Illustrations and Tables

Activism: Unidentified activists from the AIDS Coalition To Unleash Power (ACT UP) stage a demonstration on July 11, 2000, in Durban, South Africa, at the 13th International AIDS Conference. ACT UP called on the World Health Organization (WHO) to distribute antiretroviral treatments to poor countries.

Asia, practice of public relations in: *Far Eastern Economic Review (FEER)* journalists, British citizen Rodney Tasker (*left*) and United States citizen Shawn Crispin (*right*), attend a press conference at the Thai Immigration Bureau in Bangkok on February 27, 2002. Thai Prime Minister Thaksin Shinawatra insisted that Thailand had the sovereign right to expel the two foreign journalists over an article they wrote that touched on the government's relations with the country's revered monarchy.

Barnum, P. T.: A portrait of P. T. Barnum on a Barnum and Company circus poster that advertises an exhibit featuring "Great Jumbo's Skeleton."

Berlowe, Phyllis: Photo

Bernays, Edward: Photo

Bogart, Judith S.: Photo

Burson, Harold: Photo

Byoir, Carl: Photo

Collaborative decision making: Table 1. Common Techniques for Collaborative Decision Making

Committee on Public Information: Poster for "Under Four Flags," one of a series of films by the Committee on Public Information promoting the United States' efforts in World War I. Such films

were used both as propaganda and as fundraisers for the war effort.

Communication management: Table 1. Six Domains of Communication Management

Communication technologies: Table 1. Technological Considerations in Designing Messages and Selecting Media

Community relations: Gray Panthers' founder Maggie Kuhn gestures and screams during her address to the Poletown Neighborhood Council in Hamtramck, Michigan, circa 1980.

Consumer/customer relations: Figure 1. Ten phrases to attract return customers.

Co-orientation theory: Figure 1. Co-orientation model.

Crisis and crisis management: Joe Allbaugh, Director of the Federal Emergency Management Agency (FEMA), briefs reporters on September 15, 2001, about the ongoing operations at the Pentagon in Washington, DC. Workers started to remove the collapsed portion of the Pentagon shortly after the briefing.

Crisis communications and the Tylenol poisonings: James Burke, Johnson & Johnson executive, displays a new tamper-resistant Tylenol bottle on November 11, 1982. Nearly eight months earlier, six Chicago-area people died of cyanide poisoning from tainted Tylenol tablets.

Cultural topoi: Table 1. Cultural Topoi Compared

Cutlip, Scott M.: Photo

Drobis, David: Photo

Dudley, Pendleton: Photo

Ellsworth, James Drummond: Photo

Environmental groups: Protesters at a 1990 Earth First! protest hold up a banner reading “Stop Redwood Slaughter.”

Exxon and the Valdez crisis: Cleanup workers spray oiled rocks with high-pressure hoses after the *Exxon Valdez* ran aground on March 24, 1989, spilling more than 10 million gallons of crude oil into Prince William Sound.

Exxon and the Valdez crisis: An Exxon memo proclaims the rules of zero tolerance, posted after the 1989 *Exxon Valdez* oil spill in Alaska.

Federal Trade Commission: The former R.J. Reynolds cigarette advertising mascot, “Joe Camel,” plays pool and smokes cigarettes in an advertisement for Camel cigarettes that covers a billboard in a field. The FTC and antismoking advocates pressured R.J. Reynolds to eliminate the “Joe Camel” campaign in 1997, accusing the company of using a cartoon character to attract young smokers.

Focus group: As a focus group in Needham, Massachusetts, watches an interview of Monica Lewinsky on televisions in 1999, members’ reactions are displayed directly on screen in graph form.

Four-Minute Men: A 1917 poster for one of the Four-Minute Men speeches. President Woodrow Wilson recruited 75,000 speakers called Four-Minute Men to give short talks on United States war aims to the public at theater intermissions and other venues.

Frede, Ralph E.: Photo

Hammond, George: Photo

Health Belief Model: Figure 1. Health Belief Model.

Hill, John Wiley: Photo

Hoog, Thomas W.: Photo

Hunter, Barbara W.: Photo

Image restoration theory: Table 1. Image Restoration Strategies

Industrial barons (of the 1870s–1920s): Industrial baron J. P. Morgan (1837–1913), founder of U.S. Steel, shakes his cane at a passerby on a city street. Although Morgan is alleged to have said, “I don’t owe the public anything,” he called upon early public relations practitioner Theodore Newton Vail

to help save the American Telephone & Telegraph Company in 1902.

Integrated marketing communication: Table 1. Strengths of Alternative IMC Tactics

Involvement: Figure 1. Motivation-ability-opportunity model for enhancing message processing.

Labor Union Public Relations: Local 600 of the Congress of Industrial Organizations (CIO) electrical workers electrocuting an effigy of Hitler in a 1942 Labor Day parade. Public relations philosophy, strategies, and tactics have been used in struggles for organized labor and its goals.

Lucky Strike Green Campaign: Lucky Strike Cigarettes used a variety of campaigns to sell products in the 1930s, from promoting green—the color of their cigarette packaging—as fashionable for women to featuring Santa Claus as a customer, as in this 1936 advertisement. “Luckies are easy on my throat,” Santa is quoted as saying. “There are no finer tobaccos than those used in Luckies, and Luckies’ exclusive process is your throat protection against irritation . . . against cough.”

Muckrakers (and the age of progressivism): American journalist and political philosopher Lincoln Steffens (1866–1936), who published many articles exposing urban political corruption. He was prominent among the writers Theodore Roosevelt called “muckrakers.”

National Investor Relations Institute: Chairman of the Board of the General Electric Company, Ralph J. Cordiner (*center*), pounds the gavel here to open a meeting of share owners of the firm. Some 2,500 owners attended the 68th annual meeting of the firm. Flanking Cordiner are Robert Patton (*left*), President, and Ray H. Luebbe, Secretary. Cordiner established the first efforts at formalizing a company’s communication program with shareholders in 1953.

Nongovernmental organizations (NGOs): Members of nongovernmental organizations (NGOs) wave fliers during a protest outside the conference room of the opening session of the World Trade Organization (WTO) conference in Doha on November 9, 2001.

Page, Arthur W.: Photo

Page, Arthur W.: Arthur W. Page’s book, *The Bell Telephone System* (1941), explained the company’s

the financial policy and how it affected the company's mission to serve, including the public relations function. Nearly 200,000 copies of the book were sold in hardcover and in paperback.

Perjury: Senator Karl Mundt (R) of South Dakota, who was acting chairman of the House Un-American Activities Committee (HUAC) when the first testimony on the Alger Hiss–Whitaker Chambers investigation was heard, is shown in his office scanning the headlines that tell him of the jury's January 21, 1950, verdict in Hiss's second perjury trial. Chambers, a senior editor from *Time* magazine and an admitted ex-communist, identified Hiss and several other federal officials to HUAC as having been members of a communist cell whose purpose had been to infiltrate the U.S. government. The conviction made Hiss liable to a maximum sentence of 10 years in prison and fines totaling \$4,000.

Plank, Betsy: Photo

Political action committees (PACs): United States President Bill Clinton addresses the 54th annual meeting of the Association of Trial Lawyers of America (ATLA) while in Chicago, July 30, 2000. The ATLA is regularly one of the top-spending political action committees (PACs).

Postcolonialism theory and public relations: An Indian protester uses a megaphone during a demonstration against the 1984 Bhopal gas tragedy in New Delhi on August 27, 2003. Scholars have pointed to the Bhopal tragedy as an example of postcolonialism because most mainstream public relations literature continues to depict how the company dealt with the crisis and maintained its line of communication with its shareholders and investors, while the voice of the victims of the tragedy is rarely heard.

Psychographics: Figure 1. Generational influences.

Public Affairs Council: Table 1. The Public Affairs Council, in Profile

Public Affairs Council: Table 2. Membership Composition

Public Affairs Council: Table 3. Most Active Members

Public Affairs Council: Table 4. The Components of Public Affairs: The Public Affairs Council's Fields of Expertise

Public health campaign: The U.S. Department of Health and Human Services' *Healthy People 2010: National Health Promotion and Disease Prevention Outcomes* is one of the major engines driving the prioritization of specific efforts in current health services and research.

Preface

Some may wonder why public relations is a deserving topic for the extensive analysis it receives in this encyclopedia. After all, many might think, it is “just PR.” In the view of some or even many, public relations is the art of sham, spin, buzz, sandbagging, and “being nice.” Others fear it as deep-pockets lobbying that gives privilege to powerful companies and special interests. Having said that, some critics and many in the general public might be satisfied. They may take a dismissive attitude. That attitude, however, can be counterproductive. Public relations does not slink into the corner because it is dismissed. It is there to be seen and to exert influence. Thus, engaged and thoughtful analysis of the profession may be required before a final opinion is formed on the ethics and societal role of the practice. Otherwise, critics and students of public relations may make a couple of serious mistakes.

First, a dismissive attitude toward public relations often is based on a narrow and considerably naïve sense of what public relations is and what practitioners do. This sort of flippant dismissal can lead one to miss the darker side of the practice, which indeed adds evidence to support many of those claims. However, such dismissal causes one to avoid considering the reality that when mispracticed, public relations can divert attention from the real issue, giving a false sense of how popular and favorable a product might actually be. Endless public relations efforts exist, some heavily masked or even

dismissed by the half-sibling of public relations, marketing. Thus, when we watch the Super Bowl or the Academy Awards (or any of the endless list of similarly high-profile events), we may fail to recognize the hand of public relations being played. Publicity and promotion are the often silent tools of public relations; some will argue that the best public relations is that which is not recognized as such.

The second mistake is failure to understand that public relations also plays a large role in public policy issue debates. In fact, during the 1970s, when the term *issues management* was coined, that aspect of the practice was started in large part by advertisers who believed that issue advertising could combat the critics of large business activities. This was not a new era in public policy debates. Many senior practitioners had a long reputation of working in the public policy arena. Many believe that the enormous, society-defining debates in the last decades of the 19th century spawned much of the practice as we know it today. But practitioners quickly realized that issue advertising had limited likelihood of appeal and impact as a means of narrowing the chasm between corporate performance and public expectations. In such debates, members of various segments of the general public and opinion leaders may be more interested in the arguments made in a well-crafted editorial or book by an expert—or a feature article—than an advertisement. Thus, the work of the public relations practitioner came to the fore—once again.

Society could exist without public relations, but it won't. This means that public relations, for better or for worse, is here to stay. What we think of as public relations may not be in dispute, but what practitioners do and the good or bad they accomplish will be the subject of debate. The challenge facing the profession of public relations, and the men and women who serve as practitioners, is to earn the trust and respect of critics and the general public. Senior practitioners and academics do not take this challenge lightly.

Public relations gained professional and academic status during the 20th century in the United States and from there it spread to much of the rest of the world. That is the good news. In that regard, public relations in the minds of many people and academics came to be viewed as a positive way for organizations to get their message before markets, audiences, and strategic publics, the critics and supporters of such organizations. In a positive sense, then, public relations helped organizations build mutually beneficial relationships with customers, critics, and other stakeholders. This effort will continue. However, because of its contemporary origins, it has often been associated with propaganda—a label that senior practitioners tend to avoid and reject.

The bad news is that public relations, in the minds of some or many, is the dark art of manipulation and confusion. For some, it is a shifty business. It occurs in the White House as well as board rooms of businesses, nonprofits, and governmental agencies. It has been characterized as “a stealth bomber” that can deliver persuasive messages in ways that get through people's defenses. Seen in this way, public relations can be viewed as a tool that large organizations have and will continue to use to engineer consent. That means that people should not trust public relations or its practitioners if they are sneaky, manipulative, deceptive, and dishonest—if they do not tell the truth, if they engage in spin, or if they are expert sandbaggers and flacks.

The *Encyclopedia of Public Relations* is a vehicle that may help the field to reach a wide array of readers who can serve as opinion leaders for improving the image and ethics of the practice. This

work intends to provide an honest but positively biased treatment of public relations. It strives to give a sound, insightful, and appreciative view of what public relations is and does as well as the ethical challenges it must meet to be seen as a positive force in society. From its launch, this project has been a substantial, even daunting, undertaking. Like all edited projects, this one has been a difficult and exciting journey. The most fascinating part has been wrestling with the list of practitioners who should be featured with their own biographical entries. Talk to 20 senior practitioners and academics, and you will get a list of names they believe deserve recognition in a work such as this. Some people will be on all lists. Some lists will be substantially different. Some people will argue that certain people should not be featured, although others will insist that such a work would be inadequate without them.

Consequently, we created a list of names of extraordinary practitioners who have helped define the profession by what they have said and done. The next problem was getting authors. Many of the people who were qualified to write certain biographical entries deserved entries themselves. So we did some trading. Some potential authors of various entries were not in a mental or physical state to contribute. We even had some people pass beyond this physical existence during the process. Often the “only person” who could write an entry was unable to do so, but never unwilling. For the subjects of some entries, documents and other source materials simply were not available or were in storage somewhere unknown to the authors. In some crucial instances, the person featured in the entry was mentally or physically unable to provide additional information.

Out of these difficulties, however, we did find worthy entries and came to see this document as the most authoritative reference source on many of the persons who crafted the profession in the 19th and 20th centuries. In finding subjects and authors, we were even able to reach beyond the boundaries of the United States and feature key players in other countries, such as Great Britain and Germany. Public relations neither started in the United States nor does it reside exclusively there. So we were

fortunate to give voice to the presence of the practice and key practitioners in other countries.

Still, there are omissions. Some will never be recovered. Facts get lost in time. We were fortunate, if for no other reason than this, to undertake this project when we did. The lives and careers of these pioneers are fleeting. And most of the people who made the profession what it is today lived and worked in the 20th century.

PUBLIC RELATIONS: WHAT'S IN A TERM?

Other than the people who made their livings from public relations, what is this book about? One of the longest entries is devoted to a terribly inadequate definition of the profession. People in public relations can't universally agree on what the practice constitutes or what the term means. For this reason, the definition of public relations is offered as a dialogue on public relations to help students, practitioners, academics, and people in general appreciate the scope and purpose of the term. If the book helps readers to think about the meaning of the term and consider its many facets, then those of us who contributed to the definition will feel satisfied. We simply don't like the term to be treated as a stereotype. And for the most part, practitioners and academics prefer the term *public relations* to *PR* because the latter is invariably associated with the dark side of the profession.

As long ago as the 1970s, attempts were made to sort out definitions. Senior practitioners such as Edward L. Bernays and John W. Hill had by then published books in which they offered their definitions. By the early 1970s, the term had been defined by the Public Relations Society of America. Several textbook authors had tried their hand at defining the term. Endless efforts at definition have occurred in journal articles and critical comments by journalists.

As is true of many crucial words for professions in society, this one passes through history, professional practice, academic classes, media commentary, and everyday conversations. The passing flows as easily and unstoppably as water through cupped hands. It just won't stay put. But just as medicine once was generally referred to as quackery, public

relations practitioners in some circles are known as flacks and journalists are called hacks—a term that was used in that context long before it was made popular in reference to cyber-intruders.

Some practitioners and academics have tracked the various definitions of this wily beast as hunters pursue their prey. Writing in 1977, Dr. Rex Harlow observed, using the start of the 20th century as his benchmark,

A review of the history of the definition of public relations shows that the definition has changed considerably over the past 70 years. This historical review reveals how inextricably the development of the definition has been and is bound to the movement of thought and action of the society in which the public relations practitioner does his [or her] work. It shows the present form, content and status of the public relations definition, but even more the effect of environmental factors and change upon its development during the past quarter of a century. (p. 49)

Without a doubt, then, a discussion of public relations is necessarily a discussion of the society or societies in which it is practiced. We can't discuss this topic without considering the human drama of change, markets, public policies, and the public policy "fistfights" that go along with all of that. We added the word *her* to Harlow's comment because today the public relations professional is more likely to be a woman than a man.

ELEMENTS OF THE PRACTICE AND STUDY: WHAT MAKES UP THE PRACTICE?

One of the goals of this book is to make the practice of public relations more adequately understood by an array of readers, including the general public. For better or worse, public relations plays a vital role in commerce, nonprofit activities, and the processes of government. Movies such as *Wag the Dog* give people a shocking view of how people might be able to manipulate the media by manufacturing news that shapes policy—thereby manipulating what people know, think about, and end up doing. That's a lot of power. It must be guided by a strong sense of professionalism and sound

ethical principles. In the conduct of their business, practitioners have a lot of “tools” in their kits. Each day, they get more. What’s in the tool kit?

Mission/Vision

Organizations craft mission and vision statements to help them know where they are going and to chart their plans to achieve those outcomes. Public relations is a useful tool to help frame missions as well as to accomplish those ends. Also, persons who practice public relations operate out of stated and unstated mission and vision statements. Organizations such as the Public Relations Society of America and the International Association of Business Communicators voice their own mission and vision statements to serve as broad guides for the practice of professional communicators.

Strategies

Perhaps the broadest tools in the kit are strategies. It is here that public relations’ reputation for manipulation is often deserved. One of the strategies available to practitioners is manipulation. Practitioners have made the small seem large, and the large seem small. They create buzz to compete with disinterest. At their worst, they can be masters and mistresses of attracting attention and framing statements—manufacturing reputations and crafting images that may be far from reality. They have created pseudo-events. Many of the entries in this book look at the strategies of public relations.

In a broad sense, some of the strategies include publicizing, promoting, engaging in issue debates, informing, persuading, and working to create mutually beneficial relationships. They can entail negotiation, collaboration, and cooperation.

On the down side, just as practitioners know how to open the flow of information, they also may stop that flow through spin, sandbagging, and diversion. Practitioners may cover up as well as uncover.

Functions

The functions of public relations often are part of the list of services announced by agencies. They

may be job descriptions and divisions in large corporate public relations departments.

Functions are used to accomplish or implement strategies. Thus, for instance, if publicly traded companies are required by the Securities and Exchange Commission to communicate with shareholders, they have an investor relations function.

Nonprofits engage in fundraising or development, a function. All organizations engage in media relations, another function. They may have a customer relations or employee relations function. They may engage in issues management. Universities and colleges have sports information functions, marketing functions, development functions, student relations functions, and so on.

Counseling is a vital function. Counseling is the stock and trade of the senior practitioner. Such persons work to position organizations to help them earn respect and support and to avoid collisions with opinions and competing interests. Acting wisely and ethically, the counselor can help the organization to operate in ways that do not offend the sentiments and expectations of key publics. Engaged in as manipulation, counseling can help an organization to appear to be something quite different from what it is and thereby enable it to earn falsely deserved rewards. In the worst sense, perhaps, such counseling can keep a politician from being found wanting or help a business to seem to be worth much more than shareholders would otherwise suspect.

A function is a broad category of tools to achieve specific strategies for a particular purpose in working with some definable audience, market, or public.

Perhaps the ultimate function of public relations is the creation of meaning. Here also, practitioners and academics confront thorny ethical issues. What meaning needs to be created to help build and maintain mutually beneficial relationships? How can practitioners help shape the meaning that strengthens community through diverse voices and alternative opinions?

Academics tend to look at process more than meaning. Practitioners never forget the importance of meaning. The meaning may center on the favorable attributes of a product or service. Meaning may seek to foster a favorable image of an organization. Employee relationships depend on meaning. So do

donor relationships. The list is long. The challenge is great.

Serious, ethical, and responsible practitioners know they cannot manipulate meaning. Meaning must be based on sound judgment, high ethical principles, and a mutuality of interests.

We may add ethical decision making to the list of functions. That notion may baffle critics. Practitioners, however, are in an excellent position to hold and apply sound, ethical principles to guide the organizations they serve.

Tools and Tactics

How a function works to implement strategies depends on and defines the tools or tactics that are specialized to that function. Thus, for investor relations, one of the tools is the annual financial report. Another tool, used especially by companies that manufacture chemicals, is the health, safety, and environment report.

The media release—what used to be called the press release—is a standard tool practitioners use to feature newsworthy facts and opinions for the use of reporters and editorialists.

Events, or what some call pseudo-events, are vital tools. Many newspapers carry regular features giving the details of some fundraiser. A charity for children might hold a gala to raise funds and honor those who work hard to raise those funds. The practitioner makes sure that a photojournalist gets the obligatory shot of three or four—never more—of the persons who help publicize the event. From the most ancient times, manufactured events have been a vital part of society—business and government administration. That trajectory is unlikely to change soon—if ever.

Press conferences are a counterpart of media releases, as are backgrounders. Practitioners create media kits and groom Web sites. They create 1-800 hotlines and FAQs for Web site home pages.

Practitioners engage in crisis prevention, planning, and response. During a crisis, we like to have practitioners and others help us understand what happened, why it happened, and what we should do. During a hurricane or a chemical release, we like to have emergency plans to execute to know how to be safe. Practitioners help us in these ways.

We may appreciate learning about cures and treatments, as well as the symptoms of ailments. Medical researchers discover medical facts and offer treatments, which professional communicators may publicize and promote.

ONWARD INTO THE FOG—BUT PERHAPS WITH A LANTERN TO LEAD

Public relations as demonstrated in this encyclopedia is timeless. And it is here to stay. Some see it as the essence of a democratic society, where all sides of an issue can be contested, examined, and weighed. But it is also a tool usable by the worst despot to manufacture his or her image and craft support for his or her regime.

Ethics and social responsibility are key concerns of our day and age. That is not new, but corporate scandals and attempts by government officials to manipulate public opinion have emerged as deep concerns. Some observers watch for missteps and call for remedies. But a cynical culture that convinces itself that no one tells the truth and that believes in no one can be even more of a threat to civil society.

As much as it features the positive service and contributions of practitioners, this work also attempts to display the theoretical and ethical concerns that consume academic and professional attention and consideration. Because of the role practitioners have in society, they must be attentive to such concerns. So must the academics who work to shape and guide the profession—as well as educate the next generation of practitioners.

In that vein, the *Encyclopedia of Public Relations* may serve some as a primer. Others may find refreshing or even disappointing comments and concerns. However, we hope the book advances the dialogue that can make the profession ever more healthy. It is here to stay. It serves society best by asking more and more of itself.

—Robert L. Heath

Harlow, R. F. (1977). Public relations definitions through the years. *Public Relations Review*, 3(1), 49–63.

Acknowledgments

At various times during the creation of this encyclopedia, I reflected on its progress—slow, steady, tedious, and painful at times. In my reflection, one of my favorite popular movies seemed to capture the essence of the project. It is *Witness*, which stars Harrison Ford who for a while tries to blend into an Amish community. In one scene, the members of the community in a symphony of workmanship assemble and erect a barn. In its construction, each barn builder knows the job and does it with skill. There is little oversight. Micromanagement is not part of the scene. While some workers toiled on the construction, others performed their own symphony of preparing simple, wholesome, and beautiful food. It is abundant and prepared with love. At the end of the day, the sun sets on work well done. Congratulations were not as important as self-satisfaction. The effort of each contributed to the collective good of the community.

So, too, was the creation of this book—a work of skill with very little coordination. It was a symphony of preparation: simple, wholesome, and beautiful. It is abundant in its provision and prepared with love. It grew one entry at a time. I am indebted to many people, starting with the Advisory Board and including a host of friends and colleagues who volunteered for entries. They offered entries that I and the Advisory Board had not thought to include. Key members of the Advisory Board not only wrote an abundant number of entries, but they also worked to help find the best authors for other entries. For their

efforts above and beyond, I tip my hat twice to the following members of the Board: Shannon Bowen (who helped with ethics, systems, and collaborative decision making), Tim Coombs (who helped sort out the research topics), Kirk Hallahan (who advised sagely and wrote proficiently), Kathy Kelly (who helped with biographies), John Madsen (who helped find authors for business related topics), Elizabeth Toth (who brought the biographies of women practitioners to fruition), and Betteke van Ruler (who helped sort out the nuances of Europe). Thanks to my other friends and colleagues who wrote well and in a tight time frame.

Two practitioners were invaluable. Thanks to a handoff by George Hammond, Richard Truitt bailed me out when I lost an author for the Carl Byoir entry. Then he offered lists of names to contact, contact information, and biography suggestions. Betsy Plank was steady in her influence. She offered valuable advice on biographies and authors. She was endless in her praise for the value of the project. She truly is a grand lady of public relations.

The timing of this project was just right—almost too late. For some, it might have been too late. We know that some biographies might have been developed had we not lost contributors or subjects of their own biographies. I had many conversations with contributors who tried to help me find authors for some public relations legends who were not included. Their omission was not because of a lack of commitment to them, but a failure of the system

to provide sufficient information or a willing and capable author to choose the words to capture their contribution. Many of us recognized that a generation of legends was nearing its end before our very eyes. We were reminded of how fragile the telling of history can be. We did the best we could and hope to catalyze others to plow the fields, cultivate, and harvest more biographies to honor as well as evaluate the contributions of the men and women who crafted public relations into a honed profession during the 20th century.

Along this journey we lost travelers: W. Howard Chase and George Hammond—two legends. At the beginning of the project, Bill Adams played a vital role in recommending entries, especially biographies, and was quick to take on the writing of entries. His career was a valued blend of academic and practitioner.

Many of the people who helped create this “barn” were only known to me by phone and Internet. I know a lot of the contributors and thank them profusely for their help. Others took me on “spec.” They only met me by e-mail or phone. They must have asked themselves, “Who is this nut?” Thanks to all of you who trusted me. I believe the proof is in the pudding.

Thanks to the many folks at Sage Publications. Margaret Seawell dreamed up the project and thought I could pull it off. Paul Reis stepped into the project as a developmental editor and picked up the slack at a crucial moment. He dealt with an endless array of niggling details, especially the entry contracts. He was cheery and efficient. Because of his work ethic and responsiveness, I logged endless responses and encouragement from him in the “in” and “out” boxes of the Internet. He helped in the final harvest of entries. Paul was inspired and aggressive in finding pictures and ancillary documents that help tell the story of public relations and demonstrate the abundance of material relevant to the field. And lastly, I thank Diane Foster for guiding the project through the production process.

Some critics may fault the work that follows. They will say that the encyclopedia paints a rosy picture of a profession dedicated to manipulation, spin, deceit, and flack. The persons who contributed to this work know those criticisms and recognize the challenge to make this influential practice worthy of praise and respect. This challenge is best met by moving standards up rather than wallowing in despair, denial, disgust, or doubt. Practitioners and academics have met and will continue to meet the challenge.

About the Editor

Robert L. Heath (Ph.D., University of Illinois) is Professor of Communication at the University of Houston, Director of the Institute for the Study of Issues Management, and former Advisory Director of Research for Bates Churchill Southwest. His *Handbook of Public Relations* won the 2001 PRIDE Award for best publication. With co-editor Elizabeth Toth, he won the PRIDE Award in 1992 for *Rhetorical and Critical Approaches to Public Relations*. He won the Pathfinder Award in 1992 and the Jackson, Jackson, and Wagner Award in 1998.

His other books are *Management of Corporate Communication: From Interpersonal Contacts to External Affairs* (1994); *Human Communication Theories and Research: Concepts, Contexts, and Challenges* (1992, with Jennings Bryant); *Strategic Issues Management* (1988); *Realism and Relativism: A Perspective on Kenneth Burke* (1986); *Issues Management: Corporate Public Policymaking in an Information Society* (1986, with Richard Alan Nelson); and *Strategic Issues Management* (1997), which also won a PRIDE Award.

ACCOMMODATION: CONTINGENCY THEORY

Accommodation occurs when public relations practitioners attempt to meet the needs of their organization *and* a stakeholder group through dialogue, negotiation, and compromise. Contingency theory defines pure accommodation as the polar opposite of pure advocacy in public relations. Advocacy occurs when public relations practitioners attempt to meet the needs or desires of their organization *or* a stakeholder group to the exclusion of the needs or desires of the other side.

Accommodation is a central tenet of contingency theory. The contingency theory of accommodation in public relations has been under development since 1997 by a team of researchers led by Glen T. Cameron at the University of Missouri School of Journalism. Contingency theory posits that ideal public relations practice is constantly influenced by variables ranging from the experience of the public relations staff to the credibility of an external public.

An accommodation continuum ranging from pure accommodation to pure advocacy was developed to illustrate contingency theory and the dynamic nature of public relations practice. A key phrase in early contingency theory literature was “It depends.” The ideal stance of an organization in a particular situation

depends on a variety of contingencies. Cameron and associates argued that at any particular time a practitioner’s position may shift toward or away from accommodation or advocacy, depending on the presence of influential internal or external variables. Contingency theory claims there is no one-size-fits-all normative approach to public relations practice. It suggests that public relations practice is ever changing. Evidence that contingencies affect accommodation in *normative* public relations practice is the primary contribution of contingency theory.

Contingency theory also suggests that there are ethical implications to accommodation. Contingency theorists argue that there are times when it would be ethically inappropriate to accommodate a public. They have noted that any accommodation of “the Hitlers of the world” (Yarbrough, Cameron, Sallot, & McWilliams, 1998, p. 40) would be unethical.

Accommodation has been compared to symmetrical public relations practice, whereas advocacy has been compared to asymmetrical practice. Symmetry and asymmetry are concepts articulated by James E. Grunig and colleagues in their seminal program of public relations theory building known as the Excellence study (*see* Excellence theory).

Contingency theorists introduced 86 variables that they suggest influence whether a specific public

relations position will be more accommodation or more advocacy. Variables in contingency theory are categorized as external and internal. External variables fall into the subcategories of external threats, industry environment, characteristics of the external public, and the specific issue at hand. Internal variables are subcategorized to address characteristics of the organization, the public relations department, management, individuals, relationships, and internal threats.

As the program of research unfolded, external and internal variables were further subdivided into predisposing and situational variables. Predisposing variables are those that are always present in an organization and set the tone for the organizational response to stakeholder groups. Predisposing variables are more influential than situational variables. Situational variables are responsive to specific circumstances and settings and are therefore more subject to rapid change.

Strong predisposing variables include size of the organization, organizational culture, and inclusion of public relations in the dominant coalition of decision makers. Strong situational variables include characteristics of the public and its claims, potential threats, and the cost or benefit of a particular organizational position.

Case studies, depth interviews, and surveys have been used to test contingency theory. Case analyses of communication episodes during the 1996 Centennial Olympic Games illustrate the challenges of accommodation when an organization is faced with two or more diametrically opposed publics. In this instance, contingency theory highlights the back-and-forth, give-and-take nature of public relations practice. When an organization, such as the Atlanta Committee for the Olympic Games, is faced with demands from two opposed publics, accommodation of the two publics is likely impossible. Another Olympic Games case shows how the relative power of an organization and an external public can affect the organization's willingness to accommodate.

The Cameron team used depth interviews to examine variables that affect the level of accommodation by an organization. Practitioners at larger corporations reported that the corporation's size

often made them more likely to accommodate a powerful external public such as consumer activists. Corporate culture variables such as the position of the CEO in a specific public relations situation were also identified as potentially strong influences on the level of accommodation.

With the use of 86 variables central to contingency theory to define in detail the impediments to and supports of accommodation in practice, some scholars have suggested that the theory is unwieldy. Attempts to bring some parsimony to the theory have included identifying proscriptions to accommodation. Regulatory agencies, moral convictions, legal constraints, contending publics, and jurisdictional issues have been identified as proscriptions to accommodation of a public.

Recent developments in contingency theory include scale development for select internal and external, predisposing and situational variables, and exploring emotional "weight" and "heat" at different points on the continuum.

Some public relations scholars have suggested that contingency theory is simply an extension of excellence theory. They have argued that models such as the mixed-motive games model promoted by Priscilla Murphy and the new model of symmetry as two-way practices outlined by David M. Dozier, J. E. Grunig, and Larissa A. Grunig address the dynamic nature of practice within the framework of the symmetry/asymmetry paradigm. Contingency theory scholars have acknowledged that contingency theory extends excellence theory, but they argue that it provides unique contributions to public relations theory through analysis and description of the dynamic nature of public relations practice, evidence that ideal and ethical practice is conditional and depends on a number of contingencies, and identification of specific contingencies to accommodation.

ACCOUNT EXECUTIVE

The term *account executive* (AE) refers to the practitioner within an agency or public relations firm who is responsible for day-to-day contact with a client or clients. As such, the AE is responsible for managing all agency-client initiatives, including publicity, press relations, special events, crisis communication, the creation and production of communication messages, and media buying and placement. In many instances, AE or assistant AE is the title of the entry-level position in public relations agencies.

In the earlier days of the profession, the AE's function was viewed as the agency's liaison with a client or clients. It was the AE's job to represent the agency to the client. However, in today's consumer-driven environment, the AE is seen as

functioning best as the client's representative within the agency. In that role, it is the responsibility of the AE to ensure that the interest of the client is foremost in all initiatives undertaken by the agency on behalf of the client.

Activities performed by the AE include the following:

- Developing and maintaining expertise in the client's business and industry
- Understanding the structure and policies of the client organization
- Scanning the economic, political, and social environment for challenges and opportunities vis-à-vis the client
- Maintaining an ongoing base of information concerning competitors for the client's interests
- Developing relationships at a minimum of three levels within the client organization
- Acting as consultant to the client with regard to communication planning and implementation, including advertising, media relations, Web content, media planning, and other activities
- Maintaining day-to-day contact with the client's representative(s) to maintain goodwill and keep the client "in the loop" regarding all activities on its behalf
- Representing the agency at client meetings
- Coordinating activities with the agency's creative director and media director as appropriate
- Monitoring and protecting the agency-client relationship
- Working with the client to develop planning documents
- Summarizing agency-client meetings for distribution within the agency and to the client organization
- Ensuring that all creative messaging and other initiatives are fully supported by the client prior to implementation
- Making certain that all members of the agency team assigned to the client's account understand the needs of the client and act accordingly
- Ensuring that all creative is "on target" (*creative* refers to the text, graphics, pictures, and other tactical tools that are crafted for each client as contracted)

However, the central focus of the AE has always been—and always will be—to effectively and

efficiently manage the relationship between the client and the agency to protect the interests of both and to ensure mutual benefit. Moreover, the agency tenure of an AE is directly linked to the maintenance of that relationship.

The appropriate educational background includes public relations, advertising, or journalism.

ACCOUNT MANAGER/ ACCOUNT MANAGEMENT

The term *account management* refers to the coordination, billing, and evaluation of all activities undertaken by a public relations agency or firm on behalf of a client or client organization. Unlike the account executive (AE), who is in day-to-day contact with a client, the account manager (AM) acts as a higher-level planner and coordinator, working within the agency environment with various AEs and creative and media directors to assess the future needs of the client, to develop strategic plans to meet those needs, and to put in place evaluation strategies to determine the success or failure of programmatic initiatives. In agency tradition, AEs report to AMs. A central concern of the AM is to look for opportunities to grow the agency's business through the expansion of current work undertaken for the client, or by working with the client to develop new initiatives. Moreover, the AM may be responsible for several accounts at the same time.

As a senior member of the executive team, the AM also is responsible for initiating, nurturing,

and maintaining mutually beneficial relationships between the agency and the client. Research indicates that these relationships follow a familiar pattern of growth and decline. The effective AM must understand and appreciate this process and be able to recognize the current phase of the relationship and how to alter that relationship, if necessary, to ensure that it is positive. Moreover, research has demonstrated that the dimensions of openness, trust, involvement, commitment, and investment are crucial in managing the agency-client relationship. In this context, "openness" is the degree to which the agency and the client share plans for the future with each other. "Trust" refers to the degree to which the agency or the client can be relied on to do what it says it will do. "Involvement" refers to the willingness of the agency to become actively involved in the business of the client. "Commitment" addresses the need to demonstrate an ongoing interest in helping the client organization achieve its goals. "Investment" concerns the amount of time and energy the agency is willing to put into maintaining the agency-client relationship. A simple "relationship audit" can provide an illustration of the state of the agency-client relationship as well as indicate areas for improvement.

Despite a substantial increase in the number of AM positions, many companies continue to report dissatisfaction with the ability of the AM to build sustaining relationships with strategic clients. To a large degree, responsibility for the inability to sustain a relationship is claimed to rest, not surprisingly, with the selection of a client. This usually can be traced to a "poor fit" between the agency's and the client organization's business.

ACTIVISM

Activism is the process by which groups of people exert pressure on organizations or other institutions to change policies, practices, or conditions that the activists find problematic. Activism has generally been seen as one of the catalysts for the growth of the public relations profession, because some of the most significant periods of development in the field have featured high levels of activism. More recently, public relations has been seen as necessary for activist organizations both to make their case and to sustain their organizations. Activists generally practice public relations “from the bottom up,” using the strategies and tactics of the field to achieve goals that are not that dissimilar from those of other, more institutionalized organizations.

Activism generally arises when members of a public perceive some problematic situation. Sociological explanations of activism typically identify major social divisions, such as race, gender, or economic differences, as the preconditions for activism. This view also privileges ideological motivations for activists, that is, the position that those who engage in activism are driven by political, religious, or economic ideology. This has led to the common perception that most activists are radical reformers, when, in fact, activists come in all ideological stripes and may actually seek to resist social change. Although it is true that many activist organizations are ideological, not every activist public is driven by ideology. From a public relations standpoint, problematic situations arise when people perceive some adverse impact of an institution’s actions or policies. For example, when an organization appears to be responsible for something that harms the public, activists call for some corrective action. Whereas some activists are motivated by

ideology, others are simply reacting to what they interpret as impositions from organizations. For example, the NIMBY (“not in my back yard”) phenomenon often pits otherwise docile community members against organizations that they see as creating problems in their communities. The resistance to the construction of a new Wal-Mart store in a particular area seems grounded more in the perceived impact that the store would have on older businesses than in any anticapitalist harangue.

Activists share many of the traits that James E. Grunig and Todd Hunt have identified as *characteristics of active publics*. Activists recognize some problem and feel empowered to take some action, to seek information, and to communicate with each other and with the institution they deem responsible for the problem, and are likely to organize to address that problem.

Activism has been one of the catalysts for the development of public relations throughout the field’s history. During what is generally seen as the period of the field’s inception, activism played an important role. In the late 19th century, progressive and populist groups in the United States sought to limit the power and scope of monopolistic organizations. The press, partially prompted by activists, sought to reveal problematic conditions caused by corporate practices. Groups seeking fair and safe treatment for workers, the vote for women, sanitary practices in food and drug production, and other social goals pressured organizations through either direct confrontation or increased government regulation. In response, corporations hired the first public relations counselors or established departments designed to tell the organization’s story. Ivy Lee, for example, was hired by the Rockefeller family to help craft responses to labor activism.

During the 1950s and 1960s, American corporations were again forced to respond to a wave of activism. A number of significant activist movements reached their peak of influence and public attention. These included the women’s rights movement, the civil rights movements, the consumer safety movement, environmentalism, and the anti-Vietnam War protests. What distinguished these confrontations from those of the seedbed years of the public relations field was the presence of

television. The muckraking reporters of the earlier period begat those who carried cameras and microphones. Public opinion was galvanized around specific issues and corporations, and government officials were pressured to solve problems. Corporations, which had largely been using public relations to support the marketing function, turned to public relations professionals to defend companies in the court of public opinion. The need to anticipate problematic situations and to engage in public debate with activists gave rise to issue management and crisis communication. Scholars and practitioners alike began to examine the development of activist organizations and the tactics they employed.

Activists themselves began to notice the need for a more sophisticated approach to communicating with supporters and opponents alike. For example, Saul Alinsky's 1972 book, *Rules for Radicals*, offered practical suggestions for activists in organizing, making their case before the public, and engaging in a productive public debate.

In the first few years of the 21st century, activism has taken several forms. On one hand, activism has become almost institutionalized. Many of the reforms sought by 1960s activists were enacted into law or regulation, spawning government agencies such as the Consumer Product Safety Commission and the Environmental Protection Agency. Activists continue to raise issues and monitor the performance of these government agencies. Although this is important work, it often does not generate much public attention, which leads to the impression that the level of activism has waned. On the other hand, activism is embraced by a variety of publics with a sometimes dizzying range of agendas. Cultural norms and shifts in public opinion, as well as greater access to organizations, has empowered many activists. There is such a broad range of empowered activist groups that virtually no corporate decision can be made without taking into account activists' likely reaction.

As with most other communication functions, inexpensive computers and the development of the Internet and the World Wide Web have revolutionized activism. Activists use e-mail chains and

Web sites to share information about issues and to organize collective action. This trend has necessitated an increasingly sophisticated response on the part of organizations engaged by activists.

Activism has been so closely linked to important developments in public relations that it is now seen as one of the preconditions for the field. Larissa A. Grunig, J. E. Grunig, and David Dozier argued that "a turbulent, complex environment with pressure from activist groups stimulates organizations to develop an excellent public relations function" (2002, p. 16). Krishnamurthy Sriramesh and Dijan Vercic indicated that activism is one of the essential characteristics that shape the creation and development of public relations internationally.

Despite the importance of activism to the development of the field, public relations practitioners or scholars do not universally value or respect activists. The strategies used by organizations in response to activism run the gamut from attacks and resistance to the formation of cooperative relationships. Christine Oliver outlined five strategic responses organizations typically adopt toward activists: (1) acquiescence, which involves giving in to the activists' demands; (2) compromise, which occurs when the organization negotiates with activists to resolve problematic situations; (3) avoidance through concealing problems or otherwise erecting barriers between the organization and outside pressure; (4) defiance, which involves actively engaging opponents in debate, challenging new regulations or proposals for change, or attacking the organization's opponents; and (5) manipulation, typically through co-optation, which involves making cosmetic changes to an organization's practices without changing their substance.

The shape of an organization's response to activism depends on the assumptions of the company's managers toward both public relations and activists. Many organizations resist being "managed from the outside" and thus resist pressure from activists. For example, when the Clorox Company devised a crisis communication plan in response to environmental activism, some of the strategies included questioning the activists' motives and undermining the credibility of the activist group.

Other corporations have observed a strategic benefit in working with activists to pursue common goals. Merck Pharmaceutical Company and the AIDS activist organization ACT UP (AIDS Coalition to Unleash Power) worked together to persuade the U.S. Food and Drug Administration to speed the approval of AIDS treatments. The drug company was able to get its product to market faster, and the activists saw an effective treatment become available sooner.

Activist groups compel organizations to create excellent public relations programs, but they also can be viewed as a locus for public relations activities themselves. Activists use public relations strategies and tactics to pursue two general goals. The first is to influence public opinion and behavior to rectify the situation they see as problematic. The second is to create and maintain organized, structured, and coordinated efforts. These goals are not that different from those of other organizations, which use public relations both to pursue their strategic goals and to maintain the organization.

The area that has received the most attention from practitioners and scholars is the strategies that activist groups use to pursue their goals. Activists often seek to “make an issue” out of the problematic conditions they have identified. Whereas the study of issue management has often examined how institutionalized organizations proactively or reactively deal with issues, the study of activist groups focuses on the creation and promotion of issues. Michael Smith and Denise Ferguson claimed “through its public relations activities, an [activist] organization communicates its positions on issues, solicits support for action, and . . . engages target organizations in policy discussions” (2001, p. 294).

Activists use a range of strategies to pursue their goals. The iconic images of activists tend to involve mass protests or violent demonstrations. Media accounts of the so-called new activism of the late 1990s invoked images of violent confrontations between antiglobalization protestors and authorities in Seattle; Washington, DC; and several foreign cities. However, activists use a variety of strategies and tactics to pursue their goals. Some tactics are confrontational, including boycotts, demonstrations,

and symbolic events, which are often designed to dramatize an issue or galvanize public attention. For example, anti-handgun groups staged symbolic demonstrations outside the premises of gun manufacturers one Memorial Day. The activists lined the fences outside the sites with the shoes of victims of gun violence. Pictures of the event were featured in newspapers around the country.

Other strategies are more informational, designed to raise awareness and increase understanding of an activist group’s issues and proposals for resolving those issues. These tactics typically involve media relations, including news conferences and interviews. Groups with sufficient resources can run issue advertisements. For example, an animal rights organization wanted to claim that animals being raised for food were often treated poorly. The activist organization ran an ad that played off the notable “Pork: The Other White Meat” campaign and claimed that the “other white meat has a very dark side.” Web sites allow activists not only to provide a great amount of information about their issues, but also to direct members and others on how to take action to promote policy solutions. Throughout the legislative process, for example, activists regularly update the media and other interested publics as the bill moves through committee to wider consideration by the legislature.

The final set of strategies employed by activists involves building relationships with the institutions or organizations that the activists hold responsible for a problematic situation, with the goal of negotiating an outcome satisfactory to all parties. As with corporations’ use of symmetrical approaches to public relations, this approach is not as widely practiced as the ones described previously. In the early 1990s, Vermont’s Deerfield River generating plant spent four years negotiating with environmentalists, business owners, fishermen (who wanted calm water for angling), and kayakers (who wanted rough water for training) to craft a mutually beneficial agreement for controlling the flow of the river through the plant.

As with other strategic public relations practices, the strategy that activists select depends on how those who run the organization value the role of

public relations. Often, the choice of strategies is prompted by the response of the target of the activists' efforts. The 2003 dispute between the National Council of Women's Organizations (NCWO) and the Augusta National Country Club, host of the Masters Golf Tournament, became confrontational only after Augusta's president publicly chastised the NCWO for urging the private club to accept women members. The dispute escalated quickly once Augusta National went public.

Activist groups use public relations strategies and tactics not only to promote their causes, but also to maintain themselves. Activist movements tend to pass through various stages of development. At each stage, the organization faces various communication and organizational challenges. One fertile area of research has been the identification of the various stages in the "life cycle" of activism. Robert L. Heath, for example, identified five stages. The first stage, strain, happens even before organizations form and consists of publics recognizing and defining issues. Once issues are identified, activists move to the second stage, mobilization, which is when organizations are formed, issues are promoted more widely, and the activists begin to marshal resources to correct the issue. Activists then seek to confront corporations and/or the government in order to resolve problems. Following this is negotiation, during which the parties involved exchange messages designed to reach some agreement. Finally, the activist group enters the resolution stage, during which the controversy is resolved, perhaps only temporarily. A number of issue management scholars have noted that although issues may disappear from the public's agenda, the conditions that led to the issues may still exist. Thus, activist groups often continue to exist with the goal of monitoring issues and making sure the resolutions are carried out.

The organizational and communication challenges facing activist groups are many and change as the groups move through the life cycle of activism. An activist group must recruit members, gather resources, and establish the organization as a legitimate advocate for an issue during the strain and mobilization stages. In addition to gaining

public attention for their issues, activists also create communication networks designed to alert members to coordinated action, from organizing rallies and training sessions to urging people to contact elected officials regarding legislation. A number of organizations establish so-called rapid response networks through which members can be contacted quickly.

During the confrontation and negotiation stages, activist groups must maintain member motivation over the course of long campaigns. They also have to compete for members and resources with other activist groups pursuing similar issues. As issues are seemingly resolved and fall lower on the public agenda, activists often see membership and financial resources decline. The Committee in Solidarity with the People of El Salvador (CISPES) went from publishing a four-color, tabloid-style newsletter to a photocopied two-page briefing paper when peace treaties were signed. Sometimes activist groups cease to exist altogether.

Activists use a variety of internal publications, including newsletters and Web sites, to maintain contact with followers, sustain interest in issues, or redefine the issues that the group addresses to those that are higher on the public agenda. For example, when the United States and Russia signed nuclear weapons accords in the early 1990s, the anti-nuclear weapons group SANE-Freeze changed its name to Peace Action and began to redefine nuclear weapons issues as an environmental problem just as the environment was becoming a hot issue.

ACTUALITY

An actuality is an audiotape recording of a human news source that is intended to be played as an integral part of a news story prepared for broadcast in an electronic medium. The term is often used interchangeably with *bite* (or *sound bite*), although purists among media workers consider the two terms distinct in their definitions and proper use. Specifically, the second edition of the *Broadcast News Writing Stylebook* (2002, p. 93) notes that *actuality* is a radio term whereas *bite* is a television term. Of course, the latter would include video.

Nevertheless, those in radio today commonly use the term *sound bite*, so any subtle distinction may be lost on many electronic media news people. Common usage in television coverage of politics also seems to have popularized the term *sound bite* among the lay public, whereas *actuality* seems to be a term that is used and understood mostly among media workers.

Both *actuality* and *bite* (*sound bite*) describe the actual sound of someone talking as a part of a news narrative, for example, the recorded speech of a source from the public relations practitioner's organization who is a newsmaker or who is being used as a secondary source for a news story. An actuality is analogous, indeed equivalent, to a direct quote in print media and thus adds credibility and interest; furthermore, a colorfully expressed actuality often provides a unique—and highly effective—means to emphatically express a fact or point of view.

An actuality may be part of a story narrative that is being prepared by an electronic media journalist to be aired on a newscast, but such recording of an actuality often is included in a media release being prepared by the public relations practitioner for a news release to be submitted to electronic media as an information subsidy for broadcast news programs.

Actualities or bites are to be differentiated, nevertheless, from natural sound, background sound, ambient sound, and other types of sound that may be used as background under the voice track of a reporter or news source. Such background sounds can give the listening/viewing audience a sense

of being at the news site but do not include recognizable, or at least primarily important, speech.

The public relations practitioner must use caution in preparing and coaching her or his organization's people in acting as sources for actualities, whether the actuality is being produced by the public relations practitioner to be included in a news release to electronic media, whether the source is a speaker at a news conference being hosted by the practitioner's organization, or whether the source is simply participating in an unexpected interview sought by an electronic media news reporter because the representative is a credible or important source for news that involves the practitioner's organization.

If the public relations practitioner produces the actuality, the utmost care must be taken to exercise technical excellence in recording the spoken words. Poor technical quality may prevent an actuality that accompanies a news release from being used by electronic media or, at best, will detract from the message that the source is trying to convey.

—Dean Kruckeberg
and Marina Vujnovic

ADVANCE

An advance is a story that public relations professionals and others send to the news media to announce upcoming meetings, performances, speeches, sports events, news conferences, fundraisers, hearings, rallies, conferences, and other activities. The goal is to tell people about the event in an

interesting way so they can decide whether or not to attend. A good practitioner will avoid hyperbole, which puts people off—particularly the editors who decide whether or not to publish the advance.

A good advance begins with the event's main topic (what the speaker plans to say or the main agenda item), the main purpose (to raise funds for a charity, for example), or a key personality (such as the star of a musical performance). This is followed by the time, day (date), and place (with room number) of the event. An advance also reports the exact name of the group holding or sponsoring an event, background information about the speaker or primary issue, other important items on the agenda for a meeting, and mention of other key personalities.

An advance for a print publication or Web site typically is no more than two or three paragraphs long. This allows an editor to slip it in almost anywhere in a newspaper, newsletter, magazine, or Web page. An advance for broadcast typically is no more than 25 words or so and is written as a public service announcement. This also can be used to fill space during a broadcast. An advance writer must always remember that a release that doesn't get published or aired is worthless.

In olden times, before 1995 or so, advance stories were mailed or faxed to newspapers and some broadcast outlets. The distribution process today is more sophisticated. Advances may still be mailed or faxed to local news media, but some editors prefer to receive advances electronically. A writer creates the advance in a word processing program, pastes it into an electronic mail message, and sends the story. A recipient can paste the advance into his or her word-processing program, and no retyping is required.

An advance writer also can bypass the middle-person by posting all advances in prominent positions on the organization's Web site with links to a speaker's biographical information, background material to be discussed at a meeting, and other relevant information. It's a good idea to send advance stories to interested parties on listservs. News media writers may be on the listserv, but the list will include names of people who are simply interested

in the organization's activities. Advance writers should make sure their lists are accurate and current, for this is a good way to get the advance to the people most likely to attend the event.

ADVERTISING

Advertising, as a tool used in public relations, involves the purchase of paid space or time in newspapers, magazines, radio, television, out-of-home media, or the Internet to communicate messages to target audiences.

More broadly, advertising encompasses an array of other, ancillary promotional tools to promote interest in products, services, organizations, candidates, or causes. These include *direct response* (including direct mail) and *sales promotion* (including point-of-sale materials, collateral, sweepstakes and contests, advertising specialties, and special events). Advertising can be contrasted with *publicity*, that is, unpaid coverage in the news or entertainment portion of media.

Public relations practitioners use advertising when they want complete control over a message—including when and where the message will appear. In contrast to publicity and many other public relations techniques, audiences often are skeptical about advertising because they attribute its purpose to *persuading* rather than *informing*. As a result, people often avoid, resist, or discount advertising messages.

TYPES OF PUBLIC RELATIONS ADVERTISING

Public relations advertising takes several forms.

Institutional advertising promotes an organization (versus merely a product or service) and typically is used to announce a new corporate identity, to

attract investors, to enhance an organization's overall reputation, or to reach out to local communities by promoting the sponsor as a good citizen engaged in social concerns such as the environment.

Financial advertising is used by for-profit corporations to announce new financial developments. Securities underwriters routinely publish simple *tombstone ads* when new securities are offered for a client. These ads are published as a matter of public record as reputation enhancement, not as an offer to sell or a solicitation to purchase securities (which requires receipt of a prospectus). Many firms try to attract investor interest through ads that tout their financial performance. Other financial ads are used in contested tender offers, where proponents or opponents of an acquisition urge shareholders to either sell or not sell their shares to the acquirer. Minority shareholders and activists also use advertising to sway shareholder votes in proxy fights or other actions to be considered at corporate annual meetings.

Issues advertising enables an organization to speak out on an important social problem or situation in which it has a stake. Advocacy advertising is being used with increased frequency as part of issues management programs to sway public opinion on public discussions of social issues. Issues ads also can be run as part of government relations programs to influence voters in local ballot measures, referenda, and initiatives and to reach congressmen, state legislators, and local officials when votes are pending on important legislation.

Political advertising is used to lend support to political candidates that a sponsoring organization supports (or to undermine or attack a candidate they oppose). Such *independent expenditures* are permissible under federal election laws (and under state laws) but have been the focus of intense scrutiny in recent years as labor unions, corporations, and advocacy groups have become major factors in elections.

Crisis advertising involves the use of print ads or broadcast commercials to inform people about how an organization is responding to an adverse situation—such as a natural disaster, strike, or other event that disrupts service or relationships.

Events advertising is intended to promote public attendance or participation in special activities that organizations want to promote. Not-for-profit organizations (sometimes funded by their for-profit partners) use paid ads to create public support for upcoming fundraising activities.

Not-for-profit organizations use *public service advertising* to promote social causes and ideals (also referred to as *social marketing*). Public service announcements (PSAs) take the form of print ads or broadcast commercials in the non-editorial portions of public media as well as messages that appear in out-of-home media (billboards, transit ads, etc.). Media organizations donate the space or time as a public service—to engender themselves to audiences and to demonstrate social responsibility to their regulators.

Public relations advertising differs from traditional product or service advertising by its focus on promoting an organization's image or advocating a position on a particular topic. However, fully separating product/service promotion from organizational goals is often difficult. Many product advertising campaigns, for example, seek to enhance the organization's reputation while also selling products. Similarly, some public relations firms provide product advertising and related promotional services as part of an integrated marketing communications program for clients.

ADVERTISING MESSAGES

Effective advertising messages focus on a single topic and include a clear call for action. When developing ads, sponsors confront several basic creative decisions. The most important of these is to develop a "big idea" or creative concept around which the message will be constructed. Sponsors also must choose how direct they wish to be. A *direct* message strategy uses hard-hitting language and images that leave little doubt about an ad's purpose; *indirect* strategies are more subtle so that the intent is less obvious.

Another major creative decision involves whether to use *rational* or *emotional* appeals. Both techniques can be effective. Rational advertising

appeals focus on logic and argument strength and rely on facts, figures, and illustration. Rational ads can be particularly effective with audiences that possess the ability and motivation to process complex arguments. Emotional advertising appeals to the *heart* (versus the *head*) and tugs at people's affective responses by relying on illustrations, anecdotes, and related devices. Emotional appeals often draw the interest of people with little previous involvement in a topic.

Ads also can be structured as lectures or dramas. In a *lecture*, a speaker addresses the audience using a first-, second-, or third-person narrative. In a *drama* format, the audience eavesdrops on a scenario involving others and participates vicariously. Dramas invariably provide lessons that are inferred by the audience and reinforced in the ad's closing.

ADVERTISING FORMATS

Print advertising

Effective print ads follow generally accepted conventions but can vary considerably in terms of design (layout, typography, color scheme, etc.). Print ads use a large headline or strong graphic device to attract attention. Headlines telegraph the key message to audiences and are sometimes followed by overlines (secondary headlines that appear above the main text). The ad's body copy then presents explanatory or supporting arguments. Most ads end with a strong call to action and a signature element identifying the message's sponsor. Advertising slogans and organizational logotypes serve as continuity devices between messages. Legally required (known as *mandatory*) disclosures and other pieces of information generally are included in fine print at the bottom.

Print ads are most useful when a complex or detailed argument needs to be presented or when people must respond using coupons or forms. Newspapers and magazines usually sell ads in standardized formats. Most public relations advertising in newspapers strive for page dominance by using standard advertising units (SEUs) that are at least one-quarter of a page in size, preferably larger. In

magazines, half- and full-page ads are the most frequently used formats. Other formats include double-truck ads (a two-page spread), multiple-page series, and inserts. Smaller formats can be used in both newspapers and magazines but often fail to generate sufficient attention. Smaller ads are also less efficient generally because they cost more on a per-inch basis.

Broadcast advertising includes radio and television commercials. Broadcast messages must be especially cogent, draw people into the message quickly, restate the key points several times, involve the audience, and clearly describe the actions to be taken. Broadcast advertising uses a variety of devices to attract attention—sound, music, a familiar voice, or (in television) strong visuals. All of these elements play a critical role and must be used imaginatively and integratively to create a persuasive message that can be told in 10, 30, or 60 seconds—the typical lengths of broadcast commercials. On radio, critical points must be repeated orally; on television, text can be added to emphasize key points (such as an 800 number to call). Text can be superimposed over video and frequently takes the form of a billboard or closing title (signature) of a TV commercial.

Internet advertising is becoming increasingly popular. Various types of ads can be purchased on sites operated by third parties (search engine sites, media sites, and many special-topic portal sites). Banner, skyscraper, pop-up, and superstitial ads create awareness of an organization or offer (in ways similar to the use of outdoor billboards) and can drive traffic to a sponsor's own site using a hyperlink. However, click-through rates generally have disappointed sponsors.

ADVERTISING MEDIA PLANNING

Much public relations advertising involves purchasing time and space on a one-time or very limited basis. In such cases, the appropriate media outlets—such as a particular local newspaper or a handful of trade/financial publications—are quickly identifiable. However, when advertising is used to sway public opinion over time or in more than a single

media market, advertisers need to follow basic media planning principles (the same ones used by product advertisers) to maximize their impact and avoid wasting precious advertising dollars.

The focal concept in media planning is the *impression*—the opportunity for one person to be exposed to one of a sponsor's messages. Cumulative exposures are calculated as *gross impressions* by adding together the total impressions created in any particular media buy. The number of exposures created can be expressed in actual numbers of impressions or, more commonly, as ratings. A *rating point* represents 1 percent of the total potential audience for a message. A particular vehicle's *rating* is the percentage of total audience reached by that newspaper, magazine, or radio or TV show.

Gross rating points (GPRs) are the total percentages reached over a particular time frame when two or more messages appear in combination, whether in the same or in different advertising vehicles or media. The calculation of gross rating points provides a metric for ascertaining the cumulative total number of unduplicated impressions in an advertising effort. Generally, advertisers strive to generate the largest possible GRPs that a budget will allow (but avoid overspending).

Generally, advertisers seek to maximize a campaign's *reach*, or the number of distinct individuals exposed to a message at least once (eliminating duplication). Advertisers also want to optimize *frequency*, or to create multiple opportunities for an audience to be exposed to a message. More than one exposure to a message is usually necessary for people to pay attention and understand an ad message, but excessive exposure can waste dollars because no additional persuasion effect occurs. Excessive exposure can also annoy audiences so that they disregard or respond negatively to a message. Thus, frequency involves balancing the need for wear-in of a message and the avoidance of wear-out.

Advertisers generally want to gain maximize *effectiveness* by spending the least total dollars possible in a campaign. In choosing media, advertisers also strive for optimal *efficiency* by selecting media that deliver the largest audience (on either a duplicated or nonduplicated basis) for the same

dollars. An important consideration here is timing. Some campaigns rely on *continuous* exposure, that is, repeating the message in steady increments over a period of days, weeks, or months. However, in many instances advertisers can create or maintain *share-of-mind* awareness among audiences by staggering exposure. Total expenditures can be stretched by alternating between periods of high and low levels of exposure (*pulsing*) or between periods of nonexposure and exposure during key time blocks (*flighting*). Because of the high costs of advertising, many public relations advertisements are purposely timed to appear in a specific time period, such as the days before an event, election, holiday, or critical legislative vote. With a few exceptions, such as evergreen public service campaigns, most public relations-oriented advertising uses flighting schedules to optimize exposure and minimize costs. The absence of ads during periods of low or no exposure is offset in part by advertising's *carryover effect*, in which people remember a sponsor's name or message.

Cost per thousand (CPM) is the shorthand index used to compare the cost efficiency of two or more media. CPM is computed by dividing the total expenditure for an ad in a particular vehicle by the number of people in the audience and multiplying the result by 1,000. The result is an easy-to-compare dollars-and-cents figure. When two media are considered, a \$3.50 CPM would compare favorably with a \$4.25 CPM, suggesting that the first medium is more efficient—if it can be assumed that the quality of the audiences reached is the same. CPM rates of \$5 to \$10 are common in consumer advertising, but the cost per thousand can escalate in business-to-business and other situations where the audiences are small and the rates charged by media for advertising are comparatively high.

ADVERTISING EQUIVALENCY

Advertising equivalency involves calculating the value of public relations-generated media coverage by determining what the air time/print space would have cost if the organization had had to pay advertising rates for it. For example, if a print medium charges \$200 per column inch for an advertisement, a five-column-inch story generated through public relations efforts would have an advertising equivalency of \$1,000. For broadcast media, if a 30-second spot costs \$10,000, then a 15-second news mention would be worth \$5,000.

Although many organizations have used advertising equivalency in an attempt to assign a value to public relations efforts, the practice is fraught with problems. First, most newspapers, for example, don't sell ad space on the front page of a business section, where strong public relations efforts often appear. Comparing such a placement to an advertisement is thus an apples-and-oranges situation. There is no true basis for calculating the cost of the space.

A second issue is the credibility difference between an advertisement and an objective, third-party story. The majority of the public today has enough media savvy to understand that ads are controlled in both content and placement by the organizations that pay for them. People tend to be more skeptical about the veracity of and motivation behind ads. A news or feature story, however, has the credibility boost of being produced by an independent, third party. Although there have been

notable media honesty scandals, for the most part people still seem to trust mainstream media sources. Generating a placement in such a source has inherently more credibility than a paid advertising placement. A multiplier is sometimes applied to the advertising rate to compensate for this difference. However, the question then becomes, what is the appropriate multiplier? How much more credible is a story on the front business page written by a business reporter than an ad on the third page of the section produced by a company? Such an attempt to demonstrate the value of public relations efforts can produce more skepticism than it alleviates with an analytical manager or client.

Clearly, the need exists for an adequate and appropriate manner through which to value public relations efforts. Although still used, advertising equivalency is not that method. The inherent differences between advertisements and independent coverage make advertising equivalency too imprecise to reflect the value and credibility of public relations efforts. If asked to provide such a figure, a practitioner should explain to the client or manager the limits of this method.

AFRICA, PRACTICE OF PUBLIC RELATIONS IN

PUBLIC RELATIONS PRACTICE

The public relations profession in Africa achieved momentum only during the last two decades. As in other parts of the world, many African practitioners enter the profession through journalism, often being trained abroad since few facilities exist locally.

African public relations practitioners have a different role than their U.S. counterparts. In the West, it is assumed that public relations practitioners will be socially responsible. In the Third World, public relations practices are designed to be consistent with political ideologies, levels of development,

and sociopolitical controls. African public relations practitioners are thus expected to be team players on the side of the government. In politically unstable Africa, governmental public relations is used to present an image of a unified country.

The development of public relations on the African continent has been influenced by the availability of mass media. For example, Nigeria, with its extensive system of mass communication, has a thriving, professional public relations community. The Nigerian Institute of Public Relations (NIPR) was established in 1963, and after the oil boom, public relations exploded. By 1993 the NIPR had 2,000 members as well as a constitution and a code of ethics. The NIPR's current president is Bobo Brown of Shell Petroleum Nigeria (bobo.s.brown@spdc.shell.com).

Egypt—for reasons of history, culture, and geography—has influenced public relations beyond its borders. The “godfather” of the public relations profession in Egypt, Prof. Dr. Mahmoud El Gohary, founded the Arab Public Relations Society (APRS) in 1966, first in Egypt and then in other Arab and African countries. For 28 years he was chairman of its public relations institute, editor-in-chief of its journal, and chairman of the International Academy for Public Relations and Information.

The field of public relations in Egypt is still rather misunderstood. There is confusion between public relations, marketing, and advertising; many organizations see sales as the primary goal for public relations. In many instances, publicity is paid for outright. Public relations departments have no power to answer the questions of journalists and have to seek answers from superiors. Maybe because of a lack of formal education, only 10 percent of individuals in the public relations business are considered to be skilled professionals. If offered at universities, public relations is limited to a single course in the business or communications department.

The Zimbabwe Institute of Public Relations (ZIPR) was founded in 1957 and has made enormous progress. Among the principal players were George

Author's Note: This entry reports on African countries (excluding South Africa) for which information on public relations practice and education was available electronically. In some instances, the information is likely dated. It is not certain that all of the educational institutions and public relations associations mentioned still exist.

Foot (who retired from the IPRA board in 1993 and received an IPRA Gold Medal for his work on the Consultants Committee) and Helen Tinker (president of ZIPR in 1993, who received both an IPRA Golden Award and a UN Award for a public relations program on AIDS awareness). By 1993 ZIPR had 207 members, most working in the capital city, Harare. Over 75 percent were in-house practitioners in the industrial and commercial sectors, and less than 15 percent were consultants.

In other countries in southern Africa, professional organization in public relations started later than in Zimbabwe, and public relations is served by few practitioners. Swaziland has its own public relations association, and PRISA has recently formed chapters for practitioners in Namibia and Botswana.

The Public Relations Society of Kenya (PRSK) was established in 1971; its current president is Fatuma H. Mohammed of Nation Media Group (fhmohammed@nation.co.ke). The Sudan Public Relations Association was founded in 1973, and the Public Relations Association of Uganda originated in 1976. The current president of the Ghana Institute of Public Relations is K. O. Bimpong (osebimpong@ssnit.org.gh). By 1981, 9 of the 56 national public relations associations in the world were in Africa. The public relations associations of Kenya, Nigeria, Egypt, Ghana, Uganda, Cameroon, Swaziland, and Zimbabwe are registered with IPRA.

FAPRA (Federation of African Public Relations Associations) was formed in Nairobi in 1975 with the aim of uniting the Francophone and Anglophone parts of Africa. Some say that FAPRA has had little effect on the development of the profession—largely because of a lack of resources, communication difficulties, and the lack of general professional direction in the field of public relations. The current secretary-general is Kabir Dangogo (kabirdangogo@hotmail.com) from Nigeria, and its president is J. E. Allotey-Pappoe (jeap200@yahoo.com) from Ghana. The 16th FAPRA public relations conference, which took place in Accra, Ghana, in March 2003, was attended by more than 200 members from the African continent. Addressing this conference, Ghana's President Kufuor called on FAPRA to assist African leaders in managing the image of the

continent globally. This annual event was held in May 2004 in Abuja, Nigeria, and will be held again in Nigeria in 2005 and in Johannesburg, South Africa, in 2006.

The East African Public Relations Association (EAPRA), in cooperation with the PRSK, hosted the second EAPRA Conference in Nairobi, Kenya, on November 27–28, 2003. The theme was “Excellence in Public Relations—Opportunities and Challenges Towards Successful Strategic Public Relations.”

EDUCATION AND TRAINING IN AFRICA

Public relations education in Africa ranges from formal tertiary diploma, degree, and postdegree courses to in-service training by employers and government ministries (such as the Tanzanian government's initiative to train their most senior communication officials in strategic public relations in 2003). Formal public relations education is most active in Egypt, Zimbabwe, Kenya, and Nigeria.

At the tertiary level, many public relations programs in Africa are taught as part of a bachelor's degree in communication, mass communication, or journalism (e.g., in Egypt). The University of Nigeria started public relations training in 1960 and now offers a M.Sc. degree program in public relations, in association with the professional association. Public relations courses in Nigeria are also an integral part of mass communication programs; in 1992 there were more than 40 schools of journalism/mass communication in Nigeria. At that time, the University of Nigeria was the only institution offering mass communication training up to the doctoral level.

Some universities teach public relations to complement other disciplines, such as marketing and business management. A number of distance learning public relations programs are also available in Africa. South African courses include degree and postgraduate courses offered by UNISA; as well as diplomas offered by the IAC and Technikon SA. British courses include the CAM in communication studies, the CEM diploma in public relations, and the MSc distance learning program offered by the University of Stirling.

A variety of short courses are offered by professional institutes and private colleges. Foreign governments and development agencies also sponsor communication-related training in African countries (e.g., the Dutch government, the Norwegian Agency for Development Co-operation, UNICEF, UNESCO, SIDA [Swedish Development Agency], CIDA [Canadian Development Agency], and the Ford Foundation of the United States).

RESEARCH IN AFRICA

Public relations research is practically nonexistent (or does not get published). Database searches produced only a few articles in local or international academic journals. Private companies and government ministries occasionally contract international consultants to do ad hoc research projects (sometimes funded by the UN Development Program).

In a search of the database of African Theses and Dissertations (a project of the Association of African Universities), only one master's thesis in public relations was found—written by Margaret Gyan. She was of the opinion that public relations, as a practice and an academic subject, has received little attention in Ghana. Before independence in 1957, typical public relations functions were performed by organizational departments such as personnel, administration, welfare, and sales. After 1957, the need for black intermediaries was fulfilled by information officers who practiced press agency.

Currently, practitioners study through the Ghana Institute of Journalism and the School of Communication Studies, Legon. However, public relations still occupies an insignificant place on the list of professional bodies in Ghana and is quite low in the organizational hierarchy.

Betsie Ferreira, a senior lecturer at the Port Elizabeth Technikon in South Africa, conducted an ad hoc research project on the state of public relations education in Africa (excluding South Africa) between 1994 and 1998. Information was solicited from 45 countries, and information was obtained on 28 countries.

Gené van Heerden, a lecturer in communication management at the University of Pretoria in South

Africa, is currently completing her master's thesis on public relations practice and education in Africa (including South Africa).

CONCLUSION

It is difficult to comment on public relations in Africa because there is little information available. It is, however, clear that there are pockets of excellence in public relations practice and education on the African continent.

AGE OF DEFERENCE (END OF)

At some point during the 1960s, the United States experienced a sharp trend that led to the end of the age of deference. The point when deference ended is not clearly marked in the sands of time, but it

clearly is the result of reduced belief in the honesty and ethics of American business practices as well as government policy. The age of deference ended when people moved from trusting to distrusting large companies for what they did, for the values they used to guide operations, and for what they represented.

One of the strongest indicators of the end of deference can be found in poll data results. In 1966, 55 percent of the public had a great deal of confidence in the management capability and ethical standards of American business executives. A decade later the confidence level had fallen to 16 percent. Tracking the status of executive managements on these indicators, polling companies such as Gallup found that after post-World War II highs, company executives and other societal leaders have tended to receive very low honesty and ethics ratings for over three decades.

American business leaders used much of the last part of the 19th century to create a rationale supporting the concentration of capital as the operating financial and business arrangement. Tug-of-wars occurred between executives, media reporters, labor leaders, consumer advocates, civil rights advocates, and government leaders during the early years of the 20th century. The Great Depression dampened this corporate effort, which was lifted to new heights by World War II. During the war effort, American industry contributed to democracy, prosperity, and the dream of a new lifestyle. Public relations practitioners featured in this encyclopedia helped to position companies through counseling during these years of the 20th century. They communicated messages for and listened to concerned citizens. Slowly, deference was earned and granted by statement and deed.

After having worked successfully to create and then restore confidence in large business practices, many executives and senior practitioners were caught off guard by the events of the last half of the 20th century. They saw a slow erosion of faith in the American dream that had been created by capitalistic concentration of publicly held wealth and that had produced what many thought was the most envied lifestyle of the world.

Not only had business executives suffered a loss of deference, but so had many other categories of societal leaders. Gallup poll data revealed that legislators, government executives, reporters, news anchors, advertisers, marketers, and others had high honesty and ethics ratings with only a small fraction of the public. None of these categories enjoyed high ratings with more than a third of the population, and many of these positions were associated with honesty and ethics ratings in the single digits.

Many factors account for this slide. People in the United States were looking for a morale rebound after the despair of the Great Depression. World War II gave a substantial boost to the collective feeling of well-being and goodwill. Industry had excelled in its ability to innovate, invent, and manufacture materials. A new lifestyle was created by the abundance of goods and materials, research and development achievements, and the manufacturing capacity created during the war.

Women and minorities had gone to work in large numbers. The loss of servicemen to death and wounds had created jobs after the war. The GI Bill trained men and women for new occupations that changed their lives and the national lifestyle. The nation felt that its role in the war had been righteous. Words such as *freedom* and *democracy* became the hallmarks of the age—and the challenge.

The civil rights movement was sparked by many events during the war, but protest was unpatriotic. Postwar criticism focused on the disparity between claims of a new country dedicated to freedom and democracy. In marked contrast were myriad institutional and cultural barriers against people of color. Thus, the civil rights movement began to scrutinize every aspect of American business and government looking for gaps between promise and delivery. Many gaps were found, and substantial opposition arose to efforts to close these gaps. The 1950s and 1960s witnessed an era when civil rights leaders examined the ability of government and business to deliver on promises.

Without a doubt, the civil rights movement created a foundation for the dozens of activist movements that occurred over the latter half of the century. The antiwar efforts examined the rationale and strategic

military choices made in Vietnam. Deference toward the presidency of the United States hit a low when college students and other antiwar activists chanted, “Hell no, we won’t go” and “Hey, hey, LBJ, how many kids did you kill today?”

During the last three decades of the 20th century, more regulation and legislation was enacted to constrain corporate actions than had been put into place during all of the rest of U.S. history. Activists from all points of view converged on the federal and state capitals with a list of grievances about corporate behavior. They also doubted that congresses and city governments had much stomach for constraining corporate actions. They became prone to sue government to force them to create and implement regulatory and legislative change.

This outburst signaled that the era of deference had ended. No longer were significant parts of the society willing to trust business or government. The ringing call for “power to the people” shouted by civil rights activists had become the soul of American politics.

Businesses and government agencies were caught off guard by this sudden and profound change. The initial reaction in the late 1960s and 1970s was to dismiss the critics and denigrate their motives. Some of the denigration brought up Cold War claims of communistic leanings. Reactivity was the spirit of the day.

Eventually, more proactive measures were innovated and implemented. One of the innovations was the creation of issues management as a strategic response discipline and corporate program. This move followed a similar initiative that included the creation of the concept and practice of *public affairs*, a term coined by larger companies to reshape the public relations discipline to make it more responsive to government relations. The traditional approach to public relations, these innovators believed, had been slanted toward publicity responses and reputation management rather than the public debate of the merits of various issues of fact, value, and policy. Legislatures became the battlegrounds for dealing with complex issues related to every aspect of society. Topics ranged from civil and human rights to environmental quality and product safety.

Governments responded by creating new government agencies, such as the Environmental Protection Agency and the Occupational Safety and Health Administration. Regulatory powers and budgets grew rapidly as government was given new charges to protect the public interest.

In addition to the creation of issues management and public affairs, other measures were implemented. The most important of these measures was the broad and deep reexamination of corporate ethics. Some of the 1970s and all of the 1980s saw a surge of interest in the generic topic of business and society. Dozens of books and hundreds of articles discussed the new operating standards that must be considered by executive managements. Blue ribbon panels were created to formulate standards and new directions to meet this challenge. Executives were offended by the accusations they were destroying human rights, consumer interests, and the environment. But the indictments stuck and responses other than offense and denial were needed.

Corporate responsibility received considerable attention and took on new meaning during this era. First calls asked for responsiveness—businesses must be sensitive and responsive to the interests of their stakeholders. This discussion elevated to the demand for responsibility. A new sense of corporate responsibility carried organizations into thinking in terms beyond merely paying salaries and taxes (reluctantly, according to some pro-corporate thinkers, such as Milton Friedman), providing goods and services, and sponsoring visible philanthropy. Now calls came for organizations to achieve an even higher moral standard, rectitude. They had to consider higher-level values focusing broadly on considerations of fairness, equality, safety, and environmental quality. Executives and their counselors could not simply defend themselves by pointing to the goods and services provided and the cost that change would cause. Defenders of corporate policy learned that some methods of response were clearly outdated, such as responses by electricity generators that the critics could just “freeze to death in the dark.”

Generations of public relations practitioners had fostered corporate sensitivity to the quality of

relationships with members of the public. Now two changes had occurred that strained or ruptured those relationships. One was the failure on the part of business to recognize that values of American society had changed. Progress was no longer the single rationale for business activities based on executives' preferences. The quality of goods and services had been engineered to the point where planned obsolescence had prompted a high level of consumer dissatisfaction. The American automobile industry, for instance, had been so focused on style and cost reduction that they failed to realize that the public was more concerned with safety and quality than with style and price. Imported automobiles set a high standard on both counts. The slogan "Buy American" now rang hollow because that meant going along with American businesses for their sake rather than the interests of customers. The incentive to increase profit margins for the company had led to a loss in buyer confidence. Relations were asymmetrical, with the balance going toward the interests of business.

The other dramatic change resulted from the creation of new standards of operation and environmental excellence. Slowly, various publics had developed a higher sense of value on all aspects of corporate operation. Each critical statement by activists added to growing zones of meaning regarding operating standards. People were offended by discrimination in hiring and promotion of women and people of color. They came to criticize many business practices as being unfair. They looked at the environment and indicted various industries for health and aesthetics violations. The right of wild animals to a natural habitat came to take precedence over corporate desires and plans to harvest timber in the most cost-effective manner.

Once the demise of the age of deference began, the role of the public relations practitioner changed and smart companies realized that many new functions were needed. An old, and now outdated, sense of public relations and reputation management argued that reporters could say anything they wanted about businesses as long as they got the names correct. This approach to public relations held that favorable publicity could combat unfavorable

publicity. Advertising dollars were assumed to mute or soften media criticism. Industry held an elite status with the media. Neither could exist without the other; criticism could only go so far, or it would kill the goose that was laying the golden eggs. This tension has not stopped, but more and more practitioners are in a counseling position to caution managements that if they "like that planning decision they are opting for, they will be happy to see it on the front page of the newspaper or at the top of the hour on radio or television news."

During the change from deference to doubt, the United States witnessed a 180-degree change in the definition and locus of responsibility. Once caveat emptor—buyer beware—had been the standard. Industry softened this harsh reality by using their earned deference to say, "Trust us." People, thus, were responsible for the safe use of automobiles—which were built to safety standards preferred by Detroit executives. If consumers hurt themselves or were hurt, they were responsible for their injuries. The bias in understanding and attributing responsibility favored industry. Today, the equation has reversed. No one is responsible for any misuse of a product because they can and do argue they were not properly warned of the hazards in using the product.

In the public policy arena, the debate continues in legislatures and regulatory hearings over corporate operations, planning, and policy. However, much of this debate has now fallen into the hands of litigators, judges, and juries. Class action suits with damages in the billions have become so standard that juries make awards at levels that could cripple the industry or company, if not put it into bankruptcy. A list of the products and industries that have been slammed by such litigation would be too long to print, but two products—*asbestos* and *tobacco*—are indicative of this trend.

Trust is basic to the business transaction—the relationship between vendor and customer, between vendor and citizen. After having worked hard to build trust and demonstrate that they had earned the public's trust, American industry failed to maintain the level of deference they had earned. Whether the indictments against it are fair or unfair is moot.

What is real is the evidence that managements, including public relations counselors, now operate in an era where deference must be earned, not taken for granted.

AGENDA ONLINE

Imagine the details required to plan an event. The challenge of event planning increases if the event is scheduled to occur out of town. Agenda Online (www.agendaonline.com) is one answer to the planning challenges of making an event occur in a seamless fashion. To an extent, the site is an e-commerce link to help event planners make contact with vendors, most particularly hotels, convention centers, and other key elements of an event.

As stated in its Web site, “Agenda is a business-to-business directory providing relevant information about sites and services that event planners need to plan and produce special events of any size. Agenda also offers its readers a free referral service to help corporate planners plan their events. This service is entirely free to planners and their resources and always helpful.”

One of the close companions for event management is the hospitality industry. A diverse array of professionals in that industry create and offer services that assist event planners to make arrangements in as efficient a manner as possible. Traditionally, event planners might be specialists in the public relations industry or the hospitality industry—or both. Even with specialists, organizations planning events had to rely on a plethora of

directories for cities where they might want to hold an event but with which they were not familiar.

Agenda Online is a Web-based service that can help bring the planner together with persons who will help to make arrangements and deliver services to make the event pleasant and productive. It features the relevant contacts and services for various major cities and convention sites.

The Web site includes advertisements for attractions in those cities that might appeal to the event participants and their families. A bookstore is also available at the site. The user will find a bulletin board and an e-bulletin board, as well as events calendars. This part of the site allows planners and schedulers to make contact with one another and to coordinate their efforts. The site also includes referrals and agenda contacts.

One of the most helpful parts of Agenda Online is the tips it provides. This window is designed based on various categories where the planner—however skilled—can get relevant advice such as beverage services convenient to the locale of the event and group activities. It includes such tantalizing options as tips for holding events on yachts and ways to choose the right floral designer.

—Robert L. Heath

AGENDA-SETTING THEORY

The focus of social science and the new field of mass media research on the social and psychological effects of new, widespread media technologies and vehicles dominated communication theory and research during the first 50 years of the 20th century. In mid-century, however, University of North Carolina researcher Maxwell McCombs and his partner Donald Shaw returned to an original theme focusing on the power and effects of media itself. Their three presidential election studies explored the relationship between media presentations of news and the resulting importance recipients of that news assigned to it. Thus was born the theory of agenda setting, which McCombs continued to study for the next four decades. This theory advances

the theme that reporters serve as gatekeepers to filter news events and by their reporting set an agenda. The agenda results from the kind and amount of attention that are given to news events, especially in the context of elections, where candidates chase news to keep their views before the voters.

The original agenda-setting proposition was a direct reflection of 1920s public opinion scholar Walter Lippman's statement that the press formed "pictures in our heads" (Lowery & DeFleur, 1995, p. 266). McCombs and Shaw tested that idea in an exploratory study of the 1968 presidential election coverage in Chapel Hill, North Carolina. What they discovered was a high correlation between what the news media reported as issues and what voters identified as issues. Their findings helped clarify the definition of agenda setting—focusing on the cognitive (awareness) level rather than the affective (feeling) level; in other words, media make voters aware of the issues, but do not tell them how to think or feel about the issues. Also identified were suggestions about media's limitations in the process, specifically the impossible task for media outlets of covering all issues. These findings refocused attention on the media as a powerful force in its own right, rather than just another variable in the viewers' social and psychological processes.

McCombs and Shaw then used the 1972 presidential election to conduct a more comprehensive study of agenda setting in Charlotte, North Carolina. They expanded the scope of the 1968 study to include voters' information from other people as well as from the media, voters' own personal characteristics, the influence of time on setting agendas, and the role of politics in agenda setting. This study confirmed the general hypothesis about creating awareness from the 1968 study and led them to concentrate on awareness and information as critical stages in opinion formation. It also reconfirmed media limitations in covering all events and issues, and clarified how these limitations influenced the complex process of how and why media make decisions to cover or not cover certain issues.

Next came the study of the entire 1976 presidential election year in three communities: Indianapolis,

Indiana; Evanston, Illinois; and Lebanon, New Hampshire. This study revealed more contributing factors: (1) newspapers and television influence voters more in the early campaign stages; (2) voters did seem to rank the importance of issues in the same sequence as the media did; and (3) voters with personal characteristics such as higher educational levels, more political knowledge, and more interest in political matters were more inclined to use media on a regular basis, making them more likely to be influenced by the media.

These three studies spawned more than 200 studies exploring agenda setting during the next 25 years. Significant studies include the following:

- Doris Graber's 1980 study looked specifically at the strength of the media's influence on voters' judgments; she found that the influence varied depending on environmental circumstances as well as media content.
- Dominic Larsorsa and Wayne Wanta's 1990 study added interpersonal experience to the agenda-setting paradigm of newspaper and television news on issues' importance.
- Scott Hays and Henry Glick's 1997 study extended the agenda-setting idea from its news effects to policy adoption effects, and concluded that when environmental conditions in the political entity (the state) and media influences are similar and convincing, "the policy in question is more likely to be adopted" (p. 511).

McCombs then expanded his study to the international arena, studying the 1996 general election in Pamplona, Spain; the 1994 Taipei mayoral election; and the 1993 Japanese general election. He concluded that the idea of what the media presents to voters as issues holds across cultural differences.

McCombs identified two levels of agenda setting: a level that embodies the original concept that media tells voters what to think about, and a second level that adds the idea that media select attributes to cover to the exclusion of others, creating a way of thinking about what is presented.

From his extensive research, McCombs further refined the roles of agenda setting in terms of how the news media builds consensus. He suggested the

media play four roles in agenda setting and thus must exhibit four traits to build informed communities:

1. The media should be professionally detached, reporting the facts and not determining the pros and cons of issues.
2. One of the functions of news media is to recognize their targeted involvement in putting issues on the agenda.
3. The media are the precursors of issues.
4. The long-term effect of media involvement in issues is the creation of a public agenda.

Criticisms of the agenda-setting focus range from the strength of the media influence to recognition of the effects of interviewing variables on voters' attitudes and behaviors. Everett Rogers and James Dearing identified three distinct agendas: media agendas, public priorities, and policy priorities. They contended that the three agendas interact at various times and to various degrees, rather than assuming that the media agenda is always the dominant factor. Denis McQuail claimed that there is insufficient evidence to show a causal connection between different issue agendas, and that the perspective needs more long-term information on party platforms correlated with long-term public opinion panel data.

Sharon Lowery and Melvin DeFleur developed a list of concerns related to the agenda-setting concept, including the influence of different audience categories, the individual characteristics of voters, the role and influence of interpersonal communication on voters' opinions, differences in the importance of issues, and the effects of political candidate advertising in relation to news coverage.

Perhaps one of the greatest contributions of the agenda-setting hypothesis is the variety of related theories and perspectives it has spawned. The following studies can all trace their theoretical foundations to agenda setting.

Shanton Iyengar and Donald Kinder's 1987 work described media priming as "an extension of agenda setting (that) addresses the impact of news coverage on the weight assigned to specific issues" (McQuail,

2000, p. 456). They concluded, for example, that priming in news portrayals causes politicians to try to associate themselves with the issues they appear strongest on and disassociate or distance themselves from issues on which they appear weaker to create congruence with the perspectives that the media have presented.

Dearing and Rogers combined agenda setting with other media effects, such as bandwagon, spiral of silence, diffusion of news, and media gatekeeping, in an effort to include the social and psychological components of the social science realm.

Framing theory, however, is one of the most visible extensions of agenda-setting theory. Originally proposed by James Tankard, Laura Hendrickson, Jackie Silberman, Kriss Bliss, and Salma Ghanem in 1991, the concept holds that entities can create a media frame to convey a central idea in a chosen context; in other words, they can stage the idea and plan the format in advance. Robert Entman advanced the framing idea to include highlighting certain elements within the frame—in essence, including the most salient ideas to the targeted audience while excluding others.

These adaptations of agenda setting have moved the concept of media influence into the repertoires of other media practitioners, particularly in public relations and advertising, which rely on creating awareness as a condition for motivating behavior.

McCombs is still involved in exploring and refining the future of agenda setting. In a turn-of-the-century review of his work, he outlined two major directions he sees for agenda setting. First, agenda-setting research will continue to move from its journalistic roots to other areas such as public relations and advertising: "Public issues are not the only objects that can be studied from the agenda-setting perspective" (McCombs, 2000, n.p.). Second, agenda-setting research will continue to study the relationships among factors influencing individuals' decisions on how to vote and other issues.

In addition to McCombs's defined directions, a third major direction should be considered: the international study of agenda-setting effects. McCombs's own Spanish election research and other scholars' work in different cultural and political settings

provides yet another vast arena to explore how media and people interact to decide what's important and how to think about it.

AILES, ROGER EUGENE

Roger Eugene Ailes has been referred to by politicians, media personnel, and media critics as the most effective conservative political consultant and media manager of the last 40 years of the 20th century and the early part of the 21st century. His work on behalf of conservative candidates, personalities, and causes has affected the political and media spectrum in the United States through the election of three conservative presidents and the establishment of significant and successful news organizations.

Ailes, a 1962 graduate of Ohio University, began his television career in Cleveland, Ohio, where he was the producer and director of a local talk/variety show called *The Mike Douglas Show*. He became the executive producer for the show and led it to national syndication. The show would eventually win two Emmy awards. According to Linda Lee Kaid, it was in this milieu that Ailes met Richard Nixon, a show

guest, who at the time was out of office. Kaid wrote that Ailes, in a spirited interchange, convinced Nixon that television was more than a gimmick and that Nixon would need to develop a television persona if the former vice president were to return to prominence in American politics. When Nixon gained the Republican nomination for president, Ailes was appointed the executive producer of television for the successful campaign.

Following the success of the Nixon campaign, Ailes formed his own political consulting firm, Ailes Communication, Inc., in 1969. For the next 23 years, Ailes successfully consulted with a large stable of local, state, and congressional candidates as well as a number of successful business and media corporations. Ailes returned to presidential politics in 1984, when he was asked to coach President Ronald Reagan in his second debate with Democratic candidate Walter Mondale. Reagan's performance in the first debate was considered by many to be lackluster. In the second debate, Reagan was able to use humor to successfully upstage his rival in the eyes of political critics and the American voters. The performance put the Reagan campaign back on track toward a landslide victory in November.

Ailes was again active in the 1988 campaign, mentoring George W. Bush. Bush had trailed early in the campaign but finished strongly with effective attacks on Democratic candidate Michael Dukakis. Ailes did not consult for Bush's losing 1992 campaign.

While effectively working in the consulting field, Ailes was also pursuing his interest in television. His abilities were recognized in 1977 with an Emmy nomination for his production and direction of *Feiini: Wizards, Clowns and Honest Liars*. In 1984 he was awarded an Emmy as the executive producer and director of the television special *Television and the Presidency*. In 1988 Ailes wrote, with Jon Krausher, *You Are the Message: Secrets of the Master Communicators*. In that volume he outlined his strategies for successfully dealing with the public media. Following his 1992 announcement that he would no longer be active as a political consultant, Ailes returned to television.

Named as president of CNBC in 1993, Ailes built the NBC cable network into a successful news organization. He is credited with increasing the ratings by 50 percent and tripling the network's income. While in this position, he developed a new all-talk network for NBC, called America's Talking. The network debuted in 1994.

In 1996, Ailes was named chair and chief executive officer of FOX News and the FOX News Channel, and he is credited with building the network into a serious competitor with the established networks ABC, CBS, and NBC. Ailes was able to convince a number of reporters, commentators, and talk show hosts with conservative viewpoints to join the organization. The network also was able to post substantial ratings against their more established competitors. Several media critics and politicians have condemned the network for its conservative perspective. However, Ailes and his allies argue that the network is an effective counterbalance to the generally accepted liberal perspective of other television networks and print news media.

Ailes is not a legendary public relations practitioner in the strictest sense, but he is typical of the sort of political strategist who sets the tone and style for winning campaigns. He knows how to read voters' preferences and cast candidates in a light that is most favorable.

ALUMNI RELATIONS

Alumni are graduates of or former students who did not graduate from a school, college, or university. Alumni relations, a function of public relations, centers around relationships—not only forming them, but nurturing and maintaining them throughout their duration. Most institutions have an entire department devoted to alumni relations, and many

of the large institutions have separate organizations that exist to support alumni activities.

Using the proper terminology when addressing or referring to alumni is critical, especially for the public relations practitioner who is employed by an alumni organization or an educational institution. An alumna is a woman graduate or former student of a school, college, or university. The plural form of *alumna*, used to refer to more than one woman graduate or former student, is *alumnae*. The singular form of *alumni* is *alumnus*. When referring to a male graduate or former student, use *alumnus* as the singular form and *alumni* for the plural.

According to the *American Heritage Book of English Usage*, coeducational institutions usually use *alumni* to refer to graduates of both sexes.

The word *alum* refers either to one of two colorless crystalline aluminum-containing compounds or a colorless aluminum salt used to purify water. Therefore, this word should not be used when referring to graduates or former students of a school, college, or university.

Although students who attend or graduate from a school, college, or university are automatically considered alumni of that particular institution, they most likely will be asked to pay dues to join an alumni organization or association (not paying dues does not mean that a person cannot claim alumni status of a particular institution). This is where the role of public relations becomes essential. Alumni organizations exist to help sustain a particular institution. Here the notion of “giving back” to an institution comes into play, and the role of the public relations practitioner is to identify those alumni who are willing and able to give (not just financially) and facilitate the ways in which alumni are recognized for their efforts.

Often, alumni organizations or associations offer various levels of membership, with increasing increments of membership dues. Many associations offer a “life” membership, often at a high dues level, to those alumni who are financially able and willing to support the organization at a higher level. Memberships at all levels are an important aspect of alumni relations, especially the acknowledgment of all donors, whether they can give \$10 or \$1,000.

Upon joining an alumni organization or association, alumni undoubtedly expect to receive benefits as dues-paying members. Benefits such as continued use of the university's library services or free parking in student lots should appeal to local alumni. When the objective is to appeal to nonlocal alumni, benefits will mean less; but if they support the university, they should join regardless of whether they intend to continue to use the university as a resource.

Public relations practitioners who work in the area of alumni relations are faced with the critical task of directing, implementing, and evaluating all communications with alumni. Equally challenging is the fact that alumni tend to be scattered across the globe, and communications cannot be limited to local alumni. Keeping track of alumni who graduated more than 30 or 40 years ago is not easy, and part of the responsibility falls to the alumna or alumnus to provide the alumni organization with updated personal contact information. If alumni organizations offer services and benefits that appeal to alumni, then those alumni should *want* to keep their information current so that they may be contacted about upcoming events, such as reunions and homecomings, and stay current on news about their former institutions.

Another way to keep alumni connected who do not live close to the university area is to form constituent groups of alumni who are based in other regions of the country or world, such as the Southeast or Southwest. This enables alumni who live near one another to meet and hold events and still feel connected to the university and other alumni.

Research is essential to learn what alumni want and how to effectively maintain relationships with them. Making assumptions is risky. Surveys are important and simple ways for alumni organizations and universities to gain an understanding of how their alumni view their respective institutions and how willing they are to support them, whether financially, as volunteers, as mentors to current students, or most important, as spokespersons. Their experiences and the way they were treated bear heavily on their decision to stay connected and

also determine how and if they will support the university financially.

Constant and continuing communications with alumni are perhaps most important to maintaining healthy relationships, and it is the role of the public relations practitioner to guide the organization in these communications. Alumni magazines published quarterly or alumni newsletters published monthly are essential to maintaining contact. Offering a section within these communications pieces for class updates and personal information encourages alumni to keep in touch with their former classmates. In the world of electronic communications, alumni Web sites provide easy ways for alumni to register and keep their contact information current, as well as allowing them to connect to their former institution on a daily basis. The job of the alumni organization is to build the bridge to make this possible. Capturing multiple e-mail addresses for alumni may prove to be more effective than trying to capture physical mailing addresses, especially in view of possible complications such as job uncertainty and relocation.

Alumni recognition plays a huge part in maintaining healthy alumni relationships. Recognizing alumni achievements and support, and not only those of alumni in high positions, goes a long way in showing that the organization cares and takes a vested interest in each individual who represents it and the institution he or she attended.

Most universities maintain a list of "famous alumni" to display the prestige of the university, as well as of the alumni organization. This is to be expected, as all universities and schools encourage their students to continue on and make their mark in the world. From a public relations standpoint, recognition of alumni at all levels will serve the organization well.

ANNUAL COMMUNITY REPORTS

Increasingly, the relationship between a manufacturing facility and its community is scrutinized, challenged, validated, measured, and ultimately redefined as the public's expectations of the performance of industrial neighbors evolve. One indication of a socially responsible facility is the extent to which it engages in dialogue with the community, typically using a combination of face-to-face, printed, and electronic communication tools. One of these tools, a community annual report, can be particularly effective when it addresses local issues and concerns, and is produced as one component of an overall communications strategy.

Community annual reports have been around for decades in one form or another, and the good ones—those that have credibility with their target audiences—go well beyond being public relations vehicles for the publishing facilities. A public that has grown comparatively more astute and less accepting over time now requires, and in some cases demands, the good, bad, and ugly of facility operations that affect their quality of life. And depending on the historical operations of a facility—including its ability to quickly communicate in response to incidents that directly impact neighbors, such as noise, odor, lights, and possibly emergencies—even a comprehensive *annual* report may not be sufficient. Recurring or significant problems that disrupt quiet residential life are clear justifications for more frequent communications.

The starting point for a community annual report is understanding what constitutes community relations and social performance; who are the key, relevant stakeholders; and what constitutes meaningful dialogue with the community. Only then can a baseline be established and a go-forward strategy implemented that are critical to measuring the ongoing effectiveness of a community annual report.

Community relations is the active management of the relationship between a facility and the local community interests around it. Community relations may mean no more than “getting to know your neighbors,” talking with them and inviting them to visit. It might involve good site management—ensuring

that neighbors are satisfied that when issues occur their concerns are handled promptly and professionally. Two valuable benefits of good community relations are goodwill and trust, which are almost always achieved through sincere effort, action, and alliance with community residents. Not to be overlooked are the employees, including retirees, who can be among the best community ambassadors.

Social performance includes all the ways a facility's activities affect society. At a local level it includes employment, contracting, operations, community involvement, security, social investments, and health, safety, and environmental issues. It also reflects the local priorities and issues of significance as identified through stakeholder engagement. Nationally it might include the impact on U.S. economic and social development; globally it may include the impact and contribution of the company's products and activities.

A *stakeholder* is anyone who has an interest in or can influence a business or facility. Stakeholder cooperation or involvement is needed for the facility to obtain and maintain its “license to operate.” Stakeholders may be shareholders, employees, customers, suppliers, contractors, families of workers, business partners, people whose livelihoods are dependent on the facility, and people who live and work near the facility—the community—which includes local media, elected officials, activists, civic leaders, schools, and residential and industrial neighbors. It is this community stakeholder group, along with employees and retirees, who are the primary audience for a community annual report. These people are at the front line of a facility's efforts to develop and sustain community goodwill and trust, also known as reputation management. In good times, this bank of reputation receives deposits through good operational performance and relationship building; on the other hand, reputation hits or withdrawals occur when facility performance negatively affects the community, such as during an accident that requires public action or, at the very least, when operations are more noticeable than usual to nearby residents. Slow response to and public perception of indifference to a problem

caused by a facility, particularly through inadequate communication, also can drain the reputation account.

Dialogue with the community means engaging stakeholders and listening to what they tell facility representatives. Good dialogue sets the stage for a community annual report and other communication tools. Done well, it provides for mutual understanding and respect, clear and open lines of communication, opportunities to identify common ground, and other benefits. One limitation to dialogue is the inability to reach everyone who feels he or she has an interest in facility operations. Some people or communities farther away from the facility, or special communities of interest within the facility's operational area, may feel excluded. A community annual report mailed to homes and businesses by zip code is a way of reaching stakeholders beyond traditional community boundaries.

Fit-for-purpose best describes the approach for determining the content and appearance of a community annual report. In some cases a letter from the facility manager to the community outlining business and operational performance may be adequate. At the opposite and more expensive end of the spectrum, an elaborate full-color brochure with graphs, photos, and text covering such issues as health, safety, environmental impacts, taxes, economic and other issues of local significance, employee volunteerism, and philanthropic endeavors—emphasizing with examples the facility's commitment to be a good neighbor—may be the way to go. Again, producing an effective and well-received annual report can be leveraged by up-front analyses of community relations, social performance, stakeholder identification, and dialogue as they pertain to the facility-community relationship. A disconnect occurs when the facility's communication messages do not meet the community's expectations, are regarded as insincere or self-serving, or simply are written at a level that is inappropriate for the readers (the communication relies on corporate/industry jargon and acronyms, misses the mark on topics addressed, etc.).

As its name implies, a community annual report is a communication tool that is produced and distributed yearly. However, given today's available

technology and the information-dependent public, interim reports may be appropriate for the full annual report stakeholder distribution list or subsets of that list. These can take the form of printed pieces, e-mails alone or with links to a Web site, open meetings with the community, one-on-one with influential stakeholders, and other methods. Consideration must be given to the relationship between the facility and the community—"hot" issues that need attention—logistics, demographics, staff required to do the work, costs, and other factors. Also, recognition must be given to the possible barriers of each interim approach; for example, everyone on the stakeholder list may not have an e-mail address. Whether it be a stand-alone annual report or a more comprehensive approach with several elements, it is better to start slow and build momentum than to launch an aggressive communications program and curtail it later due to resource limitations.

Finally, the value of a community annual report is enhanced when readers have an opportunity to provide feedback on the content, style, and frequency of the publication. A postage-paid tear-out postcard is an easy way for readers to rate the effectiveness of the community annual report. Keep it simple, with boxes to check and a space for general comments and suggestions. Formal readership surveys also can be productive, as can focus groups and informal sensing of stakeholders. Options for feedback include printed (mailed or faxed), electronic (e-mail or responses to a Web site), and in-person (individual or group settings) formats.

Community annual reports can be an effective way to stimulate meaningful dialogue between a facility and its community. Basic or slick in format, mailed to homes or distributed electronically, if the result is open communication about issues and concerns of mutual interest, and used in conjunction with other regular communications that incorporate the principles of stakeholder engagement and dialogue, a community annual report is a worthwhile outreach tool.

—David B. McKinney

ANNUAL FINANCIAL REPORT

There is probably no investor communications tool discussed and “cussed” more in corporate American boardrooms today than the annual report. Beyond the document’s historical baggage, evoking many to describe it as the “Rodney Dangerfield” of financial publications, today’s intense disclosure environment—due in large part to the Sarbanes-Oxley Act—has prompted a whole new role for the annual report.

But first things first. What is the annual report, and why are 12,000-plus U.S. public companies spending literally billions of dollars each year to produce such a document?

Simply stated, and as defined by the New York Stock Exchange, the annual report is the formal financial statement issued yearly by a publicly owned corporation. The report shows assets, liabilities, revenues, expenses, and earnings. The report also shows the company’s financial condition at the close of the business year and other basic information of interest to shareholders.

Although there is no prescribed format for the annual report, most companies organize their report in four main sections: the president’s letter to the shareholders, the “pretty pictures” section or operations review, the management discussion and analysis, and the really boring but most important stuff—the financials and footnotes. In his *Investor Relations: The Professional’s Guide to Financial Marketing and Communications*, author William F. Mahoney likened the annual report to a multicourse gourmet dinner.

If the shareholders’ letter is the main course, the financial statements/footnotes are the *piece de resistance*. The operations review makes up the side dishes. The management discussion and analysis is the special salad. Not to be overlooked . . . are the corporate profile (the appetizer), financial highlights (the soup), and investor information (the sorbet or fine assortment of fruits and cheeses, as you wish). (1991, p. 286)

Although the genesis of the corporate annual report can be traced as far back as oral presentations made at annual meetings of medieval craft guilds,

its modern form emerged from the Securities and Exchange Act of 1934, which required all publicly traded companies to provide yearly financial reports to investors. But there has never been a legal requirement for annual reports to become the show-place publications many are today. This landmark legislation specified only that publicly held companies make full financial disclosure of details relevant to the current and future value of the company to shareholders on a yearly basis. It did not say that companies could turn their annual report process into a beauty contest, spending billions yearly on lavish graphics while being less than candid about their financial doings.

Somehow, over the decades, Congress’s seemingly clear and reasonable expectation has been lost on corporate America. Whereas the remainder of the 1930s and the 1940s brought cautious, colorless reporting, the 1950s marked the Renaissance, when “make it pretty” became the standard in annual report design. The 1960s produced annual report Impressionism. “Use color,” one designer would say. “Just a little dab will do it.” The annuals of the 1960s brought drama and zest in design, but they were blatantly shy of what the SEC Act mandated: facts, figures, and analysis.

The 1970s and 1980s—the age of seriousness—saw financial market turmoil and a corresponding impact on annual reports, forcing companies to become more cautious and thrifty in their spending. The 1990s and opening years of the new decade may well become known as the new age of corporate governance and transparency, as corporate America was brought to its knees by an unprecedented flurry of accounting and reporting scandals.

Except for the 2000 passage of the Regulation Full Disclosure (Reg. FD), which restricted selective disclosure of material information to analysts and investors prior to its availability to the general public, Congress and the SEC basically had stood aside as corporations maintained their free-spirit form of financial disclosure. For its part, the annual report continued as a showy marketing tool rather than a serious investor information document.

Then, in October 2001, the world learned that a high-flying energy trading company, Enron, was under SEC investigation for its accounting practices. Within weeks the company collapsed, costing shareholders and employees billions of dollars, and taking with it the long-esteemed accounting firm Arthur Andersen. Over the next several months, accounting scandals swept across corporate America, destroying several major Wall Street favorites.

Multiple issues were blamed: aggressive accounting practices to meet quarterly earnings “consensus” forecasts, conflicts of interest between research and investment banking, weakness in board oversight, a compensation system ill designed to align management’s interest with that of shareholders, and conflict of interest between auditing and consulting in major accounting firms.

Enron’s collapse, exacerbated by the other scandals, triggered the most extensive wave of congressional legislation and SEC regulations dealing with disclosure seen on Wall Street in 60 years. Heading the list was the 2002 Sarbanes-Oxley Act, which, in its simplest definition, required public companies to validate the accuracy and integrity of their financial management. Moreover, the SEC began pumping out 18 rule proposals beginning in 2001 designed to help restore investor confidence. Although some see Sarbanes-Oxley and the other rules as just more compliance burdens, many see them as opportunities to make real improvements in governance and transparency.

Enter the annual report. With mandates for improved information and new financial reporting standards, the annual report certainly takes on new importance as a financial communications conduit between public companies and their myriad financial audiences. Despite its maligned past, the annual report remains probably the most important financial information tool in a company’s communications arsenal. Two major studies conducted nearly a decade apart seem to support the annual report’s continuing importance. In 1994 this writer surveyed several hundred institutional investment security analysts and found that the corporate annual report, more than any other major communication tool, was indeed meeting their financial information

requirements. In August 2003, Rebecca Aguilar published similar findings of institutional analyst support for the informational value of the annual report in her master’s research thesis for the University of Houston School of Communication.

Accordingly, the challenge now for annual report producers is not in providing more information—that’s easy. The real challenge is to produce an annual report that doesn’t bury information in page upon page of complex legalese, financial voodoo, and corporate jargon. Moreover, the challenge is to provide information in a way that all investors and potential investors—not just financial professionals—can understand. That’s *real* disclosure and transparency.

And although the following three communication dicta have been around as long as dirt, they still serve as guidelines to helping meet the transparency challenge.

- Use plain English. Direct, easy-to-understand, short sentences remain the foundation of clear communication.
- Keep it simple. The KISS rule lets investors know where to look for important information, and then helps them understand it.
- Tell it like it is. Be honest, open, and candid. Evasive reporting will get you nothing but trouble, and probably worse.

Is all this necessary? The answer is clearly yes for companies who want to pull away from the pack with meaningful disclosure and transparency.

—H. R. Hutchins

ANNUAL HEALTH, SAFETY, AND ENVIRONMENT (HSE) REPORTS

Environmental and community activists raise doubts about companies' willingness and ability to reduce their impact on citizens' health and safety as well as environmental quality. In response, concerned companies set goals and improve their environmental performance. A second response is to communicate their corrective actions and the results of those actions to the communities where they operate.

Health, Safety, and Environment reports typically are issued annually and tell of the progress being made to change processes and procedures/practices to reduce the company's potential impact on people's health and safety as well as to protect the environment. These reports are often abbreviated HSE or SHE, to highlight their content but shorten their names. Health details relate to changes that might include discontinuing the use or emission of products associated with long-term consequences for people's health. Exposure to some chemicals in sufficient quantity, for instance, might cause respiratory problems or increase the incidence of cancer among community residents. Safety issues relate to sudden occurrences that might harm or kill area residents, such as explosions. Environmental impact statements might include reductions in emissions that change the color of the sky or produce unpleasant odors.

Industries such as refining, chemical manufacturing, and electrical generation have used trade associations to get members to set and achieve higher standards of HSE performance. They conduct, commission, and respond to research in an effort to understand the technical aspects of each issue. They want to know what chemicals are harmful and under which circumstances. They share best practices that can improve the performance and therefore enhance the image of the industry.

Some of these reports feature specific measures being taken by individual companies. They might, for instance, tell of increased maintenance routines or manufacturing procedures that have been undertaken to achieve positive HSE results. They may

report the installation of new equipment or processes to enhance performance.

A typical aspect of these reports is to state the mission and vision that guide a company's strategic business planning. In recent years, under pressures from peers, government, and activists, companies have also begun to state their mission, goals, and objectives relevant to HSE performance. For instance, they might report that specific processes are being implemented over a five-year period to reduce the discharge of harmful chemicals into water in the community. Each year they might then indicate how the changes are progressing and how discharges are being reduced to acceptable levels. In some cases, a company will publicly commit to reduce emissions beyond the levels specified in permits issued by regulatory agencies, or voluntarily relinquish the "grandfather" status of particular process units that, due to their age, are exempt from current emission standards.

Some HSE reports are highly technical and specifically tied to best business practices. Others tend to feature image more than substance. They might indicate that a company is committed to a clean, safe, and healthy environment. They even include pretty pictures of birds, sunsets, and equipment. But those reports might not indicate in a fully technical and operational way what constructive changes are being implemented. Early in the modern era of increased openness by industry, graphs illustrating downward trends of emissions were common, because they demonstrated progress over time. Companies were able to take credit for reducing emissions without always focusing on whether the current levels were still too high. As the public grew accustomed to the trend graphs, harder questions were asked, along the lines of "We see you are reducing emissions of certain chemicals; what we want to know is if the level today poses any health risks to us."

The incentive for such reports started in the 1980s when several major operating plant failures alarmed community residents and citizens around the world. The most notorious was the release of MIC by the Union Carbide Plant in Bhopal, India.

Citizens around the world feared for their health and safety if they lived near chemical facilities.

Such concern sparked legislation in the United States called Community Right to Know. People have a right to know what is occurring in their community that could affect their health or safety. Federal legislation and regulation sparked changes in operations, including communication between companies and area residents. One of the tools in this communication was the annual HSE report. For the chemical manufacturing industry, it was one of the recommendations made by the Responsible Care Program initiated through its trade association.

So that local residents could be informed, state and federal regulatory bodies required companies to indicate what amounts of specific chemicals were being released into the atmosphere. The federal Environmental Protection Agency was one of the organizations spearheading this trend. Data collected by operating plant experts are reported to the EPA and to various state agencies.

These are public data. Activist organizations such as Environmental Defense have access to these data. Once they are collected, Environmental Defense reports these data at their Web site. The data are summarized so they can be accessed by zip code. Thus, a concerned citizen could go to this Web site, enter his or her zip code, and obtain the relevant EPA-reported data.

Company versions of HSE reports were typically published documents, either pamphlets or booklets. Many more copies of such documents were printed than needed. One solution has been to include HSE reports at the company Web site. This makes the information available to any concerned citizen who wants to better understand a neighboring company's HSE plan and progress reports.

Data tell only part of the story. HSE reports give companies the opportunity to put those data in perspective and to show how changes are being made to improve the HSE conditions of the community. Under the best of circumstances, such reports become part of the community dialogue and planning process. Citizen input is obtained. Concerns are voiced and heard. Organizations use sound science and responsible operating procedures to

make and report changes and improvements. Such efforts become a vital part of these companies' community relations operations. They want to demonstrate their concern for citizens of the communities where they operate. They want to be seen as beneficial rather than harmful neighbors. They work and report to achieve goodwill. Such documents are a means by which companies demonstrate how they operate in the public interest.

ANTECEDENTS OF MODERN PUBLIC RELATIONS

Conventional wisdom marks the beginning of public relations as we know it today as occurring during the 19th century, in the United States. A confluence of growing mass media outlets, a desire to reach mass markets, and a need to create public policy support for large industrial complexes fostered the practice and motivated the pioneers of the field to refine and shape the practice to the conditions of their time. Promotional giants such as P. T. Barnum used the profession as a honed art. Industries such as railroads and electric utilities used the profession to gain acceptance for uniform operations.

Important to note, however, is the fact that although the growth of media outlets offered new challenges and opportunities during the 19th century, many of the functions of the practice were well established by this time. Pioneers of the practice working in the 19th century built on a foundation that arguably reaches back to the dawn of civilizations that are hundreds and even thousand of years old. These origins are traceable by noting how staged events, including all sorts of pageantry, for instance, are virtually timeless. Such events, which include pseudo events staged purely for publicity and promotion purposes, are age-old tactics used to attract attention and make statements about the sponsors. For centuries, leaders of government, religion, and commerce have worked to inspire awe, mystery, and obedience.

Mercantile activities have required persons who can promote products, services, and business opportunities. Explorers opened trade routes and created treaty relationships to spark commerce. Shipping fleets, trade expeditions, and commercial relationships offer anthropologists insights into the forces that shaped cultures.

Governments of many types and in all regions of the globe were crafted by strong central leaders who used communication to manage their reputations, to coordinate ruling structures, and to command the loyalty of the governed. Changes in government have often been associated with traditional public relations strategies, functions, and tactics. Scholars have identified antecedents of public relations with the communication efforts to foster the War of Independence, by which some of the colonies in the new America broke away from England.

Public relations is associated with all aspects of cultural growth and change. Political campaigns are the playground of public relations. European monarchies have used pageantry, diplomacy, warfare, executions, and managed marriages to create and change governments. Colleges and universities, in places as recent as colonial America and as old as the centers of education of Alexandria and Athens, used public communication to focus attention on their educational accomplishments. The creation and propagation of new faiths also provided antecedents. Churches, perhaps most notably the Catholic Church, have used techniques to attract and keep converts loyal to the faith.

The historical antecedents of public relations, therefore, are often entangled with communication activities typically associated with what is called propaganda. Even well into the early decades of the 20th century, practitioners thought they were engaged in the practice of propaganda. Once that term became associated with manipulation, lying, and deceit, senior practitioners such as Edward Bernays and John W. Hill worked to divorce themselves and their practice from that aspect of public communication.

Out of this plethora of activities arose what we today call public relations. A brief discussion of

some of these antecedents illustrates how the practice developed long before the 19th century.

A search for the antecedents of public relations might focus on tools, tactics, strategies, functions, and outcomes that characterize the profession today. Tools and tactics include rallies, events, newsworthy stories, editorials, buildings, logos, and treatises. Strategies are timeless: inform, persuade, identify, collaborate, compete, compromise, and negotiate. The functions provide some of the strongest evidence: government relations, marketing communication, publicity, promotion, investor relations, employee relations, and student relations. Outcomes seem timeless: motivate people to buy, believe, fear, follow, live in religious faith, and support. These lists are more suggestive than definitive. The following discussion indicates various examples suggested by these lists.

The range of historical antecedents is more limited if we think only of public relations as organizations' response to and utilization of mass media. If we think of public relations more as a rhetorical process of image, reputation, control, command, marketing, and organizational—even empire—positioning, then it is likely to closely parallel the evolution of fledgling, formal, and ordered societies.

The history of public relations can then be traced to ancient empires such as Persia, Egypt, India, and China. The roots of public relations stretch back 4,000 years. They include the creation of the buildings, statues, idols, and governmental communication systems of highly sophisticated ancient societies. The ceremonial burial of leaders, even as deities, is part of the history of public relations. Throughout ancient societies, statues and other carved figures were widely used to capture the personas and personalities of government and religious leaders. Coins often carried some logo or the visage of some leader as a way of uniting that person or image with the national identity of a people.

Researchers seeking to identify the antecedents of public relations are prone to focus on instances of governments asserting power, church communication, mystery, and symbolism. One of the universal needs of people in power or those who seek power is to keep in touch with the opinions of stakeholding

publics. A key realization of the powerful is that they rule and control only by knowing and molding or conforming with the opinions of key publics. Thus, for centuries those in power or seeking power have commissioned individuals to “conduct research” into the minds, wills, and motives of targeted publics. Some of this research was conducted by using espionage and even torture.

Antecedents include church communication, used by religious leaders of all kinds to disseminate the doctrine, foster loyalty to the faith, and establish the symbols of the church as a vital part of people’s lives. The antecedents of public relations include all of those sources of power. Power is displayed not only to intimidate but also to foster a sense of loyalty, submission, allegiance, and identification. It would be incorrect to suggest that the power of emperors, kings, sultans, pharaohs, and other magnates was always unwelcome and that allegiance was not warranted. Societies often emerged as people collectively created agriculture, science, and art. Strong central governments were a source of collective power needed to advance scholarship, technology, and commerce. Some researchers will see this as part of the public relations of religion and government.

Antecedents of public relations can include the creation and manipulation of mystery, by secular and religious leaders. In particular, religious figures have maintained control and faith by demonstrating their understanding and perhaps even control of the mysteries of life. Uncertainty is uncomfortable.

In addition to religious identification, antecedents include efforts to foster national identity. Flags, armadas, great walls, giant pyramids, and other symbolic displays are vital components of national pride and allegiance. Counselors of various kinds, in the style of senior public relations practitioners, offered advice and inspired efforts to demonstrate the power and success of governmental leaders. One widely examined antecedent is the public display of opposition and appeals for regime change. Another is the display of leadership. This application of public relations runs through many of the antecedents noted.

Although lost in time or unknown because of the limitations of travel, many roots of public relations

were well established by Persian kings as well as the kings and emperors of China, Japan, and Korea. Refined pageantry, sponsorship of invention, poetry, agriculture, and scholarship, as well as military display were the public relations stock and trade of these civilizations. Magnificent structures, mystery, and physical distance separated the rulers from the people. What was known and believed often resulted from proclamations and statements circulated to the people through the contemporary version of public relations practice. These might include the commissioning of poems, sagas, and songs. Proclamations of antiquity find modern parallels in statements by corporate spokespersons and presidential press secretaries.

Once Philip II of Macedonia had subdued the regions of the Hellenic peninsula, he commissioned the creation of gold and ivory statues of himself to adorn the temples. He taught his son, Alexander the Great, similar techniques of power display. In one way or another, living beings were proclaimed or suggested to be closely connected with deities. Hannibal’s army, like the armies of the Roman Empire, moved with great pageantry. They often proclaimed themselves religious or secular deities and used cruel methods to enforce their power. Symbols of power and spiritual connection were carefully honed tools that are antecedents to modern corporate and nonprofit logos.

Displays of power are a vital part of human history. Leaders by all titles have recognized the importance of developing and disseminating the symbols of power. Such symbols have at least two purposes: to foster identification and loyalty among the faithful and to promote fear and intimidation in the enemies of the governing regime. Colors are an important part of this display of power. Generations of battle garb featuring England’s red and gold with the sign of the lion were pitted against the blue and fleur-de-lis of France. The return of victorious monarchs was carefully staged to foster identification and intimation through the display of power. Burials, without parallel in Egypt and China, constituted great events used to empower parts of the public and deity rulers. The grand cities, including famous libraries such as that at Alexandria, were

designed to celebrate the prominence, power, and judgment of those who worked to keep themselves as rulers.

The Romans were masters of the event. Thousands of people witnessed long victory processions designed to proclaim the might of Rome and its ability to spread law throughout vast regions. Although the Romans did not invent the circus, they mastered it as a technique for demonstrating political and religious views. Great arenas were created that required advanced engineering and theatrical skills. Into these circus arenas entered chariot racers, wild animals, gladiators, and victims of religious oppression. Life and death were spectacles to show how the emperor and the people could make just and final decisions, often merely for amusement but always for ceremony to demonstrate the power of Rome. Not only were such displays intended to create identification by the people with Rome, but they also were intended to show other nations and competitors for political power how decisive and warranted the rulings of the current emperor could be.

Religions traditionally focus attention on key figures. It is common for the personages of the faith to be captured and presented in various forms—statues, sacred artifacts, carvings, and paintings—including Buddhas of various sizes, including giant figures. Paintings and statuary abound displaying the figure and face of Jesus Christ. The cross is a universal symbol, as is the sign of the fish. The Star of David has been a sign of religious affiliation and affection as well as a target of hatred. In 1622, under the leadership of Pope Gregory, the Catholic Church developed the concept of propaganda as it instituted the *Congregatio de Propaganda Fide*—the Congregation for Propagating the Faith. Members of various religious orders have been sent forth to propagate the faith—proselytizing potential converts to promise their adherence and support.

This battle for the faithful was ongoing. In 1351 John Wycliffe called for reform of the Catholic Church, including the publication of the Bible in the vernacular. Control of the Bible was an essential tool to display church power. Until the printing press and moveable print appeared in Western

culture, the production of Bibles through the handwork of monks was a vital means for controlling access to the word of God. Bibles were physically as well as symbolically attached to churches.

Missionary activities are ubiquitous. Colors are often associated with religious leaders, such as the purple and saffron of the Dalai Lama. Religious buildings are part of this display, as is the ritual of religious expression. Pageantry and ritual play prominent roles in expressions of faith and allegiance to a religious creed. Parallels to secular expressions can be made. Such parallels do not intentionally undercut religious adherence, but indicate the close parallels between lay and secular forms and people's need to wrestle with mysteries.

Executions often constituted dramatic events. They attracted crowds, often as means of impressing the public with the laws and power of the state. The Reformation launched by Martin Luther began with the dramatic event of the proclamation of the wrongs of the church. On October 31, 1517, he nailed the 95 theses to the door of the castle church in Wittenberg, Germany. Featured in these claims were denunciations of the role of indulgences in the daily lives of the faithful. Over the next century, many events and actions acknowledged the war among church leaders and the people. This battle included public burnings and other torturous executions of those whose faith put them at odds with the religious and secular leaders popular at the time.

Jousts were favorite pastimes in England, Germany, and France. Although they featured the prowess of individual knights, they were in many ways similar to military maneuvers and grand parades in later times. They provided opportunities for kings and others nobles to display the caliber of fighting equipment, men, and horses that could be brought to bear—sometimes in the pursuit of mercenary work.

The advent of democracy opened the doors to additional antecedents of modern public relations. In many ways, the efforts of Stephen Langton, Archbishop of Canterbury in 1215, are quite modern. He mobilized a disgruntled group of barons who confronted King John with ultimatums that eventually matured into the Magna Carta. Similar

challenges of government are instrumental to English and American history and are widely recognized as precursors to modern political campaigns. Kings sought through intrigue and pageantry to control the people of England, for instance. Their rule was challenged by the church, reformation, national identity, and the spirit of the new world.

The events leading to the American War of Independence offer historians a clear link to the origins of public relations. The effort to create the sentiment for a Declaration of Independence required a sustained campaign. It included the use of all of the forms of mass communication of the time. It introduced images, slogans, and icons. It used cartoons. It created events, such as the Boston Tea Party. It mixed ideology with flaunted displays to challenge the authority of the king. At the same time, the Revolutionaries tried hard to avoid a direct clash with the House of Commons because it wanted to showcase the virtues of popular government. Clear evidence of what would be called propaganda by the turn of the 20th century included the continuing publicity and promotion of the Revolution. Revolutionary leaders sought to create crises that would defame British control. They engaged in issues debates over principles such as local sovereignty and taxation with representation. Colonists used pamphlets, newspaper broad sheets, and clever symbols including burned effigies.

The tools and tactics of the Revolutionaries constitute a list familiar to current practitioners. It included bonfires, fireworks, heroes and heroines, victims to substantiate claims of atrocities, exhibitions, slogans, speeches, and even crude lantern slides. Legends include Yankee Doodle and The Spirit of '76. The symbols of the Liberty Tree and a chopped snake accompanied slogans such as "Don't Tread on Us." Committees were formed to create and disseminate the ideology, post lists of complaints, and organize events. Some patriots were skilled at recruiting rebels in taverns, where ample amounts of spirits hardened the patriotic resolve needed to oppose the British government at the risk of death for being a traitor.

The activism and publicity components of the formation of the new government in the United

States are often included in discussions of the antecedents of public relations. Other aspects of this effort also deserve attention. Perhaps no better example of an issues brief exists than the Declaration of Independence. It was a careful articulation of the complaints justifying resistance to the British government's authority. Particular care was given to placing blame on the king rather than on the House of Commons. Also, as the new government struggled to survive, emissary efforts by Benjamin Franklin constituted early examples of the importance of skillful government relations.

The democratic spirit of popular governance and free election opened the door to myriad political campaign techniques that have long been the stock and trade of political public relations experts. Rumors, lies, and myths provided substance to political campaigns—people born in log cabins, men of the people, and Old Hickory. Songs were crafted to praise one candidate and to defame his opponent.

Among the many antecedents, the origin of the term *public relations* is obscured. Thomas Jefferson, the third president of the United States, as long ago as 1807 combined *public* with *relations* in a statement about the obligation of government to the governed. The more specific coinage combining those terms as a field may have occurred during an address by Dorman Eaton to the Yale graduating class of 1882. Without a doubt, universities were some of the earliest organizations to use public relations. Medieval universities announced lectures and other academic achievements. In the 18th and 19th centuries, intercollegiate athletic competition drew crowds, which resulted in media announcements and student and alumni interest. Formally, and without reservation, the term was specifically and functionally used in the naming of departments and activities by the railroad industry by the end of the 19th century. Now a fledgling profession by name was able to draw on centuries of practice as it refined techniques influenced by emerging and changing communication technologies.

AP STYLE

AP style is a standard of journalism and a public relations writing style and format that is based on rules and guidelines established by the *AP Stylebook*. In June 1953 the Associated Press instituted something that would change the history of writing for journalists, editors, teachers, and students. This innovation was named the *AP Stylebook*, which celebrated its 50th anniversary in June 2003. The 1953 edition consisted of 12,000 terms and 100 pages. It was written as a substitution for the first “16-page AP Style Book and the AP Copy Book, known as the Red Book” (Moynihan, 2003, p. 11). Today, the *AP Stylebook* contains over 400 pages.

Although the 1953 edition was the foundation for future editions, Norm Goldstein, *AP Stylebook* editor for 14 years, stated that the 1977 edition marked the beginning of the newer, more precise versions. The structure was changed and entries were organized in alphabetical order so that users could find what they needed in a timely manner. Louis D. Boccardi, Associated Press president and CEO, stated in an article on AP style that “complication of style rules was accompanied by the accumulation of so much fact and information that the effort resulted in ‘a Stylebook,’ but also a reference work” (DiNicola, 1994, p. 64).

The Associated Press defines the *AP Stylebook* as

the journalist’s “bible,” the style manual that is an essential tool for all writers, editors, students and public relations specialists. It provides guidelines on spelling, capitalization, grammar, punctuation and usage, with special sections on business and sports. Included is a guide on media law, with practical guidelines on libel law, privacy, copyright and access to places of information, and a special section on

Internet and computer terms, a comprehensive effort to unify spelling and usage of computer-related terms, from Web site and e-mail to URLs and “cyber”-prefixes. This segment also offers Internet searching tips and cautions. (Associated Press, September 15, 2003, n.p.)

The Elements of Style by William Strunk, Jr., and E.B. White is also an important book that writers use when dealing with style and word usage. This book, popularly called the “little” book, educates writers on how to use words in the proper manner, how to form meaningful paragraphs, and how to use expressions correctly. It also consists of a section that reminds writers of dos and don’ts in writing. For example, it explains the importance of rewriting and revising. It also encourages writers not to overstate their points and never to make the reader guess what you are stating. This is accomplished by clarifying what is meant in a simple, comprehensive way.

Many journalism teachers consider the *AP Stylebook* the most important tool for assisting students in their classes. It educates students on how to use certain writing techniques in different situations. For example, when using numbers, a student is taught to always spell out numbers one through nine and to use numerals for numbers 10 and above, with some exceptions, such as ages and percentages. If a student cites an address in a story, he or she must also use figures for the address number to represent the location.

The stylebook also assists students with punctuation, spelling, government matters, state abbreviations, explanations about how court cases are written, and other points. Teachers have found that certain entries within the stylebook, such as “political correctness,” can be used as learning tools. These issues open the door to dialogue and student participation about current events. Although the *AP Stylebook* does not explicitly state guidelines for inclusion of entries, it makes an effort to take into account changes in language and social norms. Public relations professionals find the stylebook very important in assisting them in their writing, since their work is routinely disseminated to journalists.

Due to the rise in Internet usage, a stylebook subscription can now be purchased online. “Editors at AP, as well as faculty at journalism schools and editors at newspapers around the world, make suggestions on style changes as they arise” (Moynihan, 2003, p. 11).

The AP Stylebook is often used as a guide for proper word usage, punctuation and spelling for news releases, news stories, annual reports, brochures, media kits, radio and television news broadcasts and all other aspects dealing with public relations. Writing for the public relations field is similar to writing for journalism, so the same rules apply. Professionals have found that AP style is just as important in the profession as it is in classroom settings. The tools learned early on are implemented throughout their career.

Whether composing a news release or a 20-second public service announcement, professionals as well as students have learned that writing is the most common form of communication. To communicate effectively, rules and guidelines must be followed. The AP stylebook sets the foundation for this. The lessons learned in the journalists’ “bible” should never be taken for granted. These lessons shape today’s and tomorrow’s journalists, writers, teachers, and public relations professionals.

APOLOGIA THEORY

In today’s increasingly turbulent and mediated environment, companies regularly face criticism for their actions. How they respond to allegations of wrongdoing constitutes the form of communication

generally recognized as corporate apologia. A corporate apologia is a response to accusations of ethical misconduct in which a company has as its primary motive the defense of its reputation and to which it offers discourse in self-defense that denies, explains, or apologizes for its actions. It should be noted that an apologia is not an apology, though it may contain one; rather, it is a justification of its actions that seeks to present a competing interpretation of “the facts” and, in so doing, repair an organization’s damaged reputation. Although the success of apologiae in repairing damaged reputations is arguable, a central benefit appears to be the fact that they provide a conclusion for a negative story, one whose purpose is to disentangle companies from a difficult news cycle.

The ability to navigate apologetic situations successfully is critical, given the high costs of product development and production, the aforementioned turbulent media environment in which news magazines and 24-hour news outlets are incessantly searching for more grist for the media mill, a dynamic and complicated legal environment, and the confessional nature of contemporary culture.

CRISIS SITUATIONS

The study of apologetic communication by and large has focused on understanding the situation that necessitates an apologia as well as explicating the message strategies that constitute this form of address. As to the situation that necessitates an apologia, B. L. Ware and Wil A. Linkugel defined an apologia as a response to “the questioning of a man’s moral nature, motives, or reputation” (1973, p. 274). In dealing with more organizational contexts, H. R. Ryan has expanded the concept to include allegations against not just character but also the policies of individuals and institutions. Given that there exists a “legitimacy gap” between societal expectations for corporate behavior and the reality of how such organizations are seen to act, the situation that necessitates an apologia is better conceptualized as a legitimation crisis where an apologia is needed because organizational actions are seen to have violated commonly held public values,

resulting in public animosity and antipathy toward the company. Such hostility takes the form of social sanctions whereby media, consumers, and key opinion leaders criticize said organizational actions.

APOLOGIA STRATEGIES

As to the substance of a corporate apologia, scholars have spent a great deal of time and effort to articulate the different message strategies used by organizations. One such strategy is to deny—to reject charges by characterizing them as false. Those not in a position to deny that they committed an act often find it useful to deny that they intended to do so, for intent is a key factor in gauging culpability. Concomitantly, bolstering constitutes an indentificational strategy that focuses on the strength and benefits of a past relationship. One way that corporations bolster is to remind constituents of the number of jobs they bring to a community.

Strategies of redefinition are a major category with which apologists are able to deal with the public perception of their guilt. Differentiation is one strategy, in which a narrow context is redefined into a broader one. An additional strategy of redefinition is transcendence. Transcendence differs from differentiation in that the redefinition is to a broader, more abstract context and often involves a religious dimension. Other strategies of redefinition include provocation, where an organization claims that it simply reacted to the hostilities of another; the use of defeasibility, where corporate officers claim that forces beyond their control were at work; and the good-intentions strategy, where a company claims it had good intentions in creating a specific policy that only recently has faced criticism. Finally, in minimization, an organization seeks to lessen its responsibility by claiming that the problem is actually small or insignificant.

Another strategy of redefinition includes the concept of dissociation. In using dissociation, organizations seek to deal with the problem of their guilt by claiming that criticisms are but an “appearance” and do not accurately reflect the “true facts” of the case. This dissociation often takes one of three forms. First, when the facts that precipitate an allegation

of wrongdoing are in doubt, many apologists will employ an opinion-knowledge dissociation. In such an instance, an apologist will claim that the media organizations that have leveled the charges are trafficking in the realm of opinion and do not have all the facts. A frequent corollary to this approach is to level a counterattack against the accuser. A second dissociational strategy used by apologists is a scapegoating strategy in which the apologist uses an individual-group dissociation. As a rule, organizations and corporations go through great effort and great expense to craft carefully constructed images; yet when wrongdoing occurs, such companies are quick to bifurcate such images by separating the individuals from the group and locating guilt in those individuals. Such a move, then, moves the guilt from the company as a whole to said individuals, who may then be disciplined or fired. A final form of dissociational strategy is accident-essence dissociation; here organizations find it rhetorically useful to claim that a criticized act was an “accident” and that, as such, it does not represent the essence of the organization, which is made up of dedicated employees who should not be judged on the basis of one aberrant act.

Conciliation strategies represent another major defense used by apologists. They are chosen by apologists who decide it is in their best interests to utilize a strategy of mortification in which guilt is accepted and forgiveness is sought—typically in the form of an apology. Bradford and Garrett (1995) found that a concession strategy is more rhetorically resonant with audiences than any other approach. Conciliation attempts often are coupled with two additional strategies. The first, corrective action, occurs when an organization announces steps it is implementing to fix a problem and ensure that it does not happen again; and the second, compensation, occurs when an organization reimburses victims in the form of monetary reparations.

COMPETING TENSIONS

Corporations caught in wrongdoing face two competing tensions as revealed by research into apologetic communication. On one side is the fact that an

organization has committed a wrong, and it is the impulse of organizational officials to want to “do the right thing” and own up to their misconduct. Moreover, media and consumers clamor for an apology, the absence of which causes ongoing damage to a corporation’s reputation. Finally, drawing from any number of ethical standards, it is easy to deduce that an accommodative message strategy is the preferred ethical response to the crisis situation.

Yet standing in conflict to this so-called public relations response is the argument that corporate officials realize that to apologize and accept responsibility would incur direct costs for the organization in the form of significant liability judgments. Indeed, research suggests that when a company is caught in a crisis, defensive message strategies are responded to favorably by investors and accommodative ones are viewed negatively. Hence, to meet its fiduciary responsibilities to its stockholder interests (its only interest enshrined in law), managers conclude that they *cannot* apologize. Organizations typically respond to such a quandary with equivocal communication—which often includes a statement of regret—a carefully crafted statement in which they acknowledge the tragedy or injury but carefully construct their own account to avoid assuming culpability. Such an approach puts an organization in the position of denying it has done anything wrong while promising never to do it again.

APR

APR (Accredited in Public Relations) is a voluntary professional certification for public relations practitioners designed to identify professionals with demonstrated competency and experience. Practitioners holding the credential may use the letters “APR” after their names.

The credential was created by the Public Relations Society of America (PRSA) in 1964, motivated by a desire to enhance the professional image of the field. It required passing oral and written examinations and a minimum of five years’ public relations experience. Since public relations has no mandatory entry standards such as educational exams or licensing, practitioner accreditation provided a way to distinguish highly competent practitioners from others and offered some form of quality assurance to potential clients and employers. Today, the APR certification is recognized as an important step in the evolution of public relations toward professional status.

The APR program is the largest certification program for public relations practitioners in the United

States and has been most successful in producing accredited members. As of 2003, 21 percent of PRSA's members were accredited. According to PRSA, the average pass rate over the five years between 1998 and 2003 was 62 percent. Other organizations in the United States and abroad offer similar certification programs. Most notable in the United States is the International Association of Business Communicators' Accredited Business Communicator (ABC) designation. Internationally, a number of public relations professional organizations, including those in Australia, South Africa, and Great Britain, offer accreditation programs with criteria similar to those of current U.S. programs.

In the early 1980s, leaders of several public relations organizations in the United States began advocating for "universal accreditation"—the consolidation of accreditation programs that had sprung up among a number of public relations associations. A unified accreditation program would help to standardize professional expectations for public relations practitioners, as well as the consequences for accredited practitioners who violate codes of ethics. Competing interests among professional organizations stymied these efforts for nearly two decades. Eventually, PRSA and eight smaller public relations bodies forged a partnership called the Universal Accreditation Program (UAP).

In 1998, oversight for APR certification was transferred from PRSA to the new consortium. UAP partners include PRSA, the Agricultural Relations Council, the National School Public Relations Association, the Religion Communicators Council, the Society for Healthcare Strategy and Market Development, and several state and regional public relations associations. A governing board composed of representatives from these organizations develops and maintains the accreditation examination and related policies, reviews appeals, and grants the APR accreditation. Day-to-day operations are administered at PRSA headquarters in New York.

Eligibility for accreditation is limited to members of UAP partner organizations who have at least five years of paid, full-time experience in the practice of public relations or in the teaching of public relations courses in an accredited college or university.

Nonmembers who belong to member organizations of the North American Public Relations Council and who meet the same employment requirements as members are also eligible. Candidates must pay a fee of several hundred dollars and complete an application form. They may access a study guide, online self-study course, and instructions for preparing a portfolio from the Universal Accrediting Board.

Since its inception, the APR examination has required demonstrated understanding of the public relations body of knowledge and the ability to apply that knowledge in practice. Until 2003, the accreditation process required a written examination and an oral interview before a panel of accredited peers. In July 2003, after a three-year period of research and testing, the UAP replaced the oral examination with a preliminary "Readiness Review," designed to assess whether candidates are likely to succeed in the written examination. The UAP also revised the written examination to cover 10 specific clusters of knowledge, skills, and abilities.

Once a candidate's eligibility for the exam process has been confirmed, the candidate requests a Readiness Review through a local chapter of PRSA or partner organization. The Readiness Review is a one- to two-hour interview and portfolio presentation before a panel of accredited members. It includes a written submission addressing open-ended questions related to the candidate's position and experiences, submitted to the panel in advance; a portfolio review; and an assessment of readiness to take the exam. The review panel uses a point system employing standardized criteria to assess the candidate's responses and supporting materials, and scoring the candidate's knowledge, skills, and abilities in 16 areas, including public speaking, interpersonal skills, writing skills, and management skills. If any weaknesses are identified, the panel will suggest study materials to strengthen those areas. Candidates may not take the written exam until they pass the Readiness Review. Candidates who do not pass the Readiness Review portion of the process may repeat the Readiness Review after a waiting period. Candidates are informed of the panel's decision by the UAP.

The computer-based written examination contains multiple-choice questions related to 10 competency clusters: public relations history and current issues; business literacy; ethics and law; communication theory; the public relations process of researching, planning, implementing, and evaluating campaigns; management skills and issues; crisis communication; use of information technology; media relations; and advanced communication skills such as consensus building, consulting, and negotiating skills. The typical candidate requires two to three hours to complete the written exam.

Practitioners accredited in 1993 or later must document their continuing professional growth every three years in an accreditation maintenance program that requires the accumulation of points in continuing education, professionalism, or service categories. Accredited practitioners must maintain their membership in PRSA or a partner organization in order to continue use of the APR designation.

Although the accreditation of public relations practitioners is widely viewed as a step forward toward professionalism, it alone is unlikely to lead to universal acknowledgment of the value of public relations. However, within the field, increasing recognition of the APR designation is evidenced by public relations job listings that specify “APR preferred” as a candidate qualification. Although little research exists that compares accredited and non-accredited practitioners, evidence does suggest that accredited practitioners are somewhat more likely to embrace professional values than nonaccredited members.

Accreditation remains a favorable alternative to licensing in the eyes of many practitioners, who view licensure as infringing on free speech rights and unnecessary governmental interference. Enforcement of ethical behavior remains a limitation of voluntary accreditation, however. Unlike failure to attain licensure, loss of accreditation does not prevent an individual from practicing public relations.

ASIA, PRACTICE OF PUBLIC RELATIONS IN

Asia is the largest continent both in geographical size and in population. It is arguably the most complex region as well. Particularly in the past decade, Asian countries such as China and India have emerged as large and significant markets for multinational corporations. This process of cross-national trade in Asia continues to expand as evident during the ninth ASEAN summit that concluded in Bali, Indonesia, on October 8, 2003. At this summit, the 10-nation ASEAN (Association of South-East Asian Nations) signed mutual trade and security agreements with China, Japan, South Korea, and India. The goal is to create a huge Asian trading zone that will involve more than 60 percent of the world population. The creation of these new markets will continue to demand an increase in the level of public relations activity in the continent. However, despite its rich heritage and vast potential, Asia has largely remained a silent continent as far as public relations pedagogy is concerned. There is little doubt that conducting empirical analyses of the public relations industry in Asia and incorporating these findings into public relations pedagogy are long overdue.

PUBLIC RELATIONS IN ANCIENT ASIA

The existing, relatively small number of publications about public relations in Asia has chronicled

this continent's rich and varied history and the use of public relations since pre-biblical times (see Sriramesh, 2003, for a more elaborate review). For example, there is archeological evidence that India's Emperor Asoka used rock and pillar edicts for such things as communicating the policies of his government to his subjects, persuading them to observe those policies, creating harmony among them, and propagating Buddhism, to which he had converted later in life. In the Arabian peninsula, a circular handwritten on crude paper around 2000 B.C. is known to have advised farmers of Babylonia on ways of increasing their crop yields. Even in recent times, Arab cultures have used fora such as the *Okadh Souk* and *majlis*, where the ruler and the ruled gathered and debated issues using speech and poetry—evidence of symmetrical communication. In addition, there are references to the use of publicity techniques in the Holy Land in biblical times. Unfortunately, the lessons from this rich heritage have not yet been adequately incorporated into the public relations body of knowledge or practice.

Globalization has opened up the economies of a dozen or so Asian countries, resulting in a significant influx of multinational corporations into the region. A concomitant result has been the entry of leading multinational public relations agencies into Asia, resulting in an infusion of Western perspectives of public relations practice. Some observers have rightly commented that this development has led to an increase in the level of professionalism among public relations practitioners in the continent. However, it is also important to recognize that there has been no corresponding flow of information *out of Asia* that could help in the development of effective strategies for conducting public relations globally. It is reasonable to believe that a continent as rich as Asia, with its long heritage, has something useful to offer the public relations industry and pedagogy.

Most of the multinational agencies operating in Asia have limited their operations to about 12 countries primarily based on demand and economy. As other Asian countries develop, there is bound to be significant growth in cross-national public relations activities in those regions as well. Multinational

public relations agencies have typically used three strategies to establish their presence in Asia. Some have opened their own offices in Asian cities often under an executive from the home office while employing host country employees at lower levels. A second strategy has been to establish "exclusive representation" affiliations with well-established domestic agencies of the host country. Finally, these agencies also have bought partial or total equity in successful domestic agencies, while retaining a part of the original name and much of the local staff in recognition that retention of local staff is instrumental to success given the complexity of the Asian environment, which will be discussed presently.

TERMINOLOGY

Although public relations has been practiced since prebiblical times in different regions of Asia, the term *public relations* and the modern version of the profession can be traced to Asia's recent colonial past. The concept of public relations was alien to the Japanese until it was introduced by the Supreme Allied Command in 1945 as part of the democratization of postwar Japan. The U.S. military also introduced public relations to South Korea in 1945 when it established the Office of Civil Information in Seoul. Singapore was introduced to modern public relations by British colonists who "were primarily propagandists seeking to promote the credibility of the British especially after their defeat by the Japanese army in World War II" (Chay-Nemeth, 2003, p. 87). Sam Black noted that it was only in 1981, after Chairman Mao's death, that public relations was introduced to China in the Shenzhen Special Economic Zone "through contacts with foreign joint venture partners" (1992, p. 41). Among others, Hamoud Al-Badr has noted that modern public relations was introduced to Saudi Arabia in the 1930s by the Arabian-American Oil Company (ARAMCO) to reduce the communication problems between its Arab and American employees.

As in many other parts of the world, the terms *public relations* and *PR* carry a pejorative meaning in Asia, often taken to be synonymous with *spin doctoring*. Not surprisingly, the mass media often

portray public relations negatively. For example, the premier newspaper of Singapore reported the launch of the PR Academy set up by the government principally to train government ministers in public communication with the lead “Top former White House spin doctors will be in town next week to share tips on public communications with civil service chiefs and spokesmen” (*Straits Times*, June 21, 2002, n.p.). It is also important to recognize that the modesty prescribed by Asian cultures often makes publicity a shunned, if not alien, concept, although modernization (some would call it Westernization) has been changing some of these values, at least in the urban areas of some Asian countries. Cultural factors, among others, make it imperative that new and culturally sensitive ways of conducting public relations be identified and incorporated into organizational strategies.

CULTURES OF ASIA

The cultures of Asia are steeped in religion, which is not surprising for a continent that is the birthplace of all the major religions of the world, in addition to being home to some of the most ancient civilizations, existing millennia before biblical times. Stark cultural differences are evident even within the political boundaries of the same Asian country. For example, India, seen by the uninitiated outsider as a homogeneous society, is an example of unity in diversity of culture, religion, and language. Countries such as Malaysia, Singapore, and Indonesia have multiethnic societies. To be effective, public relations professionals need to tailor their communication initiatives to these cultural differences.

Geert Hofstede (2001) concluded that most Asian cultures are collectivist in nature. Although this is an accurate framing of a cultural dimension of most countries in Asia, it is important to recognize that collectivism is manifested in different ways in different countries. For example, the Japanese quest for *wa* (harmony with fellow humans) makes them reticent to disagree publicly. C. Carl Pegels wrote, “The quest for *wa* is a national cultural philosophy. . . Attaining *wa* does not allow for individualism—*wa* demands considerable conformity, and the Japanese

are trained to conform from early childhood” (1984, n.p.). This cultural trait has a direct influence on public relations; this is evident in the press clubs of Japan, which ensure that all members of the club receive the same information, negating the possibility of scoops by individual reporters, for example. Press clubs also are indicative of an insular system that is based on personal influence—widely seen in Asia in different manifestations. Further, the concepts of *honne* (private self) and *tataeme* (the public persona and behavior of an individual) play a large role in maintaining harmony in Japanese society. Publicly criticizing an individual is shunned because it leads to a loss of face for the other, thus destroying *wa* (social harmony). For this very reason, the Japanese prefer to build stable personal relationships (typified by the personal influence model) by communicating in informal settings, which are ideal for exchanging *honne*.

The public relations industry in China and Taiwan, as well as other countries that have a significant Chinese population (such as Singapore and Malaysia), is influenced by *Guanxi*. Just as culture is hard to define, the term *Guanxi* defies easy definition because its practice varies from context to context. Andrew Kipnis addressed this issue succinctly:

No unchanging, single form of *guanxi* exists. [There are] urban *guanxi*, rural *guanxi*, business *guanxi*, all-female *guanxi*, owner/tenant *guanxi*, class *guanxi*, marriage *guanxi*, comrade *guanxi*, husband/wife *guanxi*, mother-in-law/daughter-in-law *guanxi*, classmate *guanxi*, and more. Each of these relationships carries its own connotations and its own social/historical specificity. (1997, p. 184)

The caste system in India, even in its modern (post-independence) manifestation, is a mixture of collectivism and personal influence mostly among members of the same class. Singapore’s culture is best described by *kiasuism* (fear of losing) that breeds the conformist outlook of most Singaporeans. David Chan described *kiasuism* as “a herd mentality where everyone goes after the same things and avoids the same things” (1994, p. 71). Many observers have noted that *kiasuism* has fostered a

culture of self-censorship in Singapore, where individuals perceive the *OB (out-of-bounds) markers* and refrain from violating them. Of late, nationalistic and religious sentiments have begun to run high in most Asian countries, which makes it imperative that communicators take extra care to design culturally sensitive messages and communication campaigns.

POLITICAL SYSTEMS IN ASIA

Although many Asian nations call themselves democracies, each country has its own version of democracy. Covert and overt government influence is so pervasive in most Asian nations that the government often becomes the most relevant, if not the sole, *public* for the public relations practitioner. For example, prior to the liberalization and democratization of South Korea (particularly after the 1988 Seoul Olympics), the term *Gong-Bo* (public relations by government) typified the public relations industry in the country. Since 1988, the word *Hong-Bo* (wide dissemination of information) has been used to describe the industry in South Korea. *Hong-Bo* originated from the *Chaebol* (business conglomerates) system that was instituted in South Korea in the early 1960s. An offshoot of the Japanese *Chaibatz* system that ended in Japan after World War II, the *Chaebol* system was set up by the South Korean government to develop a partnership between corporations and the government to promote national development. Although this was a laudable goal in principle, in reality it ensured that only a handful of *Chaebols* dominated the South Korean economy. Particularly after the 1961 revolution led by Park Chung-Hee (whose reign ended in 1979), the *Chaebols* rapidly expanded their outreach with the consent of Park's administration. In this symbiotic arrangement between the government and corporations, the *Chaebols* had near monopolistic control over different sectors of the economy while the economic development they brought helped Park stay in power. The largely unpopular *Chaebols* resorted to using *Hong-Bo* (public relations) to either evade or counter media criticism.

The political system in Singapore also has a great influence on the role of public relations in the society. Observers such as Chung-Kwong Yuen have critiqued the level of pluralism in this economically advanced democratic republic: "Singapore is a place that arouses deeply divided feelings among observers. Economically, it is one of the great success stories of this century, but it is also widely seen as an authoritarian state that limits freedom of speech and political rights" (1999, p. 1). Yuen stated that the version of democracy that former prime minister Lee Kuan Yew has proposed for Singapore and other Asian nations is based on "'Asian' values of studiousness, achievement through hard work, and *deference to authority and group* [italics added]" (p. 1). Yuen noted that Western journalists have consistently focused on "Lee's speeches and the actions of the Singapore government, hoping to detect chinks in their armours, while [members of the government] answer in kind through their various public relations channels" (p. 1).

Ho Khai Leong (2000) highlighted the minimal role that corporations play in public policy making in Singapore, and S.P. Tan observed that whatever influence corporations have on public policies is derived primarily from their use of the *personal influence* model. The impact of culture on the political system in Asia and the different worldviews of what democracy encompasses are evident from Ho's comment that the Asian version of democracy advocates community interests over individual rights and consensus over dissent.

MEDIA CULTURE IN ASIA

The direct influence that the political system has on media culture is evident in an example from Singapore where the acting Minister for Information and the Arts exhorted the media to play their "social role" as partners in nation building despite the "pressures" of globalization: "Our local media have played an important role in building modern Singapore. By communicating the government's message across to the people, it has [*sic*] helped to rally support for policies that have brought us

progress and prosperity” (*Straits Times*, March 8, 2002, n.p.).

The Western democratic notion that the mass media should operate as “watchdogs” of society is seen either minimally or not at all, even among the Asian countries that claim to be democracies. For example, in early March 2002 the World Association of Newspapers and the World Editors Forum, which represents more than 18,000 publications in 100 countries, complained to Thailand’s prime minister, Mr. Thaksin Shinawatra, that his government’s decision to expel two correspondents of the *Far Eastern Economic Review* (*FEER*) was “a breach of the right to freedom of expression.” The *FEER* had incurred the wrath of the Shinawatra government when it reported on the tensions between it and the Thai monarchy. There are numerous cases from an array of Asian democracies where overt and covert pressures are placed on editorial freedom, which force public relations professionals to operate within these constraints.

Far Eastern Economic Review (*FEER*) journalists, British citizen Rodney Tasker (left) and United States citizen Shawn Crispin (right), attend a press conference at the Thai Immigration Bureau in Bangkok on February 27, 2002. Thai Prime Minister Thaksin Shinawatra insisted that Thailand had the sovereign right to expel the two foreign journalists over an article they wrote that touched on the government’s relations with the country’s revered monarchy.

ACTIVISM

Although activism resulted in the freedom from colonial rule for many Asian nations (as in the case of India, for example) and revolutionary social movements helped change political systems (as in the cultural revolution of China), until the mid-1990s activism against corporations had largely been limited to trade union movements. But the influx of multinational corporations has met with increased opposition from nationalistic interests. Not only is activism increasing within countries, but Asian countries themselves are becoming activists when global issues are involved. An example of this was evident in the leadership role that India and China took when the G-21 effectively challenged the industrialized countries at the ministerial meeting in Cancun in September 2003, which led to the collapse of the meeting. Agricultural and environmental activists have increased their activities in recent times, and this will induce organizations to pay greater attention to their role as responsible and communicative corporate citizens in Asia.

THE CHANGING STATUS OF PUBLIC RELATIONS EDUCATION IN ASIA

Finally, it is important to note that one of the primary reasons Asia has not been well represented in the public relations body of knowledge is the relatively small number of graduate public relations programs in Asian universities. This has resulted in an inadequate number of well-trained public relations scholars in Asia. Most of the current public relations scholars have had their graduate education in the United States or Western Europe. The majority of empirical studies on public relations in Asia have been conducted by Asian graduate students predominantly in U.S. universities. These scholars have continued their programs of research and continue to help build the fledgling body of knowledge of public relations in Asia. However, the number of these scholars is currently rather small, and they hail from a small number of Asian countries. There is a dire need to develop a larger and more diverse pool of Asian public relations scholars, and this

calls for a greater number of graduate programs in Asian universities. Even the few public relations graduate courses that currently exist in Asia are predominantly skills oriented and generally lack theoretical and methodological rigor, which inhibits efforts at advancing education and the profession. A more diverse pool of students and educators should help build a robust body of empirical knowledge of public relations in Asia in the near future.

ATTRIBUTION THEORY

Understanding causality and responsibility is at the base of interpreting social behavior, and attribution

theory explains how we assess the causes of behavior, both our own and others'. In sense making, interactants reason "backward" from observed behavior to determine underlying causes, so that they may know how to proceed in specific interactions and predict future behavior.

Although primarily used to examine interpersonal processing, attribution theory has been applied in other contexts. For example, Timothy Coombs revised attribution theory definitions and concepts to apply to organizations and examined perceptions of crises and their impact on reputation. With unexpected events, such as crises, individuals strive to explain causes. If an organization is seen as responsible for an event, its reputation sustains damage. When conditions of stability (i.e., a history of such problems) and control are believed to exist, organizations are likely to be seen as responsible. Thus, attribution theory has promise for organizational and public relations research.

Three assumptions undergird attribution theory: (1) individuals assign causes to behavior they observe, (2) individuals use systematic processes in explaining behavior, and (3) once attributions are made, they influence feelings and subsequent behavior.

There are two types of attributions, internal and external. Internal attributions place the cause for behavior within a person, whereas external attributions assign the cause to some factor outside the person. In other words, internal attributions focus on some aspect of a person, including stable traits or characteristics, such as intelligence or personality; variable behaviors, such as effort; and temporary states, such as mood or exhaustion. Locating the cause outside the person, external attributions place responsibility on some force or agent in the situation or environment. Such agents include rules and restrictions, difficulty of tasks, availability of resources, and chance or luck.

Much research has examined factors affecting the choice between internal and external attributions. For example, Fritz Heider discussed differences in self versus other attributions. Individuals tend to attribute responsibility for their own failures to external causes (e.g., bad luck) and the failures of

others to internal causes (e.g., lack of intelligence), and to attribute responsibility for their own successes to internal qualities (e.g., intelligence) and the successes of others to external factors (e.g., good luck).

Widely regarded as the father of attribution theory, Heider said that like “naïve psychologists,” people work to interpret human behavior—to understand *why* people behave as they do. Because many interpretations of a given behavior are possible, he argued that we start to recognize individual patterns of perception, labeled “perceptual styles.” Heider’s theory is regarded as the first attribution theory, and it has spawned considerable theoretical extension and research.

Most research in attribution theory has revolved around two models, Harold Kelley’s and Bernard Weiner’s. Kelley’s model, or Kelley’s cube, is especially concerned with attributions regarding the behavior of others and has been the “primary paradigm for describing how people use information to make social attributions for the behavior and outcomes of others” (Martinko & Thomson, 1998, p. 271). Weiner’s work, involving the achievement-motivation model, is focused on self-attributions.

Although recognizing self-attribution, Kelley’s work primarily covers attributions made to explain the behavior of others. Two tenets underlie this work. One is the covariation principle, employed with multiple instances of behavior, which asserts that “an effect is attributed to the one of its possible causes with which, over time, it covaries” (Kelley, 1973, p. 108). That is, when an observer has more than one instance of behavior to evaluate, the observer assesses which outcomes covary (i.e., are associated) with particular causes. The other is the discounting effect, used for single instances of observed behavior, which suggests that “the role of a given cause in producing a given effect is discounted if other plausible causes are also present” (Kelley, 1973, p. 113). That is, observers assess possible causes relative to one another. These tenets assume rationality where behavior and varying possibilities are carefully examined.

According to Kelley, three types of information are employed in making judgments: consensus,

consistency, and distinctiveness. Consensus asks, “Do other people exhibit this behavior in this situation?” If so, consensus is high; if not, consensus is low. Consistency asks, “Does this person exhibit this behavior in other situations like this one?” If so, consistency is high; if not, consistency is low. Distinctiveness asks, “How does this person behave in other situations?” If the person behaves differently, distinctiveness is high; if the person behaves similarly, distinctiveness is low.

Evaluations regarding this information lead to conclusions on causes—person, stimulus, or situation. Attributions are likely to pinpoint the person when there is low consensus, high consistency, and low distinctiveness. Attributions are likely to pinpoint the stimulus (or entity, such as an organization) when there is high consensus, high consistency, and high distinctiveness. Attributions are likely to favor the situation (e.g., event) when there is low consensus, low consistency, and high distinctiveness.

Beyond the three general categories (person, stimulus, and situation), Kelley did not address how information is used specifically in refining evaluations. Although attribution to the person is one of Kelley’s categories, his model does not address varying personal attributions. Assigning cause to effort or ability is an attribution to person. However, findings suggest that these attributions lead to different responses.

Weiner’s work in attribution theory has played a major role in explaining motivation for more than three decades. His interest is in individuals’ interpretations of their achievements. The following are key achievement attributions: ability, effort, difficulty of task, and chance. In Weiner and his colleagues’ work, three dimensions of causality are used to predict these attributions. The first is control locus (i.e., internal vs. external). The second is stability, the degree to which change occurs across time (i.e., stable vs. unstable). For example, ability is seen as stable, whereas effort is variable. The third is controllability, whether something was intentional or unintentional.

First proposed by Weiner and colleagues in 1971 and later modified, this achievement-motivation

model has primarily dealt with examining one's own behavior. The resulting judgments influence future beliefs about capabilities. Whereas Kelley's model looks at processes involved in attribution formation, Weiner's concern is motivational and behavioral outcomes. Although the focus is self-attributions, especially achievement-oriented ones, Weiner's recent work includes attributions of others' behavior and social responsibility.

Though the Kelley and Weiner models have dealt with self and other attributions, they highlight different facets of related processes. Recently some attempts have been made to integrate the models.

Criticisms of attribution theory include its reliance on normative models, which assume logical processing of information, and lack of recognition of the role of emotion. Further, as Mark J. Martinko and Neal F. Thomson point out, as with other complex kinds of information processing, attributions result from the interactions of a number of variables. Several attribution biases are common, including the fundamental attribution error, actor-observer bias, hedonic relevance bias, false consensus effect, false uniqueness effect, self-serving bias, and male gender bias. Other concerns include dependence on experimental tests, issues with generalizability, and insensitivity to actual interaction.

AUSTRALIA AND NEW ZEALAND, PRACTICE OF PUBLIC RELATIONS IN

The development of public relations in Australia and New Zealand can be traced from its early media origins through to its current status as a complex profession that may be broadly characterized as Westernized, localized, informal, and nonspecialized. The public relations profession in Australia and New Zealand evolved from journalists moving into the field of media relations. In Australia, public relations practitioners in New South Wales became the first to form a professional body in 1949. Today each Australian state has a division of the Public Relations Institute of Australia (PRIA), which is the national professional body. In New Zealand, the profession traces its birth date back to 1954, when a group of demobilized military press officers formed what was to become the Public Relations Institute of New Zealand (PRINZ). In the days before airmail or the Internet, New Zealand and Australia were isolated from developments elsewhere, but relevant information was sought from the United States and Europe, which were leading the field of public relations.

Public relations was originally practiced as an organizational or political function, and the primary task was to secure positive media coverage. Practitioners worked as consultants or internal organizational media and publicity experts. Anyone—regardless of education, experience or understanding of ethics—could claim to be a public relations practitioner. There is still no requirement in either country for a public relations practitioner to belong to one of the professional associations, so the role of public relations practitioner has not been regulated or standardized. Titles given to or adopted by practitioners include corporate communications,

business communications, corporate affairs, media relations, press officer, in-house journalist, external relations, and executive assistant. Titles that do not include the term *public relations* are sometimes chosen out of a desire to dissociate the position from public relations or in an attempt to elevate the position. The public relations industry in both countries is focused on achieving professional status but is subject to media disparagement.

Acknowledgment of public relations as a “profession” has been complicated by the voluntary nature of PRIA and PRINZ membership. Both professional bodies provide education and professional standards and promote the role of public relations, but practitioners are not compelled to join. In joining either PRINZ or PRIA, practitioners are arguably demonstrating their commitment to the development of public relations as a profession. However, they are also submitting themselves to the external rigor and security to be derived from an accreditation system and a code of conduct or ethical practice. In both countries, practitioners who have been accused of misconduct generally choose to avoid censure by resigning. PRINZ had a membership of 760 in October 2003, while the membership of PRIA stood at 2223. The demographics of their memberships bear striking similarities. In both countries around 60 percent of practitioners are women.

Education has been a key factor in the progress of public relations as a profession. Public relations education is now widely available in both Australia and New Zealand. Students may take degree and diploma courses at universities, polytechnics, and technical and further education (TAFE) institutes. Practitioners can select from a wide variety of short courses run by PRIA and PRINZ or any of a variety of private training organizations. PRIA also oversees an accreditation system for public relations courses, which guides students toward qualifications that have industry recognition. No similar system exists in New Zealand. PRIA and PRINZ are not, however, the sole organizations serving the interests of public relations practitioners in Australia and New Zealand. The International Association of Business Communicators (IABC) has strong membership in Australia, but the New

Zealand chapter recently closed. Unlike PRIA and PRINZ, IABC does not offer accreditation examinations for practitioners, nor does it administer a disciplinary process for members who transgress the organization’s code of conduct. Accreditation examinations were initially a source of tension for PRIA and PRINZ because senior practitioners resisted the notion that they should take an examination in order to be an accredited member of the professional body, but there is now greater general acceptance of the accreditation process.

Professional public relations codes of ethics or conduct are now commonplace internationally, and within Australia and New Zealand, PRIA and PRINZ are the professional bodies that devise and implement the codes of ethics. Australia has two separate codes in operation: the Consultancy Code of Practice and the Code of Ethics. The Consultancy Code of Practice has sections on “general standards” and “client relations,” as well as guidelines for fees and income. According to the “general standards” section of the code, a registered consultancy

accepts a positive duty to observe the highest standards in its business practice and in the practice of public relations; promote the benefits of public relations practice in all dealings; and improve the general understanding of professional public relations practice. (Public Relations Institute of Australia, 2001, n.p.)

Consultancies are thus charged with responsibility for “professionalizing” public relations and strengthening its reputation. This section also binds consultancies to observe the code, to adhere to “the highest standards of accuracy and truth,” to ensure that employees adhere to the code, and to refrain from recruiting the staff of their clients.

The “client relations” section of the code sets out a framework for the conduct of relationships. This section requires consultancies to safeguard client confidences unless required by a court of law to divulge them. Consultancies are also barred from offering their services simultaneously to clients with competing interests. They may not make unrealistic promises to clients. Soliciting others to engage in unethical conduct on behalf of clients is

also prohibited. Australian consultancies are not required to either affiliate with PRIA or apply the Code of Practice. However, a register of affiliated consultancies is operated by PRIA, and only those consultancies that adhere to the code are able to list their services in this widely used directory. Thus, there is a real incentive for consultancies to affiliate. PRINZ also has a register of New Zealand public relations consultancies. However, the absence of a consultancy code of practice means that the list functions as a trade directory rather than as a mark of professionalism.

PRIA and PRINZ each have a code of ethics for individual practitioners. The PRIA code focuses primarily on the obligations of practitioners to clients and employers. Overall, the PRIA code is more extensive, with an emphasis on the activities of consultancies. The PRIA code is designed to ensure that members comply with PRIA's professional standards. Members are required to "adhere to the highest standards of ethical practice and professional competence." Key regulations include public relations practice (honesty, fairness, and confidentiality), business practice (treatment of clients and employers), and commitment to the profession (promoting the profession, building the body of knowledge, and surveillance of other members' practice).

The current PRINZ code of ethics was developed in response to concern over an ethical issue that focused media attention on the profession and tensions in organizational versus societal obligations. In New Zealand the profession faced a major problem following disclosures in a book titled *Secrets and Lies: The Anatomy of an Anti-environmental PR Campaign*. This 1998 book by Nicky Hagar and Bob Burton mapped a prominent New Zealand public relations consultancy's role in assisting industry to continue the logging of native forests. The book accused the consultancy of a range of activities, including spying, lying, media manipulation, and undermining the democratic process. Following censure, the practitioner involved resigned but has since rejoined PRINZ.

In response to the media criticism and public condemnation of such practices, PRINZ developed

a new code of ethics. The code marked a shift in understanding of the role of public relations. Public relations was no longer conceptualized and promoted simply as a communication role but was explicitly repositioned as an advocacy function that promotes an organization or client's identity, ideas, products, services, or position. The code emphasizes the sensitive judgment required for acceptable and ethical public relations practice: "We must balance our role as advocates for individuals or groups with the public interest. We must also balance a commitment to promote open communication with the privacy rights of individuals and organisations" (Public Relations Institute of New Zealand, 2001, n.p.). Although the Code does not specify how that balance should be determined, it does make it unmistakably clear that public relations obligations and responsibilities extend beyond the client to the public interest. Like the code of the Public Relations Society of America (PRSA), the PRINZ code of ethics outlines a set of values that guide behavior and decision-making processes. The PRINZ values are advocacy, honesty, expertise, independence, loyalty, and fairness. The code then sets out the principles and standards for the practice of public relations in New Zealand. Members are required to balance advocacy and honesty as well as openness and privacy, disclose conflicts of interest, abide by the law, and act in a professional manner.

The codes of Australia and New Zealand are therefore different in orientation. PRINZ has redesigned its code to more accurately explain the advocacy role of public relations and position that role within the context of society, whereas PRIA is more concerned with client/employer relations. However, both codes aim to provide a professional standard for public relations practice and enhance the reputation of the industry. Both PRIA and PRINZ are members of the Global Alliance of Public Relations and Communications Management Associations. The Global Alliance is a framework for public relations associations to "share ideas and best practices, seek common interests and standards, and better understand the unique aspects of each culture in which practitioners operate" (Global Alliance for Public Relations and Communications

Management, 2002, n.p.). The Global Alliance has established a protocol on public relations that is based on the “fundamental value and dignity of the individual” (Global Alliance for Public Relations and Communications Management, 2002, n.p.). This individualistic focus may create challenges for public relations associations that have more collectivist, community-based values. For example, PRINZ has to balance the dominant Western individualist focus with the more collectivist values of the indigenous people, the Maori. The Global Alliance protocol is based on the principles of advocacy, honesty, integrity, expertise, and loyalty. The ethical standards of the protocol emphasize responsibility to clients, client publics, and an informed society, along with professional competence, development, and commitment to the public relations industry. As members of the Global Alliance, PRIA and PRINZ now have greater access to international networks, knowledge, a virtual ethics forum, news, and examples of best practice.

The major practice-related issues confronting practitioners are similar in Australia and New Zealand. Western global business practices have come to dominate the practice of public relations, although they are to some extent balanced by local multicultural and bicultural policies and issues. Information and communication technologies, including the Internet, e-mail, databases, mobile telephones, and personal computers, have all speeded the process of globalization. Technology has also been responsible for enabling public relations practitioners to rapidly disseminate information on behalf of their clients to wide-ranging audiences. However, in Australasia, as elsewhere, technology has also given voice to a wide range of stakeholders and stakeholder concerns, making the work of practitioners more complex and challenging. Public relations is no longer something that is the preserve of the organization. Any individual or community group with access to computers and the Internet can set up Web sites, issue media releases, and lobby decision makers.

Public relations practice in Australia and New Zealand is characterized by a small market size, which results in a high degree of informalization,

accessibility, lack of specialization, and localization. Media relations in the two countries are rendered less formal because public relations and media professionals have often been educated together and have worked together. Common backgrounds and experiences mean that public relations practitioners are able to informally approach journalists with the expectation that they will receive positive media attention and possible coverage. This degree of informality results in what Norman Fairclough termed cultural democratization, that is, greater accessibility to public figures and a reduction of elitism (Fairclough, 1995, p. 13).

Another consequence of smaller market size is that public relations practitioners are more likely to develop generalist skills rather than specializing in a particular public relations function. Within the smaller consultancies in Australia and New Zealand, practitioners must be able to undertake a range of tasks, such as lobbying, managing events, and developing corporate brand and reputation programs. Although international public relations consultancy firms have affiliates and offices in both Australia and New Zealand, the work is most often based in those countries rather than internationally. Australia has a multicultural policy, whereas New Zealand has a bicultural policy that is enshrined in the Treaty of Waitangi, a document that acknowledges the rights of the Maori. Consequently, localized public relations approaches have developed that embrace multicultural and bicultural communication and relationship challenges.

A more sophisticated understanding of public relations is evident within both public relations associations. The 2003 national president of PRIA, Liz McLaughlin, argued that Australian public relations has matured from “words to strategies to leadership” and that practitioners need to work toward being part of the dominant coalition (McLaughlin, 2002, p. 113). For McLaughlin, the challenge for public relations professionals is to balance the leadership role that public relations plays with a responsibility to society. PRINZ has indicated that public relations is centrally concerned with stakeholder management. The 2003 national president of PRINZ, Tim Marshall, promoted the role of public relations as

“stakeholder communication, public consultation and education, and reputation management” (Marshall, 2003b, n.p.). Thus, public relations has moved a long way from its early media relations beginnings to positioning itself as a professional leadership role in stakeholder management.

BACKGROUNDER

A backgrounder is one of many written public relations tactics that often supports and explains an accompanying news release. It is an in-depth document that provides an information base by offering relevant background information on the organization. Backgrounders can be a good reference tool for journalists, who want an explanation of main areas of interest relevant to their target audiences. They are often included as collateral materials in a press kit or distributed at a news conference.

Backgrounders are similar to a more detailed version of a fact sheet, usually presented in a brief “who-what-when-where-why” outline or bulleted format. The factual information is presented in that traditional list (the five W’s) of journalist topics. The details are featured to make the writing of the story easier and more orderly. Both backgrounders and fact sheets are objective in nature, which makes them different from *position papers*, sometimes called white papers. Position papers usually take a stance or position on a particular issue. A position paper uses evidence to make a case for the specific viewpoint of the organization. A backgrounder, however, is a more neutral and thorough examination of either a specific topic or the organization in general.

Backgrounders normally appear on organizational letterhead and are between one and five pages

long. They may be written in one of two styles: a concise, inverted-pyramid style; or a longer, more descriptive narrative style that provides more depth than a news release. It is important to avoid jargon and advanced, industry-specific language unless the backgrounder is designed for a specialized or technically oriented audience, as for a trade publication. Backgrounders are meticulously researched and often require the use of subheads or main points of interest so that the reader can skim and quickly digest the most relevant material.

The content of a backgrounder can include information on organizational management, organizational history, biographical information on the company CEO, target markets, products or services, testimonials, explanations or elaborations of the findings of a survey or other research, and the organization’s Web site address. Because a backgrounder often provides supplemental information to an accompanying news release, it can contain material on any topic that would help a journalist write a comprehensive story. A backgrounder is usually longer and more general in content than a news release, which is limited to information announcing a specific news item.

When composed for an external audience (such as journalists), it is essential that the backgrounder appear in a journalistically approved style. As with a news release, no payment or compensation is made

if the content of the backgrounder is published. Also similar to a news release, backgrounders are sent on the basis of news interest and timeliness for the audience. They can be very valuable for a journalist and are often kept on file for future reference by both journalists and public relations practitioners. However, they should be updated regularly to keep information current and accurate. Other external audiences for a backgrounder include opinion leaders, regulators, legislators, and special interest organizations. Backgrounders can also be used for internal audiences as an information resource for management and employees. They may supplement content for speeches, annual reports, or internal magazines, for example.

BAKER, JOSEPH VARNEY

Joseph Varney Baker, born on August 20, 1908, was a South Carolinian who was once described by a newspaper as a “short, crippled, intense man” (Binzen, 1967). In 1934, Joseph V. Baker left his job at a newspaper to become the first African American public relations practitioner to gain nationwide prominence by obtaining major accounts from large corporations. It was at this time that his career in public relations was solidified and he became a communications pioneer. More specifically, to devote all of his time to his newly found professional interest in public relations, he resigned as editor of the *Philadelphia Tribune* to work as a

public relations consultant for the Pennsylvania Railroad Company. This act ultimately led him to an entrepreneurial endeavor that allowed him to start his own firm, Joseph V. Baker Associates, in 1934. An astute business mogul, Baker determined that his mission as a public relations practitioner was threefold and could be delineated as crucial in the areas of community relations, press relations, and publicity.

Arthur C. Kaufman and Baker, cited as a publicist, were given the Phi Beta Sigma annual Awards for Public Service at the fraternity’s annual Better Business Week’s dinner at the Bellevue Stratford in 1954. Baker was cited for being a public relations leader and for being active in the public relations business for over 20 years. At the time of the award, he was credited with having persuaded several large corporations to “increase qualitative opportunities for Negroes and to include that group’s purchasing power in policy planning” (“Fraternity to Honor,” 1954, p. C).

Baker traveled in journalistic and industrial circles for over 50 years. In 1955, he was dismissed or resigned as Philadelphia’s chief of Negro research and planning, a position for which he was being paid \$5,652.

Having made a name for himself in public relations, Baker became the first African American president of the Philadelphia chapter of the Public Relations Society of America (PRSA) in 1958. He was unanimously elected. At the time of his election, his firm had been in business for 22 years. Baker was a charter member of the Philadelphia chapter of PRSA and had served as vice-president prior to assuming the helm of the organization. Furthermore, he became the first African American who was accredited by one of the premier national organizations for public relations practitioners, PRSA. Also at that time his public relations agency served as counsel to a number of leading industrial and business ventures. More and more corporations, organizations, businesses, and other entities hired his firm to design community-related events and public relations campaigns. His firm also was known for the comprehensive research on the black consumer market that it provided to its clients.

A multidimensional professional, Baker was designated as an assistant on Vice President Nixon's campaign staff by the campaign director, Robert H. Finch, in 1960. He was charged with preparing background information for Nixon's presidential campaign. At the time of Baker's appointment, Nixon was at a speaking engagement in Greensboro, NC, where he was defending the Eisenhower administration's record on civil rights.

In 1963, Baker addressed delegates who attended the American Gas Association's Mideastern Workshop, which was held on May 2 and 3. Baker was a featured speaker at the two-day workshop that was directed by Charles R. DeHaven, manager of public relations at the Philadelphia Gas Works. The workshop attracted gas industry public relations executives from 10 Eastern states. As reported in the *Pittsburgh Courier* on May 18, 1963, Baker gave a speech titled "Public Relations—Sociologically Speaking." Baker immediately captured the attention of the audience when he asserted "the Negro is at war with every vestige of the old order and everything which even vaguely reminds him of the century just passed" ("Old Order' Association," 1963). He further stated, "a hundred years ago, four million human beings who had been legally regarded for three hundred years as chattle property were set out under the skies." He then outlined the history of African Americans in the United States from 1619 to the year 1963. When he discussed the modern black community, he focused on the sizable annual disposable income and purchasing power of blacks and noted that Philadelphia was at the epicenter of a movement spearheaded by black ministers "expert in the balancing of numbers."

The public relations practitioner then turned his attention to public relations and warned that "PR men must do their homework and recognize facts—here is a people who have read the books and listened to the patriotic speeches. Here is a people with ballots and dollars and in this democracy these two sit on the right hand of the Father" ("Old Order' Association," 1963).

Baker ended his remarks by observing that "some increasing loud knocks are now being laid

upon the doors and hearts of mankind . . . as public relations people we have committed ourselves to know what these sounds will be like even before they come—it may be that some people are trying to get in the human race."

The idea that a black person was invited to speak to such an esteemed group during that period in history, a year prior to the Voting Rights Act of 1964, which gave African Americans stronger voting rights, is illustrative of Baker's influence during that time. The other distinguished panelists on the program included John McCollough, account director, art department, N.W. Ayer & Son, and president of the Philadelphia Art Directors Club; and Rev. Carter W. Merbrier, pastor of the Messiah Lutheran Church.

An article published in the *New York Times* in 1966 titled "Racial Image Challenges Big Business" spotlights Baker's views, which were often opposed to those of his white colleagues. The article focused on the fact that public relations executives thought that corporate executives were very naïve regarding the functioning and needs of their employment departments. Noting Baker's expertise regarding the employment needs of large corporations relative to blacks, the journalist recorded Baker's opposing views. "The higher you go in these corporations, the less knowledge you find. So public relations men have to be knowledgeable and they have to have the guts to transmit cold facts to their clients" (Lelyveld, 1963, p. 59). Baker proceeded to share his company's techniques for dealing with employment challenges by finding and providing corporations with exemplary black employees.

We start talking with the top management, then we drop down an echelon, then we drop down another echelon till we're talking with the personnel man who sits at the interview desk. The moment I get the guy at the top willing to understand the motives and objectives of these things, the second and third-echelon people get religion very quickly. (Lelyveld, 1963, p. 59)

The public relations guru then opined that it was much more profitable for blacks in business to specialize in areas that pertain to blacks.

In an article published in 1967 by the *Pittsburgh Courier* newspaper titled “Negro Entrepreneurs Here Face Heavy Odds, Successful Ones Say,” Baker voiced his concern regarding the growth of black businesses in Philadelphia. At that time in Philadelphia, only 27 black-owned manufacturing and wholesaling establishments existed. He did not see much of a future for black businesses in Philadelphia. “I can see Negroes in business, but not in Negro businesses,” he said (Binzen, 1967). “Top-flight Negro minds are not thinking that way. They’re committed to big business almost down to the sophomore year in college. And the big corporations have a lot more opportunities for talented Negroes today than there are Negroes to fill them” (Binzen, 1967).

A Philadelphia black opinion leader who agreed with Baker was William C. Wingate, Jr., secretary of the Wingate Beauty and Barber Supply Company. The company was founded by Wingate’s father in 1926. “You just don’t reap the harvest you’d expect for the hours you put into it,” he said. “I’m afraid that small businesses—not just those run by Negroes—are on their way out” (Binzen, 1967). Wingate agreed with Baker that “bright, ambitious, Negro businessmen will increasingly move into executive spots in big corporations” (Binzen, 1967). “Not only do Negroes lack entrepreneurial experiences,” said Wingate, “but until recently it was extremely difficult for them to negotiate bank loans.”

Another business owner who added his voice to the chorus of blacks discussing the plight of blacks in business was E. Washington Rhodes, publisher of the *Philadelphia Tribune*. At that time Rhodes was the owner of what was considered the largest and most prominent enterprise in Philadelphia. Rhodes, a former board of education member, worried about the trend that Baker and Wingate forecast.

In 1967 Baker’s agency had 19 employees and represented 12 blue-chip firms, including some of the most well-known and largest names in American business. Over the next 40 years, Baker’s firm, located in New York City, amassed a blue-chip roster of clients that included RCA, Procter & Gamble, Chrysler, Gillette, DuPont, U.S. Steel, Western Union, Scott Paper Company, Hamilton Watch, and the Association of American Railroads.

In 1968, when Baker became chairman of the board of his own public relations firm, Joseph V. Baker Associates had been in business for 34 years. A much-revered entrepreneur within both the black community and corporate America, Baker was seen as a formidable force in bridging the two constituencies. One newspaper article asserted, “Baker is the big corporation link to the Negro consumer and job market” (Binzen, 1967, p. 21). According to Baker, there were two primary reasons that big business should be interested in the employment of blacks. The first was that if blacks had jobs, they could use the money they made to make their communities financially stable. The second, he suggested, was that more money in the black community would mean more money for black businesses to borrow. He ultimately asserted that this would make the federal government, an entity that he called the biggest customer in the country, one of the biggest allies for the black consumer. “Who wants to get into an argument with the federal government?” Baker asked (Binzen, 1967, p. 21).

Baker saw a lot of opportunity in the advertising, marketing, and public relations industries for black professionals. “Big business was a leader in hiring Negro, p.r. and marketing people. Business men were smart and alert enough to see this is good business” (Ryan, 1968). He argued that many large corporations recruited Negroes as “urban affairs specialists and sales promotion executives years before the Negro revolution” (Ryan, 1968). To further substantiate his point, Baker highlighted the career path of Raymond S. Scruggs, a black man, who held a position as a personnel director for urban affairs at American Telephone and Telegraph (AT&T), virtually a public relations position as described by Baker. His career began with Michigan Bell in 1939, and he joined AT&T in 1963. Baker asserted that Scruggs was of the opinion that urban affairs was developing into a public relations function and that corporations needed connections—those owned by whites as well as those owned by blacks—to guide them relative to problems occurring in the city of Philadelphia.

By 1968, Baker had owned his agency for over 34 years and employed 20 workers. He could count

among his clients DuPont, Procter & Gamble, and Western Union. Speaking tongue-in-cheek, he referred to corporate recruiting as “raiding.” Thus, he suggested that mainstream corporations had raided black public relations agencies, newspapers, the Urban League and NAACP, and black universities and colleges in an attempt to diversify their companies. To further reinforce his thoughts, he mentioned the fact that Pepsi-Cola hired a marketing professor who previously taught at Howard University and promoted him to vice president of special markets. According to Baker, the professor served as a role model for justifying the “recruiting raids” because it offered job opportunities for talented blacks. Baker had firsthand knowledge of the raids because Barbara Harris, a black woman whom he had groomed for over 30 years and who had served as president of his agency for at least 10 years, had left three weeks earlier, about mid-September 1968, to work as a consultant for the Sun Oil Company. Following Harris’s resignation, Virginia Clark was selected president of Joseph V. Baker Associates on October 7, 1968.

Baker also served as a mentor and opened the gates for the advent of African American women into the public relations profession. One of his most celebrated protégés was Barbara C. Harris, mentioned earlier. Harris began her public relations career with Joseph V. Baker Associates after completing high school. When she took on this assignment, she became the first woman of color to handle major corporate public relations accounts. While working at Baker’s firm, she handled press relations for such luminaries as Roxie Roker (a black actress on the television program *The Jeffersons* whose character was married to a white character), RCA, Johnny Hartman, Harry Belafonte, and Marian Anderson. She established and developed a Division of Women’s Information and edited a monthly publication for homemakers. In 1958, Harris became president of the firm. And following in the footsteps of her mentor, Joseph Baker, she became president of PRSA’s Philadelphia chapter.

Harris, a public relations pathfinder, later pursued her religious interest and was ordained to the priesthood in the Episcopal Church in 1980. She

thus became a trailblazer in another arena, and in 1990 became the first female bishop in the Episcopal Church. Her religious work culminated with Harris receiving the American Black Achievement Award in religion in 1989 and 1990.

Baker opened the doors to his agency in the year 1934. For his many achievements in public relations, the PRSA Multicul named one of its Excellence in Multicultural Communications Awards (EMCA) in his honor in 1990. The Joseph Varney Baker Award recognizes multiracial practitioners who have designed campaigns for corporate and business entities with budgets under \$100,000.

By the time Baker’s agency closed its doors, the society in which he operated had changed significantly. In 1934 he did not have all the rights that should have been readily accorded to all American citizens. He was classified as black, and depending on where he lived, he may not have been able to vote, use public facilities, or have equal opportunities to obtain education, housing, and employment. He may not have had the opportunity to frequent a restaurant for a meal. Thirty years later, in 1974, he had been guaranteed the right to vote, he could go to a restaurant and sit down to have a meal, and all public facilities were integrated. Some would argue that he served as a catalyst in making some of those rights a reality.

Baker had a passion for public relations, and he shared that passion with other colleagues every chance that he could. He serves as a role model for all prospective business owners, especially those who are black. He was one of the first blacks to introduce black shoppers to corporate America and to get Madison Avenue to recognize the purchasing power of the black consumer market.

Baker, who had been described as the “dean of Negro public relations men,” died on May 7, 1993, in Philadelphia.

BARKELEW, ANN H.

Ann Barkelew has established a reputation for being one of the best public relations professionals in the field. Ms. Barkelew recently retired from her position as senior partner and founding general manager of Fleishman-Hillard Inc., an international communications agency, in 2001. She is now a senior counselor for the agency, providing expertise to Fleishman-Hillard worldwide on special projects.

Ann Barkelew was born in St. Joseph, Missouri, on March 21, 1935, to Alexander Hamilton, an engineer, and Ruth Welsh Hamilton, a teacher. At the age of 12, she moved with her family to Jefferson City, Missouri. Ms. Barkelew recalls that her mother always worked, from the time Ann was little. She characterized her as an "incredible person" (Barkelew, personal communication, October 20, 2003). Active and involved, Barkelew's mother served as a strong role model for working women. Her father's political career helped Barkelew embrace a life of service, encouraging her to not stand idly by, but to jump in and take an active role in her community. A Girl Scout throughout her public school years, Barkelew credits this experience as very important in shaping her personality. Ms. Barkelew had one brother, William Warren Hamilton, who died in 1984.

Ms. Barkelew graduated from Central Missouri State University with a bachelor's degree in 1957. After graduating, she taught English and journalism in high schools in California and Missouri until she entered a master's program in 1965. She finished her master's degree in 1966, taking a year's leave of

absence from her regular job to complete this advanced degree at the University of Missouri-Columbia. Her master's thesis, which organized a program of public relations for the Santa Barbara schools, so impressed administrators that she was invited to work in the district's central office to implement the public relations program. Although Ms. Barkelew acknowledges that she never wished to be an administrator, this assignment allowed her to test her management skills and propelled her into a very successful public relations career.

She worked in community relations for the Santa Barbara schools from 1966 to 1971. From 1972 until 1981, she was the chief public information officer for the Los Angeles County Office of Education. Ms. Barkelew characterized the Compton, California, teachers' strike as the first big strike in a series of strikes in the 1970s, which created great challenges for her and for California public education. Rather than deal with strikes once they began, Barkelew encouraged administrators to work to avert strikes. This was during a period of severe enrollment decline and the closing of more than 100 secondary schools in Los Angeles County. Barkelew's formula for using communication to manage these crises included honest communication with teachers about the school district's finances. She believed in keeping school employees informed because she saw them as the most important group in the school system.

She entered the field of corporate public relations in 1981, when Munsingwear tapped her to help manage a major plant closing in Minnesota, followed by plant closings around the country. She joined Munsingwear Inc. as the vice president of corporate relations in order to build a corporate communications department. What was supposed to be a six-month leave of absence from Los Angeles County turned into a permanent move to Minnesota, a state she says she quickly came to love.

She joined Dayton Hudson as the vice president of corporate public relations in 1982 and played a major role in avoiding a hostile takeover threat to the corporation in 1987. Ms. Barkelew holds the distinction of being the first woman to be named a member of the Dayton Hudson Management Committee.

In 1984, Ms. Barkelew joined the Board of Directors of the Children's Theatre of Minneapolis. After just two weeks on the board, Ms. Barkelew and the board of directors faced an issue that would tear the artistic community apart. Just before the Theatre's Spring Show opened, John Clark Donahue, the Theatre's artistic director, was accused of sexually abusing young boys. Known for her ability to work and succeed in a crisis, Ms. Barkelew quickly convened a public relations committee to handle the situation. She and other board members met with parents, children, and donors to work through the crisis. An interim executive committee, which Ms. Barkelew chaired, helped oversee the Theatre during this difficult time. The situation was successfully managed, and today the Theatre is one of the strongest regional theaters in America. In 2003, it was the first Children's Theatre to receive a regional Tony Award. Ms. Barkelew served as chairman of the Theatre's board of directors and remained on the Children's Theatre board for 14 years.

Ms. Barkelew retired from Dayton Hudson (now known as Target Corp.) in 1994, but clients kept contacting her, and true retirement has never really been possible. Within less than a month of leaving Dayton Hudson, Ms. Barkelew had three significant clients, and in addition to her consulting work, she served on several boards of directors.

From 1995 to 1996, Ms. Barkelew was a senior counselor, offering advice to corporations in the Twin Cities and often working with Patrick (Pat) Jackson of Jackson, Jackson & Wagner. Although Ms. Barkelew had never been a big supporter of public relations agencies, Fleishman-Hillard CEO John Graham convinced her to join his firm by offering her the opportunity to create the kind of agency office she would have hired when she was in corporate America. She became the first general manager of Fleishman-Hillard in Minneapolis-St. Paul when the office opened on July 1, 1996.

Ms. Barkelew, an Accredited Public Relations Practitioner (1973), has also been involved in the advancement of the field, working to establish common accreditation standards and codes of ethics for the public relations profession. As president of the National School Public Relations Association, she co-founded a coordinating body

for professional societies in the field called the North American Public Relations Council in 1980. Ms. Barkelew is a member of the Public Relations Society of America (PRSA) and has in the past co-chaired its National Committee on the Future of Public Relations. She was elected to PRSA's College of Fellows in 1990 and served as its chair in 1992.

In September 2003, she was presented with the Arthur B. Page Society's Distinguished Service Award. This award recognizes a person whose contributions over the years in service to the profession have strengthened the role of public relations in our society. She joins distinguished public relations legends Patrick Jackson, Jack Felton, and Betsy Plank as only the fourth person to win this exclusive designation. She is a member of the board of directors of the Arthur B. Page Society and is a former member of the PR Seminar and the Wisemen (Arthur B. Page Society, 2003).

Ms. Barkelew has received many other awards:

- 1984—President's Award, National School Public Relations Association
- 1985—One of 85 Outstanding Women in Business (*Business Week's* "85 in '85")
- 1993—Vernon C. Schranz Lecturer, Ball State University
- 1993—National Honor Roll of Women in Public Relations, Northern Illinois University
- 1995—National Public Relations Achievement Award, Ball State University
- 1995—Learning and Liberty Award, National School Public Relations Association
- 1995—Voted by international peers as "PR News Public Relations Professional of the Year"
- 1997—Public Relations Hall of Fame, Rowan University
- 1999—One of *CityBusiness's* 25 Most Influential Women in Business in Minnesota
- 2001—Fleishman-Hillard Lifetime Achievement Award

What also makes Ms. Barkelew exceptional are her public relations efforts in day-to-day work. She prefers answering her own telephone calls and does not leave work without returning every press call that she receives that day ("Corporate PR Heads," 1993).

Ann Barkelew credits her tremendous success in public relations to one thing: teamwork. “I love working with teams. I love leading things. Working together, we can make great things happen” (Barkelew, personal communication, 2003). Barkelew says she always had an advisory council wherever she worked and made sure she pulled people from all areas of the businesses in which she worked. “Teams,” she notes, “can accomplish great things” (Barkelew, personal communication, October 20, 2003).

Ms. Barkelew married James O’Hagan, an attorney, in 1988 and lives in the Twin Cities. Their blended family has six children.

BARNUM, P. T.

Public relations played a substantial role in the growth of America’s entertainment industry—so concluded Doug Newsom, Judy Vanslyke Turk, and Dean Kruckeberg in 2000. They wrote that the tactic of *press agentry*, defined as “a function of public relations that involves creating news events of a transient, often flighty sort” (Newsom, Turk, & Kruckeberg, 2000, p. 533), grew up with the entertainment business in the 19th century. Perhaps no one is more completely identified with that tradition than P. T. Barnum.

Newsom, Turk, and Kruckeberg (2000) described Phineas T. Barnum (1810–1891) as one of many “circus showmen” who practiced press agentry (p. 37). If 20th-century public relations grew out of 19th-century press agentry, then public relations practitioners should be familiar both with what press agentry was, especially as practiced by Barnum, and with the effects that Barnum’s actions had on the way that public relations is viewed today.

In *The Fabulous Showman: The Life and Times of P.T. Barnum*, Irving Wallace (1959) wrote that

Barnum considered himself more of a promoter and a “museum man” than a “circus man” (p. 226). According to Wallace, Barnum did not become a full-time circus proprietor until after his 60th birthday, and even though he “gave the circus its size, its most memorable attractions and its widest popularity,” the misconception persists that he invented the circus. In fact, the modern circus was created in England by Philip Astley in 1768.

According to the Web site www.ringling.com, Barnum joined promotional forces with James A. Bailey and James L. Hutchinson in 1881, and in 1888 the “Barnum & Bailey Greatest Show on Earth” first toured America. Barnum died in 1891, and Bailey followed him in the spring of 1906. In 1907, the Ringling brothers of Baraboo, Wisconsin, purchased Barnum & Bailey Circus, their largest competitor. In 1919, the two entities merged, forming Ringling Bros. and Barnum & Bailey®, The Greatest Show on Earth®, as it is still known in the 21st century.

A closer look is needed to explore the years of Barnum’s life that led up to his circus days.

In the year 2000, Barnum’s autobiography, *The Life of P.T. Barnum, Written by Himself*, was reprinted (it was first printed in 1855). In the introduction, Terence Whalen (2000) wrote

For more than fifty years, Phineas T. Barnum embodied all that was grand and fraudulent in American mass culture. His life spanned nearly the entire nineteenth century, and during that period he inflicted himself upon a surprisingly willing public in a wide variety of roles. Barnum’s supporters pointed to his exemplary success as a newspaper editor, lottery agent, museum director, politician, traveling showman and distinguished public benefactor. Barnum’s detractors, however, used different names to describe his meteoric career: libeler, swindler, huckster, demagogue, charlatan and shameless hypocrite. (p. vi)

Whalen (2000) also observed that Barnum “desired and deliberately fostered this ambiguous public image” and that it was through his use of the new publishing industry and being a notable author that he made this happen (p. vi). In the 2001 update of *Introduction to Mass Communication*, Stanley J. Baran confirmed that “mass circulation newspapers

and the first successful consumer magazines appeared in the 1830s, expanding the ability of people and organizations to communicate with the public” (p. 251).

After a Danbury, Connecticut, newspaper refused to print a letter from Barnum, he decided to publish his own weekly newspaper, the *Herald of Freedom*, which commenced publication October 19, 1831. Of course, this wasn't without incident. During his three years as editor, Barnum was prosecuted three times for libel and at one point was fined and sentenced to 60 days in jail. But on the day he was released, Barnum made sure it was a “media event and public-relations triumph. He achieved this by assembling carriages for a procession, engaging a band and organizing a large celebration dinner” (Whalen, 2000, p. xiii). Whalen (2000) concluded that “in a more modern sense, Barnum acted as a prototypical spin doctor, for he understood that the social meaning of an event (or crime) was not given from the start but could instead be created or manipulated through the emergent mass media” (p. xiii).

Newsom and colleagues (2000) identified Barnum as one of the most famous and successful 19th-century press agents and credited him for creating, promoting, and exploiting the careers of many celebrities. They cited the example of Barnum exhibiting a black slave in 1835 named Joice Heth, claiming she had nursed George Washington 100 years before and reported how newspapers fell for the story, intrigued by its historical angle (Newsom et al., 2000, p. 38). Whalen (2000) claimed that although Heth was reputed to be the 161-year-old nurse of George Washington, it was, of course, “a patent lie.” He noted that whereas later editions of Barnum's autobiography “describe the affair in apologetic terms, the original version seems playfully indifferent to issues of truth and falsehood” (p. xiv).

In his autobiography, Barnum wrote that he learned of Heth in the summer of 1835 and paid \$1,000 for her possession. Whalen attributed many factors to why thousands paid to see her, including the fact that she looked the part, being “withered, blind and toothless; she had also lost the use of most of her limbs” (2000, p. xiv). Newsom et al. noted that when public interest in Heth began to die down, Barnum kept the story alive by writing letters

to the editor under assumed names, debating her authenticity. Barnum didn't care what the papers said, as long as he got space. Some practitioners today operate out of a similar philosophy. They don't care what kind of coverage their client gets as long as the client's name is spelled correctly, an all-too-common philosophy of the press agent, especially in the entertainment industry.

When Heth died, an autopsy revealed her age to be about 80. According to Whalen, even after Heth's death, Barnum continued to try to convince the public of her authenticity. He sent his associate, Levi Lyman, to James Gordon Bennett of the *New York Herald* with a different story, as, Whalen notes, “Barnum had decided it would be expedient to muddy the waters and reinforce the continuing public belief in Heth's authenticity” (p. xv). Lyman told Bennett the autopsy itself had been a hoax and that Heth was alive and well in Connecticut. Bennett reacted as Barnum had anticipated. Whalen notes, “Bennett, eager to scoop a rival paper, ran the story and attacked the autopsy results. He stood behind the story for a time, but much to his dismay, he soon realized the hoax was on him” (p. xv). But several months later, Barnum's associate Levi Lyman appeared “contrite” and offered another “real” story to Bennett, who was convinced and, in a series of stories, offered a new “full and accurate account of the hoax” (Whalen, 2000, p. xv).

Whalen (2000) observed that “Barnum allowed this account to remain unchallenged until his autobiography, where, like a triumphant serial-hoaxer, he confessed to having duped Bennett a second (or third) time” (p. xvi). There was a reason Barnum waited 20 years to do this. In Barnum's words, “newspaper and social controversy on the subject (and seldom have vastly more important matters been so largely discussed) served my purpose as ‘a showman’ by keeping my name before the public” (1855/2000, p. 176).

Barnum's last sentence of the Heth chapter in his autobiography claimed that “the remains of Joice were removed to Bethel, and buried respectably” (1855/2000, p. 176), but in his book, *P.T. Barnum: The Legend and the Man*, A. H. Saxon wrote that “there is no trace today of Joice Heth in Bethel” (1989, p. 74). Newsom et al. noted that after the fraud had been exposed, Barnum claimed that he,

too, had been duped in regard to details about Heth's life. The authors asked, "Was this true? Why not? After all, 'there's a sucker born every minute'" (Newsom et al., 2000, p. 38).

What's interesting about this phrase, wrote Saxon in 1989, is that it is the one statement nearly everyone associates with Barnum, but in fact, it was never spoken nor written by him. Saxon unravels the mystery this way: A tale was told by Joseph McCaddon, Bailey's bother-in-law, who was in turn told by Captain Alexander Williams of the New York City Police Department that the expression was first used in the early 1880s by a notorious "confidence man" known to the police as "Paper Collar Joe." His real name was Joseph Bessimer. McCaddon reported the complete statement as being "There is a sucker born every minute, but none of them ever die" (Saxon, 1989, p. 336).

Whalen told the reader that the first six chapters of Barnum's autobiography are about petty frauds and practical jokes that the people of Bethel, Connecticut (where Barnum was raised), inflicted upon each other. Chapter 7 included the Heth account. Whalen concluded that "Barnum's stunning success derived from his unique ability to combine short-term sensations with a profitable, long-term strategy" (2000, p. xi) and that "although the individual scenes reek of scandal and low cunning, the narrative voice wins a measure of sympathy through frankness, audacity and irony" (2000, p. xii). Whalen observed that

in subsequent chapters, Barnum portrays himself in a more sympathetic light by showing how he occasionally gave the public its money's worth. The second half of his autobiography includes extended accounts of Barnum's three most "worthy" ventures: Tom Thumb, Jenny Lind and the American Museum. (2000, p. xix)

Charles Sherwood Stratton was a four-year-old Connecticut boy whom Barnum named "General Tom Thumb." Stratton was less than two feet tall and weighed less than 16 pounds, probably because of a condition called ateliotic dwarfism. Barnum realized the promotion possibilities with this midget were endless; he just needed to make it a really great story. In his autobiography, he writes that he upped Tom Thumb's age to 11 to emphasize that he was "really a dwarf" (1855/2000, p. 244).

The case with opera singer Jenny Lind shows that perhaps Barnum was trying to control his exaggerations. Whalen argued that Barnum negotiated a contract with Lind and from September 1850 to June 1851, she was "at the center of a carefully orchestrated media storm, and she played to packed houses throughout the nation" (2000, p. xx). Barnum wrote in his autobiography,

I may as well here state, that although I relied prominently upon Jenny Lind's reputation as a great musical *artiste*, I also took largely into my estimate of her success with all classes of the American public, her character for extraordinary benevolence and generosity. Without this peculiarity in her disposition, I never would have dared make the engagement. (1855/2000, p. 307)

Whalen had this to say about the one other example from later chapters in Barnum's autobiography: "From Barnum's perspective, old-fashioned morality was less important than professional achievement, and thus is the story of his acquisition of the American Museum at the end of 1841" (2000, p. xxii). This event included what people of today might consider deception or false advertising, but Barnum had other thoughts.

Barnum hired a band to perform at the museum, free of charge to the public. But people who came to hear the free music got less than they bargained for—and on purpose. Barnum wrote in the second version of his autobiography in 1869 (*Struggles and Triumphs: Or, Forty Years' Recollection of P.T. Barnum, Written by Himself*, as cited in Whalen),

I took pains to select and maintain the poorest band I could find—one whose discordant notes would drive the crowd into the Museum, out of earshot of my outside orchestra. Of course, the music was poor. When people expect to get "something for free" they are sure to be cheated and generally deserve to be. (2000, pp. 131–132)

Although these stories provide only a glimpse into the thought processes and dealings of P.T. Barnum, they send a message to public relations practitioners of today that distorting the facts for profitable gain at the expense of the public is not morally right or acceptable.

According to Stanley Baran, the time that the modern national political campaign was born (1896) is about the same time that public relations began to acquire its deceitful, huckster image. He concluded that “a disregard for the public and the willingness of public relations experts to serve the powerful fueled this view, but public relations began to establish itself as a profession during this time” (2001, p. 252). Some might argue that Barnum helped contribute to any misconceptions that the current practice of public relations is like his practice of press agency.

The Public Relations Society of America (PRSA) was formed in 1947. Although this was a little too late for Barnum, one might wonder whether he would have belonged or would have simply formed his own society. The fact remains that the world is much different than it was in the 1800s. Even if the public is gullible, it is the job of the responsible and ethical practitioner to report only what is true.

In the year 2000, the PRSA board of directors introduced a dramatically revised Public Relations Member Code of Ethics (available at www.prsa.org). Within the core values of the code is the following statement:

We adhere to the highest standards of accuracy and truth in advancing the interests of those we represent and in communicating with the public, we are accountable for our actions, and we are faithful to those we represent, while honoring our obligation to serve the public interest.

Is Barnum just the exception to the rule? Scott Cutlip et al. offered the following interpretation of this phenomenon called P.T. Barnum:

Barnum’s showmanship was evident not only in a canny instinct that enabled him to give the masses what they wanted, but also in his ability to dictate to them a desire for what he thought they should want. . . . Every man has his star. Barnum’s star was an exclamation mark. (1999, p. 107)

BATEMAN, J. CARROLL

“I believe that public relations is a profession which should concern itself not with manipulation

of people but with their continuing enlightenment” (Bateman, 1974, p. 6). So begins the credo that J. Carroll Bateman, APR (1917–1982) wrote for public relations practice. Bateman was a public relations practitioner, leader, and educator whose philosophy and leadership continue to inspire.

Bateman was a leader in public relations both nationally and internationally. He served as president of the Public Relations Society of America (PRSA) in 1967, presiding over the PRSA board meeting in Philadelphia during which it voted to establish the Public Relations Student Society of America. The national case competition administered by PRSSA is named for him. He served as president of the International Public Relations Association in 1980. He devoted his last two years to public relations education after a long and distinguished career as a practitioner.

Born July 13, 1917, in Norwood, Pennsylvania, Bateman was raised in Baltimore. He earned a bachelor’s degree from Johns Hopkins University and a master’s degree from New York University, where he wrote a thesis titled “Communications in Education.” He was a reporter and feature writer for the *Baltimore Evening Sun* from 1934 to 1942 before becoming assistant editor of the Baltimore and Ohio Railroad’s *B&O Magazine*. He served in the United States Army in World War II and then returned to B&O Railroad as public relations representative, being promoted in 1951 to assistant director of public relations for the railroad. He joined the Eastern Railroad Presidents Conference in New York in 1953 as assistant chairman for public relations and advertising.

He served as public relations director of the Milk Industry Foundation in Washington, D.C. from 1955 to 1960. From 1960 to 1979 he served as general manager and president of the Insurance Information Institute, a public relations and public education organization supported by several hundred insurance companies in the property and liability field.

Bateman received numerous awards for his contributions in public relations. He was named “PR Professional of the Year” by *Public Relations News* in 1973. He received the Gold Anvil Award from PRSA in 1975 for his contributions to the profession. During

his tenure at the Insurance Information Institute, he received seven Silver Anvil Awards for outstanding public relations programs. He served as editor and sole contributor to the *Public Relations Journal’s* book review column. He was a frequent contributor to the *Public Relations Quarterly* and the *IPRA Review*, and he served in an editorial capacity with the *Public Relations Review*, *Public Relations News*, and *Journal of Commerce*. Bateman participated in several International Public Relations Association (IPRA)–sponsored World Congresses, serving as general chairman of the VII World Congress of Public Relations, held in Boston in 1976.

Bateman is revered in PRSSA for his instrumental role in founding PRSSA during his PRSA presidency. He made education one of his initiatives in his term as president of PRSA in 1967. In his acceptance speech in November 1966, Bateman “stressed the advancement of education for public relations practitioners, one of the main goals of his regime” (Simon, 1968b, p. 30). In his inaugural speech as the new president of PRSA, Bateman “stressed his intention to underscore professional advancement through education as one of his chief goals” (Simon, 1967a, p. 37).

Bateman and two other representatives of PRSA met in August 1967 at the annual Association of Education in Journalism convention in Boulder, Colorado, to discuss “the desirability of establishing a single, nationwide student organization affiliated with the PRSA” (Simon, 1967c, p. 47). Formation of the student organization was approved by the PRSA Board in November 1967. It was expected that the first chapters would be activated by the end of the following spring term.

The PRSA Board of Directors on April 4, 1968, “gave formal approval to the formation of nine chapters of the newly-organized PRSSA.” The board decision established “the first professional public relations oriented student organization in America sponsored by a national association of public relations practitioners” (Simon, 1968a, p. 30). The first chapters were at San Jose State College, The Ohio State University, University of Maryland, University of Texas, University of Florida, University of Houston, University of South

Carolina, Utica College of Syracuse, and West Virginia University. Additional student chapters were established by the end of the year.

The purpose of the student organization was, in the words of Dr. Frederick Teahan of PRSA's headquarters, to

cultivate a favorable and mutually advantageous relationship between students and professional public relations practitioners, foster students' understanding of current theories and procedures . . . and make evident and desirable membership in the PRSA—when the student subsequently becomes eligible. (Simon, 1968b, p. 31)

When Betsy Plank and Jon Riffel founded the informal organization, Friends of PRSSA (now Champions of PRSSA), in 1981, Bateman became a charter member.

Bateman represented PRSA on the American Council on Education for Journalism after PRSA became an active participant in American Council for Education in Journalism (ACEJ) in 1968. He represented PRSA on ACEJ for 11 years and was a member of more than 20 accrediting visits for public relations sequences across the country.

From 1973 to 1974 Bateman served as co-chair of the Commission on Public Relations Education and was co-author with Scott Cutlip of the commission's report titled "A Design for Public Relations Education." The Bateman–Cutlip report was considered "a very valuable contribution on the subject of public relations education" (Karl, 1980, p. 62).

A National Case Study competition was established by PRSA in 1973 to allow students in PRSSA to have an opportunity to exercise the analytical skills and mature judgment required for public relations problem-solving. Following his death, the name of the competition was changed to honor Bateman in 1983.

In September 1980, Bateman joined the public relations faculty at the University of Tennessee to provide leadership in the public relations sequence. The university's public relations undergraduate and professional master's programs were accredited in 1980. He taught courses in public relations management and public relations cases, advised

the University of Tennessee chapter of PRSSA, organized a student-run public relations firm, planned the university's first PR Day, participated in the university's College of Business Administration's Executive-on-Campus program, and convinced the PRSA's board to bring its annual Institute to East Tennessee during the 1982 World's Fair.

After his first quarter of teaching, his doctor warned him of congestive heart failure, urging him to slow down. Bateman wrote to his department head, "My own inclination is to keep going" (Bateman, 1981, n.p.). At age 64, Justus Carroll Bateman died suddenly from a heart attack on April 24, 1982. He had participated in the University of Tennessee's second PR Day the previous week. He was in Philadelphia making final preparations as a member of the steering committee and consultant for the Philadelphia World Insurance Congress. He was survived by his wife of 42 years, Marguerite, a daughter, Carol Anne, and a son, Walter Raymond.

An editorial in the University of Tennessee's student newspaper, *The Daily Beacon*, observed, "Students Lose a Friend." The *Public Relations Journal* devoted a full page to honor his memory in May 1982. He had figured prominently in the 34th national convention of PRSA in November 1981, serving on a panel discussion.

"Carroll was never really satisfied with the status quo of his chosen profession," (Bain, 1982, n.p.) said longtime friend and public relations colleague Herbert B. Bain, speaking at Bateman's memorial service in April 1982. "He always wanted to know more about it, to find better ways of doing things. He continued his university studies at night school and received his master's degree. He wrote articles and books on public relations" (Bain, 1982, n.p.). Bain acknowledged Bateman's numerous professional recognitions, "and rightly so. For no one ever did more to turn this vocation of PR into a real profession than did J. C. Bateman" (1982, n.p.).

The J. Carroll Bateman Papers are preserved in the Special Collections for American History in the Center for American History at the University of Texas at Austin. The papers of this national pioneer in the public relations industry include 24 linear feet of correspondence, reports, speeches, and

manuscripts, covering the years 1940–1982 and documenting Bateman’s career as president of the Insurance and Information Institute and as innovator in the public relations field.

Bateman published a self-defined “draft” of his credo in 1963, and he continued to revise it. The following version of his credo concluded his remarks to the American Assembly of Collegiate Schools of Businesses at the Diplomat Resort and Country Club, Hollywood, Florida, April 25, 1974:

I believe that public relations is a profession which should concern itself not with manipulation of people but with their continuing enlightenment;

I believe that public relations practice should strive to elevate its audiences rather than to degrade them, and that communications should be addressed to reason and judgment rather than to emotion and prejudice;

I believe that sound public relations comprises policies and deeds as well as words; that it should deal in truth rather than deception; and that it should seek to clarify the issues of our times rather than to confuse them;

While I may undertake to present one side of an issue for public consideration, I believe in the right of those with opposing points of view to present their case also;

I believe that the public interest takes precedence over the interests of those I represent; and I conceive of my functions as being to assist in conforming the interests of those I represent to the interests of the public when the two do not coincide;

I recognize that the consequences of my actions are effected in the minds of men; and because the human mind has unmeasurable potentials for good and evil, I should approach my task with overriding respect for the right of the individual to make his own judgments. (Bateman, 1974, n.p.)

BATTLE OF THE CURRENTS

One of the most dramatic exchanges in the history of public relations is the “battle of the currents,” a competition begun in the late 1880s which sought to determine whether direct current (DC) or alternating current (AC) would become the industry standard for electricity delivery. Specifically, the battle pitted Thomas Edison and the General Electric Corporation against Nikola Tesla, who was backed by George Westinghouse of the Westinghouse Corporation. The exchange is significant in that it is paradigmatic of the personal, political, economic, and public relations battles that occur as new technology matures to the point whereby one form of technology becomes the industry standard at the expense of another.

ALTERNATING CURRENT VERSUS DIRECT CURRENT

On one level, the battle between alternating current and direct current was a straightforward technical

question. Direct current is the more simple and uncomplicated form. In it, current flows in one direction, such as in a flashlight, where it flows from the batteries to the light. In the battle of the currents, direct current was developed first and was already on the market—with stations in Manhattan and in other major cities—when alternating current appeared. In Edison's day, direct current required the construction of a power station every mile or two because direct current degraded as it was transmitted down a power line.

Alternating current is much more complex. Current moves not in one direction but in both directions, alternating approximately 60 times every second. Unlike direct current, alternating current at the time had been shown to be able to travel large distances with increasing success, which would allow for the development of fewer and hence more cost-effective power stations.

Two other advantages stood out for alternating current: One, it could easily be sent through narrow copper wire, unlike direct current, which at the time needed larger wire; and two, it could be “stepped up” to high velocity, which enabled large volumes to be transmitted over high tension wires, and then “stepped down” to low velocity for use in individual homes and applications.

Clearly alternating current enjoyed a technical advantage over direct current. But Edison had “gotten there first,” and believed that he had spent too much money developing direct current to abandon it, even at the urging of some of his fellow colleagues at Menlo Park. After 11 patent infringement lawsuits against Westinghouse failed, Edison decided to go public. Such a decision led to the battle of the currents.

THE BATTLE IS JOINED

The battle, depending on one's perspective, shows public relations at its most innovative and creative, or at its most desperate. As General Electric began to witness the development and popular acceptance of alternating current, Edison and his colleagues went on the offensive, with the assistance of his secretary, Samuel Insull. In particular, they claimed that alternating current was unsafe (though ironically, direct

current was responsible for the death of 400 people in the great blizzard of March 1888). Indeed, they published a bright red pamphlet, titled, “A Warning from the Edison Electric Light Company,” which purported to explain the dangers of alternating current. Harold Passer (1953) wrote

The Edison viewpoint was that alternating current endangered the lives of all members of a community where it was present. . . . The strategy of the Edison Company was to educate public opinion to the view that AC was an intolerable menace to the American people, fostered upon it by a selfish and profit seeking corporation. (p. 168)

In addition to the arguments against the form, the book contained an appendix that listed the names of those killed by alternating current.

Much of the strategy was conducted through the media-savvy Edison and his team. Most of their efforts focused on the supposed danger that surrounded alternating current. In 1887, at his Menlo Park laboratory, Matthew Josephson wrote that “in the presence of newspaper reporters and other invited guests Edison and Batchelor [an associate] would edge a little dog onto a sheet of tin to which were attached wires from an AC generator supplying current at 1,000 volts” (1959, p. 347). The implication, of course, was that alternating power was dangerous. And the fact that members of Edison's team would use the term “Westinghoused” for the act of killing the dogs did not hurt either.

In recounting the efforts by Edison against Tesla and Westinghouse, George Westinghouse recounted some of the stunts used by Edison:

I remember Tom [Edison] telling them that direct current was like a river flowing peacefully to the sea, while alternating current was like a torrent rushing violently over a precipice. Imagine that! Why they even had a professor named Harold Brown who went around talking to audiences . . . and electrocuting dogs and old horses right on stage, to show how dangerous alternating current was. (Tesla, 2003, n. p.)

Perhaps the lowest moment of Edison's storied career came during the battle of the currents. In an effort to show that alternating current was dangerous,

he engaged in a subtle, behind-the-scenes effort to get the State of New York to use alternating current to execute a criminal. Although Edison's involvement in the effort was originally thought to be limited, recent works show that he played a more direct role in its development. The primary electrician was the aforementioned Harold Brown, who led the push for the electric chair until it was adopted in 1888. When the first criminal, William Kemmler, a fellow from Buffalo who had killed his paramour, Matilda "Tillie" Ziegler, was executed on August 6, 1890, the electrocution required two different jolts of 1,300-volt alternating current; the first lasted 17 seconds, and the second took more than a minute. Indeed, after seeing it, some suggested that hanging was a much more humane way to execute criminals. One newspaper ran the headline "Kemmler Westinghoused." Richard Moran hypothesized that Edison bribed a reporter to run the story and headline (2002).

Although Edison was offensive and relentless in his efforts to promote direct current at the expense of alternating current, the Westinghouse Corporation was slow to respond and, in its efforts, tended to emphasize the technical superiority of alternating current over direct current. Indeed, H. C. Passer asserted that by the summer of 1888 Westinghouse realized that Edison's efforts were starting to be effective with a public that knew little about electricity. As a result, the Westinghouse Company finally came out with a booklet in October 1889 titled, "Safety of the Alternating System of Electrical Distribution," which hailed the benefits and safety of this form of electrical distribution. George Westinghouse also went one step further and hired a newspaperman, Ernest H. Heinrichs, a reporter who worked for the Pittsburgh *Chronicle Telegraph*, to tell the AC side of the story. In his charge, Westinghouse stated that he wanted to use advertising to correct the negative perception of the safety of alternating current and to rebut inaccurate accounts. Scott Cutlip wrote that Heinrichs led the public relations campaign for Westinghouse by "ghosting a reply to articles by Edison and Brown that had been published in the *North American Review*" (1995, p. 203), which refuted the

claims against alternating current. Indeed, research suggests that it took approximately three years of consistent advertising and communication for alternating current to begin to be recognized for its safety and advantages and for it to become adopted as the standard by many municipalities.

Most consider that the battle of the currents was not completely finished until the successful completion of two events. The first was the choice of alternating current to power the 1893 Chicago World's Fair; this was the first all-electric World's Fair in history. From then on, 80 percent of all electrical devices ordered were for alternating current. The second was the development of hydroelectric power in the late 1890s at Niagara Falls. The consortium that developed the Falls included both Westinghouse and General Electric; it chose the alternating current system to deliver electricity throughout the region.

BAXTER, LEONE, AND WHITAKER, CLEM

The California-based husband and wife team of Clem Whitaker (1899–1961) and Leone Baxter

(1906–) opened the first professional political campaign management agency in the United States in 1933. Their clients included Earl Warren, Pacific Gas and Electric Company, Richard Nixon, and the American Medical Association.

Whitaker and Baxter met while working on a campaign to promote California's Central Valley Water Project in 1933. Whitaker, a former journalist, was working as a lobbyist when he was hired by supporters of the water project to convince voters to approve the project in an upcoming referendum. Baxter, a 26-year-old widow, was manager of the Redding, California, Chamber of Commerce, which had a vested interest in passage of the project. Finding they worked well together, the two opened Campaigns, Incorporated, a public relations agency specializing in political campaigns for candidates and propositions, that same year. They also formed an advertising agency to handle the advertising used in campaigns run by Campaigns, Inc. Three years later, they established the California Feature Service, which sent out a weekly clipsheet of editorials and feature stories to the state's small daily and weekly newspapers. They formalized their partnership on a personal level by marrying in 1938.

Political campaigning and the hiring of publicists to manage media coverage were not new when Whitaker and Baxter came on the scene. What they brought to the table was the concept of experts managing the entire campaign. In addition to the usual publicity and advertising functions, Whitaker and Baxter provided overall strategy, campaign organization, and even financial supervision. They insisted on having complete control over the entire operation.

California served as a particularly ready market for the kind of services the two provided. Party identity in the state had been undercut by the cross-filing system, which allowed Republicans and Democrats to run in each other's primaries. In addition, progressive reforms in the first two decades of the twentieth century granted more power to California citizens through initiatives and referendums. The reforms were intended to break the stronghold of the old party machines, and they did. But by the 1930s, the number of initiatives and referendums

in each election meant electors were constantly asked to make decisions about complex issues. Reaching individual voters via the mass media, therefore, became a political necessity in California.

Whitaker and Baxter were experts at using all of the communication media available to them. In a typical campaign, they would use thousands, if not tens of thousands, of leaflets, letters to opinion leaders, advertisements, film trailers, billboards, and posters to promote their client. They were among the first to recognize the value of radio and newsreels to reach voters.

The two enjoyed remarkable success. Between 1933 and 1959, for example, Whitaker and Baxter managed 80 campaigns and won all but six of those. Their success can be credited to the way they approached their business and to their understanding of the American electorate. According to Whitaker and Baxter, a successful campaign depended on having the best candidate or the best cause. In fact, they were known to refuse candidates whom they did not feel had a chance of winning. According to the pair, there were two kinds of winning candidates: those who were fighting for a cause, because Americans love a good fight, and those who could put on a show, because Americans like to be entertained. Most often, the pair combined the two, presenting a fight in an entertaining way. But they would never allow their clients to wage a defensive fight. Candidates always had to appear to be on the offensive, even if they were not.

Once the couple took on a candidate or an issue, they secluded themselves in their home to work on their overall plan, which included a campaign budget. The most important part of the plan was the theme or appeal that would guide the rest of the campaign. The appeal had to be simple, with strong human interest potential. It had to have more "corn than caviar," a phrase used by the two to illustrate that the theme had to capture what was important to voters in their daily lives. The theme also had to appeal to voters as individuals. Whitaker and Baxter recognized that voters were not just Democrats or Republicans; they were parents, employees, veterans, club members, and churchgoers. The theme, then, had to resonate with voters on a number of different levels. Part of their

deliberations was the creation of a hypothetical plan for the opposition, which they would test out to determine the strength of their plan.

Once satisfied with their plan, they would boil the theme down to a slogan. Baxter was apparently the source of most of the slogans created by the pair. For example, for a mayoral recall in which there was no visible opponent, she created “the Faceless Man” to generate in voters’ minds the idea of a sinister and cowardly opposition. When voters were faced with the issue of legalizing gambling, Whitaker and Baxter built their campaign for the opposition on the theme, “Keep the Crime Syndicates Out.”

Believing that the success of a campaign depended in part on grass-roots organization to effectively disseminate material, Whitaker and Baxter also relied heavily on the support of allies. Alliances with organizations directly or indirectly affected by the issue meant that campaign materials reached more people. For example, when campaigning in behalf of teachers for pay raises, Whitaker and Baxter enlisted the support of parent-teacher associations and school construction companies.

One of their first campaigns, and the one that established their reputation, was to defeat Upton Sinclair, the author of *The Jungle*, in his bid for governor of California in 1934. Whitaker and Baxter spent days poring over Sinclair’s writing, finding damaging quotes that could be used against the left-wing author. They then hired an artist to create cartoons portraying typical Americans juxtaposed with quotes from Sinclair that, when taken out of context, appeared to denigrate traditional American values, such as marriage and family. The cartoons, which essentially linked Sinclair to communism, ran in newspapers and appeared on billboards throughout California. Sinclair was soundly defeated in the election.

One of their later campaigns became what sociologist Stuart Ewen has called the most underrated public relations campaign in American history. In 1945, California Gov. Earl Warren proposed a state-administered health insurance plan. Whitaker and Baxter were hired by the California Medical Association to defeat the plan. They were so successful that, in 1948, when President Truman

proposed a similar plan for compulsory health insurance at the national level, the American Medical Association approached them to handle the campaign. It was the first national campaign the two had run, and to facilitate the operation, they moved to Chicago.

From Chicago, Whitaker and Baxter directed an eleven-month campaign to doctors and the public, arguing that the government should be kept out of the doctor-patient relationship and promoting voluntary group insurance plans as an alternative. They used the slogan “The Voluntary Way Is the American Way” to get their point across and to foster the idea that compulsory health insurance was socialized medicine. Connecting Truman’s plan with socialism and suggesting it was un-American meant defeat for the national health insurance plan, a defeat that continues fifty years later.

In 1958, Whitaker and Baxter sold Campaigns, Inc. to three junior partners, one of whom was Clem Whitaker, Jr., Whitaker’s son from a previous marriage. They continued as consultants under the name of Whitaker & Baxter International until 1961, when Whitaker died. After her husband’s death, Baxter continued consulting and speaking to groups inside and outside the public relations field. In 1985, she won a Gold Anvil award from the Public Relations Society of America for her achievements and in 1990 was among the first group inducted into the PRSA College of Fellows.

BEAT

A beat is the specific assignment filled by a reporter. Each beat is a general topic area, usually

relating to some special part of the newspaper, television, or radio news.

Typical beats include city hall, police, entertainment, finance, social scenes, religion, education, fashion, and sports. Weather is another beat. Some news organizations even have environmental quality and consumer protection beats. Certain news organizations have national and international beats. They might have state capital and Washington, DC, beats.

By dividing reporters by beats, news organizations can be sure that they cover all of the important topics, groups, and institutions within their community where news is likely to occur. That means that once beats are established, specific reporters are responsible for covering them—knowing what is going on in that segment of the community. This increases the likelihood that the news organization will know what is going on over the full range of news. Thus, beats allow for breadth of news coverage.

They also facilitate coverage in depth. Each reporter becomes an expert on the events, people, opinions, and issues relevant to that beat. The dynamics of a community's social scene (society page beat), for example, are quite different—even if interdependent at times—from the city hall beat. Which socialite is hosting which nonprofit event is different from what member of city council is fighting for or against some measure pending before the council. Financial reporting on business trends, economic forces, and publicly traded companies takes special knowledge and insights that differ from sports reporting. Sports reporters need to know the ERAs (earned run averages) of the baseball leagues' pitchers. The financial or business beat reporters need to know about IRAs (individual retirement accounts). And they must work to meet reporters' needs for the details they require to report the "news."

Just as beats are important for news organizations, they have a parallel importance for public relations. If a publicly held company is hosting a golf tournament, that is sports news, and it is financial news. In the sports page, the company wants its name mentioned as often as possible because that gives it name recognition and brand equity with customers. In the financial section, it wants to be seen as a company that knows how to

gain name recognition and sell products. Such an event might also make the social page if the CEO gives a large check to some charity. That news also can help drive sales and might attract investors.

The savvy public relations practitioner knows the reporters in each beat that is relevant to his or her practice. They know what each reporter believes to be newsworthy and how each reporter investigates and reports on a story.

In that sense, public relations practitioners work through skilled media relations to help reporters do their business. Media releases and photo-ops are standard tools of the practice. So are newsworthy events.

BEEMAN, ALICE L.

Alice L. Beeman (1919–2003) was named in 1974 the first woman president of a national public relations association, the Council for the Advancement and Support of Education (CASE), a position she held until 1978.

CASE represented a merger of the American College Public Relations Association and the American Alumni Council and a shift in emphasis from college publicity to a focus on fundraising and development. Today, CASE is the professional organization for those who work in alumni relations, communications, and development.

Beeman began her communication career as a reporter for the University of Texas News Service. Also, she held university relations positions at Vanderbilt University and the University of Michigan. During her 22 years at the University of Michigan, she established a new university publications office and served as director of the Office of Publications. She was General Director of the American Association of University Women (AAUW), Washington, DC, from 1969 to 1974.

Beeman was president of the American College of Public Relations Association in 1975 and was

president of the AAUW Michigan chapter from 1955 to 1957.

She received her B.J. in 1941 from the University of Texas; her L.L.D. at Central Methodist College; and her L.H.D. from Anderson-Broadus College, 1973, and Boston University, 1978.

CASE honored Beeman by naming its annual research awards in her honor, recognizing outstanding theses, dissertations, and published scholarship on communications and education. Such research might include such areas as marketing, public relations, government relations, issues management, and institutional image enhancement. Awards are presented in two program areas—Outstanding Master's Thesis or Doctoral Dissertation and Outstanding Published Scholarship.

Former CASE President Peter McE. Buchanan repeated, upon her passing, Beeman's observation about the people of advancement in which she said, "To the degree that we convey our faith in education to others, we will be successful in our work of educational advancement" ("A legendary loss," 2003, p. 53).

BENCHMARKING

Benchmarking is the process of creating points or measures against which a public relations campaign can be evaluated. Quite simply, without some form of benchmark, evaluating public relations is not possible. A benchmark, then, is some outcome used to measure the current campaign. For example, businesses and corporations often benchmark quarters and compare how sales, unit production, and shares compare against the previous quarter, or perhaps the same quarter two years ago.

All public relations campaigns need a benchmark against which to judge progress or against which decisions are made about alternate tactics. In most public relations campaigns, there are three separate campaign phases: The *developmental phase* is the planning process of the campaign, where specific benchmarks are established. The *refinement phase* occurs when the campaign is actually underway, and during this phase measurements are taken and compared against the identified benchmarks. The *evaluation phase* occurs when the campaign has been completed and results are compared against initial benchmarks. It is through this process that benchmarking occurs.

BENCHMARK OBJECTIVES

Benchmarks are established based on the campaign's goals and objectives. A *goal* is the campaign's general expected outcome. *Objectives* are specific outputs employed tactically to obtain certain outcomes. For example, a goal may be to increase awareness of a corporation's philanthropy. The goal may be obtained through the use of press releases, brochures, articles in magazines, and so forth. The use of the various media is part of the objective—to increase awareness through these outputs—to achieve an outcome. The outcome must be measurable, must be tied to the goal, and must clearly come from the outputs. The objectives are then evaluated against the established benchmarks for the campaign.

Unlike many business objectives, which are almost always based on financial or physical objects, a public relations objective often is more abstract. Thus, public relations objectives and their benchmarks are typically of three types: informational, motivational, and behavioral. *Informational benchmarks* set the mark against how much information is getting out in the campaign. *Motivational benchmarks* establish what that information has done regarding attitudes toward the campaign object. *Behavioral benchmarks* establish whether the target audience is doing what the campaign seeks. Finally, there is the ultimate evaluation, where the actual behavior desired either occurs at the level expected or does not.

In our business awareness example, benchmarks are created during the campaign's developmental phase to be used both in evaluating the campaign's progress toward meeting its goal and to determine whether the specific informational, motivational, and behavioral objectives are being met. Developmental benchmarks are often obtained from historical and secondary data. These may come from previous campaigns or may be found in industry-wide or media-related publications. For instance, suppose the company had conducted a similar campaign five years earlier. Use of the results from that campaign could be used as a benchmark against which to evaluate the new campaign. On the other hand, a survey may have been conducted that indicated an awareness problem, and the results can be used as the benchmark against which the campaign would be evaluated during the refinement and evaluation phases. The survey (or focus group or interview data) would be considered primary data—data gathered by the company itself just prior to the developmental phase or as a part of the developmental phase. Thus, developmental benchmarks might consist of attitude surveys (primary data) or secondary data. Secondary data are gathered from other sources that would indicate how aware key customers, for instance, are of the company, its products, or its services. Primary and secondary data can be used in combination.

What is important is that the benchmarks be something the campaign can be evaluated against during its implementation. Developmental benchmarks provide data as to whether the campaign is progressing effectively in terms of messages being received and understood, whether those messages are motivating the target audience as intended, and whether the target audience will engage in the desired behaviors.

Refinement benchmarks should be established across the campaign timeline to indicate whether the campaign is working as expected. Refinement benchmarks can help to determine whether outputs are being received, and if they are, whether they are motivating the target public as expected. Good refinement benchmarks typically take the form of “by such and such a date, outcome should

be X as compared to the initial baseline.” These benchmarks are extremely important and not only provide a measure of effectiveness, but also can pinpoint errors in campaign logic. The ability of a campaign to determine whether certain outputs are working or require a tactics change may well be the difference between final success or failure.

Final evaluation benchmarks are found in the closing stages of the campaign. These benchmarks are set as close to the campaign goals as possible. Thus, final evaluation benchmarks are used to gauge whether the campaign's tactics will meet the projected goal or whether that goal should be reconsidered, the campaign revised or extended, or both. These benchmarks should clearly indicate behavioral intentions—in our example, that people will (1) have increased awareness of the company and (2) will use that awareness to do something that impacts positively on the company. Thus, final surveys or focus groups will assess whether the company's awareness has changed (hopefully for the better) and what that change may yield in terms of business objectives—again, typically financial or production-oriented.

Benchmarking provides the public relations practitioner with information as to why a campaign accomplished what it did and logic from which to explain its outcome to clients. A campaign that has no benchmarks cannot provide a client with a clear-cut and empirically related rationale for why something worked (or often more importantly, why it did not work). It does not help if a target audience approached the campaign goal, but the practitioner was unable to show how that outcome was obtained; communication and psychological researchers have found that if someone engages in an action and does not know why she engaged in it, then it is doubtful that she will do so a second time. Carefully selected benchmarks provide the data that show that a campaign's information was received, interpreted, and motivated the target audience to do what the campaign intended. They can also show where campaign tactics fell short, where they require reevaluation, or whether they were applied in an appropriate manner.

Without benchmarking, the public relations campaign is not measurable. Benchmarks provide the data points against which the campaign can be evaluated—both during the campaign (and thus providing evaluation points from which tactical change can be incorporated) and at the campaign's end. Benchmarking should be employed in all types of public relations campaigns no matter the campaign's goal: whether to win an election, to manage a crisis, or to promote a product or personality.

BERLOWE, PHYLLIS

Phyllis Harriette Berlowe was a public relations executive at a time when women were largely absent from upper management in agencies. Born in New York City on Dec. 10, 1922, she was the daughter of Louis, a businessman, and Rose Jatches Berlowe, a homemaker. Her father and several partners owned a beer distributorship that was wiped out during the Great Depression. Following this setback, he remained a salesman in the liquor industry. Phyllis had a brother, Max, and three sisters, Shirley, Yvette, and Dorothy. All of the Berlowe siblings followed creative pursuits.

Ms. Berlowe lived most of her life in New York City. She made the first step toward her career in public relations while attending New York University, where she majored in journalism and marketing. After a time, however, she went off on a

tangent for two years pursuing a premedical degree at Hunter College.

On graduating from Hunter College, Ms. Berlowe took up her first position as an editorial assistant on the petroleum publications at McGraw Hill Publishing Company in 1953. She left this position in 1955 to become head of the public relations department at Toscony Fabrics. Her agency experience included Theodore R. Sills & Co. (1959–1963), Harshe-Rotman & Druck, Inc. (1963–1965) and later work as executive vice president of Edward Gottlieb & Associates (1965–1978) and vice president at Hill & Knowlton (1978–1979).

It was at this point that she was accredited by the Public Relations Society of America (PRSA) and steadily rose to the positions of vice president of Doremus Public Relations, in charge of their Mindshare division, and president of Padilla Speer.

Ms. Berlowe was asked to mentor a client, and thus, she left Padilla Speer in 1986 to establish her own consulting firm, The Berlowe Group. Through The Berlowe Group, Ms. Berlowe provided specialized advice in a variety of business areas, including firm management, crisis management, and marketing strategies. Her expertise lay in understanding existing and emerging trends and connecting clients with the relevant publics through these trends.

Over four decades, Ms. Berlowe worked on an array of accounts offering different kinds of products and services aimed at a range of audiences. Her clients included comedienne Phyllis Diller, RT French Company (makers of French's Mustard and other products), Armstrong World Industries, and Pfizer, for which she created a major program with Ms. Alice Fay. Her global endeavors included working for Russian, French, and Dutch governmental agencies.

Her flair for public relations led her to win the prestigious Silver Anvil from PRSA in 1977 for her "cooking for the blind" program for Thomas J. Lipton, Inc. She also received the John Hill Award for balancing her conflicting professional and public priorities. Ms. Berlowe was also made a member of the PRSA College of Fellows in 1990.

She eventually returned as an instructor in public relations and advertising to her alma mater,

New York University, and other institutions, including Russell Sage College. She was also the Chairperson of the Counselors Academy in 1981, where her monograph on effective budgeting was published.

Ms. Berlowe was a member of PRSA, Women Executives in Public Relations, the Publicity Club of New York, American Women in Radio and Television, the Society of Consumer Affairs Professionals in Business, and the World Futurist Society. Remarkably, unlike most, she was an active member of all these societies, serving as mentor, president, or secretary. She was intensely involved in the formation of the PRSA accreditation program.

Her friend and colleague, Ms. Sheila Kelley, remembers, “She was extraordinarily creative, a very strategic thinker, and widely read” (personal communication, August 26, 2003). Ms. Kelley recalls Ms. Berlowe’s love of travel, a passion that took her to the Galapagos, Africa, and Russia while Khrushchev was still in power.

Ms. Berlowe’s niece, Kathy Berlowe, also noted Phyllis Berlowe’s love of travel. Trips to China and Africa yielded prints, photographs, and carvings that found their way into every corner of Phyllis Berlowe’s West 77th Street New York apartment, the place where she grew up. Kathy Berlowe described her Aunt Phyllis’ home as lively and eclectic.

Kathy Berlowe characterized her aunt as a “champion of women” and noted that Phyllis Berlowe was very supportive of her and of other women’s careers. She remembered her aunt as “witty, funny, clever and at times mischievous” (Berlowe, personal communication, 2003). Kathy Berlowe said Phyllis loved her life and was an explorer in her own way. Feisty, she broke through the glass ceiling at a time when women were seldom seen in business, let alone in positions of power and authority.

A “real New Yorker,” Phyllis Berlowe was also known for her sense of fashion and style. Niece Kathy Berlowe recalled that she loved shoes, color, hats, and jewelry and always made a striking appearance. Modest to a fault, Kathy said her aunt seldom talked about her business successes unless

Phyllis Berlowe

prodded to do so. Kathy attributed her aunt’s success, in part, to a unique ability to bring people out, to get them to talk about themselves. Tough and a good listener, she was able to understand people’s positions and strategize to best advantage for them. She was a master at building consensus, handling crises, and resolving conflict.

Ms. Berlowe died at the age of 77 on February 9, 2000, at Lenox Hill Hospital. She had two marriages that ended in divorce and is remembered as a loving aunt and great-aunt to the descendants of her brother and sisters.

BERNAYS, EDWARD

Edward L. Bernays, who was born in 1891 in Vienna, Austria, and died in 1995 in the United States, was one of the founding fathers of public relations. He invented the name for an emerging profession in 1920. In 1923, he taught the first course in public relations at New York University, he wrote the first book—*Crystallizing Public Opinion*—on public relations, he published the first article on public relations in an academic journal—“Manipulating Public Opinion: The Why and the How,” and he published in *The American Journal of Sociology*—the same year. He concluded that article with the following paragraph:

This is an age of mass production. In the mass production of materials a broad technique has been developed and applied to their distribution. In this age, too, there must be a technique for the mass distribution of ideas. Public opinion can be moved, directed, and formed by such a technique. But at the core of this great heterogeneous body of public opinion is a tenacious will to live, to progress, to move in the direction of ultimate social and individual benefit. He who seeks to manipulate public opinion must always heed it. (Bernays, 1928a, p. 971)

He saw a broader social mission for the new social technology in a pluralist society. He defined it very simply: “Public relations means exactly what it says, relations of an organization, individual, idea, whatever, with the publics on which it depends for its existence” (Bernays, 1986, p. 35). For that reason, “Public relations counsel functions on a two way street. He interprets public to the client and client to public” (Bernays, 1986, pp. 35–36). Bernays envisioned public relations as a profession: “By definition, profession is an art applied to a science, in which the primary consideration is

public interest, not pecuniary motivation” (Bernays, 1986, p. 36). Although his 1998 biography by Lary Tye is entitled *The Father of Spin: Edward L. Bernays & the Birth of Public Relations*, Bernays was an articulate opponent of “image making” (Bernays, 1986, p. 53):

The interest of both public and profession demands that the word “image” referring to public relations be eliminated. Practitioners should cease use of the word to describe their activities. The word “image” makes the reader or listener believe public relations deals with shadows and illusions. This word belittles a profession dealing with hard facts of behavior, attitudes and actions, that requires ability to evaluate public opinion and advise clients or employers on how to adjust to gain socially acceptable goals and to inform and persuade the public. (Bernays, 1986, pp. 54–55)

On p. 67 this argument is repeated in a short statement: “Public relations deals primarily with advice on action, based on social responsibility” (Bernays, 1986). For that reason he was a promoter of public relations research, education, and licensing. He saw public relations as being a social technology that can be used for either good or bad purposes—and as such in need of regulation.

Edward Bernays was born in 1891 in Vienna and celebrated his first birthday on the ship with which his parents immigrated to the United States. He was a double nephew of Sigmund Freud (his father Eli Bernays was married to Ana Freud, sister of Sigmund Freud, the founder of psychoanalysis; Sigmund Freud was married to Eli's sister, Martha Bernays). After graduating from Cornell University, in 1913 he traveled to Europe to meet his famous uncle. When back in the United States, Bernays corresponded with Freud and helped him with translations of his works from German into English. James E. Grunig and Todd Hunt wrote that it was because of his relations with Freud that Bernays became interested in social sciences and that he was probably the first “intellectual” (Grunig & Hunt, 1984, p. 77) in the public relations profession. This is how Bernays saw his work:

Public relations counsel . . . functions primarily as an adviser to his client, very much as a lawyer

does. . . . His first efforts are, naturally, devoted to analyzing his client's problems and making sure that what he has to offer the public is something which the public accepts or can be brought to accept. It is futile to attempt to sell an idea or to prepare the ground for a product that is basically unsound. . . . His next effort is to analyze his public. He studies the groups which must be reached, and the leaders through whom he may approach these groups. Social groups, economic groups, geographical groups, age groups, doctrinal groups, language groups, cultural groups, all these represent the division through which, on behalf of his client, he may talk to the public. . . . Only after this double analysis has been made and the results collated, has the time come for the next step, the formulation of policies governing the general practice, procedure and habits of the client in all those aspects in which he comes in contact with the public. And only when these policies have been agreed upon is it time for the fourth step. (1928b, pp. 38–41)

This fourth step is implementation, or execution of public relations programs. Here Bernays, in the contemporary literature, gets nearly mythical powers and becomes everything he was fighting against: Stuart Ewen put Edward Bernays in the very center of his *PR! A Social History of Spin* in 1996, while Tye named Bernays *The father of spin* in 1998. Bernays himself contributed to this mythology when he published his autobiography three years after retiring in 1962 and listed 229 of the most important clients he had served, among them: American Tobacco, Bank of America, CBS, General Electric, General Motors, Proctor & Gamble, United Fruit, Westinghouse, and more.

The most articulate criticism of Edward Bernays' work was published by Marvin Olasky in 1987. He wrote,

Bernays is known to some historians for naming the field that he would influence so heavily. In 1922, while Ivy Lee was still referring to himself as a publicity advisor, publicity expert, or publicity director, Bernays was describing himself as a public-relations counsel, and that is the title that caught on. . . . But Bernays did something more important: He gave public relations practitioners pride in their activities. . . . He was able to do so because of his communication skills and a

personal belief-structure made up of atheism, Freudianism, and a faith that behind-the-scenes controllers should exercise "social responsibility" by devising clever public relations campaigns to direct "human herds" into appropriate corrals. (1987, p. 80)

Although Ewen's 1996 criticism of Bernays, his work, and his writing came from the left side of a political spectrum, Olasky's criticism is from the political right; Bernays became a symbolic figure for everything to be censured in contemporary public relations, and it is very interesting to see that the United States public relations community, academic and practitioner alike, is uncomfortable dealing with Bernays. Yet, if public relations is ever to get widespread recognition for doing something socially valuable, it can achieve this only by confronting Edward Bernays and his legacy.

Bernays said in his 1955 article, "The Theory and Practice of Public Relations: A Resume," that

public relations is the attempt, by information, persuasion, and adjustment, to engineer public support for an activity, cause, movement, or institution. . . . Professionally, its activities are planned and executed by trained practitioners in accordance with scientific principles based on the findings of social sciences. The dispassionate approach and methods may be likened to those of the engineering professionals which stem from the physical sciences. (1955a, pp. 3–4)

Modernist and positivist approaches to social research and education explicit in Bernays's definition of public relations are not so popular at the beginning of the 21st century as they used to be in the middle of the 20th century, but the use of public relations as social technology based on scientific research and education will become ever more present as cohorts of undergraduate and graduate students in public relations from universities around the world enter the market. Bernays' life spanned over a century, but his time is yet to come; public relations has yet to become an art applied to science.

BEST PRACTICES

Best practices are those that can be applied universally in public relations with assurance that such approaches will yield the most effective, responsible, and ethical performance and results. Robert Heath suggested in his *Handbook of Public Relations* that the theme of best practices drives the discipline, noting that much of the professional literature—as well as much of the field’s academic literature—addresses this central question: How can public relations practice be improved to increase practitioners’ abilities to influence desirable outcomes benefiting the organizations they are serving? Like every other human endeavor, public relations involves probabilities; best practices serve to enhance the probabilities that public relations endeavors will be effective and successful.

Best practices may emerge from the experiences and judgments of leading practitioners. They may be derived from the theory building and academic research conducted by scholars of public relations. Best practices may be defined, tested, and refined by practitioners and academics alike; in fact, it may well be that it is during this quest to identify best practices that practitioners and academics are most likely to meet and complement one another. Some suggest that if the reality that public relations is a practical, applied discipline is disregarded, then the

research and theory building of the field may risk becoming dysfunctional.

However, the fact that myriad options exist in public relations makes identifying universal best practices challenging indeed. Edward Bernays wrote in his memoirs that he had once thought the practice of public relations could be modeled after the practice of law; that public relations could be codified and, like law, practiced after precedents were established, applied, and followed. However, Bernays gave up the notion of public-relations-practice-by-precedent because he found there are simply too many variables to be accounted for in public relations practice, complicated further by the fact the variables so often are constantly changing. Bernays' assessment that public relations is too complicated to be practiced by precedent has implications for best practices. Although it is clear that there *is* a best practice for any given situation in public relations, determining *what* the best practice is can be challenging.

For example, most will agree that public relations constitutes a process. Contemplating different paradigms in public relations practice, Kirk Hallahan identified no fewer than seven different paradigmatic models of processes presently used in practice. These include (1) the *four-step process model* (Research-Action-Planning Evaluation), which Hallahan viewed as the dominant default paradigm conceptualizing public relations as an ongoing set of routine activities without time frames; (2) the *plan or program paradigm*, focusing on planned or programmed strategies and tactics; (3) the *communication/practice style paradigm*, focusing on communications produced regardless of process or plan; (4) the *organizational/managerial effectiveness paradigm*, emphasizing developing effective relationships with the organization represented and meeting organizational expectations; (5) the *behavioral paradigm*, stressing the achievement of intended behavioral outcomes among target publics; (6) the *social problems paradigm*, focusing on public relations' response to political or sociological problems and opportunities and how practitioners deal with power relationships in society; and (7) the *systems paradigm*, emphasizing internal

and external inputs and communication and action outputs designed to reduce conflict and build consensus between an organization and its publics.

Which of these or any other paradigms is the best practice in a particular public relations application will depend on a number of variables, beginning perhaps with the worldviews of key participants making the public relations decisions. For example, one study identified 87 variables that practitioners typically take into account when determining which best practices to apply in accommodating an external public in a given situation. In his elaboration of the process paradigms, Hallahan (1993) noted that none provides a unifying framework for the field, let alone a fully satisfactory overview of the field. Hallahan also pointed out that evaluations for each of the process paradigms is different—for example, for the four-step process paradigm, evaluation answers the question, “Were all the steps of the process followed?” whereas for the plan/program paradigm, evaluation answers, “Was the campaign well executed in terms of objectives, strategies, tactics, budget, and so on?” and for the systems paradigm, “Was equilibrium maintained?” (1993).

Although such variability among evaluations exists, depending on the process paradigm applied, it is clear it is a best practice in public relations to *evaluate*. Similarly, it is a best practice to conduct research when investigating the situational context necessary to define a public relations problem or opportunity; however, what type of research will constitute best practice in a particular instance will be contingent on the particular situation. Likewise, there are best practices with regard to ethics. For example, it is a best practice to conduct public relations ethically, with honesty for all parties concerned, and with loyalty to the organization and its causes represented as well as to the public. The Code of Ethics of the Public Relations Society of America (PRSA), in statements of professional values, reflects these best practices. Regarding honesty, the code says, “We adhere to the highest standards of accuracy and truth in advancing the interests of those we represent and in communicating with the public,” and, regarding loyalty: “We are faithful to those we represent, while honoring our obligation to serve the

public interest” (PRSA, 2000). Although these broad statements may well be universally accepted, no doubt the finer points of many best practices of ethics in actuality would be situationally determined.

There is no single source summarizing all best practices in public relations. It is doubtful that practitioners and scholars would agree on a uniform code of best practices, at least in part due to the situational variability that characterizes the field. Certainly, best practices in public relations have evolved over time and will continue to evolve along with the field. At the same, there are a multitude of resources for practitioners and scholars to create their own compendiums of best practices to guide their individual work. For example, there are numerous textbooks about public relations. Three examples are *Effective Public Relations* (Cutlip, Center, & Broom, 2000), *Public Relations: Strategies and Tactics* (Wilcox, Cameron, Ault, & Agee, 2003), and *This Is PR: The Realities of Public Relations* (Newsom, Turk, & Kruckeberg, 1996). Although none of these three textbooks index the words “best practices,” they all dedicate themselves to summarizing many best practices. A range of other recent books about the field also covers best practices. For example, the *Handbook of Public Relations* (Heath, 2001) has 16 chapters specially devoted to best practices, covering topics such as planning and organization, crisis communication, relationship building, educational public relations, and other specialties “in context,” such as health care; many of the book’s other 62 chapters also address best practices, as do books such as the *Manager’s Guide to Excellence in Public Relations and Communication Management* (Dozier, L. A. Grunig, & J. E. Grunig, 1995) and *Management of Corporate Communication: From Interpersonal Contacts to External Affairs* (Heath, 1994).

Academic journals such as *Journal of Public Relations Research*, *Journal of Communication Management*, *Management Communication Quarterly*, and *Public Relations Review*, including the *Review’s* annual Bibliography, publish content and references concerning best practices; many of these have a theoretical grounding or framework. The professional press, such as *PR Tactics*, *PR*

Week, *Inside PR*, *Public Relations Quarterly*, and *Communication Briefings*, among many other titles, frequently offers information about best practices, sometimes featuring case studies. Online resources include a public relations Web site administered by Kirk Hallahan (available at <http://PR-education.org>) with numerous links to sources of information about best practices.

PRSA’s Professional Resources Center provides a lending library of case studies and other materials illustrating best practices for nominal fees. Continuing education professional development seminars and workshops offered by the International Association of Business Communicators, PRSA, and other national and regional professional organizations as well as their local chapters typically highlight best practices. These are just a few of the available sources of information about best practices. Finally, as this *Encyclopedia of Public Relations* is being compiled, so is a long-awaited update to the Public Relations Body of Knowledge. With that latter document, PRSA attempts to codify the field’s knowledge about best practices—a necessary condition for any occupation to be considered a profession. Copies will be available through the PRSA’s Professional Resources Center.

BILL STUFFER

Bill stuffers are one of many public relations tools used to reach targeted audiences. They are especially available for utility companies and other business types that send out periodic billing statements. They are also used by nonprofits, especially activists who know that their mailing lists contain the names of people who are likely to be motivated to take specific actions.

Each month or on some other occasion, thousands of bills are mailed to customers and donors across the nation. Anyone who receives such bills often is aware of the “clutter” of stuff that accompanies the bill. Certain organizations also take these opportunities to communicate with their customers or donors.

Bill stuffers can contain information that actually is of value to many patrons. For instance, a utility company might suggest ways their customers can reduce their heating and cooling bills. For these companies, such bill stuffers can be part of their customer relations program. Activist groups might take billing time to profile the plight of some group of individuals in society, the need for increased funding, and even legislative initiatives that are favored or opposed by the sponsor who mailed the bill stuffer.

These tools can also be used to shape opinions and motivate the targeted audience. They can suggest that some opinion would be in the best

interest of their targets. Insurance companies, as an example, might call their customers’ attention to legislation or regulation that might raise—or lower—insurance rates. Activists, for instance, might indicate how research has discovered an association between a product’s design and consumer health. Utility companies have often used bill stuffers to justify support or opposition of some legislation or regulation.

One can well imagine that many bill stuffers go unread. Customers and donors have to sort through the clutter accompanying bills to find what needs to be done. They may be focused on other tasks, such as paying bills, rather than responding to appeals or seeking information. At best they reach only persons who are already cognitively involved with some issues. These people might be opinion leaders who pass information, evaluation, and advice to others.

Although such communication tools might be inefficient or ineffective because of the few people they reach—the ones who actually read and respond—they have found themselves at the vortex of controversies. One example of controversy was the era of anti-nuclear plant construction activism. Some electric generating utilities that wanted to build and operate nuclear generating facilities included pro-nuclear messages on their bill stuffers. Anti-nuclear activists argued that this use of message delivery unfairly privileged the utility companies, who could easily reach their customers each month.

Various regulatory agencies have reviewed the use of such bill stuffers. Typically the Supreme Court has ruled that these tools are not regulated or prohibited communication if they serve a larger public interest beyond the narrow commercial interest of the sponsor.

—Robert L. Heath

BIO

Bio is the abbreviation for *biography*. Bios are the life sketches of individuals who represent an organization or business entity. Although bios do not provide the entire life story of a member or leader

of an organization or company, they do contain information about a person that establishes him or her as qualified and as someone whose experience brings credibility to the organization or company.

Items to include in bios are a person's educational background; previous places of employment, with emphasis on management positions held; and awards, achievements, and professional recognitions received. A limited amount of personal data also may be included, such as spouse and children's names, as well as community involvements.

Bios are almost always included as a component of media kits. When a company or organization distributes a media kit, bios of the top executives should be included, along with other background information about the organization. Bios also may be included with a press release, especially if it is an announcement of a promotion within a company, organization, or public relations agency. Depending on whether the press release is e-mailed or sent by hard copy, headshots of the newsmakers should also be included, preferably in color fit to print. If only black and white photos are available, a note should be included that indicates when color photos will be ready.

Bios also are useful to have available for each member of an organizational team and also for each member of an organization's board of directors. Depending on the organization, bios may appear on Web sites to familiarize key publics with those that are serving them.

Most often, public relations practitioners are responsible for compiling bios and ensuring they are kept current. Having bios available will only make the public relations practitioner's job easier, as the content may be used in internal news publications, brochures, and other items.

Credentials contained within bios are crucial for providing credibility for an organization's message. For example, sources with biochemistry degrees speaking about the effects of harmful radiation are viewed as more credible than sources with world history degrees. Both degrees are meaningful, but biochemistry is more relative to the issue at hand.

Having bios readily available also enhances the public relations practitioner's credibility with

the media. When a reporter needs background information immediately for a breaking story, not having to wait for the public relations department to produce it lends credibility to the organization.

Bios most often are written in the third person. They should also avoid editorializing. They should appear on company letterhead, but without the contact information that would appear in a press release.

BLACK, SAM

Pioneering and prolific summarize the contributions of Britain's Sam Black, one of the world's first global practitioners, as well as one of the founders of modern-day United Kingdom public relations practice. Born to Russian immigrant parents in Britain in 1915, Black's career spanned most of the 20th century; the name "Sam Black" is still widely associated across Asia and Africa with the father figure in public relations.

Black's first employment was as an ophthalmic optician, from which he ventured into media work for the BBC's broadcast of the *Women's Hour from Alexandra Palace*. He then developed his professional public relations experience through organizing exhibitions and conferences in 51 countries promoting British industry. Although belittled by some of his International Public Relations Association (IPRA) colleagues for not coming up through the general practitioner ranks, it is clear from Black's writing that he recognized that his public relations specialization was an important contribution to both public relations and national development. The confirmation of the widespread influence of Black's work came in 1969 when the Crown and the British government awarded him an MBE. His

personal definition of public relations was “Public relations practice is the art and science of achieving harmony with the environment through mutual understanding based on truth and full information” (Melvin Sharpe, personal communication, November 10, 2003).

In addition to his promotion work, Black was a prolific writer, producing numerous articles and more than a dozen books, beginning in 1962 with the first edition of *Practical Public Relations* (the fourth edition was co-authored with Ball State professor Mel Sharpe in 1983). He also wrote what was arguably one of the first public relations management books in the world, *The Role of Public Relations in Management*, in 1972. His last book, *The Practice of Public Relations*, was published in 1995, but he continued to comment about the practice until his death in 1999. Black was also the organizer of some of the most successful IPRA World Congress gatherings, where more than 1,000 delegates from around the world came to hear him. He was a sought-after speaker, doing lectures in more than 100 countries on five continents, including Australia and Asia, and in countries from Nigeria to China. Black gave the keynote address at the first International Seminar on Corporate Public Relations in Shenzhen, China, in 1990, where 200 practitioners from 21 Chinese provinces listened to his lecture and then asked him questions for more than two hours. He returned to China and Hong Kong in 1992, where he worked with the Chinese Public Relations Institute and contributed to a prospectus for the China Global PR Company. He followed that in Hong Kong with work on the IPRA’s conference program.

Perhaps Black’s most enduring contribution to the development of public relations was his development and promotion of public relations education. He was particularly interested in promoting education in some of the more undeveloped regions in Africa and Southeast Asia.

In September 1980, he organized a special IPRA Educators’ meeting in Hong Kong; the proceedings of this meeting became the basis for IPRA Gold Paper No. 4, titled “Model for Public Relations Education for Professional Practice” and published

in 1982. IPRA Gold Paper No. 7, “Public Relations Education—Recommendation and Standards,” was published in September 1990. In the mid-1980s he completed a world tour that again took him to the Far East, Australasia, and Africa; along the way he received recognition for his work from a number of local and regional public relations societies. In particular, Black played an important part in helping public relations education develop in Kenya and Nigeria. He also established and conducted a summer school for the Zimbabwe Institute of Public Relations.

While he was spearheading worldwide public relations education efforts, he also found time to contribute to public relations in his home country. Recognized as the United Kingdom’s first public relations professor, he began work on public relations curricula in 1975 and brought into existence the country’s first graduate program in public relations in 1988 at the University of Stirling in Scotland. With the success of the residential program, Black was also involved, along with Tim Traverse-Healy, another pioneering practitioner and educator in the United Kingdom, in creating the first distance-learning master’s in public relations, initially sponsored by Shandwick Plc.

In addition to his professional and academic work, Black contributed his time and expertise to a number of professional organizations, including serving as IPRA president in 1982 and secretary general and treasurer from 1977 to 1980; being a founding member of the Institute of Public Relations (IPR); and serving as the chairman of IPRA’s International Commission on Public Relations Education in 1990. He was also the founder and editor of the *International Public Relations Review* from 1977 to 1985. In addition to his MBE, Black earned the Institute of Public Relations President’s Media in 1972, a certificate of merit from the European Public Relations Centre in 1972, and a President’s Citation from the Public Relations Society of America in 1978. Black’s MBE was not his only title; he also earned the distinction of being an IPR Fellow and a British Institute of Marketing Fellow.

Specific American activities included Black’s attendance at Edward Bernays’s 90th, 95th, and

100th birthday parties, along with lectures on the South Alabama, Southern Illinois University, and Ball State University campuses at his own travel expense.

Remembered as a modest man, Black's correspondence on a global basis was prodigious; today many of his papers are housed in the Sam Black correspondence and papers collection at the University of Stirling. As a person, Black was noted for his keen sense of humor and his membership in the Finchley Chess Club.

BLOCK, ED

Ed Block was senior vice president of public relations for AT&T from 1975 to 1986 and was one of the principal founders of the Arthur W. Page Society, which inducted him into its Hall of Fame in 1993.

Block became AT&T's senior vice president of public relations when a friend and contemporary who held the job succumbed to lung cancer at the age of 50. He retired from that position 11 years later, following the 1984 demise of the Bell Telephone System. In between, he led a public relations organization of more than 4,000 employees at AT&T and its 21 principal subsidiaries. He established the AT&T Foundation with the proceeds from selling the company's headquarters building and directed grants of more than \$250 million to education, community, and arts organizations. In the era before 24-hour news channels, he helped the Public Broadcasting System launch the first one-hour evening news program by making a five-year, \$50 million underwriting commitment to the *MacNeil/Lehrer NewsHour*. And when, to settle a government anti-trust suit, AT&T divested the local telephone companies through which it was primarily known, he crafted a new identity for the company and built it into one of the world's best-known brands. The trajectory of his life demonstrates

how one success builds on another when you seize opportunities others might mistake for chance, coincidence, or even bad luck.

Edward Martel Block was born on July 10, 1927, in Houston, Texas, where he was brought up and attended parochial schools. His mother gave her maiden name to each of her sons as a middle name in celebration of her Louisiana French heritage. His father was a Certified Public Accountant who counted Howard Hughes' father among his clients. Somewhat to his father's dismay and unlike his older brother, Ed had no interest in joining the family business. Perhaps inspired by family friends who were editors and columnists, young Ed always wanted to be a newspaper reporter. Nevertheless, following high school, he attended Notre Dame University to study business. However, after two semesters and as soon as he turned 17, he joined the United States Marine Corps. He had hoped to be accepted for pilot training in either the Navy or the Army, but a deformed jaw disqualified him, and he spent the last years of World War II riding a desk in Pensacola, Florida.

Mustered out of the armed services in August 1946 and uncertain about his future, he enrolled at the University of Houston. But that decision didn't last. A high school friend proposed a visit to Saint Edwards University in Austin, only a small detour from their intended destination, a country music concert. Discovering that one of his former Notre Dame professors had transferred there, he enrolled for the January semester. He became editor of the Saint Edwards student newspaper, but to placate his father, he also took business courses at Notre Dame during the summer. In the end, he switched his major to journalism and received his degree from Saint Edwards.

While in school, he worked part-time for United Press and, also, the *Austin American Statesman*, where he covered high school sports. On the Monday following his college graduation, he joined the reporting staff of the *Banner Press* in Brenham, Texas, halfway between Houston and Austin. Soon married to the former Shirley Ross Young and beginning a family, Block supplemented his \$40-a-week reporter's salary by doing evening newscasts

for \$10 a week at the newspaper's radio station and moonlighting for UP at 10 cents a word.

In 1952, a childhood friend's father, who was a noted columnist for the *Houston Post*, asked Block to participate on a panel at a meeting of the Texas Gulf Coast Press Association. The topic was the myths and realities of the newspaper business. Block's advice on how to develop and cultivate sources so impressed one of the attendees, who happened to be a public relations manager for Southwestern Bell, that he offered him a job. While not anti-business, Block was at best ambivalent about the opportunity. He had covered many of the telephone company's rate cases and was at least suspicious of its monopolistic ways. On the other hand, his first child had just been born, and he couldn't afford not to explore every career opportunity. He agreed to talk, thinking nothing would come of it.

Before he knew it, the phone company sent him a questionnaire developed by an industrial psychologist of national repute, Burleigh Gardner. Block tossed it aside, planning to fill it out in the odd moments of quiet in the newsroom or at home. Weeks later, his new friend at the phone company called to ask whether he had received the questionnaire. Block knew it was somewhere in the clippings and wire reports on his desk. Embarrassed to have taken so long to respond, he dashed off his responses and threw it in the mail. Soon after, as he was finishing his evening news broadcast, his phone rang and a sweet female voice asked him to hold for a Mister Douglas Williams, vice president of public relations for the Southwestern Bell Telephone Company. Williams, who was based in St. Louis, Missouri, expected to be in Houston in a few days. Could Block see him then? Block agreed and, when they met, Williams offered him a job in St. Louis at \$475 a month. Between his two jobs and his moonlighting, Southwestern Bell's offer would more than double Block's salary. Years later, Block discovered that, based on his responses to Gardner's questionnaire, the psychologist had recommended against hiring him because his responses indicated that he "was not a team player."

Williams was not a conformist and was not uncomfortable with people who stood out. Short,

fat, with a pocket full of pens and pencils, he was a former reporter for the *St. Louis Post-Dispatch* who had never lost his taste for gambling on dice and horses—nor on people. He moved them around from job to job every six or seven months until they knew how to do every assignment in the organization. Then he gave them more responsibility until he knew their limits. At one time, half of all the public relations leaders in the Bell System had reported to Williams earlier in their careers.

Block's first job was handling media relations and employee communications for the company's Missouri operations. Accustomed to simultaneously handling multiple assignments and making decisions by the seat of his pants with little or no supervision, Block was amazed by all the approvals his work required and was shocked by how slowly everything moved within the phone company. Despite his handsome salary, he shared a typewriter with another public relations person. After a year or so, he was moved to a similar assignment on the general headquarters staff, and then he was sent back to the Missouri area as a supervisor. But he never got used to the bureaucracy, and in 1956 he quit to join Gardner Advertising. Because Southwestern Bell was the agency's biggest client, its president talked to Williams about the move. To everyone's surprise, Williams considered it just another dimension to Block's training, even though he would be leaving the company's payroll. Not long after joining the ad agency, Block began to see that William's observation was more than rationalization. Faced with the chaos of the agency business, he quickly learned to manage people who didn't report to him. He learned how to work with art directors so an ad was not simply words with an illustration but a single concept expressed as language and art. He learned the discipline of writing to rigorously defined type-space and time slots. And he learned to collapse a promise into the fewest possible words with the greatest possible power and clarity.

Although he worked for clients ranging from Monsanto to Cessna Aircraft, he also wrote ads for Southwestern Bell. On a trip with the Gardner account supervisor and Williams, Williams started giving Block some assignments. Then he caught

himself and asked Block who he worked for. He had forgotten that Block had moved to the ad agency, and he wanted him back. For his part, after less than three years in the agency world, Block was ready to return to the client side. But it came with a price. Despite his apparent complicity in Block's "outside training," Williams did not want to encourage it. He told Block he would be returning with a title a notch below what it had been when he left. Swallowing his pride, Block agreed and returned. Within months he was promoted to editor of the company's magazine, which he quickly converted into an award-winning glossy picture magazine with outside art direction. Williams had made his point and Block was once again a member in good standing of Ma Bell's public relations family.

In 1962, when Block returned from vacation, his immediate supervisor called him in and made a surprising announcement. "We have a new job for you. We want you to start an in-house agency to handle our advertising." Block's reaction was immediate: "That's a terrible idea." But they had already drawn up an organization chart that Block remembers looked like "the outside plant department in Nebraska" (Block, personal communication, May 8, 2003). Convinced that they intended to move forward with or without him, Block agreed to lead the effort on three conditions: He wanted to rent space outside the telephone company building, he wanted a staff of no more than three—himself, another copywriter, and an art director—and he wanted to hire an outside agency to handle media buying. To his surprise, they agreed, and the new agency moved five blocks down the street into a rented apartment. Over the next two years, Block and his team created more ads than the company could run.

Meanwhile, one of Block's supervisors when he first joined Southwestern Bell had been moved to AT&T, and in 1964, he asked him to take a media relations job at corporate headquarters in New York. In those days, an AT&T assignment was almost a requirement for advancement in the Bell System. Block accepted. About a year after his arrival, AT&T suffered the equivalent of a torpedo to its hull. On October 27, 1965, the Federal Communications Commission initiated an inquiry into the company's

pricing practices. No one knew it at the time, but this would be the first of a series of government inquiries that would ultimately lead to the break-up of the Bell System. Block's assignment that day was deceptively simple—dream up every question that this FCC action could stimulate and find answers to them. He typed every question on a single sheet and distributed all the sheets to the operating department heads, asking them to fill in the answer by the next day. Stapled together, those questions and answers became the company's "Bible," guiding not only media responses and speeches but also the Company's response to the FCC.

When Southwestern Bell reorganized its public relations department in 1966, they brought Block back as general information manager responsible for media relations, employee communications, and speech writing across the company. It was a significant promotion, but he was not allowed to enjoy it for long. Remembering the "Bible" he had constructed on his last rotational assignment in New York, AT&T's public relations leadership called Block back to corporate headquarters in 1969. A big part of his new job was overseeing public relations for all the Bell companies' rate cases across the country.

In 1971, while in an executive development program at Dartmouth College, Block learned that he had been appointed assistant vice president of advertising, replacing a manager whom the "26th floor" (where AT&T's senior executives had their offices) felt was dabbling in "controversial" programming, such as a Simon and Garfunkel concert that featured flag burning. The Vietnam War had divided America along generational lines, and Block decided to develop not only advertising but also programming vehicles that were more in character with the company's values. The result was the "Bell System Family Theater," which launched in 1972 with a 90-minute program devoted to the music of George Gershwin and garnered a dozen Emmy Award nominations.

Block had held the advertising job for less than two years when he was asked to interview with the new Chief Executive of Illinois Bell, Charles Brown, to become his vice president of public relations. The former head of Illinois Bell public

relations, Paul Lund, had just become Block's boss in New York. "Can you start Monday?" Brown asked. Apparently, the decision had already been made.

His first day on the job in Chicago, Block attended the CEO's Monday morning staff meeting and listened to a presentation on the company's plan to file for price increases. After the presentation, Brown asked each of his officers if they had any questions or comments. There was a lot of mumbling approval until Brown looked at Block. A little uncomfortable disagreeing with a colleague so early in his tenure, Block nevertheless plunged ahead. "I think we need to go back to the drawing board," he said. "A rate case is really an exercise in public persuasion and this plan has no component for getting public approval." Seemingly eager to avoid a prolonged discussion, Brown cut in and asked Block to work with the pricing people. Later, Block was surprised to learn that not only did Brown agree with his assessment, but so did the officer who had made the presentation. Together, they fielded public surveys and translated the justification for price increases into terms the average person could understand. For example, they put price tags on lengths of cable showing how their cost had increased since the last price changes. For the first time, the company actually received favorable press coverage for one of its rate cases, and it sailed through approval.

Within two years, Charlie Brown had moved to AT&T as executive vice president and a confidant of the company's chairman, John deButts, who also had at one time been a CEO at Illinois Bell. When the head of AT&T public relations, Paul Lund, died unexpectedly, Block was offered the job. By then, the United States Department of Justice had filed an antitrust suit against the company, in addition to the FCC's continuing inquiries and dozens of private antitrust suits. The company's agenda was dominated by regulatory and legal issues, and its chairman, John deButts, was determined to resist any further efforts to open the telecommunications markets to competition.

In February of 1979, Charlie Brown succeeded deButts as AT&T's chairman and CEO. Convinced that competition was inevitable, Brown thought it

made little sense to waste time in the courthouse. He wanted to settle the antitrust case and get on with deciding what business the company was in and where it should stake its future. Setting aside the company's public utility lawyers, he brought in a senior partner of the company's outside law firm as General Counsel. Within months, the company reached a handshake agreement with the Carter White House that would have settled the suit by spinning off Pacific Bell and the companies in which AT&T had minority interests. Block even prepared a communications plan for the agreement, but Carter was not reelected president, and the deal was called off. In the Reagan administration, both the Attorney General and his chief deputy had to recuse themselves from participating in any discussions of the case. Months went by before a Stanford law professor, William Baxter, was appointed to take charge. He believed the local telephone companies were natural monopolies, and everything else was competitive. He would not negotiate around those points.

In December of 1981, Block's intercom rang and Brown asked whether he could drop by. In the hallway, he ran into the Chief Counsel, who had received the same call. When they got to Brown's office, he told them that he had decided to settle the case by spinning off all the local telephone companies. But he had two questions. For the chief lawyer: "How do we lay down our sword? What's the legal procedure?" And for Block: "I can't make this decision unless you can convince me we can explain it plausibly to the public. Get to your typewriter" (Block, personal communication, June 26, 2003).

While his legal colleague researched the finer points of precedents, Block converted the laundry room of his Manhattan apartment into a makeshift office, using the washing machine as a stand-up desk and moving his Olympia typewriter around on a rolling stand. He hired pollster Lou Harris to do a quick survey on the general terms of the settlement. Harris delivered the results within one week, equipping Block to fashion his storyline around many of the questions the settlement raised. Forcing himself to focus on the essential elements of the story,

Block wrote it as a full-page newspaper ad, which became the platform for all other communications. He then moved backward and forward from that announcement ad to develop a plan for pre-notification and follow-up with each key constituency, from employees and labor leaders to the Secretary of Defense and other public officials. When Block emerged from his laundry room with his homemade ad and his hand-typed plan, he reviewed it with Brown and then brought his staff on board one by one. To avoid leaks, AT&T's ad agency arranged to have parts of Block's ad set in type at different printers. On January 8, 1982, AT&T and the Department of Justice announced the historic settlement. The Bell System would be no more.

Ironically, only about 10 percent of the general public knew that AT&T offered long-distance service, the key business on which the company had staked its future. Before retiring in September of 1986, Block had helped increase that figure to more than 90 percent. But his most lasting contribution to public relations will probably be the establishment of the Arthur W. Page Society in December of 1983. Originally conceived as a means of bringing together public relations officers of the former Bell System, it quickly evolved into a highly select membership organization for senior public relations and communications executives across a wide spectrum of industries. Committed to the belief that public relations is a function of executive management central to a corporation's success, the Page Society seeks to perpetuate the business principles of Arthur W. Page, who was one of the foremost contributors to the modern concept of public relations. The man who brought Ed Block into public relations, Doug Williams, at one time reported to Page and taught his standards. With the Page Society, Block has returned the favor.

—*Dick Martin*

BOGART, JUDITH S.

Judith Bogart (1936–), public relations consultant, was appointed the second woman president of

the Public Relations Society of America (PRSA) in 1983. She commented on the fact that her presidency would be followed by a third woman president, Barbara Hunter: "It's good—gets us out of feeling we *should* have a woman. This way, we're breaking precedent. Now sex can play less of a part, even if no more women take posts in the *next* 10 years" (Bogart, 1983).

Bogart's career in nonprofit public relations was atypical among PRSA's national leaders; however, Bogart pointed out that hospital public relations had much in common with corporate public relations. "Jewish Hospital of Cincinnati for example, one of the top 25 employers in Cincinnati in 1983, had an \$80 million budget" (Bogart, 1983, p. 36).

After completing an undergraduate degree at Baldwin-Wallace College, Bogart began her professional public relations career for the Girl Scout Council in Great Cincinnati. She then moved on to Arlington, Virginia, for the Girl Scout Council of the Nation's Capital and later worked for the Great Rivers Council in Cincinnati. She was regional account executive for Education Funds, Inc. and was director of community relations for the Cincinnati Human Relations Council.

Bogart was vice president of Jewish Hospital of Cincinnati from 1977 to 1985. From 1985 to 1988, she was executive vice president of Diversified Communication Inc., Cincinnati. She then purchased the Southwest Ohio office of Diversified Communications, changing its name in 1989 to Judith Bogart Associates, Cincinnati. From 1991 to 1996 she was director of public relations for Sive/Young & Rubicam, Cincinnati.

Bogart was named Career Woman of Achievement, YWCA, in 1983; Fellow, Public Relations Society of America, in 1990; member and 1982 national headliner of Women in Communications; and president of the North American Public Relations Council in 1989. In 1995, she was on the board of governors of the Bankers Club and on the board of directors of the Institute for Community Capacity Building.

Bogart was winner of the Paul Lund national PRSA award for community service in 1999. Her career civic activities include, in addition to the Girl

Scouts of America, service on Cincinnati's International Visitors Board, the Uptown Task Force Executive Committee, Xavier University's Community Relations Advisory Board, and Northern Kentucky University and Western Kentucky University communication and journalism school advisory boards.

BOULWARISM

Boulwarism is a pejorative term used in labor relations to describe a take-it-or-leave-it stance by a party engaged in collective bargaining. More generally, Boulwarism is the aggressive effort by management to communicate its positions on economic

and labor matters directly to (union-organized) employees and communities.

The concept stems from the no-nonsense approach to employee relations advocated by Lemuel R. Boulware (1895–1990), vice president of employees and communications at General Electric (GE) from 1947 to 1961. Boulware was a native of Kentucky who graduated from the University of Wisconsin, where he briefly taught accounting and commercial law following graduation. During his career, Boulware held posts with the Easy Washing Machine Company, Carrier Corporation, and Celotex Corporation before becoming operations vice chairman of the War Production Board during World War II. He joined GE as a consultant and also oversaw seven of its manufacturing subsidiaries.

Prior to Boulware being appointed to his corporate post, GE had undergone a bitter seven-week strike in 1946. Boulware's charge from GE management was to overcome the distrust and disapproval among employees and neighbors using innovative solutions that avoided mistakes made at other companies. Boulware's lack of experience in labor relations was considered to be a benefit because he provided a fresh perspective.

Boulware delved into his assignment with the same fervor he used in product marketing and began by conducting in-depth interviews. He identified four key groups of "contributor-claimants" (Boulware, 1969, p. 17)—customers, owners, other businesses, and employees. He quickly identified three key areas of neglect: GE had failed to explain how it benefited others, GE had not geared "its intentions, practices, manners and results as intimately as we could and should to the other fellow's viewpoint" (Boulware, 1969, p. 5), and finally, the firm had failed to manage people's expectations about what was reasonable, possible, and feasible.

Within six months, Boulware outlined a nine-point checklist of what employees wanted from their jobs. These included attractive compensation, improved working conditions, competent supervision, a feeling of job security, respect for human dignity, opportunities for promotion, information about management's goals, belief in the importance of one's job, and satisfaction about accomplishments.

Boulware aggressively promoted these ideas to employees. He also launched an economics education program that addressed the importance of profits, how jobs are created, how profits are earned, who pays the costs of doing business, the sizeable share of taxes paid by business, the causes of unemployment, and the dangers of price and wage controls. Boulware used articles and ads in employee publications and oversaw a massive program of meetings (using materials borrowed from DuPont) where 190,000 employees were paid to attend three 90-minute sessions on “How Our Business System Operates.” GE extended the message to communities by taking out full-page advertisements in plant-city newspapers.

As Boulware later explained, his objective was “the deserving and thus the regaining of favorable regard and the active cooperation of employees and neighborhoods in their own interests” (Boulware, 1969, p. 5). He later observed,

I think the real mission of General Electric or any other private business—as well as a requirement for its survival—has been and is to please people by helping them get all they have come, on the basis of enlightened understanding, reasonably to expect from the business in both material and nonmaterial ways. (Boulware, 1969, p. 5)

Boulware’s innovative strategy was grounded in solid public relations ideals. First, he strived to correct causes of people’s justified dissatisfaction “by getting them to tell us what was wrong and doing all possible not only to right any such wrongs but also to try to right them in their way and not our own.” Second, he hoped to correct information or misconceptions that caused unwarranted dissatisfaction—“no matter how far afield we had to go in our own improved education and in helping our employees update their knowledge—and no matter who of high or low estate had to be contradicted in the process” (Boulware, 1969, p. 84).

Boulware’s pro-business stance won respect from business leaders, but GE’s unions attacked the company viciously as organizers attempted to increase their power and to address displacements in the workforce in the post–World War II economy. As the subtitle of his later book on the topic

suggests, Boulware aimed for “trying to do right voluntarily.” Yet his approach was decidedly prescriptive, controlling, and anti-union.

Boulware believed employees at GE and other firms didn’t understand how many of the criticisms launched against business were rooted in socialist ideology. As Boulware enumerated his concerns, people thought that all managers and owners were brutes and crooks, that private businesses allowed the privileged to exploit helpless workers in the name of profits, and that brute force rather than individual persuasion or individual worth was a way for people to get what they wanted. Consistent with Cold War fears about the spread of socialism, Boulware was convinced that Communists had infiltrated many unions.

Boulware’s disdain for unions was particularly reflected in his views on bargaining—the aspect of his work for which he is most remembered. He believed that rank-and-file union members were uninformed, unsophisticated, and misguided by union leaders. Moreover, Boulware argued that union officials came to collective bargaining sessions with an undue advantage: Labor union claims were automatically judged to have merit and to be backed widely by employees and by the public at large. Employers, by contrast, were viewed with skepticism, had little support, and were portrayed as the “greedy, wicked and undeserving few” (Boulware, 1969, p. 107). In fact, the Wagner Act of 1935 and the Taft-Hartley Act of 1947 had guaranteed labor the right to collective bargaining and outlawed industrial representation plans (also known as company unions) established in the aftermath of the Colorado coal strike of 1913–1914.

Boulware faulted business leaders for this imbalance and called on them to stand up and tell their story. Boulware later explained,

The plain fact seemed to be that the leftist intellectuals, the nosier of the more leftist union officials and their publications and field organizations, and the federal bureaucracy were operating more and more across the country as the ideological detractors of private business and of the concept of free choice, private property, and limited government on which our unique well-being had been built. (1969, p. 109)

As a champion for business, Boulware challenged attendees at the Harvard Business School's commencement in 1949 to engage in public affairs discussions. "We businessmen are bold and imaginative before commercial competitors. We are cowardly and silent in public when confronted with union and other economic and political doctrines contrary to our beliefs" (Boulware, 1969, p. 163). He added, "We have simply got to learn, and preach, and practice what's the good alternative to socialism. And we have to interpret this to a majority of adults in a way that is understandable and credible and attractive" (p. 165).

To overcome this advantage during labor negotiations in 1948, Boulware obtained permission from the unions with which GE was negotiating to lift the then customary ban on publicity by the parties involved in collective bargaining. Boulware instituted twice daily Teletype dispatches to GE's 140 plants on the progress of negotiations. These bulletins were duplicated for distribution to employees, union stewards, local press, and any other interested parties. Summaries of negotiations also were included in GE's weekly *Employee Relations News Letter*, distributed to 15,000 managers. Local managers were authorized and encouraged to talk to local media, and Boulware regularly engaged the press in New York to tell the company's side of the story.

Reflecting his disdain for the advantages enjoyed by unions, Boulware sought to break the patterns of wage settlements that characterized union negotiations until then by staunchly presenting and defending "fair but firm" proposals from the company. Boulware painstakingly researched and fleshed out what he termed a competitive "product" that he believed was both attractive to employees and within the means of the company. Union officials bristled at the tactic. For all of Boulware's talk about balancing common interests, the unions believed that GE was dictating terms and not bargaining "in good faith."

Boulware's hardball tactics soon became public knowledge; controversy ensued as media, politicians, commentators, and editorialists took sides. Boulware later explained that he was not inflexible. Indeed, only one of his opening proposals ever became a part of a GE-union contract without amendment. Boulware said he always welcomed

unions to provide "any old or new information proving changes would be in the balanced interests of all" (Boulware, cited in Peterson, 1991, p. 147).

Boulware's stance in GE's 1960 negotiations with the International Union of Electrical, Radio and Machine Workers, AFL-CIO, led the National Labor Relations Board to rule that GE had engaged in unfair labor practices. The NLRB now requires representatives in collective bargaining to negotiate "in good faith." This involves a willingness to listen to counterproposals and a prohibition against *pro forma* refusals to make changes in a package offer. Although none of Boulware's tactics were illegal in the abstract, the NLRB and subsequent court rulings found that the overall effect of GE's tactics was to circumvent the rights of unions.

Boulwarism is an example of an important business concept stemming out of public relations practice. The prohibition against Boulware's negotiation approach is a firmly established principle regularly addressed in labor law. Boulwarism also represents an important—but possibly misdirected—effort to address anti-business sentiments in modern society. One indirect effect of Boulware's work was the resurgence in pro-business sentiments in the 1980s under the presidency of Ronald Reagan. GE had hired Reagan to heighten the popularity of its weekly TV series in the 1950s, and Boulware sent Reagan on a tour of GE plants where the future president—then a liberal anti-communist—was fully indoctrinated in GE's free enterprise philosophy.

Boulware's work is also a historically important case study of how one organization recognized the importance of building mutually beneficial relationships and how management sought to establish a more balanced relationship with key constituencies. It is also an example of the failed application of what is characterized today as two-way asymmetric communication. Although Boulware's approach to employee education has never been completely assessed, his labor negotiation strategy proved unsuccessful in the long term.

BOXED PRINT

Newspapers, magazines, brochures, pamphlets, and virtually all other publications have a variety of “makeup” options that an editor can select to communicate visually to the reader. A well-laid-out page spread (except for the front and back pages, a publication’s *page spread* of facing left and right pages should be considered as one visual unit) is not only attractive and inviting, but also directs the reader across the page spread in a way that can be predicted and controlled to showcase what the editor wants to emphasize and to direct the reader in the sequential order that the editor wants elements of the page spread to be viewed. Indeed, a knowledgeable and skilled graphic designer or layout editor can predict and control with almost complete certainty how the reader will proceed in viewing information that is presented on the page spread, using such elements of makeup as body copy (text); headlines, subheads, and editorial blurbs or pullout quotes; photographs and other art, for example, line art and accompanying cutlines and captions; and white space—all of which can be used to entice readership and to make information processing as easy as possible for readers.

Of course, different publications are used in different ways: A newspaper editor knows that virtually no one will read the whole newspaper, for example, so she presents the stories and art in a

way that will help readers to select what is most significant and what interests them most. Magazine editors likewise know that few people will read a whole magazine cover-to-cover, although they hope readers will be interested in a far greater percentage of an issue’s feature-length stories than they would read in a newspaper. Pamphlets and brochures are most often designed to be read in their entirety and are laid out accordingly—to encourage readership of the whole publication, usually front to back.

To add visual interest as well as to feature a story or article, boxes are frequently used to surround the print (i.e., the text). Traditional newspaper makeup uses boxed print on occasion to showcase a short human-interest story as well as to brighten a page, whereas *modular* newspaper makeup depends on boxed print to dramatize a large and important story, usually a box created with a quite narrow *hairline rule*, which may have squared or sometimes rounded corners and surround the story and its accompanying art (e.g., photographs and cutlines). Such use of boxed print requires at least a two-column story (some editors argue that a three-column story is better), and each page may have a boxed print (it’s usually better to have only one such boxed print per page or else all emphasis becomes no emphasis). As a visual element, boxes add “weight” to a page or page spread that helps to balance or contrast other visual elements, and thus boxed prints may appear at the bottom of a page to help create page balance.

Of course, magazines frequently use boxed prints (sometimes with a gray or colored screen inside the box on which the text is overprinted) to emphasize or to distinguish the story from others on a page spread. Brochures and pamphlets may use boxed prints as an integral part of their design theme; for example, copy (text) on each page may be inside a box, or each page may have a border box. Of course, Web sites also use boxed prints a great deal, and many of the guidelines that apply to boxed prints in printed publications are equally valid for Web sites.

Boxed prints are highly effective when used well—when they are used tastefully and with discretion to visually communicate that the text inside

each box is special in some way (e.g., it is more important or is significantly different from surrounding text). Boxed print may be a *sidebar* story to the main story; may be used to provide balance and contrast to pages; and is often used to brighten pages. The public relations person doing her own makeup of employee newspapers, magazines, brochures, and pamphlets must remember that there can be too much of a good thing, however; too many boxed prints on a page or page spread means each one loses some of its potential effectiveness.

BRAND EQUITY AND BRANDING

The concepts of *brand equity* and *branding* are necessarily intertwined, and they are connected with both advertising and public relations. Lisa Wood (2000) indicated that there are several different meanings of brand equity: First, it may be construed as the total value of a brand as a distinct asset. In other words, when the brand is actually sold in the marketplace or included on a balance sheet. Second, brand equity may be interpreted as a measure of the strength of consumer attachment to a brand. Finally, it may be considered a description of the associations and beliefs the consumer has about a particular brand. The distinctions in these various definitions primarily derive from accounting and marketing.

In many cases, financial accountants (preferring the first definition) will use the term *brand value* rather than *brand equity*. The brand's value, relative to the rest of the marketplace, emerges as the overriding consideration. Advertising and public relations professionals generally recognize this first definition, but they tend to be more interested in customer-brand relationships and associations. These professionals will often build on the brand

equity concept with ideas such as *brand identity* or *brand image*.

Brand image is aligned with the needs and desires of a target market by utilizing the "four P's" (product, price, place, and promotion). The combined success of these factors determines *brand strength*, the degree of loyalty or attachment customers feel toward the brand. Because there are a number of related concepts, Max Blackston (2000) summarizes them with the key principle of brand equity; a brand is necessarily intertwined with a product(s), but it is different because there is a consumer investment over time.

Brand equity consists of the incremental, added-value qualities that synergistically combine in the minds of consumers. A brand may be a product, but it can also represent an organization through the creation of a unique identity.

Blackston argued that the fundamental marketing variables (product, price, etc.) are critical values but the *added value* concept is where the success of branding is truly realized. However, this concept is difficult to define because of its intangible nature. Generally, this idea is indirectly measured or inferred in terms of the consumer's idea of the brand. Even though such inferences will continue, Blackston posited that greater understanding of brand equity may be achieved by recognizing that brand relationships are occurring, interactive processes involving both the brand and the consumer. Relationships are, of course, constructed through communication. The organization is projecting an image, and consumers are providing meaning to the messages. Thus, a relationship between the brand and the consumer flourishes or disintegrates. These brand relationships comprise two key factors that are necessary for synergistic success: trust in the brand and customer satisfaction with the brand. In other words, added value is realized when these factors are maximized.

The brand's success depends on the creation of a personal link with each consumer, and obviously, this objective is not easy to achieve, but when an organization moves from a self-centered to an "other-centered" (customer-focused) stance, success in these relationships may be eventually achieved. Blackston indicated that the brand relationship

concept has been applied to the development of advertising campaigns, but it can be extended to all areas of marketing communication, including public relations. An objective for a desired relationship with the critical stakeholders (the consumers) may provide a guide for the brand's "communication" transactions with each consumer. Because behavioral consistency is essential for long-term relationship success, the sales promotion, packaging, and public relations that are associated with a brand must be consistent. When the consumer is satisfied and trusts these consistent behaviors, he or she is likely to continue the brand relationship and, thus, added value may be achieved over time in the branding experience. Corporate branding (and brand equity) is the "true" mark of a product or organization. In other words, it can be construed as a unique declaration of identity, quality, trust, and value with the final judgment on those factors resting with the individual consumer.

With the branding concept in public relations (and related areas of communication), four process areas are often considered: (1) creating, (2) maintaining, (3) damaging, and (4) repairing. Creating unique identities for products is challenging, considering the vast array of information that consumers are exposed to in the marketplace. William Wells, John Burnett, and Sandra Moriarty (2003) provided the following suggestions for advertising and public relations professionals as they create messages about their brands:

1. Make the brand distinctive by drawing attention to its qualities/strengths.
2. Utilize a design that aligns with the brand image that you wish to project and send public relations and advertising messages that are generally consistent with other mass media messages.
3. Make the packaging as functional as possible.
4. Product packaging, advertising, and public relations should dovetail. In other words, consistency is repeatedly emphasized.

Organizations need to ensure that their resources are committed to brands that offer the greatest likelihood of success, whether those brands are

products or subunits of the organizations with their own distinct identities. As Peter Sackett and Efstathios Kefallonitis (2003) argued, creating a unique brand experience will reflect the organization's advantages over its competitors. Thus, the organization will maintain its existing customer base and also attract other consumers.

Sackett and Kefallonitis also emphasized the importance of aligning the consistency, originality, and relevance of the brand experience to the core brand value (i.e., quality or durability) that is being communicated. If this alignment does not occur, organizations will struggle to differentiate their brands in the vast consumer universe of information. They posited that creating brands involves attention to consumers' perceptions of similar brands in the marketplace and, then, designing product features that are not only distinct but also add value to those perceptions. Thus, added value is created and potentially sustained for consumers and organizations.

In many cases, organizations will conduct research (i.e., interviews and surveys) to determine the likely importance of various attributes in brand choice processes. In short, what is missing in the marketplace? What would consumers like to see as they perceive it? Subsequently, a brand is developed that addresses these needs and perceptions, and this data is aligned with information on the target market (i.e., senior citizens). Of course, not all organizations follow these procedures with brand creation, but in general, sophisticated organizations in the modern business environment engage in these rigorous market research activities.

Brian Wansink (1997) advanced some additional thoughts on the brand creation discussion by talking about "re-creating" brands or providing a revised brand perspective for consumers. Many marketing managers believe that brands, like many other natural life cycles, observe the laws of positive entropy; they are created, they grow, they mature, they decline, and they die. In some cases, brand sales and market share decline because people have lost interest due to changing conditions in the marketplace (i.e., typewriters and the advent of word processing) or because another brand becomes more salient for consumers. Wansink illustrated this re-creation with

the Arm & Hammer situation in 1969. The product's sales were declining because of reduced home baking and the introduction of ready-to-bake packaged food products. In order to address these issues, the product re-emerged as a deodorizer for refrigerators, freezers, and kitchen sink drains.

The product's sales rebounded. Even though brand creation and re-creation are distinct in terms of actual product existence, the same principle guides the success of these processes: addressing the needs of consumers and their perceptions in relation to your product or organizational niche.

Brand re-creation can also be considered, in some product cases, a natural maintenance activity. In order to maintain a successful brand relationship (as in many other relationships), some modifications may need to occur. Of course, there are cases where limited brand maintenance occurs because the product continues to address the needs of consumers in its particular niche. However, ongoing communication campaigns are always recommended so that consumers are consistently reminded about the attributes and strengths of the organization or product.

Typically, organizations have different brand maintenance strategies and tactics. For example, some organizations focus on their brand name, making it synonymous with a product class. These corporate brand names appear as the only brand identity. Corporate brands are used when a company operates in a tightly defined market (e.g., Kellogg's with breakfast cereal). Promoting related products is a brand maintenance strategy for the organization as well as for the potential variety of brand names (e.g., Raisin Bran). Standardization strategies may also be employed when companies wish to associate related products or names internationally. Additionally, corporate history can be influential when brands are leveraged or *extended*. With this strategy, a corporate brand name is maintained by association with new products. In other words, the brand name is revitalized and recreated.

As the information age continues, dynamic brand maintenance strategies are necessary. Brand leverage is an example of such a strategy, along with the more general goal of creativity. Maintaining an information-based context may also be useful. In

other words, through a medium such as a Web site, people consume, communicate, and transact with the organization or corporate brand. With Web site maintenance, the corporation's identity (and that of its associated brands) is preserved in the minds of consumers. Even though some modifications may inevitably occur, the brand is still important because a personal link to the consumer has been maintained. Brand maintenance and relationship maintenance are not distinct concepts; they are necessarily intertwined.

In some cases, damage to a brand name's reputation occurs. Malfeasance on the part of managers or the mishandling of crisis situations may provide rationales for why such damage occurs. Because organizations can be construed as brands, there are numerous examples of brand names that have endured injurious circumstances. The debacles that have plagued corporations such as Exxon (1989 oil tanker mishap) and MCI (misappropriation of corporate funds in 2001 and 2002) have been documented in the popular media. Typically, such an event creates a thriving environment for brand damage, especially if stakeholders, such as customers, perceive that the organization does not care or is mishandling the situation.

However, brand identity may also become poorly perceived in an incremental fashion. Over the course of time, without proper maintenance, brand damage will probably occur and, eventually, the brand's image cannot be restored to its prior positive state. If brand identity is perceived as poor (damaged), the brand experience that is created will be unfavorable. Corporate brand names can also be damaged by claims from internal and external stakeholder groups, such as the media, that are inconsistent with the organization's story. Such claims can damage brands. However, if the organization can distance itself from the claims and provide evidence of accountability on the part of other parties, brand damage may be limited. On the other hand, social legitimacy and financial stability may be permanently harmed.

The image restoration strategies that are employed by various organizations provide insight into the subject of brand repair, rejuvenating a damaged brand name.

W. L. Benoit (1995) provided a typology of brand repair and image restoration strategies for corporations: (1) denying, (2) evading responsibility, (3) reducing offensiveness, (4) taking corrective action, and (5) mortifying (mortification). Each of these strategies may be effective in particular circumstances. With the first two strategies, if the organization can legitimately deny or not take responsibility for a potentially damaging situation, these communicative stances may be appropriate. Benoit also provides the following suggestions for image repair discourse:

1. Avoid making false claims for brands and provide adequate support.
2. If your organization is responsible, admit this fact immediately.
3. Communicate plans to correct and prevent recurrence of the problem.

The final recommendation might be classified as goodwill, if such actions are designed to enhance a community or group of stakeholders beyond simple repair of brand damage. If customers perceive that the organization is truly acting in their best interests, brand repair will begin to occur. It should also be noted that restoration tactics may not involve a long period of time, if the organization is honest with its' stakeholders about crises and claims. In these cases, brand damage is limited because the organization assumes responsibility and provides evidence related to claims.

Audience perceptions are critical to brand repair and image restoration. In terms of perceptions, if the organization reminds stakeholders of past good works and relationships through bolstering communication strategies without addressing the critical brand-damaging issue(s), brand repair may not even occur.

Customers may quickly reject the brand, or it may eventually fade from the public scene because such reminders fall into a communicative vacuum chamber.

BRIDGE

Bridge is a term derived from the stage and journalism to mean *transition*. Usage of this word as a term of art when referring to crisis responses and media training probably results from adaptation by public relations professionals of its many definitions in the related fields of journalism, graphic design or layout, theater, and broadcasting or film.

In journalism, the term's most common definition has meaning to writers and editors alike. Both use *bridge* to mean the “logical transition from the summary information of the lead to the detailed information in the body of the story when using the inverted pyramid structure method of newswriting” (Connors, 1982, pp. 99–100). When used in this context, the term *bridge* serves to explain and expand on the information in the lead. In more general usage, writers use the term to mean “a phrase or sentence connecting two stories” (Newsom, Turk, & Kruckeberg, 2000, p. 519) or “a few words tying one element of news to another” (Weiner, 1996, p. 78). To editors, *bridge* refers to “a proof-reader's mark indicating that two letters or words should be connected” (Weiner, 1996, p. 78),

whereas graphic designers and layout artists use *bridge* to mean “type or art that runs across the *gutter* and links two adjacent pages, more commonly called a *crossover* or *gutter bleed*” (Weiner, 1996, p. 78, italics in original).

In theater, broadcasting, and film, *bridge* conveys not just a changing of scenes, but often a changing of emotion, as well. Public relations educators Doug Newsom, Judy VanSlyke Turk, and Dean Kruckeberg define *bridge* in terms of its usage in broadcasting as “transitional program music” (Newsom et al., 2000, p. 519). According to *The Dictionary of Media Terms*, a bridge is a “music cue used to carry us from one scene or one mood to another” (Penney, 1984, p. 27). *NTC’s Mass Media Dictionary* expands on that definition and defines *bridge* as “sound effects or music used to indicate a lapse of time, or to link dramatic scenes” (Ellmore, 1991, p. 77). The *Longman Dictionary of Mass Media & Communication* summarizes these ideas with the following entry: “Narrative, sound, or music section used to transition between two scenes or to show an elapse of time or change of mood or locale” (Conners, 1982, pp. 99–100). Finally, *Webster’s New World Dictionary of Media and Communications* includes the visual with the auditory, as they include in their definition “a musical, visual, or other type of transition, particularly between scenes (*a bridging shot*)” (Weiner, 1996, p. 78, italics in original). An interesting but also germane definition of the term used in theater refers to “a narrow platform on which stage lights (*bridge lights*) are mounted, usually called a *light bridge* in the United States or *lighting bridge* in the United Kingdom” (Weiner, 1996, p. 78, italics in original). *NTC’s Mass Media Dictionary* notes, “Luminaries and projection devices are accessible during performances” (Ellmore, 1991, p. 77).

In public relations, *bridge* refers primarily to the technique used in a crisis response or while training someone to deal with the media that allows the speaker to take control of the interview. Simply stated, the speaker connects their answer to the interviewer’s question or subject to a topic of their own choosing or to their communication points or commercials. Put another way, the speaker *reframes*

the question or issue to allow the points they want made to lead the response.

Done poorly, bridging can be offensive and disingenuous to journalist and viewer alike. An example one journalist used to illustrate this point was the response Senator Warner gave when challenged about whether the Iraqis had taunted the United States in a message. His answer to the question: “I want to turn to this other thing.”

Successful use of the bridge starts with communication points, or commercials. These are the one, two, or three things the speaker wants the audience to remember, even if they don’t remember anything else. Some public relations professionals prefer message mapping instead of communication points—where all roads lead to a central point—but the intent is the same: The speaker has a message that they want heard.

Once the communication points are established, they become the point the speaker makes first in response to a question. The bridge technique then connects the communication point(s) to a more expansive explanation of the point or to another of the speaker’s communication points. Phrases such as “That’s such a complex subject . . .,” “Your question really relates to . . .,” and “You bring up an interesting point, but before I discuss that, it’s important to note that . . .” are all good bridges.

A good example of how communication points and bridges interoperate can be seen in the following mock interchange, regarding an accident that has claimed several lives:

Reporter: “Witnesses claim they saw the aircraft oscillating wildly just before it plowed into those hangers over there. What can you tell us about the maintenance standards of your company and could that have been the cause of this accident?”

Spokesperson: “Obviously, we won’t know the cause of the accident until after the investigation is completed (communication point). Your question really relates to our maintenance practices (bridge) and that is a part of our business that we take very seriously

(second communication point). We have an extensive training program that requires continual refresher courses and includes an extensive certification process. . . .”

Though allowing the spokesperson to control the interview, the effective use of the bridging technique in the interchange above helped improve the communication between the two parties by providing additional information and perspective on the issue at hand. Had the spokesperson merely stated that the accident was under investigation and provided nothing further, or worse, ineffectively used the bridging technique to try and deflect the reporter’s legitimate question, the public would not have been served well, and the relationship between spokesperson and reporter would have been unnecessarily tense and adversarial.

Effective use of the bridge incorporates many of the attributes found in definitions of the term from journalism, graphic design or layout, theater, and broadcasting or film. It connects your lead, or the most important information in the story, to the rest of the story and serves to explain and expand on the information in the lead (journalism). It conveys a changing of scenes and often emotion (theater, broadcasting, and film) when used to connect two communication points, especially if one of those points is a statement of condolence, concern, or regret. Finally, by providing additional explanation and perspective or expanding on particular points, the bridge serves to illuminate and remains accessible throughout the conversation (theater).

BROCHURE

A brochure is a printed piece of collateral material used for public relations, advertising, and marketing purposes. Brochures are considered a communication tool or tactic and a form of direct media, such as fliers, newsletters, and posters, which reaches its audiences through distribution channels other than mass media (i.e., newspapers, magazines, radio, and television). Other terms used to describe brochures are *pamphlets*, considered a simple version of a brochure, and *booklets*, which are brochures that are produced in small, book-like formats.

Every organization, whether corporate or non-profit, needs brochures to convey key messages to particular target audiences. A brochure is a tactic with a specific objective. For example, brochures can educate an employee audience about company policies, inform customers about new products, or encourage members of a community to use a program offered by a nonprofit organization.

Brochures communicate a sizable amount of information to a single reader at a hand-held viewing distance. An orderly sequence of information is presented in stages through panels using a common design thread that visually connects all of the panels and helps entice and sustain the reader’s attention.

Brochures are commonly distributed to a target audience interpersonally, in information racks and through the mail in a standard business envelope. In order to be effective, brochures must be strategically sound, which means they need to be targeted toward a particular audience, convey an overall key message, and attempt to achieve a specific objective. Some of the most common objectives in public relations include increasing awareness about a specific organization and educating the target audience about a specific service or product.

Brochures are produced in a variety of styles, shapes, and sizes. A format often used in public relations is a simple two-fold, six-panel, 8½ × 11 brochure. Another popular format is a one-fold,

four-panel, 8½ × 11 brochure, which can be expanded by adding multiple pages. Brochures can be folded and bound in many ways. Letter, broad-side, map, and accordion folds are commonly used. A common type of binding for booklets is a saddle stitch, which involves a staple through the spine of the publication.

Brochures need to be created with a unifying design throughout the entire publication, which can be conveyed through an appropriate choice of type-face, line rules, screens and tints, clip art, and color schemes. Brochures are commonly printed in one color, spot color (usually black for the type and another color to highlight specific areas in the brochure), and full color, which is the most expensive to produce. Some public relations practitioners begin with a layout and copy for a brochure and then work with a designer and/or printer to develop the final printed piece. Other practitioners create the entire piece themselves, using any number of desktop publishing programs, such as PageMaker, QuarkXpress, and Microsoft Publisher.

BURSON, HAROLD

Harold Burson, founder and chairman of Burson-Marsteller, one of the largest public relations firms in the world, was named the most influential public relations figure in the 20th century by *PR Week* in 1999.

Burson attributed his success to a combination of many factors, including luck and taking advantage of opportunities. “Some people get opportunities but never know how to capitalize on them,” he said (personal communication, October 10, 2002). Early on, Burson recognized the value of a supportive,

well-read father (who taught him to read at age 3) and the global vision given to him by his immigrant parents and the military, which were instrumental in shaping his career.

Burson was born February 15, 1921, in Memphis, Tennessee. Like many legendary figures in public relations, he started his career as a journalist; however, Burson started earlier than most. He was the editor of his junior high school newspaper and was appointed the Sunday high-school page reporter for *The Commercial Appeal* in Memphis. Though only 14 years old, Burson had a byline in the city’s largest newspaper.

Burson said *The Commercial Appeal* continued to influence his life throughout high school and college: “I started out working with [*The Commercial Appeal*] as a copy boy, so I could pay my way through college” (personal communication, October 10, 2002). While attending the University of Mississippi in Oxford, Burson made an average of \$60 per month as a stringer. He also headed the university’s publicity department for three semesters, which he described as “the most valuable component of my college experience” (Burson, 2003, n.p.).

After graduating in May 1940, Burson continued to work for *The Commercial Appeal*. One of the stories he covered was the construction of a mammoth ammunition plant for the War Department near Memphis. The engineer–building contractor, the H. K. Ferguson Company, found itself in a labor dispute, and the company’s owner asked Burson to take a leave of absence from his reporting job to handle press relations for the company. The dispute was resolved in a few weeks, and the owner asked Burson to join the company’s headquarters staff as publicity director. In addition to providing a substantially higher salary, the opportunity allowed the 20-year-old Burson to fulfill his dream of moving to New York City. He worked for the Ferguson Company from 1941 until 1943, traveling throughout the United States. He enlisted in the army in 1944.

During World War II, Burson first was assigned to an engineer combat group and sent to Europe, where he cleared mines off the beaches of Normandy, France. With the Ninth U.S. Army, he marched across Belgium, Holland, and Germany.

In April 1945, he transferred to the Press and Psychological Warfare Detachment of the U.S. 12th Army Group, and when the war in Europe ended, he transferred to the news staff of American Forces Network (AFN)—the military radio network—and was sent to Paris. At 24, he was selected as AFN's chief correspondent at the Nuremberg Trial, where he worked alongside such reporters as Walter Cronkite and Walter K. Smith.

During his military service, Burson decided he wanted to start his own public relations firm when he returned to civilian life. He wrote the new CEO of his former employer, the H. K. Ferguson Company, asking whether the company would become his first client. The answer was yes.

Burson was released from the army in May 1946 and started his consulting firm in New York City in August. The small firm specialized in business-to-business clients. By its fifth year, it had grown to five employees. An opportunity soon changed the firm and defined Burson's subsequent career.

In early 1952, while Burson was sitting in his office in the *New York Daily News* building, he received a telephone call from Harry Leather, a close friend at *The New York Times*. Leather called Burson to tell him that he had recommended his firm to Bill Marsteller, the owner of an industrial advertising agency based in Chicago. Marsteller said he needed the help of a public relations firm to handle a project for his agency's largest client, Rockwell Manufacturing Company (now Rockwell International).

According to Burson, W. F. Rockwell, Jr., wanted to have his picture on the cover of *Life* magazine with a helicopter he had purchased for company executives to travel to different manufacturing plants. "The project worked out well," said Burson (personal communication, October 10, 2002). Although Rockwell's helicopter did not make *Life*'s cover page, Burson's publicity efforts resulted in getting one of the company's new combination home-workshop power tools a three-page article in *Life* magazine during the 1952 Thanksgiving holiday.

After their joint success working with Rockwell, Harold Burson and Bill Marsteller formed a new company on March 1, 1953, which eventually

would become the world's largest public relations firm—Burson-Marsteller.

At the end of 2001, the firm had more than \$259 million in fees and more than 2,000 employees in 34 countries worldwide—a far cry from the \$84,000 in fees it commanded in its first year of operation. In 2003, Burson-Marsteller celebrated its 50th anniversary.

Throughout the years, Burson-Marsteller has been a major player in many public relations milestones. Citing just a few examples, the firm was influential in helping Union Carbide work through its 1984 poison gas disaster that killed an estimated 3,800 people in Bhopal, India. It also provided consultation services to Johnson & Johnson during the cyanide-laced Tylenol scare in the early 1980s.

According to Burson, his greatest contribution to public relations is that he has been "one who probably made public relations global in scope and added good-sized business practices and principles to it" (personal communication, October 10, 2002). Burson said his background helped him recognize that the firm had to become global in order to grow. He explained that as a first generation American, the son of British immigrants, "I grew up knowing the world was out there. It came more naturally to me. I took a global perspective when I was growing up. The real defining moment was in 1961 when we opened the first European office in Geneva." Burson said, "Committing to become international" was a significant event in the company's history (personal communication, October 10, 2002).

Harold Burson has received numerous honors and awards in recognition of his extensive contributions to the public relations profession, both nationally and internationally. A few of his awards are as follows: the Alexander Hamilton Medal, Institute for Public Relations, 1999; the Atlas Award, International Section, Public Relations Society of America (PRSA), 1998; Hall of Fame, the Arthur W. Page Society, 1991; Public Relations Professional of the Year, *Public Relations News*, 1989 and 1977; and the Gold Anvil Award, PRSA, 1980.

Burson's outlook for the future of public relations is that the function will be one of growing importance: "My feeling is public relations considerations

are going to be central to the decision-making process” (personal communication, October 10, 2002).

BUSINESS WIRE

Business Wire (www.businesswire.com) is a privately held company that provides services to investor relations and public relations professionals by electronically distributing their full-text news announcements and other information to news media, financial

markets, investors, and other audiences around the world. The service is one of many available today, but traditionally it has been either the leader or one of the top two such services in terms of revenue and number of customers and subscribers.

The public relations clients—called *member companies*—provide news releases, photos, regulatory filings, and multimedia and other content to Business Wire. For a fee, sometimes as low as \$125, the company will disseminate the information to journalists and other audiences simultaneously and in real time. Clients can select the most appropriate geographic market, industry audience, and editorial desk.

Subscribers—journalists at newspapers, wire services, television and radio programs, magazines, and online news services—can access the information through their newsroom editorial systems.

The company now serves more than 18,000 clients in more than 100 different industries through several dozen bureaus in the United States and Europe, reaching more than 60 news organizations.

The company also provides a variety of services to help organizations manage their corporate communications and research needs. Publicly traded companies in the United States, the United Kingdom, Canada, France, and Germany can use Business Wire to meet requirements for public disclosure. Business Wire was the first newswire to offer EDGAR (Securities and Exchange Commission) filings to its public company clients. The service is also used by financial and research databases and online news organizations, which store company news releases distributed by Business Wire and make them available in company news archives.

Founded in San Francisco in 1961 by veteran journalist and public relations executive Lorry I. Lokey, the company started out with seven clients and distributed news releases to 16 news organizations in Northern California. Through the next decade, it expanded its geographic reach by forming affiliations with other wires, such as the Associated Press.

The speed at which a news service could distribute information was a major attraction of the service. By 1967, Business Wire’s ability to send

100 words per minute—which equates to sending a standard news release in about 5–10 minutes—was the fastest of any service.

A decade later, the service reached a new level when Business Wire inaugurated satellite-to-computer delivery of news releases via the Associated Press DataFeature circuit. It was the first news wire to do so, increasing its speed to 1,200 words per minute. Today, technology enables Business Wire to distribute information instantaneously.

The company continued to expand its services in the 1980s, adding 10 new offices and more employees. It also created its AnalystWire service, which connected clients with financial analysts, and SportsWire and EntertainmentWire, services that brought sports- and entertainment-related news to key sports and entertainment media.

Developments in the 1990s included the addition of Associated Press (AP) PhotoExpress service for commercial photo satellite delivery and the first commercial Web site for a newswire. In 1996, Business Wire introduced the Smart News Release, the industry's first multimedia news release.

In 2003, the company became the first commercial newswire to distribute its content over AP's Internet-based delivery platform. The service supplements Business Wire's satellite distribution and enables journalists and photo editors to view news releases directly on their desktops and to forward stories to their news production system with minimal additional intervention. Today, the company's Web site is totally compliant with the NewsML standard, enabling Business Wire to deliver more multimedia content faster to all media points.

—Catherine L. Hinrichsen

BYLINE

Byline is the term used for the signature line of a newspaper article or other contributed piece to a news publication. Bylines refer to the author or authors of a news item and appear in conjunction with the dateline and the place where the story originated, if it is not a local story. For news articles

received via a wire service, a byline is not reported and credit is given to the respective news service, such as the Associated Press. Internal newsletters may or may not allow for bylines if the articles are written by a staff member.

For public relations practitioners, securing a byline is not as important as it is to reporters. Press releases do not contain a byline; they include only contact information for reporters who need additional information. If a reporter uses a press release to write his or her article, he or she receives the byline. Even if public relations practitioners issue press releases on behalf of a client, the reporter gets the byline.

If a reporter prints a press release in its entirety, the reporter gets the byline, not the person who wrote the release. Because this sometimes happens, it is imperative that a press release contain accurate information and be written as if it were going to be printed as submitted.

Reporters have an urgency to “get the byline,” but there are certain checks in place to ensure that this need for “immediate and frequent reward” does not cause a story to be written prematurely (Mencher, 2000, p. 419).

Mencher made the point that when a reporter was given a byline, that means that he or she was *actually present* and on the scene before writing the story. Mencher refers to an “old-timer,” who commented,

In the old days, a reporter was given a byline if he or she personally covered an important or unusual story, or the story was an exclusive. Sometimes if the writing was superior, a byline was given. Nowadays, everyone gets a byline, even if the story is a rewrite and the reporter never saw the event described in the story. (2000, p. 766)

Public relations practitioners should be aware of this issue in journalism and should work to provide reporters with all pertinent facts. Although the public relations practitioner does not receive the byline for the article, it is highly likely that he or she will be quoted in the article. Whether those quotes are supplied in a press release or given through follow-up interviews with a reporter, the article's truth

will fall back on the public relations practitioner and the organization.

BYOIR, CARL

Carl Byoir created and ran, until his death in 1957, one of the largest and most successful public relations firms in United States history. The firm was unique in many ways, with little employee turnover and remarkably few client departures. There also was no new-business solicitation because Mr. Byoir (as everyone in the business called him) felt the firm would acquire new accounts by virtue of its reputation.

Other unusual characteristics of the organization captured the attention and loyalty of clients and bonded the employees. Today, long after the company's sale to Foote Cone and Belding and then to Hill & Knowlton in the mid-1980s, the unique techniques of Carl Byoir & Associates are spoken of as "The Byoir Way" by practitioners. This was, in fact, the name of the firm's elegant (and only) brochure, produced in 1977.

As an example of Byoir's business plan, all accounts were charged a uniform annual retainer fee no matter what the size of their programs. At one point, for example, Byoir represented a tiny one-product firm that made stainless steel screw settings for space capsule heat shields. The company paid the standard annual fee of \$36,000 plus the hourly charges of a few Byoir specialists who served the business from time to time.

The firm also represented the Minneapolis-Honeywell Heat Regulator Company (now Honeywell), which was Byoir's biggest client, with 22 staff members serving the account full time. Honeywell also paid the \$36,000 fee.

"That will represent our profit," Mr. Byoir said. Operating costs, ranging up to well over \$3 million a year in salaries and costs at Honeywell, were presented monthly in voluminous, highly detailed invoices, at no markup.

Another Byoir characteristic was the practice of permanently installing staff executives in client headquarters offices. At one point, 3 Byoir people worked full time at Hallmark Cards in Kansas City, 17 were located at various Honeywell locations (including one in Iran), and 6 were deployed around the country for the Road Information Program.

These workers were supported by a system of departments in the New York City headquarters devoted to such specialties as research, television, women's interests, business news, and the like. Reflecting its news heritage, Byoir employed an editorial director, a former wire service editor, who personally cleared every piece of news and feature copy before it was released to the news media.

The firm had strict requirements about the news backgrounds of employees, and most applicants had to show proof of having experienced at least four years in a newsroom.

The combination of news savvy and close client contact brought much success to the Byoir organization, represented in part by the company's skill in winning dozens of PRSA Silver Anvil awards. It also brought a collegial atmosphere that still exists long after the Byoir brand has more or less disappeared. Reunions of Byoir alumni are commonplace, and strong friendships among former staffers endure.

Most importantly, the Byoir firm, working with and in the interests of its clients, made monumental contributions to public understanding of the business function and to the documented successes of hundreds of industrial companies, associations, and public causes.

The man who created this firm in 1930 and was responsible for its news orientation and sound business base was, himself, both a newsman and a business pioneer.

Carl Robert Byoir was born on June 28, 1888, in Des Moines, Iowa. He was the last of six children born to Benjamin and Minna Gunyon Byoir, Jewish immigrants who had arrived in America in 1875

from Poland. Benjamin Byoir was not particularly successful in his efforts to run a retail clothing business or later to operate a restaurant in Des Moines, so Mrs. Byoir occasionally took in roomers for income.

Young Byoir was captivated by the contrast between the lifestyles of the rich who occupied the great houses standing along Grand Avenue in Des Moines and the grinding poverty and pitifully inadequate homes of the coal miners from nearby towns. He determined to acquire wealth of his own.

Carl Byoir began his career as a writer on the Iowa State *Register* while still a high school sophomore. After graduation, he joined the Waterloo *Times-Tribune* as city editor and became managing editor when the incumbent died unexpectedly.

But after a year, Byoir gave in to the urging of a close friend and joined him as a student at the University of Iowa. While there, he continued his enterprising ways, financing his education by continuing to write as a correspondent, selling campus items, and winning contests that offered cash.

Carl Byoir got himself elected as general manager of the college yearbook, the *Hawkeye*, and set about to create an advertising department that would build revenues for the book. In short order he devised a manual for his successors to guide them in producing the annual. When that proved useful, he set out to market the planning document elsewhere and succeeded, not only within the state of Iowa, but also at Yale, the University of Texas, and the University of Washington.

After college, Byoir joined the same friend who had lured him to Iowa and enrolled in Columbia Law School. While there, he became enchanted by the teaching methods of Dr. Maria Montessori, an Italian educator. Byoir felt the Montessori system would be appealing to American mothers and might also represent a rewarding business opportunity. So before graduating from Columbia Law in 1912, Byoir had joined with Dr. Montessori to set up a United States sales program. It flourished, and Byoir made a substantial profit when he sold the enterprise one year after graduation. Byoir then decided to go into business instead of law.

What followed was a series of business ventures related to publishing. Byoir held numerous

advertising and circulation management jobs, mainly with Hearst and *Cosmopolitan* magazine. Before the age of 30, Byoir was an aggressive business operator with solid experience in advertising, promotion, and sales psychology.

Early in 1917, Byoir was summoned to Washington, DC, to serve as a major figure on the U.S. World War I Committee on Public Information, a pioneer governmental propaganda agency. This was the Creel Committee, a central agency established by President Woodrow Wilson to coordinate the wartime flow of news and information from the many sources in the nation's capital.

Surrounded by bedlam and politics at the Creel Committee, Byoir set out to do what he did best. The very ambitious George Creel had arranged for a group of eminent historians and authors to write patriotic pamphlets for distribution by the Committee, but he had no plan for printing them.

Byoir solved the problem by calling on his experience producing the *Hawkeye* and also on several friends from New York who owned printing houses. Soon thereafter, Byoir was named the committee's associate chairman.

The Byoir/Creel years probably mark the beginning of what is now known as institutional advertising. The use of paid and donated "informational" advertising by the government during World War I was monumental. Byoir himself would later use this tool to advantage with clients such as the A&P and the Eastern Railroads.

After the war Byoir and a number of other Creel Committee executives who had learned how to sway public opinion began to capitalize on the know-how they'd gained on the committee. Byoir moved to Cuba to try to get rid of his sinus problems and quickly established a promotional effort to build Cuban tourism. Key executives of the Byoir firm in later years, all of them journalists, began to join his undertaking. Gerry Swinehart, later to become chairman, joined the firm in Havana in 1930.

The Cuban tourist promotion account was Mr. Byoir's first public relations contract, and it caused him to be identified as a political supporter of dictator Gerardo Machado. As one way of reducing his identification with Machado, Byoir moved his operation to New York and began to acquire new

clients. He opened operations there in 1930 with five full-time staff. George Hammond, the longtime Byoir chairman who presided over the firm's eventual sale to Foote Cone, joined in 1932.

Most of the firm's early work was connected with tourism and travel. But knowing that he would need to expand his capabilities, Carl Byoir began to restructure his firm. He said that new accounts would not be directly solicited, and he said the firm would charge a minimum \$36,000 fee per year plus actual expenses at cost. Tongues wagged at this huge fee in 1932, but the amount held firm until it was raised to \$50,000 in the late 1970s.

Without a doubt, Carl Byoir is best known for the groundbreaking work his firm did for two of the firm's most significant early clients, the Great Atlantic and Pacific Tea Company and the Eastern Railroads Presidents Conference, and also for his involvement with the German Tourist Information Office.

A Byoir officer signed a contract in late 1933 with the German Tourist Office to promote American tourist travel to Germany. But Byoir himself quickly realized this was a mistake. One United States congressman remarked on the House floor that Byoir's firm had a contract with agents of the German Propaganda Ministry "for the distribution in America of informative material on the 'new Germany.'"

Congress ultimately began an investigation of Nazi propaganda activities in America. Mr. Byoir, stunned by public reactions to the investigation and also to the hints that he now supported another dictator (recalling his support of Cuba's Machado), gave the Germans the agreed-upon three months' notice of resignation early in 1934. Years later Congressman Wright Patman of Texas charged Byoir on the House floor with setting up "front organizations" to represent Nazi interests in the United States.

Within weeks, Mr. Byoir was fully cleared in an FBI investigation, but he never was able to completely erase the stain that attached to a Jew who had the temerity to promote German business interests while Hitler was in power.

Wright Patman showed up once again in Mr. Byoir's life as the co-author of a 1936 amendment to the Clayton antitrust act that would seriously

restrict the market practices of the country's large chain stores and mail order houses. *Business Week* reported that Patman had "heard the cry of little wholesalers for protection against the giants." The magazine delivered a powerful editorial opposing the bill.

Immediately, owners of the Great Atlantic and Pacific Tea Company retained the Byoir firm to work for the repeal or defeat of state anti-chain store legislation in New York and elsewhere. Byoir responded with a research effort that established two key points: Customers loved the low prices of the grocery chains, but they also favored higher taxes on the chains.

Using this paradox as the foundation of his campaign, Byoir launched a publicity attack on the anti-chain store legislation proposals in many states. Byoir made his studies of "unfair taxes" available to many groups who distributed them in their own materials.

But perhaps the most significant aspect of the Byoir campaign was a large "Statement of Public Policy" ad that first appeared in September and October of 1938 in some 60 newspapers in New York and other Eastern states. This was Byoir's first use of extensive newspaper advertising to obtain an objective rather than to build goodwill. Although the ad ran in papers with a circulation of more than 40 million, it was aimed at state legislators and members of Congress. It built huge public support for the A&P because of its low-keyed but effective revelation of the company's concern for the interests of consumers, farmers, and laborers. One magazine said this stood in marked contrast to the chain's previous stance. Byoir pointed out in a later speech that the A&P previously had failed to express its feeling accurately.

"At last business is beginning to realize that you can win public understanding and approval, no matter how big you are or how rich your success has made you, if you have done it in a fair and honest way," Mr. Byoir said in a later speech. In mid-1940, after a spirited campaign and much debate, the congressional subcommittee that had conducted hearing on the bill voted to reject it.

Perhaps the most spectacular controversy of Mr. Byoir's career centered on the struggle for

public opinion between the Pennsylvania Motor Trucking Association and the Eastern Railroads Presidents Conference. Each organization was a regional arm of a national trade organization representing the trucking and the rail interests.

The issue was weight limitations. The truckers wanted to raise the limit from 45,000 to 60,000 pounds in Pennsylvania, and the railroads saw a major threat in the increase and a resulting loss of business. They reasoned that as weight limits increased, roads would wear out more quickly, and the truckers should bear the extra cost in terms of added taxes.

The Byoir firm was awarded the railroad account in 1949. By this time, Mr. Byoir had reorganized his firm to install Gerry Swinehart as president in charge of most of its operations. Mr. Byoir had suffered a slight heart attack in 1938, at age 50, and hoped to limit his involvement to counseling senior clients.

The Byoir firm set about to build a third-party organization to provide favorable information about the railroads, following other successful Byoir programs that used this technique. In this case, Byoir directed its opinion campaigns mainly through three existing Pennsylvania organizations of farmers, town supervisors, and railroad workers.

In January of 1953, a group of Pennsylvania trucking organizations filed suit in Philadelphia, charging that Byoir and the Eastern Railroads Presidents Conference had embarked on an illegal conspiracy. The defendants said their efforts were directed only toward attaining legislative relief from the growing trucker abuse of public-supported highways.

Mr. Byoir testified at a pretrial hearing, primarily about charges that he had created sympathetic opinion groups. He said that although he was active on only three Byoir accounts at the time (A&P, Libby

Carl Byoir

Owens Ford, and RCA), he could not say, “no staffer had done anything that shouldn’t have been done.” But, he said, “if deception is involved, it’s no good. Integrity is the cement of our business.”

The trial was heard without jury, and in October of 1957, the judge announced against the Byoir firm and the railroads. In late 1959, a U.S. appeals court upheld the judge’s verdict.

But in 1961, the U.S. Supreme Court reversed the decision, saying, “No violation of the Sherman Act can be predicated on mere attempts to influence passage or enforcement of laws.”

Mr. Byoir had died four years earlier from inoperable cancer.

—Richard H. Truitt

CAMPAIGN

A campaign is the strategic design of a series of messages sent to one or more targeted populations for a discrete period of time in response to a positive or negative situation affecting the organization. An organization or agency plans a campaign by utilizing paid messages or unpaid message outlets such as press releases or other news events to respond to a crisis affecting the organization or to create a proactive campaign that enhances the corporation's images. The key to the definition of a campaign is that it is created by an organization such as a profit-oriented corporation, a political candidate, or a social agency to communicate to a single small audience such as employees within one office or to millions of persons in multiple audiences across the nation.

A campaign cannot be assumed when news stories saturate the media covering a natural disaster or reporting a crisis that affects a corporation or an industry. For example, a flurry of news stories reporting the Exxon oil spill in Prince William Sound in Alaska or the Bridgestone/Firestone tire recall crisis are not campaigns simply because of widespread media coverage. These represent only major news stories that are picked up by media outlets across the nation. However, when Exxon and Bridgestone/Firestone began responding to the news

reports with their own messages and explanations of the crisis situations, in essence, each was conducting a campaign of strategically designed messages calculated to diminish the crisis and restore their respective corporate images.

THREE ELEMENTS DEFINE A CAMPAIGN

Three factors identify a campaign and distinguish a series of news stories from a series of campaign messages developed by an organization. Also known as the conceptualization model of a campaign, the factors of (1) campaign situation, (2) nature of organization, and (3) traits of the targeted audiences or publics are the few but crucial elements that represent the conceptualization of a campaign.

Any campaign is prompted by a campaign situation, that is, either a crisis affecting the organization or a project developed by the organization. A negative or crisis event can prompt an organization to conduct a campaign to attempt to correct any damage done to persons and the environment and, additionally, to rebuild any damage to the image of the corporation that results from the incident. A proactive, positive project such as giving additional benefits to the employees or sponsoring a fundraising campaign to benefit research into an illness or disease or to call attention to domestic violence also

demands a well-thought-out, strategic campaign to get the information out to the affected and interested populations.

The nature of the organization is also a factor in any campaign. A for-profit organization, obviously, exists on profits from sales of its products or services. A not-for-profit organization—for example, a social agency—exists to raise funds from donors and to generate goodwill to benefit its social cause. Political candidates and the organizations supporting them work to garner votes and financial support to successfully support their candidates. Understanding the various natures and characteristics of organizations leads to an understanding of the campaigns that each conducts.

The third and final element of a campaign is knowledge of and considerations of all the multiple respective audiences that relate to the organization, such as employees, stockholders, community residents, media, truck drivers, customers, activist groups, and competitors or the rest of the industry. Consideration of each audience's traits such as its needs; personality traits; dominant demographics; knowledge, attitude, and behaviors toward the organization; and all the other various images held of the organization ultimately enlightens and affects the campaign that an organization plans. Campaign messages that are most effective are those that appeal to any or all of these traits in the targeted audiences.

Background knowledge of any organization, any campaign situation, and any or all targeted populations defines an actual campaign from any succession of random messages found in the media. Knowing the role of each of these elements and how each of these factors affects the others leads to an accurate definition of a campaign and separates campaign communication from other kinds of communication.

KINDS OF CAMPAIGNS

Not only do the three elements of the conceptualization model of a campaign—campaign situation, organization, and audience—identify campaigns, but these same elements also define kinds of

campaigns. The most accepted conceptual classes of campaigns are as follows: commercial campaigns, which are advertising, marketing, and public relations; political campaigns; and social issue campaigns. For each of these kinds of campaigns, the nature of the organization, the campaign situation, and the distinct traits of the audience inherently label and identify the kind of campaign.

The three kinds of commercial campaigns are marketing, advertising, and public relations. Marketing as a field of business was created first; its purpose is to place a company's product or service in the marketplace and, hopefully, carve a unique space and create a singular demand for the product. Advertising emerged from marketing communication as a more specialized and narrow kind of campaign; the singular purpose of advertising messages is to generate interest in and sell the product or service of the corporation. For these campaigns, the organization is profit oriented, the campaign situation is product sales, and the important audiences are customers, potential customers, and retailers.

For the third kind of commercial campaign of public relations, the project or crisis campaign situation and the targeted audiences are radically different from those of marketing and advertising. In the field of public relations many more kinds of campaigns are possible, given the potential for numerous project and crisis campaign situations and given all the other populations (besides customers and retailers) with whom public relations professionals must communicate. Public relations communication is exclusively responsible for crisis communication and corporate image management. This necessitates that public relations is responsible for all kinds of campaign situations outside of sales and for all the other populations outside of customers and retailers. For political campaigns, the common campaign situation is to get a candidate elected or a piece of legislation passed. In terms of important populations, a political campaign obviously targets voters or constituencies and the media as primary audiences.

The final classification of campaign is the social issue campaign. Described as a campaign to benefit society or to benefit a social or charitable cause, it

takes two forms. The social issue campaign is a campaign to attract followers and donors to causes such as National Smoke-Out Day, various environmental campaigns, or the pro-life and pro-choice campaigns surrounding the abortion issue. The second kind of social issue campaign, which is gaining in popularity, is for profit-oriented corporations to support a social issue campaign for altruistic reasons and for image management reasons. This second move for corporations to support social issues blurs the lines between a public relations campaign and a social issue campaign. The assumed definition of a public relations campaign is to foster positive images in all the various populations, but a profit-oriented corporation supporting social causes also makes it responsible for social issue campaigns.

CANADA, PRACTICE OF PUBLIC RELATIONS IN

In Canada, as elsewhere, public relations can trace its roots to activities that predate its emergence as a distinct occupation. For example, after French explorer Samuel de Champlain returned from his first voyage along the St. Lawrence and Saguenay rivers in 1603, he published a book about his exploits that was designed to lure settlers to Quebec.

However, it is in the promotion of immigration in the late 19th century, as well as in the education of immigrant farmers in agricultural techniques appropriate to their new homeland, that one finds the rise of public relations as a distinct profession in the public and private sectors. Established in 1892, the Department of Trade and Commerce became the second government department (after the Department of

Agriculture) to place a significant focus on publicity activities.

The first government publicists made use of traveling exhibits, lectures, pamphlets, and advertising to promote Canada's agricultural, trade, and commerce interests in the United States and abroad. The federal government also sponsored visits to Canada by clergymen and farmers, then circulated their comments to more than a million citizens of Great Britain. In a grand gesture, they granted 160-acre parcels of free land to each of more than 30,000 Americans.

DEVELOPMENT OF PUBLIC RELATIONS IN THE PRIVATE SECTOR

Similarly, immigration was a key factor in the rise of private-sector public relations. The railroads, especially the Canadian Pacific (CPR), were important government partners in attempting to populate the West. This cooperation was motivated, however, more by political necessity than financial strategy: Promoting immigration helped curry government support for various railroad subsidies including large land grants. By the dawn of the 20th century, the CPR had turned its promotional efforts to tourism, using such techniques as press junkets, brochures, and in-house film production.

For its part, the Canadian National Railway (CNR) was a debt-ridden, half-completed system when the government nationalized it in the 1920s. To salvage the operation, the CNR president promoted his firm as a valuable service to Canadians by introducing traveling schools and medical teams to rural communities; the firm also launched a radio broadcasting network that eventually became the foundation for the Canadian Broadcasting Corporation.

Many of the early activities in the private sector centered on internal communication. For example, the Massey Manufacturing Co. of Toronto, a farm implements maker, established what has been recognized as the first true employee publication in North America, *The Trip Hammer*. It published monthly beginning in 1885.

Early public relations efforts can often be tied to industries threatened by regulation, if not outright

nationalization. These industries developed public relations departments to foster supportive public opinion in the hope of stemming unwanted infringements on their freedom. As early as the mid-1800s, for example, Quebec brewers employed a form of public relations to counteract that province's introduction of local options on prohibition; the scenario repeated in 1917 against similar restrictive moves.

Other early adopters of public relations included utilities such as Bell Canada, which established a publicity department in 1914 shortly after ad hoc public relations helped derail proposals to nationalize telephone service. However, it has been suggested that the status of public relations at Bell ebbed once the crisis passed, a pattern that may have been true in other organizations as well.

In many cases, publicity emerged organizationally from in-house advertising departments; the hiring of ex-journalists also brought a public information orientation to marketing communications efforts. Among early journalist-practitioners were George Ham and J. Murray Gibbon of the CPR, John Yocom of British American Oil Co., Charles Fortier of Bell Canada, Yves Jasmin of Air Canada, and Toronto consultant Ruth Hammond.

The birth of public relations consulting firms, which did not lag for long, is similarly tied to people with newspaper backgrounds. The first known Toronto agency was established in 1930 by James Cowan, who had worked at the *Toronto Star*. Publicity bureaus existed in Montreal prior to that time, but there is no reliable evidence regarding dates. Probably the oldest firm still in business, OEB International, was founded in St. Catharines, Ontario, in 1936, by newspaperman Louis J. Cahill, who continued working simultaneously as a journalist for some time.

While there was sporadic growth in the private sector through the Depression, it was not until after World War II that public relations came into its own in English Canada. Public relations experience in wartime propaganda gave communicators skills that could be transferred to the private sector and to new wars against social unrest and expanding regulation.

In French-speaking Canada, public relations blossomed by 1960, when the Quiet Revolution—in essence, a turn toward secular, civil society from the

conservative, church-dominated society of the past—gave rise to a more consultative society. Local organizations found it advantageous to get their messages across, given more powerful media and the rise of government communication.

Today, public relations is routine within most private- and nonprofit-sector organizations of any size, and public relations specialists perform the same mix of managerial, strategic, and technical work as colleagues elsewhere. While some major public relations consultancies are independently owned, major international firms like Hill & Knowlton, Weber Shandwick, and Fleishman-Hillard have Canadian operations.

DEVELOPMENT OF PUBLIC RELATIONS IN THE PUBLIC SECTOR

The government did little to develop public relations activities in departments other than Agriculture, Trade and Commerce, and Transport until the 1920s and 1930s, when the problems and opportunities of large scale migration into cities necessitated new social legislation. However, it was not until World War II that public relations activities in the Canadian government became truly large scale.

The history of public relations in the public sector is tightly bound to the rise and fall of central communication agencies. At the onset of World War II, the Department of National War Services established the Wartime Information Board to support Canada's war effort and to facilitate interdepartmental information sharing. The Board reported directly to the Prime Minister. At the same time, the war spurred the proliferation of information services across government. Another federal agency, the Bureau of Public Information, orchestrated speaking tours; produced articles, posters, photos, and films; and took over the printing and distribution of all government documents. The Wartime Information Board absorbed this agency in 1942. Following the war, distrust of central agencies led to the Board's being renamed the Canadian Information Service (CIS). CIS died a quiet death after the government abandoned domestic activities and transferred the organization to the Department of External Affairs.

Despite the expression of skepticism toward central agencies, public relations services were expanding and thriving, and by 1944, the federal government employed 396 publicity officers. A classification system, established in 1946, set lower end salaries (IS-1) at \$2400 and higher end salaries (IS-4) at \$4500.

After a lengthy time lapse, the next major development in public relations occurred in 1962, with the establishment of the Glassco Commission on Government Organization. The war had made Canadians fearful of organizations with too much power or control. Reflecting this bias, the Glassco Commission recommended fragmentation of the communication function. The Commission also declared the “right of the public to know”; called for communication officers to “inform” rather than “impress”; and criticized the large number of IS officers in the armed services, the volume of government press releases, and the use of the term *PR*. Commission members recommended the establishment of clear communication policies, guidelines, and training in public relations for government communicators.

After this report, public relations departments in government became known as “Information Services.” Despite the Commission’s focus on the information function, members recognized the necessity for some government departments such as (1) Health and Welfare and (2) Energy, Mines, and Resources to seek to persuade on matters related to the public interest.

Another benchmark in the history of public-sector public relations occurred with the establishment of a 1969 Task Force on Government Information, chaired by D’Iberville Fortier. Reverting to earlier patterns, task force members championed the development of a central communication agency that could act as a reference center and technical adviser to departments, learn the views of Canadians on government issues and policies, and coordinate departmental resources (especially in crisis situations). The Task Force published its recommendations in a controversial document titled *To Know and Be Known*. Authors D’Iberville Fortier, Bernard Ostry, and Tom Ford called for the creation of a comprehensive and innovative

communication policy that would include selection standards and training requirements for public relations practitioners. They also argued that the directors of Information Services should sit on department management committees and report to the highest level of each department executive. In other words, they recommended that public relations should become a management function.

Acting on the Task Force report, in 1970, Treasury Board charged Jack Donoghue (then Director of Information Services at the Department of Energy, Mines, and Resources) with developing a career path for IS officers, and subsequently, Donoghue gained Cabinet approval for a “Career Plan and Manpower Guidelines” (sometimes called the “Y” theory of IS careers) that upgraded and clarified the public relations function within government.

Also in 1970, the government made a second failed try at centralizing the communication function in the body of Information Canada, an agency that came under severe criticism from members of Parliament, government departments, and journalists. Information Canada ceased operations in 1976. Eric Miller wrote a report that explained its failure in terms of orphaned operational responsibilities, a weak and unclear mandate, a sensitive political climate in which everyone assumed a “big brother” mentality about Information Canada, lack of a clear constituency or clientele, lack of support from ministers with clout, isolation from bureaucratic realities, harsh judgments by the media, and a dependency that came with a cost recovery budget.

Nonetheless, in 1977, shortly after the separatists took power in Quebec, the government made a third effort at establishing a central agency to coordinate public relations activities. The Canadian Unity Information Office (CUIO) had a clear mission: to contribute to the patriation of the Constitution and to foster national unity. To accomplish these tasks, the CUIO established sophisticated public opinion research and media monitoring systems to track Constitutional and unity issues. Like its forerunners, the CUIO came under attack almost immediately for being a propaganda tool, partisan in mission and operations. And so the CUIO fell, within months of the conservatives coming to power in 1984.

The next significant development occurred when the Tories commissioned a management review of communications in 1987. As part of the review process, government undertook an occupational analysis of communication functions. They found that public relations specialists were acting as media liaisons, writers, editors, exhibition designers, speech writers, and in other creative positions. Subsequently Cabinet approved a series of decisions that formed the basis for the 1988 *Government Communications Policy*, authored by Assistant Secretary of Communications to Cabinet Mary Gusella with the assistance of Paul Tellier (Clerk to the Privy Council) and Jack Manion (Assistant Clerk to the Privy Council).

This document was a key development, transforming the work of the government communicator into a strategic management function. The new policy required communication officers to research and analyze the public opinion environment, engage in planning, perform an advisory function, and manage communications. Public relations specialists across the government registered in a massive retraining effort to prepare for their new strategic roles and responsibilities.

The goals of the new communication policy were to set out basic principles of communication within the context of representative government, encourage transparency and the free flow of information between government and citizens, highlight the importance of communication in achieving government objectives, establish a framework for government-wide management of communication, and provide guidelines for implementing a range of communication activities such as advertising, publishing, public opinion research, and media relations.

The most recent incarnation of a central communication agency occurred in 1996 with the establishment of the Canadian Information Office (CIO), later renamed Communications Canada. The formation of this agency followed on the heels of the Quebec referendum—a referendum that came within two percentage points of dividing Canada into French and English entities. The federal response was decisive. With ministerial approval, Treasury Board established a Corporate Identity and Government Communications Division in late 1998. The division

had a twofold mandate: to brand the Government of Canada and to renew the 1988 *Government Communications Policy*. Jean-Pierre Villeneuve was appointed to head that renewal process.

Also in 1998, Assistant Secretary of Communications to Cabinet Ruth Cardinal steered a government-wide committee that created a vision statement for the communications community. That vision statement outlined the need for communicators to develop strategic and operational communication plans, in partnership with stakeholders; implement communication plans, projects, and activities by using modern communication tools and techniques; evaluate and adjust communication plans and activities, as needed; and ensure a capacity to respond quickly and effectively to crisis situations. The committee also contributed to a competency profile for communicators, part of the Universal Classification System initiative undertaken by the Public Service Commission. The competency profile included categories related to knowledge, cognitive thinking abilities, interpersonal and partnering skills, and specialized and technical skills.

More than a decade after initiating its review of the 1988 *Government Communications Policy*, Treasury Board issued a revised policy in April 2002. That policy document resulted in a greatly expanded definition of the government communications function. According to the policy, the job duties of communicators range from informing and serving Canadians to environmental analysis, public opinion research, consultation and citizen engagement, risk communication, crisis and emergency communication, management and coordination, planning and evaluation, internal communication, Internet and electronic communication, media relations, involvement with public events and announcements, advertising, establishment of partnering and collaborative arrangements, marketing, publishing, and the production of films, video, and multimedia products.

ORGANIZATIONS

The two principal professional associations operating in Canada are the Canadian Public Relations Society (CPRS) and the International Association of Business Communicators (IABC).

CPRS is a federation of 17 locally based societies from Vancouver Island to Newfoundland. Its 2003 membership stands at 1,780. Like the Public Relations Society of America, with which it is loosely affiliated, CPRS fosters the interests and professional stature of the field and offers its members professional development opportunities through chapter programming, an annual national convention, an online resource library, and so on. It has an accreditation program leading to the designation APR; nearly 500 of its members are accredited. CPRS was established in 1948, linking separate bodies in Montreal and Toronto.

IABC has a strong presence in Canada, with 2,180 members in mid-2003. Its largest chapter worldwide is in Toronto. There are 14 other Canadian chapters within its two Canadian districts—including a chapter in the Caribbean whose members determined they had more in common with Canadian practitioners than with their more proximate U.S. colleagues. IABC members have access to professional development opportunities similar to those of its sister organization, as well as an accreditation scheme leading to the designation ABC (Accredited Business Communicator). Several of the association's world leaders have been Canadian. Both CPRS and IABC are members of the Global Alliance for Public Relations and Communication Management, founded in 2000. The president-elect of the Global Alliance is Canadian Jean Valin.

Canada also has a number of organizations linking practitioners in specific industry sectors. These include the Health Care Public Relations Association of Canada, with seven chapters; the Canadian Association of Communicators in Education, which embraces communicators from school boards, teachers unions, and provincial ministries of education; and the Canadian Council for the Advancement of Education, whose members are drawn from the postsecondary education sector.

STATUS

Just as in the United States, public relations in Canada is an unlicensed profession. In the 1980s, surveys indicated that up to 60 percent of practitioners supported mandatory licensing, a call

echoed by several CPRS leaders such as 1987–1988 president Allan Sinclair. Nothing came of these pronouncements, however, and public relations remains open to entry by anyone, though increasing numbers have taken some form of public relations education at the postsecondary level.

The 2001 Statistics Canada census found that 4,360 respondents listed public relations and customer service as their major field of study at the university level. The figure was based on a 20 percent data sample of those at least 20 years old with a university degree or degrees.

Educational programs in public relations appear most often in community colleges. The exceptions are programs at Mount Saint Vincent, the University of Ottawa (in cooperation with Algonquin College), l'Université Laval, and the University of Quebec at Montreal, which offer the opportunity to specialize in public relations within their communication programs. The University of Guelph, McGill University, the University of Regina, l'Université de Montreal, the British Columbia Institute of Technology, Ryerson University, and the University of Lethbridge (in cooperation with Grant McEwan College) grant diplomas or certificates in public relations. (These programs do not always fall under the aegis of communication.) Courses relevant to the study of public relations also appear within a number of communication and continuing education programs in Canadian universities such as the University of Calgary.

Opportunities for graduate work in public relations are limited. Royal Roads University offers an MBA in Public Relations and Communication Management. A joint program between l'Université Laval (Quebec) and l'Institut d'Études Politiques de Bordeaux (France) grants a diploma of graduate studies in Public Affairs and Lobbying.

There is some evidence that Canadian public relations practitioners enjoy about the same status as their U.S. counterparts. A 2002 survey by IABC, for example, shows similar rankings on such measures as job satisfaction, job security, and level of managerial responsibility. Indeed, to the extent that links to senior management are a marker of status, Canadian respondents reported somewhat greater access than Americans, and they were more apt to regard the

reporting relationship as effective. The average salary of Canadian respondents in the IABC survey was about one-third lower than that of their U.S. peers, when adjusted to U.S. currency; however, they were no more likely to complain that their salary was too low for the number of hours they are compelled to work. As elsewhere, women in the field have increased in number. For example, CPRS membership in 1958–1959 was 13 percent female; at the turn of the millennium, the figure was 60 percent.

CAPTION/CUTLINE

A caption, or cutline, refers to those identifying words that appear beneath a photograph when it is used to accompany an article or to stand alone in a news publication. If a photograph accompanies an article, the caption or cutline should summarize the article, as the reader may rely only on the caption or cutline for information.

The intention is that captions or cutlines should be interesting enough to entice the reader to read the entire article. “Research repeatedly demonstrates that photographs with captions are most effective at increasing readership and understanding than news stories standing alone. Studies also show that news

stories are more effective than photographs without a caption” (Morton, pp. 17–18).

Photographs can be considered among the most effective publicity tools. Single photographs with captions or cutlines are sometimes called “wild art” by editors. These are photographs that are taken with the intent to draw reader interest.

Captions or cutlines should identify all individuals who appear in a photograph from left to right. Be sure to include their titles and their involvement as they relate to the photograph's purpose. Photograph consent forms should be obtained, especially for anyone under the age of 18.

Most often, public relations practitioners are responsible for writing captions or cutlines for their organizational newsletters or for photographs being submitted to the media. When submitting a photograph with a press release, or as a stand-alone item, submit the caption or cutline in press release format, including contact information. Write in the active tense and try to limit it to no more than three sentences.

Public relations practitioners may be responsible for taking photographs or directing a photographer at special events. Plan out the shots ahead of time by making a list of who needs to appear together in photographs. For example, if board members or staff members will be present in honor of a special guest, work to get these people together for a quick photograph during the event.

When directing or taking photographs, public relations practitioners should try not to have more than four individuals appear in each picture. Photographs that capture people in their natural state as they are talking or looking at objects are preferred over those that are posed. Avoid, if at all possible, publishing (or taking) photographs of individuals who have alcoholic drinks in their hands or are smoking cigarettes to avoid any liability issues that could ensue.

CASE STUDY

The case study is a descriptive, qualitative research method that analyzes in great detail a person, an organization, or an event. Case studies are found in most applied areas, such as business, law, and marketing, and offer insight into practices and tactics. The case study's major advantage is the detail and analysis it provides of a specific person, organization, or event. Its major disadvantage is that it cannot be generalized to situations other than the one that was studied. A major problem in using case studies is the "it worked here, it will work for me" mode—that is, trying to take specific tactics or messages from one case and apply them to another. Even in situations where cases are within an industry, trying to compare case 1 to case 2 is like trying to compare apples to oranges.

CASE STUDY TYPES

There are three major types of case studies common to public relations: linear, process-oriented, and grounded. The *linear case study* focuses primarily on the entity as the object of research from a historical perspective. Its function is, as Jerry Hendrix notes, a linear ROPE (Research, Objective, Program, Evaluation) model. The *process case study* examines the object of research as a unique event within a larger process. As suggested by Allen Center and Patrick Jackson (1995), this case study type includes feedback loops whereby campaign strategy and tactics can be revised or changed due to evaluation carried out against planned benchmarks. Both types are linked to some type of communication theory. The *grounded case study*, on the other hand, is crafted around a business objective and relies less, if at all, on communication. Its function is to demonstrate the business principles in play and typically is based on some business model, such as Management by Objectives (MBO).

CONDUCTING A CASE STUDY

The actual application of any of the three case study types follows a historical review of a public relations campaign, specific event, institution, or person. As such, a case study typically follows a *timeline format* that focuses on the events leading up to, and then follows through to, a campaign or event, or it chronicles the individual or institutional life. If the case study takes a problem-solution approach, then the case is formatted based on causes and effects, typically following a deductive logic. Regardless of format, the case study usually includes a statement of the problem, a research phase, the goals and objectives of the campaign, event, institution, or person, the communication strategy employed (if employed), and evaluation.

All public relations case studies focus on some element or problem. Defining and stating the problem or element is the first step in conducting the case study. This is typically phrased as a problem, opportunity, or situation and sets the stage for the research phase. Case studies have been conducted on economic, political, environmental, and personal problems. The handling of the Clinton-Lewinsky affair, for instance, might provide insight into how to handle a political problem on a personal level. A case study of Dell Computer Corporation might examine how the CEO influences public relations strategies and impacts the bottom line.

The research phase is an exhaustive review of all documents—published and unpublished—relevant to the case. The research phase may also include visits to sites, interviews with participants, and interviews with representatives from other publics affected by the case. Although there may be interviews, most of the case study's efforts are found in historical research. Historical research tries to examine as many primary sources—original documentation—as possible in order to paint as complete a picture as possible of the case. This requires visiting libraries and other places where documents may be found. In many instances the case study researcher will have to travel to specialized libraries, such as the mass communication collection that houses John W. Hill's personal papers at the University of Wisconsin or the archives of the

company or institution under study. The key is to obtain as much of the original material as possible. This is followed up with secondary sources: newspaper articles, reports of various industries or the government, and so forth. For instance, in a crisis management case the researcher might examine stock prices before, during, and after the crisis.

Based on this research the case's goals and objectives are formally stated and then the communication strategy used to meet the goals and objectives is examined. At this phase of the case study, a content analysis of messages may be employed and key figures may be (re)interviewed. Here the researcher attempts to state specifically the campaign or individual goals and objectives and the benchmarks against which it will be evaluated. In addition, the actual communication strategy and the various written, visual, and verbal tactics employed are addressed. Many grounded, business-oriented cases do not offer great detail here, mainly because they are more concerned with a cause-effect model. In a linear model the case would progress to the next phase, but in a process model the evaluation of benchmarks would be presented and any revisions of strategy and changes of tactics explained.

Finally, the case study evaluates whether the objectives were met and the goals achieved. This is done by reexamining the problem, opportunity, or situation, the goals and objectives, the communication strategy, and the tactics and comparing them against either the benchmarks or some other criteria that provide indications of success or failure. Given the advantage of hindsight, suggestions for improvement may be offered for objectives and goals not met as well as a critical appraisal of output tactics offered.

IMPORTANCE OF THE CASE STUDY

Case studies provide public relations practitioners with examples of good and bad public relations tactics. In some instances a case study provides insight into how a public relations firm operated, such as Karen Miller's case study of Hill & Knowlton. Others might provide insight into how public relations was not employed and the impact of that failure, such as James O'Rourke's Ford Motor Company versus Firestone. Each provides the

practitioner with examples of successful and unsuccessful strategy and tactics.

CAUSE-RELATED MARKETING

Cause-related marketing links a product or a company to a charitable cause. The funds that are donated to the charitable cause usually come from a portion of the sales of the product. For example, when a person buys cosmetics from Avon, a portion of the sales profit is donated by Avon to support the breast cancer research cause. In this way, cause-related marketing is an indirect form of corporate sponsorship. It is often used as part of an integrated marketing campaign since it relies on advertising as well as public relations.

The concept of cause-related marketing was first pioneered in the early 1980s. One of the first companies to use it was American Express when the company linked its marketing campaign to the refurbishing of the Statue of Liberty. A portion of profits from credit card use was donated to the Statue of Liberty Fund. Use of the credit cards increased because customers felt they were making a contribution to the cause.

The purposes of cause-related marketing are twofold, and the two purposes must be balanced for

the marketing effort to be effective. The first purpose, of course, is to increase sales. The second purpose should be a socially responsible effort on the part of the company to support a cause and to be a good corporate citizen. When the second purpose is sincere, the first—sales—is better served.

If cause-related marketing is done strategically, it can be an effective marketing tool that can increase media exposure, help a product cut through media clutter, increase sales by adding an additional benefit to the purchase of a product, and increase the chance of reaching specific audiences. A survey of 2,000 adults in the United States by Cone-Roper found that 78 percent said they would be more likely to buy a product that supported a cause in which they believed. A little more than half (54 percent) said they would pay more for a product that supported a cause they cared about, and 66 percent said they would switch brands to support a cause.

To use cause-related marketing strategically, a company must understand what charitable causes will appeal to the customers the company is trying to attract and, at the same time, find a cause that is a good fit for the company and the product. There must be a logical connection between the cause and the target market for the product, and the cause must be relevant to the consumers. But as important, there also should be a logical and strategic connection between the vision and values of the company and the cause. And finally, the relationship needs to show long-term commitment to the cause.

An example of a company that has used cause-related marketing effectively is Avon. Avon's "cause," breast cancer research and related support efforts, is a good fit for the company, the product, and the consumers. Part of Avon's mission statement reads "Our dedication to supporting women touches not only beauty, but health, fitness, self-empowerment, and financial independence" (www.avon.com). The Avon Breast Cancer Crusade matches the vision and values of the company. It also has an identifiable link to the product—cosmetics—that makes women feel good about themselves. Additionally, the company has shown long-term and genuine commitment to the cause. The Avon Foundation was established in 1955, and in the last 10 years has raised more than

\$250 million for breast cancer research, education, early detection programs, and clinical care and support services for women. The Breast Cancer Crusade is clearly identified and associated with Avon and Avon cosmetics.

One definition of public relations is "doing good and getting credit for it." For cause-related marketing to have maximum benefits for a company, information about the cause must be integrated into as many elements of the communication efforts of the company as is possible and appropriate. It is not enough to have a cause; the cause must be communicated to the customers. For instance, Avon integrates the pink ribbon—the breast cancer awareness symbol—into most of its advertisements and public relations campaigns. In some cases, whole-page advertisements are used for image and advocacy advertising, promoting the Avon Foundation Breast Cancer Crusade, rather than for advertising its products and cosmetics. In product ads, information about the crusade is included, and information about the Breast Cancer Crusade is also prominent on the company's web site and is included in product packaging.

When there is a good fit among the cause, the customers, and the company, the company's image is enhanced and the customer feels good about the product purchase. An emotional element is added to the relationship between the company and customer, which can help position the company in the customer's mind and differentiate it in a positive way from the competition. It can help make the company seem less "commercial" and more socially responsible.

A word of caution should be noted. If the cause is not consistent with the company or product's image and does not seem logical for a particular company to promote, or if the cause is not relevant to the target consumers or is not well communicated, then cause-related marketing is useless as a way to increase sales. Furthermore, if the commitment between the company and the cause does not appear to be long term and genuine, cause-related marketing can backfire. Fifty-eight percent of the people surveyed by Cone-Roper think that cause-related marketing is done only to improve the image of the company. The perception that a company is

using cause-related marketing to be self-serving rather than altruistic can result in decreased sales.

CHAOS AND COMPLEXITY THEORY

Science defines *chaos theory* along technical lines as the study of unstable, or a periodic, behavior in complex, nonlinear, and dynamic systems accounted for by relatively few rules. In other disciplines, chaos can be defined more simply as the structures and regularities underpinning irregular systems or behaviors. Such systems unfold over time in a manner different from predictably linear, cause-and-effect change. These systems tend not to repeat themselves exactly. An example is the phenomenon of being deafened by the screech of positive feedback from amplified music. Tiny adjustments may result in clearer amplification, or in making the screech louder, so that future actions cannot be plotted from past behavior. In nonlinear systems minuscule variations at the input stage, in what chaos terms “sensitivity to initial conditions,” may lead to disproportionately different outcomes later.

Public relations features many examples of perceptions of an organization altering, and crises arising, with dramatic suddenness through seemingly insignificant events. The Pentium chip’s infinitesimal mathematical errors stirred up enough of an initial Internet storm among specialists, and then through to the mainstream media, that Intel lost substantial share value. As a postcrisis rule organizational systems do revert to order, whether a return to the status quo, as Intel did by gradually restoring

investor confidence and a high share value, or to a revised status quo, as Enron did by crashing from its US\$60 billion book value in the wake of 24 days of *Wall Street Journal* reporting. Ian I. Mitroff has generalized from his study of crisis management that “signals go off all the time in organizations, but because there is no one there to recognize them or record them, or attend to them, then for all practical reasons the signals are ‘not heard’” (2001, p. 109). His associated four ubiquitous signals of crisis—internal and external people, and internal and external technical—suggest chaos-inspired future research into their finer gradations. By highlighting the potential power of small regularities, akin to those four ubiquitous signals at the outset, chaos theory holds out the promise of identifying simplified sets of interactions, or consistent patterns of neglect, before issues escalate into crises.

While running computer weather predictions, meteorologist Edward Lorenz discovered that trivial rounding errors, at the outset of an experiment, lead to huge variations in long-range forecasts. In 1973, Lorenz posed his discovery in the memorable question “Does the Flap of a Butterfly’s Wings in Brazil Set off a Tornado in Texas?” (1993, p. 181). Despite the intractable problems his question raised, it catalyzed activity across scientific and nonscientific disciplines alike. It loosened the meaning of chaos from its common language use, as “completely unstructured confusion,” to allow for the more technically influenced sense of “structured, and therefore only apparently random, movements between order and disorder” (1993, p. 181). The so-called butterfly effect influenced the study of dramatic change arising out of tiny variations, from biology and physics to business and sociology, and it demonstrated both visually, since one of Lorenz’s graphs took the shape of a butterfly, and practically, that computers could generate virtual research capable of informing empiric studies.

In addition to demonstrating the power of computer-generated insights, and the butterfly effect, Lorenz’s research typifies chaos in several areas. One is the concentration on everyday topics, such as weather. Another is the identification of consistent patterns underlying erratic real-life systems. These are accompanied by simultaneous admissions

that pattern identification, while increasing understanding of the system's processes and likely parameters, can never predict with complete accuracy. Nevertheless, in moving out of laboratories, chaos research moves away from relatively regular, and hence predictable, environments. In studying nonpredictable, real-world behavior, it departs from the deterministic impulse in the western scientific tradition that values reproducibility. Reproducibility comes at the cost of simplification, or isolation, in order to run experiments confirming predictable outcomes. Chaos highlights conventional science's lack of engagement with complicated systems that exhibit awkward nonlinear features and disturbingly unpredictable real-life turbulence.

Priscilla Murphy's seminal 1996 article on "Chaos Theory as a Model for Managing Issues and Crises" speculated on what implications chaos had for those unpredictable areas of public relations. One implication is that chaos, by analogy, can reveal persistent structures that underpin intractable problems. Accordingly, while likely parameters for activist publics can be established, those groups can never be completely controlled. These acknowledgments of the impossibility of total control mean that practitioner claims in terms of assured outcomes should remain modest. Nevertheless, Murphy concludes that "in many situations chaos theory balances out overly rational management approaches and provides useful reminders that context-sensitivity, patience, and careful timing may effect change where wholesale proactivity cannot" (1996, p. 111).

In science, chaos was succeeded by complexity, defined as "the *collective* behavior of many basic but interacting units . . . that are endowed with the potential to evolve in time" (Coveney & Highfield, 1995, p. 7). Complexity shares conceptual territory with chaos: Both foreground the loss of control by conscious entities; both acknowledge persistent unpredictability; and both engage with predominantly nonlinear behavior. Complexity extends chaos by concentrating on self-organization. In complexity theory all things tend to self-organize into systems of coherent collective phenomena and the result is "emergent properties" that provide "order for free." A classic example is when bone, neural pathways, and synapses coalesce to human

consciousness and life itself becomes an emergent property arising when certain orders of physical and chemical systems interact.

Complexity stimulated new modeling for irreducible human interaction problems in public relations (see Murphy, 2000). The models allowed for a wider range of independent component actions from differing social spheres so that "adbusters" and cultural "jammers" can be seen to impact on reputation as well as corporate copywriters. Identity emerges as the collective result of many small behaviors rather than the outcome of consciously generated organizational intentions. Chemical giant Monsanto developed agricultural biotechnology to make profits and reduce global starvation with more productive agricultural practices. They mobilized sizable communications programs to promote that view but neglected small behaviors, such as the European distrust of food regulatory bodies in the wake of mad cow disease, and the impact of activist nongovernmental organizations in shaping negative public perceptions of genetically modified (GM) food. The resulting European consumer rejection of GM food precipitated Monsanto's corporate decline. In complexity terms of "interacting agents responding to environmental feedback," Monsanto's limited recognition of the range of active agents factored into that decline.

As the vocabulary of adaptation indicates, complexity draws metaphors and models from evolution. It reconsiders relations between human and nonhuman agency with nonhuman agency assigned an active part. As a result, just as an ecosystem is greater than the sum of its flora and fauna, an organization is a complex adapting system evolving to a whole greater than the sum of its computers, personnel, and premises. In these emerging institutional systems, which are shaping and are shaped by interactions between buildings, language, and people, evolutionary metaphors impact on perceptions. Their changing imagery calls into question the power "to manage," in the sense of "to control," and strengthens ideas of "managing," in the sense of "coping with," ongoing organizational and environmental uncertainties. Economists may set clear profit margins, but returns on investment remain vulnerable to co-creation, with variables as fragile as consumer whims and currency speculators.

The business equivalent of evolution's survival-of-the-fittest metaphor is sustainable organizational success. Logically it too would emerge through coevolution with natural, social, and technological environments. Both dominant coalitions and public relations practitioners constitute important parts of organizational systems, but they are just parts. Both are highly sensitive to public opinion and its interplay with government regulation. Robert L. Heath's 1994 work on enactment in managing corporate communication established the centrality of these interactions. However, in their greater decentering of traditional command and control management, complexity perspectives point both groups toward further relinquishment of the will to control in favor of facilitating configurations for collaborative growth.

Future growth through socially responsible behavior fosters collaborations with publics and decreases the risk of government intervention. One British public relations exercise involved the Sky television channel partnering its employees and its positive youth image with an inner-city youth charity's altruism and expertise. Together the organizations motivated staff, deployed technology, and inspired young people to participate in grassroots career workshops. Along the lines of ecological sustainability models, the structured interaction of simple components led to common emergent properties greater than the sum of their individual parts. The results improved job selection skills among teenagers significantly, and expanded the charity's effectiveness, while simultaneously advancing Sky's ethical profile and brand equity. The Sky configuration demonstrates the art of complexity-aligned public relations in facilitating desirable, in the sense of socially responsible and sustainable, self-organization between discourses, materials, and people.

CHASE ISSUE MANAGEMENT CYCLES

The Chase Model of Issue Management is the leading model that attempts to explain how organizations can and should respond to significant public issues. Developed by W. H. Chase along with colleague Barrie Jones, the model is composed of the following five key steps: issue identification, issue analysis, issue change strategy options, issue action programs, and evaluation of results. The assumption of the model is that instead of acting as passive reactants to the interests of advocacy groups, corporations can use their discourse as an organizational resource. Chase asserts that the tracking of issues and the organizational response to those issues constitutes a “new science,” that is, one that uses a systems approach that elevates the public relations function of the organization from an auxiliary enterprise to the strategic level. Examples of major issue management campaigns include those by the then-Mobil Corporation in the 1980s, which offered “observations” about technology, conservation, and government regulation, as well as a campaign by the Insurance Information Institute in the 1990s, which offered a public policy response to the so-called lawsuit crisis.

ISSUE IDENTIFICATION

The first stage of the Chase issue management model is that of issue identification. Issue identification “starts with consideration of trends which precede issues” (1984, p. 11). An issue is defined as an “unsettled matter which is ready for decision,” whereas trends “are detectable changes which precede issues” (1984, p. 11). This is the stage in

which a futurist research approach is taken toward issues that may affect an organization. Chase recommends that issues be classified according to their type (e.g., social, economic, political, or technological), impact and response source (e.g., business system, industry, corporation, subsidiary, or department), geography (e.g., international, national, regional, state, or local), span of control (e.g., uncontrollable, semicontrollable, or controllable), and salience (e.g., immediacy, or prominence). The idea is that since it is impossible to manage every issue, a company must develop a process by which it can classify issues.

ISSUE ANALYSIS

The second stage, issue analysis, involves the application of theory and research to analyze the identified trends and issues. The idea of this stage of the model is that social, economic, and political trends affect how issues develop. The use of quantitative (e.g., public opinion surveys, and content analyses) and qualitative analysis (e.g., statements by opinion leaders) helps to aid the process. The point of such analysis, then, is to use the data in order to make judgments about issues and to set priorities to aid in determining which issues warrant an organizational response.

ISSUE CHANGE STRATEGY OPTIONS

Issue change strategy options, the third stage of the Chase model, describe an organization's "basic decisions . . . on the corporation's response to challenges and opportunities posed by one issue within the public policy process" (1984, p. 15). Jones and Chase offered the following three potential issue stances by organizations: reactive, adaptive, and dynamic. The reactive approach is best characterized as "stonewalling" an issue. An adaptive approach indicates an openness to change that seeks to offer accommodations on emerging issues; that is, an organization seeks to participate in final public policy decision making. The third approach, and the one advocated by Jones and Chase, is the dynamic approach: "This strategy anticipates and attempts to shape the direction of public policy

decisions by determining the theater of war, the weapons to be used, and the timing of the battle itself. In other words, the company employing the dynamic strategy directs change by developing *real* solutions to *real* problems with *real* results" (1984, p. 17). The authors suggested that "the dynamic option can be used in combination with the Reactive and Adaptive to create a fourth change strategy option that is paradigmatically realistic over time" (1984, p. 17).

ISSUE ACTION PROGRAMMING

In the fourth stage, Jones and Chase advised that management must formulate a policy to support the change strategy and must operate an issue action program from within the boundaries set by the policy. Here, organizations begin with a strategic goal and specific program objectives. The action program implies strategies about research, analysis, and priority setting. At this point the organization allocates and coordinates financial and human resources toward the project. It then determines which information resources will be utilized and what messages will be communicated through which message delivery system to which target audience. Jones and Chase recommended using tracking surveys to determine if a campaign is working by creating the "desired perceptions"; if not, "the model provides for the *redesign* of communication programming" (1979, p. 21).

EVALUATION OF RESULTS

In the final stage, Jones and Chase advocated that such programs must be evaluated systematically. Here the organization must "evaluate the *real* versus *intended* program results and subject the program managers to performance review" (Chase, 1984, p. 74). Ongoing monitoring of social, political, and economic changes is also recommended.

CONCLUSIONS

It is difficult for organizations to manage an entire public policy issue of its own. Indeed, one of the ironies of issue management is that the more

successful issue managers are, the more likely they are to lose control of an issue. While it is difficult to measure the success of issue management, other justifications for engaging in issue management are the positive effects that issue management has on a company's image as well as the support that issue campaigns are able to build with strategic constituencies who might be needed at a future date.

CHASE, W. HOWARD

W. Howard Chase is best known for coining the term *issue management*. A man of unique intellectual and experiential depth, Chase argued for the following statement as the official definition of the Public Relations Society of America (PRSA) in 1947: “Public relations is an operating philosophy that integrates the corporation into the daily lives of the people it serves” (Crane, 2003, p. 49). With this line of reasoning, Chase was one of a few leaders who recognized that constant change and innovation were necessary not only for how people practiced public relations, but also for how the profession was defined. He was primed in these ways to demand more responsiveness and leadership from practitioners, as businesses were sharply criticized during the turbulent 1960s. He helped revolutionize the practice in many ways during the 1970s and 1980s.

A Phi Beta Kappa cum laude graduate of the University of Iowa, Chase received the Sanxay Award granted to “the outstanding senior who gives

promise of achieving the highest career.” Postgraduate studies included the London School of Economics and Harvard University. Dongguk University, the largest Buddhist university in the world, in Seoul, Korea, awarded Chase an honorary doctoral degree in economics. He taught at Harvard-Radcliffe, Drake University, New York Polytechnic Institute, The George Washington University, and the Graduate School of Business Administration at the University of Connecticut, where Chase introduced the first course ever offered on issue management.

As the first chair of the Executive Committee of PRSA, Chase was one of many leaders of the profession who helped to found this organization of working professionals. Chase twice received the PRSA's Gold Anvil Award for “distinguished professional proficiency.”

Chase's corporate service as officer or director includes American Can Company, General Mills, and General Foods. In 1951, Chase assumed the post of political public relations director for U.S. Army Gen. Dwight Eisenhower, in charge of all Republican National Convention arrangements for Eisenhower's presidential nomination in 1952. Subsequently, he served as assistant secretary of commerce for the initial Korean War mobilization. He also served as deputy administrator for the Office of Defense Mobilization under Charles Wilson, Lucius Clay, and Sidney Weinberg. He served as a trustee at Wellesley College, Sarah Lawrence College, and Mannes College of Music in New York City.

In 1962, Chase created the Council for Management of Change, with the monthly newsletter, *The Innovation and Management of Change* (IMC), as an incubator of his ideas. The newsletter's thesis was “The principle of responsibility of senior executives today is the successful management of change itself.”

In 1976, he coined the term *issue management* as part of a robust discussion centering on the question: How should management respond to the deep and wide criticism being heaped on corporate America during the 1970s? With the publication of his 1984 book, *Issue Management, Origins of the Future*, Chase presented his signature comprehensive

approach to strategic issue management. He defined the new field's objectives, in the debut edition (April 15, 1976) of the newsletter *Corporate Public Issues and Their Management* (CPI), as follows: "to introduce and validate a breakthrough in corporate management design and practice in order to manage corporate public policy issues at least as well or better than the traditional management of profit-center operations" (Chase, 1976, n.p.). That same year, the Institute for Public Issues Management, of which Chase is founder and director, in cooperation with the Graduate School of Business at the University of Connecticut, sponsored the first of a series of seminars on issue analysis and techniques for corporate reorganization of public policy functions.

The first Issue Management Process Model, developed by Howard Chase, Barry Jones, and Teresa Yancey Crane, was published in 1977 in a special edition of CPI. (See also Jones & Chase, 1979.) The Public Affairs Council, under President Raymond L. Hoewing's leadership, held its first issues management conference for corporate public officers in 1977, and Chase was a presenter at what has since become an annual event. The Chase Award for Excellence in Issue Management, named in his honor, is annually bestowed by the Issue Management Council.

Speaking as co-founder and chairperson of the Issues Management Association in 1982, Chase offered the following widely quoted definition: "Issue management is the capacity to understand, mobilize, coordinate, and direct all strategic and policy planning functions, and all public affairs/public relations skills, toward achievement of one objective: meaningful participation in creation of public policy that affects personal and institutional destiny" (1982, p. 1). Chase stressed the proactive aspect of issues management that "rejects the hypothesis that any institution must be the pawn of the public policy determined solely by others" (1982, p. 2). In 1984, Chase defined issue management as issue identification, analysis, change strategy options, action programming, and evaluation of

results. "An issue change strategy option is a choice among carefully selected methods and plans for achieving long-term corporate goals in the face of public policy issues, a choice based on the expected effect of each method of employment, cost, sales, and profits" (p. 56). Action programming entails the use of resources to gain the strategy option selected.

Chase passed away on August 19, 2003, in Stamford, CT. In his address as PRSA president in 1956, he advised practitioners to realize that their profession entailed more than competent or even excellent communication skills. Their profession required that they be counselors to help their employers and clients to more completely win the public's approval by deserving that approval.

CHAT

Chat has become one of the most popular online features. Chat is real-time text-based communication between two or more users. Chats are conducted using online services such as America Online, bulletin board services, and Web sites. Chatting can also be conducted by using audio or

audio and video, but requires much greater bandwidth and the appropriate software. Most discussions about chat refer to the text-based real-time communication. Chatting is an effective and efficient way to instantly communicate with other online users.

Chat rooms are places on the Internet where chatting occurs. Chat rooms are designed for interactive messaging and most do not require special software to use. Corporations and organizations use chat rooms for a number of reasons. First, chat rooms can be used to provide convenient real-time customer service. Web sites such as Godiva.com allow users to instantly talk to customer service representatives. Although the company's responses follow a standard protocol, responses are tailored to the users' questions or requests. Some companies, such as Westlaw.com, also provide users with a transcript of the real-time dialogue between the customer service representative and the user. However, companies using chat for customer service purposes must provide their representatives with adequate training. Real-time customer service representatives who fail to adequately address customers' questions or inappropriately respond to online users could result in a public relations disaster.

Second, chat rooms can be used to conduct meetings or interviews. For example, companies can host online real-time press conferences with the media. These chat rooms can be open to the public or private. By hosting interviews or press conferences online, communication practitioners have greater control over the content of the discussion because they can write and edit responses before posting them to the chat room. Another advantage of chat rooms is the low connection cost when compared to traditional phone lines—especially when conducting interviews or conferences with international participants.

Chat rooms usually require individuals who want to participate in the discussion to register by choosing a username that will be displayed on other users' computers when they join the discussion. Some chat rooms also require users to create a password before joining a discussion. Although corporate and organizational Web sites may have only one chat room (for example, customer service),

some Web sites host multiple chat rooms based on subject or interest. For example, Yahoo!, the search directory and engine, lists hundreds of different chat rooms for users to participate in.

Starting in the late 1990s, communication practitioners began to monitor chat rooms for misinformation or negative comments about their organizations. One of the ways communication practitioners monitor chat rooms is by lurking. Lurking is entering a chat room, reading the posted messages, but not participating in the discussion. Services such as PR Newswire, or software such as ContentWatch.com, allow communication practitioners to monitor discussions in chat rooms. By monitoring relevant chat rooms, communication practitioners can keep a pulse on what online users say about their organization, products, and services and possibly prevent crises.

In using chat, communication practitioners must be aware of the expected etiquette protocol—called "netiquette" on the Internet. Although netiquette is largely based on the Golden Rule—do unto others as you would have them do unto you—different chat rooms assume different rules. In addition, these netiquette rules often change. Thus, communication practitioners are advised to learn about the appropriate netiquette for each chat room before engaging in real-time messaging with users. Communication practitioners who post unrelated content in chat rooms are considered spammers, which can lead to considerable backlash by online users.

Instant messages (IM) are a form of chat. They are a cross between chat and e-mail. Instant messaging allows users to engage in real-time text-based messaging. Instant messaging is used most often to communicate with a single individual or a very small group. Further, in order to engage in instant messaging, the user must know the other participants' instant messaging addresses, whereas with chat, knowledge of users' online identities is not required. In contrast, chat does not require users to know the usernames of the other participants before communicating with them.

CIRCULATION

Circulation refers to the number of readers a certain publication reaches. According to the Web site for the National Newspaper Association, small-circulation newspapers reach fewer than 50,000 readers; medium-circulation newspapers reach 50,000 to 200,000 readers; and large-circulation newspapers reach more than 200,000 readers. As of June 2003, the circulation of *The New York Times* was 1.2 million readers on weekdays, while the circulation of the *Portland Press Herald* in Maine was approximately 70,000.

For the public relations practitioner, circulation figures are most important when evaluating in which publications to advertise. Since advertising is a paid form of promotion, as opposed to publicity items such as calendar listings that are generally free, chances are that the public relations practitioner's advertising budget (if even given one) will not be large enough to advertise freely in all major publications.

Although it may make sense to advertise in the publications that reach the most people, if your organization or its audiences are very specialized, then a smaller circulation in a specialized publication will serve your organization much better than reaching people who have no interest in your product or service.

When meeting with representatives from publications, it is important to gather not only circulation figures, but also the demographic information of the audience the publication reaches. If you are trying to reach a young audience with a particular message, placing that message in the *Wall Street Journal* may not be most effective. The public relations practitioner must always keep its many audiences in mind.

When considering circulation figures, it is also important to ask how many of those people are actual subscribers and how many copies are sold directly from the newsstand. Subscribers are most likely to be devoted to the publication—as is shown by the number of people who are renewing subscribers. Always request this information before committing to paid advertisements, especially since most will require at least a six-month commitment.

Public relations practitioners are also responsible for keeping their own circulation statistics to provide to interested parties, especially statistics about the number of people who receive the organizational newsletter, magazine, or annual report. These figures are also important, from an internal standpoint, to provide to management.

Although advertising is a good thing to keep in mind when comparing circulation figures, also keep your audience in mind from an editorial standpoint. The more media pitches a public relations practitioner is successful with, the more articles that will appear in a publication. Even if it is not possible to pay to reach an audience, the successful placement of a feature story, news article, or editorial in a publication that reaches an intended audience may prove more successful than any form of advertisement.

CITIZENS ADVISORY COMMITTEES/PANELS

Citizens advisory committees/panels (CAC/P) are composed of individuals, with membership drawn from a cross section of the community, who provide a link between the public and various organizations who operate in the region by providing counsel and recommendations on matters of public affairs and public policy.

CAC/Ps perform key functions for community residents, private interest groups, government, non-governmental organizations, and private industry. They improve the quality of services by encouraging closer ties between the public and organizations that have an affect on their community, and make for improved decision-making capabilities that involve perspectives from interested parties who participate in the process. CAC/Ps incorporate strategic community relations values such as the cooperation of key stakeholders, information and

perception exchange, and the development of trust, sense of control, credibility, and consensus making.

Through the implementation of public policy at the community level, CAC/Ps provide a level of accountability for government, nongovernmental, and private organizations, opening up decision-making and policy formation processes to concerned citizens while providing resources for citizens to participate in the public policy process.

The use of advisory committees moves the role of external input and influence to an internal advisory role working within the system. This public/private partnership facilitated by the role of the advisory committee is the “buckle that fastens the administrative process to the dominant institutions, elites, and value in society” (Cottin, 1973, p. 1140). The proliferation of and increased use and dependence upon advisory committees is a product of a response to the needs of the citizenry, the needs of government officials, and the demands of special interest groups to work together in reaching compromise and solutions to numerous public policy concerns.

Originally categorized as lay advisory committees, CAC/Ps gained a foothold in American society because, as a representative democracy, they provide a means by which citizens represent their community in addressing particular public affair issues ranging from education to land preservation.

The Western development and use of citizens committees can be traced back to England, where the use of such advisory groups for education and government was seen on a wide scale. In the United States, formal community advisory groups have been in operation since the first presidency. There was a significant increase in the number and types of community advisory groups during World War I, when many governmental commissions had citizens serving in an advisory capacity. Their role expanded during the depression of the 1930s, providing counsel on such topics as national illiteracy and emergency aid. During and following World War II, CAC/Ps expanded into areas of labor-management relations and postwar training programs for agricultural and industrial production.

The development and expansion of CAC/Ps have been driven not just by citizens’ desires to

participate in the public policy process, but also by national legislation aimed at increasing community input on vital issues. This approach is often called legislative citizen participation.

At the federal level, the 1972 Federal Advisory Committee Act (Public Law 92-463) defines an advisory committee as any committee, board, commission, council, panel, task force, or similar group established in the interest of obtaining advice or recommendations for the president or one or more agencies or offices of the federal government. Federal advisory committees constitute one of the most significant vehicles for special interest group representation and influence on the policy-making process of the national government. This form of government by committee has been termed the fifth arm of the federal government.

In the past 20 years there has been a tremendous growth in legislated citizen participation in many areas. At present, most federal agencies have mandated citizen participation for many of their programs. The Mental Health Systems Act of 1980 (Public Law 96-398), for example, relies heavily on the voluntary efforts of citizens who advise and govern local community mental health center programs.

Typically there are two types of CAC/Ps: Short-term committees are organized to address specific issues and concerns for a finite time period, and long-term committees address specific as well as sweeping concerns and problems, providing continuous feedback from the community.

There are some typical rules and responsibilities of CAC/Ps across a broad spectrum of organizations. Advisory committees are appointed when there is a definite function to be performed; they are appointed primarily to advise and are not typically requested to perform specific services. Their composition should represent the entire community related to the function to be performed, with membership representing various segments of community life ranging from lay representatives to acknowledged experts. Staff members typically are not appointed, but if they are they constitute a minority of any such committee and the chairperson is chosen from among the lay members. Typically the public is made aware of major

recommendations, and the board or organization to which the committee reports controls public announcements.

CAC/Ps are active in areas of education, health, manufacturing, transportation, and virtually every other facet of public policy decision making that affects communities. For example, within the chemical industry, a CAC/P consists of a group of individuals who live near or around a chemical facility and who represent their community and have made a commitment to meet with the management of the local plant on a regular basis to discuss issues of mutual interest. Members include environmental groups, civic leaders, business leaders, homemakers, hourly workers, and individuals who represent key elements of a community such as clergy, health care providers, emergency responders, and educators.

CLIENT

The client is the representative entering into a contractual relationship with a public relations firm for the purpose of securing the firm's expertise. The representative can be an individual such as a political candidate or an entertainer, a department or subsidiary of a larger organization, a corporation, and so on. Firms are hired by that client for any number of reasons ranging from general promotions to

strategic planning and issues management. Larger organizations may contract with several firms for needed specializations such as hiring one firm for international relations work and another firm for crisis management. These relationships may be short term such as for the duration of a crisis, a particular special event, or the publication of specialized collateral material, and in these cases the client sets up some project-based method of payment for the services. The business may also be long term based on providing longer-standing services through continued counseling or augmenting the organization's staff in particular areas, in which case a retainer method of payment for the services may be preferred.

The client initiates the relationship, of course, by recognizing a need for some kind of assistance in the area of public relations. The better the client can explicate its objectives, the more likely it will have an efficient and highly successful search. The search can range from informal to formal. In some cases one representative of the client handles the entire process, and in other cases the team may include several representatives of the organization. Ideally, the team will include the key contact person for the firm and the final decision maker, because these players will be critical in establishing the relationship with the firm selected.

If the search is handled informally, it may be based solely on contacts. The client may have had a productive past relationship with a firm and choose to renew that relationship. If the need for the firm is local, very specific, and specialized and the budget is limited, the search may be a matter of simply determining availability of a local firm.

In the more formal cases, the selection process may be managed either by the client or by a consulting firm that specializes in assisting groups with the details involved in a formal search of public relations firms. Time may be a determinant in whether the client organizes the search or hires out the search process. Using a consulting firm would allow the firm to identify the public relations firms most likely to be of interest, to manage the request for proposals, and to organize the formal agency proposal processes.

Regardless of whether the client or another firm manages the search, it begins with networking and

general research to identify potential firms. The firms viewed as most interesting in terms of perceived capabilities and reputations are sent requests for proposals (RFPs). RFPs are questionnaires designed to narrow the field of potential firms and may include demographic data related to the firm (size, length of time in the field, specializations, and so on) as well as a few screening questions to determine expertise in the client's area or ability to handle the issues at hand. RFPs allow the organization to examine the firms from a distance to determine the firm's expertise, its style, and especially to identify any conflict of interest in which the firm may be representing a competitor. RFPs, furthermore, allow the public relations firms themselves to "self-select" their formal participation in the search; for example, some firms may opt out of the process due to other commitments, the project being too large or, conversely, too small, and so on.

The organization then generally will choose three to five firms to interview. The client may want to consider finalists for the continued search process based on variety—of size, services (full service to boutique), location, ownership (independent to multinational)—as well as various specializations. Including a variety of firms allows the client to better assess a range of issues affecting the final decision. Smaller firms with fewer clients may be able to provide more attention to the issue, whereas larger firms with offices throughout the United States and overseas may be better prepared to manage international product introductions or other broader based public relations programs.

The firms considered as finalists in the search process are contacted and asked to put together a presentation (also known as a pitch), which may consist of general information on the firm or a specialized presentation with suggestions for addressing the prospective client's objectives. The more specific the presentation requests, the more conscientious the client must be. Clients may need to consider payment for formal presentations complete with specific program proposals; many such presentations are copyrighted and selection of one firm to implement another firm's program would likely involve legal redress.

Following the various pitches, the client then must select one firm. The selection typically focuses on which firm is best qualified to handle the account, which firm best understands the organization as well as its business or service, and which firm the decision makers feel most comfortable in working with or the "chemistry" perceived during this selection process. In some cases, the client may have difficulty choosing between two firms and may request a follow-up interview, often conducted as a conference call or through e-mail.

At this point the firm generally sets up a contract based on estimations of costs for the objectives to be accomplished. The client and the firm will agree on the contract as well as the billing procedures. Billing is frequently managed by a projected cost with monthly billable hours toward that projected cost. Projected costs may or may not include out-of-pocket expenses and commissions for any sub-contracted work (e.g., with a printer). Clients can then monitor expenditures and determine whether the firm is staying within reasonable budgeted programs or whether the progress of the program may warrant additional expenditures.

As is evident, much time is invested in initiating and establishing the firm-client relationship. Once secured, the client representatives can focus on their own jobs knowing that the firm is ably managing the public relations program. The firm formalizes the account team with a designated account executive who will be the primary point of contact between the firm and the client. Note that the ideal pitch will involve individuals who will be part of the account team. The client should proceed with caution if only the firm's CEOs manage the pitch because the relationship will be set by those who work on the account daily. On the client side, the key contact points and decision-making process should be established and streamlined as much as possible to reduce delays in approval processes.

Ideally, the firm-client relationship will stretch far into the future without the need to undergo another search. Nevertheless, the economy, management changes, and other business development may lead to a need for a different or an additional firm.

The ultimate goal of the successful firm-client relationship is to achieve what is considered the most efficient contract (per “agency theory” derived from finance and economics research). The burden of demonstrating efficiency is often placed on the agency or firm, yet the client sets the tenor of the relationships. The ideal client who ultimately finances this relationship to secure or augment available public relations expertise will stay involved and interested in the public relations program. The ideal client does not micromanage, but strikes a balance of trust in the firm and of supervision of the firm. Clients should be cautioned that some monitoring may be necessary to ensure the client interests remain paramount for the firm and to verify that all billing is appropriate and per contract. This balance can be achieved with clear expectations, regular communication, and timely payments for services rendered. The ideal firm similarly provides clear plans and programs, meets deadlines, stays within budget, and communicates regularly.

The successful relationship, then, depends on evaluation—of the public relations program as well as of the relationship itself. Clear and honest communications about the program, as well as any impending changes to the client organization are critical to managing expectations and program fulfillment. If the public relations firm does not initiate evaluations at various points in the relationship, then the client may request or implement them. The evaluations may range from informal discussions (although the evaluation should be a specified agenda item if not the sole topic of discussion) to formal checklists that would then be discussed with the agency account executive and CEO as well as key client liaisons.

CLIENT/AGENCY RELATIONSHIPS

The client/agency relationship is the state of interaction between an organization (or its representative) and the public relations firm it hires to represent it. Their relationship can be the most important factor in the success of the client’s public relations program and the firm’s ability to serve the client well.

Much of the pressure to maintain the relationship rests with the agency. The ability to build a strong client/agency relationship is one of the most important skills a practitioner can offer. The agency staff must not only demonstrate public relations expertise but also constantly build a strong relationship with the client by providing excellent client service. Serving the client requires that the agency staff keep the client’s best interests in mind and share the client’s passion for their business goals, while at the same time working toward the agency’s own goals.

Some client/agency relationships have been so strong that they make history. For example, the widely praised handling of the Tylenol crisis in 1982 was the result of the bond between Tylenol maker Johnson & Johnson and its firm, Burson-Marsteller. This case is widely recognized as one of the most important in the history of the practice of public relations and exemplifies the ideal client/agency relationship qualities of mutual respect, trust, and understanding of the client’s needs.

Client confidence in the agency, free-flowing communication, willingness to compromise on both sides, and collaboration between client and agency are also key. The client wants the feeling of being top priority regardless of what other accounts the

agency is working on. The most successful account people remember that on and off the job, they represent not only themselves and the agency but the client as well, and they must exhibit professionalism at all times. In addition, thoughtfulness and consideration of both the agency staff and client contact's work and personal situations can help the relationship flourish.

The client also wants the agency to be problem solvers. Industry leader Harold Burson once said that the counselor's main objective is to identify and deal successfully with a problem. Burson also advised taking advantage of opportunities; developing a set of options and a range of their advantages/ disadvantages; honing the ability to get up to speed quickly on a problem and to listen; and knowing the client's business.

The most valuable commodity the agency can offer is its counsel—the ability to advise the client on the proper course of action. The ability to counsel comes with experience. But it also means being able to sift through issues and information and make a recommendation. Even the most junior-level staff member can demonstrate this skill.

The client and agency may not always agree. Sometimes counseling means being able to persuade a client who is not open to what the agency has to say. When the agency and client disagree, the agency must decide whether to try to push to persuade—or challenge—the client. It takes a delicate touch to know when to take that stand, and a strong relationship provides the foundation for respectful give-and-take.

Sometimes the working relationship between the client and agency creates conflict that cannot be resolved, and the result is either a reassignment of those working on the account or a parting of ways. If the client fires the agency, more often than not, it is because the client is not satisfied with the agency's performance. Sometimes the client expected too much; but in many cases, companies who fire their agencies say it is because of sloppy work. Better communication between the agency and client might prevent such an outcome.

Conversely, a firm might resign the account because of problems with the relationship such as client mistreatment of account people. Again, in a

strong relationship such behavior can be addressed and resolved, preventing the severing of ties.

Ideally, the client appreciates and draws upon the agency's level of expertise, looks to the agency to provide direction, and considers the value of the agency's work well worth the cost. A successful agency is able to produce excellent results, maintain a nourishing workplace, and meet its own business goals while nurturing its client relationships to the betterment of both client and agency.

CLIP (NEWS CLIP) AND CLIPPING SERVICES

A clip, or news clip, is an actual copy of an article about an organization or company that has appeared in the media. Traditionally, news clips were limited to print articles, but today, “clippings” can consist of print, broadcast, and online media sources.

Clipping services, also known as media monitoring services, will monitor the media for references of a client's organization or company and supply the client with a compilation of the clips. These clips are essential to gauging the success of a media relations campaign because they allow the client to keep track of how many times the organization or company was mentioned and where these articles appeared. Information gained from media monitoring services allows communications professionals to gather important insight about how their organization is being portrayed in the media and what topics are deemed newsworthy, as well as what reporters are covering the topics.

There are many companies that will keep track of media “hits” for an organization on a fee-for-subscription basis. Some companies are limited to one medium, whereas others will not only keep track of all media, but will also analyze and interpret the numbers. Some of the best known clipping services include BurrellesLuce (www.burrellesluce.com), Bacon's (www.bacons.com),

Vocus (www.vocus.com), Lexis-Nexis (www.lexisnexis.com), CyberAlert (www.cyberalert.com), EWatch (www.ewatch.com), CyberScan (www.clippingservice.com), and a host of other companies that have developed in the past few years.

Originally, only print media were monitored. When Burrelle's began its service in 1888, only New York City daily newspapers were included in the service. Today, however, Burrelle's and other companies that provide monitoring services scan not only newspapers, but also magazines, radio and TV broadcasts, wire services, and various news programs found on the Internet. Additionally, media from across the United States and international sources are often included in the service.

Monitoring services have taken their products a step further and now will monitor the Internet for rumors about a company as well as search for general news stories. By catching negative chatter about a company in Internet chat rooms and discussion forums, corporations can become aware of the scuttlebutt that is circulating online and can swiftly respond to rumors if necessary.

Subscribing to these services may be cost prohibitive for small companies and organizations. Annual costs for a media monitoring service can easily surpass \$30,000; therefore, it is necessary to determine whether the considerable cost justifies the means, or if it would be possible to subscribe to a more limited service.

COALITION BUILDING

Coalition building is the process of developing working relationships among individuals, groups, organizations, or nations for the purposes of mobilizing collective action, sharing information, coordinating communication efforts, or using any combination of these functions. Coalitions are a type of an alliance; however, unlike alliances, such as the North Atlantic Treaty Organization (NATO), members frequently organize coalitions for short-term purposes. For example, several NATO nations formed the Coalition to Disarm Iraq in 2002. In addition to government coalitions, Fortune 500 and nonprofit organizations commonly use coalitions to advance their interests. Given the frequent diversity and competing interests of coalition members, the construction and maintenance of successful coalitions requires skilled facilitation and communication by coalition organizers.

Coalition building is an important part of public relations because it can enable like-minded members to exert increased influence by working together. The synergy of coalitions can enhance credibility for a particular position by demonstrating widespread agreement. Using combined economic, social, and political resources, coalition lobbying can increase clout with key decision makers and boost mass media coverage. Communication networks among coalition members can facilitate rapid information sharing, which can serve as early warning systems for issues that arise that impact the coalition, its members, or both.

To identify coalition members, Kerry Tucker and Sharon McNerney (1992) suggested the following criteria: reputation with peers and publics, concern for the issue, position on the issue (from moderate to extreme), ability to collaborate in a consensus-seeking group, and availability of outreach methods to peers and publics. Another consideration is how potential members would enhance the coalition's credibility. According to Barry Rubin (1997), coalition organizers can attempt to increase the coalition's credibility by including unlikely members. For example, a coalition for clean energy use comprised only of gas companies or only of environmental organizations would have less credibility than a

coalition that combined these groups. Although this scenario seems unlikely, politics can lead to surprising partnerships. Coalition organizers should think creatively to diversify the membership. By crossing divisive lines such as politics, ideology, age, and geography, coalitions position themselves to present their views as representing broader interests than they would otherwise. Still, Rubin cautioned coalition organizers against pursuing diverse members that could not entirely commit to coalition goals. To avoid this situation, Rubin advised coalition organizers to inform potential coalition members of the coalition's goals and objectives. Potential members can then base the decision to join on whether the coalition's plans are in their stakeholders' interests.

How coalitions are structured is an important aspect of their formation and management. Some coalitions are created as equal partnerships; others are not. In equal partnerships, each member commits to share power from the earliest planning stages to the final efforts. Even relatively minor details, such as who gets to speak first at a dinner event, whose name appears first on an invitation, and who is quoted in press and public materials, can threaten the vitality of relationships among coalition members. Consequently, organizers should have coalition members affirm their commitment to equal control, and the coalition's decisions should be made with this principle in mind.

In unequal partnership designs, one or more members assume a majority of the responsibility for the coalition's efforts. Dominant members often fund all coalition costs, develop all public relations materials, and take full behind-the-scenes responsibility for the planning, execution, and evaluation of coalition actions. Prior to preparing materials, dominant coalition members commonly recruit new members for the coalition. Invitations can occur via face-to-face interactions, phone calls, e-mails, or Web sites. New members receive name recognition on coalition materials while the coalition enhances its legitimacy by demonstrating the support of additional members and, implicitly, their supporters. In addition, members that play minor coalition roles typically receive free media materials from dominant members; in turn, dominant members benefit

from the message being further publicized without added cost.

Among the most powerful uses of coalitions is mobilizing collective action on issues to increase their salience, influence their direction, or both. Coordinating efforts requires skilled facilitation, particularly in relation to coalition meetings. Tucker and McNerney outlined the following responsibilities of coalition facilitators at meetings: develop and carry out a plan to advance coalition members' interests, find common ground among coalition members with different opinions, prevent members' individual agendas and egos from overpowering meetings, give each member opportunities to express opinions, keep coalition members on task, remind members of the goal of striving toward the greatest public benefit, and manage all information the coalition produces. Throughout the meeting, facilitators should serve the coalition's collective interest rather than that of a particular member.

Organizers can coordinate information gathering and sharing among coalition members in different ways. One way is to have each coalition member monitor many information sources to keep updated about a particular area such as politics. Coalition members share information about their assigned areas, which together provides a comprehensive view of the environment. Another way to organize information sharing is to have each coalition member gather information on many areas from particular information sources such as community leaders or trade magazines. Coalition members report the relevant information they have learned in various areas based on the particular sources they monitor. Frederick Hunt (1993) stated that information sharing also occurs without assigned roles, particularly in cases in which the sole purpose of the coalition is to track issues together. Coalition members can share information asynchronously through mechanisms like e-mail or synchronously through ways such as conference calls and face-to-face meetings. Examples of sources that organizations can use for information include advisory boards, industry analysts, academic journals, local and national leaders, public opinion polls, trade media, and Web sites. By working together,

coalition members receive a more comprehensive sense of their environment than they would have received working alone.

When presenting the coalition's position to a wider audience, coalitions should coordinate consistent messages among members. Coalition members can reject, agree upon, and create new terms to encourage a particular position on a situation. For example, the word *so-called* typically precedes words that coalitions reject, and coalitions can encourage the media to use desired terms and place the qualifying word *so-called* in front of rejected terms. In addition to determining words to use and avoid, coalitions can develop message points for media inquiries and train experts to whom coalition members can refer these inquiries. Sometimes coalitions want to present a united front on contentious issues; however, at other times, members might prefer to coordinate communication privately. Practitioners have found creative ways to agree in public policy contexts without compromising coalition members' positions. One way is to have coalition members support a general position, which is expressed in all coalition public relations materials. Each member's specific materials can include the coalition's position accompanied by its specific stance on it.

When conflicts arise, Roger Fisher's and William Ury's (1981) work as facilitators in the Harvard Negotiation Project suggests emphasizing shared interests among coalition members. Facilitators should work with coalition members to establish ground rules before they are needed. These ground rules include how decisions will be made (e.g., consensus versus majority vote), who can speak on behalf of the coalition, and who can commit the coalition to meet with outsiders. Bill Berkowitz and Tom Wolff (2000) advised that the coalition structure should remain flexible, permitting changes when needed.

Rubin (1997) provided two excellent examples of coalition building that illustrate how diverse coalition memberships can be. The first coalition formed when automobile manufacturers wanted to oppose a proposed increase in fuel efficiency standards, which could lead to fewer large cars and vans. The manufacturers created the Coalition for

Vehicle Choice, whose members included disabled veterans' organizations and senior citizens' groups, both of which depend on large vehicles for transportation. The second coalition was the Common Ground Network for Life and Choice, which pro-choice and pro-life organizations formed in 1999. Working toward a mutual objective of increased awareness and support for adoption, this coalition achieved more visibility and progress together than either member could have done alone or with its more common allies.

CO-CREATION OF MEANING THEORY

It was Robert L. Heath who adopted a co-creation of meaning theory for public relations in his approach to management of corporate communication. By doing this, he referred to E. M. Eisenberg as the one who stressed the need to focus on the concepts of meaning and interpretation in organizations, expanded this theory into a theory on the relationship between (people in) organizations and the outside world, and adopted a co-orientational view of meaning as opposed to a referential view:

A referential view of meaning assumes that people think of the same referent as they interpret the definition of a term or phrase. A co-orientational view of

meaning acknowledges the presence of ambiguity and assumes that one person can understand the other by knowing how that person interprets a word or phrase even if the two people hold different interpretations. (Heath, 1994, p. 25)

This co-orientational view assumes that through interaction people develop the interpretations and expectations they need to coordinate their activities. A meaning, therefore, is not an attribute of a message or a recipient but of the interaction itself. In managing corporate communication the key issue is to manage the interactions in such a way that “compatible zones of meaning” are created with stakeholders.

The co-creation of meaning theory can also be found in European approaches to public relations. Roland Burkart, for example, sees public relations as the facilitation of dialogic interaction between an organization and its publics. It is also found in organizational theory, where Stanley A. Deetz, Sarah J. Tracy, and Jennifer Lyn Simpson focused on the “enactment of meanings” (2000, p. xiii) by which learning processes are developed. In this organizational theory Deetz et al. discussed the process through which people develop their interpretations of an event. They focused on how language, stories, and ritual frame or reframe people’s understanding of an event, whereas conversations are useful in creating alternative futures and opening the business to a wider collective learning process. Ansgar Zerfass calls these dialogues “arguments in which new meanings develop” (1996, pp. 31–32). The basis of this view of public relations is contemporary rhetorical theory, which explains discourse tactics as what players use to maneuver in communicative interactions. A key aspect of this view is the creation of as many meanings as possible, which is based more on a “battle” of interests than on harmony of interest. Heath referred to this process also as the rhetorical enactment approach, reasoning “that all of what an organization does and says is a statement. It is a statement that is interpreted idiosyncratically by each market, audience, and public” (2000, p. 4). In a co-creation of meaning theory of public relations, the aim is at finding deliberate and pluralistic solutions for problems. By doing this, an organization produces

and reproduces its environment and is, therefore, a key actor itself. The key perspective is that by facilitating interactions new meanings are continually created. That is why this is an open-ended model, a learning process that never stops.

The concept of meaning is a much debated concept in human communication theory. Meaning can be explained as the “whole way in which we understand, explain, feel about, and react towards a given phenomenon” (Rosengren, 2000, p. 59). From this point of view on communication, a crucial question is whose meaning is created by whom, and what does it mean for interpreting the world? Recent approaches to the concept of communication are focused on communication as a fundamental two-way process for creating and exchanging meaning, interactive and participatory at all levels. This can be seen as a paradigmatic change from a sender/receiver orientation to an actor orientation, and the co-creation of meaning theory fits into this paradigmatic change. Regarding the character of meaning, many theorists differentiate between connotative and denotative meaning by stressing that the connotative meaning steers behavior much more than the denotative meaning does. A denotative meaning of a phenomenon is the dictionary meaning. It is the literal or overt meaning that is shared by most people. The connotative meaning refers to subjective associations. In a co-creation of meaning theory, the connotative perspective of meaning is seen as most powerful in steering behavior.

Co-creation of meaning theory is rooted in symbolic interactionism. The idea that reality is not “something out there,” but that human beings construct reality themselves was popularized by one of the most frequently cited works in social sciences, *The Social Construction of Reality*, by Peter Berger and Thomas Luckmann (1966). For them reality is a quality pertaining to phenomena we recognize as having a being independent of our own volition: We cannot wish them away. Knowledge is the certainty that phenomena are real and that they possess specific characteristics. The sociology of knowledge is therefore concerned with the analysis of the social construction of reality. Social structure can be seen as an essential element of the reality of everyday life.

At one pole of the continuum are those others with whom I frequently interact in face-to-face situations—my inner circle, as it were. At the other pole are highly anonymous abstractions, which by their very nature can never be available in face-to-face interaction. Social structure is the sum total of these typifications and of the recurrent patterns of interaction established by means of them. (1966, p. 48)

Languages, as the most important system of vocal signs, build up semantic fields or zones of meaning that are linguistically circumscribed. While it is possible to say that man has a nature, it is more significant to say that man constructs his own nature, or simply, that man produces himself. This self-production is always, and of necessity, a social enterprise, as Berger and Luckmann argue. Men together produce a human environment, with the totality of its sociocultural and psychological formations. It may be that a given social order precedes any individual organism's development. But social order is still a human product, or, more precisely, an ongoing human production. By playing roles, the individual participates in a social world. By internalizing these roles, the same world becomes subjectively real to him. Roles represent institutional order. Some of these, however, symbolically represent that order in its totality more than others do. Such roles are of great strategic importance in a society, since they represent not only that or the other institution, but the integration of all institutions in a meaningful world. These are the roles that have a special relationship to the legitimating apparatus of society. Historically these roles have most commonly been located in political and religious institutions. This is no longer the case, however; it is said that nongovernmental organizations and corporations now have more power than politics and religion. According to Berger and Luckmann, legitimation (the term is from Weber) as a process is best described as a "second-order" objectification of meaning. Its function is to make objectively available and subjectively plausible the "first-order" objectifications that have been institutionalized (1966, p. 110). It embodies the institutional order by ascribing cognitive validity to its objectified meanings and justifies them. But in

the modern world there is always a rivalry between definitions of reality. Social structure can predict its outcome.

In communication science, as well as in organization science, symbolic interactionism has recently inspired some scholars to take a constructionist view of reality. In 1993, German communication scholars Günter Bentele and Manfred Rühl introduced a constructivist approach to public relations theory. The basic premise of this view is that human beings reflect the other to themselves, and social reality in a dynamic process. Thus, constructing social reality is a shared process of meanings construction. In this view, reflective interpretation and conceptualization of meanings are at the forefront in a constant process of de- and reconstruction; they are a "reflection." Klaus Krippendorf, a constructionist communication scientist, mentions the "recursiveness" of communication: It is an ongoing social process of de- and reconstruction of interpretations. That is why Werner Faulstich and other constructionist public relations scholars state that public relations is not interaction between human beings, but societal action as such.

CODES OF ETHICS

A code of ethics is a formal statement of conduct or a set of rules, standards, or guidelines for appropriate member behavior that has been adopted by an organization or professional association. Ethical codes have been popular in organizations since at least the 1970s. Codes of ethics were originally created by many organizations and professional associations in the 1950s and 1960s in response to specific ethical wrongdoings. Some were even mandated by the courts as part of larger legal settlements. Other professional codes of conduct, such as the Hippocratic Oath in medicine, have ancient origins. Codes have become very common, with essentially all major organizations and professional associations having some formal statement regarding ethics and values.

Ethical codes take a variety of forms. Some are very specific legalistic documents with a mechanism for enforcement and signature pages requiring that the employee explicitly agree to abide by the code. Others are very general statements of values

or principles that the organization or association aspires to with no specific enforcement provisions. Some codes include vignettes or cases to illustrate ethical conduct. Statements of core values or mission statements sometimes serve as the organization's formal declaration of ethics. Many organizations will have both general mission statements and specific codes of ethics. Codes are typically distributed to members of the organization, may be posted on Web sites, and in some cases, are prominently displayed throughout the organization. Codes are often formally adopted by the organization's board of directors or the professional association's legislative or executive body.

Codes also serve a variety of functions, including protecting the organization from legal liability, constraining and focusing employee behavior, limiting unethical conduct, assessing and judging member behavior, and enhancing the image and reputation of an organization or professional group. In the latter sense, ethical codes themselves may serve an issue management, image restoration, or public relations function. In addition, codes also help communicate value positions and ethical standards to stakeholders and facilitate discussions regarding appropriate organizational or professional ethics and values. In this way, codes are often the most important and explicit means whereby organizational and professional values are communicated. It is relatively common, for example, for all new employees to receive copies of ethical codes. Some organizations train new employees in the ethics code and use codes to socialize members into the organization's culture. Codes and ethics programs are related to improved ethical climate and are particularly important during times of uncertainty, transition, and even crisis.

Ethical codes and guidelines function in part by explicitly clarifying issues of responsibility and accountability. Many corporate codes are also designed to clarify issues of conflict of interest, loyalty, and obligations. Some provide checklists of questions to answer in making ethical decisions. Many of the more legalistic corporate codes require that employees sign a legally binding affidavit indicating that they have read and agree to abide by the code. Some organizations have established

ethics officers or committees responsible for both promoting the code and enforcing its standards. Many organizations also use their codes or ethical guidelines to foster broader conversations about ethics and values. Richard L. Johannesen (2002) suggested that codes serve an argumentative function, “to stimulate public and professional scrutiny of major ethical issues” (p. 201). Many codes, for example, discuss the value of a good or ethical reputation and encourage members to interact in a professional and responsible manner with external stakeholders. Ethical codes and value statements, however, should not be seen as panaceas for ethical communication in organizations or among professionals. Enron had an extensive ethics code that included explicit provisions about ethical communication. The code was posted on the company Web site and often quoted by senior executives. The Enron code obviously failed to prevent fundamental ethical misconduct.

Codes of ethical conduct are also recognized as one hallmark of a professional community. They suggest that the members of that profession have reached consensus regarding professional standards and values and that members have agreed to abide by those standards. They may also help create cohesion and professional identity. These codes also allow the association to impose some minimum standards and consistency on member behavior. Although there are legal issues regarding enforcement, many professional associations will suspend the membership of those individuals who violate ethical codes. Professional groups such as in accounting, medicine, law, nursing, education, government, psychology, and public relations have generated sophisticated ethical codes and associated standards for professional conduct.

Associational and professional codes for communication professionals have been used for several years. These include codes for journalists, marketing and advertising professionals and broadcasters, as well as public relations. The Public Relations Society of America, the International Association of Business Communicators, and the International Public Relations Association have all developed elaborate associational codes for the public relations profession. These codes embody a variety

of professional values and standards and have been used to judge and sometimes publicly sanction member behavior. Public relations codes are grounded in larger communication values such as free speech and free access to information, honesty and truthfulness, and fairness. It has been suggested that public relations codes of ethics were particularly important given the somewhat sordid early history of public relations including manipulative and deceptive practices. Ethical codes have helped public relations practitioners clarify professional expectations, maintain higher standards of professional conduct, and, in general, elevate the reputation of the profession.

Recently, the National Communication Association (NCA) adopted what it described as a professional credo for ethical communication. The credo includes 10 general principles regarding what is judged as the ethical practice of communication. The NCA credo draws on broad sets of ethical traditions in communication including honesty, truthfulness, free speech, condemnation of hate speech, the ethic of care, privacy, respect, social justice, protest, responsibility and responsiveness, among others. The NCA credo also suggests an explicit link between ethical and effective communication.

Although ethical codes are clearly very popular, some observers have described them as worthless exercises in vagueness, irrelevance, and mere window dressing largely designed to avoid responsibility. Some critics have even called ethical codes exercises in deceptive public relations. It is optimistic to expect a code of ethics to resolve complex ethics dilemmas and competing values. Codes of ethics, at the very least, however, elevate the level of debate and discussion regarding ethics and lay down a formal record regarding those standards and values to which the organization or professional community aspires. They enhance the quality of decisions and behavior and provide a basis for making ethical judgments. Although codes are a critical component in improving professional and organizational ethics, they cannot alone be expected to ensure ethical conduct.

CODES OF PUBLIC RELATIONS PRACTICE

Codes of public relations practice are formalized statements of professional obligations, standards, norms, and conduct adopted by the professional associations of public relations. One of the first initiatives of the Public Relations Society of American (PRSA), founded in 1948, was to establish an ethical code of practice for its members. The desired outcome of this code was to establish clear standards for practitioners, clarify these standards to management, and to distinguish public relations professionals from those who engage in

deceptive and unethical promotion. The importance of such codes has not diminished over the past five decades. A survey conducted by PRSA in 2000 found that half the members surveyed have at some point felt “an extraordinary amount of pressure” to jeopardize their ethical standards (Fitzpatrick, 2002b, p. 119).

Establishing a code of professional conduct and social responsibility is essential because “business exists at the pleasure of society, and its behavior must fall within the guidelines set by society” (Daugherty, 2001, p. 389). Robert L. Heath (1997) explained that public relations specialists are active players in the process of determining social responsibility. He argued that “through their comments—as well as actions that reveal their commitment to mutual interests—companies help shape the standards by which they are judged” (p. 132). Formalizing these standards into codes of practice can establish a climate of social responsibility in an organization that influences decision making at all levels.

Codes of practice offer practitioners a set of consistent standards that allow them to move beyond relying on “merely subjective judgments” (Day, Dong, & Robins, 2001, p. 406). Patricia A. Curtin and Lois A. Boynton (2001) also found that “codes also may reinforce ethical expectations to public relations novices and deter government intervention, thereby enhancing professionalism” (p. 415). The perceived benefits of such codes is manifested in the fact that businesses have “increasingly developed their own codes of ethics and have hired ethics officers to establish standards for what is right and wrong, or good and bad, within the organization” (Leeper, 2001, p. 435).

The three best known codes for public relations are PRSA’s Member Code of Ethics, the International Public Relations Association’s (IPRA) International Code of Ethics, informally known as the Code of Athens, and the International Association of Business Communicator’s (IABC) Code of Ethics for Professional Communicators.

PRSA offers the most detailed and complex code of the three organizations. The PRSA Member Code of Ethics 2000 is composed of six core values, and six code provisions. The values include

advocacy for clients and an open marketplace of ideas, honesty, expertise, independence in the form of objective council and personal accountability, loyalty to both clients and the public interest, and fairness. The six code provisions are comprised of free flow of information, competition among professionals in a manner that serves the public interest, disclosure of information in a manner that builds trust with the public, safeguarding confidences to protect privacy rights, avoiding conflicts of interest, and enhancing the profession through building trust in all levels of interaction. The code ends with its only mention of enforcement. Members sign a pledge to uphold the article of the code with the understanding that “those who have been or are sanctioned by a government agency or convicted in a court of law of an action that is in violation of this Code may be barred from membership or expelled from the Society” (Fitzpatrick, 2002b, p. 135).

IPRA’s International Code of Ethics (Code of Athens) was originally adopted in 1965 at a meeting in Athens and later revised in 1968. The organization claims that this code has been “promoted widely and presented formally to numerous Heads of State” (IPRA). The International Code of Ethics is particularly sensitive to supporting an international view of human rights. The code repeatedly advocates preserving the human rights entitled by the Universal Declaration of Human Rights. Specifically, the code asks professionals to perform their duties within the moral principles and rules of the Universal Declaration of Human Rights, to uphold human dignity, to recognize the rights of all parties involved to express their views, to act in a manner that is respectful of the parties involved—including the interests of concerned publics, and to show loyalty and integrity in order to keep the “confidence of clients or employers, past or present, and all the publics that are affected” (Matrat, 1968, n.p.). Finally, the code asks professionals to refrain from “subordinating the truth,” circulating information that is not based on “ascertainable facts,” taking any action that is “unethical or dishonest or capable of impairing human dignity and integrity,” and using exploitive techniques “to create subconscious motivations which the individual cannot

control of his/her own free will and so cannot be accountable for the action taken of them” (Matrat, 1968, n.p.).

The IABC Code of Ethics for Professional Communicators has 13 articles and a provision for enforcement (IABC). Like the IPRA, the IABC code makes specific mention in one of its articles of the need for sensitivity to cultural values and beliefs in hopes of encouraging mutual understanding. Two articles outline the importance for the protection and use of confidential information. Other articles stipulate loyalty to the laws governing the public relations profession, honesty, precluding plagiarism, avoiding behavior considered unethical by the communicator, upholding the credibility and dignity of the profession, accuracy, and free speech. Unlike PRSA or IPRA, the IABC code includes two articles dedicated to refusing undisclosed gifts and avoiding any pledge to guarantee results beyond the certain capacity of the practitioner. The IABC’s clause for enforcement is clearly aspirational rather than punitive. The clause begins by stating, “IABC fosters compliance with its Code by engaging in global communication campaign rather than through negative sanctions” (IABC, n.p.).

There is some debate over the proper function of professional codes, such as those sponsored by PRSA, IPRA, and IABC. Some argue that effective codes should “provide the grounds for charges of wrongdoing and defenses” (Day et al., 2001, p. 406). From this perspective, critics argue that most professional codes of practice are “vague, unenforceable, or applied inconsistently” and that they cannot account for the diversity of views in a globalized society (Curtin & Boynton, 2001, p. 415).

There is evidence to support claims that professional codes are difficult to enforce. For example, K. R. Fitzpatrick (2002a) pointed out that only “five formal sanctions were imposed against members [based on violations of its code] as a result of PRSA investigations from 1954 to 2000” (2002a, p. 105). She argued that “unless one assumes that most of the allegations were groundless, the PRSA enforcement

system was clearly ineffective in adjudicating ethical misconduct” (2002a, p. 105). In response to such criticism, PRSA revised its code in 2000 so that its discussion of enforcement is limited to membership in the organization. Fitzpatrick explained that the revised code of PRSA, like code sponsored by IABC, is “aspirational and educational, designed to motivate ethical behavior rather than punish unethical misbehavior” (2002b, p. 111).

Another concern is that professional codes of responsibility are so vague that they are of limited value to practitioners. For example, Curtin and Boynton (2001) explained that the PRSA code “proscribes lying,” but it fails to provide “clear guidance on when withholding information is justified” (p. 415). Consequently, some practitioners have called for operational definitions in the code that clarify the standards and leave less ambiguity. In contrast, other practitioners argue that codes simply cannot “encompass all potential problems” and that “if they are too detailed, then they might be inflexible and unlikely to be read” (Daugherty, 2001, p. 397). Others maintain that some degree of ambiguity is an inherent part of public relations activity and that ethicality of ambiguity is dependent upon the intent of the communicator.

A final concern to be addressed here involves the capacity of professional codes to account for the diversity of the multiple cultures that are involved in international business activity. With the advent of globalization, some practitioners assert that professional codes are “unlikely to gain wide acceptance” and that such codes are “so broad as to lack pragmatic application” (Curtin & Boynton, 2001, p. 416). This issue has received considerable attention from professional organizations. For example, the IABC and IPRA dedicate considerable space to emphasizing sensitivity to intercultural issues in their codes of practice. These provisions encourage practitioners to alter their practices in order to avoid insult or insensitivity to members of any culture.

Ideally, codes of practice provide practitioners with an objective means for proactively assessing their behavior as they engage in their profession. Codes have been questioned for their inadequacy in

the areas of clarity, enforcement, and intercultural sensitivity. In response to these concerns, the codes established by PRSA, IPRA, and IABC, among others, have evolved in order to meet the challenges and to address the criticisms that have emerged over the past half century.

COLLABORATIVE DECISION MAKING

Collaborative decision making entails working together rather than independently in a decision making process. Although it can refer to as few as two individuals working together to make a decision, collaborative decision making in public relations typically refers to organizations working together with one or more external publics in a shared decision-making process. Common contexts for collaborative decision making in public relations are community relations and employee relations, and instruments of collaboration range from citizen surveys and public meetings to negotiations, mediations, and search conferences. Done well, collaborative decision making can lead to greater trust among participants and higher quality outcomes that publics view as more acceptable and legitimate than decisions where publics were not involved. Done poorly, collaborative decision-making efforts can leave participants feeling used, undervalued, and distrustful of future interactions.

Although a very visible aspect of public relations today, the spirit of collaborative decision making is evident in early democratic principles, such as the right of citizens to have a voice in decisions that affect them. Early examples of collaborative decision making in the United States include the ubiquitous town hall meeting, where colonialists debated the future of the fledgling nation. The freedom to share in decision-making efforts has not always come without a struggle, however, as evidenced by the women's suffragist movement to earn voting rights or the labor movement to earn collective bargaining privileges, among others. In response to greater calls for collaborative decision making, the latter half of the 20th century saw more legislation guaranteeing the right of citizens to participate in government-sponsored decision-making processes. Private organizations also experienced greater protest from publics that resisted being excluded from decisions that affected them.

Today, the techniques used for collaborative decision making are many and varied and can be targeted at internal as well as external publics. Because different techniques will produce different

outcomes, choosing the appropriate technique requires public relations practitioners to consider carefully the context and goals of the collaboration. One of the first considerations concerns who will have the final decision-making authority. The degree of collaboration in a decision can range from consultation and advisement to full-fledged partnership and control of the decision. Ensuring that all participants in a collaborative decision-making process know from the beginning their likely impact on the decision will reduce the potential for later misunderstandings about how decisions were made. Table 1 provides descriptions of several techniques available for collaborative decision making. The table includes typical participants of the techniques, as well as typical impacts participants have on decisions.

As the table illustrates, public meetings are collaborative decision-making techniques where participants act in more of a consultant or advisory role. Rather than making a decision at the meeting, participants typically provide information or feedback to meeting organizers, who then make a decision sometime after the meeting. Benefits of public meetings are that they are open to any member of the public to attend; therefore, the decision makers can often access a wide range of knowledge from people who attend. Drawbacks include the sometimes limited nature of collaboration, which may frustrate meeting attendees who want a greater role in the decision-making process. Biased representation is also a frequent criticism of public meetings, since only those most interested in the decision—though not necessarily most impacted by the decision—typically attend.

Advisory committees and advisory panels are also methods of collaborative decision making, where publics serve as consultants to the organization. These methods differ from public meetings in that participation is usually limited to participants that have been purposively selected for their expertise or ability to represent a particular viewpoint. For instance, the U.S. Food and Drug Administration (FDA) relies on its many advisory committees to evaluate research and make recommendations about issues related to foods, drugs, biologics, and medical devices. The FDA specifically chooses members for their expertise, and members meet frequently over a

Table 1 Common Techniques for Collaborative Decision Making

<i>Techniques</i>	<i>Participants</i>	<i>Primary Purpose</i>	<i>Typical Public Impact on Decision</i>
Public meetings (public hearings, availability sessions, scoping sessions)	Open to a wide range of self-selected individuals	To provide information and obtain feedback	Limited—public serves primarily as consultant to organization, which is not obligated to follow recommendations
Advisory committees (advisory panels, advisory boards, citizen juries)	Individuals having some expertise or characteristics vital to the issue	To evaluate the situation and provide recommendations over a period of time and multiple issues	Limited—public serves primarily as consultant to organization, which is not obligated to follow recommendations
Citizen surveys (public opinion polls)	Representative sample of stakeholders	To assess attitudes from affected individuals who may not otherwise participate in the decisions	Limited—public serves primarily as consultant to organization, which is not obligated to follow recommendations
Workshops (study circles, deliberative polling, roundtable discussions)	Interest group leaders, experts, officials	To bring members of the public and organization together in a working session.	Mixed—organization is not obligated to follow recommendations
Referenda (ballots)	Self-selected sample of registered voters	To make a choice about whether to approve or disprove the issue on the ballot	Substantial—in most cases, votes are binding
Search conferences	Wide range of individuals representing stakeholders internal and external to organization	To identify shared goals and strategically plan ways of attaining them	Substantial—participants share responsibility for making and implementing decisions
Negotiations (collective bargaining, alternative dispute resolution, arbitration)	Individuals directly and/or legally involved with the issue	To find mutually acceptable solution	Substantial—in most cases, results are binding

period of years to assist the FDA in its decision making. As with most advisory panels or committees, the FDA is not obligated to follow their committees' recommendations.

Other techniques in which external publics typically have less direct impact on decisions include citizen surveys and workshops. Surveys can provide useful input from a representative sample into a

decision-making process, although some people criticize that surveys only provide a "snapshot" of opinions at a particular moment. In response, deliberative polls are a type of workshop where a representative sample is selected to attend an intense discussion, often over a weekend or other three-day period. Participants complete questionnaires at the beginning of the workshop and at the workshop's end.

Supporters of this technique have argued that this provides a truer gauge of public opinion should the public have had access to the available expertise on the issue. Both citizen surveys and workshops (with or without surveys) are typically used as a component of a larger decision-making process; therefore, their impact on the final decision will vary.

Negotiations, referenda, and search conferences are collaborative decision-making processes where external publics have comparatively more control in formulating final decisions. Negotiations entail participants working together to find some agreed-upon solution. Referenda are essentially ballots where individuals cast their input on a decision using a formulized vote-taking process. Search conferences are large gatherings where people work together to identify shared goals and strategize ways to reach them. Although serving different needs, negotiations and search conferences both have the advantage of face-to-face deliberation, which referenda do not, and many view face-to-face deliberation as an important precursor of successful collaborative decision making.

The above techniques represent commonly used processes of collaborative decision making. There are many variations among them and this list is not exhaustive. Organizers can also use more than one technique as part of a decision-making process, such as when public meetings are held to keep a more general audience apprised of a negotiation's progress. In addition to the processes themselves, many guidelines exist to enhance interaction in group decision making. Although exploring these guidelines is beyond the scope of this entry, there are some suggested readings in the bibliography.

When planning collaborative decision-making efforts, public relations practitioners should also consider legal, practical, logistical, and philosophical issues. One of the first factors is whether collaboration is legally mandated or conducted voluntarily. This is important because mandated collaboration could involve additional requirements. For instance, legally mandated government-sponsored public meetings typically occur at a specific time in a decision-making process. Although this is not always the case, mandated meetings also tend to be more formal than nonmandated meetings. On the plus side, the formal

procedures that accompany mandated collaboration could help to ensure that the process is viewed as fair by all parties. The formality of some meetings could leave some participants feeling constricted in how they can contribute. Finally, some publics could view an organization suspiciously if it only seems to be collaborating because the law says it must. In comparison, if an organization is voluntarily collaborating with publics in a decision, publics could interpret this meeting as more of a "goodwill" effort than if collaboration was required.

Practical issues relate to the topic of the collaborative decision-making effort. For instance, decisions that deal with highly technical topics may hinder participation from nontechnical publics. This may be most apparent in techniques geared to wider, more general audience participation, such as public meetings and public hearings. To offset the power imbalances that could arise from this situation, practitioners could provide nontechnical audiences with access to unbiased, technical support. The U.S. Environmental Protection Agency, for example, provides Technical Assistance Grants up to \$50,000 to communities to assist them in participating in decisions about eligible Superfund sites.

Logistical issues relate to the implementation of the decision-making effort. If the forum for collaboration is a public meeting, for instance, logistical issues include choosing the location, timing, and length of the meetings; soliciting participants and coordinating schedules; and preparing appropriate handouts. Choices about timing and location of meetings can send signals to participants about the degree to which their attendance is valued. Meetings held during holidays or at remote locations, for example, can result in lower turnouts for reasons unrelated to the issue at hand. In addition, if poor scheduling results in a lack of attendance, this can detract from the credibility of the process. Meetings that occur late in the decision-making process can also leave participants feeling dissatisfied and angry.

Philosophical issues refer to the incentives for participants to collaborate. Participation scholar Daniel Fiorino recounted that, traditionally, people argued that decisions—especially technical ones—should be left up to administrative officials, who would consult as necessary with the appropriate

experts, elected officials, and other representative interest groups. He summarized the argument against such an arrangement as having normative, substantive, and instrumental qualities. The normative argument states that individuals have a right to participate in decisions that affect them and excluding them from the decision-making process thus violates democratic ideals. The substantive argument states that input and knowledge from non-technical audiences can be as sound, or more sound, than experts' or officials' knowledge or input. For instance, local groups could have a much greater sensitivity to contextual factors, such as culture, which can influence the successful implementation of decisions. Finally, the instrumental argument states that involving individuals in the decision may decrease conflict and increase acceptance of decisions.

As noted in the instrumental argument, when properly executed, collaborative decision making can have the added benefit of reducing conflict among organizations and publics. This requires, however, an acknowledgment of the role that power and control play in the decision. Not everyone is inclined to collaborate with their internal or external publics, preferring to follow an elite model of decision making. Even when parties choose initially to collaborate, at some point, discontinuing collaboration could be strategically better for one or more participants. Roger Fisher and William Ury of the Harvard Negotiation Project coined the term BATNA to refer to the state when the incentives to act unilaterally exceed the incentives to collaborate. BATNA refers to the Best Alternative to a Negotiated Agreement. Before coming to the negotiation table, shrewd participants have identified their BATNA as well as attempted to learn the other side's BATNA. Collaboration does not necessarily mean compromise or accommodation, especially if participants have identified their BATNA. However, scholars in conflict resolution and public relations have suggested that parties in a negotiation or conflict should try to identify shared interests in efforts to reach some type of agreement.

There are several ways to evaluate the effectiveness of collaborative decision-making techniques.

Some of the criteria focus more on process-oriented variables whereas others examine outcomes. Process-oriented criteria examine the success of the implementation effort, including the number of people who participated, the degree of interaction among participants, the fairness of the procedures, and the length of time people deliberated. Outcome-oriented criteria examine the results of the procedures, including the quality of the decision, whether the decision is viewed as fair or legitimate by participants, and participant satisfaction with the decision. Recently, more attention has been given to long-term outcomes, including relationships between organizations and their publics. Rather than viewing collaboration as simply a one-time event, long-term outlooks consider the likelihood that additional interaction will occur and therefore pay attention to ways to increase trust among participants, for example.

COLLATERAL

Collateral refers to the accessory promotional materials agencies and companies produce to accompany an advertising or public relations campaign. As a broad term, collateral traditionally has been used to encompass all nonmedia advertising work. It most often includes any print work done in addition to advertising in its traditional form, which includes print advertisements, radio spots, and television commercials. Collateral comprises all promotional materials not associated with major media and accessory nonmedia advertising materials prepared by manufacturers to help dealers sell a product, including brochures, signage, point-of-purchase displays, direct-mail pieces, catalogs, booklets, manuals, films, audiovisual materials, technical specification sheets, trade show exhibits, sales promotion materials, sales kits, and other sales aids available from the manufacturer.

Collateral services is an agency term to describe noncommissionable forms of service, such as the creation of sales promotion materials, new product studies, research, and merchandising. These types of services are usually performed on a negotiated fee basis rather than a percentage of advertising media buy.

Public relations practitioners who work in marketing communications are often responsible for collateral materials that support the marketing function. In this case, they develop customer newsletters, brochures that explain product features, and magazines geared toward the buyers of a product or service. These practitioners also ensure the proper implementation of the corporate identity system throughout all collateral materials, which may even include posters, fliers, postcards, and Web pages.

A brochure is a printed piece of collateral material used for public relations, advertising, and marketing purposes. Brochures are considered a communication tool or tactic and a form of direct media (e.g., fliers, newsletters, and posters) that reach their audiences through distribution channels other than mass media (i.e., newspapers, magazines, radio, and television). Other terms used to describe brochures are pamphlets, considered a

simple version of a brochure, and booklets, which are brochures produced in small booklike formats.

Every organization, whether corporate or non-profit, needs brochures to convey key messages to particular target audiences. A brochure is a tactic with a specific objective. For example, brochures can educate an employee audience about company policies, inform customers about new products, or encourage members of a community to use a program offered by a nonprofit organization. Brochures communicate a sizable amount of information to a single reader at a handheld viewing distance. An orderly sequence of information is presented in stages through panels using a common design thread that visually connects all of the panels and helps entice and sustain the reader's attention.

A newsletter is a type of publication produced most often by public relations practitioners. Almost all organizations—nonprofit and profit-making alike—create and distribute newsletters to members of their key audiences. With the development of desktop publishing, newsletters have grown in popularity. Although they share similar traits with magazines and newspapers, newsletters are smaller, less formal publications that are directed toward a specific audience, such as employees, customers, members of the community, donors, or volunteers.

COLLEGE AND UNIVERSITY PUBLIC RELATIONS

Colleges and universities engage in public relations to manage their relationships with key constituencies. Their public relations activities typically are divided into three areas: news, development activities, and alumni relations. The news function normally is part of a university news service housed

under the rubric of university relations or external affairs; development, also called advancement, is located within an office of development, donor relations, or a university foundation; and alumni relations work is mostly conducted within an office of alumni affairs.

Much of the difficulty in managing public relations is the diverse constituencies to which a multifaceted educational institution must address and respond. Not only must a college or university deal with internal publics such as faculty, staff, and administrators, but it also must manage external constituents as broad and diverse as parents, alumni, trustees, clubs, civic and community leaders, business leaders, neighbors, athletic boosters, legislators, governmental agencies, unions, and accreditation agencies, as well as area employers who hire graduates. With such a task in mind, universities face a challenging public relations environment as they seek to create a distinct “brand” for their institution.

UNIVERSITY RELATIONS

The principal place where the public relations work of an educational institution is completed is in what is commonly called university relations. One of the major components of public relations is a university news service whose job it is to publicize the information that originates from the campus. University relations officials do this by responding to calls from media who need information, as well as fielding inquiries from the general public. This information takes the form of news releases and feature stories about significant events in a university’s existence such as hiring a new president, common and regular occurrences like commencement ceremonies, as well as to publicize the newsworthy research efforts of faculty members.

As part of its news service, many universities also produce news calls—prepackaged news stories disseminated throughout a state or region that then are accessed by broadcasters. The benefit here is that radio stations get ready-made stories at little or no cost while universities generate publicity and institutional recognition. In addition to external efforts, university relations also seeks to communicate with

internal publics through newsletters and other media. The chief spokesperson for the university is housed within a university relations department.

A second area of work in university relations is that of special events management. An educational institution is overwhelmed with special events—which can include major grant announcements, technology transfers, new building dedications, orientations, homecoming events, campus races, as well as major events like Centennial celebrations.

A third area of effort is graphic arts and Web design. Such work usually includes the control of the presentation of the institution’s name and logo, project planning, design and layout assistance for the many places across campus that need brochures and other promotional materials, and a great deal of photography, whether documentary, news related, or an updating of the school’s photo files. In addition, with the advent of information technology, the development of college and university Web pages normally falls under the purview of university relations.

A fourth area of work by university relations personnel is the creation and production of university publications, whether books or university and alumni magazines. Other types of materials produced for publication by university relations personnel are fact books and expert guides.

Finally, tasks that are not easily classified but fall under the purview of university relations personnel include the following: providing an overview of press clippings for senior level administrators, developing a campus-specific style manual, offering editorial project assistance to departments, engaging in crisis management for when matters do not go well, and offering media training to faculty and staff.

DEVELOPMENT

Development is a second area of distinct public relations activity by colleges and universities. Here the idea is to secure the future of the institution by engaging in systematic efforts to increase financial support. Colleges conduct fundraising activities in order to support their endowments, recruit faculty by creating “named” chairs, increase financial aid

for students, as well as to build and equip new buildings or renovate old ones. Frequently, gift giving is organized into honorary clubs that offer increased ranks of exclusivity in exchange for larger dollar amounts.

Although always an important part of educational public relations, with the national trend of reduced state funding and the variable nature of the business cycle, the need to develop potentially new sources of revenue has become more important. Consequently, it is now more common for universities to engage in major capital campaigns, which in the case of large universities often total over \$1 billion.

Development activities tend to fall into three types: annual funds, major gifts, and corporate relations. Annual funds consist of the once-a-year solicitation of a monetary gift through letters or a phone-a-thon. Such gifts are important beyond their monetary value; many institutional rating agencies judge alumni involvement based on participation in annual giving.

A second area of development work is in the area of major gifts—those gifts beyond the small dollar amounts typically pledged during annual fund campaigns. Here, development officers frequently spend several years cultivating donors with substantial assets in order to lay the groundwork for a direct request by the president or another senior academic official. An important component of major gifts is the use of planned giving whereby people make sizable charitable gifts through their estates.

A final area of development work, corporate and foundation relations, is designed to facilitate advancement activities by developing relationships with major corporations and their foundations. Many companies that hire a large number of an institution's graduates find it in their interest to develop and endow programs in order to create strategic joint ventures with universities. Additionally, companies may form partnerships whereby they match the giving efforts of their employees.

Development personnel usually participate in the Council for Advancement and Support of Education (CASE). Begun in 1917, CASE represents 2,400 institutions and provides services to individuals and institutions in the form of seminars, assessment services, a

certification program, awards, publications, and a placement service.

ALUMNI RELATIONS

A final area of public relations by educational institutions is the development of an alumni relations program. Alumni relations deals with a college or university's efforts to keep in contact and facilitate healthy relationships with a critical public—its alumni.

In order to develop and maintain pride in an institution, colleges and university alumni associations carry out a number of public relations activities. One task is to facilitate the ongoing communication between school and alumni. To this end, alumni associations publish magazines and newsletters that keep alumni updated on significant university activities and career milestones in the alumni ranks. Individuals in alumni relations also host a large number of special events, particularly during the homecoming season. These occasions often take the form of alumni reunions or other gatherings. Such meetings are not always located on campus; typically alumni relations personnel make efforts to meet with chapters around the region as well as in other major cities. Other types of organizational events are the creation of specific societies of alumni. They are alumni joined by a common interest or theme, such as those who worked at a campus radio station, those from a close-knit or well-known program, or those from a specific ethnic group.

Alumni often help the institution in tangible ways. Many universities seek the political support of their alumni, frequently in the form of organizing a legislative network to lobby for state support of their programs. Oftentimes alumni also get involved by meeting and recruiting potential students. Recent developments in this area also include the development of mentoring programs to help young professionals to get established in their careers.

Universities also help their alumni to stay in contact through the creation of alumni locators and directories; this helps strengthen ties to their alma mater. Finally, universities often use alumni relations as a vehicle by which to recognize their

distinguished graduates, usually in the form of distinguished alumni awards. These awards often serve as the foundation for future development opportunities for the institution.

COLORADO COAL STRIKE

The bitter strike waged against the coal operators of southern Colorado in 1913–1914 was one of the first major tests of the emerging field of public relations in the United States.

The United Mine Workers of America (UMWA) sought to organize the immigrant workers who worked for some 70 companies in the state. However, the largest and most influential coal operator was the Colorado Fuel & Iron Company (CF&I), which was 40 percent owned by John D. Rockefeller, Sr., scion of the Standard Oil Trust. Rockefeller took comparatively little interest in the company, which he invested in as a favor to railroad tycoon George Gould. The Rockefellers actually intended to sell their stake in CF&I as soon as market conditions improved. But events on April 20, 1914, squelched any hope of doing so.

On that Monday morning, as the strike ended its seventh month, a gun battle broke out between Colorado militiamen and armed strikers, who had

been evicted from company-owned houses and were living in a tent colony near Ludlow, Colorado. Accounts vary about how the skirmish began, but by the end of the day at least eight men and one boy had been killed by gunfire before the tent colony burned to the ground. However, the real tragedy of the “Ludlow massacre” was the suffocation deaths of two women and 11 children who were consumed by smoke after hiding from the crossfire in earthen pits below ground.

The union, aided by sympathetic and sensationalistic newspapers in Denver, quickly blamed the entire affair on Rockefeller and his son, John D. Rockefeller, Jr., who had assumed responsibility for the family’s business affairs. Although they were 1,500 miles away from the incident and had not been in Colorado for 10 years, the Rockefellers were labeled as personally responsible for the strike, for the attack by the militia, and for the deaths of innocent women and children.

Newspapers across the country carried glaring headlines for the first several days about the tragedy. But the real pressure came as newspapers in New York and the East covered efforts by Congressman Martin Foster and President Woodrow Wilson to seek a settlement of the strike. Rockefeller had steadfastly refused to meddle with the local managers who, like their counterparts in all other Rockefeller investments, were allowed and expected to operate the day-to-day business. CF&I was a member of a mine operators association that staunchly opposed union recognition, particularly any union led by the tawdry leaders of UMWA District 15.

Rockefeller had told a congressional subcommittee in early April 1914 that he was not opposed to unions. But JDR Jr. (and presumably his father) staunchly believed philosophically that men should not be forced to join a union and should be able to work anywhere they wished. About the strike, he had told the committee prior to Ludlow, “My conscience acquits me.” Those words would haunt him.

The Rockefellers were helplessly sucked into the fray. A well-oiled publicity campaign was launched by Walter H. Fink, publicity director of the UMWA in Colorado. Protests were also organized in Denver by George Creel and in New York City and Tarrytown, New York (home of several Rockefeller

estates) by Upton Sinclair. The socialist writer also picketed the Rockefellers' office at 26 Broadway and went to jail instead of paying a small fine in order to generate even more sympathetic press coverage. The Rockefellers received death threats from the radical members of the Industrial Workers of the World (IWW). Sunday services at their church were disrupted. Later, a bomb intended for the Rockefellers exploded in a New York tenement house and killed four suspected protesters.

Rallies were organized in cities around the country, ministers lashed out from pulpits across the country about the brutality in Colorado, and a delegation of miners' wives toured Washington and New York to tell their tales of woe. The Rockefellers were bolstered by positive letters of support from many business people, but crank letters containing threats were also received. For nearly two months, the family's homes were under armed guard.

PUBLIC RELATIONS RESPONSE

After six weeks of intense pressure, John D. Rockefeller, Jr., and his staff desperately sought ways to set the public record straight, to rectify the damage to the family's name, and to solve the underlying problem between labor and capital. To do so, in early June 1914, JDR Jr. enlisted the aid of two consultants, publicist Ivy Lee and industrial relations specialist William Lyon Mackenzie King.

Lee is often referred to as the father of modern public relations, although he always used the term "publicity" to describe his work. Lee was special assistant to the president of the Pennsylvania Railroad and, in addition to his regular job, assumed the job of helping one of the nation's most powerful families.

Lee set out to tell the Rockefellers' side of the story by issuing a series of 15 bulletins that were distributed to as many as 40,000 opinion leaders across the country. The bulletins detailed previously untold aspects of the strike favorable to the coal mine operators. He also sought publicity opportunities for the bulletins to appear in newspapers and served as an intermediary with the press. Lee moonlighted for the Rockefellers as a consultant for the remainder of 1914 and then joined the Rockefeller staff for 15 months in 1915–1916 before becoming an

independent consultant with the Rockefellers as clients.

Lee gained considerable notoriety for himself and for the emerging field of publicity when information about his activities and errors pertaining to the salaries of union officials, which were contained in his bulletins, became disclosed publicly. The United States Commission on Industrial Relations (USCIR), which had been created by Congress to investigate industrial strife, grilled Colorado officials, Lee, and Rockefeller about Lee's activities. Although the USCIR's intent was to put Lee and Rockefeller in an unfavorable light, the USCIR hearings in 1914 and 1915 also shined the light of public scrutiny on the emerging power of publicity before World War I.

While Lee attended to publicity matters, King focused his attention on resolving the labor problems themselves. King proved to be a turn-of-the-century advocate for improvement of management-employee relations and proposed a mechanism for conciliation that would bring labor and capital to voluntary organization during a time before unions were guaranteed the right to negotiate.

King was almost as controversial as Lee. After being hired to study labor relations problems by the then-fledgling Rockefeller Foundation, USCIR investigators quickly questioned whether the nonprofit Rockefeller Foundation (which received a special federal charter in 1913) was misusing its resources to benefit the Rockefellers in Colorado. King had been the labor minister in Canada, until 1911, and was distrusted by American union leaders for his legislation, adopted in Canada, that required arbitration of labor disputes before any strike could be called.

The centerpiece of King's work for the Rockefellers was the Colorado Industrial Representation Plan (CIP), adopted in 1915. The CIP became a prototype for company unions that created mechanisms for dialogue between management and rank-and-file employees. The CIP served as a model for American industrial relations until 1935, when Congress passed the Wagner Act, which guaranteed the right of unions to engage in collective bargaining. Moreover, King was successful in persuading young Rockefeller and CF&I officials about the need for employees to participate in management

decisions and the value of good working and living conditions.

King, who became prime minister of Canada in 1921, proved to be more than a labor relations specialist. He also became a long-time trusted adviser to the Rockefellers. King (along with Lee) helped prepare Rockefeller for grueling testimony before the USCIR, organized a program of social welfare to improve economic conditions in Colorado, and orchestrated a highly successful three-week visit by Rockefeller to Colorado in October 1915. While in Colorado, JDR Jr. saw conditions firsthand, met with miners in their homes, spoke with community leaders, and committed himself to much needed improvements.

Industry and Humanity, a book penned by King while he served as a consultant to the Rockefeller Foundation in 1916–1918, serves as a treatise on labor-capital relationships that is a precursor of modern public relations thought. Among King's key points are the importance of two-way communication and mutual respect, the importance of stakeholders in organizations, and the value of publicity so that the activities of organizations are widely known and misunderstandings are avoided.

COMMERCIAL ONLINE SERVICE

A commercial online service is one of three typical ways used to access the Internet. The other two include simple dial-up, or Internet service provider (ISP) service, and local area network (LAN) service. If a user has a computer at work that is

networked, and allows access to the Internet, a LAN connection is being used.

While commercial online services and ISP accounts have a lot of overlap, commercial online services are actually a subset of ISP services. Both commercial online services and ISPs provide an entry point. An access phone number is dialed by the modem in the customer's computer, and after the connection is established, access to the Internet is had by linking through the commercial online service's (or ISP's) computers. That is where the similarity ends.

ISPs usually provide e-mail accounts, and maybe some hard drive space (on their servers) for customers to put up a Web page, but they do not offer tailored content and more complex add-on services as a commercial online service provider does. Another distinction to be made is with respect to software. Because an ISP does not provide the customer with customized (and customizable) content, the ISP will not usually have customers install software on their computers as a requirement of use.

The biggest example of a commercial online service is America Online (AOL). Subscribers get a customized entry point (gateway site) that includes both access to the Internet and content unique to AOL subscribers. The unique content includes chat rooms, games, and news. However, if subscribers seek more than what the gateway has to offer, they can access other sites through the same (AOL) connection. That is to say, they do not "hang up the phone" and dial a different connection.

There is an earlier technological example similar to commercial online services: Bulletin Board Systems (BBS). While a BBS would provide things like e-mail, chat rooms, games, and so on, BBSs were, for the most part, closed systems. There was some linking between BBSs, but users did not have the ability to go from any BBS to any other (unlike today, where a user can go from any Web site to any another). For the most part, if they wanted to visit a different BBS, they would have to disconnect from one before going to the other. Some BBSs would require paid membership, others welcomed one and all.

As computer technology continues to blend and merge mass media channels, it is important to

understand where the access points are to the Internet. With this understanding, the decision on access for the individual can best be made. For example, is it best to tailor a message and have that message available only to AOL users? If the desire is to reach everyone (including people who use smaller ISPs, for example), then a full-on Web site may be the answer. For further consideration, there is the issue of restricted access: Some people do not have a computer at home. The only way they access the Internet is through their computer at work. Access to a Web site may be blocked by the company's LAN administrator, on orders from a superior who may feel that the message conveyed by the Web site is at odds with the company's goals.

—Michael Nagy

COMMERCIAL SPEECH

Commercial speech, for purposes of First Amendment law, has been defined by the United States Supreme Court as speech that does “no more than propose a commercial transaction” or, on occasion, as expression “solely motivated by the desire for profit.” Commercial speech receives lesser First Amendment protection than does speech on political or social issues of public importance because it has traditionally been perceived as having lesser value in a democratic society and because of the desire to protect consumers from fraudulent business practices.

Advertisements for products or services clearly are commercial speech. But communication materials such as informational brochures and issue ads are harder to classify. An example of how the classification can affect public relations speech is *Bolger v. Youngs Drug Products Corp.* (1983). Youngs Drug manufactured condoms. To promote its products, it sent unsolicited direct mail pieces to the general public. One piece was an informational pamphlet on the prevention of venereal disease through the use of condoms. At the end of the pamphlet, Youngs Drug's name appeared as the producer of the pamphlet. An action was brought against Youngs Drug because a federal postal

regulation prohibits the mailing of unsolicited advertisements regarding contraception. The Supreme Court held that the informational pamphlet was commercial speech because it was included in a direct mail ad, it referred to products by Youngs Drug, and it was motivated by profit. The three factors would not be sufficient individually to turn the informational pamphlet into commercial speech, but the combination of all three supported a finding that it was, the Court said. The Court was concerned that holding otherwise would lead advertisers to combine false or misleading product information with social or political information to avoid government regulation.

In determining whether a government regulation on commercial speech is constitutional, courts apply a four-part test. Under what is known as the *Central Hudson* (1980) test from the case in which it was first enunciated by the Supreme Court, courts must consider each of the following:

- Whether the commercial speech is worthy of First Amendment protection (it must be accurate and for a lawful product or service)
- Whether the government has a substantial interest for regulating the speech (courts usually consider the government to have a substantial interest in protecting the health, safety, and morals of the public)
- Whether the regulation in question directly advances the government's interest
- Whether there is a reasonable fit between the regulation and the interest to be protected

Although the Court applies the *Central Hudson* test to all commercial speech cases, it reaches different decisions depending on the kind of product or service advertised. For example, the Court has strongly supported the right of truthful, nondeceptive advertising, even of “vice” products and services, such as alcohol, tobacco, and gambling, to protection under the First Amendment. Yet the Court has consistently limited the advertising of professionals, such as lawyers, accountants, and dentists. Professionals may advertise the price of standardized procedures but not of more complex services. The Court has also restricted the means by which attorneys may communicate with consumers.

The idea that commercial speech is entitled to any First Amendment protection is a relatively recent legal phenomenon. The Supreme Court did not even consider whether commercial speech was protected speech until 1942. At that time, the Court held that “purely commercial advertising” was outside the protections of the First Amendment. The case arose when a businessman included a political protest on the back of his leaflet advertising his business to get around a New York City sanitary code banning the distribution of leaflets except for those of a political or informational nature. The Supreme Court found that the addition of the protest did not make the leaflet political speech. The leaflet was purely commercial speech, and the Constitution imposed no restraints on government with respect to such speech. Commercial speech was simply not as valuable to society, the Court held, as was political speech, and therefore it should not be protected.

In subsequent cases, the Court clarified its reasons for denying First Amendment protection to commercial speech. First, the Court was not worried about the chilling effect of regulation on commercial speech. One of the Court’s primary justifications for protecting political speech is the fear that people will stop speaking out against the government if they can be punished by the government for so doing. But ads, according to the Court, would continue regardless of whether they were protected by the First Amendment because the desire of businesses to make a profit is so strong. Second, the Court concluded that it was easier to determine whether an advertiser’s claims were true than it was to determine whether allegations against the government were true. Therefore, while society had to tolerate a certain level of false political speech to ensure that political speech continued, society did not have to tolerate false ads.

In the 1960s, however, the Court began to carve out areas within the commercial speech doctrine that had some First Amendment protection. The Court began by distinguishing purely commercial advertising from political advertising. Political speech did not lose its First Amendment protection simply because it appeared in an advertising format, the Court held. Later, the Court would find that a

newspaper ad for abortion referral services was not “purely commercial” because it contained important factual information clearly of interest to members of the public.

The Court has continued to expand its protection for commercial speech, finding that commercial speech can be as important to people as political speech, especially in terms of their everyday lives. The Court has emphasized the right of the consumer to have access to information, rather than the right of the businesses to advertise. It is the communication itself that is protected by the First Amendment, not the speaker. Despite the movement toward greater protection of commercial speech, such speech continues to receive less protection from government regulation than does noncommercial speech.

COMMITTEE ON PUBLIC INFORMATION

At the outset of United States involvement in World War I, President Woodrow Wilson issued executive order 2594 to create the Committee on Public Information (CPI). The CPI served two vital functions during the war: as the “propaganda” bureau of the administration, and to publicize voluntary censorship of national media. David Lawrence, a former student of President Wilson at Princeton, and Arthur Bullard, a reporter and novelist, had suggested to the president that he establish a publicity bureau and that he be cautious of unnecessary

ensorship efforts. Bullard's arguments for such an approach started long before the 1917 creation of the CPI, and in the early days of the CPI Bullard did considerable work to help develop the organization and its materials.

The idea of using a government agency to sell the war to the people was also advanced by George Creel. After his initial meeting with the president, Creel was appointed as chairman of the CPI and was granted full executive powers. Stephen Vaughn (1980) noted that "President Wilson trusted him (Creel) and never considered any other person for the chairmanship" (p. 17). Although Creel had the full support of the president, his appointment was questioned by others, who noted his inability to accept criticism.

John Dos Passos (1962) said that Creel was "a hardworking man with an inexhaustible self confidence, his failing was snap judgements [*sic*]" (p. 301). Creel was an activist Democrat who believed that Woodrow Wilson was one of the greatest men who ever lived. He tended to view individuals in two extremes. Those who agreed with his position on an issue were great; those who disagreed with him were skunks. In fact, Creel wrote, "It must be admitted that an open mind is no part of my inheritance. I took in prejudices with mother's milk and was weaned on partisanship" (Dos Passos, 1962, p. 301).

Creel's family had moved to Missouri from Virginia after the Civil War. Creel grew up in Independence and Odessa, Missouri. While working in Kansas City, Creel met Wilson when Wilson (who was at Princeton) spoke to local high school students. Creel worked to get Wilson nominated for the presidency and worked for his reelection in 1916. Creel was a journalist who had worked on newspapers in Kansas City and New York before returning to Missouri in 1899 to found the *Independent* with Arthur Grissom. Prior to WWI Creel moved to Denver and wrote for the *Post* and the *Rocky Mountain News* and later served as the police commissioner.

President Wilson noted the importance of strong national support for the war in his draft proclamation by arguing that "the whole nation must be a team." "To turn the whole nation into a team it was

not enough to punish the expression of the wrong opinions. It was necessary to disseminate the right opinions" (Dos Passos, 1962, p. 300). To create this teamwork it was essential to promote the war to the American people. Creel was given the job of selling the war to the citizens of the United States and many other nations.

The efforts of the CPI are important because they are one of the earliest examples of a large-scale promotional campaign. Additionally, individuals who worked in the CPI were some of the founding members of what we now call public relations. Indeed, Edward Bernays used his experiences with the CPI to create one of the early public relations firms and to start such an impressive career that he has been called one of the fathers of public relations.

George Creel and the CPI created a promotional campaign for the United States and the world. This campaign used all the channels of communication available at the time. Various accounts of their activities have been reported. The following quote from C. H. Hamlin and Charles F. Dole presented this description of the various CPI divisions and provides some evidence of the scope of CPI's activities:

This "Committee on Public Information" issued 75,099,023 pamphlets and books to encourage the public "morale." They hired the services of 75,000 speakers who operated in 5,200 communities. Altogether, about 755,190 speeches were made by these people known as the "Four Minute Men." Exhibits were given at fairs, and war films were prepared for the cinema. . . . A total of 1,438 drawings were employed to arouse popular hatred. An official daily newspaper was issued which had a circulation of 100,000 copies. A propaganda bureau was established by the United States, in the capitals of every nation in the world except those of the Central powers. (1927, p. 91)

The CPI used the press, films, and public speakers to reach its audience—the nation and the world. Through these various channels they carried the views of the president as articulated by Creel. The activities of the CPI would surely compare with those of any of the largest public relations/marketing campaigns of recent years. A detailed description of

each of the techniques used by the CPI can be found in George Creel's 1920 work, *How We Advertised America*.

The second major area of effort by the CPI involved their attempts to censor the media. In the first few weeks after the United States entered World War I, President Woodrow Wilson was granted wartime powers by the Congress. However, the ability to censor the press, which he had desired, was not included in these powers. Because President Wilson's efforts to obtain formal censorship privileges through the War Powers Act had failed, Creel and the CPI assumed the task. Creel's efforts to establish some form of control are not surprising in light of his admiration of the president and his position as the spokesperson of the administration. Creel was President Wilson's link to the Censorship Board.

The censorship efforts focused on voluntary guidelines that publishers were asked to follow. The June 2, 1917, issue of the *Official Bulletin*, a publication of the CPI, provided more than three pages of voluntary guidelines for publishers to follow so that the press could not be used by enemy nations. On page 12 of that issue's discussion of the voluntary guidelines, news was divided into three distinct categories:

Matters which obviously must not be mentioned in print; matters of a doubtful nature which should not be given publicity until submitted to and passed by the committee; matters which do not affect the conduct of the war, do not concern this committee and are governed only by peacetime laws of libel, defamation of character, etc.

Descriptions of types of news that would fall into each of the categories were provided.

In the specific regulations given on page 13 of the June 2, 1917, issue, the committee notes that "the suppression of all news matter which is obviously likely to be of direct utility to the enemy is urged and expected." The December 31, 1917, issue of the *Official Bulletin* provides revisions for the earlier guidelines. These revisions, like the initial guidelines, were mailed to all editors.

How successful were these voluntary guidelines? The CPI issued the following statement in the June 14 issue of the *Official Bulletin*. "While 99 per cent of the newspapers of the country are scrupulously observing the rules of voluntary censorship, a certain few are printing daily information that may expose American soldiers and sailors to deadly peril." This quote suggests that the vast majority of papers were observing the voluntary guidelines.

Even though the press privately expressed dissatisfaction over the techniques used by Creel, all papers, even opposition papers, remained respectful of the regulations until the end of the war. Dos Passos (1962) summarized the position of the CPI as an agency of censorship. "The CPI became the fountainhead of war news for the Washington press corps. The existence of an official press censorship was consistently denied but editors were safer if their materials had passed through Creel's hands" (p. 301).

The CPI and its chairman were successful in establishing censorship guidelines to which publishers would submit. Even though these guidelines were voluntary, adherence to them was almost universal. Publishers soon discovered that it was simply easier to submit news to the committee rather than take a chance of violating the guidelines. Although no official censorship was available, the Espionage Act made it illegal to spread false reports that would hinder recruiting. Those reports that did not match the official releases of the CPI were viewed as false.

COMMODYING INFORMATION

Commodifying information means that organizations focus their information acquisition and public relations efforts on the cost effectiveness or productivity of supplying information to help key markets, audiences, and publics make a wide array of decisions. Many think of public relations as a discipline that provides information. The concept of commodification challenges practitioners to go the extra step of being ever more accountable for the return on investment of acquiring and using information for the interests of building mutual relationships.

People desire information to make decisions they deem valuable. Their desire for information is a function of their involvement—need or desire—to make a decision, so reasons involvement theory. People experience higher levels of involvement when they need or want to make decisions.

Organizations communicate for two broad reasons, to get out messages (containing information) that management wants to be told and to respond to the needs and wants of markets, audiences, and publics. The desire by management and its stakeholders may or may not be a close fit.

Organizations engage in public relations to supply information to people who want information. Executive managements expect public relations to provide information to targeted individuals to influence their decisions, often the choices executives want them to make. For various reasons, executives may want to withhold information desired by others. Information can drive decisions, whether it is information the organization wants people to have or whether it is information people want.

Typically, it is thought to be more costly to provide people with information the organization wants them to have if the people do not have some reason for receiving and using the information. This condition leads public relations to be thought of as a mass communication discipline, broadly casting information through the mass media to put it before some small part of the public, even if targeted. People are inundated with information. Thus, attracting attention to information and getting it to be considered is a serious strategic challenge.

A commodity is something that is bought and sold. It affords ease of transaction and convenience. In the purchase of goods and services, this concept is relevant. Most of the goods people buy are a commodity. It is standardized to make the transaction as easy as possible. People rarely barter in countries such as the United States. Goods come packaged as commodities, even fruits and vegetables. This commodification makes the transaction easier, one the buyer may feel he or she has more control over.

Services are also commodified. For instance, routine and even special dental or medical treatment is performed at standard fees. Legal and other professional fees can be commodified so that the purchaser has a reasonable sense of what the service will be and what it will cost.

As public relations practitioners seek to understand and measure their practice, they should realize the advantages of calculating how much various bits of information cost to acquire and to make available to

key publics. Thus, for instance, they can calculate the cost effectiveness of providing such information in an “on demand” format such as a Web site because typically persons who encounter information in that medium are looking for it, more so than if they were randomly skimming the mass media. They are cognitively involved in searching for, getting, and using key bits of information to make decisions. Information on demand for customers or reporters, for instance, can reduce the cost of disseminating the information.

If businesses, government agencies, or nonprofits attempt to broadly “push” information to markets, audiences, and publics, it is necessarily going to be more costly in delivery even if its cost of development remains the same.

This sort of analysis lends itself to standard productivity measures. As a mathematical formula, productivity is the result of output divided by input. If output remains the same (the price charged for a bag of apples, for instance), but costs more (more input) to produce, then productivity declines. If output increases while the level of input remains the same, then productivity rises.

To think in terms of commodifying information, practitioners need to learn to calculate the cost of getting information and providing that information in ways that serves the organization’s and its stakeholders’ mutual interests.

Output value can be assessed in several ways. One is the reduction in the saved cost of regulation or legislation that is appropriately modified or defeated based on relevant information. Another is the increased marketing impact of getting the right information to the right customers at the right time. A third is the appropriate valuation of publicly held companies because relevant information is available to investors.

COMMUNICATION AUDIT AND AUDITING

A communication audit is an assessment tool used for formative, diagnostic, or evaluative research in public relations. The term audit, appropriated from the accounting field, has ambiguous meaning in public relations. Both the trade press and academic texts have used the term to describe a wide variety of research approaches with distinct objectives, methodologies, and study populations. Some describe a communication audit as a comprehensive study of all an organization’s stakeholder groups and their perceptions of the organization, whereas others define the term more narrowly. In general, all these approaches refer to a research process designed to identify perceptions of the organization or its communication vehicles and culminate in appropriate recommendations for action to management. Communication audits are commonly used by corporations, hospitals, and other large organizations to assess the organization’s image among its employees, customers, community residents and leaders, media, and other key publics. Audits are a standard offering of public relations research firms and larger public relations agencies, although various firms may define their audit services differently.

Typically, the audit process begins with an interview with top management to determine the objectives and focus of the audit, specific issues or questions that the audit should address, and key publics to be audited. Then appropriate methodologies for each group are selected and research instruments developed. Surveys, focus groups, interviews with opinion leaders, and content analysis of organizational publications and media coverage are common research techniques. Often, a package of several research techniques is employed. Data are gathered and analyzed, and a report is written that interprets the research findings and makes recommendations to management for future actions. The findings of a communication audit may serve as a tool to justify a change in strategic direction, funding for new programs, or to help a public

relations program gain management approval for such changes.

TYPES OF AUDITS

In 1977, Otto Lerbinger identified three distinct categories of audits used in public relations: public relations audits, communication audits, and social audits. These terms continue to be used, albeit somewhat inconsistently, and are joined by additional variations on the audit described in the trade and academic press in subsequent years.

Public Relations Audits

The public relations audit assesses the health of the relationships between an organization and its key publics. This type of audit provides insight into who key publics are and the images they hold of the organization. Surveys and focus groups are often used to determine key publics' levels of awareness of the organization and its products, services, programs, logos and slogans, or key personnel. Rating scales may be used to measure attitudes toward these, including characteristics that the public associates with the organization. The audit may also ask participants to describe and rate their personal experiences or interactions with the organization. Public relations audits may reveal misperceptions about what the organization is or does, and disparities between management's perception of the organization and the way the organization is actually perceived by its publics. Recommendations stemming from a public relations audit would focus on tactics to strengthen relationships with key publics.

Communication Audits

Lerbinger's (1977) definition of the communication audit limited it to research to determine whether messages have actually gotten through to intended receivers. Today, such audits focus on evaluating an organization's communication vehicles, such as newsletters, annual reports, brochures, press materials, Web sites, and video programs, in the eyes of their intended users. Typical research

methods include readership surveys, content analysis to identify predominate content themes, and measurement of text readability by using standardized formulas that determine reading difficulty based on factors such as word and sentence length. Respondents may be asked about their actual use of communication vehicles, their preferences for particular kinds of content, and whether they remember particular articles or acted on information. They often rate the effectiveness of various communication vehicles they receive on the basis of accuracy, timeliness, and usefulness.

A communication audit can identify information needs that are not being met, distrust of organizational news sources, preferences for particular communication channels, and whether a message is received, understood, and acted upon. Results of a communication audit may be used to improve the content, design, and distribution of publications, or to revamp or discontinue communication vehicles that are not achieving desired results.

Organizational Communication Audits

Communication audit is a term also used in the organizational communication field to describe research to assess employees' satisfaction with communication in their organizations. Because employee relations is often a key public relations concern, the organizational communication audit may be implemented by public relations managers. The International Communication Association (ICA) audit is the most widely used such assessment. It asks employees to rate how much information they receive on particular topics, such as job duties, pay, and their own performance, versus how much they would like to receive. Respondents also rate the amount of communication they receive from and initiate with superiors, subordinates, and co-workers, versus desired levels. An open-ended portion of the audit asks respondents to describe specific interactions they have had in which communication was particularly effective or ineffective. The data are used to make recommendations to management, and may be used to create a network analysis—a diagram depicting the path and frequency of information flow through an organization.

The organizational communication audit can reveal a great deal about the communication climate within an organization. It can identify problems with communication system design, employee information needs that are not being met, and bottlenecks in the communication flow. A limitation of the ICA audit is that it focuses on the amount of communication given and received; it does not ask employees to evaluate the specific strengths and weaknesses of existing communication vehicles. A multitude of studies employing the ICA audit in a variety of settings over the past three decades have confirmed a significant relationship between the communication climate within an organization and employee loyalty and job satisfaction. Employees' preferred source of communication is nearly always their immediate supervisor; however, employees consistently say "the grapevine" and employee publications are their most frequent sources of information.

Social Audits

A social audit evaluates an organization's social responsibility activities, such as voluntary environmental programs, community education programs, corporate philanthropy and volunteerism, and diversity initiatives. The audit measures public awareness of these programs and perceptions of the organization's performance as a corporate citizen. Most often, survey or focus group research is used to attempt to quantify the contribution of these programs to the organization's image and perceptions of the organization as a good place to patronize or work. Social audits were common in the 1970s, when they were used to assess corporate America's first large-scale social action programs. Recently, however, the term *social audit* has been less frequently used, having been replaced by more recent techniques associated with the practice of issues management such as environmental scanning.

Comprehensive Audits

Sometimes the terms *communication audit* and *public relations audit* are used to describe a

comprehensive audit that evaluates the organization's entire communication program and assesses the image of the organization based on the perceptions of all key stakeholder groups. Such an audit examines every facet of the organization's internal and external communication activities, along with the impact of these tactics on key publics. Research techniques may include interviews, focus groups or surveys with all levels of employees, consumers, community leaders and media gatekeepers, and critiques of all materials distributed inside and outside the organization, including newsletters, marketing materials, Web sites, and annual reports. This type of audit is used to identify strengths and weaknesses in the existing public relations position of the organization, to inform the development of long-term communication strategy, and to provide guidelines for future public relations programming.

Other Types of Audits

The public relations literature also describes "crisis audits" (Littlejohn, 1983) and "risk audits" (Ogrizek & Guillery, 1999), both of which are designed to help organizations identify, prioritize, and respond to potential crisis issues. "Public relations agency audits" (Croft, 1997) are described as internal performance assessments to help public relations firms gauge how well they are serving their clients.

Future Trends

The popularity of audits as a research tool in public relations reflects growing recognition of the need to quantify the value of public relations activities. More frequently, formative and evaluative research skills, such as the ability to design and conduct an audit, will be expected of communication professionals. To ensure the acceptance of audits as credible research, knowledgeable practitioners or professional research firms are needed to minimize problems inherent in any type of opinion research, such as those associated with sampling and bias in question design. An additional challenge for

practitioners is that top management may not always follow through on an audit's recommendations and make suggested changes.

COMMUNICATION MANAGEMENT

Communication management is an umbrella concept that suggests public relations can be one of several communications functions commonly found in for-profit and not-for-profit organizations. Communication management can also be defined as a set of techniques used in public relations and related activities to execute programs, campaigns, and projects.

UMBRELLA CONCEPT

Growing numbers of organizations have recognized that various communications disciplines share common purposes and have moved toward the integration of communications functions into a single unit. This convergence has resulted (a) from recognition of common strategic approaches used by public relations and related disciplines, (b) by the convergence of media and the rise of shared media such as the Internet, (c) by the blurring of the demarcation of traditional communications disciplines, including the rise of integrated marketing

communication, and (d) from efforts by organizations to achieve greater synergy and efficiency and to reduce redundancies and costs in communications operations. This centralization trend is far from complete, however. Most organizations continue to maintain separate functional units devoted to managerial communications, public relations, advertising, and technical communication. In Europe, for instance, communication management is the preferred term for traditional public relations.

In the academic arena, communication management is consistent with the umbrella concept of *strategic communication*, which involves the examination of how organizations use communications across traditional professional disciplines to achieve stated organizational goals and objectives. Both communication management and strategic communication purposely look beyond differences in disciplines and to focus on the similarity of strategic approaches found in various disciplines.

Table 1 compares six conceptual approaches to organizational communications that can be incorporated under this umbrella, although the conceptual focus and techniques that are used are somewhat different in each traditional discipline.

COMMUNICATION MANAGEMENT APPROACHES

Communication management says that all communications in an organization are tools used to achieve the desired organizational outcomes. Indeed, communication represents the constitutive activity of management. Organizational strategies are explained, ideas advocated, staff motivated, and products or services promoted through communication.

Communication management is grounded in the concept of *management by objectives* (MBO), which posits that all organizational activity should be planned around the attainment of goals. Furthermore, communication management recognizes that communications efforts can emanate from the following organizational frameworks or paradigms:

Table 1 Six Domains of Communication Management

Domain (Typical Organizational Unit Involved in Communication)	Goal/Purpose	Traditional Techniques
Management communication Leadership and personnel throughout organization	Facilitate operations of organization; promote understanding of vision, goals; communicate information used in day-to-day operations, including customer and vendor transactions and customer and staff training	Memoranda, contracts, meetings, and presentations
Marketing communication Marketing staff	Create awareness and promote interest and sales of products and services; attract and retain users and customers, including intermediaries in distribution channels	Trade and consumer advertising and product publicity, direct response and sales promotion, personal selling
Public relations Public relations or publicity, human resources, finance or government relations staff	Establish and maintain mutually beneficial relationships with key constituencies; includes consumers and customers, as well as investors, employees, community, and government	Publicity and corporate advertising in public media, interactive media, controlled media, events, personal contacts
Technical communication Technical support, training staff	Train people to reduce errors and improve their efficiency in the use of technology and procedures used in performing tasks important to organization	Procedures manuals, instructions; telephone call centers and computer-based assistance programs
Political communication Politicians, advocacy groups	Influence voting by general public in elections or decisions by lawmakers or administrators considering legislation or regulation	Political advertising, editorial coverage and editorial page opinions, printed materials, get-out-the-vote solicitations/personal contacts
Information campaigns/social marketing Not-for-profit and governmental agencies	Alter human behavior to reduce incidence of risky behaviors or to promote social causes important to the betterment of community	Public service messages, educational materials, interventions by professionals, family and friends

Programs are long-term efforts to establish and maintain communications between organizations and key audiences. Programs can include the establishment of *channels* (such as a Web site), *policies* and *procedures*, and ongoing *activities* (such as events) designed to facilitate communication over time. Program is the nomenclature most commonly associated with managerial communication, technical communication, and public relations.

Campaigns are coordinated efforts to promote particular ideas among key constituencies over a specified time. Campaigns are undertaken by an organization's own staff or with the assistance of outside specialists or consultants. Campaigns represent the basic framework used in advertising, political communication, and social marketing efforts. Some communicators prefer to use the term *programs* instead of *campaigns*. The latter word's origins in military theory suggest

that victors must triumph in a zero-sum game by conquering an enemy, which gives the word a negative connotation.

Projects are limited-purpose activities undertaken to accomplish particular outcomes within an organization. Project management, as a management tool, has received widespread attention in recent years. Unlike a long-term program or campaign, projects are of shorter duration and involve representatives of units working together to accomplish a particular purpose. Communications professionals may be participants in, but are not in charge of, various projects—annual reports, special events, Web sites, and so on. Many projects are undertaken within staffs of communications units.

ROLE OF PLANS

Central to the notion of communication management is the idea of planning or organizing communication effort. The preparation of a formal or written plan is deemed a critical element in effective management. Written plans serve both as *proposals* used to obtain client approval and as *internal control documents* for day-to-day guidance.

Communications managers become involved in the preparation of various keys of planning documents. These include the following:

Strategic plans, which guide the overall direction of the organization or the communication unit for a long-term period (often 3 to 5 years)

Annual plans, which outline specific activities to be taken within an organization's yearly planning cycle

Programs, campaigns, or project plans, which specify efforts to be undertaken to achieve particular outcomes (often without regard to yearly planning cycles)

Contingency plans, which are procedures to be followed in case of unexpected events or crises

ELEMENTS OF A PLAN

Although the specifics will vary by the domain, by the scope of activity, and by specific plan type, all communication management plans address the following:

The situation—An analysis of a problem to be resolved or the opportunity to be exploited.

Organizational goals—The desired outcome of an organization, stated in specific and measurable terms, that can be realistically achieved within a specified time frame. These might be stated in terms of sales, profitability, activity levels, or efficiency.

Communication objectives—The desired changes in human behavior (such as awareness or knowledge, attitudes, or behaviors) that will contribute to achievement of organizational goals. Common behaviors addressed include buying, investing, donating, working, and voting. Lifestyle changes might include adoption of particular spiritual or other beliefs, engagement in healthy or satisfying activities, or avoidance of risky behaviors.

Action strategies—Recommendations for changes in an organization's offerings, policies, or practices that would improve the probabilities of successful communications and thus attaining organizational goals.

Communication strategies—The overall conceptual approach to how communication objectives are to be achieved. Usually, this involves the following: (a) targeting particular *audiences*—which might be defined as market segments, publics, users, voters, or at-risk populations; (b) choosing media channels or specific vehicles to reach those audiences; and (c) development of key messages or themes that will be used in a program, campaign, or project to communicate with key audiences.

Tactics—The specification of *tasks* (including activities, events, or the preparation of materials and messages) to deliver the communication strategy.

Important details must be addressed in the day-to-day execution of a strategy, including *staffing* assignments and *calendar*ing to assure that tactics are executed efficiently and on time. As part of the implementation, *quality control* measures should be implemented to ensure that materials or messages are effective.

Evaluation—Predetermined methods for assessing whether a communication effort was successful in attaining the stated communication objectives and organizational goals.

Budget—A spending plan that appropriates the financial resources needed to achieve stated communications

objectives, that estimates costs, and that allocates spending to specific budget categories, avoiding waste.

The elements outlined are strikingly similar to those commonly found in textbook discussions of public relations campaigns. But whereas public relations conceptualizes its work as involving a four-step process, communications management adopts a (similar) model more closely aligned with general business planning.

ACCOUNTABILITY

The communication management approach places a premium on deploying resources effectively and efficiently with the same rigor and accountability as that imposed on other unit managers. Thus, along with planning, evaluation plays a critical role in the management of communication programs, campaigns, and projects.

Communication managers use the following different measures to assess their effectiveness and efficiency:

Qualitative measures include critical examination of the work product to identify deficiencies and opportunities for improvements. These often are for the internal use of the communication and to provide a benchmark for professionalism.

Output measures include examining the materials and message produced in quantitative terms. These involve examination of the extent of use of materials or tools and exposure to messages by audiences. These measures serve as a proxy (indirect) indicator of an effort's impact.

Impact measures assess the achievement of communications objectives (changes in people's awareness or knowledge, attitudes, or actions) as well as organizational goals (achievement of desired sales, contributions, productivity, voting, or risk reduction outcomes).

Financial measures include the contribution of the communication activity to the organization, including *return on investment* (ROI) and determination of the optimal *efficiency* when two or more tools are available to achieve similar outcomes.

—Kirk Hallahan

COMMUNICATION TECHNOLOGIES

Since humans first used sticks and charcoal to augment the human voice as a medium of communication, technologies have shaped the form, content, and dissemination of communications. Today, technology has become an increasingly important topic for public relations practitioners, who have available to them an increasingly wide array of tools to communicate ideas.

The advent of every new technology brings important changes to how public relations is practiced. The advent of printing with movable type, books, newspapers and magazines, the telegraph, photography and new illustration reproduction technologies, the typewriter, the telephone, the motion picture, radio, and television have altered the nature of advocacy, promotion, and persuasion over time. "New" communications technologies, such as the Internet, brought yet further changes.

COMPUTER-BASED TECHNOLOGIES IN THE WORKPLACE

Most organizations, including the public relations units within them, now use mainframes, workstations, and personal computers connected in local area networks (LANs) for a wide range of activities, including accounting and data processing, database management, and word processing and graphic production. Computer networks are used for management reporting and for work group collaboration (e.g., using groupware and group decision support systems [GDSS] software). As result, hierarchical structures have become flattened and reporting relationships splintered. Work production itself has recentered around computer screens.

Similarly, many organizations and functions have become decentralized. Work units in dispersed geographic locations and individuals working in remote locations (e.g., *telecommuters*) share information via wide area networks (WANs) in real time.

Web technologies have facilitated this process by creating Intranets using graphical interfaces that integrate text, images, and sounds. The latest enhancements now permit Webcasting and Webconferencing. Meanwhile wireless technologies have extended these capabilities by providing even more mobility.

As a result, workers in public relations and other fields have had to become more computer savvy. In an effort to reduce costs, many routine tasks have become automated with the advent of voice mail, e-mail, automated telephone response systems, and Web interfaces to database information. Critics argue that organizations have become more impersonal as a result; others suggest employees, customers, and others find it more difficult to make sense of events in organizations today. Thus, changing communications technologies have posed new challenges for public relations as it strives to establish and maintain mutually beneficial relationships on behalf of organizations.

HOW TECHNOLOGY IMPACTS PUBLIC RELATIONS

Technology had impacted public relations in several ways by the beginning of the 21st century. Many public relations practitioners approached the Internet timidly and without considerable thought, yet many practitioners have embraced technology widely. In 2001, Edward J. Lordan suggested that communication technologies primarily have influenced how practitioners conduct research and then package and distribute information. Research includes access to a wide range of electronic intelligence gathering sources, including the Web, proprietary databases, and specialized research software used in surveys and content analysis that improves monitoring situations and enhances the ability of practitioners to assume the role of a true manager versus merely a technician. Packaging includes the more sophisticated production and archiving of materials in digital formats by using word processing, database, graphic design, and electronic presentation software. Distribution covers the digital dissemination of information through the Internet, voice and text messaging, facsimile,

and satellite uplinks and downlinks in addition to traditional systems.

Whether communications technology has improved the productivity and effectiveness of the public relations practice is yet to be fully understood. However, the public relations practice clearly has been impacted in the following various ways:

Volume of Information

The sheer amount of information available to people has increased and, in general, organizations are making more and more information accessible than in the past. This requires the careful management, organization, sharing, and archiving of larger and larger volumes of organizational knowledge.

Speed of Information Exchange

Information can be distributed more quickly due to real-time information delivery systems. In turn, there have been greater demands from audiences to access available information on a timely basis. This has led to the blurring of time, haste, and competitive pressures that did not exist in earlier times.

Audience Choice

A fundamental shift has occurred that shifts the decision making about information access into the hands of the audience versus the organization. Audiences have more channels available to access information and often dictate when and how they access information. Thus, many public relations operations today operate on a 24/7 basis.

Changed Relationships

Whereas technologies were thought to be tools to disseminate information, they have been shown to actually create new constituencies for organizations and new opportunities for organizations to interact with constituencies. New Internet-based technologies, for example, allow organizations to engage in true two-way communication that can equalize power relationships. Technology also enables organizations to facilitate communication *among* various constituencies important to the organizations,

not merely *between* the organization and those constituencies.

Control of Information

The breakdown of boundaries that delineate an organization from its external environment, the flattening of hierarchical structures, and the expanded sharing of organizational knowledge through the use of technology have all made it difficult for management to limit the flow of organizational information and intelligence. This problem has been exacerbated by changing social values that pertain to propriety of organizational information, confidentiality, and privacy and calls for institutions to make their activities more transparent.

Ownership of Information

A special extension of the control issue is that new technologies facilitate the duplication, archiving, and sharing of information by third parties after it has been distributed by an organization initially. Thus, possession of information is increasingly being assumed by others, leading to the perpetuation of misinformation as well as undesirable information that otherwise might fade from the public domain. This raises several concerns for organizations that can be exploited by information attackers, hackers, lurkers, rogues, and thieves.

Formats for Information Dissemination

Information is being distributed in a variety of different forms now using both analog and digital formats. Moreover, public relations professionals must provide the same information in several different forms to meet requirements of audiences, resulting in increased costs and staffing needs for many public relations operations.

TECHNOLOGY-BASED CHARACTERISTICS OF MESSAGES AND MEDIA

Theories of *technological determinism* suggest that the nature of societies, organizations, and communication is shaped by technologies employed.

Marshall McLuhan popularized this notion when he observed “the medium is the message” (McLuhan, 1964, p. 9). In deploying alternative communications technologies, public relations practitioners must be keenly aware of the technological characteristics of various media and select communications media that best match their needs.

Table 1 outlines more than a dozen criteria that might be used to differentiate media based on their technological characteristics. Although polar extremes are indicated, many of these criteria provide for a continuum of options.

Each technology offers certain advantages and disadvantages and combines these characteristics in different ways. The task confronting the practitioner in choosing a particular technology is to select technologies that are appropriate to the target audience (based on use, preference, ability, motivation, etc.) and compatible with the message (such as spoken word versus text, and simplicity versus complexity). Practitioners also want to consider technological *effectiveness* (whether a particular technology can achieve the desired impact, such as building awareness versus resolving a problem) and *efficiency* (achieving the desired impact at the lowest possible cost).

MEDIA STRATEGY AND TECHNOLOGY

Communications technology should be deployed strategically and in combination to achieve desired outcomes. In 2001, Kirk Hallahan outlined a model of five principal types of public relations media in an effort to identify the most basic types of communications media based on their technological characteristics and uses. Briefly, these include the following:

Public media—Traditional mass media (newspapers, magazines, radio, and television) are operated by third parties that depend on sources for material but assume responsibility for the actual delivery of messages to audiences. People are exposed to public relations-sponsored messages through a process of incidental exposure when they read, listen to, or view media as part of their everyday lives. For that reason, public media represent the best technologies to generate broad

Table 1 Technological Considerations in Designing Messages and Selecting Media

Primary modality: Ear (sound) vs. eye (text, visuals)
Data format: Analog (nonelectronic) vs. digital (electronic)
Interactivity: High interaction (two-way communication) vs. low interaction (one-way communication)
Mediation level: Personal (nonmediated) vs. quasi-personal (partly mediated or combination) vs. nonpersonal (completely mediated)
Media richness: Rich (provides many contextual cues about message's meaning) vs. lean (few contextual cues, such as a simple data report)
Social presence: Human source present vs. implied vs. not evident
Sophistication: Simple (low-tech) vs. complex (high-tech)
Channel ownership: by a third party (e.g., mass media), by the message sponsor, or no channel ownership involved
Message selection: By third parties/producers, by audience/receiver, by sponsor/organizer, or combination of these
Audience processing involvement: High vs. low
Reach: Large audience vs. small audience
Cost per impression: Expensive vs. cheap
Best uses: Build mere awareness vs. prompting specific action

public awareness of a topic efficiently, but are not necessarily effective to promote actions.

Interactive media—These computer- and telephone-based delivery systems are distinguished from public media by the ability of users to use the technology to control media content and provide direct feedback. Examples include Internet-based technologies (e.g., World Wide Web, e-mail, discussion and newsgroups, and bulletin boards) and automated telephone response systems. Importantly, interactive media depend upon users to seek out information—an involvement level that far exceeds exposure commonly found in public media. When structured correctly, interactive media enable people to take perfunctory actions that can be completed electronically.

Controlled media—Numerous tools that are designed, produced, manufactured, and distributed by message sponsors fall into this category: printed materials, CDs, video brochures, promotional specialties, and so on. Although the technologies vary widely, the onus of delivering the message falls to message sponsors, who must make materials available for people and get materials into their hands through postal mail or package or personal delivery. Unlike the rather superficial and often limited messages delivered in public media, controlled media give sponsors complete latitude to say as much as they want to say however they want to say it. Controlled media are a comparatively costly set of technologies to create awareness and

incorporate only limited opportunities for people to act (such as filling out a coupon or form).

Events and group communication—These involve bringing people together in one geographic or virtual (online) location. In most cases, the principal tool used is oral communication where speakers make presentations or engage those in attendance in conversation. However, events are often enhanced through sound amplification and audiovisual equipment and the creation of a conducive atmosphere that engages participation and involvement—decorations, pageantry, music, and sound. Importantly, people at events learn as much from others in attendance as they do from any formal presentations and their lasting impressions are based upon their personal experience. Events and group communications, thus, are most valuable for reinforcing existing beliefs and attitudes. Many large-scale settings are not conducive to making commitments or taking personal actions.

One-on-one communication—The last group of public relations tools involves simple techniques and comparatively unsophisticated technologies in which one representative of an organization communicates on a personal level with an individual member of an important constituency or public. One-on-one communications can use oral communication in the form of personal meetings, visits or telephone conversations, as well as written (textual) communication in the

form of personal letters or e-mail correspondence. One-on-one communication is a highly involving process best reserved for situations in which negotiations or commitments are required. Overall, one-on-one communication is the least efficient approach on a cost-per-impression basis, but the most effective in prompting people to take action.

COMMUNITARIANISM

In 1988, Dean Kruckeberg and Kenneth Starck argued that the concept of community should be used as the basis for the theory and practice of public relations. Their book coincided with a modern communitarian movement. The debate over the proper balance between the individual and the community goes back to the ancient Greeks and Romans. In Western society, there are two fundamental approaches to explaining the world around us that have been competing for dominance—liberalism and communitarianism. While liberalism has been the dominant paradigm in American society, there has been a significant resurgence in communitarian thought with both theoretical and programmatic implications.

Three common themes among the major communitarian theorists (Alasdair MacIntyre, Michael Sandel, Charles Taylor, and Michael Walzer)

include the following. First, the liberal position that the state should be neutral in regard to ends is harmful to the development of community. Second, state neutrality with regard to ends is itself a value choice that is not neutral. Third, liberalism sees human rights as transcendent and universal rather than historically contingent. In terms of a programmatic agenda, American communitarians have tended to group themselves around Amitai Etzioni, the Institute for Communitarian Policy Studies, and the journal *The Responsive Community: Rights and Responsibilities*. They argue for a “four-point agenda”: “a moratorium on the minting of most, if not all, new rights; reestablishing the link between rights and responsibilities; recognizing that some responsibilities do not entail rights; and, most carefully, adjusting some rights to the changed circumstances” (Etzioni, 1993, pp. 4–11). This agenda, in turn, leads to recommendations and lobbying on various issues including strengthening family structures and implementing neighborhood associations.

A metatheory is grouped around four elements or questions: epistemology, ontology, perspective or focus, and value. In epistemology, the communitarian approach is constructivist in approach. This approach holds that knowledge “arises not out of discovery but from interaction between knower and known” (Littlejohn, 1992, p. 32). In terms of ontological questions, communitarians see the community or society as their basic starting point, not the individual. From a perspective, or definitional viewpoint, the field of public relations is unclear. No agreed-upon definition of the field of public relations makes the issue of a foundation, or metatheory, for the field so important. Agreement on a foundational starting point might make it easier to agree upon a set of definitions that would stem from that starting point. With regard to the questions of values or ethics, communitarians hold that there are no universally valid ethical principles. Stress is on character and virtue. As a result, history and tradition play a major role in ethical analysis. (See the analysis in MacIntyre's *After Virtue*.)

Several implications are involved in accepting communitarianism as an approach to the field

of public relations. One implication impacts communication models. Communitarianism would seem to mandate a two-way symmetrical model for the practice of public relations. Strong parallels exist between the communitarian worldview and the symmetrical models as presented by James E. Grunig and between the liberal worldview and the asymmetrical models of public relations. The symmetrical models, like communitarianism, are based upon an interactive epistemology, relationships between individuals as the correct ontological approach, define the public relations world as an interactive place, hold that theory is not value free, and that a function of theory is idealistic and change oriented. Among the assumptions of communitarianism are a need for social cohesion, agreement on core values, and citizen empowerment. If the goal of public relations is bringing public and private interests into harmony as the Public Relations Society of America Code suggests, then fostering these values is important.

Communitarianism also has implications for the way publics are defined and approached. Some public relations practitioners define publics narrowly and segment them in order to better tailor their messages. But segmenting publics has consequences for the community at large within which the narrower publics are situated. The question becomes, when does tailoring messages become destructive of the commonality of the larger community, and then ultimately of the environment within which the smaller publics exist? There is also a question of whether the practice of segmenting publics to better tailor a message is consistent with the idea of symmetry. Lana F. Rakow makes the argument that such a practice is still in the "talking to" rather than in a "talking with" mode, or one-way versus two-way communication. The communitarian position is that public relations must see the general "public at the center of activity, *directing* the actions of institutions, which become its object and not the other way around" (1989, p. 178). It is only through this power reversal that true symmetry and "genuine democracy," or community, can be attained. At least a hint of this power reversal is found in the symmetrical literature.

Approaches toward a communitarian perspective can be seen within the issues of social responsibility, stewardship, and nonprofit development.

Corporate social responsibility focuses on the good of the community. As decisions are made, they are made with the goal of contributing to the social, political, and economic health of the global community. The evidence is becoming increasingly compelling that a community's perception of corporate social responsibility has a positive influence on profits. Developing strong ties with the community in which an organization is based is important for developing community support of that organization. Evidence suggests that a perception of corporate social responsibility decreases community resistance to controversial organizational initiatives within the community. If the community perceives the organization as being a valued member of the community, as opposed to someone who is simply in the community, then it is more likely to work with the organization.

Establishment of ties with the community means the organization is in the position to identify and manage issues before a crisis develops for the organization. It is always easier to manage the issues and make necessary adjustments and resolve conflicts prior to the development of the crisis. Organizations that need to convince the community that the organization is a part of the community after the crisis becomes full blown face difficult challenges.

Publics who feel they are being harmed by the corporation may appeal to the government for regulatory help with their problem. Strong community ties enable organizations to understand and make changes so that community groups are not upset and do not need to make that appeal. It is in the organization's best interests to have a relationship with their community such that the community will try to work out the problem with the organization. In fact, it has been suggested that the best shield against big government and its regulatory powers is strong communities capable of taking care of their own problems.

Such efforts will often go beyond even the most enlightened public relations theory based on symmetrical communication and reciprocity. It will

often entail the organization planning with the community, not just presenting or even discussing the organization's plan with the community. It will include more than encouraging employees to become active in their environment. It may involve the organization providing the community with information not just so the community members can engage in a meaningful dialogue with the organization, but so the community is capable of making its own, independent decisions on issues affecting the organization. Citizen empowerment decreases dependency that leads to asymmetrical relationships. This approach means that the organization does more than ask the community to trust it—it means helping the community develop resources and institutions so that it can rely on itself and not on the organization—it means provisional planning and resultant consultation, not strategic manipulation.

The concept of stewardship is appropriate within a communitarian approach. Within stewardship is a focus on responsibility for all of the assets of the organization. Because these assets include more than just financial assets, but also physical assets, relational assets, and image assets, they definitely fall within a public relations approach and are seen in aspects of social responsibility.

The creation of nonprofit organizations is a demonstration of the communitarian approach. Because nonprofit organizations are created to make the community better, they represent the assumption of responsibilities by the community to meet specific community needs, whether those needs are to provide for social services, health issues, educational issues, religious organizations, hospitals, or cultural issues. These organizations can continue to exist not only as a result of volunteer involvement within the community, but also through community financial support.

Communitarianism also has implications for public relations ethics. The communitarian critique of liberalism in the area of ethics forms a basis for the rejection of an excessive reliance on the rights approach and provides a foundation for a relational/responsibilities approach. Communitarianism theorizes that a constructivist basis for ethics is possible as opposed to reliance on consequential

calculation (utilitarianism) or on universal reason (Immanuel Kant and rule ethics). The basis for this constructivist approach is found in the reciprocity and symmetry that is necessary for the development of community, common values, and trust.

In discussing Lawrence Kohlberg's theory of moral development, J. E. Grunig and Jon White wrote that what is needed is to recognize another stage in the development of ethics, a stage involving

interactive competence or the ability to engage in dialogue. At that stage, people base morality on responsibility rather than on rights and develop a greater sense of interdependence and relationship. In short, the more ethically developed an individual is—and also an organization—the more he or she uses the concepts of reciprocity and symmetry to decide what is moral. (1992, p. 60)

The communitarian approach to ethics seems to be a virtue approach, which puts the emphasis on character development and on Aristotle's golden mean. The teaching of this approach would necessarily involve dialogue as to what it means to be virtuous. What it means to be ethical would not focus on rule following but on the situation and the interaction of the parties involved.

Communitarianism as a movement has reemerged and reenergized the political and social debates in the Western world. The outcomes of those debates, both at the theoretical and practical levels, are important not only for the larger community but also for the field of public relations.

COMMUNITY AND COMMUNITY BUILDING

Community and *community building* represent an alternative framework to the notion of *public* for conceptualizing public relations activities.

For most of the 20th century, the idea of “public” served as the central concept in public relations theory and practice. The term *public* is used today in varying ways to describe the entire citizenry of a country (the *general public*) as well people affected by an organization or in a position to impact the organization (*stakeholders*). Alternatively, a public is defined as prospective recipients of public relations messages (*audiences*) or as groups that organize to resolve a situation they define as problematic (*activists*).

By contrast, a *community* can be conceptualized as a group of people who share a common experience, identity, or interest and who are joined

together through their interaction or communication. Importantly, *communis* (to commune) is the root word for both community and communication. Community, as a concept, has deep historical roots in many cultures but has received increased scholarly interest since the 1980s as a way to describe groups of various sorts. The popularity of the term is evident in everyday references to such ideas as the *business community*, the *educational community*, the *minority community*, and so on.

GEOGRAPHIC VERSUS SYMBOLIC COMMUNITIES

Traditional use of the term *community* denotes a locality. A geographic community is a particular region, city, or neighborhood. Many organizations engage in community relations programs to reach out to people in geographic proximity to their operations to foster mutually beneficial relationships.

Yet communities are not bounded by geography anymore. Today, communities can be plotted along a continuum from purely geographic to purely symbolic in nature. In a symbolic community, people are tied together because they interact with one another and share common beliefs, values, and cultural artifacts of life—language, traditions, customs, mores, and so on. Whereas proximity and geographic boundaries once delineated communities, the rise of new communications technologies has redefined communities so they can operate on a global basis.

The rise of industrial life was described by early sociologist Fernand Tönnies as a transformation of human life from *gemeinschaft* or community (a small agrarian village where people all knew one another) to *gesellschaft* or society (where people live interdependently among strangers with whom they have few or only specialized relationships). Early sociologists lamented *anomie*, or an emerging sense of isolation and loss of identity among people, as a deleterious effect of modern life. Later researchers, however, recognized that people engage in various activities that help develop a sense of community and overcome alienation. Sociologists from the University of Chicago (known as the “Chicago school of social thought”),

for example, examined how people operated as small communities within the larger urban setting of Chicago.

COLLECTIVISM VERSUS INDIVIDUALISM

People in Western cultures have been described as torn between a desire for freedom (being independent and self-reliant) and a desire to belong (and thus become a part of a larger collectivity). The premium placed on freedom in Western cultures is evident in the American and French revolutions as well as in the early 19th century American literature that focused on the virtues of transcendental individualism. This rise of intellectual interest in individualism paralleled the growth of capital markets, the polis (nation-state), the nuclear family, and the early beginnings of mass society.

The second half of the 1800s, however, saw an increased awareness in the importance of communal life. This was evident in intellectual thought related to politics, morality, nature and genetics, and the nature of intellectual inquiry itself. Importantly, collectivism as a value orientation or cultural dimension never lost its importance in Eastern cultures, where collective decision making and self-identity as a member of a larger collectivity are stronger than in Western cultures.

COMMUNITIES VERSUS PUBLICS

For organizations concerned about building and maintaining mutually beneficial relations with important constituencies, the difference between publics and communities is an important one.

Communities define themselves and thus exist outside the context of any particular organization. One of the benefits of using community as a framework for public relations work, therefore, is avoidance of various conceptual problems that plague the public construct. Communities are not merely audiences and are not defined by their stakeholder relationship to the organization. Communities are the umbrella grouping within which various publics might exist and from which groups of people might form to address issues.

Communities differ from publics because they organize around common interests, not issues, and are apolitical. Their goal is usually to sustain the group, rather than to effect change. In this way, communities are proactive, not reactive. Communities have long and well-established histories and people within them routinely interact by sharing a common culture. By contrast, a public created around an issue often has a short-term life span and brings together diverse people whose only commonality is concern about a common problem.

As the term is commonly used, a public is considered to be made up of individuals, yet communities can be thought of as being composed of individuals as well as organizations and institutions. Communities are often easier to locate and to identify, compared to an issues-driven public that must first make its presence known. Importantly, a single-purpose public can evolve into a community, but the group's focus usually broadens beyond the single issue around which it might have been formed.

COMMUNITY-BASED THEORY IN PUBLIC RELATIONS

Several public relations theorists have called for focusing on community and community building in public relations practice.

Dean Kruckeberg and Kenneth Starck (1988) were the first to argue that public relations should be practiced as an active attempt to restore and maintain a sense of community. Such an approach places a premium on caring about and for others to create a more human and mutually supportive society. The authors challenged public relations to (1) make community members conscious of their common interests, (2) overcome alienation, (3) use technology to create community, (4) promote leisure-time activities, (5) engage in consummatory (self-fulfilling) communication that can be enjoyed for its own sake, (6) lead in charitable works, (7) help communities share aesthetic experiences, religious ideas, personal values, and sentiments, and (8) foster personal relationships.

Wilson (1996) similarly argued that creating strategic communities is a means for corporations to

foster positive relationships. The following five characteristics are required by corporations: (1) long-range vision, (2) a sincere commitment to community service, not just profit, (3) organizational values that emphasize the importance of people (including trust, respect, and human dignity), (4) cooperative problem solving and empowerment, and (5) a relationship-building approach to public relations.

Other researchers have pointed to the communitarian movement of the 1990s as a potentially ethical framework for public relations. Hugh N. Culbertson and Ni Chen, for example, outlined six major tenets in 1996. These ideas stress the importance of commitment to relationships, interconnectedness and social cohesion, common core values and beliefs, a balancing between rights and responsibilities, empowerment and involvement in joint decision making, and a broadening of perspectives to reduce fragmentation.

Although not using the term *community* per se, various theories related to symmetric communication, symmetric worldviews, two-way communication, and dialogue are all consistent with notions of community. Similarly, the development of communal (versus merely exchange) relationships and community involvement measures has been incorporated into the measure of relationship outcomes in public relations.

Although community can be situated firmly in modern thought, postmodern theorists have especially embraced community as a concept that lends itself to both critical and cultural approaches to the study of public relations. The shift away from conceptualizing public relations as an organization-centered practice to one in which various social actors engage reflects the importance of power in the community. Similarly, cultural theorists have examined the problems related to universalism versus particularism of public relations practices and how premises of public relations practice must be adapted to particular communities or cultures.

The community construct can be found in numerous aspects of the field, including adoption of new technologies (e.g., the creation of online or virtual communities), risk communication (e.g.,

community conflict and community advocacy councils), health communications (e.g., community-level interventions and community readiness to change). Other theories in which community plays an important role include public relations field dynamics (community versus self-orientation) and theories of social capital (which measure social cohesion and interaction as a basis for assessing the quality of life).

THREE DIMENSIONS OF COMMUNITY BUILDING

Community has been criticized as an abstract, idealized state that can never be achieved. Some would argue that true community can be achieved only where everyone shares an affinity or like-mindedness, where people always like one another, and where consensus is always present. Yet, such an approach to community is improbable in today's pluralistic society. Others suggest that community exists where people are conscious of others and recognize people's personal needs for expression, growth, and transformation. In such a community of otherness, many points of view are present but polarization is avoided. Such communities are functional because members support the well-being of the group so that everyone is successful and social order is maintained.

Public relations representatives of organizations can participate in and build communities in three ways.

Community involvement involves facilitating an organization or cause's participation in an already existing community—the traditional boundary spanning function commonly associated with geographic community relations. Involvement includes socially responsible gestures (such as attendance at community events) and participation in discussions and dialogues—in order to interact with others as responsible community citizens.

Community nurturing entails fostering the economic, political, social, and cultural vitality of a community where people and organizations or causes are members—beyond mere involvement. Organizations can be official sponsors of activities,

such as a Little League team or a major event. Organizations can also recruit volunteers or engage in philanthropy to help communities. Community-oriented organizations can view their involvement as matters of social responsibility (where no quid pro quo is expected), or as relationship building, or as enlightened self-interest in that some reciprocity is expected. True nurturing, however, excludes efforts by organizations that are intended simply to put a face on the organization through adroit impression management.

Community organizing involves the grassroots forging of new communities among disparate individuals or organizations with common interests. Such is the case with the creation of formal or informal groups within organizations as well as efforts to create clubs, associations, and societies outside of an existing organizational context. To the extent that efforts are rooted in social problems, community organizing closely resembles the formation of a social movement. Yet, interests—not issues—define communities.

Public relations practitioners can play varying roles in this community organizing process. In community involvement, public relations professionals are agent representatives of an organization or cause who become active participants in community activities and conversations. In community nurturing, public relations professionals act as program facilitators, orchestrators of events, producers of information, and managers or coordinators of volunteer and philanthropic activities. In community organizing, the roles are as leaders, recruiters, and advocates. The overarching metaphor for all of these roles is *community builder*.

COMMUNITY RELATIONS

Community relations is largely a public relations responsibility focusing on the management of potential and existing communication interactive networks of organizations and publics for the benefit of both groups. This assumes that public relations utilizes communication functions to interact with intent and commitment to create *dialogue*. The framework guiding this process is grounded in the concepts of the participants’ rights and responsibilities and is “trim-tabbed” by the power of public opinion. One often views community relations as the overall tone of attitudes within a sphere of influence.

There are some general conclusions that can be drawn about community relations:

1. It has inherent factors involving rights, responsibilities, and public input.
2. It is needed before an issue or crisis is evident.
3. It is complex, and a careful and thorough analysis of relations must be conducted.
4. It is wherever the network of communications develops—local, regional, national, or global.
5. It is greatly affected by the forces in the environment requiring ever-changing strategic approaches.

HISTORICAL DEVELOPMENT OF COMMUNITY RELATIONS CONCEPT

The historical evolution of community relations emerged from the changing pressures in society resulting in great dissatisfaction between organizations and their publics. Originally, the concept of philanthropy in terms of educational programs or job training was considered enough effort to bring goodwill to an organization, especially corporate entities. The emergence of community relations as more dedicated to *research* and analyzing *attitudes* paralleled the increased activism of publics within communities.

In the early stages of industrial expansion, business organizations were considered a benefit to a community. New industry provided jobs from generation to generation and supplied the community with an ample tax base for developing the infrastructure of a community. However, as time passed, it became more and more evident that corporations often exacted a toll on a community in terms of layoffs, relocations, pollution, increased health problems, safety issues, the attraction of large groups of people, as well as domination of the local boards of directors. Initially, the activism was directed toward business, often corporate organizations, established within a geographical community. As technology and transportation improved, the geographical constraint was not always the central factor. The “voice” of the community was more like coalescing around an idea or concept that emerged often as an *issue* wherever the organization was located.

Groups were being established with official names like unions, service groups, and educators to organize and represent certain issues. Other groups clustered under general labels like environmentalists (e.g., Greenpeace and Sierra Club), animal rights (e.g., PETA), or senior citizens (e.g., Gray Panthers) were named to brand their coalition’s mission. The Gray Panthers, for example, do not have a main office or physical meetings. This electronic network of senior citizens lobbies for legislation, senior rights for access, and medical care through their listserv and electronic e-mails. The community is where the locus of communication exists.

These resistance and opposition groups sought to bring organizations into public disfavor. Such forces resulted in the public relations function of *issue management* emerging as a specific organizational responsibility. Community relations contributes by monitoring the emerging top social issues, a practice that documents the range and change of concerns within society on a yearly basis.

Consumer Forces

The earliest dissent groups formed were coalitions representing consumers. In the United States, particularly, the organizational power of communities resulted in many consumer laws restricting and regulating business organizations. In response, more organizations dedicated community relations resources to working with consumer activists. Internationally, too, organizations did not always respect human needs and rights and were met with severe resistance. When the United States sent unsafe or unsatisfactory products to Poland, the negative reaction cast a shadow over all future U.S. efforts—trust had been broken. Now protest groups met the organization outside its border as anti-smoking groups alerted Russia to the tobacco corporations’ intent to initiate a campaign to attract young smokers after even though the industry had been restrained severely from targeting this age group in the United States. The level of sophistication in communication effort is becoming quite complex for the organization and publics.

Customer Power

Community relations is not relegated to just corporate entities. Nonprofits and government are faced with similar social challenges. The community relations’ role in public relations is well established in nonbusiness organizations. Public relations is often central to the very survival of the nonprofit organization.

In educational dissertations, for example, principals rated community relations as the most important activity outside of classroom responsibilities. The role of community relations in the work of police and other similar groups stresses the importance of community relations.

A bias remains such that most discussions refer to corporate community relations. However, with the development of public relations in countries where there are few corporations, the need for community relations focuses more on government and service agencies to address severe social problems to assure the survival of a community.

Goals for Community Relations

Community relations involves more than appearing positive and planning. Community relations prepares an organization for meeting the challenges in a diverse often unpredictable climate. Whereas often publics seek recognition, a hearing, and sincere consideration, the public relations professional must prepare by completing the following series of stages: to initiate or reestablish a community relations intent, to research internal and external infrastructures, attitudes, requests, and so on, to build dialogic bridges, to monitor continually the environment, and to integrate the data and actions into some synergistic approach that allows for a mutually beneficial coexistence for organizations and the various publics. Both groups (organizations and publics) must create *trust* to further establish ongoing dialogue. The *stakeholders* especially need to be integrated into the dialogic process.

COMMUNICATION: A METATHEORETICAL APPROACH TO COMMUNITY RELATIONS

How this evolution of opposition and resistance has developed to stimulate the need for community relations is attributed by some to the individual who discovers power in joining groups and thus having more of a voice in issues. Robert L. Heath (1997) noted “dialogue and collaborative decision making” and stressed the “importance of two-way communication” as “these functions are the heart and soul of issues management” (p. 22). References to the community relations role of public relations in *harmonizing* society suggest that the dialogic exchange is needed to sustain trust and confidence. In these complex times, the true test of public relations will be if the discipline can sustain an ongoing impact on the major global challenges facing society today. Public

relations is involved in all phases of life such as biogenic food, aids, building a civil society, association representation, education, and health. The degree to which public relations is consulted and involved in these societal needs to lead the dialogue will attest to the depth and breadth of the community relations effort by public relations professionals.

Communication remains the single and most impactful theoretical approach to developing community relations from a public relations perspective. There have been misdirected efforts to supplant the communication metatheory underlying public relations. For example, the liberal versus communitarian debate lacks the stature to qualify as a public relations metatheory because

1. The concepts are primarily posed as a Western world discussion and, therefore, are not as useful for global public relations.
2. The statements presented reflect primarily polarized concepts—liberal versus communitarianism—and, therefore, are either unrealistic or idealized.
3. The discussion is based on a disregard for the understanding of the nature and evolution of communication knowledge.
4. It is impossible to implement or develop as a requirement of societies to conform, even if this applies only to the United States.

Another group representing a segment of the public relations academics attempted to develop the concept of “relationship” as a public relations metatheory. Philip Lesly noted this is another attempt to balkanize the field of public relations into segments (1996, p. 43). This approach, too, confuses the concept of public relations by focusing on a sublevel factor while largely ignoring the communication process. Bruber and Griffin confirm that only through dialogue is ethical communication possible as a basis for relationships. Communication ranges from public communication including debate or discussion as rhetorical or persuasive and emphasizes the more dialogic approach. Communication serves as the foundational metatheory for conducting community relations.

The agreement for a theoretical perspective for community relations comes from the centrality of

Gray Panthers' founder Maggie Kuhn gestures and screams during her address to the Poletown Neighborhood Council in Hamtramck, Michigan, circa 1980.

communication to the public relations process. It is through communication that dialogue is established and the languaging constructs the conceptual possibilities. It is impossible to proceed from agreed upon common ends in dialogue because one is engaged in a creative process going from known to unknown. The dialogic approach also carries critical universal structural elements to assure the communication act is truly complete. This is different from rules or procedures because, again, this is a creative process. In community relations, communication is the core of public relations and the fundamental metatheory focused on the speech act as affected by the self, the episode, the relationship, and culture.

COMPOSING/COMPOSITION

Composition is the process of composing (creating and arranging) type for printing, that is, the letters, numerals, punctuation marks, and other symbols that are used to create written text that appears in a printed publication. Type was assembled by hand for about 400 years after Johannes Gutenberg had invented a printing press in 1440 that used movable type to print ink on paper. Although some 19th-century inventions preceded the typesetting machine that Ottmar Mergenthaler invented in 1886, his Linotype was the first that was suitable for commercial use.

Other metal-casting typesetting machines soon followed that also created raised (i.e., relief) metal “hot-type” for letterpress printing, for example, the Intertype and the Ludlow, both of which also cast one-piece fully spaced lines, and the Monotype, which cast individual type characters in justified lines. Although such innovations were a remarkable improvement over the tedious hand composition of individual type characters, the type compositors who used these typesetting machines were laboriously slow compared with today’s typesetters, who simply use a computer keyboard to set type for offset lithography (planographic) printing—with the normal speed of creating any other type of document on a computer. Indeed, anyone today who does “desktop” printing could be considered a type compositor, albeit one lacking in the skills the craft required in past generations of printing technology.

As opposed to the creation of cast-metal hot type, a “cold-type” process evolved in the mid-20th century that ranged from “strike-on” machines that were similar to electric typewriters and that evolved into the far more sophisticated photocomposition machines that produced type on film and transferred this type directly onto a printing plate. Such cold type could be used in offset lithography (planographic) printing, which newspapers began

using as early as the late 1930s but which became common among even the largest-circulation dailies in the late 1960s and 1970s. Nevertheless, for their own job-printing needs, public relations practitioners still bought typesetting from those offering photocomposition services (often the same companies that would do the printing) until the past quarter century or so, when direct computer links to printers made even this specific skill obsolete.

To fully appreciate the evolution of type composition and the skills of the type compositors of an earlier era, the public relations practitioner must study the whole process of printing, which is changing rapidly today—more so than it has in the five and a half centuries since Gutenberg’s press first began using hand-assembled movable type. Just as was the case with their long-dead predecessors who could rapidly assemble hand-set type, those type compositors who composed type using the Linotype and similar machines of an earlier era—with their large keyboards or other mechanical type selection methods that differed greatly from today’s computer keyboards—are a disappearing breed. The few remaining Linotype compositors might only operate such machines at a history pavilion for the entertainment of those attending a state fair; nevertheless, there are tales about newspapers still using such early technologies in remote areas of lesser-developed countries as well as religious sects that eschew today’s technology. Nevertheless, the mystique of this highly skilled craft of the type compositor will never be known by those who today compose type for printing on their computer keyboards.

CONFEDERATION EUROPEENNE DES RELATIONS PUBLIQUES (CERP)

Confederation Europeenne des Relations Publiques (CERP) strives to bring practitioners and academics

together and set standards throughout Europe to strengthen the profession as practiced by professionals and to advance the education of students interested in public relations. In 1956 the Frenchman Lucien Matrat launched the idea to create a “Comité Européen des Relations Publiques” (a European Committee of Public Relations). The following year the organization became a reality when a few people from four European countries met in Luxemburg to form such a committee. Very quickly this group thought about establishing an association of the existing national public relations organizations. During the world exhibition in Brussels (1958), these contacts were strengthened and the idea gained momentum. Still, when the organization was officially established in Orléans (France) on May 8, 1959, its name given by the founding members (France, Italy, the Netherlands, and Belgium) sounded rather modest: “Centre Européen de Relations Publiques” (European Center of Public Relations).

Germany and Greece were the first countries to join the founding members. With some hesitation, the British “Institute of Public Relations” followed suit in 1965.

The hesitance of the British was due mainly to the fact that, at first, French was the only official language. Only in 1966 did English also become an official language of the organization.

In the mid-1970s, 13 national associations were “active members” of CERP. Moreover, the organization also had some 300 “professional members.” Those were corporate bodies or legal entities and individuals professionally involved in public relations. The statutes provided for three working groups. One, aimed at the active members, was CEDAN, that is, the “European Conference of National Public Relations Associations.” CEDAN endeavored to coordinate the activities of the national associations in order to reach agreement on professional principles, ethics, and practice. The two remaining working groups were aimed at the professional members; CEDET was meant for anyone involved in research and education, whereas CEDAP was the forum for independent advisers and integrated employees.

OBJECTIVES

The organization set for itself six objectives:

1. To study the public relations techniques of communication and information on a European scale
2. To develop and promote the teaching of subjects that contribute to the training of specialists
3. To establish a public relations information, research, and study center
4. To facilitate contacts and cooperation among European public relations specialists
5. To study and propose measures of cooperation and unification in matters of professional principles, ethics, and practice, and to put forward proposals for coordination of the activities of the national associations
6. To promote and to support all initiatives aimed at developing public relations on a European scale

FIRST ACHIEVEMENTS

One of the most important accomplishments of the young CERP was the approval of the "Code of Athens" in 1965. This code of professional ethics is based on fundamental human rights. All organizations that belonged to CERP had to accept this code and ensure that their members adhered to its principles. The former happened; the latter was more difficult to achieve, as the profession was nowhere officially recognized and the national associations had only limited moral authority, depending on their strength.

The meetings organized annually in the different member countries and later the triennial congresses led to a valuable exchange of professional experiences. The comparison of techniques used and the promotion of public relations on the international level are among the most appreciated achievements.

When the Danish Public Relations association joined in 1974, the organization counted 13 members and consequently covered the greater part of Western Europe.

Still, not everything was bright. The links between the national associations and CERP varied and the representation was not always "representative." Moreover, even in cases where there was a good link

with the national association, it was often only the board of the association that was reached and not the members. On top of that, CERP tended to lean too much toward the "professional members," among whom there was a strong lack of balance. Indeed, in France there were 80 members, whereas Germany and the United Kingdom counted only 20 (1974).

Consequently, French remained the dominant language, which would soon lead to problems within the organization.

FURTHER ACTIVITIES AND EVOLUTION (1975–1985)

From the end of the 1970s onward, official recognition of the profession became the main concern in different countries. CERP shared this concern and wanted to coordinate this recognition and, if possible, deal with it on a European level. But as was the case in other political, social, and economic fields, the different European countries were still thinking nationally, and the effort didn't go beyond formulating common intentions.

As recognition of the profession didn't work out, harmonization became the main objective. This didn't prove to be easy either, as most countries wanted to maintain their own definition of public relations. This is still the case today.

The most important achievement is undoubtedly a European Code of professional conduct in Public Relations (Code of Lisbon, 1978). This code established criteria that professionals must meet as they work on behalf of their clients or employees, to influence public opinion, to work with the media, and toward colleagues and toward the profession.

The then 15 member-countries of CERP agreed to this code and also agreed on disciplinary measures in case the code was not respected. The impact of this achievement obviously depended on the strength of each national association. In some countries it worked wonderfully; in others it was not much more than a recommendation.

CERP also wanted to impose a minimal level of professional experience (two years) for those who wanted to belong to a national association. However, national associations only accepted this as a recommendation.

In this period CERP also acquired consultative status within the Council of Europe (1976) and UNESCO (1983), which earned the organization some prestige.

In the meantime, a new problem arose; in some countries there was more than one national association. After long discussions it was decided (1979) that several associations from a single country could become part of the organization.

FIRST DIFFICULTIES REGARDING RESTRUCTURING

In the latter part of the 1980s, the hybrid structure of the organization was seriously questioned. CERP wanted to be an umbrella organization for all national associations in Europe, but it also aimed at being a forum where practitioners, researchers, and professors from all over Europe could meet. With regard to the first objective, the results remained limited and national associations were becoming less interested. CERP actually threatened to become an organization of and for a group of individual members with strong European interests. Even their membership numbers stagnated. Moreover, the ever-present French-language dominance hampered relations between members of some nationalities.

It was mainly under the encouragement of the Netherlands and the United Kingdom that restructuring was demanded. Very soon two camps emerged. The first was mainly rational and wanted an exclusive confederation of national associations that would determine the management of the organization. The other was more emotional and firmly defended the organization of individual members because that was the one that had achieved the most results.

After three years of discussion, a compromise was reached. CERP became a confederation of 19 national associations and 3 *autonomous* international organizations: CERP CONSULTANTS; CERP PRO (Public Relations Officers), in which the former CEDAN is clearly recognized; and CERP EDUCATION, the former CEDET. Hence, it became a confederation of 22 members (Strasbourg, 1989). In the 1990s, they were gradually joined by countries from central and eastern Europe.

These achievements signaled a new start for CERP. The trust of the national associations seems to have been regained, and the three autonomous international organizations are met with enthusiastic support.

HOW DID THE CONFEDERATION FUNCTION IN THE 1990S?

CERP strives to be the common house for advancing public relations in Europe. The members of all associations that have adhered to CERP are considered "associated members." That way CERP serves as the umbrella over 20,000 practitioners in Europe.

As one of its first objectives, the organization wants to grant those practitioners an *accreditation*. To that purpose, documents discuss the key fields of the profession. "A European Charter for Public Affairs" (1991), a document for "Consumer Relations" (1993), and a "Guideline Regarding Lobbying" (1994) are thus discussed and approved.

The intrinsic value of these documents is clear; still, even now, they only receive the character of recommendation. In some countries they are applied, in others not. The same holds for the second priority: *harmonization*. The following two means are at hand to achieve this: (1) the *updating of the code of professional conduct*, which continues, and (2) the *recognition of the public relations profession*, which has yet to be realized. It also tries to further the relations with the European community. In the course of several years a "European PR Survey" was elaborated, which gives insight into the scope of public relations in the different European countries.

The satellite organizations of CERP operate with varying success, as follows:

CERP PRO has had the most difficulties, as many integrated public relations professionals already have their own international contacts. The organization will work on a few dossiers and organize a case study contest every year.

CERP CONSULTANTS has made a strong start. It has studied the development of public relations in Eastern Europe and launched an East-West training program. Still, the organization feels the competition

of ICO (International Consultants Organization), which is well organized and aims at the same target group.

CERP EDUCATION succeeds in profiling itself: First a survey was made of all study programs in Europe. Public relations research was collected, exchanged, and stimulated. An "Educational Audit" was established to determine, in accordance with the European guideline (22.12.88), which courses would be accepted as preparing students for the profession. A glossary was created to facilitate mutual communication. The triennial seminars (Bruges, Prague, and Maastricht) are highlights within CERP history. Moreover, it is this organization that was responsible for the foundation and development of a fourth autonomous international organization within CERP: CERP STUDENTS (1993). Consequently CERP counted 23 full members from 20 different countries and 4 autonomous international organizations in 1995.

UNCLEAR FUTURE

The absence of a legal recognition of the profession, the continuing sense of independence of the stronger national associations, and the inadequate cooperation of the weaker links hamper CERP's future. On top of that, CERP receives increasingly less support from CERP PRO and CERP CONSULTANTS. Consequently, CERP EDUCATION has become too heavily burdened. This led to its separation. In 1998 it became an independent organization: EUPRERA (European Public Relations Education and Research Association). CERP PRO has been challenged to continue to exist. CERP CONSULTANTS is still going on but with limited activities.

CERP opts for a confederation in which all national associations under the leadership of their presidents would directly determine the vision and strategy of the organization. Instead, however, the link between CERP and most national associations remains very loose.

CERP mainly aims at maintaining the existing contacts and at circulating as much information as possible about what happens within the different national and international public relations associations.

Only the future will tell whether CERP can succeed in making the link between the national

members and the "common house" much more binding.

—Jos M. Willems

CONFLICT RESOLUTION

Conflicts among stakeholders and organizations require attention and the problem-solving capabilities of public relations managers. Public relations scholars have suggested that these managers, functioning in the roles of organizational boundary spanners, often help an organization manage its response to conflict and to rapid environmental changes.

TWO-WAY MODELS OF PUBLIC RELATIONS

Conflict resolution in public relations evolved from the four models of public relations. The most sophisticated of the four models are the two-way asymmetrical and the two-way symmetrical models. As these two models of public relations evolved, James E. Grunig described the two-way symmetrical model as "public relations efforts which are based on research and evaluation and that use communication to manage conflict and to improve understanding with strategic publics" (1989, p. 17). In 1995, the *new model of symmetry as two-way practices* was developed, where the win/win zone uses negotiation and compromise to allow organizations to find common ground among their separate and sometimes conflicting self-interests. By doing so, it did not exclude the use of asymmetrical means to achieve symmetrical ends.

MIXED MOTIVES

Although the two-way symmetrical model would seem to be the ideal for conflict management, it is difficult to determine the exact point for appropriate behavior on a continuous scale between two-way asymmetric and two-way symmetric communication. In 1991, Priscilla Murphy suggested that a "mixed motive" version of the two-way symmetrical

model might better describe what is happening in the actual practice of public relations because it incorporates both asymmetrical and symmetrical strategies. More recent studies acknowledge the more frequently practiced model is the one termed *mixed motives*.

In mixed motives, each side in a stakeholder relationship retains a strong sense of its own self-interests, yet each is motivated to cooperate to attain at least some resolution of the conflict. They may be on opposite sides of an issue, but it is in their best interests to cooperate with each other. Mixed-motive games provide a broad third category that describes behavior as most public relations people experience it: a multidirectional scale of competition and cooperation in which organizational needs must be balanced against constituents' needs. These parties are really *cooperative protagonists* in the struggle to satisfy their own interests with the knowledge that satisfaction is best accomplished through satisfying each other's interests as well. In the context of this discussion, protagonists are the main characters in the play of negotiation who seek their own values or self-interests. The question is not one of mixed motives where short-term asymmetrical tactics are combined with long-term symmetrical tactics as advocated by Dozier et al. (1995), but rather one of discovering the priority level of importance for the common self-interests of the strategic parties.

MIXED MOTIVE MODEL FOR PUBLIC RELATIONS

More recently, Ken Plowman and colleagues (2001) established a number of negotiation strategies that fit into what Plowman and his group called a mixed-motive model for public relations that encompassed the entire spectrum between the two-way asymmetrical and the two-way symmetrical models. It now includes the strategies of contention, avoidance, accommodation, compromise, cooperation, unconditionally constructive, win/win or no deal, principled, and mediated or cultural.

CONTINGENCY MODEL OF CONFLICT

Since 1997, Glen Cameron and his colleagues have been developing a continuum stretching from advocacy (two-way asymmetrical) to accommodation (two-way symmetrical) as the basis for a contingency model of organization-public relationships. Accommodation is not viewed in the classic sense as giving in to the other party or the trend in the conflict literature as giving in on issues not important while retaining that which is important. Rather, they define it as "the degree of willingness to entertain change for the benefit of others" (Shin, Jin, Cheng, & Cameron, 2003, p. 9). Extending that definition to include change on the part of the opposing party or balance among the self-interests of the two parties would be closer to the two-way symmetrical definition. Research by Shin of conflicts played out in the media have shown that an organization uses the advocate strategy more when its key stakeholder advocates in an escalating spiral, indicating the media may be a separate power-brokering party. As the field of conflict resolution and public relations becomes more developed, the more complex are strategies, factors, and tactics. This is evidenced by the 86 factors developed for the contingency theory of public relations. Strategies, as mentioned under previous subheadings, refer to broad techniques to address organization-public issues. Tactics are relatively isolated tools to achieve the broader strategies.

IMPLICATIONS AT THE INTERNATIONAL LEVEL

Culture is a powerful force shaping thoughts, perceptions, behavior, and communication. By its very complexity, culture initiates the negotiation tactics of contention or principled conflict resolution in many instances. The ability to successfully navigate and negotiate cross-culturally will be the key to successful public relations practice on the global scale in the future. Cultural diversity makes communication more difficult. Because knowledge is culture specific, the more a communicator understands cross-cultural differences, the easier the communication task becomes. Paradoxically, although

communication cross-culturally is often more difficult, creating mutually beneficial options can become easier. If negotiators can overcome communication barriers, mutually beneficial solutions—the cooperative tactic and win-win solutions—may become easier. Differences, rather than similarities, can form the basis of mutually beneficial solutions. Obviously, in a multicultural environment, the differences are increased. Thus, the opportunities for mutual gain are also increased.

MULTIPLE-PARTY NEGOTIATIONS

Complexity is also a major factor in multiparty negotiations that may be the next step in this type of public relations research. In 2003 Plowman undertook a qualitative quasi-experimental design with 11 graduate students taking on different roles in the hot waste issue in Utah. These students framed the issue, defined their self-interests as stakeholders, and then conducted a series of five role plays on the issue. All nine strategies were paired against each other in different combinations. Preliminary findings revealed that contention was the most used strategy, but was most often combined with the principled strategy. If those strategies were not successful, then role players turned to avoidance. During the third round, role players started using cooperation and compromise. Using these two strategies created a less confrontational atmosphere, and the role players were more inclined to discuss alternatives. The most useful strategy, however, was mediation in resolving the hot waste issue.

Most research in conflict resolution has involved just two-party disputes, but in practicality and especially for public relations, there is most often more than one stakeholder involved. Lawrence Susskind, from the Harvard Program on Negotiation, addressed public relations and conflict resolution in public disputes in 1996. His book with Patrick Field (1996) describes public relations using terms that essentially equate to one-way and asymmetrical models, then uses a version of Roger Fisher and William Ury's mutual gains approach to resolve public disputes in a symmetrical manner. The field of conflict resolution has realized that more work

must be done in multiparty disputes, and now public relations is beginning to address it.

A multiparty dispute can be defined as a simultaneous negotiation among three or more parties over multiple issues. In 1989, Saadia Touval laid out a prescriptive multiparty approach. In such negotiations, the most important work takes place before negotiations and in the prenegotiation phase. Issues that should be addressed about the negotiation itself include the identity and number of parties involved, possible coalitions among them, different possible roles, and an acceptable agenda to follow. The larger the number of participants in these multiparty conflicts, the more difficulty there will be in defining the problem and agreeing on an acceptable solution. There will be more likelihood of complexity in conflicting positions, the underlying self-interests, and the relationships—as in public relationships among the various parties involved. Mediation seems to be a common strategic direction for the field. In multiparty settings, mediators are usually a part of the negotiation. Their intervention does not alter the structure of the negotiation and is not difficult to accept by the parties involved. Such mediators can come from outside the dispute or there can be several, some acting from their roles inside the dispute.

DIRECTIONS FOR RESEARCH

Several directions for future research suggest themselves in the combined conflict resolution and public relations field. International and cultural aspects, of course, should be included. Also, consideration of public relations and the media's involvement in a conflict should be further explored as suggested by Susskind and later by Shin. Plowman also is currently conducting research of conflicts played out in the media. Do the media play a third-party mediator role, or is it another party escalating the conflict? Do certain parties gain power through the media to equalize their role in a conflict? What about comparing the notion of community negotiation (meaning negotiation with special-interest and citizen groups) in the conflict resolution literature with the activist and segmentation of publics?

literature in public relations? Such negotiation implicitly includes multiparty negotiations. It also overlaps into a newer trend in journalism of public or civic journalism, where reporters have a responsibility to help the public understand the context of the news or conflict. This is very similar to the goal of media relations within public relations, to provide information to the media to ensure balanced coverage. What about the role of the public relations manager in such a public dispute? Is it the role of advocate, mediator, third party, or ombudsman? And, finally, there is the concept of relationships among stakeholders in a conflict. How are relationships perceived differently or alike between the two fields? A new strategy is beginning to reveal itself in public relations, as well, that should be investigated. That is the strategy of aggressive meekness, or assertive pacifism.

CONSTRUCTIONISM THEORY

In a premodern societal setting, values and norms are concrete and fundamental, even if their truths are not necessarily taken for granted. The values are institutionally fixed and, consequently, not open to reflection and relativization. In the modern world, society is institutionally pluralistic, humanly individualistic, and culturally generalized. This allows for a constructionist view of society. Although constructionism is rooted in continental European sociology, it is certainly not a typical European perspective. It was John Dewey who in 1916 argued that society is not only maintained by communication, but also constituted by it. E. M. Rogers shows in his *History of Communication Study* (1994) how the founding father of Social Science in Chicago, Small, developed his faculty into the “Chicago School,” which became famous for its constructionist approach to social science. Although strongly influenced by German thinking, they did not simply copy it. Whereas continental European scholars focused on fundamental thinking and philosophical and rhetorical theory building, U.S. scholars focused on the empirical study of society and thereby were able to develop empirical theories of social life, including the role of communication in it. Nevertheless, the fundamental critical thinking of European scholars at that time was very influential for sociology and communication studies in the United States (see Rogers, 1994). It enabled the development of what in 1937 Herbert Blumer called “symbolic interaction” (Ritzer, 2000) and is now known as constructionism (see Bentele & Rühl, 1993). But it has not yet significantly influenced theories of public relations or communication management.

The start of sociology can be located in the Enlightenment period, where reasoning was seen as a fundamental human activity for the first time. Traditional authority became unacceptable (i.e.,

“irrational, that is, contrary to human nature and inhibitive of human growth and development,” Ritzer, 2000, p. 12). Or, as Klaus Krippendorff pointed out, “Social theories must be livable” (1994, p. 102). The roots of sociology are critical to an unbalanced social structure and authority. Sociology has been based on the idea that human beings create society, and that society in turn creates its institutions, and thereby the reality for the human beings, in a dynamic process. That is where the roots of symbolic interactionism are located, and that is the basis for constructionism.

The idea that reality is not “something out there,” but that human beings construct reality themselves was popularized by one of the most frequently cited works in social sciences, *The Social Construction of Reality*, by Peter L. Berger and Thomas Luckmann. For them reality is a quality pertaining to phenomena we recognize as having a being independent of our own volition: we cannot wish them away. Knowledge is the certainty that phenomena are real and that they possess specific characteristics. The sociology of knowledge is therefore concerned with the analysis of the social construction of reality. Social structure can be seen as an essential element of the reality of everyday life.

At one pole of the continuum are those others with whom I frequently interact in face-to-face situations—my inner circle, as it were. At the other pole are highly anonymous abstractions, which by their very nature can never be available in face-to-face interaction. Social structure is the sum total of these typifications and of the recurrent patterns of interaction established by means of them. (1966, p. 48)

Languages, as the most important system of vocal signs, build up semantic fields or zones of meaning that are linguistically circumscribed. Although it is possible to say that man has a nature, it is more significant to say that man constructs his own nature, or simply, that man produces himself. This self-production is always, and of necessity, a social enterprise, as Berger and Luckmann argue. Men together produce a human environment, with the totality of its sociocultural

and psychological formations. It may be that a given social order precedes any individual organism’s development. But social order is still a human product, or, more precisely, an ongoing human production. By playing roles, the individual participates in a social world. By internalizing these roles, the same world becomes subjectively real to him. Roles represent institutional order. Some of these, however, symbolically represent that order in its totality more than others do. Such roles are of great strategic importance in a society, since they represent not only this or that institution, but the integration of all institutions in a meaningful world. These are the roles that have a special relationship to the legitimating apparatus of society. Historically these roles have most commonly been located in political and religious institutions. This is no longer the case, however; it is said that nongovernmental organizations and corporations now have more power than politics and religion. According to Berger and Luckmann, legitimation (the term is from Weber) as a process is best described as a “second-order” (1966, p. 110) objectification of meaning. Its function is to make objectively available and subjectively plausible the “first-order” (1966, p. 110) objectifications that have been institutionalized. It embodies the institutional order by ascribing cognitive validity to its objectified meanings and justifies them. But in the modern world there is always a rivalry between definitions of reality. Social structure can predict its outcome. That is why, in our view, communication management must be studied from a public point of view.

In communication science, as well as in organization science, symbolic interactionism has recently inspired some scholars to take a constructionist view of reality. German communication scholars Gunther Bentele and Manfred Rühl have recently introduced a constructivist approach to public relations theory. The basic premise of this view is that human beings reflect each other to themselves, and social reality in a dynamic process. Thus, constructing social reality is a shared process of meanings construction. In this view reflective interpretation and conceptualization of

meanings are at the forefront in a constant process of de- and reconstruction (Van Nistelrooij, 2000, p. 275); they are a “reflection.” Klaus Krippendorff (1994), a constructionist communication scientist, mentions the “recursiveness” of communication: It is an ongoing social process of de- and reconstruction of interpretations. That is why Faulstiege (1992) and other constructionist public relations scholars state that public relations is not interaction between human beings, but societal action as such.

CONSUMER/CUSTOMER RELATIONS

Public relations and consumer relations share many commonalities. In fact, some may argue that these two functions are “first cousins” because they both seek not only to develop relationships between organizations and their key stakeholders—but also to maintain and strengthen such relationships. To observe how this era of concern for relationship management has escalated, one needs only to channel-surf via the radio or television or to skim the headlines of magazine and newspapers advertisements.

Everywhere, people are blasting out “relationship” cries of some kind. Banks, credit card companies, hotels, hospitals, automobile dealers, and the like promise that they are committed to offering “the right relationship” for you. Or type in “customer service” or “relationship management” as key words for an online Internet search; the hit count results are overwhelming.

The heightened concern for consumers can be traced to the early 1960s, when President John F. Kennedy mandated four bills of rights: the right to safety, the right to be informed, the right to choose, and the right to be heard. According to Robert J. Lampman (1988), two more have since been added: the right to enjoy a clean and healthful environment and the right of poor and other minorities to have their interests protected. Subsequent presidents have also joined forces to encourage Congress to institute policies that serve to safeguard consumers. During his 1962 congressional speech in which he declared the Consumer Bill of Rights, President Kennedy explained the important role consumers (publics) play in our society: “Consumers, by definition, includes all of us. They are the largest economic group in the economy, affecting and affected by almost every public and private economic decision. But they are the only group whose views are often not heard.”

This era of consumerism has escalated throughout the years to more than just a plea from consumers to be treated fairly and ethically by corporate America. Today, consumers seek more interpersonal communication among the organizations

they patronize. In tandem, organizations have a better understanding of the tremendous financial benefits they can potentially reap by maintaining relationships with the publics they serve. Market research consistently demonstrates that consumers no longer want to be treated as part of the “masses.” They desire individualized, personalized service in combination with individualized, personalized information. And, if they aren’t pleased with the product or service the organization provides, they are empowered to “move on.”

But what is the *value* of a loyal consumer? That question can be answered in a variety of ways and addressed from an array of perspectives. In the business world, success is measured in dollars, one way or another. From a quantifiable standpoint, the value of a faithful consumer equates to repeat business—business that is much more cost effective to capture compared with the costs associated with generating new business.

Let’s look at an example. In the lodging industry, nearly 55 percent of the business is represented by repeat customers. This means that more than half of the hotel industry’s client base revolves around the “maintenance” component. Without the implementation of strategic public relations strategies and tactics to safeguard relationships among its client base, this industry risks falling below the profitability level.

The Technical Assistance Research Program (TARP) also examined the cost to obtain a new customer versus retaining a current one. The market research firm’s results illustrate that it is five times more expensive to earn a new customer than to keep a current one. And at least 50 percent of consumers who experience problems will not complain or contact the organization; they will simply “vote with their feet” and go elsewhere.

The average organization loses 10 to 15 percent of its customers per year because of bad service experiences.

Managers need to make themselves available to listen to their consumers so they can analyze or measure organizational performance against the established marketplace standards. Implementing two-way mechanisms for obtaining feedback is a critical aspect of public relations management to

enhance customer relations opportunities (see Ledingham & Bruning, 1999). Providing customers opportunities for feedback and two-way flow of communication is an important part of the public relations process. Methods include providing customers with comments cards, a link to provide online feedback via the organization’s Web site, 1-800 consumer hotlines, focus group interviews, follow-up telephone calls, and satisfaction questionnaires. Engaging in “management by wandering around” offers another practical way to monitor the environment of an organization.

Having on-site managers available to personally talk with customers offers yet another chance for consumers to “connect” with the organization.

The previous examples clearly and quantifiably demonstrate the importance of maintaining relationships with external publics. Let us consider one of an organization’s most important internal publics—the employees. A plethora of industries monitor and measure the costs associated with turnover and employee attrition rates. Using the example of turnover costs associated with losing an employee who earns \$8 per hour, sponsoring research organizations’ results ranged from \$3,500 to \$8,000 in losses, taking into consideration direct, indirect, tangible, and intangible costs. A study conducted by Tony Simons and Timothy Hinkin (2001) illustrated that employee turnover is strongly associated with decreased hotel profits. In this study, the costs associated with turnover on a per-employee basis averaged approximately \$5,000.

Aside from quantifying employees in terms of how much it costs to replace them, many scholars and business executives refer to them as “human capital.” In short, they are part of an organization’s investment and, therefore, represent a valuable asset. Let’s put their worth in perspective by comparing them with another corporate asset. If managers of an organization make a financial commitment to purchase brand new, state-of-the-art computers for their employees, equipped with every bell and whistle imaginable, they will also expand their commitment in other ways, such as making sure that the computers are maintained and kept “healthy” by equipping them with antivirus programs, that employees are trained to use them to their full potential, and that

their property is secured safely to diminish possibilities of theft. Similarly, these managers should extend such concern for their “human” assets to make them feel safe, healthy, and motivated to work at their maximum level of potential.

One point that is constant among the consumer relations and customer service/satisfaction literature—regardless of the publics (internal or external), industry, product, or service under investigation—is that consumers are more apt to return (or stay) if they feel some kind of a personal connection to the product, service, or organization.

Relationship management plays a key role in maintaining customer loyalty and enhancing levels of satisfaction. And since public relations is a key component in supporting relationships between organizations and their key consumers, this management function aids in enhancing the consumer/employee retention rate, which, in turn, saves the organization money, thereby contributing to a lucrative bottom line.

When discussing customer service within the framework of public relations, we cannot negate the importance (and the power and influence) of word-of-mouth communication. For example, TARP research indicates that consumers who are dissatisfied tell as many as 16 friends about their negative experience. And a prominent study conducted by the White House Office on Consumer Affairs reveals that 13 percent of dissatisfied customers will tell 20 people about it. This “tell your friends” communication concept is similar to the multiplier effect, a term borrowed from the economic literature, which explains the trickling down of revenues. For example, when a person travels to a particular city for vacation, the local economy also experiences financial ramifications as well because these travelers spend money on local lodging, restaurant, entertainment facilities, and various other resources such as gasoline, clothing, and souvenirs. If their experience is a positive one, the multiplier or word-of-mouth publicity may work in that city’s favor (e.g., the visitors will return home and tell friends and family about their favorable experience). If, however, the vacationers had a bad experience, the negative word-of-mouth publicity may work against the city. In short, the visitors are

serving as informal public relations ambassadors for the destinations they visit.

Examples throughout this selection have illustrated how important it is for an organization to maintain a sound public relations program. They also demonstrate how quality customer service supports the public relations function. Mahatma Gandhi, quoted in 1890 (see the Pugmarks Web site, www.pugmarks.net), captured the essence of true customer service when he said,

A customer is the most important visitor on our premises. He is not dependent on us. We are dependent on him. He is not interruption in our work—he is the purpose of it. We are not doing him a favor by serving him. He is doing us a favor by giving us the opportunity to serve him.

Consumer relations represents an important spoke on the public relations wheel—one that should not be overlooked. Public relations is the linking agent between an organization and would-be satisfied consumers. In essence, satisfied customers are the end result of a well-orchestrated public relations program.

A “Crash Course” on Customer Service

The 10 most important words: “I apologize for our mistake. Let me make it right”

The 9 most important words: “Thank you for your business. Please come back again.”

The 8 most important words: “I’m not sure, but I will find out”

The 7 most important words: “What else can I do for you?”

The 6 most important words: “What is most convenient for you?”

The 5 most important words: “How may I serve you?”

The 4 most important words: “How did we do?”

The 3 most important words: “Glad you’re here!”

The 2 most important words: “Thank you.”

The MOST important word: “Yes”

Figure 1 Ten phrases to attract return customers.

CONTENT ANALYSIS

Content analysis represents the blending of qualitative and quantitative research methodologies focusing on messages. It provides users with an ability to take the qualitative message and quantify it using percentages and frequency counts. Further, content analysis can be used as a measurement tool. Content analysis is used quite extensively in public relations evaluation to better understand messages and how key people (e.g., editors and reporters) react to those messages; that use, however, is typically in a more informal, simple analysis. Hence, content analysis probably is best considered a qualitative public relations research method. Any type of content can be analyzed, including interviews, focus group

discussions, editorials, television programming, and news releases, to name a few.

As a method, content analysis provides a way of systematically evaluating message content. If, for example, practitioners were interested in gauging news coverage regarding a promotional event, they might find all newspaper stories relating to that event and subject the stories to a content analysis. They might specifically want to see if the print media picked up a press release and, if published, how it was treated. A content analysis would provide a way to evaluate the release’s reach—how many papers published it, which is calculated as a percentage or “score.” If all 10 papers in an area picked up the release, the release would have 100 percent reach. How the release was reported, however, would require additional analysis. The analysis might focus on where the release was printed—which newspaper section, location on the page (above or below the fold, which quarter of the page, and so forth), the tone of the news article (positively reported, negatively reported, or neutrally reported), or the type of article (“straight” news, editorial, or column). Content analysis provides a way of evaluating the press release’s impact on the event, albeit in a simplistic way.

Conducting a content analysis requires more than simple counting. The method is the most systematic of all qualitative methodologies and typically requires the practitioner to follow several steps. First, the practitioner must identify the type of content, establish the unit(s) of analysis, create a category system, obtain the messages, code the data in such a way as to quantify it, and establish coding reliability and validity. Each of these phases is critical in conducting and evaluating based on content analysis, especially since the creation of computer programs that conduct the mundane and time-consuming task of coding and counting.

TYPES OF CONTENT

Ole Holsti (1969) said there are two types of content that can be analyzed. *Manifest content* is the content physically observable in the messages. It is simple and requires little analysis. For instance, manifest content might consist of a story’s column

inches or minutes of air time. It could be the number of times certain words or phrases were found in a story. *Latent content*, on the other hand, is not what is seen, but what is unseen; latent content focuses on the underlying messages found in the message or the message's theme(s). Latent content might concern the tone of the message (positive, negative, or neutral), or whether a particular theme was being followed through a campaign, or whether editorial content was good, bad, or neutral through a crisis. While manifest content is easy to code, latent content is more elaborate and often employs some measurement scheme or scale on which the theme is evaluated. Once the type of content is determined, the units to be coded must be determined.

UNITS OF ANALYSIS

Bernard Berelson (1952) suggested that content analysis employs five different units of analysis. A particular evaluation might focus on one or more of these units, the choice being determined by the questions asked. Four of Berelson's units focus on manifest content; in fact, he suggested that content analysis is best employed in evaluating manifest content. Berelson's manifest units are symbols or words, characters, items, and time and space measures; his latent content unit is the theme or thesis. *Symbols and words* are just what they appear to be: individual or company or event names, logos, types or trademarks, or articles of speech. *Characters* are units that describe such things as race, stereotypes, occupations, or personalities. *Items* are units that typically have a clear purpose, such as advertisements, editorials, television or radio programming, and forms of communication (e.g., newspapers, newsletters, and Internet chat rooms). *Time and space* measures include amount of air time given to a story, location within a newscast of a particular message, number of inches in an advertisement or story, or the physical size of a story, photograph, or advertisement. *Themes or theses* are units of analysis that must be analyzed and represent an underlying meaning; units such as goodness, badness, sexuality, appropriateness, or fairness

are latent thematic units of analysis. When latent content is being analyzed, the units must be specifically or operationally defined.

CATEGORY SYSTEMS

Once the content and units of analysis have been established, the content must be placed into appropriate categories. A good category system requires that each unit be placed in a unique category and that its placement not be dependent on other category systems. In creating a category system, the purpose of the research is reflected in the categories' meanings; the categories must be exhaustive—that is, all possible categories must be included and almost always include an “other” category; the categories must be independent of each other; and, finally, the category system must reflect a common classification system. Category systems are critical to content analysis reliability and must be defined precisely. A simple category system for adoption of a message would include the categories of “adopted” and “not adopted.” A thematic category system is more complex and requires that theme scales be created and evaluated; a fairness category might include scale items ranging from fair to unfair, negative to positive, and good to bad so that coders would make decisions based on how the message was portrayed.

OBTAINING MESSAGES

Collecting and copying the actual content can be a time-consuming phase of a content analysis. If the messages are in print, they must be duplicated for analysis; if they are electronic, such as radio or television programming, they must be recorded and duplicated. When there are few messages and they are easily obtainable, then all messages are typically analyzed. When there are numerous messages, the population of messages is usually sampled. In sampling, a representative number of messages are randomly collected and analyzed. Suppose a practitioner wanted to evaluate if local newspapers picked up a press release. After identifying all the papers, each edition for a specified period of time

would be read and articles based on the release would be noted and copied. It is important that all editions of the papers be reviewed; some papers have more than one edition and the story may have been “bumped” from a later edition due to breaking news. Further, some papers may have special editions for different regions or neighborhoods. All this must be taken into consideration when obtaining the messages.

CODING

Coding occurs once the messages have been collected. A good content analysis employs at least two people other than the researcher who have been trained in the category system to read each message and code the individual units of analysis into the coding system. Coding is as simple as counting the number of times a company’s name appears in the media or as complex as determining whether that company’s name is portrayed positively. In its simplest form, coding is the placing of the units into the appropriate category, or as in the case of a theme, placing a mark on a series of scale items.

ESTABLISHING RELIABILITY AND VALIDITY

Coder reliability and validity is an important feature of content analysis. It is the only qualitative method that allows for an estimation of reliability and validity. Coding reliability, a prerequisite for validity, can be computed. Typical reliability estimates are reported using Holsti’s reliability coefficient or Scott’s pi index. Both provide a reliability estimate from 0 to 100 percent; a coding reliability of at least 90 percent is desirable, meaning the coders agreed 90 percent of the time. To ensure that coding is being conducted in a reliable manner, the coders are often trained to code within an agreeable reliability. Coding validity is less quantifiable and is evaluated by the specification of the units of analysis (are they appropriate?), how the units were defined, and whether the category system meets the five criteria specified earlier.

COMPUTER-ASSISTED CONTENT ANALYSIS

There are a variety of computer programs that will do the actual placement of messages into categories. Computer-assisted content analysis reliability is, however, still dependent on the decisions made by the researcher in creating the content analysis. The computer will dependably count the units as defined to it and place them in the categories if instructed, but if the units are inappropriate or the category system flawed, then the results are questionable. Computers have not proved very useful in thematic content analysis.

CONTINGENCY THEORY

The contingency theory of public relations is a theoretical lens to view what public relations is about, as a realistic and nuanced means of managing the conflict that inevitably occurs between organizations and their publics. Contingency theory explicates the conflictual and strategic relationships between an organization and its publics on a continuum from pure advocacy to pure accommodation. Advocacy concerns self-interest of either party while accommodation considers the other party’s concern. Contingencies focus on essentially conflictual aspects of organization-public relationships and lead to the strategic management of relationships under complex and changing environments. The theory gives a positive perspective of conflicts

and strategies associated with several factors in the public relations discipline and practice.

Led by Glen T. Cameron, numerous scholars have advanced contingency theory through a series of theoretical and empirical public relations studies. The theory has yielded many insights into public relations as a profession and as a social science-based domain of learning, with substantial empirical support for the theory to date. Researchers have conducted interviews, case studies, content analysis, and surveys among public relations professionals by asking what matters most in public relations. Grounded on the empirical studies, scholars have built up the essence of the contingency theory paradigm.

First, contingency theory of public relations takes into account the views of an organization and its publics in organization-public relationships. The term of mixed views not only embraces concepts of advocacy and accommodation of an organization and its public but represents a process rather than a certain static condition. It suggests a punctuated hybrid of advocacy and accommodation on a continuum from pure advocacy to pure accommodation. At a certain point, the organization-public relationship can be almost symmetrical or asymmetrical, but seldom remains static. The organization-public relationship can be best illuminated as a dynamic process at any given time. The focus is on the shifting balance in the organization-public relationships, not on the equilibrium. Public relations professionals may be accommodative of a public in one situation and adversarial in another situation involving the same public. Also, public relations professionals may try to behave symmetrically involving a public, and accordingly, may behave asymmetrically involving another public in the same situation. This is best described as a continuum delineated by advocacy at one end and accommodation on the other.

Contingency theory combines concepts such as conflict and strategy. The conflict is always located in the organization-public relationship because both an organization and its public have different and sometimes conflictual goals, roles, values, rules, processes, and desired outcomes in their relationships. The theory postulates that preferred outcomes can be obtained by strategically managing

the conflict in organization-public relationships and suggests a strategic guideline for an optimally beneficial solution for both an organization and its public, and essentially, a possible solution for an organization. When conflicts arise, an organization determines a degree of accommodation or advocacy to serve its strategic purposes. The theory suggests that the primacy of self-interest of an organization and its public is a critical evaluative factor in the organization-public relationship.

Recent work on the contingency theory paradigm addresses the stance along the continuum from accommodation to conflict management strategies illustrated by research on the strategy contingency and its relationship with stance contingency. It supports a more particular theoretical approach of how contingency change in stances leads to strategy change. Contingency theory research in public relations shows an association between the stances and strategies of an organization and its public. The more advocative stances of an organization or its public, the harder tactics such as litigation or contending both an organization and its public will employ.

Finally, the paradigm of contingency theory is that organizational effectiveness and ethical consideration of each public results from fitting many variables to explain the stances or strategies of an organization and its public. The factors affect the stance of an organization in its attempt to practice normative public relations and whether more advocacy or more accommodation will be effective in achieving departmental and organizational objectives in the short and long term. The contingent factors meld concepts with continuous variable orientation to trace the stances and strategies of an organization and its public. Contingencies include a lot of factors, for example, top management's support, representation in top management, culture of organization, level of trust, issue stakes, perception of external environment, and so on. Cameron and colleagues (2001) characterized 86 factors into 11 categories—threats, industry environment, political/social/cultural environment, external publics, issue under questions, organization's characteristics, public relations department characteristics, management characteristics, internal threats, individual

characteristics, and relationship characteristics—and into two dimensions, external factors and internal factors. The factors are arrayed into internal and external categories that affect the degree of accommodation public relations professionals may adopt in dealing with a specific issue and a particular public at a given point in time.

Contingency theory has been a major competing scientific paradigm to the excellence theory in public relations. Excellence theory has been criticized by scholars, with several reasons, such as multiple publics, regulatory constraints, jurisdictional issues, legal constraints, and so on, which qualify the normative and positive approach to public relations in the real world. One of the main criticisms centers on the array of public relations into idealism of two-way symmetry where both an organization and its public are ready to change by balancing one's interest with the other. Scholars mainly from critical and rhetorical perspectives have attacked the feasibility of the excellence theory, and some others have promoted some alternatives.

Contingency theory has grounded the main criticism and developed a body of theoretical knowledge that differentiates public relations from other disciplines. The theory enhances better understanding of public relations practice by giving depth and breadth to empirical and humanistic approaches. For further development of the contingency theory in public relations, a line of study departs from the importance of understanding the extent to which an organization and its public deal with the relational, organizational, and societal conflicts, and how they strategically manage the conflicts. The relationship between an organization and its public is a complicated process in itself and is not easily captured even with the complex interplay of contingent factors.

CONTROL

Control is one of several variables basic to scholarship and best practices of public relations because it is fundamental to human existence. People want control over matters relevant to their health, safety, and general well-being. They try to minimize risks or otherwise control them, for example, by learning special skills. They may take driver's education to master the operation of an automobile. That knowledge and skill allows them to calculate and adapt to the behavior of others. Traffic rules are created and enforced as a means for controlling the flow of

traffic and the operation of vehicles. Society comprises many individuals in professional roles, such as fire and police personnel, who are expected to assist citizens' efforts to control events in their daily routines.

Executive managements of companies want to control as many factors as possible that enhance their chance of business success. That is a basic principle of management. Financial reports announce controls, for example, cost control by technology innovation or personnel layoffs. Executives seek legislation and regulation that fosters control over their enterprises. Bellwether companies often advocate, through industry trade associations or government agencies, higher operating standards that can reduce the likelihood that bad-apple companies will damage the reputation of an industry. Or one industry seeks to control its operations by forcing controls onto other businesses. For this reason, the automobile insurance industry has advocated more government regulation to achieve safer automobile designs. Such designs help reduce the business liability for insurance companies, as does tighter drunk driving legislation.

Products and services are advertised and promoted to help customers increase control over various aspects of their lives. Diet medications ostensibly increase weight control. Savings plans and insurance policies give people more control over their financial future.

On the other side of the coin, activism arises from a desire on the part of citizens—publics—to control various aspects of their life. Environmental activists believe that businesses (and various governmental agencies) exert either too much or too little control over their operations. Thus, activists want to control corporate management policy by exerting control through other means, such as legislation, regulation, or consumer pressures. Legislation and regulation might force higher standards for the various substances that industries can discharge into the air or water. They might control insurance rates or utility bills through state regulatory agencies such as insurance boards or public utility commissions.

Nonprofit organizations serve society by exerting control to solve societal problems where businesses

or government fails to meet the challenge, creates the challenge, or needs special values or skills to meet the challenge. The Red Cross works to help people restore control over their lives when disaster occurs. Health-oriented nonprofit organizations such as the March of Dimes work to raise money and apply it to research, therapy, and prevention, to control disease or its impact on individual lives and community health. Fundraising is an essential nonprofit activity seeking to bring elements of each community together to exert control in the interest of the community.

Because control is a central part of human experience, it is vital to the theory and practice of public relations. The concept has received substantial discussion by scholars as well as practitioners. It has strategic and ethical implications for the ways organizations operate and foster relationships with their stakeholders.

The history of public relations is inseparable from the desire and ability of various organizations or persons to direct and control the opinions and behaviors of others. Organizations must be able to control their activities and predict how others will respond accordingly. Thus, companies seek to attract customers to help them control—bring order to—their business activities for orderly, well-managed operations. Organizations of all kinds, for instance, want to control the efforts of employees. They want to direct, regulate, and coordinate those activities. One rationale for employee communication is that it helps organizations to manage the time and talents of employees to accomplish a specific mission. In contrast, a fundamental motive for activists of all kinds is to oppose efforts by a company, for instance, to exert a level of control in some manner that offends the values and opinions of the activists. In this sense, even labor unions can be activists trying to exert control against management over wages and working conditions.

Interpersonal communication theory and research have offered insights into the nature of control and the role it plays in human communication. Carried to an extreme, control can equate with domination that is likely to harm relationships and, in the case of public relations, motivate opposition rather

than support by stakeholders. Under the best circumstances, control should be a comfortable balance between the power exerted by all parties in a relationship. For this reason, public relations can be practiced as relationship management.

Writing on interpersonal relationships, Frank E. Millar and L. Edna Rogers (1987) featured control as one of three concepts central to the quality of a relationship. The other two concepts are trust and intimacy. Trust and intimacy are relevant to the sorts of relationships public relations practitioners work to build on behalf of clients and employers. Trust refers to a person's or organization's ability and willingness not to exploit or take advantage of the vulnerability of parties engaged in a relationship. Intimacy includes liking. The equation is simply this: Control wisely used builds trust and fosters liking. Organizations must use control strategically and collaboratively as they work to build trust and to be liked—supported—rather than opposed.

Control entails the right and ability of parties to a relationship to define, direct, and limit the actions that transpire to build the relationship and results from the ways participants act toward each other as a consequence of the relationship. Trust results from the responsible use of control. In relationships, each party is vulnerable to the other in various ways. Trust results when each party is willing to support rather than oppose the other and to avoid taking advantage of the other party's vulnerability. Dominance is a function of the willingness and ability of one party to influence outcome, to exert power, without opposition.

Since control is a function of the codefinition and relationship development, it is a matter of perception and relationship comfort. The balance between the control exerted by each party in a relationship is subject to the perceptions and expectations of each party. Various publics, for this reason, may feel comfortable with the amount of control being exerted, for example, by a company or a government agency, whereas other publics may believe that too little or too much control is exerted.

One rationale for public policy battles is the clash over appropriate amounts of control. Activists seek to increase their control over corporate activities by

increased amounts of regulation or legislation. Stakes are a form of power held by the parties in a relationship. Customers hold the stake of buying power. Activists hold the stake of legislative influence. Companies hold the power of legislative influence as well as their ability and willingness to control their operations as others expect of them. For this reason, issues management has a lot to do with the clash over the dynamics of the public policy arena that lead to or away from the use of control to regulate the affairs of each society.

One remedy to control conflict is for organizations to be more willing to share control with stakeholders thereby leading to a more symmetrical relationship. Another remedy is to increase controls (such as reducing environmental emissions) or to use control for the community interest rather than for the narrower interest of the organization or industry.

Another dimension of public relations and control is the role of crisis management and response. A crisis occurs when an organization fails to exert the appropriate amount or type of control over its activities. Crisis management and response entails an organization either recognizing and acknowledging how it must control its activities, or suffering a remedy imposed from the outside. One classic crisis management response is to discuss the reason for the crisis, looking to determine whether the organization exerted appropriate amounts of control in the public interest.

By the same token, risk communication is a challenge for organizations that create risks. They are expected to share information that can help stakeholders to understand the risk and determine whether the organization is exerting appropriate controls. This dimension of risk management and communication was very much at play on the part of the airline industry after the terrorist destruction of the World Trade Center. Airlines were faulted for not exerting appropriate control over what passengers could bring onto airlines, what weapons they could obtain within the airplane, and the ease with which they could gain access to the cockpit.

Control tells a lot about a relationship, and for this reason it is essential to understanding the role and practice of public relations. People expect organizations to exert control appropriate to their role in

society. Activism is a counterresponse to what is seen as a lopsided amount of control in this relationship. Public relations practitioners see value in understanding and positioning organizations to work toward symmetry of control that fosters all stakeholders' sense of what is good for the community, a matter of public interest, achieved through collaborative decision making.

CO-OPTATION

Co-optation is a strategy used by dominant institutions or organizations to respond to and eventually neutralize activists who threaten to disrupt the dominant group. The strategy takes a variety of forms, but essentially the more powerful organization creates the appearance that they share the less powerful group's aims and grants some concessions or shares power with the less powerful group. The effect is that the activists appear to have won concessions or even outright victory, but the underlying behavior of the dominant organization remains unchanged. Co-optation is related to public relations because the strategy often involves communication or forming new patterns of relationships. In critical studies of public relations, co-optation is viewed as a way

in which unfair power relationships in society are perpetuated. However, some of the tactics associated with co-optation may actually be good-faith efforts by organizations to seek symmetrical relationships with activist publics.

Co-optation can take many forms. One of the more common strategies is to identify the organization's opponents and their issues, then invite leaders of the opposition to meet with the organization under the guise of working together to address those issues. For example, the leader of an environmental activist group might be invited to join an environmental action group sponsored by a corporation that has been perceived as having a negative impact on the environment. The action group meets regularly with company officials, approves inconsequential changes in operations, and sponsors long-running studies on the quality of the environment. These efforts are widely publicized, and the corporation can claim that it is working with others to protect the environment. However, in the long run, the changes may be minuscule and the underlying operations of the company are largely undisturbed.

Other forms of co-optation involve borrowing the symbols or language of activist movements to make the dominant organization appear to be cooperating with activists' demands. Some environmentalists have accused corporations of "greenwashing" their products. Andy Rowell (1998) offered the examples of "environmentally friendly" automobiles and "ozone friendly" aerosols that, while appearing to be responsive to the problem of air pollution, actually mask other environmentally damaging corporate practices.

Some activists have even cast suspicion on the process of dialogue between corporations and activists, claiming that corporations use discussion as a delaying tactic or as the first step toward further co-optation. This suspicion creates a double bind for corporations that work in good faith to resolve issues with activists. Dialogue is an important component of symmetrical relationships with activists; however, some activists see dialogue as the first step toward co-opting the movement.

CO-ORIENTATION THEORY

Co-orientation occurs when two or more individuals are simultaneously oriented to one another and to something of mutual interest. The assumption is that individuals behave toward each other based on their *perceptions* of the other's views and intentions regarding the object of mutual interest.

For example, after Senator George J. Mitchell returned from one of his many trips to Ireland and Great Britain in his role as mediator, he described the difficult environment in which he was trying to help forge the Northern Ireland Peace Accord: "Each side acts based on its assumption that the other side will not keep its promises" (Mitchell, 1999, n.p.).

Groups of individuals, then, also act toward other groups based on perceptions of other groups' views, positions, and intentions. Similarly, organizations and their publics deal with each other based on the collective perceptions of the other's views.

ORGANIZATION–PUBLIC AGREEMENT VERSUS PERCEPTIONS OF AGREEMENT

Typically, public relations practitioners use public opinion surveys to determine public knowledge and opinion related to issues important to their organizations. The results are used to determine differences between organizational orientations and positions on issues and those held by various publics. Some refer to the process as "gap analysis," meaning the differences are seen as measures of *agreement* between organizations and publics. Agreement, then, is a measure of how similar or dissimilar an organization's views are to those held by various publics.

Using what is often called a "public relations audit," practitioners first determine "what we think." Second, they attempt to measure or to estimate "what 'they' think" (publics). Third, they assess the magnitude and seriousness of differences between organization and public views. A public relations problem exists when gaps are found, leading to a recommended public relations program to "close the gaps"—to increase agreement between the orientations held by an organization and those held by its publics.

In such cases, public relations strategy typically represents a program of action and communication (usually dominated by persuasive communication). Implicit to such an approach is the assumption that a public's opinion of and its behavior toward an organization are determined by the magnitude of the gaps—the level of agreement or disagreement. Additionally, there is an assumption that if the gaps are small or there are no gaps, then public opinion and behavior will be consistent with organizational needs and views of public interest. Both assumptions are easily challenged.

ACTUAL AGREEMENT VERSUS PERCEPTIONS OF AGREEMENT

First, the extent of actual agreement or disagreement usually is not known either to those in an organization or to members of a public, as accurate information is seldom available. Consequently, both sides in organization-public relationships behave toward and react to the other based on their *perceptions* of the others' views and *perceptions* of how close they are to their own views. As T. J. Scheff (1967) pointed out in his explication of "consensus," (a) perceptions of agreement can be independent of the level of actual agreement, (b) the level of actual agreement is not known to those involved, and (c) perceptions of agreement affect the behavior of those involved in a relationship.

Using measures of actual and perceived agreement, Scheff (1967) defined *monolithic consensus* as actual high agreement that is accurately perceived by a majority of those involved. He defined *dissensus* as

the state when actual disagreement is perceived accurately by the majority. Accuracy is the key variable, however, as *false consensus* represents a state of actual disagreement that is inaccurately perceived as high agreement. Similarly, Scheff called the state when actual high agreement is perceived as disagreement *pluralistic ignorance*. When those involved have inaccurate perceptions of others' views, they behave inappropriately toward them based on what they erroneously believe to be the others' orientation.

To avoid inappropriate public relations responses and strategies based on misperceptions, organizational intelligence gathering must discern the cross perceptions held by both sides in organization-public relationships. J. M. McLeod and S. H. Chaffee's (1973) interpersonal model describes how two individuals are simultaneously oriented to an object and to each other—"coorientation" (pp. 483–485).

Their model extended previous attempts to describe relationship states by incorporating R. F. Carter's (1965) notions of "salience" and "pertinence" (pp. 203–204). *Salience* represents an individual's summary evaluation of the object of orientation. *Pertinence* is the individual's object-by-object comparisons based on attributes that objects have or do not have in common. In other words, an individual's orientations comprise both evaluations and definitions of objects (the top boxes in Figure 1). In addition, an individual holds perceptions of how the other evaluates and defines the object of mutual concern (the bottom boxes in the model).

The parallel orientations and cross perceptions are used to calculate both intrapersonal and interpersonal co-orientational variables (represented by the arrows in the model). *Congruency*, or perceived agreement, represents the extent to which Individual A's own views are similar to A's perceptions of Individual B's views. This intrapersonal variable clearly does not take into account the other person's actual views, but surely serves as the basis of A's responses and strategy for dealing with the other person.

Interpersonal *agreement* indexes the similarity of A's and B's views—both salience and pertinence—held by the parties. *Accuracy* measures the extent to which A's estimate of B's views are similar to B's actual views. The interpersonal model can be

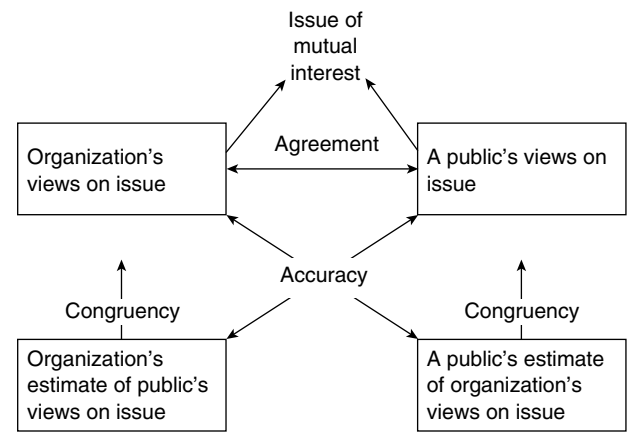

Figure 1 Co-orientation model

adapted to public relationships by substituting an organization and one of its publics for the individuals in the model.

Intraorganizational congruency represents the dominant views within the organization of how close or far apart organizational views (salience and pertinence) are from perceptions of the views held by one of its publics. *Intrapublic congruency* indicates the extent to which a majority of a public perceives a difference between public views and those held by the organization. How the organization deals with its publics, and how a particular public deals with the organization, are a function of their respective levels of congruency—perceived agreement or disagreement.

Organization-public agreement takes on two values—the extent to which an organization and one of its publics hold similar evaluations of the object or issue of mutual interest, and the extent to which they hold similar definitions of the object or issue. For example, even if an organization and one of its publics share similar evaluations of an issue, they may not agree on the details of the issue. Or they may agree on the specific attributes of the issue while disagreeing on its valence or importance. In most cases, disagreement on either evaluation or definition of issues of mutual interest creates public relations problems.

Organization-public accuracy represents the extent to which an organization's estimate of public views matches that public's actual views and vice versa. Chaffee and McLeod argued that "perfect

communication' . . . would not necessarily improve agreement . . . might well reduce congruency . . . (but) should always improve accuracy . . . to the point where each person knows precisely what the other is thinking" (1970, p. 9). Likewise, effective public relations two-way communication would lead to high accuracy for both organizational players and those in the target public.

DESCRIBING CO-ORIENTATIONAL RELATIONSHIPS

Co-orientational measures of organization-public relationships require data on the following:

1. How organizational management defines and evaluates the issue
2. What organizational management thinks about how each of the target publics defines and evaluates the issue
3. How each of the publics defines and evaluates the issue
4. What each of the publics thinks about how organizational management defines and evaluates the issue

These data—the boxes in the model—are necessary for calculating the co-orientational variables—the arrows in the model.

Beyond describing the levels of agreement, congruency, and accuracy separately, one can combine these variables to describe relationships. Scheff's 1967 typology of consensus, although not originally intended for this purpose, serves as a model for defining organization-public relationships from the perspectives of the parties involved.

For example, if organizational management and most of a particular public have similar evaluations and definitions of an issue of mutual concern, and they both recognize that they agree, then they have achieved the state of *consensus*. If the organization and its public do not agree on either the evaluation or the definition of an issue, and they accurately recognize that they disagree, then the state is *dissensus*. These represent the states of accurate cross perceptions. However, two qualifications apply:

(1) agreement or accuracy may not apply equally to both the evaluations and definitions of the issue of mutual interest, and (2) agreement or accuracy may not be shared, thereby producing consensus or dissensus from the perspective of only one side of the relationship.

In a case of *false consensus*, one or both sides may think that there is a higher level of agreement than actually exists. Even though there is low agreement on the issue, one or both sides of the organization-public relations perceives high levels of agreement . . . and behaves toward the other based on those inaccurate perceptions. Eventually a critical incident will force a reality check, thus revealing the actual level of disagreement. Lost time and false starts are the costs of these relationships.

Likewise, if one or both sides perceive higher levels of disagreement than actually exist, then the relationship could be referred to as *false conflict* (Scheff's "pluralistic ignorance"). In this state of low accuracy, the actors think—and act—as though they disagree, developing needless strategy based on the perceived disagreement—avoiding, challenging, undercutting, and criticizing, each other. Without outside intervention and facilitation, the parties involved may never develop appropriate strategies for dealing with one another. Waste and lost opportunities are the costs of these relationships.

The public relations problems that result from each of these states call for significantly different strategies. If the organizational actors and a public hold different evaluations or definitions of an issue, a persuasion strategy may be necessary—both inside and outside the organization. If they do not recognize that they agree or disagree, then an information-sharing intervention can increase accuracy.

Absent data on the true state of actual and perceived agreement, public relations strategy—just as behavior in interpersonal relationships—may be unnecessary or inappropriate. One can imagine effort and resources wasted on programs designed to persuade publics to accept positions to which they already subscribe. Alternatively, one can imagine situations in which publics protest imagined or rumored organizational positions that do not accurately represent the organization's actual

stance, which might be in accord with those of the publics.

Early co-orientational studies in public relations explored relationships among internal organizational publics, between schools and their community constituencies, and between public agencies and their publics. Recent studies using co-orientational designs have analyzed relationships between public relations practitioners and lawyers, and between government and corporate practitioners.

The imagery of co-orientational relationships again makes clear the important role of research in public relations. Framing responses to publics and formulating strategy for building and maintaining relationships demand that public relations counsel is informed about the actual and perceived levels of agreement on both sides of organization-public relationships. Accuracy is the critical variable, not agreement.

COPY

Copy is written text that will be printed. It may be informative or persuasive in nature. It can be used in reference to articles that will appear in newspapers or magazines. It can also refer to the text of advertising.

In the context of public relations, copy may take many forms. These include press releases, fact sheets, backgrounders, brochures, newsletters, reports, speeches, position papers, and press statements. When writing copy, public relations practitioners must be mindful of the interests of the organizations they represent as well as the needs of their publics.

Public relations writers must understand the organization and its purpose for communication and know the public for whom the piece is written to write good copy. To do this, the practitioner must be certain that the copy answers all pertinent questions while emphasizing the points the organization believes to be most important. To write copy well, one must possess an intimate knowledge of spelling, grammar, punctuation, appropriate capitalization, appropriate abbreviations, and language usage. In addition, good copy is accurate, brief, and clear. It is important for a writer to be accurate because mass audiences tend to believe what they see and read in the media.

Practitioners are ethically bound to disseminate only that information that is factual and correct; many also find that their credibility and reputation depend upon it. Most writers are limited to a certain amount of space, as measured by column inches or pages, and therefore must learn the merits of brevity.

Last, clarity is an important goal because it helps mass audiences to understand the writer's intent. Copy usually follows a particular stylebook, whether that of the organization or a commonly used one such as *The Associated Press Stylebook*. Stylebooks beget consistency by establishing rules for items such as correct word usage, weights, measures, capitalization, titles, and abbreviations. Stylebooks should not inhibit creativity, but rather enhance readability via consistency.

Well-prepared copy adheres to the elements of news value such as timeliness, consequence,

prominence, and proximity. Many public relations practitioners follow the inverted pyramid style in their writing as do journalists. When using the method, copy is presented with the most important information first and additional information in descending order. This style is followed in the hopes that it will grab an editor's attention and the piece will be published. In addition, it ensures that the most important information is not cut if space is limited. Editing and rewriting are integral parts of the writing process and help writers to meet the goals of providing factual information that is brief and clear while adhering to stylebook rules.

COPYRIGHT

Before the European Enlightenment, there was no concept of copyright. It was the product of a shift from seeing knowledge as divine revelation to seeing knowledge as created by people. In the 1500s, the issue of ownership of intellectual property was largely moot because of the licensing system, whereby the government granted a monopoly to printing companies and authors had little say in the matter if they wanted to be published. With the decline of licensing arrangements (in part because of an increasing resistance to censorship), and with both an increasing literacy and a resultant increasing demand for knowledge, the issue of ownership took on greater importance. Two justifications were offered for copyright protection for authors—natural rights and utilitarianism. The natural rights justification was that people had a natural right to dispose of, and benefit from, the product of their labor, whether mental or physical. The utilitarian justification was that copyright was the best means of encouraging the development of new knowledge that benefited society. The first copyright statute in the Western world, the Statute of Anne (1710), was a compromise between the two positions as its full title indicates—“A Bill for the Encouragement of Learning and for Securing the Property of Copies of Books to the Rightful Owners

Thereof” (Hesse, 2002, p. 38). The basis of United States copyright law, the federal Constitution, has a similar approach. As set forth in Article 1, Section 8, Congress has the power to “promote the Progress of Science and useful Arts, by securing for limited Times to Authors and Inventors the exclusive Right to their respective Writings and Discoveries.”

What can be copyrighted are “original works of authorship fixed in any tangible medium of expression, now known or later developed, from which they can be perceived, reproduced, or otherwise communicated, either directly or with the aid of a machine or device” (1997, 17 U.S.C. §102[a]). This includes literary works, musical works, dramatic works, pantomimes and choreographic works, pictorial, graphic, and sculptural works, motion pictures and other audiovisual works, sound recordings, and architectural works. But “any idea, procedure, process, system, method of operation, concept, principle, or discovery, regardless of the form in which it is described, explained, illustrated, or embodied” (1997, 17 U.S.C. §102[b]) cannot be copyrighted.

While it is intended that copyright would be invested in the creator of the work, this is not the case for works for hire, either within the normal scope of employment or commissioned works. In these cases, the employer is considered the author. The parties involved in the employment situation may change this by contract.

Copyright exists from the time of the creation of the work and registration is not required. To register for a copyright, a completed application form, a filing fee, and two copies of the work (one if unpublished) are filed with the copyright office. Notice in the form of some sort of recognizable abbreviation or symbol, name of the copyright holder, and the date should be placed on the work in a noticeable place. Although registration or notice are not required, there are certain advantages to registration. For example, there may be pride of ownership in claiming the creative activity, certain copyright infringement actions cannot be initiated absent registration, and no statutory damages or attorney fees can be awarded without registration. Duration of the copyright depends on such items as time when granted, whether the copyright holder is an individual or a

corporation, and so on. For individuals, generally it is the life of the author plus 70 years.

Rights of the copyright holder include the right to reproduce the work, prepare derivative works, and distribute copies. In 1990, a provision was added to the Copyright Act on “moral rights” of the copyright holder, bringing the United States more in line with international copyright laws. Such moral rights include the right to claim authorship, and to prevent intentional distortion and mutilation.

In spite of the rights of copyright holders, there are certain defenses to copyright infringements. Defenses include independent creation and, in certain situations, compulsory licensing upon payment of royalties. It has been suggested that there might be a public need-to-know defense based on the First Amendment in such areas of news photographs or videotapes (Merges, Menell, & Lemley, 2003, pp. 494–495).

An often-used defense in copyright infringement suits is the fair use doctrine. This doctrine allows for the “fair use” of copyrighted works for certain purposes such as news reporting, scholarship, and teaching. In determining whether the use is fair, the courts look at the purpose and character of the use (e.g., nonprofit or not), the nature of the copyrighted work (e.g., unpublished or published, or workbook), amount and substantiality taken, and, most important in the eyes of the law, the impact on the market for the copyrighted work. A good discussion of how these factors interact occurs in *Harper and Row Publishers, Inc. v. Nation Enterprises*, 471 U.S. 539 (1969), involving President Ford’s memoirs.

Somewhat analogous to copyright law is the law regarding trade and service marks. This is covered in the Lanham Act (1946, 15 U.S.C. §1051ff.). Among the differences between copyright and trade or service marks is that copyright protects expression whereas trade and service marks protect goodwill and reputation (Gower, 2003, pp. 96–100).

New technologies have made copyright infringement easier to accomplish and harder to enforce. Various encryption systems have been established to thwart unauthorized infringements and laws have been put in place to punish circumvention of such encryption devices, but infringements continue.

Knowledge of copyright law is important to public relations practitioners both in protecting their own creative product and in making sure that they don’t infringe on the rights of others.

—Roy V. Leeper

CORPORATE IMAGE

The concept of corporate image is one of the most central theoretical constructs to the study of public relations. In fact, public relations communication is defined as the management of the corporate image(s) for the organization. A corporate image is any singular piece of knowledge, attitude, or behavior that an individual possesses toward an organization. Defining corporate image in this way, as a relatively singular conception, suggests that any person has the potential for multiple images—positive and negative knowledge, various attitudes, assorted behaviors—toward *any one organization*.

For example, if one reflects on the organization she or he works for, any employee holds many positive, neutral, and negative pieces of knowledge, opinions, behaviors, and other images toward the organization that employs her or him. Further, when faced with a negative situation, a person can adopt a negative image of the employer at that moment, or

when experiencing a positive issue such as a raise in pay, a person's image of the organization becomes more positive given that action. In short, any person holds multiple images of organizations; the more experience the person has of the organization, the greater the number and variety of corporate images.

CONTRASTING EARLIER DEFINITIONS AGAINST CURRENT CONCEPTS OF CORPORATE IMAGE

Known as the "collapse theory" of corporate image, this theory of image as numerous attitudes or behaviors toward an organization is a relatively new way to conceptualize image and contrasts to earlier definitions of the process of corporate image. The traditional, established views toward corporate image have been that the organization is largely responsible for its image and that the corporate image of an organization is essentially one, global construct. These traditional views toward corporate image are still around today: State Farm Insurance wants to be a "good neighbor," Budweiser wants to be the "king of beers," and Xerox wants its image to be "the document company."

While these global images are still accepted and communicated by many organizations as their corporate image, recent research into corporate image processes has called into question whether corporate image can be, in fact, one universal or global construct and whether it can be controlled by the organization at all. Several public relations researchers and professionals have discovered that both these established definitions of corporate image are misleading and that other theories of image can improve how the organization manages its images.

The move to conceptualize images as plural, and potentially ever changing, in the individual inherently privileges corporate image development also in the audience members as well as in the control of the organization. As suggested above, corporate images are all those pieces of knowledge and opinions that the individual holds toward the organization. Corporate images can certainly be developed by an organization and communicated to all the important audiences that relate to the corporation or agency. But at the same time, the organization must

recognize that any member of any audience who is important to the company has the potential for multiple, ever-changing images of the given organization, based on all the various experiences and environmental stimuli that can influence and lead to their images.

In sum, several implications of these revised definitions of corporate image processes exist for public relations scholars, teachers, and professionals. First, corporate image is, indeed, developed and delivered by organizations to all their respective and important populations: employees, stockholders, media, community residents, retailers, customers, activist groups, truck drivers, and competition. But, in addition to the somewhat global, overarching image that the organization builds its reputation on, numerous other, singular, even contrasting images can also be delivered in the messages of an organization in its public relations, advertising, or social issue campaigns.

Second, organizations need to appreciate that while they might have some control—through their design of campaign messages—of their global corporate images and supporting corporate images that they want others to accept, they cannot control how images are received in their targeted audience members. As suggested above, outside influences can cause persons to have other images of an organization besides the intended image communicated by the company. For example, an automotive insurance corporation can advertise their cost-effective rates and their speedy claim services, but if a policyholder has a personal experience of an expensive rate and a negative experience with a long, drawn-out claim, this policyholder holds negative images of the automotive insurance corporation.

In another instance, a different policyholder with this same company, given an alternative experience in another city of speedy service and reasonable rates, holds very positive images of the insurance company. The bottom line is that, while corporations can certainly communicate a corporate image or images that they want their audiences to hold toward them, other factors such as business experiences with the organization, or perhaps damaging environmental issues, legal issues, negative or

positive media stories, or crises in competitive companies can damage or enhance the image of the corporation even if these factors are out of the control of the organization.

In today's intensely competitive business environment, the public relations function of any organization must appreciate that corporate image is in both the organization and the audiences that relate to the organization. Multiple images are available to the organization and are possible in the audience members. Public relations professionals must realize that campaign messages should address multiple images and that these images relate to the interests and experiences of their audiences. And, finally, public relations communication must understand that many factors affect and influence image process and development—environmental factors, business factors, legal factors, personal factors—and that these factors are often out of the control of the organization.

CORPORATE IMAGE IN OTHER BUSINESS FIELDS

The development of the theoretical construct of corporate image in public relations research is noteworthy and adds to the understanding of the concept as it has developed up to today. Corporate image issues inform both academics as a theoretical construct and practitioners as a technical construct. Other, related fields such as advertising, marketing, or business management also share an interest in understanding the production and the reception of an organization's image.

From the standpoint of public relations, corporate image processes are inevitable, and image may be a positive and negative reality situated in both the production and the consumption of an organization's campaign messages and images. Public relations assumes the concept of image as a fluid process communicating both positive and negative, intended and unintended, strong and weak, images and messages—often simultaneously—to any given population and its members. And importantly, multiple factors from the organization, the individual, and the environment can intersect and stimulate various images in the audience membership.

Scholars and practitioners from many other business fields have struggled to define the elusive concept of corporate image. Debates over which terms adequately label the concept—identity, image, corporate image, brand image, identification, reputation, cognitions, attributes—add to the confusion about how to define a corporation's image. Research by professionals and scholars in advertising, marketing, management, and public relations reveals that the points of view of different fields toward corporate image mirror their respective views toward what populations are most important to their operation.

For advertising and marketing, the focus on sales dictates that the consumer population is the most important population—and virtually the only population—targeted by an organization's messages. For advertising and marketing, recognition of an organization's image is tied to the sale of the organization's product. The bottom-line assumption is that fostering a positive corporate image in the eyes of the consumers will inevitably lead to sales. The inherent relationship of image to the consumers for advertising and marketing is that image is primarily determined and controlled by the organization.

Business management studies agree that image is largely controlled by the organization. The inherent nature of business management is to privilege one population—the employees. For business management, an organization's positive image is cultivated in the employees to encourage their satisfaction in working for the organization. This management view contends that an organization's image is a form of social identification in which the employees feel an association with the organization.

Public relations image research has yielded findings that support the multifaceted definition of corporate image as understood today in public relations communication. Early intense study of corporate image processes recognized that image is a give-and-take, a sort of dialogue, between the organization and all the targeted and important audiences surrounding the organization. Further research built on these findings and established that many social and personal factors from the organization and from the audience members' lived experiences go into the image formation process.

Additionally, research has confirmed the capacity of any individual to hold several, perhaps contradicting, images of the same organization. One line of research recognized the image formation process as a cognitive process, privileged in the individual, where the thought processes of a person affects the relationship among the receiver, related objects, assigned attributes, other persons, rules understood for this interaction, and other pertinent time and special relationships. Others extended the personal cognition process and argued, additionally, for the power of environmental factors and cultural factors to influence persons and organizations and, eventually, the image process. The distinctive contribution of public relations research to the concept of corporate image is to recognize that corporate identity is not defined as a company's logo, slogan, name, or other name recognition elements but as a company's overall definition, direction, and distinctiveness as perceived by all its various audiences.

CORPORATE MORAL CONSCIENCE

Public relations is sometimes considered the “conscience of the corporation” because it incorporates ethical concerns and the diverse voices of publics into the strategic decision making of an organization. If public relations does not work to include their views in organizational planning, these publics are often ignored. A power imbalance might exist that

prevents publics from participating in organizational decision making, or they might perceive the organization as uncaring toward their concerns. Including the concerns of publics is inherently ethical because it is based on dialogical communication. The public relations communicator also acts as the conscience of the organization by attempting to determine the morally correct course of action in a situation and counsel the chief executive officer and dominant coalition on this perspective. Ethical analysis often arises when the public relations practitioner is called on to address the question “How will our publics see this decision?”

Since the development of modern forms of public relations in the 20th century, practitioners have attempted to position the practice as an integral part of the moral, social, or ethical conscience of organizations. Practitioners have counseled organizations to be more open and accessible, tell the truth, and operate in ways that benefit society. A conscience should guide behavior along accepted moral principles. It represents our better self or what we should do to resolve a dilemma in terms of normative ethical guidelines. Does public relations play the corporate (or organizational) conscience role in corporations? Should it? How does public relations contribute to more ethical behavior? And what are the principles of public relations that help it serve a conscience function?

WHAT IS A CONSCIENCE?

According to Sissela Bok, the conscience “is seen as another, and more exacting, self” (1999, p. 94). Bok advised those confronted with dilemmas to engage in a dialectic dialogue with one's conscience. A conscience should provide guidance regarding what is best. However, defining what is best has always been the difficult part of ethics: Best could be defined through moral principles (derived by accepted norms or divine rules), or best can be determined by desired consequences. Regardless of which paradigm is used, moral decisions should be justifiable to those affected by the decision.

Ethical decisions involve making choices concerning competing loyalties or values. The right decision should be influenced by moral principles so

that they are explicable to publics and defensible from a rational perspective. Ethical decisions usually affect others and impact the quality of relationships between the decision makers and those affected by the decision. Because a primary function of public relations is to maintain relationships with strategic publics, public relations professionals should be concerned about the impact of organizational decisions on relationships with various publics.

HISTORICAL FOUNDATIONS OF THE CORPORATE CONSCIENCE FUNCTION

Ivy Lee was the first to develop a statement of principles, which he issued in 1906. His declaration of ethical principles was based on the idea of truthful communication, and it encouraged transparency and mediation between corporate behavior and public expectations. Increasing public understanding became the bedrock of his counsel to the railroad and coal industries. As companies opened up to public scrutiny, they also began to respond to public pressure.

Arthur W. Page, named the first vice president of public relations in 1927, endorsed telling the truth, listening to stakeholders, and matching action to talk. Page demanded the vice president position at AT&T, illustrating the value of public relations by holding a position capable of influencing corporate policy. Congruent with later findings on public relations roles, Page believed that the impact of public relations was peripheral if limited to the spokesperson role. Page's impact was in being an active voice in policy and action that promoted integrity. His principle, "tell the truth," meant to be truthful in all situations and to all publics: customers, employees, client, and boss. Page was an advocate for telling the truth even when it is difficult, thus providing a dimension of "conscience" to the corporation.

John W. Hill was a pioneer in the idea of public relations acting as corporate conscience. Hill argued, "Good public relations has been called the corporate conscience—an indispensable attribute of modern and progressive business" (Hill, 1958, p. 173). Hill was an early proponent of public relations acting as the ethical arbiter in an

organization, maintaining that a corporation has a duty of acting with goodwill toward its publics and public relations practitioners should counsel objectively toward that end. Hill advocated integrity, sound management policies regarding employees and consumers, and disclosure in the public interest. Hill argued that facts should drive public relations, not the other way around; and that people must know what a company is doing to approve of its actions. Hill believed that public relations could serve as a corporate conscience by helping to establish policy that is ethical and socially responsible.

WHY PUBLIC RELATIONS SHOULD ACT AS THE CORPORATE CONSCIENCE

Scholars, such as D. K. Wright, Michael Ryan and David L. Martinson, Thomas H. Bivins, Roy V. Leeper, and others, have called for public relations officers to act as the ethical consciences of their organizations. Although this role is often delegated to other organizational functions such as legal, financial, or human relations, public relations can offer insight into the ethical decision-making process that other functions cannot. In fact, there are many reasons that public relations practitioners are those best suited in the organization to act as the corporate conscience; we review these below.

Public and Defensible Decisions

Ethical decisions affect others, and as such, they should be made public to those affected. John Rawls (1999) asserted that a moral decision, in order to be justifiable, must be able to be discussed and defended publicly. Rawls explained, "The point of the publicity condition is to have the parties evaluate conceptions of justice as publicly acknowledged and fully effective moral constitutions of social life" (1999, p. 115). Steven Phelps Wall described this publicity argument as "the basic justification argument" and said that "this requirement is that citizens are owed an honest, publicly accessible justification" (1996, p. 502).

Rawls argued that such justification begins with public discussion by those involved in the decision.

[Justification] presumes a clash of views between persons or within one person, and seeks to convince others, or ourselves, of the principles upon which our claims and judgments are founded. Being designed to reconcile by reason, justification proceeds from what all parties to the discussion hold in common. (1999, p. 508)

Public relations, as a two-way communication function, should be involved in facilitating the discussion between management and stakeholders. The job of a public relations practitioner in this situation is to foster dialogue and understanding between an organization and key publics, so that options for mutual gain can be discovered. The best situation is that in which public relations is used to design a mutually beneficial solution with publics and then presents that resolution to the public as required in Rawls's test of morality.

Obligation of Dialogue

Philosophers have agreed for centuries that dialogue is an inherently ethical form of communication because it reinforces the dignity and respect of both parties. R. L. Pearson (1989) based his public relations ethics on the dialogical philosophy of Jürgen Habermas. Habermas emphasized the ethical obligation of engaging in dialogue and the crucial function of dialogue in the public sphere to discover truth through discussion. Other communication scholars have continued the line of theory equating ethics with dialogical public relations. James E. Grunig and Larissa A. Grunig (1996) included the obligation of dialogue in their reasoning of public relations ethics, using symmetry as a way of satisfying that obligation. Robert Van Es and Tiemo Meijlink argued that symmetrical communication is the "core concept" of dialogue (2000, p. 69). Symmetry is, therefore, an inherently ethical form of communication because it involves dialogue and seeks to maintain the dignity and respect of those involved.

Symmetrical public relations is achieved when "practitioners use research and dialogue to bring about symbiotic changes in the ideas, attitudes, and behaviors of both their organizations and publics" (J. E. Grunig, 2001, p. 12). Because change happens in both the organization and its public,

symmetrical communication is conceived as integrative. Practitioners act as an ethical conscience seeking truth rather than acting only as an advocate of the organization as seen in an asymmetrical approach. When practitioners have the freedom to act as the corporate conscience, they can seek to create the most ethically responsible resolution to an issue through integrating the ideas of publics with those of the organization. This role might not be possible if the dominant coalition insists on the public relations practitioner acting simply as an advocate for the organization's position. Similar to membership in the dominant coalition, the leadership of an organization must want the public relations practitioner to act as the corporate conscience and actively seek his or her counsel.

Shaping Values, Culture, and Behavior Through Communication

Public relations is the primary communication function in an organization, both with internal and external publics. This fact means that public relations can be instrumental in shaping the values, culture, and behavior of an organization through communication. The values of an organization are often expressed in a *mission statement*, ethics statement, or credo. Public relations practitioners often help to construct these documents as well as enact their tenets in organizational decision making.

When public relations practitioners enact the role of corporate conscience in their organizations, they can be instrumental in fostering an organizational culture that is supportive of ethical analyses. Shaping the organizational values and culture to include ethically conscientious behavior and regular consideration of the moral implications of decisions can result in more responsible organizational behavior. In this way, corporate social responsibility and public relations practitioners that act as the ethical conscience of the organization are linked.

More Enduring Decisions Through a Systems Theory Approach

Public relations is uniquely situated to discover, learn, and understand the views of publics around the organization. In systems theory terms, public

relations acts as a boundary spanner, collecting information from publics in the environment of the organization and using that information in organizational decision making. Acting as a boundary spanner between the organization and publics allows the public relations practitioner to form long-term relationships with publics and incorporate the views of publics into decision making. This means that publics should be more satisfied with the organization than with one that does little to incorporate the ideas and values of publics into its decision making.

Public relations practitioners can enact a dual membership role in the organization and in groups in its environment. The practitioner works to educate each side on the views of the other, while learning the values and ideals of each in a symmetrical fashion. The symmetrical model is of great importance because it allows communicators to gain knowledge of an issue from a perspective outside the organization and to incorporate that knowledge into decision making. The resulting decisions should be better considered than they would be without this boundary spanning input. Understanding the values of publics allows the public relations practitioner to counsel as the corporate conscience with a good idea in mind of how publics will view the decision in terms of its morality. These types of integrative decisions are thought to be ethical because they are based on dialogue, but they also serve to build and maintain relationships with publics.

Listening to public needs and concerns and responding to them are often overlooked but important functions of public relations acting as the corporate conscience. When the views of publics are considered in decision making, those publics are respected by the organization, which furthers the relationship. These types of decisions are more enduring over the long term because publics build trust in the credibility of the organization and see that their ideas can impact organizational policy in meaningful ways. When the views of publics are not taken into consideration, the issue is often reopened to debate. Public relations practitioners that act as the corporate conscience and incorporate the values of publics into organizational policy can

therefore save the organization resources by resolving matters effectively in a long-term manner.

Impediments to Acting as the Corporate Conscience

Even though “public relations professionals seem to be uniquely qualified and situated to gather data and to supply leadership and expertise that can help corporations develop effective and useful ethical standards,” they may not be playing that role (Heath & Ryan, 1989, p. 34). In a survey of 300 corporate public affairs officers, Heath and Ryan found that more than half were only moderately involved in developing corporate ethics programs, with a large number not being involved at all.

In Kathy R. Fitzpatrick’s 1996 survey of ethics officers, less than 7 percent of the officers had primary responsibility in public relations. They were more likely to be lawyers, human resource managers, or finance managers. Codes of ethics were considered the most helpful in ethical decisions, whereas public relations counsel and academic theories were cited least important. This raises the question, Why is public relations not more involved in ethics policy? There might be several reasons:

1. Management sometimes sees public relations practitioners in a technical role of communicator rather than management counselor.
2. A corporate conscience must affect corporate policy. If public relations is not involved in that process, it cannot fulfill this role.
3. Corporate ethical behavior is often (mis)equated with compliance—either with the law or with industry and corporate codes of ethics. Lawyers are often considered better counsel on compliance issues.
4. Fitzpatrick raised the concern of a lacking community orientation among ethics officers. These officers are internally directed regarding ethics, focused on employees rather than the larger picture of social responsibility.

According to theory and research in the discipline, each of these pitfalls can be countered and resolved by public relations. Enacting a manager

role, earning inclusion in the dominant coalition to advise on issues, learning methods of moral reasoning, and understanding social responsibility to the community allow the public relations practitioner to effectively argue for enacting the role of corporate conscience.

PUBLIC RELATIONS AS THE CORPORATE CONSCIENCE

The ever-growing mandate for corporate accountability and ethical responsibility illustrates that more ethical deliberation is needed in corporate decision making. The public demand for corporate transparency beckons communication through public relations, so the time is ripe for public relations practitioners to enact the corporate conscience role. Even with this demand, much work remains to be done in public relations before practitioners are regularly sought after as a corporate conscience and commonly prepared to enact that role. Although public relations is ideally situated to act as the corporate conscience for the reasons outlined above, it often abdicates that position to legal counsel, human relations, or other departments.

As research shows, public relations practitioners are generally seen as a corporate conscience late in their careers. More training in ethics is needed in public relations before the majority of practitioners feel adequately equipped to advise on ethical dilemmas, even at the midlevel of the organization. Several factors, such as age and reporting relationships, play a role in the practitioner's ability to function as the corporate conscience. Ethical sensitivity, or the ability to recognize the moral or ethical implications of a situation, also plays a role, as does prior practitioner training in ethics. Despite the difficulties associated with being able to function as the corporate conscience, public relations practitioners are filling this role at forward-thinking organizations, and the demand for ethical analysis conjoint with legal analysis is growing. J. D. Frances reasoned,

Professional public relations practitioners are uniquely suited to fill the apparent void in ethics and

social responsibility that exists in many organizations today. . . . The public relations professional knows how to find out what the public is thinking, relay that to management, and formulate communications programs to increase public understanding and alter public attitudes toward the organization. (1990, p. 32)

Acting as the corporate conscience involves a leadership and counseling role for public relations practitioners that would truly allow the function a maximal contribution to organizational effectiveness and ethically responsible behavior. In this role, public relations practitioners can affect the ethics of the organization both internally and externally. Cornelius B. Pratt confirmed that corporate ethics initiatives are “contingent on public relations practitioners who, as the consciences of their organizations, play an important role in ethical leadership” (1991, p. 231).

Ethical obligation demands that public relations—as the function most readily equipped to understand and involve the values of publics in organizational decision making—step forward to act as the corporate conscience. If practitioners do not meet this challenge, ethical analysis is likely to be lacking the views of key publics or equated with legal or financial imperatives rather than moral ones, costing the organization losses of credibility and resources. By acting as the ethical conscience of the organization, public relations improves the responsiveness of organizations to their publics and helps contribute to the positive social role of business in society.

CORPORATE SOCIAL RESPONSIBILITY

“Doing well by doing good” is the maxim for social responsibility. A greater demand for social responsibility always seems to follow periods of notorious corporate abuse. However, the real measure of social responsibility is whether organizations will act responsibly without pressure from outside entities. The concept of corporate social responsibility (CSR) is becoming more of a buzzword and is gaining acceptance as essential to successful business practice. However, it remains controversial despite public insistence for accountability beyond financial obligations. This entry will cover the historical development of CSR, its fundamental concepts, the criticisms of CSR, and the role public relations plays for corporations that choose to follow its precepts.

HISTORICAL DEVELOPMENT OF CSR

The libertarian view that corporations exist solely for the sake of making money, and that by fulfilling this obligation they benefit society, has historically provided organizations with a justification for abuse. During the late 19th and early 20th centuries, several organizations were guilty of such exploitations as price gouging, monopolizing markets, producing defective or harmful products, and mistreating work forces. The code that guided business was caveat emptor (“let the buyer beware”), and the corporation’s concern for its effects on the public was expressed by William Vanderbilt’s quotation “the public be damned.” Although the view of business’s

singular responsibility, to make a profit, is not extinct—it can be found in the contemporary works of Milton Friedman—organizations are restricted from many of the past abuses because of government regulations resulting from appeals by consumer groups, unions, and environmental watchdogs.

The initiative to make corporations accountable for their actions beyond profit began in the 20th century with the progressive movement's attempts at muckraking and reform. The call for transparency by progressive reformists was grounded in the faith that organizations would be compelled to behave more responsibly if their actions were publicized. Corporations' primary responsibility was still financial, but progressives lobbied for responsible action in gaining profits.

According to Jerry L. Kinard, Michael E. Smith, and Brian R. Kinard (2003), the debate about corporate responsibilities beyond making profits began in the 1930s with influential books such as *The Modern Corporation and Private Property* by Adolf Berle and Gardiner Means (1932), *The Human Problems of an Industrial Civilization* by Elton Mayo (1933), and *The Decline of Competition* by Arthur Burns (1936). These early authors argued that as an organization gained more power through economic wealth, its potential for abuse grew along with its obligation to contribute to society. Where companies resisted reforms, government often stepped in to provide legal parameters ensuring some minimal standard of responsibility.

Social change in the 1960s and 1970s once again brought the concept of social responsibility to the forefront. According to Rogene A. Buchholz (1989), civil rights for minorities, equal rights for women, environmental protection, consumer rights, and safety and health in the workplace “had far-reaching and long-lasting impacts on business organizations” (p. 23). People's expectations about the role of corporations in society changed, and these business organizations had to adapt to the growing demand for responsibility that went beyond the narrow pursuit of making profits. Society would no longer tolerate the social costs of business's single-minded quest for economic growth, such as pollution, harmful products, and dangerous work environments.

Since the 1970s, social responsibility has grown in stature and in practice. Today's socially responsible organizations seek ways of accomplishing the financial directive through socially responsible means. The concept is still primarily an ethical one, but current researchers and philosophers repeatedly seek pragmatic verification of the need for social responsibility. Many believe what Robert C. Solomon (1992) proposed when he wrote that “business ethics, rightly conceived, is just good business” (p. 21).

THE NEED FOR SOCIAL RESPONSIBILITY

Corporate social responsibility simply means that organizations have responsibilities to society that extend beyond the traditional contract to produce goods and services at a profit. In today's complex and dynamic environment of conflicting interests, being socially responsible means that “corporations are more than just economic institutions and have a responsibility to help society solve some of its most pressing social problems, many of which corporations helped to cause, by devoting some of their resources to the solution of these problems” (Buchholz, 1989, p. 25). Social responsibility does not replace the financial obligations of corporations; it simply adds other responsibilities. In short, it means that corporations should act as responsible citizens because their actions can have such a substantial impact on society. Responsible citizens are expected to behave beyond strict compliance with the law. Of course, there are minimum restrictions that prevent citizens from harming others while satisfying self-interests, but responsible citizens have the additional obligation of benefiting society.

Proponents of CSR argue that organizations must acknowledge the responsibilities beyond financial obligations. Solomon (1992) contended that the values of business have become distorted by placing too much emphasis on making money while ignoring basic purposes of providing services and products for the benefaction of society. “The making of money pure and simple is not the culmination of business life, much less the fulfillment of one's social responsibilities” (p. 19). If society expects

businesses to offer more than return on investments, then businesses are obligated to accommodate these demands. After all, in a competitive market, an institution's survival depends on whether it continues to have perceived value in society. When institutions fail to live up to society's expectations, they either have to adapt or they become obsolete.

Others advocate that social responsibility provides a more long-term approach to success. Social responsibility is a commitment to the long-term public good that outweighs short-term individual self-interests and is based on the principle of reciprocity—the notion that “individuals and institutions have a moral obligation to the public's welfare, in return for which society bestows its respect and trust” (Day, 2003, p. 35). Rather than a focus on short-term profit maximization, socially responsible behavior is based on enlightened self-interest of doing something that benefits society as a whole. It may cost more in the short term to improve social problems such as health, quality of air, and education. But the success of an organization depends on the future availability of these resources. If an organization's practices deteriorate society, it will not have viable resources to successfully operate in the future. Today, more than ever before, organizations must consider their social obligations and responsibilities to increasingly educated and concerned publics.

The third argument is that businesses will benefit from a better public image by acting responsibly. Some analysts report that organizations are acting more responsibly because they are responding to the demands of the marketplace. If consumers are buying from, investors investing in, and future employees seeking employment from organizations considered more socially responsible, then organizations will change behavior to earn such a reputation. However, the value of social responsibility is diminished when corporations seek the “image” of responsibility without paying the full price for the reputation. Social responsibility requires significant investments and commitments to solving social problems. These efforts can take years to produce results and may not always result in a lot of publicity. The commitment to social responsibility

should be genuine. The resulting image will only benefit the organization if it is authentic in its efforts. Even Enron had social responsibility statements that fostered a positive image for many years until the true motivations and behavior of senior management became public.

The final, and most compelling, reason for social responsibility is enhanced autonomy. Keith Davis (1965) noted that “the social responsibility of businessmen needs to be commensurate with their social power” (p. 404). Davis added that if “power and responsibility are to be relatively equal, *then the avoidance of social responsibility leads to gradual erosion of social power*” (1965, p. 406, italics in original). This advice may be more relevant today than when Davis wrote it, because of increased value placed on a clean environment, safety, health, and equal opportunity. When organizations have not met these expectations, the media have been quick to expose the errant behavior. Subsequently, when business power is not used responsibly, government, labor groups, and active advocacy groups have acted to diminish business influence with protests, strikes, economic boycotts, and regulations. It is becoming more evident that organizations must operate in a public environment that demands more than just the pursuit of profits in order to maintain the autonomy to pursue long-term goals without outside interference.

Organizations that behave within the socially responsible parameters established by society maintain more autonomy and establish trusting relationships with their publics. Organizations that have shown their concern for society's welfare at the risk of their own, such as Johnson & Johnson and the Tylenol case, have benefited in the long run from such behavior. Organizations that have consistently abused their economic positions in the past have a more arduous task in gaining the trust of publics that have grown cynically skeptical.

CRITICISMS OF SOCIAL RESPONSIBILITY

There are many critics of the doctrine of social responsibility, and their arguments should be addressed. The primary concerns about social

responsibility are that it has been difficult to define and measure, it dilutes the primary responsibility to shareholders, it undermines the free enterprise system, and it gives too much power and control to business.

S. Prakash Sethi (1975) has written that “social responsibility . . . has been used in so many different contexts that it has lost all meaning. Devoid of an internal structure and content, it has come to mean all things to all people” (p. 58). Such definitional problems at the conceptual and operations levels raise questions about accountability. Who decides what social problems a business should address, what goals and standards should be applied, and how social responsibility should be measured? In the absence of outside standards, management could presumably make these decisions according to their own criteria. Milton Friedman (1970) questioned the right of managers of private corporations to set public policy on behalf of stockholders, consumers, and employees. He said it was tantamount to taxing these stakeholders to satisfy the social interests of management.

According to Friedman (1970), the sole responsibility of a corporation is to its shareholders. Friedman argues that organizations have only the following four basic social obligations: obey the law, provide goods and services, employ resources efficiently, and pay resource owners fairly according to the market. Since the manager of the corporation is an employee of the owners, he or she is morally bound to provide the greatest return on the owner’s investments and nothing more. Pursuing any other objectives is outside the legal and ethical purview of responsibility. Other critics claim that the doctrine of social responsibility undermines the free enterprise system and can debilitate U.S.-based corporations if they must compete against international business organizations that don’t follow the same expectations.

And what qualifies business to solve social problems? Some criticize the concept of CSR because business people are not trained to solve these problems. Will corporations seek social goals with the same gusto with which they seek financial objectives? Only if there are enough incentives tied to economic gain. Related to this argument is the

concern that businesses will gain too much power if they take over responsibilities traditionally considered under the domain of such institutions as governments and other social improvement nonprofit organizations. Should businesses become all things to all people?

Obviously, it is impossible for a single business organization to solve the world’s ills. However, if all corporations worked together then several problems could be fixed. But herein lies a dilemma: Concerted actions to solve social problems cannot happen in a competitive environment because it would result in collusion. As Buchholz noted, the only way such concerted efforts can take place is if an outside institution, namely government, creates a level playing field by enacting policy and law. And for the most part, this is what usually happens.

Moving away from reactive social responsiveness, many organizations now work proactively by engaging in issues management and public policy. Such actions identify key issues before they become crises (pollution, workplace safety, and so on) and then engage other institutions to establish public policy that promotes social responsibility while creating an equal playing field in the marketplace.

ACCEPTANCE OF SOCIAL RESPONSIBILITY

Public opinion research of corporate executives indicates a growing acceptance of the practice of social responsibility. This has come primarily from an increased recognition about the long-term profitability of the practice. A recent worldwide survey found that more than two-thirds of chief executive officers believed being socially responsible is important to profitability, can help prevent the loss of customers, and can attract shareholders and employees. For example, investors have exerted their influence by choosing to put money into companies with high social responsibility ratings. If being socially responsible increases profitability, then such results address Friedman’s concern about the moral imperative to provide a good return on the shareholder’s investment.

Governments are also getting on board with increased standards for reporting social impact. As

these standards become legal requirements, business adherence moves from abstract and vague definitions of socially responsible behavior to measurable criteria. Other nongovernmental organizations, such as the Global Reporting Initiative, have also encouraged companies to publish a “triple-bottom line” annual report of economic, environmental, and social responsibility outcomes. Also called “sustainability” reporting, this movement has set standards for reporting social responsibility.

THE ROLE OF PUBLIC RELATIONS IN SOCIAL RESPONSIBILITY

The onus for designing and implementing social responsibility plans should be shared across several organizational domains: legal, human resources, public relations, accounting, and planning. No matter where the primary responsibility lies, public relations should be an active player in these programs. Additionally, many public relations firms offer social responsibility consulting. The impact an organization has on its publics through policies and behaviors is central to the unique organizational function of public relations in managing mutually beneficial relationships with key stakeholders. Public relations also helps organizations manage their image, primarily by listening to key publics and effectively communicating corporate values, behaviors, and goals. If corporations seek financial benefits from social responsibility, public relations must be a part of the mix.

According to the Strategic Social Responsibility Section of PRSA, public relations professionals should engage in the following activities to help their organizations be more socially responsible:

- Monitor the sociopolitical-economic horizon for issues that may affect an organization
- Identify the perceptions and expectations of an organization among its key publics
- Promote best social responsibility practices in light of these perceptions and expectations

Additionally, public relations practitioners can help their organizations be more transparent by

encouraging management to publicize policies and actions that affect stakeholders. The bad news must be shared with as much effort as the good news. Through transparency, an organization gains trust and can more quickly resolve problems in ways that are socially responsible and respectful of stakeholder interests.

COUNSELING

Counseling is the “crème de la crème” function of the public relations profession. It occurs when senior practitioners give advice to the senior members of an organization. All of that advice giving sounds much easier than it is. Advice can redirect the future of an organization as well as refine its communication functions, strategies, and tactics.

In essence, this kind of advice is intended to build, maintain, or repair a favorable relationship between the organization and one or more markets or publics. This advice is intended to guide the

senior management of the organization in its efforts to gain an advantageous position vis-à-vis its relationships with stakeholders. If proper, the advice will address problems that might strain the relationship and increase the quality of strategic relations. Such research may lead to dramatic or subtle changes on the part of the organization to make it more capable of meeting the expectations of its stakeholders. It can focus on increased standards of corporate responsibility or better ways to achieve those standards. It addresses standards of ethics and helps the management of the organization recognize what it needs to produce a good organization, so that it can communicate with character and authority with one or more of its stakeholders.

The advice may focus on what the organization needs to do as well as how it should do it. The persons receiving the counsel seek to better understand and respond to some challenge. Counseling by its nature requires experience. It is best when it brings to bear sound judgment, often based on long experience, that draws on best practices as well as sage ethical advice. Through years of experience, counselors earn the ability to offer such advice by developing and grooming their careers so that their advice is valued, as it often is quite costly in terms of billable hourly consulting rates. Such advice is often based on astute insights into case studies—both successful and unsuccessful.

Counseling can occur reactively and proactively. In the first case, a management team may call on the advice of a senior practitioner after some problem has reached the boiling point. Slowly, the relationship between an organization and one or more publics may have deteriorated. Other counseling expertise may have been used to solve the problem. But the advice has failed to solve the problem. Perhaps, someone thinks, the problem may be a “PR problem”—whatever that might mean. In such situations they may unfortunately think that one or two well-crafted messages and perhaps a slick slogan or pamphlet delivered appropriately can set the matter right. Often such strategies fail because the problem is due to something other than ineffective communication that is straining the relationship.

Counseling may be least useful when it focuses only on communication solutions.

Proactive counseling is employed to head off a problem before it starts or before it reaches the boiling point. A substantial amount of discussion, for instance, occurred in the 1970s regarding the ability of public relations practitioners to use issue monitoring and other issue management techniques to spot and respond to an emerging issue. Experts often thought that if an emerging issue could be addressed early enough, the messages the organization disseminated could allay the strain. Such studies, however, eventually realized that the strain might not be due to an emerging issue that can be “communicated away.” But thinking about, planning for, and responding in an open and constructive way may lead to a proactive, collaborative decision that can occur before combatants become recalcitrant to give in because the problem and its solution have become ego involving.

One of the other types of counsels that is sought in such situations is the advice of attorneys—thus, the concept of legal counsel. Lawyers are often trained to advise clients to respond in different ways than public relations practitioners. Lawyers focus on the status of the law and the extent to which some entity might bear the burden of proof against the organization. Such advice might also be inadequate because the problem may arise not because of a difference of legal interpretation, but due to differences that arise because of facts, the interpretation of facts, value conflicts, and preferred policies.

These latter aspects of marketing and public policy are squarely in the realm of senior public relations practitioners. They often are called on to solve or prevent problems. They may in fact bring problems to the attention of senior management. If the senior practitioner is adequately serving the interest of his or her client or employer, he or she should be tuned into the various relationships and watch for their dysfunction. Counselors need to be on guard for strains in the relationship or look for ways to strengthen those relationships. They are called on for advice—counsel to solve the problem. When they are called on, the mark of their professional skill is

their ability to offer sound and ethical strategic advice. As a senior practitioner once said,

A long time ago, I learned that when management needs advice most, you had better be ready to offer several solutions and be ready to defend each. Also, you better not raise a problem unless you think you have a sound solution. And, you must be ready to raise problems when you see them. And, you had better see them first. (personal communication, December 1992).

Some of the high-water points in the history of the profession occurred when practitioners responded soundly to the need for counsel. Likewise, some of the lowest moments of the profession occurred when the advice was not sound. Some of the worst counsel has crafted communication responses to problems that led to manipulation and even lying—what some might call the engineering of consent.

As is true of all professions, public relations is best when it serves the mutual interests of client or employer and one or more publics or markets. Done properly, it is counseling—the giving of advice—that can distinguish the profession and demonstrate its value to society. Applied improperly, it leads to pejorative definitions of the term *public relations* as fouling rather than fostering the good of society. Counseling as part of the profession does more to define its reputation than any other function. One million good counsels cannot undo the harm of one notoriously bad counsel.

CREDITS

Credits are the texts shown at the end (and increasingly, also at the beginning) of television programs and theatrical films. With the possible exception of radio dramas (which are almost extinct), credits for radio programs are always given at the end. If

examined properly, credits can provide a wealth of information beyond the obvious, such as what actor played which character, who directed, and so on. It is the credits for above-the-line personnel that can provide additional insight into a production.

All jobs (or positions) listed in credits fall into two broad categories: above-the-line and below-the-line. Below-the-line positions are technical and production positions. They include camera operators, sound recorders, editors, and other hands-on areas with limited creative input.

Above-the-line positions include producers, directors, writers, and actors. The positions of actors, writers, and directors are fairly well defined. The title of producer, or other associated titles (e.g., executive producer or line producer) cover a lot of very important ground.

In general, a producer secures financial backing for a project. Sometimes that backing is provided by the people who want the project done (for example, a 30-minute tourism promo by a local chamber of commerce). In the case of a feature film, a producer may secure financing from a studio or go to outside investors. Outside investors range from companies and individuals who finance films for a living to individuals or small companies that provide funds because they simply “believe in” the project.

Producers also serve as liaisons between investors and the other above-the-line production members, and can also be responsible for budgeting, scheduling, and may even be making day-to-day production decisions. In some instances, the producer may delegate most of the responsibilities and simply fill a management-type role.

In the case of documentaries and other potential “advocacy” productions, the credits usually include a “Special Thanks” or some sort of acknowledgments section. In the case of independent (meaning “small budgets and no major studio backing for production”) films, there is usually a very large run of names that falls under the heading “Thanks.” The names usually included are individuals who donated time or services, low-dollar investors, and small contribution financial backers.

An examination of the credits in a production can raise important questions. The advocacy or “slant”

in a particular production could be that of the scriptwriter or the original story the scriptwriter is working from. If the lead actor's name shows up in the producer credits as well, are they simply backing a project they think will make money, or are they "true believers"? With feature films, the number of actors who also direct, co-write, and co-produce the films they are starring in continues to grow. It is not uncommon to see the scriptwriter's name in the producers' credits.

CRISIS AND CRISIS MANAGEMENT

The study of crisis and crisis management is a very vibrant field within public relations. There is a strong imperative for understanding crises and crisis management. All organizations should realize they are vulnerable to crises so they must prepare for the eventuality. Once management realizes crises are possible, it must grapple with what a crisis is and what constitutes crisis management.

A crisis can be defined as "an unpredictable, major threat that can have a negative effect on the organization, industry, or stakeholders" (Coombs, 1999, p. 2). This definition is derived from a synthesis of other crisis definitions and presents the three critical features of a crisis. First, a crisis cannot be predicted but it can be expected. Crisis managers know a crisis will hit but cannot say exactly when—a crisis is unpredictable. Second, a major threat has the potential to disrupt organizational operations in some way. A crisis might close a production line or require inventorying the return of defective products. This does not mean operations are always disrupted, just that the potential exists. Quick actions by the crisis management team can prevent the crisis from fulfilling its disruptive potential. Thierry Pauchant and Ian Mitroff (1992) called smaller problems "incidents." Incidents are fairly easy to cope with and will not disrupt the organizational routine. Third, the crisis can threaten the organization, the industry, or the stakeholders. The crisis can harm any or all three of

these entities. Consider an explosion at a petroleum processing facility that kills three workers. The organization may be shut down for repairs and loss of production time. The safety of the entire industry may come under scrutiny because of the publicity and investigation surrounding a high-profile accident. Nearby residents may have been evacuated after the explosion as a precaution against hazardous chemicals while customers may experience an increase in price as production levels drop.

A crisis extends over a period of time. Steven Fink (1986) described a four-step life cycle for a crisis: (1) prodromal, where warning signs appear before a crisis hits; (2) crisis breakout or acute, where the trigger event occurs or what we typically think of as the crisis happening; (3) chronic, the time it takes to attend to the damage and disruption from the crisis; and (4) resolution, in which there is evidence that the crisis is over and no longer a factor with stakeholders. Fink's work helped people to realize there is more to crisis management than simply reacting to the crisis. Crisis management could be much more proactive by attempting to prevent crises.

Crisis management is "a set of factors designed to combat crises and lessen the actual damage inflicted by a crisis" (Coombs, 1999, p. 4). Crisis management often is mistakenly equated with having a crisis management plan. Crisis management is a complex set of factors that unfold in four stages: prevention, preparation, response, and learning. The stages of crisis management were influenced by work in disaster management and Fink's life cycle of a crisis.

Crisis management begins with prevention or mitigation. Prevention seeks to identify the various risks an organization faces. A risk is a potential threat that could escalate into a crisis. Risks include weather threats, worker error or violence, and technology failures. Prevention involves attempts to identify and to mitigate the risks. Identification involves locating potential sources of risk—the organization scans for risks that could trigger a crisis.

Mitigation tries to eliminate or reduce the risks. Some risks can be eliminated. For instance, an organization uses a hazardous chemical in its production process. The presence of a hazardous chemical

presents the risks of a hazardous chemical release. The risk of a hazardous chemical can be eliminated if the organization can find a nonhazardous chemical to replace the hazardous one it uses.

Most risks cannot be eliminated. For instance, workers can always make mistakes or become violent. Training and monitoring can be used to reduce the risks that cannot be eliminated. Prevention and mitigation reinforce the need for crisis management. Managers begin to realize what can go wrong in their organization and that they cannot stop many of the risks.

Preparation means the organization is getting ready for a crisis because management realizes one might occur. Preparation is what many people in organizations think about when the term *crisis management* is used. The essential elements of preparation are a crisis management plan, a crisis management team, and practicing the crisis management plan. The crisis management plan is an outline for the organization to respond to the crisis. The value of the crisis management plan lies in the preassignment of responsibilities and precollection of critical information. Time is saved during a crisis when people already know what they are supposed to do. Time is not lost in deciding who should do what. Critical contact names and methods of contact have been collected so that time is not lost later on. The key to a useful crisis management plan is not making it too detailed or too thick. A crisis management plan must be adapted because each crisis is unique and a plan cannot cover all contingencies. A crisis management plan will include the names of members of the crisis management team and their contact information, key people or groups that may be useful during a crisis and their contact information, and forms to remind crisis team members of what to do, such as “logging” and responding to outside inquiries about the crisis or documenting actions taken to address the crisis.

To develop a crisis management plan, managers must revisit their identification of risks. The managers perform a crisis vulnerability analysis to determine which types of crises they are most likely to face; the risk analysis will indicate what crises are likely to emerge. Management tailors the crisis

management plan to fit the most likely crises. Again, the crisis management plan must be flexible because it is a living document. A crisis management plan should be revised at least once a year. During the course of a year, the composition of the team may change, key contacts may change jobs, and the crisis vulnerability may change. An out-of-date plan is of no value because the advantages derived from saving time are lost.

The crisis management team comprises those people who will enact the crisis management plan and address the crisis. The crisis management team is cross-functional, meaning it is composed of people from different sectors of the organization. On the team you want the best mix of knowledge and skills for handling a crisis. Typical crisis team membership includes legal, operations, public relations, facilities management, and security. Legal expertise is required to ensure that the words and actions of the team do not increase the legal liabilities of the organization. Operations personnel know detailed information about the production process. The crisis may raise questions about the production process, so their expertise is important. Public relations personnel are viewed as skilled in media relations. This is important when media inquiries about the crisis occur. A crisis can raise questions about the structure or layouts of a facility. Facilities management will have the knowledge to answer these questions. Security personnel are often the first to learn of a crisis and to reach the crisis scene. They may have firsthand information about the event. Security must also coordinate its efforts with emergency responders such as fire and medical teams.

Having a crisis management plan and a crisis management team is pointless if the two are never tested. The Federal Emergency Management Agency (FEMA) is the strongest advocate of practicing crisis management plans. Only by practicing a crisis management plan can management be sure that there are no large holes in the plan (e.g., important contacts were not included), there are no mistakes in the plan (e.g., a wrong phone number or radio frequency), and that the crisis team members can work together effectively. A crisis simulation tests the plan and the team members. It is possible that

Joe Allbaugh, Director of the Federal Emergency Management Agency (FEMA), briefs reporters on September 15, 2001, about the ongoing operations at the Pentagon in Washington, DC. Workers started to remove the collapsed portion of the Pentagon shortly after the briefing.

SOURCE: © AFP/CORBIS

some team members will not be able to handle the stress of crisis management and will need to be replaced. It is recommended that an organization practice its crisis management plan once or twice a year. Regular practice helps new members of the team get up to speed and tests any modifications made to the crisis management plan. Practice is costly because people must take a day or two away from their jobs to be part of the crisis management test. However, without testing, an organization does not know if it has a functional crisis management plan or a functional crisis management team.

Response is the actual reaction once a crisis does hit. The response encompasses what the crisis management team says and does to handle the crisis. Preparation makes the response more effective

if the organization has practiced. The crisis management team faces physical and informational demands. The physical demands include addressing the damage from the crisis. Examples include injured people in need of treatment, evacuating people at risk, containing and suppressing fires, reinforcing buildings with structural damage, and salvaging equipment. The crisis management team will be coordinating its efforts with the business continuity team. The business continuity team is charged with keeping an organization functioning during a crisis or returning an organization to regular functioning as soon as possible. Business continuity teams might use alternative facilities, rented equipment, or temporary staff to help maintain an organization's ability to function. It is important that the crisis management and business continuity teams work in concert to prevent redundant actions or interference with one another.

When a crisis hits, an information vacuum is created. Stakeholders and people in the organization do not know what happened but want to know. The crisis management team collects information to discover what happened. The crisis management team is responsible for collecting and disseminating information to various stakeholders. The crisis management team is trying to find out basic information about the crisis: what happened, what was the cause, who was or might be affected, where did it occur, and how much damage was sustained. This information is necessary to help make decisions about the physical response. For instance, a crisis team must know what is in a gas cloud created by an accident and where the gas cloud will travel before determining if an evacuation is necessary and who should be evacuated. Stakeholders will contact the organization to get information. The news media, people living near the facility, suppliers, clients, and government officials all might contact the organization to get information about the crisis. The crisis management plan helps to coordinate the collection and dissemination of crisis information.

Crisis management does not end when the crisis ends. There are three key activities that must transpire after the crisis, that is, monitor and cooperate

with investigations, update stakeholders, and evaluate the crisis management effort. Many crises, such as airline accidents and chemical accidents, take time to investigate to determine their cause. The crisis management team must help investigators, typically some government agency, and keep abreast of any findings. Reporting results of investigations is one of the points that would be communicated to stakeholders in updates. Updates also include any other information that the crisis team promised to deliver to the stakeholders during the crisis. For example, an explosion at a plastic manufacturing facility halts production at that site. The crisis team promises to inform employees and the community about the cause of the accident and any corrective measures. The crisis team must also inform customers when the facility will be operational again. Once the investigation determines the cause of the accident, the crisis team can tell employees and community members why the crisis occurred and what actions can be taken to prevent a repeat of the crisis. Similarly, the crisis team can update customers as to when the facility will be operational once that has been determined.

Experts agree that the best learning experience for crisis management is a real crisis. Therefore, an organization must do all it can to learn from its own crisis experience. To learn from a crisis, the crisis management efforts must be carefully evaluated. The careful postcrisis analysis is called a *postmortem*. A postmortem is a systematic study of what the crisis management team did and the effectiveness of those actions—it assesses what was done well or poorly. Postmortems are stressful because people fear management is looking for a scapegoat. It is critical that postmortems are not a search for blame but a search for information. Once evaluated, the crisis team is briefed on its performance. The team learns what it is doing right and what it should change for future crisis management efforts. The next crisis practice should focus on the points the team should change. For instance, if there is a problem coordinating efforts with emergency responders, the next crisis practice should concentrate on the organization-emergency responder interface. The postmortem needs to be structured by having a set group of criteria. The results of the

postmortem will be better organized if the process is systematic. The results of the postmortem are then stored for future reference. The better organized the postmortem information is, the easier it will be to retrieve as a reference at some future date. Storing the postmortem information is institutional memory about crisis management and the knowledge can be referenced whenever needed.

The crisis management process is actually a circle. Learning can inform any of the other three stages. Lessons from the crisis may help in prevention (e.g., how to reduce some risks), preparation (e.g., how to improve the crisis management plan), or response (e.g., how better to deal with the news media).

New communication technology has had an impact on crisis management. The impact has been felt in information storage and dissemination. A crisis plan should be short but will include how to find information that could be critical in a crisis such as the location, amount, and types of hazardous chemicals at a facility. An intranet is a perfect supplemental source to the crisis management plan. Volumes of information can be stored on the intranet and quickly retrieved by the crisis team during a crisis. Instead of requesting information from another party, the crisis team can access information directly. Of course, this assumes the crisis team will have access to the intranet and that the intranet will remain functional during a crisis. Crisis management teaches the teams to have backups so there are alternative means for finding the requisite information. Stakeholders expect organizations to integrate the internet into their crisis communication efforts. It is now common for organizations to have either dedicated crisis Web sites or sections of their organizational Web site for crisis information. Customers, suppliers, the news media, and community members can be updated quickly by posting information to the crisis Web site. Again, this assumes that the crisis team can access the Web site during a crisis. This is a fairly safe assumption because crisis-prepared organizations will use secure, remote locations to store servers. As a result, even if a facility is destroyed, an organization will still have its intranet and Web site that the crisis team can access remotely.

Crisis management is a complex process rather than consisting of a few simple actions. For crisis management to be effective, an organization must embrace the entire concept and not declare itself crisis prepared just by creating a crisis management plan and team. Crisis management is an ongoing process as organizations monitor risks that could become crises, revise existing procedures, and practice current crisis management plans with crisis management teams.

CRISIS COMMUNICATION

Crisis communication is like the Indian parable about the blindfolded men trying to describe an elephant. Each man describes only the part he feels, which results in very different descriptions of the animal. Crisis communication is used in a variety of ways in crisis management. Depending what article or book is read, a person can discover very different uses of the term. Broadly, crisis communication is the collection and dissemination of information by the crisis management team. There are two general

uses of the term *crisis communication*: (1) crisis communication as information and (2) crisis communication as strategy. Crisis communication as information refers to the need to collect and disseminate information during a crisis. The information is collected to fill the information void of a crisis and thereby allow the crisis management team to understand what is happening and what actions they need to take. Decisions in a crisis require accurate information if they are to be effective. Crisis communication as strategy refers to the use of messages to repair relationships with stakeholders. What an organization says and does after a crisis, crisis response strategies, affects its relationships with stakeholders. Thus, the crisis manager must carefully construct postcrisis response strategies. Crisis communication is a factor throughout the four stages of a crisis: prevention, preparation, response, and learning. (Refer to the entry “Crisis and crisis management” for a complete discussion of the crisis stages.) The crisis stages serve as a useful framework for reviewing the finer points of crisis communication.

The prevention stage involves identifying possible crisis risks and trying to reduce or eliminate those risks. Effective crisis managers are constantly collecting information about and assessing information about the crisis threats the organization faces. The crisis manager becomes the center of a crisis-sensing web. All information about crisis risks is directed to the crisis manager. For instance, the crisis manager would review safety data, environmental compliance, worker complaints, customer complaints, and other information related to crisis risks. Collecting crisis risk information is crisis communication. The crisis manager is receiving messages from other units in the organization. Collecting crisis risk information allows the crisis manager to determine what areas need further mitigation efforts and to monitor the success or failure of previous mitigation efforts. Safety data can be used to illustrate the point. If several similar, small chemical spills are occurring, this is a warning that a large spill could occur. The crisis manager identifies a risk that should be reduced. To mitigate the risk, employees could be given refresher courses in proper chemical handling and new incentives provided for reducing

spills. Collecting follow-up information would indicate whether the new safety program was actually working to reduce chemical spills.

The preparation stage centers on the crisis management plan and the crisis management team. The crisis management plan has sections devoted to crisis communication as information. The crisis management plan will have complete contact information for the crisis management team near the front of the document. The crisis management plan also contains contact information for people or groups who might have information that the team might need during the crisis. Finally, the crisis team has been preassigned tasks for the crisis. The team members know whom they should be communicating with during a crisis. The crisis team must learn how to communicate with one another during the crisis. Crisis drills will indicate if there are problems with team members such as a team member not communicating or being overwhelmed by the experience. Team members not communicating effectively with one another erode the ability of the team to succeed.

The response stage is the most visible and widely studied aspect of crisis communication. The response can be divided into the initial response and crisis response strategies. There is strong agreement among crisis experts about the initial response. The crisis team must have an initial response that is quick, consistent, open, and expresses sympathy for victims. In addition, early in the crisis communication the organization must provide instructing information and adjusting information.

Technology has increased the speed at which people communicate. The same holds true for crisis communication. Expectations are that an organization will respond within one hour of the crisis event. Also there are growing expectations that crisis teams will use the Internet as one communication tool for the initial response by posting information to a separate Web site or a special section of the organization's existing Web site.

Consistent means that an organization is providing a coordinate response that is free of contradictions. Two elements can undermine consistency. The first threat is error. The need for speed in a response can create mistakes about a factual

statement. When the crisis team must correct previous statements, the organizational response appears confused and inconsistent. The second threat is multiple spokespersons. The idea of only one person speaking for an organization during a crisis is a myth. As a crisis extends over time, one person cannot continue to speak for an organization 24 hours a day. Long crises will demand multiple spokespersons. Also, a variety of organizational experts might be needed to address questions from the news media. A workplace violence incident, for example, may require a representative from human resources and security to answer questions about preemployment screening and on-site precautions. The news media want to ask questions directly to experts and not have the information filtered through one generic spokesperson. Openness refers to the crisis team being willing to discuss the crisis with interested stakeholders and to answer inquiries. It also means the crisis team seems willing to share information rather than stonewall by hiding information. Creating trust that the organization engages in full disclosure is built prior to and not during a crisis. If an organization has a history of withholding information, why should stakeholders suddenly believe that will change during a crisis?

Crises can create a unique stakeholder, the victim. The victims are people who are somehow harmed by the crisis. The harm can be death, injuries, relocation, property damage, financial loss, stress, or being inconvenienced. The key is that the crisis negatively affects people in some way. Victims want their needs to be recognized and other stakeholders expect organizations to address victims. Crisis managers should state sympathy or compassion for victims. There is a legal issue involved here. Expressions of sympathy for the victims do not need to include accepting responsibility for their injuries. Accepting responsibility opens an organization to legal claims and financial losses. Sympathy can be expressed without incurring legal and financial liabilities. It is important that the legal department review statements of sympathy. Moreover, crisis managers should check state laws to determine if sympathy statements are exempt from use in court or if lawyers may try to use them against the organization in future

litigation. Generally, properly worded sympathy for victims will not increase legal liabilities.

Victims are the reason for *instructing* and *adjusting information*. Instructing information tells stakeholders what they must do physically to protect themselves from the adverse effects of the crisis. A consumer must know how to identify a defective product and what process they must follow to get a refund, replacement, or repair. People living near a facility must know when they should evacuate the area after an industrial accident. Adjusting information helps people to cope psychologically with the crisis. Victims and other stakeholders want to know what happened, why, and what is being done to prevent a repeat of the crisis. Of special concern is corrective action, the steps the organization is taking to prevent the crisis from happening again. A crisis will create psychological stress. Adjusting information reduces the stress by helping people to realize what happened and the efforts designed to prevent a repeat of the crisis. For example, when an airliner crashes, future travelers want to know why it crashed and what the airline is doing to prevent a similar crash. Stakeholders will be less fearful of a crisis when they understand why it happened and that it is less likely to occur in the future. One problem with adjusting information is that it can be days, weeks, or months before the cause of a crisis is known. A crisis manager may be providing adjusting information over a long period of time and have little available for the initial response.

Crisis communication as strategy uses words and actions (crisis response strategies) to shape stakeholder perceptions of the crisis or the organization in crisis. Researchers using corporate apology, impression management, image restoration theory, and situational crisis communication theory have all examined the use of crisis communication to lessen the negative stakeholder perceptions created by a crisis. Perceptions of the crisis or the organization in crisis affect future interactions between the organization and its stakeholders. By changing how stakeholders feel about the crisis or the organization in crisis, crisis managers can minimize the damage a crisis inflicts on the stakeholder-organization relationship. Three types of crisis response strategies are available to crisis managers: deny, diminish, and

deal. The deny strategies claim there is no crisis or that the organization has no responsibility for the crisis. No crisis or responsibility means the organization should experience little negative effects from the crisis. The diminish strategies try to weaken the connection between the organization and the crisis. The crisis manager maintains that the organization did not try to create a crisis, had little control over the crisis, or the crisis was minor. Reactions to a crisis are less negative if the organization could not control the event or the damage was minor. The deal strategies address stakeholder concerns directly by offering compensation or by accepting full responsibility for the crisis. These strategies offer positive words and actions in an attempt to offset the negative effects of the crisis.

The learning stage returns to crisis communication as information. The need to keep stakeholders informed often continues as investigations progress and updates are needed. The crisis team must collect information from a wide range of sources to complete a thorough postmortem of the crisis management effort. The postmortem information must be analyzed and stored in some usable fashion. Moreover, lessons from the postmortem are used to improve prevention, preparation, and response. Those lessons must be communicated to the proper people in the organization—those who can effect the desired changes. For instance, the postmortem may discover a previously unknown risk in production. Personnel in operations must be informed of the danger so that they can work to mitigate it.

Crisis communication is the lifeblood of the entire crisis management effort. Crisis communication plays a vital role in all stages of crisis management. Communication carries the vital information needed in a crisis management effort and is critical to shaping stakeholder perceptions about the crisis.

CRISIS COMMUNICATIONS AND THE TYLENOL POISONINGS

When a major crisis strikes an organization, inevitably comparisons are made with Johnson & Johnson's handling of the Tylenol poisoning incidents in the 1980s. Johnson & Johnson, the world's most broadly based manufacturer of health care products, faced the most severe tests in its history when the leading nonprescription analgesic in America, Tylenol, was poisoned with cyanide in 1982 and again in 1986.

To put these criminal incidents into perspective, the Tylenol tragedies resulted in the deaths of eight people and cost Johnson & Johnson more than \$240 million. Law enforcement officials concluded that random murders occurred when an unknown individual or individuals purchased bottles of Extra-Strength Tylenol capsules in food and drug stores, replaced the acetaminophen medication with cyanide, and put the product back on store shelves—to be purchased and ingested by innocent victims.

The company's public relations response to both incidents was coordinated by Lawrence G. Foster, a former night editor of the *Newark News* who joined Johnson & Johnson in 1957 to help form its first public relations department. In his book *Robert Wood Johnson: The Gentleman Rebel*, Foster wrote about the Tylenol poisonings in a postlude:

James Burke, Johnson & Johnson executive, displays a new, tamper-resistant Tylenol bottle on November 11, 1982. Nearly eight months earlier, six Chicago-area people died of cyanide poisoning from tainted Tylenol tablets.

SOURCE: © Bettmann/CORBIS

The senior management of Johnson & Johnson took two early steps to protect the public. From the very first call, the company was completely open and forthright with the news media and began a phased voluntary withdrawal of Tylenol capsules that would later become both nationwide and worldwide. Cooperation with the news media was seen as the most effective way to warn all consumers about the potential danger. . . . Johnson & Johnson's reputation and credibility were at stake, as was the compelling need to protect the public. (1999, pp. 619–620)

Among the lessons learned was that in times of crisis the news media, along with other concerned agencies and organizations, want to hear from the chairman or chief executive officer—or at least a very senior executive. Major crises such as the Tylenol tamperings quickly escalate to the corporate level. Although Tylenol is produced by McNeil Consumer Products, one of Johnson & Johnson's numerous decentralized operating companies, Johnson & Johnson Chairman of the Board and CEO James E. Burke swiftly assumed the leadership role.

To assist him in making scores of decisions on highly significant issues—often acting on scant

information in short periods of time—Burke formed and headed a seven-member strategy committee. Serving with him were the company president, general counsel, three executives with responsibility for the Tylenol business, and Foster, as corporate vice president of public relations.

The strategy group met twice a day for eight weeks in 1982 to deal with the crisis that emanated from Chicago, where seven people died after ingesting cyanide-laced Extra-Strength Tylenol capsules. Burke reconvened the group in 1986 when a young woman from Westchester County, New York, died from cyanide poisoning after swallowing an Extra-Strength Tylenol capsule.

Decision making in both instances was driven by the Johnson & Johnson Credo, a document written in the mid-1940s by Chairman Robert Wood Johnson that describes the company's everyday business and social responsibilities. The credo is a constant reminder of the company's obligations to all of its constituents—consumers, employees, the community, and stockholders. The first tenet of the credo begins, "We believe our first responsibility is to the doctors, nurses and patients, to mothers and fathers and all others who use our products and services." Against that backdrop, the strategy committee placed consumer safety ahead of all other considerations, including financial ones.

Company executives worked closely during the crises with the Federal Bureau of Investigation (FBI), the Food and Drug Administration (FDA), elected officials, and various state and local health and law enforcement officials. The strategy committee's decision in 1982 to withdraw all of the company's nonprescription capsule products was at first opposed by the FBI and FDA, which did not want to give in to a terrorist act; however, both agencies subsequently concurred because of growing concern with copycat tamperings. Although the voluntary withdrawal was costly, it yielded two more bottles of cyanide-laced Tylenol capsules from the Chicago area, averting further loss of life.

Writing in the *New Jersey Bell Journal* in 1983, Foster reported, "Queries from the press on the Tylenol story exceeded 2,500. Two news clipping services generated in excess of 125,000 clippings . . . the television and radio coverage was

staggering" (p. 3). The torrent of news media inquiries ensued again in 1986 and—as during the first Tylenol crisis—efforts were made by authorized spokespersons to ensure that every reporter received a response with current information as the story evolved.

Foster later observed,

We had a relatively small but experienced corporate public relations staff, and together we handled all of the media inquiries, day and night, over a period of months. Four of us were former journalists, including Bob Kniffin, Bob Andrews and Jim Murray, so we knew the dynamics of news and how to work with the press. Moreover, the public relations department reported to the Chairman and CEO and we had the authority to deal with the news media in a straightforward, honest and cooperative way. In return, the news media gave Johnson & Johnson high marks for its handling of the two crises.

During both crises the company established free, 1-800 telephone hotlines through which consumers and retailers could receive the latest information and advisories; hundreds of thousands of calls were received. Among other initiatives, daily on-the-street consumer interviews were videotaped to keep the strategy committee abreast of the public's awareness and understanding of the Tylenol situation, and attitudes toward the company and its products; nearly 500,000 electronic messages were sent to physicians, hospitals, and other health care professionals and distributors; Tylenol television advertising was suspended; and to bolster morale, the company kept its employees and retirees updated on important information through letters, videotaped reports, and special editions of employee publications.

Just six weeks after the outset of the 1982 crisis, the company held a 30-city satellite press conference to announce the launch of Tylenol capsules packaged with three tamper-resistant seals—an outer box with glued flaps, a plastic band over the cap and neck of the bottle, and an inner foil seal over the mouth of the bottle. Backed by an offer of free Tylenol capsules in the tamper-resistant packaging, a "Thank you, America" advertising campaign, and a reservoir of public goodwill related to

its handling of the disaster, in less than a year Tylenol regained its position as the leader among nonprescription analgesic products.

Then, in 1986, the Westchester County, New York, Tylenol poisoning occurred. A pick-up and analysis of all Tylenol capsules from retail outlets within a specified three-mile radius led to the finding of a second bottle that contained five capsules of cyanide. The FBI concluded that a criminal had carefully penetrated the package's three safety seals, poisoned the capsules with cyanide, cleverly replaced the safety seals, and returned the contaminated product to a store shelf. Subsequently, the company concluded that it could no longer guarantee the safety of capsules in accord with its responsibility to consumers.

Besides implementing initiatives similar to those in 1982 to serve the public interest, Johnson & Johnson conducted three major press conferences at its headquarters during a one-week span in February 1986 to help disseminate information quickly and accurately. At the third of these press conferences Burke announced that the company would no longer manufacture or sell any capsule products made directly available to the consumer. Burke also announced that the new Tylenol caplet, a solid dosage form shaped like a capsule, would replace the company's capsule products.

In both situations Johnson & Johnson was viewed as an innocent victim that acted to protect the public safety despite enormous financial losses. Ethical behavior proved to be good for the business, as consumer loyalty returned Tylenol to its solid leadership position following both crises.

Foster, who retired from Johnson & Johnson in 1990, received numerous professional accolades for his role in helping to manage the Tylenol crises. He pointed out in his biography of Robert Wood Johnson, "The 1982 Tylenol crisis thrust the Credo into the limelight, and the news media began referring to the document as the most widely known statement on corporate responsibility in American business" (1999, p. 639). Thus Foster concluded his comments about the 1982 crisis. In his 1998 book, *Eighty Exemplary Ethics Statements*, Patrick E. Murphy, Chair of the Department of Marketing at

the University of Notre Dame, wrote, "The Johnson & Johnson credo is probably the best known ethics statement in the world, at least partially due to the central role it played in the tragic Tylenol poisonings" (p. 124).

In addition to his monumental work on the Tylenol crisis, Foster distinguished himself with leadership in the profession. Foster was Chairman of the Wisemen, a New York-based group of public relations executives from 1986 to 1990; president of the Arthur W. Page Society from 1990 to 1992; and an organizer of PRSA's College of Fellows. He received three of the highest honors in public relations: the PRSA Gold Anvil in 1989, the PRSA Atlas Award in 1998, and the Arthur W. Page Society Hall of Fame Award in 1994. *PR Week* named him one of the Ten Most Influential Public Relations Executives of the 20th Century.

CRITICAL THEORY

Critical theory can be defined in two main ways: broadly, as a wide range of philosophical approaches that take a critical view of existing power arrangements in society; and, narrowly, as the object of attention of certain traditions of thought (e.g., the Frankfurt School and their successors). In the narrower definition of critical theory, the leading contemporary representative is Jürgen Habermas. Habermas (1984) has been featured more frequently, and had more impact on public relations thinking, than any other continental philosopher. His concept of communicative rationality, with its

core in “the unconstrained, unifying, consensus-bringing force of argumentative speech” (Habermas, 1984, p. 10), predated the allied notion of two-way symmetrical communication. His associated promulgation of the ideal speech situation, whereby all stakeholders can participate equally in dialogue resolved in favor of the best argument, has affinities with, and usefully elaborates on, ideal practitioner goals. This remains true despite the fact that both communicative rationality and symmetry tend to exist much more in theory rather than in practice.

Critical theory originated in the European Enlightenment’s *raison d’être*, summed up in Immanuel Kant’s famous dictum that enlightened people would “dare to know.” It gathered momentum as its proponents not only dared to know, but also dared to act to change the world on the basis of that knowledge. Most proponents retain elements of that optimistic starting point in the Enlightenment: the belief that applied rationality, which is free to be critical of the status quo, can influence human activities and social structures in a more democratic and life-enhancing way. In the corporate-oriented 21st century, public relations is still being challenged to recognize similar aspirations and acknowledge society itself as its ultimate stakeholder.

For Habermas, the aim of speech is to reach agreement on action and how to act. Additionally, all participants in conversation should accept a set of responsibilities as a result of taking part. These would include aspiring to agreement in a fair-minded way, encouraging open (outside of church or state or business interests) debate, listening as well as talking, and honoring any consensus reached. Participation in fair process and acceptance of its outcome becomes, in itself, a legitimating process, which he extends beyond face-to-face talk into mediated public communication. In addressing the international crises associated with the spread of the antiglobalization movement, Juliet Roper (in press) has augmented Robert L. Heath’s (1997) foundational work on issues management with Habermasian legitimation theory. Her work positions events such as the battle for Seattle in the context of Habermas’s philosophy of the public sphere, which sets out and justifies normative guidelines for

the consideration of public issues. The concept of a public sphere can be a physical place where citizens gather for a democratic exchange of ideas (e.g., a town square) or a media arena. The concept is anchored in, and partially restricted by, how he imagined the political interchanges of middle class men in the communal coffee houses of early modern Europe. In what he saw as the subsequent denigration of communication in a modern public sphere marked by consumerism, mass media, and state intrusion into the private space of families, Habermas positioned public relations as a negative, if powerful, agent in the change.

Despite—or perhaps because of—his view, Habermas’s writings add value to public relations in a number of areas. He is an informative and forceful advocate of the conditions needed for open public debate and for thinking through a process for the social legitimation of ideas. Even if, as Walter Lippman suggested as early as the 1920s, the idea of “the public,” let alone the public sphere, is a phantom, it is, at least, a useful illusion. In conceptualizing it, Habermas worked to establish necessary preconditions for democratic communication: open access; the creation of public judgment through gatherings of citizens engaged in political deliberations; and freedom to discuss matters of the state, its powers, and its exercise of those powers. He also sought to establish a philosophical foundation on which to build long-term behavioral and ethical guidelines for journalists, media policy makers, and public relations practitioners. He grounded his idealism in densely argued philosophy and in an intellectual history of public communication. That history serves as both a source of knowledge and as a prototype for public relations historians. At the contemporary end of the temporal spectrum, interest in his concept of the public sphere has recently undergone a revival. Increased Internet participation has prompted consideration of the potential of cyberspace to host open democratic discussion by “netizens,” or online citizens, debating freely in relative equality.

In the broader definition of critical theory, as examining and opposing injustices in the status quo, Habermas differed from most advocates by

concentrating on the power of rationality rather than the power of power. There has been a limited amount of that broader critical theory within public relations. What exists has tended to focus on asking tough questions about taken-for-granted inequalities. Most questions cluster around critiques of how the field minimizes, or excludes, alternative forms of expression, how it restricts access in favor of the powerful rather than the disadvantaged, and how it stays complicit with big business and political elites. Critical theory has been explicitly invoked to illuminate how high-sounding claims for the free flow of information really mean the “deregulation and privatization of publicly held or publicly regulated media, replaced with advertising-supported media” so that “information flows freely only for those entities with pockets deep enough to pay” (Dozier & Lauzen, 2000, p. 17).

Greater attention to those kinds of critical theory concerns within the field could do much to counter damaging, and widely disseminated, allegations of public relations as “weapons of mass deception” by external critics. The lessons from issues management of talking to all stakeholders, including hostile ones, and even, using Heath’s (1997) usefully suggestive term, “stake seekers,” could be applied internally by taking seriously the challenges posed by critical theorists.

Critical theory has yet to satisfy its detractors within public relations that it can reconstruct as well as deconstruct. Certain of its adherents would deny that it is required to do so. One early proponent, Theodor Adorno (1951/1974), argued that by the middle of the 20th century positive reconstruction was no longer possible. The Enlightenment dream of a rationally organized just society had degenerated into a nightmarish “iron cage” imprisoned in the “instrumental reason” of self-interested functionalism epitomized by narrow rationalization in bureaucracy, economics, and technoscience. In the wake of atomic bombs and concentration camps, Adorno practiced the cultivation of “negative thought” because the loss of hope that philosophy could change the world and teach the good life had to be abandoned in favor of reflecting from the realities of the damaged life of the time.

Nevertheless, even if that pessimism is denied, the influence of critical theory on public relations is likely to increase. One reason is its growing influence on other areas of management, especially allied areas such as organizational communication. Other reasons include the burgeoning of academic public relations literature and the associated trend toward greater philosophical breadth, depth, diversity, and openness, as well as the field’s internationalization into countries where critical theory is more common and universities can be legally required to act as the conscience of society. These combine with, above all, the continuation of powerful economic and social forces seeking legitimacy for controversial topics and interacting with public relations in the course of their search. Recent examples of critical theory in action have been critiques of the public relations efforts to gain support for the second Gulf War by self-declared “information warriors” and the persistent use of covert public relations (e.g., the setting up of Impotence Australia as a front group for drug giant Pfizer’s Viagra) by pharmaceutical companies. In such contexts, through its attachment to society itself as the ultimate stakeholder, critical theory in public relations looks set to expand rather than contract.

—David McKie

CULTIVATION THEORY

In 1968, President Johnson's National Commission on the Causes and Prevention of Violence appointed George Gerbner to analyze the content of television shows. This began the "Cultural Indicators project," described as the longest-running continuous media research undertaking in the world. George Gerbner and his researchers perform "cultivation analysis" to determine if and how watching television influences viewers' ideas and perceptions of reality.

Cultivation analysis, or cultivation theory, wrote S. J. Baran, is the theory that

television "cultivates," or constructs a reality of the world that, although possibly inaccurate, becomes accepted simply because we as a culture believe it to be true. We then base our judgments about and our actions in the world on this cultivated reality provided by television. (2001, p. 333)

Its role has expanded beyond that of just violent acts on television. Public relations practitioners should have an understanding of this theory and be aware of how their efforts may contribute to such effects on society.

Since there is no single TV show to credit for creating the effects of cultivation analysis, it is instead the medium of television that is responsible. These authors view television shows as mainstream entertainment that are easy to access and generally easy to understand. Thus, their reasoning is that these shows provide a means by which people are socialized into society, although with an unrealistic notion of reality at times, particularly with respect to social dangers. They make the point that television seeks to show and reinforce commonalities among us, so that those who regularly watch television tend to see the world in the way television portrays it.

Not everyone is successfully cultivated by television. These authors conclude that those who watch little television are not affected. Likewise, people who talk about what they see, especially adolescents who talk with their parents, are less likely to alter their view of reality to match what they see on television.

Clearly, cultivation theory does consider that there are other influences in television viewers'

lives besides the television itself. Demographics, social, personal, and cultural aspects are also factors in considering how a viewer will interpret television programming. What it means to be a certain ethnicity, race, gender, or age, however, is defined by cultivation, and television helps define what it means to be those things in our society. The implication that cultivation theory has for public relations practitioners is that repeated messages over time are perceived as true. If what people see on television and in the news is not an accurate representation of reality, there is the chance that some people will still perceive it as truth.

Other influences on people besides the television screen include messages on the radio, in print, and on billboards. Often public relations practitioners are the people behind the creation and presentation of these messages. Whether the messages appear on television or not, it is critical that the messages contain the truth. Because repetition breeds truth, public relations practitioners must ensure that the messages they create and send, often through the mass media, on behalf of the organizations they represent, are the truth. It is one thing for a message that is the truth to be constantly repeated in society, but when the messages are not accurate, this can become a public relations nightmare.

Cultivation theory can also be observed in the way media report the news. If they repeat the same messages over and over, whether they are true or not, people tend to be left with one view to perceive as the truth. Wrote Baran,

Television newscasts never say, "Most crime is violent, most violent crime is committed by people of color, and you should be wary of those people." But by the choices news producers make, television news presents a broad picture of "reality" with little regard for how its "reality" matches that of its audiences. (2000, p. 333)

Baran concluded that "even though we cannot always see media effects, they do occur and eventually will change the culture in possibly profound ways (p. 334)."

Regardless of its criticisms, Gerbner's cultivation theory is studied by mass media, journalism, and public relations students throughout the world. The

effects of television continue to be questioned and studied, especially with the introduction of “reality TV shows.” With these shows, television cameras follow individuals around and record their thoughts and feelings while the world watches them, for example, choose to stay with a boyfriend or girlfriend or move on with their lives. Is the term *reality TV* an oxymoron, or does it provide for a more accurate perception of “reality” than shows that have come before?

CULTURAL TOPOI

Topoi are lines of argument that can be repeatedly used in debates (a *topos* is a single line of argument). General topoi can be employed across many subjects, whereas specific topoi apply only within a specific discourse field such as the law. Communicators use topoi to generate arguments or to anticipate arguments they must prepare to refute. Widely used topoi include stock issues of policy debate (e.g., stasis) or lists of values that audience members believe in.

This article discusses a system of topoi that was developed to characterize cultural discourse within a society. Mary Douglas (1997) recently characterized culture as an accounting system. “Think of culture as essentially a dialogue that allocates praise and blame. Then focus particularly on the blame (p. 129).” From this view, culture involves a clash between competing views of

social reality. A cultural topos is a set of coherent premises that supports a particular way of organizing social relations. These premises include perceptions of reality and value premises about what is desirable and good.

The cultural topoi framework identifies the underlying premises of competing accounting systems that participate in the discourse of praising and blaming. The premises that make up these topoi often require considerable effort to uncover because they are automatically accepted, or because they underlie second- and third-order premises that are actually voiced. The cultural premises that constitute the five competing cultural topoi are illustrated in Table 1. They are ordered from left to right in terms of the level of measurement that each cultural topos embodies.

The cultural topoi originate in different ways of life that compete with each other. Each way of life is part of a cultural ecosystem that has an inherent requisite variety. Michael Thompson, Richard Ellis, and Aaron Wildavsky (1990) wrote, “Each way of life needs each of its rivals, either to make up for its deficiencies, or to exploit, or to define itself against. To destroy the other (way of life) is to murder the self” (p. 4). The ongoing competition between the cultural forms gives a particular group its unique cultural configuration. At one point in time, a single way of life may dominate a scene, or two ways of life may form a dominant coalition. The remaining ways of life are usually pushed toward the periphery of the cultural system. Indeed, egalitarianism typically appears as an ideology that critiques the status quo. Representative democracy itself is a coalition of cultures in which each way of life has a voice within a differentiated social structure.

The egalitarian and competitive individualist topoi usually vigorously oppose one another. The egalitarian topos privileges the value of social equality, whereas the competitive individualist topos elevates the value of individual freedom. The egalitarian strongly resists reducing sacred values (i.e., human life) to a cash value, but the competitive individualist insists that everything should have a price (e.g., donor organs). However, cultural collaboration is possible even between these perennial antagonists.

Egalitarians and competitive individuals were allies in constraining the reach of the federal government in the early decades of the American republic. Egalitarians feared that a strong federal government would increase social inequality, and competitive individualists feared that a strong federal government would undermine individual liberty. Cultural collaboration is often possible, when a particular strategy serves different ends for each way of life.

The cultural topoi perspective provides several analytic advantages. It offers a richer understanding of rhetorical options than the prevailing discourse of a right/left political spectrum. It provides a parsimonious framework for describing the social construction of reality while enabling cross-cultural comparisons and descriptions of cultural change. It also allows one to anticipate opportunities for collaboration between groups that typically oppose each other (e.g., egalitarian-oriented democrats and Buchanan social conservatives uniting to oppose the North American Free Trade Agreement).

A cultural topoi framework also provides a springboard for investigating perceptions and discourse about risk. The different ways of life fear different things. Those who fear ozone depletion are not more fearful than those who fear anarchy. One's cultural premises alert one to some dangers and blind one to other dangers.

The perspective also explains how audiences come to different interpretations of the same message. To understand how a message is likely to be interpreted, one need not understand the intricacies of cognitive dynamics so much as one needs to understand which cultural topoi a message interpreter is applying. The credibility of a message depends on how closely it aligns with the receiver's underlying premises. When a message is consistent with the receiver's cultural premises, inference is facilitated. When it contains premises at odds with a receiver's cultural topoi, the message will likely be resisted.

Carl Botan and Francisco Soto (1998) have defined a public "as an ongoing process of agreement upon an interpretation" (p. 21). In many cases, the shared interpretation of a particular public stems from a shared cultural topoi. The public relations

function participates in the ongoing clash of perspectives that takes place in a democratic society. The cultural topoi perspective represents part of the tacit knowledge of astute practitioners. Such practitioners have a breadth of perspective that enables them to interact with audiences operating from different cultural premises. Public relations practitioners serve as interpretive intermediaries between an organization's management and important publics. They work to find rhetorical positions that will enable alignment and collaboration between audiences operating from different cultural premises.

The cultural topoi framework also provides a useful heuristic for characterizing public relations practice. Public relations not only participates in cultural dialogue, but the same cultural processes operate to define and prescribe for public relations practice. In particular, competitive individualist and hierarchical versions of public relations practice have contended with each other since the early decades of the 20th century. Ivy Lee is an icon of competitive-individualist oriented practice, and Edward Bernays is an icon of hierarchically oriented practice. In addition, egalitarian models of practice are emerging. Fittingly, the dialectic of praise and blame accounting, in which public relations participates, also plays an important role in constituting public relations practice.

Table 1 Cultural Topoi Compared

Foundational Beliefs	Fatalist Topoi	Egalitarian Topoi	Hierarchical Topoi	Autonomous Individualist Topoi	Competitive Individualist Topoi
Nature	Nature is capricious and unpredictable.	Nature is fragile; its equilibrium is precarious.	Nature is bountiful, if it has a gardener.	Nature is benevolent if you match yourself to it.	Nature is bountiful and resilient.
Human nature	Human nature is capricious and unpredictable	Human nature is good, but social inequality corrupts it.	Human nature is bent, but discipline can straighten it.	Human nature is ignorant, but it can be enlightened.	Human nature is self-seeking, but competition channels it productively.
Value imperative	Accept reality; don't try to change it.	Seek equality.	Seek order.	Seek enlightenment.	Seek liberty.
Decision principle	Let fate decide.	Seek consensus.	Legitimate authority decides. The chain of command implements.	One person, one vote.	Let the market decide.
Activity principle	Take what comes your way.	Do it for love.	Practice until you are good at it.	If you do it, avoid coercive entanglements.	Do whatever you do best.
Justice principle	Que será será.	From each according to ability to each according to his need.	Give and receive according to rank.	To each an equal portion.	To each in proportion to her contribution.
Measurement level	None	Nominal	Ordinal	Interval	Ratio

CULTURE

Whether in drafting a basic press release or crafting a major campaign, an awareness of culture, both that of relevant organizations and that of key publics, is critical to public relations practice. In general, culture is defined as understandings and practices shared by a group of people. Cultural knowledge plays an important role in message design and interpretation.

According to Krishnamurthy Sriramesh, despite some awareness of the important role of culture, research in public relations has placed primary attention on culture for only slightly more than a decade, and still too few studies examine links between culture and public relations. Thus, this area remains a rich and important one for future inquiry.

Stephen P. Banks suggested that although culture shapes practice, public relations is fundamental across modern societies. Several changes in and

across societies have resulted in variations in public relations practice.

CULTURE AND PUBLIC RELATIONS IN THE 21ST CENTURY

Robert L. Wakefield (2001) asserted that in the 21st century, public relations practitioners face new challenges. Once primarily a domestic undertaking, public relations has gone global. The increased number of multinational organizations, ease of transnational and worldwide communication, and global marketplace have redefined the practice of public relations. Although some organizations and industries are more often affected, changes reverberate throughout organizational practice.

Sriramesh (2003) questioned “whether there is such a thing as *domestic* public relations anymore because of the international outreach of organizations of all sizes and types as a result of the recent spurt of globalization” (p. xxv). A previous subspecialty, international public relations is now synonymous with general practice. Thus, skills in communicating with multiple publics across differing cultures are essential.

Sriramesh (2002) noted that “PR practice in the 21st century has, and will continue to, become multinational and multicultural in nature” (p. 54). However, “precious little information exists to help multinational organizations to understand the global nature of their public relations or to guide them as they develop resources not only to get their messages out to increasingly cross-cultural publics but also to anticipate and respond to behaviors by those publics that could affect the organizations” (Wakefield, 2001, p. 639). This lack of information hampers efforts and places achieving organizational goals in jeopardy. “Multinationals need to understand the nuances of public relations between countries, or even in different regions within countries, and how misunderstandings of those nuances can bring problems on a global scale” (Wakefield, 2001, p. 640).

VIEWS OF CULTURE

Work on culture, organizations, and public relations describes two lenses used in assessment. One takes

a primarily internal focus, viewing organizations as distinct cultures, with their own beliefs and practices, emerging from and adapting to surrounding cultures. The other is more external, examining the role of public relations in adapting to and influencing culture and cross-cultural issues. Wendy Hall (1995) suggested culture and cultural difference must be addressed on two levels. The first is the organizational level. For example, some organizations, even in different nations, share similar cultures, perhaps due to their type and structure. The second is the national or individual level, which recognizes that culture varies by country with individuals, groups, and organizations being influenced. Understanding of both levels is essential.

Within the first view, each organization is seen as a distinct culture with its own value system (e.g., where particular types of behavior are more valued or particular outcomes more emphasized). Once entrenched, organizational cultures are relatively stable, though they do evolve over time (e.g., especially with key changes, such as the appointment of a new chief executive officer). If an organization diversifies into new locations, its culture shapes those facilities, but it must also adapt to local culture. Such transitions are easier when organizational and local cultures are similar, and they can be facilitated by public relations efforts.

Within the second view, general cultural characteristics and their influence on individuals are salient. National cultures are very stable, with changes taking place slowly. In addition, distinct regional variations are common. Therefore, according to Doug Newsom, Judy VanSlyke Turk, and Dean Kruckeberg (2001), the successful public relations practitioner needs to understand a country’s government, power structure, laws and legal system, public and private sectors, financial system and markets, and media.

Several typologies have emerged that characterize cultural differences. Geert Hofstede’s (1980) four dimensions—individualism/collectivism, uncertainty avoidance, power distance, and masculinity/femininity—are commonly employed to describe cultural variation. Hofstede added a fifth dimension, that is, long-term versus short-term orientation. Marlene Rossman’s (1994) system with eight

cultural qualities is another example. Her system included attitudes about time, formality, individualism, hierarchy, religion, taste/diet, colors/numbers/symbols, and assimilation and acculturation.

AREAS OF RESEARCH

Comparing intercultural communication and international public relations, R. S. Zaharna (2000) described three lines of research. The first, "culture-specific," seeks to pinpoint communicative behaviors common in a culture. A considerable amount of public relations work, especially from the "comparative public relations" perspective (i.e., delineating public relations practice in particular countries or regions), is indicative of this line of research.

The second, "culture-general," attempts to uncover practices common across cultures. For example, much attention has been devoted to assessing the similarity of public relations goals and functions regardless of the specific location of practice. Dennis L. Wilcox, Glen T. Cameron, Philip H. Ault, and Warren K. Agee (2003) maintained that the goals of public relations are essentially the same (e.g., creating and sustaining favorable conditions and relationships for operation, assessing the potential for and avoiding opposition and negative situations, and managing crises to minimize damage) regardless of the country or culture in which one practices. However, a variety of factors may make intercultural communication and public relations more challenging: differences in language, customs, chain of command, media and public relations practice, and perception of individuals and nations. Thus, practitioners must learn as much about local customs and culture as possible, but they also need to consult cultural insiders for guidance.

The third area, "intercultural interaction," draws from each of the previous two and examines the communication of interactants from different cultures. Thus, the focus moves "from individual *communication behaviors* to exploring . . . how different behaviors affected the *communication process*" (Zaharna, 2000, p. 90, italics in original). Examples in public relations work are studies examining how public relations programs are evaluated through cultural lenses.

Newsom et al. (2001) noted that

despite the ability to build generalizable theory by incorporating multiple cultures and disciplines, difference among cultures must be addressed. What works in one country might not work well in another country because of national culture, political and economic infrastructure, media systems, and research protocols. (p. 651)

MULTICULTURAL EDUCATION

Kenneth Starck and Dean Kruckeberg (2001) suggested that

a major contribution that public relations educators can make is to help students become interculturally literate, for the sine qua non of this newly emerging global economy is intercultural communication. One of our major goals should be to promote intercultural literacy among present and future public relations practitioners. (p. 58)

Building and maintaining positive relationships rests on understanding cultural nuances. As Wakefield (2001) asserted, "although the interactions of diverse cultural groups can foster harmony, they also can produce opposite effects such as more entrenched stereotypes and increased suspicions, misunderstandings, tribalism, and conflict" (p. 639). Clearly, effective communication is essential and public relations practitioners can help shape outcomes.

That messages need to be adapted to audiences is an age-old principle of communication. The increasing cultural diversity of audiences makes this concept an even more important one.

CUTLIP, SCOTT M.

As the senior author of a leading textbook, *Effective Public Relations*, Cutlip was regarded by many as the father of public relations education in the United States during the second half of the 20th century. He also remains the field's most eminent historian.

Cutlip introduced the study of public relations at the University of Wisconsin School of Journalism in 1946 and continued as a Wisconsin faculty member until 1975, when he became a professor at the University of Georgia, Athens. He served as dean of the Henry W. Grady School (now College) of Journalism and Mass Communication at Georgia from 1976 to 1983 and was a university professor until his retirement in 1985.

A proud native of West Virginia, Cutlip received a bachelor's degree from Syracuse University and a Ph.M. degree in journalism and political science from Wisconsin in 1941. He had worked as reporter, weekly newspaper editor, and press secretary to a

gubernatorial candidate in West Virginia prior to attending Syracuse, where he worked for three years as an assistant in Syracuse's Bureau of Public Information.

Upon graduation from Wisconsin, Cutlip served as public relations director for the State Road Commission of West Virginia. Then, during World War II, he served as a public information officer and a counterintelligence officer for the U.S. Army, attaining the rank of major.

In 1952, Cutlip and co-author Allen H. Center, an official of Parker Pen Company and later Motorola, published the first edition of *Effective Public Relations*, which was updated with new editions in 1958, 1964, 1971, 1978, 1985, 1994, and 1999. The book was widely adopted as a college textbook and translated into Italian, Spanish, Korean, and Japanese editions. The Public Relations Society of America (PRSA) adopted the book as the basic text for its accreditation examination. Cutlip and Center entrusted the book's legacy to Glen M. Broom, who joined them as co-author beginning with the sixth edition in 1985.

Cutlip and Center's centerpiece concept was the *four-step public relations process* as a model for organizing public relations programs. The first edition emphasized the importance of fact finding, planning, and communication. The fourth step, evaluation, was not added until the second edition in 1958. The model has been usurped by strategic communication approaches that follow more general business planning models, but continues to be the criteria for judging in PRSA's Silver Anvil Award and many regional competitions recognizing outstanding public relations programs.

Cutlip's other major early contribution was compilation of the first comprehensive bibliography of public relations, produced in 1957 and updated in 1965. Former student Robert L. Bishop produced a third edition in 1974. Annual bibliographies in the Cutlip tradition began to be published soon thereafter in *Public Relations Review*.

Cutlip is familiar to many philanthropic and fundraising professionals as the author of the most comprehensive early history of American fundraising. He also edited a volume on the public opinion for public administrators. In 1975, he co-chaired

with J. Carroll Bateman the first commission on undergraduate public relations education.

Cutlip's passion for public relations history was evident in many of his early scholarly journal articles. He also played a pivotal role in securing the personal papers of many early public relations pioneers, such as John W. Hill and Earl Newsom, which are now preserved and accessible to scholars at the Mass Communication History Center of the State Historical Society of Wisconsin in Madison.

In retirement, Cutlip compiled his extensive research on early public relations in two books. One title examined the roots of the practice before the 20th century; the second tome profiled the work of a dozen leading practitioners from the first half of the 20th century.

Cutlip was honored in 1972 with PRSA's first Distinguished Public Relations Teaching award and in 1990 with the society's Gold Anvil award for the advancement of the public relations. In 1991, he became only the 10th individual—the first in public relations—to receive the prestigious Paul J. Deutschmann Award for Excellence in Research from the Association for Education in Journalism and Mass Communication.

DAVIS, ELMER, AND THE OFFICE OF WAR INFORMATION

Although primarily a journalist, Elmer Davis is important to the public relations profession because he was known nationally and internationally as the director of the Office of War Information during World War II.

Davis was born in 1890 in Aurora, Indiana. His career in journalism began when he was a boy “printer’s devil” on the *Aurora Bulletin*, but printing the newspaper was not his destiny. He enrolled in Franklin College, where he earned his Bachelor of Arts degree in 1910. While at Franklin, he wrote articles as a correspondent for the *Indianapolis Star* and was paid \$25 per story. He went to Oxford University in 1910 as a Rhodes scholar but had to leave when his father became ill. He returned to the United States and took an editorial position with *Adventure* magazine.

A year later, he left that job to be a cub reporter at *The New York Times*, where he remained for 10 years. He reported on a wide variety of subjects. His coverage of evangelist Billy Sunday earned him fame and fortune. At the time, reporters were paid by the space their stories occupied, and the Billy Sunday stories were long for news stories and lucrative for Davis. However, readers did not consider his stories long because they were easy to read and

interesting. Samuel T. Williamson, a fellow *Times* reporter, said Davis “benefited from his facility with the English language which made it possible for him to write a long story so phrased that a copyreader couldn’t cut it much” (Burlingame, 1961, p. 69). A skillful analyst of contemporary politics, when he wrote editorials and features on American politics, he was widely read and respected. He also wrote *History of the New York Times, 1851–1921* in 1921.

Davis left the *Times* in 1923 to become a freelance writer. He tried fiction and nonfiction and published *I’ll Show You the Town* in 1924, several novels, short stories, and a volume of essays, *Show Window* (1927).

In 1939, Davis received a call from the CBS news chief asking him to fill in for one night for news analyst H. V. Kaltenborn, who was reporting from Europe. He accepted, was an immediate success, and became a full-time CBS analyst. His nightly five-minute newscast was heard by 12.5 million people, and he became known for his straightforward style and dry humor. After two and a half years, he had earned the trust of radio listeners and the confidence of newsmen. Edward R. Murrow wrote to Davis, “I’ve spent a lot of time listening to broadcasts from many countries . . . and yours stand out as the best example of fair, tough-minded, interesting talking I’ve heard” (Radio Days, 2003, n.p.).

On one broadcast Davis recommended that the government organize news information under one organization, saying that the public needed and wanted more news. He said, "The whole government publicity situation has everybody in the news business almost in despair, with half a dozen different agencies following different line. . . . Under one head, with real power, they might get somewhere" (Burlingame, 1961, p. 186).

Following the broadcast, E. B. White, in *The New Yorker*, suggested that President Franklin Roosevelt create an Office of War Information (OWI). That's exactly what Roosevelt did, and he asked Davis to be director. Davis did not feel he was requested to take the position; he felt it was an order. He said on his final CBS broadcast, "I have been called into government service." He took the \$10,000-per-year government salary, knowing he was giving up his \$52,000-per-year CBS salary.

Executive Order 9182 established the Office of War Information on June 13, 1942. A White House press release read that Davis "will have full authority to eliminate all overlapping and duplication and to discontinue in any department any informational activity which is not necessary or useful to the war effort."

Davis said, "Our job at home is to give the American people the fullest possible understanding of what the war is about . . . not only to tell (them) how the war is going and where it came from—its nature and origins, how our Government is conducting it, and what our Government hopes to get out of the victory" (Davis, 1943, p. 11).

He called the effort "three-dimensional truth"—the news that is immediate enough to get into the news media and also the background information that will help people understand the news. He planned to use radio, movies, magazines, pamphlets, posters, speeches, discussion groups—"anything to promote the public understanding."

The OWI started out coordinating the release of war news for domestic use and established an overseas branch (headed by Robert E. Sherwood) to launch a propaganda and information campaign internationally. Davis promised to give Americans not "morale-building" information but news, more

news than they had been getting, and he thought that morale would not need to be built if people understood the reasons for actions and demands.

Perhaps the greatest problem was the difference between news or truth and propaganda. Davis had to cope with people who didn't recognize the difference or refused to acknowledge the difference. The word *propaganda* has a bad connotation, and he made efforts to define the word for the American people as "an instrument which may use truth or falsehood as its material, which may be directed toward worthy or unworthy end" (Davis, 1943, p. 14). He emphasized that the OWI would only use truth and only for education, saying that there was no public hostility to the idea of education. Still, he had his battles over what the people should and should not know.

Nevertheless, in all his battles with military officers, Cabinet members, and members of the United States Congress, he referred his opponents to Executive Order 9182 and the words "The director shall have full authority . . ." He always remembered he was a journalist and fought government suppression of facts, taking one case all the way to the White House and winning. Even though he declared he was always a writer first, he never expressed any negative feelings, even in personal letters, about anyone during his three and a half years with the OWI.

Some members of Congress opposed the domestic operations of the OWI, and its funds were eventually curtailed. By 1944, the OWI operated primarily abroad. In 1945, even those overseas functions were taken over by the Department of State; the OWI and the war ended. Davis had previously said there was no reason to have an Office of War Information when there was no war.

From 1945 to 1953, Davis was a radio news analyst with the American Broadcasting Company (ABC). It was Davis on radio and Murrow on television who urged the nation to be reasonable during the campaign speeches of Senator Joe McCarthy. *The New York Times* called Davis the "Mount Everest of Commentators" as he opposed the threat to freedom of thought during the McCarthy era.

Davis later published several works, including *But We Were Born Free* (1954) and *Two Minutes till Midnight* (1955). He can be seen playing himself (a radio commentator) in the 1951 feature film *The Day the Earth Stood Still*. He died in 1958.

DEADLINE

A deadline is the day and time when a media release or other contact must be in to newsrooms if the story is to have a chance to be aired or printed on that news day. Media correspondents operate in news cycles. They work stories for a specific period of time, within one day or over several days. They have deadlines that allow them to properly prepare a story in time to go to press or go on the air.

A deadline is the time when a newspaper or a station can no longer receive a story for a specific printing or broadcast. A newspaper typically has one deadline for each day's printing. Radio might have several deadlines for the various news segments. Most television stations have news deadlines for morning, noon, evening, and nightly news. Deadlines can correspond to the kind of audience the organization is trying to reach—drive time or evening news, for instance. News television stations such as CNN may have hourly news deadlines.

Deadlines are one of the hard realities in the news and public relations businesses. Because of the preparation times that are required to gather news details and prepare stories for print and airing, news departments establish deadlines. Public relations practitioners must know the deadlines for each news venue where they would like to have a story appear.

In preparation for getting reporters' attention to their media releases, practitioners may need a campaign plan that includes set schedules. Part of setting each schedule is to *backtime*. Backtiming means that practitioners set a schedule starting from the date a campaign must be executed and scheduling backward to set the times when each element of the campaign must be started to meet the deadlines of the various reporters whose attention they seek.

A lot of preparation can be wasted if at some crucial moment the practitioners fail to have the news information to the reporters within the limits of their deadlines. Stories that are pitched too soon may be forgotten by the date of the event. Releases that reach reporters after the deadline will necessarily fail to be printed or aired as part of the regular news.

Because of the combination of campaign schedules and media deadlines, any observant reader, listener, or viewer can predict certain events by what they see happening. For instance, it is not a matter of accident or coincidence that a major star appears on early-morning or late-night talk shows just days before a release of a movie or CD featuring the artist. All of that "news" is carefully timed to meet deadlines and campaign schedules. It is intended to create interest, or buzz, about the movie or CD and enhance sales.

Thus, deadlines affect when the practitioner needs to get information to the reporters in time to pitch an event. Another variation of this theme can become a reality during crisis response. If something newsworthy happens, reporters are likely to contact a company spokesperson, for instance, seeking comment. If the comment comes too late, the story is likely to air or be printed without the company's side of the story being included. Even worse might be the inclusion of one of the following statements by reporters: "The company did not respond to our inquiries by air time" or "This reporter tried repeatedly to contact the company without success." Such comments indict the company, make it seem guilty, and damage its reputation or image. Experienced practitioners provide recorded telephone message information that allows reporters to find them, perhaps through a

pager, at virtually any hour of the day. They know that they must be available as needed to meet reporters' deadlines for a working story, especially one concerning a crisis.

—Robert L. Heath

DECISION THEORY

Decision theory is the formal analysis of decision making through the systematic evaluation of decision alternatives. Understanding decision theory is important to public relations because the function involves high-level decision making and counseling the dominant coalition on decision alternatives, particularly in the area of issues management. Francis Heylighen defined decision theory in this way: "Decision theory is a body of knowledge and related analytical techniques of different degrees of formality designed to help a decision maker choose among a set of alternatives in light of their possible consequences" (1999, n.p.). This is a noteworthy definition because it covers all areas of decision making, whether based in statistics, ethics, management, public relations, or issues management. Another definition of decision theory, from the *McGraw-Hill Encyclopedia of Science & Technology*, states, "Decision Theory: A broad spectrum of concepts and techniques which have been developed to both describe and rationalize the process of decision making, that is, making a choice among several possible alternatives" (p. 66). Generally, decision theory falls into the areas of decision making under conditions of certainty, uncertainty or ambiguity, and risk. Much of the literature in the decision discipline discusses its theory as a mathematical framework for reducing uncertainty.

Decision making is a crucial concern for an organization because it impacts all individual and group efforts that take place. Practically every act in public relations is a result of a decision among alternatives. A decision alternative is a viable option in the weighing of various actions the organization could take in managing an issue.

The most commonly occurring theme in decision theory is *utility*. Utility is a measure of the benefit of each decision alternative, or what that alternative would bring about. In decision theory, expected utility is understood as the possible outcomes of a decision and their usefulness to the decision maker. Decision theory generally holds that the best decision is the one that generates the greatest utility. The concept of utility is related to the moral philosophy of utilitarianism, which holds that a moral decision is that which produces the greatest good, or utility, for the greatest number of people.

Tapan Biswas (1997) said the decision maker is normally conceived in theoretical decision models as a *utility maximizer*. However, many decision theorists have noted that in reality, people often make choices that are less than maximized, choosing things that will just satisfy their needs; they "satisfice." Satisficing is based on bounded rationality, in which the decision maker is unable to maximize because of imperfect information but makes do with the information available. Often, imperfect access to and flow of communication was the factor limiting decision making to bounded rationality, sometimes forcing the decision maker to satisfice.

Stephen P. Robbins explained satisficing as "Good enough replaces maximization as a criterion of effectiveness" (1990, p. 263). Because satisficing does not lead to optimal conditions or results, it generally renders a temporary solution. Problems that are not resolved to the satisfaction of all parties, including those decisions that simply satisfice, prove an unstable base for relationship building in public relations. When decisions are made on the basis of satisficing rather than maximizing, it is common for one or more publics to be less than satisfied with the outcome. When that occurs, it is common for publics to reopen the decision to discussion and contention.

Factors that influence decision making are complex. John P. Van Gigch wrote, "The search processes by which the mind generates alternatives is still only partially understood" (1974, p. 59). One such influence is the pressure of human interaction on the decision. Ronald R. Sims stated, "Pressure toward conformity . . . is the main factor that leads individuals to make and own defective decisions" (1994, p. 56). Commonly referred to as "peer

pressure” or “group think,” the influence on the decision making exerted by social norms, role expectations, group membership, and fear of negative repercussions is considerable. Decision theory is an attempt to assuage the influences of these factors in favor of a more scientific decision-making framework. However, there are many challenges when attempting to conceptualize human decision making.

Another factor that influences decision making is the choices, or lack thereof, perceived by the decision maker as available to him or her. A decision is only as good as the best choice available to the decision maker. However, the decision maker must be free to take an option in order to consider it a viable decision alternative, worthy of analysis, investigation, and potential implementation. At this juncture, options and freedom are vitally important. Frederic Schick argued, “Choices presupposes options, and having the option of doing something implies that you think you are free to do it” (1997, p. 9).

Dealing with decisions under conditions of certainty, we can employ decision trees listing the various decision alternatives available and the probabilities associated with the outcomes of each. However, because certainty is nearly impossible in the realistic implementation of public relations, we will briefly review the two other branches of decision theory: decision making under risk and decision making under uncertainty or ambiguity.

DECISION MAKING UNDER RISK: BAYESIAN THEORY

Bayes, who lived from 1702 to 1761 in Great Britain, was a mathematician who first used probability inductively and established a mathematical basis for probability inference. Probability inference is a logical means of calculating, from the number of times an event has not occurred, the probability that it will occur in future trials. In his discussion of decision theory involving risk, Schick stated: “The maximizing-utility logic of risk is often called *Bayesian*. The Bayesian form of logic assumes precise numerical utilities and probabilities” (1997, p. 38).

This mathematical basis for decision making is called the *Bayesian Theorem*. It uses probability

theory as logic and serves as a starting point for inference problems. A logical consequence of the Bayesian Theorem is *Bayes’ Rule*, a decision-making rule whereby one acts to maximize the expected posterior utility. In simpler terms, one acts where the probability of attaining one’s goal is highest. This concept is analogous to acting on the highest expected value in a decision tree.

Although Bayesian logic is highly theoretical, its practical applications have grown. Microsoft Corporation is using a Bayesian approach, enabling software to identify problem areas and provide help to users based on the inferential probability of what is causing the problem. Bayes’ theorem is being used at an increasing rate in many branches of science and technology, such as drug trials overseen by the Food and Drug Administration, as well as in management. However, the application of Bayes’ Theorem requires advanced computing resources and, more formidably, familiarity with applying the theorem to practical decisions.

DECISION MAKING UNDER UNCERTAINTY OR AMBIGUITY

In decisions being made under conditions of uncertainty or ambiguity, the complexity of choices containing many options of varying utilities poses difficulty. Schick termed these types of scenarios “multidimensional choosing, multi-attribute or multi-objective choosing” (1997, p. 41). Complexity is compounded when we consider that decision alternatives can have unknown utility or unintended consequences. There are two types of decision making under uncertainty: the maximins rule and the subjective probabilities approach. Both of these approaches represent a way to “solve for” the condition of uncertainty.

In an attempt to reduce uncertainty, decision makers can base their choices on what is known in decision theory as “maximins” or the “max-min rule.” Schick explained this concept as the “option whose worst or *minimal* outcome is the best or *maximal* of the different worst possibles” (1997, p. 37). The concept of maximins, or choosing the option that maximizes the minimum outcome, is a principle that must be carefully implemented to avoid

limiting long-term options. In practical application, maximins means choosing the decision alternative that provides the least chance for problems and the best probability of maximum utility.

In the subjective probabilities approach, research is conducted to gather as much information as possible. Then, with the aid of historical data, experts assign projected probabilities to each decision alternative. This approach is a systematic attempt to reduce the impact of a lack of information on the decision. However, it is difficult, if not impossible, to attain precision and apportion probabilities when problems are vague. Indeterminate problems can defeat the tools decision theory uses in measuring weighted averages. Decision making under conditions of ambiguity or uncertainty is an imprecise science. The possibility for error and miscalculation is high due to the subjective and indeterminate nature of this approach.

DECISION THEORY IN PUBLIC RELATIONS

Given the importance held by decision making, we can understand how it relates to many of the functions of public relations discussed in this encyclopedia: strategic issues management, ethics, crisis, conflict resolution, and counseling senior management, as well as day-to-day technical functions. Decision theory is applicable to almost every business pursuit.

Although decision theory is not commonly linked to public relations theory, it is clear that the application of decision theory to public relations can enhance effective management. Perhaps the most important area of application is issues management or top-level organizational decision making on matters of policy and debate. In this area, it is necessary to evaluate decision alternatives under conditions of imperfect information (ambiguity or uncertainty) and risk.

Conflict is inherent in decision making, and issues management decisions are often a contentious interplay of competing interests, such as those of activists, those of the legal department, financial concerns, management concerns, labor

interests, regulatory agencies, and so on. Decision theory provides the public relations practitioner with a coherent and methodical framework within which to analyze alternatives and maximize the efficacy of his or her decisions.

DEFAMATION (LIBEL AND SLANDER)

At one time, the field of defamation was separated into libel (written) and slander (oral). This separation assumed that a more permanent record of the defamation had the potential for greater harm. But with new technologies such as radio and television, with the potential for the spoken word reaching millions of people, and with audio and video recordings being as least semipermanent, the reasons for the distinction have vanished.

The key component of defamation is a statement or inference of fact that has the tendency either to harm the plaintiff's reputation and lower the plaintiff in the esteem of the community or to harm the plaintiff's business or organization by deterring people from doing business with them. The plaintiff can be an individual, a corporation (either for profit

or nonprofit), or some other organization. However, in the United States, the government cannot sue for defamation.

The issue of defamation is important for public relation practitioners because it is the “most common, and perhaps the most serious, legal problem facing the mass communications industry. . . . Nearly every press release, news article, or advertisement holds the potential for a libel suit” (Moore, Farrar, & Collins, 1998, pp. 188–189). As noted by a number of commentators, defamation law is very frustrating and erratic. The lines are not very distinct and do not adequately protect either media or communication professionals from the costs of defending themselves in law suits, nor does the law provide adequate protection for the plaintiff who has been defamed. There have been several suggestions for improvement, such as the American Bar Association’s Uniform Correction or Clarification of Defamation Act and the Annenberg Washington Program’s Libel Reform Act, but they have not been adopted.

The elements that go into making up a defamation suit are publication, identification, defamation, and fault. The defamatory statement has to be “published” to at least one person other than the plaintiff and the defendant. The scope of the publishing goes to the issue of harm and damages. The plaintiff then has to be identified in some way; otherwise the plaintiff has not been harmed. The identification does not have to be by name if there are surrounding facts that would enable the community to identify the plaintiff. The statement also has to be capable of decreasing the reputation of the plaintiff in the estimation of a relevant community. And since 1964 in *New York Times v. Sullivan* (public officials), and 1974 in *Gertz v. Robert Welch, Inc.* (public figures/private figures), the plaintiff has to prove fault on the part of the defendant. If the plaintiff is a public official or a public figure, either all-purpose (i.e., occupying a position of pervasive influence in society or having a name recognized by the general public) or limited (involved in a limited public controversy), the level of fault that the plaintiff has to prove is actual malice, meaning the defendant acted with knowledge that the statement was false or with reckless disregard of its truth or

falsity. If the plaintiff is a private figure not involved in a public controversy, there has to be some level of fault proven, but that level is left up to the individual state courts. It is usually some level of negligence, but it cannot be strict liability, which means that if there is publication, identification, and defamation, fault on the part of the defendant is assumed. Negligence is a much easier burden of proof for the plaintiff to meet than is malice, and often, as a result, defamation cases are decided at the threshold level of the classification of the plaintiff as either public or private.

There are defenses against defamation suits based on the First Amendment (*New York Times* and *Gertz*) that are intended to ensure that communication is protected, absent actual malice, and to ensure uninhibited and robust debate on matters of public concern. In addition, certain common law defenses are also available. These include truth that can be proven. In other words, the statement in question does not have to be absolutely true but true in the crux of the charge being made (see *Masson v. New Yorker Magazine, Inc.*, 501 U.S. 496 [1991]). There may be a privilege to disseminate the information. The privilege may be absolutely protected by law or qualified, if the dissemination is fair and accurate. Another defense is the expression of fair comment and opinion, which allows for criticism of plays, restaurants, governmental policies, and so on (see *Milkovich v. Lorain Journal Co.*, 487 U.S. 1 [1990]). There are other defenses that don’t come into play as much, such as neutral reportage, consent, and right of reply.

Often what the potential plaintiff is looking for is an apology or a retraction, but negotiations for redress are often unsuccessful, and the issue goes to court (Moore et al., p. 189). Although an injunction may be possible in some cases (usually not favored because of free speech implications), the usual remedy if the plaintiff succeeds is monetary damages. Nominal damages are awarded if the plaintiff was right but suffered little or no damage to reputation. Special damages are provable out-of-pocket losses. General or presumed damages attempt to compensate plaintiff for damage to reputation. Punitive damages tend to be large in amount and are

designed to dissuade the defendant from taking similar actions in the future. After *Gertz*, plaintiffs cannot be awarded general or punitive damages without meeting the actual malice standard.

Defamation is the most common legal concern of communication professionals. Knowledge of the basics of defamation law is essential for public relations practitioners. Changing technology will lead to even more challenges and a continuing need to keep current in the area.

DEMOGRAPHICS

Demographics represent the physical characteristics of a population, such as age, occupation, marital status, household size, geographic location, education, and ethnic background. *American Demographics* magazine uses the acronym RAGE to explain the more popular demographic variables examined by the Census Bureau and other organizations: race, age, gender, and education. For public relations practitioners in particular, demographic characteristics help one to better define target publics and to tailor messages and programs especially for them. For instance, although one organization may be interested in enhancing its awareness among preteens, another organization may be planning to focus on senior citizens when launching a new service.

Demographic information plays a key role in the research process. This information is usually requested when primary research is being conducted. Using both qualitative and quantitative research methods, sponsoring organizations seek to distinguish demographic characteristics for an array of variables. First, the sponsoring organization can calculate descriptive statistical analyses to examine the mean, medium, and mode in order to describe the population being researched. Further, patterns in the data can be detected.

Second, the sponsoring organization can calculate differential statistical analyses to determine whether particular characteristics serve as predictors of behavior. For instance, an organization may learn that gender significantly influences how much money a person spends on formal dress attire. Or one might determine from the results that age significantly influences the types of media its primary publics refer to when seeking information.

Valuable demographic information can also be obtained via an array of secondary resources, such as the United States Census Bureau and other organizations responsible for collecting ongoing demographic and market data about a given population. For example, various research and governmental entities collect data among a broad spectrum of segments, ranging from industry-specific (e.g., retail, health, education, and entertainment) to gender, income, age, and consumer lifestyle activities and trends. With access to the World Wide Web, a plethora of information is now available, free of charge, via the Internet.

However, demographics, independently, may not be the most feasible characteristics on which to focus. Much of the literature recommends examining demographics in tandem with various psychographic characteristics such as lifestyles, attitudes, and personal values. Together, demographic and psychographic characteristics can paint a vivid picture of a *potential* public. The practitioner also can learn valuable information about the *present* primary publics the organization is serving. For example, managers at a local convention and visitors bureau (CVB) located in Michigan may conduct survey research to learn more about vacationers who travel to this destination. From their research, they learn that most vacationers

come from neighboring states because Michigan offers travelers opportunities within a drivable distance. The data further indicate that these travelers represent families with children under the age of 18 with an average gross family income of between \$40,000 and \$60,000 and at least one parent having earned a bachelor's degree.

The psychographic portion of the research reveals that these travelers engage in outdoor recreational activities, they are very interpersonally oriented, they refer to the Internet when seeking information about making travel plans, and although they are not "cheap" per se, they do value "bang for their vacation buck." This information can aid CVB managers in developing communication programs that further enhance relationships among their key traveling publics. They also can use the information to develop promotional communication campaigns to attract potential new visitors to the area.

DEONTOLOGY

Immanuel Kant (1724–1804), the progenitor of deontology, is among the most influential

philosophers of the Western intellectual tradition. Kant taught and wrote late in the Modern period of philosophy, defined as the 1500s through the 1700s. Kant's doctrines had such an impact on philosophy that they were considered a revolutionary approach, worthy of consideration separately from all other schools and philosophers of the Modern period.

Kant authored an enormous volume of philosophical writings on topics as diverse as geometry, political theory, the physics of time and space, metaphysics, geography, cosmology, and moral philosophy. Kant's moral philosophy and the ethical theory of deontology that developed from it are of primary concern in public relations.

WHO WAS IMMANUEL KANT?

Kant was born in Königsberg, Germany in 1724, where he lived almost exclusively until his death in 1804. He began his career as a mathematics professor at the University of Königsberg, where he was appointed to a chair of metaphysics at age 46. He went on to become "the first great professor of philosophy" (Beck, 1963, p. x). Paul Guyer wrote that "Kant's *Critique of Pure Reason* (1781) shook the very foundations of the intellectual world" (1992, p. i). Kant's impact can be seen in almost all subsequent philosophical schools.

Kant was fourth of nine children of a harness maker. He was reared in a devout Protestant family. Kant was later deemed the premier philosopher of Protestantism due to his unadulterated belief in individual autonomy. Evaluations of his family's economic means ranged from modest to impoverished. Although Kant's writings were perceived as foreboding, he gained renown as an engaging lecturer who drew students from throughout Europe. A former student described Kant's "playfulness, wit, and humor" and, although Kant is often portrayed as a solitary individual, friends lauded his social graces and skill as a conversationalist.

Kant was a productive author, producing 20 books and hundreds of essays, most in German and several in Latin (Sullivan, 1989). He was also an inspiring professor; a former student remarked, "His hearers certainly never left a single lecture in

his ethics without having become better men” (Beck, 1963, p. ix).

KANT’S CONTRIBUTION

Kant radically altered the thought patterns in Western culture and turned philosophy inward toward the self. Herbert J. Paton, an emeritus professor of moral philosophy at the University of Oxford, asserted: “Kant contrived to say something new about morality. This remarkable achievement has compelled every subsequent writer on moral philosophy to examine his views” (1967, p. 15). All philosophers must now include Kant in their philosophizing and argue for or against him because his impact is so great that he cannot be ignored.

Kantian contributions to philosophy include his expositions of moral worth, duty, and good will. Moral worth and duty are arguably the most well known tenets of his doctrine, but Marcia Baron explained that these two constructs are tools Kant used to illustrate the crux of his philosophy: the good will. Baron explained, “The good will is manifested in actions done from duty” (1995, p. 183). Actions done from duty differ from actions inspired by inclination or self-interest. Therefore, Kant’s discussion of duty provides a means to analyze the good will. Kant’s exposition of the morally good will profoundly influenced the course of philosophy.

DEONTOLOGY: KANT’S MORAL PHILOSOPHY

The term *deontology* is derived from the Latin word for “duty,” indicating the central role that acting from obligation to uphold moral law plays in Kantian philosophy. Deontology is defined as “the ethical theory taking duty as the basis of morality” (Flew, 1979, p. 88). This branch of ethics asserts that an act is morally worthy if it upholds one’s moral obligation. Kantian philosophy is a prime example of a nonconsequentialist approach to ethics, meaning that actions are not justified by their consequences. The course of moral action is not determined by projecting

the consequences of the decision. Rather, the consequences of a decision are noted, but they are not the determining factor of the decision. The determining factor in Kantian philosophy is whether the act upholds a universal duty to the moral law as defined by the good will or good intention. However, deontology is too complex to be summarized so briefly, and is best understood as a synergy of its theoretical components. The core theoretical components in deontology (Bowen, 2004, p. 70) are

- Transcendentalism and rationality
- The law of autonomy
- The categorical imperative
- Dignity and respect
- Duty
- Intention—a morally good will

TRANSCENDENTALISM AND RATIONALITY

Kant attempted to show the primacy of moral decision making over logical positivism and pure empiricism, which were popular in his day. Deontology incorporates the strengths of both rationalism and empiricism and attempts to avoid the flaws in each.

Kant’s contribution to methodology was introducing what he called a *transcendental deduction*. Roger Scruton explained, “An argument is transcendental if it ‘transcends’ the limits of empirical inquiry, so as to establish the a priori conditions of experience” (1982, p. 23). Kant’s philosophy was transcendental because it arose from the elements of human cognition, which are not purely empirical but also based on sensation and intuition. Matt McCormick explained the transcendental deduction as the structure imposed by the mind on external things that makes experience possible. Reality as seen by the mind is a common concept today, but it was a revolutionary idea in Kant’s time. The importance of Kant’s *Critique of Pure Reason* (trans. 1997) is that it restructured the way the intellectual world conceived reality.

Kant’s argument (in the 1977 book *Prolegomena to Any Future Metaphysics . . .*) is that his philosophy

is in direct response to the moral skepticism of British philosopher David Hume. Hume held that knowledge could not be gained through reason and based his philosophy entirely on empirical experience. Disagreeing with Hume, Kant held that the rationality of the human agent was a necessary condition for moral decision making. Kant based his theory on the understanding that people have a rational, moral reason that is capable of “determin[ing] how we should act and also be able to motivate us to act on [our] judgments without relying on any prior desires” (Sullivan, 1989, p. 45). Kant defined reason as “the faculty of principles” and believed that the ability to reason was the basis for morally worthy decisions—as opposed to self-interest, greed, fiat, or similar factors. This belief in the individual decision maker forms the basis of Kant’s philosophy.

LAW OF AUTONOMY

Kant derived the maxims for his moral philosophy from his law of autonomy, which stated, “A moral agent is an agent who can act autonomously, that is, as a law unto himself or herself, on the basis of objective maxims of his or her reason alone” (Sullivan, 1989, p. 48). Kant added that universality is the key on which the law of autonomy rests; he called this “the idea of the will of every rational being as a will which makes universal law” (Kant, trans. 1964, p. 98).

The idea of a universal law includes the reversibility concept of the decision maker being on the “receiving end” of a decision. Therefore, if a rational human agent is free to act autonomously in willing his or her moral will to become universal law, then it must be a moral decision. This standard must exclude children, animals, and the mentally ill, because the agent must be a rational decision maker.

Kant articulated the theory that a person has the autonomous power to act as an independent decision maker, using only good will and rationality as the bases for a decision. Based on the deontological law of autonomy, a decision can be made through reason, rationality, and moral duty, rather than being based on the subjective concerns that promote one’s personal advantage, or the advantage of

the organization or client, which can cloud practitioner–client relationships in public relations. Kant regarded autonomy as a moral absolute and as an obligation that provides the basis for a powerful moral norm in the form of the categorical imperative.

CATEGORICAL IMPERATIVE

The guide to moral decision making that Kant based on the law of autonomy is the categorical imperative. The categorical imperative is a decision guide that can be employed to address ethical dilemmas in practice. There are three forms of Kant’s categorical imperative, but the most well known is Form 1 from his *Groundwork of the Metaphysic of Morals* (trans. 1964), which reads, “Act only on that maxim through which you can at the same time will that it should become a universal law” (p. 88). Kant explained that a maxim is a principle on which a subject acts.

Categorical refers to the fact that all moral agents are obligated absolutely and unconditionally, “not hypothetically or conditionally” (Sullivan, 1989, p. 49). The categorical imperative goes beyond the Golden Rule—do unto others as you would have them do unto you. Kant argued that the Golden Rule is based on merely prudential maxims of self-interest rather than a morally good will and is thus simply a norm of prudential reciprocity. Further, Kant maintained that the Golden Rule does not require “the respect owed others or duties of benevolence to them” (Sullivan, 1989, p. 204).

The categorical imperative is such a powerful norm of moral behavior because it is grounded in universal applicability. Paton argued, “To judge our own actions by the same universal standard we apply to the actions of others is an essential condition of morality” (1967, p. 73). The categorical imperative is a valuable guide for public relations ethics because it reduces the potential for subjective interpretations.

DIGNITY AND RESPECT

Form 2 of the categorical imperative is once again based on the law of autonomy, but it concentrates on the dignity and respect inherent to all autonomous

agents. It states, “Act in such a way that you always treat humanity, whether in your own person or in the person of any other, never simply as a means, but always at the same time as an end” (Kant, trans. 1964, p. 96).

This form of the categorical imperative is often interpreted as Kant’s law of justice because it obligates people to respect all other human beings and themselves as well. Kant maintained that all people are deserving of dignity, respect, and self-respect. Scruton clarified, “The autonomous being is both the agent and repository of all value, and exists, as Kant puts it, as an end in himself” (1982, p. 70). Every person is equal in Kant’s view, and this assertion was a radical—and dangerous—break with the prevailing view of aristocracy in Kant’s day. In fact, during the reigns of both Kings of Prussia—Frederick the Great and Frederick William II—Kant had to exercise great care in publishing such revolutionary ideas.

DUTY

Kant contended that acting according to universal duty is obligated by people’s ability to reason and act autonomously, and occurs out of reverence or respect for the moral law. Doing one’s duty to uphold the moral law results in happiness, in Kant’s view. In fact, he defined ethics as being worthy of happiness.

Kant argued that feelings and desires are subjective and that morality would be reduced to prudence if these were used to guide moral decisions. Sullivan asserted, “The categorical imperative commands us, not to allow ourselves to be ruled by our feelings and inclinations” (1989, p. 120).

Acting from duty is seen in deontology as morally worthy. Acting from compulsion is still moral but far less worthy. For this reason, codes of ethics in public relations, such as the Public Relations Society of America (PRSA) Code of Ethics and Professional Standards, rarely have a punitive component. Acting ethically is considered the duty of public relations professionals, and moral worth is found in desiring to be an ethical practitioner and acting accordingly out of a sense of duty.

INTENTION AND THE MORALLY GOOD WILL

A good will holds the highest moral worth in deontology. Kant wrote, “Nothing can possibly be conceived in the world, or even out of it, which can be called good without qualification, except a *good will*” (Kant, trans. 1964, p. 61). Kant discussed the possibility of courage, happiness, and other good characteristics becoming evil when possessed by the maleficent person. Happiness, he noted, could even inspire vanity and presumption if not complemented by a good will. He concluded, “Thus a good will appears to constitute the indispensable condition for even being worthy of happiness” (trans. 1964, p. 154).

The morality of an action does not depend on its outcome because outcome is beyond control. Instead, intention is where Kant finds morality, and he deducts that a good intention begins with the will. Kant conceived of acts in terms of the motivation behind the action. People are obligated to act according to duty, but the intentions behind the action determine the action’s moral worth. Kant believed that an action has less moral worth when it is performed from obligation than from duty and a good will.

Critics of Kant often judged his theory harshly because they saw acting from duty as onerous. However, Kant’s equation of happiness and a morally good will with the ultimate value argued against this interpretation. Kant believed that a morally good will gives equally high worth and dignity to all people who possess it. Kant had great faith in the ability of reason in the common person, and he argued that one need not be highly educated to understand and possess a moral character. Sullivan explicated, “Kant’s entire moral philosophy can be understood as a protest against distinctions based on the far less important criteria of rank, wealth, and privilege” (1989, p. 197). Kant’s categorical imperative shows that he was a truly egalitarian philosopher because every person, regardless of socioeconomic status, is capable of achieving the highest known achievement—a good will.

CONCLUSION

There are several advantages in applying deontology to public relations decisions over applying a utilitarian paradigm. Utilitarianism asks the decision maker to accurately predict future consequences of a decision, often an impossible task. Utilitarianism always favors the interests of the majority, even though a small public might have valuable ethical insight into an issue that would go unattended. Utilitarianism can also be used to justify questionable activities in an “ends justifies the means” approach. Deontology suffers from none of these drawbacks; furthermore, it offers a consistent, rational, methodical approach to ethical decisions. The clear imperatives of deontology allow organizational values to be followed in a reliable manner. Such consistency can enhance the reputation of an organization as ethical, thereby building and maintaining relationships with publics.

Kantian deontology has been applied to public relations in developing theory, empirically testing deontological theory, and assessing the ethical paradigms of public relations practitioners. Deontology provides a means for practitioners to analyze ethical dilemmas that is both philosophically sophisticated and immanently practical.

DE-POSITIONING

Positioning a product or service in a market and differentiating it from the competition are strategies widely viewed as ethical and professional, as long as assertions made in the campaign are accurate, complete, and fair. The same cannot be said for a different practice: de-positioning, which seems to mean undermining a competitor's product or service using any means available.

De-positioning, in the view of some proponents, means attacking a competitor's new idea, product, or service the moment it surfaces. The attack begins even before all the facts are available. It means rushing to get your own new idea, product, or service out even if it isn't fully developed. It means generating sufficient chaos and confusion to discredit a competitor's new product, idea, or service or to spoil its launch.

There are many problems with de-positioning, not the least of which is the damage a de-positioning campaign can do to your own industry. If you attack product X unmercifully, consumers might start to wonder about product Y and product Z, and they might eventually get around to wondering about your product. An attack against a competitor can actually be an attack against yourself if the campaign has an unanticipated and negative impact on your product or service.

De-positioning also lowers the ethical and moral tone of society generally and of business, fundraising, and other practices specifically. This hurts any organization that is trying to get a fair hearing from the public for a product or service and makes it hard for honest businesses and nonprofit organizations to establish and to maintain high credibility with their publics.

An organization that tries to de-position the competition uses questionable techniques that, when publicized, will harm the organization's prospects. It can take years and a good deal of hard work to polish a tarnished image. When those de-positioning activities are exposed, as they surely will be, they will be described as unethical.

Consumers are poorly served by de-positioning activities. If company X really does have a super new product but cannot get it accepted because of the confusion created by company Y's de-positioning efforts, consumers will be the primary losers. Worse, consumers might buy company Y's bad product (rushed off the assembly line before it was ready just to de-position company X's product), rather than company X's superior product. All of this is good for company Y in the near term, but it is bad for everyone else, and it will be bad for company Y in the long term.

DIALOGUE

The dialogic approach to communication goes back to the Socratic notion of dialogue (or dialectic) as a philosophical tool for uncovering truth and discovering knowledge. Modern treatments of dialogue have described it as an interpersonal conversational technique based on respect and trust, and as an approach, or orientation, toward communication.

Dialogue as an approach to communication involves *risk* (a willingness to interact with others and to be changed), *trust* (fairness and openness), *proximity* (spontaneous, honest, face-to-face contact), *empathy* (supportiveness), *mutuality* (a recognition of shared goals and interests), and *commitment* (to ethical conversation). Rob Anderson, Kenneth Cissna, and Ronald Arnett explained, “Dialogue is a dimension of communication quality that keeps communicators more focused on mutuality and relationship than on self-interest, more concerned with discovering than disclosing, more interested in access than in domination” (1994, p. 2).

Each dialogic concept is integral to achieving “ethical” conversation. For example, when individuals or groups with divergent beliefs are interacting, each party must be able to trust that the other will not exploit them. An activist who agrees to meet with an organizational representative must be able to trust that the organization is not simply trying to distract the group while they secretly lobby Congress or take some other action. Without trust, authentic, mutually oriented communication cannot occur. Similarly, before trust can be built, interlocutors must be willing to risk, taking a chance that the other party will be honest and forthright.

Authentic dialogue is said to require spontaneous, face-to-face, interpersonal interaction. Both parties must be committed to the process of dialogue, or conversation. True dialogue is not achieved through sporadic or infrequent interactions. Trust and empathetic understanding are built over time, through repeated conversations and the pursuit of mutually beneficial goals. True dialogue requires commitment to the conversational process.

Dialogue has been studied by an assortment of scholars from diverse fields of study including communication, philosophy, political science, and psychology. As Carl Rogers suggested of his dialogic approach to therapy, dialogue is about “unconditional positive regard” for the other (1994, p. 128). Paolo Freire suggested in *Pedagogy of the Oppressed*, “Dialogue cannot exist without humility. . . . How can I dialogue if I am closed to—and even offended by—the contribution of others?” (1994, pp. 71–72). Similarly, Michael Kent and

Maureen Taylor (1998) conceived of dialogue as a public relations tool, with *dialogic communication* referring to any negotiated exchange of ideas and opinions. The term *dialogic* denotes a communicative give-and-take and is guided by two principles: First, individuals who engage in dialogue do not necessarily have to agree; quite often they vehemently disagree. However, what they share is a willingness to try to reach mutually satisfying positions. Second, dialogic communication is about intersubjectivity.

Implicit in the notion of dialogue is the belief that the orientation that one holds toward others influences the quality of communication, and ultimately, influences the development of relationships. When interlocutors are viewed as alien, or “other,” effective conversation (involving risk, trust, empathy, etc.) is more difficult.

One of the obstacles to using dialogue as a practical public relations tool has been the variety of ways that the term *dialogue* has been used. To political pundits, dialogue often means nothing more than talk. To political scientists, dialogue often refers to public forums where political leaders express opinions (public debates). According to Richard L. Johannesen, dialogue often refers to ethical communication that acknowledges “the *attitudes toward each other* held by the participants in a communication exchange” (1990, p. 58, italics in original).

Until recently, dialogue in public relations was equated with “two-way symmetrical” communication. The equating of dialogue with symmetrical communication, however, has primarily been the result of casual language use. More recent treatments of dialogue in public relations have focused on dialogue as a useful framework for effective (and ethical) organization–public communication.

Most public relations treatments of dialogue have made it clear that dialogue is not simply a procedural approach to effective communication. Rather, dialogue requires commitment on the part of organizations and publics to communicate ethically (according to a set of mutually agreed upon conversational rules), and to try to act in the mutual interest of organizations and publics.

DIFFERENTIATION

Organizations need to stand out as unique among their various competitors. Thus, marketing, management, and communication professionals seek to differentiate their organizations from their competitors.

Differentiation results when stakeholders (markets and publics) make attributions about an organization that, at least in part, view it as different or unique in some way among its competitors. Differentiation is important for businesses. The assumption is that customers make strategic distinctions among competitors. The most obvious distinctions might be as simple as price, quality, availability, and customer relations.

Differentiation is also vital for nonprofits. They work to provide unique community-based services. Thus, some support the arts (museums and theaters, for instance). Others address needs of specific populations. For instance, nonprofit hospitals raise money to provide services that might depend on a specialty (burn treatment or cancer treatment) or for a demographic class (children or the indigent). The United Way differentiates itself by raising funds for a variety of charitable purposes. The Light House for the Blind serves individuals who have limited or no vision capability.

Differentiation occurs even in the governmental sector. Some agencies build or repair roads. Others provide emergency and safety (police, fire) response. Some protect water quality, and others handle solid waste. Various military branches compete for funding based on their unique service to the national welfare and general peace. The United States Postal Department competes with commercial package delivery rivals.

Differentiation is primarily a marketing decision. Businesses are differentiated by product line (chemical manufacturing versus farm implement manufacturing), and by product type or line (pickups, SUVs, minivans, sedans, or sub-compacts). Product positioning can include filling a market niche, such as high-cost luxury watches versus low-cost sports watches. Discount stores are different from department stores and specialty boutiques.

Placement can also be a matter of differentiation. At the counter of movie theatres one would expect popcorn, soft drinks, hot dogs, and candy, but not pickups and farm equipment. Specialty products are often sold in specialty stores, or even by brand name. Such stores are unlikely to stock the high-volume, low-cost items that are more typical of discount stores.

Positioning is also a matter of differentiation. What markets does a company serve? What markets within its industry does it not serve? Is it retail or wholesale? Is it long on service and short on product? Or is it the opposite? Quality is also a positioning decision that can differentiate products and the companies that sell them. Think of the varieties of alcoholic beverages that are available—to satisfy all tastes.

Many of the matters of differentiation mentioned above are the primary responsibility of marketing. Others come closer to the purview of public relations. Some advocate, for instance, that customer relations should be a primary function of public relations. Organizations can differentiate themselves by how well they respond to the needs, wants, and concerns of customers. Product support can be a matter of differentiation, as well as the return policy.

Organizations attempt to differentiate themselves by how they relate to the people in the communities

where they operate. Some organizations build rapport, solid relationships, with persons in the community. These relationships can differentiate the organization as one demonstrating commitment to the community. They work to prove that they operate in the public interest. That is an important focal point of differentiation. The way an organization seeks (or fails) to build goodwill can differentiate it from other organizations. Is it open? Is it ethical, aspiring to the highest standards of corporate responsibility? Does it share control with the members of the community? Is it willing to work to solve issues, or does it seek to dominate their resolution? Does it foster and work to meet values of its stakeholders, such as working toward a diverse workforce or demonstrating a commitment to environmental protection?

The identity or image of the organization features the attributes that stakeholders use when they think about it. The strongest theoretical foundation for this line of analysis can be derived from information integration theory. This conceptualization of differentiation assumes that each set of stakeholders can have different (and compatible or incompatible) views of the same organization, including products and services. Employees see it as a good place to work, because it supports employees and produces products or services that foster pride among the workforce. Customers may ignore the elements of employee relations but focus on those attributes of the organization most relevant to purchases or service use.

The list of attributes that are used to differentiate one organization from another, one industry from another, or one service group from another is both endless and fairly limited. On the one hand, terms relevant to a set of services in the military may be used to attract recruits to one branch of the military based on its differences; serving in the air force is different from serving in the navy or army. The basic attributes then may be “land,” “air,” and “sea.” On the other hand, one unifying theme across all branches (differentiating them from other organizations) might be “leadership training” and “technology training.” Thus, information integration theory suggests that people carve their experiences into discrete categories and make decisions accordingly.

Product claims are a vital part of product or service differentiation. Marketing, advertising, and public relations specialists work to decide which claims do the best job of differentiating in ways that lead, for instance, to increased sales. Soft drinks are “refreshing,” beauty products make us more “attractive,” and package delivery is “next day” and “overnight.”

Designing, producing, and getting the product or service to the customer is a marketing function. Letting the customer know about the service is an advertising or public relations function. Here publicity and promotion support advertising to get the message before the stakeholder and create awareness, recognition, and recall. Combined, these functions lead to a motivation to buy, donate, use, attend, and so on.

Beyond publicity and promotion, public relations assists the organization in communication with its myriad stakeholders, such as employees, customers, competitors, community residents, investors, legislators, regulators, and so forth. Public relations also assists organizations with their efforts to differentiate themselves on issue positions as well as to respond during a crisis.

DIFFUSION OF INNOVATIONS THEORY

Diffusion of innovations theory examines how new ideas, practices, or objects are adopted by individuals and organizations (or other “units of adoption”)—a field of research important to public relations practitioners advocating change.

Beginning in the 1950s, Everett M. Rogers, the leading researcher in the field, developed the most comprehensive model of how innovations are adopted. The robustness of diffusion theory is evident in how its early focus has changed from

examining the acceptance of new strains of hybrid seeds among American and developing-country farmers to Rogers’s contemporary analyses of the adoption of new communications technologies.

The major tenet of diffusion theory is that people undergo a five-step process that begins with *awareness*, followed by *interest*, *evaluation*, *trial*, and *adoption*. These steps are alternatively labeled *knowledge*, *persuasion*, *decision*, *implementation*, and *confirmation* (acceptance or rejection). The consequences of adopting a new innovation are alternatively categorized as desirable or undesirable, direct or indirect, or anticipated to unanticipated.

According to Rogers, three sets of variables influence the acceptance of innovations.

Prior conditions provide a context for the consideration of changes by adopters. Examples include previous practices, felt needs or problems, innovativeness as a characteristic of the individual or organization, and norms (expectations) of the social system in which the adoption occurs.

Characteristics of the decision-making unit relate to systemic or inherent characteristics of the adopter, suggesting that certain groups might be more open to change. Characteristics include socioeconomic factors (age, education, status, financial well-being, etc.), personality variables (curiosity, open-mindedness, etc.), and communication behaviors.

Characteristics of the innovation itself also influence acceptance. Rogers suggested that innovations are more likely to gain acceptance if they provide a relative advantage compared to the ideas they replace or to alternative solutions. Acceptance is also more likely when innovations offer compatibility with existing processes or ideas, simplicity (versus complexity), trialability (the ability to experiment on a limited and risk-free basis), and observability (being tangible and readily inspected).

Rogers posits that the adoption rate for innovations follows an S-shaped curve in which adoption begins slowly but rapidly escalates once a critical mass is achieved. Rates of adoption will then taper off after reaching a peak. The relative steepness or shape of the S-curve explains how some innovations are quickly adopted (sharp, steep rise) or

require longer times for acceptance (a wider, flatter curve).

Diffusion theory suggests that adopters can be categorized as to their rate or readiness of accepting new ideas or objects. Rogers alternatively defines and describe these groups as follows:

Innovators—adventuresome, eager to try new ideas; more cosmopolitan than their peers

Early adopters—respectable *localites* (less cosmopolitan than innovators), usually with a high degree of opinion leadership within the social system

Early majority—deliberate, interacting frequently with their peers but seldom holding leadership positions

Late majority—skeptical, often adopting an innovation because of economic uncertainty or increasing network pressure

Laggards—traditionals who are localites, including near-isolates and people whose point of reference is the past

Advocates for change, such as public relations practitioners, are designated as *change agents* in the parlance of diffusion theory. A change agent is usually a professional person who attempts to influence the adoption process in a way deemed desirable.

Early diffusion research examined the degree of homophily or similarity between the change agent and the adopter. The more these parties share common beliefs, the greater the rate of acceptance. However, most change agents are better educated and enjoy higher socioeconomic status than the people they attempt to influence. This makes these groups heterophilous. To overcome differences, change agents must find ways to establish a commonality between themselves and their target audiences. In some cases, this involves employing opinion leaders, community leaders, sales people, and local agents as third-party intermediaries.

Criticisms of diffusion theory. Although more than 4,000 published studies have been completed,

diffusion theory treats the adoption of innovations as a rational process in which people thoughtfully consider innovations. However, many low-involvement innovations don't necessarily follow the rational approach assumed in diffusion theory. Although diffusion theory provides a useful umbrella concept, the exact processes for the adoption of any particular innovation can vary, which makes generalization difficult.

Implications for public relations. Diffusion theory provides several useful ideas for practitioners as they develop strategies for public relations programs and campaigns. These include:

- The importance of stressing characteristics of innovations that increase the probability of adoption
- The importance of prior conditions and characteristics of the adopter; not all adopters are alike
- The importance of creating a critical mass of adopters, particularly by segmenting innovators and early adopters
- Recognition of public relations practitioners as change agents on behalf of their clients

DIGITAL AGE/DIGITIZATION

Digitization (sometimes seen as *digitalization*) is the process of converting information to binary form by means of using 1s and 0s. The Digital Age is the era in which the uses and effects of digitization are manifest in all levels of society.

Computers (in the general sense) predate the Digital Age. Prior to the 1950s, computers were analog, using vacuum tubes. Later, vacuum tubes were used in conjunction with diodes. Like the digital computers that came later, analog computers

used binary logic, but instead of being directly controlled by a program consisting of 1s and 0s, the state of the vacuum tube was changed by a change in voltage. The voltage change was analogous to a 1 (power on) versus a 0 (power off).

In 1956, MIT built TX0, the first general-purpose, programmable computer to use transistors. It was this transition from vacuum tubes that marked the beginning of the Digital Age. Since then, we have moved from simple transistors to integrated circuits, which have allowed us to make computers and computer systems faster, more capable, and more inexpensive.

The progress in hardware capability has allowed for equally exponential growth in software capability. Along with software becoming more powerful, feature laden, and (occasionally) easier to use, the cost has also gone down dramatically.

In 1946, computers stopped being a tool that resided exclusively in the hands of government and became commercially available. After several unsuccessful attempts, the personal computer finally took off in 1977.

It is the last 25 or so years that have come to define the Digital Age. The Digital Age has promoted a substantial transfer of power to the individual. A person with a few thousand dollars worth of equipment now can put together and present information that rivals the output of established news agencies, corporations, and governments.

Although digitization of information allows for easier information flow, it is the Digital Age that has accelerated that flow. People who embrace the Digital Age are being forced to answer a very difficult question: Are the benefits of increased information flow worth the disadvantages?

The increased information flow has allowed corporations and governments to achieve more output with fewer people. Increased information flow also has made it harder to restrict access to information. One example of an internal threat involves a large sensitive document. It would be difficult for someone to walk off with a printed copy of a 1,500-page report. However, the Digital Age has made it possible for someone to walk off with a data file copy of that same report in a memory storage unit that clips onto a key chain.

Organizations interested in maintaining an Internet presence, or who simply have decided to have their computer system hooked up to the Internet have to deal with external threats, usually in the form of hackers. If a hacker does not like a particular organization, the hacker may deface the Web site, which happened to the CIA and the White House a couple of times in the 1990s.

However, sometimes hackers engage in the total destruction of all files they can access on the Web server. Worse, they may gain access to the organization's computer system. Other hackers engage in espionage. They simply make copies of sensitive files. In the Digital Age, backup (redundant) copies of information are essential.

This still doesn't solve what is perhaps the biggest problem with the Digital Age: Is what we are seeing (and hearing) really what we are getting?

In the past, we relied on physical documentation—photographs, handwritten or typed documents, analog sound and video recordings. All of those things are, to varying degrees, difficult to fake. The Digital Age stands all of that on end. We now can make anybody look like anybody else (for example, Oliver Reed's digital replacement in the film *Gladiator*). With the right audio processing equipment, women can sound like men (e.g., performance artist Laurie Anderson). Or more subtle transformations can be made, such as "enhancing" O. J. Simpson's arrest photo on the cover of a weekly news magazine to make him look "guilty."

Public relations practitioners today have three major problems in plying their trade that are unique to the Digital Age. First, with more information and accelerated information flow, public relations practitioners have to do more to compete for the public's attention.

Second, they have to overcome an increasingly skeptical public, born in part out of a far wider range of information channels than previously thought possible.

Third, the public you are trying to engage is capable of meeting that engagement head on. They have the capability of offering a counter or alternative message to the public relations message. Sometimes it is the counter message that reaches

and holds a segment of the public's attention, not the public relations message.

—*Michael Nagy*

DIRECT MAIL

Dennis L. Wilcox reported that Benjamin Franklin used direct mail in 1744 to inform potential buyers of books he had for sale. Today, direct mail is the most prevalent form of direct marketing, but public relations practitioners use it not only to reach existing and potential customers, but also to communicate with donors, volunteers, voters, investors, and myriad other audiences. For example, public relations practitioners may want to distribute newsletters to consumers of specific products; solicit donations for civic, health, and humanitarian causes; send financial reports to potential investors; enlist support for a political issue, cause, or candidate; or distribute correspondence about a product recall.

Direct mail allows communicators to cost effectively tailor and personalize their messages directly to the audiences they choose, using the appeals deemed most appropriate for them. Databases and marketing research allow public relations practitioners to target their direct mailings with precision. Recipients may be profiled by specific demographics, psychographics, income levels, street addresses, hobbies, past purchase histories, professional associations, health problems, reading preferences, household type, voter registration, credit history, charitable contributions, pet ownership, and nearly any other documented variable or combination thereof. This specificity, computerized personalization, and the reduced costs of bulk mailings make direct mail an attractive communication tool.

Direct mail packages typically include such elements as a personalized mail envelope; a personalized letter, appeal, and call to action with various response and contact options (e.g., return mail, toll-free number, and Web site); an informational brochure, fact sheet, or pamphlet; some type of response card or form; and a postage-paid response envelope.

There are basically three types of mailing lists used by public relations practitioners: (1) those derived from in-house databases, (2) "response lists" of people who have responded to other organizations, and (3) "cold call" lists of people identified according to specific characteristics or variables. Examples of common types of marketing data collection include catalog purchases, grocery store discount cards, online inquiries, and Web searches. Companies that offer tailored mailing lists or list contact information include Standard Rate and Data Service's (SRDS) Direct Marketing List Source and Metromail, among others. List delivery options often include mailing labels, directly printed envelopes, zip disks, or CDs. Although rented lists vary in price, one might expect to pay between \$50 and \$300 for the one-time use of a 1,000-name list (Stone & Jacobs, 2001, p. 81; Wilcox, 2001, p. 401). List owners have the option of declining to sell lists to those they deem are competitors or otherwise not appropriate organizations for their customers, patrons, donors, or subscribers.

Wilcox (2001) estimated that American households receive more than 550 pieces of direct mail each year. With the October 2003 enforcement of the national marketing "do-not-call" registry, one might expect that even more direct mail will be sent to American households, creating even greater challenges for communicators trying to get audiences' attention and to avoid having their messages be seen as irrelevant junk mail. As a result, even more people might use the Direct Marketing Association's Mail Preference Service to have their names removed from national mailing lists. Such constraints make research techniques such as pretesting materials with a sample of the target audience and split message research even more critical to obtaining public relations objectives.

Other tactics used to enhance direct mail success include requesting address corrections from the United States Postal Service, so that bad or outdated addresses are returned with updated address information, when available; offering the audience options and incentives to act, when possible; getting the audience involved in the piece by asking them to do something, such as placing a stamp or sticker on an

envelope; getting the audience's attention by making the envelope appear to be handwritten; and mailing an unusually shaped package that will be enticing to the recipient. New mailing regulations allow for odd-shaped packages to be sent through the mail; however, they are more expensive to produce and send.

DISCOURSE THEORY

There are numerous strands of discourse theory, each offering a competing definition and focus of study. The two principal strands comprise linguistically oriented theories and socially oriented theories. These two strands can in turn be divided between those theorists who take a critical approach and those who do not. For the field of public relations, the most promising school of discourse theory in terms of its application to the field's objects of study is to be found in the area of *critical discourse analysis* (CDA). CDA draws upon both linguistic and social theory and, as the name suggests, is critical in its perspective.

CDA is the application of critical theory to discourse and the creation of new critical theory relevant to discourse. It involves the analysis of texts in their sociocultural context. It may be distinguished from noncritical forms of discourse analysis by its inclusion of the concept of power as a central analytical lens. CDA involves a detailed examination and description of discourse, but it also moves beyond description in attempting to explain social phenomena. It is the explanatory dimension of CDA that distinguishes it from other, noncritical forms of discourse analysis. It is also this explanatory dimension that renders CDA a useful tool for both the analysis and conduct of public relations practice.

According to Norman Fairclough, there are three elements to CDA. The first element is a focus on texts.

Initially, within CDA, texts were viewed as written language, including transcripts of spoken language. However, there has been increasing emphasis within CDA upon other elements of text, such as pictures and sound. Although the primary focus remains upon language, these additional elements are now routinely included in the analysis of texts. There are numerous established methods for textual analysis, including both quantitative and qualitative approaches. There are also computer programs such as NUDIST that assist with the organization of qualitative data. These programs are particularly suited for research projects involving large texts or large numbers of texts. The selection of a method is guided by the objectives of the study. For example, Fairclough favors close textual analysis derived from linguistics, which enables a detailed deconstruction of texts.

The second element of CDA is the analysis of the discursive practices associated with the production, distribution, and interpretation of texts. These practices may be institutional, social, and personal. For example, the sending of a birthday card may be a personal interaction, but it may also be an institutional interaction between a business and its clients. The creation of the card message may involve a professional writer and a manufacturer who then distributes the card through retailers. Alternatively the card may be created by a child and personally handed to a parent. These alternative discourse practices are central to the meaning that is then derived from the card by its recipient. Discourse practices, then, actively contribute to the production of meaning.

The third element of CDA is the analysis of the sociocultural practices that provide the context for the discourse practices associated with texts. This element of CDA draws on critical social theory for its analytical frameworks. Louis Althusser, Michel Foucault, Antonio Gramsci, and Stuart Hall are some of the major social theorists whose work underpins critical discourse theory generally and CDA in particular. From Althusser, CDA derives the view that ideas can circulate within society and ideologies can operate in ways that are relatively independent of the economic base of that society. Thus, when public relations practitioners attempt to

change the way an idea or activity is perceived, they are demonstrating an Althusserian approach to the production of ideas.

Foucault's rich body of work can be seen as part of the foundations of CDA. The view that power and knowledge are closely interrelated concepts, with each contributing to the formation of the other, is Foucauldian. The traditional axiom has been that knowledge is power. To this Foucault added that power is also knowledge and that the two concepts should be considered together. That is, what is to count as knowledge or truth in a society is to a large extent determined by those with power. In turn, that knowledge supports and enhances the powerful. Judges determine guilt or innocence on the basis of precedent established by other judges. Psychiatrists separate the sane from the insane on the basis of guidelines established by other psychiatrists. In both cases, the canon of knowledge is a source of their power, and yet they are also the sources of that canon because of their position of power. A central goal of much public relations work is to establish the legitimacy of particular institutions or actors in relation to areas of knowledge and, in the process, enhance their power.

Foucault also challenged the idea that language is simply a reflection of reality. To this descriptive function, Foucault added the prescriptive notion that the world—including the social world—is constituted within discourse. Thus in speaking about the world in different ways, we can transform the world as we know it, or we can maintain the status quo. Again, this Foucauldian view underpins any public relations practice that attempts to reframe the way in which events, activities, or objects are viewed. Thus, for example, a ban on smoking in the workplace to protect people from the effects of passive smoking may be reframed as an attack on personal freedom. In attempting to change the discourse, such campaigns aim to change the way in which people think and act.

Gramsci's primary contribution to CDA is the concept of *hegemony*. Hegemony refers to power over society exercised through the dominance of particular ideas, theories, or ideologies. When an idea is so commonly accepted in society that questioning it positions the questioner on the

fringes of society, it can be said to be hegemonic. For example, the belief in democracy could be said to be hegemonic in Western countries. Hegemonic ideas are those that are simply taken for granted and thus provide solid starting points for any new position that is seeking legitimacy. They are supported by the dominant institutions within a society, which means that to challenge hegemonic ideas is to challenge the interests of dominant institutions and potentially the entire social, political, and economic structure of a nation.

Stuart Hall, the leading theorist of the cultural studies school of thought, is in some ways similar to Foucault in terms of the significance and breadth of contributions that he has made to CDA and to social theory generally. Hall's 1988 work on effecting change within dominant discourses is, perhaps, the most important both for CDA and for public relations. Central to Hall's analysis of the shift in the United Kingdom from the Keynesian economic paradigm to Thatcherism was the concept of *articulation*. This concept refers to the way in which words may become linked to certain meanings and then shifted and attached to other meanings. Hall explored the limits of such articulations and concluded that though some elements of language are relatively free floating, others are held in place by social, economic, or political forces. An understanding of the concept of articulation is essential for any sophisticated practice of public relations.

CDA was introduced to the field of public relations scholarship in 1996 by an article in *Public Relations Review*. This article positioned public relations practitioners as active participants in discursive struggles over socio-cultural change. It demonstrated the application of many of the key concepts of CDA, which have been discussed above, in the day-to-day practice of public relations. Public relations practitioners were shown to be actively engaged in changing society through their work in transforming discourse. Since 1996, CDA has emerged as a new paradigm for the conduct of public relations research. CDA can be used to critique public relations practice, and it is particularly useful in teasing out power relationships when multiple stakeholders are involved. CDA also provides a significant toolbox for the research,

design, and implementation of public relations campaigns.

DISCUSSION BOARD

Discussion boards are locations on the Internet where users can post and read messages. Discussion boards are known by many names, including *discussion group*, *discussion forum*, *message board*, and *online forum*. Discussion boards are most often used to share and discuss information and opinions about specific topics or interests. There are literally thousands of discussion boards available on the Internet, and topics range from Arabic religion to Zimbabwe.

The software Web sites use for discussion boards defines the parameters for the activities online users can engage in. For example, some discussion boards require users to register before posting or reading a message. Other discussion boards allow users to rate and evaluate other users' messages. In addition, some Web sites allow users to upload audio and video files to the discussion board. Discussion boards usually include

guidelines or rules for their members. Failure to comply with those rules usually results in a member being barred from posting future messages. In addition to these rules, online users are expected to engage in *netiquette*—online etiquette. Discussion boards differ from chat rooms in that chat rooms offer real-time, ephemeral, text-based communication. With discussion boards, users can read and often search for messages that have previously been posted. Most discussions boards are kept on a single server maintained by the creator of the discussion board. The location of the discussion board distinguishes it from newsgroups, which are also forums that facilitate discussions about topics and areas of interests. However, newsgroups' messages are not maintained on a single server. Instead, the messages are replicated to hundreds of servers around the world.

Discussion boards have become an integral form of communication on the Internet. Online newspapers such as *The New York Times*, the *Washington Post*, and the *Wall Street Journal* include discussion boards on their Web sites, as do other news organizations such as CNN, MSNBC, and Salon.com. In addition to the media, discussion boards are widely used by organizations, corporations, and communities to facilitate communication.

For communication practitioners, keeping up with information and opinions posted on discussion boards has become quite a challenge. Services such as PR Newswire's eWatch and CyberAlert monitor discussion boards that are relevant to a communication practitioner's organization. Discussion boards sponsored by disgruntled employees, advocacy and special interest groups, and online news services that can affect communication practitioners' organizations are often monitored. Further, communication practitioners and monitoring services frequently read messages posted in investor relations message boards because information and opinions posted in these communication forums can threaten a public company's share price.

Corporate "cyber-smearing" occurs when users post on the Internet false or disparaging untrue comments about a company, its management, or its stock that is intended to affect a company's market

value. Communication practitioners need to consider whether to respond to rumors and misinformation, and whether they should seek legal action against users who anonymously post false or confidential information that can harm their organization. In addition to cyber-smearing, communication practitioners monitor discussion boards for copyright and trademark infringement as well as defamatory comments about their organization.

DOUBLESPEAK

Doublespeak is language that is strategically chosen to distort or obscure reality. It is often associated with misleading advertising claims, unethical politicians, and public relations “spin doctors,” who use language to frame a subject in the most positive light. When doublespeak is exposed, it may generate public distrust and be counterproductive to long-term public relations goals.

William Lutz (1989) identifies four types of doublespeak: euphemisms, jargon, “bureaucratese,” and inflated language. Euphemism is language that sugarcoats negative or unpleasant realities. For example, people have their pets “put to sleep,” an overweight boy is “husky” rather than fat, and a down payment is “an initial investment.” Jargon is specialized language that may be unique to a particular industry, occupation, or social group. It may be used to intentionally obscure meaning for those who are outside the group. For example, the term *collateral damage* has been used to describe the deaths of innocent civilians in wartime. Lutz wrote that sewage sludge may be labeled “regulated

organic nutrients” (1997, n.p.). Bureaucratese is characterized by the combination of jargon with lengthy, wandering sentences that attempt to conceal the truth or confuse the listener. This type of doublespeak may be used by officials who wish to appear to be answering a question or addressing an issue, but who are in fact revealing nothing. Inflated language is intended to make the ordinary seem extraordinary. A common tactic is renaming. Store clerks may become “sales associates,” beauty parlors “day spas,” and college home economics programs “family and consumer science” majors. Sometimes doublespeak is introduced so successfully that the terms become accepted as the appropriate, standard terms to use.

Doublespeak is often associated with *newspeak*, as coined by George Orwell in his 1949 novel, *1984*, in which a fictional government attempts to control public thought through the manipulation of language. However, Orwell did not use the term *doublespeak*. The term entered the popular vocabulary in the United States in the early 1970s as anti-war sentiment spurred challenges to government characterizations of the Vietnam War. In 1972, the National Council of Teachers of English created a Committee on Public Doublespeak to expose the misuse of language by government, military, and corporate officials. The committee began publishing a newsletter in 1974 that eventually became the *Quarterly Review of Doublespeak*. Although the newsletter ceased publication after more than 20 years, the committee continues to present an annual Doublespeak Award for “language that is grossly deceptive, evasive, euphemistic, confusing or self-contradictory and which has pernicious social or political consequences” (National Council of Teachers of English, 2003). Recent awards have gone to the tobacco industry (2000), the Department of Defense (2001), and a state school system that removed references to Judaism from a literary work about Jewish life in Europe (2002).

Scholars of doublespeak agree that the growth of mass media, advertising, and public relations have contributed to the ubiquitous presence of doublespeak. In particular, demands from news media for spokesperson accessibility and quick public

comment may lead pressured officials to resort to doublespeak.

Although most scholars denounce the use of doublespeak, it has been noted that intentional ambiguity may be helpful to organizations confronted by multiple challenges in turbulent environments. “Strategic ambiguity” (1984), according to Eric Eisenberg, strikes a balance among being understood, not offending others, and maintaining one’s self-image. He contends that by employing vague, ambiguous, equivocal communication, organizations may avoid creating factions and smooth the path for organizational change. Whether the strategy is ethical, Eisenberg notes, depends on the goals of the communicator.

DRAMATISM AND DRAMATISM THEORY

Conventional rhetorical theory tends to focus attention on how discourse influences the way people think. Formulated by Kenneth Burke, dramatism adds depth to rhetorical theory. It provides insights into how language and its connections to thought can be studied as modes of action rather than ways of conveying information. Thus, Burke devoted his massive study of language and society to the analysis of symbolic action, based on his proposition

that “language is primarily a species of action, or expression of attitudes, rather than an instrument of definition” (1968, p. 447).

In his early years in the 1920s and 1930s as a literary critic, Burke began to create his theory of dramatism to assist his ability to perform insightful literary criticism. Burke began his career as a literary critic but soon expanded that interest to analyze and critique all discourse, especially that which leads to cooperation and competition in society. This evolution saw his influence grow beyond literary criticism to social criticism. He influenced the thinking of scholars in literature, rhetorical theory, sociology, history, communication, and political science, for instance. His theory of dramatism allowed him to offer some of the richest existing critiques of how the free market system can work to the advantage of some while disadvantaging others.

In this context, Burke revealed how the term *progress* can be the guiding light for a society. Any act can be done in the name of progress. Such commitment, he reasoned, was often at the heart of the conflict between business leaders and other groups, such as laborers and environmental activists. One group’s progress might justify sacrifice on the part of another group.

This innovative contribution to literary criticism and social commentary began with a deep curiosity into the workings of the poet’s, dramatist’s, or novelist’s mind. Burke was looking for a critical apparatus that would allow him to disclose the reason or motive behind the creation of any work of literature. He believed that it was necessary to unlock the bond between the writer and the reader, a special relationship in better literature. In better literature, readers and authors participate—act—together in the experience of literature. A work of literature does not report the feelings—hope, for instance—of the author. Rather, it evokes those feelings in the reader.

He noted early in his inquiry that a poem or other literary device is not a mere report. That is, the poet who feels joy at seeing nature—a tree, for instance—writes a poem not to report or convey knowledge about that tree, but to evoke a similar experience at enjoying the symbolic tree characterized in

the poem. This line of thought led Burke to discount the element of communication by conveying knowledge—*epistemology*—as being less important than the creation of action—*ontology*. He argued that the reader does not interpret and respond to the poem as a report but as a symbolic experience—an act. The author, by this reasoning, wants the reader to participate in the experience rather than to receive a report of the experience.

By this logic, Burke argued that Hamlet's plight appealed, not because he reported his circumstances and feelings, but because Shakespeare was capable of having the audience share in the symbolic action of feeling betrayal and revenge. Attitude is the objective of literature, not knowledge gained by report.

Central to his theory of dramatism was the distinction between motion and action. A truck rolling down a hill is in motion. If a bystander decides to jump into the truck and bring it to a stop, that is action. Action is differentiated from motion by the intervention of moral choice and attitude. Motion occurs without morality. Action is the essence of morality. For this reason, Burke believed he could shed light on the moral choices being made and advocated by the voices of society.

Because of his societal interests, Burke was able to reason that property is not a thing but an action. This conclusion is substantially relevant for the application of dramatism to public relations practice and ethical inquiry. In a capitalistic society such as the United States, much of the discourse of public relations is devoted to the promotion and defense of property. Promotion and publicity dramatize the joys of ownership and participation. It is not merely knowing that a new car line is now on the market; the sponsor of such discourse is not conveying information but inviting customers to participate in—enact—the joys of property ownership. Buying is action.

Activists are likely to elevate the concept of ownership beyond the limits of property to the privileges and responsibilities of society. Thus, if a business owns property, such as a coal mine, it can do what it wants with that property, including strip mining, according to one terminology. By the

activists' interpretation of property, however, the mine is part of the total property of the nation, collectively owned. Thus, the business must act according to larger rather than smaller interests on matters of property ownership.

One of the key elements of dramatism is its awareness that words are propositional. The word *teacher* reports something about a person in that profession. More important, however, it is a command for specific action. People who share the symbolic substance *teacher* are expected to respond through action—to teach. Thus, fathers are supposed to father and mothers to mother. Preachers preach. Firefighters fight fires. Legislators legislate. Regulators regulate. Investors invest. Critics critique. Activists become active. In each case, the action implied or mandated in the role-based label goes beyond the informative report to a spirited motivation to action—to participate in the action or symbolic action.

Sigmund Freud gave Burke insights into the associational nature of words and the motives that came from those words. On social issues, Burke was prone to consider the guidance of Karl Marx, who suggested ways to disclose the hidden traps of action embedded in words. Some of the most interesting sets of terms, Burke mused, were those associated with work and workers in the 1920s and 1930s. The symbolic action of labor and management, thus having implications for employee communication, can work out so that management is boss, giving direction and determining the limits of reward and the requirements of each job. Burke opposed asymmetrical relationships of this kind. Labor should participate in the definition, and therefore, the enactment of work and reward.

Burke reasoned that motives are shorthand terms for situation. The reasoning behind this conclusion is based on Burke's experience with a photography exhibit at an art show. He was fascinated by how a photographer could take different pictures of the same subject. By using differently colored lenses, the same subject could look unique in each photograph. From this experience, Burke reasoned that people see reality through terministic screens. In other words, as each different colored lens gives a

unique view of reality, so does any terminology. Each terminology is a way of seeing uniquely and a way of acting uniquely. Terms, thus, prescribe actions. Words are not only natural, but they also add dimensions to nature. They characterize, define, and introduce attitudes into nature. Words mediate between nature and persons' minds.

As public relations practitioners, along with others, communicate about some product, service, or issue, they use words that invite the target of those messages to participate—act—in accord with the screen offered by the terminology. This kind of reasoning suggests why there is a clash between activists and corporate spokespersons. Activists call for the enactment of “environmental responsibility.” That action word challenges citizens to achieve some preferred state by acting responsibly toward the environment. Activists call for higher environmental standards by dramatizing the dire consequences of failing to do so. Companies respond with their facts and images of progress.

By this logic, Burke came to define dramatism for the *International Encyclopedia of Social Sciences* as “a method of analysis and corresponding critique of terminology as designed to show that the most direct route to the study of human relations and human motives is via a methodical inquiry into the cycles or clusters of terms and their functions” (1968, p. 445). He reasoned that terms become meaningful and motivational as clusters. Each cluster focuses attention on a primary term that is modified by secondary terms. In a piece of discourse, a central term might be modified by defining terms as it is developed by an artist or some other advocate.

In the realm of public relations, the central term might be *purchase*. One rationale for public relations is to increase revenue through increased sales. *Purchase* is a motive. What is to be purchased? That is the product or service promoted. Ads offer excellent examples of such symbolic action. They show “satisfied customers” using the product. Soaps and creams moisturize keeping skin healthy and young looking. The symbolic action here is the product as a fountain of youth. The car roaring across the countryside is freedom, power, and status. To buy is to participate—enact—those terms as terministic

screens. Participation joins the interests of the consumer with the seller.

As Burke argued, dramatism deals with relationships. Is the relationship of buyer and seller, in these cases, one of mutual benefit? Is the terministic screen imbalanced in its implications for the participants? Does one party benefit disproportionately? Will it lead to cooperation or to competition, which can even foster buying from the competitor or seeking the services of a litigator? Each choice is an enactment of various conflicting or competing terminologies.

DROBIS, DAVID

David R. Drobis, senior partner of New York–based Ketchum, one of the largest public relations firms in the world, epitomizes the American ideal of “working your way to the top.” Drobis joined Ketchum as an account executive in the firm’s Pittsburgh office in 1969; 23 years later he was named CEO of the firm, and he retired as chairman in 2004. Drobis also is a role model for the concept of “investing in your profession.” Through leadership and service, he helped public relations mature into a stronger and more respected field.

Drobis was born May 1, 1941, in Baltimore, Maryland. He graduated from Western Maryland College in 1963 with a bachelor’s degree in

psychology. He went on to study journalism and public relations at American University in Washington, DC, where he earned a master's degree in 1965. Later in his career, Drobis enhanced his business skills by taking courses at Harvard University Business School and the Wharton School at the University of Pennsylvania.

During the four years immediately following graduate school, Drobis worked as a publications editor in the Alumni Relations Office at American University and as a press officer in the Press Information Office of Montgomery County, Maryland. Unlike most of his contemporaries in public relations, he never worked as a journalist, which may account for his longtime emphasis on managerial rather than technical skills. His decision to join Ketchum in 1969 started him on an ascending career path that he followed for the next 35 years. He helped Ketchum grow from a small, specialized firm into a top-10 global agency. Under his leadership, Ketchum expanded from North America into Asia, Europe, and Latin America and into such vertical industry categories as brand marketing, food and nutrition, health care, and technology.

Drobis's firm, Ketchum, was founded in 1923, in Pittsburgh, by two brothers who had recently graduated from the University of Pittsburgh: Carlton and George Ketchum (Cutlip, 1965/1990). Interestingly, the Ketchum brothers' firm first dealt with both public relations and fundraising, but fundraising proved to be much more lucrative than public relations and became the dominant business of the firm. Eventually, two Ketchum firms evolved, one specializing in fundraising (still headquartered in Pittsburgh but owned by a Texas firm) and one specializing in public relations—the New York firm formerly led by Drobis.

In 1996, Ketchum was acquired by the Omnicom Group, Inc., the third largest marketing communications holding company in the world. During the 1990s, Ketchum established operations in Munich, Milan, Paris, London, and Madrid. In 1997, it established its first base in Latin America, with partnerships in Brazil, Argentina, and Chile. The firm has more than 1,300 employees. Some of its current high-profile clients are FedEx, DuPont, Cingular Wireless, Estee Lauder, Wendy's, and Hanes.

Indicative of the firm's success, Ketchum won *PRWeek's* PR Agency of the Year award in 1990, 1995, 1998, and 2002. Also in 2002, *The Holmes Report* named Ketchum the number 3 large public relations agency to work for and the number 1 agency that public relations practitioners would choose to work for if they left their current firm. Under Drobis's leadership, Ketchum earned more Silver Anvils from the Public Relations Society of America (PRSA) than any other agency.

The challenges Ketchum now faces, according to Drobis, are to keep up with costly technology, hire the best people in public relations, and strengthen the business in new overseas markets, such as Latin America and Asia. He believes that his success heading Ketchum is inseparable from the people he worked for and with. Being surrounded by successful people, he said, leads to one's own success. Regarding personal traits, Drobis believes his tenacity, perseverance, stamina, and concentration on what can be achieved have helped him overcome challenges.

In addition to his accomplishments at Ketchum, Drobis has been a high-profile leader in the public relations profession. In 1999, *PRWeek* named him one of the top-10 most influential people in public relations of the 20th century. In 2001, Drobis was awarded the National Public Relations Achievement Award by Ball State University.

Drobis currently is president of the International Communications Consultancy Organisation (ICCO), the international trade association for public relations firms. He is founding chairman and a member of the board of the Council of Public Relations Firms. He was the 2003 president of the Arthur W. Page Society. He is an accredited member of PRSA, an elected member of the PRSA College of Fellows, a past board member of the PRSA Counselors Academy, a member of the PRSA International Section, and past president of the New York Chapter of PRSA. Drobis also is a member of the International Public Relations Association and serves on the board of directors of the Center for Communication, an organization dedicated to communications education.

Drobis has authored many papers and articles on topics ranging from client–agency partnerships to corporate social responsibility. He also has lectured at

numerous universities and given dozens of speeches from Tokyo to Beijing, Paris to Frankfurt, Bratislava to San Francisco, and Fort Lauderdale, Florida, to Muncie, Indiana. His speeches usually focus on such topics as corporate reputation, measuring public relations effectiveness, technology, and globalization.

Globalization is a topic of particular passion for Drobis, who asserts that public relations people who helped create the profession, particularly those in the United States, need to nurture the public relations field as it develops in Asia, Latin America, India, and Africa. It is their responsibility to help practitioners in such new markets to professionalize their practice of public relations.

Drobis also is a leading commentator on public relations' continuing evolution. As he pointed out, public relations initially was only publicity and media focused. Instead of being involved in the decision-making process, public relations people often were told by management what to do. Today, public relations is growing and becoming more valuable. It has become a management function with influence over organizations' policy making. Public relations people now are better paid, more experienced, and have much greater opportunities. They also have more critical responsibilities.

According to Drobis, public relations practitioners need to serve as a barometer, providing good information and knowledge and measuring awareness and attitude changes afterward. They need to provide communication solutions—not just good publicity, which usually is only one element in a public relations program. Finally, in today's era of accountability and transparency, the objective of public relations must be trust building.

DRUCKENMILLER, ROBERT T.

Robert T. Druckenmiller, chairman of New York City-based Porter Novelli International, thought he would end up in the world of big business; instead, he migrated into the realm of public relations and rose to the top of the field.

Druckenmiller was born March 15, 1942, in Bethlehem, Pennsylvania. He earned a Bachelor of Arts in Economics degree from Colgate University in 1964, and he graduated from the Wharton School of Commerce and Business at the University of Pennsylvania with an MBA in marketing in 1966.

Druckenmiller's first job was with the advertising firm J. Walter Thompson. His first six months

on the job, he worked out of the firm's Los Angeles office while finishing active duty with the Army Reserve. There, he reported to Bob Haldeman, who would later become President Richard Nixon's chief of staff. Afterward, Druckenmiller returned to the New York office. During his nearly five years at J. Walter Thompson, Druckenmiller handled advertising accounts for several national companies, including Scott Paper, 7Up, and Lever Brothers. He also met Bill Novelli, with whom he would later found Porter Novelli.

Druckenmiller followed Novelli to the Peace Corps, where he served as advertising director. He also worked closely there with Jack Porter, director of public affairs and another future Porter Novelli founder. Together, the three men applied commercial advertising principles to reverse a decline in Peace Corps volunteer commitments and, in turn, stumbled on the formula that would make them successful in their own firm. "It was good to fight for a cause, beyond increasing market share," Druckenmiller said of the experience (personal communication, October 7, 2002).

Druckenmiller, along with Porter, Novelli, and Mike Carberry, founded Porter Novelli in 1972 (while working their respective jobs at Henry J. Kaufman, then the largest advertising agency in Washington, DC) on the principle that one can "do well by doing good." Their idea was to take traditional marketing techniques and apply them to national social issues. They did this by creating integrated communications programs, combining concepts from the public relations and advertising worlds.

One of the first issues they tackled was the campaign to increase Americans' awareness of their blood pressure readings. Working with the National Heart, Lung & Blood Institute, Porter Novelli's integrated program for health education would be duplicated in efforts to raise awareness on cholesterol levels, smoking cessation, and various other health issues.

What made Porter Novelli stand out was the ability of its founders to monitor, research, and fine-tune their techniques to those most appropriate for their nonprofit clients. This led to the firm's becoming the foremost practitioner and pioneer of *social marketing*, which Druckenmiller defines as the

"application of commercial marketing techniques to social issues" (personal communication, October 7, 2002). After a year of working double lives, the four founders made the decision to go full-time with Porter Novelli and officially incorporated in 1973.

In 1981, the firm was acquired by Needham Harper Steers, an advertising agency from Chicago, which allowed Porter Novelli to expand domestically and operate offices in New York, Los Angeles, and Chicago. Porter Novelli was now Needham Porter Novelli, and the firm often provided public relations services complimentary for clients. In 1988, Needham merged with Omnicom, and this allowed Porter Novelli to expand internationally, as it was the only public relations firm in the Omnicom group at that time.

Druckenmiller was appointed president and CEO in 1992, and he was at the helm when the firm broke away and established an independent international brand as Porter Novelli International in 1996, merging with fellow Omnicom firm Countrywide Communications Group in the United Kingdom. The firm became one tightly knit brand, instead of one group under a federation of brands. The acquisition of Copithorne & Bellows Public Relations in 1999 gave the firm a leading edge in technology, and additional acquisitions have led to increased power in other specialty areas.

In 2002, Druckenmiller, the only original founder still involved with the firm, was appointed chairman of Porter Novelli International. Under his leadership, the firm has grown to more than \$200 million in revenue and ranks among the top-10 public relations agencies worldwide. Porter Novelli International has a presence in 56 countries, employs over 1,500 people, and has board members across the globe.

The firm handles accounts for such giants as Gillette and the American Cancer Society. Porter Novelli also maintains clients in the food, pharmaceutical, health care, and technology industries. Druckenmiller attributes the progress his firm has made to the quality of work that has been done previously and its ability to recruit and retain top-notch talent to carry out this work.

The firm's success, according to Druckenmiller, comes from applying a marketing-based approach

to public relations, which provides a broad strategic network upon which to work. Druckenmiller disparages the many practitioners who are media focused, which he says reduces public relations to a tactical level. His way of practice provides more options at a managerial level for changing attitudes and behaviors, defining objectives more clearly, and measuring results more effectively.

Such an approach was used in the "Truth" campaign, which encouraged teenagers not to smoke. Through work with research groups in Florida, his firm found that teens would respond if they felt outraged and manipulated by tobacco companies; therefore, Porter and Novelli created the campaign as a brand to counter the tobacco brands.

Although Druckenmiller's focus has been on social or nonprofit groups, his firm still handles for-profit clients that target consumer publics. His approach to working with these companies on problems and opportunities is the same as with social organizations: Work backward and determine who you are trying to reach and what outcome is desired, and then segment these groups, tailoring approaches to reach each segment.

An area that Druckenmiller has taken great interest in recently is the concept of corporate social responsibility. In fact, he would like to see more public relations firms and practitioners practice the concept of giving back in the workplace, much like the legal profession encourages pro bono work.

"Today, employees are more likely to expect their companies to demonstrate their commitment to social responsibility," said Druckenmiller in a presentation given to the American Marketing Association in March 2002. "Also, customers and the general public are more likely to support companies they respect and trust, especially when there are few discernible differences between good products and services. A company's commitment to a substantive program of corporate social responsibility is one way for a company to distinguish itself."

He recently added, "Public relations professionals and firms are in the best position to help companies manage their corporate brand, having managed relations with all of a company's key stakeholders and other key influentials" (personal communication, October 7, 2002).

Druckenmiller said that companies must manage not only the brand of their products or services, but also the brand of the company behind them. Unfortunately, many companies wait until they are in crisis management mode to do this.

At Porter Novelli International, Druckenmiller practices what he preaches through a program called "Kids Think Link," which helps children (especially disadvantaged ones) to learn and understand the Internet. Additionally, each regional office determines a cause for which the company matches donations at 50 cents on the dollar, and the firm also performs pro bono public relations work for various organizations. Druckenmiller said he'd like to be thought of as "introducing the quality of compassion and consideration into the workplace" (personal communication, October 7, 2002).

DUDLEY, PENDLETON

Pendleton Dudley started what Scott Cutlip enumerated as the fifth public relations agency launched in New York City in the early 20th century. Dudley's

career was encouraged by Ivy Ledbetter Lee, who recognized the virtue in having several public relations agencies competing for business in New York City. Having many firms gave credibility to each one. It was a profession that called on many to set their sights on using professional skills to advance clients' interests in an ethical and responsible manner. Lee also recognized Dudley's skills as a journalist and public relations practitioner.

Born on September 8, 1876, Dudley, like others of his time, responded to the joint need for mass media outlets to fill their time or space as well as the complementary desire by and need for clients to reach mass audiences. He was fascinated by the potential impact of magazines to reach audiences with news, opinion, and publicity. Long after, in 1952, he recalled the luring power that an article in the *Saturday Evening Post* had had on his young mind in Missouri. He yearned to travel to New York City to learn how to write such articles. The name of the article was "Working One's Way Through College."

Like John W. Hill and Earl Newsom, Dudley was born and raised in the Midwest (in Missouri), where he became interested in the news business and was lured to New York by the excitement, education, and prosperity the city offered. Dudley became acquainted with Lee, who inspired him with an ability to gather and present the news. Like Lee, Dudley was attracted to businessmen who did things in a big way. Industrial news had an electrifying effect on Dudley, who realized that successful competition required sound communication skills to reach targeted audiences. Publicity was a calling that drew the attention of Dudley, as it did others who forged the profession by forming successful agencies in New York City in the early 20th century.

As he began his career, he made the transition from working for publications such as the *Wall Street Journal* to serving clients. Much to his professional and ethical surprise, he learned that clients had no qualms about his remaining on the payroll of the *Journal* while being paid by clients to use his column space to promote their interests.

The agency he created in 1909, Pendleton Dudley and Associates, matured into the venerable Dudley-Anderson-Yutzy, which expired when it

was purchased by Ogilvy & Mather in 1983. At the time of its sale, the agency was owned by two of the pioneering women in public relations, Jean Way Schoonover and Barbara Hunter. As was typical of such successful agencies, this one had a long and distinguished list of industrial clients, trade associations, charities, and labor unions. AT&T was an early and continuing client. Dudley also influenced the development of the American Meat Packers Association of Chicago and the Corn Industries Research Foundation. He lent space and writing talent to two of his clients, DeWitt and Lila Wallace, who launched the *Reader's Digest* from Dudley's pony barn.

As well as establishing a successful practice, he recognized the need for a profession to have a successful organization to support its activities. He was a founder and president of the National Association of Public Relations Counsels. He was the first president of the Foundation for Public Relations Research and Education of the Public Relations Association of America. He often lectured on public relations practices and their role in the success of organizations. He contributed articles on this topic in various professional publications.

He was one of many who had learned to distinguish public relations from propaganda, a point he made in an article for the *Public Relations Journal* in 1952, when he referred to it as "the biased self-pleadings of those having axes to grind" (p. 8). Out of the need to communicate, which Dudley did not believe the tycoons of the early 20th century understood very well, emerged the profession of public relations. In the same 1952 article, Dudley claimed "the giants of business and finance were inept at meeting newspapermen and apathetic to the potential importance of the news" (p. 9). The men who were starting the publicity agencies, such as George F. Parker and Ivy Lee, worked to remedy this problem. Part of the deficiency was also corrected by newspaper reporters who had no qualms in taking pay from tycoons as well as publishers of the newspapers in whose columns they used to pass along favorable financial and business information. This clear conflict of interest posed an ethical challenge that bothered Dudley immensely because he had experienced

this ethical misjudgment firsthand. People whom Dudley thought had crafted the profession were well on their way long before the popularizing of propaganda techniques by a subsequent generation of practitioners. He credited solid journalist instincts for news and the writing ability to present information objectively and with interest as the forerunner of the profession, not the clever ability to propagandize.

From these reflections on the birth and growth of the profession, Dudley saw it as growing to fill a void in society: “As society becomes more and more complex and the potential causes of misunderstanding and human disagreement multiply, the need to create an environment for mass learning has become more acute and infinitely larger” (1955, p. 25). Society is a mix of many voices, from many disciplines and ideologies. Thus, Dudley reasoned, “among these the public relations practitioner does occupy a unique position through which he can make a unique contribution. He can serve as interpreter for the interpreters, or as liaison between the communicators, or as expediter of information from source to outlet” (1955, pp. 25–26). To this end, practitioners constantly create new strategies, tools, and functions by which to serve clients and the parts of society that approve or disapprove of what clients seek to accomplish.

What will keep the profession healthy? Dudley answered, “The public relations man (and woman) must improve the quality of his product, broaden his view, temper his judgment, and enrich his knowledge” (1955, p. 112). One of the major mechanisms by which that can be accomplished, he knew, was an ever-stronger and more vibrant sense of professionalism fostered by associations such as the Public Relations Society of America. In his words, it is “a custodian of our standards of practice” (1955, p. 112).

In a 1967 memoir of Dudley’s contributions, Milton Fairman referred to him as the dean of public relations, whose demise had ended 57 years of practice. In addition to extensive daily reading of the news, Dudley consumed scholarly information on semantics and psychoanalysis to sharpen his insights into human cognition and the nature of effective expression. He firmly believed this knowledge and skill, coupled with ethical practice, would

EDGAR ONLINE

EDGAR Online is an online subscription service (www.edgar-online.com) used to access a database of Securities and Exchange Commission (SEC) public filings. For a fee, investor relations and corporate public relations officers can gather financial information on their company and on similar, competitive companies using the EDGAR database. EDGAR Online, Inc. is listed on the National Association of Securities Dealers Automated Quotation (NASDAQ) under the symbol EDGR. Subscriptions are paid on a monthly or quarterly basis, and usage is limited to a certain number of documents per term, with an additional fee for each additional document accessed. The database may be searched by filing type, date of filing, company name, or person name. Though EDGAR Online is not affiliated with the SEC, it serves as a carrier of information from the SEC to the consumer.

EDGAR stands for Electronic Data Gathering, Analysis, and Retrieval. The SEC mandates that all publicly traded companies must file their annual, quarterly, and current reports, along with reports on stock sales among company executives (Form 144), with the SEC for review and public dissemination. The typical annual (10-K) or quarterly (10-Q) report includes financial statements, messages from the company's leadership, and information

regarding company performance and future plans. Current reports (8-K) partially fulfill material disclosure requirements; they usually include press releases of updated information regarding changes of management, mergers, or acquisitions.

The EDGAR live filing system began on July 15, 1992. Originally documents were sent to the SEC by diskette or magnetic tape. With the introduction of computers, files could be sent via modem. They are now transmitted over the Internet via high-speed lines (T1 or ISDN) or FTP servers directly to the SEC. In 2001 the SEC began accepting transmissions of Hyper Text Markup Language (HTML) files, which show photos, graphics, and formatting. The documents that are filed with the SEC are later publicly disseminated through services such as EDGAR Online. Subscribers to EDGAR Online may be stockbrokers, analysts, shareholders, investment bankers, or others interested in timely information pertaining to public companies. This subscription service, in addition to providing access to public company filings, offers international public company reports, normalized financial data for company comparisons, financial news, initial public offering (IPO) alerts, stock quotes, charts, and investor relations services. EDGAR Online also presents a full range of hosting, intranet, and Application Programming Interface solutions to bring public company filings onto company Web sites and news sites.

In addition, EDGAR Online offers a free service, Free EDGAR, which can be found at <http://www.freedgar.com>. Users of Free EDGAR must register with the site by supplying name, address, telephone number, e-mail address, and occupation. Free EDGAR offers only the most basic access to filings and is meant for use by individuals. Only one free file can be viewed per day, but additional filings can be viewed for a fee. The one-filing-a-day limit allows EDGAR Online to offer a public service while answering the demand for its subscription service by professionals and serious stock researchers.

EDITING

The verb *edit* is defined in the *American Heritage Dictionary of the English Language* as follows: “**1a.** To prepare (written material) for publication or presentation, as by correcting, revising, or adapting. . . . **c.** To modify or adapt so as to make suitable or acceptable. **2.** To supervise the publication of (a magazine, for example)” (Dictionary.com, 2003, n.p.).

The word *editor* first came into use around 1712, and the French word *editer* was established in 1784. By 1793, the word *edit* was connected with the publishing process (Dictionary.com, 2003, n.p.).

Today’s public relations professionals use editing in many kinds of publications, including newspapers, newsletters, annual reports, brochures, and news releases.

In his article, “Protect Your R.E.P.! Revise, Edit and Proofread,” Philip Vassallo stated that many factors are involved in the writing process, among them editing. Editing corrects for good sentence structure, proper word and grammar usage, and correct spelling of words and people’s names. One way to check written documents is by reading them aloud several times for errors.

The revising process is an important part of the editing process. No document is ever final. One must revise several times to improve one’s work and make it less confusing and reader-friendly. This

process is sometimes time consuming, but it has great payoffs.

Stylebooks such as the *The Associated Press Stylebook and Briefing on Media Law* and *The Elements of Style* are helpful resources for editing. Both books deal with proper writing style and word usage. The importance of editing, revising and rewriting are all explained in the stylebooks. They help guide writers in the right direction by showing them a simple, comprehensive way to produce their work. With careful editing, not only is writing easy to read, but it is more widely understood.

Public relations professionals know the importance of editing. Pieces such as annual reports, brochures, and proposals all require thorough editing before the final document is printed and read by the public.

Whether the writing job is big or small, editing is necessary. Although it often requires effort and time, it is a major part of the writing and publication process. No writer can assume that his or her work is accurate and error-free on the first draft. One should always carefully read one’s work and correct errors. Using multiple editors is also a good tactic.

EDITOR AND PUBLISHER

Editor is a very broad title for people who work for organizations such as book publishers, newspapers, and magazines. Editors are usually distinguished by the particular function they oversee. Some examples of editorial titles are *executive editor*; *managing editor*; *copyeditor*; *page editor*; *section editor*; *headline writer*; and *photo chief*. Generally

editors set the editorial policy for their publication. They are responsible for determining issues such as the design, content, focus, and audience of the publication. Editors also make day-to-day decisions on what's important to readers, on content, and on ethics. They may ask questions of reporters and authors to strengthen their piece and check facts for accuracy. In addition, editors may rewrite parts of a piece or change the order of presentation to make it more readable and appealing. Some editors are involved in managerial decisions; for example, they may hire and fire personnel, and they may give input and sometimes final say on editorial budgets, including salaries, travel budgets, other expenses, and equipment budgets.

A *publisher* is typically the chief officer of a newspaper, magazine, or publication. His or her role is often determined by the nature of the publication. Publishers are the on-site authority for the organization; for example, they may set the editorial policy of the publication, including the political stance it favors. In newspapers, publishers typically reserve their editorial input for the opinion or editorial page, where writers tackle social and political issues affecting their communities. Often publishers oversee the fiscal health of the publication, thus serving the interests of a higher authority such as a newspaper chain, communications conglomerate, publishing company, or stockholders. Because these higher authorities want a return on their investment, the publisher must determine the best ways to produce a profit margin, to minimize or at least carefully control operating expenses, and to maximize market share and general revenue through such avenues as paid circulation, advertisements, commercial printing, and Internet subsidiaries. In general, publishers delegate editorial, advertising, and production oversight to subordinate editors and managers in each respective department, maintaining overall control by monitoring market share, profit margins, revenues, operating expenses, and other factors. Publishers can also be ombudsmen and address public concerns; the "public" may include readers who question the content or display of a story, photograph, or headline; readers who want to praise the newspaper or magazine for its work; and readers who complain about everything

from missed home deliveries to the opinions expressed by columnists. Often publishers become members of civic organizations, and become involved in charities and sponsor local events. They often deem it essential to be visible in the communities they serve because of the widespread belief that the publication is a community business and therefore benefits from a healthy community.

—*Brigitta Brunner*

EDITORIAL

An editorial is an article in a newspaper or magazine that presents the view of the editor or a guest columnist on a particular topic. The purpose of an editorial is to interpret, to advocate, or to entertain. Sometimes editorials are intended to persuade, and sometimes they are written to provide background on an issue so that readers may draw their own informed conclusion.

Editorializing is expressing an opinion. This is appropriate in editorials but not in news articles, in news releases, or in any unattributed statement. The news convention of objectivity requires that news articles and news releases limit their statements to reports, or statements that are verifiable. For example, the statement "More than 50 people attended the library open house" is verifiable. In contrast, the statement "A lot of people attended the open house" is a judgment and an example of editorializing. An opinion does not belong in a news article or news release (written by a journalist or public relations practitioner, respectively) unless it is attributed to a source. (For example: "'A lot of people attended the open house,' said Ann Lee, director of the library.")

Editorials appear on the editorial page in newspapers, along with columns and letters to the editor, to distinguish them from news articles, which are intended to provide objective reports. They are useful in stimulating readers to think and to reach conclusions. They also provide a personality to the newspaper, magazine, or organizational publication. In editorials, readers may find more than just the facts. John M. McClelland, editor of the *Longview (Washington) News* and past national president of Sigma Delta Chi (predecessor to the Society of

Professional Journalists), has said, “To have a personality a paper must have strong convictions and opinions. And it must support those opinions and convictions consistently” (Waldrop, 1955, p. 14).

Editorializing in a news release can be the kiss of death to good media relations. When busy editors receive news releases that include editorializing, they may discard them immediately and then in the future discard releases from the same organization even before opening them. When public relations practitioners write news releases, they should carefully avoid editorializing, or including unattributed opinions, to protect good relations and maintain credibility with news media editors.

When practitioners write columns and guest pieces submitted for a publication’s editorial page, editorializing is fine. Editorializing has its place, but it is not in the news article or news release.

ELLSWORTH, JAMES DRUMMOND

James Drummond Ellsworth was the first public relations executive on the payroll of the American Telephone and Telegraph Company, serving from 1907 to 1930.

The son of a Congregationalist minister, Ellsworth was born in Massachusetts around 1863. He was raised in North Carolina, Iowa, and Illinois as his father moved from one congregation to another. In his youth, he was at various times a cowboy, lumberjack, and printer’s devil. This last job ignited an interest in journalism—or at least in the rough-and-ready reporting practiced in small towns of the time—and he wrote for the *Colorado Springs Gazette* while studying at Colorado College. His

efforts to help start a newspaper in the silver-mining town of Aspen failed when the steel bars used to turn the plates on the printing press were lost. But in his fourth year of college, he had an opportunity to take over the weekly *Enterprise* in Coal Creek, Colorado, as editor, manager, and printer. The paper had about 2,000 subscribers. Just 22 years old, Ellsworth was celebrated as the youngest editor in the state, and he never went back to college.

After a year and a half, Ellsworth moved to Denver and, over the next 4 years, landed successive reporting jobs with the *Rocky Mountain News*, the *Denver Journal*, and the *Denver Times*. In 1889, he moved back east and talked himself into a job with the *Boston Herald*. Over the next 12 years, he left the *Herald* four times for better pay or more interesting work at other papers, including one stint as ad manager and traveling salesman for a patent medicine company, but he always returned. In his last period at the *Herald*, he moonlighted as an opera singer’s press agent, placing a piece about her in his own paper. She paid him \$50 for it, substantially more than he was making at the paper.

When George Michaelis, one of the founding partners of the Publicity Bureau of Boston, approached Ellsworth about taking a job, he officially moved from journalism to publicity. The Publicity Bureau, established in 1900 by three former newspapermen “to do a general press agent business,” was the forerunner of today’s public relations firms. Its early clients were Charles W. Eliot of Harvard, the Massachusetts Institute of Technology, the Boston Elevated, and the Fore River Ship Yard.

In 1903, the American Telephone Company, then headquartered in Boston, hired a patent attorney—Frederick Fish—as its president. At the time, the company had a reputation for poor customer service, high-handed business practices, and exorbitant prices. Fish, an excellent lawyer, had no idea what to do about it, so he was receptive when Michaelis suggested that “the situation could not be made worse by a venture in publicity and it might be made better” (Ellsworth, 1936, p. 58).

Ellsworth was assigned to the AT&T account. His first step was to analyze newspaper clippings from across the country that the Bell Company’s

“Information Bureau” was carefully cataloguing. About 90 percent were antagonistic. After 6 months, the negative media reviews declined to 80 percent, then to 60 percent and steadily lower, until, according to Ellsworth’s memoirs, they were less than 20 percent.

Ellsworth traveled extensively on behalf of his client. In Kansas City, the local newspaper had been running particularly negative stories and editorials. Ellsworth discovered that the newspaper’s owner was on the board of the Old Colony Trust Company with AT&T president Fish. He took advantage of the interlocking directorships, suggesting that Fish talk to his fellow director about the newspaper’s antagonism. It worked so well that the newspaper owner ran some of Ellsworth’s “stories” as editorials and eventually became president of the local Bell Company.

In Salt Lake City, Ellsworth discovered that one of Bell’s competitors had organized a “telephone improvement association,” which planned to meet on Christmas Eve. Ellsworth visited the editor of every paper in town and convinced them not to cover the meeting.

When Ellsworth returned from one of his tours of the operating companies in 1907, he discovered that Theodore N. Vail, who had been the company’s chief operating officer in its early days, had replaced Fish. One of Vail’s first acts was to fire the Publicity Bureau for claiming another agency’s work as its own. Ellsworth was then 44 years old and without a job. According to Ellsworth’s c. 1927 official company biography, the newspaper owner and new president of Bell Telephone in Kansas City intervened and convinced Vail to hire Ellsworth with instructions to “make a job for himself along publicity lines.”

Ellsworth continued his peregrinations, traveling as much as 30,000 to 40,000 miles a year and extending his stays in cities with particularly nettlesome public relations problems. He continued to pioneer new tactics to counter negative media coverage, some of which may seem questionable today. He shadowed the company’s critics on their speaking tours, circulating discrediting information about them. He even tried to interfere with competitors’ efforts to obtain financing. In Rochester, he spent about \$4,000 on ads touting Bell’s policies and

service investments. To influence the local editors and reporters directly, he sponsored a contest among them for writing the best ad copy. Few of the entries were usable, but every entry received an award.

The Rochester advertising was so successful that Vail hired the N. W. Ayer ad agency to place similar ads in national media in what would become the first institutional advertising campaign. Ellsworth explained his philosophy regarding this advertising in his memoirs:

From the first, our purpose was to educate the public by telling the facts about the Bell System. I, at any rate, believed that the public opposition came chiefly from a lack of knowledge. . . . Hence the fundamental policy was to give information as to our purposes, problems and progress. . . . Anyone who came into the company, and saw it at close range, became a supporter and friend. As it was impractical to take the great public into the company, we tried to take the company to the public, hoping for similar results.” (Ellsworth, 1936, p. 68)

Ellsworth participated in a string of firsts—the opening of the telephone lines between New York and San Francisco; the launch of the first commercial radio station, WEAJ; the introduction of trans-Atlantic radiotelephony; the sending of news photos by wire; and the first television broadcast over an experimental system developed by Bell’s manufacturing subsidiary, Western Electric. He produced one of the first company-sponsored films, *Spinners of Speech*. He was even involved in designing the metal Bell System signs nailed to telephone poles across the country. But his influence within the company was best demonstrated in a study he conducted to convince Vail and the AT&T board of directors to initiate a company-sponsored pension plan.

As Ellsworth himself approached retirement age, he was made assistant to the company’s president in January 1927 to make way for his successor, Arthur W. Page. Ellsworth began his AT&T career as an unapologetic press agent, but by the time he retired in June of 1930, at 66 years of age, he had defined a very different role for himself and for the practice of public relations within AT&T. He died on June 13, 1940.

EMPLOYEE COMMUNICATION

Employee communication is the context in which information and messages are communicated for direct and indirect strategic purposes. Often referred to as “internal communication,” employee communication is defined by the function it serves within the corporate or organizational communication model as

well as by the channel, level, and networks used to most effectively communicate to or with employees.

Two themes are apparent in employee or internal communication. First, employee or internal communication efforts improve relationships among employees within the organization, including relationships between employees and management, employees and other employees, and management and other management. Programs are often centered around morale- and relationship-building activities. This is the relational element in managing communication within the organization. Second, employee or internal communication efforts help members be more effective and efficient in production and service. These programs focus on developing company or product knowledge, managing the work environment, and becoming more concerned with quality. This is the content element in managing communication within an organization. Although these two themes may not be mutually exclusive, depending on the nature and function of any given organization, they do provide a somewhat artificial means of distinguishing between employee and internal communication. Employee communication focuses on the relationships within the organization, whereas internal communication focuses on the content of work within the organization.

Employee communication can be understood in relation to other possible corporate or organizational communication functions. Depending upon the size, type, and purpose of an organization, the number of corporate or organizational communication functions may vary. They can include image or identity creation, advertising, media relations, marketing, financial affairs, community relations, government relations, crisis management, and employee relations or employee communication. Although some organizations may have formally established employee or internal communication programs, others may not but may still manage a variety of functions that address information sharing, morale building, and product or service understanding, among other activities. All organizations should have some form of employee communication program. In large, high-profile companies such programs constitute an entire department

and are formal, highly visible programs. In smaller companies, employee communication functions tend to be isolated, informal, and managed by a variety of personnel.

Another way to understand employee communication is to identify the channels or media in which relationships and information are managed within the organizational setting. The three most common channels used to facilitate the goals and objectives of employee communication are face-to-face channels, written channels, and electronic channels. Face-to-face channels are used most frequently in activities requiring relationship growth and development. Often employee communication programs include human resource, personnel, and training functions. Programs and information related to such topics as new employee orientation, compensation, benefits, employee assistance, continuing education, and personal and professional development training all necessitate a certain level of face-to-face interaction. In large companies these functions can be highly specialized and handled individually by numerous employees. In smaller organizations, they tend to be handled by a fewer number of less specialized employees. In some organizations, management personnel are responsible for many employee communication activities. It seems clear that such activities improve relationships within the organization and therefore require a great deal of face-to-face interaction. They also seem more suitable for relational rather than content elements of employee communication.

The second channel used to facilitate employee communication activities is the written or print channel, usually newsletters, magazines, or other forms of frequent correspondence. This form of print medium varies greatly by frequency, depth, and focus. Some organizations may produce a quarterly printing dealing with issues in great depth, whereas other organizations may produce a weekly document of less substance. Some companies, like Hallmark's corporate headquarters, produce a daily form of employee correspondence (*Noon News*) to regularly update company employees. The nature, purpose, and available resources of an organization in many ways determine the frequency and depth of such publications. Whereas face-to-face channels

work well for the relational goals of employee communication programs, print channels are a hybrid and tend to serve both relational and content goals. Many times written channels are used to announce and coordinate the relational activities of the employee communication officer in a face-to-face setting. Print publications may also help employees develop product or service knowledge, quality control, or other work environment or content issues within their organization.

Like print publications, the third medium, electronic forms, is also a hybrid channel for reaching both relational and content goals. In addition to being similar to print channels, it has become a rapidly growing means of managing employee communication functions. In particular, the use of intranets has become an important feature for developing, implementing, and maintaining a strong employee communication program. Intranets provide specific network content for those with access. This type of channel or medium use for all organizational members, especially the employee or internal communication specialist, has had a noticeable impact in three ways. First, the duties and responsibilities of the communication professional have become more electronically and technologically oriented. One who works in employee communication must be proficient in navigating the networked system of the organization. The proficiency often entails computer application knowledge in word processing, database management, desktop publishing, presentational software, the internal e-mail system, and any specialized software programs related to the function and structure of the organization. Again, in larger organizations the technical functions within the employee communication program can be quite specialized. In midsized to small companies the electronic and technological job responsibilities are often shared by a number of employees.

The second noticeable impact intranets have had on employee communication is that they have improved the accuracy and timeliness demanded in the workplace. Electronic forms of communication through intranet capabilities have greatly enhanced the communication specialist's ability to provide accurate and timely information to rank-and-file

employees, who can use this information to improve the effectiveness and efficiency of production and services. Intranets have also allowed the communication specialist to improve communication between employees and management. Many intranet systems have been structured to support employee communication functions in human resources and personnel, such as in the recruitment, selection, and retention of employees. In large organizations, intranets have helped organizations coordinate activities in an accurate and timely manner between such corporate communication functions as media relations, marketing, and crisis management.

The third impact intranets have had on the employee communication function is that they have been able to control response or interaction time. Intranets have enabled employees and management to communicate in both asynchronous and synchronous ways. Asynchronous communication (communication that is not in real time), as well as synchronous communication (interaction in real time through electronic channels), has created much flexibility for communication specialists. For example, time and space have become much more flexible to employees and management and have influenced the desire and need to interact face to face.

The level of interaction also helps explain how relationships and information are managed in the organizational setting. *Levels of interaction* refers to the number of participants in a communication encounter. For the employee communication specialist, managed interaction takes place at the interpersonal, group or team, organizational, public, and mass-mediated levels. Although mediated forms of communication such as e-mail, intranets, teleconferencing, and videoconferencing continue to be popular, management of a successful employee communication program requires substantial interaction at all levels. A distinction again can be made between employee and internal communication. Employee communication, or the improvement of relationships, is more frequently managed at the interpersonal and group or team levels. Internal communication, which improves the effectiveness or efficiency of production and service, is usually present at all levels but usually is managed at the organizational, public, or mass-mediated levels of communication.

The final influence to consider when defining employee communication is the communication network in an organization. Formal networks are the prescribed, official routes for sending messages, and informal networks carry unofficial messages when sender identity may or may not be known by other organizational members. The employee communication specialist assists management in moderating, regulating, and modifying these networks. Whereas traffic or speed of information is closely managed on the formal network, accuracy is vitally important to managing the informal network. The complexity of formal and informal networks is determined in some way by the size of organization. Larger companies tend to have more complex networks. Consequently, the functions of the employee communication specialist are determined by the complexity of the network in which they work. In addition to recognizing the level of network complexity, the employee communication specialist must assess the network's ability to improve relationships among employees and to assist members in the production or service goals of the organization.

Employee or internal communication is used to strategically communicate to or with employees. It is defined by the function it manages within the corporate communication model and is best understood by its relationship to the channels, levels, and networks it serves within a unique organizational setting.

ENCROACHMENT THEORY

Encroachment in public relations practice and research refers to “the assignment of non-public relations professionals to manage the public relations function” (Lauzen, 1991, p. 245). It takes place “when top management hires, promotes or moves individuals laterally from some department and/or profession other than public relations into the public relations manager role” (Lauzen, 1992, p. 173). Encroachment is a serious problem to practitioners and academics when top management assigns the top public relations position to individuals with little or no training or experience in public relations and corporate communication. Because of what public relations can add to the planning and operations of an organization, its full impact can be lost if the person managing this function does not understand or appreciate what it brings to management decisions.

Three forms of encroachment have been identified: authority, structural, and functional. Authority encroachment involves assigning the wrong personnel to manage a public relations department or unit. Structural encroachment subordinates the public relations unit to other units in the organizational hierarchy. Functional encroachment occurs as other departments or units take on activities that expand into the traditional operational realm of public relations or communication management.

Two factors affect the extent to which authority encroachment takes place: (a) other units' involvement in “traditional” public relations functions and (b) the public relations practitioner's ability to serve in a managerial capacity. Units such as marketing, legal, investor relations, and fundraising may have a damaging impact on traditional public relations efforts because they deny some or much of the influence public relations can exert over corporate and communication policy. For example, Martha Lauzen observed that the more the marketing department becomes involved in traditional public relations areas, the more top management tends to

fill the managerial positions of public relations departments with someone other than a senior person in the public relations unit. Thus public relations practitioners can reduce encroachment if they are primarily responsible for media relations, promotions and publicity, employee communication, and financial or shareholder relations.

In addition, public relations' authority in the organization is likely to decline when practitioners serve in a managerial capacity less frequently. To reduce encroachment, it is vital that public relations managers take responsibility and be accountable for the success or failure of the organization's public relations program. They need to be respected by others in management so that they truly are the organization's public relations expert. They must make communication policy decisions. Otherwise, the authority of the public relations function is likely to diminish.

A number of variables increase authority encroachment. High on the list of factors are gender, length of experience, and managerial competence. The increased number of women in public relations raises concern that the profession will be “feminized” and therefore marginalized by managements that “don't take women seriously.” Practitioners also need to know their discipline as well as the type of organization they serve. If they can't bring such knowledge to bear on increasing the organization's effectiveness, they are likely to suffer encroachment. The ability to resist encroachment increases as they become more experienced in public relations. Thus they advance the influence of their department if they continue their education and training. Public relations can also resist encroachment by being unique and generating its own budget resources, rather than depending on receiving a portion of another department's budget. This is especially important if it is going to resist the encroachment of marketing.

Finally, managerial competence is a factor. Once senior management acknowledges that the organization is challenged by a wide array of stakeholders whose goodwill is needed but is not necessarily forthcoming, then public relations is more likely to resist encroachment. Unfortunately, nothing does as much good for the role of public relations than

for an organization to suffer a major crisis. Managements of many types have learned a hard lesson by not being prepared to have fully influential public relations practitioners to meet the challenges of crises or major issues. Once an organization learns that it cannot take itself for granted and must engage in two-way communication, public relations practitioners receive more access to management and are given more decision-making power because their value is recognized.

One of the most important defenses against encroachment is for public relations to be managed by a person who understands the uniqueness of the profession. It loses power and responsibility if it is subordinate to departments such as marketing or corporate legal counsel. Encroachment results when public relations practitioners are told what to do rather than asked for their planning and crisis response advice. Lauzen found that at the managerial level, as public relations and marketing units shared more domain similarity (the degree to which the two departments share the same goals, skills, or tasks) and more resource dependency (the degree to which a member of one functional area must obtain resources from another area to accomplish his or her objectives), marketers tended to become more involved in public relations activities. Further, as marketers became involved more in “managerial” public relations activities (community relations, employee communication, media relations, promotions and publicity, fundraising, public affairs and lobbying, and financial or shareholder relations), more authority encroachment occurred. Kathleen Kelly found that the knowledge and expertise required to practice two-way symmetrical and asymmetrical public relations were significantly related to functional encroachment; that is, the fundraising function increasingly took over the management of public relations.

Functional encroachment by legal counsel is likely to occur during crisis management. To explore this hypothesis, K. R. Fitzpatrick and M. S. Rubin examined 39 cases of organizational responses to sexual harassment charges. They found that the traditional legal strategy was most prevalent (simple denial of guilt or acting indignant followed by no comment or saying as little as possible). In other

words, legal counsel dominated organizational decisions regarding public communication, a public relations domain, and thereby increased functional encroachment. Organizational excellence also played a vital role in predicting encroachment. As organizations achieved a more symmetrical communication system, a more organic and participative structure, and more strategic planning, the more the public relations officers rather than legal counsels affected decision making in crisis management.

Kelly found that when senior public relations practitioners possess little managerial competencies (e.g., environmental scanning or strategic planning), the fundraising department is more likely to structurally encroach into public relations. Based on 19 in-depth interviews with public relations managers, she found that structural encroachment on public relations was substantial. In seven charitable organizations (37%), public relations was “subordinate” to fundraising structurally. She argued that even when public relations and fundraising had equal status in the formal structure (which was often imposed by the organizational headquarters), the fundraising department encroached on public relations because of the imbalance in power, access to the dominant coalition, and resources, particularly during unstable or environmentally turbulent times (e.g., less funding, layoff, recession, and economic downturn).

Academics and practitioners worry that encroachment threatens the public relations profession. Encroachment may affect identity, job satisfaction and turnover, role development, effectiveness, autonomy and control, and other related matters. For example, if a non-public-relations professional heads the public relations unit or enacts “traditional” domains of public relations, there may be a professional identity crisis or confusion over what is and is not public relations. Encroachment raises the issue of “purity” in the practice of public relations. It muddles differences between public relations and other functions.

When encroachment occurs, public relations practitioners, especially those who aspire to be managers, may be dissatisfied with their supervisor and leave the organization. Further, when public relations is managed by an individual

from another profession, attention to a variety of strategically important publics tends to be limited, such as those that result in environmental blunders. Thus encroachment can result in ineffective job performance.

In addition, encroachment threatens the autonomy of the public relations unit and the decision-making authority of public relations practitioners, potentially making them nonmembers of the dominant coalition. It can also reduce the level of specialization in organizations. It may limit new practitioners' opportunities to observe, learn, and develop into roles as public relations managers or counselors to the top management. If left unchecked, encroachment is likely to give public relations less control over its own destiny and lessen its chances of survival as a separate entity.

As academics and practitioners have discovered, protecting against encroachment is a vital professional challenge. Practitioners should ask for more responsibility and demonstrate that they add value to the organizations they serve. They do so because of the unique offerings of the profession.

ENDORSEMENT

An endorsement is an expression of approval from a third party, usually on behalf of a product, service, cause, or candidate. Endorsements are useful persuasive tools that can appear in publicity, advertising, or other direct forms of communication. They can be either explicit (stated) or implicit (inferred by the audience).

Endorsements can influence a person's knowledge, attitudes, or behaviors in several ways. First, they are often contained in separate communications from other promotional messages. They thus provide an additional opportunity for exposure. Second, endorsements can catch the attention of audiences because they come from entities familiar to audiences, who might otherwise ignore a message direct from the entity being endorsed if it is unfamiliar. Third, audiences often perceive endorsers to be expert, trustworthy, or independent (with nothing to gain in making a recommendation). Thus endorsements can be more credible than messages disseminated directly by an endorsed entity.

MEDIA ENDORSEMENTS

Explicit endorsements involve both public approval and a *recommendation* of a product, service, cause, or candidate. Public relations practitioners often seek explicit endorsements from third parties as an important strategy in a program or campaign. Explicit endorsements (1) provide important and often prestigious exposure to reach key opinion leaders and other target audiences, and (2) provide the basis for subsequent communications that the endorsement was obtained.

Editorial Page Endorsements

Both candidates and sponsors of initiatives and referenda routinely seek editorial support from influential media. Candidates or advocates conduct *editorial board meetings* to share their positions and to seek editorial support. Endorsements are especially influential and can turn out voters in elections involving local candidates, ballot measures, and nonpartisan races where voters—especially

independents—are undecided or otherwise have limited sources of information.

Critics' Endorsements

Reviews by critics play a critical role in programs in the arts, where publicists seek recommendations of performances and exhibitions to create positive “buzz” or word-of-mouth advertising. Positive reviews can stimulate ticket sales, whereas negative reviews can reap ridicule and result in a low turnout. However, popular entertainment such as movies can attract a huge numbers of fans despite being panned by critics.

Editorial Product Endorsements

Reporters and editors routinely recommend products in stories and often create vehicles for making product endorsements that are coveted by organizations. Probably the best-known example is the Good Housekeeping Seal of Approval accorded to products that meet minimum performance standards (and advertise in the magazine). Other examples include the “*Motor Trend Car of the Year*,” the *U.S. News and World Report* rankings of colleges and universities, Top 10 lists of various sorts, and the numerous “best in town” designations of local businesses accorded by local media. In magazines such as *Consumer Reports*, the product ratings have been shown to correlate with audiences’ perceptions of product quality.

Advertising Endorsements

Product endorsements by famous people have become a popular creative strategy for advertisers. The extensive research about product endorsers suggests that celebrities can attract attention and interest to messages, but their personas and experience must be congruent with the endorsed product or service to be compelling. Cynical consumers discount endorsers who are merely selling their name. Nonprofit and political organizations often enlist celebrities to appear in public service advertising and related messages because they are affected by a problem personally or believe in the cause. Celebrities, government officials, researchers or experts

in a particular field, and other notables can endorse causes by signing petitions and statements in paid advertisements, issuing statements or proclamations, appearing at special events, or being interviewed by the press.

NONMEDIATED ENDORSEMENTS

Organizations often seek out various other kinds of endorsements to bolster promotion of products, services, or causes. Although these efforts can be used in publicity or advertising, the endorsement serves other purposes as well.

Alliances

Organizations that enter into arrangements to produce or market products or services essentially provide an endorsement of one another. Joint ventures, airline code sharing, franchising, dealerships, authorized software developer designations, affinity marketing programs, and other partnerships have become prevalent because of their cross-promotional opportunities.

Ratings and designations

Organizations routinely seek out forms of public approval to distinguish themselves from others. Examples include *bond ratings* by research firms such as Moody’s and Finch’s, movie ratings, CD and electronic game *content ratings* from media review boards, *safety ratings* from organizations such as Underwriter’s Laboratories, and *performance* and *satisfaction ratings* of automobiles, computers, and other products by firms such as J.D. Powers & Associates. *Accreditation* is sought by colleges and universities as well as by many professionals who are not required by law to obtain a license to practice. Some products seek approval from professional organizations, such as Crest toothpaste’s “Seal of Approval” from the American Dental Association. In a similar way, producers of foodstuffs adhere to strict standards to be certified as Kosher, and beef producers prominently feature *gradings* such as “USDA Prime.”

Testimonials

Positive comments from satisfied users of products or services or satisfied citizens can serve as powerful endorsements that can appear in ads and editorial features (such as application stories in trade publications) or that can involve presentations, site visits, or one-on-one exchanges between endorsers and others. In a similar way, consultants, advisers, sales representative and agents, professionals in helping professions, community leaders, and other opinion leaders can guide others in evaluating products, services, causes, or candidates. The goal of a public relations program might be to encourage such endorsements by opinion leaders and other influential people.

Philanthropy

Organizations that contribute funds to social causes essentially make statements of support through their actions. That support, in turn, is used by the supported organization to demonstrate to others the breadth and depth of support that exists for its programs. The number and size of contributions and the prestige of the donors are often cited by recipient organizations as indicators of why others should become involved. In a similar way, organizations can express approval of worthy causes by sponsoring volunteer programs, providing in-kind support, offering facilities, or accepting contributed merchandise for use by the organization. Sponsorship of a philanthropic activity involves a dual endorsement process: contributors lend credence to charitable or other activities while the recipient organization recognizes and subtly endorses the co-sponsor.

ENLIGHTENMENT AND MODERNITY

In northern and central Europe, public relations is rooted in the concepts of enlightenment and

modernity. In German-speaking countries, it is still called “*Öffentlichkeitsarbeit*,” which is literally translated as “working in [the] public sphere” and can be defined as “working for the public, with the public, and in public.” In many other European countries, public relations is also referred to as an organization’s obligation to “relate to [the] public sphere.” *Öffentlichkeit* is seen as an outcome, and therefore a quality of public communication in society; it means “which people talk how about what.” Although some normative elements can be found in these sociological approaches, this view differs from the community-building approach developed by Dean Kruckeberg and Kenneth Starck, who defined public relations in a normative way, as the social conscience of an organization that contributes to mutual understanding among groups and institutions and brings harmony to private and public policies. This definition reflects a premodern approach to public relations.

In many European public relations approaches, the concept of *legitimation* is used to describe how an organization, as the exponent of one of the institutions in the social system, co-produces public policies and thereby the empirical realization of institutions. An organization is legitimate as long as there is no public discourse concerning its legitimation. Although the social sciences have been used to define the concept, legitimacy is neither a moral nor an ethical principle, but rather is related to the empirical issue of what is good and justifiable for the members of society. “The legitimacy of an organization is a measure of the extent to which the public and the public sphere at a given time and place find the organization sensible and morally justifiable” (Munck Nielsen, 2001, p. 19). It is therefore a fundamental empirical and not a normative approach and is rooted in a modernist approach to society.

Franz Ronneberger and Manfred Rühl stated in 1992 that, in managing the communications of an organization, management cannot avoid having an empirical function in the development of society. Ronneberger claimed earlier that clarifying the different perspectives in public discourse, thereby furthering the development of public opinion, is the most important role of public relations. Werner

Faulstich sees public relations as interaction in society itself: It makes something publicly known and creates public discourse. Thus, we may argue that communication management is part of the “social structure of public meanings” because of its social construction of community. In this way communication management is defined as part of the larger societal communication system, much like journalism and advertising. Most of the German and Danish public relations researchers, such as Arlt, use such a social science paradigm, which can be seen as an outcome of modernist thinking.

At the end of the 18th century, reasoning was seen as a fundamental human activity for the first time. Descartes said, “*Cogito, ergo sum*” (I think, thus I exist) and emphasized individual power to create a rational world. The same idea was expressed by philosophers like Kant, who explained that in a modern world people should no longer act as national subjects of the powerful but as citizens who are able to rule the world themselves by citizenship and rational thinking and acting. Traditional authority became unacceptable and “irrational, that is, contrary to human nature and inhibitive of human growth and development” (Ritzer, 2000, p. 12).

Modernity contrasts with the premodern, traditional idea of an ideal social structure. Modernity was developed by great 19th-century sociologists such as Comte and De Saint-Simon, who maintained that human evolution should be seen as an irrefutable development toward improvement and that this improvement began in their time. The concept of modernity can explain the period of the Enlightenment. Well-known contemporary scholars devoted to modernity are Jürgen Habermas and Anthony Giddens. At the end of the 20th century they in turn were highly criticized by postmodern scholars such as Baudrillard and Foucault.

Sociologist George Ritzer characterizes the Enlightenment by the belief that people could comprehend and control the universe by means of reason and empirical research. The view was that because the physical world was dominated by natural laws, it was likely that the social world was, too. Thus it was up to the philosopher, using reason and research, to discover these social laws. Once they understood how the social world worked, the Enlightenment

thinkers had a practical goal—the creation of a more rational world, as Ritzer explains. In the Netherlands, the word *voorlichting* was until recently used as an equivalent for public relations. In the 18th century, science and knowledge were no longer seen as the possessions of the elite only, but as things that had to be diffused among all members of society. The means for this diffusion was *voorlichting*, which can be translated as “enlightening.” The idea of “*voorlichting*” is based on *sapere aude*, an expression of Immanuel Kant that literally means “dare to know” and that ultimately meant that “all people must be willing to be informed on what is going on and made enlightened, so that they can take part in the ongoing debate about and development of society.” Besides education, “*voorlichting*” was seen as the main way to help people be informed and so came to be defined as “giving full information to all people to mature and emancipate.”

Many people who were afraid of this enlightening of ordinary people expressed a more traditional view of society. They preferred to use “*voorlichting*” to show people how to behave as good citizens and to control them. The history of *voorlichting* can therefore be seen as a history of the battle between information and emancipation on the one hand, and education and persuasion on the other, but always under the (“Dutch uncle”) dogma of “knowing what is good.” In all theories of “*voorlichting*” the rather pedantic premise is that it is given for the benefit of the person or group to be enlightened, even when the persons involved do not want to be enlightened at all or at least not in this way.

In the period of the Enlightenment, the idea was that human beings create society, and that society in turn creates its institutions, and thereby the reality for human beings, in a dynamic process. This is the basis for a constructionist view of public relations.

ENTERTAINMENT INDUSTRY PUBLICITY/PROMOTION

Public relations practitioners who work in entertainment-related industries and fields often specialize in publicity and promotion. Publicity is media coverage generated in newspapers, in magazines, on radio, and on television. In most cases, the coverage is intentionally placed by an individual rather than by a news reporter covering an assigned story for publication. Publicity can be sought by any individual, but those who specialize in it are called publicists. Many public relations practitioners, even though not labeled publicists, frequently are involved in some activities that generate publicity. Some even specialize in media relations, a sophisticated specialty that involves forming ongoing positive relationships with media gatekeepers.

The entertainment industry encompasses a wide variety of organizations, including performing

arts centers, museums, orchestras, opera companies, Broadway theaters, aquariums, amusement parks, record companies, motion picture corporations, television networks, and major artists who have become corporations in themselves. All of these organizations need specialists who publicize and promote their activities. The objective for most specialists is to sell something—CDs, movie tickets, tickets to a show or concert, and even an image.

The publicity and promotion activities in entertainment-related industries are typically part of the marketing function and mix: product, place, price, and promotion. Unlike the term *publicity*, *promotion* is an umbrella word that encompasses advertising, public relations, sales, and sales promotion. Practitioners who work in entertainment may also handle advertising. In a performing arts center, for instance, practitioners create ads for center attractions that run in the local paper. They produce brochures and calendars for patrons and series subscribers that display the various attractions. They work with a sales force to develop sales materials for telemarketers who specialize in group sales or series renewals. Sales promotion techniques give the target audience an incentive to buy the product. In the performing arts, the practitioner may host an open house with showcase performances of the various groups to stimulate the interest of potential patrons. Other examples of sales promotion techniques include hosting an artists' reception for theatergoers after a performance or holding a special drawing of tickets to the various attractions.

Publicity plays a large part in entertainment. An entire field of journalists reports on the expansive world of entertainment to satisfy the public's interest. Publicists in the entertainment field focus their time on gaining coverage for their clients, attractions, or organization. They prepare press materials and pitch stories to media gatekeepers. They work with feature editors of metropolitan newspapers, associate editors of magazines, assignment editors of television news shows, producers of television programs, news directors and program directors of radio stations, and a myriad of other journalists. A skilled publicist studies the work produced by a particular journalist and the editorial environment of the publication or show in an attempt to develop

an interesting angle tailored for that particular media outlet.

Four models are widely accepted to describe the evolution of public relations: the press agency/publicity model, the public information model, the two-way asymmetric model, and the two-way symmetric model. The earliest, the press agency/publicity model, is described as one-way communication in which truth is not an essential component. The public information model focuses on publicity to the extent that disseminating truthful information is central to the practice. The two-way asymmetric model tries to persuade and relies on feedback from stakeholders. The two-way symmetric model is considered the most sophisticated form of practice because it focuses on mutual understanding, mediation, and two-way balanced flow of information.

Press agency is closely associated with publicity in the entertainment world. Press agency is the practice of attracting the attention of the press through techniques that manufacture news. Methods associated with press agency include staged events, publicity stunts, faux rallies or gatherings, spinning, and hype. A common practice in the late 1800s and early 1900s, press agency is not part of mainstream public relations. Rather, it is a practice primarily associated with major entertainment-related events, such as Hollywood premieres and boxing matches. The goal of press agency is to attract attention rather than gain understanding. Even today, however, the term *press agent* is sometimes used interchangeably with *publicist* in traditional Broadway theater and motion picture industries. Today's entertainment industries are populated with publicists rather than press agents. Publicists are individuals skilled in media relations who attempt to get the name of their clients or events in the media by carefully constructing messages that inform, educate, and persuade. Some are astute in branding and positioning strategies to aid the careers and success of their clients. In contrast, press agents want attention—good or bad—in most any form.

Press agency has been called persuasion for short-term advantage through the use of truth bending and even distortion, but it can also be simply the staging of provocative acts to get publicity and draw attention to an individual, event, or cause. Therefore,

it is understandable that one of the earliest proponents of press agency was Phineas Taylor (P. T.) Barnum, the famed American showman and promoter who put Gen. Tom Thumb on exhibit and launched a mobile circus featuring Jumbo the elephant and freak shows. Barnum was a master of press agency. For instance, he wrote letters both praising and criticizing his circus show to newspapers under an assumed name.

In the early part of his career, Edward L. Bernays was also a master of press agency. He persuaded 10 debutantes to hold up Lucky Strike cigarettes manufactured by his client, the American Tobacco Company, as “torches of freedom” while participating in New York’s Easter parade. In 1929, Bernays staged a global news event by organizing the “Light’s Golden Jubilee,” a worldwide celebration commemorating the 50th anniversary of the electric light bulb for his client, General Electric. Bernays managed to secure several prominent individuals for the event, including carmaker Henry Ford, electricity scientist Thomas Edison, and President Herbert Hoover.

Henry Rogers, one of the founders of Rogers and Cowan, the largest and most successful West Coast entertainment publicity firm, became well known when he promoted an unknown contract player for Columbia Pictures named Rita Hayworth. He contacted *Look* magazine with a telegram from the Fashion Couturiers Association of America, a fictitious group, claiming that Hayworth was the best-dressed off-screen actress. *Look* magazine took the bait and put Hayworth on the cover and published 10 pages of her photographs.

ENVIRONMENTAL GROUPS

Environmental groups can either be a major source of work and irritation for public relations, or a very helpful supporter. Almost all organizations today must address environmental issues at some point. Beginning in the late 1960s and extending to the present, Congress has enacted and reauthorized laws that affect all aspects of business, from raw materials used to production processes and by-products. Current practices are not the only ones impacted. Many organizations are being forced to deal with the environmental impacts of activities that took place decades ago. And for every environmental issue with which an organization must deal, there seems to be at least one environmental group ready to scrutinize its words and deeds.

In terms of the national or international environmental groups, some deal with broad environmental concerns, and some are fairly focused on a single issue. Many of these groups have clear and even stated political agendas. While a large, parent group will focus on issues with broad impact, local chapters of a group take up specific issues of local concern as well as support the larger group. Some environmental groups are not connected with a national organization and are composed entirely of local citizens who have banded together to address community concerns. Thus, in environmental matters public relations must be prepared to deal with a broad range of interests and agendas. Some general categories of groups based on their approaches to issues are discussed below.

Radical

This category includes groups such as Earth First! and Greenpeace. Although they cover a broad range of environmental issues, they are grouped together because of their very visible and often contentious approach to issues. These groups have taken a lesson from Bernays's approach by using staged events (probably more sensational than Bernays would have approved of) to generate media coverage, a major goal of such groups. They want the widest possible dissemination of their position and message, and they are willing to go to great lengths to achieve that goal. Some examples

include Earth First! members chaining themselves to trees or engaging in tree sits (camping out in a tree for weeks on end) and the presence of Greenpeace's ship, the *Rainbow Warrior*, whose 2003 detention in Spain caused international protests at Spanish embassies, or Greenpeace members driving dinghies around oil tankers to protest shipping too close to sensitive shores (directed not only at the oil companies, but at the government as well). Although they sometimes accomplish the goals of saving trees or coastal ecosystems, clearly these actions are designed to reach a mass audience through media coverage. The events have visual appeal and are unusual, two attributes public relations often strives for when trying to place a story. Sometimes it even appears that these groups understand media relations better than the public relations staffs charged with addressing the negative press these groups generate for the target organizations.

Animal rights activist groups, such as the Animal Liberation Front (ALF), are sometimes considered radical. ALF has been known to go as far as violating laws by breaking into labs or fur farms to free animals. They are quite unrelenting in their approach to their cause, advocating vegan diets and complete elimination of all animal products.

When faced with groups such as these, public relations practitioners are in a very difficult situation. These groups do not like to compromise and seem to thrive on direct confrontation. Confrontation is what they're trained for, and they know how to use it to gain even more media attention. Some organizations do try to confront these groups, with mixed to disastrous results. Others try to ignore them and hope they'll go away or the media will find a new story to cover. There is no one answer for how to deal with these groups. Each situation and the temperament of the targeted organization will to a large degree determine what public relations can and can't do. The only certain approach is to try not to do anything that will inflame the situation any further.

Mainstream Activist

Groups such as the Sierra Club and the National Wildlife Federation have broad memberships across

the United States. They are definitely more centrist than the radical groups, although they, too, have well-defined political agendas. They approach these agendas through professional lobbyists and grassroots organizing. While they certainly can, and have, approached businesses and governments in a radical manner, their typical approach is through media and political pressure and influence. Basically, these organizations are structured and behave very much the way many businesses do, with elected presidents and boards, national offices, and strategic planning for both accomplishing their environmental agenda and maintaining and increasing their membership. For example, the Sierra Club offers environmentally sound investment packages for its members. (It should be noted that many radical groups also follow such organization, but their approach to issues gives them a very different outward appearance.)

One key to understanding such groups is to understand their membership. Organizations such as the Sierra Club and the National Audubon Society (not just concerned with birds, but with habitat conservation and a range of environmental issues) have state and many local chapters and even publish magazines. Although their members do join to support an environmental cause, the groups use social functions to maintain support and cohesion. The Sierra Club offers national vacation opportunities centered on environmental themes, and local chapters have outings and activities, not all of which are environmentally related. Local Audubon chapters go bird-watching, hold annual bird counts, and have meetings with noted speakers. The end result is that people identify with the organization and thus write letters and often vote in accord with the organization's positions. National endorsements can be important, but a strong showing on local issues can have an even greater and more direct impact on organizations, because changes in the local operating environment can sometimes be more critical to organizations than national issues.

Unlike the radical groups, there are realistic possibilities for interacting constructively with mainstream activist groups. These groups must balance the pursuit of their environmental goals with the need to maintain approaches consistent with the

perspectives of their members. Certainly there are points beyond which these groups will not bend, but often there is both room and willingness to negotiate on issues. For example, if organization X is willing to preserve the most sensitive natural areas on its complex as wildlife areas, it may be able to work a compromise with the environmental group criticizing it about plans for plant expansion and even get the group to endorse the revised plans. The key to success here, as in any negotiation, is to understand the values and constraints of the other side and create a match with the organization's desires. When such a compromise can be reached, the organization should realize good opportunities for positive press about its environmental efforts.

Quiet Workers

Another type of environmental group consists of those who maintain a relatively low profile while working to achieve their goals. These groups rarely, if ever, assume the attack posture of a radical group, but they do occasionally use political and media pressure to push their point. More often than not, these groups look for appropriate partners to help them achieve their objectives. For example, the Nature Conservancy partners with government bodies and businesses to preserve important natural places through its Conservation by Design program. The conservancy uses established science to determine which areas are essential for protecting important ecosystems and then does everything it can to protect those lands. The conservancy uses everything from conservation easements to gifts of land or land purchases in its attempt to ensure stable ecosystems for the future.

The Ocean Futures Society, headed by Jean-Michel Cousteau, takes a slightly different approach. Ocean Futures, as the organization and Cousteau names indicate, is concerned with protecting the world's oceans. Membership in the society is free. It has a well-established education function that focuses mainly on children. The society provides information and experiences for youth that it hopes will impress upon them the importance of healthy oceans and the general environment to the health of humankind. The underlying goal is not only to create

a generation that values the oceans, but also to see that information passed on to parents, as children often do. Ocean Futures worked to return Keiko (the *Free Willy* orca) to the wild and ties to Nemo (the Disney/Pixar fish character) to provide information about coral reefs. These efforts are made possible through many partnerships, some of which include Icelandair, Applebee's Restaurants, Kawasaki, and UPS (all listed on the Ocean Futures Web site, www.oceanfutures.org, with links to corporate Web sites).

Clearly, environmental groups such as these provide opportunities for constructive partnerships, enabling organizations to generate positive environmental coverage for themselves. Finding an appropriate partner (there are no oil companies listed as Ocean Futures partners) is the key, and a task public relations practitioners are well suited for.

Local Community Groups

These groups form around issues of specific concern in a community. Although some members may belong to larger environmental groups and call on them for support, the focus is on the conditions in the immediate area. Examples of these types of groups include Lois Gibbs and the other Love Canal residents, inner-city groups who form to fight industrial pollution and landfills in their neighborhoods (these are often minority groups and fall under the environmental justice movement), and the many citizen groups who have come together to fight environmental problems at the United States nuclear weapons production facilities.

Members of these groups may start out without much knowledge or information, but they tend to acquire it quickly. Personal safety and the safety of one's family are key motivators to action. These groups may also lack power, particularly when compared to the organizations they often oppose. But that should not be a reason to overlook them. Lisa Crawford and the residents around the Fernald nuclear weapons plant got their problems on the cover of *Time* magazine and successfully sued the United States Department of Energy, winning compensation for lost property value, health problems, and lifetime medical monitoring. They educated

themselves about air and water pollution, the effects of radiation, and remediation technologies. They made everything that happened at the plant their business. When the media had a question about something happening at the plant, they would go to Crawford for a quote. And this group connected with groups at other weapons facilities to exchange information and tactics for dealing with their problems. The pressure exerted by these community groups, individually and as a whole, played a major role in forcing the government to begin the cleanup of the weapons facilities. Today, the cleanup organization at Fernald consults with the local citizens on most cleanup decisions, major and otherwise, rather than simply telling them what the decision is on a course of action.

The power of local community groups should never be underestimated. The media love an underdog, and there are few more appealing than a group of mothers fighting for the health of their children. Emotional appeals are very common with these groups, especially in the early stages of a conflict. An organization can rarely win such a battle, and more often than not looks extremely callous when trying to do so. The group's concerns must be taken seriously and addressed in a meaningful manner. At this point, an organization often becomes involved in risk communication. Dealing with these groups successfully, and with all other environmental groups, requires that an organization be able to support its claims with specific actions taken to address environmental concerns.

Overall, an issues management approach should be used to address environmental groups and their concerns. The ultimate goal is to be prepared through research and informed anticipation. Organizations can influence environmental regulations and anticipate objections to their actions that groups will have. Public relations can accomplish this task through monitoring national and international groups on the Web in order to track environmental concerns and also find appropriate partners for positive environmental activities. The Public Relations Society of America Environmental Section Web site (www.prsa.org/_Networking/environment/) has many useful links, not only to some of these groups, but also to sites useful for monitoring environmental legislation

ENVIRONMENTAL SCANNING

Environmental scanning is a method of gathering information from the external environment for use in issues management and the strategic decision-making process. It’s an early warning system for changes outside the organization—a type of radar to pick up the new or unexpected in order to help top management plan for the organization’s future. In addition to detecting emerging issues, the strategic intelligence provided by environmental scanning can also help quantify existing problems.

Although environmental scanning or monitoring appears to have originated in the business management arena, David M. Dozier referred to it in the context of public relations as “the gathering of information about publics, about reactions of publics

toward the organization, and about public opinion toward issues important to the organization” (1986, p. 1).

In addition to detecting threats and opportunities for the organization, environmental scanning also encourages future-oriented thinking in the dominant coalition.

As a research method designed to bring information into the organization, environmental scanning is a function of an open system, which uses either two-way asymmetric or two-way symmetric models of communication.

Environmental scanning is important to public relations practitioners because successful management of dynamic organizations depends upon the ability of the senior leaders to adapt to a rapidly changing external environment. Because it is easy for management to become insulated from key publics, the public relations practitioner can use environmental scanning data to help keep the dominant coalition in touch with the opinions of those critical to the organization’s success or failure.

Collecting and processing intelligence about the environment also makes the communication manager a useful and necessary part of the organization’s management decision-making team. Those who don’t do environmental scanning are often not included in the dominant coalition. Dozier and Larissa A. Grunig wrote, “This is one source of power that practitioners can use to redefine the public relations function and alter its vertical and horizontal structure” (1992, p. 412).

Organization leaders or executive managements often face information overload when they have more information than they can efficiently and effectively process. Having a formal environmental scanning program can help identify the sources of information most important to the organization. Scanning, therefore, is a way of separating the wheat from the chaff.

There are few guidelines on how to do environmental scanning. Scanners should seek signs of

change; look for signals of potential events on the horizon; study forecasts of experts and indirect effects; and write abstracts to crystallize thoughts.

To develop the objectives of the scanning program, the public relations practitioner must decide if periodic or continuous scanning is needed. Interviews with key decision makers in the organization and a review of the organization's current master plan will help develop an initial list of trends and issues to monitor.

When considering the environment to be scanned, a variety of levels should be considered: the local environment, which includes the organization's current and potential stakeholders; the industry environment of the organization; and a more global environment, which includes trends and issues in the economy, politics, technology, and society.

Both informal and formal methods can be used to gather information. Samples used in casual research may not be scientifically representative but may still be beneficial. Practitioners scan by studying mass media and specialized media such as scholarly journals, trade magazines, newsletters, newspapers, recent books, the Web, and radio and TV programs. They may confer with a network of contacts, such as colleagues and experts within their industry, advisory boards, community forums, or political and community leaders. Records of phone calls, letters, or e-mails coming into the organization may be useful as well. More formal methods of gathering market research data through surveys and focus groups may be used, along with ongoing communication programs with the organization's priority stakeholders.

After information is gathered through the scanning process, it must be analyzed and interpreted for the dominant coalition to make sense of it and to incorporate it into strategic decision making.

EPLEY, JOE

Joe S. Epley reflects the expression “You can take the boy out of the country, but you can’t take the country out of the boy.”

He was born in the small North Carolina town of Forest City in 1938 and spent his formative years with blue-collar workers and farmers. Today, after completing a public relations trip, Epley still returns to a sparsely populated area at the foot of the Blue Ridge Mountains. Often, when he is “in residence,” some of the best minds in public relations sit on his porch in a rocking chair to share Epley’s wisdom.

For the better part of three decades, Epley has been sharing his passion for *sound, pragmatic public relations*. He is committed to professionalism and has given time and money to educate and train young people in both the art and ethics of public relations. Epley has made major contributions to three different areas of public relations: ethical behavior, futuristic insight, and globalization.

DOING WHAT’S RIGHT

Epley was first recognized as a significant public relations leader during and immediately after 1986, when he served as chair of the Counselors Academy of the Public Relations Society of America (PRSA). Using this platform, he became perhaps the leading advocate in the field for higher professional standards and has held a PRSA leadership position without interruption for more than 20 years.

While Epley was becoming president of PRSA in 1991, many African American members said they would not attend the national PRSA conference in

Phoenix because the state of Arizona had elected not to celebrate the Martin Luther King holiday. Moving the conference to another city would have cost PRSA about \$500,000 in contractual penalties. Nevertheless, Epley said, "We cannot have a conference at a location in which many of our members would not participate on moral grounds" (Epley, personal communication, 1991). Epley's solution was to call a special meeting that included the PRSA board, representatives of PRSA's chapters in Arizona, members of PRSA's cultural diversity committee, and other trusted advisers. Epley offered the assistance of several nationally prominent PRSA members who understood political campaigns and who would assist Arizona's PRSA members in helping to wage a statewide election that ultimately made that state the first to establish a Martin Luther King Day by popular vote. The theme of the 1991 PRSA conference in Phoenix was "What's Right?" Epley has said, "Our focus has to change from 'building awareness' to 'building relationships,' from 'educating' to 'persuading.' We do that by paying as much, if not more, attention to personal, corporate and product reputation as we do to promoting products and ideas" (1999, n.p.).

Epley has been careful to reject potential clients that do not fit his standards. For example, he was asked to counsel controversial PTL evangelist Jim Bakker when Bakker first emerged as a target of editorial criticism in the early 1980s. After conducting his own research, Epley turned down the offer, explaining, "We weren't going to work for somebody who deceived his constituents, and who we believed would not change his 'off-camera' behavior" (Epley, 1999, n.p.).

Neither has he avoided controversial clients. Rather, he has tried to present them with constructive alternatives to achieve the same type of win-win result he did for PRSA in Arizona. For instance, he convinced the chemical company Sodyeco to open its gates not only to neighbors but also to the Sierra Club for scrutiny so they could see firsthand what the company was doing to protect the environment. This tactic, which has now been employed widely, was largely unacceptable when Epley first used it. The result was public support for his client at a critical time.

Epley believes that "laws don't dictate morality. The issue for us today is to regain credibility for business and for those ethical American corporate values that built our nation . . . values built on character, honesty, fair play, and hard work." He also has said, "We can build awareness. But it won't be worth a hill of beans if everyone in an organization's management team doesn't embrace the basic principles of ethical conduct in business and corporate responsibility to society" (Epley, 1999, n.p.).

SEEING AROUND CORNERS

Epley's second contribution is insight into the future. From the early days of the Information Highway, he promoted the Internet. Long before many others, he saw clearly how the Internet would affect business and, consequently, the field of public relations. This focus on how things are communicated, as well as on what is communicated, started during his time with the Army's Defense Information School, where he was elected to the Defense Information School Alumni Hall of Fame. The firm he later created, Epley Associates, continues to focus on communication. The company became one of the best independent firms in the South, with a client list that has included John Deere, Philip Morris, Glaxo Welcome/Glaxo Smith Kline, General Electric, BB&T Bank, Union Carbide, Westinghouse Broadcasting, Carolinas HealthCare System, Sandoz Chemicals, and many other organizations such as universities and local governments. Even a few political candidates have become Epley clients, including two mayors of Charlotte, two congressmen, and a chief justice of the North Carolina Supreme Court.

This impressive client list is largely due to the fact that Joe Epley has always been an early adopter of new technology. This trait has provided him with a competitive edge. His monograph on hourly billing practices and daily timesheets became a standard reference for many years. Starting with dedicated word processors, the Epley firm evolved into one of the first public relations firms to automate with networked computers.

At the same time, Epley has been able to see the downside of technology. The world is drowning in an

ocean of information overload. It's awash with messages that conflict, obscure, deceive, inform, educate, promote, motivate, or just trivialize. Navigating that sea of information clutter is our job. It requires us to master the use of advanced information technology as conduits of our information. We must shape our messages to take advantage of the tools, and not let the tools rule our communication. (Epley, 1999, n.p.)

Speaking of the Internet specifically, he has said the following:

It's undisciplined, and only partially harnessed somewhat by search engines that in nanoseconds can browse through millions of documents and organize reference Web sites on any subject ranging from the ascension of Christ to Zoology. It's intellectual, educational and entertaining. It's an archival dump for news, history, rumor, and a wide array of personal opinion, often with no sense of accuracy or fair play. . . . It also has a foreboding dark side, making possible the rapid spread of false information, hatred, immorality, deceit, and rumor.

There are as many opportunities for abuse to our freedoms and sensibilities on the Internet as there are to enlighten, to educate, to manage, and to market our goods and services. The Internet is a godsend for marketers. But, a lack of discipline and control make it a very dangerous vehicle for those opposed to particular products, specific organizations or certain beliefs.

The "Net" will dominate our lives for the next 10 to 20 years—or whenever the next radical generation of technology replaces it. And that won't be far in the future. It is a vehicle that soon will be the dominant medium for public relations messages. We must learn how to take advantage of it, to engage others with it and master its growing and rapidly changing idiosyncrasies. (Epley 1999, n.p.)

BEING A GLOBAL PUBLIC RELATIONS AMBASSADOR

As impressive as his professional leadership and futuristic approach have been, it is his contribution to global public relations for which Joe Epley will best be remembered.

He believes that good public relations practice will help make a better world, that it will contribute to stronger national economies and create understanding among diverse peoples. He advocates

forcefully that public relations can create more open societies. In his words, "Public relations is the discipline that helps build better collaboration."

In the last 10 to 15 years, Epley has been speaking in remote locations to demonstrate the power of public relations. Nowhere has this been in greater evidence than in his work to help bring public relations to the former Soviet Union.

Alexander Borisov, now an important Russian diplomat, was an educator when the first American public relations techniques were introduced just before the breakup of the Soviet Union. Borisov was then dean of the School of International Journalism at a university in Moscow. He was not practicing public relations, but rather was looking for help in how to teach it. Eventually, he would become founding president of the Russian Public Relations Association. Epley helped him introduce American public relations techniques to Russia. Borisov says that Epley is an

absolutely remarkable person in the global PR community, both as an excellent practitioner and a man of vision. . . . We worked with him closely, and he signed on behalf of PRSA a letter of understanding with the newly-born Russian PR Association which helped us to start an internship program which opened the gates of knowledge for the first Russians eager to become PR professionals in their new country. (Borisov, personal communication, 2002)

Epley is credited with leading the PRSA drive to supply textbooks and curricula to the Russians, which they adopted for their first course in Western-style public relations. Epley's business associate Mike Herman, who became chair of the PRSA Counselors Academy nearly 20 years after Epley, said the following:

Joe recognized there were no mentors in Russia for this new profession. He helped set up the first public relations course in Moscow. He led an effort by PRSA to sponsor a formal internship program to train aspiring young Russian PR teachers and professionals in the U.S. When our own USIA would not help with the program in Russia, Joe personally recruited PR firms and organizations around the country to underwrite the expenses of Russian interns while in the U.S. As a direct result of his efforts, more than a dozen Russian

interns received on-the-job training in U.S. firms, many including a rotation through our firm. In addition, Joe has personally served as a mentor to practitioners in Russia, Hungary, Slovenia, China, and Argentina. (Herman, personal communication, 2003)

Over the years, Epley has participated in a number of seminars in Russia. One included a program on community relations for the Russian Ministry of Northern Territories. In acknowledgment for all these contributions, the Russian Public Relations Association bestowed lifetime membership on Epley on the occasion of its 10th anniversary in 2001.

Epley has also helped found and chair the Worldcom Public Relations Group, a consortium of independent public relations firms that include members from 35 different countries. Worldcom partner Roger Haywood, a highly respected member of the British public relations community and honorary chairman of that country's Public Relations Standards Council, recalled a keynote address by Epley at the Institute of Public Relations:

His cogent views shaped much of the discussion at that event and for some considerable time after. Many of his perspectives had proven to be central issues. . . . His belief that public relations is a core strategic function that affects corporate policy means that the practitioner must either be in the board room or directly advising the board. He also advanced the view that good public relations is fundamentally about the values of the organization, what it does and not just what it says. Also, that we as custodians of the corporate reputation must be professionals of integrity, courage and vision. (Haywood, personal communication, 2002)

Thus, Epley has been an important global ambassador for public relations and a global role model for the way the business should be practiced.

ETHICS OF PUBLIC RELATIONS

WHY STUDY ETHICS IN PUBLIC RELATIONS?

Public relations ethics inspires much debate between public relations communicators and those suspicious of the field. Because of the weighty responsibilities of the public relations function within an organization and its ability to wield influence, public relations ethics is a vibrant topic that should be discussed, researched, and refined. First, what is ethics? Immanuel Kant wrote, "By way of introduction, I had defined ethics as a science that teaches, not how we are to achieve happiness, but how we are to become worthy of happiness" (1793/1974, p. 45). Other scholars defined ethics as the study of what is right and wrong, fair and unfair, in how we should live our lives. Simply defined, ethics is the study of morality. Ethics assumes that truth and morality exist and can be discovered through the rules, values, and principles that govern, or should govern, behavior.

POWER

Public relations has tremendous power because it involves shaping public opinion by deciding what information is important or pertinent and performing the role of liaison between the organization and its publics. The power of public relations is often debated, but its effects on attitudes and behavior are demonstrable at many levels. Therefore, public relations practitioners have the responsibility to convey honest and accurate information, because what they communicate has far-reaching ramifications. Public relations pursuits such as public affairs and lobbying, issues management, political communication, corporate communication, military communication, investor relations, and activist communication all shape the society in which we live. The power to influence society means that public relations holds enormous responsibility to be ethical. Add to this the ability to shift financial markets and alter supply and

demand, and it becomes clear that public relations is a formidable force in society.

ORGANIZATIONAL ROLE

Systems theory explains that the public relations practitioner is a boundary spanner, holding roles both inside the organization and in publics outside the organization, and thus acting as a communication facilitator. To understand the publics outside an organization, the public relations practitioner must maintain effective and open communication with them, sometimes joining their groups and meetings to understand their viewpoints. The practitioner acts as a representative or advocate of the organization's position while meeting with publics, and while meeting with management in the organization the same practitioner acts as an advocate or representative of the publics' opinions. Having this dual membership is often referred to as holding "divided loyalties," particularly by those suspicious of public relations. In reality, the practitioner is often performing a valuable role by educating the organization to the views of publics and by educating the publics to the organization's policies, priorities, and other factors outsiders could not readily discover. The relationships that the public relations practitioner maintains with publics outside the organization are unique because they provide valuable information on how those publics view certain topics, the values each public holds, and how that public is likely to react to a given decision. This input can become a crucial part of strategic decision making. It can also help to identify issues and solve them proactively before they become major problems. In general, this boundary-spanning role puts pressure on public relations practitioners to be ethical. In fact, in many organizations they counsel the CEO or the dominant coalition in ethical issues.

Critics assume that public relations holds a formidable amount of power to shape public opinion. Detractors of public relations offer cases of unethical behavior as examples of the dark arts of powerful communication effects, manipulation, or "spin doctoring." The powerful effects or "hypodermic needle" model has now been replaced by a more sound model of mediated effects, although

critics of public relations seem unaware of the mediator role communication plays in altering public opinion and behavior.

NEGATIVE PERCEPTIONS

The most vehement critics of public relations are often journalists. Research analyzing how the term *public relations* was used in the print media has revealed seven different themes: public relations as creating distraction, disaster, challenge, hype, merely PR, war, or schmooze. The consistent use of the term *public relations* to suggest manipulation of the truth to a dubious end damages the credibility of the discipline. In 2003, Shannon Bowen found that even university students majoring in public relations held negative misperceptions of the discipline and misunderstood its basic responsibilities early in their course of study.

In actuality, ethics is an important consideration to both practitioners of public relations and scholars who teach and study it. The major industry associations of public relations all have codes of ethics and offer ethics seminars and training for practitioners. The discipline has many scholars who research and refine the ethics of public relations as their life's work. Ethics is a part of the public relations curriculum in classrooms around the globe. As a profession, public relations has made strident efforts to engender meaningful ethical standards in practically every industry. The dubious historical beginning of public relations, confusion of public relations with propaganda, and a contentious relationship with journalists have all contributed to the reputation of public relations as an unethical or manipulative pursuit. Although this misconception is prevalent, honest communication and discovery of the truth are utmost concerns in the public relations discipline and professional practice. Even early practitioners such as John W. Hill argued for rigorous ethical standards; he believed that public relations should be the ethical conscience in an organization.

As with any industry or discipline, cases of ethical violations exist within public relations. These cases become famous examples to which critics often refer in attempting to illustrate the "evil" nature of the profession. What those outside the discipline often fail

to realize is that public relations is in the business of solving potential issues before they become problems or crisis situations that would be worthy of media notice. This proactive problem solving is the issues management function of the field. Success in public relations often means resolving an issue before anyone complains about it, thus saving the business untold sums of money it might have spent on lawsuits, media relations, lobbying, compliance, strikes by labor unions, and endless other permutations. Success in issues management is often measured in terms of ethical decisions, averted crises, and money saved by an organization. Thus, the victories of public relations are often unsung.

APPROACHES TO PUBLIC RELATIONS ETHICS

Scholars have attempted to conceptualize an ethical body of knowledge in public relations. Related disciplines such as communication ethics, media ethics, and business ethics have contributed theories and ideas to the discussion. Public relations scholars have applied moral philosophy to public relations ethics and found it a fruitful area of study. However, public relations practice has failed to follow scholarship by basing its ethics squarely in moral philosophy. Few public relations practitioners have studied moral philosophy or ethics, and most tend to rely on situational ethics or crude cost-benefit analyses of dilemmas rather than rigorous philosophical analyses. Research found that situational ethics are the preference of public relations practitioners in the United States. A situational approach to ethics is problematic because it sees no universal or generally applicable moral norms, but looks at each situation independently. The lack of guidance given by situational ethics limits its usefulness; furthermore, it is normally employed by those with very little ethics training. Scholars found that public relations courses and texts gave little attention to the topic of ethics.

Most appropriate for the study of public relations ethics are the philosophical schools of utilitarianism or consequentialist theory, and deontology or non-consequentialist theory. Consequentialism bases the choice of what is ethical on the projected consequences of the decision. The various schools of

thought diverge on how to judge what is of highest moral worth at that phase: it might be the decision that creates the greatest happiness and minimizes harm, serves the majority, upholds the culture in which the decision is made, or serves the greater good. Consequentialism asks us to predict the possible outcomes of our decisions and perform a cost-benefit calculation among the potential outcomes. The ethical outcome is that which generally has the most positive consequences and the least negative consequences. Utilitarianism is the most popular type of consequentialist ethics, defining as ethical that which produces the greatest good for the greatest number of people.

Nonconsequentialist ethics uses a different measure of what makes an act morally worthy. Worthiness is defined as doing one's duty to uphold moral principles that apply equally to all people. In this school of thought, ethical behavior is based on what is morally right in principle, rather than on the projected outcomes of a decision. The consequences of a decision are not ignored, but they are not the decision-making guide used in contemplating the correct option among alternatives. Deontology is the most prominent type of nonconsequentialist ethics. Doing one's duty to follow moral principles objectively is how deontologists define ethical behavior. For example, the maxim "It is wrong to lie" would be a universal moral principle, because a lie only works under an assumption of truth. Society would lose this assumption of truth if all people lied whenever it suited their own, subjective interests. Therefore, we can generalize that lying is morally wrong because it is not consistent with our duty as rational agents to uphold moral principles and it becomes logically contradictory when applied. To lie is unethical, regardless of the consequences of a particular lie. This type of reasoning has proven to be beneficial to the practitioners and organizations who employ a deontological paradigm.

THE FUTURE OF PUBLIC RELATIONS ETHICS

Many public relations researchers endorsed the idea that public relations practitioners should act as the ethical conscience of their organization. They are

seen as naturally filling this organizational role because of their expertise in relationship building, conflict management, reputation management, and communication with publics. One drawback is that most professional communicators have had little formal training in ethics or philosophy. Thomas H. Bivins concluded that although the study of ethics is crucial to the future of public relations, “there is no accepted conceptual framework from which to study public relations ethics” (1989, p. 49).

Ron Pearson contributed two moral imperatives to the study of public relations ethics. First, he said that maintaining communication relationships with publics is a moral imperative; second, he said one must improve the quality of these relationships by making them “increasingly dialogical” (1989b, p. 377). Pearson advocated a “co-orientation” theory approach based on dialogue and understanding. Viewing dialogical communication as synonymous with symmetrical communication, James E. Grunig and Larissa A. Grunig concluded, “Public relations will be inherently ethical if it follows the principles of the two-way symmetrical model” (1996, p. 40).

Applying these ethical models to public relations practice and educating public relations practitioners about the approaches to analyzing a moral dilemma are primary concerns in this field. For public relations to mature, grow in responsibility, and perform the role of ethical counsel or ethical conscience of the organization, practitioners must be well versed in ethics and trained in ethical analysis. Forward-thinking organizations are embracing this idea today. The growth of public relations ethics will ensure that it can overcome a dubious beginning and perform a positive function in society by providing information and by building and maintaining relationships between organizations and the many publics that they serve.

EUROPE, PRACTICE OF PUBLIC RELATIONS IN

Public relations in Europe is a thriving industry, but without European identity and representation. In 2004, Europe consisted of forty-three countries, and several new countries may emerge in the next couple of years. In many of those countries there are no professional public relations associations. Europe has no pan-continental individual membership public relations association for practitioners. Individual practitioners are members of their national associations. These associations are organized into a confederation—*Confédération Européenne des Relations Publiques* (CERP; <http://www.cerp.org/>)—which has been in crisis for years. European academics used to form a section within CERP, but they left that confederation and formed their own association: European Public Relations Education and Research

Association (EUPRERA; <http://www.euprera.org/>). Students are formally still members of CERP, but it is now probable that they are transforming their organization from CERP Students into European Association of Public Relations Students (<http://www.cerpstudents.net/>). In all, the situation in public relations in Europe is complex, underresearched, and, above all, misunderstood by other continents, which sometimes see Europe as the underdeveloped “United States of Europe.”

This does not mean that public relations is not a flourishing industry. *Public Relations and Communication Management in Europe* is an edited book in which experts from 27 countries have provided an inside view on the situation of public relations in their countries. It shows that public relations is well recognized in most of these countries (although it is rarely named as such), and all over Europe universities offer programs in public relations (communication management). Some textbooks state that after World War II modern public relations came over to Europe with the Marshall Plan. Most public relations experts in Europe believe, however, that the Anglo-American ideas are being mixed with already existing concepts of public relations, although these are never referred to as “public relations” and never studied as such. Public relations in Europe even has a history of at least one century. In 1995, Günter Bentele and Peter Szyska, for example, referred to Krups as the first company with a department dedicated to press relations, set up in 1870. In 1999, Jacquie L’Etang placed the beginning of public relations in England in the 1920s. Eric Lagerwey showed in 1997 that the first public relations departments in the Netherlands also emerged at the beginning of the twentieth century. Moreover, the Dutch claim to have the oldest professional association in the world, established in 1946.

The European Public Relations Education and Research Association (EUPRERA) was initiated at a meeting in Strasbourg in 1989, when CERP became a real confederation with 19 national associations, CERP PRO (an association of in-house practitioners), CERP CONSULTANTS (an association of consultants in public relations working in agencies or as independent consultants), and CERP EDUCATION (an association of educators and researchers).

With CERP collapsing in the late 1990s and other constituent interest associations disappearing, CERP EDUCATION in 1998 established itself as “an autonomous organization that aims at stimulating and promoting the knowledge and practice of public relations education and research in Europe” (EUPRERA, 2003, n.p.). In 2004, EUPRERA had 62 institutional members (primarily university departments involved in public relations teaching) and 38 individual members.

In October 1998, EUPRERA initiated the European Public Relations Body of Knowledge project (EBOK). The purpose of this project is to codify the existing body of public relations literature of European origin and to enable its fuller use and recognition, which are at present restricted by linguistic, cultural, and administrative barriers. The first question was what to include and exclude and, therefore, what the parameters and content of public relations in Europe are. With Karl Nessman’s 1995 statement in mind—that although many ideas have crossed the Atlantic, public relations theory and practice in Europe have developed rather independently—it was questionable whether the parameters of the PRSA Body of Knowledge would fit the view on public relations in European countries. EUPRERA therefore began to feel the need to understand what the United States and Europe have in common and how they differ, and to chart the public relations idiosyncracies in European countries. To investigate these issues, a project team of people from the Netherlands, Slovenia, Sweden, and Switzerland undertook the Delphi study, with participants from practice and science from 26 European countries. The study included three consultation rounds and was conducted in 1999 and early 2000 (for a full report of the research and the method used, see van Ruler et al., 2000, and van Ruler & Verčič, 2002, both available at www.viewebok.org). Looking at the outcomes of this expert discussion, we found some typicalities of European public relations. Here we focus on two issues, the naming of public relations in Europe, and the definition of public relations.

Names for “public relations” in Germanic and Slavonic languages mean “relations with the public and in the public” where “public” itself denotes a

different phenomenon than it is generally assumed to mean in the public relations discipline in English. Here we take the German term for “public relations” as an example, but similar explanations apply to other Germanic and Slavonic languages (and thus covering much of the northern, central, and eastern parts of the European continent). The German term for *public relations* is *Öffentlichkeitsarbeit*, which literally means “public work” and is explained as “working in public, with the public, and for the public” (Nessmann, 2000, p. 220). This definition contradicts the mainstream (United States) understanding of public relations as management of relationships between an organization and its publics. Yet, it also needs to be recognized that Marvin Olasky, inspired by the German sociologist Jürgen Habermas, proposed an alternative approach to the history of public relations in 1987 as being differentiated from “private relations” (and thus giving also an alternative meaning of public relations as something different from just “relations with publics”). Ever since these Germanic and Slavonic translations of the term *public relations* were introduced, it was obvious to the inhabitants that they meant something other than the original United States English term, as Nessmann argued in 2000. However, it would be wrong to just stop here with the recognition of this difference as being a matter of language(s) only. *Öffentlichkeit* does not mean *public* as in publics, audiences, and so forth; it means first of all *public sphere* and, to be more specific, *that which is potentially known and can be debated by all*. *Öffentlichkeit* is an outcome and therefore a quality of public communication in society. By equating *public* with *Öffentlichkeit*, an analytical dimension is lost, namely, that an essential aspect of public relations is that it is concerned with issues and values that are considered publicly relevant, which means relating to the *public sphere*.

This line of public relations thinking was developed in Germany, beginning with Albert Oeckl, and in the Netherlands by Anne van der Meiden. It is also represented in other European countries. These theorists reason that not only is public relations about relations with the public(s), but it also creates a platform for public debate and, consequently, a public sphere. As Franz Ronneberger and Manfred

Rühl argued, public relations is to be measured by the quality and quantity of the public sphere, which it co-produces through its activities. Quality and quantity in the public (sphere) relate to “*öffentliche Meinung*”—which can be translated as “public opinion.” This public opinion is, however, not viewed as an aggregate of individual opinions, as conceived in public opinion polling, which is a psychological approach to public opinion. In the sociological approach it has a qualitative as well as a quantitative dimension. The quality is intended as a benchmark for public relations, as a type of democratic political authority, and is the foundation on which democracy is built. Its quantity is related to such questions as: Who is in the debate and who is not?

In this societal approach, public relations serves the same kind of (democratic) function that journalism does, since they both contribute to a free flow of information and the interpretation of that information and to the development of the public sphere: in size (“How many people are involved in public life?”), in level (“What is the level at which we discuss public matters?”), and in quality (“What are the frames used in the debates?”). This echoes what James W. Carey called a cultural approach to communication. Theory building in public relations is closely related to journalism in many European countries, not because the practitioners must deal with journalists, but because of these overlapping functions in society.

For many European scholars, public relations produces social reality and, therefore, a certain type of society. That is why many European scholars look at public relations from a sociological perspective instead of an economic, psychological, or organizational perspective. In this respect the European use of *public* and *public relations* can mean something totally different than it normally does in the United States.

Secondly, we focused on the definition of public relations in Europe. The first two rounds of the research project generated a wide variety of views on public relations per se as well as on certain roles for public relations within (or on behalf of) an organization and in society at large. It became obvious that most participants did not want to choose just one view but several views, as applicable. After studying the answers and looking for a description

of the characteristics of the domain, we therefore no longer tried to find a one-dimensional definition about what public relations in Europe could be, but we clustered all of the statements and ideas into four characteristics. We examined these clusters in the third round of discussion to find out whether they can be used to study European public relations in depth in the future. We asked the participants whether they agreed with our analysis of their input, that public relations could have four characteristics and that these characteristics could be seen as distinct aspects of public relations rather than as mutually exclusive views:

1. *Reflective*: Public relations analyzes changing standards, values, and standpoints in society and discusses these with members of the organization in order to adjust the standards, values, and standpoints of the organization accordingly. This role is concerned with organizational standards, values, and views and is aimed at developing mission and organizational strategies.

2. *Managerial*: Public relations develops plans to communicate and maintain relationships with public groups in order to gain public trust and mutual understanding. This role is concerned with commercial and other internal and external public groups and with public opinion as a whole and is aimed at executing the organizational mission and strategies.

3. *Operational*: Public relations prepares the means of communication for the organization and its members in order to help the organization formulate its communications. This role is concerned with services and is aimed at executing the communication plans developed by others.

4. *Educational*: Public relations helps all the members of the organization become competent in communication so that they can respond to societal demands. This role is concerned with the mentality and behavior of the members of the organization and is aimed at internal public groups.

The participants of this Delphi research project accepted these characteristics as a means of defining the domain. According to statements from several countries of Europe, such as Denmark, Germany, The Netherlands, and Sweden, it seems to be questionable whether public relations is

restricted to maintaining relationships with certain public groups. It became obvious that in many countries public relations is also seen as the public relationship any organization has with “society” and with the search for a “license to operate” any organization needs (see Jensen, 2000; Ronneberger & Rühl, 1992). This highlights the importance of the reflective and educational characteristics of public relations.

EVALUATIVE RESEARCH

See Benchmarking; Qualitative research; Quantitative research

EVENT

Event management, also known as special event planning, provides a valuable vehicle by which for-profit and not-for-profit organizations are able to engage in specialized public relations activities. Events help organizations become recognized and establish and maintain relationships with key constituents through direct communication. Types of special events utilized by organizations include new building dedications, fundraisers, galas, product launches, receptions, and community or arts sponsorships. When executed well, events can add greatly to the organization's profile and prestige.

SPECIAL EVENTS DEFINED

Special events are those circumstances in which organizations have to deviate from traditional

public relations, advertising, and marketing efforts and meet directly with clients. Nevertheless, they should be part of an integrated public relations campaign. Some may have a non-media-related purpose, but typically they are structured to be part of the organizations' larger communication plan. They provide a vehicle by which to directly communicate with customers, often by bringing them to a place of business.

Successfully executed, a special event can enhance an organizational image by presenting a company as proficient and professional, thereby adding to its prestige. In executing special events, companies provide "ready-to-be-consumed" media images and stories that support their public relations efforts.

A major function of many, though not all, special events is that they often are organized around a fundraising theme or purpose. Many special events are designed to provide people with a meaningful experience by which they enjoy participation or entertainment in exchange for a donation to a worthy cause or to a political candidate.

EXAMPLES OF SPECIAL EVENTS

The types of special events are highly diverse; among them are press conferences, fundraisers, dedications, open houses, gala events, award ceremonies, product launches, meetings and conferences, golf outings, trade shows, contests, rallies and marches, and benefit concerts. Although the different incarnations of special events are limited only by the imagination, the primary categories of special events are open houses, fundraisers, project groundbreaking or completion ceremonies, holiday celebrations, grand openings, promotions, and commemorations and anniversaries.

FACTORS IN SUCCESSFUL SPECIAL EVENT PLANNING

To be successful in developing special events, a number of factors are worth noting. First, to generate media attention, an event should be newsworthy in its own right. Second, events tend to work best

when there is a meaningful link between a company and an event, such as when women's fitness apparel companies stage events to fight breast cancer. Third, if there is to be a product link, it should be evident but not intrusive; more direct approaches tend to turn consumers off. Finally, the event itself should be well planned and executed to make the experience distinct and memorable.

HOW TO PLAN SPECIAL EVENTS

When planning a special event, there are a number of important considerations to take into account. First, a special event needs to be a part of a larger public relations plan. It should follow traditional public relations techniques of research, planning and budgeting, implementation, and evaluation. Furthermore, the event must be effectively promoted to generate both media and public interest.

Although standard public relations techniques are necessary, special events also have a number of unique characteristics that require specific planning and focus. Attention to detail is especially critical in event management, in which perfection is in the mastery of thousands of small details.

From start to finish, there are a number of important concerns that an event planner must keep in mind. First, care must be taken in choosing the timing and the location of the event. The event also must not conflict with other major events. If the occasion will be held outside, attention must be paid to weather concerns, with contingency plans made available. Additionally, thought must be given to signage, transportation and reception, as well as to necessary banners and other promotional materials that effectively represent the organization's image. There also is the problem of providing tickets; tickets provide event managers a means by which to gauge interest and to manage attendance.

Another feature of special events is that they characteristically require production and technical assistance in the form of a stage, audiovisual equipment, microphones, and lighting. Most of this equipment, as well as tents, booths, fences, tables, and portable generators, is available for rent.

Special consideration should be given to the choice of food and beverages; the organization must take into account the image it wants the special event to promote, as well as modern drinking and dietary habits and concerns (e.g., vegetarianism and food allergies). The same concerns often surround the topic of entertainment. Entertainment must not offend, must be booked and paid for, and again, must reflect positively on the organization.

Risk management is a further concern. It clearly goes without saying that safety procedures need to be spelled out and followed. Contingencies that must be planned for include illness, heart attack, and overconsumption of food or drink; therefore, if liability insurance is not enough, necessary insurance riders for the event must be procured.

A major issue of event planning is that of security: keeping out unwanted guests or activists who would seek to disrupt the event and ensuring the safety of those who are inside.

Finally, though it is less than glamorous, sanitation is an area that requires attention. Some companies have taken to renting trailers with generous "powder rooms" to get away from the indignities of port-a-potties. Finally, additional planning must be done to handle the collection and disposal of trash.

EVOLUTION OF PUBLICITY AGENCIES

The evolution of publicity agencies followed a natural progression. Practitioners who created the first publicity agencies learned their practice in the service of various employers or individual clients. These often were politicians, but they also included large companies and some nonprofits that were just beginning to learn the value of professional communication.

As was true a century ago, today's practitioner might start her or his practice in an agency and eventually work for a company or nonprofit. That person might start with a nonprofit and change jobs to join a firm or company. This varied pattern was not unfamiliar to practitioners of the past who decided that they could make a professional career by hanging out a shingle that essentially said, "public relations publicity for sale." They had learned the rubrics of the profession in one venue and then decided to serve various clients in a professional capacity.

Scholars and practitioners may argue over the origins of the professional practice of public relations. Such studies focus on a search for the first moment the terms *public* and *relations* were used together in a manner that could suggest an origin. Some will argue that any communication by an organization such as a government to citizens, members, followers, and even enemies serves as public relations. Therefore, they look for the motive to communicate, persons whose task it was to design and disseminate messages, a formal source that wants to get messages out to targeted audiences, a target of the communication, and a technology that would be used to convey the message. By applying this standard set of conditions, various scholars have argued that they have found the exact origins of the practice at various points and in any of several countries or civilizations.

P. T. Barnum honed the skills of publicity and promotion in mid-19th century. Publicity can also be said to go back to spectacles such as the Roman games and medieval jousting matches. Ceremonies to elect and anoint leaders are part of societal behavior. Public relations techniques have been

used to dramatize coronations and the formal enrollment of religious heads. All cultures offer ample evidence that by 1900 public communication was an established art that also included some science.

Thus, what came to be called public relations was a developing professional practice by the onset of the 20th century. The skills developed in many countries and for various reasons were now being bought and sold as professional services, through what can generically be called publicity agencies. The standard tactic of the practice was press agency.

By the dawn of the 20th century, the lore of the profession was known by practitioners, recognized by other members of society, both feared and applauded because of ethics, and taught through mentoring. Industrial barons as well as other commercial and governmental interests were learning the power of the press. They were developing skills and tactics for responding to and forging news trends. They were learning to tell narratives of their industry, governmental agency, political candidate, or nonprofit organization. These ingredients of the public relations practice were emerging from a mix of growing industrial power and the burgeoning print media—newspapers and magazines. This was a battlefield for influence, promotion, and favorable public policy.

Professional publicity and promotion occur in two forms. The practitioner either works in a hired agency-client relationship or works as an employee. The person or team is employed and charged with the responsibility of attracting attention, forming positive or negative attitudes, and motivating individuals to move toward the predictable outcomes sought by the sponsor.

This model of publicity and promotion was not unique to the 19th century, but it was tailored to the societal interests and the available means of communication of the era. What became well-established professional agencies in abundance in the 20th century started as in-house operations or one-person services in the 19th century. Thus, to understand the practice as it is known today, we need to know how agencies began and evolved.

George F. Parker contributed his journalistic skills, knowledge of the media, and desire to

achieve clients' goals to one of the first publicity agencies. By the time he helped found Parker and Lee, he had years of experience working for Democratic political organizations and major candidates. He played a key role in the election of Grover Cleveland to be president of the United States in 1884. He understood the subtleties of message positioning and media relations. He wrote and placed stories. He staged events. He created excitement and organized rallies. He knew what the reporters believed to be good news fodder and was able to provide it for his candidates and against their opponents. By the early 1890s, he had opened a small office in New York City that served as campaign headquarters. He recognized that reporters need to know where to find people who know where stories are developing. Parker was able to share these vital skills and well-honed best practices with his new partner, Ivy Lee.

Perry Heath worked for Republicans. He directed the Bureau of Publications and Printing for the Republican National Committee during William McKinley's campaign against the orator of the plains, William Jennings Bryant. This organization churned out press releases, created and implemented events, wrote speeches, provided canned editorials, and manufactured innumerable pamphlets and leaflets. Forerunners of the modern press kits were distributed in the thousands. Stories were manufactured.

The utility industry engaged local newspapermen to get stories into print that could favor one company's interests against those of another. In the battle of the currents (late 1880s and 1890s), George Westinghouse, aided by Samuel Insull, arranged for local newspapermen to write favorable stories featuring the benefits of alternating current. This engineering and business initiative was opposed by Thomas Edison, who used similar tactics to applaud the safety of direct current. Edison used a variety of publicity stunts and government relations in an effort to paint alternating electrical current as unsafe and thus an unwise industrial standard for electricity use in people's homes.

The evolution of the publicity bureaus was the natural progression of the emerging mass communication industry. News hounds and editorial

writers, as well as feature story journalists, were creating a market for news by, among other things, finding fault with the industrial barons. Bad news sells newspapers. But so does product publicity. Large industries created and responded to growing mass markets. National industrial and commercial complexes supplanted local businesses. Industrialized products began to supplant products sold by local word of mouth and established local manufacturers. To create and reach mass markets, publicity attracted attention and created brand awareness through mass media.

The Civil War was a battle of regions as well as of news stories. The careers of generals and presidents hung in the balance between favorable and hostile news stories. Out of this experience also arose the American Red Cross, through the publicity and promotion efforts of Clara Barton. She and other reformers called for corporate, government agency, and private citizen support to identify, understand, and solve social problems that were often associated with poverty, disease, and disaster.

The evolving publicity bureaus recognized the link between corporate and robber baron image and a willingness to serve society. The amassing of wealth carried with it the stigma of ruthlessness. To soften this image, countless barons made philanthropic contributions and fostered the future of non-profit agencies. Publicity bureaus were often the focal point of bringing the industrial baron and a charity together. Once the relationship was forged, publicity was used for both parties. Names such as Rockefeller and Carnegie became widely associated with philanthropy, thanks to the work of experts in publicity. Favorable publicity was often an answer to the ostensible evils of amassed fortunes, unfair labor conditions, poverty, disease, and other economic disadvantages.

The first publicity agency in the United States was formed in Boston under the name Publicity Bureau. It was the amalgamation of the talents of George V. S. Michaelis, Herbert Small, and Thomas O. Marvin. The exact history of the firm is clouded in mystery, but it formed in the first years of the new century. Its client list included Harvard University. The men who forged this agency, like decades of their brothers and sisters in the trade, came to publicity through the

experience of newspaper work. They had learned news values and the patterns of the news profession. Knowing the wiles and ways of journalism, they understood how journalists looking for stories wanted individuals to interview and copy that could be readily incorporated into the next newspaper edition or magazine issue.

Fragmentary accounts credit Michaelis with giving form and life to the practice of private publicity counseling and activities for hire. He and his partners were interested in advertising as well as publicity. In a sense, they were engaging in integrated communication long before that concept would become fashionable. In the truest sense of the word, they sought to be communicators on behalf of clients whose story deserved to be told. Higher pay and a more glamorous list of associates lured newspaper people into public relations. Beyond that base motive, however, it is fair to say that these early publicists truly believed that their clients' stories deserved to be told, and told well.

Early on, agencies realized the virtue of client relationships. They built personal and professional relationships with their clients, blending the interests of the agency and the client. They knew that the continuing and future business for their agency depended on the ability to make a difference for clients. Along the way, agencies were bound to lose clients for various reasons, but they wanted continuing business with clients. That business relationship could lead to stable business practices and a predictable payroll. The leaders of these agencies recognized that success led to more success.

The perils of agencies today, and certainly in those fledgling days, included distorting the public record and working in secrecy. Both of these charges were launched against members of the Publicity Bureau during its work for the railroad industry against the likes of Teddy Roosevelt (president of the United States) and William LaFollette (reformist senator of the United States). Industries waged battles to keep control of their financial and managerial destinies against reformers who wanted to make these industrial giants operate much more in the public interest and far less in the private interest. Well-placed stories and editorial comment could be used strategically in the interest of the

client. If these stories were bought and paid for by the industry, however, while appearing to be ostensibly the work of independent journalists and opinion leaders, the worst side of this new practice could be ruinous to its reputation. Then, as now, the ethics of the profession were questioned because the profession failed to achieve openness and balance or objectivity in the generation of facts and opinions. The ethical crux of the industry, then and now, is the ability of deep pockets industry to distort the public record and public opinion by canny public relations publicity tactics. If the playing field was the news media, then the logic went that publicity could be crafted on behalf of a narrow interest far removed from the public interest.

In 1904, one of the earliest publicity firms was formed by combining the talents of George F. Parker and Ivy L. Lee, who became legendary for the development of client relationships and tactical options. In its own right, their practice was innovative, but it built on a foundation. The firm these men created lasted, through the eventual leadership of Tommy Ross, for the better part of a century.

The evolution of the publicity bureau was natural and predictable. It simply resulted from the recognition by several key individuals that they could earn nice salaries and serve clients' interests by generating favorable publicity and fighting bad publicity. The history of public relations is inseparable from the needs of an individual or organization to get out its messages, the evolution of various media, and the recognition by certain persons that they have special skills that can be sold.

Although the voices of commercial, social, and financial critics can never be silenced, the legacy of the profession has had to address—and will continue to do so—the narrow tactical options under the heading of publicity. That became the identifying theme of agencies and independent practitioners in the late 1880s through the early 1900s. In many ways, the profession has not, and cannot, get away from the ethical challenges and mistakes associated with the early publicity bureaus. Where the profession goes and how it matures are uncertain, but what is without question is that it will forever wrestle with the aura of the professional who can influence media coverage and content. The early

publicity bureaus knew this fact and sold their services, but probably not their souls.

EXCELLENCE THEORY

Excellence theory is a term used to represent the theoretical knowledge and findings of a landmark study funded by the International Association of Business Communicators (IABC) Research Foundation. The Excellence study, headed by University of Maryland’s James E. Grunig, resulted in the publication of three books: J. E. Grunig’s *Excellence in Public Relations and Communication Management* (1992) (theory and literature review), *Manager’s Guide to Excellence in Public Relations and Communication Management* (D. M. Dozier, L. A. Grunig, & J. E. Grunig, 1995) (practical implementation of the research findings), *Excellent Public Relations and Effective Organizations: A Study of Communication Management in Three Countries* (L. A. Grunig, J. E. Grunig, & D. M. Dozier, 2002) (findings and refinement of excellence theory), and numerous journal articles. Excellence theory explains how public relations can contribute as a management function to overall organizational effectiveness. Larissa A. Grunig, J. E. Grunig, and D. M. Dozier argued, “The major premise of the Excellence theory states that communication has value to an organization because it helps to build good long-term relationships with strategic publics” (2002, p. 57).

The Excellence study spanned over a decade, studied 327 organizations, and included both qualitative and quantitative study on an international level. IABC’s \$400,000 grant funded research on public relations in organizations of all types, including corporations, government agencies, nonprofits, and associations. The team of researchers sought to identify the key factors that make public relations “excellent” in its contribution to organizational effectiveness, in its role as a management function, and in the internal composition, structure, and function of the ideal public relations department. The organizations selected to participate in the Excellence study either had records as excellent communicators and served as best-case exemplars, or had poor communications, serving as examples of what can and does impede effective public relations. By integrating the literature across many diverse disciplines, the team developed theoretical propositions that it then tested with empirical data. Those propositions helped to form the Excellence theory and were refined into the principles (or factors) of excellence. These propositions comprised assertions about the normative structure of the public relations function, organizational structure, and external variables such as relationships with publics and stakeholders.

Factor analysis of the data (mathematically searching for data clustering around underlying connections among the variables) revealed what the researchers labeled the “Excellence factor.” The Excellence factor comprises several characteristics that span organization size and type, culture, and other influences, allowing them to be labeled “generic” principles of excellence. These characteristics are the backbone of the excellence theory, providing a normative yet practical guide for how public relations can make the maximal contribution to an organization. The Excellence factor was isolated into 10 principles of excellence, and then condensed into the following eight broad variables.

1. The *value of communication*, as seen by the CEO and top management of an organization, was found to be indicative of excellent public relations. CEOs were asked to rate the value of public relations in comparison with other departments. The CEOs who placed higher value on public relations favored a communication

function in their own companies with many of the attributes of excellence described here. CEOs who highly valued public relations were likely to have more effective public relations units. Senior public relations practitioners in these organizations were likely to participate in the overall strategic management of the organization.

2. *Contribution to strategic organizational functions* is an indicator of public relations excellence that is highly dependent on how highly the CEO values communication. The organization depends on effective relationships with publics for its survival, and public relations should incorporate the views of those publics into organizational planning. Active participation in strategic planning is necessary for public relations to contribute to organizational effectiveness, but access to the high-level process is difficult to attain. Public relations contributes frequently in the organization's response to social issues and routine operations. It contributes less frequently to strategic planning, except in organizations in which the CEO places high value on the public relations function.

3. *Performing a management role* is essential to public relations being included in strategic management. Public relations roles can be divided into the broad categories of *technician* (based on a skill set, such as news writing) and *manager* (based on business management knowledge, such as research, planning, and advising). Senior public relations practitioners who perform primarily a management role rather than a technical role contribute to organizational effectiveness and excellence in the communication function.

4. A crucial component of excellence theory is the *model of public relations* preferred by an organization. Four models of public relations were developed: press agency (publicity), public information (dissemination of accurate information), two-way asymmetrical communication (scientific persuasion), and two-way symmetrical communication (mutual understanding). Both two-way models are based on research; both one-way models describe a simple output of communication from the organization. Although both the two-way asymmetrical model and the two-way symmetrical model are effective and present in excellent organizations, the two-way symmetrical model is generally indicative of excellence because it provides a vehicle for dialogue with publics. The dialogue inherent in the symmetrical model results in long-term relationship building and maintenance. Moreover, including the views of publics in

organizational decision making is believed to be inherently ethical and provides information that the organization can use in strategic planning. For these reasons the two-way symmetrical model is deemed the most excellent approach to conducting public relations.

5. The *potential* of the communication department to actually practice the ideal type of excellent public relations is another factor of excellence. Excellence theory holds that the two-way symmetrical model and the managerial role must both be employed, and the potential of the top communicator to do so is based on his or her knowledge. The *knowledge of research methods* required to implement the two-way models poses a problem for some practitioners, limiting their potential for excellence. *Knowledge of managerial functions*, such as budgeting, evaluating research, managing a staff, and planning goals and objectives, is also necessary for excellence. The Excellence study found that although knowledge of the management role and research function is about average, most departments do not have enough expertise in strategic management (segmentation and evaluation research, issues management functions). Knowledge of both research and strategic management must be present and used for public relations to contribute at the highest level.

6. *Activist pressure* on an organization forces it to communicate with external publics. The Excellence study used activist pressure to determine the impact of an organization's environment on public relations effectiveness. Organizations with higher levels of activism had higher levels of successful public relations. Often, activism is an agent of positive change or spurs the organization to be proactive in managing its issues rather than reactive. Activist pressure encourages public relations to tackle important issues of organizational policy, to proactively manage issues, and to contribute at higher levels of strategic planning in the organization.

7. *Organizational culture, structure, and other employee-related variables* were also found to be a factor of excellence. Organizations with participative rather than authoritarian cultures, and organic rather than mechanistic or highly stratified structures, produce efficacious public relations. Symmetrical, dialogical systems of internal communication and high levels of job satisfaction also contribute to excellent public relations.

8. *Embodying diversity*, particularly in relation to the *status of women* in a female-dominated profession, was the next excellence factor. Researchers hypothesized that

a diverse public relations department could better understand and represent diverse publics in the organization's environment. The study revealed that organizations that treat women well do so across the board, in career advancement opportunities, nondiscriminatory policies, a supportive work environment, and so on. The team concluded that treating female employees well is a characteristic of excellence.

These factors of excellence can be applied broadly to improve almost any public relations unit. However, they revealed what was statistically significant and did not reveal every desirable trait of normative public relations. Subsequently, based on qualitative research, a final factor of excellence was added to the list: *ethics*. Dejan Verčič wrote that the final principle of excellent public relations was "ethics and integrity" (1996, p. 58). Shannon Bowen's research reinforced the importance of an organizational commitment to ethical decision making as a crucial factor of public relations excellence. Organizations with a rigorous ethics training program and codified decision-making paradigm or model were more excellent than those that simply attempted to be ethical without investing resources in defining, training, and analyzing ethics.

Excellence theory provides a normative guide for how public relations should be conducted, structured, and implemented, and it delineates the factors that help public relations contribute to overall organizational excellence. The Excellence study also provides concrete, empirical evidence to support the theory, and it explains how and why certain factors contribute to outstanding public relations. Pressure is increasing on many public relations professionals to justify expenditures on communication, to show how the function contributes to the bottom line of the organization or the return on investment, and to show that nebulous concepts such as corporate reputation translate into a competitive advantage. Excellence theory shows that public relations does enhance the operation of an organization by maintaining two-way, balanced communication with the publics on whom the organization ultimately depends.

EXECUTIVE MANAGEMENT

Executive management consists of the personnel at the top of the organizational chart. Many nonprofit organizations and government agencies also have a senior management team that fosters their culture, management principles, and guiding policies.

These executives set the mission and craft the vision of the organization, create and implement the budget, lead the strategic planning effort, and foster the organization's reputation and internal culture. They select operating standards, design and defend brand equity, foster the culture of the organization, and set the tone for the quality of relationships that

are developed and maintained with the organization's markets, publics, and targeted audiences. With or without the counsel of senior practitioners, executives create public relations for their organization, whether by design or default.

The executive management team is divided by function. Function heads take their titles from the unique activities for which they are responsible. Executives oversee the various functions they direct.

The person at the pinnacle of the organizational chart is the chief executive officer (CEO). In most organizations, whether business or nonprofit, this person reports to a board of directors. The CEO might be the chairman of the board, but this is not always the case. The typical executive arrangement empowers the board to fire a CEO and hire a replacement. The board helps set the direction—mission and vision—of the business, as well as advises its strategic planning. Nonprofits often have a similar arrangement; for instance, the CEO of a university is the president (or chancellor), who reports to a board of trustees. Many foundations and charitable nonprofits have a similar structural arrangement, with a board serving in a planning oversight capacity.

Beneath the CEO is a layer of executives, each one of which is responsible for her or his broad set of functions. The chief financial officer (CFO) or treasurer is accountable for the financial position of the business as well as its compliance with Securities and Exchange Commission regulations, in the case of a publicly traded company. The chief operating officer (COO) is responsible for the operations intended to make the organization successful because they generate revenue. Rare is the organization that does not have some variation of CEO, CFO, or COO—by whatever title. The CEO might also be president or the COO might be president, especially if the CEO is chairman of the board.

Various organizations, depending on their nature and position in the economy, will have additional function heads at the “C” level, or the persons at this level might hold the title of executive vice president, vice president, or manager. The specific titles are sensitive to the culture of the organization and

the industry or nonprofit sector where it operates. Persons at this level might be in charge of marketing, public relations or public affairs (or corporate communication), technology, domestic activities, global activities, manufacturing, and other areas. In the nonprofit world, a typical title at this level would be the chief development officer, who is in charge of raising money.

The key to understanding executive management is to realize that the first two or three levels in the organizational chart are accountable for all of the important functions needed to make the organization successful. Every activity that counts for the organization's success is brought together into the purview of senior management.

The executive management team creates and manages the organization using a set of strategies called management by objectives as it develops and implements a budget designed to achieve specific outcomes. In the broadest terms, it selects a set of desirable outcomes and formulates a budget to support the strategies needed to achieve these outcomes. Formulation of the budget is the means by which the organization generates the revenue it needs to achieve its mission and vision.

Executives are responsible for line and staff functions. A line function is anything that is vital for the success of an organization. For instance, in a manufacturing company, its manufacturing operations would be a line function. Staff functions are advisory to the persons who are responsible for line functions. In many organizations, legal counsel and public relations serve in staff capacities. Persons thus work in a matrix whereby key sets of line and staff functions are interdependent for the success of the organization.

In companies that are primarily committed to marketing, public relations may be a line function supporting the marketing effort. In other companies, such as multinational petrochemical businesses, public relations is likely to be under the public affairs functions and operate as staff. As such, the public relations persons are responsible for helping to create and implement the communication philosophy and strategies of the organization.

In organizations committed to issues management, senior public relations personnel are involved

in strategic planning, the development of standards of corporate responsibility, issue monitoring, and issue communication. This structure is most typical of businesses that work to positively position themselves in the public policy arena as well as engage in traditional marketing activities.

Businesses with a serious commitment to public relations may have a chief communication officer (CCO), who is responsible for the communication activities of the organization. As such, the person is likely to be a member of the executive cadre that develops the rationale and methods for fostering relationships, including dealing with activists and other stakeholding publics.

Relevant to the practice of public relations is the level in the organizational chart held by the most senior practitioner. The culture of many companies dictates the disciplines that persons must have mastered to serve at the “C,” “P,” and “V” levels. For example, multinational petrochemical companies may have an engineering or legal counsel bias that results in communication personnel not rising above the manager levels. In companies where marketing is the primary culture, public relations reports to marketing and is primarily limited to publicity and promotion activities.

For over a century, senior practitioners and leading academics have recommended that the counseling function of public relations be vital to the success of any organization. Public relations personnel can support the organization’s efforts to raise revenue, but they can also help it reduce costs if effective public relations and human resources collaborate to reduce turnover and build the organization as one that is preferred by the workers. Costs may also be reduced by having effective customer relationships and more collaborative rather than contentious relationships with activists. Activists often badger organizations into compliance by using tactics that raise costs. Public relations can help reduce such costs. The same is true for effective public relations prior to, during, and after a crisis. Senior practitioners can also serve as a vital part of the conscience of the organization, providing insight to ethical challenges.

EXPERIMENT/ EXPERIMENTAL METHODS

An experiment is what John Hocking, Don Stacks, and Steven McDermott have labeled the *sine qua non* of all research. The experiment is a carefully controlled research study that allows the researcher to state within certain limits that a relationship exists between two elements and what causes the relationship to change. The experiment, as John Pavlik has lamented, is underrepresented in public relations, partly because of a limited theoretical base and the applied nature of public relations. Another reason for its lack of use may be the 24/7 nature of public relations practice.

The experiment is a very powerful research method that is extremely limited in its ability to generalize to other situations. The limitation is based on the fact that the experiment requires as much control as can be placed on the actual implementation of the study. When an experiment is conducted, the researcher attempts to keep all other influences constant, varying only what is manipulated (the “independent” variable) and observing its effect on the “dependent” variable. The dependent variable, then, is dependent for its result on the manipulation of the independent variable. Because most experiments attempt to test a theory that makes predictions based on the relationship(s) between the independent variable and the dependent variable, an experiment predicts—or hypothesizes—the expected relationships. On the basis of a theory, the experiment is conducted, data are collected, and the results are submitted to a statistical analysis in a way that allows the researcher to state with a certain degree of confidence that the experiment’s results were based on hypothesized relationships and not on measurement or other types of error. Error is what the experiment attempts to reduce when the researcher establishes control.

There are a number of different experiments, each based on the degree of control placed on the

study. The most controlled experiment is the laboratory experiment, where the researcher attempts to keep all possible sources of error—“spurious variables,” as Donald Campbell and Julian Stanley (1963) call them—out of the study. Relaxing control somewhat results in an experiment that simulates what happens when other variables are allowed to influence the hypothesized relationships. Relaxing the study even more results in a field experiment, where the study is conducted in a natural environment, but still with certain degrees of control.

RELATIONSHIPS, CAUSATION, AND CONTROL

To better understand what the experiment does, one must understand relationships, causation, and control. A relationship in public relations would be a tactic (independent variable) and the outcome expected (dependent variable). Thus we would expect a particular relationship if a press release were written poorly, contained explicit or vulgar language, and was the opposite of what the targeted publication typically published (this would be a negative relationship). For an experimental relationship to exist, the independent variable must cause change in the dependent variable, and there should be no other sources or extraneous variables that might have caused that change. The experiment helps to verify that cause-effect relationship by establishing that changes in the independent variable cause changes in the dependent variable, that the effect follows the cause, and that no third variable (or other unhypothesized variables) caused the change. To establish this, the researcher must establish control over the experiment.

Control, as previously noted, means that all possible sources of error—or invalidity, as Campbell and Stanley label it—have been accounted for. In an experiment, what is unknown is what the research worries about. There are seven sources of error/invalidity that the researcher attempts to control: *history* (what occurs before and during the experiment), *instrumentation* (impact of the measures used), *maturation* (how time impacts on the experiment), *mortality*

(knowing who dropped out of the experiment), *regression* (potential problems associated with choosing people due to extreme scoring), *selection* (biased sampling of participants), and *testing* (impact of being tested on later tests). If the experiment is designed in such a way as to nullify each of the seven sources of invalidity or error, then the results can state, within some margin of safety, that one variable caused a change in another.

No other research method can establish causation; indeed, that is the primary reason for conducting an experiment. Surveys, focus groups, interviews, participant observations—all lack the formal control necessary to state that changes in one variable caused a change in another.

EXPERIMENTAL AND QUASI-EXPERIMENTAL DESIGNS

In 1963, Campbell and Stanley published a seminal work (*Experimental and Quasi-Experimental Designs for Research*) that established what has become the standard set of experimental designs. They placed these designs into three classes: pre-experimental, true experimental, and quasi-experimental. The pre-experimental designs do not randomize participants to different independent variable manipulations (the “experimental conditions”) and do not provide a control group that receives no manipulation to test against for spurious relationships. The true experimental designs randomly assign participants to experimental conditions and provide a control group or groups against which to test the impact of the manipulations. Finally, the quasi-experimental designs vary between randomization and control group assignments and include what some call “time-series” designs in which the participants are observed over a number of times. Of the three designs, the true experiment is the only method that allows researchers to state that a change in one variable *causes* a change in another variable with great certainty.

The true experiment would take a group of people and randomly select them to either the experimental (manipulated) or the control (no manipulation) conditions. The classic true experimental design looks like this:

1. R O_1 ——— X —————> O_2
2. R O_3 —————> O_4

R represents random assignment to the groups O, which represent pre- and posttest measures, X represents that the people in group O_1 were exposed to the independent variable after an individual measure and then measured again at O_2 , and participants in the control group (no X or manipulation) were measured at the same time as the experimental group. If O_2 is different from O_1 , then we know that X caused the change, but could something else have had an impact (that “third” variable)? A comparison between O_1 and O_3 and O_4 would let us know if history, maturation, instrumentation, maturation, mortality, or testing could have affected the results. Selection is controlled for by random assignment to either experimental or control conditions.

The experiment is one of the most elegant research methods available to the public relations researcher. It is not often found in the public relations literature at the academic level and because of time constraints is rarely used in day-to-day practice; however, the advent of the computer has provided some experimental simulation to test potential theories.

EXTERNAL PUBLICATIONS

External publications are internally produced media used to connect a company or organization to its publics. They include newsletters and magazines and are distributed to different external constituents to inform them of relevant news, innovations, and activities within the organization. External publications vary in size, purpose, and audience, depending on the organization that produces them and the objectives for the publications. External publications are seen as more credible and consistent than advertising, and they contain articles and information written in a professional manner. Some organizations, however, do use external publications to complement advertising or marketing goals.

There are many types of external publications that organizations use to keep in contact with relevant audiences. A large entity may produce several external publications for customers and potential customers, distributors and salespeople, and shareholders and investors. The budget allotted for an external publication dictates the publication form, from a simple newsletter to a glossy, four-color magazine.

The customer publication is targeted at current and potential customers of a business and serves to entertain, inform, and maintain consistent contact. External publications are more thoroughly read than ads, and whereas advertising budgets can fluctuate, a monthly or annual newsletter can provide customers with continuity. A quality external publication can create loyalty; reinforce the company's name, objectives, products, and services; and let customers become more acquainted with the business via profiles of employees or letters from high-ranking management. Success stories from satisfied customers or information about promotions, achievements, and innovations can create and maintain interest from the customer base. An external publication is also a good way to exhibit a company's activities that differ from normal business activities, such as contributions to causes, honors, and awards. Although an external publication is not always a publicity tool, it creates a large volume of direct exposure without the invasive quality of advertising; this feature makes it an integral part of the communication plan.

The sales publication is a useful tool for keeping distributors and salespeople connected and informed about new procedures, policies, technology, and competitors' actions. If written in a less formal tone, an external publication to distributors can build morale while reminding distributors of the company's goals and correct procedures. By spotlighting different distributors, sales publications can encourage and reward salespeople and keep them motivated to contribute to marketing goals. Solving hypothetical sales problems, demonstrating sales techniques, and including tip sheets can improve business and maintain a confident, trained sales force. When distributors and salespeople are kept up to date about competitors' actions, salespeople are better prepared to field questions from customers about competitors' products and services.

The audiences most concerned with the activities of a public company are the investors and shareholders, and a publication targeting them can fortify the relationship between a company and those with a direct stake in it. Budgets are generally higher for these publications, which are usually printed as a magazine, with longer articles and more detailed descriptions of company changes, policies, and developments. It is common for these publications to have biographies of executives, and they may often contain quarterly or annual financial documents. One such publication is the Annual Report. It is crucial for a company to maintain a healthy relationship with its shareholders and investors, and producing a well-written publication can create a favorable image and help to establish goodwill.

Once it is determined that a company wishes to produce an external publication, there are several options, depending on its size and budget. A small company may choose to produce the publication within its own business by using word processing or desktop publishing software. It might get its target audience from current customers, or it may be willing to purchase a list of addresses to supplement its own collection. A larger company might have an in-house employee with journalistic experience to work exclusively on all its external publications, or it may hire several people to specialize in different ones. Hiring a public relations or advertising firm

will incur greater costs but is more likely to ensure a quality publication.

An external publication should reflect the values and image of the organization it represents. The longevity of the publication is the key factor in determining the types of articles and information it contains. If it is published on a weekly or monthly basis, the articles can be more specific, timely, and detailed. If it is an annual or biannual publication, the articles should be more generic and used as an overview of an organization and its activities. Either way, the publication should have a catchy name and a design or format that incorporates the image and marketing concepts of its company.

In some cases, a well-produced or reputable external newsletter can bring a lot of credibility and positive attention to a company. Northwestern Mutual Foundation produces an external publication every two years, *Community Report*, that showcases its contribution to the community. *Community Report* was a 2002 Platinum PR Award Winner for best external publication, and it boosted the company's falling corporate responsibility image to the top position on *Fortune's* ranking ("External Publication," 2002).

In-flight magazines are some of the most widely read external publications. Delta's *Sky Magazine* and Southwest Airlines' *Spirit Magazine* contain articles about business, sports, entertainment, and also leisure travel destinations that the airlines service.

Not all successful external publications have to come from large organizations. A local hospital could publish a newsletter about health and fitness, or a university could maintain interest in its activities with an alumni magazine.

External publications can be as varied in size and scope as the organizations that produce them. A well-written, informative, and entertaining external publication can be more credible and more thoroughly read than advertising and can give a company direct exposure to a key public.

EXXON AND THE VALDEZ CRISIS

On March 24, 1989, the *Exxon Valdez* oil tanker was improperly navigated through the Prince William Sound region of Alaska. The tanker hit a reef, which punctured its hull and resulted in an oil spill estimated at 240,000 barrels. The oil contaminated the water and shoreline, causing significant environmental damage. The spill instantly created an environmental crisis for Exxon that required both immediate and long-term crisis response procedures. The *Valdez* spill has become a standard example of how devastating and enduring a crisis can be. It also demonstrates the importance of crisis management, planning, immediate response, and attention to the multiple publics and stakeholders involved in the crisis.

The oil spill crisis escalated in severity immediately after the grounding of the *Valdez*. Exxon initiated cleanup efforts, but they were unprepared to cope with a spill of this magnitude. The containment equipment that was immediately available was unable to maintain the spill in an area that would allow quick extraction of the oil from the water. The Alyeska Service Company stepped in to assist with machinery to help contain the spill. Alyeska was the operator of the trans-Alaska oil pipeline. Unfortunately, eight years earlier, Alyeska had disbanded a 20-member emergency team assigned to the Prince William Sound area. Exxon and Alyeska had only moderate initial success in their efforts as the oil coated marine life and began to reach the shoreline. The initial perception was that neither Exxon nor any local entity was adequately prepared for this potential crisis. Exxon and local government agencies soon began to blame each other for apparent lack of resources in the area and delays in cleanup efforts. Exxon said it had to follow slow state bureaucratic procedures before being allowed to implement important operations.

General public reaction was nearly instantaneous. At this public relations crisis, Exxon had a wide range of audiences and stakeholders to consider in their responses. Media outlets were immediately drawn to the story, and their coverage presented a horrific view of the accident. Video footage of the spill showed numerous dead birds, fish, and other marine life. Major news magazines all carried the story, often with sad or graphic photographs of affected animals and the shoreline. Environmental groups were quick to blame Exxon for the tragedy, and their predictions for the future of the Prince William Sound environment were gloomy. Some predicted that the effect of the spill would be evident in the sound for many years. Environmental groups suggested that many animals were in danger, including otters, whales, porpoises, and sea birds. Exxon would eventually need to respond to and compensate members of the fishing industry whose businesses were harmed because of the loss of productive waters and damage to their equipment. Initial claims against Exxon ranged from a few hundred dollars to millions of dollars. Alaska governor Steve Cowper headed the group of local and state officials who challenged the efficiency of the cleanup effort and Exxon's role in the response. Individual and various interest groups across the country reacted harshly as well. Protests and boycotts of Exxon were seen throughout the nation, and the media captured footage of people cutting up their Exxon gas cards and carrying protest signs. A momentary jump in gas prices also hit the general public, and the *Valdez* spill was thought to be the cause of the increase.

Two key Exxon figures came to the forefront during this crisis. Exxon chairperson Lawrence J. Rawl was the key spokesperson for the organization. Rawl was the most visible representative from Exxon and became a focal point for attention and criticism of Exxon's efforts. Chairperson Rawl led Exxon through its initial efforts in managing the crisis; the company first reported that they were moving as quickly as possible to clean up the spill but that their efforts would be hampered by weather and the immediate lack of appropriate machinery. Blowing winds made it difficult for Exxon to place floating booms in the water to keep the slick from spreading. The remote location of the spill also

meant that equipment had to be moved from other areas to Prince William Sound. The deployment of equipment seemed to move slowly as people compared the time frame estimates of when larger-scale efforts could begin with the ever widening span of the oil slick and the growing environmental damage. Scientists investigating the damage warned that it would be years before the waters could be restored to their pristine quality before the spill. At this point, Exxon was experiencing growing external pressures from groups angered by the spill and impatient with the response efforts.

Attention to the crisis took a new direction when it was widely reported on March 27 that the *Valdez* was piloted, at the time of the grounding, by third mate Gregory Cousins instead of pilot Joseph Hazelwood. The following day, Exxon reported that Hazelwood had a history of drinking problems and that he had been legally intoxicated 10 hours after the grounding. It was revealed that Hazelwood asked Cousins to pilot the ship while the captain went below. Cousins was not as familiar with the underwater terrain of the sound and ran the ship into a hidden reef. Although this finding gave some explanation for the cause of the accident, it had minimal effect on restoring public perception of the organization. Hazelwood was quickly fired, and Exxon placed blame for the accident on his shoulders. However, the public generally refused to separate Hazelwood from Exxon and blame one and not the other for the spill.

In April 1989, Rawl published a full-page open letter in major papers throughout the country in which he stated the organization's sorrow for the accident and their commitment to the quick and complete cleanup of the spill. This letter was seen as a sign of change in the crisis management approach taken by Exxon. Rawl and Exxon, at this point, appeared to move from a response strategy that focused on Hazelwood and his failure at the helm to a focus on the spill itself and the immediate need to repair the damage that had been done. This statement by Exxon was bolstered by images of wildlife refuge sites that were finding and cleaning animals that had been stricken with the oil. Some press coverage also showed the efforts being made to scrub individual rocks along the shoreline. This

move also represented a change in the crisis response strategy, from avoiding direct blame for the incident to accepting responsibility.

The Exxon crisis continued long after the story left the front pages of American newspapers. In 1991, settlements were finalized between the federal government, the state of Alaska, and Exxon. Exxon faced a \$150 million fine, with \$125 million being eliminated because of payments Exxon had already made toward the cleanup efforts and in settling civil claims. The remaining \$25 million was divided between the North American Wetlands Conservation Fund and the National Victims of Crime Fund.

Exxon also agreed to pay \$900 million over 10 years to facilitate the restoration of the Prince William Sound area. Part of this funding was directed toward reimbursement of the Alaskan and federal government for expenditures during the cleanup. Funding also went toward habitat protection and restoration efforts. This funding allows for the purchase of land that can be maintained and restored to its previous state. The funding will also provide for decades worth of restoration efforts in Prince William Sound. Research and monitoring funds were also included to investigate the needs of different species living in Prince William Sound and how to maintain various populations. Finally, funding was set aside to cover management and facilitate public communication about restoration efforts in the area.

FACT SHEET

A fact sheet is what its name implies: a compilation of facts about a certain topic. Fact sheets are typically used as supplements to news releases, to fill information requests, or as one of several pieces in a press kit. Many organizations keep them on file for standard topics (corporate history, general business facts) so that they can respond quickly to requests for information.

Fact sheets should be written with clarity and for ease of use. First, each one should be focused on one topic. The topic can be as broad as general facts about a company or as limited as facts about a specific community service program. Limiting the topic to a single subject allows for focus in the writing and precision in responding to information requests.

Next, the fact sheet should be written in as direct a manner as possible. Many fact sheets are produced as bulleted lists, with subheads to direct the reader to specific areas of interest. Such a format enables users to quickly find specific points they are looking for. This format is particularly appropriate for media users, who turn to fact sheets for additional information beyond a news release when writing a story. Full sentence style is also used, since not all material lends itself to bullet points, and some material can be presented more clearly in full sentences. As with a news release, journalistic writing style should be followed, although headings are often used. A

third possibility is a combination of the two styles: a heading, followed by a brief explanatory paragraph, followed by bullet points. Whatever writing style is chosen, the determining factor should be how to most clearly present the information for easy use.

Finally, the format of a fact sheet should mirror that of a news release. Appropriate contact information is a must, since the piece may not always be used to supplement a news release or as part of a press kit. Even in those uses, it could become separated from the other materials. The date of the most recent update of the information should also be included. This date assures the reader that the information is current and gives the public relations practitioner a quick reference point for knowing when information should be reviewed.

Increasingly, organizations are making fact sheets available on their Web sites. For example, General Electric has fact sheets on topics such as company history and company values accessible through the News Room on its home page (www.ge.com). Useful graphics and pictures are easily included through this medium. As both the media and members of the public come to rely more on the Web as a source of information, making company information available in this manner will become more of an expectation than an option.

FANTASY THEME ANALYSIS THEORY

Public relations executives must constantly deal with the challenge of divergent audience members who understand the world differently. When this happens, the challenge is to communicate with the audience(s) in such a manner that people with widely different backgrounds and understandings of the world all have the same understanding of the message. Ernest Bormann, originator of fantasy theme analysis theory (also called symbolic convergence theory), discusses precisely this concept. When a group of people are exposed to some communication stimulus, they often discuss it in such a way that they begin to share the same image of that stimulus. It is not a “fantasy” in the sense of dragons and fairy tales, but rather in the sense that members of a group come to share common perceptions of the world around them. Central to this theory is the notion that things that happen are not identical to our perceptions of what happens. For example, a sporting official may make a decision that is viewed as good by supporters of one team, bad by supporters of another, and differently still by audience members who have no particular allegiances. This article will give a general overview of fantasy theme analysis theory by explaining how it works in small groups and how it works in a mass public audience.

A small group might consist of anything from a sports team to a family to a project team in a corporate office place. Any small group will consist of members who think about the world differently. For example, consider a five-person project team at Corporation X. It is likely that both men and women will be represented on the team, and most corporations will have hired people from different races, ethnicities, regions, and religious groups. Each person’s background does not go away when he or she joins the group, and many “team” projects will begin with a series of individuals doing related tasks. Although they would certainly be able to share memos, conversations, and other communicative forms with one another, group members would still enter the project as individuals who look at things in different ways.

This raises the question, however, of how some corporations and other groups form effective project teams that share a single goal and a single vision. As group members go about the process of meeting with one another and completing the other tasks that are necessary for accomplishing group technical goals, they begin to have stories in common. They might be able to tell stories of an unusual event that happened in a meeting or of success in meeting some objective, or even to make caricatures of a supervisor or some other figure they had all encountered. Each of these stories becomes a “fantasy chain.” With the telling of each of these stories, group members are better able to build some sort of common identity. Each “fantasy” (story or shared experience) then “chains” into another story until the group has enough in common to form a cohesive unit. This cohesive unit might be more effective in meeting whatever their objective is.

For example, imagine that Project Team Y at Corporation X is responsible for developing the annual sales and marketing plan. Employees A, B, C, D, and E are assigned as members of Team Y, and at the beginning of the project they are unknown to one another. However, during the first meeting A recounts a funny story that had happened during a previous work assignment. This “fantasy” causes D to “chain” out and think of a particularly bad experience with a previous client. The group begins to tell progressively more important stories, sometimes including ones that have a direct impact on their work performance. Through such actions, Team Y increases group cohesion and productivity.

It is important to note that the process does not always work this way. Some groups may have worldviews that are too divergent to be reconciled, and a host of other issues can prevent fantasy chains from forming and group cohesion from being achieved. There may also be times when the symbolic worlds of a small group converge without a notable increase in task effectiveness. That said, group members who tell stories are more likely to form fantasy chains and bond with one another. Some research indicates that this will help group productivity.

Fantasy theme analysis theory does not have to be limited to the study of small groups. Indeed, it is completely possible for members of an entire nation to have similar enough stories to tell that their symbolic worlds converge and create a shared national story. Certainly political candidates seek to create this type of atmosphere—one in which people begin sharing common positive perceptions of the candidate and therefore increase their likelihood of voting for him or her. Although such a result might not enhance productivity on a national level, it might very well increase feelings of national unity.

For example, the United States is a country of widely different cultures. However, after the terrorist bombings of September 11, 2001, most citizens became fixated on a single national news event. This caused many to start talking to one another about what it means to be an American and about why an event such as this might have happened. Shortly afterwards, a marked increase occurred in overt acts of national support, such as the display of United States flags. More significantly, the numbers of people reporting approval of the job performance of President George Bush rose sharply. Fantasy theme analysis theory would explain this phenomenon by saying that people who had a common story to tell began looking for ways in which to display their unity with one another.

FAQS

Prepared by public relations practitioners and included in media kits and on Web sites, Frequently Asked Questions (FAQs) and their corresponding answers help explain new or technical products, services, mergers, and special events or issues to journalists and other target audiences. Prepared in a question-and-answer format, FAQs are a variation of the traditional fact sheet, and they often accompany news releases, photographs, and related materials to provide additional information that journalists may need to produce stories or that other audiences may need to better understand some product, stance, organization, service, or issue. FAQs can also supplement fact sheets or technical specification sheets.

In the early days of the World Wide Web, a simple FAQ page was placed online to answer questions about companies, products, and services, but today's Web-based FAQs often incorporate embedded links to guide audiences to more specific information about a particular question and answer or to graphics, animation, charts, or video or audio files. Although standby statements and media advisories also incorporate a question-and-answer format, FAQs serve different purposes than those communication tools.

When developing FAQs, public relations practitioners should place themselves in the minds of the target audiences to identify the questions a typical journalist, consumer, employee, or other stakeholder would pose. If possible, questions can be further identified and honed by using focus groups; inquiring informally with members of the target audience; pretesting the information by distributing it and following up with the target audience to see how well the information was understood or if there are additional questions or areas of confusion; and drawing upon previous audience queries for related products, services, or stances to identify likely questions or areas of confusion and to develop the corresponding answers.

—Diana L. Knott

FEATURE

A feature story, also referred to simply as a feature, differs from a news article in tone and organizational structure. Whereas news articles are written in objective journalistic style, feature stories employ a more creative style intended to capture the interest of readers through the use of details and descriptions.

News articles are written in inverted pyramid style, with most important information first (who, what, when, where); in contrast, feature stories are written with an interest-catching beginning, a body or middle that provides background or context, and an end that makes a final point or gives perspective to the topic. In features, sometimes the most important information is saved until the end. Features are usually longer than news articles, and they are not written to “cut from the bottom” to fit the available space. Whereas news articles offer the bare facts, presented briefly, features offer more detail.

Advantages of features for public relations practitioners include their “shelf life.” Features may be written far in advance of publication and used when the topic becomes particularly timely. Feature writing can capture emotions and imaginations more effectively than can news writing. On the minus side, feature writing can be more time-consuming and creatively challenging, and sometimes finding the mass media market for features is difficult. For organizational publications, feature stories are an important communication tool.

Public relations practitioners can write features about people, organizations, programs or services within organizations, products, and issues. Organizational leaders, employees, and volunteers offer obvious subjects for feature stories. Organizational anniversaries provide a focus for feature-length organizational histories. How-to articles are another feature approach. Topics of current public interest may provide another angle for the public relations writer to address.

FEDERAL COMMUNICATIONS COMMISSION

The Federal Communications Commission (FCC) is the independent regulatory agency of the United States government that controls most forms of electronic communication in the United States, including radio and television broadcasting, telecommunications, satellite communications, cable television, and new technologies such as direct broadcast satellite service. Created by Congress pursuant to the Communications Act of 1934 (the “1934 Act”), the FCC consists of five commissioners who are appointed by the president and confirmed by the Senate for five-year, staggered terms. The president selects one commissioner to act as chair, and he or she sets the FCC’s agenda and presides over agency deliberations. Congress monitors the FCC’s activities and controls its budget, and agency rulings are subject to judicial review.

Originally, the FCC was known as the Federal Radio Commission under the Radio Act of 1927. The Radio Act introduced two key concepts that were retained in the 1934 Act and that continue to provide the justification for government regulation of broadcasting: (1) that the broadcast airwaves are owned by the public; and (2) that broadcasters are entrusted to use those airwaves for the purpose of serving “the public convenience, interest, or necessity” (Section 4, Radio Act of 1927, incorporated into Section 303 of the 1934 Act). The 1934 Act, as amended, remains the primary statute under which the FCC operates today. The Telecommunications Act of 1996 revised the 1934 Act in several important ways, most notably with respect to the relaxation of restrictions on the number of broadcasting stations that may be owned by any one entity.

As guardian of the broadcast spectrum, the FCC has played an important role in determining whether individuals or organizations are entitled to use the broadcast media to publicize their viewpoints on

matters of public interest. Almost from its beginning, the FCC evidenced concern that broadcasters be fair with respect to their coverage of public issues. For fear that station operators would use their frequencies to advance their own causes or candidates, the FCC ruled in 1941 that radio stations were prohibited from editorializing. In 1949, the commission relaxed this ban and allowed broadcasters to editorialize as long as they also made air time available to persons holding divergent opinions. In its report entitled “In the Matter of Editorializing by Broadcasting Licensees” (13 FCC 1246), the FCC articulated what became known as the “Fairness Doctrine,” stating that the public has a right to hear balanced presentations of “all responsible viewpoints on particular issues” and that broadcasters have an affirmative duty to “preserv[e] for the public generally radio as a medium of free expression and fair presentation.” Section 315(a) of the 1934 Act was amended in 1959 to include a statement requiring broadcasters to “afford reasonable opportunity for the discussion of conflicting views on issues of public importance.” As part of the Fairness Doctrine, the FCC also required broadcasters to notify those who had been subject to on-air personal attacks, and to offer them a right of reply.

Broadcasters subjected the Fairness Doctrine to legal challenge in the 1960s on the grounds that it violated broadcasters’ First Amendment rights to control the content of their programming. In the landmark case *Red Lion Broadcasting v. FCC* (395 U.S. 367 [1969]), the U.S. Supreme Court upheld the Fairness Doctrine, reasoning that because broadcast frequencies are a scarce commodity, broadcasters can be required to provide a diversity of views. The Court noted that it considered “the right of the public to receive suitable access to social, political, esthetic, moral and other ideas and experiences” paramount to any First Amendment rights belonging to the broadcasters.

Under the Fairness Doctrine, public relations practitioners were afforded valuable opportunities to get their clients’ points of view heard in the broadcast media. If an organization believed it was the victim of biased news coverage, or if proponents of a particular perspective were denied broadcast media access that was granted to the group’s opponent, public relations practitioners had a remedy—they

could appeal to the station’s duty to provide balanced coverage under the Fairness Doctrine. However, most broadcasters did not support the doctrine, and many elected to avoid controversial programming altogether in an effort to escape the doctrine’s provisions. As a result, critics argued that rather than promoting robust debate regarding public issues, the Fairness Doctrine stifled such debate.

Following President Ronald Reagan’s appointment of deregulation advocate Mark Fowler as FCC chair in 1985, the commission concluded that the Fairness Doctrine failed to serve the public interest because it actually reduced the number of diverse views available to the public (1985 Fairness Report, 102 FCC 2d 145). The commission also found that the doctrine unjustifiably interfered with the editorial processes of broadcast journalists. Furthermore, the FCC argued that given the dramatic increase in the number of radio and television stations since *Red Lion* was decided, the “scarcity rationale” could no longer justify placing greater First Amendment restrictions on broadcast media than on print media. According to the commission, a free, unregulated marketplace would automatically provide the diversity of views that the Fairness Doctrine had tried to ensure. In 1987, the FCC repealed the basic provisions of the Fairness Doctrine and a Circuit Court of Appeals agreed that the commission had the authority to rescind the doctrine (*Syracuse Peace Council v. FCC*, 867 F.2d 654 [D.C. Cir. 1989]). Because the court did not base its decision on First Amendment grounds, however, Congress is not precluded from passing future legislation that would restore and codify the Fairness Doctrine’s requirements. Although Congress and several presidents have considered reinstating the Fairness Doctrine, so far those efforts have been unsuccessful.

One last remnant of the Fairness Doctrine, the personal attack rule, was repealed in October 2000 (*Radio Television News Directors Association v. FCC*, 229 F.3d 261 [D.C. Cir. 2000]).

FEDERAL TRADE COMMISSION

The Federal Trade Commission (FTC) is a five-person, independent government agency that has as its primary goal the protection of consumers from unfair or deceptive business practices. The FTC originally was created in 1914 to prohibit unfair competition, but Congress later expanded the commission's powers to include regulation of false and deceptive advertising. The commission's basic authority stems from Section 5 of the Federal Trade Commission Act ("FTC Act"), which states that "unfair or deceptive acts or practices in or affecting commerce are hereby declared unlawful" (5 U.S.C. §45 [a] [1]).

Historically, the FTC was known for timidity and delay; with the consumer movement of the 1960s and 1970s, however, Congress enlarged both the agency's budget and its powers. As a result, the FTC aggressively went after some of the nation's most prominent advertisers, and by the late 1970s was viewed by many as the most powerful U.S. regulatory agency. In the 1980s, however, the FTC's influence declined after the Reagan administration significantly reduced the agency's funding. The FTC again increased its enforcement efforts in the 1990s, targeting the tobacco industry for the "Joe Camel" campaign and other advertising designed to appeal to children, as well as a number of national advertisers for false advertising in the form of program-length "infomercials." Since 1996, the agency has cracked down on Internet fraud and emphasized through enforcement actions, working papers, and law enforcement initiatives that the FTC's consumer protection mandate extends to Internet, as well as traditional, retailers.

Through its Bureau of Consumer Protection, the FTC works to shield consumers against false, unfair, misleading, or deceptive advertising. The FTC defines advertising broadly, exercising jurisdiction over much more than just standard, paid-for product publicity advertisements. Public relations practitioners must be aware that the FTC considers

The former R.J. Reynolds cigarette advertising mascot, "Joe Camel," plays pool and smokes cigarettes in an advertisement for Camel cigarettes that covers a billboard in a field. The FTC and antismoking advocates pressured R.J. Reynolds to eliminate the "Joe Camel" campaign in 1997, accusing the company of using a cartoon character to attract young smokers.

SOURCE: © Joel W. Rogers/CORBIS.

all activities or communications meant to draw public attention to a product, service, person, or organization for purposes of trade as "advertisements" and therefore subject to regulation. This definition therefore includes press and video releases, sales brochures, direct mail, product labels, and promotional contests, as well as standard media advertisements.

Since 1983, the FTC has defined deceptive advertising as "a material representation, omission, or practice that is likely to mislead a consumer acting reasonably under the circumstances." Three elements should be noted about this definition. First, a literally true statement may qualify as deceptive if by omitting a fact it thereby creates a misleading implication. So, for example, the FTC ruled that Thompson Medical's advertising campaign for its Aspercreme ointment was deceptive because the advertisements implied that the cream contained aspirin, when it did not (*In re Thompson Medical Co.*, 104 F.T.C. 313 [1984]).

Second, an advertisement will be considered deceptive if it is likely to mislead a reasonable consumer with the characteristics of the target market, even if the ad does not in fact deceive anyone. In

evaluating an advertisement directed at children or the elderly, for example, the commission will take into consideration any special susceptibilities of those groups. However, an advertiser will not be responsible for misinterpretations made by consumers who act foolishly or interpret an advertisement in an irrational manner.

Finally, even an advertisement that is likely to mislead the public is nevertheless not deceptive unless the misleading claim qualifies as “material.” According to the FTC, material claims are those that are likely to affect a consumer’s decision to purchase a product or service. Some types of claims are generally presumed to be material by the FTC, including express claims as to a product’s attributes, purpose, cost, durability, warranty information, or health benefits. Ambiguities contained in advertisements are generally interpreted against the advertiser. Whereas false statements contained in advertisements are almost always deceptive, opinion statements that are incapable of being proved true or false and that reasonable consumers would not believe to be true fall into the realm of “puffery,” and are acceptable.

Since the 1970s, the FTC has also required that advertisers provide reasonable evidence to back up verifiable product claims before those claims appear in an advertisement. Claims made without this required substantiation are considered deceptive, even if later they prove to be true. If an advertiser states that test results prove something about a product, the test must have actually been conducted in a scientifically accurate manner and the results must not be presented deceptively. Furthermore, FTC guidelines require that people, including celebrities, who make endorsements implying that they use the endorsed product must actually use those items they endorse.

An FTC investigation of an advertiser’s methods can result from either consumer complaints or the commission’s own initiative. Most often, investigations begun by the FTC end by the issuance of a “consent order,” whereby the advertiser agrees to stop running the objectionable advertisement but does not admit to any violation of the law. The FTC can also bring a formal administrative complaint

against the advertiser, which requires a hearing before an administrative law judge. The judge’s ruling in the case can be appealed to the full commission, and eventually to the U.S. Circuit Courts of Appeal. If an advertising claim is ruled to be deceptive, the FTC has three possible remedies: (1) it can issue a cease and desist order, which forbids the advertiser from making further deceptive claims; (2) it can issue an affirmative disclosure order, which requires the advertiser to provide consumers with additional information to ensure that future advertisements are not deceptive; or (3) it can order the advertiser to run corrective advertising that specifically corrects past false claims.

The FTC also has the power to issue Trade Regulation Rules that define and prohibit illegal advertising practices on an industry-wide basis.

FEMINIZATION THEORY

Feminization theory is a body of research-based analysis and philosophy that has developed in response to two broad concerns. One is the impact on the field of public relations that occurs when the number of practitioners who are female is larger than the number who are male. Disciplines such as nursing and teaching changed in status, for instance, when they became more female than male demographically. The second theme is motivated by a desire for a positive and constructive role for women in public relations. What has consistently emerged from this analysis is the argument that the field is healthier because of this feminist bias. In

essence, a feminist perspective increases the quality of public relations research and practice and positions public relations to better serve society.

Linda Aldoory wrote that “the impact of gender and diversity on public relations has become widespread, and today it affects practitioners, scholars and audiences” (2003, p. 222). In her analysis, Aldoory referenced *The Velvet Ghetto*, the first comprehensive gender study in public relations, published in 1986 by C. G. Cline et al. Aldoory noted that since that study, various scholars have undertaken additional studies to describe the status of women in the profession. They applied feminist perspectives to clarify and improve prevailing public relations theories as they also explored new feminized concepts and theories. One of the leaders in this effort was Elizabeth Toth, who with others developed a body of scholarship that led to a new feminist paradigm that empowered women.

Women account for almost two-thirds of all public relations specialists in the United States, according to the 1998 U.S. Department of Commerce report (Grunig, Toth, & Hon, 2000, p. 50). Nevertheless, men continue to dominate the field because they hold the more senior positions, which are traditionally associated with power, prestige, and responsibility. L. F. Rakow stated, “The feminization of public relations should now be recognizable as nothing less than a gender crisis for the whole field, triggered by the entrance of substantial numbers of women, but fed by a long-standing conflict over [masculine and feminine] ideologies” (1989, p. 295).

Many responses to this “crisis” have been and will be voiced. One of the most constructive and illustrative of the feminist perspectives is voiced by Larissa A. Grunig et al., who wrote,

The literature of sex roles in psychology paints a composite of women as more likely than men to possess characteristics, qualities, and values ideally suited to the practice of public relations. These expressive traits should lead women to practice a model of public relations characterized by two-way communication and an equal concern for the organization’s relevant publics as for the organization itself. If supported, this hypothesis should lead us to conclude that women or people

with feminist values may in turn be the most socially responsible practitioners. If so, these people would increase both the professionalism and the effectiveness of our field. (2000, p. 52)

Examples of such feminist values include “altruism, commitment, equality, equity, ethics, fairness, forgiveness, integrity, justice, loyalty, morality, nurturance, perfection, quality of life, standards, tolerance and cherishing children” (L. A. Grunig et al., 2000, p. 58).

Little empirical work has been done to support this hypothesis that feminist values, whether implemented by female or male practitioners who aspire to excellence in their field, actually enhance public relations practice, and in turn, organizational effectiveness. According to L. A. Grunig et al., one exception is Aldoory’s 1998 search for a feminist model of leadership in public relations.

Aldoory observed that

studies such as this one might help support the notion that feminization is not a negative force for the profession. If women are moving into leadership positions, bringing with them a two-way, collaborative style of communication, then public relations might improve in status and professionalism. (1998, p. 96)

Intellectual analysis can cut two ways. On one hand, it advances the cause for change. On the other, it prevents or slows change by calling attention to issues people do not want to address. Recognizing such conflicting outcomes, L. A. Grunig et al. acknowledged the 1995 thoughts of Dozier, L. A. Grunig, and James E. Grunig, who said that “the rapid and still-growing feminization of the field may threaten any hard-won gains public relations as a function has made toward this role at the highest level of organizational decision making” (2000, p. 50).

Some scholars, including those who are male, have suggested that

the most effective public relations grows out of an entire world view that is feminine. That is, public relations that is practiced as balanced, two-way communication between an organization and its stakeholder groups stands to make the greatest contribution

to organizational effectiveness. (L. A. Grunig et al., 2000, p. 59)

Additionally, L. A. Grunig et al. reported that “feminist scholars such as Rakow suggest that women’s emergence in public relations is an opportunity for more responsible and effective practice” (2000, p. 50). They also wrote that some scholars—specifically R. M. Kanter, C. Kramarae, M. Schulz, and W. O’Barr—“see management practiced in a more persuasive, domineering and unbalanced way as rooted in masculinity” (2000, p. 59).

L. A. Grunig et al. referred to the 1989 work of Barbara Wetherell to support the argument for more women in public relations to serve in managerial roles.

Femininity (whether possessed by women or men) facilitates the practice of two-way balanced public relations. . . . Wetherell (1989) determined that far more men (and masculine people) than women (or feminine people) are in the managerial role—the role that correlates with the practice of symmetrical communication. . . . To actually practice this effective, sophisticated public relations, women must acquire more knowledge of public relations and move up into management. (2000, p. 52)

L. A. Grunig et al. believed that once this happened, the whole field would benefit from a more effective and ethical practice. Drawing on 1995 research by Dozier, L. A. Grunig, and J. E. Grunig, they wrote

The knowledge base of practitioners is a critical predictor of enacting the managerial role in public relations. . . . More women than men are acquiring formal education in public relations. It follows, then, that increasingly, women are the best-qualified practitioners to manage the function. Thus, organizations that block women’s advancement will suffer from lost potential for excellence in public relations. (2000, p. 53)

One gender issue that has been analyzed is the glass ceiling effect. A glass ceiling in public relations has been identified by reports that women were more likely to be found in technical roles than in managerial roles. Reflecting on this view,

Aldoory observed, “For years, the term glass ceiling has been used to describe the invisible barriers women face when attempting to be promoted. Although women comprise 70% of the jobs in public relations today, they do not comprise this percentage of higher positions in public relations” (2003, p. 227).

To what conclusion does this line of analysis lead? Brenda Wrigley answered this question: “The glass ceiling persists for women in public relations and communications management, despite increasing feminization of these fields” (2002, p. 27). Wrigley’s findings revealed that women are “paid 68 cents for every dollar paid to a male corporate officer . . . and men make, on average, nearly \$23,000 per year more than women make in public relations” (2002, p. 28).

Paradigms provide ways of looking at life. Many feminist scholars have argued that there is a paradigm for feminist scholarship. Sandra Harding defined a feminist paradigm in her support of sciences and technologies specifically for women: “Feminists (male and female) would invent modes of thought and learn techniques and skills to enable women to get more control over the conditions of their lives” (1991, p. 5).

The implications of feminist critiques are substantial. One difference for the practice is the changing role of public relations. If it is a tactical practice, communication skills are vital. If it is to serve a counseling role, then strategic management and ethical judgment become more important. Capturing the implications of the feminist critique for this trend, Aldoory wrote,

A public relations paradigm has also developed over the last 20 years. It emphasizes public relations as a management function, rather than a technical one; examines public relations with the goal of maintaining balance between organizations and their environments; and attempts to find new ways for building relationships with publics who are critical to an organization’s success. (2003, p. 225)

Not everyone believes the feminization of the profession is good. Aldoory concluded, “On one hand, critics have argued that feminization has

negatively affected the profession and its reputation” (2003, p. 226). But using Rakow’s 1989 analysis, Aldoory also noted that “feminization has opened doors to feminist scholars, feminine ideals and a desirable transformation of the profession and scholarship” (2003, p. 226). Also, Bey-Ling Sha asserted that feminization makes public relations more ethical, “not merely in appearance, but in practice” (1996, p. 3).

FLACK

Flack is a derogatory term for a publicist or press agent in the entertainment industry. This slang term, primarily used in the United States, has had its use extended with the passage of time to include all public relations practitioners and activities. The origin of the term is unknown, but many attribute the coining of the term to *Variety* magazine, which some sources say began using the term as a tribute to motion picture industry publicist Gene Flack in acknowledgment of his skills in promoting movies in the 1940s.

Wes Pederson, director of communications and public relations, Public Affairs Council, in a letter to the Public Relations Society of America’s *The Strategist*, attributed the first explanation of the term in common usage to Peter Martin in a *Saturday Evening Post* article in the April 1, 1950, issue. Martin’s lead in that article, entitled “Hollywood Says: ‘Please Stay Away!’” reads, “My friend, the movie-studio flack, came back from hoofing it around the jungle of soundstages and buildings, all fronts and no backs, that was his beat.” In the very next sentence, Martin explains that “flack is Hollywood slang for publicity worker or press agent.”

However, the *Oxford English Dictionary* lists the first reference to the use of *flack* as slang to Stewart Sterling. In his 1946 Fire Marshal Pedley detective story, *Where There’s Smoke*, one of the characters announces, “That publicity flack is here.”

The first reference book to include the term, according to the *Oxford English Dictionary*, was Al Berkman’s 1961 *Singers’ Glossary of Show Business Jargon*. The term was defined in that reference source as “a member of the Publicity Department (usually of a motion picture studio); press agent.”

The *Morris Dictionary of Word and Phrase Origins*, published in 1962, notes that “flack is a slang term common in the theatrical and

popular-music fields, meaning ‘press agent.’ We have been familiar with it in this sense for years and suspect it antedates the World War II meaning of ‘flak’ . . . ; that of anti-aircraft fire.” The *Morris Dictionary* goes on to observe that “it has never enjoyed the wide popular acceptance given, for example, the term ‘disc jockey,’ which became current in entertainment circles at about the same time.”

Almost every reference to flack includes another reference to flak, a 1938 term for an anti-aircraft gun, borrowed from the German *flak*, an acronym formed from Fl(ieger)a(bwehr)k(anone), literally airplane defense cannon. One surmises that if, in fact, there is an association between these two terms, it is meant to imply that a Hollywood press agent or publicist is a cannon of empty rhetoric.

More likely is the association with one of the now obsolete definitions at the root of the word flack. According to the *Oxford English Dictionary*, the word derives from the Middle English formation of the Middle Dutch *vlacken* and the Icelandic *flaka* meaning “to flap.” The transitive form of the word meant “to move or shake intermittently.” In agricultural usage, flack meant “to beat with a flail.”

Taken together, it seems more probable that the original slang had more to do with someone being a “mover or shaker” or actively pushing a story or client with such vigor that journalists felt they were being “beaten with a flail,” than anything to do with an air defense cannon or the type of shell it fires.

However, many an Allied bomber pilot in World War II reported that the German flak was “thick enough to walk on” and interfered with their mission, so one could make a case that the slang derives from the intensity of the publicist’s effort or the journalists’ impression that the never-ending stream of press releases “interferes” with their self-appointed mission to inform the public.

Fortunately, the term flack seems to have entered a period of remission in most mainstream publications. Wilcox, Cameron, Ault, and Agee (2003) noted that “in recent years most publications, including the *Wall Street Journal*, have refrained from using the “F” word in print.” However, they also point out that “trade publications such as *Editor & Publisher* still use it on a regular basis” (p. 11).

Although the term has found its way overseas, as many slang terms often do, it is not as prevalent there as it was in America in the 1950s and 1960s. One hopes that the increasing professionalism of public relations will reduce the perceived need on the part of journalists and others throughout the world to apply such a derogatory term to the practice of relationship building.

FLAME

For more than a decade, *flame* has been used to describe hostile or insulting online messages, and it has become an accepted word. Flaming has important image management implications for individuals and organizations.

“Sending abusive messages to one with whom one disagrees” is considered “an aggressive use of email, bulletin boards, or chat rooms” (Lister, Dovey, Giddings, Grant, & Kelly, 2003, p. 386) and often involves personal attacks. *The New Hacker's Dictionary* includes related terms: *flamage* (content), *flame bait* (message designed to solicit flames or provoke flame war), *flame on* (to begin or continue flaming), *flame war* (caustic altercation), and *flamer* (flame prone). *Flaming* also has been used to refer to speaking overzealously or unceasingly. Recent use dates back to 1969, and *flame* may have arisen from Chaucer’s work. *Flame on* is a pun based on the Human Torch from Marvel Comics.

Flaming is the most famous and publicized online misconduct. Further, it is one of the most enduring problems for users of computer communication. Flaming is a breach of *netiquette*, Internet etiquette (accepted conventions for behavior online). Larry Scheuermann and Gary Taylor compiled netiquette suggestions: “don’t flame,” use the Golden Rule, respond as if in person, recognize that flames detract from topics, and avoid taking offense. Other recommendations include avoiding quick responses to hostile messages, considering alternative interpretations and responses, stressing areas of agreement, softening language used to disagree, and recognizing tone and word choice. Many responses, especially if from a “rapid-fire reply key,” convey sentiments avoided in carefully crafted memos. Breaches in netiquette, such as flaming, may not result in retaliation. However, they often create negative images of the perpetrator and, if work related, of that individual’s employer. Certainly, understanding group conventions and social politeness norms gives one an advantage.

Factors influencing flaming include the degree of anonymity and the likelihood of continued interaction (e.g., whether participants frequent a list or chat room, or otherwise know each other). Further, sometimes inhibition is evidenced in flames (e.g., dots inserted in curse words and variation by context), suggesting that group norms develop.

FLEISCHMAN, DORIS ELSA

Doris Elsa Fleischman Bernays was born in New York on July 18, 1891, and died July 10, 1980, in Cambridge, Massachusetts. Along with her husband, Edward L. Bernays, she was an important contributor to the founding of public relations in the early 20th century and a prominent feminist.

Doris Fleischman was born to Samuel Fleischman and Harriet Rosenthal. Her father was an attorney and, much to her benefit, believed that women should be educated and useful. She was educated at Barnard College and graduated in 1913, having studied English, philosophy, psychology and music. After completing her bachelor’s degree, she began work at the *New York Tribune* as a reporter and editor for the women’s pages and the Sunday edition. She gained notoriety at the *Tribune* as the first newspaperwoman to report a prizefight. An active feminist throughout her life, Fleischman was a member of the Lucy Stone League, the Woman Pays Club, and Women in Communications, and she “participated in the first Women’s Peace Parade in New York in 1917” (Mayeux, 1999, p. 691). In 1919, she joined Edward Bernays in the practice of what Bernays had called “public relations counsel.” Three years later, in 1922, the couple wed.

Fleischman kept her maiden name and caused quite a media spectacle when she and Bernays convinced the desk clerk at the Waldorf-Astoria to allow her to sign the guest register as “Doris Fleischman” instead of Mrs. Edward Bernays. The couple were well-known members of the Lucy Stone League, an organization committed to preserving women’s right to keep their birth name after marriage. Bernays and Fleischman achieved

more notoriety when Fleischman became the first married woman in the United States to hold a passport in her own name. Fleischman made the headlines again in 1929 when she and Bernays convinced the New York Department of Health to allow her to put her name, Doris E. Fleischman, on the birth certificate of their daughter. Fleischman and Bernays would eventually have two daughters, Doris and Anne.

After their marriage, Doris and Eddie (as only Doris called Edward) became equal partners in his business and signed legal documents to that effect. Bernays worked for years to be labeled the “Father of Public Relations.” Whether he is the originator of the profession is a point of contention; however, Bernays is the originator of the term *public relations* and was the first to use the word *publics* to describe those who have an interest in an issue. Though Bernays garnered almost all of the glory and fame from public relations, Fleischman was instrumental to the foundation of public relations. Her counsel with Bernays and her work behind the scenes helped *public relations* become a well-known word and won legitimacy for their firm. Fleischman and Bernays depended on one another professionally, personally, and intellectually. Fleischman most often was a mitigating influence on Bernays’s grand schemes, and Bernays was Fleischman’s public voice. Larry Tye believed that Fleischman’s “most valuable contribution to the practice was in the brilliant way she compensated for Eddie’s shortcomings” (1998, p. 125).

In her 1955 novel, *A Wife Is Many Women*, Fleischman refers to her and Bernays’s relationship as a “double partnership” (1955, p. 163). During the 1920s this partnership was a modern idea. Fleischman wrote, “In the early days of public relations I was an exception in a masculine world. Silk and luggage manufacturers, radium miners, science institutes accepted me with polite surprise” (1955, p. 171). The amount of work and ideas that Fleischman contributed to the partnership cannot be underestimated. While Bernays had an office at ground level where he often met with clients, Fleischman’s office was upstairs out of the public eye, and there she went daily to strategize, draft press releases and speeches, and plan campaigns.

Bernays usually consulted with Fleischman after hours, and often her only contact with clients was when she hosted them at her and Eddie’s lavish parties at their home. The one shining example of Fleischman’s work with clients was the National Association for the Advancement of Colored People (NAACP) convention in 1920; she traveled to Georgia to consult with the governor about the convention, which was hailed as a great success and received evenhanded treatment in both the northern and southern press. It is doubtful that Bernays himself could have handled the convention with such aplomb. Usually, however, Fleischman was planning and writing in the background, with Bernays up front with all of his charisma and self-confidence. Susan Henry argued, “They were an excellent team; they complemented and respected each other, and were able to do things together that neither person—probably no single person—could have done individually” (1997, p. 54).

Fleischman’s most significant contribution to the field of public relations was her work on strategy and planning, which are considered management-level functions. She was not only an excellent technician, writing speeches and releases, but she was also a conscientious planner and innovator in public relations campaigns, such as the Lithuanian National Council’s effort to be recognized as a state, and the Lucky Strike cigarettes Green Ball. For Bernays’s part, he happily encouraged his wife to keep her name, join feminist organizations, work in the background (as was her wish), write for the business, and even explore creative writing. Bernays wrote of Fleischman in 1965, “Over the years [Doris] has been my most valuable asset. She has contributed heavily to the policy and strategy we have advised our clients to carry out. Her balanced judgment carries overriding weight with me. And she has unique compassion and understanding” (in *Biography of an Idea*, cited in Mayeux, 1999, p. 672).

In 1961 Fleischman and Bernays moved to Cambridge, Massachusetts, claiming that they were retiring. In truth they were merely scaling back and slowing down. Bernays wanted to finish his memoirs and open a small agency where they could give advice on, but not plan, public relations.

Fleischman had “left behind a circle of strong, close women friends with whom she had much in common, and she found in Cambridge few professional women with whom to associate” (Henry, 1997, p. 6). The move brought her closer to their daughters and their families living in Cambridge, but far away from the life and the friends she had in New York. Fleischman eventually found companionship through mentoring younger women and joining groups such as Theta Sigma Phi, and by writing for and running several contests sponsored by the Edward L. Bernays Foundation.

It is interesting to note that Fleischman published only a smattering of her work. In the beginning she wrote short stories in grade school and college that she claimed only Bernays had read. Early in her partnership and marriage to Bernays she began publishing *Contact*, which became the house organ for the firm of Edward L. Bernays, Counsel on Public Relations. *Contact* was published for 10 years and was circulated to over 15,000 people four times a year. It was able to get the word out about public relations in a conservative and informative fashion. She edited and published a book titled *An Outline of Careers for Women: A Practical Guide to Achievement* in 1928, and she published articles in magazines such as *Ladies' Home Journal*, *American Mercury*, *McCall's*, and *Independent Woman* that discussed topics such as working women, public relations, and feminism. Fleischman also contributed book chapters to books that Bernays wrote or edited concerning public relations. Her semiautobiographical novel, *A Wife Is Many Women*, was published in 1955 under the name Doris Fleischman Bernays. She had decided to use the name Bernays, but throughout the rest of her life she was known equally well by both names. *A Wife Is Many Women* caused some controversy because daughters Anne Bernays and Doris Bernays stated that many of the events detailed in the book never occurred. Fleischman described herself in the book as an average woman, but it is obvious that she was far from average. Significant awards that she achieved included Theta Sigma Phi's (later Women in Communication) Headliner Award and an Honorary Doctor of Law degree from

Babson College (Henry, 1998). Late in her life Fleischman wrote book reviews for the *Worcester Sunday Telegram*, and she and Bernays self-published *Progression*, a book of her poems. Her most important written contributions to the field of public relations were *Contact*, numerous speeches, and campaign plans that helped to put public relations on the map. Although she was a pioneer in the public relations field, she gained little renown during her life for her work. On July 10, 1980, Fleischman died after experiencing a stroke.

FLIER

A flier, also called a handout, is a one-sheet printed form of collateral material. Like other communication tactics or tools used in public relations, a flier must appeal to a particular target audience, contain a key message, and attempt to achieve a specific objective. Some objectives might include increasing awareness about a service, educating a target audience about a program, or encouraging a key public to attend an event. Often 8½ × 11 inches in size, a flier must be succinct, have few words, and include type or graphics that appear in broad strokes. Since space is limited, uncomplicated graphics and clean typefaces are preferable. They are printed on one side of a sheet, have a short shelf life, and are not folded. Fliers, along with

brochures, newsletters, and posters, are considered a form of direct media rather than mass media and are generally posted on bulletin boards, placed in information racks, and handed out interpersonally. Often they are used as miniposters, which means that the message should carry at a distance of 10 feet. If they are placed on counters or inserted into the fold of a newsletter, the information does not need to carry over a distance. As a tool of persuasion, fliers should adhere to publication principles. They should attract attention, stimulate interest, create a desire to act, and contain claims that are supported by facts.

Relatively inexpensive to produce, fliers are timely and disposable. Many have a single purpose, such as to announce an event or inform a specific target audience about something of interest. Whatever the method of distribution, fliers must be able to attract attention in a cluttered environment and should adhere to the principles of layout and design. An effective design should include a layout with proper *balance*, in which elements are arranged either symmetrically or asymmetrically along an implied axis; *dominance*, or an attention-getting element that stands out by its size, tone, or shape; *unity*, a sense that the message is an integrated and cohesive whole; *proportion*, the spatial relationship of elements similar in nature; and *flow*, which promotes eye movement and direction.

Since many public relations practitioners adhere to the writing style of the Associated Press, it is important to clarify terms. According to the *Associated Press Stylebook*, *flier* is the preferred name for a handbill. The word *flyer*, on the other hand, refers to the name associated with certain trains and buses.

FOCUS GROUP

A focus group is a group of people that provides some structure to a research setting. Most focus groups consist of 5 to 15 members, a moderator, and often a moderator's assistant. Focus group sessions are almost always tape-recorded or videotaped for later analysis. Analyses can range from a simple review of what the moderator understood, to what the members discussed or concluded, to complex content analyses of transcripts from the recorded groups, which may include psychological interpretations of the members' nonverbal behaviors.

The focus group provides public relations researchers with information from a variety of people focusing on a single person, product, event, or organization. Focus groups have some similarity to in-depth interviews in that a focus group facilitator asks predetermined questions to focus group participants; they differ in that group members can add on to ("tag") another member's answers or comments, and often are encouraged to do so.

The focus group is found in public relations primarily because it can be conducted quickly and fairly inexpensively. Focus groups are also used to pretest a promotion, product, or message, to prepare for larger surveys, or to provide more in-depth analysis of a survey in order to better understand the survey's results. A focus group, then, provides information from a variety of individuals about some issue or concern under some form of moderator control.

As noted, a major advantage of a focus group is its ability to gather "rich" data from the individuals assembled to discuss the research object. The disadvantages of focus groups are the cost of moderators and the inability to generalize to larger populations, and to demographic group members. Because a focus group's results are heavily dependent on the skills of the moderator, obtaining a trained moderator is essential to conducting a good focus group. Although focus groups are typically regarded as a cheap way to gather information, the primary cost associated with them is the moderator. A good moderator can cost more than half a focus group's cost. The trained moderator, however, can overcome some of the problems associated with

members, such as over- and undertalkative members who either try to monopolize the discussion or avoid discussion altogether.

Most focus group members are volunteers, and volunteers often participate because they are interested in the topic. Volunteers do not represent the larger population; therefore, the results cannot be generalized to that population. In most focus group situations, at least two and often three different focus groups are conducted to ensure that what one group says is similar to what a second group says. The third group will be used if the first two groups differ. When the research question does not consider demographic or psychographic differences, three groups per demographic or psychographic are required.

Depending on the research question under investigation and whether it requires organizational members to participate, some of whom may be subordinate to others, focus groups may differ in how they are conducted. Most focus groups meet in an arranged room, typically around a table or chairs placed in a U-shape when the research is gauging reaction to some promotion or product. Some rooms are equipped with two-way mirrors and hidden microphones so that observers can evaluate and rate the interaction; other rooms simply have a table and chairs and a tape recorder or video recorder and cameras out in the open. In a typical focus group, moderators sit at the end of the table, or in the table's 12 o'clock position, from which they can control who speaks through both verbal questions to specific members and eye contact or head nods to encourage or discourage member participation. The typical focus group lasts between one and three hours, including planned refreshment and bathroom breaks. The moderator operates from a scripted schedule of opening statements and "key" questions; sometimes the moderator will have written probe questions to further look into member responses. To get all members to talk, a typical opening will reinforce that all conversations—even recorded ones—will be edited so that no one will know who said what, that members' comments are confidential, and that their anonymity will be maintained. This is usually reinforced as well at the end of the focus group.

In organizations where the group members may feel what they say could cause them problems later,

a different kind of focus group is used: a *known group*. In the known group people are drawn from the organization's hierarchy. The technique requires that two different meetings take place. In the first members write their responses to the moderator's questions, and in the second they meet to discuss those responses. In some instances the questions are sent to members prior to the focus group's meeting; in others, they are gathered at the first meeting. Regardless of when the responses are gathered, the real discussion takes place once the now anonymous responses have been reproduced on large sheets of paper, usually taped to the room where the group meets. Discussion is then focused on the written responses, whether they may have come from a CEO, a CFO, or a clerk. Thus, no attribution of source gets in the way of ideas being discussed. The known group method takes longer to conduct and requires additional assistance and supplies. However, it works well in situations where superiors must interact with subordinates.

Focus groups are analyzed both informally and formally. Informal analysis occurs when the researcher debriefs the moderator and/or moderator's assistant. This is an immediate debriefing after the discussion in which the moderator's feelings and intuition are put down on tape or paper for later analysis. The formal analysis is made from transcripts created from the audio- or videotaped discussions (all names or references to members are removed in the transcripts), and a content analysis is made of the group's discussion.

The focus group provides public relations researchers with a rich, in-depth analysis of perceptions toward some research object. The group's discussions are kept on track by a trained moderator and are typically recorded and submitted to message analysis. While focus groups are common in public relations and can be conducted quite quickly, they are not cheap when conducted correctly. A single focus group's discussion is neither reliable nor valid unless it has been compared against another group's discussion.

FOLLOWER/ MEMBER NEWSLETTER

Utilized by most nonprofit organizations, including charitable nonprofits, trade associations, and political interest groups, the follower/member newsletter is an extremely popular public relations tool for fulfilling the information needs of a specific audience. This type of newsletter reaches out to members, alumni, volunteers, consumers/clients, boards of trustees, staff, and allied organizations of a particular organization in which audience members have a valid interest or formal membership.

Follower/member newsletters serve as the “voice” of the organization. Their audiences are made up of internal and external publics. Members, who pay dues, generally are defined as internal publics because they can be viewed as having an investment in the organization, similar to that of a

stockholder. Followers often are viewed as external because their expected outcome deals more with information seeking—finding out about issue positions rather than using the organization as an extension of one’s own voice in public policy discussions. Usually they do not have as strong an investment in an organization as members do, nor do they receive the special benefits that are accorded to members.

These newsletters, like other directed newsletters, strategically execute the public relations and marketing plans of an organization. The goals of follower/member newsletters can vary, but generally they are used to communicate newsworthy information about the sponsoring organization. In addition, newsletters are a valuable tool for fundraising: motivating existing donors, increasing gifts, recognizing the service contributions of volunteers, and demonstrating that the organization is a good steward of funds—an important responsibility for nonprofits. Some organizations also use these newsletters to market their services. Supplementing these common goals, follower/member newsletters seek to remind readers about the purpose of the organization, as well as to justify the existence of the organization in the community at large.

The follower/member newsletter is valuable to constituents who care about the mission of an organization. For instance, Health Plus, a New York City–based nonprofit whose mission includes improving access to health care for uninsured and underserved families, publishes a member newsletter that is available online. The newsletter is designed to provide Health Plus members with information about various health topics and health care providers. Professional associations, such as the National Futures Association, rely heavily on newsletters to keep their dues-paying members informed. Advocacy groups dedicated to particular issues provide a good example of organizations that use follower newsletters to their advantage. Citizens interested in certain social, economic, and political issues—for example, civil rights, abortion rights, economic reforms, or a particular piece of legislation—can subscribe to many of the available nonpartisan newsletters, which will allow them to follow the latest developments relating to the issue or legislation without actually being a member of the group.

The form and content of these newsletters varies from organization to organization. Some newsletters consist of one or two stories with little or no regard for design, whereas others are elaborate showpieces of color and flair. Depending on their content, they represent all four models of public relations practice. Newsletters from many human services charities, for example, are based on the press agency model. Their pages are filled with propaganda and stories designed to stir readers' emotions. On the other hand, non-profits categorized as business leagues, such as chambers of commerce, usually produce newsletters representative of the public information model.

The organization and development of a follower/member newsletter are very similar to those of other types of newsletters. Decisions on the audience (for example, members or followers), the articles to be featured, the budget, the format, the frequency of distribution, and the approval process should all be taken into consideration before beginning the newsletter. Because members will expect to receive the newsletter regularly, care should be taken to ensure that issues will be published in a timely manner. Also, because the newsletter is targeted to a very precise audience with very precise information needs, special attention must be given to see that its content addresses readers' needs. Providing information that is useless will alienate the targeted audience. Moreover, the newsletter needs to convey to readers that the organization is carrying out its mission effectively and efficiently. Finally, it is important to realize that a follower/member newsletter is not the end objective of the organization, but merely a tool for communicating with strategic publics.

The biggest change in follower/member newsletters in the past decade is that they increasingly are being published and distributed electronically. A variety of ways are used. The simplest, adopted by many of the smaller, less affluent organizations, is sending the newsletter via e-mail in text format. This allows the information to be transmitted through an e-mail program without the inconvenience of linking to Web pages. E-mail links are another option. Links are embedded in an e-mail message, allowing members or followers to access

the organization's newsletter on its Web site. Web newsletters can be graphically enhanced because the bulk of the information is not directly sent to the reader. Organizations with sensitive or private material are able to utilize sophisticated log-in programs that provide regulated access to members only. In addition to security, such programs give members a sense of uniqueness and make them feel they are a legitimate part of the organization.

Growing use of the Internet is blurring the lines between the traditional newsletter and organizational news in general. In the past, members and followers had to wait for information on a set time basis—monthly, quarterly, semiannually, and so on. Today, organizations are able to provide strategic publics with continuous, up-to-date information. Although traditional follower/member newsletters still will be needed in the foreseeable future, the Internet will continue to revolutionize the way organizations communicate with their members and followers.

FONT

Font refers to a complete set of characters or type with similar shape, style, and proportions; fonts are

used in printing, graphic design, and viewing on computer monitors. For example, *The New York Times* is printed using a widely recognized font created especially for *The New York Times* in 1931, called “Times.” The font selected can have a dramatic impact on the feeling of professionalism, playfulness, or excitement engendered by a document.

Fonts are grouped into categories such as Modern (Times Roman), Old Style (Bookman Old Style), Decorative (**JUMPER**), Script (*Swing*), and text letters (Old English). Fonts are also grouped into serif fonts, or those with “serifs” (curls or flourishes on the ends of characters), and sans serif fonts, or those without “serifs” or curls or flourishes. Ariel is a sans serif font, and Times Roman is a serif font.

Fonts that share the same basic shape, style, and proportion but vary in weight, width, or size are called font families. An example of a font family is Helvetica, which includes Helvetica Regular, *Helvetica italic*, **Helvetica bold**, **Helvetica Black**, Helvetica Narrow, **Helvetica Compressed**, and others.

One of the rules of effective typography is to use only a few fonts (or a single font family) per document. By using a font family like Helvetica, an individual has the ability to create headings (using Helvetica Black, for example), or to change the aesthetic feel of a document by using a narrow typeface or reducing the character weight.

Fonts are measured in points. There are 72 points per inch. Here is Times New Roman in six different type sizes:

6 point: ABCDEFGHIJKLMNOPQRSTUVWXYZ

9 point: ABCDEFGHIJKLMNOPQRSTUVWXYZ

12 point: ABCDEFGHIJKLMNOPQRSTUVWXYZ

15 point: ABCDEFGHIJKLMNOPQRSTUVWXYZ

18 point: ABCDEFGHIJKLMNOPQRSTUVWXYZ

24 point: ABCDEFGHIJKLMNOPQ

A 12-point font will typically yield six lines per inch of text at single spacing. We say “typically” because, as Michael Bruno explains, “Corresponding letters in the same size type may vary in height. We say that the face is either small on body . . . or large on body” (2000, p. 37). For example, the following are all 24-point lowercase A’s:

a a **a** a **a** *a*
 ð **a** *a* **a**

The space between lines of type is called “leading” (pronounced *led-ding*). Although most personal computer users are accustomed to selecting “single,” “space-and-a-half” or “double” spacing from the menu bar of their word processing programs, in professional practice leading is measured in points. Twelve points of leading applied to a 12-point font (called “solid” or single spacing) will yield six lines per inch of text. Using 24-points of leading with a 12-point font will result in double-spaced lines of text, or three lines per inch of text.

Adjusting the space between characters is called “kerning” and is also measured in points. Kerning can be increased or decreased to achieve specific typographic effects.

FORMATIVE RESEARCH

All public relations activities begin with formative research, an effort to understand the current situation. A public relations activity is like a journey. The better prepared a person is for a journey, the more pleasant it will be. For practitioners, the better prepared they are for a public relations activity, the more productive it will be for the organization or client. A public relations effort is driven by the needs of the situation. Practitioners try to overcome problems, or things that threaten the organization, or develop opportunities, or things that could benefit the organization. Often called other names, such as situational analysis or background research, formative research helps the public relations practitioner understand the problems or opportunity at hand. Formative research is the raw material for developing strategy. Two critical pieces of information for strategy development are stakeholders and the exact nature of the problem or opportunity.

Practitioners should know the stakeholders involved with the situation. They need to identify which stakeholders might be allies and support their efforts and which stakeholders might oppose their efforts, and they need to collect detailed information on who their target audiences might be. Detailed information about the target is critical when selecting communication channels and developing messages. Practitioners must know the target so that they can select media that will reach and messages that will appeal to the target. Practitioners also need to understand what makes a situation a problem or opportunity. They need to know the cause of a problem if they hope to solve it. Effective public relations solutions begin with a detailed understanding of the problem. Similarly, practitioners should understand why a situation is an opportunity if they are to effectively utilize it. In short, it is important for public relations practitioners to determine what harms or benefits a situation presents to an organization or client. An extended example will help to clarify the role of formative research.

MacCorp is located in a moderate-sized Midwestern town of about 50,000 people. Each year the local paper does an assessment of community needs and prints the top 10 issues that are

important to the local community. Number 5 on this year's list was a lack of park and recreation facilities. MacCorp has some unused land that would be perfect for a park: a wooded area and a level section ideal for soccer fields. The paper's survey presents MacCorp with an opportunity to improve community relations by addressing one of the community's top needs. The public relations department's first step is identifying the key players involved in the park and recreation issue. This would include all relevant local government officials, any community groups interested in parks, local sporting groups who might use the park, local neighborhoods near the proposed site, and any state or federal agencies that might have a say in the park construction, such as the Environmental Protection Agency. Next, the public relations department seeks out more information about each stakeholder, such as how strongly each is committed to the issue, what each would like to see in a new park, and whether or not some groups might oppose the company's efforts.

The public relations department then needs to specify the opportunity. It must clarify what a "need for parks and recreation" means. The focus would be on user needs—what people want from a park. Obviously understanding the key players will go a long way toward understanding the opportunity. Still, the public relations department needs to focus its efforts and make sure it understands what the opportunity really is. One starting point would be for someone from the public relations department to talk to a number of community leaders about the potential park. Let us say the leaders keep mentioning the lack of soccer fields and tennis courts in the community. The public relations department then constructs a survey that has people rate the value of 10 different park amenities, including tennis courts and soccer fields. It mails the survey to community members and tallies the results. If the survey says that tennis courts and soccer fields are the two most valued amenities, the public relations department can be confident that building those two amenities will please the community.

The formative research helps MacCorp's public relations department to develop its strategies. By researching the stakeholders involved in the situation, the public relations people know who

might help or hinder their park community relations initiative. MacCorp also knows whom they will need to target with their messages. By researching the opportunity, the public relations people can be confident that their community relations initiative will be received positively. They will know that their planned park meets the needs of the community. The next step is to convert this information into a strategy by setting objectives, specifying target audiences, designing messages, and selecting tactics.

The amount of formative research a public relations practitioner conducts depends on how much or how little the practitioner already knows about the situation. The less practitioners know about the situation, the more research they will need to conduct before they can begin the public relations activity. For seasoned public relations practitioners, many situations will be fairly routine and require very little additional research. Instead of actively searching other sources, they can draw upon past experiences and databases stored in their computer files to guide their response. The search is internal and quick. Consider the example of a manager receiving an award. The award is an opportunity to generate positive publicity for the organization. Deciding to send out a pitch letter and news release is fairly routine when someone has been doing public relations for years. Furthermore, a practitioner would have all the requisite media contact information in a database on a computer. The practitioner knows the key stakeholders (the media outlets), what types of stories they prefer, and what this opportunity means. If the situation is completely new to the practitioner, a lot of formative research is necessary before the strategic aspects of the public relations efforts can be developed.

Formative research provides the raw material needed to construct a public relations effort. Strategy becomes the map for a public relations effort. But how does a practitioner build a map? In public relations, formative research provides the information needed to construct the map. The speed at which a practitioner collects the requisite information depends on how much relevant information the practitioner already possesses and how much he or she needs to discover. Formative research is the first step in the development of a public relations activity. If a

practitioner begins by going in the wrong direction, the results of the public relations effort will probably be negative for the organization. Careful, systematic formative research points a public relations practitioner in the right direction and increases the likelihood of an effective public relations activity.

FOUR-MINUTE MEN

During World War I, the Four-Minute Men were a division of the Committee on Public Information (CPI) that helped to persuade Americans to support the war effort; they did this by giving speeches, usually in movie theaters during intermissions. Theaters were particularly effective because 10 to 13 million people attended them daily. These speeches helped to mobilize support for the war and to provide for the essentials of war. The Four-Minute Men overcame the primary weaknesses inherent in other communication channels so that they could present their message to the entire nation, since broadcasting was not yet available.

Donald Ryerson originated the idea for the Four-Minute Men and was the first head of the division. The division was organized in a state-by-state network and eventually included all states in the

union and eight territories. Each state or territory had a chairman who was responsible for coordinating activities and for picking the local chairmen, who, in turn, were responsible for the selection and training of the speakers. Despite receiving no pay or reimbursement for expenses, speakers were never hard to find.

The Four-Minute Men division of the CPI maintained control over the network of speakers, including the selection of address topics and the preparation of associated materials. Speakers were trained through a series of bulletins published by the division. From May 1917 to the end of 1918, 46 bulletins were published. Ten dealt with the organization itself. Of the remaining 36, 6 messages concerned raising money and 5 discussed conserving or acquiring food. These messages were essential for the nation to create the materials necessary for war.

Although each speech topic fulfilled a specific function, the bulletins usually provided speakers with some essential elements: an opening letter of encouragement from the division head; points to be covered in every speech and suggested optional points; sample speeches; and sometimes even answers for crowd objections. The speeches presented by the Four-Minute Men were normally delivered in theaters during the intermissions and were limited to four minutes. The organization had a series of auxiliary organizations, including groups with female speakers and Junior Four-Minute Men groups in schools.

“When the armistice brought activities to a conclusion the Four Minute Men numbered 75,000 speakers, more than 755,190 speeches had been made and a fair estimate of audiences makes it certain that a total of 134,454,514 people had been addressed” (Creel, 1920, p. 85). Creel noted that if allowances are made for those communities that made no reports, a final estimate would place the figures at 1 million speeches heard by 400 million individuals for the 18 months the organization was in operation. Creel also noted that for the total government expenditures of \$100,000 for the Four-Minute Men division, the organization accrued over \$9 million in financial benefits.

FRAME

A *frame* is a rhetorical label that encapsulates unconnected pieces of information about a subject of interest into a graphic image or a coherent story. The term naturally draws metaphorical value from the function of a cropping frame used with visual images, which limits and focuses the viewer’s gaze, while at once bestowing relevance

upon subjects within the position or scope of its borders and irrelevance upon those without. Frames illuminate matters of personal or public importance, whether they are a strategic product or an emergent outcome of ongoing communication. One important evolution in the understanding of frames is the media frame, which concerns itself with the materialization of frames in public discourse. But frames can just as easily occur within or between individuals, groups, or societies without their materialization in media.

In each of these areas, frames submit to three levels of analysis. At the level of their production, frames sustain graphic images and a common vision of worldviews or ideologies, which tend toward their own transmission or perpetuation. Nations, such as the United States, frame their symbols in a worldview that is ostensibly widely shared by citizens. At this level, the most powerful frames hold sway by virtue of their institutionalization and fixed position above societal structures. That is, the adoption and adherence to a set of values or guiding philosophy to which a group of people adhere produce a frame of understanding that is shared by the members of the group. Those members use that frame to organize and predictably qualify routine information. In one sense, the frame of “student as customer” can be thought of as a dominant frame that has expanded into the spheres of education, where it has become influential in valuation at a broader cultural level. By this cultural valuation, students are no longer thought of merely as persons who come to learn and earn a degree. They have become customers who expect treatment beyond that traditionally associated with a college education experience. If they don’t like the product or service, they are allowed—even expected—to complain and seek “customer satisfaction.” At the content level, frames import a fixed meaning to key words, ideas, or entailments and bring coherence to words and phrases within or between communications. In education, discussions of “customer service” direct dialogue, thereby implicating the frame of “student-as-customer.” Finally, at the effects level, frames become interpretive schemes used to process information, make judgments, and draw inferences, and can reveal the link between mass ideologies and policies. For example, in

education, the “customer service” frame can govern procedures that assimilate business practices, such as student evaluations.

An awareness of frames helps public relations professionals better understand general trends in society. A thorough understanding of how frames work may also aid public relations staff members in knowing their role and abilities as professionals. First, a general awareness of the power frames can assist public relations professionals in managing information so that they can clarify thinking, articulate alternative points of view, or more readily perceive less evident alternative viewpoints. Second, public relations professionals can use frames in their research and evaluation efforts to track changes, monitor events, and identify new threats and opportunities in a given environment. Third, public relations professionals may more readily express their needs and objectives with frames preferred by top management in order to accomplish organizational or public objectives. For example, public relations professionals commonly encase their agendas or activities in frames already accessible to management, such as those concerning the importance of “relationships,” or considerations of “return on investment,” “efficiency,” or “corporate reputation.” Fourth, public relations professionals can work with management groups to identify and avoid fixed perspectives preserved by lasting frames. Indeed, prior research has shown that top levels of management often become trapped in their own preferred frames and do not easily entertain alternative points of view. Working with management through the concept of frames provides a way for public relations to serve as a conscience for an organization by directing attention to the neglect of certain trends, issues, or publics. Fifth, policy advocates can enhance their success by shaping information into coherent packages with standardized prevailing values, stories, and myths. Prevailing values and the like may include “efficiency,” “capitalism,” or “rationalism,” all of which have gained considerable currency in this era as institutionalized frames. Finally, public relations professionals can use framing concepts to adapt organizational interests to the established media frame of “newsworthiness” that news workers

use in deciding what counts as news. That is, when public relations professionals are able to pitch stories or write press releases that emphasize themes favored by journalists (e.g., those characterized by “proximity,” “human interest,” or “timeliness”), such stories or press releases are more readily printed.

We are all privy and susceptible to frames, yet their effects are by no means equal. For a frame’s force at the production level determines the power of its effects. That is, those whose frames are more widely circulated, such as through public deliberation or the mass media, prevail over others. Hence, those deliberating at the policy level, such as for business or government, acquire resources by successfully funneling their interests through existing, generally accepted frames. This is especially so of those working with frames that have become tacit over time, or taken for granted. Conversely, challenging successfully promoted positions involves adopting their frames of understanding, or otherwise introducing similarly compelling values and beliefs in support of the challenge.

The use of the term *frame* as a theoretical model has origins in the work of psychologist Gregory Bateson and of the sociologist Erving Goffman. From these two can be traced stages in the evolution of the term from the conventional analogy of the picture frame into academic theory and research methods. Media sociologists Herbert Gan, Gaye Tuchman, and Todd Gitlin later disseminated their works more broadly into other disciplines.

FRAMING THEORY

Framing theory deals with framing, a rhetorical device that has received increased attention in public relations as a way to understand the construction of arguments and the different interpretations of arguments.

Framing is actually a metaphor that compares message construction to drawing a border around a painting or picture. The frame helps define the meaning of the message (a) by focusing attention on particular elements and (b) by excluding competing, distracting, or contradictory elements.

Framing draws upon the notions that message producers are involved in the construction of social reality and that message meanings are negotiated, not absolute; thus framing theory falls within post-modern and relativist perspectives. This approach suggests that public relations practitioners frame situations or problems in ways that are favorable to clients. Framing thus might be compared to the practice pejoratively referred to as spin doctoring.

HOW FRAMING WORKS

Framing is central to the establishment and maintenance of mutually beneficial relationships because it helps organizations and key publics to develop common *frames of reference*. A frame essentially limits or defines a message’s meaning. Both message creators and receivers are involved in the process. Frames reflect judgments made by message creators, who put information in either positive or negative frames, use particular semantic phrases, and tell stories using particular syntactical, thematic, or rhetorical devices.

Framing biases the audience’s cognitive processing of a message. Framed messages inevitably contain *contextual cues* that are intended to trigger associations with ideas stored in audience members’ memory. These memory traces can be either positive or negative or can conjure up particular recalled images that facilitate processing.

Framing also *primes* audiences to think about a topic in a particular way. For example, the abortion controversy might be framed as an issue involving (a) a medical procedure, (b) a religious or moral act,

or (c) the freedom to make choices. In fact, all three are involved, but, depending on which frame is used, audiences are prompted to interpret a message using different sets of memory traces or cognitive schemas. Framing affects cognitive processing by selectively influencing which sets of experiences the message draws upon and how audiences think about or define a particular topic.

Psychologists differ about the exact structure and operation of human memory, but most psychologists agree that people use processes of association and expectation to schematically make inferences and impute meaning that might not be manifested in the message itself. Importantly, audiences might or might not be conscious of these message-framing effects.

TYPES OF FRAMING

The robustness of framing theory is evident in the many different ways in which the framing concept is used. At least seven different models of framing have been identified that have potential applications to public relations.

Situations

Researchers from anthropology and sociology were the first to examine the communication process using a framing paradigm. In anthropology, Gregory Bateson defined a psychological frame as “a spatial and temporary bounding of a set of interactive messages” (Bateson, 1972, p. 191). In sociology, Erving Goffman used framing as the basis for defining and studying human interaction and developed an elaborate system for analyzing human interactions. This tradition has been carried forward in studies analyzing discourse, language, and literary storytelling. Framing of situations is routinely used by organizations to explain its actions. Framing is also a critical component used in bargaining and negotiations.

Attributes

Advertisers and other marketing communicators routinely use framing devices to promote particular

characteristics of objects, events, and people. This process can be evidenced in practices as simple as writing captions under photographs that call attention to particular aspects of an illustrated product. Marketers regularly choose particular attributes or characteristics that they wish to promote (such as convenience) while ignoring others (such as higher price). Advertisers often want to conjure up images based on prior experience so customers can relive their experience. Product positioning similarly uses framing to differentiate a particular brand from all other competitors in a category. Both product attributes and positioning provide the basis for the product claims contained in advertising. Some researchers have identified framing as a form of second-order agenda setting whereby media are able to influence not only what topics people think about, but how they think about them. A particularly important aspect of framing involves the best way to describe attributes. For example, the fat content in meat might be described as 80 percent lean or 20 percent fat. Research suggests that positive framing consistently leads to more favorable evaluations than negative framing of the same fact.

Risky Choices

The framing of choices, one of the most extensively researched areas of framing, is based on the classical work of psychologists Daniel Kahneman and Amos Tversky. These psychologists defined a frame as a decision maker’s perception of “the acts, outcomes and contingencies associated with a particular choice” (Kahneman & Tversky, 1979, p. 263). They argued that human decision making is inherently irrational because the prospect of loss has a far greater impact on decisions than does the prospect of an equivalent gain. Their *prospect theory* suggests that people avoid risks when a choice is stated in terms of gains but will take greater risks when choices are stated in terms of losses. This element has particular relevance for health communicators concerned with how people will deal with health threats, as well as for risk communicators who must encourage or discourage risk taking. However, framing of choices is also relevant to decision making in organizations, to negotiation

strategies, and to other communications in which audiences are challenged to make choices. Although findings are generally consistent with prospect theory, the effect can vary based on the type and context of the risky decisions involved.

Actions

The framing of actions involves the question of how to achieve audience compliance when no risky choice is involved but when a decision might have positive or negative consequences. Take, for example, a membership organization that wants to charge different rates for attending an event based on whether registrants sign up before or after a specified date. Early sign-ups could be promoted as a discount (gain), and late sign-ups could be explained as a penalty (loss). Which is the better way to promote participation when the options are the same? *Valence framing* and *goal framing* are terms used to differentiate between propositions stated in positive terms that focus on taking a particular action, or in negative terms that focus on what will result by taking no action. Health communicators interested in getting people to quit smoking can make a strategic creative decision to either stress the benefits of a smokeless life or the deleterious effects of cigarettes on health. The findings here are generally the same as for the framing of risky choices: framing of actions in terms of negative consequences appears to have greater persuasive impact than framing that emphasizes positive consequences. However, various factors can moderate results, including the audiences' level of involvement and their sense of self-efficacy (the ability to deal effectively with a situation).

Issues

Framing plays a pivotal role in defining social problems (such as abortion) and the moral actions attendant on dealing with them. Social researchers who adopt a constructionist approach argue that social problems are best understood as issues constructed by claims makers, who use framing as a tool in agenda building to create public interest and concern about issues. Many people today are chagrined by the absence of a robust public sphere

of dialogue in which people can use philosophical and rational arguments to persuade audiences to adopt a particular position. Framing, some argue, confounds the deliberation process because people don't even agree on the definition of a problem—a necessary condition for coming to an agreement.

Frames define problems and thus delimit possible solutions. Researchers concerned with social movements have theorized extensively about the importance of framing, including the *frame enterprise* and *frame sponsorship*, the active effort of activists to position or frame a problem as being of a particular kind and source. Thus, advocates engage in a *framing competition*. Building coalitions can involve a variety of framing-related activities, including *frame alignment*, *bridging*, *alignment*, *crystallization*, *extension*, and *transformation*.

Responsibility

Framing an issue often implies both its cause and its solution. Yet another valuable rhetorical use of framing involves the framing of responsibility, or the attribution of causes to a particular actor, to the object or entity acted upon, or the environment or circumstances in which an event occurs. Attribution theory deals with how people attempt to understand the causes of events or actions. Researchers have shown that attribution processes are easily biased by inattention, the salience of particular explanations, prior knowledge and extant schemas, and personal needs and motivations. Fundamental attribution error, for example, refers to the tendency to attribute people's behaviors to stable personality factors or dispositions rather than to situations or external causes. Actor-observer bias involves people attributing their own successes to themselves, while failures are explained as caused by situations. In crises or disasters, people tend to watch to find the root cause and assign blame rather than accept such occurrences as acts of fate. Much investigative reporting, for example, focuses on finding out the cause of a problem. Along this same vein, news tends to use episodic framing in which events or problems are explained as the result of people's actions, rather than thematic framing, in which causes are attributed to systemic problems in society.

News

Finally, framing has become a focus of researchers interested in reporting and in how dominant social themes or ideas are used to shape the way news is presented by the media. A *news frame* is a central organizing idea for explaining events that uses various symbolic and framing devices that support the main idea. William A. Gamson, for example, suggested in 1993 that media routinely use metaphors, catchphrases, exemplars, depictions, and visual images that culturally resonate with audiences. These framing devices represent conventions for telling information and help media workers arrange seemingly disjointed events into a meaningful, organized interpretive package. Meanwhile, familiar frames provide mental maps to help audiences make sense of daily events. Extensive research has been conducted on how a wide range of topics have been treated by the press. These include how deviance from social norms, as represented in the coverage of disputes and protests, can be used as a tool of power to define whose view of the world will dominate. Concerns about biased media framing have usurped concerns about merely balancing coverage.

IMPLICATIONS FOR PUBLIC RELATIONS

The central idea behind framing is contextualization: Framing puts information in a situational or cultural context that delineates how people evaluate information, comprehend meanings and take action. Public relations messages must be imbued with sufficient clues so that people can make sense of a message and be persuaded by it. In developing programs, public relations professionals operate as strategists who strive to frame situations, attributes, choices, actions, issues, and responsibility in ways that achieve favorable outcomes for their clients. When conducting publicity, it is equally important to use effective news framing to present a client's story in the press.

FREDE, RALPH E.

Ralph E. Frede, APR, Fellow PRSA, was instrumental in raising professional standards of public relations through education, accreditation, and integrity.

Born in Floydada, Texas, on September 28, 1921, Frede moved with his family to Amarillo when he was a year old, and then to Austin when he was a teenager. Frede earned a Bachelor of Journalism degree (1943) and a Master of Arts in Government degree (1947) from the University of Texas in Austin, where he was editor of the student newspaper, the *Daily Texan*, and president of Alpha Phi Omega. Between degrees, Frede was a U.S. Navy lieutenant and executive officer of an LST during World War II. He was in the first wave of small boats that went into the beaches at Normandy on D-Day.

Frede's leadership in the Public Relations Society of America (PRSA) for more than three decades was directed toward establishing higher professional standards. He was a founder of the Accredited in Public Relations (APR) program, the PRSA College of Fellows, and the Foundation for Public Relations Research and Education, which today does business as the Institute of Public Relations. He was the first president of the foundation, which also launched the *Public Relations Review* in 1975.

Equally known for his achievements in institutional development, Frede advanced the level of professionalism in both public relations and fundraising through his exacting standards and belief in education as a lifelong process. He brought the public relations and development disciplines together to create maximum value for the institutions he served.

A Houston, Texas, resident most of his career, Frede is recognized for his professional leadership at the local, state, and national level. He received the Gold Anvil award from PRSA, the Golden Spur award from the Texas Public Relations Association (TPRA), and the Excalibur Legacy Award from the PRSA Houston Chapter. All are the organizations' highest honors for professional achievement and contributions to the profession. He was a board member of PRSA and president of the Public Relations Foundation in 1973. He also served as Southwest District chairman of PRSA and as past president and national assembly delegate of the Houston Chapter, and he held many other top positions in professional organizations.

Frede was most widely recognized as a public relations practitioner. His awards include the Silver Anvil of PRSA (1965) and the Outstanding Texas Public Relations Practitioner from TPRA (1988).

Frede wrote the initial examination taken by individuals for the APR designation in the 1960s and worked with the testing firm to evaluate and score examinations. His basic test, with minor adjustments, was used by PRSA for 30 years. He mentored decades of practitioners who studied in workshops to prepare to pass this examination.

An unswerving advocate of public relations as a vital part of management, Frede insisted that public interest is paramount. His quotation from an article in the September 18, 1989, *PR Reporter* article titled "PR Opportunities of the Future Will Involve Ability to Help Management" summarized his view: "We must retain our integrity, a sense of what's good for the public. We want to *be*, not *seem* to be. So we must counsel with management to put the house in order. Performance must be part of the public relations process" (p. 2).

Frede had a special talent for making things simple. He believed that good public relations is as

simple as two or more parties reaching a mutually satisfying conclusion through effective two-way communications. When it came to philanthropy, he believed that most people wanted to give to causes if they had a passionate belief in them, and that effective fundraising was as simple as giving them the facts to create that passion.

He was vice president of public affairs for Baylor College of Medicine, Houston, from 1970 until his retirement in 1989. During this period, Frede's skills in combining public relations, government relations, and development helped Baylor gain hundreds of millions of dollars in public and private funding and move to the forefront among the nation's medical schools.

Frede was director of development for the University of Houston (UH) from 1956 to 1970. He also served as executive director of the University of Houston Foundation during this period and was a leader in bringing UH into the state university system of Texas.

He was a state representative for the National Foundation for Infantile Paralysis in Texas and Missouri from 1950 to 1956; assistant to the Dean of Student Life at the University of Texas and director of the Student Employment Bureau from 1948 to 1950; and manager of public relations and education for the Austin (Texas) Chamber of Commerce from 1947 to 1948.

Throughout his career, Frede was active in public relations education. He taught at Lincoln University in Jefferson City, Missouri, while at the National Foundation for Infantile Paralysis. At the University of Houston, he introduced and taught a course on principles of public relations in the Department of Management, College of Business Administration.

In the early 1960s, with his urging, the course was moved to the Department of Journalism (which is now the School of Communication) in the College of Arts and Sciences. In addition to principles of public relations, Ralph introduced public relations writing and public relations campaigns to provide a solid curriculum in public relations. After Frede retired on August 31, 1989, from Baylor, he continued to teach graduate courses in public affairs management and public relations management at UH.

Frede's published articles have ranged from public relations issues to church administration, and in retirement he has continued to write and consult for nonprofit institutions in Houston, Austin, and San Antonio.

Leadership positions held within the public relations profession include director of the Southwest District for the American College Public Relations Association, district conference chairman for the American Alumni Council; member, National Educational and Research Council, PRSA; member, Public Relations Division, Texas Hospital Association; president, Houston Chapter, Southwest Society of Fund Raisers; director, School of Educational Administrators, American College Public Relations Association; and vice president of the Mid-Missouri Chapter of Sigma Delta Chi (Professional Journalism Society).

Besides his professional achievements, Frede gave generously of his leadership and talent to the community and his church.

In Houston, he was a vestryman at St. Francis Episcopal Church and senior warden at Christ Church Cathedral; president of Protestant Charities of Houston; chairman of the Education Division and director of United Way of Houston; president and director of the Rotary Club of Houston; member of the advisory board, Alley Theater; president of the Rotary Club of Houston Student Education Fund, Inc.; chairman of the Public Relations Committee and director of the Sam Houston Area Council, Boy Scouts of America.

In Austin, Frede served as chairman of the Austin Rotary Foundation and was on the St. David's Church Endowment Board and on advisory committees for St. David's Hospital Foundation, the University of Texas Psychology Department, and the Texas Union.

He has received the Boy Scout Silver Beaver award; the Exceptional Achievement Award, American College Public Relations Association; the Public Service Award, Texas Optometric Association; and the Service Award, Houston Assembly of Delphian Chapters.

Frede and his wife, Martha C. Frede, Ph.D., a clinical psychologist, live in Austin. They have four daughters.

FREE MARKET SYSTEM

A free market system is one in which the basic economic questions—what to produce, how much to produce, and for whom—are answered through the unencumbered and independent actions of producers, workers, and consumers. This can be contrasted with a command economy, in which a central planner makes the decisions on where resources will be allocated, in what quantities, and with how much compensation. In an absolutely free market the economic agents make individual choices without any interference or distortion from government.

Although the concept of free markets certainly predates him, Adam Smith is widely credited with the first comprehensive discussion of this idea in *An Inquiry Into the Nature and Causes of the Wealth of Nations* (usually referred to as *The Wealth of Nations*), originally published in 1776. In this book, Smith first introduces the concept of the “invisible hand” of the marketplace, whereby the actions of self-interested consumers, producers, and workers result in scarce resources being allocated to their socially optimal destination without any visible external direction. Consumers buy the products that will maximize their utility (happiness) given the prices of the products and constrained by their available income or wealth. Producers respond by producing those products so that the price they receive will at least cover all of the costs of production, including opportunity costs (those costs related to forgoing the next best option for spending the productive resources, including the producer’s time and talents), and by ceasing production of unprofitable products.

A defining feature of a free market system is that of competition: competition between producers to provide products that consumers want and at the lowest possible cost; competition among consumers bidding for various goods and services; competition among workers to get their chosen jobs; and competition among the owners of capital and land in providing their factors of production to the highest bidder. It is this competition that determines where resources will be allocated and in what price and quantity.

Buyers of products, whether those products be goods and services or factors of production like land, labor, and capital, must choose from a wide array of products, all of which would increase the utility of the buyer. However, the buyer has a limited amount of resources, including money and time, with which to purchase the product. When considering whether to buy a specific product, the consumer must decide whether the marginal utility of the product, that is, the additional happiness that the product will give the consumer, is sufficient given the price paid. If it is, and many consumers agree with that assessment, there may be more

people demanding the product at that price than there is product available. In this case, competition among the demanders will push up the price of the product. In response to the higher price, existing or new producers will increase their output of the product, since they can now afford to pay more for the factors of production and bid them away from other uses and since they are receiving more for each unit sold.

If consumers find that the marginal utility of the product is not enough to justify the price paid, they will choose not to purchase it. Again, if there is an imbalance, with enough consumers making that decision that there is an excess supply of the product at that price, the invisible hand ensures that producers will engage in competition to make sure that their product is the one that gets sold by lowering their offering price. However, if the price that they must lower their product to is too low for the producer to sustain a profit in the long run, the producer will shut down, thus freeing up resources for production of other goods and services.

Market equilibrium occurs when the amount that producers/owners want to sell at a given price matches the amount that consumers wish to purchase at that price. Since consumers wish to buy less at higher prices and producers would like to sell more at higher prices, a price above this market equilibrium price will result in an excess supply of the goods. Market forces will return the situation to equilibrium by the process described. Similarly, a price below the market clearing equilibrium price will result in an excess demand for the product, whose price will then be bid back up to equilibrium by those same market forces. This equilibrium price does not guarantee any particular producer the opportunity to sell its product, nor does it guarantee that any individual consumer will be able to consume the product. In aggregate, however, the market will clear.

Of course, price is not the only determinant of how much a consumer wants to purchase or a producer wants to sell. Consumer demand is also impacted by other factors, such as income, the price of other goods, and the perceived marginal utility received from consumption of the product, while

producer supply is impacted by production costs, technology, and the perceived opportunities forgone in producing this product instead of something else. The key idea is that, in a truly free market, these factors are minimally impacted by government interference.

ROLE OF GOVERNMENT

A free market does not necessarily imply lack of government involvement. In fact, some sort of government or collective power is necessary to set the rules of commerce and property rights and to enforce those rules and rights. This is required to prevent potential coercion of one of the parties in the transaction, ensuring free choice by market participants. Government intervention is also desirable when the market might fail. Market failure is possible in a number of instances, such as in the areas of public goods and externalities.

Public goods are those whose benefits are not excludable from consumers who choose not to pay for that good or service. An example would be national defense. Once a country chooses a level of national defense, it applies to all of its citizens. It is impractical, if not impossible, to exclude particular citizens from defense just because they didn't pay. Because of this property of national defense, if each person were left to choose how much to contribute to the fund, many people would choose to contribute nothing and be a "free rider" on those that do contribute. Very few people would voluntarily contribute their full share toward areas such as national defense, leaving a shortfall in the amount of money available for this undertaking.

A person would naturally think, "Why should I contribute the full amount necessary to fund this project, when my neighbor who chooses not to pay still gets the same benefit that I do?" This results in less of the product/service being provided than each individual might want. In such a case, the coercive power of government to collect taxes is necessary to force individuals to pay their "fair share." There is no consensus over which goods or services should be provided by the public sector (government) and which by the private sector (free market system).

However, candidates include police and fire protection, roads and bridges, education, and health care. Often a combination of public and private sector approaches is used, as shown by the existence of both public and private universities in the United States.

A similar role of government can arise in the case of externalities. An externality is essentially a side effect of a given product, service, or production process in which the parties involved in the market exchange do not fully bear the costs and/or reap the benefits of that exchange. Externalities may be either positive or negative.

A classic example of a negative externality is pollution. If a company, in producing its product, dumps toxins into the river, many people beyond the producer will bear the cost of that decision. Since the producer does not bear the full costs of polluting and receives little compensation for not polluting, the incentives not to pollute are weakened. This is true for each producer, thus resulting in more pollution than would occur if the producers did bear all the costs of their production processes. Producers in a free market system can choose not to pollute out of a sense of social responsibility or because they believe that polluting will lead to a consumer backlash of their product. The reality is that everyone bears the negative impact of the pollution in some way, but only those who choose to buy the product would pay to make the production process cleaner, thus bearing the burden for many nonconsumers of the product. Since most consumers would be unwilling to take on this extra burden, many producers are not pushed by market forces alone to produce in a more environmentally friendly manner. The government can then step in and either tax the producer an amount such that the total costs to the producer reflect the impact of the pollution or tax the citizens an amount necessary to then subsidize the producers to give them the incentive to reduce their negative environmental impact. Conversely, a positive externality, one in which there are positive spillover benefits to others, will be underproduced if left to the free market. To correct this, government may choose to subsidize the production of such goods and services.

FREE SPEECH

In a monograph on public relations law, Frank Walsh (1988) wrote, “Democracy is fundamental to the potential of public relations. In the United States, the democratic process rests on the Constitution. Public relations without constitutionally protected free press and free speech is a misnomer. Without exception, every area of public relations practice involves legal rights and restrictions” (p. 1). The basis of the protection is the First Amendment to the Constitution, which reads, in part, “Congress shall make no law . . . abridging the freedom of speech, or of the press.” In addition to the federal constitution, freedom of speech is also protected by state constitutions, statutes, and the common law.

Although the First Amendment is phrased in absolute terms, it has never been applied as an absolute principle. For example, national security issues, fighting words, and legally obscene materials have been viewed as outside First Amendment protection. Areas that impact public relations, such as defamation, copyright protection, and privacy issues, set up conflicts between free speech rights and other protected values.

A number of commentators and textbooks have adopted the justifications for the choice enunciated by Thomas Emerson. According to Emerson, there are four justifications for guaranteeing free speech. First, “freedom of expression is essential as a means of assuring individual self-fulfillment.” Second, “freedom of expression is an essential process for advancing knowledge and discovering truth.” Third, “freedom of expression is essential to provide for participation in decision making by all members of society.” Fourth, “freedom of expression is a

method of achieving a more adaptable and hence a more stable community” (1970, pp. 6–9). Thus free speech is justified both as an individual good and as a good for society—both as an ends and a means. All four justifications find expression in various Supreme Court decisions.

Although Emerson focused his analysis primarily on the American experience and Supreme Court decisions, the justification of freedom of expression has a long philosophical history, dating back at least to the arguments in John Milton’s *Areopagitica* (1644) and advanced in John Stuart Mill’s *On Liberty* (1859). Although both Milton and Mill make a number of detailed arguments against censorship in favor of free speech, they can be reduced to two main arguments. The first is that the way to combat speech that is harmful is not to censor it but to counter with more speech. Censorship is never effective, leads to loss of mental toughness, and promotes conformity. More speech leads to public discussion, a greater possibility of resolving issues, and a greater chance that truth will emerge. The second argument is based on the idea of individual competence and responsibility. The basis of the arguments is that individuals are the best judges of what is in their best interest and that they are responsible enough, if persuaded or outvoted, to set that individual interest aside in favor of the common good.

But what does a guarantee of free speech mean? One of the first cases dealing with the issue was *Near v. Minnesota*, 283 U.S. 697 (1931). Chief Justice Hughes, writing for the majority, referenced William Blackstone’s (the 18th-century English judicial scholar) statement that “liberty of the press . . . consists in laying no previous restraints upon publications, and not in freedom from censure for criminal matter when published. Every freeman has an undoubted right to lay what sentiments he pleases before the public; to forbid this, is to destroy the freedom of the press” (1931, pp. 713–714). Although this statement was criticized from both directions—that some limited areas could be subjected to prior restraints and that liberty of the press that was not guaranteed in nonharmless statements could be subjected to criminal prosecution—the statement

became the basis for the idea that freedom of speech consisted in no prior restraints on communication.

As a corollary, freedom of speech entails the means to gather information from willing participants and from governmental sources via sunshine laws and freedom of information statutes. Another corollary necessary to freedom of speech is the right to distribute the message. This right has been sustained by the courts in various contexts, including public forums, mail, door-to-door situations, and the media. Some distribution methods have come under scrutiny, including computer spam, telemarketing, and unsolicited faxes.

Although there is a strong presumption against prior restraints on expression, a distinction is often drawn between expression and action. Expression is strongly protected, but action is not protected at the same level of scrutiny. The key is how to draw a distinction between the two. Courts have wrestled with drawing this distinction in such areas as mass picketing and various forms of symbolic speech. A distinction is also drawn between antispeech and nonspeech regulations. For example, a tax on the media may impact expression, but if the media are treated as any other business, the tax is considered a nonspeech regulation and upheld. Restrictions regarding the time, manner, and place of expression are also routinely upheld as long as they are content neutral, there is little discretionary power in the hands of the administrators, they are reasonable, and they advance a legitimate governmental interest. Captive audiences are generally given greater protection by the courts than are other types of audiences. (For a discussion of specific legal issues related to the law and public relations, *see* Commercial speech, Defamation [libel and slander], and other pertinent entries.)

On balance, Western democracies have chosen to place minimal legal restrictions on communication, preferring to rely instead on a sense of responsibility and relevant ethical standards and codes of conduct. That choice seems to have had positive results for the field of public relations.

—Roy V. Leeper

FREELANCE WRITERS

A freelance writer earns a living by writing or editing, taking photographs, or preparing graphics for broadcast stations, magazines, Web sites, newspapers, corporations, individuals, nonprofit organizations, and anyone else who needs help collecting, packaging, and disseminating information.

Public relations agencies and departments typically use freelance writers to work on special projects that the existing staff does not have the time or the expertise to handle. A freelance writer might be hired to prepare or edit an employee handbook or to develop interesting and enlightening graphics for an annual report.

The main advantage of hiring freelance writers is monetary: It costs less to hire someone on a one-time basis to complete a single project than it does to retain someone on staff to handle that job. A corporation or nonprofit organization typically doesn't have to worry about providing to freelance writers health insurance or retirement benefits. They generally aren't around long enough to use them.

Another advantage is that an organization can keep abreast of some of the latest develops in a field. A CEO who wants to add streaming video to the organization's Web site might have no idea how to do that—and he or she might have no employee who can do that. Enter a freelance writer to show how it's done.

A disadvantage of using freelance writers lies in the lack of continuity. They seldom know the organization well, and they might not care too much about its overall health. The commitment is not there to learn the organization's history, values, culture, or policies. This lack of knowledge can lead to embarrassment or to a product or service that is less useful, impressive, or compelling than it might be.

A related disadvantage is the potential lack of control over a freelance writer's work. Robin Gregg sold the *New York Post* a story (about Wal-Mart Stores dropping Kathie Lee Gifford's clothing line) that looked a good deal like a story in the *National Enquirer*. Gregg will never write for the *Post* again, according to the *Post*'s management, but the damage was done. This was not a public relations firm, but the same thing can happen in almost any media context.

Freelance writing can be viewed from an entirely different perspective: A public relations writer can be seen as a kind of freelance writer when he or she contributes material to a medium. The obvious example is the news release. Practitioners are not paid for the releases they send, but the process is the same. The practitioner, in effect, works for the television station, for example, supplying material that might be aired. It's important for the practitioner to thoroughly understand the medium and its audience, the prevailing writing style of that medium, and the length and tenor of stories accepted. The practitioner who does these things will be a successful "freelance writer."

FUNCTIONS OF PUBLIC RELATIONS

During the 20th century, public relations steadily evolved into a structured profession based on the development of specializations. The structures of clients and agencies featured functions that resulted from the development of specialties. Today, we think of these specialties as functions. A function is a unique service, program, department, or job title.

Each function has its unique set of objectives and is designed to build, maintain, and repair relationships with specific markets, audiences, or publics. Some of the most typical functions are media

relations, corporate communication, investor relations, issues management, community relations, employee relations, donor relations, strategic philanthropy, and government relations. Sometimes these functions stand alone as departments. They may fall under public relations or public affairs departments, and even the entire corporate communication effort today may be headed by a chief communication officer (CCO). The functions of public relations may be subordinate to other departments. An organization may place various public relations functions under the marketing department, such as publicity, promotion, integrated communication, integrated marketing communication, and marketing communication, which some agencies and companies call "MarCom." Each function has the sense of being a specialty under the broad umbrella of departments with titles such as *public relations* or *public affairs*, or the functions may be positioned to support some other department, such as marketing.

As a specialty, each function is developed because of the dynamics and challenges unique to each organization and its culture, which influence how it responds to internal and external stakeholders. In contrast to organizations that have their own public relations functions, each agency is likely to position itself as specializing in key functions, or it may present itself as a full-service agency. By implication, a full-service agency can support all functions. The challenge of the professional personnel who work in support of each function is to provide a unique service—whether to their employer or as an agency bringing their resources to bear on clients' needs.

As organized into a company (or other organization) or agency, each function may have specialty personnel and a dedicated budget. For instance, a large corporation may decide to have a strategic philanthropy function that is dedicated to issuing invitations for proposals for funding out of the corporate philanthropy pot of money—the money senior management dedicates to building community goodwill by funding nonprofit organizations. This function is likely to review the applicants to determine which are worthy and to also search for and investigate worthy groups that should be given funding as part of the company's strategic philanthropy.

The specific functions an organization employs or the specialties that are offered by each agency could be strategically based on positioning in response to the unique dynamics of the environment where they operate. Some functions are a direct result of external requirements. Perhaps the most obvious of these is investor relations. Publicly traded companies are required by the Securities and Exchange Commission to communicate with current or potential shareholders in a timely, public fashion so that investors can obtain the information they might want to make decisions to buy, sell, or hold shares of the company's stock. This function is generically called "investor relations." Agencies may provide an investor relations service as one of their specialties. Some agencies only specialize in investor relations, because it requires unique knowledge of SEC regulations and must meet highly regulated challenges. This function requires careful coordination with legal and financial expertise relevant to the securities marketplace. Some agencies make no pretense of offering investor relations services because of the special requirements of that function.

Thinking about investor relations, for instance, brings up another point relevant to the discussion of functions. Some of the traditional functions are located within public relations or public affairs departments, whereas others bridge several departments. In many companies, for instance, corporate or employee communications is likely to bridge between and call on specialists from public relations/public affairs and human resources. In some instances, a function typical of public relations may be located in another department. Over the years, for instance, many investor relations functions have left the shelter of public relations departments to become subsumed under the corporate general counsel or the chief financial officer (CFO).

The function called government relations might also bridge two or more departments. For instance, it might have its primary location in public relations/public affairs. Because of the unique nature of the company, it might link to the company's general counsel (bearing on the legal concerns and expertise of the organization) as well as link to operations under the chief operating officer. Depending on the

challenges unique to the company, government relations might need to be matrixed with human resources, engineering, production, and marketing. In this configuration, the service of public relations to the marketing effort is not to sell products or services, but to link that department with the legislative and regulatory arena. Government relations, for instance, might need to gear up to monitor legislative and regulatory issues that could influence how the organization markets its products and services. The government relations function might need to support, mitigate, or oppose legislation or regulation that can affect how the organization markets its products or services.

How each company selects, organizes, charges, and budgets its functions depends on its culture, its mission/vision, and its location in the marketplace or public policy arena. For instance, companies that are largely devoted to selling consumer products are likely to have a marketing bias in their culture, planning, and operations. They are so devoted to marketing that advertising and public relations will tend to be located under the marketing department or may even report to a chief marketing officer or a senior vice president of marketing. In such companies, advertising and public relations work together to sell products or services. There public relations may be limited to a publicity and promotion function. In such situations, it is not surprising to find investor relations and government relations functions located in departments totally separate from public relations. The same may be true of strategic philanthropy and employee relations. In such an organization, the community relations function may very well be devoted to events that publicize and promote products rather than address other concerns relevant to the locales where the company operates.

One reason that *public affairs* developed as a title for the primary "public relations" program in large companies was the desire and need by such companies to deal with publics that were not markets or audiences. For this reason, those companies developed a sense of public relations functions that focused more on stakeholder relations than on marketing. Thus an industrial manufacturing

company—such as one dedicated to the steel industry, the chemical manufacturing industry, or the timber industry—might have a “public affairs” department. It might have a public relations (promotion and publicity) function under public affairs; in this configuration the work assigned to public relations is likely to be limited to marketing support. Or public relations (promotion and publicity) might be located beneath the chief marketing officer, whereas public affairs might have its own chief, for instance, a chief communication officer (CCO)—or the parallel might be the vice president of public affairs on the same organizational line as the vice president of marketing. In one more variation of this theme, the company may have marketing, advertising, and public relations all located beneath the CCO or vice president of public affairs. Large manufacturing organizations that are vertically and horizontally integrated may have public relations or public affairs located in each major operating division. Some divisions may use public relations in support of marketing, whereas other divisions of the company may use public relations primarily for governmental relations, community relations, and strategic philanthropy.

The theme that runs through the definition and design of functions, then, is that the functional location and the specific functions under public relations are selected and budgeted to be relevant to the challenges that drive the organization’s mission/vision, strategic business planning, management, and stakeholder relations. Functions are specialties that are selected, designed, and organized to help the organization increase revenues and reduce costs as a return on investment decision. Their place in markets and the public policy arena motivates managements to select, foster, and use functions to solve relational problems unique to them.

Agencies position themselves competitively. To do so, they determine what functions to offer as part of the kinds of business they want. They select and feature functional specialties based on what they want to do for clients, who in turn are dependent on what they need and want. Positioning through functions is necessary for agencies to generate revenue in a highly competitive market. For instance, some

agencies are closely associated with advertising agencies, or they may be owned as departments in advertising agencies—or marketing agencies. Some agencies are marketing communication specialists that even have advertising and graphics services. For agencies such as these, as well as their clients, events may be a substantial function, whereas they are more of a tactic for other organizations.

In contrast, other agencies feature specialties less directly related to marketing. They all will have a media relations function, as will client organizations of all kinds: businesses, nonprofits, and government agencies. In addition, they might specialize or offer a specialty in community relations, government relations, risk communication, issues management, strategic philanthropy, investor relations, or crisis communication.

Functions are not unique to businesses or agencies. Nonprofits will have various functions given their mission. For instance, a museum is likely to have a development, marketing, and publicity function—or separate functions depending on size and budget. A museum might have an educational outreach function, linking it to schools. That might be a part of its community relations function. Educational outreach is often seen as a part of its marketing and development function.

Universities and colleges have marketing, public relations/public affairs, and alumni relations departments. They will have functions: government relations, alumni relations, development, publicity, faculty relations, employee relations, student relations, parent relations, and such. The logic for each college or university may differ because of its mission and vision, but each will have functional divisions and specialties. It is not unlikely that departments and colleges will have some or many public relations functions.

Thus, functions are the structural specialties that organizations create and employ to advance their missions and visions. Agencies become complementary mirrors of the organizations they strive to serve by adding value to functions in the client organization or by offering functions the client does not have. Sometimes, the role of the agency is to provide a function that a client cannot afford. For

instance, if an organization does one major event per year, it might be cost-effective to outsource that rather than to have people devoted to events or to assume that people doing other public relations function can also do events. Shipping companies may periodically need a crisis response, but they may find it is more cost-effective to have a specialty agency on retainer than to have an in-house crisis response function. Having said that, however, practitioners in nonprofits are more likely to be “Jacks and Jills of all trades” simply because they have fewer resources to spread across the functional needs they have. For this reason, the skills possessed by a corporate practitioner might be less diverse than those of a nonprofit counterpart.

One of the functions of public relations, counseling, is the most controversial and the most demanding. Some agencies—often limited in size, but not expertise—specialize as counselors. They may draw on years of experience and conduct various kinds of research to help the organization solve a problem relevant to its positioning—relevant to various functions. In this sense, counseling might relate to refining the mission and position and even address strategic business planning to better increase revenue and reduce the costs incurred through collisions with activists and other critics. Counseling might periodically review the organization’s sense and policies on corporate responsibility to ensure that it understands and meets the expectations of its stakeholders. Counseling can also be one of the internal functions that either senior members of the public relations department or specialized members of the department can provide to others in the senior management team. Departments with an issues management culture have counseling built in. They traditionally assess, for instance, organizational ethics and standards of corporate responsibility. Based on this assessment, advice can confirm or redirect management choices in a strategic way to build, maintain, or repair relationships with their markets, audiences, and publics.

FUNDRAISING

Fundraising is one of public relations’ highest paid specializations and one of the least understood. Practitioners manage relationships between one special type of organization and one special stakeholder group: charitable organizations and their donor publics. Contrary to popular belief, the purpose of fundraising is not to raise money, but to help organizations and donors fulfill mutual philanthropic interests.

A good analogy for understanding fundraising, which also is known as *development* and can be termed *donor relations*, is investor relations. Practitioners specializing in investor relations are high paid. They manage relationships between publicly owned corporations (one special type of organization) and investors, or current and potential stockholders (one special stakeholder group). Investor relations specialists do not sell stock in the corporation to generate revenue; rather, their job is to help the corporation retain and attract owners, who invest in the stock market to advance their financial interests. The two parties are interdependent; each needs the other to achieve its goals. Investors are both organizations and individuals, some of whom make major financial commitments and, by virtue of the large percentage of shares they own, hold a great deal of power in the organization–public relationship. Other investors buy only a few shares of stock and have little power individually, although their collective power is substantial. Investor relations specialists use a variety of communication techniques—from interpersonal to controlled media to mass media communication—to build and maintain these relationships.

Just as participation in the stock market is a characteristic of our capitalistic economy, America’s tradition of philanthropy pervades our society. Quite simply, donors give money to charitable

organizations not because fundraisers persuade them to give, but because giving is a customary, expected, admired, and even legally required behavior in the United States. The job of fundraisers is to retain and attract donors, who traditionally give away money to advance causes that they believe will improve society. Indeed, philanthropy and its facilitation by fundraisers are essential to what is referred to as *social capital*, which is the bedrock of civil society.

HISTORICAL AND ORGANIZATIONAL CONTEXT

Fundraising traces its beginning to the founding of the colonies that became the United States. Discussions of its history usually start with the first solicitation for Harvard College in 1641, which produced the colonies' first public relations brochure. Fundraising was conducted haphazardly by volunteers and untrained managers until the early 1900s, when specialists began to emerge. Institutionalization of the function dates back to just 50 years ago. Although fundraising has spread to almost all countries, its roots are in American democracy, which promotes a nonprofit sector and fosters philanthropy through a favorable tax system.

Fundraisers work for charitable organizations, a special type of nonprofit organization. They should not be confused with people who carry out fundraising activities for other types of nonprofits, such as political parties or electoral campaign committees. The term *fundraising* generally is reserved for bringing about *philanthropic* exchanges, meaning that the transfer of money is not based on quid pro quo (as it is in a marketing exchange) and that the money given meets the criteria of a charitable contribution, as defined by the Internal Revenue Code.

The nonprofit sector consists of tax-exempt organizations that are neither businesses nor government agencies. There are more than 1.4 million United States nonprofit organizations, of which more than 900,000, or 63 percent, are charitable nonprofits, meaning that gifts to them are deductible from donors' taxable income. Charitable nonprofits come in all shapes and sizes, from

local day-care centers and neighborhood churches to major research universities and metropolitan hospitals. Their missions, or the purpose for which they were granted tax exemption, are diverse and represent all aspects of society, including the arts, education, the environment, health, human services, and religion.

The majority of charitable organizations have annual revenues of less than \$100,000 and depend on volunteers, such as trustees, to raise philanthropic gifts. Charitable organizations with higher revenues—often millions or even billions of dollars per year—employ fundraisers, either as external consultants or as internal staff. Although no official count exists, projections based on earlier estimates place the number of full-time fundraisers at approximately 100,000.

DONOR PUBLICS

As with investors, donors consist of both organizations and individuals. Similarly, some donors make major gifts and hold a great deal of power in the organization–public relationship, whereas others make small annual gifts and hold little power unless they act collectively. The relationship is based on interdependency between the donor, who provides financial resources to carry out the charitable organization's mission, and the charitable organization, which provides the means to carry out the donor's philanthropic wishes.

There basically are three donor publics: individuals, foundations, and corporations. Individuals traditionally give more than 80 percent of all gift dollars every year. The amount of dollars given by all donors to all charitable organizations in the United States is quite impressive. It also is the envy of all other industrialized countries. For example, in 2002, Americans gave a total of \$241 billion, of which 84 percent came from individuals, 11 percent came from foundations, and 5 percent came from corporations, according to the American Association of Fundraising Counsel (AAFRC) Trust for Philanthropy.

Philanthropy by all types of donor publics, according to philanthropy and nonprofit management

scholars, is best explained by the mixed-motive model of giving, which holds that philanthropy reflects neither pure altruism nor pure egoism; it involves mixed motives: to fulfill the donor's interests in self and in a common good, as represented by the mission of the charitable organization receiving the gift.

Furthermore, the American tradition of philanthropy creates an expectation that all individuals should make charitable contributions, according to their means. Wealthy individuals are held to a philanthropic standard that is unusual in the modern world: They are expected to give away most of their wealth before or at the time of their death. The standard was outlined in the late 1880s by legendary philanthropist Andrew Carnegie, who proclaimed, "He who dies rich dies disgraced" (1889/1983, p. 108).

Corporations that give away pre-tax dollars are admired. Philanthropy is a critical element in demonstrating corporate social responsibility. The theory of corporate contributions as social currency holds that U.S. companies make gifts because senior managers are expected by their peers to contribute corporate dollars. Studies have shown that giving is the norm in many business subcultures, and managers who want to remain in the inner circles have to conform by making appropriate contributions. Finally, foundations, unlike the other donor publics, are required by law to give away each year an amount equal to 5 percent of their financial assets. Their very purpose is to provide support to charitable organizations through grants.

PROGRAMS

Fundraisers organize their activities into four traditional programs: annual giving, major gifts, planned giving, and capital campaigns. The first two are primary programs; the second two actually are strategies to raise major gifts.

Focusing on the primary programs, annual giving raises lower level gifts, whereas the major gifts program raises major gifts. Dollar amounts defining the two gift types differ among organizations. For example, universities and hospitals typically define

a major gift as a gift of \$100,000 or more, but most churches and human services organizations (such as chapters of the American Red Cross) use \$10,000 as the dividing point. Contributions and grants from corporations and foundations, respectively, usually are major gifts. Gifts from individuals run the gamut, from pennies placed in collection plates to multimillion-dollar pledges. Most Americans make at least one annual gift each year, but because wealth is not distributed equally in our capitalistic economy, a minority of individuals—those with the most income and assets—account for most major gifts.

Annual giving often is described as the bread-and-butter program of fundraising because it generates annual income that helps pay the charitable organization's operational expenses. Annual gifts, which typically are less than \$100, almost always are unrestricted in purpose, meaning they can be used where most needed as determined by the organization's managers after receipt. In contrast, major gifts almost always are restricted and must be used for the specific purposes for which they were given, determined in advance of receipt. Annual gifts usually are made from donors' *income*, whereas outright major gifts are made from donors' income and *assets*, and planned major gifts typically come only from donors' assets. As operational expenses are reoccurring, the annual giving program is *repeated* each year, unlike the major gifts program and planned giving, which are ongoing, and capital campaigns, which are sporadic.

For most charitable organizations, the major gifts program accounts for the vast majority of dollars raised, and only a relatively few gifts account for most of that money. Approximately 80 percent of all dollars raised will come from 20 percent of all gifts—what fundraisers refer to as the *principle of proportionate giving*. The major gifts program, therefore, is targeted at wealthy individuals, as well as corporations and foundations—but only those that have an expressed interest in the organization and its mission. Virtually every major donor has a long-standing, carefully nurtured relationship with the recipient organization and the people who represent it. In almost all cases, major donors have made previous gifts to the organization. Because

they provide most of the dollars raised, major donors have considerable power in affecting the organization's operations—similar to the power held by large institutional investors in publicly owned corporations. Fundraisers seek a balance between protecting organizational autonomy and being accountable to major donors. To help them achieve balance in their boundary role, fundraisers must be skilled negotiators because major gifts usually are restricted—often with multiple conditions—for purposes that may or may not coincide with the organization's self-directed plans.

Colleges, universities, and hospitals attract the largest gifts, followed by arts, culture, and humanities organizations. In 2002, for example, organizations with education and health missions raised \$32 billion and \$19 billion, respectively, according to the AAFRC Trust for Philanthropy. Not surprisingly, colleges, universities, and hospitals employ the largest number of fundraisers.

To raise annual gifts, fundraisers primarily use controlled media techniques, specifically, direct mail and special events, to solicit lower-level gifts from a large numbers of individuals. In contrast, fundraisers primarily use interpersonal communication techniques, such as face-to-face conversations and personal letters, to solicit major gifts from a much smaller number of individuals, corporations, and foundations. Building and maintaining relationships with donors is key to both programs, which requires fundraisers to devote a great deal of their time to sharing information and encouraging involvement. The emphasis of their work is on research, cultivation, and stewardship—not solicitation.

ROPES PROCESS

The ROPES process model, drawn from public relations theory, was conceptualized to describe how fundraising is conducted and was tested in field research. The resulting model was, in turn, applied to overall public relations practice, which affirmed the common theoretical basis of fundraising and public relations.

ROPES consists of five consecutive steps: research, objectives, programming, evaluation,

and stewardship. Fundraising begins with research in three progressive areas: (a) the charitable organization for which practitioners work; (b) the opportunity, or problem, faced by the organization; and (c) the donor publics related to both the organization and the opportunity. The second step is setting specific, measurable objectives that are derived from organizational goals and supported by research. Objectives are not limited to dollar totals. Programming consists of planning and implementing activities designed to bring about the outcomes stated in the objectives. These activities are categorized by the two purposes of cultivation and solicitation. Evaluation monitors programming and later determines if the set objectives were met. Stewardship completes the process and provides an essential loop back to the beginning of fundraising. Four sequential elements are basic to stewardship: reciprocity, responsibility (including responsible gift use), reporting, and relationship nurturing.

Research is deemed the most important step in fundraising, followed by stewardship. The prioritization is logical in that scholarly and practitioner analyses show that donors decide which causes are important to them and that the best prospects for future gifts are current donors. Whether raising annual, major, planned, or campaign gifts, the ROPES theory holds that fundraisers should spend 25 percent of their time on research, 15 percent on objectives, 30 percent on programming (equally divided between cultivation and solicitation), 10 percent on evaluation, and 20 percent on stewardship. Results of field research show that fundraisers generally follow the ROPES process, although they devote less time to research than advocated by the theory.

Fundraising lags about four decades behind public relations in establishing itself as a profession. Yet because of high demand and a shortage of trained practitioners, fundraisers command salaries approximately 50 percent higher than those paid to general public relations practitioners. Scholars and practitioners increasingly are drawing from public relations to build a body of knowledge that informs fundraising practice and education. The effort is

commendable given the important role that fundraising plays in our democratic society.

GAME THEORY

Game theory was introduced to communication research in 1968 and specifically to public relations research in 1987. This theory has proven useful to those working in public relations and to those who build its theories. Game theory and its models help practitioners to enhance their decision-making and relationship-maintenance strategies and skills. Among theorists, game theory's introduction to the public relations literature affected a paradigm clarification because it inspired reconceptualization of public relations' normative two-way symmetrical practice model. Consequently, a few researchers have developed contextualized frameworks for analyzing rationality, preferences, and relationship outcomes ranging from conflict to cooperation.

Games is a science metaphor for the wide range of human interactions that depend on how two or more persons directly and strategically relate with one another. This approach to modeling human behavior in terms of outcomes was developed in 1944 by mathematician John von Neumann and mathematical economist Oskar Morgenstern. Game theory has been embraced among social science fields such as communication, psychology, management science, and political science. Rational choice theory provides game theory's foundation, and it has been invoked in debates on complex

policy issues such as market competition, arms races, and environmental pollution. Game theory resonates with public relations theory *and* practice because understanding the balance of influence between an organization and its key publics is central to doing public relations well.

Specifically, game theory has enabled researchers to expand the range of communication behaviors by redefining symmetric communication (games of pure cooperation), which rarely happens in actual public relations practice even though many theorists agree that it is preferable to asymmetric communication (zero-sum games). To illustrate, whereas a three-legged race might be classified as a game of pure cooperation (or non-zero-sum game), a tug of war is a zero-sum game because there is a direct correlation between participants' performance; the better one player does, the worse the other performs incrementally.

Priscilla Murphy (1987; 1989) suggested that public relations theory, like game theory, should avoid binary dualisms that exclude perspectives and limit the full range of possible communication behaviors. Others have concurred, arguing that public relations practice should not be forced to fit into one of four models (press agency, information, asymmetry, and symmetry) because it is a profession and an arena of academic inquiry that involves many variables and that is complex and dynamic. At

times, it may be prudent to maintain some degree of tension (as compared to pure cooperation or total accommodation) among competing interests that are at ideological odds in order to achieve a desired outcome. Therefore, a continuum, rather than a series of models, may offer a more useful heuristic.

Since game theory was introduced to the public relations literature, two-way symmetric communication has been redefined as a “mixed-motive” behavior. The mixed-motive framework maintains that while organizations may have asymmetrical self-interest concerns at the core of all behaviors, each is motivated toward cooperation in order to resolve or to reduce some aspects of conflict involved in building relationships with key publics.

In terms of application, game structures have been used to analyze crisis communication issues where stakes are high and timing is key. In the language of game theory, crises are noncooperative games between organizations and publics, such as the duel (Chernobyl explosion in 1986), the tag (Ford Pinto in 1973), escalation (A. H. Robin’s Dalkon Shield in 1980s), and cooperative bargaining (Procter & Gamble’s Rely tampon recall in 1980). This typology for analyzing organization-stakeholder relationships during or as a result of crises may be used to determine what went wrong and explain why it went wrong. Also, using game theory during strategic planning sessions enables practitioners to confidently examine “what ifs” and “best-worst case scenarios”—as well as to develop strategic alliances and build coalitions. Consequently, the game becomes a negotiation involving commodities, strategic trades, and concessions wherein, optimally, there are no clear-cut winners or losers.

For researchers, game theory provides a crisis communication model and offers a graphic continuum for classifying crises. It has been suggested that the communication outcome of Union Carbide’s plant explosion in Bhopal, India, in 1984, may be classified as a Pure Conflict game (zero-sum) on the left, that Procter & Gamble’s Rely tampon recall in 1980 illustrated a Mixed-Motive game in the center, and that Johnson & Johnson’s Tylenol recall in 1982 was a Pure Symmetric game (coordination) to the right.

Importantly, journalists and public relations practitioners also play “games” during crises. Whereas the public relations practitioner hopes that reputation-damaging news coverage is minimal, journalists are rewarded for scooping competitors and for producing visual stories that tap into enduring news values of conflict and disorder. This struggle has been compared to a classic duel in which the organization scores a “hit” if it delays communication long enough to allow the crisis to abate (resulting in no media coverage) or if it breaks the news of a crisis (that is likely to be discovered). On the other hand, a media outlet scores a “hit” if it is the first to break the news about an organization’s crisis.

Our ethics literature also is richer with the introduction of game theory. Since game models involve determining all possible consequences and a full range of potential behaviors, public relations practitioners may more clearly examine the ethical implications of their counsel. In a communication context, game theory inherently suggests that relationship participants seek maximum value in all exchanges. Hypothetically, lying is one such potential behavior. However, public relations practitioners and researchers emphasize that falsehoods are unethical and unacceptable. Thus, game models have enabled researchers to expose complex ethical issues and to incorporate ethics in public relations theory building.

Therefore, game theory + public relations theory = normative, prescriptive, and analytical frameworks for maintaining and developing relationships between organizations and publics. This stream of research underscores the assumption that interdisciplinarity broadens public relations theory building.

GANTT CHART

For public relations projects, practitioners need a system for keeping track of the tasks that need to be done and those that have been completed. Henry Gantt invented the Gantt Chart as a way to track tasks for a project. The Gantt Chart is used in a wide variety of fields that involve project management. To build a Gantt Chart, the practitioner must identify all the tasks to be completed, the time each task will take to complete, and the sequencing to the tasks. The first step involves brainstorming and listing all possible tasks for the project. For instance, a simple news release could require researching the topic, drafting the release, selecting appropriate media targets, approving the news release's content, choosing proper contact names and addresses for the media targets, and distributing the news release. Next, the practitioner determines how much time each task will take. Assigning time demands that the practitioner understands the factors that affect the time it takes to complete a task.

Finally, the practitioner develops the sequence of the tasks. Sequencing requires that the practitioner separates contingent and concurrent tasks. Contingent tasks are those that are dependent on another task: Task A must be completed before Task B. For instance, research must be completed before a new release is written. All contingent tasks are arranged in the proper sequence. Sequences from the earlier example would be (a) research-draft-approval and (b) media selection-contact information. Both sequences are needed to arrive at the final task, distribution. Concurrent tasks are tasks that can be done simultaneously because they are not contingent on one another. The practitioner can select media and locate contact information while waiting for approval of the news release.

A Gantt Chart takes tasks, time, and sequence and displays them graphically. The horizontal axis on the chart is the time and the vertical axis represents tasks. Bars on the chart mark time. The unit of time depends on the nature of the project. The time units could be hours, days, weeks, or months. The longer the bar, the more time the task takes to complete. Lines drawn between the bars are used to connect the sequential tasks. Bars that overlap in time represent the concurrent tasks. A Gantt Chart makes it easy to “see” the sequential and concurrent tasks: what has been completed, what still needs to be done, when each of those tasks must be finished, and whether the project is on or off the schedule. A Gantt Chart is both a planning document and a means to monitor the progress of a project, and it works best for smaller projects. For large, highly complex projects, a practitioner is better off using the PERT Chart to organize, illustrate, and track the project (*see* PERT Chart). Microsoft Project is one of a number of software programs that provide templates for constructing Gantt Charts.

Gantt Charts are valuable planning aids to practitioners but are only as good as the work that goes into creating them. If a task is left off the Gantt Chart or times are miscalculated, the value of the Gantt Chart is reduced or completely lost. Therefore, careful preparation is necessary to develop a chart that truly reflects the demands of the project.

GATEKEEPERS

Gatekeepers are communication professionals who are involved in the traditional news selection process. They sort through a number of messages, shaping chosen messages before delivering them to viewers, readers, or listeners. Gatekeeping involves selecting, shaping, displaying, and

withholding messages. In news organizations, reporters, copywriters, photographers, editors, or even media owners function as gatekeepers by choosing and shaping newsworthy messages. In a more social context, public relations professionals, government officials, and other social actors play a role in gatekeeping by deciding on what messages are disseminated to news organizations and by controlling the channel of news information.

The term *gatekeeper* was originally coined by sociologist Kurt Lewin in his study of the primary role of housewives in the family's changing food habits. Lewin proposed that housewives directed the flow of food items and therefore functioned as "gates" or gatekeepers; later the term was applied to the news selection processes. David Manning White's 1950 study of a small-city daily newspaper editor found that the news selection process depends on the editors' news values, or on what they consider newsworthy. The gatekeeping phenomenon is linked to the channel concept in the conceptual models of communication given by Bruce H. Westley and Malcom S. MacLean and Wilbur Schramm.

Gatekeeping is a broad function that occurs to affect the flow of information in the channels between senders and receivers of messages. Gatekeepers determine what messages are selected or rejected. Messages travel through certain communication channels, and certain points within the channels function as gates, which are managed mostly by gatekeepers. Originally gatekeepers were viewed as individuals, such as journalists working for traditional media such as television, radio, and wire services.

However, decisions on what messages will make the news information are also influenced by a number of other factors. Pamela J. Shoemaker (1991) suggested the complexity of gatekeeping by a number of gatekeepers at various levels: by communication routines and by organizational, social, and institutional (extra-media) systems. Thus journalists are influenced by their news values or practices, budgetary or time restrictions, competition with other media, advertisers, social ideology, and other factors that also function as gatekeepers in the gatekeeping process.

The gatekeeper concept has recently changed. Journalists traditionally functioned as gatekeepers, but they now use information subsidies provided by public relations professionals for reducing the costs of information gathering. Such subsidies occur because public relations practitioners supply newsworthy information to reporters. This professional service reduces the costs of news organizations. They can use the information provided by practitioners in various forms, such as press releases, backgrounders, and fact sheets. They have interviews handed to them. Many news reports are little more than edited releases supplied by public relations professionals. And with the advent of the Web, information can be available to reporters in a commodified form 24/7.

The advance of online media has also changed the gatekeeper role of journalists. More organizations, companies, and authorities directly reach their publics through online media without journalists' gatekeeping. Public information officials, governmental or corporate spokespersons, and other public relations professionals have increasingly assumed the gatekeeper role by judging what information can be shared with key publics or how communication with those publics can be managed as practitioners serve as boundary spanners. As organizations become primary sources of information, journalists are sometimes less influential in the gatekeeping process because people can obtain information from the organization without the help of journalists.

GHOSTWRITING

Ghostwriting is the process whereby one person, usually a professional writer, writes a document or a speech that another person then delivers and represents as largely his or her own work. The professional writer or “ghost” lends his or her skills in message preparation to the speaker, and the speaker takes advantage of these skills. The writer is described as a “ghost” because he or she is invisible when the speech is actually delivered. Ghostwriting is a well-entrenched part of many communication professions including public relations and political communication.

Senior political figures regularly employ professional speechwriters. Many business executives similarly employ professional ghostwriters to help craft speeches, letters, and other documents. Speechwriting in most organizations is a specialized aspect of the larger public relations function. Ghostwriting is also practiced in some publishing circles. Among the most celebrated modern ghostwriters was Peggy Noonan, President Ronald Reagan’s speechwriter. Noonan described the speechwriting process as one of balancing competing interests and managing successive reviews and revisions. The principal issues surrounding ghostwriting are effectiveness and ethical concerns of masked authorship and the possibility of deception. Deception occurs when those “pearls of wisdom” voiced by one person are actually the work of someone else. The person who delivered the message does not have the time or talent to craft

the message but receives credit for it. The ideology expressed in the message may come from the author more than from the person who delivers it.

Ghostwriters are generally believed to be able to produce more effective messages than would the average executive or politician working alone because the ghost has specific communication and writing skills. Moreover, ghosts can spend much more time preparing a speech, researching the audience and issues, and developing arguments than can a busy politician or executive. Ghostwriting is often justified on the grounds that it saves valuable executive time.

One of the key features of effectiveness is the ability of the ghost to successfully write for a particular speaker. Speechwriters must be very knowledgeable about their client’s specific interests, positions on various issues, and speaking style. The relationship between speaker and writer is most effective when it is characterized by openness and trust. Writer and speaker should work closely as a team to construct a speech that each is comfortable with. Mike Morrison, former speechwriter for Lee Iacocca, noted that “when a speaker comes to trust the writer to capture his voice and to articulate his position in that voice, the process can be very smooth.” Ghostwriters are also most effective when their participation goes unnoticed. An unwritten rule of ghostwriting is that the ghostwriter remains anonymous. In general, ghostwriters should not be publicly identified with a particular speaker or speech.

The ethical questions surrounding ghostwriting cluster around issues of honesty and deception. Specifically, some critics charge that using a ghostwriter is a kind of deception: a fraud or plagiarism whereby the speaker implicitly claims that the speech is his or her own. Because credibility, according to traditional models of ethos, is created by the speaker “speaking well,” he or she must be the author of the speech. Ancient writers on rhetoric such as Aristotle, Cato, and Quintilian all embraced the view that credibility arises during the speech as the speaker demonstrates his or her reasoning, moral character, and skill. Ghostwriting short-circuits this credibility-building process by allowing the speaker to substitute the words of a professional writer for his or her own. Some have suggested that this deception is not an issue in modern political or corporate contexts because

the use of ghostwriters is essentially an open secret. Audiences have come to expect that those in leadership positions will employ professional speechwriters to assist in the preparation of their messages. Other critics have noted that in cases where a ghost is employed, the speaker is usually fulfilling a larger representative leadership role. The speech, therefore, is best viewed as a corporate or organizational product much like an advertisement or brochure. In these cases, credibility is generated for the organization rather than for the specific speaker.

Ghostwriting, although a specialized niche in the public relations profession, is often viewed as an access point to strategic organizational and management functions. Because the ghostwriter is in a position to influence what senior executives are saying, he or she may also influence strategy. Ghostwriting services are provided by most internal public relations departments, public relations and advertising agencies, political consultants, and specialized freelance writers.

GOALS

Effective public relations is strategic; it has a purpose. Each public relations action should be designed and intended to achieve something for the organization or person developing it. Goals are an important part of developing your public relations strategy and evolve from your formative or

background research. A goal is a general statement of what you hope to achieve with your public relations action(s)—the outcomes expected from the public relations effort. A goal is tied to the problem statement that was developed from your formative research. You cannot create a goal until you understand the public relations situation. The goal is designed to eliminate the public relations problem and indicates what needs to be changed. Goals are sometimes called directional statements because they provide the overall direction for the public relations actions. Goals are general statements of where you want the public relations action to go.

A few examples will help to clarify the discussion of goals. Consider these two goals: (a) “to increase awareness of the GM Cobalt” and (b) “to improve community perceptions of Merck.” The Cobalt is the new automobile model for GM. The problem is that people may not know about it and, therefore, may not consider it an option when buying a new car. The general solution (direction) is to create awareness of the Cobalt. Merck personnel may have found that local communities where they operate do not believe they are good corporate citizens. The general solution (direction) is to improve community perceptions of Merck. The goals are vague; we do not have a clear idea of the exact outcome that is desired. Objectives provide the specific outcomes for the public relations actions.

Objectives are specific and measurable, whereas a goal is vague and probably not measurable (*see* Objectives). To translate our two goals into objectives requires much more detail. Here are two potential objectives that could be drawn from our original goals: (a) “to make 75 percent of potential compact car buyers aware of Cobalt as a purchasing option” and (b) “to increase perceptions of Merck as a strong corporate citizen from 20 to 40 percent in the communities where Merck has facilities.” In each case, the objectives provide more detail. The Cobalt objective specifies the target percentage of awareness (75 percent) and the specific target public (potential compact car buyers). The Merck objective seeks a specific increase in perceptions of “strong corporate citizen” (from 20 to 40 percent) among a specific target public (people in communities where Merck has facilities).

Goals are dangerous when they become confused with objectives. If a goal is used instead of an objective, proper evaluative research is impossible. A goal is simply too vague and offers no true measure of success or failure. The public relations practitioner will be unable to clearly determine if his or her strategy was successful. Let us return to the sample goal “to improve community perceptions of Merck.” What is your measure of success or failure? Do you succeed if just one member of the community expresses a more positive perception of Merck? You cannot determine the most effective way to assess your efforts if you only have goals.

Evaluation is central to learning, and that will only occur with objectives, not with goals. Goals are general guidelines for action. The vagueness of goals makes them difficult to measure effectively. Goals are precursors to objectives and should not be used in place of objectives. Such substitution will make evaluation problematic. Without evaluation, a public relations practitioner cannot learn what works and should be repeated and what does not work and should not be repeated.

One reason for the confusion between goals and objectives is goal-setting theory, a widely known motivation theory from organizational psychology. If a practitioner receives any management-related training, she or he will probably know about goal-setting theory, which states that workers will improve their performance when they have clear, specific, and challenging goals, when they participate in setting the goals, and when they are provided with frequent feedback on progress toward the goals. Notice that in goal-setting theory a goal is clear and specific. In other words, goal-setting theory uses the term *goal* in much the same way as public relations uses the term *objective*. Hence, practitioners versed in goal-setting theory may confuse goals and objectives. However, if a practitioner creates a true objective and calls it a goal, there is no evaluation problem because the necessary specificity will be there. The real problem is when vague goals are used instead of objectives. In these cases, effective evaluation will be difficult if not impossible.

The distinction between true goals and objectives is often blurred in public relations. Each year the Public Relations Society of America (PRSA)

sponsors the Silver Anvil Awards to recognize outstanding public relations work in a variety of categories, including community relations, internal communications, and investor relations. The Silver Anvil Award winners should serve as exemplars of how to perform public relations actions. They are the best of the best. On their Web site, PRSA has an archive of the summaries for the past winners. The summaries provide information about the four basic steps in a public relations effort: research, planning, execution, and evaluation. The planning section, according to PRSA, should include the identification of the specific, measurable objectives of the public relations effort. However, even a cursory review of the summaries will reveal the use of goals (vague statements) instead of objectives (specific statements). Granted, the full Silver Anvil entry contains additional information about the public relations efforts that may include specific objectives. However, if the summary has only goals, this suggests either that there are no objectives in the public relations effort or that the summary was poorly constructed. Either way, if the public relations efforts that are recognized as the best can substitute general goals for specific objectives this easily, a general problem may exist with mixing goals and objectives. Public relations practitioners must be sure to convert their goals into objectives—to move from generalities to specifics. The value of formative research, planning, and execution is lost when a public relations effort cannot be evaluated. Thus goals are an important foundation for strategic public relations, but strategy becomes weak when practitioners fail to move from goals to objectives.

GOLIN, AL

Al Golin, founder and chairman of Chicago-based Golin/Harris International, is a man of enthusiasm, humility, and genuine commitment to long-term relationships with clients. He is a pioneer who says he has enjoyed every minute of his almost 50-year career in public relations.

Golin was born June 19, 1929, in Chicago, Illinois. He earned a bachelor's degree in business, with a minor in journalism, from Chicago's Roosevelt University. He began his career in 1951 as a Midwest field press representative for MGM Pictures. At the young age of 21, his clients included Debbie Reynolds, Clark Gable, and Gene Kelly.

In 1956, Golin joined a small public relations firm in Chicago, Max Cooper & Associates, which—as was true for almost all firms at the time—dealt primarily in publicity. A year later, in 1957, Golin made a career-changing telephone call. After reading a newspaper article about Ray Kroc and his then-fledgling McDonald's hamburger chain, Golin placed a cold call to Kroc, who invited Golin to come over to meet with him. According to Golin, "We talked for about 20 minutes, and he said, 'Okay, start Monday, and your retainer will be \$500 a month'" (personal communication, October 24, 2002). More than 45 years later, Golin/Harris still is working for McDonald's, but Golin admits, "The monthly retainer is a bit more than \$500!" ("Timeline," 2004, n.p.).

In 1958, Golin was named a partner of Max Cooper & Associates. Seven years later the firm became Cooper & Golin. In 1975, Cooper left the firm to become a full-time McDonald's franchisee and to pursue his hobby of producing Broadway musicals, and the firm was renamed Golin Communications. In 1981, the firm was renamed Golin/Harris Communications to reflect the significant contributions of Tom Harris, who later retired to teach at Northwestern University. In 1999, Golin/Harris Communications was acquired by the Interpublic Group of Companies and renamed Golin/Harris International.

In addition to McDonald's, other clients of the firm include Bayer Aspirin, DaimlerChrysler

Corporation, The Walt Disney Co., Florida Department of Citrus, Kellogg's, Keebler Foods, Levi Strauss & Co., Lowe's Companies, Nintendo of America, Pharmacia Corp., Ralston Purina, Sprint, Texas Instruments, Toyota Motor Sales of America, and VISA USA.

Golin prides himself on the firm's reputation as a full-service agency devoted to maintaining long-term relationships with clients. He stated, "We never tried to have a laundry list of clients. We are not just project oriented" (personal communication, October 24, 2002). According to Golin, the key to maintaining meaningful partnerships with clients involves a combination of environmental scanning and what he described as "changing things before they need changing" (personal communication, October 24, 2002). He continued,

Something I always say around here is that you need to "fix it *before* it breaks." Oftentimes, people get too complacent in our business. In order to look forward and interpret what is going on in terms of issues and demographics, we are always meeting with clients and with our people internally. (personal communication, October 24, 2002)

Golin/Harris International is among the top-10 largest public relations firms in the country, with nearly 1,000 employees and revenues of \$140 million. The firm has offices in London, Frankfurt, Hong Kong, Singapore, Taiwan, and Japan, with exclusive affiliates in dozens of other cities and countries. In 1996, Golin/Harris was selected as the Agency of the Year by the trade publication, *Inside PR*.

Golin said he delights in traveling to the firm's international offices and that he sees a common thread in the business. "Public relations people are creative, fun, and intelligent. No matter what language they speak, public relations practitioners are the type of people you like to be with" (personal communication, October 24, 2002).

Regarding changes in public relations he has witnessed, Golin said,

In the beginning, everything was publicity oriented. The object was simply to "get ink." But now, while

publicity is still a component, it is just one facet of public relations. The use of research has helped the industry become more business oriented. Today, we are more like management consultants who help clients with internal communication as well as with strategic consumer communication. (personal communication, October 24, 2002)

Golin is a member of the Public Relations Seminar, the Arthur W. Page Society, and the Public Relations Society of America (PRSA). He has served as consultant to the U.S. Department of Commerce, as a founding board member of Ronald McDonald House Charities, and as a public relations advisor to the National Multiple Sclerosis Society. He also is a member of the board of trustees of Roosevelt University and the Goodman Theatre in Chicago. In 1999, he was named one of the 100 most influential public relations people of the 20th century by the trade publication *PR Week*. In 2003, he was the featured speaker of the Institute for Public Relations' 42nd Annual Distinguished Lecture Series.

Golin said he is most proud of his community relations work in expanding the Ronald McDonald House program, a home away from home for families of seriously ill children receiving treatment at nearby hospitals. During the early 1970s, Golin and McDonald's Ray Kroc developed the concept of the *trust bank*, meaning that companies should make deposits of goodwill to draw on in times of crises ("Timeline," 2004). The Ronald McDonald House program originated in Philadelphia in 1974, with a local McDonald's group and a member of the Philadelphia Eagles football team. Golin's firm then recommended that it become a national and international program. Currently, there are approximately 220 houses in 19 countries. The international growth of Ronald McDonald House, according to Golin, has helped change the culture in such countries as Brazil, where large companies had never become involved in social causes until the charity came to their areas.

In 1992, McDonald's established the Al Golin Trust Bank Award, which is given annually to one of McDonald's worldwide public relations firms

that best reflects Golin's commitment to community service. Golin was named the first recipient.

According to Golin, the notion of building trust banks has become the credo of Golin/Harris International. He stated, "We believe very strongly in community relations. We learned from our first experiences with McDonald's that the best way to establish an identity is to become active in your local community. We now call that the 'trust bank'" (personal communication, October 24, 2002).

Golin (2003) recently authored a highly regarded book on the subject, *Trust or Consequences: Build Trust Today or Lose Your Market Tomorrow*. The book describes strategies for helping businesses build, strengthen, and restore bonds of trust with stakeholder groups. It also reports results of a survey of over 700 business professionals.

Golin predicts that public relations in the future will focus more on applying research to obtain goals than on publicity for the sake of publicity. He also predicts a stronger focus on government relations and investor relations.

Golin credits his success in public relations to his genuine inquisitive nature. He stated,

I've always been a curious "news junkie." I have a granddaughter who is always asking questions, and I really like to see curious little kids asking questions. I think that public relations people need to be curious and aware. Unless you are current, you aren't any good in this business. (personal communication, October 24, 2002)

GOODWILL

The standards of socially responsible behavior continue to evolve with societal trends and expectations.

In order to maintain public goodwill, companies must conduct themselves in a responsible and ethical manner while providing transparency in their business dealings, accountability to their stakeholders, and sustainability to society and the environment. “Public relations bears directly upon the area of values associated with goodwill. Its task is not one of communications only, as some have supposed. Its roots reach to the very heart of corporate policy” (Hill, 1958, p. ix). These extensions of goodwill help demonstrate commitment toward a company’s stakeholders.

The most formally understood practice of goodwill is corporate social responsibility (CSR). This practice has commonly been perceived in the United States as a largely European phenomenon, since CSR is a high priority for European companies. The European Commission, in establishing social goodwill as one of the pillars of its approach to business and economic competitiveness, has set in motion a Multi-Stakeholder Forum that recommends to the European Commission how social responsibilities should be reflected in government policy and business practices. In addition, European Union countries swiftly began adopting ambitious new requirements for corporate reporting, called “sustainability reporting,” that go beyond financial results to cover the *triple bottom line*—one that shows the economic, environmental, and social performance of an organization.

However, this responsibility has not been confined to Europe, because more U.S. companies are taking goodwill practices more seriously. The growth of technology has made all types of information more accessible, leading to greater scrutiny of corporate practices around the world. “In a nation such as the United States, where public opinion is both judge and jury, any segment of the public is free to question management’s wisdom, integrity, and good human intent in handling responsibilities that amount to a public trust” (Hill, 1958, p. ix). Corporations are buffing up their social responsibilities and reputation since the Sarbanes-Oxley Act and the emphasis on corporate governance that emerged in the wake of Enron, WorldCom, and other major corporate accounting problems. This transparency also goes beyond

financials into more global operations, like labor practices. On a local level, more and more government agencies are expanding their standards for government contracts and requiring recipients to provide their employees with a predetermined living wage. Globally, NGOs, the media, and other groups are increasingly scrutinizing human rights and labor issues and demanding internal and external monitoring.

“The corporation exists to serve the common good and must constantly justify its performance on that basis before the bar of public opinion” (Hill, 1958, p. 146). Beyond the necessary reporting requests, companies are wisely working to have an influence in setting the standards by which they will be measured. According to Hill & Knowlton’s 2002 Corporate Reputation Watch survey, two thirds of CEOs feel that corporate social responsibility initiatives contribute at least a moderate amount to their company’s corporate reputation, including the way they are perceived by groups such as customers, shareholders, and the media. In fact, participating in goodwill practices, which boost a corporation’s reputation, increases the length of time that a firm spends earning above-average financial returns and decreases the length of time that a firm spends earning below-average financial returns.

John Hill, founder of Hill & Knowlton in 1927, outlined the basic tenets of social responsibility:

Here are some of the precepts of sound policy as evolved over the years through the experience of successful corporations. Under these precepts management seeks:

To maintain or improve the financial and economic strength and welfare of the company in all ways consistent with the community and public interest. The company must prosper if it is to live and grow.

To build an efficient and loyal labor force through the best possible working conditions and wages.

To conduct the affairs of the company in a way that will reflect credit upon it and upon the system of competitive enterprise under which it lives.

To remember always that the esteem of people has no substitute and that the good will of customers, employees, the community, and the investing groups is essential to success.

To take the long view in defining goals, and, by communicating information, to fortify the company against adverse movements and misunderstandings which may arise along the way. (1958, p. 53)

More specifically, there are many ways in which corporate social responsibility contributes to reputation and business results, most commonly recognized by the tangible benefits it provides employees, customers, and investors.

The common benefits employees receive are improved employee recruitment, retention, and motivation. Companies perceived to have strong commitments to goodwill practices often find it easier to recruit and retain employees, and thus have less turnover and associated recruitment and training costs. Even in difficult labor markets, potential employees evaluate a company's performance on acts of goodwill to determine whether it is the right "fit." In fact, more than half of MBA students would accept a lower salary to work for a socially responsible company.

Beyond employees, it is necessary to understand the role of customers, who serve as the foundation for a corporation's existence in the first place. A number of studies have suggested a large and growing market for the products and services of companies perceived to be socially responsible. While businesses must satisfy customers' key buying criteria, such as price, quality, availability, safety and convenience, studies also show a growing desire to buy, or not buy, because of other values-based criteria, such as being "sweatshop-free" and "child-labor-free," having lower environmental impact, and not having genetically modified materials or ingredients.

Corporate social responsibility is also useful in attracting investors, partly because of a perceived lower level of risk attaching to companies that make socially favorable decisions. Not only do socially responsible companies actually have better financial results; they also appear to have an advantage when it comes to attracting investor capital.

However, a corporation must consider how to conduct corporate social responsibility correctly by evaluating where it stands on CSR, where it eventually hopes to be, how it can get there, and how it can show results. To answer these questions, the corporation will need to consider a number of factors, including the regulatory framework the company is facing and the broad public policy issues that are driving the framework. After a company has a clear overall goodwill vision and mandate, it becomes possible to set specific targets and prioritize business activities.

When a company decides how to achieve the desired results, it must identify new ways to reach stakeholders that may have been overlooked in the past, using new partnerships, diversity marketing programs, or other approaches. In some cases, it may be necessary to create full-fledged educational, cause-related, and social-issues marketing campaigns. Dialogue, whether establishing it, building it, or enhancing it, is the common denominator in all these potential approaches. To generate the most impact from these initiated programs, a company must consider creating reports and disseminating information to stakeholders and key media and opinion leaders, who can help develop clear-cut internal and external communications plans.

There are many reasons why goodwill practices are necessary in today's business world. Not least of them is the fact that if practiced right, corporate social responsibility is substantially beneficial to business. "The steady building of good will matched by good deeds creates a substructure of strength that becomes valuable in times of crisis" (Hill, 1958, p. 57). By evaluating its current standing and strategies, a company can help maintain an appropriate standard of practice that adheres to acceptable measures of goodwill.

GOVERNMENT RELATIONS

Government relations is a function of public relations that organizations—both for-profit and nonprofit—use to strategically influence the public policy aspects of their environments. Corporate participation in shaping public policy can be traced to the business barons of the early 1900s. Since that time, business organizations have struggled with appropriate ethical and strategic responses to unprecedented changes, constraints, and challenges in their environment brought on by government policy decisions.

Scholars from such fields as political science, futurism, business management, public policy, communication, public relations, strategic planning, management information systems, and business ethics have advanced the field's understanding of the function of government relations. Communication efforts to government officials have a historical place in the public relations literature. When undergraduate texts narrate public relations' history, they often show how organization-to-government communication efforts shaped the early years of the field. The recognition of the value of the relationship between organizations and governments began more than 50 years ago. J. A. R. Primlott first linked public relations, government relations, and democracy together. Later, Ron Pearson examined the relationship between democracy and public relations.

Why are the offices of government an important public for organizations? Richard E. Crable and Steven L. Vibbert (1985) argued that organizations do not have authority in public policy. Rather, organizations have the ability to *influence* public policy. That is, organizations, whether profit seeking or not for profit, need to participate in the multiple state and federal arenas where “public policy is being decided” (Ewing, 1990, p. 24).

The importance of government as an organizational public has also been addressed in the management literature. Henry Mintzberg viewed government as one of the most important external publics with which an organization must communicate. Mintzberg argued that organizations must always give special consideration to government

officials because “they represent the ultimate legislative authority of the society . . . [and] establish the rules—the laws and regulations—within which every organization must function” (1983, p. 44). The management literature identifies government as a public to be researched, monitored, and regularly engaged through communication.

Barrie L. Jones and W. Howard Chase are credited with the systematic approach that explained how organizations can legitimize and validate organizational positions on relevant public policy issues. Government officials were considered one of the three major targets (business, citizens, government) of communication for strategic management (Jones & Chase, 1979, pp. 4–5). The authors encouraged organizations to “increase efforts to anticipate social change and respond to reasonable public expectations” rather than wait for others to set the public agenda (Jones & Chase, 1979, p. 11).

In Jones and Chase's initial conceptualization of issues management, issues precede government policies and organizations should “react” to events and be ready to proactively guide issues in the direction of favorable outcomes. Crable and Vibbert later admitted that business, citizens, and government are not coequal publics for organizations; rather, “public policy rests where it has for more than two hundred years—in the halls of government” (1985, p. 4). Indeed, the authors concede that even in the lower levels of state and local government, the need for government support for organizational decisions is clear. Robert L. Heath and K. R. Cousino acknowledged that organizations must communicate with government officials as key stakeholders in order to influence and benefit from favorable public policy decisions. Their advice for issue managers is clear—organizations need to know the relevant “persons who create law or ordinance that prescribes which actions are rewardable or punishable” (1990, p. 28).

Large and small organizations can build relationships with government officials.

There are certain steps that organizations can enact that will ensure that they have the information necessary to conduct government relations. The first step is for organizational leaders to know the legislative agenda in the different arenas of

government. Local, state, and national bodies all have individual, although sometimes overlapping, agendas that may affect an organization. Organizations should conduct environmental scanning to identify which policy issues will be salient in each government arena. Legislation normally progresses through various stages to become the law of the land. One is the prelegislative stage of deliberation, during which the prevailing forces attempt to craft bills that may sustain themselves in legislative debate. Hearings are a crucial element in this phase. Legislation progresses to become bills, which are signed into effect by executive authorities. Regulation is created to implement legislation. All of this may end up being litigated before finally becoming the enacted law. Government relations is relevant at each step.

Once an organization knows the legislative agenda for a body of government, the second step is to explore how the acceptance or rejection of a policy may affect the short-term and long-term functioning of their organization. Government decisions influence such diverse organizational practices as competition, mergers and acquisitions, employment, licensing, access to scarce resources, retirement procedures, and financial investments. The public relations department should speak with other organizational units to see how these potential policies will affect the different subsections of the organization.

A third way that organizations can enact government relations is by gathering, organizing, and disseminating background information that shows the organization's position on the policy. White papers and position papers can be created to provide background to government officials detailing how proposed policy decisions may influence constituents. Often the public relations department will not need to collect new information; rather, it will need to be able to summarize large amounts of intra-organizational information into easy-to-understand, jargon-free background that can be used by government officials as they deliberate.

Information is only one part of the relationship-building process with government officials. Fourth, organizational members will need to establish an interpersonal connection with elected officials. It is

recommended that organizational leaders set up appointments and meetings to develop face-to-face relationships with officials at various levels of government. There are a variety of ways that organizations can foster this type of rich communication with their elected officials. They can invite political leaders to their organizations, have key organizational members attend political fundraisers, or have organizational members participate in advisory bodies that report to elected officials. Building relationships with government officials takes time and energy, and access to high-level government officials may require multiple attempts before anyone from the organization actually sits down to talk with a government official.

Another way to increase the visibility of the organization is to combine government relations efforts with lobbying and issues management efforts. This convergence of mission and message will create a comprehensive and synergistic strategic communication program. Open communication is needed within an organization to ensure that the lobbying efforts are in sync with other strategic efforts.

Finally, organizations should join their respective trade or industry group to maximize their influence. Most governmental policies will not merely affect just one organization, but instead will affect whole industries. Industry groups allow competitors to cooperate with each other to ensure the future of their group. Industry groups often have resources to conduct comprehensive government relations efforts that benefit all members. At times, organizations may also want to partner with activist groups or organizations outside of their trade group to better communicate broader objectives and needs to government officials.

It is important to note that government relations are also very important in international public relations. Successful public relations efforts aimed at governmental publics require more than merely targeting particular officials. Effective public relations must also consider the unique social, economic, and political conditions of a nation. As the economic and social status of nations throughout the world changes, the offices of government may become the target of international public relations

efforts. The developing world is rapidly moving toward privatization, as the impetus for economic development shifts from national governments to private sector corporations. During this time of transition, government offices are emerging as especially powerful publics to the corporations that want to participate in and benefit from the economic opportunities. One task for international public relations practitioners is to successfully build, maintain, and change relationships with key foreign government officials.

GRAPHICS

Graphics are visual elements used to create images for print publications, videos, and Web sites. The term *graphic* is often used in a generic sense and can encompass a variety of visual elements associated with the design and creation of printed

materials, such as photographs, illustrations, drawings, clip art, line rules, typefaces, and tint boxes.

Graphics are a powerful way to communicate in today's visually oriented society. Most publications need strong, dominant visual elements to make them more interesting to the reader. Graphics can accompany copy to help attract attention, unify a look, convey special meaning, and add impact. They can also clarify, educate, and improve readability. Graphics are pieces of art used to express ideas, create a mood or image, and enhance the attractiveness of a piece.

Public relations practitioners use graphics to create identity systems for an organization. An identity system includes the organizational name and logo, which are used in all the materials produced by the organization, such as letterhead, business forms, brochures, invitations, and advertisements. Practitioners also use graphics to produce just about any communication tool, including newsletters, signs, posters, press kits, and Web sites.

Graphic design is the artistic and skillful application of type, color, and images to paper or another medium, such as a Web site, to create a clear and appealing whole. Many specialists work with the creation and production of graphic images, including art directors, graphic artists, and graphic designers, and they comprise an entire industry of professions relating to the design and printing of messages. Graphic designers, for instance, are professionals who design and may even coordinate the production of a printed piece, including the selection of type, art, paper, and ink. They work with public relations practitioners to ensure that a piece is visually appealing. A graphic artist is an individual who produces art through graphic methods, such as painting, etching, and drawing. Public relations practitioners work with these graphic specialists to create materials with graphics, such as brochures, corporate identity systems, Web sites, and advertisements. Public relations practitioners who work in this capacity are considered print brokers because they hire illustrators, graphic designers, and printers to help produce their work.

Like any type of pictorial matter in a publication or other medium, graphics can include original

illustrations and clip art; photographs; logos and symbols; graphs, charts, and maps; numbers; and visual elements such as bullets, line rules, borders, screens and tint boxes, typographic ornaments, geometric shapes (bars, stars, diamonds, hexagon), and enlarged letters. Clip art includes images in many different forms, such as photographs, illustrations, and typefaces. Clip art can be purchased on a CD; it is also available free on Web sites. Typically not created for any specific use, the art is generally copyright-free. Public relations practitioners need to be aware of the United States Copyright Revision Act of 1976, which states that those who use copyrighted work must have the permission of the copyright holder. Even though some graphics work may be in the public domain, other images may be protected by copyright even if a copyright does not appear with the graphic.

When public relations practitioners need graphics that are especially tailored to their needs, they may use the services of stock image providers or photo banks. Much less expensive and time-consuming than hiring a photographer and orchestrating a photo shoot, photo banks offer a wide variety of subjects, themes, and styles that can be accessed online and delivered digitally. Royalty-free images are purchased for unlimited usage at a flat fee, but they can be accessed by other users, including competitors. Rights-protected images can be used for a particular use and period of time.

GREGG, DOROTHY

Dorothy Gregg (1920–1997), Ph.D., was the first woman appointed a corporate officer at Celanese Corporation and was the first vice president of the National Council of Women in the United States.

Gregg was vice president of communication at Celanese for eight years, from 1975 to 1983, and was a senior consultant to Ruder, Finn & Rotman from 1983 to 1987, when she left to open her own firm. Prior to joining Celanese, she was assistant to the director of public relations at U.S. Steel Corporation, a pioneering position she held for 16 years.

Gregg had been a public relations consultant since 1954, and her contributions to the growth of the field were highlighted by numerous awards. Her exceptional leadership skills and achievements were well recognized statewide and nationwide. She was a 1962 recipient of the New York State Woman Award, given by the New York Department of Commerce. In 1968, she received the National Federation of Business and Professional Women's Clubs Top Hat Award, the American Advertising Federation's National Advertising Woman of the Year Award, and the Advertising Woman of the Year in New York City Award. In 1969, she received the Outstanding Woman of the Year, presented by the Toastmistress Club. In 1970, she was the recipient of Governor Rockefeller's Certificate of Honor.

A distinguished female executive herself, Gregg was dedicated to advancing the role of women in public relations and marketing communication. As an expression of her concern for women, she chaired the Committee on Women in Public Relations, supervised the Association for Women in Communication, and was director of the American Woman's Association and the Advertising Women of New York. She was also a member of the board of governors of the International Women's Forum and the New York Women's Forum.

Other national honorary organizations of which she was a member include Gamma Alpha Chi, Phi Beta Kappa, Pi Sigma Alpha, and Theta Sigma Phi.

Gregg began her career as an educator. She had been an assistant professor in Columbia University's Economics Department and on the faculty of Barnard College, the New School for Social Research, Pace College, and the University of Texas.

A graduate of the University of Texas with B.A. and M.A. degrees in economics, Dr. Gregg earned her Ph.D. in the same discipline from Columbia University.

Dr. Gregg and her husband, Dr. Paul Hughling Scott, had two children. She died May 18, 1997 at the age of 77.

GRISWOLD, DENNY

Denny Griswold (1908–2001), co-founder and editor of *PR News*, was a dynamic force who facilitated the spread of public relations throughout the world during the second half of the 20th century.

She is credited with having had a profound influence on winning management recognition for public relations. She said, "I early on felt that unless management gave public relations its support and understood it, public relations couldn't get anywhere" (S. A. Serini, interview with Denny Griswold, June 21, 1994). *PR News* was founded in part to address that concern. During her tenure on the editorial staffs of *Forbes* and then *Business Week*, she met many industrialists. "I was appalled at how little they knew about public relations . . . and I became motivated and almost obsessed with the need for public relations" (S. A. Serini, interview with Denny Griswold, June 21, 1994).

Mrs. Griswold championed the importance of public relations among top management and the growing number of public relations practitioners, ultimately defining the field as a management function. She developed the following definition of public relations for *Webster's Dictionary* in the late 1940s:

Public relations is the management function which evaluates public attitudes, identifies the policies and procedures of an individual or an organization with the

public interest, and plans and executes a program of action to earn public understanding and acceptance. (J. Fox, interview with Denny Griswold, May 21, 1992)

A tireless advocate for the profession, she liberally distributed business cards with that definition as well as large green buttons emblazoned with a phrase she coined, "PRoud to be in PR."

Mrs. Griswold's understanding of public relations developed early in her career. She began working for the media but quickly made the transition to public relations. Her experience in the offices of early public relations pioneers Benjamin Sonnenberg and Edward Bernays, as well as her advertising promotion background at J. Walter Thompson and Conde Nast, prepared her well. By the time she met and married Glenn Griswold, editor and publisher of *Business Week*, she was ready for a new venture.

The Griswolds left the magazine business to form a public relations agency and provide counsel to large industrial accounts. Mr. Griswold brought his vast experience and connections with American industrialists, and she brought the public relations acumen.

There was very little written about the practice of public relations at the time, and the Griswolds recognized that as a weakness in the field. They founded *PR News*, the first public relations weekly in the world, in 1944, and Mrs. Griswold served as editor for nearly 50 years. *PR News* filled an important void in the developing field of public relations, providing not only news and information but the first case studies as well.

During World War II, Mrs. Griswold arranged to send *PR News* to public information officers overseas. It kept them informed about and connected to the growing field of public relations, which they entered in large numbers when the war ended. That was also the beginning of the spread of *PR News* into international markets. By the end of the 20th century, it had subscribers in over 90 countries and was instrumental in spreading the practice of public relations globally. She said, "We are developing a profession that will contribute to international relations, and bring to us the peace and harmony that

we are all seeking” (N. Carlson, interview with Denny Griswold, November 11, 1986).

Also in response to the paucity of public relations literature, the Griswolds coauthored a 634-page handbook, *Your Public Relations*, which was used in classrooms as well as by working professionals. It was published in 1948, 2 years before Mr. Griswold died of cancer.

In addition to building the literature in the field, the Griswolds also worked to build important social networks to facilitate the growth and understanding of public relations. They held many social gatherings at their New York townhouse on East 80th Street. Some of the most powerful and influential people of the decade—industry CEOs, diplomats, senior executive officers, heads of public relations and advertising agencies, prominent public relations practitioners, and thinkers of all ilks—gathered, conversed, and built relationships there. “I love giving parties and our parties are quite famous,” Mrs. Griswold said (S. A. Serini, interview with Denny Griswold, June 21, 1994).

Mrs. Griswold was a driving force in building important professional organizations. She was instrumental in founding Women Executives in Public Relations in the 1950s, and has been credited with facilitating the development of public relations organizations abroad as well. She claimed responsibility for proposing the idea of holding a meeting of top public relations executives in conjunction with the annual Congress of American Industry, sponsored by the National Association of Manufacturers, to which CEOs were invited to discuss issues and problems of business. That meeting evolved into what is known today as the annual PR Seminar.

She traveled extensively, promoting public relations and *PR News* at conferences and important gatherings throughout the world. She was an active member of numerous professional organizations, including the Public Relations Society of America, the International Public Relations Association, Women Executives in Public Relations, and the Newsletter Association.

Mrs. Griswold is a recipient of the highest award presented to an individual by the Public Relations Society of America, the Gold Anvil. During her

lifetime, she received over 130 honors for her contributions to public relations from organizations around the world, including Women in Communications, International Women’s Forum, the International PR Association, the National Federation of Business and Professional Women’s Clubs, and the National Association of Manufacturers. She was also one of the first women to be named to the Northern Illinois University Honor Roll of Women in Public Relations in 1993.

She was a strong voice for the important role that social responsibility plays in doing business, and was herself actively involved in a wide variety of service activities. She gave generously of her time and talent and served on numerous boards and advisory committees including the USO (United Service Organizations), the Camp Fire Girls of America, the Institute of International Education, the Joint Council on Economic Education, Pace College, and the U.S. Chamber of Commerce. Following her death, the Women Executives in Public Relations Foundation instituted an annual award in her name, the Denny Griswold Award for Social Responsibility.

Mrs. Griswold was also a classically trained opera singer. She studied music and planned a career in it. When her voice coach died, her “audition died with him,” she said, so she turned to radio and worked for National and Mutual Broadcasting (Serini, 1994). She introduced children’s songs on the radio and worked for dramatic shows, including *The Shadow*. Being a “practical person,” she found the 13-week radio contracts to be too tenuous for her, and she moved to the more secure jobs of first newspaper and then public relations.

She held two degrees, a bachelor of arts from Hunter College and a master of arts from Radcliffe, and she started work on a doctorate at Columbia University. “I like to learn,” she said, “and I feel like I’ve wasted a day if I haven’t learned something” (S. A. Serini, interview with Denny Griswold, June 21, 1994).

Although she refused to call herself a feminist, her commitment to an egalitarian workplace was unequivocal. She broke through the glass ceiling long before women had entered the workplace in significant numbers, and she helped other women to

do the same. Women Executives in Public Relations stands as but one example of that effort.

She was tireless, hard-working, and fiercely determined, and, above all else, Mrs. Griswold was a lady. Petite, feminine, and confident, she never appeared in public without a hat and, until very late in life, white gloves. “You see lots of women who lose their kindness, their softness, their gentleness, they become hard,” she said. “I think that’s wrong, and I don’t think that’s necessary either” (S. A. Serini, interview with Denny Griswold, June 21, 1994).

After the death of her first husband, Mrs. Griswold married investment manager J. Langdon Sullivan. She retained Griswold as her professional name.

In an interview recorded before she died, she was asked how she would like to be remembered. Here is what she said:

I would like them to remember me as a force that . . . can be credited to some extent for having spread the practice of Public Relations throughout the world. . . . And I think that I would like to be recognized as having persuaded top management that there was something besides the bottom line to doing business—and that was to recognize their social responsibility. (S. A. Serini, interview with Denny Griswold, June 21, 1994)

GROSS IMPRESSIONS

Gross impressions are widely used in program evaluation to indicate the number of people potentially exposed to a media message. These numbers are based on circulation figures for print media and

ratings figures for broadcast media. Gross impressions are calculated by multiplying the number of messages that appear by the appropriate circulation or rating. The gross impressions number can become very large, very quickly; however, it must be used with care. The main caveat that should always be stressed is that these are potential exposures, not actual numbers of people who read, viewed, or heard the message. The classic example is Super Bowl commercials. Air time during the game sells for very high sums based on the potential audience exposure. But people are known to do many things during commercial time aside from watch the commercials (for example, go to the refrigerator or restroom). Thus, actual exposures are typically lower (and sometimes greatly so) than gross impressions for TV messages. The opposite might actually be true of print media. One newspaper in a library or periodical in a doctor’s office will likely have far more than one reader. And with the current proliferation of cafés in bookstores, countless newspapers and periodicals are read but not purchased. Thus, circulation figures can actually underestimate the number of people exposed to a print message.

Another problem with the gross impressions number is that although it may provide some idea of the number of people exposed to a message, it says nothing about whether those exposed were part of the actual target audience. This issue is partly addressed by choosing appropriate media placements, but few media sources, especially major outlets, provide the precise targeting public relations often desires. One way to ameliorate this problem somewhat is to develop an overall promotion and publicity effort that generates a “buzz” about a topic. For example, movie promotion is very involved these days. Trailers and product tie-ins create awareness and anticipation. Then a star hits the talk show circuit to talk about what she’s doing in her life, and just happens to mention her latest movie that opens in a few days and has a clip or two from it. People who like the star and are thus likely to go to the movie see the interview on *Leno*. They will talk to friends at work the next day, and those people may well be more inclined to watch the star

on *Letterman* the next night. The overall promotion effort thus enhances the impressions generated among the most desirable audience members.

Finally, simple exposure says nothing at all about the impact or effect of a message. Use of the gross impressions figure alone is very misleading

as a measure of the effectiveness of public relations activities. Meaningful program evaluation must always measure impact, not simply potential.

—*Maribeth S. Metzler*

HAMMOND, GEORGE

George Hammond (1907–2003) led a remarkable life in the practice of public relations. He earned the reputation of being the man who could make things happen.

The golden age of public relations began to shine during the darkest days of U. S. economic history, the Great Depression. At the Carl Byoir Company, a pioneer in the field, the gold turned to 24 carat under the leadership of George Hammond, who joined the firm in 1932 and retired as chairman of the board in 1981. The style and methods of the company, America's most successful public relations firm for 50 years, were never duplicated.

George Hammond was a problem solver who worked directly with company CEOs to analyze the problems and the goals of their companies and then directed those challenges to his hundreds of employees across this nation and around the world. Those clients—more than 100 *Fortune 500* companies—included BF Goodrich, Honeywell, Bendix, A&P, Hallmark, Johnson's Wax, and countless others. The accomplishments of those companies are legendary.

With every client of the Byoir organization, the contact was with the CEO, a far different method than exists today. Under George Hammond's direction, it was the job of the Byoir executive to

continuously inform the CEO of anything that was happening in his company, the nation, or the world that could affect his company and its clients. This access and close contact with the CEO of the company prevented a host of problems that exist today.

This was not a spin company. This was not a company that made millions of dollars in profits or whose employees were the best paid in the industry. This was a company whose employees remained with the firm solely because George Hammond created an atmosphere in which they could do their best work. He was a strategic thinker; a visionary who thought through the problems, devised the plan, chose the best man or woman for the job, and allowed the freedom for them to do their best work.

He made things happen.

His parents, both well known but not wealthy musicians from Brooklyn, provided love and support and instilled confidence, which carried George Hammond to the heights of his profession, lauded by associates, clients, and peers worldwide.

His exposure from birth to the beauty of classical music and the visual arts continued throughout his life and produced a creative thinker. He continually expressed concern that the country's education formula did not acknowledge the need for more literature, art, and music.

In 1924, it took Hammond several trips from Brooklyn into New York City and eight tests in one

day, but he persisted in pursuing a scholarship to Columbia. His persistence paid off with a full Pulitzer scholarship and \$250 annually in spending money.

Persistence became a way of life for George Hammond. Throughout high school and college, he wrote sports copy for the *New York Sun*. After graduating from Columbia in 1928, he continued his sports career. He ghosted the Grantland Rice column, covered golf, and worked for a hotel chain in Cuba, where he met Carl Byoir. In 1932 he was hired by Byoir to manage a sports program at the Miami Biltmore Hotel to attract visitors to the empty hotel. Through his creative efforts, he filled the hotel in the depths of the Depression. He did the same for several other hotels on both coasts of Florida.

The company's tourism business grew through George Hammond's expertise in sports; he utilized the press corps to publicize various cities including Orlando, Coral Gables, and Sarasota, bringing attention to those areas as vacation meccas even in the darkest days of the Depression.

He was ultimately called to New York and given the responsibility of his first client, the BF Goodrich Tire and Rubber Company. He was associated with Byoir for nearly 50 years.

In 1978, he received a letter from Bert Johnson, an executive in Orlando who credited Hammond with putting Orlando in the map. He wrote,

What you did for Orlando in 1935 can never be questioned. You gave us new spirit, confidence and vision. You not only put our town's name in the newspapers around the country, but you showed us there was still hope. You came here among us and you turned on the light. (Johnson, personal communication, 1978)

As the years progressed, George Hammond turned on the lights of many corporations. He turned on the lights of the Long Island Railroad when his genius as a strategic thinker, who did his homework, brought the company out of bankruptcy and saved 60,000 commuters from being stranded on Long Island with no way to get into the city. He did it without sending a word to any news media. He did his homework. He learned that the railroad,

with no history of accidents for 100 years, had two in 1954 in which 80 people were killed. He studied the engineering reports. He learned that the railroad needed several million dollars to upgrade their equipment and the tracks.

He used a large easel bearing the headline "The Long Island Railroad is the worst railroad in the nation." On succeeding pages of the large easel he outlined the problems, how to solve them, and how much it would cost.

The easel made the rounds of Long Island and Pennsylvania Railroad executives and soon landed on Governor Dewey's desk. The governor called a special session of the legislature, and the needed money was provided by the State of New York.

In 1952 Hammond turned on the lights for more than 200 passengers of the streamliner train, "City of San Francisco." Trapped in Donner Pass in the High Sierras for three days, the streamliner had run out of food and heat, and both the U.S. Marines and the railroad had failed in rescue attempts. But Hammond applied his usual problem-solving skills and paid a skier to get a message to his New York office. Then things began to happen. He led the other passengers to the warmth and safety of a nearby bar and grill. A letter of congratulations and thanks from the vice president of the railroad did not compare to the appreciation of the grateful passengers, who had had little to eat and minimal heat the last 24 hours of the ordeal.

He turned on the lights at BF Goodrich when he convinced a board member to vote in favor of a financing plan approved by Goldman Sachs that would save the company from bankruptcy. The company had tried three times to get the plan approved by the stockholders and could not. Hammond was 29 at the time and had just arrived in New York from Florida. While others in the office—probably 10 at the time—looked for ingenious ways to solve the problem, George Hammond looked for the largest stockholder and went to the source. The man refused to see him. He returned to the building when it was time for the stockholder's car to pick him up. He slid in beside him and in that 15-minute ride, Hammond convinced him that the financing plan was the best way to solve the problem.

The lights continued to shine as he worked with the new BF Goodrich president, John Collyer, who knew from his long experience in Europe that Germany was producing synthetic rubber. Collyer and Hammond convinced the government that the United States could lose the war without synthetic rubber and that this country must immediately start making tires from synthetic rubber. The government complied. When the war was over, Collyer, with George Hammond at his side, went to Washington and persuaded the government to get out of the synthetic rubber business and sell the plants to private enterprise. To the surprise of everyone, the government complied. This is but one of the accomplishments directed by George Hammond that changed the way America lives today.

Hammond was a take-charge man who could and did solve problems when others had exhausted every plausible tactic. He was an adviser, a problem solver who directed a worldwide company of well-trained employees who utilized his problem-solving methods. A career that started modestly became a career filled with business accomplishments that would change the way this nation thinks. George Hammond was on his way to becoming chairman of the board of Carl Byoir and Associates.

His was the only public relations firm that was departmentalized, with experts heading every department. Editor John Stahr edited and approved every piece of copy that was sent to news media, regardless of where the account executive was assigned at the time. This resulted in enormous respect from all the media, including *The New York Times*. A release from CBA needed no editing and could be depended on to be accurate and well written.

The company never used a lobbyist during its entire existence and had no set formula for solving problems. Hammond thought that each problem was unique. He met with the CEO, determined the problem and the course he would take, then assigned the work to the best people for the job.

Although he was distressed with the business scandals of the early 21st century, he acknowledged that there were 17,000 public companies that were honestly run, and said that their efforts would keep the country going.

The merry band of professionals who worked for George Hammond at the Byoir company were dedicated, happy people. They loved their work, and they admired the leadership of George Hammond. They did not move from company to company. There was very little turnover.

Muriel Fox, executive vice president of radio and television for the company, said,

We thought there wasn't anything we couldn't do. George Hammond knew everything that was going in the company. He cared about race relations and predicted in the 50's that we must solve these problems or this country would have major problems in the cities. He was very focused in regard to human relations and brought in people to teach the executives about the wider world. He covered a broad span intellectually. (personal communication, 2003).

Fox realized the rareness of Hammond's character by his actions toward her career: "He promoted me to executive vice president of radio and television. He was the first in New York to place a woman in such a position" (personal communication, 2003).

Dick Truitt, another executive vice president, said, "After he retired and I had a difficult problem, I would go to a quiet place and say to myself, 'What would Hammond do?'" (personal communication, 2003).

His executive secretary of 30 years, Mary Apelian, said, "He was a lofty thinker who always presented me with a challenge. There is a lot that the exterior does not show of the interior" (personal communication, 2003). After he retired, he retained her as his secretary until his death. She worked for him for 50 years.

At 93 years old, when George Hammond started co-authoring an autobiography, he said,

As I sit here on my 93rd birthday watching the birds fly south over the Mystic River, I contemplate a remarkable life that a kid from Brooklyn was fortunate enough to enjoy.

A short time ago, as I assessed this life, I realized the worth of many of the things I have learned and practiced during a 50 year career in the public relations

business. As I think of the problems which face this nation today, I am firmly convinced that many of them could be solved if we could reach the people one on one, not by spin, but by thorough explanation.

For 50 years our job was to listen, to solve problems and to explain. We did that and we did it very well for such companies as BF Goodrich, Honeywell, Bendix, Hallmark, A&P, The Long Island Railroad, Johnson's Wax, various U. S. Cities and the United States government.

Everything we did and the way we did it was different from the method our colleagues used. We did not measure our success by the number of press clippings we could generate or the size of the bill we could present to the client. Our success was determined by this standard: did we solve the problem?

I have lots of time to read, think and evaluate. I believe there are three crises in this country today:

1. The attack on business
2. Ineffective treatment of our rising generation's education formula
3. The lack of participation in one of the greatest freedoms in this country: voting. We are not exercising the hard fought freedom of voting as less than 50 percent of the eligible population goes to the polls. (Orsborn, 2003, n.p.)

George Hammond believed that an effective person-to-person program throughout the nation, such as the method used to make the nation aware of the Children's Television Workshop, could be used to motivate the American public to appreciate that great freedom that our founding fathers envisioned for us.

Joan Cooney did not launch her idea for a television program for preschool youngsters until she had the guarantee of \$7 million in underwriting. Her budget for something that did not exist included an ice-breaking program that cost \$250,000 the first year. She retained Hammond's company to do the job. George Hammond directed his executives to innovate. They remembered old ways and invented new ways to communicate and persuade. It took

personal calls, handbills, sound trucks, and the enlisted support of hundreds of community organizations all over the country because some of those areas did not yet have television. Today, *Sesame Street* is still one of the most popular and watched children's television shows in the nation.

This is the quality of work George Hammond created and supervised. Mr. Hammond died December 4, 2003, five days after his 96th birthday.

HEALTH BELIEF MODEL

Over the past four decades, the Health Belief Model (HBM) has been one of the most widely used

psychosocial models that attempts to explain health behavior and compliance. Formulated initially in the 1950s to help explain why individuals failed to engage in prevention or early disease detection behaviors, the model was later extended to embrace illness and sick-role behaviors, as well as compliance with medical regimens.

The still-evolving HBM integrates elements of operant conditioning and Kurt Lewin's theory of goal setting in the level-of-aspiration situation. As B. F. Skinner wrote, operant-conditioning theory focuses on the hypothesis that the frequency of a behavior is determined by its consequences or reinforcements, whereas Lewin et al. (1944) hypothesized that behavior depends mainly upon two variables: (1) the value placed by an individual on a particular outcome and (2) the individual's estimate of the likelihood that a given action will trigger a desired outcome. The model was subsequently categorized as an "expectancy x value" theory, attempting to describe behavior or decision-making processes under conditions of uncertainty.

The HBM is based on value-expectancy concepts: the desire to avoid illness or get well (value) and the belief that a specific health action available to a person would prevent or ameliorate illness (expectation). The expectancy was further delineated in terms of the individual's estimate of personal susceptibility to and severity of an illness, and of the likelihood of being able to reduce that threat through personal action.

The HBM proposes that one's subjective state of readiness to take action and engage in health-related behaviors, relative to a particular health condition, is a function of several factors. An individual's beliefs or perceptions of his or her likelihood of susceptibility to an illness, and the perception of the probable severity level accompanying a particular illness, represent major model features. Consequences can be social and physical. A second factor is the perceived benefit of the action, in contrast to the perceived barriers. That is, individuals are thought to weigh an action's effectiveness in reducing a health threat against possible negative outcomes associated with that action. A third factor involves access to cues for action or

triggers. Cues can be either internal (e.g., pain) or external (e.g., interpersonal interactions or mediated messages). Becker and Mainman also emphasized that the preceding three factors can be influenced by demographic factors such as gender, age, and ethnicity; psychosocial factors such as social class and personality; and structural factors such as knowledge levels about diseases and concomitant disease experiences. A detailed review of the evidence supports the inclusion of the various HBM components. A brief summary of supporting evidence follows.

PERCEIVED SUSCEPTIBILITY

This dimension refers to one's subjective perception of the risk for contracting a health condition. A number of retrospective and prospective studies of health behavior have reported positive correlations between relatively higher levels of subjective vulnerability and compliance to various health-related behaviors.

Perceived Severity or Perceived Threat of a Disease

Feelings concerning the seriousness of contracting an illness, or leaving it untreated, include evaluations of medical, clinical, and social consequences. The model focuses on the predictive power of the individual's perception of illness severity. Although the results of studies focusing on perceived severity and acceptance of preventive health recommendations are mixed, the individual's estimates of the seriousness or severity of the illness are consistently predictive of compliance with medical recommendations.

Perceived Benefits and Barriers

The HBM identifies and accounts for the relative benefits and barriers to engaging in behaviors to reduce health threats. For example, an individual exhibiting an optimal level of beliefs in susceptibility and severity would not be expected to accept any recommended health action unless that strategy was perceived as potentially efficacious. The individual

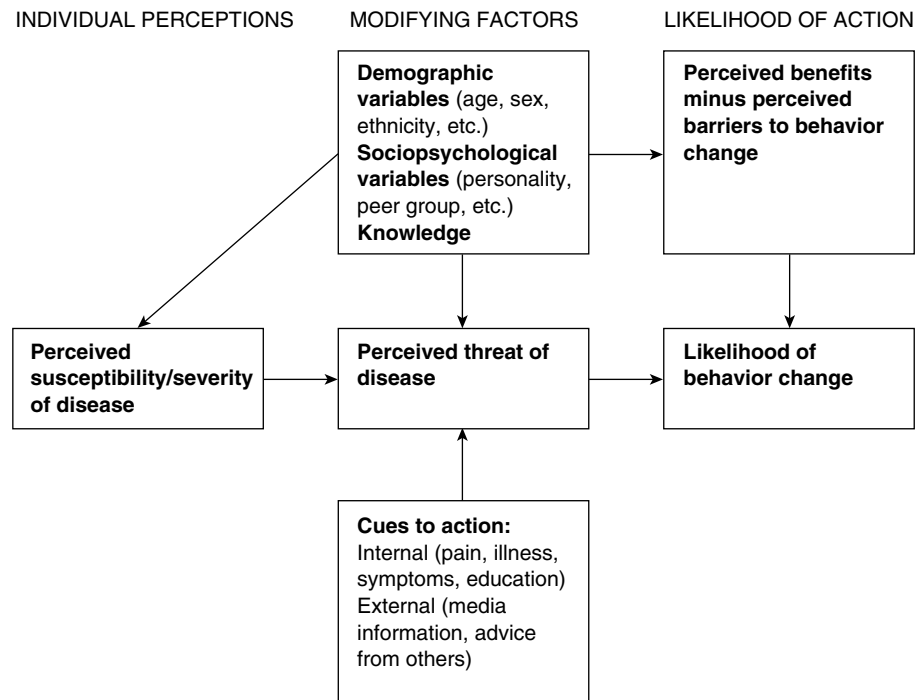

Figure 1 Health Belief Model

SOURCE: Adapted from Feurstein, Labbé, & Kuczmierczyk (1986) and Strecher & Rosenstock (1997).

thus weighs the action's expected effectiveness against perceptions that it may be expensive, dangerous, unpleasant, inconvenient, etc. Thus, the combined levels of susceptibility and severity provided the energy or force to act and the perception of benefits (less barriers) provide a preferred path of action.

Cues to Action

The notion that cues which trigger action are to be "held as necessary for activating the readiness variables, appears to serve to make the individual consciously aware of his feelings, thus enabling him to bring them to bear upon the particular problem" (Mainman & Becker, 1974, p. 22). Cues to action were discussed in various and early formulations of the HBM; however, they have not been systematically studied.

Modifying Factors

Demographic, structural, attitudinal, interactional, and enabling factors are examples of modifying

variables included in the HBM. They represent factors that may indirectly promote, have a mixed effect, or discourage health behavior. Sociodemographic factors, particularly educational attainment, are believed to have an indirect effect on behavior by influencing the perception of susceptibility, severity, benefits, and barriers. The key variables of the HBM, subsumed under three categories, are summarized in Figure 1.

Victor Strecher and Irwin Rosenstock (1997) believed that the concept of self-efficacy, introduced by Albert Bandura should be added to the HBM to increase its explanatory power and to become a more useful tool for the practitioner. Self-efficacy is defined as "the conviction that one can successfully execute the behavior required to produce the outcome" (Bandura, 1977a, p. 79). A growing body of research supports the importance of self-efficacy in helping to account for initiation and maintenance of behavioral change.

Many criticisms of the HBM stem from its high level of abstraction. For instance, Fitzpatrick and

associates (1984) describe the HBM as a conceptual framework for thinking about illness behavior rather than a model. Unfortunately, no research has been conducted to examine the HBM in its entirety. The vast majority of HBM-related studies analyze the constructs of the model separately. Taken together, the results support the model in understanding factors influencing health-related behaviors. In a revision of the HBM in 1977, motivation or the desire or intention to comply was emphasized. Also, positive health motivation may exist and account for positive action. Another critical review and overall assessment of the HBM's performance was conducted by N. K. Janz and M. H. Becker and published in 1984. Included in the review were preventive health and screening behaviors and sick-role behaviors requiring long-term changes. Additional research assessing experimental interventions to modify health beliefs and health behavior, as well as psychometric work to measure specific factors that need to be added to the HBM, should enhance the model's heuristic and pragmatic appeal.

HEARING

A public hearing is a forum held by decision makers, usually elected officials, to listen to various stakeholder positions on a piece of legislation. The public hearing is at the heart of the democratic process because any interested party can speak on behalf of the legislation. Both citizens, not-for-profits, and corporations have the opportunity to participate in public hearings. In most public hearings, speakers will support a particular piece of legislation and other speakers will voice their concerns about that piece of legislation. Public hearings ensure transparency in the decision-making process.

Different types of bodies hold public hearings. At the local level, town councils, city councils, and boards of commissioners meet to deliberate issues such as zoning, new laws, and taxes. At the state level, elected legislators also hold public hearings about issues such as education reform and the budget that affects the entire state. The U.S. Congress, both the House of Representatives and the Senate, also holds public hearings to solicit public comment on upcoming legislation of national and international topics.

Interested parties conduct research before participating in a public hearing. Data from reliable sources are needed to ensure that the arguments made in the public hearing are accurate and credible. Sources for data can include the United States Census, statistics from other communities/states, public documents, and information gathered through the Freedom of Information Act (FOIA). Another type of research involves gathering personal narratives about the people's lives that will be affected, either positively or negatively, by the proposed legislation. This research is as important as the statistics because it puts a human face on the bill or regulation. Both types of research help to create a persuasive argument. Finally, interested parties should research the positions of each member of the committee prior to attending the public hearing. Citizens and organizations can contact the offices of each member of the committee and ask for each elected official's position on the legislation.

There is a predictable process to most public hearings. Generally, decision-making bodies announce the times and dates that they will listen to public comment on a particular piece of legislation. The announcement of the date and time of the public hearing is usually published on the decision-making body's Web site or in the local media. Interested organizations then can contact the appropriate governmental office and ask to be placed on the list of speakers. Individual citizens and organizations must provide the name and contact information of the intended speaker. Interested parties are given a date and time to appear in front of the committee. They are also given a time limit for their speeches.

Because speakers have limited time, in addition to writing a speech, each speaker prepares a written document. This document, in the form of a position paper or white paper, provides additional information about the speaker's position. Speakers submit a copy of this written document to the committee prior to speaking. Many speakers bring extra copies to hand out to media representatives and other interested parties. These written documents should contain background, contact information, and the same statistics and narratives as the speech. It is best to place the most important information at

the beginning of the document, use bullets, and make the position paper easy to read.

In public hearings each speaker is called to testify before the deliberative committee. Speakers introduce themselves (name, home town, organizational membership) to the committee, thank the committee for their time, and read their formal statement. The committee members may ask the speaker questions; however, it is unusual for the audience to be allowed to ask the speakers questions. Committee members are usually addressed by their formal titles and are treated with respect during the speech.

It is important for all speakers to stay within their allotted time limit. At any public hearing, there could be dozens of interested parties seeking to speak about their position. Speakers who extend beyond their allotted time may be asked to stop and will not be able to complete their statement. Speakers practice their presentations (often many times) and must anticipate difficult questions from the committee members. If there are several interested parties sharing the same position on the legislation, it benefits all of them to coordinate in advance which person will make which argument. Although repetition can be persuasive, it is best to bring a wide variety of arguments into the speeches.

During the public hearings, a level of decorum is expected from the audience. Members of the audience are expected to sit quietly and politely as different speakers present their arguments. Clapping for like-minded speakers is inappropriate as is making noise when opposing arguments are being made.

Representatives from the media often attend public hearings. Speakers should be prepared to give statements to the media and answer any questions about their position. Interested parties can invite the media to attend and offer to speak privately to them about their position. The media representatives may ask speakers for additional information and it is wise to provide it.

When all interested parties have had the opportunity to speak and after all of the committee members' questions have been answered, the committee adjourns for private deliberations. These meetings are not open to the public. It is here that the

public part of the public hearing is over. Interested parties can continue to communicate privately with their elected officials and provide additional written materials. Interested parties can also contact local media representatives to further explain their position. However, once the committee ends the public hearing phase of its deliberative process, there is no more space for public testimony.

The public hearing is one way that interested citizens and organizations can have direct contact with their elected officials. Each community has a slightly different process for holding public hearings, but the general process is as explained. It is the right of individuals and organizations to speak out on issues that affect their community. The public hearing provides the opportunity for elected officials to solicit public comment as they make legislative decisions. An interested party can be successful if he or she is well prepared, anticipates difficult questions, and provides meaningful written support materials to decision makers.

—Maureen Taylor

HILL, JOHN WILEY

John Wiley Hill (1890–1977) was the principal founder of Hill & Knowlton of New York, the largest and most successful public relations firm in history. For about 30 years after World War II, Hill & Knowlton led the industry in billings, and journalists and other public relations practitioners routinely rated it the best in the business. It was the first public relations agency to expand successfully into Europe and other international markets, while at home, by 1959 the combined sales of its clients amounted to 10 percent of the gross national product. Moreover, Hill's influence and that of his top executives was greater than most other public relations counselors of the time. Hill & Knowlton officers routinely attended board meetings and served as part of the management team of the agency's clients, which included the steel, tobacco, and aviation industry trade associations. Hill & Knowlton was the agency others wanted to emulate from the 1950s to the 1980s.

BIRTH AND EDUCATION

John Hill was born on November 26, 1890, on a farm near Shelbyville, Indiana, the third of four sons born to Theophilus Wiley and Katherine (Jameson) Hill. Growing up on a failing farm, Hill graduated from the public high school in 1909. He worked for local newspapers before joining the staff of the *Akron (Ohio) Press*. After about two years there, Hill left to study journalism and English at Indiana University. After two brief stints in school, he quit and returned to Akron, this time to work for the *Beacon-Journal*. In 1913 he and a friend founded the short-lived *Chicago Daily Digest*; a few months after it folded, he and another friend began publishing a paper in Shelbyville. It, too, collapsed, and he moved to Cleveland to report again for the *Press* and then the *Plain Dealer*. Hill married Hildegard Beck on June 19, 1916, in Cleveland; she was the daughter of the first conductor of that city's symphony. Hill's formal education apparently ended for lack of funds, but his entrepreneurial spirit would serve him well.

EARLY PUBLIC RELATIONS CAREER

In 1920 Hill made a tentative step toward a career in public relations. He created a newsletter for local executives for the Union Trust Company in Cleveland, while also serving as financial editor for the *Daily Metal Trade*. This dual role led him to two important realizations: first, that many journalists were inept in reporting on financial news, and, second, that most executives had no desire to deal with the press. In short, Hill identified a need for a "corporate publicity office," which he opened in Cleveland in April 1927. In 1933 he invited Don Knowlton to join him, thus creating Hill & Knowlton.

People who knew Hill believed that Hill & Knowlton's Cleveland accounts, including Union Trust, Otis Steel, Standard Oil of Ohio, and Republic Steel, had a tremendous impact on Hill's way of thinking and his approach to public relations. In his later years, Hill often reminded people of a banker or a statesman, and his quiet, conservative approach seems to have developed from his association

with financiers and steel magnates, many of whom hated big government and organized labor.

Tom Girdler, Republic Steel's fanatically anti-union president, drew Hill & Knowlton into a wider world, and into one of the biggest industrial controversies of the Depression. On Girdler's recommendation, the American Iron and Steel Institute (AISI) retained Hill & Knowlton in 1933, forming an association that lasted well into the 1970s. (Eventually this became the largest single public relations account in the world.) The agency developed institutional advertisements opposing union organization of the steel industry, defended Republic and other companies when the 1937 Little Steel strike resulted in violence, and represented the AISI during the Senate hearings that investigated the companies' actions during the strike. A Senate subcommittee of the Education and Labor Committee, popularly known as the La Follette committee (its chair was Robert M. La Follette, Jr., of Wisconsin), even investigated Hill & Knowlton, because of a mysterious special fund the agency kept on behalf of the steel companies. None of the companies that contributed to the fund had received anything beyond a newsletter that all Hill & Knowlton clients received, and La Follette suspected the agency was involved with the antiunion "citizens committees" that had sprung up in strike towns, but the senator was unable to connect the money or Hill & Knowlton to anything illegal.

Although he often failed to see or understand the problems of the consumer or the worker, Hill had a strong appreciation for the power of public opinion. Because rational people ruled in a democracy, Hill asserted, "Public opinion is entitled to the facts in matters of public concern" (Hill, 1958, p. 63). Therefore, he explained, a good public relations program must be based on integrity, sound policies, and the release of information that the public could understand and believe. He was greatly influenced by Ivy Lee, whose 1925 book, *Publicity: Some of the Things It Is and Is Not*, Hill read and whose ideas he often repeated, particularly regarding the need for publicists to counsel their clients rather than simply taking orders.

Within a few years after its founding, Hill & Knowlton began to expand. Hill opened a New York

office in 1938, moving there while separating from and later divorcing his wife. In 1944 he opened a Washington, DC, branch to handle government relations for the New York and Cleveland offices. By November of 1945 the New York branch's billings were double those of Cleveland, and Hill recognized that his future was in Manhattan. In 1947 he turned over all but 5 percent of his interest in the Cleveland office to Knowlton and established a separate agency, Hill & Knowlton, Inc. (Knowlton owned a small share in exchange for the use of his name.) Hill married for a second time, on December 2, 1949, to Elena Karam, and he adopted two children.

HILL & KNOWLTON OF NEW YORK

Some of Hill's Cleveland accounts—Standard Oil of Ohio, Warner and Swasey, and the Austin Company—transferred to New York with him. The AISI and several other clients he had recruited through the Manhattan office, most notably Avco Manufacturing and the Aircraft Industries Association, gave the new firm a presence in both the field of public relations and in big business. Although he had several corporate accounts, large trade association clients were Hill & Knowlton's bread and butter.

The aviation industry campaign after World War II was typical of Hill & Knowlton's trade association work. The Aviation Industry Association (AIA) sought a steady diet of military appropriations for its member companies, and it promoted air safety, travel, and other aspects of civil aviation. After the war ended, military contracts took a nosedive, so the agency focused on convincing the federal government to audit the nation's air policies and its readiness for another war. When both Congress and President Harry S Truman set up commissions to review air policy, Hill & Knowlton helped industry officials prepare their testimony and publicized the boards' findings. Joining with the American Legion, the AIA sponsored a campaign, "Air Power Is Peace Power," beginning in 1947. Working through the Aviation Writers Association, which had its headquarters at the AIA offices, Hill & Knowlton promoted the aircraft industry with journalists who specialized in aviation. Interest in flying was high,

and in a three-month period in 1947, local media devoted almost 5,000 column inches to just one portion of the air power campaign. The AIA also mailed publications about aviation to opinion leaders such as college professors, state legislators, ministers, and business leaders, and sent speakers to civic club meetings across the nation. Thus, Hill & Knowlton coordinated the efforts of the media and political and public interest groups to promote its client's interests.

During the next two decades, Hill & Knowlton regularly took part in important public debates because of the stature of its clients. It represented the steel industry, for example, in 1952, when President Truman seized the mills to prevent a strike during the Korean War, producing booklets, speeches, advertisements, and more than 100 news releases in just a few months, both opposing the workers and disputing Truman's right to take the mills. In December 1953 the agency acquired a new account, a group of tobacco executives responding to a series of medical studies that linked smoking to lung cancer and other diseases. Hill & Knowlton created the Tobacco Industry Research Committee, funded by tobacco farmers and cigarette manufacturers, to distribute grants for research on smoking and health and to promote the idea that the link between smoking and disease had not been proven. The agency successfully convinced reporters to include its statements alongside those of doctors who condemned the industry's products in a growing body of evidence indicting cigarettes. (In 1969, Hill & Knowlton quietly resigned the account as its influence on industry policy dwindled.) Finally, the natural gas controversy of 1956 represented a major defeat for Hill & Knowlton, despite its best efforts. The agency mobilized corporations and individuals to fight federal regulation of the industry. It appeared to be headed for success after a favorable vote in the U.S. House of Representatives when a U.S. senator announced that two gas industry lawyers (not affiliated with Hill & Knowlton) had tried to bribe him. The bill still passed the Senate, but President Dwight D. Eisenhower refused to sign it because of the scandal. Hill & Knowlton also represented the pharmaceutical industry during the Kefauver hearings of the early 1960s, which were

followed closely by many citizens as well as business leaders.

INTERNATIONAL PUBLIC RELATIONS

Several factors contributed to Hill & Knowlton's move into international public relations. First, John Hill toured Europe for the first time in 1952, when he was 62 years old. He detected extraordinary potential for the field of public relations there. Additionally, several of the agency's corporate accounts, including Procter and Gamble and Texaco, were multinationals with interests all over the world, and Hill needed a new challenge. Hill & Knowlton was the largest firm of its kind, and it had already begun buying up smaller agencies and absorbing their client lists. (In the 1980s this trend would accelerate among all the large agencies.) By July 1954, Hill & Knowlton had developed a network of affiliated agencies in Britain, France, the Netherlands, and Belgium, and had opened its own office in Sydney, Australia. In December of that year, Hill & Knowlton sent an officer to Paris to establish its international headquarters. Hill traveled to Europe three times in three years, flush with optimism about his new venture, but not until 1958 did the international office gain its first big account: promotion of the 1958 World's Fair in Brussels. Although Hill & Knowlton International failed to turn a profit for almost a decade, Hill & Knowlton had established a firm toehold in international public relations and had enhanced its reputation as the leading public relations agency in the world.

INNOVATION AND GROWTH

Hill & Knowlton was a public relations innovator in many other ways. In the late 1940s, the agency hired Price Waterhouse to apply cost accounting and modern budget management practices to public relations, setting up a system of standard fees and staff-time charges. (Most agencies rather haphazardly set different rates for different clients.) The agency also established stock purchase and profit sharing plans for employees, effectively minimizing turnover. It created educational programs for public schools and developed extensive community

relations programs for companies and industries. In 1966 it established an Environmental Health Unit to work with corporate clients on pollution and other environmental issues. Other specialized departments included women's interests, press relations, radio and television, graphics, and technical writing. Hill & Knowlton also experimented with new kinds of public relations research and with the use of computers during the 1960s.

In 1966 the agency listed 42 domestic clients and 15 international accounts, many of which were prominent in national and world affairs. In addition to the steel industry, trade associations included the American Petroleum Institute, Lead Industries Association, Licensed Beverage Industries, and the Tobacco Institute (a successor organization to the Tobacco Industry Research Committee). Corporations included Allied Chemical, Ernst and Ernst, Gillette, Marathon Oil, Procter and Gamble, and the Union Pacific Railroad. It even represented the American League of Major League Baseball. Internationally, such groups as Alcoa, the Hong Kong Chamber of Commerce, Hughes Aircraft, and World Airways retained Hill & Knowlton.

Hill & Knowlton's staff also made an impressive testament to the agency's leadership and reputation in the field. A 1963 survey of its talented employees showed that the average staff member had 15 years experience in public relations; at least three in four of them had worked in journalism. They had written 44 books and had published articles in more than 100 publications. Hill himself wrote two books, made dozens of speeches, and wrote numerous articles for the trade press. Among his staff, three held doctorates; several were attorneys; one had won a Pulitzer Prize. Of those employed in the United States, 33 could read or write French, 19 German, 18 Spanish, and others spoke Russian, Italian, Arabic, Greek, and Dutch. At Hill's death, Hill & Knowlton boasted 560 employees scattered among 18 offices overseas and 36 in the United States.

John Hill consciously set up an agency that would outlast him, designating a line of succession to follow him. Beginning in 1960 he gradually withdrew from day-to-day participation in account management and reduced his personal holdings in the agency. He retired as chairman and CEO in 1962,

John Wiley Hill

although he retained his corner office until his death. Hill & Knowlton's reputation for integrity and professionalism, however, was based largely on Hill's personal reputation among business leaders and other public relations executives. After he died in New York City on March 17, 1977, executives found it increasingly difficult to balance growth with ethical performance. Still, with its combination of size and endurance, Hill & Knowlton represented a new kind of public relations consultancy.

HOLD AND HOLD FOR RELEASE

Press releases are among the most used public relations tools. They are an efficient means of disseminating information to the media and are heavily relied upon. Generally the information contained within press releases may be used by media outlets upon receipt. To make editors aware of this situation, the term "For Immediate Release" is found near the top of the release, usually in the upper right- or left-hand corner of the piece.

However, this is not always the case. In cases of sensitive information or to coordinate events and efforts, practitioners may send releases to media before they should be used. In these situations, the information is embargoed, meaning that a specific date and time are given for when the information can be used; editors are asked to hold it for release until then. To signify this, the term "Hold for Release" and specific release information such as time and date will appear in either the upper right- or left-hand corner of the piece.

Most editors will respect these requests and will not publish the information until appropriate, but public relations practitioners have no guarantee of this and have no recourse if an editor chooses to run the information before the embargo ends. Therefore, it is imperative for practitioners to be careful in releasing information that should be held for release. There are advantages to this practice as well. By sending the releases before the publication

time, public relations practitioners attempt to pique the interest of editors and reporters. With the advance notice, the media can develop more complex and in-depth articles about the subject without the pressure of deadlines; with the advent of instantaneous transmission of news in today's society, some say hold for release and embargoed items will soon be relics of the past.

HOME PAGE

A Web page is a computer file that is stored on a computer server in such a way as to make the file available to other computer users via the Internet. Web pages can contain a variety of formats and types of information, including text, pictures, audio, and video.

Web pages are usually written in HyperText Markup Language (HTML) and are uniquely identified by a Universal (also Uniform) Resource Locator (URL). An example of a URL is <http://loc.gov/>

Not all URLs contain *www*, leading to a minor, but important distinction. The terms *Internet* and *World Wide Web* are used interchangeably, when in fact one is a subset of the other. All URLs that start <http://www> are part of the World Wide Web, which is a subset of all URLs making up the Internet. All URLs start with "http://." The inclusion of *www* does not make a Web page any more (or less) accessible.

A home page is simply the top level or *gateway* page for a Web site. A Web site is simply a collection of Web pages that are linked together. Creating Web pages in HTML allows a person to program the links into individual pages as they are created. Any content in a Web page can be linked to any other content in any other Web page. Or if a page is particularly long, links can help a user to navigate the page more quickly.

Web page creators typically use three different ways to let users know when something on the page is linked: (1) A different color can be used for the linked text, (2) the text can be underlined, or (3) both methods can be used. In all cases (meaning all data types, including text), when the mouse cursor

is passed over linked material, the cursor turns into a pointing hand.

The presenting and organizing of information in a Web page format has a unique advantage/disadvantage. It allows a content provider to structure and organize information in a nonlinear arrangement, consisting of text, pictures (moving and still), and video. Because no two people process and consume information in the same way, a Web page allows users some degree of control over the order and method in which they get the message.

This is also a disadvantage. Web page creators have to be familiar not only with ergonomic issues (where to put what information so it is easy to scroll to and access on a page), but also with communication theory, logic, and information flow, so information is not “lost” simply because it was not put where a Web page user expected it to be.

Organizations seeking to engage in public relations are wise to have a presence on the Internet. A home page serves as a 24/7 communication link that allows interested parties wide access to an organization.

There are also marketing advantages. Customers can acquire product and service information and possibly make purchases. A home page can allow open- and closed-end customer feedback and allow customers to ask questions about how to use a product or service. Web pages are replacing 1-800 customer service hotlines as the best means to make product inquiries.

Organizations can create and use a Web site to serve as a repository of information: annual reports of various kinds, collections of past and current media releases, and the history of the organization as well as its mission and vision. Financial information—for businesses as well as nonprofits—can be listed and updated. It can offer pictures and audio statements that make the people of the organization seem less distant. Such sites usually include a location for FAQs (frequently asked questions).

Web pages offer reporters access to media releases, sometimes with a password that allows them also to seek additional information about a story. Discussion rooms can be established where issues can be debated.

HOOD, CAROLINE

Caroline Hood (married name Carlin) (1909–1981) was the first woman vice president of Rockefeller Center, Inc., a 21-building development in Manhattan, where she managed public relations programs, community events, and corporate advertising from 1934 to 1973. Hood was also the first woman to be elected to the board of directors of the New York Convention and Visitors Bureau and of Radio City Music Hall.

Hood began her work at Rockefeller Center as a “Flying Ambassador” traveling thousands of miles annually to publicize and promote the new multi-building project (“Caroline Hood,” 1981), although a 1951 article on women in public relations reported that Caroline Hood began selling souvenirs to tourists in the basement of Rockefeller Center and then suggested offering tours of the center’s gardens to the public (“Women in Public Relations,” 1951, p. 6).

Some of her accomplishments include the annual search for the famous Rockefeller Center Christmas tree; receptions for the world’s great—from the Dionne quintuplets to Haile Salassie to Princess Margaret; the celebration for the liberation of Paris in 1944 to the annual Christmas tree lighting ceremonies” (“Caroline Hood,” 1981, p. 1).

Hood was the first woman appointed to the Public Relations Society of America’s Board of Directors in 1951. In 1972, she received the Distinguished Service Award from the New York chapter of the Public Relations Society of America, the first woman so honored. The New York chapter of Theta Sigma Pi, a national journalism sorority, named her the outstanding woman in journalism and communication.

Hood served as president of Women Executives in Public Relations and of Advertising Women in New York.

In 1959, she served on a 16-member advisory panel for the United States Information Agency in

Washington, DC, and in 1963 she served on the New York State Women's Council. In 1964, the Republican Women in Business and Professions honored her as "the outstanding woman in public relations." Her career highlights are housed at the Schlesinger Library at Radcliffe College.

Hood studied at Columbia University and the New School. She was married to John Hayward Carlin.

HOOG, THOMAS W.

Thomas W. Hoog, who serves as chairman of Hill & Knowlton/USA, has made two defining contributions to the practice of public relations and public affairs in the United States during his tenure at the agency. The first was expanding the practice of public affairs beyond representation at the federal level to representation at the state and local levels. The second was developing a client service model that integrated equally both the geographic and practice expertise available to clients throughout the extensive U.S. network of the agency.

Tom Hoog was born in 1939 in Ste. Genevieve, Missouri. He went to the University of Illinois and received his degree in aeronautical engineering. Hoog started his career in 1960 as a naval aviator and spent four years with the U.S. Navy's Pacific Fleet from 1962 to 1966. He began his work in politics and public affairs with stints in the presidential campaigns of both Senator Robert F. Kennedy and Senator George McGovern. In 1974, Hoog became chief of staff for U.S. Senator Gary Hart of Colorado, and served as political director of Senator Hart's presidential campaign in 1984. Hoog later extended his involvement in U.S. presidential elections by serving on the executive committee and national finance committee for then-governor Bill Clinton's 1992 presidential campaign.

In 1980, after his Capitol Hill experience, Hoog founded and served as president of Hoog and Associates, Inc. This firm specialized in government relations and public affairs and had offices in Denver; Washington, DC; and Orange County, California. In 1989 the firm was acquired by Hill & Knowlton to expand its public affairs practice, which was headquartered in Washington, DC.

As Hoog advanced in Hill & Knowlton, he served as chairman of its U.S. Public Affairs Practice in 1992, and as general manager of its Washington, DC, office from 1993 to 1996. In 1996 he became president and CEO of Hill & Knowlton/USA and served on the agency's Worldwide Executive Committee.

In 1960, Hill & Knowlton became the first national public relations agency to open offices in Washington with the explicit purpose of representing its clients to the federal executive and legislative branches. At this time, the agency began to offer lobbying as a service to its clients. This was one of the initial steps in what evolved over the next two decades as the practice of public affairs. Just as the visionary John Hill saw that the interests of American businesses and commerce dictated the expansion of Hill & Knowlton into the international arena, so Hoog believed that those same interests would be increasingly impacted by the growth of the federal government in the United States.

Over those two decades, as federal legislation and regulation expanded, so did the Washington office of Hill & Knowlton. But Washington was not alone in influencing business and commerce. In the 1980s, increasingly state legislative and regulatory actions became significantly relevant to the business community. Referenda, particularly in California, became a powerful force for change and impacted the business sector significantly. As a full-service firm, Hill & Knowlton wanted to offer services to its clients dealing with this shift in policy and legislative activity.

It needed a leader who understood the interplay of public affairs at the federal as well as state levels and who could build a network of public affairs specialists throughout its national operations. It chose Tom Hoog to build this capacity, which remains a fundamental component of the agency's public affairs offering today.

An early example of this capacity at work in a multistate campaign involved a fight between the juice carton industry and the bottlers. The Maine legislature passed a bill that prevented the use of the individual juice boxes in schools. Similar legislation was introduced in other states. Hill & Knowlton waged a campaign that not only prevented the passage of similar legislation in other states but also reversed the decision in Maine.

Another example of this capacity at work harnessing powerful state interests to prevent a federal legislative action involved a fight between domestic and foreign automobile manufacturers. Congress was considering levying a tax on luxury automobiles manufactured by foreign companies. By working in California's large U.S.-based facilities of the foreign manufacturers and expressing the labor interests of those employed by these companies, Hill & Knowlton convinced the Congress not to proceed with this new tax.

Upon becoming president and CEO of Hill & Knowlton/USA, Hoog was faced with a significant challenge. Within the agency there existed a substantial geographic network of offices with varying degrees of staff composition and communications expertise. A high degree of specialized expertise also existed throughout the organization. For instance, the New York office dominated the financial public relations practice, with some expertise in Chicago and Los Angeles. Although media relations were offered in every office, the dominant media capitals were Washington and New York. Marketing services were becoming industry specialized. The health care practice was no longer directed solely to the pharmaceutical industry but also to the provider/payer sector, and the emerging biotech/bioscience industry, which flourished then in California and Massachusetts.

Yet clients needed the best the agency could offer, whether in crisis communications, reputation management, or issues management, wherever headquartered in the Hill & Knowlton U.S. network. Hoog was challenged to develop a client service model that harnessed all the disparate specialized talent of the agency, and a business management model that incorporated effective

incentives for different offices to work with each other on behalf of clients.

The concept of "best teams" was not new to Hoog. The goal was clear: Bring together the professional team with the right expertise needed by the client irrespective of where that expertise resided geographically. What Hoog did that profoundly altered the way Hill & Knowlton provided its services to its domestic clients was to make the concept of "best teams" work. He did this by taking two steps.

The first step was to bring into the organization a top tier of practice directors who had parity with the general managers of the U.S. offices. This parity was essential to enabling the senior management of the U.S. operations to focus on client service and also strategic growth for the agency. Parity was manifest in the management and governance of the U.S. company by having both general managers and practice directors on the U.S. management committee. In addition to 12 geographic offices, five functional practices and two industry-sector practices were established (corporate public relations, media relations, marketing communications, financial public relations, public affairs, health care and pharmaceuticals, and technology).

The integration of authority was manifest in hiring, in allocation of resources, in performance reviews, in business development activity, and in ensuring that every client—large or small—had access to the top counselors in the firm as well as the most specialized expertise. Incentives to work across geographic and practice boundaries were instituted at the individual, office, and practices levels.

The second step Hoog took was to institute a formal professional development program at Hill & Knowlton in which every professional was required to take 10 training courses per year. The training was provided by experts and was taken to each office throughout the U.S. network. An extensive curriculum was offered, including courses in journalism, client service, account management, writing, computer skills, and each of the core practices of the agency. The goals of this training program were to ensure that all professionals had a common standard of excellence in the basics of communications, learned more about specializations outside their own, stayed abreast of technology advances,

Thomas W. Hoog

and were challenged to think about the impact of communications on the rapid changes taking place in society and business.

In addition, Hoog redefined Hill & Knowlton College, held once or twice a year for various professional levels throughout the agency. The faculty of the college consisted of internal and external experts, and attendees participated in three days of intensive training on how to harness the resources of the entire firm on behalf of clients. The personal relationships developed by this boot camp approach changed the way the professional staff interacted with each other on behalf of clients.

Hoog's leadership and contribution were recognized in his final year as CEO of Hill & Knowlton/USA by the agency's being named Agency of the Year by *PR Week*. In addition, Hoog was selected by *PR Week* as one of the 100 most influential public relations practitioners of the 20th century. He recently completed a term as chairman of the Counselors Academy of the Public Relations Society of America.

HOTLINE

Hotlines provide customers and concerned citizens easy access to seek information or express opinions to businesses, government agencies, and nonprofit organizations. Hotlines originated as 1-800 numbers to replace personal letters from customers who wrote to obtain information or express concerns. Savvy businesses were among the first organizations to realize that customers might wish additional information about products or services. So hotlines were established to make it easy for a customer to call an expert to seek advice on the use of a product or to solve a problem relevant to a product or service, such as might occur with an insurance policy. Government organizations and nonprofits soon recognized the virtue of this kind of constituent contact.

Hotlines can play a vital role in people's lives. Imagine for a moment a young couple who obligated themselves to prepare one of the major holiday meals for other members of the family or friends—or both. Early on the morning of the event, the young couple comes to grips with the reality that they have a very large, frozen turkey that is far from being easily and readily prepared for that delicious meal they imagined—based on their recollection of “Mom's” holiday table. Now, the couple might just call Mom. But that might mean admitting the truth: The couple is poorly prepared to deal with the realities of life at the holiday season. So why not call the company that harvested and sold the turkey? Should the package wrapping that plump turkey have a 1-800 number printed on it so that the young cooks could talk to an expert regarding how to prepare that magical meal that appears so easy when Mom fixes it? Realizing the marketing and customer relations value of such a number, poultry companies proudly display “1-800-Call-Turkey.” Frontline companies committed to customer relations print such numbers to give customers access to expertise.

The backs, sides, tops, bottoms, and fronts of packages now routinely include that magical 1-800 number or the even more modern version: an e-mail or a Web site address. The reality of this public relations tool is that companies are wise to make an easy and useful communication link with customers. Network theory advises that the easier information is to acquire, the more likely people are able to reduce uncertainty and feel a sense of accomplishment—part of what is necessary to build a mutually beneficial relationship. They also feel included in the organization. They are more than a customer; they are a valued customer. Customer satisfaction is more than a buzzword; it is a commitment indeed.

This public relations tactic can be used to ease communication with members, donors, activists, media, employees, students, and all of the stakeholders in a long list. Not only does the link allow for information to be sought, but information to be provided and opinions to be expressed by the outsider. Concerned citizens need a number to call if they are worried about their health or safety because of a company's operations. Government agencies can use the channel to provide information to citizens in an as-needed basis. At tax preparation time, for instance, the Internal Revenue Service can use links of this type to assist taxpayers. So can activist groups and other nonprofits, opening themselves to those who seek information and voice concerns.

If organizations aspire to be open, they need to facilitate that openness. They need to create various communication channels that can be used by customers, audiences, and publics. Organizations espouse the virtue of two-way communication but may fail to create the counterpart to one-way communication flows—from them to markets, audiences, and publics. Another benefit is that such channels give the organization an opportunity to conduct environmental scanning, looking for product/service-related problems or community concerns.

Whereas the 1-800 number began the tradition of opening an organization to outsiders, the current new technologies offer another 24/7 dimension to this. One additional option is the frequently asked question (FAQ) feature at homepage Web sites. Another is the chat room, where concerned citizens can voice

concerns, see the concerns voiced by other citizens, and read the organization's response. Whereas letters once were the sole link, this extremely impersonal and time-consuming process has given way to more modern and effective means for opening organizations to their constituents. Hotlines can help companies achieve the goal of promising to be the first and best source of information on all matters relevant to them and those they affect.

HOWLETT, E. ROXIE

E. Roxie Howlett, head of Howlett & Gaines Public Relations of Portland, Oregon, has been a leader in public service to society for the field of public relations. A fellow of PRSA, M.S., and C.H.E., she received the Public Relations Society of America (PRSA) Paul M. Lund Public Service Award in 1992. Lund challenged the field of public relations to change the human condition by becoming agents of understanding between institutions and society. Howlett illustrated this ideal through “exemplary dedication to the community of the San Francisco Bay area on a volunteer as well as professional basis” (“To Business Desk,” 1985, p. 1).

Howlett has volunteered her services to such organizations as the American Lung Association of San Francisco, the Commonwealth Club of California, the Assistance League of San Mateo County, the National Assistance League, and the San Francisco School of the Arts Foundation.

Howlett & Gaines, Portland, Oregon, was located in the San Francisco area from 1968 to 1989. Prior to forming this agency, Howlett was western manager, Home and Fashion Division for Infoplan, the public relations arm of McCann-Erickson, Inc. from 1962 to 1968. She was the first non-owner to run the San Francisco office of Infoplan.

Howlett worked as an account representative for Lee & Associates Public Relations, Los Angeles,

California (1958–1968), was assistant food editor for the *Los Angeles Times*, and was Director of Women's Programs at KPOJ, Portland, Oregon.

Howlett has been a leader in the International Public Relations Association (IPRA). She has served on the IPRA Council and coordinated IPRA interests with the PRSA International Section. In 1991, she reviewed the Zimbabwe Institute of Public Relations diploma, creating regulations and a syllabus for the Professional Diploma in Public Relations.

Howlett has held many leadership positions in the local, state, and national levels of the Public Relations Society of America, receiving national presidential citations for "meritorious service to the PRSA Counselors Section."

In 1983 Howlett became the first woman president of the Public Relations Round Table of San Francisco, formed in 1939 and said to be the oldest public relations organization in the United States.

She was one of the first female members of the Commonwealth Club of California, a leading public affairs forum and the oldest and largest such forum with more than 20,000 members in the United States. Howlett served as secretary and board of governors member for the Commonwealth Club, helping receive visiting U.S. presidents, vice presidents, congressional leaders, world political personalities, authors, researchers, and environmentalists.

Howlett's other professional activities include leadership roles in the American Home Economics Association, the Oregon Home Economics Association, the Oregon State University College of Home Economics and Education Alumni Association, Kappa Omicron Nu, the International Federation for Home Economics, the California Home Economics Association, and the San Jose State University Public Relations Degree Advisory Board.

Other community service activities have included service for Volunteers of America, Oregon, Inc.; the American Lung Association of Oregon; the American Lung Association of California (she was the second woman to serve as its president in 1984 and 1985); and the national American Lung Association.

Howlett earned a Master of Science degree from the University of California at Los Angeles, and a

Bachelor of Science degree from Oregon State University. She studied under Rex Harlow, Stanford University professor emeritus and a founder of public relations. In 1981, she was the first woman to receive the PRSA Rex Harlow Award.

HUMAN INTEREST

Human interest is a vital ingredient in making some event or situation newsworthy. One of the compelling questions answered by journalists is "Who did something?" or "To whom did something happen?" The element of human interest enlivens a news story. It makes the story more appealing because it is about real people. It centers on the feelings and emotions of real people.

The human interest value of a story is easily revealed in the news programming axiom: If it bleeds, it leads. That statement reflects the sense that if the story has human drama, pathos, it is going to satisfy audiences' desire to see the human element of the news. News doesn't just happen. It happens to real people.

Meeting the human interest challenge separates the inadequate, adequate, good, excellent, and great journalists and public relations practitioners. Every practitioner is challenged to create media relations. Part of that challenge is to release to reporters news and news tips that attract their interest because the news is newsworthy. Newsworthiness is a strategic decision about the reader, listener, or viewer appeal of the content and presentation of news stories.

Human interest is created, for instance, by a news report that a child is missing from home. That story is made more interesting by noting the age of the child. A younger child would likely generate more news value, human interest impact, than an older child. The story would have more human interest if

the days were cold, the disappearance occurred under suspicious circumstances, the child were blind, or the child were lightly clothed—too lightly for safety given the lowering temperatures. If a storm were brewing, that would add human interest.

Thus, the details that enrich the drama of the news event add human interest. If a practitioner is trying to attract attention to some event, he or she is more likely to do so if it has human interest. Let's reflect on a real-life situation. What if a practitioner working to gain attention for the grand opening of a department store or mall is confronted with a nuance such as the mall or store catching fire near the opening date? The news releases are attempting to attract customers' attention to the opening to increase traffic. But the fire diverts the grand opening. Announcing that the store or mall is about to open after the appropriate repairs have been made might be anticlimactic. What if the merchants pool resources and buy a Dalmatian puppy to give to the fire station that responded to the fire alarm? What if the merchants also contributed money to a charity that was sponsored by the fire personnel and announced the gift? Would the new grand opening have more news value, more human interest, if associated with this tribute to the fire personnel who had risked their lives to extinguish the fire?

In the best sense, human interest is a vital part of each news story. One of the reasons people pay attention to the news is to learn about the impact of news events on people's lives. For this reason charities tend to build on the human interest, such as stories of needy families at Christmas, to increase the likelihood that reporters will present the news and audiences will receive it. Used ethically for the good of the issue, human interest is a very positive aspect of news and the media relations efforts of practitioners.

By the opposite use, human interest can exploit human feelings for no particular news value. It may appeal only to the darker side of the public's interest in seeing something bad happen to people. This may be especially true of people who want to pry into others' lives. For that reason, news reporting can focus on "dirty laundry." The assumption is that the news story has more appeal if dirty laundry

is aired in public. For this reason, celebrities of whatever walks of life are subject to extraordinarily unfair reporting standards. What might be a family tragedy, such as drug addiction, becomes even more newsworthy if it is associated with the rich and famous. The lurid details and horrifying pictures might even be blatantly displayed in the tabloids at grocery store checkout lines.

Human interest is an important dimension of news reporting. Because of its connection with news reporting, public relations has a responsibility to understand and comply with the strategic and ethical dimensions of human interest as news value. Practitioners would be guilty of unethical hype if they played up the human interest aspect of a story beyond what good judgment, responsibility, and taste would dictate. In this regard, an unethical practitioner would use and embellish the human interest beyond what was reasonable to meet community standards for the interest of the client. Such self-serving displays of human interest can erode the news value of stories, harm media relationships, and turn off the public, which has sensibilities to fair and honest reporting. On the opposite side of the coin, however, practitioners who represent certain clients must acknowledge that human feelings are a vital part of stories. In some instances, such as a sensational kidnapping, a practitioner might try to protect the family from the prying eyes of reporters and audiences who want lurid details and raw displays of feelings, which have no real news value. By the same token, however, practitioners in service of the rich and famous must know that the public and reporters are likely to demand more details, however raw, of those clients who seem to climb highest and fall the farthest.

Human interest is a two-edged sword of news and public relations practice. It focuses attention on the human drama that is explained by narrative theory. Nevertheless, some elements of decorum must bring perspective to the personal aspects of stories and the people who make them. The axiom that not everything is the news or newsworthy has substantial implications for those interested in human interest.

HUNTER, BARBARA W.

Barbara Way Hunter, founder and former CEO of New York-based Hunter & Associates, Inc. (now Hunter Public Relations, LLC), was a trailblazer for women in public relations who aspire to own their own firm—to be the boss. In the late 1960s, when it was virtually unheard of for a woman to own and head a business, Hunter countered opposition and purchased her own public relations firm. Her actions encouraged other women to do the same in a field then dominated by men.

Hunter was born in 1927 in Westport, New York. After graduating from Cornell University's College of Arts & Sciences with a bachelor's degree in government, she accepted a job as a trade magazine editor. Using her liberal arts background, Hunter quickly progressed to a publicist position for a major food company. In February 1956, she joined the public relations firm of Dudley Anderson Yutzy (D-A-Y) as an account executive. After two of the original D-A-Y partners died in 1969, Hunter and her sister, Jean Schoonover, bought out the remaining partner. Hunter became president of the new firm, which grew 500 percent in the next 12 years.

D-A-Y was sold to Ogilvy & Mather Public Relations in 1983, and Hunter became vice chairman of the subsidiary of the large advertising agency.

In 1989, Hunter founded Hunter & Associates, a firm specializing in marketing and public relations for food and beverage companies. The firm started with two clients: McIlhenny Company, maker of Tabasco sauce, and Kraft Foods. Eleven years later, when Hunter retired, the firm had added Campbell Soup Company, McCormick & Company, Morgan Stanley, Pepperidge Farm, Pernod Ricard USA, 3M, Sears, and others to its client roster. It also was the number two independent public relations agency in the nation, billing over \$7.8 million in 2000.

Hunter led the firm as CEO until her retirement in December 2000. Senior managers then purchased

the firm from Hunter, and—keeping her name and professional commitments and ideologies—renamed it Hunter Public Relations.

According to Hunter, honesty has been key to her success. During her 42 years of practicing public relations in an agency setting, she lived by one rule: “Do not overpromise results to your client and make certain you deliver the promises you do make” (B. W. Hunter, personal communication, November 14, 2002).

Honesty paid off. By not overpromising, she ensured that clients stayed loyal to her firm and referred her to other business associates. She explained, “When you promise an outcome and deliver on those promises, it builds confidence, and from confidence comes a loyal client” (B. W. Hunter, personal communication, November 14, 2002). She was not afraid to admit when she could not accomplish an organization's objective. Summarizing, she said, “Honesty is a large aspect of success.”

Going to great lengths for the client also helped build successful and beneficial relationships for her firm. Hunter elaborated, “If a clients know you will be responsive to their individual needs, they will stay with you. Everyone likes personal attention” (B. W. Hunter, personal communication, November 14, 2002).

Hunter also attributes her success to the creative and interesting approaches she has taken with her clients and their products. The bottom line, however, is that a public relations firm is only as good as the practitioners it employs. Practitioners must have good judgment and be creative, articulate, and skillful to get their message out to targeted publics.

Hunter's contributions extend to professional and civic organizations, and her achievements have been recognized with numerous honors and awards.

She is a past president of the Public Relations Society of America (PRSA) and of the New York chapter of PRSA. She is a member of PRSA's College of Fellows and the recipient of 12 PRSA presidential citations. In 1993, the society honored her with its Gold Anvil Award, its highest individual award. She also is a past recipient of the John Hill Award from the New York chapter. She served as the chairman of the 1998 PRSA national conference in

Dallas, Texas, and founded PRSA's Food and Beverage Section in 1992.

A former trustee of the Institute for Public Relations, Hunter also was a board member of the Advertising Women of New York and Women Executives in Public Relations. She received the National Headliner Award from the Association for Women in Communications in 1984, the Matrix Award from New York Women in Communications in 1980, and the Entrepreneurial Woman Award from the Business Owners of New York in 1981.

Hunter was a charter member of the Committee of 200, the professional organization of preeminent women entrepreneurs and corporate leaders; she is also a member of the YWCA Academy of Women Achievers. In 1976, *Business Week* named her one of the 100 Outstanding Women in Business.

Hunter has served as a trustee of Cornell University, as well as a member of the advisory councils of Cornell's Colleges of Veterinary Medicine and Agriculture and Life Sciences. She is a lifetime member of the Cornell University Council.

Reflecting on her chosen career, Hunter said she has watched acceptance of public relations as a profession grow. As formal educational programs are offered and utilized, acceptance by the business community of public relations as a true profession has emerged. Also, advancements in computers and technology have extended the reach of a practitioner's message. The Internet has become an invaluable tool in a profession where immediacy matters.

Looking to the future, Hunter predicts that more emphasis will be placed on ethical practice. She has always believed that ethics is an essential aspect of public relations, but in tomorrow's world, practitioners will have no choice but to perform ethically. Ethics will be utilized more to communicate what the organization is doing *right*.

Hunter also predicts that public relations practitioners will have to pay more attention to social trends. Religion, economy, war, and other factors will shape constantly changing trends that create communication gaps. Practitioners will have to bridge these gaps to ensure that messages between organizations and their publics flow smoothly and effectively.

Barbara Hunter, who now enjoys retirement in her roles as wife, mother, and grandmother, took

great risks in her career that cleared the path for other women to follow.

—Kathleen S. Kelly and
Kathryn L. Ferguson

HYPE

The term *hype* keeps company with varying definitions, most of which are negative. When referencing its formal denotative term via various online dictionaries, we find noun-based descriptions like “blatant or sensational promotion,” “a deception or racket,” and “an intensive or exaggerated publicity or sales promotion.” Verb-based descriptions include “to put on, deceive”; “to market or promote (a product) using exaggerated or intensive publicity”; and “to falsify or rig (something).”

HYPERLINK

Hyperlink is synonymous with both *link* and *hypertext link* on the World Wide Web. The World Wide Web exists on the Internet, a vast network of computers. Although the concept of interconnected machines to facilitate the widespread sharing of knowledge first appeared in Vannevar Bush's July 1945 *Atlantic Monthly* article, "As We May Think," the word *hypertext* did not appear until 20 years later in a 1965 paper written by Ted Nelson. Two years later, a team of researchers developed the first hypertext-based system. However, hypertexts, now more commonly called hyperlinks, would not make their public debut until the early 1990s with Tim Berners-Lee's innovation, the World Wide Web. The extensive use of hyperlinks between Web pages is why the medium is termed the *Web*.

Hyperlinks make it possible to access content stored in the files of millions of individual computers. Hyperlinks allow users to navigate on the Web. Hyperlinks provide connections between a word, picture, or object to another. While the most common link on the Web is between a highlighted word or picture, links can also connect objects such as sound and video files. When users conduct searches using search engines, the results always include hyperlinks. In theory, if linking between objects and files on Web sites were not possible, the Web would no longer exist. By selecting a link (usually with a mouse), users are immediately connected or *jump* to another file on the Internet. Hyperlinking enables Web users to connect to other Web pages and find information within seconds without having to perform new searches or other complex tasks.

Hyperlinks can connect users to other pages within a Web site or to external Web pages. Web pages can contain anywhere between one to an

unlimited number of hyperlinks. The Web page owner controls these branching mechanisms. In most cases, Web site operators want their pages to be the destination of as many links as possible. The more links that point to a Web page, the wider the potential dissemination of information on those pages.

Starting in the late 1990s, hyperlinks became the center of intellectual property lawsuits. In a 1997 case, Ticketmaster sued Microsoft for *deep linking*. Deep linking is the process of bypassing a Web site's home page and linking to other pages on the Web site that are typically accessed from the home page. Ticketmaster claimed Microsoft's bypassing of its home page by deep linking allowed users to bypass its policies, service information, and ads. Although the case was eventually settled out of court, a district court ruled that hyperlinks themselves do not violate copyright law; hyperlinks automatically transfer users to the Web page of the original author, and no actual copying occurs.

Inline linking is another legal issue involving hyperlinks. For example, in *Kelly v. Arriba*, a search engine imported pictures to its Web site instead of providing a direct link to the photographer's Web site, which contained the pictures. Thus, the pictures appeared to originate on the search engine's Web site instead of the photographer's. The court ruled that inline linking was a violation of copyright law. In addition, Web sites that post hyperlinks to materials that violate copyright law can also be held liable. In a case involving the Web publisher of *2600 Magazine*, links to other Web pages containing software code that broke encryption access controls on DVDs was found liable for violating copyright law.

IDENTIFICATION

In an age when people frequently communicate with a variety of organizations in their daily lives, the theory of identification offers public relations practitioners a strategy companies and other organizations employ to influence audiences and build relationships with them.

Organizations do this when they demonstrate how they share identities, values, and norms with audiences and publics. As so many organizations try to capture and keep the audience's attention, this strategic process of creating and communicating common ground is crucial. First articulated by scholar Kenneth Burke, identification is a rhetorical concept that has become increasingly important in public relations as more organizations compete to garner the audience support needed for survival. Identifying with an audience consists of persuading them how an organization and an audience member are similar. As Burke described it, "A is not identical with his colleague, B. But insofar as their interests are joined, A is identified with B" (1969, p. 20). Less overt than some persuasive strategies, without the ability to convince audiences of shared interests, an organization's message is likely to fail. On the other hand, if people believe their views and beliefs overlap with an organization's, it becomes much easier to successfully persuade them, as approving

of an organizational message is akin to approving of themselves.

Identification is an ongoing process; indeed, public relations must help organizations to continually show audiences how they are alike and have shared interests. Companies that fail to maintain identification with audiences are in danger of failing. Without the specific connection created by identification, for example, the fur industry in the United States is struggling. It is having difficulty convincing people who value animals for more than their aesthetics that fur clothing is desirable. For some audiences today, then, creating identification on the basis of the values of status and prestige is no longer persuasive. The fur industry faces the danger that "if people find that old identifications are unacceptable, they can be persuaded, and even persuade themselves, to abandon them and adopt new ones" (Heath, 2001, p. 377). Savvy public relations practitioners must therefore monitor changing societal values, trends, and norms.

Understanding societal preferences is necessary, inasmuch as Burke saw identification as "compensatory to division" (1969, p. 22). That is, creating rapport between organizations and audiences necessarily involves showing the audiences how they are like the organization in question but different from other companies also seeking to establish common identity. The messages public relations employs to

create identification work to include audience members as part of a certain group, while at the same time they exclude other groups and competing organizational messages. This means, for example, that when The Gap tries to persuade audiences that they share the values of hip style, reasonable price, and comfort, they are excluding audience members who prefer high end, luxury, or more classic clothing. The company would then need to show how it is more similar to potential customers seeking this type of fashion than other casual clothing marketers.

There are a number of ways public relations can attempt to induce identification. In his study of organizational communication, George Cheney (1983) devised three prominent strategies that follow from Burke's (1969) original formulation of the identification theory. These strategies include (a) the common ground technique, (b) identification through antithesis, and (c) the assumed or transcendent *we*. (Cheney, 1983). Each works to persuade an audience member that they share similar interests. In the common ground technique, an organization would link itself to stakeholders in an overt manner. Audiences are told explicitly that they share organizational values, as in when a company says it has a "commitment to fairness." Identification through antithesis works by demonstrating and uniting against a common enemy. This strategy functions by an "us versus them" mentality, where organizations point out the differences between themselves and a competitor. Finally, identification can be created through use of the assumed or transcendent *we*. The use of this pronoun and its derivatives calls audiences to see themselves as part of the organization or institution. When we are called to act as Americans, for example, we unite on the basis of this particular strategy's evocation of our national identity.

As people identify with institutions when they see that they are alike in some fashion, it follows that these various identifications also work to provide portions of a person's identity. In this sense, identification can function beyond just persuading a person of a message; rather, areas of initial overlap can filter out and constitute portions of how a

person views him or herself. Indeed, as Cheney (1983) noted, "our corporate (or organizational or institutional) identities are vital because they grant us personal meaning" (p. 145). When a person feels she belongs to a certain group or accepts a particular name or label for herself, parts of her identity become constituted. For example, someone who describes herself as a Southern Baptist not only identifies with that organization's values but also views society through this lens. In other words, it is possible to become consubstantial with an organization, meaning that both the organization and audience act together. If one is consubstantial with a particular group, they share common motives. Here, the Southern Baptist would perhaps possess the willingness for acting together on the church's mission and goals (see Cheney, 1983, pp. 145–146).

It is in this way that individual identities can broaden collectively and form groups and coalitions. As Heath explained, "Through identification, people develop various collective identities with which they govern themselves and form human relations" (2001, p. 376). Environmental activists, for instance, support the idea of protecting and conserving the earth. Such groups appeal to these values to gain new members and use this belief to differentiate themselves from other societal groups in order to encourage action. Whatever the set of values or norms, if one shares substance, or is consubstantial, with a given group, then that individual will be more likely to take action when those values are threatened. Once again it is clear how closely identification is connected to societal division. People can feel the need to compensate for the stratification of our society and its attendant pressures by belonging to one group or another. Public relations can rely on the identification strategy to help audiences fulfill their needs of belongingness while simultaneously garnering stakeholder commitment to organizational missions.

These audiences are not always external to organizations, however. It is important for organizations to continually induce identification on behalf of their members to ensure success. If a person feels like they are a part of a given company and supports its values, they are more likely to be happy and productive

employees. Companies work to instill this type of identification in a variety of ways. From corporate newsletters, to team-building outings, to employee-of-the-month-style programs, public relations assists management in recognizing the need to remind employees continually of common interests.

It should be apparent that Burke's seemingly simple idea of demonstrating shared interests is quite complex and forms an important part of public relations practice. In a variety of arenas, public relations managers help craft identifications that support organizational functioning. The concept moves beyond public relations' particular goals, however, and is part of Burke's larger rhetorical theory about the nature of communication. Identification is a central theme in Burke's discussion of rhetoric. In his formulation, identification is a more prominent term than persuasion, as it broadens the role of rhetoric from that of a speaker delivering a persuasive message to one that shows how language, delivered through public relations and other conduits, constructs and reconstructs our realities.

In this way, identification can be broadly understood as a way of viewing society as a whole. Burke saw identification as having a powerful impact on society. He theorized that if identification leads to division, division then leads to societal hierarchy, in which certain audience members believe that they are superior to others. This feeling then leads to what he termed *mystification*, in which the audience questions whether some people *are* truly better, which then leads to victimage. In the victimage part of the identification cycle, audiences symbolically purge their guilt that they may not be as good as others by blaming a scapegoat. This feeling is followed by redemption, or purifying through projecting guilt, leading once again to a state of similarity and consubstantiality (Burke, 1969). Since Burke believed that no form of communication is exempt from motivation, he wanted to reveal the ways in which communication or rhetoric influences motives. Burke believed that rhetoric must investigate the symbolic means of ideology that can both create cohesion within a community and maintain divisions between them. Identification is this symbolic means.

In this sense, the public relations use of the identification strategy is one that perhaps should be viewed with caution. When capable of producing such powerful associations and divisions in society, it is important to understand how encouraging identification around a given issue or person can have more than immediate or short-term impact and can shape society as we know it. When applied thoughtfully, however, the identification strategy becomes a powerful public relations strategy. The benefits of showing audiences how an organization has their best interests in mind are difficult to overstate.

IMAGE

The term *image* is one of the most controversial in the lexicon of public relations. It has been heralded as essential to an organization and dismissed as irrelevant to an organization. Edward Bernays condemned the concept, but others embraced it and corporations spend millions of dollars a year to build them. The problem is that image has developed a negative connotation for stakeholders. That is why it has been replaced by and large in research and practice by the terms *reputation* and *reputation management*. (Refer to the entry “Reputation management” for additional details.)

Early skeptics discounted the basic idea of an image. Many in public relations felt the concept

was irrelevant because it did not affect public relations. Since an image is not tangible, a person cannot touch it; it does not really matter. Efforts and money spent on building reputations were considered wasted. Kenneth Boulding's (1977) early work on image suggested the opposite. He believed people treat images as if they are real. Later research conducted in business found an image has significant effects on organizations. Images were found to affect a stakeholder's behavior toward an organization. Early research found images related to stock prices and employee recruitment. Images do matter because they can shape stakeholder behaviors. The problem is not whether or not image matters; it does. The problem is in the use of the term image by organizations.

Image has many meanings, but focusing on the negative meaning helps us to understand how it came to be vilified and ultimately replaced in the public relations lexicon. Carl Botan (1993) noted that the most common definition of image was that of a manipulated representation of an organization that lacked substance or accuracy. This can be termed the shallow use of image representing style over substance. An image was something that an organization or even a nation tried to fabricate. The image was based on what the organization said about itself, not what the organization actually did. Zeta Corporation might promote its environment-friendly image in advertisements and brochures but do little to help the environment. Manheim and Albritton (1984) documented that many repressive nations with "bad images" hired U.S. public relations firms to help place positive stories about them in the U.S. news media without changing their repressive policies. The organizations or nations would "talk the walk" but not "walk the talk." For an image, actions became detached from words. The image became a projection that might have no basis in reality. If an organization did not like its image, it would simply try to project a new and better image. An organization could become whatever it desired to be.

The shallow use of image takes a very simplistic and patronizing view of stakeholders. First, it assumes a one-way view of communication. Organizations

send messages to stakeholders with no need to gather feedback. An organization assumes the stakeholders receive the image messages and construct the desired image. People have many filters that affect how they interpret messages. It is simply wrong to assume all stakeholders will interpret a message in the desired fashion. Practitioners must solicit feedback to see if their messages are being received as desired. Two-way communication is recognized as a much more effective way of developing accurate message interpretations by stakeholders. Second, it assumes stakeholders are not critical consumers of messages. Stakeholders do not simply accept whatever an organization says. Stakeholders do evaluate statements made by an organization and will form images based upon those evaluations, not just upon what an organization says.

The negative connotation generated by the shallow view of image was a detriment to public relations. In a field where the focus is on building mutually beneficial relationships, the shallow view of image was counterproductive. Images became associated with pseudo-realities and deception. This was an accurate portrayal because words without action are manipulations and inaccuracies. In turn, public relations became associated with building "shallow" images. An image was not what an organization did but what it claimed to do. In time, stakeholders will come to see through the image and realize the deception, thus damaging the organization-stakeholder relationship. Stakeholders will compare words to actions to evaluate an image. When the two do not match, stakeholders will form negative images of that organization. When stakeholders discover Zeta Corporation is not environmentally friendly, they will form negative images of Zeta. Practitioners should not divorce words from actions the way the shallow use of image does.

An organization can operate under the flawed assumptions that stakeholders will not discover their deception—image without action. True, many stakeholders have neither the time nor motivation to investigate every claim made by an organization. However, many activist and public interest groups carefully monitor and report on the behavior of organizations. Through the Internet and news-media

coverage, those who do monitor organizational actions can spread the word of discrepancies between words and actions. For instance, millions of people buy Nike products, but a small percentage personally investigates whether Nike is living up to its claims of not exploiting workers in Southeast Asia. Activists do monitor Nike's treatment of contract workers and publicize those findings widely in the news media and Internet. There was even a lawsuit filed against Nike for using messages saying it had stopped exploiting workers. The messages were circulated widely to Nike stakeholders, including customers and shareholders. The Internet has helped to foster an age of transparency for organizations. With easy-to-find information, stakeholders can see through an organization—it is transparent—and discover inconsistencies between words and actions.

In so many ways the shallow view of image is outdated and inappropriate for public relations. However, negative connotative meanings for words are difficult, if not impossible to shake. The deeper view of image that looked at it as a process and premised it on matching words and action is tarnished by the legacy of the shallow view of image. Hence, practitioners and researchers moved to the term reputation to reflect the deeper view of image. Reputation management moves away from the flaws of image. Painstaking work has gone into developing measures of reputation so that an organization can monitor how stakeholders actually perceive it; efforts to change reputation are premised on behavioral changes by the organization, not on just presenting a new message. The misapplication of image by short-sighted practitioners resulted in the death of image as a functional part of the public relations lexicon.

IMAGE RESTORATION THEORY

Image restoration theory was crafted to understand the communication options available for those, whether organizations or persons, who face threats to their reputation. This theory is particularly relevant to crisis response. It integrated (and elaborated) previous work on *apologia* by B. L. Ware and Wil A. Linkugel (1973); on accounts, by scholars such as Marvin H. Scott and Sanford M. Lyman (1968); and on guilt redemption, by scholars such as Kenneth Burke (1970).

A person's image or reputation is extremely important. Accusations or suspicions of wrongdoing have a variety of adverse effects. Corporations can lose business, politicians can lose support and elections, people can lose friends and attract hostility; and at times legal or other sanctions can be applied. Because credibility is important to persuasion, threats to image can damage one's ability to communicate effectively. People and organizations have important reasons to maintain a favorable image.

Image repair messages are needed whenever an image is threatened. You must determine (1) what accusation(s) or suspicion(s) threaten the image, and (2) who is or are the most important audience(s). You cannot hope to successfully counteract an accusation unless you know the nature of the accusation. Vague rumors or whispers may arouse your concern, but you must know the problem to repair it. If there are multiple accusations, you must know them all to deal with them all (and to avoid ignoring an allegation). The audience must be kept in mind here. If the audience is not aware of an accusation, that accusation can safely be ignored (unless you think they will hear it later). In fact, the act of responding to an accusation will inform your audience of a potential problem. The accusations that really matter are those known to your audience.

Identifying the audience is important. For example, consider a company accused of polluting the environment. There are many potential audiences in this situation: the accusers (environmentalists and/or reporters), people who live near the polluting facility, customers, stockholders, and government regulators. The company must decide which audience matters (it may need to prioritize several audiences). First, some groups have more power over the company. It should be obvious that shareholders cannot be ignored. Depending on the nature of the alleged pollution and laws relevant to the actions, government regulators may be another group that cannot be ignored. Second, these groups have different interests. Stockholders would surely be concerned about the company's profitability; government regulators would presumably be most interested in the level of pollution and the relevant law. Environmental groups might want the company to reduce pollution to zero; however, the law is probably not that extreme and completely eliminating pollution may be prohibitively expensive (and possibly technically impossible). So, the company must decide which audience is most important (or it must prioritize audiences), and which audiences to try to persuade.

It is important to ascertain what the audience knows. For example, if the company considers government regulators to be important, the key question is whether *they* consider the alleged problem serious enough to warrant action. If regulators believe pollution is at acceptable levels, the company may not need to develop messages for them (or perhaps just messages to reassure them). On the other hand, if regulators think that there is a serious violation of the law, the company will need to deal forcefully with that concern.

Anita Pomerantz (1978) explained that accusations have two key components: (a) An offensive act must have occurred, and (b) the accused must be considered to blame for that act. If nothing happened, or what happened was not really bad, there should be no threat to image. Similarly, if you are not to blame for the offensive act, then there should be no threat to your image. Of course, the perceptions of the relevant audience are what matter most. If they believe you performed a wrongful deed, your image will suffer even if you know the act did not happen, was not

really bad, or that you did not do it. Of course, if any of these things is true, you can use them in a message to repair your image. It is also important to realize that blame can come in many forms: You may have committed the wrongful act, or encouraged it, or permitted it to occur, or perhaps you will be blamed for not preventing the act (inaction). The key point is that a threat to image has two key components: an offensive act for which you are blamed.

These elements are important because they help one understand the image repair options available. Options for repairing an image threatened by accusation or suspicion have been organized into five general image restoration options. The first two, denial and evasion of responsibility, concern blame; the third one, reducing offensiveness, concerns offensiveness. The fourth, corrective action, can address offensiveness (by repairing damage) or blame (by taking action to prevent the offensive act in the future); and the final option, mortification, accepts responsibility for the offensive act but asks forgiveness (apologizes). Table 1 illustrates these options (some of which have several forms).

Those who confront a threat to image should consider the allegations, the facts in the case, and the audience, and then select the strategies that can help to restore image. One must consider the advantages and disadvantages of the media that are available for delivering the messages (with one or more of these strategies) to the audience.

Effective image repair suggests that those who are truly at fault should admit it immediately and take appropriate corrective action. People want others to take responsibility for their actions, and they want them to clean up their messes (and/or prevent future problems). Furthermore, it is wrong to lie, and if (or when) the truth comes out, you can be vilified not only for the original wrong-doing but also for lying about it. Of course, lawyers would argue against admissions that would work against a company or organization in court. My advice here is about how to repair an image; however, I realize that people and organizations must consider other goals (i.e., consequences for on-going or future litigation). Of course, those who are innocent of wrong-doing should use that fact in their defense. Notice that even the innocent (Tylenol introduced

Table 1 Image Restoration Strategies

<i>Strategy</i>	<i>Key Characteristic</i>	<i>Example</i>
Denial		
Simple denial	Did not perform act	Tylenol: Did not poison capsule
Shift the blame	Another performed act	Tylenol: A “madman” poisoned capsules
Evasion of Responsibility		
Provocation	Responded to act of another	Firm moved because of new taxes
Defeasibility	Lack of information or ability	Executive not told meeting changed
Accident	Mishap	Tree fell on tracks, causing train wreck
Good intentions	Meant well	Sears wants to provide good auto repair service
Reducing Offensiveness of Event		
Bolstering	Stress good traits	Exxon’s “swift and competent” clean-up of oil spill
Minimization	Act not serious	Exxon: Few animals killed in oil spill
Differentiation	Act less offensive than similar acts	Sears: Unneeded repairs were preventive maintenance, not fraud
Transcendence	More important values	Helping humans justifies testing animals
Attack accuser	Reduce credibility of accuser	Coke: Pepsi owns restaurants, competes directly with you for customers
Compensation	Reimburse victim	Disabled moviegoers given free passes after being denied admission to movie
Corrective action	Plan to solve/prevent	AT&T long-distance upgrades; promised to spend billions more to improve service
Mortification	Apologize	AT&T apologized for service interruption

tamper-resistant packaging and then switched to caplets even though it was not to blame for the poisoning) can introduce corrective action.

Shifting the blame works best when the target is plausible and when the blame actually shifts away from you (e.g., President Nixon blamed the cover-up

on his hand-picked subordinates, which meant he was ultimately responsible). Do not assume that the strategies are equally effective (e.g., I would say that in most cases minimization and provocation will be less effective than other options). Some strategies can work well together (e.g., good intentions and accident) but others do not (e.g., “I did not do it” [denial] and “You made me do it” [provocation]).

It is important to realize that a given strategy can be used persuasively as well as unpersuasively. For example, one can produce a heartfelt apology as well as a perfunctory apology. The former is far more likely to succeed than the latter. Furthermore, there are limits on the power of persuasive messages. Some acts are so reprehensible that nothing one can say will earn forgiveness (although usually over time people tend to forget). It is easiest to repair the image of those who are innocent; it is (and should be) more difficult to salvage the images of those who are guilty.

IMPRESSION MANAGEMENT THEORY

Impression management theory takes a humanistic approach to the ways in which people organize their symbolic experience. The theory descends from the *symbolic interactionism* perspective of sociology and the social cognitive tradition of psychology; its terminology is dramaturgical in nature, revealing its connections with mid-20th century dramatism and dramaturgical theory. The 1959 book that introduced and elaborated this theory, Erving Goffman's *The Presentation of Self in Everyday Life*, remains one of its key works.

Though once considered as somewhat aberrant behavior or an unwanted variable created by social psychological research in a laboratory context, impression management theory has gained adherents in many disciplines, including linguistics, semiotics, cultural studies, sociology, communication studies, rhetoric, and philosophy. In public relations research, the theory was initially considered under *organizational politics* and later as *organizational impression management*. It is now particularly important to public relations in its relationship to the concepts of *corporate impression management*, *image*, and *ingratiation*. Recently, researchers have studied impression management through observational studies, experimental studies, field work, case or scenario studies, measures of individual difference, and meta-analysis of existing studies.

THEORETICAL FOUNDATIONS

Symbolic Interactionism

The theoretical foundations of impression management theory extend to George Herbert Mead's (1934) sociological works on symbolic interactionism, which declared that both individual and group identity is socially constructed; that shared symbols form the basis for communication; and that human interaction is by nature dramatic, relying on the creation and adoption of social roles in particular situations. This theoretical perspective established within the individual a dichotomous relationship

between a *real*, underlying self (the *I*) and the reflective self (the *me*), which constructs a self-perception from observing how other individuals respond to the individual's behavior. The influence of this perspective remains evident in the characterization of communicators as actors who construct a persona that may or may not display their actual thoughts or emotions.

Social Cognition

Daniel T. Gilbert (1998) explained how the social cognitive tradition of psychology further developed impression management theory, elaborating its connections with *attribution theory* and *implicit personality theory*. Attribution theory posits that people infer unknown personality traits and dispositions about others based on behaviors they have observed. From extensive experience with the organization of human personalities, observers construct an implicit personality for the other and evaluate the other's behavior accordingly. Impression management is the complement to attribution, claiming that the individual actor works consciously and unconsciously to shape the behaviors that others see, and thus the implicit personality that they construct.

Dramatism and Dramaturgical Theory

Goffman's (1959) *The Presentation of Self in Everyday Life* is a key text to impression management theory. In it, Goffman introduced the metaphor of staged performance, which has remained dominant within the theory: Individuals are actors who attempt to control both the situation or scene and the content of the interaction in which they participate. Observers, including interlocutors, are considered members of an audience. The actor is responsible for two kinds of signaling in interaction: that which is *given*, and that which is *given off*. First, the actor actively (though not always consciously) constructs a *front*, or persona, using verbal and nonverbal cues to project either the image of reality that he or she wants the audience to accept, or the image of reality that the audience expects to see. Second, the actor *gives off* expressions that are read and attributed to

personality characteristics. Goffman proposes that individuals rely heavily on their own expectations and the expectations of those with whom they communicate to determine what behaviors are appropriate to a given scene. Such performances ceremonially confirm socially accredited values, much as Emile Durkheim (1915/1965) described in his own sociological works on ceremony. Furthermore, to maintain tact and respect how others present themselves, actors and audiences must be aware of cultural differences.

The scene of a performance, termed *region* by Goffman, refers to the physical, relational, temporal, and situational elements that shape an interaction and, to some extent, determine the acceptability of specific fronts and behaviors. The *front region* refers to the activity that is considered on stage, or visible to a particular audience; for example, Goffman discusses the activity of making work, or of merely looking busy at work in case one is being watched by one's supervisor. In the *back region* or backstage, facts and behaviors of a person that are carefully controlled in the front region are released. For instance, instructors may put on their sunny "instructor faces" for the duration of the class they teach; when they return to their offices and close the door, they are in their back regions, where they can safely mutter about their students' deficiencies. A location can function as front region for one type of interaction and as back region for another; of course, lapses, errors, and other actors often disrupt the drama. One of the most interesting of such problems occurs when the actor cannot protect a desired impression from being exposed to more than one audience at once. At such times, the actor is faced with the challenge of protecting what Kenneth Burke (1969) and Durkheim (1915/1965) identify as the *mystery* of the front—the preservation of an actor's control over the front region. The performer must actively manage the collision of conflicting impressions by employing defensive or *protective impression management strategies*, one of two categories of strategic impression management. Protective strategies identified by Goffman (1959) include shifting to a team performance in which the actor and the onetime audience become a new front

region for the benefit of an intruder; a second strategy is to invite intruders into the existing performance as if they belonged there. Neither technique is very effective; *acquisitive impression management strategies*, or attempts to establish initially favorable impressions, often present a better alternative.

The dramaturgical metaphor of impression management applies to group interaction as well as one-on-one communication. The *team*, which may consist of a married couple, a social group, a company, or a public relations group, is an entity in and of itself, although many individual performers may comprise it. Teams are defined by two kinds of reciprocal bonds: that of dependence, by which all members must actively contribute to a social performance, and that of familiarity, or the recognition of in-group/out-group boundaries. Beyond these boundaries, certain behaviors may jeopardize the performance, the group identity, or the scene itself. Acting together, the individual team members establish a group *identity* that becomes one mask, one representation of self, one public (and private) identity.

CRITIQUES OF IMPRESSION MANAGEMENT THEORY

Like Goffman, who takes a somewhat skeptical perspective of the practices actors employ to safeguard the fronts they build, scholars such as Paul Rosenfeld, Robert Giacalone, and Catherine Riordan (1995) have taken a *restrictive view* of the process of impression management, describing it as Machiavellian (p. 19)—that is, the intentional deception or manipulation of others by hiding or pretending to be something one is not. However, other scholars take the *expansive view* of impression management, arguing that the mystery in the drama is a necessary element of both personality and relationship.

The theory of impression management introduced in *The Presentation of Self in Everyday Life* is based on the very human desire to avoid embarrassment caused when “the reality sponsored by the performers is threatened” (Goffman, 1959, p. 212). However, the dramaturgical metaphor employed in this theory translates semi-unconscious action into explicit intention. While the metaphor serves as a

helpful frame for conceptualizing how people control their self-exposure, it implies that individual actors, as well as actors in a team, are fully cognizant of what they do to shape how others see them, as well as why they do so. If taken literally, the intent and awareness implied by the dramaturgical framework is seriously overstated.

IMPRESSIONS

Impressions are a measure of how many potential readers, viewers, or listeners were reached by a placement in the media. It is usually equivalent to the circulation number in the case of print (i.e., newspaper, magazine) and the estimated viewership or listeners for broadcast outlets (i.e., television, radio). With broadcast, audience numbers vary depending upon the time of the newscast. With print, pass-along rates are often extrapolated and

taken into account in addition to merely relying upon circulation. Most good media databases (e.g., Bacon's) and monitoring services (e.g., Video Monitoring Service, Burrelle's) provide these numbers. Because no service is completely comprehensive, going to individual media outlets and asking is sometimes still necessary. Media buyers are also a good source of such numbers.

No exact number of people reached can ever really be determined, but impressions are the closest estimates that are available, keeping in mind that they do not gauge an actual *impression* that individual audience members have of the media clip and its message. Therefore, although impressions are a good tally of potential audience reach, they cannot definitively predict the actual imprint left by the coverage. Sometimes tone of the piece can help determine the likelihood of the latter.

Impressions usually come into play as a tool used in the evaluation stage of a public relations campaign or initiative in trying to determine reach. Although impression is considered a good measure by many communicators, other professionals in the field do not consider it to be a valid account of reach due to its decidedly quantitative nature. A more qualitative approach comes with measuring actual effect of a news clip, such as inquiries received as a direct result or a marked improvement in sales, business, or traffic. Impressions, however, are a good evaluation tool from a statistical standpoint in that potential audience numbers can give practitioners an idea of reach, with higher numbers increasing the odds of message dissemination.

—Lisa K. Merkl

INDUSTRIAL BARONS (OF THE 1870s–1920s)

“The public be damned,” a quote attributed to—albeit denied by—railroad magnate William Henry Vanderbilt in 1882, epitomizes the atmosphere of the United States during its industrial growth from the 1870s through the 1920s. The masses had seen evidence to support such sentiments about industrialists, who often believed the less the public knew

about their dealings the better. Thus grew a restless distrust of the “robber barons,” whose power and wealth were gained and secured for generations during this era, often through the exploitation of labor and natural resources.

The change from an agrarian society to an industrialized one had been inevitable. As Scott M. Cutlip noted in *Public Relations History* (1995), in just 25 years—1875 to 1900—the nation's population doubled, immigration and urban living swelled, mass production processes began, natural resources continued to be discovered and developed, railroads and telegraph wires crossed the country, and the mass media of newspapers and magazines proliferated. These profound changes set the stage for the rise of corporate *public relations*, which according to Cutlip and others, was a term first used by the Association of American Railroads in an 1897 company listing. However, by this time, the railroads' use of public relations tactics was nothing new.

On the contrary, said Cutlip, it was this industry that helped pioneer the profession. Vanderbilt's and others' railroads had long used articles, murals, pamphlets, and other means to convince Americans to take the rails westward. Such settlements would in turn expand the railroads' business territory. However, to do so, transportation by rail had to be proved safe to a doubtful public and investors had to be secured. Public relations tactics helped to do just that. By 1860, railroads were no longer seen as experimental, and by the 1870s railroads were still enticing people to head farther west. Cutlip detailed how the Burlington Railroad fashioned a campaign that included the use of news releases, philanthropy and community relations, third-person testimonials, letters, and pamphlets to accomplish its business objectives.

In its early years, the railroad industry also understood the power of public opinion and, thus, the power of the press. Cutlip reported that the industry provided free passes to reporters and established a trade journal and Bureau of Information, which served to educate the “press, legislators and the public, as to the true relations of the railway interest to the public welfare” (1995, p. 143). The industry used opinion leaders, long before the *two-step flow* theory was posited, to help win public

favor for such issues as route selection, freight and passenger business, and investors. Railroads also made use of speeches, letters of endorsement, and staff-written articles for popular periodicals.

However, railroad industrialists of this era also faced public relations challenges. Indeed, it was the perception of *us* versus *them*—exemplified by the publicity surrounding examples of the arrogance and greed that were pursued instead of the ideals of humanity and public good—that fostered recognition by giants of industry that the public could not be ignored. For example, the fallout from Vanderbilt’s alleged “public be damned” quote regarding express railroad operations’ existence due to competition, not to public need, included pressure being exerted (by a group called the National Grange) that resulted in the passage of the Interstate Commerce Act of 1887. The act, meant to stem industrial age excesses, resulted, said Cutlip, in the implementation of public relations programs by utilities and common carriers, for they were among the first industries to experience public wrath.

By the turn of the century, tensions between industry elites and workers had been further heightened, and Theodore Roosevelt and his Square Deal populism had become firmly ensconced in Washington, DC. By this time, industrialists such as financial giant J. Pierpont Morgan saw that courting the president’s administration and legislators’ favor was not enough. Public opinion also had to be considered.

Indeed, the power of the public to influence business interests was growing, and such muckrakers as Lincoln Steffens, Upton Sinclair, and Ida May Tarbell exposed gross injustices that made executives aware of the importance of public opinion and goodwill.

John D. Rockefeller and his Standard Oil Trust became the ultimate example of greed run amok at the expense of the nation. During the 1880s, the trust was the largest and richest manufacturing organization in the world. Rockefeller, who took pride in his positive relationships with fellow Standard Oil executives and believed himself misunderstood by the public, was largely silent to his critics. Although Standard Oil also employed such public relations strategies as influencing newspapers and legislators to plead its case to the

public, these endorsements, said Cutlip, were often provided in exchange for monetary compensation. Following investigative journalist Tarbell’s critical work on the history of Standard Oil in 1904, which accused it of strategically buying public goodwill and favors through charitable gifts, the Standard Oil Trust monopoly was eventually broken by a federal antitrust lawsuit.

The violent labor lockout in Homestead, Pennsylvania, in 1892 had also served to underscore the seemingly unfettered power of industry. It was then that former railroad and oil man turned steel magnate Andrew Carnegie and his business partner Henry Clay Frick hired Pinkerton Agency guards and enlisted the Pennsylvania State Militia to help break the world’s strongest craft union, the Amalgamated Association of Iron and Steel Workers. The strike at Carnegie-Frick Steel Company ended with 35 dead and hundreds wounded from both sides. Frick directed the assault upon the workers, while Carnegie, once proud of his reputation as friend to working men, remained quietly distant in his Scottish castle, allowing Frick to do what he deemed necessary. According to Carnegie biographer Harold C. Livesay, Carnegie never recovered his public reputation.

Although J. P. Morgan is alleged to have said, “I don’t owe the public anything,” it was Morgan who called upon early public relations practitioner Theodore Newton Vail to help save the American Telephone & Telegraph Company in 1902. Vail, who had also worked in the railroad industry hastening U.S. mail delivery and later served as general manager of the nearly new Bell Telephone Company in 1878, was named AT&T president five years later. During this time, Vail “made public relations and business history” (Cutlip, 1995, p. 198), for he was the first to formally ask questions about company relationships with the public and customer conflicts or difficulties. Vail subsequently initiated a formalized method for dealing with customer complaints.

Also blessed with visionary public relations instincts was George Westinghouse, founder of Westinghouse Electric Company. In 1886, he had developed alternating electric current (AC), which would compete with Thomas Edison’s direct

current (DC) systems already being sold. Edison and his public relations counsel, Samuel Insull, fought Westinghouse's invention largely through a smear campaign intended to scare would-be AC consumers. As detailed by Cutlip, Westinghouse was slow to respond to his competitor's campaign, believing his superior product would prevail, but soon realized he must tell his story to the public. As a result, he hired then-newspaper reporter Ernest H. Heinrichs to work for him and to produce and distribute accurate information about the Westinghouse product to the press. The superior product did win over consumers, but not before communication about the product had become part of the company's strategy. Three years later, in 1889, Westinghouse and Heinrichs had essentially established the first corporate publicity department.

Although Edison's product lost the consumer war, his public relations man Insull later emerged to become a pioneer in utility public relations, creating an in-house advertising department in his Chicago Edison Company. Insull used films, initiated bill stuffers, and developed an external community publication "to gain understanding and good will" (Cutlip, Center, & Broom, 2000, p. 119).

Indeed, the public relations industry grew along with the rise of the industrialists. Prior to the turn of the century, publicity and press agency had reigned, although there were glimpses of modern public relations practice. In 2000, Cutlip, Center, and Broom denoted 1900–1917 as the profession's "seedbed era," when publicity was used by companies to try to counter muckraking journalism and strategic presidential and federal agency press relations began. It was during these years that industrialist Henry Ford was probably the first to implement the public relations principles of positioning oneself or one's company as *first* at something and of making oneself accessible to the press. Ford's mass production processes afforded him great competitive advantage, but he also recognized the importance of an early marketing strategy that involved seeking publicity, while many business owners still shied away from it.

It was also during this seedbed era that Ivy League-educated Ivy Ledbetter Lee traded business reporting for the publicity business. Dennis Wilcox,

Philip Ault, Warren Agee, and Glen Cameron (2001) credited his "Declaration of Principles" as ending the "public be damned" attitude of the industrialists and as starting the "public be informed" era. These principles extolled the value of providing accurate and timely information and access to the press.

Lee also is tied to the industrialists. Hired by railroad executives to help them win a rate increase after several prior failures by the industry to do so, Lee used a strategy of taking the executives' reasons for the increase to the public to gain its support; it succeeded, and the increase was approved by Congress in 1914. This was the "genesis of the coupling of public relations with legislative relations to attain governmental favors or stay the hand of government" (Cutlip, 1994, p. 8).

The same year the railroad rate increase was approved, the heartbreaking Ludlow, Colorado, coal mine massacre occurred, and Lee was hired by John D. Rockefeller's son, John D. Jr., to help address the public fallout. The result of an attempt to break a strike, the massacre resulted when government troops opened fire with machine guns on the tents, which striking miners and their families were living in after being evicted from the company's housing. Led and supported by the United Mine Workers against the Colorado Fuel & Iron Co., the 1913–1914 strike followed an attempt nine years earlier to strike for better working conditions and compensation, which also had been harshly suppressed. The barrage of gunfire at the Ludlow tent colony killed 21, including women and children. John Jr. would later testify that he hadn't known of the mine operators' intended actions, but public outrage was nonetheless directed at the Rockefellers, who owned the company. Lee insisted that Rockefeller himself visit with the miners and their families and that the press be invited to attend as well. Lee provided the press with a fact sheet outlining management's view of the strike, and the visits ultimately resulted in new policies and better employee compensation.

Following this positive outcome, the junior Rockefeller hired Lee to help instill a positive image of the Rockefeller family itself, for John Sr.'s negative monopolistic Standard Oil image was still

embedded in the public psyche. Lee responded by making the Rockefeller family's philanthropy public and by keeping images of the senior Rockefeller—often giving away money—in the press. By the time of his death, the elder Rockefeller had become a much-loved public citizen.

After the seedbed years of public relations came the World War I period, 1917–1919, which demonstrated the power of strategic publicity to enlist support and cull patriotism, and the “booming twenties era” of 1919–1929. These periods also served to intertwine industry and public relations, for it was in the 1920s that communication strategies learned during the war years were applied to consumer products.

Arthur W. Page emerged during this intertwining era, and in his time with the American Telephone & Telegraph Company, he helped define modern corporate public relations. AT&T's first vice president for public relations, Page believed that it was performance that drives positive public relations, not publicity. He also espoused the belief that businesses exist only via public support and that it was important for public relations to be part of a company's management team. These modern principles evolved from the lessons of the industrialists who came before him, lessons that included being responsive to the public, telling one's story, being accessible, and operating in the public good.

INFOMERCIAL

An infomercial is a program-length television commercial designed to get around some problems inherent in the regular television advertising model. Infomercials subvert the traditional advertising model in several ways. Infomercials tend to mimic the production values (sets, lighting, and style of delivery used by the talent) of television news shows. Sometimes, an infomercial has name talent (such as Ricardo Montalban, hired for the Nativity Cross infomercial). Infomercials also use an increased runtime (length of the advertisement), typically 30 or 60 minutes.

The year 2004 marks the 20th anniversary of the Federal Communications Commission's removal of restrictions on the number of advertising minutes

per hour allowed on broadcast television, which paved the way for the birth of the infomercial. Deregulation of cable television gave the infomercial additional room to grow rapidly. According to *Response* magazine, long-form media billing for 2003 totaled US\$910,038,403. On average, media billing represents 40 percent of generated sales, making the generated sales figure for 2003 US\$2,275,096,008.

In addition to their longer format, infomercials, which are also referred to as direct response television (DRTV), offer the opportunity for a soft-sell approach. Combined with a long runtime and news program stylings, infomercials make for a more immersive experience. This cuts down on channel switching, and there is less reliance on additional viewings for message reinforcement.

Infomercials work well with mature (older) audiences, which are often less tolerant of a high-pressure pitch. Infomercials allow for a much more indirect approach, which can include numerous demonstrations of the product and its benefits.

The power of infomercials has been recognized by the Federal Trade Commission. They have disclaimer requirements, along with specifications on the use of celebrities to endorse products.

In contrast to regular commercials, infomercials use production elements and techniques that are more subtle and are traditionally given secondary consideration. Background (environmental) information can become more useful. What the actors are saying is important, but what the actors are surrounded by can become equally important. Music can be used extensively to set mood or serve as repeated punctuation for other audiovisual information. Set decor can become more extensive, and integral to the message.

Stations that run infomercials benefit in two ways. Stations that don't generate their own content have to buy it; and infomercials are a handy way for stations to fill broadcast time between 1:00 and 6:00 in the morning, when viewership (and advertising rates) are low. Stations save money by not having to purchase content and make money by selling the time slot for the infomercial to run.

INFORMATION INTEGRATION THEORY

Information integration theory “suggests that people form attitudes that result from a blending of positives and negatives” (Heath & Bryant, 1992, p. 15). In this way, information integration theory is nicely parsimonious.

You may like the taste of pizza, but you may dislike its calories and fat content. You may like the prestige and comfort of driving a luxury car, but you may dislike the cost and low gas mileage of the car. You may dislike the time demands of a regular exercise program, but you may like how it makes you look and feel. People form an attitude toward everything they encounter. Attitudes include affective or evaluative components, referring to likes or dislikes, as well as cognitive components that involve degrees of certainty, or the extent to which people consider something as likely to be true.

Information integration theory argues that attitudes “provide consistency for judgment and behavior because they reflect patterns of preferences that each individual has established” (Heath & Bryant, 2000, p. 202). This approach also argues that attitudes “are not singular or undifferentiated evaluative cognitions. Rather, each attitude is the product of several affective (evaluative) qualities that are combined into a single expression of opinion” (Heath & Bryant, 2000, p. 202).

Theories that help explain how people think and form attitudes are important in communication. Public relations practitioners can use theory to better understand how people receive and process messages.

Information integration theory is an approach that can increase understanding of how people can be influenced by information. "Information is the essence of the persuasion process," noted Martin Fishbein and Icek Ajzen (1981, p. 339). Information integration can help explain how attitudes interact and how attitudes affect behavioral intention. This approach explains behavior as the result of attitude toward an action and of belief about the social expectation of others who approve or disapprove of the action.

Sometimes considered a perspective more than a single theory, information integration emphasizes the important role of information in affecting attitudes, or predispositions for behavior. This approach focuses on attitude change through the information variables of valence and weight.

The valence of information relates to direction (positive or negative) as a function of agreement or disagreement. The weight of information relates to credibility assigned by the person evaluating a message. The information-integration perspective has been appreciated for more than three decades, and it includes a number of widely used theories including expectancy-value theory and theory of reasoned action.

According to expectancy-value theory, attitudes are a function of beliefs and evaluations. The relationship may be expressed mathematically as attitude toward something equals the sum of each belief about the object multiplied by the evaluation. The theory allows for change in attitude to occur as a result of shift in weight of specific beliefs, of shift in valence (positive or negative) of a belief, or of addition of new beliefs. Fishbein and Ajzen viewed beliefs as "the building blocks of the cognitive structure, the information base that supports evaluative systems as well as intentions and behaviors" (Heath & Bryant, 2000, p. 203).

For public relations practitioners, one application of this theory is that attitude change may be accomplished by increasing the credibility or believability of beliefs, by shifting the negative or positive

direction of information, or by providing information to add new beliefs related to a topic or organization.

In 1980, Ajzen and Fishbein extended expectancy-value theory in the theory of reasoned action, which focuses on the influence of attitudes on behavioral intention. Attitude, they suggested, is "a learned predisposition to respond in a consistently favorable or unfavorable manner with respect to a given object" (Fishbein & Ajzen, 1975, p. 6).

The theory of reasoned action assumes that people are rational beings, making deliberate decisions based on their reasoning of information. The theory of reasoned action is expressed mathematically as: a person's behavioral intention equals the sum of a belief that the behavior will give positive result, multiplied by how strongly the person believes, plus the person's perception of social expectation, multiplied by how important social acceptance is to the person. In other words, behavioral intent equals the attitude toward the behavior times the weight of the attitude plus the subjective norm (opinion of others) times the weight of subjective norm. For a more detailed discussion, see Heath & Bryant (2000) or Littlejohn (2002).

The theory focuses on intent to behave rather than actual behavior, but it posits that behavioral intention can be influenced either by attitude or the opinion of others. The theory is useful in assessing attitudes and behaviors of large populations.

The information integration approach explains how attitudes are made up of multiple components that can be conflicting. The approach also explains how behavior is the function of attitude toward an action and belief about subjective norms (social expectation) approving or disapproving of the action. "Going beyond the notion that behavior is predicated on 'motives,' this theory argues that behavior results from a collinear interaction between the attitude that a specific action is good or bad and awareness of social pressures or norms favoring or disfavoring it" (Heath & Bryant, 1992, p. 145).

In 1987 G. J. Shepherd extended information integration theory by showing that the degree of collinearity can differ between attitudes and normative beliefs. It depends on individuals' differentiation of issues involved and how much information the individual brings to the situation.

Information integration theory is important “for those who wish to be persuasive” (Heath & Bryant, 2000, p. 207). It reveals that communicators may change individuals’ attitudes by changing either evaluation or belief. It explains how a person’s behavioral intentions may be changed “by focusing on the goodness or badness of the decision or by influencing a person’s perception of the prevailing subjective norm” (Heath & Bryant, 2000, p. 207).

Theories in the information integration tradition serve to emphasize the importance of information as potential for attitude change. These theories complement consistency theories in helping to explain how people organize information and what they do with messages.

Information integration explains how recently integrated information may result in attitude change. The information integration approach “is one of the most popular models of the nature of attitudes and attitude change” (Littlejohn, 2002, p. 123).

INFORMATION RETRIEVAL SYSTEM

An information retrieval (IR) system is (increasingly) a computer-based research tool. The purpose of IR systems is to provide references to pieces of information related to the particular inquiry. Traditional equivalents to IR systems include card catalogs and printed volumes of abstracts or annotated bibliographies. According to F. W. Lancaster, as quoted in the introduction to C. J. van Rijsbergen’s *Information Retrieval*, “An information retrieval system does not inform (i.e., change the knowledge of) the user on the subject of his inquiry. It merely informs on the existence (or non-existence) and whereabouts of documents relating to his request” (van Rijsbergen, 1979, n.p.).

Information retrieval is a term with a long history and a changing meaning. In the past, an IR system was understood to be a closed information system that offered in-depth information on a very specific topic or area. The system would usually include a mixture of complete documents, abstracts, and bibliographic references. The closest current example of that sort of system that exists today would be a non-Internet-connected information kiosk.

With the arrival of the Internet, closed systems have become fewer, and with documents increasingly being created using computer-based systems, more documents have become available online.

Distinctions are further compounded by a conversational understanding of what is defined as information. Information retrieval scholars like van Rijsbergen have made a distinction between data retrieval (DR) and information retrieval (IR).

In the introduction to *Information Retrieval*, van Rijsbergen addressed the attributes that make the distinction relevant. Attributes particular to DR include exact matches, an artificial language used in queries, and sensitivity in error response. The attributes for IR, as expected, are the opposite. IR involves partial or best matches, natural language use in queries, and a lack of sensitivity in error responses.

A Web browser is an interesting example of a piece of software that is capable of handling both DR and IR queries. An example of data retrieval would involve typing in a specific universal resource locator (URL), with the result that the specific page of information associated with that URL appears on screen. An artificial language is being used (the URL), which if not entered correctly, results in either the wrong information or no information at all (matching and error sensitivity).

Still using the Web browser, information retrieval is represented by the use of a search engine (for example, Google). Queries can be structured in natural language (What is the temperature of the sun?), with (at the time of this writing) 2,550,000 results. The order of the results, barring financial considerations, is based on Google's proprietary software (partial and best matches).

Information retrieval presents an interesting problem for Web page creators: How can the error sensitivity be maximized? When the query for the sun's temperature was run, the contents of the 2.5 million Web pages found were not scanned. Rather, each Web page has keyword entries. The keywords are not visible unless the Web page's source code is examined. In the case of the Web page that came up first in the query, the keyword entries included

- Space simulation education math science challenger
- Space shuttle 51-L crew children school links
- Publications astronomy solar system resources Doctor
- Jeff questions answers

Public relations practitioners will have to make sure when assembling Web pages that careful choices are made with respect to entries. Keyword entries determine how well partial and best matches will work, and how the practitioner's Web page will sort in relation to other pages that may include related information.

To avoid a cliffhanger ending, the sun's surface temperature is about 11,000 degrees Fahrenheit, with a core temperature of around 30,000,000 degrees Fahrenheit.

INFORMATION SOCIETY

Information society is a term introduced by Alvin Toffler in his 1980 book, *The Third Wave*. Toffler defined three eras or waves of society; he called the third wave the *information society*. The first wave is an *agricultural society*, where the main factors in production are land and farm labor. The second wave is an *industrial society*. The land still retains its value and importance, with a difference in the application of labor. The second wave sees labor move from farming and tending cattle to manufacturing and tending machinery. The third wave represents a significant shift, where industrial muscle and might are replaced by the power of information and knowledge.

The primary resource of the third wave is what Toffler called *actionable knowledge*. This knowledge includes data and information in the form of text and images, as well as culture, ideology, and values. The third wave has opened a knowledge age. Toffler said that the knowledge age will not reach its potential unless social and political dominance are added to the technological and economic strength fueling the transition.

Although it's been over 20 years since Toffler introduced the concept, he has provided the occasional update. In 1994, he joined with Esther Dyson, George Gilder, and George Keyworth to write *Cyberspace and the American Dream: A Magna Carta for the Knowledge Age*. Toffler followed this in 1996 with *Future Shock in the Present Tense*.

Toffler, as did other futurists, pointed out that the transitions from one wave to the next are not as easy to delineate as the waves themselves. From the preamble of *Cyberspace and the American Dream*, we learn:

The industrial age is not fully over. In fact, classic Second Wave sectors (oil, steel, auto-production) have learned how to benefit from Third Wave technological breakthroughs—just as the First Wave’s agricultural productivity benefited exponentially from the Second Wave’s farm-mechanization. (1994, p. 1)

The transition to the third wave includes two important characteristics. First, the third wave is, structurally, allowing people to take a big step backward. The primary tool of the third wave is the computer. Reliance on “smokestack” industry is decreasing because of an increased reliance on work that is delivered via the decentralized structure of computer networks. Currently, 11 percent of the United States workforce works from home, via computer. We are seeing a return to the home as a primary location of production, just as it was for the first wave and during the transition to the second wave.

A second important characteristic of the transition is the increase in the levels of uncertainty and unpredictability found in everyday life. Employment and capital are more liquid than ever. The stability that smokestack industries of the second wave provided is eroding. This is compounded by an implied requirement that for individuals to function in the third wave, they will have to become much more technologically literate.

In *Future Shock in the Present Tense*, Toffler explained what *future shock* is, and goes a bit further. Future shock is “the distress and disorientation brought on by trying to adapt to too much change at rates faster than people can handle. We also believe that, in fact, today’s most disturbing social, cultural, and political developments can be traced precisely to this condition” (1996, p. 2).

After the transition period ends and the third wave properly begins, future shock and other disturbing developments are supposed to abate. The result will be a new economy, where billions of people will be raised out of poverty, the social fabric will be mended, and the planet will be allowed to begin healing.

There are problems with Toffler’s vision of the future. The single biggest one is the bold naivety that clouds that vision (strikingly similar to that found in an Ayn Rand novel). It reads well from a

theoretical or philosophical standpoint; however, the “universe” that serves as the foundation for a possible future bears only a passing resemblance to the reality innovators wish to reshape.

It is easy to poke holes in the idea of the third wave, now that the rosy future the technology boom was to deliver has turned out to be mere wishful thinking. The trouble is, the signs that it would not occur have always been present. It is simply a question of whether or not individuals, corporations, and agencies choose to ignore them, acknowledge them, or postpone such an agenda indefinitely.

If the computer is to be our salvation, what happens to all of the people whose work becomes displaced by the savior? Toffler’s observation of how second-wave industries have benefited from third-wave technology is the pointed end of the stick. What is it that will reverse the erosion of jobs and foster replacement of the millions of jobs lost because of technology? The processing power of computers roughly doubles every 18 or so months. How is being able to do more with fewer people going to enable those who are not fortunate enough to be those fewer people?

This leads to an interesting problem for mass communicators in general and public relations practitioners in particular. Technologies should continue to force the number of parent companies and organizations to decrease, while the number of mass media and other communication channels should continue to increase. Moving into an information or knowledge age, by definition, places a greater importance (weight) on the content and construction of the new currency.

In this case, the new currency is Toffler’s actionable knowledge. The information society represents an economic transition, where information is transformed. Information becomes a commodity, and that commodity simultaneously works (functions) as currency.

The computer and the Internet are the tools that make the third wave possible. It is the use of these tools that significantly change the role of the public relations practitioner. In a media relations context, the job becomes not only global, but also 24/7. Audience makeup is far more complex, as is

the variety of uses audiences will have for the information they receive.

From a marketing, publicity, or promotion standpoint, the 24/7 element means that the information tap is always on. This makes it far more difficult to create a finished, definitive information package. Instead, a Web-based information environment results in information streams that are forever works in progress.

There are upsides to all this. Since the tap is always on, there can be genuine, literal information flow. Message comprehension and retention benefit greatly from a steady stream of information, along with the steady exposure to it.

INSTITUTE OF PUBLIC RELATIONS (IPR)

Established in 1989 by a group of senior public relations practitioners, the Institute of Public Relations (IPR) is the only independent foundation in the field of public relations focusing on research and education. IPR has distinguished itself by sponsoring pioneering research, textbooks, fora, lectures, awards, and other activities to enhance the professional practice of public relations.

MISSION

IPR strives to improve the effectiveness of communications of organizations by advancing the

professional knowledge and practice of public relations through research and education.

In accomplishing its mission IPR helps

- Top managements understand how to use public relations more effectively to achieve success with employees, shareholders, and customers
- Researchers focus on the most important issues affecting public relations and the outcomes in dealing with them
- Educators in developing the skills needed for future practitioners
- The general public to appreciate the value of public relations as a management function and communications tool for use in creating better understanding of business, government, and nonprofit enterprises

IPR serves as a catalyst for creating and disseminating research that is usable by public relations senior management, agencies, clients, educators, and everyday practitioners.

To keep pace with ever-changing public relations challenges, IPR seeks to be the leading sponsor and provider of innovative, timely, and informative communication-related research.

SERVICES

IPR sponsors practical research studies on cutting-edge topics. In addition to public relations research, IPR offers symposia, grants, awards, and scholarships to outstanding scholars. Recent studies have focused on subjects such as finding ways to quantify the value of public relations and identifying current research in other academic fields such as psychology, sociology, and anthropology, which offer significant new concepts for public relations.

RESEARCH

IPR has sponsored more than 300 separate research projects covering everything from what public relations students should study to an analysis of how new technologies are affecting the profession around the world.

All IPR publications, awards, competition, and research are made available for use by students, educators, and practitioners, regardless of their organizational affiliations. This nonproprietary research has led to breakthroughs in improving the teaching and the understanding of public relations. Other publications have helped to strengthen the effectiveness of public relations in profit-making and non-profit organizations. IPR's distinguished awards and competitions serve as incentives for students and scholars to build the body of knowledge in the field.

PUBLIC RELATIONS EXECUTIVE FORUM

A major initiative of IPR is the Public Relations Executive Forum, a limited-enrollment professional development seminar designed especially for high-potential, mid-level corporate communications and public relations executives who report to senior corporate communications officers. Many alumni of this annual forum now occupy top chairs in agencies and corporations.

COMMISSION ON PUBLIC RELATIONS MEASUREMENT AND EVALUATION

IPR also sponsors the Commission on Public Relations Measurement and Evaluation, a volunteer group of leading experts in the field. The commission exists to establish standards and methods for public relations research and measurement and to issue authoritative best-practices white papers. This series of studies, called the "Measurement Tree," are available without cost, as are nearly all IPR publications, on IPR's Web site: www.instituteforpr.com.

Objectives for the commission include:

- To be the leading provider of information about and advocate for public relations measurement and related communication research and evaluation
- To instigate research and be the first group public relations professionals turn to when they want definitive answers on effective public relations measurement and evaluation methods and standards
- To represent the four pillars of the profession in the evaluation of public relations: the client

sector, the counseling sector, research firms, and academicians

SPONSORSHIPS

"International Index of Bribery for News Coverage" is a study in cooperation with the International Public Relations Association to expose the unethical payment of the media for press coverage, which is the practice in some countries.

IPR is a co-sponsor of a case-writing competition for students of business, communications, and journalism that encourages students to conduct research that demonstrates the critical role public relations plays in helping to solve management problems.

IPR is the major sponsor of the annual International Interdisciplinary Public Relations Research Conference. Here leading academic researchers and top practitioners discuss research areas of mutual interest to the entire profession. IPR is also underwriting a book of international case studies for use in teaching public relations in developing countries.

TEXTBOOKS

From time to time IPR sponsors the creation of new textbooks on special subject areas needed in the field. The latest example is *The Primer of Public Relations Research*, authored by Dr. Don W. Stacks, which won the "best textbook of the year" Pride Award from the National Communications Association in 2002. This practical how-to book, now translated into other languages, is the preferred research text at colleges and universities.

AWARDS AND SCHOLARSHIPS

Each year at its Awards and Lecture Dinner, IPR presents awards for excellence in public relations:

- The Alexander Hamilton medal for years of distinguished service
- The Pathfinder Award for the best academic research

- The Master's Thesis Award for the best student thesis
- The Ketchum-Lindenmann Scholarship for the best graduate research

OFFICERS AND TRUSTEES

The officers and board of trustees of IPR are thought leaders in the industry drawn from leading international corporations, universities, and consultancies. Donors and supporters of IPR's work are likewise broadly representative of the profession and welcomed from around the world.

SUPPORT

Research and education are so critical to the future of public relations that IPR attempts to assist and serve everyone in the field with better programs and activities to improve the knowledge and professional practice of public relations. IPR is funded by donations from corporations, agencies, and individuals—all tax deductible. Some donors remember IPR when they wish to honor a friend or mentor, establish a special scholarship, need a custom research study, or are reviewing estate planning.

— *Institute of Public Relations*

INSULL, SAMUEL

Samuel Insull (1859–1938) was a tycoon's tycoon who used and often abused public relations to craft a financial empire that eventually toppled, leading to his indictment on charges of mail fraud, violation of federal bankruptcy law, and embezzlement. He was acquitted. Eventually in financial ruin and ill health, the career ended for this master of publicity, promotions, and government relations, although he was never a practitioner by that name. In 1901, he created one of the first corporate public relations departments to forge favorable opinion on the part of customers and government officials.

His business career began in 1882, when he became Thomas Edison's private secretary. He

participated in the battle of the currents, which convinced him of the power of public relations even though Edison lost that battle to George Westinghouse. Through the battle, Insull realized the potent impact of public policy for giving rationale to specific business activities.

Insull served Edison as the general manager of his business organizations, which were growing and becoming more varied. Through their efforts, they created Edison General Electric and eventually Chicago Edison Company. Over time, this business and others became part of what was generally called the "Insull Empire."

Insull realized that no product—even electricity—could survive, let alone prosper, without publicity and promotion. He engaged in such activities as using publicity associated with electric trolleys in Chicago to demonstrate the virtues of this power source. Substantial attention was focused on electricity through the 1893 Chicago World's Fair; the Tower of Light, an illuminated Ferris wheel; and many displays to help residential users of power understand the industry. He engaged in mass marketing through the magazine *Electric City*. This publication was full of ideas favoring lifestyle advantages and cost savings for users of electricity. The sorts of marketing appeals he loved featured the use of electricity as a mark of affluence. Electric lights glowing in windows would demonstrate to neighbors the financial achievements of the homeowner.

Merger was a vital part of his empire building. He realized the need for regulated monopoly as a way to protect investments in electricity generation and distribution. Not only did he see the need to manufacture products that used electricity, such as the General Electric refrigerator, but he also wanted to extend electricity to every part of the country. This last mission motivated him to promote government financing of rural electrification.

Insull, along with other tycoons, recognized the need to create various opinions that led to favorable acceptance and treatment of various business activities. No industry or product is merely accepted and taken for granted. Acceptance must be crafted, and public relations plays a vital part in that fabric of

thought. In 1897, Insull convinced the city council of Chicago to grant his company a 50-year franchise to sell electricity as a regulated monopoly operating in the public interest. Far from creating political corruption as the basis of business dealing, Insull merely became very good at what was established practice long before his time. He realized that without oiling politicians with self-serving advantages, businesses could be brought to a standstill.

Trade associations were an important part of those sorts of business management and communication efforts. In 1928 the U.S. Congress wanted to understand the dynamics of such efforts as it investigated the activities of the National Electric Light Association, which through the guidance of Insull and others had engaged in an unsavory, if not illegal, communication and public policy campaign since 1922. The campaign used misinformation and bribery of public officials to gain a favorable acceptance of its business activities. Espousing the virtue of operating in the public interest, this association achieved protection to operate because of government franchise in the name of the public interest. Industries such as this balanced the right and power of government control with a mask, if not the reality, of yielding their plans and operations to public control.

This campaign was defined as propaganda, which had previously been viewed as a worthy approach to communication. Now, through scrutiny by governmental officials and academics, propaganda was being characterized as the art of manipulation and deceit. It no longer was a healthy part of the honest creation of opinion through mass dissemination of ideas and information. The Federal Trade Commission scrutinized this campaign, disclosing its myriad techniques, tools, and strategies.

In one sense, the efforts of the electricity industry were no different from those of other business segments. Blue sky reporting of profits and the advantages of industry growth were rife. This was the era of the booming 1920s, which led to the collapse of the stock market in 1929 when the sky fell because the financial community had built itself on false statements, false promises, and investor greed. In this campaign, publicity and promotion of

products and services featured advantages that simply could not be delivered by the standard business practices of the time. Books were commissioned; faculty members were paid to write favorably of the industry. Lobbyists promised a variety of personal and political advantages to congressmen who supported their industry. Insull's publicity genius, Bernard J. Mullaney, was hard at work to connect the dots to show all that was good with the industry. All that opposed the industry, including the aura of Red-scare communism, must be challenged because it could ruin the electric generation industry. Electricity through this campaign became a patriotic mission.

Mullaney, a former Chicago newspaperman, used a variety of mass media to reach his targeted audiences. He used house publications to communicate with internal audiences, workers who could spread the word of the advantages of electricity. He looked at the communication potential of "new communication technologies" of the era, such as film. He wanted to sell electricity and the idea that utility companies should be publicly owned, rather than owned by state or municipal governments. They should be regulated; however, they would be influential in how that regulation would ensure their growth because of the advantages of electricity to a modern society, the American lifestyle.

Although he was not a professional practitioner of public relations, Insull provides continuity in the evolution of public relations as practiced in the United States. As secretary of a literary society in England while still a very young man, Insull convinced Phineas T. (P. T.) Barnum to lecture to the society on promotion and publicity. Perhaps no one was better at these public relations functions in practice or theory than Barnum at the time. Insull quickly appreciated strategy and necessity of keeping ideas and options in front of people explained in ways that caught their attention and captured their imagination. These lessons, never forgotten, were refined and applied through Insull's long and infamous career in American business.

INTEGRATED MARKETING COMMUNICATION

Integrated marketing communication (IMC) involves the synergistic use of public relations in tandem with other promotional tools to promote products, services, causes, or candidates.

ORIGINS OF IMC

The traditional tools in the "promotion mix" used by marketers include advertising, sales promotion, direct response, personal selling, and public relations/publicity. Clients have used these tools for many years, but beginning in the early 1990s marketers and advertisers began to recognize the importance of using these tools more effectively in combination.

The advertising agency business, in particular, became alarmed about reduced spending on traditional space and time advertising. Clients were shifting dollars away from activities based on building long-term brand awareness and brand equity to activities that would generate more immediate, demonstrable results: trade and consumer promotions, direct response, and cause-related marketing and events. Agencies responded by promoting the idea that they could coordinate all these elements for clients and acquired or established alliances with companies with expertise in these other specialties.

ELUSIVENESS OF INTEGRATION

Early IMC theorizing called for an *audience-centered* (versus *activity-centered* or *product-centered*)

approach to marketing communications. Implicit in this approach was recognition that various tools could be used to reach audiences. Early IMC theorizing also emphasized the extension of the same metrics used to measure advertising to all communications efforts.

Duncan (2002, p. 8) defined IMC as the "cross-functional process for creating and nourishing profitable relationships with customers and other stakeholders by strategically controlling or influencing all messages sent to these groups and encouraging data-driven purposeful dialogue with them."

IMC advocates have identified a series of stages through which integration progresses: (a) awareness within the organization; (b) image integration, or the melding of messages and themes across communications activities; (c) functional integration of units responsible for producing messages; (d) consumer and database integration, where customer intelligence is brought together; (e) stakeholder integration to address groups beyond customers; and (f) technological integration, where communications with customers are both intelligent and interactive. These varying approaches suggest that integration is actually conceptualized and used in a variety of ways today.

Full integration has been difficult to achieve due to structural, economic, creative, and tactical issues that continue to differentiate the disciplines involved in the process. Advertising continues to receive top priority in many programs because of the broad reach and awareness ads can create (and the large revenues generated from advertising for agencies). Sales promotion, direct response, and public relations are often ancillary activities, considered only after a creative direction for advertising is established.

Full integration is also difficult because of the different creative, production, and distribution conventions used by these disciplines. Integrated communications campaigns invariably involve the conjoint efforts of communications professionals with different skills, training, and orientations who create different genres of communications that follow different conventions. Even with the best of intentions, these inherent differences pose misunderstandings and conflicts. Among some public relations practitioners, IMC has been viewed as an

encroachment by imperialistic marketers who seek to take over the public relations function.

Public relations practitioners produce a wide range of tools that can be used in an IMC campaign. These include product publicity, speeches and presentations, events (celebrations, tours, meetings, conferences), and school and club programs. Significantly, some tools commonly used in public relations also might be assigned to sales promotion or direct response specialists. Examples are publications (collateral), displays, exhibitions, audio-visuals, direct mail and e-mail, and Web sites. Corporate advertising, cause-related marketing, and campaigns involving tie-ins with philanthropic organizations are examples of where traditional distinctions between public relations and marketing functions have become blurred.

COORDINATION OF CAMPAIGN ELEMENTS

An integrated marketing communications campaign, at minimum, requires three elements: (a) deployment of different tools and media to achieve the objectives or outcomes for which they are best suited, (b) timing of campaign elements to take maximum advantage of each, and (c) message consistency or continuity so that audiences recognize a topic or message as being familiar.

Coordination of Tools

Integrated communication involves optimizing the effectiveness and efficiency of various marketing tools. Certain communications tools are especially well suited to achieve particular outcomes as outlined in Table 1.

Coordination of Message Timing

Integration also involves purposefully disseminating messages using the same or different strategies to maximize results. In a new product introduction, for example, it is customary to lead with a new product publicity announcement to take full advantage of media interest and a product's inherent newsworthiness. Once fully exploited, publicity efforts are often reduced (unless there is ongoing news interest) and advertising begins. In-store sales promotion

(point-of-purchase, etc.) often coincides with the initial advertising campaigns, but also can be used later to bolster interest when no public advertising is being used. Direct response often follows publicity and advertising, capitalizing on previous awareness and interest to stimulate ordering.

Coordination of Message Content

Marketers seeking maximum integration and messages will ensure that messages carry common elements across communications tools wherever possible. Elements include common brand identification, spokespersons, and message themes (product promises, benefits, descriptions, and key facts). To the extent possible, consistent use of executional features of advertising such as logos, signatures, slogans, and graphic designs can provide important cues that attract attention, trigger recall, and facilitate learning and memory.

The critical issue in message integration is consistency—speaking with a “single voice.” Contradictory positioning or descriptions of a product or service obviously should be avoided. However, research suggests that moderate levels of inconsistency might actually increase attention to messages because audiences are motivated to resolve differences between a message's content and their existing knowledge stored in memory. Psychologists describe this phenomenon as a desire for cognitive consistency or the reduction of cognitive dissonance.

Varying messages within or across media categories has been shown to enhance interest and avoid the problem of message “wear-out,” where people become bored and disengage from message processing. In publicity and other forms of promotion where marketers have control of message content, varying the source, phrasing, and valence of messages can contribute to message acceptance because the message appears to be from a source other than the marketer. The challenge for effective publicity thus is to imbue the message with sufficient cues to create linkages with other communications that might appear as part of an integrated campaign.

—Kirk Hallahan

Table 1 Strengths of Alternative IMC Tactics

<i>Communication Tactic</i>	<i>Ideal Uses/Outcomes</i>
Advertising	Building awareness and desire
Publicity	Building awareness, establishing credibility
Interactive media	Handling queries, facilitating routine ordering
Sales promotion	Increasing involvement, prompting action
Direct response	Facilitating routine ordering
Personal selling	Overcoming objections, negotiating terms, facilitating nonroutine orders

INTERCULTURAL COMMUNICATION THEORY

Intercultural communication occurs whenever a message that is produced in one culture is interpreted in another culture. To understand the dynamics of intercultural communication, one must first understand the concepts of *culture* and *communication*. The concept of culture has many different definitions. Yet most definitions accept that culture is a learned collective or group process that is tied to communication. Communication is a meaning-making process.

Intercultural communication, then, is all about making meaning of the messages from a different culture.

The 21st century is a century of rapid changes in technology, trade, and communication. Both large and small organizations now operate in intercultural environments. For instance, American companies now have subsidiaries all over the world. Likewise, companies from other parts of the world have business relationships with the United States. Public relations practitioners must understand the fundamentals of intercultural communication. Practitioners, both in the United States and abroad, should become familiar with how public relations can be explained and improved upon by a consideration of intercultural communication theories.

The ways in which organizations can effectively communicate with international publics depend on a variety of cultural and societal forces. These cultural and societal variations will affect the communication between international organizations and the publics in the host nations. Extensive research shows the similarities and differences between cultures, and many researchers agree that context is one of the most useful theories for understanding intercultural communication. The theory of *context* is foundational for understanding the various cultural differences that influence interpersonal communication. Context is most easily understood as the situation or environment that encompasses a communicative interaction. By understanding the context of the situation, the parties gain the meaning and cues that guide people in how to act

and react in an interpersonal encounter. Edward Hall (1984) identified two types of context. High-context cultures, such as those in Asia and Latin America, are characterized by communication that is driven by the cues of both the situation and the relationship between the parties. In a high context the parties evaluate the environment and understand the meaning of the situation without too many words being spoken. Personal and professional relationships in these high-context societies have very little room for negotiation. These roles (superior, subordinate, partner, member) dictate the tone and content of the communication; when people do not know each other very well, they rely on very polite and formal communication. In low-context cultures, such as the United States and Germany, the tone and content of the communication is literally what is being spoken or written. People from low-context cultures generally seek certainty in their understanding of the situation by relying on spoken words, written documents, and formal agreements. In low-context cultures, the meanings that guide people's understandings of the situation are in the words, not the situation.

The theory of context offers several applications for public relations practitioners. In the higher-context cultures, individuals act out a particular role—manager, technician, or client—and little or no clarification is needed regarding tasks. In low-context cultures, public relations practitioners may need to ask more questions and seek verbal or written agreements.

A second set of theories for understanding the dynamics of intercultural communication is *cultural variation*. The work of Geert Hofstede is a central theoretical basis in the international public relations research literature. Hofstede (1984) has created five dimensions of culture, including (a) power distance, (b) uncertainty avoidance, (c) individualism-collectivism, (d) masculinity-femininity, and (e) Confucian dynamism. Public relations researchers have applied many of these dimensions in qualitative and quantitative studies of international public relations. *Power distance* refers to the openness of upward communication across societies. In high-power distance cultures, such as nations in Asia, public relations practitioners may

hesitate to express their opinions to their supervisors. The second dimension, *uncertainty avoidance*, refers to organizational members' tolerance of ambiguity. Uncertainty avoidance measures the ability of humans to cope with uncertainty. There tend to be more written rules, regulations, and stress in high-uncertainty avoidance cultures. The third dimension, *masculinity*, explains how work tasks are distributed across a culture and identifies whether or not these tasks are equally distributed to both men and women. For instance, in a highly feminine culture such as Sweden, both men and women work as pre-school teachers, secretaries, and nurses. A highly masculine culture is characteristic of any nation where women perform certain jobs and men do other tasks. The fourth dimension, *individualism-collectivism*, characterizes how people value themselves in relation to the larger group or community. Individualism-collectivism explores the relationships between the individual and the group or collective. Cultures with high individualistic values, such as the United States and Australia, tend to care about self-actualization and career progression in the organization. Cultures with collectivist values tend to value the benefits to the organization more than the interests and rights of the individual. The newest dimension, *Confucian dynamism*, describes cultures based on the ideas of thrift, perseverance, and the desire for orderly relationships with others. Denise Fernandez, Dawn Carlson, Lee Stepina, and Joel Nicholson (1997) conducted follow-up research and updated the dimensions of culture in 14 nations. Their article includes scores for China and Russia that were both excluded from Hofstede's original data set.

According to Hofstede (1984), these five variables are present in all cultures, and the degree of their presence will influence the internal and external communication of any organization. Cultural variation affects the practice of international public relations at two levels. First, it can influence communication relationships *within* an organization. For instance, the power distance dimension can tell us about the experiences of public relations practitioners with their supervisors or managers. In a study of Indian organizations, Krishnamurthy Sriramesh (1992) found that power distance can

have a strong influence on the public relations activities. Later research by Sriramesh, Yungwook Kim, and Miyoko Takasaki (1999) identified the cultural dimension of collectivism as a major influence on Japanese public relations; the concept of *wa*, meaning “harmony,” and *amae*, meaning “other’s goodness,” results in public relations efforts that create a “mutual solidarity” in the organization.

Second, cultural variation can affect the development of the practice of international public relations at the *societal level*. Nations that have high uncertainty avoidance are not tolerant of risk or threat of crisis. Organizations that operate in high-uncertainty avoidance nations must recognize that situations that may appear to be low risk may actually be perceived as crises by members of another culture. Poor communication during times of perceived risk will negatively affect public acceptance of organizational messages. Just as cultural variation is important for understanding international public relations, so too are societal factors. Different societies will react differently to public relations messages.

A related intercultural theory with clear implications for public relations is William Gudykunst’s (1995) theory of anxiety/uncertainty management (AUM). AUM theory provides a framework for understanding interpersonal, organizational, and society levels of risk tolerance.

Theories of intercultural communication are also informed by nonverbal communication. Hall’s (1984) intercultural theory of time shows that different cultures organize and experience time in different ways. *Polychronic* cultures are those that believe that time is flexible and can involve doing many things at one time. In polychronic cultures, involvement in and completion of a task are more important than adhering to a prearranged schedule. *Monochronic* cultures, on the other hand, believe that scheduled events and timelines must be met. People in these cultures work on one thing at a time and stop working on a task if another appointment or meeting is scheduled. Time orientation can affect business, communication, and relationships. Effective public relations practitioners need to identify the assumptions of their own time orientation and

be willing to understand and accommodate the orientation of others.

The trend of globalization creates opportunities for those with an intercultural communication understanding of the public relations function. Opportunities include the potential for public relations practitioners to lead their organizations during times of overseas expansions. The public relations function creates, changes, and maintains relationships with publics. It is because of this role that public relations practitioners can help their organizations to reflect on and incorporate the theories of intercultural communication in their communication with international publics.

INTERNAL COMMUNICATION

Internal communication is public relations directed to and among employees in an organization. James E. Grunig and Yi-Hui Huang (2000) referred to critical attributes of intraorganizational relationships such as reciprocity, trust, credibility, mutual legitimacy, and mutual understanding. For example, employee relations may be negative if there is a loss of credibility with organizational leaders.

Similarly, they indicate that trust is the characteristic that allows organizations to exist, including trust by stockholders, employees, communities, and consumers.

Individual perceptions of co-workers and supervisors are critical as these employee relationships emerge and develop. The diversity of communication relationships and the perceptions may lead to greater organizational efficiency or problematic relational dynamics. These dynamics also deserve consideration along with how organizations construct employee public relations material. The objective should be not just sharing information but also building understanding and resolving conflicts so that positive results (financial, productivity, relational) occur. Internal publics are groups of people inside the organization: supervisors, administrative assistants, clerks, and other staff members. Employee perceptions of internal public relations messages can be understood through comprehension of the various relationships that exist within the organization. Organizations and their employees can see their values as necessarily intertwined (i.e., “living the mission statement”) through various messages. When the positions taken by the organization (i.e., “white papers”) are supported by internal publics and the agreement is reflected in favorable views of the organization, the relationships among organizational members (especially among managers and subordinates) may be enhanced. Internal public relations material is often directed to employees, a communicative extension of management thoughts. However, media such as employee newsletters may provide a voice for employees on, perhaps, a weekly or monthly basis.

Theories of employee voice emphasize that such input can increase both organizational effectiveness and employee satisfaction. Participation and other supportive management practices can improve information flows, decentralize power, and increase communication within and among employee groups. Simultaneously, enhancement of employee voice can provide feelings of perceived autonomy and positive perceptions of organizational fairness. Many American corporations emphasize consultative participation. With this strategy, employees make suggestions (possibly through an online newsletter

link), but management chooses which ideas to implement. Even though management retains control in these circumstances, such computer-mediated communication may eventually permit employees to communicate in ways that reduce spatial and temporal barriers. Communication can occur more quickly and minimize the role of hierarchy, creating a more horizontal rather than a vertical organization. Groups may be created by management, or committees may emerge spontaneously within the company to address issues. Computer-mediated communication, in terms of employee relations, may enhance organizational efficiency.

Employee relations messages may be distributed through, as stated earlier, online mechanisms (i.e., company intranet) and employee newsletters. Additionally, short promotional announcements may be conveyed through memos and electronic mail (also online) or live broadcasts of events on corporate video (if the organization has this medium). Many organizations strive to share critical news with employees using other communication tactics and media. Deborah Hauss (1993) provided some examples:

1. Special editions of company newspapers, with lengthy explanations of events
2. Videotaped appearances by the company’s chief executive officer addressing employee concerns such as financial stability and job security
3. Monthly staff meetings, which may become weekly, daily, or even hourly in crisis situations, to keep everyone abreast of the latest developments
4. Town meetings, allowing open-forum discussions among employees
5. A series of mental and physical health workshops to help employees deal with job-related stress and/or the balance of work with their personal/family lives

Efficient communication systems allow for rapid processing and dissemination of information. As Libby Bishop and David Levine (1999) argued, individuals may feel that an equal opportunity to participate in organizational affairs exists through employee relations technology.

With the range of perceptions and attitudes along with enhanced employee performance due to participation, the relationships among internal publics can be quite complex. For example, credibility issues and unethical behavior are prevalent in many organizations, and these interconnected problems can affect the aforementioned factors. Employee relations can also be affected by organizational decisions that are publicized before employees have a chance to provide input on such decisions. Consequently, these media leaks may irreparably harm the credibility that organizational leaders have with their employees. Potentially, employees may be portrayed as victims of a brutal and uncaring organization. The relationships can be even more complex when globalization and diversity concerns affect organizations. For example, multinational corporations are confronted with a similar dilemma, whether to have a standardized global campaign or adapt the campaign to the local cultures. Employees who are assigned to such tasks need to be trained as culturally sensitive boundary spanners, and this training is another mechanism for internal public relations. These training sessions may be similar in style (teaching) to the aforementioned workshops but more relevant to the employee's role in the organization. Even though many training sessions are sponsored by the human resources department or the employee's work group, they are an integral public relations tool. Employee relations is likely to suffer when job-related training is limited or nonexistent.

Diversity training initiatives can also be helpful. Speakers address employees on such topics as career development and the "glass ceiling." Managers and executives are also invited to attend these sessions, and every diversity promotion (traditionally affecting underprivileged groups such as African Americans and women) is well publicized throughout the entire organization, potentially enhancing employee relationships.

Focus groups may also be helpful for internal public relations. These groups may include people from different company departments or, as M. J. Major (1993) suggested, different ethnic and gender groups. These groups may have a direct influence on the image of a company as it is projected to

external publics. The influence can extend from corporate advertising campaigns to conversations at the local grocery store between a focus group employee and a potential customer of the organization. Major recommended another direction for employees and public relations in the form of community outreach programs. The focus groups plan, sponsor, and host various events, or they may get involved in high school and college internship programs. For the organization and its employees, the objective is not only to give back to the community but also to make employees feel good about their company. The focus group members, as well as other employees, see that the organization is (1) a good corporate citizen and, most important, (2) a company that strives to have beneficial relationships among all employees.

Employee relations can also be enhanced through company mission statements and communication of a vision. (These two items are often interrelated because organizations frequently communicate a vision through their mission statements.) Leaders and employees advocate for the mission statement by consistently executing its principles.

These enactments may create and sustain a sense of community among diverse people in an organization (job role, ethnicity, etc.). Thus, employee relations can be enhanced with company mission statements. However, these enhancements are maximized when employees are truly interested in principle execution: They are "walking the walk."

The mission statement may only be temporarily successful as a leader-driven employee relations mechanism; employees must have input into its development and execution.

An optimal organizational situation is when the vision, as articulated in the mission statement, is internalized by employees and projected to other relationships (internal and external) on a daily basis.

Internal public relations can also be strengthened through organizational storytelling. Stories can be a means for capturing employees' experiences and expressing them so they represent an organization's traditions, values, beliefs, and priorities. Stories

can foster understanding among employees, comprehension of the subcultures and political realities of daily organizational life. Additionally, stories can help managers with their leadership tasks.

Leaders may communicate how they viewed or handled a certain issue. Ideally, the stories will offer practical advice and solutions for employees. These experiences can be stored for future reference so that the next generation of leaders can learn from them.

The most valuable stories that are expressed in organizations are those that teach, inspire, motivate, and add value through shared meaning. Of course, there will be variations in meaning among different employees, but if there is a common frame of reference within the story, it can be a way to strengthen employee relations through identification. Organizational tales are created from past experiences, from current ideas and questions, and from a personal vision about the future (through stories and, possibly, mission statements).

These stories can be relayed through staff meetings (as mentioned previously, a common employee relations tool). For example, a sales team might report monthly figures in a meeting. A sales manager may ask them to review some of their best and worst experiences of the month through a story. These stories can provide the team with important lessons, make the report numbers more meaningful, and build relationships among individuals. Stories can also be conveyed in more informal settings, such as a local restaurant after working hours. The team may decide to meet at this specific location, and even though the setting is informal and casual, team members and leaders may be using the get-together as a means for strengthening employee relationships.

Additionally, organizational storytelling may also be revealing in terms of employee turnover; why is the person leaving, and what can be learned from his or her departure?

T. H. Feeley (2000) suggested that such attrition can be reduced by socializing employees using their peers or supervisors. Storytelling may provide a rich set of information that assists with socialization.

In terms of employee relations, partnerships must be built with internal stakeholders. Contextual

issues (i.e., environmental scanning) must be evaluated to gain an objective understanding of organizational life. By recognizing that employees are critical stakeholders, managers and team members can identify (through storytelling and other means of communication) which external and internal forces are of primary concern to the organization. Open feedback is essential. The open-door policy espoused by many organizations must be continuously practiced. Current and future employees must be aware of organizational processes and their roles within the organization.

Continuous feedback may stimulate such awareness. Employees need to be made aware of their responsibility in identifying development opportunities that will broaden and expand their skills and knowledge. Managers can also be helpful with identification of these opportunities. Thus, employees not only learn critical professional skills, but they also internalize that their organization is committed to forging positive relationships among employees. A final recommendation for successful employee relations is the institution and execution of employee mentoring programs. Positive relationships may be further enhanced through one-on-one identification and interaction.

INTERNATIONAL ASSOCIATION OF BUSINESS COMMUNICATORS (IABC)

The International Association of Business Communicators (IABC) is a not-for-profit professional association headquartered in San Francisco, California, with more than 13,000 members in more than 100 chapters with representation in 62 countries. IABC's mandate is to support members in their work to create strategic, interactive, integrated, and international organizational communication.

Members are linked through local chapter activities; local, national, and regional professional development initiatives that are delivered online, via telephone, and in person; an international conference; a print magazine, *Communication World*; *CW Bulletin*, an online newsletter; and an Internet Web site (www.iabc.com). A volunteer international executive board of directors composed of 26 communicators provides the strategic vision for the organization, which is informed by regional and local volunteer leaders. A salaried president and staff at its world headquarters handle day-to-day management of the association.

The organization boasts a well-developed and well-respected research arm, the IABC Research Foundation. The foundation develops original research that aims to advance the practice, perception and effectiveness of communication.

Through IABC's accreditation program, professional communicators can work toward an Accredited Business Communicator (ABC) designation. In addition to various recognition awards, IABC offers the Gold Quill Awards Program, an annual international competition for excellence in communication.

HISTORICAL OVERVIEW

IABC is more than 30 years old. From its beginnings at a communication conference in Pittsburgh, Pennsylvania, in 1970, the organization has supported and acted as an advocate for professional communicators and their organizations. In the era of a booming post-WWII marketplace, the number of local International Council of Industrial Editors

(ICIE) chapters grew to the point where its leaders decided to create the first American professional communication association. Although the headquarter concept did not work for ICIE, the organization continued its print publications through local chapters. In addition, the association developed a peer and management evaluation and awards program. A similar organization, the American Association of Industrial Editors (AAIE), later established the Gold Quill awards, a program of recognizing excellence in the field, which continues today.

The associations began tracking membership and the function of communication in organizations during the 1950s. Using quantitative measures, the volunteer members analyzed data from nearly 2,000 American editors of nearly 10,000 internal and external organizational publications. Those findings are interesting to communication history students in that they demonstrate the gender, age, and income of the early professional communicators. (In 1955, one-third of the respondents were women, nearly one-half were more than 40 years old, and the average salary for those 40 years and older was US\$12,000.) The figures also trace the evolving functions of internal communicators.

The mid-1950s saw a shift in a communicator's responsibilities. Editors were increasingly moving from external communication departments to those of internal relations. However, many business publications had no identified link to their organization's objectives. The volunteer members identified this incongruity as an opportunity to communicate the value of their work to their organizational leaders.

Associations with the American Management Association, Cornell University's School of Industrial and Labor Relations, and Oklahoma A & M led to professional development and strategic initiatives for local members during the 1950s. During this decade, ICIE volunteers developed measurement techniques that would help members communicate the value of their work to industry leaders. The main goal of the volunteers was to demonstrate through case histories with tangible results that managed communication programs tied to business objectives can lead to better understanding of company policies, lower turnover rates, and increased sales.

ICIE continued supporting its membership through print publications and professional development seminars throughout the 1960s. *Reporting* detailed the activities of the association, and the newsletter *Contact* was meant to assist communicators in demonstrating to their management that they could convey integral economic and policy information to employees. A nationwide tour of seminars endeavored to do the same in face-to-face settings. Regular mailings of successful case studies and research findings would later become the core of IABC's library and information resources (considered one of the major member benefits today).

In June of 1970 members of ICIE and AAIE amalgamated to form a 2,280-member IABC, and in 1974 Corporate Communicators Canada joined the association. Today, IABC consists of 12 districts or regions around the globe, including the Asia/Pacific Region, the Europe Region and the Sub-Saharan Africa Region. The association has evolved in correlation with the way people and their organizations communicate. In particular, technology now supplements print communication, and IABC communicates with members through its Web site, e-mail messages, and *CW Bulletin*.

Changing the way that people communicate changes the nature of relationships, which is not particular to any one situation or institution. As part of an ongoing process, public relations practitioners constantly analyze which communication channels work in their organizations and in society and which do not. According to Julie Freeman, IABC's current president, the association continues to respond to these contemporary realities and offers professional support for its members through "content, community and credibility."

LEARNING OPPORTUNITIES FOR MEMBERS

The content that Freeman refers to includes professional development opportunities, such as a yearly international conference, corporate communications summits, and research and measurement conferences. Many of the professional development vehicles and knowledge resources are delivered directly to the members via electronic channels.

The 94 local chapters in 12 countries provide professional development that is relevant to the needs of their specific members. Ranging from workshops, seminars, and presentations on topics such as negotiation skills in Australia and New South Wales, to managing employee communication during the SARS outbreak in Toronto, to using local attractions to promote the city of New Orleans, IABC members experience timely and relevant sessions that assist them in achieving high professional standards and innovation in organizational communication.

Although the majority of members work in the United States and Canada, IABC leaders attempt to capture global diversity by bringing best-practice examples from outside the continent to North America, and vice versa through research initiatives, articles in its publications, and the content of the learning sessions. Professional development seminars are delivered to members via the Internet and telephone, and in face-to-face settings. Those who present the learning opportunities are often top communicators from various parts of the world. These organizational leaders share experience and expertise on topics such as global branding, media coaching, and reputation risk management.

IABC membership reflects the changing face of where and how communicators work. The last two decades have seen a gradual switch from communicators working predominantly in corporate positions, to those working independently. IABC programming and intellectual resources reflect this change as the phenomenon becomes more prevalent.

In addition to working for professionals, IABC's efforts also include student and educator relations. The organization does not have a student-specific association under its umbrella; rather, individual local chapters choose to establish and support university and college student chapters. However, not all student chapters are supported by a local chapter; they can and do exist independently of a practitioner chapter. In an effort to actively establish relationships with future practitioners, to bring educators, students, and professional members together, and to encourage a wider diversity in organizational communication, IABC has established guidelines for local chapters interested in developing and nurturing these relationships.

ETHICAL AND EFFECTIVE COMMUNICATION PRACTICES

IABC members abide by the Code of Ethics for Professional Communicators. The code assumes three worldwide principles:

that just societies are governed by a profound respect for human rights and the rule of law; that ethics, the criteria for determining what is right and wrong, can be agreed upon by members of an organization; and, that understanding matters of taste requires sensitivity to cultural norms. (<http://www.iabc.com/members/joining/code.htm>)

According to the code, members agree to

1. Engage in communication that is not only legal but also ethical and sensitive to cultural values and beliefs
2. Engage in truthful, accurate, and fair communication that facilitates respect and mutual understanding
3. Adhere to the articles of the IABC Code of Ethics for Professional Communicators (<http://www.iabc.com/members/joining/code.htm>)

These articles might not be referenced on a daily basis, but the topics within the code are addressed in publication articles, seminar themes, and member discussions. The code also plays a large part in a member achieving the Accredited Business Communicator (ABC) designation.

Similar to other professions, such as bar exams for lawyers and competency exams for general accountants, IABC members can earn accreditation. The program is managed by an accreditation council and represents both an evaluation of a communicator's expertise and a learning process for the applicant. Earning an ABC through IABC is a challenging process in which a communicator has to prove the ability to ethically and successfully manage and respond to organizational communication needs. The process is peer evaluated, and each section of the accreditation process is marked or graded by at least two, and occasionally more than four, experienced and accredited IABC members. The process has been adapted for different cultures and languages to reflect the global diversity of IABC membership.

Members with a minimum of five years' professional communication experience and a bachelor's degree, or a total of nine years of combined experience and education, are eligible to go through the process. After an application has been approved, the communicator submits a portfolio of work samples demonstrating the range of communication projects managed. The portfolio is meant to demonstrate to the evaluators how well the communicator understands communication planning. The final phase of the accreditation process consists of four hours of written and 30 minutes of oral testing. The entire process pays particular attention to ethical communication and is meant to reflect work situations and theoretical underpinnings of the profession. Nearly 25 percent of the applicants fail at least one section of the process on the first attempt. However, the process allows for an applicant to resubmit or retest specific sections of the evaluative process.

IABC members who commit to the accreditation program are supported on local, national, and international levels. Through virtual and face-to-face mentors, members learn from their peers and experience opportunities to articulate skills and knowledge. In addition, applicants can partake in virtual or face-to-face classes. Accredited members often boast an increase in credibility within their organizations and in the industry. Accredited members also report having higher salaries than their non-accredited peers. Although these are assets of the program, accredited members articulate that the learning process involved with accreditation is the most beneficial aspect.

The association offers other opportunities for members to demonstrate skills and knowledge, and to be honored for them. The most prominent of these is the Gold Quill Award, a program that offers professional communicators an opportunity to have their work evaluated by expert judges. All Gold Quill finalist entries are considered for the IABC Research Foundation's Jake Wittmer award for outstanding research in organizational communication, and for publication in IABC's knowledge resource materials. Although the association receives thousands of submissions each year, only a select few are chosen for excellence in business communication.

IABC recognizes its volunteers through various awards. The Fellow Designation acknowledges remarkable leadership, as well as contribution to the profession and service to the association, and is considered the highest and most prestigious honor for a member. Each year, the Chairman's Award recognizes an IABC volunteer who has demonstrated initiative, leadership, and a willingness to contribute to the association at an international level, and to the communication profession in general. Chapter Management Awards are presented to local chapters judged to have excelled in innovation, creativity, and best practices. Overall chapter management excellence is celebrated through the IABC Chapter of the Year award.

The association also recognizes individuals outside the organization who have proven to be extraordinary leaders in fostering excellent communication. The Excellence in Communication Leadership Award is usually given to member-nominated CEOs, managing directors, or presidents who consistently demonstrate vision and leadership in their commitment to effective business communication. In addition, the IABC Research Foundation facilitates a Lifetime Friend Award, which recognizes individuals who have been ardent supporters of research initiatives and who have donated their time and expertise to the Research Foundation's work.

GROUND-BREAKING RESEARCH

With its own distinct board of directors, IABC's Research Foundation aims to advance the practice, perception, and effectiveness of organizational communication by funding and publishing scholarly and professional research. The research results inform the association's educational programs by identifying the issues that are important to the members. This is achieved, in part, by a working group of 15 nominated communication thought leaders from academe, corporate, not-for-profit, and government sectors. The rotating membership of this think tank ensures that there is a fresh focus on future thinking about the profession and that key issues affecting public relations are recognized. The meeting's purpose is to recommend to the IABC

Research Committee a list of topics that can be developed into practical and original IABC information resources, services, and research. In addition, the information generated at the meeting is used to develop ideas for foundation projects and gives direction to the professional community through IABC publications.

IABC is unique in North America in that the organization supports international primary research through the Research Foundation. Past projects include the 1986 *Velvet Ghetto Summary Report*, the *Excellence in Public Relations and Communication Management* study, and *Communication as an Intangible Asset*, among others. The studies are made available to members and nonmembers through IABC.

PEOPLE NETWORKS

IABC membership reflects the many forms of organizational communication. Members can range from investor relations professionals, to photographers, to CEOs of public relations firms. Freeman believes that one of the strengths of IABC is that it not only brings together people who are practicing different kinds of communication, but the organization connects practitioners around the world.

The community that forms around the membership manifests on different levels. For example, members use the membership directory, or the online "member search" feature and "member speak" to form a peer community, hire professionals, seek clients, or look for a job in areas where they may not have contacts. A member might also use the online IABC Job Centre to post a job vacancy or search for one. Perhaps the biggest benefit of IABC membership is the opportunity to volunteer and become involved in a community, where professional relationships and friendships are created at local, national, and international events. Because the organization is large and the membership diverse, people will often call on one another for knowledge sharing, professional advice and supplier recommendations, or problem-solving assistance. Members will also work together on collaborative projects, either for the association or for their own organizations. IABC leadership has

articulated a goal that the association facilitate the personal and/or professional connection that assists communicators to exchange knowledge about how to do their jobs.

INTERNATIONAL PUBLIC RELATIONS ASSOCIATION

The International Public Relations Association (IPRA) is the world's only truly international public relations professional organization, with 1,000 professional members in 87 countries and with 89 countries identified as members of the global professional organization. Student memberships were also recently made available, and more than 200 students were identified with the organization in the 2003–2004 membership year directory as individuals interested in international public relations practitioner performance. A collegiate membership is also available for educators.

Fifteen world congresses have been hosted every three years since 1958 by the global association in major cities on six continents. In addition, the IPRA Council, which currently has global representation from 58 countries in its 77 elected members, has met annually since 1955 in 49 different cities of the world on seven continents. Council meetings are normally held in conjunction with jointly sponsored IPRA public relations conferences hosted by a country's national public relations association or with a country's annual national convention. IPRA has also hosted a number of international educator congresses, usually in association with its own congresses. The outreach of the association, therefore,

has truly been worldwide in educational impact for both professionals and educators.

In addition to providing networking and the sharing of information through conferences and meetings, IPRA has become significant to the global profession by providing global awards, the identification of universal ethical standards, recognition to groups that have advanced world understanding, publications on key professional and societal issues, and a consultancy role with the United Nations. An explanation of each of these programs follows.

GOLDEN WORLD AWARDS FOR EXCELLENCE

In 1990 IPRA initiated a program to recognize excellence in public relations practice with the creation of the annual IPRA Golden World Awards for Excellence. The awards program has increased in prestige annually, and today international public relations firms, corporations, associations, health organizations, chambers of commerce and other business groups, and governmental agencies are increasingly vying for recognition in this competition.

GLOBAL STANDARDS FOR ETHICAL PERFORMANCE

The pioneers within IPRA adopted the first code of conduct for global practitioners in Venice in 1961. The elements of the code were patterned after the code identified by the Public Relations Society of America for its members in 1950. In 1965, Lucien Matrat of France authored an international code of ethics that was adopted in Athens, Greece, by the IPRA General Assembly; it tied requirements for member practitioner professional and personal behaviors to the United Nation's Declaration of Human Rights. In particular, the code requires that members shall refrain from (a) subordinating truth to other requirements, (b) circulating information that is not based on established and ascertainable facts, (c) taking part in professional activities damaging to human dignity or integrity, and (d) the use of subconscious approaches designed to manipulate the public without its awareness.

Concerns about environmental communication in 1991 resulted in a declaration that was approved in Nairobi under the IPRA chairmanship of Charles van der Straten Walle of Belgium. This code addresses practitioner responsibility to ensure the information and counsel they provide protects the environment, binding participants to environmental codes of practice adopted by the United Nations and the International Chamber of Commerce.

In 2002 specific member expectations were added to the IPRA charter on media transparency. The code identifies the expected relationship of IPRA members with members of the journalism profession within countries. The policy prohibits payment for editorial coverage and requires that when payment of any kind is received for editorial content, it be clearly identified as advertising or paid promotion. Gifts and the solicitation of coverage by journalists have also been addressed, with members required to prepare policy statements agreed to by journalists and public relations practitioners that have been made available to the public for inspection.

Although enforcement of the codes presents difficulties, their significance is related to the standard the codes identify for acceptable global public relations performance and the identification of practitioner behavior with the protection of fundamental human rights. Some indication of the positive impact is the fact that the Code of Athens has been translated into 20 languages and copies have been presented to numerous heads of state and the Pope. Other codes are carried in membership materials, emphasized at international meetings, and communicated through what is now a globally assessable Web site.

IPRA PRESIDENT'S AWARD

The IPRA President's Award was established in 1977 to recognize individuals or institutions outside of the public relations profession for "outstanding contributions that have led to better world understanding." Designed as a way of bringing recognition to individuals or institutions that have promoted principles of peace, social justice, cultural understanding, or the role and importance of

the public relations function in global society, the prize has been awarded to the Nobel Foundation, International Red Cross, Band Aid, the World Wide Fund for Nature, and Archbishop Desmond Tutu. The award reflects credit on public relations as a profession globally while bringing recognition to IPRA.

UNITED NATIONS

IPRA received recognition by the United Nations in 1964 as an international nongovernmental organization and has been granted consultative status by the Economic and Social Council (UNESCO).

GOLD PAPERS

Position papers, printed with metallic gold covers and termed gold papers, were introduced under the leadership of Tim Traverse-Healy. The papers have defined the standards and ethics of public relations performance and education. Fourteen gold papers have been published. They have examined globalization; research and evaluation; public relations education; communication challenges including environmental concerns, quality control, and accountability; and ethical and social responsibility issues. These papers continue to be available and can be acquired by contacting the IPRA Secretariat at www.IPRA.org.

Among the gold papers with the greatest impact on global developments are those on public relations education.

HISTORY

IPRA has its origins in founders who were members of the Dutch Public Relations Club and the Institute for Public Relations in Britain, organizations in countries where international trade had long been the economic foundation. Two Dutch public relations practitioners—Hans Hermans and Jo Brongers—and four British practitioners—R. S. Forman, Roger Wimbush, Tom Fife Clark, and Norman Rogers—all officers of their respective public relations organizations, met informally in

London, where they identified a group of public relations executives in Britain, the Netherlands, France, Norway, and the United States of America whom they would invite to meet at the Royal Netherlands International Trade Fair in Holland for discussion of the needs and challenges entailed in the international practice of public relations. The meeting, which was also held under the auspices of the Public Relations Society of Holland, created the framework for initiating the development of what in 1955 would become IPRA. The formal establishment occurred with the adoption of a constitution and the appointment of the first IPRA council.

Founding council members included

- Tom Fife Clark, president (Great Britain)
- Tim Traverse-Healy, honorary secretary (Great Britain)
- Roger Wimbush (Great Britain)
- Alan Hess (Great Britain)
- Etienne Bloch (France)
- Jean Choppin de Janvry (France)
- Rene Tavernier (France)
- Rein J. Vogels (Netherlands)
- M. Weisglas (Netherlands)
- Erling Christopherson (Norway)
- Per Johansen (Norway)
- Odd Medboe (Norway)
- Richard B. Hall (United States)
- Edward L. Lipscomb (United States)

The mission of the organization was originally conceived as providing for the exchange of information and cooperation among international practitioners. However, following the adoption of an international code of ethics, the mission evolved into that of supporting the development of the highest possible standards of public relations ethics, practice, and performance.

By the 1990s, the mission had broadened to that of helping members keep in touch with national, regional, and international trends and issues via

informal contact and official functions, as well as that of explaining to opinion formers the role of the public relations function.

By the turn of the 21st century, the vision and mission were being defined in more strategic terms. The vision is now that of being the world's most relevant, resourceful, and influential professional associations for senior international public relations executives. The focus of the mission has also changed to providing professional development and member services that enable practitioners to be more effective in international counseling relationships.

LEADERSHIP

The United Kingdom and the United States have led in the numbers of professionals who have served as president. However, presidents from 19 countries have headed the organization since 1955. Dr. Don Wright, a leading American educator, will be the first educator elected to serve as president in 2005. A number of distinguished professionals have also served as influential secretary-generals of IPRA. Among these were Tim Traverse-Healy, who guided the organization in its formative years, and Sam Black, who through world travel substantially increased awareness of the global association. Currently, council members elected from 58 different countries guide the policies of the organization. At least one council member served as national chair within their countries.

AWARDS AND RECOGNITION

At the present, only one recognition has been established to acknowledge outstanding contribution to IPRA and to the global profession. This is the granting of Membership Emeritus Status in IPRA. Those who have been identified as making a distinguished contribution to IPRA and to the global advancement of the public relations profession by country include

Belgium: Charles Van Der Straten Waillet

Egypt: Mahmoud El Gohary

France: Claude Chapeau, Jacques Coup de Frejac, Lucien Matrat

Germany: Albert Oeckl

Greece: Manos B Pavlidis, Marcel Yoel

India: Anand Akerkar

Israel: Michael Barzilay

Japan: Roy Sanada

Netherlands: Anne Van Der Meiden, Rein J. Vogels

Netherlands Antilles: Arturo Jesuran

Norway: Odd H. Medboe

Sweden: Goran Sjoberg

Switzerland: Alain Modoux, Jean-Jacques Wyler

Turkey: Betul Mardin

United Kingdom: Sam Black, Dennis Buckle, Tom Fife Clark, Tim Traverse-Healy

United States: Edward L. Bernays, Robert L. Bliss, John W. Felton, Denny Griswold, Roy J. Leffingwell, Gene G. McCoy, John E. Sattler

—Melvin L. Sharpe

INTERNSHIP

As perhaps the most widely recognized and frequently practiced form of experiential education, internships are regular curricular offerings in most college and university public relations programs. An internship is work experience, typically approved for academic credit and offered by a business or nonprofit organization, designed to accomplish specific learning goals. Student interns are monitored by an on-site supervisor and a faculty member, each of whom ideally serves as a mentor. Internships extend the traditional classroom, allowing students to apply knowledge gained in their coursework to specific, practical tasks. Many public relations practitioners, faculty members, and professional associations consider internships an essential part of career preparation.

Based on the work of John Dewey (1938) and borrowing the label *intern* from medical schools, educational programs in many disciplines offer hands-on field experiences in which students connect abstract classroom concepts with work-based problems

and, by extension, increase their marketability after graduation. As Richard Katula and Elizabeth Threnhauser (1999) discussed, internships have two main goals: (a) acquainting students with professional working environments and (b) providing opportunities for professional development.

Fred Beard and Linda Morton (1999) found six predictors of successful internships: (a) academic preparation, (b) student initiative, (c) positive outlook, (d) quality of supervision, (e) task appropriateness, and (f) compensation. Compensation traditionally has taken many forms, ranging from academic credit to tuition reimbursement to payment for service. Discussion continues regarding the most appropriate compensation, and some research indicates that paid internships are taken more seriously by both students and field supervisors. Also important is that tasks assigned to interns be both structured and rich enough to promote skill development.

Beard and Morton (1999) also pointed to five internship outcomes: (a) development of job-related skills, (b) accrual of career benefits (e.g., job prospects, mentors), (c) increased career focus (e.g., understanding requisite skills and work environments), (d) enhanced professionalism (e.g., refined interpersonal skills), and (e) tangible outcomes (e.g., portfolio materials). Both the academic and field supervisors play critical roles. Structured internship programs better enable students to connect their experiences with public relations coursework. Field supervisors who provide specific directions and feedback assist in maximizing the experience—both for the intern and the organization. Internships should be designed as much more than work for academic credit; they should be learning experiences where students are mentored while having opportunities to contribute productively to host organizations.

Most student interns, faculty supervisors, and field mentors evaluate participation positively; and professional associations, such as PRSA, recommend internship experience as important in career preparation. Based on a survey of practitioners, Gayle Pohl and Dee Vandeventer (2001) concluded that persons entering the profession must possess specific skills; thus, job-related experience, such

as that attained through internships, is essential. Further, the *Occupational Outlook Handbook* (2002–2003) predicted fierce competition for entry-level public relations positions and noted that internships are vital to securing employment.

INTERPERSONAL COMMUNICATION THEORY

Historically, public relations has been closely associated with mass communication, in part because until only recently, public relations practitioners usually were educated and worked as journalists before entering public relations. Also, public relations frequently targets mass media as a popular channel to carry its messages, placing great emphasis on publicity-gaining activities and media relations. However, public relations also commonly employs interpersonal communication in carrying out its research and planning functions and executing its strategies, tactics, and evaluation processes. Public relations practitioners might well study interpersonal communication theory and master interpersonal communication techniques to enhance their probabilities of engaging in best practices.

Mass media functions to provide glimpses of socially constructed reality, projecting “pictures

in our heads” synthesized from the real world, in Walter Lippmann’s (1965) terms. Gaye Tuchman (1978) noted the news media acts as the public’s window on the world. Mass communication influences the way people relate to one another interpersonally and vice versa. The assessment applies just as well to public relations: In many instances, public relations influences the way people relate to one another interpersonally, and there is a growing recognition of the importance of interpersonal communication in public relations.

As early as 1955, Elihu Katz and Paul Lazarsfeld described interpersonal communication as an intervening variable between mass communication and behavior change. Katz and Lazarsfeld introduced the two-step model of mass media effects, depicting interpersonal interactions as channels of mass media information in which individuals engage in interpersonal communication about mass media content, exchanging information and influencing each other’s opinions. Public relations campaigns frequently work to facilitate application of the two-step model and depend on word-of-mouth amplifications of public relations’ mass media publicity placements.

Traditionally, interpersonal communication contexts have included theories dealing with individuals in relationships or the relationships themselves, especially—but not limited to—dyads. Public relations might well serve as a bridge between interpersonal and mass communications, since public relations contexts often include communication between dyads as well as broader societal interactions.

Weighing similarities as well as differences between interpersonal communication and mass communication, Jennings Bryant and R. L. Street, Jr., (1988) suggested that interpersonal and mass communication differ in (a) theoretical focus, with mass communication being preoccupied with receiver-oriented, and interpersonal with both receiver- and source-oriented, with an emphasis on the latter; (b) nature of the communication process, with mass and interpersonal communication each having varying active, recursive (involving feedback), interactive, and transactional patterns, depending on respective theoretical perspectives; and (c) outcomes of message perception in relation

to receiver cognitions and attitudes: Interpersonal research assumes cognitions and attitudes to be comparatively stable, whereas mass communication assumes they are dynamic and subject to influence by the mediated message. Bryant and Street concluded that studying each other's models and sharing findings can only enrich both interpersonal and mass communication domains. The same assumption likely applies equally to interpersonal communication and public relations.

APPLYING INTERPERSONAL COMMUNICATION THEORY TO PUBLIC RELATIONS

Elizabeth Toth (1992), Timothy Coombs (2001), and others have argued for pluralistic studies and applications in public relations, involving rhetorical, relational and systems perspectives from interpersonal communication theory. In general, practitioners in public relations engage in communication in three different categories of relationships: (a) client/organization–practitioner relations, (b) journalist/media gatekeeper–practitioner relations, and (c) members of target publics–practitioner relations. Interpersonal communication occurs within each of the three different categories.

Interpersonal communication theory has been applied to public relations practice to good effect. For example, Marcia Prior-Miller (1989) examined four theoretical perspectives rooted in what she characterized as “sociological-organizational traditions,” including (a) symbolic interactionism, (b) exchange theory, (c) conflict theory, and (d) structural-functional theory, and found that they each help explain various public relations communication phenomena under varying conditions. Studying internal public relations in a hospital, Gary Kreps (1989) discovered that information theory/uncertainty reduction is important to the organization as a system, where information becomes a prerequisite to the development and implementation of relevant innovations to accomplish systemwide organizational development.

Classically rhetorical post hoc evaluations of speaker's intent, oration, environment, and effect

dates back at least to the Greeks but is central to many different types of public relations campaigns conducted today. Although research on compliance-gaining message strategies has been conducted mainly in interpersonal settings, public relations messages that have compliance gaining as a goal or component are commonplace. Effective persuasive campaigns often rely on multiple messages. In public relations, multiple messages may involve use of different channels, calling upon different theoretical traditions including interpersonal communication theory.

Considering public relations campaigns invites further consideration of communication theory, which serves to inform campaigns about effective audience segmentation and message design, while campaigns provide data for further theoretical development. James VanLeuven (1989) found five theoretical frameworks—(a) persuasion/learning effects, (b) social learning, (c) low involvement, (d) cognitive consistency, and (e) value change—useful for understanding campaigns and their effects.

Two exploratory studies analyzed Silver Anvil Award–winning campaign case histories recognized for campaign excellence by the Public Relations Society of America (PRSA) for expressed and implied application of interpersonal theoretical perspectives. The first study, limited to 35 campaigns conducted only in the year or so before 1990, concluded that interpersonal communication theorists could use public relations as a laboratory in which to develop and test their theories. Interpersonal communication strategies are important to the effectiveness of public relations campaigns along with other strategies, such as mass media publicity placements, direct (unmediated) communications, and special events.

In the second study, 136 Silver Anvil campaign cases from 1970 to 1990 were analyzed for applicability of seven interpersonal theoretical perspectives. Information theory was found the most applicable overall and, along with social exchange theory, did not vary over time. Systems theory was found to be the least applicable overall, but did vary over time, along with constructivism, social influence, developmental approaches, and symbolic

interactionism. Also, interpersonal communication strategies suggested by theories have been for some time as applicable as other strategies, such as mass media publicity placements. A follow-up content analysis of leading public relations academic journals found that 12 percent of the research published had been guided by interpersonal theory and that another 15 percent of the research published might have benefited from framing with interpersonal theories about persuasion, cognitive factors, situational factors such as involvement, and need for negotiation during crises and conflicts.

Theoretical applications to public relations may enable practitioners to predict and control outcomes, or at least influence probabilities of outcomes. Practitioners perform a variety of management roles and functions while acting as liaisons between the organizations they represent and an organization's publics. Among functions performed are ascertaining and influencing public opinion, often using some combination of interpersonal and mass communication techniques. When public opinion about the organization is favorable, the practitioner's function is maintenance and problem prevention. However, when public opinion is less than desirable, practitioners are expected to design and implement communication programs to change the public's attitudes. Vincent Hazleton and Carl Botan (1989) cited the example that positive or negative publicity may affect stock prices in predictable directions: With positive media coverage, stock prices are likely to rise, and vice versa. A practitioner applying a theory that prescribed intervention in the communication process with journalists to affect the valence of publicity would be exercising control, but within ethical and legal boundaries. It is likely that at least some of those public relations–initiated communications between practitioners and journalists would be interpersonal in nature. New technologies such as Internet-based e-mail exponentially broaden opportunities for interpersonal communication across publics. By using theory-based models to drive strategy selection and implementation, probabilities of effectiveness may be greatly enhanced.

INTERVIEW AS A COMMUNICATION TOOL

Public relations professionals make use of media interviews to get the organization's message across and enhance its image. Such interviews can result because a spokesperson is invited to appear on a talk program or asked to respond to key questions in an interview format. A second way they occur is for practitioners to pitch the interview to producers who are looking for interesting personalities to put on talk programs.

Television (national and local cable networks), radio, print and the Internet provide opportunities for interviews. Public relations practitioners arrange for members of their organization to be interviewed by the media by maintaining an active media relations program. Media relations can be defined as "working with mass media in seeking publicity or responding to their interests in the organization" (Wilcox, Cameron, Ault, & Agee, 2003, p. 8). A practitioner must have an updated media list and keep in touch to know the shows/columns, the type of audience targeted, the time constraints, format used for interviewing, and so forth.

With a well-cultivated relationship, it is easier for public relations professionals to successfully pitch (present and sell) interview ideas for their clients. Public relations practitioners need to focus their pitch to media by highlighting benefits to the audience rather than assuming a self-serving role on behalf of the organization.

Television shows today are replete with celebrities, making it difficult for public relations professionals to sell their non-glamorous, corporate clients. However, the practitioner can look to local TV stations and radio to get the message across. With thousands of radio stations in the United States, it is relatively easy to reach targeted audiences.

The public relations practitioner's job does not end with getting the placement. He/she then approaches the required media professionals to give them basic information so that the interview appears "spontaneous, conversational and natural" (Anderson, 1991, p. 19). The next step is coaching the interviewee for the interview (also called media

training). This ensures that the interviewee is comfortable and has a good grasp of the subject. Public relations practitioners may want to conduct mock interviews beforehand. It also helps to decide in advance key messages that the organization wants to convey through the interview. The interviewee can then try to incorporate them into his or her answers. It is essential to consider the target audience while framing these answers. An interviewee's appearance plays a dominant role in the success of the interview, especially in the case of a broadcast interview. Body language, tone, and attire speak a lot louder than words. It is also advisable to decide in advance how to deal with awkward questions.

On the day of the interview, public relations practitioners may be present to smooth over any glitch during the interview. Some practitioners also prefer to audiotape the interview to clear up subsequent misunderstandings. The interviewer should be informed that the client is also taping the interview.

Finally, practitioners need to ensure that the interview was aired/printed appropriately and should use evaluation research to gauge its effect on the public.

INTERVIEW AS A RESEARCH TOOL

Interviewing is an age-old technique, for people have long asked questions to find out information. As Andrea Fontana and James H. Frey noted in 1994, population censuses in ancient Egypt, followed more recently by clinical analyses and by World War I psychological evaluations, employed interviewing techniques. Opinion polls have long relied on interview responses, and today interviewing is a common research tool in public relations, marketing, therapy, and academic inquiry. Further, although interviewing is used in quantitative research (e.g., survey interviews), it is more common as a qualitative technique.

According to Thomas R. Lindlof (1995),

In qualitative research, one interviews people to understand their perspectives on a scene, to retrieve experiences from the past, to gain expert insight or information, to obtain descriptions of events or scenes that are normally unavailable for observation, to foster trust, to understand a sensitive or intimate relationship, or to analyze certain kinds of discourse. (1995, p. 5)

Interviews may take place in dyads or groups and can be conducted in person, over the telephone, or more recently, on the Internet. Most often, interviews are conducted in face-to-face, individual sessions. They can be very brief or quite lengthy, sometimes including multiple meetings. Typically, interviews are conducted based on an interview schedule or guide—a list of planned questions.

Various types of interviews are used in research. Three of these are structured, semistructured, and unstructured. In structured interviews, the interviewer adheres to the interview guide, typically asking the same questions in the same order of all interviewees. These interviews may have predetermined response categories into which answers are recorded; however, practices vary. In semistructured formats, the interviewer has specific questions

to ask but is free to vary the order and use probes to elicit more information. In unstructured (sometimes labeled *depth* or *in-depth*) interviews, broad, open-ended questions are employed to understand the interviewee's views and behaviors; there are no predetermined response categories, and questions and probes can take various directions.

Interviewing has both strengths and weaknesses as a research tool. The strengths include comprehensive questions, probing for additional information, flexibility in dealing with interviewees, rich data, and unanticipated information. The weaknesses include time required (in collecting, transcribing, and analyzing data), potential interviewer influence on responses, answers containing unimportant information, and low anonymity. Although interviews may reduce error because interviewees can speak in their own words and not select answers from predetermined categories, the potential for bias still exists (e.g., interpreting responses). Thus, trained interviewers and careful analysis are required.

If interviewing is partly conversation, then the interviewer must be a skilled conversationalist. . . . If interviewing is partly the “digging tool” of social science, then the interviewer must be an effective, nonthreatening interrogator. If interviewing is partly a learning situation, then the interviewee must be a willing student. (Lindlof, 1995, p. 175)

INVESTIGATIVE JOURNALISM

Investigative journalism grew out of the muckraking tradition established by Lincoln Steffens, Upton

Sinclair, Samuel Hopkins Adams, Ida Tarbell, and others in the early 20th century. The muckrakers essentially created a new journalistic form, one that exposed social ills and government, personal, or corporate misbehavior.

Muckraking is known today by several names, including investigative journalism, depth reporting, precision journalism, and computer-assisted reporting. Most techniques used in investigative journalism are not much different from those used in other journalism. Investigative writers rely on interviews, records and documents, narrative leads, and vignettes, just as other journalists do.

The difference lies primarily in the purpose of investigative journalism (to expose misbehavior or problems) and the amount of space or time devoted to such reports. A newspaper might devote six complete pages and a broadcast outlet, 30 minutes over a week to compelling, important investigative reports. Social science methods also are used in many investigative reports; beat reporters rarely engage in the kinds of computations, analyses, and interpretations that investigative journalists use routinely.

One of hundreds of examples of investigative journalism is the *Chicago Tribune's* analysis of the relationship between patient deaths and hospital cleanliness. The *Tribune* pointed out that approximately 100,000 patients die each year because of dirty hands, instruments, and facilities. Moreover, the *Tribune* showed that hospitals have reduced by 25 percent their cleaning staffs since 1995. The *Tribune* studied health data from 75 federal and state agencies, court and hospital records, health organizations, and patient databases. The methods essentially were those used by epidemiologists.

Advocacy organizations and foundations, for which public relations practitioners work, sometimes use the techniques of investigative journalism to shine light on a pressing problem or issue.

The Center for Responsive Politics, the National Institute on Money in State Politics, and the Center for Public Integrity, for example, completed a massive study of the states' campaign spending practices during the 2000 elections. They found, among other things, that unregulated soft money was sometimes transferred to state party committees from federal party committees. This confirms "a

commonly held perception that state parties are used to launder soft money and influence presidential and congressional elections in ways never envisioned nor intended by federal election laws" (Dunbar, Sylwester, & Moore, 2002, n.p.). Data from all 50 states were analyzed, hundreds of election officials were interviewed, Federal Election Commission data were analyzed, and hundreds of written records were collated and analyzed.

This and similar work is not done by a newspaper or broadcast station, but it is in effect investigative journalism. Public relations practitioners occasionally find themselves involved in such projects, if only to help write and disseminate the results.

Investigative journalism, of course, frightens practitioners who work in secretive, morally challenged organizations because they know an investigative writer might uncover an organization's dirty secrets. Practitioners in many hospitals, for example, probably were distraught to read the *Tribune's* series about dirty hospitals. Such publicity doesn't make an organization look good.

INVESTOR RELATIONS

There's an old saw in Texas that goes "if you don't like the weather, wait a few minutes and it will change." The unpredictable nature of Texas weather says much about the practice of investor relations.

In its relatively short history, investor relations (IR) has experienced a number of life-changing events. No wonder, given the dynamics of our world, our society,

and our economy. Never mind the massive impact of the economy's boom of the late 1990s and bust at the beginning of the new millennium. Just look at what's happened the last two years, with scandals such as Enron and others. Unquestionably, the way corporate America did business yesterday is not the way it will do business tomorrow. Similarly, the way investor relations was practiced yesterday is not the way it is being practiced today. Tomorrow is anyone's guess.

What do we mean by investor relations? Much like its parent, public relations, investor relations has many definitions. They range from long-time investor relations consultant William F. Mahoney's succinct "to market public companies to investors" (1991, p. 3) to Bruce Marcus and Sherwood Lee Wallace's (1997) encompassing "the process by which we inform and persuade investors of the values inherent in the securities we offer as a means to capitalize business" (p. xi). At an extreme is the National Investor Relations Institute's definition that blends a number of communications and finance disciplines and calls it IR:

Investor relations is a strategic management responsibility that integrates finance, communication, marketing and securities laws compliance to enable the most effective two-way communication between a company, the financial community, and other constituencies, which ultimately contributes to company's securities achieving fair valuation. (p. 1)

FROM PUBLIC RELATIONS TO FINANCE TO IMC AND BACK AGAIN

Part of the difficulty with getting a generally accepted definition is that investor relations is a work in progress.

Communications professionals agree that investor relations is the offspring of public relations and finance. Its maturation has been nurtured by the thoughtful and strategic responses to the dynamics occurring virtually daily in the marketplace and corporate America.

IR'S DEVELOPMENT PATH

We have to go back to the Great Depression to find IR's finance parent. Part of the reason for the stock

market crash in 1929 was the practice of using puffery to feature stocks. Tycoons, reporters, and public relations persons often claimed that the share values of their companies were worth well beyond their actual value.

Newspaper reporters representing some of America's most respected journals sometimes wrote stories that falsely lauded the investment value of companies. For example, George Gunton was a popular economist who championed the free enterprise systems in his capacity as editor of *Gunton's Magazine*. While in that position, he received a \$15,000 annual retainer from Standard Oil.

Such practices led newly elected president Franklin D. Roosevelt to urge Congress to address the need for federal securities laws governing publicly held companies. Congress passed the Securities Act of 1933, which required that a company going public file a prospectus and that the information contained within be complete and truthful. Congress then passed the Securities Act of 1934, which required public companies to periodically report on their financial condition. This Act created the Securities and Exchange Commission (SEC), a powerful federal agency that has more than lived up to its billing as the watchdog of Wall Street, striking fear in the hearts of big and small investors alike for more than six decades.

It took 20 years after the SEC mandate before General Electric Co. (GE) established the first formal IR department in 1953. Glenn Saxon was the first investor relations officer (IRO) at GE, and early members of his staff went on to create investor relations functions at half a dozen major corporations. Together they also helped form New York's Investor Relations Association, which continues to operate today. More important, the New York group was the catalyst for creating the voice of the investor relations profession, the National Investor Relations Institute (NIRI). NIRI was begun in 1969 and today numbers more than 5,000 members in 35 chapters around the nation. In essence, it's an association of corporate officers and investor relations professionals responsible for communicating among corporate management, the investing public, and the broad financial community.

At GE and other early investor relations adopters, IR was an appendage of the public relations or corporate communications function, typically with a dotted line to the chief financial officer's office. The requirement in these early years was to generate information for existing and potential shareholders. Gathering, crafting, and distributing information was and is, of course, one of the primary tasks of public relations.

IR GROWS WITH A FLARE

Understandably, investor relations evolved during the 1960s and 1970s with, as Mahoney wrote, a "promotional flare" (1991, p. 3). Annual reports became showpieces of color and graphics with extraordinary budgets. "Dog and pony shows," the euphemism for multimedia presentations to security analyst and stockholder meetings, became the trademark of full-service public relations departments. Investor relations practitioners were technicians, leveraging their communication skills to create the necessary tools, such as reports, speeches and multimedia presentations, to inform the investment community. Few interfaced directly with the chief executive officer or any other member of the strategy-setting dominant coalition. Simply stated, they were order takers.

ENTER THE CORPORATE RAIDERS

This "Age of Impressionism," as Mahoney described it (1991, p. 3), came to sudden and unnerving end in the early 1980s with the emergence of a most unlikely influencer—the corporate raider. Individuals such as T. Boone Pickens, Ivan Boesky, Carl Icahan, and others created a battleground unlike any ever experienced in corporate America. A whole new lexicon gave the era almost a romantic feel. Terms like *white knight*, *black knight*, *poison pill*, *Saturday night special*, *junk bonds*, *greenmail*, and the dreaded *restructuring* captured everyone's attention, particularly the media's. Interestingly, investor relations took more strides toward becoming a valuable corporate function during this tumultuous time than in any

previous decade in the practice's short history. It was the demand of the merger and acquisition business for quality information that set the stage for investor relations to become an important part of corporate strategy and communications.

As company after company was put into play and industry after industry consolidated, corporate raiders, along with stable companies looking to grow by acquisition, determined that the market was undervaluing most businesses. Moreover, managements recognized the value of a higher share price in discouraging unsolicited bids for control. The higher the stock price, the costlier the takeover. The phrase "the best defense is a high stock price" was heard in countless corporate boardrooms during the 1980s (Mahoney, 1991, p. 87).

Traditional public relations practitioners, functioning as investor relations representatives, found themselves involved in financial discussions with corporate leaders. Those who understood the financial markets moved easily into the dialogue. Those who did not sooner or later relinquished their investor relations role to the professionals who had boned up on SEC regulations, learned basic accounting, or took to learning finance. In a matter of months, the investor relations/public relations practitioner experienced a major reality jolt. Priorities went from producing bland press releases and glitzy annual reports to battling in the takeover trenches:

- Giving daily reports from the field on how the battle was going
- Assessing the friends and foes
- Identifying and facilitating direct contact with shareholders who were hidden behind brokerage or bank accounts
- Doing quality research on the bidder
- Leading or conducting media contact or providing the information that went to reporters
- Determining the strategic content of information that would sway investors and analysts
- Preparing and disseminating the actual communications materials

By the 1990s, the takeover battlefield was considerably quieter because corporate managements

had pretty well learned their lessons. Managements became more aware of enhancing shareholder value and incorporating it into strategic growth priorities. In the process, senior corporate executives recognized a very different role for investor relations. Swept aside were the more traditional public relations technical skills. In their place came the more specific and strategic tools of monitoring investor attitudes and actions, and communicating corporate valuation programs and results.

Not surprisingly, because of their “financial” nature, these tasks fell to the finance-savvy people. Subsequently, investor relations moved from the public relations or corporate communications departments to the chief financial officer’s group, or even as a direct report to the chief executive officer. The people who occupied the posts were highly credentialed and often consisted of former business journalists, public relations executives who possessed strong communications skills but also thoroughly understood business and finance, and perhaps a research analyst, an accountant, or a line business manager. They were working in a field that had become well defined as focusing on the investor constituency. They often took on additional responsibility for strategizing and executing high-level corporate communications that involved the CEO, whose acknowledged ultimate responsibility was to enhance valuation.

ENTER THE BULLS OF THE 1990S

The next major life-changing event for investor relations was the bull market that led Wall Street virtually throughout the 1990s and into this century. Individuals rushed back into the market by the millions. Institutional investments recorded phenomenal growth. Media made the market front page news virtually daily. The Dow Jones Industrial Index, which hovered around 1000 in the 1970s, hit 7000 in 1997 and then soared beyond 9000 just months later. Venture capitalists could not fund all the new businesses being formed, particularly the dot-coms.

The boom led to two developments that dramatically altered the investor relations landscape.

First, the competition for capital and for market visibility became intense. IR pros were charged

with developing initiatives that would break through the clutter on Wall Street, improve their company’s market visibility, and open the door to low-cost capital to fuel growth. This prompted the marketing discipline to enter and, in fact, emerge as a primary driver of the investor relations process.

Marcus and Wallace (1997) argued that, in fact, investor relations always has been a marketing function. “It has always been a process of understanding the needs of the target audience, and of casting the information about a company in ways that persuade the investor that a dollar invested in my company will appreciate faster than a dollar invested in somebody else’s company,” they maintained (p. xvii). They said,

Call it what you will, but any process that relates a company’s products or services—or even cogent information about that company—to the needs of the buyer is marketing. And that . . . is what investor relations really is. To pretend otherwise is to put oneself in a poor competitive position. (1997, p. xvii)

Second, the boom of the 1990s rudely forced aside the notion of investing for long-term value and replaced it with a very short-term focused approach that worried about satisfying Wall Street quarter to quarter. With this shift came the *managed earnings* syndrome, where corporate managements, through the accounting process, attempted to meet or beat the previous quarterly earnings to satisfy analyst expectations. The culprit here, as Louis M. Thompson wrote, was the reality that a “penny missed” could have devastating results on a company’s stock price (2002, p. 12).

The combination of these two developments during the 1990s—vying for the attention of Wall Street and managed earnings—brought the investment community to the brink of another dramatic sea change in the history of Wall Street and investor relations.

THE CRASH OF CORPORATE CREDIBILITY

Except for the 2000 passage of Regulation Full Disclosure, which restricted the selective disclosure of material information to analysts and investors

prior to making it available to the general public, Congress and the SEC basically stood aside as corporate America maintained its managed earnings practice.

Then in October 2001 the world learned that a high-flying energy trading company was under SEC investigation for its accounting practices. Within weeks, Enron, with 16 of 17 “buy” to “strong buy” ratings, collapsed, costing shareholders and employees billions and taking with it long esteemed accounting firm Arthur Andersen. Within months, Global Crossing cratered, followed by accounting scandals at WorldCom, Tyco International, Adelphia Communications, and other blue-chip companies.

Multiple issues were blamed: aggressive accounting practices to meet quarterly earnings “consensus” expectations, conflicts of interest between research and investment banking, weaknesses in board oversight, a compensation system ill designed to align managements’ interests with those of their shareholders, and conflicts of interest between auditing and consulting in major accounting firms.

Adding fuel to the fire was intense media coverage of the almost daily developments and increasing loss of investor confidence. Cover stories like *Fortune*’s “You Bought, They Sold” with the photos of CEOs who took away millions from their failing companies while shareholders lost it all, were all too common.

The investor relations profession was not immune from the firestorm. When one looks at the companies that were headlined in the scandals, all had investor relations professionals who were members in good standing of the National Investor Relations Institute (NIRI). Were the IROs in these companies aware of the alleged fraudulent practices? If so, is it that they voiced their objections and no one listened? If they saw fraud, did they try to report it? Whatever they did or didn’t do “obviously reflects on our profession,” remarked NIRI’s president and CEO Louis M. Thompson, Jr. (2002, p. 11).

Enron’s collapse, exacerbated by the other scandals, triggered the most extensive Congressional legislation and SEC regulations seen on Wall Street in 60 years (Thompson, 2002, p. 2). Heading the list was the Sarbanes-Oxley Act, passed in July 2002,

that in its simplest definition requires public companies to validate the accuracy and integrity of their financial management. Although some see Sarbanes-Oxley as just another compliance burden, many see it is an opportunity to make real improvements in governance, compliance, and risk management transparency, control, and performance.

Moreover, beginning in December 2001, the SEC began pumping out 18 rule proposals designed to help restore investor confidence. Even NIRI tightened its reins. In April 2002, the NIRI board released its “Ten Point Plan to Restore Investor Confidence.” Their program is designed to be NIRI’s contribution to an overall effort in which all players in the equity markets must contribute to ensure investors that equity markets are fair, credible, and transparent.

IR RETURNS TO ITS PUBLIC RELATIONS ROOTS

Fast forward to 2003, and we see investor relations again evolving, this time seemingly back to its public relations roots.

Shane McLaughlin, senior writer at Best Practices in Corporate Communications, maintained that IR and public relations are once again converging. “With renewed calls for information in the wake of corporate scandals and new financial reporting standards . . . there is more reason than ever to combine the functions of investor relations and corporate communications,” he said (2003, p. 9).

Also, McLaughlin argued that it is only natural that as companies open up more channels to send information, corporate communications will play a central role in preserving consistency and content (2003, p. 9). Even if a company hasn’t integrated the two functions of IR and PR, the people on these two sides need to be joined at the hip, he adds. “That way communications is systematically involved way before a matter becomes a public issue” (2003, p. 9).

Roger S. Pondel (2002) argued that the debate essentially is over. Those who don’t understand that investor relations and public relations are converging are seriously weakening the companies’

valuations. The two management disciplines of IR and public relations are being brought together more closely, Pondel maintained, because of heightened disclosure regulations and exploding technology around the Internet and related telecommunications.

Jeffrey Greene, global vice chair of corporate finance at Ernst & Young, suggested a new view of IR before a symposium of investor relations professionals earlier this year. He called it “Investor Relationship Management,” whereby IROs move beyond providing data to facilitating a dialogue with the investor community on how best to value their companies. Greene added that the IRO’s job is to manage relationships—internally and with the investing community, communicating but also educating and coaching: “It’s a two-way dialogue (shades of Grunig!), and it requires integrated communications” (Berstein, 2003, p. 4).

However, the mingling of communication functions and reporting, along with the increased level of sophistication in the IRO function, has led to tension among the disciplines—public relations, investor relations, marketing, and corporate communications. One solution calls for companies to have a linking pin structure of employee groups: The corporate communications department overlaps with the CFO, who overlaps with IR, and they all overlap with the CEO, and so on. Many see IR as that linking pin.

IR DESTINED FOR NEW RESPECT

Far from a new issue, this turf battle among the disciplines promises to prevail for decades. Regardless of where investor relations lands within the dominant coalition, corporate managements appear in agreement that the role and responsibilities of the IR executive will continue to expand. Specifically, five developments are singled out for fueling the future growth of IR, including:

- A greater need to satisfy more stringent disclosure requirements
- A broader communications role in the company
- A more proactive attitude by corporate managements toward investor relations
- More involvement in the strategic planning process
- Greater information needs from institutions and portfolio managers

In sum, corporate managements have a great opportunity to elevate investor relations to a more strategic and valuable role in response to today’s turmoil in capital markets and corporate governance. Companies need strong IR and communications competencies to successfully help shape the evolution of capital markets communication for their company and their industry. In return for such a proactive approach, companies likely will see the benefits in stock price and operating performance.

—H.R. Hutchins

INVOLVEMENT

Involvement is a psychological concept used to explain people’s motivation to process persuasive and other messages.

The *involvement* construct traces its roots to the late 1940s in psychology, but flourished in the 1960s as a way to explain a variety of communication

phenomena. These included people's *selectivity* in message processing, differences in the processing of *television versus print* messages, and resistance to *attitude change* attempts. For a review, see Charles T. Salmon's 1986 chapter "Perspectives on Involvement in Consumer and Communication Research" in *Progress in Communication Sciences*.

Today, involvement thrives as an umbrella construct that subsumes a variety of closely related concepts. In general, involvement influences the processing of public relations messages two ways: (a) as an *antecedent* that moderates people's willingness to focus on a message and (b) as the *heightened processing* of messages themselves.

INVOLVEMENT AS AN ANTECEDENT TO MESSAGE PROCESSING

Involvement is most often defined as the degree to which an individual perceives a message as being relevant to him or her because the subject matter (an idea or topic, product or service, cause, etc.) has consequences in his or her life. James E. Grunig and Todd Hunt (1984) defined involvement as a degree of connectedness between an individual and a message. Robert L. Heath and William Douglas explained that involvement "can be used to predict a person's willingness to process a message as well as the likelihood that existing message content will be used to assess each new message" (1991, p. 179).

Involvement moderates message processing because people are inundated with messages (informational overload) and have limited cognitive capacity to process information. People have been described as "cognitive misers" who are selective in what messages they pay attention to and devote only the effort necessary to make correct judgments. People are more motivated to process messages deemed relevant (high involvement) and less willing to exert the cognitive effort required if messages appear to be of little or no importance (low involvement).

Reviews of the involvement construct demonstrate the varying ways in which antecedent involvement is used. Johnson and Eagly (1989) suggested that antecedent involvement can be classified as *outcome-*, *value-*, or *impression-relevant* involvement. In 1986, Charles T. Salmon suggested

a continuum in which involvement can be described as (a) an enduring overall personality trait, (b) a psychological state triggered by a message's connection to a person's enduring values, (c) a psychological state that results from the salience of a subject matter and a person's short-term interest in it (not necessarily linked to long-term values), and (d) as an inherent characteristic of a subject that prompts varying levels of interest among different populations. In 1997 and 2003, Michael D. Slater suggested involvement is a goal-directed concept that pertains to a person's interest in processing messages based on six different possible processing goals in which people engage.

Common types of involvement important to public relations message strategists include the following:

1. *Political or civic involvement*, an example of involvement as a personality trait, is the degree to which people are generally aware of and interested in news, civic affairs, or politics at the societal or organizational level. Certain individuals want to know about what's happening in the world around them without regard to particular issues. These individuals are sometimes referred to as *all-issues publics*.
2. *Ego involvement* is the degree to which a subject or idea is of *enduring* importance to people because it links to their personal values or convictions. People become connected to many activities and causes that reflect important values or foster their self-identity. People can be motivated by their desire to either affirm or protect personal values.
3. *Topic or issue involvement*, one of the most studied forms of involvement, is the degree to which a person is concerned about a *situation* (such as the impending actions by others) that could have an impact on the person's life. Topic or issue involvement can center on issues that have relatively little personal meaning for a person, but could have a positive or negative consequence nonetheless. Examples include proposed changes in tax, utility, or tuition rates, which will prompt short-term concerns.
4. *Task involvement* is the degree to which a person focuses attention on a message in order to make a correct judgment or to take action. People who know they must perform a task (such as making an

unfamiliar or complex purchase or passing a proficiency test) are usually motivated to learn information in order to attain a desired outcome. Their motivation often is based upon their perceptions about the social consequences of their performance.

5. *Impression-relevant involvement* is rooted in the desire to receive praise and avoid ridicule or criticism.
6. *Product involvement* is the degree to which certain products or services are perceived as inherently more interesting to people than other products. High-involvement products can be described variously as entertaining (movies), stimulating (books), complex (computers), costly (homes), status conferring (cars), fashionable (clothes), or risky (exotic travel). By contrast, low-involvement products exhibit many of the opposite characteristics—uninteresting, simple, inexpensive, ordinary, and safe. Examples include many items purchased for everyday use—laundry detergent, snack foods, personal toiletries, hand tools, and so forth. People's interest in particular categories of high-involvement products is readily evident in the media's coverage of topics such as sports, travel and leisure, entertainment, travel, books, fashion, and interesting foods.

Implications of Antecedent Involvement

Involvement's importance to public relations is readily evident in examining psychological approaches to learning and persuasion.

Traditional learning theory assumes a hierarchy of effects in which people follow a series of steps from learning to attitude formation to action. Although this model clearly applies to high-involvement situations, researchers have found it does not necessarily apply in all cases. In low-involvement situations, for example, people can form strong opinions or attitudes first and develop comparatively little in-depth knowledge before they take action.

Meanwhile, developers of *social judgment theory* demonstrated that attitude change was closely related to personal values critical to a person's identity and ego. Highly involved individuals were posited to accept persuasive arguments within a relatively

narrow range (latitude of acceptance or rejection). Meanwhile, individuals with low levels of involvement in a topic were not as discriminating and were open to a broader array of ideas and opinions.

The importance of topic or issue involvement is readily evident by looking at the two principal process models of persuasion that have predominated persuasion research since 1980: the Elaboration Likelihood Model (ELM) and the Heuristic-Systematic Model (HSM).

Both models posit that motivation to process persuasive messages is predicated on involvement. Individuals with high motivation (involvement) are able and willing to examine the quality or strength of arguments presented and process arguments effortfully (ELM) or systematically (HSM). This is labeled *central route* (ELM) or *systematic processing* (HSM).

By contrast, less motivated individuals (low involvement) look for cognitive shortcuts. These are referred to as *peripheral cues* (ELM) or *heuristic cues* (HSM) contained in messages. Examples of cues include the credibility of the source (including expertise or familiarity), graphics (photos, charts, etc.), and the simple number of arguments made. These low-involvement individuals thus use *peripheral route* (ELM) or *heuristic processing* (HSM).

The two models vary somewhat in terms of their explanations for how persuasion occurs and originally suggested that these processes operate independently (ELM) or concurrently (HSM). Both agree, however, that central or systematic processing is a more enduring form of persuasion.

APPLICATIONS OF ANTECEDENT INVOLVEMENT IN PUBLIC RELATIONS

Researchers have recognized the importance of involvement in theories identifying the probability that people become active on issues and in models for segmenting public relations audiences.

James E. Grunig and Todd Hunt (1984) incorporated involvement in their situational theory of publics to explain why people become active on particular issues, specifically their engagement in communications behaviors: active information seeking and passive information processing.

Situational theory posits that people with high issue involvement, high recognition of a situation as problematic, and low recognition of the constraints that might inhibit a remedy are most likely to become active on an issue. Indeed, involvement served as a better predictor of activism than various other socioeconomic variables.

Separately, Grunig (2000) used involvement to distinguish between *active* and *passive* publics and suggested that public relations practitioners should focus efforts on active or highly involved publics. However, Heath and Douglas (1990, 1991) pointed out that people can be highly involved in an issue because they either oppose or support the issue. The authors suggested a three-part typology that specifies (a) *involved-opposed*, (b) *involved-supportive*, and (c) *passive* audiences.

Separately, Kirk Hallahan (2000a, 2000b, 2001) argued that involvement should be distinguished from knowledge about an issue. Hallahan suggested that level of involvement and knowledge about a topic can form the basis for segmenting publics using a 2 × 2–category matrix. He defined an *active* public as a group with high involvement and high knowledge of a topic, versus an *inactive* public, where both involvement and knowledge are low. By contrast, an *aware* public can be knowledgeable but not be involved because they perceive a situation as having little consequence for them. Meanwhile an *aroused* public is one with high involvement but low knowledge.

Beyond situational theory and typologies of publics, public relations message researchers have examined the impact of involvement in only a few studies. On the other hand, advertisers have developed an extensive body of knowledge about the impact of topic, task, and product involvement in a variety of persuasive contexts. One noteworthy public relations study used the dual processing models to test the comparative effectiveness of news versus advertising. Content class—whether information appeared as news or advertising—served as a peripheral or heuristic cue. The study manipulated both task and product involvement and some support for the HSM and only modest support for the claim about the superiority of news versus advertising (Hallahan, 1999).

INVOLVEMENT AS HEIGHTENED MESSAGE PROCESSING

Whereas antecedent involvement focuses on characteristics the audience brings to the message processing experience (including personality, concerns, perceptions, etc.), involvement also has been addressed as increased motivation that stems from and explains message processing itself. Glen T. Cameron, for example, argued in 1993 that involvement entails making relational judgments and can only be examined as a condition or experience within an individual in response to a stimulus. Importantly, message processing involvement must be clearly distinguished from antecedent involvement.

Increased involvement in message processing has been defined and measured by C. Whan Park and Banwari Mittal (1985) as heightened arousal and attention to the message. Others have explained heightened processing involvement as including four stages or increasingly deeper levels of message processing, namely pre-attention, focal attention, comprehension, and elaboration. Others proposed that involvement can be explained as increased cognitive activation of memory nodes: The more cognitive stimulation and the more associations made, the higher the level of involvement.

Implications of Message Processing Involvement for Public Relations

Public relations strategists must recognize that not all audiences will share the same level of interest in an issue or topic. The objectives of persuasive public relations messages must be to capture people's attention and to promote greater message exposure, perception, comprehension, and retention.

All effective messages must underscore the relevance of subject to the audience. This task is particularly critical for audiences with low levels of antecedent involvement. In this instance, it is critical to present messages rich in peripheral or heuristic cues and to avoid complex arguments that might result in suspended processing. But even for individuals with comparatively high levels of antecedent involvement, it is important to maintain (and heighten) involvement in the message itself.

Applications of Message Processing Involvement in Public Relations

Recent research in information campaigns suggested that one technique is to match the type of argument to the *type* (not merely level) of involvement. Michael D. Slater and Donna Rouner (1996) showed that statistics (versus anecdotes) led to greater persuasiveness and believability among individuals engaged in processing messages that bolstered personal values (value-affirmative processing), whereas anecdotes (versus statistics) were more persuasive and believable among individuals when messages challenged their values (value-protective processing).

Drawing upon research in the advertising arena, Hallahan (2000b) suggested that practitioners must enhance an audience's motivation, ability, and opportunity (M-A-O) to process public relations messages (see Figure 1). He identified various commonly accepted techniques ("tricks of the trade") that serve that purpose and are grounded in persuasion theory. Beyond motivation, however, he stressed it is important to make messages *easy* to understand and to give audiences *more chances* to be exposed to a message. This is especially important for low-involvement audiences, who will not otherwise seek out the information in the same way as highly involved individuals.

Among activists, agenda building involves increasing people's involvement, that is, getting people to recognize that a problem or issue has personal relevance to them. Claims makers use a variety of techniques—including the use of statistics and large numbers, celebrity endorsers, symbols (icons, stories, typification, and synecdoche), framing, and media publicity to capture public attention and broaden interest. Activists must rely upon heightened message involvement (increased arousal and attention, more elaborative cognitive processing, and the activation of cognitive traces related to seemingly disparate areas of interest) to make the connections required.

Antecedent involvement and message involvement clearly work in tandem. Previous exposure to persuasive communications helps define one's antecedent involvement level. Then heightened involvement in processing a subsequent message itself helps tap a person's predisposition toward a

message and can make the subject matter even more relevant.

—Kirk Hallahan

ISSUE MANAGEMENT COUNCIL

The Issue Management Council (IMC) is the professional membership organization for people

whose work is managing issues and those who wish to advance the discipline. The council focuses on management processes rather than advocacy on specific issues. IMC was formed in 1988 for professionals who did not “fit the mold” of existing membership organizations. These men and women spanned the existing—but artificial—barriers between public relations (image), government/legal affairs (influence), and strategic planning (operations). Many people collaborated in the formation of the council, but its organizing leader was W. Howard Chase.

MEMBERS

Members come from diverse industries, countries, cultures, and sectors. Yet all are alike in their intent to exercise corporate leadership on issues, rather than waiting until issues reach a crisis stage or are narrowly interpreted by special interests. The majority of members (approximately 75 percent) represent management of large corporations. Consultants to these companies compose the second largest membership segment (approximately 15 percent). Approximately 7 percent of IMC members are issue management practitioners in the public sector. Academic participation is the smallest membership segment, at approximately 3 percent.

GOVERNANCE

An international board of directors governs the IMC, representing a diverse combination of industries, countries, cultures, sectors, and expertise. The chair is elected from the board of directors and serves a two-year term. Officers—the chair, president, vice president, treasurer, and secretary—serve as the executive committee. Projects are completed through board member–led task forces that in 2003 developed programs in membership value, issue management advocacy, awards, and membership development. Board members are nominated and elected from the membership and can serve no more than two consecutive three-year terms. All board members serve in a volunteer capacity. A small staff provides administrative support at IMC headquarters near Washington, DC.

MISSION STATEMENT

As steward of the issue management discipline, the Issue Management Council is the advocate for effective and principled global application of issue management and the source for practitioners seeking education, collaboration, recognition, and inspiration.

AREAS OF EMPHASIS

1. Membership development and advocacy work to create global awareness of the field of issue management and the resulting desire to become a member of the council.
2. Operations and governance center attention on leadership and management of a robust, growing, and practitioner-based professional organization.
3. Stewardship exercises the responsibility to exert IMC’s leadership to advance the discipline.
4. Products and services continue to refine educational, communication, and consultation offerings to support practitioner needs and field advancement.

PRODUCTS AND SERVICES

IMC offers the following services to the global body of issue management practitioners, as well as to any member of the general public who is interested in learning more about issue management:

Practitioner Exchange

Member dialogue takes place along formal and informal channels. Many IMC members simply contact each other on an as-needed basis. Sometimes the IMC staff helps to facilitate small-group conversations based on member interests and inquiries. Each month an emerging issues teleconference takes place, involving selected members according to their issue expertise. For the first year of membership, individuals are assigned an IMC new-member mentor. These relationships provide the camaraderie of like-minded colleagues who are helping their organizations to reach a breakthrough in management philosophy and practice.

Access to the Members Only section of the IMC Web site offers the capability to search for fellow

members by name, company, region, and issue expertise. Other online resources include the Issue Management Bibliography and the Compendium of Issue Management Speeches, as well as occasional papers and presentations of interest.

Issue Management Training

Beginners find the one-day overview titled Introduction to Issue Management very useful as an outline of key concepts, methodologies, terminology, and structure. This workshop is usually held in conjunction with the IMC Annual Conference and is also available on an in-house basis for member companies.

For those interested in identifying emerging issues, the IMC hosts an Emerging Issue Workshop featuring presentations from leading issue advocates and advanced methodologies for issue identification.

The Issue Management in Practice workshop offers case studies and practical applications of issue management in the field. When sponsored by an IMC member company, this gathering is held as a member forum, and registration fees are waived for IMC members.

The IMC Annual Conference is an examination of the current state of the art in issue management on a worldwide basis and features elements of the aforementioned themes, along with the presentation of the Chase Award for Excellence in Issue Management. At this conference, practitioners explore the most recent developments in issue management, including new applications of leadership and process, opportunities for deeper integration with existing business functions, and innovative approaches to anticipating and resolving issues.

Issue Management Literature

Through our affiliated publishing company, IMC members receive a subscription to *Corporate Public Issues and Their Management*, a monthly exhibit of issue management in practice at leading corporations. Members also receive a subscription to *The Issue Barometer*, a monthly examination of emerging issues, as surfaced by IMC member teleconferences and supplemented by original editorial research. Members also receive a succinct quarterly e-mail update of IMC activities.

Opportunity for Recognition

Each year, one deserving organization earns the W. Howard Chase Award for Excellence in Issue Management. Winning this prestigious competition represents the highest achievement in the field of issue management. Awards are also granted for individual achievement in issue management and for extraordinary service to the IMC.

Every IMC member also receives a certificate of membership that is suitable for framing.

CATEGORIES OF MEMBERSHIP

The most customary membership option is on an individual basis. Organizational memberships are also available. The third category of member is for vendors who wish to use the council as a means to display their services.

VISION

It is easy for the IMC Board to envision what it wants the IMC to become. The IMC will be

- The most sought-after, effective, and trusted advocate for the advancement and utilization of issue management principles worldwide; we will be known as the “keeper of the flame”
- Populated with the best practitioners from around the world (our conferences will need interpreters of many tongues!) who are known for their vibrant, engaging, and innovative practices
- The first stop and only stop needed by our stakeholders for the best issue management resources—all others will benchmark to us
- Firmly entrenched in our stakeholders’ top-of-mind position
- Recognized globally as best in class
- Known as the rising tide that lifts all the ships

Our vision is huge, but so is our passion for issue management!

—Teresa Yancey Crane

ISSUES MANAGEMENT

Issues management is a strategic set of functions used to reduce friction and increase harmony between organizations and their publics in the public policy arena. Issues management entails four core functions: (a) engaging in smart business and public policy planning that is sensitive to public policy trends, (b) playing tough defense and smart offense through issue communication, (c) getting the house in order by meeting or exceeding stakeholder expectations, and (d) scouting the terrain to gain early warning about troublesome issues. Applied properly, it gives organizations the opportunity to reduce the harm of threats and to take advantages of opportunities created as public policy changes occur.

First, issues management must be an intimate part of strategic business planning as issue managers help their senior executive colleagues look for and avoid threats while working to take advantage of issues-driven opportunities—those that are created by emerging issue trends. Second, issues managers need to build and cooperate systematically with other issues specialists whose insights and foresights can scan for issues, identify issues, analyze issues, and monitor their trajectory and implications for the strategic business plan of the organization. Third, issues management can help organizations to understand and work to achieve the standards of corporate responsibility to reduce the legitimacy gap between them and their stakeholders. Fourth, issues management entails issue communication, on the assumption that the voice of large organizations needs to be heard on policy issues. For the formation of societally responsible public policy, the best minds and voices need to blend to create the needed platforms of fact, value, and policy.

The term *issues management* was coined in the 1970s in response to 1960s activism, much of which was spawned by the increased salience of the Civil Rights movement and the turbulence created by the protests against the war in Vietnam. Angry publics fought to impose their wills and values on business and government policies and practices. In the 1960s activist groups challenged media reporters and

government officials to press for myriad changes in business activities and policies. Industry was caught off guard by this era of unrest and redefinition. Industry had reason to feel good about itself. The Great Depression had ended and the industrial might of the United States had played a major role in the victories that ended World War II.

Industrial leadership went into the 1960s with high marks for ethics and honesty. After activist scrutiny of every aspect of industrial policy, senior management's high ratings have never been the same since. Part of this slide resulted from an often quite reactive response to criticism. Issues management was innovated and developed to give industry a philosophy, a set of refined functions, and tactics to give it more of a proactive approach to its vilification.

In 1977, W. Howard Chase coined the term *issue management*, which he designated as a new science. To recommend a new kind of corporate communication response to critics of business activities, Chase drew on his long-term corporate public relations experience, especially his tenure at American Can Company. He was also influenced by John E. O'Toole, who may have coined the term *advocacy advertising*.

Two themes emerged but soon were eclipsed by a more solid approach to issues management. One was the assumption that advocacy advertising, or advertising by any similar name, could solve the collision between industry values and those of its critics. The second was that if issues could be spotted as they were emerging, industry could head them off with skillfully designed messages.

As early as the mid-1970s, issue experts advised companies to rely less on providing information and to become more willing to advocate their case in public policy debates. Proponents of this strategy were convinced that companies, especially large companies, had remained silent too long and had expertise that needed to be considered in the raging debates that swirled throughout the 1960s and 1970s. By 1976, terms such as *issue advertising* and *advocacy advertising* were being used in business publication discussions of the aggressive op-ed campaign made famous by the vice president of public relations of Mobil Oil

Corporation, Herbert Schmetz. The International Association of Advertising (IAA), in its global study of issues communication, urged adoption of the less contentious term, *controversy advertising*. Advocates of a communication approach to issues management assured their employers and clients that “ideas could be sold like soap” (Dinsmore, 1978, p. 16) if their presentation was complete and truthful.

Practitioners and senior management recognized that their organizations were targets in bitter confrontations. This realization opened new opportunities and challenges to the strategic and ethical practitioners who understood that management and public relations must work in harmony. Public relations would fail to assist clients and employers in these battles if they were charged only with providing positive news and reputational statements. They understood that new challenges required new response options. Thus, for some, issues management was a subdiscipline of public relations. Its purpose was to debate the positions advocated by corporate critics. The assumption was that the voice of industry could be strong enough, and the position advocated by companies was accurate enough, to silence the challenges of the critics. One reason for this communication bias in the design of issues management was the fact that many of the leaders in its development were communication professionals more than individuals engaged in management.

For this reason, issues management would have been a much different, and arguably much less important corporate response if other disciplines and persons with other experiences had not engaged in the design and development of issues management. As an early advocate for thorough investigation and innovation, founder of the Issue Management Council, W. Howard Chase offered a widely quoted definition:

Issues management is the capacity to understand, mobilize, coordinate, and direct all strategic and policy planning functions, and all public affairs/public relations skills, toward achievement of one objective: meaningful participation in creation of public policy that affects personal and institutional destiny. (1982, p. 1)

Chase stressed the proactive aspect of issues management, which “rejects the hypothesis that any institution must be the pawn of the public policy determined solely by others” (1982, p. 2).

Maturing in his thinking, Chase defined issues management as being a systematic and proactive approach to criticism and change that builds on several key steps: issue identification, analysis, change strategy options, action programming, and evaluation of results. “An issue change strategy option is a choice among carefully selected methods and plans for achieving long-term corporate goals in the face of public policy issues, a choice based on the expected effect of each method of employment, cost, sales, and profits” (1984, p. 56). Action programming entails the use of resources to gain the strategy option selected.

William Renfro (1993), a pioneer in the theory and practice of issues management, focused his analytical attention on the factors that predict how issues emerge and become worthy of management consideration and response. He stressed the need to identify and monitor issues as preliminary to strategic business planning. “The field of issues management emerged as public relations or public affairs officers included more and more forecasting and futures research in their planning and analysis of policy” (p. 23). In this sense, “issues management is an intelligence function that does not get involved in the ‘operations side’ unless specifically directed to do so” (Renfro, 1993, p. 89). Despite its need to support business activities, this function “is not closely connected to immediate operations and the bottom line” and therefore “it is difficult to determine the effectiveness and value of an issues management capability” (p. 89).

However defined, realists understand that organizations are required to reduce what management professor S. P. Sethi (1977) called the legitimacy gap by changing their policies and procedures as well as by using communication. A legitimacy gap is that chasm between what an organization believes and does and what its key publics think it should do and believe.

Sponsored by the Conference Board’s Public Affairs Research Council, James K. Brown (1979) developed one of the early comprehensive approaches to issues management. He reasoned that

if management should accustom itself routinely to ask the full range of questions that ought to be asked about vital corporate decisions, taking into account all the relevant external environments as well as the internal environment, this business of issues would become, properly, a non-issue. (p. 74)

His view in the late 1970s was entirely too optimistic, but it helped direct thinking in the right direction. No single issues management function can accomplish that goal. Many functions are required, some of which require the expertise of public relations practitioners, and the performance of which can strengthen the rationale for including public relations in the dominant coalition of corporations.

One innovator of the practice and conceptualization of issues management, Raymond Ewing, featured its functions as giving “public policy foresight and planning for an organization” (1987, p. 1). This sort of thinking prompted many who studied issues management to feature the role of futuristic thinking. These seers wanted to understand how issues emerge and mature. They worked for scanning, identification, and analysis processes that could systematically alert organizations to issues as they emerged. These systems could also monitor the trajectory of issues in the hopes that strategic responses to influence this trajectory would benefit the organization. Such thinking led some senior public relations officers to think they could “manage issues” while others believed they could not. At least the persons tended to agree that early warning systems would help the organization to manage its response to issues as they emerge and mature or decay.

Early thinking about the topic of issues management demonstrated many influences. Among the voices heard on this topic, some were from the highest executive levels, regardless of whether the organization was a business, a governmental agency, or a nonprofit that engaged in public policy changes. The management theme stressed the role of issues management and public policy trends and forces in savvy strategic business planning. Many early discussions did not consider the possibility that management philosophy and policies had to change as part of issues management. Others

realized that if those philosophies and policies created the problems brought to public attention by critics, then one part of strategic issues management had to be smart and honest responses. Management philosophy and policies simply had to change sometimes in order to achieve harmony. Managements often did not like to entertain that option because it meant giving in to critics. Recalcitrant managements were reluctant to acknowledge that activist and governmental critics did indeed want to manage the business from the outside. The tools for this management were legislation, regulation, and litigation. For this reason, the era launched in the 1960s has seen much more legislation, regulation, and litigation brought to corporate managements than occurred in any previous period in American history.

As former Allstate Insurance public affairs manager, Ewing widely concluded that “issues management is about power” (1987, p. 1). Organizations, as the collective expression of individual interests, engage in reward/loss analysis regarding the expediency of opposing or yielding to power pressures from stakeholders who can impose sanctions. The equation works like this: Assuming accuracy of understanding between the parties in contention with one another—but suffering an unchangeable difference in evaluation—companies, regulators, or activists groups have the option of exerting influence or opposing the influence efforts of others. Issues management serves organizations when it assists executives to foster the bottom line by enhancing the quality of the relationship with stakeholders in a power arena.

Despite the fact that the term *issues management* was coined in the 1970s, much of the comprehensive thinking about that concept extends back to the Industrial Revolution, before the advent of the 20th century. Business and government leaders were carving out a new view of industrial might. Slowly fading from the commercial landscape was the small company. In its place was the massive corporation on scale with what we know today. These industrial giants needed to convince key publics that big was good. They needed legislation

and regulation that would support this concept. They were also fighting over industrial standards, such as the “battle of the currents,” which pitted George Westinghouse and Thomas Edison against one another to determine whether alternating current or direct current would be the industry standard.

In a time when free capitalism was on the lips of these industrial giants, many were trying, and often succeeding, to limit competition through monopolistic practices. The issues management question of that day was when is big too big? When does competition fail to serve the interest of customers? Related to that was the issues management challenge of the telephone companies to convince the public that regulated monopolies were best. Tangles of phone lines and incompatible systems nearly convinced the public that the telephone was a nuisance rather than a necessity. AT&T convinced government and the public that regulated monopolies are good. So did the electric industry and the natural gas industry, for instance. The irony of business and the role of issues management in strategic planning is nowhere more evident than in the fact that years later the telephone companies and the electric generating companies are now deregulated and forced into a competitive mode.

Thus, issues management is more than aggressive and open communication in contest of issues. It is the management function that helps a variety of organizations serve stewardship roles to create better businesses and better business systems. It is a vital part of activism, issue-relevant nonprofits, and governmental agencies. It has even become quite popular with organizations that are devoted to protecting their brand equity against unfair and inaccurate criticism, as well as unforeseen public policy shifts.

Because of the study of issues management, the dynamics of public policy battles has changed. Some industries are reluctant to change. Some even foolishly assert that they have changed to improve their philosophies and policies. Critics monitor

their actions closely and look to ascertain whether the claims are true. All of this battleground of issues analysis and problem solving has for three decades been conducted in an arena where the general public has had the incentive to be less willing to accept responsibility for their actions and choices, based on the rationale that they are not dealing with large corporate entities that are honest and ethical. Myriad horror stories, such as poorly designed automobiles that burst into flame on impact, continue to be part of the nation’s popular culture. Activists have leveraged substantial power because they are at times the only segment that the general public has to look to for advocates of their interests. Government officials find themselves strained to balance these tangled interests. Such is the challenge and playing field of issues management, one strategic option to reestablish the age of deference.

JAFFE, LEE K.

Lee K. Jaffe, APR, Fellow PRSA, and award-winning government public relations practitioner, served as director of public relations for The Port of New York Authority from 1944 until 1965, during the revitalization of Manhattan's financial district and the planning and early construction of the World Trade Center. She is credited with suggesting that the World Trade Center be the tallest building in the world and, by the time she retired, she was said to be earning the highest salary in the country for someone at her level.

Born Lillian Kreiselman in Treveskyn, Pennsylvania, and schooled in Ohio, Jaffe moved to Wichita, Kansas, with her family after graduating from high school. There she soon began working for U.S. Senator Henry J. Allen. Allen also was born in Pennsylvania but moved to Kansas with his family at the age of 2. He was a reporter turned newspaper publisher who served first as the governor of Kansas from 1919 to 1923, and later as the publicity director for the Republican National Committee before being appointed to fill a U.S. Senate seat from 1929 to 1930.

When Allen lost his bid for that seat, he set Jaffe up as the Washington correspondent for his flagship newspaper, the *Wichita (Kansas) Beacon*, where her first story was the 1932 Veterans' Bonus March, a demonstration by 12,000–15,000 veterans calling

for their World War I service benefits. She also wrote for the *Binghamton (New York) Press* and *The Northwestern Miller* trade journals before joining the Domestic Division of the Office of War Information. Later she worked for the New York Metropolitan Region of the Office of Price Administration, the wartime agency charged with price regulation and rationing; there she served first as an information officer and then as the regional radio director. She married Isidore Jaffe on December 22, 1933, and they lived in Great Neck, Long Island.

In 1944, Austin J. Tobin, a longtime Port Authority attorney who had become executive director two years earlier, hired Jaffe to help promote the agency's image during a time when the wartime lack of money and materials kept it from fulfilling its own mission. Founded on April 30, 1921, The Port of New York Authority was the first agency of its kind in the Western Hemisphere with a bi-state district, and it surrounded the Statue of Liberty (in 1972 the name changed to The Port Authority of New York and New Jersey). Over the years, it was responsible for the planning, building, policing, and administering of systems and structures relating to transportation, from bridges and tunnels to airports and a rail line—which later became the Port Authority Trans-Hudson lines (PATH)—as well as other commercial entities in

the port jurisdiction. Thus, the Port Authority eventually came to oversee the building of the World Trade Center, which was originally conceived in the 1940s as a global import/export business center in downtown Manhattan.

With the backing of David Rockefeller and his Downtown-Lower Manhattan Development Association, then-Governor Nelson Rockefeller, and the Port Authority, among others, the first plans for the center were unveiled in 1961. But a year earlier, according to historian Angus Kress Gillespie, Jaffe wrote a memo suggesting that the center be the tallest in the world. As it turned out, the final set of plans presented to the public in 1964 revealed two towers, each of which would be the tallest in the world upon completion—only to be upstaged by the Sears Tower in Chicago a month before the Center's dedication on April 4, 1973.

Jaffe reported directly to Tobin. Known professionally as Lee K. Jaffe, much of her subsequent success could be attributed to her own ideas concerning government public relations. In January 1950 Jaffe published an article in *Public Relations Journal*, the trade magazine of the Public Relations Society of America, in which she emphasized the importance of public relations in city government as a nonpolitical function and one that represented “one single, assigned and authoritative news source” (Jaffe, 1950, p. 4) for the media and the general public. Additionally, she stressed the policy-level function of her role as the director of public relations for the Port Authority, her refusal to bury bad news or to block media access to Port Authority management, and her practice of responding promptly to inquiries and on-site visit requests. Indeed, Jaffe testified in a 1960 U.S. House Judiciary investigation into Port Authority finances that \$2,609 worth of meals spent on herself, her assistant, and the media at New York International Airport's Golden Door restaurant over a period of two and one-half years was part of the job when conducting press tours or sponsoring other Port Authority media events.

Jaffe joined PRSA in May 1950. In 1951 she was elected president of the Government Public Relations Association, which consisted of state and city practitioners. In 1955 she published another

article in *Public Relations Journal* exploring the place of government public relations in the post-Korean War world. Reminding readers of the 1913 federal legislation prohibiting the funding of publicists with congressional monies unless the funding was “specifically appropriated for that purpose,” Jaffe pointed out that the top annual salary among federal civil service information specialists during the previous year was \$12,690, whereas the 1955–1956 budget for the United States Information Agency was \$85 million. She observed,

The Washington “propaganda machine” of World War I has been traded in from administration to administration for newer and more powerful models. There is room for some traffic direction, if not control to keep the contraptions [the many information offices] from running wild and crashing head-on. (Jaffe, 1955, pp. 78–79)

Better organization could foster improved relations with the public, she said, and it would “increase the dignity and self-respect of public relations personnel” (Jaffe, 1955, p. 79). Ultimately, though, Jaffe wrote, “Government must first do a job that people can think well of, and then intelligently and deftly call attention to it” (Jaffe, 1955, p. 141).

In February 1956, Jaffe and the Port Authority received the “Best Government Public Relations Award” from PRSA. In May of that year, she was one of three speakers at the Southern Public Relations Conference in New Orleans, during which she emphasized the importance of government listening to the public, being open and honest with it, and complying with the public's desires as much as possible. In October 1956, Jaffe served on a panel, “Women in Public Relations,” at the ninth PRSA Conference in Milwaukee. In 1958, she and *PR News* editor Denny Griswold were the only two women representing PRSA at the First World Congress of Public Relations in Brussels.

In 1965 Jaffe became the first woman to receive PRSA's Gold Anvil Award for lifetime achievement. In May of that year, she retired from the Port Authority after 21 years of service and, with a salary of \$35,000, as the highest paid person at that level of government relations. In 1989 Jaffe was one

of 26 inductees into PRSA's inaugural class of the College of Fellows, along with other Golden Anvil winners Leone Baxter; Edward L. Bernays; John F. Budd, Jr.; Chester Burger; Harold Burson; Allen H. Center, Ph.D.; W. Howard Chase; Kalman B. Druck; Dan J. Forrestal; Lawrence G. Foster; James F. Fox; Ralph E. Frede; Denny Griswold; George Hammond; Rex F. Harlow, Ph.D.; Carl F. Hawver, Ph.D.; Patrick Jackson; Philip Lesly; Ed Lipscomb; Donald B. McCammond; Hale Nelson; Betsy Ann Plank; J. Handly Wright; Frank W. Wylie; and Kenneth Youel.

In the October/November 1994 issue of the *Public Relations Journal*, some of the past Gold Anvil recipients were asked to comment on the future of the public relations field. True to form, Jaffe emphasized that "integrity is the key to the proper practice of public relations" and that public relations practitioners should make it a priority not only to weigh in on policy decisions but also to put themselves in the shoes of those who will be affected by those policies.

Throughout her career, Jaffe was a member of a number of professional and community groups, including the Aviation Writers Association, the Foreign Press Association, the Women's City Club, and the Women's National Press Club. She served on the board of the American Public Relations Association, the Government Public Relations Association, the New York chapter of PRSA, and the

Greater New York Safety Councils. Additionally, the American Public Relations Association recognized Jaffe in 1950, 1951, and 1957 for her work in government, as did the Government Public Relations Association in 1955 and 1956. In June 1955 *Charm*, a magazine for working women, selected Jaffe to spotlight the achievements of the 1,328,747 working women in New York. In 1958, *PR News* honored Jaffe with its Annual Achievement Award.

KAISER, INEZ Y.

Inez Yeargan Kaiser was born on April 22, 1918, in Kansas City, Missouri. After receiving a bachelor's degree from Kansas Teacher's College in Pittsburg, Kansas, she attended Columbia University in New York for a master's degree; there she majored in home economics and received a certificate in mass communication. The certification in mass communication first brought Kaiser exposure to public relations.

Prior to finding her place in public relations, she taught for over 20 years in public schools in Evanston, Illinois; Kansas City, Kansas; and Kansas City, Missouri. More specifically, Kaiser taught home economics in the public schools. While working as a home economics instructor, she helped organize the Home Economics Department for the Board of Education and worked with the Red Cross and the Reserve Officers Training Corps (ROTC).

Additionally, she served as chairperson of the Home Economists in Business organization and was cited by *Seventeen* magazine as one of the most outstanding home economics teachers in the country. Kaiser was often recognized for excellence by her colleagues and was selected as Teacher of the Year by the Missouri State Teachers Association. For all of her accolades and recognitions, she was named Business Woman of the Year in Kansas City.

Kaiser was introduced to black readers and communities across America through several columns that she wrote for the black press. The columns, titled "Fashionwise and Otherwise," "Teen Tips," Kaiser Konsumer Korner," and "Hints for Homemakers," served as precursors for a second career in public relations. Using her columns as a platform and her experience as credibility, Kaiser devoted herself to educating black consumers on issues that she considered important. During the peak of her journalistic endeavors, her most widely read column, "Hints for Homemakers," reached a national audience of over 8 million readers. She was later honored by the National Newspaper Publishers Association (NNPA) for her 20 years of achievements in public relations and for providing information to black consumers through the black press. Kaiser also showcased her writing talents in a book titled *Soul Food Cookery* in 1968, which was published by Pittman.

Kaiser used her celebrity status to help black models secure work on Seventh Avenue and was one of the first African American women to cover fashion shows and menswear showings in New York, California, and Paris for the black press. Through her columns and other journalistic activities, Kaiser made black fashion and black beauty more visible and indirectly paved the way for acclaimed models such as Tyra Banks, Iman,

Naomi Campbell, and Tyson to grace the covers of mainstream magazines and to achieve their supermodel status. In 1980 she also received the Eartha M. White Women's Achievement Award from the National Business League for being a "pioneer black woman in the fields of public relations, fashions and the food industry."

After retiring as a school teacher in the Kansas City School District during the late 1950s, she decided to use the notoriety gained from the press to become an entrepreneur and open her own public relations agency. Thus, Inez Kaiser and Associates, located in downtown Kansas City, Missouri, was founded in 1961. This venture accorded Kaiser the distinction of becoming the first African American female to establish a public relations firm with national accounts. In that capacity she also became the first black consultant to land a soft drink account, a pharmaceutical account, and a household account. Over the years her clients have included, but are not limited to, J. Walter Thompson, Seven-Up, Sperry and Hutchinson, Continental Baking Company, and Pillsbury. She was one of the first public relations practitioners to merge advertising and public relations when she prepared advertorials for Sterling Drug, Inc. and Sears Roebuck Company.

The agency worked with major corporations, federal agencies, and associations throughout America and community-based groups in Missouri. In addition to her recognition as a public relations pathfinder, Kaiser was a civil rights activist whose agency was hired to consult with the Equal Opportunity Commission in Washington, DC. In 1972 she founded the National Association of Minority Women in Business, which was headquartered in Kansas City, Missouri. She subsequently coordinated the Department of Commerce's first Conference for Women in Business. Moreover, she became a member of the Women's Chamber of Commerce and the American Marketing Association (AMA) of Kansas City. Her activism continued into the 1990s, when she accused the Missouri Division of Tourism of racial discrimination against businesses owned by people of color. In a news conference on October 6, 1992, held at the NAACP office located in St. Louis, she outlined charges of

biases that favored white-owned businesses. Kaiser's agency, Inez Kaiser and Associates, had subcontracted for two years to promote African American tourism in Missouri. She had received the contract with Glennon and Company, a St. Louis firm that handled tourism advertising and public relations for Missouri. The contract was canceled, and Kaiser complained that the state was using her ideas, "even though she was told her ideas weren't needed before the contract was canceled" (Penington, 1992, p. 3A). Although Marjorie Beenders, director of the Tourism Division, said Kaiser's contract was canceled not because of her race but because her specialty was not needed, Kaiser garnered a great deal of publicity over the cancellation.

In 1994 she continued to fight discrimination in the tourism industry when consulted for a newspaper article addressing racial issues encountered by travelers of color. Kaiser suggested that most managers and supervisors were interested in resolving any racially sensitive problems and were very interested in preserving positive images of their hotels.

Because of the roads that she paved for other blacks and her unabashed commitment to public relations, the litany of awards and accolades given to her were quite extensive. She was named Business Woman of the Year in Kansas City and was selected as one of the 100 Most Outstanding Black Business and Professional Women by *Dollars & Sense* magazine. Educational organizations expressed their gratefulness for her efforts by perpetuating her name in several ways. The Kansas City Branch of the American Association of University Women named a scholarship award in her honor during the mid-1970s. One of her highest accolades was an honorary doctorate of law from Lincoln University in 1986. Kaiser was the first African American female to become a member of the Public Relations Society of America (PRSA). During the early 1990s, the Minority Scholarship in Public Relations was established by Jack Detweiler and Marilyn Kern-Foxworth for the Public Relations Division (PRD) of the Association for Education in Journalism and Mass Communication (AEJMC). Graduate students of color pursuing degrees in public relations or conducting research

in the area of public relations are eligible for the award. Students often are nominated by their professors, or thesis and dissertation committee chairs. The students, domestic and international, selected for this award are given funds to pay for their membership in AEJMC and for membership in the Public Relations Division (PRD) of the organization. Another benefit of the award is the introduction of students of color studying public relations to the activities of both AEJMC and the PRD. The funds are provided by public relations professors and journalism/public relations/communications schools and departments. During the annual PRD luncheon of the AEJMC held August 12, 1993, in Kansas City, Missouri, the award was named in honor of Inez Yeargan Kaiser. On July 31, 2003, 10 years after the awards were named in her honor, the PRD of AEJMC featured her at the Bill Adams/Edelman Luncheon. By this time over 175 graduate students had become recipients of the Inez Kaiser Award, named after the trailblazing legend.

The International Association of Market Developers (IAMD), during a ceremony held in Chicago on April 19, 1997, recognized Kaiser as a public relations legend. During that same ceremony, she passed the torch in public relations to Marilyn Kern-Foxworth, who received the Torchbearer Award.

As part of a CBS special Fourth of July program on July 4, 1997, titled "What's Right With America," Kaiser was interviewed by Dan Rather and was one of four people profiled as having made a difference in America. Kaiser's major achievements in public relations and her leadership in advancing black business women were accompanied by a collage of pictures that showed her conversing with such luminaries as former presidents Nixon and Ford, both of whom she consulted on issues pertinent to women of color in business.

Inez Yeargan met Richard Kaiser when he was stationed in the U.S. Navy at the Fairfax Naval Base in Kansas City, Kansas. They were married on October 29, 1944, at the First Baptist Church in Kansas City. In January 1949 their son, Richard Stafford Kaiser, Jr., was born. Kaiser spent her life making the world more inclusive and along the way has been a pathfinder and a pioneer. Remarkable on her success, Kaiser

notes, "I was just a woman who happened to be black and good. Persistence and patience are the biggest things I've learned. Still, I think the thing that keeps me going is my faith in God."

—Marilyn Kern-Foxworth

KANT, IMMANUEL

See Deontology

KASSEWITZ, RUTH B.

Armed with a bachelor of science degree in Journalism Management from Ohio State University in 1951, Ruth Eileen Blower Kassewitz (1928–) began her professional public relations career in that year as a copywriter in charge of print advertising for the Ohio Fuel Gas Company, Columbus, Ohio. She continued to work in advertising as an account secretary for the Merritt Owens Agency, Kansas City, Kansas, and in 1956–1959 was an account executive for Grant Advertising, Inc., Miami, Florida.

Kassewitz's first public relations position came in 1968 as director of public relations for an architecture and engineering firm, Spillis/Candela Partners. In 1969 she became director of communications for the Metro-Dade County Department of Housing and Urban Development. In this position,

she organized public information programs in urban renewal communities, helping impoverished citizens to communicate and participate in government's earliest community involvement initiatives.

With the passage in 1972 of the Florida Government-in-the-Sunshine Law, Metro-Dade County appointed Kassewitz to establish the first office of public information. As communications officer, Kassewitz launched a public relations campaign to inform the voters of the services represented by the county's \$550 million Decade of Progress bond issue. The campaign won a Public Relations Society of America (PRSA) Silver Anvil Award in 1973.

Kassewitz ran a successful public information campaign for Metro Dade County's \$70 million water bond issue in 1974. The campaign won first place in the WICI (Women in Communications, Inc.) Clarion Awards.

During Kassewitz's seven years as communication director, she built up her department from 1.5 to 13 staff persons to serve the public information needs of the county manager, all county departments, and citizen advisory boards. Kassewitz accomplished this using an "internal agency" budgeting model so that the net impact on the county budget remained at 1.5 persons.

From 1978 to 1991, Kassewitz was administrator for public relations at the University of Miami/Jackson Memorial Medical Center. She created the campaign "One of the Nation's Best," helping to increase the county hospitals' private patient admissions. This campaign won the Florida Public Relations Association (FPRA) Golden Image Award. Kassewitz retired in 1990.

Kassewitz's public service and leadership in professional organizations includes serving as the first woman president in 1993–1994 of the Rotary Club of Miami, Inc. Rotary, founded in 1905, began accepting women into its membership only in 1987.

Kassewitz was Miami president of Women in Communication in 1962 and president of the Mental Health Association in 1982. She was president in 1963 of the Dade/Miami Lung Association and of the University of Miami Women's Guild in 1973–1974. She served on PRSA's national board of directors from 1974 to 1976 and was the South Florida PRSA Chapter president in 1969.

Now a public service/public relations consultant in Coral Gables, Kassewitz received the Miami PRSA Lifetime Achievement Award in 1975. Among her other awards are Woman of the Year from the University of Miami School of Medicine; the PRSA Paul M. Lund Community Service Award in 1993; the Distinguished Rotarian of the Year award, 1996; and Rotarian of the Year, International District award, 1999.

KENDRIX, MOSS

Moss Kendrix was born in Atlanta, Georgia, on March 8, 1917. His early education took place in local public schools. He often bragged that Lena Horne, one of the most celebrated African American female entertainers, was a close childhood friend. Following his graduation from high school, he attended Morehouse in Atlanta, the most prestigious college for African American men. His career in public relations was sparked at Morehouse, where he edited the school newspaper, *The Maroon Tiger*. It was during his college years that he joined Alpha Phi Alpha, the first African American fraternity. He also co-founded the Phi Delta Delta Journalism Society, the first and only society of its kind for African American journalism students.

Following graduation from Morehouse in 1939, he felt the necessity to honor black journalism pioneers by creating National Negro Newspaper Week. Although he was admitted to Howard University Law School in 1939, he deferred the offer and opted to improve his journalistic skills by gaining work experience. In 1939, he also married Dorothy Marie Johnson, a student at Spelman College, a premier black college for African American women, also located in Atlanta.

Drafted into the U.S. Army in 1941, Kendrix worked for the Treasury Department in the War Finance Office. In this capacity he traversed the nation with African American luminaries, such as composer-musician Duke Ellington and singer Billy Eckstine, promoting war bonds. It was at this

juncture that he regularly appeared on radio programs for the CBS network.

Kendrix subsequently became the director of public relations for the Republic of Liberia's centennial celebration in 1944, an experience that laid the groundwork for his illustrious career in public relations. During his career as a lobbyist, he was the first African American to represent a mainstream organization and often had the opportunity to work with other black lobbyists such as Edgar G. Brown and Leslie S. Perry.

The power of the African American market during the early 1940s was not recognized by many of the white-owned and oriented organizations, companies, advertising agencies, and public relations firms. So in 1944 he started his own public relations firm, the Moss Kendrix Organization. The agency, located in Washington, DC, heralded the mantra "What the Public Thinks Counts." Understanding the purchasing power of the "Negro market" was crucial to getting the market noticed with retailers, manufacturers, and on Madison Avenue. The economic clout of the market was reinforced in an issue of the *Negro History Bulletin* in 1956, which featured Kendrix on the cover. Moreover, the article contended that disposable income of blacks paralleled that of Canada; doubled that of Belgium, Greece, and Australia; and tripled that of Sweden. The article further noted that the *Wall Street Journal* had suggested that "sales messages must be slanted" toward the Negro people. Thus, Kendrix, a skilled communicator, was relentless in his efforts to gain attention for the virtually untapped Negro market. He established a remarkable rapport and reputation with some of the most prominent business leaders in the country who valued his counsel. In his quest to gain notice for African American consumers, he became the conduit between the Coca-Cola Company, one of the largest beverage companies in the world, and the black community.
