bhering's island, and the Kurile or Kurilian islands, extending from the southern promontory of Kamtschatka towards Japan.

26
Dago. The island of Dago, but briefly noticed in our general alphabet, is for the most part rocky, and its western shore is sandy; but the southern and eastern parts consist of a bluish clay, and are very fertile. They produce considerable quantities of barley, especially in rainy seasons; but it is found necessary to sow the seed very early in the spring. There are here several forests, especially one of alders, which is seen at a great distance, and serves as a land-mark. This island is extremely populous, and very healthy. It is inhabited chiefly by Esthonians. The sea round Dago abounds with shallows, rocks, and sand banks, that render the navigation dangerous; but to prevent ships from being stranded on the coast, a light-house has been erected on the western promontory, about three miles from the sea.

27
Oesel. Oesel is much more considerable than Dago, being nearly 80 miles long, and about 60 at its greatest breadth. Its soil is naturally more barren than that of Dago, being chiefly sand, or loam and clay; but as it is well manured, the crops are pretty considerable. These consist of wheat, rye, and barley, and in favourable seasons, oats and pease. Oesel abounds in quarries, from which are procured excellent limestone, black and gray flagstone, and grindstones. Marble is also found, but is not much esteemed.

28
Novaya Zemlia. The islands of Novaya Zemlia, or the New Land, consist chiefly of two very large insulated tracts, nearly alike in size and figure, extending between 45^o and 68^o of east longitude, and between 70^o and 77^o of north latitude. They are separated from the main land by the strait of Waigats. They may be estimated at 600 miles in length, by a medium breadth of nearly 400. Yet

this large tract of country is desert and uninhabited, except by reindeer, polar bears, white and blue foxes; and on the coast seals and walruses. The islands are well supplied with water, but are rocky and destitute of wood except a few stunted bushes. On the northern side they are encompassed with mountains of ice. In these dreary regions the sun is not seen for nearly four months, viz from the middle of October to February.

Bhering's island is situated in the sea of Kamtschatka, about 3^o to the east of that peninsula, extending from 55^o to 56^o of N. Lat. It was discovered by Bhering in 1740. It consists of a range of bald cliffs and hills, running north and south, the highest of which are nearly 1000 fathoms above the level of the sea. These rocks consist of granite in the middle ridge, and a sandstone on each side; but some of the lower appear to be covered with clay. This island is entirely destitute of wood, but is otherwise not bare of vegetation. It contains springs of excellent water, and has several fine cataracts. The cold is moderate, and thunder has never been observed, though it is said some shocks of earthquakes have been felt. There are no human inhabitants; but the island affords a dwelling to sea bears, arctic foxes, seals, and walruses. The Aleutian and Kurilian islands, have already been described under their respective heads; and an account of SPITSBERGEN will be found under that article.

Russia was scarcely known as an independent state before the latter end of the 9th century. We know, indeed, that long before that period, namely about the 5th century, a horde, of these nations that roved at large on the banks of the Dnieper and the Volkhof, established themselves in that part of the region bordering on the Dnieper, where is now situated the government of Kief or Kiow. These people were called Slavi, or Slavonians, and had advanced eastward from the shores of the Danube. They appear to have laid the first foundation of the Russian monarchy, and to have built Kief, where they fixed their capital. It is probable that about the same time another tribe of Slavi had settled still farther to the east, in the province of Novgorod, where they built the city still known by that name, as their metropolis. Of the government and transactions of these people we have no regular accounts till the conclusion of the 9th century. It appears, however, from a work of the emperor Constantine Porphyrogenitus on the administration of the empire, that in his time the city of Novgorod was a place of great importance, and carried on an extensive commerce, both with Constantinople and the countries bordering on the Baltic. The government of the Novgorodians appears to have been republican, but the people were probably rather merchants than warriors. We find them involved in frequent disputes with the neighbouring nations, from whose ravages they suffered considerable losses.

If we may credit the Russian historians, the Slavi that had settled about Kief and Novgorod, must have extended the boundaries of their territory northwards as far as the shores of the Baltic. We find that they were much harassed by a piratical nation who dwelt on the coasts of that sea, and were denominated Varages or Varagians, and who made frequent descents on the Russian coasts, and ravaged the country. It is not improbable that these Varagians formed a part of the Scandinavian nations, who, under the names of Danes and

Russia.

Settlement of the Varagians in Russia.

Russia.

Saxons, successively made themselves masters of England. They were occasionally employed by the weaker neighbouring states as mercenary auxiliaries, and in this capacity they were once called to the assistance of the Novgorodians. As is usual, where a weak people requires the assistance of a warlike and powerful nation, the auxiliaries, after having overcome the enemies whom they were invited to combat, began to think of availing themselves of the advantages which their bravery had given them over their employers. From allies and servants they soon became the masters of the Slavi; and finding the country about Novgorod superior to that which they had left, they began to think of taking up their residence in their new quarters.

32
An. 860.
Establishment of the monarchy under Ruric.

Their leader Ruric built a town near the Volkhof, and surrounded it with a rampart of earth. This town is now called Old Ladoga. Here Ruric established the seat of his government. This event appears to have taken place about the year 860; and from this period we may date the commencement of the Russian monarchy. Ruric was assisted by two other chiefs of the Varages, Sinaus and Truvor, who are supposed to have been his brothers, and with whom he divided the territory of which he had possessed himself. Of these, Sinaus took up his residence at Bielo Osero, or the white lake, while Truvor kept his court at Isborsk, or according to some, at Twertzog, in the district of Pleskow. The three chiefs having thus divided among them the territories of the Novgorodians, continued to reign in amity with each other for several years.

33
Opposition of the Slavi.

The Slavi, however, did not submit to the dominion of their new masters, without an effort to regain their independence. At first, astonishment at the unexpected proceedings of their auxiliaries overcame the spirit of liberty which had hitherto actuated their minds; but they soon awakened from their lethargy, and determined to repel by force those whom they now considered as the invaders of their country. They flew to arms, and chose for their leader, Vadim, who by his feats in war had acquired the honourable appellation of the *valiant*. A fierce engagement took place between the Novgorodians under Vadim, and the Varages headed by Ruric and his brothers. The contest ended in favour of the latter, and the brave Vadim, with several other chiefs of the Novgorodians, lost their lives in the attempt to free their country from its ambitious guests. This new success emboldened Ruric to extend his territories, and to change the seat of government from the insignificant town of Ladoga, to the spacious and opulent city of Novgorod. Soon after, by the death of his partners in the government, Ruric became sole monarch of the conquered territory, where he reigned without farther molestation for 17 years, and became the primogenitor of a long line of descendants, who held the sovereignty without interruption for several centuries. Ruric appears to have been zealous for the strict administration of justice in his dominions, and issued his command to all the boyars who held territories under him, to see it exercised in an exact and uniform

manner. We are not informed of the nature of his institutions; nor is it known whether the laws then existing in his territories were merely oral, or were committed to writing.

Ruric assumed the title of grand prince. His dominions extended over the present governments of Riga, Reval, Polotsk, Pscov, Vyborg, St Petersburg, Novgorod, Smolensk, Olonetz, Archangel, Vladimir, Yaroslavl, Kostroma, and Vologda.

As Ruric left only one son, Igor, who was still a minor at his father's death, Oleg, a kinsman of the deceased monarch, took on him the administration of affairs. Either from the natural restlessness of the Varages, or from the spirit of rebellion manifested by the Novgorodians, which indicated the necessity of employing his people in some active enterprise, the new monarch did not long remain idle. He appears very early to have projected the extension of his territories, by annexing to them the settlement which the Slavi had formed about Kiev, against which he soon undertook a formidable expedition. He collected a numerous army, composed of Slavi, Varages, and Tschudes, carried with him the young prince Igor, and opened the campaign with the capture of Lubitch, and of Smolensk the capital of the Krivitsches (c).

Having reduced several other towns of less consequence, he advanced towards Kiev, the possession of which formed the chief object of his ambition, as through the Kievian territory he would have an easy passage to the Grecian empire, by inroads into which he could gratify the predatory disposition of his followers. Having advanced near the walls of Kiev, he did not think it advisable to hazard an open attack, and thus leave to the precarious decision of a battle the ultimate success of his favourite project. He therefore had recourse to artifice, and leaving behind him the greater part of his troops, he concealed the remainder in the barks that had brought them down the Dnieper from Smolensk. Oleg himself, disguising his name and quality, passed for a merchant sent by Oleg and his ward Igor on business of importance to Constantinople; and he dispatched officers to Oskhold and Dir, the two chieftains of the Kievians, requesting permission to pass through their territory into Greece, and inviting them to visit him as friends and fellow-citizens, pretending that indisposition prevented him from paying his respects to them in person. The princes, free from mistrust, and relying on these appearances of friendship, accepted Oleg's invitation, and scarcely thought it necessary to take with them their ordinary attendants. They were soon undeceived; for when they arrived at the regent's encampment, they were quickly surrounded by the Varagian soldiers, who sprung from their place of concealment in the barks. Oleg taking Igor in his arms, and casting on the sovereigns of Kiev a fierce and threatening look, exclaimed, "You are neither princes nor of the race of princes; behold the son of Ruric." These words, which formed the signal that had been agreed on

(c) The Krivitsches were a Slavonian tribe who inhabited the regions bordering on the upper parts of the rivers Volga, Dvina, Oka, and Dniepr, where are now the governments of Polotsk, Smolensk and Minsk. The Tschudes whom we have mentioned as forming part of Oleg's army, were a nation of Finnish extraction, and inhabited those districts which form part of the present governments of Pscov and Reval.

on between Oleg and his soldiers, were no sooner uttered, than the latter rushed on the two princes, and laid them prostrate at the feet of their master.

The inhabitants of Kief, thrown into consternation by this bold and treacherous act, made no resistance, but opened the gates of their city to their invader; and thus the two Slavonian states were united under one head.

Having thus made himself master of the key to the eastern empire, Oleg prepared to carry into effect his ambitious designs against Constantinople. Leaving Igor at Kief, he himself embarked on the Dniepr with 80,000 warriors, on board of not fewer than 2000 vessels. Their passage down the river met with no obstruction, till they came to that part where its course is embarrassed for nearly 15 leagues by seven rocks; and here began a series of perils, labours, and fatigues, which none but barbarians could have overcome. They were obliged to unload their barks, and convey them over the rocks; and in particular at the fourth rock, they carried their baggage for above 6000 paces, exposed to the perpetual risk of attack from the neighbouring nations with whom they were at war, while thus hampered and encumbered. Having at length passed all the rocks, and reached the mouth of the Dniepr, Oleg drew together his scattered vessels at a small island that lies between the points of Otchakof and Kinburn, where he caused them to be refitted, and waited for a favourable wind to carry him across the Black sea to the mouth of the Dniester. Here the vessels were again refitted, and hence the expedition coasting along the shores of the Euxine, soon arrived at the strait of Constantinople.

The inhabitants of the imperial city, on discovering the approach of the barbarians, had drawn a massy chain across the harbour, thus hoping to prevent their landing. In this hope, however, they were deceived. The invaders drew ashore their barks, fitted wheels to their flat bottoms, and converted them into carriages, which by the help of sails they forced along the roads that led to the city, and thus arrived under the walls of Constantinople. In their route they ravaged the whole country, and pillaged and demolished the houses, loaded the inhabitants with irons, and committed other enormities which generally attend the incursions of a barbarous enemy. The earth that had been fertilized by the sweat of the husbandman, was now drenched with his blood, and the sea received, as in one vast grave, both the carcases of the dead, and the bodies of the living. The weak Leo, who then swayed the sceptre of the Grecian empire, instead of making a manly resistance, is said to have attempted carrying off his enemy by poison; but this not succeeding, he was obliged to purchase from the conqueror an ignominious peace. Thus, even at that early period, the sovereign of Russia triumphed over the emperor of Constantinople, and Oleg acquired the full completion of his wishes, by the rich booty which he carried off. He made his entrance into Kief on his return, laden with the wealth acquired by his victory; and the people, dazzled with such splendid objects, imagined their prince to be endowed with supernatural powers, and looked up to him with a reverence approaching to adoration.

Soon after his return to his own dominions, the Russian monarch dispatched deputies to Constantinople, with the articles of a treaty which he required the Greek emperor to sign*. This treaty, which is pre-

served in the Chronicles of Nestor, is extremely curious; and we learn from it many important particulars respecting the internal policy of the Russians at the beginning of the tenth century. Several articles of this treaty shew, that the Russian laws laid great stress on oaths; that they pronounced the sentence of death against the murderer, instead of inflicting on him only a pecuniary fine, and thus allowing the rich to commit assassination with impunity; that wives were allowed a part of the estates of their husbands; that the punishment of offences did not extend to the entire confiscation of goods, and hence the widow and orphan did not suffer for a crime of which they were innocent; that robbery, which attacks only property, was punished by the privation of property, so that the Russian laws maintained a just proportion between the crime and the penalty; that the citizens, secure in their possessions, were under no apprehension that the sovereign would seize on their heritage, and might even dispose of their effects in favour of friends.

Oleg maintained the sovereign power for 33 years, nor does it appear that Igor, even after he obtained the age of majority, had any share in the government, till the death of his guardian, in 913, left him in full possession of the throne.

Igor had reached his 40th year before he entered on the government. He soon discovered marks of the same warlike spirit which had actuated his predecessor. Among the nations that had been subjugated by Oleg, several, on the accession of a new sovereign, attempted to regain their independence; in particular the Drevlians, who dwelt on the banks of the Uscha, in the present district of Vrutsch, were the first to rise in revolt. They were, however, soon quelled, and punished by the imposition of an increased tribute. The Uglitches, who inhabited the southern bank of the Dniepr, maintained a longer contest for their liberty. One of their principal towns sustained a siege of three years, and at last submitted on condition of the trifling tribute of a marten's skin blackened by fire; as these furs were valued in proportion to the darkness of their colour.

Igor soon had to contend with more formidable enemies. The Petchenegans, a nation hitherto unknown, quitted their settlements on the Yaik and the Volga, and made incursions into the Russian territory. These people appear to have been at least as powerful and warlike as the Varages; and Igor finding himself unable to cope with them in arms, concluded a treaty of alliance. About five years after, disputes arose between the new allies, and both had recourse to arms. It appears that the Russians were finally victorious, and the Petchenegans were, for some time, disabled from giving Igor any farther molestation.

The Russian monarch, in imitation of his guardian, soon turned his attention towards the Grecian empire, where depredations might apparently be made with impunity. He equipped an immense armament, consisting, as we are assured by the Russian annals, of 10,000 barks, each carrying 40 men, thus forming an army of 400,000 warriors. With this immense force he set sail for Constantinople, without any previous declaration of war, and without any ostensible motive for thus infringing the treaty that had been concluded some years before between Oleg and Leo. In his route he overran and ravaged the provinces of Paphlagonia, Pontus, and Bithynia,

thynia, plundering the towns, and butchering the inhabitants. For some time the barbarians met with no opposition, as the imperial troops were engaged in distant provinces; but the government of the empire was now in very different hands from those which held it during the former invasion. The Grecian forces were well appointed, and commanded by two generals of approved ability and courage. These were Theophanes and Phocas, of whom the former commanded the fleet, and the latter the army. The Russians had soon cause to repent their temerity. Theophanes attacked them on board their ships, within sight of the Pharos, and throwing among them the unquenchable Grecian fire, with the effects of which they were wholly unacquainted, threw them into such confusion, that many plunged into the sea to avoid the fires that threatened and pursued them. Their vessels were dispersed, shattered, or consumed by flames, and great numbers of their crews perished. The remainder reached the shores of Bithynia; but before they could recover from their consternation, they were met by Phocas, who fell upon them with his troops, and made prodigious slaughter. So great were the losses sustained by Igor in this unfortunate expedition, that he carried back with him scarcely a third of his army. This second naval expedition of the Russians against Constantinople took place in 941.

Though discouraged by the ill success which had attended his first invasion of the Grecian empire, Igor was too much stimulated by the desire of plunder, not to risk the second attempt. Three years after, he collected new forces, took into pay many of the Petchenegans, and again set out for Greece; but before he had advanced beyond the Taurian Chersonesus, the emperor Romanus, informed of his approach, and not choosing to hazard the result of an engagement, sent deputies to the Russian leader, offering to pay him the same tribute which had been given to his predecessor. With this offer Igor complied, and once more retired with his army.

Igor was now far advanced in years; but the insatiable rapacity of his officers, ever craving fresh spoils from vanquished nations, impelled him to turn his arms against the Drevlians, for the purpose of obtaining from them an increase of their yearly tribute. In this unjust attack he was at first successful, and returned loaded with the contributions which he had levied from that people; but having dismissed great part of his troops with the spoils of the vanquished, and marching with the remainder too far into the country, he fell into an ambuscade, which the Drevlians, now grown desperate, had formed on his approach in the neighbourhood of Korosten. The Russians were soon overpowered, and Igor being made prisoner, was put to death.

Before the death of Oleg, Igor had married a princess of a bold and daring spirit, named Olga, by whom he had one son, Sviatoslaf; but as he was very young at the death of his father, the queen mother Olga assumed the reins of government. Her first care was to take signal vengeance on the unhappy Drevlians, for having bravely defended themselves against the encroachments of tyranny and oppression. These people, satisfied with the death of their oppressor, appeared desirous of renewing their amicable intercourse with the Russians, and their chief, Male, is even said to have made an offer of his hand to Igor's widow. Olga, with that deep cunning

and concealed malice that so often mark the character of the despotic leader of a barbarous people, pretended to listen to their overtures, received the deputies of Male, but immediately ordered them to be privately put to death. In the mean time she invited a larger deputation from the Drevlian chief, which she treated in the same inhuman manner, taking care that no tidings of either murder should be carried to the Drevlians. She then set out, as if on an amicable visit, to conclude the new alliance, and having proclaimed a solemn entertainment, to which she invited some hundreds of the principal inhabitants of the Drevlian towns, she caused them to be treacherously assassinated. This was but the first step to the more dreadful vengeance which she had resolved to inflict on this deluded people. She laid waste the whole country of the Drevlians, and in particular the town of Korosten, near which Igor had lost his life. For a long time she could not master the place, as the inhabitants, dreading the horrible fate that awaited them, from the revengeful spirit of Olga, defended themselves with the utmost valour and success. At length, being assured of clemency, on condition of sending to Olga all the pigeons of the town, they submitted; but Olga causing lighted matches to be fastened to the tails of the pigeons, set them at liberty. The birds flew to their usual places of residence in the town, which were speedily in a conflagration. The wretched inhabitants endeavouring to escape the flames, fell into the hands of the Russian soldiers, planted round the town for that purpose, by whom they were put to the sword.

This was the only warlike transaction, if it deserves that name, which took place during the regency of Olga. Though not uncommon in the annals of a barbarous people, it would have been sufficient to hand down her name with detestation to posterity, had she not, in the opinion of her panegyrists, atoned for the enormity, by attempting to introduce into her dominions the Christian religion.

Hitherto the Slavi, and the Scandinavian nations who had taken possession of their territories, were Pagans; and their religious ceremonies, like those of all the surrounding nations, were marked by an absurd and cruel superstition, which, under pretence of worshipping the Supreme being, insulted his attributes, and increased instead of lessening the miseries of human nature. Their deities seem to have been borrowed, partly from the Greeks and Romans, and partly from the Scythians; but were characterised by peculiar names, and represented by idols of complex workmanship and grotesque appearance. Thus, the god Perune, or Perkune, who was the chief among the Slavonian deities, analogous to the Zeus of the Grecian, and the Jupiter of the Roman mythology, was personated by an idol whose head was of silver, his ears and mustachios of massy gold, his legs of iron, and his trunk of hard incorruptible wood. It was decorated with rubies and carbuncles, and held in its hand a stone carved, to represent the symbol of lightning. The sacred fire burnt continually before it; and if the priests suffered this to be extinguished, they were doomed to perish in the flames, as enemies of the god. Sacrifices of their flocks to this supreme deity were regarded as trifling; his altar smoked with the blood of captives, and even the children of his worshippers were sometimes immolated to appease his wrath or propitiate his favour. Superstition has in all ages, tinged the hands

Russia.

Religion
the Sla

hands of its pontiffs with blood, and has everywhere represented the Deity as a cruel and malignant being delighting in the spectacle of suffering humanity.

It is uncertain at what time the light of Christianity began to beam on the nations that occupied the banks of the Dniepr, nor are we acquainted with the circumstances that led to the conversion of the queen regent. We find, however, that about the middle of the 10th century, she undertook a journey to Constantinople for the express purpose of being initiated into the religion of Jesus Constantine Porphyrogenitus, who then sat on the imperial throne, received the royal convert with the greatest honour and respect; himself conducted her to the baptismal font, and, in the character of her sponsor, gave her the name of Helen. He dismissed her loaded with rich presents, consisting chiefly of those fine stuffs which were then fabricated only in the east, and several costly vases. In return for the honour she had received at Constantinople, Olga promised to send the emperor a quantity of furs and wax, and to furnish him with troops: but as she delayed the performance of her promise, Constantine despatched an embassy to remind her of her engagements. We are told that she treated the ambassadors with disrespectful levity, and dismissed them with frigid compliments; so little change had baptism effected on the insidious disposition of the Russian princess! It is no wonder, therefore, if her example had little influence on her son, or the nation at large. The Russians do not seem to have been very ardent in their religious observations, or peculiarly attached to the opinions of their forefathers; but the nature of Christianity, and the character of its disciples, were not in their eyes sufficiently striking or alluring to produce any change in their religious system. Olga endeavoured to persuade her son Sviatoslaf to embrace her new religion; but either from his contempt for the unwarlike character of the Greek Christians, or through fear of the ridicule to which his conversion might subject him from his young companions, he disregarded her solicitations. He did not, however, prevent the people over whom he seems by this time to have assumed the chief dominion, from receiving baptism, and a few proselytes were made. Though the character of Olga, even after her conversion to Christianity, was by no means such as to intitle her to the rank which she afterwards attained among the Russian saints, it appears that she had given her son many wise and prudent instructions respecting the government of his future empire. She travelled with him round the country; superintended the erection of bridges and the making of roads, for the benefit of trade and commerce; built several towns and villages, and founded such laudable institutions, as sufficiently evince her talents for governing a nation. She died about the year 969, at a very advanced age.

It is probable that Olga retired from the administration of affairs soon after her conversion to Christianity; for we find Sviatoslaf in full possession of the government long before his mother's death. This prince has been considered one of the Russian heroes; and if a thirst for blood, a contempt of danger, and disregard of the luxuries and conveniences of life, be admitted as the characteristics of a hero, he deserves the appellation. His private life was such as to render him the favourite of his army. Regarding the narrow inclosure of a palace as little better than a splendid prison, he took up his

habitation in a camp, where he indulged himself in nothing more delicate or costly than what could be procured by the meanest soldier in his army. Without a utensil for preparing his food, he contented himself with cutting up the meat which was to form his meals, and broiling it upon the coals; and this meat often consisted of horse flesh. If he kept so poor a table, he was not more delicately lodged. He had no tent, but slept in the open field, with a saddle for his pillow, a horse-cloth for his covering, and lying on the bare ground, or at most on a piece of the coarsest felt. How much influence such a mode of life must have had on the minds of the barbarous soldiers whom he commanded, is sufficiently proved by the experience of times far posterior to that of which we are now writing. The Swedish hero who, in the beginning of the 18th century, astonished the whole of Europe with his mad exploits, fared in a similar manner, and, like Sviatoslaf, became the darling of his troops. Soldiers willingly share dangers and death with a leader who submits himself to every hardship, and denies himself every accommodation, except what he can enjoy in common with themselves.

When Sviatoslaf had thus ingratiated himself with his troops, he prepared to employ them in those ambitious projects which he had long been forming. His first expedition was against the Kozares, a people who had come from the shores of the Caspian, and the sides of Mount Caucasus, and had established themselves along the eastern coast of the Black sea. These people had rendered tributary both the Kievians and the Viatches, a Slavonian nation that dwelt on the banks of the Oka and the Volga. Sviatoslaf, desirous of transferring to himself the tribute which the Kozares derived from the latter people, marched against them, and appears to have succeeded in his design. He defeated them in a pitched battle, and took by storm their capital city Sarkel, or Belgorod. It is said by some historians, that he even annihilated the nation; and certain it is, that from that time no mention is made of the Kozares.

The martial fame of Sviatoslaf had extended to Constantinople; and the emperor Nicephorus Phocas, who was then harassed by the Ungrians, assisted by his treacherous allies, the Bulgarians, applied for succours to the Russian chieftain. A subsidiary treaty was entered into between them, and Sviatoslaf hastened with a numerous army to the assistance of his new allies. He quickly made himself master of most of the Bulgarian towns along the Danube, and was so elated with his success, that he determined to remove the seat of government from Kief to the city of Pereiaslavatz, now Yamboly, seated on the shores of that river. He was soon obliged, however, to postpone the completion of this design, on receiving intelligence that his old enemies the Petchenegans had assembled in great numbers, ravaged the Kievian territory, and laid siege to the capital, within the walls of which were shut up his mother and his sons. Sviatoslaf hastened to the relief of his family, but before he reached home, the Petchenegans had been induced to raise the siege by an artifice of the Kievian general. Sviatoslaf on his arrival pursued the enemy, defeated them, and obliged them to sue for peace.

He now resumed his design of establishing himself on the banks of the Danube, and divided his hereditary dominions among his children. He gave Kief to Yamboly,

ropolk,

ropolk, the Drevlian territory to Oleg, and on Vladimir, a natural son, born to him by one of the attendants of Olga, he bestowed the government of Novgorod. On his return to Bulgaria, however, he found that his affairs had assumed a very different aspect. The Bulgarians taking advantage of his absence with his troops, had recovered most of their towns, and seemed well prepared to resist the encroachments of a foreign power. They fell on Sviatoslaf as he approached the walls of Pereiaslavatz, and began the attack with so much fury, that at first the Russians were defeated with great slaughter. They, however, soon rallied, and taking courage from despair, renewed the battle with so much success, that they in their turn became masters of the field. Sviatoslaf took possession of the town, and soon recovered all that he had lost.

During these transactions the emperor Nicephorus had been assassinated, and John Zemisces, his murderer, had succeeded to the imperial diadem. The new emperor sent ambassadors to the Russian monarch, requiring him to comply with the stipulations of his treaty with Nicephorus, and evacuate Bulgaria, which he had agreed to occupy as an ally, but not as a master. Sviatoslaf refused to give up his newly acquired possessions, and prepared to decide the contest by force of arms. The particulars of this campaign, and the numbers of the contending armies, are very differently related by the Russian annalists, and the historians of the Grecian empire; the former stating that Sviatoslaf had not more than 10,000 men, and yet was victorious over the troops of Zemisces; while the Grecian historians affirm that the Russians amounted to 300,000, but were defeated, and compelled to abandon Bulgaria by the superior skill and discipline of the imperial troops. As far as respects the issue of the war, the Grecian writers are probably correct, for it is certain that Sviatoslaf retreated towards Russia with the shattered remains of his army. He did not, however, live to reach the capital, for having, contrary to the advice of his most experienced officers, attempted to return to Kiev, up the dangerous navigation of the Dnieper, he was intercepted by the Petchenegs near the rocks that form the cataracts of that river. After remaining on the defensive during winter, exposed to all the horrors of famine and disease, he on the return of spring attempted to force his way through the ranks of the enemy: but his troops were defeated, and himself killed in the battle.

It is said that Sviatoslaf extended the boundaries of the Russian dominions by his conquests in Bulgaria; but if his expeditions in that quarter terminated in the manner which we have related, this extension must have been merely temporary, and seems to have had little effect in increasing the power and resources of his successors.

46
An. 973.
Succession
of Yaropolk.

Yaropolk the sovereign of Kiev may be considered as the successor of Sviatoslaf on the Russian throne; but his reign was short and turbulent. A war took place between him and his brother Oleg, on account of a base assassination committed by the latter on the son of his father's friend and privy counsellor Svenald. Oleg was defeated and slain, and the other brother, Vladimir, dreading the increased power and ambitious disposition of Yaropolk, abandoned his dominions, which were quickly seized on by the Kievian prince. Vladimir had retired among the Varagians, from whom he

soon procured such succours as enabled him to make effectual head against the usurper. While his natural courage was thus increased, his enmity against Yaropolk received an additional spur from an affront put on him by a lady whom he had sought in marriage, but who despising the meanness of his birth, as being the son of a slave, had rejected his proposals, and offered her hand to Yaropolk. The vindictive Vladimir, on being informed of this insult, attacked the possessions of the lady's father, put both him and his two sons to the sword, and obliged the princess to accept his hand, yet reeking with the blood of her father. He now advanced towards Kiev, where Yaropolk was by no means prepared to oppose him. The Kievian prince had indeed been lulled into security by the treacherous reports of one of his voyevodes, who was in the interest of Vladimir, and who not only prevented Yaropolk from taking effectual measures for his safety, but found means to raise suspicions in his breast against the inhabitants of his capital, which he thus induced him to abandon. The Kievians, left without a leader, opened their gates to Vladimir; and the wretched Yaropolk, still misled by the treachery of his adviser, determined to throw himself on the mercy of his brother. It is probable that this would have availed him little, as Vladimir seems to have determined on his death; but before he could reach the arms of his revengeful brother, Yaropolk was assassinated by some of his Varagian followers.

By this murder, which had probably been planned by Vladimir, the conqueror acquired the undivided possession of all his father's territories, and maintained the sovereignty during a long reign, respected at home, and feared abroad. Indeed, had not the commencement of his reign been stained with the blood of his father-in-law and his brother, we might place him among the most distinguished monarchs of the age in which he lived, as he not only extended and enriched his empire, but was the means of establishing in his dominions on a firm and lasting basis, the Christian religion, which though introduced by Olga, appears hitherto to have made but a very trifling progress.

The commencement of Vladimir's reign formed but a continuation of those enormities which had conducted him to the throne. He began with removing Blude, the treacherous voyevode, by whom his brother had been betrayed into his power, and to whom he had promised the highest honours and dignities. Accordingly for three days he suffered Blude to live in all the splendour of a prince. At the end of that period he thus addressed him. "I have fulfilled my promise; I have treated thee as my friend: the honours thou hast received exceed thy most sanguine wishes. To day as the judge of crimes, and the executor of justice, I condemn the traitor, and punish the assassin of his prince." Having uttered these words, he caused Blude to be put to death.

He displayed still more the perfidiousness of his character in his behaviour towards the Varagians, who had assisted in reinstating him on the throne of his ancestors; for on their requesting permission to go and seek their fortune in Greece, he granted their request, but privately advertised the emperor of their approach, and caused them to be arrested and secured.

Vladimir engaged in numerous wars, and subjected several of the neighbouring states to his dominion. He

seized on part of the Polish territories, and compelled the Bulgarians who dwelt in the districts that now form the government of Kagan, to do him homage. He subdued the Petehenegans and Khazares, who lay in the immediate neighbourhood of the Kievian state; he reduced to his authority Halitsch and Vladimir, countries which are now called Galicia and Lubomiria; he conquered Lithuania as far as to Memel, and took possession of a great part of the modern Livonia.

His conduct after these successes by no means prognosticated his future zeal for the Christian religion. None of the Russian monarchs appear to have been more devout in the adoration of their heathen deities than Vladimir. It was usual for him to return thanks to the gods for the success which they had granted to his arms; and to show his gratitude by offering on their altars a part of the prisoners he had taken in war. On one occasion his piety extended so far, that he resolved on selecting one of his own subjects as the object of his sacrifice, thinking that he should thus more worthily testify his gratitude for the signal favours he had received from heaven. His choice fell on a young Varagian, the son of a Christian, and who had been brought up in the new faith. The unhappy father refused the demanded victim; the people enraged at deeming their prince and their religion insulted by the refusal, assailed the house of the Christian, and having burst open the doors, butchered both the father and the son, folded in mutual embraces.

Yet this furious Pagan, and bloody warrior, afterwards became a most zealous Christian, and a shining example to his subjects of charity and benevolence. The circumstances that led to these important changes are, as well as the martial achievements of this favourite prince, related with great minuteness by the Russian annalists, and give this part of their chronicles the air rather of a historical romance, than a narrative of facts. We are told that the fame of Vladimir's military exploits had rendered him so formidable to the neighbouring nations, that each courted his alliance, and strove to render this more lasting by engaging him in the ties of the same religion with themselves. In particular the Grecian emperors sent to him a philosopher, whose exhortations, though they did not at first induce Vladimir to embrace the Greek ritual, at least succeeded in giving him a favourable opinion of it; so that the philosopher was entertained with respect, and returned home loaded with presents. We are also told, that, determined to act in the most impartial manner with respect to the several religions which he had been invited to embrace, he dispatched persons remarkable for their wisdom and sagacity, to visit the surrounding nations, observe the religious tenets and ceremonies that distinguished them, and report to him the result of their observations. On the return of these deputies, the report of those who had visited the churches of Constantinople, and witnessed the imposing splendour of religious adoration, and the gorgeous decorations of the Greek priests, in the superb basilicom of St Sophia, proved so satisfactory to Vladimir, that he determined on embracing the Christian religion according to the observances of the Greek church. Though he resolved on baptism, he was too proud to seek from the Greek emperor a priest, by whom the solemn ordinance might be performed. With a savage ferocity worthy

of the times in which he lived, he determined to gain by conquest what his haughty soul disdained to acquire by request. He assembled an army selected from all the nations of which his empire was composed, and marching to Taurida, laid siege to Theodosia, a town even then of great repute, and which commanded the whole Chersonesus. On sitting down before the walls of this place, he is said to have offered up the following characteristic prayer: "O God grant me thy help to take this town, that I may carry from it Christians and priests, to instruct me and my people, and convey the true religion into my dominions." His prayer was at length granted; and, rather by stratagem than force, he made himself master of the town, and through it, of the whole Crimea. He might now have received baptism; but his desire of being initiated into the Christian faith seems to have been excited more by ambition than by true devotion. His ruling passion promised to be amply gratified by an alliance with the Grecian emperors, as he would thus acquire some legal claim on the territories which they possessed. He therefore demanded in marriage, Anna, the sister of Basilius and Constantine, who jointly held the imperial dignity, threatening, that if they refused his proffered alliance, he would lay siege to Constantinople. After some deliberation, the emperors complied, on condition that Vladimir and his people should become Christians; and these conditions being accepted, the Russian monarch was baptized, took the name of Basilius, received the Grecian princess, and, as the reward of his victories, carried off several popes and archimandrites, together with sacred vessels and church books, images of saints, and consecrated relics.

Whatever might have been the considerations that swayed with Vladimir in his conversion to the Christian faith, it is certain that his new religion had the happiest influence on his future life and conduct. He not only abjured idolatry himself, and destroyed the idols which he had caused to be raised in his dominions, but used every exertion to persuade and compel his subjects to follow his example. Before his conversion, he is said to have possessed five wives, and 800 concubines, but after he became a Christian, he maintained an unshaken fidelity towards the imperial princess. As a Pagan he had been lavish of human blood, and set but a trifling value on the life of a man; but after he had adopted the religion of Jesus, he could scarcely be persuaded to sentence to death a single highway robber. His former delight had been in storming towns and gaining battles; but he now found his greatest pleasure in building churches, and endowing seminaries of education. He encouraged the raising of new cities and towns; peopled the waste districts of his country with the prisoners whom he had taken in war; and not only conducted himself as a sovereign who consulted the welfare of his dominions, but displayed many amiable qualities that highly endeared him to his subjects. On great festivals, he was accustomed to give entertainments to the inhabitants of the capital, and to send refreshments to those who were prevented, by sickness or infirmity, from attending the public feast. By these marks of regard to the general and individual interests of his people, he contributed to win them from the old religion, and to give them a taste for the new doctrines which he professed. By showing that Christianity had made him bo'h

Russi.

His latter character.

Russia.

a milder and a wiser prince, he insured from his people a respect for the new religion, while the striking example of the sovereign and his nobles could not fail to influence the minds of the inferior orders. Having one day issued a proclamation, ordering all the inhabitants of Kief to repair next morning to the banks of the river to be baptized, the people cheerfully obeyed the order, observing that if it were not good to be baptized, the prince and the boyars would never submit to the ceremony.

An. 1015.

52
Death and
character
of Vladim-
mir.

The establishment of Christianity in the Russian dominions, forms one of the most prominent features in the reign of Vladimir, and gives him a much juster claim to the title of *Great*, which has been bestowed on him by historians, than all his numerous victories. We have therefore dwelt on it with the greater minuteness. Indeed the latter transactions of his reign afford but little interest. His last days were embittered by domestic vexations; his wife and one of his favourite sons died long before him, and another of his sons, Yaroslaf, on whom he had bestowed the government of Novgorod, refused to acknowledge him as his liege, and applied to the Varangians for assistance against his father. The aged Vladimir, compelled to march against a rebellious son, died with grief upon the road, after a long and glorious reign of 35 years.

The character of this monarch may be easily collected from the account we have given of the transactions that marked his reign. He had certainly great, if not amiable qualities; and if he failed in communicating to his subjects the zeal for civilization and improvement which he himself possessed, it was the fault rather of the times, than of the instructor. His country remained barbarous, because barbarism was the characteristic of the age, and the monarch himself rose but little above the character of a barbarian, because the times in which he lived did not admit of superior refinement. It has been well observed by an ingenious writer on the history of Russia, that it is scarcely possible for a man to rise far above his cotemporaries, and that had Vladimir lived in the 17th century, the civilization and refinement of Russia might have been imputed to him, as it is now imputed to Peter the Great.

53

His im-
provement
of the Rus-
sian monar-
chy.

Notwithstanding the circumstances we have noticed, the improvement which Russia owed to this prince was great and permanent. With the Christian religion he imported from Greece the arts which then flourished in that empire, and almost entirely new-modelled the language of his country, by engrafting on it the more refined dialect of the Greeks, and adopting, in a great measure, the letters of their alphabet. See PHILOLOGY.

The dominions of Russia, which at first consisted of two principalities, that of Novgorod, bordering on the Baltic, and that of Kief, occupying no very large space on the eastern bank of the Dniepr, were, by the victories of Vladimir, extended westward along the shores of the Baltic, into Lithuania and Poland; southward along the shores of the Euxine, so as to include the Crimea and great part of the Bulgarian territories; while to the east it extended to the Oka, the Don and the Volga. He still maintained the seat of government at Kief, of which he was styled grand prince, while the other districts were either tributary to that principality, or held of it as their superior.

Before his death, Vladimir had divided his extensive territories among his twelve sons, reserving to himself and his immediate heir, the grand principality of Kief. The consequences of this ill-judged distribution were disunion, contention, and almost perpetual warfare among the brothers. The most respectable, and in the end the most powerful of these, was Yaroslaf, or as he is commonly called Jarislaus, prince of Novgorod. This prince finding that Sviatopolk, who had raised himself to the sovereignty of Kief after his father's death, attempted by assassination, or force of arms, to take possession of the neighbouring principalities, determined to resist him in his encroachments. Collecting an army of Novgorodians, he in 1016, drove Sviatopolk from Kief, and forced him to seek an asylum with his father-in-law, Boleslaus, duke of Poland. Boleslaus was easily persuaded to engage in the cause of his son-in-law, as he hoped to reap advantage from the quarrels among the descendants of Vladimir, and not only regain that part of his dominions which had been conquered by that prince, but enlarge his territory by encroachments on the Russian borders. He therefore accompanied Sviatopolk into Russia with an army, retook Kief, and obliged the Novgorodian prince to retire with precipitation. While he was endeavouring to collect fresh forces to renew the war with Boleslaus and Sviatopolk, the latter, by the treachery and perfidy with which he treated his Polish allies, contributed to his own downfall. He caused great numbers of the Poles to be secretly massacred, a transaction by which Boleslaus was so incensed, that he plundered Kief, made himself master of several places on the Russian frontiers, and then left his perfidious son-in-law to shift for himself. Sviatopolk now sought assistance from the Petchengians, and with an army of these auxiliaries, offered battle to Yaroslaf, not far from the place, where he had, four years before, caused one of his brothers to be murdered. The contest was long and bloody, but terminated in favour of Yaroslaf. Sviatopolk was put to flight, and died soon after.

By this victory Yaroslaf acquired possession of the greater part of his father's dominions, and testified his gratitude for the assistance given him by the Novgorodians, by the attention which he paid to the particular improvement of that state. He drew up for it a code of laws, which are still known by the appellation of the municipal law of Novgorod. He also exerted himself for the welfare of other towns, and of the country at large.

Yaroslaf did not neglect the advancement of the Christian religion. He established a metropolitan in Kief, and thus gave to the Russian clergy a head, who might watch over the morals of the inferior pastors, and provide for the general dissemination of the Christian doctrine. He collected several books in the Greek religion, and caused many of them to be translated into the Russian language.

This monarch is supposed to have died in 1054, and to have reigned 35 years. He followed the example of his father, in dividing his territories among his sons, though he endeavoured to prevent the dissensions which he himself had witnessed from such a partition, by exhorting them on his death-bed, to the most intimate concord, and endeavouring to convince them that they would be respected by their subjects, and feared by their enemies,

An. 1051.

An. 1054.

enemies, only while they continued to act with unanimity.

We know little of the proceedings of Yaroslav's successors, except that Isiaslaf, his eldest son, and grand prince of Kief, had frequent disputes with his brothers, in which he was assisted by the Poles, and supported by the influence of the Roman pontiff. During these disputes he was once expelled from his dominions, but again recovered them, and reigned till 1078.

From the death of Isiaslaf to the beginning of the 13th century, the history of Russia comprises little else than a continued series of intestine commotions and petty warfares with the neighbouring states. The same system of dismemberment was continued by the succeeding princes, and was attended with the same result. There were during this period not fewer than 17 independent principalities, though these were at length reduced to seven, viz. those of Kief, Novgorod, Smolensk, Vladimir, Tver, Halitch, and Moskva (Mosco). Of these, Kief and Novgorod long continued to be the most powerful, though they could not always maintain their superiority over the other principalities; and towards the latter end of the period which we have mentioned, the district of Vladimir erected itself into a grand principality, and became at least as powerful as Kief and Novgorod.

In the supremacy of these three great principalities, we may trace the division of European Russia into Great, Little, and White Russia, a distinction which long maintained its ground, and in later times gave to the sovereign of this empire the title of monarch or emperor of all the Russias. Great Russia comprehended the principality of Novgorod, and extended northward to the White sea, eastward to the river Dvina, and the entrance of the Petchora into the Uralian mountains; while to the south it bordered on the district of Vladimir, as far as the Volga and the mouth of the Medreditza, and to the west on Lithuania and Prussia, including the tributary tribes on the Baltic, as far as Memel. Its capital was Novgorod. Little Russia extended along the river Ager to the north above the Donetz and the Oka, on the east to the Polovtzes and the Petchenegans, while to the south it stretched as far as the Taurican Chersonesus, or the Crimea, and to the west along the banks of the river Goryn. This was the principality of Kief, and in that city was held the seat of government. The principality of Vladimir received the name of White Russia. It extended northward along the Volga, to the southern boundary of Great Russia; to the east it bordered on the possessions of the Ugres, and the territory of the Mordvines, stretching down the Volga to the mouth of the Oka; to the south it extended along the Oka to the principality of Riazan, and the Bulgarian territory. The metropolis of this division was at first Shuia, afterwards Rostof, Susdal, and Vladimir, till at length the seat of government was transferred to Mosco.

The principality of Novgorod appears, during this interval, to have been the most respectable for its commercial intercourse with the neighbouring nations, and for the independent spirit of its internal government. This, though nominally monarchical, seems to have possessed much of a republican character. The princes were evidently dependent on the people, and some ludicrous instances of this dependence are related by the old histori-

ans. One of the grand princes had so much displeased his people, that they refused to pay him their usual obedience. As the prince seems to have been aware of the little influence which he possessed in the state, he employed the metropolitan of the principality to negotiate a reconciliation. This prelate accordingly wrote to the Novgorodians in the following terms. "The grand prince has acted wrong towards you, but he is sorry for it, desires you to forgive him, and will behave better for the future. I will be surety for him, and beseech you to receive him with honour and dignity*."

During the intestine broils that attended the dismemberment of the Russian monarchy, the ambition of its neighbours, and partly the folly of the contending princes, who solicited their assistance against their rivals, contributed to diminish the strength and resources of the empire. In particular the Poles and the Hungarians availed themselves of these circumstances. Invited into Russia by the rival princes, and allured by the hope of plunder, they readily lent their aid to any of the parties. By ravaging the towns and villages, carrying off the captives into slavery, and making a prey of whatever appeared most useful, they quickly recompensed themselves for their assistance. The Poles seem to have been most successful in their depredations, and to have fully revenged themselves for their former humiliation.

It is not surprising that a state of anarchy and confusion, such as we have described, should hold out a temptation to any powerful nation to attempt at acquiring the dominion of a people who showed that they were incapable of governing themselves. Not far from the confines of Vladimir and Kief, viz. in the neighbourhood of the sea of Aral, the wandering hordes of Mongoles, or Mongol Tartars, had taken up their residence. These people appear to have descended from the ancient Scythians, and to have long dwelt on the confines of the Chinese empire. Hence they gradually marched westward, and about 1223 arrived on the shores of the sea of Aral, under the conduct of Tusch, son of the famous Tschinghis Khan, chief of the Mogul empire, many of whose warlike exploits have been recounted under the article MOGUL. From the Aral, Tusch conducted his horde along the shores of the Caspian, and gradually approached the Dniepr. In his course he attacked and overcame the Tscherkesses, or Circassians, who on his approach had joined with the Polovtzes, to resist the terrible enemy. The defeated Polovtzes gave notice to their neighbours the Russians, of the approaching storm, and invited them to form a common cause against the enemy. In the mean time the Tartars had sent ambassadors to the Russians, hoping to prevent their alliance with the Polovtzes, and thus the more easily subdue the disunited nations. For this time, however, the Russians were true to their own interest, and proved firm to their alliance. In concert with the Polovtzes, they assembled an army, and prepared to resist the incursions of the Tartars. Both parties met near the small river Kalka, which flows into the sea of Asof, and a furious engagement took place. The Russians fought with great intrepidity, but the Polovtzes thrown into consternation at the furious onset of the Tartars, suddenly betook themselves to flight. As they formed the van-guard, their flight put the Russian army, which was drawn up behind them, into such complete

Russia.

60 Invasion of the Tartars.

Russia.

disorder, that a total rout ensued. The prince of Kiev, who had kept himself aloof during the engagement, attempted to resist the victorious Tartars, but his army was attacked and defeated with great slaughter.

Had the princes who then shared among them the Russian territories firmly united against the common enemy, there is little doubt that they might have stemmed the torrent, which soon, from their state of rivalry and disunion, burst in and overwhelmed them. About 13 years after the defeat on the Kalka, another horde of Tartars, headed by Baaty Khan, the grandson of Tschinghis-khan, penetrated into Russia, after having attacked and defeated their neighbours the Bulgarians. The Tartars soon spread far and wide the terror of their name. Wherever they came, the whole face of nature was laid waste; towns and villages were destroyed by fire; all the men capable of bearing arms were put to the sword, and the children, women, and old men, carried into captivity. If the inhabitants of the towns to which they approached offered a compromise, the faithless barbarians affected to receive their submission; but immediately broke the agreement, and treated those who surrendered to their mercy with as much rigour as those who had endeavoured to defend themselves, and had been overcome. If the inhabitants of the open towns and villages came out to meet them, and to receive them as conquerors and friends; death, torture, or the most ignominious bondage, was the reward of their spontaneous submission.

The first state which they attacked was Riazan, the prince of which applied for assistance to Yury, commonly called by historians, George Sevoloditch, grand prince of Vladimir, who was then chief of the Russian princes. He sent them a few auxiliaries, but they either came too late, or their number was too small. The principality of Riazan fell, and its fall was succeeded by that of Pereiaslavl, Rostof, Susdal, and several others. Like a furious torrent rushing down the mountain's side, and irresistibly carrying with it all that impedes its progress, these barbarous hordes rolled their rapid course, carrying in their train fire and sword, ravages and desolation, torments and death, and sweeping all before them in one common devastation. They now approached the principality of Vladimir, and no army appeared to resist them on the frontiers. They advanced unimpeded to the capital, which, left to its fate by the grand prince, had nothing to expect, but the same cruel treatment which the neighbouring cities had received. Yury, with unpardonable negligence, was celebrating a marriage feast, when he ought to have been employed in collecting the means of defence against the enemy, of whose approach to his borders he had received timely intimation. The city of Vladimir, which contained the princess and two of her sons, was left to the protection of a chieftain, totally unqualified for its defence, and the inhabitants seemed to share the pusillanimity of their governor. Instead of annoying the enemy by occasional excursions, and preparing the means of defending the walls against a sudden attack, they gave themselves up to terror and despair; and as they conceived death to be inevitable, they prepared for it, by taking the habits of monks and nuns, in order to insure to themselves a blissful departure. A prey to fear and despondency, the city soon fell into the hands of the Tartars. They one morning scaled the walls, and meeting with little

opposition, quickly made themselves masters of the place; when they cast aside every feeling of humanity, and like beasts of prey, glutted their appetite for blood among the wretched inhabitants. The grand princess, and other ladies of distinction, dreading the brutality of the relentless conquerors, had taken refuge in the choir of a church, an asylum which all the assurances of the Tartars that they should suffer no injury, could not prevail on them to abandon. It was therefore set on fire by the barbarians, who feasted their ears with the shrieks and groans of the women, as the flames surrounded them.

Yury, incensed almost to desperation, at the fate of his capital, and the horrible death of his wife and children, was determined to take signal vengeance on the assailants. He assembled all the forces which he could draw together, and though his army was greatly inferior in numbers to the Tartars, he marched against the enemy, and attacked them with the most determined valour. The struggle was short, but bloody; the Tartars were victorious, and the body of Yury was found among the slain.

This appears to have been the only vigorous stand made by the Russian princes. The Tartars pushed forward with rapidity, and successively overpowered the principalities of Novgorod and Kiev. In the latter city they found immense booty; but this circumstance did not prevent them from repeating here the same bloody scenes which they had acted in the other capitals. The governor was preserved from the cruelties that had been inflicted on the inhabitants, by the courage he had displayed in defence of the city; and his noble demeanour, when he fell into the hands of the conqueror, acquired the esteem and affection of that chief, and enabled him to obtain a temporary repose to his country.

The Tartars had now established themselves in the Russian territories, and their khan or chief, though he did not himself assume the nominal sovereignty, reigned as paramount lord, and placed on the throne any of the native princes whom he found most obsequious to his will, or who had ingratiated themselves by the magnificence of their presents. The throne was successively occupied by Yaroslaf II. Alexander Yaroslavitch, Yaroslaf Yaroslavitch, Vasilii Yaroslavitch, Dimitri Alexandrovitch, Andrei, Danül, both brothers of Dimitri, Mikaila Yaroslavitch, Yury Danilovitch, Alexander Mikailovitch, Ivan Danilovitch, Simeon Ivanovitch, and Ivan Ivanovitch.

Among the princes whom we have enumerated, we must particularly notice Alexander the son of Yaroslaf II. This prince was installed grand prince of Russia by the Tartar khan in 1252, and continued to reign till 1264. He is remarkable chiefly for a decisive victory gained by him over the Danes on the banks of the Neva;—a victory which procured him the honourable surname of Neffsky (*the conqueror*). This victory is said to have taken place in 1239, while Alexander was governor of Novgorod, under his father Yaroslaf, who then reigned at Vladimir. After his accession to the throne on the death of his father, he engaged in a successful war with Sweden. This prince is held in great veneration by the Russians, and several miracles are attributed to him. In particular it is said, that when the prayer of absolution was offered to his corpse previous to interment (a practice long customary in Russia), the

hand of the dead body opened to receive it. His reputation for sanctity occasioned him to be ranked among the tutelary saints of the Greek church, where he still holds a distinguished place, by the title of St Alexander Neffsky.

During these several reigns, which all historians have passed over for want of records concerning them, the miseries of a foreign yoke were aggravated by all the calamities of intestine discord and war; whilst the knights of Livonia, or brothers of the short-sword, as they are sometimes called, a kind of military order of religious, on one side, and the Poles on the other, catching at the opportunity, attacked Russia, and took several of its towns, and even some considerable countries. The Tartars and Russians, whose interests were in this case the same, often united to oppose their common enemy; but were generally worsted. The Livonians took Pleskow, and the Poles made themselves masters of Black Russia, the Ukraine, Podolia, and the city of Kief. Casimir the Great, one of their kings, carried his conquests still farther. He asserted his pretensions to a part of Russia, in right of his relation to Boleslaus duke of Kalitz, who died without issue, and forcibly possessed himself of the duchies of Perzemysla, Kalitz, and Luckow, and of the districts of Sanock, Lubakzow, and Trebowla; all which countries he made a province of Poland.

The newly-conquered Russians were ill-disposed to endure the government of the Poles, whose laws and customs were more contrary to their own than those of the Tartars had been. They joined the latter to rid themselves of the yoke, and assembled an army numerous enough to overwhelm all Poland, but destitute of valour and discipline. Casimir, undaunted by this deluge of barbarians, presented himself at the head of a few troops on the borders of the Vistula, and obliged his enemies to retire.

About the year 1362 Dimitri Ivanovitch received the sovereignty from the Tartar chief, and established the seat of his government at Mosco. This prince possessed considerable ambition, and contrived to inspire the other Russian princes with so much respect for his person and government, that they consented to hold their principalities as fiefs under Dimitri. This increased the consequence of the Russian prince, excited the jealousy of Mammai the Tartar khan, who determined to take measures for maintaining his superiority. He began by demanding an increase of tribute, but when Dimitri seemed to demur at consenting to this new encroachment, the khan not only insisted on his demand, but required the grand prince to appear before him in person. This requisition Dimitri thought proper to refuse, and prepared to support his refusal by force of arms. The terror with which the Tartars had inspired the inhabitants of Russia had now considerably subsided, while the hatred which the Russians bore these haughty masters, was kept alive by the barbarity of their manners, and the difference of their religion. The Christian ministers, justly dreading that the Tartars, in their furious progress, might extirpate Christianity, contributed all in their power to confirm the spirit of revolt among the people; and they promised the crown of martyrdom to such as should fall in battle against the infidels. Thus, the contest into which the grand prince determined to enter in support of his authority, became in

some measure a holy war, undertaken in defence of the national religion. This combination of favourable circumstances operated so strongly in favour of Dimitri, and the princes that had confederated with him, that they soon collected an army of 200,000 men. With this force the grand prince left Mosco, and marched towards the Don, on the southern bank of which the Tartars were encamped. Arrived at this river, he left it to the choice of his troops, either to cross the river, and encounter the enemy on the other side, or to await the attack where they were. The general voice declared for passing over to the assault. The grand prince accordingly transported his battalions across the river, that he might cut off all hope of escaping by retreat. The fight now commenced, and though the numbers of the foe far exceeded their own, the Russians defended themselves valiantly against the furious onset of the Tartars; but as these barbarians were continually relieved by fresh reinforcements, they appeared to be gaining ground. Indeed, nothing but the impossibility of retreating across the river, and the firm persuasion that death would immediately transport them to the mansions of eternal bliss, restrained the Russians from a general flight. At the moment when the day seemed entirely lost, a detachment of the grand prince's army which he had stationed in reserve, and had remained out of the view of the enemy, came up with unabated force, fell on the rear of the Tartars, threw them into such terror and confusion, that they fled with Mammai at their head, and left the Russians masters of the field. This contest must have been extremely bloody, as we are told that eight days were employed by the remains of the Russian army, in burying the bodies of their slaughtered companions, while those of the Tartars were left uninterred upon the ground.

This glorious victory, which took place in 1380, was attended with numerous advantages to the Russian cause. In particular, it taught the native princes that the Tartars were not unconquerable; that nothing was wanting to relieve them from the galling yoke under which they had long groaned, but mutual union, courage, and prudence. The Tartars appear to have been so much humbled by this defeat, that for a time they left the Russians to enjoy in peace their recovered liberty. This forbearance, however, was not of long duration. Before the death of Dimitri they returned with increased numbers, laid siege to Mosco, which, after an obstinate defence, was at length induced to surrender, and Russia once more submitted to her old masters.

Dimitri died in 1389, and was succeeded by his son Vasilii Dimitrievitch. In the reign of this prince a new incursion of the Tartars took place, under the great Timur or Tamarlane, who after having subdued all the neighbouring Tartar hordes, extended his conquests to the Russian territories, carried Mosco by assault, and carried off immense plunder.

The grand principality of Vladimir, or as it may now be called, of Mosco, had, at the end of the 14th century, attained its greatest height, while that of Kief had proportionally declined. This latter principality was, at the time of which we are now writing, under the dominion of the Poles, having been seized on in 1320 by Gedemin, duke of Lithuania.

The latter end of the 15th century forms a splendid epoch in the Russian history; At this time, viz. from

67
Accession
of Ivan Va-
silivitch.

1462 to 1505, reigned Ivan Vasilivitch, or, as he is commonly called, John Basilovitz. This able prince, by his invincible spirit and refined policy, became both the conqueror and deliverer of his country, and laid the first foundation of its future grandeur. Observing with indignation the narrow limits of his power at his accession to the throne, after the death of his father Vasilis the Blind, he began immediately to resolve within himself the means of enlarging his dominions. Marriage, though he had in reality no regard or inclination for women, seemed to him one of the best expedients he could begin with; and accordingly he demanded and obtained Maria, sister of Michael duke of Twer, whom he soon after deposed, under pretence of revenging the injuries done to his father, and added this duchy to his own territories of Moseo. Maria, by whom he had a son named Ivan, who died before him, did not live long; and upon her death he married Sophia, daughter of Thomas Paleologus, who had been driven from Constantinople, and forced to seek shelter at Rome, where the Pope portioned this princess, in hopes of thus procuring great advantage to the Romish religion: but his expectations were frustrated, Sophia being obliged to conform to the Greek church after her arrival in Russia.

68
Incited by
his wife to
shake off
the Tartar
yoke.

What could induce Ivan to seek a consort at such a distance is nowhere accounted for, unless it be, that he hoped by this means to establish a pretension to the empire of the east, to which her father was the next heir; but however that may be, the Russians certainly owed to this alliance their deliverance from the Tartar yoke. Shocked at the servile homage exacted by these proud victors, her husband going to meet their ambassadors at some distance from the city, and standing to hear what they had to say, whilst they were at dinner; Sophia told him that she was surprised to find that she had married a servant to the Tartars. Nettled at this reproach, Ivan feigned himself ill when the next deputation from the Tartars arrived, and by means of this stratagem, avoided a repetition of the humiliating ceremonial. Another circumstance equally displeasing to this princess was, that the Tartars possessed by agreement within the walls of the palace at Moseo, houses in which their ministers resided, a stipulation which they had made, at once to shew their power, and watch the actions of the grand prince. To rid her husband and herself of these unpleasant neighbours, Sophia sent a formal embassy to the khan, to inform him, that as she had been favoured with a vision from above, commanding her to build a temple in the place where then stood the houses of the Tartar ministers, her mind could not be at ease till she had fulfilled the divine command; she therefore desired his leave to pull them down, and give his people others. The khan consented; the houses within the Kremlin (D) were demolished, and no new ones being provided, the Tartar residents were obliged to leave Moseo, an affront which their prince was not able to revenge, as he was then engaged in a war with the Poles.

69
His suc-
cesses a-
gainst the
Tartars.

Ivan taking advantage of this circumstance, and having gradually increased his forces, now openly disclaimed all subjection to the Tartars, attacked their territo-

ries, and made himself master of Kazan. Here he was solemnly crowned with a diadem which is said to be the same that is still used in the coronation of the Russian sovereigns. This took place about the year 1470, and led to a complete emancipation of Russia from the Tartar dominion. Ivan afterwards carried his arms against the neighbouring states. The province of Permia, with Asiatic Bulgaria, and great part of Lapland, soon submitted to him, and the great Novgorod, a city then so famous that the Russians were accustomed to intimate their idea of its importance by the proverbial expression, Who can resist God and the great Novgorod? was reduced by his generals after a seven years siege, and yielded immense treasure. This place was so wealthy, that Alexander Witold, prince of Lithuania, to whom the Novgorodians were then tributary, derived from it a yearly contribution of 100,000 rubles. The booty carried off by Ivan to Mosco, is said to have consisted of 300 cart loads of gold, silver, and precious stones, with a much greater quantity of furs, cloths, and other merchandise. After he quitted the city, which had been awed by his presence, the discontents excited at his violent measures broke out into acts of mutiny, on which he, in 1485, carried off 50 of the principal families, and distributed them through several of the Russian towns. He afterwards carried off some thousands of the most considerable inhabitants, and replaced them by more loyal subjects from other places. By these proceedings the flourishing commerce of this city received a considerable shock, and it suffered still more by the imprisonment of all the German merchants, and the confiscation of their effects. Indeed from this period Novgorod never recovered its former splendour.

After his reduction of Novgorod, Ivan invaded the territories of Livonia and Esthonia, in consequence, as we are told, of an affront offered to him by the inhabitants of Reval. Here, however, he met with a stout resistance, and does not seem to have made much progress. Towards the conclusion of his reign, the Kazanian Tartars, who, though humbled, had continued to inhabit that district, made a hard struggle to shake off the Russian yoke that had been imposed on them; but Ivan had established his authority too firmly for them to accomplish their purpose during his life. He died in 1505, and was succeeded by his son Vasilii Ivanovitch, commonly called Basilius III.

The Tartars of Kazan werestill suffered to maintain a shew of independency, by electing their own khans; but a Russian noble, under the denomination of voivode was associated with the khan in the government, and took care that the administration should be conducted in such a manner as to secure the interests of his master. About 14 years after the death of Ivan, however, the Tartars resolved to overturn so humiliating an administration. They murdered the Russian voivode, expelled their nominal khan, and united themselves with their brethren of the Crimea. With their assistance they assembled amighty force, entered the Russian dominions, and carried their arms even to the gates of Mosco. The grand prince Vasilii found himself at that time

unable

(D) The Kremlin is a quarter of Moseo, where stands the palace of the tzars, first built of stone by Dimitri Ivanovitch Dowski in 1367. See Mosco.

unable to resist the barbarians, and therefore purchased an exemption from general pillage by great presents, and a promise of renewed allegiance. The Tartars retired, but carried off immense booty, and nearly 300,000 prisoners, the greater part of whom they sent to Theodosia in the Crimea, and sold them to the Turks. This humiliation of Vasilii did not, however, long continue, and he was soon enabled to make head against the Tartars, and to recover possession of the city Kazan, and of Pskove, a city which had been built by the princess Olga, and was the great rival of Novgorod in wealth and commercial importance. Under this prince all the principalities of Russia were once more united, and they have remained ever since under the dominion of one sovereign.

It was under the son and successor of Vasilii, Ivan IV. or, as he is styled by the Russian historians, Ivan Vasilievitch II. that Russia completely emancipated herself from her subjection to the Tartars, and acquired a vast accession of territory, which extended her empire into the north-east of Asia, and rendered her for the first time, superior in extent to any state that had appeared since the Roman empire. Vasilii died in 1533, having reigned 28 years, and lived 55. His son Ivan was only three years old when he succeeded to the throne, and the queen-mother was appointed regent during his minority. During her administration the state became a prey to anarchy and confusion. She seems to have had no talents for government, and devoted herself entirely to the pursuit of pleasure, so that the ambitious nobles, and in particular the uncles of the young prince, had the most favourable opportunity for aggrandizing themselves at the expence of the sovereign. The queen-mother died in 1538; and though the names and characters of those who assumed the regency after her death are not known, it appears that they must have conducted the administration with considerable prudence and circumspection, as, when Ivan attained his 17th year, he was enabled to assume the reins of government without opposition; and from the important transactions in which he immediately engaged, must have been possessed of considerable resources.

In taking into his own hands the government of the state, Ivan displayed so much prudence and manly fortitude, as soon raised him very high in the estimation of his subjects. At the same time he shewed marks of a tyrannical disposition, and irritability of temper, which made him rather feared than admired by his friends, while they rendered him an object of terror to his neighbours and his enemies. He saw himself surrounded on all sides by contending factions, and to suppress these was the first object of his care. In the choice of means for effecting this, he does not seem to have been very scrupulous, provided they tended to the accomplishment of his aim; and in punishing the offences of those who opposed his purpose, his violence of temper not infrequently led him to confound the innocent with the guilty. He was, however, successful in his great design, and having secured the domestic tranquillity of his dominions, he had leisure to direct his attention to the more remote, but not less predominant objects of his ambition. He resolved to attempt liberating his country for ever from the dominion of the Tartars, and he succeeded. In 1551, he marched an army in the depth

of winter into the district of Kazan, and laid siege to the capital, regardless of the murmurs of his troops, who loudly and openly expressed their dislike to this expedition, declaring that no good commander would think of conducting his forces to sieges and battles during the inclemencies of winter, or attempt at such a season to attack the enemy in their quarters. Exasperated at these murmurs, he determined to punish severely the principal officers who had contributed to foment the discontents of the soldiers, and by this well-timed severity he effectually repressed all opposition to his will.

Before entering seriously on the siege of Kazan, he built several forts on the frontiers of the Tartar territories, by which he hoped to awe these barbarians, and prevent them from disturbing the peace of his dominions. He then invested Kazan, and in the year 1552, made himself master of it by the new, and, to the Tartars, unheard-of method of springing a mine below the walls. We are told by some historians, that the city had made an obstinate defence, and that, during the siege, which lasted above seven years, another alarming mutiny broke out in the besieging army; that Ivan was in great danger of his life, and was obliged for a time to abandon the enterprise, and retire to Mosco, where he made an example of the chief mutineers, and again returned to the siege of Kazan. How far this statement is to be relied on, it is difficult now to determine; but perhaps this mutiny is confounded with that which we have already noticed, as having taken place at the commencement of the enterprise.

As Kazan was taken by storm, the inhabitants were treated with much rigour; and the slaughter was so dreadful, that even the flinty heart of Ivan is said to have relented at the heaps of dead bodies which struck his sight on entering the city. The inhabitants that escaped slaughter, and the remains of the Tartars, were offered mercy on condition that they should embrace the Christian faith. By this important conquest the dominion of the Tartars, which had oppressed the Russians for more than three centuries, was completely and permanently overthrown.

About two years after he had abolished the power of the Tartars, he extended his conquests eastward to the shores of the Caspian, and took possession of the territory that lay on the right bank of the Volga, round the city of Astracan, which was also inhabited by the Tartar hordes.

Ivan, as well as his grandfather, had found it necessary to chastise the inhabitants of Novgorod; but in the year 1570, this city being suspected of forming a plot for delivering itself and the surrounding territory into the hands of the king of Poland, felt still more severely the effects of his vengeance. All who had been in any degree implicated in the conspiracy, to the number of 25,000, suffered by the hands of the executioner. The city of Pskove was threatened with a similar proscription; but Ivan, on their voluntary submission, contented himself with the execution of a few monks, and the confiscation of the property of the most opulent inhabitants. It is not surprising that acts like these should have given to this prince the names of *terrible* and *tyrant*, by which historians have occasionally distinguished him; though it is not a little extraordinary, that he should

should have retained so much interest in the affections of his subjects, that when, to try their attachment, he, in 1575, abdicated the government, and retained only the title of Prince of Mosco, the majority of the nation loudly expressed their wish for him to resume the administration of affairs. We can account for this, only by considering the measures which he had adopted for the improvement and civilization of his people. These were of such a nature as in a great measure to obliterate the remembrance of his cruelty and oppression. He promulgated a new code of laws, composed partly of such ancient statutes as still were in force, and were capable of improvement, and partly of new regulations, which he either contrived himself, or adopted from the neighbouring states. He found it necessary, however, to render many of these laws extremely severe, though their execution was most frequently exemplified in the persons of his nobles, whose perverseness and obstinacy seemed unconquerable by more lenient measures.

77
Cultivates
an inter-
course with
the neigh-
bouring
states.

Ivan cultivated an intercourse with several of the European states, especially with Germany, for which country he seems to have had a very particular esteem. Early in his reign, viz. in 1547, he sent a splendid embassy to the emperor Charles V. requesting him to permit a number of German artists, mechanics, and literary men, to establish themselves in Russia. Charles readily complied with his request, and several hundred volunteers were collected and assembled at Lubeck, whence they were to proceed through Livonia to Mosco. The Lubeckers, however, jealous that the improvement of the Russians in arts and manufactures might render them independent of their neighbours, and diminish the commercial intercourse that had long subsisted between their city and the principal towns of Russia, arrested the Germans in their route, and in concert with the merchants of Reval and Riga, sent a petition to Charles, requesting him to recal the permission he had granted. In consequence of these measures, many of the German artists returned home, but several of them escaped the vigilance of the Lubeckers, and reached Mosco by a circuitous route. Ivan endeavoured to revenge himself on the Livonians by invading their country. This was strenuously defended by the Teutonic knights; and these champions, finding at last that they were unable to maintain their ground, rather than submit to the Russian monarch, put their country under the protection of Poland.

73
War be-
tween the
Russians
and Swedes.

The Swedes also came in for a share of the Livonian territories; and this circumstance gave rise to a war between them and the Russians. Ivan invaded Finland; but that country was bravely defended by William of Furstenberg, grand master of the Livonian knights, with the assistance of the troops of Gustavus Vasa; and it does not appear that Ivan gained much in this expedition, though we are told that the Livonian grand master ended his life in a Russian prison.

An. 1553.
79
First inter-
course be-
tween Eng-
land and
Russia.

In 1553, an event happened which first led to an intercourse between Russia and England. Some Englishmen who were at that time on a voyage of discovery, landed on the shores of the White sea, where soon after was built the port of Archangel. They were hospitably received by the natives; and in imitation of the circumstance being conveyed to Ivan, he sent for the strangers, and was so much pleased with their abilities and

deportment, that he resolved to give every encouragement to the English commerce, and thus open a new channel of intercourse with a highly polished nation, by which his subjects might obtain fresh incitements to activity and industry. We are told, that his affection for the English proceeded so far, as to induce him to form the design of marrying an English lady. He expressed the highest esteem for Queen Elizabeth, and requested by his ambassador, that if the ingratitude of his subjects should ever compel him to quit Russia, (a circumstance by no means improbable), she would grant him an asylum in her dominions. It was in consequence of this accidental communication between the Russians and the English, that England first engaged in a trade to Russia, and promoted this new commerce by the establishment of a company of Russia merchants in London.

About twenty years after Astracan had been annexed to the Russian empire, a new acquisition of territory accrued to it from the conquests of a private adventurer, in the unknown regions of Siberia. The steps that led to the acquisition of this immense tract of the Asiatic continent, are thus related by Mr Tooke.

“The grand prince, Ivan III. had already sent out a body of men who penetrated across the Ingrian mountains, and traversed all the districts as far as the river Oby. But, amidst the urgent affairs of government, the discoveries they made insensibly fell into oblivion. Some years afterwards a merchant, named Stroganof, who was proprietor of some salt-works on the confines of Siberia, was curious to gain a farther knowledge of that country, which was likewise inhabited by Tartars, whose khan resided in the capital Sibir. Perceiving, among the persons who came to him on affairs of trade, men who belonged to no nation with which he was acquainted, he put several inquiries to them concerning the place whence they came, and once sent a few of his people with them back to their country. These people brought with them, at their return from the regions they had now explored, and which proved to be this very Siberia, a great quantity of invaluable furs, and thus opened to their master a new road to wealth. However, not so covetous as to wish to keep this treasure to himself, he sent information of it to the court, and the attention of government was once more directed to this country. But the conquest of it, and its conjunction with Russia, was reserved for an adventurer named Timoseyef Yermak. This Yermak, at the head of a gang of Don Zozaks, had made it his practice to rob and plunder the caravans and passengers that occasionally frequented the roads, as well as the inhabitants, wherever he came, and was so fortunate as to escape the search of the Russian troops that had been sent out against him and his band, which consisted of not fewer than 6000 men. On their flight, he and his people accidentally came to the dwelling of Stroganof, where, hearing much talk about Siberia, and being persons who had nothing to lose, and therefore might put all to the hazard, they soon formed a plan to penetrate farther into that country, and there seek at once their safety and their fortune. After numerous struggles and conflicts with the natives, which greatly reduced their numbers, they at length conquered the capital, and shortly after the whole country. Yermak now presented the

fruit

fruit of his toilsome and perilous victories to his tzar, (E) Ivan, in hopes of obtaining thereby, a pardon of his former depredations, which was granted him accordingly, by the building of several towns, and constructing a number of forts, the possession of this country was soon permanently secured. The less and the greater Kabardey were also added to Russia in the reign of Ivan. This tzar, however, not only enlarged the circumference of his empire, partly by force of arms and partly by accident, but he resolved to reform his people, to render them more polished, more skilful, and industrious; but this he found to be the most arduous enterprise he could possibly have undertaken. The insuperable impediments which threw themselves in the way of the execution of this grand work, were the principal incitements to those frequent acts of cruelty and despotism which have covered his memory with so deep a stain."

Towards the close of Ivan's reign, a prodigious army of Turks and Tartars entered Russia, with a design to subdue the whole country. But Zerebrinoff, the tzar's general, having attacked them in a defile, put them to flight with considerable slaughter. They then retired towards the mouth of the Volga, where they expected a considerable reinforcement; but being closely pursued by the Russians and Tartars in alliance with them, they were again defeated and forced to fly towards Azof on the Black sea. But when they came there, they found the city almost entirely ruined by the blowing up of a powder magazine. The Russians then attacked their ships there, took some and sunk the rest; by which means almost the whole army perished with hunger or by the sword of the enemy.

From this time the empire of Russia became so formidable, that none of the neighbouring nations could hope to make a total conquest of it. The Poles and Swedes indeed continued to be very formidable enemies; and, by the instigation of the former, the Crim Tartars, in 1571, again invaded the country with an army of 70,000 men. The Russians, who might have prevented their passing the Volga, retired before them till they came within 18 miles of the city of Mosco, where they were totally defeated. The tzar no sooner heard this news, than he retired with his most valuable effects to a well-fortified cloyster; upon which the Tartars entered the city, plundered it, and set fire to several churches. A violent storm which happened at the same time soon spread the flames all over the city; which was entirely reduced to ashes in six hours, though its circumference was upwards of 40 miles. The fire likewise communicated itself to a powder magazine at some distance from the city; by which accident upwards of 50 rods of the city wall, with all the buildings upon it, were destroyed; and, according to the best historians, upwards of 120,000 citizens were burnt or buried in the ruins, besides women, children, and foreign-

VOL. XVIII. Part I.

ers. The castle however, which was strongly fortified, could not be taken; and the Tartars, hearing that a formidable army was coming against them under the command of Magnus duke of Holstein, whom Ivan had made king of Livonia, thought proper to retire. The war, nevertheless, continued with the Poles and Swedes; and the tzar being defeated by the latter after some trifling success, was reduced to the necessity of suing for peace; but the negotiations being broken off, the war was renewed with the greatest vigour. The Livonians, Poles, and Swedes, having united in a league against the Russians, gained great advantages over them; and in 1579, Stephen Battori, who was then raised to the throne of Poland, levied an army expressly with a design of invading Russia, and of regaining all that Poland had formerly claimed, which indeed was little less than the whole empire. As the Poles understood the art of war much better than the Russians, Ivan found his undisciplined multitudes unable to cope with the regular forces of his enemies; and their conquests were so rapid, that he was soon obliged to sue for peace, which, however, was not granted; and it is possible that the number of enemies which now attacked Russia might have overcome the empire entirely, had not the allies grown jealous of each other. The consequence of this was, that in 1582 a peace was concluded with the Poles, in which the Swedes were not comprehended. However, the Swedes finding themselves unable to effect any thing of moment after the desertion of their allies, were obliged to conclude a truce; shortly after which the tzar having been worsted in an engagement with the Tartars, died in the year 1584.

The eldest son of the late tzar, Feodor (or as he is commonly called, Theodore) Ivanovitch, was by no means fitted for the government of an empire so extensive, and a people so rude and turbulent as had devolved to him by the death of his father. Ivan had seen the incapacity of his son, and had endeavoured to obviate its effects, by appointing three of his principal nobles as administrators of the empire; while to a fourth he committed the charge of his younger son Dimitri. This expedient, however, failed of success; and partly from the mutual jealousy of the administrators, partly from the envy which their exaltation had excited in the other nobles, the affairs of the empire soon fell into confusion. The weak Feodor, had married a sister of Boris Gudonof, a man of considerable ambition, immense riches, and tolerable abilities. This man had contrived to make himself agreeable to Feodor, by becoming subservient to his capricious desires and childish amusements; and the wealth he had acquired through his interest with the sovereign, enabled him to carry on his ambitious designs. He had long directed his wishes towards the imperial dignity, and he began to prepare the way for its attainment by removing Dimitri the brother of Feodor. This young prince suddenly disappeared; and there is every

Reign of
Feodor
Ivanovitch.

+ 3 A reason

(E) Previous to the reign of Vasilii, the predecessor of the monarch whose transactions we are now relating, the Russian sovereigns held the title of Velikii Kniaz, which has been translated great duke, though it more properly denotes grand prince; and by this latter appellation we have accordingly distinguished the preceding monarchs. Vasilii, near the conclusion of his reign, adopted the title of tzar, or emperor; but this title was not fully established till the successes and increasing power of his son Ivan enabled the latter to confirm it both at home and abroad: and since his time it has been universally acknowledged.

Russia.

reason to believe that he was assassinated by the order of Boris. Feodor did not long survive his brother, but died in 1598, not without suspicion of his having been poisoned by his brother-in-law. We are told that the tzaritza, Irene, was so much convinced of this, that she never after held any communication with her brother, but retired to a convent, and assumed the name of Alexandria.

84
Accession
of Boris,
and termi-
nation of
the dynasty
of Iuric.

With Feodor ended the last branch of the family of Ruric, a dynasty which had enjoyed the supreme power in Russia ever since the establishment of the principality by the Varagian chief, viz. during a period of above 700 years. On the death of Feodor, as there was no hereditary successor to the vacant throne, the nobles assembled to elect a new tzar; and the artful Boris having, through the interest of the patriarch, a man elevated by his means, and devoted to his views, procured a majority in his favour, he was declared the object of their choice. Boris pretended unwillingness to accept the crown, declaring that he had resolved to live and die in a monastery; but when the patriarch, at the head of the principal nobles, and attended by a great concourse of people, bearing before them the cross, and the effigies of several saints, repaired to the convent, where the artful usurper had taken up his residence, he was at length prevailed on to accompany them to the palace of the tzars, and suffer himself to be crowned.

Boris affords another example, in addition to the numerous instances recorded in history, of a sovereign who became beneficial to his subjects, though he had procured the sovereignty by unjustifiable means. If we give implicit credit to the historians of those times, Boris was a murderer and a usurper, though he had the voice of the people in his favour; but by whatever means he attained the imperial power, he seems to have employed it in advancing the interests of the nation, and in improving the circumstances of his people. He was extremely active in his endeavours to extend the commerce, and improve the arts and manufactures of the Russian empire; and for this purpose he invited many foreigners into his dominions. While he exerted himself in securing the tranquillity of the country, and defending its frontiers by forts and ramparts, against the incursions of his neighbours, he made himself respected abroad, received ambassadors from almost all the powers of Europe; and after several attempts to enlarge his territories at the expence of Sweden, he concluded with that kingdom an honourable and advantageous alliance.

An. 1601.
85
Dreadful
famine at
Mosco.

Soon after the commencement of his reign, the city of Mosco was desolated by one of the most dreadful famines recorded in history. Thousands of people lay dead in the streets and roads; and in many houses the fattest of their inmates was killed, to serve as food for the rest. Parents are said to have eaten their children, and children their parents; and we are told by one of the writers of that time (Petrius), that he saw a woman bite several pieces out of her child's arm as she was carrying it along. Another relates, that four women having desired a peasant to come to one of their houses, on pretence of paying him for some wood, killed and devoured both him and his horse. This dreadful calamity lasted three years; and notwithstanding all the exertions of Boris to provide for the necessities of the inhabitants

of Mosco, we are assured that not fewer than 500,000 perished by the famine.

During these distresses of the capital, the power of Boris was threatened with annihilation by an adventurer who suddenly started up, and pretended to be the young prince Dimitri, whom all believed to have been assassinated, or, as Boris had given out, to have died of a malignant fever. This adventurer was a monk named Otrepief, who learning that he greatly resembled the late Dimitri, conceived the project of passing for that prince, and endeavouring, in that character, to ascend the Russian throne. He retired from Russia into Poland, where he had the dexterity to ingratiate himself with some of the principal nobles, and persuade them that he was really prince Dimitri, the lawful heir to the crown of Russia. The better to insure to himself the support of the Poles, he learned their language, and professed a great regard for the Catholic religion. By this last artifice he both gained the attachment of the Catholic Poles, and acquired the friendship of the Roman pontiff, whose blessing and patronage in his great undertaking he farther secured, by promising that, as soon as he should have established himself on the throne, he would make every exertion to bring the Russians within the pale of the Catholic church. To the external graces of a fine person, the pretended Dimitri added the charms of irresistible eloquence; and by these accomplishments he won the affections of many of the most powerful among the Polish nobility. In particular the voivode of Sandomir was so much captivated by his address, that he not only espoused his cause, but promised to give him his daughter in marriage, as soon as he should be placed on the throne of his fathers. This respectable man exerted himself so warmly in behalf of his intended son-in-law, that he brought over even the king of Poland to his party. The Kozaks of the Don, who were oppressed by Boris, hoped to gain at least a temporary advantage by the disturbance excited in favour of the adventurer, and eagerly embraced the opportunity of declaring in his favour. The news of Prince Dimitri being still alive, soon penetrated into Russia; and though Boris did all in his power to destroy the illusion, by prohibiting all intercourse between his subjects and the Poles, and by appealing to the evidence of the murdered prince's mother in proof of his death, the cause of the pretender continued to gain ground. Many circumstances concurred to interest the Russian people in favour of Otrepief. He had prepared a manifesto, which he caused to be dispersed through the empire, and in which he affirmed himself to be the son of Ivan, and asserted his right to the throne then usurped by Boris. The courtiers of the usurper, who had long been jealous of his elevation, pretended to believe these assertions; while those who were persuaded that the young prince had been murdered by order of the present tzar, regarded this event as a judgment from heaven. The greater part of the nation appear to have been persuaded, that the pretender was the real Dimitri; and as they believed that he had been miraculously preserved, they piously resolved to concur with the hand of Providence in assisting him to recover his just rights. Thus, before he set foot in Russia, a numerous party was formed in his behalf. He soon made his appearance on the frontiers with a regiment of Polish troops, and a body of Kozaks. Boris sent an army

86
Invasion of
the pretender
Dimitri.

to oppose him ; but though the number of these troops greatly exceeded the small force of Dimitri, these latter were so animated by the eloquence of their leader, and the intrepidity and personal bravery which he displayed in the field of battle, that, after a bloody conflict, the army of Boris was defeated, and the pretended Dimitri remained master of the field.

This victory, over a superior army, served still further to strengthen the belief, that Dimitri was favoured by heaven, and consequently could not be an impostor. To confirm the good opinion which he had evidently acquired, the victor treated his prisoners with great kindness ; caused the dead to be decently interred, and gave strict injunctions to his troops to behave with humanity in the towns through which he passed. This gentle behaviour, when contrasted with the horrible excesses committed by the soldiers of Boris, wherever the people appeared to shew any inclination towards the cause of the invader, gained Dimitri more adherents than even the persuasion that he was the lawful sovereign of the country. Unluckily for Boris, the superstition of the Russians was about this time directed against him, by the appearance of a comet, and by more than usual coruscations of the aurora borealis, phenomena which were immediately regarded as manifest demonstrations that the Almighty was pouring out his plials of wrath on the devoted country. It was almost universally believed, that the awful effects of these alarming appearances could be averted only by supporting the cause of Dimitri, who had hitherto been so signally protected, and brought to light by the hand of heaven. Boris, unable to resist the torrent of public opinion in favour of his rival, is said to have taken poison, and thus hastened that fate which he foresaw awaited him, if he should fall into the hands of his enemies.

The death of Boris took place in the year 1605 ; and though the principal nobility at Mosco placed his son Feodor on the throne, the party of Dimitri was now so strong, that Feodor was dethroned and sent to prison with his mother and sister, within six weeks after his accession.

The successful monk had now attained the summit of his ambitious hopes, and made his entry into Mosco with the utmost magnificence, attended by his Russian adherents, and his Polish friends. Not deeming himself secure, however, while the son of Boris remained alive, he is said to have caused him to be strangled, together with one of his sisters. The new tzar, though he evidently possessed great abilities, seems to have been deficient in point of prudence. Instead of conciliating the favour of his subjects, by attention to their interests, and by conferring on the chief men among them the titles and honours that were at his disposal, he openly displayed his predilection for the Poles, on whom he conferred high posts and dignities, and even connived at the extravagance and enormities which they committed. This impolitic conduct, together with his partiality for the Catholic religion ; his marked indifference towards the public worship of the national church, and his want of reverence for the Greek clergy ; his marrying a Polish lady ; his affectation of Polish manners ; his inordinate voluptuousness, and the contempt with which he treated the principal nobility ; so irritated and exasperated the

Russians, that discontents and insurrections arose in every quarter of the empire ; and the joy with which he had been at first received, was converted into indifference, contempt, and detestation. The Russians soon discovered, from a curious circumstance, that their new sovereign could not be sprung from the blood of their ancient tzars. These had been always lifted on their horses, and rode along with a slow and solemn pace, whereas Dimitri bestrode a furious stallion, which he mounted without the help of his attendants. In addition to these sources of discontent, it was rumoured that a timber fort which Dimitri had caused to be constructed before Mosco, was intended to serve as an engine of destruction to the inhabitants, and that at a martial spectacle which the tzar was preparing for the entertainment of his bride, the Poles, and other foreigners that composed his body guard, were, from this building, to cast firebrands into the city, and then slaughter the inhabitant. This rumour increased their hatred to fury, and they resolved to wreak their vengeance on the devoted tzar. The populace were still farther incensed by the clergy, who declaimed against Dimitri as a heretic, and by Schuiskoy, a nobleman who had been condemned to death by the tzar, but had afterwards been pardoned. This nobleman put himself at the head of the enraged mob, and led them to attack the tzarian palace. This they entered by assault, put to the sword all the Poles whom they found within its walls, and afterwards extended their massacre to such as were discovered in other parts of the city. Dimitri himself, in attempting to escape, was overtaken by his pursuers, and thrust through with a spear, and his dead body being brought back into the city, lay for three days before the palace, exposed to every insult and outrage that malice could invent, or rage inflict. His father-in-law and his wife escaped with their lives, but were detained as prisoners, and the tzaritza was confined at Yaroslavl.

Schuiskoy, who had pretended to be actuated by no other motives than the purest patriotism, now aspired to the vacant throne, and had sufficient interest to carry his election. His reign was short and uninteresting, and indeed from this time till the accession of the house of Romanof in 1613, the affairs of Russia have little to gratify the curiosity of our readers. Schuiskoy's short reign was disturbed by the pretensions of two fictitious Dimitris, who successively started up, and declared themselves to be either the late tzar, or the prince whom he had personated ; and his neighbours the Swedes and Poles, taking advantage of the internal dissensions in the empire, made many successful incursions into Russia, set fire to Mosco, and massacred above 100,000 of the people. The Russians, dissatisfied with the reigning prince, treated with several of the neighbouring potentates for the disposal of the imperial crown. They offered it to Vladislaf, or Uladislaus, son of Sigismund, king of Poland, on condition that he should adopt the Greek persuasion ; but as he rejected this preliminary, they turned their eyes, first on a son of Charles IX. of Sweden, and lastly, on a young native Russian, Mikhail Feodorovitch, of the house of Romanof, a family distantly related to their ancient tzars, and of which the head was then metropolitan of Rostof, and was held in great estimation. Thus, after a long series of confusion and disaster, there ascended the Russian throne a

Russia.

new family, whose descendants have raised the empire to a state of grandeur and importance unequalled in any former period.

We have seen the calamities brought upon the empire by the partitions of its early monarchs, and the wars to which these partitions gave birth; by the invasions and tyranny of the Tartars; and lastly, by the disturbances that prevailed from the machinations of the false Dimitris. We have observed the depression which the empire suffered under these calamities. We are now to witness its sudden elevation among the powers of Europe, and to accompany it in its hasty strides towards that importance which it has lately assumed. But before we enter on the transactions that have enriched the pages of the Russian annals since the accession of the house of Romanof, it may not be improper or uninteresting, to take a general view of the state of the empire at the beginning of the 17th century.

90
State of the
Russian
empire at
the begin-
ning of the
17th cen-
tury.

At this period the government of Russia may be considered as a pure aristocracy, as all the supreme power rested in the hands of the nobles and the superior clergy. In particular the boyars, or chief officers of the army, who were also the privy counsellors of the prince, possessed a very considerable share of authority. The election of the late princes Boris, Dimitri, and Schuiskoy, had been conducted principally by them, in concert with the inhabitants of Mosco, where was then held the seat of government. The common people, especially those of the inferior towns, though nominally free, had no share in the government, or in the election of the chief ruler. The boors, or those peasants who dwelt on the noblemen's estates, were almost completely slaves, and transferable with the land on which they dwelt. An attempt to do away this barbarous vassalage had been made, both by Boris and Schuiskoy, but from the opposition of the nobles it was abandoned.

The laws in force at the time of which we are now speaking, consisted partly of the municipal laws drawn up for the state of Novgorod by Yaroslaf, and partly of an amended code, called *sudebnik*, promulgated by Ivan Vasiliivitch II. By this *sudebnik* the administration of the laws was made uniform throughout the empire, and particular magistrates were appointed in the several towns and districts, all subject to the tzar as their chief. The *sudebnik* consisted of 97 articles, all containing civil laws, as the penal statutes are only briefly mentioned in some articles, so as to appear either connected with the civil, or as serving to illustrate them. The criminal laws were contained in a separate code, called *gubnaia gramota*, which is now lost, but is referred to in the civil code. In neither of these codes is there any mention of ecclesiastical affairs; but these were regulated by a set of canons drawn up in 1542, under the inspection of Ivan Vasiliivitch, in a grand council held at Mosco. In the civil statutes of the *sudebnik*, theft was punished in the first instance by restitution, or, if the thief were unable to restore the property stolen, he became the slave of the injured party, till by his labour he had made sufficient compensation. Of murder nothing is said, except where the person slain was a lord or master, when the murderer was to be punished with death. There is no mention of torture, except in cases of theft.

Before the accession of the house of Romanof, the

commercial intercourse which the cities of Novgorod and Pscove formerly held with the Hans towns, had entirely ceased; but this was in some degree compensated by the newly established trade between Russia and England, the centre of which was Archangel. This trade had been lately increased by the products derived from the acquisition of Siberia, in exchange for which the English principally supplied the Russians with broad cloth. In 1568, an English counting-house was established at Mosco, and about the same time the Russian company was incorporated. Previous to the 15th century, the trade of the Russians had been carried on merely by barter, but during that century the coinage of money commenced at Novgorod and Pscove; and from this time their commerce was placed on an equal footing with that of the other European nations.

Except in the article of commerce, the Russians were deplorably behind the rest of Europe; and though attempts had been made by Ivan I. Ivan Vasiliivitch II. and Boris, to cultivate their manners and improve the state of their arts and manufactures, these attempts had failed of success. The following characteristic features of the state of Russia in the 16th century, are given by Mr Tooke.

The houses were in general of timber, and badly constructed, except that in Mosco and other great towns, there were a few houses built of brick.

That contempt for the female sex, which is invariably a characteristic of defective civilization, was conspicuous among the Russians. The women were kept in a state of perfect bondage, and it was thought a great instance of liberality, if a stranger were but permitted to see them. They durst seldom go to church, though attendance on divine worship was considered of the highest importance. They were constantly required to be within doors, so that they very seldom enjoyed the fresh air.

The men of the middle ranks always repaired about noon to the market, where they transacted business together, conversed about public affairs, and attended the courts of judicature to hear the causes that were going forward. This was undoubtedly a practice productive of much good, as the inhabitants of the towns by these means improved their acquaintance, interchanged the knowledge they had acquired, and thus their patriotic affections were nourished and invigorated.

In agreements and bargains the highest asseveration was, "If I keep not my word, may it turn to my infamy," a custom extremely honourable to the Russians of those days, as they held the disgrace of having forfeited their word to be the deepest degradation.

If the wife was so dependent on her husband, the child was still more dependent on his father; for parents were allowed to sell their children.

Masters and servants entered into a mutual contract respecting the terms of their connection, and a written copy of this contract was deposited in the proper court, where, if either party broke the contract, the other might lodge his complaint.

Single combat still continued to be the last resource in deciding a cause; and to this the judge resorted in cases which he knew not otherwise to determine: but duels out of court were strictly prohibited; and when these took place, and either party fell, the survivor was regarded

Russia.

ussia. regarded as a murderer, and punished accordingly. Personal vengeance was forbidden under the strictest penalties.

The nobles were universal soldiers, and were obliged to appear when summoned, to assist the prince in his wars.

Till the end of the 16th century, the boor was not bound to any particular master. He tilled the ground of a nobleman for a certain time on stated conditions. Thus, he either received part of the harvest or of the cattle, a portion of wood, hay, &c ; or he worked five days for the master, and on the sixth was at liberty to till a piece of ground set apart for his use. At the expiration of the term agreed on, either party might give up the contract to the other ; the boor might remove to another master, and the master dismiss the boor that did not suit him.

During the troubles and dissensions in which the empire had been involved, since the death of Feodor Ivanovitch, the chief men of the state were divided into several parties. Of these, one sought to elevate to the throne a Polish prince, while another rather favoured the succession of a Swede. A third, and by far the strongest party, were desirous to place upon the throne a native Russian ; and they soon turned their eyes on Mikhail Romanof, a distant relation of the ancient family of the tzars, whose father was metropolitan of Rostof. The clergy seemed particularly interested in this choice, as they justly concluded, that a Russian born and brought up in the orthodox Greek faith, would most effectually prevent the poison of Catholic opinions or Protestant heresy, the introduction of which was to be feared from the accession of a Polish or a Swedish monarch. Accordingly, the voice of a single ecclesiastic decided the electors in favour of Mikhail. A metropolitan declared in the hall of election, that it had been announced to him by divine revelation, that the young Romanof would prove the most fortunate and prosperous of all the tzars who had filled the Russian throne. This revelation had an immediate effect on the electors, as their reverence for the superior clergy was so great, that none could presume to doubt the veracity of a person of such exalted rank and sacred function. The revelation once made public, the people too expressed so decidedly their desire to have the young Romanof for their sovereign, that all soon united in their choice. The young man himself, however, refused the proffered honour, and his mother, dreading the fate that might arise from so dangerous an elevation, with tears implored the deputies to depart. The modest refusal of Mikhail served only to persuade the people, that he was the most worthy object on which they could fix their choice ; and at length the deputies returned to Mosco, bringing with them the consent of the monarch elect. The coronation took place on the 11th of June 1613, and thus the views of Poland and of Sweden, as well as the designs of Marina, the widow of the first pretender Dimitri, who still contrived to keep a party in her favour, were entirely frustrated.

At the accession of Mikhail, the Swedes and Poles were in possession of several parts of the empire ; and to dislodge these invaders was the first object of the new tzar. Aware of the difficulty of contending at once with both these formidable enemies, he began by negotiating a treaty of peace with Sweden. This was not

effected without considerable sacrifices. Mikhail agreed to give up Ingria and Karilii, and to evacuate Esthonia and Livonia. Thus freed from his most dangerous enemy, Mikhail prepared to oppose the Poles, of whom a numerous body had entered Russia, to support the claims of their king's son, Vladislaf. Mikhail proceeded, however, in a very wary manner, and instead of opposing the invaders in the open field, he entrapped them by ambuscades, or allured them into districts already desolated, where they suffered so much from cold and hunger, that in 1619 they agreed to a cessation of hostilities for fourteen years and a half, on condition that the Russians should cede to Poland the government of Smolensk.

Thus freed from external enemies on terms which, though not very honourable, were the best that the then posture of his affairs admitted, Mikhail set himself to arrange the internal affairs of his empire. He began by placing his father at the head of the church, by conferring on him the dignity of patriarch, which had become vacant. The counsels of this venerable man were of great advantage to Mikhail, and contributed to preserve that peace and tranquillity by which the reign of this monarch was in general distinguished. The tzar's next step was to form treaties of alliance with the principal commercial states of Europe. He accordingly sent ambassadors to England, Denmark, Holland, and the German empire ; and Russia, which had hitherto been considered rather as an Asiatic than a European power, became so respectable in the eyes of her northern neighbours, that they vied with each other in forming with her commercial treaties.

Mikhail also began those improvements of the laws which we shall presently see more fully executed by his son and successor ; but the tide of party ran so high, that he could do but little in the way of reformation. He was also obliged to put his frontiers in a state of defence, to provide for the expiration of the truce with Poland, which now drew nigh : and as no permanent peace had been established, both parties began to prepare for a renewal of hostilities. Indeed the armistice was broken by the Russians, who, on the death of Sigismund, king of Poland, appeared before Smolensk, and justified the infringement of the treaty, on the pretext that it was concluded with Sigismund, and not with his successors. Nothing of consequence, however, was done before Smolensk ; and the Russian commander, after having lain there in perfect indolence, with an army of 50,000 men, for two years, at length raised the siege. Mikhail attempted to engage the Swedes in an alliance with him against Poland ; but failing in this negotiation, patched up a new treaty, which continued unbroken till his death. This happened in 1645.

Mikhail was succeeded by his son Alexei ; but as the young prince was only 15 years of age at his father's death, a nobleman named Moro-of had been appointed his governor, and regent of the empire. This man possessed all the ambition, without the prudence and address of Boris, and in attempting to raise himself and his adherents to the highest posts in the state, he incurred the hatred of all ranks of people. Though Moro-of, by properly organising the army, provided for the defence of the empire against external enemies, he shamefully neglected internal policy, and connived at the most flagrant enormities in the administration of justice.

justice. These abuses went so far, that the populace once stopped the czar as he was returning from church to his palace, calling aloud for righteous judges. Though Alexei promised to make strict enquiry into the nature and extent of their grievances, and to inflict deserved punishment on the guilty, the people had not patience to await this tardy process, and proceeded to plunder the houses of those nobles who were most obnoxious to them. They were at length pacified, however, on condition that the author of their oppression should be brought to condign punishment. One of the most nefarious judges was put to death; and the principal magistrate of Mosco fell a victim to their rage. The life of Morosof was spared at the earnest entreaty of the czar, who engaged for his future good behaviour.

Similar disturbances had broken out at Novgorod and Pscove; but they were happily terminated, chiefly through the exertions of the metropolitan Nicon, a man of low birth, but who, from a reputation for extraordinary piety and holiness, had raised himself to the patriarchal dignity, and was high in favour with Alexei.

These commotions were scarcely assuaged, when the internal tranquillity of the empire was again threatened by a new pretender to the throne. This man was the son of a linen-draper, but gave himself out at one time for the son of the emperor Dimitri, at another for the son of Schuiskoy. Fortunately for Alexei the Poles and Swedes, whose interest it was to have fomented these intestine disturbances, remained quiet spectators of them, and the pretender meeting with few adherents, was soon taken and hanged.

The pacific conduct of the neighbouring states did not long continue, though indeed we may attribute the renewal of hostilities to the ambition of the czar.

The war with Poland was occasioned by Alexei's supporting the Kozaks, a military horde, who had left the northern shores of the Dniepr, and retired further to the south. Here they had established a military democracy, and during the dominion of the Tartars in Russia, had been subject to the khan of those tribes; but after the expulsion or subjugation of the Tartars, the Kozaks had put themselves under the guardianship of Poland, to which kingdom they formerly belonged. As the Polish clergy, however, attempted to impose on them the Greek faith, they threw off their allegiance to the king of Poland, and claimed the patronage of Russia. Alexei, who seems to have sought for a pretext to break with Poland, gladly received them as his subjects, as he hoped, with their assistance, to recover the territories that had been ceded to Poland by his father. He began by negotiation, and sent an embassy to the king of Poland, complaining of some Polish publications, in which reflections had been cast on the honour of his father, and demanding that by way of compensation, the Russian territories formerly ceded to Poland should be restored. The king of Poland of course refused so arrogant a demand, and both parties prepared for war. The Russians, assisted by the Kozaks, were so successful in this contest, that the king of Sweden became jealous of Alexei's good fortune, and apprehensive of an attack. He therefore determined to take an active part in the war, especially as the Lithuanians, who were extremely averse to the Russian dominion, had sought his protection. The war with Sweden commenced in 1656, and continued for two years, without any important advan-

tage being gained by either party. A truce was concluded in 1658, for three years, and at the termination of this period, a solid peace was established. In the mean time the war with Poland continued, but was at length terminated by an armistice, which was prolonged from time to time, during the remainder of Alexei's reign.

The reign of this monarch is as remarkable for turbulence, as that of his predecessor had been for tranquillity. No sooner was peace established with the neighbouring states than fresh commotions shook the empire from within. The Don Kozaks, who now formed a part of the Russian population, felt themselves aggrieved by the rigour with which one of their officers had been treated, and placing at their head Radzin, the brother of the deceased, broke out into open rebellion. Allured by the spirit of licentiousness, and the hopes of plunder, vast numbers both of Kozaks and inferior Russians flocked to the standard of Radzin, and formed an army of nearly 200,000 men. This force, however, was formidable merely from its numbers. Radzin's followers were without arms, without discipline, and were quite unprepared to stand the attack of regular troops. Radzin himself seems to have placed no reliance on the courage or fidelity of his followers, and eagerly embraced the first opportunity of procuring a pardon by submission. Having been deceived into a belief that this pardon would be granted on his surrendering himself to the mercy of the czar, he set out for Mosco, accompanied by his brother; but when he was arrived within a short distance of the capital, whither notice of his approach had been sent, he was met by a cart containing a gallows, on which he was hanged without ceremony. His followers, who had assembled at Astracan, were surrounded by the czar's troops, taken prisoners, and 12,000 of them hung on the gibbets in the highways. Thus this formidable rebellion, which had threatened to subvert the authority of Alexei, was crushed almost at its commencement.

The influence which Alexei had obtained over the Donskoi Kozaks, excited the jealousy of the Sublime Porte, who justly dreaded the extension of the Russian territory on the side of the Crimea, a peninsula which at that time belonged to Turkey. After a successful attempt on the frontiers of Poland, a Turkish army entered the Ukraine, and the Russians made preparations to oppose them. Alexei endeavoured to form a confederacy against the infidels among the Christian potentates of Europe; but the age of crusading chivalry was over, and the czar was obliged to make head against the Turks, assisted by his single ally the king of Poland. The Turkish arms were for some years victorious, especially on the side of Poland, but at length a check was put to their successes by the Polish general Sobieski, who afterwards ascended the throne of that kingdom. Hostilities between the Turks and Russians were not, however, terminated during the reign of Alexei, and the czar left to his successor the prosecution of the war.

The reign of Alexei is most remarkable for the improvements introduced by him into the Russian laws. Before his time the *emannoï ukases*, or personal orders of the sovereign, were almost the only laws of the country. These edicts were as various as the opinions, prejudices, and passions of men; and before the days of Alexei they produced endless contentions. To remedy this

this evil, he made a selection from all the edicts of his predecessors, of such as had been current for 100 years; presuming that these either were founded in natural justice, or during so long a currency had formed the minds of the people to consider them as just. This digest, which he declared to be the common law of Russia, and which is prefaced by a sort of institute, is known by the title of the *Ulogeniè* or *Selection*, and was long the standard law book; and all edicts prior to it were declared to be obsolete. He soon made his new code, however, more bulky than the Selection; and the additions by his successors are beyond enumeration. This was undoubtedly a great and useful work; but Alexei performed another still greater.

Though there were many courts of judicature in this widely extended empire, the emperor was always lord paramount, and could take a cause from any court immediately before himself. But as several of the old nobles had the remains of principalities in their families, and held their own courts, the sovereign or his ministers, at a distance up the country, frequently found it difficult to bring a culprit out of one of these hereditary feudal jurisdictions, and try him by the laws of the empire. This was a very disagreeable limitation of imperial power; and the more so, that some families, claimed even a right of reprieve. A lucky opportunity soon offered of settling the dispute, and Alexei embraced it with great ability.

Some families on the old frontiers were taxed with their defence, for which they were obliged to keep regiments on foot; and as they were but scantily indemnified by the state, it sometimes required the exertion of authority to make them keep up their levies. When the frontiers by the conquest of Kazan were far extended, those gentlemen found the regiments no longer burdensome, because by the help of false musters, the formerly scanty allowance much more than reimbursed them for the expence of the establishment. The consequence was, that disputes arose among them about the right of guarding certain districts, and law suits were necessary to settle their respective claims. These were tedious and intricate. One claimant showed the order of the court, issued a century or two back, to his ancestor, for the marching of his men, as a proof that the right was then in the family. His opponent proved, that his ancestors had been the real lords of the marches; but that, on account of their negligence, the court had issued an *emmanoy ukase* to the other, only at that particular period. The emperor ordered all the family archives to be brought to Mosco, and all documents on both sides to be collected. A time was set for the examination; a fine wooden court-house was built, every paper was lodged under a good guard; the day was appointed when the court should be opened and the claims heard; but that morning the house, with all its contents, was in two hours consumed by fire. The emperor then

said, "Gentlemen, henceforward your ranks, your privileges, and your courts, are the nation's, and the nation will guard itself. Your archives are unfortunately lost, but those of the nation remain. I am the keeper, and it is my duty to administer justice for all and to all. Your ranks are not private, but national; attached to the services you are actually performing. Henceforward Colonel Buturlin (a private gentleman) ranks before Captain Viazemsky (an old prince)" (F).

The Russians owe more to this prince than many of their historians seem willing to acknowledge; and there seems no doubt that some of the improvements attributed to Peter the Great, were at least projected by his father. Under Alexei a considerable trade was opened with China, from which country silks, and other rich stuffs, rhubarb, tea, &c. were brought into Russia, and exchanged for the Siberian furs. The exportation of Russian products to other countries was also increased; and we are assured that Alexei had even projected the formation of a navy, and would have executed the design, had he not been perpetually occupied in foreign wars and domestic troubles.

Alexei died in 1676, leaving three sons and six daughters.—Two of the sons, Feodor and Ivan, were by a first marriage; the third, Peter, by a second. The two former, particularly Ivan, were of a delicate constitution, and some attempts were made by the relations of Peter to set them aside. These attempts, however, proved unsuccessful, and Feodor was appointed the successor of Alexei.

The reign of this prince was short, and distinguished rather for the happiness which the nation then experienced, than for the importance of the transactions that took place. He continued the war with the Turks for four years after his father's death, and at length brought it to an honourable conclusion, by a truce for 20 years, after the Turks had acknowledged the Russian right of sovereignty over the Kozaks. Feodor died in 1682, but before his death nominated his half-brother Peter his successor.

The succession of Peter, though appointed by their favourite czar Feodor, was by no means pleasing to the majority of the Russian nobles, and it was particularly opposed by Galitzin, the prime minister of the late czar. This able man had espoused the interest of Sophia, the sister of Feodor and Ivan, a young woman of eminent abilities, and the most insinuating address. Sophia, upon pretence of asserting the claims of her brother Ivan, who, though of a feeble constitution and weak intellects, was considered as the lawful heir of the crown, had really formed a design of securing the succession to herself; and, with that view, had not only insinuated herself into the confidence and good graces of Galitzin, but had brought over to her interests the Strelitzes (G). These licentious soldiers assembled for the purpose, as was pretended, of placing on the throne Prince Ivan, whom

Intrigues of the princess Sophia.

(F) This transaction is, by most historians, placed under the reign of Alexei, as we have related it; but Mr Tooke, in his history of Russia (vol. ii. p. 37.) attributes the burning of the records of service, by which the nobles and chief courtiers held their offices, to Feodor.

(G) The Strelitzes composed the standing army of Russia, and formed the body guard of the tzars. At this time they amounted to about 14,000, and of course became a formidable engine in the hands of the enterprising princess.

Russia.

they proclaimed czar by acclamation. During three days they roved about the city of Mosco, committing the greatest excesses, and putting to death several of the chief officers of state, who were suspected of being hostile to the designs of Sophia. Their employer did not, however, entirely gain her point; for as the new czar entertained a sincere affection for his half-brother Peter, he insisted that this prince should share with him the imperial dignity. This was at length agreed to; and on the 6th of May 1682, Ivan and Peter were solemnly crowned joint emperors of all the Russias, while the princess Sophia was nominated their copartner in the government.

101

Joint reign
of Ivan
and Peter
I.

From the imbecility of Ivan and the youth of Peter, who was now only 10 years of age, the whole power of the government rested on Sophia and her minister Galitzin, though till the year 1687 the names of Ivan and Peter only were annexed to the imperial decrees. Scarcely had Sophia established her authority than she was threatened with deposition, from an alarming insurrection of the Strelitzes. This was excited by their commander Prince Kovanskoi, who had demanded of Sophia that she would marry one of her sisters to his son, but had met with a mortifying refusal from the princess. In consequence of this insurrection, which threw the whole city of Mosco into terror and consternation, Sophia and the two young tzars took refuge in a monastery, about 12 leagues from the capital; and before the Strelitzes could follow them thither, a considerable body of soldiers, principally foreigners, was assembled in their defence. Kovanskoi was taken prisoner, and instantly beheaded; and though his followers at first threatened dreadful vengeance on his executioners, they soon found themselves obliged to submit. From every regiment was selected the tenth man, who was to suffer as an atonement for the rest; but this cruel punishment was remitted, and only the most guilty among the ringleaders suffered death.

102
The party
of Peter
gains
ground.

The quelling of these disturbances gave leisure to the friends of Peter to pursue the plans which they had formed for subverting the authority of Sophia; and about this time a favourable opportunity offered, in consequence of a rupture with Turkey. The Porte was now engaged in a war with Poland and the German empire, and both these latter powers had solicited the assistance of Russia against the common enemy. Sophia and her party were averse to the alliance; but as there were in the council many secret friends of Peter, these had sufficient influence to persuade the majority, that a Turkish war would be of advantage to the state. They even prevailed on Galitzin to put himself at the head of the army, and thus removed their principal opponent. It is difficult to conceive how a man, so able in the cabinet as Galitzin, could have suffered his vanity so far to get the better of his good sense, as to accept a military command, for which he certainly had no talents. Assembling an army of nearly 300,000 men, he marched towards the confines of Turkey, and here consumed two campaigns in marches and countermarches, and lost nearly 40,000 men, partly in unsuccessful skirmishes with the enemy, but chiefly from disease.

While Galitzin was thus trifling away his time in the south, Peter, who already began to give proofs of those great talents which afterwards enabled him to act so conspicuous a part in the theatre of the north, was

strengthening his party among the Russian nobles. His ordinary residence was at a village not far from Mosco, and here he had assembled round him a considerable number of young men of rank and influence, whom he called his play-mates. Among these were two foreigners, Lefort a Genevese, and Gordon a Scotchman, who afterwards signalized themselves in his service. These young men had formed a sort of military company, of which Lefort was captain, while the young czar, beginning with the situation of drummer, gradually rose through every subordinate office. Under this appearance of a military game, Peter was secretly establishing himself in the affections of his young companions, and effectually lulled the suspicions of Sophia, till it was too late for her to oppose his machinations.

About the middle of the year 1689, Peter, who had now attained his seventeenth year, determined to make an effort to deprive Sophia of all share in the government, and to secure to himself the undivided sovereignty. On occasion of a solemn religious meeting that was held, Sophia had claimed the principal place as regent of the empire; but this claim was strenuously opposed by Peter, who, rather than fill a subordinate situation, quitted the place of assembly, and, with his friends and adherents, withdrew to the monastery of the Holy Trinity, which had formerly sheltered him and his copartners from the fury of the Strelitzes. This was the signal for an open rupture. Sophia, finding that she could not openly oppose the party of the tzars, attempted to procure his assassination; but as her design was discovered, she thought proper to solicit an accommodation. This was agreed to, on condition that she should give up all claim to the regency, and retire to a nunnery. The commander of the Strelitzes, who was to have been her agent in the assassination of Peter, was beheaded, and the minister Galitzin sent into banishment to Archangel.

Peter now saw himself in undisputed possession of the imperial throne; for though Ivan was still nominally czar, he had voluntarily resigned all participation in the administration of affairs, and retired to a life of obscurity. The first object to which the czar directed his attention was the establishment of a regular and well-disciplined military force. He had learned by experience how little dependence was to be placed on the Strelitzes, and these regiments he determined to disband. He commissioned Lefort and Gordon to levy new regiments, which, in their whole constitution, dress, and military exercises, should be formed on the model of other European troops. He next resolved to carry into execution the design which had been formed by his father, of constructing a navy. For this purpose he first took a journey to Archangel, where he employed himself in examining the operations of the shipwrights, and occasionally taking a part in their labours; but as he learned that the art of ship-building was practised in greater perfection in Holland, and some other maritime countries of Europe, he sent thither several young Russians to be initiated into the best methods of constructing ships of war. The other measures taken by Peter for establishing a navy, and the success with which they were attended, have been already related under his life*, to which we may refer our readers for several circumstances relating to his life and character; as our object here is not to write a biography of this extraordinary

mail,

man, but briefly to narrate the transactions of his reign.

The war with Turkey still languished, but Peter was resolved to prosecute it with vigour, hoping to get possession of the town of Azof, and thus open a passage to the Black sea. He placed Gordon, Lefort, and two of his nobles at the head of the forces destined for this expedition, and himself attended the army as a private volunteer. The success of the first campaign was but trifling, and Peter found that his deficiency of artillery, and his want of transports, prevented him from making an effectual attack on Azof. These difficulties, however, were soon surmounted. He procured a supply of artillery and engineers from the emperor and the Dutch, and found means to provide a number of transports. With these auxiliaries he opened the second campaign, defeated the Turks on the sea of Azof, and made himself master of the town. Peter was so elated with these successes, that on his return from the seat of war, he marched his troops into Mosco in triumphal procession, in which Lefort, as admiral of the transports, and Scheim as commander of the land forces, bore the most conspicuous parts, while Peter himself was lost without distinction in the crowd of subaltern officers.

He now resolved to form a fleet in the Black sea; but as his own revenues were insufficient for this purpose, he issued a *ukase*, commanding the patriarch and other dignified clergy, the nobility and the merchants, to contribute a part of their income towards fitting out a certain number of ships. This proclamation was extremely unpopular, and, together with the numerous innovations which Peter was every day introducing, especially his sending the young nobles to visit foreign countries, and his own avowed intention of making the tour of Europe, contributed to raise against him a formidable party. The vigilance and prudence of the czar, however, extricated him from the dangers with which he was threatened, and enabled him to carry into execution his proposed journey. See PETER I.

On his return to his own dominions, Peter passed through Rawa, where Augustus king of Poland then was. The czar had determined, in conjunction with Augustus and the king of Denmark, to take advantage of the youth and inexperience of Charles XII. who had just succeeded to the Swedish throne; and in this interview with Augustus, he made the final arrangements for the part which each was to take in the war. Augustus was to receive Livonia as his part of the spoil, while Frederick king of Denmark had his eye on Holstein, and Peter had formed designs on Ingria, formerly a province of the Russian empire.

In the middle of the year 1700, Charles had left his capital, to oppose these united enemies. He soon compelled the king of Denmark to give up his designs on Holstein, and sign a treaty of peace; and being thus at liberty to turn his arms against the other members of the confederacy, he resolved first to lead his army against the king of Poland; but on his way he received intelligence that the czar had laid siege to Narva with 100,000 men. On this he immediately embarked at Carlscrona, though it was then the depth of winter, and the Baltic was scarcely navigable; and soon landed at Pernaw in Livonia with part of his forces, having ordered the rest to Reval. His army did not exceed 20,000 men, but it was composed of the best soldiers in

Europe, while that of the Russians was little better than an undisciplined multitude. Every possible obstruction, however, had been thrown in the way of the Swedes. Thirty thousand Russians were posted in a defile on the road, and this corps was sustained by another body of 20,000 drawn up some leagues nearer Narva. Peter himself had set out to hasten the march of a reinforcement of 40,000 men, with whom he intended to attack the Swedes in flank and rear; but the celerity and valour of Charles baffled every attempt to oppose him. He set out with 4000 foot, and an equal number of cavalry, leaving the rest of the army to follow at their leisure. With this small body he attacked and defeated the Russian armies successively, and pushed his way to Peter's camp, for the attack of which he gave immediate orders. This camp was fortified by lines of circumvallation and contravallation, by redoubts, by a line of 150 brass cannons placed in front, and defended by an army of 80,000 men; yet so violent was the attack of the Swedes, that in three hours the entrenchments were carried, and Charles, with only 4000 men, that composed the wing which he commanded, pursued the flying enemy, amounting to 50,000, to the river Narva. Here the bridge broke down with the weight of the fugitives, and the river was filled with their bodies. Great numbers returned in despair to their camp, where they defended themselves for a short time, but were at last obliged to surrender. In this battle, 30,000 were killed in the intrenchments and the pursuit, or drowned in the river; 20,000 surrendered at discretion, and were dismissed unarmed, while the rest were totally dispersed. A hundred and fifty pieces of cannon, 28 mortars, 151 pairs of colours, 20 standards, and all the Russian baggage, fell into the hands of the Swedes; and the duke de Croy, the prince of Georgia, and seven other generals were made prisoners. Charles behaved with the greatest generosity to the conquered. Being informed that the tradesmen of Narva had refused credit to the officers whom he detained prisoners, he sent 1000 ducats to the duke de Croy, and to every other officer a proportionable sum.

Peter was advancing with 40,000 men to surround the Swedes, when he received intelligence of the dreadful defeat at Narva. He was greatly chagrined; but comforting himself with the hopes that the Swedes would in time teach the Russians to beat them, he returned to his own dominions, where he applied himself with the utmost diligence to the raising of another army. He evacuated all the provinces which he had invaded, and for a time abandoned all his great projects, thus leaving Charles at liberty to prosecute the war against Poland.

As Augustus had expected an attack, he endeavoured to draw the czar into a close alliance with him. The two monarchs had an interview at Birsen, where it was agreed that Augustus should lend the czar 50,000 German soldiers, to be paid by Russia; that the czar should send an equal number of his troops to be trained up to the art of war in Poland; and that he should pay the king 3,000,000 of rixdollars in the space of two years. Of this treaty Charles had notice, and, by means of his minister Count Piper, entirely frustrated the scheme.

After the battle of Narva, Charles became confident and negligent, while the activity of Peter increased with his losses. He supplied his want of artillery by melting

108
Renewed exertions of Peter,

down the bells of the churches, and constructed numerous small vessels on the lake of Ladoga, to oppose the entrance of the Swedes into his dominions. He took every advantage of Charles's negligence, and engaged in frequent skirmishes, in which, though often beaten, he was sometimes victorious. Thus, he proved to his soldiers, that the Swedes though conquerors, were not invincible, and kept up the spirit of his troops by liberally rewarding every instance of courage and success. He contrived to make himself master of the river Neva, and captured Nyenschantz, a fortress at the mouth of that river. Here he laid the foundation of that city which he had long projected, and which was to become the future metropolis of his empire. At length in 1704 he became master of Ingria, and appointed his favourite Prince Menzikoff to be viceroy of that province, with strict orders to make the building of the new city his principal concern. Here already buildings were rising in every quarter, and navigation and commerce were increasing in vigour and extent.

109
The Swedes
defeated.

In the mean time Augustus king of Poland, though treating with Charles for the surrender of his dominions, was obliged to keep up the appearance of war, which he had neither ability nor inclination to conduct. He had been lately joined by Prince Menzikoff with 30,000 Russians; and this obliged him, contrary to his inclination, to hazard an engagement with Meyerfeldt, who commanded 10,000 men, one half of whom were Swedes. As at this time no disparity of numbers whatever was reckoned an equivalent to the valour of the Swedes, Meyerfeldt did not decline the combat, though the army of the enemy was four times as numerous as his own. With his countrymen he defeated the enemy's first line, and was on the point of defeating the second, when Stanislaus, with the Poles and Lithuanians, gave way. Meyerfeldt then perceived that the battle was lost; but he fought desperately, that he might avoid the disgrace of a defeat. At last, however, he was oppressed by numbers, and forced to surrender; suffering the Swedes for the first time to be conquered by their enemies. The whole army were taken prisoners excepting Major-general Krassau, who having repeatedly rallied a body of horse formed into a brigade, at last broke through the enemy, and escaped to Posnania. Augustus had scarcely sung *Te Deum* for this victory, when his plenipotentiary returned from Saxony with the articles of the treaty, by which he was to renounce all claim to the crown of Poland in favour of his rival Stanislaus. The king hesitated and scrupled, but at last signed them; after which he set out for Saxony, glad at any rate to be freed from such an enemy as the king of Sweden, and from such allies as the Russians.

110
Augustus

* See *Patkul*.

111
Peter de-
termines to
continue
the war.

The czar Peter was no sooner informed of this extraordinary treaty, and the cruel execution of his plenipotentiary Patkul*, than he sent letters to every court in Christendom, complaining of this gross violation of the law of nations. He entreated the emperor, the queen of Britain, and the States-General, to revenge this insult on humanity. He stigmatized the complaisance of Augustus with the opprobrious name of pusillanimity; exhorted them not to guarantee a treaty so unjust, but to despise the menaces of the Swedish bully. So well, however, was the prowess of the king of Sweden known, that none of the allies thought proper to irritate him, by refusing to guarantee any treaty he

thought proper. At first, Peter thought of revenging Patkul's death by massacring the Swedish prisoners at Mosco; but from this he was deterred, by remembering that Charles had many more Russian prisoners than he himself had of Swedes. Giving over all thoughts of revenging himself in this way, therefore, in the year 1707 he entered Poland at the head of 60,000 men. Advancing to Leopold, he made himself master of that city, where he assembled a diet, and solemnly deposed Stanislaus with the same ceremonies which had been used with regard to Augustus. The country was now reduced to the most miserable situation; one party, through fear, adhered to the Swedes; another was gained over, or forced by Peter to take part with him; a violent civil war took place between the two, and great numbers of people were butchered; while cities, towns, and villages, were laid in ashes by the frantic multitude. The appearance of a Swedish army under King Stanislaus and General Lewenhaupt, put a stop to these disorders, Peter himself not caring to stand before such enemies. He retired, therefore, into Lithuania, giving out as the cause of his retreat, that the country could not supply him with provision and forage necessary for so great an army.

Russia.

An. 170
112
Peter ent.
Poland.

During these transactions Charles had taken up his residence in Saxony, where he gave laws to the court of Vienna, and in a manner intimidated all Europe. At last, satiated with the glory of having dethroned one king, set up another, and struck all Europe with terror and admiration, he began to evacuate Saxony in pursuit of his great plan, the dethroning the czar Peter, and conquering the vast empire of Russia. While the army was on full march in the neighbourhood of Dresden, he took the extraordinary resolution of visiting King Augustus with no more than five attendants. Though he had no reason to imagine that Augustus either did or could entertain any friendship for him, he was not uneasy at the consequences of thus putting himself entirely in his power. He got to the palace door of Augustus before it was known that he had entered the city. General Fleming having seen him at a distance, had only time to run and inform his master. What might be done in the present case immediately occurred to the minister, but Charles entered the elector's chamber in his boots before the latter had time to recover from his surprise. He breakfasted with him in a friendly manner, and then expressed a desire of viewing the fortifications. While he was walking round them, a Livonian, who had formerly been condemned in Sweden, and served in the troops of Saxony, thought he could never have a more favourable opportunity of obtaining pardon. He therefore begged of King Augustus to intercede for him, being fully assured that his majesty could not refuse so slight a request to a prince in whose power he then was. Augustus accordingly made the request, but Charles refused it in such a manner, that he did not think proper to ask it a second time. Having passed some hours in this extraordinary visit, he returned to his army, after having embraced and taken leave of the king he had dethroned.

113
Charles
visits A
gustus.

The armies of Sweden, in Saxony, Poland, and Finland, now exceeded 70,000 men; a force more than sufficient to have conquered all the power of Russia, had they met on equal terms. Peter, who had his army dispersed in small parties, instantly assembled it on receiving

1
and march
again
Russi

ceiving notice of the king of Sweden's march, was making all possible preparations for a vigorous resistance, and was on the point of attacking Stanislaus, when the approach of Charles struck his whole army with terror. In the month of January 1708 Charles passed the Niemen, and entered the south gate of Grodno just as Peter was quitting the place by the north gate. Charles at this time had advanced some distance before the army, at the head of 600 horse.

The tzar having intelligence of his situation, sent back a detachment of 2000 men to attack him, but these were entirely defeated; and thus Charles became possessed of the whole province of Lithuania. The king pursued his flying enemies in the midst of ice and snow, over mountains, rivers, and morasses, and through obstacles, which to surmount seemed impossible to human power. These difficulties, however, he had foreseen, and had prepared to meet them. As he knew that the country could not furnish provisions sufficient for the subsistence of his army, he had provided a large quantity of biscuit, and on this his troops chiefly subsisted, till they came to the banks of the Berizine, in view of Borislow. Here the tzar was posted, and Charles intended to give him battle, after which he could the more easily penetrate into Russia. Peter, however, did not think proper to come to an action, but retreated towards the Dniepr, whither he was pursued by Charles, as soon as he had refreshed his army. The Russians had destroyed the roads, and desolated the country, yet the Swedish army advanced with great celerity, and in their march defeated 20,000 Russians, though entrenched to the very teeth. This victory, considering the circumstances in which it was gained, was one of the most glorious that ever Charles had achieved. The memory of it is preserved by a medal struck in Sweden with this inscription; *Sylvæ, paludes, aggeres, hostes, victi.*

When the Russians had re-passed the Dniepr, the tzar, finding himself pursued by an enemy with whom he could not cope, resolved to make proposals for an accommodation; but Charles answered his proposals with this arrogant reply; "I will treat with the tzar at Mosco;" a reply which was received by Peter with the coolness of a hero. "My brother Charles, said he, affects to play the Alexander, but he shall not find in me a Darius." He still, however, continued his retreat, and Charles pursued so closely, that daily skirmishes took place between his advanced guard and the rear of the Russians. In these actions the Swedes generally had the advantage, though their petty victories cost them dear, by contributing to weaken their force in a country where it could not be recruited. The two armies came so close to each other at Smolensk, that an engagement took place between a body of Russians composed of 10,000 cavalry and 6000 Kalmuks, and the Swedish vanguard, composed of only six regiments, but commanded by the king in person. Here the Russians were again defeated, but Charles having been separated from the main body of his detachment, was exposed to great danger. With one regiment only, he fought with such fury as to drive the enemy before him, when they thought themselves sure of making him prisoner.

By the 3d of October 1708, Charles had approached within 100 leagues of Mosco; but Peter had rendered the roads impassable, and had destroyed the villages

on every side, so as to cut off every possibility of subsistence to the enemy. The season was far advanced, and the severity of winter was approaching, so that the Swedes were threatened with all the miseries of cold and famine, at the same time that they were exposed to the attacks of an enemy greatly superior in number, who, from their knowledge of the country, had almost constant opportunities of harassing and attacking them by surprise. For these reasons the king resolved to pass the Ukraine, where Mazeppa, a Polish gentleman, was general and chief of the nation. Mazeppa having been affronted by the tzar, readily entered into a treaty with Charles, whom he promised to assist with 30,000 men, great quantities of provisions and ammunition, and with all his treasures, which were immense. The Swedish army advanced towards the river Disna, where they had to encounter the greatest difficulties; a forest above 40 leagues in extent, filled with rocks, mountains, and marshes. To complete their misfortunes, they were led 30 leagues out of the right way; all the artillery was sunk in bogs and marshes; the provision of the soldiers, which consisted of biscuit, was exhausted; and the whole army spent and emaciated when they arrived at the Disna. Here they expected to have met Mazeppa with his reinforcement; but instead of that, they perceived the opposite banks of the river covered with a hostile army, and the passage itself almost impracticable. Charles, however, was still undaunted; he let his soldiers by ropes down the steep banks; they crossed the river either by swimming, or on rafts hastily put together; drove the Russians from their post, and continued their march. Mazeppa soon after appeared, having with him about 6000 men, the broken remains of the army he had promised. The Russians had got intelligence of his designs, defeated and dispersed his adherents, laid his town in ashes, and taken all the provisions collected for the Swedish army. However, he still hoped to be useful by his intelligence in an unknown country; and the Kozaks, out of revenge, crowded daily to the camp with provisions.

Greater misfortunes still awaited the Swedes. When Charles entered the Ukraine, he had sent orders to General Lewenhaupt to meet him with 15,000 men, 6000 of whom were Swedes, and a large convoy of provisions. Against this detachment Peter now bent his whole force, and marched against him with an army of 65,000 men. Lewenhaupt had received intelligence that the Russian army consisted of only 24,000, a force to which he thought 6000 Swedes superior, and therefore disdained to entrench himself. A furious contest ensued, in which the Russians were defeated with the loss of 15,000 men. Now, however, affairs began to take another turn. The Swedes, elated with victory, prosecuted their march into the interior; but from the ignorance or treachery of their guides, were led into a marshy country, where the roads were made impassable by felled trees and deep ditches. Here they were attacked by the tzar with his whole army. Lewenhaupt had sent a detachment to dispute the passage of a body of Russians over a morass; but finding his detachment likely to be overpowered, he marched to support them with all his infantry. Another desperate battle ensued; the Russians were once more thrown into disorder, and were just on the point of being totally defeated, when Peter gave orders to the Kozaks and Kalmuks to fire

Russia.

upon all that fled; "Even kill me, said he, if I should be so cowardly as to turn my back." The battle was now renewed with great vigour; but notwithstanding the tzar's positive orders, and his own example, the day would have been lost, had not General Bauer arrived with a strong reinforcement of fresh Russian troops. The engagement was once more renewed, and continued without intermission till night. The Swedes then took possession of an advantageous post, but were next morning attacked by the Russians. Lewenhaupt had formed a sort of rampart with his waggons, but was obliged to set fire to them to prevent their falling into the hands of the Russians, while he retreated under cover of the smoke. The tzar's troops, however, arrived in time to save 500 of these waggons, filled with provisions destined for the distressed Swedes. A strong detachment was sent to pursue Lewenhaupt; but so terrible did he now appear, that the Russian general offered him an honourable capitulation. This was rejected with disdain, and a fresh engagement took place, in which the Swedes, now reduced to 4000, again defeated their enemies, and killed 5000 on the spot. After this, Lewenhaupt was allowed to pursue his retreat without molestation, though deprived of all his cannon and provisions. Prince Menzikoff was indeed detached with a body of forces to harass him on his march; but the Swedes were now so formidable, even in their distress, that Menzikoff dared not attack them, so that Lewenhaupt with his 4000 men arrived safe in the camp of Charles, after having destroyed nearly 30,000 of the Russians.

This may be said to have been the last successful effort of Swedish valour against the troops of Peter. The difficulties which Charles's army had now to undergo, exceeded what human nature could support; yet still they hoped by constancy and courage to subdue them. In the severest winter known for a long time, even in Russia, they made long marches, clothed like savages in the skins of wild beasts. All the draught horses perished; thousands of soldiers dropt down dead through cold and hunger; and by the month of February 1709 the whole army was reduced to 18,000. Amidst numberless difficulties these penetrated to Pultava, a town on the eastern frontier of the Ukraine, where the tzar had laid up magazines, and of these Charles resolved to obtain possession. Mazeppa advised the king to invest the place, in consequence of his having correspondence with some of the inhabitants, by whose means he hoped it would be surrendered. However, he was deceived; the besieged made an obstinate defence, the Swedes were repulsed in every assault, and 8000 of them were defeated, and almost entirely cut off, in an engagement with a party of Russians. To complete his misfortunes, Charles received a shot in his heel from a carabine, which shattered the bone. For six hours after, he continued calmly on horseback, giving orders, till he fainted with the loss of blood; after which he was carried into his tent.

For some days the tzar, with an army of 70,000 men, had lain at a small distance, harassing the Swedish camp, and cutting off the convoys of provision; but now intelligence was received, that he was advancing as if with a design of attacking the lines. In this situation, Charles, wounded, distressed, and almost surrounded

by enemies, is said to have, for the first time, assembled a grand council of war, the result of which was, that it became expedient to march out and attack the Russians. Voltaire, however, totally denies that the king relaxed one jot of his wonted obstinacy and arbitrary temper; but that, on the 7th of July, he sent for General Renschild, and told him, without any emotion, to prepare for attacking the enemy next morning.

The 8th of July 1709 is remarkable for the battle which decided the fate of Sweden. Charles having left 8000 men in the camp to defend the works and repel the sallies of the besieged, began to march against his enemies by break of day with the rest of the army, consisting of 26,000 men, of whom 18,000 were Kozaks. The Russians were drawn up in two lines behind their entrenchments, the horse in front, and the foot in the rear, with chasms to suffer the horse to fall back in case of necessity. General Slippenbach was dispatched to attack the cavalry, which he did with such impetuosity that they were broken in an instant. They, however, rallied behind the infantry, and returned to the charge with so much vigour, that the Swedes were disordered in their turn, and Slippenbach made prisoner. Charles was now carried in his litter to the scene of confusion. His troops, re-animated by the presence of their leader, returned to the charge, and the battle became doubtful, when a blunder of General Creuk, who had been dispatched by Charles to take the Russians in flank, and a successful manœuvre of Prince Menzikoff, decided the fortune of the day in favour of the Russians. Creuk's detachment was defeated, and Menzikoff, who had been sent by Peter with a strong body to post himself between the Swedes and Pultava, so as to cut off the communication of the enemy with their camp, and fall upon their rear, executed his orders with so much success as to cut off a corps de reserve of 3000 men. Charles had ranged his remaining troops in two lines, with the infantry in the centre, and the horse on the two wings. They had already twice rallied, and were now again attacked on all sides with the utmost fury. Charles in his litter, with a drawn sword in one hand, and a pistol in the other, seemed to be everywhere present; but new misfortunes awaited him. A cannon ball killed both horses in the litter; and scarcely were these replaced by a fresh pair, when a second ball stroke the litter in pieces, and overturned the king. The Swedish soldiers believing him killed, fell back in consternation. The first line was completely broken, and the second fled. Charles, though disabled, did every thing in his power to restore order; but the Russians, emboldened by success, pressed so hard on the flying foe, that it was impossible to rally them. Renschild and several other general officers were taken prisoners, and Charles himself would have shared the same fate, had not Count Poniatoski (father of the future favourite of Catharine II.) with 500 horse, surrounded the royal person, and with desperate fury cut his way through ten regiments of the Russians. With his small guard the king arrived on the banks of the Dniepr, and was followed by Lewenhaupt with 4000 foot, and all the remaining cavalry. The Russians took possession of the Swedish camp, where they found a prodigious sum in specie; while Prince Menzikoff pursued the flying Swedes; and as they were in want of boats to cross the Dniepr, obliged them

Russia.

to surrender at discretion. Charles escaped with the utmost difficulty, but at length reached Otchakof on the frontiers of Turkey. See SWEDEN.

By this decisive victory, Peter remained in quiet possession of his new acquisitions on the Baltic, and was enabled to carry on, without molestation, the improvements which he had projected at the mouth of the Neva. His haughty rival, so long and so justly dreaded, was now completely humbled, and his ally the king of Poland was again established on his throne. During the eight years that had elapsed from the battle of Narva to that of Pultava, the Russian troops had acquired the discipline and steadiness of veterans, and had at length learned to beat their former conquerors. If Peter had decreed triumphal processions for his trifling successes at Azof, it is not surprising that he should commemorate a victory so glorious and so important as that of Pultava by similar pageants. He made his triumphal entry into Mosco for the third time, and the public rejoicings on this occasion far exceeded all that had before been witnessed in the Russian empire.

The vanquished Charles had, in the mean time, found a valuable friend in the monarch in whose territories he had taken refuge. Achmet II. who then filled the Ottoman throne, had beheld with admiration the warlike achievements of the Swedish hero, and, alarmed at the late successes of his rival, determined to afford Charles the most effectual aid. In 1711, the Turkish emperor assembled an immense army, and was preparing to invade the Russian territories, when the tzar, having intimation of his design, and expecting powerful support from Cantemir, hospodar of Moldavia, a vassal of the Porte, resolved to anticipate the Turks, and to make an inroad into Moldavia. Forgetting his usual prudence and circumspection, Peter crossed the Dniepr, and advanced by rapid marches as far as Yassy or Jassy, the capital of that province, situated on the river Pruth; but his temerity had nearly cost him his liberty, if not his life. The particulars of his dangerous situation, with the manner in which he was extricated from it, by the prudent counsel of his consort Catherine, and the advantageous treaty of the Pruth, which was the result of that counsel, have been already related under CATHERINE I.

By this treaty, in which the interests of Charles had been almost abandoned, Peter saw himself delivered from a dangerous enemy, and returned to his capital, to prosecute those plans for the internal improvement of his empire which justly entitled him to the appellation of GREAT. Before we enumerate these improvements, however, we must bring the Swedish war to a conclusion. The death of Charles, in 1718, had left the Swedish government deplorably weakened, by the continual drains of men and money, occasioned by his mad enterprises, and little able to carry on a war with a monarch so powerful as Peter. At length, therefore, in 1721, this ruinous contest, which had continued ever since the commencement of the century, was brought to a conclusion by the treaty of Nystadt, by which the Swedes were obliged to cede to Russia, Livonia, Esthonia, Ingria, a part of Karelia, the territory of Vyborg, the isle of Oesel, and all the other islands in the Baltic, from Courland to Vyborg; for which concessions they received back Finland, that had been conquered by Peter, together with 2,000,000 of dollars and the liberty of

exporting duty free, from Riga, Reval, and Arensburg, corn to the annual amount of 50,000 rubles. In consequence of this great accession to the Russian empire, Peter received from his senate the title of *emperor and autocrator of all the Russias*, and the ancient title of tzar fell into disuse.

The improvements introduced by Peter into the internal policy of the empire, must be acknowledged to have been numerous and important. He organized anew the legislative assembly of the state; he greatly ameliorated the administration of justice; he new-modelled the national army; entirely erected the Russian navy; rendered the ecclesiastical government milder and less intolerant; zealously patronised the arts and sciences; erected an observatory at St Petersburg, and by publicly proclaiming the approach of an eclipse, and the precise time at which it was to take place, taught his subjects no longer to consider such a phenomenon as an omen of disaster, or an awful menace of divine judgement. He enlarged the commerce of his empire, and gave every encouragement to trade and manufactures. He formed canals, repaired the roads, instituted regular posts, and laid down regulations for a uniformity of weights and measures. Lastly, he in some measure civilized his subjects, though it is evident that he could not civilize himself.

It is the province of the historian to delineate the characters of the princes whose transactions he relates. Various have been the characters given of Peter the Great, by those who have detailed the events of his reign. It is certain that to him the Russian empire is indebted for much of that splendour with which she now shines among the powers of Europe. As a monarch, therefore, he is entitled to our admiration, but as a private individual we must consider him as an object of detestation and abhorrence. His tyranny and his cruelty admit of no excuse; and if we were to suppose that in sacrificing the heir of his crown he emulated the patriotism of the elder Brutus, we must remember that the same hand which signed the death warrant of his son, could, with pleasure, execute the sentence of the law, or rather of his own caprice, and, in the moments of dissipation and revelry, could make the axe of justice an instrument of diabolical vengeance, and of cool brutality.

Peter was succeeded by his consort Catharine, in whose favour he had, some years before his death, altered the order of succession. As the character of this princess, and the transactions of her short reign, have been fully detailed under her life*, we shall here only notice in the most cursory manner the events that took place.

From the commencement of her reign, Catherine conducted herself with the greatest benignity and gentleness, and thus secured the love and veneration of her subjects, which she had acquired during the life of the emperor. She reduced the annual capitation tax; ordered the numerous gibbets which Peter had erected in various parts of the country to be cut down, and had the bodies of those who had fallen victims to his tyranny decently interred. She recalled the greater part of those whom Peter had exiled to Siberia; paid the troops their arrears; restored to the Kozaks those privileges and immunities of which they had been deprived during the late reign; and she continued in office most of the servants of Peter, both civil and military. She concluded

a treaty with the German emperor, by which it was stipulated that in case of attack from an enemy, either party should assist the other with a force of 30,000 men, and should each guarantee the possessions of the other. In her reign the boundaries of the empire were extended by the submission of a Georgian prince, and the voluntary homage of the Kubinskian Tartars. She died on the 17th of May 1727, having reigned about two years. She had settled the crown on Peter the son of the tzarovitch Alexei, who succeeded by the title of Peter II.

An. 1727.
124
Reign of
Peter II.

Peter was only 12 years of age when he succeeded to the imperial throne, and his reign was short and uninteresting. He was guided chiefly by Prince Menzikoff, whose daughter Catharine had decreed him to marry. This ambitious man, who, from the mean condition of a pye-boy, had risen to the first offices of the state, and had, during the late reign, principally conducted the administration of the government, was now, however, drawing towards the end of his career. The number of his enemies had greatly increased, and their attempts to work his downfall now succeeded. A young nobleman of the family of the Dolgorukis, who was one of Peter's chief companions, was excited by his relations, and the other enemies of Menzikoff, to instil into the mind of the young prince, sentiments hostile to that minister. In this commission he succeeded so well, that Menzikoff and his whole family, not excepting the young empress, were banished to Siberia, and the Dolgorukis took into their hands the management of affairs. These artful counsellors, instead of cultivating the naturally good abilities of Peter, encouraged him to waste his time and exhaust his strength in hunting, and other athletic exercises, for which his tender years were by no means calculated. It is supposed that the debility consequent on such fatigue increased the natural danger of the small-pox, with which he was attacked in January 1730, and from which he never recovered.

125
Anne
duchess of
Courland
succeeds to
the impe-
rial throne.

Notwithstanding the absolute power with which Peter I. and the empress Catharine had settled by will the succession to the throne, the Russian senate and nobility, upon the death of Peter II. ventured to set aside the order of succession which those sovereigns had established. The male issue of Peter was now extinct; and the duke of Holstein, son to Peter's eldest daughter, was by the destination of the late empress entitled to the crown; but the Russians, for political reasons, filled the throne with Anne duchess of Courland, second daughter to Ivan, Peter's eldest brother; though her eldest sister the duchess of Mecklenburg was alive. Her reign was extremely prosperous; and though she accepted the crown under limitations that some thought derogatory to her dignity, yet she broke them all, asserted the prerogative of her ancestors, and punished the aspiring Dolgoruki family, who had imposed upon her limitations, with a view, as it is said, that they themselves might govern. She raised her favourite Biren to the duchy of Courland; and was obliged to give way to many severe executions on his account. Few transactions of any importance took place during the reign of Anne. She followed the example of her great predecessor Peter, by interfering in the affairs of Poland, where she had sufficient interest to establish on the throne Augustus III. This interference had nearly involved her in a war with France, and she had already sent a considerable army to

the banks of the Rhine, for the purpose of acting against that power, when the conclusion of a treaty of peace rendered them unnecessary. She entered into a treaty with the shah of Persia, by which she agreed to give up all title to the territories that had been seized by Peter I. on the shores of the Caspian, in consideration of certain privileges to be granted to the Russian merchants.

In 1735, a rupture took place between Russia and Turkey, occasioned partly by the mutual jealousies that had subsisted between these powers, ever since the treaty on the Pruth, and partly by the depredations of the Tartars of the Crimea, then under the dominion of the Porte. A Russian army entered the Crimea, ravaged part of the country, and killed a considerable number of Tartars; but having ventured too far, without a sufficient supply of provisions, was obliged to retreat, after sustaining a loss of nearly 10,000 men. This ill success did not discourage the court of St Petersburg; and in the following year another armament was sent into the Ukraine, under the command of Marshal Munich, while another army under Lasey proceeded against Azof. Both these generals met with considerable success; the Tartars were defeated, and the fort of Azof once more submitted to the Russian arms. A third campaign took place in 1737. and the Russians were now assisted by a body of Austrian troops. Munich laid siege to Otchakof, which soon surrendered, while Lasey desolated the Crimea.

No material advantages were, however, gained on either side; and disputes arose between the Austrian and Russian generals. At length in 1739, Marshal Munich having crossed the Bog at the head of a considerable army, defeated the Turks in a pitched battle near Stavutshan, made himself master of Yassy, the capital of Moldavia, and before the end of the campaign reduced the whole of that province under his subjection. These successes of the Russian arms induced the Porte to propose terms of accommodation; and in the latter end of 1739, a treaty was concluded, by which Russia again gave up Azof and Moldavia, and to compensate the loss of above 100,000 men, and vast sums of money, gained nothing but permission to build a fortress on the Don.

Upon the death of Anne, which took place in 1740, Ivan, the son of her niece, the princess of Mecklenburg was, by her will, entitled to the succession; but being no more than two years old, Biren was appointed to be administrator of the empire during his minority. This nomination was disagreeable to the princess of Mecklenburg and her husband, and unpopular among the Russians. Count Munich was employed by the princess of Mecklenburg to arrest Biren, who was tried, and condemned to die, but was sent into exile to Siberia.

The administration of the princess Anne of Mecklenburg and her husband was upon many accounts disagreeable, not only to the Russians, but to other powers of Europe; and notwithstanding a prosperous war they carried on with the Swedes, the princess Elizabeth, daughter by Catharine to Peter the Great, formed such a party that in one night's time she was declared and proclaimed empress of the Russias; and the princess of Mecklenburg, her husband, and son, were made prisoners. The fate of this unhappy family was peculiarly severe. All but Ivan were sent into banishment, to an island

Russia.

An. 1740.
Ivan

Acco-
and
sonn

island at the mouth of the Dvina, in the White sea, where the princess Anne died in child bed in 1747. Ivan's father survived till 1775, and at last ended his miserable career in prison. The young emperor Ivan was for some time shut up in a monastery at Oranienburg, when, on attempting to escape, he was removed to the castle of Schlüsselburg, where he was, as will hereafter be related, cruelly put to death.

The chief instrument in rousing the ambition of Elizabeth, and procuring her elevation to the throne, was her physician and favourite Lestoc, who, partly by his insinuating address, and partly by the assistance of the French ambassador, brought over to Elizabeth's interest most of the royal guards. By their assistance she made herself mistress of the imperial palace, and of the persons of the young emperor and his family, and in a few hours was established without opposition on the throne of her father.

During the short regency of Anne of Mecklenburg, a new war had commenced between Russia and Sweden; and this war was carried on with considerable acrimony and some success, by Elizabeth. The Russian forces took possession of Abo, and made themselves masters of nearly all Finland. But at length in 1743, in consequence of the negotiations that were carrying on relative to the succession of the Swedish crown, a peace was concluded between the two powers, on the condition that Elizabeth should restore the greater part of Finland.

Soon after her accession, Elizabeth determined to nominate her successor to the imperial throne, and had fixed her eyes on Charles Peter Ulric, son of the duke of Holstein Gottorp, by Anne, daughter of Peter the Great. This prince was accordingly invited into Russia, persuaded to become a member of the Greek church, and proclaimed grand duke of Russia, and heir of the empire. The ceremony of his baptism was performed on the 18th November, 1742, and he received the name of Peter Feodorovitch. He was at this time only fourteen years of age; but before he had attained his sixteenth year, his aunt had destined him a consort in the person of Sophia Augusta Frederica, daughter of Christian Augustus prince of Anhalt-zerbst-Dornburg. It is unnecessary for us here to relate the circumstances that led to this marriage, and the unhappy consequences that resulted from it during the life of Elizabeth, as they have already been sufficiently detailed*.

Having thus settled the order of succession, Elizabeth began to take an active part in the politics of Europe. The death of Charles VI. emperor of Germany had left his daughter, Maria Theresa queen of Hungary, at the mercy of the enterprising king of Prussia, till a formidable party, more from jealousy of that monarch's military fame than regard to the interests of an injured princess, was formed in her behalf. To this confederacy the empress of Russia acceded, and in 1747 sent a considerable body of troops into Germany, to the assistance of the empress queen. The events of this long and bloody contest have been fully detailed under the article PRUSSIA, from N^o 18 to 64, and they comprise the greater part of those transactions in the reign of Elizabeth that do not particularly regard the internal policy of the empire. The more private transactions of the court of St Petersburg, as far as they are connected with the intrigues of her niece Catherine and the follies

of the grand duke Peter, have also been related in our life of CATHERINE II. Elizabeth died on the 5th January 1762, the victim of disease brought on by intemperance. With her character as a private woman we have little business here. Her merits as a sovereign will appear from the following summary drawn by Mr Tooke.

Elizabeth, as empress, governed but little of herself; it being properly her ministers and favourites who dictated her regulations and decrees. Of this number, besides Bestuchef, was also Bazumofsky, to whom, it has been said, the empress was even privately married. At the beginning of her reign, it is true, she went a few times to the sitting of the senate; but the matters transacted there were by much too serious for her mind; and, accordingly, she very soon left off that practice altogether, contenting herself by confirming with her signature the resolutions of that assembly, and the determinations of her minister, or the *conference*, which supplied the place of the council.

Her character in general was mild, as was evident from the tears it cost her whenever she received accounts from Prussia even of victories gained by her own army, on account of the human blood by which they must necessarily have been purchased. Yet even this delicate sensibility did not restrain her from prosecuting the war into which she had entered from a species of revenge, and for the purpose of humbling the king of Prussia, and even on her death-bed from exhorting the persons who surrounded her to the most vigorous continuation of it. It also proceeded from this sensibility, that immediately on her accession to the government she made the vow never to put her signature to a sentence of death. A resolution which she faithfully kept; though it cannot be averred to have been for the benefit of the empire; since in consequence of it the number of malefactors who deserved to die was every day increasing, insomuch that even the clergy requested the empress to retract her vow, at the same time urging proofs that they could release her from it. All the arguments they could use, however, were of no avail to move the conscientious monarch; she would not give effect to any sentence of death, although the commanders in the army particularly would have been glad that her conscience had yielded a little on that point. They declared that the soldiers were not to be restrained from their excesses by the severest corporal punishments they could employ; whereas such was their dread of a solemn execution, that a few examples of that nature would have effectually kept them in awe.

Commerce and literature, arts, manufactures, handicrafts, and the other means of livelihood, which had been fostered by the former sovereigns, continued their course under Elizabeth with increasing prosperity. The country products were obtained and wrought up in greater quantities, and several branches of profit were more zealously carried on. The sum appointed for the support of the academy of sciences founded by Peter I. at St Petersburg, was considerably augmented by Elizabeth: and she moreover established in 1758 the academy still subsisting for the arts of painting and sculpture, in which a number of young persons are brought up as painters, engravers, statuaries, architects, &c. At Mosco she endowed a university and two gymnasia.

The empress Elizabeth herself having a good voice, music,

music, which Anne had already much encouraged, found under her administration a perpetual accession of disciples and admirers; so that even numbers of persons of distinction at St Petersburg became excellent performers. The art of acting plays was now also more general among the Russians. Formerly none but French or Italian pieces were performed on the stage of St Petersburg, whereas now Sumarokof obtained celebrity, as a dramatic poet in his native language, and in 1756 Elizabeth laid the foundation of a Russian theatre in her residence. Architecture likewise found a great admirer and patroness in her, St Petersburg and its vicinity being indebted to her for great embellishments, and numerous structures.

The magnificence which had prevailed under Anne at the court of St Petersburg was not diminished during her reign, and the court establishment therefore amounted to extraordinary sums. Elizabeth, indeed, in this respect did not imitate her great father; and accordingly in the seven years war the want of a well-stored treasury was already very sensibly felt.

The population of the empire was considerably increased under her reign; and so early as 1752, according to the statement in an account published by an official person, it was augmented by one-fifth.

Elizabeth continued the practice of her predecessors in encouraging foreigners to come to settle in her empire. Emigrant Servians cultivated a considerable tract of land, till then almost entirely uninhabited, on the borders of Turkey, where they built the town of Elizabethgorod, and multiplied so fast, that in the year 1764 a particular district was formed of these improvements, under the name of New Servia. Only the Jews Elizabeth was no less resolute not to tolerate than her father had been; insomuch that, so early in her reign as 1743, they were ordered to quit the country on pain of death.

The army was augmented under Elizabeth, but certainly not improved. There were now no longer at the head of it such men as the foreigners, Munich, Keith, or Loewendal, who, besides their personal courage and intrepidity, possessed the soundest principles of the art of war; and, what is of no less consequence in a commander, kept up a strict discipline, and took care that the laws of subordination were punctually observed. The excessive licence which the regiments of guards, particularly the life company of the Preobajerskoy guards, presumed to exercise, under the very eyes of the empress in St Petersburg, afforded no good example to the rest of the army; and Elizabeth, in appointing those soldiers of that life company, who had been most guilty of flagrant disorders, and the basest conduct, to be officers in the marching regiments, gives us no very high idea of what was required in an officer, but rather serves easily to explain whence it arose that such frequent complaints were made of insubordination. A great number of excellent regulations that had been introduced into the army, and always enforced by foreigners, especially by Munich, were suffered by the Russian generals to fall into total disuse. The bad effects of this negligence were very soon perceived; and it was undoubtedly a circumstance highly favourable to the Russian troops, that for several years successively, in the war which we have had occasion so often to mention, they had to engage with such a master in the military art as

the king of Prussia, and by their conflicts with him, as well as by their connection with the Austrians, and in the sequel with the Prussian soldiery, they had an opportunity of learning so many things, and of forming themselves into regular combatants.

Elizabeth tarnished her reign, however, by the institution of a political court of inquisition, under the name of a secret state chancery, empowered to examine into and punish all such charges as related to the expression of any kind of displeasure against the measures of government. This, as is usual in such cases, opened a door to the vilest practices. The lowest and most profligate of mankind were now employed as spies and informers, and were rewarded for their denunciations and calumnies against the most virtuous characters, if these happened by a look, a shrug of the shoulders, or a few harmless words, to signify their disapprobation of the proceedings of the sovereign*.

The grand duke ascended the throne by the name of Peter III. This prince's conduct has been variously represented. He entered on the government possessed of an enthusiastic admiration of the virtues of the king of Prussia, with whom he immediately made peace, and whose principles and practice he seems to have adopted as patterns for his imitation. He might have surmounted the effects even of those peculiarities, unpopular as they then were in Russia; but it is said that he aimed at reformatations in his dominions, which even Peter the Great durst not attempt; and that he even ventured to cut off the beards of his clergy. He was certainly a weak man, who had no opinions of his own, but childishly adopted the sentiments of any person who took the trouble to teach him. His chief amusement was buffoonery; and he would sit for hours looking with pleasure at a merry-Andrew singing drunken and vulgar songs. He was a stranger to the country, its inhabitants, and their manners; and suffered himself to be persuaded by those about him, that the Russians were fools and beasts unworthy of his attention, except to make them, by means of the Prussian discipline, good fighting machines. These sentiments regulated his whole conduct, and prepared the way for that revolution which improprieties of a different kind tended to hasten.

Becoming attached to one of the Vorontzoff ladies, sister to the princess Dashkoff, he disgusted his wife, who was then a lovely woman in the prime of life, of great natural talents and great acquired accomplishments; whilst the lady whom he preferred to her was but one degree above an idiot. The princess Dashkoff, who was married to a man whose genius was not superior to that of the emperor, being *dame d'honneur* and lady of the bed-chamber, had of course much of the empress's company. Similarity of situations knit these two illustrious personages in the closest friendship. The princess being a zealous admirer of the French *economistes*, could make her conversation both amusing and instructive. She retailed all her statistical knowledge; and finding the empress a willing hearer, she spoke of her in every company as a prodigy of knowledge, judgment, and philanthropy. Whilst the emperor, by his buffoonery and attachment to foreign manners, was daily incurring more and more the odium of his subjects, the popularity of his wife was rapidly increasing; and some persons about the court expressed their regret, that so much knowledge of government, such love of humanity, and

such ardent wishes for the prosperity of Russia, should only furnish conversations with Catharina Romanova (the princess Dashkoff). The empress and her favourite did not let these expressions pass unobserved, they continued their studies in concert; and whilst the former was employed on her famous code of laws, for a great empire, the latter always reported progress, till the middling circles of Mosco and St Petersburg began to speak familiarly of the blessings which they might enjoy if these speculations could be realized.

Meanwhile Peter III. was giving fresh cause of discontent. He had recalled from Siberia Count Munich, who was indeed a sensible, brave, and worthy man; but as he was smarting under the effects of Russian despotism, and had grounds of resentment against most of the great families, he did not much discourage the emperor's unpopular conduct, but only tried to moderate it and give it a system. Peter, however, was impatient. He publicly ridiculed the exercise and evolutions of the Russian troops; and hastily adopting the Prussian discipline, without digesting and fitting it for the constitution of his own forces, he completely ruined himself by disgusting the army.

In the midst of these imprudences, however, Peter was sometimes disturbed by the advice of virtuous counsellors. Among these Gudovitch, the vice-chamberlain, is said to have reproached him in the following spirited address:

"Peter Feodorovitch, I now plainly perceive that you prefer to us the enemies of your fame. You are irrecoverably subservient to them; you acknowledge them to have had good reason for saying that you were more addicted to low and degrading pleasures, than fit to govern an empire. Is it thus that you emulate your vigilant and laborious grandsire, that Peter the Great whom you have so often sworn to take for your model? Is it thus that you persevere in the wise and noble conduct, by which, at your accession to the throne, you merited the love and the admiration of your people? But that love, that admiration, is already forgotten. They are succeeded by discontent and murmurs. Petersburg is anxiously enquiring whether the tzar has ceased to live within her walls? The whole empire begins to fear that it has cherished only vain speculations of receiving laws that shall revive its vigour and increase its glory. The malevolent alone are triumphant; and soon will the intrigues, the cabals, which the first moments of your reign had reduced to silence, again raise their heads with redoubled insolence. Shake off then this disgraceful lethargy, my tzar! hasten to shew and to prove, by some resplendent act of virtue, that you are worthy of realizing those hopes that have been formed and cherished of you."

These remonstrances, however, produced only a temporary gleam of reformation, and Peter soon relapsed into his accustomed sensuality. What he lost in popularity was soon gained by the emissaries of Catharine. Four regiments of guards, amounting to 8000 men, were instantly brought over by the three brothers Orloff, who had contrived to ingratiate themselves with their officers. The people at large were in a state of indifference, out of which they were roused by the following means. A little manuscript was handed about, containing principles of legislation for Russia, founded on natural rights, and on the claims of the different

classes of people which had insensibly been formed, and became so familiar as to appear natural. In that performance was proposed a convention of deputies from all the classes, and from every part of the empire, to converse, but without authority, on the subjects of which it treated, and to inform the senate of the result of their deliberations. It passed for the work of her majesty, and was much admired.

While Catharine was thus high in the public esteem and affection, the emperor took the alarm at her popularity, and in a few days came to the resolution of confining her for life, and then of marrying his favourite. The servants of that favourite betrayed her to her sister, who imparted the intelligence to the empress. Catharine saw her danger, and instantly formed her resolution. She must either tamely submit to perpetual imprisonment, and perhaps a cruel and ignominious death, or contrive to hurl her husband from his throne. No other alternative was left her, and the consequence was what was undoubtedly expected. The proper steps were taken; folly fell before abilities and address, and in three days the revolution was accomplished.

When the emperor saw that all was lost, he attempted to enter Cronstadt from Oranienbaum, a town on the gulf of Finland, 30 versts, or nearly 26 miles, from St Petersburg. The sentinels at the harbour presented their muskets at the barge; and though they were not loaded, and the men had no cartridges, he drew back. The English sailors called from ship to ship for some person to head them, declaring that they would take him in and defend him; but he precipitately withdrew. Munich received him again, and exhorted him to mount his horse, and head his guards, swearing to live and die with him. He said, "No, I see it cannot be done without shedding much of the blood of my brave Holsteiners. I am not worthy of the sacrifice." It is unnecessary for us to be more particular in detailing the progress of the revolution that placed Catharine on the throne of Russia, as the principal circumstances attending this event are given under the life of CATHERINE; but as the conclusion of the tragedy has been there omitted, we shall relate it from the most authentic sources which we have been able to procure.

Six days had already elapsed since the revolution, and that great event had been apparently terminated without any violence that might leave odious impressions on the mind of the public. Peter had been removed from Peterhof to a pleasant retreat called Ropscha, about 30 miles from St Petersburg; and here he supposed he should be detained but a short time previous to his being sent into Germany. He therefore sent a message to Catharine, desiring permission to have for his attendant a favourite negro, and that she would send him a dog, of which he was very fond, together with his violin, a bible, and a few romances, telling her that, disgusted with the wickedness of mankind, he was resolved henceforth to devote himself to a philosophical life. However reasonable these requests, not one of them was granted, and his plans of wisdom were turned into ridicule.

In the mean time the soldiers were amazed at what they had done; they could not conceive by what fascination they had been hurried so far as to dethrone the grandson of Peter the Great, in order to give his crown to a German woman. The majority, without plan or

137
Peter de-
throned,

138
and put to
death.

Russia.

sentiment of what they were doing, had been mechanically led on by the movements of others; and each individual now reflecting on his baseness, after the pleasure of disposing of a crown had vanished, was filled only with remorse. The sailors, who had never been engaged in the insurrection, openly reproached the guards in the tipping houses with having sold their emperor for beer. Pity, which justifies even the greatest criminals, pleaded irresistibly in every heart. One night a band of soldiers attached to the empress took the alarm, from an idle fear, and exclaimed that their mother was in danger, and that she must be awaked, that they might see her. During the next night there was a fresh commotion more serious than the former. So long as the life of the emperor left a pretext for inquietude, it was thought that no tranquillity was to be expected.

On the sixth day of the emperor's imprisonment at Ropscha, Alexey Orloff, accompanied by an officer named Teploff, came to him with the news of his speedy deliverance, and asked permission to dine with him. According to the custom of that country, wine glasses and brandy were brought previous to dinner; and while the officer amused the czar with some trifling discourse, his chief filled the glasses, and poured a poisonous mixture into that which he intended for the prince. The czar, without any distrust, swallowed the potion, on which he immediately experienced the most severe pains; and on his being offered a second glass, on pretence of its giving him relief, he refused it, with reproaches against him that offered it.

He called aloud for milk, but the two monsters offered him poison again, and pressed him to take it. A French valet-de-chambre, greatly attached to him, now ran in. Peter threw himself into his arms, saying in a faint tone of voice, "It was not enough then to prevent me from reigning in Sweden, and to deprive me of the crown of Russia! I must also be put to death."

The valet-de-chambre presumed to intercede for his master; but the two miscreants forced this dangerous witness out of the room, and continued their ill-treatment of the czar. In the midst of this tumult the younger of the princes Baratinsky came in, and joined the two former. Orloff who had already thrown down the emperor, was pressing upon his breast with both his knees, and firmly gripping his throat with his hand. The unhappy monarch, now struggling with that strength which arises from despair, the two other assassins threw a napkin round his neck, and put an end to his life by suffocation.

It is not known with certainty what share the empress had in this event; but it is affirmed that on the very day on which it happened, while the empress was beginning her dinner with much gaiety, an officer (supposed to be one of the assassins) precipitately entered the apartment with his hair dishevelled, his face covered with sweat and dust, his clothes torn, and his countenance agitated with horror and dismay. On entering, his eyes, sparkling and confused, met those of the empress. She arose in silence, and went into a closet, whither he followed her; a few moments afterwards she

sent for Count Panin (the former governor of Peter), who was already appointed her minister, and she informed him that the emperor was dead, and consulted him on the manner of announcing his death to the public. Panin advised her to let one night pass over, and to spread the news next day, as if they had received it during the night. This counsel being approved, the empress returned with the same countenance, and continued her dinner with the same gaiety. On the day following, when it was published that Peter had died of an hæmorrhoidal colic, she appeared bathed in tears, and proclaimed her grief by an edict.

The corpse was brought to St Petersburg, there to be exposed. The face was black, and the neck excoriated. Notwithstanding these horrible marks, in order to assuage the commotions which began to excite apprehension, and to prevent impostors from hereafter disturbing the empire, he was left three days, exposed to all the people, with only the ornaments of a Holstein officer. His soldiers, disbanded and disarmed, mingled with the crowd; and, as they beheld their sovereign, their countenances indicated a mixture of compassion, contempt, and shame. They were soon afterwards embarked for their country; but, as the sequel of their cruel destiny, almost all of these unfortunate men perished in a storm. Some of them had saved themselves on the rocks adjacent to the coast; but they again fell a prey to the waves, while the commandant of Cronstadt dispatched a messenger to St Petersburg to know whether he might be permitted to assist them (N).

Thus fell the unhappy Peter III. in the 34th year of his age, after having enjoyed the imperial dignity only six months. Whatever may have been his faults or follies, it must be allowed that he suffered dearly for them. Of the violent nature of his death there can scarcely be a doubt, though there appear to be grounds for believing that, however much Catharine must have wished for his removal, she did not take an active part in his death.

On her accession, Catharine behaved with great magnanimity and forbearance towards those who had opposed her elevation, or were the declared friends of the deceased emperor. She gave to Prince George, in exchange for his title of duke of Courland conferred on him by Peter, the government of Holstein. She reinstated Birn in his dukedom of Courland; received into favour Marshal Munich, who had readily transferred his fidelity from the dead to the living, and even pardoned her rival, the Countess Vorontzoff, and permitted her to retain the tokens of her lover's munificence. She permitted Gudovitch, who, as we have seen, was high in the confidence of Peter, and had incurred her particular displeasure, to retire to his native country. Perhaps the most unexpected part of her conduct towards the friends of Peter, was her adhering to the treaty of peace which that monarch had concluded with the king of Prussia six months before. The death of his inveterate enemy Elizabeth had relieved Frederick from a load of solicitude, and had extricated him from his dangerous situation. He now, as he thought, saw himself

(N) The above account of Peter's assassination is taken chiefly from M. Kullhiere's *Histoire ou Anecdotes sur la Revolution de Russie*, with some modifications from Tooke's *Life of Catharine II.*

self again involved in a war with the same formidable power; but to his great joy he found that Catharine, from motives of policy, declined entering on a war at the commencement of her reign.

In one particular the empress showed her jealousy and her fears. She increased the vigilance with which the young prince Ivan was confined in the castle of Schlus-selburg, from which Peter III. had expressed a resolution to release him. Not long after her accession, this unfortunate prince was assassinated; though whether this event was to be imputed to the empress or her counsellors, cannot be determined. The circumstances of the assassination are thus related by Mr Tooke, from documents supplied by a manifesto published by the court of Petersburgh, and supposed to be written by the empress herself.

"A lieutenant, named Mirovitch, thinking himself neglected as an officer, conceived a plan to revenge himself on the empress Catharine II. by delivering the captive Ivan from his dungeon, and replacing him on the throne: a plan which, besides the extraordinary difficulties with which it must be attended, seemed unlikely to succeed, as the manner of life to which that prince had all along been condemned, disqualified him forever for the station of a ruler. Yet Mirovitch, capable of any attempt, however inconsiderate, to which he was prompted by his vindictive spirit, found means to gain over a few accomplices to his rash design. The empress having gone on a journey into Livonia in 1764, and he happening to have a command at Schlus-selburg, for strengthening the guard at that fortress, whereby he had frequent opportunities of making himself thoroughly acquainted with the place of Ivan's confinement, caused the soldiers of his command to be roused in the night, and read to them a pretended order from the empress commissioning him to set the prince at liberty.

"The soldiers thus taken by surprise, were induced by threats, promises, and intoxicating liquors, to believe what, however, on the slightest reflection, must have struck them as the grossest absurdity. Headed by Mirovitch, they proceeded to the cell of Ivan. The commandant of the fortress, waked out of his sleep by the unexpected alarm, immediately on his appearing, received a blow with the butt end of a musket, which struck him to the ground; and the two officers that had the guard of the prisoner were ordered to submit. Here it is to be observed, that the officers whose turn it was to have the custody of him, had uniformly, from the time of Elizabeth, secret orders given them, that if any thing should be attempted in favour of the prince, rather to put him to death than suffer him to be carried off. They now thought themselves in that dreadful predicament; and the prince who, when an infant of nine weeks, was taken from the calm repose of the cradle to be placed on an imperial throne, was likewise fast locked in the arms of sleep when that throne was taken from him only one year afterwards, and now also enjoying a short respite from misery by the same kind boom of nature, when he was awakened—by the thrust of a sword; and, notwithstanding the brave resistance which he made, closed his eyes for ever by the frequent repetition of the stroke. Such was the lamentable end of this unfortunate prince! of this Russian monarch! The event excited great animadversion throughout the residence; every unbiassed person bewailed the youth so innocently

put to death; and incessant crowds of people flocked to see his body in the church of the fortress of Schlus-selburg. The government was at length obliged to steal it away by night for inhumation in a monastery at a considerable distance from town. Mirovitch paid the forfeit of this enterprise with his head*.

Were we to offer a detailed account of the principal transactions that took place during the long reign of Catharine, we should far exceed the limits within which this article must be confined, and should at the same time repeat much of what has already been given under other articles. As the events that distinguished the life of Catharine, however, are too important to be wholly omitted, we shall present our readers with the following chronological sketch of them, referring for a more particular account to Mr Tooke's *Life of Catharine II.* and to the articles CATHARINE II. BRITAIN, FRANCE, POLAND, PRUSSIA, SWEDEN, and TURKEY, in this work.

The year 1766, presented at St Petersburgh the grandest spectacle that perhaps was ever seen in Europe. At an entertainment, which the empress chose to name a carousal, the principal nobility appeared in the most sumptuous dresses sparkling with diamonds, and mounted on horses richly caparisoned, in a magnificent theatre erected for that purpose. Here all that has been read of the ancient jousts and tournaments was realized and exceeded in the presence of thousands of spectators, who seemed to vie with each other in the brilliancy of their appearance.

In 1768, the empress composed instructions for a new code of laws for her dominions; and the same year she submitted to the danger of inoculation, in order that her subjects, to whom the practice was unknown, might be benefited by her example; and the experiment, under Baron Dimsdale, having happily succeeded, it was commemorated by an annual thanksgiving.

In the same year a war broke out with the Ottoman Porte. The various events of this long and important conflict, which continued for seven years, must here be only briefly enumerated, as they will hereafter be more particularly noticed under the article TURKEY. In this war, our countryman Greig, then an admiral in the Russian service, highly distinguished himself by his conduct in a naval engagement with the Turks, in the harbour of Tschesme in the Archipelago, in which the Turkish fleet was entirely defeated, and their magazines destroyed. This took place on the 4th of November 1772.

In the beginning of the year 1769, the khan of the Crimea made an attack on the territory of Bachmut on the river Bog, where he was several times bravely repulsed, with his army of Tartars and Turks, by Major-general Romanus and Prince Prosorofskoi. At the same time were fought the battles of Zekanofca and Soroca on the Dniepr, when the large magazines of the enemy were burned. In February the Polish Kozaks in the voyvodship of Brac-lau put themselves under the Russian sceptre. In the same month the Nisovian Saporogian Kozaks gained a battle in the deserts of Krim. In March the Polish rebels were subdued, and their town taken by Major-general Isma-ilof. April 2. the fort of Taganrock, on the sea of Az-of, was taken. On the 15th the Russian army, under the general in chief Prince Galitzin, crossed the Dniestr. On the 19th a victory was gained by Prince Galitzin near Chotzim. On the 21st the Turks were defeated

not far from Chotzim by Lieutenant-general Count Solतिकof. The 29th, an action was fought between the Russian Kalmucks and the Kuban Tartars, to the disadvantage of the latter. June 8th, the Turks were defeated at the mouth of the Dniepr near Otchakof. 19th, An action took place on the Dniester, when the troops of Prince Prosorofski forced the Turks to repass the river in great disorder. Chotzim was taken September 19th. Yassy, in Moldavia, was taken 27th September. Bucharest, in Wallachia, was taken, and the hospodar made prisoner, in November 1770. A victory was gained by the Russians under Generals Podhorilshany and Potemkin, near Fokshany. The town of Shursha was taken by Lieutenant-general Von Stoffeln, Feb. 4. A Russian fleet appeared in the port of Maina in the Morea, Feb. 17. Mistra, the Laceæmon of the ancients, and several other towns of the Morea, were taken in February. Arcadim in Greece surrendered, and a multitude of Turks were made prisoners, in the same month. The Turks and Tartars were driven from their entrenchments near the Pruth, by Count Romantsof, Prince Reppin, and General Bauer, 11th—16th June. Prince Prosorofski gained several advantages near Otchakof, June 18. The Russian fleet, under Count Alexey Orlof, gained a complete victory over the Turks near Tscheme, June 24th; and the consequence of this victory was the destruction of the whole Turkish fleet, near Tscheme, where it was burned by Admiral Greig, June 26. A battle was fought on the Kagul, in which Count Romantsof defeated the Turkish army, consisting of 150,000 men, took their camp, and all the artillery, July 21. The fortress Bender was taken July 22. The town of Ismail was taken by Prince Reppin, July 26. Kilia by Prince Reppin, August 21, and Ackerman in October. Brailof was taken, November 10. 1771. The fortress of Shursha by General Olitz, on February 23.; the town of Kaffa by Prince Dolgoruckof, June 29.; the fort of Kertchi, July 2.; the fort of Yenicali, July 3.; and numberless other victories were obtained by sea and land, till the peace was concluded the 13th January 1775. By this the Crimea was declared independent of the Porte, all the vast tract of country between the Bog and Dniepr was ceded to Russia, besides the Kuban and the isle of Taman, with free navigation in all the Turkish seas, including the passage of the Dardanelles, privileges granted to the most favoured nations, and stipulations in behalf of the inhabitants of Moldavia and Wallachia.

An. 1779.

145
Division of
the empire
into vicero-
yalties.

In 1779, the empress intending to divide the empire into viceroalties, began in January with the viceroalty of Orlof. March 21. a new treaty was signed at Constantinople between Russia and the Porte. May 13. the treaty of peace between the belligerent powers in Germany, and the French king, was signed under the mediation of her majesty. In June she established an hospital for invalids at Moscow, to be confined to officers. In July, General Bauer received orders to cause a canal to be cut to supply Moscow with wholesome water. In October, a ship built at Taganrock, named the Prince Constantine, sailed to Smyrna with Russian commodities. December 3. the viceroalty of Voronetsh was institu-

ted; and the 27th, Count Romantsof Zadunaiski opened the viceroalty of Kursk with great solemnity.

In 1780, February 28. appeared the memorable declaration of her imperial majesty, relating to the safety of navigation and commerce of the neutral powers. May 9. the empress set out on a journey to White Russia from Zarscoi Selo, visited Narva, Plescof, met the emperor of Germany under the title of Count Falkenstein at Mohilef, and they pursued the journey together to Smolensk. June 6. Count Falkenstein arrived at Moscow. The 17th, the empress returned to Zarscoi Selo, and the count Falkenstein arrived at St Petersburg. July 8. the emperor returned to Vienna.

In 1781, March 1. the empress became mediatrix between England and Holland. April 5. instituted the first public school in St Petersburg. August 27. the grand dukes, Alexander and Constantine, were inducted by Baron Dimsdale. August 31. the first stone of a cathedral was laid at Cherson, dedicated to St Catherine. September 19. the grand duke, Paul Petrovitch, and his consort, Maria Feodorovna, departed from Zarscoi Selo, through Plescof, Mohilef, and Kief, on a journey into foreign countries, under the title of Count and Countess of the North.

In 1782, by a command of her majesty, dated January 18. a Roman Catholic Archbishop was installed in the city of Mohilef, with authority over all the Catholic churches and convents in the Russian empire. August 7. the famous equestrian statue of Peter the Great, being finished, was uncovered to the public in presence of the empress, on which occasion she published a proclamation containing pardons for several criminals, &c. (c). November 22. the order of St Vladimir was instituted. The 27th. the empress published a new tariff. November 20. the grand duke and his dukes, having completed their travels through Germany, Italy, France, Holland, the Netherlands, &c. returned to St Petersburg.

In 1783, May 7. the empress instituted a seminary for the education of young persons of quality at Kursk. June 21. a treaty of commerce concluded with the Ottoman Porte. July, the institution of the other viceroalties of the empire followed in succession. July 21. the empress published a manifesto by her commander in chief Prince Potemkin, in the Krim, in regard to the taking possession of that peninsula, the Kuban, and the island of Taman. The 24th, a treaty was concluded with Heraclius II. czar of Kartalina and Kacheti, by which he submitted himself, his heirs and successors for ever, with his territories and dominions, to the sceptre of her majesty, her heirs and successors. The 29th account was received from the camp of Prince Potemkin at Karas-Basar, that the clergy, the beys, and other persons of distinction, with the towns of Karas-Basar, Bachtsiserai, Achmetchet, Kaffa, Kosloff, with the districts of Turkanskoikout and Neubasar, and that of Peterkop, in the peninsula of the Krim, together with the hordes of Edisbank and Dshambolusk, the sultan Alim Girey, and his vassals, with all the Budshaks and Bashkirs there, and all the tribes dwelling beyond the river Kuban, the sultan Boatur Girey and his vassals, took

the oath of allegiance to her imperial majesty, and with willing hearts submitted for ever to her glorious sway. The 30th, the hospodar of Vallachia was deposed, and Draco Sutzo set up in his place. September 22. her majesty raised Gabriel, archbishop of Novgorod and St Petersburg, to the dignity of metropolitan. October 21. in the great hall of the Academy of Sciences, the new institution of the Imperial Russian academy was opened, after a most solemn consecration by the metropolitan Gabriel, and others of the clergy, under the presidency of the princess Dashkoff. November 7. the empress became mediatrix for accommodating the differences between the king of Prussia and the city of Dantzic. The school for surgery was opened at St Petersburg on the 18th. December 13. a school commission was instituted for superintending all the public schools. The 28th, an act was concluded with the Ottoman Porte, by which the possession and sovereignty of the Krim, the Kuban, &c. were solemnly made over to the empress.

1784. January 1. the senate most humbly thanked her majesty for the benefactions which she had graciously bestowed on the whole empire in the preceding year, in a speech by Field-marshal Count Razomofkoi. The 18th, the Roman Catholic archbishop of Mohilef, Stanislaus Tshesrentshevitch of Bogush, constituted by her majesty, was, with a variety of church ceremonies, solemnly invested, in the Roman Catholic church at St Petersburg, with the pallium from his holiness the pope, by the papal ambassador Count Archetti, archbishop of Chalcedon. October 14. the Lesgiers, having crossed the river Alasan, and invaded the dominions of Georgia, were repulsed with great loss by a detachment of Russian troops. December 29. Katolikos Maksim, the serdar and court-marshal Prince Zeretelli, and the chief justice Kuinichese, ambassadors from David, tzar of Imeretia, were admitted to a public audience of her majesty, at which they submitted, in the name of the tzar, him, and his subjects, to the will and powerful protection of her imperial majesty, as the rightful head of all the sons of the orthodox eastern church, and sovereign ruler and defender of the Georgian nations.

1785. January 1. the senate in the name of the empire, humbly thanked her majesty for the benefits she had bestowed upon it during the preceding year. The 8th and 15th, the empress in person, held a public examination of the young ladies educated in the Devitza Monastery. The 12th, Mauro Cordato, hospodar of Vallachia, was deposed; and Alexander Mauro Cordato, his uncle, restored to that dignity. The 21st, the empress visited the principal national school, and passed a long time in examining the classes, and the proficiency of the youth in that seminary; on which occasion a marble tablet was fixed in the wall of the fourth class, with this inscription, in gold letters: THOU VISITEST THE VINEYARD WHICH THY OWN HAND HATH PLANTED. Jan. 21. 1785. April 21. the privileges of the nobility were confirmed; and, on the same day, the burghers of towns constituted into bodies corporate, by a particular manifesto. The public school in Voronetsk was opened. The 24th of May, her majesty went to inspect the famous sluices at Vishney Volotshok, and other water communications, and from thence proceeded to Mosco. June 19. her majesty returned to St Pe-

tersburgh. July 3. she visited the hardware manufactories at Sisterbeck, in Finland. 14th, A manifesto was issued, granting full liberty of religion and commerce, to all foreigners settling in the regions of Mount Caucasus, under the Russian government. September 15. the public school at Nishney Novgorod was opened. October 12. the Jesuits in White Russia, in a general assembly, elected a vicar general of their order. November 1. a treaty of commerce was concluded with the emperor of Germany. The 24th, the Russian consul, in Alexandria, made his public entry on horseback (an honour never before granted to any power); erected the imperial standard on his house, with discharge of cannon, &c. December 28. a Russian mercantile frigate, fully freighted, arrived at Leghorn from Constantinople.

1786. January 1. the senate returned thanks for the benefits conferred on the empire. From the 11th to the 16th the new election of persons to the offices in the Petersburg government, ending with masquerade and illuminations, took place. The 29th, the empress confirmed the plan of a navigation school. February 12. by a decree, the usual slavish subscriptions to petitions were to be discontinued; and, instead of them, only the words *humble or faithful subject*; and, in certain cases, only *subject* were ordained to be used. March 2d, the empress granted the university of Mosco 125,000 rubles, and all the materials of the palace Krem'in for increasing its buildings. The 25th, a decree was passed for making and repairing the roads throughout the whole empire at the sole expence of the crown, and 4,000,000 of rubles were immediately allotted for the road between St Petersburg and Mosco. April 10th, a new war establishment for the army was signed; 23d, the hospodar of Vallachia was deposed, and Mavroyeni set up in his place. June 28th, the empress instituted a loan bank at St Petersburg, to the fund whereof she allotted 22,000,000 to be advanced to the nobility, and 11,000,000 to the burghers of the town, on very advantageous terms. August 5th, there were published rules to be observed in the public schools. October 4th, a large Russian ship, with Russian productions from St Petersburg, arrived at Cadiz. November 24th, the empress erected public schools at Tambof. December 14th, Prince Ypsilanti was appointed hospodar of Moldavia in the room of the deposed Mauro Cordato. December 31st, a treaty of commerce and navigation was concluded between Russia and France.

1787. January 7. the empress departed from Zarskoi Selo on a journey to her southern dominions; 29th, after having visited the towns of Veleki-Luki, Smolensk, Sterodub, Novgorod Severskoi, Beresua, Tshernigof, &c. leaving testimonies of her clemency and bounty in each, arrived at Kief. February 6-7th, the deposed hospodar of Moldavia, Mauro Cordato, thinking his life not safe in Yassi, found an opportunity privately to escape. March, public schools were endowed and opened at Rostof, Uglitsh, Molaga, and Romanof in the viceroyalty of Yaroslavl; also at Usting and Arasovitz in the viceroyalty of Vologda. April 21st, a manifesto was issued for promoting peace and concord among the burghers of the empire. The 22d, her majesty pursued her journey from Kief, to the Dniepr. The 25th, the concerted interview between her and the king of Poland, near the Polish town of Konief, took place. The

Progress of Catharine through part of the empire.

Russia.

30th, the empress visited Kremenshuk in the viceroyalty of Katarinoslauf. The treaty of commerce with England being expired, the British factory were informed that they must henceforward pay the duties on imports in silver money, like the other nations who had no commercial treaty. May 7th, the empress hearing that the emperor of Germany was at Cherson, proceeded thither, and met him there on the 12th. The 17th, she prosecuted her journey to the Krim. June 2d, the emperor, after travelling with her majesty through the Krim, took leave of her at Borislaufl, in the viceroyalty of Katarinoslauf, on his way home. 23d, The empress having returned from the Krim, through Kremenskuk, Pultava, Karsk, Orel, and Tula, arrived at the village of Kolomensk, seven versts from Mosco. June 28th, the 25th anniversary of her reign, she displayed various marks of her bounty. The debtors to the crown were forgiven, prisoners released, imposts taken off, soldiers rewarded, &c. July 4th, returned over Tver, Tula, Valdai, Vishnei-Volotshok, and Novgorod, to Zarskoi-Selo, where she arrived the 11th. The 12th, the new built school at Riga, called *Lyceum*, was solemnly dedicated. August 5th, Bulgakoff, the Russian ambassador, at the Ottoman Porte, was imprisoned in the Seven Towers, contrary to the law of nations, which the empress regarded as a public declaration of war. 21st, The Turkish fleet at Otchakof, attacked the Russian frigate Skorui, and the sloop Bitingi, but was repulsed and put to flight by the bravery of the latter. Many signal advantages were gained over the Turks; several public schools founded in various parts of the empire between this and August following; during which time the war broke out with Sweden.

War with
Sweden.

1788. August 12th, in the expedition beyond the Kuban, the Russian troops entirely routed a company of 4000 Arutayans and Alcasinians; 800 of the enemy were slain, and five villages destroyed. 15th, The surrender of the Turkish fortress of Dubitsha took place. 18th, The Turks made a violent sortie from Otchakof, but were repulsed by the Russian yagers; and, after a battle of four hours, were driven back with the loss of 500 men. 23d, A fierce battle was fought between the Russian troops and Sacubanians, in which the latter lost 1000 men. The Russian fleet kept the Swedish blocked up in Sveaborg, ever since the battle of July 6th. The Swedish army left the Russian territory in Finland. September 18th, the town and fortress of Chotzim surrendered to the Russians, with the garrison of 2000 men, 153 cannon, 14 mortars, and much ammunition. 19th—29th, A small Russian squadron from the fleet at Sevastophol, cruising along the coast of Anatolia, destroyed many of the enemy's vessels, prevented the transporting of the Turkish troops, and returned with great booty. 20th, Ussenier Shamanachin, chief of the Bsheduchovians, was on his petition, admitted a subject of Russia. 26th, A numerous host of Kubanians and Turks were beaten on the river Ubin, with the loss of 1500 men. November 7th, Prince Potemkin, at the head of his Kozaks, took the island Beresan, with many prisoners and much ammunition. December 6th, the town and fortress of Otchakof were taken by Prince Potemkin Tavritsheskoï; 9510 of the enemy were killed, 4000 taken prisoners, 180 standards, 310 cannons and mortars. The whole of the inhabitants were taken prisoners, amounting to

25,000; the Russians lost 956 killed and 1824 wounded. December 19th, General Kamenskoy gained considerable advantages over the Turks near Gangur.

1789. April 16th, Colonel Rimskoy Korsgkoff was surrounded by the Turks, who were beaten, with great slaughter, by Lieutenant-General Von Derfelden. 17th—28th, Some Russian cruisers from Sevastopol effected a landing on Cape Karakarman, burnt six mosques, and carried off great booty. 20th, General Derfelden drove the Turks from Galatch, gained a complete victory, killed 2000, took 1500 prisoners, with the seraskier Ibrahim Pasha, and the whole camp. Several skirmishes took place between the Russians and Swedes in Finland, always to the advantage of the former. May 31st, another victory was gained over the Swedes. June 5th, Sulkof was taken from the Swedes, and Fort St Michael on the 8th. July 15th, Admiral Tchitchagoff engaged the Swedish fleet under the command of the duke of Sudermania; but no ship was lost on either side. 21st, A battle was fought at Fokshany to the great loss of the Turks, and Fokshany was taken. August 13th, the Russian galley fleet fought the Swedish under Count Ehrenscherdt, the former took a frigate and five other ships, and 2000 prisoners. August 21st, another sea fight took place, and Prince Nassau Siegen made good his landing of the Russian troops in sight of the king of Sweden at the head of his army. September 7th, Prince Reppin attacked the seraskier Hassan Pasha near the river Seltska, and took his whole camp. 11th, Count Suvaroff and prince of Saxe-Cobourg engaged near the river Kymnik the grand Turkish army of nearly 100,000 men, and gained a complete victory; from which Count Suvaroff received the surname Kymnikskoi. 14th, The Russian troops under General Ribbas, took the Turkish citadel Chodshabey, in the sight of the whole of the enemy's fleet. 30th, The fortress Palanka being taken, the town of Belgorod or Akermann surrendered to Prince Potemkin Tavritsheskoï. November 4th, the town and castle of Bender submitted at discretion to the same commander.

1790, April 24. General Numsen gained a victory over the Swedes near Memel. May 2d, a sea fight took place off Reval, in which the Russians took the Prince Charles of 64 guns from the Swedes; and in this engagement those two gallant English officers, Captains Trevennin and Dennison, were killed. 23d, the fleet under Vice-admiral Cruse engaged the Swedish fleet near the island Siskar in the gulf of Finland, without any advantage being gained on either side, though they fought the whole day. 24th, an action was fought at Savataipala, when the Swedes were forced to fly. June 6. the Swedes were defeated by Major Buxhovden, on the island Uransari. June 22. the whole Swedish fleet, commanded by the duke of Sudermania, was entirely defeated by Admiral Tchishagoff and the prince of Nassau Siegen; on this occasion 5000 prisoners were taken, amongst whom were the centre admiral and 200 officers. 28. General Denisoff defeated the Swedes near Davidoff. July 9. Admiral Ushakoff obtained a victory over the Turkish fleet commanded by the capudan pasha, at the mouth of the straits of Yenikali. August 3. peace was concluded with Sweden, without the mediation of any other power. August 28, 29. an engagement took place on the Euxine, not far from Chodshabey, between the Russian admiral Ushakoff

ussia. koff and the capudan pasha, when the principal Turkish ship, of 80 guns, was burnt, one of 70 guns, and three taken, the admiral Said Bey being made prisoner, and another ship sunk; the rest made off. September 30. a great victory was obtained over the Turks by General Germann, with much slaughter, and the seraskier Batal Bey, and the whole camp, were taken. October 18. Kilia surrendered to Major Bibbas. November 6, 7. the fortress Cultsha and the Turkish flotilla were taken. December 11. the important fortress of Ismail, after a storming for seven hours without intermission, surrendered to Count Suvaroff, with the garrison of 42,000 men; 30,816 were slain on the spot, 2000 died of their wounds, 9000 were taken prisoners, with 265 pieces of cannon, an incredible store of ammunition, &c. The Russians lost only 1815 killed, and 2450 wounded.

1791. 1791, March 25—31. the campaign opened by the troops under Prince Potemkin, not far from Brailof, when the Turks were defeated in several battles, in which they lost upwards of 4000 men. June 5. the troops under General Golenitshof Kutusoff, near Tultsha, drove the Turks beyond the Danube, and at Babada entirely routed a body of 15,000 men, of whom 1500 were left dead upon the field. 22. The fortress Anapuas was taken by storm, when the whole garrison, consisting of 25,000 men, were put to the sword, excepting 1000 who were taken prisoners. 28. The troops under Prince Repnin attacked the Turkish army, consisting of nearly 80,000 men, commanded by the grand vizir Yussuf Pasha, eight pashas, two Tartar sultans, and two beys of Anatolia; and after a bloody battle of six hours, entirely routed them: 5000 Turks were killed in their flight. June 28. Sudskuk Kale was taken. July 31. Admiral Ushakoff beat the Turkish fleet on the coasts of Rumelia. Prince Repnin and Yussuf Pasha signed the preliminaries of peace between the Russian empire and the Ottoman Porte, by which the Dniestr was made the boundary of the two empires, with the cession of the countries lying between the Bog and the Dniestr to Russia. August 15, 16. at Pilmitz near Dresden, a congress was held by the emperor of Germany, the king of Prussia, the elector of Saxony, the count d'Artois, &c. &c. One of the most important events in this year was the death of Prince Potemkin at Yassy in Moldavia on the 15th October.

1792. 1792. Early in this year Bulgakoff, the Russian minister at Warsaw, declared war against Poland; and the Polish patriots raised an army in which Thaddeus Kosciusko (or according to some Koschiefsky) soon bore a conspicuous part.

In 1788, the diet of Poland had abrogated the constitution which the empress of Russia had, in 1775, compelled that nation to adopt, and had formed an alliance with the king of Prussia, by way of defence against the further encroachments of the Russian despot. Three years after, viz. on the third of May 1791, the new constitution which was intended further to destroy the ambitious hopes of Catharine, was decreed at Warsaw. See POLAND, N^o 125. These were affronts which the Russian empress could not forgive, and in one of the *conciliabula*, in which the ministers of state, and the favourite for the time being, sat to regulate the affairs of the north of Europe, and to determine the fate of the surrounding nations, the annihilation of the Polish monarchy was resolved on.

Russia. The declaration of war above mentioned was denounced by Bulgakoff at an assembly of the diet. See POLAND, N^o 148. That body received the declaration with a majestic calmness, and resolved to take measures for the defence of the nation. The generous enthusiasm of liberty soon spread throughout the republic, and even the king pretended to share in the general indignation. An army was hastily collected, and the command of it bestowed on Prince Joseph Poniatofsky, a general whose inexperience and frivolous pursuits were but ill adapted to so important a charge.

In the mean time several Russian armies were preparing to overwhelm the small and disunited forces of the Poles. A body of 80,000 Russians extended itself along the Bog; another of 10,000 was collected in the environs of Kief, and a third of 30,000 penetrated into Lithuania. While these armies were carrying murder and desolation through the Polish territories, Catharine was employing all her arts to induce the neighbouring powers to join in the partition of Poland, and in this she was but too successful. A treaty was accordingly concluded between the empress and the king of Prussia, by which either appropriated to itself a certain share of the remains of Poland. Stanislaus Augustus, the powerless head of that republic, was prevailed on to make a public declaration, that there was a necessity for yielding to the superiority of the Russian arms.

1793. On the 9th of April the Polish confederation An, 1793. of the partizans of Russia assembled at Grodno; and on this occasion the Russian general placed himself under the canopy of that throne which he was about to declare for ever vacant, and the Russian minister Sievers, produced a manifesto, declaring the intention of his mistress to incorporate with her domains all the Polish territory which her arms had conquered.

The Russian soldiers dispersed through the provinces, committed depredations and ravages of which history furnishes but few examples. Warsaw became especially the theatre of their excesses. Their general Igelstrom, who governed in that city, connived at the disorders of the soldiers, and made the wretched inhabitants feel the whole weight of his arrogance and barbarity. The patriots of Poland had been obliged to disperse; their property was confiscated, and their families reduced to servitude. Goaded by so many calamities, they once more took the resolution to free their country from the oppression of the Russians, or perish in the attempt. Some of them assembled, and sent an invitation to Kosciusko, to come and lead them on against the invaders of their freedom.

Kosciusko had retired to Leipsic with Kolontay, Zagonchek, and Ignatius Pottocky, all eminent for patriotism and military ardour. These four Poles hesitated not a moment in giving their approbation to the resolution adopted by their indignant countrymen; but they were sensible that, in order to succeed, they must begin by emancipating the peasants from the state of servitude under which they then groaned. Kosciusko and Zagonchek repaired with all expedition to the frontiers of Poland, and the latter proceeded to Warsaw, where he held conferences with the chief of the conspirators, and particularly with several officers who declared their detestation of the Russian yoke. All appeared ripe for a general insurrection, and the Russian commanders, whose suspicions had been excited by the appearance of Kosciusko

Russia.

ciusko on the frontiers, obliged that leader and his confederates to postpone for a time the execution of their plan. To deceive the Russians, Kosciusko retired into Italy, and Zagonchek repaired to Dresden, whither Ignatius Potoski and Kolontay had gone before him. On a sudden, however, Zagonchek appeared again at Warsaw, but was impeached by the king to General Igelstrom, and, in a conference with the general, was ordered to quit the Polish territory. He must now have abandoned his enterprise altogether, or immediately proceeded to open insurrection. He chose the latter.

Attempts of
the patriots
to oppose
the in-
croach-
ments of
Russia.

1794. Kosciusko was recalled from Italy, and arrived at Cracow, where the Poles received him as their deliverer. Here he was joined by some other officers, and took the command of his little army, consisting of about 3000 infantry, and 1200 cavalry. On the 24th of March was published the manifesto of the patriots, in which they declared the motives for their insurrection, and called on their countrymen to unite in the glorious attempt to free the republic from a foreign yoke. Kosciusko was soon joined by 300 peasants armed with scythes, and some other small reinforcements gradually came in. A body of 7000 Russians had collected to oppose the movements of this little army, and a battle took place, in which the patriots were successful.

While the insurrection had thus auspiciously commenced on the frontiers, the confederates of the capital were nearly crushed by the exertions of the Russian general. Hearing at Warsaw of the success of Kosciusko, Igelstrom caused all those whom he suspected to have any concern in the insurrection, to be arrested; but these measures served only to irritate the conspirators. On the 18th of April they openly avowed their confederacy with the patriots of the frontiers, and proceeded in great numbers to attack the Russian garrison. Two thousand Russians were put to the sword, and the general being besieged in his house, proposed a capitulation; but profiting by the delay that had been granted him, he escaped to the Prussian camp, which lay at a little distance from Warsaw.

Wilna, the capital of Lithuania, followed the example of Warsaw, but the triumph of the insurgents was there less terrible, as Colonel Yasinsky, who headed the patriots, conducted himself with so much skill, that he made all the Russians prisoners without bloodshed. The inhabitants of the cantons of Chelm and Lublin, also declared themselves in a state of insurrection, and three Polish regiments who were employed in the service of Russia, espoused the cause of their country. Some of the principal partizans of Russia were arrested, and sentenced to be hanged.

Kosciusko exerted himself to the utmost to augment his army. He procured recruits among the peasants, and to inspire them with the more emulation, he adopted their dress, ate with them, and distributed rewards among such as appeared most to merit encouragement. All his attempts to inspire the lower orders of the Poles with the ardour of patriotism were, however, unavailing. A mutual distrust prevailed between the nobles and the peasants, and this was fomented by the arts of Stanislaus and the other partizans of Russia.

The empress had sent into Poland two of her best generals, Suvaroff and Fersen. For some time Kosciusko succeeded in preventing the junction of these generals,

and several engagements took place between the Russians and patriots, in which the former were generally successful. At length, on the 4th of October the fate of Poland was decided by a sanguinary conflict between Kosciusko and Fersen, at Maciejowitch, a small town of Little Poland, about 60 miles from Warsaw. The talents, the valour, and desperation of Kosciusko, could not prevent the Poles from yielding to superior numbers. Almost the whole of his army was either cut in pieces, or compelled to surrender at discretion, and the hero himself, covered with wounds, fell senseless on the field of battle, and was made prisoner.

The small number that escaped fled to Warsaw, and shut themselves up in the suburb of Praga. Hither they were pursued by Suvaroff, who immediately laid siege to the suburb, and prepared to carry it by storm. On the 2d of November, the brutal Suvaroff gave the assault, and having made himself master of the place, put to the sword both the soldiers and the peaceable inhabitants, without distinction of age or sex. It is computed that 20,000 persons fell victims to the savage ferocity of the Russian general; and, covered with the blood of the slaughtered inhabitants, the barbarian entered Warsaw in triumph.

Thus terminated the feeble resistance of the Polish patriots. The partition of the remaining provinces was soon effected, and Stanislaus Augustus, who had long enjoyed merely the shadow of royalty, and had degraded himself by becoming the instrument of Russian usurpation, retired to Grodno, there to pass the remainder of his days on a pension granted him by the empress.

1795. On the 18th of February, a treaty of defensive alliance between the empress of Russia and his Britannic majesty was signed at St Petersburg. The ostensible object of this treaty was to maintain the general tranquillity of Europe, and more especially of the north; and by it Russia agreed to furnish Great Britain with 10,000 infantry and 2000 horse in case of invasion; while Great Britain was, under similar circumstances, to send her imperial majesty a squadron consisting of two ships of 74 guns, six of 60, and four of 50, with a complement of 4560 men. On the 18th March was signed the act by which the duchies of Courland and Semigalia, together with the circle of Pilten, all which had lately belonged to the duke of Courland, but had long retained only the shadow of independence, submitted themselves to the Russian dominion.

In this year there took place between the courts of St Petersburg and Stockholm, a dispute which threatened to terminate in a war. Gustavus III. had been assassinated by Ankerstroem at a masquerade, on the 15th March 1791, and the young king Gustavus Adolphus being still a minor, the duke of Sudermania, his uncle, had been appointed regent of the kingdom. The regent had determined to effect a marriage between his nephew and a princess of the house of Mecklenburg; but Catharine publicly declared that the late king had betrothed his son to one of her granddaughters. The misunderstanding hence originating, was increased by the rude and indecorous behaviour of the baron Von Budberg, the Russian *charge des affaires* at Stockholm, and matters seemed tending to an open rupture; when in 1796, a French emigrant named Christin effected a reconciliation, and General Budberg, the baron's uncle, was sent

Russia. sent as ambassador to Stockholm from the Russian court. In consequence of this reconciliation, the young king, attended by the regent, and a numerous train of Swedish courtiers, set out on a visit to St Petersburg, where they arrived on the 24th of August, and an interview took place between the empress and her royal visitors, for the purpose of finally adjusting the projected matrimonial alliance. Gustavus Adolphus was much pleased with the appearance of the grand duchess Alexandra; but informed the empress, that by the fundamental laws of Sweden he could not sign the marriage contract before the princess had abjured the Greek religion; and as neither the solicitations nor the flatteries of Catharine could prevail on the young monarch to depart from the received custom of his country, the negotiation ended, and the next day Gustavus and his retinue quitted St Petersburg.

The last transaction of importance in the reign of Catharine was her invasion of the Persian territories, undertaken for the purpose of acquiring certain possessions on the shores of the Caspian. A Russian army entered Daghestan, and made itself master of Derbent, but was afterwards defeated by the Persians under Aga Mahmed.

The death of the empress took place, as we have elsewhere stated, on the 9th of November of this year; and the grand duke Paul Petrovitch ascended the throne under the title of Paul I.

n. 1796. 166 sign of sul. Paul Petrovitch had attained his 42d year before the death of his mother placed him on the imperial throne; but for many years before her death, he had lived in a state of comparative obscurity and retirement, and had apparently been considered by the empress as incapable of taking any active part in the administration of affairs. It is well known that Catharine never admitted him to any participation of power, and kept him in a state of the most abject and mortifying separation from court, and in almost total ignorance of the affairs of the empire. Although by his birth he was generalissimo of the armies, president of the admiralty, and grand admiral of the Baltic, he was never permitted to head even a regiment, and was interdicted from visiting the fleet at Cronstadt. From these circumstances it is evident that the empress either had conceived some jealousy of her son, or saw in him some mental imbecility, that appeared to her to disqualify him for the arduous concerns of government. There is little doubt, from the circumstances which distinguished his short reign, that Catharine had been chiefly influenced in her treatment of the grand duke, by the latter consideration. There were certainly times at which Paul displayed evident marks of insanity, though he occasionally gave proofs of a generous and tender disposition, and even of intellectual vigour.

It is generally believed that, a short time before her death, Catharine committed to Plato Zuboff, her last favourite, a declaration of her will, addressed to the senate, desiring that Paul should be passed over in the succession, and that on her death the grand duke Alexander should ascend the vacant throne. As soon as Zuboff was made acquainted with the sudden death of the empress, he flew to Pavlovsk, about 23 miles from St Petersburg, where Paul occasionally resided, but meeting the grand duke on the road, he, after a short

VOL. XVIII. Part I.

Russia. explanation, delivered up the important document. Paul, charmed with his zeal and loyalty, rewarded the late favourite, by permitting him to retain the wealth and honours which had been heaped on him by his mistress, while a general and rapid dispersion soon took place among the other adherents of the late sovereign. On the day following the death of his mother, Paul made his public entry into St Petersburg, amidst the acclamations of all ranks of people.

One of the first measures adopted by the new emperor excited considerable surprise, and divided the opinions of the public with respect to the motives by which it had been suggested; some attributing it to his respect for the memory of his late father; others to a culpable reflection on that of his mother. He ordered the remains of Peter III. to be removed from the sepulchre in which they had been deposited in the church of St Alexander Nefski, and caused him to lie in state for three weeks, while they were watched night and day by the only two remaining conspirators who had assisted at his assassination. After this dreadful mark of his justice on the murderers of his father (surely more terrible to the guilty mind than death itself), he consigned the ashes to the sepulchre of Catharine II. in the cathedral of St Peter and St Paul, obliging the assassins to walk in the procession as chief mourners.

Few political events of any importance marked the reign of Paul previous to the year 1798, when, in consequence of a treaty between Paul and the emperor of Germany, a Russian army of 45,000 men under Field-marshal Suvaroff, joined the imperialists in the Austrian territories in Italy. The progress of Suvaroff, his successes over Moreau, and his final recal by his master, have already been related in the article FRANCE, from 498 to 506.

An. 1799. 168 Treaty of alliance between Russia and Britain. In 1799, Paul entered into a treaty of offensive and defensive alliance with his Britannic majesty. This treaty was signed at St Petersburg on the 22d of June, having been preceded by a provisional treaty between the same powers at the end of the year 1798. By the provisional treaty it had been stipulated that Paul should assist the king of Prussia, if the latter could be persuaded to join his arms to the allied powers against France, with 45,000 men; and that the king of Great Britain should pay to Russia a subsidy of L.75,000 sterling per month; and in case the king of Prussia should refuse to join the coalition, the same number of troops, in consideration of the same subsidy, should be employed as occasion might require, to assist the common cause. By the new treaty, the emperor of Russia, instead of the 45,000 troops, engaged to furnish 17,500, with the necessary artillery, to be employed in an expedition against Holland; and he engaged to furnish six ships, five frigates, and two transports, for the purpose of transporting part of the invading army from Britain, to the continent. In consideration of these succours, the court of London engaged to advance to Russia a subsidy of L.44,000 sterling per month; to pay the sum of L.58,929 10s. sterling for the expences of equipping the fleet; and after the period of three months had elapsed from such equipment, to pay a further subsidy of L.19,642, 10s. sterling per month, so long as the fleet should remain under the command of his Britannic majesty.

In consequence of this treaty, a Russian fleet joined that

+ 3 D

that

that of Britain in Yarmouth roads, and took part in the unfortunate expedition to the coast of Holland, undertaken in the summer of 1799. See BRITAIN, N^o 1069.

AN. 1801.
169
Paul's chal-
lenge to the
sovereigns
of Europe!

In the beginning of the year 1801, all Europe was thrown into the greatest astonishment by the appearance of a paragraph in the *Hamburgh gazette* of the 16th of January. The paragraph was dated from Petersburg, the 30th December, 1800, and is as follows.

"We learn from Petersburg, that the emperor of Russia, finding that the powers of Europe cannot agree among themselves, and being desirous to put an end to a war which has desolated it for 11 years past, intends to point out a spot, to which he will invite all the other sovereigns to repair and fight in single combat; bringing with them as seconds and squires, their most enlightened ministers, and their most able generals, such as Messrs Thugot, Pitt, Bernstorff, &c. and that the emperor himself proposes being attended by generals count de Pahlen and Khutosof: We know not if this report be worthy of credit; however, the thing appears not destitute of some foundation, and bears strong marks of what he has been often taxed with."

This paragraph was immediately copied or translated into all the public papers, and it was strongly affirmed by many, that it was the composition of Paul himself. This has since been confirmed by the poet Kotzebue, who was employed by the emperor of Russia to translate the original into German, for the express purpose of its being inserted in the *Hamburgh gazette* (H).

170
Other
marks of
the em-
peror's de-
rangement.

This was not the only mark of mental derangement displayed by the unhappy monarch. His favours and his displeasure were alternately experienced by some of his most distinguished courtiers and adherents. Stanislaus, the deposed king of Poland, partook by turns of his beneficence and his severity; and at length on the death of that monarch, Paul assisted at his funeral, commanded in person the guards that attended on the ceremony, and uncovering himself with the utmost emotion, saluted the coffin as it passed. To the memory of the hoary Suvaroff, who is said to have fallen a broken-hearted victim to the distraction of his imperial master, he raised a colossal statue of bronze; and on the days when he reviewed his troops in the square where the statue had been erected, he used to command them to march by in open order, and face the statue. Notwithstanding the important service that had been rendered him by Zuboff, the emperor soon became disgusted with him; spoke of him to his friends with great asperity; at length denounced him as a defaulter to the imperial treasury of half a million of rubles; and convinced of the justice of the allegation, proceeded to sequester the vast estates which belonged to him and his two brothers.

Driven to desperation by such conduct, the second brother of the favourite one day walked up boldly to the emperor upon the parade, and with manly eloquence represented the injustice of his measures. Paul received him without anger, heard him without interruption, and restored the property; but soon after he ordered Plato Zuboff to reside on his estate. He formed an adulterous connexion with Madame Chevalier, a French actress, through whose influence Zuboff was again recalled to court, and restored to favour.

It is not surprising that these instances of folly and caprice should alarm and disgust many of the nobles. In particular, Count P——, the governor of St Petersburg, a son of the celebrated general P—— P——, who so eminently distinguished himself in the last Turkish war, Prince Y——, with some other men of rank, entered into a confederacy with Zuboff, to prevent the final ruin of their country, by removing the present emperor. In their conferences, which were managed with great prudence and discretion, it was resolved that Paul should die, and the day of the festival called Maslaintza, the eleventh of March O. S. should be the day for executing the awful deed. At the time of this confederacy, the emperor and his family resided in the new palace of St Michael, an enormous quadrangular pile standing at the bottom of the summer gardens. As Paul was anxious to inhabit this palace as soon after he was crowned as possible, the masons, carpenters, and various artificers, toiled with incredible labour by day and by torch light, under the sultry sun of the summer, and in all the severity of a polar winter, and in three years this enormous and magnificent fabric was completed. The whole is moated round, and when the stranger surveys its bastions of granite, and numerous draw bridges, he is naturally led to conclude, that it was intended for the last asylum of a prince at war with his subjects. Those who have seen its massy walls, and the capaciousness and variety of its chambers, will easily admit that an act of violence might be committed in one room, and not be heard by those who occupy the adjoining one; and that a massacre might be perpetrated at one end, and not known at the other. Paul took possession of this palace as a place of strength, and beheld it with rapture, because his imperial mother had never even seen it. While his family were here, by every act of tenderness, endeavouring to sooth the terrible perturbation of his mind, there were not wanting those who exerted every stratagem to inflame and increase it. These people were constantly insinuating that every hand was armed against him. With this impression, which added fuel to his burning brain, he ordered a secret staircase to be constructed,

171
Conspirac-
formed
against the
emperor.

(u) This paragraph is such a curious *morceau* of witty insanity, that we shall here give the original French, as written by Paul himself, and published by Kotzebue, in his account of his exile into Siberia. "On apprend de Petersbourg, que l'Empereur de Russie, voyant que les puissances de l'Europe ne pouvoient s'accorder entr'elles, et voulant mettre fin a une guerre qui la desoloit depuis onze ans, vouloit proposer un lieu ou il inviteroit tous les autres Souverains de se rendre et y combattre en champ clos, ayant avec eux pour écuyer juge de camp et heros des armes leurs ministres les plus éclairés et les généraux les plus habiles, tels, que M. M. Thugot, Pitt, Bernstorff; lui meme se proposant de prendre avec lui les généraux C. de Pahlen et Khutosof. On ne sçait si on doit y ajouter foix; toute fois la chose ne paroit pas destituée de fondement, en portant l'impreinte de ce dont il a souvent été taxé."

structed, which, leading from his own chamber, passed under a false stove in the anti-room, and led by a small door to the terrace.

It was the custom of the emperor to sleep in an apartment next to the empress's, upon a sofa, in his regimentals and boots, whilst the grand duke and duchess, and the rest of the imperial family, were lodged at various distances, in apartments below the story which he occupied. On the 10th March, 1801, the day preceding the fatal night, whether Paul's apprehension, or anonymous information, suggested the idea, is not known, but conceiving that a storm was ready to burst upon him, he sent to Count P——, the governor of the city, one of the noblemen who had resolved on his destruction: I am informed, P——, said the emperor, that there is a conspiracy on foot against me, do you think it necessary to take any precaution? The count, without betraying the least emotion, replied, Sire, do not suffer such apprehensions to haunt your mind; if there were any combinations forming against your majesty's person, I am sure I should be acquainted with it. Then I am satisfied, said the emperor, and the governor withdrew. Before Paul retired to rest, he, beyond his usual custom, expressed the most tender solicitude for the empress and his children, kissed them with all the warmth of farewell fondness, and remained with them for a considerable time. He afterwards visited the centinels at their different posts, and then retired to his chamber. Soon after the emperor had retired, the guard that was always placed at his chamber door was, by some pretext, changed by the officers who had the command for the night, and who were engaged in the conspiracy. One man only remained. This was a hussar whom the emperor had honoured with particular marks of attention, and who always slept at night in the antichamber, at his sovereign's bed room door. This faithful soldier it was found impossible to remove, except by force, which at that time the conspirators did not think proper to employ. Silence now reigned throughout the palace, disturbed only by the pacing of the centinels, or by the distant murmurs of the Neva; and only a few straggling lights were to be seen, irregularly gleaming through the windows of the palace. In the dead of the night, Z——, and his friends, amounting to eight or nine persons, passed the drawbridge, ascended the staircase that led to the emperor's apartments, and met with no opposition till they reached the antichamber, where the faithful hussar, awakened by the noise, challenged them, and presented his fusée. Though they must have admired the brave fidelity of the guard, neither time nor circumstances would admit of an act of generosity, which might have endangered their whole plan of operations. Z—— drew his sabre, and cut the poor fellow down. In the mean time Paul, roused by the unusual bustle, sprang from his couch. At this moment the whole party rushed into his chamber. The unhappy sovereign anticipating their design, at first endeavoured to entrench himself behind the chairs and tables; but soon recovering some share of his natural courage, he assumed a high tone, told them they were his prisoners, and required them to surrender. Finding that they fixed their eyes steadily and fiercely upon him, and continued to advance, he implored them to spare his life, declared his willingness instantly to relinquish the sceptre, and to accept of any terms which

they might dictate. He even offered to make them princes, and to confer on them orders and estates. Regardless alike of his threats and promises, they now began to press on him, when he made a convulsive effort to reach the window, but failed in the attempt; and, indeed, had he succeeded in his endeavour to escape that way, the height from the window to the ground was so great, that the expedient would probably have only put a more speedy period to his existence. As the conspirators drew him back, he grasped a chair, with which he knocked down one of the assailants, and a desperate conflict now took place. So great was the noise, that notwithstanding the massy walls, and double folding doors that divided Paul's apartments from those of the empress, she was disturbed, and began to call for help, when a voice whispered in her ear, commanding her to remain quiet, and threatening that if she uttered another word, she should instantly be put to death.

Paul was now making his last struggle, when the prince Y—— struck him on the temple with his fist, and laid him prostrate on the floor. Recovering from the blow, the unhappy monarch again implored his life. At this moment the heart of one of the conspirators relented, and he was observed to hesitate and tremble, when a young Hanoverian, who was one of the party, exclaimed, We have passed the Rubicon; if we spare his life, we shall, before the setting of to-morrow's sun, become his victims; on saying which he took off his sash, turned it twice round the naked neck of the emperor, and giving one end to Z——, himself drew the other, till the object of their attack expired*.

The assassins retired from the palace without the least molestation, and returned to their respective homes. As soon as the dreadful catastrophe was discovered, medical assistance was called in, in the hope of restoring what might be only suspended animation; but these attempts proved fruitless. At seven o'clock on the morning of the 12th, the intelligence of the death of Paul, and the accession of the grand duke Alexander were announced to the capital. By eight o'clock the principal nobility had paid their homage to the new emperor, in the chapel of the winter palace; and the great officers of state being assembled, Alexander was solemnly proclaimed emperor of all the Russias. The emperor presented himself at the parade on horseback, and was hailed by the troops with loud and cordial acclamations.

The emperor Alexander was in his 24th year when he ascended the throne, and from his amiable disposition had acquired the love and respect of all his subjects. The first measure which he adopted, his proclamation, and his first imperial orders, all tended to encourage and confirm the confidence with which the people beheld him ascend the throne of his forefathers. He solemnly promised to tread in the steps of Catharine II.: he allowed every one to dress according to their own fancy; exonerated the inhabitants of the capital from the trouble and duty of alighting from their carriages on the approach of the imperial family; dismissed the court advocate, who was universally and justly detested; suppressed the secret inquisition that had become the scourge of the country; restored to the senate its former authority; set at liberty the state prisoners, and recalled from Siberia several of the exiles. He even extended his mercy to the assassins of the late emperor. Zuboff was ordered not to approach the imperial resi-

Russia.

dence, and the governor of the city was transferred to Riga.

It is not easy to explain the motives that induced Alexander to forego that vengeance which justice seemed to demand on the heads of his father's assassins. It has been attributed by one of his panegyrists to a forlorn and melancholy conviction that the murderers had been prompted to commit the bloody deed, solely by a regard for the salvation of the empire. This conviction might have induced the young monarch to diminish the weight of that punishment which piety and justice called on him to inflict, but can scarcely account for his total forbearance.

174
Amicable
disposition
of Alexan-
der towards
Britain.

The emperor Alexander, on his accession to the throne, appeared desirous to cultivate the friendship of the neighbouring states, and especially that of Great Britain. His late father, among other projects, had procured himself to be elected grand master of the knights of Malta, and had laid claim to the sovereignty of that island. This claim, which had nearly produced a rupture between the courts of London and St Petersburg, Alexander consented to abandon, though he expressed a wish to be elected grand master of the order, by the free suffrages of the knights. In the mean time a confederacy had been formed among the northern powers of Europe, with a view to oppose the British claim to the sovereignty of the seas; but by the spirited interference of the British court, especially with the cabinet of St Petersburg, the good understanding between Britain and the northern states was re-established, and the embargo which had been laid on British vessels in the Russian ports was taken off.

On the 19th of June, Alexander caused to be published the following circular letter, showing his disposition to be on terms of amity with the French republic. "All the relations of policy, commerce, and correspondence with France, which were interrupted, in consequence of the revolution in that country, have not yet been re-established in their full extent; but as at the present moment negotiations are going on to effect a reconciliation with that power by every means consistent with the dignity of the emperor and the interests of his people, his majesty has been pleased to charge his ministers to apprise his foreign ambassadors and agents, that he is willing to renew the usual course of connection with the government, and that the conferences respecting that object are in full activity. In the situation in which this matter stands, therefore, it is no longer proper that the ambassadors of his imperial majesty should continue to observe any distance towards the ambassadors of the French government."

175
Treaty of
amity and
commerce
with Swe-
den.

Early in the same month there was signed at St Petersburg, a treaty of amity, commerce, and navigation, between Russia and Sweden, to continue for 12 years, by which Sweden was allowed to import into Russia, alum, salt herrings, and salt, on the payment of one-half of the duties then exacted, and into Russian Finland the produce of Swedish Finland, duty free; while the importation of Russia into Sweden, of hemp, linen, and tallow, was allowed at one half of the existing duties, and of linseed at two-thirds. The most remarkable part of this treaty was the recognition, by the court of St Petersburg, of the northern confederacy, which the amicable adjustment with Britain appeared to have done away.

The commerce of Russia had now recovered its former splendour. The exports from the city of Riga alone for the year ending July 1801, amounted to 6,770,638 rubles, and of these exports, England alone imported to the value of 2,509,853 rubles.

On the 25th of March 1802 was signed at Amiens the definitive treaty of peace between the belligerent powers of Europe, by one material article of which the islands of Malta, Gozo and Comino, were to be restored to the knights of St John of Jerusalem, under the protection and guarantee of France, Great Britain, Austria, Spain, Russia, and Prussia; and his Sicilian majesty was invited to furnish 2000 men, natives of his states, to serve in garrisons at the different fortresses of the said islands, for one year after their restitution to the knights, or until they should be replaced by a force deemed sufficient by the guaranteeing powers. Some time after the conclusion of this treaty, disputes arose among the contracting powers relative to the sovereignty of Malta, which the emperor of Russia insisted should be yielded to Naples, otherwise he would not undertake to guarantee the order, and would separate from it the priories of Russia. The result of these disputes is well known, as they afforded a reason for renewing the bloody contest which has so long desolated the face of Europe.

During the short interval of peace that was enjoyed by Europe, the emperor of Russia made several prudent regulations in the internal administration of his empire. On the 12th of September 1801, a manifesto had been published, proclaiming the union of Georgia or Russian Grufinia with the empire, and on the 1st April 1802, Alexander sent a deputation to establish the new government at Teflis, the capital of the province. This deputation was received by the natives with enthusiastic joy, especially as they brought back the image of St Nina, which their prince Wachtang at his death had left at Mosco. On the 28th May, the emperor wrote a letter to the chamberlain Wittostoff, president of the commission for ameliorating the condition of the poor of St Petersburg, in which he recommended the commission to follow the example of a similar establishment at Hamburg, in selecting proper objects for their charitable bequests, preferring the humble and industrious pauper to the idle and sturdy beggar. He also offered considerable premiums to persons who should introduce any new or advantageous mode of agriculture, or who should bring to perfection any old invention, open any new branch of commerce, establish any new manufacture, or contrive any machine or process that might be useful in the arts.

Early in the year 1803, the emperor fitted out at his own expence, two vessels for a voyage of discovery round the world, under the command of Captain Kruzenstern. These ships were provided with every necessary for accomplishing the object of the voyage; and several men of eminence for science and literature, among whom was Churchman the American astronomer, volunteered their services on this occasion. The vessels sailed in the latter end of 1803, and about a year after, intelligence was received from M. Kruzenstern, who was then lying at Kamtschatka. They had touched at the Marquesas islands, where they had found a Frenchman and an Englishman, who had been left there several years before. The Englishman had completely forgotten his

native language, and the Frenchman, who had for seven years spoken nothing but the language of the natives, scarcely retained sufficient French to inform M. Krusenstern that he had made part of the crew of an American vessel which was wrecked on those coasts. The expedition was then preparing to sail for Japan, to carry thither M. de Rasannoff, who had been appointed ambassador extraordinary from the court of Russia to that of Japan.

In the beginning of 1804, the emperor established a university at Kharkof in Lithuania, for the cultivation and diffusion of the arts and sciences in that part of the Russian empire, and Mr Fletcher Campbell, a Scots gentleman, was employed to procure masters for this new institution. Some time after, the emperor ordered that meteorological observations should be regularly made at all the universities and public schools, and the results published. It appears that at the end of this year the sums allotted by the Russian government, for defraying the expences of these institutions amounted to 2,149,213 rubles, besides a gift of nearly 60,000 rubles towards erecting the new university.

About this time an imperial ukase was published, granting to the Jews a complete emancipation from the shackles under which that devoted people had long groaned, and allowing them the privileges of educating their children in any of the schools and universities of the empire, or establishing schools at their own expence.

For some time the genius of discord, which had again actuated the minds of the European sovereigns, failed to extend her baleful influence over the Russian empire; but it was scarcely possible that the emperor should long remain an impartial spectator of the renewed disputes between his more powerful neighbours. An important change had, in the latter end of 1802, taken place in the ministry of the empire; and Count Woronzoff, brother to the late ambassador at London, had been appointed great chancellor in chief of the department of foreign affairs, with Prince Adam Tzartoriski for his assistant. How far this change in the councils of the empire influenced the political measures of the court of St Petersburg, it is not easy to determine; but in the latter end of 1803, Alexander appeared to view with a jealous eye the presumption and violence exercised by France among the German states, and the encroachments which she appeared desirous of making on the freedom of the Baltic. Alexander had offered his mediation between Great Britain and France, but without effect, and both these parties strove to bring over the Russian emperor to their alliance. France seems to have held out to the ambition of Alexander the bait of a partition of the Turkish territories, the dismemberment of which had long been a favourite object with his predecessors. At length, however, the court of London prevailed, and the Russian ambassador, by his master's orders, took leave of the First Consul of the French republic, though without demonstrating any intentions of immediate hostility. A new levy of 100,000 men was immediately ordered, to recruit the Russian army, and to prevent any jealousy on the side of Turkey, assurances were given to the Sublime Porte of the amicable intentions of Russia towards that power.

On the 11th April a treaty of concert was concluded between Great Britain and Russia, in which the two governments agreed to adopt the most efficacious means

for forming a general league of the states of Europe, to be directed against the power of France. The objects of this league were undoubtedly of great importance to the welfare of Europe; and it is deeply to be regretted that the circumstances of the times did not admit of their being carried into execution. From the terms of the treaty, these objects appear to be,—First, The evacuation of the country of Hanover and the north of Germany. Secondly, The establishment of the independence of the republics of Holland and Switzerland. Thirdly, The re-establishment of the king of Sardinia in Piedmont, with as large an augmentation of territory as circumstances would allow. Fourthly, The future security of the kingdom of Naples, and the complete evacuation of Italy, the island of Elba included, by the French forces. Fifthly, The establishment of an order of things in Europe, which might effectually guarantee the security and independence of the different states, and present a solid barrier against future usurpation.

For the prosecution of the great objects of this treaty, it was proposed by the first article that an army of 500,000 men should be levied; but in a subsequent separate article, the contracting parties, after observing that it was more desirable than easy to assemble so large a force, agreed that the treaty should be carried into execution as soon as it should be possible to oppose to France an active force of 400,000 men. It was understood and stipulated that these troops should be provided by the powers of the continent who should become parties to the league, and subsidies should be granted by Great Britain in the proportion of 1,250,000l. sterling for every 100,000 men, besides a considerable additional sum for the necessary expence occasioned in bringing them into the field.

About this time the occupation of Genoa by the French, on the pretence that that republic was too feeble to support itself against the attacks of Great Britain, was communicated to the different courts of Europe, and excited in every quarter the highest indignation. The emperor Alexander, in particular, was incensed at this new outrage. Such an open violation of those principles which were justly regarded as essential to the general safety, committed not only during the peace of the continent, but when passports had been delivered to his ambassador, in order that a negotiation might be commenced for the purpose of providing for the permanent security and repose of Europe, he considered as an indecent insult to his person and crown. He issued immediate orders for the recall of M. Novosiltzoff; and the messenger dispatched upon this occasion was commanded to repair with the utmost diligence to Berlin. M. Novosiltzoff had not yet left that city; he immediately therefore returned his passports to the Prussian minister of state, Baron de Hardenberg, and at the same time delivered, by order of his court, a memorial explanatory of the object of his mission, and of the circumstances which had led to its termination.

It stated that the emperor had, in compliance with the wishes of his Britannic majesty, sent his ambassador to Bonaparte, to meet the pacific overtures which he had made to the court of London: that the existing disagreement between Russia and France might have placed insurmountable obstacles in the way of a negotiation for peace by a Russian minister; but that his imperial majesty

Russia.

majesty of Russia did not for a moment hesitate to pass over all personal displeasure, and all the usual formalities; that he had declared he would receive the passports only on condition that his minister should enter directly upon a negotiation with the chief of the French government, without acknowledging the new title which he had assumed: and that Bonaparte should give explicit assurances that he was still animated by the same wish for a general peace, which he had appeared to shew in his letter to his Britannic majesty; that after his Prussian majesty had transmitted the positive answer of the court of the Thuilleries, that it persevered in the intention sincerely to lend its hand to a pacific negotiation, the emperor had accepted the passports; but that by a fresh transgression of the most solemn treaties, the union of the Ligurian republic with France had been effected; that this event of itself, the circumstances which had accompanied it, the formalities which had been employed to hasten the execution of it, the moment which had been chosen to carry the same into execution, had formed an aggregate which must terminate the sacrifices which the emperor would have made at the pressing request of Great Britain, and in the hope of restoring tranquillity to Europe by the means of negotiation.

The recal of the Russian envoy appeared to be the signal of hostilities on the part of Russia and Austria against France. These hostilities may be said to have commenced and terminated in the autumn of this year. The military operations that distinguished this short but bloody conflict, the rapid successes of the French, the capitulation of Ulm on the 17th of October, the occupation of Vienna by the French on the 12th of the same month, and the sanguinary battle of Austerlitz on the 27th of November, have been already noticed under FRANCE, N^o 552—555, and are fresh in the memory of our readers. The consequences of these disastrous events were, first a cessation of hostilities, and at length a treaty of firm alliance between Russia and France.

An. 1806.

Before Alexander finally stooped to the imperial eagles of Napoleon, however, he was determined to make one more effort to preserve his independence. The Russian envoy at Paris, d'Oubril, had hastily concluded a preliminary treaty of peace between his master and the emperor of the French, which he signed at Paris on the 8th of July 1806, and instantly set out for St Petersburg to procure the ratification of his master. The terms of this convention were laid before the privy council by Alexander; but they appeared so derogatory to the interests of Russia, that the emperor refused them his sanction, and declared that the counsellor of state, d'Oubril, when he signed the convention, had not only departed from the instructions he had received, but had acted directly contrary to the sense and intention of the commission with which he had been entrusted. His imperial majesty, however, signified his willingness to renew the negotiations for peace, but only on such terms as were consistent with the dignity of his crown, and the interests of his empire.

185
Alliance
with Prussia
against
France,

In the mean time, the king of Prussia began, when it was too late, to see the folly and imprudence of the neutrality which he had so long maintained, and he at length prepared to oppose his now feeble efforts to the growing power of France. He brought together in the summer of this year, an army of at least 200,000 men,

near Weimar and Jena, while the French myriads assembled in Franconia, and on the frontiers of Saxony. Previous to the commencement of hostilities, his Prussian majesty issued a spirited manifesto, in which he explained his motives for abandoning his plan of neutrality, and appealed to Europe for the justice of his cause. The king of Prussia entered into an alliance with the emperor Alexander, and with the king of Sweden, and it was expected, that these united forces would at length hurl the tyrant of Europe from his throne, or at least compel him to listen to equitable terms of pacification. These expectations were, however, miserably disappointed. The same extraordinary success was still to attend the arms of France, and the north of Europe was again condemned to submit in silence to her yoke.

On the 13th October, the Prussians received a dreadful check at the battle of Jena, where, according to the French accounts, their loss amounted to 20,000 in killed and wounded, and above 30,000 prisoners; and on the 27th of the same month, Napoleon entered Berlin. While the French were thus successful, the troops of the emperor Alexander entered Prussian Poland, and took up their residence at Warsaw; but they were soon attacked by the French under the grand duke of Berg*. On the 26th of November, the outposts of the respective armies fell in with each other, and a skirmish took place, in which the Russians were thrown into some confusion and a regiment of Kozaks was made prisoners. On the 28th the grand duke of Berg entered Warsaw with his cavalry, and the Russians retreated across the Vistula, burning the bridge over which they had passed. On the 26th of December, a dreadful engagement took place between the Russians, commanded by General Benningsen, and the French under generals Murat, Davoust, and Lasnes. The scene of action was at Ostralenka, about 60 miles from Warsaw, and the fighting continued for three days. The loss was immense on both sides, though the advantage appears to have been on the side of the French. According to French accounts, the Russian army lost 12,000 men in killed and wounded, together with 80 pieces of cannon, and all its ammunition waggons, while the Russian account states the loss of the French at 5000 men.

In the beginning of February 1807, the Russians obtained a partial advantage in the battle of Eylau. According to the account of this battle, given by General de Budberg, in a dispatch to the marquis of Douglas, the British ambassador at St Petersburg, the Russian general Benningsen, after having fallen back, for the purpose of choosing a position which he judged well adapted for manœuvring the troops under his command, drew up his army at Preussisch Eylau. During four days successively his rear guard had to withstand several vigorous attacks; and on the 7th of February at three o'clock in the afternoon, the battle became general through the whole line of the main army. The contest was destructive, and night came on before it could be decided. Early on the following morning, the French renewed the attack, and the action was contested with obstinacy on both sides, but towards the evening of that day the assailants were repulsed, and the Russian general remained master of the field. In this action, Napoleon commanded in person, having under him Au-
gerea,

Russia.

Murat.

An. 1807
Battle
Eylau.

gereaue, Davoust, Soult, Ney, and Bessieres, at the head of the imperial guards. The loss of the Russians in that engagement, was by themselves stated at above 6000 men, while they estimated that of the French at nearly double that number.

This was the last important stand made by the Russian army. Several actions succeeded at Spanden, at Lammitten, at Guttotadt, and at Heilsberg, in all of which the French had the advantage, till at length on the 14th of June, the Russians appeared in considerable force on the bridge of Friedland, whither the French army under Napoleon was advancing. At three in the morning, the report of cannon was first heard, and at this time Marshals Lasnes and Mortier were engaged with the Russians. After various manœuvres, the Russian troops received a check, and fled off towards Konningsberg. In the afternoon, the French army drew up in order of battle, having Marshal Ney on the right, Lasnes in the centre, and Mortier on the left, while Victor commanded a corps de reserve, consisting of the guards. At half past five the attack began on the side of Marshal Ney; and notwithstanding the different movements of the Russians to effect a diversion, the French soon carried all before them. The loss of the Russians, according to the usual exaggerations of the French bulletins, was estimated at from 10,000 to 15,000 men, and 25 of their generals were said to have been killed, wounded, or taken. In consequence of this victory, the French became masters of all the country round Konningberg, and Marshal Soult entered that city in triumph.

Thus concluded the campaign in Germany, in which the Russians sustained a loss of at least 30,000 of their choicest troops.

While these military operations were going forward on the continent of Europe, the emissaries of France were busily employed at Constantinople, in exciting the divan to declare against their ancient enemies. They at length succeeded; and on the 30th of December war with Russia was proclaimed, and 28 regiments of janissaries assembled under the command of the grand vizir; but the disturbances which broke out in the latter end of May 1807, prevented any operations of importance from taking place, and the pacification which was soon concluded between Russia and France, though it did not entirely put a stop to the war between the former power and Turkey, in some measure diminished their hostile preparations.

The defeats which the allied armies had sustained in Prussia and Poland, rendered peace, almost on any terms, a desirable object; and Alexander found himself constrained to meet, at least with the appearance of friendship, the conqueror of his armies. Propositions for an armistice had been made by the Prussian general to the grand duke of Berg near Tilsit, and after the battle of Friedland, the Russian prince Labanoff had a conference, on similar views, with the prince of Neufchatel, soon after which an armistice was concluded between the French and Russians. On the 25th of June

an amicable meeting took place on the river Niemen between the emperors of France and Russia, and adjoining apartments were fitted up for the reception of both courts in the town of Tilsit. This constrained friendship was soon after cemented by the treaty of Tilsit, concluded between the emperor of the French on the one part, and the emperor of Russia and the king of Prussia on the other; on the 7th and 12th of July in this year.

The conclusion of the treaty of Tilsit was notified to the court of London on the 1st of August by M. Alopeus, minister plenipotentiary from the emperor of Russia; and at the same time a proposal was made from his imperial majesty for mediating a peace between France and Britain. This mediation, however, was declined on the part of Great Britain, until his Britannic majesty should be made acquainted with the stipulations of the treaty of Tilsit, and should find them such as might afford him a just hope of the attainment of a secure and honourable peace. This declining of the mediation of Russia was no doubt expected by the court of St Petersburg; but it served as a pretext for binding more closely the alliance between that power and France, by breaking off her connection with Great Britain. Accordingly, in October, Lord Granville Leveson Gower, who had succeeded the marquis of Douglas as British envoy, received a note from the government, intimating that, as a British ambassador, he could be no longer received at the court of St Petersburg, which he therefore soon after quitted. An embargo was laid on all British vessels in the ports of Russia, and it was peremptorily required by Napoleon, and Alexander, that Sweden should abandon her alliance with Great Britain.

An additional ground of complaint against the British court was furnished by the attack on Copenhagen, and the seizure of the Danish fleet in the beginning of September; and though Lord Gower had attempted to justify these measures on the plea of anticipating the French in the same transaction, the emperor of Russia expressed, in the warmest terms, his indignation at what he called an unjust attack on a neutral power. A considerable Russian fleet joined the French, but the combined squadrons were compelled to seek for shelter in the Tagus, where they remained blocked up by the British; and another fleet of 15 sail of the line that proceeded up the Mediterranean, and advanced as far as Trieste, shared a similar fate (1).

On the 26th of October the emperor of Russia published a declaration, notifying to the powers of Europe that he had broken off all communication between his empire and Great Britain, until the conclusion of a peace between this power and France. In a counter-declaration, published at London on the 10th of December, his Britannic majesty repels the accusations of Russia, while he regrets the interruption of the friendly intercourse between that power and Britain. His majesty justifies his own conduct, and declares, that when the opportunity for peace between Great Britain and Russia shall

(1) By the unfortunate convention of Cintra, concluded on the 3d of September 1808, the Russian fleet in the Tagus was surrendered to the British, to be held as a deposit, till six months after the signing of a definitive treaty of peace.

An. 1808, 191
Renewed negotiations with Britain.

In October 1808, a meeting took place at Erfurth between the emperors of France and Russia, and a letter was drawn up under their signature, addressed to his Britannic majesty. The object of this letter was, to induce the king of Great Britain to enter into negotiations for a general peace, and with that view it was dispatched by Count Romanzoff, the Russian minister at Erfurth, to Mr Canning the British secretary of state for foreign affairs. As this letter, and the official note of the British government in answer to it, supply two very important documents in the latter history of the present war, we shall here introduce them. The letter of the two emperors is as follows.

“Sire.—The present circumstances of Europe have brought us together at Erfurth. Our first thought is to yield to the wish and the wants of every people, and to seek, in a speedy pacification with your majesty, the most efficacious remedy for the miseries which oppress all nations. We make known to your majesty our sincere desire in this respect by the present letter.

“The long and bloody war which has torn the continent is abandoned, without the possibility of being renewed. Many changes have taken place in Europe; many states have been overthrown. The cause is to be found in the state of agitation and misery in which the stagnation of maritime commerce has placed the greatest nations. Still greater changes may yet take place, and all of them contrary to the policy of the English nation. Peace, then, is at once the interest of the continent, and that of the people of Great Britain.

“We unite in entreating your majesty to listen to the voice of humanity, silencing that of the passions; to seek, with the intention of arriving at that object, to conciliate all interests, and by that means to preserve all the powers which exist, and to ensure the happiness of Europe and of this generation, at the head of which Providence has placed us.”

(Signed) ALEXANDER.——NAPOLEON.

In answer to this letter the following official note, signed by Mr Secretary Canning, was dispatched to Erfurth; and as the imperial correspondents refused to accede to the requisitions it contained, all hopes of present accommodation were at an end.

“The king has uniformly declared his readiness and desire to enter into negotiations for a general peace, on terms consistent with the honour of his majesty’s crown, with fidelity to his engagements, and with the permanent repose and security of Europe. His majesty repeats that declaration.

“If the condition of the continent be one of agitation and of wretchedness; if many states have been overthrown, and more are still menaced with subversion; it is a consolation to the king to reflect that no part of the convulsions which have been already experienced, or of those which are threatened for the future, can be in any degree imputable to his majesty. The king is most willing to acknowledge that all such dreadful changes are indeed contrary to the policy of Great Britain,

Russia. “If the cause of so much misery is to be found in the stagnation of commercial intercourse, although his majesty cannot be expected to hear, with unqualified regret, that the system devised for the destruction of the commerce of his subjects has recoiled upon its authors, or its instruments, yet it is neither in the disposition of his majesty, nor in the character of the people over whom he reigns, to rejoice in the privations and unhappiness even of the nations which are combined against him. His majesty anxiously desires the termination of the sufferings of the continent.

“The war in which his majesty is engaged, was entered into by his majesty for the immediate object of national safety. It has been prolonged only because no secure and honourable means of terminating it have hitherto been afforded by his enemies.

“But in the progress of a war, begun for self-defence, new obligations have been imposed upon his majesty, in behalf of powers whom the aggressions of a common enemy have compelled to make common cause with his majesty, or who have solicited his majesty’s assistance and support in the vindication of their national independence.

“The interests of the crown of Portugal and of his Sicilian majesty are confided to his majesty’s friendship and protection.

“With the king of Sweden his majesty is connected by the ties of the closest alliance, and by stipulations which unite their counsels for peace as well as for war.

“To Spain his majesty is not yet bound by any formal instrument; but his majesty has, in the face of the world, contracted with that nation engagements not less sacred, and not less binding, upon his majesty’s mind, than the most solemn treaties.

“His majesty, therefore, assumes that, in an overture made to his majesty for entering into negotiations for a general peace, the relations subsisting between his majesty and the Spanish monarchy have been distinctly taken into consideration; and that the government acting in the name of his Catholic majesty, Ferdinand VII. is understood to be a party to any negotiation in which his majesty is invited to engage.”

The demand of concurrence in the views of France and Russia made on Sweden was formally repeated in a declaration of the emperor Alexander, published at St Petersburg on the 10th February in this year. In this declaration his imperial majesty intimated to the king of Sweden, that he was making preparations to invade his territories; but that he was ready to change the measures he was about to take, to measures of precaution only, if Sweden would, without delay, join Russia and Denmark in shutting the Baltic against Great Britain, until the conclusion of a maritime peace. He professed that nothing could be more painful to him, than to see a rupture take place between Sweden and Russia; but that his Swedish majesty had it still in his power to avoid this event, by resolving without delay, to adopt that course which could alone preserve strict union and perfect harmony between the two states.

The king of Sweden, however, determined to abide by the measures which he had for some time pursued, and to accede to the terms of the convention which had just been concluded between him and the king of Great Britain. In consequence of this determination, a Russian

ssia. sian army entered Finland in the beginning of March, under the command of general Buxhovden, and advanced against Helsingfors, which was occupied by a single battalion of a Swedish regiment. This small force retired into the fortress of Sweaborg, where they maintained themselves with great bravery till the 17th of April, when they were obliged to capitulate. The loss of this fortress, though inconsiderable in itself, so highly enraged the king of Sweden, that he dismissed the naval and military commanders who had been concerned in the capitulation.

On the 27th of April, some slight advantage was gained over the Russians near Rivolax, by the Swedish army under General Count Klinspor; but this was only a partial gleam of success. The Russians soon overran almost all Finland, took possession of Wasa, old and new Carleby, and reduced under subjection the whole province of which Wasa is the capital. The army of Field-marshal Klinspor, which originally consisted of 16,000 regulars, and many boors, was, by the end of the campaign, reduced to little more than 9000 men. The Russian troops were said to have committed great excesses, in consequence of which the king of Sweden addressed the following letter to the emperor of Russia.

"Honour and humanity enjoin me to make the most forcible remonstrances to your imperial majesty against the numberless cruelties and the injustice committed by the Russian troops in Swedish Finland. These proceedings are too well known and confirmed, to require from me any proof of their reality; for the blood of the ill-fated victims still cries aloud for vengeance against the abettors of such enormities. Let not your imperial majesty's heart be insensible to the representations which I find myself compelled to make to you, in the name of my faithful subjects in Finland. But what is the object of this war, as unjust as it is unnatural? It is not, I suppose, to excite the strongest aversion for the Russian name? Is it criminal in my subjects in Finland not to have suffered themselves to be seduced from their allegiance by promises as false as the principles on which they are founded? Does it become a sovereign to make loyalty a crime? I conjure your imperial majesty to put a stop to the calamities and horrors of a war which cannot fail to bring down on your own person and government the curses of divine Providence. Half of my dominions in Finland are already delivered by my brave Finnish troops; your majesty's fleet is shut up in Baltic port, without the hope of ever getting out, any otherwise than as a conquest; your flotilla of galleys has recently sustained a very severe defeat; and my troops are at this moment landing in Finland, to reinforce those who will point out to them the road to honour and to glory.

"Head-quarters, Sept. 7. 1808.

(Signed) "GUSTAVUS ADOLPHUS."

The king of Sweden sent some reinforcements to his army in Finland; but the forces which should have supported Klinspor, were foolishly employed in a fruitless attempt to conquer Norway; and in 1809 the Swedes were compelled to cede Finland to Russia. This province, including Lapmark, occupies an extent of about 120,000 square English miles, and was estimated to contain 895,000 inhabitants.

Russia continued to appear in the unworthy character of Napoleon's ally; and when Austria made an effort in 1809 to recover her losses, a Russian army advanced to cooperate with the French. The diversion which this produced was one cause of the final success of Napoleon, whose situation after the battle of Aspern was extremely critical. When Austria was at last compelled to accept of peace on humiliating terms, Russia received as the reward of her services the district of Tarnopol in Galicia, with a population of 400,000 souls. This district was restored to Austria in 1814.

In 1811 hostilities commenced between Russia and the Porte. It is of little consequence to inquire into the causes of this rupture: a powerful and ambitious government in the neighbourhood of a weak one, never wants pretexts for war. The result might have been serious, if not fatal to the Porte, had not the prospect of a more arduous struggle induced Russia to suspend her efforts in that quarter, and conclude a peace on condition of receiving a part of Moldavia and Bessarabia.

The great contest was now approaching which was to try the resources of Russia, and ultimately to raise her to unexampled greatness. The seizure by France of the territories of the Prince of Oldenburg, who was the emperor of Russia's brother-in-law, on the one hand; and the admission of British produce into the Russian harbours, on the other, furnished the ostensible grounds of the quarrel. After some fruitless negotiations, Bonaparte dismissed the Russian ambassador, and left Paris to join the army, on the 9th of May 1812. This vast army, the largest ever assembled in modern times, was posted on the frontiers of Poland. Its numbers have been variously estimated; but, including the auxiliary corps of Austria and Prussia, and the garrison corps left behind to maintain its communications, it certainly did not fall short of half a million of men. In the end of June the advanced corps passed the Niemen without resistance. From this time till it arrived at Smolensk on the 15th August, the French army experienced an obstinate resistance, and sustained many heavy losses. On the 17th August a general engagement took place in front of Smolensk, which terminated in favour of the French, who took possession of the town after the Russians had destroyed the magazines, and burned all the buildings most likely to be serviceable. At Borodina the Russian general Kutusof collected all his corps into a mass, with the resolution of making a desperate effort to arrest the enemy in his advances to Moscow. The battle fought here on the 7th September, was one of the most bloody on record. It ended in the Russian position being forced, but not without the loss of forty or fifty thousand of the assailants, and about an equal number of Russians. On the 14th September, the French army arrived at Moscow; but what was their consternation when they discovered the city to be in flames in a hundred places! After a fruitless attempt to dictate a peace from this ancient capital, Bonaparte found himself compelled to evacuate the place on the 19th October, having previously destroyed the Kremlin. The retreat that followed was the most disastrous to be found in history. Those who were spared by the sword were destroyed by famine; and of the magnificent army that entered Russia, scarcely 50,000

Russia.

reached Wilna on the 8th of December. The noble resistance of Russia now roused Prussia and Austria; and early in 1813, a league was formed between these powers, to which Bavaria and other small states acceded. The battle of Leipsic, fought on the 18th October, led to the final overthrow of the French domination. In all the transactions which followed, Russia bore a leading part. At the congress of Vienna in 1814, the duchy of Warsaw, consisting of part of the original conquests of Austria and Prussia in Poland, was assigned to Russia, who has thus ultimately obtained about four-fifths of the territory, and three-fourths of the population of that ancient kingdom. The duchy of Warsaw has since been erected into a kingdom, to which a representative constitution was given in 1818. Its population is about 2,793,000 upon a surface of 48,000 square English miles. When we add to this the territories which Russia has gained, by conquest or cession, in the Crimea, Georgia, Finland and Moldavia, the whole amount of her acquisitions, during the last forty years, cannot be estimated at less than nine millions of population, and 450,000 square miles of territory.

193

Extent of population in the Russian empire.

The population of Russia, according to Dr Hassel a German writer, (in his Account of the States of Europe, Weimar 1816), was 45,516,000 in 1815, of which 34,394,000 were in Europe, and 8,376,000 in Asia, the remaining number consisting of the population of the new kingdom of Poland. This population is very unqually distributed over the country; some of the governments in the central part of the empire being nearly as populous as northern Germany, while others have scarcely an inhabitant to a square league. The number of the people is increasing in such a ratio as to double itself in about seventy years. It consists of about 100 nations, who speak at least forty different languages. The Slavonic race, however, predominates greatly: it is computed to amount to 38 millions, the Finns 2,376,000, the Tartars 1,850,000, the Caucasian nations 1,200,000, the Mongols 300,000, the Mandshurs 80,000, the Polar tribes, Samoeids, Tschutzes, &c. 300,000, Colonists including Moldavians, French, Germans, &c. 800,000.

In this population, it is computed that there are 34,000,000 belonging to the Greek church; 5,300,000 Catholics or Schismatic Greeks, in Poland, Lithuania, &c.; 2,500,000 Lutherans in Courland, Finland, and among the German colonists; 33,000 Reformed; 70,000 Armenians; 1,800,000 Mahometans; 210,000 Jews; and 300,000 Worshippers of the Dalai Lama.

194

Revenues.

The revenue of Russia, according to the writer above mentioned, was about 215 millions of rubles in 1815. If the paper ruble is meant, this would only be equal to 10 millions sterling; if the silver ruble, it would be equal to 36 millions Sterling. The former sum is evidently too small, and the latter too large. By another German writer (Crome), the revenue is estimated at 250 millions of florins, equal to 25 millions sterling. This revenue is derived from domains;

monopolies of brandy, and other articles; a poll-tax of two rubles upon each peasant, and five upon each burgher; imposts on property, customs, &c.

The rapid increase of the population of the Russian empire, is proved by the proportion of deaths to births. Thus, in 1803, the number of marriages was 300,470; that of the births of the same year 1,270,341; and that of the deaths only 791,973: so that the number of births exceeded that of deaths by 478,368; and the population had of course, in that year, increased nearly half a million (L).

In the year 1804, the number of marriages was 311,798; of births 715,334 males, and 642,233 females, making 1,357,567; and of deaths 439,137 males, and 380,681 females, making a total of 819,818; so that in the course of that year, the number of births exceeded that of deaths by 537,749.

The government of Russia appears always to have been despotic; and we have no traces of any legislative power distinct from that of the sovereign, as what

is called the senate is only the supreme court of judicature. Vasilii Schuiskey, who obtained the crown in 1606 (see N^o 80), pretended to obtain it in consequence of a free election by the senate and people; but we have seen that his coronation was produced by intrigues among the chiefs; and there appears in the Russian history no vestige of any national council, parliament, or estates of the empire, far less of a free elective diet, like that which distinguished the republic of Poland. The emperor is absolute lord, not only over all the estates of the empire, but also of the lives of his subjects. The greatest noblemen call themselves his slaves, and execute his commands with the most implicit obedience. The common people revere him as something supernatural; and never mention his name, or any thing immediately belonging to him, without marks of the most profound respect and awful veneration.

During the reign of Catharine II. the immediate administration of affairs was nominally vested in what was called her imperial majesty's council. This was composed of the principal officers and persons of the empire, namely, of general feldt-marshals, generals in chief, and actual privy-counsellors: at present they are 14 in number; the fifteenth fills the place of a chancery-director, and has a secretary under him. The vice-chancellor of the empire is a member of this council. The post of grand-chancellor is sometimes suffered to remain vacant.

The cabinet, to which belongs the care of the sovereign's private affairs or concerns, as likewise the reception of petitions, consists generally of ten persons, the high-steward of the household, privy-counsellors, major-generals, and state-counsellors, with their several subordinate officers and chanceries. It also examines despatches, passes accounts, &c.; takes cognizance of the produce of silver mines, &c. Whoever is not satisfied with a decision of the senate, may appeal by petition to the cabinet; and in this respect it

(L) It is curious to remark how many people of a very advanced age died in Russia during this year. Thus, among the deaths are reckoned 1145 between 95 and 100; 158 between 100 and 105; 90 between 105 and 110; 34 between 110 and 115; 36 between 115 and 120; 15 between 120 and 125; 5 between 125 and 130; and 1 between 145 and 150.

ussia. it does the office of a supreme tribunal, in which the sovereign in person decides.

In extraordinary cases, it sometimes happens that a special high court of justice is appointed, not subordinate to the senate, but immediately under the sovereign. The presidents are usually taken from the imperial colleges and other eminent stations, and likewise from among the members of the synod. Where the alleged offence is of an extremely heinous nature, the examination is first made by particular persons appointed for that purpose, and the protocol is laid before the commissioners for their judgments. †

In number of titles the emperor of Russia rivals the proudest monarchs of the east. In the reign of Catharine II. the imperial titles, when written at length, ran thus;—"By the grace of God, Catharine II. empress and autocratrix of all the Russias, of Mosco, Kief, Vladimir, Novgorod; tzarina of Casan, tzarina of Astrakhan, tzarina of Siberia, tzarina of the Tauridan Chersonese, lady of Pscove, and grand dutchess of Smolensk; princess of Esthonia, Livonia, Karelia, Tver, Yugoria, Permia, Viatka, Bulgaria, and other countries; lady and grand dutchess of Novgorod of the low country, of Tschernigof, Reazan, Polotsk, Rostoff, Yaroslavl, Bileosero, Udoria, Obdoria, Kondia, Vitepsk, Mstislavl; sovereign of the whole northern region, and lady of the country of Iveria, of the Kartalinian and Grusinian tzars, and of the Kabardinian country, of the Tscherkassians, and of the mountain princes, and of others hereditary lady and sovereign.

The Russian army, in time of peace, exceeds that of any other power in Europe. In 1815, it amounted to 620,415 men.

I. Guards, 3 battalions infantry	- - -	12,150
7 regiments horse	- - -	4,450
artillery	- - -	600
II. Field Troops.		
Infantry, 141 regiments of the line, and 3 regiments marines	- - -	317,360
Regular cavalry, 58 regiments	- - -	57,000
Field artillery	- - -	29,522
Engineer corps	- - -	1,113
III. Garrison Troops.		
Infantry	- - -	72,800
Artillery	- - -	11,500
IV. Invalids	- - -	13,920
V. Irregulars	- - -	100,000
		620,415

In addition to these, the national guards or landwehr amount to 612,000 men; so that Russia has altogether about a million and a quarter of men under arms.

The Russian regiments are usually encamped from the end of May to the end of August. The soldiers are allowed no straw in their tents, but each man lies on the bare and often wet ground. When he mounts guard it is for a fortnight together; but when he is taken ill, he is attended with the greatest care by the medical officers appointed by government. No expense is spared in providing hospitals, for which purpose large buildings have been constructed in the principal towns, and a proper number of physicians and surgeons attached to each. Here the patients are sup-

plied with medicines and diet suited to the nature of their complaints. Still, however, the Russian soldiers enter the hospitals with reluctance, and leave them as soon as possible.

Notwithstanding the great population of the Russian empire, it sometimes requires the utmost stretch of arbitrary power to raise levies for recruiting the army, as the lower orders of the people are more averse to the military profession in Russia than in almost any other country. This is the more extraordinary, as the pay is tolerably good, and they are furnished in abundance with the necessaries of life. It is true that leave of absence can seldom be obtained, and each soldier is bound to serve for 25 years. The discipline is severe, and the subaltern officers may, on their own authority, inflict punishment on any private, to the extent of 20 strokes of a cane. While the soldiers remain in garrison, they are generally not allowed to marry; but when permitted to marry, there is an extra allowance for their wives and children. *

There is one absurdity in the dress of the Russian soldiers, especially in that of the officers, which merits notice. Their waists are so pinched by the tightness of their clothes, and a leathern belt over the coat, as must certainly impede their respiration, and otherwise affect their health. †

Of the regular troops, the imperial foot guards are the most respectable. Their uniform consists of a green coat turned up with red, with white pantaloons, and very high caps or hats, surmounted with a black feather or tuft of hair. Of the other troops, the most remarkable are the Kozaks, which form the principal cavalry of the empire. Of those there are several varieties, but the most striking are the Donsky Kozaks. The persons, air, and appointments of these troops seem completely at variance with those of the horses on which they are mounted. The men are fierce and robust, generally dressed in a blue jacket and pantaloons or loose trowsers, with a black cap surmounted by a kind of red turban. They are distinguished by formidable whiskers, and are armed with a sabre, a brace of pistols, and a long spear. Their horses are mean in shape, slouching in motion, and have every appearance of languor and debility. They are, however, extremely hardy and tractable; will travel incalculable journeys, and remain exposed, without inconvenience, to all the vicissitudes of the weather.

The navy of Russia is respectable; but since her rupture with Great Britain, it has become nearly useless. It generally consists of several detached fleets, of which one belongs to the Baltic, and another to the Black sea; the former having its rendezvous at Cronstadt, the latter at Sevastopol and Kherson. There is also generally a small squadron on the Caspian. In 1794, the Baltic fleet consisted of 40 ships of the line, and 15 frigates; while that of the Black sea was composed of 8 ships of the line, and 12 frigates. The Caspian squadron consists of three or four small frigates, and a few corvettes. Besides these fleets, there was lately at Odessa in the Black sea, a flotilla consisting of 25 very large vessels, and 60 vessels of inferior size, to serve as transports for conveying troops. The Russians are said to be averse to a seafaring life, but the sailors are extremely brave. In point of neatness, the

Russia.

Russia. Russian ships are inferior to those of any other European nation.

As connected with the government of the empire, we shall here notice the coins, weights, and measures, all of which are regulated by government.

199
Coins.

The standard according to which the value of the Russian coins is usually estimated, is the ruble; but as the value of this coin, with respect to the money of other countries, varies according to the course of exchange between these countries and Russia, it is necessary to take into account the value of the ruble as it stands at any particular time. When Sir John Carr was in Russia in 1804, the ruble was worth only 2s. 8d. of English money, and as the course of exchange between Great Britain and Russia is now against the latter country, we may perhaps estimate the ruble at about 2s. Keeping this in view, the following table by Mr Tooke will show the value of the Russian coins.

GOLD.	{ Imperial,	10 rubles.
		{ Half imperial,
	{ Ruble,	100 copecks.
		{ Half ruble,
SILVER.	{ Quarter ruble,	25
	{ Twenty-copeck piece,	20
	{ Fifteen-copeck piece,	15
	{ Grievnik,	10
	{ Five-copeck piece,	5
COPPER.	{ Petaki,	5
	{ Grosch,	2
	{ Copeck,	1
	{ Denushka,	$\frac{1}{2}$
	{ Polushka,	$\frac{1}{4}$

200
Weights.

It is not easy to compute the Russian weights according to the standard of either avoirdupois or troy weight. The least Russian weight is called solotnik, and weighs about 68 troy grains, or a little more than one troy dram. Three *solotniks* make a *lote*, and 32 *lotes* or 96 *solotniks*, a Russian pound. Thus the Russian is to the troy pound, as 6528 is to 5760. Forty-five Russian pounds are equal to 38 Hamburgh pounds. It is usual in Russia to estimate the parts of a pound by solotniks, and not by lotes; thus, any thing that weighs 7 lotes, is said to weigh 27 solotniks.

A Russian pood weighs 40 Russian pounds, or 3840 solotniks, and is by Mr Tooke reckoned at 36 English pounds avoirdupois.

201
Measures.

The measures of Russia, as in other countries, may be divided into measures of length and measures of capacity. The former are easily estimated in English measure, as the English foot was adopted by Peter the Great, and is now the standard for the whole empire. It is also divided into 12 inches, but every inch is divided into 10 lines, and each line into 10 scruples. Twenty-eight English inches make an arshine, and three arshines one sajéne, or Russian fathom, equal to 7 feet English.

A Russian verst is equal to 3500 English feet; and a geographical mile contains 6 versts, 475 sajénes, and 7.25 arshines.

Superficial measure is sometimes estimated by square versts and sajénes, but more commonly by desatines; each of which is equal to 2400 square sajénes, or 117,600 English square feet.

Of dry measures of capacity, the smallest is the *garnitza*, *osmuka*, or *osmushka*, which is a measure capable of holding 5 Russian pounds of dried rye, and is used chiefly in measuring out corn for horses. A *poltchetveriek* contains $614\frac{1}{2}$ Paris cubic inches, or half a pood of dried rye. A *polosmina* contains 8 *poltchetverieks*, or four *tchetverieks*. A tonne of corn at Reval holds 5964 French cubic inches; at Riga, 6570; at Narva, 8172; and in Viborg it is equal to the weight of 6 pood. A Riga lof measures 3285 French cubic inches, and is equal to 27 cans; and a last is equal to 24 tonnes.

Of liquid measure the *vedro* contains 610 French cubic inches, and is equal to 5 Riga cans; a *krushka* or *oslim* is $\frac{1}{3}$, and a *tchetverk* $\frac{1}{3}$ of a *vedro*; a *stoff* is about 60 French cubic inches; 19 *vedro* make 1 hog-shead, or 6 ankers, and 57 *vedro* amount to 152 English gallons, each containing 233 French cubic inches.

We have seen that in the earlier periods of Russian history, the empire was regulated by no other laws than the will of the sovereign, as promulgated in his *ukases*; and that even the first Russian code of laws, viz. those published by Ivan IV. in the 16th century, contain rather the arbitrary orders of that monarch, than such regulations as might have been the result of the deliberations of a national assembly. The code of Ivan was greatly improved by Alexei Mikhailovitch; but the late empress has the merit of giving to the empire a new and rational code, chiefly drawn up by her own hands. Of the precise nature of the laws contained in this code very little is known, as all conversation on the laws of the empire is either forbidden, or is considered as indelicate. It is not indeed of much consequence to ascertain the present existing laws, as they are subject to continual alterations.

In 1775, the late empress made a complete new modelling of the internal government in a form of great simplicity and uniformity. By that regulation she divided the whole empire into governments, as we have already mentioned, placing over each, or, where they are of less extent, over two contiguous governments, a governor-general with very considerable powers. She subdivided each government into provinces and districts; and for the better administration of justice, erected in them various courts of law, civil, criminal, and commercial, analogous to those which are found in other countries. She established likewise in every government, if not in every province, a tribunal of conscience, and in every district a chamber for the protection of orphans. Amidst so many wise institutions, a chamber for the administration of her imperial majesty's revenues was not forgotten to be established in each government, and a tribunal of police in each district. The duty of the governor-general, who is not properly a judge, but the guardian of the laws, is to take care that the various tribunals in his government discharge their respective duties, to protect the oppressed, to enforce the administration of the laws; and when any tribunal shall appear to have pronounced an irregular sentence, to stop the execution till he make a report to the senate, and receive her majesty's orders. It is his business likewise to see that the taxes be regularly paid; and, on the frontiers of the empire, that the proper number of troops be kept up, and that they be attentive to their duty.

This

ussia. This reglement contains other institutions, as well as many directions for the conducting of lawsuits in the different courts, and the administration of justice, which do her majesty the highest honour; but the general want of morals, and what we call a sense of honour, in every order of men through this vast empire, must make the wisest regulations of little avail. Russia is perhaps the only nation in Europe where the law is not an incorporated profession. There are no seminaries where a practitioner may be educated. Any man who will pay the fees of office may become an attorney, and any man who can find a client may plead at the bar. The judges are not more learned than the pleaders. They are not qualified for their offices by any kind of education, nor are they necessarily chosen from those who have frequented courts, and been in the practice of pleading. A general, from a successful or an equivocal campaign, may be instantly placed at the head of a court of justice; and in the absence of the imperial court from St Petersburg, the commanding officer in that city, whoever he may be, presides *ex officio* in the high court of justice. The other courts generally change their presidents every year. Many inconveniences must arise from this singular constitution; but fewer, perhaps, than we are apt to imagine. The appointment to so many interior governments makes the Russian nobility acquainted with the gross of the ordinary business of law-courts; and a statute or imperial edict is law in every case. The great obstacles to the administration of justice are the contrariety of the laws, and the venality of the judges. From inferior to superior courts there are two appeals; and, in a great proportion of the causes, the reversal of the sentence of the inferior court subjects its judges to a heavy fine, unless they can produce an edict in full point in support of their decision. This indeed they seldom find any difficulty in doing; for there is scarcely a case so simple that edicts may not be found clear and precise for both parties; and therefore the judges, sensible of their safety, are very seldom incorruptible. To the principle of honour, which often guides the conduct of judges, in other nations, they are such absolute strangers, that an officer has been seen sitting in state and distributing justice from a bench to which he was chained by an iron collar round his neck, for having the day before been detected in conniving at smuggling. This man seemed not to be ashamed of the crime, nor did any one avoid his company in the evening.

Few crimes are capital in Russia; murder may be atoned for by paying a sum of money; nay, the civil magistrate takes no cognisance of murder, without having previously received information at the suit of some individuals. Criminals were punished with torture and the most cruel deaths till the reign of Catharine I. when a more merciful system took place; and this the late empress confirmed by law.

The usual punishments for crimes of inferior magnitude are, imprisonment, and banishment to the deserts of Siberia; and for crimes of greater moment, that most dreadful of all corporal punishments, the *knout*. The exact nature of this punishment has not been well understood in this country. We shall therefore explain it, from the information of one of our latest travellers in Russia.

205 knout. The apparatus for inflicting the punishment of the

knout consists principally of a whip, composed of a wooden handle about a foot long, very strong, and bound tightly round with leather, and having attached to it a stout and weighty thong, longer than the handle, and formed of a tapering strip of buffalo's hide, well dried, and about $\frac{1}{2}$ inch thick, fastened to the handle in the manner of a flail. Besides this, the executioner is furnished with a pair of iron pincers for the purpose of slitting the nose, and another instrument shaped like a round brush, strongly set with iron teeth, for marking the forehead, or any other part of the body, according to the terms of the sentence.

The infliction of the punishment, in a case where it was peculiarly severe, (*viz.* that of a servant who had murdered his master) is thus described by Mr Ker Porter.

“The poor wretch, attended by part of the police, had been walked through the streets, in order to show him to the populace, and to strike them with horror at his guilt. As soon as the procession arrived in front of the troops, a circle was formed, and preparations made for the instant commencement of the execution. A paper being read aloud in the Russ language, which, most probably, was an account of his crime and sentence, he was speedily stripped of his clothes, leaving on his person only a pair of loose trowsers. In the midst of this silent groupe (and awful indeed was their silence) stood, firm and well secured, a block of wood, about three feet high, having three cavities in the top, to receive the neck and arms. Being fully prepared for his dreadful punishment, the unhappy man crossed himself, repeating his *gospertian pomelia* with the greatest devotion. The executioner then placed him with his breast to the board, strongly binding him to it by the neck and the upper parts of his arms, passing the rope close under the bend of both knees. Thus bowed forward, the awful moment approached. The first stroke was struck, and each repeated lash tore the flesh from the bone. A few seconds elapsed between each; and for the first ten or twelve, the poor sufferer roared most terribly; but soon becoming faint and sick, the cry died away into groans; and in a few minutes after, nothing was heard but the bloody splash of the knout, on the senseless body of the wretched man.

“After full an hour had been occupied in striking these dreadful blows (and more than 200 were given him), a signal was made from the head officer of the police, and the criminal was raised a little from the block. Not the smallest sign of life seemed to remain; indeed, so long did it appear to have fled, that during the half of the lashing, he had sunk down as low as the ligatures which bound him would allow. The executioner took the pale and apparently lifeless body by the beard, while his assistant held an instrument like a brush with iron teeth, and placing it a little below his temple, struck it with the utmost force, and drove its pointed fangs into the flesh. The opposite temple and forehead received the same application. The parts thus pierced, were then rubbed with gunpowder, to remain, should the mangled sufferer survive, a perpetual mark of his having undergone the punishment.

“You would suppose that rigour had exhausted all her torments, and justice was now appeased: But no; another punishment yet remained, to deprive the nose of its nostrils. The inflicting pincers, something like monstrous

Russia. strous curling irons, were inserted up the nose of him whom I supposed dead (and indeed I only endured the latter part of the sight, from having imagined that these inflictions were directed to one already past the sense of pain); the performer of this dreadful sentence, aided by his companion, actually tore each from his head in a way more shocking than can be described. The acuteness of this last torture, brought back sense to the torpid body:—What was my horror, to see the writhings of the poor mangled creature; and my astonishment, as soon as he was unbound, to see him rise by the assistance of the men, and walk to a cart ready to return him to his prison. From whence, if he did not die, he was immediately to be conveyed to Siberia, there to labour for life. His lost strength seemed to revive every moment, and he sat in the vehicle perfectly upright, being covered with his caftan, which he himself held upon his shoulders, talking very composedly with those who accompanied him.*

vol. ii.
p. 21.
206
Religion.

The established religion of Russia is that of the Greek church, which differs little from the Roman Catholic persuasion, except in a few rites and ceremonies. The people are very strict in the observance of the external forms of worship, as attendance on mass, keeping numerous fasts, performance of domestic devotions morning and evening, confession, receiving the sacrament, &c. To build churches is considered as a meritorious act; and hence even the small towns abound in these religious edifices; and as, from the severity of the winter, it is necessary to heat the churches during that season, it is not uncommon to see two churches in the same churchyard; one used for winter, and the other for summer worship. The clergy are held in great honour; and every one meeting a priest kisses his hand, in return for which he receives his blessing with the sign of the cross. From the external ceremonies of the Greek church, we shall select those of baptism, marriage, and burial.

207
Baptism.

As soon as a child is born, the priest repairs to the chamber of the mother, and offers up a thanksgiving for her and her infant. On the eighth day the child is carried to the church, and receives its name, in addition to which is given that of the saint to which the day is dedicated. Thirty-two days after this the purification of the mother takes place, after which succeeds the baptism itself. The child is dipped three times, and then immediately anointed on several parts of the body, and signed with the cross. Seven days after unction, the body of the child is washed, and its head is shorn in the form of the cross; and, in general, a little cross of gold or other precious material, is suspended from its neck.

208
Marriage
ceremony.

The marriage ceremony in the Greek church consists of three parts. The first office is that of the espousals or betrothing. The parties pledge themselves to be true to each other, by the interchange of rings; and the priest before whom the vows are made, presents lighted tapers to the contracting pair. The liturgy being said, the priest places the parties who come to be betrothed, before the door which leads into the sanctuary, while two rings are laid on the holy table. The priest makes the sign of the cross three times on the heads of the betrothed couple; and then touching their foreheads with the lighted tapers, presents one to each. Then follows the benediction, with a few short prayers, after which

Russ. the priest takes the rings, and gives one to the man, and the other to the woman, with a short address, which he repeats thrice to each, signs them on the forehead with the rings, and puts these on the forefingers of their right hands. The espoused couple then exchange their rings, and after a long prayer from the priest, are dismissed.

The second rite is called the matrimonial coronation, as in this the bride and bridegroom are crowned, to indicate their triumph over all irregular desires. The betrothed parties enter the sanctuary with lighted tapers in their hands, the priest preceding with the censor singing the nuptial psalm, in which he is accompanied by the choristers. After being assured of the inclination of each party to receive the other in wedlock, the priest gives them the holy benediction, and after three invocations, takes the crowns, and places one on the head of the bridegroom, and the other on that of the bride. After this is read St Paul's epistle on the duties of marriage, with some other portions of Scripture, and several prayers. The cup is then brought, and blessed by the priest, who gives it thrice both to the bride and bridegroom, after which he takes them by the hand, and leads them in procession, attended by bridemen and maids, three times round a circular spot, turning from west to east. The crowns are now taken off their heads; and after proper addresses, and a short prayer, the company congratulate the parties: these salute each other, and the ceremony of coronation is terminated by a holy dismissal.

The third rite is called that of dissolving the crowns, and takes place on the eighth day. It consists of little more than a prayer for the comfort and happiness of the married pair, after which the bride is conducted to the bridegroom's house.

On the death of a person, after the usual offices of closing the eyes and mouth, and washing the body, are performed, the priest is sent for to perfume the deceased with incense, while prayers and hymns are said and sung beside the corpse. The body is watched for a longer or shorter time, according to the rank of the deceased; and when all things are ready for the interment, those relations who are to act as mourners and pall-bearers, are called together. Before the coffin is closed, the ceremony of the kiss must be performed, as the last respect paid to the body. The priest first, and then the relations and friends, take their farewell, by kissing the body of the deceased, or the coffin in which it is contained. The funeral service then begins with the priest pouring his incense from the holy censer on the coffin and the attendants, after which he gives the benediction, and the choristers chant suitable responses. The coffin is then carried into the church, the priests preceding with a lighted taper, and the deacon with the censer. When the procession reaches the sanctuary, the body is set down; the 91st psalm is sung, followed by several anthems and prayers. The corpse is then laid into the grave, while the funeral anthem to the Trinity is sung over it; and the ceremony of sprinkling earth on the coffin, usual in most countries, is performed. After this, oil is poured from a lamp on the coffin, and incense again diffused. The grave is next covered in, and the ceremony ends with a prayer to the Saviour for the rest and eternal happiness of the deceased.

Those who wish for a more minute account of these and

and other ceremonies of the Greek church, may consult Mr Ker Porter's *Travelling Sketches*, vol. i. letters 8, 9, and 10.

The hierarchy of the Russians consists of three metropolitans, seven archbishops, and 18 bishops. We have seen that there was originally at the head of the church a patriarch, who possessed all the power of the Roman pope. This office was abolished by Peter I. The whole number of ecclesiastics belonging to the church of Russia, is computed at 67,900, and the number of churches at 18,350.

There are several monasteries and convents in the Russian empire, where the monks and nuns, as in Roman Catholic countries, lead a life of seclusion and indolence, though their inhabitants are not subject to such severe restrictions as those of the Catholic persuasion. The heads of the monasteries are called *archimandrites* or *hegumens*, the former being nearly synonymous with abbot, the latter with prior. The superior of a nunnery is called *hegumena*. The principal religious order is that of St Basil; and the chief monasteries are those of St Alexander Nefsky at St Petersburg, and Divitchy at Mosco.

Formerly no religion, except the Greek, was tolerated in Russia; but, since the reign of Peter I., all religions and sects are tolerated throughout the empire. It was indeed with great difficulty that Peter could be prevailed on to allow the free exercise of the Roman Catholic religion; but this is now not only tolerated, but is dignified by the establishment of Russian Catholic bishops. Even the despised Jews are permitted to hold their synagogues, and the Mahometans their mosques.

The Russian language is a dialect of the ancient Gothic, and is extremely difficult of pronunciation by a southern European; though in the mouth of the politer Russians, it appears by no means deficient in melody. It is very difficult to acquire, as it abounds with extraordinary sounds and numerous anomalies. The characters amount to at least 36, some of which resemble those of the Greek language, while others are peculiar to the Russ. Among other singularities there is one character to express *sch*, and another *ssch*, which latter sound is said to be scarcely capable of enunciation, except by the most barbarous of the Russian natives. See PHILOLOGY, N° 220.

Since the accession of the emperor Alexander, the literature of Russia has undergone a material improvement. Incredible indeed, was the pressure of the rigorous genius-destroying restrictions and prohibitory edicts under the reign of Paul, of the state of whose mind, continually tormented with suspicion, but in other respects endowed with many good qualities, so striking a picture has been drawn by Kotzebue, in *The most Remarkable Year of his Life*, of which a Russian translation has been published. During that inauspicious season, only a few plants sprang up here and there in the garden of Russian literature, chiefly in Petersburg, and for the glorification of imperial institutions. Among these, for instance, may be reckoned the Cabinet of Peter the Great, written in the Russian language by Joseph Bielajeu, under librarian to the Academy of Sciences, and splendidly printed in 1800, at the expense of the academy, in three large quarto volumes. It is intended to be a catalogue of the books, natural curiosities, works of art, medals, pictures, and other treasures,

which the academy founded by Peter the Great possesses; but it is to be feared, that this list itself will swell to a library, if the succeeding parts should be written in the same spirit as the first three. The first volume contains only the relics of Peter the Great, with five plates, comprehending even the productions of his turning lathe, which are preserved, as is well known, in a separate apartment. The second volume gives some, but extremely defective accounts of the Academic Library, in which there are 2964 Russian works (and among them not fewer than 305 Russian romances!) and 1350 MSS. (236 of them Chinese, and 410 relating to the history of Russia). In the third volume, the cabinet of medals is illustrated. It is really astonishing how many curiosities and exquisite works of art have from every part of Europe been collected in St Petersburg, especially under the reign of Catherine II. What treasures of art and literature are to be found only in the imperial hermitage! Here, for instance, is the most valuable and complete collection of ancient engraved gems, of which the celebrated collection of the duke of Orleans composes only a small part. Here the libraries of Voltaire and Diderot are placed, containing their MSS. and manuscript notes on the margins of the books. M. Von Köhler, a German, is the keeper of these treasures; and the antiquarian writings which he has published in the French and German languages, sufficiently prove him to be a proper person for such an office. It is, however, an unfortunate circumstance for the rest of Europe, that it is difficult to learn what has been swallowed up by these repositories on the banks of the Neva. It is therefore to be lamented, that the splendid description of the Michaelowitzian palace has since the death of Paul been discontinued. From what Kotzebue has said concerning it in the second volume of the account of his exile, one may guess what immense quantities of curiosities it contained. At present only three large engravings of the external views of the now deserted palace, are to be obtained at the price of 40 rubles. Of Gotschiza too, the favourite residence of Paul, and which the new emperor has presented to the empress dowager, we have a view in six large sheets, engraved before the death of the late emperor, and giving us at least a general idea of the plan of the extensive pleasure grounds, &c.

There is no longer any doubt that the new university of Dorpat, which has already cost the nobility of Esthonia and Livonia more than 100,000 rubles, will at length be established by authority. Several learned men were invited from foreign countries to fill the professional chairs, and some of them had arrived in the beginning of 1802. The military academy, which has likewise been erected at Dorpat, has received great favour and support from the emperor. Full permission is now again granted to visit foreign schools and universities; and in consequence, about 70 Livonians, Esthonians, and Courlanders, now prosecute their studies at the university of Jena; and proportionate numbers at the universities of Germany.

The book-trade, which had been entirely annihilated, has for the most part broken the iron fetters imposed by the licensers; it is indeed a highly beneficial change, that no Tumanskow, and other Russian zealots, but Germans, are appointed to examine German books. Here, however, many things still require to be corrected.

Russia.

ed. The new emperor, notwithstanding his almost incredible activity, cannot at once discover all the abuses and improper applications of some of the laws, nor by an *emmenoi ukase*, open to every innoxious book (as was the case with respect to Kotzebue's *Most Remarkable Year*) the gate that had been shut against it by the licensers. For Kotzebue's work would not have been permitted to pass, if the procurator-general in St Petersburg had not laid a copy before the emperor himself, and received a particular *ukase* in its favour. Another great impediment to literature is, that all books must be imported by sea; and consequently during the winter no new publications can be procured from abroad. The greatest difficulty in procuring books, however, arises from the circumstance that a Russian *ukase* always remains in full force till it be expressly repealed by another. Previous to the reign of Paul, the examination and licensing of books was entrusted to the chief magistrates of the respective capitals; but Paul appointed inferior licensers for that purpose, and the same regulation continues, unless altered by a particular *ukase*. Under Paul, nothing was permitted to be printed in the large printing-office of Reval, except advertisements, playbills, hymns for the Reval hymn book, and the weekly newspaper, the articles contained in which were subjected to a strict previous examination; and the same restrictions continued to be enforced in 1802, though repugnant to the emperor's intentions, because no *emmenoi ukase* had been published to abolish them. A wine merchant in Reval was desirous of having some tickets printed, for the purpose of distinguishing his different sorts of wine. At first the licenser would not permit any of the French wines to have their names printed, and when at last he relented with respect to this point, the printing of the words *St Ueber's wine*, and *bishop*, a well-known drink composed of wine and oranges, was deemed by him quite inadmissible, because *St* denotes saintship, and ought not to be profaned by being affixed to a wine bottle, and because *bishop* denotes an ecclesiastical dignity, and of course should not be exposed to a similar profanation. *

* *Monthly Magazine*, vol. xiii. p. 215.

A new school of practical jurisprudence has lately been established at St Petersburg. Here there are four professors who give lectures on the law of nature and nations, on the Roman law, on ethics, and on the history of Russia, besides a course of lectures on the commission of legislation. All the lectures are in the Russian language.

The Academy of Sciences at St Petersburg have formed the plan of a rule for the manner of writing Russian words with foreign characters, and foreign words with Russian characters. This plan consists of a vocabulary, drawn up by a committee of the academy, and composed of two alphabets, German and French, by means of which the proper orthography and pronunciation of words in the Russian language are rendered intelligible to foreigners.

For a fuller account of the language and literature of Russia, we may refer our readers to Tooke's *View of the Russian Empire*, vol. iii. p. 572., and his *Life of Catharine II.* vol. iii. p. 394.

215
State of the
Russian
stage.

Notwithstanding the partiality of the court of St Petersburg for dramatic exhibitions, no idea was entertained of erecting a Russian theatre in the capital till the year 1756. Feodor Wolchhof, the son of a merchant

of Yaroslavl had, in 1749, erected a theatre in his native city, in consequence of the delight with which he had been inspired on witnessing the exhibitions of the German players at the capital. Accordingly, when he returned home, he fitted up a large saloon in his father's house for a theatre, and painted it himself; then mustering a small company, consisting of his four brothers and some other young persons, he represented sometimes the sacred pieces of the bishop Dimitri Rostoffschy, sometimes the tragedies of Sumarokof and Lomonossof, which had just appeared; and at other times, comedies and farces of his own composition. The undertaking of Wolchhof met with the greatest encouragement. Not satisfied with lavishing applause upon him, the neighbouring nobility furnished him in 1750 with the requisite funds for erecting a public theatre, where money was taken for admission. The report of this novelty reached St Petersburg, and in 1752 the empress Elizabeth sent for Wolchhof's company. He was placed, with several of his young actors, in the school of the cadets, to improve himself in the Russian language, and in particular to practise declamation.

At length, in 1756, the first Russian theatre was formally established by the exertions of Sumarokof, and the actors paid by the court. A German company appeared in 1757, but it was broken up by the arrival of an Italian opera. The opera *Buffa* formed in 1759 at Mosco had no better success; its failure was favourable to that which remained at St Petersburg, and which received so much the more encouragement. The fireworks displayed on the stage after the performance, afforded great amusement to the public, and drew together more company than the music. At the coronation of the empress Catharine II., the Russian court theatre accompanied her to Mosco, but soon returned to St Petersburg, where it has been fixed ever since. The taste for dramatic exhibitions had at this period become so general, that not only the most distinguished persons of the court of the two capitals performed Russian plays, but Italian, French, German, and even English theatres arose, and maintained their ground for a longer or shorter time. Catharine the Great, desirous that the people should likewise participate in this pleasure, ordered a stage to be erected in the great place in the wood of Brumberg. There both the actors and the plays were perfectly adapted to the populace that heard them. What will seem extraordinary is, that this performance sometimes attracted more distinguished amateurs; and it is perhaps the only theatre where spectators have been seen in carriages of four and six horses. But what is still more surprising is, to see actors ennobled as a reward for their talents, as was the case in 1762, with the two brothers Feodor and Gregory Wolchhof. The former died the following year, while still very young. His reputation as a great tragic and comic actor will perhaps one day be considerably abated; but the Russians will ever recollect with gratitude that he was the real founder of the Russian stage.

They will likewise remember the services of Sumarokof as a tragic poet. He first showed of what the Russian language, before neglected, was susceptible. Born at Mosco in 1727, of noble parents, he zealously devoted himself to the study of the ancient classic authors and of the French poets. This it was that roused his poetic talents. His early compositions were all on the

ussia. the subject of love. His countrymen admired his songs, and they were soon in the mouth of every one. Animated by this success, Sumarakof published by degrees his other poetical productions. Tragedies, comedies, psalms, operas, epitaphs, madrigals, odes, enigmas, elegies, satires; in a word, every species of composition that poetry is capable of producing, flowed abundantly from his pen, and filled not less than ten octavo volumes. His tragedy, *Choruf*, was the first good play in the Russian language. It is written in Alexandrine verses, in rhyme, like his other tragedies, as *Hamlet*, *Sinaw* and *Trumor*, *Aristona*, *Semira*, *Ngaropolk* and *Dimisa*, the false *Dimitri*, &c.; and this first performance showed, that in the plan, the plot, the character, and style, he had taken *Corneille*, *Racine*, and *Voltaire*, for his models. Though Sumarakof possessed no very brilliant genius, he had, however, a very happy talent of giving to his tragedies a certain originality, which distinguished them from those of other nations. He acquired the unqualified approbation of his countrymen by the selection of his subjects; almost all of which he took from the Russian history, and by the energy and boldness which he gave to his characters. But his success rendered him so haughty and so vain, that he could not endure the mildest criticism. Jealous of the fame acquired by *Lomonossof*, another Russian poet, he sought every opportunity of discouraging him; and it was a great triumph to Sumarakof to observe that the public scarcely noticed the first dramatic essays of that writer, and that they were soon consigned to oblivion.

Sumarakof has likewise written a great number of comedies, in which the manner of *Moliere* is discoverable. In spite of their original and sometimes low humour, they were not much liked. The principal are, the *Rival Mother* and her *Daughter*; the *Imaginary Cuckold*; the *Malicious Man*, &c. He has composed some operas; among others, *Cephalus* and *Procris*, set to music by *d'Araja*, master of the imperial chapel, and represented for the first time at *St Petersburg* during the carnival of 1755. The performers of both sexes were children under the age of 14.*

The state of agriculture in the Russian empire is of course extremely various. Husbandry is scarcely known in the northern parts of the governments of *Olonetz* and *Archangel*; but in the central parts of the empire has been pursued from the earliest ages. The Russian plough is light and simple, and scarcely pierces the ground to the depth of two inches; but in the southern provinces a heavier kind is used, resembling the German. In what is called the summer field, the corn is sown and reaped in the same year; while in the winter field the corn is sown in autumn, and the produce reaped in the ensuing summer. The former yields what is called summer wheat, and rye, barley, millet, buckwheat, flax, hemp, peas, &c. the latter only wheat or rye; and the winter field is commonly left fallow to the following spring. In general, agriculture is conducted with great negligence, yet the harvests are abundant. Even in the neighbourhood of *St Petersburg*, there are large marshes which might be easily drained, and converted into fertile land. In the north, rye is most generally cultivated; but in the middle and southern regions, wheat; in the government of *Ekatarinoslaf* the *Arnautan* wheat is beautiful, the flour yellowish, the

return commonly fifteen fold: nor is Turkish wheat, or maize, unknown in *Taurida*. Barley is a general production, and is converted into meal, as well as oats, of which a kind of porridge is composed. Rice succeeds well in the vicinity of *Kislear*. Potatoes are unaccountably neglected, except in the north. This invaluable root bears the cold of *Archangel*, and yields from 30 to 50 fold. Flax and hemp form great objects of Russian cultivation. Madder, woad, and saffron, grow wild in the south. The hop is also cultivated, and is found wild near the *Uralian* chain, and in *Taurida*. Tobacco has been produced since the year 1763, chiefly from Turkish and Persian seed. In the gardens are cultivated cabbages (of which a great number is consumed in the form of *sour-kROUT*), and other plants common in Europe. The government of *Moscow* produces abundance of excellent asparagus, and sugar-melons abound near the *Don* and the *Volga*. Large orchards are seen in the middle and southern parts of Russia, yet quantities of fruit are imported. What is called the *Kireskoi* apple often weighs four pounds, is of an agreeable flavour, and will keep a long time. A transparent sort from *China*, is also cultivated, called the *Nalivni*, melting and full of juice. The culture of the vine has been attempted in the south, and will certainly succeed in *Taurida*. Bees are not known in *Siberia*, but form an object of attention in the *Uralian* forests, where proprietors carry their hives to a considerable height in large trees, and they are secured from the bear by ingenious contrivances described by *Mr Tooke*. Mulberry trees and silk are not unknown in the south of European Russia, especially in *Taurida* and the *Krimea*. In the *Krimea*, camels are very commonly used for draught, a custom which seems peculiar to that province.

The arts in Russia have received very considerable improvement within the last 50 years. Most of the arts that relate to luxuries are exercised at *St Petersburg*, to such an extent, and in such perfection, as to render it unnecessary to import these articles from other countries. The chief works of this kind are those of gold and silver goods. Here are 44 Russian and 139 foreign, consequently in all 183 workers in gold, silver, and trinkets, as masters; and besides them several gilders and silverers. The pomp of the court, and the luxury of the rich and great, have rendered a taste in works of this kind so common, and carried the art itself to such a pitch, that the most extraordinary objects of it are here to be met with. Several of them are wrought in a sort of manufactory; in one set of premises are all the various workmen and shops for completing the most elegant devices, ornamental and useful, from the rough bullion. Even the embroiderers in gold and silver, though they are not formed into a company, are yet pretty numerous. The works they produce are finished in so high a taste, that quantities of them are sold in the shops that deal in English or French goods, and to which they are not inferior. This business, which is a perpetual source of profit to a great number of widows and young women of slender incomes, forms a strong objection to the declamations against luxury. Perhaps the remark is not unnecessary, that sham laces and embroidery cannot here be used, even on the stage. Next to these may be ranged the host of milliners, who are mostly of French descent; and here, as in *Paris*, together with their industry, are endowed with a variety of agreeable

Russia.

Russia.

agreeable and profitable talents. Their numbers are daily increasing; and the greater their multitude, the better they seem to thrive. Their works are neat, elegant, and modish; but they certainly bear an enormous price: a *marchande des modes*, if she understand her business, is sure to make a fortune. The generality of them, after completing this aim, return to their native country.

The coachmaker's trade is likewise here in a flourishing state. The great concerns in which this business is carried on in all its parts, from the simple screw to the finest varnish; the solidity and durability, the elegance and the taste of the carriages they turn out, the multitude of workmen, and, in short, the large sums of money that are employed in them, which would otherwise be sent abroad for these vehicles, render this business one of the most consequential of the residence. In the judgment of connoisseurs, and by the experience of such as use them, the carriages made here yield in nothing to those of Paris or London; and in the making of varnish the Russians have improved upon the English: only in point of durability the carriages are said to fall short of those built by the famous workmen of the last-mentioned nation; and the want of dry timber is given as the cause of this failure. With all these advantages, and notwithstanding the great difference in price, increased by the high duties of those carriages which come from abroad, yet these are yearly imported to a great amount. The Russians have, however, succeeded in appropriating the greater part of this business to themselves. The shape of their carriages is in the height of the mode; the varnish is excellent, and the whole outward appearance elegant and graceful: but for durability, the reputation of the Russian workmen is inferior to that of the Germans settled in this country. This censure applies to all the Russian works of art; their exterior is not to be found fault with, but they are deficient in the solidity which so much recommends the work of foreign artists. The Russians have indeed to contend with an obstacle that renders it almost impossible for them to employ so much time, labour, and expense, on their work, as are requisite for bringing it to the utmost perfection. This is the general prejudice in favour of British commodities, which is nowhere carried to so high a pitch as it was in Russia a few years ago. The Russian workman, therefore, naturally endeavours to impose his work upon the customer for foreign; and where this is not practicable, he is obliged to sacrifice solidity to outward appearance, for which alone he can expect to be paid. A chariot made by a German coachmaker will cost 600 or 700 rubles, whereas a Russian chariot can be bought for half the money; and it sometimes happens that the latter is even more durable than the former.

Joinery is exercised as well by the Russians as the Germans; but the cabinet-maker's art, in which the price of the ingenuity far exceeds the value of the materials, is at present solely confined to some foreigners, among whom the Germans distinguish themselves to their honour. The artists of that nation occasionally execute masterpieces, made at intervals of leisure under the influence of genius and taste, and for which they find a ready sale in the residence of a great and magnificent court. Thus, not long since one of these made a cabinet, which for invention, taste, and excellency of

Russia.

workmanship, exceeded every thing that had ever been seen in that way. The price of this piece of art was 7000 rubles; and the artist declared, that with this sum he should not be paid for the years of application he had bestowed upon it. Another monument of German ingenuity is preserved in the Academy of Sciences, in the model of a bridge after a design of the state counsellor Von Gerhard. This bridge, which would be the most magnificent work of the kind, if the possibility of its construction could be proved, consists of 11 arches, a drawbridge for letting vessels pass, distinct raised footways, landing places, &c. The beauty of the model, and the excellency of its execution, leave every thing of the sort very far behind. The Empress Catharine II. rewarded the artificer with a present of 4000 rubles, and he was ever after employed by the court.

Both these works of art have been, however, far excelled by a writing desk made by Röntgen, a native of Neuwied, and a Moravian, who lived several years in St Petersburg, and embellished the palaces of the empress and principal nobility with the astonishing productions of his art. In this writing desk the genius of the inventor has lavished its riches and its fertility in the greatest variety of compositions: all seems the work of enchantment. On opening this amazing desk, in front appears a beautiful group of bas-reliefs in bronzes superbly gilt; which, by the slightest pressure on a spring, vanishes away, giving place to a magnificent writing-flat inlaid with gems. The space above this flat is devoted to the keeping of valuable papers or money. The bold hand that should dare to invade this spot would immediately be its own betrayer; for, at the least touch of the table part, the most charming strains of soft and plaintive music instantly begin to play upon the ear, the organ whence it proceeds occupying the lower part of the desk behind. Several small drawers for holding the materials for writing, &c. likewise start forward by the pressure of their springs, and shut again as quickly, without leaving behind a trace of their existence. If we would change the table part of the bureau into a reading-desk, from the upper part a board springs forward, from which, with incredible velocity, all the parts of a commodious and well contrived reading-desk expand, and take their proper places. The inventor offered this rare and astonishing piece to the empress Catharine II. for 20,000 rubles; but she generously thought that this sum would be barely sufficient to pay for the workmanship; she therefore recompensed his talents with a farther present of 5000 rubles. Her majesty presented this matchless piece of art to the Academy of Sciences, in whose museum it still remains.*

The Russian skill in architecture is evinced by the magnificent buildings which adorn the city of St Petersburg, and more especially by the Taurida palace. Here is seen the largest hall of which we have any account. This prodigious hall was built after the unassisted design of Prince Potemkin, and unites to a sublime conception, all the graces of finished taste. It is supported by double rows of colossal doric pillars, opening on one side into a vast pavilion, which forms the emperor's winter garden. This garden is very extensive, the trees chiefly orange, of an enormous size, sunk in the earth in their tubs, with fine mould covering the surface between them. The walks are gravelled; wind and undulate in a very delightful manner; are neatly turfed,

* Took
Catharine
II. vol.
p. 50.

Russia. and lined with roses and other flowers. The whole pavilion is lighted by lofty windows, and from the ceiling are suspended several magnificent lustres of the richest cut glass. In the enormous hall of which this garden forms a part, Prince Potemkin gave the most sumptuous entertainment ever recorded since the days of Roman voluptuousness. *

es.

Among the Russian manufactories, the imperial establishments are so much distinguished for the magnitude of their plan, and the richness and excellence of their productions, that they may enter into competition with the most celebrated institutions of the same kind in any other country. The tapestry manufactory, which weaves both hangings and carpeting, produces such excellent work, that better is not to be seen from the Gobelines in Paris. The circumstance that at present only native Russians are employed, enhances the value and curiosity of the establishment. Nowhere, perhaps, is the progress of the nation in civilization more striking to the foreigner than in the spacious and extensive work rooms of this manufactory. The porcelain manufactory likewise entertains, excepting the modellers and arcanists, none but Russian workmen, amounting in all to the number of 400, and produces ware that, for taste of design and beauty of execution, approaches near to their best patterns. The clay was formerly brought from the Ural, but at present it is procured from the Ukraine, and the quartz from the mountains of Olonetz. It is carried on entirely at the expense of government, to which it annually costs 15,000 rubles in wages, and takes orders. But the price of the porcelain is high; and the general prejudice is not in favour of its durability. The Fayence manufactory has hitherto made only ineffectual attempts to drive out the queen's ware of England; but the neat and elegant chamber-stoves made there give it the consequence of a very useful establishment. Almost all the new built houses are provided with the excellent work of this manufactory, and considerable orders are executed for the provinces.

A bronze manufactory, which was established for the use of the construction of the Isaak church, but works now for the court and private persons, merits honourable mention, on account of the neatness and taste of its executions.

The stone-cutting works of Peterhof are remarkable for the mechanism of their construction. All the instruments, saws, turning lathes, cutting and polishing engines, are worked by water under the floor of the building. Fifty workmen are here employed in working foreign, and especially Russian sorts of stone, into slabs, vases, urns, boxes, columns, and other ornaments of various kinds and magnitudes. Many other imperial fabrics for the use of the army, the mint, &c. are carried on in various places; but the description of them would lead us beyond our limits.

The number of private manufactories at present subsisting in St Petersburg amounts to about 100. The principal materials on which they are employed, some on a larger and others on a smaller scale, are leather, paper, gold and silver, sugar, silk, tobacco, distilled waters, wool, glass, clay, wax, cotton and chintz. Leather, as is well known, is among the most important of their manufactures for the export trade; accordingly here are 16 tan-works. The paper manufactories amount to the like number, for hangings and general use.

Russia. Twelve gold and silver manufactories sell threads, laces, edgings, fringes, epaulets, &c. There are 8 sugar works; 7 for silk goods, gauze, cloths, hose, stuffs and several others. Here must not be forgotten the great glass-houses set on foot by Prince Potemkin, where all the various articles for use and ornament, of that material, are made; but particularly that for looking glasses, where they are manufactured of such extraordinary magnitude and beauty, as to exceed any thing of the kind produced by the famous glass-houses of Murano and Paris. Among many others which we cannot here particularize, are not fewer than five letter foundries, one manufactory for clocks and watches, &c.

In giving a general view of the commerce of the Russian empire, it will be necessary that we should first enumerate the exports and imports, with their average amount, and we shall then be able, by comparing these, to form a just estimate of the commercial advantages enjoyed by the empire. Mr Tooke has furnished us with the following statements of the annual exports from St Petersburg, on an average of ten years, from 1780 to 1790. During that time there were annually exported,

Iron,	2,655,038	poods.
Saltpetre,	19,528	do.
Hemp,	2,498,950	do.
Flax,	792,932	do.
Napkins and linens,	2,907,876	arschines*
Sail-cloth and flems,	214,704	pieces.
Cordage,	106,763	poods.
Hemp oil and linseed oil,	167,432	do.
Linseed,	192,328	do.
Tobacco,	52,645	do.
Rhubarb,	129	do.
Wheat,	105,136	do.
Rye,	271,976	do.
Barley,	35,864	do.
Oats,	200,000	do.
Masts,	1456	
Planks,	1,193,125	
Boards,	85,647	
Rosin,	7,487	do.
Pitch,	9,720	do.
Tar,	37,336	do.
Train oil,	81,386	do.
Wax,	10,467	do.
Tallow, and tallow candles,	943,618	do.
Potashes,	31,712	do.
Isinglas,	5,516	do.
Caviar,	8,958	do.
Horse hair,	5,635	do.
Horse tails,	69,722	
Hogs bristles,	29,110	do.
Russia matts,	106,045	
Goats skins,	292,016	
Hides and sole leather,	144,876	do.
Pieces of peltry,	621,327	
Ox tongues,	9982	
Ox bones,	73,350	

It will be seen from the above table, that a very great proportion of the exports of Russia consists of raw materials, or of the unmanufactured products of the country. Indeed the employment of the nation, considerably as it has increased since the time of Peter I., is still directed more to production than to manufacture. This

Russia. is the natural progress of every human society advancing towards civilization; and Russia must continue to confine itself to the production and to the commerce in products, till the degree of its population, and the employment of its inhabitants, be adequate to the manufacturing of its raw materials.

The buying up of the foregoing articles, and their conveyance from the remote and midland regions of the empire, form an important branch of the internal commerce. The greater part of these products is raised on the fertile shores of the Volga; and this inestimable river, which, in its course, connects the most distant provinces, is at the same time the channel of business and industry almost to the whole empire. Wherever its water laves the rich and fruitful coast, diligence and industry have fixed their abode, and its course marks the progress of internal civilization. St Petersburg, though at a distance of from 5000 to 6000 versts from the rich mines of Siberia, receives, through the medium of this river, the stores of its enormous magazines, the greater part of which are brought thither from the most eastern districts of Siberia, almost entirely by water. The Selenga receives and transfers them to the Baikal, whence they proceed by the Angara to the Yenissy, and pass from that river along the Oby into the Tobol. Hence they are transported over a tract of about 400 versts by land, to the Tchussovaiya; from this river into the Kamma, and thence into the Volga, from which they pass through the sluices at Vishney-Volotshok into the Volkhof, and from that river into the Ladoga lake; from which, lastly, after having completed a journey through two quarters of the globe, they arrive by the Neva, at the place of their destination. This astonishing transport is rendered still more interesting by the consideration that these products, thus conveyed to St Petersburg from the neighbourhood of the north-eastern ocean, remain here but for a few weeks, for the purpose of again setting out on a second, and perhaps a longer voyage, or, after being unshipped in distant countries, of returning thither under an altered form, and by a tedious and difficult navigation, coming back to their native land. Thus, how many scythes of the Siberian boors may have gone this circuitous course!

The number of vessels which, taking the average of ten years, from 1774 to 1784, came by the Ladoga canal to St Petersburg, was 2861 barks, 797 half-barks, 508 one masted vessels, 1113 chaloups; in all 5339. If to these we add 6739 floats of barks, we shall have a total of 12,078.

The value in money of these products is, by the want which Russia experiences of wrought commodities, and by the increasing luxury, so much lessened, that the advantage on the balance is proportionally very small. A list of the articles of trade with which St Petersburg annually furnishes a part of the empire, would afford matter for the most interesting economical commentary.

The annual imports brought to St Petersburg, on an average of ten years from 1780 to 1790, will appear from the following table.

	Rubles.
Silken stuffs to the amount of,	2,500,000
Woolen stuffs,	2,000,000
Cloth,	2,000,000

	Rubles.	Russia.
Cotton stuffs,	534,000	
Silk and cotton Stockings, 10,000 dozen pairs.		
Trinkets,	700,000	
Watches, 2000.		
Hardware,	50,000	
Looking glasses,	50,000	
English stone-ware,	43,800	
English horses, 250.		
Coffee, 26,300 poods.		
Sugar, 372,000 poods.		
Tobacco, 5000 poods.		
Oranges and lemons,	101,500	
Fresh fruit,	65,000	
Herrings, 14,250 tons.		
Sweet oil,	20,000	
Porter and English beer,	262,000	
French brandy, 50,000 ankers.		
Champagne and Burgundy, 4000 pipes.		
Other wines, 250,000 hogsheads.		
Mineral waters,	12,000	
Paper of different kinds,	42,750	
Books,	50,150	
Copper-plate engravings,	60,200	
Alum, 25,500 poods.		
Indigo, 3830 poods.		
Cochineal, 1335 poods.		
Glass and glass wares,	64,000	
Scythes, 325,000, &c. &c.		

A considerable part of these commodities remains for consumption at St Petersburg, while the rest is conveyed by land carriage to various parts of the empire. Land-carriage is preferred on these occasions, as the passage of the river up the stream would be tedious and expensive. The carts or sledges made use of in this conveyance are generally drawn by one horse, and have each its own driver; though sometimes on long journeys there is only one driver to every three carts. They commonly go in caravans of from 25 to 100 carts.

According to the above tables, we are now enabled to state the value of the exports and imports, and the balance of trade, at St Petersburg; and from these to deduce pretty just conclusions with respect to the commerce of the whole empire. By the most probable estimation on this same average of 10 years from 1780 to 1790, the statement will stand as follows.

Exports,	13,261,942	rubles
Imports,	12,238,319	do.

Thus the amount of the whole commerce of St Petersburg during the above period of ten years, was annually 25,837,325 rubles. The commerce of Russia by sea, exclusive of the Caspian sea, was stated by Storck at 30 millions of rubles of exports; but including the Caspian sea, and the commerce with China and other countries by land, he estimates the whole exports in 1796 at 50 millions of rubles. In 1805 they were stated by Crome at 72,400,000 of rubles; and from the increasing numbers of the population, must now be much greater. The imports according to the official statements are always less than the exports. The trade by land with China and other parts of Asia, is stated to employ 38,000 persons as carriers.

The proportion which the other principal sea-ports of the Russian empire share in the general commerce, will appear from the following table, drawn up for the year 1793.

	Rubles.
St Petersburg,	23,757,954
Riga,	8,985,929
Archangel,	2,525,308
Taganrok,	428,087

ver the goods according to the particulars therein specified, at which time they commonly receive the half or the whole of the purchase-money, though the goods are not to be delivered till the following spring or summer by the barks then to come down the Ladoga canal. The quality of the goods is then pronounced on by sworn *brackers* or sorters, according to the kinds mentioned in the contract. The articles of importation are either disposed of by the Russian merchants through the resident factors, or the latter deliver them for sale at foreign markets; in both cases the Russian, to whose order they came, receives them on condition of paying for them by instalments of 6, 12, and more months. The Russian merchant, therefore, is paid for his exports beforehand, and buys such as are imported on credit; he risks no damages by sea, and is exempted from the tedious transactions of the custom-house, and of loading and unloading.

The clearance of the ships, the transport of the goods into the government warehouses, the packing and unpacking, unloading and despatching of them,—in a word, the whole of the great bustle attendant on the commerce of a maritime town is principally at Cronstadt, and that part of the residence called Vassiliostrof. Here are the exchange, the custom-house; and in the vicinity of this island, namely, on a small island between that and the Petersburg island, the hemp warehouses and magazines, in which the riches of so many countries are bartered and kept. In all the other parts of the city, the tumult of business is so rare and imperceptible, that a stranger who should be suddenly conveyed hither, would never imagine that he was in the chief commercial town of the Russian empire. The opulent merchants have their dwellings and counting-houses in the most elegant parts of the town. Their houses, gateways, and court-yards, are not, as in Hamburg and Riga, blocked up and barricaded with bales of goods and heaps of timber. Here, besides the counting-house, no trace is seen of mercantile affairs. The business at the custom-house is transacted by one of the clerks, and people who are hired for that purpose, called *expeditors*; and the labour is performed by *artelschiki*, or porters belonging to a kind of guild.

The factor delivers the imported goods to the Russian merchant,

The commerce of St Petersburg is carried on chiefly by commission in the hands of factors. This class of merchants, which consists almost entirely of foreigners, forms the most respectable and considerable part of the persons on the exchange. In the year 1790, of the foreign counting houses, not belonging to the guilds, were 28 English, 7 German, 2 Swiss, 4 Danish, several Prussian, 6 Dutch, 4 French, 2 Portuguese, 1 Spanish, and 1 Italian. Besides these, were 12 denominated burghers, and of the first guild 106, with 46 foreign merchants, and 17 belonging to other towns, though several cause themselves to be enrolled in these guilds who are not properly merchants.

The Russian merchants from the interior of the empire repair, at a stated time, to St Petersburg, where they bargain with the factors for the sale of their commodities. This done, they enter into contracts to deli-

(M) To this table of the principal sea-ports of Russia, must now be added the town of Odessa, or New Odessa, which 10 years ago was scarcely known as a place of trade, but is now become a populous and important sea-port. Odessa is situated in the government of Katharinoslaf, on a small gulf of the Black sea, between the rivers Dniepr and Dniestr, 44 miles W. by S. of Otchakof, and nearly 1000 miles S. of St Petersburg. In 1805, this town contained a population of 10,000 persons, and its population was yearly increasing. The houses are well built of free stone; the streets are wide, and are disposed according to a regular plan, but unpaved. The town is fortified, has a secure and capacious harbour, capable of admitting vessels of considerable burden, and a mole or quay extending above one-fourth of a mile into the sea, susceptible of being converted to the most useful purposes. There are several warehouses for the purpose of depositing bonded goods, at times when the market proves unfavourable. The public markets are well supplied, and there are two good theatres, besides other places of public amusement. The society of this thriving town is rendered extremely gay by the residence of the Polish nobles, who resort to it in great numbers, during the summer, for sea-bathing; and the wise and upright administration of the duke de Richelieu, who was governor in 1805, had added greatly to the prosperity of the place. The merchants are chiefly Germans and Italians, though, at the time we mention, there were established in this port two British houses of respectability. The chief exports from this place are wheat and other grain, with which 1000 ships have been loaded in a single year. Among the natural disadvantages of Odessa, must be noticed the bareness and want of wood in its immediate neighbourhood, and the dangerous navigation of the Black sea, from the currents and want of sea room. In point of commercial importance, Odessa ranks at least on an equal footing with Taganrok. Long. 29° 24' E. Lat. 46° 28' N. See *Macgill's Travels in Turkey, Italy, and Russia*, vol. i. p. 257.

Russia.

merchant, who sends them off, in the manner already mentioned, or retails them on the spot, in the markets, warehouses, and shops.

There is no exaggeration in affirming, that it would be difficult to point out a people that have more the spirit of trade and mercantile industry than the Russians. Traffic is their darling pursuit; every common Russian, if he can but by any means save a trifling sum of money, as it is very possible for him to do, by his frugal and poor way of living, tries to become a merchant. This career he usually begins as a *rasnoschik* or seller of things about the streets; the profits arising from this ambulatory trade, and his parsimony, soon enable him to hire a *lavka* or shop; where, by lending small sums at large interest, by taking advantage of the course of exchange, and by employing little artifices of trade, he in a short time becomes a pretty substantial man. He now buys and builds houses and shops, which he either lets to others, or furnishes with goods himself, putting in persons to manage them for small wages; begins to launch out into an extensive trade; undertakes *podriads*, contracts with the crown, deliveries of merchandise, &c. The numerous instances of the rapid success of such people almost exceed all description. By these methods a Russian merchant, named Sava Yacovlof, who died not many years ago, from a hawker of fish about the streets, became a capitalist of several millions of rubles. Many of these favourites of fortune are at first vassals, who obtain passes from their landlords, and with these stroll about the towns, in order to seek a better condition of life, as labourers, bricklayers and carpenters, than they could hope to find at the plough tail in the country. Some of them continue, after fortune has raised them, and even with great riches, still slaves, paying their lord, in proportion to their circumstances, an *olero*k, or yearly tribute. Among the people of this class at St Petersburg are many who belong to Count Sheremetof, the richest private man in Russia, and pay him annually for their pass above 1000 rubles. It often happens that these merchants, when even in splendid circumstances, still retain their national habit and their long beard; and it is by no means rare to see them driving along the streets of the residence, in this dress, in the most elegant carriages. From all this it is very remarkable, that extremely few Russian houses have succeeded in getting the foreign commission trade; a striking proof that there is *something* besides industry and parsimony requisite to mercantile credit, in which the Russians must have been hitherto deficient.

Those who wish for a more minute account of the arts, manufactures, commerce and trade of the Russian empire, will find ample details on these important subjects, in the third volume of Mr Tooke's *View of the Russian empire, during the reign of Catharine II. and to the close of the eighteenth century.*

This vast empire contains within its boundaries, according to Mr Tooke's account, not fewer than 81 distinct nations, differing from each other in their origin, their language, and their manners. Without enumerating all those tribes, the names of many of which are scarcely known to civilized Europe, we shall only particularize the most remarkable. These are the descendants of the ancient Slavi, comprehending the Russians properly so called, and the neighbouring Poles; the Fins, under which denomination we may include the

221
Nations
composing
the Russian
empire.

Laplanders, the Esthonians, the Livonians, the Permi-ans, and the Ostiaks; the numerous Tartar hordes that inhabit the southern parts of the empire, comprehending the Mongol Tartars, the Kalmuks, the Derbetans, the Torgots, the Bargaburats; the Khazares, the Kangli or Petchenegans; the Siberian Tartars; the Tartars of the Crimea; the Baschkirs; the Kirgsheses, and the Chevines; the inhabitants of the regions of Mount Caucasus, including the Georgians; the Mandshurs, including the Tunguses, the Samoiedes, the Kamtschadales, and the Kozaks.

Of several of these nations we have already given an account, in the articles COSSACS, KAMTSCHATKA, LAPLAND, POLAND, &c.; and we shall here confine ourselves chiefly to the manners and customs of the Russians, the Fins, the Samoiedes, the Baschkirs, the Kozaks, the inhabitants of the Ukraine, and the Crimean Tartars.

The native Russians are of the middle size, of a strong and robust make, and in general extremely hardy. They have usually a small mouth, with thin lips and white teeth; little eyes; a low forehead; the nose frequently small, and turned upwards, and a bushy beard. The expression of their countenance is grave, but good-natured. The gait and gestures of the body have often a peculiar and impassioned vivacity, partaking of a certain *complaisance*, and engaging manner. They are in general capable of bearing fatigue, want of accommodation and repose, better than the inhabitants of any other European nation. Notwithstanding the severity of the climate, their diseases are few, and there are frequent and remarkable instances of longevity.

With respect to general character, all writers allow that they are ignorant, and often brutal, not easily roused to action, and extremely addicted to drunkenness. They are also not remarkable for cleanliness.

Having thus given a general view of the Russian character, we must consider a little more particularly that of the several classes into which they may be divided, and make a few remarks on their manners and customs.

According to Mr Tooke, there is in Russia at present but one order of nobility, though it is not unusual with travellers to mention the higher and lower nobility. The title *boyar*, so common in the beginning of the 18th century, is now disused; and those of prince, count, and *baran*, form the principal distinctions. The Russian nobility have always enjoyed certain peculiar rights and privileges, though these have been rather derived from long usage, than sanctioned by any written law. Thus, they can exclusively possess landed estates, though they cannot alienate or sell them. If a nobleman be found guilty of any high crime, he may incur the forfeiture of his estate, his honour, or his life, but he cannot be made a vassal to the crown. The nobility can arbitrarily impose taxes and services on their vassals, and may inflict on them any corporal punishment short of death, and they are not responsible for their vassals. A nobleman cannot be compelled to raise recruits against his will, or to build a magazine or barrack for the crown; his person and landed property are exempted from taxation; he can hold assemblies, set up manufactories, and open mines on his own ground, without paying tribute to the crown. He is, however, bound to personal service in war. The Russian nobility live in great style, and support a considerable establishment of servants. As part

of this establishment, they have generally a dwarf and a fool. These dwarfs are the pages and playthings of the great, and, at almost all entertainments, stand for hours at their lord's chair, holding his snuff box, or awaiting his commands.

The tzar Alexei abhorred the personal abasement of the inferior classes to their superiors, which he would not accept when exhibited to himself; and it may appear surprising that Peter I. who despised mere ceremonials, should have encouraged every extravagance of this kind. In a few years of his reign, the beautiful simplicity of designation and address which his father had encouraged was forgotten, and the cumbersome and almost ineffable titles which disgrace the little courts of Germany were crowded into the language of Russia. He enjoined the lowest order of gentlemen to be addressed by the phrase, *your respectable birth*; the next rank, by *your high good birth*; the third, *your excellence*; the fourth, *your high excellence*: then came *your brilliancy*, and *high brilliancy*: *highness* and *majesty* were reserved for the grand duke and the emperor.

These titles and modes of address were ordered with all the regularity of the manual exercise; and the man who should omit any of them when speaking to his superior, might be lawfully beaten by the offended boyar. Before this period, it was polite and courtly to speak to every man, even the heir apparent, by adding his father's name to his own; and to the grand duke, Paul Petrovitch would have been perfectly respectful, or a single word signifying *dear father*, when he was not named. Though pompous titles were unknown among them before the era of Peter, the subordination of ranks was more complete than in any other European nation; but with this simplicity peculiar to them and the Poles, that they had but three ranks, the sovereign, the noblesse or gentry, and the serfs. It was not till lately that the mercantile rank formed any distinction; and that distinction is no more than the freedom of the person, which was formerly a transferable commodity belonging to the boyar. Notwithstanding this simplicity, which put all gentlemen on a level, the subscription of a person holding an inferior office was not *servant*, but *slave*; and the legal word for a petition in form was *tehelobitii*; which signifies a beating with the forehead, or stirring the ground with the forehead, which was actually done. The father of Alexei abolished the practice; but at this day, when a Russian petitions you, he touches his forehead with his finger; and if he be very earnest, he then puts his finger to the ground.

The Russian nobles formerly wore long beards, and long robes with strait sleeves dangling down to their ancles; their collars and shirts were generally wrought with silk of different colours; in place of hats, they covered their heads with furred caps, and instead of shoes, wore red or yellow leathern buskins. The dress of the women nearly resembled that of the other sex, with this difference, that their garments were looser, their caps fantastical, and their shift sleeves three or four ells in length, gathered up in folds from the shoulder to the fore arm. At present, however, the French fashions prevail among the better sort throughout all Russia.

The common people are generally tall, healthy, and robust, patient of cold and hunger, inured to hardships, and remarkably capable of bearing the most sudden transition from the extremes of hot or cold weather.

Nothing is more customary than to see a Russian, who is overheated and sweating at every pore, strip himself naked, and plunge into a river; nay, when their pores are all opened in the hot bath, to which they have daily recourse, they either practise this immersion, or subject themselves to a discharge of some pailfuls of cold water. This is the custom of both men and women, who enter the baths promiscuously, and appear naked to each other, without scruple or hesitation.

A Russian will subsist for many days on a little oatmeal and water, and even raw roots; an onion is a regale; but the food they generally use in their journeys is a kind of rye-bread, cut into small square pieces, and dried again in the oven. These, when they are hungry, they soak in water, and eat as a very comfortable repast. Both sexes are remarkably healthful and robust, and accustom themselves to sleep every day after dinner.

The Russian women are remarkably fair, comely, strong, and well-shaped, obedient to their lordly husbands, and patient under discipline; they are even said to be fond of correction, which they consider as an infallible mark of their husbands' conjugal affection; and they pout and pine if it is withheld, as if they thought themselves treated with contempt and disregard. Of this neglect, however, they have very little cause to complain; the Russian husband being very well disposed, by nature and inebriation, to exert his arbitrary power.

Such is the slavery in which the Russians of both sexes are kept by their parents, their patrons, and the emperor, that they are not allowed to dispute any match that may be provided for them by these directors, however disagreeable or odious it may be. Officers of the greatest rank in the army, both natives and foreigners, have been saddled with wives by the sovereign in this arbitrary manner. A great general some time ago deceased, who was a native of Britain, having been pressed by Elizabeth to marry one of her ladies, saved himself from a very disagreeable marriage, only by pleading the badness of his constitution.

In Russia, the authority of parents over their children is almost as great as it was among the ancient Romans, and is often exercised with equal severity. Should a father, in punishing his son for a fault, be the immediate cause of his death, he could not be called to account for his conduct; he would have done nothing but what the law authorized him to do. Nor does this legal tyranny cease with the maturity of children; it continues while they remain in their father's family, and is often exerted in the most indecent manner. It was not uncommon, even in St Petersburg, to see a lady of the highest rank, and in all the pomp and pride of youthful beauty, standing in the court-yard with her back bare, exposed to the whip of her father's servants. And so little disgrace is attached to this punishment, that the same lady would sit down at table with her father and his guests immediately after she had suffered her flogging, provided its severity had not confined her to bed.

In superstitious notions and practices, the common Russians are by no means behind their neighbours. Most of them believe in ghosts, apparitions, and hobgoblins; and few of them are fond of inhabiting the houses of near relatives deceased. Hence it happens that many houses are left to fall into ruins, or sold to strangers.

Russia.

Their superstitions.

Russia.

strangers at a very cheap rate. Even a house whose owner has fallen into poverty, or has otherwise become unfortunate, will not easily find a purchaser, because it has ejected its master. On the Thursday before Whitsuntide, the young women celebrate the festival of the Slavonian goddess Lada, and her son Dida, with singing and dancing; and at this time they decorate a birch bush with garlands and ribbons, and then throwing it with great solemnity into a river, predict from the figures the ribbons assume in the current, whom they shall wed, and what shall be their fate in marriage. On the 5th of January they go by night into a cross street or a cellar, and fancy they hear in every sound the prediction of their destiny. This is called *shuschit*, to go a bearing. The day after Christmas is solemnized by the midwives, because the Virgin Mary's midwife was materially concerned in the redemption of the world. In many places they believe that some witches, by their incantations, have the power of depriving the female sex of their privilege of becoming mothers, but that others can preserve it inviolable; of course brides always apply to the latter. Their *domovois* are our fairies, and their *vodovois* our water goblins, or wizards of the stream.

227
Diet.

The enjoyment of the table is carried to greater excess in Russia than in almost any other country. What has a very curious appearance to a foreigner is, that in summer a course of hot meats, and another of iced meats of the same kind, are very commonly served up together. Their cookery is in general commendable, but their cooks are chiefly from foreign countries. It is usual before dinner to take, in the drawing-room, a repast consisting of savory meats, accompanied with wines and cordials; and at these repasts it is not unusual for some of the party to forget they have to dine afterwards; nor is it thought any thing remarkable to see a person enter the dining-room in a state of intoxication.

A Russian dinner among the politer classes, is thus described by Sir John Carr. It is seldom later than three o'clock. Upon a side board in the drawing-room is always placed a table filled with fish, meats, and sausages, salted, pickled, and smoked; bread and butter, and liqueurs. These airy nothings are mere running footmen of the dinner, which is in the following order:—A cold dish, generally of sturgeon or some other fish, precedes, followed by soup, a number of made dishes, a profusion of roasted and boiled meats, among which the Ukraine beef is distinguishable, and abundance of excellent vegetables; then pastry and a dessert of very fine melons, and sour flavoured wall fruit. The table is covered with a variety of wines, and excellent ale or beer. The master of the house, or the cook, carves; and slices of every dish are handed round to the guests. Among the most gratifying dishes in summer, is a large vase of ice broken into small pieces, with which the guests cool their wine and beer. In the yard of every Russian house, there are two large cellars, one warm for winter, and the other filled with ice for the summer. The soup, and coffee, and chocolate, are frequently iced. After a few glasses of delicious wines, the lady of the house usually rises, and the company retires to coffee in the drawing-room.

Their common drink is called *quash*, and is made by pouring hot water upon rye bread. This is left to ferment, and soon produces a drink, which, though at first disagreeable, becomes afterwards sufficiently grate-

ful to the palate. Mead is also a common beverage; but the native malt liquors are very bad. The Russians consume a great quantity of tea, and are said by Mr Macgill to have the best which is drunk in Europe. This is called the *flower of tea*, and is brought over land by the Chinese merchants who come to the Russian fairs, and exchange their tea for other articles used in their country.

The amusements of the native Russians consist principally of singing, dancing, drafts, and some other games; foot-ball, and more especially swinging. The swing is everywhere, and at all times, used as an amusement by persons of rank and condition; but at Easter it is the grand diversion of the holidays. The swings may be divided into three sorts; some have a vibrating motion, and these are the most common, well known in Germany and Britain; others are turned round in a perpendicular, and others again in a horizontal direction. The first of these latter species consists of two high posts, on the top of which rests an axle, having two pairs of poles fixed in its centre. Each of these pairs of poles has at its two extremities a seat suspended from a moveable axis. The proprietor, by turning the axis that rests on the two posts, makes all the eight seats go round in a perpendicular circle, so that they alternately almost touch the ground, and then are mounted aloft in the air. The last kind is composed of chairs, chariots, sledges, wooden horses, swans, goats, &c. fastened at the extremities of long poles, and forced rapidly round in a horizontal circle. In the Easter holidays all kinds of machines are set up in the public squares; and as the common people are remarkably fond of the diversion, it is a joyful season to the populace, who then devote themselves without restraint to their national propensity to mirth. The numerous concourse of persons of all ranks and descriptions, who parade in a circle with their elegant and sumptuous equipages, the honest merriment of the crowd, the hearty participation with which they enter into these amusements, the striking and singular appearances of the exhibition itself, give this popular festivity a character so peculiar, that the man of observation, who will take pains to study the nation even on this humorous stage, may catch very powerful strokes of the pencil for his delineation. He will not fail to discern the general gaiety with which old and young, children and graybeards, are possessed, and which is here not kindled for a transient moment, but is supported by every pleasant occasion, and placed in its most agreeable light. He will remark the spirit of urbanity and gallantry, appearing in a thousand little ways, as by no means an indifferent feature in the national character. Here a couple of beggars with their clothes in tatters, are saluting one another in the most decent and respectful manner; a long string of questions about their welfare opens the dialogue, which likewise concludes with a polite embrace. Yonder a young fellow is offering to hand his girl, whose cheeks are glowing with paint and brandy, into a seat in which they are both presently to be canted up in the air; and even in those lofty regions his tenderness never forsakes him. Only one step farther, and the eye is attracted by different scenes. The same people who were but now greeting each other in friendly terms, are engaged in a violent quarrel, exhausting the enormous store of abusive epithets with which the Russian tongue abounds. All that can de-

ussia. grade and exasperate a human being finds its expression in this energetic language; yet with this vehemence of speech they never lose their temper.

While they are making the most furious gestures, straining their throats to the utmost pitch, loading one another with the most liberal profusion of insults, there is not the least danger that they should proceed to blows. The police, well knowing that with all this noise no lives will be lost, cools the heated parties by a plentiful shower from the fire engine, kept on the spot for that purpose, and which is found to be of such excellent service, that one of them is always at hand wherever a concourse of people is expected. Now, all at once the strife is over, the two vagabonds are running arm in arm to the nearest post house, to ratify their renovated friendship over a glass of brandy.

In the vicinity of the swings, booths are usually run up with boards, in which low comedies are performed. Each representation lasts about half an hour, and the price of admittance is very trifling; but as the confluence of the people is extremely great, and the acting goes on the whole day, the profits are always considerable both to the managers and to the performers, who share the amount between them.

229
bles of
c yance. The principal modes of conveyance in Russia, are by means of sledges and drojekas. The latter carriage is, we believe, peculiar to Russia, and is employed in the large towns like our hackney coaches. It is described by Mr Porter as a sort of parallelogram with four leathern wings projecting at no great distance from its body, and passing in a semicircular line towards the ground. It runs on four low wheels, and is generally furnished with two seats, placed in such a manner, that two persons can sit sideways, but with their backs to each other. In some of these carriages the seat is so formed, that the occupier sits as on a saddle, and for his better security holds by the driver's sash.

230
ic and
ding. The Russians are fond of the bagpipe, and have a kind of violin, with a large belly like that of a lute; but their music is very barbarous and defective. Yet there are public schools in which the children are taught to sing. The very beggars ask alms in a whining cadence, and ridiculous sort of recitative. A Russian ambassador at the Hague, having been regaled with the best concert of vocal and instrumental music that could be procured, was asked how he liked the entertainment: he replied, Perfectly well; the beggars in my country sing just in the same manner. The warlike music of the Russians consists in kettledrums and trumpets; they likewise use hunting horns; but they are not at all expert in the performance. It has been said, that the Russians think it beneath them to dance, which may have been the case formerly; but at Petersburg dancing is at present much relished, and a minuet is nowhere so gracefully performed in Europe as by the fashionable people in that metropolis.

231
ns. The Finns are rather of a short stature, have a flat face with sunk cheeks, dark gray eyes, a thin beard, tawny hair, and a sallow complexion. They are all of a strong make, and were it not for their excessive propensity to drinking spirituous liquors, would be remarkably healthy. They are universally great eaters, and in spite of their strong passion for brandy, not unfrequently attain to a very advanced age. Their dress consists of woollen kaitans, worn short to the knee,

with loose black pantaloons and boots. Now and then, by way of extraordinary finery, a sort of embroidered decoration adorns their upper garments. Their caps are unvaryingly of the same shape, round, with a broad rim turned up on all sides round the crown.

Mr Acerbi has given the following characteristic account of the Finnish peasants.

“The very beggars in other countries live in ease, and even luxury,” says Mr Acerbi “compared to the peasantry of the north; but the northern peasantry are a far happier, and far more respectable race, than the poor of more civilized countries; they are industrious, and their industry can always procure enough to support life with comfort: that abject degree of poverty is not known there, which destroys industry by destroying hope. They have a curious mode of fishing: when the fisherman observes a fish under the ice, in shallow water, he strikes the ice forcibly, immediately over the fish, with a club, and the fish, stupefied by the blow, rises to the surface. They use a spear to kill the bear, or, as they call him, the old man in the pelice: a cross bar is fixed about a foot from the point of the spear, as otherwise the bear might fall upon the spearsman: the beast, feeling himself wounded, holds the spear fast, and presses it more deeply into the wound. The proverbs of the Finlanders bear testimony to their industry and hospitality.”

Their poetry is alliterative, without rhyme. The 252
specimens translated by Mr Acerbi are very interesting. Finnish poetry.
The following was composed by a Finnish peasant upon his brother's death.

“The word went forth from heaven, from Him in whose hands are all things. Come hither, I will make thee my friend; approach, for thou shalt henceforth be my champion. Come down from the high hill: leave the seat of sorrow behind thee; enough hast thou suffered; the tears thou hast shed are sufficient; thou hast felt pain and disease; the hour of thy deliverance is come; thou art set free from evil days; peace hasteneth to meet thee, relief from grief to come.

“Thus went he out to his Maker: he entered into glory; he hastened to extreme bliss; he departed to enjoy liberty; he quitted a life of sorrow; he left the habitations of the earth.”

The Finns have many Runic verses which are supposed to contain healing powers, and these are styled *sanat*, or charms; as *mandansanat*, charms for the bite of a serpent; *tulensanat*, charms to cure scalds or burns; *raudansanat*, charms to heal wounds, &c.

“These charms are very numerous, and though not much esteemed by the inhabitants of the sea-coast, are in the highest repute amongst those who dwell in the interior and mountainous parts of the country. This is likely to continue to be the case as long as the practice of physic remains in the hands of itinerant empirics and ignorant old women. They jointly with charms use some simple remedies, as salt, milk, brandy, lard, &c. but attribute the cures they perform to the superior efficacy of the verses they sing during the application; the chief theory and foundation of their practice consisting in a belief with which too they impress their patients very strongly, that their complaints are occasioned by witchcraft, and can only be removed by means of these incantations.

“Of these charms it is not easy to obtain specimens,

Russia.

as they who are versed in them are unwilling to communicate them to literary men, especially when they see them prepare to commit them to writing, as they fear to be reported to the magistrate or clergyman, and punished, or at least chided, for their superstition. It is a pity the clergymen will not be at the pains of discriminating betwixt the verses which are the production of superstition, and those of an innocent nature. So far are they from attending to this particular, that they do their utmost to discourage Runic poetry in general, and without exception; which, partly on that account, and more owing to the natural changes which time brings about in all human affairs, is rapidly falling into disuse, and in a few years will be found only in the relations of travellers."*

* Acerbi's Travels.

253

Samoiedes.

The Samoiedes are shorter and thicker than the Laplanders; in other respects they resemble them very much. They have little hair, and cover their heads with a fur cap. Their skin coat reaches to their knees, and is fastened round the waist with a girdle. They have breeches, shoes, and stockings, made of the same materials as their coats. Over their shoulders they throw a black bear's skin, with the feet hanging at the four corners. This cloak is placed obliquely on the left side, that the right arm may be more at liberty to use their bows and arrows. On their feet they wear a kind of skates two feet long, with which they slide with prodigious swiftness over the frozen snow, that incessantly covers their mountains.

The women are capable of enduring great fatigue, and assiduously breed up their children in the use of the bow, which they handle with great dexterity. They are dressed nearly like the men, except about the head. A lock of twisted hair hangs down to their shoulders, at the extremity of which is a knot formed of a long slip of bark, which reaches to their heels. In this consists their finery. They hunt with their husbands, and are equally expert in the use of their weapons. Conjugal fidelity is strictly observed, and the punishment annexed to a violation of it on either side is death.

The Samoiedes have no knowledge of the Supreme Being; they use, as idols, the heads of beasts of prey, particularly those of bears, which they put up in the woods, and fervently worship. Their priests, whom they call Shamanns, are chosen from among such as are advanced in years; and they imagine that these can reveal to them the will of their gods, foretel future events, and perform all kinds of magical operations.

Samoiedes, in the Russian language, signifies men-eaters, a term which denotes the barbarity of the people; but there is no good reason for believing that the term can be applied to them in its worst acceptation. They probably derived the name from the custom they have of eating their meat without dressing, and not from the habit of devouring their deceased friends or prisoners, of which they have been accused.

The Samoiedes, like the Laplanders, live in tents or caverns, according to the season of the year. Like the Ostiaks and Tungusians, they are exceedingly dirty in their persons and habits. Their marriages are attended with no other ceremony than a verbal agreement. They call their new-born children by the name of the first animal they meet; or if they happen to meet a relation, he generally names the child. Their priests use a tabor, or an instrument very much like it, either to

make their conjurations, or to assist them in those arts by which they delude their countrymen.

Russia.

254
Baschkirs.

The Baschkirs form one of the military hordes of wandering Tartars, which formerly roamed about the southern part of Siberia, under the conduct of their chiefs, and subsisted principally by plunder. They now constitute a part of the irregular troops of the Russian empire, and have taken up their residence among the Ural mountains, extending to the Tartar deserts on the borders of the rivers Oby and Tobol. In the year 1770, they consisted of about 27,000 families.

Every tribe of the Baschkirs chooses its own ruler, who is called *starchirsis*. The huts which they inhabit during winter are built in the fashion of those in the Russian villages, having a chimney of a conical form of about five feet high in the middle of the principal apartment, which is furnished with large benches, used either as seats or couches. The house is usually filled with smoke, and in its whole economy seems very much to resemble an Irish cabin. In summer the Baschkirs inhabit tents covered with felt, and furnished like the huts with divisions and a chimney in the centre. A summer encampment never exceeds 20 tents, but a winter village contains from 10 to 50 huts.

The most opulent of these tribes are those which dwell on the east of the Ural chain. Some individuals of this nation possess not fewer than 4000 horses, who fatten on the richest pastures in the valley till the month of June, when they are compelled by wasps and other insects to seek for shelter in the mountains. The principal wealth of this people consists of their flocks and herds; but it is chiefly from their horses they derive the necessaries of life, milk, meat, vessels, and garments. They have some knowledge of tillage; but as they sow but little grain, their harvests are very inadequate to their wants; and in general they prefer a pastoral life. Much of their traffic consists of honey. They apply with great success to the cultivation of bees, making their hives in hollow trees, as a greater protection from accidents and wild animals. Frequently one man is the possessor of 500 or 600 of these industrious commonwealths.

The women employ themselves in weaving, dyeing and fulling their narrow coarse cloths, and they also make the clothes of the whole family, while the men of the lower classes follow the more laborious occupation of fabricating felts, and tanning leather. Both sexes use linen spun from the down of nettles, of which they make wide drawers descending to the ancles. On their feet they wear the usual eastern slipper, and by way of outer garment, a long gown, generally of a red colour, bordered with fur, and fastened round the waist with a girdle, in which is hung the dagger or scymeter. The lower ranks in winter wear a pelice of sheep skin, while the higher orders wear a horse's skin, in such a manner that the mane flows down their backs, and waves in the wind. The head is covered with a conical cloth cap, sometimes ornamented with fur, and sometimes plain. The garments of the women, among the superior classes, are of silk, buttoned before as high as the neck, and fastened by a broad steel girdle. Round their bosoms and throats they wear a shawl hung with strings of beads, shells, and coins.

Their diversions are confined to religious ceremonies and a few peculiar festivals, and consist of singing, dancing,

ing, and horse racing. In their songs they ename-
rate the achievements of their ancestors, or of them-
selves, and sometimes alternate these epic poems with
love ditties. These songs are always accompanied
with appropriate gestures. In their dances they make
strange gesticulations, but the motion of the feet is
very gentle; and the women, while using these, hold
a long silk handkerchief in their hand, which they
wave about in a wanton manner.

In their entertainments, the aged occupy seats of
honour; and when strangers are introduced, these are
placed next the old men. The language of the Basch-
kirs is a Tartar dialect, but different from that which
is spoken in the district of Kazan. Their religion is
Mahometan, and they are much addicted to all the
superstitions of the east.

The Baschkir soldiers are dexterous horsemen, and
skilful in managing the bow. They are usually cased
in shirts of mail, with shining helmets. Their ordi-
nary weapons are a sword, a short bow, and a quiver
containing 24 arrows. They also carry a long pike,
adorned at the top with various coloured pendants.
Their horses are small, and though hardy and active,
are not at all superior in point of appearance to those
of the Kozaks.

The leaders of the Baschkirs have a very superb and
warlike appearance. They wear a shirt of mail and a
steel helmet like the common men, but over the shirt
is thrown a scarlet kaftan flowing from the shoulders
down over the backs of their horses. They also wear
large scarlet trowsers, and large boots of yellow leather.
The saddle covering of the horses usually consists of
a leopard's skin. See *Porter's Travels*, vol. ii. Plate
at p. 59.

Under the article *COSSACS*, we have enumerated the
several tribes of these people, and have made some re-
marks on their manners and customs; but as the Don
Kozaks form a considerable part of the Russian armies,
we shall here add a few remarks on these people, con-
sidered in a military capacity.

The common men among these troops have no pay,
even in time of war, and their officers have but a very
moderate allowance. They are obliged to provide
themselves with horses, arms and clothing. Nothing is
furnished them except oatmeal and flour. Frequently
even nothing is given them but a sorry biscuit (*sukare*).
Thence those hideous tatters with which most of them
are covered, when they have no opportunity of plunder-
ing, and which give them the appearance of beggars
and robbers; thence the ruinous condition of their arms,
and the bad state of their horses; thence the murders,
robberies, fires, and rapine which every where mark
their passage, and which, doubtless, would not be so
frequent, if government, less avaricious and less cruel,
provided them with even the bare necessaries of life.

They are armed with a pike from 15 to 18 feet in
length, which they hold vertically, resting on the right
stirrup, and which they couch at the moment of attack.
The Kozak makes a very dexterous use of this pike for
leaping on his horse. With the left hand he grasps the
mane, and as soon as he has his foot in the stirrup, in-
stead of placing his right hand on the crupper, as is ge-
nerally done, the pike which he holds serves him as a
prop; he makes a spring, and, in the twinkling of an
eye, he is in the saddle. The Kozaks have no spurs; a

large whip suspended from the left wrist supplying their
place. Besides their pike, they commonly have a bad
sabre, which they neither like, nor well know how to
make use of; one or two pistols in a bad condition,
and a carbine which they seldom employ.

Their horses are small, lean and stiff, by no means
capable of a great effort, but indefatigable. Bred in
the *steppes*, they are insensible to the inclemency of
the season; accustomed to endure hunger and thirst;
in a word, not unlike their masters. A Kozak will
seldom venture to expose himself against a Turk or a
Tartar, of whom he commonly has neither the address
nor the vigour: besides, his horse is neither sufficiently
supple, nor swift, nor sure-footed; but in the end his
obstinate perseverance will tire the most active horse-
man, and harass the most frisky steed, especially if it
be in a large plain, after a defeat. All the Kozaks,
however, are not badly armed and ill mounted. Sev-
eral of them keep the arms and horses which they may
have been able to obtain by conquest in a campaign;
but, in general, they had rather sell them, preferring
their patient ponies and their light pikes. As for their
officers, they are almost all well mounted, and many
of them have good and magnificent arms, resembling
in that respect the Turks and Poles.

The Kozaks, if we except the Tschugnief brigade,
never fight in a line. They are scattered by platoons,
at the head, on the flanks, and in the rear of the army,
sometimes at considerable distances. They do the duty
of advanced guards, videttes, and patroles. Their acti-
vity and vigilance are incredible. They creep and fer-
ret every where with a boldness and address of which
none but those who have seen them can obtain an idea.
Their numerous swarms form, as it were, an atmosphere
round the camps and armies on a march, which they se-
cure from all surprise, and from every unforeseen attack.
Nothing escapes their piercing and experienced eye;
they divine, as if by instinct, the places fit for ambus-
cades; they read on the trodden grass the number of men
and horses that have passed; and from the traces, more
or less recent, they know how to calculate the time of
their passing. A bloodhound follows not better the
scent of his game. In the immense plains from Azof to
the Danube, in those monotonous solitudes covered with
tufted and waving grass, where the eye meets with no
tree, no object that can obstruct it, and whose melan-
choly uniformity is only now and then interrupted by
infectious bogs and quagmires, torrents overgrown with
briars, and insulated hillocks, the ancient graves of un-
known generations; in those deserts, in short, the roam-
ing Kozak never misses his way. By night, the stars
direct his solitary course. If the sky is clear, he alights
from his horse at the first *kurgan* that chance throws in
his way; through a long habit of exercising his sight in
the dark, or even by the help of feeling alone, he dis-
tinguishes the herbs and plants which thrive best on the
declivity of the hillock exposed to the north or to the
south. He repeats this examination as frequently as
the opportunity offers, and, in this manner, he follows
or finds again the direction which he ought to take for
regaining his camp, his troop, or his dwelling, or any
other place to which he is bound. By day, the sun is
his surest guide; the breath of the winds, of which he
knows the periodical course, (it being pretty regular in
these countries), likewise serves him as a compass to steer

Russia.

by. As a new species of augury, the Kozak not unwillingly interrogates the birds; their number, their species, their flight, their cry, indicate to him the proximity of a spring, a rivulet, or a pool; a habitation, a herd, or an army. Those clouds of Kozaks which encompass the Russian armies for the safety of their encampments, or of their marches, are not less formidable to the enemy. Their resistless vigilance, their rash curiosity, their sudden attacks, alarm him, harass him incessantly, and incessantly watch and controul his motions. In general action, the Kozaks commonly keep at a distance, and are spectators of the battle; they wait for its issue, in order to take to flight, or to set out in pursuit of the vanquished, among whom their long pike makes a great slaughter. †

256
Kozaks of
the Uk-
raine.

To the account, given under COSSACS, of the inhabitants of the Ukraine, we may add the following particulars, which, though anonymous, appear to be accurately stated.

When a young woman, in the Ukraine, feels a tender passion for a young man, she goes to his parents, and says to him, "*Pomagac-bog*," (be you blessed of God). She then sits down, and addressing herself to the object of her affection, makes her declaration of love in the following terms: "Ivan, (Theodore or whatever else may be his name) the goodness I see written in your countenance, is a sufficient assurance to me, that you are capable of ruling and loving a wife; and your excellent qualities encourage me to hope, that you will make a good *gospodar* (husband or master). It is in this belief, that I have taken the resolution to come and beg you, with all due humility, to accept me for your spouse." She afterwards addresses the father and mother in words to the same effect; and solicits them earnestly to consent to the marriage. If she meets with a refusal, or apology, she answers, that she will not quit the house, till she shall have married the object of her love. Sometimes the parents persist in their refusal; but if the girl be obstinate, and have patience to stay a few days or weeks in the house, they are not only forced to give their consent, but frequently to persuade their son to marry her. Besides, the young man is generally moved by her perseverance and affection, and gradually accustoms himself to the idea of making her his wife; so that the young female peasants of the Ukraine seldom fail of being provided with a husband to their mind, if they do but possess a tolerable share of constancy. There is no fear of their being obliged to leave the house of the youth whom they prefer; the parents never think of employing force, because they believe, that by so doing, they should draw down the vengeance of heaven upon their heads; and to this consideration is added, the fear of offending the girl's family, who would not fail to resent such behaviour as a grievous affront.

Russia.

It sometimes happens, that the lord of a village in the Ukraine, gives the peasants a dance before his door, and joins in it himself, with his wives and children. (Let it be observed, that most of the villages in the Ukraine are surrounded with thick woods, in which the peasantry conceal themselves in the summer, when afraid of a visit from the Tartars). Although the peasants are *serfs*, they have possessed, from time immemorial, the right of carrying off any young woman they like from the dance, not excepting even the daughters of their lords, provided they do it with sufficient dexterity; for otherwise their lives pay the forfeit of their temerity. On these occasions they watch an opportunity of seizing their prey, and hasten to conceal themselves in the thickest parts of the neighbouring woods. If they can find means to stay there 24 hours undiscovered, the rape remains unpunished, and they are at liberty to marry the young woman, provided she consents; but if taken before that time expires, they are beheaded without farther ceremony.

On Easter Monday, early in the morning, the young men assemble in the streets, lay hold of all the young girls they meet with, and pour five or six buckets of water on their heads. This sport is not permitted later than 12 o'clock. The day after, the girls take their revenge; but as they are inferior in strength, they are forced to have recourse to stratagem. They hide themselves five or six in a house, with each a jug of water in her hand, a little girl standing sentry, and giving the signal when she sees a young man approach. In an instant the others rush out; surround him with loud acclamations; two or three of the strongest lay hold of him; the neighbouring detachments arrive, and the poor devil is almost drowned with the torrents of water that are poured upon his head.

The men have also another amusement on Easter Monday. They meet in the morning, and go in a body to the lord of the manor, to whom they make a present of fowls, and other poultry. The lord, in return, knocks out the head of a cask of brandy, places it in the court-yard, and ranges the peasants around. He then takes a large ladle, fills it, and drinks to the eldest of the company, who pledges him; and thus it passes from hand to hand, and from mouth to mouth, till the cask is empty. If this happens at an early hour, the lord sends for another, which is treated in the same way; for he is bound to entertain the peasants till sunset. But as soon as the sun sinks beneath the horizon, the signal of retreat is given; and those who are able walk away. The rest pass the night in the open air; and in this manner, some have been known to sleep for upwards of 24 hours. †

We have already given a general account of the Krimia and its inhabitants. See CRIMEA (o). We shall here

Tartars
the Kri-
mea.

(o) The isthmus by which the peninsula of the Krimia is connected with the main land, is commanded by a fortress called by the Russians *Perekop*, i. e. an entrenchment of the isthmus, and by the Tartars, *Or-Kapi*, the gate of the fortification. As this fortress has been mentioned only in a cursory manner, in our article CRIMEA; and as, from its commanding the entrance into the Krimia from the main land, it is a place of great importance, we shall here give some account of it from the travels of Professor Pallas.

The only entrance into the Krimia by land is over a bridge, and through an arched stone gate, both erected at the side of the fortress. Contiguous to the gate, in an eastern direction, and within the precincts of the fosse, is the fortress of *Perekop*. This is a model of irregular fortification, which, together with the walls of the deep ditch,

1 ssia. here add some interesting particulars respecting the Crimean Tartars, from Professor Pallas.

The Crimea is inhabited by three classes of Tartars. The first of these are called Nagays, and are a remnant of that numerous horde which was lately distinguished by the name of Kubanian Tartars, as they formerly occupied the district of Kuban, to the east of the sea of Azof. These Nagays, like their kinsmen in the neighbourhood of Mount Caucasus, live in small huts constructed of felt, the largest of which are from 4 to 5½ archines in diameter, and cannot be taken to pieces, but are placed by two men on carriages, and thus removed from one place to another. They have a vent hole for an outlet to the smoke; and to this is applied a cover with a handle, from which a line is suspended, for the purpose of occasionally closing and opening the aperture. Mats of reeds and wooden work, much withered and smoked, are employed to line the sides of the huts; for as these tribes are destitute of timber, they are obliged to purchase it from Taurida at a considerable expense.

The dress of the men consists of sheep skins, and a coarse kind of cloth, with small round caps, made of lamb skins, and reaching no lower than the ears. The women are dressed in close vests, over which is worn a loose flowing gown with hanging sleeves. The girls generally wear Circassian caps; and married women have their heads covered with a veil. To their shoes are sometimes attached cross pieces, so as to raise them considerably from the ground.

In conformity with the usage of all Asiatic nations, a

kalim or marriage portion, consisting, among the opulent, of 40 mares, two horses completely caparisoned, a suit of armour, a gun, and a sabre, is delivered up to the father of the bride on the celebration of the nuptials. The language of the Nagays is said to vary in many respects from that spoken in Taurida; which latter is a Turkish dialect. These people possess more activity and vivacity than the inhabitants of Taurida; but they are also more rapacious and ungovernable, and retain a strong predilection for a wandering life. In summer they travel with their flocks along the banks of the rivulets, where they sow wheat and millet in remote places, and neglect all further cultivation till the time of harvest. On the return of winter they again approach the sea of Azof, near which they find grass preserved for forage, and perhaps a remaining supply of that hay which they had formerly made in the valleys.

The features of these people show them to be the unmixed descendants of the Mongolian Tartars, who formed the bulk of the army of Tschinghis-khan, which invaded Russia and the Crimea.

The second class of the Crimean inhabitants consists of those Tartars who inhabit the heaths or steppes, as far as the mountains, especially on the north side, and who in the district of Perekop, where they are still unmixed, retain many traces of the Mongolian countenance, with a thinly scattered beard. They devote themselves to the rearing of cattle, to a greater extent than the mountaineers, but are at the same time husbandmen, though they pay no attention to gardening.

In

is constructed entirely of freestone. It forms an oblong square, extending along the trench which terminates the line of defence. On the side adjoining this line, there are no outworks; but on the other three sides, the fort is strengthened by an additional deep fosse, the whole amounting to 158 fathoms in length, and 85 in breadth, computing from the fosse of the line. At the north-western angle there is a pentagonal bastion, serving as an outwork; another of a hexagonal form on the south-west, and a third with two angles at the south-east; but at the north-eastern angle the hexagonal bastion is farther extended into the fosse, so as to cover a narrow passage leading to a deep and excellent spring, that rises between this ditch and the interior fortification. The chief entrance into the fortress is near the southern curtain, on the side of which a projecting demibastion has been erected; but another outlet has been contrived at the eastern extremity.

The houses of the suburbs of Perekop were formerly dispersed in a very irregular manner on the southern side of the fortress; but they are at present situated at a distance of three versts within the country. In the vicinity of the gate, however, there are only a few houses, partly within and partly without the line, inhabited by Russian officers appointed at the salt magazine, or by those belonging to the garrison. Since the year 1797, the garrison of Perekop has been considerably increased.

Although the Crimea is at present united to Russia, Perekop will, on many accounts, always remain a post of the greatest consequence; in some respects to Russia, and in others to the Crimea. If, for instance, the plague should ever spread its baneful influence into Krim-Tartary, (an event which the constant trade carried on with Constantinople and Anatolia may easily produce), or, if seditious commotions should arise among the Tartars, whose loyalty is still doubtful; in these cases Perekop would effectually secure the empire, by closely shutting the barrier. On the other hand, this fortress not only renders every attempt at desertions from the Crimea into Russia very difficult; but if, in future, the project of opening free ports should be realized, and thus the important commerce from the Black sea to the Mediterranean and to Anatolia, be vigorously promoted, Perekop would then afford the most convenient situation for a custom-house. Farther, if the best ports of the Crimea were appointed, in the same manner as those of Toulon and Marseilles have been selected for all the southern parts of France, in order to establish places of quarantine for all ships navigating the Black sea and that of Azof, so that all vessels destined for Taganrok, Kherson, and Odessa, should be obliged to perform a certain quarantine at Sevastopol, Theodosia, and Kertsk, as has already been twice proposed; the important pass of Perekop would for ever secure the open and more populous provinces of the interior parts of the empire from that terrible scourge, the plague. Thus, all danger might be obviated, not only from the sea of Azof, the coasts of which are in every direction exposed to the contagion, so that they can with difficulty be protected; but also from the ports of Kherson, Nicolaeff, and Odessa. At the same time, the expense of maintaining various places for quarantines might be greatly reduced, and complete institutions of this nature be speedily established. See *Pallas's Travels*, vol. ii. p. 5.

Russia.

In situations destitute of stone, they build with unbaked bricks of clay, and make use of dry dung as fuel. Of this they prepare large quantities, and pile it up into stacks like peat or turf, to serve them during winter. Nearer to the mountains, these Tartars, as well as the nobles, are more intermixed with the Turkish race, and exhibit few of the Kalmuk Mongolian features. This is particularly the case with the Crimean nobility, in whom these peculiarities of feature are almost entirely obliterated. See Pallas's Travels, vol. ii. Plate 21.

The third class of Crimean Tartars comprehends the inhabitants of the southern valleys, a mixed race, which seems to have originated from the remnants of various nations crowded together in these regions at the conquest of the Crimea by the armies of the Mongolian leaders. These people generally display a very singular countenance, having a stronger beard, but lighter hair, than the other Tartars, by whom they are not considered as true descendants of the Tartar race, but are distinguished by the contemptuous name of Tat (or renegado.) By their costume, they are remarkably distinguished from the second class, or heath Tartars; the men among these latter wearing outer garments, very like the loose coats or jackets worn by the European peasants, with round close caps; while the Tartars of the valleys wear the usual eastern dress, with turbans. The dress and veils of the women are, however, alike in both classes. See Pallas's Travels, vol. ii. Plates 12, 20, and 22. Their houses or huts are partly under ground, being generally constructed against the steep precipices of mountains, with one half excavated from the earth or rock, and only the front raised with rough stones. They have also a flat roof covered with earth.

There are among these people skilful vinedressers and gardeners; but they are too indolent to undertake new plantations, and avail themselves only of those trees which have been left by their predecessors. They also cultivate flax and tobacco; objects of culture which are unknown to the Tartars of the heaths.

In the costume of the Tartars inhabiting the plains, there is some variety. Young persons, especially those of noble or wealthy families, dress nearly in the Circassian, Polish, or Kozak fashion, with short or slit sleeves in the upper garment. The nobility of more advanced age wear unslit sleeves, like the common Tartars; and old men suffer the whole beard to grow, whereas the young and middle-aged wear only whiskers. Their legs and feet are dressed in half-boots of Morocco or other leather, or they use stockings of the same material, especially in the towns; and over these are worn slippers or clogs, and, in dirty weather, a sort of stilt-shoes, like those described in the dress of the Nagays. Their heads are either entirely shaved, or have the hair cut very short; and they wear a high cap, generally green, edged with black or gray lamb-skin, and quilted at the top with cotton. This cap is never moved by way of compliment. Those who have performed their pilgrimage to Mecca, are distinguished by a white handkerchief round the edge of the cap, this being the mark of a *hadshi* or pilgrim.

The physiognomy of the true Tauridan Tartars bears a great resemblance to that of the Turks, and of most Europeans. There are handsome, tall, robust people

among them, and few are inclined to corpulency; their complexion is rather fair, and their hair black or dark brown.

The dress of the Tartar women of these two latter classes is very different from that of the Nagays. They are in general of low stature, owing probably to the state of confinement in which they are kept during the early part of their lives, though their features are tolerably handsome. Young women wear wide drawers, a shift reaching to their ankles, open before, and drawn together at the neck; a gown of striped silk, with long sleeves, and adorned with broad trimmings embroidered with gold. They have also an upper garment of some appropriate colour, with short thick Turkish sleeves edged with gold lace, ermine, or other fur. Both girls and married women fasten their gowns with a heavy girdle, having in front two large buckles of embossed or filligree work, such as were formerly in fashion among the Russian ladies at St Petersburg and Moscow. Their hair is braided behind into several loose tresses; and the head is covered, either with a small red cap, or with a handkerchief crossed below the chin. Their fingers are adorned with rings, and their nails tinged of a reddish-brown colour, with a dye stuff called *kna* (derived from the *lawsonia*) imported from Constantinople for that purpose. Paint is rarely employed by young women.

Married women cut off their hair obliquely over their eyes, and leave two locks also cut transversely, hanging down their cheeks; they likewise bind a long narrow strip of cloth round the head, within the ends of which they confine the rest of the hair, and turn it up from behind, braiding it in two large tresses. Like the Persians, they dye their hair of a reddish brown with *kna*. Their under garment is more open below, but in other respects similar to that of the unmarried women, as are their upper dress and girdle. They paint their faces red with cochineal; and by way of white paint, they use an oxide of tin, carefully prepared in small earthen pipkins over a dung fire. They also dye the white of the eye blue, with a preparation of copper finely pulverized; and by a particular process they change the colour of their hair and eyebrows to a shining black, which is retained for several months. At weddings, or on other solemn occasions, the wealthy females further ornament their faces with flowers of gold leaf; colour their hands and feet, as far as the wrists and ankles, of an orange hue; and destroy all the hairs on the body with a mixture of orpiment and lime.

Both married and single women wear yellow half-boots or stockings of Morocco leather; and for walking, they use red slippers with thick soles, and in dirty weather put on stilt-shoes. Abroad, they wear a kind of undress gown of a loose texture, manufactured by themselves of white wool; wrap several coloured Turkey or white cotton handkerchiefs round their heads, and tie them below the chin; and over all they throw a white linen cloth reaching half way down the arms, drawing it over the face with their right hand, so that their black eyes alone are visible. They avoid as much as possible the company of men; and when they accidentally meet a man in the street, they avert their face, or turn towards the wall.

Polygamy rarely occurs, even among the nobles, and more wealthy inhabitants of the towns; yet there are

some

Russia.

some persons in the villages, who encumber themselves with two wives. Male and female slaves are not common in this country; but the nobility support numerous idle attendants, and thus impoverish their estates; while their chief pride consists in rich and beautiful apparel for themselves and their wives, and in handsome equipages for riding to town, being accompanied by a train of domestics, who follow them on every excursion, though the chief employment of the latter is that of giving their master his pipe at his demand, standing in his presence, or assisting him to dress, and, in all other respects, living in the same indolent manner as their lords. Another source of expense is the purchase of elegant swords, and especially of excellent blades; the distinction between the different sorts of which, together with their names, constitute among the nobles a complete science. They are also great admirers of beautiful and costly tobacco-pipes, together with expensive mouth-pieces of milk-white amber, that are likewise used by the Turks, and of tubes of curious woods; but the *kalian*, or the pride of the Persians, is scarcely known here; and the Tartars employ only small ornamental bowls made of clay, which are almost every moment filled with fine-cut leaf-tobacco. The generality of these noble lords, or Murses, were so ignorant, that they could neither read nor write; and instead of signing their names, they substituted an impression of their rings, on which a few Turkish words are engraven. Some of the young nobility, however, are beginning to study not only the Russian language, of which they perceive the necessity; but also apply themselves more sedulously to reading and writing, and thus become more civilized. The expense of wearing apparel for the women shut up in their harems is, according to their manner and fortune, little inferior to that of Europeans; with this single difference, that the fashions among the former are not liable to change. Even the wives of the common Tartars are sometimes dressed in silks and stuffs, embroidered with gold, which are imported from Turkey. In consequence of such extravagance, and the extreme idleness of the labouring classes, there are very few wealthy individuals among the Tartars. Credulity and inactivity are the principal traits in the Tartar character. To sit with a pipe in their hands, frequently without smoking, for many hours on a shady bank, or on a hill, though totally devoid of all taste for the beauties of nature, and looking straight before them; or, if at work, to make long pauses, and above all to do nothing, constitute their supreme enjoyments: for this mode of life, a foundation is probably laid by educating their boys in the harems. Hunting alone occasionally excites a temporary activity in the Murses, who pursue their prey with the large species of greyhound, very common in the Crimea; or with falcons and hawks.

The language and mode of writing of the real Tartars differ little from those of the Turks; but the language of the Nagays deviates considerably from that of the other Tartars, as they have retained numerous Mongolian phrases, and make use of an ancient mode of writing called *shagaltai*.

The food of the Crimean Tartars is rather artificial for so unpolished a nation. Among the most esteemed delicacies are, forced meat-balls wrapped in green vine or sorrel leaves, and called *sarma*; various fruits, as cu-

cumbers, quinces, or apples, filled with minced meat; *dolma*; stuffed cucumbers; dishes of melons, *badilshan*, and *hibiscus esculentus*, or *bamia*, prepared in various ways with spices or saffron; all of which are served up with rice; also *pelaw*, or rice, boiled in meat-broth, till it becomes dry; fat mutton and lamb, both boiled and roasted, &c.: eolt's flesh is likewise considered as a dainty; and horse flesh is more commonly eaten by the Nagays, who are still attached to their ancient custom. The Tartars rarely kill horned cattle: mutton and goat's flesh constitute the food of the common people, especially in the country, together with preparations of milk and eggs; butter, (which they churn and preserve in the dry stomachs of oxen); a kind of *pelaw*, made either of dried or bruised unripe wheat, and which they call *bulgur*; and, lastly, their bread is generally composed of mixed grain. Their ordinary beverage is made by triturating and dissolving cheese in water; the former of which is called *yasma*, being prepared from coagulated milk, or *yugurt*; but the fashionable intoxicating drink is an ill-tasted and very strong beer, or *busà*, brewed of ground millet. Many persons also drink a spirituous liquor, *arraki*, which the Tartar mountaineers distil from various kinds of fruit, particularly plums. It is also extracted from sloes, dogberries, elder-berries, and wild grapes, but never from the common cherry. They likewise boil the expressed juice of apples and pears into a kind of marmalade, *bekmess*, of the consistence of a syrup, or that of grapes into *nardenk*, as it is called; the latter preparation is a favourite delicacy, and eagerly purchased by the Tartars of the steppes; hence great quantities of it are imported in deal casks from Anatolia, at a very cheap rate, for the purpose of converting it into brandy.

In consequence of their temperate, simple, and careless habits, the warm clothing which they wear throughout the summer, and the little fatigue which they undergo, the Tartars are liable to few diseases, and, in particular, are generally exempted from the intermittent and bilious remittent fevers which commonly prove so fatal to foreigners and new settlers in the Crimea. Indeed, few disorders, except the itch and rheumatism, prevail among them, and many of them attain to a vigorous old age. The true leprosy, which is by the Ural Kozaks termed the *Krimean disease*, never occurs in this peninsula. *

As a mistress-market must be a curious subject to the polished nations of Europe, we shall give a specimen of the manner in which it is carried on at Theodosia, in the words of Mr Keelman, a German merchant, as related by Mrs Guthrie. "The fair Circassians," says Mr Keelman, "of whom three were offered me for sale in 1768, were brought from their own chamber into mine (as we all lodged in the same inn), one after another, by the Armenian merchant who had to dispose of them. The first was very well dressed, and had her face covered in the oriental style. She kissed my hand by order of the master, and then walked backward and forward in the room, to show me her fine shape, her pretty small foot, and her elegant carriage. She next lifted up her veil, and absolutely surprised me by her extreme beauty. Her hair was fair, with fine large blue eyes, her nose a little aquiline, with pouting red lips. Her features were regular, her complexion fair and delicate, and her cheeks covered with a fine natu-

ral vermilion, of which she took care to convince me by rubbing them hard with a cloth. Her neck I thought a little too long; but, to make amends, the finest bosom and teeth in the world set off the other charms of this beautiful slave, for whom the Armenian asked 4000 Turkish piasters (about 800*l.* sterling), but permitted me to feel her pulse, to convince me she was in perfect health; after which she was ordered away, when the merchant assured me, that she was a pure virgin of 18 years of age.

"I was more surprised than I ought to have been at the perfect indifference with which the inhabitants of Theodosia beheld this traffic in beauty, that had shocked me so much, and at their assuring me, when I seemed affected at the practice, that it was the only method which parents had of bettering the state of their handsome daughters, *destined at all events to the haram*; for that the rich Asiatic gentleman who pays 4000 piasters for a beautiful mistress, treats and prizes her as an earthly houri, in perfect conviction that his success with the hours of Paradise entirely depends on his behaviour to the sisterhood on earth, who will bear testimony against him in case of ill usage; in short, that, by being disposed of to rich mussulmans, they were sure to live in affluence and ease the rest of their days, and in a state by no means degrading in Mahometan countries, where their prophet has permitted the seraglio. But that, on the contrary, if they fell into the hands of their own feudal lords, the barbarous inhabitants of their own native mountains, which it is very difficult for beauty to escape, their lot was comparatively wretched, as those rude chieftains have very little of either respect or generosity towards the fair sex."*

* Mrs
Guthrie's
Travels.

RUST, the calx or oxide of a metal, iron, for instance, formed by exposure to the air, or by corroding and dissolving its superficial parts by some menstruum. Water is the great instrument or agent in producing rust; and hence oils, and other fatty bodies, secure metals from rust; water being no menstruum for oil, and therefore not able to make its way through it. Almost all metals are liable to rust. The rust of iron is not merely an oxide of that metal; it contains, besides, a portion of carbonate.

RUSTIC, in *Architecture*, implies a manner of building in imitation of nature, rather than according to the rules of art. See *ARCHITECTURE*.

Rustic Gods, *dii rustici*, in antiquity, were the gods of the country, or those who presided over agriculture, &c. Varro invokes the 12 *dii consentes*, as the principal among the rustic gods; viz. Jupiter, Tellus, the Sun, Moon, Ceres, Bacchus, Rubigus, Flora, Minerva, Venus, Lympha, and Good Luck. Besides these 12 arch-rustic gods, there were an infinity of lesser ones; as Pales, Vertumnus, Tutelina, Fulgor, Sterculius, Mellona, Jugatinus, Collinus, Vallonia, Terminus, Sylvanus, and Priapus. Struvius adds the Satyrs, Fauns, Sileni, Nymphs, and even Tritons; and gives the empire over all the rustic gods to the god Pan.

Rustic Order, that decorated with rustic quoins, rustic work, &c.

Rustic Work, is where the stones in the face, &c. of a building, instead of being smooth, are hatched, or picked with the point of a hammer.

RUSTRE, in *Heraldry*, a bearing of a diamond

shape, pierced through in the middle with a round hole. See *HERALDRY*.

RUT, in hunting, the venery or copulation of deer.

RUTA, RUE; a genus of plants belonging to the decandria class; and in the natural method ranking under the 26th order, *Multisiliquæ*. See *BOTANY Index*.

Rue has a strong ungrateful smell, and a bitterish penetrating taste: the leaves, when full of vigour, are extremely acrid, insomuch as to inflame and blister the skin, if much handled. With regard to their medicinal virtues, they are powerfully stimulating, attenuating, and detergent; and hence, in cold phlegmatic habits, they quicken the circulation, dissolve tenacious juices, open obstructions of the excretory glands, and promote the fluid secretions. The writers on the materia medica in general have entertained a very high opinion of the virtues of this plant. Boerhaave is full of its praises; particularly of the essential oil, and the distilled water cohobated or re-distilled several times from fresh parcels of the herb. After extravagantly commending other waters prepared in this manner, he adds, with regard to that of rue, that the greatest commendations he can bestow upon it fall short of its merit: "What medicine (says he) can be more efficacious for promoting sweat and perspiration, for the cure of the hysteric passion and of epilepsies, and for expelling poison?" Whatever service rue may be of in the two last cases, it undoubtedly has its use in the others: the cohobated water, however, is not the most efficacious preparation of it. An extract made by rectified spirit contains in a small compass the whole virtues of the rue, this menstruum taking up by infusion all the pungency and flavour of the plant, and elevating nothing in distillation. With water, its peculiar flavour and warmth arise; the bitterness, and a considerable share of the pungency, remaining behind.

Ruta Baga, or Swedish turnip. For the mode of cultivation, see *AGRICULTURE Index*.

BOOK OF RUTH, a canonical book of the Old Testament; being a kind of appendage to the book of Judges, and an introduction to those of Samuel; and having its title from the person whose story is here principally related. In this story are observable the ancient rights of kindred and redemption; and the manner of buying the inheritance of the deceased, with other particulars of great note and antiquity. The canonicalness of this book was never disputed; but the learned are not agreed about the epocha of the history it relates. Ruth, the Moabitess is found in the genealogy of our Saviour. Matth. i. 5.

RUTILUS. See *CYPRINUS*, *ICHTHYOLOGY Index*.

RUTHERGLEN, or by contraction RUGLEN, the head borough of the nether ward of Lanarkshire in Scotland, is situated in N. Lat. 55° 51', and W. Long. 4° 13'; about two miles south-east of Glasgow, and nine west of Hamilton. Few towns in Scotland can lay greater claim to antiquity than Rutherglen. Maitland, in his History of the Antiquities of Scotland, vol. i. p. 92, tells us, that it was founded by a King Reuther, from whom it derived its name; and a tradition of the same import prevails among the inhabitants. But without laying any stress on the authority of tradition, which is often false and always doubtful, we find, from several original charters still preserved, that it was erected into

Rustre
||
Ruther-
glen.

Rutherglen.

a royal borough by King David I. about the year 1126.

The territory under the jurisdiction of the borough was extensive, and the inhabitants enjoyed many distinguished privileges, which were however gradually wrested from them, by political influence, in favour of Glasgow, which in latter times rose into consequence by trade and manufactures. The ancient dimensions of the place are now unknown; but in the fields and gardens towards the east, the foundations of houses are occasionally discovered. It is now of a very reduced size, consisting but of one principal street and a few lanes, and containing about 1631 inhabitants.

About 150 yards to the south of the main street is a kind of lane, known by the name of *Dins-dykes*. A circumstance which befel the unfortunate Queen Mary, immediately after her forces were routed at the battle of Langside, has ever since continued to characterise this place with an indelible mark of opprobrium. Her majesty, during the battle, stood on a rising ground about a mile from Rutherglen. She no sooner saw her army defeated than she took her precipitate flight to the south. *Dins-dykes* unfortunately lay in her way. Two rustics, who were at that instant cutting grass hard by, seeing her majesty fleeing in haste, rudely attempted to intercept her, and threatened to cut her in pieces with their scythes if she presumed to proceed a step further. Neither beauty, nor even royalty itself, can at all times secure the unfortunate when they have to do with the unfeeling or the revengeful. Relief, however, was at hand; and her majesty proceeded in her flight.

Adjoining to a lane called the *Back-row* stood the castle of Rutherglen, originally built at a period coeval, it is reported, with the foundation of the town. This ancient fortress underwent several sieges during the unhappy wars in the days of King Robert Bruce, and it remained a place of strength until the battle of Langside; soon after which it was destroyed by order of the regent, to revenge himself on the Hamilton family, in whose custody it then was. The foundations of the buildings are now erased, and the site converted into dwelling-houses and gardens.

The church of Rutherglen, an ancient building of the Saxon-Gothic style, was rendered famous by two transactions, in which the fate of Sir William Wallace and his country was deeply concerned. In it a truce was concluded between Scotland and England in the year 1297 (Henry's Life of Wallace, book vi. verse 862.), and in it Sir John Montcath bargained with the English to betray Wallace his friend and companion. (Life of Wallace, book xi. verse 796.) This ancient building having become inconvenient, was, in 1794, pulled down, and one of a modern style was erected in its place. Buried in the area were found vast quantities of human bones, and some relics of antiquity.

No borough probably in Britain possesses a political constitution or sett more free and unembarrassed than Rutherglen. It was anciently under the influence of a self-elected magistracy, many of whom lived at a distance from the borough, and who continued long in office without interruption. Negligence on the one hand, and an undue exertion of power on the other, at length excited the burgesses, about the middle of the last century, to apply an effectual remedy to this evil. The community who, at that period, possessed the power of reform-

ing the abuses that had long prevailed in the management of the borough, were much assisted in their exertions by a Mr David Spens, town-clerk, a gentleman unbiassed by false politics, and who was animated with a high degree of true patriotism. Great opposition was at first made to the reform; but the plan adopted by the burgesses was wisely laid, and was prosecuted with unremitting assiduity. They were proof against the influence and bribery of a party that struggled to continue the old practice; and having at length surmounted every difficulty, they formed a new constitution or sett for the borough, which, in 1671, was approved of by all the inhabitants of the town, and afterwards inserted in the records of the general convention of the royal boroughs of Scotland.

Rutherglen, in conjunction with Glasgow, Renfrew, and Dumbarton, sends a member to the British parliament. The fairs of this town are generally well attended, and have long been famous for a great show of horses, of the Lanarkshire breed, which are esteemed the best draught horses in Britain. The inhabitants of this borough still retain some customs of a very remote antiquity. One of these is the making of *Rutherglen sour cakes*. The operation is attended with some peculiar rites, which lead us to conclude that the practice is of Pagan origin. An account of these rites is given in Ure's History of Rutherglen and Kilbride, p. 94.; from whence we have taken the above account of this place, and which we do not hesitate to recommend to the attention of such of our readers as are fond of natural and local history, being persuaded that they will find it to be both an useful and entertaining performance.

RUTLANDSHIRE, is the smallest county in England, being but 40 miles in circumference; in which are two towns, 48 parishes, and in 1811, 3402 houses, and 16,380 inhabitants. However, for quality it may be compared with any other county; the air being good, and the soil fertile both for tillage and pastures; and it not only affords plenty of corn, but feeds a great number of horned cattle and sheep. It is well watered with brooks and rivulets; and the principal rivers are the Weland and the Wash. It is bounded on the east by Lincolnshire; on the south by the river Weland, which parts it from Northamptonshire; and on the west and north by Leicestershire. It has only two market-towns; namely, Okeham, where the assizes and sessions are held, and Uppingham.

RUYSCH, FREDERIC, one of the most eminent anatomists of which Holland can boast, was born at the Hague in 1638. After making great progress at home, he repaired to Leyden, and there prosecuted the study of anatomy and botany. He studied next at Franeker, where he obtained the degree of doctor of physic. He then returned to the Hague; and marrying in 1661, dedicated his whole time to the study of his profession. In 1665 he published a treatise, entitled *Dilucidatio valvularum de variis lymphaticis et lacteis*; which raised his reputation so high, that he was chosen professor of anatomy at Amsterdam. This honour he accepted with the more pleasure, because his situation at Amsterdam would give him easy access to every requisite help for cultivating anatomy and natural history. After he settled in Amsterdam, he was perpetually engaged in dissecting and in examining with the most inquisitive eye the various parts of the human body. He improved the

Rutherglen.
||
Ruysch.

Ruysch.
||
Ruyter.

science of anatomy by new discoveries; in particular, he found out a way to preserve dead bodies many years from putrefaction. His anatomical collection was curious and valuable. He had a series of fetuses of all sizes, from the length of the little finger to that of a new-born infant. He had also bodies of full grown persons of all ages, and a vast number of animals almost of every species on the globe, besides a great many other natural curiosities. Peter the Great of Russia, in his tour through Holland in the year 1698, visited Ruysch, and was so charmed with his conversation, that he passed whole days with him; and when the hour of departure came, he left him with regret. He set so high a value on Ruysch's cabinet of curiosities, that when he returned to Holland in 1717, he purchased it for 30,000 florins, and sent it to Petersburg.

In 1685 he was made professor of medicine, an office which he discharged with great ability. In 1728 he got his thigh-bone broken by a fall in his chamber. The year before this misfortune happened he had been deprived of his son Henry, a youth of talents, and well skilled in anatomy and botany. He had been created a doctor of physic, and was supposed to have assisted his father in his discoveries and publications. Ruysch's family now consisted only of his youngest daughter. This lady had been early inspired with a passion for anatomy, the favourite science of her father and brother, and had studied it with success. She was therefore well qualified to assist her father in forming a second collection of curiosities in natural history and anatomy, which he began to make after the emperor of Russia had purchased the first. Ruysch is said to have been of so healthy a constitution, that though he lived to the age of 93, yet during that long period he did not labour under the infirmities of disease above a month. From the time he broke his thigh he was indeed disabled from walking without a support; yet he retained his vigour both of mind and body without any sensible alteration, till in 1731 his strength at once deserted him. He died on the 22d of February the same year. His anatomical works are printed in 4 vols 4to.

The style of his writings is simple and concise, but sometimes inaccurate. Instruction, and not ostentation, seems to be his only aim. In anatomy he undoubtedly made many discoveries; but from not being sufficiently conversant in the writings of other anatomists, he published as discoveries what had been known before. The Academy of Sciences at Paris in 1727 elected him a member in place of Sir Isaac Newton, who was lately deceased. He was also a member of the Royal Society of London.

RUYSCHIA, a genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking with those that are doubtful. See *BOTANY Index*.

RUYTER, MICHAEL ADRIAN, a distinguished naval officer, was born at Flessingue, a town of Zealand, in 1607. He entered on a seafaring life when he was only 11 years old, and was first a cabin-boy. While he advanced successively to the rank of mate, master, and captain, he acquitted himself with ability and honour in all these employments. He repulsed the Irish, who attempted to take Dublin out of the hands of the English. He made eight voyages to the West Indies and ten to Brazil. He was then promoted to the rank of

rear-admiral, and sent to assist the Portuguese against the Spaniards. When the enemy came in sight, he advanced boldly to meet them, and gave such unquestionable proofs of valour as drew from the Portuguese monarch the warmest applause. His gallantry was still more conspicuous before Salee, a town of Barbary. With one single vessel he sailed through the roads of that place, in defiance of five Algerine corsairs who came to attack him.

In 1653 a squadron of 70 vessels was despatched against the English under the command of Van Tromp. Ruyter, who accompanied the admiral in this expedition, seconded him with great skill and bravery in the three battles which the English so gloriously won. He was afterwards stationed in the Mediterranean, where he captured several Turkish vessels. In 1659 he received a commission to join the king of Denmark in his war with the Swedes; and he not only maintained his former reputation, but even raised it higher. As the reward of his services, the king of Denmark ennobled him and gave him a pension. In 1661 he ran ashore a vessel belonging to Tunis, released 40 Christian slaves, made a treaty with the Tunisians, and reduced the Algerine corsairs to submission. His country, as a testimony of her gratitude for such illustrious services, raised him to the rank of vice-admiral and commander in chief. To the latter dignity, the highest that could be conferred upon him, he was well entitled by the signal victory which he obtained over the combined fleets of France and Spain. This battle was fought in 1672; about the time of the conquest of Holland. The battle was maintained between the English and Dutch with the obstinate bravery of nations which were accustomed to dispute the empire of the main. Ruyter having thus made himself master of the sea, conducted a fleet of Indiamen safely into the Texel; thus defending and enriching his country, while it had become the prey of hostile invaders. The next year he had three engagements with the fleets of France and England, in which, if possible, his bravery was still more distinguished than ever. D'Estrees, the French vice-admiral, wrote to Colbert in these words: "I would purchase with my life the glory of De Ruyter." But he did not long enjoy the triumph which he had so honourably won. In an engagement with the French fleet off the coast of Sicily, he lost the day, and received a mortal wound, which put an end to his life in a few days. His corpse was carried to Amsterdam, and a magnificent monument to his memory was there erected by the command of the states-general. The Spanish council bestowed on him the title of duke, and transmitted a patent investing him with that dignity; but he died before it arrived.

When some person was congratulating Louis XIV. upon De Ruyter's death, telling him he had now got rid of one dangerous enemy; he replied, "Every one must be sorry at the death of so great a man."

RYE. See *SECALE*, *BOTANY Index*; and also *AGRICULTURE Index*.

Rye-Grass. See *AGRICULTURE Index*.

RYE, a town in Sussex, with two markets on Wednesdays and Saturdays, but no fair. It is one of the cinque-ports; is a handsome well-built place, governed by a mayor and jurats, and sends two members to parliament. It has a church built with stone, and a town-hall; and consists of three streets, paved with stone.

Ruyter.
Rye.

Rye. Rymer. One side of the town has been walled in, and the other is guarded by the sea. It has two gates, and is a place of considerable trade in the shipping way. From thence large quantities of corn are exported, and many of the inhabitants are fishermen. It is 34 miles south-east by south of Tunbridge, and 64 from London. The mouth of the harbour is of late choked up with sand; but, if well opened, it would be a good station for privateers that cruize against the French. Population in 1811, 2681. E. Long. 0. 50. N. Lat. 51. 0.

RYMER, THOMAS, Esq. the author of the *Fœdera*, was born in the north of England, and educated at the grammar-school of Northallerton. He was admitted a scholar at Cambridge, then became a member of Gray's Inn, and at length was appointed historiographer to King William in place of Mr Shadwell. He wrote A View of the Tragedies of the last Age, and afterwards published a tragedy named *Edgar*. For a critic he was certainly not well qualified, for he wanted candour; nor is his judgment much to be relied on, who could condemn Shakespeare with such rigid severity. His tragedy will show, that his talents for poetry were by no means equal to those whose poems he has publicly censured. But though he has no title to the appellation of poet or critic, as an antiquarian and historian his memory will long be preserved. His *Fœdera*, which is a collection of all the public transactions, treaties, &c. of the kings of England with foreign princes, is esteemed one of our most authentic and valuable records, and is oftener referred to by the best English historians than perhaps any other book in the language. It was published at London in the beginning of the 18th century in 17 volumes folio. Three volumes more were added by Sanderson after Rymer's death. The whole were reprinted at the Hague in 10 vols in 1739. They were abridged by Rapin in French, and inserted in *Le Clerc's Bibliothecque*, a translation of which was made by Stephen Whatley, and printed in 4 vols 8vo, 1731.

Rymer died 14th December 1713, and was buried in the parish church of St Clement's Danes. Some specimens of his poetry are preserved in the first volume of Mr Nichol's Select Collection of Miscellaneous Poems, 1780.

Rymer
Ryswick.

RYNCHOPS, a genus of birds belonging to the order of anseres. See ORNITHOLOGY *Index*.

RYOTS, in the policy of Hindostan, the modern name by which the renters of land are distinguished. They hold their possessions by a lease, which may be considered as perpetual, and at a rate fixed by ancient surveys and valuations. This arrangement has been so long established, and accords so well with the ideas of the natives, concerning the distinction of casts, and the functions allotted to each, that it has been invariably maintained in all the provinces subject either to Mahometans or Europeans; and to both it serves as the basis on which their whole system of finance is founded.

Respecting the precise mode, however, in which the ryots of Hindostan held their possessions, there is much diversity of opinion; the chief of which are very impartially delineated in note iv. to the Appendix of Robertson's Historical Disquisition, &c. concerning India, p. 345; to which we refer such of our readers as are interested in this subject of finance.

RYSWICK, a large village in Holland, seated between the Hague and Delft, where the prince of Orange has a palace, which stands about a quarter of a mile farther. It is a very noble structure, all of hewn stone, of great extent in front, but perhaps not proportionably high. It is adorned with a marble staircase, marble floors, and a magnificent terrace. There is a good prospect of it from the canal between Delft and the Hague. This place is remarkable for a treaty concluded here in 1697 between England, Germany, Holland, France and Spain. E. Long. 4. 20. N. Lat. 52. 8.

S.

S, s, the 18th letter and 14th consonant of our alphabet; the sound of which is formed by driving the breath through a narrow passage between the palate and the tongue elevated near it, together with a motion of the lower jaw and teeth towards the upper, the lips being a little way open; with such a configuration of every part of the mouth and larynx, as renders the voice somewhat sibilous and hissing. Its sound, however, varies; being strong in some words, as *this*, *thus*, &c. and soft in words which have a final *e*, as *muse*, *wise*, &c. It is generally doubled at the end of words, whereby they become hard and harsh, as in *kiss*, *loss*, &c. In some words it is silent, as *isle*, *island*, *viscount*, &c. In writing or printing, the long character *f* is generally used at the beginning and middle of words, but the short *s* at the end.

In abbreviation, S stands for *societas* or *socius*; as,

R. S. S. for *regiæ societatis socius*, i. e. fellow of the royal society. In medicinal prescriptions, S. A. signifies *secundum artem*, i. e. according to the rules of art: And in the notes of the ancients, S stands for *Sextus*; S. P. for *Spurius*; S. C. for *senatus consultum*; S. P. Q. R. for *senatus populusque Romanus*; S. S. S. for *stratum superstratum*, i. e. one layer above another alternately; S. V. B. E. E. Q. V. for *si vales bene est, ego quoque valeo*, a form used in Cicero's time, in the beginning of letters. Used as a numeral, S anciently denoted seven; in the Italian music, S signifies *solo*. And in books of navigation, S stands for south; S. E. for south-east; S. W. for south-west; S. S. E. for south south-east; S. S. W. for south south-west, &c.

SAAVEDRA, MICHAEL DE CERVANTES, a celebrated Spanish writer, and the inimitable author of *Don Quixote*, was born at Madrid in the year 1541. From

S.
Saavedra.

Saavedra. his infancy he was fond of books; but he applied himself wholly to books of entertainment, such as novels and poetry of all kinds, especially Spanish and Italian authors. From Spain he went to Italy, either to serve Cardinal Aquaviva, to whom he was chamberlain at Rome; or else to follow the profession of a soldier, as he did some years under the victorious banners of Marco Antonio Colonna. He was present at the battle of Lepanto, fought in the year 1571; in which he either lost his left hand by the shot of an harquebus, or had it so maimed that he lost the use of it. After this, he was taken by the Moors, and carried to Algiers, where he continued a captive five years and a half. Then he returned to Spain, and applied himself to the writing of comedies and tragedies; and he composed several, all of which were well received by the public, and acted with great applause. In the year 1584 he published his *Galatea*, a novel in six books; which he presented to Ascanio Colonna, a man of high rank in the church, as the first fruits of his wit. But the work which has done him the greatest honour, and will immortalize his name, is the history of *Don Quixote*; the first part of which was printed at Madrid in the year 1605. This is a satire upon books of knight-errantry; and the principal, if not the sole, end of it was to destroy the reputation of those books which had so infatuated the greater part of mankind, and especially those of the Spanish nation. This work was universally read; and the most eminent painters, tapestry-workers, engravers, and sculptors, have been employed in representing the history of *Don Quixote*. Cervantes, even in his lifetime, obtained the glory of having his work receive a royal approbation. As King Philip III. was standing in a balcony of his palace at Madrid, and viewing the country, he observed a student on the banks of the river Manzanares reading in a book, and from time to time breaking off, and beating his forehead with extraordinary tokens of pleasure and delight: upon which the king said to those about him, "That scholar is either mad, or reading *Don Quixote*:" the latter of which proved to be the case. But *virtus laudatur et alget*: notwithstanding the vast applause his book everywhere met with, he had not interest enough to procure a small pension, for he could scarcely keep himself from starving. In the year 1615, he published a second part; to which he was partly moved by the presumption of some scribbler, who had published a continuation of this work the year before. He wrote also several novels; and among the rest, "*The Troubles of Persiles and Sigismunda*." He had employed many years in writing this novel, and finished it but just before his death; for he did not live to see it published. His sickness was of such a nature that he himself was able to be, and actually was, his own historian. At the end of the preface to the *Troubles of Persiles and Sigismunda*, he represents himself on horseback upon the road, and a student, who had overtaken him, engaged in conversation with him: "And happening to talk of my illness (says he), the student soon let me know my doom, by saying it was a dropsy I had got; the thirst attending which, all the water of the ocean, though it were not salt, would not suffice to quench. Therefore Senior Cervantes, says he, you must drink nothing at all, but do not forget to eat; for this alone will recover you without any other physic. I have been told the same by others, answered I;

but I can no more forbear tipping, than if I were born to do nothing else. My life is drawing to an end; and from the daily journal of my pulse, I shall have finished my course by next Sunday at the farthest.—But adieu, my merry friends all, for I am going to die; and I hope to see you ere long in the other world, as happy as heart can wish." His dropsy increased, and at last proved fatal to him; yet he continued to say and to write bon mots. He received the last sacrament on the 18th of April 1616; yet the day after wrote a dedication to the *condé de Tremos* and *Sigismunda* to the *condé de Lemos*. The particular day of his death is not known.

SABA, a Dutch island near St Eustatia in the West Indies. It is a steep rock, on the summit of which is a little ground, very proper for gardening. Frequent rains, which do not lie any time on the soil, give growth to plants of an exquisite flavour, and cabbages of an extraordinary size. Fifty European families, with about one hundred and fifty slaves, here raise cotton, spin it, make stockings of it, and sell them to other colonies for as much as ten crowns * a pair. Throughout America there is no blood so pure as that of Saba; the women there preserve a freshness of complexion, which is not to be found in any other of the Caribbee islands. Happy colony! elevated on the top of a rock between the sky and sea, it enjoys the benefit of both elements without dreading their storms; it breathes a pure air, lives upon vegetables, cultivates a simple commodity, from which it derives ease without the temptation of riches; is employed in labours less troublesome than useful, and possesses in peace all the blessings of moderation, health, beauty, and liberty. This is the temple of peace, from whence the philosopher may contemplate at leisure the errors and passions of men, who come like the waves of the sea, to strike and dash themselves on the rich coasts of America, the spoils and possession of which they are perpetually contending for, and wrestling from each other: hence may he view at a distance the nations of Europe bearing thunder in the midst of the ocean, and burning with the flames of ambition and avarice under the heats of the tropics; devouring gold without ever being satisfied; wading through seas of blood to amass those metals, those pearls, those diamonds, which are used to adorn the oppressors of mankind; loading innumerable ships with those precious casks, which furnish luxury with purple, and from which flow pleasures, effeminacy, cruelty, and debauchery. The tranquil inhabitant of Saba views this mass of follies, and spins his cotton in peace.

SABÆANS. See SABIANS.

SABAZIA, in Greek antiquity, were nocturnal mysteries in honour of Jupiter Sabazius. All the initiated had a golden serpent put in at their breasts, and taken out at the lower part of their garments, in memory of Jupiter's ravishing Proserpina in the form of a serpent. There were also other feasts and sacrifices distinguished by this appellation, in honour of Mithras, the deity of the Persians, and of Bacchus, who was thus denominated by the Sabians, a people of Thrace.

SABBATARIANS, or SEVENTH DAY BAPTISTS, a sect of Anabaptists; thus called, because they observed the Jewish or Saturday-Sabbath, from a persuasion that it was never abrogated in the New Testament by the institution of any other.

SABBATH,

SABBATH, in the Hebrew language, signifies *rest*. The seventh day was denominated the *Sabbath*, or *day of rest*, because that in it God had rested from all his works which he created and made. From that time the seventh day seems to have been set apart for religious services; and, in consequence of a particular injunction, was afterwards observed by the Hebrews as a holyday. They were commanded to set it apart for sacred purposes in honour of the creation, and likewise in memorial of their own redemption from Egyptian bondage.

The importance of the institution may be gathered from the different laws respecting it. When the ten commandments were published from Mount Sinai in tremendous pomp, the law of the Sabbath held a place in what is commonly called the first table, and by subsequent statutes the violation of it was to be punished with death. Six days were allowed for the use and service of man; but the seventh day God reserved to himself, and appointed it to be observed as a stated time for holy offices, and to be spent in the duties of piety and devotion. On this day the ministers of the temple entered upon their week; and those who had attended on the temple service the preceding week went out at the same time. New loaves of shew-bread were placed upon the golden table, and the old ones taken away. Two lambs for a burnt-offering, with a certain proportion of fine flour, mingled with oil, for a bread-offering, and wine for a libation, were offered. The Sabbath, as all other festivals, was celebrated from evening to evening. It began at six in the evening on Friday, and ended at the same time the next day.

Concerning the time at which the Sabbath was first instituted, different opinions have been held. Some have maintained, that the sanctification of the seventh day, mentioned in Gen. ii. is only there spoken of *δια προλεψιν*, or by anticipation; and is to be understood of the Sabbath afterwards enjoined the children of Israel at the commencement of the Mosaic dispensation. But without entering into a particular examination of all the arguments adduced to support this opinion, a few observations, it is presumed, will be sufficient to show that it rests on no solid foundation.

It cannot easily be supposed that the inspired penman would have mentioned the sanctification of the seventh day amongst the primeval transactions, if such sanctification had not taken place until 2500 years afterwards. Writers, ambitious of that artificial elegance which the rules of criticism have established, often bring together in their narratives events which were themselves far distant, for the sake of giving form to their discourse; but Moses appears to have despised all such flimsy refinements, and to have constructed his narrative in great conformity to the series of events.

From the accounts we have of the religious service practised in the patriarchal age, it appears that, immediately after the fall, when Adam was restored to favour through a Mediator, a stated form of public worship was instituted, which man was required to observe, in testimony, not only of his dependence on the Creator, but also of his *faith* and *hope* in the promise made to our first parents, and seen afar off. Of an institution, then, so grand and important, no circumstance would be omitted that is necessary to preserve it, or that contributes to render the observance of it regular and solemn.

That determined times are necessary for the due celebration of divine service, cannot be denied. Such is the constitution of man, that he must have particular times set apart for particular services. He is doomed to toil and labour; to earn his bread in the sweat of his face; and is capable of performing religious duties only in such a manner as is consistent with his situation in the world. If stated times for religious solemnities had not been enjoined, the consequence would have been, that such solemnities would have been altogether neglected; for experience shows, that if mankind were left at liberty when and how often they should perform religious offices, these offices would not be performed at all. It is the observation of holy times that preserves the practice of holy services; and without the frequent and regular returns of hallowed days, man would quickly forget the duty which he owes to God, and in a short time no vestige of religion would be found in the world.

Among the ordinances which God vouchsafed his ancient people, we find that the pious observation of holydays was particularly insisted upon; and the Sabbath was enjoined to be kept holy, in the most solemn manner, and under the severest penalties. Can it then be supposed that He would suffer mankind, from the creation of the world to the Mosaic era, to remain without an institution so expedient in itself, and as well fitted to answer the end proposed by it, under the one dispensation, as ever it could be under the other? No; we have every imaginable reason to conclude, that when religious services were enjoined, religious times were appointed also; for the one necessarily implies the other.

It is no objection to the early institution of the Sabbath, that there is no mention of it in the history of the patriarchal age. It would have swelled the Bible to a most enormous size, had the sacred historian given a particular account of all the transactions of those times; besides, it would have answered no end. When Moses wrote the book of Genesis, it was unnecessary to relate minutely transactions and institutions already well known by tradition: accordingly we see, that his narrative is everywhere very concise, and calculated only to preserve the memory of the most important facts. However, if we take a view of the church-service of the patriarchal age, we shall find that what is called the *legal* dispensation, at least the liturgic part of it, was no new system, but a collection of institutions observed from the beginning, and republished in form by Moses. The Scriptures inform us that Cain and Abel offered sacrifices; and the account which is given of the acceptance of the one, and the rejection of the other, evidently shows that stated laws respecting the service had then taken place. "In process of time," *at the end of the days*, "Abel brought an offering." Here was *priest, altar, matter of sacrifice, appointed time, motive to sacrifice, atonement made, and accepted*. The distinction of animals into clean and unclean before the flood, and Noah's sacrifice immediately after his deliverance, without any new direction, is an unanswerable proof of the same truth. It is testified of Abraham, by God himself, that he kept his *charge, his commandments, his statutes, and his laws*. These expressions comprehend the various branches, into which the law given at Sinai was divided. They contain the moral precepts, affirmative and negative, the matter of religious service, a body of laws.

Sabbath:
5
Necessity
of stated
days for
the per-
formance.

6
Objections
to the ear-
ly institu-
tion of the
Sabbath
considered.

Sabbath. laws to direct obedience, and to which man was to conform his conduct in every part of duty. Agreeably to this, we find that sacrifices were offered, altars and places of worship consecrated, and the *Sabbath* also mentioned as a well-known solemnity, before the promulgation of the law. It is expressly taken notice of at the fall of man; and the incidental manner in which it is then mentioned, is a convincing proof that the Israelites were no strangers to the institution: for had it been a new one, it must have been enjoined in a positive and particular manner, and the nature of it must have been laid open and explained, otherwise the term would have conveyed no meaning.

7.
Argument from the general division of time into weeks.
* שבוע
Seven.

The division of time into *weeks*, or periods of seven days, which obtained so early and almost universally, is a strong indication that *one* day in seven was always distinguished in a particular manner. *Week*, * and *seven days*, are in scripture language synonymous terms. God commanded Noah, *seven days* before he entered the ark, to introduce into it all sorts of living creatures. When the waters of the flood began to abate, Noah sent forth a dove, which, finding no rest for the sole of her foot, returned to him. After *seven days* he sent forth the dove a second time, and again she returned to the ark. At the expiration of other *seven days* he let go the dove a third time: and a *week* is spoken of (Gen. xxix.) as a well-known space of time.

This septenary division of time has been, from the earliest ages, uniformly observed over all the eastern world. The Israelites, Assyrians, Egyptians, Indians, Arabians, and Persians, have always made use of a week, consisting of seven days. Many vain attempts have been made to account for this uniformity; but a practice so general and prevalent could never have taken place, had not the septenary distribution of time been instituted from the beginning, and handed down by tradition.

From the same source also must the ancient heathens have derived their notions of the sacredness of the seventh day. That they had such notions of it is evident from several passages of the Greek poets quoted by Aristobulus, a learned Jew, by Clement of Alexandria, and Eusebius.

Ἐβδομη, ἕρον ἡμερᾶ. Hesiod.

The seventh, the sacred day.

* Ἐβδοματὴ δ' ἑπτα κατηλυθεν, ἕρον ἡμερᾶ. Homer.

Afterwards came the seventh, the sacred day.

Again:

Ἐβδομον ἡμερᾶ ἐν, καὶ τῷ τετελετο πάντα.

On the seventh day all things were completed.

Ἐβδοματῆ ἡμέρᾳ τετελεσμένα πάντα τίθηται. Linus.

All things were made perfect on the seventh day.

That they likewise held the number *seven* in high estimation has been shown by a learned, though sometimes fanciful, author, * with such evidence as to enforce conviction. The Pythagoreans call it the venerable number, *σεβασμὸς ἀξίος*, worthy of veneration, and held it to be perfect and most proper to religion. They denominated it *fortune*, and also styled it *voice*, *sound*, *muse*, because, no doubt, *seven* distinct notes comprehend the whole scale of music, beyond which neither voice nor instrument can go, but must return from the seventh, and begin again

anew. They likewise designed it *τελειόφορος*, leading to the end. *Seven*, in the Hebrew language, is expressed by a word that primarily signifies *fulness*, *completion*, *sufficiency*, and is applied to a *week*, or *seven days*, because that was the *full time* employed in the work of creation; to the *Sabbath*, because on it all things were completed; and to an *oath*, because it is *sufficient* to put an end to all strife. This opening of the Hebrew root will enable us to come at the meaning of those expressions of the heathens, and also let us see whence they derived their ideas and modes of speaking, and that the knowledge of the transactions at the creation, though much perverted, was never entirely lost by them.

It has been supposed by some, that the heathens borrowed the notion of the sacredness of the seventh day from the Jews. But this opinion will not readily be admitted, when it is considered that the Jews were held in the greatest contempt by the surrounding nations, who derided them no less for their sabbaths than for their circumcision. All sorts of writers ridiculed them on this account. Seneca charged them with spending the seventh part of their time in sloth. Tacitus said, that not only the seventh day, but also the seventh year, was unprofitably wasted. Juvenal brings forward the same charge; and Persius upbraided them with their *recutita sabbata*. Plutarch said that they kept it in honour of Bacchus. Tacitus affirmed, that it was in honour of Saturn; but the most abominable assertion of all is that of Apion, who said that they observed the Sabbath in memory of their being cured on that day of a shameful disease, called by the Egyptians *sabbo*.

Some perceiving the force of this objection have contended, that time was divided into weeks of seven days, that each of the planetary gods, the Sun, Moon, Mercury, Venus, Mars, Jupiter, and Saturn, who were the *Dii majorum gentium*, might have a day appropriated to his service. But if such was the origin of weeks, how came the great and ancient goddess *Tellus* to be omitted? She was worshipped by the early idolators as well as the other planets, and must surely have been deemed by them as worthy of a particular day set apart to her honour as the planet Saturn, who was long undiscovered, afterwards seen but occasionally, and at all times considered as of malign aspect. (See REMPRIAN.)

Others have supposed, that as the year was divided into lunar months of something more than 28 days, it was natural to divide the months into quarters from the different phases of the moon, which would produce as many weeks of seven days. But this supposition is less tenable than the former. The phases of the moon are not so precisely marked at the quarters as to attract to them any particular notice, nor are the quarterly appearances of one month commonly like those of another. We cannot, therefore, conceive what should have induced the earliest observers of the phases of the moon to divide the month into four parts rather than into three, or five, or seven. Had the ancient week consisted of 14 days, it might have been inferred, with some degree of plausibility, that its length was regulated by the phases of the moon, because the shape of that luminary, at the end of the second quarter, is very precisely marked; but there is nothing which, in the present hypothesis, could have everywhere led mankind to make their weeks consist of seven days. This division of time, therefore, can

* *Hollo-way's Originals*, vol. ii. p. 60.

can be accounted for only by admitting the primeval institution of the Sabbath, as related by Moses in the book of Genesis. That institution was absolutely necessary to preserve among men a sense of religion; and it was renewed to the Jews at the giving of the law, and its observance enforced by the severest penalties. It was accordingly observed by them with more or less strictness in every part of their commonwealth; and there is none of the institutions of their divine lawgiver which, in their present state of dispersion, they more highly honour. They regard it, indeed, with a superstitious reverence, call it their *spouse*, their *delight*, and speak of it in the most magnificent terms. They have often varied in their opinions of the manner in which it ought to be kept. In the time of the Maccabees, they carried their respect for the sabbath so very high, that they would not on that day defend themselves from the attacks of their enemies. But afterwards they did not scruple to stand upon their necessary defence, although they would do nothing to prevent the enemy from carrying on their operations. When our Saviour was on earth, it was no sin to loose a beast from the stall, and lead him to water; and if he had chanced to fall into a ditch, they pulled him out: but now it is absolutely unlawful to give a creature in that situation any other assistance than that of food; and if they lead an animal to water, they must take care not to let the bridle or halter hang loose, otherwise they are transgressors.

As the law enjoins rest on that day from all servile employments, in order to comply with the injunction, they undertake no kind of work on Friday but such as can easily be accomplished before evening. In the afternoon they put into proper places the meat that they have prepared to eat the day following. They afterwards set out a table covered with a clean cloth, and place bread upon it, which they also cover with another cloth; and during the sabbath the table is never moved out of its place. About an hour before sunset, the women light the sabbath lamps, which hang in the places where they eat. They then stretch forth their hands to the light, and pronounce the following benediction. "Blessed be thou, O God, king of the world, who hast enjoined us, that are sanctified by thy commandments, to light the sabbath lamp." These lamps are two or more in number, according to the size of the chamber in which they are suspended, and continue to burn during the greatest part of the night. In order to begin the sabbath well, they wash their hands and faces, trim their hair, and pare their nails, beginning at the fourth finger, then going to the second, then the fifth, then the third; and ending with the thumb. If a Jew casts the parings of his nails to the ground, he is *rascah*, that is, a *wicked* man; for Satan has great power over those parings of nails; and it seems they are of great use to the wizards, who know how to employ them in their enchantments. If he buries them in the earth, he is *tzedic*, that is, a *just* man; if he burns them in the fire, he is *chesid*, that is, worthy of honour, an holy man. When they have performed these preparatory ceremonies, they repair to the synagogue, and enter upon their devotions. As soon as prayers begin, the departed souls spring out of the purgatorial flames, and have liberty to cool themselves in water while the sabbath lasts; for which reason the Jews pro-

long the continuance of it as much as they can; and the Rabbins have strictly commanded them not to exhaust all the water on the sabbath day, lest those miserable souls should by that means be deprived of the refreshing element. When they have ended their prayers, they return home, and salute one another, by wishing a good sabbath. They then sit down to table. The master of the family takes a cup full of wine, and lifting up his hand, says, "Blessed be thou, O God our Lord, king of the world, who hast created the fruit of the vine.—Blessed be thou, O God our Lord, king of the world, who hast sanctified us by thy commandments, and given us thy holy sabbath; and of thy good will and pleasure hast left it to us an inheritance, the memorial of thy works of creation. For it is the beginning of the congregation of saints, and the memorial of the coming out of Egypt. And thou hast also chosen us from all other people, and sanctified us, and with love and pleasure hast left thy holy sabbath an inheritance. Blessed be thou, O God, who sanctifiest the sabbath." After this benediction is ended, he drinks, and gives the cup to all that are present. He then removes the cloth, and taking bread, says, "Blessed be thou, O God our Lord, king of the world, who bringest bread out of the earth." Then he breaks off a bit, and eats, and also gives a piece of it to every one of the company.

On the morning of the sabbath, the Jews do not rise so early as they do at other times; thinking, the greater pleasure they take on that day, the more devoutly they keep it. When they come into the synagogue, they pray as usual, only the devotions are somewhat longer, being intermingled with psalmody, in honour of the sabbath. The pentateuch is then produced, and seven sections of it are read in order by seven persons chosen for the purpose. Several lessons are likewise read out of the prophets, which have some relation to what was read out of the law. After morning prayers they return to their houses, and eat the second sabbath-meal, showing every token of joy, in honour of the festival. But if one has seen any thing ominous in his sleep; if he has dreamed that he burnt the book of the law; that a beam has come out of the walls of his house; that his teeth have fallen out;—then he fasts until very late at night, for all such dreams are bad ones. In the afternoon they go again to the synagogue, and perform the evening service, adding to the ordinary prayers some lessons that respect the sabbath. When the devotional duties are ended, they return home, and light a candle resembling a torch, and again sit down to eat. They remain eating until near six, and then the master of the family takes a cup, and pouring wine into it rehearses some benedictions; after which he pours a little of the wine upon the ground, and says, "Blessed be thou, O Lord, King of the world, who hast created the fruit of the vine." Then holding the cup in his left hand, with the right he takes a box of sweet spices, and says, "Blessed be thou, O Lord God, who hast created various kinds of sweet spices." He smells the spices, and holds them out to the rest, that they may do the same. He then takes the cup in his right hand, and going to the candle views the left very narrowly, and pronounces a blessing. With the cup in the left hand, he examines the right in the same manner. Again, holding the cup in his right hand, he rehearses another benediction, and at the same time pours some of the wine

Sabbath. on the ground. After this he drinks a little of it, and then hands it about to the rest of the family, who finish what remains. In this manner the sabbath is ended by the Jews, and they may return to their ordinary employments. Those who meet pay their compliments, by wishing one another a happy week.

10
Prohibitions observed.

The Rabbins have reckoned up nine and thirty primary prohibitions, which ought to be observed on the sabbatic festival; but their circumstances and dependents, which are also obligatory, are almost innumerable. The 39 articles are, Not to till the ground; to sow; to reap; to make hay; to bind up sheaves of corn; to thrash; to winnow; to grind; to sift meal; to knead the dough; to bake; to shear; to whiten; to comb or card wool; to spin; to twine or twist; to warp; to dye; to tie; to untie; to sew; to tear or pull in pieces; to build; to pull down; to beat with a hammer; to hunt or fish; to kill a beast; to slay it; to dress it; to scrape the skin; to tan it; to cut leather; to write; to scratch out; to rule paper for writing; to kindle a fire; to extinguish it; to carry a thing from place to place; to expose any thing to sale. These are the primary prohibitions, and each of these has its proper consequences, which amount to an incredible number; and the Jews themselves say, that if they could keep but two sabbaths as they ought, they would soon be delivered out of all their troubles.

If a Jew on a journey is overtaken by the sabbath in a wood, or on the highway, no matter where, nor under what circumstances, he sits down; he will not stir out of the spot. If he falls down in the dirt, he lies there; he will not rise up. If he should tumble into a privy, he would rest there: he would not be taken out. (A). If he sees a flea skipping upon his clothes, he must not catch it. If it bites him he may only remove it with his hand; he must not kill it; but a louse meets with no such indulgence, for it may be destroyed. He must not wipe his hands with a towel or cloth, but he may do it very lawfully with a cow's tail. A fresh wound must not be bound up on the sabbath day; a plaster that had been formerly applied to a sore may remain on it; but if it falls off, it must not be put on anew. The lame may use a staff, but the blind must not. These particulars, and a great many more of the same nature, are observed by the Jews in the strictest manner. But if any one wishes to know more of the practice of that devoted race, he may consult Buxtorf's *Judaica Synagoga*, chap. x. xi. where he will find a complete detail of their customs and ceremonies on the sabbath; and likewise see the primary prohibitions branched out into their respective circumstances.

11
Institution of Sunday or the Lord's day.

As the seventh day was observed by the Jewish church, in memory of the rest of God after the works of creation, and their own deliverance from Pharaoh's tyranny; so the first day of the week has always been observed by the Christian church, in memory of the resurrection of Jesus Christ, by which he completed the work of man's redemption on earth, and rescued

him from the dominion of him who has the power of death.

This day was denominated by the primitive Christians the *Lord's day*. It was also sometimes called *Sunday*; which was the name given to it by the heathens, who dedicated it to the sun. And indeed, although it was originally called *Sunday* by the heathens, yet it may very properly retain that name among Christians, because it is dedicated to the honour of "The true light," which lighteth every man that cometh into the world; of Him who is styled by the prophet "The Sun of righteousness," and who on this day arose from the dead. But although it was, in the primitive times, indifferently called the *Lord's day* or *Sunday*, yet it was never denominated the *sabbath*; a name constantly appropriated to Saturday, or the *seventh day*, both by sacred and ecclesiastical writers.

Of the change from the *seventh* to the *first day* of the week, or even of the institution of the *Lord's day* festival, there is no account in the New Testament. However, it may be fairly inferred from it, that the first day of the week was, in the apostolic age, a stated time for public worship. On this day the apostles were assembled, when the Holy Ghost came down so visibly upon them to qualify them for the conversion of the world. On this day we find St Paul preaching at Troas, when the disciples came to break bread: and the directions which the same apostle gives to the Corinthians concerning their contributions for the relief of their suffering brethren, plainly allude to their religious assemblies on the first day of the week.

Thus it would appear from several passages in the New Testament, that the religious observation of the first day of the week is of apostolical appointment; and may indeed be very reasonably supposed to be among those directions and instructions which our blessed Lord himself gave to his disciples, during the 40 days between his resurrection and ascension, wherein he conversed with them, and spoke of the things pertaining to the kingdom of God. Still, however, it must be owned that those passages, although the plainest that occur, are not sufficient to prove the apostolical institution of the Lord's day, or even the actual observation of it. In order, therefore, to place the matter beyond all controversy, recourse must be had to ecclesiastical testimony.

From the consentient evidence and uniform practice of the primitive church, and also from the attestation of Pliny, an heathen of no mean figure both in learning and power, we find that the first day of the week was observed in the earliest ages as a holyday or festival, in honour of the resurrection of Christ. Now there are but two sources whence the custom could possibly have arisen. It must have been instituted either by *human* or *divine* authority: by human authority it was not instituted; for there was no general council in those early times, and without the decree of a general council it was impossible that any ecclesiastical institution could

(A) This, it seems, was once really the case. A Jew of Magdeburg fell into a privy on a Saturday. He might have been taken out; but he told those who offered him their assistance to give themselves no trouble; for there he was determined to keep holy the sabbath day. The bishop, when he heard of it, resolved that he should sanctify the next day also in the same place; and so betwixt them, the poor Jew lost his life.

could have been universally established at once. It remains, therefore, that it must have been instituted by divine authority: and that it really was so, will farther appear from the following considerations. It is certain that the apostles travelled over the greatest part of the world, and planted churches in the remotest parts of it. It is certain also that they were all led by the same *spirit*; and their desire was, that unity and uniformity should be observed in all the churches which they had founded. It is not therefore surprising that, in the primitive times, the same doctrine, the same worship, the same rites and customs, should prevail all over the Christian world; nay, it would have been unaccountable had the case been otherwise. For this reason we may conclude that every custom, universally observed in the early ages of the Christian church, and not instituted by a general council, was of original appointment.

As the *Lord's day* is sanctified, that is, *set apart* to Christians for the worship and service of God, their Creator, Redeemer, and Sanctifier, a little consideration will easily discover how it ought to be observed. Although a day separated from worldly business, yet it is in no sense a day of idleness, but a season appropriated to the works of salvation and labours of charity.

In the primitive times this holy day was observed in the most solemn manner. From the monuments of those early ages we learn, that it was spent in a due and constant attendance on all the offices of divine worship. On it they held their religious assemblies, in which the writings of the apostles and prophets were read to the people, and the doctrines of Christianity further pressed upon them by the exhortations of the clergy. Solemn prayers and praises were offered up to God, and hymns sung in honour of Christ; the *Lord's supper* was constantly celebrated; and collections were made for the maintenance of the clergy and the relief of the poor. On this day they abstained, as much as they could, from bodily labour. They looked upon it as a day of joy and gladness; and therefore all fasting on it was prohibited, even during the season of lent, their great annual fast.—Such was the zeal of those times, that nothing, no not the severest persecutions, hindered them from celebrating holy offices on this day. They were often beset and betrayed, and as often slaughtered in consequence of cruel edicts from emperors; those very emperors for whose happiness and prosperity they always offered up their fervent prayers. For this cause, when they could not meet in the daytime, they assembled in the morning before it was light; and when sick, in exile, or in prison, nothing troubled them more than that they could not attend the service of the church. No trivial pretences were then admitted for any one's absence from public worship; for severe censures were passed upon all who were absent without some urgent necessity. When the empire became Christian, Constantine and his successors made laws for the more solemn observation of the *Lord's day*. They prohibited all prosecutions and pleadings and other juridical matters to be transacted on it, and also all unnecessary labour; not that it was looked upon as a Jewish sabbath, but because these things were considered as inconsistent with the duties of the festival.

But although the primitive Christians did not in-

dulge themselves in the practice of unnecessary labour or trifling amusements, yet they did not wholly abstain from working, if great necessity required it. The council of *Laodicea* enjoined that men should abstain from work on the *Lord's day* if possible; but if any were found to *judaize*, they were to be censured as great transgressors. So circumspect were the primitive Christians about their conduct on this festival, that on the one hand they avoided all things which tended to profane it, whilst on the other they censured all those who insisted it should be observed with Pharisical rigour.

The primary duty of the *Lord's day* is *public worship*. The nature and design of the Christian religion sufficiently shows the necessity and importance of assembling for the duties of devotion. The whole scope of Christianity is to bring us to an union with God, which cannot be obtained or preserved without frequent communications with him; and the reasons which show religious intercourse to be the indispensable duty of Christians in a private capacity, will bind it with equal or more force on them considered as a community.

The advantages of public worship, when duly performed, are many and great. There are two, however, which deserve to be considered in a particular manner. It gives Christians an opportunity of openly professing their faith, and testifying their obedience to their Redeemer in the wisest and best manner; and in an age when atheism has arisen to an alarming height, when the Son of God is crucified afresh, and put to open shame, every man, who has any regard for religion, will cheerfully embrace all opportunities of declaring his abhorrence of the vicious courses pursued by those degenerate apostates. He will with pleasure lay hold on every occasion to testify that he is neither afraid nor ashamed to confess the truth; and will think it his indispensable duty openly to disavow the sins of others, that he may not incur the guilt of partaking of them.

Public worship preserves in the minds of men a sense of religion, without which society could not exist. Nothing can keep a body of men together and unite them in promoting the public good, but such principles of action as may reach and govern the heart. But these can be derived only from a sense of religious duties, which can never be so strongly impressed upon the mind as by a constant attendance upon public worship. Nothing can be more weak than to neglect the public worship of God, under the pretence that we can employ ourselves as acceptably to our Maker at home in our closets. Both kinds of worship are indeed necessary; but one debt cannot be paid by the discharge of another. By public worship every man professes his belief in that God whom he adores, and appeals to Him for his sincerity, of which his neighbour cannot judge. By this appeal he endears himself more or less to others. It creates confidence; it roots in the heart benevolence, and all other Christian virtues, which produce, in common life, the fruits of mutual love and general peace.

People in general are of opinion that the duties of the *Lord's day* are over when public worship is ended. But they seem to forget for what purposes the day was set apart. It is not only appropriated to the duties of public worship, but also sanctified to our improvement in the knowledge of the doctrines of Christianity. It

Sabbath.

16

Advantages resulting from the observation of it.

Sabbath,
Sabbath-
Breaking.

is an institution calculated to alleviate the condition of the laborious classes of mankind, and, in consequence of that, to afford rest to *beasts* also. It is proper, it is necessary, that man should reflect on his condition in the world, that he should examine the state of his soul, and inquire what progress he has made in that work which was given him to do. Those that have children or servants are obliged to look after *their* instruction as well as their own. These are the ends which the institution of Sunday was designed to answer. Every man must allow that these things must be done at some time or other; but unless there be *set* times for doing them, the generality of mankind would wholly neglect them.

Visiting and travelling (though very common) are enormous profanations of this holy day. Families are thereby robbed of their *time*; a loss for which no amends can ever be made them: Servants, instead of having leisure to improve themselves in spiritual knowledge, are burdened with additional labour: And, in a man of any humanity, it must excite many painful sensations, when he reflects how often the useful horse on that day experiences all the anguish of hunger, torn sides, and battered knees. Every kind of *amusement*, every kind of *common* labour, is an encroachment on the particular duties of the Lord's day; and consequently men profane the day by spending it in any amusements, or undertaking upon it any ordinary employment, unless it be a work of absolute necessity.

SABBATH-Breaking, or profanation of the Lord's day, is punished by the municipal laws of England. For besides the notorious indecency and scandal of permitting any secular business to be publicly transacted on that day in a country professing Christianity, and the corruption of morals which usually follows its profanation, the keeping one day in seven holy, as a time of relaxation and refreshment, as well as for public worship, is of admirable service to a state, considered merely as a civil institution. It humanizes, by the help of conversation and society, the manners of the lower classes; which would otherwise degenerate into a sordid ferocity and savage selfishness of spirit: it enables the industrious workman to pursue his occupation in the ensuing week with health and cheerfulness: it imprints on the minds of the people that sense of their duty to God so necessary to make them good citizens; but which yet would be worn out and defaced by an unremitted continuance of labour, without any stated times of recalling them to the worship of their Maker. And therefore the laws of King Athelstan forbade all merchandizing on the Lord's day, under very severe penalties. And by the statute 27 Hen. VI. c. 5. no fair or market shall be held on the principal festivals, Good-friday, or any Sunday (except the four Sundays in harvest), on pain of forfeiting the goods exposed to sale. And, since, by the statute 1 Car. I. c. 1. no persons shall assemble, out of their own parishes, for any sport whatsoever, upon this day; nor, in their parishes, shall use any bull or bear-beating, interludes, plays, or other unlawful exercises or pastimes; on pain that every offender shall pay 3s. 4d. to the poor. This statute does not prohibit, but rather impliedly allows, any innocent recreation or amusement, within their respective parishes, even on the Lord's day, after divine service is over. But by statute 29 Car. II. c. 7. no person is allowed to work on the Lord's day, or use any boat or

barge, or expose any goods to sale, except meat in public houses, milk at certain hours, and works of necessity or charity, on forfeiture of 5s. Nor shall any drover, carrier, or the like, travel upon that day, under pain of 20s.

Sabbath-
Breaking
||
Sable.

SABELLIANS, a sect of Christians of the 3d century, that embraced the opinions of Sabellius, a philosopher of Egypt, who openly taught that there is but one person in the Godhead.

The Sabellians maintained, that the Word and the Holy Spirit are only virtues, emanations, or functions of the Deity; and held, that he who is in heaven is the Father of all things; that he descended into the virgin, became a child, and was born of her as a son; and that having accomplished the mystery of our salvation, he diffused himself on the apostles in tongues of fire, and was then denominated the *Holy Ghost*. This they explained by resembling God to the sun, the illuminative virtue or quality of which was the Word, and its warming virtue the Holy Spirit. The Word, they taught, was darted, like a divine ray, to accomplish the work of redemption; and that being re-ascended to heaven, the influences of the Father were communicated after a like manner to the apostles.

SABIANS, an early sect of idolaters, which continues to this day, and worships the sun, moon, and stars. See POLYTHEISM, N^o 10, 11, 12.

SABINA, a province of Italy, in the territories of the church; bounded on the north by Umbria, on the east by Farther Abruzzo, on the south by the Campagna of Rome, and on the west by the patrimony of St Peter. It is 22 miles in length, and almost as much in breadth; watered by several small rivers, and abounding in oil and wine. There is no walled town in it; and Magliano is the principal place.

SABINUS, GEORGE, a celebrated Latin poet, born in the electorate of Brandenburg in 1508. His poem *Res gestæ Caesarum Germanorum*, spread his reputation all over Germany, and procured him the patronage of all the princes who had any regard for polite literature: he was made professor of the belles lettres at Frankfort on the Oder, rector of the new academy of Koningsburg, and counsellor to the elector of Brandenburg. He married two wives, the first of whom was the eldest daughter of the famous reformer Melancthon; and died in 1560. His poems are well known, and have been often printed.

SABLE, or *SABLE Animal*, in *Zoology*, a creature of the weasel-kind, called by authors *mustela zibellina*. See MUSTELA, MAMMALIA *Index*.

The chase of these animals, in the more barbarous times of the Russian empire, was the employment, or rather task, of the unhappy exiles in Siberia. As that country is now become more populous, the sables have in a great measure quitted it, and retired farther north and east, to live in desert forests and mountains: they live near the banks of rivers, or in the little islands in them; on this account they have, by some, been supposed to be the *Sabiqon* of Aristotle (*Hist. An.* lib. viii. c. 5.) which he classes with the animals conversant among waters.

At present the hunters of sables form themselves into troops, from five to forty each: the last subdivide into lesser parties, and each chooses a leader; but there is one that directs the whole: a small covered boat is provided

Sable. provided for each party, loaded with provisions, a dog and net for every two men, and a vessel to bake their bread in: each party also has an interpreter for the country they penetrate into. Every party then sets out according to the course their chief points out: they go against the stream of the rivers, drawing their boats up, till they arrive in the hunting country; there they stop, build huts, and wait till the waters are frozen, and the season commences: before they begin the chase, their leader assembles them, when they unite in a prayer to the Almighty for success, and then separate: the first sable they take is called *God's sable*, and is dedicated to the church.

They then penetrate into the woods; mark the trees as they advance, that they may know their way back; and in their hunting quarters form huts of trees, and bank up the snow round them: near these they lay their traps; then advance farther, and lay more traps, still building new huts in every quarter, and return successively to every old one to visit the traps, and take out the game to skin it, which none but the chief of the party must do: during this time they are supplied with provisions by persons who are employed to bring it on sledges, from the places on the road, where they are obliged to form magazines, by reason of the impracticability of bringing quantities through the rough country they must pass. The traps are a sort of pit-fall, with a loose board placed over it, baited with fish or flesh: when sables grow scarce, the hunters trace them in the new-fallen snow to their holes; place their nets at the entrance; and sometimes wait, watching two or three days for the coming out of the animal: it has happened that these poor people have, by the failure of their provisions, been so pinched with hunger, that, to prevent the cravings of appetite, they have been reduced to take two thin boards, one of which they applied to the pit of the stomach, the other to the back, drawing them tight together by cords placed at the ends: such are the hardships our fellow-creatures undergo to supply the wantonness of luxury.

The season of chase being finished, the hunters reassemble, make a report to their leader of the number of sables each has taken; make complaints of offenders against their regulations; punish delinquents; share the booty; then continue at the head-quarters till the rivers are clear of ice; return home, and give to every church the dedicated furs.

SABLE, Cape, the most southerly province of Nova Scotia, in North America, near which is a fine cod-fishery. W. Long. 65. 34. N. Lat. 43. 24.

Sable Isle is adjoined to this cape, and the coasts of both are most commodiously situated for fisheries.

SABLE Trade, the trade carried on in the skins or furs of sables; of which the following commercial history was translated by Mr J. R. Forster from a Russian performance on that subject by Mr Muller.

“*Sable*; *soble*, in Russian; *zoble* in German. Their price varies from 1*l.* to 10*l.* sterling and above: fine and middling sable-skins are without bellies, and the coarse ones are with them. Forty skins make a collection called *zimmer*. The finest sables are sold in pairs perfectly similar, and are dearer than single ones of the same goodness; for the Russians want those in pairs for facing caps, cloaks, tippets, &c. the blackest are reputed the best. Sables are in season from November to February; for those caught at any other time of

the year are short-haired, and then called *nedosoboli*. The hair of sables differs in length and quality: the long hairs, which reach far beyond the inferior ones, are called *os*; the more a skin has of such long hairs, the blacker it is, and the more valuable is the fur; the very best have no other but those long and black hairs.

Motchka is a technical term used in the Russian fur-trade, expressing the lower part of the long hairs; and sometimes it comprehends likewise the lower and shorter hairs: the above-mentioned best sable furs are said to have a black motchka. Below the long hairs are, in the greater part of the sable furs, some shorter hairs, called *podosie*, i. e. under-os; the more *podosie* a fur has, it is the less valuable: in the better kind of sables the *podosie* has black tips, and a gray or rusty motchka. The first kind of motchka makes the middling kind of sable furs; the red one the worst, especially if it has but few *os*. Between the *os* and *podosie* is a low woolly kind of hair, called *pod sada*. The more *pod sada* a fur has, the less valuable: for the long hair will, in such case, take no other direction than the natural one; for the characters of sable is, that notwithstanding the hair naturally lies from the head towards the tail, yet it will lie equally in any direction as you strike your hand over it. The various combinations of these characters, in regard to *os*, motchka, *podosie*, and *pod sada*, make many special divisions in the goodness of furs: besides this, the furriers attend to the size, preferring always, *ceteris paribus*, the biggest, and those that have the greatest gloss. The size depends upon the animal being a male or a female, the latter being always smaller. The gloss vanishes in old furs: the fresh ones have a kind of bloomy appearance, as they express it; the old ones are said to have done blooming: the dyed sables always lose their gloss; become less uniform, whether the lower hairs have taken the dye or not; and commonly the hairs are somewhat twisted or crisped, and not so straight as in the natural ones. Some fumigate the skins, to make them look blacker; but the smell, and the crisped condition of the long hair, betrays the cheat; and both ways are detected by rubbing the fur with a moist linen cloth, which grows black in such cases.

“The Chinese have a way of dyeing the sables, so that the colour not only lasts (which the Russian cheats cannot do), but the fur keeps its gloss, and the crisped hairs only discover it. This is the reason that all the sables, which are of the best kind, either in pairs or separate, are carried to Russia; the rest go to China. The very best sables come from the environs of Nertchitsk and Yakutsk; and in this latter district, the country about the river Ud affords sometimes sables, of which one single fur is often sold at the rate of 60 or 70 rubles, 12*l.* or 14*l.* The bellies of sables, which are sold in pairs, are about two fingers breadth, and are tied together by 40 pieces, which are sold from 1*l.* to 2*l.* sterling. Tails are sold by the hundred. The very best sable furs must have their tails; but ordinary sables are often cropped, and 100 sold from 4*l.* to 8*l.* sterling. The legs or feet of sables are seldom sold separately; white sables are rare, and no common merchandize, but bought only as curiosities: some are yellowish, and are bleached in the spring on the snow.”

SABLE, in *Heraldry*, signifies black; and is borrowed from the French, as are most terms in this science: in engraving it is expressed by both horizontal and perpendicular lines crossing each other. Sable of itself signifies

Sable
||
Saccharum.

nifies constancy, learning, and grief; and ancient heralds will have it, that when it is compounded with

Or.	} it signifies	Honour.
Arg.		Fame.
Gul.		Respect.
Azu.		Application.
Ver.		Comfort.
Pur.		Austerity.

The occasion that introduced this colour into heraldry is thus related by Alexander Nisbet, p. 8. The duke of Anjou, king of Sicily, after the loss of that kingdom, appeared at a tournament in Germany all in black, with his shield of that tincture, *semé de larmes*, i. e. besprinkled with drops of water, to represent tears, indicating by that both his grief and loss.

SABLESTAN, or SABLUSTAN, a province of Asia, in Persia, on the frontiers of Indostan; bounded on the north by Khorasan; on the east, by the mountains of Balk and Candahar; on the south, by Sages-tan or Segestan; and on the west, by Heri. It is a mountainous country, very little known to Europeans; nor is it certain which is the capital town.

SABRE, a kind of sword or scimitar, with a very broad and heavy blade, thick at the back, and a little falcated or crooked towards the point. It is the ordinary weapon worn by the Turks, who are said to be very expert in the use of it.

SABURRA, in *Medicine*, usually denotes any collection of half putrid indigested matter in the stomach and intestines, by which the operation of digestion is impeded.

SABURRÆ, GRITTS, in *Natural History*; a kind of stone, found in minute masses. They are of various colours, as stony and sparry gritts, of a bright or grayish white colour; red stony gritts; green stony gritts; yellow gritt; blackish gritts.

SACÆA, a feast which the ancient Babylonians and other orientals held annually in honour of the deity Anaitis. The Sacæa were in the East what the Saturnalia were at Rome, viz. a feast for the slaves. One of the ceremonies was to choose a prisoner condemned to death, and allow him all the pleasures and gratifications he would wish, before he were carried to execution.

SACCADE, in the manege, is a jerk more or less violent, given by the horseman to the horse, in pulling or twitching the reins of the bridle all on a sudden and with one pull, and that when a horse lies heavy upon the hand, or obstinately arms himself.

This is a correction used to make a horse carry well; but it ought to be used discretely, and but seldom.

SACERDOTAL, something belonging to priests. See PRIEST.

SACCULUS, in *Anatomy*, a diminutive of saccus, signifies a little bag, and is applied to many parts of the body.

SACCHARUM, SUGAR, or the *Sugar-Cane*, a genus of plants belonging to the triandria class; and in the natural method ranking under the 4th order, *Gramina*. See BOTANY Index.

This plant is a native of Africa, the East Indies, and of Brazil; from whence it was introduced into our West India islands soon after they were settled. The sugar-cane is the glory and the pride of those islands. It amply rewards the industrious planter, enriches the

British merchant, gives bread to thousands of manu-^{Saccharum}facturers and scamen, and brings an immense revenue to the crown. For the process of making sugar, see ^{Sacheverel}SUGAR.

Sugar, formerly a luxury, is now become one of the necessaries of life. In crop-time every negro on the plantations, and every animal, even the dogs, grow fat. This sufficiently points out the nourishing and healthy qualities of sugar. It has been alleged, that the eating of sugar spoils the colour of, and corrupts, the teeth: this, however, proves to be a mistake, for no people on the earth have finer teeth than the negroes in Jamaica. Dr Alston, formerly professor of botany and materia medica at Edinburgh, endeavoured to obviate this vulgar opinion: he had a fine set of teeth, which he ascribed solely to his eating great quantities of sugar. Externally too it is often useful: mixed with the pulp of roasted oranges, and applied to putrid or ill-disposed ulcers, it proves a powerful corrector.

SACCHAROMETER, an instrument for ascertaining the value of worts, and the strength of different kinds of malt liquor. The name signifies a measure of sweetness. An instrument of this kind has been invented by a Mr Richardson of Hull, on the following principle. The menstruum or water employed by the brewer, becomes more dense by the addition of such parts of the materials as have been dissolved or extracted by, and thence incorporated with it: the operation of boiling, and its subsequent cooling, still adds to the density of it by evaporation; so that when it is submitted to the action of fermentation, it is denser than at any other period.

In passing through this natural operation, a remarkable alteration takes place. The fluid no sooner begins to ferment than its density begins to diminish; and as the fermentation is more or less perfect, the fermentable matter, whose accession has been traced by the increase of density, becomes more or less attenuated; and in place of every particle thus attenuated, a spirituous particle, of less density than water, is produced; so that when the liquor is again in a state of rest, it is so much specifically lighter than it was before, as the action of fermentation has been capable of attenuating the component parts of its acquired density; and if the whole were attenuated in this manner, the liquor would become lighter, or less dense than water, because the quantity of spirit produced from the fermentable matter, and occupying its place, would diminish the density of the water in some degree of proportion to that in which the latter has increased it.

SACHEVEREL, DR HENRY, a famous clergyman of the Tory faction in the reign of Queen Anne; who distinguished himself by indecent and scurrilous sermons and writings against the dissenters and revolution principles. He owed his consequence, however, to being indiscreetly prosecuted by the house of lords for his assize sermon at Derby, and his 5th of November sermon at St Paul's in 1709; in which he asserted the doctrine of non-resistance to government in its utmost extent; and reflected severely on the act of toleration. The high and low church parties were very violent at that time; and the trial of Sacheverel inflamed the high church party to dangerous riots and excesses: he was, however, suspended for three years, and his sermons burned by the common hangman. The Tories being in administration when Sacheverel's suspension expired; he

verel. he was freed with every circumstance of honour and public rejoicing; was ordered to preach before the commons on the 29th of May, had the thanks of the house for his discourse, and obtained the valuable rectory of St Andrew's, Holborn.

SACK, a wine used by our ancestors, which some have taken to be Rhenish and some Canary wine.—Venner, in his *Via Recta ad Vitam Longam*, printed in 1628, says that sack is “completely not in the third degrec, and that some affect to drink sack with sugar and some without; and upon no other ground, as I think, but as it is best pleasing to their palate.” He goes on to say, “that sack, taken by itself, is very hot and very penetrative; being taken with sugar, the heat is both somewhat allaycd, and the penetrative quality thereof also retarded.” He adds farther, that Rhenish, &c. decline after a twelvemonth, but sack and the other stronger wines are best when they are two or three years old. It appears to be highly probable that sack was not a sweet wine, from its being taken with sugar, and that it did not receive its name from having a saccharine flavour, but from its being originally stored in sacks or borachios. It does not appear to have been a French wine, but a strong wine the production of a hot climate. Probably it was what is called dry mountain, or some Spanish wine of that kind. This conjecture is the more plausible, as Howell, in his French and English Dictionary, printed in the year 1650, translates sack by the words *vin d'Espagne, vin sec*.

SACK of Wool, a quantity of wool containing just 22 stones, and every stone 14 pounds. In Scotland, a sack is 24 stones, each stone containing 16 pounds.

SACK of Cotton Wool, a quantity from one hundred and a half to four hundred weight.

SACKS of Earth, in *Fortification*, are canvas bags filled with earth. They are used in making entrenchments in haste, to place on parapets, or the head of the breaches, &c. to repair them, when beaten down.

SACKBUT, a musical instrument of the wind kind, being a sort of trumpet, though different from the common trumpet both in form and size; it is fit to play a bass, and is contrived to be drawn out or shortened, according to the tone required, whether grave or acute. The Italians call it *trombone*, and the Latins *tuba ductilis*.

SACKVILLE, THOMAS, *Lord Buckhurst and Earl of Dorset*, a statesman and poet, the son of Richard Sackville, Esq. of Buckhurst, in the parish of Withian in Sussex, was born in the year 1536. He was sent to Hart-hall in Oxford, in the latter end of the reign of Edward VI. whence he removed to Cambridge, where he took a master of arts degree, and thence to the Inner Temple. He now applied himself to the study of the law, and was called to the bar. We are told that he commenced poet whilst at the universities, and that these his juvenile productions were much admired, none of which, however, have been preserved.—In the fourth and fifth year of Queen Mary, we find him a member of the house of commons; about which time, in 1557, he wrote a poetical piece, entitled *The Induction, or The Mirror of Magistrates*. This last was meant to comprehend all the unfortunate Great from the beginning of our history; but the design being dropped, it was inserted in the body of the work. The *Mirror of Magistrates* is formed on a dramatic plan;

in which the persons are introduced speaking. The Induction is written much in the style of Spencer, who, with some probability, is supposed to have imitated this author. Sackville.

In 1561, his tragedy of *Gorboduc* was acted before Queen Elizabeth by the gentlemen of the Inner Temple. This was the first tolerable tragedy in our language. The Companion to the Playhouse tells us, that the three first acts were written by Mr Tho. Norton. Sir Philip Sidney, in his *Apology for Poetry*, says, “it is full of stately speeches, and well-sounding phrases, climbing to the height of Seneca in his style, &c.” Rymer speaks highly in its commendation. Mr Spence, at the instigation of Mr Pope, republished it in 1736, with a pompous preface. It is said to be our first dramatic piece written in verse.

In the first parliament of this reign, Mr Sackville was member for Sussex, and for Bucks in the second. In the mean time he made the tour of France and Italy, and in 1566 was imprisoned at Rome, when he was informed of his father's death, by which he became possessed of a very considerable fortune.

Having now obtained his liberty, he returned to England; and being first knighted, was created Lord Buckhurst. In 1570 he was sent ambassador to France. In 1586 he was one of the commissioners appointed to try the unfortunate Mary Queen of Scots; and was the messenger employed to report the confirmation of her sentence, and to see it executed. The year following he went ambassador to the States General, in consequence of their complaint against the earl of Leicester; who, disliking his impartiality, prevailed on the queen to recal him, and confine him to his house. In this state of confinement he continued about 10 months, when Leicester dying, he was restored to favour, and in 1580 was installed knight of the Garter: but the most incontrovertible proof of the queen's partiality for Lord Buckhurst appeared in the year 1591, when she caused him to be elected chancellor in the university of Oxford, in opposition to her favourite Essex. In 1598, on the death of the treasurer Burleigh, Lord Buckhurst succeeded him, and by virtue of his office became in effect prime minister; and when, in 1601, the earls of Essex and Southampton were brought to trial, he sat as lord high steward on that awful occasion.

On the accession of James I. he was graciously received, had the office of lord high treasurer confirmed to him for life, and was created earl of Dorset. He continued in high favour with the king till the day of his death, which happened suddenly, on the 19th of April 1608, in the council chamber at Whitehall. He was interred with great solemnity in Westminster abbey. He was a good poet, an able minister, and an honest man. From him is descended the present noble family of the Dorsets. “It were needless (says Mr Walpole) to add, that he was the patriarch of a race of genius and wit.”

SACKVILLE, *Charles, earl of Dorset*, a celebrated wit and poet, descended from the foregoing, was born in 1637. He was, like Villiers, Rochester, Sedley, &c. one of the libertines of King Charles's court, and sometimes indulged himself in inexcusable excesses. He openly discountenanced the violent measures of James II. and engaged early for the prince of Orange, by whom he was made lord chamberlain of the household, and taken.

taken into the privy council. He died in 1706, and left several poetical pieces, which, though not considerable enough to make a volume by themselves, may be found among the works of the minor poets, published in 1749.

SACRAMENT is derived from the Latin word *sacramentum*, which signifies an oath, particularly the oath taken by soldiers to be true to their country and general. The words of this oath, according to Polybius, were, *obtemperaturus sum et facturus quicquid mandabitur ab imperatoribus juxta vires*. The word was adopted by the writers of the Latin church, and employed, perhaps with no great propriety, to denote those ordinances of religion by which Christians came under an obligation, equally sacred with that of an oath, to observe their part of the covenant of grace, and in which they have the assurance of Christ that he will fulfil his part of the same covenant.

Of sacraments, in this sense of the word, Protestant churches admit of but two; and it is not easy to conceive how a greater number can be made out from Scripture, if the definition of a sacrament be just which is given by the church of England. By that church, the meaning of the word sacrament is declared to be "an outward and visible sign of an inward and spiritual grace given unto us, ordained by Christ himself as a means whereby we receive the same, and a pledge to assure us thereof." According to this definition, baptism and the Lord's Supper are certainly sacraments; for each consists of an outward and visible sign of what is believed to be an inward and spiritual grace: both were ordained by Christ himself, and by the reception of each does the Christian come under a solemn obligation to be true to his divine master, according to the terms of the covenant of grace. (See **BAPTISM** and **SUPPER of the Lord**.) The Romanists, however, add to this number *confirmation, penance, extreme unction, ordination, and marriage*, holding in all seven sacraments; but two of these rites not being peculiar to the Christian church cannot possibly be *Christian* sacraments, in contradistinction to the sacraments or obligations into which men of all religions enter. Marriage was instituted from the beginning, when God made man male and female, and commanded them to be fruitful, and multiply and replenish the earth; and penance, as far as it is of the same import with repentance, has a place in all religions which teach that God is merciful, and men fallible.—The external severities imposed upon penitents by the church of Rome (see **PENANCE**) may indeed be in some respects peculiar to the discipline of that church, though the penances of the Hindoos are certainly as rigid; but none of these severities were ordained by Christ himself as the pledge of an inward and spiritual grace; nor do they, like baptism and the Lord's Supper, bring men under obligations which are supposed to be analogous to the meaning of the word *sacramentum*. Confirmation has a better title to the appellation of a sacrament than any of the other five popish rites of that name, though it certainly was not considered as such by the earliest writers of the Christian church, nor does it appear to have been ordained by Christ himself, (see **CONFIRMATION**.) Ordination is by many churches considered as a very important rite; but as it is not administered to *all* men, nor has any particular form appropriated to it in the New Testament, it cannot be

considered as a Christian sacrament conferring grace generally necessary to salvation. It is rather a form of authorising certain persons to perform certain offices, which respect not themselves but the whole church; and extreme unction is a rite which took its rise from the miraculous powers of the primitive church vainly claimed by the succeeding clergy. (See **ORDINATION** and **EXTREME UNCTION**.) These considerations seem to have some weight with the Romish clergy themselves; for they call the eucharist, by way of eminence, the *holy sacrament*. Thus to expose the holy sacrament, is to lay the consecrated host on the altar to be adored.—The procession of the holy sacrament is that in which this host is carried about the church, or about a town.

Numerous as we think the sacraments of the Romish church, a sect of Christians sprung up in England early in the current century who increased their number.—The founder of this sect was a Dr Deacon, we think, of Manchester, where the remains of it subsisted very lately, and probably do so at present. According to these men, *every rite and every phrase* in the book called the *Apostolical Constitutions* were certainly in use among the apostles themselves. Still, however, they make a distinction between the greater and the lesser sacraments. The greater sacraments are only two, Baptism and the Lord's Supper. The lesser are no fewer than ten, viz. five belonging to baptism, *exorcism, anointing with oil, the white garment, a taste of milk and honey, and anointing with chrism or ointment*. The other five are, *the sign of the cross, imposition of hands, unction of the sick, holy orders, and matrimony*. Of the nature of these lesser sacraments, or the grace which they are supposed to confer, our limits will permit us to give no account.—Nor is it necessary that we should. The sect which taught them, if not extinguished, is certainly in its last wane. It has produced, however, one or two learned men; and its founder's Full, True, and Comprehensive View of Christianity, in two Catechisms, is a work which the Christian antiquary will read with pleasure for information, and the philosopher for the materials which it contains for meditation on the workings of the human mind. It was published in 8vo, in the year 1748.

Congregation of the Holy SACRAMENT, a religious establishment formed in France, whose founder was Autherius, bishop of Bethlehem, and which, in 1644, received an order from Urban VIII. to have always a number of ecclesiastics ready to exercise their ministry among pagan nations, wherever the pope, or congregation *de propaganda*, should appoint.

SACRAMENTARIANS, a general name given to all such as have published or held erroneous doctrines of the sacrament of the Lord's Supper. The term is chiefly applied among Roman Catholics, by way of reproach, to the Lutherans, Calvinists, and other Protestants.

SACRAMENTARY, an ancient Romish church-book, which contains all the prayers and ceremonies practised at the celebration of the sacraments.

It was wrote by Pope Gelasius, and afterwards revised, corrected, and abridged, by St Gregory.

SACRE, or **SAKER**, in *Ornithology*, the name of a species of falcon, called by authors *falco sacer*, and differently described by different authors, but by all agreed to be an extremely bold and active bird. It is a native

of the northern regions of Europe; and a variety, called by some writers the *speckled partridge hawk*, is found at Hudson's bay, North America.

SACRED, something holy, or that is solemnly offered and consecrated to God, with benedictions, unctions, &c.

Kings, prelates, and priests, are reckoned sacred persons; abbots are only blessed.—The deaconhood, sub-deaconhood, and priesthood, are all sacred orders, and are said to impress a sacred indelible character. The custom of consecrating kings with holy oil is derived (says Guttingius) from the Hebrews; among whom, he agrees with Grotius, it was never used but to kings who had not an evident right by succession. He adds, that the Christian emperors never used it before Justin the younger; from whom he takes it to have passed to the Goths, &c.

SACRED is also applied to things belonging to God and the church. Church-lands, ornaments, &c. are held sacred.—The sacred college is that of the cardinals.

SACRED Majesty, is applied to the emperor and to the king of England; yet Loyseau says it is blasphemy. See MAJESTY. The ancients held a place struck with thunder as sacred. In the civil law, sacred place chiefly denotes that where a person deceased has been interred.

SACRED Elixir. See ELIXIR.

SACRIFICE, an offering made to God on an altar, by means of a regular minister, as an acknowledgement of his power, and a payment of homage. Sacrifices (though the term is sometimes used to comprehend all the offerings made to God, or in any way devoted to his service and honour) differ from mere oblations in this, that in a sacrifice there is a real destruction or change of the thing offered; whereas an oblation is only a simple offering or gift, without any such change at all: thus, all sorts of tythes, and first fruits, and whatever of men's worldly substance is consecrated to God, for the support of his worship and the maintenance of his ministers, are offerings or oblations; and these, under the Jewish law, were either of living creatures or other things: but sacrifices, in the more peculiar sense of the term, were either wholly or in part consumed by fire. They have by divines been divided into bloody and unbloody. Bloody sacrifices were made of living creatures; unbloody of the fruits of the earth. They have also been divided into *expiatory*, *impetratory*, and *characteristical*. The first kind were offered to obtain of God forgiveness of sins; the second, to procure some favour; and the third, to express thankfulness for favours already received. Under one or other of these heads may all sacrifices be arranged; though we are told, that the Egyptians had 666 different kinds, a number surpassing all credibility.

Concerning the origin of sacrifices very various opinions have been held. By many, the Phœnicians are supposed to have been the authors of them; though Porphyry attributes their invention to the Egyptians; and Ovid imagines, from the import of the name *victim* and *hostia*, that no bloody sacrifices were offered till wars prevailed in the world, and nations obtained victories over their enemies. These are mere hypotheses contradicted by the most authentic records of antiquity, and entitled to no regard.

By modern deists, sacrifices are said to have had their origin in superstition, which operates much in the same way in every country. It is therefore weak, according to those men, to derive this practice from any particular people; since the same mode of reasoning would lead various nations, without any intercourse with each other, to entertain the same opinions respecting the nature of their gods, and the proper means of appeasing their anger. Men of gross conceptions imagine their deities to be like themselves, covetous and cruel. They are accustomed to appease an injured neighbour by a composition in money; and they endeavour to compound in the same manner with their gods, by rich offerings to their temples and to their priests. The most valuable property of a simple people is their cattle. These offered in sacrifice are supposed to be fed upon by the divinity, and are actually fed upon by his priests. If a crime is committed which requires the punishment of death, it is accounted perfectly fair to appease the deity by offering one life for another; because, by savages, punishment is considered as a debt for which a man may compound in the best way that he can, and which one man may pay for another. Hence, it is said, arose the absurd notions of imputed guilt and vicarious atonement. Among the Egyptians, a white bull was chosen as an expiatory sacrifice to their god Apis. After being killed at the altar, his head was cut off, and cast into the river, with the following execration: "May all the evils impending over those who perform this sacrifice, or over the Egyptians in general, be averted on this head." * *Herodotus, lib. ii.*

Had sacrifice never prevailed in the world but among such gross idolaters as worshipped departed heroes, who were supposed to retain in their state of deification all the passions and appetites of their mortal state, this account of the origin of that mode of worship would have been to us perfectly satisfactory. We readily admit, that such mean notions of their gods may have actually led far distant tribes, who could not derive any thing from each other through the channel of tradition, to imagine that beings of human passions and appetites might be appeased or bribed by costly offerings. But we know from the most incontrovertible authority, that sacrifices of the three kinds that we have mentioned were in use among people who worshipped the true God, and who must have had very correct notions of his attributes. Now we think it impossible that such notions could have led any man to fancy that the taking away of the life of a harmless animal, or the burning of a cake or other fruits of the earth in the fire, would be acceptable to a Being self-existent, omnipotent, and omniscient, who can neither be injured by the crimes of his creatures, nor receive any accession of happiness from a thousand worlds.

Sensible of the force of such reasoning as this, some persons of great name, who admit the authenticity of the Jewish and Christian scriptures, and firmly rely on the atonement made by Christ, are yet unwilling (it is difficult to conceive for what reason) to allow that sacrifices were originally instituted by God. Of this way of thinking were St Chrysostom, Spæncer, Grotius, and Warburton, as were likewise the Jews Maimonides, R. Levi, Ben Gerson, and Abarbanel. The greater part of these writers maintain, that sacrifices were at first a human institution; and that God, in order to prevent their

Sacrifice. their being offered to idols, introduced them into his service, though he did not approve of them as good in themselves, or as proper rites of worship. That the infinitely wise and good God should introduce into his service improper rites of worship, appears to us so extremely improbable, that we cannot but wonder how such an opinion should ever have found its way into the minds of such men as those who held it. Warburton's theory of sacrifice is much more plausible, and being more lately published, is worthy of particular examination.

According to this ingenious prelate, sacrifices had their origin in the sentiments of the human heart, and in the ancient mode of conversing by action in aid of words. Gratitude to God for benefits received is natural to the mind of man, as well as his bounden duty.

* *Divine*
Æg. b. ix.
c. 2.

"This duty (says the bishop *) was in the most early times discharged in expressive actions, the least equivocal of which was the offerer's bringing the first fruits of pasturage or agriculture to that sequestered place where the Deity used to be more solemnly invoked, at the stated times of public worship; and there presenting them in homage, with a demeanor which spoke to this purpose—'I do hereby acknowledge thee, O my God! to be the author and giver of all good: and do now, with humble gratitude, return my warmest thanks for these thy blessings particularly bestowed upon me.'—Things thus devoted became thenceforth sacred: and to prevent their *deseccation*, the readiest way was to send them to the table of the priest, or to consume them in the fire of the altar. Such, in the opinion of our author, was the origin of eucharistical sacrifices. *Impetratory* or *precativè* sacrifices had, he thinks, the same origin, and were contrived to express by action an invocation for the continuance of God's favour. "Expiatory sacrifices (says the learned prelate) were in their own nature as intelligible, and in practice as rational, as either of the other two. Here, instead of presenting the first fruits of agriculture and pasturage, in corn, wine, oil, and wool, as in the eucharistical, or a portion of what was to be sown or otherwise propagated, as in the *impetratory*, some chosen animal, precious to the repenting criminal who deprecates, or supposed to be obnoxious to the Deity who is to be appeased, was offered up and slain at the altar, in an action which, in all languages, when translated into words, speaks to this purpose:—'I confess my transgressions at thy footstool, O my God! and with the deepest contrition implore thy pardon; confessing that I deserve death for those my offences.'—The latter part of the confession was more forcibly expressed by the *action* of striking the devoted animal, and depriving it of life; which, when put into words, concluded in this manner.—'And I own that I myself deserve the death which I now inflict on this animal.'"

This system of sacrifice, which his lordship thinks so well supported by the most early movements of simple nature, we admit to be ingenious, but by no means satisfactory. That mankind in the earlier ages of the world were accustomed to supply the deficiencies of their language by expressive gesticulations we are not inclined to controvert: the custom prevails among savage nations, or nations half civilized, at the present day. His lordship, however, is of opinion, and we heartily agree with him, that our first parents were instructed by God

to make articulate sounds significant of ideas, notions, and things (see LANGUAGE, N^o 6.), and not left to fabricate a language for themselves. That this heaven-taught language could be at first copious, no man will suppose, who thinks of the paucity of ideas which those who spoke it had to express; but when we consider its origin, we cannot entertain a doubt but that it was precise and perspicuous, and admirably adapted to all the real purposes of life. Among these purposes must surely be included the worship of God as the most important of all. Every sentiment therefore which enters into worship, gratitude, invocation, confession, and deprecation, the progenitors of mankind were undoubtedly taught to clothe in words the most significant and unequivocal; but we know from Moses, whose divine legation the bishop surely admitted, that Cain and Abel, the eldest children of our first parents, worshipped God by the rites of sacrifice: and can we suppose that this practice occurred to *them* from their having so far forgotten the language taught them by their father, as to be under the necessity of denoting by action what they could not express by words? If this supposition be admitted, it will force another upon us still more extravagant. Even Adam himself must, in that case, have become dumb in consequence of his fall; for it is not conceivable, that as long as he was able to utter articulate sounds, and affix a meaning to them, he would cease, in the presence of his family, to confess his sins, implore forgiveness, and express his gratitude to God for all his mercies.

The right reverend writer, as if aware of some such objection as this to his theory, contends, that if sacrifices had arisen from any other source than the light of reason, the Scripture would not have been silent concerning that source; "especially since we find Moses carefully recording what *God* immediately, and not *nature*, taught to Adam and his family. Had the original of sacrifice, says he, been prescribed, and directly commanded by the Deity, the sacred historian could never have omitted the express mention of that circumstance. The two capital-observances in the Jewish ritual were the SABBATH and SACRIFICES. To impress the highest reverence and veneration on the *Sabbath*, he is careful to record its divine original: and can we suppose that had sacrifices had the same original, he would have neglected to establish this truth at the time that he recorded the other, since it is of equal use and of equal importance? I should have said, indeed, of much greater; for the multifarious *sacrifices* of the LAW had not only a reference to the *forfeiture* of Adam, but likewise prefigured our redemption by Jesus Christ."

But all this reasoning was foreseen, and completely answered before his lordship gave it to the public. It is probable, that though the distinction of weeks was well known over all the eastern world, the Hebrews, during their residence in Egypt, were very negligent in their observance of the Sabbath. To enforce a religious observance of that sacred day, it became necessary to inform them of the time and occasion of its first institution, that they might keep it holy in memory of the creation; but, in a country like Egypt, the people were in danger of holding sacrifices rather in too high than too low veneration, so that there was not the same necessity for mentioning explicitly the early institution

sacrifice. of them. It was sufficient that they knew the divine institution of their own sacrifices, and the purposes for which they were offered. Besides this, there is reason to believe, that, in order to guard the Hebrews from the infections of the heathen, the rite of sacrificing was loaded with many additional ceremonies at its second institution under Moses. It might, therefore, be improper to relate its original simplicity to a rebellious people, who would think themselves ill-used by any additional burdens of trouble or expense, however really necessary to their happiness. Bishop Warburton sees clearly the necessity of concealing from the Jews the spiritual and refined nature of the Christian dispensation, lest such a backsliding people should, from the contemplation of it, have held in contempt their own economy. This, he thinks, is the reason why the prophets, speaking of the reign of the Messiah, borrow their images from the Mosaic dispensation, that the people living under that dispensation might not despise it from perceiving its end; and we think the reason will hold equally good for their lawgiver concealing from them the simplicity of the first sacrifices, lest they should be tempted to murmur at their own multifarious ritual.

But his lordship thinks that sacrifices had their origin from the light of natural reason. We should be glad to know what light natural reason can throw upon such a subject. That ignorant pagans, adoring as gods departed heroes, who still retained their sensual appetites, might naturally think of appeasing such beings with the fat of fed beasts, and the perfumes of the altar, we have already admitted; but that Cain and Abel, who knew that the God whom they adored has neither body, parts, nor passions; that he created and sustains the universe; and that from his very nature he must will the happiness of all his creatures, should be led by the light of natural reason to think of appeasing him, or obtaining favours from him, by putting to death harmless animals, is a position, which no arguments of his lordship can ever compel us to admit. That Abel's sacrifice was indeed accepted, we know; but it was not accepted because it proceeded from the movements of the human mind, and the deficiency of the original language, but because it was offered through *faith*. The light of natural reason, however, does not generate faith, but science; and when it fails of that, its offspring is absurdity. "Faith is the substance of things hoped for, the evidence of things not seen," and comes not by reasoning but by hearing. What things then were they of which Abel had heard, for which he hoped, and in the faith of which he offered sacrifice? Undoubtedly it was a restoration to that immortality which was forfeited by the transgression of his parents. Of such redemption, an obscure intimation had been given to Adam, in the promise that the seed of the woman should bruise the head of the serpent; and it was doubtless to impress upon his mind in more striking colours the manner in which this was to be done, that bloody sacrifices were first instituted.* As long as the import of such rites was thus understood, they constituted a perfectly rational worship, as they showed the people that the wages of sin is death; but when men sunk into idolatry, and lost all hopes of a resurrection from the dead, the slaughtering of animals to appease their deities was a practice grossly superstitious. It

Vol. XVIII. Part II.

rested in itself without pointing to any farther end, and the grovelling worshippers believed that by their sacrifices they purchased the favour of their deities. When once this notion was entertained, human sacrifices were soon introduced; for it naturally occurred to those who offered them, that what they most valued themselves, would be most acceptable to their offended gods. (see the next article.) By the Jewish law, these abominable offerings were strictly forbidden, and the whole ritual of sacrifice restored to its original purity, though not simplicity.

All Christian churches, the Socinian, if it can be called a church, not excepted, have till very lately agreed in believing that the Jewish sacrifices served, amongst other uses, for types of the death of Christ and the Christian worship, (see TYPE.) In this belief all sober Christians agree still, whilst many are of opinion that they were likewise foederal rites, as they certainly were considered by the ancient Romans.*

Of the various kinds of Jewish sacrifices, and the subordinate ends for which they were offered, a full account is given in the books of Moses. When an Israelite offered a loaf or a cake, the priest broke it in two parts; and setting aside that half which he reserved for himself, broke the other into crumbs, poured oil, wine, incense, and salt upon it, and spread the whole upon the fire of the altar. If these offerings were accompanied with the sacrifice of an animal, they were thrown upon the victim to be consumed along with it. If the offerings were of the ears of new corn, they were parched at the fire, rubbed in the hand, and then offered to the priest in a vessel, over which he poured oil, incense, wine, and salt, and then burnt it upon the altar, having first taken as much of it as of right belonged to himself.

The principal sacrifices among the Hebrews consisted of bullocks, sheep, and goats; but doves and turtles were accepted from those who were not able to bring the other: these beasts were to be perfect, and without blemish. The rites of sacrificing were various; all of which are minutely described in the books of Moses.

The manner of sacrificing among the Greeks and Romans was as follows. In the choice of the victim, they took care that it was without blemish or imperfection; its tail was not to be too small at the end; the tongue not black, nor the ears cleft; and that the bull was one that had never been yoked. The victim being pitched upon, they gilt his forehead and horns, especially if a bull, heifer, or cow. The head they also adorned with a garland of flowers, a woollen infula or holy fillet, whence hung two rows of chaplets with twisted ribands; and on the middle of the body a kind of stole, pretty large, hung down on each side: the lesser victims were only adorned with garlands and bundles of flowers, together with white tufts or wreaths.

The victims thus prepared were brought before the altar; the lesser being driven to the place, and the greater led by an halter; when, if they made any struggle, or refused to go, the resistance was taken for an ill omen, and the sacrifice frequently set aside. The victim thus brought was carefully examined, to see that there was no defect in it; then the priest, clad in his sacerdotal habit, and accompanied with the sacrificers

Sacrifice.

and other attendants, and being washed and purified according to the ceremonies prescribed, turned to the right hand, and went round the altar, sprinkling it with meal and holy water, and also besprinkling those who were present. Then the crier proclaimed with a loud voice, Who is here? To which the people replied, Many and good. The priest then having exhorted the people to join with him by saying, Let us pray, confessed his own unworthiness, acknowledging that he had been guilty of divers sins; for which he begged pardon of the gods, hoping that they would be pleased to grant his requests, accept the oblations offered them, and send them all health and happiness; and to this general form added petitions for such particular favours as were then desired. Prayers being ended, the priest took a cup of wine; and having tasted it himself, caused his assistants to do the like; and then poured forth the remainder between the horns of the victim. Then the priest or the crier, or sometimes the most honourable person in the company, killed the beast, by knocking it down or cutting its throat. If the sacrifice was in honour of the celestial gods, the throat was turned up towards heaven, but if they sacrificed to the heroes or infernal gods, the victim was killed with its throat towards the ground. If by accident the beast escaped the stroke, leaped after it, or expired with pain and difficulty, it was thought to be unacceptable to the gods. The beast being killed, the priest inspected its entrails, and made predictions from them. They then poured wine, together with frankincense, into the fire, to increase the flame, and then laid the sacrifice on the altar; which in the primitive times was burnt whole to the gods, and thence called an *holocaust*; but in after-times, only part of the victim was consumed in the fire, and the remainder reserved for the sacrificers; the thighs, and sometimes the entrails, being burnt to their honour, the company feasted upon the rest. During the sacrifice, the priest, and the person who gave the sacrifice, jointly prayed, laying their hand upon the altar. Sometimes they played upon musical instruments in the time of the sacrifice, and on some occasions they danced round the altar, singing sacred hymns in honour of the god.

HUMAN SACRIFICES, an abominable practice, about the origin of which different opinions have been formed.—The true account seems to be that which we have given in the preceding article. When men had gone so far as to indulge the fancy of bribing their gods by sacrifice, it was natural for them to think of enhancing the value of so cheap an *atonement* by the cost and rarity of the offering; and, oppressed with their malady, they never rested till they had got that which they conceived to be the most precious of all, a human sacrifice.

“It was customary (says Sanchoniathon),* in ancient times, in great and public calamities, before things became incurable, for princes and magistrates to offer up in sacrifice to the avenging dæmons the dearest of their offspring.” Sanchoniathon wrote of Phœnicia, but the practice prevailed in every nation under heaven of which we have received any ancient account. The Egyptians had it in the early part of their monarchy. The Cretons likewise had it, and retained it for a long time.—The nations of Arabia did the same. The people of Dumali, in particular, sacrificed every year a child, and buried it underneath an altar, which they made use of

* Apud Euseb. Præp. Evang. lib. 4.

instead of an idol; for they did not admit of images. The Persians buried people alive. Amestris, the wife of Xerxes, entombed 12 persons quick under ground for the good of her soul. It would be endless to enumerate every city, or every province, where these dire practices obtained. The Cyprians, the Rhodians, the Phœceans, the Ionians, those of Chios, Lesbos, Tenedos, all had human sacrifices. The natives of the Tauric Chersonesus, offered up to Diana every stranger whom chance threw upon their coast. Hence arose that just expostulation in Euripides upon the inconsistency of the proceeding; wherein much good reasoning is implied. Iphigenia wonders, as the goddess delighted in the blood of men, that every villain and murderer should be privileged to escape, nay, be driven from the threshold of the temple; whereas, if an honest and virtuous man chanced to stray thither, he only was seized upon, and put to death. The Pelasgi, in a time of scarcity, vowed the tenth of all that should be born to them for a sacrifice, in order to procure plenty. Aristomenes the Messenian slew 300 noble Lacedæmonians, among whom was Theopompus the king of Sparta, at the altar of Jupiter at Ithome. Without doubt the Lacedæmonians did not fail to make ample returns; for they were a severe and revengeful people, and offered the like victims to Mars. Their festival of the Diamastigosis is well known; when the Spartan boys were whipped in the sight of their parents with such severity before the altar of Diana Orthia, that they often expired under the torture. Phylarchus affirms, as he is quoted by Porphyry, that of old every Grecian state made it a rule, before they marched towards an enemy, to solicit a blessing on their undertakings by human victims.

The Romans were accustomed to the like sacrifices. They both devoted themselves to the infernal gods, and constrained others to submit to the same horrid doom. Hence we read in Titus Livius, that, in the consulate of Æmilius Paulus and Terentius Varro, two Gauls, a man and a woman, and two in like manner of Greece, were buried alive at Rome in the Ox-market, where was a place under ground walled round, to receive them; which had before been made use of for such cruel purposes. He says it was a sacrifice not properly Roman, that is, not originally of Roman institution; yet it was frequently practised there, and that too by public authority. Plutarch makes mention of a like instance a few years before, in the consulship of Flaminus and Furius. There is reason to think, that all the principal captives who graced the triumphs of the Romans, were at the close of that cruel pageantry put to death at the altar of Jupiter Capitolinus. Caius Marius offered up his own daughter for a victim to the Dii Avernici, to procure success in a battle against the Cimbric; as we are informed by Dorotheus, quoted by Clemens. It is likewise attested by Plutarch, who says that her name was *Calpurnia*. Marius was a man of a sour and bloody disposition; and had probably heard of such sacrifices being offered in the enemy's camp, among whom they were very common, or he might have beheld them exhibited at a distance; and therefore murdered what was nearest, and should have been dearest to him, to counteract their fearful spells, and outdo them in their wicked machinery. Cicero making mention of this custom being common in Gaul,

adds,

^{Sacrifice.} adds, that it prevailed among that people even at the time he was speaking; from whence we may be led to infer, that it was then discontinued among the Romans. And we are told by Pliny, that it had then, and not very long, been discouraged. For there was a law enacted, when Lentulus and Crassus were consuls, so late as the 657th year of Rome, that there should be no more human sacrifices: for till that time those horrid rites had been celebrated in broad day without any mask or controul; which, had we not the best evidence for the fact, would appear scarcely credible. And however they may have been discontinued for a time, we find that they were again renewed; though they became not so public, nor so general. For not very long after this, it is reported of Augustus Cæsar, when Perusia surrendered in the time of the second triumvirate, that besides multitudes executed in a military manner, he offered up, upon the ides of March, 300 chosen persons, both of the equestrian and senatorial order, at an altar dedicated to the manes of his uncle Julius. Even at Rome itself this custom was revived: and Porphyry assures us, that in his time a man was every year sacrificed at the shrine of Jupiter Latialis. Heliogabalus offered the like victims to the Syrian deity which he introduced among the Romans. The same is said of Aurelian.

The Gauls and the Germans were so devoted to this shocking custom, that no business of any moment was transacted among them without being prefaced with the blood of men. They were offered up to various gods; but particularly to Hesus, Taranis, and Thautates. These deities are mentioned by Lucan, where he enumerates the various nations who followed the fortunes of Cæsar.

The altars of these gods were far removed from the common resort of men; being generally situated in the depth of woods, that the gloom might add to the horror of the operation, and give a reverence to the place and proceeding. The persons devoted were led thither by the Druids, who presided at the solemnity, and performed the cruel offices of the sacrifice. Tacitus takes notice of the cruelty of the Hermunduri, in a war with the Catti, wherein they had greatly the advantage; at the close of which they made one general sacrifice of all that was taken in battle. The poor remains of the legion under Varus suffered in some degree the same fate. There were many places destined for this purpose all over Gaul and Germany; but especially in the mighty woods of Arduenna, and the great Hercynian forest; a wild that extended above 30 days journey in length. The places set apart for this solemnity were held in the utmost reverence, and only approached at particular seasons. Lucan mentions a grove of this sort near Massilia, which even the Roman soldiers were afraid to violate, though commanded by Cæsar. It was one of those set apart for the sacrifices of the country.

Claudian compliments Stilicho, that, among other advantages accruing to the Roman armies through his conduct, they could now venture into the awful forest of Hercynia, and follow the chase in those so much dreaded woods, and otherwise make use of them.

These practices prevailed among all the people of the north, of whatever denomination. The Massagetae, the Scythians, the Getae, the Sarmatians, all the various na-

tions upon the Baltic, particularly the Suevi and Scandinavians, held it as a fixed principle, that their happiness and security could not be obtained but at the expense of the lives of others. Their chief gods were Thor and Woden, whom they thought they could never sufficiently glut with blood. They had many very celebrated places of worship; especially in the island Rugen, near the mouth of the Oder; and in Zealand: some, too, very famous among the Semnones and Naharvalli. But the most revered of all, and the most frequented, was at Upsal; where there was every year a grand celebrity, which continued for nine days. During this term they sacrificed animals of all sorts: but the most acceptable victims, and the most numerous, were men. Of these sacrifices none were esteemed so auspicious and salutary as a sacrifice of the prince of the country. When the lot fell for the king to die, it was received with universal acclamations and every expression of joy; as it once happened in the time of a famine, when they cast lots, and it fell to King Domalder to be the people's victim: and he was accordingly put to death. Olaus Tretelger, another prince, was burnt alive to Woden. They did not spare their own children. Harald the son of Gunild, the first of that name, slew two of his children to obtain a storm of wind. "He did not let (says Verstegan) to sacrifice two of his sons unto his idols, to the end he might obtain of them such a tempest at sea, as should break and disperse the shipping of Harald king of Denmark." Saxo-Grammaticus mentions a like fact. He calls the king Haquin; and speaks of the persons put to death as two very hopeful young princes. Another king slew nine sons to prolong his own life; in hopes, perhaps, that what they were abridged of would in great measure be added to himself. Such instances, however, occur not often: but the common victims were without end. Adam Bremensis, speaking of the awful grove at Upsal, where these horrid rites were celebrated, says, that there was not a single tree but what was revered, as if it were gifted with some portion of divinity: and all this because they were stained with gore, and foul with human putrefaction. The same is observed by Scheiffer in his account of this place.

The manner in which the victims were slaughtered, was diverse in different places. Some of the Gaulish nations chined them with a stroke of an axe. The Celtæ placed the man who was to be offered for a sacrifice upon a block, or an altar, with his breast upwards, and with a sword struck him forcibly across the sternum; then tumbling him to the ground, from his agonies and convulsions, as well as from the effusion of blood, they formed a judgment of future events. The Cimbri ripped open the bowels; and from them they pretended to divine. In Norway they beat men's brains out with an ox-yoke. The same operation was performed in Iceland, by dashing them against an altar of stone. In many places they transfixed them with arrows. After they were dead, they suspended them upon trees, and left them to putrefy. One of the writers above quoted mentions, that in his time 70 carcasses of this sort were found in a wood of the Suevi. Dithmar of Mersburgh, an author of nearly the same age, speaks of a place called *Ledur* in Zealand, where there were every year 99 persons sacrificed to the god Swantowite. During these bloody festivals a general joy prevailed, and

Sacrifice.

Sacrifice. banquets were most royally served. They fed, caroused, and gave a loose to indulgence, which at other times was not permitted. They imagined that there was something mysterious in the number nine: for which reason these feasts were in some places celebrated every ninth year, in others every ninth month; and continued for nine days. When all was ended, they washed the image of the deity in a pool; and then dismissed the assembly. Their servants were numerous, who attended during the term of their feasting, and partook of the banquet. At the close of all, they were smothered in the same pool, or otherwise made away with. On which Tacitus remarks, how great an awe this circumstance must necessarily infuse into those who were not admitted to these mysteries.

These accounts are handed down from a variety of authors in different ages; many of whom were natives of the countries which they describe, and to which they seem strongly attached. They would not therefore have brought so foul an imputation on the part of the world in favour of which they were each writing, nor could there be that concurrence of testimony, were not the history in general true.

The like custom prevailed to a great degree at Mexico, and even under the mild government of the Peruvians; and in most parts of America. In Africa it is still kept up; where, in the inland parts, they sacrifice some of the captives taken in war to their fetiches, in order to secure their favour. Snelgrave was in the king of Dahome's camp, after his inroad into the countries of Ardra and Whidaw; and says, that he was a witness to the cruelty of this prince, whom he saw sacrifice multitudes to the deity of his nation.

The same abominable worship is likewise practised occasionally in the islands visited by Captain Cook, and other circumnavigators, in the South sea. It seems indeed to have prevailed in every country at one period of the progress of civilization, and undoubtedly had the origin which we have assigned to it.

The sacrifices of which we have been treating, if we except some few instances, consisted of persons doomed by the chance of war, or assigned by lot, to be offered. But among the nations of Canaan, the victims were peculiarly chosen. Their own children, and whatever was nearest and dearest to them, were deemed the most worthy offering to their god. The Carthaginians, who were a colony from Tyre, carried with them the religion of their mother-country, and instituted the same worship in the parts where they settled. It consisted in the adoration of several deities, but particularly of Kronus; to whom they offered human sacrifices, and especially the blood of children. If the parents were not at hand to make an immediate offer, the magistrates did not fail to make choice of what was most fair and promising, that the god might not be defrauded of his dues. Upon a check being received in Sicily, and some other alarming circumstances happening, Hamilcar without any hesitation laid hold of a boy, and offered him on the spot to Kronus; and at the same time drowned a number of priests, to appease the deity of the sea. The Carthaginians another time, upon a great defeat of their army by Agathocles, imputed their miscarriages to the anger of this god, whose services had been neglected. Touched with this, and seeing the enemy at their gates, they seized at once 300 children

of the prime nobility, and offered them in public for a *Sacrifice.* Three hundred more, being persons who were somehow obnoxious, yielded themselves voluntarily, and were put to death with the others. The neglect of which they accused themselves, consisted in sacrificing children purchased of parents among the poorer sort, who reared them for that purpose, and not selecting the most promising, and the most honourable, as had been the custom of old. In short, there were particular children brought up for the altar, as sheep are fattened for the shambles; and they were bought and butchered in the same manner. But this indiscriminate way of proceeding was thought to have given offence. It is remarkable, that the Egyptians looked out for the most specious and handsome person to be sacrificed. The Albanians pitched upon the best man of the community, and made him pay for the wickedness of the rest. The Carthaginians chose what they thought the most excellent, and at the same time the most dear to them; which made the lot fall heavy upon their children. This is taken notice of by Silius Italicus in his fourth book.

Kronus, to whom these sacrifices were exhibited, was an oriental deity, the god of light and fire; and therefore always worshipped with some reference to that element. See PHœNICIA.

The Greeks, we find, called the deity to whom these offerings were made *Agraulos*; and feigned that she was a woman, and the daughter of Cecrops. But how came Cecrops to have any connexion with Cyprus? *Agraulos* is a corruption and transposition of the original name, which should have been rendered *Uk El Aur*, or *Uk El Aurus*; but has, like many other oriental titles and names, being strangely sophisticated, and is here changed to *Agraulos*. It was in reality the god of light, who was always worshipped with fire. This deity was the Moloch of the Tyrians and Canaanites, and the Melech of the east; that is, the great and principal god, the god of light, of whom fire was esteemed a symbol; and at whose shrine, instead of viler victims, they offered the blood of men.

Such was the Kronus of the Greeks, and the Moloch of the Phœnicians: and nothing can appear more shocking than the sacrifices of the Tyrians and Carthaginians, which they performed to this idol. In all emergencies of state, and times of general calamity, they devoted what was most necessary and valuable to them for an offering to the gods, and particularly to Moloch. But besides these undetermined times of bloodshed, they had particular and prescribed seasons every year, when children were chosen out of the most noble and reputable families, as before mentioned. If a person had an only child, it was the more liable to be put to death, as being esteemed more acceptable to the deity, and more efficacious for the general good. Those who were sacrificed to Kronus were thrown into the arms of a molten idol, which stood in the midst of a large fire, and was red with heat. The arms of it were stretched out, with the hands turned upwards, as it were to receive them; yet sloping downwards, so that they dropt from thence into a glowing furnace below. To other gods, they were otherwise slaughtered, and, as it is implied, by the very hands of their parents. What can be more horrid to the imagination, than to suppose a father leading the dearest of all his sons to such an infernal shrine?

of her daughters, just rising to maturity, to be slaughtered at the altar of Ashtaroth or Baal? Justin describes this unnatural custom very pathetically: *Quippe homines, ut victimas, immolabant; et impuberes (quæ ætas hostium misericordiam provocat) aris admovebant; pacem sanguine eorum exposcentes, pro quorum vitâ Dii rogari maxime solent.* Such was their blind zeal, that this was continually practised; and so much of natural affection still left unextinguished, as to render the scene ten times more shocking, from the tenderness which they seemed to express. They embraced their children with great fondness, and encouraged them in the gentlest terms, that they might not be appalled at the sight of the hellish process; begging of them to submit with cheerfulness to this fearful operation. If there was any appearance of a tear rising, or a cry unawares escaping, the mother smothered it with her kisses, that there might not be any show of backwardness or constraint, but the whole be a free-will offering. These cruel endearments over, they stabbed them to the heart, or otherwise opened the sluices of life; and with the blood warm, as it ran, besmeared the altar and the grim visage of the idol. These were the customs which the Israelites learned of the people of Canaan, and for which they are upbraided by the Psalmist: "They did not destroy the nations, concerning whom the Lord commanded them; but were mingled among the heathen, and learned their works: yea, they sacrificed their sons and their daughters unto devils, and shed innocent blood, even the blood of their sons and of their daughters, whom they sacrificed unto the idols of Canaan; and the land was polluted with blood. Thus were they defiled with their own works, and went a-whoring with their own inventions."

These cruel rites, practised in so many nations, made Plutarch debate with himself, "Whether it would not have been better for the Galatæ, or for the Scythians, to have had no tradition or conception of any superior being, than to have formed to themselves notions of gods who delighted in the blood of men; of gods, who esteemed human victims the most acceptable and perfect sacrifice? Would it not (says he) have been more eligible for the Carthaginians to have had the atheist Critias, or Diagoras, their lawgiver, at the commencement of their polity, and to have been taught, that there was neither god nor demon, than to have sacrificed, in the manner they were wont, to the god which they adored? Wherein they acted, not as the person did whom Empedocles describes in some poetry, where he exposes this unnatural custom. The sire there with many idle vows offers up unwittingly his son for a sacrifice; but the youth was so changed in feature and figure, that his father did not know him. These people used knowingly and wilfully, to go through this bloody work, and slaughter their own offspring. Even they who were childless would not be exempted from this cursed tribute; but purchased children, at a price, of the poorer sort, and put them to death with as little remorse as one would kill a lamb or a chicken. The mother, who sacrificed her child, stood by, without any seeming sense of what she was losing, and without uttering a groan. If a sigh did by chance escape, she lost all the honour which she proposed to herself in the offering, and the child was notwithstanding slain. All the time

of this ceremony, while the children were dying, there was a noise of clarions and tabors. For before the idol, that the cries and shrieks of the victims might not be heard. "Tell me now (says Plutarch) if the monsters of old, the Typhons and the giants, were to expel the gods, and to rule the world in their stead; could they require a service more horrid than these infernal rites and sacrifices?"

SACRILEGE, SACRILEGIUM, the crime of profaning sacred things, or things devoted to God; or of alienating to laymen, or common purposes, what was given to religious persons and pious uses.

SACRISTAN, a church-officer, otherwise called **SEXTON.**

SACRISTY, in church-history, an apartment in a church where the sacred utensils were kept, being the same with our **VESTRY.**

SADDLE, is a seat upon a horse's back, contrived for the conveniency of the rider.

A hunting-saddle is composed of two bows, two bands, fore-bolsters, pannels, and saddle-straps; and the great saddle has, besides these parts, corks, hind-bolsters, and a troussequin.

The pommel is common to both.

SADDUCEES, were a famous sect among the ancient Jews, and consisted of persons of great quality and opulence. Respecting their origin there are various accounts and various opinions. Epiphanius, and after him many other writers, contend, that they took their rise from Dositheus a sectary of Samaria, and their name from the Hebrew word צדק, *just* or *justice*, from the great justice and equity which they showed in all their actions; a derivation which neither suits the word *Sadducee* nor the general character of the sect. They are thought by some too to have been Samaritans: but this is by no means probable, as they always attended the worship and sacrifices at Jerusalem, and never at Gerizzim.

In the Jewish Talmud we are told that the Sadducees derived their name from *Sadoc*, and that the sect arose about 260 years before Christ, in the time of Antigonus of Socho, president of the Sanhedrim at Jerusalem, and teacher of the law in the principal divinity school of that city. He had often in his lectures, it seems, taught his scholars, that they ought not to serve God as slaves do their masters, from the hopes of a reward, but merely out of filial love for his own sake; from which *Sadoc* and Baithus inferred that there were no rewards at all after this life. They therefore separated from their master, and taught that there was no resurrection nor future state. This new doctrine quickly spread, and gave rise to the sect of Sadducees, which in many respects resembled the **EPICUREANS.**

Dr Prideaux thinks that the Sadducees were at first no more than what the Caraites are now; that is, they would not receive the traditions of the elders, but stuck to the written word only: and the Pharisees being great promoters of those traditions, hence these two sects became directly opposite to each other. See *Prideaux's Conn.* part. 2. book 2. and 3.; and see also **PHARISEES** and **CARAITES.**

Afterwards the Sadducees imbibed other doctrines, which rendered them a sect truly impious: for they denied the resurrection of the dead, and the existence of angels, and of the spirits or souls of men departed (Matt.

Sadducees. (Matt. xxii. 23. Acts xxiii. 8.). They held, that there is no spiritual being but God only; that as to man, this world is his all. They did not deny but that we had reasonable souls: but they maintained this soul was mortal; and, by a necessary consequence, they denied the rewards and punishments of another life. They pretended also, that what is said of the existence of angels, and of a future resurrection, are nothing but illusions. St Epiphanius, and after him St Austin, have advanced, that the Sadducees denied the Holy Ghost. But neither Josephus nor the evangelists accuse them of any error like this. It has been also imputed to them, that they thought God corporeal, and that they received none of the prophecies.

It is pretty difficult to apprehend how they could deny the being of angels, and yet receive the books of Moses, where such frequent mention is made of angels and of their appearances. Grotius and M. Le Clerc observe, that it is very likely they looked upon angels, not as particular beings, subsisting of themselves, but as powers, emanations, or qualities, inseparable from the Deity, as the sunbeams are inseparable from the sun. Or perhaps they held angels not to be spiritual but mortal; just as they thought that substance to be which animates us and thinks in us. The ancients do not tell us how they solved this difficulty, that might be urged against them from so many passages of the Pentateuch, where mention is made of angels.

As the Sadducees acknowledged neither punishments nor recompenses in another life, so they were inexorable in their chastising of the wicked. They observed the law themselves, and caused it to be observed by others, with the utmost rigour. They admitted of none of the traditions, explications, or modifications, of the Pharisees; they kept only to the text of the law; and maintained, that only what was written was to be observed.

The Sadducees are accused of rejecting all the books of Scripture except those of Moses; and to support this opinion, it is observed, that our Saviour makes use of no Scripture against them, but passages taken out of the Pentateuch. But Scaliger produces good proofs to vindicate them from this reproach. He observes, that they did not appear in Israel till after the number of the holy books was fixed; and that if they had been to choose out of the canonical Scriptures, the Pentateuch was less favourable to them than any other book, since it often makes mention of angels and their apparition. Besides, the Sadducees were present in the temple and at other religious assemblies, where the books of the prophets were read indifferently, as well as those of Moses. They were in the chief employments of the nation, many of them were even priests. Would the Jews have suffered in these employments persons that rejected the greatest part of their Scriptures? Menassehen-Israel says expressly, that indeed they did not reject the prophets, but that they explained them in a sense very different from that of the other Jews.

Josephus assures us, that they denied destiny or fate; alleging that these were only sounds void of sense, and that all the good or evil that happens to us is in consequence of the good or evil side we have taken, by the free choice of our will. They said, also, that God was far removed from doing or knowing evil, and that man was the absolute master of his own actions. This was

roundly to deny a providence; and upon this footing I know not, says F. Calmet, what could be the religion of the Sadducees, or what influence they could ascribe to God in things here below. However, it is certain they were not only tolerated among the Jews, but that they were admitted to the high-priesthood itself. John Hircanus, high-priest of that nation, separated himself in a signal manner from the sect of the Pharisees, and went over to that of Sadoc. It is said, also, he gave strict command to all the Jews, on pain of death, to receive the maxims of this sect. Aristobulus and Alexander Jannæus, son of Hircanus, continued to favour the Sadducees; and Maimonides assures us, that under the reign of Alexander Jannæus, they had in possession all the offices of the Sanhedrim, and that there only remained of the party of the Pharisees, Simon the son of Secra. Caiaphas, who condemned Jesus Christ to death, was a Sadducee (Acts v. 17. iv. 1.); as also Ananus the younger, who put to death St James the brother of our Lord. At this day, the Jews hold as heretics that small number of Sadducees that are to be found among them. See upon this matter *Serrar. Trihæres. Menasse ben-Israel de Resurrectione mortuorum; Basnage's History of the Jews, &c.; and Calmet's Dissertation upon the Sects of the Jews before the Commentary of St Mark.*

The sect of the Sadducees was much reduced by the destruction of Jerusalem, and by the dispersion of the Jews; but it revived afterwards. At the beginning of the third century it was so formidable in Egypt, that Ammonim, Origen's master, when he saw them propagate their opinions in that country, thought himself obliged to write against them, or rather against the Jews, who tolerated the Sadducees, though they denied the fundamental points of their religion. The emperor Justinian mentions the Sadducees in one of his novels, banishes them out of all places of his dominions, and condemns them to the severest punishments, as people that maintained atheistical and impious tenets, denying the resurrection and the last judgment. Ananus, or Ananus, a disciple of Juda, son of Nachman, a famous rabbin of the 8th century, declared himself, as it is said, in favour of the Sadducees, and strenuously protected them against their adversaries. They had also a celebrated defender in the 12th century, in the person of Alpharag, a Spanish rabbin. This doctor wrote against the Pharisees, the declared enemies of the Sadducees; and maintained by his public writings, that the purity of Judaism was only to be found among the Sadducees; that the traditions avowed by the Pharisees were useless; and that the ceremonies, which they had multiplied without end, were an unsupportable yoke. The rabbi Abraham ben David Italiere replied to Alpharag, and supported the sect of the Pharisees by two great arguments, that of their universality and that of their antiquity. He proved their antiquity by a continued succession from Adam down to the year 1167; and their universality, because the Pharisees are spread all the world over, and are found in all the synagogues. There are still Sadducees in Africa and in several other places. They deny the immortality of the soul, and the resurrection of the body; but they are rarely found, at least there are but few who declare themselves for these opinions.

SADLER, JOHN, was descended from an ancient family in Shropshire; born in 1615; and educated at Cambridge,

Cambridge, where he became eminent for his great knowledge in the oriental languages. He removed to Lincoln's-Inn, where he made no small progress in the study of the law; and in 1644 was admitted one of the masters in chancery, as also one of the two masters of requests. In 1649 he was chosen town-clerk of London, and the same year published his *Rights of the Kingdom*. He was greatly esteemed by Oliver Cromwell, by whose special warrant he was continued a master in chancery, when their number was reduced to six. By his interest it was that the Jews obtained the privilege of building for themselves a synagogue in London. In 1658 he was made member of parliament for Yarmouth; and next year was appointed first commissioner under the great seal with Mr Taylor, Mr Whitelocke, and others, for the probate of wills. In 1660 he published his *Olbia*. Soon after the restoration, he lost all his employments. In the fire of London in 1666, he was a great sufferer; which obliged him to retire to his seat of Warmwell in Dorsetshire, where he lived in a private manner till 1674, when he died.

SADOC, a famous Jewish rabbi, and founder of the sect of the SADDUCEES.

SADOLET, JAMES, a polite and learned cardinal of the Romish church, born at Modena in 1477. Leo X. made him and Peter Bembo his secretaries, an office for which they were both well qualified; and Sadolet was soon after made bishop of Carpentras, near Avignon: he was made a cardinal in 1536 by Paul III., and employed in several negotiations and embassies. He died in 1547, not without the suspicion of poison, for corresponding too familiarly with the Protestants, and for testifying too much regard for some of their doctors. His works, which are all in Latin, were collected in 1607 at Mentz, in one volume 8vo. All his contemporaries spoke of him in the highest terms.

SAFE-GUARD, a protection formerly granted to a stranger who feared violence from some of the king's subjects for seeking his right by course of law.

SAFE-Conduct is a security given by a prince under the great seal, to a stranger for his *safe-coming* into and passing out of the realm; the form whereof is in *Reg. Orig.* 25. There are letters of safe-conduct which must be enrolled in Chancery; and the persons to whom granted must have them ready to show; and touching which there are several statutes. See PREROGATIVE.

SAFFRON, in the *Materia Medica*, is formed of the stigmata of the crocus officinalis, dried on a kiln, and pressed together into cakes. See CROCUS, BOTANY *Index*. There are two kinds of saffron, the English and Spanish; of which the latter is by far the most esteemed. Saffron is principally cultivated in Cambridge-shire, in a circle of about ten miles diameter. The greatest part of this tract is an open level country, with few inclosures; and the custom there is, as in most other places, to crop two years, and let the land be fallow the third. Saffron is generally planted upon fallow-ground, and, all other things being alike, they prefer that which has borne barley the year before.

The saffron ground is seldom above three acres, or less than one; and in choosing, the principal thing they have regard to is, that they be well exposed, the soil not poor, nor a very stiff clay, but a temperate dry mould, such as commonly lies upon chalk, and is of an hazel

colour; though, if every thing else answers, the colour of the mould is pretty much neglected.

The ground being made choice of, about Lady-day or the beginning of April, it must be carefully ploughed, the furrows being drawn much closer together, and deeper if the soil will allow it, than is done for any kind of corn; and accordingly the charge is greater.

About five weeks after, during any time in the month of May, they lay between 20 and 30 loads of dung upon each acre, and having spread it with great care, they plough it in as before. The shortest rotten dung is the best: and the farmers, who have the conveniency of making it, spare no pains to make it good, being sure of a proportionable price for it. About midsummer they plough a third time, and between every 16 feet and a half they leave a broad furrow or trench, which serves both as a boundary to the several parcels, and for throwing the weeds into at the proper season. The time of planting is commonly in the month of July. The only instrument used at this time is a small narrow spade, commonly called a *spit-shovel*. The method is this: One man with his shovel raises about three or four inches of earth, and throws it before him about six or more inches. Two persons, generally women, follow with roots, which they place in the farthest edge of the trench made by the digger, at about three inches from each other. As soon as the digger has gone once the breadth of the ridge, he begins again at the other side; and, digging as before, covers the roots last set, which makes room for another row of roots at the same distance from the first that they are from one another. The only dexterity necessary in digging is, to leave some part of the first stratum of earth untouched, to lie under the roots; and, in setting, to place the roots directly upon their bottom. The quantity of roots planted on an acre is generally about 16 quarters, or 128 bushels. From the time of planting till the beginning of September, or sometimes before, there is no more labour required; but at that time they begin to vegetate, and are ready to show themselves above ground, which may be known by digging up a few of the roots. The ground is then to be pared with a sharp hoe, and the weeds raked into the furrows, otherwise they would hinder the growth of the saffron. In some time after, the flowers appear.

They are gathered before they are full blown, as well as after, and the proper time for it is early in the morning. The owners of the saffron-fields get together a sufficient number of hands, who pull off the whole flowers, and throw them by handfuls into a basket, and so continue till about 11 o'clock. Having then carried home the flowers, they immediately fall to picking out the stigmata or chives, and together with them a pretty large proportion of the stylus itself, or string to which they are attached: the rest of the flower they throw away as useless. Next morning they return to the field, without regarding whether the weather be wet or dry: and so on daily, even on Sundays, till the whole crop is gathered.—The next labour is to dry the chives on the kiln. The kiln is built upon a thick plank, that it may be moved from place to place. It is supported by four short legs: the outside consists of eight pieces of wood of three inches thick, in form of a quadrangular frame, about 12 inches square at the bottom on the inside, and 22 on the upper part; which

last.

Saffron.

last is likewise the perpendicular height of it. On the foreside is left a hole of about eight inches square, and four inches above the plank, through which the fire is put in; over all the rest laths are laid pretty thick, close to one another, and nailed to the frame already mentioned. They are then plastered over on both sides, as are also the planks at bottom, very thick, to serve for a hearth. Over the mouth is laid a hair-cloth, fixed to the edges of the kiln, and likewise to two rollers or moveable pieces of wood, which are turned by wedges or screws, in order to stretch the cloth. Instead of the hair-cloth, some people use a net-work of iron-wire, by which the saffron is soon dried, and with less fuel; but the difficulty of preserving it from burning makes the hair-cloth preferred by the best judges. The kiln is placed in a light part of the house; and they begin with putting five or six sheets of white paper on the hair-cloth, and upon these they lay out the wet saffron two or three inches thick. It is then covered with some other sheets of paper, and over these they lay a coarse blanket five or six times doubled, or, instead of this, a canvas pillow filled with straw; and after the fire has been lighted for some time, the whole is covered with a board having a considerable weight upon it. At first they apply a pretty strong heat, to make the chives sweat as they call it: and at this time a great deal of care is necessary to prevent burning. When it has been thus dried about an hour, they turn the cakes of saffron upside down, putting on the coverings and weight as before. If no sinister accident happens during these first two hours, the danger is thought to be over; and nothing more is requisite than to keep up a very gentle fire for 24 hours, turning the cake every half hour. That fuel is best which yields the least smoke; and for this reason charcoal is preferable to all others.

The quantity of saffron produced at a crop is uncertain. Sometimes five or six pounds of wet chives are got from one rood, sometimes not above one or two; and sometimes not so much as is sufficient to defray the expense of gathering and drying. But it is always observed, that about five pounds of wet saffron go to make one pound of dry for the first three weeks of the crop, and six pounds during the last week. When the heads are planted very thick, two pounds of dry saffron may at a medium be allowed to an acre for the first crop, and 24 pounds for the two remaining ones, the third being considerably larger than the second.

To obtain the second and third crops, the labour of hoeing, gathering, picking, &c. already mentioned, must be repeated; and about midsummer, after the third crop is gathered, the roots must all be taken up and transplanted. For taking up the roots, sometimes the plough is made use of, and sometimes a forked hoe; and then the ground is harrowed once or twice over. During all the time of ploughing, harrowing, &c. 15 or more people will find work enough to follow and gather the heads as they are turned up. The roots are next to be carried to the house in sacks, where they are cleaned and rased. This labour consists in cleaning the roots thoroughly from earth, decayed old pieces, involucra, or excrescences; after which they become fit to be planted in new ground immediately, or they may be kept for some time, without danger of spoiling. The quantity of roots taken up in proportion to those planted is uncertain; but at a medium, 24 quarters of clean

roots, fit to be planted, may be had from each acre.— There sometimes happens a remarkable change in the roots of saffron and some other plants. As soon as they begin to shoot upwards, there are commonly two or three large tap-roots sent forth from the side of the old one, which will run two or three inches deep into the ground. At the place where these bulbs first come out from, the old one will be formed sometimes, though not always, and the tap-root then decays. The bulb increases in bigness, and at last falls quite off; which commonly happens in April. But many times these tap-roots never produce any bulbs, and remain barren for ever after. All such roots therefore should be thrown away in the making a new plantation. This degeneracy in the roots is a disease for which no cure is as yet known.

When saffron is offered to sale, that kind ought to be chosen which has the broadest blades; this being the mark by which English saffron is distinguished from the foreign. It ought to be of an orange or fiery-red colour, and to yield a dark yellow tincture. It should be chosen fresh, not above a year old, in close cakes, neither dry nor yet very moist, tough and firm in tearing, of the same colour within as without, and of a strong, acrid, diffusivc smell.

This drug has been reckoned a very elegant and useful aromatic. Besides the virtues it has in common with other substances of that class, it has been accounted one of the highest cordials, and is said to exhilarate the spirits to such a degree, as, when taken in large doses, to occasion immoderate mirth, involuntary laughter, and the ill effects which follow from the abuse of spirituous liquors. This medicine is particularly serviceable in hysteric depressions proceeding from a cold cause or obstruction of the uterine secretions, where other aromatics, even those of the more generous kind, have little effect. Saffron imparts the whole of its virtue and colour to rectified spirit, proof spirit, wine, vinegar, and water. A tincture drawn with vinegar loses greatly of its colour in keeping: the watery and vinous tinctures are apt to grow sour, and then lose their colour also: that made in pure spirit keeps in perfection for many years.

Meadow SAFFRON. See COLCHICUM, BOTANY Index.

SAGAN, in scripture history, the suffragan or deputy of the Jewish high-priest. According to some writers, he was only to officiate for him when he was rendered incapable of attending the service through sickness or legal uncleanness on the day of expiation; or, according to others, he was to assist the high-priest in the care of the affairs of the temple and the service of the priests.

SAGAPENUM, in *Pharmacy*, &c. a gum-resin which is made up in two forms; the finer and purer is in loose granules or single drops; the coarser kind is in masses composed of these drops of various sizes, cemented together by a matter of the same kind; and is brought from Persia and the East Indies. See MATERIA MEDICA Index.

SAGE. See SALVIA, BOTANY Index.

SAGE, *Alain Rene*, an ingenious French romance-writer, was born at Ruys in Brittany in the year 1667. He had a fine flow of imagination, was a complete master of the French and Spanish languages, and wrote several admired romances in imitation of the Spanish authors.

Saffron
Sage.

thors. These were, *The Bachelor of Salamanca*, 2 vols 12mo; *New Adventures of Don Quixote*, 2 vols 12mo; *The Devil on Two Sticks*, 2 vols 12mo; and *Gil Blas*, 4 vols 12mo. He produced also some comedies, and other humorous pieces. This ingenious author died in the year 1747, in the vicinity of Paris, where he supported himself by writing.

SAGE, *the Reverend John*, so justly admired by all who knew him for his classical learning and reasoning powers, was born, in 1652, in the parish of Creich and county of Fife, North Britain, where his ancestors had lived for seven generations with great respect though with little property. His father was a captain in Lord Duffus's regiment, and fought for his king and country when Monk stormed Dundee on the 30th of August 1651.

The issue of the civil wars, and the loyalty of Captain Sage, left him nothing to bestow upon his son but a liberal education and his own principles of piety and virtue. In those days the Latin language was taught in the parochial schools of Scotland with great ability and at a trifling expense; and after young Sage had acquired a competent knowledge of that language at one of those useful seminaries, his father, without receiving from an ungrateful court any recompense for what he had lost in the cause of royalty, was still able to send him to the university of St Andrew's, where having remained in college the usual number of terms or sessions, and performed the exercises required by the statutes, he was admitted to the degree of master of arts, the highest honour which it appears he ever received from any university.

During his residence in St Andrew's he studied the Greek and Roman authors with great diligence, and was likewise instructed in logic, metaphysics, and such other branches of philosophy as then obtained in the schools; which, though we affect to smile at them in this enlightened age, he always spoke of as highly useful to him who would understand the poets, historians, and orators of ancient Greece, and even the fathers of the Christian church. In this opinion every man will agree with him, who is at all acquainted with the ancient metaphysics, and has read the writings of Clements Alexandrinus, Origen, Tertullian, Chrysostome, and other fathers of great name; for each of those writers adopted the principles of some one or other of the philosophical sects, reasoned from their notions, and often made use of their terms and phrases.

When Mr Sage had taken his master's degree, the narrowness of his fortune compelled him to accept of the first literary employment which was offered to him; and that happened to be nothing better than the office of schoolmaster in the parish of Bingry in Fifeshire, whence he was soon removed to Tippermuir in the county of Perth. In these humble stations, though he wanted many of the necessaries and almost all the comforts of life, he prosecuted his studies with great success; but in doing so, he unhappily imbibed the seeds of several diseases which afflicted him through life, and, notwithstanding the native vigour of his constitution, impaired his health and shortened his days. From the miserable drudgery of a parish-schoolmaster, he was relieved by Mr Drummond of Cultmalundie, who invited him to superintend the education of his sons, whom he accompanied first to the public school at

Perth, and afterwards to the university of St Andrew's. This was still an employment by no means adequate to his merit, but it was not wholly without advantages. At Perth, he gained the friendship and esteem of Dr Rose, afterwards lord bishop of Edinburgh, and at St Andrew's of every man capable of properly estimating genius and learning.

The education of his pupils was completed in 1684, when he was left with no determinate object of pursuit. In this moment of indecision, his friend Dr Rose, who had been promoted from the parsonage of Perth to the professorship of divinity in the university which he was leaving, recommended him so effectually to his uncle, then archbishop of Glasgow, that he was by that prelate admitted into orders and presented to one of the churches in the city. He was then about 34 years of age; had studied the Scriptures with great assiduity; was no stranger to ecclesiastical history, or the apologies and other writings of the antient fathers; was thorough master of school-divinity; had examined with great accuracy the modern controversies, especially those between the Romish and Reformed churches, and between the Calvinists and Remonstrants; and it was perhaps to his honour that he did not fully approve of all the articles of faith subscribed by any one of these contending sects of Christians.

A man so far advanced in life, and so thoroughly accomplished as a scholar, would naturally be looked up to by the greater part of the clergy as soon as he became one of their body. This was in fact the case: Mr Sage was, immediately on his admission into orders, appointed clerk to the synod or presbytery of Glasgow; an office of great trust and respectability, to which we know nothing similar in the church of England.

During the establishment of episcopacy in Scotland, from the restoration of Charles II. till the year 1690, the authority of the bishops, though they possessed the sole power of ordination, was very limited in the government of the church. They did every thing with the consent of the presbyters over whom they presided. Diocesan synods were held at stated times for purposes of the same kind with those which employ the meetings of presbyteries at present (see PRESBYTERIANS); and the only prerogative which the bishop seems to have enjoyed was to be permanent president, with a negative voice over the deliberations of the assembly. The acts of each synod, and sometimes the charge delivered by the bishop at the opening of it, were registered in a book kept by the clerk, who was always one of the most eminent of the diocesan clergy.

Mr Sage continued in this office, discharging in Glasgow all the duties of a clergyman, in such a manner as endeared him to his flock, and gained him the esteem even of those who were dissenters from the establishment. Many of his brethren were trimmers in ecclesiastical as well as in civil politics. They had been republicans and presbyterians in the days of the covenant; and, with that ferocious zeal which too often characterizes interested converts, had concurred in the severities which, during the reign of Charles II, were exercised against the party whom they had forsaken at his restoration. When that party again raised its head during the infatuated reign of James, and every thing indicated an approaching change of the establishment,

Sage.

those whose zeal for the church had so lately incited them to persecute the dissenters, suddenly became all gentleness and condescension, and advanced towards the presbyterians as to their old friends.

The conduct of Mr Sage was the reverse of this. He was an episcopalian and a royalist from conviction; and in all his discourses, public and private, he laboured to instil into the minds of others the principles which to himself appeared to have their foundation in truth. To persecution he was at all times an enemy, whilst he never tamely betrayed through fear what he thought it his duty to maintain. The consequence was, that in the end of the year 1688 he was treated by the rabble, which in the western counties of Scotland rose against the established church, with greater lenity than his more complying brethren. Whilst they, without the smallest apprehension of their danger, were torn from their families by a lawless force, and many of them persecuted in the cruellest manner, he was privately warned to withdraw from Glasgow, and never more to return to that city. So much was consistency of conduct and a steady adherence to principle respected by those who seemed to respect nothing else.

Mr Sage retired to the metropolis, and carried with him the synodical book, which was afterwards demanded by the presbytery of Glasgow, but not recovered, till about twenty years ago, that, on the death of a nephew of Dr Rose the last established bishop of Edinburgh, it was found in his possession, and restored to the presbytery to which it belonged. Mr Sage had detained it and given it to his diocesan friend, from the fond hope that episcopacy would soon be re-established in Scotland; and it was doubtless with a view to contribute what he could to the realising of that hope, that, immediately on his being obliged to leave Glasgow, he commenced a keen polemical writer. At Edinburgh he preached a while, till refusing to take the oaths of allegiance when required by the government, he was obliged to retire. In this extremity, he found protection in the house of Sir William Bruce, the sheriff of Kinross, who approved his principles and admired his virtue. Returning to Edinburgh, in 1695, he was observed, and obliged to abscond. Yet he returned in 1696, when his friend Sir William Bruce was imprisoned as a suspected person. He was soon forced to seek for refuge in the hills of Angus, under the name of Jackson.

After a while Mr Sage found a safe retreat with the countess of Callendar, who employed him to instruct her family as chaplain, and her sons as tutor. These occupations did not wholly engage his active mind: for he employed his pen in defending his order, or in exposing his oppressors. When the countess of Callendar had no longer sons to instruct, Sage accepted the invitation of Sir John Steuart of Garntully, who wanted the help of a chaplain, and the conversation of a scholar. With Sir John he continued till the decency of his manners, and the extensiveness of his learning, recommended him to a higher station. And, on the 25th of January 1705, he was consecrated a bishop by Paterson the archbishop of Glasgow, Rose the bishop of Edinburgh, and Douglas the bishop of Dumblain. But this promotion did not prevent sickness from falling on him in November 1706. After lingering for many months in Scotland, he tried the effect of the waters of Bath in 1709, without suc-

cess. At Bath and at London he remained a twelvemonth, recognised by the great and caressed by the learned. Yet though he was invited to stay, he returned in 1710 to his native country, which he desired to see, and where he wished to die. And though his body was debilitated, he engaged, with undiminished vigour of mind, in the publication of the works of Drummond of Hawthornden, to which the celebrated Ruddiman lent his aid. Bishop Sage died at Edinburgh on the 7th of June 1711, lamented by his friends for his virtues, and feared by his adversaries for his talents.

His works are, 1st, Two Letters concerning the Persecution of the Episcopal Clergy in Scotland, which with other two by different authors were printed in one volume at London in 1689. 2dly, An Account of the late Establishment of Presbyterian Government by the Parliament of Scotland, in 1690, London, 1693. 3dly, The Fundamental Charter of Presbytery, London, 1695. 4thly, The Principles of the Cyprianick Age with regard to Episcopal Power and Jurisdiction, London, 1695. 5thly, A Vindication of the Principles of the Cyprianick Age, London, 1701. 6thly, Some Remarks on the Letter from a Gentlemen in the City, to a Minister in the Country, on Mr David Williamson's Sermon before the General Assembly, Edinburgh, 1703. 7thly, A Brief Examination of some Things in Mr Meldrum's Sermon, preached on the 16th of May 1703, against a Toleration to those of the Episcopal Persuasion, Edinburgh, 1703. 8thly, The Reasonableness of a Toleration of those of the Episcopal Persuasion inquired into purely on Church Principles, Edinburgh, 1704. 9thly, The Life of Gawin Douglas, in 1710. 10thly, An Introduction to Drummond's History of the Five James's, Edinburgh, 1711. Of the principles maintained in these publications, different readers will think very differently; and it is probable that the acrimony displayed in some of them will be generally condemned in the present day; whilst the learning and acuteness of their author will be universally acknowledged and admired by all who can distinguish merit in a friend or an adversary.

SAGENE, or SAJENE, a Russian long measure, 500 of which make a verst: the sagene is equal to seven English feet.

SAGINA, a genus of plants belonging to the tetrandria class; and in the natural method ranking under the 22d order, *Caryophyllei*. See BOTANY Index.

SAGITTA, in *Astronomy*, the Arrow, a constellation of the northern hemisphere near the Eagle, and one of the 48 old asterisms. According to the fabulous ideas of the Greeks, this constellation owes its origin to one of the arrows of Hercules, with which he killed the eagle or vulture that gnawed the liver of Prometheus. In the catalogues of Ptolemy, Tycho, and Helvelius, the stars of this constellation are only five in number, while Flamstead made them amount to 18.

SAGITTA, in *Geometry*, a term used by some writers for the absciss of a curve.

SAGITTA, in *Trigonometry*, the same as the versed sine of an arch, being so denominated because it is like a dart or arrow, standing on the chord of the arch.

SAGITTARIA, ARROW-HEAD, a genus of plants belonging to the monocæcia class; and in the natural method ranking under the fifth order, *Tripetaloidæ*. See BOTANY Index.—A bulb which is fomed at the lower part.

Sage.
Sagittari

part of the root of a species of this plant, constitutes a considerable part of the food of the Chinese; and upon that account they cultivate it.

SAGITTARIUS, in *Astronomy*, the name of one of the 12 signs of the zodiac.

SAGO, a nutritive substance brought from the East Indies, of considerable use in diet as a restorative. It is produced from a species of palm-tree (*Cycas circinalis*, Lin.) growing spontaneously in the East Indies without any culture. The progress of its vegetation in the early stages is very slow. At first it is a mere shrub, thick set with thorns, which make it difficult to come near it; but as soon as its stem is once formed, it rises in a short time to the height of 30 feet, is about six feet in circumference, and imperceptibly loses its thorns. Its ligneous bark is about an inch in thickness, and covers a multitude of long fibres; which, being interwoven one with another, envelope a mass of a gummy kind of meal. As soon as this tree is ripe, a whitish dust, which transpires through the pores of the leaves, and adheres to their extremities, proclaims its maturity. The Malays then cut them down near the root, divide them into several sections, which they split into quarters; they then scoop out the mass of mealy substance, which is enveloped by and adheres to the fibres; they dilute it in pure water, and then pass it through a straining bag of fine cloth, in order to separate it from the fibres. When this paste has lost part of its moisture by evaporation, the Malays throw it into a kind of earthen vessels, of different shapes, where they allow it to dry and harden. This paste is a wholesome nourishing food, and may be preserved for many years. The Indians eat it diluted with water, and sometimes baked or boiled. Through a principle of humanity, they reserve the finest part of this meal for the aged and infirm. A jelly is sometimes made of it, which is white and of a delicious flavour.

SAGUM, in Roman antiquity, a military habit, open from top to bottom, and usually fastened on the right shoulder with a buckle or clasp. It was not different in shape from the *chlamys* of the Greeks, and the *paludamentum* of the generals. The only difference between them was, that the *paludamentum* was made of a richer stuff, was generally of a purple colour, and both longer and fuller than the sagum.

SAGUNTUM, an ancient town of Spain, now called *Morvedro*, where there are still the ruins of a Roman amphitheatre to be seen. The new town is seated on a river called *Morvedra*, 15 miles to the north of Valencia, in E. Long. 0. 10. N. Lat. 39. 38. It was taken by Lord Peterborough in 1706.

SAHARA, or ZAARA, the Great Desert, is a vast extent of sand in the interior parts of Africa, which, with the lesser deserts of Bornou, Bilma, Barca, Sort, &c. is equal to about one half of Europe. If the sand be considered as the ocean, the Sahara has its gulfs and bays, as also its islands, or OASES, fertile in groves and pastures, and in many instances containing a great population, subject to order and regular government.

The great body, or western division of this ocean, comprised between Fezzan and the Atlantic, is no less than 50 caravan journeys across, from north to south; or from 750 to 800 G. miles; and double that extent in length: without doubt the largest desert in the world. This division contains but a scanty portion of islands

(or oases), and those also of small extent: but the eastern division has many, and some of them very large. Fezzan, Gadamis, Taboo, Ghanat, Agadez, Augila, Berdoa, are amongst the principal ones: besides which, there are a vast number of small ones. In effect, this is the part of Africa alluded to by Strabo, when he says, from *Cneius Piso*, that Africa may be compared to a leopard's skin.

From the best inquiries that Mr Park could make when a kind of captive among the Moors at Ludamar, the Western Desert, he says, may be pronounced almost destitute of inhabitants; except where the scanty vegetation, which appears in certain spots, affords pasturage for the flocks of a few miserable Arabs, who wander from one well to another. In other places, where the supply of water and pasturage is more abundant, small parties of the Moors have taken up their residence. Here they live, in independent poverty, secure from the tyrannical government of Barbary. But the greater part of the desert, being totally destitute of water, is seldom visited by any human being; unless where the trading caravans trace out their toilsome and dangerous route across it. In some parts of this extensive waste, the ground is covered with low stunted shrubs, which serve as land-marks for the caravans, and furnish the camels with a scanty forage. In other parts, the desolate wanderer, wherever he turns, sees nothing around him but a vast interminable expanse of sand and sky; a gloomy and barren void, where the eye finds no particular object to rest upon, and the mind is filled with painful apprehensions of perishing with thirst. Surrounded by this dreary solitude, the traveller sees the dead bodies of birds, that the violence of the wind has brought from happier regions; and, as he ruminates on the fearful length of his remaining passage, listens with horror to the voice of the driving blast—the only sound that interrupts the awful repose of the desert.

The wild animals which inhabit these melancholy regions, are the antelope and the ostrich; their swiftness of foot enabling them to reach the distant watering-places. On the skirts of the desert, where the water is more plentiful, are found lions, panthers, elephants, and wild boars.

The only domestic animal that can endure the fatigue of crossing the desert is the camel; and it is therefore the only beast of burden employed by the trading caravans which traverse, in different directions, from Barbary to Nigritia. The flesh of this useful and docile creature, though to our author's taste it was dry and unsavoury, is preferred by the Moors to all others. The milk of the female, he says, is in universal esteem, and is indeed pleasant and nutritive.

That the desert has a dip towards the east, as well as the south, seems to be proved by the course of the Niger. Moreover, the highest points of North Africa, that is to say, the mountains of Mandinga and Atlas, are situated very far to the west. The desert, for the most part, abounds with salt. But we hear of salt mines only in the part contiguous to Nigritia, from whence salt is drawn for the use of those countries, as well as of the Moorish states adjoining; there being no salt in the negro countries south of the Niger. There are salt lakes also in the eastern part of the desert.

SAHLITE, a species of mineral, see *MINERALOGY Index*.

Sahara,
Sahlite.

Sai
||
Sail.

SAI, a large town near the banks of the Niger, which, according to Mr Park, is completely surrounded by two very deep trenches, at about two hundred yards distant from the walls. On the top of the trenches are a number of square towers: and the whole has the appearance of a regular fortification. Inquiring into the origin of this extraordinary entrenchment, our author learned from two of the towns-people the following particulars; which, if true, furnish a mournful picture of the enormities of African wars:

About fifteen years before our traveller visited Sai, when the king of Bambarra desolated Maniana, the Dooty of Sai had two sons slain in battle, fighting in the king's cause. He had a third son living; and when the king demanded a further reinforcement of men, and this youth among the rest, the Dooty refused to send him. This conduct so enraged the king, that when he returned from Maniana, about the beginning of the rainy season, and found the Dooty protected by the inhabitants, he sat down before Sai with his army, and surrounded the town with the trenches which had attracted our author's notice. After a siege of two months, the towns-people became involved in all the horrors of famine; and whilst the king's army were feasting in their trenches, they saw with pleasure the miserable inhabitants of Sai devour the leaves and bark of the Bentang tree that stood in the middle of the town. Finding, however, that the besieged would sooner perish than surrender, the king had recourse to treachery. He promised, that if they would open the gates, no person should be put to death, nor suffer any injury, but the Dooty alone. The poor old man determined to sacrifice himself, for the sake of his fellow-citizens, and immediately walked over to the king's army, where he was put to death. His son, in attempting to escape, was caught and massacred in the trenches; and the rest of the towns-people were carried away captives, and sold as slaves to the different Negro traders. Sai, according to Major Rennel, is situated in N. Lat. 14°, and in W. Long. 3° 7'.

SAICK, or SAIQUE, a Turkish vessel, very common in the Levant for carrying merchandise.

SAIDE, the modern name of Sidon. See SIDON.

SAIL, in *Navigation*, an assemblage of several breadths of canvas sewed together by the lists, and edged round with cord, fastened to the yards of a ship, to make it drive before the wind. See SHIP.

The edges of the cloths, or pieces, of which a sail is composed, are generally sewed together with a double seam; and the whole is skirted round at the edges with a cord, called the *bolt-rope*.

Although the form of sails is extremely different, they are all nevertheless triangular or quadrilateral figures; or, in other words, their surfaces are contained either between three or four sides.

The former of these are sometimes spread by a yard, as lateen-sails; and otherwise by a stay, as stay-sails; or by a mast, as shoulder-of-mutton sails; in all which cases the foremost leech or edge is attached to the said yard, mast, or stay, throughout its whole length. The latter, or those which are four-sided, are either extended by yards, as the principal yards of a ship; or by yards and booms, as the studding-sails, drivers, ring-tails, and all those sails which are set occasionally; or

by gaffs and booms, as the main-sails of sloops and brigantines.

The principal sails of a ship (fig. 1.) are the courses or lower sails *a*; the top-sails *b*, which are next in order above the courses; and the top-gallant sails *c*, which are expanded above the top-sails.

The courses are the main-sail, fore-sail, and mizen, main stay-sail, fore stay-sail, and mizen stay-sail; but more particularly the three first. The main stay-sail is rarely used except in small vessels.

In all quadrangular sails the upper edge is called the *head*; the sides or skirts are called *leeches*; and the bottom or lower edge is termed the *foot*. If the head is parallel to the foot, the two low corners are denominated *clues*, and the upper corners earings.

In all triangular sails, and in those four-sided sails wherein the head is not parallel to the foot, the foremost corner at the foot is called the *tack*, and the after lower-corner the *chue*; the foremost perpendicular or sloping edge is called the *fore-leech*, and the hindmost the *after-leech*.

The heads of all four-sided sails, and the fore-leeches of lateen-sails, are attached to their respective yard or gaff by a number of small cords called *ro-bands*; and the extremities are tied to the yard-arms, or to the peak of the gaff, by earings.

The stay-sails are extended upon stays between the masts, whereon they are drawn up or down occasionally, as a curtain slides upon its rod, and their lower parts are stretched out by a tack and sheet. The clues of a top-sail are drawn out to the extremities of the lower yard, by two large ropes called the *top-sail sheets*; and the clues of the top-gallant sails are in like manner extended upon the top-sail yard-arms, as exhibited by fig. 2.

The studding-sails are set beyond the leeches or skirts of the main-sail and fore-sail, or of the top-sails or top-gallant sails of a ship. Their upper and lower edges are accordingly extended by poles run out beyond the extremities of the yards for this purpose. Those sails, however, are only set in favourable winds and moderate weather.

All sails derive their name from the mast, yard, or stay, upon which they are extended. Thus the principal sail extended upon the main-mast is called the *mainsail*, *d*; the next above, which stands upon the main-top mast, is termed the *main-top sail*, *e*; and the highest, which is spread across the main-top-gallant mast, is named the *main-top-gallant sail*, *f*.

In the same manner there is the fore-sail, *g*; the fore-top sail, *h*; and the fore-top-gallant sail, *i*; the mizen, *k*; the mizen-top sail, *l*; and mizen-top-gallant sail, *m*. Thus also there is the main-stay sail, *o*; main top-mast stay-sail, *p*; and main-top-gallant stay-sail, *q*; with a middle stay-sail which stands between the two last.

N. B. All these stay-sails are between the main and fore-masts.

The stay-sails between the main-mast and mizen-mast are the mizen stay-sail, *r*; and the mizen top-mast stay-sail, *s*; and sometimes a mizen top-gallant stay-sail above the latter.

The stay-sails between the foremast and the bowsprit are the fore stay-sail, *t*; the fore top-mast stay-sail,

SAILING.

SARCOPHAGUS.
OF ALEXANDER THE GREAT.

Sail. *u*; and the jib, *x*. There is besides two square sails extended by yards under the bow-sprit, one of which is called the *sprit-sail*, *y*; and the other the *sprit-sail top-sail*, *z*.

The studding-sails being extended upon the different yards of the main-mast and fore-mast, are likewise named according to their stations, the *lower*, *top-mast*, or *top-gallant studding sails*.

The ropes by which the lower yards of a ship are hoisted up to their proper height on the masts, are called the *jeers*. In all other sails the ropes employed for this purpose are called *haliards*.

The principal sails are then expanded by haliards, sheets, and bowlines; except the courses, which are always stretched out below by a tack and sheet. They are drawn up together, or trussed up, by bunt-lines, clue-lines, *dd*; leech-lines, *ee*; reef-tackles, *ff*; slab-line, *g*; and spiling-lines. As the bunt-lines and leech-lines pass on the other side of the sail, they are expressed by the dotted lines in the figure.

The courses, top-sails, and top-gallant sails, are wheeled about the mast, so as to suit the various directions of the wind, by braces. The higher studding-sails, and in general all the stay-sails, are drawn down, so as to be furled, or taken in, by down-hauls.

Some experienced sail-makers contend, that it would be of much advantage if many of the sails of ships were made of equal magnitude; in which case, when necessity required it, they could be interchangeably used. For example, as the mizen top-sail is now made nearly as large as the main top-gallant sail, it would be easy to make the yards, masts, and sails, so as mutually to suit each other. The main and fore-top sails differ about two feet at head and foot, and from one to three feet in depth. These likewise could be easily made alike, and in some cases they are so. The same may be said of the main and fore top-gallant sails, and of the mizen top-gallant sail, and main fore-royal. The main-sail and fore-sail might also, with respect to their head, be made alike; but as the former has a gore at the leech, and a larger gore at the foot for clearing it of the galleys, boats, &c. which the latter has not, there might be more difficulty in arranging them. The difficulty, however, appears not to be insurmountable. These alterations, it is thought, would be extremely useful in the event of losing sails by stress of weather. Fewer sails would be thus necessary, less room would be required to stow them, and there would be less danger of confusion in taking them out. But perhaps the utility of these alterations will be more felt in the merchant-service than in the navy, which latter has always a large store of spare sails, and sufficient room to stow them in order. Thus, too, spare yards and masts might be considerably reduced in number, and yet any casual damages more easily repaired at sea. Top-mast studding sails are occasionally substituted for awnings, and might, by a very little attention in planning the rigging of a ship, be so contrived as to answer both purposes. See SHIP-BUILDING.

SAIL is also a name applied to any vessel seen at a distance under sail, and is equivalent to ship.

To set SAIL, is to unfurl and expand the sails upon their respective yards and stays, in order to begin the action of sailing.

To Make SAIL, is to spread an additional quantity of sail, so as to increase the ship's velocity.

To shorten SAIL, is to reduce or take in part of the sails, with an intention to diminish the ship's velocity.

To Strike SAIL, is to lower it suddenly. This is particularly used in saluting or doing homage to a superior force, or to one whom the law of nations acknowledges as superior in certain regions. Thus all foreign vessels strike to a British man of war in the British seas.

SAILING, the movement by which a vessel is wafted along the surface of the water, by the action of the wind upon her sails.

When a ship changes her state of rest into that of motion, as in advancing out of a harbour, or from her station at anchor, she acquires her motion very gradually, as a body which arrives not at a certain velocity till after an infinite repetition of the action of its weight.

The first impression of the wind greatly affects the velocity, because the resistance of the water might destroy it; since the velocity being but small at first, the resistance of the water which depends on it will be very feeble: but as the ship increases her motion, the force of the wind on the sails will be diminished; whereas, on the contrary, the resistance of the water on the bow will accumulate in proportion to the velocity with which the vessel advances. Thus the repetition of the degrees of force, which the action of the sail adds to the motion of the ship, is perpetually decreasing; whilst, on the contrary, the new degrees added to the effort of resistance on the bow are always augmenting. The velocity is then accelerated in proportion as the quantity added is greater than that which is subtracted; but when the two powers become equal, when the impression of the wind on the sails has lost so much of its force, as only to act in proportion to the opposite impulse of resistance on the bow, the ship will then acquire no additional velocity, but continue to sail with a constant uniform motion. The great weight of the ship may indeed prevent her from acquiring her greatest velocity; but when she has attained it, she will advance by her own intrinsic motion, without gaining any new degree of velocity, or lessening what she has acquired. She moves then by her own proper force *in vacuo*, without being afterwards subject either to the effort of the wind on the sails, or to the resistance of the water on the bow. If at any time the impulsion of the water on the bow should destroy any part of the velocity, the effort of the wind on the sails will revive it, so that the motion will continue the same. It must, however, be observed, that this state will only subsist when these two powers act upon each other in direct opposition; otherwise they will mutually destroy one another. The whole theory of working ships depends on this counter action, and the perfect equality which should subsist between the effort of the wind and the impulsion of the water.

The effect of sailing is produced by a judicious arrangement of the sails to the direction of the wind. Accordingly the various modes of sailing are derived from the different degrees and situations of the wind with regard to the course of the vessel. See SEAMANSHIP.

Sail.
Fig. 5.

To illustrate this observation by examples, the plan of a number of ships proceeding on various courses is represented by fig. 3. which exhibits the 32 points of the compass, of which C is the centre; the direction of the wind, which is northerly, being expressed by the arrow.

It has been observed in the article *CLOSE-HAULED*, that a ship in that situation will sail nearly within six points of the wind. Thus the ships B and *y* are close-hauled; the former being on the larboard-tack, steering E. N. E. and the latter on the starboard-tack, sailing W. N. W. with their yards *a b* braced obliquely, as suitable to that manner of sailing. The line of battle on the larboard-tack would accordingly be expressed by CB, and on the starboard by C *y*.

When a ship is neither close-hauled, nor steering afore the wind, she is in general said to be sailing large. The relation of the wind to her course is precisely determined by the number of points between the latter and the course close-hauled. Thus the ships *c* and *x* have the wind one point large, the former steering E. *b* N. and the latter W. *b* N. The yards remain almost in the same position as in B and *y*; the bowlines and sheets of the sails being only a little slackened.

The ships *d* and *u* have the wind two points large, the one steering east and the other west. In this manner of sailing, however, the wind is more particularly said to be upon the beam, as being at right angles with the keel, and coinciding with the position of the ship's beams. The yards are now more across the ship, the bowlines are cast off, and the sheets more relaxed; so that the effort of the wind being applied nearer to the line of the ship's course, her velocity is greatly augmented.

In *e* and *t* the ships have the wind three points large, or one point abaft the beam, the course of the former being E. *b* S. and that of the latter W. *b* S. The sheets are still more flowing, the angle which the yards make with the keel further diminished, and the course accelerated in proportion.

The ships *f* and *j*, the first of which steers E. S. E. and the second W. S. W. have the wind four points large, or two points abaft the beam. In *g* and *r* the wind is five points large, or three points abaft the beam, the former sailing S. E. *b* E. and the latter S. W. *b* W. In both these situations the sheets are still farther slackened, and the yards laid yet more athwart the ship's length, in proportion as the wind approaches the quarter.

The ships *h* and *q*, steering S. E. and S. W. have the wind six points large, or more properly on the quarter; which is considered as the most favourable manner of sailing, because all the sails co-operate to increase the ship's velocity; whereas, when the wind is right aft, as in the ship *m*, it is evident that the wind in its passage to the foremost sails will be intercepted by those which are farther aft. When the wind is on the quarter, the fore-tack is brought to the cat-head; and the main-tack being cast off, the weather-clue of the main-sail is hoisted up to the yard, in order to let the wind pass freely to the fore-sail; and the yards are disposed so as to make an angle of about two points, or nearly 22°, with the keel.

The ships *i* and *p*, of which the former sails S. E. *b* S. and the latter S. W. *b* S. are said to have the wind

three points on the larboard or starboard quarter: and those expressed by *k* and *o*, two points; as steering S. S. E. and S. S. W. in both which positions the yards make nearly an angle of 16°, or about a point and a half, with the ship's length.

When the wind is one point on the quarter, as in the ships *l* and *n*, whose courses are S. *b* E. and S. *b* W. the situation of the yards and sails is very little different from the last mentioned; the angle which they make with the keel being somewhat less than a point, and the stay-sails being rendered of very little service. The ship *m* sails right afore the wind, or with the wind right aft. In this position the yards are laid at right angles with the ship's length: the stay-sails being entirely useless, are hauled down; and the main-sail is drawn up in the brails, that the foresail may operate; a measure which considerably facilitates the steering, or effort of the helm. As the wind is then intercepted by the main-top sail and main-top-gallant sail, in its passage to the fore-top sail and fore-top-gallant sail, these latter are by consequence entirely becalmed; and might therefore be furled, to prevent their being fretted by flapping against the mast, but that their effort contributes greatly to prevent the ship from broaching-to, when she deviates from her course to the right or left thereof.

Thus all the different methods of sailing may be divided into four, viz. close-hauled, large, quartering, and afore the wind; all which relate to the direction of the wind with regard to the ship's course, and the arrangement of the sails.

SAILING also implies a particular mode of navigation, formed on the principles, and regulated by the laws, of trigonometry. Hence we say, Plain Sailing, Mercator's, Middle-latitude, Parallel, and Great-circle Sailing. See the article NAVIGATION.

SAIL-MAKING, the art of making sails. See SAIL and SHIP-BUILDING.

SAILOR, the same with MARINER and SEAMAN.

SAINT, means a person eminent for piety and virtue, and is generally applied by us to the apostles and other holy persons mentioned in Scripture. But the Romanists make its application much more extensive. Under the word CANONIZATION we have already said something on their practice of creating saints. Our readers, however, will not, we trust, be displeased with the following more enlarged account, which they themselves give of the matter. The canonization of saints, then, they tell us, is the enrolment of any person in the *canon* or catalogue of those who are called *saints*; or, it is a judgment and sentence of the church, by which it is declared, that a deceased person was eminent for sanctity during his lifetime, and especially towards the end of it; and that consequently he must now be in glory with God, and deserves to be honoured by the church on earth with that veneration which she is wont to pay to the blessed in heaven.

The discipline with regard to this matter has varied. It would seem that in the first ages every bishop in his own diocese was wont to declare what persons were to be honoured as saints by his people. Hence St Cyprian, about the middle of the third century, B. 3. ep. 6. requires that he be informed of those who should die in prison for the faith, that so he might make mention of them in the holy sacrifice with the martyrs,

Sail.
Saint.

Saint. and might honour them afterwards on the anniversary day of their happy death. This veneration continued sometimes to be confined to one country; but sometimes it extended to distant provinces, and even became universal all over the church. It was thus that St Laurence, St Ambrose, St Augustine, St Basil, and many others, appear to have been canonized by custom and universal persuasion. In those ages none were reckoned saints but the apostles, the martyrs, and very eminent confessors, whose sanctity was notorious everywhere.

Afterwards it appears that canonizations were wont to be performed in provincial synods under the direction of the metropolitan. It was thus that St Isidore of Seville was canonized in the 7th century, by the 8th council of Toledo, 14 years after his death. This manner of canonization continued occasionally down to the 12th century. The last instance of a saint canonized in that way, is that of St Walter abbot of Pontoise, who was declared a saint by the archbishop of Rouen in the year 1153.

In the 12th century, in order to prevent mistakes in so delicate a matter, Pope Alexander III. judged it proper to reserve this declaration to the Holy See of Rome exclusively; and decreed that no one should for the future be honoured by the church as a saint without the express approbation of the pope.

Since that time, the canonization of saints has been carried on in the form of a process; and there is at Rome a congregation of cardinals, called the *congregation of holy rites*, who are assisted by several divines under the name of *consultors*, who examine such matters, and prepare them for the decision of his holiness. When therefore any potentate, province, city, or religious body, think fit, they apply to the pope for the canonization of any person.

The first juridical step in this business must be taken by the bishop in whose diocese the person for whom the application is made had lived and died, who by his own authority calls witnesses to attest the opinion of the holiness, the virtues, and miracles, of the person in question. When the deceased has resided in different dioceses, it may be necessary that different bishops take such depositions; the originals of which are preserved in the archives of their respective churches, and authentic copies sealed up are sent to Rome by a special messenger, where they are deposited with the congregation of rites, and where they must remain for the space of ten years without being opened. They are then opened, and maturely examined by the congregation, and with their advice the pope allows the cause to go on or not as he thinks proper. The solicitors for the canonization are then referred by his holiness to the said congregation, which, with his authority, gives a commission to one or more bishops, or other respectable persons, to examine, on the spot and in the places where the person in question has lived and died, into his character and whole behaviour. These commissioners sum-

mon witnesses, take depositions, and collect letters and other writings of the venerable man, and get all the intelligence they can concerning him, and the opinion generally entertained of him. The report of these commissioners is considered attentively and at length by the congregation, and every part of it discussed by the consultors, when the congregation determines whether or not they can permit the process to go on. If it be allowed to proceed, a cardinal, who is called *ponent*, undertakes to be the principal agent in that affair. The first question then that comes to be examined is, whether or not the person proposed for canonization can be proved to have been in an eminent degree endued with the moral virtues of prudence, justice, fortitude, and temperance; and with the theological virtues of faith, hope, and charity? All this is canvassed with great deliberation; and there is a distinguished ecclesiastic called the *promoter of the holy faith*, who is sworn to make all reasonable objections to the proofs that are adduced in favour of the canonization. If the decision be favourable, then the proofs of miracles done to show the sanctity of the person in question are permitted to be brought forward; when two miracles must be verified to the satisfaction of the congregation, both as to the reality of the facts, and as to their having been truly above the power of nature. If the decision on this comes out likewise favourable, then the whole is laid before the pope and what divines he chooses (A). Public prayer and fasting are likewise prescribed, in order to obtain light and direction from heaven. After all this long procedure, when the pope is resolved to give his approbation, he issues a bull, first of *beatification*, by which the person is declared *blest*, and afterwards another of *sanctification*, by which the name of *saint* is given him. These bulls are published in St Peter's church with very great solemnity.

A person remarkable for holiness of life, even before he is canonized, may be venerated as such by those who are persuaded of his eminent virtue, and his prayers may be implored; but all this must rest on private opinion. After his canonization, his name is inserted in the Martyrology, or catalogue of saints, of which the respective portion is read every day in the choir at the divine office. A day is also appointed for a yearly commemoration of him. His name may be mentioned in the public church service, and his intercession with God besought. His relics may be enshrined; he may be painted with rays of glory, and altars and churches may be dedicated to God in honour of him, and in thanksgiving to the divine goodness for the blessings bestowed on him in life, and for the glory to which he is raised in heaven.

The affair of a canonization is necessarily very expensive, because so many persons must be employed about it; so many journeys must be made; so many writings for and against it must be drawn out. The expense altogether amounts to about 25,000 Roman crowns, or 6000*l.* sterling. But it is generally contrived

(A) His holiness generally appoints three consistories; in the first of which the cardinals only assist, and give their opinion; in the second, a preacher pronounces a speech in praise of the candidate before a numerous audience; to the third, not only the cardinals, but all the bishops who are at Rome, are invited, and all of them give their vote by word of mouth.

Saints.
Saintes.

trived to canonize two or three at a time, by which means the particular expense of each is very much lessened, the solemnity being common.

It often happens that the solicitors for a canonization are unsuccessful. Thus the Jesuits, even when their interest at Rome was greatest, could not obtain the canonization of Bellarmine; and it is remarkable, that the objection is said to have been, his having defended the indirect power of the pope over Christian princes even in temporals.

Several authors have written on canonization, and particularly Prosper Lambertini, afterwards pope under the name of Benedict XIV., who had held the office of *promoter of the faith* for many years. He published on it a large work in several volumes, in folio, of which there is an abridgement in French. In this learned performance there is a full history of the canonization of saints in general, and of all the particular processes of that kind that are on record: an account is given of the manner of proceeding in these extraordinary trials; and it is shown, that, besides the assistance of providence, which is implored and expected in what is so much connected with religion, all prudent human means are made use of, in order to avoid mistakes, and to obtain all the evidence of which the matter is susceptible, and which must appear more than sufficient to every impartial judge. See PORE, POPERY, &c.

SAINT Catharine, a Portuguese island in the South sea, not far distant from the coast of Brazil. It was visited by La Prouse, who ascertained it to lie between $27^{\circ} 19' 10''$ and $27^{\circ} 49'$ N. Lat. and its most northerly point to lie in $49^{\circ} 49'$ W. Long. from Paris. Its breadth from east to west is only six miles, and it is separated from the main land by a channel only about 200 fathoms broad. On the point stretching farthest into this channel is situated the city of Nostra Señora del Destero, the metropolis of the government, and the place of the governor's residence. It contains about 400 houses, and 3000 inhabitants, and has an exceedingly pleasant appearance. In the year 1712, this island served as a retreat to vagabonds, who effected their escape from different parts of the Brazils, being only nominal subjects of Portugal. Its whole population has been estimated at 20,000. The soil is extremely fertile, producing all sorts of fruit, vegetables, and corn, almost spontaneously. The whale fishery is very successful; but it is the property of the crown, and is farmed by a company at Lisbon, which has three considerable establishments upon the coast. Every year they kill about 400 whales, the produce of which, both oil and spermaceti, is sent to Lisbon by the way of Rio Janeiro. The inhabitants are idle spectators of this fishery, from which they derive not the smallest advantage. A very amiable picture, however, is given of their hospitality to strangers, by M. La Prouse.

SAINY-Foin, a species of hedysarum. See HEDYSARUM, Botany Index, and AGRICULTURE Index.

SAINTES, an ancient and considerable town of France, in the department of Lower Charente. Before the revolution, it was a bishop's see. It contained likewise several convents, a Jesuits college, and an abbey remarkable for its steeple, which is said to be one of the loftiest in France. It is seated on an eminence, 37 miles south-east of Rochelle, and 262 south-south-west of Paris. W. Long. 0. 38. N. Lat. 45. 54. The cas-

tle is seated on a rock, and is reckoned impregnable. The population in 1800 was 10,162.

This city was a Roman colony; and those conquerors of the earth, who polished the nations they subdued, have left behind them the traces of their magnificence. In a hollow valley between two mountains, and almost adjoining to one of the suburbs, are the ruins of the amphitheatre. Though now in the last stage of decay, its appearance is august and venerable. In some parts, scarcely any of the arches are to be seen; but the east end is still in a great degree of preservation. From its situation in a valley, and from the ruins of an aqueduct which conveyed water to the town from near three leagues distance, it has been supposed that Naumachie were represented in it; but this amounts only to conjecture. A triumphal arch, on which is an inscription in Roman letters, merits likewise attention. It was erected to Germanicus, on the news of his death, so universally lamented throughout the empire. The river Charente surrounds this city, as the Severn does that of Shrewsbury, describing the form of a horse-shoe.

Except the remains of Roman grandeur yet visible at Saintes, the place contains very little to detain or amuse a traveller. It is built with great irregularity; the streets are narrow and winding, the houses mean, and almost all of them are some centuries old. The cathedral has been repeatedly defaced and destroyed by Normans and Huguenots, who made war alike on every monument of art or piety. One tower only escaped their rage, which is said to have been built as early as the year 800 by Charlemagne. It is of an enormous magnitude, both as to height and circumference. These circumstances have probably conduced more to its preservation during the fury of war, than any veneration for the memory of its founder, or for the sanctity of its institution.

SAINTOGNE, a province of France, now forming with the province of Aunis the department of Lower Charente, is bounded on the east by Angoumois and Perigord, on the north by Poitou and the territory of Aunis, on the west by the ocean, and on the south by Bourdelois and Giron, about 62 miles in length and 30 in breadth. The river Charente runs through the middle of it, and renders it one of the finest and most fertile provinces in France, abounding in all sorts of corn and fruits: and it is said the best salt in Europe is made here.

THE SAINTS, are three small islands, three leagues distant from Guadaloupe, which form a triangle, and have a tolerable harbour. Thirty Frenchmen were sent hither in 1648, but were soon driven away by an excessive drought, which dried up their only spring before they had time to make any reservoirs. A second attempt was made in 1652, and permanent plantations were established, which now yield 50,000 weight of coffee, and 100,000 of cotton.

SAJENE, a Russian measure of length, equal to about seven English feet.

SAKRADAWENDRA is the name of one of the Ceylonese deities, who commands and governs all the rest, and formerly answered the prayers of his worshippers; but according to the fabulous account which is given of him, the golden chair on which he sat, and the foot of which was made of wax, that was softened by their prayers and tears, and sunk downward, so that

Saintes
Sakradawendra.

he could take notice of their requests and relieve them, being disposed of among the poor, they no longer derive any benefit from him, or pay him any reverence.

See BUDUN.

SAL. See SALT.

SALADIN, a famous sultan of Egypt, equally renowned as a warrior and legislator. He supported himself by his valour, and the influence of his amiable character, against the united efforts of the chief Christian potentates of Europe, who carried on the most unjust wars against him, under the false appellation of *Holy Wars*. See the articles EGYPT and CROISADE.

SALAMANCA, an ancient, large, rich, and populous city of Spain, in the kingdom of Leon, situated on the river Tormes, about 75 miles west from Madrid. It is said to have been founded by Teucer the son of Telamon, who called it *Salamis* or *Salman-tica*, in memory of the ancient Salamis. Here is an university, the greatest in Spain, consisting of 24 colleges, and perhaps inferior to none in the whole world, in respect at least to its revenues, buildings, number of scholars, and masters. Here are also many grand and magnificent palaces, squares, convents, &c. Of the colleges in the university, four are appropriated to young men of quality; and near it is an infirmary for poor sick scholars. In the neighbourhood of this town a battle was fought on the 21st July 1812, between the British army under Lord Wellington, and the French army under Marshal Marmont, in which the latter was defeated with the loss of 7000 prisoners, and a vast number killed and wounded. The British loss amounted to 700 killed, and 4000 wounded. W. Long. 6. 10. N. Lat. 41. 0.

SALAMANDER. See LACERTA, ERPETOLOGY Index.

SALAMIS, an island of the Archipelago, situated in E. Long. 34. 0. N. Lat. 37. 32.—It was famous in antiquity for a battle between the Greek and Persian fleets. In the council of war held among the Persians on this occasion, all the commanders were for engaging, because they knew this advice to be most agreeable to the king's inclinations. Queen Artemisia was the only person who opposed this resolution. She was queen of Halicarnassus; and followed Xerxes in this war with five ships, the best equipped of any in the fleet, except those of the Sidonians. This princess distinguished herself on all occasions by her singular courage, and still more by her prudence and conduct. She represented, in the council of war we are speaking of, the dangerous consequence of engaging a people that were far more expert in maritime affairs than the Persians; alleging, that the loss of a battle at sea would be attended with the ruin of their army; whereas, by spinning out the war, and advancing into the heart of Greece, they would create jealousies and divisions among their enemies, who would separate from one another in order to defend each of them their own country; and that the king might, almost without striking a blow, make himself master of Greece. This advice, though very prudent, was not followed, but an engagement unanimously resolved upon. Xerxes, in order to encourage his men by his presence, caused a throne to be erected on the top of an eminence, whence he might safely behold whatever happened; having several scribes about him, to write down the names of such as should signalize themselves against the enemy. The approach of the Persian fleet,

with the news that a strong detachment from the army was marching against Cleombrotus, who defended the isthmus, struck such a terror into the Pelopponesians, that they could not by any intreaties be prevailed upon to stay any longer at Salamis. Being therefore determined to put to sea, and sail to the isthmus, Themistocles privately dispatched a trusty friend to the Persian commanders, informing them of the intended flight; and exhorting them to send part of their fleet round the island, in order to prevent their escape. The same messenger assured Xerxes, that Themistocles, who had sent him that advice, designed to join the Persians, as soon as the battle began, with all the Athenian ships. The king giving credit to all he said, immediately caused a strong squadron to sail round the island in the night, in order to cut off the enemy's flight. Early next morning, as the Pelopponesians were preparing to set sail, they found themselves encompassed on all sides by the Persian fleet; and were against their will obliged to remain in the straits of Salamis and expose themselves to the same dangers with their allies. The Grecian fleet consisted of 380 sail, that of the Persians of 2000 and upwards. Themistocles avoided the engagement till a certain wind, which rose regularly every day at the same time, and which was entirely contrary to the enemy, began to blow. As soon as he found himself favoured by this wind, he gave the signal for battle. The Persians, knowing that they fought under their king's eye, advanced with great resolution; but the wind blowing directly in their faces, and the largeness and number of their ships embarrassing them in a place so strait and narrow, their courage soon abated; which the Greeks observing, used such efforts, that in a short time breaking into the Persian fleet, they entirely disordered them; some flying towards Phalarus where their army lay encamped; others saving themselves in the harbours of the neighbouring islands. The Ionians were the first that betook themselves to flight. But Queen Artemisia distinguished herself above all the rest, her ships being the last that fled: which Xerxes observing, cried out that the men behaved like women, and the women with the courage and intrepidity of men. The Athenians were so incensed against her, that they offered a reward of 10,000 drachmas to any one that should take her alive: but she, in spite of all their efforts, got clear of the ships that pursued her, and arrived safe on the coast of Asia. In this engagement, which was one of the most memorable actions we find recorded in history, the Grecians lost 40 ships; and the Persians 200, besides a great many more that were taken, with all the men and ammunition they carried.

The island of Salamis is of a very irregular shape; it was reckoned 70 or 80 stadia, *i. e.* 8 or 10 miles, long, reaching westward as far as the mountains called *Kerata*, or *The Horns*. Pausanias informs us, that on one side of this island stood in his time a temple of Diana, and on the other a trophy for a victory obtained by Themistocles, together with the temple of Cy-chreus, the site of which is now thought to be occupied by the church of St Nicholas.

The city of Salamis was demolished by the Athenians, because in the war with Cassander it surrendered to the Macedonians, from disaffection. In the second century, when it was visited by Pausanias, some ruins of the Agora or market-place remained, with a temple and image of Ajax; and not far from the port was shown a stone,

Salamis
||
Sale.

on which, they related, Telamon sat to view the Salaminian ships on their departure to join the Grecian fleet at Aulis. The walls may still be traced, and it has been conjectured were about four miles in circumference. The level space within them was now covered with green corn. The port is choked with mud, and was partly dry. Among the scattered marbles are some with inscriptions. One is of great antiquity, before the introduction of the Ionic alphabet. On another, near the port, the name of Solon occurs. This renowned lawgiver was a native of Salamis, and a statue of him was erected in the market-place, with one hand covered by his vest, the modest attitude in which he was accustomed to address the people of Athens. An inscription on black marble was also copied in 1676 near the ruin of a temple, probably that of Ajax. The island of Salamis is now inhabited by a few Albanians, who till the ground. Their village is called *Ampelaki*, "the Vineyard," and is at a distance from the port, standing more inland. In the church are marble fragments and some inscriptions.

SALARY, a recompense or consideration made to a person for his pains and industry in another man's business. The word is used in the statute 23 Edw. III. cap. 1. *Salarium* at first signified the rents or profits of a *salle*, hall, or house (and in Gascoigne they now call the seats of the gentry *sala's*, as we do *halls*); but afterwards it was taken for any wages, stipend, or annual allowance.

SALACIA, a genus of plants belonging to the *gynandria* class. See *BOTANY Index*.

SALE, is the exchange of a commodity for money; barter, or permutation, is the exchange of one commodity for another. When the bargain is concluded, an obligation is contracted by the buyer to pay the value, and by the seller to deliver the commodity, at the time and place agreed on, or immediately, if no time be specified.

In this, as well as other mercantile contracts, the safety of commerce requires the utmost good faith and veracity. Therefore, although by the laws of England, a sale above the value of 10*l.* be not binding, unless earnest be paid, or the bargain confirmed by writing, a merchant would lose all credit who refused to perform his agreement, although these legal requisites were omitted.

When a specific thing is sold, the property, even before delivery, is in some respect vested in the buyer; and if the thing perishes, the buyer must bear the loss. For example, if a horse dies before delivery, he must pay the value: but if the bargain only determines the quantity and quality of the goods, without specifying the identical articles, and the seller's warehouse, with all his goods, be burned, he is intitled to no payment. He must also bear the loss if the thing perish through his fault; or when a particular time and place of delivery is agreed on, if it perish before it be tendered in terms of the bargain.

If a person purchase goods at a shop without agreeing for the price, he is liable for the ordinary market-price at the time of purchase.

If the buyer proves insolvent before delivery, the seller is not bound to deliver the goods without payment or security.

If the importation, or use of the commodities sold,

be prohibited by law, or if the buyer knows that they were smuggled, no action lies for delivery.

The property of goods is generally presumed, in favour of commerce, to belong to the possessor, and cannot be challenged in the hands of an onerous purchaser. But to this there are some exceptions. By the Scots law, stolen goods may in all cases be reclaimed by the proprietor, and also by the English law, unless they were bought *bona fide* in open market; that is, in the accustomed public places, on stated days, in the country, or in a shop in London; and horses may be reclaimed, unless the sale be regularly entered by the book-keeper of the market. In all cases, if the goods be evicted by the lawful proprietor, the seller is liable to the purchaser for the value.

Actions for payment of shop-accounts, as well as other debts not constituted by writing, are limited in England to six years. The testimony of one witness is admitted; and the seller's books, although the person that kept them be dead, are good evidence for one year. In Scotland, merchants' books may be proved within three years of the date of the last article, by one witness, and the creditors' books and oath in supplement. After three years, they can only be proved by the oath or writ of the debtor. A merchant's books are in all cases good evidence against him.

SALEP, in the *Materia Medica*, the dried root of a species of orchis. See *ORCHIS*, *BOTANY Index*.

Several methods of preparing salep have been proposed and practised. Geoffroy has delivered a very judicious process for this purpose in the *Histoire de l'Academie Royale des Sciences*, 1740; and Retmus, in the *Swedish Transactions*, 1764, has improved Geoffroy's method. But Mr Moulton of Rochdale has lately favoured the public with a new manner of curing the orchis root; by which salep is prepared, at least equal, if not superior, to any brought from the Levant. The new root is to be washed in water; and the fine brown skin which covers it is to be separated by means of a small brush, or by dipping the root in hot water, and rubbing it with a coarse linen cloth. When a sufficient number of roots have been thus cleaned, they are to be spread on a tin-plate, and placed in an oven heated to the usual degree, where they are to remain six or ten minutes, in which time they will have lost their milky whiteness, and acquired a transparency like horn, without any diminution of bulk. Being arrived at this state, they are to be removed, in order to dry and harden in the air, which will require several days to effect; or by using a very gentle heat, they may be finished in a few hours.

Salep thus prepared, may be afforded in those parts of England where labour bears a high value, at about eightpence or tenpence per pound: and it might be sold still cheaper, if the orchis were to be cured, without separating from it the brown skin which covers it; a troublesome part of the process, and which does not contribute to render the root either more palatable or salutary; whereas the foreign salep is now sold at five or six shillings per pound.

Salep is said to contain the greatest quantity of vegetable nourishment in the smallest bulk. Hence a very judicious writer, to prevent the dreadful calamity of famine at sea, has lately proposed that the powder of it should constitute part of the provisions of every ship's company.

Sale,
Salep.

salep. company. This powder and portable soup, dissolved in boiling water, form a rich thick jelly, capable of supporting life for a considerable length of time. An ounce of each of these articles, with two quarts of boiling water, will be sufficient subsistence for a man a-day; and as being a mixture of animal and vegetable food, must prove more nourishing than double the quantity of rice-cake, made by boiling rice in water: which last, however, sailors are often obliged solely to subsist upon for several months; especially in voyages to Guinea, when the bread and flour are exhausted, and the beef and pork, having been salted in hot countries, are become unfit for use.

flour, salt, and yeast. The flour amounted to two pounds, the yeast to two ounces, and the salt to 80 grains. The loaf when baked was remarkably well fermented, and weighed three pounds two ounces. Another loaf, made with the same quantity of flour, &c. weighed two pounds and 12 ounces; from which it appears that the salep, though used in so small a proportion, increased the gravity of the loaf six ounces, by absorbing and retaining more water than the flour alone was capable of. Half a pound of flour and an ounce of salep were mixed together, and the water added according to the usual method of preparing bread. The loaf when baked weighed 13 ounces and a half; and would probably have been heavier if the salep had been previously dissolved in about a pint of water. But it should be remarked, that the quantity of flour used in this trial was not sufficient to conceal the peculiar taste of the salep.

“ But as a wholesome nourishment (says Dr Percival*), rice is much inferior to salep. I digested several alimentary mixtures prepared of mutton and water, beat up with bread, sea-biscuit, salep, rice-flower, sago-powder, potato, old cheese, &c. in a heat equal to that of the human body. In 48 hours they had all acquired a vinous smell, and were in brisk fermentation, except the mixture with rice, which did not emit many air-bubbles, and was but little changed. The third day several of the mixtures were sweet, and continued to ferment; others had lost their intestine motion, and were sour; but the one which contained the rice was become putrid. From this experiment it appears, that rice as an aliment is slow of fermentation, and a very weak corrector of putrefaction. It is therefore an improper diet for hospital-patients; but more particularly for sailors in long voyages; because it is incapable of preventing, and will not contribute much to check, the progress of that fatal disease, the sea scurvy. Under certain circumstances, rice seems disposed, of itself, without mixture, to become putrid; for by long keeping it sometimes acquires an offensive fetor. Nor can it be considered as a very nutritive kind of food, on account of its difficult solubility in the stomach. Experience confirms the truth of this conclusion; for it is observed by the planters in the West Indies, that the negroes grow thin, and are less able to work, whilst they subsist upon rice.

“ Salep has the singular property of concealing the taste of salt water; a circumstance of the highest importance at sea, when there is a scarcity of fresh water. I dissolved a dram and a half of common salt in a pint of the mucilage of salep, so liquid as to be potable, and the same quantity in a pint of spring water. The salep was by no means disagreeable to the taste, but the water was rendered extremely unpalatable. This experiment suggested to me the trial of the orchis root as a corrector of acidity, a property which would render it a very useful diet for children. But the solution of it, when mixed with vinegar, seemed only to dilute like an equal proportion of water, and not to cover its sharpness. Salep, however, appears by my experiments to retard the acetous fermentation of milk; and consequently would be a good lithing for milk-pottage, especially in large towns, where the cattle being fed upon sour draff must yield accscent milk.

“ Salep in a certain proportion, which I have not yet been able to ascertain, would be a very useful and profitable addition to bread. I directed one ounce of the powder to be dissolved in a quart of water, and the mucilage to be mixed with a sufficient quantity of

“ The restorative, mucilaginous, and demulcent qualities of the orchis root, render it of considerable use in various diseases. In the sea scurvy it powerfully obtunds the acrimony of the fluids, and at the same time is easily assimilated into a mild and nutritious chyle. In diarrhœas and the dysentery it is highly servicable, by sheathing the internal coat of the intestines, by abating irritation, and gently correcting putrefaction. In the symptomatic fever, which arises from the absorption of pus from ulcers in the lungs, from wounds, or from amputation, salep used plentifully is an admirable demulcent, and well adapted to resist the dissolution of the crasis of the blood, which is so evident in these cases. And by the same mucilaginous quality, it is equally efficacious in the strangury and dysury; especially in the latter, when arising from a venereal cause, because the discharge of urine is then attended with the most exquisite pain, from the ulceration about the neck of the bladder and through the course of the urethra. I have found it also an useful aliment for patients who labour under the stone or gravel.” The ancient chemists appear to have entertained a very high opinion of the orchis root, as appears from the *secretæ secretorum* of Raymund Lully, a work dated 1565.

SALERNO, an ancient and considerable town of Italy, in the kingdom of Naples, and capital of the Hither Principato, with an archbishop's see, a castle, harbour, and an university chiefly for medicine. It is seated at the bottom of a bay of the same name. E. Long. 14. 53. N. Lat. 40. 35.

SALET, in *War*, a light covering or armour for the head, anciently worn by the light-horse, only different from the casque in that it had no crest and was little more than a bare cap.

SALIENT, in *Fortification*, denotes projecting. There are two kinds of angles, the one salient, which have their points outwards; the other, re-entering, which have their points inwards.

SALIENT, SALIENT, or SAILLANT, in *Heraldry*, is applied to a lion, or other beast, when its fore-legs are raised in a leaping posture.

SALIC, or SALIQUE, LAW, (*Lex Salica*), an ancient and fundamental law of the kingdom of France, usually supposed to have been made by Pharamond, or at least by Clovis; in virtue of which males only are to inherit.

Salic
||
Salino.

Some, as Postellus, would have it to have been called *Salic*, q. d. *Galic*, because peculiar to the Gauls. For Montanus insists, it was because Pharamond was at first called *Salicus*. Others will have it to be so named, as having been made for the salic lands. These were noble fiefs which their first kings used to bestow on the salians, that is, the great lords of their salic or court, without any other tenure than military service; and for this reason, such fiefs were not to descend to women, as being by nature unfit for such a tenure. Some, again, derive the origin of this word from the Saliens, a tribe of Franks that settled in Gaul in the reign of Julian, who is said to have given them lands on condition of their personal service in war. He even passed the conditions into a law, which the new conquerors acquiesced in, and called it *salic*, from the name of their former countrymen.

SALICORNIA, JOINTED GLASS-WORT, or *Saltwort*; a genus of plants belonging to the monandria class, and in the natural method ranking under the 12th order, *Holoracea*. See BOTANY INDEX.

The inhabitants near the sea-coasts where these plants grow, cut them up toward the latter end of summer, when they are fully grown; and, after having dried them in the sun, they burn them for their ashes, which are used in making glass and soap. These herbs are by the country people called *kelp*, and promiscuously gathered for use.

SALII, in Roman antiquity, priests of Mars, whereof there were 12, instituted by Numa, wearing painted, particoloured garments, and high bonnets; with a steel cuirasse on the breast. They were called *salii*, from *sallare*, "to dance;" because, after assisting at sacrifices, they went dancing about the streets, with bucklers in their left hand, and a rod in their right, striking musically with their rods on one another's bucklers, and singing hymns in honour of the gods.

SALINO, one of the Lipari islands, situated between Sicily and Italy, consists of two mountains, both in an high state of cultivation. The one lying more towards the north than the other is rather the highest of the two, and is called *del Capo*, "the head." The other is called *della Fossa felice*, or the "happy valley." One third of the extent of these hills from the bottom to the summit is one continued orchard, consisting of vines, olive, fig, plum, apricot, and a vast diversity of other trees. The white roofs of the houses, which are everywhere interspersed amid this diversity of verdure and foliage, contribute to variegate the prospect in a very agreeable manner. The back part of almost all the houses is shaded by an arbour of vines, supported by pillars of brick, with cross poles to sustain the branches and foliage of the vines. Those arbours shelter the houses from the rays of the sun, the heat of which is quite scorching in these southern regions. The vines are extremely fruitful; the poles bending under the weight of the grapes.

The scenes in this island are more interesting to the lover of natural history than to the antiquarian. See RETICULUM.

On the south side of the island, however, there are still to be seen some fine ruins of an ancient bath, a Roman work. They consist of a wall 10 or 11 fathoms in extent, and terminating in an arch of no great height,

of which only a small part now remains. The building seems to have been reduced to its present state rather by the ravages of men than the injuries of time. Almost all the houses in the island are built of materials which have belonged to ancient monuments. The ancients had, in all probability, baths of fresh as well as of salt water in this island; for whenever the present inhabitants have occasion for a spring of fresh water, they have only to dig a pit on the shore, and pure sweet water flows in great abundance.

There were formerly mines of alum here, from which the inhabitants drew a very considerable yearly revenue. But whether they are exhausted, or whatever circumstance may have caused them to be given up, they are now no longer known. The island abounds in a variety of fruits.

On the east side it is very populous. There are two places which are both called *Lingua*, "the tongue," and which contain a good number of inhabitants; the one is near Salino, the other is distinguished by the name of *St Marina*: there are, besides these, two other villages. All these places together may contain about 4000 inhabitants: the circumference of the island may be about 14 miles.

SALISBURY, the capital of the county of Wiltshire in England, situated in W. Long. 1. 55. N. Lat. 51. 3. This city owed its first rise to its cathedral, which was begun in 1219, and finished in 1258. According to an estimate delivered in to Henry III., it cost forty thousand merks. It is a Gothic building, and is certainly the most elegant and regular in the kingdom. The doors and chapels are equal in number to the months, the windows to the days, and the pillars and pilasters to the hours in a year. It is built in the form of a lantern, with a spire in the middle, and nothing but buttresses and glass windows on the outside. The spire is the highest in the kingdom, being 410 feet, which is twice the height of the Monument in London. The pillars and pilasters in the church are of fusile marble; the art of making which is now either entirely lost or little known. This magnificent church has lately undergone most beautiful alterations; with an addition of two fine windows, and an organ presented by the king. The roof of the chapter house, which is 50 feet in diameter and 150 in circumference, bears entirely upon one slender pillar, which is such a curiosity as can hardly be matched in Europe. The turning of the western road through the city in the reign of Edward III. was a great advantage to it. The chancellorship of the most noble order of the Garter, which is annexed to this see, was first conferred on Bishop Richard Beauchamp. The hospital of St Michael's, near this city, was founded by one of its bishops. Dr Seth Ward, bishop of this see in the reign of Charles II., contributed greatly to the making the river Avon navigable to Christ-church in Hampshire. The same prelate, in 1683, built an hospital for the entertainment of the widows of poor clergymen. There are three other churches besides the cathedral, which is without the liberty of the city, and a greater number of boarding schools, especially for young ladies, than in any other town in England. Here is a manufacture of druggets, flannels, bonelace, and those cloths called *Salisbury whites*; in consideration of which, and its fairs, markets, assizes, boarding-

Salino
||
Salisbury.

ix. **Salisbury.** boarding-schools, and clergy, the city may be justly said to be in a flourishing condition. It was incorporated by Henry III.; and is governed by a mayor, high-steward, recorder, deputy-recorder, 24 aldermen, and 30 assistants or common-council men. The number of souls, in 1811, was 8243. A new council chamber, with proper courts of justice, was built here in the year 1794 by the earl of Radnor; to which Mr Hussey was also a great benefactor. That quarter called the *Close*, where the canons and prebendaries live, is like a fine city of itself. In this town are several charity-schools; the expense of one of them is entirely defrayed by the bishop. The city gives title of earl to the noble family of Cecil.

SALISBURY Plain. The extensive downs in Wiltshire, which are thus denominated, form in summer one of the most delightful parts of Great Britain for extent and beauty. It extends 28 miles west of Weymouth, and 25 east to Winchester; and in some places is near 40 miles in breadth. That part about Salisbury is a chalky down, and is famous for feeding numerous flocks of sheep. Considerable portions of this tract are now enclosing, the advantages of which are so great, that it is hoped the whole will undergo so beneficial a change. This plain contains, beside the famous Stonehenge, numerous other remains of antiquity.

SALIVA, is that fluid by which the mouth and tongue are continually moistened in their natural state; and is supplied by glands which form it, that are called *salivary glands*. This humour is thin and pellucid, incapable of being concreted by the fire, almost without taste and smell. By chewing, it is expressed from the glands which separate it from the blood, and is intimately mixed with our food, the digestion of which it greatly promotes. In hungry persons it is acrid, and copiously discharged; and in those who have fasted long it is highly acrid, penetrating, and resolvent. A too copious evacuation of it produces thirst, loss of appetite, bad digestion, and an atrophy.

SALIVATION, in *Medicine*, a promoting of the flux of saliva, by means of medicines, mostly by mercury. The chief use of salivation is in diseases belonging to the glands and membrana adiposa, and principally in the curc of the venereal disease; though it is sometimes also used in epidemic diseases, cutaneous diseases, &c. whose crises tend that way.

SALIX, the **WILLOW**, a genus of plants belonging to the diœcia class; and in the natural method ranking under the 50th order, *Amentaceæ*. See **BOTANY Index**.

Willow trees have been frequently the theme of poetical description, both in ancient and modern times. In Virgil, Horace, and in Ovid, we have many exquisite allusions to them and their several properties; and for a melancholy lover or a contemplative poet, imagination cannot paint a fitter retreat than the banks of a beautiful river, and the shade of a drooping willow. The *Babylonica*, *Babylonian pendulous salix*, commonly called *weeping willow*, grows to a large size, having numerous, long, slender, pendulous branches, hanging down loosely all round in a curious manner, and long, narrow, spear-shaped, serrated, smooth leaves. This curious willow is a native of the east, and is retained in our hardy plantations for ornament; and exhibits a most agreeable variety, particularly when disposed singly by

the verges of any piece of water, or in spacious openings of grass ground.

All the species of salix are of the tree kind, very hardy, remarkably fast growers, and several of them attaining a considerable stature when permitted to run up to standards. They are mostly of the aquatic tribe, being generally the most abundant and of most prosperous growth in watery situations: they however will grow freely almost anywhere, in any common soil and exposure; but grow considerably the fastest and strongest in low moist land, particularly in marshy situations, by the verges of rivers, brooks, and other waters; likewise along the sides of watery ditches, &c.; which places often lying waste, may be employed to good advantage, in plantations of willows, for different purposes.

SALLEE, an ancient and considerable town of Africa in the kingdom of Fez, with a harbour and several forts. The harbour of Sallee is one of the best in the country; and yet, on account of a bar that lies across it, ships of the smallest draught are forced to unload and take out their guns before they can get into it. There are docks to build ships; but they are hardly ever used, for want of skill and materials. It is a large place, divided by the river Guero into the Old and New Towns. It has long been famous for its rovers or pirates, which make prizes of all Christian ships that come in their way, except there is a treaty to the contrary. The town of Sallee in its present state, though large, presents nothing worthy the observation of the traveller, except a battery of 24 pieces of cannon fronting the sea, and a redoubt at the entrance of the river, which is about a quarter of a mile broad, and penetrates several miles into the interior country. W. Long. 6. 30. N. Lat. 34. 0.

SALLET, or **SALAD**, a dish of eatable herbs, ordinarily accompanying roast meat; composed chiefly of crude fresh herbage, seasoned with salt, oil, and vinegar.

Menage derives the word from the Latin *salata*; of *sal*, "salt;" others from *salcedo*; Du-Cange from *salgama*, which is used in Ausonius and Columella in the same sense.

Some add mustard, hard eggs, and sugar; others, pepper, and other spices, with orange-peel, saffron, &c.

The principal sallet-herbs, and those which ordinarily make the basis of our English sallets, are lettuce, celery, endive, cresses, radish, and rape; along with which, by way of furniture, or additional, are used purslane, spinach, sorrel, tarragon, burnet, corn-sallet, and chervil.

The gardeners call some plants *small herbs* in sallets; these should always be cut while in the seed-leaf: as cresses, mustard, radish, turnip, spinach, and lettuce; all which are raised from seeds sown in drills, or lines, from the middle of February to the end of March, under glasses or frames; and thence to the middle of May, upon natural beds, warmly exposed; and during the summer heats in more shady places; and afterwards in September, as in March, &c.; and lastly, in the rigour of the winter, in hot-beds. If they chance to be frozen in very frosty weather, putting them in spring-water two hours before they are used, recovers them.

SALLO, **DENIS DE**, a French writer, famous for being

Sallo.
Sallustius.

being the projector of literary journals, was born at Paris in 1626. He studied the law, and was admitted a counsellor in the parliament of Paris in 1652. It was in 1664 he schemed the plan of the *Journal des Sçavans*; and the year following began to publish it under the name of Sieur de Heronville, which was that of his valet de chambre. But he played the critic so severely, that authors, surprised at the novelty of such attacks, retorted so powerfully, that M. de Sallo, unable to weather the storm, after he had published his third Journal, declined the undertaking, and turned it over to the abbé Gallois; who, without presuming to criticise, contented himself merely with giving titles, and making extracts. Such was the origin of literary journals, which afterwards sprang up in other countries under different titles; and the success of them, under judicious management, is a clear proof of their utility. M. de Sallo died in 1669.

SALLUSTIUS, CAIUS CRISPUS, a celebrated Roman historian, was born at Amiternum, a city of Italy, in the year of Rome 669, and before Christ 85. His education was liberal, and he made the best use of it. His Roman history in six books, from the death of Sylla to the conspiracy of Catiline, the great work from which he chiefly derived his glory among the ancients, is unfortunately lost excepting a few fragments; but his two detached pieces of history which happily remain entire are sufficient to justify the great encomiums he has received as a writer.—He has had the singular honour to be twice translated by a royal hand: first by our Elizabeth, according to Camden; and secondly, by the present Infant of Spain, whose version of this elegant historian, lately printed in folio, is one of the most beautiful books that any country has produced since the invention of printing. No man has inveighed more sharply against the vices of his age than this historian; yet no man had fewer pretensions to virtue. His youth was spent in a most lewd and profligate manner; and his patrimony almost squandered away when he had scarcely taken possession of it. Marcus Varro, a writer of undoubted credit, relates, in a fragment preserved by Aulus Gellius, that Sallust was actually caught in bed with Fausta the daughter of Sylla, by Milo her husband; who scourged him very severely, and did not suffer him to depart till he had redeemed his liberty with a considerable sum. A. U. C. 694, he was made questor, and in 702 tribune of the people; in neither of which places is he allowed to have acquitted himself at all to his honour. By virtue of his questorship, he obtained an admission into the senate; but was expelled thence by the censors in 704, on account of his immoral and debauched way of life. In the year 705 Cæsar restored him to the dignity of a senator; and to introduce him into the house with a better grace, made him questor a second time. In the administration of this office he behaved himself very scandalously: exposed every thing to sale for which he could find a purchaser; and if we may believe the author of the invective, thought nothing wrong which he had a mind to do: *Nihil non venale habuerit, cujus aliquis emptor fuit, nihil non æquum et verum duxit, quod ipsi facere collibisset.* In the year 707, when the African war was at an end, he was made prætor for his services to Cæsar, and sent to Numidia. Here he acted the same part as Verres had done in Sicily; out-

rageously plundered the province; and returned with such immense riches to Rome that he purchased a most magnificent building upon Mount Quirinal, with those gardens which to this day retain the name of *Sallustian gardens*, besides his country house at Tivoli. How he spent the remaining part of his life we have no account from ancient writers. Eusebius tells us that he married Terentia, the divorced wife of Cicero; and that he died at the age of 50, in the year 710, which was about four years before the battle of Actium. Of the many things which he wrote, besides his histories of the Catilinarian and Jugurthine wars, we have some orations or speeches, printed with his fragments.

SALLY PORTS, in fortification, or *Postern Gates*, as they are sometimes called, are those under-ground passages which lead from the inner works to the outward ones; such as from the higher flank to the lower, or to the tenailles, or the communication from the middle of the curtain to the ravelin. When they are made for men to go through only, they are made with steps at the entrance and going out. They are about 6 feet wide and 8½ feet high. There is also a gutter or shore made under the sally-ports, which are in the middle of the curtains, for the water which runs down the streets to pass into the ditch; but this can only be done when they are wet ditches. When sally-ports serve to carry guns through them for the out-works, instead of making them with steps, they must have a gradual slope, and be 8 feet wide.

SALMASIUS, CLAUDIUS, a French writer of uncommon abilities and immense erudition, descended from an ancient and noble family, and born at or near Semur in 1596. His mother, who was a Protestant, infused her notions of religion into him, and he at length converted his father: he settled at Leyden; and in 1650 paid a visit to Christina queen of Sweden, who is reported to have shown him extraordinary marks of regard. Upon the violent death of Charles I. of England, he was prevailed on by the royal family, then in exile, to write a defence of that king; which was answered by our famous Milton in 1651, in a work intitled *Defensio pro Populo Anglicano contra Claudii Salmasii Defensionem Regiam.* This book was read over all Europe; and conveyed such a proof of the writer's abilities, that he was respected even by those who hated his principles. Salmasius died in 1653; and some did not scruple to say, that Milton killed him by the acuteness of his reply. His works are numerous, and of various kinds; but the greatest monuments of his learning are, his *Notæ in Historiæ Augustæ Scriptores*, and his *Exercitationes Plinianæ in Solinum.*

SALMO, the SALMON; a genus of fishes belonging to the order of abdonimals. See ICHTHYOLOGY *Index.*

SALMON. See SALMO, ICHTHYOLOGY *Index.*

SALMON-Fishery. See SALMON-FISHERY.

SALON, or SALOON, in architecture, a lofty, spacious sort of hall, vaulted at top, and usually comprehending two stories, with two ranges of windows.

The saloon is a grand room in the middle of a building, or at the head of a gallery, &c. Its faces, or sides, are all to have a symmetry with each other; and as it usually takes up the height of two stories, its ceiling, Daviler observes, should be with a moderate sweep.

Sallustius
Salon.

The saloon is a state room much used in the palaces in Italy; and from thence the mode came to us. Ambassadors, and other great visitors, are usually received in the saloon.

It is sometimes built square, sometimes round or oval, sometimes octagonal, as at Marly, and sometimes in other forms.

SALONA, a sea-port town of Dalmatia, seated on a bay of the gulf of Venice. It was formerly a very considerable place, and its ruins show that it was 10 miles in circumference. It is 18 miles north of Spalatto, and subject to Venice. It is now a wretched village, preserving few distinguishable remains of its ancient splendour. Doubtless the two last ages have destroyed all that had escaped the barbarity of the northern nations that demolished it. In a valuable MS. relation of Dalmatia, written by the senator Giambattista Guistiniani, about the middle of the 16th century, there is a hint of what existed at the time. "The nobility, grandeur, and magnificence of the city of Salona, may be imagined from the vaults and arches of the wonderful theatre, which are seen at this day; from the vast stones of the finest marble, which lie scattered on, and buried in the fields; from the beautiful column of three pieces of marble, which is still standing in the place where they say the arsenal was, towards the seashore; and from the many arches of surprising beauty, supported by very high marble columns: the height of the arches is a stone-throw, and above them there was an aqueduct, which reached from Salona to Spalatro. There are to be seen many ruins and vestiges of large palaces, and many ancient epitaphs may be read on fine marble stones; but the earth, which is increased, has buried the most ancient stones, and the most valuable things." E. Long. 17. 29. N. Lat. 24. 10.

SALONICHI, formerly called *Thessalonica*, a sea-port town of Turkey in Europe, and capital of Macedonia, with an archbishop's see. It is ancient, large, populous, and rich, being about 10 miles in circumference. It is a place of great trade, carried on principally by the Greek Christians and Jews, the former of which have 30 churches, and the latter as many synagogues; the Turks also have a few mosques. It is surrounded with walls flanked with towers, and defended on the land-side by a citadel, and near the harbour with three forts. It was taken from the Venetians by the Turks in 1431. The principal merchandise is silk. It is seated at the bottom of a gulf of the same name, partly on the top, and partly on the side of a hill, near the river Vardar. E. long. 23. 13. N. Lat. 40. 41.

SALSSES, a very strong castle of France, in Roussillon, on the confines of Languedoc. It was taken from the Spaniards by the French in 1642; and is seated on a lake of the same name, among mountains, 10 miles north of Perpignan. E. Long. 3. 0. N. Lat. 43. 35.

SALSETTE, an island of the East Indies, adjacent to Bombay, from which it is in one place divided only by a narrow pass fordable at low water. It is about 26 miles long, and eight or nine broad. The soil is rich, and by a proper cultivation capable of producing any thing that will grow in tropical climates. It is everywhere well watered, and when in the possession of the Portuguese furnished such quantities of rice, that it

was called the *Granary of Goa*. It abounds also in all kinds of provisions, and has great plenty of game, both of the four-footed and feathered kind. It has pretty high mountains; and there is a tradition that the whole was thrown up from the bottom of the sea: in confirmation of which it is said, that on the top of the highest hill there was found, some years ago, a stone anchor, such as was anciently used by the inhabitants of that country. Here we meet with the ruins of a place called *Canara*, where there are excavations of rocks, supposed to be contemporary with those of *Elephanta*. They are much more numerous, but not comparable to the former either in extent or workmanship.

The island of Salsette lately formed part of the Portuguese dominions in India. It ought to have been ceded to the English along with Bombay, as part of the dower of Catharine of Lisbon, espoused to Charles II. The fulfilment of this article, however, being evaded, the island remained in possession of the Portuguese; and notwithstanding the little care they took of it, the revenue of it was valued at 60,000*l*. Such was the negligence of the Portuguese government, that they took no care to fortify it against the attacks of the Mahrattas, from whose dominions Salsette was only separated by a very narrow pass fordable at low water. Here they had only a miserable redoubt of no consequence, till, on the appearance of an approaching war with the Mahrattas, they began to build another, which indeed would have answered the purpose of protecting the island, provided the Mahrattas had allowed them to finish it. This, however, was not their intention. They allowed them indeed to go on quietly with their works till they saw them almost completed, when they came and took possession of them. The Mahrattas thus became dangerous neighbours to the English at Bombay, until it was ceded to the latter by the treaty concluded with these people in 1780. E. Long. 72. 15. N. Lat. 19. 0.

SALSOLA, GLASS-WORT, a genus of plants belonging to the pentandria class; and in the natural method ranking under the 12th order, *Holoracea*. See *BOTANY Index*.

All the sorts of glass-wort are sometimes promiscuously used for making the sal kali, but it is the third sort which is esteemed best for this purpose. The manner of making it is as follows: Having dug a trench near the sea, they place laths across it, on which they lay the herb in heaps, and, having made a fire below, the liquor, which runs out of the herbs, drops to the bottom, which at length thickening, becomes sal kali, which is partly of a black, and partly of an ash-colour, very sharp and corrosive, and of a saltish taste. This, when thoroughly hardened, becomes like a stone; and in that state is transported to different countries, for making of glass.

SALT, one of the great divisions of natural bodies. The characteristic marks of salt have usually been reckoned its power of affecting the organs of taste, and of being soluble in water. But this will not distinguish salt from quicklime, which also affects the sense of taste, and dissolves in water; yet quicklime has been universally reckoned an earth, and not a salt. The only distinguishing property of salts, therefore, is their crystallization in water: but this does not belong to all salts; for the nitrous and marine acids, though allowed on all hands to be salts, are yet incapable of crystallization, at least

Salsette
||
Salt.

Salt.

least by any method hitherto known. Several of the imperfect neutral salts also, such as combinations of the nitrous, muriatic, and vegetable acids, with some kinds of earths, crystallize with very great difficulty. However, by the addition of spirit of wine, or some other substances which absorb part of the water, keeping the liquor in a warm place, &c. all of them may be reduced to crystals of one kind or other. Salt, therefore, may be defined a substance affecting the organs of taste, soluble in water, and capable of crystallization, either by itself or in conjunction with some other body; and, universally, every salt capable of being reduced into a solid form, is also capable of crystallization *per se*. Thus the class of saline bodies will be sufficiently distinguished from all others; for quicklime, though soluble in water, cannot be crystallized without addition either of fixed air or some other acid; yet it is most commonly found in a solid state. The precious stones, basaltes, &c. though supposed to be formed by crystallization, are nevertheless distinguished from salts by their insipidity and insolubility in water.

But acids and alkalies, and combinations of both, when in a concrete form, are salts, and of the purest form. Hence we conclude, that the bodies, to which the name of *salts* more properly belongs, are the concretions of those substances; which are accordingly called *acid salts*, *alkaline salts*, and *neutral salts*. These last are combinations of acid and alkaline salts, in such proportion as to render the compounds neither sour nor alkaline to the taste. This proportionate combination is called *saturation*: thus common kitchen salt is a neutral salt, composed of muriatic acid and soda combined together to the point of saturation. The appellation of *neutral salts* is also extended to denote all those combinations of acids, and any other substance with which they can unite, so as to lose, wholly or in great measure, their acid properties.

But although this general definition of salts is commonly received, yet there are many writers, especially mineralogists, who confine the denomination of *salts* in the manner we first mentioned, viz. to those substances only which, besides the general properties of salts, have the power of crystallizing, that is, of arranging their particles so as to form regular shaped bodies, called *crystals*, when the water superfluous to their concrete existence has been evaporated.

Common SALT, or *Sea Salt*, the name of that salt extracted from the waters of the ocean, which is used in greater quantities for preserving provisions, &c.

It is a perfect neutral salt, composed of marine or muriatic acid, saturated with mineral alkali. It has a saline but agreeable flavour. It requires about four times its weight of cold water to be dissolved, and nearly the same quantity of boiling water, according to Macquer. But according to Kirwan, it only requires 2.5 its weight of water to be dissolved in the temperature of sixty degrees of Fahrenheit. This salt always contains some part formed with a calcareous base; and, in order to have it pure, it must be dissolved in distilled

water; then a solution of mineral alkali is to be poured in it until no white precipitation appears; then by filtering and evaporating the solution, a pure common salt is produced. Its figure is perfectly cubic, and those hollow pyramids, or *tremies* as the French call them, as well as the parallelopedes formed sometimes in its crystallization, consist all of a quantity of small cubes, disposed in those forms. Its decrepitation on the fire, which has been reckoned by some as a characteristic of this salt, although the vitriolated tartar, nitrous lead, and other salts, have the same property, is owing chiefly to the water, and perhaps also to the air of its crystallization.

Its specific gravity is 2,120 according to Kirwan. The acid of tartar precipitates nothing from it. One hundred parts of common salt contain thirty-three of real acid, fifty of mineral alkali, and seventeen of water. It is commonly found in salt water, and salt springs, in the proportion of even thirty-six per cent. It is found also in coals, and in beds of gypsum. This salt is unalterable by fire, though it fuses, and becomes more opaque: nevertheless a violent fire, with the free access of air, causes it to evaporate in white flowers, which adhere to the neighbouring bodies. It is only decomposed, as Macquer affirms, by the sulphuric and nitric acids; and also by the boracic or sedative salt. But although nitre is decomposed very easily by arsenic, this neutral marine salt is nowise decomposed by the same. According to Monge, the fixed vegetable alkali, when caustic, decomposes all this marine salt. It preserves from corruption almost all sorts of animal food much better for use than any other salt, as it preserves them without destroying their taste and qualities; but when applied in too small a quantity, it then promotes putrefaction.

Of this most useful commodity there are ample stores on land as well as in the ocean. There are few countries which do not afford vast quantities of rock or fossil salt. Mines (A) of it have long been discovered and wrought in England, Spain, Italy, Germany, Hungary, Poland, and other countries of Europe. In several parts of the world, there are huge mountains which wholly consist of fossil salt. Of this kind are two mountains in Russia, nigh Astracan; several in the kingdoms of Tunis and Algiers, in Africa, and several also in Asia; and the whole island of Ormaus in the Persian gulf almost entirely consists of fossil salt. The new world is likewise stored with treasures of this useful mineral, as well as with all other kinds of subterranean productions. Moreover, the sea affords such vast plenty of common salt, that all mankind might thence be supplied with quantities sufficient for their occasions. There are also innumerable springs, ponds, lakes, and rivers, impregnated with common salt, from which the inhabitants of many countries are plentifully supplied therewith. In some countries which are remote from the sea, and have little commerce, and which are not blessed with mines of salt or salt-waters, the necessities of the inhabitants have forced them to invent a method of extracting

(A) Amongst the salt mines of chief note are those of Northwich in Cheshire, Altemonte in Calabria, Halle in Tyrol, Cardona in Catalonia: also those stupendous mines at Wilieczka in Poland, to be noticed in the sequel of this article, and Soowar in Upper Hungary; of which see accounts in Phil. Trans. N^o 61. and 413.

ting their common salt from the ashes of vegetables. The muriatic salt of vegetables was described by Dr Grew under the title of *lixivated marine salt*. Leeuwenhoek obtained cubical crystals of this salt from a lixivium of soda or kelp, and also from a solution of the lixivial salt of carduus benedictus; of which he hath given figures in a letter to the Royal Society, published in N^o 175. of their Transactions. Dr Dagner, in *Act. Acad. N. C.* vol. v. obs. 150, takes notice of great quantities of it which he found mixed in pot-ashes. And the ingenious Dr Fothergill extracted plenty of it from the ashes of fern: See *Medical Essays*, vol. v. article 13.

The muriatic salt which the excellent Mr Boyle extracted from sandiver, and supposed to be produced from the materials used in making glass, was doubtless separated from the kelp made use of in that process. Kunckel also informs us, that he took an alkaline salt; and after calcining it with a moderate fire, dissolved it in pure water, and placing the solution in a cool cellar, obtained from it many crystals of a neutral salt. He supposes that the alkaline salt was by the process converted into this neutral salt. But it is more reasonable to believe, that the alkaline salt which he applied was not pure, but mixed with the muriatic salt of vegetables, which by this process was only separated from it.

It is doubtless chiefly this muriatic salt which, in some of the inland parts of Asia, they extract from the ashes of duck-weed and of Adam's fig-tree, and use for their common salt.

That they are able in those countries to make common salt to profit from vegetables, ought not to be wondered at, since in Delhi and Agra, capitals of Indostan, salt is so scarce as usually to be sold for half-a-crown a pound. We may therefore give some credit to Marco Polo, when he informs us, that in the inner parts of the same quarter of the world, in the province of Caidu, lying west of Tibet, the natives used salt instead of money, it being first made up in cakes, and sealed with the stamp of their prince; and that they made great profit of this money by exchanging it with the neighbouring nations for gold and musk. We are also told by Ludolfus, in his *Historia Aethiopiae*, that in the country of the Abyssines there are mountains of salt, the which when dug out is soft, but soon grows hard; and that this salt serves them instead of money to buy all things. The same is confirmed by Ramusio.

Mr Boyle discovered common salt in human blood and urine. "I have observed it (says Mr Brownrigg), not only in human urine, but also in that of dogs, horses, and black cattle. It may easily be discovered in these, and many other liquids impregnated with it, by certain very regular and beautiful starry figures which appear in their surfaces after congelation. These figures I first observed in the great frost in the year 1739. The dung of such animals as feed upon grass or grain, doth also contain plenty of common salt."

Naturalists, observing the great variety of forms under which this salt appears, have thought fit to rank the several kinds of it under certain general classes; distinguishing it, most usually, into rock or fossil salt, sea-salt, and brine or fountain salt. To which classes, others might be added, of those muriatic salts which are found in vegetable and animal substances. These sc-

veral kinds of common salt often differ from each other in their outward form and appearance, or in such accidental properties as they derive from the heterogeneous substances with which they are mixed. But when perfectly pure, they have all the same qualities; so that chemists, by the exactest inquiries, have not been able to discover any essential difference between them; for which reason we shall distinguish common salt after a different manner, into the three following kinds, viz. into rock or native salt, bay salt, and white salt.

By *rock salt*, or *native salt*, is understood all salt dug out of the earth, which hath not undergone any artificial preparation. Under the title of *bay salt* may be ranked all kinds of common salt extracted from the water wherein it is dissolved, by means of the sun's heat, and the operation of the air; whether the water from which it is extracted be sea water, or natural brine drawn from wells and springs, or salt water stagnating in ponds and lakes. Under the title of *white salt*, or *boiled salt*, may be included all kinds of common salt extracted by coction from the water wherein it is dissolved; whether this water be sea water, or the salt water of wells, fountains, lakes or rivers; or water of any sort impregnated with rock-salt, or other kinds of common salt.

The first of these kinds of salt is in several countries found so pure, that it serves for most domestic uses, without any previous preparation (trituration excepted); for of all natural salts rock-salt is the most abundantly furnished by nature in various parts of the world, being found in large masses, occupying great tracts of land. It is generally found in strata under the surface of the earth, as in Hungary, Muscovy, Siberia, Poland, Calabria, Egypt, Ethiopia, and the East Indies. "In England (says Magellan), the salt mines at Northwich are in a high ground, and contain it in layers or strata of various colours, of which the yellow and brown are the most plentiful, as I have observed on the spot, which I visited in June 1782, in company with my worthy and learned friend Mr Volta, professor of natural philosophy in the university of Pavia, and well known by his great abilities, and many discoveries in that branch of knowledge. The mine into which we descended was excavated in the form of a vast dome or vault under ground, supported by various columns of the salt, that were purposely left to support the incumbent weight. And the workmen having lighted a number of candles all round its circumference, it furnished us with the most agreeable and surprising sight, whilst we were descending in the large tub, which serves to bring up the lumps that are broken from the mine," &c.

Wraxall gives the following description of the famous salt mines near Cracow in Poland.

"After being let down (says he) by a rope to the *Memoirs* depth of 230 feet, our conductors led us through galle-^{of the}ries, which, for loftiness and breadth, seemed rather to *Courts of* resemble the avenues to some subterraneous palace, than *Berlin,* passages cut in a mine. They were perfectly dry in every *Dresden,* part, and terminated in two chapels composed entirely *Warsaw,* of salt, hewn out of the solid mass. The images which *and Vienna.* adorn the altars, as well as the pillars and ornaments, were all of the same transparent materials; the points and spars of which reflecting the rays of light from the lamps which the guides held in their hands, produced an effect equally novel and beautiful. Descending low-

Salt.

er into the earth by means of ladders, I found myself in an immense hall or cavern of salt, many hundred feet in height, length, and dimensions, the floor and sides of which were cut with exact regularity. A thousand persons might dine in it without inconvenience, and the eye in vain attempted to trace or define its limits. Nothing could be more sublime than this vast subterranean apartment, illuminated by flambeaux, which faintly discover its prodigious magnitude, and leave the imagination at liberty to enlarge it indefinitely. After remaining about two hours and a half under ground, I was drawn up again in three minutes with the greatest facility."

See also an account of the same mines by Mr Bernard, *Journal de Physique*, vol. xvi. for 1780, in which the miraculous tales concerning those subterranean habitations, villages, and towns, are reduced to their proper magnitude and estimate.

The English fossil salt is unfit for the uses of the kitchen, until by solution and coction it is freed from several impurities, and reduced into white salt. The British white salt also is not so proper as several kinds of bay-salt for curing fish and such flesh-meats as are intended for sea provisions, or for exportation into hot countries. So that for these purposes we are obliged, either wholly or in part, to use bay salt, which we purchase in France, Spain, and other foreign countries.

However, it does not appear that there is any other thing requisite in the formation of bay salt than to evaporate the sea water with an exceedingly gentle heat; and it is even very probable, that our common sea-salt by a second solution and crystallization might attain the requisite degree of purity. Without entering into any particular detail of the processes used for the preparation of bay-salt in different parts of the world, we shall content ourselves with giving a brief account of the best methods of preparing common salt.

At some convenient place near the sea-shore is erected the saltern. This is a long, low building, consisting of two parts; one of which is called the *fore-house*, and the other the *pan-house*, or *boiling-house*. The fore-house serves to receive the fuel, and cover the workmen; and in the boiling-house are placed the furnace, and pan in which the salt is made. Sometimes they have two pans, one at each end of the saltern; and the part appropriated for the fuel and workmen is in the middle.

The furnace opens into the fore-house by two mouths, beneath each of which is a mouth to the ash-pits. To the mouths of the furnace, doors are fitted; and over them a wall is carried up to the roof, which divides the fore-house from the boiling-house, and prevents the dust of the coal and the ashes and smoke of the furnace from falling into the salt pan. The fore-house communicates with the boiling-house by a door placed in the wall which divides them.

The body of the furnace consists of two chambers, divided from each other by a brick partition called the *midfeather*; which from a broad base terminates in a narrow edge nigh the top of the furnace; and by means of short pillars of cast iron erected upon it, supports the bottom of the salt pan; it also fills up a considerable part of the furnace, which otherwise would be too large, and would consume more coals than, by the help of this contrivance, are required. To each chamber of the

furnace is fitted a grate, through which the ashes fall into the ash-pits. The grates are made of long bars of iron, supported underneath by strong cross bars of the same metal. They are not continued to the farthest part of the furnace, it being unnecessary to throw in the fuel so far: for the flame is driven from the fire on the grate to the farthest part of the furnace; and from thence passes, together with the smoke, through two flues into the chimney; and thus the bottom of the salt pan is everywhere equally heated.

The salt pans are made of an oblong form, flat at the bottom, with the sides erected at right angles; the length of some of these pans is 15 feet, in breadth 12 feet, and the depth 16 inches; but at different works they are of different dimensions. They are commonly made of plates of iron, joined together with nails, and the joints are filled with a strong cement. Within the pan five or six strong beams of iron are fixed to its opposite sides, at equal distances, parallel to each other and to the bottom of the pan, from which they are distant about eight inches. From these beams hang down strong iron hooks, which are linked to other hooks or clasps of iron firmly nailed to the bottom of the pan; and thus the bottom of the pan is supported, and prevented from bending down or changing its figure. The plates most commonly used are of malleable iron, about four feet and a half long, a foot broad, and the third of an inch in thickness. The Scots prefer smaller plates, 14 or 15 inches square. Several make the sides of the pan, where they are not exposed to the fire, of lead; those parts, when made of iron, being found to consume fast in rust from the steam of the pan. Some have used plates of cast iron, five or six feet square, and an inch in thickness; but they are very subject to break when unequally heated, and shaken (as they frequently are) by the violent boiling of the liquor. The cement most commonly used to fill the joints is plaster made of lime.

The pan, thus formed, is placed over the furnace, being supported at the four corners by brick work; but along the middle, and at the sides and ends, by round pillars of cast iron called *taplins*, which are placed at three feet distance from each other, being about eight inches high, and at the top, where smallest, four inches in diameter. By means of these pillars the heat of the fire penetrates equally to all parts of the bottom of the pan, its four corners only excepted. Care is also taken to prevent the smoke of the furnace from passing into the boiling-house, by bricks and strong cement, which are closely applied to every part of the salt pan. In some places, as at Blyth in Northumberland, besides the common salt pans here described, they have a preparing pan placed between two salt pans, in the middle part of the building, which in other works is the fore-house. The sea-water being received into this preparing pan, is there heated and in part evaporated by the flame and heat conveyed under it through flues from the two furnaces of the salt pans. And the hot water, as occasion requires, is conveyed through troughs from the preparing pan into the salt pans. Various other contrivances have been invented to lessen the expense of fuel, and several patents have been obtained for that purpose; but the salt-boilers have found their old methods the most convenient.

Between the sides of the pan and walls of the boiling-

Salt.

ing-house, there runs a walk five or six feet broad, where the workmen stand when they draw the salt, or have any other business in the boiling-house. The same walk is continued at the end of the pan, next to the chimney; but the pan is placed close to the wall at the end adjoining to the fore-house.

The roof of the boiling-house is covered with boards fastened on with nails of wood, iron nails quickly mouldering into rust. In the roof are several openings, to convey off the watery vapours; and on each side of it a window or two, which the workmen open when they look into the pan whilst it is boiling.

Not far distant from the saltern, on the sea-shore, between full sea and low-water marks, they also make a little pond in the rocks, or with stones on the sand, which they call their *sump*. From this pond they lay a pipe, through which, when the tide is in, the sea-water runs into a well adjoining to the saltern; and from this well they pump it into troughs, by which it is conveyed into their ship or cistern, where it is stored up until they have occasion to use it.

The cistern is built close to the saltern, and may be placed most conveniently between the two boiling-houses, on the back side of the fore-house; it is made either of wood, or brick and clay; it sometimes wants a cover, but ought to be covered with a shed, that the salt water contained therein may not be weakened by rains, nor mixed with soot and other impurities. It should be placed so high, that the water may conveniently run out of it, through a trough, into the salt pans.

Besides the buildings already mentioned, several others are required; as storehouses for the salt, cisterns for the bittern, an office for his majesty's salt-officers, and a dwelling-house for the salt-boilers.

All things being thus prepared, and the sea-water having stood in the cistern till the mud and sand are settled to the bottom, it is drawn off into the salt-pan. And at the four corners of the salt-pan, where the flame does not touch its bottom, are placed four small lead pans, called *scratch pans*, which, for a salt pan of the size above mentioned, are usually about a foot and a half long, a foot broad, and three inches deep; and have a bow or circular handle of iron, by which they may be drawn out with a hook, when the liquor in the pan is boiling.

The salt pan being filled with sea-water, a strong fire of pit-coal is lighted in the furnace; and then, for a pan which contains about 400 gallons, the salt-boiler takes the whites of three eggs, and incorporates them well with two or three gallons of sea-water, which he pours into the salt pan while the water contained therein is only lukewarm; and immediately stirs it about with a rake, that the whites of eggs may everywhere be equally mixed with the salt water.

Instead of whites of eggs, at many salterns, as at most of those nigh Newcastle, they use blood from the butchers, either of sheep or black cattle, to clarify the sea-water: And at many of the Scots salterns they do not give themselves the trouble of clarifying it.

As the water grows hot, the whites of eggs separate from it a black frothy scum, which rises to the surface of the water, and covers it all over. As soon as the pan begins to boil, this scum is all risen, and it is then time to skim it off.

The most convenient instruments for this purpose are skimmers of thin ash boards, six or eight inches broad, and so long that they may reach above half way over the salt pan. These skimmers have handles fitted to them; and the salt-boiler and his assistant, each holding one of them on the opposite sides of the pan, apply them so to each other that they overlap in the middle, and beginning at one end of the pan, carry them gently forward together, along the surface of the boiling liquor, to the other end; and thus, without breaking the scum, collect it all to one end of the pan, from whence they easily take it out.

After the water is skimmed, it appears perfectly clear and transparent; and they continue boiling it briskly, till so much of the fresh or aqueous part is evaporated, that what remains in the pan is a strong brine almost fully saturated with salt, so that small saline crystals begin to form on its surface; which operation, in a pan filled 15 inches deep with water, is usually performed in five hours.

The pan is then filled up a second time with clear sea-water drawn from the cistern; and about the time when it is half filled, the scratch-pans are taken out, and being emptied of the scratch found in them, are again placed in the corners of the salt pan. The scratch taken out of these pans is a fine white calcareous earth found in the form of powder, which separates from the sea-water during its coction, before the salt begins to form into grains. This subtle powder is violently agitated by the boiling liquor, until it is driven to the corners of the pan, where the motion of the liquor being more gentle, it subsides into the scratch-pans placed there to receive it, and in them it remains undisturbed, and thus the greatest part of it is separated from the brine.

After the pan hath again been filled up with sea-water, three whites of eggs are mixed with the liquor, by which it is clarified a second time, in the manner before described; and it is afterwards boiled down to a strong brine as at first; which second boiling may take up about four hours.

The pan is then filled up a third time with clear sea-water; and after that, a fourth time; the liquor being each time clarified and boiled down to a strong brine, as before related; and the scratch-pans being taken out and emptied every time that the pan is filled up.

Then, at the fourth boiling, as soon as the crystals begin to form on the surface of the brine, then slacken the fire, and only suffer the brine to simmer, or boil very gently. In this heat they constantly endeavour to keep it all the time that the salt comes or granulates, which may be nine or ten hours. The salt is said to granulate, when its minute crystals cohere together into little masses or grains, which sink down in the brine, and lie at the bottom of the salt pan.

When most of the liquor is evaporated, and the salt thus lies in the pan almost dry on its surface, it is then time to draw it out. This part of the process is performed by raking the salt to one side of the pan into a long heap, where it drains a while from the brine, and is then filled out into barrows or other proper vessels, and carried into the store-house, and delivered into the custody of his majesty's officers. And in this manner the whole process is performed in 24 hours; the salt being usually drawn every morning.

Salt.

In the store-house the salt is put hot into drabs, which are partitions like stalls for horses, lined on three sides and at the bottom with boards, and having a sliding-board on the fore-side to put in or draw out as occasion requires. The bottoms are made shelving, being highest at the back-side, and gradually inclining forwards; by which means the saline liquor, which remains mixed with the salt, easily drains from it; and the salt, in three or four days, becomes sufficiently dry; and is then taken out of the drabs, and laid up in large heaps, where it is ready for sale.

The saline liquor which drains from the salt is not a pure brine of common salt, but hath a sharp and bitter taste, and is therefore called *bittern*: this liquor, at some works, they save for particular uses, at others throw away. A considerable quantity of this bittern is left at the bottom of the pan after the process is finished; which, as it contains much salt, they suffer to remain in the pan, when it is filled up with sea-water. But at each process this liquor becomes more sharp and bitter, and also increases in quantity: so that, after the third or fourth process is finished, they are obliged to take it out of the pan; otherwise it mixes in such quantities with the salt, as to give it a bitter taste, and disposes it to grow soft and run in the open air, and renders it unfit for domestic uses.

After each process there also adheres to the bottom and sides of the pan, a white stony crust, of the same calcareous substance with that before collected from the boiling liquor. This the operators call *stone-scratch*, distinguishing the other found in the lead-pans by the name of *powder-scratch*. Once in eight or ten days they separate the stone-scratch from their pans with iron picks, and in several places find it a quarter of an inch in thickness. If this stony crust is suffered to adhere to the pan much longer, it grows so thick that the pan is burnt by the fire, and quickly wears away.

In M. de Pagés's Travels round the World, we find the following important fact. "I had been anxious (says that author) to ascertain by comparison, whether sea-water contains salt in greater quantity under the torrid than under the other zones; and my experiments on this subject served to show, contrary to what I expected, that sea-water is impregnated with salt in less quantity within than without the tropics." These ex-

periments were made on a hundred pounds of sea-water, taken at the depth of ten fathoms, and weighed in water-scales. M. de Pagés has given a table of these experiments, from which it appears that 100lb. of sea-water in 46° 12' S. lat. gave 4½ lb. of salt; and in 1° 16' only 3½ lb.; and that in 74 N. lat. it gave 4¾ lb. and in 4° 22' only 3½ lb. these being the highest and lowest latitudes in which the experiments were made, and also the greatest and least quantities of salt.

Duty on SALT, is a distinct branch of his majesty's extraordinary revenue, and consists in an excise of 3s. 4d. per bushel imposed upon all salt, by several statutes of King William and other subsequent reigns. This is not generally called an excise, because under the management of different commissioners: but the commissioners of the salt-duties have, by statute 1 Ann. c. 21. the same powers, and must observe the same regulations, as those of other excises. This tax had usually been only temporary; but by statute 26 Geo II. c. 3. was made perpetual.

SALTASH, a sea-port town of Cornwall in England, situated on the river Tamar, having sufficient depth of water for large ships. Saltash is a borough town, sends two members to parliament, and contained 1478 inhabitants in 1811. It is distant 5 miles N. W. from Plymouth, 220 miles W. S. W. from London, and is in W. Long. 4. 6. N. Lat. 50. 24.

SALTCOATS, a sea-port town of Ayrshire in Scotland, and on the frith of Clyde, at the end of the 17th century consisted of only four houses, but contained 1684 inhabitants in 1811. It is now a great resort of strangers in summer as a watering-place, has a considerable trade in coal and salt, with a rope-yard, the manufacture of sail-cloth and ship-building. It is 30 miles from Glasgow, and 18 from Ayr, and in W. Long. 4. 37. N. Lat. 55. 41.

SALTS, effects of, in producing great degrees of cold. In the account of the remarkable effects of frigorific mixtures, in which saline bodies act so important a part, given in our article CHEMISTRY, some errors had crept in. These errors, through the liberal attention of Mr Walker of Oxford, whose researches on this subject have been carried farther than any other chemist, we are enabled to correct, by laying before our readers the following tables, most obligingly communicated to us by that gentleman.

Salt
||
Salts.

TABLES,

TABLES, exhibiting a collective View of all the Frigorific Mixtures contained in Mr Walker's Publication, 1808.

TABLE I.—This Table consists of Frigorific Mixtures, having the power of *generating* or *creating* cold, *without the aid of ice*, sufficient for all useful and philosophical purposes, in any part of the world, at any season.

Frigorific Mixtures, *without Ice*.

Mixtures.	Thermometer sinks.	Deg. of cold produced.
Muriate of ammonia 5 parts Nitrate of potash 5 Water 16	From +50° to +10°.	40
Muriate of ammonia 5 parts Nitrate of potash 5 Sulphate of soda 8 Water 16	From +50° to +4°.	46
Nitrate of ammonia 1 part. Water 1	From +50° to +4°.	46
Nitrate of ammonia 1 part Carbonate of soda 1 Water 1	From +50° to -7°.	57
Sulphate of soda 3 parts Diluted nitric acid 2	From +50° to -3°.	53
Sulphate of soda 6 parts Muriate of ammonia 4 Nitrate of potash 2 Diluted nitric acid 4	From +50° to -10°.	60
Sulphate of soda 6 parts Nitrate of ammonia 5 Diluted nitric acid 4	From +50° to -14°.	64
Phosphate of soda 9 parts Diluted nitric acid 4	From +50° to -12°.	62
Phosphate of soda 9 parts Nitrate of ammonia 6 Diluted nitric acid 4	From +50° to -21°.	71
Sulphate of soda 8 parts Muriatic acid 5	From +50° to 0°.	50
Sulphate of soda 5 parts Diluted sulphuric acid 4	From +50° to +3°.	47

N. B. If the materials are mixed at a warmer temperature, than that expressed in the table, the effect will be proportionably *greater*; thus, if the most powerful of these mixtures be made, when the air is - 85°, it will sink the thermometer to +2°.

TABLE II.

TABLE II.—This Table consists of Frigorific Mixtures, composed of *ice*, with chemical salts and acids.Frigorific Mixtures, *with ice*.

Mixtures.	Thermometer sinks.	Deg. of cold produced.
Snow, or pounded ice 2 parts Muriate of soda 1	From any Temperature to —50°	*
Snow, or pounded ice 5 parts Muriate of soda 2 Muriate of ammonia 1		* to —12°
Snow, or pounded ice 24 parts Muriate of soda 10 Muriate of ammonia 5 Nitrate of potash 5		* to —18°
Snow, or pounded ice 12 parts Muriate of soda 5 Nitrate of ammonia 5		* to —25°
Snow - - - 3 parts Diluted sulphuric acid 2	From +32° to —23°	55
Snow - - - 8 parts Muriatic acid - 5	From +32° to —27°	59
Snow - - - 7 parts Diluted nitric acid 4	From +32° to —30°	62
Snow - - - 4 parts Muriate of lime 5	From +32° to —40°	72
Snow - - - 2 parts Chryst. muriate of lime 3	From +32° to —50°	82
Snow - - - 3 parts Potash - - - 4	From +32° to —51°	83

N. B. The reason for the *omissions* in the last column of this table, is, the thermometer sinking in these mixtures to the degree mentioned in the preceding column, *and never lower*, whatever may be the temperature of the materials at mixing.

TABLE III.

TABLE III.—This Table consists of Frigorific Mixtures selected from the foregoing tables, and combined, so as to increase or extend cold to the extremest degrees.

Salt,
||
Salting.

Combinations of Frigorific Mixtures.

Mixtures.	Thermometer sinks.	Deg. of cold produced.
Phosphate of soda 5 parts Nitrate of ammonia 3 Diluted nitric acid 4	From 0° to —34°	34
Phosphate of soda 3 parts Nitrate of ammonia 2 Diluted mixed acids 4	From —34° to —50°	16
Snow 3 parts Diluted nitric acid 2	From 0° to —46°	46
Snow 8 parts Diluted sulphuric acid 3 } Diluted nitric acid 3 }	From —10° to —56°	46
Snow 1 part Diluted sulphuric acid 1	From —20° to —60°	40
Snow 3 parts Muriate of lime 4	From +20° to —48°	68
Snow 3 parts Muriate of lime 4	From +10° to —54°	64
Snow 2 parts Muriate of lime 3	From —15° to —68°	53
Snow 1 part Chryst. muriate of lime 2	From 0° to —66°	66
Snow 1 part Chryst. muriate of lime 3 parts	From —40° to —73°	33
Snow 8 parts Diluted sulphuric acid 10	From —68° to —91°	23

N. B. The materials in the first column are to be cooled, previously to mixing, to the temperature required, by mixtures taken from either of the preceding tables.

Triple SALTS, a kind of salts formed by the union of three ingredients; the common neutrals being composed only of two, as for instance, common alum, which is composed of sulphuric acid, alumina, and potash.

SALT-Mines. See SALT.

Rock-SALT. See SALT.

SALT-Water, or *Sea-water*, *Distillation of*. See *SEA-Water*.

Neutral-SALTS. See CHEMISTRY, *passim*.

SALT Springs. Of these there are great numbers in different parts of the world, which undoubtedly have their origin from some of the large collections of fossil salt mentioned under the article *Common SALT*. See that article, and likewise *SPRING*.

SALTIER, one of the honourable ordinaries—See *HERALDRY*.

This, says G. Leigh, in his *Accedence of Arms*, p. 70, was anciently made of the height of a man, and driven full of pins, the use of which was to scale walls, &c. Upton says it was an instrument to catch wild beasts, whence he derives this word from *saltus*, i. e. “a forest.” The French call this ordinary *sautoir*, from *sauter*, “to leap;” because it may have been used by soldiers to leap over walls of towns, which in former times were but low; but some modern authors think it is borne in imitation of St Andrew’s cross.

SALTING MEAT FOR THE USE OF THE NAVY. The following is the method recommended by the late Admiral

Salting.
Saltpetre.

Admiral Sir Charles Knowles. When the ox is killed, let it be skinned and cut up into pieces fit for use as quick as possible, and salted while the meat is hot. For which purpose we must have a sufficient quantity of saltpetre and bay salt pounded together and made hot in an oven, of each equal parts; with this sprinkle the meat at the rate of about two ounces to the pound; then lay the pieces on shelving boards to drain for 24 hours; which done, turn them and repeat the same operation, and let them lie for 24 hours longer. By this time the salt will be all melted, and have penetrated the meat, and the pieces be drained off; each piece must then be wiped dry with clean coarse cloths. A sufficient quantity of common salt must then be made hot likewise in an oven, and mixed when taken out with about one third of brown sugar; then the casks being ready, rub each piece well with this mixture, and pack them well down, allowing about half a pound of the salt and sugar to each pound of meat, and it will keep good several years.

It is best to proportion the casks to the quantity used at one time, as the less it is exposed to the air the better. The same process does for pork, only a larger quantity of salt and less sugar must be used; but the preservation of both depends equally upon the meat being hot when first salted.

One pound of beef requires two ounces of saltpetre and two ounces of bay-salt, because it is to be sprinkled twice; an ounce of each to a pound of beef both times. The saltpetre requisite for 100 lb. of beef is $12\frac{1}{2}$ lb. which at 12d. per lb. is 12s. 6d.; and the same quantity of bay-salt (for 100 lb. of beef), at three half-pence per lb. is 1s. 6d.; of brown sugar and common salt mixed together half a pound is required, the former in the proportion of one-third, the latter of two-thirds, to a pound of beef. The brown sugar at 8d. per pound. A hundred pounds of beef will take 250 ounces of it, which costs 10s. 5d. The quantity of common salt requisite for 100 lb. of beef is 533 ounces, which at 2d. per lb. amounts to 5s. 6d. The expense therefore will stand thus.

Saltpetre, $12\frac{1}{2}$ lb. for 100 lb. of beef, is	L.0	12	6
Bay-salt, $12\frac{1}{2}$ lb. for do. is	-	0	1
Brown sugar, 250 oz. for do. is	-	0	10
Beef, 100 lb. at 6d. per pound, is	-	2	10
Three casks for it at 1s. 6d. each,	-	0	4
Labour, and heating the oven twice,	-	0	4
Common salt, 533 oz. for do. is	-	0	5

L.4 8 5

These articles are taken high; and if beef costs 6d. per pound, meat cured thus will cost less than 1s. per pound; and therefore comes much cheaper than live-stock in long sea voyages.

SALTPETRE, or NITRE, (*nitrate of potash*), a compound of nitric acid and potash. See POTASH, CHEMISTRY *Index*. The importance of this salt in various manufactures renders every information relative to its production valuable. The following method has been long practised by the farmers of Appenzell in Switzerland. In so hilly a country, most houses and stables are built on slopes, one side of the edifice resting on the hill, and the other being supported by two strong posts, elevated two or three feet above the

ground; so that the air has a free current under the building. Immediately under the stable a pit is dug, usually occupying both in breadth and length the whole space of ground covered by the building; and instead of the clayey earth which is dug out, the pit is filled up with sandy soil. This is the whole process, and all the rest is done by nature. The animal water, which is continually oozing through the planks of the floor, having drenched the earth contained in the pit for the space of two or three years, the latter is emptied, and the saltpetre is refined and prepared in the usual manner.

That manner, however, is not the best; and the French chemists, during the incessant wars occasioned by the revolution, have, for the sake of supplying their armies with gunpowder, turned their attention to the best method of refining saltpetre. The following are directions given for this purpose by Chaptal, Champy, and Bonjour.

The crude saltpetre is to be beaten small with mallets, in order that the water may more easily attack every part of the mass. The saltpetre is then to be put into tubs, five or six hundred pounds in each tub. Twenty per cent. of water is to be poured into each tub, and the mixture well stirred. It must be left to macerate or digest until the specific gravity of the fluid ceases to augment. Six or seven hours are sufficient for this first operation, and the water acquires the density of between 25 and 35 degrees. (Sp. gr. 1.21, and 1.306, ascertained by Baumé's hydrometer.)

The first water must then be poured off, and a second portion of water must be poured on the same saltpetre amounting to 10 per cent.; after which the mixture must be stirred up, suffered to macerate for one hour, and the fluid drawn or poured off.

Five per cent. of water must then be poured on the saltpetre; and after stirring the whole, the fluid must be immediately drawn off.

When the water is drained from the saltpetre, the salt must be thrown into a boiler containing 50 per cent. of boiling water. When the solution is made, it will mark between 66 and 68 degrees of the hydrometer. (Sp. gr. 1.848, and 1.898).

The solution is to be poured into a proper vessel, where it deposits, by cooling, about two thirds of the saltpetre originally taken. The precipitation begins in about half an hour, and terminates in between four and six hours. But as it is of importance to obtain the saltpetre in small needles, because in this form it is more easily dried, it is necessary to agitate the fluid during the whole time of the crystallization. A slight motion is communicated to this liquid mass by a kind of rake; in consequence of which the crystals are deposited in very slender needles.

In proportion as the crystals fall down, they are scraped to the borders of the vessel, whence they are taken with a skimmer, and thrown to drain in baskets placed on tressels, in such a manner that the water which passes through may either fall into the crystallizing vessel, or be received in basins underneath.

The saltpetre is afterwards put into wooden vessels in the form of a mill-hopper or inverted pyramid with a double bottom. The upper bottom is placed two inches above the lower on wooden ledges, and has many small perforations through which water may pass to the

saltpetre. the lower bottom, which likewise affords a passage by one single aperture. A reservoir is placed beneath. The crystallized saltpetre is washed in these vessels with 5 per cent. of water; which water is afterwards employed in the solution of saltpetre in subsequent operations.

The saltpetre, after sufficient draining, and being dried by exposure to the air upon tables for several hours, may then be employed in the manufacture of gunpowder.

But when it is required to use the saltpetre in the speedy and immediate manufacture of gunpowder, it must be dried much more strongly. This may be effected in a stove, or more simply by heating it in a flat metallic vessel. For this purpose the saltpetre is to be put into the vessel to the depth of five or six inches, and heated to 40 or 50 degrees of the thermometer (or about 135° of Fahrenheit). The saltpetre is to be stirred for two or three hours, and dried so much that, when strongly pressed in the hand, it shall acquire no consistence, nor adhere together, but resemble a very fine dry sand. This degree of dryness is not required when the powder is made by pounding.

From these circumstances, we find that two saline liquids remain after the operation; (1) the water from the washing; and (2) that from the crystallizing vessels.

We have already remarked, that the washing of the saltpetre is performed in three successive operations, in which, upon the whole, the quantity of fluid made use of amounts to 35 per cent. of the weight of the crude saltpetre. These washings are established on the principle, that cold water dissolves the muriates of soda, and the earthy nitrates and muriates, together with the colouring principle, but scarcely attacks the nitrate of potash.

The water of these three washings therefore contains the muriate of soda, the earthy salts, the colouring principle, and a small quantity of nitrate of potash; the amount of which is in proportion to that of the muriate of soda, which determines its solution. The water of the crystallizing vessels contains a portion of the muriates of soda, and of the earthy salts which escaped the operation of washing, and a quantity of nitrate of potash, which is more considerable than that of the former solution. The waters made use of at the end of the operation, to whiten and wash the crystals deposited in the pyramidal vessel, contain nothing but a small quantity of nitrate of potash. These waters are therefore very different in their nature. The water of the washings is really a mother water. It must be collected in vessels, and treated with potash by the known processes. It must be evaporated to 66 degrees (or 1,848 sp. gr.), taking out the muriate of soda as it falls. This solution is to be saturated with 2 or 3 per cent. of potash, then suffered to settle, decanted, and poured into crystallizing vessels, where 20 per cent. of water is to be added to keep the whole of the muriate of soda suspended.

The waters which are thus obtained by treatment of the mother water may be mixed with the water of the first crystallization. From these the marine salt may be separated by simple evaporation; and the nitrate of potash, which they hold in solution, may be afterwards obtained by cooling. The small quantity of water made use of to wash and whiten the refined

saltpetre, contains nothing but the nitrate of potash: it may therefore be used in the solution of the saltpetre when taken from the tubs. Saltpetre.
Saltsburg.

From this description it follows, that a manufactory for the speedy refining of saltpetre ought to be provided with mallets or rammers for pounding the saltpetre; tubs for washing; a boiler for solution; a crystallizing vessel of copper or lead, in which the saltpetre is to be obtained by cooling; baskets for draining the saltpetre; scales and weights for weighing; hydrometers and thermometers, to ascertain densities and temperatures; rakes to agitate the liquor in the crystallizing vessel; skimmers to take out the crystals, and convey them to the baskets; syphons or hand-pumps to empty the boilers. The number and dimensions of these several articles must vary according to the quantity of saltpetre intended to be refined.

SALTSBURG, an archbishopric of Germany, in the circle of Bavaria, bounded on the east by Stiria and the Upper Austria, on the west by the county of Tyrol, on the north by the duchy of Bavaria, and on the south by the duchy of Carinthia and the bishopric of Brixen. It is said to be about 100 miles from east to west, and upwards of 60 from north to south. With respect to the soil, it is very mountainous, yielding, however, excellent pasturage, and, in consequence of that, abounding in cattle, and horses remarkable for their mettle and hardiness. This country is particularly noted for the great quantities of salt it produces, and its strong passes and castles. Here are also considerable mines of silver, copper, lead, iron, and lapis calaminaris, with quarries of marble, and a natural hot-bath. The principal rivers are the Salza, the Inn, the Ens, and Maer; which, as well as the lakes and other streams, are well stored with fish. The peasants here are all allowed the use of arms, and trained to military duty. There are no nobles in the country, and most of the lands belong to the clergy. The states consist of the prelates, the cities, and towns. Notwithstanding this country is under the power of a Popish ecclesiastic, and the violent, arbitrary, and oppressive manner in which the Protestants have always been treated, great numbers of them still remained in it till the year 1732, when no less than 30,000 of them withdrew from it, dispersing themselves in the several Protestant states of Europe, and some of them were even sent from Great Britain to the American colonies. Besides brass and steel wares, and all sorts of arms and artillery, there are manufactures of coarse cloth and linen here. The archbishop had many and great prerogatives: he was a prince of the empire, and perpetual legate of the holy see in Germany, of which he is also primate. He had the first voice in the diet of this circle, and next to the electors in that of the empire, in the college of princes, in which he and the archduke of Austria presided by turns. But his rights as a sovereign prince were lost when the territory was united to Austria in 1805. He had also the nomination to several bishoprics; and the canonicates that fall vacant in the months in which the popes, by virtue of the concordat, are allowed to nominate, are all in his gift. His suffragans are the bishops of Freysingen, Ratisbon, Brixen, Gurk, Chiemsee, Seckan, and Lavant; and of these, the four last are nominated, and even confirmed by him and not by the pope. His revenue was

Salzburg. said to amount to near 200,000*l.* a year, a great part of it arising from the salt-works. He was able to raise 25,000 men; but kept in constant pay, besides his guards, only one regiment, consisting of 1000 men. At his accession to the see, the archbishop paid 100,000 crowns to Rome for the pall. There is an order of knighthood here, instituted in 1711, in honour of St Rupert, who was the first bishop of Salzburg, about the beginning of the 8th century. This territory, which formerly was an independent principality, was united to Austria at the peace with France in 1805. At the peace of Presburg in 1809, she was compelled to cede Salzburg to Bavaria; but she regained it in 1815, and it now forms an integral part of the Austrian monarchy.

SALZBURG, the capital of a German archbishopric of the same name, and which takes its own from the river Salza, on which it stands, and over which it has a bridge. It is a very handsome place, well fortified, and the residence of the archbishop. The houses are high, and all built of stone: the roofs are in the Italian taste, and you may walk upon them. The castle here is very strong, and as strongly garrisoned, and well provided with provisions and warlike stores. The archbishop's palace is magnificent; and, in the area before it, is a fountain, esteemed the largest and grandest in Germany. The stables are very lofty; and the number of the horses usually kept by the archbishop is said to be upwards of 200. The city, of which one part stands on a steep rock, is well built, but the streets are narrow and badly paved. Besides the above mentioned, there are two other stately palaces belonging to the archbishop, one of which is called the *Nuebau*, and the other *Mirabella*. The latter of these has a very beautiful garden; and the number of trees in the orangery is so great, that Mr Keysler tells us, 20,000 oranges have been gathered from them in one year. The river Salza runs close by the walls of this garden. There are a great many other fine structures in the city, public and private, such as palaces, monasteries, hospitals, and churches. In the cathedral dedicated to St Rupert (the apostle of Bavaria, and a Scotchman by birth), all the altars are of marble of different kinds, and one of the organs has above 3200 pipes. The whole structure is extremely handsome. It is built of freestone in imitation of St Peter's at Rome. The portico is of marble, and the whole is covered with copper. Before the portico there is a large quadrangular place, with arches and galleries, in which is the prince's residence; and in the middle of this place there is a statue of the Virgin in bronze; it is a fine piece of art, but of an unnatural size. There are large areas encompassed with handsome buildings on both sides of the church. In the middle of that which is to the left, there is a most magnificent fountain of marble, and some valuable figures of gigantic size. There is likewise a fountain in that to the right, but it is not to be compared with the former one, and the Neptune of it makes but a very pitiful figure. This town contains many more excellent buildings and statues, which remind one that the borders of Italy are not far distant. The winter and summer riding schools here are noble structures. The university was founded in 1629, and committed to the care of the Benedictines. Besides it, there are two

colleges, in which the young noblemen are educated. **Salzburg** E. Long. 13. 0. Lat. 47. 45.

SALVADORA, a genus of plants belonging to the tetrandria class; and in the natural method ranking with those of which the order is doubtful. See **BOTANY Index**.

SALVAGE-MONEY, a reward allowed by the civil and statute law for the saving of ships or goods from the danger of the sea, pirates, or enemies.—Where any ship is in danger of being stranded, or driven on shore, justices of the peace are to command the constables to assemble as many persons as are necessary to preserve it; and, on its being preserved by their means, the persons assisting therein shall, in 30 days after, be paid a reasonable reward for their salvage; otherwise the ship or goods shall remain in the custody of the officers of the customs as a security for the same.

SALVATION, means the safety or preservation of any thing which is or has been in danger, and is generally used in a religious sense, when it means preservation from eternal death, or reception to the happiness of heaven, which is now offered to all men by the Christian religion upon certain conditions. The Hebrews but rarely make use of concrete terms as they are called, but often of abstracted. Thus, instead of saying that God saves them and protects them, they say that God is their salvation. Thus the word of salvation, the joy of salvation, the rock of salvation, the shield of salvation, the horn of salvation, &c. is as much as to say, The word that declares deliverance; the joy that attends the escaping a great danger; a rock where any one takes refuge, and where he may be in safety from his enemy; a buckler, that secures him from the arm of the enemy; a horn or ray of light, of happiness and salvation, &c. See **THEOLOGY**, &c.

SALVATOR ROSA. See **ROSA**.

SALVE REGINA, among the Romanists, the name of a Latin prayer, addressed to the Virgin, and sung after complines, as also upon the point of executing a criminal. Durandus says, it was composed by Peter bishop of Compostella. The custom of singing the *salve regina* at the close of the office was begun by order of St Dominic, and first in the congregation of Dominicans at Bologna, about 1237. Gregory IX. first appointed it to be general. St Bernard added the conclusion, *O dulcis! O pia*, &c.

SALVIA, **SAGE**, a genus of plants belonging to the digynia class; and in the natural method ranking under the 42d order, *Verticillata*. See **BOTANY Index**.

SALVIANUS, an ancient father of the Christian church, who flourished in the 5th century, and was well skilled in the sciences. It is said he lived in continence with his wife Palladia, as if she had been his sister; and that he was so afflicted at the wickedness of that age, that he was called the *Jeremiah of the fifth century*. He acquired such reputation for his piety and learning, that he was named the *master of the bishops*. He wrote a Treatise on Providence; another on Avarice; and some epistles, of which Baluze has given an excellent edition; that of Conrad Rittershusius, in 2 vols octavo, is also esteemed.

SALUTATION, the act of saluting, greeting, or paying respect and reverence to any one.

When men (writes the compiler of *L'Esprit des Usages*

Salutation. *Usages et des Coutumes*) salute each other in an amicable manner, it signifies little whether they move a particular part of the body, or practise a particular ceremony. In these actions there must exist different customs. Every nation imagines it employs the most reasonable ones; but all are equally simple, and none are to be treated as ridiculous. This infinite number of ceremonies may be reduced to two kinds; to reverences or salutations; and to the touch of some part of the human body. To bend and prostrate one's self to express sentiments of respect, appears to be a natural motion; for terrified persons throw themselves on the earth when they adore invisible beings. The affectionate touch of the person they salute, is an expression of tenderness. As nations decline from their ancient simplicity, much farce and grimace are introduced. Superstition, the manners of a people, and their situation, influence the modes of salutation; as may be observed from the instances we collect.

Modes of salutation have sometimes very different characters, and it is no uninteresting speculation to examine their shades. Many display a refinement of delicacy, while others are remarkable for their simplicity or for their sensibility. In general, however, they are frequently the same in the infancy of nations, and in more polished societies. Respect, humility, fear, and esteem, are expressed much in a similar manner; for these are the natural consequences of the organization of the body. These demonstrations become, in time, only empty civilities, which signify nothing. We shall notice what they were originally, without reflecting on what they are.

The first nations have no peculiar modes of salutation; they know no reverences, or other compliments, or they despise and disdain them. The Greenlanders laugh when they see an European uncover his head and bend his body before him whom he calls his superior. The islanders, near the Philippines, take the hand or foot of him they salute, and with it they gently rub their face. The Laplanders apply their nose strongly against that of the person they salute. Dampier says, that at New Guinea they are satisfied in placing on their heads the leaves of trees, which have ever passed for symbols of friendship and peace. This is at least a picturesque salute.

Other salutations are very incommodious and painful; it requires great practice to enable a man to be polite in an island situated in the straits of Sunda. Houtman tells us, they saluted him in this odd way: "They raised his left foot, which they passed gently over the right leg, and from thence over his face." The inhabitants of the Philippines bend their body very low, in placing their hands on their cheeks, and raising at the same time one foot in the air, with their knee bent. An Ethiopian takes the robe of another, and ties it about his own waist, so that he leaves his friend half naked. This custom of undressing on these occasions takes other forms; sometimes men place themselves naked before the person whom they salute; it is to show their humility, and that they are unworthy of appearing in his presence. This was practised before Sir Joseph Banks, when he received the visit of two female Otaheitanans. Their innocent simplicity, no doubt, did not appear immodest in the eyes of the *virtuoso*. Sometimes they only undress partially. The Japanese only take off

a slipper; the people of Arracan, their sandals in the street, and their stockings in the house. Salutation.

In the progress of time, it appears servile to uncover one's self. The grandees of Spain claim the right of appearing covered before the king, to show that they are not so much subjected to him as the rest of the nation; and (this writer observes) we may remark, that the English do not uncover their heads so much as the other nations of Europe. In a word, there is not a nation (observes the humorous Montaigne), even to the people who, when they salute, turn their backs on their friends, but that can be justified in their customs. It must be observed of the negroes, that they are lovers of ludicrous actions, and thus make all their ceremonies farcical. The greater part pull the fingers till they crack. Snelgrave gives an odd representation of the embassy which the king of Dahomy sent to him. The ceremonies of salutation consisted in the most ridiculous contortions. When two negro monarchs visit, they embrace in snapping three times the middle finger.

Barbarous nations frequently imprint on their salutations the dispositions of their character. When the inhabitants of Carnena (says Athenæus) would show a peculiar mark of esteem, they breathed a vein, and presented for the beverage of their friend the blood as it issued. The Franks tore hair from their head, and presented it to the person they saluted. The slave cut off his hair, and offered it to his master. The Chinese are singularly affected in their personal civilities; they even calculate the number of their reverences. These are their most remarkable postures. The men move their hands in an affectionate manner, while they are joined together on the breast, and bow their head a little. If they respect a person, they raise their hands joined, and then lower them to the earth in bending the body. If two persons meet after a long separation, they both fall on their knees, and bend the face to the earth; and this ceremony they repeat two or three times. Surely we may differ here with the sentiment of Montaigne, and confess this ceremony to be ridiculous. It arises from their national affectation. They substitute artificial ceremonies for natural actions. Their expressions mean as little as their ceremonies. If a Chinese is asked how he finds himself in health? he answers, *Very well; thanks to your abundant felicity*. If they would tell a man that he looks well, they say, *Prosperity is painted on your face; or Your air announces your happiness*. If you render them any service, they say, *My thanks should be immortal*. If you praise them, they answer, *How shall I dare to persuade myself of what you say of me?* If you dine with them, they tell you at parting, *We have not treated you with sufficient distinction*. The various titles they invent for each other it would be impossible to translate.

It is to be observed, that all these answers are prescribed by the Chinese ritual, or academy of compliments. There are determined the number of bows; the expressions to be employed; the genuflections, and the inclinations which are to be made to the right or left hand; the salutations of the master before the chair where the stranger is to be seated, for he salutes it most profoundly, and wipes the dust away with the skirts of his robe; all these and other things are noticed, even to the silent gestures, by which you are entreated to enter the house. The lower class of people are equally

Salutation,
Salute.

nice in these punctilios; and ambassadors pass 40 days in practising them before they are enabled to appear at court. A tribunal of ceremonies has been erected, and every day very odd decrees are issued, to which the Chinese most religiously submit.

The marks of honour are frequently arbitrary; to be seated, with us, is a mark of repose and familiarity; to stand up, that of respect. There are countries, however, in which princes will only be addressed by persons who are seated, and it is considered as a favour to be permitted to stand in their presence. This custom prevails in despotic countries. A despot cannot suffer without disgust the elevated figure of his subjects: he is pleased to bend their bodies with their genius: his presence must lay those who behold him prostrate on the earth: he desires no eagerness, no attention; he would only inspire terror.

The pope makes no reverence to any mortal except the emperor, to whom he stoops a very little when he permits him to kiss his lips.

SALUTE, in military matters, a discharge of artillery, or small arms, or both, in honour of some person of extraordinary quality. The *colours* likewise salute royal persons, and generals commanding in chief; which is done by lowering the point to the ground. In the field, when a regiment is to be reviewed by the king or his general, the drums beat a march as he passes along the line, and the officers salute one another, bowing their half-pikes or swords to the ground; then recover and take off their hats. The ensigns salute all together, by lowering their colours.

SALUTE, in the navy, a testimony of deference or homage rendered by the ships of one nation to another, or by ships of the same nation to a superior or equal.

This ceremony is variously performed, according to the circumstances, rank, or situation, of the parties. It consists in firing a certain number of cannon, or volleys of small arms; in striking the colours or top-sails; or in one or more general shouts of the whole ship's crew, mounted on the masts or rigging for that purpose.

The principal regulations with regard to salutes in the royal navy are as follows.

“When a flag-officer salutes the admiral and commander in chief of the fleet, he is to give him fifteen guns; but when captains salute him, they are to give him seventeen guns. The admiral and commander in chief of the fleet is to return two guns less to flag-officers, and four less to captains. Flag-officers saluting their superior or senior officer, are to give him thirteen guns. Flag-officers are to return an equal number of guns to flag-officers bearing their flags on the same mast, and two guns less to the rest, as also to captains.

“When a captain salutes an admiral of the white or blue, he is to give him fifteen guns; but to vice and rear admirals, thirteen guns. When a flag officer is saluted by two or more of his majesty's ships, he is not to return the salute till all have finished, and then to do it with such a reasonable number of guns as he shall judge proper.

“In case of the meeting of two squadrons, the two chiefs only are to exchange salutes. And if single ships meet a squadron consisting of more than one flag, the principal flag only is to be saluted. No salute shall be

repeated by the same ships, unless there has been a separation of six months at least.

“None of his majesty's ships of war, commanded only by captains, shall give or receive salutes from one another, in whatsoever part of the world they meet.

“A flag-officer commanding in chief shall be saluted upon his first hoisting his flag, by all the ships present, with such a number of guns as is allowed by the first, third, or fifth articles.

“When any of his majesty's ships shall meet with any ship or ships belonging to any foreign prince or state, within his majesty's seas (which extend to Cape Finisterre), it is expected, that the said foreign ships do strike their top-sail, and take in their flag, in acknowledgement of his majesty's sovereignty in those seas: and if any shall refuse or offer to resist, it is enjoined to all flag-officers and commanders to use their utmost endeavours to compel them thereto, and not suffer any dishonour to be done to his majesty. And if any of his majesty's subjects shall so much forget their duty, as to omit striking their top-sail in passing by his majesty's ships, the name of the ship and master, and from whence, and whither bound, together with affidavits of the fact, are to be sent up to the secretary of the admiralty, in order to their being proceeded against in the admiralty court. And it is to be observed, that in his majesty's seas, his majesty's ships are in nowise to strike to any; and that in other parts, no ship of his majesty's is to strike her flag or top-sail to any foreigner, unless such foreign ship shall have first struck, or at the same time strike, her flag or top-sail to his majesty's ship.

“The flag-officers and commanders of his majesty's ships are to be careful to maintain his majesty's honour upon all occasions, giving protection to his subjects, and endeavouring, what in them lies, to secure and encourage them in their lawful commerce; and they are not to injure, in any manner, the subjects of his majesty's friends and allies.

“If a foreign admiral meet with any of his majesty's ships, and salutes them, he shall receive gun for gun. If he be a vice-admiral, the admiral shall answer with two guns less. If a rear-admiral, the admiral and vice-admiral shall return two less. But if the ship be commanded by a captain only, the flag-officer shall give two guns less, and captains an equal number.

“When any of his majesty's ships come to an anchor in a foreign port or road, within cannon-shot of its forts, the captain may salute the place with such a number of guns as have been customary, upon good assurance of having the like number returned, but not otherwise. But if the ship bears a flag, the flag-officer shall first carefully inform himself how flags of like rank, belonging to other crowned heads, have given or returned salutes, and to insist upon the same terms of respect.

“It is allowed to the commanders of his majesty's ships in foreign parts, to salute the persons of any admirals, commanders in chief, or captains of ships of war of foreign nations, and foreign noblemen, or strangers of quality, as also the factories of the king's subjects, coming on board to visit the ship; and the number of guns is left to the commander, as shall be suitable to the occasion and the quality of the persons visiting; but he is nevertheless to remain accountable for any excesses in the abuse of this liberty. If the ship visited be in com-

Salute.

pany with other ships of war, the captain is not to make use of the civilities allowed in the preceding articles but with leave and consent of the commander in chief or the senior captain.

“ Merchant-ships, whether foreigners or belonging to his majesty’s subjects, saluting the admiral of the fleet, shall be answered by six guns less ; when they salute any other flag-ships, they shall be answered by four guns less ; and if they salute men of war commanded by captains, they shall be answered by two guns less. If several merchant-ships salute in company, no return is to be made till all have finished, and then by such a number of guns as shall be thought proper ; but though the merchant-ships should answer, there shall be no second return.

“ None of his majesty’s ships of war shall salute any of his majesty’s forts or castles in Great Britain or Ireland, on any pretence whatsoever.”

SALUZZO, called by the French *Saluces*, a town and castle of Italy, in Piedmont, and capital of a marquisate of the same name, with a bishop’s see. It is situated on an eminence at the foot of the Alps near the river Po, in E. Long. 7. 29. N. Lat. 44. 33, and is subject to the king of Sardinia.

SALUZZO, the marquisate of, a province of Piedmont in Italy, bounded on the north by Dauphiny, and the province of the Four Valleys, on the east by those of Savigliano and Fossano, on the south by that of Cona and the county of Nice, and on the west by Barcelonetta. It was ceded to the duke of Savoy in 1601.

SAMA, a town and fort in the hands of the Dutch on the Gold Coast of Africa, stands on an eminence, the fort being watered by the pleasant river of St George, that discharges itself into the sea. The town contains above 200 houses, which seem to form three distinct villages, one of which is immediately under the cannon of the Dutch fort St Sebastian. Des Marchais deems this town to be one of the largest on the whole coast, Barbot likewise agreeing with him in its situation, extent, and number of inhabitants. The sole employment of the natives is fishing ; a circumstance which easily accounts for their poverty. The government of this place is republican, the magistrates having the supreme power, being subject to periodical changes, and under the authority of the king of Gavi, who seldom however interferes in the affairs of the state. This prince resides some leagues distant from the sea, is rich, and much respected by his neighbours.

SAMANEANS, in antiquity, a kind of magi or philosophers, have been confounded by some with the Bramins. They proceeded from Ariana, a province of Persia, and the neighbouring countries, spread themselves in India, and taught new doctrines.

The Bramins, before their arrival, it is said, were in the highest period of their glory, were the only oracles of India, and their principal residence was on the banks of the Ganges, and in the adjacent mountains ; while the Samaneans were settled towards the Indus. Others say, that the Bramins acquired all their knowledge from the Samaneans, before whose arrival it would be difficult to prove that the Bramins were the religious teachers of the Indians. The most celebrated and ancient of the Samanean doctors was Boutta, or Budda, who

was born 683 years before Christ. His scholars paid him divine honours ; and his doctrine, which consisted chiefly in the transmigratio of souls, and in the worship of cows, was adopted not only in India, but also in Japan, China, Siam, and Tartary. It was propagated according to M. de Sainte Croix, in Thibet, in the 8th century, and succeeded there the ancient religion of Zamolxis. The Samaneans, or Buddists, were entirely destroyed in India by the jealous rage of the Bramins, whose absurd practices and fables they affected to treat with contempt ; but several of their books are still preserved and respected on the coasts of Malabar.

We are told, too, that several of the Bramin orders have adopted their manner of living, and openly profess the greatest part of their doctrines. *L’Ezour Vedam, ou Ancien Comment du Vedam*, published by M. de S. Croix, Paris 1779. See BRAMINS.

SAMAR, a Spanish island not far from Manilla in the East Indies, is called *Samar* on the side which looks towards the other isles, and *Ibabao* on that next the ocean. Its greatest length, from Cape Baliqaton, which, with the point of Manilla, makes the strait of St Bernardino, in 13 deg. 30 min. north latitude, extends to that of Guignan in 11 deg. towards the south. The other two points, making the greatest breadth of the island, are Cabo de Spirito Santo, or *Cape of the Holy Ghost*, the high mountains of which are the first discovered by ships from New Spain ; and that which lying opposite to Leyte westward, makes another strait, scarce a stone’s throw over. The whole compass of the island is about 130 leagues. Between Guignan and Cape Spirito Santo is the port of Borognon, and not far from thence those of Palapa and Catubig, and the little island of Bin, and the coast of Catarman. Vessels from countries not yet discovered are very frequently cast away on the before-mentioned coast of Palapa. Within the straits of St Bernardino, and beyond Baliqaton, is the coast of Samar, on which are the villages of Ibatan, Bangalon, Cathalogan, Paranos, and Calviga. Then follows the strait of St Juanillo, without which, standing eastward, appears the point and little island of Guignan, where the compass of the island ends. It is mountainous and craggy, but the few plains which it contains are very fertile. The fruits are much the same as those of LEYTE ; but there is one particular sort, called by the Spaniards *chicoy*, and by the Chinese, who put a great value on it, *seyzu*, without kernels.

SAMARA, a genus of plants belonging to the tetrandria class. See BOTANY Index.

SAMARCAND, or SARMACAND, an ancient and famous town of Asia, capital of the kingdom of the same name in the country of the Usbeck Tartars, with a castle and a famous university. The houses are built with stones, and it carries on a trade in excellent fruits. It is pleasantly seated near the river Sogde, a branch of the Amu. E. Long. 69. 0. N. Lat. 39. 50. This town was the capital of the kingdom of Sogdia in the time of Alexander the Great, when it was called *Maracanda*. It was afterwards the capital of the empire of Tamerlane the Great. In the time of Jenghis Khan, it was forced to yield to the arms of that cruel conqueror ; by whom the garrison, amounting to 30,000 men, were butchered ; 30,000 of the inhabitants, with their wives,

and

and children, were presented to his generals; the rest were permitted to live in the city, on paying a tribute of 300,000 dinars or crowns of gold.

SAMARIA, in *Ancient Geography*, one of the three larger Cisjordan districts, situated in the middle between Galilee to the north and Judea to the south, beginning at the village Ginæa, in the Campus Magnus, and ending at the toparchy called *Acrobatena* (Josephus). Its soil differing in nothing from that of Judea; both equally hilly and campaign, both equally fertile in corn and fruit (ib.). Called the *kingdom of Samaria in Ephraim* (Bible); comprising the ten tribes, and consequently all the country to the north of Judea and east and west of Jordan.

SAMARIA, the capital city of the kingdom of Samaria, or of the ten tribes. It was built by Omri king of Israel, who began to reign in the year of the world 3079, and died 3086 (1 Kings xvi. 24.). He bought the hill Samaria of Shemer for two talents of silver or for the sum of 684*l.* 7*s.* 6*d.* It took the name of *Samaria* from Shemer the owner of the hill; though some think there were already some beginnings of a city, because, before the reign of Omri, there is mention made of Samaria (1 Kings xiii. 32.) in the year of the world 3030. But others take this for a prolepsis, or an anticipation, in the discourse of the man of God, who speaks of Samaria under the reign of Jeroboam.

However this be, it is certain that Samaria was no considerable place, and did not become the capital city of the kingdom of Israel till after the reign of Omri. Before him, the kings of Israel dwelt at Shechem, or Tirzah. Samaria was situated upon an agreeable and fruitful hill, in an advantageous situation, and was 12 miles from Dothaim, 12 from Merrom, and four from Atharoth. Josephus says, it was a day's journey from Jerusalem. Besides, though it was built upon an eminence, yet it must have water in abundance: since we find medals struck in this city, whereon is represented the goddess Astarte treading a river under foot; which proves it to have been well watered. And Josephus observes, that when it was taken by John Hircanus the prince of the Jews, he entirely demolished it, and caused even the brook to flow over its ruins, to obliterate all the footsteps of it.

The kings of Samaria omitted nothing to make this city the strongest, the finest, and the richest that was possible. Ahab built there a palace of ivory (1 Kings xxii. 39.), that is, in which there were many ornaments of ivory. Amos describes Samaria under Jeroboam II, as a city sunk into all the excesses of luxury and effeminacy (Amos iii. 15. and iv. 1, 2.).

Ben-hadad king of Syria built public places or streets in Samaria (1 Kings xx. 34.) probably for traffic, where his people dwelt to promote trade. His son Ben-hadad besieged this place under the reign of Ahab (1 Kings xx. 1, 2, 3, &c.) in the year of the world 3103.

The following year, Ben-hadad brought an army into the field, probably with a design to march against Samaria; but his army was again cut in pieces. Some years after this, Ben-hadad came a third time, lay down before Samaria, and reduced it to such necessities by famine, that a mother was there forced to eat her own child; but the city was relieved by a sensible effect of the protection of God.

Lastly, it was besieged by Salmaneser king of Assyria, in the ninth year of Hoshea king of Israel (2 Kings xvii. 6, 7, &c.), which was the fourth of Hezekiah king of Judah. It was taken three years after, in the year of the world 3283. The prophet Hosea speaks of the cruelties exercised by Salmaneser against the besieged (Hos. x. 4, 8, 9. xiv. i.); and Micah says, that this city was reduced to a heap of stones (Mic. i. 6.). The Cuthites that were sent by Esar-haddon to inhabit the country of Samaria, did not think it worth their while to repair the ruins of this city; they dwelt at Shechem, which they made the capital city of their state. They were still upon this footing when Alexander the Great came into Phœnicia and Judea. However, the Cuthites had rebuilt some of the houses of Samaria, even from the time of the return from the captivity, since Ezra then speaks of the inhabitants of Samaria (Ezra iv. 17. Nehem. iv. 2.); and that the Samaritans, being jealous of the favours that Alexander the Great had conferred on the Jews, revolted from him while this prince was in Egypt, and burnt Andromachus alive, whom Alexander had left governor of Syria. Alexander marched against them, took Samaria, and put in Macedonians to inhabit it; giving the country round it to the Jews; and to encourage them to cultivate it, he granted them an exemption from tribute. The king of Egypt and Syria, who succeeded Alexander, deprived them of the property of this country.

But Alexander Balas king of Syria restored to Jonathan Maccabæus the cities of Lydda, Ephrem, and Ramatha, which he cut off from the country of Samaria (1 Mac. x. 30, 38, and xi. 28, 34.) Lastly, the Jews re-entered into the full possession of this whole country under John Hircanus the Asmonæan, who took Samaria, and ruined it in such a manner, according to Josephus, that he made the river run through its ruins. It continued in this condition to the year of the world 3947, when Aulus Gabinus, the proconsul of Syria, rebuilt it, and gave it the name of Gabiniana. But it was yet but very inconsiderable, till Herod the Great restored it to its ancient lustre, and gave it the Greek name of Sebaste, which in Latin is Augusta, in honour of the emperor Augustus, who had given him the property of this place.

The sacred authors of the New Testament speak but little of Samaria; and when they do mention it, it is rather in respect of the country about it, than of the city itself. (See Luke xvii. 11. John iv. 4, 5.)—It was there our Lord had the conversation with the woman of Samaria, that is, with a Samaritan woman of the city of Sychar. After the death of St Stephen, (Acts viii. 1, 2, 3.), when the disciples were dispersed through the cities of Judea and Samaria, St Philip the deacon withdrew into the city of Samaria, where he made several converts. When the apostles heard that this city had received the word of God, they sent Peter and John thither, to communicate the Holy Ghost to such as had been baptized. It was there they found Simon Magus, who offered money to the apostles, being in hopes to buy this power of communicating the Holy Ghost. Samaria is never called Sebaste in the books of the New Testament, though strangers hardly knew it but by this name. St Jerome says, that it was thought Obadiah was buried at Samaria. They also showed there the tombs of Elisha and of St John the Baptist. There are

Samaria, found many ancient medals that were struck at Sebaste, or Samaria, and some bishops of this city have subscribed to the ancient councils.

SAMARITANS. We have already spoken of the Samaritans under the article **CUTHI**. The Samaritans are the people of the city of Samaria, and the inhabitants of the province of which Samaria was the capital city. In this sense, it should seem that we might give the name of Samaritans to the Israelites of the ten tribes, who lived in the city and territory of Samaria. However, the sacred authors commonly give the name of Samaritans only to those strange people whom the kings of Assyria sent from beyond the Euphrates to inhabit the kingdom of Samaria, when they took away captive the Israelites that were there before. Thus we may fix the epoch of the Samaritans at the taking of Samaria by Salmaneser, in the year of the world 3283. This prince carried away captive the Israelites that he found in the country, and assigned them dwellings beyond the Euphrates, and in Assyria, (2 Kings xvii. 24.). He sent other inhabitants in their stead, of which the most considerable were the Cuthites, a people descended from Cush, and who are probably of the number of those whom the ancients knew by the name of Scythians.

After Salmaneser, his successor Esar-haddon was informed, that the people which had been sent to Samaria were infested by lions that devoured them, (2 Kings xvii. 25.); this he imputed to the ignorance of the people in the manner of worshipping the god of the country. Wherefore Esar-haddon sent a priest of the God of Israel that he might teach them the religion of the Hebrews. But they thought they might blend this religion with that which they professed before; so they continued to worship their idols as before, in conjunction with the God of Israel, not perceiving how absurd and incompatible these two religions were.

It is not known how long they continued in this state; but at the return from the captivity of Babylon, it appears they had entirely quitted the worship of their idols; and when they asked permission of the Israelites that they might labour with them at the rebuilding of the temple of Jerusalem, they affirmed, that from the time that Esar-haddon had brought them into this country they had always worshipped the Lord, (Ezra iv. 1, 2, 3.). And indeed, after the return from the captivity, the Scripture does not anywhere reproach them with idolatrous worship, though it does not dissemble either their jealousy against the Jews, nor the ill offices they had done them at the court of Persia, by their slanders and calumnies, or the stratagems they contrived to hinder the repairing of the walls of Jerusalem.—(Nehem. ii. 10, 19. iv. 2. &c. vi. 1, 2, &c.).

It does not appear that there was any temple in Samaria, in common to all these people who came thither from beyond the Euphrates, before the coming of Alexander the Great into Judea. Before that time, every one was left to his own discretion, and worshipped the Lord where he thought fit. But they presently comprehended, from the books of Moses which they had in their hands, and from the example of the Jews their neighbours, that God was to be worshipped in that place only which he had chosen. So that since they could not go to the temple of Jerusalem which the Jews would not allow of, they bethought themselves of building a

temple of their own upon Mount Gerizim, near the city of Shechem, which was then their capital. Therefore Sanballat the governor of the Samaritans, applied himself to Alexander, and told him he had a son-in-law, called Manasses, son to Jaddus the high-priest of the Jews, who had retired to Samaria with a great number of other persons of his own nation; that he desired to build a temple in this province, where he might exercise the high-priesthood; that this undertaking would be to the advantage of the king's affairs, because in building a temple in the province of Samaria, the nation of the Jews would be divided, who are a turbulent and seditious people, and by such a division would be made weaker, and less in a condition to undertake new enterprises.

Alexander readily consented to what Sanballat desired, and the Samaritans presently began their building of the temple of Gerizim, which from that time they have always frequented, and still frequent to this day, as the place where the Lord intended to receive the adoration of his people. It is of this mountain and of this temple, that the Samaritan woman of Sychar spoke to our Saviour, (John iv. 20). See **GARIZIM**.

The Samaritans did not long continue under the obedience of Alexander. They revolted from him the very next year, and Alexander drove them out of Samaria, put Macedonians in their room, and gave the province of Samaria to the Jews. This preference that Alexander gave to the Israelites contributed not a little to increase that hatred and animosity that had already obtained between these two people. When any Israelite had deserved punishment for the violation of some important point of the law, he presently took refuge in Samaria or Shechem, and embraced the way of worship according to the temple of Gerizim. When the Jews were in a prosperous condition, and affairs were favourable to them, the Samaritans did not fail to call themselves Hebrews, and pretended to be of the race of Abraham. But no sooner were the Jews fallen into discredit or persecution, but the Samaritans immediately disowned them, would have nothing in common with them, acknowledged themselves to be Phœnicians originally, or that they were descended from Joseph and Manasseh his son. This used to be their practice in the time of Antiochus Epiphanes.

The Samaritans, having received the Pentateuch, or the five books of Moses, from the priest that was sent by Esar-haddon, have preserved it to this day, in the same language and character it was then, that is, in the old Hebrew or Phœnician character, which we now call the Samaritan, to distinguish it from the modern Hebrew character, which at present we find in the books of the Jews. These last, after their captivity, changed their old characters, and took up those of the Chaldee, which they had been used to at Babylon, and which they continue still to use. It is wrong, says F. Cœnnet, to give this the name of the Hebrew character, for that can be said properly only of the Samaritan text. The critics have taken notice of some variations between the Pentateuch of the Jews and that of the Samaritans; but these varieties of reading chiefly regard the word Gerizim, which the Samaritans seem to have purposely introduced to favour their pretensions, that Mount Gerizim was the place in which the Lord was to be adored.

Samaritans, adored. The other various readings are of small importance.

The religion of this people were at first the Pagan. Every one worshipped the deity they had been used to in their own country (2 Kings xvii. 25, 30, 31.) The Babylonians worshipped Succoth-benoth; the Cuthites, Nergal; the Hamathites, Ashima; the Avites, Nibhaz and Tartak; the Sepharvites, Adrammelech and Anammelech. If we would enumerate all the names of false gods to whom the Samaritans have paid a sacrilegious worship, we should have enough to do. This matter is sufficiently perplexed, by reason of the different names by which they were adored by different nations, insomuch that it would be almost impossible to clear up this affair. See SUCCOTH-BENOTH, &c. Afterwards, to this profane worship the Samaritans added that of the Lord, the God of Israel, (2 Kings xvii. 29, 30, 31, 32.) They gave a proof of their little regard to this worship of the true God, when under Antiochus Epiphanes they consecrated their temple at Gerizim to Jupiter Argivus. In the time of Alexander the Great, they celebrated the sabbatical year, and consequently the year of jubilee also. We do not know whether they did it exactly at the same time with the Jews, or whether they observed any other epoch; and it is to little purpose that some critics have attempted to ascertain the first beginning of it. Under the kings of Syria they followed the epoch of the Greeks, or that of the Seleucidæ, as other people did that were under the government of the Selencidæ. After that Herod had re-established Samaria, and had given it the name of Sebaste, the inhabitants of this city, in their medals, and all public acts, took the date of this new establishment. But the inhabitants of Samaria, of which the greater part were Pagans or Jews, were no rule to the other Samaritans, who probably reckoned their years according to the reigns of the emperors they were subject to, till the time they fell under the jurisdiction of the Mahometans, under which they live at this day; and they reckon their year by the Hegira, or, as they speak, according to the reign of Ishmael, or the Ishmaelites. Such of our readers as desire to be further acquainted with the history of the ancient Samaritans, we refer to the works of Josephus, where they will find that subject largely treated of.

As to their belief, it is objected to them, that they receive only the Pentateuch, and reject all the other books of Scripture, chiefly the prophets, who have more expressly declared the coming of the Messiah.—They have also been accused of believing God to be corporeal, of denying the Holy Ghost, and the resurrection of the dead. Jesus Christ reproaches them (John iv. 22.) with worshipping they know not what; and in the place already referred to he seems to exclude them from salvation, when he says, that “Salvation is of the Jews.” True it is, that these words might only signify, that the Messiah was to proceed from the Jews; but the crime of schism alone, and a separation from the true church, was sufficient to exclude them from salvation. The Samaritan woman is a sufficient testimony that the Samaritans expected a Messiah, who they hoped would clear up all their doubts (John iv. 25.) Several of the inhabitants of Shechem believed at the preaching of Jesus Christ, and several of Samaria be-

lieved at that of St Philip; but it is said, they soon fell back to their former errors, being perverted by Simon Magus.

The Samaritans at present are very few in number. Joseph Scaliger, being curious to know their usages, wrote to the Samaritans of Egypt, and to the high-priest of the whole sect who resided at Neapolis in Syria. They returned two answers to Scaliger, dated in the year of the Hegira 998. These were preserved in the French king's library, and were translated into Latin by Father Morin, and printed in England in the collection of that father's letters, in 1682, under the title of *Antiquitates Ecclesiæ Orientalis*. By these letters it appears, that they believe in God, in his servant Moses, the holy law, the mountain Gerizim, the house of God, the day of vengeance and of peace; that they value themselves upon observing the law of Moses in many points more rigidly than the Jews themselves.—They keep the sabbath with the utmost strictness required by the law, without stirring from the place they are in, but only to the synagogue. They go not out of the city, and abstain from their wives on that day. They never delay circumcision beyond the eighth day. They still sacrifice to this day in the temple on Mount Gerizim, and give to the priest what is enjoined by the law. They do not marry their own nieces, as the Jews do, nor do they allow themselves a plurality of wives. Their hatred for the Jews may be seen through all the history of Josephus, and in several places of the New Testament. The Jewish historian informs us, that under the government of Coponius, one passover night, when they opened the gates of the temple, some Samaritans had scattered the bones of dead men there, to insult the Jews, and to interrupt the devotion of the festival. The evangelists show us, that the Jews and Samaritans held no correspondence together. (John iv. 9.) “The Jews have no dealings with the Samaritans.” And the Samaritan woman of Sychar was much surprised that Jesus talked with her, and asked drink of her, being a Samaritan. When our Saviour sent his apostles to preach in Judea, he forbade them to enter into the Samaritan cities, (Matt. x. 5.); because he looked upon them as schismatics, and as strangers to the covenant of Israel. One day when he sent his disciples to provide him a lodging in one of the cities of the Samaritans, they would not entertain him, because they perceived he was going to Jerusalem. (Luke ix. 53.) “Because his face was as though he would go to Jerusalem.” And when the Jews were provoked at the reproaches of Jesus Christ, they told him he was a Samaritan (John viii. 48.) thinking they could say nothing more severe against him. Josephus relates, that some Samaritans having killed several Jews as they were going to the feast at Jerusalem, this occasioned a kind of a war between them. The Samaritans continued their fealty to the Romans, when the Jews revolted from them; yet they did not escape from being involved in some of the calamities of their neighbours.

There are still at this day some Samaritans at Shechem, otherwise called Naplouse. They have priests there, who say they are of the family of Aaron. They have a high-priest, who resides at Shechem, or at Gerizim, who offers sacrifices there, and who declares the feast of the passover,

passover, and all the other feasts, to all the dispersed Samaritans. Some of them are to be found at Gaza, some at Damascus, and some at Grand Cairo.

SAMBUCUS, ELDER, a genus of plants belonging to the pentandria class; and in the natural method ranking under the 43d order, *Dumosaæ*. See **BOTANY Index**.

All the sorts of elder are of the deciduous tribe, very hardy, and grow freely anywhere; are generally free shooters, but particularly the common elder and varieties, which make remarkably strong, jointed shoots, of several feet in length, in one season; and they flower mostly in summer, except the racemose elder, which generally begins flowering in April; and the branches being large, spreading, and very abundant, are exceedingly conspicuous; but they emit a disagreeable odour. The flowers are succeeded in most of the sorts by large bunches of ripe berries in autumn, which, although very unpalatable to eat, are in high estimation for making that well known cordial liquor called *elder wine*, particularly the common black-berried elder. In gardening, the elder is both useful and ornamental, especially in extensive grounds.

SAMIAN EARTH, in the materia medica, the name of two species of marl used in medicine, viz. The white kind, called by the ancients *collyrium samium*, being astringent, and therefore good in diarrhœas, dysenteries, and hæmorrhagies; they also used it externally in inflammations of all kinds. 2. The brownish white kind, called *aster samius* by Dioscorides; this also stands recommended as an astringent.

SAMIELS, the Arabian name of a hot wind peculiar to the desert of Arabia. It blows over the desert in the months of July and August from the north-west quarter, and sometimes it continues with all its violence to the very gates of *Bagdad*, but never affects any body within the walls. Some years it does not blow at all, and in others it appears six, eight, or ten times, but seldom continues more than a few minutes at a time. It often passes with the apparent quickness of lightning. The Arabians and Persians, who are acquainted with the appearance of the sky at or near the time this wind arises, have warning of its approach by a thick haze, which appears like a cloud of dust arising out of the horizon; and they immediately upon this appearance throw themselves with their faces to the ground, and continue in that position till the wind is passed, which frequently happens almost instantaneously; but if, on the contrary, they are not careful or brisk enough to take this precaution, which is sometimes the case, and they get the full force of the wind, it is instant death.

The above method is the only one which they take to avoid the effects of this fatal blast; and when it is over, they get up and look round them for their companions; and if they see any one lying motionless, they take hold of an arm or leg, and pull or jerk it with some force; and if the limb thus agitated separates from the body, it is a certain sign that the wind has had its full effect; but if, on the contrary, the arm or leg does not come away, it is a sure sign there is life remaining, although to every outward appearance the person is dead; and in that case they immediately cover him or them with clothes, and administer some warm diluting liquor to cause a perspiration, which is certainly, but slowly, brought about.

The Arabs themselves can say little or nothing about the nature of this wind, only that it always leaves behind it a very strong sulphureous smell, and that the air at these times is quite clear, except about the horizon, in the north-west quarter, before observed, which gives warning of its approach. We have not been able to learn whether the dead bodies are scorched, or dissolved into a kind of gelatinous substance; but from the stories current about them, there has been frequent reason to believe the latter; and in that case such fatal effects may be attributed rather to a noxious vapour than to an absolute and excessive heat. The story of its going to the gates of Bagdad and no farther, may be reasonably enough accounted for, if the effects are attributed to a poisonous vapour, and not an excessive heat. The above mentioned wind, Samiel, is so well known in the neighbourhood of Bagdad and Bassora, that the very children speak of it with dread.

SAMOGITIA, a province of Poland, bounded on the north by Courland, on the east by Lithuania, on the west by the Baltic sea, and on the south by Regal Prussia, being about 175 miles in length and 125 in breadth. It is full of forests and very high mountains, which feed a great number of cattle, and produce a large quantity of honey. There are also very active horses, in high esteem. The inhabitants are clownish, but honest; and they will not allow a young woman to go out in the night without a candle in her hand and two bells at her girdle. Rossenna and Worma are the principal places.

SAMOIEDA, a country of the Russian empire, between Asiatic Tartary and Archangel, lying along the sea-coast as far as Siberia. The inhabitants are extremely rude and barbarous. They travel on the snow on sledges, drawn by an animal like a rein-deer, but with the horns of a stag. Their stature is short; their shoulders and faces are broad, with flat broad noses, hanging lips, and staring eyes; their complexion is dark, their hair long and black; and they have very little beard. If they have any religion at all, it is idolatry, though there have been some attempts of late to convert them. Their huts are made of birch bark sewed together, and laid upon stakes set in the ground; at the top is a hole to let out the smoke; the fire is made in the middle, round which they repose in the night.— Their chief employment is hunting and fishing.

SAMOLUS, WATER PIMPERNEL; a genus of plants belonging to the pentandria class, and in the natural method ranking under the 21st order, *Preciæ*. See **BOTANY Index**.

SAMOS, in *Ancient Geography*, an island at no great distance from the promontory Mycale, on the continent of the Hither Asia, and opposite to Ephesus; the distance only seven stadia (Strabo); a free island, in compass 87 miles (Pliny); or 100 (Isodorus); with a cognominal town (Ptolemy, Horace); famous for the worship and a temple of Juno, with a noted asylum (Virgil, Strabo, Tacitus); and hence their coin exhibited a peacock (Athenæus): The country of Pythagoras, who, to avoid the oppression of tyrants, retired to Italy, the land of freedom. Samos, though not so happy in producing wine, which Strabo wonders at, all the adjoining islands yielding a generous sort, yet abounds in all the necessaries of life. The *Vasa Samia*, among earthen ware, were held in high repute. *Samii*, the people

Samos,
Sampan.

ple (Ovid).—The island is now in the hands of the Turks. It is about 32 miles in length, and 22 in breadth, and extremely fertile. The inhabitants live at their ease, their taxation by the Turks being moderate. The women are very nasty and ugly, and they never shift above once a month. They are clothed in the Turkish manner, except a red coif, and their hair hanging down their backs, with plates of silver or block-tin fastened to the ends.—They have abundance of melons, lentils, kidney-beans, and excellent muskadine grapes. They have white figs four times as big as the common sort, but not so well tasted. Their silk is very fine, and their honey and wax admirable; besides which, their poultry are excellent: They have iron mines, and most of the soil is of a rusty colour: they have also emery stone, and all the mountains are of white marble. The inhabitants are about 12,000; who are almost all Greeks; and the monks and priests occupy most part of the island. They have a bishop who resides at Cora. See POLYCRATES.

Osbec's Voyage to China and the East Indies.

SAMPAN, is a Chinese boat without a keel, looking almost like a trough; they are made of different dimensions, but are mostly covered. These boats are as long as sloops, but broader, almost like a baking trough; and have at the end one or more decks of bamboo sticks: the cover or roof is made of bamboo sticks, arched over in the shape of a grater; and may be raised or lowered at pleasure: the sides are made of boards, with little holes, with shutters instead of windows: the boards are fastened on both sides to posts, which have notches like steps on the inside, that the roof may be let down, and rest on them: on both ends of the deck are commonly two little doors, at least there is one at the hindmost end. A fine white smooth carpet, spread up as far as the boards, makes the floor, which in the middle consists of loose boards; but this carpet is only made use of to sleep on. As these boats greatly differ from ours in shape, they are likewise rowed in a different manner: for two rowers, posting themselves at the back end of the sampan, work it forwards very readily by the motion of two oars; and can almost turn the vessel just as they please: the oars, which are covered with a little hollow quadrangular iron, are laid on iron swivels, which are fastened in the sides of the sampan: at the iron the oars are pierced, which makes them look a little bent: in common, a rower sits before with a short oar; but this he is forced to lay aside when he comes near the city, on account of the great throng of sampans; and this inconvenience has confirmed the Chinese in their old way of rowing. Instead of pitch, they make use of a cement like our putty, which we call *chinam*, but the Chinese call it *kiang*. Some authors say that this cement is made of lime and a resin exuding from the tree *tong yea*, and bamboo ockam.

Besides a couple of chairs, they have the following furniture: two oblong tables or boards on which some Chinese characters are drawn; a lantern for the night time, and a pot to boil rice in. They have also a little cover for their household god, decorated with gilt paper and other ornaments: before him stands a pot filled with ashes, into which the tapers are put before the idol. The candles are nothing else than bamboo chips, to the upper end of which saw-dust of san-

dal-wood is stuck on with gum. These tapers are everywhere lighted before the idols in the pagodas, and before the doors in the streets; and, in large cities, occasion a smoke very pernicious to the eyes. Before this idol stands some *samso*, or Chinese brandy, water, &c. We ought to try whether the Chinese would not like to use juniper-wood instead of sandal-wood; which latter comes from Surat, and has almost the same smell with juniper.

SAMSON, one of the judges of Israel, memorable for his supernatural strength, his victories over the Philistines, and his tragical end, as related in the book of *Judges*.

SAMSON's Post, a sort of pillar erected in a ship's hold, between the lower deck and the keelson, under the edge of a hatchway, and furnished with several notches that serve as steps to mount or descend, as occasion requires. This post being firmly driven into its place, not only serves to support the beam and fortify the vessel in that place, but also to prevent the cargo or materials contained in the hold, from shifting to the opposite side, by the rolling of the ship in a turbulent and heavy sea.

Books of SAMUEL, two canonical books of the Old Testament, as being usually ascribed to the prophet Samuel.

The books of Samuel and the books of Kings are a continued history of the reigns of the kings of Israel and Judah; for which reason the books of Samuel are likewise styled *the first and second books of Kings*. Since the first 24 chapters contain all that relates to the History of Samuel, and the latter part of the first book and all the second include the relation of events that happened after the death of that prophet, it has been supposed that Samuel was author only of the first 24 chapters, and that the prophets Gad and Nathan finished the work. The first book of Samuel comprehends the transactions under the government of Eli and Samuel, and under Saul the first king; and also the acts of David while he lived under Saul; and is supposed to contain the space of 101 years. The second book contains the history of about 40 years, and is wholly spent in relating the transactions of David's reign.

SAMYDA, a genus of plants belonging to the decandria class; and in the natural method ranking with those of which the order is doubtful. See BOTANY *Index*

SANA, or SANAA, a large, populous, and handsome town of Asia, capital of Arabia Felix, is situated in Proper Yemen, at the foot of Mount Nikkum, on which are still to be seen the ruins of a castle, which the Arabs suppose to have been built by Shem. Near this mountain stands the castle; a rivulet runs upon the other side; and near it is the Bustan el Metwokkel, a spacious garden, which was laid out by Imam Metwokkel, and has been embellished with a fine garden by the reigning imam. The walls of the city, which are built of bricks, exclude this garden, which is inclosed within a wall of its own. The city, properly so called, is not very extensive: one may walk round it all in an hour. The city-gates are seven. Here are a number of mosques, some of which have been built by Turkish pacha. Sana has the appearance of being more populous than it actually is; for the gardens occupy a part of

Sampan

Heron.

Sana. of the space within the walls. In Sana are only 12 public baths; but many noble palaces, three of the most splendid of which have been built by the reigning imam. The palace of the late imam El Manzor, with some others, belong to the royal family, who are very numerous.

The Arabian palaces are built in a style of architecture different from ours. The materials are, however, burnt bricks, and sometimes even hewn stones; but the houses of the common people are of bricks which have been dried in the sun. There are no glass windows, except in one palace, near the citadel. The rest of the houses have, instead of windows, merely shutters, which are opened in fair weather, and shut when it is foul. In the last case, the house is lighted by a round wicket, fitted with a piece of Muscovy glass; some of the Arabians use small panes of stained glass from Venice.

At Sana, and in the other cities of the East, are great simseras or caravanseras for merchants and travellers. Each different commodity is sold in a separate market. In the market for bread, none but women are to be seen; and their little shops are portable. The several classes of mechanics work, in the same manner, in particular quarters in the open street. Writers go about with their desks, and make out briefs, copy-books, and instruct scholars in the art of writing, all at the same time. There is one market where old clothes are taken in exchange for new.

Wood for the carpenter's purpose is extremely dear through Yemen; and wood for the fire at Sana is no less so. All the hills near the city are bleak and bare, and wood is therefore to be brought hither from the distance of three days' journey; and a camel's burthen commonly costs two crowns. This scarcity of wood is partially supplied by the use of a little pit-coal. Peats are burnt here; but they are so bad, that straw must be intermixed to make them burn.

Fruits are, however, very plenteous at Sana. Here are more than 20 different species of grapes, which, as they do not all ripen at the same time, continue to afford a delicious refreshment for several months. The Arabs likewise preserve grapes, by hanging them up in their cellars, and eat them almost through the whole year. The Jews make a little wine, and might make more if the Arabs were not such enemies to strong liquors. A Jew convicted of conveying wine into an Arab's house is severely punished; nay, the Jews must even use great caution in buying and selling it among themselves. Great quantities of grapes are dried here; and the exportation of raisins from Sana is considerable. One sort of these grapes is without stones, and contains only a soft grain, the presence of which is not perceptible in eating the raisin.

In the castle, which stands on a hill, are two palaces. "I saw (says Niebuhr) about it some ruins of old buildings, but, notwithstanding the antiquity of the place, no remarkable inscriptions. There is the mint, and a range of prisons for persons of different ranks. The reigning imam resides in the city; but several princes of the blood-royal live in the castle. The battery is the most elevated place about these buildings; and there I met with what I had no expectation of, a German mortar, with this inscription, *Jorg Selos Gosmick*, 1513. I saw also upon the same battery seven

iron cannons, partly buried in the sand, and partly set upon broken carriages. These seven small cannons, with six others near the gates, which are fired to announce the return of the different festivals, are all the artillery of the capital of Yemen."

SANADON, NOEL ETIENNE, a Jesuit, was born at Rouen in 1676, and was a distinguished professor of humanity at Caen. He there became acquainted with Huet, bishop of Avranches, whose taste for literature and poetry was similar to his own. Sanadon afterwards taught rhetoric at the university of Paris, and was entrusted with the education of the prince of Conti, after the death of Du Morceau. In 1728 he was made librarian to Louis XIV, an office which he retained to his death. He died on the 21st September 1733, in the 58th year of his age.

His works are, 1. Latin Poems, in 12mo, 1715, and reprinted by Barbou, in 8vo, 1754. His style possesses the graces of the Augustan age. His language is pure and nervous; his verses are harmonious, and his thoughts are delicate and well chosen; but sometimes his imagination flags. His Latin poems consist of Odes, Elegies, Epigrams, and others, on various subjects. 2. A translation of Horace, with Remarks, in 2 vols. 4to, printed at Paris in 1727; but the best edition of this work was printed at Amsterdam in 1735, in 8 vols. 12mo, in which are also inserted the versions and notes of M. Dacier. Sanadon translated with elegance and taste; but he has not preserved the sublimity of the original in the odes, nor the energy and precision in the epistles and satires. In general, his version is rather a paraphrase than a faithful translation. Learned men have justly censured him for the liberty which he has taken in making considerable changes in the order and structure of the odes. He has also given offence by his uncouth orthography. 3. A Collection of Discourses delivered at different times, which afford strong proofs of his knowledge of oratory and poetry. 4. A book entitled *Prieres et Instructions Chretiennes*.

SANBALLAT, the chief or governor of the Cuthites or Samaritans, was always a great enemy to the Jews. He was a native of Horon, or Horonaim, a city beyond Jordan, in the country of the Moabites. He lived in the time of Nehemiah, who was his great opponent, and from whose book we learn his history. There is one circumstance related of him which has occasioned some dispute among the learned; and the state of the question is as follows: When Alexander the Great came into Phœnicia, and sat down before the city of Tyre, Sanballat quitted the interests of Darius king of Persia, and went at the head of 8000 men to offer his service to Alexander. This prince readily entertained him, and being much solicited by him, gave him leave to erect a temple upon Mount Gerizim, where he constituted his son-in-law Manasseh the high-priest. But this story carries a flagrant anachronism: for 120 years before this, that is, in the year of the world 3550, Sanballat was governor of Samaria; wherefore the learned Dr Prideaux (in his Connexion of the Histories of the Old and New Testament) supposes two Sanballats, and endeavours to reconcile it to truth and probability, by showing it to be a mistake of Josephus. This author makes Sanballat to flourish in the time of Darius Codomannus, and to build his temple upon

Sanballat. Mount Gerizim by license from Alexander the Great ;
 Sanchoniatho. whereas it was performed by leave from Darius Nothus, in the 15th year of his reign. This takes away the difficulty arising from the great age of Sanballat, and brings him to be cotemporary with Nehemiah, as the Scripture history requires.

SANCHEZ, FRANÇOIS, called in Latin *Sanctius*, was of Las Brocas in Spain, and has been dignified by his own countrymen with the pompous titles of *le Pere de la Langue Latine, et le Docteur de tous les Gens de lettres*. He wrote, 1. An excellent treatise intitled *Minerva, or de Causis Linguae Latinae*, which was published at Amsterdam in 1714, in 8vo. The authors of the *Port-Royal Methode de la Langue Latine* have been much indebted to this work. 2. *The Art of Speaking, and the Method of translating Authors*. 3. Several other learned pieces on grammar. He died in the year 1600, in his 77th year.

We must be careful to distinguish him from another *François Sanchez*, who died at Toulouse in 1632. This last was a Portuguese physician who settled at Toulouse, and, though a Christian, was born of Jewish parents. He is said to have been a man of genius and a philosopher. His works have been collected under the title of *Opera Medica. His juncti sunt tractatus quidam philosophici non insubtiles*. They were printed at Toulouse in 1636.

SANCHONIATHO, a Phœnician philosopher and historian, who is said to have flourished before the Trojan war about the time of Semiramis. Of this most ancient writer, the only remains extant are sundry fragments of cosmogony, and of the history of the gods and first mortals, preserved by Eusebius and Theodoret ; both of whom speak of Sanchoniatho as an accurate and faithful historian ; and the former adds, that his work, which was translated by Philo-Byblius from the Phœnician into the Greek language, contains many things relating to the history of the Jews which deserve great credit, both because they agree with the Jewish writers, and because the author received these particulars from the annals of Hierombalus, a priest of the god Jao.

Several modern writers, however, of great learning, have called in question the very existence of Sanchoniatho, and have contended, with much plausibility, that the fragments which Eusebius adopted as genuine upon the authority of Porphyry, were forged by that author or the pretended translator Philo, from enmity to the Christians, and that the Pagans might have something to show of equal antiquity with the books of Moses. These opposite opinions have produced a controversy that has filled volumes, and of which our limits would hardly admit of an abstract. We shall therefore in few words state what to us appears to be the truth, and refer such of our readers as are desirous of fuller information

to the works of the authors (A) mentioned at the bottom of the page. Sanchoniatho.

The controversy respecting Sanchoniatho resolves itself into two questions. 1. Was there in reality such a writer ? 2. Was he of the very remote antiquity which his translator claims for him ?

That there was really such a writer, and that the fragments preserved by Eusebius are indeed parts of his history, interpolated perhaps by the translator (B), we are compelled to believe by the following reasons. Eusebius, who admitted them into his work as authentic, was one of the most learned men of his age, and a diligent searcher into antiquity. His conduct at the Nicene council shows, that on every subject he thought for himself, neither biassed by authority to the one side, nor carried over by the rage of innovation to the other. He had better means than any modern writer can have of satisfying himself with respect to the authenticity of a very extraordinary work, which had then but lately been translated into the Greek language, and made generally known ; and there is nothing in the work itself, or at least in those parts of it which he has preserved, that could induce a wise and good man to obtrude it upon the public as genuine, had he himself suspected it to be spurious. Too many of the Christian fathers were indeed very credulous, and ready to admit the authenticity of writings without duly weighing the merits of their claim ; but then such writings were always believed to be favourable to the Christian cause, and inimical to the cause of Paganism. That no man of common sense could suppose the cosmogony of Sanchoniatho favourable to the cause of revealed religion, a farther proof cannot be requisite than what is furnished by the following extract.

“ He supposeth, or affirms, that the principles of the universe were a dark and windy air, or a wind made of dark air, and a turbulent evening *chaos* ; and that these things were boundless, and for a long time had no bound or figure. But when this wind fell in love with his own principles, and a mixture was made, that mixture was called *desire* or *cupid* (*πρωτος*).

“ This mixture completed, was the beginning of the (*κτισσις*) making of all things. But that wind did not know its own production ; and of this, with that wind was begotten *Mot*, which some call *Mua*, others the putrefaction of a watery mixture. And of this came all the seed of this building, and the generation of the universe.

“ But there were certain animals, which had no sense, out of which were begotten intelligent animals, and were called *Zophesemin*, that is, the spies or overseers of Heaven ; and were formed alike in the shape of an egg. Thus shone out *Mot*, the sun and the moon, the less and the greater stars.

“ And the air shining thoroughly with light, by its fiery

(A) Bochart, Scaliger, Vossius, Cumberland, Dodwell, Stillingfleet, Mosheim's Cudworth, and Warburton.

(B) Of these there are indeed several proofs. Philo makes Sanchoniatho speak of *Byblus* as the most ancient city of Phœnicia, which, in all probability, it was not. We read in the book of Judges of *Berith* or *Berytus*, the city where Sanchoniatho himself lived ; but not of *Byblus*, which was the native city of Philo, and to which he is therefore partial. He makes him likewise talk of the Greeks at a period long before any of the Grecian states were known or probably peopled.

ichonia-
tho. ficry influence on the sea and earth, winds were begot-
ten, and clouds and great defluxions of the heavenly
waters. And, when all these things first were parted,
and were separated from their proper place by the heat
of the sun, then all met again in the air, and dash-
ed against one another, and were broken to pieces ;
whence thunders and lightnings were made : and at
the stroke of these thunders the fore-mentioned intel-
ligent animals were awakened, and frighted with the
sound ; and male and female stirred in the earth and
in the sea : This is the generation of animals.

“ After these things our author (Sanchoniatho)
goes on saying : ‘ These things are written in the *Cos-
mogony of Taautus*, and in his memoirs ; and out of the
conjectures and surer natural signs which his mind
saw, and found out, and wherewith he hath enlight-
ened us.’ ”

“ Afterwards declaring the names of the winds, *north*
and *south* and the rest, he makes this epilogue. ‘ But
these first men consecrated the plants shooting out of
the earth, and judged them gods, and worshipped
them ; upon whom they themselves lived, and all their
posterity and all before them : to these they made their
meat and drink offerings.’ Then he concludes :
‘ these were the devices of worship agreeing with the
weakness and want of boldness in their minds.’ ”

Let us suppose Eusebius to have been as weak and
credulous as the darkest monk in the darkest age of
Europe, a supposition which no man will make who
knows any thing of the writings of that eminent histo-
rian ; what could he see in this senseless jargon, which
even a dreaming monk would think of employing in
support of Christianity ? Eusebius calls it, and calls it
truly, direct atheism ; but could he imagine that an
ancient system of atheism would contribute so much
to make the Pagans of his age admit as divine revela-
tions the books of the Old and New Testaments, that
he should be induced to adopt, without examination,
an impudent forgery, not 200 years old, as genuine
remains of the most remote antiquity ?

If this Phenician cosmogony be a fabrication of Por-
phyry, or of the pretended translator, it must surely have
been fabricated for some purpose ; but it is impossible for
us to conceive what purpose either of these writers could
have intended to serve by forging a system so extrava-
gantly absurd. Porphyry, though an enemy to the
Christians, was not an atheist, and would never have
thought of making an atheist of him whom he meant
to obtrude upon the world as the rival of Moses. His
own principles were those of the Alexandrian Platonists ;
and had he been the forger of the works which bear
the name of Sanchoniatho, instead of the incomprehen-
sible jargon about *dark wind*, *evening chaos*, *Mot*, the
overscers of heaven in the shape of an egg, and *animation*
proceeding from the sound of thunder, we should doubt-
less have been amused with refined speculations con-
cerning the operations of the *Demiurgus* and the other
persons in the Platonic Triad. See PLATONISM and
PORPHYRY.

Father Simon of the oratory imagines * that the
purpose for which the history of Sanchoniatho was
forged, was to support Paganism, by taking from it its
mythology and allegories, which were perpetually ob-
jected to it by the Christian writers ; but this learned
man totally mistakes the matter. The primitive Chri-

istians were too much attached to allegories themselves
to rest their objections to Paganism on such a founda-
tion : what they objected to that system was, the immo-
ral stories told of the priests. To this the Pagan priests
and philosophers replied, that these stories were only
mythologic allegories, which veiled all the great truths of
Theology, Ethics, and Physics. The Christians said,
this could not be ; for that the stories of the gods had
a substantial foundation in fact, these gods being only
dead men deified, who, in life, had like passions and in-
firmities with other mortals. This then was the objec-
tion which the forger of the works of Sanchoniatho
had to remove, if he really forged them in support of
Paganism ; but, instead of doing so, he gives the genea-
logy and history of all the greater gods, and shows, that
they were men deified after death for the exploits, some
of them grossly immoral, which they had performed in
this world. We have elsewhere (POLYTHEISM, N^o 17.)
given his account of the deification of *Chryisor*, and *Ou-
ranos*, and *Ge*, and *Hypsistos*, and *Muth* ; but our read-
ers may not perhaps be ill pleased to accompany him
through the history of *Ouranos* and *Cronus*, two of his
greatest gods ; whence it will appear how little his
writings are calculated to support the tottering cause
of Paganism against the objections which were then
urged to it by the Christian apologists.

“ *Ouranos* (says he), taking the kingdom of his fa-
ther, married *Ge* his sister, and by her had four sons ;
Ilus, who is called *Cronus* ; *Betylus* ; *Dagon*, who is *Si-
ton*, or the *god of corn* ; and *Ailas*. But by other wives
Ouranos had much issue, wherefore *Ge* being grieved at
it and jealous, reproached *Ouranos*, so as they parted
from each other. But *Ouranos*, though he parted from
her, yet by force invading her, and lying with her when
he listed, went away again ; and he also attempted to
kill the children he had by her. *Ge* also often defend-
ed or avenged herself, gathering auxiliary powers unto
her. But when *Cronus* came to man’s age, using *Her-
mes Trismegistus* as his counsellor and assistant (for he
was his secretary), he opposed his father *Ouranos*,
avenging his mother. But *Cronus* had children, *Per-
sephone* and *Athena* ; the former died a virgin, but by
the counsel of the latter *Athena*, and of *Hermes*, *Cro-
nus* made of iron a scymitar and a spear. Then *Her-
mes*, speaking to the assistants of *Cronus* with enchant-
ing words, wrought in them a keen desire to fight
against *Ouranos* in the behalf of *Ge* ; and thus *Cronus*
warring against *Ouranos*, drove him out of his kingdom,
and succeeded in the imperial power or office. In the
fight was taken a well-beloved concubine of *Ouranos*
big with child. *Cronus* gave her in marriage to *Dag-
on*, and she brought forth at his house what she had
in her womb by *Ouranos*, and called him *Demaroon*.
After these things *Cronus* builds a wall round about
his house, and founds *Byblus* the first city in Phenicia.
Afterwards *Cronus*, suspecting his own brother *Atlas*,
with the advice of *Hermes*, throwing him into a deep
hole of the earth, there buried him, and having a son
called *Sadid*, he despatched him with his own sword,
having a suspicion of him, and deprived his own son of
life with his own hand. He also cut off the head of
his own daughter, so that all the gods were amazed at
the mind of *Cronus*. But in process of time, *Ouranos*
being in flight, or banishment, sends his daughter *A-
starte*, with two other sisters *Rhea* and *Dione*, to cut

Sanchoniatho.

Sanchoniatho. off Cronus by deceit, whom Cronus taking, made wives of these sisters. Ouranos, understanding this, sent Eimarmene and Hore, Fate and Beauty, with other auxiliaries, to war against him: but Cronus, having gained the affections of these also, kept them with himself. Moreover, the god Ouranos devised *Bætulia*, contriving stones that moved as having life. But Cronus begat on Astarte seven daughters called *Titanides* or *Artemides*; and he begat on Rhea seven sons, the youngest of whom, as soon as he was born, was consecrated a god. Also by Dione he had daughters, and by Astarte more-over two sons, *Pothos* and *Eros*, i. e. Cupid and Love. But Dagon, after he had found out bread corn, and the plough, was called *Zeus Aratrius*. To *Sydye*, or *the just*, one of the *Titanides* bare *Asclepius*. Cronus had also in *Peræa* three sons, 1. *Cronus* his father's namesake. 2. *Zeus Belus*. 3. *Apollo*."

Is it conceivable, that a writer so acute as Porphyry, or indeed that any man of common sense, either in his age or in that of Philo, would forge a book filled with such stories as these, in order to remove the Christian objections to the immoral characters of the Pagan divinities? The very supposition is impossible to be made. Nor let any one imagine that Sanchoniatho is here writing allegorically, and by his tales of *Ouranos*, and *Ge* and *Cronus*, is only personifying the *heaven*, the *earth*, and *time*. On the contrary, he assures us, that *Ouranos*, or *Epigeus*, or *Autochthon* (for he gives him all these names), was the son of one *Eliaun* or *Hypsistos*, who dwelt about Byblus, and that from him the element which is over us was called *heaven*, on account of its excellent beauty, as the earth was named *Ge* after his sister and wife. And his translator is very angry * with the Neoteric Greeks, as he calls them, because that "by a great deal of force and straining, they laboured to turn all the stories of the gods into allegories and physical discourses." This proves unanswerably, that the author of this book, whoever he was, did not mean to veil the great truths of religion under the cloak of mythologic allegories; and therefore, if it was forged by Porphyry in support of Paganism, the forger so far mistook the state of the question between him and his adversaries, that he contrived a book, which, if admitted to be ancient, totally overthrew his own cause.

The next thing to be inquired into with respect to Sanchoniatho is his antiquity. Did he really live and write at so early a period as Porphyry and Philo pretend? We think he did not; and what contributes not a little to confirm us in our opinion, is that mark of national vanity and partiality, common to after-times, in making the sacred mysteries of his own country original, and conveyed from Phœnicia into Egypt. This, however, furnishes an additional proof that Porphyry was not the forger of the work; for he well knew that the mysteries had their origin in Egypt (see MYSTERIES), and would not have fallen into such a blunder. He is guilty, indeed, of a very great anachronism, when he makes Sanchoniatho contemporary with Semiramis, and yet pretends that what he writes of the Jews is compiled from the records of Hierombalus the priest of the god Jao; for Bochart has made it appear in the highest degree probable, † that *Hierombalus* or *Jeromb-baal* is the *Jerub-baal* or *Gideon* of Scripture.

Between the reign of Semiramis and the Trojan war a period elapsed of near 800 years, whereas Gideon flourished

not above seventy years before the destruction of Sanchoniatho. Troy. But supposing Sanchoniatho to have really consulted the records of Gideon, it by no means follows that he flourished at the same period with that judge of Israel. He speaks of the building of Tyre as an ancient thing, while our best chronologers † place it in the time of Gideon. Indeed, were we certain that any writings had been left by that holy man, we should be obliged to conclude, that a large tract of time had intervened between the death of their author and their falling into the hands of Sanchoniatho; for, surely, they could not, in a short period, have been so completely corrupted as to give any countenance to his impious absurdities. His atheistic cosmogony he does not indeed pretend to have got from the annals of the priest of Jao, but from records which were deposited in his own town of Berytus by Thoth a Phœnician philosopher, who was afterwards made king of Egypt. But surely the annals of Gideon, if written by himself, and preserved pure to the days of Sanchoniatho, must have contained so many truths of the Mosaic religion, as must have prevented any man of sense from adopting so impossible a theory as Thoth's, though sanctioned by the greatest name of profane antiquity. Stillingfleet indeed thinks it most probable that Sanchoniatho became acquainted with the most remarkable passages of the life of Jerub-baal from annals written by a Phœnician pen. He observes, that immediately after the death of Gideon, the Israelites, with their usual proneness to idolatry, worshipped *Baal-berith*, or the idol of Berytus, the town in which Sanchoniatho lived; and from this circumstance he concludes that there must have been such an intercourse between the Hebrews and Berytians, that in process of time the latter people might assume to themselves the Jerub-baal of the former, and hand down his actions to posterity as those of a priest instead of a great commander. All this may be true; but if so, it amounts to a demonstration that the antiquity of Sanchoniatho is not so high by many ages as that which is claimed for him by Philo and Porphyry, though he may still be more ancient, as we think Vossius has proved him to be, * than any other profane historian whose writings have come down to us either entire or in fragments.

But granting the authenticity of Sanchoniatho's history, what, it may be asked, is the value of his fragments, that we should be at any trouble to ascertain whether they be genuine remains of high antiquity, or the forgeries of a modern impostor? We answer, with the illustrious Stillingfleet, that though these fragments contain such absurdities as it would be a disgrace to reason to suppose credible; though the whole cosmogony is the grossest sink of atheism; and though many persons make a figure in the history, whose very existence may well be doubted; yet we, who have in our hands the light of divine revelation, may in this dungeon discover many excellent relics of ancient tradition, which throw no feeble light upon many passages of holy scripture, as they give us the origin and progress of that idolatry which was so long the opprobrium of human nature. They furnish too a complete refutation of the extravagant chronology of the Chaldeans and Egyptians, and show, if they be genuine, that the world is indeed not older than it is said to be by Moses. We shall conclude the article by earnestly recommending to our readers

readers an attentive perusal of *Cumberland's SANCHO-*
NIATHO.

SANCROFT, WILLIAM, archbishop of Canterbury, was born at Fresingfield in Suffolk in 1616; and admitted into Emanuel college, Cambridge, in 1633. In 1642 he was elected a fellow; and, for refusing to take the covenant, was ejected from his fellowship. In 1660 he was chosen one of the university preachers; and in 1663 was nominated to the deanry of York. In 1664 he was installed dean of St Paul's. In this station he set himself with unwearied diligence to repair the cathedral, till the fire of London in 1666 employed his thoughts on the more noble undertaking of rebuilding it, toward which he gave 1400*l.* He also rebuilt the deanry, and improved its revenue. In 1668 he was admitted archdeacon of Canterbury, on the king's pre-entation. In 1677, being now prolocutor of the convocation, he was unexpectedly advanced to the archbishopric of Canterbury. In 1687 he was committed to the Tower, with six other bishops, for presenting a petition to the king against reading the declaration of indulgence. Upon King James II.'s withdrawing himself, he concurred with the lords in a declaration to the prince of Orange for a free parliament, and due indulgence to the Protestant dissenters. But when that prince and his consort were declared king and queen, his grace refusing to take the oath to their majesties, he was suspended and deprived — He lived in a very private manner till his death in 1693. His learning, integrity, and piety, made him an exalted ornament of the church. He published a volume in 12mo, entitled *Modern Politics*, taken from Machiavel, Borgia, and other select authors; *Familiar Letters to Mr North*. an 8vo pamphlet; and three of his sermons were printed together after his death.

SANCTIFICATION, the act of sanctifying, or rendering a thing holy. The reformed divines define sanctification to be an act of God's grace, by which a person's desires and affections are alienated from the world; and by which he is made to die to sin, and to live to righteousness; or, in other words, to feel an abhorrence of all vice, and a love of religion and virtue.

SANCTION, the authority given to a judicial act, by which it becomes legal and authentic.

SANCTORIUS, or **SANCTORIO**, a most ingenious and learned physician, was professor in the university of Padua, in the beginning of the 17th century. He contrived a kind of statical chair, by means of which, after estimating the aliments received, and the sensible discharges, he was enabled to determine with great exactness the quantity of insensible perspiration, as well as what kind of victuals and drink increased or diminished it. On these experiments he erected a curious system, which he published under the title of *De Medicina Statica*; which is translated into English by Dr Quincy. Sanctorius published several other treatises, which showed great abilities and learning.

SANCTUARY, among the Jews, also called *Sanc-tum sanctorum*, or *Holy of holies*, was the holiest and most retired part of the temple of Jerusalem, in which the ark of the covenant was preserved, and into which none but the high-priest was allowed to enter, and that only once a year, to intercede for the people.

Some distinguish the sanctuary from the sanctum

sanctorum, and maintain that the whole temple was called the *sanctuary*. Sanctuary.
Sand.

To try and examine any thing by the weight of the sanctuary, is to examine it by a just and equal scale; because, among the Jews, it was the custom of the priests to keep stone weights, to serve as standards for regulating all weights by, though these were not at all different from the royal or profane weights.

SANCTUARY, in the Romish church, is also used for that part of the church in which the altar is placed, encompassed with a rail or ballustrade.

SANCTUARY, in our ancient customs, the same with **ASYLUM**.

SAND, in *Natural History*, properly denotes small particles of siliceous stones. Sands are subject to be variously blended, both with different substances, as that of talcs. &c.; and hence, as well as from their various colours, are subdivided into, 1. White sands, whether pure or mixed with other arenaceous or heterogeneous particles; of all which there are several kinds, differing no less in the fineness of their particles than in the different degrees of colour, from a bright and shining white, to a brownish, yellowish, greenish, &c. white. 2. The red and reddish sands, both pure and impure. 3. The yellow sands, whether pure or mixed, are also very numerous. 4. The brown sands, distinguished in the same manner. 5. The black sands, of which there are only two varieties, viz. a fine shining grayish-black sand, and another of a fine shining reddish-black colour. 6. The green kind: of which there is only one known species, viz. a coarse variegated dusky green sand, common in Virginia.

Sand is of great use in the glass manufacture; a white kind of sand being employed for making of the white glass, and a coarse greenish-looking sand for the green glass.

In agriculture it seems to be the office of sand to render unctuous or clayey earths fertile, and fit to support vegetables, by making them more open and loose.

SAND-Bags, in the art of war. See **SACKS of Earth**.

Sand-EEL. See **AMMODYTES**, **ICHTHYOLOGY Index**.

SAND-Floods, a name given to the motion of sand so common in the deserts of Arabia. Mr Bruce gives the following accurate description of some that he saw in travelling through that long and dreary desert. "At one o'clock (says he) we alighted among some acacia trees at Waadi el Halboub, having gone twenty-one miles. We were here at once surprised and terrified by a sight surely one of the most magnificent in the world. In that vast expanse of desert from west and to north-west of us, we saw a number of prodigious pillars of sand at different distances, at times moving with great celerity, at others stalking on with a majestic slowness: at intervals we thought they were coming in a few minutes to overwhelm us; and small quantities of sand did actually more than once reach us. Again they would retreat so as to be almost out of sight, their tops reaching to the very clouds. There the tops often separated from the bodies; and these, once disjoined, dispersed in the air, and did not appear more. Sometimes they were broken near the middle, as if struck with a large cannon shot. About noon they began to advance with considerable swiftness upon us, the wind being very strong

Sand.

strong at north. Eleven of them ranged alongside of us about the distance of three miles. The greatest diameter of the largest appeared to me at that distance as if it would measure ten feet. They retired from us with a wind at south-east, leaving an impression upon my mind to which I can give no name, though surely one ingredient in it was fear, with a considerable deal of wonder and astonishment. It was in vain to think of flying, the swiftest horse or fastest sailing ship could be of no use to carry us out of this danger; and the full persuasion of this rivetted me as if to the spot where I stood, and let the camels gain on me so much in my state of lameness, that it was with some difficulty I could overtake them.”—

“The same appearance of moving pillars of sand presented themselves to us this day, in form and disposition like those we had seen at Waadi Halboub, only they seemed to be more in number and less in size. They came several times in a direction close upon us, that is, I believe, within less than two miles. They began immediately after sunrise, like a thick wood, and almost darkened the sun: his rays shining through them for near an hour, gave them an appearance of pillars of fire. Our people now became desperate: the Greek shrieked out, and said it was the day of judgment: Ismael pronounced it to be hell; and the Tucorories, that the world was on fire. I asked Idris, if ever he had before seen such a sight? He said he had often seen them as terrible, though never worse; but what he feared most was that extreme redness in the air, which was a sure presage of the coming of the simoom.” See SIMOOM.

The flowing of sand, though far from being so tremendous and hurtful as in Arabia, is of very bad consequences in this country, as many valuable pieces of land have thus been entirely lost; of which we give the following instances from Mr Pennant, together with a probable means of preventing them in future. “I have more than once (says he), on the eastern coasts of Scotland, observed the calamitous state of several extensive tracts, formerly in a most flourishing condition, at present covered with sands, unstable as those of the deserts of Arabia. The parish of Purvie, in the county of Aberdeen, is now reduced to two farms, and above 500*l.* a year lost to the Errol family, as appears by the oath of the factor in 1600, made before the court of session, to ascertain the minister’s salary. Not a vestige is to be seen of any buildings, unless a fragment of the church.

“The estate of Coubin, near Forres, is another melancholy instance. This tract was once worth 300*l.* a year, at this time overwhelmed with sand. This strange inundation was still in motion in 1769, chiefly when a strong wind prevailed. Its motion is so rapid, that I have been assured, that an apple-tree has been so covered with it in one season, that only the very summit appeared. This distress was brought on about ninety years ago, and was occasioned by the cutting down some trees, and pulling up the bent or star which grew on the sand hills; which at last gave rise to the act of 15 George III. c. 33. to prohibit the destruction of this useful plant.

“I beg leave to suggest to the public a possible means of putting a stop to these destructive ravages. Providence hath kindly formed this plant to grow only in pure sand. Mankind was left to make, in after-times,

I

an application of it suitable to their wants. The sand-hills, on a portion of the Flintshire shores, in the parish of Llanasa, are covered with it naturally, and kept firm in their place. The Dutch perhaps owe the existence of part at least of their country to the sowing of it on the *mobile solum*, their sand-banks.

“My humane and amiable friend, the late Benjamin Stillingfleet, Esq. recommended the sowing of this plant on the sandy wilds of Norfolk, that its matted roots might prevent the deluges of sand which that country experiences. It has been already remarked, that where-soever this plant grows, the salutary effects are soon observed to follow. A single plant will fix the sand, and gather it into a hillock; these hillocks, by the increase of vegetation, are formed into larger, till by degrees a barrier is made often against the encroachments of the sea; and might as often prove preventive of the calamity in question. I cannot, therefore, but recommend the trial to the inhabitants of many parts of North Britain. The plant grows in most places near the sea, and is known to the Highlanders by the name of *murah*; to the English by that of *bent-star, mat grass*, or *marram*. Linnæus calls it *arundo arenaria*. The Dutch call it *helm*. This plant hath stiff and sharp-pointed leaves, growing like a rush, a foot and a half long: the roots both creep and penetrate deeply into their sandy beds: the stalk bears an ear five or six inches long, not unlike rye; the seeds are small, brown, and roundish. By good fortune, as old Gerard observes, no cattle will eat or touch this vegetable, allotted for other purposes, subservient to the use of mankind.”

SAND-Piper. See TRINGA, ORNITHOLOGY Index.

SAND-Stone, a compound stone, of which there are numerous varieties, arising not only from a difference of external appearance, but also in the nature and proportions of the constituent parts. See GEOLOGY Index.

There is a singular variety of sand-stone, which consists of small grains of hard quartz which strike fire with steel united with some micaceous particles. This variety is flexible and elastic, the flexibility depending on the micaceous part and softness of the gluten with which the particles are cemented. This elastic stone is brought from Brazil. There are also two tables of white marble, kept in the palace of Borghese at Rome, which have the same property. But the sparry particles of their substance, though transparent, are rather soft, and may be easily separated by the nail. They effervesce with acids, and there is a small mixture of minute particles of talc or mica.

Sand-stones are of great use in buildings which are required to resist air, water, and fire. Some of them are soft in the quarry, but become hard when exposed to the air. The loose ones are most useful, but the solid and hard ones crack in the fire, and take a polish when used as grindstones. Stones of this kind ought therefore to be nicely examined before they are employed for valuable purposes.

SANDAL, in antiquity, a rich kind of slipper worn on the feet by the Greek and Roman ladies, made of gold, silk, or other precious stuff; consisting of a sole, with an hollow at one extreme to embrace the ankle, but leaving the upper part of the foot bare.

SANDAL, is also used for a shoe or slipper worn by the pope and other Romish prelates when they officiate.

It

Sand.

Sandal.

andal, Sandarach. It is also the name of a sort of slipper worn by several congregations of reformed monks. This last consists of no more than a mere leathern sole, fastened with latches or buckles, all the rest of the foot being left bare. The Capuchins wear sandals; the Recollects, clogs; the former are of leather, and the latter of wood.

SANDAL-Wood. See SAUNDERS.

SANDARACH, in *Natural History*, a very beautiful native fossil, though too often confounded with the common factitious red arsenic, and with the red matter formed by melting the common yellow orpiment.

It is a pure substance, of a very even and regular structure. is throughout of that colour which our dyers term an *orange scarlet*, and is considerably transparent even in the thickest pieces. But though, with respect to colour, it has the advantage of cinnabar while in the mass, it is vastly inferior to it when both are reduced to powder. It is moderately hard, and remarkably heavy; and, when exposed to a moderate heat, melts and flows like oil: if set on fire, it burns very briskly.

It is found in Saxony and Bohemia, in the copper and silver mines; and is sold to the painters, who find it a very fine and valuable red: but its virtues or qualities in medicine are no more ascertained at this time than those of the yellow orpiment.

Gum-SANDARACH, is a dry hard resin, usually in the form of loose granules, of the size of a pea, a horse-bean, or larger; of a pale whitish, yellow colour, transparent, and of a resinous smell, brittle, very inflammable, of an acrid and aromatic taste, and diffusing a very pleasant smell when burning. It was long the prevailing opinion that this gum was obtained from the *juniperus communis*; but this plant does not grow in Africa, in which country only sandarach is produced; for the gum sandarach of the shops is brought from the southern provinces of the kingdom of Morocco. About six or seven hundred quintals of it are exported every year from Santa Cruz, Mogador, and Saffy. In the language of the country it is called *el grassa*. The tree which produces it is a *Thuia*, found also by M. Vahl in the kingdom of Tunis. It was made known several years ago by Dr Shaw, who named it *Cypressus fructu quadrivalvi, Equiseti instar articulatis*; but neither of these learned men was acquainted with the economical use of this tree; probably because, being not common in the northern part of Barbary, the inhabitants find little advantage in collecting the resin which exudes from it.

M. Schousboe (A), who saw the species of *thuia* in question, says that it does not rise to more than the height of 20 or 30 feet at most, and that the diameter of its trunk does not exceed ten or twelve inches. It distinguishes itself, on the first view, from the two other species of the same genus, cultivated in gardens, by having a very distinct trunk, and the figure of a real tree; whereas in the latter the branches rise from the root, which gives them the appearance rather of bushes. Its branches also are more articulated and brittle. Its flowers, which are not very apparent, show themselves

VOL. XVIII. Part II.

in April; and the fruit, which are of a spherical form, ripen in September. When a branch of this tree is held to the light, it appears to be interspersed with a multitude of transparent vesicles which contain the resin. When these vesicles burst in the summer months, a resinous juice exudes from the trunk and branches, as is the case in other coniferous trees. This resin is the sandarach, which is collected by the inhabitants of the country, and carried to the ports, from which it is transported to Europe. It is employed in making some kinds of sealing-wax, and in different sorts of varnish. In 1793 a hundred weight of it cost in Morocco from 13 to 13½ piastres, which make from about 3*l.* 5*s.* to 3*l.* 7*s.* 6*d.* sterling. The duty on exportation was about 7*s.* 6*d.* sterling per quintal.

Sandarach, to be good, must be of a bright yellow colour, pure and transparent. It is an article very difficult to be adulterated. Care, however, must be taken, that the Moors do not mix with it too much sand. It is probable that a tree of the same kind produces the gum sandarach of Senegal, which is exported in pretty considerable quantities.

Pounded SANDARACH. See POUNCE.

SANDEMANIANS, in ecclesiastical history, a modern sect that originated in Scotland about the year 1728; where it is at this time distinguished by the name of *Glassites*, after its founder Mr John Glass, who was a minister of the established church in that kingdom; but being charged with a design of subverting the national covenant, and sapping the foundation of all national establishments by the kirk judicatory, was expelled by the synod from the church of Scotland. His sentiments are fully explained in a tract published at that time, intitled, "The Testimony of the King of Martyrs," and preserved in the first volume of his works. In consequence of Mr Glass's expulsion, his adherents formed themselves into churches, conformable in their institution and discipline to what they apprehended to be the plan of the first churches recorded in the New Testament. Soon after the year 1755, Mr Robert Sandeman, an elder in one of these churches in Scotland, published a series of letters addressed to Mr Hervey, occasioned by his Theron and Aspasio; in which he endeavours to show, that his notion of faith is contradictory to the scripture account of it, and could only serve to lead men, professedly holding the doctrines commonly called *Calvinistic*, to establish their own righteousness upon their frames, inward feelings, and various acts of faith. In these letters Mr Sandeman attempts to prove, that faith is neither more nor less than a simple assent to the divine testimony concerning Jesus Christ, recorded in the New Testament; and he maintains, that the word *faith*, or *belief*, is constantly used by the apostles to signify what is denoted by it in common discourse, viz. a persuasion of the truth of any proposition, and that there is no difference between believing any common testimony, and believing the apostolic testimony, except that which results from the nature of the testimony itself. This led the way to a controversy among those who were called *Calvinists*, concerning the nature of justifying faith; and those who adopted Mr Sandeman's notion

Sandarach

Sandemans.

Sandema-
nians
||
Sandori-
cum.

tion of it, and who took the denomination of *Sandemans*, formed themselves into church order, in strict fellowship with the churches in Scotland, but holding no kind of communion with other churches. The chief opinions and practices in which this sect differs from other Christians, are, their weekly administration of the Lord's Supper; their love-feasts, of which every member is not only allowed but required to partake, and which consist of their dining together at each other's houses in the interval between the morning and afternoon service; their kiss of charity used on this occasion, at the admission of a new member, and at other times, when they deem it to be necessary or proper; their weekly collection before the Lord's Supper, for the support of the poor, and defraying other expenses; mutual exhortation; abstinence from blood and things strangled; washing each other's feet, the precept concerning which, as well as other precepts, they understand literally; community of goods, so far as that every one is to consider all that he has in his possession and power as liable to the calls of the poor and church; and the unlawfulness of laying up treasures on earth, by setting them apart for any distant, future, and uncertain use. They allow of public and private diversions; so far as they are not connected with circumstances really sinful; but apprehending a lot to be sacred, disapprove of playing at cards, dice, &c. They maintain a plurality of elders, pastors, or bishops, in each church; and the necessity of the presence of two elders in every act of discipline, and at the administration of the Lord's Supper. In the choice of these elders, want of learning, and engagements in trade, &c. are no sufficient objection; but second marriages disqualify for the office; and they are ordained by prayer and fasting, imposition of hands, and giving the right hand of fellowship. In their discipline they are strict and severe; and think themselves obliged to separate from the communion and worship of all such religious societies as appear to them not to profess the simple truth for their only ground of hope, and who do not walk in obedience to it. We shall only add, that in every church transaction, they esteem unanimity to be absolutely necessary. From this abstract of the account which they have published of their tenets and practices, it does not seem to be probable that their number should be very considerable.

SANDERS, a dye wood. See SAUNDERS.

SANDIVER, an old name for a whitish substance which is thrown up from the *metal*, as it is called, of which glass is made; and, swimming on its surface, is skimmed off.

Sandiver is also plentifully ejected from volcanoes; some is of a fine white, and others tinged bluish or yellow.

Sandiver is said to be detergent, and good for foulnesses of the skin. It is also used by gilders of iron.

SANDIX, a kind of minium, or red lead, made of ceruse, but much inferior to the true minium.

SANDOMIR, a city, the capital of a palatinate of the same name, in Austrian Poland, on the Vistula. The Swedes blew up the castle in 1656; and here, in 1659, was a dreadful battle between the Tartars and Russians. It is 84 miles south-east of Cracow. Lat. 49. 26. Long. 20. 10.

SANDORICUM, a genus of plants belonging to the

decandria class; and in the natural method ranking under the 23d order, *Trihilate*. See BOTANY Index.

SANDPU, or SANPOO, the vulgar name of a river in the East Indies, which is one of the largest in the world; but it is better known by that of *Burrampooter*. Of this most majestic body of waters we have the following very animated account in Maurice's Indian Antiquities. "An object equally novel and grand now claims our attention; so novel, as not to have been known to Europeans in the real extent of its magnificence before the year 1765, and so awfully grand, that the astonished geographer, thinking the language of prose inadequate to convey his conception, has had recourse to the more expressive and energetic language of poetry: but

—scarce the Muse herself

Dares stretch her wing o'er this enormous mass
Of rushing waters; to whose dread expanse,
Continuous depth, and wondrous length of course,
Our floods are rills.

"This stupendous object is the *Burrampooter*, a word which in Shanscrit signifies *the son of Brahma*; for no meaner origin could be assigned to so wonderful a progeny. This supreme monarch of Indian rivers derives its source from the opposite side of the same mountain from which the Ganges springs, and taking a bold sweep towards the east, in a line directly opposite to the course of that river, washes the vast country of Tibet, where, by way of distinction, it is denominated *Sanpoo*, or *the river*. Winding with a rapid current through Tibet, and, for many a league, amidst dreary deserts and regions remote from the habitations of men, it waters the borders of the territory of Lassa, the residence of the grand Lama; and then deviating with a cometary irregularity, from an east to a south-east course, the *mighty wanderer* approaches within 200 miles of the western frontiers of the vast empire of China. From this point its more direct path to the ocean lay through the gulf of Siam; but with a desultory course peculiar to itself, it suddenly turns to the west through Assam; and enters Bengal on the north-east quarter. Circling round the western point of the Garrow mountains, the *Burrampooter* now takes a southern direction; and for 60 miles before it meets the Ganges, its sister in point of origin, but not its rival in point of magnitude, glides majestically along in a stream which is regularly from four to five miles wide, and, but for its freshness, Mr Rennel says, might pass for an arm of the sea. About 40 miles from the ocean these mighty rivers unite their streams; but that gentleman is of opinion that their junction was formerly higher up, and that the accumulation of two such vast bodies of water, scooped out the amazing bed of the *Megna lake*. Their present conflux is below *Luckipoor*; and by that confluence a body of fresh running water is produced, hardly equalled, and not exceeded, either in the old or the new hemisphere. So stupendous is that body of water, that it has formed a gulf of such extent as to contain islands that rival our *Isle of Wight* in size and fertility; and with such resistless violence does it rush into the ocean, that in the rainy season the sea itself, or at least its surface, is perfectly fresh for many leagues out."

SANDS, *Goodwin*, or *Godwin*, are dangerous sand banks

Sandori-
cum
||
Sands.

sands, Sandwich. banks lying off the coast of Kent in England. See KENT.

SANDWICH, a town of Kent, and one of the cinque ports, having the title of an earldom. It consisted of 1398 houses in 1801, most of them old, and built with wood, though there are a few new ones built with brick and flints. The town is walled round, and also fortified with ditches and ramparts; but the walls are much decayed, on account of the harbour being so choked up with sand that a ship of 100 tons burthen cannot get in. The number of inhabitants, according to the census of 1801, was 6506; but in the census for 1811, the number given is 2735, which is probably an error. E. Long. 1. 20. N. Lat. 51. 20.

SANDWICH ISLANDS, a group of islands in the South sea, lying near New Ireland, were among the last discoveries of Captain Cook, who so named them in honour of the earl of Sandwich, under whose administration these discoveries were made. They consist of 11 islands, extending in latitude from 18. 54. to 22. 15. N. and in longitude from 150. 54. to 160. 24. W. They are called by the natives *OWHYHEE*, *MOWEE*, *RANAI*, *MOROTOI*, *TAHOOROWA*, *WOAHOO*, *ATOOL*, *Neeheehew*, *Orechoua*, *Morotinne*, and *TAHOORA*, all inhabited except the two last. An account of the most remarkable of which will be found in their alphabetical order, in their proper places in this work. The climate of these islands differs very little from that of the West Indies in the same latitude, though perhaps more temperate; and there are no traces of those violent winds and hurricanes, which render the stormy months in the West Indies so dreadful. There is also more rain at the Sandwich isles, where the mountainous parts being generally enveloped in a cloud, successive showers fall in the inland parts, with fine weather, and a clear sky, on the sea shore. Hence it is, that few of those inconveniences, to which many tropical countries are subject, either from heat or moisture, are experienced here. The winds, in the winter months, are generally from east-south-east to north-east. The vegetable productions are nearly the same as those of the other islands in this ocean; but the taro root is here of a superior quality. The bread-fruit trees thrive not in such abundance as in the rich plains of Otaheite, but produce double the quantity of fruit. The sugar-canes are of a very unusual size, some of them measuring 11 inches and a quarter in circumference, and having 14 feet eatable. There is also a root of a brown colour, shaped like a yam, and from six to ten pounds in weight, the juice of which is very sweet, of a pleasant taste, and is an excellent substitute for sugar. The quadrupeds are confined to the three usual sorts, hogs, dogs, and rats. The fowls are also of the common sort; and the birds are beautiful and numerous, though not various. Goats, pigs, and European seeds, were left by Captain Cook; but the possession of the goats soon gave rise to a contest between two districts, in which the breed was entirely destroyed. The inhabitants are undoubtedly of the same race that possesses the islands south of the equator; and in their persons, language, customs, and manners, approach nearer to the New Zealanders than to their less distant neighbours, either of the Society or Friendly Islands. They are in general about the middle size, and well made; they walk very gracefully, run nimbly, and are capable of bearing very great fatigue. Many of both sexes have

fine open countenances; and the women in particular have good eyes and teeth, with a sweetness and sensibility of look, that render them very engaging. There is one peculiarity, characteristic of every part of these islands, that even in the handsomest faces there is a fullness of the nostril, without any flatness or spreading of the nose. They suffer their beards to grow, and wear their hair after various fashions. The dress of both men and women nearly resemble those of New Zealand, and both sexes wear necklaces of small variegated shells. Tattowing the body is practised by every colony of this nation. The hands and arms of the women are also very neatly marked, and they have the singular custom of tattowing the tip of the tongue. Like the New Zealanders, they have adopted the method of living together in villages, containing from 100 to 200 houses, built pretty closely together, without any order, and having a winding path between them. They are generally flanked, towards the sea, with detached walls, which are meant both for shelter and defence. These walls consist of loose stones, and the inhabitants are very dexterous in shifting them suddenly to such places as the direction of the attack may require. In the sides of the hills, or surrounding eminences, they have also little holes, or caves, the entrance to which is also secured by a fence of the same kind. They serve for places of retreat in cases of extremity, and may be defended by a single person against several assailants. Their houses are of different sizes, some of them being large and commodious, from 40 to 50 feet long, and from 20 to 30 broad; while others are mere hovels. The food of the lower class consists principally of fish and vegetables, to which the people of higher rank add the flesh of dogs and hogs. The manner of spending their time admits of little variety. They rise with the sun, and, after enjoying the cool of the evening, retire to rest, a few hours after sunset. The making of canoes, mats, &c. forms the occupations of the men; the women are employed in manufacturing cloth, and the servants are principally engaged in the plantations and fishing. Their idle hours are filled up with various amusements, such as dancing, boxing, wrestling, &c. Their agriculture and navigation bear a great resemblance to those of the South-sea islands. Their plantations, which are spread over the whole sea-coast, consist of the taro, or eddy-root, and sweet potatoes, with plants of the cloth-trees set in rows. The bottoms of their canoes are of a single piece of wood, hollowed out to the thickness of an inch, and brought to a point at each end. The sides consist of three boards, each about an inch thick, neatly fitted and lashed to the bottom part. Some of their double canoes measure 70 feet in length, three and a half in depth, and twelve in breadth. Their cordage, fish-hooks, and fishing-tackle, differ but little from those of the other islands. Among their arts must not be forgotten that of making salt, which they have in great abundance, and of a good quality. Their instruments of war are spears, daggers, clubs, and slings; and for defensive armour they wear strong mats, which are not easily penetrated by such weapons as theirs. As the islands are not united under one sovereign, wars are frequent among them, which, no doubt, contribute greatly to reduce the number of inhabitants, which, according to the proportion assigned to each island, does not exceed 400,000. The same system of subordination prevails

Sandwich
||
Sanguina-
ria.

here as at the other islands, the same absolute authority on the part of the chiefs, and the same unresisting submission on the part of the people. The government is likewise monarchical and hereditary. At Owhyhee there is a regular society of priests living by themselves, and distinct in all respects from the rest of the people. Human sacrifices are here frequent; not only at the commencement of a war, or any signal enterprise, but the death of every considerable chief calls for a repetition of these horrid rites. Notwithstanding the irreparable loss in the death of Captain Cook, who was here murdered through sudden resentment and violence, they are acknowledged to be of the most mild and affectionate disposition. They live in the utmost harmony and friendship with each other; and in hospitality to strangers they are not exceeded even by the inhabitants of the Friendly Islands. Their natural capacity seems, in no respect, below the common standard of mankind; and their improvements in agriculture, and the perfection of their manufactures, are certainly adequate to the circumstances of their situation, and the natural advantages which they enjoy.

SANDYS, SIR EDWIN, second son of Dr Edwin Sandys, archbishop of York, was born about 1561, and educated at Oxford under Mr Richard Hooker, author of the Ecclesiastical Polity. In 1581 he was collated to a prebend in the cathedral of York. He travelled into foreign countries; and, upon his return, grew famous for learning, prudence, and virtue. While he was at Paris, he drew up a tract, published under the title of *Europa Speculum*. In 1602, he resigned his prebend; and, the year following, was knighted by King James I., who employed him in several important affairs. He was dexterous in any great employment, and a good patriot. However, opposing the court with vigour in the parliament field in 1621, he, with Mr Selden, was committed to custody for a month. He died in 1629, having bequeathed 1500*l.* to the university of Oxford, for the endowment of a metaphysical lecture.

SANDYS, *George*, brother of the foregoing Sir Edwin, and youngest son of Archbishop Sandys, was born in 1577. He was a very accomplished man; travelled over several parts of Europe and the East; and published a relation of his journey in folio, in 1615. He made an elegant translation of Ovid's *Metamorphoses*; and composed some poetical pieces of his own, that were greatly admired in the times of their being written. He also paraphrased the Psalms; and has left behind him a Translation, with notes, of one Sacred Drama, written originally by Grotius, under the title of *Christus Patiens*; on which, and *Adamus Exul*, and *Masenius*, is founded Lauder's impudent charge of plagiarism against our immortal Milton. Our author became one of the privy chamber to Charles I., and died in 1643.

SAN FERNANDO, near the entrance of the Golfo Dolce, in the Bay of Honduras, in 15 degrees 18 minutes north latitude, has lately been fortified by the Spaniards, for the purpose of checking the Musquitomen, logwood-cutters, and bay-men. It is a very good harbour, with safe anchorage from the north and east winds, in eight fathoms water.

SANGUIFICATION, in the animal œconomy, the conversion of the chyle into true blood. See BLOOD.

SANGUINARIA, BLOOD-WORT, a genus of plants

belonging to the polyandria class, and in the natural method ranking under the 27th order, *Rheadea*. See BOTANY *Index*. The Indians paint themselves yellow with the juice of these plants.

SANGUISORBA, GREATER WILD BURNET, a genus of plants, belonging to the tetrandria class, and in the natural method ranking under the 54th order, *Miscellanea*. See BOTANY *Index*. The cultivation of this plant has been greatly recommended as food for cattle. See BURNET, AGRICULTURE *Index*.

SANHEDRIM, or SANHEDRIN, from the Greek word *Συνεδριον*, which signifies a council or assembly of persons sitting together, was the name whereby the Jews called the great council of the nation, assembled in an apartment of the temple of Jerusalem to determine the most important affairs both of their church and state. This council consisted of seventy senators. The room they met in was a rotunda, half of which was built without the temple, and half within; that is, one semicircle was within the compass of the temple; the other semicircle, they tell us, was built without, for the senators to sit in; it being unlawful for any one to sit down in the temple. The Nasi, or prince of the sanhedrim, sat upon a throne at the end of the hall, having his deputy at his right hand, and his sub-deputy on his left. The other senators were ranged in order on each side.

The rabbins pretend, that the sanhedrim has always subsisted in their nation from the time of Moses down to the destruction of the temple by the Romans. They date the establishment of it from what happened in the wilderness, some time after the people departed from Sinai (Numb. xi. 16.), in the year of the world 2514. Moses, being discouraged by the continual murmurings of the Israelites, addressed himself to God, and desired to be relieved, at least, from some part of the burden of the government. Then the Lord said to him, "Gather unto me 70 men of the elders of Israel, whom thou knowest to be the elders of the people, and officers over them; and bring them unto the tabernacle of the congregation, that they may stand there with thee: And I will come down and talk with thee there; and I will take of the spirit which is upon thee, and will put it upon them; and they shall bear the burden of the people with thee, that thou bear it not thyself alone." The Lord, therefore, poured out his spirit upon these men, who began at that time to prophesy, and have not ceased from that time. The sanhedrim was composed of 70 counsellors, or rather 72, six out of each tribe; and Moses, as president, made up the number 73. To prove the uninterrupted succession of the judges of the sanhedrim, there is nothing unattempted by the partisans of this opinion. They find a proof where others cannot so much as perceive any appearance or shadow of it. Grotius may be consulted in many places of his commentaries, and in his first book *De jure belli et pacis*, c. 3. art. 20. and *Selden de Synedriis veterum Hebraeorum*. Also, Calmet's Dissertation concerning the polity of the ancient Hebrews, printed before his Comment upon the Book of Numbers.

As to the personal qualifications of the judges of this bench, their birth was to be untainted. They were often taken from the race of the priests or Levites, or out of the number of the inferior judges, or from the lesser

Sanguina-
ria
||
Sanhedri

hedrim. lesser sanhedrim, which consisted only of 23 judges.— They were to be skilful in the law, as well traditional as written. They were obliged to study magic, divination, fortune-telling, physic, astrology, arithmetic, and languages. The Jews say, they were to know to the number of 70 tongues; that is, they were to know all the tongues, for the Hebrews acknowledged but 70 in all, and perhaps this is too great a number. Eunuchs were excluded from the sanhedrim because of their cruelty, usurers, decrepid persons, players at games of chance, such as had any bodily deformities, those that had brought up pigeons to decoy others to their pigeon-houses, and those that made a gain of their fruits in the sabbatical year. Some also exclude the high-priest and the king, because of their too great power; but others will have it, that the kings always presided in the sanhedrim, while there were any kings in Israel.— Lastly, it was required, that the members of the sanhedrim should be of a mature age, a handsome person, and of considerable fortune. We speak now, according to the notions of the rabbins, without pretending to warrant their opinions.

The authority of the great sanhedrim was vastly extensive. This council decided such causes as were brought before it by way of appeal from the inferior courts. The king, the high-priest, the prophets, were under its jurisdiction. If the king offended against the law; for example, if he married above 18 wives, if he kept too many horses, if he hoarded up too much gold and silver, the sanhedrim had him stripped and whipped in their presence. But whipping, they say, among the Hebrews was not at all ignominious; and the king bore this correction by way of penance, and himself made choice of the person that was to exercise this discipline over him. Also the general affairs of the nation were brought before the sanhedrim. The right of judging in capital cases belonged to this court, and this sentence could not be pronounced in any other place, but in the hall called *Laschat-haggazith*, or the *hall paved with stones*, supposed by some to be the *Λιθοστράσιος*, or *pavement*, mentioned in John xix. 13. From whence it came to pass, that the Jews were forced to quit this hall when the power of life and death was taken out of their hands, 40 years before the destruction of their temple, and three years before the death of Jesus Christ. In the time of Moses this council was held at the door of the tabernacle of the testimony. As soon as the people were in possession of the land of promise, the sanhedrim followed the tabernacle. It was kept successively at Gilgal, at Shiloh, at Kirjath-jearim, at Nob, at Gibeon in the house of Obed-edom; and, lastly, it was settled at Jerusalem, till the Babylonish captivity. During the captivity it was kept up at Babylon. After the return from Babylon, it continued at Jerusalem to the time of the Sicarii, or Assassins. Then finding that these profligate wretches, whose number increased every day, sometimes escaped punishment by favour of the president or judges, it was removed to Hanoth, which were certain abodes situated, as the rabbins tell us, upon the mountain of the temple. From thence they came down into the city of Jerusalem, withdrawing themselves by degrees from the temple. Afterwards they removed to Jamia, thence to Jericho, to Uzzah, to Sepharvaim, to Bethsanim, to Sephoris, last of all to Tiberias, where they continued to the

time of their utter extinction. And this is the account the Jews themselves give us of the sanhedrim.

But the learned do not agree with them in all this. Father Petau fixes the beginning of the sanhedrim not till Gabinius was governor of Judea, who, according to Josephus, erected tribunals in the five principal cities of Judea; at Jerusalem, at Gadara, at Amathus, at Jericho, and at Sephora or Sephoris, a city of Galilee. Grotius places the origin of the sanhedrim under Moses, as the rabbins do; but he makes it determine at the beginning of Herod's reign. Mr Basnage at first thought that the sanhedrim began under Gabinius; but afterwards he places it under Judas Maccabæus, or under his brother Jonathan. We see, indeed, under Jonathan Maccabæus, (1 Macc. xii. 6.), in the year 3860, that the senate with the high-priest sent an embassy to the Romans. The Rabbins say, that Alexander Jannæus, king of the Jews, of the race of the Asmonæans, appeared before the sanhedrim, and claimed a right of sitting there, whether the senators would or not. Josephus informs us, that when Herod was but yet governor of Galilee, he was summoned before the senate, where he appeared. It must be therefore acknowledged, that the sanhedrim was in being before the reign of Herod. It was in being afterwards, as we find from the Gospel and from the Acts. Jesus Christ in St Matthew (v. 22.) distinguishes two tribunals.— “Whosoever is angry with his brother without a cause shall be in danger of the judgment;” this, they say, is the tribunal of the 23 judges. “And whosoever shall say to his brother Raca, shall be in danger of the council;” that is, of the great sanhedrim, which had the right of life and death, at least generally, and before this right was taken away by the Romans. Some think that the jurisdiction of the council of 23 extended to life and death also; but it is certain that the sanhedrim was superior to this council. See also Mark xiii. 9. xiv. 55. xv. 1.; Luke xxii. 52, 66.; John xi. 47.; Acts iv. 15. v. 21. where mention is made of the synedrion or sanhedrim.

From all this it may be concluded, that the origin of the sanhedrim is involved in uncertainty; for the council of the 70 elders established by Moses was not what the Hebrews understand by the name of sanhedrim. Besides, we cannot perceive that this establishment subsisted either under Joshua, the judges, or the kings. We find nothing of it after the captivity, till the time of Jonathan Maccabæus. The tribunals erected by Gabinius were very different from the sanhedrim, which was the supreme court of judicature, and fixed at Jerusalem; whereas Gabinius established five at five different cities. Lastly, It is certain that this senate was in being in the time of Jesus Christ; but the Jews themselves inform us that they had no longer then the power of life and death (John xviii. 31.)

SANJACKS, a people inhabiting the Curdistan, or Persian mountains, subsisting chiefly by plunder, and the scanty pittance afforded by their own mountainous country. “They were much reduced (says Mr Ives) by the late bashaw Achmet of Bagdad, who pursued them in person to their subterranean retreats, and destroyed many by the sword, and carried off great numbers of prisoners, who were sold for slaves.” Notwithstanding this check, in the year 1758, they again became so daring that they would attack caravans of 700 men,

Sanjacks.
||
Santa
Cruz.

men, and sometimes carry all off. They are said to be worshippers of the evil principle.

SAN JUAN DE PUERTO RICO, usually called *Porto Rico*, one of the West India islands belonging to Spain, is situated in about 18. N. Lat. and between 65. 36. and 67. 45. W. Long. and is about 40 leagues long and 20 broad. The island is beautifully diversified with woods, valleys, and plains, and is extremely fertile. It is well watered with springs and rivers, abounds with meadows, is divided by a ridge of mountains running from east to west, and has a harbour so spacious that the largest ships may lie in it with safety. Before the arrival of the Spaniards it was inhabited by 400,000 or 500,000 people, who, in a few years, were extirpated by its merciless conquerors. Raynal says, that its whole inhabitants amount at present only to 1500 Spaniards, Mestoes, and Mulattoes, and about 3000 negroes. Thus one of the finest islands in the West Indies has been depopulated by the cruelty, and left uncultivated by the indolence, of its possessors. But it is the appointment of Providence, who seldom permits flagrant crimes to pass unpunished, that poverty and wretchedness should be uniform consequences of oppression.

SANICULA, SANICLE, or *Self-heal*, a genus of plants belonging to the pentandria class, and in the natural method ranking under the 45th order, *Umbellatae*. See BOTANY Index.

SANIES, in *Medicine*, a serous putrid matter, issuing from wounds. It differs from pus, which is thicker and whiter.

SANNAZARIUS, JAMES, in Latin *Actius Cincenis Sannazarius*, a celebrated Latin and Italian poet, born at Naples in 1458. He by his wit ingratiated himself into the favour of King Frederic; and, when that prince was dethroned, attended him into France, where he staid with him till his death, which happened in 1504. Sannazarius then returned into Italy, where he applied himself to polite literature, and particularly to Latin and Italian poetry. His gay and facetious humour made him sought for by all companies; but he was so afflicted at the news that Phillibert prince of Orange, general of the emperor's army, had demolished his country-house, that it threw him into an illness, of which he died in 1530. It is said, that being informed a few days before his death, that the prince of Orange was killed in battle, he called out, "I shall die contented, since Mars has punished this barbarous enemy of the Muses." He wrote a great number of Italian and Latin poems: among those in Latin, his *De Partu Virginis* and Eclogues are chiefly esteemed; and the most celebrated of his Italian pieces is his *Arcadia*.

SANSANDING, a town in Africa, situated near the banks of the Niger, in N. Lat. 14° 24', and 2° 23' W. Long. It is inhabited by Moors and Negroes to the number of from eight to ten thousand. The Negroes are kind, hospitable, and credulous; the Moors are, at Sansanding, as everywhere else in the interior parts of Africa, fanatical, bigotted, and cruel.

SANTA CRUZ, a large island in the South sea, and one of the most considerable of those of Solomon, being about 250 miles in circumference. W. Long. 130. 0. S. Lat. 10. 21.

SANTA CRUZ, or St Croix, a small and unhealthy island, situated in about 64 degrees west longitude and

18 north latitude. It is about eighteen leagues in length, and from three to four in breadth. In 1643 it was inhabited by Dutch and English, who soon became enemies to each other; and in 1650 were both driven out by 1200 Spaniards, who arrived there in five ships. The triumph of these lasted but a few months. The remains of that numerous body, which were left for the defence of the island, surrendered without resistance to 160 French, who had embarked, in 1651, from St Christopher's, to make themselves masters of the island.

These new inhabitants lost no time in making themselves acquainted with a country so much disputed. On a soil, in other respects excellent, they found only one river of a moderate size, which, gliding gently almost on a level with the sea through a flat country, furnished only a brackish water. Two or three springs, which they found in the innermost parts of the island, made but feeble amends for this defect. The wells were for the most part dry. The construction of reservoirs required time. Nor was the climate more inviting to the new inhabitants. The island being flat, and covered with old trees, scarcely afforded an opportunity for the winds to carry off the poisonous vapours with which its morasses clogged the atmosphere. There was but one remedy for this inconvenience; which was to burn the woods. The French set fire to them without delay; and, getting on board their ships, became spectators from the sea, for several months, of the conflagration they had raised in the island. As soon as the flames were extinguished, they went on shore again.

They found the soil fertile beyond belief. Tobacco, cotton, arnotto, indigo, and sugar, flourished equally in it. So rapid was the progress of this colony, that in 11 years from its commencement there were upon it 822 white persons, with a proportionable number of slaves. It was rapidly advancing to prosperity, when such obstacles were thrown in the way of its activity as made it decline again. This decay was as sudden as its rise. In 1696 there were no more than 147 men, with their wives and children, and 623 blacks remaining; and these were transported to St Domingo.

Some obscure individuals, some writers unacquainted with the views of government, with their secret negotiations, with the character of their ministers, with the interests of the protectors and the protected; who flatter themselves that they can discern the reason of events amongst a multitude of important or frivolous causes, which may have equally occasioned them; who do not conceive, that among all these causes the most natural may possibly be the farthest from the truth; who after having read the news, or journal of the day, with profound attention, decide as peremptorily as if they had been placed all their lifetime at the helm of the state, and had assisted at the council of kings; who are never more deceived than in those circumstances in which they display some share of penetration; writers as absurd in the praises as in the blame which they bestow upon nations, in the favourable or unfavourable opinion they form of ministerial operations: these idle dreamers, in a word, who think they are persons of importance, because their attention is always engaged on matters of consequence, being convinced that courts are always governed in their decisions by the most comprehensive views of profound policy, have supposed that the court

Santa
Cruz.

Raynal's
History of
the East
and West
Indies,
vol. iv.
p. 293.

of Versailles had neglected Santa Cruz, merely because they wished to abandon the small islands in order to unite all their strength, industry and population, in the large ones; but this is a mistaken notion. This determination arose from the farmers of the revenue, who found that the contraband trade of Santa Cruz with St Thomas was detrimental to their interests. The spirit of finance hath in all times been injurious to commerce; it hath destroyed the source from whence it sprang. Santa Cruz continued without inhabitants, and without cultivation, till 1733, when it was sold by France to Denmark for 30,750*l*. Soon after, the Danes built there the fortress of Christianstadt. Then it was that this northern power seemed likely to take deep root in America. Unfortunately, she laid her plantations under the yoke of exclusive privileges. Industrious people of all sects, particularly Moravians, strove in vain to overcome this great difficulty. Many attempts were made to reconcile the interests of the colonists and their oppressors, but without success. The two parties kept up a continual struggle of animosity, not of industry. At length the government, with a moderation not to be expected from its constitution, purchased, in 1754, the privileges and effects of the company. The price was fixed at 412,500*l*. part of which was paid in ready money, and the remainder in bills upon the treasury, bearing interest. From this time the navigation to the islands was opened to all the subjects of the Danish dominions. Of 345 plantations, which were seen at Santa Cruz, 150 were covered with sugar canes, and every habitation is limited to 3000 Danish feet in length, and 2000 in breadth. It is inhabited by 2136 white men, by 22,244, slaves, and by 155 freedmen.

SANTA Cruz, in Teneriffe. See TENERIFFE.

SANTA Cruz, a town of Africa, on the coast of Barbary, and in the province of Suez and kingdom of Morocco, with a harbour and a fort. The Moors took it from the Portuguese in 1536. It is seated at the extremity of Mount Atlas, on the Cape Aguer. W. Long. 10. 7. N. Lat. 30. 38.

SANTA Cruz de la Sierra, a town of South America, and capital of a province of that name in Peru, and in the audience of Los Charcas, with a bishop's see. It is seated at the foot of a mountain, in a country abounding in good fruits, on the river Guapy. W. Long. 59. 35. S. Lat. 20. 40.

SANTA Fe de Bogota, a town of South America, and capital of New Granada, with an archbishop's see, a supreme court of justice, and an university.

The city is situated at the foot of a steep and cold mountain, at the entrance of a vast and superb plain. In 1774 it contained 1770 houses, 3246 families, and 16,233 inhabitants. Population must necessarily increase there, since it is the seat of government, the place where the coin is stricken, the staple of trade; and lastly, since it is the residence of an archbishop, whose immediate jurisdiction extends over 31 Spanish villages, which are called towns; over 195 Indian colonies, anciently subdued; and over 28 missions, established in modern times. This archbishop hath likewise, as metropolitan, a sort of inspection over the dioceses of Quito, of Panama, of Caraccas, of St Martha, and of Carthagena. It is by this last place, though at the distance of 100 leagues, and by the river Magdalena, that Santa Fe keeps up its communication with Europe. There

are silver mines in the mountains about the city. W. Long. 60. 5. N. Lat. 3. 58.

SANTALUM, a genus of plants belonging to the octandria class; and in the natural method ranking with those of which the order is doubtful. See BOTANY *Index*.

SANTAREN, a handsome town of Portugal, in Estremadura, seated on a mountain near the river Tajo, 55 miles N. E. from Lisbon, in a country very fertile in wheat, wine, and oil. They get in their harvest here two months after they have sown their corn. It was taken from the Moors in 1447. The population is estimated at 8000. W. Long. 8. 48. N. Lat. 39. 15.

SANTAUGUSTINE. See AUGUSTINE.

SANTEN, a town of Germany, in the Prussian territories in Westphalia. It is seated on the Rhine, 15 miles S. E. from Cleves. It has a handsome church belonging to the Roman Catholics, wherein is an image of the Virgin Mary, which it is pretended performs a great many miracles. Here the fine walks begin that run as far as Wesel, from which it is five miles distant to the north-west. E. Long. 6. 33. N. Lat. 51. 38.

SANTERRE, the former name of a small territory of France, in Picardy; bounded on the north by Cambresis, on the east by Vermandois, on the west by Amienois, and on the south by the river Somme. It is very fertile, and the capital town is Peronne.

SANTEUIL, or rather *SANTEUL*, JOHN BAPTIST DE, in Latin *Santolius Victorinus*, an excellent Latin poet, was born at Paris in 1630. Having finished his studies in Louis the Great's college, he applied himself entirely to poetry, and celebrated in his verse the praises of several great men; by which he acquired universal applause. He enriched Paris with a great number of inscriptions, which are to be seen on the public fountains, and the monuments consecrated to posterity. At length, some new hymns being to be composed for the Breviary of Paris, Claude Santeuil his brother, and M. Bossuet, persuaded him to undertake that work; and he succeeded in it with the greatest applause. On which the order of Clugny desiring him to compose some for their Breviary, he complied with their request; and that order, out of gratitude, granted him letters of filiation, with an annual pension. Santeuil was caressed by all the learned men of his time; and had for his admirers the two princes of Condé, the father and son, from whom he frequently received favours. Louis XIV. also gave him a proof of his esteem, by bestowing a pension upon him. He attended the Duke of Bourbon to Dijon, when that prince went thither in order to hold the states of Burgundy; and died there in 1697, as he was preparing to return to Paris. Besides his Latin hymns, he wrote a great number of Latin Poems, which have all the fire and marks of genius discoverable in the works of great poets.

To Santeuil we are indebted for many fine church-hymns, as above mentioned. Santeuil read the verses he made for the inhabitants of heaven with all the agitations of a demoniac. Despreaux said he was the devil whom God compelled to praise saints. He was among the number of poets whose genius was as impetuous as his muse was decent.

La Bruyere has painted the character of this singular and truly original poet in the most lively colours.

“ Image

Santeuil
||
Saone.

"Image a man of great felicity of temper, complainant and docile, in an instant violent, choleric, passionate, and capricious. A man simple, credulous, playful, volatile, puerile; in a word, a child in gray hairs: but let him collect himself, or rather call forth his interior genius, I venture to say, without his knowledge or privacy, what sallies! what elevation! what images! what latinity! Do you speak of one and the same person, you will ask? Yes, of the same; of Theodas, and of him alone. He shrieks, he jumps, he rolls upon the ground, he roars, he storms; and in the midst of this tempest, a flame issues that shines, that rejoices. Without a figure, he rattles like a fool, and thinks like a wise man. He utters truths in a ridiculous way; and, in an idiotic manner, rational and sensible things. It is astonishing to find good sense disclose itself from the bosom of buffoonery, accompanied with grimaces and contortions. What shall I say more? He does and he says better than he knows. These are like two souls that are unacquainted with each other, which have each their turn and separate functions."

SANTILLANE, a sea-port town of Spain, in the province of Asturias, of which it is the capital. It is seated on the sea-coast, 55 miles east of Oviedo, and 200 north-west of Madrid. W. Long. 4. 2. N. Lat. 43. 23.

SANTOLINA, LAVENDER-COTTON, a genus of plants belonging to the syngenesia class; and in the natural method ranking under the 49th order, *Compositæ*. See BOTANY *Index*.

SANTORINI, or SANTORIN, an island of the Archipelago, to the north of Candia, and distant from it about 90 leagues, and to the south-west of Naphio. It is eight miles in length, and nearly as much in breadth, and almost covered with pumice-stone, whence the soil in general must be dry and barren: it is, however, greatly improved by the labour and industry of the inhabitants, who have turned it into a garden. It affords a great deal of barley, plenty of cotton, and large quantities of wine. Fruit is scarce, except almonds and figs; and there is neither oil nor wood. The partridge and the hare, so common in the other islands of the Archipelago, are scarce at Santorin; but quails are met with in abundance. The inhabitants are all Greeks, and are about 10,000 in number. Pyrgos is the capital town, beside which, there are several little towns and villages. There is but one spring of water in the island, for which reason the rain-water is preserved in cisterns. Though subject to the Turks, they choose their own magistrates. E. Long. 25. 36. N. Lat. 36. 38.

SANIZO, RAPHAEL. See RAPHAEL.

SAO, a territory, called a kingdom, of Africa, on the Gold-coast of Guinea, hardly two miles in length along the shore. It produces abundance of Indian corn, yams, potatoes, palm-wine, and oil. The inhabitants are very treacherous, and there is no dealing with them without great caution. It contains several villages, of which Sabo is the principal.

SAONE, a considerable river of France, which has its source in Mount Vosges near Darney, and falls into the Rhone at Lyons.

SAONE, UPPER, a department in the east of France, including the sources of the river Saone. The soil is fertile in grain, hemp, fruits, and vines, and the pastures are numerous and good. It contains mines of iron, coal, and salt. The manufactures are chiefly of iron,

glass, tinware, tiles, paper, and linen; and there is some trade in corn, wine, &c. The territorial extent of this department is 500,220 hectares. The population in 1817 was 300,156. The contributions of this department in 1800 amounted to 2,199,713 francs. Vesoul is the principal town.

SAONE and LOIRE, a department in the east of France, forming part of the ancient Burgundy. The canal of the Centre, which joins the Saone and the Loire, and is about 60 miles in length, lies chiefly in this department. The soil of this department is hilly, but fertile. It produces all kinds of grain, hemp, cattle, and fruits. Its wines are in high estimation. There are mines of iron and coal, and some manufactures of woollens, hosiery, glass, &c. Its territorial extent is 857,678 hectares; its population in 1817 was 471,457. The contributions for 1802 amounted to 4,376,459 francs. Macon is the chief town.

SAP, the juice found in vegetables.

We observed, when treating of PLANTS, that it has been long disputed whether the sap of plants be analogous to the blood of animals, and circulates in the same manner. We also mentioned the conclusions that Dr Hales drew from his numerous experiments, which were all in opposition to the doctrine that the sap circulates.

Dr Walker, late professor of Natural History in the university of Edinburgh, has published, in the 1st volume of the Philosophical Transactions of Edinburgh, an account of a course of experiments on this subject, accompanied with some observations and conclusions.

It is well known that, in the spring, vegetables contain a great quantity of sap; and there are some trees, as the birch and plane, which, if wounded, will discharge a great portion of it. Whence is this moisture derived? Whether is it imbibed from the atmosphere, or does it flow from the soil through the roots? These are the questions which require first to be answered; and Dr Walker's experiments enable us to answer them with confidence.

He selected a vigorous young birch, 30 feet high and 26 inches in circumference at the ground. He bored a hole just above the ground on the 1st of February, and cut one of its branches at the extremity. He repeated this every second day; but no moisture appeared at either of the places till the 5th of May, when a small quantity flowed on making an incision near the ground. He then cut 21 incisions in the trunk of the tree, on the north side, at the distance of a foot from one another, and reaching from the ground to the height of 20 feet. The incisions were solid triangles, each side being an inch long and an inch deep, and penetrating through the bark and wood. Dr Walker visited the tree almost every day for two months, and marked exactly from which of the incisions the sap flowed. He observed that it flowed from the lowest incision first, and gradually ascended to the highest. The following table will show the progress of the sap upwards, and its correspondence with the thermometer.

The first column is the day of the month on which the observation was made; the second expresses the number of incisions from which the sap flowed on the day of the month opposite; and the third column the degree of the thermometer at noon. Some days are omitted in March, as the incisions, though made on the 5th, did not bleed till the 11th. Some days are also passed

Dr Walker found that the sap ascends through the wood, and still more copiously between the wood and the bark; but none could be perceived ascending through the pith or the bark. He found also, that when the thermometer at noon is about 49, or between 46 and 50, the sap rises about one foot in 24 hours; that when the thermometer is about 45 at noon, it ascends about one foot in two days; and that it does not ascend at all unless the mid-day heat be above 40. He observed that it moves with more velocity through young than through old branches. In one young branch it moved through seven feet in one day, the thermometer being at 49, while it moved in the trunk of the tree only seven feet in seven days. Dr Walker has thus explained the reason why the buds on the extremities of branches unfold first; because they are placed on the youngest wood, to which the sap flows most abundantly.

The effects produced by the motion of the sap deserve to be attended to. In those parts to which it has mounted, the bark easily separates from the wood, and the ligneous circles may, without difficulty, be detached from one another. The buds begin to swell and their scales to separate, while those branches to which the sap has not ascended, remain closely folded. When the sap has reached the extremities of the branches, and has thus pervaded the whole plant, it is soon covered with opening buds, and ceases to bleed. The bleeding ceases first in the upper parts of the tree, and in the lower parts successively downwards, and the wood becomes dry. An inverted branch flows more copiously when cut than those which are erect. This is a proof that the ascent of the sap is not occasioned by capillary attraction; for water which has risen in a small glass tube by this attraction will not descend when the tube is inverted.

It is evident that there is an intimate connexion between heat and the ascent of the sap. It did not begin to flow till the thermometer stood at a certain point: when it fell below 40, it was arrested in its progress. The south side of the tree, when the sun was bright,

bled more profusely than the north side; and at sunset the incisions at the top ceased to bleed, where it was exposed most to the cold air, while it still continued to flow from the incisions next to the ground; the ground retaining its heat longer than the air.

SAP, in sieges, is a trench, or an approach made under cover, of 10 or 12 feet broad, when the besiegers come near the place, and the fire from the garrison grows so dangerous that they are not able to approach uncovered.—There are several sorts of saps; the single, which has only a single parapet; the double, having one on each side; and the flying, made with gabions, &c. In all saps traverses are left to cover the men.

SAP, or *Sapp*, in building, as to sap a wall, &c. is to dig out the ground from beneath it, so as to bring it down all at once for want of support.

SAPHIES, a kind of charms, consisting of some scrap of writing, which the Negroes believe capable of protecting them from all evil. The Moors sell scraps of the Koran for this purpose; and indeed any piece of writing may be sold as a saphie; but it would appear that the Negroes are disposed to place greater confidence in the saphies of a Christian than in those of a Moor.

When Mr Park was at Koolikorro, a considerable town near the Niger, and a great market for salt, his landlord, hearing that he was a Christian, immediately thought of procuring a saphie. For this purpose he brought out his *wolha*, or writing board, assuring me (says our author) that he would dress me a supper of rice if I would write him a saphie to protect him from wicked men. The proposal was of too great consequence to me to be refused; I therefore wrote the board full, from top to bottom, on both sides; and my landlord, to be certain of having the whole force of the charm, washed the writing from the board into a calabash with a little water; and having said a few prayers over it, drank this powerful draught; after which, lest a single word should escape, he licked the board until it was quite dry. A saphie writer was a man of too great consequence to be long concealed: the important information was carried to the Dooty, who sent his son with half a sheet of writing-paper, desiring me to write him a *naphula saphie* (a charm to procure wealth). He brought me as a present, some meal and milk; and when I had finished the saphie, and read it to him with an audible voice, he seemed highly satisfied with his bargain, and promised to bring me in the morning some milk for my breakfast.

SAPINDUS, the SOAP-BERRY TREE, a genus of plants belonging to the octandria class; and in the natural method ranking under the 23d order, *Trihilitæ*. See BOTANY *Index*.

SAPONARIA, SOPEWORT; a genus of plants belonging to the decandria class; and in the natural method ranking under the 22d order, *Caryophyllææ*. See BOTANY *Index*.

SAPOR, TASTE. See TASTE, and ANATOMY, N° 139.

SAPOTA PLUM. See ACHRAS, BOTANY *Index*.

SAPPERS. are soldiers belonging to the royal artillery, whose business it is to work at the saps, for which they have an extraordinary pay. A brigade of sappers generally consists of eight men, divided equally into two parties;

Sap
||
Sappers.

Sappers
||
Sappho.

parties; and whilst one of these parties is advancing the sap, the other is furnishing the gabions, fascines, and other necessary implements. They relieve each other alternately.

SAPPHIRA, was the wife of a rich merchant in Gueldres, and equally distinguished for her beauty and her virtue. Rhinsauld, a German officer, and governor of the town of Gueldres, fell in love with her; and not being able to seduce her either by promises or presents, he imprisoned her husband, pretending that he kept up a traitorous correspondence with the enemies of the state. Sapphira yielded to the passion of the governor in order to relieve her husband from chains; but private orders had already been given to put him to death. His unhappy widow, overwhelmed with grief, complained to Charles Duke of Burgundy. He ordered Rhinsauld to marry her, after having made over to her all his possessions. As soon as the deed was signed, and the marriage over, Charles commanded him to be put to death. Thus the children of a wife whom he had seduced, and of a husband whom he had murdered, became lawful heirs to all his wealth.

SAPPHIRE, a species of precious stone, of a blue colour. See MINERALOGY *Index*.

SAPPHO, a famous poetess of antiquity, who for her excellence in her art has been called the *Tenth Muse*, was born at Mitylene, in the isle of Lesbos, about 610 years before Christ. She was contemporary with Stesichorus and Alcæus; which last was her countryman, and some think her suitor. A verse of this poet, in which he insinuates to her his passion, is preserved in Aristotle, *Rhet.* lib. i. cap. 9. together with the fair damsel's answer.

- ALC. I fain to Sappho would a wish impart,
But fear locks up the secret in my heart.
SAP. Thy downcast look, respect, and timid air,
Too plain the nature of thy wish declare.
If lawless, wild, inordinate desire,
Did not with thoughts impure thy bosom fire,
Thy tongue and eyes, by innocence made bold,
Ere now the secret of thy soul had told.

M. le Fevre observes, that Sappho was not in her usual good humour when she gave so cold an answer to a request, for which, at another time, perhaps she would not have waited.—It has been thought, too, that Anacreon was one of her lovers, and his editor Barnes has taken some pains to prove it: but chronology will not admit this; since, upon inquiry, it will be found that Sappho was probably dead before Anacreon was born. Of the numerous poems this lady wrote, there is nothing remaining but some small fragments, which the ancient scholiasts have cited; a hymn to Venus, preserved by Dionysius of Halicarnassus; and an ode to one of her mistresses: * which last piece confirms a tradition delivered down from antiquity, that her amorous passion extended even to persons of her own sex, and that she was willing to have her mistresses as well as her gallants.

Ovid introduces her making a sacrifice to Phaon, one of her male paramours: from which we learn, that Sappho's love for her own sex did not keep her from loving ours. She fell desperately in love with Phaon, and did all she could to win him; but in vain: upon which she threw herself headlong from a rock, and died.

It is said that Sappho could not forbear following Phaon into Sicily, whither he retired that he might not see her; and that during her stay in that island she probably composed the hymn to Venus, still extant, in which she begs so ardently the assistance of that goddess. Her prayers, however, proved ineffectual: Phaon was cruel to the last degree. The unfortunate Sappho was forced to take the dreadful leap; she went to the promontory Leucas, and threw herself into the sea. The cruelty of Phaon will not surprise us so much, if we reflect, that she was a widow (for she had been married to a rich man in the isle of Andros, by whom she had a daughter named *Cleis*); that she had never been handsome; that she had observed no measure in her passions to both sexes; and that Phaon had long known all her charms. She was, however, a very great wit, and for that alone deserves to be remembered. The Mitylenians held her merit in such high esteem, that they paid her sovereign honours after her death, and stamped their money with her image. The Romans afterwards erected a noble statue of porphyry to her; and in short, ancients as well as moderns have done honour to her memory. Vossius says, that none of the Greek poets excelled Sappho for sweetness of verse; and that she made Archilochus the model of her style, but at the same time took care to soften the severity of his expression. It must be granted, says Rapin, from what is left us of Sappho, that Longinus had great reason to extol the admirable genius of this woman; for there is in what remains of her something delicate, harmonious, and impassioned to the last degree.

SARABAND, a musical composition in triple time, the motions of which are slow and serious.

Saraband is also a dance to the same measure, which usually terminates when the hand that beats the time falls; and is otherwise much the same as the minuet.

The saraband is said to be originally derived from the Saracens, and is usually danced to the sound of the guitar or castanettes.

SARACA, a genus of plants belonging to the diadelphia class. See BOTANY *Index*.

SARACENS, the inhabitants of Arabia; so called from the word *saru*, which signifies a desert, as the greatest part of Arabia is; and this being the country of Mahomet, his disciples were called Saracens.

SARACOLETS, a Negro nation occupying the country between the rivers of Senegal and Gambia. They are a laborious people, cultivate their lands with care, are plentifully supplied with all the necessaries of life, and inhabit handsome and well built villages; their houses, of a circular form, are for the most part terraced; the others are covered with reeds as at Senegal: they are inclosed with a mud wall a foot thick, and the villages are surrounded with one of stone and earth of double that solidity. There are several gates, which are guarded at night for fear of a surprise. This nation is remarkably brave, so that it is very uncommon to find a Saracole slave. The religious principles of this people are nearly allied to Mahometanism, and still more to natural religion. They acknowledge one God; and believe that those who steal, or are guilty of any crime, are eternally punished. They admit a plurality of wives, and believe their souls to be immortal like their own. The extent of this country is unknown. It is governed by four powerful princes, all bearing the name

Sapph
||
Saracoi

* See *Poetry*, No. 122.

racolets. name of Fouquet. The least considerable, according to the testimony of the Saracolets, is that of Tuago, who can assemble 30,000 horse.

SARAGOSSA, a city of Spain, in the kingdom of Arragon, with an archbishop's see, an university, and a court of inquisition. It is a large, handsome, and well-built town. The streets are long, broad, well paved, and very clean, and the houses from three to six stories high. It is adorned with many magnificent buildings; and they reckon 17 large churches, and 14 handsome monasteries, not to mention others less considerable. In 1808, this city sustained two of the most memorable sieges recorded in history. When the French in the beginning of the year had occupied a considerable part of Spain, a body of 8000 infantry and 900 cavalry, were despatched under General Le Fevre, against Saragossa. The Spaniards, under the celebrated Palafox, met them in the field, but being worsted in some actions, retired into the town. Saragossa stands in an open plain, covered with olive grounds, but quite unfortified, and without any natural strength of position. The inhabitants were estimated at 60,000. Some parties of French entered the town on the 14th June, but were instantly driven back with great loss. The French commander, sensible that his force was too weak, retired; but on the 27th they renewed their attacks with great reinforcements. From this time to 13th August, the siege continued almost without intermission. After incredible efforts, the French obtained possession of some streets; but the Spaniards obstinately contested every inch of ground. When a summons was sent to the besieged to surrender, "war to the point of the knife," was the reply. To procure ammunition, they collected all the sulphur in the town, worked the soil of the streets for saltpetre, and burnt the stalks of hemp to furnish charcoal. The contest was carried on house by house, and street by street. Batteries were erected by the opposite parties within a few yards of one another; and to prevent the accumulation of carcasses on the streets from spreading contagion, Palafox caused French prisoners to be pushed out with a rope attached to them to collect the bodies of their countrymen, and remove them for burial. The women assisted bravely in the most perilous exertions. In this singular warfare the citizens gained by degrees upon their enemies, and from a half of the town which they once possessed, reduced them to an eighth. At length, on the 13th August, the French general Verdier, retired from the town, carrying with him a vast number of wounded. On the 27th November, a French army under Moncey, appeared before the town. The bombardment continued till the 20th February; and after one of the most heroic defenses in history, the town was compelled to surrender, 30,000 of the inhabitants having fallen in the siege, and 300 or 400 dying daily of the pestilence, and only a very small number of men remaining fit to bear arms. W. Long. O. 48. N. Lat. 41. 44.

SARCASM, in *Rhetoric*, a keen bitter expression which has the true point of satire, by which the orator scoffs and insults his enemy: such as that of the Jews to our Saviour; "He saved others, himself he cannot save."

SARCOCELE, in *Surgery*, a spurious rupture or hernia, wherein the testicle is considerably tumefied or

indurated, like a scirrhus, or much enlarged by a fleshy excrescence, which is frequently attended with acute pains, so as to degenerate at last into a cancerous disposition. See SURGERY.

SARCOCOLLA, a concrete juice brought from Persia and Arabia, in small whitish-yellow grains, with a few of a reddish and sometimes of a deep red colour mixed with them: the whitest tears are preferred, as being the freshest: its taste is bitter, accompanied with a dull kind of sweetness. See CHEMISTRY.

SARCOLOGY, is that part of anatomy which treats of the soft parts, viz. the muscles, intestines, arteries, veins, nerves, and fat.

SARCOMA, in *Surgery*, denotes any fleshy excrescence.

SARCOPHAGUS, in antiquity, a sort of stone coffin or grave, wherein the ancients deposited the bodies of the dead which were not intended to be burnt.

The word, as derived from the Greek, literally signifies *flesh-eater*; because originally a kind of stone was used for tombs, which quickly consumed the bodies. See the following article.

One of the most celebrated specimens of antiquity is the great sarcophagus, which is commonly called the tomb of Alexander the Great. It fell into the hands of the British at the capitulation of Alexandria in Egypt in 1801, is now deposited in the British Museum, and is thus described by a writer in the Monthly Magazine. * Vol. xxvii.

"It was brought from the mosque of St Athanasius, at Alexandria, where it had been transformed, by the Mahometans, into a kind of reservoir, consecrated to contain the water for their pious ablutions. It is of considerable magnitude, and would form an oblong rectangle, were not one of the ends or shorter sides of the parallelogram rounded somewhat like a bathing tub. It is probable that formerly it was covered with a lid, but no trace of it is now visible; but is entirely open like an immense laver, of one single piece of beautiful marble, spotted with green, yellow, reddish, &c. on a ground of a fine black, of the species called breecia, a sort of pudding stone, composed of agglutinated fragments of various sizes, which are denominated according to their component parts. This comes under the class of calcareous breecias. But what renders this magnificent fragment of antiquity peculiarly interesting, is the prodigious quantity of small hieroglyphic characters, with which it is sculptured both within and without, as you may perceive by the figure. It would employ me nearly a month to make faithful copies of them: their shape and general appearance is pretty fairly given in the figure; but it can only serve to convey to you an idea of the monument in one view. A correct and faithful copy of all the hieroglyphics, though an Herculean task, is a desideratum; for it can be only by copying with scrupulous accuracy, and of a large size, the figures of this symbolical language, that we can attain the knowledge of a mysterious composition, on which depends that of the history of a country, once so highly celebrated. When that language shall be understood, we may perhaps learn the original purpose of this sarcophagus, and the history of the puissant man whose spoils it contained. Till then it is but the vain and fitting field of conjecture.

"Many men of science and learning, have examined this memento of Egyptian skill and industry; but no

Sarcocele.

CCCLXVIII.

Sarcophagus.

positive decision of its former application is yet found by the learned. Sonnini and Denon, who both closely and attentively examined it, have pronounced nothing decisive on the subject. Dr Clark of Cambridge, an indefatigable and learned antiquary, has asserted that the sarcophagus of the museum really was the tomb of Alexander; but it requires more talents than I possess, to remove the obstacles that withstand the clear intelligibility of this invaluable antique."

SARCOPHAGUS, or *Lapis Assius*, in the natural history of the ancients, a stone much used among the Greeks in their sepulchres, is recorded to have always perfectly consumed the flesh of human bodies buried in it in forty days. This property it was much famed for, and all the ancient naturalists mention it. There was another very singular quality also in it, but whether in all, or only in some peculiar pieces of it, is not known: that is, its turning into stone any thing that was put into vessels made of it. This is recorded only by Mutianus and Theophrastus, except that Pliny had copied it from these authors, and some of the later writers on these subjects from him. The account Mutianus gives of it is, that it converted into stone the shoes of persons buried in it, as also the utensils which it was in some places customary to bury with the dead, particularly those which the person while living most delighted in. The utensils this author mentions, are such as must have been made of very different materials; and hence it appears that this stone had a power of consuming not only flesh, but that its petrifying quality extended to substances of very different kinds. Whether ever it really possessed this last quality has been much doubted; and many, from the seeming improbability of it, have been afraid to record it. What has much encouraged the general disbelief of it is, Mutianus's account of its taking place on substances of very different kinds and textures; but this is no real objection, and the whole account has probably truth in it. Petrifications in those early days might not be distinguished from incrustations of sparry and stony matter on the surfaces of bodies only, as we find they are not with the generality of the world even to this day; the incrustations of spar on mosses and other substances in some of our springs, being at this time called by many *petrified moss*, &c.; and incrustations like these might easily be formed on substances enclosed in vessels made of this stone, by water passing through its pores, dislodging from the common mass of the stone, and carrying with it particles of such spar as it contained; and afterwards falling in repeated drops on whatever lay in its way, it might again deposit them on such substances in form of incrustations. By this means, things made of ever so different matter, which happened to be inclosed, and in the way of the passage of the water, would be equally incrustated with, and in appearance turned into, stone, without regard to the different configurations of their pores and parts.

The place from whence the ancients tell us they had this stone was Assos, a city of Lycia, in the neighbourhood of which it was dug; and De Boot informs us, that in that country, and in some parts of the East, there are also stones of this kind, which, if tied to the bodies of living persons, would in the same manner consume their flesh. *Hill's Notes on Theophrastus*, p. 14.

SARCOTICS, in *Surgery*, medicines which are supposed to generate flesh in wounds.

SARDANAPALUS, the last king of Assyria, whose character is one of the most infamous in history. He is said to have sunk so far in depravity, that, as far as he could, he changed his very sex and nature. He clothed himself as a woman, and spun amidst companies of his concubines. He painted his face, and behaved in a more lewd manner than the most lascivious harlot. In short, he buried himself in the most unbounded sensuality, quite regardless of sex and the dictates of nature. Having grown odious to all his subjects, a rebellion was formed against him by Arbaces the Mede and Belesis the Babylonian. They were attended, however, with very bad success at first, being defeated with great slaughter in three pitched battles. With great difficulty Belesis prevailed upon his men to keep the field only five days longer; when they were joined by the Bactrians, who had come to the assistance of Sardanapalus, but had been prevailed upon to renounce their allegiance to him. With this reinforcement they twice defeated the troops of Sardanapalus, who shut himself up in Nineveh the capital of his empire. The city held out for three years; at the end of which, Sardanapalus finding himself unable to hold out any longer, and dreading to fall into the hands of an enraged enemy, retired into his palace, in a court of which he caused a vast pile of wood to be raised; and heaping upon it all his gold and silver, and royal apparel, and at the same time inclosing his eunuchs and concubines in an apartment within the pile, he set fire to it, and so destroyed himself and all together.

SARDINIA, an island of the Mediterranean, bounded by the strait which divides it from Corsica on the north; by the Tuscan sea, which flows between this island and Italy, on the east; and by other parts of the Mediterranean sea, on the south and west. It is about 140 miles in length, and 70 in breadth, and contains 420,000 inhabitants. The revenue arises chiefly from a duty upon salt, and is barely sufficient to defray the expenses of government; but it certainly might be considerably augmented, as the soil produces wine, corn, and oil, in abundance. Most of the salt that is exported is taken by the Danes and Swedes; the English formerly took great quantities for Newfoundland; but having found it more convenient to procure it from Spain and Portugal, they now take little or none. A profitable tunny fishery is carried on at the south-west part of the island; but it is monopolized by the proprietors of the adjoining land. Wild boars abound in the hilly parts of the island; and here are some few deer, not so large as those in Britain, but in colour and make exactly the same. Beeves and sheep are also common, as well as horses.

The feudal system still subsists in a limited degree, and titles go with their estates, so that the purchaser of the latter inherits the former. The regular troops seldom exceed 2000 men; but the militia amount to near 26,000, of whom 11,000 are cavalry. Their horses are small, but uncommonly active. In a charge, we should beat them; but, on a march, they would be superior to us. The country people are generally armed; but notwithstanding their having been so long under the Spanish and Italian government, assassinations are by no means frequent; and yet, by the laws of the country, if

Sarcotics
Sardinia

a man stabs another without premeditated malice, within four hours after quarrelling with him, he is not liable to be hanged. On the other hand, the church affords no protection to the guilty. The Sardinians are not at all bigotted; and, next to the Spaniards, the English are their favourites. This island was formerly subject to the duke of Savoy, who enjoyed the title of king of Sardinia. See CAGLIARI. It is now under the dominion of the French.

There is in this island a pleasing variety of hills and valleys, and the soil is generally fruitful; but the inhabitants are a slothful generation, and cultivate but a little part of it. On the coast there is a fishery of anchovies and coral, of which they send large quantities to Genoa and Leghorn. This island is divided into two parts; the one, called *Capo di Cagliari*, lies to the south; and the other *Capo di Lugary*, which is seated to the north. The principal towns are Cagliari the capital, Oristagno, and Sassari.

SARDIS, or SARDES, now called *Sardo*, or *Sart*, is an ancient town of Natolia in Asia, about 40 miles east of Smyrna. It was much celebrated in early antiquity, was enriched by the fertility of the soil, and had been the capital of the Lydian kings. It was seated on the side of Mount Tmolus; and the citadel, placed on a lofty hill, was remarkable for its great strength. It was the seat of King Cræsus, and was in his time taken by Cyrus; after which the Persian satrapas or commandant resided at Sardis as the emperor did at Susa. The city was also taken, burnt, and then evacuated by the Milesians in the time of Darius, and the city and fortress surrendered on the approach of Alexander after the battle of Granicus. Under the Romans Sardis was a very considerable place till the time of Tiberius Cæsar, when it suffered prodigiously by an earthquake. The munificence of the emperor, however, was nobly exerted to repair the various damages it then sustained. Julian attempted to restore the heathen worship in the place. He erected temporary altars where none had been left, and repaired the temples if any vestiges remained. In the year 400 it was plundered by the Goths, and it suffered considerably in the subsequent troubles of Asia. On the incursion of the Tartars in 1304, the Turks were permitted to occupy a portion of the citadel, separated by a strong wall with a gate, and were afterwards murdered in their sleep. The site of this once noble city is now green and flowery, the whole being reduced to a poor village, containing nothing but wretched huts. There are, however, some curious remains of antiquity about it, and some ruins which display its ancient grandeur. See *Chandler's Travels in Asia Minor*, p. 251, &c.

There is in the place a large caravansary, where travellers may commodiously lodge. The inhabitants are generally shepherds, who lead their sheep into the fine pastures of the neighbouring plain. The Turks have a mosque here, which was a Christian church, at the gate of which there are several columns of polished marble. There are a few Christians, who are employed in gardening. E. Long. 28. 5. N. Lat. 37. 51.

SARDONIUS RISUS, *Sardonian Laughter*; a convulsive involuntary laughter; thus named from the herba sardonia, which is a species of ranunculus, and is said to produce such convulsive motions in the cheeks as resemble those motions which are observed in the face during a fit of laughter. This complaint is sometimes

speedily fatal. If the ranunculus happens to be the cause, the cure must be attempted by means of a vomit, and frequent draughts of hydromel with milk.

SARDONYX, a precious stone, consisting of a mixture of the calcedony and carnelian, sometimes in strata, but at other times blended together. See MINERALOGY.

SARMENTOSÆ (from *sarmentum*, a long shoot like that of a vine); the name of the 11th class in Linnæus's Fragments of a Natural Method, consisting of plants which have climbing stems and branches, that, like the vine, attach themselves to the bodies in their neighbourhood for the purpose of support. See BOTANY.

SAROS, in chronology, a period of 223 lunar months. The etymology of the word is said to be Chaldean, signifying restitution, or return of eclipses; that is, conjunctions of the sun and moon in nearly the same place of the ecliptic. The Saros was a cycle like to that of Meto.

SAROTHTA, a genus of plants, belonging to the pentandria class; and in the natural method ranking under the 20th order, *Rotaceæ*. See BOTANY *Index*.

SARPLAR of WOOL, a quantity of wool, otherwise called a *pocket* or *half sack*; a sack containing 80 tod; a tod two stone; and a stone 14 pounds.—In Scotland it is called *sarpliath*, and contains 80 stone.

SARRACONIA, a genus of plants belonging to the polyandria class; and in the natural method ranking under the 54th order, *Miscellanææ*. See BOTANY *Index*.

SARRASIN, or SARRAZIN, in fortification, a kind of portcullis, otherwise called a *herse*, which is hung with ropes over the gate of a town or fortress, to be let fall in case of a surprise.

SARSAPARILLA. See SMILAX, BOTANY, and MATERIA MEDICA *Index*.

SARTHE, a department in the west of France, forming part of the ancient Maine. It contains a considerable proportion of poor soil and wastes, and the surface is generally hilly. The principal productions are rye; maiz, buck wheat, and vines; and there are considerable pastures. The manufactures are considerable, and consist of serges, flannels, druggets, light woollens, cloths of linen and hemp, handkerchiefs, hosiery, laces, paper, iron-ware, glass, soap, &c. The territorial extent of the department is 639,276 hectares: the population in 1817 was 410,380. The contributions in the year 1802 amounted to 3,986,579 francs. Mans is the chief town. The department takes its name from the river Sarthe, which runs through it in a south-west direction, and falls into the Loire near Angers.

SARTORIUS, in *Anatomy*. See there, *Table of the Muscles*.

OLD SARUM, in Wilts, about one mile north of New Sarum or Salisbury, has the ruins of a fort which belonged to the ancient Britons; and is said also to have been one of the Roman stations. It has a double intrenchment, with a deep ditch. It is of an orbicular form, and has a very august look, being erected on one of the most elegant plans for a fortress that can be imagined. In the north-west angle stood the palace of the bishop, whose see was removed hither from Wilton and Sherborn; but the bishop quarrelling with King Stephen, he seized the castle and put a garrison into it,

which was the principal cause of its destruction, as the see was soon after removed from hence to Salisbury in 1219. The area of this ancient city is situated on an artificial hill, whose walls were three yards thick, the ruins of which in many places in the circumference are still to be seen, and the tracks of the streets and cathedral church may be traced out by the different colour of the corn growing where once the city stood. Here synods and parliaments have formerly been held, and hither were the states of the kingdom summoned to swear fidelity to William the Conqueror. Here also was a palace of the British and Saxon kings, and of the Roman emperors; which was deserted in the reign of Henry III. for want of water, so that one farm house is all that is left of this ancient city; yet it is called the *Borough of Old Sarum*, and sends two members to parliament, who are chosen by the proprietors of certain adjacent lands.

In February 1795 a subterraneous passage was discovered at this place, of which we have the following account in the *Gentleman's Magazine* for March, in a letter dated Salisbury, Feb. 10. "Some persons of Salisbury on Saturday last went to the upper verge of the fortification (the citadel), and on the right hand, after they had reached the summit, discovered a large hole. They got a candle and lantern, and went down a flight of steps for more than 30 yards. It was an arched way seven feet wide, neatly chiselled out of the solid rock or chalk. It is probable the crown of the arch gave way from the sudden thaw, and fell in. There is a great deal of rubbish at the entrance. It appears to be between six and seven feet high, and a circular arch overhead all the way. These particulars I learned from the person who himself explored it; but was afraid to go farther, lest it might fall in again and bury him. He thinks it turns a little to the right towards Old Sarum house, and continues under the fosse till it reaches the outer verge. The marks of a chisel, he says, are visible on the side. There are two large pillars of square stone at the entrance, which appear to have had a door at foot. They are 18 inches by 27, of good free-stone, and the mason work is extremely neat. The highest part of the archway is two feet below the surface of the ground.

"It is all now again filled up by order of farmer Whitechurch, who rents the ground of Lord Camelford, and thinks curiosity would bring so many people there as to tread down his grass whenever grass shall be there. I went into it 30 yards, which was as far as I could get for the rubbish. I measured it with a line, and found it extend full 120 feet inwards from the two pillars supposed to be the entrance; then onwards it appeared to be filled to the roof with rubbish. By measuring with the same line on the surface of the earth, I found it must go under the bottom of the outer bank of the outer trench; where I think the opening may be found by digging a very little way. Whether it was a Roman or a Norman work it is difficult to say; but it certainly was intended as a private way to go into or out of the castle; and probably a fort or strong castle was built over the outer entrance. I looked for inscriptions or coins, but have not heard of any being found."

SASAFRAS. See LAURUS, BOTANY and MATERIA MEDICA *Index*.

SASHES, in military dress, are badges of distinction

worn by the officers of most nations, either round their waist or over their shoulders. Those for the British army were made of crimson silk: for the Imperial army crimson and gold; for the Prussian army black silk and silver; the Hanoverians yellow silk; the Portuguese crimson silk with blue tassels.

SASINE, or SEISIN. See LAW, N^o clxiv. 15. &c.

SASSA. See MYRRH, OPOCALPASM, MATERIA MEDICA *Index*, and *Bruce's Travels*, vol. v. p. 27, &c.

SATAN, a name very common in Scripture, means the devil or chief of the fallen angels. See DEVIL.

SATELLITE, in *Astronomy*, the same with a secondary planet or moon.

SATIRE. See SATYR.

SATRAPA, or SATRAPES, in Persian antiquity, denotes an admiral; but more commonly the governor of a province.

SATTIN, a glossy kind of silk stuff, the warp of which is very fine, and stands so as to cover the coarser woof.

SATTINET, a slight thin kind of sattin, which is commonly striped, and is employed for different purposes of female dress.

SATURANTS, in *Anatomy*, the same with ABSORBENTS.

SATURATION, in *Chemistry*, is the impregnating an acid with an alkali, or *vice versa*, till either receive no more, and the mixture then becomes neutral.

SATURDAY, the seventh and last day of the week, so called from the idol Seater, worshipped on this day by the ancient Saxons, and thought to be the same as the Saturn of the Latins.

SATUREIA, SAVORY, a genus of plants belonging to the didynamia class; and in the natural method ranking under the 42d order, *Verticillatae*. See BOTANY *Index*.

SATURN, in *Astronomy*, one of the planets of our solar system, revolving at the distance of more than 900 millions of miles from the sun. See ASTRONOMY *Index*.

SATURN, in *Chemistry*, an appellation formerly given to lead.

SATURN, in *Heraldry*, denotes the black colour in blazoning the arms of sovereign princes.

SATURN, one of the principal of the Pagan deities, was the son of Cœlus and Terra, and the father of Jupiter. He deposed and castrated his father; and obliged his brother Titan to resign his crown to him, on condition of his bringing up none of his male issue, that the succession might at length devolve on him. For this purpose he devoured all the sons he had by his wife Rhea or Cybele: but she bringing forth at one time Jupiter and Juno, she presented the latter to her husband, and sent the boy to be nursed on Mount Ida; when Saturn being informed of her having a son, demanded the child; but in his stead his wife gave him a stone swaddled up like an infant, which he instantly swallowed. Titan finding that Saturn had violated the contract he had made with him, put himself at the head of his children and made war on his brother, and having made him and Cybele prisoners, confined them in Tartarus: but Jupiter being in the mean time grown up, raised an army in Crete, went to his father's assistance, defeated Titan, and restored Saturn to the throne.

Some

^{Satyavrata.} Some time after, Saturn being told that Jupiter intended to dethrone him, endeavoured to prevent it; but the latter being informed of his intention, deposed his father, and threw him into Tartarus. But Saturn escaping from thence, fled into Italy, where he was kindly received by Janus king of the country, who associated him to the government: whence Italy obtained the name of *Saturnia Tellus*; as also that of *Latium*, from *lateo*, "to lie hid." There Saturn, by the wisdom and mildness of his government, is said to have produced the golden age.

Saturn is represented as an old man with four wings, armed with a scythe; sometimes he is delineated under the figure of a serpent with its tail in its mouth. This is emblematic of the seasons, which roll perpetually in the same circle. Sometimes also Saturn is painted with a sand-glass in his hand. The Greeks say, that the story of his mutilating his father and destroying his children is an allegory, which signifies, that Time devours the past and present, and will also devour the future. The Romans, in honour of him, built a temple, and celebrated a festival which they called *Saturnalia*. During this festival no business or profession was allowed to be carried on except cookery; all distinctions of rank ceased; slaves could say what they pleased to their masters with impunity; they could even rally them with their faults before their faces.

SATURNALIA, in Roman antiquity, a festival observed about the middle of December, in honour of the god Saturn, whom Lucan introduces giving an account of the ceremonies observed on this occasion, thus. "During my whole reign, which lasts but for one week, no public business is done; there is nothing but drinking, singing, playing, creating imaginary kings, placing servants with their masters at table, &c. There shall be no disputes, reproaches, &c. but the rich and poor, masters and slaves, shall be equal," &c.

On this festival the Romans sacrificed bare-headed, contrary to their custom at other sacrifices.

SATURNINE, an appellation given to persons of a melancholy disposition, as being supposed under the influence of the planet Saturn.

SATYAVRATA, or *MENU*, in Indian mythology, is believed by the Hindoos to have reigned over the whole world in the earliest age of their chronology, and to have resided in the country of *Dravira* on the coast of the eastern Indian peninsula. His patronymic name was *Vaivasvata*, or *child of the sun*. In the *Bhagavat* we are informed, that the Lord of the universe, intending to preserve him from the sea of destruction, caused by the depravity of the age, thus told him how he was to act. "In seven days from the present time, O thou tamer of enemies, the three worlds will be plunged in an ocean of death; but, in the midst of the destroying waves, a large vessel, sent by me for thy use, shall stand before thee. Then shalt thou take all medicinal herbs, all the variety of seeds; and, accompanied by seven saints, encircled by pairs of all brute animals, thou shalt enter the spacious ark and continue in it, secure from the flood on one immense ocean without light, except the radiance of thy holy companions. When the ship shall be agitated by an impetuous wind, thou shalt fasten it with a large sea-serpent on my horn; for I will be near thee; drawing the vessel, with thee and thy attendants, I will remain on the ocean, O chief of

men, until a night of *Brahma* shall be completely ended. Thou shalt then know my true greatness, rightly named the supreme Godhead: by my favour, all thy questions shall be answered, and thy mind abundantly instructed." All this is said to have been accomplished; and the story is evidently that of Noah disguised by Asiatic fiction and allegory. It proves, as Sir William Jones has rightly observed, an ancient Indian tradition of the universal deluge described by Moses; and enables us to trace the connexion between the eastern and western traditions relating to that event. The same learned author has shown it to be in the highest degree probable, that the *Satyavrata* of India is the *Cronus* of Greece and the *Saturn* of Italy. See *SATURN*; and *Asiatic Researches*, vol. i. p. 230, &c.

SATYR, or *SATIRE*, in matters of literature, a discourse or poem, exposing the vices and follies of mankind. See *POETRY*, Part II. sect. x.

The chief satirists among the ancients are, Horace, Juvenal, and Persius; those among the moderns are, Regnier and Boileau, in French; Butler, Dryden, Rochester, Buckingham, Swift, Pope, Young, &c. among the English; and Cervantes among the Spaniards.

SATYRIASIS. See *MEDICINE Index*.

SATYRIUM, a genus of plants belonging to the gymnoandria class; and in the natural method ranking under the 42d order, *Verticillatae*. See *BOTANY Index*.

SATYRS, in ancient mythology, a species of demigods who dwelt in the woods. They are represented as monsters, half-men, and half-goats; having horns on their heads, a hairy body, with the feet and tail of a goat. They are generally in the train that follows Bacchus. As the poets supposed that they were remarkable for piercing eyes and keen raillery, they have placed them in the same pictures with the Graces, Loves, and even with Venus herself.

SAVAGE, *RICHARD*, one of the most remarkable characters that is to be met with perhaps in all the records of biography, was the son of Anne countess of Macclesfield by the earl of Rivers, according to her own confession; and was born in 1698. This confession of adultery was made in order to procure a separation from her husband the earl of Macclesfield; yet, having obtained this desired end, no sooner was her spurious offspring brought into the world, than, without the dread of shame or poverty to excuse her, she discovered the resolution of disowning him; and, as long as he lived, treated him with the most unnatural cruelty. She delivered him over to a poor woman to educate as her own; prevented the earl of Rivers from leaving him a legacy of 6000*l.* by declaring him dead: and in effect deprived him of another legacy which his godmother Mrs Lloyd had left him, by concealing from him his birth, and thereby rendering it impossible for him to prosecute his claim. She endeavoured to send him secretly to the plantations; but this plan being either laid aside or frustrated, she placed him apprentice with a shoemaker. In this situation, however, he did not long continue; for his nurse dying, he went to take care of the effects of his supposed mother; and found in her boxes some letters which discovered to young Savage his birth, and the cause of its concealment.

From the moment of this discovery it was natural for him to become dissatisfied with his situation as a shoemaker. He now conceived that he had a right to share

Savage. in the affluence of his real mother; and therefore he directly, and perhaps indiscreetly, applied to her, and made use of every art to awaken her tenderness and attract her regard. But in vain did he solicit this unnatural parent: she avoided him with the utmost precaution, and took measures to prevent his ever entering her house on any pretence whatever.

Savage was at this time so touched with the discovery of his birth, that he frequently made it his practice to walk before his mother's door in hopes of seeing her by accident; and often did he warmly solicit her to admit him to see her; but all to no purpose: he could neither soften her heart nor open her hand.

Meantime, while he was assiduously endeavouring to rouse the affections of a mother in whom all natural affection was extinct, he was destitute of the means of support, and reduced to the miseries of want. We are not told by what means he got rid of his obligation to the shoemaker, or whether he ever was actually bound to him; but we now find him very differently employed in order to procure a subsistence. In short, the youth had parts, and a strong inclination towards literary pursuits, especially poetry. He wrote a poem; and afterwards two plays, *Woman's a Riddle*, and *Love in a Veil*: but the author was allowed no part of the profits from the first; and from the second he received no other advantage than the acquaintance of Sir Richard Steele and Mr Wilks, by whom he was pitied, caressed, and relieved. However, the kindness of his friends not affording him a constant supply, he wrote the tragedy of *Sir Thomas Overbury*; which not only procured him the esteem of many persons of wit, but brought him in 200*l*. The celebrated Aaron Hill, Esq. was of great service to him in correcting and fitting this piece for the stage and the press; and extended his patronage still farther. But Savage was, like many other wits, a bad manager, and was ever in distress. As fast as his friends raised him out of one difficulty, he sunk into another; and, when he found himself greatly involved, he would ramble about like a vagabond, with scarce a shirt on his back. He was in one of these situations during the time that he wrote his tragedy above mentioned; without a lodging, and often without a dinner: so that he used to scribble on scraps of paper picked up by accident, or begged in the shops, which he occasionally stepped into, as thoughts occurred to him, craving the favour of pen and ink, as it were just to take a memorandum.

Mr Hill also earnestly promoted a subscription to a volume of *Miscellanies*, by Savage; and likewise furnished part of the poems of which the volume was composed. To this miscellany Savage wrote a preface, in which he gives an account of his mother's cruelty, in a very uncommon strain of humour.

The profits of his Tragedy and his *Miscellanies* together, had now, for a time, somewhat raised poor Savage both in circumstances and credit; so that the world just began to behold him with a more favourable eye than formerly, when both his fame and life were endangered by a most unhappy event. A drunken frolic in which he one night engaged, ended in a fray, and Savage unfortunately killed a man, for which he was condemned to be hanged; his friends earnestly solicited the mercy of the crown, while his mother as earnestly exerted herself to prevent his receiving it. The coun-

ness of Hertford at length laid his whole case before Queen Caroline, and Savage obtained a pardon.

Savage had now lost that tenderness for his mother which the whole series of her cruelty had not been able wholly to repress; and considering her as an implacable enemy, whom nothing but his blood could satisfy, threatened to harass her with lampoons, and to publish a copious narrative of her conduct, unless she consented to allow him a pension. This expedient proved successful; and the lord Tyrconnel, upon his promise of laying aside his design of exposing his mother's cruelty, took him into his family, treated him as an equal, and engaged to allow him a pension of 200*l*. a year. This was the golden part of Savage's life. He was courted by all who valued themselves upon a refined taste. In this gay period of his life he published the *Temple of Health and Mirth*, on the recovery of Lady Tyrconnel from a languishing illness; and *The Wanderer*, a moral poem, which he dedicated to Lord Tyrconnel, in strains of the highest panegyric: but these praises he in a short time found himself inclined to retract, being discarded by the man on whom they were bestowed. Of this quarrel Lord Tyrconnel and Mr Savage assigned very different reasons. Our author's known character pleads too strongly against him; for his conduct was ever such as made all his friends, sooner or later, grow weary of him, and even forced most of them to become his enemies.

Being thus once more turned adrift upon the world, Savage, whose passions were very strong, and whose gratitude was very small, became extremely diligent in exposing the faults of Lord Tyrconnel. He, moreover, now thought himself at liberty to take revenge upon his mother.—Accordingly he wrote *The Bastard*, a poem, remarkable for the vivacity of its beginning where he finely enumerates the imaginary advantages of base birth), and for the pathetic conclusion, wherein he recounts the real calamities which he suffered by the crime of his parents.—The reader will not be displeased with a transcript of some of the lines in the opening of the poem, as a specimen of this writer's spirit and manner of versification.

Blest be the bastard's birth! thro' wondrous ways,
He shines eccentric like a comet's blaze.
No sickly fruit of faint compliance he;
He! stamp'd in nature's mint with ecstasy!
He lives to build, not boast, a gen'rous race;
No tenth transmitter of a foolish face.
He, kindling from within, requires no flame,
He glories in a bastard's glowing name.
—Nature's unbounded son, he stands alone,
His heart unbiass'd, and his mind his own.
—O mother! yet no mother!—'tis to you
My thanks for such distinguish'd claims are due.

This poem had an extraordinary sale; and its appearance happening at the time when his mother was at Bath, many persons there took frequent opportunities of repeating passages from the *Bastard* in her hearing. This was perhaps the first time that ever she discovered a sense of shame, and on this occasion the power of wit was very conspicuous: the wretch who had, without scruple, proclaimed herself an adulteress, and who had first endeavoured to starve her son, then to transport him

him, and afterwards to hang him, was not able to bear the representation of her own conduct; but fled from reproach, though she felt no pain from guilt; and left Bath with the utmost haste, to shelter herself among the crowds of London (A).

Some time after this, Savage formed the resolution of applying to the queen; who having once given him life, he hoped she might farther extend her goodness to him, by enabling him to support it.—With this view, he published a poem on her birth-day, which he entitled *The Volunteer-Laureat*; for which she was pleased to

send him 50*l.* with an intimation that he might annually expect the same bounty. But this annual allowance was nothing to a man of his strange and singular extravagance. His usual custom was, as soon as he had received his pension, to disappear with it, and secrete himself from his most intimate friends, till every shilling of the 50*l.* was spent; which done, he again appeared, pennyless as before: But he would never inform any person where he had been, or in what manner his money had been dissipated.—From the reports, however, of some, who found means to penetrate his haunts,

Savage,

it

(A) Mr Boswell, in his life of Dr Johnson, has called in question the story of Savage's birth, and grounded his suspicion on two mistakes, or, as he calls them, falsehoods, which he thinks he has discovered in his friend's memoirs of that extraordinary man. Johnson has said, that the earl of Rivers was Savage's godfather, and gave him his own name; which, by his direction, was inserted in the register of the parish of St Andrew's, Holborn. Part of this, it seems, is not true; for Mr Boswell carefully inspected that register, but no such entry is to be found. But does this omission amount to a proof, that the person who called himself *Richard Savage* was an impostor, and not the son of the earl of Rivers and the countess of Macclesfield? Mr Boswell thinks it does; and, in behalf of his opinion, appeals to the maxim, *falsum in uno, falsum in omnibus*. The solidity of this maxim may be allowed by others; but it was not without surprise that, on such an occasion, we found it adopted by the biographer of Johnson. To all who have compared his view of a celebrated cause, with Stuart's letters on the same subject addressed to Lord Mansfield, it must be apparent, that, at one period of his life, he would not have deemed a thousand such mistakes sufficient to invalidate a narrative otherwise so well authenticated as that which relates to the birth of Savage. The truth is, that the omission of the name in the register of St Andrew's may be easily accounted for, without bringing against the wretched Savage an accusation of imposture, which neither his mother nor her friends dared to urge when provoked to it by every possible motive that can influence human conduct. The earl of Rivers would undoubtedly give the direction about registering the child's name to the same person whom he entrusted with the care of his education; but that person, it is well known, was the countess of Macclesfield, who, as she had resolved from his birth to disown her son, would take care that the direction should not be obeyed.

That which, in Johnson's life of Savage, Mr Boswell calls a second falsehood, seems not to amount even to a mistake. It is there stated, that "Lady Macclesfield having lived for some time upon very uneasy terms with her husband, thought a public confession of adultery the most obvious and expeditious method of obtaining her liberty." This Mr Boswell thinks cannot be true; because, having perused the journals of both houses of parliament at the period of her divorce, he there found it authentically ascertained, that so far from voluntarily submitting to the ignominious charge of adultery, she made a strenuous defence by her counsel. But what is this to the purpose? Johnson has nowhere said, that she confessed her adultery at the bar of either house of parliament, but only that her confession was *public*: and as he has taught us in his Dictionary, that whatever is *notorious* or *generally* known is *public*; public, in his sense of the word, that confession certainly was, if made to different individuals, in such a manner as showed that she was not anxious to conceal it from her husband, or to prevent its notoriety. She might, however, have very cogent reasons for denying her guilt before parliament, and for making a strenuous defence by her counsel; as indeed, had she acted otherwise, it is very little probable that her great fortune would have been restored to her, or that she could have obtained a second husband.

But Mr Boswell is of opinion, that the person who assumed the name of Richard Savage was the son of the shoemaker under whose care Lady Macclesfield's child was placed; because "his not being able to obtain payment of Mrs Lloyd's legacy must be imputed to his consciousness that he was not the real person to whom that legacy was left." He must have a willing mind who can admit this argument as a proof of imposture. Mrs Lloyd died when Savage was in his 10th year, when he certainly did not know or suspect that he was the person for whom the legacy was intended, when he had none to prosecute his claim, to shelter him from oppression, or to call in law to the assistance of justice. In such circumstances he could not have obtained payment of the money, unless the executors of the will had been inspired from heaven with the knowledge of the person to whom it was due.

To these and a thousand such idle cavils it is a sufficient answer, that Savage was acknowledged and patronized as Lady Macclesfield's son by Lord Tyrconnel, who was that lady's nephew; by Sir Richard Steele, the intimate friend of Colonel Brett, who was that lady's second husband; by the queen, who, upon the authority of that lady and her creatures, once thought Savage capable of entering his *mother's* house in the night with an intent to murder her; and in effect by *the lady herself*, who at one time was prevailed upon to give him 50*l.* and who fled before the satire of the *Bastard*, without offering, either by herself or her friends, to deny that the author of that poem was the person whom he called himself, or to insinuate so much as that he might possibly be the son of a shoemaker. To Mr Boswell all this seems *strange*: to others, who look not with so keen an eye for supposititious births, we think it must appear *convincing*.

Savage.

it would seem that he expended both his time and his cash in the most sordid and despicable sensuality; particularly in eating and drinking, in which he would indulge in the most unsocial manner, sitting whole days and nights by himself, in obscure houses of entertainment, over his bottle and trencher, immersed in filth and sloth, with scarce decent apparel; generally wrapped up in a horseman's great coat; and, on the whole, with his very homely countenance, altogether exhibiting an object the most disgusting to the sight, if not to some other of the senses.

His wit and parts, however, still raised him new friends as fast as his behaviour lost him his old ones. Yet such was his conduct, that occasional relief only furnished the means of occasional excess; and he defeated all attempts made by his friends to fix him in a decent way. He was even reduced so low as to be destitute of a lodging; insomuch that he often passed his nights in those mean houses that are set open for casual wanderers; sometimes in cellars, amidst the riot and filth of the most profligate of the rabble; and not seldom would he walk the streets till he was weary, and then lie down in summer on a hulk, or in winter with his associates among the ashes of a glass-house.

Yet, amidst all his penury and wretchedness, had this man so much pride, and so high an opinion of his own merit, that he ever kept up his spirits, and was always ready to repress, with scorn and contempt, the least appearance of any slight or indignity towards himself, in the behaviour of his acquaintance; among whom he looked upon none as his superior. He would be treated as an equal, even by persons of the highest rank. We have an instance of this preposterous and inconsistent pride, in his refusing to wait upon a gentleman who was desirous of relieving him when at the lowest ebb of distress, only because the message signified the gentleman's desire to see him at nine in the morning. Savage could not bear that any one should presume to prescribe the hour of his attendance, and therefore he absolutely rejected the proffered kindness. This life, unhappy as it may be already imagined, was yet rendered more unhappy, by the death of the queen, in 1738; which stroke deprived him of all hopes from the court. His pension was discontinued, and the insolent manner in which he demanded of Sir Robert Walpole to have it restored, forever cut off this considerable supply; which possibly had been only delayed, and might have been recovered by proper application.

His distress became now so great, and so notorious, that a scheme was at length concerted for procuring him a permanent relief. It was proposed that he should retire into Wales, with an allowance of 50*l.* per annum, on which he was to live privately in a cheap place, for ever quitting his town-haunts, and resigning all farther pretensions to fame. This offer he seemed gladly to accept; but his intentions were only to deceive his friends by retiring for a while, to write another tragedy, and then to return with it to London in order to bring it upon the stage.

In 1739, he set out in the Bristol stage-coach for Swansea, and was furnished with 15 guineas to bear the expense of his journey. But, on the 14th day after his departure, his friends and benefactors, the principal of whom was no other than the great Mr Pope, who

Savage.

expected to hear of his arrival in Wales, were surprised with a letter from Savage, informing them that he was yet upon the road, and could not proceed for want of money. There was no other method than a remittance; which was sent him, and by the help of which he was enabled to reach Bristol, from whence he was to proceed to Swansea by water. At Bristol, however, he found an embargo laid upon the shipping; so that he could not immediately obtain a passage. Here, therefore, being obliged to stay for some time, he, with his usual facility, so ingratiated himself with the principal inhabitants, that he was frequently invited to their houses, distinguished at their public entertainments, and treated with a regard that highly flattered his vanity, and therefore easily engaged his affections. At length, with great reluctance, he proceeded to Swansea; where he lived about a year, very much dissatisfied with the diminution of his salary; for he had, in his letters, treated his contributors so insolently, that most of them withdrew their subscriptions. Here he finished his tragedy, and resolved to return with it to London: which was strenuously opposed by his great and constant friend Mr Pope; who proposed that Savage should put this play into the hands of Mr Thomson and Mr Mallet, in order that they might fit it for the stage, that his friends should receive the profits it might bring in, and that the author should receive the produce by way of annuity. This kind and prudent scheme was rejected by Savage with the utmost contempt.—He declared he would not submit his works to any one's correction; and that he should no longer be kept in leading strings. Accordingly he soon returned to Bristol in his way to London; but at Bristol, meeting with a repetition of the same kind treatment he had before found there, he was tempted to make a second stay in that opulent city for some time. Here he was again not only caressed and treated, but the sum of 50*l.* was raised for him, with which it had been happy if he had immediately departed for London: But he never considered that a frequent repetition of such kindness was not to be expected, and that it was possible to tire out the generosity of his Bristol friends, as he had before tired his friends everywhere else. In short, he remained here till his company was no longer welcome. His visits in every family were too often repeated; his wit had lost its novelty, and his irregular behaviour grew troublesome. Necessity came upon him before he was aware; his money was spent, his clothes were worn out, his appearance was shabby; and his presence was disgustful at every table. He now began to find every man from home at whose house he called; and he found it difficult to obtain a dinner. Thus reduced, it would have been prudent in him to have withdrawn from the place; but prudence and Savage were never acquainted. He staid, in the midst of poverty, hunger, and contempt, till the mistress of a coffee-house, to whom he owed about eight pounds, arrested him for the debt. He remained for some time, at a great expense, in the house of the sheriff's officer, in hopes of procuring bail; which expense he was enabled to defray, by a present of five guineas from Mr Nash at Bath. No bail, however, was to be found; so that poor Savage was at last lodged in Newgate, a prison so named in Bristol.

But

age. But it was the fortune of this extraordinary mortal always to find more friends than he deserved. The keeper of the prison took compassion on him, and greatly softened the rigours of his confinement by every kind of indulgence; he supported him at his own table, gave him a commodious room to himself, allowed him to stand at the door of the gaol, and even frequently took him into the fields for the benefit of the air and exercise; so that, in reality, Savage endured fewer hardships in this place than he had usually suffered during the greatest part of his life.

While he remained in this not intolerable prison, his ingratitude again broke out, in a bitter satire on the city of Bristol; to which he certainly owed great obligations, notwithstanding the circumstances of his arrest; which was but the act of an individual, and that attended with no circumstances of injustice or cruelty. This satire he entitled *London and Bristol delineated*; and in it he abused the inhabitants of the latter, with such a spirit of resentment, that the reader would imagine he had never received any other than the most injurious treatment in that city.

When Savage had remained about six months in this hospitable prison, he received a letter from Mr Pope, (who still continued to allow him 20*l.* a year) containing a charge of very atrocious ingratitude. What were the particulars of this charge we are not informed; but, from the notorious character of the man, there is reason to fear that Savage was but too justly accused. He, however, solemnly protested his innocence; but he was very unusually affected on this occasion. In a few days after, he was seized with a disorder, which at first was not suspected to be dangerous: but growing daily more languid and dejected, at last a fever seized him; and he expired on the 1st of August 1743, in the 46th year of his age.

Thus lived, and thus died, Richard Savage, Esq.; leaving behind him a character strangely chequered with vices and good qualities. Of the former we have seen a variety of instances in this abstract of his life; of the latter, his peculiar situation in the world gave him but few opportunities of making any considerable display. He was, however, undoubtedly a man of excellent parts; and had he received the full benefits of a liberal education, and had his natural talents been cultivated to the best advantage, he might have made a respectable figure in life. He was happy in a quick discernment, a retentive memory, and a lively flow of wit, which made his company much coveted; nor was his judgement both of writings and of men inferior to his wit: but he was too much a slave to his passions, and his passions were too easily excited. He was warm in his friendships, but implacable in his enmity; and his greatest fault, which is indeed the greatest of all faults, was ingratitude. He seemed to think every thing due to his merit, and that he was little obliged to any one for those favours which he thought it their duty to confer on him: it is therefore the less to be wondered at, that he never rightly estimated the kindness of his many friends and benefactors, or preserved a grateful and due sense of their generosity towards him.

The works of this original writer, after having long lain dispersed in magazines and fugitive publications, have been collected and published in an elegant edition, in 2 vols 8vo; to which are prefixed the

admirable memoirs of Savage, written by Dr Samuel Johnson.

Savage.

SAVAGE is a word so well understood as scarcely to require explanation. When applied to inferior animals, it denotes that they are wild, untamed, and cruel; when applied to man, it is of much the same import with *barbarian*, and means a person who is untaught and uncivilized, or who is in the rude state of uncultivated nature. That such men exist at present, and have existed in most ages of the world, is undeniable; but a question naturally occurs respecting the origin of this savage state, the determination of which is of considerable importance in developing the nature of man, and ascertaining the qualities and powers of the human mind. Upon this subject, as upon most others, opinions are very various, and the systems built upon them are consequently very contradictory. A large sect of ancient philosophers maintained that man sprung at first from the earth like his brother vegetables; that he was without ideas and without speech; and that many ages elapsed before the race acquired the use of language, or attained to greater knowledge than the beasts of the forest. Other sects again, with the vulgar, and almost all the poets, maintained that the first mortals were wiser and happier, and more powerful, than any of their offspring; that mankind, instead of being originally savages, and rising to the state of civilization by their own gradual and progressive exertions, were created in a high degree of perfection; that, however, they degenerated from that state, and that all nature degenerated with them. Hence the various ages of the world have almost everywhere been compared to gold, silver, brass, and iron, the golden having been always supposed to be the first age.

Since the revival of letters in Europe, and especially during the present century, the same question has been much agitated both in France and England, and by far the greater part of the most fashionable names in modern science have declared for the original savagism of men. Such of the ancients as held that opinion, were countenanced by the atheistic cosmogony of the Phœnicians, and by the early history of their own nations; the moderns build their system upon what they suppose to be the constitution of the human mind, and upon the late improvements in arts and sciences. As the question must finally be decided by historical evidence, before we make our appeal to facts, we shall consider the force of the modern reasonings from the supposed innate powers of the human mind; for that reasoning is totally different from the other, and to blend them together would only prevent the reader from having an adequate conception of either.

Upon the supposition that all mankind were originally savages, destitute of the use of speech, and, in the strictest sense of the words, *mutum et turpe pecus*, the great difficulty is to conceive how they could emerge from that state, and become at last enlightened and civilized. The modern advocates for the universality of the savage state remove this difficulty by a number of instincts or internal senses, with which they suppose the human mind endowed, and by which the savage is, without reflection, not only enabled to distinguish between right and wrong, and prompted to do every thing necessary to the preservation of his existence, and the continuance of the species, but also led to the discovery

Savage. of what will contribute, in the first instance, to the ease and accommodations of life. The instincts, they think, brought mankind together, when the reasoning faculty, which had hitherto been dormant, being now roused by the collisions of society, made its observations upon the consequences of their different actions, taught them to avoid such as experience showed to be pernicious, and to improve upon those which they found beneficial; and thus was the progress of civilization begun. But this theory is opposed by objections which we know not how to obviate. The bundle of instincts with which modern idleness, under the denomination of philosophy, has so amply furnished the human mind, is a mere chimaera. (See INSTINCT.) But granting its reality, it is by no means sufficient to produce the consequences which are derived from it. That it is not the parent of language, we have shown at large in another place (see LANGUAGE, N° 1—7.); and we have the confession of some of the ablest advocates for the original savagism of man, that large societies must have been formed before language could have been invented. How societies, at least large societies, could be formed and kept together without language, we have not indeed been told; but we are assured by every historian and every traveller of credit, that in such societies only have mankind been found civilized. Among known savages the social *storge* is very much confined; and therefore, had it been in the first race of men of as enlarged a nature, and as safe a guide, as the instinctive philosophers contend that it was, it is plain that those men could not have been savages. Such an appetite for society, and such a director of conduct, instead of enabling mankind to have emerged from savagism, would have effectually prevented them from ever becoming savage; it would have knit them together from the very first, and furnished opportunities for the progenitors of the human race to have begun the process of civilization from the moment that they dropt from the hands of their Creator. Indeed, were the modern theories of internal senses and social affections well founded, and were these senses and affections sufficient to have impelled the first men into society, it is not easy to be conceived how there could be at this day a savage tribe on the face of the earth. Natural causes, operating in the same direction and with the same force, must in every age produce the same effects; and if the social affections of the first mortals impelled them to society, and their reasoning faculties immediately commenced the process of civilization, surely the same affections and the same faculties would in a greater or less degree have had the same effect in every age and on every tribe of their numerous offspring; and we should everywhere observe mankind advancing in civilization, instead of standing still as they often do, and sometimes retreating by a retrograde motion. This, however, is far from being the case. Hordes of savages exist in almost every quarter of the globe; and the Chinese, who have undoubtedly been in a state of civilization for at least 2000 years, have during the whole of that long period been absolutely stationary, if they have not lost some of their ancient arts. (See PORCELAIN.) The origin of civilization, therefore, is not to be looked for in human instincts or human propensities, carrying men forward by a natural progress; for the supposition of such propensities is contrary to fact; and by fact and historical evidence, in conjunction with what we

of the nature of man, must this great question be at last decided. Savage.

In the article RELIGION, N° 7., it has been shown that the first men, if left to themselves without any instruction, instead of living the life of savages, and in process of time advancing towards civilization, must have perished before they acquired even the use of some of their senses. In the same article it has been shown (N° 14—17.), that Moses, as he is undoubtedly the oldest historian extant, wrote likewise by immediate inspiration; and that therefore, as he represents our first parents and their immediate descendants as in a state far removed from that of savages, it is vain to attempt to deduce the originality of such a state from hypothetical theories of human nature. We have, indeed, heard it observed by some of the advocates for the antiquity and universality of the savage state, that to the appeal to revelation they have no objection, provided we take the Mosaic account as it stands, and draw not from it conclusions which it will not support.

They contend, at the same time, that there is no argument fairly deducible from the book of Genesis which militates against their position. Now we beg leave to remark, that besides the reasoning which we have already used in the article just referred to, we have as much positive evidence against their position as the nature of the Mosaic history could be supposed to afford.

We are there told that God created man after his own image; that he gave him dominion over every thing in the sea, in the air, and over all the earth; that he appointed for his food various kinds of vegetables; that he ordained the Sabbath to be observed by him, in commemoration of the works of creation; that he prepared for him a garden to till and to dress; and that, as a test of his religion and submission to his Creator, he forbade him, under severe penalties, to eat of a certain tree in that garden. We are then told that God brought to him every animal which had been created; and we find that Adam was so well acquainted with their several natures as to give them names. When, too, an helpmate was provided for him, he immediately acknowledged her as bone of his bone, flesh of his flesh, and called her *woman*, because she was taken out of man.

How these facts can be reconciled to a state of ignorant savagism is to us absolutely inconceivable; and it is indeed strange, that men who profess Christianity should appeal to reason, and stick by its decision on a question which revelation has thus plainly decided against them. But it is agreeable to their theory to believe that man rose by slow steps to the full use of his reasoning powers. To us, on the other hand, it appears equally plausible to suppose that our first parents were created, not in full maturity, but mere infants, and that they went through the tedious process of childhood and youth, &c. as to suppose that their minds were created weak, uninformed, and uncivilized, as are those of savages.

But if it be granted that Adam had a tolerable share of knowledge, and some civilization, nothing can be more natural than to suppose that he would teach his descendants what he knew himself; and if the Scriptures are to be believed, we are certain that some of them possessed more than savage knowledge, and better than

than savage manners. But instead of going on to further perfection, as the theory of modern philosophers would lead us to suppose, we find that mankind degenerated in a most astonishing degree; the causes of which we have already in part developed in the article POLYTHEISM, N^o 4, &c.

This early degeneracy of the human race, or their sudden progress towards ignorance and savagism, appears to lead to an important consequence. If men, so very soon after their creation, possessing, as we have seen they did, a considerable share of knowledge and of civilization, instead of improving in either, degenerated in both respects, it would not appear that human nature has that strong propensity to refinement which many philosophers imagine; or that, had all men been originally savage, they would have civilized themselves by their own exertions.

Of the ages before the flood we have no certain account anywhere but in Scripture; where, though we find mankind represented as very wicked, we have no reason to suppose them to have been absolute savages. On the contrary, we have much reason, from the short account of Moses, to conclude that they were far advanced in the arts of civil life. Cain, we are told, built a city; and two of his early descendants invented the harp and organ, and were artificers in brass and iron. Cities are not built, nor musical instruments invented, by savages, but by men highly cultivated: and surely we have no reason to suppose that the righteous posterity of Seth were behind the apostate descendants of Cain in any branch of knowledge that was really useful. That Noah and his family were far removed from savagism, no one will controvert, who believes that with them was made a new covenant of religion; and it was unquestionably their duty, as it must otherwise have been their wish, to communicate what knowledge they possessed to their posterity. Thus far then every consistent Christian, we think, must determine against original and universal savagism.

In the preliminary discourse to Sketches of the History of Man, Lord Kames would infer, from some facts which he states, that many pairs of the human race were at first created, of very different forms and natures, but all depending entirely on their own natural talents. But to this statement he rightly observes, that the Mosaic account of the Creation opposes insuperable objections. "Whence then (says his Lordship) the degeneracy of all men into the savage state? To account for that dismal catastrophe, mankind must have suffered some dreadful convulsion." Now, if we mistake not, this is taking for granted the very thing to be proved. We deny that at any period since the creation of the world, all men were sunk into the state of savages; and that they were, no proof has yet been brought, nor do we know of any that can be brought, unless our fashionable philosophers choose to prop their theories by the buttress of Sanchoniatho's Phœnician cosmogony. (See SANCHONIATHO). His Lordship, however, goes on to say, or rather to suppose, that the confusion at Babel, &c. was this dreadful convulsion: For, says he, "by confounding the language of men, and scattering them abroad upon the face of all the earth, they were rendered savages." Here again we have a positive assertion, without the least shadow of proof; for it does not at all appear that the confusion of

language, and the scattering abroad of the people, was a circumstance such as could induce universal savagism. There is no reason to think that all the men then alive were engaged in building the tower of Babel; nor does it appear from the Hebrew original that the language of those who were engaged in it was so much changed as the reader is apt to infer from our English version. (See PHILOLOGY, N^o 8—16.)—That the builders were scattered, is indeed certain; and if any of them were driven, in very small tribes, to a great distance from their brethren, they would in process of time inevitably become savages. (See POLYTHEISM, N^o 4—6, and LANGUAGE, N^o 7.). But it is evident, from the Scripture account of the peopling of the earth, that the descendants of Shem and Japheth were not scattered over the face of all the earth, and that therefore they could not be rendered savage by the catastrophe at Babel. In the chapter which relates that wonderful event, the generations of Shem are given in order down to Abram; but there is no indication that they had suffered with the builders of the tower, or that any of them had degenerated into the state of savages. On the contrary, they appear to have possessed a considerable degree of knowledge; and if any credit be due to the tradition which represents the father of Abraham as a statuary, and himself as skilled in the science of astronomy, they must have been far advanced in the arts of refinement. Even such of the posterity of Ham as either emigrated, or were driven from the plain of Shinar in large bodies, so far from sinking into savagism, retained all the accomplishments of their antediluvian ancestors, and became afterwards the instructors of the Greeks and Romans. This is evident from the history of the Egyptians and other eastern nations, who in the days of Abraham were powerful and highly civilized. And that for many ages they did not degenerate into barbarism, is apparent from its having been thought to exalt the character of Moses,—that he was learned in all the wisdom of the Egyptians, and from the wisdom of Solomon having been said to excel all the wisdom of the east country and of Egypt.

Thus decided are the Scriptures of the Old Testament against the universal prevalence of savagism in that period of the world; nor are the most authentic pagan writers of antiquity of a different opinion. Moschus the Phœnician, * Democritus, and Epicurus, appear to be the first champions of the savage state; and they are followed by a numerous body of poets and rhapsodists, among the Greeks and Romans, who were unquestionably devoted to fable and fiction. The account which they have given of the origin of man, the reader will find in another place (see THEOLOGY, Part I. sect. 1.): But we hardly think that he will employ it in support of the fashionable doctrine of original savagism. Against the wild reveries of this school are posted all the leaders of the other sects, Greeks and Barbarians; the philosophers of both Academies, the sages of the Italian and Alexandrian schools; the Magi of Persia; the Bramins of India, and the Druids of Gaul, &c. The testimony of the early historians among all the ancient nations, indeed, who are avowedly fabulists, is very little to be depended on, and has been called in question by the most judicious writers of Pagan antiquity. (See *Plut. Vita Thes. sub mit.*; *Thucyd. l. i. cap. 1.*; *Strabo, l. 11. p. 507.*; *Livy Pref. and Varro ap. August. de Civ. Dei.*)

Savage:

* Strabo, lib. xvii. Diog. Laert. Vita Democ. et Vita Epicuri.

Savage.

Dei.) The more populous and extensive kingdoms and societies were civilized at a period prior to the records of profane history: the presumption, therefore, without taking revelation into the account, certainly is, that they were civilized from the beginning. This is rendered further probable from other circumstances. To account for their system, the advocates of savagism are obliged, as we have seen, to have recourse to numerous suppositions. They imagine that since the creation dreadful convulsions have happened which have spread ruin and devastation over the earth, which have destroyed learning and the arts, and brought on savagism by one sudden blow. But this is reasoning at random, and without a vestige of probability: for the only convulsion that can be mentioned is that at Babel, which we have already shown to be inadequate.

Further, it does not appear that any people who were once civilized, and in process of time had degenerated into the savage or barbarous state, have ever recovered their pristine condition without foreign aid. From whence we conclude, that man, once a savage, would never have raised himself from that hopeless state. This appears evident from the history of the world; for that it requires strong incitements to keep man in a very high state of knowledge and civilization, is evident from what we know of the numerous nations which were famed in antiquity, but which are now degenerated in an astonishing degree. That man cannot, or, which is the same thing, has not risen from barbarism to civilization and science by his own efforts and natural talents, appears further from the following facts. The rudiments of all the learning, religion, laws, arts, and sciences, and other improvements that have enlightened Europe, a great part of Asia, and the northern coast of Africa, were so many rays diverging from two points, on the banks of the Euphrates and the Nile. In proportion as nations receded from these two sources of humanity and civilization, in the same proportion were they more and more immersed in ignorance and barbarism. The Greeks had made no progress towards civilization when the Titans first, and afterwards colonies from Egypt and Phenicia, taught them the very elements of science and urbanity.* The aborigines of Italy were in the same state prior to the arrival of the Pelasgi, and the colonies from Arcadia and other parts of Greece. Spain was indebted for the first seeds of improvement to the commercial spirit of the Phenicians. The Gauls, the Britons, and the Germans, derived from the Romans all that in the early periods of their history they knew of science, or the arts of civil life, and so on of other nations in antiquity. The same appears to be the case in modern times. The countries which have been discovered by the restless and inquisitive spirit of Europeans have been generally found in the lowest state of savagism; from which, if they have emerged at all, it has been exactly in proportion to their connexion with the inhabitants of Europe. Even western Europe itself, when sunk in ignorance, during the reign of monkery, did not recover by the efforts of its own inhabitants. Had not the Greeks, who in the 15th century took refuge in Italy from the cruelty of the Turks, brought with them their ancient books, and taught the Italians to read them, we who are disputing about the origin of the savage state, and the innate powers of the human mind, had at this day been gross and ignorant savages

* See *Titan*.

ourselves, incapable of reasoning with accuracy upon any subject. That we have now advanced far before our masters is readily admitted; for the human mind, when put on the right track, and spurred on by emulation and other incitements, is capable of making great improvements: but between improving science, and emerging from savagism, every one perceives there is an immense difference.

Lord Kames observes, that the people who inhabit a grateful soil, where the necessaries of life are easily procured, are the first who invent useful and ingenious arts, and the first who figure in the exercises of the mind. But the Egyptians and Chaldeans, who are thought to support this remark, appear from what we have seen to have derived their knowledge from their antediluvian progenitors, and not from any advantages of situation or strength of genius. Besides, the inhabitants of a great part of Africa, of North and South America, and of many of the islands lately discovered, live in regions equally fertile, and equally productive of the necessaries of life, with the regions of Chaldea and Egypt; yet these people have been savages from time immemorial, and continue still in the same state. The Athenians, on the other hand, inhabited the most barren and ungrateful region of Greece, while their perfection in the arts and sciences has never been equalled. The Norwegian colony which settled in Iceland about the beginning of the 8th century, inhabited a most bleak and barren soil, and yet the fine arts were eagerly cultivated in that dreary region when the rest of Europe was sunk in ignorance and barbarism. Again, there are many parts of Africa, and of North and South America, where the soil is neither so luxuriant as to beget indolence, nor so barren and ungrateful as to depress the spirits by labour and poverty; where, notwithstanding, the inhabitants still continue in an uncultured state. From all which, and from numerous other instances which our limits permit us not to bring forward, we infer that some external influence is necessary to impel savages towards civilization; and that in the history of the world, or the nature of the thing, we find no instance of any people emerging from barbarism by the progressive efforts of their own genius. On the contrary, as we find, in societies highly cultivated and luxurious, a strong tendency to degenerate, so in savages we not only find no mark of tendency to improvement, but rather a rooted aversion to it. Among them, indeed, the social appetite never reached beyond their own horde. It is, therefore, too weak and too confined to dispose them to unite in large communities; and of course, had all mankind been once in the savage state, they never could have arrived at any considerable degree of civilization.

Instead of trusting to any such natural progress, as is contended for, the Providence of Heaven, in pity to the human race, appears at different times, and in different countries, to have raised up some persons endowed with superior talents, or, in the language of poetry, some heroes, demi-gods, or god-like men, who having themselves acquired some knowledge in nations already civilized, by useful inventions, legislation, religious institutions, and moral arrangements, sowed the first seeds of civilization among the hordes of wandering disunited barbarians. Thus we find the Chinese look up to their Fohee, the Indians to Brahma, the Persians

Savage.

to Zoroaster, the Chaldeans to Oanes, the Egyptians to Thoth, the Phenicians to Melicerta, the Scandinavians to Odin, the Italians to Janus, Saturn, and Picus, and the Peruvians to Manco. In later times, and almost within our own view, we find the barbarous nations of Russia reduced to some order and civilization by the astonishing powers and exertions of Peter the Great. The endeavours of succeeding monarchs, and especially of Catharine II. have powerfully contributed to the improvement of this mighty empire. In many parts of it, however, we still find the inhabitants in a state very little superior to savagism; and through the most of it, the lower, and perhaps the middling orders, appear to retain an almost invincible aversion to all further progress; * a fact which, when added to numerous others of a similar nature which occur in the history of the world, seems to prove indisputably, that there is no such natural propensity to improvement in the human mind as we are taught by some authors to believe. The origin of savagism, if we allow mankind to have been at first civilized, is easily accounted for by natural means: The origin of civilization, if at any period the whole race were savages, cannot, we think, be accounted for otherwise than by a miracle, or repeated miracles.

To many persons in the present day, especially, the doctrine we have now attempted to establish will appear very humiliating; and perhaps it is this alone that has prevented many from giving the subject so patient a hearing as its importance seems to require. It is a fashionable kind of philosophy to attribute to the human mind very preeminent powers: which so flatter our pride, as in a great measure, perhaps, to pervert our reason, and blind our judgment. The history of the world, and of the dispensations of God to man, are certainly at variance with the popular doctrine respecting the origin of civilization: for if the human mind be possessed of that innate vigour which that doctrine attributes to it, it will be extremely difficult to account for those numerous facts which seem with irresistible evidence to proclaim the contrary—for that unceasing care with which the Deity appears to have watched over us—and for those various and important revelations He has vouchsafed to us. Let us rejoice and be thankful that we are men, and that we are Christians; but let not a vain philosophy tempt us to imagine that we are angels or gods.

SAVAGE Island, one of the small islands in the South sea, lying in S. Lat. 19. 1. W. Long. 169. 37. It is about seven leagues in circuit, of a good height, and has deep water close to its shores. Its interior parts are supposed to be barren, as there was no soil to be seen upon the coast; the rocks alone supplying the trees with humidity. The inhabitants are exceedingly warlike and fierce, so that Captain Cook could not have any intercourse with them.

SAVANNA-LA-MAR, a town of Jamaica, situated in the county of Cornwall in that island. It is the county town, where the assize courts are held. This town was almost totally destroyed in 1781 by an earthquake and inundation, when many of the inhabitants perished. It has now an elegant court-house, and contains about one hundred other houses. It belongs to Westmoreland parish, in which are 89 sugar-estates, 106 other estates, and 18,000 slaves.

SAVANNAH, formerly the capital of Georgia in North America, situated on a river of the same name, and 17 miles from its mouth, in W. Long. 80. 20. N. Lat. 32. 0. This town is regularly built in form of a parallelogram.

Savannah,
Savary.

SAVARY, James, an eminent French writer on the subject of trade, was born at Done, in Anjou, in 1622. Being bred to merchandise, he continued in trade until 1658; when he left off the practice, to cultivate the theory. He had married in 1650; and in 1660, when the king declared a purpose of assigning privileges and pensions to such of his subjects as had twelve children alive, Mr Savary was not too rich to put in his claim to the Royal bounty. He was afterwards admitted of the council for the reformation of commerce; and the orders which passed in 1670 were drawn up by his instructions and advice. He wrote *Le Parfait Negociant*, 3to; and, *Avis et conseils sur les importantes matieres du Commerce*, in 4to. He died in 1690; and out of 17 children whom he had by one wife, left 11. Two of his sons, James and Philemon Lewis, laboured jointly on a great work, *Dictionnaire Universelle du Commerce*, 2 vols. folio. This work was begun by James who was inspector-general of the manufactures at the custom-house, Paris; who called in the assistance of his brother Philemon Lewis, although a canon of the Royal church of St Maur; and by his death left him to finish it. This work appeared in 1723, and Philemon afterwards added a third supplemental volume to the former. Postlethwayte's English Dictionary of Trade and Commerce is a translation, with considerable improvements, from Savary.

SAVARY, an eminent French traveller and writer, was born at Vitre, in Brittany, about the year 1748. He studied with applause at Rennes, and in 1776 travelled into Egypt, where he remained almost three years. During this period he was wholly engaged in the study of the Arabian language, in searching out ancient monuments, and in examining the national manners. After making himself acquainted with the knowledge and philosophy of Egypt, he visited the islands in the Archipelago, where he spent 18 months. On his return to France, in 1780, he published, 1. A Translation of the Koran, with a short Life of Mahomet, in 1783, 2 vols. 8vo. 2. The Morality of the Koran, or a collection of the most excellent maxims in the Koran; a work extracted from his translation, which is esteemed both elegant and faithful. 3. Letters on Egypt, in 3 vols. 8vo, in 1785. In these the author makes his observations with accuracy, paints with vivacity, and renders interesting every thing he relates. His descriptions are in general faithful, but are perhaps in some instances too much ornamented. He has been justly censured for painting modern Egypt and its inhabitants in too high colours. These letters, however, were bought up by the curious public, and read with pleasure and advantage. Encouraged by this flattering reception, he prepared his letters upon Greece. He died soon after at Paris of a malady contracted from too intense application. A sensible obstruction in the right lobe of the liver had made a decisive progress, which the return of summer, some simple medicines, a strict regimen, and travelling, seemed to remove.

On his return into the country adjacent to Paris, his health however was still doubtful; for it is well known

Savary
||
Save.

known that when the organization of one of the viscera has been much deranged, deep traces of it will ever remain. His active mind, however, made him regardless of his health, and he conceived it his duty to profit by those appearances of recovery which he experienced at the close of the summer and the beginning of autumn, to put into order his travels into the islands of the Archipelago, intended as a continuation of his letters on Egypt. His warmth of temper was exasperated by some lively criticisms which had been made on his former productions, and he gave himself up to study with a degree of activity of which the consequences were sufficiently obvious. An obstruction in the liver again took place, and made a new progress; his digestion became extremely languid; sleep quite forsook him, both by night and by day; a dry and troublesome cough came on; his face appeared bloated, and his legs more and more inflamed. The use of barley-water and cream of tartar still however promoted, in some degree, the urinary secretions, and afforded some little glimmering of hope. In this situation he returned to Paris in the beginning of the year 1788, to attend to the publication of his new work concerning the islands of the Archipelago, particularly the isle of Candia. He had then all the symptoms of a dangerous dropsy, which became still more alarming from the very exhausted state of the viscera. The right lobe of the liver was extremely hard and sensible. The patient had shiverings without any regular returns, and his strength was undermined by a hectic fever. At the same time still more uneasy symptoms took place, those of a dropsy in the chest; but the circumstances which destroyed all hope, and announced his approaching dissolution, were a severe pain in the left side, with a very troublesome cough, and a copious and bloody expectoration (*in hepaticis*, says Hippocrates, *sputum cruentum mortiferum*); his respiration became more and more difficult; his strength was exhausted, and his death took place on the 4th of February 1788, attended with every indication of the most copious overflowing in the chest, and of an abscess in the liver.—Thus was destroyed, in the vigour of his age, an author whose character and talents rendered him worthy of the happiest lot.

Mr Savary's genius was lively and well cultivated; his heart warm and benevolent; his imagination vigorous; his memory retentive. He was cheerful and open; and had so great a talent for telling a story, that his company was not less agreeable than instructive. He did not mingle much with the world, but was satisfied with performing well the duties of a son, of a brother, and of a friend.

SAUCISSE, or SAUCISSON, in mining, is a long pipe or bag, made of cloth well pitched, or sometimes of leather, of about an inch and a half diameter, filled with powder, going from the chamber of the mine to the entrance of the gallery. It is generally placed in a wooden pipe called an *auget*, to prevent its growing damp. It serves to give fire to mines, caissons, bomb-chests, &c.

SAUCISSON, is likewise a kind of fascine, longer than the common ones; they serve to raise batteries and to repair breaches. They are also used in making epaulements, in stopping passages, and in making traverses over a wet ditch, &c.

SAVE, a river of Germany, which has its source in Upper Carniola, on the frontiers of Carinthia. It runs

through Carniola from west to east, afterwards separates Slavonia from Croatia, Bosnia, and part of Serbia, and then falls into the Danube at Belgrade.

SAVENDROOG, a strong fortress of Hindostan, in the Mysore kingdom. It is situated on the summit of a vast rock, measuring about half a mile in perpendicular height, its base being upwards of eight miles in circumference, and divided by a chasm at the top, by which it is formed into two hills, each having a peculiar kind of defence. They answer the purpose of two citadels which are capable of being maintained independent of the lower works, which are remarkably strong. It was, however, taken by the gallantry of British troops in the year 1791, after a siege of seven days continuance. It is 18 miles west of Bangalore. See INDIA, N° 167.

SAVER-KROUT. See KROUTE.

SAVERNAKE-Forest, is situated near Marlborough in Wiltshire, and is 12 miles in circumference, well stocked with deer, and delightful from the many vistas cut through the woods and coppices with which it abounds. Eight of these vistas meet, like the rays of a star, in a point near the middle of the forest, where an octagon tower is erected to correspond with the vistas; through one of which is a view of Tottenham Park, Lord Ailesbury's seat, a stately edifice erected after the model, and under the direction, of our modern Vitruvius, the earl of Burlington, who to the strength and convenience of the English architecture has added the elegance of the Italian.

SAVILLE, SIR GEORGE, afterwards Marquis of Halifax, and one of the greatest statesmen of his time, was born about the year 1630; and some time after his return from his travels was created a peer, in consideration of his own and his father's merits. He was a strenuous opposer of the bill of exclusion; but proposed such limitations of the duke of York's authority, as should disable him from doing any harm either in church or state, as the taking out of his hands all power in ecclesiastical matters, the disposal of the public money, and the power of making peace and war; and lodging these in the two houses of parliament. After that bill was rejected in the house of lords, he pressed them, though without success, to proceed to the limitation of the duke's power; and began with moving, that during the king's life he might be obliged to live five hundred miles out of England. In August 1682 he was created a marquis, and soon after made privy-seal. Upon King James's accession, he was made president of the council; but on his refusal to consent to the repeal of the test, he was dismissed from all public employments. In that assembly of the lords which met after King James's withdrawing himself the first time from Whitehall, the marquis was chosen their president; and upon the king's return from Feversham, he was sent, together with the earl of Shrewsbury and Lord Delamere, from the prince of Orange, to order his majesty to quit the palace at Whitehall. In the convention of parliament he was chosen speaker of the house of lords, and strenuously supported the motion for the vacancy of the throne, and the conjunctive sovereignty of the prince and princess; upon whose accession he was again made privy seal. Yet, in 1689, he quitted the court, and became a zealous opposer of the measures of government till his death, which happened in April 1695. The Rev. Mr Grainger

Save
||
Savile.

Grainger observes, that " he was a person of unsettled principles, and of a lively imagination, which sometimes got the better of his judgment. He would never lose his jest, though it spoiled his argument, or brought his sincerity or even his religion in question. He was deservedly celebrated for his parliamentary talents; and in the famous contest relating to the bill of exclusion was thought to be a match for his uncle Shaftsbury. The pieces he has left us show him to have been an ingenious, if not a masterly writer; and his *Advice to a Daughter* contains more good sense in fewer words than is, perhaps, to be found in any of his contemporary authors." His lordship also wrote, *The Anatomy of an Equivalent*; a *Letter to a Dissenter*; a *Rough Draught of a New Model at Sea*; and *Maxims of State*; all which were printed together in one volume 8vo.—Since these were also published under his name, the *Character of King Charles II.* 8vo; the *Character of Bishop Burnet*, and *Historical Observations upon the reigns of Edward I. II. III. and Richard II.* with *Remarks upon their faithful Counsellors and false Favourites.*

SAVILLE, SIR HENRY, a learned Englishman, was the second son of Henry Saville, Esq. and was born at Bradley, near Halifax, in Yorkshire, November the 30th, 1549. He was entered of Merton College, Oxford, in 1561, where he took the degrees in arts, and was chosen fellow. When he proceeded master of arts in 1570, he read for that degree on the *Almagest* of Ptolemy, which procured him the reputation of a man eminently skilled in mathematics and the Greek language; in the former of which he voluntarily read a public lecture in the university for some time.

In 1578 he travelled into France and other countries; where, diligently improving himself in all useful learning, in languages, and the knowledge of the world, he became a most accomplished gentleman. At his return, he was made tutor in the Greek tongue to Queen Elizabeth, who had a great esteem for him.

In 1585 he was made warden of Merton College, which he governed 36 years with great honour, and improved it by all the means in his power.—In 1596 he was chosen provost of Eton College; which he filled with many learned men.—James I. upon his accession to the crown of England, expressed a great regard for him, and would have preferred him either in church or state; but Saville declined it, and only accepted the ceremony of knighthood from the King at Windsor in 1604. His only son Henry dying about that time, he thenceforth devoted his fortune to the promoting of learning. Among other things, in 1619, he founded, in the university of Oxford, two lectures, or professorships, one in geometry, the other in astronomy; which he endowed with a salary of 160*l.* a year each, besides a legacy of 600*l.* to purchase more lands for the same use. He also furnished a library with mathematical books, near the mathematical school, for the use of his professors; and gave 100*l.* to the mathematical chest of his own appointing: adding afterwards a legacy of 40*l.* a year to the same chest, to the university, and to his professors jointly. He likewise gave 120*l.* towards the new building of the schools, beside several rare manuscripts and printed books to the Bodleian library; and a good quantity of Greek types to the printing press at Oxford.

VOL. XVIII. Part II.

After a life thus spent in the encouragement and promotion of science and literature in general, he died at Eton College the 19th of February 1622, in the 72d year of his age, and was buried in the chapel there. On this occasion, the university of Oxford paid him the greatest honours, by having a public speech and verses made in his praise, which were published soon after in 4to, under the title of *Ultima Linea Savillii.*

The highest encomiums were bestowed on Saville by all the learned of his time: by Casaubon, Mercerus, Meibomius, Joseph Scaliger, and especially the learned Bishop Montague; who, in his *Diatriba* upon Selden's History of Tythes, styles him, " that magazine of learning, whose memory shall be honourable amongst not only the learned, but the righteous, for ever." His works are,

1. Four Books of the Histories of Cornelius Tacitus, and the Life of Agricola; with Notes upon them, in folio, dedicated to Queen Elizabeth, 1581.—2. A View of certain Military Matters, or Commentaries concerning Roman Warfare, 1598.—3. *Rerum Anglicarum Scriptores post Bedam*, &c. 1596. This is a collection of the best writers of our English history; to which he added chronological tables at the end, from Julius Cæsar to William the Conqueror.—4. The Works of St Chrysostom, in Greek, in 8 vols folio, 1613. This is a very fine edition, and composed with great cost and labour. In the preface he says, " that having himself visited, about 12 years before, all the public and private libraries in Britain, and copied out thence whatever he thought useful to this design, he then sent some learned men into France, Germany, Italy, and the East, to transcribe such parts as he had not already, and to collate the others with the best manuscripts." At the same time, he makes his acknowledgements to several eminent men for their assistance; as Thuanus, Velserus, Schottus, Casaubon, Ducæus, Gruter, Hoeschelius, &c. In the 8th volume are inserted Sir Henry Saville's own notes, with those of other learned men. The whole charge of this edition, including the several sums paid to learned men, at home and abroad, employed in finding out, transcribing, and collating the best manuscripts, is said to have amounted to no less than 8000*l.* Several editions of this work were afterwards published at Paris.—5. In 1618 he published a Latin work, written by Thomas Bradwardin, archbishop of Canterbury, against Pelagius, entitled *De Causa Dei contra Pelagium, et de virtute causarum*; to which he prefixed the life of Bradwardin.—6. In 1621 he published a collection of his own Mathematical Lectures on Euclid's Elements, in 4to.—7. *Oratio coram Elizabetha Regina Oxoniæ habita*, anno 1592. Printed at Oxford in 1658, in 4to.—8. He translated into Latin King James's Apology for the Oath of Allegiance. He also left several manuscripts behind him, written by order of King James; all which are in the Bodleian library. He wrote notes likewise upon the margin of many books in his library, particularly Eusebius's Ecclesiastical History; which were afterwards used by Valesius, in his edition of that work in 1659.—Four of his letters to Camden are published by Smith, among Camden's Letters, 1691, 4to.

SAVIN, in *Botany*. See JUNIPERUS, BOTANY *Index.*

SAVIOUR, an appellation peculiarly given to Jesus Christ,

Saviour
||
Saunderson.

Christ, as being the Messiah and Saviour of the world. See JESUS.

Order of St SAVIOUR, a religious order of the Romish church, founded by St Bridget, about the year 1345, and so called from its being pretended that our Saviour himself declared its constitution and rules to the foundress. According to the constitutions, this is principally founded for religious women who pay a particular honour to the holy virgin; but there are some monks of the order, to administer the sacrament and spiritual assistance to the nuns.

SAUL the son of Kish, of the tribe of Benjamin, was the first king of the Israelites. On account of his disobedient conduct, the kingdom was taken from his family, and given to David. See the First Book of Samuel.

SAUL, otherwise called Paul. See PAUL.

SAUMUR, a considerable town of France, in the department of Maine and Loire, with an ancient castle. The town is pleasantly situated on the Loire, across which is a long bridge, continued through a number of islands. It contained 9585 inhabitants in 1800. Saumur was anciently a most important pass over the river, and of consequence was frequently and fiercely disputed by either party, during the civil wars of France in the sixteenth century. The fortifications are of great strength; and Henry IV, on the reconciliation which took place between him and Henry III. near Tours in 1589, demanded that Saumur should be delivered to him, as one of the cities of safety. The castle overlooks the town and river. It is built on a lofty eminence, and has a venerable and magnificent appearance, and was lately used as a prison of state, where persons of rank were frequently confined. The kings of Sicily, and dukes of Anjou of the house of Valois, who descended from John king of France, often resided in the castle of Saumur, as it constituted a part of their Angevin dominions. E. Long. O. 2. N. Lat. 47. 15.

SAUNDERS, a kind of wood brought from the East Indies, of which there are three kinds; white, yellow, and red. See PTEROCARPUS and SANTALUM, *BOTANY Index*.

SAUNDERSON, DR ROBERT, an eminent casuist, was born at Rotherham in Yorkshire on the 19th September 1587, and was descended of an ancient family. He attended the grammar-school at Rotherham, where he made such wonderful proficiency in the languages, that at 13 it was judged proper to send him to Lincoln college, Oxford. In 1608 he was appointed logic reader in the same college. He took orders in 1611, and was promoted successively to several benefices. Archbishop Laud recommended him to King Charles I. as a profound casuist; and that monarch, who seems to have been a great admirer of casuistical learning, appointed him one of his chaplains in 1631. Charles proposed several cases of conscience to him, and received so great satisfaction from his answers, that at the end of his month's attendance he told him, that he would wait with impatience during the intervening 11 months, as he was resolved to be more intimately acquainted with him, when it would again be his turn to officiate. The king regularly attended his sermons, and was wont to say, that "he carried his ears to hear other preachers, but his conscience to hear Mr Saunderson."

In 1642 Charles created him regius professor of divinity at Oxford, with the canonry of Christ church annexed: but the civil wars prevented him till 1646 from entering on the office; and in 1648 he was ejected by the visitors which the parliament had commissioned. He must have stood high in the public opinion; for in the same year in which he was appointed professor of divinity, both houses of parliament recommended him to the king as one of their trustees for settling the affairs of the church. The king, too, reposed great confidence in his judgment, and frequently consulted him about the state of his affairs. When the parliament proposed the abolition of the episcopal form of church-government as incompatible with monarchy, Charles desired him to take the subject under his consideration, and deliver his opinion. He accordingly wrote a treatise entitled, *Episcopacy as established by law in England not prejudicial to regal power*. At taking leave, the king advised him to publish *Cases of Conscience*: he replied, that "he was now grown old and unfit to write cases of conscience." The king said, "It was the simplest thing he ever had heard from him; for no young man was fit to be a judge, or write cases of conscience." Walton, who wrote the life of Dr Saunderson, informs us, that in one of these conferences the king told him (Dr Saunderson), or one of the rest who was then in company, that "the remembrance of two errors did much affect him; which were his assent to the earl of Strafford's death, and the abolishing of episcopacy in Scotland; and that if God ever restored him to the peaceable possession of his crown, he would prove his repentance by a public confession and a voluntary penance, by walking barefoot from the Tower of London, or Whitehall, to St Paul's church, and would desire the people to intercede with God for his pardon."

Dr Saunderson was taken prisoner by the parliament's troops and conveyed to Lincoln, in order to procure in exchange a Puritan divine named *Clark*, whom the king's army had taken. The exchange was agreed to, on condition that Dr Saunderson's living should be restored, and his person and property remain unmolested. The first of these demands was readily complied with: and a stipulation was made, that the second should be observed; but it was impossible to restrain the licentiousness of the soldiers. They entered his church in the time of divine service, interrupted him when reading prayers, and even had the audacity to take the common prayer book from him, and to tear it to pieces.

The honourable Mr Boyle, having read a work of Dr Saunderson's entitled *De juramenti obligatione*, was so much pleased, that he inquired at Bishop Barlow, whether he thought it was possible to prevail on the author to write *Cases of Conscience*, if an honorary pension was assigned him to enable him to purchase books, and pay an amanuensis. Saunderson told Barlow, "that if any future tract of his could be of any use to mankind, he would cheerfully set about it without a pension." Boyle, however, sent him a present of 50*l.*, sensible no doubt, that, like the other royalists, his finances could not be great. Upon this Saunderson published his book *De Conscientia*.

When Charles II. was reinstated in the throne, he recovered his professorship and canonry, and soon after was promoted to the bishopric of Lincoln. During the

Saunderson.

under-son. the two years and a half in which he possessed this new office, he spent a considerable sum in augmenting poor vicarages, in repairing the palace at Budgen, &c. He died January 29. 1662-3, in his 76th year.

He was a man of great acuteness and solid judgment. "That staid and well-weighted man Dr Saunderson (says Dr Hammond) conceives all things deliberately, dwells upon them discreetly, discerns things that differ exactly, passeth his judgment rationally, and expresses it aptly, clearly, and honestly." Being asked, what books he had read most? he replied, that "he did not read many books, but those which he did read were well chosen and frequently perused." These he said, were chiefly three, Aristotle's Rhetoric, Aquinas's *Secunda Secundæ*, and Tully's works; especially his Offices, which he had not read over less than 20 times, and could even, in his old age, recite without book." He added, that "the learned civilian Dr Zouch had written *Elementa juris prudentiæ*, which he thought he could also say without book, and that no wise man could read it too often." He was not only conversant with the fathers and schoolmen, with casuistical and controversial divinity; but he was well acquainted with all the histories of the English nation, was a great antiquary, had searched minutely into records, and was well skilled in heraldry and genealogy.

It will now be proper to give a short account of his works. 1. In 1615 he published *Logicæ Artis Compendium*, which was the system of lectures he had delivered in the University when he was logic reader. 2. Sermons, amounting in number to 36, printed in 1681, folio, with the author's life by Walton. 3. Nine Cases of Conscience resolved; first collected in one volume, in 1678, 8vo. 4. *De juramenti obligatione*. This book was translated into English by Charles I. while a prisoner in the isle of Wight, and printed at London in 1665, 8vo. 5. *De Obligatione conscientia*. 6. Censure of Mr Antony Aseham his book of the confusions and revolutions of government. 7. *Pax Ecclesiæ*, concerning Predestination, or the five points. 8. Episcopacy, as established by law in England, not prejudicial to the regal power, in 1661. Besides these, he wrote two Discourses in defence of Usher's writings.

SAUNDERSON, Dr Nicholas, was born at Thurlstone in Yorkshire in 1682, and may be considered as a prodigy for his application and success in mathematical literature in circumstances apparently the most unfavourable. He lost his sight by the smallpox before he was a year old. But this disaster did not prevent him from searching after that knowledge for which nature had given him so ardent a desire. He was initiated into the Greek and Roman authors at a free school at Peniston. After spending some years in the study of the languages, his father (who had a place in the excise) began to teach him the common rules of arithmetic. He soon surpassed his father; and could make long and difficult calculations, without having any sensible marks to assist his memory. At 18 he was taught the principles of algebra and geometry by Richard West of Underbank, Esq. who, though a gentleman of fortune, yet being strongly attached to mathematical learning, readily undertook the education of so uncommon a genius. Saunderson was also assisted in his mathematical studies by Dr Nettleton. These two gentlemen read books to him and explained them. He was next

sent to a private academy at Attercliff near Sheffield, where logic and metaphysics were chiefly taught. But these sciences not suiting his turn of mind, he soon left the academy. He lived for some time in the country without any instructor; but such was the vigour of his own mind, that few instructions were necessary: he only required books and a reader.

His father, besides the place he had in the excise, possessed also a small estate; but having a numerous family to support, he was unable to give him a liberal education at one of the universities. Some of his friends, who had remarked his perspicuous and interesting manner of communicating his ideas, proposed that he should attend the university of Cambridge as a teacher of mathematics. This proposal was immediately put in execution; and he was accordingly conducted to Cambridge in his 25th year, by Mr Joshua Dunn, a fellow-commoner of Christ's college. Though he was not received as a member of the college, he was treated with great attention and respect. He was allowed a chamber, and had free access to the library. Mr Whiston was at that time professor of mathematics; and as he read lectures in the way that Saunderson intended, it was naturally to be supposed he would view his project as an invasion of his office. But, instead of meditating any opposition, the plan was no sooner mentioned to him than he gave his consent. Saunderson's reputation was soon spread through the university. When his lectures were announced, a general curiosity was excited to hear such intricate mathematical subjects explained by a man who had been blind from his infancy. The subject of his lectures was the *Principia Mathematica*, the Optics, and *Aritmetica Universalis* of Sir Isaac Newton. He was accordingly attended by a very numerous audience. It will appear at first incredible to many that a blind man should be capable of explaining optics, which requires an accurate knowledge of the nature of light and colours; but we must recollect, that the theory of vision is taught entirely by lines, and is subject to the rules of geometry.

While thus employed in explaining the principles of the Newtonian philosophy, he became known to its illustrious author. He was also intimately acquainted with Halley, Cotes, De Moivre, and other eminent mathematicians. When Whiston was removed from his professorship, Saunderson was universally allowed to be the man best qualified for the succession. But to enjoy this office, it was necessary, as the statutes direct, that he should be promoted to a degree. To obtain this privilege the heads of the university applied to their chancellor the duke of Somerset, who procured the royal mandate to confer upon him the degree of master of arts. He was then elected Lucasian professor of mathematics in November 1711. His inauguration speech was composed in classical Latin, and in the style of Cicero, with whose works he had been much conversant. He now devoted his whole time to his lectures, and the instruction of his pupils. When George II, in 1728, visited the university of Cambridge, he expressed a desire to see Professor Saunderson. In compliance with this desire, he waited upon his majesty in the senate-house, and was there, by the king's command, created doctor of laws. He was admitted a member of the Royal Society in 1736.

Saunderson was naturally of a vigorous constitution;

Saunderson.

but having confined himself to a sedentary life, he at length became scorbutic. For several years he felt a numbness in his limbs, which, in the spring of 1739, brought on a mortification in his foot; and, unfortunately, his blood was so vitiated by the scurvy, that assistance from medicine was not to be expected. When he was informed that his death was near, he remained for a little space calm and silent; but he soon recovered his former vivacity, and conversed with his usual ease. He died on the 19th of April 1739, in the 57th year of his age, and was buried at his own request in the chancel at Boxworth.

He married the daughter of the reverend Mr Dickens, rector of Boxworth, in Cambridgeshire, and by her had a son and a daughter.

Dr Saunderson was rather to be admired as a man of wonderful genius and assiduity, than to be loved for amiable qualities. He spoke his sentiments freely of characters, and praised or condemned his friends as well as his enemies without reserve. This has been ascribed by some to a love of defamation; but perhaps with more propriety it has been attributed by others to an inflexible love of truth, which urged him upon all occasions to speak the sentiments of his mind without disguise, and without considering whether this conduct would please or give offence. His sentiments were supposed unfavourable to revealed religion. It is said, that he alleged he could not know God, because he was blind, and could not see his works; and that, upon this, Dr Holmes replied, "Lay your hand upon yourself, and the organization which you will feel in your own body will dissipate so gross an error." On the other hand, we are informed, that he had desired the sacrament to be given him on the evening before his death. He was, however, seized with a delirium, which rendered this impossible.

He wrote a system of algebra, which was published in 2 volumes 4to, at London, after his death, in the year 1740, at the expense of the university of Cambridge.

Dr Saunderson invented for his own use a Palpable Arithmetic; that is, a method of performing operations in arithmetic solely by the sense of touch. It consisted of a table raised upon a small frame, so that he could apply his hands with equal ease above and below. On this table were drawn a great number of parallel lines which were crossed by others at right angles; the edges of the table were divided by notches half an inch distant from one another, and between each notch there were five parallels; so that every square inch was divided into a hundred little squares. At each angle of the squares where the parallels intersected one another, a hole was made quite through the table. In each hole he placed two pins, a big and a small one. It was by the various arrangements of the pins that Saunderson performed his operations. A description of this method of making calculations by his table is given under the article BLIND, N° 38, though it is there by mistake said that it was not of his own invention.

His sense of touch was so perfect, that he could discover with the greatest exactness the slightest inequality of surface, and could distinguish in the most finished works the smallest oversight in the polish. In the cabinet of medals at Cambridge he could single out the Roman medals with the utmost correctness; he could also perceive the slightest variation in the atmosphere. One

day, while some gentlemen were making observations on the sun, he took notice of every little cloud that passed over the sun which could interrupt their labours. When any object passed before his face, even though at some distance, he discovered it, and could guess its size with considerable accuracy. When he walked, he knew when he passed by a tree, a wall, or a house. He made these distinctions from the different ways his face was affected by the motion of the air.

His musical ear was remarkably acute; he could distinguish accurately to the fifth of a note. In his youth he had been a performer on the flute; and he had made such proficiency, that if he had cultivated his talents in this way, he would probably have been as eminent in music as he was in mathematics. He recognised not only his friends, but even those with whom he was slightly acquainted, by the tone of their voice; and he could judge with wonderful exactness of the size of any apartment into which he was conducted.

SAVONA, a large, handsome, and strong town of Italy, in the territory of Genoa, with two castles, and a bishop's see, and containing about 6000 inhabitants in 1800. It contains several handsome churches. It was taken by the king of Sardinia in 1746, at which time it had a capacious harbour; but the people of Genoa, being afraid that it would hurt their own trade, choked it up. It is seated on the Mediterranean sea, in a well-cultivated country, abounding in silk and all kinds of good fruit. E. Long. 8. 14. N. Lat. 44. 21.

SAVONAROLA, JEROME, a famous Italian monk, was born at Ferrara in 1452, and descended of a noble family. At the age of 22 he assumed the habit of a Dominician friar, without the knowledge of his parents, and distinguished himself in that order by his piety and ability as a preacher. Florence was the theatre where he chose to appear; there he preached, confessed, and wrote. He had address enough to place himself at the head of the faction which opposed the family of the Medici. He explained the Apocalypse, and there found a prophecy which foretold the destruction of his opponents. He predicted a renovation of the church, and declaimed with much severity against the clergy and the court of Rome. Alexander VI. excommunicated him, and prohibited him from preaching. He derided the anathemas of the pope: yet he forbore preaching for some time, and then resumed his employment with more applause than before. The pope and the Medici family then thought of attacking him with his own weapons. Savonarola having posted up a thesis as a subject of disputation, a Franciscan, by their instigation, offered to prove it heretical. The Franciscan was seconded by his brother friars, and Savonarola by his; and thus the two orders were at open war with each other. To settle the dispute, and to convince their antagonists of the superior sanctity of Savonarola, one of the Dominicans offered to walk through a fire: and in order to prove his wickedness, a Franciscan agreed to the same experiment. The multitude, eager to witness so extraordinary a spectacle, urged both parties to come to a decision; and the magistrates were constrained to give their consent. According'y, Saturday the 7th of April 1498 was fixed for the trial. On that day the champions appeared; but when they saw one another in cold blood, and beheld the wood in flames, they were seized with fear, and were very anxious to escape by any subterfuge the imminent

Saunderson.
Savonarola

voy. Savoy

nent danger into which they had rashly thrown themselves. The Dominican pretended he could not enter the flames without the host in his hand. This the magistrates obstinately refused to allow; and the Dominican's fortitude was not put to the test. The Franciscans incited the multitude against their opponents, who accordingly assaulted their monastery, broke open the gates which were shut against them, and entered by force. Upon this, the magistrates thought it necessary to bring Savonarola to trial as an impostor. He was put to the torture and examined; and the answers which he gave fully evinced that he was both a cheat and a fanatic. He boasted of having frequent conversations with God, and found his brother friars credulous enough to believe him. One of the Dominicans, who had shared in his sufferings, affirmed, that he saw the Holy Ghost in the shape of a dove, with feathers of gold and silver, twice in one day alight on the shoulder of Savonarola and peck his ear; he pretended also that he had violent combats with demons. John Francis Picus earl of Mirandula, who wrote his life, assures us, that the devils which infested the convent of the Dominicans trembled at the sight of Friar Jerome, and that out of vexation they always suppressed some letters of his name in pronouncing it. He expelled them from all the cells of the monastery. When he went round the convent sprinkling holy water to defend the friars from the insults of the demons, it is said the evil spirits spread thick clouds before him to prevent his passage.— At length, the pope Alexander VI. sent the chief of the Dominicans, with bishop Romolino, to degrade him from holy orders, and to deliver him up to the secular judges with his two fanatical associates. They were condemned to be hanged and burned on the 23d May 1498. Savonarola submitted to the execution of the sentence with great firmness and devotion, and without uttering a word respecting his innocence or his guilt. He was 46 years of age. Immediately after his death, his Confession was published in his name. It contained many extravagancies, but nothing to deserve so severe and infamous a punishment. His adherents did not fail to attribute to him the power of working miracles; and so strong a veneration had they for their chief, that they preserved with pious care any parts of his body which they could snatch from the flames. The earl of Mirandula, the author of his life, has described him as an eminent saint. He gravely informs us, that his heart was found in a river; and that he had a piece of it in his possession, which had been very useful in curing diseases, and ejecting demons. He remarks, that many of his persecutors came to a miserable end. Savonarola has also been defended by Father Quetif, Bzovius, Baron, and other religious Dominicans.

He wrote a prodigious number of books in favour of religion. He has left, 1. Sermons in Italian; 2. A Treatise entitled, *Triumphus Crucis*; 3. *Eruditorum Confessionum*, and several others. His works have been published at Leyden in 6 vols 12mo.

SAVORY. See SATUREIA, BOTANY. *Index*.

SAVOUR. See TASTE.

SAVOY, a country belonging to the king of Sardinia, lying between France and Italy, and which takes its name from the Latin Sabaadia, altered afterwards to Saboia, and Sobojia.

This country was anciently inhabited by the Celtes,

whose descendants therein were subdivided into the Allobroges, Nantuates, Veragri, Seduni, Salassi, Centrones, Garocelli, and some others of inferior note.— Of all these the Allobroges were the most considerable. The reduction of these tribes, in which Julius Cæsar had made a great progress, was completed under Augustus. Afterwards this country shared the fate of the rest of the western empire, and was overrun by the northern barbarians. The Burgundians held it a considerable time; but when or how it first became a distinct earldom under the present family, is what historians are not agreed about: thus much, however, is certain, that Amadæus I, who lived in the 12th century, was count of it. In 1416, Amadæus VIII. was created by the emperor Sigismund duke of Savoy; and Victor Amadæus first took the title of king of Sicily, and afterwards of Sardinia. See SARDINIA. Savoy was lately conquered by the French, and added to the republic as the 80th department. As this arrangement, though decreed by the convention to last for ever, may probably be of short duration, we shall write of the duchy as of an independent state. Savoy, then, is bounded to the south by France and Piedmont; to the north by the lake of Geneva, which separates it from Switzerland; to the west by France; and to the east by Piedmont, the Milanese, and Switzerland; its greatest length being about 88 miles, and breadth about 76.

As it lies among the Alps, it is full of lofty mountains, which in general are very barren: many of the highest of them are perpetually covered with ice and snow. The summit of those called *Montagnes Maudites*, "the cursed mountains," are said to be more than two English miles in perpendicular height above the level of the lake of Geneva, and the lake itself is much higher than the Mediterranean. In some few of the valleys there is corn land and pasture, and a good breed of cattle and mules; and along the lake of Geneva, and in two or three other places, a tolerable wine is produced. Mount Senis or Cenis, between Savoy and Piedmont, over which the highway from Geneva to Turin lies, is as high, if not higher, than the *Montagnes Maudites*; but of all the mountains of the Alps, the highest is Mount Rochmelon, in Piedmont, between Fertièrè and Novalesè. The roads over these mountains are very tedious, disagreeable, and dangerous, especially as huge masses of snow, called by the Italians *avalanches*, and fragments of rocks, frequently roll down into them from the impending precipices. The way of travelling is either in sledges, chairs, or on the backs of mules: in some places the path on the brink of the precipices is so narrow, that there is but just room for a single person to pass. It begins to snow on these mountains commonly about the beginning of October. In summer, in the months of July, August, and September, many of them yield very fine grass, with a great variety of flowers and herbs; and others boxwood, walnuts, chesnuts, and pines. The height and different combinations of these mountains, their towering summits rising above one another and covered with snow, the many cataracts or falls of water, the noise and rapidity of the river Arc, the froth and green tincture of its water, the echoes of its numerous streams tumbling from cliff to cliff, form altogether a very romantic scene. These mountainous tracts, notwithstanding their height, are not altogether free from thunder in summer, and are also much exposed

Savoy.

ed to thick clouds, which sometimes settle unexpectedly on them, and continue several days. There are some wolves among the thickets; and they abound with hares, rupicapras or chamois, and marmottes. In the lower parts of Savoy, there are also bears, wild boars, deer, and rabbits; and among the desolate mountains are found great quantities of rock-crystal. In the glaciers or ice-valleys, between the high mountains, the air is extremely cold, even in the months of July and August. The surface of these ice-valleys looks like a sea or lake, which, after being agitated by fierce and contrary winds, has been frozen all at once, interspersed with hideous cracks and chasms. The noise of these cracks, when first made by the heat of the noon-day sun, and reverberated by the surrounding rocks and mountains, is astonishing. The height of the impending mountains is such, that the sun's rays seldom reach the ice-valleys, except a few hours in the middle of summer. The avalanches or snow-balls, which the least concussion of the air will occasion, tumble down the mountains with amazing rapidity, continually increasing, and carrying all before them. People have been taken out alive, after being buried several days under them. The mountainous nature of this dutchy renders the plough an useless instrument of agriculture. The peasants break up the hungry soil with the pickaxe and spade, and to improve it carry up mould and dung in baskets. For the purpose of preserving it from drought in the spring and summer, they cut small reservoirs above it, the water of which may be let out at will; and to prevent the earth from giving way, break the declivity of the mountains by building walls on the side for its support, which frequently assume the appearance of ancient fortifications, and are a very pleasing deception to travellers. The Savoyards carry their better sort of cheese into Piedmont, as the flavour is much esteemed there; but they gain more by their skins of bears, chamois, and bouquetins (a species of the wild goat), or by the sale of grouse and pheasants, which they carry in great numbers to Turin.

The chief rivers are the Rhone, which, on the side of Geneva, separates Savoy from France; the Arve, which has some particles of gold in its sands; the Isere, the Seran, the Siers, and the Arc. There are also a great many lakes in this country, which yield plenty of fish, but none of them are very large, together with medicinal and reciprocating springs and hot baths.

The language of the common people is a corrupt French; but the better sort, and those that live in the great cities, speak as good French as they do in Paris itself.

In their temper, however, and disposition, the Savoyards resemble the Germans more than the French, retaining still much of the old German honesty and simplicity of manners, which no doubt is partly owing to the poverty and barrenness of the country. To this also, joined to their longevity and the fruitfulness of their women, which are the effects of their cheerful disposition, healthy air, activity, temperance, and sobriety, it is owing that great numbers of them are obliged to go abroad in quest of a livelihood, which they earn, those at least who have no trades, by showing marmottes, cleaning shoes, sweeping chimneys, and the like. It is said, that there are generally about 18,000 of them, young and old, about Paris. In summer they

lie in the streets, and in winter, 40, 50, or 60 of them lodge together in a room: they are so honest that they may be trusted to any amount. The children are often carried abroad in baskets before they are able to walk. In many villages of Savoy there is hardly a man to be seen throughout the year, excepting a month or two. Those that have families generally set out and return about the same season, when their wives commonly lie in; and they never fail to bring home some part of their small earnings. Some of them are such consummate masters of economy, that they set up shops and make fortunes, and others return home with a competency for the rest of their days. An old man is often despatched with letters, little presents, and some money, from the younger sort, to their parents and relations, and brings back with him fresh colonies, letters, messages, and news. The cultivation of their grounds, and the reaping and gathering in of the harvest and vintage, are generally left to the women and children; but all this is to be understood of the mountainous parts of Savoy. Great numbers of the mountaineers of both sexes are said to be lame and deformed; and they are much subject to a kind of wens, which grow about their throats, and very much disfigure them, especially the women; but that is the only inconvenience they feel from them.

The nobility of Savoy, and the other dominions of the king of Sardinia, labour under great hardships and restrictions, unheard of in other countries. A minute account of them will be found in Mr Keyser's Travels. In short, the king has left neither liberty, power, nor much property, to any but himself and the clergy, whose overgrown wealth he has also greatly curtailed.

No other religion is professed or tolerated in Savoy but that of the church of Rome. The decrees, however, of the council of Trent are not admitted; nor are the churches asylums for malefactors. This country was annexed to France in 1792, and remained in her possession till the peace of 1814. At the Congress of Vienna in 1805, the lordships of Chablais, Faucigny, and Genevrino, were separated from the Sardinian dominions.

SAURIN, JAMES, a celebrated preacher, was born at Nismes in 1677, and was the son of a protestant lawyer of considerable eminence. He applied to his studies with great success; but at length being captivated with a military life, he relinquished them for the profession of arms. In 1694 he made a campaign as a cadet in Lord Galloway's company, and soon afterwards obtained a pair of colours in the regiment of Colonel Renault which served in Piedmont. But the duke of Savoy having made peace with France, he returned to Geneva, and resumed the study of philosophy and theology under Turretin and other professors. In 1700 he visited Holland, then came to England, where he remained for several years, and married. In 1705 he returned to the Hague, where he fixed his residence, and preached with the most unbounded applause. To an exterior appearance highly prepossessing, he added a strong harmonious voice. The sublime prayer which he recited before his sermon, was uttered in a manner highly affecting. Nor was the attention excited by the prayer dissipated by the sermon: all who heard it were charmed; and those who came with an intention to criticise, were carried along with the preacher and forgot their design. Saurin had, however, one fault

Savoy,
Saurin.

urin. fault in his delivery; he did not manage his voice with sufficient skill. He exhausted himself so much in his prayer and the beginning of his sermons, that his voice grew feeble towards the end of the service. His sermons, especially those published during his life, are distinguished for justness of thought, force of reasoning, and an eloquent unaffected style.

The first time that the celebrated Abbadie heard him preach, he exclaimed, "Is it an angel or a man who speaks!" Saurin died on the 30th of December 1730, aged 53 years.

He wrote, 1. Sermons, which were published in 12 vols 8vo and 12mo; some of which display great genius and eloquence, and others are composed with negligence. One may observe in them the imprecations and the aversion which the Calvinists of that age were wont to utter against the Roman Catholics. Saurin was, notwithstanding, a lover of toleration; and his sentiments on this subject gave great offence to some of his fanatical brethren, who attempted to obscure his merit, and embitter his life. They found fault with him because he did not call the pope *Antichrist*, and the Romish church *the whore of Babylon*. But these prophetic metaphors, however applicable they may be, were certainly not intended by the benevolent religion of Jesus to be bandied about as terms of reproach; which would teach those to rail who use them; and irritate, without convincing, those to whom they were applied.

Saurin, therefore, while he perhaps interpreted these metaphors in the same way with his opposers, discovered more of the moderation of the Christian spirit. Five volumes of his sermons were published in his life, the rest have been added since his decease.

2. Discourses Historical, Critical, and Moral, on the most memorable Events of the Old and New Testament. This is his greatest and most valuable work. It was printed first in two volumes folio. As it was left unfinished, Beausobre and Roques undertook a continuation of it, and increased it to four volumes. It is full of learning: it is indeed a collection of the opinions of the best authors, both Christian and Heathen; of the philosophers, historians, and critics, on every subject which the author examines. 3. The State of Christianity in France, 1725, 8vo. In this book he discusses many important points of controversy, and calls in question the truth of the miracle said to be performed on La Fosse at Paris. 4. An Abridgement of Christian Theology and Morality, in the form of a Catechism, 1722, 8vo. He afterwards published an abridgement of this work.

A Dissertation which he published on the Expediency of sometimes disguising the Truth, raised a multitude of enemies against him. In this discourse his plan was, to state the arguments of those who affirm that, in certain cases, it is lawful to disguise truth, and the answers of those who maintain the contrary. He does not determine the question, but seems, however, to incline to the first opinion. He was immediately attacked by several adversaries, and a long controversy ensued; but his doctrines and opinions were at length publicly approved of by the synods of Cambray and of the Hague.

The subject of this controversy has long been agitated, and men of equally good principles have supported opposite sides. It would certainly be a dangerous

maxim that falsehood can ever be lawful. There may, indeed, be particular cases, when the motives to it are of such a nature as to diminish its criminality in a high degree; but to lessen its guilt is a very different thing from justifying it by the laws of morality.

SAURIN, *Joseph*, a geometrician of the academy of Sciences at Paris, was born at Courtousson in the principality of Orange, in 1659. His father, who was a minister at Grenoble, was his first preceptor. He made rapid progress in his studies, and was admitted minister of Eure in Dauphiny when very young; but having made use of some violent expressions in one of his sermons, he was obliged to quit France in 1683. He retired to Geneva, and thence to Berne, where he obtained a considerable living. He was scarcely settled in his new habitation, when some theologians raised a persecution against him. Saurin, hating controversy, and disgusted with Switzerland, where his talents were entirely concealed, repaired to Holland. He returned soon after to France, and surrendered himself into the hands of Bossuet, bishop of Meaux, who obliged him to make a recantation of his errors. This event took place in 1690. His enemies, however, suspected his sincerity in the abjuration which he had made. It was a general opinion, that the desire of cultivating science in the capital of France had a greater effect in producing this change than religion. Saurin, however, speaks of the reformers with great asperity, and condemns them for going too far. "Deceived in my opinions concerning the rigid system of Calvin, I no longer regarded that reformer in any other light but as one of those extravagant geniuses who are carried beyond the bounds of truth. Such appeared to me in general the founders of the reformation; and that just idea which I have now obtained of their character has enabled me to shake off a load of prejudices. I saw in most of the articles which have separated them from us, such as the invocation of saints, the worship of images, the distinction of meats, &c. that they had much exaggerated the inevitable abuses of the people, and imputed these to the Romish church, as if sanctioned by its doctrines. Besides, that they have misrepresented those doctrines which were not connected with any abuse. One thing which surprised me much when my eyes began to open, was the false idea, though in appearance full of respect, for the word of God, and which the reformers entertained of the perfection and perspicuity of the Holy Scriptures, and the manifest misinterpretation of passages which they bring to support that idea (for that misinterpretation is a point which can be proved). Two or three articles still raised some objections in my mind against the Romish church; to wit, Transubstantiation, the adoration of the sacrament, and the infallibility of the church. The adoration of the sacrament I considered as idolatry, and, on that account, removed from her communion. But soon after, the Exposition of the bishop of Meaux, a work which can never be sufficiently admired, and his Treatise concerning changes, reversed all my opinions, and rendered me an enemy to the Reformation." It is said also, that Saurin appeased his conscience by reading Poiret's *Cogitationes rationales*. This book is written with a view to vindicate the church of Rome from the charge of idolatry.

If it was the love of distinction that induced Saurin to return

Saurin.

Saurin
||
Saussure.

return to the Romish church, he was not disappointed: for he there met with protection and support. He was favourably received by Louis XIV., obtained a pension from him, and was treated by the Academy of Sciences with the most flattering respect. At that time (1717), geometry formed his principal occupation. He adorned the *Journal des Sçavans* with many excellent treatises; and he added to the memoirs of the academy many interesting papers. These are the only works which he has left behind him. He died at Paris on the 29th December 1737, in his 78th year, of a fever. He married a wife of the family of Crousas in Switzerland, who bore him a son, Bernard Joseph, distinguished as a writer for the theatre.

Saurin was of a bold and impetuous spirit. He had that lofty deportment which is generally mistaken for pride. His philosophy was austere; his opinions of men were not very favourable; and he often delivered them in their presence: this created him many enemies. His memory was attacked after his decease. A letter was printed in the *Mercure Suisse*, said to be written by Saurin from Paris, in which he acknowledges that he had committed several crimes which deserved death. Some Calvinist ministers published in 1757 two or three pamphlets to prove the authenticity of that letter; but Voltaire made diligent enquiry, not only at the place where Saurin had been discharging the sacerdotal office, but at the deans of the clergy of that department. They all exclaimed against an imputation so opprobrious. It must not, however, be concealed, that Voltaire, in the defence which he has published in his general history of Saurin's conduct, leaves some unfavourable impressions upon the reader's mind. He insinuates, that Saurin sacrificed his religion to his interest; that he played upon Bossuet, who believed he had converted a clergyman, when he had only given a little fortune to a philosopher.

SAURURUS, a genus of plants belonging to the heptandria class; and in the natural method ranking under the second order, *Piperite*. See *BOTANY Index*.

SAUSSURE, HORACE BENEDICT DE, a celebrated naturalist, was a native of Geneva, and born in 1740. His father was an intelligent farmer, who lived at Conches, about half a league from Geneva, which no doubt contributed, in addition to his active education, to increase the physical strength of young Saussure, so requisite for a naturalist who intends to travel. He went daily to town for public instruction; and as he lived at the foot of a mountain, he frequently amused himself in ascending its steep and rugged sides. Thus environed by the phenomena of nature, and assisted by study, it was to be expected that he would soon conceive a predilection for natural history. Botany was his most early and favourite study, a taste which was powerfully encouraged by his local situation, and was the means of introducing him to the acquaintance of the great Haller, to whom he paid a visit in 1764, and was astonished at his intimate acquaintance with every branch of the natural sciences.

His attachment to the study of the vegetable kingdom was also increased by his connexion with Bonnet, who had married his aunt, and who put a proper estimate on the talents of his nephew. He was at that time engaged in the examination of the leaves of plants, to which Saussure was also induced to turn his atten-

tion, and published the result of his researches under the title of *Observations on the Bark of Leaves*. About this time the philosophical chair at Geneva became vacant, and was given to Saussure at the age of 21. Rewards conferred so early have been thought to extinguish in some a zeal for the increase of knowledge, but this was not the case with De Saussure, who taught physics and logic alternately with equal success. For physics, however, he had the greatest taste, as affording the means of prosecuting the study of chemistry, mineralogy, and other kindred sciences.

He now began his travels through the mountains, not for the purpose of studying, as formerly, their flowery decorations, but their constituent parts, and the disposition of their masses. During the first fifteen years of his professorship, he was alternately engaged in discharging the duties of his office, and in traversing the mountains in the vicinity of Geneva; and in this period his talents as a great philosopher were fully displayed. He extended his researches on one side to the banks of the Rhine, and on the other to the country of Piedmont. He travelled to Auvergne to examine the extinguished volcanoes, going afterwards to Paris, England, Holland, Italy and Sicily. It is proper to remark that these were not mere journeys, but were undertaken purely with the view of studying nature; and in all his journeys he was surrounded with such instruments as would be of service to him; together with plans of his procedure previously drawn up. Readily will our readers believe this great philosopher when he asserts, that he found such a method extremely beneficial.

The first volume of his travels through the Alps, which was published in 1779, contains a circumstantial description of the environs of Geneva, and an excursion as far as Chamouni, a village at the foot of Mont-Blanc. It contains a description of his *magnetometer*, with which philosophers will probably be delighted. In proportion as he examined mountains, the more was he persuaded of the importance of mineralogy; and that he might study it with advantage, he acquired a knowledge of the German language. In the last volumes of his travels, the reader will see how much new mineralogical knowledge he had acquired.

During the troubles which agitated Geneva in 1782, he made his beautiful and interesting experiments on hygrometry, which he published in 1783. This has been pronounced the best work that ever came from his pen, and completely established his reputation as a philosopher. De Saussure resigned his chair to his pupil and fellow labourer, Pictet, who discharged the duties of his office with reputation, although rendered difficult to him by succeeding so great a man. He projected a plan of reform in the education of Geneva, the design of which was to make young people acquainted with the natural sciences and mathematics at an early period, and wished that their physical education should not be neglected, for which purpose he proposed gymnastic exercises. This plan found admirers in the city, but the poverty of its funds was an obstacle in the way of any important innovation. It was dreaded too, that if established forms were changed, they might be altered for the worse.

The attention of De Saussure was not wholly confined to public education, for he superintended the education of his own two sons and a daughter, who have since

since proved themselves worthy of such a father and preceptor. In 1786, he published his second volume of travels, containing a description of the Alps around Mont-Blanc, the whole having been examined with the eye of a mineralogist, geologist, and philosopher. It contains some valuable experiments on electricity, and a description of his own electrometer, said to be the most perfect we have. To him we are indebted for a *cyanometer*, for measuring the degree of blueness of the heavens, which is found to vary according to the height of the observer; his *diaphanometer* for measuring the transparency of the atmosphere; and his *anemometer* for ascertaining the force of the winds. He founded the Society of Arts, to the operations of which Geneva is indebted for the state of prosperity it has reached within the last 30 years. Over that society he presided to the day of his death; and the preservation of it in prosperity constituted one of his fondest wishes.

In 1794, the health of this eminent man began rapidly to decline, and a severe stroke of the palsy almost deprived him totally of the use of his limbs. Such a condition was no doubt painful to such a man; but his intellects still preserved their original activity, and he prepared for the press the two last volumes of his travels, which appeared in 1796. They contain a great mass of new facts and observations, of the last importance to physical science. During his illness he published *Observations on the Fusibility of Stones by means of the Blow-pipe*. He was in general a Neptunian, ascribing the revolutions of our globe to water, and admitting the possibility of mountains having been thrown up by elastic fluids disengaged from the cavities of the earth. In the midst of his rapid decline he cherished the hopes of recovery; but his strength was exhausted; a languor succeeded the vigour which he had formerly enjoyed; his slow pronunciation did not correspond with the vivacity of his mind, and was a melancholy contrast to the pleasantness which he had formerly exhibited. He tried in vain to procure the re-establishment of his health; for all the remedies prescribed by the ablest physicians were wholly ineffectual. His mind afterwards lost its activity; and on the 22d of March 1799, he finished his mortal career, in the 59th year of his age, lamented by a family to whom he was dear,—by a country to which he had done honour,—and by Europe, the knowledge of which he had extended.

SAUVAGESIA, a genus of plants belonging to the pentandria class, and in the natural method ranking with those of which the order is doubtful. See *BOTANY Index*.

SAUVEUR, JOSEPH, an eminent French mathematician, born at La Fleche in 1653. He was absolutely dumb until he was seven years of age; and even then his organs of speech were not evolved so fully as to permit him to speak without great deliberation. Mathematics were the only studies he had any relish for, and these he cultivated with extraordinary success; so that he commenced teacher at 20 years of age, and was so soon in vogue, that he had Prince Eugene for his scholar. He became mathematical professor in the royal college in 1686; and ten years after was admitted a member of the Academy of Sciences. He died in 1716; and his writings, which consist rather of detached papers than of connected treatises, are all inserted in the *Memoirs of the Academy of Sciences*.

He was twice married; and by the last wife had a son, who, like himself, was dumb for the first seven years of his life. Sauveur, Saw.

SAW, an instrument which serves to cut into pieces several solid matters; as wood, stone, ivory, &c.

The best saws are of tempered steel ground bright and smooth; those of iron are only hammer-hardened: hence the first, besides their being stiffer, are likewise found smoother than the last. They are known to be well hammered by the stiff bending of the blade; and to be well and evenly ground, by their bending equally in a bow.

The lapidaries, too, have their saw, as well as the workmen in mosaic; but of all mechanics, none have so many saws as the joiners, the chief of which are the following. The pit-saw, which is a large two-handed saw, employed for sawing timber in pits, and chiefly used by the sawers. The whip-saw, which has likewise two handles, used in sawing such large pieces as the hand-saw will not easily reach. The hand-saw is made to be used by an individual, of which there are different kinds, as the frame-saw, which is furnished with checks. By the twisted cords which pass from the upper parts of these checks, and the tongue in the middle of them, the upper ends are drawn close together, and the lower set further asunder. The tenon-saw, which being very thin, has a back to keep it from bending. The compass-saw, which is very small, and its teeth usually not set; its use is to cut a round, or any other compass-kerf, on which account the edge is made broad, and the back thin, that it may have a compass to turn in.

At an early period, the trunks of trees were split with wedges into as many and as thin pieces as possible; and if it were necessary to have them still thinner, they were hewn on both sides to the proper size. This simple and wasteful manner of making boards has been still continued in some places to the present day. Peter the Great of Russia endeavoured to put a stop to it, by forbidding hewn deals to be transported on the river Neva. The saw, however, though so convenient and beneficial, has not been able to banish entirely the practice of splitting timber used in building, or in making furniture and utensils; for we do not here speak of fire-wood; and indeed it must be allowed that this method is attended with peculiar advantages which that of sawing can never possess. The wood-splitters perform their work more expeditiously than sawers, and split timber is much stronger than that which has been sawn; for the fissure follows the grain of the wood, and leaves it whole; whereas the saw, which proceeds in the line chalked out for it, divides the fibres, and by these means lessens its cohesion and solidity. Split timber, indeed, turns out often crooked and warped; but for many purposes to which it is applied this is not injurious, and these faults may sometimes be amended. As the fibres, however, retain their natural length and direction, thin boards particularly, can be bent much better. This is a great advantage in making pipe staves, or sieve frames, which require still more art, and in forming various implements of a similar kind.

Our common saw, which requires only to be guided by the hand, however simple it may be, was not known to the inhabitants of America when they were subdued by the Europeans. The inventor of this instrument has been inserted in their mythology by the Greeks, with a

Saw
||
Saw-mills.

place, in which, among their gods, they honoured the greatest benefactors of the earliest ages. By some he is called Talus, and by others Perdix. None except Pliny make Dædalus the inventor; but Hardouin, in the passage where this occurs, reads Talus for Dædalus. Talus is the name of the inventor according to Diodorus Siculus, Apollodorus, and others. He was the son of Dædalus's sister, and was by his mother placed under the tuition of her brother, to be instructed in his art. Having found the jaw-bone of a snake, he employed it to cut through a small piece of wood; and by these means was induced to fabricate a similar instrument of iron, that is, to make a saw. This invention, by which labour is greatly facilitated, excited the envy of his master, and prompted him to put Talus privately to death. Being asked, when burying the body, what he was depositing in the earth, he replied, *a serpent*. This ambiguous answer discovered the murder; and thus a snake was the cause of the invention, of the murder, and of its being brought to light. By others the inventor is called Perdix, who is supposed to have been the son of a sister of Dædalus. Perdix did not employ the jaw-bone of a snake for a saw, but the back-bone of a fish, as is mentioned by Ovid.

The saws of the Grecian carpenters had the same form, and were made with equal ingenuity as the same instruments at present. This appears from a painting preserved among the antiquities of Herculaneum. Two genii are represented at the end of a bench, consisting of a long table resting on two four-footed stools; and the piece of wood to be sawn through is secured by cramps. The saw with which the genii are at work bears a striking resemblance to our frame-saw. It consists of a square frame, having a blade in the middle, the teeth of which are perpendicular to the plane of the frame. The piece of wood to be sawn extends beyond the end of the bench, and one of the workmen appears standing, and the other sitting on the ground. The arms in which the blade is fastened, have the same form as that given to them at present. In the bench are seen holes, in which the cramps holding the timber are stuek. They are shaped like the figure 7; and the ends of them reach below the boards which form the top of it.

Saw-fish. See PRISTIS, ICHTHYOLOGY *Index*.

Saw-Mills. The most beneficial improvement of the operation of sawing was the invention of saw-mills, which are driven either by water or by wind. Mills of the first kind were erected so early as the fourth century, in Germany, on the small river Ruer. The art of cutting marble with a saw is very ancient. According to Pliny, it was invented in Caria. Stones of the soap-rock kind, which are softer than marble, were sawn at that period; but it appears that the harder kinds of stone were also then sawn; for we are informed respecting the discovery of a building which was encrusted with cut agate, carnelian, lapis lazuli, and amethysts. There is, however, no account in any of the Greek or Roman writers of a mill for sawing wood; and as modern authors speak of saw-mills as new and uncommon, it appears that the oldest construction of them has been forgotten, or that some interesting improvement has made them appear entirely new.

Becher says that saw-mills were invented in the 17th century, which is a mistake; for when the infant Henry

sent people to settle in the island of Madeira, discovered in 1420, he gave orders for saw-mills to be erected, for the purpose of sawing into deals the various species of excellent timber with which the island abounded, and which were afterwards exported to Portugal. There was a saw-mill in the city of Breslau about the year 1427, producing a yearly rent of three merks; and in 1490, the magistrates of Erfurth purchased a forest, in which they erected a saw-mill, besides renting another in the neighbourhood. The first saw-mill in Norway was erected about the year 1530. In the year 1552 there was a saw-mill erected at Joachimsthal, the property of a mathematician called Jacob Geusen. In 1555, the bishop of Ely, ambassador from Queen Mary of England to the court of Rome, having seen a saw-mill in the vicinity of Lyons, the writer of his travels gave a particular description of it. The first saw-mill was erected in Holland at Saardam in 1596, the invention of which is ascribed to Cornelius Cornelissen.

The first mill of this kind in Sweden was erected in the year 1653. At present, that kingdom possesses the largest perhaps ever constructed in Europe, where a water-wheel, 12 feet broad, drives at the same time 72 saws.

In England, saw-mills had at first a similar fate with printing in Turkey, the ribbon-loom in the dominions of the church, and the crane at Strasburg. When attempts were made to introduce them, they were violently opposed, because it was apprehended that the sawers would thus be deprived of the means of procuring subsistence. An opulent merchant in 1767 or 1768, by desire of the Society of Arts, caused a saw-mill to be erected at Limehouse, driven by wind; but it was demolished by the mob, and the damage was sustained by the nation, while some of the rioters were punished. This, however, was not the only mill of the kind then in Britain; for at Leith there was one driven by wind, some years before.

Saw-mills are very common in America, where the moving power is generally water. Some have been constructed on a very extensive plan; one in particular, we have been informed, has been erected in the province of New Brunswick, in British America, for the purpose of cutting planks for the English market. This machine works 15 saws in one frame, and is capable, it is said, of cutting annually not fewer than 8,000,000 feet of timber.

The mechanism of a sawing-mill may be reduced to three principal things: the first, that the saw is drawn up and down as long as is necessary, by a motion communicated to the wheel by water: the second, that the piece of timber to be cut into boards is advanced by an uniform motion to receive the strokes of the saw; for here the wood is to meet the saw, and not the saw to follow the wood, therefore the motion of the wood and that of the saw ought immediately to depend the one on the other: the third, that where the saw has cut through the whole length of the piece, the whole machine stops of itself, and remains immoveable; lest having no obstacle to surmount, the moving power should turn the wheel with too great velocity, and break some part of the machine.

Saw-mills have been distinguished into two kinds, viz. those which have a reciprocating and those which have a rotatory motion.

Fig. 1. represents the elevation of a reciprocating saw-mill. AA is the shaft or axle, upon which is fixed the wheel BB (of $17\frac{1}{2}$ or 18 feet diameter), containing 40 buckets to receive the water by which it is impelled. CC a wheel fixed upon the same shaft containing 96 teeth, to drive the pinion N° 2. having 32 teeth, which is fastened upon an iron axle or spindle, having a coupling box on each end that turns the cranks, as DD, round: one end of the pole E is put on the crank, and its other end moves on a joint or iron bolt at F, in the lower end of the frame GG. The crank DD being turned round in the hole E, moves the frames GG up and down, and these having saws in them, by this motion cut the wood. The pinion, N° 2, may work two, three, or more cranks, and thus move as many frames of saws. N° 3. an iron wheel having angular teeth, which one end of the iron K takes hold of, while its other end rolls on a bolt in the lever HH. One end of this lever moves on a bolt at I, the other end may lie in a notch in the frame GG so as to be pushed up and down by it. Thus the catch K pulls the wheel round, while the catch L falls into the teeth and prevents it from going backwards. Upon the axle of N° 3. is also fixed the pinion N° 4. taking into the teeth the under edge of the iron bar, that is fastened upon the frame TT, on which the wood to be cut is laid: by this means the frame TT is moved on its rollers SS, along the fixed frame UU; and of course the wood fastened upon it is brought forward to the saws as they are moved up and down by reason of the turning round of the crank DD. VV, the machine and handle to raise the sluice when the water is to be let upon the wheel BB to give it motion. By pulling the rope at the longer arm of the lever M, the pinion N° 2 is put into the hold or grip of the wheel CC, which drives it; and by pulling the rope R, this pinion is cleared from the wheel. N° 5. a pinion containing 24 teeth, driven by the wheel CC, and having upon its axle a sheave, on which is the rope PP, passing to the sheave N° 6. to turn it round; and upon its axle is fixed the pinion N° 7. acting on the teeth in an iron bar upon the frame TT, to roll that frame backwards when empty. By pulling the rope at the longer arm of the lever N, the pinion N° 5. is put into the hold of the wheel CC; and by pulling the rope O it is taken off the hold. N° 8. a wheel fixed upon the axle N° 9. having upon its periphery angular teeth, into which the catch N° 10. takes; and being moved by the lever attached to the upper part of the frame G, it pushes the wheel N° 8. round; and the catch N° 11. falls into the teeth of the wheel, to prevent it from going backwards while the rope rolls in its axle, and drags the logs or pieces of wood in at the door Y, to be laid upon the moveable frames TT, and carried forward to the saws to be cut. The catches N° 10, 11. are easily thrown out of play when they are not wanted. The gudgeons in the shafts, rounds of the cranks, spindles, and pivots, should all turn round in cots or bushes of brass. Z, a door in one end of the mill-house at which the wood is conveyed out when cut. WW, walls of the mill-house. QQ, the couples or framing of the roof. XXX, &c. windows to admit light to the house.

Saw-mills for cutting blocks of stone, are generally, though not always, moved horizontally: the horizontal alternate motion may be communicated to one or more

saws, by means of a rotatory motion, either by the use of cranks, &c. or in some such way as the following. Let the horizontal wheel ABDC (fig. 2.) drive the pinion O p N, this latter carrying a vertical pin P, at the distance of about one-third of the diameter from the centre. This pinion and pin are represented separately in fig. 3. Let the frame WSTV, carrying four saws, marked 1, 2, 3, 4, have wheels V, T, W, W, each running in a groove or rut, whose direction is parallel to the proposed direction of the saws; and let a transverse groove PR, whose length is double the distance of the pin P from the centre of the pinion, be cut in the saw frame to receive that pin. Then, as the great wheel revolves, it drives the pinion, and carries round the pin P: and this pin, being compelled to slide in the straight groove PR, while by the rotation of the pinion on which it is fixed its distance from the great wheel is constantly varying, causes the whole saw frame to approach to and recede from the great wheel alternately, while the grooves in which the wheels run confine the frame so as to move in the direction T t, V v. Other blocks of stone may be sawn at the same time by the motion of the great wheel, if other pinions and frames running off in the directions of the respective radii EB, EA, EC, be worked by the teeth at the quadrantal points B, A, and C. And the contrary efforts of these four frames and pinions will tend to soften down the jolts, and equalize the whole motion.

The same contrivance, of a pin fixed at a suitable distance from the centre of a wheel, and sliding in a groove, may serve to convert a reciprocating into a rotatory motion: but it will not be preferable to the common conversion by means of a crank.

When saws are used to cut blocks of stone into pieces having cylindrical surfaces, a small addition is made to the apparatus. See figs. 4. and 5. The saw, instead of being allowed to fall in a vertical groove as it cuts the block, is attached to a lever or beam FG, sufficiently strong; this lever has several holes pierced through it, and so has the vertical piece ED, which is likewise moveable towards either side of the frame in grooves in the top and bottom pieces AL, DM. Thus, the length KG of the radius can be varied at pleasure, to suit the curvature of NO; and as the saw is moved to and fro by proper machinery, in the direction CB, BC, it works lower and lower into the block, while, being confined by the beam FG, it cuts the cylindrical portion from the block P, as required.

When a completely cylindrical pillar is to be cut out of one block of stone, the first thing will be to ascertain in the block the position of the axis of the cylinder, then lay the block so that such axis shall be parallel to the horizon, and let a cylindrical hole of from one to two inches diameter be bored entirely through it. Let an iron bar, whose diameter is rather less than that of this tube, be put through it, having just room to slide freely to and fro as occasion may require. Each end of this bar should terminate in a screw, on which a nut and frame may be fastened: the nut frame should carry three flat pieces of wood or iron, each having a slit running along its middle nearly from one end to the other, and a screw and handle must be adapted to each slit: by these means the frame-work at each end of the bar may readily be so adjusted as to form equal isosceles or equilateral triangles; the iron bar will connect two cor-

Saw-mills.

Fig. 2.

Fig. 3.

Fig. 4. & 5.

Saw-mills. responding angles of these triangles, the saw to be used two other corresponding angles, and another bar of iron or of wood the two remaining angles, to give sufficient strength to the whole frame. This construction, it is obvious, will enable the workmen to place the saw at any proposed distance from the hole drilled through the middle of the block; and then, by giving the alternating motion to the saw frame, the cylinder may at length be cut from the block, as required.

If it were proposed to saw a conic frustum from such a block, then let two frames of wood or iron be fixed to those parallel ends of the block which are intended to coincide with the bases of the frustum, circular grooves being previously cut in these frames to correspond with the circumferences of the two ends of the proposed frustum; the saw being worked in these grooves will manifestly cut the conic surface from the block. This, we believe, is the contrivance of Sir George Wright.

The best method of drilling the hole through the middle of the proposed cylinder seems to be this. On a carriage running upon four low wheels let two vertical pieces (each having a hole just large enough to admit the borer to play freely) be fixed two or three feet asunder, and so contrived that the pieces and holes to receive the borer may, by screws, &c. be raised or lowered at pleasure, while the borer is prevented from sliding to and fro by shoulders upon its bar, which are larger than the holes in the vertical pieces, and which, as the borer revolves, press against those pieces: let a part of the boring bar between the two vertical pieces be square, and a grooved wheel with a square hole of a suitable size be placed upon this part of the bar; then the rotatory motion may be given to the bar by an endless band which shall pass over this grooved wheel and a wheel of a much larger diameter in the same plane, the latter wheel being turned by a winch handle in the usual way. See *Boring of Ordnance*.

Circular saws, acting by a rotatory motion, have been long known in Holland, where they are used for cutting wood used in veneering. They were introduced into this country, we believe, by General Bentham, and are now used in the dock-yard at Portsmouth, and in a few other places: but they are not, as yet, so generally adopted as might be wished, considering how well they are calculated to abridge labour, and to accomplish with expedition and accuracy what is very tedious and irksome to perform in the usual way. Circular saws may be made to turn either in horizontal, vertical, or inclined planes; and the timber to be cut may be laid upon a plane inclined in any direction; so that it may be sawn by lines making any angle whatever, or at any proposed distance from each other. When the saw is fixed at a certain angle, and at a certain distance from the edge of the frame, all the pieces will be cut of the same size, without marking upon them by a chalked line, merely by causing them to be moved along, and keeping one side in contact with the side of the frame; for then, as they are brought one by one to touch the saw revolving on its axle, and are pressed upon it, they are soon cut through.

Mr Smart, of Ordnance-wharf, Westminster-bridge, has several circular saws, all worked by a horse in a moderate sized walk: one of these, intended for cutting and boring tenons used in this gentleman's hollow masts, is represented in fig. 6. NOPQR is a hollow frame,

Fig. 6.

under which is part of the wheel-work of the horse-mill. —A, B, DC, E, F, are pulleys, over which pass straps or endless bands, the parts of which out of sight run upon the rim of a large vertical wheel: by means of this simple apparatus, the saws S, S', are made to revolve upon their axles with an equal velocity, the same band passing round the pulleys D, C, upon those axles; and the rotatory motion is given to the borer G by the band passing over the pulley A. The board I is inclined to the horizon in an angle of about 30 degrees; the plane of the saw S' is parallel to that of the board I, and about a quarter of an inch distant from it, while the plane of the saw S is vertical, and its lowest point at the same distance from the board I. Each piece of wood K, out of which the tenon is to be cut, is four inches long, an inch and a quarter broad, and 5-eighths of an inch thick. One end of such piece is laid so as to slide along the ledge at the lower part of the board I; and as it is pushed on, by means of the handle H, it is first cut by the saw S', and immediately after by the saw S: after this the other end is put lowest, and the piece is again cut by both saws: then the tenon is applied to the borer G, and as soon as a hole is pierced through it, it is dropped into the box beneath. By this process, at least 30 tenons may be completed in a minute, with greater accuracy than a man could make one in a quarter of an hour, with a common hand-saw and gimblet. The like kind of contrivance may, by slight alterations, be fitted for many other purposes, particularly all such as may require the speedy sawing of a great number of pieces into exactly the same size and shape. *Gregory's Mechanics, II.*

SAXE, MAURICE count of, was born the 13th October 1696. He was the natural son of Frederic Augustus II. elector of Saxony, and king of Poland, and of the countess of Konigsmarc, a Swedish lady, celebrated both for her wit and beauty. He was educated along with Frederic Augustus the electoral prince, afterwards king of Poland. His infancy announced the future warrior. Nothing could prevail on him to apply to his studies but the promise of being allowed, after he had finished his task, to mount on horseback, or exercise himself with arms.

He served his first campaign in the army commanded by prince Eugene and the duke of Marlborough, when only twelve years old. He signalized himself at the sieges of Tournay and Mons, and particularly at the battle of Malplaquet. In the evening of that memorable day, he was heard to say, "I'm content with my day's work." During the campaign of 1710, Prince Eugene and the duke of Marlborough made many public encomiums on his merit. Next year the young count accompanied the king of Poland to the siege of Stralsund, the strongest place in Pomerania, and displayed the greatest intrepidity. He swam across the river in sight of the enemy, with a pistol in his hand. His valour shone no less conspicuously on the bloody day of Gaedelbusck, where he commanded a regiment of cavalry. He had a horse killed under him, after he had three times rallied his regiment, and led them on to the charge.

Soon after that campaign, his mother prevailed on him to marry the countess of Lubin, a lady both rich and beautiful. This union lasted but a short time. In 1721, the count procured a dissolution of the marriage;

Fig. 1.

Saxe. a step of which he afterwards repented. The countess left him with regret; but this did not prevent her from marrying soon after. The count of Saxe was too fond of pleasure and variety to submit to the duties which marriage imposes. In the midst, however, of the pleasures in which he sometimes indulged, he never lost sight of his profession. He carried along with him wherever he went a library of military books; and even when he seemed most taken up with his pleasures, he never failed to spend an hour or two in private study.

In 1717 he went to Hungary, where the emperor had an army of 15,000 men under the command of Prince Eugene. Young Count Saxe was present at the siege of Belgrade, and at a battle which the prince gained over the Turks. On his return to Poland in 1718, he was made a knight of the Golden Eagle.

The wars in Europe being concluded by the treaties of Utrecht and Passarowitz, Count Saxe went to France. He had always professed a partiality for that country. French, indeed, was the only foreign language which during his infancy he was willing to learn. He spent his whole time during the peace in studying mathematics, fortification, and mechanics, sciences which exactly suited his genius. The mode of exercising troops had struck his attention when very young. At 16 he invented a new exercise, which was taught in Saxony with the greatest success. Having obtained a regiment in France in 1722, he formed it himself according to his new plan. From that moment the *Chevalier Folard*, an excellent judge of military talents, predicted that he would be a great man.

In 1726 the states of Courland chose him for their sovereign. But both Poland and Russia rose in arms to oppose him. The Czarina wished to bestow the duchy on Menzikoff, a happy adventurer, who from a pastry-cook's boy, became a general and a prince. Menzikoff sent 800 Russians to Milan, where they besieged the new-chosen duke in his palace. Count Saxe, who had only 60 men, defended himself with astonishing intrepidity. The siege was raised, and the Russians obliged to retreat. Soon after he retired to Usmaiz, and prepared to defend his people against the two hostile nations. Here he remained with only 300 men, till the Russian general approached at the head of 4000 to force his retreat. That general invited the count to a conference, during which he intended to surprise him, and take him prisoner. The count, informed of the plot, reproached him for his baseness, and broke up the conference. About this time he wrote to France for men and money. Mademoiselle le Couvreur, a famous actress, pawned her jewels and plate, and sent him the sum of 40,000 livres. This actress had formed his mind for the fine arts. She had made him read the greater part of the French poets, and given him a taste for the theatre, which he retained even in the camp. The count, unable to defend himself against Russia and Poland, was obliged in the year 1729 to leave his new dominions, and retire into France. It is said that Anne Iwanowa, dutchess dowager of Courland, and second daughter of the czar Iwan Alexiowitz, had given him hopes of marriage, and abandoned him at that time because she despaired of fixing his wavering passion.—This inconstancy lost

him not only Courland, but the throne of Russia itself, which that princess afterwards filled.

Count Saxe, thus stripped of his territories, devoted himself for some time to the study of mathematics. He composed also, in 13 nights, and during the intervals of an ague, his *Reveries*, which he corrected afterwards. This book is written in an incorrect but forcible style; it is full of remarks both new and profound, and is equally useful to the soldier and the general.

The death of the king of Poland his father in 1733, kindled a new war in Europe. His brother, the elector of Saxony, offered him the command of all his forces, but he preferred the French service, and repaired to the marechal of Berwick's army, which was encamped on the Rhine. "Count," said that general, who was preparing to attack the enemy's entrenchments at Etinghen, "I was going to send for 3000 men, but your arrival is of more value than theirs." When the attack began, the count, at the head of a regiment of grenadiers, forced the enemy's lines, and by his bravery decided the victory. He behaved at the siege of Philipsburgh with no less intrepidity. For these services he was, in 1734, rewarded with the rank of lieutenant-general. Peace was concluded in 1736; but the death of Charles VI., emperor of Germany, kindled a new war almost immediately.

Prague was besieged by the Count of Saxe in 1741, near the end of November, and taken the same month by assault. The conquest of Egra followed that of Prague. It was taken a few days after the trenches were opened. This success gave so much joy to the emperor Charles VII., that he wrote a congratulatory letter to the conqueror with his own hands.

In 1744 he was made marechal of France, and commanded a part of the French army in Flanders. During that campaign he displayed the greatest military conduct. Though the enemy was superior in number, he observed their motions so skilfully that they could do nothing.

In January 1745, an alliance was concluded at Warsawia between the queen of Hungary, the king of England, and the States of Holland. The ambassador of the States General, meeting Marechal Saxe one day at Versailles, asked his opinion of that treaty. "I think (says he), that if the king my master would give me an unlimited commission, I would read the original at the Hague before the end of the year." This answer was not a bravado; the marechal was capable of performing it.

He went soon after, though exceedingly ill, to take the command of the French army in the Low Countries. A gentleman seeing the feeble condition in which he left Paris, asked him how he could in that situation undertake so great an enterprise. "The question (replied he) is not about living, but setting out."—Soon after the opening of the campaign, the battle of Fontenoy was fought. Marechal Saxe was at the point of death, yet he caused himself to be put into a litter, and carried round all the posts. During the action he mounted on horseback, though he was so very weak that his attendants dreaded every moment to see him expire. The victory of Fontenoy, owing entirely to his vigilance and capacity, was followed by the reduction of Tournay, Bruges, Ghent, Oudenard, Ostend, Ath, and

Saxe.

and Brussels: This last city was taken on the 28th February 1746; and very soon after the king sent to the marechal a letter of naturalization conceived in the most flattering terms. The succeeding campaigns gained him additional honours. After the victory of Raucoux, which he gained on the 11th October 1746, the king of France made him a present of six pieces of cannon. He was, on the 12th of January of the following year, created marechal of all the French armies, and, in 1748, commander-general of all those parts of the Netherlands which were lately conquered.

Holland now began to tremble for her safety. Maastricht and Bergen-op-Zoom had already fallen, and nothing but misfortunes seemed to attend the further prosecution of the war. The States General, therefore, offered terms of peace, which were accepted, and a treaty concluded on the 18th October 1748.

Marechal Saxe retired to Chambord, a country seat which the king of France had given him. Some time after, he went to Berlin, where the king of Prussia received him as Alexander would have received Cæsar.—On his return to France, he spent his time among men of learning, artists, and philosophers. He died of a fever, on the 30th November 1750, at the age of 54.

Some days before his death, talking to M. Senac his physician about his life, "It has been (says he) an excellent dream." He was remarkably careful of the lives of his men. One day a general officer was pointing out to him a post which would have been of great use. "It will only cost you (says he) a dozen grenadiers." "That would do very well," replied the marechal, "were it only a dozen lieutenant-generals."

It was impossible for Marechal Saxe, the natural brother of the king of Poland, elected sovereign of Courland, and possessed of a vigorous and restless imagination, to be destitute of ambition. He constantly entertained the notion that he would be a king. After losing the crown of Russia by his inconstancy in love, he formed, it is said, the project of assembling the Jews, and of being the sovereign of a nation which for 1700 years had neither possessed chief nor country. When this chimerical idea could not be realized, he cast his eyes upon the kingdom of Corsica. After failing in this project also, he was busily employed in planning a settlement in some part of America, particularly Brazil, when death surprised him.

He had been educated and died in the Lutheran religion. "It is a pity (said the queen of France, when she heard of his death) that we cannot say a single *De profundis* (prayer for the dead) for a man who has made us sing so many *Te Deums*." All France lamented his death.

By his will, which is dated at Paris, March 1. 1748, he directed that his body should be buried in quicklime: "that nothing (says he) may remain of me in this world but the remembrance of me among my friends." These orders, however, were not complied with; for his body was embalmed, put into a leaden coffin, which was inclosed in another of copper, and this covered

with one of wood, bound about with iron. His heart was put into a silver gilt box, and his entrails into another coffin. Louis XV. was at the charge of his funeral. By his order his corpse was interred with great pomp and splendour in the Lutheran church of St Thomas, at Strasburg, on the 8th February 1751.

The marechal was a man of ordinary stature, of a robust constitution, and extraordinary strength. To an aspect, noble, warlike, and mild, he joined the excellent qualities of the heart. Affable in his manners, and disposed to sympathize with the unfortunate, his generosity sometimes carried him beyond the limits of his fortune. On his death-bed he reviewed the errors of his life with remorse, and expressed much penitence.

The best edition of his *Reveries* was printed at Paris 1757, in two vols 4to. It was compared with the greatest attention with the original manuscript in the king's library. It is accompanied with many designs exactly engraved, and a *Life of the Author*. The *Life of Marechal Saxe* was written by M. d'Espagnac, two vols 12mo. This history is written in the panegyric style. The author is, however, impartial enough to remark, that in the three battles upon which the reputation of Marechal Saxe is founded, he engaged in the most favourable circumstances. "Never did a general (says he) stand in a more advantageous situation. Honoured with the confidence of the king, he was not restrained in any of his projects. He always commanded a numerous army: his soldiers were steady, and his officers possessed great merit."

SAXIFRAGA, SAXIFRAGE, a genus of plants belonging to the decandria class; and in the natural method ranking under the 13th order, *Succulentæ*. See *BOTANY Index*.

SAXO-GRAMMATICUS, descended from an illustrious Danish (A) family, was born about the middle of the 12th century. Stephens, in his edition of *Saxo-Græmaticus*, printed at Sorø, indubitably proves, that he must have been alive in 1156, but cannot ascertain the exact place and time of his birth. See Stephens's *Prolegomena* to the *Notes on Saxo-Græmaticus*, p. 8, to 24; also Holberg, vol. i. p. 269; and Mallet's *North. Antiq.* vol. i. p. 4. On account of his uncommon learning, Saxo was distinguished by the name of *Græmaticus*. He was provost of the cathedral church of Roskilde, and warmly patronized by the learned and warlike Absalon, the celebrated archbishop of Lunden, at whose instigation he wrote the *History of Denmark*. His epitaph, a dry panegyric in bad Latin verses, gives no account of the era of his death, which happened, according to Stephens, in 1204. His history, consisting of 16 books, begins from the earliest account of the Danish annals, and concludes with the year 1186. According to the opinion of an accurate writer, the first part, which relates to the origin of the Danes, and the reigns of the ancient kings, is full of fables; but the eight last books, and particularly those which regard the events of his own times, deserve the utmost credit. He wrote in Latin;

(A) Some authors have erroneously conjectured, from his name Saxo, that he was born in Saxony; but Saxe was no uncommon appellation among the ancient Danes. See Olaus Wormius *Monumenta Danica*, p. 186, and Stephens's *Prolegomena*, p. 10.

Saxo-

cus
||
Saxony.

Latin; the style, if we consider the barbarous age in which he flourished, is in general extremely elegant, but rather too poetical for history. Mallet, in his *Histoire de Dannemarck*, vol. i. p. 182, says, "that Sperling, a writer of great erudition, has proved, in contradiction to the assertions of Stephens and others, that Saxo-Grammaticus was secretary to Absalon; and that the Saxo. provost of Roskild, was another person, and lived earlier."

SAXONY, the name of two circles of the German empire, a kingdom, and a dutchy of the same. The lower circle is bounded to the south by the circle of Upper Saxony, and a part of that of the Upper Rhine; to the north by the dutchy of Sleswick, belonging to the king of Denmark, and the Baltic; to the west, by the circle of Westphalia and the North sea; and to the east by the circle of Upper Saxony. The states belonging to it are the dukes and princes of Magdeburg and Bremen, Zell, Grubenhagen, Calenburg, Wolfenbuttle, Halberstadt, Mecklenburg-Schwerin, Mecklenburg-Gustro, Holstein-Gluckstadt, Holstein-Gottorf, Hildesheim, Saxe-Lawenburg; the archbishopric of Lubeck; the principalities of Schwerin, Ratzburg, Blankenburg, Ranzau; the imperial cities of Lubeck, Gotzlar, Muhlhausen, Nordhausen, Hamburg, and Bremen. The dukes of Bremen and Magdeburg are alternately directors and summoning princes; but, ever since the year 1682, the diets which used generally to be held at Brunswick or Lunenburg have been discontinued. Towards the army of the empire, which, by a decree of the empire in 1681, was settled at 40,000 men, this circle was to furnish 1322 horsemen and 2707 foot; and of the 300,000 florins granted to the imperial chest in 1707, its quota was 31,271 florins; both which assessments are the same with those of Upper Saxony, Burgundy, Swabia, and Westphalia. The inhabitants of this circle are almost all Lutherans.

The circle of Upper Saxony is bounded by that of Franconia, the Upper Rhine, and Lower Saxony; and also by the Baltic sea, Prussia, Poland, Silesia, Lusatia, and Bohemia. It is of great extent, and contains the following states; viz. the electors of Saxony and Brandenburg, Saxe-Weimar, Saxe-Eisenach, Saxe-Cobourg, Saxe-Gotha, Saxe-Altenburg, Saxe-Querfurt, the Hither and Farther Pomerania, Camin, Anhalt, Quidlenburg, Gernrode, Walkenried, Schwarzburg, Sondershausen, Schwarzburg-Rudolstadt, Mansfeld, Stolberg, Barby, the counts of Reussen, and the counts of Schonberg. No diets have been held in this circle since the year 1683. The elector of Saxony has always been the sole summoning prince and director of it. Most of the inhabitants profess the Protestant religion. When the whole empire furnishes 40,000 men, the quota of this circle was 1322 horse and 2707 foot. Of the 300,000 florins granted by the empire in 1707, it contributed only 31,271 florins, 28 kruitzers, being rated no higher than those of Westphalia, Lower Saxony, Swabia, and Burgundy, though it is much larger. Agreeable to a resolution and regulation in 1654, this circle was to nominate only two assessors of the chamber-court.

The electorate of Saxony was raised to the rank of a kingdom by Bonaparte in 1806, and still retains the dignity. Previous to the overthrow of the French power in 1814, it consisted of the dutchy of Saxony, the greatest part of the margravate of Meissen, a part

of Vogtland, and the northern half of the landgravate of Thuringia. The Lusatias also, and a part of the country of Henneberg, belong to it, though no part of this circle; but by an act of the Congress of Vienna in 1814, one half of the territory, and two-fifths of the population were given to Prussia. The soil of the kingdom of Saxony is in general exceeding rich and fruitful, yielding corn, fruits, and pulse in abundance, together with hops, flax, hemp, tobacco, aniseed, wild saffron, wood: and in some places woad, wine, coals, porcelain, clay, terra sigillata, fuller's-earth, fine shiver, various sorts of beautiful marble, serpentine stone, and almost all the different species of precious stones. Sulphur also, alum, vitriol, sand, and free-stone, salt-springs, amber, turf, cinnabar, quicksilver, antimony, bismuth, arsenic, cobalt, and other minerals, are found in it. This country, besides the above articles, contains likewise valuable mines of silver, copper, tin, lead, and iron. In 1790, the produce of the mines was estimated at 2,000,000 crowns. The country abounds in many places with horned cattle, sheep, horses, and venison. The principal rivers by which it is watered are the Elbe, the Scherze-Elster, the Mulde, the Saale, the Unstrut, the Weisse-Elster, and the Pleisse. These rivers, as well as the lakes and rivulets, abound in fish; and in the White-Elster are found beautiful pearls. The kingdom is extremely well cultivated and inhabited. The population, in 1802, was estimated at 2,150,000; but by the cession in 1814, it is reduced to 1,200,000. The superficial extent of the kingdom is now about 7200 English square miles; before the cessions, it was about 15,200. The provincial diets here consist of three classes. The first is composed of the prelates, the counts, and lords, and the two universities of Leipsic and Wittenberg. To the second belong the nobility in general, immediate or mediate, that is, such as stand immediately under the fief chancery or the aulic judicatories, and such as are immediately under the jurisdiction of the amtman. The third class is formed of the towns in general. The general provincial diets are ordinarily held every six years; but there are others called *selection diets*, which are convened commonly every two years. We would here observe, that not only these diets, but those in most of the other states of Germany, are at present extremely insignificant and unimportant, retaining little more than the shadow of their former power and privileges; for even the petty princes, though they depend upon their more potent neighbours, and must be careful not to give them any umbrage, are almost as absolute in their respective territories as the grand seignior himself. As to religion, it was in this country that the reformation took its rise in the 16th century, to which it hath ever since adhered, according to the doctrines of Luther.* The two late electors, when they embraced Popery in order to qualify themselves to be elected kings of Poland, gave the most solemn assurances to their people, that they would inviolably maintain the established religion and its professors in the full and free enjoyment of all their ecclesiastical rights, privileges, and prerogatives whatsoever, in regard to churches, worship, ceremonies, usages, universities, schools, benefices, incomes, profits, jurisdictions, and immunities. The royal family still continue Roman catholics, though they have lost the

formation,
No. 8.

Saxony.

crowns of Poland, for which they at first embraced Popery. With respect to ecclesiastical matters, the country is divided into parishes, and these again into spiritual inspections and consistories, all subordinate to the ecclesiastical council and upper consistory of Dresden, in which city and Leipsic the Calvinists and Roman Catholics enjoy the free exercise of their religion. Learning flourishes in this kingdom; in which, besides the free schools and gymnasia in most of the chief towns, is the celebrated university of Leipsic, in which are societies for the liberal arts and the German language; and in the town are booksellers and printers of the greatest eminence. A great variety of manufactures are also carried on in this country. The principal are those of fine and coarse linen, thread, fine lace, paper, fine glasses and mirrors; porcelain, equal if not superior to that of China; iron, brass, and steel wares; manufactures of gold and silver, cotton, wool, and silk; gloves, caps, hats and tapestry; in which, and the natural productions mentioned above, together with dyeing, an important foreign commerce is carried on. Leipsic is one of the most industrious places. In 1800 it had eight manufactories of wax-cloth, eight of velvet and other silk stuffs, two of silk-stockings, two of painted paper; two extensive and excellent type-foundries, fifteen printing establishments, besides others of tobacco, leather, &c. But the mining district round Freyberg is the most industrious of the whole kingdom. Here, besides the extensive establishments for the amalgamation and purification of silver, there are foundries of canon and bells, several manufactures of gold and silver lace, of woollen cloth, of cotton yarn, &c. At Chemnitz, there were, in 1796, 1626 weavers, and twelve establishments for printing cotton.

Before the abolition of the electorate, the titles of the elector of Saxony were, duke of Saxony, Juliers, Cleve, and Berg; as also of Engern and Westphalia, arch-marshal and elector of the Holy Roman empire, landgrave in Thuringia, margrave of Meissen, and of Upper and Lower Lusatia, burgrave of Magdeburg, princely count of Henneberg, count of La Mark, Ravensberg, Barby, and Hanau, and lord of Ravenstein. Among the electors he was reckoned the sixth, as great marshal of the empire, of which he was also vicar, during an interregnum, in all places not subject to the vicariate of the county palatine of the Rhine. He was moreover sole director of the circle; and in the vacancy of the see of Mentz claims the directorium at the diet of the empire. His matricular assessment, on account of the electorate, was 1984 florins, besides what he paid for other districts and territories. To the chamber-courts he contributed, each term, the sum of 1545 rix-dollars, together with 83 rix-dollars and 62 kruitzers on account of the county of Mansfeld. In this kingdom, subordinate to the privy council, are various colleges for the departments of war, foreign affairs, the finances, fiefs, mines, police, and ecclesiastical affairs, together with high tribunals and courts of justice, to which appeals lie from the inferior. The revenues of the king of Saxony amounted to about 900,000*l.* in 1816. They arise from the ordinary and extraordinary subsidies of the states; his own demesnes, consisting of several bailiwicks; the impost on beer, and the fine porcelain of the country;

Saxony.

tenths of corn, fruit, wine, &c.; his own silver mines, and the tenths of those that belong to individuals. The kingdom, however, is at present deeply in debt. The regular troops amount to 12,000 men, exclusive of the militia of the ban, the arriere-ban, and the body of miners and hunters, who are obliged in time of war to bear arms. The whole kingdom is divided into circles.

Saxony was raised to the rank of a kingdom by Bonaparte in 1806. In the following year, Prussia was compelled to cede to Saxony the district of Cottbus, and at the same time four-fifths of her Polish territories were disunited from her, and erected into a principality, under the name of the duchy of Warsaw, and the sovereignty given to the King of Saxony. The duchy was afterwards enlarged by cessions from Austria, and continued subject to the king of Saxony till 1814, when it was transferred to Russia.

The country of Saxony is remarkable for being the mother of the present English nation; but concerning the Saxons themselves, previous to that period, we have very few particulars. The Saxons (says Mr Whitaker) have been derived by our historians from very different parts of the globe; India, the north of Asia, and the forests of Germany. And their appellation has been equally referred to very different causes; the name of their Indian progenitor, the plundering disposition of their Asiatic fathers, and the short hooked weapons of their warriors. But the real origin of the Saxons, and the genuine derivation of their name, seem clearly to be these.

In the earlier period of the Gallic history, the Celtæ of Gaul crossed the Rhine in considerable numbers, and planted various colonies in the regions beyond it. Thus the Volcæ Tectosages settled on one side of the Hercynian forest and about the banks of the Neckar; the Helvetii upon another and about the Rhine and Maine; the Boii beyond both; and the Senones in the heart of Germany. Thus also we see the Treviri, the Nervii, the Suevi, and the Marcomanni, the Quadi, the Venedi, and others, in that country; all plainly betrayed to be Gallic nations by the Gallic appellations which they bear, and all together possessing the greatest part of it. And, even as late as the conclusion of the first century, we find one nation on the eastern side of this great continent actually speaking the language of Gaul, and another upon the northern using a dialect nearly related to the British. But as all the various tribes of the Germans are considered by Strabo to be *γεννησιοι Γαλαῖαι*, or genuine Gauls in their origin; so those particularly that lived immediately beyond the Rhine, and are asserted by Tacitus to be indubitably native Germans, are expressly denominated *Γαλαῖαι*, or Gauls, by Diodorus, and as expressly declared by Dio to have been distinguished by the equivalent appellation of *Celtæ* from the earliest period. And the broad line of nations, which extended along the ocean, and reached to the borders of Scythia, was all known to the learned in the days of Diodorus, by the same significant appellation of *Γαλαῖαι*, or Gauls.

Of these the most noted were the Si Cambri and Cimbrî; the former being seated near the channel of the Rhine, and the latter inhabiting the peninsula of Jutland. And the denominations of both declare their original;

original; and show them to have been derived from the common stock of the Celtæ, and to be of the same Celtic kindred with the Cimbri of our own Sommersetshire, and the Cymbri or Cambrians of our own Wales. The Cimbri are accordingly denominated *Celtæ* by Strabo and Appian. And they are equally asserted to be Gauls by Diodorus; to be the descendants of that nation which sacked the city of Rome, plundered the temple of Delphi, and subdued a great part of Europe and some of Asia.

Immediately to the south of these were the Saxons, extending from the isthmus of the Chersonesus to the current of the Elbe. And they were equally Celtic in their origin as their neighbours. They were denominated *Ambrones* as well as Saxons; and, as such, are included by Tacitus under the general appellation of *Cimbri*, and comprehended in Plutarch under the equal one of *Celto-Scythæ*. And the name of *Ambrones* appears particularly to have been Gallic; being common to the Saxons beyond the Elbe, and the Ligurians in Cisalpine Gaul; as both found to their surprise, on the irruption of the former into Italy with the Cimbri. And, what is equally surprising, and has been equally unnoticed by the critics, the Welsh distinguish England by the name of *Loegr* or *Liguria*, even to the present moment. In that irruption these Saxons, Ambrons, or Ligurians, composed a body of more than 30,000 men, and were principally concerned in cutting to pieces the large armies of Manlius and Cæpio. Nor is the appellation of *Saxons* less Celtic than the other. It was originally the same with the Belgic Suessones of Gaul; the capital of that tribe being now intitled *Soissons* by the French, and the name of the Saxons pronounced *Saisen* by the Welsh, *Sason* by the Scotch, and *Sasenach* or *Saxsenach* by the Irish. And the Suessones or Saxones of Gaul derived their own appellation from the position of their metropolis on a river, the stream at Soissons being now denominated the *Aisne*, and formerly the *Axon*; Uesson or Axon importing only waters or a river, and S-uess-on or S-ax-on on the waters or the river. The Suessones, therefore, are actually denominated the *Uessonnes* by Ptolemy; and the Saxones are actually intitled the *Axones* by Lucan.

These, with their brethren and allies the Cimbri, having been more formidable enemies to the Romans by land, than the Samnites, Carthaginians, Spaniards, Gauls, or Parthians, in the second century applied themselves to navigation, and became nearly as terrible by sea. They soon made themselves known to the inhabitants of the British isles by their piracies in the northern channels, and were denominated by them *Lochlyn* or *Lochlynach*; *lud-lyn* signifying the people of the wave, and the *d* being quiescent in the pronunciation. They took possession of the Orkney islands, which were then merely large shoals of sand, uncovered with wood, and overgrown with rushes; and they landed in the north of Ireland, and ravaged the country. Before the middle of the third century they made a second descent upon the latter, disembarked a considerable body of men, and designed the absolute subjection of the island. Before the conclusion of it, they carried their naval operations to the south, infested the British channel with their little vessels, and made frequent descents upon the coasts. And in the fourth and fifth centuries, acting in conjunction with the Picts of Caledonia and

Vol. XVIII. Part II.

the Scots of Ireland, they ravaged all the eastern and south-eastern shores of Britain, began the formal conquest of the country, and finally settled their victorious soldiery in Lancashire.

SAY, or SAYE, in *Commerce*, a kind of serge much used abroad for linings, and by the religious for shirts; with us it is used for aprons by several sorts of artificers, being usually dyed green.

SCAB. See ITCH and MEDICINE.

SCAB in Sheep. See SHEEP, Diseases of, under FARRIERY.

SCABIOSA, SCABIOUS; a genus of plants belonging to the tetrandria class; and in the natural method ranking under the 48th order, *Aggregatæ*. See BOTANY Index.

SCABRITA, a genus of plants belonging to the tetrandria class. See BOTANY Index.

SCÆVOLA, C. MUCIUS, a young Roman of illustrious birth, is particularly celebrated in the Roman history for a brave but unsuccessful attempt upon the life of Porsena king of Etruria, about the year before Christ 504. See the article Rome, N° 71.

SCÆVOLA, a genus of plants belonging to the pentandria class. See BOTANY Index.

SCAFFOLD, among builders, an assemblage of planks and boards, sustained by tressels and pieces of wood fixed in the wall; whereon masons, bricklayers, &c. stand to work, in building high walls, and plasterers in plastering ceilings, &c.

SCAFFOLD, also denotes a timber-work raised in the manner of an amphitheatre, for the more commodious viewing any show or ceremony: it is also used for a stage raised in some public place for the execution of criminals.

SCALA-NOVA, anciently Neapolis, called by the Turks *Kovshadase*, is situated in a bay, on the slope of a hill, the houses rising one above another, intermixed with minarets and tall slender cypresses. "A street, through which we rode (says Dr Chandler†), was hung† with goat skins exposed to dry, dyed of a most lively red. At one of the fountains is an ancient coffin used as a cistern. The port was filled with small craft. Before it is an old fortress on a rock or islet frequented by gulls and sea-mews. By the water-side is a large and good khan, at which we passed a night on our return. This place belonged once to the Ephesians, who exchanged it with the Samians for a town in Caria."

SCALADO, or SCALLADE, in the art of war, a furious assault made on the wall or rampart of a city, or other fortified place, by means of ladders, without carrying on works in form, to secure the men.

SCALD-CREAM, sometimes also called *Clouted-cream*; a curious method of preparing cream for butter, almost peculiar to Devonshire. Dr Hales, in Philosophical Transactions volume xlix. p. 342, 1755, Part I. gives some account of the method of preparing this delicate and luxurious article; other writers also speak of it. With an elucidation or two, we shall nearly quote Mr Feltham's account from the Gentleman's Magazine, volume lxi. part ii. It is there observed, that the purpose of making scald-cream is far superior butter than can be procured from the usual raw cream, being preferable for flavour and keeping; to which those accustomed are so partial, as seldom to eat any other. As leaden cisterns would not answer for scalding cream, the

Scaliger,

dairies mostly adopt brass pans, which hold from three to five gallons. for the milk; and that which is put into those pans one morning, stands till the next, when, without disturbing it, it is set over (on a trivet) a steady brisk wood fire, devoid of smoke, where it is to remain from seven to fifteen minutes, according to the size of the pan, or the quantity in it: the precise time of removing it from the fire must be particularly attended to, and is, when the surface begins to wrinkle or to gather in a little, showing signs of being near the agitation of boiling, which it must by no means do; it is then instantly to be taken off, and placed in the dairy until the next morning, when the fine cream is thrown up, and may be taken for the table, or for butter, into which it is now soon converted by stirring it with the hand. Some know when to remove it from the fire by sounding the pan with the finger, it being then less sonorous; but this can only be acquired by experience. Dr Hales observes, that this method of preparing milk takes off the ill taste which it sometimes acquires from the cows feeding on turnips, cabbage, &c.

SCALDS, in the history of literature, a name given by the ancient inhabitants of the northern countries to their poets; in whose writings their history is recorded.

SCALE, a mathematical instrument consisting of several lines drawn on wood, brass, silver, &c. and variously divided, according to the purposes it is intended to serve; whence it acquires various denominations, as the *plain scale*, *diagonal scale*, *plotting scale*, &c.

SCALE, in *Music*, sometimes denominated a *gamut*, a *diagram*, a *series*, an *order*, a *diapason*. It consists of the regular gradations of sound, by which a composer or performer, whether in rising or descending, may pass from any given tone to another. These gradations are seven. When this order is repeated, the first note of the second is consentaneous with the lowest note of the first; the second of the former with the second of the latter; and so through the whole octave. The second order, therefore, is justly esteemed only a repetition of the first. For this reason the scale, among the moderns, is sometimes limited to an octave; at other times extended to the compass of any particular voice or instrument. It likewise frequently includes all the practical gradations of musical sound, or the whole number of octaves employed in composition or execution, arranged in their natural order.

SCALE, in *Architecture* and *Geography*, a line divided into equal parts, placed at the bottom of a map or draught, to serve as a common measure to all the parts of the building, or all the distances and places of the map.

SCALENE, or SCALENOUS TRIANGLE, *scalenum*, in *Geometry*, a triangle whose sides and angles are unequal. See GEOMETRY.

SCALENUS, in *Anatomy*. See there, *Table of the Muscles*.

SCALIGER, JULIUS CÆSAR, a learned critic, poet, physician, and philosopher, was born at the castle of Ripa, in the territories of Verona, in 1484; and is said to have been descended from the ancient princes of Verona, though this is not mentioned in the letters of naturalization he obtained in France in 1528. He learned the first rudiments of the Latin tongue in his own country; and in his 12th year was presented to the emperor Maximilian, who made him one of his

pages. He served that emperor 17 years, and gave signal proofs of his valour and conduct in several expeditions. He was present at the battle of Ravenna in April 1512, in which he had the misfortune to lose his father Benedict Scaliger, and his brother Titus; on which his mother died with grief: when being reduced to necessitous circumstances, he entered into the order of the Franciscans, and applied himself to study at Bologna; but soon after, changing his mind with respect to his becoming a monk, he took arms again, and served in Piedmont; at which time a physician persuaded him to study physic, which he did at his leisure hours, and also learned Greek; and at last the gout determined him, at 40 years of age, to abandon a military life. He soon after settled at Agen, where he married, and began to apply himself seriously to his studies. He learned first the French tongue, which he spoke perfectly in three months: and then made himself master of the Gascon, Italian, Spanish, German, Hungarian, and Sclavonian: but the chief object of his studies was polite literature. Meanwhile, he supported his family by the practice of physic. He did not publish any of his works till he was 47 years of age; when he soon gained a great name in the republic of letters. He had a graceful person, and so strong a memory, even in his old age, that he dictated to his son 200 verses which he had composed the day before, and retained without writing them down. He was so charitable, that his house was as it were an hospital for the poor and sick; and he had such an aversion to lying, that he would have no correspondence with those who were given to that vice; but, on the other hand, he had much vanity, and a satirical spirit, which created him many enemies. He died of a retention of urine in 1558. He wrote in Latin, 1. A Treatise on the Art of Poetry. 2. Exercitations against Cardan: which works are much esteemed. 3. Commentaries on Aristotle's History of Animals, and on Theophrastus on Plants. 4. Some Treatises on Physic. 5. Letters, Orations, Poems, and other works, in Latin.

SCALIGER, *Joseph Justus*, one of the most learned critics and writers of his time. He was the son of the former, and was born at Agen in France in 1540. He studied in the college of Bourdeaux; after which his father took him under his own care, and employed him in transcribing his poems; by which means he obtained such a taste for poetry, that before he was 17 years old he wrote a tragedy upon the subject of Oedipus, in which he introduced all the poetical ornaments of style and sentiment. His father dying in 1558, he went to Paris the year following, with a design to apply himself to the Greek tongue. For this purpose he for two months attended the lectures of Turnebus; but finding that in the usual course he should be a long time in gaining his point, he shut himself up in his closet, and by constant application for two years gained a perfect knowledge of that language. After which he applied to the Hebrew, which he learned by himself with great facility. He made no less progress in the sciences; and his writings procured him the reputation of one of the greatest men of that or any other age. He embraced the reformed religion at 22 years of age. In 1563, he attached himself to Lewis Casteignier de la Roch Pozay, whom he attended in several journeys; and in 1593, was invited to accept of the place of honorary professor.

aliget
||
ander-
beg.

professor of the university of Leyden, which he complied with. He died of a dropsy in that city in 1609. He was a man of great temperance; was never married; and was so close a student, that he often spent whole days in his study without eating; and though his circumstances were always very narrow, he constantly refused the presents that were offered him. He published many works; the principal of which are, 1. Notes on Seneca's Tragedies, on Varro, Ausonius, Pompeius Festus, &c. 2. His Latin Poems. 3. A Treatise *de Emendatione Temporum*. 4. Eusebius's Chronicle, with Notes. 5. *Canones Isagogici*; and many other works. The collections entitled *Scaligeriana*, were collected from his conversations by one of his friends; and being ranged into alphabetical order, were published by Isaac Vossius.

SCALLOP. See OSTREA, CONCHIOLOGY *Index*.

In the Highlands of Scotland, the great scallop shell is made use of for skimming milk. In old times, it had a more honourable place; being admitted into the halls of heroes, and was the cup of their festivity when the tribe assembled in the hall of their chieftain.

SCALPEL, in *Surgery*, a kind of knife used in anatomical dissections and operations in surgery.

SCALPER, or SCALPING-IRON, a surgeon's instrument used for scraping foul carious bones.

SCALPING, in military history, a barbarous custom, in practice among the Indian warriors, of taking off the tops of the scalps of the enemies skulls with their hair on. They preserve them as trophies of their victories, and are rewarded by their chiefs according to the number of scalps they bring in.

SCALPRA DENTALIA, instruments used by surgeons to take off those black, livid, or yellow crusts which adhere to the teeth, and not only loosen and destroy them, but taint the breath.

SCAMMONY, a concreted vegetable juice of a species of convolvulus, partly of the resin, and partly of the gum kind. See CONVOLVULUS, MATERIA MEDICA *Index*.

SCANDALUM MAGNATUM, in *Law*, is a defamatory speech or writing to the injury of a person of dignity; for which a writ that bears the same name is granted for the recovery of damages.

SCANDERBEG, the surname of George Castriot king of Albania, a province of Turkey in Europe, dependent on the Ottoman empire. He was delivered up with his three elder brothers as hostages, by their father, to Amurath II. sultan of the Turks, who poisoned his brothers, but spared him on account of his youth, being likewise pleased with his juvenile wit and amiable person. In a short time he became one of the most renowned generals of the age: and revolting from Amurath, he joined Hunniade Corvin, a most formidable enemy to the Ottoman power. He defeated the sultan's army, took Amurath's secretary prisoner, obliged him to sign and seal an order to the governor of Croia, the capital of Albania, to deliver up the citadel and city to the bearer of that order, in the name of the sultan. With this forged order he repaired to Croia; and thus recovered the throne of his ancestors and maintained the independency of his country against the numerous armies of Amurath and his successor Mahomed II. who was obliged to make peace with this hero in 1461. He then went to the assistance of Fer-

dinand of Arragon, at the request of Pope Pius II. and by his assistance Ferdinand gained a complete victory over his enemy the count of Anjou. Scanderbeg died in 1467.

SCANDEROON. See ALEXANDRETTA.

SCANDINAVIA, a general name for the countries of Norway, Sweden, and Denmark, anciently under the dominion of one prince. The inhabitants of these countries, in former times, were excessively addicted to war. From their earliest years they applied themselves to the military art, and accustomed themselves to cold, fatigue, and hunger. Even the very sports of youth and childhood were dangerous. They consisted in taking frightful leaps, climbing up the steepest rocks, fighting naked with offensive weapons, wrestling with the utmost fury; so that it was usual to see them grown up to be robust men, and terrible in the combat, at the age of 15. At this early age the young men became their own masters; which they did by receiving a sword, a buckler, and a lance. This ceremony was performed at some public meeting. One of the principal men of the assembly named the youth in public; after which he was obliged to provide for his own subsistence, and was either now to live by hunting, or by joining in some incursion against the enemy. Great care was taken to prevent the young men from too early connexions with the female sex; and indeed they could have no hope to gain the affection of the fair, but in proportion to the courage and address they had shown in their military exercises. Accordingly, in an ancient song, we find Bartholin, king of Norway, extremely surprised that his mistress should prove unkind, as he could perform eight different exercises. The children were generally born in camps; and being injured from their infancy to behold nothing but arms, effusion of blood, and slaughter, they imbibed the cruel disposition of their fathers, and when they broke forth upon other nations, behaved rather like furies than like human creatures.

The laws of this people, in some measure, resembled those of the ancient Lacedæmonians. They knew no virtue but bravery, and no vice but cowardice. The greatest penalties were inflicted on such as fled from battle. The laws of the ancient Danes declared such persons infamous, and excluded them from society. Among the Germans, cowards were sometimes suffocated in mud; after which they were covered over with hurdles, to show, says Tacitus, that though the punishment of crimes should be public, there are certain degrees of cowardice and infamy which ought to be buried in oblivion. Frotho king of Denmark enacted, by law, that whoever solicited an eminent post ought upon all occasions to attack one enemy, to face two, to retire only one step back from three, and never to make an actual retreat till assaulted by four. The rules of justice themselves were adapted and warped to these prejudices. War was looked upon as a real act of justice, and force was thought to be an incontestable title over the weak, and a visible mark that God had intended them to be subject to the strong. They had no doubt but that the intentions of the Deity had been to establish the same dependence among men that takes place among inferior creatures; and, setting out from this principle of the natural inequality among men, they had from thence inferred that the weak had no right

via.

Scandinavia.

to what they could not defend. This maxim was adopted with such rigour, that the name of divine judgment was given not only to the judicatory combat, but to conflicts and battles of all sorts; victory being, in their opinion, the only certain mark by which Providence enables us to distinguish those whom it has appointed to command others.—Lastly, Their religion, by annexing eternal happiness to the military virtues, gave the utmost possible degree of vigour to that propensity which these people had for war, and to their contempt of death, of which we shall now give some instances. We are informed that Harold, surnamed *Blaatand*, or *Blue-tooth*, a king of Denmark, who lived in the beginning of the ninth century, had founded on the coasts of Pomerania a city named *Julin* or *Jomsburg*. To this place he sent a colony of young Danes, bestowing the government on a celebrated warrior called *Palnatoko*. In this colony it was forbidden to mention the word *fear*, even in the most imminent dangers. No citizen of Jomsburg was to yield to any number of enemies however great. The sight of inevitable death was not to be taken as an excuse for showing the smallest apprehension. And this legislator really appears to have eradicated from the minds of most of the youths bred up under him, all traces of that sentiment so natural and so universal, which makes men think on their destruction with horror. Nothing can show this better than a single fact in their history, which deserves to have place here for its singularity. Some of them having made an irruption into the territories of a powerful Norwegian lord, named *Haquin*, were overcome in spite of the obstinacy of their resistance; and the most distinguished among them being made prisoners, were, according to the custom of those times, condemned to death. The news of this, far from afflicting them, was on the contrary received with joy. The first who was led to punishment was content to say, without changing countenance, and without expressing the least sign of fear, “Why should not the same happen to me as did to my father? He died, and so must I.” A warrior, named *Thorhill*, who was to cut off the head of the second, having asked him what he felt at the sight of death, he answered, “that he remembered too well the laws of Jomsburg to utter any words that denoted fear.” The third, in reply to the same question, said, “he rejoiced to die with glory; and that he preferred such a death to an infamous life like that of *Thorhill*’s.” The fourth made an answer much longer and more extraordinary. “I suffer with a good heart; and the present hour is to me very agreeable. I only beg of you (added he, addressing himself to *Thorhill*) to be very quick in cutting off my head; for it is a question often debated by us at Jomsburg, whether one retains any sense after being beheaded. I will therefore grasp this knife in my hand; if, after my head is cut off, I strike it towards you, it will show I have not lost all sense; if I let it drop, it will be a proof of the contrary. Make haste therefore, and decide the dispute.” *Thorhill*, adds the historian, cut off his head in a most expeditious manner; but the knife, as might be expected, dropt from his hand. The fifth showed the same tranquillity, and died rallying and jeering his enemies. The sixth begged of *Thorhill*, that he might not be led to punishment like a sheep; “Strike the blow in my face (said he), I will sit still without

shrinking; and take notice whether I once wink my eyes, or betray one sign of fear in my countenance: for we inhabitants of Jomsburg are used to exercise ourselves in trials of this sort, so as to meet the stroke of death without once moving.” He kept his promise before all the spectators, and received the blow without betraying the least sign of fear, or so much as winking with his eyes. The seventh, says the historian, was a very beautiful young man, in the flower of his age. His long hair, as fine as silk, floated in curls and ringlets on his shoulders. *Thorhill* asked him, what he thought of death? “I receive it willingly (said he), since I have fulfilled the greatest duty of life, and have seen all those put to death whom I would not survive. I only beg of you one favour, not to let my hair be touched by a slave, or stained with my blood.”

Neither was this intrepidity peculiar to the inhabitants of Jomsburg; it was the general character of all the Scandinavians, of which we shall only give this further instance. A warrior, having been thrown upon his back in wrestling with his enemy, and the latter finding himself without his arms, the vanquished person promised to wait, without changing his posture, till his antagonist fetched a sword to kill him; and he faithfully kept his word.—To die with his arms in his hand was the ardent wish of every free man; and the pleasing idea which they had of this kind of death led them to dread such as proceeded from old age and disease. The history of ancient Scandinavia is full of instances of this way of thinking. The warriors who found themselves lingering in disease, often availed themselves of their few remaining moments to shake off life, by a way that they supposed to be more glorious. Some of them would be carried into a field of battle, that they might die in the engagement. Others slew themselves: many procured this melancholy service to be performed by their friends, who considered it as a most sacred duty. “There is, on a mountain of Iceland, (says the author of an old Iceland romance), a rock so high, that no animal can fall from the top and live. Here men betake themselves when they are afflicted and unhappy. From this place all our ancestors, even without waiting for sickness, have departed into Eden. It is useless, therefore, to give ourselves up to groans and complaints, or to put our relations to needless expenses, since we can easily follow the example of our fathers, who have all gone by the way of this rock.”—When all these methods failed, and at last when Christianity had banished such barbarous practices, the disconsolate heroes consoled themselves by putting on complete armour, as soon as they found their end approaching.

SCANDIX, SHEPHERD’S NEEDLE, or *Venus Comb*, a genus of plants, belonging to the pentandria class; and in the natural method ranking under the 45th order, *Umbellatae*. See *BOTANY Index*.

SCANNING, in *Poetry*, the measuring of verse by feet, in order to see whether or not the quantities be duly observed. The term is chiefly used in Greek and Latin verses. Thus an hexameter verse is scanned by resolving it into six feet; a pentameter, by resolving it into five feet, &c.

SCANTLING, a measure, size, or standard, by which the dimensions, &c. of things are to be determined. The term is particularly applied to the dimensions

sions of any piece of timber, with regard to its breadth and thickness.

SCANTO, or **SPAVENTO**, a sudden impression of horror upon the mind and body. It is extremely dreaded by the inhabitants of Sicily; and the wild ideas of the vulgar part of the inhabitants respecting it are almost incredible, and their dread of a sudden shock is no less surprising. There is scarce a symptom, disorder, or accident, they do not think may befall the human frame in consequence of the scanto. They are persuaded that a man who has been frightened only by a dog, a viper, a scorpion, or any other creature, which he has an antipathy to, will soon be seized with the same pains he would really feel, had he been torn with their teeth, or wounded with their venomous sting; and that nothing can remove these nervous imaginary pangs but a strong dose of dilena, a species of cantharides found in Sicily.

SCAPE-GOAT, in the Jewish antiquities, the goat which was set at liberty on the day of solemn expiation. For the ceremonies on this occasion, see *Levit. xvi. 5, 6, &c.*

Some say, that a piece of scarlet cloth, in form of a tongue, was tied on the forehead of the scapegoat. *Hoff. Lex. Univ. in voc. Lingua.*

Many have been the disputes among the interpreters concerning the meaning of the word *scape-goat*; or rather of *azazel*, for which *scape-goat* is put in our version of the Bible.

Spencer is of opinion, that *azazel* is a proper name, signifying the devil or evil dæmon. See his reasons in his book *De leg. Hebr. ritual. Dissert. viii.* Among other things, he observes, that the ancient Jews used to substitute the name *Samaël* for *Azazel*; and many of them have ventured to affirm, that at the feast of expiation they were obliged to offer a gift to *Samaël* to obtain his favour. Thus also the goat, sent into the wilderness to *Azazel*, was understood to be a gift or oblation. Some Christians have been of the same opinion. But Spencer thinks that the genuine reasons of the ceremony were, 1. That the goat loaded with the sins of the people, and sent to *Azazel*, might be a symbolical representation of the miserable condition of sinners. 2. God sent the goat thus loaded to the evil dæmons, to show that they were impure, thereby to deter the people from any conversation or familiarity with them. 3. That the goat sent to *Azazel*, sufficiently expiating all evils, the Israelites might the more willingly abstain from the expiatory sacrifices of the Gentiles.

SCAPEMENT, in clock-work, a general term for the manner of communicating the impulse of the wheels to the pendulum. The ordinary scapements consist of the swing-wheel and pallets only; but modern improvements have added other levers or detents, chiefly for the purposes of diminishing friction, or for detaching the pendulum from the pressure of the wheels during part of the time of its vibration. See *WATCH-work.*

SCAPULA, in *Anatomy*, the shoulder, or shoulder-bone.

SCAPULA, *John*, the reputed author of a Greek lexicon, studied at Lausanne. His name is recorded in the annals of literature, neither on account of his talents nor learning, nor virtuous industry, but for a gross act of disingenuity and fraud which he committed against an

eminent literary character of the 16th century. Being employed by Henry Stephens as a corrector to his press while he was publishing his *Thesaurus lingue Græcæ*, Scapula extracted these words and explications which he reckoned most useful, comprised them in one volume, and published them as an original work, with his own name.

The compilation and printing of the *Thesaurus* had cost Stephens immense labour and expense; but it was so much admired by those learned men to whom he had shown it, and seemed to be of such essential importance to the acquisition of the Greek language, that he reasonably hoped his labour would be crowned with honour, and the money he had expended would be repaid by a rapid and extensive sale. But before his work came abroad, Scapula's abridgement appeared; which, from its size and price, was quickly purchased, while the *Thesaurus* itself lay neglected in the author's hands. The consequence was, a bankruptcy on the part of Stephens, while he who had occasioned it was enjoying the fruits of his treachery. Scapula's *Lexicon* was first printed in 1570, in 4to. It was afterwards enlarged, and published in folio. It has gone through several editions, while the valuable work of Stephens has never been reprinted. Its success is, however, not owing to its superior merit, but to its price and more commodious size. Stephens charges the author with omitting a great many important articles. He accuses him of misunderstanding and perverting his meaning; and of tracing out absurd and trifling etymologies, which he himself had been careful to avoid. He composed the following epigram on Scapula.

*Quidam περιεμνων me capulo tenuis abdidit ensem
Æger eram à Scapulis, sanus et huc redeo.*

Doctor Busby, so much celebrated for his knowledge of the Greek language, and his success in teaching it, would never permit his scholars at Westminster school to make use of Scapula.

SCAPULAR, in *Anatomy*, the name of two pair of arteries, and as many veins.

SCAPULAR, or *Scapulary*, a part of the habit of several religious orders in the church of Rome, worn over the gown as a badge of peculiar veneration for the Blessed Virgin. It consists of two narrow slips or breadths of cloth covering the back and the breast, and hanging down to the feet.—The devotees of the scapular celebrate its festival on the 10th of July.

SCARABÆUS, the **BETLE**, a genus of insects of the coleoptera order. See *ENTOMOLOGY Index.*

SCARBOROUGH, a town of the north riding of Yorkshire, seated on a steep rock, near which are such craggy cliffs that it is almost inaccessible on every side. On the top of this rock is a large green plain, with two wells of fresh water springing out of the rock. It is greatly frequented on account of its mineral waters called the *Scarborough-Spa*; on which account it is much improved in the number and beauty of the buildings. The spring was under the cliff, part of which fell down in 1737, and the water was lost; but in clearing away the ruins in order to rebuild the wharf, it was recovered, to the great joy of the town. The waters of Scarborough are chalybeate and purging. The two wells are both impregnated with the same principles, in different proportions; though the purging well is the

Scapula
||

rough.

Scarbo-
rough.
Scardona.

most celebrated, and the water of this is usually called the *Scarborough water*. When these waters are poured out of one glass into another, they throw up a number of air bubbles; and if they are shaken for some time in a phial close stopped, and the phial be suddenly opened before the commotion ceases, they displode an elastic vapour, with an audible noise, which shows that they abound in fixed air. At the fountain they have a brisk, pungent chalybeate taste; but the purging water tastes bitterish, which is not usually the case with the chalybeate one. They lose their chalybeate virtues by exposure and by keeping; but the purging water the soonest. They both putrefy by keeping; but in time recover their sweetness. Four or five half pints of the purging water drank within an hour, give two or three easy motions, and raise the spirits. The like quantity of the chalybeate purges less, but exhilarates more, and passes off chiefly by urine. These waters have been found beneficial in hectic fevers, weaknesses of the stomach, and indigestion; in relaxations of the system; in nervous, hysteric, and hypochondriacal disorders; in the green sickness, scurvy, rheumatism, and asthmatic complaints; in gleet, the fluor albus, and other preternatural evacuations; and in habitual costiveness. Here are assemblies and balls as at Tunbridge. It is a place of some trade, has a very good harbour, and sends two members to parliament. Population in 1811, 7067. E. Long. 54. 18. N. Lat. 0. 3.

SCARDONA, a sea-port town of Dalmatia, seated on the eastern banks of the river Cerca, with a bishop's see. It has been taken and retaken several times by the Turks and Venetians; and these last ruined the fortifications and its principal buildings in 1537; but they have been since put in a state of defence.

Travels
into Dal-
matia.

"No vestiges (says Fortis) now remain visible of that ancient city, where the states of Liburnia held their assembly in the times of the Romans. I however transcribed these two beautiful inscriptions, which were discovered some years ago, and are preserved in the house of the reverend canon Mercati. It is to be hoped, that, as the population of Scardona continues increasing, new lands will be broken up, and consequently more frequent discoveries made of the precious monuments of antiquity. And it is to be wished, that the few men of letters, who have a share in the regulation of this reviving city, may bestow some particular attention on that article, so that the honourable memorials of their ancient and illustrious country, which once held so eminent a rank among the Liburnian cities, may not be lost, nor carried away. It is almost a shame, that only six legible inscriptions actually exist at Scardona; and that all the others, since many more certainly must have been dug up there, are either miserably broken, or lost, or transported to Italy, where they lose the greatest part of their merit. Roman coins are very frequently found about Scardona, and several valuable ones were shown to me by that hospitable prelate Monsignor Trevisani, bishop and father of the rising settlement. One of the principal gentlemen of the place was so kind as to give me several sepulchral lamps, which are marked by the name of *Fortis*, and by the elegant form of the letters appear to be of the best times. The repeated devastations to which Scardona has been exposed, have left it no traces of grandeur. It is now, however, beginning to rise again, and many merchants of Servia

and Bosnia have settled there, on account of the convenient situation for trade with the upper provinces of Turkey. But the city has no fortifications, notwithstanding the assertion of P. Farlati to the contrary." E. Long. 17. 25. N. Lat. 43. 55.

SCARIFICATION, in *Surgery*, the operation of making several incisions in the skin by means of lances or other instruments, particularly the cupping instrument. See *SURGERY*.

SCARLET, a beautiful bright red colour. See *DYEING Index*.

In painting in water-colours, minium mixed with a little vermilion produces a good scarlet: but if a flower in a print is to be painted a scarlet colour, the lights as well as the shades should be covered with minium, and the shaded parts finished with carmine, which will produce an admirable scarlet.

SCARLET-Fever. See *MEDICINE Index*.

SCARP, in *Fortification*, is the interior talus or slope of the ditch next the place, at the foot of the rampart.

SCARP, in *Heraldry*, the scarf which military commanders wear for ornament. It is borne somewhat like a battoon sinister, but is broader than it, and is continued out to the edges of the field, whereas the battoon is cut off at each end.

SCARPANTO, an island of the Archipelago, and one of the Sporades, lying to the south-west of the isle of Rhodes, and to the north-east of that of Candia. It is about 22 miles in length and 8 in breadth; and there are several high mountains. It abounds in cattle and game; and there are mines of iron, quarries of marble, with several good harbours. The Turks are masters of it, but the inhabitants are Greeks.

SCARPE, a river of the Netherlands, which has its source near Aubigny in Artois, where it washes Arras and Douay; after which it runs on the confines of Flanders and Hainault, passing by St Amand, and a little after falls into the Scheldt.

SCARRON, PAUL, a famous burlesque writer, was the son of a counsellor in parliament, and was born at Paris about the end of the year 1610, or in the beginning of the succeeding year. His father marrying a second time, he was compelled to assume the ecclesiastical profession. At the age of 24 he visited Italy, where he freely indulged in licentious pleasures. After his return to Paris he persisted in a life of dissipation till a long and painful disease convinced him that his constitution was almost worn out. At length when engaged in a party of pleasure at the age of 27, he lost the use of those legs which danced so gracefully, and of those hands which could paint and play on the lute with so much elegance. In the year 1638 he was attending the carnival at Mons, of which he was a canon. Having dressed himself one day as a savage, his singular appearance excited the curiosity of the children of the town. They followed him in multitudes, and he was obliged to take shelter in a marsh. This wet and cold situation produced a numbness which totally deprived him of the use of his limbs; but notwithstanding this misfortune he continued gay and cheerful. He took up his residence at Paris, and by his pleasant humour soon attracted to his house all the men of wit about the city. The loss of his health was followed by the loss of his fortune. On the death of his father he entered into a process with

Scard
||
Scarr

with his mother-in-law. He pleaded the cause in a ludicrous manner, though his whole fortune depended on the decision. He accordingly lost the cause. Mademoiselle de Hautefort, compassionating his misfortunes, procured for him an audience of the queen. The poet requested to have the title of *Valetudinarian* to her majesty. The queen smiled, and Scarron considered the smile as the commission to his new office. He therefore assumed the title of *Scarron, by the grace of God, unworthy valetudinarian to the queen.*

Cardinal Mazarine gave him a pension of 500 crowns; but that minister having received disdainfully the dedication of his *Typhon*, the poet immediately wrote a *Mazarinade*, and the pension was withdrawn. He then attached himself to the prince of Condé, and celebrated his victories. He at length formed the extraordinary resolution of marrying, and was accordingly, in 1651, married to Mademoiselle d'Aubigné (afterwards the famous Madame de Maintenon), who was then only 16 years of age. "At that time (says Voltaire) it was considered as a great acquisition for her to gain for a husband a man who was disfigured by nature, impotent, and very little enriched by fortune." When Scarron was questioned about the contract of marriage, he said he acknowledged to the bride two large invincible eyes, a very beautiful shape, two fine hands, and a large portion of wit. The notary demanded what dowry he would give her? Immediately replied Scarron, "The names of the wives of kings die with them, but the name of Scarron's wife shall live for ever." She restrained by her modesty his indecent buffooneries, and the good company which had formerly resorted to his house were not less frequent in their visits. Scarron now became a new man. He became more decent in his manners and conversation: and his gaiety, when tempered with moderation, was still more agreeable. But in the mean time, he lived with so little economy, that his income was soon reduced to a small annuity and his marquisate of Quinet. By the marquisate of Quinet, he meant the revenue he derived from his publications, which were printed by one Quinet. He was accustomed to talk to his superiors with great freedom in his jocular style. In the dedication to his *Don Japhet d'Armenie*, he thus addresses the king. "I shall endeavour to persuade your majesty, that you would do yourself no injury were you to do me a small favour; for in that case I should become more gay: if I should become more gay, I should write sprightly comedies: and if I should write sprightly comedies, your majesty would be amused, and thus your money would not be lost. All this appears so evident, that I should certainly be convinced of it if I were as great a king as I am now a poor unfortunate man."

Though Scarron wrote comedies, he had neither time nor patience to study the rules and models of dramatic poetry. Aristotle and Horace, Plautus and Terence, would have frightened him; and perhaps he did not know that there was ever such a person as Aristophanes. He saw an open path before him, and he followed it. It was the fashion of the times to pillage the Spanish writers. Scarron was acquainted with that language, and he found it easier to use the materials which were already prepared, than to rack his brain in inventing a subject; a restraint to which a genius like his could not easily submit. As he borrowed liberally

from the Spanish writers, a dramatic piece did not cost him much labour. His labour consisted not in making his comic characters talk humorously, but in keeping up serious characters; for the serious was a foreign language to him. The great success of his *Jodelet Maître* was a vast allurements to him. The comedians who acted it eagerly requested more of his productions. They were written without much toil, and they procured him large sums. They served to amuse him. If it be necessary to give more reasons for Scarron's readiness to engage in these works, abundance may be had. He dedicated his books to his sister's greyhound bitch; and when she failed him, he dedicated them to a certain Monsieur, whom he praised higher, but did not much esteem. When the office of historiographer became vacant, he solicited for it without success. At length Fouquet gave him a pension of 1600 livres. Christina queen of Sweden having come to Paris, was anxious to see Scarron. "I permit you (said she to Scarron) to fall in love with me. The queen of France has made you her valetudinarian, and I create you my *Roland.*" Scarron did not long enjoy that title: he was seized with so violent a hiccough, that every person thought he would have expired. "If I recover (he said), I will make a fine satire on the hiccough." His gaiety did not forsake him to the last. Within a few minutes of his death, when his domestics were shedding tears about him, "My good friends (says he), I shall never make you weep so much for me as I have made you laugh." Just before expiring, he said, "I could never believe before that it is so easy to laugh at death." He died on the 14th of October 1660, in the 51st year of his age.

His works have been collected and published by Bruzen de la Martiniere, in 10 vols 12mo, 1737. There are, 1. The *Eneid* travestied, in 8 books. It was afterwards continued by Moreau de Brasey. 2. *Typhon*, or the *Gigantomachia*. 3. Many comedies; as *Jodelet*, or the *Master Valet*; *Jodelet cuffed*; *Don Japhet d'Armenie*; *The Ridiculous Heir*; *Every Man his own Guardian*; *The Foolish Marquis*; *The Scholar of Salamanca*; *The False Appearance*; *The Prince Corsaire*, a tragi-comedy. Besides these, he wrote other pieces in verse. 4. His *Comic Romance* in prose, which is the only one of his works that deserves attention. It is written with much purity and gaiety, and has contributed not a little to the improvement of the French language. Scarron had great pleasure in reading his works to his friends as he composed them: he called it trying his works. Segrais and another of his friends coming to him one day, "Take a chair (says Scarron to them) and sit down, that I may examine my *Comic Romance.*" When he observed the company laugh, "Very well (said he), my book will be well received since it makes persons of such delicate taste laugh." Nor was he deceived. His *Romance* had a prodigious run. It was the only one of his works that Boileau could submit to read. 5. *Spanish Novels* translated into French. 6. A volume of *Letters*. 7. *Poems*; consisting of *Songs*, *Epistles*, *Stanzas*, *Odes*, and *Epigrams*. The whole collection abounds with sprightliness and gaiety. Scarron can raise a laugh in the most serious subjects; but his sallies are rather those of a buffoon than the effusions of ingenuity and taste. He is continually falling into the mean and the obscene. If we should make any exception

Scarron.

Scarron
||
Sceptic.

tion in favour of some of his comedies, of some passages in his *Eneid* travestied, and his *Comic Romance*, we must acknowledge that all the rest of his works are only fit to be read by footmen and buffoons. It has been said that he was the most eminent man in his age for burlesque. This might make him an agreeable companion to those who choose to laugh away their time; but as he has left nothing that can instruct posterity, he has but little title to posthumous fame.

SCENE, in its primary sense, denoted a theatre, or the place where dramatic pieces and other public shows were exhibited; for it does not appear that the ancient poets were at all acquainted with the modern way of changing the scenes in the different parts of the play, in order to raise the idea of the persons represented by the actors being in different places.

The original scene for acting of plays was as simple as the representations themselves: it consisted only of a plain plot of ground proper for the occasion, which was in some degree shaded by the neighbouring trees, whose branches were made to meet together, and their vacancies supplied with boards, sticks, and the like; and to complete the shelter, these were sometimes covered with skins, and sometimes with only the branches of other trees newly cut down, and full of leaves. Afterwards more artificial scenes, or scenical representations, were introduced, and paintings used instead of the objects themselves. Scenes were then of three sorts; tragic, comic, and satiric. The tragic scene represented stately magnificent edifices, with decorations of pillars, statues, and other things suitable to the palaces of kings: the comic exhibited private houses with balconies and windows, in imitation of common buildings: and the satiric was the representation of groves, mountains, dens, and other rural appearances; and these decorations either turned on pivots, or slid along grooves as those in our theatres.

To keep close to nature and probability, the scene should never be shifted from place to place in the course of the play: the ancients were pretty severe in this respect, particularly Terence, in some of whose plays the scene never shifts at all, but the whole is transacted at the door of some old man's house, whither with inimicable art he occasionally brings the actors. The French are pretty strict with respect to this rule; but the English pay very little regard to it.

SCENE is also a part or division of a dramatic poem. Thus plays are divided into acts, and acts are again subdivided into scenes; in which sense the scene is properly the persons present at or concerned in the action on the stage at such a time: whenever, therefore, a new actor appears, or an old one disappears, the action is changed into other hands; and therefore a new scene then commences.

It is one of the laws of the stage, that the scenes be well connected; that is, that one succeed another in such a manner as that the stage be never quite empty till the end of the act. See POETRY.

SCENOGRAPHY, (from the Greek *σκηνη*, *scene*, and *γραφη*, *description*), in perspective, a representation of a body on a perspective plane; or a description thereof in all its dimensions, such as it appears to the eye. See PERSPECTIVE.

SCEPTIC, *σκηπτικος*, from *σκηπτομαι*, "I consider, look about, or deliberate," properly signifies *considera-*

tive and *inquisitive*, or one who is always weighing reasons on one side and the other, without ever deciding between them. It is chiefly applied to an ancient sect of philosophers founded by Pyrrho (see PYRRHO), who, according to Laertius, had various other denominations. From their master they were called *Pyrrhonian*; from the distinguishing tenets or characteristic of their philosophy they derived the name of *Aporetici*, from *απορειν*, "to doubt;" from their suspension and hesitation they were called *ephectici*, from *επιχειν*, "to stay or keep back:" and lastly, they were called *zetetici*, or *seekers*, from their never getting beyond the search of truth.

That the sceptical philosophy is absurd, can admit of no dispute in the present age; and that many of the followers of Pyrrho carried it to the most ridiculous height, is no less true. But we cannot believe that he himself was so extravagantly sceptical as has sometimes been asserted, when we reflect on the particulars of his life, which are still preserved, and the respectful manner in which we find him mentioned by his contemporaries and writers of the first name who flourished soon after him. The truth, as far as at this distance of time it can be discovered, seems to be, that he learned from Democritus to deny the real existence of all qualities in bodies, except those which are essential to primary atoms, and that he referred every thing else to the perceptions of the mind produced by external objects, in other words, to appearance and opinion. All knowledge of course appeared to him to depend on the fallacious report of the senses, and consequently to be uncertain; and in this notion he was confirmed by the general spirit of the Eleatic school in which he was educated. He was further confirmed in his scepticism by the subtleties of the Dialectic school in which he had been instructed by the son of Stilpo; choosing to overturn the cavils of sophistry by recurring to the doctrine of universal uncertainty, and thus breaking the knot which he could not unloose. For being naturally and habitually inclined to consider immovable tranquillity as the great end of all philosophy, he was easily led to despise the dissensions of the dogmatists, and to infer from their endless disputes, the uncertainty of the questions on which they debated; contrariwise, as it has often happened to others, becoming also with respect to him the parent of scepticism.

Pyrrho's doctrines, however new and extraordinary, were not totally disregarded. He was attended by several scholars, and succeeded by several followers, who preserved the memory of his notions. The most eminent of his followers was Timon (see TIMON), in whom the public succession of professors in the Pyrrhonic school terminated. In the time of Cicero it was almost extinct, having suffered much from the jealousy of the dogmatists, and from a natural aversion in the human mind to acknowledge total ignorance, or to be left in absolute darkness. The disciples of Timon, however, still continued to profess scepticism, and their notions were embraced privately at least by many others. The school itself was afterwards revived by Ptolæmeus a Cyrenian, and was continued by Ænesidemus a contemporary of Cicero, who wrote a treatise on the principles of the Pyrrhonic philosophy, the heads of which are preserved by Plotius. From this time it was continued through a series of preceptors of little note to Sextus Empiricus, who also gave a summary of the sceptical doctrine.

Sceptic

ceptic. A system of philosophy thus founded on doubt, and clouded with uncertainty, could neither teach tenets of any importance, nor prescribe a certain rule of conduct; and accordingly we find that the followers of scepticism were guided entirely by chance. As they could form no certain judgment respecting good and evil, they accidentally learned the folly of eagerly pursuing any apparent good, or of avoiding any apparent evil; and their minds of course settled into a state of undisturbed tranquillity, the grand postulatium of their system.

In the schools of the sceptics we find ten distinct topics of argument urged in support of the doctrine of uncertainty, with this precaution, however, that nothing could be positively asserted either concerning their number or their force. These arguments chiefly respect objects of sense: they place all knowledge in appearance: and, as the same things appear very different to different people, it is impossible to say which appearance most truly expresses their real nature. They likewise say, that our judgment is liable to uncertainty from the circumstance of frequent or rare occurrence, and that mankind are continually led into different conceptions concerning the same thing by means of custom, law, fabulous tales, and established opinions. On all these accounts, they think every human judgment is liable to uncertainty; and, concerning any thing, they can only assert, that it seems to be, not that it is what it seems.

This doubtful reasoning, if reasoning it may be called, the sceptics extended to all the sciences, in which they discovered nothing true, or which could be absolutely asserted. In all nature, in physics, morals, and theology, they found contradictory opinions, and inexplicable or incomprehensible phenomena. In physics, the appearances they thought might be deceitful; and respecting the nature of God and the duties of morality, men were, in their opinion, equally ignorant and uncertain. To overturn the sophistical arguments of these sceptical reasoners, would be no difficult matter, if their reasoning were worthy of confutation. Indeed, the great principle is sufficiently, though shortly refuted by Plato, in these words. "When you say all things are incomprehensible (says he), do you comprehend or conceive that they are thus incomprehensible, or do you not? If you do, then something is comprehensible; if you do not, there is no reason we should believe you, since you do not comprehend your own assertion."

But scepticism has not been confined entirely to the ancients and to the followers of Pyrrho. Numerous sceptics have arisen also in modern times, varying in their principles, manners, and character, as chance, prejudice, vanity, weakness, or indolence, prompted them. The great object, however, which they seem to have in view, is to overturn, or at least to weaken, the evidence of analogy, experience, and testimony; though some of them have even attempted to show, that the axioms of geometry are uncertain, and its demonstrations inconclusive. This last attempt has not indeed been often made; but the chief aim of Mr Hume's philosophical writings is to introduce doubts into every branch of *physics, metaphysics, history, ethics, and theology*. It is needless to give a specimen of his reasonings in support of modern scepticism. The most

VOL. XVIII. Part II.

important of them have been noticed elsewhere (see *MIRACLE, METAPHYSICS, and PHILOSOPHY, N° 41.*); and such of our readers as have any relish for speculations of that nature can be no strangers to his Essays, or to the able confutations of them by the Doctors Reid, Campbell, Gregory, and Beattie, who have likewise exposed the weakness of the sceptical reasonings of Des Cartes, Malbranche, and other philosophers of great fame in the same school.

SCEPTICISM, the doctrines and opinions of the sceptics. See the preceding article.

SCEPTRE, a kind of royal staff, or baton, borne on solemn occasions by Kings, as a badge of their command and authority. Nicod derives the word from the Greek *σκηπτρον*, which he says originally signified "a javelin," which the ancient kings usually bore as a badge of their authority; that instrument being in very great veneration among the heathens. But *σκηπτρον* does not properly signify a javelin, but a *staff to rest upon*, from *σκηπλω*, *inmitor*, "I lean upon." Accordingly, in the simplicity of the earlier ages of the world, the sceptres of kings were no other than long walking-staves: and Ovid, in speaking of Jupiter, describes him as resting on his sceptre (*Met. i. ver. 178.*) The sceptre is an ensign of royalty of greater antiquity than the crown. The Greek tragic and other poets put sceptres in the hands of the most ancient kings they ever introduce. Justin observes, that the sceptre, in its original, was a *hasta*, or spear. He adds, that, in the most remote antiquity, men adored the *hastæ* or sceptres as immortal gods; and that it was upon this account, that, even in his time, they still furnished the gods with sceptres.—Neptune's sceptre is his trident. Tarquin the Elder was the first who assumed the sceptre among the Romans. Le Gendre tells us, that, in the first race of the French kings, the sceptre was a golden rod, almost always of the same height with the king who bore it, and crooked at one end like a crozier. Frequently instead of a sceptre, kings are seen on medals with a palm in their hand. See *REGALIA*.

SCHÆFFERA, a genus of plants belonging to the *diceia* class; and in the natural method ranking with those that are doubtful. See *BOTANY Index*.

SCHAFFHAUSEN, the smallest canton of Switzerland, bounded on the north and west by Suabia, on the east by the canton of Zurich and the bishopric of Constance, and on the south by the same and Thurgau. It is about 15 miles long and 9 broad, and its population amounts to about 30,000. Its revenues are not extensive, as one proof of which the burgomaster or chief has not more than 150*l.* a year. The reformation was introduced before the middle of the 16th century. The clergy are paid by the state, the highest incomes not exceeding 100*l.* and the lowest 40*l.* annually. Sumptuary laws are in force, as well as in most other parts of Switzerland; and no dancing is allowed except on very particular occasions. Wine is their chief article of commerce, which they exchange with Suabia for corn, as this canton produces very little of that necessary article.

SCHAFFHAUSEN, a town of Switzerland, the metropolis of a canton of the same name. It is seated on the Rhine, and owes its origin to the interruption of the navigation of that river by the cataract at Lauffen. It was at one period an imperial town, and admitted a

Schaff-
hausen
||
Scheele.

member of the Helvetic confederacy in 1501; and its territory forms the 12th canton in point of rank. The inhabitants of this town are computed at 6000, but the number of citizens or burgesses is about 1600. From these were elected 85 members, who formed the great and little council; the senate, or little council of 25, being entrusted with the executive power; and the great council finally deciding all appeals, and regulating the more important concerns of government. Though a frontier town, it has no garrison, and the fortifications are weak; but it once had a famous wooden bridge over the Rhine, the work of one Ulric Grubenman, a carpenter. The sides and top of it were covered; and it was a kind of hanging bridge; the road was nearly level, and not carried, as usual, over the top of the arch, but let into the middle of it, and there suspended. This curious bridge was burnt by the French, when they evacuated Schaffhausen, after being defeated by the Austrians, April 13. 1799. Schaffhausen is 22 miles north by east of Zurich, and 39 east of Basil. Long. 3° 41' E. Lat. 47° 39' N.

SCHALBEA, a genus of plants belonging to the didynamia class. See *BOTANY Index*.

SCHEDULE, a scroll of paper or parchment, annexed to a will, lease, or other deed; containing an inventory of goods, or some other matter omitted in the body of the deed. The word is a diminutive of the Latin *scheda*, or Greek *σχῆδη*, a leaf or piece of paper.

SCHEELE, CHARLES WILLIAM, was born on the 19th of December 1742, at Stralsund, where his father kept a shop. When he was very young, he received the usual instructions of a private school; and was afterwards advanced to an academy. At a very early age he showed a strong desire to follow the profession of an apothecary, and his father suffered him to gratify his inclinations. With Mr Bauch, an apothecary at Gottenburg, he passed his apprenticeship, which was completed in six years. He remained, however, some time longer at that place, and it was there that he so excellently laid the first foundations of his knowledge. Among the various books which he read, that treated of chemical subjects, Kunckell's Laboratory seems to have been his favourite. He used to repeat many of the experiments contained in that work privately in the night, when the rest of the family had retired to rest. A friend of Scheele's had remarked the progress which he had made in chemistry, and had asked him by what inducements he had been at first led to study a science in which he had gained such knowledge? Scheele returned the following answer: "The first cause, my friend, arose from yourself. Nearly at the beginning of my apprenticeship you advised me to read Neuman's Chemistry, from the perusal of which I became eager to make experiments myself; and I remember very well how I mixed together, in a conserve-glass, oil of cloves, and fuming acid of nitre, which immediately took fire. I see also still before my eyes an unlucky experiment which I made with pyrophorus. Circumstances of this kind did but the more inflame my desire to repeat experiments." After Scheele's departure

from Gottenburg, in the year 1765, he obtained a place with Kalstrom, an apothecary at Malmo. Two years afterwards he went from thence to Stockholm, and managed the shop of Mr Scharenberg. In 1773, he changed this appointment for another at Upsal, under Mr Looock. Here he was fortunately situated; as, from his acquaintance with learned men, and from having free access to the university laboratory, he had opportunities of increasing his knowledge. At this place also he happily commenced the friendship which subsisted between him and Bergman. During his residence at this place, his Royal Highness Prince Henry of Prussia, accompanied by the Duke of Sudermania, visited Upsal, and chose this opportunity to see the academical laboratory. Scheele was accordingly appointed by the university to exhibit some chemical experiments to them. This office he undertook, and showed some of the most curious processes in chemistry. The two princes asked him many questions, and expressed their approbation of the answers which he returned to them. The duke asked him what countryman he was, and seemed to be much pleased when Scheele informed him that he was born at Stralsund. At their departure they told the professor, who was present, that they should esteem it a favour if he would permit the young man to have free access to the laboratory, as often as he chose to make experiments.

In the year 1777 Scheele was appointed by the Medical College to be apothecary at Koping. It was at that place that he soon showed the world how great a man he was, and that no place or situation could confine his abilities. When he was at Stockholm he showed his acuteness as a chemist, as he discovered there the new and wonderful acid contained in the fluor spar. It has been confidently asserted, that Scheele was the first who discovered the nature of the aerial acid; and that whilst he was at Upsal he made many experiments to prove its properties. This circumstance might probably have furnished Bergman with the means of treating this subject more fully. At the same place he began the series of excellent experiments on that remarkable mineral substance, manganese; from which investigation he was led to make the very valuable and interesting discovery of oxymuriatic acid. At the same time he examined the properties of ponderous earth.

At Koping he finished his dissertation on Air and Fire; a work which the celebrated Bergman most warmly recommended in the friendly preface which he wrote for it. The theory which Scheele endeavours to prove in this treatise is, that fire consists of pure air and phlogiston. According to more recent opinions (if inflammable air be phlogiston), water is composed of these two principles. Of these opinions we may say, in the words of Cicero, "*Opiniones tam variae sunt tamque inter se dissidentes ut alterum profecto fieri potest, ut earum nulla, alterum certe, non potest ut plus una, vera sit.*" The author's merit in this work, exclusive of the encomiums of Bergman, was sufficient to obtain the approbation of the public; as the ingenuity displayed in treating so delicate a subject, and the many new and valuable observations (A) which are dispersed through the treatise, justly

(A) Scheele mentions in this work, in a cursory way, the decomposition of common salt by the calx of lead. Mr Turner,

heele. } justly entitled the author to that fame which his book procured him. It was spread abroad through every country, became soon out of print, was reprinted, and translated into many languages. The English translation is enriched with the notes of that accurate and truly philosophic genius Richard Kirwan, Esq.

Scheele now diligently employed himself in contributing to the Transactions of the Academy at Stockholm. He first pointed out a new way to prepare the salt of benzoin. In the same year he discovered that arsenic, freed in a particular manner from phlogiston, partakes of all the properties of an acid, and has its peculiar affinities to other substances.

In a Dissertation on Flint, Clay, and Alum, he clearly overturned Beaumé's opinion of the identity of the siliceous and argillaceous earths. He published an Analysis of the Human Calculus. He showed also a mode of preparing mercurius dulcis in the humid way, and improved the process of making the powder of Algaroth. He analyzed the mineral substance called *molybdena* or flexible black lead. He discovered a beautiful green pigment. He showed us how to decompose the air of the atmosphere. He discovered that some neutral salts are decomposed by lime and iron. He decomposed plumbago, or the common black lead. He observed, with peculiar ingenuity, an acid in milk, which decomposes acetated alkali; and in his experiments on the sugar of milk, he discovered another acid, different in some respects from the above-mentioned acids and the common acid of sugar. He accomplished the decomposition of tungsten, the component parts of which were before unknown, and found in it a peculiar metallic acid united to lime. He published an excellent dissertation on the different sorts of ether. He found out an easy way to preserve vinegar for many years. His investigation of the colouring matter in Prussian blue, the means he employed to separate it, and his discovery that alkali, sal ammoniac, and charcoal, mixed together, will produce it, are strong marks of his penetration and genius. He found out a peculiar sweet matter in expressed oils, after they have been boiled with litharge and water. He showed how the acid of lemons may be obtained in crystals. He found the white powder in rhubarb, which Model thought to be selenitic, and which amounts to one-seventh of the weight of the root, to be calcareous earth, united to the acid of sorrel. This suggested to him the examination of the acid of sorrel. He precipitated acetate of lead with it, and decomposed the precipitate thus obtained by the vitriolic acid; and by this process he obtained the common acid of sugar; and by slowly dropping a solution of fixed alkali into a solution of the acid of sugar, he regenerated the acid of sorrel.—From his examination of the acids contained in fruits and berries, he found not one species of acid alone, viz. the acid of lemon, but another also, which he denominat-

ed the malaceous or malic acid, from its being found in the greatest quantity in apples. } Scheele.

By the decomposition of Bergman's new metal (siderite) he showed the truth of Meyer's and Klaproth's conjecture concerning it. He boiled the calx of siderite with alkali of tartar, and precipitated nitrate of mercury by the middle salt which he obtained by this operation; the calx of mercury which was precipitated was found to be united to the acid of phosphorus; so that he demonstrates that this calx was phosphorated iron. He found also, that the native Prussian blue contained the same acid. He discovered by the same means, that the perlate acid, as it was called, was not an acid *sui generis*, but the phosphoric united to a small quantity of the mineral alkali. He suggested an improvement in the process for obtaining magnesia from Epsom salt; he advises the adding of an equal weight of common salt to the Epsom salt, so that an equal weight of Glauber's salt may be obtained; but this will not succeed unless in the cold of winter. These are the valuable discoveries of this great philosopher, which are to be found in the Transactions of the Royal Society at Stockholm. Most of his essays have been published in French by Madame Picardet, and Mons. Morveau of Dijon. Dr Beddoes also has made a very valuable present to his countrymen of an English translation of a greater part of Scheele's dissertations, to which he has added some useful and ingenious notes. The following discoveries of Scheele are not, we believe, published with the rest. He showed what that substance is, which has been generally called 'the earth of the fluor spar.' It is not produced unless the fluor acid meet with siliceous earth. It appears from Scheele's experiments to be a triple salt, consisting of flint, acid of fluor, and fixed alkali. Scheele proved also, that the fluor acid may be produced without any addition of the vitriolic or any mineral acid: The fluor is melted with fixed alkali, and the fluorated alkali is decomposed by acetated lead. If the precipitate be mixed with charcoal dust, and exposed in a retort to a strong heat, the lead will be revived, and the acid of fluor, which was united to it, will pass into the receiver possessed of all its usual properties. This seems to be an ingenious and unanswerable proof of its existence.

He observed, that no pyrophorus can be made unless an alkali be present; and the reason why it can be prepared from alum and coal is, that the common alum always contains a little alkali, which is added in order to make it crystallize; for if this be separated from it, no pyrophorus can be procured from it. His last dissertation was his very valuable observations on the acid of the gall-nut. Ehrlhart, one of Scheele's most intimate friends, asserts, that he was the discoverer of both of the acids of sugar and tartar. We are also indebted to him for that masterpicce of chemical decomposition, the separation of the acid of phosphorus from bones. This appears

Turner, a gentleman who happily unites the skill of the manufacturer with the knowledge of the philosophic chemist, has also the merit of this discovery, as he observed the same fact, without having been indebted to Scheele's hint on the subject. Mr Turner has done more; he has converted this discovery to some use in the arts; he produces mineral alkali for sale, arising from the decomposition; and from the lead which is united to the marine acid he forms the beautiful pigment called the *patent yellow*.

Scheele. appears from a letter which Scheele wrote to Gahn, who has generally had the reputation of this great discovery. This acid which is so curious in the eye of the chemist, begins to draw the attention of the physician. It was first used in medicine, united to the mineral alkali, by the ingenious Dr Pearson. The value of this addition to the materia medica cannot be better evinced than from the increase of the demand for it, and the quantity of it which is now prepared and sold in London.

We may stamp the character of Scheele as a philosopher from his many and important discoveries. What concerns him as a man we are informed of by his friends, who affirm, that his moral character was irreproachable. From his outward appearance, you would not at first sight have judged him to be a man of extraordinary abilities; but there was a quickness in his eye, which, to an accurate observer, would point out the penetration of his mind. He mixed but little with the crowd of common acquaintance; for this he had neither time nor inclination, as, when his profession permitted him, he was for the most part employed in his experimental inquiries. But he had a soul for friendship; nor could even his philosophical pursuits withhold him from truly enjoying the society of those whom he could esteem and love. Before he adopted any opinion, or a particular theory, he considered it with the greatest attention; but when once his sentiments were fixed, he adhered to them, and defended them with resolution. Not but that he was ingenuous enough to suffer himself to be convinced by weighty objections; as he has shown that he was open to conviction.

His chemical apparatus was neither neat nor convenient; his laboratory was small and confined; nor was he particular in regard to the vessels which he employed in his experiments, as often the first phial which came to hand was placed in his sand heat; so that we may justly wonder how such discoveries, and such elegant experiments, could have been made under such unfavourable circumstances. He understood none of the modern languages except the German and Swedish; so that he had not the advantage of being benefited by the early intelligence of discoveries made by foreigners, but was forced to wait till the intelligence was conveyed to him in the slow and uncertain channel of translation. The important services which Scheele did to natural philosophy entitled him to universal reputation; and he obtained it: his name was well known by all Europe; and he was member of several learned academies and philosophical societies.

It was often wished that he would quit his retirement at Koping, and move in a larger sphere. It was suggested to him, that a place might be procured in England, which might afford him a good income and more leisure; and, indeed, latterly an offer was made to him of an annuity of 300*l.* if he would settle in this country. But death, alas! put an end to this project. For half a year before this melancholy event, his health had been declining, and he himself was sensible that he would not recover. On the 19th of May 1786, he was confined to his bed; on the 21st he bequeathed all of which he was possessed to his wife (who was the widow of his predecessor at Koping, and whom he had lately married); and, on the same day he departed this life. So the world lost, in less than two years, Bergman and Scheele, of whom Sweden may justly

boast; two philosophers, who were beloved and lamented by all their contemporaries, and whose memory posterity will never cease most gratefully to revere.

SCHEINER, CHRISTOPHER, a German mathematician, astronomer, and Jesuit, eminent for being the first who discovered spots on the sun, was born at Schwaben in the territory of Middleheim in 1575. He first discovered spots on the sun's disk in 1611, and made observations on these phenomena at Rome, until at length reducing them to order, he published them in one volume folio in 1630. He wrote also some smaller things relating to mathematics and philosophy; and died in 1660.

SCHELD, a river which rises on the confines of Picardy, and runs north-east by Cambrai, Valenciennes, Tournay, Oudenarde, &c. and receiving the Lis at Ghent, runs east by Dendermond, and then north to Antwerp: below which city it divides into two branches, one called *the Wester-Scheld*, which separates Flanders from Zealand, and discharges itself into the sea near Flushing; and the other called *the Oster-Scheld*, which runs by Bergen-op-zoom, and afterwards between the islands Beveland and Schowen, and a little below falls in the sea.

SCHEME, a draught or representation of any geometrical or astronomical figure, or problem, by lines sensible to the eye; or of the celestial bodies in their proper places for any moment; otherwise called a diagram.

SCHEMNITZ, a town of Upper Hungary, with three castles. It is famous for mines of silver and other metals, as also for hot baths. Near it is a rock of a shining blue colour mixed with green, and some spots of yellow. E. Long. 19. O. N. Lat. 48. 40.

SCHERARDIA, a genus of plants belonging to the tetrandria class. See *BOTANY Index*.

SCHETLAND. See *SHETLAND*.

SCHEUCHZERIA, a genus of plants belonging to the hexandria class; and in the natural method ranking under the fifth order, *Tripelatoideæ*. See *BOTANY Index*.

SCHIECHS, or **SCHECH**, among the Arabs, is a name applied to their nobles. "Among the Bedouins," says Niebuhr, "it belongs to every noble, whether of the highest or the lowest order. Their nobles are very numerous, and compose in a manner the whole nation: the plebeians are invariably actuated and guided by the schiechs, who superintend and direct in every transaction. The schiechs, and their subjects, are born to the life of shepherds and soldiers. The greater tribes rear many camels, which they either sell to their neighbours, or employ them in the carriage of goods, or in military expeditions. The petty tribes keep flocks of sheep. Among those tribes which apply to agriculture, the schiechs live always in tents, and leave the culture of their grounds to their subjects, whose dwellings are wretched huts. Schiechs always ride on horses or dromedaries, inspecting the conduct of their subjects, visiting their friends, or hunting. Traversing the desert, where the horizon is wide as on the ocean, they perceive travellers at a distance. As travellers are seldom to be met with in those wild tracts, they easily discover such as pass that way, and are tempted to pillage them when they find their own party the strongest."

SCHINUS, a genus of plants belonging to the diccia class;

class; and in the natural method ranking under the 43d order, *Dumosa*. See *BOTANY Index*.

SCHIRAS, or SCHIRAUZ, a large and famous town of Persia, capital of Farsistan, is three miles in length from east to west, but not so much in breadth. It is seated at the north-west end of a spacious plain surrounded with very high hills, under one of which the town stands. The houses are built of bricks dried in the sun; the roofs are flat and terraced. There are 15 handsome mosques, tiled with sones of a bluish green colour, and lined within with black polished marble. There are many large and beautiful gardens, surrounded with walls 14 feet high, and four thick. They contain various kinds of very fine trees, with fruits almost of every kind, besides various beautiful flowers. The wines of Schiras are not only the best in Persia, but, as some think, in the whole world. The women are much addicted to gallantry, and Schiras is called an *earthly paradise* by some. The ruins of the famous Persepolis are 30 miles to the north-east of this place. E. Long. 56. 0. N. Lat. 29. 36.

SCHISM, (from the Greek, *σχισμα*, *clift, fissure*), in its general acceptation signifies *division or separation*; but is chiefly used in speaking of separations happening from diversity of opinions among people of the same religion and faith.

Thus we say the *schism* of the ten tribes of Judah and Benjamin, the *schism* of the Persians from the Turks and other Mahometans, &c.

Among ecclesiastical authors, the great schism of the West is that which happened in the times of Clement VII. and Urban VI. which divided the church for 40 or 50 years, and was at length ended by the election of Martin V. at the council of Constance.

The Romanists number 34 schisms in their church.—They bestow the name *English schism* on the reformation of religion in this kingdom. Those of the church of England apply the term *schism* to the separation of the nonconformists, viz. the presbyterians, independents, and anabaptists, for a further reformation.

SCHISTUS, in *Mineralogy*, a name given to several kinds of stones, as argillaceous, siliceous, bituminous, schistus, &c. See *MINERALOGY Index*.

SCHMIEDELIA, a genus of plants belonging to the octandria class. See *BOTANY Index*.

SCHOENOBATES, (from the Greek, *σχοινος* a rope; and *βαινω*, I walk), a name which the Greeks gave to their rope-dancers: by the Romans called *funambuli*. See *ROPE-DANCER* and *FUNAMBULUS*.

The *schoenobates* were slaves whose masters made money of them, by entertaining the people with their feats of activity. *Mercurialis de arte gymnastica*. lib. iii. gives us five figures of *schoenobates* engraven after ancient stones.

SCHOENUS, a genus of plants belonging to the triandria class; and in the natural method ranking under the 3d order, *Calamariae*. See *BOTANY Index*.

SCHOLASTIC, something belonging to the school. See *SCHOOL*.

SCHOLASTIC Divinity, is that part or species of divinity which clears and discusses questions by reason and arguments; in which sense it stands, in some measure, opposed to *positive divinity*, which is founded on the authority of fathers, councils, &c. The school-divinity

is now fallen into contempt; and is scarce regarded anywhere but in some of the universities, where they are still by their charters obliged to teach it. Scholastic
||
Schomberg.

SCHOLIAST, or COMMENTATOR, a grammarian who writes *scholia*, that is, notes, glosses, &c. upon ancient authors who have written in the learned languages. See the next article.

SCHOLIUM, a note, annotation, or remark, occasionally made on some passage, proposition, or the like. This term is much used in geometry and other parts of mathematics, where, after demonstrating a proposition, it is customary to point out how it might be done some other way, or to give some advice or precaution in order to prevent mistakes, or add some particular use or application thereof.

SCHOMBERG, FREDERICK-ARMAND DUKE OF, a distinguished officer, sprung from an illustrious family in Germany, and the son of Count Schomberg by an English lady, daughter of Lord Dudley, was born in 1608. He was initiated into the military life under Frederick-Henry prince of Orange, and afterwards served under his son William II. of Orange, who highly esteemed him. He then repaired to the court of France, where his reputation was so well known; that he obtained the government of Gravelines, of Furnes, and the surrounding countries. He was reckoned inferior to no general in that kingdom except Mareschal Turenne and the prince of Condé; men of such exalted eminence that it was no disgrace to acknowledge their superiority. The French court thinking it necessary to diminish the power of Spain, sent Schomberg to the assistance of the Portuguese, who were engaged in a war with that country respecting the succession to their throne.—Schomberg's military talents gave a turn to the war in favour of his allies.—The court of Spain was obliged to solicit for peace in 1668, and to acknowledge the house of Braganza as the just heirs to the throne of Portugal. For his great services he was created Count Mentola in Portugal; and a pension of 5000*l.* was bestowed upon him, with the reversion to his heirs.

In 1673 he came over to England to command the army; but the English at that time being disgusted with the French nation, Schomberg was suspected of coming over with a design to corrupt the army, and bring it under French discipline. He therefore found it necessary to return to France, which he soon left, and went to the Netherlands. In the month of June 1676, he forced the prince of Orange to raise the siege of Maestricht; and it is said he was then raised to the rank of Mareschal of France. But the French *Dictionnaire Historique*, whose information on a point of this nature ought to be authentic, says, that he was invested with this honour the same year in which he took the fortress of Bellegarde from the Spaniards while serving in Portugal:

Upon the revocation of the edict of Nantes, when the persecution commenced against the Protestants, Schomberg, who was of that persuasion, requested leave to retire into his own country. This request was refused; but he was permitted to take refuge in Portugal, where he had reason to expect he would be kindly received on account of past services. But the religious zeal of the Portuguese, though it did not prevent them from accepting assistance from a heretic when their kingdom

Schomberg-kingdom was threatened with subversion, could not permit them to give him shelter when he came for protection. The Inquisition interfered, and obliged the king to send him away. He then went to Holland by the way of England. Having accepted an invitation from the elector of Brandenburg, he was invested with the government of Ducal Prussia, and appointed commander in chief of the elector's forces. When the prince of Orange sailed to England to take possession of the crown which his father-in-law James II. had abdicated, Schomberg obtained permission from the elector of Brandenburg to accompany him. He is supposed to have been the author of an ingenious stratagem which the prince employed after his arrival in London to discover the sentiments of the people respecting the revolution. The stratagem was, to spread an alarm over the country that the Irish were approaching with fire and sword. When the prince was established on the throne of England, Schomberg was appointed commander in chief of the forces, and master of the ordnance. In April 1689 he was made knight of the Garter, and naturalized by act of parliament; and in May following was created a baron, earl, marquis, and duke of the kingdom of England, by the name and title of Baron Teys, earl of Brentford, marquis of Harwich, and duke of Schomberg. The House of Commons voted to him 100,000*l.* as a reward for his services. Of this he only received a small part; but after his death a pension of 5000*l.* a year was bestowed upon his son.

In August 1689 he was sent to Ireland to reduce that kingdom to obedience. When he arrived, he found himself at the head of an army consisting only of 12,000 foot and 2000 horse, while King James commanded an army three times more numerous. Schomberg thought it dangerous to engage with so superior a force, and being disappointed in his promised supplies from England, judged it prudent to remain on the defensive. He therefore posted himself at Dundalk, about five or six miles distance from James, who was encamped at Ardee. For six weeks he remained in this position, without attempting to give battle, while from the wetness of the season he lost nearly the half of his army. Schomberg was much blamed for not coming to action; but some excellent judges admired his conduct as a display of great military talents. Had he risked an engagement, and been defeated, Ireland would have been lost. At the famous battle of the Boyne, fought on the 1st July 1690, which decided the fate of James, Schomberg passed the river at the head of his cavalry, defeated eight squadrons of the enemy, and broke the Irish infantry. When the French protestants lost their commander, Schomberg went to rally and lead them on to charge. While thus engaged, a party of King James's guards, which had been separated from the rest, passed Schomberg, in attempting to rejoin their own army. They attacked him with great fury, and gave him two wounds in the head. As the wounds were not dangerous, he might soon have recovered from them; but the French Protestants, perhaps thinking their general was killed, immediately fired upon the guards, and shot him dead on the spot. He was buried in St Patrick's cathedral.

Bishop Burnet says, Schomberg was "a calm man, of great application and conduct, and thought much better than he spoke; of true judgment, of exact probability, and of a humble and obliging temper."

SCHOOL, a public place, wherein the languages, the arts, or sciences, are taught. Thus we say, a grammar school, a writing school, a school of natural philosophy, &c.—The word is formed from the Latin *schola*, which, according to Du Cange, signifies discipline and correction: he adds, that it was anciently used, in general, for all places where several persons met together, either to study, to converse, or do any other matter. Accordingly, there were *scholæ palatinae*, being the several posts wherein the emperor's guards were placed; *schola scutariorum*, *schola gentili-um*, &c. At length the term passed also to civil magistrates; and accordingly in the code we meet with *schola chartulariorum*, *schola agentium*, &c.; and even to ecclesiastics, as *schola cantorum*, *schola sacerdotum*, &c.

The Hebrews were always very diligent to teach and study the laws that they had received from Moses. The father of the family studied and taught them in his own family. The Rabbin taught them in the temple, in the synagogues, and in the academies. They pretend, that even before the deluge there were schools for knowledge and piety, of which the patriarchs had the direction.—They place Adam at their head, then Enoch, and lastly Noah. Melchisedec, as they say, kept a school in the city of Kajrathsepher, otherwise Hebron, in Palestine. Abraham, who had been instructed by Heber, taught in Chaldæa and in Egypt. From him the Egyptians learned astronomy and arithmetic. Jacob succeeded Abraham in the office of teaching. The scripture says, he was "a plain man, dwelling in tents;" which, according to the Chaldee paraphrast, is, "that he was a perfect man, and a minister of the house of doctrine."

All this, indeed, must be very precarious and uncertain. It cannot be doubted but that Moses, Aaron, and the elders of Israel, instructed the people in the wilderness, and that many good Israelites were very industrious to instruct their families in the fear of God. But all this does not prove to us that there were any such schools as we are now inquiring after. Under Joshua we see a kind of academy of the prophets, where the children of the prophets, that is, their disciples, lived in the exercise of a retired and austere life, in study, in the meditation and reading of the law of God. There were schools of the prophets at Naioth in Ramah; 1 Sam. xix. 12, 20, &c. See the article PROPHET.

These schools, or societies of the prophets, were succeeded by the synagogues. See the article SYNAGOGUE.

Charity-SCHOOLS, are those schools which are set apart by public contributions or private donations for the instruction of poor children, who could not otherwise enjoy the benefits of education. In no country are these more numerous than in Great Britain, where charity and benevolence are characteristic of the nation at large. The following is a summary view of the number of charity-schools in Great Britain and Ireland, according to the best information at present, 1795.

	Schools.	Boys.	Girls.
At London - - -	182	4442	2870
In other parts of South Britain - - -	1329	19506	3915
In North Britain by the account published in 1786, In Ireland, for teaching to read and write only -	135	5187	2618
In ditto, erected pursuant to his majesty's charter, and encouraged by his bounty of 1000 <i>l.</i> per annum, for instructing, employing, and wholly maintaining the children, exclusive of the Dublin work-house school -	168	2406	600
	42	1935	---
Total of schools, &c.	1856	33476	10003

Sunday Schools are another species of charity schools lately instituted, and now pretty common in Great Britain. The institution is evidently of the first importance; and if properly encouraged must have a very favourable effect on the morals of the people, as it tends not only to preserve the children of the poor from spending Sunday in idleness, and of consequence in dissipation and vice, but enables them to lay in for the conduct and comfort of their future life a stock of useful knowledge and virtuous principles, which, if neglected in early life, will seldom be sought for or obtained amidst the hurry of business and the cares and temptations of the world.

The excellent founder of Sunday-schools was Mr Raikes, a gentleman of Gloucestershire, who, together with Mr Stock, a clergyman in the same county, and who, we believe, was equally instrumental in the business with Mr Raikes, showed the example, and convinced many of the utility of the plan. From Gloucestershire the institution was quickly adopted in every county and almost every town and parish of the kingdom; and we have only further to remark on a plan so generally known, so much approved, and so evidently proper, that we hope men of eminence and weight will always be found sufficiently numerous and willing to bestow their time and countenance in promoting it to the utmost of their power.

SCHOONER, in sea-language, a small vessel with two masts, whose main-sail and fore-sail are suspended from gaffs, reaching from the mast towards the stern, and stretched out below by booms, whose foremost ends are hooked to an iron, which clasps the mast so as to turn therein as upon an axis, when the after ends are swung from one side of the vessel to the other.

SCHORL, a species of mineral belonging to the siliceous genus. See *MINERALOGY Index*.

SCHOTIA, a genus of plants belonging to the decandria class; and in the natural method ranking under the 33d order, *Lomentaceæ*. See *BOTANY Index*.

SCHREBERA, a genus of plants belonging to the pentandria class. See *BOTANY Index*.

SCHREVELIUS, CORNELIUS, a laborious Dutch critic and writer, who has published some editions of the ancient classics more distinguished for their elegance than accuracy: his Greek Lexicon is esteemed the best of all his works. He died in 1667.

Schrevelius
||
Schurman.

SCHULTENS, ALBERT, professor of Hebrew and of the eastern languages at Leyden, and one of the most learned men of the 18th century, was born at Groningen, where he studied till the year 1706, and from thence continued his studies at Leyden and Utrecht. Schultens at length applied himself to the study of Arabic books, both printed and in manuscript; in which he made great progress. A short time after, he became minister of Wassenar; and two years after, professor of the eastern tongues at Franeker. At length he was invited to Leyden, where he taught Hebrew and the eastern languages with extraordinary reputation till his death, which happened in 1750. He wrote many learned works; the principal of which are, 1. A Commentary on Job, 2 vols 4to. 2. A Commentary on the Proverbs. 3. *Vetus et regia via Hebraizandi*. 4. *Animadversiones philologicæ et criticæ ad varia loca Veteris Testamenti*. 6. An excellent Hebrew grammar, &c. Schultens discovered in all his works sound criticism and much learning. He maintained against Gousset and Driessen, that in order to have a perfect knowledge of Hebrew, it is necessary to join with it, not only the Chaldee and Syriac, but more particularly the Arabic.

SCHURMAN, ANNA MARIA, a most extraordinary German lady. Her natural genius discovered itself at six years of age, when she cut all sorts of figures in paper with her scissors without a pattern. At eight, she learned, in a few days, to draw flowers in a very agreeable manner. At ten, she took but three hours to learn embroidery. Afterwards she was taught music, vocal and instrumental; painting, sculpture, and engraving; in all of which she succeeded admirably. She excelled in miniature-painting, and in cutting portraits upon glass with a diamond. Hebrew, Greek, and Latin, were so familiar to her, that the most learned men were astonished at it. She spoke French, Italian, and English, fluently. Her handwriting, in almost all languages, was so inimitable, that the curious preserved specimens of it in their cabinets. But all this extent of learning and uncommon penetration could not protect her from falling into the errors of Labadie, the famous French enthusiast, who had been banished France for his extravagant tenets and conduct. To this man she entirely attached herself, and accompanied him wherever he went; and even attended him in his last illness at Altena in Holstein. Her works, consisting of *De vitæ humanæ termino*, and *Dissertatio de ingenii muliebris ad doctrinam et meliores literas aptitudine*; and her Letters to her learned correspondents, were printed at Leyden in 1648; but enlarged in the edition of Utrecht, 1662, in 12mo, under the following title: *M. Schurman Opuscula Hebræa, Græca, Latina, Gallica, Prosaica, et Metrica*. She published likewise at Altena, in Latin, A Defence of her attachment to Labadie, while she was with him in 1673; not worth reading. She was born at Cologne in 1607, but resided chiefly in Holland, and died in Friesland in 1678.

SCHWARTENBURG,

Schwarten-
burg
|
Schweitz.

SCHWARTENBURG, a town and castle of Germany, and circle of Upper Saxony, in the landgrate of Thuringia, and capital of a county of the same name belonging to a prince of the house of Saxony. It is seated on the river Schwartz, 20 miles south-east of Erford, and 35 north of Cullembach. E. Long. 11. 27. N. Lat. 50. 45.

SCHWARTS, CHRISTOPHER, an eminent history-painter, born at Ingolstadt in 1550, who was distinguished by the appellation of the *German Raphael*. He learned the first principles of the art in his own country, but finished his studies at Venice; when he not only made the works of Titian his models, but had the advantage of receiving some personal instructions from that illustrious master. His performances were soon in the highest esteem, as his manner of painting was very different from what the Germans had been accustomed to before that time: he was, therefore, invited by the elector of Bavaria to his court, and appointed his principal painter. He died in 1594; and his most capital works, as well in fresco as in oil, are in the palace at Munich, and in the churches and convents.

SCHWARTZEMBERG, a town of Germany, in the circle of Franconia, and capital of a principality of the same name, in the kingdom of Bavaria. The castle is seated on the river Lec, 5 miles north-west of Nuremberg, and 20 east of Wertzburg. E. Long. 10. 27. N. Lat. 49. 43.

SCHWEIDNITZ, a strong town of Silesia, and capital of a province of the same name, with a castle. Next to Breslaw, it is the handsomest town of Silesia. The streets are large, the church fine, and the houses well built. The fortifications are not very considerable, and the royal palace is turned into a convent. Great part of the city was burnt down in 1716, but it was afterwards elegantly rebuilt and improved. In 1757, it fell into the hands of the Austrians, but was retaken by the Prussians the following year. All the magistrates are Roman Catholics; but most of the inhabitants are Protestants, who have a church without the town, as also a public school. It is seated on an eminence on the river Weistritz, 27 miles S. E. of Lignitz, and 22 S. W. of Breslaw. E. Long. 16. 54. N. Lat. 50. 46.

SCHWEINFURT, a very strong, and formerly a free, and imperial town of Franconia in Germany, with a magnificent palace, where the senators, who were 12 in number, met. The environs are rich in cattle, corn, and wine; the inhabitants are Protestants. They carry on an extensive trade in woollen and linen cloth, goose-quills, and feathers. It is seated on the river Maine, 27 miles north-east of Wurtzburg, and 25 west of Bamberg. E. Long. 10. 25. N. Lat. 50. 15. This town was taken by the French in 1796. It now belongs to Bavaria.

SCHWEITZ, a canton of Switzerland, bounded on the west by the lake of the Four Cantons; on the south by the canton of Uri; on the east by that of Glaris, and on the north by those of Zurich and Zug. This canton, in conjunction with those of Uri and Underwalden, threw off the Austrian yoke in 1308, and formed a perpetual alliance in 1315, which was the grand foundation of the Helvetic confederacy. The name of Schweitzerland, or Switzerland, which at first compre-

hended only those three cantons, was afterwards extended to all Helvetia. It derived that name, either from the canton of Schweitz, as being the most distinguished by the revolution of 1308, or because the Austrians called all the inhabitants of these mountainous parts by the general denomination of Schweitzers. The government of Schweiz and Uri was entirely democratical before the late revolution. They contain about 50,000 inhabitants, and could furnish more than 12,000 militia. The whole country being mountainous, consists chiefly of pasture, raises little corn, and has no wine; but the soil, though naturally barren, has been improved by the natives to a great degree of fertility. Luxury is scarcely known here; and a purity of morals prevails, which can scarcely be imagined by the inhabitants of extensive and opulent cities. The Roman Catholic is the established religion.

A dreadful disaster happened in this canton by the fall of part of a mountain called Ruffiberg or Rosenberg, on the evening of the 2d of September 1806. Three villages were entirely overwhelmed by it in less than five minutes, and two others were very much damaged. The torrent of earth and stones disengaged on this melancholy occasion was even more rapid than that of lava, and its terrible effects were equally irresistible, carrying rocks, trees, houses, every thing before it, and burying a space of charming country upwards of three miles square. So rapid was the motion of this dreadful mass, that it not only covered the adjoining valley, but ascended to a considerable height on the side of the opposite mountain. A portion of it rolled into the lake of Lauwertz, a fifth part of which it is supposed to have filled up. The agitation of the water was so great as to overturn a number of houses, chapels, mills, &c. along the southern shore of the lake, particularly the mill of Lauwertz, where 15 persons were killed, and buried in the ruins of the buildings, although it was about 60 feet above the level of the lake.

The villages of Goldau and Rothen, consisting of 115 houses, that of Busingen, of 126, and that of Huzloch, totally disappeared. Of Lauwertz there remain only ten buildings much damaged, and 25 were destroyed. Stein lost two houses and several stables, which latter were very numerous in all these villages. The total loss of property of different kinds, as houses, cows, horses, goats, sheep, &c. sustained on this occasion, has been estimated at 120,000 sterling. In the villages which were overwhelmed, not an individual escaped. More than 1000 persons were the victims of this disaster. Thirteen travellers were on their way from Arth to Schweitz, of whom the foremost nine perished, and the remaining four escaped, being about 40 paces behind them.

About 20 years ago General Pfyffer foretold this catastrophe, from his particular knowledge of the mountain. There was a sea of water above Spiezflue, which for several years had undermined the rock, and, in a cavern of great depth beneath, the waters were ingulfed. The quantity of water which fell during the preceding years, tended to hasten the approach of this melancholy event, and the rains of some weeks before, decided the fate of this mountain.

SCHWEITZ, a town of Switzerland, and capital of the canton of the same name, is seated near the Waldstetter

weitz sea, on the slope of a hill, and at the bottom of two high, sharp, and rugged rocks, called the Schweitzer Hahuem. The church is an edifice both large and magnificent. It is 10 miles south-east of Lucerne. E. Long. 8. 30. N. Lat. 46. 55.

SCHWENKFELDIA, a genus of plants belonging to the pentandria class; and in the natural method ranking with those that are doubtful. See BOTANY Index.

SCHWENKIA, a genus of plants belonging to the diandria class. See BOTANY Index.

SCHWINBURG, a town of Denmark, on the south coast of the island of Funen, opposite to the islands of Arroa and Langeland. E. Long. 10. 30. N. Lat. 55. 10.

SCIACCA, anciently called *Therma Selinuntie*, in Sicily, derives its present denomination from the Arabic word *Scheich*. It is a very ancient place, being mentioned in the account of the wars between the Greeks and Carthaginians, to the latter of whom it belonged. It is defended by ancient walls and the castle of Luna. It stands upon a very steep rock, hanging over the sea, and excavated in every direction into prodigious magazines, where the corn of the neighbouring territory is deposited for exportation; there is no harbour, but a small bay formed by a wooden pier, where lighters lie to load the corn which they carry out about a mile to ships at anchor.

The town is irregularly but substantially built, and contains 13,000 inhabitants, though Amico's *Lexicon Topographicum* says the last enumeration found only 9484. His accounts do not take in ecclesiastics, and several denominations of lay persons.

SCIENA, a genus of fishes belonging to the order thoracici. See ICHTHYOLOGY Index.

SCIAGRAPHY, or SCIOGRAPHY, the profile or vertical section of a building, used for showing the inside of it.

SCIAGRAPHY, in *Astronomy*, &c. is a term made use of by some authors for the art of finding the hour of the day or night, by the shadow of the sun, moon, stars, &c.

SCIATICA, the HIP-GOUT. See MEDICINE Index.

SCIENCE, in *Philosophy*, denotes any doctrines deduced from self-evident principles.

Sciences may be properly divided as follows: 1. The knowledge of things, their constitutions, properties, and operations: this, in a little more enlarged sense of the word, may be called *φυσική*, or *natural philosophy*; the end of which is speculative truth. See PHILOSOPHY and PHYSICS.—2. The skill of rightly applying these powers, *πρακτική*: The most considerable under this head is ethics, which is the seeking out those rules and measures of human actions that lead to happiness, and the means to practise them (see MORAL PHILOSOPHY); and the next is mechanics, or the application of the powers of natural agents to the uses of life (see MECHANICS).—3. The doctrines of signs, *σημασιολογία*; the most usual of which being words, it is aptly enough termed *logic*. See LOGIC.

This, says Mr Loeke, seems to be the most general, as well as natural, division of the objects of our understanding. For a man can employ his thoughts about nothing but either the contemplation of things themselves for the discovery of truth; or about the things in his own power, which are his actions, for the attainment of his own ends; or the signs the mind makes use of both in the one and the other, and the right ordering of them for its clearer information. All which three, viz. things as they are in themselves knowable, actions as they depend on us in order to happiness, and the right use of signs in order to knowledge, being *toto cælo* different, they seem to be the three great provinces of the intellectual world, wholly separate and distinct one from another

Sciagraphy. Science.

SCIENCE, AMUSEMENTS OR RECREATIONS OF.

A DESIRE of amusement and relaxation is natural to man. The mind is soon fatigued with contemplating the most sublime truths, or the most refined speculations, while these are addressed only to the understanding. In philosophy, as in polite literature, we must, to please and secure attention, sometimes address ourselves to the imagination or to the passions, and thus combine the agreeable with the useful. For want of this combination, we find that pure mathematics (comprehending *arithmetic*, *geometry*, *algebra*, *fluxions*, &c.), notwithstanding their great and acknowledged utility, are studied but by few; while the more attractive sciences of experimental philosophy and chemistry, are almost universally admired, and seldom fail to draw crowds of hearers or spectators to the lectures of their professors. The numerous striking phenomena which these latter sciences present to our senses, the splendid experiments by which their principles may be illustrated, and the continual application which they admit, of those principles and experiments to the affairs of common life, have a powerful influence on the imagination; fix and keep alive the attention; excite the passions of joy, terror or surprise; and gratify that love of the marvellous which nature has implanted in the human mind. Even the more abstruse subjects of pure mathematics,

especially *arithmetic* and *geometry*, may be sometimes enlivened by amusing examples and contrivances; and are found the more pleasing, in proportion as they are susceptible of such elucidation.

These experimental contrivances, and useful applications to the purposes of common life, constitute what we may term the *Amusements or Recreations of SCIENCE*. They have very properly been denominated *rational recreations*, as they serve to relax and unbend the mind after long attention to the cares of business, or to severer studies, in a manner more rational, and often more satisfactory, than those frivolous pursuits which too often employ the time, and injure the health of the rising generation.

In the preceding volumes of this work we have supplied our readers with many examples of *scientific recreation*. Thus, the articles LEGERDEMAIN and PYROTECHNY may be regarded as entirely of this nature; and in the experimental parts of CHEMISTRY, ELECTRICITY, GALVANISM, and MAGNETISM; in the articles ACOUSTICS, HYDRODYNAMICS, MECHANICS, OPTICS, and its correlative divisions, CATOPTRICS, DIOPTRICS, PERSPECTIVE, and MICROSCOPE; in PNEUMATICS and AEROSTATION, we have related a variety of interesting experiments, and described many ingenious

Introduction.

ous contrivances, calculated both for instruction and amusement. It is the object of the present article to bring these under one point of view, and to add a few of the more curious or useful experiments and contrivances which could not before be conveniently introduced. In particular, we propose to explain some of those scientific deceptions which have excited so much interest and admiration, and to describe several useful philosophical instruments, which either are of very late invention, or have been overlooked in the preceding parts of the work. We shall thus be enabled to supply several deficiencies (otherwise unavoidable), and shall render the present article a sort of general index or table of reference to the various subjects of scientific amusement which are dispersed through the Encyclopædia.

For greater convenience, and more easy reference to preceding articles, we shall arrange the sections under which the various amusements of science may be reduced, in alphabetical order, according to the series of the principal mathematical and philosophical treatises. Thus the article will be divided into 13 sections, comprehending the recreations and contrivances that relate to *ACOUSTICS, ARITHMETIC, ASTRONOMY, CHEMISTRY, ELECTRICITY, GALVANISM, GEOGRAPHY, GEOMETRY, HYDRODYNAMICS, MAGNETISM, MECHANICS, OPTICS* and *PNEUMATICS*.

It must not be supposed, from the title of this article, that the subjects which we are here to discuss are puerile or trifling. They will be such as are best calculated to excite the attention, quicken the ingenuity, and improve the memory of our young readers, and they will be similar to those pursuits which have employed the lighter hours of some of the most distinguished philosophers and mathematicians. The names of Bacon, of Boyle, of Newton, of Desaguliers, of Ozanam, of Montucla, and of Hutton, stamp a value on the recreations of science, and prevent us from considering them as frivolous or trifling.

Writers on scientific recreations.

The subject of scientific recreations must be regarded as entirely modern, as, previous to the era of Lord Bacon, philosophers were much more attached to rigid demonstration and metaphysical reasoning, than to experimental illustration. Much may be found on these subjects in the works of Lord Bacon and Mr Boyle; but the earliest collection of scientific amusements which deserves notice, is the work of Ozanam, entitled *Récréations Mathématiques et Physiques*, published in 1692, in 2 vols 8vo, and afterwards several times republished with improvements and additions, till it was enlarged to 4 vols 8vo. This work was soon translated into most of the modern languages, and was given to the English reader by Dr Hooper, under the title of *Rational Recreations*, first published, we believe, in 1774, and again in 1783, in 4 vols 8vo. The original work of Ozanam has been lately recomposed and greatly improved by M. Montucla, and a translation of this improved edition into English was published in 1803, in 4 vols 8vo, by Dr Charles Hutton. In this English edition, the work is much better adapted than in any former copy, to the English reader, and is enriched by some of the latest improvements in natural philosophy and chemistry.

Popular works on experimental philosophy.

It may not be improper to add, to this notice of works on the amusements of science, a list of the best popular treatises on natural and experimental philosophy and chemistry, to which our younger readers may have

recourse for an explanation of the principles of these sciences, if they should find some of the articles in this Encyclopædia too abstruse or too mathematical.

To young people who have never read any work on these sciences, we may recommend Mr Joyce's *Scientific Dialogues*, *Dialogues on Chemistry*, and *Dialogues on the Microscope*, and Mr Fren'd's *Evening Amusements*. After attentively perusing these, they may enlarge their information by reading Brewster's edition of *Ferguson's Lectures*; Nicholson's *Introduction to Natural Philosophy*; Gregory's *Economy of Nature*; or Dr Young's *Lectures on Natural Philosophy*; and Henry's *Epitome of Chemistry*, 8vo edition.

SECT. I. *Recreations and Contrivances relating to ACOUSTICS.*

In the article *ACOUSTICS*, Vol. I. p. 159. we have explained the six amusing experiments and contrivances, and related them on the principles of acoustics. These are, the *conversing statue*, explained on the principle of the reflexion of sound; the *communicative busts*, and the *oracular head*, explained from the reverberation of sound; the *solar sonata*, the *automaton harpsichord*, and the *ventose symphony*, explained partly on the principles of acoustics, and partly on those of mechanics. We have now to explain a deception connected with the conveyance of sound, well known to many of our readers, by the name of the *invisible lady* or *invisible girl*; and to notice some curious figures assumed by sand or other light bodies on the surface of vibrating plates.

Some years ago M. Charles, brother to the well-known philosopher of that name, exhibited in London, and afterwards in most of the large towns of Great Britain and Ireland, the experiment of the *invisible girl*. The apparatus by means of which this experiment was conducted, and the principal circumstances attending the exhibition, have been described by Mr Nicholson, in his *Philosophical Journal*, from which the following account is principally taken.

In the middle of a large lofty room, in an old house, where, from the appearance of the wainscot, and other circumstances, there seemed to be no situation for placing acoustic tubes or reflectors, was fixed a wooden railing, about 5 feet high, and as many wide, inclosing a square space. A perspective view of the apparatus is given at fig. 1. of Plate CCCCLXX, where A, A, A, A, represent the four upright posts. These posts were united by a cross rail near the top, BB, and by two or more similar rails at the bottom. The frame, thus constructed, stood upon the floor, and from the top of each of the four upright pillars proceeded a strong bended brass wire *a, a, a, a*, so that they all met together at the top *e*, where they were secured by a crown and prince's feather, or other ornaments. From these four wires was suspended a hollow copper ball, about a foot in diameter, by means of slight ribbons, so as to cut off all possible communication with the frame. Round this ball were placed four trumpets, at right angles to each other, as represented at A, A, A, A, fig. 2. having their mouths open externally.

Such was the apparent construction of the apparatus, and it was pretended that there resided within the ball an invisible lady, capable of giving answers to any questions that were put to her. When a question was proposed,

Recreations in acoustics.

Recreations in acoustics.

Invisible lady.

posed, it was uttered in at the mouth of one of the trumpets, and an answer immediately proceeded from all the trumpets, so distinctly loud as to be heard by an ear applied to any of them, and yet so distant and feeble, that it appeared to come from a very diminutive being. In this consisted the whole of the experiment, except that the lady could converse in several languages, sing, describe all that happened in the room, and display a fund of lively wit and accomplishment that admirably qualified her to support the character she had undertaken.

The principles on which this experiment is constructed are similar to those of the *oracular head* described under *ACOUSTICS*; except that in the present deception, an artificial echo is produced by means of the trumpets, and thus the sound is completely reversed, instead of proceeding in its original direction. Fig. 3. represents a section of the apparatus, and will explain the method by which the deception is effected. One of the posts *A, A*, as well as one-half of the hand-rail connected with it, is hollowed into a tube, the end of which opens on the inside of the rail, opposite the centre of the trumpet on that side, though the hole is very small, and is concealed by reeds or other mouldings. At the other end the tube communicates with a long tin pipe *pp* about half an inch in diameter, concealed below the floor of the room *ff*, and passing up the wall to a large deal case, *k*, almost similar to an inverted funnel, and large enough to contain the confederate, and a piano forte, on which tunes may be occasionally played. A small hole closed with glass is left through the funnel and side-wall of the room, as at *h*, so that the confederate may have an opportunity of observing and commenting on any circumstances which may take place in the room. Thus, when any question is asked at one of the trumpets, the sound is conveyed through the communicating tubes into the funnel-shaped case, so as to be heard by the confederate, who then gives the answer, which in like manner is conveyed through the tube below the floor to one of the trumpets, and is heard, either from that, or any of the rest.

On the Figures produced by Light Bodies on Vibrating Surfaces.

About the year 1787, Dr Chladni of Wittemberg drew the particular attention of philosophers to the nature of vibration, by investigating the curves produced by the moving points of vibrating surfaces. It is found that if sand, or a similar substance, be strewed on the surface of an elastic plate, such as glass or the sonorous metals, and if the plate be made to vibrate, the sand will arrange itself on particular parts of the surface, showing that these points are not in motion. These figures are often extremely curious, and may be varied according to the pleasure or address of the experimentalist. Some of the more remarkable are represented at figs. 5, 6, 10, 11.

To produce these figures, nothing is necessary but to know the method of bringing that part of the surface which we wish not to vibrate into a state of rest; and of putting in motion that which we wish to vibrate: on this depends the whole expertness of producing what are called *vibration figures*.

Those who have never tried these experiments may

imagine that to produce fig. 5. it would be necessary to damp, in particular, every point of the part to be kept at rest, viz. the two concentric circles and the diameter, and to put in motion every part intended to vibrate. This, however, is not the case; for we need damp only the points *a* and *b*, and cause to vibrate one part *c*, at the edge of the plate; for the motion is soon communicated to the other parts which we wish to vibrate, and the required figure will in this manner be produced.

The damping may be best effected by laying hold of the place to be damped between the fingers, or by supporting it with only one finger. This will be more clearly comprehended by turning to fig. 8, where the hand is represented in the position necessary to hold the plate. In order to produce fig. 6. we must hold the plate horizontally, placing the thumb above at *a*, with the second finger directly below it; and besides this, we must support the point *b* on the under side of the plate. If the bow of a violin be then rubbed against the plate at *c*, there will be produced on the glass the figure which is delineated at fig. 6. When the point to be supported or damped lies too near the centre of the plate, we may rest it on a cork, not too broad at the end, brought into contact with the glass in such a manner as to supply the place of the finger. It is convenient also, when we wish to damp several points at the circumference of the glass, to place the thumb on the cork, and to use the rest of the fingers for touching the part which we wish to keep at rest. For example, if we wish to produce fig. 7. on an elliptic plate, the larger axis of which is to the less as 4 to 3, we must place the cork under *c*, the centre of the plate; put the thumb on this point, and then damp the two points of the edge *p* and *q*, as may be seen at fig. 8, and make the plate to vibrate by rubbing the violin bow against it at *r*. There is still another convenient method of damping several points at the edge when large plates are employed.

Fig. 4. represents a strong square piece of metal *a b*, a line in circumference, which is screwed to the edge of the table, or made fast in any other manner; and a notch, about as broad as the edge of the plate, is cut into one side of it by a file. We then hold the plate resting against this piece of metal, by two or more fingers when requisite, as at *c* and *d*, by which means the edge of the plate will be damped in three points *d, c, e*; and in this manner, by putting the plate in vibration at *f*, we can produce fig. 13. In cases of necessity, the edge of a table may be used, instead of the piece of metal; but it will not answer the purpose so well.

To produce the vibration at any required place, a common violin bow, rubbed with rosin, is the most proper instrument to be employed. The hair must not be too slack, because it is sometimes necessary to press pretty hard on the plate, in order to produce the tone sooner.

When we wish to produce any particular figure, we must first form it in idea upon the plate, in order that we may be able to determine where a line at rest, and where a vibrating part, will occur. The greatest rest will always be where two or more lines intersect each other, and such places must in particular be damped. For example, in fig. 9. we must damp the part *n*, and stroke with the bow in *p*. Fig. 13. may be produced with no less ease, if we hold the plate at *r*, and stroke with the

Recreations in Acoustics.

Recreations in Acoustics.
Fig. 10, 11.

bow at *f*. The strongest vibration seems always to be in that part of the edge which is bounded by a curve; for example, in figs. 10. and 11. at *n*. To produce these figures, therefore, we must rub with the bow at *n*, and not at *r*.

Fig. 5.

We must, however, damp not only those points where two lines intersect each other, but endeavour to support at least one which is suited to that figure, and to no other. For example, when we support *a* and *b*, fig. 5, and rub with the bow at *c*, fig. 9. also may be produced, because both figures have these two points at rest. To produce fig. 5. we must support with one finger the part *e*, and rub with the bow in *c*; but fig. 9. cannot be produced in this manner, because it has not the point *e* at rest.

One of the greatest difficulties in producing the figures, is to determine before-hand the vibrating and resting points which belong to a certain figure, and to no other. Hence, when we are not able to damp those points which distinguish one figure from another, if the violin bow be rubbed against the plate, several hollow tones are heard, without the sand forming itself as expected. We must therefore acquire by experience a readiness, in being able to search out among these tones, that which belongs to the required figure, and to produce it on the plate by rubbing the bow against it. When we have acquired sufficient expertness in this respect, we can determine before-hand, with tolerable certainty, the figures to be produced, and even the most difficult. It may be easily conceived, that we must remember what part of the plate, and in what manner we damped; and we may mark these points by scratching the plate with a piece of flint.

When the plate has acquired the proper vibration, endeavour to keep it in that state for some seconds; which can be done by rubbing the bow against it several times. By these means the sand will be more accurately formed.

Any sort of glass may be employed, provided its surface be smooth, otherwise the sand will fall into the hollow parts, or be thrown about irregularly. Common glass plates, when cut with a stone, are very sharp on the edge, and would soon destroy the hair of a violin bow; for which reason the edge must be smoothed by a file, or a piece of freestone.

We must endeavour to procure such plates as are uniformly thick, and of different sizes; such as circular ones from four to 12 inches in diameter. Sand too fine must not be employed. The plate must be equally bestrewed with it, and not too thickly, as the lines will then be exceedingly fine, and the figures will acquire a better defined appearance.*

The subject of ventriloquism, or that peculiar modification of voice by which sounds are made to appear as coming from situations at a distance from the person who utters them, is a deception connected with the subject of acoustics. This deception we have already explained under PHYSIOLOGY, N^o 251, 254.

SECT. II. *Recreations and Contrivances relating to ARITHMETIC.*

Arithmetical Recreations.

THE only amusements connected with this subject, of which we have already given an account, are those contained under the head of *Miscellaneous Performances* in the 4th section of the article *LEGERDEMAIN*, the most curious of which is the method of discovering, by calculation, what person in a select party has put a ring on his finger, as well as the *hand*, the *finger*, and the *joint* on which the ring is placed. We have also described the magic squares, and magic circles, in vol. xvi. p. 354, *et seq.* A mechanical method of performing the principal arithmetical operations has been described under *ABACUS*.

To perform a question in Simple Addition merely by knowing the first line.

The question proposed may consist of five lines of figures, of which the first and second lines are written by the proposer, the third by the person to whom the question is proposed, and the fourth and fifth alternately by the proposer and expounder; but before the second line is written, the expounder is to discover the sum in the following manner. To each digit of the first line he adds 2, which gives as many digits of the sum as are contained in the first line of the question, and to these, 2 is to be prefixed on the left hand. To accommodate the question to this sum, when the proposer has written the second line, the expounder constructs the third by deducting each digit of this line from 10, so that his third line consists of the remainders. In like manner the expounder constructs the fifth line by remainders from the digits of the fourth line set down by the proposer, deducting the first digit on the right hand from 12, and the rest from 10. The following example will illustrate the method of procedure.

Suppose it be required to find the sum in a question of which the first line is 35726. Adding 2 to each of these digits, and prefixing 2 to the sum, we have for the sum of the whole question 257948. Let us now suppose that the second line written by the proposer is 21354. To construct the third line, the expounder subtracts 2, 1, 3, 5, 4 each from 10; and the remainders 8, 9, 7, 5, 6, form the third line. Lastly, Suppose that the proposer's next line, forming the fourth, stands thus, 1, 3, 2, 4, 8. To find the last line, the expounder deducts 1, 3, 2, 4, each from 10, and 8 from 12, by which he obtains 9, 7, 8, 6, 4; and it is evident that the addition of these five lines produces the sum originally set down from the first line only.

N. B. It is essential to the performance of this question, that none of the digits written by the proposer be ciphers (A.)

Most

(A) Though it is not our intention in the present article, to explain all the experiments and contrivances so fully as to leave nothing to the ingenuity of the reader, we may remark, with respect to the present question, that as the obtained sum is derived merely from the first line of figures, all below this must be so contrived as to produce by their addition a line in which all the digits are 2's. Accordingly, it will be found that the addition of the first

* *Phil. Mag.* vol. iii. p. 589. 8 Ventriloquism.

Most of our readers are well acquainted with the question in multiplication respecting the price of a horse from successively doubling a farthing as often as there are nails in the horse's shoes. (See Montucla's *Recreations* by Hutton, vol. i. or *Sandford and Merton*, vol. i.) The following question is of a similar nature, but appears still more surprising.

A courtier having performed some very important service to his sovereign, the latter wishing to confer on him a suitable reward, desired him to ask whatever he thought proper, promising that it should be granted. The courtier, who was well acquainted with the science of numbers, requested only that the monarch would give him a quantity of wheat equal to that which would arise from one grain doubled 63 times successively. What was the value of the reward?

The origin of this problem is related in so curious a manner by Al-Sephadi, an Arabian author, that it deserves to be mentioned. A mathematician named Sessa, says he, the son of Daher, the subject of an Indian prince, having invented the game of chess, his sovereign was highly pleased with the invention, and wishing to confer on him some reward worthy of his magnificence, desired him to ask whatever he thought proper, assuring him that it should be granted. The mathematician, however, asked only a grain of wheat for the first square of the chess-board, two for the second, four for the third, and so on to the last or 64th. The prince at first was almost incensed at this demand, conceiving that it was ill suited to his liberality, and ordered his vizir to comply with Sessa's request; but the minister was much astonished when, having caused the quantity of corn necessary to fulfil the prince's order to be calculated, he found that all the grain in the royal granaries, and that even of all his subjects, and in all Asia, would not be sufficient. He therefore informed the prince, who sent for the mathematician, who candidly acknowledged his inability to comply with his demand, the ingenuity of which astonished him still more than the game which he had invented.

To find the amount of this prodigious reward, to pay which even the treasury of a mighty prince was insufficient, we shall proceed most easily by way of geometrical progression, though it might be discovered by common multiplication and addition. It will be found by calculation, that the 64th term of the double progression, beginning with unity, is 9,223,372,036,854,775,808. But the sum of all the terms of a double progression, beginning with unity, may be obtained by doubling the last term and subtracting from it unity. The number, therefore, of the grains of wheat equal to Sessa's demand, will be 18,446,744,073,709,551,615. Now, if a standard English pint contain 9216 grains of wheat, a gallon will contain 73,728; and, as eight gallons make one bushel, if we divide the above result by 8 times 73,728, we shall have 31,274,997,412,295 for the number of the bushels of wheat necessary to dis-

charge the promise of the Indian king: and if we suppose that one acre of land be capable of producing in one year, 30 bushels of wheat, to produce this quantity would require 1,042,499,913,743 acres, which make more than 8 times the surface of the globe; for the diameter of the earth being supposed equal to 7930 miles, its whole surface, comprehending land and water, will amount to very little more than 126,437,889,177 square acres.

If the price of a bushel of wheat be estimated at 10s. (it is at present, August 1809, 12s. 6d. per bushel), the value of the above quantity will amount to 15,637,498,706,147l. 10s.; a sum which, in all probability, far surpasses all the riches on the earth. *

* Hutton's Recreations, vol. i.

To discover any Number thought of.

Of this problem there are several cases, differing chiefly in complexity of operation.

12 To tell a number thought of.

I. Desire the person who has thought of a number, to triple it, and to take the exact half of that triple if it be even, or the greater half if it be odd. Then desire him to triple that half, and ask him how many times that product contains 9; for the number thought of will contain double the number of nines, and one more if it be odd.

Thus, if 4 has been the number thought of, its triple will be 12, which can be divided by 2 without a remainder. The half of 12 is 6, and if this be multiplied by 3, we shall have 18, which contains 9 twice, the number will therefore be 4 equal twice 2, the number of nines in the last product.

II. Bid the person multiply the number thought of by itself; then desire him to add unity to the number thought of, and to multiply that sum also by itself; in the last place, ask him to tell the difference of those two products, which will certainly be an odd number, and the least half of it will be the number required.

Let the number thought of be 10, which multiplied by itself gives 100; in the next place 10 increased by 1 is 11, which multiplied by itself makes 121, and the difference of these two squares is 21, the least half of which being 10, is the number thought of.

This operation might be varied in the second step by desiring the person to multiply the number by itself, after it has been diminished by unity, and then to tell the difference of the two squares, the greater half of which will be the number thought of.

Thus, in the preceding example, the square of the number thought of is 100, and that of the same number, subtracting 1, is 81; the difference of these is 19, the greater half of which, or 10, is the number thought of.

III. Desire the person to add to the number thought of its exact half if it be even, or its greater half if it be odd, in order to obtain a first sum; then bid him add to this sum its exact half, or its greater half, according as

first right-hand column produces 22, and that of all the rest 20, which, with the addition of the 2 carried, supplies the other 2's in the line. From this it is evident, that though, for more easy illustration, we have given a question containing only five lines; seven, nine, or any unequal number may be employed, constructing the seventh, ninth, &c. on similar principles.

Arithmeti-
cal Recrea-
tions.

as it is even or odd, to have a second sum, from which the person must subtract the double of the number thought of. Then desire him to take the half of the remainder, or its less half if it be an odd number, and continue halving the half till he comes to unity. When this is done, count how many subdivisions have been made, and for the first division retain two, for the second 4, for the third 8, and so of the rest, in double proportion. It is here necessary to observe, that 1 must be added for each time that the least half was taken, because, by taking the least half, one always remains; and that 1 only must be retained when no subdivision could be made; for thus you will have the number the halves of the halves of which have been taken; the quadruple of that number then will be the number thought of, in case it was not necessary at the beginning to take the greater half, which will happen only when the number thought of is evenly even, or divisible by 4; but if the greater half has been taken at the first division, 3 must be subtracted from the above quadruple, or only 2 if the greater half has been taken at the second division, or 5 if it has been taken at each of the two divisions, and the remainder then will be the number thought of.

Thus, if the number thought of has been 4; by adding to it its half, we shall have 6; and if to this we add its half, 3, we shall have 9; if 8, the double of the number thought of, be subtracted, there will remain 1, which cannot be halved, because we have arrived at unity. For this reason, we must retain 1; and the quadruple of this, or 4, will be the number thought of.

IV. Desire the person to take 1 from the number thought of, and to double the remainder; then bid him take 1 from this double, and add to it the number thought of. Having asked the number arising from this addition, add 3 to it, and the third of the sum will be the number required.

Let the number thought of be 5; if 1 be taken from it, there will remain 4, the double of which 8, being diminished by 1, and the remainder 7 being increased by 5, the number thought of, the result will be 12; if to this we add 3, we shall have 15, the third part of which, 5, will be the number required.

V. Desire the person to add 1 to the triple of the number thought of, and to multiply the sum by 3; then bid him add to this product the number thought of, and the result will be a sum, from which if 3 be subtracted, the remainder will be double of the number required. If 3 therefore be taken from the last sum, and if the cipher on the right be cut off from the remainder, the other figure will indicate the number sought.

Let the number thought of be 6, the triple of which is 18, and if unity be added it makes 19; the triple of this last number is 57, and if 6 be added it makes 63, from which if 3 be subtracted the remainder will be 60; now, if the cipher on the right be cut off, the remaining figure 6 will be the number required.

VI. Among the various methods contrived for discovering numbers thought of, we have seen none more ingenious than the following, which was lately communicated to us. This is a sort of puzzle, consisting of six slips of paper or pasteboard, on which are written numbers as expressed in the following columns.

A	B	C	D	E	F
1	2	4	8	16	32
3	3	5	9	17	33
5	6	6	10	18	34
7	7	7	11	19	35
9	10	12	12	20	36
11	11	13	13	21	37
13	14	14	14	22	38
15	15	15	15	23	39
17	18	20	24	24	40
19	19	21	25	25	41
21	22	22	26	26	42
23	23	23	27	27	43
25	26	28	28	28	44
27	27	29	29	29	45
29	30	30	30	30	46
31	31	31	31	31	47
33	34	36	40	48	48
35	35	37	41	49	49
37	38	38	42	50	50
39	39	39	43	51	51
41	42	44	44	52	52
43	43	45	45	53	53
45	46	46	46	54	54
47	47	47	47	55	55
49	50	52	56	56	56
51	51	53	57	57	57
53	54	54	58	58	58
55	55	55	59	59	59
57	58	60	60	60	60
59	59	61	61	61	61
61	62	62	62	62	62
63	63	63	63	63	63

Arithmeti-
cal Recrea-
tions.

The six slips being thus prepared, a person is to think of any one of the numbers which they contain, and to give to the expounder of the question those slips which contain the number thought of. To discover this number, the expounder has nothing to do but to add together the numbers at the top of the columns put into his hand. Their sum will express the number thought of.

Example. Thus, suppose we think of the number 14. We find that this number is in three of the slips, viz. those marked B, C, and D, which are therefore given to the expounder, who on adding together 2, 4, and 8, obtains 14, the number thought of.

This trick may be varied in the following manner. Instead of giving to the expounder the slips containing the number thought of, these may be kept back, and those in which the number does not occur be given. In this case the expounder must add together, as before, the numbers at the top of the columns, and subtract their sum from 63; the remainder will be the number thought of.

Example. Taking again the former number 14, the slips in which this is not contained are those marked A, E, and F. Adding together 1, 16, and 32, the expounder has 49, which subtracted from 63, leaves 14, the number thought of as before.

The slips containing the columns of numbers are usually

usually marked with letters on the back, and not above the columns, as we have expressed them. This renders the deception more complete, as the expounder of the question, knowing before-hand the number at the top of each column, has only to examine the letters at the back of the slips given him, when he performs the problem without looking at the numbers, and thus renders the trick more extraordinary.

Towards explaining the principles on which this puzzle has been constructed, we may remark, 1. That each column may be divided into sets of figures; those of each column consisting of as many figures as are represented by the number at the head of the column, one figure in each set in the column marked 1; two in that marked 2; four in four, &c. 2. That after each parcel there is a blank of as many figures as that parcel consists of, counting in a regular series from the last number of the parcel. 3. That the numbers of each parcel are in arithmetical progression, while those at the head of the columns are in geometrical progression. 4. That the first sets of all the columns taken together in regular series, compose the whole series of numbers in the columns from 1 to 63, and are consequently the most important, as any number thought of must be found in only one of these sets. 5. That the sum of all the terms of the geometrical progression is equal to the last or highest term of the arithmetical progression 63, and is also equal to the double of the last term of the geometrical progression diminished by unity.

Having premised these remarks, we shall not proceed farther than to hint, that, in constructing this ingenious puzzle, the author appears to have employed the properties of geometrical progressions, and their relations to arithmetical progressions, for which see the article SERIES.

To render these columns more portable, they may each be divided into three or more, and written on small cards, marked at the back with letters. In this form the first figure of the first column must be employed, like the first figure at the head of the slips; or the better to disguise the contrivance, the figures of each column may be placed in a confused order, and the letters alone employed.

Mr William Frend, well known as the author of the *Evening Amusements*, has rendered an important service to the rising generation, by the publication of his *Tangible Arithmetic*, or the Art of Numbering made easy, by means of an arithmetical toy. The toy which forms the basis of this method of numbering, is similar to what has been called the Chinese board, which is explained in the fourth volume of Mr Frend's *Evening Amusements*. This toy is so constructed as to be capable of expressing any number as far as 16,666,665, and is capable of performing a great variety of arithmetical operations, merely by moving a few balls. The author gives a variety of simple instances and amusing games, by which the first four rules of arithmetic may be explained and illustrated. The whole contrivance is very ingenious, and well deserves the attention of mothers and all teachers of children.

SECT. III. *Recreations and Contrivances relating to ASTRONOMY.*

MANY scientific recreations may be derived from astronomy, and some of these have already been noticed

in our treatise on that subject. Among the most useful of the astronomical amusements, however, is the method of discovering the several stars that compose the constellations; and this we shall here explain.

Astronomical Recreations

Method of learning the constellations.

Before we can become acquainted with the stars that compose the constellations, we must be provided with accurate celestial charts, or a good planisphere, of such a size that stars of the first and second magnitudes can be readily distinguished on it. Having placed before us one of these charts, as that containing the north pole, or that part of the planisphere which contains the northern hemisphere, first find out the *Great Bear*, commonly called *Charles's wain* (Plate CCCCLXXI. fig. 14.). It may be easily known, as it forms one of the most remarkable groupes in the heavens, consisting of several stars of the second magnitude, four of which are arranged in such a manner as to represent an irregular square, and the other three a prolongation in the form of a very obtuse scalene triangle. Besides, by examining the figure of these seven stars, as exhibited in the chart, we shall easily distinguish those in the heavens which correspond to them. When we have made ourselves acquainted with these seven principal stars, we examine on the chart the configuration of the neighbouring stars, which belong to the *Great Bear*; and thence learn to distinguish the other less considerable stars which compose that constellation.

After knowing the *Great Bear*, we may easily proceed to the *Lesser Bear*; for nothing will be necessary but to draw, as may be seen in fig. 15. a straight line through the two anterior stars of the square of the *Great Bear*, or the two farthest distant from the tail; this line will pass very near the polar star, a star of the second magnitude, and the only one of that size in a pretty large space. At a little distance from it, there are two other stars of the second and third magnitudes, which, with four more of a less size, form a figure somewhat similar to that of the *Great Bear*, but smaller. This is what is called the *Lesser Bear*; and we may learn, in the same manner as before, to distinguish the stars which compose it.

Fig. 15.

Now if a straight line be drawn through those stars of the *Great Bear*, nearest to the tail, and through the polar star, it will conduct us to a very remarkable group of five stars arranged nearly in this form M (see fig. 16.). These are the constellation of *Cassiopeia*, in which a very brilliant new star appeared in 1572; though soon after it became fainter, and at length disappeared.

Fig. 16.

If a line, perpendicular to the above line, be next drawn through this constellation, it will conduct, on the one side, to a very beautiful star called *Algenib*, which is in the back of *Perseus*; and in the other, to the constellation of the *Swan* (fig. 17.), remarkable by a star of the first magnitude. Near *Perseus* is the brilliant star of the *Goat*, called *Capella*, which is of the first magnitude, and forms part of the constellation of *Auriga*.

Fig. 17.

After this, if a straight line be drawn through the last two stars of the tail of the *Great Bear*, we shall come to the neighbourhood of *Arcturus*, one of the most brilliant stars in the heavens, which forms part of the constellation of *Bootes* (fig. 18.).

In this manner we may successively employ the knowledge which we have obtained of the stars of one constellation, to enable us to find out the neighbouring

Astronomical
Recreations.

ones. We shall not enlarge further on this method; for it may be easily conceived, that we cannot proceed in this manner through the whole heavens; but any person of ingenuity may thus in the course of a few nights, learn to know a great part of the heavens, or at any rate the principal stars and constellations.

16
Brewster's
astrometer.

In the article ASTRONOMY we have described the usual instruments for ascertaining the situation, distances, &c. of the heavenly bodies. We must here add an account of an ingenious instrument for finding the rising and setting of the stars and planets, and their position in the heavens. This instrument is called an *astrometer*, and was originally invented by M. Jurat. An improved astrometer has been lately contrived by Dr David Brewster, and is thus described by him in Nicholson's Journal for May 1807, vol. xvi.

"This astrometer, represented in Plate CCCCLXXI. fig. 19. consists of four divided circumferences. The innermost of these is moveable round the centre A, and is divided into 24 hours, which are again subdivided into quarters and minutes, when the circle is sufficiently large. The second circumference is composed of four quadrants of declination, divided by means of a table of semidiurnal arcs, adapted to the latitude of the place. In order to divide these quadrants, move the horary circle, so that 12 o'clock noon may be exactly opposite to the index B: then since the star is in the equator, and its declination 0, when the semidiurnal arc is VI hours, the zero of the scales of declination will be opposite VI. VI.; and as the declination of a star is equal to the colatitude of the place, when its semidiurnal arc is 0, or when it just comes to the south point of the horizon, without rising above it, the degree of declination at the other extremity of the quadrant, or opposite XII. XII., will be the same as the colatitude of the place, which in the present case is 39°, the latitude of the place being supposed 51° north. The intermediate degrees of declination are then to be laid down from a table of semidiurnal arcs, by placing the degree of declination opposite to the arc to which it corresponds; thus the 10° of south declination must stand opposite V^h 13' in the afternoon, and VI^h 47' in the morning, because a declination of 10° south gives a semidiurnal arc of V^h 13'. When the scales of declination are thus completed, the instrument is ready for showing the rising and setting of the stars. For this purpose move the horary circle till the index B points to the time of the star's southing; thus, opposite to the star's declination to the scale C, if the declination is south, or in the scale D if it is north, will be found the time of its rising above the horizon; and the degree of declination on the scales E and F, according as it is south or north, will point out on the horary circle the time of the star setting. If the rising of the star is known from observation, bring its declination to the time of its rising on the circle of hours, and the index B will point out the time at which it passed the meridian; and its declination on the opposite scale will indicate the time when it descends below the horizon. In the same way, from the time of the star setting, we may determine the time when it rises and comes to the meridian.

"The two exterior circles are added to the astrometer, for the purpose of finding the position of the stars and planets in the heavens. The outermost of these is divided into 360 equal parts; and the other, which is a

scale of amplitudes, is so formed, that the amplitude of any of the heavenly bodies may be exactly opposite the corresponding degree of declination in the adjacent circle. The degree of south declination, for instance, in the latitude of 51°, corresponds with an amplitude of 15° 20', consequently the 15° of amplitude must be nearly opposite to the tenth degree of declination; so that by a table of amplitudes the other points of the scale may be easily determined. The astrometer is also furnished with a moveable index MN, which carries at its extremities two vertical sights *m n*, in a straight line with the centre A. The instrument being thus completed, let it be required to find the planet Saturn, when his declination is 15° north, and the time of his southing 3^h 30' in the morning. The times of his rising and setting will be found to be 7^h 15', and 10^h 45', and his amplitude 24° north. Then shift the moveable index till the side of it which points to the centre is exactly above 24° of the exterior circle in the north-east quadrant, and when the line AB is placed in the meridian, the two sight holes will be directed to the point of the horizon where Saturn will be seen at 7^h 15', the time of his rising. The same being done in the north-west quadrant, the point of the horizon where the planet sets will likewise be determined. In the same way the position of the fixed stars, and the other planets, may be easily discovered.

"If it is required to find the name of any particular star that is observed in the heavens, place the astrometer due north and south, and when the star is near the horizon, either at its rising or setting, shift the moveable index till the two sights point to the star. The sight of the index will then point out, on the exterior circle, the star's amplitude. With this amplitude enter the third scale from the centre, and find the declination of the star in the second circle. Shift the moveable horary circle till the time at which the observation is made be opposite to the star's declination, and the index B will point to the time at which it passes the meridian. The difference between the time of the star's southing, and 12 o'clock noon, converted into degrees of the equator, and added to the right ascension of the sun if the star comes to the meridian after the sun, but subtracted from it if the star souths before the sun, will give the right ascension of the star. With the right ascension and declination thus found, enter a table of the right ascensions and declinations of the principal fixed stars, and you will discover the name of the star which corresponds with these numbers. The meridian altitudes of the heavenly bodies may always be found by counting the number of degrees between their declination and the index B. The astrometer may be employed in the solution of various other problems; but the application of it to other purposes is left to the ingenuity of the young astronomer."

SECT. IV. *Recreations and Contrivances relating to CHEMISTRY.*

The experiments which illustrate the principles of Chemistry, afford abundant examples of scientific recreations. We cannot here enter on this extensive field, as we have already illustrated the subject very fully under the article CHEMISTRY. In the present section, therefore, we shall do little more than enumerate some of the most striking experiments, referring our readers for

Chemical
Recreations.17
Chemical
Recreations.

for a description and explanation of them, to the above article, and to the principal elementary works on modern chemistry, especially the *Epitome of Chemistry*, by Dr William Henry (8vo edition), to which the following enumeration will chiefly refer.

Among the more curious and interesting experiments of chemistry, we may notice the combustion produced by wrapping *nitrate of copper*, slightly moistened, in a sheet of *tin foil* (Henry, p. 15.); the reflection of heat and cold from the surface of concave mirrors (CHEMISTRY, N° 170, or Henry, p. 28.); the artificial production of great degrees of cold, so as to freeze *mercury* and *alcohol* (CHEMISTRY, 274, or Henry, p. 36.); the experiments of Dr Herschel, shewing that the sun emits rays which *heat* without *illuminating*; others which *illuminate* nor *heat*; and others which neither *illuminate* nor *heat*, but produce evident *chemical changes* (CHEMISTRY, 172, or Henry, p. 48.); the *combustion of charcoal, phosphorus, and iron wires, in oxygenous gas*, and more especially the combustion of metals in a combined stream of *oxygen* and *hydrogen* gases (Henry, p. 60.); the *explosion of hydrogenous and oxygenous gases, and consequent production of water* (CHEMISTRY, 382, and Henry, p. 70.); the *decomposition of water* (CHEMISTRY, 384, or Henry, p. 78.); the effect of *alkalies* and *acids* in changing the colour of *blue* vegetable infusions to *green* and *red* (Henry, p. 102.); the combustion produced by mixing *nitric acid* with *essential oils*, or other combustibles (CHEMISTRY, 510, and Henry, p. 151.); the combustion produced by throwing *metallic particles* into *oxygenized muriatic acid gas* (Henry, p. 181.); the deflagration of *hyperoxygenized muriate of potash*, with *phosphorus* and other combustibles (CHEMISTRY, 962, et seq. or Henry, p. 187.); the production of *phosphorated hydrogen gas*, by throwing *phosphuret of lime* into water, (Henry, p. 197.); and the decomposition of metallic solutions, so as to procure the metals in a pure or metallic state.

As these last experiments are only incidentally noticed in the article CHEMISTRY, and in Dr Henry's *Epitome*, we shall here describe two of the most curious instances of what have been called *metallic vegetations*.

The first of these which we shall notice is called *Arbor Dianæ*, the tree of Diana, or the silver tree, as it is produced by decomposing a solution of silver, so that the silver is exhibited in the metallic state, and in an arborescent form. There are two methods of producing the *arbor Dianæ*, one by Homberg, and the other by Beaumé.

According to Homberg's method, an amalgam is to be formed by rubbing a quarter of an ounce of very pure mercury, and half an ounce of fine silver reduced to leaves or filings, by triturating them together in a porphyry mortar, with an iron pestle. This amalgam is to be dissolved in four ounces of the purest nitric acid of a moderate strength, and the solution is to be diluted with about 24 ounces of distilled water. An ounce of this liquor is to be poured into a glass, and a small piece of a similar amalgam of mercury and silver, of the consistence of butter, is to be introduced. Soon after there may be seen rising from the ball of amalgam a multitude of small shining filaments, which visibly increase in number and size, and throw out branches, so as to form a kind of shrub.

Beaumé's method is as follows.—Six parts of a solution of silver in nitric acid, and four of a solution of

mercury in the same acid, both in a state of saturation, are to be mixed together, and a small quantity of distilled water to be added. This mixture is to be poured into a conical glass vessel, containing six parts of an amalgam made of seven parts of mercury and one of silver. At the end of some hours there will appear on the surface of the amalgam a metallic precipitate in the form of a vegetation.

The other experiment which we have to describe is that of producing a leaden tree, which, as it may be performed on a large scale, and at a trifling expense, is preferable to the former. The method of effecting this decomposition which we have found most effectual, is the following.

Dissolve in distilled or pure rain water a quantity of acetate of lead (sugar of lead), not sufficient to saturate it; viz. in the proportion of four scruples of the salt to the English pint of water. When the solution has become clear, pour it into a cylindrical vessel, or a glass wine decanter of considerable size, and introduce into it an irregular piece of pure bright zinc, suspended by a string, or a piece of brass wire. In the course of a few hours, the zinc will be covered with a dusky grayish mass, having the appearance of moss, and from this are gradually shot out plates or leaves of a brilliant metallic substance. These will extend themselves towards the bottom of the vessel, and will form trunks, branches, and leaves, so as to resemble a leaden tree suspended by its roots from a mossy hill. In this way we have produced a vegetation that has nearly filled a cylindrical glass-jar of a foot in height, and four or five inches in diameter.

SECT. V. Recreations and Contrivances relating to ELECTRICITY.

THE subject of electricity, like that of chemistry, affords ample room for scientific recreations. Of these we have given a large collection in our treatise on ELECTRICITY, and shall here only enumerate the more striking experiments.

These are, the phenomena produced by paper when excited by caoutchouc or Indian rubber (see ELECTRICITY, Part I. Chap. 3.); the experiments of the *dancing-figures, dancing-balls*, illustrating electrical attraction and repulsion; the *electrical orrery*, and *electrified cotton*, illustrating the action of points; the *electrified spider*; the *magic picture, electrical jack, self-moving wheel, spiral tube, luminous conductor, aurora borealis, electrified can and chain*, and the *thunder-house*.

SECT. VI. Amusements and Contrivances relating to GALVANISM.

THE subject of galvanism, though so nearly allied to electricity, is capable of supplying still more extraordinary experiments, many of which are often witnessed with surprise and admiration. Many of these have been related in our treatise of Galvanism. The most striking of these are, the muscular contractions produced in dead animals, especially those of Aldini (GALVANISM, N° 35.); the combustion of charcoal (N° 42.); the deflagration of metals (N° 43.); and the decomposition of water (N° 44.). The experiments on deflagrating the metals, and on other perfect conductors, succeed best with a trough of very large plates of zinc and copper; but experiments on animal bodies, and other imperfect

Geographical Recreations. conductors, are most effectual in proportion to the number of plates employed.

SECT. VII. *Recreations and Contrivances relating to GEOGRAPHY.*

22 Geographical recreations. SOME of the problems on the globes, and the use of the *analemma* engraved on Plate CCXXXV. constitute the principal recreations and contrivances relating to geography. To these we shall add only an easy method of approximating to the third problem on the terrestrial globe, (see GEOGRAPHY, N^o 67.), namely, having the hour at any place given, to find what hour it is at other places on the earth.

23 Geographical horologium. Fig. 20. consists of an outer circle graduated at the edge into 96 equal parts, representing the 24 hours and their quarters, and is marked with two sets of hours from I. to XII. each; the XII. at the top of the figure representing noon, and the XII. at the bottom, midnight. The hours on the right hand are of course those of the evening, and those on the left are morning hours. About the centre of this large circle there is moveable a circular plate, having the figure of a globe in the middle, and having the circumference divided into 360 equal parts, comprehending so many degrees. The diameter marked O, 180, represents the meridian of London. It has the names of the principal places on the earth marked at its edge. Of these London is the principal, and is engraved in capitals. Now, by means of this contrivance, if the time at any one of these places be given, we can find very nearly the time at the other places marked on the inner circle. Thus, suppose it is X. o'clock in the forenoon at London, to find the hour at the other places in the inner circle, place the word LONDON opposite X. on the left hand; then we shall find that at Rome it is a quarter before XI.; at Berlin it is about XI.; at Stockholm about 20 minutes after XI.; at St Petersburg it is noon; at Bombay it is nearly III. in the afternoon; at Peking it is nearly VI. in the evening; at Botany Bay it is about VIII. in the evening; at New Zealand it is X. at night; at Mexico it is about III. in the morning; at Philadelphia it is V.; and at the Leeward Islands about VI. in the morning.

24 Gualtier's game of geography. The Abbé Gualtier has contrived a game, by which he shows how geography may be taught to young people by means of a set of toys. This method appears to be very ingenious, and is much extolled by those who are acquainted with it. As we have not been able to procure the apparatus, we cannot describe the method, according to which the game is conducted.

25 Edgeworth's portable globe. Mr Edgeworth proposes that geography should be taught to young people by means of a large globe made of silk, marked with the proper meridians and parallels, to be occasionally inflated; and that the places met with in reading should be laid down according to their proper longitudes and latitudes as they occur. See *Practical Education*, 8vo. vol. ii. p. 239.

SECT. VIII. *Recreations and Contrivances relating to GEOMETRY.*

26 Geometrical recreations. FROM among the numerous problems which have been contrived by geometricians, we shall select a few of the most simple and curious.

To divide a Rectangular Gnomon into four equal and similar Gnomons. Geometrical Recreations. Fig. 21.

Suppose we have the rectangular figure A, B, C, D, E, F, fig. 21. (A); it is required to divide it into four equal and similar rectangular figures.

On examining this figure, we find that the sides AB and BC are equal, and that if the sides AF and CD were produced, they would, by meeting, complete the square, of which the gnomon is evidently a part. The figure therefore forms three-fourths of a square, and may be divided into three squares, AHEF, EHBG, and DEGC. Each of these squares may in like manner be divided into four, as represented by the dotted lines. Thus we have the whole gnomon divided into 12 equal squares, and it is easy to see how from this division we may form four figures, each constituting three-fourths of a square, and consequently similar to the original figure.

From four unequal Triangles, of which three must be Right-angled, to form a Square.

27 To form a square of four unequal triangles. Fig. 22. As the triangles with which this problem is usually performed, are generally made mechanically, by cutting them from a square already formed, we shall for the more easy solution, follow the same method in our first illustration. The square A, B, C, D, fig. 22. is divided into the four triangles E, F, G, H, of which E, F, and G, are evidently right-angled triangles, while H is a scalene triangle.

If these triangles were separate, it would appear very difficult to unite them, so as to form a square. This may be done, however, by reflecting that three of the angles of the square must be formed by the angles of the right-angled triangles, so that these must first be placed as in the figure, while the scalene triangle fills up the vacant space, and by its most acute angle contributes with the most acute angles of the two other large triangles, to form the remaining right angle of the square.

These triangles may be constructed geometrically, without forming them immediately out of a square. For this purpose the following proportions may be employed. Two of the right-angled triangles must have one of the sides about the right angle of the same length in both. The other side about the right angle may be in one, two-thirds of the first side in the same triangle, while in the other it may be one-half. In the third, right-angled triangle, one of the sides containing the right angle must, in the present case, be one-third, and the other one-half of the larger side containing the right angle in the two former triangles. Having these three triangles formed, the hypotenuses of which are evidently determined by the length of the sides containing the right angles, we may easily construct the remaining triangle from the hypotenuses of the three triangles already formed, according to the 22d proposition of the first book of Euclid.

To illustrate this by numbers, let us suppose that the side of the square to be formed is = four inches. One of the triangles, as E, will have its longer side = four inches, its shorter = three inches, and its hypotenuse = five inches. The second triangle, as F, will have its longer

(A) We have denominated this figure a *gnomon*, because it resembles, in its outline, that part of a parallelogram which is distinguished by the name of *gnomon* in the second definition of the second book of Euclid's Elements.

longer side = four inches, its shorter = two inches, and its hypotenuse = square root of 20 (4.472135); and the third triangle, as G, will have its longer side = two inches, its shorter = one inch, and its hypotenuse = square root of 5 (2.236068): the sides of the remaining triangle will be respectively 5 inches, 4.472135 inches, and 2.236068 inches.

To form a Square of five equal Squares.

Divide one side of each of four of the squares, as A, B, C, D, (fig. 23. N° 1, and 2) into two equal parts, and from one of the angles adjacent to the opposite side draw a straight line to the point of division; then cut these four squares in the direction of that line, by which means each of them will be divided into a trapezium and a triangle, as seen fig. 23. N° 1.

Lastly, arrange these four trapeziums and these four triangles around the whole square E, as seen fig. 23. N° 2, and you will have a square evidently equal to the five squares given.

To describe an Ellipsis or Oval geometrically.

The geometrical oval is a curve with two unequal axes, and having in its greater axis two points so situated, that if lines be drawn to these two points, from each point of the circumference, the sum of these two lines will be always the same. See CONIC SECTIONS.

Let AB (fig. 24.) be the greater axis of the ellipsis to be described; and let ED, intersecting it at right angles, and divided into two equal parts, be the lesser axis, which is also divided into two equal parts at C; from the point D as a centre, with a radius = AC, describe an arc of a circle, cutting the greater axis in F and f; these two points are what are called the foci. Fix in each of these a pin, or, if you operate on the ground, a very straight peg; then take a thread or a cord, if you mean to describe the figure on the ground, having its two ends tied together, and in length equal to the line AB, plus the distance Ff; place it round the pins or pegs Ff; then stretch it as seen at FGf, and with a pencil, or sharp-pointed instrument, make it move round from B, through D, A, and E, till it return again to B. The curve described by the pencil on paper, or on the ground, by any sharp instrument, during a whole revolution, will be the curve required.

This ellipsis is sometimes called the *gardener's oval*, because, when gardeners describe that figure, they employ this method.

An oval figure approximating to the ellipse, may be described at one sweep of the compasses, by wrapping the paper on which it is to be described round a cylindrical surface. If a circle be described upon the paper thus placed, assuming any point as a centre, it is evident that when the paper is extended on a plain surface, we shall have an oval figure, the shorter diameter of which will be in the direction of the axis of the cylinder on which the oval was described. This figure, however, is by no means an accurate oval, though it may serve very well as the border of a drawing, or for similar purposes, where great accuracy is not required.

In no science are amusing contrivances more requisite to facilitate the progress of the young pupil than in geometry. We are therefore disposed to regard, with particular attention, every attempt to illustrate and render popular the elements of this science. We may say

with Mr Edgeworth, that though there is certainly no royal road to geometry, the way may be rendered easy and pleasant by timely preparations for the journey. Without some previous knowledge of the country, or of its peculiar language, we can scarcely expect that our young traveller should advance with facility or pleasure. Young people should, from their earliest years, be accustomed to what are commonly called the regular solids, viz. the tetrahedron, or regular four-sided solid; the cube, or regular six-sided solid; the octahedron, or regular eight-sided solid; the dodecahedron, or regular 12-sided solid; and the icosahedron, or regular 20-sided solid. These may be formed of card or wood, and Mr Don, an ingenious mathematician of Bristol, has constructed models of these and other mathematical figures, and explained them in an Essay on Mechanical Geometry. Children should also be accustomed to the figures in mathematical diagrams. To these should be added their respective names, and the whole language of the science should be rendered as familiar as possible. * 51

We have lately met with a contrivance for rendering familiar to children the terms of geometry by means of an easy trick. This contrivance is called *Le Petit Euclid*, and consists of two circular cards, which are represented at fig. 25. Plate CCCCLXXII, and fig. 26. Plate CCCCLXXIII. Each of these circles is divided into eight compartments, marked 1, 2, 3, 4, 5, 6, 7, 8, and within each compartment are represented several mathematical figures or diagrams. In the centre of the card represented at fig. 25. is the word *question*, and in that at fig. 26. the word *answer*. On the latter the figures are distinguished by numbers, referring to their explanations in the following table.

- | | |
|--|---------------------------------|
| N° | N° |
| 1. The cone. | 29. The foci of an ellipse. |

|----|-------------------------|----|----------------------------------|
| N° | 57. Dotted versed sine. | N° | 62. A spherical frustum. |
| | 58. Alternate angles. | | 63. Vertical or opposite angles. |
| | 59. A semicircle. | | 64. An acute angle. |
| | 60. Dotted chord. | | |
| | 61. A right angle. | | |

To form a trick with these cards, the teacher is to hold the question card, and the pupil the answer card. The teacher is to think of a figure in any one of his compartments, and to mention to the pupil both the number of the compartment in the question, and that in the answer card, on which the figure is found. The pupil is then to begin with the first or outmost diagram on the left hand of the compartment in his own card, where the figure thought on is said to be contained, and to count from this down the left-hand row towards the centre, and thence, if necessary, from the outmost diagram on the right hand of the same compartment towards the centre, till his counting reaches the number of the compartment in the question card, where the figure was at first found.

For example, let us suppose that the teacher thinks on a figure in the compartment of his card marked 2, and that he finds the same figure in the compartment of the answer card which is marked 6. The learner beginning to count from the first figure on the left hand in his sixth compartment, viz. that marked 48, comes immediately to the figure marked 30, which is that thought of by the teacher, and proves to be an octagon. Again, if the figure thought on be found in the sixth compartment of the question card, and in the fifth of the answer card, the learner beginning with the figure marked 15, and passing successively to 22, 24, 57, and 49, comes for his sixth place to 36, the figure thought of, which is a parallelogram.

The design of this contrivance is ingenious; but its execution, at least in the copy which we have seen, is extremely faulty. Many of the terms are misprinted, some of them inaccurate, and the explanation scarcely intelligible. We have endeavoured to rectify these defects, and trust we have succeeded.

SECT. IX. *Recreations and Contrivances relating to HYDRODYNAMICS.*

32
Hydrostatic
Recreations.

In our treatise on HYDRODYNAMICS, under which head we have included HYDROSTATICS and HYDRAULICS, we have described several entertaining experiments and useful contrivances, and explained them according to hydrostatical principles. Thus, at N° 49 and 50, we have explained the *hydrostatic paradox*, showing that the pressure on the bottoms of vessels filled with fluids does not depend on the quantity of fluid which they contain, but on its altitude; at N° 51, we have illustrated the upward pressure of fluids by the *hydrostatic bellows*; at N° 54 and 55, we have explained and illustrated the use of the syphon; at N° 112 and 113, we have shown how capillary attraction and the attraction of cohesion may be illustrated by experiment; in Chap. III. of Part III. we have described the various machines employed for raising water, such as pumps, fire engines, Archimedes's screw, the Persian wheel, &c. and explained their action; at N° 355, we have described Bramah's hydrostatic press, and at N° 356, *et*

seq. we have described and explained the clepsydra with its varieties. The following amusing experiments are derived from Ozanam and Montucla.

Hydrostatic
Recreations.

To construct a vessel which, when filled to a certain height with any liquor, shall retain the liquor, but shall suffer the whole to escape when filled with the same fluid ever so little above that height.

33
Tantalus's
cup.

Let there be a metallic vessel, as ABCD, fig. 27. divided into two parts by a partition Ff, having in the middle a small round hole, as at M, to receive a tube MS, about two lines in diameter, so that the lower orifice M may descend a little below the partition. This tube is open at both ends, but is to be covered with another a little larger, closed at the top, and having on one side, at the bottom, an aperture, so that when water is poured into the vessel, it may force its way between the two tubes, and rise to the upper orifice S, of the inner tube. This mechanism must be concealed by a small figure of a man in the attitude of stooping to drink, which we may call *Tantalus*. This figure must have its lips a little above the orifice S.

If water be poured into this vessel, so long as it does not ascend above the orifice S, it will be retained; but as soon as it gets above this orifice, so as to touch the lips of Tantalus, it will begin to run off, the tubes acting in the manner of a syphon, and carrying off the whole of the water into the lower cavity, which ought to have in its side, near the partition, a small aperture for allowing the air which it contains to escape, while the water supplies its place.

This machine may be rendered still more amusing by constructing the small figure of Tantalus in such a manner, that when the water has attained its utmost height, it shall cause the head of the figure to move, so that its lips may approach the fluid, thus representing the gestures of Tantalus endeavouring to catch the water to quench his thirst.

To construct a vessel which, while standing upright, retains the liquor poured into it; but if inclined, as for the purpose of drinking, immediately suffers it to escape.

Let a hole be pierced in the bottom or side of the vessel to which you are desirous of giving this property, and insert in it the longer branch of a syphon, the other extremity of which must reach nearly to the bottom, as seen fig. 28.; then fill the vessel with any liquor as far as the lower side of the bent part of the syphon; it is evident that when inclined, and applied to the mouth, this movement will cause the surface of the water to rise above the bending, and from the nature of the syphon the liquor will begin to flow; and if the vessel is not restored to its former position, will continue doing so till it becomes empty.

Fig. 28.

This artifice might be concealed by means of a double cup, as appears at fig. 29.; for the syphon *abc*, placed between the two sides, will produce the same effect. If the vessel be properly presented to the person whom you are desirous of deceiving, that is to say, in such a manner as to make him apply his lips to the side *b*, the summit of the syphon, the inclination of the liquor will cause it to rise above that summit, and it will immediately escape at *c*. Those persons, however, who are acquainted with the artifice will apply their lips to the other side, and not meet with the same disappointment.

Method

Method of constructing an hydraulic machine, in which a bird appears to drink up all the water that spouts up through a pipe, and falls into a basin.

Let ABDC, fig. 30. be a vessel, divided into two parts by a horizontal partition EF; and let the upper cavity be divided into two parts also by a vertical partition GH. A communication is formed between the upper cavity BF, and the lower one EC, by a tube LM, which proceeds from the lower partition, and descends almost to the bottom DC. A similar communication is formed between the lower cavity EC, and the upper one AG, by the tube IK, which, rising from the horizontal partition EF, proceeds nearly to the top AB. A third tube, terminating at the upper extremity in a very small aperture, descends nearly to the partition EF, and passes through the centre of a basin RS, intended to receive the water which issues from it. Near the edge of this basin is a bird with its bill immersed in it; and through the body of the bird passes a bent syphon QP, the aperture of which, P, is much lower than the aperture Q. Such is the construction of this machine, the use of which is as follows.

Fill the two upper cavities with water through two holes made for the purpose in the sides of the vessel, and which must be afterwards shut. It may be easily seen that the water in the cavity AG ought not to rise above the orifice K of the pipe KI. If the cock adapted to the pipe LM be then opened, the water of the upper cavity HF will flow into the lower cavity, where it will compress the air, and make it pass through the pipe KI into the cavity AG; in this cavity it will compress the air which is above it, and the air pressing upon it, will force it to spout up through the pipe NO, from whence it will fall down into the basin.

But at the same time that the water flows from the cavity BG, into the lower one, the air will become rarified in the upper part of that cavity; hence, as the weight of the atmosphere will act on the water already poured into the basin through the orifice O of the ascending pipe NO, the water will flow through the bent pipe QSP, into the same cavity BG; and this motion, when once established, will continue as long as there is any water in the cavity AG.

SECT. X. *Recreations and Contrivances relating to MAGNETISM.*

THE attracting and repelling power of the opposite poles of a magnet, have furnished the writers on scientific recreations with a great variety of entertaining experiments. In our treatise on MAGNETISM, we have selected a few of these, viz. the communicating piece of money (MAGNETISM, N^o 39.); the magnetic table (N^o 40.); the mysterious watch (N^o 41.); the magnetic dial (N^o 42.); and the divining circles (N^o 43.) We shall here describe a few other interesting experiments, and refer such of our readers as wish for a greater variety of these amusements, to the original work of Ozanam already mentioned in N^o 3, or the *Rational Recreations* of Dr Hooper, and to the 51st part of the *Encyclopédie Methodique*, containing *Amusemens des Sciences*, with the plates on *Amusemens de Physique*, in the 42d part of the same work.

The dexterous Painter.

Provide two small boxes, as M and N (fig. 31.) four

inches wide, and four inches and a half long. Let the box M be half an inch deep, and N two thirds of an inch. They must both open with hinges, and shut with a clasp. Have four small pieces of light wood (figs. 32, 33, 34, 35.) of the same size with the inside of the box M (fig. 31.), and about one third of an inch thick. In each of these let there be a groove, as AB, EF, CD, GH; these grooves must be in the middle, and parallel to two of the sides. In each of these grooves place a strong artificial magnet, as fig. 36. The poles of these magnets must be properly disposed with regard to the figures that are to be painted on the boards; as is expressed in the plate. Cover the bars with paper to prevent their being seen; but take care, in pasting it on, not to wet the bars, as they will be rusted, and thus their virtue will be considerably impaired. When you have painted such subjects as you choose, you may cover them with a very thin clear glass. At the centre of the box N, place a pivot, (fig. 37.) on which a small circle of pasteboard OPQR (fig. 38.) is to turn quite free. Under this must be a touched needle S. Divide this circle into four parts, which are to be disposed with regard to the poles of the needle, as is expressed in the figure. In these four divisions paint the same subjects as are on the four boards, but reduced to a smaller compass. Cover the inside of the top of this box with a paper, M, (see fig. 31.) in which must be an opening, D, at about half an inch from the centre of the box, that you may perceive successively, the four small pictures on the pasteboard circle just mentioned. This opening is to serve as the cloth on which the little painter is supposed to draw one of the pictures. Cover the top of the box with a thin glass. Then give the first box to any person, and tell him to place any one of the four pictures in it privately; and when he has closed it, to give it to you, then place the other box over it, when the moveable circle, with the needle, will turn till it comes in the same position with the bar in the first box. It will then appear that the little dexterous painter has already copied the picture that is enclosed in the first box.

The Cylindric Oracle.

Provide a hollow cylinder about six inches high, and three wide, as AB (fig. 39.) Its cover CD must be made to fix on in any position. On one side of this box or cylinder, let there be a groove, nearly of the same length with that side; in which place a small steel bar (fig. 40.) that is strongly impregnated, with the north pole next to the bottom of the cylinder. On the upper side of the cylinder describe a circle, and divide it into ten equal parts, in which are to be written the numbers from 1 to 10, as is expressed in fig. 41. Place a pivot at the centre of this circle, and have ready a magnetic needle. Then provide a bag in which there are several divisions. In each of these divisions put a number of papers, on which the same or similar questions are to be written. In the cylinder put several different answers to each question, and seal them up in the manner of small letters. On each of these letters or answers is to be written one of the numbers of the dial or circle at the top of the box. You are supposed to know the number of answers to each question. Then offer one of the divisions of the bag, (observing which division it is) to any person, and desire him to draw one

Magnetic Recreations.

Fig. 32, 33, 34, 35.

Fig. 31.

36
Cylindric Oracle.

Magnetic
Recreations.

of the papers. Next put the top on the cylinder, with that number which is written on the answer directly over the bar. Then desire the person who drew the question to observe the number at which the needle stands, and to search in the box for a paper of the same number, which he will find to contain the answer.—The experiment may be repeated by offering another division of the bag to the same, or another person; and placing the number that corresponds to the answer over the magnetic bar, proceeding as before.

It is easy to conceive several answers to the same question. For example, suppose the question to be, *Is it proper for me to marry?*

Ans. 1. While you are young, not yet; when you are old, not at all.

2. Marry in haste, and repent at leisure.

3. No, if you are apt to be out of humour with yourself; for then you will have two persons to quarrel with.

4. Yes, if you are sure to get a good husband (or wife), for that is the greatest blessing of life. But take care you are sure.

5. No, if the person you would marry is an angel; unless you would be content to live with the devil.

Fix a common ewer, as A (fig. 42.) of about 12 inches high, upon a square stand BC; on one side of which there must be a drawer D, of about four inches square, and half an inch deep. In the ewer place a hollow tin cone inverted, as AB (fig. 43.) of about four inches and a half diameter at top, and two inches at bottom; and at the bottom of the ewer there must likewise be a hole of two inches diameter.

Upon the stand, at about an inch distance from the bottom of the ewer, and directly under the hole, place a small convex mirror II, of such convexity that a person's visage, when viewed in it at about 15 inches distance, may not appear above $2\frac{1}{2}$ inches long.

Upon the stand likewise at the point I, place a pivot of half an inch high, on which must be fixed a touched needle RQ, inclosed in a circle of very thin pasteboard OS (fig. 44.) of five inches diameter. Divide this pasteboard into four parts, in each of which draw a small circle; and in three of these circles paint a bead; as *x*, *y*, *z*, the dress of each of which is to be different; one, for example, having a turban, another a wig, and the other a woman's cap. Let that part which contains the face in each picture be cut out, and let the fourth circle be entirely cut out, as it is expressed in the figure. You must observe, that the poles of the needle are to be disposed in the same manner as in the figures.

Next provide four small frames of wood or pasteboard, N^o 1, 2, 3, 4, each of the same size with the inside of the drawer. On these frames must be painted the same figures as on the circular pasteboard, with this difference, that there must be no part of them cut out. Behind each of these pictures place a magnetic bar, in the same direction as is expressed in the figures; and cover them over with paper, that they may not be visible. Matters being thus prepared, first place in the drawer the frame N^o 4, on which there is nothing painted. Then pour a small quantity of water into the ewer, and desire the company to look into it, asking them if they see their own figures as they are. Then take out the frame N^o 4, and give the three others to any one, desiring him to choose in which of those dresses he would appear. Then put the frame with the

dress he has chosen in the drawer, and a moment after, the person looking into the ewer will see his own face surrounded with the dress of that picture. For, the pasteboard circle (divided as above described, into four parts, in three of which are painted the same figures as on three of the boards, and the fourth left blank) containing a magnetic needle, and the four boards having each a concealed magnet; therefore when one of them is put in the drawer under the ewer, the circle will correspond to the position of that magnet, and consequently the person looking into the top of the ewer will see his own face surrounded with the head dress of the figure in the drawer. This experiment, well performed, is highly entertaining. As the pasteboard circle can contain only three heads, you may have several such circles, but must then have several other frames: and the ewer must be made to take off from the stand.

Provide a wooden box, about 13 inches long and 7 inches wide, as ABCD (fig. 45.) The cover of this box should be as thin as possible. Have six small boxes or tablets, about an inch deep, all of the same size and form, as E, F, G, H, I, K, that they may indiscriminately go into similar holes made in the bottom of the large box. In each of these tablets is to be placed a small magnetic bar, with its poles disposed as expressed in the figure. Cover each of these tablets with a thin plate of one of the six following metals, viz. gold, silver, copper, iron, pewter, and lead. Have also a magnetic perspective, at the end of which are to be two circles, one divided into six equal parts, and the other into four (as in fig. 46.), from the centre of which there must be drawn an index N, whose point is to be placed to the north. Therefore, when you are on the side CD of the box, and hold the perspective over any one of the tablets that are placed on the holes E, F, G, so that the index drawn on the circle is perpendicular to the side AB, the needle in the perspective will have its south pole directed to the letter that denotes the metal contained in that tablet. When you hold the perspective over one of the boxes placed in the holes H, I, K, so that the index drawn on the circle is perpendicular to the side CD, the south pole of the needle will, in like manner, express the name of the metal inclosed. If the under side of any of the tablets be turned upwards, the needle will be slower in its motion, on account of the greater distance of the bar. The gold and silver will still have the same direction; but the four other metals will be expressed by the letters on the interior circle. If any one of the metals be taken away, the needle will not then take any of the above directions, but naturally point to the north; and its motion will be much slower. Therefore, give the box to any one, and leave him at liberty to dispose all the tables in what manner and with what side upwards he pleases, and even to take any of them away. Then, by the aid of the perspective, you may tell him immediately the name of the metal on each tablet, and of that which he has taken away.

Construct a round box, ILNM (fig. 47.), of eight or nine inches diameter, and half an inch deep. On its bottom fix a circle of pasteboard, on which draw the central circle A, and the seven surrounding circles B, C, D, E, F, G, H. Divide the central circle into seven equal parts by the lines AB, AC, AD, AE, AF, AG, AH, which must pass through the centres of the other

57

The magnetic
planetarium
Fig. 47.

other circles, and divide each of them into two equal parts. Then divide the circumference of each of these circles into 14 equal parts, as in the figure. Have also another pasteboard of the same figure, and divided in the same manner, which must turn freely in the box by means of an axis placed on a pivot, one end of which is to be in the centre of the circle A (see fig. 48.) On each of the seven smaller circles at the bottom of the box, place a magnetic bar, two inches long, in the same direction with the diameters of those circles, and their poles in the situation expressed in the figure. There must be an index O (fig. 48.) like that of the hour hand of a dial, which is to be fixed on the axis of the central circle, and by which the pasteboard circle in the box may be turned about. There must also be a needle P, which must turn freely on the axis, without moving the circular pasteboard. In each of the seven divisions of the central circle write a different question; and in another circle, divided into 12 parts, write the names of the 12 months. In each of the seven circles write two answers to each question, observing that there must be but seven words in each answer, in the following manner. In the first division of the circle G (fig. 47.), which is opposite to the first question, write the first word of the first answer. In the second division of the next circle, write the second word, and so on to the last word, which will be in the seventh division of the seventh circle.

In the eighth division of the first circle, write the first word of the second answer; in the ninth division of the second circle, write the second word of the same answer, and so on to the 14th division of the seventh circle, which must contain the last word of that answer. The same must be done with all the seven questions, and to each of them must be assigned two answers, the words of which must be dispersed through the seven circles. At the centre of each of these circles place a pivot, and have two magnetized needles, the pointed end of one of which must be north, and the other south, QR (fig. 48.) Now, the index of the central circle being directed to any one of the questions, if you place one of the two magnetic needles on each of the seven lesser circles, they will fix themselves according to the direction of the bars on the correspondent circles at the bottom of the box, and consequently point to the seven words which compose the answer. If you place one of the other needles on each circle, it will point to the words that are diametrically opposite to those of the first answer; the north pole being in the place of the south pole of the other. Therefore, present this planetarium to any person, and desire him to choose one of the questions there written; and then set the index of the central circle to that question; putting one of the needles on each of the seven circles, turn it about; and when they all settle, they will point to the seven words that compose the answer. The two answers may be one favourable and the other unfavourable, and the different needles will serve to diversify the answers when the experiment is repeated.

There may be also a moveable needle to place against the names of the months; and when the party has fixed upon a question, place that needle against the month in which he was born, which will give the business a more mysterious air. On the centre of the large circle may be the figure of the sun; and on each of the seven small

er circles one of the characters of the principal planets. This experiment, well executed, is one of the most entertaining produced by magnetism.

Provide a box XY (fig. 49.), 18 inches long, nine wide, and two deep, the top of which is to slide off and on at the end Y. Towards the end X, describe a circle of six inches diameter, around which are to be fixed six small vases of wood or ivory, of an inch and a half high, and to each of them there must be a cover. At the end Y place an egg B, of ivory or some such material, about three inches and a half high, with a cover that shuts by a hinge, and fastens with a spring. It must be fixed on the stand C, through which, as well as the bottom of the egg, and the part of the box directly underneath, there is a hole of one-third of an inch diameter. In this cavity place an ivory cylinder F, that can move freely, and which rises or falls by means of the spring R. You must have a thin copper basin, A, of six inches diameter, which is to be placed on the centre of the circle next X, and consequently in the middle of the six vases. Let a proper workman construct the movement expressed by fig. 50. which is composed of a quadrant G, that has 16 teeth; and is moveable about an axis in the stand H, that has an elbow, by which it is screwed to the bottom of the box at L. To the quadrant there must be joined the straight piece K. The horizontal wheel M has 24 teeth, and is supported by the piece S, which is screwed to the end of the box next Y. On the axis of this wheel place a brass rod OP, five inches long; and at the part O place a large bar or horse shoe, of a semicircular form, and about two inches and a half diameter, strongly impregnated. The steel rod V, takes at one end the teeth of the quadrant G, by the pinion F, and at the other end the wheel M, by the perpendicular wheel N, of 30 teeth; the two ends of this rod are supported by the two stands that hold the other pieces. Under the piece K, that joins to the quadrant, must be placed the spring R, by which it is raised, and pushes up the cylinder that goes through the stand C into the egg. You must also have six small cases as Y, Y, Y, Y, Y, Y. These must be of the same circumference with the cylinder in the stand, and round at their extremities; their length must be different, that when they are placed in the egg, and the lower end enters the hole in which is the cylinder, they may thrust it down more or less, when the top of the egg against which they press is fastened down; and thereby lower the bar that is fixed to the end of the quadrant, and consequently by means of the pinion Z and wheels NM turn the horse shoe that is placed upon the axis of the last wheel. The exact length of these cases can be determined by trials only; but these trials may be made with round pieces of wood. In each of these cases place a different question, written on a slip of paper and rolled up, and in each of the vases put the answer to one of the questions; as you will know, by trials, where the magnetic bar or horse shoe will stop. Lastly, Provide a small figure of a swan, of cork or enamel, in which fix a touched needle, of the largest size of those commonly used in sewing.

Being thus prepared, offer a person the six cases, and desire him to choose any one of them, and conceal the rest, or give them to different persons. He is then to open his case, read the question to himself, and return the case, after replacing the question. You then put the

Magnetic
Recrea-
tions.

40

The sagacious swan.
Fig. 49.

the case in the egg, and placing the swan in the basin on the water, you tell the company she will soon discover in which of the vases the answer is contained. The same experiment may be repeated with all the cases.

SECT. XI. *Recreations and Contrivances relating to MECHANICS.*

In the article MECHANICS, we have described some of the lighter experiments by which the principles of that science are illustrated, and have explained the construction and action of several ingenious and useful machines. In particular, we have described the windmill at N° 428.; several carriages that are capable of moving without horses, at Nos. 455, 456, 457, and 458.; a carriage that cannot be overturned, at N° 459.; Atwood's machine for illustrating the doctrines of accelerated and retarded motion, at N° 460.; a machine for illustrating the theory of the wedge, at 467.; a machine for illustrating the effects of the centrifugal force in flattening the poles of the earth, at 468.; a machine for trying the strength of materials, at 469.; a machine in which all the mechanical powers are united, 470.; Fiddler's balance at 471.; an improvement in the balance, 472.; a machine for showing the composition of forces, at 473.; Smeaton's machine for experiments on windmill sails, at 474.; Smeaton's machine for experiments on rotatory motion, at 475.; Prony's condenser of forces, at 476.; a portable stone crane for loading and unloading carts, with several other cranes, at 477, 478, 479, 480, and 482.; Bramah's jib for cranes, at 481.; the common worm-jack, at 483.; a portable loading and unloading machine, at 484.; Vauloué's pile engine, at 485. and Bunce's pile engine at 486. We have also, in the articles ANDROIDES and AUTOMATON, described several ingenious contrivances for producing various animal motions by means of machinery, or what is commonly called clock-work, especially M. Vaucanson's flute-player, and M. Kempell's chess-player.

In the present article we shall first present our readers with a few mechanical contrivances that may properly be called amusing; shall give the substance of an ingenious paper on the philosophical uses of a common watch; and shall conclude the section with an account of Edgeworth's *Panorganon*, or universal machine for illustrating the effect of the mechanical powers.

- 42 *To support a pail of water by a stick, only one half of which, or less, rests on the edge of a table.*

Fig. 51.

Let AB (fig. 51.) be the top of the table, and CD the stick that is to support the bucket. Convey the handle of the bucket over this stick, in such a manner, that it may rest on it in an inclined position, as IH, and let the middle of the bucket be a little within the edge of the table. That the whole apparatus may be fixed in this situation, place another stick as GFE, with one end, G, resting against the side of the bucket at the bottom, while its middle, F, rests against the opposite edge of the bucket at the top, and its other extremity, E, rests against the first stick CD, in which a notch should be cut to retain it. By these means the bucket will remain fixed in that situation, without inclining to either side; and if not already full of water, it may be filled

with safety, for its centre of gravity being in the vertical line passing through the point H, which meets with the table, it is evident that the pail is in the same circumstances as if it were suspended from that point of the table where the vertical line would meet the edge. It is also evident that the stick cannot slide along the table, nor move on its edge, without raising the centre of gravity of the bucket, and of the water which it contains. The heavier it is, therefore, the more stable will be its position.

According to this principle, various other tricks of the same kind, which are generally proposed in books on mechanics, may be performed. For example, provide a bent hook DGF, as seen at the opposite end of the same figure, and insert the part, FD, in the pipe of a key at D, which must be placed on the edge of a table: from the lower part of the hook suspend a weight G, and dispose the whole in such a manner that the vertical line GD may be a little within the edge of the table. When this arrangement has been made, the weight will not fall; and the case will be the same with the key, which, had it been placed alone in that situation, would perhaps have fallen; and this resolves the following mechanical problem, proposed in the form of a paradox: *A body having a tendency to fall by its own weight, how to prevent it from falling, by adding to it a weight on the same side on which it tends to fall.*

To construct a figure which, without any counterpoise, shall always raise itself upright, and preserve or regain that position, however it may be disturbed.

Let a figure, resembling a man, ape, &c. be formed of some very light substance, such as the pith of elder, which is soft, and can easily be cut into any required figure. Then provide a hemispherical base of some very heavy substance, such as lead. The half of a leaden bullet made very smooth on the convex part will be very proper for this purpose. If now the figure be cemented to the plain part of this hemisphere; in whatever position it may be placed it will rise upright as soon as it is left to itself; for the centre of gravity of its hemispherical base being in the axis, tends to approach the horizontal plain as much as possible. This it cannot attain till the axis becomes perpendicular to the horizon; but as the small figure, on account of the disproportion between its weight and that of the base, scarcely deranges the latter from its place, the natural perpendicularity of the axis is easily regained in all positions.

According to this principle were constructed the small figures called Prussians, which some years ago constituted one of the amusements of young people. They were formed into battalions, and being made to fall down by drawing a rod over them, immediately started up again as soon as it was removed. On the same principle screens have been constructed, so as to rise of themselves when they happen to be thrown down.

To make a body ascend along an inclined plane in consequence of its own gravity.

Let a body be constructed of wood, ivory, or some such material, consisting of two equal right cones united by

M
R
ca-
is.
Fig. 2.

by their bases, as EF (fig. 52.); and let two straight, flat, smooth rulers, as AB, CD, be so placed as to join in an angle at the extremities A, C, and diverge towards BD, where they must be a little elevated, so that their edges may form a gently inclined plane. If now the double cone be placed on the inclining edges, pretty near the angle, it will roll towards the elevated ends of the rulers, and thus appear to ascend; for the parts of the cone that rest on the rulers, growing smaller as they go over a larger opening, and thus letting down the larger part of the body, the centre of gravity descends, though the whole body seems to rise along the inclined plane.

To insure the success of this experiment, care must be taken that the height of the elevated ends of the rulers be less than the radius of the circle forming the base of the cones.

4 *Explanation of the upright Position preserved in a Top or Tee-totum while it is revolving.*

This is explained on the principle of centrifugal force, which teaches us that a body cannot move in a circular direction, without making an effort to fly off from the centre; so if it be confined by a string made fast in that centre, it will stretch the string in proportion as the circular motion is more rapid. See DYNAMICS. It is this centrifugal force of the parts of the top or tee-totum that preserves it in an upright position. The instrument being in motion, all its parts tend to fly off from the axis, and that with greater force the more rapid the revolution. Hence it follows that these parts are like so many powers acting in a direction perpendicular to the axis. As, however, they are all equal, and pass rapidly round by the rotation, the instrument must be in *equilibrio* on its point of support, or the extremity of the axis on which it turns. The motion is gradually impeded by the friction of the axis against the surface on which it moves; and we find that the instrument revolves for a longer time, in proportion as this friction is avoided by rendering very smooth the surfaces of the axis, and the plane on which it moves.

5
Philosophical
values of
a common
wa.

There are many observations and experiments in different departments of science, the accuracy of which depends greatly, and in some cases entirely, on the accurate measurement of minute portions of time; such, for instance, as the determination of the velocity of sound, the nature of the descent of falling bodies, the measure of the sun's diameter, the distance of two contiguous, or at least apparently contiguous, heavenly bodies taken at their passage over the meridian, and the distance of places from the difference of the velocity of light and sound. A pendulum for swinging seconds has usually been employed for these and similar purposes, and in an observatory is found to be very convenient; but a watch, by being more portable, is calculated to be more general in its application, and will measure smaller portions of time than any other instrument that has been invented. Besides, it possesses this peculiar advantage, that in all situations its beats may be counted by the ear, at the same time that the object of observation is viewed by the eye, so that no loss is incurred, as must inevitably happen, when the eye is used to view both the object and pendulum in succession, should this latter be ever so quick. But it will be objected here, that few

watches measure time accurately, and that, from the different constructions of watches, the times corresponding to their beats vary in a very considerable degree. We allow these objections to be true, and conceive that to them the reason may be attributed, why the beat of a watch is not generally applied as the measure of the lowest denomination of subdivisions of time. We shall therefore endeavour to obviate these objections, by showing how any tolerably good watch, whatever be its construction, may be applied with advantage to many philosophical purposes.

We must, in the first place, consider, that the portions of time which we propose to measure by a watch are small, and those to be counted not by a second-hand, as is the custom with medical men, but altogether by the beats; in which case, if the watch be not liable to lose or gain time considerably in a day, the error in the rate of going will be extremely minute in the time corresponding to any number of beats that the memory can retain, or that the purposes to which we propose the application to be made will require; and even if the error in the rate of going be considerable, so as to amount to several minutes in a day, as it is uniform, it may easily be allowed for by a correction. Thus, if the error were five minutes per day, the allowance would be upwards of $\frac{1}{360}$ th part. Hence the first objection, which relates to the error occasioned by the rate of going of any watch, will constitute no real obstacle to its application in the ascertaining of small portions of time, provided a sudden change of temperature be avoided at the time of using it; for it will be necessary that the rate of going be estimated when the temperature is the same, as when the watch is used for philosophical purposes; so that if it is usually worn in the pocket, it may be held in the hand to the ear, but if it be hanging in a room or in the open air where the rate of going is ascertained, it must be hung near the ear, under similar circumstances, where any observation is intended to be made by it.

As to the other objection, which applies to the variation in the lengths of the beats of two different watches, owing to the difference of their constructions, though they indicate hours and minutes alike, it may be very readily removed. All common watches have the same number of wheels and pinions, which are known by the same names, and placed, no matter how variously, so as to act together without interruption; but all watches have not their corresponding wheels and pinions divided into the same number of teeth and spaces; and from this circumstance the beats of different watches differ from each other. As the rate of going of a watch is regulated by the lengthening or shortening of a spring, without any regard being had to the numbers which compose the teeth of the wheels and pinions, a great latitude is allowable in the calculation of those numbers; of which the different makers avail themselves according as the numbers on the engines they use for cutting the teeth require; but whatever the numbers may be of which the wheel-work consists, if we divide double the product of all the wheels, from the centre wheel to the crown wheel inclusively, by the product of all the pinions with which they act, the quotient will invariably be the number of beats of the watch in question in one hour; and again, if we divide this quotient by 3600, the number of seconds in an hour, this latter quotient

will be the number of beats in every second, which may be carried to any number of places in decimals, and be copied upon the watch-paper for inspection whenever it may be wanted.

When any particular watch is cleaned, the workman may be directed to count, and return in writing, the numbers of the centre wheel, the third wheel, the contrate wheel, and the crown (balance) wheel, and also of the three pinions which they actuate, respectively, from which the calculation of the length of a beat is easily made by the rule just given, and, when once made, will apply in all instances where that individual watch is used. It may be remarked here, that no notice is taken of the wheels and pinions which constitute the dial work, or of the great wheel and pinion with which it acts; the use of the former of these is only to make the hour and minute hands revolve in their respective times, and may or may not be the same in all watches; and the use of the latter, the great wheel and its pinion, is to determine in conjunction with the number of spirals on the fusee, the number of hours that the watch shall continue to go, at one winding up of the chain round the barrel of the mainspring. All these wheels and pinions, therefore, it will be perceived, are unnecessary to be taken into the account in calculating the beats per hour. The reason why double the product of the wheels specified is taken in the calculation is, that one tooth of the crown wheel completely escapes the palats at every two beats or vibrations of the balance.

A few examples of the numbers exhibited in the wheels of some common watches will render the general rule which we have laid down more intelligible. We shall take four examples, the first expressing the numbers of a common watch, as given by Mr Emerson. In this watch the centre wheel contained 54 teeth, its pinion 6 teeth; the third wheel 48 teeth, its pinion 6; the contrate wheel 48 teeth, and its pinion 6; the crown wheel 15 teeth, besides 2 palats. Now, we have $54 \times 48 \times 48 \times 15 \times 2 = 3732480$ for double the product of the specified wheels, and $6 \times 6 \times 6 = 216$ for the product of the specified pinions; also $\frac{3732480}{216} = 17280$ are the number of beats in an hour: accordingly Mr Emerson says that this watch makes about 4.75 beats in a second. The number of spirals on the fusee is 7; therefore $7 \times \frac{48}{12} = 28$, the number of hours that the watch will go at one winding up: likewise the dial work $\frac{40}{10} \times \frac{36}{12} = \frac{1440}{120} = 12$ shews that whilst the first driving pinion of 10 goes 12 times round, the last wheel of 36 goes only once; whence the angular velocity of two hands carried by their hollow axles are to each other as 12 to 1.

In a second example the numbers in the calculation of beats per second will be as follows, $60 \times 60 \times 60 \times 13 \times 2 = 5616000 =$ double the product of the wheels, and $8 \times 8 \times 6 = 384$, the product of the pinions; then $\frac{5616000}{384} = 14625 =$ the number of beats in an hour, and $\frac{14625}{3600} = 4.0625$, the number of beats per second.

In a third watch the numbers require the following calculation, $54 \times 52 \times 52 \times 13 \times 2 = 3796416$, for dou-

ble the product of the wheels, and $6 \times 6 \times 6 = 216$, the product of the pinions: therefore $\frac{3796416}{216} = 17576$,

the beats in an hour, and $\frac{17576}{3600} = 4.882$, beats per second.

In a fourth, $56 \times 51 \times 50 \times 13 \times 2 = 3712800$, double the product of the wheels, and $6 \times 6 \times 6 = 216$, the product of the pinions, consequently $\frac{3712800}{216}$ gives 17188 beats in an hour, which, divided by 3600, gives 4.7746 for the beats per second.

It remains now to adduce an example or two of the mode of applying the beats of a watch to philosophical purposes.

For one example let us suppose with Dr Herschel, that the annual parallax of the fixed stars may be ascertained by observing how the angle between two stars, very near to each other, varies in opposite parts of the year. For the purpose of determining an angle of this kind, where an accurate micrometer is wanting, let a telescope that has cross wires be directed to the stars when passing the meridian, in such a manner that the upright wire may be perpendicular to the horizon, and let it remain unmoved as soon as the former of the two stars is just coming into the field of view; then fixing the eye to the telescope and the watch to the ear, repeat the word *one* along with every beat of the watch before the star is arrived at the perpendicular hair, until it is in conjunction with it, from which beat go on *two, three, four, &c.* putting down a finger of either hand at every twenty till the second star is seen in the same situation that the leading one occupied at the commencement of the counting; then, these beats divided by the beats per second, marked on the watch-paper, will give the exact number of uncorrected seconds, by which the following star passes later over the meridian than the leading one. When these seconds and parts of a second are ascertained, we have the following analogy for determining the angle, which includes also the correction, namely,—as $23^{\text{h}} 56' 4'' 098$ (the length of a sidereal rotation of the earth), plus or minus the daily error in the rate of going, are to 360° ; so is the number of observed seconds of time, to the quantity of the horizontal angle required. The watch is here supposed to be regulated to show solar time; but if it should be regulated exactly for sidereal time, instead of $23^{\text{h}} 56' 4'' 098$, we must use exactly 24 hours in the analogy.

As a second instance, let it be required to ascertain the distance of the nearer of two electrified clouds from an observer when there are successive peals of thunder to be heard: a little time before the expected repetition of a flash of lightning place the watch at the ear, and commence the numbering of the beats at the instant the flash is seen, as before directed, and take care to cease with the beginning of the report. Then the beats converted into seconds, with the proportional part of the daily error added or subtracted, will give the difference of time taken up by the motion of the light and sound. If, lastly, we suppose light to be instantaneous at small distances, the distance of the nearer cloud will be had by multiplying the distance that sound is known to pass through in a second by the number of observed seconds obtained from the beats that were counted.

Many more instances might be pointed out, in which the beats of a good watch would be extremely serviceable in the practical branches of philosophy; but the occurrence of such instances will always point out the propriety of the application, when it is once known and practised.

We shall therefore mention only one further advantage which seems peculiar to this mode of counting a limited number of seconds by a watch, namely, that it is free from any error which might arise from the graduations of a dial-plate, or unequal divisions in the teeth of wheels and pinions, where the seconds are counted by a hand.

In order to introduce this method of measuring small portions of time accurately, it is desirable that a watch be constructed so as to make an exact number of beats per second without a fraction, for then the reduction of beats into seconds would be more readily made. With the view of promoting this object, Mr William Pearson has calculated numbers for a watch, which will produce the desired effect, and which, as they are equally practicable with those in use, we shall here insert. By the method of arrangement already given, the numbers proper for such a watch, as will indicate hours, minutes, and seconds, by three hands, and also make just four beats per second, will stand thus, viz.

- 50 great wheel
- 10—60 centre wheel
- 8—64 third wheel
- 8—48 contrate wheel
- 6—15 crown wheel
- 2 palats.

Dial work as usual.
Six spirals on the fusee—to go 30 hours.

By the preceding general rule for ascertaining the beats per second in any watch, the calculation of these numbers will be thus: $60 \times 64 \times 48 \times 15 \times 2 = 5529600$,

and $8 \times 8 \times 6 = 384$; then $\frac{5529600}{384} = 14400$ the beats

in an hour, and $\frac{14400}{3600} = 4$ exactly, for the beats per second; which agreement with the rule is a proof of the accuracy of the numbers.

Before we conclude this subject, we may caution medical gentlemen against an imposition which is practised by some watchmakers in the sale of watches with second hands. It is no uncommon thing with some of these workmen to put a second hand with a stop and an appropriate face to a watch, the wheel work of which is not calculated for indicating seconds. The second watch, the numbers of which are set down a little above, was of this kind. In this watch that part of the train which lay between the axle of the centre wheel and that of the contrate wheel on which the hands are placed, viz. $\frac{60}{8} \times \frac{60}{8} =$ to only 56.25, instead of 60, so that $3\frac{3}{4}$ seconds are deficient in every minute, a deficiency which in 16 minutes is equal to a whole revolution of the second hand. *

For the purpose of bringing to our assistance the sense of feeling, in teaching the use of the mechanic powers, Mr Edgeworth has constructed the following apparatus, to which he gives the name of *panorganon*.

It is composed of two principal parts, a frame for

containing the moving machinery, and a capstan or windlass erected on a *sill* or plank that is sunk a few inches into the ground. By these means, and by braces or props, the frame is rendered steady. The cross rail or *transom* is strengthened by braces, and a *king-post* to make it lighter and cheaper. The capstan consists of an upright shaft, on which are fixed two drums (about either of which a rope may be wound), and two arms or levers, by which the capstan may be turned round. There is also an iron screw fixed round the lower part of the shaft, to show the properties of the screw as a mechanic power. The rope which goes round the drum, passes over one of the pulleys near the top of the frame, and below another pulley near the bottom. As two drums of different sizes are employed, it is necessary to have an upright roller, for conducting the rope to the pulleys in a proper direction, when either of the drums is used. Near the frame, and in the direction in which the rope runs, is made a platform or road of deal boards, one board in breadth and 20 or 30 feet long, on which a small sledge loaded with different weights may be drawn.

Fig. 53. represents the principal parts of this apparatus. FF, the frame; *b, b*, braces to keep the frame steady; *a, a, a*, angular braces, and a king post to strengthen the transom; S, a round taper shaft, strengthened above and below the mortises, through which the levers pass, with iron hoops; *L d*, two arms or levers by which the shaft, &c. are to be moved round; DD, the drums, which are of different circumferences; R, the roller to conduct the rope; P, the pulley, round which the rope passes to the larger drum; P 2, another pulley to answer to the smaller drum; P 3, a pulley through which the rope passes when experiments are made with levers, &c.; P 4, another pulley through which the rope passes when the sledge is used; R o, the road of deal boards for the sledge to move on; S l, the sledge with pieces of hard wood attached to it to guide it on the road.

As this machine is to be moved by the force of men or children, and as this force varies, not only with the strength and weights of each individual, but also according to the different manner in which that strength or weight is applied, we must in the first place establish one determinate mode of applying human force to the machine, as well as a method of determining the relative force of each individual, whose strength is employed in setting it in motion.

1. To estimate the force with which a person can draw horizontally by a rope over his shoulder.

Hang a common long scale-beam (without scales or chains) from the top or *transom* of the frame, so that one end of it may come within an inch of one side or post of the machine. Tie a rope to the hook of the scale-beam, where the chains of the scale are usually hung, and pass it through the pulley P 3, which is about four feet from the ground; let the person pull this rope from 1 towards 2, turning his back to the machine, and pulling the rope over his shoulder (fig. 58.) As the pulley may be either too high or too low to permit the rope to be horizontal, the person who pulls it should be placed 10 or 15 feet from the machine, which will lessen the angular direction of the cord, and thus diminish the inaccuracy of the experiment.

Fig. 58.

ment. Hang weights to the other end of the scale-beam, till the person who pulls can but just walk forward, pulling fairly without knocking his feet against any thing. This weight will estimate the force with which the person can draw horizontally by a rope over his shoulder.

Let a child who tries this, walk on the board with dry shoes; let him afterwards chalk his shoes, and then try it with his shoes soaped. He will find that he can pull with different degrees of force in these different circumstances. When he makes the following experiments, however, let his shoes be always dry, that he may always exert the same degree of force.

49 2. To shew the force of the three different kinds of Levers.

Fig. 54, 55. The lever L (fig. 54.) is passed through a socket (fig. 55.) in which it can be shifted from one of its ends towards the other, so that it may be fastened at any place by the screw of the socket. This socket has two gudgeons, upon which both the socket and the lever which it contains can turn. The socket and its gudgeons can be moved out of the hole in which it plays between the rails RR (fig. 54.), and may be put into other holes at RR, (fig. 57.).

Hook the cord that comes over the person's shoulder to the end I, of the lever L. Loop another rope to the other end of this lever, and let the person pull as before. Perhaps it should be pointed out that the person must walk in a direction contrary to that in which he walked before, viz. from 1 towards 3 (fig. 53.). The height to which the weight ascends, and the distance to which the person advances, should be carefully marked and measured; and it will be found, that he can raise the weight to the same height, advancing through the same space as in the former experiment. In this case, as both ends of the lever moved through equal spaces, the lever only changed the direction of the motion, and added no mechanical power to the direct strength of the person.

Fig. 56.

3. Shift the lever to its extremity in the socket; the middle of the lever will now be opposite to the pulley (fig. 56.); hook to it the rope that goes through the pulley P 3, and fasten to the other end of the lever the rope by which the person is to pull. This will be a lever of the second kind, as it is called in books of mechanics; in using which, the resistance is placed between the centre of motion or fulcrum and the moving power. He will now raise double the weight that he did in experiment 2. and he will advance through double the space.

Fig. 57.

4. Shift the lever, and the socket which forms the axis, (without shifting the lever from the place in which it was in the socket in the last experiment) to the holes that are prepared for it at RR, (fig. 57.). The free end of the lever E will now be opposite to the rope, and to the pulley (over which the rope comes from the scale beam). Hook this rope to it, and hook the rope by which the person pulls to the middle of the lever. The effect will now be different from what it was in the last two experiments; the person will advance only half as far, and will raise only half as much weight as before. This is called a lever of the third kind.

The experiments upon levers may be varied at pleasure, increasing or diminishing the mechanical advantage, so as to balance the power and the resistance, to

accustom the learners to calculate the relation between the power and the effect in different circumstances, always pointing out that whatever excess there is in the power, or in the resistance, is always compensated by the difference of space through which the power passes.

The experiments which we have mentioned are sufficiently satisfactory to a pupil, as to the immediate relation between the power and the resistance; but the different spaces through which the power and the resistance move when one exceeds the other, cannot be obvious, unless they pass through much larger spaces than levers will permit.

5. To show the different space through which the power and resistance move in different circumstances.

Place the sledge on the farthest end of the wooden road (fig. 53.): fasten a rope to the sledge, and conduct it through the lowest pulley P 4, and through the pulley P 3, so that the person may be enabled to draw it by the rope passed over his shoulder. The sledge must now be loaded, till the person can but just advance with short steps steadily upon the wooden road; this must be done with care, as there will be but just room for him beside the rope. He will meet the sledge exactly on the middle of the road, from which he must step aside to pass the sledge. Let the time of this experiment be noted. It is obvious that the person and the sledge move with equal velocity, there is therefore no mechanical advantage obtained by the pulleys. The weight that he can draw will be about half a hundred, if the weight be about nine stones; but the exact force with which the person draws is to be known by experiment 1.

6. To the largest drum (fig. 53.) fasten a cord, and pass it through the pulley P downwards, and then through the pulley P 4, to the sledge placed at the end of the wooden road which is farthest from the machine. Let the person, by a rope fastened to the extremity of one of the arms of the capstan, and passed over his shoulder, draw the capstan round; he will wind the rope round the drum, and draw the sledge upon the road. To make the sledge advance 24 feet upon its road, the person must have walked circularly 144 feet which is six times as far, and he will be able to draw about three hundred weight, which is six times as much as in the last experiment.

It may now be pointed out, that the difference of space, passed through by the power in this experiment, is exactly equal to the difference of weight which the person could draw without the capstan.

7. Let the rope be now attached to the smaller drum; the person will draw nearly twice as much weight upon the sledge as before; and will go through double the space.

8. Where there is a number of persons, left five or six of them, whose power of drawing (estimated as in experiment 1.) amounts to six times as much as the force of the person at the capstan, pull at the end of the rope which was fastened to the sledge; they will balance the force of the person at the capstan: either they or he, by a sudden pull may advance, but if they pull fairly, there will be no advantage on either side. In this experiment the rope should pass through the pulley P 3, and should be coiled round the larger drum. And it must also

also be observed, that in all experiments upon the motion of bodies, on which there is much friction, as where a sledge is employed, the results are never so uniform as under other circumstances.

9. Upon the pulley we shall say little, as it is in every body's hands, and experiments may be tried upon it without any particular apparatus. It should, however, be distinctly inculcated, that the power is not increased by a fixed pulley. For this purpose, a wheel without a rim, or, to speak with more propriety, a number of spokes fixed in a nave, should be employed, (fig. 61.). Pieces like the heads of crutches should be fixed at the ends of these spokes, to receive a piece of girthweb, which is used instead of a cord, because a cord would be unsteady; and a strap of iron with a hook to it should play upon the centre, by which it may sometimes be suspended, and from which at other times a weight may be hung.

Let this skeleton of a pulley be hung by the iron strap from the transom of the frame; fasten a piece of web to one of the radii, and another to the end of the opposite radius. If two persons of equal weight pull these pieces of girthweb, they will balance each other; or two equal weights hung to these webs, will be in equilibrio. If a piece of girthweb be put round the aftermost radius, two equal weights hung at the ends of it will remain immovable; but if either of them be pulled, or if a small additional weight be added to either, it will descend, and the web will apply itself successively to the ascending radii, and will detach itself from those which are descending. If this movement be carefully considered, it will be perceived that the web, in unfolding itself, acts in the same manner upon the radii, as two ropes would, if they were hung to the extremities of the opposite radii in succession. The two radii which are opposite, may be considered as a lever of the first kind, when the centre is in the middle of the lever: as each end moves through an equal space, there is no mechanical advantage. But if this skeleton-pulley be employed as a common *block* or *tackle*, its motions and properties will be entirely different.

10. Nail a piece of girthweb to a post, at the distance of three or four feet from the ground; fasten the other end of it to one of the radii (see fig. 61.). Fasten another piece of web to the opposite radius, and let a person hold the skeleton-pulley suspended from the web; hook weights to the strap that hangs from the centre. The end of the radius to which the fixed girthweb is fastened will remain immovable; but if the person pulls the web which he holds in his hand upwards, he will be able to lift nearly double the weight which he can raise from the ground by a simple rope without the machine, and he will perceive that his hand moves through twice as great a space as the weight descends: he has therefore the mechanical advantage, which he would have by a lever of the second kind. Let a piece of web be put round the under radii, let one end of it be nailed to the post, and the other be held by the person, and it will represent the application of a rope to a moveable pulley; if its motion be carefully considered, it will appear that the radii, as they successively apply themselves to the web, represent a series of levers of the second kind.

Upon the wooden road lay down a piece of girthweb; nail one end of it to the road; place the pulley upon the web at the other end of the board; and bring-

ing the web over the radii, let the person taking hold of it, draw the loaded sledge fastened to the hook at the centre of the pulley; he will draw nearly twice as much in this manner as he could without the pulley.

Here the web lying in the road shows more distinctly, that it is quiescent where the lowest radius touches it; and if the radii, as they tread upon it, are observed, their points will appear at rest, while the centre of the pulley will proceed as fast as the sledge, and the top of each radius successively will move twice as far as the centre of the pulley and the edge.

If a person holding a stick in his hand, observes the relative motions of the top and the middle, and the bottom of the stick, whilst he inclines it, he will see that the bottom of the stick has only half the motion of the top. This property of the pulley has been considered more at large, because it elucidates the motion of a wheel rolling upon the ground; and it explains a common paradox, which appears at first inexplicable, the bottom of a rolling wheel never moves upon the road. This is asserted only of a wheel moving over hard ground, which, in fact, may be considered rather as laying down its circumference upon the road, than as moving upon it.

11. *The inclined Plane and the Wedge.*

The *inclined plane* is to be next considered. When a heavy body is to be raised, it is often convenient to lay a sloping artificial road of planks, upon which it may be pushed or drawn. This mechanical power, however, is but of little service without the assistance of wheels or rollers; we shall therefore speak of it as it is applied in another manner, under the name of the *wedge*, which is in fact a moving inclined plane; but if it be required to explain the properties of the inclined plane by the panorganon, the wooden road may be raised and set to any inclination required, and the sledge may be drawn upon it as in the former experiments.

Let one end of a lever, N (fig. 59.), with a wheel at one end of it, be hinged to the post of the frame, by means of a gudgeon driven or screwed into the post. To prevent this lever from deviating sideways, let a slip of wood be connected with it by a rail, which shall be part in the lever, but which may move freely in a hole in the rail. The other end of this slip must be fastened to a stake driven into the ground at three or four feet from the lever, at one side of it, and towards the end in which the wheel is fixed (fig. 62.), in the same manner as the treadle of a common lathe is managed, and as the treadle of a loom is sometimes guided.

12. Under the wheel of this lever place an inclined plane (fig. 59.) on the wooden road, with rollers under it, to prevent friction; fasten a rope to the foremost end of the wedge, and pass it through the pulleys (P 4 and P 3), as in the fifth experiment; let a person draw the sledge by this rope over his shoulder, and he will find, that as it advances it will raise the weight upwards; the wedge is five feet long, and elevated one foot. Now, if the perpendicular ascent of the weight, and the space through which he advances, be compared, he will find that the space through which he has passed will be five times as great as that through which the weight has ascended; and that *this* wedge has enabled him to raise five times as much as he could raise without it, if his strength were applied as in experiment 1. without any mechanical

mechanical advantage. By making this wedge in two parts hinged together, with a graduated piece to keep them asunder, the wedge may be adjusted to any given obliquity; and it will always be found, that the mechanical advantage of the wedge may be ascertained by comparing its perpendicular elevation with its base. If the base of the wedge be 2, 3, 4, 5, or any other number of times greater than its height, it will enable the person to raise respectively 2, 3, 4, or 5 times more weight than he could do in experiment 1. by which his power is estimated.

54

13. *The Screw.*

The screw is an inclined plane wound round a cylinder: the height of all its revolutions round the cylinder taken together, compared with the space through which the power that it turns passes, is the measure of its *mechanical advantage*. Let the lever used in the last experiment be turned in such a manner as to reach from its gudgeon to the shaft of the Panorganon, guided by an attendant lever as before (fig. 60.). Let the wheel rest upon the lowest *helix* or thread of the screw; as the arms of the shaft are turned round, the wheel will ascend, and carry up the weight which is fastened to the lever. As the situation of the screw prevents the weight from being suspended exactly from the centre of the screw, proper allowance must be made for this in estimating the force of the screw, or determining the mechanical advantage gained by the lever. This can be done by measuring the perpendicular ascent of the weight, which in all cases is useful, and more expeditious, than measuring the parts of a machine, and estimating its force by calculation; because the different diameters of ropes, and other small circumstances, are frequently mistaken in estimates—both methods should be employed and their results compared. The space passed through by the moving power, and by that which it moves, are infallible data for estimating the powers of engines.

Fig. 60.

Two very material subjects of experiment yet remain for the Panorganon; friction, and wheels of carriages; but perhaps we may be thought to have extended this section beyond its just proportion to the rest of the article, in which it is not intended to write a treatise upon science, but to point out methods of initiating young people in the rudiments of knowledge, and of giving them a distinct view of those principles on which they are founded. No preceptor who has had experience will cavil at the superficial knowledge of a boy of 12 or 13 upon these subjects; he will perceive that the general view which we wish to give, must tend to form a taste for literature and investigation. The *sciolist* has learned only to *talk*—we wish to teach our pupils to *think* upon the various objects connected with the present article.

The Panorganon may be employed in ascertaining the resistance of air and water; the force of different muscles; and in a great variety of amusing and useful experiments. In academies and private families, it may be erected in the place allotted for amusement, where it will furnish entertainment for many a vacant hour. When it has lost its novelty, the shaft may from time to time be taken down, and a swing may be suspended in its place. *

* *Edgeworth's Practical Education*, vol. ii. chap. xvii.

SECT. XII. *Recreations and Contrivances relating to OPTICS.*

IN the articles CATOPTRICS, DIOPTRICS, MICROSCOPE and PERSPECTIVE, we have described a variety of optical recreations, viz. under CATOPTRICS, Sec. III. CATOPTRICAL ILLUSIONS; the appearance of a boundless vista; a fortification apparently of immense extent; a surprising multiplication of objects; the *optical paradox*, by which opaque bodies are seemingly rendered transparent; the *magician's mirror*; the *perspective mirror*; the action of concave mirrors in inflaming combustible bodies, and the *real apparition*. Under DIOPTRICS, page 244 of Vol. VII. *optical illusions*; the *optical augmentation*, *optical subtraction*; the *alternate illusion*; the *dioptrical paradox*; the *camera obscura*; the method of showing the spots on the sun's disk, and magnifying small objects by means of the sun's rays; the *diagonal opera glass*; the construction and uses of the *magic lantern*; the *nebulous magic lantern*; method of producing the appearance of a *phantom* on a pedestal placed on the middle of a table; and the *magic theatre*. Under MICROSCOPE, besides fully explaining the construction of the several kinds of microscopes, and explaining their uses, we have given an account of a great variety of objects which are seen distinctly only by means of these instruments; such as the *microscopic animalcula*; the minute parts of *insects*; the structure of *vegetables*, &c.; and under PERSPECTIVE, we have described and explained the *anamorphosis*, an instrument for drawing in perspective mechanically, and the *camera lucida* of Dr Wollaston. Under OPTICS, Part III. Chap. I. we have explained the construction of the principal optical instruments, as *multiplying glasses*, *mirrors*, improvements on the *camera obscura*, by Dr Brewster and Mr Thomson; *microscopes*, *telescopes*, and various kinds of apparatus for measuring the intensity of light. Under PYROTECHNY, N° 150, we have shown how artificial fireworks may be imitated by certain optical deceptions.

At present we shall only describe one or two additional optical recreations, and explain the nature of the optical deception called *Phantasmagoria*.

Experiment to show the Blue Colour of Shadows formed in Day-Light.

Darken a room in daylight, or towards twilight, so that only a small proportion of light may enter by the shutter. Then holding a lighted candle near the opening of the shutter, cast the shadow of an object, such as a small ruler, on a white paper. There will in general be seen two shadows, the one blue, and the other orange; the former of which resembles the blue colour of the sky in clear sunshine, and is of a greater or less intensity according as the object is brought nearer to a focus.

For explanations of the blue colour of the sky, see OPTICS, Part II. Sect 4.

The Air-drawn Dagger.

An improved variety of the experiments described under CATOPTRICS, N° 14. by the name of the *real apparition*, is thus described by Montucla. Fig. 62. represents a different position of the mirror and partition from that described under CATOPTRICS, and one better adapted

adapted for exhibiting the fact by various objects. ABC is a thin partition of a room down to the floor, with an aperture for a good convex lens, turned outwards into the room nearly in a horizontal direction, proper for viewing by the eye of a person standing upright from the floor, or on a stool. D is a large concave mirror, supported at a proper angle, to reflect upwards through the glass in the partition B, images of objects at E, presented towards the mirror below. A strong light from a lamp, &c. being directed on the object E, and nowhere else; then to the eye of a spectator at F, in a darkened room, it is truly surprising and admirable to what effect the images are reflected up into the air at G.

Exhibitions of the appearances of spectres have sometimes been formed on the principles of this experiment; but the most striking deception of this kind is the *phantasmagoria*, which some winters ago formed one of the principal public amusements at Paris and London.

This exhibition was contrived by Mr Philipsthal, and was conducted in a small theatre, all the lights of which were removed, except one hanging lamp, and this could be drawn up, so that its flame was perfectly enveloped in a cylindrical chimney, or opaque shade. In this gloomy and wavering light the curtain was drawn up, and presented to the spectators a sort of cave, with skeletons and other figures of terror, painted or moulded in relievio on the sides or walls. After a short interval the lamp was drawn up into its chimney, and the spectators were in total darkness, interrupted only by flashes of lightning succeeded by peals of thunder. These phenomena were followed by the appearance of figures of departed men, ghosts, skeletons, transmigrations, &c. Several figures of celebrated men were thus exhibited with various transformations, such as the head of Dr Franklin, suddenly converted into a skull, &c. These were succeeded by phantoms, skeletons, and various terrific figures, which were sometimes seen to contract gradually in all their dimensions, till they became extremely small, and then vanished; while at others, instead of seeming to recede and then vanish, they were, to the surprise and astonishment of the spectators, made suddenly to advance, and then disappear, by seeming to sink into the ground.*

The principal part of these phenomena was produced by a modification of the magic lantern, having all its parts on a large scale, and placed on that side of a semi-transparent screen of taffeta which was opposite to the spectators, instead of the same side, as in the ordinary exhibitions of the magic lantern. To favour the deception, the sliders were made perfectly opaque, except in those places that contained the figures to be exhibited, and in these light parts the glass was covered with a more or less transparent tint, according to the effect required. The figures for these purposes have also been drawn with water colours on thin paper, and afterwards varnished. To imitate the natural motions of the objects represented, several pieces of glass placed behind each other were occasionally employed. By removing the lantern to different distances, and at the same time altering more or less the position of the lens, the images were made to increase or diminish, and to become more or less distinct at the pleasure of the exhibiter; so that, to a person unaccustomed to the effect of optical instruments, the figures appeared actually to advance and re-

tire. In reality, however, figures exhibited in this way become much brighter as they are rendered smaller, while in nature the imperfect transparency of the air causes objects to appear fainter when they are remote, than when they are nearer the observer. Sometimes, by throwing a strong light on an object really opaque, or on a living person, its image was formed on the curtain, retaining its natural motions; but in this case the object must have been at a considerable distance, otherwise the images of its nearer and remoter parts could never be sufficiently distinct at once, as the refraction must either be too great for the remoter, or too small for the nearer parts; and there must also be a second lens placed at a sufficient distance from the first, to allow the formation of an inverted image between them, and to throw a second erect picture of this image on the screen in its natural erect position, unless the object be of such a nature that it can be inverted without inconvenience*.

Dr Thomas Young proposes the following apparatus for an exhibition similar to the phantasmagoria. The light of the lamp A (fig. 63.) is to be thrown by the mirror B and the lenses C and D on the painted slider at E, and the magnifier F forms the image of the screen at G. This lens is fixed to a slider, which may be drawn out of the general support or box H; and when the box is drawn back on its wheels, the rod IK lowers the point K, and by means of the rod KL adjusts the slider in such a manner, that the image is always distinctly painted on the screen G. When the box advances towards the screen, in order that the images may be diminished and appear to vanish, the support of the lens F suffers the screen M to fall and intercept a part of the light. The rod KN must be equal to IK, and the point I must be twice the focal length of the lens F, before the object, L being immediately under the focus of the lens. The screen M may have a triangular opening, so as to uncover the middle of the lens only, or the light may be intercepted in any other manner.†

Mr Ezekiel Walker has lately constructed a new optical instrument, calculated for affording entertainment to those who derive pleasure from optical illusions. This instrument is called *phantascope*, and is so contrived, that a person standing before it sees a door opened, and a phantom make its appearance, coming towards him, and increasing in magnitude as it approaches, like those in the phantasmagoria. When it has advanced about 3 feet, it appears of the greatest magnitude, and as it retires, becomes gradually contracted in its dimensions, till it re-enters the machine, when it totally vanishes. This phantom appears in the air like a beautiful painting, and has such a rich brilliancy of colouring, as to render it unnecessary to darken the room. On the contrary, this aerial picture is seen with rather greater perfection when the room is illuminated. Fig. 64. represents a section of this machine, and will explain the principles of its construction.

ABCD, a wooden box, 36 inches by 21, and 22 deep. EF, a concave mirror, 15 inches diameter, placed near the end BD. AC, the other end, is divided into two parts at *m* by a horizontal bar, of which *m* is a section. A *m*, a door that opens to the left hand. *n o* a board with a circular opening, 10 inches diameter, covered with plate glass in that side next the mirror. GHI a drawer, opened at the end I, and covered at the top G *m* with tin plate. It is represented in the figure

figure as drawn out 16 inches. *a b* a moveable stage, 15 inches by 6, which slides freely upon the bottom of the drawer by means of a strong brass rod *c a*. *d x* a partition fixed to the stage *a b*, which is 15 inches long, and reaches nearly to the top of the drawer. *x* a circular aperture, 3 or 4 inches in diameter, made near the bottom of the partition, and at equal distances from each end of it. *z a*, a screen, $7\frac{1}{2}$ inches high by $4\frac{1}{2}$, covered with white paper on that side next the mirror. This screen prevents any light, reflected from the end of the drawer, from passing through the aperture *x*. *n p*, part of the cover, fixed as represented in the figure, to prevent the inside of the machine from being seen by the observer.

When this machine is used, take a painting on glass in transparent colours; place it against the aperture *x* in the partition on that side the mirror, and two short candles on the other side, between *z a* and *d x*. The glass must be perfectly opaque, except that part upon which the figure is painted; then the light which is transmitted through the painting and falls upon the mirror, is reflected into the air where the phantom is formed; but the phantom is much more beautiful than the painting, as the colouring receives a particular delicacy from the glasses.

When the painting is in the place represented in the figure, the phantom appears without the machine at *y*; but if the stage be drawn out to the end of the drawer *GH*, the phantom will appear within the machine at *r*, and very small. A very pleasing effect is also produced from a small painting on paper, or a coloured print put into the place of the painting on glass, with candles on the other side, near *b*.

Mr Walker has shown how this instrument may be employed to exhibit several phenomena in the heavens; as, for example, the appearance of Jupiter and his satellites, and the colour of Mars and the moon.

To represent Jupiter and his satellites as they appear through a common telescope, take a piece of paper stained very black, about 3 inches square, near the middle of which cut a hole perfectly circular, to represent the planet, and 4 small holes, in a line with the centre of the large one, for the satellites; but these must be cut out with a small punch, as it is difficult to make a circular hole with a sharp-pointed instrument. After this paper has been pasted on a piece of glass, rough-ground on one side, draw 3 or 4 lines across the planet with a black lead pencil to imitate the belts. From this simple contrivance the machine produces a very beautiful effect. The new moon represented in this way is a striking resemblance of the real object in the heavens: comets and fixed stars may also be represented by the same method.

The colour of Mars and of the moon, at rising or setting, may be imitated by covering the screen *z a* with paper stained red, which will reflect a ruddy tint upon the object placed at *x*; and this tint may be increased or decreased by only altering the situations of the candles. *

recreations.

SECT. XIII. Recreations and Contrivances relating to PNEUMATICS.

IN our treatise on PNEUMATICS, we have related several entertaining experiments, illustrating the principles of that science, such as experiments proving the fluidity of the air in N° 52; that of *Hero's fountain*

4

in N° 54; experiments illustrating the application of hydrostatics to air, N° 57, *et seq.*; a great variety of experiments with the *air pump*, N° 160; the experiment of the *syphon fountain*, N° 178; and experiments on the compressibility and expansibility of the air, N° 196, &c. We have also, in that article, explained the construction and operation of the principal pneumatical engines, such as *syringes*, *syphons*, *air-pumps*, *bellows*, &c. The construction and uses of *barometers* have been explained under BAROMETER, and under HYDRODYNAMICS, N° 72. Those of *thermometers* under CHEMISTRY from N° 194. to 203; and those of *common pumps* under the article PUMP.

As the account of the air-gun, referred to PNEUMATICS, has been omitted in that article, we must here describe the construction and action of that ingenious instrument.

The common air-gun is made of brass, and has two barrels; the inside barrel *A*, fig. 65. which is of a small bore, from whence the bullets are exploded; and a larger barrel *ECDR* on the outside of it. There is a syringe *SMNP* fixed in the butt of the gun, by which the air is injected into the cavity between the two barrels through the valve *EP*. The ball *K* is put down into its place in the small barrel, with the rammer, as in any other gun. At *SL* is another valve, which being opened by the trigger *O*, permits the air to come behind the bullet, so as to drive it out with great force. If this valve be opened and shut suddenly, one charge of condensed air may be sufficient for several discharges of bullets; but if the whole air be discharged on a single bullet, it will drive it out with a greater force. The discharge is effected by means of a lock, placed here as in other guns: for the trigger being pulled, the cock will go down and drive the lever *O*, fig. 65. which will open the valve, and let in the air upon the bullet *K*.

The air-gun has received very great improvements in its construction. Fig. 66. is a representation of one now made by several instrument-makers in the metropolis. For simplicity and perfection it exceeds any hitherto contrived. *A* is the gun-barrel, with the lock, stock, rammer, and of the size and weight of a common fowling-piece. Under the lock, at *b*, is a steel tube having a small moveable pin in the inside, which is pushed out when the trigger *a* is pulled, by the spring-work within the lock; to this tube *b*, is screwed a hollow copper ball *c*, so as to be perfectly air tight. This copper ball is fully charged with condensed air by the syringe *B*, fig. 67. previous to its being applied to the tube *b* of fig. 66. It is evident, that if a bullet be rammed down in the barrel, the copper ball screwed fast at *b*, and the trigger *a* be pulled, that the pin in *b* will, by the action of the spring-work within the lock, forcibly strike out into the copper ball; and thereby pushing in suddenly a valve within the copper ball, let out a portion of the condensed air, which will rush up through the aperture of the lock, and forcibly act against the bullet, driving it to the distance of 60 or 70 yards, or farther. If the air be strongly condensed, at every discharge, only a portion of it escapes from the ball; therefore by re-cocking the piece, another discharge may be made; and this repeated 15 or 16 times.

The air in the copper ball is condensed by means of the

the syringe B (fig. 67.), in the following manner. The ball *c* is screwed quite close in the top of the syringe at *b*, at the end of the steel pointed rod; *a* is a stout ring through which passes the rod *k*: upon this rod the feet are commonly placed, then the hands are to be applied to the two handles *ii*, fixed on the side of the barrel of the syringe. Now by moving the barrel B steadily up and down on the rod *a*, the ball *c* will become charged with condensed air; and it may be easily known when the ball is as full as possible, by the irresistible action which the air makes against the piston while working the syringe. At the end of the rod *k* is usually a square hole, which with the rod serves as a key to make the ball *c* fast on the screw *b* of the gun and syringe close to the orifice in the ball *c*. In the inside is fixed a valve and spring, which gives way for the admission of air; but upon its emission comes close up to the orifice, shutting up the internal air. The piston rod works air-tight, by a collar of leather on it on the barrel B; it is therefore plain, that when the barrel is drawn up, the air will rush in at the hole *b*. When the barrel is pushed down, the air contained in it will have no other way to pass, from the pressure of the piston, but into the ball *c* at top. The barrel being drawn up, the operation is repeated, until the condensation is so strong as to resist the action of the piston.

The magazine air-gun was invented by that ingenious artist L. Colbe. By this contrivance 10 bullets are so lodged in a cavity, near the place of discharge, that they may be drawn into the shooting barrel, and successively discharged so fast as to be nearly of the same use as so many different guns.

Fig. 68. represents the present form of this machine, where part of the stock is cut off, to the end of the injecting syringe. It has its valve opening into the cavity between the barrels as before. KK is the small shooting barrel, that receives the bullets from the magazine ED, which is of a serpentine form, and closed at the end D when the bullets are lodged in it. The circular part *abc*, is the key of a cock, having a cylindrical hole through it, *ik*, which is equal to the bore of the same barrel, and makes a part of it in the present situation. When the lock is taken off, the several parts Q, R, T, W, &c. come into view, by which means the discharge is made by pushing up the pin P *p*, which raises and opens a valve V to let in the air against the bullet I, from the cavity FF, which valve is immediately shut down again by means of a long spring of brass NN. This valve V being a conical piece of brass, ground very true in the part which receives it, will of itself be sufficient to confine the air.

To make a discharge, the trigger ZZ is to be pulled, which throws up the seer *y a*, and disengages it from the notch *a*, on which the strong spring WW moves the tumbler F, to which the cock is fixed. This, by its end *u*, bears down the end *v* of the tumbling lever R, which, by the other end *m*, raises at the same time the flat end of the horizontal lever Q; and by this means, of course, the pin P *p*, which stands upon it, is pushed up, and thus opens the valve V. and discharges the bullet. This is all evident, merely from the view of the figure.

To bring another bullet to succeed that marked I, instantaneously turn the cylindric cavity of the key of the cock, which before made part of the barrel KK, into the situation *ik*, so that the part *i* may be at K;

and hold the gun upon your shoulder, with the barrel downwards and the magazine upwards, by which means that bullet next the cock will fall into it out of the magazine, but go no further into this cylindric cavity than the two little springs *f's* which detain it. The two circles represent the cock barrel, wherein the key formerly mentioned turns upon an axis not represented here, but visible in fig. 69. This axis is a square piece of steel, on which comes the square hole of the hammer H, fig. 70. by which the cylindrical cavity mentioned is opened to the magazine. Then opening the hammer, as in that figure, the bullet is brought into its proper place near the discharge valve, and the cylindric cavity of the key of the cock again makes a part of the inward barrel KK.

It appears how expeditious a method this is of charging and discharging a gun; and, were the force of condensed air equal to that of gun-powder, such an air-gun would answer the purpose of several guns.

In the air-gun, and all other cases where the air is required to be condensed to a very great degree, it will be requisite to have the syringe of a small bore, viz. not exceeding half an inch in diameter, because the pressure against every square inch is about 15 pounds, and therefore against every circular inch about 12 pounds. If, therefore, the syringe be one inch in diameter, when one atmosphere is injected, there will be a resistance of 12 pounds against the piston; and when 10 are injected, there will be a force of 120 pounds to be overcome; whereas 10 atmospheres act against the circular half-inch piston with only a force equal to 30 pounds; or 40 atmospheres may be injected with such a syringe, as well as 10 with the other. In short, the facility of working will be inversely as the squares of the diameter of the syringe.

It is not certain when, or by whom the air-gun was invented. Montucla ascribes the invention to Otto Guericke, burgomaster of Magdeburg, so celebrated about the middle of the 17th century for his pneumatic and electrical experiments; but it is certain that air-guns, or wind-guns, as they were sometimes called, were known long before the time of Guericke. In the *Elemens d'Artilerie* of David Rivant, preceptor to Louis XIII. of France, this instrument is, we believe, first noticed in writing; and here the invention is attributed to one Marin, a burgher of Lisieux, who presented an air-gun to Henry IV. The air-gun is now considered rather as a curious philosophical instrument, than a useful offensive or defensive weapon; and its use in the latter capacity is, we believe, forbidden by law.

The subject of balloons has been fully discussed under the article AEROSTATION. For the sake of experiment, fire-balloons, or Mongolfiers, of a moderate size, may be constructed, by pasting together gores of lawn paper meeting at the top, and having the other extremities pasted round a light and slender hoop, from which proceeds several wires terminating in a kind of basket, capable of supporting a sponge dipped in rectified spirit of wine. If the gores are properly formed and neatly joined, the balloon will be so far air-tight, that the expanded air within it, caused by the inflammation of the spirit, will inflate the cavity, and enable the halloon to rise to a considerable height in the atmosphere. It is obvious that such an experiment can be made only in calm weather.

Easy method of constructing small fire-balloons.

Scilla,
Scilly.

SCILLA, the SQUILL; a genus of plants, belonging to the hexandria class; and in the natural method ranking under the 10th order, *Coronaria*. See BOTANY and MATERIA MEDICA *Index*.

SCILLY, or SILLEY, a cluster of small islands and rocks, situated in the Atlantic ocean, and about 10 leagues W. of the Land's End in Cornwall, in W. Long. 7°. N. Lat. 50°.

These islands were first called *Cassiterides*, or the *Tin Isles*, from their being rich in that metal. The common opinion is, that this is a Greek appellation; which in the most obvious sense is true: But as the Phœnicians were familiar with the metal, and with the country that produced it, before the Greeks knew any thing of either, it is very likely they introduced the names of both from their own language. Strabo says these islands were ten in number, lying close together, of which only one was uninhabited: the people led an erratic life, lived upon the produce of their cattle, wore an under-garment which reached down to their ankles, and over that another, both of the same colour, which was black, girt round a little below the breast with a girdle, and walked with staves in their hands. The riches of these islands were tin and lead, which, with the skins of their cattle, they exchanged with foreign merchants, that is, the Phœnicians from Cadiz, for earthen ware, salt, and utensils made of brass. An author of as great or greater antiquity, seems to include a part at least of Cornwall amongst these islands; or rather he suggests, that they were not perfect islands except at full sea, but that at ebb the inhabitants passed from one to another upon the sands, and that they even transported their tin in large square blocks upon carriages from one island to another. He further takes notice, that such as inhabited about Belerium (the Land's End) were in their conversation with strangers remarkably civil and courteous. Other ancient writers style these islands *Hesperides*, from their western situation, and *Oestrymnides*, asserting that the land was extremely fertile, as well as full of mines; and that the people, though very brave, were entirely addicted to commerce, and boldly passed the seas in their leather boats.

The Romans were exceedingly desirous of having a share in this commerce, which the Phœnicians as carefully laboured to prevent, by concealing their navigation to these islands as much as it was in their power. At length, however, the Romans prevailed; and Publius Crassus coming thither, was so well pleased with the industry and manners of the people, that he taught them various improvements, as well in working their mines, which till that time were but shallow, as in carrying their own merchandise to different markets. There is no room to doubt that they followed the fate of the rest of Britain, and particularly of Cornwall, in becoming subject to the Roman empire. We find them called in the itinerary of Antoninus, *Sigdeles*; by Sulpitius, *Sillena*; and by Solinus they are termed *Silures*. All we know of them during this period is, that their tin trade continued, and that sometimes state-prisoners were exiled, or, to use the Roman phrase, relegated hither as well as to other islands.

When the legions were withdrawn, and Britain with its dependencies left in the power of the natives, there is no reason to question that these islands shared the

Scilly.

same lot with the rest. As to the appellation which from this period prevailed, the ordinary way of writing it is *Scilly*: in records we commonly find it spelt *Silly*, *Silley*, or *Sulley*; but we are told the old British appellation was *Sulleh*, or *Sylleh*, which signifies rocks consecrated to the sun. We have not the least notice of any thing that regards them from the fifth to the tenth century. It is, however, with much appearance of truth conjectured, that some time within this space they were in a great measure destroyed by an earthquake, attended with a sinking of the earth, by which most of their lowlands, and of course the greatest part of their improvements, were covered by the sea, and those rich mines of tin which had rendered them so famous swallowed up in the deep. They have a tradition in Cornwall, that a very extensive tract of country called the *Lioness*, in the old Cornish *Lethosow*, supposed to lie between that country and Scilly, was lost in that manner; and there are many concurrent circumstances which render this probable. In reference to these islands, the case is still stronger; for at low ebbs their stone inclosures are still visible from almost all the isles, and thereby afford an ocular demonstration that they were formerly of far greater extent, and that in remoter ages their inhabitants must have been very numerous, and at the same time very industrious. This sufficiently proves the fact, that by such an earthquake they were destroyed; and, that it happened at some period of time within those limits that have been assigned, appears from our hearing nothing more of their tin trade, and from our having no notice of it at all in any of our ancient chronicles, which, if it had fallen out later, from their known attention to extraordinary events, must certainly have happened.

It is generally supposed, and with great appearance of truth, that king Athelstan, after having overcome a very powerful confederacy formed against him, and having reduced Exeter, and driven the Britons beyond the river Tamar, which he made the boundary of their Cornish dominions, passed over into these islands, (then surely in a better state than now, or they would not have been objects of his vengeance), and reduced them likewise. History does not inform us, that the Danes ever fixed themselves in these islands; but as their method of fortifying is very well known, it has been conjectured that the Giant's Castle in the isle of St Mary was erected by them; and indeed, if we consider the convenient situation of these islands, and the trade of piracy which that nation carried on, there seems to be nothing improbable in that conjecture. It is more certain that there were churches erected in these isles, and that there were in them also many monks and hermits, before the conquest.

The fertility of the islands is much insisted upon in all the accounts; and it is expressly said of St Mary's, that it bears exceeding good corn, insomuch that if men did but cast corn where swine had rooted, it would come up. There is mention made of a breed of wild swine, and the inhabitants had great plenty of fowl and fish. But notwithstanding the fertility of the country, and the many commodities that men had or might have there, it was nevertheless but thinly peopled; and the reason assigned is, because they were liable to be frequently spoiled by French or Spanish pirates.

pirates. In Leland's time, one Mr Davers of Wiltshire, and Mr Whittington of Gloucestershire, were proprietors of Scilly, and drew from thence, in rents and commodities, about 40 merks a year.

The inhabitants at that juncture, and long before, appear to have carried on a small trade in dried skate and other fish to Bretagne, with which they purchased salt, canvas, and other necessaries. This seems to be the remains of a very old kind of commerce, since, for many ages, the people of that country, those of the Scilly isles, and the people of Cornwall, looked upon themselves as countrymen, being in truth no other than remnants of the ancient Britons, who, when driven out by the Saxons, took refuge in those islands, and in that part of France which had before been called *Armorica*, and from hence styled *Bretagne*, *Brittany*, or *Little Britain*, and the people *Bretons*. This, in all probability, was a great relief to those who dwelt in those isles; who, during the long civil war between the houses of York and Lancaster, had their intercourse with England so much interrupted, that if it had not been for this commerce with their neighbours on the French coast, they might have been driven to the last distress.

The Scilly or Silley islands, lie due west from the Lizard about 17 leagues; west and by south from the old Land's End, next Mount's Bay, at the distance of 10 leagues; and from the western Land's End, they lie west-south-west, at the distance of something more than nine leagues. There are five of them inhabited; and that called *Samson* has one family in it. The largest of these is *St Mary's* which lies in the north latitude of 49 degrees 55 minutes, and in the longitude of 6 degrees 40 minutes west from Greenwich. It is two miles and a half in length, about one and a half in breadth, and between nine and ten miles in compass. On the west side there projects an isthmus. Beyond this there is a peninsula, which is very high; and upon which stands *Star Castle*, built in 1593, with some outworks and batteries. On these there are upwards of threescore pieces of cannon mounted; and for the defence of which there is a garrison of an entire company, with a master-gunner and six other gunners. In the magazine there are arms for 300 islanders, who, when summoned, are bound to march into the fortress. Underneath the castle barracks and lines stands *Hugh Town*, very improperly built, as lying so low as to be subject to inundations. A mile within land stands *Church Town*, so denominated from their place of worship; it consists of a few houses only, with a court house. About two furlongs east of this lies the *Old Town*, where there are more houses, and some of them very convenient dwellings. The number of inhabitants in this island is about 600 or 700; and it produces to the lord proprietor 300*l.* per annum.

Trescaw lies directly north from *St Mary's*, at the distance of two miles. It was formerly styled *St Nicholas's island*; and was at least as large as *St Mary's*, though at present about half the size. The remains of the abbey are yet visible, the situation well chosen, with a fine basin of fresh water before it, half a mile long and a furlong wide, with an ever-green bank high enough to keep out the sea, and serving at once to preserve the pond, and shelter the abbey. In this pond there are most excellent eels, and the lands lying

round it are by far the best in those islands. There are about half a score stone houses, with a church, which are called *Dolphin Town*; an old castle built in the reign of Henry VIII. called *Oliver's Castle*; and a new block-house, raised out of the ruins of that castle, which is of far greater use. This island is particularly noted for producing plenty of the finest sapphire, and the only tin works that are now visible are found here. There are upon it at present about 40 families, who are very industrious, and spin more wool than in *St Mary's*. Its annual value is computed at 80*l.* a year.

A mile to the east of *Trescaw*, and about two miles from the most northern part of *St Mary's*, lies the isle of *St Martin's*, not much inferior in size to that of *Trescaw*. It very plainly appears to have been formerly extremely well cultivated; notwithstanding which it was entirely deserted, till within somewhat less than a century ago, that Mr Thomas Ekines, a considerable merchant, engaged some people to settle there. He likewise caused to be erected a hollow tower twenty feet in height, with a spire of as many feet more; which being neatly covered with lime, serves as a day-mark for directing ships crossing the channel or coming into Scilly. *St Martin's* produces some corn, affords the best pasture in these islands, nourishes a great number of sheep, and has upon it 17 families, who pretend to have the secret of burning the best kelp, and are extremely attached to their own island. As a proof of this, it is observable, that though some of the inhabitants rent lands in *St Mary's*, yet they continue to reside here, going thither only occasionally.

St Agnes, which is also called the *Light-house Island*, lies near three miles south-west of *St Mary's*; and is, though a very little, a very well cultivated island, fruitful in corn and grass. The only inconvenience to which the people who live in it are subject, is the want of good water, as their capital advantage consists in having several good coves or small ports, where boats may lie with safety; which, however, are not much used. The light-house is the principal ornament and great support of the island; it stands on the most elevated ground, and is built with stone from the foundation to the lantern, which is fifty-one feet high, the gallery four, the sash-lights eleven feet and a half high, three feet two inches wide, and sixteen in number. The floor of the lantern is of brick, upon which stands a substantial iron grate, square, barred on every side, with one great chimney in the canopy-roof, and several lesser ones to let out the smoke, and a large pair of smith's bellows are so fixed as to be easily used whenever there is occasion. Upon the whole, it is a noble and commodious structure; and being plastered white, is a useful day-mark to all ships coming from the southward. The keeper of this light-house has a salary from the *Trinity-house* at *Deptford* of 40*l.* a year, with a dwelling-house and ground for a garden. His assistant has 20*l.* a year. It is supplied with coals by an annual ship; and the carriage of these coals from the sea-side to the light-house is looked on as a considerable benefit to the poor inhabitants. They have a neat little church, built by the *Godolphin* family. There are at present 50 households in the island, which yield the proprietor 40*l.* a year.

Brehar, or, as pronounced, *Bryar island*, lies north-west of *St Mary's*, and to the west of *Trescaw*, to

Scilly.

which, when the sea is very low, they sometimes pass over the sand. It is very mountainous, abounds with sea and land fowls, excellent samphire, and a great variety of medicinal herbs. There are at present thirteen families, who have a pretty church, and pay 30*l.* a year to the proprietor.

South from hence, and west from Trescaw, stands the island of *Samson*, in which there is not above one family, who subsist chiefly by the making of kelp. To the westward of these there lie four islands, which contain in the whole 360 acres of meadow and arable land. The *eastern isles*, so denominated from their position in respect to *St Mary's*, contain 123 acres; and there are also seven other rocky and scattered islands, that have each a little land of some use; and besides these, innumerable rocks on every side, among which we must reckon *Scilly*, now nothing more than a large, ill-shaped, craggy, inaccessible island, lying the farthest north-west of any of them, and consequently the nearest to the continent.

The air of these islands is equally mild and pure; their winters are seldom subject to frost or snow. When the former happens, it lasts not long; and the latter never lies upon the ground. The heat of their summers is much abated by sea-breezes. They are indeed frequently incommoded by sea fogs, but these are not unwholesome. Agues are rare, and fevers more so. The most fatal distemper is the small-pox; yet those who live temperately survive commonly to a great age, and are remarkably free from diseases. The soil is very good, and produces grain of all sorts (except wheat, of which they had anciently plenty) in large quantities. They still grow a little wheat, but the bread made of it is unpleasant. They eat, for this reason, chiefly what is made of barley; and of this they have such abundance, that though they use it both for bread and beer, they have more than suffices for their own consumption. The introduction of potatoes was an essential improvement; the cultivation of this plant succeeded so well, as to yield every season the most luxuriant crops. Roots of all sorts, pulse, and salads, grow well; dwarf fruit-trees, gooseberries, currants, raspberries, and every thing of that kind, under proper shelter, thrive exceedingly; but they have no trees, though formerly they had elder; and *Porthelik*, i. e. the harbour of willows, proves they had these likewise; and with a little care, no doubt, great improvements might be made. The ranunculus, anemone, and most kinds of flowers, are successfully cultivated in their gardens. They have wild fowl of all sorts, from the swan to the snipe; and a particular kind called the *hedge chicken*, which is not inferior to the ortolan: also tame fowl, puffins, and rabbits, in great numbers. Their black cattle are generally small, but very well-tasted, though they feed upon ore-weed. Their horses are little, but strong and lively. They have also large flocks of fine sheep, whose fleeces are tolerably good and their flesh excellent. There are no venomous creatures in these islands.

We must now pass to the sea, which is of more consequence to these isles than that small portion of land which is distributed amongst them. *St Mary's* harbour is very safe and capacious, having that island on the south; the eastern islands, with that of *St Martin*, on the east; *Trescaw*, *Brehar*, and *Samson*, to the

north; *St Agnes* and several small islands to the west. Ships ride here in three to five fathom water, with good anchorage. Into this harbour there are four inlets, viz. *Broad Sound*, *Smith's Sound*, *St Mary's Sound*, and *Crow Sound*: so that hardly any wind can blow with which a ship of 150 tons cannot safely sail through one or other of them, *Crow Sound* only excepted, where they cannot pass at low water, but at high water there is from 16 to 24 feet in this passage. Besides these there are two other harbours; one called *New Grynsey*, which lies between *Brehar* and *Trescaw*, where ships of 300 tons may ride securely. The other is called *Old Grynsey*, and lies between *Trescaw*, *St Helen's*, and *Theon*, for smaller ships. The former is guarded by the batteries at *Oliver's Castle*; the latter by the *Blockhouse*, on the eastern side of *Trescaw*, called *Dover*. Small coasters bound to the northward have more convenient outlets from these little harbours than from *St Mary's*, where, at the west end of *Hugh Town*, there is a fine pier built by the earl of *Godolphin*, 430 feet long, 20 feet wide in the narrowest part, and 23 feet in height, with 16 feet of water at a spring, and 10 at a neap tide; so that under the shelter of this pier, vessels of 150 tons may lie securely, not only close to the quay, but all along the strand of the town.

In this harbour, and in all the little coves of the several isles, prodigious quantities of mackerel may be caught in their season; also soal, turbot, and plaice, remarkably good in their kind; and ling, which from its being a thicker fish, mellow, and better fed, is very justly preferred to any caught nearer our own coasts. Salmon, cod, pollock, are in great plenty, and pilchards in vast abundance. To these we may add the alga marina, fucus, or ore-weed, which serves to feed both their small and great cattle, manures their lands, is burned into kelp, is of use in physic, is sometimes preserved, sometimes pickled, and is in many other respects very beneficial to the inhabitants, of whom we are next to speak.

The people of *Scilly* in general are robust, handsome, active, hardy, industrious, generous, and good-natured; speak the English language with great propriety; have strong natural parts (though for want of a good school they have little education), as appears by their dexterity in the several employments to which they are bred. They cultivate most of their lands as well as can be expected under their present circumstances. They are bred from their infancy to the management of their boats, in which they excel; are good fishermen, and excellent pilots. Their women are admirable housewives, spin their own wool, weave it into coarse cloth, and knit stockings. They have no timber of their own growth, and not much from England; yet they have many joiners and cabinet-makers, who, out of the fine woods which they obtain from captains of ships who put in here, make all kinds of domestic furniture in a very neat manner. They are free from the land-tax, malt-tax, and excise; and being furnished with plenty of liquors from the vessels which are driven into their roads for refreshment, for necessary repairs, or to wait for a fair wind, in return for provisions and other conveniences; this, with what little fish they can cure, makes the best part of their trade, if we except their

Scilly.

Scilly. their kelp, which has been a growing manufacture for these fourscore years, and produces at present about 500*l.* per annum.

The right honourable the earl of Godolphin is styled proprietor of Scilly, in virtue of letters-patent granted to the late earl, then Lord Godolphin, dated the 25th of July 1698, for the term of 89 years, to be computed from the end and expiration of a term of 50 years, granted to Francis Godolphin, Esq. by King Charles I., that is, from the year 1709 to 1798, when his lease determines. In virtue of this royal grant, his lordship is the sole owner of all lands, houses, and tenements; claims all the tithes, not only of the fruits of the earth, but of fish taken at sea and landed upon those premises; harbour-duties paid by ships, and one moiety of the wrecks, the other belonging to the admiralty. There is only one ecclesiastical person upon the islands, who resides at St Mary's, and visits the other inhabited islands once a year. But divine service is performed, and sermons read, every Sunday in the churches of those islands, by an honest layman appointed for that purpose; and there are likewise church-wardens and overseers, regularly chosen in every parish. As to the civil government, it is administered by what is called the *Court of Twelve*; in which the commander in chief, the proprietor's agent, and the chaplain, have their seats in virtue of their offices: the other nine are chosen by the people. These decide, or rather compromise, all differences; and punish small offences by fines, whippings, and the ducking-stool: as to greater enormities, we may conclude they have not been hitherto known; since, except for the soldiers, there is no prison in the islands. But in case of capital offences, the criminals may be transported to the county of Cornwall, and there brought to justice.

The great importance of these islands arises from their advantageous situation, as looking equally into St George's channel, which divides Great Britain from Ireland, and the English channel, which separates Britain from France. For this reason, most ships bound from the southward strive to make the Scilly islands, in order to steer their course with greater certainty. It is very convenient also for vessels to take shelter amongst them; which prevents their being driven to Millford Haven, nay sometimes into some port in Ireland, if the wind is strong at east; or, if it blow hard at north-west, from being forced back into some of the Cornish harbours, or even on the French coasts. If the wind should not be very high, yet if unfavourable or unsteady, as between the channels often happens, it is better to put into Scilly, than to beat about at sea in bad weather. The intercourse between these two channels is another motive why ships come in here, as choosing rather to wait in safety for a wind, than to run the hazard of being blown out of their course; and therefore a strong gale at east seldom fails of bringing 30 or 40 vessels, and frequently a larger number, into Scilly; not more to their own satisfaction than to that of the inhabitants. Ships homeward-bound from America often touch there, from the desire of making the first land in their power, and for the sake of refreshment. These reasons have an influence on foreign ships, as well as our own; and afford the natives an opportunity of showing their wonderful dexterity in conducting them safely into St Mary's harbour, and, when the wind

Scilly. serves, through their sounds. Upon firing a gun and making a waft, a boat immediately puts off from the nearest island, with several pilots on board; and having with amazing activity dropped one of them into every ship, till only two men are left in the boat, these return again to land, as the wind and other circumstances direct, in one of their little coves.

Respecting a current which often prevails to the westward of Scilly, Mr Rennel has published some observations of much importance. "It is a circumstance (says he) well known to seamen, that ships, in coming from the Atlantic, and steering a course for the British channel, in a parallel somewhat to the south of the Scilly islands, do notwithstanding often find themselves to the north of those islands; or, in other words, in the mouth of St George's or of the Bristol channel. This extraordinary error has passed for the effects either of bad steerage, bad observations of latitude, or the indraught of the Bristol channel: but none of these account for it satisfactorily; because, admitting that at times there may be an indraught, it cannot be supposed to extend to Scilly; and the case has happened in weather the most favourable for navigating and for taking observations. The consequences of this deviation from the intended tract have very often been fatal; particularly in the loss of the Nancy packet in our own times, and that of Sir Cloudesley Shovel and others of his fleet at the beginning of the present century. Numbers of cases, equally melancholy, but of less celebrity, have occurred; and many others, in which the danger has been imminent, but not fatal, have scarcely reached the public ear. All of these have been referred to accident; and therefore no attempt seems to have been made to investigate the cause of them.

"I am, however, of opinion, that they may be imputed to a specific cause; namely, a current; and I shall therefore endeavour to investigate both that and its effects, that seamen may be apprized of the times when they are particularly to expect it in any considerable degree of strength: for then only it is likely to occasion mischief, the current that prevails at ordinary times being probably too weak to produce an error in the reckoning, equal to the difference of parallel between the south part of Scilly and the tract in which a commander, prudent in his measures, but unsuspecting of a current, would choose to sail."

The original cause of this current is the prevalence of westerly winds in the Atlantic, which impel the waters along the north coast of Spain, and accumulate them in the bay of Biscay; whence they are projected along the coast of France, in a direction north-west by west to the west of Scilly and Ireland. The Major assigns strong reasons for the existence of this current between Ushant and Ireland, in a chart of the tracks of the Hector and Atlas, East India ships, in 1778 and 1787. The following remarks on the effect of this current are abridged from the author's work, which is well worthy the perusal of all sailors and shipmasters.

1st, If a ship crosses it obliquely, that is, in an east by south or more southerly direction, she will continue much longer in it, and of course be more affected by it, than if she crossed it more directly. The same consequence will happen if she crosses it with light winds. 2dly, A good observation of latitude at noon would be thought a sufficient warrant for running eastward during

Scilly,
Scio.

ing a long night; yet, as it may be possible to remain in the current long enough to be carried from a parallel, which may be deemed a very safe one, to that of the rocks of Scilly, it would appear prudent, after experiencing a continuance of strong westerly winds in the Atlantic, and approaching the Channel with light southerly winds, either to make Ushant in time of peace, or at all events to keep in the parallel of 48° 45' at the highest. 3dly, Ships, bound to the westward, from the mouth of the Channel, with the wind in the south-west quarter, should prefer the larboard tack. 4thly, Major Rennel approves the design of removing the light-house of Scilly (if it be not already removed) to the south-west part of the high rocks. 5thly, He recommends the sending a vessel, with time-keepers on board, to examine the soundings between the parallels of Scilly and Ushant; from the meridian of the Lizard Point as far west as the moderate depths extend. A set of time-keepers, he observes, will effect more in one summer, in skilful hands, than all the science of Dr Halley could do in the course of a long life.

In time of war, the importance of these islands is still more conspicuous; and it is highly probable, that they afforded the allies a place for assembling their fleet, when the Britons, Danes, Scots, and Irish, sailed under the command of Anlaff, to attack King Athelstan; which convinced him of the necessity of adding them to his dominions. Upon the like principle, Henry VIII., when upon bad terms with his neighbours, caused an old fortress to be repaired, and Queen Elizabeth, who had more to fear, directed the construction of a castle, which, in part at least, still remains. But the most singular instance of the detriment that might arise from these islands falling into other hands than our own, happened in 1651, when Sir John Grenville took shelter in them with the remains of the Cornish cavaliers. For the depredations committed by his frigates soon made it evident that Scilly was the key of the English commerce; and the clamours of the merchants thereupon rose so high, that the parliament were forced to send a fleet of fifty sail, with a great body of land forces on board, under Sir George Ayscue and Admiral Blake, who with great difficulty, and no inconsiderable loss, made themselves masters of Trescow and Brehar; where they erected those lines and fortifications near the remains of the old fortress that are called *Oliver's Castle*. But at length, finding that little was to be done in that way, they chose to grant Sir John Grenville a most honourable capitulation, as the surest means to recover places of such consequence; with which the parliament were very little satisfied, till Mr Blake gave them his reason; which appeared to be so well founded, that they directed the articles he had concluded to be punctually carried into execution.

SCIO, or CHIO, a celebrated island of the Archipelago (see CHIO). It is 32 miles long and 15 broad, and is a mountainous but very pleasant country. The principal mountain, called anciently *Pelinæus*, presents to view a long lofty range of bare rock, reflecting the sun; but the recesses at its feet are diligently cultivated, and reward the husbandman by their rich produce. The slopes are clothed with vines. The groves of lemon, orange, and citron trees, regularly planted, at once perfume the air with the odour of their blossoms, and

delight the eye with their golden fruit. Myrtles and jasmine are interspersed, with olive and palm trees, and cypresses. Amid these the tall minarets rise, and white houses glitter, dazzling the beholder. The inhabitants export a large quantity of pleasant wine to the neighbouring islands, but their principal trade is in silks. They have also a small commerce in wool, cheese, figs, and mastich. The women are better bred than in other parts of the Levant; and though the dress is odd, yet it is very neat. The partridges are tame, being sent every day into the fields to get their living, and in the evening are called back with a whistle. The town called *Scio* is large, pleasant, and the best built of any in the Levant, the houses being beautiful and commodious, some of which are terraced, and others covered with tiles. The streets are paved with flint-stones; and the Venetians, while they had it in their possession, made a great many alterations for the better. The castle is an old citadel built by the Genoese, in which the Turks have a garrison of 1400 men. The harbour of Scio is the rendezvous of all shipping that goes to or comes from Constantinople, and will hold a fleet of fourscore vessels. They reckon there are 10,000 Turks, 100,000 Greeks, and 10,000 Latins, on this island. The Turks took it from the Venetians in 1695. Scio is a bishop's see, and is seated on the sea-side, 47 miles west of Smyrna, and 210 south-west of Constantinople.

There are but few remains of antiquity in this place. "The most curious of them (says Dr Chandler) is that which has been named without reason the *School of Homer*. It is on the coast at some distance from the city northward, and appears to have been an open temple of Cybele, formed on the top of a rock. The shape is oval, and in the centre is the image of the goddess, the head and an arm wanting. She is represented, as usual, sitting. The chair has a lion carved on each side, and on the back. The area is bounded by a low rim or seat, and about five yards over. The whole is hewn out of the mountain, is rude, indistinct, and probably of the most remote antiquity. From the slope higher up is a fine view of the rich vale of Scio, and of the channel, with its shining islands, beyond which are the mountains on the mainland of Asia."

SCIOPIUS, GASPAR, a learned German writer of the 17th century, was born at Neumark in the Upper Palatinate on the 27th of May 1576. He studied at the university with so much success, that at the age of 16 he became an author; and published books, says Ferrari, which deserve to be admired by old men. His dispositions did not correspond with his genius. Naturally passionate and malevolent, he assaulted without mercy the characters of eminent men. He abjured the system of the Protestants, and became a Roman Catholic about the year 1599; but his character remained the same. He possessed all those qualities which fitted him for making a distinguished figure in the literary world; imagination, memory, profound learning, and invincible impudence. He was familiar with the terms of reproach in most of the languages. He was entirely ignorant of the manners of the world. He neither showed respect to his superiors, nor did he behave with decency to his equals. He was possessed with a frenzy of an uncommon kind: he was indeed a perfect firebrand, scattering around him, as if for his amusement, the most atrocious calumnies. Joseph Scaliger, above
all

Scio,
Scioppi

all others, was the object of his satire. That learned man, having drawn up the history of his own family, and deduced its genealogy from princes, was severely attacked by Scioppius, who ridiculed his high pretensions. Scaliger in his turn wrote a book entitled *The Life and Parentage of Gaspar Scioppius*, in which he informs us, that the father of Scioppius had been successively a grave-digger, a journeyman stationer, a hawker, a soldier, a miller, and a brewer of beer. We are told that his wife was long kept as a mistress, and at length forsaken by a debauched man whom she followed to Hungary, and obliged to return to her husband; that then he treated her harshly, and condemned her to the lowest offices of servitude. His daughter, too, it is said, was as disorderly as her mother: that after the flight of her husband, who was going to be burned for some infamous crimes, she became a common prostitute; and at length grew so scandalous, that she was committed to prison. These severe accusations against the family of Scioppius inflamed him with more eagerness to attack his antagonist anew. He collected all the calumnies that had been thrown out against Scaliger, and formed them into a huge volume, as if he had intended to crush him at once. He treated with great contempt the king of England, James I., in his *Ecclesiasticus*, &c. and in his *Collyrium Regium Britannicæ Regi graviter ex oculis laboranti munere missum*; that is, "An Eye-salve for his Britannic Majesty." In one of his works he had the audacity to abuse Henry IV. of France in a most scurrilous manner, on which account his book was burned at Paris. He was hung in effigy in a farce which was represented before the king of England, but he gloried in his dishonour. Provoked with his insolence to their sovereign, the servants of the English ambassador assaulted him at Madrid, and corrected him severely: but he boasted of the wounds he had received. He published more than thirty defamatory libels against the Jesuits; and, what is very surprising, in the very place where he declaims with most virulence against that society, he subscribes his own name with expressions of piety. *I Gaspar Scioppius, already on the brink of the grave, and ready to appear before the tribunal of Jesus Christ, to give an account of my works.* Towards the end of his life he employed himself in studying the Apocalypse, and affirmed that he had found the key to that mysterious book. He sent some of his expositions to Cardinal Mazarine; but the cardinal did not find it convenient to read them.

Ferrari tells us, that during the last fourteen years of his life, he shut himself up in a small apartment, where he devoted himself solely to study. The same writer acquaints us, that he could repeat the Scriptures almost entirely by heart; but his good qualities were eclipsed by his vices. For his love of slander, and the furious assaults which he made upon the most eminent men, he was called the *Cerberus of literature*. He accuses even Cicero of barbarisms and improprieties. He died on the 19th November 1649, at the age of 74, at Padua, the only retreat which remained to him from the multitude of enemies whom he had created. Four hundred books are ascribed to him, which are said to discover great genius and learning. The chief of these are, 1. *Verisimilium Libri* iv. 1596, in 8vo. 2. *Commentarius de arte critica*, 1661, in 8vo. 3. *De sua ad Catholicos migratione*, 1660, in 8vo. 4. *Notationes Criticæ in*

Phædrum, in Præcipua, Patavii, 1664, in 8vo. 5. *Suspectarum lectionum Libri* v. 1664, in 8vo. 6. *Classicum belli sacri*, 1619, in 4to. 7. *Collyrium regium*, 1611, in 8vo. 8. *Grammatica Philosophica*, 1644, in 8vo. 9. *Relatio ad Reges et Principes de Stratagematibus Societatis Jesu*, 1641, in 12mo. This last mentioned was published under the name of *Alphonso de Vargas*. He was at first well disposed to the Jesuits; but these fathers on one occasion opposed him. He presented a petition to the diet of Ratisbon in 1630, in order to obtain a pension; but the Jesuits, who were the confessors both of the emperor and the electors, had influence to prevent the petition from being granted. From that moment Scioppius turned his whole artillery against the Jesuits.

SCIOPTIC, or **SCIOPTIC BALL**, a sphere or globe of wood, with a circular perforation, where a lens is placed. It is so fitted, that, like the eye of an animal, it may be turned round every way, to be used in making experiments of the darkened room.

SCIPIO, **PUBLIUS CORNELIUS**, a renowned Roman general, surnamed *Africanus*, for his conquests in that country. His other signal military exploits were, his taking the city of New Carthage in a single day; his complete victory over Hannibal, the famous Carthaginian general; the defeat of Syphax king of Numidia, and of Antiochus in Asia. He was as eminent for his chastity, and his generous behaviour to his prisoners, as for his valour. He died 180 B. C. aged about 51.

SCIPIO, **Lucius Cornelius**, his brother, surnamed *Asiaticus*, for his complete victory over Antiochus at the battle of Magnesia, in which Antiochus lost 50,000 infantry and 4000 cavalry. A triumph, and the surname of *Asiaticus*, were the rewards of his valour. Yet his ungrateful countrymen accused him, as well as his brother, of pecculation; for which he was fined: but the public sale of his effects proved the falsehood of the charge; for they did not produce the amount of the fine. He flourished about 190 B. C.

SCIPIO, **Publius Emilianus**, was the son of Paulus Emilius; but being adopted by Scipio Africanus, he was called *Scipio Africanus junior*. He showed himself worthy of adoption, following the footsteps of Scipio Africanus, whom he equalled in military fame and public virtues. His chief victories were the conquest of Carthage and Numantia; yet these signal services to his country could not protect him from an untimely fate. He was strangled in his bed by order of the Decemviri, who dreaded his popularity, 129 B. C. aged 56.

SIRO, an island of the Archipelago, to the west of Mytilene, to the north-east of Negropont, and to the south-east of Sciati. It is 15 miles in length, and eight in breadth. It is a mountainous country, but has no mines. The vines make the beauty of the island, and wine is excellent; nor do the natives want wood. There is but one village; and that is built on a rock, which runs up like a sugar-loaf, and is 10 miles from the harbour of St George. The inhabitants are all Greeks, the cad being the only Turk among them.

SIROCHO, or **SIROCCO**, a name generally given in Italy to every unfavourable wind. In the south-west it is applied to the hot suffocating blasts from Africa; and in the north-east it means the cold bleak winds from the Alps.

Scirpus
||
Scone.

SCIRPUS, a genus of plants belonging to the triandria class; and in the natural method ranking under the third order, *Calamaria*. See BOTANY Index.

SCIRRHUS, in *Surgery* and *Medicine*, a hard tumor of any part of the body, void of pain, arising, as is supposed, from the inspissation and induration of the fluids contained in a gland, though it may also appear in any other part of the body, especially in the fat; being one of the ways in which an inflammation terminates. These tumours are exceedingly apt to degenerate into cancers.

SCITAMINEÆ, one of the natural orders of plants. See BOTANY Index.

SCIURUS, the SQUIRREL; a genus of quadrupeds belonging to the order of glires. See MAMMALIA Index.

SCIURUS, a genus of plants belonging to the diandria class; and in the natural method ranking with those that are doubtful. See BOTANY Index.

SCLAVONIA, a country of Europe between the rivers Save, the Drave, and the Danube. It is divided into six counties, and belongs to the house of Austria. It was formerly called a *kingdom*; and is very narrow, not being above 75 miles in breadth; but it is 300 in length, from the frontiers of Austria to Belgrade. It contains about 7500 square miles, and in 1813 had 528,200 inhabitants. The eastern part is called *Ratzia*, and the inhabitants *Ratzians*. These are of the Greek church. The language of Selavonia is the mother of four others, namely, those of Hungary, Bohemia, Poland, and Russia.

SCLERANTHUS, a genus of plants belonging to the dodecandria class; and in the natural method ranking under the 22d order, *Caryophylleæ*. See BOTANY Index.

SCLERIA, a genus of plants belonging to the monocia class; and in the natural method ranking under the 4th order, *Gramina*. See BOTANY Index.

SCLEROTICS, medicines which are supposed to have the property of hardening and consolidating the flesh of the parts to which they are applied; as purslain, house-leek, flea-wort, garden nightshade, &c.

SCOLOPAX, a genus of birds belonging to the order of grallæ. See ORNITHOLOGY Index.

SCOLOPENDRA, a genus of insects belonging to the order of aptera. See ENTOMOLOGY Index.

SCOLYMUS, a genus of plants belonging to the syngenesia class; and in the natural method ranking under the 49th order, *Compositæ*. See BOTANY Index.

SCOMBER, the MACKEREL, a genus of fishes belonging to the order of thoracici. See ICHTHYOLOGY Index.

SCONCES, small forts, built for the defence of some pass, river, or other place. Some sconces are made regular, of four, five, or six bastions; others are of smaller dimensions, fit for passes or rivers; and others for the field.

SCONE, a village of Scotland, now chiefly remarkable for being the place where the kings were anciently crowned. W. Long. 3. 10. N. Lat. 56. 28. Here was once an abbey of great antiquity, which was burnt by the reformers at Dundee. Kenneth II. upon his conquest of the Picts in the ninth century, having made Scone his principal residence, delivered his laws, called the *Macalpine laws*, from a *tumulus*, named the *Mote*

Hill of Scone. The old palace was begun by the earl of Gowrie; but was completed by Sir David Murray of Gospatric, the favourite of King James VI, to whom that monarch had granted it; and the new possessor, in gratitude to his benefactor, put up the king's arms in several parts of the house. It was built around two courts. The dining room was large and handsome; and had an ancient and magnificent chimney-piece, and the king's arms, with this motto:

Nobis hæc invicta miserunt centum sex proavi.

Beneath were the Murray arms. In the drawing room was some good old tapestry, with an excellent figure of Mercury. In a small bed-chamber was a medley scripture-piece in needle-work, with a border of animals, said to be the work of Queen Mary during her confinement in Loch Leven castle. The gallery was about 155 feet long, the top arched, divided into compartments filled with paintings in water-colours. The pieces represented were various kinds of huntings; that of Nimrod, and King James and his train, appear in every piece. But the whole of this building we believe has been demolished, and a most magnificent pile erected in its place by the earl of Mansfield, who is hereditary keeper. Till the destruction of the abbey, the kings of Scotland were crowned here, sitting in the famous wooden chair which Edward I. transported to Westminster abbey, to the great mortification of the Scots, who looked upon it as a kind of palladium. Charles II. before the battle of Worcester, was crowned in the chapel at Scone. The old pretender resided for some time at Scone in 1715; and his son paid it a visit in 1745.

SCOPARIA, a genus of plants belonging to the tetrandria class; and in the natural method ranking under the 40th order, *Personatæ*. See BOTANY Index.

SCOPER or SCUPPER HOLES, in a ship, are holes made through the sides, close to the deck, to carry off the water that comes from the pumps.

SCOPOLIA, a genus of plants belonging to the gynandria class; and in the natural method ranking under the 11th class, *Sarmentaceæ*. See BOTANY Index.

SCORBUTUS, the SCURVY. See MEDICINE, N° 8.

SCORDIUM, or WATER-GERMANDER. See TEUCRIUM, BOTANY Index.

SCORIA, or DROSS, among metallurgists, is thecrement of metals in fusion; or, more determinately speaking, is that mass which is produced by melting metals and ores: when cold, it is brittle, and not dissoluble in water, being properly a kind of glass.

SCORIFICATION, in *Metallurgy*, is the art of reducing a body, either entirely or in part, into scoria.

SCORPÆNA, a genus of fishes belonging to the order thoracici. See ICHTHYOLOGY Index.

SCORPIO, a genus of insects belonging to the order of aptera. See ENTOMOLOGY Index.

SCORPIO, *Scorpion*, in *Astronomy*, the eighth sign of the zodiac, denoted by the character ♏ . See ASTRONOMY.

SCORPION-FLY. See PANORPA, ENTOMOLOGY Index.

SCORPIURUS, CATERPILLARS, a genus of plants belonging to the diadelphia class; and in the natural method ranking under the 32d order, *Papilionaceæ*. See BOTANY Index.

SCORZONERA,

Scorpius
||
Scorpius

zonera
||
stales.

SCORZONERA, VIPER-GRASS, a genus of plants belonging to the syngenesia class; and in the natural method ranking under the 49th order, *Compositæ*. See *BOTANY Index*.

SCOT, a customary contribution laid upon all subjects, according to their abilities. Whoever were assessed in any sum, though not in equal proportions, were said to pay scot and lot.

SCOT, *Michael*, of Balwirie, a learned Scottish author of the 13th century. This singular man made the tour of France and Germany; and was received with some distinction at the court of the emperor Frederic II. Having travelled enough to gratify his curiosity or his vanity, he returned to Scotland, and gave himself up to study and contemplation. He was skilled in languages; and, considering the age in which he lived, was no mean proficient in philosophy, mathematics, and medicine. He translated into Latin, from the Arabic, the history of animals by the celebrated physician Avicenna. He published the whole works of Aristotle, with notes; and affected much to reason on the principles of that great philosopher. He wrote a book concerning *The Secrets of Nature*, in which he treats of generation, physiognomy, and the signs by which we judge of the temperaments of men and women. We have also a tract of his *On the Nature of the Sun and Moon*. He there speaks of the *grand operation*, as it is termed by alchemists, and is exceedingly solicitous about the *projected powder*, or the *philosopher's stone*. He likewise published what he calls *Mensa Philosophica*, a treatise replete with astrology and chiromancy. He was much admired in his day, and was even suspected of magic; and had Roger Bacon and Cornelius Agrippa for his panegyrist.

SCOT, *Reginald*, a judicious writer in the 16th century, was the younger son of Sir John Scot of Scots-hall, near Smeethe in Kent. He studied at Hart-Hall in the University of Oxford; after which he retired to Smeethe, where he lived a studious life, and died in 1599. He published, *The perfect Platform of a Hop-Garden*; and a book entitled, *The Discovery of Witchcraft*; in which he showed that all the relations concerning magicians and witches are chimerical. This work was not only censured by King James I. in his *Dæmonology*, but by several eminent divines; and all the copies of it that could be found were burnt.

SCOTAL, or SCOTALE, is where any officer of a forest keeps an ale-house within the forest, by colour of his office, making people come to his house, and there spend their money for fear of his displeasure. We find it mentioned in the charter of the forest, cap. 8. "Nullus forestarius, faciat *Scotallas*, vel garbas colligat, vel aliquam collectam faciat," &c. *Manwood*, 216.—The word is compounded of *scot* and *ale*, and by transposition of the words is otherwise called *aleshot*.

SCOTALES, were meetings formerly held in England for the purpose of drinking ale, of which the expense was paid by joint contribution. Thus the tenants of South Malling in Sussex, which belonged to the archbishop of Canterbury, were, at the keeping of a court, to entertain the lord or his bailiff with a drinking, or an *ale*; and the stated quotas towards the charge were, that a man should pay threepence halfpenny for himself and his wife, and a widow and cottager a penny halfpenny. In the manor of Ferring, in the same county, and under the same jurisdiction, it was the custom for

the tenants named to make a *scotale* of sixteen pence halfpenny, and to allow out of each sixpence a penny halfpenny for the bailiff.

Common *scotales* in taverns, at which the clergy were not to be present, are noticed in several ecclesiastical canons. They were not to be published in the church by the clergy or the laity; and a meeting of more than ten persons of the same parish or vicinage was a *scotale* that was generally prohibited. There were also common drinkings, which were denominated *lect-ale*, *bride-ale*, *clerk-ale*, *church-ale*. To a *lect-ale* probably all the residents in a manorial district were contributors; and the expense of a *bride-ale* was defrayed by the relations and friends of a happy pair, who were not in circumstances to bear the charges of a wedding dinner. This custom prevails occasionally in some districts of Scotland even at this day, under the denomination of a *penny bride-ale*, and was very common about half a century ago. The *clerk's-ale* was in the Easter holidays, and was the method taken to enable clerks of parishes to collect their dues more readily.

Mr Warton, in his history of English poetry, has inserted the following extract from an old indenture, which clearly shows the design of a *church-ale*. "The parishioners of Elveston and Okebrook, in Derbyshire, agree jointly to brew four ales, and every ale of one quarter of malt, betwixt this and the feast of St John the Baptist next coming; and that every inhabitant of the said town of Okebrook shall be at the several ales. Every husband and his wife shall pay twopence, every cottager one penny; and all the inhabitants of Elveston shall have and receive all the profits and advantages coming of the said ales, to the use and behoof of the said church of Elveston."

The *give-ales* were the legacies of individuals, and from that circumstance entirely gratuitous. They seem to have been very numerous, and were generally left to the poor; though, from the largeness of the quantity of ale enjoined to be brewed, it must have been sometimes intended that others were to partake of them. These bequests were likewise made to the altar of a saint, with directions for singing masses at the obit, or anniversary of the testator. The *give-ales* were sometimes dispensed in the church, and frequently in the church-yard, by which means Godde's house was made a tavern of gluttons. Such certainly would be Chalk-church, if in it was kept the *give-ale* of William May of that parish; for he ordered his wife "to make in bread six bushels of wheat, and in drink 10 bushels of malt, and in cheese 20d. to give to poor people, for the health of his soul; and he ordered that, after the decease of his wife, his executors and feoffees should continue the custom for evermore."

SCOTER. See ANAS, ORNITHOLOGY *Index*.

NOVA SCOTIA, or *NEW SCOTLAND*, one of the British settlements in North America, situated between 43° and 49° north latitude, and between 60° and 67° west longitude, is bounded by the river St Laurence on the north; by the gulf of St Laurence and the Atlantic ocean on the east; by the same ocean on the south; and by Canada and New England on the west.—In the year 1784, this province was divided into two governments. The province and government now styled *New Brunswick*, is bounded on the westward of the mouth of the river St Croix, by the said river to its source, and

Scotales
||
Nova Scotia.

Nova Scotia.

by a line drawn due north from thence to the southern boundary of the province of Quebec; to the northward by the said boundary as far as the western extremity of the bay De Chaleurs; to the eastward by the said bay to the gulf of St Laurence to the bay called *Bay Verte*; to the south by a line in the centre of the bay of Fundy, from the river St Croix aforesaid, to the mouth of the Musquat river, by the said river to its source; and from thence by a due east line across the isthmus into the Bay Verte, to join the eastern lot above described, including all islands within six leagues of the coast.

The chief rivers are, the river of St Laurence, which forms the northern boundary. The rivers Risgouche and Nipisiguit run from west to east, and fall into the bay of St Laurence. The rivers of St John, Passamagandi, Penobscot, and St Croix, which run from north to south, fall into Fundy bay, or the sea a little to the eastward of it.

The seas adjoining to it are, the Atlantic ocean, Fundy bay, and the gulf of St Laurence. The lesser bays are, Chenigto and Green Bay upon the isthmus which joins the north part of Nova Scotia to the south; and the bay of Chaleurs on the north-east; the bay of Chedibucto on the south-east; the bay of the Islands; the ports of Bart, Chebucto, Prosper, St Margaret, La Heve, Port Maltois, Port Rysignal, Port Vert, and Port Joly, on the south; Port La Tour on the south-east; Port St Mary, Annapolis, and Minas on the south side of Fundy bay, and Port Roseway, now the most populous of all.—The chief capes are, Cape Portage, Ecoumenac, Tourmentin, Cape Port, and Epis, on the east; Cape Fogerie and Cape Canceau on the south-east; Cape Blanco, Cape Vert, Cape Theodore, Cape Dore, Cape La Heve, and Cape Negro, on the south; Cape Sable and Cape Fourche on the south-west.—The lakes are very numerous, but have not yet received particular names.

The face of the country, when viewed at a distance, presents a pleasingly variegated appearance of hills and valleys, with scarcely any thing like mountains to interrupt the prospect, especially near the sea. A nearer approach discovers those sublime and beautiful scenes which are so far superior to the gaudy embellishments of art. Immense forests, formed of the tallest trees, the growth of ages, and reaching almost to the clouds, everywhere cover and adorn the land: their leaves falling in autumn, add continually to that crust of moss, vegetables, and decaying wood, that has for many centuries been accumulating; whilst the rays of the sun, unable to pierce the thick shade which everywhere covers the ground, leaves it in a perpetual state of damp and rottenness; a circumstance which contributes in no small degree, to increase the sharpness of the air in winter.

The clouds, flying over the high grounds, which are covered in every direction with one vast forest, and arrested by the attraction of the woods, fill the country with water. Every rock has a spring, and every spring causes a swamp or morass, of greater or less extent in proportion to its cause: hence it is, that travelling becomes almost impracticable in summer, and is seldom attempted, but in the fall of the year, when winter begins to set in, and the ground is already frozen.

The land throughout the peninsula is in no part mountainous, but frequently rises into hills of gradual ascent, everywhere clothed with wood. From these

arise innumerable springs and rivulets, which not only fertilize and adorn the country, but have formed, in the midst of it, a large lake or piece of fresh water, which is of various depths, and of which, however, little more is known, than that it has upon its borders very large tracts of meadow-land highly improveable. That part of the province which is beyond the bay of Fundy, and extends to the river of St Laurence, rises also gradually as we advance from the sea quite to Canada; but is, however, hardly anywhere mountainous. Its lands are for the most part very rich, particularly at a distance from the sea; and its woods abound with the hardest and loftiest trees.

Though this country, like Canada, is subject to long and severe winters, succeeded by sudden and violent heats, often much greater than what are felt in the same latitudes in Europe, yet it cannot be accounted an unhealthy climate. The air in general in winter is very sharp, frosty, and dry; the sky serene and unclouded, by which every kind of exercise adapted to the season is rendered pleasant and agreeable. The fogs are frequent near the sea, but seldom spread themselves to any distance inland.

The winter commonly breaks up with heavy rains, and the inhabitants experience hardly any of the delights of the spring, which in England is accounted the most agreeable season of the year. From a lifeless and dreary appearance, and the gloomy scenes of winter wrapped around the vegetable world, the country throws off its forbidding attire, and in a few days exhibits a grand and pleasant prospect: the vegetation being inconceivably rapid, nature passes suddenly from one extreme to another, in a manner utterly unknown to countries accustomed to a gradual progression of seasons. And, strange as it appears, it is an acknowledged fact, a fact which furnishes a certain proof of the purity of the air, that these sudden changes seldom, if ever, affect the health of strangers or Europeans.

In this country agriculture has yet made but small progress. Nova Scotia is almost a continued forest, producing every kind of wood which grows in the neighbouring provinces of New England. Four-fifths of all the lands in the province are covered with pines, which are valuable not only for furnishing masts, spars, lumber for the sugar plantations, and timber for building, but for yielding tar, pitch, and turpentine, commodities which are all procured from this useful tree, and with which the mother country may in a few years easily be supplied.

The various species of birch, beech, and maple, and several sorts of spruce, are found in all parts in great abundance; as also numerous herbs and plants, either not common to, or not known in, England. Amongst these none is more plentiful than sarsaparilla, and a plant whose root resembles rhubarb in colour, taste, and effects; likewise the Indian or mountain tea, and maiden hair, an herb much in repute for the same purpose, with shrubs producing strawberries, raspberries, and many other pleasant fruits, with which the woods in summer are well stored: Of these wild productions the cherries are best, though smaller than ours, and growing in bunches somewhat resembling grapes. The sassafras tree grows plentifully in common with others; but amongst them none is more useful to the inhabitants than a species of maple, distinguished by the name of the

the *sugar tree*, as affording a considerable quantity of that valuable ingredient. See SUGAR.

Amorist the natural productions of Nova Scotia, it is necessary to enumerate their iron-ore, which is supposed equally good with that found in any part of America.

Limestone is likewise found in many places; it is extremely good, and is now much used for building: independent of which, it gives the farmers and landholders a great advantage for improving the ground, as it is found by experience to be one of the most approved things in the world for that purpose.

Several of the useful and most common European fruits have been planted in many places; so that the province now produces great quantities of apples, some pears, and a few plums, which are all good of their kinds, especially the former. The smaller fruits, such as currants, gooseberries, &c. grow to as great perfection as in Europe; and the same may be said of all the common and useful kinds of garden plants. Among these their potatoes have the preference, as being the most serviceable in a country abounding with fish; and indeed they are not to be exceeded in goodness by any in the world. The maize, or Indian corn, is a native of much warmer climates; and, though planted here, never arrives at more than two-thirds of its natural bigness; a defect which arises as well from the shortness of the summer as the gravelly nature of the soil. Tobacco may likewise be cultivated with ease in Nova Scotia, as it is already everywhere in Canada, from Lake Champlain to the isle of Orleans, for the purpose of internal consumption.

This country is not deficient in the animal productions of the neighbouring provinces, particularly deer, beavers, and otters. Wild fowl, and all manner of game, and many kinds of European fowls and quadrupeds, have from time to time been brought into it and thrive well. At the close of March the fish begin to spawn, when they enter the rivers in such shoals as are incredible. Herrings come up in April, and the sturgeon and salmon in May. But the most valuable appendage of New Scotland is the Cape Sable coast, along which is one continued range of cod-fishing banks and excellent harbours. This fishery employs a great number of men, in some seasons not less than 10,000, when 120,000 quintals are caught, of which 40,000 may be exported. These, at the lowest price, must bring into the colony 26,000*l.* sterling, either in cash or in commodities necessary to the inhabitants. But this estimation, it must be observed, refers to a distant period, as that trade has now greatly increased.

Notwithstanding the comparatively uninviting appearance of this country, it was here that some of the first European settlements were made. The first grant of lands in it was given by James I. to his secretary Sir William Alexander, from whom it had the name of *Nova Scotia* or *New Scotland*. Since that period it has frequently changed proprietors, sometimes in the possession of the French, and sometimes in that of the English.

In 1604, the French first settled in Nova Scotia, to which they gave the name of *Acadia*. Instead of fixing towards the east of the peninsula, where they would have had larger seas, an easy navigation, and plenty of cod, they chose a small bay, afterwards called French

Bay, which had none of these advantages. It has been said that they were invited by the beauty of Port Royal, where a thousand ships may ride in safety from every wind, where there is an excellent bottom, and at all times four or five fathoms of water, and eighteen at the entrance. It is more probable that the founders of this colony were led to choose this situation, from its vicinity to the countries abounding in furs, of which the exclusive trade had been granted to them. This conjecture is confirmed by the following circumstance—that both the first monopolizers, and those who succeeded them, took the utmost pains to divert the attention of their countrymen, whom an unsettled disposition, or necessity, brought into these regions, from the clearing of the woods, the breeding of cattle, fishing, and every kind of culture; choosing rather to engage the industry of these adventurers in hunting or in trading with the savages.

This colony was yet in its infancy when the settlement, which has since become so famous under the name of *New England*, was first established in its neighbourhood. The rapid success of the plantations in this new colony did not much attract the notice of the French. This kind of prosperity did not excite any jealousy between the two nations. But when they began to suspect that there was likely to be a competition for the beaver trade and furs, they endeavoured to secure to themselves the sole property of it, and were fortunate enough to succeed.

At their first arrival in Acadia, they had found the peninsula, as well as the forests of the neighbouring continent, peopled with small savage nations, who went under the general name of *Abenakies*. Though equally fond of war as other savage nations, they were more sociable in their manners. The missionaries easily insinuating themselves among them, had so far inculcated their tenets as to make enthusiasts of them. At the same time that they taught them their religion, they inspired them with that hatred which they themselves entertained for the English name. This fundamental article of their new worship, being that which made the strongest impression on their senses, and the only one that favoured their passion for war, they adopted it with all the rage that was natural to them. They not only refused to make any kind of exchange with the English, but also frequently disturbed and ravaged the frontiers of that nation.

This produced perpetual hostilities between the New Englanders and the French settlers in Acadia, till that province was, at the peace of Utrecht, for ever ceded to the English, who seemed not for a long time to discover the value of their new acquisition. They restored to it its ancient name of *Nova Scotia*; and having built a slight fortification at Port-Royal, which they called *Annapolis* in honour of Queen Anne, they contented themselves with putting a very small garrison into it. In process of time, however, the importance of Nova Scotia to the commerce of Great Britain began to be perceived; and at the peace of 1749, the ministry offered particular advantages to all persons who chose to go over and settle in Acadia. Every soldier, sailor, and workman, was to have 50 acres of land for himself, and ten for every person he carried over in his family. All non-commissioned officers were allowed 80 for themselves, and 15 for their wives and children;

Nova Scotia.
 Scotland.
 * About 1s.
 Sterling.

ensigns 200; lieutenants 300; captains 400; and all officers of a higher rank 600; together with 30 for each of their dependents. The land was to be tax free for the first ten years, and never to pay above one livre two sols six deniers * for fifty acres. Besides this, the government engaged to advance or reimburse the expenses of passage, to build houses, to furnish all the necessary instruments for fishery or agriculture, and to defray the expenses of subsistence for the first year. These encouragements determined 3740 persons, in the month of May 1749, to go to America, in hopes of bettering their fortune.

Thus encouraged, the province of Nova Scotia began to flourish, though in 1769 it sent out only 14 vessels and 148 boats, which together amounted to 7324 tons, and received 22 vessels and 120 boats, which together made up 7006 tons. They constructed three sloops, which did not exceed 110 tons burden. Their exportation for Great Britain and for the other parts of the globe did not amount to more than 729,850 livres 12 sols 9 deniers. † Continuing, however, true to its allegiance when the other colonies threw off the dominion of Great Britain, it has now become a place of great consequence both to the mother country and the West Indies. Its shipping and seamen have rapidly increased, as well as its produce, which affords the pleasing prospect of being able to supply itself with all the necessaries of life. It now supplies Britain with timber and fish to the amount of 50,000ℓ.

† About
 30,410ℓ.

yearly; and receives from hence linen and woollen cloths to the value of about 30,000ℓ. The number of persons who have abandoned their habitations in the more southern provinces, and settled either there or in Canada, is very great. The population of Nova Scotia was estimated by Mr Colquhoun in 1812, at 100,000; and it is without doubt the most convenient in point of situation of any province of America for a maritime power of Europe to be possessed of.

SCOTIA, in *Architecture*, a semicircular cavity or channel between the tores in the bases of columns.

SCOTISTS, a sect of school divines and philosophers, thus called from their founder *J. Duns Scotus*, a Scottish cordelier, who maintained the immaculate conception of the Virgin, or that she was born without original sin, in opposition to Thomas Aquinas and the Thomists.

As to philosophy, the Scotists were, like the Thomists, Peripatetics (see PERIPATEICS); only distinguished by this, that in each being, as many different qualities as it had, so many different formalities did they distinguish; all distinct from the body itself, and making as it were so many different entities; only these were metaphysical, and as it were superadded to the being. The Scotists and Thomists likewise disagreed about the nature of the divine co-operation with the human will, the measure of divine grace that is necessary to salvation, and other abstruse and minute questions, which it is needless to enumerate.

Scotists.
 Scotland.

S C O T L A N D.

¹
 Extent and
 boundaries.

SCOTLAND, the modern name of that part of the island of Britain which lies to the north of the Solway frith and the river Tweed. It is bounded on the north by that part of the Atlantic called the Northern ocean; on the east by the German ocean or North sea; on the west by the Atlantic ocean, and partly by the Irish sea; and on the south by England, the boundary on this side being formed by the river Tweed, the Cheviot hills, and an ideal line drawn south-west down to the Solway frith. Excluding the islands, the continental part of Scotland extends from the Mull of Galloway in the 55th to Cape Wrath in the 58½ degree of north latitude, and from 1° 35' to 6° 20' west from the meridian of Greenwich, counting from Buchanness on the east to Ardnamurchan on the west. If we include the islands of Shetland and the Hebrides, we shall find this part of the British empire extending northward to 63°, and westward to the isle of St Kilda to 8° 18' west longitude. The continental part of Scotland is generally estimated at 260 miles in length, and about 160 at its greatest breadth, and its superficial contents have been computed at 27,793 square miles.

²
 Divisions.

Scotland has been divided into Highlands and Low-

lands; but the boundaries of these are arbitrary and undetermined. A more natural division appears to be that into northern, middle, and southern parts. The northern part is bounded to the south by a range of lakes, extending from the Murray frith to the island of Mull, in a south-west direction, and comprehends the counties of Orkney, Caithness, Sutherland, Ross, Cromarty and Inverness. The southern division extends northward to the friths of Forth and Clyde, and the canal by which they are united, and comprehends the counties of Linlithgow, Edinburgh, Haddington, Berwick, Renfrew, Ayr, Wigton, Lanark, Peebles, Selkirk, Roxburgh, Dumfries and Kirkcudbright. In the midland division are included the counties of Argyll, Bute, Nairn, Moray, Banff, Aberdeen, Mearns, Angus or Forfar, Perth, Fife, Kinross, Clackmannan, Stirling, and Dumbarton.

In the following table we have brought together some of the most important circumstances respecting the topography and statistics of these counties, viz. the county town, their extent in square acres, their population, according to the latest accounts, and the number of militia which each county is obliged to raise, according to last militia act.

{ Ross and
Cromarty.

For a topographical account of the several counties, the reader is referred to their names in the order of the alphabet.

4
Face of the
country. Scotland is in general extremely mountainous, especially on the northern and western sides, whence these parts have been denominated the *Highlands*. Even the eastern and southern parts of the country have very little of that uniform flatness which distinguishes some parts of England, but are agreeably diversified with hill and dale. Numerous rivers intersect the country; and several romantic lakes are found at the foot of the most remarkable mountains. There is in general little wood, except in the northern parts, where there are still immense forests. Nothing can appear more wild and savage to the eye of a stranger than the Highlands of Scotland. Here the whole country seems composed of blue rocks and dusky mountains heaped upon each

other, with their sides embrowned with heath, and their summits covered with snow, which lies unthawed for the greater part of the year, or pours down their jagged sides in a thousand torrents and roaring cataracts, falling into gloomy vales or glens, some of which are so deep and narrow as to be altogether impenetrable by the rays of the sun. Yet even these mountains are in some places sloped into agreeable green hills fit for pasture, and interspersed with pleasant straths or valleys capable of cultivation; and there are several extensive districts of low fertile ground, though in other parts the interstices of the mountains are rendered nearly impassable by bogs and morasses. The entrance into the Highlands from the south-east near Dunkeld, is peculiarly impressive, there being here a considerable tract of plain, extending to what may be called the *gates* of the mountains.

The

Note.—The writers on Scottish topography have noted the extent of the several counties, sometimes in English, and sometimes in Scotch acres. We have therefore affixed to the numbers expressing the acres of each county, E or S, according as they are English or Scotch. The reader may reduce them to either standard, by recollecting that the Scotch acre exceeds the English nearly in the proportion of five to four.

Scotland. The soil of Scotland, which, considering the little variety of the country, is extremely various, will be best understood by examining that of the several counties, as described under their respective heads. In some parts, as the carse of Gowrie in Perthshire, and most of the counties of Haddington and Berwick, the soil vies in fertility with the richest parts of England, or even Ireland, while in the more mountainous tracts of Ross-shire, Sutherland, and Argyle, the country is very little adapted to tillage, and is therefore almost wholly devoted to pasturing large flocks of sheep and herds of black cattle.

6 Mountains. The principal mountains of Scotland are those of the Grampians, extending from Loch Lomond to Stonehaven, and forming the southern boundary of the Highlands; the Leadhills, partly in Dumfries-shire and partly in Lanark-shire; the Cheviot hills, forming the principal part of the southern boundary, and the Ochil hills, north of the river Forth. The highest individual mountains are those of Ben Nevis, Cairngorum, Ben Lawers, Ben More, Ben Lomond, Schhallien, Mount Battock, and Cruachan. The situation and direction of the mountainous chains, and the minerals which they contain, have been described under GEOLOGY, N° 140.

7 Bays and gulfs. The most remarkable inlets of the sea on the Scottish coasts are, the friths of Forth, Tay, Solway, Murray, Cromarty, Dornoch, and Clyde, and the bays of Wigton and Glenluce. Many of what are called lochs, are properly large gulfs or inlets of the sea, especially Loch Fine, Loch Shin, Loch Broom, and Loch Linnhe.

8 Rivers. The chief rivers of Scotland are the Forth, that divides Stirling and Fife from the Lothians; the Tay, dividing Perth-shire and Angus-shire from Fife-shire; the Tweed, forming the boundary between Scotland and England to the east; the Clyde, passing through great part of Lanark-shire, and separating this county from those of Renfrew and Dumbarton; the Dee and the Don, passing through Aberdeen-shire; the Spey, separating the counties of Banff and Murray; the Nith, passing through Dumfries-shire, and the Eden in the county of Fife. See each under their respective names.

9 Lakes. The lakes or lochs of Scotland, are chiefly those of Lomond in Dumbarton-shire, Awe, in Argyle-shire, Tay, Katrine, and Erne, in Perth-shire; Loch Ness in Inverness-shire; and the classical lake of Leven in Kinross-shire. See LEVEN, LOMOND, TAY, &c.

10 Forests. We have said that Scotland is in general bare of wood, though there are numerous traces of its having formerly abounded in forests. The most remarkable of these was Ettrick forest in the county of Selkirk; the forest of Mar in the west of Aberdeen-shire, where still remains a considerable tract of woodland, called Abernethy forest; the forest of Sletadale to the north of Dun-Robin in the county of Sutherland; those of Dirrymore and Dirrymena, to the north and south of Loch Shin, and the forest of Athol in the county of Perth.

11 Climate and seasons. The climate of Scotland is, if possible, still more constant than that of England; and though in general extremely healthy to the robust mountaineer, it is by no means genial to the valetudinarian. The eastern coast is exposed to the keenness of the east wind during the greater part of the year, while the western shores, from their vicinity to the Atlantic, are deluged with almost

perpetual rain. The winter in this country is remarkable, rather for the abundance of snow which falls at that season, than for the intensity of frost; while in summer the heat of the sun is reflected with great violence in the narrow vales between the mountains, so as sometimes to occasion the appearance of glittering particles that seem to swim before the eye. The bareness of wood adds to the effects of sudden alternations of the weather, though it contributes to diminish the natural humidity of the air. The spring is in general very late and inclement, so as not unfrequently to destroy the fairest prospects of the farmer and the gardener. The harvests are also late; and we have seen corn either uncut, or standing in sheaves on the field, in the latter end of November.

12 Animals. The zoology of Scotland, as distinguished from that of England, offers little remarkable to the eye of the naturalist. In the northern counties, and in Galloway to the south, there is a breed of small horses, like the Welsh ponies, called *shelties*, which are extremely hardy but obstinate and skittish. The cattle in Galloway are often without horns; a circumstance which is said to add to the quantity and quality of the milk which they produce. One of the chief primitive breeds of cattle in this country are the kylie, so called from the province of Kyle. These are of a middle size, and have short sharp horns pointing upwards. The Scotch sheep are smaller and shorter than those of England, but their flesh is much more delicate; and the fleeces of the Shetland sheep are remarkable for the fineness of their wool. Goats are not nearly so common in the Highlands of Scotland as in most other mountainous tracts, and swine are very little cultivated, pork not being a favourite food among the inhabitants of North Britain. There seems to be no breed of dogs peculiar to this country; but the colies or shepherd dogs are remarkable for their sagacity, and are often entrusted with the guardianship of flocks and herds during their master's absence. There are scarcely any wild quadrupeds peculiar to Scotland. The wolf, indeed, continued here to a much later period than in England, and the wild cat is occasionally observed. Small herds of roes also are still found in some of the northern districts, and seals and porpoises frequent the sea coasts.

Of the native birds, the black cock and the grouse are the most remarkable. Eagles are often seen on the rocky cliffs, and elegant falcons in the remaining forests. The shores and islands present numerous sea fowl, and the isle of Bass is proverbially the haunt of the solan goose. The golden-crested wren is sometimes seen in the most northern parts of the country; but the nightingale has never yet appeared north of the Tweed.

The shores of Scotland are abundantly supplied with fish, especially herrings, haddocks, turbot, and lobsters; and the mouths of the great rivers, especially the Tweed and the Tay, furnish an inexhaustible supply of the finest salmon. Oysters are plentiful, but they are not so delicate as those on the coast of Essex. Mackerel, whiting, and smelts, are uncommon; and sprats are scarcely known. The lakes and streams abound in trout, perch, and other fresh-water fish. The whale sometimes appears on the northern coast, and the basking shark on the western inlets.

13 Vegetables. The vegetable productions of Scotland, considered in general,

Scotland. general, differ little from those of England; and those of the whole island may be seen by referring to the article BOTANY, where each British species is marked with an asterisk. We may remark, that the warm, moist regions of Cornwall, Devonshire, and Dorset; the range of chalk hills that forms the greater part of the banks of the Thames; the dry sandy tracts of Norfolk, Suffolk, and Cambridge; and the fens of Lincolnshire, contain many plants that are either unknown, or very rarely met with in North Britain: while on the other hand, the snowy summits of the Grampians, the extensive forests of Badenoch and Braemar, and the bleak unsheltered rocks of the Hebrides, possess many hardy vegetables not to be found in the southern parts of the island. South Britain contains a greater number of species peculiar to itself; but those that are similarly circumstanced in this northern division, are of more frequent occurrence. To the English botanist, Scotland will have more the air of a foreign country than England to a Scottish botanist. The researches of the former will be continually solicited, and repaid amid the grand romantic scenery of the Highlands, by the appearance of plants either altogether new to him, or which he has been accustomed to consider as the rare reward of minute investigation. In traversing the natural forests of birch and pine, though his attention will be first attracted by the trees themselves in every stage of growth, from the limber sapling to the bare and weather-beaten trunks that have endured the storms of 500 or 600 winters; the new forms of the humbler vegetables will soon divide his attention, and will each attract a share of his regard. It would be an uninteresting task both to us and our readers, to enumerate the plants more peculiar to Scotland. These may be found in Lightfoot's *Flora Scotica*, and many of them in Mr Pinkerton's *Geography*.

Scotland is by no means remarkable for abundance of fruit. Gooseberries, strawberries, and raspberries, do indeed ripen nearly as well as in England; and apples, pears, and some species of wall-fruit, as Orleans plums and apricots, are not uncommon; but peaches, nectarines, and grapes, are scarcely seen in the open air; and in the best gardens we have not observed the walnut, the mulberry, or the fig. Even the currants, which are very abundant, scarcely ever attain that degree of ripeness which can fit them for use as a dessert, but are employed almost entirely for jellies and wines. The chief fruit districts are those on the banks of the Clyde.

14 Minerals. Few countries possess a greater store of subterraneous riches than Scotland; most of the metals, and some of the most valuable minerals, being very common. Even gold itself has been found in the Leadhills, in the sands of Elvan, a rivulet which joins the Clyde, and in the Ochil hills; and a considerable quantity of silver is annually obtained from the lead mines of Leadhills and Wanlockhead. Copper is rare; but has been met with near Alva in the Ochills; at Colvend in Galloway, and some other places. The most remarkable lead mines are those of Leadhills and Wanlockhead, Strontian and Islay; but traces of this metal have been found in other parts. Iron is a most abundant mineral production, but that called the Carron ore is best known. Cobalt is found at Alva; calamine (an impure oxide of zinc) at Wanlockhead; plumbago or graphite in Ayrshire; and antimony in Dumfries-shire.

Scotland. Among the other minerals, coal is to be regarded as the most abundant and most valuable. We have already remarked, under GEOLOGY, that one of the two chief beds of coal found in this island, is that which runs from the valley traversed by the Tay and the Forth, westward to the coast of Ayrshire. The Lothians and Fifeshire particularly abound with coal; and it is not less abundant in the vicinity of Glasgow, and in several places of the counties of Ayr and Renfrew.

Scotland may be called the quarry of Britain, as hence is derived most of the stone that is carried to the south for building and paving. Abundance of freestone and limestone is found in most parts of the country; and the beauty and durability of the houses in the New Town of Edinburgh bear ample testimony to the value of the quarries in that neighbourhood. Beautiful granite is found in Ben Nevis, and fine statuary marble in Asynt, and in Blairgowrie in Perthshire. A black marble freckled with white occurs at Fort William; jasper is found in various parts; fullers earth occurs near Campbeltown, and considerable quantities of talc in the mountains of Findhorn. The beautiful quartz of Cairngorum is well known, and numerous pebbles of agates and onyxes are frequently collected on the eastern coast.

15 Mineral waters. The mineral waters of Scotland are numerous; but the principal are those of Moffat, Peterhead, St Bernard's well near Edinburgh, and Pitcaithly. At Moffat are two springs, one a sulphureous, and the other from Hartfell a chalybeate water. The water at St Bernard's well is strongly impregnated with sulphur.

16 Natural curiosities. Many singular natural curiosities are to be found in Scotland. Among these the beautiful falls of the Clyde, the insulated rock of the Bass, the scenery about Loch Lomond, and the isles of Staffa, Eigg, and Cannay, are chiefly deserving of notice. In the isle of Arran is an immense vaulted cavern, hollowed in the solid rock; and near Colvend in Dumfries-shire, and on the eastern coast of Fife, are several remarkable caves. Noss head presents a singular quarry of slate, marked with metallic figures; and at Glatton in the heights of Glenelchraig, is a cascade, which, viewed amidst the constant darkness of hills and woods, is truly sublime.

In the parish of Gaurie in Banffshire are three remarkable natural curiosities; a perpendicular rock of very great extent full of shells, which are possessed by myriads of birds; a cave, or rather den, called *Hell's lum* or *chimney*, 50 feet deep, 60 long, and 40 broad, having a subterraneous passage to the sea, about 240 feet long, through which the waves are driven with great violence in stormy weather, so as to occasion smoke to rise from the den; and another subterraneous passage through a peninsula from sea to sea, nearly 450 feet long, and so narrow that a man can with difficulty creep through it. At one end of this passage is a cave about 20 feet high, 30 broad, and 150 long, supported by immense columns of rock.

17 Scottish islands. There are three principal groups of Scottish islands; those of Shetland and Orkney, to the north of the Pentland frith, and that of the Hebrides, Hebrides, or Western Isles, in the Western Atlantic. An ample account of these will be found under the articles **HEBRIDES, ORKNEY, and SHETLAND**; and under the names of the principal individual islands. The isles of

Scotland, of Bute and Arran, which are distinct from the Hebrides, have also been described under their respective names.

18
Names of
North Bri-
tain.

The name Scotland, as applied to North Britain, is comparatively of recent date. By the later Roman writers, *Scotia* was applied to Ireland, as the country which had been colonized by the *Scoti*, and the names of *Hiberni* and *Scoti* are, after the 4th century of the Christian era, indiscriminately applied to the inhabitants of Ireland. When North Britain first became known to the Romans under Agricola, it was by them denominated *Caledonia*, from its abounding in forests, and the natives were called *Caledonii*. These names continued in use till the extirpation of the Roman power in Britain, when this part of the island was generally known by the name of *Provincia Pictorum*, and the inhabitants were divided into *Picti-Caledonii*, and *Picti*. It is not till the 11th century that we find *Scotia* or *Scotland* appropriated to North Britain.

With respect to the origin of this name there is much dispute; but it is generally agreed that the term *Scots* was applied to the inhabitants of North Britain by their neighbours, by way of reproach.

19
Aborigines
of Scotland.

Few points have been disputed with more keenness and more asperity than the original population of Scotland. The Irish and the Scotch have strenuously contested the claim of their country to be the stock from which the other was colonized. There seems no doubt that both Britain and Ireland were originally peopled by the Celtic tribes, who had long before occupied the west of Europe, and advanced from the shores of Gaul, probably across the straits of Dover, to take possession of the southern part of Britain. Thence it appears they extended themselves northwards, till they had peopled the whole island, when, from a spirit of enterprise, or to find more room and better pasture for their herds, they crossed the channel to the west of Britain, and planted a colony in Ireland. This seems to be their most natural route; and numerous authorities have been lately adduced to prove, not only that the whole of Britain and Ireland were peopled by Celtic tribes, but that the colonization of Ireland was subsequent to that of Scotland. "This region (North Britain) during the first century," says Mr Chalmers, "is a small but genuine mirror of Gaul during the same age. North Britain was inhabited by one-and-twenty clans of Gaelic people, whose polity, like that of their Gaelic progenitors, did not admit of very strong ties of political union. They professed the same religious tenets as the Gauls, and performed the same sacred rites; their stone monuments were the same, as we know from remains. Their principles of action, their modes of life, their usages of burial, were equally Gaelic; and above all, their expressive language, which still exists for the examination of those who delight in such lore, was the purest Celtic."*

* *Caledonia*, vol. i. p. 33.

20
Names and
situations
of the Abo-
riginal
tribes.

The names and position of the 21 tribes which occupied North Britain in the first century, have been minutely investigated by Mr Chalmers, and we shall here briefly state the result of his investigations. The first tribe which he mentions is that of the *Ottadini*, who possessed the country which stretches from the river Tyne northward along the coast of the German sea and the frith of Forth. On the west of these lay the *Ga-*

deni, occupying the western part of Northumberland, that small portion of Cumberland which lies to the north of the river Irthing; the west of Roxburghshire, the whole of Selkirk and Tweeddale, part of Mid Lothian, and nearly the whole of West Lothian, or Linlithgow. To the south-west of the *Gadeni* lay the *Selgovæ*, inhabiting Annandale, Nithsdale, and Eskdale in Dumfries-shire; the eastern part of Galloway as far as the river Dee, which formed their western boundary; while to the south they extended to the Solway frith. The *Novantes* inhabited the western and middle parts of Galloway, from the Dee on the east to the Irish sea on the west. The *Damnii* occupied the whole extent of country from the ridge of hills lying between Galloway and Ayrshire on the south, to the river Earn on the north, comprehending all Strathclyud, the counties of Ayr, Renfrew, and Stirling, with a small part of Dumbarton and Perth. The *Horestii* inhabited the country lying between the Forth and Tay, including the shires of Fife, Clackmannan, and Kinross, with the eastern part of Strathearn, and the country lying westward of the Tay, as far as the river Brand. The *Venricones* possessed the country between the Tay and the Carron, comprehending a great part of Perthshire, the whole of Angus, and part of Kincardineshire. The *Taixali* inhabited the northern part of the Mearns, and the whole of Aberdeenshire, to the Doveran; a district which included the promontory of Kinnaird's-head, to which the Romans gave the name of *Taixalorum promontorium*. The *Vacanagi* occupied the country on the south side of the Murray frith, from the Doveran on the east, to the Ness on the west: an extent comprehending the shires of Banff, Elgin, Nairn, the east part of Inverness, with Braemar in Aberdeenshire. The *Albani*, afterwards called *Damnii Albani*, inhabited the interior districts, between the lower ridge of the Grampians on the south, and the chain of mountains forming the southern limit of Inverness-shire on the north, including Braidalban, Athol, a small part of Lochaber, with Appin and Glenorchy in Upper Lorn. The *Attacotti* inhabited the whole country from Loch Fine on the west, to the eastward of the river Leven and Loch Lomond, comprehending the whole of Cowal in Argyleshire, and the greater part of Dumbartonshire. The proper *Caledonii* possessed the whole of the interior country, from the ridge of mountains which separates Inverness from Perth on the south, to the range of hills that forms the forest of Balnagavan on the north, comprehending all the middle parts of Inverness and of Ross. The *Cantæ* inhabited the east of Ross-shire from the æstuary of Varar on the south, to the frith of Dornoch on the north, having the frith of Cromarty in the centre, and a ridge of hills on the west. The south-eastern coast of Sutherland was inhabited by the *Logi*, whose country extended from the frith of Dornoch on the south-west to the river Ila on the east. The *Carnabii* inhabited the south of Caithness from the Ila river; the small tribe of the *Cateni* inhabited the north-west corner of Caithness; and the *Mertæ* occupied the interior of Sutherland. The *Carmonacæ* inhabited the north and west coast of Sutherland, while the *Creones* occupied the west coast of Ross-shire, the *Cerones* the western coast of Inverness, and the *Epidii* the south-west of Argyleshire, from Loch Linnhe to the frith of Clyde.

Scotland. All these Celtic tribes, in their laws, religion, manners, and customs, appear to have resembled the Britons of the south. Their life was equally simple, their manners were equally savage, and their religion, like that of the South Britons, was certainly Druidical. See ENGLAND, N° 4, and the article DRUIDS. The fact of Druids having existed in North Britain, so strenuously denied by some writers, is, in the opinion of Mr Chalmers, completely ascertained by numerous remains of places of Druidical worship. These he has been at much pains to investigate, and has described several remarkable circles of stones and rocking stones, resembling in almost every particular those in South Britain, which are on all hands allowed to be Druidical. Some remarkable remains of this kind occur in the parish of Kirkmichael in Perthshire, where there is an immense rocking stone standing on a flat-topped eminence in the vicinity of a large body of Druidical remains. Opposite to the manse of Dron, in the same county, there is another large rocking stone, ten feet long and seven broad; and in the parish of Abernethy, near Balvaird, there is a third which attracted the notice of Buchanan. In the stewartry of Kirkcudbright is a stone of a similar description, called *Logan stone*, which from its size appears to be eight or ten tons in weight, and is so nicely balanced on two or three protuberances, that the pressure of the finger produces a rocking motion from the one side to the other. †

Caledonia, vol. i. p. 76.

22 Roberton's division of the Scottish history.

It has been remarked by Dr Robertson, that the history of Scotland may properly be divided into four periods. The first reaches from the origin of the monarchy to the reign of Kenneth II.; the second, from Kenneth's conquest of the Picts to the death of Alexander III.; the third extends to the death of James V.; the last, from thence to the accession of James VI. to the crown of England. In the opinion of the same historian, the first period, extending from the earliest accounts to the year 843 of the Christian era, is the region of pure fable and conjecture, and ought to be totally neglected, or abandoned to the industry and credulity of antiquaries; that in the second period from 843 to 1286, truth begins to dawn with a light feeble at first, but gradually increasing, and that the events which then happened may be slightly touched, but merit no particular or laborious enquiry; that in the third period, from 1286 to 1542, the history of Scotland, chiefly by means of records preserved in England, becomes more authentic, as not only events are related, but their causes and effects are explained; and here every Scotchman should begin, not only to read, but to study the history of his country.

23 To authentic traces of Scottish story previous to the Christian era.

It must be allowed that most of the transactions recorded by Buchanan and Boece, as having taken place in Scotland before the Christian era, are either purely fabulous, or are substantiated by no authentic documents; and we cannot but contemplate with the smile of incredulity, the long and minute list of Scottish monarchs from Fergus I. to Fergus II., so pompously displayed by these historians. That the names of 39 princes should be handed down with correctness by uncertain traditions, for a period of 690 years; that the duration of their reigns and the date of their accession should be so exactly ascertained, is surely a circumstance of the highest improbability; and we are compelled to believe that the earlier writers of Scottish history, like the Chinese annalists, have described the transactions of the

same monarch under different names, or under the same names with the designation of I, II, III, &c. This is rendered the more probable by considering that both Fergus I. and Fergus II. are said to have been of Irish extraction, and to have come over from Ireland to assist the inhabitants of North Britain against their more powerful neighbours. Under the persuasion that nothing authentic can be recorded in the Scottish history before the arrival of the Romans in Britain, we shall commence the historical part of this article from the period when Agricola first penetrated north of the Tweed.

Scotland.

It is to the luminous pages of Tacitus that we must look for the first rational and authentic documents of Scottish history.

24 Invasion of Scotland by Agricola. An. 80.

The invasion of Agricola happened during the dominion of a chief, called by the Roman historians *Galgacus*. Agricola having completed the conquest of the southern part, and in a great measure civilized the inhabitants, formed a similar plan with regard to Scotland. It is probable, that at this time the Caledonians had become formidable by the accession of numbers from the south; for though the Romans had civilized the greatest part, it cannot be doubted that many of those savage warriors, disdaining the pleasures of a peaceable life, would retire to the northward, where the martial disposition of the Caledonians would better suit their inclination. The utmost efforts of valour, however, were not proof against the discipline of the Roman troops, and the experience of their commander. In the third year Agricola had penetrated as far as the river *Tau*, (probably the *Solway Frith*, and not the *Tay*); but the particulars of his progress are not recorded. The following year he built a line of forts between the friths of Forth and Clyde, to exclude the Caledonians from the southern parts of the island; and the year after, he subdued those parts which lay to the south and west of his forts, namely, the districts of Galloway, Cantyre, and Argyle.

Agricola still pursued the same prudent measures by which he had already secured the possession of such a large tract of country, that is, advancing but slowly, and building forts as he advanced, in order to keep the people in obedience. The Caledonians, though commanded by their king *Galgacus*, who is said to have been well acquainted with the manner of fighting and discipline of the Romans, were yet obliged to retreat; but at last, finding that the enemy made such progress as endangered the subjugation of the whole country, he resolved to cut off their communication with the southern parts, and likewise to prevent all possibility of a retreat by sea. Agricola, though solicited by some of his officers, refused to retreat; but divided his troops into three bodies, having a communication with each other. Upon this, *Galgacus* resolved to attack the weakest of the three, which consisted only of the ninth legion, and lay at that time, as is said, at a place called *Lochore*, about two miles from *Loch-Leven* in Fife. The attack was made in the night: and as the Romans were both unprepared and inferior in number, the Caledonians penetrated into the heart of their camp, and were making a great slaughter, when Agricola detached some light-armed troops to their assistance; by whom the Caledonians in their turn were routed, and forced to fly to the marshes and inaccessible places, where the enemy could not follow them.

This engagement has been magnified by the Roman historians into a victory, though it can scarcely be admitted

† 4 E

Scotland. ²⁵ Great victory gained by the Romans.
 mitted as such from the testimonies of other historians. The Romans, however, certainly advanced very considerably, and the Caledonians as constantly retreated, till they came to the foot of the Grampian mountains, where the latter resolved to make their last stand. In the eighth year of the war, Agricola advanced to the foot of the mountains, where he found the enemy ready to receive him. Tacitus has given us a speech of Galgacus, undoubtedly fabricated for him, in which he sets forth the aspiring disposition of the Romans, and encourages his countrymen to defend themselves vigorously, as knowing that every thing valuable was at stake. A desperate engagement accordingly ensued. In the beginning, the Britons had the advantage, by the dexterous management of their bucklers: but Agricola having ordered three Tungrian and two Batavian cohorts, armed with short swords, and embossed bucklers terminating in a point, to attack the Caledonians, who were armed with long swords, the latter soon found these weapons useless in a close encounter; and as their bucklers covered only a small part of their bodies, they were easily cut in pieces by their adversaries. The most forward of their cavalry and charioteers fell back upon their infantry, and disordered the centre: but, the Britons endeavouring to out-flank their enemies, the Roman general opposed them with his horse; and the Caledonians were at last routed with great slaughter, and forced to fly into the woods, whither the Romans pursued with so little caution, that numbers of them were cut off. Agricola, however, having ordered his troops to proceed more regularly, prevented the Caledonians from attacking and cutting off his men in separate parties, as they had expected; so that this victory proved the greatest stroke to the Caledonians that they had hitherto received. This battle is supposed by some to have been fought in Strathern, half a mile south from the kirk of Comrie; but others imagine the place to have been near Fortingal-Camp, a place somewhat farther on the other side of the Tay.

Great as this victory was, it seems not to have been productive of any solid or lasting advantage to the Romans; since we find that Agricola, instead of putting an end to the war by the immediate conquest of all Caledonia, retreated into the country of the Horestii. Here he received hostages from part of the Caledonians; and ordered part of his fleet to sail round Britain, that they might discover whether it was an island or a continent. The Romans had no sooner left that part of the country, than the Caledonians demolished all the forts they had raised: and Agricola being soon after recalled by Domitian, the further progress of the Roman arms was stopped; Galgacus proving superior to any of the successors of that general.

From the time of Agricola to that of Adrian, we know little of the affairs of Scotland, excepting that during this interval the Caledonians must have entirely driven the Romans out of their country, and reconquered all that tract which lay between Agricola's chain of forts and Carlisle on the west, and Newcastle or Tintmouth-bar on the east; which Adrian, on visiting Britain, thought proper to fix as the northern boundary of the Roman dominions. Here he built a wall of turf between the mouth of the Tine and the Solway frith, with a view to shut out the barbarians; which, however, did not answer the purpose, nor indeed could it be

²⁶ Wall built by Adrian. An. 120.

thought to do so, as it was only built of turf, and guarded by not more than 18,000 men, who could not be supposed a sufficient force to defend such an extent of fortification. Scotland.

In the reign of Antoninus Pius, the proprætor Lollius Urbicus drove the Caledonians far to the northward, and repaired the chain of forts built by Agricola, which lay between the Carron on the frith of Forth and Dunglass on the Clyde. These were joined together by turf walls, and formed a much better defence than the wall of Adrian. After the death of Antoninus, however, Commodus having recalled Calpurnius Agricola, an able commander, who had kept the Caledonians in awe, a more dangerous war broke out than had ever been experienced by the Romans in that quarter. The Caledonians having passed the wall, put all the Romans they could meet with to the sword: but they were soon repulsed by Ulpius Marcellus, a general of consummate abilities, whom Commodus sent into the island.—In a short time the tyrant also recalled this able commander. After his departure, the Roman discipline in Britain suffered a total relaxation; the soldiery grew mutinous, and great disorders ensued: but these were happily removed by the arrival of Clodius Albinus, a person of great skill and experience in military affairs. His presence for some time restrained the Caledonians within proper bounds: but a civil war breaking out between him and Severus, Albinus crossed over to the continent with the greatest part of the Roman forces in Britain; and meeting his antagonist at Lyons, a dreadful battle ensued, in which Albinus was utterly defeated, and his army cut in pieces. See ROME, N° 375.

The absence of the Roman forces gave encouragement to the Caledonians to renew their depredations, which they did with such success, that the emperor became apprehensive of losing the whole island; on which he determined to go in person and quell these troublesome enemies. The army collected by him on this occasion was far more numerous than any the Romans had ever sent into Britain; and being commanded by such an able general as Severus, it may easily be supposed that the Caledonians must have been reduced to great difficulties. The particulars of this important expedition are very imperfectly related; but we are assured that Severus lost a vast number of men, it is said not fewer than 50,000, in his march through Scotland. Notwithstanding this, however, he is said to have penetrated to the most northern extremity of the island, and obliged the enemy to yield up their arms. On his return, he built a much stronger fortification to secure the frontiers against the enemy than had ever been done before, and which in some places coincided with Adrian's wall, but extended farther at each end. But in the mean time the Caledonians, provoked by the brutality of the emperor's son Caracalla, whom he had left regent in his absence, again took up arms; on which Severus himself took the field, with a design, as appears, to extirpate the whole nation; for he gave orders to his soldiers "not to spare even the child in the mother's belly." The event of the furious order is unknown: but in all probability the death of the emperor, which happened soon after, put a stop to the execution of this revenge; and it is certain that his son Caracalla, who succeeded Severus, ratified the peace with the Caledonians.

Scotland. 29 transactions from 1 to 446. lities occurred between the Romans and Caledonians, assisted by the Picts. The inroads of these northern tribes were repelled by the Roman legions under Constantius, and after his death in 306, they appear to have remained quiet till 343, when a fresh inroad of the Picts is said to have been repelled by Constans. In the year 360, the Scotch are first mentioned by Roman writers. They were, as we have said, an Irish people of Caledonian extraction, and at this time invaded Scotland, and joined with the Picts against the Romans and their tributaries. In 364 they made a very formidable attack on the Roman provincials, and in 367 had advanced as far as Augusta, or London, where they were met by Theodosius, and were compelled to retire. From this time to 446, when the Romans finally quitted the British island, nothing remarkable occurs in the history of Scotland.

30 Picts. Of the Picts, who now begin to make a figure in Scottish history, we have given an account under the article PICTS, and shall here remark only that the name Picti does not properly belong to a new or distinct tribe of the inhabitants of North Briton, but was applied about this time to a part of the Caledonians who inhabited a considerable tract of country north of the friths of Forth and Clyde; and that the dominion of their kings, of whom a long list is given by Mr Chalmers, extended from the year 451 to 842, when it finally terminated.

31 appearance of colony on Ireland. An. 503. In the middle of the second century, one of those turbulent tribes which long involved Ireland in contest and dissension, possessed themselves of the north-east corner of Ireland, under the conduct of Cairbre-Riada; and from the name of their leader gave to this district the denomination of Dal-Riada, or the portion of Riada. The sixth century had scarcely commenced, when the progress of population and the spirit of enterprise induced a number of the inhabitants of Dal-Riada to emigrate to the opposite coast of North Britain, led by three chiefs, Loarn, Fergus, and Angus, the three sons of Erc, the descendant of Cairbre-Riada, who then ruled over the Dalriadan tribe. They landed in the country of the Epidii, in the south-west of Argyleshire, about the year 503. These colonies, who to the time of Bede, were denominated Dalriadini, brought with them their language, religion, manners and customs, which differed in some respects from those of the Celtic tribes which had long occupied the north of Britain.

In the records of time there scarcely occurs a period of history so perplexed and confused as that afforded by the annals of the Scoto-Irish tribes, from their settlement in 503 to their ultimate ascendancy in 843. The want of cotemporaneous writings left an ample field for the conflicts of national emulation. Ignorance and ingenuity, sophistry and system, contributed by various efforts to darken what was already sufficiently obscure. There remain, however, in the sister island, various documents of subsequent compilation, which throw considerable light on the obscure transactions of the Scoto-Irish tribes, and enable us to unravel the entangled genealogies of their kings. These consist chiefly of the Irish annals of Tigernoch and of Ulster, with the useful observations on them of O'Flaherty and O'Connor; of several brief chronicles and historical documents first brought to light by Innes; and of a Gaelic poem, con-

tainin a genealogical account of the Scoto-Irish kings. Scotland. From these documents Mr Chalmers has constructed an elaborate genealogical and chronological table of those kings, from Fergus to Kenneth Macalpin, from which we shall extract the two most important columns, showing the date of accession, and the duration of the reigns of the several monarchs.

	Accessions.	Reigns.
1. Fergus the son of Erc,	503	3
2. Domangart the son of Fergus,	506	5
3. Comgal, son of Domangart,	511	24

27. Dungal, son of Selvach II.	826	7
28. Alpin, son of Eocha-Anneune IV.	833	3
29. Keneth, son of Alpin,	836	7

We shall not attempt to follow Mr Chalmers through the detail of events which he has narrated as taking place during the reigns of the Scoto-Irish kings. Whatever light he may have thrown on this obscure part of Scottish history, it must still remain uninteresting, except to the antiquary, and the minute historian. It is of more importance to the general reader, to be informed of the manners and customs, the polity and the laws of the tribes that occupied the chief part of North Britain at the accession of Kenneth II. from whose reign, as we have already remarked, the Scottish history begins to dawn.

We have said that the Dalriadinian colonists brought with them from Ireland, and established in their new settlements, their peculiar laws and customs. According to these laws, the succession both of the kings and chieftains

Scotland.

32 Laws and customs of Scoto-Irish tribes.

Scotland. tains was so regulated, that the person in the family who seemed best qualified, from abilities or experience, to exercise the chief authority, whether a son or a brother, was fixed on by the tribe for the succession to the vacant throne or chieftainship. Much of the dignity of the monarch was supported by the voluntary contributions of his vassal princes and chiefs, paid in cattle, clothes, and utensils; and the monarch was compelled to purchase the service and assistance of these chiefs by similar presents; in consideration of which they entertained the sovereign in his journeys, and served him in his wars during a limited period. A similar polity appears to have pervaded all ranks among the Scoto-Irish people, from the king to the prince, and from the prince to the chieftain. The toparch governed his district as the monarch governed his kingdom; and the chieftains ruled their territories and their fortified villages, on the same principles of mutual dependence, of the higher on the lower, and of the subordinate on the superior ranks. Such brittle ties were easily broken; and during these rude times, when the voice of law was but faintly heard, the performance of those reciprocal duties could be enforced only by the dread of assassination, and the breach of them punished only by the sword.

The Scoto-Irish women, of whatever rank, seem not to have been entitled to the slightest possession of land, under the Brehon law. To them were assigned a certain number of their father's cattle as their marriage-portion. The herds of the Scoto-Irish were so frequently within their contemplation, and during a rude state of society supplied so many comforts to their possessors, that the native terms which signify possession, or a field, also convey the idea of a herd or drove. Yet such is the copiousness of the Irish language, that it has a great variety of terms which convey the notion of a law; but we may infer from these law-terms, with their several modifications, that the people of whom we are speaking had little of positive statute, or written law; their whole body of jurisprudence consisting almost entirely of traditional customs, and local usages. According to Cox, it was no written law, but only the will of the brehon or lord. And it is observable that these brehons held their offices by descent and inheritance, and of course were not qualified for the posts to which he succeeded. The brehon or judge, when he administered justice, used to sit on a turf or heap of stones, or on the top of a hillock, without covering, and without clerks, or any of the usual formalities of a court of judicature. Some remains of this state of laws and manners may be traced in some parts of Scotland to the present period. Every baron had his mote-hill, whence he distributed justice to his vassals, either in person, or by his baron-bailie. Under the brehon system all crimes were commutable; theft, rape, and even murder, were punished by a fine.

It was an ancient custom of these tribes, that every head of every sept, and the chief of every clan, should be answerable for each of their sept or kindred, when charged with any crime; and it is remarkable that both in Ireland and Scotland this ancient custom was adopted into the statute book. The protection of bees was a great head of the brehon law. The Scoto-Irish territories were fully peopled by this industrious race, and their honey supplied abundance of mead, the favourite beverage of the ancient Britons. In vain do the Irish anti-

quaries give us splendid pictures of the learning, opulence, and refinement, of the ancient Irish; the laws of every people are the truest histories of their domestic affairs. While we see that the wealth of these tribes consisted of their bees and their cattle, we may certainly infer, that they had only advanced from the first to the second stage of society, from hunters to feeders of flocks. In this unrefined state the Scoto-Irish long continued, as is evident from their rent-rolls.

It is apparent that more of wretchedness than of comfort prevailed among the Dalriadian districts in every rank of society. Their best houses were built of wattles; and buildings of lime and stone were late works of more intelligent times. The clothing even of the monks was the skins of beasts, though there is no doubt that they obtained from abroad, by means of traffic, both woollen and linen stuffs. Venison and fish, the flesh of seals, and milk, constituted the food of the people; but the monks of Iona, who lived by their labour, and perhaps the chief, had some provision of corn. The most unbounded hospitality was enjoined by law, as well as by manners, as a capital virtue. Manufactures and trades exercised as a profession were unknown. Every family had its own carpenter, weaver and shoemaker, however unskilful and inadequate to the uses of civilization these homely workmen might appear.

The Scoto-Irish tribes were not destitute of shipping, which consisted partly of canoes, and partly of a more skilfully constructed kind of vessels called *currachs*. These were formed by covering a keel of wood and a frame of wicker-work, with skins of cattle and of deer, and by experience these rude boats were improved into roomy vessels, that served either for transports or for war.

Of the various customs of the Scoto-Irish, that of *fosterage* has been regarded as a subject for particular speculation. By this singular custom, children were mutually given from different families to be nursed by strangers. The lower orders considered this trust as an honour, rather than a service, for which an adequate reward was either given or accepted. The attachment of those who were thus educated is said to have been indissoluble; for, according to Camden, there is no love in the world comparable to that of foster-brethren in Ireland. From this practice arose a connexion of family, and a union of tribes, which often prompted and sometimes prevented evil feuds.*

The Dalriadian tribe which colonized the south-west of Scotland, in the beginning of the sixth century, professed the Christian religion, which had been introduced into Ireland in the middle of the preceding century. They did not, however, introduce into Scotland a new religion, for there is reason to believe that the benign influence of Christianity had been felt in those parts of North Britain which were inaccessible to the Roman power so early as the beginning of the third century; and the Romanized Britons of Valencia, called by Bede the southern Picts, had been converted from the superstitions of Druidism at the commencement of the fifth century. This reformation is attributed to St Ninian, a native of the country of the Novantes, born of noble parentage, about the year 360. (See NINIAN.) St Ninian died on the 16th September 432; on which day a festival in honour of his name was celebrated in Britain for many ages. About the middle of the sixth century,

century, appeared Kentigern, a Christian bishop, who fixed his residence at Aleluyd, in the kingdom of Cumbria. He contributed much towards improving the state of religion in North Britain, where he continued his instructions with little interruption till the year 601. Contemporary with Kentigern was the celebrated Columba, who converted the northern Picts, and has always been held in the highest veneration as one of the principal saints in the North British calendar. He established the seat of his ecclesiastical academy in the small island of Hy, or Iona, which had been conferred on him either by Connal, king of the Scoto-Irish, or Bridei, the Pictish sovereign. Here he settled with his 12 disciples, and laboured for two years with their own hands in erecting huts, and building a church. In the course of a few years Columba had converted Bridei, king of the Picts, and most of his subjects, and had established monasteries in several parts of the Caledonian territories. (See COLUMBA).

Before entering on the reign of Kenneth, it may be proper to take a short view of that of his father and predecessor, Alpin, as in his reign commenced those bloody conflicts between the Scots and Picts which finally terminated in the subjugation or expulsion of the latter.

At the accession of Alpin, the dominion of the Scots comprehended the Western islands, together with the districts of Argyle, Knapdale, Kyle, Kintyre, Loehaber, and a part of Breadalbane; while the Picts possessed all the rest of Scotland, and part of Northumberland; so that the Picts seem to have been by much the more powerful people of the two. The Scots, however, appear to have been superior in military skill; for Alpin, the successor of Dongal, having engaged the Pictish army near Forfar, after an obstinate engagement defeated them, and killed their king, though not without the loss of a great number of his own men. The Picts chose Brudus, the son of their former king, to succeed him; but soon after deposed and put him to death, on account of his stupidity and indolence. His brother Kenneth shared the same fate on account of his cowardice; till at last another Brudus, a brave and spirited prince, ascended the throne. Having raised a powerful army, he began with offering terms of peace to the Scots; which, however, Alpin rejected, and insisted on a total surrender of his crown. Brudus on this endeavoured to procure the assistance of Edwin king of Northumberland. Edwin accepted the money offered by Brudus; but pretending to be engaged in other wars, refused the assistance which he at first promised. Brudus, not dismayed by this disappointment, marched resolutely against his enemies; and the two armies came to an engagement near Dundee. The superior skill of the Scots in military affairs was about to have decided the victory in their favour, when Brudus thought of the following stratagem to preserve his army from destruction. He caused all the attendants, and even the women who attended his army, to assemble and show themselves at a distance as a powerful reinforcement coming to the Picts. This struck the Scots with such a panic, that all the efforts of Alpin could not recover them, and they were defeated with great slaughter. Alpin himself was taken prisoner, and soon after beheaded by order of the conqueror. This execution happened at a place now called *Pit-alpy*, but in former

times *Bas-alpin*, which in the Gaelic language signifies the death of Alpin. His head was afterwards stuck upon a pole, and exposed on a wall.

Alpin was succeeded by his son Kenneth II. who being a brave and enterprising prince, resolved to take a most severe revenge for his father's death. The Scots, however, were so dispirited by their late defeat, that they were exceedingly averse to any renewal of the war; while, on the other hand, the Picts were so much elated, that they made a law by which it became death for any man to propose peace with the Scots, whom they resolved to exterminate; and some of the nobility were expelled the council on account of their opposition to this law. The consequence of this was, that civil dissensions took place among them, and a bloody battle was fought between the opposite parties, before the Scots had thought of making any farther resistance.

By these distractions Brudus, who had in vain endeavoured to appease them, was so much affected, that he died of grief, and was succeeded by his brother Drusken.—The new prince also failed in his endeavours to accommodate the civil differences; so that the Scots, by gaining respite, at last began to recover from their consternation; and some of them having ventured into the Pictish territories, carried off Alpin's head from the capital of their dominions, supposed to have been Abernethy. In the mean time, Kenneth found means to gain over the nobility to his side by the following stratagem; which, however ridiculous, is not incredible, if we consider the barbarism and superstition of that age. Having invited them to an entertainment, the king introduced into the hall where they slept a person clothed in a robe made of the skins of fishes, which made such a luminous appearance in the dark, that he was mistaken for an angel or some supernatural messenger. To add to the terror of those who saw him, he denounced, through a speaking trumpet, the most terrible judgments, if war was not immediately declared against the Picts, the murderers of the late king. In consequence of this celestial admonition, war was immediately renewed with great vigour. The Picts were not deficient in their preparations, and had now procured some assistance from England. The first battle was fought near Stirling; where the Picts, being deserted by their English auxiliaries, were utterly defeated. Drusken escaped by the swiftness of his horse, and a few days after made application to Kenneth for a cessation of hostilities; but as the Scottish monarch demanded a surrender of all the Pictish dominions, the treaty was instantly broken off. Kenneth pursued his good fortune, and conquered the counties of Mearns, Angus, and Fife; but as he marched against Stirling, he received intelligence that these counties had again revolted, and cut off all the garrisons which he had left, and that Drusken was at the head of a considerable army in these parts. On this Kenneth hastened to oppose him, and a negotiation again took place. The result was equally unfavourable with the rest. Kenneth insisted on an absolute surrender of the counties of Fife, Mearns, and Angus; and as this was refused, both parties prepared for a decisive battle. The engagement was very bloody and desperate, the Picts fighting like men in despair. Drusken renewed the battle seven times; but at last was entirely

Scotland.

Stratagem
of Kenneth
to renew
the war...

tiredly

Scotland. tirely defeated and killed, and the counties in dispute became the immediate property of the conqueror.

Kenneth did not fail to improve his victory, by reducing the rest of the Pictish territories; in which he is said to have behaved with the greatest cruelty, and even to have totally exterminated the inhabitants. The capital, called *Camelon*, (supposed to have been Abernethy), held out four months; but was at last taken by surprise, and every living creature destroyed. This was followed by the reduction of the Maiden Castle, now that of Edinburgh; which was abandoned by the garrison, who fled to Northumberland.

After the reduction of these important places, the rest of the country made no great resistance, and Kenneth became master of all the kingdom of Scotland in the present extent of the word; so that he is justly to be esteemed the true founder of the Scottish monarchy. Besides this war with the Picts, Kenneth is said to have been successful against the Saxons, though of these wars we have very little account. Having reigned 16 years in peace after his subjugation of the Picts, and composed a code of laws for the good of his people, Kenneth died of a fistula, at Fort Teviot, near Duplin in Perthshire. Before his time the seat of the Scots government had been in Argyleshire; but he removed it to Scone, by transferring thither the famous black stone, supposed to be the palladium of Scotland, and which was afterwards carried off by Edward I. of England, and lodged in Westminster abbey.

38
Donald II.
An. 859.

Kenneth was succeeded by his brother Donald, who is represented as a man of the worst character; so that the remaining Picts who had fled out of Scotland were encouraged to apply to the Saxons for assistance, promising to make Scotland tributary to the Saxon power after it should be conquered. This proposal was accepted; and the confederates invaded Scotland with a powerful army, and took the town of Berwick; however, they were soon after defeated by Donald, who took their ships and provisions. This capture proved their ruin; for some of the ships being laden with wine, the Scots indulged themselves so much with that liquor, that they became incapable of defending themselves; in consequence of which the confederates, rallying their troops, attacked them in that state of intoxication. The Scots were defeated with excessive slaughter. Twenty thousand of the common soldiers lay dead on the spot; the king and his principal nobility were taken prisoners, and all the country from the Tweed to the Forth became the property of the conquerors. Still, however, the confederates found themselves unable to pursue their victory farther; and a peace was concluded, on condition that the Saxons should become masters of all the conquered country. Thus the Forth and Clyde became the southern boundaries of the Scottish dominions. It was agreed that the Forth should from that time forward be called the *Scots sea*; and it was made capital for any Scotsman to set his foot on English ground. They were to erect no forts near the English confines; to pay an annual tribute of a thousand pounds, and to give up 60 of the sons of their chief nobility as hostages. A mint was erected by the Saxon prince named *Osbreth*, at Stirling; and a cross raised on the bridge at that place, with the following inscription, implying that this place was the boundary between Scotland and England:

39
The Scots
defeated by
the Saxons.

*Anglos à Scotis separat crux ista remotis :
Arma hic stant Bruti, stant Scoti sub hac cruce tuti.*

Scotlan

After the conclusion of this treaty, so humiliating to the Scots, the Picts, finding that their interest had been entirely neglected, fled to Norway, while those who remained in England were massacred. Donald shared the common fate of unfortunate princes, being dethroned and shut up in prison, where he at last put an end to his own life in the year 858.—In justice to this unhappy monarch, however, it must be observed, that the character of Donald, and indeed the whole account of these transactions, rests on the credit of a single author, namely Boece; and that other writers represent Donald as a hero, and successful in his wars: but the obscurity in which the whole of this period of Scottish history is involved, renders it impossible to determine any thing satisfactorily concerning these matters.

Donald was succeeded by his nephew Constantine, the son of Kenneth Mac Alpin, in whose reign Scotland was first invaded by the Danes, who proved such formidable enemies to the English. This invasion is said to have been occasioned by some exiled Picts who fled to Denmark, where they prevailed upon the king of that country to send his two brothers, Hungar and Hubba, to recover the Pictish dominions from Constantine. These princes landed on the coast of Fife, where they committed the most horrid barbarities, not sparing even the ecclesiastics who had taken refuge in the isle of May at the mouth of the Forth. Constantine defeated one of the Danish armies commanded by Hubba, near the water of Leven; but was himself defeated and taken prisoner by Hungar, who caused him to be beheaded at a place since called the *Devil's Cave*, in the year 874.

40
Reign of
Constantine.
An. 86

This unfortunate action cost the Scots 10,000 men: but the Danes seem not to have purchased their victory very easily, as they were obliged immediately afterwards to abandon their conquest, and retire to their own country. However, the many Danish monuments that are still to be seen in Fife, leave no room to doubt that many bloody scenes have been acted here between the Scots and Danes, besides that above mentioned.

Constantine was succeeded by his brother Eth, surnamed the *Swift-footed*, from his agility. Concerning him we find nothing memorable; indeed the accounts are so confused and contradictory, that it is impossible to form any decisive opinion concerning the transactions of this reign. All agree, however, that it was but short; and that he was succeeded by Gregory the son of Dongal, contemporary with Alfred of England, and that both princes deservedly acquired the name of *Great*. The Danes at their departure had left the Picts in possession of Fife. Against them Gregory immediately marched, and quickly drove them into the north of England, where their confederates were already masters of Northumberland and York. In their way thither they threw a garrison into the town of Berwick; but this was presently reduced by Gregory, who put to the sword all the Danes, but spared the lives of the Picts. From Berwick, Gregory pursued the Danes into Northumberland, where he defeated them; and passed the winter in Berwick. He then marched against the Cumbrians, who being mostly Picts were in alliance with the Danes. He easily overcame them, and obliged

ged them to yield up all the lands they had formerly possessed belonging to the Scots, at the same time that he agreed to protect them from the power of the Danes. In a short time, however, Constantine the king of the Cumbrians violated the convention he had made, and invaded Annandale; but was defeated and killed by Gregory near Loehmaben. After this victory Gregory entirely reduced the counties of Cumberland and Westmoreland, which, it is said, were ceded to him by Alfred the Great; and indeed the situation of Alfred's affairs at this time renders such a cession by no means improbable.

We next find Gregory engaged in a war with the Irish, to support Donach, an Irish prince, against two rebellious noblemen. The Irish were the first aggressors, and invaded Galloway; but being repulsed with great loss, Gregory went over to Ireland in person, where the two chieftains, who had been enemies to each other before, now joined their forces in order to oppose the common enemy. The first engagement proved fatal to one of their chiefs named *Brian*, who was killed with a great number of his followers. After this victory Gregory reduced Dundalk and Drogheda. On his way to Dublin he was opposed by a chieftain named *Cornel*, who shared the fate of his confederate, being also killed, and his army entirely defeated. Gregory then became guardian to the young prince whom he came to assist, appointed a regency, and obliged them to swear that they would never admit into the country either a Dane or an Englishman without his consent. Having then placed garrisons in the strongest fortresses, he returned to Scotland, where he built the city of Aberdeen; and died in the year 892, at his castle of Dundore in the Garioch.

Gregory was succeeded by Donald III. the son of Constantine, who imitated the virtues of his predecessor. The Scots historians unanimously agree that Northumberland was at that time in the hands of their countrymen; while the English as unanimously affirm that it was subject to the Danes, who paid homage to Alfred. Be this as it will, however, Donald continued to live on good terms with the English monarch, and sent him a body of forces, who proved of considerable advantage to him in his wars with the Danes. The reign of Donald was but short; for having marched against some robbers (probably Danes) who had invaded and ravaged the counties of Murray and Ross, he died at Forres soon after, having defeated and subdued them in the year 903. He was succeeded by Constantine III. the son of Eth the Swift-footed, concerning whom the most remarkable particular which we find related is his entering into an alliance with the Danes against the English. The occasion of this confederacy is said to have been, that the English monarch, Edward the Elder, finding the Scots in possession of the northern counties of England, made such extravagant demands on Constantine as obliged him to form an alliance with the Danes in order to preserve his dominions in security. However, the league subsisted only for two years, after which the Danes found it more for their advantage to resume their ancient friendship with the English.

As soon as Constantine had concluded the treaty with the Danes, he appointed the presumptive heir to the Scottish crown, Malcolm, or, according to some,

Eugene the son of the late king Donald, prince of the southern counties, on condition of his defending them against the attacks of the English. The young prince had soon an opportunity of exerting his valour: but not behaving with the requisite caution, he had the misfortune to be defeated, with the loss of almost all his army, he himself being carried wounded out of the field; and in consequence of this disaster, Constantine was obliged to do homage to Edward for the possessions he had to the southward of the Scots boundary.

In the beginning of the reign of Athelstan the son of Edward the Elder, the northern Danes were encouraged by some conspiracies formed against that monarch to throw off the yoke: and their success was such, that Athelstan thought proper to enter into a treaty with Sithrie the Danish chief, and to give him his daughter in marriage. Sithrie, however, did not long survive his nuptials; and his son Guthred endeavouring to throw off the English yoke, was defeated, and obliged to fly into Scotland. This produced a series of hostilities between the Scots and English; which in the year 938 brought on a general engagement. At this time the Scots, Irish, Cumbrians, and Danes, were confederated against the English. The Scots were commanded by their king Constantine, the Irish by Anlaff the brother of Guthred the Danish prince, the Cumbrians by their own sovereign, and the Danes by Froda. The generals of Athelstan were Edmund his brother, and Turketil his favourite. The English attacked the entrenchments of the confederates, where the chief resistance which they encountered was from the Scots. Constantine was in the utmost danger of being killed or taken prisoner, but was rescued by the bravery of his soldiers: however, after a most obstinate engagement, the confederates were defeated with such slaughter, that the slain are said to have been *innumerable*. The consequence of this victory was, that the Scots were deprived of all their possessions to the southward of the Forth; and Constantine, quite dispirited with his misfortune, resigned the crown to Malcolm, and retired to the monastery of the Culdees at St Andrews, where he died five years after, in 943.

The distresses which the English sustained in their subsequent wars with the Danes, gave the Scots an opportunity of retrieving their affairs; and in the year 944, we find Malcolm, the successor of Constantine, invested with the sovereignty of Northumberland, on condition of his holding it as a fief of the crown of England, and assisting in defence of the northern border. Soon after the conclusion of this treaty, Malcolm died, and was succeeded by his son Indulfus. In his reign the Danes became extremely formidable by their invasions, which they now renewed with greater fury than ever, being exasperated by the friendship subsisting between the Scots and English monarchs. Their first descent was upon East Lothian, where they were soon expelled, but crossed over to Fife. Here they were a second time defeated, and driven out; and so well had Indulfus taken care to guard the coasts, that they could not find an opportunity of landing; till having seemed to steer towards their own country, the Scots were thrown off their guard, and the Danes on a sudden made good their landing at Cullen, in Banffshire. Here Indulfus soon came up with them, attacked their camp, and drove them towards their ships, but was killed in an ambu-

cade,

Scotland.
